Enseco
A CORNING Company

October 25, 1991

Mr. John O'Donnell
Balsam Environmental Consultants, Inc.
5 Industrial Way
Salem, NH 03079

Dear John:

Enclosed are the results of the analyses for UCC Soil Analysis October 1991 (UCC Soil Analyisis 10/07/91). This project was received at Enseco - Erco Laboratory on October 5, 1991, and was processed for a 21 day turnaround time and in accordance with CLP analyses and reporting protocols, where applicable. This letter authorizes the release of the analytical results and should be considered an integral part of this report.

Please refer to this project by the Enseco project number 010135 to expedite any further discussions. I will be happy to address any questions or concerns that you may have.

Sincerely,

Mary B. Ford

Case Narrative

Client: Balsam Environmental Consultants, Inc.
Project Name: UCC Soil Analyisis 10/07/91
Erco Project No.: 010135

1. This project consists of the results for samples received at Enseco - Erco Laboratory on October 5, 1991. Please see the sample description information sheet for a list of samples.

2. In the volatile fraction, 10135-04 (UCC-SB-B-17-4) was run outside of the holding time.

DATA REPORTING QUALIFIERS

The nine EPA-defined qualifers to be used are as follow:

U - Indicates compound was analyzed for but not detected. The sample quantitation limit must be corrected for dilution and for percent moisture. For example, 10 U for phenol in water if the sample final volume is the protocol-specified final volume. If a 1 to 10 dilution of extract is necessary, the reported limit is 100 U. For a soil sample, the value must also be adjusted for percent moisture. For example, if the sample had 24% moisture and a 1 to 10 dilution factor, the sample quantitation limit for phenol (330 U) would be corrected to:

$$\frac{(330\ U)}{D} \times df \quad \text{where } D = \frac{100 - \%\ \text{moisture}}{100}$$

and df = dilution factor

$$\text{at 24\% moisture, } D = \frac{100-24}{100} = 0.76$$

$$\frac{(330\ U)}{.76} \times 10 = 4300\ U$$ rounded to the appropriate number of significant figures

For soil samples subjected to GPC cleanup procedures, the extract must be concentrated to 0.5 mL, and the sensitivity of the analysis is not compromised by the cleanup procedures. Therefore, the CRQL values in exhibit C will apply to all samples, regardless of cleanup. However, if a sample extract cannot be concentrated to the protocol-specific volume (see exhibit C), this fact must be accounted for in reporting the sample quantitation limit.

J - Indicates an estimated value. This flag is used either when estimating a concentration for tentatively identified compounds where a 1:1 response is assumed, or when the mass spectral data indicate the presence of a compound that meets the identification criteria but the result is less than the sample quantitation limit but greater than zero. For example, if the sample quantitation limit is 10 µg/L, but a concentration of 3 µg/L is calculated, report it as 3J. The sample quantitation limit must be adjusted for dilution as discussed for the U flag.

N - Indicates presumptive evidence of a compound. This flag is only used for tentatively identified compounds where the identification is based on a mass spectral library search. It is applied to all TIC results.

P - This flag is used for a pesticide/aroclor target analyte when the percent difference between the two GC columns is greater than 25% for detected concentrations (see form X). The lower of the two values is reported on form I and flagged with a P.

C - This flag applies to pesticide results where the identification has been confirmed by GC/MS. If GC/MS confirmation was attempted but was unsuccessful, do NOT apply this flag. Instead, use a laboratory-defined flag.

DATA REPORTING QUALIFIERS (CONT.)

B - This flag is used when the analyte is found in the associated blank as well as in the sample. It indicates possible/probable blank contamination and warns the data user to take appropriate action. This flag must be used for a TIC as well as for a positively identified TCL compound.

E - This flag identifies compounds whose concentrations exceed the calibration range of the GC/MS instrument for that specific analysis. If one or more compounds have a response greater than full scale (except as noted in exhibit D), the sample or extract must be diluted and reanalyzed according to the specifications in Exhibit D. All such compounds with a response greater than full scale should have the concentration flagged with an "E" on the Form I for the original analysis. If the dilution of the extract causes any compounds identified in the first analysis to be below the calibration range in the second analysis, then the results of both analyses shall be reported on separate copies of Form I. The Form I for the diluted sample shall have the "DL" suffix appended to the sample number.

NOTE: For total xylenes where three isomers are quantified as two peaks, the calibration range of <u>each</u> peak should be considered separately (e.g., a diluted analysis is <u>not</u> required for total xylenes unless the concentrations of either peak separately exceed 200 µg/L).

D - This flag identifies all compounds identified in an analysis at a secondary dilution factor. If a sample or extract is reanalyzed at a higher dilution factor, as in the "E" flag above, the "DL" suffix is appended to the sample number of the Form I for the diluted sample, and <u>all</u> concentration values reported on that Form I are flagged with the "D" flag. This flag alerts data users that any discrepancies between the concentrations reported may be due to dilution of the sample or extract.

A - This flag indicates that a TIC is a suspected aldol-condensation product.

The laboratory-defined data reporting qualifiers to be used are as follow:

X - Indicates that the database has been modified.

Z - Indicates coelution.

Case Narrative

Client: Balsam Environmental Consultants, Inc.
Project Name: UCC Soil Analyisis 10/07/91
Erco Project No.: 010135

1. This project consists of the results for samples received at Enseco - Erco Laboratory on October 5, 1991. Please see the sample description information sheet for a list of samples.

2. In the volatile fraction, 10135-04 (UCC-SB-B-17-4) was run outside of the holding time.

DATA REPORTING QUALIFIERS

The nine EPA-defined qualifers to be used are as follow:

U - Indicates compound was analyzed for but not detected. The sample quantitation limit must be corrected for dilution and for percent moisture. For example, 10 U for phenol in water if the sample final volume is the protocol-specified final volume. If a 1 to 10 dilution of extract is necessary, the reported limit is 100 U. For a soil sample, the value must also be adjusted for percent moisture. For example, if the sample had 24% moisture and a 1 to 10 dilution factor, the sample quantitation limit for phenol (330 U) would be corrected to:

$$\frac{(330\ U)}{D} \times df \quad \text{where } D = \frac{100 - \%\ \text{moisture}}{100}$$

and df = dilution factor

$$\text{at 24\% moisture, } D = \frac{100-24}{100} = 0.76$$

$$\frac{(330\ U)}{.76} \times 10 = 4300\ U$$ rounded to the appropriate number of significant figures

For soil samples subjected to GPC cleanup procedures, the extract must be concentrated to 0.5 mL, and the sensitivity of the analysis is not compromised by the cleanup procedures. Therefore, the CRQL values in exhibit C will apply to all samples, regardless of cleanup. However, if a sample extract cannot be concentrated to the protocol-specific volume (see exhibit C), this fact must be accounted for in reporting the sample quantitation limit.

J - Indicates an estimated value. This flag is used either when estimating a concentration for tentatively identified compounds where a 1:1 response is assumed, or when the mass spectral data indicate the presence of a compound that meets the identification criteria but the result is less than the sample quantitation limit but greater than zero. For example, if the sample quantitation limit is 10 µg/L, but a concentration of 3 µg/L is calculated, report it as 3J. The sample quantitation limit must be adjusted for dilution as discussed for the U flag.

N - Indicates presumptive evidence of a compound. This flag is only used for tentatively identified compounds where the identification is based on a mass spectral library search. It is applied to all TIC results.

P - This flag is used for a pesticide/aroclor target analyte when the percent difference between the two GC columns is greater than 25% for detected concentrations (see form X). The lower of the two values is reported on form I and flagged with a P.

C - This flag applies to pesticide results where the identification has been confirmed by GC/MS. If GC/MS confirmation was attempted but was unsuccessful, do NOT apply this flag. Instead, use a laboratory-defined flag.

DATA REPORTING QUALIFIERS (CONT.)

B - This flag is used when the analyte is found in the associated blank as well as in the sample. It indicates possible/probable blank contamination and warns the data user to take appropriate action. This flag must be used for a TIC as well as for a positively identified TCL compound.

E - This flag identifies compounds whose concentrations exceed the calibration range of the GC/MS instrument for that specific analysis. If one or more compounds have a response greater than full scale (except as noted in exhibit D), the sample or extract must be diluted and reanalyzed according to the specifications in Exhibit D. All such compounds with a response greater than full scale should have the concentration flagged with an "E" on the Form I for the original analysis. If the dilution of the extract causes any compounds identified in the first analysis to be below the calibration range in the second analysis, then the results of both analyses shall be reported on separate copies of Form I. The Form I for the diluted sample shall have the "DL" suffix appended to the sample number.

NOTE: For total xylenes where three isomers are quantified as two peaks, the calibration range of <u>each</u> peak should be considered separately (e.g., a diluted analysis is <u>not</u> required for total xylenes unless the concentrations of either peak separately exceed 200 µg/L).

D - This flag identifies all compounds identified in an analysis at a secondary dilution factor. If a sample or extract is reanalyzed at a higher dilution factor, as in the "E" flag above, the "DL" suffix is appended to the sample number of the Form I for the diluted sample, and <u>all</u> concentration values reported on that Form I are flagged with the "D" flag. This flag alerts data users that any discrepancies between the concentrations reported may be due to dilution of the sample or extract.

A - This flag indicates that a TIC is a suspected aldol-condensation product.

The laboratory-defined data reporting qualifiers to be used are as follow:

X - Indicates that the database has been modified.

Z - Indicates coelution.

ANALYTICAL NARRATIVE
General Chemistry Section

DATE: 22-OCT-91
CODE/CONTROL: ERCO / 5618
CLIENT/SITE: ENSECO-ERCO LAB / PROJ# 10135
PROJECT/BATCH: 420.2 / 7

This task consisted of four soil samples which were analyzed for total organic carbon (TOC) using a Perkin-Elmer Elemental Analyzer, model #2400. Prior to analysis, air-dried sample aliquots were acidified and heated to remove inorganic carbon. Sample results have been reported on an oven-dried basis.

Samples were received October 8, 1991 and were analyzed October 21. No analytical or quality assurance problems were encountered. Check standard recoveries were within acceptable limits, and blank results were below method detection limits. Duplicate and spike analyses were not required.

Release of this data has been authorized by laboratory management.

Sincerely,

Melanie J. Dillman

A CORNING Company

October 25, 1991

Mr. John O'Donnell
Balsam Environmental Consultants, Inc.
5 Industrial Way
Salem, NH 03079

Dear John:

Enclosed are the results of the analyses for UCC Soil Analysis October 1991 (UCC Soil Analyisis 10/08/91). This project was received at Enseco - Erco Laboratory on October 8, 1991, and was processed for a 21 day turnaround time and in accordance with CLP analyses and reporting protocols, where applicable. This letter authorizes the release of the analytical results and should be considered an integral part of this report.

Please refer to this project by the Enseco project number 010147 to expedite any further discussions. I will be happy to address any questions or concerns that you may have.

Sincerely,

Mary B. Ford

Mary Ford
Program Administrator

Project Name: UCC Soil Analyisis 10/08/91
Erco Project No.: 010147

1. This project consists of the results for samples received at Enseco - Erco Laboratory on October 8, 1991. Please see the sample description information sheet for a list of samples.

2. Temperature of cooler was upon receipt was 6.0c.
   Bottles were not broken in transit.
   Bottles were properly labeled.
   Samples agree with chain-of-custody.
   Samples were properly preserved.
   VOA vials were properly preserved.
   VOA vials did not contain headspace.

DATA REPORTING QUALIFIERS

The nine EPA-defined qualifers to be used are as follow:

U - Indicates compound was analyzed for but not detected. The sample quantitation limit must be corrected for dilution and for percent moisture. For example, 10 U for phenol in water if the sample final volume is the protocol-specified final volume. If a 1 to 10 dilution of extract is necessary, the reported limit is 100 U. For a soil sample, the value must also be adjusted for percent moisture. For example, if the sample had 24% moisture and a 1 to 10 dilution factor, the sample quantitation limit for phenol (330 U) would be corrected to:

$$\frac{(330\ U)}{D} \times df \quad \text{where } D = \frac{100 - \%\ \text{moisture}}{100}$$

and df = dilution factor

$$\text{at 24\% moisture, } D = \frac{100-24}{100} = 0.76$$

$$\frac{(330\ U)}{.76} \times 10 = 4300\ U$$ rounded to the appropriate number of significant figures

For soil samples subjected to GPC cleanup procedures, the extract must be concentrated to 0.5 mL, and the sensitivity of the analysis is not compromised by the cleanup procedures. Therefore, the CRQL values in exhibit C will apply to all samples, regardless of cleanup. However, if a sample extract cannot be concentrated to the protocol-specific volume (see exhibit C), this fact must be accounted for in reporting the sample quantitation limit.

J - Indicates an estimated value. This flag is used either when estimating a concentration for tentatively identified compounds where a 1:1 response is assumed, or when the mass spectral data indicate the presence of a compound that meets the identification criteria but the result is less than the sample quantitation limit but greater than zero. For example, if the sample quantitation limit is 10 µg/L, but a concentration of 3 µg/L is calculated, report it as 3J. The sample quantitation limit must be adjusted for dilution as discussed for the U flag.

N - Indicates presumptive evidence of a compound. This flag is only used for tentatively identified compounds where the identification is based on a mass spectral library search. It is applied to all TIC results.

P - This flag is used for a pesticide/aroclor target analyte when the percent difference between the two GC columns is greater than 25% for detected concentrations (see form X). The lower of the two values is reported on form I and flagged with a P.

C - This flag applies to pesticide results where the identification has been confirmed by GC/MS. If GC/MS confirmation was attempted but was unsuccessful, do NOT apply this flag. Instead, use a laboratory-defined flag.

DATA REPORTING QUALIFIERS (CONT.)

B - This flag is used when the analyte is found in the associated blank as well as in the sample. It indicates possible/probable blank contamination and warns the data user to take appropriate action. This flag must be used for a TIC as well as for a positively identified TCL compound.

E - This flag identifies compounds whose concentrations exceed the calibration range of the GC/MS instrument for that specific analysis. If one or more compounds have a response greater than full scale (except as noted in exhibit D), the sample or extract must be diluted and reanalyzed according to the specifications in Exhibit D. All such compounds with a response greater than full scale should have the concentration flagged with an "E" on the Form I for the original analysis. If the dilution of the extract causes any compounds identified in the first analysis to be below the calibration range in the second analysis, then the results of both analyses shall be reported on separate copies of Form I. The Form I for the diluted sample shall have the "DL" suffix appended to the sample number.

NOTE: For total xylenes where three isomers are quantified as two peaks, the calibration range of <u>each</u> peak should be considered separately (e.g., a diluted analysis is <u>not</u> required for total xylenes unless the concentrations of either peak separately exceed 200 µg/L).

D - This flag identifies all compounds identified in an analysis at a secondary dilution factor. If a sample or extract is reanalyzed at a higher dilution factor, as in the "E" flag above, the "DL" suffix is appended to the sample number of the Form I for the diluted sample, and <u>all</u> concentration values reported on that Form I are flagged with the "D" flag. This flag alerts data users that any discrepancies between the concentrations reported may be due to dilution of the sample or extract.

A - This flag indicates that a TIC is a suspected aldol-condensation product.

The laboratory-defined data reporting qualifiers to be used are as follow:

X - Indicates that the database has been modified.

Z - Indicates coelution.

DATA REPORTING QUALIFIERS

The nine EPA-defined qualifers to be used are as follow:

U - Indicates compound was analyzed for but not detected. The sample quantitation limit must be corrected for dilution and for percent moisture. For example, 10 U for phenol in water if the sample final volume is the protocol-specified final volume. If a 1 to 10 dilution of extract is necessary, the reported limit is 100 U. For a soil sample, the value must also be adjusted for percent moisture. For example, if the sample had 24% moisture and a 1 to 10 dilution factor, the sample quantitation limit for phenol (330 U) would be corrected to:

$$\frac{(330\ U)}{D} \times df \quad \text{where } D = \frac{100 - \%\ \text{moisture}}{100}$$

and df = dilution factor

$$\text{at 24\% moisture, } D = \frac{100-24}{100} = 0.76$$

$$\frac{(330\ U)}{.76} \times 10 = 4300\ U$$ rounded to the appropriate number of significant figures

For soil samples subjected to GPC cleanup procedures, the extract must be concentrated to 0.5 mL, and the sensitivity of the analysis is not compromised by the cleanup procedures. Therefore, the CRQL values in exhibit C will apply to all samples, regardless of cleanup. However, if a sample extract cannot be concentrated to the protocol-specific volume (see exhibit C), this fact must be accounted for in reporting the sample quantitation limit.

J - Indicates an estimated value. This flag is used either when estimating a concentration for tentatively identified compounds where a 1:1 response is assumed, or when the mass spectral data indicate the presence of a compound that meets the identification criteria but the result is less than the sample quantitation limit but greater than zero. For example, if the sample quantitation limit is 10 µg/L, but a concentration of 3 µg/L is calculated, report it as 3J. The sample quantitation limit must be adjusted for dilution as discussed for the U flag.

N - Indicates presumptive evidence of a compound. This flag is only used for tentatively identified compounds where the identification is based on a mass spectral library search. It is applied to all TIC results.

P - This flag is used for a pesticide/aroclor target analyte when the percent difference between the two GC columns is greater than 25% for detected concentrations (see form X). The lower of the two values is reported on form I and flagged with a P.

C - This flag applies to pesticide results where the identification has been confirmed by GC/MS. If GC/MS confirmation was attempted but was unsuccessful, do NOT apply this flag. Instead, use a laboratory-defined flag.

DATA REPORTING QUALIFIERS (CONT.)

B - This flag is used when the analyte is found in the associated blank as well as in the sample. It indicates possible/probable blank contamination and warns the data user to take appropriate action. This flag must be used for a TIC as well as for a positively identified TCL compound.

E - This flag identifies compounds whose concentrations exceed the calibration range of the GC/MS instrument for that specific analysis. If one or more compounds have a response greater than full scale (except as noted in exhibit D), the sample or extract must be diluted and reanalyzed according to the specifications in Exhibit D. All such compounds with a response greater than full scale should have the concentration flagged with an "E" on the Form I for the original analysis. If the dilution of the extract causes any compounds identified in the first analysis to be below the calibration range in the second analysis, then the results of both analyses shall be reported on separate copies of Form I. The Form I for the diluted sample shall have the "DL" suffix appended to the sample number.

NOTE: For total xylenes where three isomers are quantified as two peaks, the calibration range of <u>each</u> peak should be considered separately (e.g., a diluted analysis is <u>not</u> required for total xylenes unless the concentrations of either peak separately exceed 200 µg/L).

D - This flag identifies all compounds identified in an analysis at a secondary dilution factor. If a sample or extract is reanalyzed at a higher dilution factor, as in the "E" flag above, the "DL" suffix is appended to the sample number of the Form I for the diluted sample, and <u>all</u> concentration values reported on that Form I are flagged with the "D" flag. This flag alerts data users that any discrepancies between the concentrations reported may be due to dilution of the sample or extract.

A - This flag indicates that a TIC is a suspected aldol-condensation product.

The laboratory-defined data reporting qualifiers to be used are as follow:

X - Indicates that the database has been modified.

Z - Indicates coelution.

ANALYTICAL NARRATIVE
General Chemistry Section

DATE: 22-OCT-91
CODE/CONTROL: ERCO / 5620
CLIENT/SITE: ENSECO-ERCO LAB / PROJ# 10147
PROJECT/BATCH: 420.2 / 8

This task consisted of two soil samples which were analyzed for total organic carbon (TOC) using a Perkin-Elmer Elemental Analyzer, model #2400. Prior to analysis, air-dried sample aliquots were acidified and heated to remove inorganic carbon. Sample results have been reported on an oven-dried basis.

Samples were received October 9, 1991 and were analyzed October 21. No analytical or quality assurance problems were encountered. Check standard recoveries were within acceptable limits, and blank results were below method detection limits. Duplicate and spike analyses were not required.

Release of this data has been authorized by laboratory management.

Sincerely,

Melanie J Dillman
