A Summary of Results of 1978 Louisiana Brown
Shrimp Tagging Experiments, with
Regard to Movement and Migration

by

S. L. Hollaway and K. N. Baxter

Introduction

Research on penaeid shrimp stocks in the northern Gulf of Mexico began in 1977 as part of Project MEXUS-GULF and continued in 1978. During the 1978 phase, brown shrimp (Penaeus aztecus) were the target species for mark-recapture studies. Expanded operations were initiated in Louisiana, both in Caillou Lake and offshore, in an attempt to characterize the brown shrimp stocks of the north central Gulf of Mexico.

In 1978, reported commercial landings of brown shrimp in Louisiana totaled 15.7 million kg (34.6 million lb), headless weight, with a total value of \$35.8 million (USDOC, 1980).

Under contract with the National Marine Fisheries Service (NMFS) the Louisiana Department of Wildlife and Fisheries tagged and released brown shrimp inshore in the Caillou Lake estuarine system in 1978. In addition to inshore tagging efforts, NMFS personnel from the Galveston Laboratory tagged and released brown shrimp in Louisiana offshore waters from both the NOAA Fishery Research Ship OREGON II and a commercial shrimp trawler under contract. These studies were a continuation of efforts to meet shrimp management information needs identified in the regional shrimp fishery management plan for the Gulf of Mexico (Christmas and Etzold, 1977). This report presents a summarization of these mark-recapture experiments.

Materials and Methods

Inshore tagging efforts were concentrated in the Caillou Lake estuarine system during May, June, and July. Offshore tagging studies were carried out southwest of Caillou Lake and south of Calcasieu Lake in June, and south of Calcasieu Lake in July and August (Figure 1). Marked brown shrimp were released from two locations during the June offshore study. Of the 11,156 shrimp released from the NOAA Fishery Research Ship OREGON II, 7457 were released offshore of Atchafalaya Bay and 3699 were released offshore of Calcasieu Lake. Depths of release during the June study were from 10 to 15 fm. During the August offshore study, shrimp were released offshore of Calcasieu Lake in 13 fm. low concentrations of brown shrimp, compounded by an abundance of jellyfish, prevented the release of more than 1521 marked animals. Survival of shrimp was low due to the jellyfish, resulting in a low percentage of shrimp in condition necessary for tagging.

In all Louisiana studies conducted during the 1978, brown shrimp were tagged with the vinyl mini-ribbon streamer tag similar to that described by Marullo et al. (1976). All holding equipment and procedures and tagging equipment and procedures used during the 1978 were similar to those described for the 1977 Louisiana studies (Baxter and Hollaway, 1981). Capture of shrimp for tagging studies was accomplished by trawling at night during inshore and offshore studies.

The incentive award program described by Baxter and Hollaway (1981) was continued in 1978 with no modification. Publicity for the program and cash awards were distributed by Louisiana State University's Center for Wetland Resources, Sea Grant Program, under contract with NMFS.

LOUISIANA RELEASE SITES FOR 1978

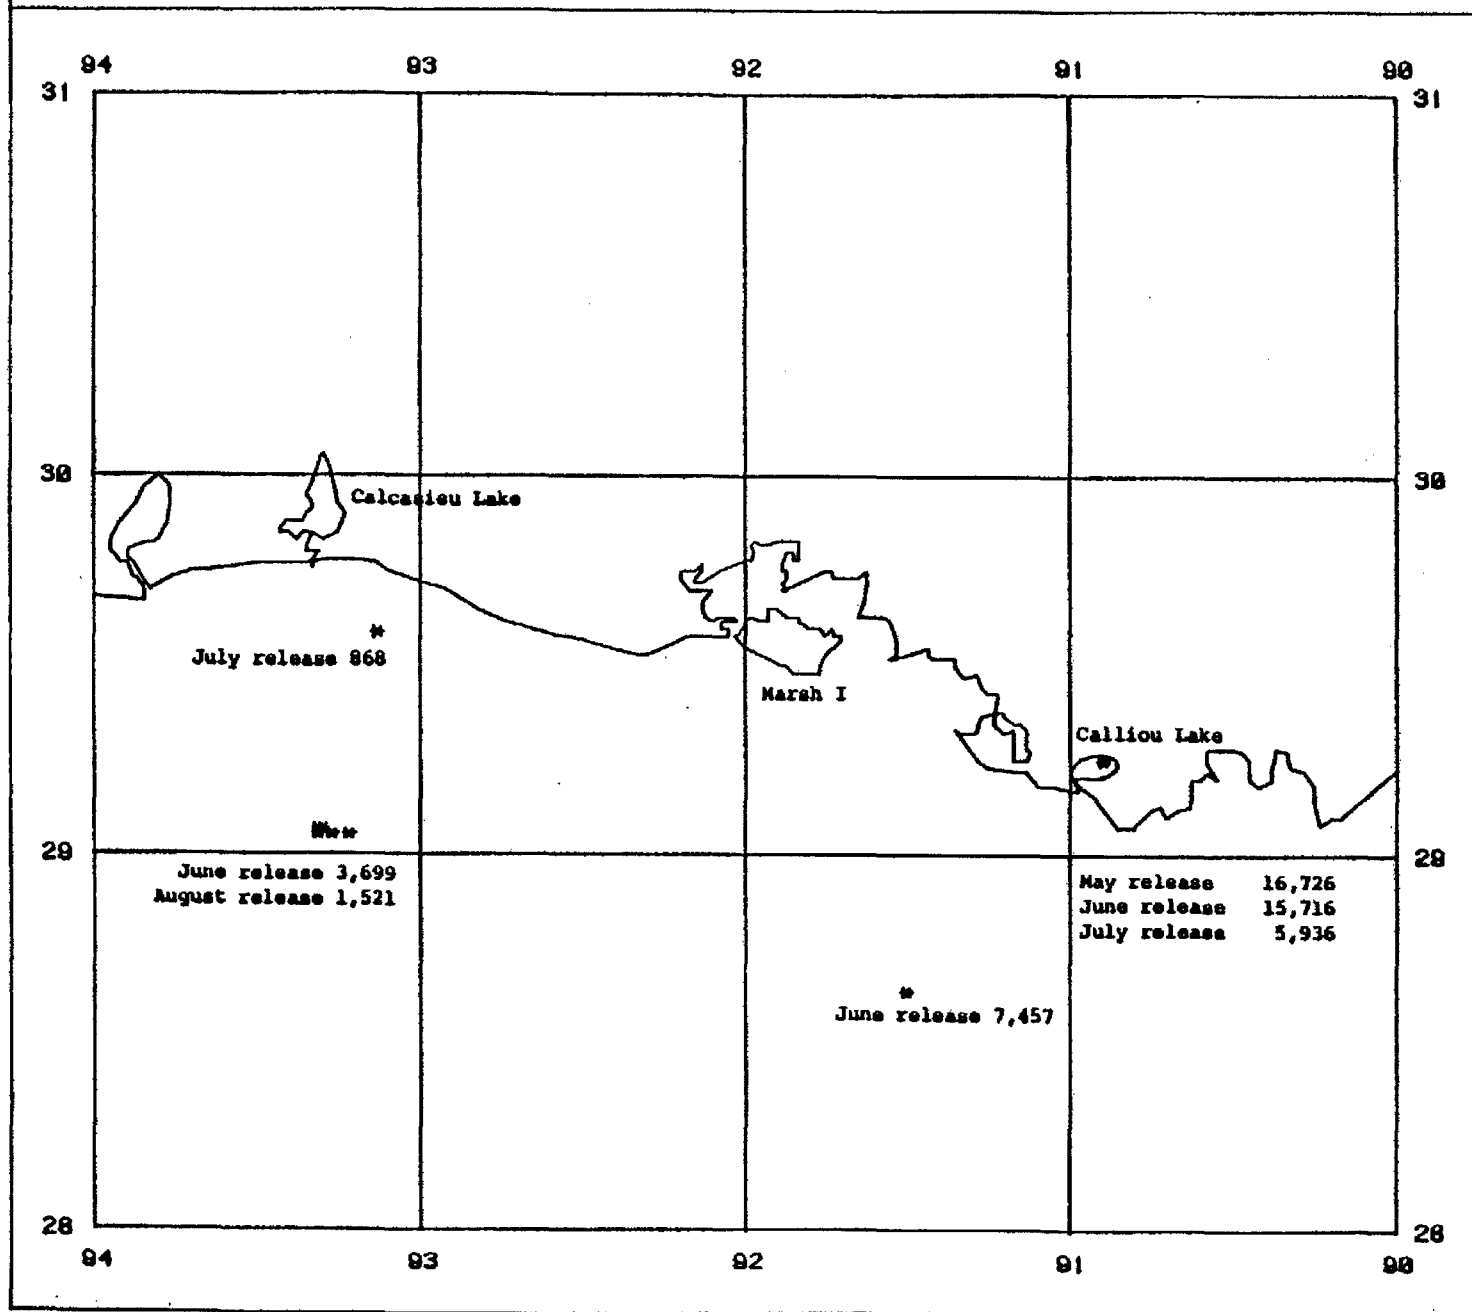

Figure 1. Release sites and number released for 1978 inshore and offshore Louisiana brown shrimp tagging studies.

Table 1. Summary of 1978 Louisiana inshore release and recapture data.

<u>Month</u>	<u>Number released</u>	<u>Number recaptured</u>	<u>% recaptured</u>
May	16726	1534	9.2
June	15716	1709	10.9
July	5936	402	6.8
Total	38378	3645	9.5

Results and Discussion

Inshore and offshore release sites and the number released during each study are shown in Figure 1. A total of 51,923 tagged brown shrimp were released during these studies in 1978. A total of 4,138 were subsequently recaptured, yielding an 8.0% recovery rate. Data on individual recaptures, including distance and direction traveled, days at large, and change in length, are presented in Appendix I.

Inshore

A summary of the 1978 inshore release and recapture data is given in Table 1. Between May and July, 38,378 tagged brown shrimp were released in the Caillou Lake estuarine system. Of those released, 3,645 were recaptured, yielding an overall recovery rate of 9.5%. Recovery rates for the three monthly studies ranged from 6.8% for the July study to 10.9%. The majority of recoveries were recaptured inshore within 60 days of release; net movement was to the south and southwest (Table 2).

In May, 16,726 tagged brown shrimp were released, with 1,534 subsequently recaptured. Over 89% of those recovered were recaptured in inshore areas as defined by the State of Louisiana¹, indicative of the intensive inshore fishery operating in and around this estuarine system. Among those marked animals recovered from the offshore fishery, net movement was to the west and southwest through September, as indicated by graphs of recapture locations (Figures 2 through 5).

The June study resulted in the release of 15,716 tagged brown shrimp.

A total of 1,709 tagged shrimp were recaptured, giving a recovery rate of 10.9%, the highest for 1978 inshore Louisiana studies. The majority of recaptures were recovered in inshore areas surrounding the release site (Figure 6). Subsequent recoveries from offshore indicated a net westward movement through September (Figures 7 through 9).

Marked shrimp released during the July study showed a more rapid movement out of the estuarine system than releases from the May and June inshore studies (Figure 10). Again, net movement was to the west and southwest. The proportion of these marked animals returned from the offshore fishery 18.6%, was greater than that from the May and June inshore studies. Recaptures during August indicated a net west-northwest movement after the marked shrimp left the release area (Figure 11).

The net directional movements shown in Table 2 indicated general movement to the south from the release site, however, this is biased by those shrimp recaptured by the intensive inshore fishery while emigrating south out of the Caillou Lake estuarine system. Those marked shrimp that successfully moved offshore and were subsequently recaptured tended to move west along shore. Gaidry and White (1973) address these two separate movement patterns, describing an initial movement of 60 to 70 mm total length juveniles into larger open bay systems or "staging areas." The second movement, an offshore migration, occurs when the shrimp reach approximately 90 to 110 mm total length in mid to late May, increasing in June and July. Upon entering the offshore fishery, the shrimp tend to move into deeper waters in a westerly direction. This westward movement has been discussed by several investigators (Gaidry and White, 1973; Perret and Boudreaux, 1976; Klima, 1980; Klima and Parrack, 1980).

Offshore

During the Louisiana offshore mark-recapture studies, 13,545 brown shrimp were marked and released. A total of 493 marked shrimp were subsequently recovered,

1978 OFFSHORE LOUISIANA BROWN SHRIMP STUDY

JUNE RELEASE
 JUNE RECAPTURES
 NUMBER RECAPTURED = 127

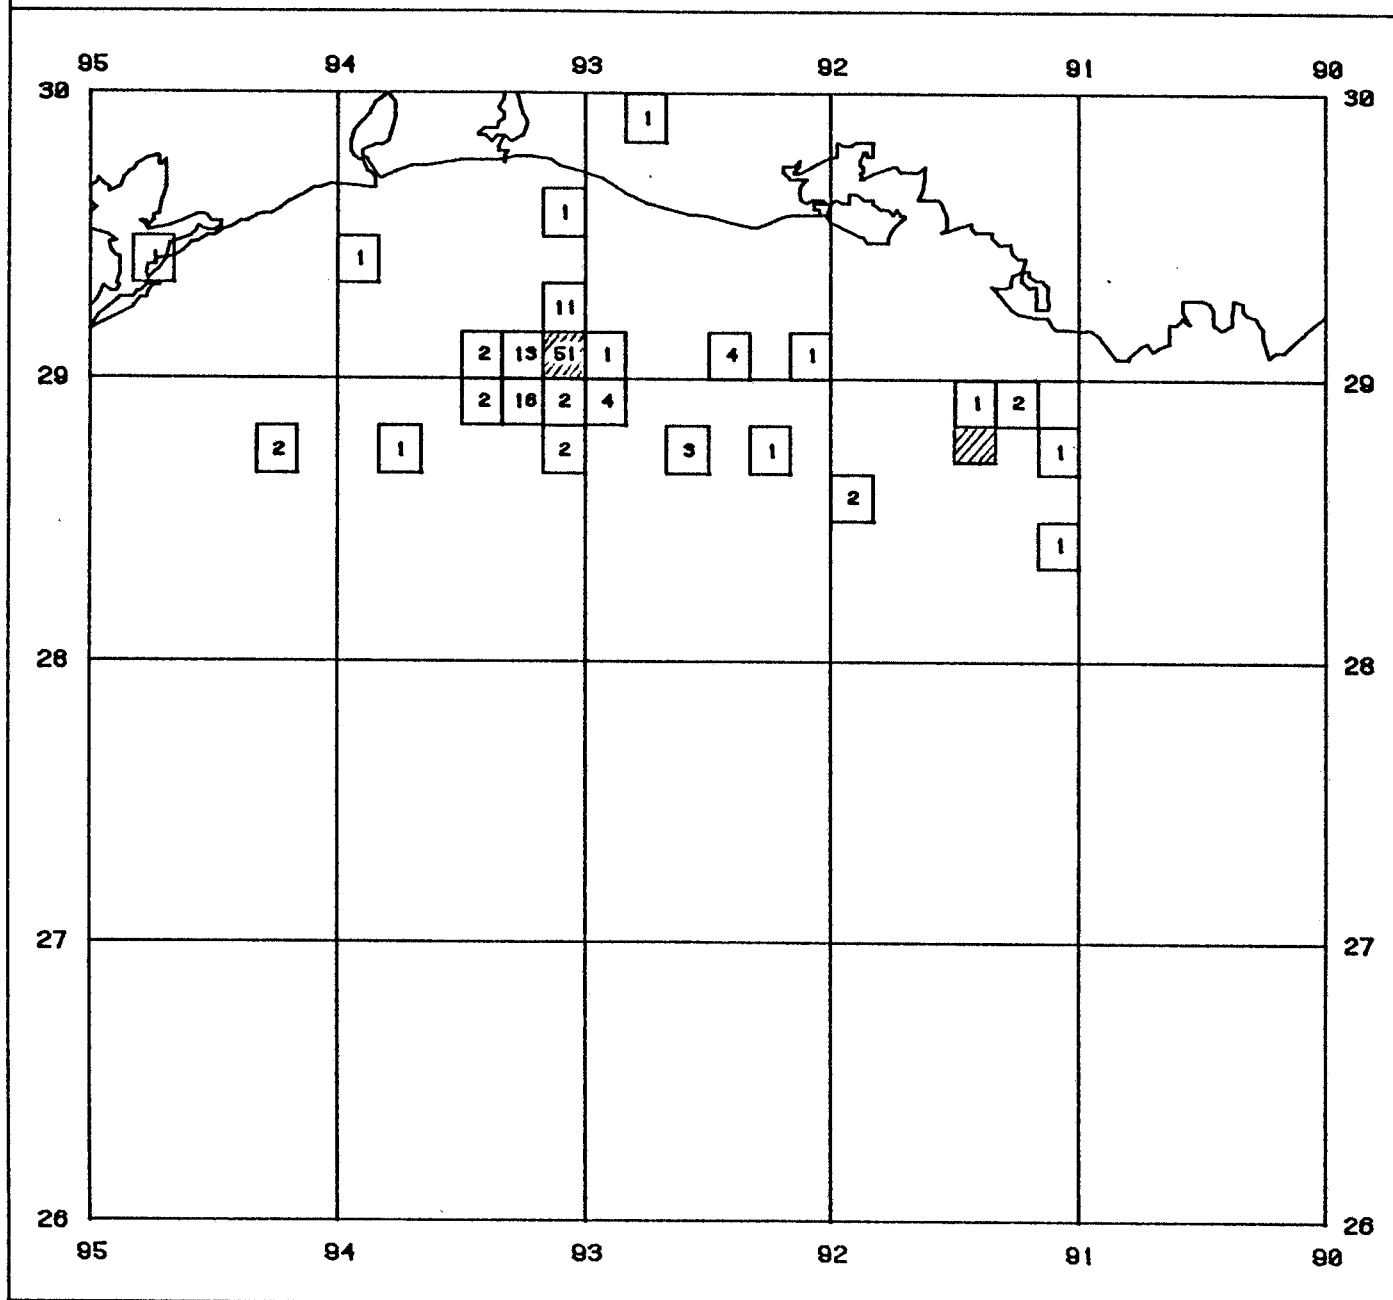

Figure 12. Recapture locations of tagged brown shrimp released and recaptured in June. Shaded block indicates release area.

representing a recovery rate of 3.6% (Table 3). Recovery rate for individual studies varied from less than 1.0% for the July study to 4.0% for the June study. The majority of recoveries were recaptured within 60 days of their release after net movement to the south and west, although some movement to the southeast was indicated (Table 4).

A total of 450 marked animals were recaptured through December, resulting in a recovery rate of 4.0% for the June offshore study. Recaptures during the month of June indicate dispersion from release sites into deeper waters, although some inshore movement is evident (Figure 12). More pronounced eastward and westward movement from release sites, as well as offshore movement, was observed from July recaptures (Figure 13). From August through December, the number of recaptures is considerably reduced from levels seen during the previous two months, but the east-west dispersion into deeper waters remains evident (Figures 14 through 17).

Due to low availability of brown shrimp, compounded by problems associated with trawling, marked brown shrimp were released on only two days during the July study. A total of 868 marked animals were released, of these only one was subsequently recovered.

Recapture rates from the August study were low during August, but a net westward movement is indicated, with some movement to the east and into deeper waters (Figure 18). During September, the number of recaptures increased, showing westward movement of the shrimp into Texas waters, as well as movement into deeper waters (Figure 19). Recoveries through December indicate little movement from that shown by September recoveries (Figures 20 and 21).

Despite the release of relatively low numbers of marked brown shrimp during two of the three offshore studies, general movement patterns are discernible. The movement of marked brown shrimp into deeper waters over time is well illustrated

by the return density by area plots. This is also shown in Table 4, which indicates the majority of marked animals moving south into deeper waters after release. Graphs of numbers recaptured also indicate an east to west migration trend, as was shown for brown shrimp marked and released at Caillou Lake.

The offshore movement of brown shrimp has been reported by several investigators. In a mark/recapture study conducted off Port Aransas, Texas, Klima and Benigno (1965) reported that small brown shrimp moved parallel to the coastline and seaward after release. Compton and Bradley (1962) marked and released juvenile brown shrimp in Aransas Bay, Texas, and reported that subsequent movement was primarily toward the Gulf during the summer. Matthews (unpublished manuscript), analyzing transect data collected during May through August off Texas by NMFS during 1961-65 and Texas Parks and Wildlife Department during 1975-80, determined that brown shrimp exhibit a definite offshore migration over time or with increasing age, eventually being recruited into the offshore stock in 20 to 30 fm. Griffin et al. (1974) reported that brown shrimp move from inshore and shallow water areas to deeper offshore waters. The data obtained during the mark-recapture studies reported here corroborate the seaward migration of brown shrimp over time. Brown shrimp marked and released during the Louisiana offshore studies were returned from as far west as Freeport, Texas. Results of concurrent studies off the Texas and Mexican coasts show a mixing of stocks in the northwestern Gulf of Mexico, indicating a single mobile stock of adult individuals existing from the Mississippi River to Tampico, Mexico (Klima and Parrack, 1980).

INCOMPLETE RECORD TABULATION

NO DATES	NO SPECIES	NO RECAPTURE LENGTHS	NO SEX
95	0	278	216

LEGEND

SPECIES CODE: W=WHITE; P=PINK; B=BROWN; U=UNKNOWN

SEX CODES: M=MALE; F=FEMALE; U=UNKNOWN

DISTANCE TRAVELLED IS IN NAUTICAL MILES

DIRECTION TRAVELLED IS COMPASS HEADING (AS THE CROW FLIES) FROM RELEASE LOCATION
TO POINT OF RECAPTURE IN DEGREES AND TENTHS OF DEGREES

DATES ARE IN THE FORM: YEAR,MONTH,DAY

NEGATIVE DAYS OUT ARE RECORDED AS RECEIVED

DAYS OUT HAS +- IF RECAPTURE DATE IS NOT KNOWN EXACTLY,
IF RECAPTURE DATE IS ONLY DATE FOUND; DAYS OUT WILL BE
ZERO AND NA FOR NOT APPLICABLE

ALL LENGTHS ARE IN MILLIMETERS TAIL

LENGTHS AT RECAPTURE ARE RECORDED AS RECEIVED EVEN IF NEGATIVE GROWTH IS INDICATED

RELEASE AREA KEY: I=INSHORE; O=OFFSHORE

RELEASE STATE KEY: L=LOUISIANA; T=TEXAS; M=MEXICO

INCOMPLETE RECORD TABULATION: COUNTS ARE NOT ADDITIVE;
I.E. A RECORD MAY BE MISSING A RECAPTURE LENGTH AND DATE
AND BE COUNTED IN BOTH CATEGORIES
