

Cisco 4G LTEA, 4G LTE, and 3G Omnidirectional Dipole Antenna (LTE-ANTM-SMA-D)

Last Updated: 2/12/2018

This document provides the description, supported features, and installation instructions for the Cisco 3G/4G LTE and LTEA Omnidirectional Dipole Antenna (LTE-ANTM-SMA-D).

Caution: Read the information in [Safety Instructions, page 494](#) before installing or replacing antennas.

This document contains the following sections:

- [Overview, page 486](#)
- [Specifications, page 487](#)
- [Antenna Radiation Patterns, page 489](#)
- [Safety Instructions, page 494](#)
- [Installation Instructions, page 495](#)
- [Related Documentation, page 496](#)

Overview

The LTE-ANTM-SMA-D omnidirectional dipole antenna is designed for indoor use with Cisco 4G Long Term Evolution (LTE) and Long Term Evolution Advanced (LTEA) Service Routers (ISRs) and Pluggable Modules with an SMA connector.

The LTE-ANTM-SMA-D antenna is marked with a dual green band to indicate that it supports Cisco LTEA routers and modules.

This antenna has the following features:

- Support for frequencies of 698–960, 1448–1511, and 1710–2690 MHz.
- Standalone antenna peak gain of less than 3.7 dBi in the supported frequency bands.
- Articulating joint that can maneuver into three stop positions: 0°, 45°, and 90°.
- Male SubMiniature A connector that allows direct mounting of the antenna to any Cisco supported router or Pluggable Module with an SMA connector.
- The SMA connector design has added rotational frictional torque to ensure the SMA interface stays properly mated, and to reduce chances of a disconnect. The design is also more finger friendly compared to a classic SMA hex nut design.

For optimal performance, we strongly recommend that you use two antennas to take full advantage of MIMO technology on all Cisco cellular routers that support MIMO (4G LTE and later releases).

Specifications

Table 1 Specifications of the LTE-ANTM-SMA-D antenna:

Operating Frequencies	698-960 MHz 1447-1511 MHz 1710-2690 MHz
Polarization	Vertical, linear
Nominal Impedance	50 Ohms
Peak Gain	2.0 dBi (698-960 MHz) 2.8 dBi (1447-1511 MHz) 3.7 dBi (1710-2690 MHz) Note: The standalone antenna peak gain numbers are provided above. When you install an antenna close to metallic objects or directly on chassis, the peak gain will be affected. We recommend that you keep antennas away from very large chassis and metallic objects. You can install antennas directly on smaller or medium size chassis. In all cases, we recommend that you keep different antennas away from each other and from various known sources of electromagnetic radiation.

Table 1 Specifications of the LTE-ANTM-SMA-D antenna:

VSWR	$\leq 2.5:1$ (698-960 MHz) $\leq 2.5:1$ (1447-1511 MHz) $\leq 2.0:1$ (1710-2690 MHz)
Maximum RF Input Power	5 W
DC Power	No DC power required for LTE-ANTM-SMA-D antenna operation.
Dimensions	9" (L) x 1.46" (W) x 0.43" (D) (229 x 37 x 11 mm)
Weight	56.8 grams
Efficiency	LTE-ANTM-SMA-D antennas have high standalone efficiency, and maintain high efficiency when directly installed on front plate of a small or medium size Cisco router. However, depending on chassis size and a variety of other electromagnetic considerations, installing the antenna directly on the chassis is not always recommended.
Temperature Range	-30° C to + 70° C (Operating) -40° C to + 85° C (Storage)

Safety Instructions

Warning: IMPORTANT SAFETY INSTRUCTIONS

A warning means danger. You are in a situation that could cause bodily injury. Before you work on any equipment, be aware of the hazards involved with electrical circuitry and be familiar with standard practices for preventing accidents.

SAVE THESE INSTRUCTIONS

Follow these safety instructions when installing the antenna.

Antenna Installation Warning

Warning: In order to comply with FCC radio frequency (RF) exposure limits, antennas should be located at a minimum of 7.9 inches (20 cm) or more from the body of all persons.

Warning: When installing or replacing the unit, the ground connection must always be made first and disconnected last.

Caution: Do not install the antenna in an outdoor environment.

Caution: For your physical safety, and to help you install your antenna successfully, follow these safety precautions.

- Plan your installation procedure carefully and completely before you begin.
- Choose your installation site with both safety and performance in mind.
- If you are installing an antenna for the first time, for your own safety as well as others, seek professional assistance. Your Cisco sales representative can explain which mounting method to use for the size and type of antenna you are about to install.
- Before you install an antenna, contact your Cisco account representative to explain which mounting method to use for the size and type of antenna that you are about to install.

Installation Instructions

The following section contains information for installing the LTE-ANTM-SMA-D antenna:

This antenna is designed to be mounted either directly or on an antenna extension stand to any Cisco 3G/4G wireless ISR, LTE and LTEA router with an SMA(f) connector by threading it onto the mating connector. Refer to the routers technical documentation for recommendations of direct mounting of antenna to the router versus installing the antenna on an antenna extension stand. Mount and deploy the antenna at the 0° position, 45° position, or the 90° position, and then change that position at will. The rotation of the antenna into the proper position can take place while the antenna is still loose on the mating connector. No software is required for this installation.

In addition to the antenna orientation, the installation location of 4G routers and cellular modules play a significant role in determining overall network performance. Routers located at the farthest coverage points might have 10 to 50 percent of the bandwidth available compared to routers located closer to the cellular base station tower.

Because antennas transmit and receive radio signals, their performance can be adversely affected by the surrounding environment, including physical obstructions. Radio frequency (RF) interference may occur between wireless systems located close to each other, especially if the antennas of these systems are located close to each other.

Follow these guidelines to ensure the best possible performance:

- When you use the antenna on a modular router with an LTE pluggable module, always mount the antenna on an appropriate extension cable and antenna stand. The antenna performance, and therefore that of the router, will not be optimal if mounted directly to the pluggable module.
- Mounting of the antenna directly to smaller physical size routers is allowed.
- For optimal performance, space multiple antennas apart by at least 17 inches (43 cm).
- The lowest LTE frequency of 700 MHz 17 inches represents 1 wavelength. Spacing of 0.5 wavelength or 8.5 inch (22.5cm) results in good performance.
- Spacing of less than 8.5 inch may result in significantly reduced MIMO performance.
- Spacing antennas close to each other (e.g. 3") results in antennas detuning from their original designed performance due to antenna coupling.
- Wherever possible, mount the ISR cellular router or the pluggable LTE module and antenna where the cellular base station or tower are within sight and without physical obstructions. Barriers along the line of sight between the device and the local base station will degrade the wireless radio signals. Install ISR cellular routers, pluggable modules and antennas above floor level in office environments or near the ceiling for better performance because most obstructions tend to be near the floor level.

- The density of the materials used in a building's construction determines the number of walls the signal must pass through while still maintaining adequate coverage. Consider the following before choosing the location for installing your antenna:
 - Paper and vinyl walls have very little effect on signal penetration.
 - Solid and precast concrete walls limit signal penetration to one or two walls without degradation of coverage.
 - Concrete and wood block walls limit signal penetration to three or four walls.
 - A signal can penetrate five or six walls constructed of drywall or wood.
 - A thick metal wall or wire-mesh stucco wall causes signals to reflect back and causes poor penetration.
- Avoid mounting the antenna next to a column or vertical support that could create a shadow zone and reduce the coverage area.
- Keep the antenna away from reflective metal objects such as heating and air-conditioning ducts, large ceiling trusses, building superstructures, and major power cabling runs. If necessary, use an extension cable to relocate the antenna away from these obstructions.
