## Introduction

The principal facts for 4,202 gravity stations on the Ely 1 by 2 degree quadrangle are listed in table 3. The format of the principal facts are described in table 2. The Ely 1 by 2 degree quadrangle is located between 39° and 40° north latitude and 114° and 116° west longitude.

All gravity data have been reduced to complete Bouguer anomalies and terrain corrected to 166.7 km. No attempt has been made to edit redundant stations and only gross errors greater than about 5 mGal have been removed. Redundant stations may amount to 30% of the complete data set. Inconsistencies between various sources of data have not been removed, these errors may include observed gravity datum shifts. The purpose of the report is to quickly release and make the data available to potential investigators. A more detailed and final edition is forthcoming.

## Gravity Data

Standard gravity corrections were made on all the gravity data and include: (a) the earth-tide, (b) the instrument drift, (c) the free-air, (d) the Bouguer, (e) the latitude, (f) the curvature, and (g) the terrain. Theoretical gravity is based on the Geodetic Reference System of 1967 (International Union of Geodesy and Geophysics, 1971) and observed gravity values are referenced to the IGSN 1971 gravity datum (Morelli, 1974, p. 18). The general formulas and references to formulas are outlined by Oliver (1980, p. 50-52).

A partial list of IGSN 1971 observed gravity base stations include ELYA (ACIC Reference Number 0390-2) at the Ely Airport, Nevada and BAKER (ACIC Ref. No. 2360-1) at the Baker Store (now the Terry Motel) in Baker, Nevada (Jablonsky, 1974).

The inner-zone terrain corrections were either manually calculated or computer calculated to a radius of 0.59 km, equivalent to the outer radius of the Hayford-Bowie zone D (Swick, 1942). Terrain corrections from 0.59 to 166.7 km were computer calculated. Computer calculated terrain corrections were made using a FORTRAN program by Plouff (1977).

At present, only recent data of the U.S. Geological Survey and Stanford University data include manually calculated inner-zone terrain corrections (to a radius of 0.59 km). These two sources are at the beginning of table 3 and begin and end with station names ELYA and KV110, respectively.

Other data sources were primarily provided by the Defense Mapping Agency Aerospace Center (DMAAC), St. Louis, MO (written commun., 1983). DMAAC source codes have been converted to a 1 character alphabetic code (A to T) and are described in table 2.

Table 1.-- Principal fact format

STATION NAME is an alphanumeric combination of up to eight characters used for station identification.

LATITUDE AND LONGITUDE are the geographic coordinates of the station location expressed in degrees and decimal minutes to the nearest 0.01 minute.

ELEV is the station elevation in feet to the 0.1 ft.

OG is the observed gravity to the nearest 0.01 mGal.

ACCURACY CODE is an alphanumeric combination of up to four characters describing the general location; and the elevation, latitude, and observed gravity accuracy. (Not used)

FAA is the free-air anomaly to the nearest 0.01 mGal using Swick's (1942, p. 65) formula.

INNER is the inner-zone terrain correction in mGal to the nearest 0.01 mGal, for a density of 2.67 g/cm<sup>3</sup>.

TC is the total terrain correction in mGal to a radius of 166.7 km, for a density of 2.67 g/cm<sup>3</sup>, to the nearest 0.01 mGal.

CBA1 is the complete Bouguer anomaly in mGal to the nearest 0.01 mGal, reduced for a density of 2.67 g/cm<sup>3</sup>.

CBA2 is the complete Bouguer anomaly reduced for a density of 2.50 g/cm<sup>3</sup>.
