The shared evolutionary history of all life makes it possible to use genetically tractable organisms to study fundamental aspects of cell and developmental biology, as well as to explore the molecular basis of many human diseases. This course will focus on six of the most common model genetic systems (yeast, worms, fruit flies, zebrafish, mouse and mustard weed), examining the unique genetic features of each, and how they are being used to investigate such topics as animal and plant development, cell growth and cancer, neurological disease, behavior, and aging. The format of this seminar course includes lectures, student presentations, discussions, quizzes and writing assignments.
