Please also see Major Response HC-6 (page C&R 3.23-25) regarding skilled nursing facilities (SNF), which explains that CPMC has committed to maintain 100 SNF beds to meet its actual demand.[325] As further explained in Major Response HC-6, CPMC would maintain 38 SNF beds at the Davies Campus under the proposed LRDP, and the text revisions in this C&R document CPMC's plans to maintain capacity to serve its existing patient needs by providing a total of at least 100 SNF beds, including 38 beds currently located at the Davies Campus and adding 62 new SNF beds at other on- or off-campus locations (yet to be determined).[326] CPMC has also committed that no existing community-based beds would be utilized to provide the additional 62 SNF beds, because of the existing shortage of SNF beds in the community.[327] As explained in Major Response HC-6, the Draft EIR, text revisions in Chapter 4 of

Health Commission Resolution No. 02-10.

[327] S.F. Health CommissionResolution No. 02-10.

this C&R document have been made to Table 2-2, "CPMC Existing and Proposed LRDP Licensed Hospital Bed Uses" in the Draft EIR, page 2-10 (see Response PD-6, page C&R 3.2-6), to clarify CPMC's commitment to continue maintenance of 101 licensed SNF beds at the California Campus unless and until CPMC identifies another plan for providing the 62 SNF beds (in addition to the 38 SNF beds that would continue to be maintained at the Davies Campus under the LRDP) necessary for CPMC to meet its commitment to provide a total of 100 SNF beds systemwide.

The only CPMC campus that currently includes inpatient subacute-care beds is the St. Luke's Campus, which has a 60-bed subacute care unit located in the existing St. Luke's Hospital tower. Please see Major Response HC-6, which explains that because of higher construction and staffing costs associated with acute care facilities, it is not practical to create subacute care units in a new acute care hospital. Major Response HC-6 further explains that none of the current proposed new acute care hospitals under design or construction in the United States has proposed to include subacute care within a new inpatient facility. Major Response HC-6 also explains that a study conducted by The Camden Group indicated that "[h]istorically, almost all of the subacute patients [at the St. Luke's Campus] have been direct admit patients residing in areas outside SOMA, and often outside San Francisco County."[328] The Blue Ribbon Panel, therefore, did not recommend that CPMC provide new replacement subacute-care beds in the proposed new replacement hospital at St. Luke's Campus for those in the existing St. Luke's Hospital. Instead, the Blue Ribbon Panel recommended that "CPMC should replace lost subacute beds with placements for all individuals currently in those beds."[329]

Consistent with the Blue Ribbon Panel's recommendations, CPMC would gradually remove the existing 60 subacute beds from service at St. Luke's Hospital, through attrition or transfers to other facilities between now and when the existing St. Luke's Hospital tower would be demolished.[330] Inpatient operations (including any remaining subacute-care services) at St. Luke's Hospital would continue until the proposed St. Luke's Replacement Hospital was completed and in operation, and transfer of acute-care services would begin. The proposed St. Luke's Replacement Hospital would not have subacute-care beds. Any patients not able to be transferred to other subacute-care facilities by that time would be placed, as appropriate, in a CPMC acute-care or SNF bed.[331] As explained in Major Responses HC-1 and HC-6, this volume could be accommodated by the CPMC system under the LRDP.[332]

As explained in Major Response HC-6, most of the patients utilizing CPMC's existing subacute-care facilities do not reside in the south of Market Street area, but rather come from other areas of the City or outside the City. Therefore, it is anticipated that patients would, in the future, seek services across a wide geographic area and would not cluster at any one facility or area. Furthermore, the patient transition plan for the current patient population utilizing the existing subacute-care beds at St. Luke's Hospital anticipates that a limited number of patients would be transitioning at any given time from St. Luke's Hospital to other non-CPMC hospitals or other health care facilities.[333] Therefore, the future potential shift of subacute-care services from CPMC to other hospitals and/or health care service providers would not result in secondary impacts at any given facility.

The comments express general concerns that the proposed LRDP would reduce access to health care as well as a more specific concern in Comment 96-23 regarding "reduced access to service provided by the

[328] The Camden Group, 2009 (April 28), *San Francisco Blue Ribbon Panel: Utilization Projections and Assumptions for St. Luke's Campus*, page 10.

[333] Ibid.

new Cathedral Hill Hospital." Please see Response INTRO-7 (page C&R 3.1-17) for a detailed discussion regarding the extent to which social and economic issues are considered under CEQA. As explained in Response INTRO-7, CEQA does not require the analysis of a project's social and economic impacts, or in this case, access to health care, unless such health care impacts would in turn indirectly result in physical environmental impacts. Therefore, the analysis of the potential impacts of the proposed LRDP on health care is beyond the scope of CEQA review. While these comments involve social and economic concerns, the following discussion regarding access to health care and the discussion regarding access to health services in Major Response HC-8 (page C&R 3.23-32) have been provided for informational purposes.

Please see Major Response HC-2 (page C&R 3.23-8), regarding the location, size, and scope of services at the proposed Cathedral Hill, St. Luke's and Davies Campuses and Major Response HC-8 (page C&R 3.23-32), regarding access to health services for detailed discussions, respectively, of the distribution of CPMC health care services throughout the City under the proposed LRDP and the provision of local access to health care under the proposed LRDP. As explained in detail in Major Response HC-2, the proposed Cathedral Hill Campus would be centrally located with respect to the existing California and Pacific Campuses and would consolidate and relocate acute care, emergency, and other services from the California and Pacific Campuses, and neither St. Luke's nor Davies Campuses would experience reductions of services that would have adverse effects elsewhere. Major Response HC-2 also explains that the Cathedral Hill Campus would be closer than the existing California and Pacific hospitals to the area of San Francisco with the highest residential population density (i.e., the area including the Tenderloin), including the highest population density of low-income households, seniors (the most frequent users of hospital care), children and youth.[334]

As explained in Major Response HC-2, a report prepared by The Lewin Group concluded that the consolidation of health care services at the Cathedral Hill Campus location would not create any major access issues from CPMC patients' perspectives.[335] Major Response HC-2 also explains that the San Francisco Health Commission Task Force on CPMC's IMP determined that the St. Luke's Replacement Hospital as planned under the LRDP would be appropriately sized and programmed to accommodate existing and projected future patient demand for the south of Market service area.[336] Therefore, the proposed LRDP plan for the St. Luke's Campus would not exacerbate any health care delivery problems in the south of Market Street area.

As explained in more detail in Major Response HC-2 and in Response HC-2 above, with the exception of inpatient pediatrics, skilled nursing facilities, and subacute care, all services currently provided at the St. Luke's Campus are proposed to be maintained or expanded at St. Luke's.

As explained in detail in Major Response HC-8, since January 1, 2007 (the merger of St. Luke's into CPMC), there has been no difference in medical access policies between any of the CPMC hospitals. All CPMC hospitals are equally open to the receipt of under-insured and uninsured patients and decisions on the granting of financial assistance and waivers are made on a uniform policy basis across all campuses.[337] CPMC's coverage of care for under- and uninsured patients is available to families with incomes up to 400 percent of the federal poverty level.[338]Therefore, there is no indication that the proposed LRDP would reduce or fail to provide local access to health care in any particular area of San Francisco.

337 CPMC, Memorandum from Geoffrey Nelson, Director, EDP, to Brian Boxer (AECOM) re: Access to Healthcare Services (May 13, 2011).

338 San Francisco Department of Public Health, Healthy San Francisco, *Participant Handbook*, page 13. See also CPMC, patient financial assistance application form. Dated May 31, 2007.

All San Francisco non-profit hospitals (including CPMC), together with DPH, human service organizations, private philanthropic organizations, and community-based organizations collaborate on a community needs assessment for San Francisco, used for program planning and analysis within San Francisco.[339] These reports (called "Building a Healthy San Francisco," or BHSF) identify community health goals and track progress towards achieving community health goals, assess current needs, and prioritize goals for future action with specific metrics to monitor for improvement.[340] The current needs assessment data can be accessed online at Health Matters San Francisco.[341] Further information regarding access to health care for the uninsured or under-insured is available in the BHSF reports and the San Francisco Charity Care Reports published by DPH, which are available at the DPH website,[342] and comparative data provided in Major Response HC-8, including coverage of care as a percentage of the federal poverty level, overall amounts of charity care, and Medi-Cal patient access. Major Response HC-8 provides additional information regarding CPMC's charity care programs, and access to CPMC health care services within the Tenderloin neighborhood and southeastern areas of San Francisco.

As explained above, under the proposed LRDP sufficient licensed acute care, psychiatric, and SNF beds would be provided at the CPMC campuses to meet existing and projected patient demand, and it is anticipated that subacute patients would, in the future, seek services across a wide geographic area and would not cluster at any one facility or area. As also explained above, there would be no reductions in access to health care under the proposed LRDP that would result in a major shift of patients currently receiving services at the St. Luke's Campus to other CPMC campuses, or a shift of patients currently receiving services at CPMC campuses to other health care service providers in the region, Therefore, the proposed LRDP would not result in changes in travel distances that would result in associated impacts on traffic, transportation, parking, air quality, and public services that are not analyzed in the Draft EIR, or increased exposure of people traveling on public transportation to infectious diseases.

The Draft EIR included extensive analysis of transportation and circulation issues, as well as impacts related to air quality and public services. These issues were thoroughly examined with respect to direct and indirect construction and operational impacts of the LRDP, and the Draft EIR identified mitigation measures to reduce impacts determined to be significant to a less-than-significant level to the extent feasible. Please see Section 4.5, "Transportation and Circulation," Section 4.7, "Air Quality," and Section 4.11, "Public Services" in the Draft EIR. The issue of parking supply and demand is considered by the City of San Francisco to be a social and economic issue, and not a physical environmental issue.

All air quality and traffic impacts associated with the proposed LRDP (including cumulative impacts) were analyzed in the Draft EIR in Sections 4.5 and 4.7. To the extent that changes in CPMC's patient and employee travel patterns (travel distances, types of trips, etc.) are relevant to the project's direct or indirect environmental impacts (including cumulative impacts), that information has been factored into the analysis in the Draft EIR. As explained in the Draft EIR, page 4.5-72, travel surveys of CPMC personnel, patients, and visitors were conducted to develop origin-destination assumptions for purposes of the transportation analysis. Based on this survey information, trip distribution was assigned for CPMC personnel, patients, and visitors traveling to or from the CPMC campuses from four quadrants (or "Superdistricts") of the City, or from the East Bay, South Bay, North Bay, or outside the Bay Area.[343] Table 4.5-12, "Trip Distribution Patterns by Campus" in the Draft EIR, page 4.5-78, indicates the distribution of trips by San Francisco quadrant as well as by trips originating or ending outside of San Francisco that were assumed for each of the CPMC campuses based on the survey results. The

[343] Adavant Consulting, 2010 (Jan. 29), *CPMC LRDP Travel Demand Estimation for the San Francisco Campuses*, prepared for the San Francisco Department of Public Works, pages 21 and 39.

transportation analysis based upon the origin-destination assumptions developed from the travel surveys of CPMC personnel, patients, and visitors, in turn, was utilized to develop the analyses in the Draft EIR of other environmental impacts related to traffic that would be generated by the proposed LRDP, e.g., Noise (Section 4.6), Air Quality (Section 4.7), and Greenhouse Gas Emissions (Section 4.8). An EIR is not required to further respond to comments speculating on potential impacts that are not supported by substantial evidence in the record.

Use of Ambulance Service

Comment PC-44 states that the proposed LRDP "may increase the use of ambulance service." The comment does not provide any supporting evidence for this statement or offer any explanation as to the manner that the proposed LRDP could increase the use of ambulance service.

The Draft EIR's analysis of the proposed LRDP's potential impacts related to emergency vehicle services was based, in part, upon a report prepared by TransOptions4Healthcare (TransOptions Report).[344] The TransOptions Report concluded: "The data suggests the proposed Cathedral Hill Hospital will not increase citywide 911 ambulance transport volume. Changing the location of a hospital, opening a new hospital, or closing an existing hospital does not impact the total volume of citywide 911 calls, only the destination."[345] The TransOptions Report also explained that the number of 911 transports under the proposed LRDP would likely be greater than the number today, because the City of San Francisco has a rapidly aging population that will contribute to increased 911 utilization, but none of these growth factors was directly related to the opening of the proposed Cathedral Hill Hospital under the proposed LRDP.[346] Therefore, the evidence in the record does not indicate that the proposed LRDP would result in increased use of ambulance services.

Additionally, as explained in Major Response HC-5 (page C&R 3.23-20) regarding emergency services, the overall systemwide Emergency Department capacity at the CPMC campuses would be increased under the proposed LRDP, and the LRDP would not result in impacts to emergency rooms at other San Francisco hospitals. Impacts resulting from changes in trips to other non-CPMC San Francisco hospitals and admissions at the emergency rooms of other San Francisco health care providers would not be impacts of the proposed LRDP, and they are not required to be analyzed in the Draft EIR.

As stated on page 4.5-145 of the Draft EIR, the proposed Cathedral Hill Campus is expected to receive between 8,400 and 9,600 emergency calls, or about half of all emergency patients within the CPMC system per year. The transportation impacts of these emergency vehicle trips were evaluated in Impacts TR-52, TR-53, and TR-54 in the Draft EIR, pages 4.5-145 through 4.5-147. The Pacific and California Campuses were anticipated to receive zero emergency calls per year under the proposed LRDP.[347] The effects of emergency vehicle access at the Pacific Campus are evaluated under Impact TR-65 in the Draft EIR, page 4.5-175. The effects of emergency vehicle access at the California Campus are evaluated under Impact TR-72 in the Draft EIR, page 4.5-182. The Davies Campus was anticipated to receive between approximately 3,200 and 3,600 emergency calls per year under the LRDP.[348] The effects of emergency vehicle access at the Davies Campus are evaluated under Impact TR-82 in the Draft EIR, page 4.5-192. The St. Luke's Campus was anticipated to receive between approximately 5,400 and 6,300 emergency calls per year under the LRDP.[349] The effects of emergency vehicle access at the St. Luke's Campus are evaluated under Impacts TR-92 and TR-93 in the Draft EIR, page 4.5-206.

[344] TransOptions4Healthcare, 2011 (Feb. 28), *City of San Francisco Fire Department 911 Emergent Transports to CPMC Campuses: 2004, 2008, 2015*, prepared for California Pacific Medical Center.
[345] Ibid.
[346] Ibid.
[347] Ibid.
[348] Ibid.
[349] Ibid.

Existing and project-related emergency room trips and admissions are fully accounted for in the trip generation for the CPMC acute-care hospitals and, therefore, were factored into the Draft EIR analysis of transportation and circulation impacts. The transportation analysis based upon these trip generation assumptions, in turn, was utilized to develop the analyses in the Draft EIR of other environmental impacts related to traffic that would be generated by the proposed LRDP, e.g., Noise (Section 4.6), Air Quality (Section 4.7), and Greenhouse Gas Emissions (Section 4.8).

As explained in Major Response HC-5, the proposed LRDP would increase Emergency Department capacity at the St. Luke's Campus, and would also increase the total combined emergency and urgent care capacity within the entirety of the CPMC system from 88,000 visits/year currently to over 100,000 visits/year at the Cathedral Hill, Davies, and St. Luke's Hospitals. Therefore, patients would not be required to travel greater distances for services than under current conditions, except that patients who would travel to the California or Pacific Campuses for emergency services under existing conditions generally would instead travel to the Cathedral Hill Campus under the proposed LRDP.

As explained in the Draft EIR, page 4.5-72, travel surveys of CPMC personnel, patients, and visitors were conducted to develop origin-destination assumptions for purposes of the transportation analysis. Based on this survey information, trip distribution was assigned for CPMC personnel, patients, and visitors traveling to or from the CPMC campuses from four quadrants (or "Superdistricts") of the City, or from the East Bay, South Bay, North Bay, or outside the Bay Area.[350] The transportation analysis based upon the origin-destination assumptions developed from the travel surveys of CPMC personnel, patients, and visitors accounted for the shift of patients currently receiving emergency and other services at the California and Pacific Campuses to the Cathedral Hill Campus. The transportation analysis, in turn was utilized to develop the analyses in the Draft EIR of other environmental impacts related to traffic that would be generated by the proposed LRDP, e.g., Noise (Section 4.6), Air Quality (Section 4.7), and Greenhouse Gas Emissions (Section 4.8). An EIR is not required to further respond to comments speculating on potential impacts that are not supported by substantial evidence in the record.

St. Luke's Intensive Care Unit (ICU)

Comment PC-206 expresses concerns regarding "downsizing" the ICU at the St. Luke's Campus. The average daily census of ICU beds at the St. Luke's Campus was approximately 5.8 in 2009, 6.0 in 2008, and 6.6 in 2007.[351] Therefore, the 8 licensed ICU beds proposed under the LRDP would provide sufficient capacity to meet ICU demand at the St. Luke's Campus.

Comment

(Philip L. Pillsbury, Jr.—St. Luke's Hospital, October 10, 2001) [29-1 HC]

"During the affiliation process, you and I spoke at length about the scope of the services offered by St. Luke's Hospital at the time of the affiliation.

You will recall that your letter to me of October 26, 2000 memorializing the agreement to affiliate provided, in pertinent part:

'St. Luke's Hospital, with Sutter Health's support shall remain a separately incorporated and separately licensed acute care hospital, at its current location and in the context of its current mission, providing the same services for which it is licensed as of the date hereof.' (emphasis added)

[350] Adavant Consulting, 2010 (Jan. 29), *CPMC LRDP Travel Demand Estimation for the San Francisco Campuses*, prepared for the San Francisco Department of Public Works, pages 21 and 39.

[351] OSHPD, ALIRTS, Annual Utilization Report of Hospitals, St. Lukes Hospital, 2007 and 2008, California Pacific Medical Center - St. Lukes Campus, 2009, available at http://www.alirts.oshpd.ca.gov, accessed Apr. 8, 2011.

We prepared as an Exhibit to the Affiliation Agreement an actual list of the services provided as of the date of the letter of intent to affiliate; you requested that we not include such a detailed list in the Affiliation Agreement, but that instead, we make broad reference to the license issued to St. Luke's Hospital by the Department of Health Services. I agreed, at the time, that the hospital's services were certainly broadly identified on the license, but I believed we should make a record as to the extent of the actual services, since I understood your letter to support the actual services themselves, not just the maintenance of the license.

You and I agreed that I would write to you a side letter to the Affiliation Agreement identifying those services so that we could all acknowledge, in making future decisions about services, the substance and extent of the various services St. Luke's was providing as of October 26; 2000.

Accordingly, I have attached to this letter the list of current services prepared by Mary Coulton, our Chief operating Officer, at my request."

Response HC-18

Comment Letter 29 was submitted to the Planning Commission at the September 23, 2010, hearing regarding the Draft EIR. Letter 29, which is dated October 10, 2001, was written more than 8 years before the publication of the Draft EIR and does not raise any concerns regarding the adequacy, accuracy, or completeness of the scope of analysis in the Draft EIR. The comment is noted. The comment will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project.

Responses to particular comments regarding the scope of services at the St. Luke's Campus are addressed in Major Response HC-2 (page C&R 3.23-8).

Comment

(Sandra Manning, September 23, 2010) [31-2 HC]

"• So while CPMC worsens the quality of life for residents like me, it also plans to deny health services to me and other low-income people who live near the planned facility.

- Does this make sense? Is this in the best interest of me - a neighborhood resident or the City? I DON'T THINK SO

- So is CPMC saying that low-income Tenderloin residents like me will be denied access to a hospital only blocks from my home? THAT's NOT RIGHT!"

Response HC-19

Please see Major Response HC-8 (page C&R 3.23-32), which includes a detailed discussion regarding access to health services for City residents living in the Tenderloin area. Please also see Response HC-12 (page C&R 3.23-91), which provides responses to several specific comments regarding access to health services for Tenderloin area residents. The general comment regarding impact on quality of life will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project. The comment appears to be related to Comment 31-1, which addressed traffic and pedestrian impacts; please see Response TR-124 (page C&R 3.7-207).

Comments

(SEIU UHW Bargaining Committee, September 23, 2010) [33-1 HC]

"Our future depends on Cathedral Hill. We need hospitals that are earthquake safe and provide more and better services to our patients and our community. We write to you today because we need your support to make that happen. If CPMC is not permitted to build seismically compliant hospitals by 2015, the majority of the Medical Center will be forced to close, we will lose our jobs and the community will lose critical access to healthcare."

(SEIU UHW Bargaining Committee, September 23, 2010) [33-3 HC]

"We support the Cathedral Hill building project because it will:

Improve Safety: Our new hospitals will nearly **double the number of earthquake safe beds** in the city. San Francisco currently only has 600 of the 1,500 earthquake safe beds that the city requires on a daily basis.

Ensure Quality Patient Care: Our new hospitals will improve patient care by incorporating the **medical advancements that reduce infection, shorten overall hospital stays and increase access for patients with disabilities**. The new facility will also **centralize high acuity services** at Cathedral Hill and Davies campuses, which will prevent sick patients from having to shuttle from one campus to another to receive the services they need.

Enhance Community Access: CPMC will **expand services most utilized by the community**. This includes a 25% increase in overall ER capacity and an overall increase in the number of staffed acute-care beds throughout the Medical Center.

To **make healthcare more affordable** for the community, CPMC has committed too the City to increase contributions to charity care by 79% and will increase its uncompensated care for Medi-Cal patients by 22% in the next five years. Additionally, the St. Luke's rebuild and the new Cathedral Hill will provide **access to state-of-the-art acute care for the underserved Mission, Tenderloin and Western Addition neighborhoods**."

Response HC-20

These comments expresses general support for the proposed LRDP and do not raise any specific comments on the adequacy, accuracy, or completeness of the analysis presented in the Draft EIR. The comments are noted, and will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project.

Comments

(Anonymous, September 23, 2010) [34-1 HC]

"CPMC's nephrologists and nurses saved my daughter's life 4 years ago and have continued to do so.

I am here to tell you that allowing CPMC to sell its dialysis units to DaVita will cause imminent, irreparable harm to dialysis patients and the people and city of San Francisco.

Neither federal nor state case law supports the idea that a non-profit community hospital such as CPMC can, without serious legal consequences, sell its patients to a for-profit company such as DaVita, which has a track record of causing harm and injuries to patients.

Several lawsuits have been filed about DaVita's Gambro dialysis machines causing deaths and Hepatitis B. In one typical case, the federal court DENIED DaVita's motion to exclude the testimony of the patients' expert witness,

who is an MD. The court also DENIED DaVita's motion for summary judgment that would have thrown the case out of court.

In another PENDING case, the United States of America has accused DaVita of patient endangerment and fraud, committed in several states, INCLUDING CALIFORNIA:

DaVita stands accused of over-using an anemia drug without regard to medical necessity, good medical practice, or patient need and "WITH RECKLESS DISREGARD" for FDA Labels and guidelines by the Department of Health and Human Services and CMS, thereby putting dialysis patients in danger of bacterial infection, pyrogenic reactions, strokes, fatal cardiovascular events and impaired survival. DaVita knowingly and fraudulently submitted claims and was paid hundreds of millions of dollars.

DaVita allowed the manufacturer of Epogen to review confidential patient charts without patient's knowledge or consent, in violation of privacy rights granted by federal and state laws.

Directors of Nursing, Doctors and "other higher-up authorities" working under DaVita's authority were implicated in the above violations. Patient safety, quality of care, minimizing mortality, etc. are NOT a matter of the number of chairs that a vendor, with the track record at issue provides.

Until DaVita has answered the above and other charges to the satisfaction of federal courts, CPMC should not be allowed to proceed with this sale."

(Tanya Castanian, September 23, 2010) [35-1 HC]

"I am one of 350 dialysis patients. CPMC wants to sell our care to a for-profit company with a history of litigation over patient safety issues. We are all concerned about our own safety by being transferred to DaVita, and over 100 of us signed a petition in protest."

(Tanya Castanian, September 23, 2010) [35-2 HC]

"The EIR is incomplete because it does not consider the cumulative effects on city services or traffic resulting from unsafe conditions (like 911 calls) caused by this sale."

(Tanya Castanian, September 23, 2010) [35-3 HC]

"Also, CPMC submitted a plan that included providing dialysis, and before that plan was even approved they cut the service. CPMC cannot be trusted to provide the services they say they are going to provide. We ask you to hold their feet to the fire to ensure that our lives are not put in danger by this plan."

(Tanya Castanian, September 23, 2010) [PC-2 HC]

"MS. CASTANIAN: Oh, sorry. Just give me a second. Good afternoon. My name is Tanya Castanian. I am one of 350 dialysis patients. CPMC wants to sell our care to a for-profit company with a history of litigation over patient safety issues. We are all concerned about our own safety of our being transferred to Da Vita and over 100 of us signed the petition in protest."

(Tanya Castanian, September 23, 2010) [PC-3 HC]

"The EIR is incomplete because it does not consider the cumulative effects on City services or traffic resulting from unsafe conditions like 911 calls, calls [sic] by the sale."

(Tanya Castanian, September 23, 2010) [PC-4 HC]

"Also, CPMC submitted a plan that included providing dialysis and, before that plan was even approved, they cut the service. CPMC cannot be trusted to provide the services they say they are going to provide. We ask you to hold their feet to the fire to ensure that our lives are not put in danger by this plan. Thank you."

Response HC-21

Please see Response INTRO-7 (page C&R 3.1-17) regarding the appropriate consideration of social and economic impacts under CEQA. These comments do not raise issues regarding the adequacy, accuracy, or completeness of the Draft EIR. The comments may be considered by the decision-makers as part of their deliberations on the project.

The transfer of CPMC's dialysis services to DaVita, which became effective on February 1, 2011, has not resulted in any physical impacts or changes to the environment. Regardless of who the provider of dialysis services is, all are held to the same regulatory standards and are overseen by the California Department of Health.[352] The process of stabilizing and transporting dialysis patients to an Emergency Department remains the same, regardless of the transfer of dialysis services operations from CPMC to DaVita.[353] Therefore, the sale of the dialysis unit has not resulted in any changes in activities or operations related to emergency (911) calls and has not contributed to any cumulative impacts on City services or traffic. The Draft EIR includes adequately analyzes the cumulative impacts of the proposed LRDP on City services (see Draft EIR page 4.11-36) and traffic (pages 4.5-215 to 4.5-247), and identified mitigation measures to reduce impacts determined to be significant to a less-than-significant level to the extent feasible.

The comments reference "several lawsuits" that have been filed against DaVita and "a history of litigation over patient safety issues," and Comment 34-1 contends that until "DaVita has answered the above and other charges to the satisfaction of federal courts, CPMC should not be allowed to proceed with the sale." The comments provide no specific information regarding the lawsuits mentioned.

As required by San Francisco's Community Health Care Planning Ordinance[354] ("Proposition Q" or "Prop Q"), private hospitals like CPMC must provide public notice before leasing, selling, or transferring management of their services. CPMC provided notice of the sale of dialysis services to its patients on November 16, 2009.[355] Subsequently, on August 2, 2010, 60 days after receiving Federal Trade Commission (FTC) approval to proceed with negotiations, CPMC provided notice of the sale to the San Francisco Department of Public Health and other interested parties. Four public hearings on this issue were held before the San Francisco Public Health Commission, culminating in approval of Resolution 11-10 on November 2, 2010.[356] The licensing agency, the California Department of Public Health, was notified of the request for change of ownership for these dialysis services on October 28, 2010.[357] Neither the State nor the FTC has raised an objection to the sale.[358]

Comment 35-3 characterizes the transfer of ownership as a "cut," but dialysis services and staff, and the location of dialysis services all remain mainly unchanged.[359] CPMC has indicated that dialysis services

have not been materially reduced or cut, nor are they planned to be materially reduced or cut in the future.[360]

Comment

(Barbara Ann Berwick, September 23, 2010) [36-2 HC]

"2. Sutter Health is in litigation with Marin General. Good relations with our sister county need to be maintained, therefore, this litigation needs to be resolved."

Response HC-22

The comment is noted. This comment does not raise any specific comments on the adequacy, accuracy, or completeness of the Draft EIR. The comment will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project. Please also see Response INTRO-7 (page C&R 3.1-17) regarding the appropriate consideration of social and economic impacts under CEQA.

Comments

(Barbara Ann Berwick, September 23, 2010) [36-3 HC]

"3. It is foreseeable that the five campuses collective could falter to foreseeable wrongful death litigations due to the failure of Rebuild CPMC to acquire an experienced nursing staff. Both the government and Rebuild CPMC have a duty to promote public safety. Rebuild CPMC needs to secure a working relationship with CNA for a project of this size and importance. Additionally, any and all Health Department recommendations should be adhered to. I would prefer to have both the City and Rebuild CPMC not depend upon Sutter Health as a safety net."

(Barbara Berwick, September 23, 2010) [PC-334 HC]

"As another point of public safety, if the new hospital is not staffed with experienced nurses, you have a whole bunch of newbie's running around there trying to figure out what they're going to do, we're going to have patient deaths, we're going to have wrongful death lawsuits. If we didn't address that at this time, whether we're actually fiscally responsible or not, we are morally responsible for that, it seems to me that CPMC needs to make a commitment to work with California Nurses Association to provide the kind of staffing necessary for a hospital of this size so as to ensure the safety of the potential patients. Thank you very much."

Response HC-23

The comments are noted. These comments do not raise issues regarding the adequacy, accuracy, or completeness of the Draft EIR. The comments will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project. The comments express concerns regarding the acquisition of an experienced nursing staff. These concerns are social and economic in nature. The record reflects that CPMC continues to have a nurse retention rate substantially higher than the national average.[361] CPMC has indicated that under the proposed LRDP, it would continue to staff its facilities with nurses who are qualified and have the experience needed for their positions, as is CPMC's long standing practice.

As noted in the Draft EIR, page 2-18, the California Department of Health Care Services (CDHS) is responsible for the licensing of new hospital facilities. The proposed LRDP would comply with all CDHS requirements.

Please also see Response INTRO-7 (page C&R 3.1-17) regarding the appropriate consideration of social and economic impacts under CEQA and Major Response HC-2 (page C&R 3.23-8) regarding the size and scope of services at the St. Luke's Campus, which includes a discussion of the proposed LRDP's adherence to the recommendations of the Blue Ribbon Panel and San Francisco Health Commission.

Comments

(Barbara Ann Berwick, September 23, 2010) [36-5 HC]

"5. St Luke's is our southernmost hospital. It serves the needs of a great number of City residents and therefore needs to be staffed at current/historical levels diminished only by lay offs of nursing staff for patients whose needs would better be served by in-home care rather than in-hospital care. Failure to do so would result in addition uninsured and indigent patients being treated at SF General at the city's expense."

(Barbara Berwick, September 23, 2010) [PC-331 HC]

"MS. BERWICK: I was called third, but I'm the only one standing. You have, of course, my little sheet of paper which is something we posted on my website, which means, as a Candidate for District 2 Supervisor, I'm committed to what's on there. Now, St. Luke's, being staffed at its traditional level, is something that the people clearly want, and I hope to serve on the Committee of Budget and Finance and from a perspective of City Budget and Finance, it makes sense that St. Luke's stays open, too. So I'm hoping that you all folk here will decide that St. Luke's should be staffed at its current level, or greater, so that if I am elected, I don't have to try to deal with it legislatively. It would just save me so much trouble, I think it is going to make a whole lot more people happier."

Response HC-24

The comments raise concerns regarding the maintenance of current or historical staffing levels at the St. Luke's Campus, and Comment 36-5 also expresses concern regarding the potential for any reduction in staffing at the St. Luke's Campus to result in an increase in the number of uninsured and indigent patients treated at San Francisco General Hospital (SFGH).

Please see Major Responses HC-1 and HC-2 (page C&R 3.23-1 and 3.23-8) for detailed discussion regarding the supply of acute-care beds and size and scope of services at the St. Luke's Campus. Major Response HC-1 explains that the 80 beds proposed to be provided at the St. Luke's Hospital would provide sufficient capacity to meet the current and projected demand at the St. Luke's Campus, with additional capacity to meet peak demand periods. Major Response HC-2 further explains that the proposed LRDP would not exacerbate any shortage of inpatient acute-care beds for the south of Market Street area traditionally served by the St. Luke's Campus, in part because the Health Commission Task Force has determined that the St. Luke's Replacement Hospital would be appropriately sized to accommodate existing and projected future patient demand for that service area,[362] and because the St. Luke's Replacement Hospital would accommodate growth in patient census, increase its Emergency Department and surgery capacity, and expand primary care programs in clinical areas of demonstrated need to the community.

As explained in more detail in Major Response HC-2, with the exception of inpatient pediatrics, skilled nursing facilities (SNF), and subacute care, all services (including staffing for those services) currently provided at the St. Luke's Campus are proposed to be maintained or expanded at St. Luke's, including various outpatient pediatric services; chronic disease management; comprehensive women's care; senior care including orthopedic surgery, medical cardiology, ophthalmic surgery, and a diabetes center; diagnostic services; family-oriented urgent care (which would be a new service at the St. Luke's Campus); and Emergency Department.

[362] San Francisco Health Commission Task Force on CPMC's IMP Addressing Resolution No. 10-09, 2010 (Mar. 2), *Updates and Accomplishments.*

Additionally, as shown in Table 4.3-10, "Projections of CPMC Full-Time Equivalent Personnel and Share of Citywide Employment," the total number of full-time equivalent (FTE) personnel at the St. Luke's Campus is projected to increase under the proposed LRDP from 597 in 2006 to 1,190 in 2015 and 1,530 in 2030.

Please also see Major Response HC-3 (page C&R 3.23-17) regarding impacts on San Francisco General Hospital, which explains that no services currently being provided at the existing St. Luke's Hospital would be shifted to other, non-CPMC hospitals or health care service providers.

For the above reasons, the St. Luke's Campus is anticipated to be staffed at levels that are at or above current levels and no reductions in services that would increase demand for treatment for indigent or uninsured patients at SFGH.

Comments

(Barbara Ann Berwick, September 23, 2010) [36-6 HC]

"6. The City has a duty to address public safety issues. A major quake or other disaster could produce a situation where rubble from neighboring structures could block ambulance access to the proposed mega-hospital. Putting all of our 'eggs in one basket' with respect to hospital emergency room locations is unwise. Emergency rooms that already exist should therefore be kept open. This is a foreseeable health care disaster. It is a must to keep as many emergency rooms open as possible to diversify our downside risk. 7. The graying of our population dictates that we need more hospital services, but let's do this right, let's make as few people unhappy as possible. Clearly the seismic tolerance issue is present, legislated by the State and needs to be addressed. Time is running out. As a point of fact, there is a 2/3 chance of a catastrophic earthquake within the next 30 year. We are at war with Al Qaeda."

(Barbara Berwick, September 23, 2010) [PC-332 HC]

"As a matter of promoting public safety, one of the things that was not mentioned was, in the event of a disaster, it's very possible that rubble could block access to the mega-hospital that is being proposed. In that case, we would want emergency rooms open at other locations, just as a matter of saving lives, it is just that simple."

(Diane and Richard Wiersba, October 11, 2010) [49-8 HC]

"Having half a thousand patients confined in a single building, in a densely populated area such as Cathedral Hill, would be extremely hazardous in an earthquake. We are both NERT-trained, so we know how city resources would be strained if a fire or quake occurred in our neighborhood."

(Ben Bear, October 18, 2010) [65-6 HC]

"Adequate distribution of hospital facilities is integral to disaster response. You must take community safety concerns into account when weighing this proposal."

(Linda Chapman, October 19, 2010) [76-30 HC, duplicate comment was provided in 111-30 HC]

"In the event of a disaster, it threatens public safety to concentrate medical services on the north side of the city. After the 1906 earthquake, people resorted to traversing the city on foot. CPMC proposed to build seismically safe hospitals that much of the population may be unable to reach."

(Barbara Kautz—CHNA and Bernal Heights Neighborhood Center, October 19, 2010) [87-17 HC, duplicate comment was provided in 108-17 HC]

"Effects of overall reductions of licensed inpatient beds (from 1,273 to 854) on emergency services, including the ability to respond to epidemics or disasters such as earthquakes."

(Sue Hestor, October 19, 2010) [89-13 HC]

"The analysis of how the CITY is served is substantially lacking in regard to a major disaster, which in San Francisco means an earthquake. The distribution of health facilities – particularly the original plan which closed St. Luke's, and currently includes closure of Children's/California campus – shifts hospital services to a smaller area in the eastern part of the City. Please provide two maps. One showing the location of hospitals and other medical facilities which will be available in an earthquake (Laguna Honda may be such) AFTER the CPMC is implemented. It will show the new UCSF hospital in Mission Bay as well. Then please provide one as a benchmark from whenever CPMC acquired its first facility in San Francisco (under whatever name CPMC functioned at the time of that acquisition.) The map will show the virtual abandonment of the western part of San Francisco. There is still a VA hospital, but the US Public Health hospital has closed. Please explain the TERRAIN problems and difficulties of circulation after an earthquake. To the extent the CPMC helps bleed available emergency and medical facilities to the east – so that it more convenient for physicians – the ability of the City to function after a disaster may be impaired."

(Sue Hestor, October 19, 2010) [89-14 HC]

"This project is being sold as enabling BUILDINGS to survive an earthquake. Please discuss the City's ability to provide medical services throughout the City abstracted from THESE buildings. The reason St Luke's is so important – AND MUST BE STRENGTHENED BEYOND EVEN ALT 3A – is that it is located where it is ACCESSIBLE to a lot more people., in particular those in the southeast and southern parts of San Francisco who may be able to get to Mission and Cesar Chavez but would have physical impediments getting to other locations. Medical SERVICES, not just hospital buildings, are important in a major disaster."

(Eileen Prendiville, September 23, 2010) [PC-265 HC]

"One of our concerns is the size of this proposed hospital, where all tertiary care would be consolidated in one building. A huge hospital on busy Van Ness Avenue could be disastrous after a massive earthquake. While the building most likely would be standing, wounded patients and staff, as well, would have extreme difficulty in getting their in a timely manner, as traffic would be gridlocked. It is not good planning to have all of these services at one facility, and I disagree with my co-worker neonatologist, Chris Retajczyk, but it wouldn't be the first time that nurses and doctors disagree. Now is the time, Commissioners, before it is too late, to make sure that the healthcare needs of San Franciscans are met effectively, as hospitals prepare to comply with the State's Hospital Seismic law."

(Linda Carter, September 23, 2010) [PC-289 HC]

"MS. CARTER: Hello. My name is Linda Carter. I've been a resident of San Francisco for 44 years and a proud RN at Saint Luke's for 40 of those. I am coming to you today, though, as a San Francisco resident. I am really really concerned about several issues, one of those is, well, the fact that this plan makes it top heavy with most of the medical services being North of Market, nothing further southeast of the City. In the case of a disaster, we would be cut off, basically, and if we are a very small hospital of 80 beds, there's no way that we could handle whatever San Francisco General can't handle in the case of a big earthquake."

Response HC-25

The comments express concerns regarding physical access to the proposed Cathedral Hill Hospital following an earthquake and the implications in the event of an earthquake of providing acute care beds for 555 patients within one building in a densely populated area, express concerns regarding keeping as many emergency rooms as possible open to minimize risks associated with earthquakes or other major disasters, express concerns regarding the concentration of medical services on the north side of the city in the event of a disaster, express concerns regarding shifting emergency services from the western to the eastern portion of the city, express concerns regarding community safety and impacts on City resources in the event of a fire or earthquake in the vicinity of the Cathedral Hill Campus, express concerns regarding

the impact of the reduction of licensed beds for CPMC systemwide under the proposed LRDP on the provision of emergency services, request the provision of maps related to emergency medical services that would be available in the event of an earthquake, and request a discussion of the "City's ability to provide medical services throughout the city as abstracted from" the buildings proposed under the LRDP. Each of these concerns is addressed below.

At the outset, before addressing each of the various concerns described above, it is important to explain that the Draft EIR included an analysis of the proposed LRDP's potential impacts related to earthquakes, seismicity, emergency response and evacuation plans, fires, and the need for new or physically altered fire protection and emergency services in Section 4.14, "Geology and Soils" (Draft EIR pages 4.14-42 to 4.14-53, 4.14-55 to 4.15-58, and 4.14-70 to 4.14-72), Section 4.16, "Hazards and Hazardous Materials" (Draft EIR pages 4.16-72 to 4.16-78. and 4.16-81), and Section 4.11, "Public Services," (Draft EIR pages 4.11-17 to 4.11-30 and 4.11-36), as discussed in more detail below.

The analysis of Impact GE-1 on pages 4.14-42 to 4.14-45 of the Draft EIR, which concluded that the proposed LRDP would not expose people or structures to the risk of loss, injury, or death involving rupture of a known earthquake fault or strong seismic ground shaking, because no earthquake zones have been mapped in the city, no evidence of fault rupture was observed at the Cathedral Hill, Pacific, Davies, and St. Luke's Campuses, because the proposed LRDP is intended to ensure that all existing and proposed CPMC campus structures would be in full compliance with SB 1953 and SB 1661, as applicable, which require that acute-care hospitals remain life-safe and operational after a seismic event, because the proposed new hospitals would be subject to OSHPD design review to ensure such compliance, and because all new structures proposed under the LRDP that would not provide acute care services would be required to comply with California Building Code, San Francisco Department of Building Inspection, and San Francisco Building Code seismic standards

Similarly, the analysis of Impact GE-2, on pages 4.14-45 to 4.14-49 of the Draft EIR, concluded that the proposed LRDP would not expose people or structures to the risk of loss, injury, or death involving ground failure, including liquefaction, or be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the proposed LRDP, and potentially result in liquefaction or lateral spreading, because the Cathedral Hill, Pacific, Davies, and St. Luke's Campuses are not located within a liquefaction zone as identified by the California Geological Survey and the potential for liquefaction or lateral spreading is very low at the Cathedral Hill, Pacific, Davies, and St. Luke's Campuses.

Additionally, the analysis of Impact GE-5, on pages 4.14-55 to 4.14-58 of the Draft EIR, concluded that the proposed LRDP would not expose people to the risk of loss, injury, or death involving ground failure, including densification or seismic settlement, because excavation for the planned basements of the proposed near-term projects at the Cathedral Hill, Davies, and St. Luke's Campuses would extend well below the zones of loose geologic material, and because Mitigation Measure M-GE-L5 would ensure that geotechnical studies are updated and prepared once the design-level plans for long-term projects at the Pacific and Davies Campuses are finalized, and that all recommendations in the geotechnical studies would be implemented and followed.

For the above reasons, the Draft EIR concluded that the proposed LRDP would have less than significant impacts related to such risks associated with earthquakes and seismicity analyzed under Impacts GE-1, GE-2, and GE-3.

Physical Access to the Proposed Cathedral Hill Hospital Following an Earthquake

The proposed Cathedral Hill Hospital and its Emergency Department would be centrally located within the area of San Francisco with the highest density of population, reducing the amount of travel by being within walking distance of more people than the existing California and Pacific Campuses Emergency

Departments. The proposed Cathedral Hill Hospital would also be located closer than the California and Pacific Campuses to the City areas with the greatest risk of experiencing damage from a major earthquake and, thus, would move Emergency Department services closer to the City areas likely to have the highest number of persons needing emergency medical care.[363] Please also see Major Response HC-2 (page C&R 3.23-8) regarding the location of hospital facilities for disaster response, which explains CPMC's rationale for selecting Van Ness and Geary as the location for the new Cathedral Hill Campus.

In the event of an earthquake or other major disaster, not only CPMC's emergency bays, but all of its inpatient and outpatient facilities would be used to provide emergency care.[364] Although the location of Emergency Departments is one factor in determining capacity for responding to disasters, physicians and specialized equipment also provide such capacity regardless of whether they are located within an Emergency Department or elsewhere.[365] Given the location of the proposed Cathedral Hill Hospital at the intersection of a wide, six-lane, major north-south thoroughfare (Van Ness Avenue) and a major east-west thoroughfare (Geary), as well as the surrounding network of streets such as Franklin and Post Streets, and given that the Cathedral Hill Hospital, itself, would meet the highest seismic safety rating (SPC-5) under SB 1953, it is extremely unlikely that rubble would block access to the Hospital in the event of an earthquake or other major disaster, as suggested by Comment 36-6, or that there would be difficulties in circulation, as suggested by Comment 89-13. Comment 89-13 requests an explanation of "terrain problems" that could occur after an earthquake. The comment does not identify or explain what "terrain problems" the commenter is referring to. However, as explained above, the proposed LRDP would not result in emergency services being inaccessible in the event of an earthquake. If the commenter is concerned that surrounding streets could be demolished in an earthquake, cutting off access to the hospital facility, it is possible for streets to be damaged in an earthquake. However, any such damage to the streets would not be an impact of the proposed LRDP. Thus, a study of the seismic conditions of all San Francisco streets to identify which ones have less of an opportunity for failure in the event of the earthquake is outside the scope of CEQA analysis required to be taken in connection with the proposed LRDP. To the extent that the commenter's concern is that hills could impede access to the proposed Cathedral Hill Hospital after a major earthquake, potentially preventing people in other areas of the City (e.g., the western area of the City currently served by the California and Pacific Campus Emergency Departments), it should be noted that the St. Mary's Medical Center, San Francisco Veterans Affairs Medical Center, the Kaiser Permanente San Francisco Medical Center, and UCSF at Parnassus Heights will continue to serve to provide emergency medical services to the western part of San Francisco in the event of major disaster, as explained in detail below. Providing multiple, SPC-5 hospitals equallydistributed around the City potentially would result in greater accessibility to hospitals regardless of terrain in the event of a major disaster. However, such a scenario is not feasible given economic realities, availability of building sites for new hospital facilities, the need to account for the existing locations of hospitals within the City, and the need to coordinate such a distribution of hospitals among various health care providers. In that context, providing a critical mass of emergency facilities in an SPC-5 facility near the greatest concentration of the City's population, which is what would occur under the proposed LRDP, is considered to be a reasonable and realistic approach.

---

Borcherdt et al., *Integrated Strong-Motion, Soil-Response Arrays in San Francisco California,* U.S. Geological Survey, available: http://nsmp.wr.usgs.gov/Presentations/San_Francisco_Array/San_Francisco_Array_Presentation_s.html, last updated Sept/ 23, 1999; accessed Dec. 16, 2010; Figure 1b, map showing estimated losses for a repeat of the 1906 earthquake (Mw = 7.7), from Risk Management Solutions, Inc., Shah, et al. 1995.

[364] CPMC, Memorandum from Malia Weinberg to David Reel (AECOM) & Brian Boxer (AECOM) re: Emergency Services in the Event of a Major Disaster (June 1, 2011).

[365] Ibid. See also American Journal of Emergency Medicine. 2004 Sep;44(3):253-61. "Health care facility and community strategies for patient care surge capacity." Hick JL, Hanfling D, Burstein JL, DeAtley C, Barbisch D, Bogdan GM, Cantrill S.

Concentration of Emergency Medical Services and Acute-care Beds in a Single Location (i.e., the Cathedral Hill Campus)

Comment 36-6 expresses concerns that that development of the proposed Cathedral Hill Hospital would result in the City putting all of its "eggs in one basket" with respect to hospital emergency room locations. This comment overlooks the fact that CPMC would be providing emergency room services in other campus locations as well, and that CPMC's hospitals are not the only hospitals that would be available to provide emergency services in San Francisco in the event of a disaster. As explained in Major Response HC-5 (page C&R 3.23-20) regarding access to emergency services, in addition to the emergency room at the new Cathedral Hill Campus, the project would increase the capacity of the emergency room at the St. Luke's Campus. Emergency services would also continue to be provided at the Davies Campus. In addition to the CPMC emergency rooms, other emergency rooms in San Francisco that would be available to provide services in the event of a major disaster would include Chinese Hospital, the Kaiser Permanente San Francisco Medical Center, Saint Francis Memorial Hospital, St. Mary's Medical Center, San Francisco General Hospital, San Francisco Veterans Affairs Medical Center, UCSF at Parnassus Heights, and the proposed UCSF Mission Bay hospital. Therefore, the City would not be putting all of its "eggs in one basket" in terms of emergency room services in the event of a disaster under the proposed LRDP.

Similarly, Comment 49-8 HC states that confining half a thousand patients in a single building would be extremely hazardous in an earthquake. This comment involves a concern similar to the "eggs in one basket" comment responded to above. It should be remembered that, as stated on page 2-7 of the Draft EIR, one of the overarching objectives of the proposed LRDP is to "[c]onstruct modern, seismically safe hospital facilties that would remain operational in the event of a major disaster, both to serve CPMC's patients and to play an important role in San Francisco's disaster response and preparedness system…"

As explained on page 1-20 of the Draft EIR, CPMC plans to construct the proposed Cathedral Hill Hospital (and the proposed St. Luke's Replacement Hospital) to a structural rating of SPC-5. As further explained on Draft EIR page 1-19, SPC-5 is the highest of California's structural performance category (SPC) ratings related to performance of a hospital building in a strong earthquake. SPC-5 buildings are designed not only to not significantly jeopardize life in the event of such an earthquake, but also to be reasonably capable of providing services to the public following strong ground motion. Therefore, the Cathedral Hill Hospital is not anticipated to present hazards in the event of an earthquake. To the contrary, the Cathedral Hill Hospital and the St. Luke's Replacement Hospital would increase earthquake safety by replacing acute care hospital facilities at the Pacific, California, and St. Luke's Campuses, which, as stated on Draft EIR page 1-20, largely have a structural rating of SPC-1. As explained on Draft EIR page 1-19, hospital buildings rated SPC-1 pose a significant risk of collapse and a danger to the public after a strong earthquake.

Additionally, as explained on Draft EIR page 4.16-73, an emergency operations and evacuation plan would be developed for the Cathedral Hill Campus, which would include a plan for the care of casualties in the event of an internal or external disasters, and emergency egress routes. Specific concerns regarding the concentration of emergency services in the northern and eastern portions of the City are addressed in detail below. Additionally, as further explained on Draft EIR page 4.16-73. the San Francisco Fire Department and the Department of Building Inspection would review the building permits for the proposed Cathedral Hill Hospital (and other buildings proposed under the LRDP) to ensure that appropriate evacuation plans and emergency access, including equipment access, would be in compliance with the San Francisco Fire Code and the San Francisco Building Code. The existing streets provide access for emergency responders and egress for residents and workers, and the proposed LRDP would neither directly nor indirectly alter that situation to any substantial degree. Additionally, CPMC has been meeting with the Hospital Council Emergency Preparedness Partnership, Emergency Medical Services, and the San Francisco Fire Department (including the Neighborhood Emergency Response Team) and

will continue to work with these agencies on updated, comprehensive emergency planning. The same process of developing an emergency operations and evacuation plan and working with the agencies listed above would also apply to the St. Luke's Campus under the proposed LRDP. For all of the above reasons, the Draft EIR concluded on page 4.16-74 that implementing the LRDP at the various CPMC campuses (including at the Cathedral Hill Hospital) would result in less than significant impacts related to an emergency operations plan or emergency evactuation plan.

The emergency operations and evacuations plan for the Cathedral Hill Hospital would include provisions for "surge capacity," which is essentially the ability of a health care facility to expand its operations to treat an influx of patients in response to a major disaster.[366] At the Cathederal Hill Hospital, the Emergency Department drop-off area would serve as a triage point.[367] CPMC would be capable of controlling the space around the Cathedral Hill Hospital to ensure that people needing medical attention would receive assistance, while those not needing medical attention but in a panic would be sent to an area for the "worried well."[368] In the new Cathedral Hill Hospital Emergency Operations Plan, areas have been designated to accommodate patient family members and "worried well" who may arrive at the Cathedral Hill Hospital after a major disaster.[369]

Concentration of Medical Services in the Northern Portion of the City

Comment 76-30 HC expressed concerns regarding the concentration of medical services on the north side of the City in the event of disaster. Similarly, Comment 89-14 expressed concerns regarding increasing the size of the St. Luke's Campus to provide accessible medical services in the event of a major disaster to people within the southeast and southern parts of San Francisco. As explained in Major Response HC-2, from a citywide hospital distribution perspective, the proposed LRDP has been planned in the context of other proposed and pending medical campus projects in the City. Three new hospital facilities have been recently planned in the south of Market Street area: CPMC's proposed St. Luke's Replacement Hospital, San Francisco General Hospital's replacement hospital, and the University of California, San Francisco's new hospital/medical campus at Mission Bay. CPMC's proposed Cathedral Hill Campus is the only new acute care facility currently proposed in the north of Market Street area. Therefore, given the proposed and pending medical campuses in the south of Market Street area, the proposed LRDP would not result in a concentration of medical services on the north side of the City in a manner that would adversely affect the southern portion of the City in the event of a disaster. CPMC would continue to provide medical services at the St. Luke's Campus under the proposed LRDP, with increased emergency room capacity.

Moreover, the proposed LRDP is intended to increase the safety of CPMC patients that would receive inpatient medical services by housing them in seismically safe facilities at the proposed Cathedral Hill Campus; many of these patients currently receive inpatient services at facilities at the California and Pacific Campuses, which are rated SPC-1, the lowest seismic safety rating and are expected to close by January 1, 2013 under SB 1953, unless extended (potentially out to 2020 by SB 90) or successor legislation. To do this, the proposed LRDP includes the replacement of existing acute-care facilities at the California and Pacific Campuses (that would required to comply with state-mandated deadlines for meeting seismic safety standards under SB 1953 as modified by subsequent legislation) with new, seismically compliant, acute-care facilities at the proposed Cathedral Hill Campus that could remain open beyond 2030.

[366] CPMC, Memorandum from Malia Weinberg to David Reel (AECOM) & Brian Boxer (AECOM) re: Emergency Services in the Event of a Major Disaster (June 1, 2011); Bonnett, Carl. J. et al., "Surge Capacity: A Proposed Conceptual Framework, American Journal of Emergency Medicine (2007) 25, page 297.
[367] CPMC, Memorandum from Malia Weinberg to David Reel (AECOM) & Brian Boxer (AECOM) re: Emergency Services in the Event of a Major Disaster (June 1, 2011).
[368] Ibid.
[369] Ibid.

Please see Section 1.5.2, "Seismic Requirements for Hospitals" and Section 1.5.3, "Review Process for Compliance with Seismic Requirements" in the Draft EIR, pages 1-17 to 1-20, for detailed information regarding State seismic safety requirements under SB 1953 and related laws and regulations, including the structural ratings of acute-care hospital buildings by Structural Performance Category (SPC). The proposed Cathedral Hill Hospital and St. Luke's Replacement Hospital would both meet the highest seismic safety rating, SPC-5, which would enable it to be used as an acute-care facility through 2030 and beyond. The existing California, Pacific, and St. Luke's Campus hospitals are rated SPC-1, the lowest seismic safety rating, and would be required to close by January 1, 2013, under SB 1953, unless extended (potentially out to 2020) by SB 90 or successor legislation. In addition, the Davies Hospital North Tower was recently seismically retrofitted to meet SPC-2, enabling it to be used as an acute-care facility until 2030. Therefore, the proposed LRDP would increase the City's preparedness for an earthquake or other natural disaster and would increase the safety of the patient population that currently receives inpatient services at the California and Pacific Campuses by relocating such services to newer facilities that would meet the highest seismic safety standards under State law.

Concentration of Emergency Services in the Eastern Portion of the City

Comment 89-13 expresses concerns regarding the City's emergency preparedness capabilities, particularly within the western portion of San Francisco. These comments seem to be based on the assumption that the lack of a hospital facility within the western part of the City would result in inadequate emergency preparedness in that area. In 2010, there were approximately 1,129 licensed non-CPMC beds west of Van Ness Avenue at the UCSF Medical Center at Parnassus Heights, St. Mary's Medical Center and Kaiser Permanente San Francisco Medical Center, and the Veterans Affairs Medical Center, Seton Medical Center in Daly City, and the Laguna Honda Hospital that would serve the western population of San Francisco to provide medical care in the event of an emergency.[370] At the time the Cathedral Hill Campus would become operational in 2015, it is estimated that there would be approximately 840 licensed non-CPMC beds west of Van Ness Avenue at UCSF Parnassus (after decommissioning of the Moffitt wing of UCSF's Moffitt/Long Hospital), St. Mary's Medical Center and Kaiser Permanente San Francisco Medical Center.[371] These licensed bed totals do not include skilled nursing facility, rehabilitation, or psychiatric beds and there would be no reduction in the capacity of the Veterans Affairs Medical Center, Seton Medical Center, and the Laguna Honda Hospital to serve as triage centers.[372]

Although hospitals play an important role in emergency preparedness, the more critical resources are those of first responders (e.g., Police, Fire Department, NERT, Search and Rescue, etc.) and ongoing support functions after a disaster (i.e., local evacuation centers, emergency supply locations, food and water distribution, fire suppression infrastructure, etc.).[373] The first responders and schools, clinics, and other buildings and facilities currently available in the western portion of the City are not anticipated to change substantially in the future, and would provide adequate support functions after a disaster in the western portion of the City.[374] As explained in Major Response HC-5 (page C&R 3.23-20), given the proposed Cathedral Hill Hospital's centralized location at a transit hub within approximately two miles from the location of the existing California Campus, there would also be adequate access to this proposed new hospital from the western portion of San Francisco in the event of a disaster.

[372] Ibid.
[373] Ibid.
[374] Ibid.

Provision of Multiple Emergency Rooms

With respect to Emergency Departments in particular, the proposed LRDP would replace of existing Emergency Departments at the California, Pacific, and St. Luke's Campuses that otherwise would be required to close under SB 1953, with new, seismically-compliant Emergency Departments at the proposed Cathedral Hill Campus and St. Luke's Campus that could remain open beyond 2030. Additionally, it should be noted that the Pacific Campus Emergency Department would be renovated and used for urgent care under the proposed LRDP. Major Response HC-5 also explains that although under the proposed LRDP, two emergency services locations would be closed (at the California and Pacific Campuses), for the entirety of the CPMC system, total combined and urgent care capacity would increase, from capacity for 88,000 visits per year currently to over 100,000 visits per year at the Cathedral Hill, Davies, and St. Luke's Hospitals.

Impacts on City Resources in the Event of a Fire or Earthquake

With respect to concerns regarding community safety and strains on City resources in the event of a major fire or earthquake, the discussion of Impact HZ-6 on pages 4.16-72 to 4.16-76 of the Draft EIR concluded that the project would not conflict with emergency response or evacuation plans of the City during the proposed LRDP's construction and operational periods. This is because CPMC is integrated into the continuous citywide preparation for emergencies and disasters, each CPMC campus would have an emergency operations and evacuation plan, the current emergency operations and evaluation plans at the existing campuses would continue to be maintained during construction and the San Francisco Fire Department (SFFD) and Police Department would be notified by CPMC of all temporary changes to campus access during construction, and CPMC would continue to work with the Hospital Council Emergency Preparedness Partnership, Emergency Medical Services, and SFFD on updated, emergency planning. Therefore, the Draft EIR concluded that Impact HZ-6 related to the potential of the LRDP to conflict with emergency response or evacuation plans would be less than significant.

The discussion of Impact HZ-7 on pages 4.16-76 to 4.16-78 of the Draft EIR concluded that the proposed LRDP would not expose people or structures to a significant risk of loss, injury, or death involving fires, because all new development at the CPMC campuses under the proposed LRDP would be built to meet San Francisco Fire Code standards and would be subject to plan review to ensure compliance with San Francisco Fire Code requirements and thereby would minimize fire-related emergency dispatches,

Additionally, the discussion of Impact PS-1 on pages 4.11-17 to 4.11-23 of the Draft EIR concluded that the proposed LRDP would not result in substantial impacts associated with the provision of, or the need for, new or physically altered fire and emergency services facilities to maintain acceptable service ratios, response times, or other performance objectives, because, among other reasons set forth on pages 4.11-17 to 4.11-23 of the Draft EIR, the proposed LRDP is an urban infill project that would not require the expansion of SFFD's service area or extend travel routes between fire stations and service destinations, SFFD does not anticipate that implementing the proposed LRDP would degrade service levels below the adopted performance objective, or would require new fire service facilities, or result in increased staffing needs at existing fire stations. CPMC would work with SFFD and local agencies to determine utility and access requirements for fire and emergency services during the project's construction and operational phases, each existing CPMC campus already has an emergency response plan to be implemented in the event of a disaster, each campus currently coordinates and would continue to coordinate with the Hospital Council Emergency Preparedness Partnership, Emergency Medical Services, and SFFD (911 and Neighborhood Emergency Response Team), and a similar emergency response plan would be created for the proposed Cathedral Hill Campus.

Impacts of Reduction of Licensed Beds on Emergency Services in the Event of an Earthquake

Comment 87-17 expresses concern regarding the effects of the reduction in licensed beds within the overall CPMC system on emergency services, including the ability to respond to epidemics or disasters such as earthquakes. Comment 87-17 states that the proposed LRDP would reduce the number of overall licensed beds at the CPMC campuses from 1,273 to 854. This statement appears to misunderstand Table 2-2, "CPMC Existing and Proposed LRDP Licensed Hospital Bed Uses," on page 2-10 of the Draft EIR. Table 2-2 indicated that in 2009, the year during which the Notice of Preparation of the Draft EIR was issued, there were a total of 1,133, rather than 1,273 (as stated in comment 87-17), licensed beds overall at the existing CPMC campuses. The comment is correct, however, that Table 2-2 in the Draft EIR indicated that this total of 1,133 beds would be reduced to 854 under the proposed LRDP.

Since the publication of the Draft EIR, Table 2-2 has been updated, as shown in the text revisions in Chapter 4 "Draft EIR Text Changes" of this C&R document. As shown in the updated version of Table 2-2, a total of 1,174 licensed acute-care beds existed at the CPMC campuses in both 2009 and 2010, and the proposed LRDP would reduce this total to 903 licensed acute care beds. Please also see Response PD-6 (page C&R 3.2-6) concerning text revisions to Table 2-2 (in the Draft EIR, page 2-10) for licensed beds under the proposed LRDP, as stated in this C&R document.

As explained in detail in Major Response HC-5 (page C&R 3.23-20), the proposed LRDP would expand the capacity of Emergency Departments or provide comparable emergency services at the CPMC campuses. Under the proposed LRDP, two emergency services locations would be closed (at the California and Pacific Campuses).[375] However, for the entirety of the CPMC system, total combined emergency and urgent care capacity would increase from 88,000 visits/year currently to over 100,000 visits/year at the Cathedral Hill, Davies and St. Luke's Hospitals. In addition, as explained above, the new Emergency Departments at the Cathedral Hill Hospital and St. Luke's Replacement Hospital would be rated SPC-5, the highest seismic safety standard under SB 1953, and would replace the existing Emergency Department facilities at the California, Pacific, and St, Luke's Hospitals, which are rated SPC-1, thereby increasing the ability of the CPMC system to respond to disasters such as earthquakes.

Request for Maps Related to Emergency Medical Services Available in Event of an Earthquake

Comment 89-13 asks for two maps. The first map requested is "[o]ne showing the location of hospitals and other medical facilities which will be available in an earthquake (Laguna Honda may be such) AFTER the CPMC is implemented. It will show the new UCSF hospital in Mission bay as well." Such a map is not necessary, because adequate information regarding the impact of the LRDP related to the citywide distribution of emergency medical services after an earthquake is provided in the Draft EIR (see Draft EIR pages 4.16-72 to 4.16-76) and in Major Response HC-5 (page C&R 3.23-20) regarding access to emergency services. Please see the discussion of the Draft EIR's analysis in Section 4.14, "Geology and Soils," Section 4.16, "Hazards and Hazardous Materials," and Section 4.11, "Public Services" of impacts related to seismicity and interference with emergency response or evacuation plans. As detailed in these sections and explained above, the proposed LRDP's impacts related to seismicity, including fault rupture and ground shaking, and interference with emergency response or evacuation plans would be less than significant.

The second map requested was characterized by the comment as "a benchmark from whenever CPMC acquired its first facility in San Francisco." This is beyond the scope of environmental review documents under CEQA. The State CEQA Guidelines establish that the baseline for purposes of the CEQA analysis normally is the physical environmental conditions on site and in the vicinity of the project as they exist at the time the Notice of Preparation of the Draft EIR (NOP) is published (see Section 15125(a) of the State

[375] The Pacific Campus Emergency Department would be renovated and used for urgent care. The California Campus Emergency Department and Emergency Department services at Pacific Campus would be transferred to the proposed Cathedral Hill Campus.

CEQA Guidelines). The NOP for the CPMC LRDP EIR was filed on May 27, 2009. Therefore, changes in the environmental setting that occurred between the time CPMC acquired its first facility in San Francisco (i.e., 1991) and the publication of the Notice of Preparation (2009) are not relevant to the analysis of the proposed LRDP's environmental impacts.

Request for Discussion of City's Ability to Provide Medical Services Throughout the City

Comment 89-14 also requests a discussion of "the City's ability to provide medical services throughout the City as abstracted from THESE buildings." This comment raises issues similar to other comments suggesting that the Draft EIR analysis is incomplete without prior completion of a Health Care Master Plan or an equivalent analysis of citywide health care services. Please see Major Response HC-9 (page C&R 3.23-38) and Response HC-7 (page C&R 3.23-74) regarding the health care master plan for a detailed response to such comments. As explained in Major Response HC-9, CEQA does not require the CPMC LRDP EIR to include an analysis of citywide or regional health care service delivery systems, absent evidence that the proposed LRDP would contribute to health care service gaps that would cause an adverse physical environmental effect on the environment, and no such evidence has been provided by the comments. As further explained in Major Response HC-9, the proposed LRDP would not result in any transfer or displacement of services at other non-CPMC health care facilities that could result in a physical environment effect of the LRDP related to citywide health services that is not analyzed in the Draft EIR. Major Response HC-9 also explains that no further information is necessary regarding the delivery of health care services systemwide to adequately identify and analyze the environmental impacts of the proposed LRDP.

Comment

(Flavio Casoy—San Francisco General Hospital Physician Organizing Committee, September 23, 2010) [42-3 HC]

"As a psychiatrist working at SFGH, I am painfully aware of the impact of service cuts in other facilities. Our volume of patients are increasing at a time of severe budget constraints and staffing cuts. I worry that further cuts in St. Luke's would result in an increase in the volume at SFGH which would certainly compromise the quality of care received by SFGH patients. Sutter's actions at St. Luke's stands not only to harm St. Luke's patients, but negatively impact many more people who depend on the C&C's health delivery system. I am terrified. I ask the Planning Commission to look carefully into this matter and uphold it's mission to (quoted from SF General Plan Policy 7.2.1) 'Promote the continued operation of existing human and health services that serve low-income and immigrant communities in the Eastern Neighborhoods.'"

Response HC-26

The comment expresses concerns regarding the potential for service cuts at the St. Luke's Campus to result in increased volume at San Francisco General Hospital (SFGH), and a request that the Planning Commission ensure consistency with "San Francisco General Plan Policy 7.2.1," which appears to be a reference to East of SoMA (South of Market) Area Plan Policy 7.2.1.

Please see Major Response HC-3 (page C&R 3.23-17) regarding impacts on SFGH and Major Response HC-2 (page C&R 3.23-8) regarding the size and scope of services at the St. Luke's Campus, which explain that no services currently being provided at the existing St. Luke's Hospital would be shifted to other, non-CPMC hospitals (including SFGH) or health care service providers under the proposed LRDP. Therefore, the proposed LRDP would not result in service cuts at the St. Luke's Campus that would increase volume at SFGH.

East of SoMA Area Plan Policy 7.2.1 encourages the City to "[p]romote the continued operation of existing human and health services that serve low-income and immigrant communities in the Eastern

Neighborhoods, and prevent their displacement." None of the CPMC campuses are located within the area that is subject to the East of SoMA Area Plan. Therefore, this policy is not applicable to the proposed LRDP.

However, since the comment primarily focuses on the St. Luke's Campus, it should be noted that the proposed LRDP would result in the replacement of the existing hospital tower at the St. Luke's Campus, which will be required to cease providing acute care services by January 1, 2013, pursuant to the seismic safety requirements of SB 1953, unless extended by SB 90 (potentially out to 2020) or successor legislation. Therefore, the proposed LRDP would prevent the displacement and promote the continued operation of existing health and human services serving low-income and immigrant communities in the area served by the St. Luke's Campus. Please also see Major Response HC-2 for additional discussion of the scope of the existing health services at the St. Luke's Campus that would be maintained or expanded under the proposed LRDP, and Major Response HC-8 (page C&R 3.23-32) for a detailed discussion regarding access for low-income persons to health care services at the CPMC campuses, including the St. Luke's Campus.

Comments

(Carol and Michael Stack, October 17, 2010) [62-6 HC]

"It is unnecessary: there are now at least 3 major medical facilities in the immediate area and CP could upgrade its existing Webster St. hospital to meet architectural requirements. I understand this would cost them more to do, but weighed against the proposed alternative and its overt and hidden costs I believe the City would be advantaged in requiring the hospital company to absorb these costs."

(Donald Scherl, October 18, 2010) [74-7 HC]

"4.2 St. Francis Hospital: No explanation is offered for how it makes sense to build a huge acute care hospital at the chosen Cathedral Hill site when literally five (5) blocks away there already exists a 239 bed acute care hospital complete with emergency room. In terms of distribution of access to medical care across the city, this makes no sense."

(Donald Scherl, October 18, 2010) [74-36 HC]

"7.5: Location: The placement of a hospital on Cathedral Hill is ill--chosen since an existing full service acute care hospital (St. Francis) sits just 5 blocks away. The new hospital creates hospital overload for the area."

(Hossein Sepas, October 19, 2010) [82-3 HC]

"Cathedral Hill already has the huge Mt Zion and Kaiser campus' nearby and ambulances are non stop, to have a huge hospital at Geary & Van Ness when Geary & Divisadero (a few blocks away) is already the home of major medical facilities is just too much medical care in a small area. Plus there is St. Francis Hospital a few blocks to the east; there is simply too high concentration of medical care in one area to the detriment and other parts of San Francisco."

(Patrick Carney, October 19, 2010) [83-3 HC]

"Cathedral Hill already has the huge Mt Zion and Kaiser campus' nearby and ambulances are non stop, to have a huge hospital at Geary & Van Ness when Geary & Divisadero (a few blocks away) is already the home of major medical facilities is just too much medical care in a small area. Plus there is St. Francis Hospital a few blocks to the east; there is simply too high concentration of medical care in one area to the detriment and other parts of San Francisco."

Response HC-27

Comment 62-6, when read in context with the rest of Comment Letter 62, suggests that the construction of the proposed Cathedral Hill Hospital is unnecessary, because there are three existing major medical facilities in the vicinity of the Cathedral Hill Campus. Similarly, Comments 74-7, 74-36, and 82-3 suggest that locating a new acute care hospital at the Cathedral Hill Hospital does not make sense in terms of distribution of access to medical care given the Cathedral Hill site's proximity to the St. Francis Memorial Hospital and would result in "hospital overload" or too high a concentration of medical care in one area. The use of the phrase "hospital overload" appears to be a comment that there would be too many hospitals in one area of the City. Comment 82-3 also appears to express concern regarding increased siren noise from ambulances within the vicinity of the Cathedral Hill Campus. Comment 62-6 also suggests as an alternative to constructing the Cathedral Hill Campus that CPMC should "upgrade" its existing "Webster St. hospital." No existing CPMC hospitals are located on Webster Street, but presumably the comments intended to refer to CPMC's existing 2333 Buchanan Street Hospital at the Pacific Campus, because other existing CPMC buildings at the Pacific Campus are located on Webster Street. These comments do not raise issues regarding the adequacy, accuracy, or completeness of the Draft EIR and are noted. The comments will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project.

Location of the Cathedral Hill Campus in the Vicinity of Other Medical Facilities

Please see Major Response HC-2 (page C&R 3.23-8), which explains CPMC's rationale for selecting the Cathedral Hill Campus as the location for the proposed Cathedral Hill Hospital. Major Response HC-2 explains that from a citywide hospital distribution perspective, the proposed LRDP has been planned in the context of other proposed and pending medical campus projects in the city, and that the proposed Cathedral Hill Hospital is the only currently proposed new acute care facility currently proposed in the north of Market Street area. As explained in detail in Major Response HC-2, the proposed Cathedral Hill Campus would be centrally located with respect to the existing California and Pacific Campuses and would consolidate and relocate acute care, emergency, and other services from the California and Pacific Campuses. The Cathedral Hill Hospital would be approximately .5 mile from the Pacific Campus and 2 miles from the California Campus, and would accommodate CPMC patients, especially those that currently use the California and Pacific Campuses whose acute-care inpatient services and facilities are being relocated and consolidated at Cathedral Hill. It would also be conveniently located for CPMC's existing affiliated physicians who service currently patients the Pacific or California campuses and to outpatient facilities. Major Response HC-2 also explains that the Cathedral Hill Campus would be closer than the existing California and Pacific hospitals to the area of San Francisco with the highest residential population density (i.e., the area including the Tenderloin), including the highest population density of low-income households, seniors (the most frequent users of hospital care), children and youth.[376] The proposed size of the Cathedral Hill Hospital is based upon replacing inpatient bed capacity of the two existing hospitals at the Pacific and California Campuses. The rationale for the size of the proposed Cathedral Hill Hospital is discussed in detail in Major Response HC-2.

Please also see Major Response HC-3 (page C&R 3.23-17) regarding LRDP impacts to other hospitals, which explains that there is no substantial evidence that moving any of CPMC's acute-care services, emergency services, or any other services the relatively short distance from the existing Pacific Campus and the California Campus to the proposed Cathedral Hill Campus would result in a substantial change in existing medical use patterns or otherwise adversely impact other, non-CPMC medical facilities in the vicinity, including St. Francis Memorial Hospital.

[376] S.F. Planning Department, 2009 (May), *Draft San Francisco General Plan Recreation and Open Space Element*, page 19, Figure 2, "High Needs Analysis."

Ambulance Siren Noise in the Cathedral Hill Campus Vicinity

Analysis of the proposed LRDP's impacts related to noise from emergency vehicles, including ambulances, are analyzed on pages 4.6-70 to 4.6-71 in the Draft EIR, which concluded that such impacts would be less than significant. Please also see Response NO-59 (page C&R 3.8-64), which explains that depending on the severity of a particular patient's medical emergency, ambulances accessing the proposed Cathedral Hill Hospital could require the use of their sirens, the use of which could cause a temporary elevation of ambient noise levels on an intermittent basis at nearby noise-sensitive land uses adjacent to the ambulance route. As noted on page 4.6-70 of the Draft EIR, emergency vehicle sirens can generate intermittent L_{max} levels of up to 106 dB at a distance of 75 feet. As explained in Response NO-59, the use of emergency vehicle sirens is a common element of the urban noise environment in San Francisco, including the neighborhoods around the site of the proposed Cathedral Hill Campus.

Response NO-59 provides a detailed discussion regarding the existing use of emergency vehicle sirens in the vicinity of the Cathedral Hill Campus, as well as the increased use of such sirens that would occur because of the proposed LRDP. As explained in Response NO-59, the number of emergency transports associated with the proposed Cathedral Hill Campus that would require the use of a siren would average fewer than 1.5 transports per day. Further, approximately 21.8 of the total number of such transports are anticipated to occur between the hours of 10 p.m. and 7 a.m., considered by most to be the most noise-sensitive period of the day. This would result in approximately 117 emergency transports per year during those hours, which is equivalent to less than one emergency transport every three nights. Response NO-59 further explains that assuming that a particular noise-sensitive receptor in the vicinity of the proposed Cathedral Hill Campus would experience siren-related noise for no more than 15 seconds per emergency transport, L_{dn} noise levels would experience less than a 0.1-dBA increase, and hourly L_{eq} would experience an increase of up to approximately 0.4 dBA. Although the proposed LRDP would represent an increase in the annual frequency of events, the level of siren-related noise that would be experienced by noise-sensitive receptors located in the vicinity of the proposed Cathedral Hill Campus would not be distinguishable from the level of urban noise in the project vicinity. As such, the level of siren-related noise that would be experienced by receptors located in the vicinity of the proposed Cathedral Hill Campus is similar to the level that currently exists in this part of the City and therefore, would not make the neighborhood less livable.

Furthermore, as noted on page 4.6-17 of the Draft EIR, it is common practice for ambulances to discontinue the use of their sirens within a few blocks of emergency access at other hospitals within the City of San Francisco. This is dependent on traffic flow and other factors, and such practice could reasonably be assumed to occur at the proposed Cathedral Hill Campus. As such, in consideration of the potential change in ambient noise levels, the frequency of emergency transports that could occur, and the historic practice by ambulance service providers in the City, siren noise impacts would be considered less than significant, consistent with the findings of the Draft EIR. Alternative of Upgrading 2333 Buchanan Street Hospital at Pacific Campus

Please see the discussion of the Four-Campus Renovation/Retrofit of Existing Acute-Care Facilities Alternative (a considered but rejected alternative) in the Draft EIR, pages 6-24 to 6-25, which addresses the suggestion to renovate and retrofit the 2333 Buchanan Street Hospital at the Pacific Campus, and other facilities rather than constructing the proposed new hospitals at the Cathedral Hill and St. Luke's Campuses under the LRDP. The discussion explains that the Four-Campus Renovation/Retrofit of Existing Acute Care Facilities Alternative was rejected from further consideration, because (a) retrofitting of the Buchanan Street Hospital at the Pacific Campus would be prohibitively disruptive from a patient care perspective and, therefore, would not meet the project objective of ensuring ongoing medical services and an uninterrupted continuum of care at the Pacific Campus during LRDP construction through a carefully planned, appropriately phased project to minimize disruption; (b) retrofitting could not bring existing on-campus structures up to "new construction" standards of safety without prohibitive costs;

(c) the layout of the existing Buchanan Street Hospital would not be optimal for accommodating contemporary best practices in standards of care and hospital design; and (d) the investment in retrofitting the Buchanan Street Hospital would achieve relatively short-lived results, as it would at most bring the building up to a "life safe" (also called SPC-2) seismic safety rating, which would allow the provision of acute-care services until, but not beyond, 2030. In contrast, new acute-care facilities, such as the proposed Cathedral Hill Hospital, could achieve the highest seismic safety rating (SPC-5), enabling them to continue providing acute-care services through 2030 and beyond.

In addition, it should be noted that the Cathedral Hill Hospital would replace CPMC's existing hospital at the California Campus as well as the Pacific Campus hospital. Therefore, under the Four-Campus Renovation/Retrofit of Existing Acute-Care Facilities Alternative, CPMC would also need to upgrade the existing California Campus hospital, which would involve the same disadvantages described above, related to ensuring ongoing medical services, prohibitive costs, hospital layout, and relatively short-lived results.

Comments

(Ben Bear, October 18, 2010) [65-4 HC]

"I have had the opportunity to meet with CPMC representatives to discuss this project and its impact on the neighborhood. They made no secret of the fact that this facility is intended to be a magnet for all of Northern California. It will indeed be a profit center for the most profitable and least charitable non-profit in California. And as such, it will provide relatively little benefit to the people of San Francisco."

(Margaret Kettunen Zegart, October 20, 2010) [97-1 HC]

"I support the Cathedral Hill Neighbors' observations regarding the CPMC and LFPD and the DEIR assessment and choice of a new and enlarged St. Lukes, serving the neighborhood with additional beds, and its focus for women's and childrens' care. Sutter Health Corporation shall use this proposed long range development for increased regional medical services (as they do now for existing specialty diagnostic, treatment/surgery and inpatient care.) Rather than providing improving all sites' medical facilities and services in all areas of medical need in a balanced traffic accessible and distribution of care, the Cathedral Hill 331-385 foot high (15 story plus rooftop mechanics) and 3 underground levels mega-structure with a Van Ness tunnel serving a medical office complex is planned with the many more adverse impacts than analyzed in this DEIR."

Response HC-28

When read in context with the rest of Comment Letter 65, it is clear that the reference to "this facility" in Comment 65-4 is a reference to the Cathedral Hill Campus. The comments raise concerns regarding an increased amount of regional health care services at CPMC, in general, and at the Cathedral Hill Hospital, in particular, under the proposed LRDP, the ability of traffic to access CPMC medical facilities, and balanced distribution of health care. Comment 97-1 also states support for a larger St. Luke's Campus with additional beds and a women's and children's center, similar to what is proposed under Alternative 3A, and suggests that the proposed Cathedral Hill Campus would result in additional adverse environmental impacts that were not analyzed in the Draft EIR. The comments are noted. The comments will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project.

Regional Health Care Services

For many years CPMC has been a provider of local and regional health care services, many of which are not available in smaller, less regionally accessible locations.[377] As explained in CPMC's 2008 Institutional Master Plan (IMP):

> [I]n 2007, 70 percent of CPMC's inpatients came from San Francisco and 21 percent were from other Bay Area cities. Six percent were from other parts of Northern California and approximately three percent were from Southern California or out of state. A higher percentage of outpatients are local. In 2007, 75 percent of CPMC's outpatients came from San Francisco and 21 percent were from other Bay Area cities. Two percent of outpatients were from elsewhere in Northern California and the remaining one percent were from Southern California or out of state (CPMC Community Benefit Plan Report, 2007). Patients who travel from outside San Francisco for health care at CPMC are often drawn by its noted specialty programs.[378]

CPMC offers specialized services which, though also needed outside of the City, cannot be provided in all areas where the services are needed for reasons of unavailability of facilities, physicians' preferences regarding where they practice, and patient volume. CPMC has indicated that the proposed LRDP is intended to allow it to continue to deliver these same local and regional health care services. CPMC anticipates that the Cathedral Hill Campus would serve similar percentages of inpatients and outpatients from San Francisco, other Bay Area cities, other parts of Northern California, and Southern California or out of state as it does under existing conditions. As Dr. Mitch Katz, former Director of the City of San Francisco Department of Public Health, stated, in addressing the regional dynamic and CPMC as a destination hospital "the regional dynamic is people come here for medical care."[379] Please also see Major Response HC-8 (page C&R 3.23-32) regarding access to health services, which includes a discussion of charity care provided by CPMC.

Traffic Accessibility

When read in context with the rest of Comment Letter 97, the reference to traffic accessibility in Comment 97-1 appears to primarily express a concern regarding traffic access to the Cathedral Hill Campus.

Impacts TR-1 through TR-58 in Draft EIR Section 4.5, "Transportation and Circulation," address traffic, transportation, and parking impacts related to the proposed development at the Cathedral Hill Campus (see Draft EIR pages 4.5-93 through 4.5-161). Please see the discussion of Impacts TR-52 and TR-92 (at Draft EIR pages 4.5-145 and 4.5-206, respectively) for an analysis of LRDP impacts related to emergency vehicle access to the Cathedral Hill Campus, and Major Response HC-5 (page C&R 3.23-20) and Response TR-100 (page C&R 3.7-170) for detailed responses to comments regarding emergency vehicle access to the Cathedral Hill Campus during periods of traffic congestion along Van Ness Avenue, Geary Street/Boulevard, and other roadways in the vicinity of the Cathedral Hill Campus. As explained therein, under the proposed LRDP, development of the Cathedral Hill and St. Luke's Campuses would result in less than significant emergency vehicle impacts.

As explained in Response TR-100 (page C&R 3.7-170), the likely routes to the proposed Cathedral Hill Hospital would be multi-lane arterial roadways that would allow emergency vehicles to travel at higher speeds and permit other traffic to maneuver out of their path. In addition, the majority of emergency

[377] Type of service and breakdown in CPMC patient origin by San Francisco/region described in CPMC's 2008 IMP documents 2008. See California Pacific Medical Center, 2008, *California Medical Center 2008 Institutional Master Plan*, San Francisco, CA: prepared by the Marchese Company, Inc., available: http://rebuildcpmc.org/assets/08IMP_CPMC.pdf, accessed Dec. 20, 2010.
[378] Ibid., page 14.
[379] Testimony of Dr. Mitch Katz, November 19, 2009, at the CPMC IMP hearing.

transports would occur during non-commute hours, further reducing the risk of traffic problems associated with commuter traffic. Furthermore, during times when congestion is most severe, emergency vehicles would likely choose to use less congested, parallel routes, and emergency vehicles would also be permitted to travel opposite the flow of traffic or contraflow in a one-way route to bypass congestion. With the grid street layout surrounding the proposed Cathedral Hill Campus, emergency vehicles would have multiple routes to choose to access the hospital, while avoiding the most congested routes.

Balanced Distribution of Health Care

The concern expressed in Comment 97-1 regarding the "balanced . . . distribution of care" raises issues similar to other comments suggesting that the Draft EIR analysis is incomplete without prior completion of a health care services master plan or an equivalent analysis of citywide health care services. Please see Major Response HC-9 (page C&R 3.23-38) regarding a health care master plan for a detailed response to these comments.

As explained in Major Response HC-9, CEQA does not require the CPMC LRDP EIR to include an analysis of citywide or regional health care service delivery systems, absent evidence that the proposed LRDP would contribute to health care service gaps that would cause a physical effect on the environment, and no such evidence has been provided by the comments. As further explained in Major Response HC-9, the proposed LRDP would not result in any transfer or displacement of services at other non-CPMC health care facilities that could result in a physical environment effect of the LRDP that is not analyzed in the Draft EIR. Please also see Major Response HC-1 (page C&R 3.23-1) and Major Response HC-2 (page C&R 3.23-8), which explain that the proposed LRDP would provide adequate capacity to meet CPMC's current and projected demand and, therefore, would not contribute to any cumulative impacts related to health care service delivery (or indirect effects associated with shifts in patients or services).

Major Response HC-9 also explains that no further information is necessary related to the delivery of health care services systemwide to adequately identify and analyze the environmental impacts of the proposed LRDP. All air quality and traffic impacts associated with the proposed LRDP (including cumulative impacts) were analyzed in the Draft EIR in Sections 4.5 and 4.7. To the extent that changes in CPMC's patient and employee travel patterns (travel distances, types of trips, etc.) are relevant to the LRDP's direct or indirect environmental impacts (including cumulative impacts), that information has been factored into the analysis in the Draft EIR. As explained in the Draft EIR, page 4.5-72, travel surveys of CPMC personnel, patients, and visitors were conducted to develop origin-destination assumptions for purposes of the transportation analysis. Based on this survey information, trip distribution was assigned for CPMC personnel, patients, and visitors traveling to or from the CPMC campuses from four quadrants (or "Superdistricts") of the City, or from the East Bay, South Bay, North Bay, or outside the Bay Area.[380] Table 4.5-12, "Trip Distribution Patterns by Campus" in the Draft EIR, page 4.5-78, indicates the distribution of trips by San Francisco quadrant as well as by trips originating or ending outside of San Francisco that were assumed for each of the CPMC campuses based on the survey results. The transportation analysis based upon the origin-destination assumptions developed from the travel surveys of CPMC personnel, patients, and visitors, in turn, was utilized to develop the analyses in the Draft EIR of other environmental impacts related to traffic that would be generated by the proposed LRDP, e.g., Noise (Section 4.6), Air Quality (Section 4.7), and Greenhouse Gas Emissions (Section 4.8). An EIR is not required to further respond to comments speculating on potential impacts that are not supported by substantial evidence in the record.

Additionally, under the proposed LRDP, CPMC's health care services would be provided in an integrated manner across the CPMC campuses. This is because the proposed LRDP plans for an integrated system of health care that would rely on a central tertiary hospital serving as a "hub" (i.e., the Cathedral Hill

[380] Adavant Consulting, 2010 (Jan. 29), *CPMC LRDP Travel Demand Estimation for the San Francisco Campuses*, prepared for the San Francisco Department of Public Works, pages 21 and 39.

Hospital), which would provide, at a single location, multidisciplinary concentration of care with teams of specialists to provide health care for multi-system diseases, chronic disease management, and higher-level interventional treatments, together with "feeder" hospitals (at the Davies and St. Luke's Campuses) providing a broad range of community hospital services in addition, to specialty programs appropriate to those campuses.

Alternative 3A

The comment expressing support for increased development at the St. Luke's Campus with additional beds and a focus on women's and children's care, similar to what was analyzed in the Draft EIR as Alternative 3A, is acknowledged. The project approval process occurs after certification of the Final EIR and is separate from the environmental review process. The decision-makers may select one of the alternatives presented in the EIR document if determined feasible, or may approve, modify, or disapprove the CPMC LRDP as proposed, Please also see Response ALT-1 (page C&R 3.22-11) for a response to comments on Alternative 3A, which explains that Alternative 3A would not meet the project objectives to the same extent as the proposed LRDP.

Adequacy of Draft EIR Analysis of Environmental Impacts

Comment 97-1 also suggests that the proposed Cathedral Hill Campus would result in "many more adverse impacts" than were analyzed in the Draft EIR. However, Comment 97-1 does not identify any particular environmental impacts that were not analyzed in the Draft EIR.

The Draft EIR has been prepared in conformance with the provisions of CEQA and the State CEQA Guidelines. Chapter 4, "Environmental Setting, Impacts, and Mitigation", of the Draft EIR adequately analyzed the physical environmental impacts that would result from development of the proposed Cathedral Hill Campus under the LRDP, and the Draft EIR identified mitigation measures to reduce Cathedral Hill Campus impacts determined to be significant (i.e., certain transportation and circulation, noise and vibration, air quality, and greenhouse gas impacts) to a less-than-significant level to the extent feasible (although some of these impacts would remain significant and unavoidable). The comment does not provide any substantial evidence regarding any deficiency in the analyses of any of the full range of environmental impacts analyzed in the Draft EIR.

Comments

(Donald Scherl, October 18, 2010) [74-10 HC]

"5.0 St. Luke's Hospital: It bears repeating that no one in todays [sic] medical world, would actually build an 80 bed stand alone acute care hospital in a large urban setting. It makes no financial or medical sense. Proceeding under alternative 3A alleviates this problem (though not others)."

(Donald Scherl, October 18, 2010) [74-38 HC]

"7.7: St Luke's: The idea of building an 80 bed full service hospital in an urban center verges on the absurd. An 80 bed free-standing acute care hospital is simply not viable. There would not be enough beds to support all the ancillary functions needed by a modern acute care institution. It would be virtually impossible for a hospital of this size to support itself and to adequately serve the local community. While alternative 3A solves some of these problems, it is the basic concepts underlying the Cathedral Hill/St. Luke's LRDP proposal that are fundamentally flawed and these cannot be corrected by nibbling at the margins."

(Gloria Smith—California Nurses Association, October 20, 2010) [96-18 HC, duplicate comment was provided in 110-18 HC]

"The plan for the St. Luke's Campus is not a plan for a viable hospital but a plan for maintaining segregation under which underinsured patients would go to St. Luke's Hospital while insured patients would go to Cathedral Hill Campus for better services. The emergency room at the St Luke's Hospital is the busiest CPMC emergency room and would be expanded under the plan. However, the plan for St. Luke's Hospital is basically a plan for as many beds as are needed to minimally support the emergency room and no more. None of the underlying problems due to which Sutter wanted to close the hospital in the past are solved. At present, the St. Luke's Hospital is planned with only 80 beds, which is likely too small to succeed.

If the hospital turns out to be unprofitable in the future, Sutter would likely close it, further exacerbating health care access to underinsured patients as well as the shortage of beds in San Francisco. As an 80-bed hospital, St. Luke's Hospital is also too small to be viable for sale or transfer to another hospital operator should Sutter decide to stop maintaining acute care services."

(Iris Biblowitz, October 26, 2010) [115-2 HC]

"The inequalities of the plan for the Cathedral Hill hospital and St. Luke's are stark. I strongly recommend increasing the beds at St. Luke's (from 80 to 200) and decreasing the beds at Cathedral Hill (from 555 to 200?) so they meet somewhere in the middle, and that's called equality. This is not for philosophical reasons but because of community needs."

(Frances Taylor, October 29, 2010) [117-3 HC]

"St. Luke's Hospital is a crucial provider of healthcare services in the southern half of San Francisco, which it shares with only San Francisco General Hospital. Slashing the number of patient beds, even without the addition of this killer garage, is unacceptable to the community. Neighbors want a viable St. Luke's, not a boutique shell of a hospital put in place only as a token to forward a large facility elsewhere in the city."

(Jose Morales, September 23, 2010) [PC-167 HC]

"And I have one of my friends that one time he had an injury, a car hit him on the knee, or it was coming out, another car came and, anyway, messed up his knee. And I went to visit him at St. Luke's Hospital and I was horrified that his bill was $30,000 a day, pardon me, $30,000 a month, something like that. Why do they have to charge so much money? It's not good for the people. What about our Social Security? They are taking away our money for the future generations that – why continuing also to save Social Security for future generations. So please save St. Luke's Hospital, they – that hospital should be built first, and the other hospital will have to be reduced to that level or less. St. Luke's Hospital first. Thank you very much."

(Joseph Snooke, September 23, 2010) [PC-252 HC]

"MR. SNOOKE: Good afternoon, Commissioners. Joseph Snooke, Bernal Heights Neighborhood Center and Coalition for Health Planning in San Francisco. It's breaking down very simply that CPMC has four campuses which are basically hospitals with other associated services. What CPMC plans to do is phase out the California campus, concentrate outpatient services at their Pacific campus, and concentrate inpatient services at the new facility at Van Ness and Geary on Cathedral Hill. The description of St. Luke's, however, in the project plan focuses on a new medical building and a new hospital building that is significantly smaller than the existing hospital. What we see in the DEIR is that there is no vision for St. Luke's, there is no anchor. Functionally, it reads as though it is simply an access point for specialty services provided at Cathedral Hill or Pacific campuses that are inpatient and outpatient facilities. I just want to remind you that St. Luke's operates as a fully service hospital, primarily providing charity care for well over 100 years, until Sutter Health took over, and Sutter Health and CPMC are basically the same corporate entity. This takeover has happened a few years ago. And instead of using its financial strengths to build on the tradition of charity care, St. Luke's and Sutter and CPMC have been systematically dismantling the charity care that has existed at St. Luke's."

(Joseph Snooke, September 23, 2010) [PC-254 HC]

"- there needs to be a vision around St. Luke's, because we don't trust that it's going to remain open. We had to create a blue ribbon panel in order to keep it open, and before the blue ribbon panel, Sutter Health said that it was going to keep St. Luke's open, and then, after the blue ribbon panel, they admitted that they had intended to close it. We don't trust that there is any vision for St. Luke's, and we want to make sure that it is a viable hospital for the future. Thank you."

(Eileen Prendiville, September 23, 2010) [PC-266 HC]

"We urge you to make sure that CPMC scales down the size of Cathedral Hill and increases the services and the size of St. Luke's in order to make it a viable hospital that will provide equal access to care for all of our patients and their families. Thank you."

Jane Sandoval, September 23, 2010) [PC-271 HC]

"Good afternoon. My name is Jane Sandoval. I am a staff nurse at St. Luke's. I've been a staff nurse for 25 years. I currently work in the Emergency Department and I've been there for 15 years. Three years ago, CPMC announced their stealth plans to close St. Luke's and this was to, in their words, provide a spectrum of services consistent with community need. Fast forward to 2010, three years later, I'm still speaking. We save the hospital, so to speak, but I'm going to call it a stay of execution because the current plan is doomed to fail. Past the storm of protest from the community and nurses, and this is the very same community that was thought to have needed the closure of St. Luke's because that was the need of the community and their Master Plan."

(Jane Sandoval, September 23, 2010) [PC-272 HC]

"Although CPMC has promised to keep St. Luke's open, there are many concerns regarding the rebuild. First of all, is their track record. I think that many people have already testified to their track record and their follow-through, or lack thereof."

(Kevin Kitchingham, September 23, 2010) [PC-304 HC]

"Instead of making sure that one of the few hospitals that serves the Southeast sector of the City remains sustainable with a mix of services, the work is a viable destination for healthcare in neighborhoods with the highest concentration of the City's youth and elderly, profit is what is most important."

(Kevin Kitchingham, September 23, 2010) [PC-308 HC]

"…that St. Luke's be rebuilt to its current licensed 227-bed capacity, at a minimum, so that it can be around for another 100 years to continue to serve San Francisco's working class neighborhoods."

(Fran Taylor, September 23, 2010) [PC-313 HC]

"MS. TAYLOR: My name is Fran Taylor. I've lived within walking distance of St. Luke's for over 30 years. My mother died there. And I want to see that hospital continued to survive, and I am worried that this plan will just reduce St. Luke's to a shell that will eventually wither away. And one of the arguments that CPMC is giving for cutting services and beds at St. Luke's is that the Census has never filled the number of beds that are there now. But the confusion in the neighborhood about what's available at St. Luke's has been pervasive over the last several years because services are getting cut."

(Fran Taylor, September 23, 2010) [PC-314 HC]

"And I was at a meeting once there that ended at 8:00 p.m. and I couldn't figure out how to get out of the hospital because the doors were locked. Now, what kind of hospital locks its doors at 8:00 and you have to sort of look for a worker to guide you out through the ER, and so on? So, the strategy seems to be like that of a grocery store chain that buys an outlet in a poor neighborhood that it really doesn't want, you know, it doesn't really want this supermarket, so it takes the stock off the shelves, and people stop shopping there because they never know, you

know, will they be out of milk today? Or they won't have bread today? And after the shoppers stop coming, then the chain can say, 'There's no demand.'"

(Mary Michellcci, September 23, 2010) [PC-339 HC]

"MS. MICHELLCCI: Hi, my name is Mary Michellcci and I work at St. Luke's for 37 years. And I'm not going to say too much more than what has been said, only currently at St. Luke's what we have is segregated care. We have people that are poor, that are homeless, that are mentally ill, suffer from a variety of socioeconomic problems. We currently don't have any way to build for a viable future. I'm not complaining about taking care of these people because, I'm going to tell you, they need care more than any other population that you can demonstrate. We welcome people from Bayview Hunters Point, we welcome people from the Mission, but they are among the most poor and the most socioeconomically sensitive population that exists in the City."

(Mary Michellcci, September 23, 2010) [PC-340 HC]

"I would also like to add to what Dionne Miller said about the Joint Commission, St. Luke's having one of its better surveys, that is true, we did very well a couple of years ago, too, when they came, but I do want to quote what one of the surveyors said was, 'St. Luke's is a jewel and does need to be invested in.' I believe we need to build for the future. If we continue to contract services, to take services out of St. Luke's instead of building away to take care of patients in our sensitive neighborhood, we are doomed to close in a very short period of time."

Response HC-29

The comments express concerns regarding the viability of the LRDP proposal to construct an 80-bed Replacement Hospital at the St. Luke's Campus from both a financial and medical standpoint, including concerns that there would not be enough beds to support ancillary functions needed by a modern acute care institution, and concerns regarding the ability of an 80-bed hospital to support itself and to adequately serve the local community. The comments also state that the basic concepts underlying the LRDP proposal for the Cathedral Hill and St. Luke's Campuses "are fundamentally flawed" and would result in segregation under which underinsured patients would go to the St. Luke's Replacement Hospital and insured patients would go to the Cathedral Hill Campus. Comment 96-18 also states that the proposal for the St. Luke's Replacement Hospital would provide the beds needed "to minimally support the emergency room and no more." The comments also state that Alternative 3A alleviates some of these problems and suggest an alternative to the proposed LRDP that would result in an increased number of beds at the St. Luke's Campus and a decreased number of beds at the Cathedral Hill Campus. These comments are noted. The comments do not raise issues regarding the adequacy, accuracy, or completeness of the Draft EIR. The comments will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project. Please see Major Response HC-2 (page C&R 3.23-8),which includes a detailed discussion of the size and scope of services at the St. Luke's Campus.

As explained in Major Response HC-2, concerns regarding the financial "viability" of the St. Luke's Campus as proposed under the LRDP were discussed at the Health Commission as part of the Blue Ribbon Panel review in 2008. As described by CPMC, and discussed in the Blue Ribbon Panel review, the proposal for the St. Luke's Replacement Hospital and Campus is part of the overall CPMC LRDP. As such, the viability of the St. Luke's Campus cannot be viewed in isolation but is contingent on the viability of CPMC's health care delivery system as a whole. Operational efficiencies and elimination of redundancies gained by consolidating specialized, tertiary, and women's and children's services at the proposed Cathedral Hill Hospital would more likely contribute to, rather than detract from, the long-term viability of the St. Luke's Campus.

As Dr. Mitch Katz has stated:

> "I certainly understand the concern about the viability. I feel the safest thing for us to be asking, and CPMC is agreeing that their commitment to St. Luke's is not whether or not it is viable separately or not. I don't want them to say here is a viable plan and if it is not a viable, we will be closing it. I want them saying, and this is what they are saying, St. Luke's is part of CPMC, and this is part of what we do.
>
> I am not concerned about whether it is independently viable, I want to know that that hospital which fills a real need, including giving us relief in the southeast part of the City for SF General Hospital, that that hospital is there. I hear that commitment and it means a lot to us."[381]

With respect to the suggestion that 80-bed hospitals generally are not viable or are not currently being built, modern hospitals of a similar size have been identified or are under development throughout the country. For example St. Anthony Hospital located in Gig Harbor, Washington, opened in March 2009, is an acute-care facility licensed for 80 beds.[382] Like the proposed St. Luke's Replacement Hospital, the St. Anthony Hospital is part of a larger system, the Franciscan Health System, which serves communities in the greater Tacoma area, in a spoke/hub arrangement (i.e., a larger, centralized hospital with a multidisciplinary concentration of care and highly specialized services serving acting as a "hub", with "spoke" hospitals that provide a broad range of community hospital services, with patients requiring more specialized services being referred to the hub) very similar to the St. Luke's Replacement Hospital proposed under the CPMC LRDP.[383] St. Anthony's characterizes this relationship to its central referral hospital (the 320-bed St. Joseph Medical Center hospital in Tacoma[384]) in the following way:

> When patients require more specialized care, such as surgery and inpatient hospitalization for cancer-related illnesses, help is just a step away. Skilled surgeons at St. Joseph Medical Center in Tacoma perform the full-range of oncologic surgeries, including abdominal, breast, colorectal, gynecologic, neurologic, thoracic, urologic and other general surgeries. And our team of physicians and certified oncology nurses at St. Joseph provide skilled, compassionate inpatient cancer care.[385]

As further explained in Major Response HC-2, the San Francisco Health Commission Task Force on CPMC's IMP, in its specific review of CPMC's responsiveness to the recommendations of the Blue Ribbon Panel, determined that the St. Luke's Hospital as planned under the LRDP would be appropriately sized and programmed as a community hospital, along with services that would be provided on the St. Luke's Campus, to accommodate existing and projected future patient demand for the South of Market service area.[386] In its September 30, 2010, Interim Report, the Health Commission Task Force indicated that "CPMC has demonstrated its commitment to the long-term viability of the St. Luke's Campus by budgeting $250,000,000 for the reconstruction of the inpatient facility."[387]

In general, please see Major Response HC-2 (page C&R 3.23-8) for discussion regarding the size and scope of services at the St. Luke's Campus, as well as the location, scope, and size of services at the

Cathedral Hill Campus. Please also see Response HC-2 for a response to similar comments expressing concerns regarding the loss of existing services at the St. Luke's Campus. As explained in more detail in Major Response HC-2 and Response HC-2, with the exception of inpatient pediatrics, skilled nursing facilities (SNF), and subacute care, all services currently provided at the St. Luke's Campus are proposed to be maintained or expanded at the St. Luke's Campus.

As such, no services at the St. Luke's Campus are proposed to be transferred or reallocated from the St. Luke's Campus to the Cathedral Hill Campus, except for inpatient pediatrics. As further explained in Major Response HC-2, the number of inpatient pediatric patients has been very low (an average daily census of 0.7) at the St. Luke's Campus. Based on research showing a link between pediatric patient volume and clinical outcomes, CPMC determined that this low pediatric inpatient demand would be better served at the higher volume dedicated program that is planned for the proposed Cathedral Hill Hospital. The San Francisco Health Commission Task Force on CPMC's Institutional Master Plan concurred that the provision of inpatient pediatric services at the proposed Cathedral Hill Hospital would provide for the inpatient pediatric service demands of current St. Luke's patients, as envisioned by the Blue Ribbon Panel.[388]

Please also see Major Response HC-1, which explains that the 80 beds proposed to be provided at the St. Luke's Hospital would provide sufficient capacity to meet the current and projected demand at the St. Luke's Campus, with additional capacity to meet peak demand periods. Major Response HC-1 also explains that with the shift from multi-patient to single-patient rooms under modern hospital guidelines, newer facilities such as the St. Luke's Replacement Hospital are projected to have a higher occupancy rate (i.e., a higher percentage of licensed beds that are expected to be used than under existing conditions) than existing facilities with multi-patient rooms such as the 1970 Hospital Tower that the St. Luke's Replacement Hospital would replace. Therefore, fewer licensed beds are required to serve the same number of patients. In addition, as explained in detail in Major Response HC-1, over time, the demand for hospital bed capacity has also been reduced because of technological and clinical advances that reduce the average length of hospital stays and allow more medical services to be provided on an outpatient basis.

Comment 96-16 states that the proposal for the St. Luke's Campus under the LRDP would result in "maintaining segregation under which underinsured patients would go to St. Luke's Hospital while insured patients would go to Cathedral Hill Campus for better services." Please see Major Response HC-8 (page C&R 3.23-32), which provides detailed information regarding access to medical care at the CPMC campuses under the proposed LRDP. Major Response HC-8 explains that since the merger of St. Luke's into CPMC, there has been no difference in medical access policies between any of the CPMC hospitals. All CPMC hospitals are equally open to the receipt of under- and uninsured patients and decisions on the granting of financial assistance and waivers are made on a uniform policy basis across all campuses. Furthermore, CPMC's coverage of care (i.e., meaning completely free care) for under- and uninsured patients is available to families with incomes up to 400 percent of the federal poverty level, which is a higher level than any other San Francisco hospital. None of these medical access policies would change under the proposed LRDP. Major Response HC-8 also describes in detail CPMC's commitment to continue or expand its community benefit levels and partnerships with community health care delivery providers, including in the Tenderloin area in the vicinity of the proposed Cathedral Hill Campus.

Major Response HC-8 further explains that as part of its commitments made to the Health Commission, CPMC committed to 1) continue to accept Medi-Cal, as it always has, at all of its hospitals, 2) to guarantee access to Medi-Cal patients through all of the clinics controlled by CPMC as described in detail

[388] San Francisco Health Commission Task Force on CPMC's IMP Addressing Resolution No. 10-09, 2010 (Mar. 2), *Updates and Accomplishments.*

in Major Response HC-8, and 3) to increase the amount of unpaid Medi-Cal shortfall systemwide by 22 percent between 2007 and 2012.[389]

The presumption in Comment 96-16 that under the proposed LRDP, health care would not be available at other CPMC campuses to government-insured or uninsured patients is not consistent with CPMC policies and commitments. Furthermore, as described in Major Response HC-1 (page C&R 3.23-1), none of the acute-care patient population would be displaced from St. Luke's Hospital as a result of the LRDP, and the St. Luke's Replacement Hospital would be sized to accommodate growth of its existing acute-care patient population. Furthermore, the effective capacity of urgent and emergency services would grow at the St. Luke's Campus (and at CPMC overall) under the LRDP (see Major Response HC-5, page C&R 3.23-20).

Please also see Major Response HC-2, which describes the size and scope of services at the Cathedral Hill and St. Luke's Campus, and which explains that the planned service mix and capacity of the proposed inpatient St. Luke's Replacement Hospital is in accordance with the recommendations of the Blue Ribbon Panel, the studies prepared by The Camden Group, and the recommendations of the San Francisco Health Commission As explained in Major Response HC-2, all of the services currently provided at the St. Luke's Campus would be maintained or expanded, except for subacute care (to be discontinued), skilled nursing (to be continued at the Davies and the California Campuses, consistent with CPMC's 100 SNF bed overall commitment), and inpatient pediatrics (to be provided at the Cathedral Hill Hospital).

Major Response HC-2 also explains that all CPMC campuses work as a system to manage the care needs of the patient. All of the CPMC Emergency Departments see patients needing care for ailments ranging from minor cuts or the common cold to patients suffering from cardiac arrest or other life threatening illnesses. Whenever the needs of the patient outstrip the acuity level provided in the Hospital or are not within the services lines delivered at that campus, patients would be sent to the most appropriate campus (or hospital outside the CPMC network) for continuing their care, a decision that would be made by the treating physician. For example, a woman in labor appearing at the Davies Emergency Department may deliver in the Davies Emergency Department and then be transferred to St. Luke's for her postpartum care as Davies does not have a maternity service line. Similarly, a patient appearing at the St. Luke's Emergency Department with severe cardiac illness may be transferred to the Pacific Campus for an open heart surgery.

For all of the above reasons, the proposed LRDP would not result in segregation under which underinsured patients would go to the St. Luke's Replacement Hospital while insured patients would go to the Cathedral Hill Campus for better services, as suggested by Comment 96-18.

Comment 96-18 also states that the proposed 80-bed St. Luke's Replacement Hospital would provide "as many beds as are needed to minimally support the emergency room and no more." As explained in Major Response HC-2, Consistent with the Blue Ribbon Panel and The Camden Group's projections, the LRDP proposes for St. Luke's Campus: (a) 53 medical/surgical beds, accommodating both the existing patient demand for 39.5 beds and the projected future demand for 49.1 beds in 2020; (b) 8 critical-care beds, sufficient to accommodate existing patient demand for 6.6 beds and the projected future demand for 8.5 such beds in 2020; and (c) 19 labor and delivery beds (5 labor/delivery/recovery and 14 postpartum) beds with the ability to accommodate 1,400 births each year and, therefore, to meet the existing demand for 1,145 annual births and the projected future demand for 1,359 annual births in 2020.[390] Except for subacute care (to be discontinued), skilled nursing (to be continued at Davies and at the California Campus consistent with CPMC's 100 SNF bed overall commitment), and inpatient pediatrics (to be

[389] Ibid., page 1.
[390] San Francisco Health Commission Task Force on CPMC's IMP Addressing Resolution No. 10-09, 2010 (Mar. 2), *Updates and Accomplishments*; CPMC, 2010 (Sept. 30), *Interim Report to the San Francisco Health Commission Regarding Progress Toward Commission Recommendation in Resolution No. 10-09*.

provided at the Cathedral Hill Hospital), all of the services currently provided at the St. Luke's Campus would be maintained or expanded, as described in detail in Major Response HC-2. Therefore, the St. Luke's Replacement Hospital would be sized to meet the existing and future patient demand for acute care medical services at the St. Luke's Campus, the beds and services provided are much broader than would be needed to "minimally support the emergency room and no more."

Major Response HC-2 further explains that the proposed LRDP would not exacerbate any shortage of inpatient acute-care beds for the south of Market Street area traditionally served by the St. Luke's Campus, in part because the Health Commission Task Force has determined that the St. Luke's Replacement Hospital would be appropriately sized to accommodate existing and projected future patient demand for that service area[391], and because the St. Luke's Replacement Hospital would accommodate growth in patient census, increase its Emergency Department and surgery capacity, and expand primary care programs in clinical areas of demonstrated need to the community.

Based on this evidence, the proposed LRDP plan at St. Luke's Campus would not exacerbate any real or perceived shortage of inpatient acute-care beds for the south of Market Street area traditionally served by St. Luke's Hospital. Under the proposed LRDP, St. Luke's Hospital would accommodate growth in patient census, increase its Emergency Department and surgery capacity, and expand primary care programs in clinical areas of demonstrated need in the community, such as senior care and low-risk obstetrics. Therefore, the proposed LRDP would not add to health care delivery problems south of Market Street. For the above reasons, there is no evidence in the record to support the claims that the proposal to provide 80 beds at the St. Luke's Replacement Hospital does not make financial or medical sense, or would not support the ancillary functions needed by a modern acute care institution.

The comments expressing support for Alternative 3A are acknowledged. The project approval process occurs after certification of the Final EIR and is separate from the environmental review process. The decision-makers may select one of the alternatives presented in the EIR document if determined feasible, or may approve, modify, or disapprove the CPMC LRDP as proposed, Please also see Response ALT-1 (page C&R 3.22-11) for a response to comments on Alternative 3A, which explains that Alternative 3A would not meet the project objectives to the extent as the proposed LRDP.

Comment 111-2 HC, which suggests increasing the number of beds at the St. Luke's Campus (from 80 to 200) and decreasing the number of beds at the Cathedral Hill Campus (from 555 to 200), is also acknowledged. Please see Response ALT-1 (page C&R 3.22-11), which explains that although an EIR must consider a range of potentially feasible alternatives, it does not have to discuss every possible variant or permutation of alternatives, or alternatives that do not further reduce or eliminate significant impacts of a proposed project. Under Alternative 3A, the Cathedral Hill Hospital would provide 400 beds, rather than 555 under the proposed LRDP, and the St. Luke's Replacement Hospital would provide 240 beds. Therefore, the reasonable range of alternatives analyzed in the Draft EIR included an alternative with a reduced number of beds at the Cathedral Hill Hospital and an increased number of beds at the St. Luke's Replacement Hospital, although the alternative did not evaluate the precise number of beds at each hospital suggested by the comment. As explained in Response ALT-1, however, the Draft EIR analyzed a reasonable range of alternatives, as required by CEQA. Therefore, it is not necessary to analyze an additional alternative that would include the precise number of beds at the Cathedral Hill and St. Luke's Campuses suggested by the comment.

[391] San Francisco Health Commission Task Force on CPMC's IMP Addressing Resolution No. 10-09, 2010 (Mar. 2), *Updates and Accomplishments.*

Comment

(Barbara Kautz—CHNA and Bernal Heights Neighborhood Center, October 19, 2010) [87-13 HC, duplicate comment was provided in 108-13 HC]

"Clearly, achieving high-quality care does not require that all specialties be located at one campus. Even CPMC itself proposes to locate neuroscience-related treatment at the proposed 201-bed Davies Medical Center. Within the Kaiser Permanente system, an integrated health maintenance organization which includes numerous specialized centers, no hospital in the Bay Area has more than 398 licensed beds.[1] None of Kaiser's hospitals have fewer than 117-120 licensed beds, and those are located in much less densely populated Sonoma and Marin Counties.

[1] California Hospital Association, 2008 Member Hospitals (January 2008). That facility is the Oakland Medical Center, which is being replaced and will include only 349 licensed beds upon completion."

Response HC-30

The comment expresses concerns regarding the size of the proposed Cathedral Hill Campus and the concentration of specialized medical services at the Cathedral Hill Campus under the proposed LRDP. The comment is noted. The comment raises questions regarding the merits of the proposed LRDP and does not raise issues regarding the adequacy, accuracy, or completeness of the Draft EIR. The comment will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project.

Please see Major Response HC-2 (page C&R 3.23-8) regarding appropriate size of the proposed central hub Cathedral Hill Hospital and other hospitals of similar size. As explained in Major Response HC-2, the size and design of the proposed Cathedral Hill Hospital are based on replacing the inpatient bed capacity of the two existing hospitals at the California Campus and the Pacific Campus. The consolidated location of services, physicians and support staff, systems, and facilities at the proposed Cathedral Hill Campus would result in elimination of redundancies, such as duplication in admitting, general support functions (e.g., environmental services [EVS], linen, food and nutrition, etc.) and clinical support functions (e.g., inpatient pharmacy).

Operational efficiencies would result from the co-location of complementary services adjacent to one another. Detailed examples of complementary services to be co-located at the proposed Cathedral Hill Hospital are described in Major Response HC-2. Co-location of services at the proposed Cathedral Hill Campus would mean that, for the first time, most CPMC patients with complex or advanced illness would be able to receive care in one location and be served by consolidated specialty care teams. Patients who needed services such as invasive cardiology, organ transplants, or newborn intensive care would find the specialty care teams and systems that supported them all in one place. This would improve clinical outcomes and reduce patient and caregiver travel.[392] Similarly, relocation of women's and children's

[392] The Lewin Group, 2009 (June 26). *California Pacific Medical Center Institutional Master Plan Review*, page 2. The Lewin Group report states that an evidence base exists to support higher quality outcome results from the consolidation of tertiary and quaternary services. Hospitals, physicians, and care teams that perform a high volume of procedures are likely to realize better outcomes than lower volume counterparts.
The Camden Group, 2009 (April 28), *San Francisco Blue Ribbon Panel: Utilization Projections and Assumptions for St. Luke's Campus*, page 18; Alyssa Turkewitz & Gerard Colman, 2009 (Oct. 8), *Out-and-Out Care*, Hospitalmanagement.net, "High volumes of patients flowing through a Multidisciplinary Care Center enhance the education and decision-making skills of the clinic's staff as they are routinely exposed to the nuances of a specific disease site. Clinical care problems can be identified more quickly, enabling solutions to be rapidly generated with a diminished level of modality-specific bias that can occur when there is no structure for discussion of patient issues across specialties."
Joe V. Selby, MD, MPH, et al., 1996 (December 19), Variation Among Hospitals in Coronary-Angiography Practices and Outcomes After Myocardial Infarction in a Large Health Maintenance Organization, The New England Journal of Medicine, Vol. 335, No. 25, page 1888, "Patients treated at hospitals with higher rates of angiography had more favorable outcomes than those treated at hospitals with lower rates."

services from the California Campus and adult acute care from the Pacific Campus to the new full-service tertiary hospital at the proposed Cathedral Hill Campus would improve operational and care efficiencies. With one exception (ALS/Neurosciences-related programs moving from the Pacific Campus to the proposed Neuroscience Institute building at the Davies Campus, as described in the Draft EIR, pages 2-143 through 2-146), the service lines currently available at the California and Pacific Campuses would be available at the proposed Cathedral Hill Campus or would remain at their existing locations (e.g., inpatient psychiatric services and outpatient oncology would remain at the Pacific Campus, and skilled nursing would remain at the California Campus indefinitely, unless and until replaced elsewhere, as discussed in Major Response HC-6 [page C&R 3.23-25]).

By stating that Kaiser Permanente does not include any Bay Area hospitals that have more than 398 licensed beds, the comment appears to implicitly suggest that the size or number of beds at the proposed Cathedral Hill Hospital should be reduced from what is proposed in the Draft EIR. Although the statement regarding Kaiser Permanente hospitals may be accurate, a number of medical centers locally and across the country operate hospitals at a scale similar to what is proposed for the new Cathedral Hill Hospital (i.e., 555 licensed beds). In San Francisco, the UCSF Medical Center at Parnassus Heights operates approximately 582 beds at its existing Moffitt/Long Hospital. Georgetown, Northwestern, UCLA, Kaiser Los Angeles, and Cedars-Sinai all operate single-site hospitals with over 500 beds.[393] Stanford Medical Center is proposing to build a 600-bed hospital in response to state seismic deadlines, and UCSF has broken ground on the first phase of a 550-bed hospital in the southeast portion of San Francisco.[394] A recent London School of Economics study of almost 1,200 hospitals in America, Britain, Canada, France, Germany, Italy, and Sweden concluded that larger hospitals result in improved medical success rates.[395]

An aging population requires a multidisciplinary concentration of care for multi-system diseases, chronic disease management, and higher-level interventional treatments.[396] **(**CPMC's LRDP would include a "hub" hospital, where teams of specialists needed to meet these challenges could be provided at a single location, with "feeder" hospitals (at the Davies and St. Luke's Campuses) providing a broad range of community hospital services in addition, to limited specialty programs appropriate to those campuses.

Hospitals and certain physicians require medical office space to be on the same site or near the hospital, to eliminate travel between sites. Internal medicine physicians, surgeons, and obstetrics doctors are the most likely types of doctors to be found in medical buildings adjacent to hospitals.[397] These doctors need regular access to the inpatient environment, where they care for hospitalized patients, perform surgeries, and deliver babies.

395 *How to Save Lives: Five Simple Rules for Running a First-Class Hospital*, The Economist, 2010 (Oct. 21). The London School of Economics study concluded that hospitals with the best management practices also ranked best on a standardized measure of medical success: death rates among emergency patients experiencing heart attacks. The researchers "found that bigger is better when it came to good management. Hospitals employing 1,500 or more staff are better run than those employing more than 500, which, in turn, outperform those with more than 100 staff." The proposed Cathedral Hill Hospital would be considered a large hospital, consistent with this criterion. The researchers also found that the higher medical success score of hospitals with the best management practices "works across countries and cultures, and has unambiguous results."

396 Hubbard, Ruth E. et al., *The ageing of the population: implications for multidisciplinary care in hospital*, Age and Ageing, 2004 Sept.; 33(5):479-82. Epub 2004 Aug. 3, http://www.ncbi.nlm.nih.gov/pubmed/15292034.

397 "Hospital-based medical office buildings: report of a national study," 1985 (May-June), Hospital Health Service Administration [quarterly journal], 30 (3):73.

At the November 19, 2009 hearing on CPMC's IMP, addressing the proposed co-location of multi-disciplinary services at the proposed Cathedral Hill Hospital, Dr. Mitch Katz, San Francisco Director of Health Services stated that high volume facilities that have the largest number of specialists provide for the highest level of care.[398] Dr. Katz said, "Can you deliver great care and not all be together? Yes. But no one would do that deliberately. The evidence is that you will do a better job if it is all together."[399]

The comment implies that CPMC is not proposing to locate any specialized services at the St. Luke's Campus. As explained in Major Response HC-2 (page C&R 3.23-8), the St. Luke's Campus would include specialized obstetrics and children's health care services under the LRDP.

The comment also implies that the proposed 80-bed St. Luke's Replacement Hospital would be too small to be "viable" or to provide high quality care, because it would be smaller than Kaiser's 117-120-bed facilities. The Sutter Health system includes several community hospitals that are smaller than or similar in size to the proposed St. Luke's Replacement Hospital, including Sutter's Novato Community Hospital (47 beds)[400], Sutter Lakeside Hospital in Lake County (25 beds)[401], and the Sutter Medical Center of Santa Rosa (82 beds)[402], all of which are "viable," partially because of their affiliations with other Sutter Health facilities (similar to the relationship under the proposed LRDP between the St. Luke's Campus and the proposed Cathedral Hill, Pacific, and Davies Campuses).

As explained in Major Response HC-2, concerns regarding the financial "viability" of the St. Luke's Campus as proposed under the LRDP were discussed at the Health Commission as part of the Blue Ribbon Panel review in 2008. As described by CPMC, and discussed in the Blue Ribbon Panel review, the proposal for the St. Luke's Replacement Hospital and Campus is part of the overall CPMC LRDP. As such, the viability of the St. Luke's Campus cannot be viewed in isolation, but rather it is contingent on the viability of CPMC's health care delivery system as a whole. Operational efficiencies and elimination of redundancies gained by consolidating specialized, tertiary, and women's and children's services at the proposed Cathedral Hill Hospital would more likely contribute to, rather than detract from, the long-term viability of the St. Luke's Campus.

As further explained in Major Response HC-2, the San Francisco Health Commission Task Force on CPMC's IMP, in its specific review of CPMC's responsiveness to the recommendations of the Blue Ribbon Panel, determined that the St. Luke's Hospital as planned under the LRDP would be appropriately sized and programmed as a community hospital, along with services that would be provided on the St. Luke's Campus, to accommodate existing and projected future patient demand for the south of Market service area.[403] In its September 30, 2010 Interim Report, the Health Commission Task Force indicated that "CPMC has demonstrated its commitment to the long-term viability of the St. Luke's Campus by budgeting $250,000,000 for the reconstruction of the inpatient facility."[404]

Comments

(Barbara Kautz—CHNA and Bernal Heights Neighborhood Center, October 19, 2010) [87-40 HC, duplicate comment was provided in 108-40 HC]

"Community members have expressed concern about the viability of nearby St. Francis Medical Center."

(Gloria Smith—California Nurses Association, October 20, 2010) [96-15 HC, duplicate comment was provided in 110-15 HC]

"The Draft EIR is inadequate because it fails to analyze the potential future failure of St. Francis and St. Luke's Hospital and the associated impacts on health care services, which have cumulative environmental impacts on traffic and transit, parking, blight, and public services."

(Gloria Smith—California Nurses Association, October 20, 2010) [96-16 HC, duplicate comment was provided in 110-16 HC]

"The Draft EIR fails to analyze the risk of blight and reduced access to health care in case CHW's Saint Francis should fail as a result of CPMC taking over their few lucrative patients. CHW has currently budgeted St. Francis at a loss of $2 million per year. This' loss is sustainable because St. Francis' charity care, psychiatric care, and emergency room care are offset by a few services to insured patients. St. Francis has the City's premier burn unit, sports medicine, infusion, spine and joint surgeries. It does not make sense for Cathedral Hill to 'duplicate services provided five blocks away at St. Francis rather than ensuring that St. Francis will continue to be efficiently utilized and successful.

The DEIR is inadequate because it fails to analyze the potential risk of failure of St. Francis as a result of the duplication of services at the proposed Cathedral Hill Campus and the related blight on the surrounding neighborhood and burden on city services which are left to pick up additional low income patient loads from displaced patients."

(Stephanie Barton, et al—Hastings Civil Justice clinic for the Good Neighbor Coalition, October 19, 2010) [104-60 HC]

"V. The DEIR analyzes CPMC's LRDP without examining its effects on San Francisco's healthcare delivery system.

A. The DEIR needs to consider project impacts on nearby St. Francis Hospital.

The proposed Cathedral Hill Campus site and St. Francis Memorial Hospital ('St. Francis') are located only 0.48 miles apart. In discussing the social and economic effects of the Cathedral Hill Campus, the DEIR analyzes only the project's consequences for neighboring retail stores[149]. It does not even mention St. Francis. Yet given the enormous changes taking place in the American healthcare system, the potential closing of St. Francis as a direct or indirect result of a new major hospital and medical office complex is reasonably foreseeable. Closure of St. Francis would create an adverse impact on its immediately surrounding neighborhood, most obviously by contributing to urban decay (a clear environmental impact) and by drastically reducing the community's access to affordable health care (a social impact with grave consequences). These reasonably foreseeable physical, economic and social impacts must be addressed in the DEIR.[150]

[149] Draft EIR 5-21.

[150] *Bakersfield Citizens for Local Control v. City of Bakersfield*, 124 Cal.App.4th 1184, 1205-1207; *Friends of Davis v. City of Davis* (2000) 83 Cal.App.4th 1004, 1019-21. *See also* CEQA Guidelines §§ 15126.2(a), 15064(d), I5131(a)."

(Stephanie Barton, et al—Hastings Civil Justice clinic for the Good Neighbor Coalition, October 19, 2010) [104-61 HC]

"Here, the DEIR should have considered whether there would be a sufficient demand for hospital services to sustain both Cathedral Hill and St. Francis as economically viable hospitals.[151] If there is not sufficient demand, and the project is likely to contribute to the closure of St. Francis, the DEIR must examine the potential impacts on St. Francis' immediate neighborhood. At the very least, following a potential closure, St. Francis' hospital buildings would be vacant and could fall into disrepair and spiraling deterioration. Furthermore, there would be a potential for nearby businesses, currently sustained by the employees, patients and visitors to St. Francis, to also close, which further increases the potential for urban decay. The physical impacts of such deterioration are well recognized as environmental harms.[152]

[151] For example, St. Francis has the only Burn Clinic in San Francisco. If CPMC were to establish a competing burn clinic at Cathedral Hill, it is likely to have severe, adverse financial consequences for St. Francis.
[152] *Hernandez v. City of Hanford*, 41 Cal.4th 279 (2007); *Wal-Mart v. City of Turlock*, 483 F.Supp.2d 1023 (2007); *Van Sicklen v. Browne*, 15 Cal.App.3d 122 (1971); *Ensign Bickford Realty Corp. v. City Council*, 68 Cal.App.3d 467 (1977)."

(Stephanie Barton, et al—Hastings Civil Justice clinic for the Good Neighbor Coalition, October 19, 2010) [104-62 HC]

"In addition to the physical impacts St. Francis' closure would have on the community, closure of a hospital with St. Francis' record of charity care would also be devastating for the Tenderloin community. A comparison of St. Francis' and CPMC's record reveals that St. Francis receives more charity care applications from residents in Supervisorial District 6 (which includes the Tenderloin) than any CPMC campus.[153] This District makes up 17% of San Francisco's charity care requests.[154] In 2008, St. Francis provided medical services to 3,164 charity care patients, while the three long-term CPMC campuses combined (excluding St. Luke's Hospital) served only 1,562 charity care patients.[155] At St. Francis, 2008 charity care expenditures amounted to a little more than $20,000 per staffed bed. At CPMC campuses (again excluding St. Luke's), the reported charity care expenditures were $7,270 per staffed bed.[156] As a result, St. Francis' 2008 charity care expenditures nearly equal those of all three long-term CMPC campuses.[157]

Looking at St. Luke's charity record since its merger with CPMC only reinforces concern that a new Cathedral Hill hospital will not be accessible to low-income Tenderloin residents. In zip code 94110, where St. Luke's is located, over ten thousand patients received charity care in 2008. St. Luke's that year served only 166 charity care patients.[158] The remainder received hospital care at San Francisco General. It is reasonable to expect that the loss of St. Francis would further strain the resources of San Francisco General, which already provides for the majority of the city's charity care.[159]

[159] Charity Care Report San Francisco Hospitals Fiscal Year 2008. Table 4, op. cit."

(Stephanie Barton, et al—Hastings Civil Justice clinic for the Good Neighbor Coalition, October 19, 2010) [104-63 HC]

"When the economic or social effects of a project cause physical change, this change is to be regarded as a significant effect in the same manner as any other physical change resulting from the project.[160] Conversely, where economic and social effects result from a physical change that was itself caused by a proposed project, then these economic and social effects may be used to determine that the physical change constitutes a significant effect on the environment.[161] Both of these impacts need to be examined in the project's DEIR. The potential

closure of St. Francis as a result of competition from a new Cathedral Hill Campus is a reasonably foreseeable concern that requires serious environmental analysis.

[160] CEQA Guidelines § 15064(c). *El Dorado Union High School Dist. v. City of Placerville,* 144 Cal. App. 3d 123, 131 (1983).

[161] *Christward Ministry v. Superior Court,* 184 Cal. App. 3d 180, 197 (1986)."

(Carol Brownson, September 23, 2010) [PC-32 HC]

"Good afternoon, Commissioners. My name is Carol. I am a senior and I have lived in Tenderloin for almost 14 years. Official my stay in the Tenderloin and I am proud of my community. That is why I also want to see it improve for residents. Today I want to share and express my concern about the proposed Cathedral Hill hospital. As a senior, I am worried about the proposed loss of care that this hospital is primarily intended. Does it mean that seniors in low income families are not going to be accepted in this facility? We need a hospital that will accept seniors in low income, families, as well. We want to make sure that Medi-Cal medical patients can also avail in the same CPMC facilities. The same applies for St. Luke's Hospital. St. Luke's must be beds large enough to ensure health care is provided to all communities. Therefore, I am demanding that CMPC assures us that they will not ignore the community. We want the CPMC to sign a community benefits agreement and build a larger centers. Thank you."

(Jeff Buckley, September 23, 2010) [PC-66 HC]

"And so, what we see here in general is CPMC kind of following almost like a Wal-Mart strategy, building new hospitals to put competitors out of business and they leave CMPC with a near complete monopoly. Because what we are really concerned about is, if they build this facility, that they're going to be, you know, not only taking away from St. Luke's, but they're also going to be taking away from Saint Francis."

(Jeff Buckley, September 23, 2010) [PC-67 HC]

"A lot of residents, you know, when General is on red alert, the residents go to Saint Francis, and that's one of the realities of this Master Plan, is how much it's going to short the Tenderloin Residents."

(Lisa Cleis, September 23, 2010) [PC-81 HC]

"We are particularly concerned with the impact on Saint Francis Hospital, who will now have a major competitor moving in next door. It has not yet been determined if Cathedral Hill could cause Saint Francis to close its doors, or reduce or alter its services. Saint Francis is a major provider of health care to low income patients in the Tenderloin. And Saint Francis also loses money every year. The fact that CPMC ignores the impacts this facility may have on surrounding communities is a symptom of their lack of an overall plan for delivering health care to low-income people."

(Lisa Cleis, September 23, 2010) [PC-82 HC]

"We want to establish policies to serve low-income communities at Cathedral Hill, regardless of their type of insurance or status as an insured. While CPMC's claims of progress and charity care and its support for a healthy San Francisco is encouraging, other trends in the Hospital's corporate behavior raises concerns for our community. In 2009, the Health Commission stated that CPMC charity care falls short in comparison to other hospitals. Charity care at St. Luke's has significantly dropped since CPMC's acquisition in 2007, and in its own Zip Code, St. Luke served only 160 patients in 2008, compared with 500 in 2006. The need for charity care is the highest in the Tenderloin and a similar record at Cathedral Hill would be appalling."

(Kevin Kitchingham, September 23, 2010) [PC-309 OTH]
"Keep in mind that CPMC made $150 million last year, it's time for them to get serious about their obligations under the law and engage with the community, rather than trying to maximize profit off the backs of the poor. Thank you."

(Commissioner Olague, September 23, 2010) [PC-395 HC]

"COMMISSIONER OLAGUE: And, again, I'm not drawing any conclusions, I'm just asking for the analysis that is not there. So, anyway.... What I did want to also – one of the speakers mentioned Saint Francis Hospital, and I guess one of the questions that they had was what would the impact be if CPMC came in, would they become a competitor to Saint Francis Hospital? And, if so, and if Saint Francis ended up in worst case scenario closing, which one hopes wouldn't occur, what physical impact might it have on the area that it is in? And just so that I think is a physical – that's a question that somehow relates to the EIR."

Response HC-31

The comments raises concerns regarding the effect of the proposed LRDP on the viability or potential failure of St. Francis Memorial Hospital (SFMH) and related blight, concerns regarding the potential failure of the St. Luke's Replacement Hospital under the proposed LRDP, concerns regarding "cumulative environmental impacts on traffic and transit, parking, blight, and public services" that potentially could occur if either or both the SFMH and/or the St. Luke's Replacement Hospital were to fail, concerns regarding CPMC's record of charity care, concerns regarding access to the proposed Cathedral Hill Hospital for low-income Tenderloin residents, and concerns regarding the ability of Medi-Cal patients to access all CPMC facilities, and concerns that sufficient beds should be provided at St. Luke's "to ensure health care is provided to all communities." Each of these concerns is addressed below.

Viability/Potential Future Failure of the St. Francis Memorial Hospital

Please see Major Response HC-3 (page C&R 3.23-17) regarding impacts of the LRDP on SFMH, which explains that no substantial evidence has been presented that would support the suggestion in the comments of potential detrimental effects on SFMH as a consequence of any aspect of the proposed LRDP, or of potential environmental impacts therefrom. As explained in Major Response HC-3, any such impacts are too speculative to evaluate. As further explained in Major Response HC-3, CEQA does not require an economic analysis of the business plans of hospitals in the vicinity of CPMC facilities. The purpose of the CPMC LRDP EIR is to identify the environmental effects that would result from the proposed LRDP. Future possible changes in services at SFMH are speculative and are not related to CPMC's proposed LRDP. No substantial evidence has been presented that would support the suggestion in the comments of potential detrimental effects of the CPMC LRDP on SFMH, as a consequence of any aspect of the proposed LRDP, or of potential environmental impacts resulting from such effects on SFMH.

The comments suggest that locating the proposed Cathedral Hill Hospital close to SFMH might have the effect of siphoning off patients from SFMH, putting SFMH in financial jeopardy. However, the comments did not provide any substantial evidence that this would occur or that the viability of SFMH would be jeopardized in any other manner, or that any shift in patients from one hospital to the other would result in any physical impact to the environment. In fact, in some areas, services at the proposed Cathedral Hill Hospital would be complementary to those at SFMH. For example, SFMH has services that are not provided by CPMC or proposed to be provided at the new Cathedral Hill Campus under the LRDP, such as a burn center, and conversely the proposed Cathedral Hill Hospital would have a labor and delivery unit, a service not found at SFMH.[405] As well as serving as a community hospital, the proposed Cathedral Hill Hospital would also serve as a tertiary referral hospital for patients throughout the region served by CPMC and Sutter Health that require highly specialized health care services, which generally would include services not provided at SFMH.

[405] Saint Francis Memorial Hospital, Medical Services, http://saintfrancismemorial.org/Medical_Services/index.htm (accessed Apr. 8, 2011).

Major Response HC-3 further explains that where services are available at a number of hospitals in the City, a key determinant of where patient volume would be directed would be the hospital affiliation of the admitting physician.[406] In the case of SFMH and CPMC, each hospital would have affiliations with different physician groups (SFMH with Hill Physicians and CPMC with Brown and Toland), although there are physicians in both groups that admit to SFMH. A review of the physicians with admitting privileges to CPMC hospitals (provided by CPMC) and to St. Francis Memorial Hospital (through their "Find a Doctor" tool on the hospital's Web site[407]) shows that approximately 96 physicians currently have admitting privileges at both SFMH and CPMC. No evidence has been presented that the proposed LRDP would result in any change to these existing hospital-physician affiliations or existing medical referral patterns.

As explained in Major Response HC-3, under the LRDP, the proposed Cathedral Hill Hospital would be located approximately one-half mile from the existing SFMH at 1150 Bush Street. The existing Pacific Campus is approximately one mile from SFMH. The California Campus is approximately 2.3 miles from SFMH. No substantial evidence has been presented to support the suggestion in the comments that moving the acute care services, emergency services, or any other services the relatively short distance from the existing Pacific Campus (about a half mile away) and California Campus (about 2 miles away) to the proposed Cathedral Hill Campus, would result in a substantial change in existing medical use patterns that would, in turn, adversely affect the financial viability of SFMH.

Please also see the discussion regarding urban decay in Major Response HC-3 for a response to comments regarding the potential for blight or urban decay at SFMH. As explained in Major Response HC-3, CEQA would require analysis of potential urban decay impacts if evidence (such as a study showing economic vulnerability of competitor facilities) showed that the proposed LRDP might directly or indirectly exacerbate chronic economic distress, facility closures, and attendant urban decay. Mere statements of the potential for urban decay, however, without substantiating evidence of economic vulnerability or decline that might lead to urban decay, do not require analysis. A review of the literature related to closures and conversions of hospitals in San Francisco since 1960 shows that, without exception, former hospital uses and their associated facilities have: (1) remained in stable hospital operation and rebuilt or modernized (e.g., Veteran's Administration Hospital on Clement, UCSF Laurel Heights, San Francisco General Hospital); (2) remained in operation through merger with larger care networks (e.g.; the merger over time of the four component hospitals of CPMC, the two component hospitals of Catholic Healthcare West, French Hospital's takeover by Kaiser, and UCSF's merger with Mt. Zion); (3) converted to related medical uses (e.g.; Green's Eye Hospital's conversion to a 'Healing Arts' Building at 1801 Bush); or 4) closed and been converted to another, neighborhood-compatible use (e.g.; Garden Hospital's conversion to apartments at 2750 Geary and St. Joseph's Hospital's conversion to the Buena Vista Park Condominiums).[408] The historical information does not indicate the existence of even one instance where a hospital change of use or closure has resulted in a blighted condition. Therefore, even if SFMH were to experience negative financial effects due to the construction of the proposed Cathedral Hill Campus, it is unlikely that blight or urban decay would result.[409]

No substantial evidence in the record suggests economic or other vulnerability of SFMH that would be exacerbated by the proposed LRDP, or that the proposed Cathedral Hill Hospital would have such a deleterious effect on SFMH that it would have to close. Lacking such evidence, CEQA does not require analysis of potential urban decay effects related to the proposed LRDP.

---

[406] CPMC, 2011 (April 1), Memorandum from Geoffrey Nelson to Brian Boxer (AECOM), re: St. Francis and CPMC Physician Rosters.

[407] http://www.saintfrancismemorial.org/Find_a_Doctor/Doctor_and_Specialist/index.htm (accessed Mar. 16, 2011). This Web site tool includes about 200 of the approximately 550 admitting physicians identified for SFMH.

[408] Scholten, Paul, MD, *Where Have All Our Hospitals Gone? A Historical Perspective on the Development of San Francisco's Hospitals*, San Francisco Medicine: Journal of the San Francisco Medical Society, Vol. 84, No. 3 (April, 2011), pp. 20-21; CPMC, Memorandum from Geoffrey Nelson, AICP, to David Reel & Brian Boxer (AECOM) re: Historical changes of use in San Francisco Hospitals (Sept. 13, 2011).

[409] Ibid.

Additionally, several of the comments regarding potential financial effects on SFMH are based upon a concern that CPMC would not provide sufficient charity care at the Cathedral Hill Campus to prevent SFMH from being overburdened with uninsured or under-insured patients that threaten SFMH's financial viability. Please see the additional discussion below regarding CPMC's provision of charity care and access to the Cathedral Hill Campus for low-income Tenderloin-area residents and Medi-Cal patients. As explained below, no substantial evidence has been presented to support the concerns expressed in some of the comments that the Cathedral Hill Hospital under the proposed LRDP would not be accessible to these populations. Therefore, no substantial evidence has been presented that the proposed LRDP would result in an increased burden on SFMH to provide care to uninsured, under-insured, or low income populations in a manner that would result in negative financial effects on SFMH.

Potential Cumulative Impacts Resulting from a Failure of St. Francis Memorial Hospital

Because no substantial evidence has been presented to support the comments' suggestion that the proposed LRDP potentially could result in the failure of SFMH, any analysis of cumulative impacts related to traffic, transit, parking, blight, or public services that would result from such a failure would be speculative in nature and, therefore, is beyond the scope of the EIR for the proposed LRDP. Section 15145 of the State CEQA Guidelines states that "[i]f, after thorough investigation, a Lead Agency finds that a particular impact is too speculative for evaluation, the agency should note its conclusion and terminate discussion of the impact." Because the potential failure of SFMH as the result of the proposed LRDP is too speculative for evaluation, there is no need to provide the analysis of cumulative impacts related to traffic, transit, parking, blight, or public services that would result from such failures as suggested by the comment.

Charity Care

Please see Major Response HC-8 (page C&R 3.23-32) regarding access to health services, which includes a discussion of CPMC's delivery of charity care. San Francisco Health Commission Resolution 02-10, approved on March 16, 2010, memorialized CPMC's commitment to increase it charity care contribution by 79 percent in a 5-year period, from approximately $5,315,000 in 2007 to $9,500,000 by 2010.[410] As explained in Major Response HC-8, according to the latest reporting by CPMC, in 2009, CPMC provided over $80 million in services for the poor and underserved.[411] The 2009 report on community benefits shows an increase in traditional charity[412] care, from $7,584,000 in 2008 to $10,215,000 in 2009. Traditional charity care at CPMC for 2007 was approximately $5,300,000. From 2007 to 2008, traditional charity care increased approximately 31 percent, and from 2008 to 2009, an additional increase of 35 percent in charity care has occurred.[413] Preliminary reporting of 2010 total charity care provided by CPMC is approximately $14.9 million, an approximately $4.7 million increase over the 2009 total of approximately $10.2 million, representing an approximately 46 percent increase from 2009 to 2010.[414]

Comment 104-62 compared charity care provided by CPMC with charity care provided by St. Francis Memorial Hospital, and stated that "St. Francis' 2008 charity care expenditures nearly equal those of all three long-term CMPC campuses." The comment's comparison of charity care provided by CPMC to St.

[410] S.F. Health Commission Resolution No. 02-10.
[411] California Pacific Medical Center: *Report to the Community 2009,* page 8.
[412] Traditional charity care is the care CPMC provides for people who come to the emergency room but are uninsured and unable to pay. In 2009, CPMC extended this community benefit to more than 3,500 people. CPMC's total provision of "services to the poor and underserved" includes this amount, plus CPMC's contributions to Healthy San Francisco, unpaid Medi-Cal costs, health programming provided directly by CPMC or through partnerships with other providers, and grants and sponsorships. CPMC, *Report to the Community 2009*, pages 4–9.
[413] CPMC, 2010 (Sept.30), *Interim Report to the San Francisco Health Commission Regarding Progress Toward Commission Recommendation in Resolution No. 10-09*.
[414] CPMC, 2011 (Jan, 26), *Fourth Quarter 2010 Report to the San Francisco Health Commission Regarding CPMC's Progress Toward Commission Recommendations in Resolution No. 10-09.*

Francis Memorial Hospital was based upon charity care expenditure per bed. As explained in Major Response HC-1 (page C&R 3.23-1), the number of beds that are actually used for patient care on a daily basis in the CPMC system is substantially less than the number that is actually licensed. This is because older hospital buildings generally have been licensed to enable the placement of two or more patients in the same room. However, in practice, often only one bed per room is available or even needed because of patient demand. For this reason, the ratio of charity care expenditure to the number of licensed beds provided by a health care services provider is not the most appropriate metric for determining the level of charity care expenditures made by that provider. A more appropriate metric is the ratio of charity care expenditures to net patient revenue.[415] This metric is utilized by the San Francisco Department of Health (DPH) in its annual charity care reports to analyze the amount of charity care expenditures by different health care providers in San Francisco.

According to the *San Francisco Charity Care Report Fiscal Year 2009* (the "2009 Charity Care Report") published by DPH, CPMC provided approximately $11.45 million in traditional charity care in 2009, compared to $10.4 million for UCSF and $6.6 million for St. Francis Memorial Hospital.[416] When measured in terms of patient revenue CPMC provided approximately 1 percent of net patient revenue in traditional charity care in fiscal year 2009, increasing to 1.38 in 2010. This compares to 0.64 percent for UCSF in both years, 4.13 percent and 4.43 percent for SFMH in 2009 and 2010, respectively.[417] Over the time period 2006 to 2009, the number of charity care patients at CPMC systemwide increased from 3,156 to 3,683.[418] This number further increased to 9,801 charity care patients in 2010.[419]

Major Response HC-8 also provides additional detailed information regarding CPMC's commitments related to Medi-Cal patient access and CPMC's partnerships in delivering low- or no-cost care to the medically underserved. Additionally, San Francisco Health Commission Resolution 02-10 memorialized CPMC's agreement to increase its amount of Medicaid shortfall (the uncompensated portion of providing care to Medicaid patients) by 22 percent in a 5-year period, from $53,369,000 in 2007 up to $65,000,000 by 2012.[420]

Access to Cathedral Hill Campus Health Care Services for Low-Income Tenderloin Residents

Please see Major Response HC-8 (page C&R 3.23-32) for detailed information regarding access to health care services for low-income and underserved communities, including access to health care services at the Cathedral Hill Campus for low-income Tenderloin residents. As explained in Major Response HC-8, since January 1, 2007 (the merger of the St. Luke's Campus into CPMC), there has been no difference in medical access policies between any of the CPMC hospitals. All CPMC hospitals are equally open to the receipt of under- and uninsured patients and decisions on the granting of financial assistance and waivers are made on a uniform policy basis across all campuses. Furthermore, CPMC's coverage of care (i.e., meaning completely free care) for under- and uninsured patients is available to families with incomes up to 400 percent of the federal poverty level, which is a higher level than any other San Francisco hospital.

No evidence has been presented to support the concern expressed in Comment 104-62 that the Cathedral Hill Hospital under the proposed LRDP would not be accessible to low-income residents of the

[415] *See e.g.,* San Francisco Department of Public Health, 2010 (Oct.), *San Francisco Charity Care Report Fiscal Year 2009,* at pp. 22-23.
[416] Ibid.
[417] Ibid.
[418] San Francisco Department of Public Health, 2011 (Oct.), *San Francisco Charity Care Report Fiscal Year 2010, 10 Years of Charity Care Reporting,* Attachment A-Report Chart Pack, p.4.
[419] Ibid. (CPMC and St. Luke's numbers consolidated)._CPMC representatives indicated that "[t]he substantial increase in CPMC's charity care for 2010, as compared to previous years, is due to a change in the method used to process patient care applications. In 2010, CPMC implemented a major change – we streamlined the application process so that, for the most patients, eligibility was determined at the initial point-of-service. Prior to 2010, the charity care eligibility process required the patient to complete the application after the service was provided, "2010 Charity Care Report, p.23.
[420] S.F. Health Commission Resolution No. 02-10.

Tenderloin neighborhood. As explained in Major Response HC-8, the San Francisco Health Commission Task Force report on CPMC's IMP[421] documented CPMC's commitment to continue or expand its community benefit levels and partnerships with community health care delivery providers, including a specific commitment to continue to serve Medi-Cal patients throughout the CPMC system, as described above.[422]

Under the proposed LRDP, the Cathedral Hill Hospital's Emergency Department would be within walking distance to the Tenderloin area, which has the highest density of low-income residents in San Francisco. The LRDP would also locate a full-service hospital at the Cathedral Hill Campus with full pediatric capabilities next to the City's highest densities of infants and children. CPMC has committed to expand its existing health programs in surrounding neighborhoods.

Access to CPMC Facilities for Medi-Cal Patients

CPMC hospitals and the CPMC physicians employed by Sutter Pacific Medical Foundation and the St. Luke's Health Care Center do at present and will continue under the LRDP to accept Medi-Cal patients.

As explained in Major Response HC-8 (page C&R 3.23-32), the financial makeup of the patient population of a particular hospital is a combination of location, private physician ability or preference for a particular insurance type, historical admitting patterns, and other factors not analyzed in this EIR. CPMC has limited control over many of these factors, but does have control over 1) whether or not CPMC hospitals accept Medi-Cal for hospital charges, and 2) whether or not its clinics, staffed with CPMC physicians (e.g., at the approximately 15 San Francisco Sutter Pacific Medical Foundation Clinics[423] and the St. Luke's Healthcare Center) accept Medi-Cal. As part of its commitments made to the Health Commission, CPMC committed to 1) continue to accept Medi-Cal, as it always has, at all of its hospitals, 2) to guarantee access to Medi-Cal patients through all of the clinics controlled by CPMC as described above, and 3) to increase the amount of unpaid Medi-Cal shortfall systemwide by 22 percent over a 5-year period, from $53,369,000 in 2007 to $65,000,000 by 2012.[424]

According to the project sponsor, CPMC cannot compel private practice physicians who are not part of the Sutter Pacific Medical Foundation to see or not see Medi-Cal patients. Brown and Toland Medical Group physicians, many of whom practice at CPMC facilities, for example, currently accept Medi-Cal patients, but this is a matter of personal physician choice.

Please also see Major Response HC-8, which provides additional detailed information regarding access to health care services at CPMC under the proposed LRDP, including information regarding CPMC's commitments related to Medi-Cal patient access and CPMC's partnerships in delivering low- or no-cost care to the medically underserved.

Viability/Potential Future Failure of the St. Luke's Replacement Hospital

Please see Major Response HC-2 (page C&R 3.23-8), which includes a detailed discussion of the size and scope of services at the St. Luke's Campus, and Response HC-29, which responds to other individual comments raising concerns related to the viability of the St. Luke's Campus under the proposed LRDP. As explained in Major Response HC-2, concerns regarding the financial "viability" of the St. Luke's

[421] CPMC, 2010 (Sept. 30), *Interim Report to the San Francisco Health Commission Regarding Progress Toward Commission Recommendation in Resolution No. 10-09*.

[422] CPMC reported that more than 19,900 individuals were served by CPMC in the Medi-Cal program. CPMC's unpaid cost for Medi-Cal patients in 2009 was $59,200,000. Ibid.

[423] For a list of 15 San Francisco and over 50 regional locations of Sutter Pacific Medical Foundation Clinics, see http://www.sutterpacific.org/locations/

[424] San Francisco Health Commission Task Force on CPMC's IMP Addressing Resolution No. 10-09, 2010 (Mar. 2), *Updates and Accomplishments.*

Campus as proposed under the LRDP were discussed at the Health Commission as part of the Blue Ribbon Panel review in 2008. As described by CPMC, and discussed in the Blue Ribbon Panel review, the proposal for the St. Luke's Replacement Hospital and Campus is part of the overall CPMC LRDP. As such, the viability of the St. Luke's Campus cannot be viewed in isolation, but rather it is contingent on the viability of CPMC's health care delivery system as a whole. Operational efficiencies and elimination of redundancies gained by consolidating specialized, tertiary, and women's and children's services at the proposed Cathedral Hill Hospital would more likely contribute to, rather than detract from, the long-term viability of the St. Luke's Campus.

As further explained in Major Response HC-2, the San Francisco Health Commission Task Force on CPMC's IMP, in its specific review of CPMC's responsiveness to the recommendations of the Blue Ribbon Panel, determined that the St. Luke's Hospital as planned under the LRDP would be appropriately sized and programmed as a community hospital, along with services that would be provided on the St. Luke's Campus, to accommodate existing and projected future patient demand for the south of Market service area.[425] In its September 30, 2010 Interim Report, the Health Commission Task Force indicated that "CPMC has demonstrated its commitment to the long-term viability of the St. Luke's Campus by budgeting $250,000,000 for the reconstruction of the inpatient facility."[426]

For the above reasons, there is no evidence in the record to support the suggestion in the comments that the proposed LRDP would likely result in the future failure of the St. Luke's Replacement Hospital.

Potential Cumulative Impacts Resulting from a Failure of the St. Luke's Replacement Hospital

Because no substantial evidence has been presented to support the comments' suggestion that the proposed LRDP potentially could result in the failure of the St. Luke's Replacement Hospital, any analysis of cumulative impacts related to traffic, transit, parking, blight, or public services that would result from such a failure would be speculative in nature and is therefore beyond the scope of the EIR for the proposed LRDP. Section 15145 of the State CEQA Guidelines states that "[i]f, after thorough investigation, a Lead Agency finds that a particular impact is too speculative for evaluation, the agency should note its conclusion and terminate discussion of the impact." Because the potential failure of the St. Luke's Replacement Hospital under the LRDP is too speculative for evaluation, there is no need to provide the analysis of cumulative impacts related to traffic, transit, parking, blight, or public services that would result from such failures as suggested by the comment.

Sufficiency of Beds at the St. Luke's Replacement Hospital to Provide Health Care to the Community

Please see Major Responses HC-1 and HC-2 (page C&R 3.23-1 and 3.23-8) for detailed discussion regarding the supply of acute-care beds and size and scope of services at the St. Luke's Campus.

Major Response HC-1 explains that the 80 beds proposed to be provided at the St. Luke's Hospital would provide sufficient capacity to meet the current and projected demand at the St. Luke's Campus, with additional capacity to meet peak demand periods. Major Response HC-1 also explains that with the shift from multi-patient to single-patient rooms under modern hospital guidelines, newer facilities such as the St. Luke's Replacement Hospital are projected to have a higher occupancy rate (i.e., a higher percentage of licensed beds that are expected to be used under existing conditions) than existing facilities with multi-patient rooms such as the 1970 Hospital Tower that the St. Luke's Replacement Hospital would replace. Therefore, fewer licensed beds are required to serve the same number of patients. In addition, as

[425] San Francisco Health Commission Task Force on CPMC's IMP Addressing Resolution No. 10-09, 2010 (Mar. 2), *Updates and Accomplishments.*

[426] CPMC, 2010 (Sept. 30), *Interim Report to the San Francisco Health Commission Regarding Progress Toward Commission Recommendation in Resolution No. 10-09*.

explained in detail in Major Response HC-1, over time, the demand for hospital bed capacity has been reduced because of technological and clinical advances that reduce the average length of hospital stays and allow more medical services to be provided on an outpatient basis.

Major Response HC-2 further explains that the proposed LRDP would not exacerbate any shortage of inpatient acute-care beds for the south of Market Street area traditionally served by the St. Luke's Campus, in part, because the Health Commission Task Force has determined that the St. Luke's Replacement Hospital would be appropriately sized to accommodate existing and projected future patient demand for that service area,[427] and because the St. Luke's Replacement Hospital would accommodate growth in patient census, increase its Emergency Department and surgery capacity, and expand primary care programs in clinical areas of demonstrated need to the community.

As explained in Major Response HC-2, with the exception of inpatient pediatrics, skilled nursing facilities (SNF), and subacute care, all services currently provided at the St. Luke's Campus are proposed to be maintained or expanded at St. Luke's. As explained in detail in Major Response HC-8 (page C&R 3.23-32), there is no difference in medical access policies between any of the CPMC hospitals. All CPMC hospitals are equally open to the receipt of under-insured and uninsured patients and decisions on the granting of financial assistance and waivers are made on a uniform policy basis across all campuses.[428] CPMC's coverage of care for under- and uninsured patients is available to families with incomes up to 400 percent of the federal poverty level, which is a higher level than any other San Francisco hospital.[429] Therefore, there is no indication that the proposed 80-bed St. Luke's Replacement Hospital under the LRDP would not be large enough to provide health care services to all of the communities served by the St. Luke's Campus. Major Response HC-8 provides additional information regarding CPMC's charity care programs, and access to CPMC health care services within the southeastern areas of San Francisco.

Comment

(Sue Hestor, October 19, 2010) [89-12 HC]

"The EIR is clearly aimed at serving CPMC in facilities which serve CPMC's patient base. Please explain how the income level and residence location of that 'patient base' matches that of the San Francisco population."

Response HC-32

The comment asks for information regarding two concerns, the income level of CPMC's existing patient base and the residence location of CPMC's patient base.

Income Level of CPMC's Patient Base

The requested information regarding the income level of CPMC's patient base involves social and economic concerns that are outside of the scope of the CEQA requirement to analyze the environmental impacts of the proposed LRDP, except to the extent that the income level of CPMC's patient base could indirectly result in indirect physical environmental impacts under the proposed LRDP. Please see Response INTRO-7 (page C&R 3.1-17) regarding the appropriate consideration of social and economic impacts under CEQA. Other than collecting income information from those seeking to qualify for charity

[427] San Francisco Health Commission Task Force on CPMC's IMP Addressing Resolution No. 10-09, 2010 (Mar. 2), *Updates and Accomplishments.*

[428] CPMC, Memorandum from Geoffrey Nelson, Director, EDP, to Brian Boxer (AECOM) re: Access to Healthcare Services (May 13, 2011).

[429] San Francisco Department of Public Health, Healthy San Francisco, *Participant Handbook*, page 13 (updated July 2009). See also CPMC, patient financial assistance application form, dated May 31, 2007.

care at its facilities, CPMC does not collect information regarding the income of its patients.[430] Therefore, this information is not available. Moreover, because the project would not change the income level of CPMC's existing patient base, which would continue to be served by the proposed replacement facilities, information regarding the income level of existing patients would not be relevant to analyzing any potential direct or indirect environmental impacts resulting from the project. Please also see Major Response HC-8 (page C&R 3.23-32) regarding access to health services, which includes information regarding charity care and other services that CPMC currently provides and would provide under the proposed LRDP for low-income and other underserved populations.

Residence Location of CPMC's Patient Base

The comment also asks for information regarding the residence location of CPMC's patient base. In 2007, 70 percent of CPMC's inpatients came from San Francisco and 21 percent were from other Bay Area cities. Six percent were from other parts of northern California and approximately three percent were from southern California or out of state.**[431]**

To the extent that the location of the residences of CPMC's existing patients is relevant to the project's direct or indirect environmental impacts, the information has been factored into the analysis in the Draft EIR. As explained in the Draft EIR, page 4.5-72, travel surveys of CPMC personnel, patients, and visitors were conducted to develop origin-destination assumptions for purposes of the transportation analysis. Based on this survey information, trip distribution was assigned for CPMC personnel, patients, and visitors traveling to or from the CPMC campuses from four quadrants (or "Superdistricts") of the City, or from the East Bay, South Bay, North Bay, or outside the Bay Area.**[432]** Table 4.5-12, "Trip Distribution Patterns by Campus" in the Draft EIR, page 4.5-78, indicates the distribution of trips by San Francisco quadrant as well as by trips originating or ending outside of San Francisco that were assumed for each of the CPMC campuses based on the survey results. Generally, the origin and destination points were the residences of survey respondents.**[433]** However, in some cases where respondents were coming to or from the campus from work or from shopping, the origin and destination points were not necessarily indicative of residential location.**[434]** The transportation analysis based upon the origin-destination assumptions developed from the travel surveys of CPMC personnel, patients, and visitors, in turn, was utilized to develop the analyses in the Draft EIR of other environmental impacts related to traffic that would be generated by the proposed LRDP, e.g., Noise (Section 4.6), Air Quality (Section 4.7), and Greenhouse Gas Emissions (Section 4.8).

Comments

(Gloria Smith—California Nurses Association, October 19, 2010) [90-22 HC]

"1. The DEIR Omitted a Description of Changes in Access to Health Care in San Francisco and the Bay Area.

Most troublesome is the DEIR's complete silence on a description of CMPC's current regionalization process that permeates all aspects of access to healthcare in San Francisco and the Bay Area at large. CPMC is affiliated with Sutter Health. Sutter is going through a process of 'regionalization,' in which its twenty-six affiliate hospitals are collapsed into five regional structures. As a result, the corporate entity of CPMC has ceased to exist, while all

430 CPMC, Memorandum from Geoffrey Nelson, Director, EDP, to Brian Boxer (AECOM) re: Access to Healthcare Services (May 13, 2011).
431 California Pacific Medical Center, 2008, *California Medical Center 2008 Institutional Master Plan*, San Francisco, CA: prepared by the Marchese Company, Inc., page 14, available: http://rebuildcpmc.org/assets/08IMP_CPMC.pdf, accessed Dec. 31, 2010.

433 Ibid., Appendix B.
434 Ibid.

CPMC operations, finance, and governance have dissolved into Sutter West Bay, which encompasses all of San Francisco.

Sutter's regionalization entails large-scale closures of services and increased transfer of patients between cities in the Bay Area. CNA has now been involved in CEQA review regarding Sutter's construction plans in Castro Valley, Oakland, Santa Rosa, San Mateo County, and San Francisco. In each instance, Sutter presents the respective plan in a vacuum, isolated from the simultaneous rebuilds the next town over.[14]

Sutter has drastically reduced the number of licensed hospital beds both at CMPC campuses and regionally. Specifically, if all of Sutter's plans in the Bay Area were approved, would entail eliminating 881 licensed hospital beds in the Bay Area between the CPMC campuses, Alta Bates Summit Medical Center in Berkeley and Oakland (Herrick Campus and Summit Campus), San Leandro Medical Campus (complete closure proposed), Eden Medical Center in Castro Valley, Sutter Medical Center of Santa Rosa, and Mills-Peninsula Health Services ('Mills Peninsula") in Burlingame and San Mateo.

The planned consolidation of by Sutter across the Bay Area assumes increased transfer of patients between cities. For example, earlier this spring a stroke patient in Novato was transferred to CPMC in San Francisco rather than to the nearest stroke center in Greenbrae in Marin County. Traffic burdens (and associated air quality and greenhouse gas emissions) caused by additional patient transports to and from San Francisco as a result of regionalization are not addressed in the DEIR. This information must be included a revised EIR that fully and accurately depicts the regional setting for health care.

[14] *See* attached Letter from Michael Lighty, CNA Director of Public Policy, (Oct. 19, 2010.)"

(Gloria Smith—California Nurses Association, October 19, 2010) [90-27 HC]

"• Information concerning cumulative projects including potential cumulative development of other health care services projects in the City and adjacent Bay Area communities."

(Gloria Smith—California Nurses Association, October 19, 2010) [90-85 HC]

"As shown. above, Sutter intends to eliminate 881 licensed hospital beds in the Bay Area. This planned consolidation across the Bay Area assumes increased transfer of patients between cities. For example, earlier this year a stroke patient in Novato was transferred to CPMC in San Francisco rather than to the nearest stroke center in Greenbrae in Marin County. Traffic burdens, and associated air quality and greenhouse gas emissions, caused by additional patient transports to and from San Francisco as a result of regionalization are not addressed in the DEIR. Impacts resulting from regional transfers present potentially significant unmitigated impacts that must be investigated and disclosed in a revised EIR."

(Gloria Smith—California Nurses Association, October 19, 2010) [90-87 HC]

"In addition to the drastic reduction of acute care, psychiatric care and skilled nursing facility ('SNF') beds under the LRDP as shown in **Error! Reference source not found** . [sic] Lighty's letter, several other hospitals in the· region are or have been reducing their services. The Sutter-affiliate Mills Peninsula recently closed their acute rehabilitation unit in Burlingame, San Mateo County,[61] advising patients to come to acute rehabilitation units at CMPC campuses in the City, specifically the Davies Campus. Sutter also plans on closing the SNF and dialysis unit at the Mills-Peninsula campus[62] and the SNF at the Santa Rosa Hospital. Now, CPMC plans to close the only sub-acute unit in San Francisco, forcing patients and their families to leave San Francisco for care. Combined with the recent closure of the SNF and sub-acute care at the Seton Medical Center in Daly City[63] and reductions at the Laguna Honda Hospital and Rehabilitation Center, the elimination of SNF beds and acute-care beds under the LRDP further compounds the existing regional shortage.

(Gloria Smith—California Nurses Association, October 19, 2010) [90-88 HC]

"In San Francisco, the proposed closure of the SNF at the St. Luke's Hospital in addition to the recent reductions in SNF beds at the California Campus in 2009/2010 represents an 83% reduction in CPMC's SNF bed capacity. SNF is the state licensing category for nursing homes, but historically a number of hospitals have opened licensed SNFs for patients who were too sick to be transferred to free-standing nursing homes. The only additional SNF services planned in San Francisco are 22 extra SNF beds part of the proposed rebuild of the Chinese Hospital. Patients will be put at risk if the patient population currently treated by the 178 historically offered by CPMC is simply placed in lower-level care SNFs. Worse still, if the need for SNFs is not met, these patients will need to be shipped out of San Francisco. SNF patients tend to have stays from three days to several weeks, which will result in multiple additional trips by their family members out of the City to visit them."

(Gloria Smith—California Nurses Association, October 19, 2010) [90-89 HC]

"The CPMC LRDP is part of Sutter's business plan for the Bay Area and must be analyzed in the context of the cumulative effects of those plans. This includes: transfer of stroke patients from the Novato Community Hospital in Marin County to CPMC; transfer of sub-acute patients and psychiatric patients out of San Francisco; transfer of SNF patients out of San Francisco; transfer of pediatric and acute rehabilitation patients into San Francisco from San Mateo County; and potential closure of the San Leandro Hospital. The DEIR fails entirely to analyze those cumulative impacts."

(Gloria Smith—California Nurses Association, October 20, 2010) [96-3 HC, duplicate comment was provided in 110-3 HC]

"Sutter is going through a process of 'regionalization,' in which its twenty-six affiliate hospitals are collapsed into five regional structures. As a result, the corporate entity of CPMC has ceased to exist, while all CPMC operations, finance, and' governance have dissolved into Sutter West Bay. Sutter West Bay is the region covering Sutter operations from San Francisco north to Clear Lake.[2]

Historically, Sutter has tied together its affiliate networks with shared purchasing, compliance, contracting, treasurer, government relations, legal, pensions, employee benefits, etc. However, each affiliate also had relative autonomy in the pursuit of its own business plans. Sutter's major leverage over its affiliates was their participation in the Sutter Health Obligated Group. By affiliating with Sutter, previously independent hospitals agreed to keep only two weeks of operating cash on hand, while transferring all excess cash to Sutter Corporate. In practice, cash transfers through the Obligated Group have been inconsistent, and apparently political among the Sutter affiliates. (It is this inconsistency that is in part the basis of the current lawsuit by Marin General Hospital to recover the over $120 million Sutter transferred out of the Marin Healthcare District in the years leading up to the restoration of local governance.)[3]

As Sutter regionalizes its hospitals, it is engaged in a parallel regionalization of all its affiliated physician foundations. It appears that in the next five years, assuming the regionalization process is successful, Sutter intends to roll out a commercial insurance product to make it competitive with Kaiser Permanente ("Kaiser"). It can be assumed that Sutter has been imposing this insurance, named "Sutter Select," on its employees as a captive patient population to seed the launch of the product.

More important for CEQA review, Sutter's regionalization entails large-scale closures of services and increased transfer of patients between cities in the Bay Area. CNA has now been involved in CEQA review regarding Sutter's construction plans in Castro Valley, Oakland, Santa Rosa, San Mateo County, and San Francisco. In each

instance, Sutter presents the respective plan in a vacuum, isolated from the simultaneous rebuilds the next town over.

[3] Sacramento Bee, Marin Hospital District Sues Sutter, August 27, 2010"

(Gloria Smith—California Nurses Association, October 20, 2010) [96-4 HC, duplicate comment was provided in 110-4 HC]

"Over the years, Sutter has drastically reduced the number of licensed hospital beds both at CMPC campuses and regionally. Specifically, if all of Sutter's plans in the Bay Area were approved, would entail eliminating 881 licensed hospital beds in the Bay Area between the CPMC campuses, Alta Bates Summit Medical Center in Berkeley and Oakland (Herrick Campus and Summit Campus), San Leandro Medical Campus (complete closure proposed), Eden Medical Center in Castro Valley, Sutter Medical Center of Santa Rosa, and Mills-Peninsula Health Services ('Mills Peninsula') in Burlingame and San Mateo. The planned consolidation of by Sutter across the Bay Area assumes increased transfer of patients between cities. For example, earlier this spring a stroke patient in Novato was transferred to CPMC in San Francisco rather than to the nearest stroke center in Greenbrae in Marin County.[4] Traffic burdens (and associated air quality and greenhouse gas emissions) caused by additional patient transports to and from San Francisco as a result of regionalization are not addressed in the Draft EIR.

[4] Marin Independent Journal, Doctors Criticize Sutter Handling of Stroke Patient, May 18, 2010

Table 1 below summarizes the past and planned future loss of licensed beds in the Bay Area.

Table 1: Reduction in number of licensed beds at Sutter-affiliated campuses in the Bay Area

Sutter Facility	2010 licensed beds	Rebuild plans	Recent past cuts	Future cuts outside rebuild plans	Total loss of licensed beds
Alta Bates Summit (Summit Campus, Oakland[a]	(345)	(309)	0	0	(36)
Alta Bates Summit (Herrick Campus, Berkeley)[b]	(180)	unknown	(18)	(77)	(95)
California Pacific Medical Center (San Francisco)[c]	(1,042)	(854)	(231)	0	(419)
Eden Medical Center (Castro Valley)[d]	(178)	(130)	(31)	0	(79)
San Leandro Hospital (San Leandro)[e]	(122)	0	0	(122)	(122)
Santa Rosa Medical Center (Santa Rosa)[f]	(135)	(70)	0	0	(65)
Mills Peninsula (San Mateo/Burlingame)[g]	(288)	(243)	(20)	0	(65)
				TOTAL	(881)

a Phase I of the rebuild at Summit Campus only
b 18 beds eliminated from adolescent psychiatric care in 2007; further cuts planned when Herrick Campus moves to Summit Campus include: closure of 40-unit pulmonary sub-acute care and reduction of adult/adolescent psychiatric care from 105 to 68 beds
c Based on Draft EIR. Table 2-2, *see* Table below
d 31-bed acute rehabilitation unit closed in 2010
e Sutter intends to close the San Leandro Hospital; currently lawsuits are pending with hospital district, community, doctors, nurses, and other health care workers fighting to maintain San Leandro Hospital as a full-service acute care hospital
f Sutter recently obtained approval to rebuild Sutter Medical Center of Santa Rosa at a much smaller size; a lawsuit has been filed challenging the EIR
g 20-bed acute rehabilitation unit dosed in 2010; cuts in addition to those listed in the table would result from closures of pediatrics and skilled nursing facility beds as announced by Mills-Peninsula in the past week

As Table 1 shows, almost half of the licensed beds eliminated by Sutter region-wide (881 beds) are removed at the CPMC campuses (419 beds) in San Francisco. Table 2 below shows a summary of licensed beds at the CPMC campuses for the time period from 2006 through 2010 and the future reductions proposed under the LRDP.

This summary table shows that from 2006 to 2010, Sutter eliminated a total of 231 licensed beds at the CPMC campuses: 124 acute-care beds, 22 psychiatric care beds, and 101 skilled nursing beds; only the number of rehabilitation beds increased by 16 (see Column A). Now, even though the LRDP would include construction of a brand-new 555-bed hospital at the Cathedral Hill Campus, Sutter proposes to further eliminate another 188

licensed beds: 109 acute-care beds and 79 skilled nursing beds (see Column B). Thus, between the year 2006 and the proposed LRDP at total of 419 licensed beds are removed from service including 233 acute-care beds, 22

b Shaded cells indicate years in which the number of licensed beds were reduced compared to the prior year(s)
c The Draft EIR, Table 2-2, incorrectly adds up the number of existing acute-care beds for all campuses and, consequently, the total number of beds for 2009 and 2010

psychiatric care beds, and 180 skilled nursing beds. And, on November 1, 2010, CPMC will sell its dialysis program at the Pacific and Davies Campuses.[5]

[5] San Francisco Business Times, CPMC Will Sell Dialysis Unit to DaVita, September 3, 2010; *http://www.bizjournals.com/sanfrancisco/stories/2010 109 106 1* story12.html."

(Gloria Smith—California Nurses Association, October 20, 2010) [96-5a HC, duplicate comment was provided in 110-5a HC]

"In addition to the drastic reduction of acute care, psychiatric care and skilled nursing facility ('SNF') beds under the LRDP as shown in Table 2, several other hospitals in the region are or have been reducing their services. The Sutter-affiliate Mills Peninsula recently closed their acute rehabilitation unit in Burlingame, San Mateo County,[6] advising patients to come to acute rehabilitation units at CMPC campuses in the City, specifically the Davies Campus. Sutter also plans on closing the SNF and dialysis unit at the Mills-Peninsula campus[7] and the SNF at the Santa Rosa Hospital. Now, CPMC plans to close the only sub-acute unit in San Francisco, forcing patients and their families to leave San Francisco for care. Combined with the recent closure of the SNF and sub-acute care at the Seton Medical Center in Daly City[8] and reductions at the Laguna Honda Hospital and Rehabilitation Center, the elimination of SNF beds and acute-care beds under the LRDP further compounds the existing regional shortage.

In San Francisco, the proposed closure of the SNF at the St. Luke's Hospital in addition to the recent reductions in SNF beds at the California Campus in 2009/2010 represents an 83% reduction in CPMC's SNF bed capacity. SNF is the state licensing category for nursing homes, but historically a number of hospitals have opened licensed SNFs for patients who were too sick to be transferred to free-standing nursing homes. The only additional SNF services planned in San Francisco are 22 extra SNF beds part of the proposed rebuild of the Chinese Hospital. Patients will be put at risk if the patient population currently treated by the 178 historically offered by CPMC is simply placed in lower-level care SNFs. Worse still, if the need for SNFs is not met, these patients will need to be shipped out of San Francisco. SNF patients tend to have stays from three days to several weeks, which will result in multiple additional trips by their family members out of the City to visit them.

The CPMC LRDP is part of Sutter's business plan for the Bay Area and must be analyzed in the context of the cumulative effects of those plans. This includes: transfer of stroke patients from the Novato Community Hospital in Marin County to CPMC; transfer of sub-acute patients and psychiatric patients out of San Francisco; transfer of SNF patients out of San Francisco; transfer of pediatric and acute rehabilitation patients into San Francisco from San Mateo County; and potential closure of the San Leandro Hospital. The Draft EIR fails entirely to analyze those cumulative impacts.

(Jane Martin, September 23, 2010) [PC-258 HC]

"The EIR also does not analyze Sutter's regionalization. Sutter's Business Plan, if approved, would entail ridding itself of 1,300 hospital beds in the Bay Area in a way that anticipates the transfer of patients between cities. CPMC's plan is a part of the same Business Plan, and Sutter's operations all over the Bay Area, and it should be analyzed in terms of the cumulative effects of those plans."

Response HC-33

Please see Major Response HC-1 (page C&R 3.23-1) regarding regional supply of licensed beds for a detailed response to similar comments regarding regional changes in the number of licensed beds at Sutter Health affiliates. Please also see Response INTRO-7 (page C&R 3.1-17) regarding the appropriate consideration of social and economic impacts under CEQA.

The comments suggest that regional changes in Sutter Health's corporate governance structure and environmental effects that ostensibly would result from the corporate regionalization process in which Sutter Health is engaged, should be discussed in the Draft EIR. The comments also state that such a process would result in the closure or reduction of services offered at the CPMC campuses and transfer of patients between Sutter Health affiliates.

The comments are correct that the corporate non-profit entity that operates all of CPMC's facilities in San Francisco is Sutter West Bay Hospitals, doing business as California Pacific Medical Center, and that California Pacific Medical Center no longer exists as a corporate entity. The changes in Sutter Health's corporate governance structure involve social and economic concerns, have occurred already and are not part of the proposed LRDP, and would not result in any physical environmental impact requiring review under CEQA. No evidence was presented that internal corporate governance structures, monetary transfer policies, or other matters would result in potential physical environmental impact that would be caused by the proposed LRDP in San Francisco. Business decisions made by Sutter Health or its other affiliates in

other jurisdictions do not relate to the adequacy of the Draft EIR's analysis of the LRDP or environmental effects of the LRDP under CEQA.

According to the project sponsor, Sutter Health has engaged in a "regionalization" initiative, designed to simplify governance structures in its various regions for the purpose of lowering administrative costs and accelerating decision-making. As explained in Major Response HC-1 (page C&R 3.23-1), "regionalization" has not caused and would not cause reductions or closures of services or increased transfers of patients between Sutter Health facilities. According to the project sponsor, these governance changes are intended to produce administrative cost savings that could be reinvested in patient care.

Comment 90-22 also suggests that the proposed LRDP would contribute to a region-wide reduction in the number of licensed beds in all Sutter Health facilities, including CPMC facilities in San Francisco, which, in turn, would have the cumulative effect of shifting patients to other Sutter and non-Sutter health medical facilities and result in other unidentified public services, traffic, and air quality impacts. As explained below, these concerns are not supported by substantial evidence and are inconsistent with evidence that is in the existing record.

No evidence was submitted in the comments to support the claim that the proposed LRDP would contribute to a region-wide reduction in beds in Sutter Health facilities that would, in turn, create adverse environmental effects related to other public services or other indirect effects, such as increased regional traffic and associated air quality impacts, that would require analysis in the CPMC LRDP EIR. As explained in Major Response HC-1, the record shows that the inpatient and outpatient capacity proposed for CPMC facilities under the LRDP would be sufficient to meet CPMC's existing and projected demand for inpatient and outpatient services and that the LRDP would not result in any transfers of patients to other CPMC, non-CPMC or non-Sutter Health medical facilities, causing potential citywide or regional significant physical environmental impacts.

For the same reason, the project would not contribute to any cumulative environmental impacts related to development at other Sutter Health projects in other Bay Area communities outside of San Francisco (or, for that matter, related to other non-Sutter health care projects in the region) and, therefore, CEQA does not require the provision of information regarding the potential cumulative development of such projects, as suggested by Comment 90-27. The Draft EIR included an adequate level of cumulative analysis to comply with the requirements of CEQA. A discussion of other health care projects, both within San Francisco and in the Bay Area region, that would not directly or indirectly combine with the proposed LRDP and contribute to physical environmental impacts, is beyond the scope of a CEQA document. There is no evidence in the record supporting the suggestion that cumulative development of health care projects is creating such cumulative impacts.

Comments 90-22 and 96-4 state that "if all of Sutter's plans in the Bay Area were approved, would entail eliminating 881 licensed hospital beds in the Bay Area." Similarly, Comment PC-258 states that "Sutter's Business Plan, if approved, would entail ridding itself of 1,300 hospital beds in the Bay Area." Additionally, Comment 90-87 discusses several changes in health care services that have occurred or are proposed at other Sutter-affiliated hospitals outside of San Francisco. The evaluation of changes in health care services at other Sutter-affiliated hospitals outside of San Francisco is beyond the scope of the Draft EIR. However, these comments will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project.

The stated totals in Comments 90-22 and 96-4 of 881 beds and in Comment PC-258 of 1,300 beds that would be eliminated at Sutter-affiliated hospitals in the Bay Area is inconsistent with OSHPD information on licensed beds for the referenced facilities and with CPMC's LRDP rebuild licensed bed count. To correct the record for informational purposes, a comparison between the number of patients currently served versus future anticipated capacity under the various Sutter Health 'rebuild' plans in the

Bay Area region, as requested and referred to in this and other comments, is provided in C&R Table 3.23-2, in Major Response HC-1. This table shows that licensed beds within regional Sutter Health facilities would be reduced by 499 beds if all of Sutter's proposed plans in the Bay Area were approved, rather than 881 or 1,300 beds as stated in some of the comments. C&R Table 3.23-2 also shows that the Sutter Health regional rebuild projects cited in the comments would have sufficient capacity to accommodate Sutter Health existing patient volume at the respective facilities, as well as varying levels of future anticipated growth in patient volume.

As explained in Major Response HC-1, no evidence is presented in the comments or elsewhere in the record of any major transfer of services from a Sutter Health facility to a non-Sutter Health facility, or of any direct or indirect environmental impacts that might result from these hospital projects (that would required to comply with state-mandated deadlines for meeting seismic safety standards under SB 1953 as modified by subsequent legislation), or any contributing impact from the proposed LRDP. The 2008 IMP for the CPMC LRDP recognized that approximately 30 percent of existing CPMC hospital patients come from outside San Francisco,[435] and no evidence exists that changes in other Sutter Health programs elsewhere would affect this pattern. As Dr. Mitch Katz, former Director of the City of San Francisco Department of Public Health, stated, in addressing the regional dynamic and CPMC hospitals as destination hospitals, "the regional dynamic is people come here for medical care."[436]

Several of the comments cite the transfer of one stroke patient in Novato to a CPMC hospital in San Francisco (rather than to the nearest stroke center in Greenbrae), as evidence that regional consolidation of Sutter Health facilities would result in increased transfers of patients between cities and, therefore, in potentially significant new traffic and associated air quality and greenhouse gas emissions impacts, or as evidence that Sutter's business plan includes the transfer of stroke patients from the Novato Community Hospital to CPMC facilities. The comments stem from articles in the Marin Independent Journal (for example, Comment 96-4 cites "Marin Independent Journal, Doctors Criticize Sutter Handling of Stroke Patient, May 18, 2010"). One patient transfer is not substantial evidence that the LRDP would increase patient transfers to such a degree that regional vehicle traffic would result in new, potentially significant indirect environmental impacts related to this traffic. CPMC has provided several documents in response to this article. These documents included an entry on the *Marin Independent Journal* Web site (dated May 20, 2010), that stated it was from the patient's family and praised the hospital transfer decision. CPMC also provided a copy of a letter from Gordon Hunt, MD, Senior Vice President and Chief Medical Officer of Sutter Health, dated May 25, 2010, stating that physicians at Sutter make any determination regarding transfer of a patient based on what is best for that patient in the treating physician's judgment, whether or not that means the patient must be sent to a hospital within or outside of the Sutter Health network. As explained in Dr. Hunt's letter, such clinical determinations are made independently by the treating physician on a physician-by-physician, and case-by-case basis. Therefore, the record does not support the suggestion that Sutter Health has an overall business plan to transfer stroke patients from the Novato Community Hospital to CPMC facilities in San Francisco.

Comment 90-87 suggests that CPMC "plans to close the only subacute unit in San Francisco, forcing patients and their family to leave San Francisco for care." Similarly, Comment 90-89 states that Sutter's business plan for the Bay Area includes the transfer of CPMC's subacute patients out of San Francisco. The only CPMC campus that currently includes inpatient subacute-care beds is the St. Luke's Campus, which has a 60-bed subacute care unit located in the existing St. Luke's Hospital tower. Please see Major Response HC-6, which explains that because of higher construction and staffing costs associated with

[435] Type of service and breakdown in CPMC patient origin by SF/region described in IMP document 2008. See, California Pacific Medical Center, 2008, *California Medical Center 2008 Institutional Master Plan,* San Francisco, prepared by the Marchese Company, Inc., available: http://rebuildcpmc.org/assets/08IMP_CPMC.pdf, accessed Dec.r 20, 2010.
Patients who come from outside San Francisco for health care at CPMC are often drawn by CPMC's noted specialty programs. Ibid. The proposed LRDP would allow CPMC to continue to deliver these same local and regional health care services.

[436] Testimony of Dr. Mitch Katz, November 19, 2009, at the CPMC IMP hearing.

acute care facilities, it is not practical to create subacute care units in a new acute care hospital. Major Response HC-6 further explains that none of the current proposed new acute care hospitals under design or construction in the United States has proposed to include subacute care within a new inpatient facility. Major Response HC-6 also explains that a study conducted by The Camden Group indicated that "[h]istorically, almost all of the subacute patients [at the St. Luke's Campus] have been direct admit patients residing in areas outside SOMA, and often outside San Francisco County."[437] The Blue Ribbon Panel, therefore, did not recommend that CPMC provide new replacement subacute-care beds in the proposed new replacement hospital at St. Luke's Campus for those in the existing St. Luke's Hospital. Instead, the Blue Ribbon Panel recommended that "CPMC should replace lost subacute beds with placements for all individuals currently in those beds."[438]

Consistent with the Blue Ribbon Panel's recommendations, CPMC would gradually remove the existing 60 subacute beds from service at St. Luke's Hospital, through attrition or transfers to other facilities between now and when the existing St. Luke's Hospital tower would be demolished. Inpatient operations (including any remaining subacute-care services) at St. Luke's Hospital would continue until the proposed St. Luke's Replacement Hospital was completed and in operation, and transfer of acute-care services would begin. The proposed St. Luke's Replacement Hospital would not have subacute-care beds. Any patients not able to be transferred to other subacute-care facilities by that time would be placed, as appropriate, in a CPMC acute-care or SNF bed.[439] As explained in Major Responses HC-1 and HC-6, this volume could be accommodated by the CPMC system under the LRDP.[440]

As explained in Major Response HC-6, most of the patients utilizing CPMC's existing subacute-care facilities do not reside in the south of Market Street area but rather come from other areas of the City or outside the City. Therefore, it is anticipated that patients would, in the future, seek services across a wide geographic area and would not cluster at any one facility or area. Furthermore, the patient transition plan for the current patient population utilizing the existing subacute-care beds at St. Luke's Hospital anticipates that a limited number of patients would be transitioning at any given time from St. Luke's Hospital to other non-CPMC hospitals or other health care facilities. Therefore, the future potential shift of subacute-care services from CPMC to other hospitals and/or health care service providers would not result in secondary impacts at any given facility.

Comment 90-87 suggests that the elimination of SNF beds and acute-care beds under the LRDP "further compounds the existing regional shortage." With respect to the proposed reductions in SNF beds, as explained in detail in Major Response HC-6, CPMC has committed to maintain sufficient SNF beds (a total of 100) to meet its actual patient demand. CPMC has also committed that no existing community-based beds would be utilized to provide these 100 SNF beds, and that to provide the 62 beds needed (in addition to the 38 that would remain at the Davies Campus), CPMC would utilize either new community-based facilities or replacement capacity provided on one of its campuses. Furthermore, the text revisions in this C&R document to Draft EIR Table 2-2, "CPMC Existing and Proposed LRDP Licensed Hospital Bed Uses," clarify that CPMC would continue to maintain the 101 licensed beds at the California Campus, unless and until an alternative plan for providing the additional 62 beds is identified. Therefore, the proposed LRDP would not exacerbate the existing citywide or regional SNF bed shortage. With respect to the proposed elimination of acute-care beds under the LRDP, please see Major Response HC-1

[437] The Camden Group, 2009 (April 28), *San Francisco Blue Ribbon Panel: Utilization Projections and Assumptions for St. Luke's Campus*, page 10.

[438] The Blue Ribbon Panel, 2008, Consensus Positions for Recommendations to CPMC's Board of Directors.

[439] CPMC, Memorandum from Malia Weinberg to David Reel (AECOM) & Brian Boxer (AECOM) re: Subacute Care (May 26, 2011). With the future decommissioning of the St. Luke's Hospital tower after construction of the St. Luke's Replacement Hospital, CPMC would place all remaining subacute-care patients in the hospital or in community facilities. By doing so, CPMC would comply with the Blue Ribbon Panel's recommendations related to subacute-care beds. San Francisco Health Commission Task Force on CPMC's IMP Addressing Resolution No. 10-09, 2010 (Mar. 2), *Updates and Accomplishments*; CPMC, 2010 (Sept. 30), *Interim Report to the San Francisco Health Commission Regarding Progress Toward Commission Recommendation in Resolution No. 10-09*.

[440] CPMC, Memorandum from Malia Weinberg to David Reel (AECOM) & Brian Boxer (AECOM) re: Subacute Care (May 26, 2011).

(page C&R 3.23-1), which explains that the proposed overall supply of 698 licensed acute-care beds under the LRDP would be more than sufficient to meet the existing demand (average daily census of 559 acute-care beds occupied in 2009) and accommodate future growth in demand. Therefore, the proposed LRDP would not exacerbate any existing regional shortage in acute-care beds.

Comment 90-88 states that there have been recent reductions in SNF beds at the California Campus, and that the proposed reduction in SNF beds, when combined with these reductions at the California Campus, would result in an 83 percent reduction in CPMC's SNF bed capacity. Please see Major Response HC-6 (page C&R 3.23-25) for a detailed discussion related to SNF beds and services at the California Campus and within CPMC systemwide. As explained in Major Response HC-6, current estimates indicate that CPMC would need to provide approximately 100 SNF beds total (for all CPMC campuses) at any given time. The San Francisco Health Commission Task Force, in its reports dated March 2 and September 30, 2010, and the San Francisco Health Commission, in Resolution 02-10 dated March 16, 2010, affirmed CPMC's plans to maintain capacity to serve its existing patient needs by providing a total of at least 100 SNF beds, including 38 beds currently located at the Davies Campus and adding 62 new SNF beds at other on- or off-campus locations (yet to be determined).[441] As shown in the updated version of Draft EIR Table 2-2 set forth in Chapter 4, "Draft EIR Text Changes", of this C&R document (page C&R 4-36), there have been no recent reductions in the number of SNF beds at the California Campus. As shown in the updated version of Table 2-2, under the proposed LRDP, CPMC's licensed SNF bed capacity would be reduced from 218 to 139, which represents an approximately 36 percent reduction in licensed SNF beds, rather than the 83 percent reduction stated by the comment. Ultimately, after another plan for providing 100 total SNF beds is identified, CPMC would reduce its licensed SNF capacity system wide to 100 beds, representing an approximately 54 percent reduction from the current total of 218 beds. Comment 90-88 also incorrectly states that CPMC historically has provided 178 SNF beds. As shown in Table 2-2 (as revised in C&R Chapter 4, "Draft EIR Text Changes", page C&R 4-36), CPMC has historically provided 218 SNF beds.

Comment 90-89 states that Sutter's business plan for the Bay Area includes the transfer of psychiatric patients out of San Francisco. As shown in Table 2-2 on page 2-10 of the Draft EIR, and the updated version of Table 2-2 included in the text revisions in Chapter 4 of this C&R document (page C&R 4-36), CPMC has a total of 18 existing licensed psychiatric beds, all of which are at the Pacific Campus, and all of which would continue to be maintained at the Pacific Campus under the proposed LRDP. As such, no psychiatric beds or services would be shifted from CPMC to other providers under the proposed LRDP. Please also see Major Response HC-4 (page C&R 3.23-19) regarding psychiatric beds, which explains that the proposed total of 18 licensed psychiatric beds under the LRDP would be adequate to respond to the demand for CPMC beds, based on the past demand census (average daily census of 10.6 for psychiatric beds in 2009)[442]. Therefore, the record does not support the suggestion that the proposed LRDP would result in the transfer of psychiatric patients out of San Francisco, or that the LRDP would contribute to any physical environmental impacts (including cumulative impacts) related to psychiatric beds.

The statement in Comment 96-3 regarding Sutter Health's cash transfer policy involves social and economic concerns and is not relevant to the potential environmental impacts of the proposed LRDP. Please see Response INTRO-7 (page C&R 3.1-17) regarding the appropriate consideration of social and economic impacts under CEQA. The statement in Comment 96-3 regarding the litigation between Sutter Health and Marin General Hospital also involves social and economic concerns, and it need not be

[441] San Francisco Health Commission Task Force on CPMC's IMP Addressing Resolution No. 10-09, 2010 (Mar. 2), *Updates and Accomplishments*; CPMC, 2010 (Sept. 30), *Interim Report to the San Francisco Health Commission Regarding Progress Toward Commission Recommendation in Resolution No. 10-09*; S.F. Health Commission Resolution No. 02-10.

[442] OSHPD, ALIRTS, Annual Utilization Report of Hospitals, California Pacific Med Ctr-Pacific Campus, 2009, available at http://www.alirts.oshpd.ca.gov, accessed Apr. 8, 2011; CPMC, Memorandum from Malia Weinberg, Senior Project Manager, Operations, Planning and Activations, to Brian Boxer (AECOM) re: Inpatient Psychiatric Beds (May 12, 2011).

addressed in the CPMC LRDP EIR. According to the project sponsor, the litigation is not correctly described. The statement in Comment 96-3 that Sutter Health intends to roll out an insurance product involves speculation about social and economic concerns, and it is not supported by evidence in the record.

Comments

(Gloria Smith—California Nurses Association, October 19, 2010) [90-69 HC]

"In addition, there are unknown and unexamined additional losses of services at Davies Medical Center. Davies has historically served as a community hospital for the Castro District, and has been home to AIDS and HIV services. The LDRP reduces licensed bed capacity at the Davies Campus substantially and proposes to shift its clinical focus away from community serving functions to neuroscience services. The DEIR, IMP, and LDRP lack any explanation of what services would be lost at the Davies Campus in order to make way for the new expanded neurosciences program, and specifically any commitments to maintain AIDS/HIV programs. It would be a significant loss of services if AIDS/HIV patients had to travel to new providers because of an erosion of CPMC's commitment as a result of its clinical realignment."

(Gloria Smith—California Nurses Association, October 20, 2010) [96-13 HC, duplicate comments were provided in 90-69 HC and 110-13 HC]

"In addition, there are unknown and unexamined additional losses of services at Davies Medical Center. Davies has historically served as a community hospital for the Castro District, and has been home to AIDS and HIV services. The LDRP reduces licensed bed capacity at the Davies Campus substantially and proposes to shift its clinical focus away from community serving functions to neuroscience services. The DEIR, IMP, and LDRP lack any explanation of what services would be lost at the Davies Campus in order to make way for the new expanded neurosciences program, and specifically any commitments to maintain AIDS/HIV programs. It would be a significant loss of services if AIDS/HIV patients had to travel to new providers because of an erosion of CPMC's commitment as a result of its clinical realignment."

Response HC-34

Please see page 2-139, Table 2-11, "Davies Campus: Project Summary Table" and pages 2-143 to 2-148 of the Draft EIR, which describe the proposed development at the Davies Campus under the proposed LRDP. As explained on page 2-143, all existing medical uses in the Davies Campus North and South Towers would continue under the LRDP. Page 2-143 also explains that the Neuroscience Institute, which would be the only near-term development at the Davies Campus, would be constructed on a portion of the Davies Campus currently occupied by a surface parking lot at the corner of Noe Street and Duboce Avenue. Therefore, no existing buildings would be demolished to construct the Neuroscience Institute.

As explained on page 2-147 of the Draft EIR, the Castro Street/14th Street MOB, which would be the only long-term project at the Davies Campus, would be constructed on the site of the existing Castro Street/14th Street Parking Garage, which would be demolished. As shown in Table 2-11, the only uses within the Castro Street/14th Street Parking Garage are structured parking. Therefore, no existing buildings that included medical uses would be demolished or altered under the proposed LRDP. Consequently, no services currently available at the Davies Campus would be displaced as a result of the proposed LRDP.

According to the project sponsor, AIDS/HIV care is primarily provided in an outpatient setting. To that end, CPMC remains committed to ensuring that there is office space at the Davies Campus for primary care physicians, many of whom treat patients with AIDS or HIV. As explained in Major Response HC-2 (page C&R 3.23-8), primary and specialist physicians associated with the Davies Campus service lines, and their respective offices and patient visits, are assumed to stay at the Davies Campus under the

proposed LRDP, primarily at the 45 Castro Street MOB. According to the project sponsors, patients needing inpatient hospital care for AIDS/HIV would continue to be provided care at the Davies Campus and at the hospital facilities at other CPMC campuses. In addition, CPMC has funded its AIDS Case Management Program for the last 13 years, even after the State of California no longer provided assistance with the cost of this program, and CPMC considers it a priority in CPMC's ongoing support of the community's health care needs.

Therefore, all existing AIDS/HIV programs would be maintained at the Davies Campus under the proposed LRDP. For more detail regarding health care services at the Davies Campus under the proposed LRDP, please see Major Response HC-2 (page C&R 3.23-8).

Comments

(Gloria Smith—California Nurses Association, October 19, 2010) [90-70 HC]

"In sum, the DEIR omitted any investigation and disclosure of the direct physical changes and reasonably foreseeable indirect physical changes described above. In addition, it failed to analyze the potentially significant adverse individual and cumulative impacts associated with the physical change of closing the existing hospital facilities and the resulting transfer of a large portion of the existing patient population to other hospitals. All of this must be included in a revised EIR."

(Gloria Smith—California Nurses Association, October 20, 2010) [96-14 HC, duplicate comment was provided in 110-14 HC]

"In sum, the Draft EIR fails entirely to discuss the direct physical changes and reasonably foreseeable indirect physical changes and to analyze the potentially significant adverse individual and cumulative impacts associated with the physical change of closing the existing hospital facilities and the resulting transfer of a large portion of the existing patient population to other hospitals."

Response HC-35

Read in context with the rest of Comment Letter 90, Comment 90-70 refers to purported changes in services at the CPMC campuses that are described in Comments 90-61 through 90-69, including a reduction in the overall number of licensed beds at the CPMC campuses, a reduction in the number of skilled nursing facility (SNF) beds at the CPMC campuses, access to CPMC services for patients receiving Medi-Cal or with other insurance coverage limitations (including access for such patients to single-patient rooms), shifts of the existing patient population at the St. Luke's Campus to other hospitals, a reduction in the number of psychiatric beds at the CPMC campuses, and a reduction in AIDS/HIV services at the Davies Campus. The comment suggests that the purported health care service changes outlined in Comments 90-61 through 90-69 would lead to direct and indirect physical changes, consisting of impacts on traffic, transportation, parking, air quality, and public services.

Please see the responses to Comments 90-61 through 90-69 in Responses HC-2, HC-7, HC-8, HC-17, and HC-34 (pages C&R 3.23-52, 3.23-77, 3.23-82, 3.23-111, and 3.23-177, respectively) of this C&R document for detailed responses to each of these above-noted concerns. As explained in those responses, several of the changes in services at CPMC campuses that the comment indicates might occur are not changes that would occur under the proposed LRDP or otherwise (e.g., the proposed LRDP would not include any reduction in psychiatric beds or AIDS/HIV services at the Davies Campus). As further explained in the responses listed above, the remaining health care service changes at CPMC campuses would not result in shifts of patient populations to other CPMC or non-CPMC hospitals in a manner that would result in the direct and indirect physical environmental impacts related to traffic, transportation, parking, air quality, and public services that were not analyzed in the Draft EIR, as suggested by Comments 90-61 through 90-70. As further explained in the above-identified responses, the Draft EIR for

the proposed LRDP has adequately analyzed the impacts (including cumulative impacts) of the proposed LRDP related to traffic, transportation, parking, air quality, and public services (see Draft EIR, Sections 4.5, 4.7, 4.8, and 4.11) and no evidence is presented in the comments regarding direct or indirect environmental impacts of the proposed LRDP that have not been analyzed in the Draft EIR. Comments on specific environmental topics, such as traffic (pages C&R 3.7-52 to 3.7-77), transportation (C&R Section 3.7), parking (pages C&R 3.7-125 to 3.7-155), air quality (C&R Section 3.9), and public services (C&R Section 3.13), are addressed in the response to comments in the applicable section of this C&R document.

Comment

(Gloria Smith—California Nurses Association, October 19, 2010) [90-86 HC]

"More specifically, Mr. Lighty's letter shows that Sutter eliminated a total of 231 licensed beds at the CPMC campuses: 124 acute-care beds, 22 psychiatric care beds, and 101 skilled nursing beds; only the number of rehabilitation beds increased by 16. Now, even though the LRDP would include construction of a brand-new 555-bed hospital at the Cathedral Hill Campus, Sutter proposes to further eliminate another 188 licensed beds: 109 acute-care beds and 79 skilled nursing beds.[59] Thus, between the year 2006 and the proposed LRDP at total of 419 licensed beds are removed from service including 233 acute-care beds, 22 psychiatric care beds, and 180 skilled nursing beds. And, on November 1, 2010, CPMC will sell its dialysis programs at the Pacific and Davies Campuses.[60]

[59] Letter from Michael Lighty (Oct. 19, 2010) at page 4.
[60] San Francisco Business Times, CPMC Will Sell Dialysis Unit to 'DaVita, September 3, 2010; http://www.bizjoumals.com/sanfrancisco/stories/20 I 0/09/06/story 12.html."

Response HC-36

Previous changes (prior to the issuance of the Notice of Preparation (NOP) of an EIR for the CPMC LRDP EIR dated May 27, 2009) in services or supply of beds at the CPMC campuses, including whatever these changes or processes may have been, are not the subject of the CPMC LRDP EIR. Baseline information on existing beds and medical services,LRDP proposed beds and medical services is provided in Table 2-2, "CPMC Existing and Proposed LRDP Licensed Hospital Bed Uses, on page 2-10 the Draft EIR.

The statements that "Sutter eliminated a total of 231 licensed beds at the CPMC campuses: 124 acute-care beds, 22 psychiatric care beds, and 101 skilled nursing beds" prior to the proposed LRDP, and that CPMC would eliminate "another 188 licensed beds: 109 acute-care beds and 79 skilled nursing beds" under the proposed LRDP appear to have been based on Table 2-2 in the Draft EIR. Please note that revisions shown in Chapter 4 of this C&R document have been made to Table 2-2, "CPMC Existing and Proposed LRDP Licensed Hospital Bed Uses" in the Draft EIR, page 2-10 (see Response PD-6 [page C&R 3.2-6]), to provide some corrections regarding the existing and proposed number of licensed acute-care beds at the Davies Campus and to clarify CPMC's commitment to continue maintenance of 101 licensed SNF beds at the California Campus, unless and until CPMC identifies another plan for providing 62 additional skilled nursing facility (SNF) beds (in addition to the 38 SNF beds that would continue to be maintained at the Davies Campus under the LRDP) necessary for CPMC to meet its commitment to provide a total of 100 SNF beds systemwide. Therefore, as shown in the updated version of Table 2-2, before the publication of the NOP for the LRDP EIR in May 2009, a total of 93 licensed acute-care beds and zero licensed skilled nursing facility beds, (rather than 124 and 101, respectively, as stated by the comment), were eliminated at the CPMC Campuses. Additionally, as shown in the updated version of Table 2-2, under the proposed LRDP, a total of 192, rather than 109, licensed acute-care beds would be eliminated.

Past changes in health care services at the CPMC campuses are beyond the scope of environmental review documents under CEQA. The State CEQA Guidelines establish that the baseline for purposes of

the CEQA analysis normally is the physical environmental conditions on site and in the vicinity of the project as they exist at the time the NOP is published (see Section 15125(a) of the State CEQA Guidelines). The NOP for the CPMC LRDP EIR was filed on May 27, 2009. Therefore, changes in the environmental setting that occurred before the publication of the Notice of Preparation (2009) are not relevant to the analysis of the proposed LRDP's environmental impacts.

The comment refers to the elimination of licensed acute-care beds, psychiatric beds, and SNF beds at the CPMC campuses under the proposed LRDP and under prior health care services changes at CPMC campuses, and the recent transfer of CPMC's dialysis programs to DaVita, which became effective on February 1, 2011. However, the comment does not state any specific concerns regarding these issues. For detailed responses to a variety of concerns regarding these health care services at the CPMC campuses, please see Major Response HC-1, (page C&R 3.23-1), which addresses comments regarding the supply of licensed acute-care beds, Major Response HC-4, (page C&R 3.23-19), which addresses comments regarding the supply of licensed psychiatric beds, Major Response HC-6 (page C&R 3.23-25), which addresses comments regarding the supply of licensed SNF beds, and Response HC-21 (page C&R 3.23-127), which addresses comments regarding the sale of the CPMC dialysis unit to DaVita.

Comments

(Gloria Smith—California Nurses Association, October 19, 2010) [93-9 HC]

"3. How will the proposed Project impact other existing health care providers locally and regionally? Will the Project capture the higher-end medical services; thereby potentially putting other facilities and services at risk for economic failure?"

(Gloria Smith—California Nurses Association, October 19, 2010) [93-10 HC]

"Do some of the competing facilities currently provide a range of not necessarily profitable services to the lower income residents that will be impacted? Might existing facilities be forced out of business, resulting in "blighted" neighborhoods? The DEIR does not address this potential set of impacts."

Response HC-37

The CPMC LRDP EIR is not required to analyze the range of services and profitability of other health care facilities with respect to the proposed LRDP. Such issues are social and economic in nature. Please see Response INTRO-7 (page C&R 3.1-17) regarding the appropriate consideration of social and economic impacts under CEQA. No evidence is presented that would suggest the need for further analysis. As is stated in Section 15384 of the State CEQA Guidelines, "[a]rgument, speculation, unsubstantiated opinion or narrative, evidence which is clearly erroneous or inaccurate, or evidence of social or economic impacts which do not contribute to or are not caused by physical impacts on the environment does not constitute substantial evidence." For a more detailed response to comments regarding impacts on other hospitals, please see Major Response HC-3 (page C&R 3.23-17).

Comment

(Gloria Smith—California Nurses Association, October 19, 2010) [93-12 HC]

"5. How will emergency patients be accommodated if they need to be air-lifted in or out of the City?"

Response HC-38

Unlike the UCSF Mission Bay Hospital, which is proposed to include a helipad, the proposed LRDP would not involve the provision of helipads at any CPMC campus. CPMC does not currently offer trauma services at any of its facilities, nor does it intend to do so under the proposed LRDP. The proposed LRDP

would not result in any change to the existing baseline related to citywide medical helicopter services, as CPMC also does not currently provide any helipads at its existing facilities. As is current practice, any CPMC patients being airlifted in or out of San Francisco would be transported from the heliport at San Francisco International Airport, with the exception of patients arriving in helicopters from the north Bay Area, which would land at Crissy Field.[443] After landing, patients would be transported to a CPMC hospital by ambulance.[444]

Comment

(Gloria Smith—California Nurses Association, October 19, 2010) [93-14 HC]

"7. Given the proposed Project's actual indirect and likely significant induced job/services multiplier effect, the Project will impact existing neighborhoods and health care services. Therefore, must additional businesses or residences be converted to health care support services for the new Cathedral Hill Campus?"

Response HC-39

At the proposed Cathedral Hill Campus, the proposed LRDP would consolidate and replace acute-care services that currently exist at the California and Pacific Campuses. The services that are required to support these hospitals already exist and a major relocation of health service providers to the area surrounding these CPMC acute-care facilities under the LRDP is not anticipated to result from the development of the proposed Cathedral Hill Hospital and Cathedral Hill MOB, and the conversion of the 1375 Sutter Building to full MOB use at the proposed Cathedral Hill Campus. For purposes of providing a conservative analysis of the impacts of the proposed LRDP, the Draft EIR assumed that all new MOB and hospital space under the LRDP would result in net new employment within San Francisco. No evidence is presented in the comment that the Draft EIR analysis understated the anticipated impacts of the LRDP.

The multiplier effect or growth inducement associated with the proposed LRDP is anticipated to be moderate, as discussed in more detail in Section 3.6.1.6, "Hiring Program" of this C&R document. Much of the economic multiplier effects generated by the proposed LRDP would result in commercial business benefits (i.e., increased day-time retail spending in surrounding neighborhoods) and not specifically health care-related economic benefits. As a result, little evidence exists as to whether additional businesses or residences would be converted to health care support services at the proposed Cathedral Hill Campus. For a discussion of the indirect and induced multiplier effects of the LRDP, please see Section 3.6.1.6 of this C&R document.

Please also see the analysis of growth-inducement impacts associated with the proposed LRDP on pages 5-16 to 5-21 of the Draft EIR. As explained on page 5-19, the economic study completed for the project concluded that the proposed Cathedral Hill Campus would have a direct positive economic effect on the neighborhood, and would encourage patronage of off-site existing (and potentially new) retail and service enterprises by campus visitors.

Comments

(Gloria Smith—California Nurses Association, October 19, 2010) [93-17 HC]

"The proposed Project would add a major new medical campus in the Cathedral Hill area by 2014 and cease operations of the California Campus by 2020. Other key project elements include.

---

[443] CPMC, memorandum from Malia Weinberg, Senior Project Manager, Operations, Planning and Activations, to David Reel (AECOM) & Brian Boxer (AECOM), re: System wide ED and Urgent Care (June 1, 2011).

[444] Ibid.

- Design, construction and operation of Cathedral Hill campus, including a 555-bed hospital and medical office building at two locations.
- Development of a new ambulatory care center, underground parking, and renovation of existing buildings at the Pacific campus.
- Development of a new neuroscience institute building and new medical office building (MOB) and parking improvements at Davies campus.
- Construction of a new 80-bed acute-care replacement hospital and an MOB/expansion building after the demolition of the existing tower at St. Luke's.
- Sale of the California campus (by 2020) after relocating impatient services (all patients staying longer than 24 hours) to the proposed Cathedral Hill Hospital and other services to the Pacific campus. A limited amount of leased office at the California campus would be used indefinitely for medical activities. DEIR at page 1-1 to 1-2.

Table 1 compares the existing CPMC campuses to the proposed CPMC campuses and briefly discusses the proposed changes."

Table 1
Comparison of Existing CPMC Campuses to Proposed CPMC Campuses

Existing CPMC	Proposed CPMC	Comments
Four-campuses: • Pacific • California • Davies • St. Luke's	Four-campuses: • Cathedral Hill • Pacific • Davies • St. Luke's	The changes to services at each of these facilities are not well described in the DEIR project description. In order for the DEIR to be an adequate information document, this and other detailed information about the Project, must be clearly described in the project description as this information is essential to the adequate analysis of transportation-related, air quality, greenhouse gas, housing and other impacts.
Four acute care hospitals	Three acute care hospitals • Cathedral Hill (555 bed acute care hospital) • Davies • St. Luke's	Again, these changes likely impact who accesses the hospitals and how these patients travel – beyond CPMC – for services. Additional details are needed to analyze those likely implications of thee proposed Project. Such details must be described in a revised project description.
1,253 licensed beds/ 875 staffed beds	952 licensed beds/ 831 staffed beds	St. Luke's Campus: Reduction of licensed beds from 229 (150 acute and 79 skilled nursing) to 80 beds. Overall licensed beds would be reduced by 178 beds.
45 emergency room bays	65 emergency room bays	The DEIR's description of existing and projected emergency room trips/admissions related to CPMC, as well as existing and projected total San Francisco population-related emergency room trips/admissions is incomplete. The omission of this information renders impact analyses related to transportation, air quality and greenhouse gas emissions incomplete.

Table 1
Comparison of Existing CPMC Campuses to Proposed CPMC Campuses

Existing CPMC	Proposed CPMC	Comments
2 triage areas	3 triage areas	
No helicopter landing	No helicopter landing	No helicopter landing could have impacts on health care services, but also on air quality and greenhouse gas emissions due to reliance on other heliports outside of San Francisco.
2004: 648,530 outpatient visits		Detailed patient information needed to fully assess Project impacts is not included in the DEIR.
2004: 1/3 of all emergency room visits – approx. 70,220		See above. This information is needed to fully assess Project impacts and should be provided by facility and campus.
2006: Full-time equivalent personnel: Pacific: 2,641 California: 1,638 Davies: 925 St. Luke's: 597 Total: 5,801 (2008 data)	2030: Full-time equivalent personnel: Cathedral Hill: 5,380 Pacific: 2,060 California: 10 Davies: 1,750 St. Luke's: 1,530 Total: 10,730	The DEIR improperly omits information concerning future employment at the California campus sites. The sale of these sites is part of the Project and as such assumptions concerning future use and total employment should be included if not in the project description, in the cumulative and growth-inducing sections of the DEIR.
Housing units Cathedral Hill: 5 residential units and 20 residential hotel units	Housing units = None	CPMC is still working with the Mayer's office to determine how to address replacement housing. CPMC is seeking exceptions and amendments to City regulations that would require housing be provided as a ratio to non-residential uses.

(Gloria Smith—California Nurses Association, October 19, 2010) [93-25 HC]

"The DEIR's Project Description sections omit information that is essential to an adequate analysis of Project-related and cumulative impacts. Key examples vital information omitted from the DEIR are a plan for replacement housing for units demolished to make way for Project construction and a clear and complete description of the change in health care services to be provided by each campus."

(Gloria Smith—California Nurses Association, October 19, 2010) [93-27 HC]

"Similarly, additional detail concerning the exact types of health care services and target patient profiles is essential to an accurate and thorough description of Project-related and cumulative impacts."

(Gloria Smith—California Nurses Association, October 19, 2010) [93-33 HC]

"• Projected emergency room admissions and ambulance trips for both near-term and long-term project phrases. This information is essential to an analysis of the adequacy of health care services and conclusions concerning impacts such as cumulative impacts of transit and traffic generated by patients having to travel greater distances for services. Details including total projected psychiatric admissions is essential for impact analyses as well."

Response HC-40

The comments express concerns regarding the adequacy of the Draft EIR's description of the changes to health care services at each of CPMC campuses and its relationship to the adequate analysis of the transportation-related, air quality, greenhouse gas, housing, and other environmental impacts of the proposed LRDP; request additional information related to changes in patient access to CPMC hospitals and patient travel patterns; state figures purportedly representing the overall reduction in the number of licensed beds and staffed beds at the CPMC campuses under the proposed LRDP; express concerns that the Draft EIR's description of existing and projected emergency room trips/admissions is incomplete; express concerns regarding potential impacts related to the lack of a helicopter landing at the CPMC campuses under the proposed LRDP; request detailed patient information (including "target patient profiles"); express concerns that the Draft EIR omits information concerning future employment at the California Campus sites; express concerns that the Draft EIR omits information regarding a plan for replacement housing for units to be demolished to facilitate project construction (at the Cathedral Hill Campus); and request details related to total projected psychiatric admissions at the CPMC campuses. Each of these concerns is addressed in turn below.

Adequacy of Description of Changes to Health Care Services at CPMC Campuses

Table 1 in Comment 93-17 includes a statement that proposed changes to services at the CPMC campuses under the LRDP are not well described in the Project Description in the Draft EIR and must be more clearly described, because such information "is essential to the adequate analysis" of various environmental impacts. Comments 93-25 and 93-27 express similar concerns. Please see Sections 2.2, 2.3, 2.5, and 2.6 in the Draft EIR, beginning on page 2-19, for the description of development at the proposed Cathedral Hill, Pacific, Davies, and St. Luke's Campuses, respectively. The comments do not provide any specific details regarding any information that would be needed additionally to adequately analyze LRDP impacts, or any reasoning as to why such additional information could affect the analysis of such impacts. In addition to the details provided in Sections 2.2, 2.3, 2.5, and 2.6, additional relevant details related to changes at the CPMC campuses are included where necessary in the environmental resource sections of Chapter 4 of the Draft EIR that contain analyses of various potential impacts of the proposed LRDP.

Please see the following Major Responses at the beginning of this section of the C&R document for additional relevant information:

- Major Response HC-1 (page C&R 3.23-1) regarding loss of acute-care beds, which explains in detail that the licensed acute-care beds that would be provided under the proposed LRDP would be sufficient to meet demand, and no direct or indirect physical environmental impacts would occur from the reduction in the total number of licensed acute-care beds under the LRDP.
- Major Response HC-2 (page C&R 3.23-8) regarding the proposed Cathedral Hill Hospital as a central hub, tertiary hospital, size and scope of services at the St. Luke's Campus, and services at Davies Campus, which explains that the effects of the location, size, or scope of facilities under the proposed LRDP on health care delivery would not result in physical environmental impacts that were not fully analyzed in the Draft EIR.
- Major Response HC-4 (page C&R 3.23-19) regarding psychiatric beds, which explains that the project would not result in any changes related to the provision of inpatient psychiatric beds.
- Major Response HC-5 (page C&R 3.23-20) regarding emergency services, which explains that the proposed LRDP would result in an overall systemwide increase in Emergency Department capacity at the CPMC campuses and therefore would not increase demand on or otherwise put a strain on or undercut emergency services within the city.

- Major Response HC-6 (page C&R 3.23-25) regarding loss of SNF and subacute-care beds, which explains that the number of SNF beds that would be provided under the proposed LRDP and pursuant to CPMC's commitment to continue to maintain 100 SNF beds and the reduction of SNF and subacute-care beds under the proposed LRDP would not result in a transfer or redistribution of services to other health care providers in a manner that would result in potential impacts on public services, or other indirect physical environmental impacts such as traffic or air quality impacts.
- Major Response HC-8 (page C&R 3.23-32) regarding access to health care services, which explains that the proposed LRDP would not reduce or fail to provide local access to health care in a manner that would result in potential physical environmental impacts.

As explained in detail in the Major Responses described above, the record indicates that the proposed LRDP would provide adequate capacity to meet CPMC's current and projected demand for health care services for its patients and, therefore, would not contribute to any project-level, program-level or cumulative impacts (or indirect effects therefrom, associated with shifts in patients or services) that are not fully disclosed in the Draft EIR. Where impacts were determined to be significant, the Draft EIR identified mitigation measures to reduce them to a less-than-significant level to the extent feasible. The Draft EIR also identified a range of reasonable alternatives that would avoid or substantially reduce the project's significant impacts.

Changes in Patient Access to CPMC Hospitals and Patient Travel Patterns.

Table 1 in Comment 93-17 also states that the change from four existing CPMC acute-care hospitals to three acute-care hospitals under the proposed LRDP "likely [would] impact who [accessed] the hospitals and how these patients [would] travel—beyond CPMC—for services," and states that additional details are needed to analyze "those implications of the proposed Project." The consolidation of services and transfer of patients, employees, and visitors from four to three acute-care hospitals at CPMC campuses under the proposed LRDP is fully accounted for in the impact analysis of all relevant topics under the Draft EIR. All air quality and traffic impacts associated with the proposed LRDP (including cumulative impacts) were analyzed in the Draft EIR in Sections 4.5 and 4.7. To the extent that changes in CPMC's patient and employee travel patterns (travel distances, types of trips, etc.) are relevant to the LRDP's direct or indirect environmental impacts (including cumulative impacts), that information has been factored into the analysis in the Draft EIR. As explained in the Draft EIR, page 4.5-72, travel surveys of CPMC personnel, patients, and visitors were conducted to develop origin-destination assumptions for purposes of the transportation analysis. Based on this survey information, trip distribution was assigned for CPMC personnel, patients, and visitors traveling to or from the CPMC campuses from four quadrants (or "Superdistricts") of the City, or from the East Bay, South Bay, North Bay, or outside the Bay Area.[445] Table 4.5-12, "Trip Distribution Patterns by Campus" in the Draft EIR, page 4.5-78, indicates the distribution of trips by San Francisco quadrant, as well as by trips originating or ending outside of San Francisco that were assumed for each of the CPMC campuses based on the survey results. The transportation analysis based upon the origin-destination assumptions developed from the travel surveys of CPMC personnel, patients, and visitors in turn was utilized to develop the analyses in the Draft EIR of other environmental impacts related to traffic that would be generated by the proposed LRDP, e.g., Noise (Section 4.6), Air Quality (Section 4.7), and Greenhouse Gas Emissions (Section 4.8).

The comment does not raise any transportation or other environmental issues that are not already analyzed in the Draft EIR. The Draft EIR included a thorough and adequate analysis of the proposed LRDP and its impacts, and the Chapter 2, "Project Description" in the Draft EIR clearly indicates that the proposed LRDP would involve changes to the CPMC system that would include the change from four to three acute-care hospitals.

[445] Adavant Consulting, 2010 (January 29), *CPMC LRDP Travel Demand Estimation for the San Francisco Campuses*, prepared for the San Francisco Department of Public Works, pages 21 and 39.

Please see Major Response HC-8 for additional detailed information regarding patient access to CPMC hospitals under the proposed LRDP.

Number of Licensed and Staffed Beds

Table 1 in Comment 93-17 states that the existing CPMC system includes 1,253 licensed beds and 875 staffed beds overall, which would be reduced to a total of 952 licensed beds and 831 staffed beds under the proposed LRDP. Table 1 in Comment 93-17 also states that overall licensed beds would be reduced by 178 beds.

Please see the text revisions to Draft EIR Table 2-2, "CPMC Existing and Proposed LRDP Licensed Hospital Bed Uses" included in Chapter 4 of this C&R document. As shown in the revised version of Table 2-2, at the time Notice of Preparation (NOP) for this EIR was issued in May 2009, establishing the environmental baseline for the Draft EIR analysis of the proposed LRDP, the existing CPMC system included a total of 1,174 licensed beds, rather than 1,253 as stated by the comment. A reduction from 1,252 to 1,174 licensed beds occurred between 2008 and 2009, prior to the issuance of the NOP, because of changes in the number of licensed acute care, rehabilitation, and psychiatric beds at the Davies Campus, as shown in the revised version of Table 2-2. Additionally, as shown in the updated version of Table 2-2, the proposed LRDP would result in a total of 903 licensed beds, rather than 952, as stated in the comment. Therefore, the project would result in an overall reduction of 271 beds.

With respect to "staffed" beds, please see Major Response HC-1 (page C&R 3.23-1), which explains that although the proposed LRDP would result in a reduction in licensed acute-care beds at CPMC campuses, it would not reduce the level or capacity of care. This largely would be because the remaining number of beds would still be sufficient to deliver all of the acute care programs and services CPMC currently delivers, and would also accommodate the anticipated future demand for acute care services. As further explained in Major Response HC-1, the number of beds that are actually used for patient care on a daily basis in the current CPMC system (which includes multi-bed rooms within the existing acute care facilities) are substantially less than the number that are licensed. For example, the California Office of Statewide Health Planning and Development (OSHPD) indicates that the average daily census (actual patients in licensed beds) for all of CPMC in 2009 was 559; an occupancy rate of 48 percent for licensed beds (of the 1174 total beds) systemwide.[446] In 2010, CPMC's observed maximum systemwide census was 656; an occupancy rate of 56 percent[447] (which is significantly below the proposed total of 903 licensed beds.) These low occupancy rates reflect a past industry practice of retaining licensed acute care bed capacity beyond what the actual demand required.

With the shift to single-patient rooms under modern hospital guidelines, newer facilities, such as the St. Luke's Replacement Hospital and the proposed Cathedral Hill Hospital under the LRDP, are projected to have a higher occupancy rate than older facilities with multi-patient rooms. In other words, a much higher percentage of licensed beds are expected to be used in hospitals with single-patient rooms. Thus, a hospital with single-patient beds can serve a larger number of patients than a hospital with the same number of beds in shared patient rooms. As explained in detail in Major Response HC-1, because of the shift from multi-patient to single-patient rooms, under the proposed LRDP, all licensed beds would be effectively utilized (occupancy rates are expected to be approximately 80 percent for acute-care beds, 88 percent for rehabilitation beds, 85 percent for psychiatric beds, and 94 percent for SNF beds).[448] There

[447] CPMC, Memorandum from Malia Weinberg to Geoffrey Nelson re: CPMC's maximum census in 2010 (Apr. 5, 2011).
[448] CPMC, Memorandum from Malia Weinberg, Senior Project Manager, Operations, Planning and Activations, to Brian Boxer (AECOM) re: Occupancy Rate Assumptions (May 12, 2011).

would be some variation in staffing on any given day, as staffing is adjusted based upon patient census and the acuity of patient conditions (the higher the acuity of patients, the more nurses are necessary).

Emergency Room Trips/Admissions and Ambulance Trips

Table 1 in Comment 93-17 also includes statements that the Draft EIR's "description of existing and projected emergency room trips/admissions related to CPMC, as well as existing and projected total San Francisco population-related emergency room trips/admissions is incomplete," and that the omission of this information renders the Draft EIR impact analyses incomplete. As explained in Major Response HC-5 (page C&R 3.23-20) regarding emergency services, the overall systemwide Emergency Department capacity at the CPMC campuses would be increased under the proposed LRDP, and the LRDP would not result in impacts to emergency rooms at other San Francisco hospitals. Impacts resulting from changes in trips to other non-CPMC San Francisco hospitals and admissions at the emergency rooms of other San Francisco health care providers would not be impacts of the proposed LRDP, and thus they are not required to be analyzed in the Draft EIR.

As stated on page 4.5-145 of the Draft EIR, the proposed Cathedral Hill Campus under the LRDP is expected to receive between 8,400 and 9,600 emergency calls, or about half of all emergency patients within the CPMC system, per year. The transportation impacts of these emergency vehicle trips were evaluated in Impacts TR-52, TR-53, and TR-54 in the Draft EIR, pages 4.5-145 through 4.5-147. The Pacific and California Campuses would be anticipated to receive zero emergency calls per year under the proposed LRDP.[449] The effects of emergency vehicle access at the Pacific Campus (under the LRDP) are evaluated under Impact TR-65 in the Draft EIR, page 4.5-175. The effects of emergency vehicle access at the California Campus (under the LRDP) are evaluated under Impact TR-72 in the Draft EIR, page 4.5-182. The Davies Campus would be anticipated to receive between approximately 3,200 and 3,600 emergency calls per year under the LRDP.[450] The effects of emergency vehicle access at the Davies Campus are evaluated under Impact TR-82 in the Draft EIR, page 4.5-192. The St. Luke's Campus would be anticipated to receive between approximately 5,400 and 6,300 emergency calls per year under the LRDP.[451] The effects of emergency vehicle access at the St. Luke's Campus (under the LRDP) are evaluated under Impacts TR-92 and TR-93 in the Draft EIR, page 4.5-206.

In all cases, these impacts were determined to be less than significant, because, among other reasons, (1) the proposed Cathedral Hill Hospital is located along major routes to many neighborhoods, (2) likely routes to the Cathedral Hill Hospital are multi-lane arterial roadways that allow the emergency vehicles to travel at higher speeds and permit other traffic to maneuver out of the path of the emergency vehicles, (3) after the relocation of acute care functions from the 2333 Buchanan Hospital at the Pacific Campus to the Cathedral Hill Campus, the Pacific Campus would no longer serve emergency ambulance vehicles, but would retain emergency vehicle access, (4) existing uses at the California Campus requiring emergency vehicle access would be relocated to the Cathedral Hill Campus, (5) the proposed LRDP would not change the existing access points for emergency vehicles entering the Davies Campus or increase the area at the Davies Campus used for emergency care, and (6) new emergency vehicle access would be provided for the St. Luke's Replacement Hospital on 27th Street between Guerrero Street and San Jose Avenue. Please also see Response TR-100 (page C&R 3.7-170) regarding emergency vehicle access, which provides further explanation regarding why the proposed LRDP would not result in significant impacts related to emergency vehicle access to the Cathedral Hill Hospital.

Existing and LRDP-related emergency room trips and admissions are fully accounted for in the trip generation for the CPMC acute-care hospitals and, therefore, were factored into the Draft EIR analysis of

[449] TransOptions4Healthcare, 2011 (Feb. 28), *City of San Francisco Fire Department 911 Emergent Transports to CPMC Campuses: 2004, 2008, 2015*, prepared for California Pacific Medical Center, p. 28.
[450] Ibid.
[451] Ibid.

transportation and circulation impacts. The transportation analysis based upon theses trip generation assumptions, in turn, was utilized to develop the analyses in the Draft EIR of other environmental impacts related to traffic that would be generated by the proposed LRDP, e.g., Noise (Section 4.6), Air Quality (Section 4.7), and Greenhouse Gas Emissions (Section 4.8).

Comment 93-33 also states that information related to emergency room admissions and ambulance trips is necessary to evaluate "cumulative impacts of transit and traffic generated by patients having to travel greater distances for services." As explained in Major Response HC-5, the proposed LRDP would increase Emergency Department capacity at the St. Luke's Campus, and would also increase the total combined emergency and urgent care capacity within the entirety of the CPMC system, from 88,000 visits/year currently to over 100,000 visits/year at the Cathedral Hill, Davies, and St. Luke's Hospitals. Therefore, patients would not be required to travel greater distances for services than under current conditions, except that patients who would travel to the California or Pacific Campuses for emergency services under existing conditions generally would instead travel to the Cathedral Hill Campus under the proposed LRDP.

As explained in the Draft EIR, page 4.5-72, travel surveys of CPMC personnel, patients, and visitors were conducted to develop origin-destination assumptions for purposes of the transportation analysis. Based on this survey information, trip distribution was assigned for CPMC personnel, patients, and visitors traveling to or from the CPMC campuses from four quadrants (or "Superdistricts") of the City, or from the East Bay, South Bay, North Bay, or outside the Bay Area.[452] The transportation analysis based upon the origin-destination assumptions developed from the travel surveys of CPMC personnel, patients, and visitors accounted for the shift of patients currently receiving emergency and other services at the California and Pacific Campuses to the Cathedral Hill Campus. The transportation analysis in turn was utilized to develop the analyses in the Draft EIR of other environmental impacts related to traffic that would be generated by the proposed LRDP, e.g., Noise (Section 4.6), Air Quality (Section 4.7), and Greenhouse Gas Emissions (Section 4.8). An EIR is not required to further respond to comments speculating on potential impacts that are not supported by substantial evidence in the record.

The comment describes CPMC as having two existing triage areas (prior to the proposed LRDP) and indicates that there would be three triage centers under the proposed CPMC LRDP. It is not clear whether the commenter is simply referring to Emergency Departments as "triage centers." If that is the definition intended by the comment, CPMC currently has four (not two) Emergency Departments and would have three Emergency Departments under the proposed LRDP (located at the proposed Cathedral Hill Hospital, the existing Davies North Hospital Tower, and the proposed St. Luke's Replacement Hospital).[453] On the other hand, if the comment is referring to actual triage rooms within the Emergency Department, defined as a room that has two doors—one with access to the waiting room and one to the main Emergency Department to allow for a one-way flow of patients into the department, then CPMC currently has four triage rooms (one at each existing campus) and would have six triage rooms under the LRDP (three at the Cathedral Hill Campus, one of which would be dedicated to pediatric patients, one at the Davies North Hospital Tower, and two at the St. Luke's Replacement Hospital).[454] As the number of triage rooms is often a rate-limiting factor in an Emergency Department's ability to accommodate patients, the increased number of triage rooms would increase the throughput of the CPMC Emergency Departments and, therefore, their ability to serve more patients.[455]

[452] Adavant Consulting, 2010 (January 29), *CPMC LRDP Travel Demand Estimation for the San Francisco Campuses*, prepared for the San Francisco Department of Public Works, pages 21 and 39.
[453] CPMC, memorandum from Malia Weinberg, Senior Project Manager, Operations, Planning and Activations, to David Reel (AECOM) & Brian Boxer (AECOM), re: System wide ED and Urgent Care (June 1, 2011).
[454] Ibid.
[455] Ibid.

Lack of Helicopter Landing Pad

Table 1 in Comment 93-17 includes a comment that the lack of a helicopter landing [pad] could result in impacts related to health care services, and related to air quality, and greenhouse gas emissions, because of reliance on other heliports outside of San Francisco. CPMC does not currently offer trauma services at any of its facilities, nor does it intend to do so under the proposed LRDP. The proposed LRDP would not result in any change to the existing baseline related to citywide medical helicopter services, as CPMC also does not currently provide any helipads at its existing facilities. The CPMC campuses would not rely on other heliports outside of San Francisco as speculatively suggested by the comment. As is current practice, any CPMC patients being airlifted in or out of San Francisco would be transported from the heliport at San Francisco International Airport, with the exception of patients arriving in helicopters from the North Bay, which would land at Crissy Field.[456] After landing, patients would be transported to a CPMC hospital by ambulance.[457] Therefore, the project would not result in any health care services, air quality, greenhouse gas emission, or other impacts related to changes in the use of or the lack of helicopter landing pads at the CPMC campuses.

Detailed Patient Information

Table 1 in Comment 93-17 also includes a statement that detailed patient information regarding outpatient visits needed to fully assess project impacts was not included in the Draft EIR. The comment does not provide details regarding specific information related to outpatient visits that would be needed to adequately analyze proposed LRDP impacts, the types of impacts that would potentially be affected by such information, or any reasoning as to why such additional information could affect the analysis of LRDP impacts in the Draft EIR. In addition to the project description details provided in Sections 2.2, 2.3, 2.5, and 2.6 of the Draft EIR, additional details related to changes at the CPMC campuses are included where necessary in the environmental resource sections of the Draft EIR that contain analyses of various potential physical environmental impacts of the proposed LRDP.

Moreover, to the extent that changes in CPMC's patient and employee travel patterns (travel distances, types of trips, etc.) are relevant to the project's direct or indirect environmental impacts (including cumulative impacts), that information has been factored into the analysis in the Draft EIR, as explained above and in page 4.5-72 of the Draft EIR. The transportation analysis based upon the origin-destination assumptions developed from the travel surveys of CPMC personnel, patients, and visitors, in turn, was utilized to develop the analyses in the Draft EIR of other environmental impacts related to traffic that would be generated by the proposed LRDP, e.g., Noise (Section 4.6), Air Quality (Section 4.7), and Greenhouse Gas Emissions (Section 4.8).

Comment 93-27 specifically requests information on CPMC's "target patient profiles." Please see Response INTRO-7 (page C&R 3.1-17) regarding the appropriate consideration of social and economic impacts under CEQA. Information regarding CPMC's patient base involves social and economic concerns that are outside of the scope of the CEQA requirement to analyze the environmental impacts of the proposed LRDP, except to the extent that information regarding CPMC's patient base could indirectly result in indirect physical environmental impacts under the proposed LRDP.

Other than collecting income information from those seeking to qualify for charity care, CPMC does not collect information regarding the income of its patients. Therefore, to the extent that this comment can be construed as requesting information regarding the income of CPMC's patient base under the proposed LRDP, this information is not available. Moreover, because the project would not change the income level of CPMC's existing patient base, which would continue to be served by the proposed replacement facilities, information regarding the income level of existing patients would not be relevant to analyzing

[456] Ibid.
[457] Ibid.

any potential direct or indirect environmental impacts resulting from the project. Please also see Major Response HC-8 (page C&R 3.23-32) regarding access to health services, which includes information regarding charity care and other services that CPMC currently provides and would provide under the proposed LRDP for low-income and other underserved populations.

Future Employment at the California Campus Sites

As explained on page 2-132 in the Draft EIR, future uses of the California Campus after it is sold by CPMC by 2020, are speculative in nature at this time. It is assumed that a prospective purchaser would ultimately seek to renovate and/or redevelop the California Campus; however, the nature, timing, and extent of development are unknown at this time and are therefore beyond the scope of the EIR for the proposed LRDP. Section 15145 of the State CEQA Guidelines states that "[i]f, after thorough investigation, a Lead Agency finds that a particular impact is too speculative for evaluation, the agency should note its conclusion and terminate discussion of the impact." Because future uses and related future employment at the California Campus sites after the sale by CPMC to a subsequent purchaser are too speculative for evaluation there is no need to provide the information regarding projected future employment at the California Campus as suggested by the comment.

Plan for Replacement Housing

Please refer to Responses PH-14, PH-15, and PH-16 (pages C&R 3.5-53 to 3.5-62) for a discussion of how and when replacement housing must be provided within San Francisco and the degree to which CPMC is assisting those residents that would be displaced as a result of construction at the proposed Cathedral Hill Campus.

Psychiatric Admissions

Comment 93-33 requests details related to psychiatric admissions at the CPMC campuses under the proposed LRDP and suggests that such details are essential for the analysis of the proposed LRDP's impacts. Please see Major Response HC-4 (page C&R 3.23-19) regarding psychiatric beds, which explains that the proposed total of 18 licensed psychiatric beds under the LRDP (all at the Pacific Campus) would be adequate to respond to the demand for CPMC beds, based on the past demand census (average daily census of 10.6 for psychiatric beds in 2009).[458] As shown in Table 2-2 on page 2-10 of the Draft EIR, and the updated version of Table 2-2 included in the text revisions in Chapter 4 of this C&R document, the existing 18 licensed psychiatric beds would continue to be maintained at the Pacific Campus under the proposed LRDP. As such, there would be no change in psychiatric services currently provided or the current level of psychiatric admissions within the CPMC system, and no psychiatric beds or services would be shifted from CPMC to other providers, under the proposed LRDP. Therefore, the record does not support the suggestion that the proposed LRDP would contribute to any physical environmental impacts (including cumulative impacts) related to psychiatric admissions, and no further information is necessary to provide an adequate analysis of the physical environmental impacts of the proposed LRDP.

Comments

(Gloria Smith—California Nurses Association, October 20, 2010) [96-1 HC, duplicate comment was provided in 110-1 HC]

"I have reviewed the Draft Environmental Impact Report ('Draft EIR') for the California Pacific Medical Center ('CMPC') Long Range Development Plan ('LRDP'). The Draft EIR was published by the City of San Francisco

[458] OSHPD, ALIRTS, Annual Utilization Report of Hospitals, California Pacific Med Ctr-Pacific Campus, 2009, available at http://www.alirts.oshpd.ca.gov, accessed Apr. 8, 2011; CPMC, Memorandum from Malia Weinberg, Senior Project Manager, Operations, Planning and Activations, to Brian Boxer (AECOM) re: Inpatient Psychiatric Beds (May 12, 2011).

('City') as the lead agency under the California Environmental Quality Act ('CEQA') for public review on July 21, 2010.[1] My comments below pertain to health care issues and environmental impacts that would result from implementation of the LRDP.

It is my opinion that the Draft Environmental Impact Report to implement California Pacific Medical Center's Long-Range Development Plan is critically flawed in deciding to ignore healthcare in its impact analyses, particularly in its cumulative impact analyses. All of the land use arguments are in their essence cost-benefit arguments about health care. Therefore, an analysis of the CEQA impacts of the LRDP, possible mitigation measures, and alternatives is incomplete and meaningless without an analysis of its health care implications.

My qualifications as a health expert include Director of Public Policy for the California Nurses Association/National Nurses United, former Oakland Planning Commissioner, and member of the San Francisco Blue Ribbon Panel for the St. Luke's Campus. My résumé is attached to this letter.

[1] City of San Francisco, California Pacific Medical Center (CPMC) Long Range Development Plan, Draft Environmental Impact Report, SCH No. 2006062157, July 21, 2010."

(Nato Green, September 23, 2010) [PC-317 HC]

"Nora Green is me when I'm in drag. I'm Nato Green with the California Nurses Association and the Coalition for Health Planning. We believe that the Draft Environmental Impact Report is seriously deficient for deciding essentially on the first page not to look at health care because all of the arguments about why the plan should go one way or another are healthcare arguments, and this body, unfortunately, cannot kick that can down the road to somebody else. And CNA, having looked at it, what we see is that CPMC is asking for a lot of concessions from the City, from a land use and city planning point of view, to build at Cathedral Hill, and the question is are the healthcare benefits so overwhelming and what is the evidence for that?"

Response HC-41

Comment 96-1 includes a statement that the Draft EIR "is critically flawed in deciding to ignore health care in its impact analyses, particularly in its cumulative impact analyses. All of the land use arguments are in their essence cost-benefit arguments about health care." Please see Response INTRO-7 (page C&R 3.1-17) regarding the appropriate consideration of social and economic impacts under CEQA, and Major Response HC-9 (page C&R 3.23-38) regarding the need to consider the proposed LRDP in light of a health care master plan or its equivalent.

Comment 96-1 provides no support for the statement that "[a]ll of the land use arguments are in their essence cost-benefit arguments about health care." The land use impacts of the proposed LRDP are adequately analyzed in Section 4.1, "Land Use and Planning" beginning on page 4.1-37 of the Draft EIR and, to the extent that the land use impacts potentially could have direct or indirect secondary physical impacts on the environment, in the analysis of other impacts throughout Chapter 4 of the Draft EIR. As explained in Section 4.1.4, "Significance Criteria," on pages 4.1-36 to 4.1-37 of the Draft EIR, as revised for additional clarifications in the text revisions on page 4-4 of this C&R document, consistent with Appendix G of the State CEQA Guidelines, the analysis of the proposed LRDP's land use impacts determined whether implementation of the proposed LRDP would have a significant impact on land use and planning if it would:

- physically divide an established community;
- conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including but not limited to the general plan, specific plan, local coastal program, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect; or
- have a substantial impact upon the existing character of the vicinity.

None of these significance criteria call for or involve cost-benefit arguments regarding health care. Therefore, no additional analysis of health care issues is required to provide an adequate analysis of the land use impacts of the proposed LRDP.

Comment

(Gloria Smith—California Nurses Association, October 20, 2010) [96-22 HC, duplicate comment was provided in 110-22 HC]

"The CEQA Guidelines, Section 15126.2, provide that:

'An EIR shall identify and focus on the significant environmental effects of the proposed project .... Direct and indirect significant effects of the project on the environment shall be clearly identified and described, giving due consideration to both the short-term and long-term effects. The discussion should include relevant specifics of the area, the resources involved, *physical changes,* alterations to ecological systems, and changes induced in population distribution, population concentration, the human use of the land (including commercial and residential development), *health and safety problems caused by the physical changes,* and other aspects of the resource base such as water, historical resources, scenic quality, *and public services*...'

Here, the Draft EIR fails to identify and describe the short-term and long-term effects with respect to *physical changes, health and safety problems caused by the physical changes, and public services* associated with implementation of the LRDP. As a result, the Draft EIR fails to assess the any associated significant impacts."

Response HC-42

The comment makes a general statement that the Draft EIR "fails to identify and describe the short-term and long-term effects with respect to *physical changes, health and safety problems caused by the physical changes, and public services* associated with implementation of the LRDP." It is unclear as to what specific impacts the comment is referring. All environmental impacts under all topics listed in Appendix G of the State CEQA Guidelines are addressed in the Draft EIR and in this C&R document in the responses regarding specific environmental impacts related to the proposed LRDP. More specifically, potential effects of the proposed LRDP on environmental issues to which the comment refers are found in the following sections and pages of the Draft EIR:

- Public health and safety is addressed in Section 4.16, "Hazards and Hazardous Materials," on pages 4.16-40 through 4.16-81.
- Effects on public services are addressed in Section 4.11, "Public Services," on pages 4.11-17 through 4.11-36.
- Water is addressed in Section 4.12, "Utilities and Service Systems," on pages 4.12-24 through 4.12-37 and 4.12-45.
- Alterations to ecological systems are addressed in Section 4.13, "Biological Resources," on pages 4.13-18 through 4.13-29.
- Changes induced in population distribution and population concentration are addressed in Section 4.3, "Population, Employment, and Housing," on pages 4.3-18 through 4.3-47.
- Changes in the human use of land (including commercial and residential development) are addressed in Section 4.1, "Land Use and Planning," on pages 4.1-37 through 4.1-70.
- Effects on historical resources are addressed in Section 4.4, "Cultural and Paleontological Resources," on pages 4.4-29 through 4.4-51.
- Effects on scenic quality are addressed in Section 4.2, "Aesthetics," on pages 4.2-95 through 4.2-194.

The Draft EIR adequately analyzes the physical environmental impacts of the proposed LRDP, including the environmental issues to which the comment refers. The comment does not provide any substantial evidence regarding any deficiency in the analyses of any of the full range of environmental impacts analyzed in the Draft EIR.

Comment

(Gloria Smith—California Nurses Association, October 20, 2010) [96-24 HC, duplicate comment was provided in 110-24 HC]

"Title 14, Section 15064, Subsection (e) of the California Administrative Code provides the following guidance for evaluating the changes:

> Economic and social changes resulting from a project shall not be treated as significant effects on the environment. Economic or social changes may be used, however, to determine that a physical change shall be regarded as a significant effect on the environment. Where a physical change is caused by economic or social effects of a project, the physical change may be regarded as a significant effect in the same manner as any other physical change resulting from the project. Alternatively, economic and social effects of a physical change may be used to determine that the physical change is a significant effect on the environment. *If the physical change causes adverse economic or social effects on people, those adverse effects may be used as a factor in determining whether the physical change is significant. For example, if a project would cause overcrowding of a public facility and the overcrowding causes an adverse effect on people, the overcrowding would be regarded as a significant effect.*

The Court in Bakersfield for Local Control v. City of Bakersfield (5th Dist. 2004), Cal. App. 4th 1184 [22 Cal Rptr. 3d 203], affirmed:

> Subdivision (e) of Guidelines section 15064 provides that when the economic or social effects of a project cause a physical change, this change is to be regarded as a significant effect in the same manner as any other physical change resulting from the project. (...) *Conversely, where economic and social effects result from a physical change that was itself caused by a proposed project, then these economic and social effects may be used to determine that the physical change constitutes a significant effect on the environment."*

Response HC-43

Please see Response INTRO-7 (page C&R 3.1-17) regarding the appropriate consideration of social and economic impacts under CEQA. As explained in Response INTRO-7, CEQA is concerned solely with whether a project may have adverse physical environmental effects. Accordingly, the State CEQA Guidelines provide that "[e]conomic and social changes resulting from a project shall not be treated as significant effects on the environment. Economic or social changes may be used, however, to determine that a physical change shall be regarded as a significant effect on the environment." Although social and economic effects are not physical environmental effects, they can be used to connect a proposed project to a physical environmental effect. Section 15131 of the State CEQA Guidelines states that "economic and social effects of a project shall not be treated as significant effects on the environment, [a]n EIR may trace a chain of cause and effect from a proposed decision on a project through anticipated economic or social changes resulting from a project to physical changes caused in turn by the economic or social changes."

In evaluating the environmental impacts of a project, an EIR must evaluate indirect physical effects in addition to the direct effects of a project. Direct effects are effects that are caused by a project and occur in the same time and place. An indirect environmental effect is a change in the physical environment that is not immediately related to a project, but that is caused indirectly by a project.

CEQA does not require the analysis of generalized social and economic impacts, as implied or suggested by many of the comments regarding a range of health care issues, A lead agency is also not required to analyze conclusive statements regarding social and economic impacts that are not supported by substantial evidence.

Comment

(Gloria Smith—California Nurses Association, October 20, 2010) [96-26 HC, duplicate comment was provided in 110-26 HC]

"What's more, impending Medi-Cal cuts will affect all hospitals and will even more severely impact "safety net" hospitals. The severity of the cuts could force some hospitals to close or reduce access to essential health care services. As a result, hospitals with already overcrowded emergency rooms will be further inundated with more patients, longer wait times, and financial stresses.

As Sutter aptly summarizes on one of its websites:

"The loss of critical hospital services will not only be devastating for low income Californians but will also present an increasingly harmful public health scenario for all Californians.

Most important, where will patients go when hospitals are forced to close their doors? More than 70 California hospitals have closed in the past 10 years. Statewide, nearly half of California's hospitals operate in the red and many are either near or already in bankruptcy proceedings. When hospital ERs are backlogged with Medi-Cal and other patients who can't find doctors to care for them, *it doesn't matter how good the insurance coverage is when patients have to drive several hours to receive emergency care.*[27]

These impacts should have been analyzed by the Draft EIR but were not.

[27] Eden Medical Center, A Sutter-Affiliate, What's New At Eden, California's Fiscal Emergency Puts Hospitals and Patients in Jeopardy, May 22, 2008; http://www.edenmedcenter.org/ whatsnew/whatsnew new.html."

Response HC-44

The comment is noted. This comment does not raise issues regarding the adequacy, accuracy, or completeness of the Draft EIR. The comment will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project. The proposed LRDP does not propose and cannot affect any changes to the State's Medi-Cal program. Therefore, any environmental or other effects resulting from changes to the Medi-Cal program would not be an effect of the proposed LRDP. Please also see Major Response HC-8 (page C&R 3.23-32) regarding access to health services.

Comment

(Gloria Smith—California Nurses Association, October 20, 2010) [96-27 HC duplicate comment was provided in 110-27 HC]

"VIII. The Large Size of the proposed Cathedral Hill Hospital Does Not Guarantee Better-Quality Patient Care

The LRDP proposes to build a 555-bed hospital at the proposed Cathedral Hill Campus, at the same time reducing the St. Luke's Hospital from 229 acute care and skilled nursing beds to 80 licensed acute-care beds, terminating services at the California Campus, and all but eliminating services at the Pacific Campus {295 acute-care beds eliminated, 18 psychiatric care beds remaining). (See Table 2.)

The 555-bed Cathedral Hill Hospital would require a myriad of variances, major entitlements, amendments and exceptions from existing plans, policies and regulations. The Draft EIR's consistency determination for the LRDP is based on the presumption that CPMC would successfully obtain changes to the following:"

Response HC-45

The comment states that the large size of the proposed Cathedral Hill Hospital does not guarantee better quality patient care, describes the proposed reduction in licensed beds at the CPMC campuses, and, presumably referring to the Draft EIR's analysis of the project's consistency with applicable land use plans, states that the determination is based upon the presumption that CPMC would successfully obtain entitlements that are proposed as part of the LRDP project description as described in Table 2-3. "Required Project Approvals," on pages 2-13 through 2-17 of the Draft EIR.

Please see Major Response HC-2 (page C&R 3.23-8), which explains the patient care benefits resulting from the size and co-location of services at the proposed Cathedral Hill Hospital.

The comment that the proposed LRDP would result in "all but eliminating services at the Pacific Campus" appears to be based on a misunderstanding of the proposed LRDP. As provided in the LRDP project description discussion in the Draft EIR, pages 2-114 through 2-117, although 18 psychiatric beds would be the only remaining inpatient uses at the Pacific Campus after implementing the proposed LRDP, the Pacific Campus would continue to provide outpatient services. The existing 2333 Buchanan Street Hospital at the Pacific Campus would be converted into the Ambulatory Care Center (ACC), which would offer outpatient care (23,200 square feet), diagnostic and treatment services (116,500 square feet), and Alzheimer's residential care (32,500 square feet). Uses within the proposed ACC Addition at the Pacific Campus might include outpatient space, diagnostic and treatment space, medical offices, and outpatient care, among other uses listed in the Draft EIR, page 2-116. No changes are foreseen under the proposed LRDP for the 2400 Clay Street MOB, the 2395 Sacramento Street building (Health Services Library), 2323 Sacramento Street Building (Mental Health Center, which would continue to operate as an inpatient and outpatient facility with 18 psychiatric beds), Pacific Professional Building (2100 Webster Street), or the 2300 California Street MOB, all at the Pacific Campus. Additionally, the proposed Pacific Campus urgent care center would treat patients with non-emergency ailments such as joint and muscle pain, skin infections, abdominal pain, urinary tract infections, headaches, infections of the ears, throat and sinuses, and cough/bronchitis, thereby reducing demand for services at the proposed Cathedral Hill Emergency Department by approximately 17 percent, and increasing effective overall capacity.

Although most services would be relocated from the California Campus to the Cathedral Hill and Pacific Campuses under the proposed LRDP, the comment's statement that the LRDP proposes to terminate all services at the California Campus is not accurate. As discussed in the Draft EIR, pages 2-131 through 2-132, "[a] small amount of CPMC-operated space (approximately 2,400 sq. ft.) at the 3838 California Street MOB (primarily outpatient imaging and blood drawing) would be leased from the buyer of the California Campus property indefinitely. With that exception, it is expected that by about 2020 almost all CPMC-related use of the California Campus would cease."

Please see Responses LU-5 and LU-9 in Section 3.3 of this C&R document (pages C&R 3.3-30 and 3.3-64, respectively) for detailed responses to similar comments regarding the Draft EIR's analysis of the project's consistency with applicable land use plans.

Comment

(Gloria Smith—California Nurses Association, October 20, 2010) [96-29 HC, duplicate comment was provided in 110-29 HC]

"It is no secret why Sutter is intent on building such a large hospital despite all the variances, major entitlements, amendments and exceptions from existing plans, policies and regulations it needs: profit. Research on hospital size and profitability indicates that large hospitals are more profitable. According to a 2002 article in the Journal of Health Care Finance: 'The relationship between hospital profitability and hospital bed size revealed that when bed size increases, hospital profitability increases, decreases, and then increases again.'[28] The study found that the turning points for patient profit proportion are 238 and 560 beds, respectively for the total profit proportion; the turning points in bed size are 223 and 504, respectively. These results on the relationship between bed size and hospital profitability indicate that medium-size hospitals are in general the least profitable. The findings regarding the profitability of large hospitals in this study are supported by the Medicare Cost Reports for 2006 which show that the more beds a hospital has, the more likely *it* will be profitable. For hospitals with more than 550 beds, 90% had a positive net income; for smaller hospitals, the percentage with positive net income drops to 72%.

[28] Kim YK, Glover SH, Stoskopf CH, Boyd SO, The Relationship between Bed Size and Profitability in South Carolina Hospitals, J Health Care Finance, Vol. 29(2):53-63, Winter 2002; abstract available at http://www.ncbi.nlm.nih.gov/pubmed/12462659."

Response HC-46

The comment is noted. This comment addresses the potential size and profitability of proposed Cathedral Hill Hospital and does not raise issues regarding the adequacy, accuracy, or completeness of the Draft EIR. The comment will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project.

Comments

(Gloria Smith—California Nurses Association, October 20, 2010) [96-30 HC, duplicate comment was provided in 110-30 HC]

"The Cathedral Hill Campus is too big for the site. The benchmarking report provided by the City's and County's Office of the Legislative Analyst ('OLA') showed that most hospitals of the size of Cathedral Hill in major urban areas occupy far larger sites.[29] In fact, for its Santa Rosa facility, Sutter tried to justify that 25 acres of land would be necessary to accommodate a 174-bed, 360,000-square foot hospital.[30] Here, Sutter would squeeze 555-bed, 655,100-square foot hospital and 307,400 square feet of MOB buildings onto 3.85 acres.[31]"

[29] Kim YK, Glover SH, Stoskopf CH, Boyd SD, The Relationship between Bed Size and profitability in South Carolina Hospitals, J Health Care Finance, Vol. 29(2):53-63, Winter 2002; abstract available at http://www.ncbi.nlm.nih.gov/pubmed/12462659.
[30] Alexa Delwiche and Frances Zlotnick, City and County of San Francisco, Office of the Legislative Analyst, Legislative Analyst Memorandum, April 3, 2009, Re: OLA No. 003-009).
[31] Sutter Health statement at May 27, 2010 County of Sonoma Board of Supervisors hearing."

(Gloria Smith—California Nurses Association, October 20, 2010) [96-31 HC, duplicate comment was provided in 110-31 HC]

"As discussed before, this would result in numerous impacts including impacts on health care, traffic and transportation, parking, air quality, greenhouse gas emissions, to name a few."

(Lisa Cleis, September 23, 2010) [PC-80 HC]

"Hi, my name is Lisa Cleis and I am a community organizer with James Tracy, at Community Housing Partnership. Regarding health care and CPMC, the Environmental Impact Report is also disturbingly silent on the impacts this project will have on health care delivery to the surrounding neighborhoods."

(Jane Martin, September 23, 2010) [PC-255 HC]

"MS. MARTIN: Hi. My name is Jane Martin and I am with the California Nurses Association, and I am also on the Board of San Francisco Pride at Work, which is a member of the Coalition for Healthcare Planning. There is a huge problem with this Draft Environmental Impact Report, and that is that it fails to analyze the healthcare implications of the plan."

Response HC-47

Please see Major Response HC-2 (page C&R 3.23-8) regarding the size of the proposed Cathedral Hill Hospital. The comment includes a statement suggesting that Sutter Health's Santa Rosa hospital, located on a 25-acre site, is evidence to support the comment's claim that the proposed Cathedral Hill Campus is too large for its site. The proposed Cathedral Hill Campus is located in a dense, highly urbanized area, with very different site constraints than are present in the less urbanized Santa Rosa location. Sutter Health's Santa Rosa hospital will be a two-story, 174-bed hospital. A replacement hospital of two-story height and with sufficient bed capacity to replace CPMC's existing acute-care facilities at the Pacific and California Campuses (i.e., a new hospital with approximately 555 beds) could not be feasibly provided in San Francisco, because of the constraints inherent to any conceivable available site in the City.

Extensive consideration was given to the range of project alternatives evaluated in the Draft EIR, including lower and differently configured alternatives, as well as hospital development in different locations in San Francisco. Please see the discussion in Chapter 6, "Alternatives" in the Draft EIR, pages 6-20 through 6-30, regarding alternative heights and configurations that were considered and rejected, and pages 6-10 through 6-20 regarding alternative sites considered but rejected.

The comment states that numerous impacts, including those related to health care, traffic and transportation, parking, air quality, and greenhouse gas emissions, would result from the proposed size of the Cathedral Hill Campus under the CPMC LRDP. The Draft EIR has been prepared in conformance with the provisions of CEQA and the State CEQA Guidelines. Chapter 4, "Environmental Setting, Impacts, and Mitigation" of the Draft EIR adequately analyzed the physical environmental impacts that would result from development of the proposed Cathedral Hill Campus under the proposed LRDP, including the environmental issues to which the comment refers, and the Draft EIR identified mitigation measures to reduce LRDP impacts determined to be significant to less-than-significant levels to the extent feasible. The comment does not provide any substantial evidence regarding any deficiency in the analyses of any of the full range of environmental impacts analyzed in the Draft EIR. Also, as noted on page 4-1 of the Draft EIR, the significance criteria used in the EIR are based on the guidance of the San Francisco Planning Department's Major Environmental Analysis (MEA)[459] Division. Impacts TR-1 through TR-58 in Draft EIR Section 4.5, "Transportation and Circulation," address traffic, transportation, and parking impacts related to the proposed development at the Cathedral Hill Campus (see Draft EIR pages 4.5-93 through 4.5-161). Impacts AQ-1 through AQ-14 address air quality impacts (see Draft EIR pages 4.7-29 to 4.7-85), and Impacts GH-1 through GH-3 address the proposed LRDP's impacts on greenhouse gases (see Draft EIR pages 4.8-21 through 4.8-32).

The comment also refers to "impacts on health care" and "impacts to health care delivery to surrounding neighborhoods." Please see Response INTRO-7 (page C&R 3.1-17) for a detailed discussion regarding the extent to which social and economic issues are considered under CEQA. As explained in Response INTRO-7, CEQA does not require the analysis of a project's social and economic impacts, such as impacts to health care. Therefore, the analysis of the potential impacts of the proposed LRDP on health care is beyond the scope of CEQA review, unless such health care impacts would in turn indirectly result in physical environmental impacts. To the extent that such physical environmental impacts would occur as the result of changes in health care services, they were analyzed in Chapter 4 of the Draft EIR. Please

[459] Since April 2011, MEA has been renamed and is now known as Environmental Planning (EP).

also see Major Responses HC-1 through HC-9 (pages C&R 3.23-1 through 3.23-38) for responses to more specific comments regarding the proposed LRDP's impacts on health care services in San Francisco and the Bay Area, including responses in Major Response HC-8 to comments regarding access to health care for the communities surrounding the CPMC campuses.

Comments

(Gloria Smith—California Nurses Association, October 20, 2010) [96-32 HC, duplicate comment was provided in 110-32 HC]

"So far, CPMC has not provided any evidence that health care benefits from a large hospital would outweigh the significant land use and environmental impacts that would result from locating this hospital on a very small site on one of the City's major thoroughfares with already compromised traffic flow and reducing its services in other parts of the City. Neither has CPMC presented any evidence that the environmentally superior project alternative of a bigger St Luke's and smaller Cathedral Hill would diminish health care benefits from the entire project."

(Gloria Smith—California Nurses Association, October 19, 2010) [96-33 HC, duplicate comment was provided in 110-33 HC]

"The only evidence CPMC has produced so far in support of concentrating services at the Cathedral Hill Campus is a selection from the U.S. News & World Report hospital rankings that show that some of the top-rated hospitals are also big.[32] The comparison is irrelevant because those bigger hospitals are not on a single city block. It might be a relevant comparison if CPMC had 20+ acres, but they do not. Moreover, the methodology of the U.S. News & World Report rankings does not conclude that bigger hospitals are better are better than smaller hospitals.

In fact, it uses 200 beds as a threshold criterion for being on the list and only looks at admittedly 'cherry-picked' specialties. The rankings are not designed to show overall hospital quality and outcomes, and rely on indicators of dubious healthcare value (like magnet status and physician opinion polling). The rankings are designed to guide consumers with rare conditions who can travel for low-volume, high-cost, high-risk specialists; they are useless for health care planning purposes. In fact, scientific studies on the issue of hospital size versus health care benefits are inconclusive and most conclusions are dependent on specialization of services. There is evidence supporting specialization and arguing for consolidation of services to achieve higher case volume, up to a point and only for certain services. There is evidence that certain services achieve better outcomes from higher volume, but not that higher volume of specific services indicates overall larger hospital size. There is no evidence that patients benefit from co-location of clinically unrelated services, like birthing and cardiology. There is no evidence that hospital size is proportional to any indicator of patient care above certain thresholds. There is only limited evidence that what relationship exists between size and patient outcomes is a causal relationship rather than related to factors other than size. Moreover, some studies conclude that large hospitals have higher costs, longer patient stays, lower patient satisfaction in emergency room care, and higher rates of infection or sepsis.

What evidence exists on the relationship between size and quality argues less in favor of an oversized 555-bed Cathedral Hill Hospital but clearly against an undersized 86-bed hospital at St. Luke's Campus. Some of the health problems associated with very small hospitals would be solved if St. Luke's Hospital were increased to 200 beds. The fact is that the trend in California is not to build hospitals as large as 555 beds, except those connected to universities. Most hospitals are between 200-300 beds, and California is almost never building urban hospitals as small as 80 beds, as is proposed for the St. Luke's Campus.

[32] Presented at Planning Commission hearing, November 19, 2009."

(Gloria Smith—California Nurses Association, October 20, 2010) [96-35 HC, duplicate comment was provided in 110-35 HC]

"CPMC has asked the City for numerous variances and massive entitlements and concessions from a land use perspective. The LRDP as proposed has several significant and unavoidable environmental impacts. The Draft

EIR concludes that the environmentally superior alternative is a bigger St. Luke's Hospital and smaller Cathedral Hill Hospital. CPMC's justification for not choosing this environmentally superior alternative is that healthcare benefits would vastly offset the environmental problems. Unfortunately for CPMC, the balance of evidence on healthcare is that healthcare would also be better served by the environmentally superior alternatives."

Response HC-48

The comments are noted. These comments do not raise issues regarding the adequacy, accuracy, or completeness of the Draft EIR. The comments will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project. It is not the role of the EIR to document the benefits of the project. However, if the decision-makers decide to approve the proposed LRDP, they would be required to adopt a statement of overriding considerations in which they would document the benefits of the proposed LRDP, which might, in their minds, outweigh the significant environmental impacts. Pursuant to Section 15093 of the State CEQA Guidelines, the statement of overriding considerations must be based on substantial evidence in the record. Alternative 3A, which would include increased development at the St. Luke's Campus and reduced development at the Cathedral Hill Campus, also could be approved by the decision-makers instead of the proposed LRDP. Please see Major Response HC-2 (page C&R 3.23-8) regarding the medical and other benefits of operation of the proposed Cathedral Hill Campus as a central hub of CPMC's San Francisco network and the size and scope of services proposed at the St. Luke's Campus. Please also see Major Responses HC-1, HC-2, HC-4, HC-5, and HC-6 (pages C&R 3.23-1, 3.23-8, 3.23-19, 3.23-20, and 3.23-25) for responses to various comments related to the implications of the proposed LRDP on health care services in San Francisco and the Bay Area. See also Response ALT-1 (page C&R 3.22-11) regarding Alternative 3A.

Comment 96-35 states that CPMC has requested "numerous variances." Please see Responses LU-5 (page C&R 3.3-30) and LU-9 (page C&R 3.3-64), which explain that no variances have been requested for the proposed LRDP; however, the project sponsor has requested General Plan amendments and changes to the text and maps of the San Francisco Planning Code that would be required to approve the associated CPMC LRDP as proposed (which are set forth in Table 2-3, on pages 2-14 through 2-17 of the Draft EIR, as updated in Chapter 4, "Draft EIR Text Changes", page C&R 4-37), as well as conditional use authorizations that would, consistent with the procedures in the Planning Code, exempt the project from certain otherwise applicable Planning Code requirements. These requested entitlements are described in detail in Responses LU-5 and LU-9.

Comment

(Gloria Smith—California Nurses Association, October 20, 2010) [96-36 HC, duplicate comment was provided in 110-36 HC]

"It is not acceptable that a health care provider with a dominant market share in San Francisco (33% in 2007) deliberately changes its services to reap greater profits while denying access to health care to a large part of its patient population that is not profitable. To put the non-profit status of Sutter into perspective: as of December 31, 2009, Sutter had a $2.63 billion investment portfolio and paid its CEO $2.8 million in 2008; the CEO's top 14 lieutenants each made between $830,000 and $1.8 million annually.[33] Sutter's operations at the CPMC campuses in San Francisco contributed $150-180 million in profit annually, representing the largest single source of Sutter's total profits of $700 million per year. Sutter must rebuild CPMC to comply with state seismic deadlines and will not risk loss of its most profitable affiliate. This means that there is no credible alternative of 'no project.' Sutter will rebuild, and can easily afford any additional costs of redesign, project alternatives, community benefits, development agreements, and any mitigation measures.

[33] Health Care Renewal, How Oligopolists Rationalize Their Market Domination: the Examples of Sutter and Carilion Clinic, August 20, 2010; http://hcrenewal.blogspot.com/2010/08/how-gligopolists-rationalize-their.html."

Response HC-49

The comment is noted. This comment does not raise issues regarding the adequacy, accuracy, or completeness of the Draft EIR. The comment will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project. Issues of the profitability or other financial parameters of CPMC's operations are social and economic in nature. Please see Response INTRO-7 (page C&R 3.1-17) regarding the appropriate consideration of social and economic impacts under CEQA.

The comment states that no potential exists for a "no project" scenario to occur. The decision to approve or deny the application for the proposed LRDP, or to approve one of the alternatives to the LRDP analyzed in the Draft EIR, would be within the discretion of the decision-makers in the Lead Agency, the San Francisco Planning Department. In light of the seismic compliance deadlines of SB 1953 (even as potentially extended to 2020, pursuant to SB 90, or by successor legislation)[460] and the time that would be involved in any major redesign of the proposed CPMC LRDP and acquisition of any OSHPD approvals for such a redesign, CPMC has indicated a substantial risk exists that it would either be forced to close its existing acute-care facilities at the California, Pacific, or St. Luke's Campuses before replacement facilities were ready due to failure to meet the state-mandated deadlines or would require a significantly longer time period to complete, increasing the duration of exposure to seismic risk, if the proposed LRDP were to be materially delayed or if a major redesign to the CPMC LRDP were to be required.

Comment

(Gloria Smith—California Nurses Association, October 20, 2010) [96-37 HC, duplicate comment was provided in 110-37 HC]

"As the San Francisco Chronicle and Business Week reported in August, the Sacramento Bee reported in April, and Kaiser Health News and San Jose Mercury News reported in October of this year, Sutter's business model is designed as a monopoly model, in which it makes itself indispensable to insurers and then charges higher rates.[34] The LRDP as proposed will increase Sutter's regional monopoly, and increase costs of health care for everyone, including taxpayer-funded health plans for public employees. The Draft EIR is incomplete if it does not address the ways in which the LRDP will increase cost of care for everyone and consider appropriate mitigation measures in this area.

[34] Bloomberg News/Business Week, Hospital Monopolies Ruin MRI Bill as Sutter Gets Price it Wants, August 20, 2010; Kaiser Health News, California Hospitals: Prices Rising Rapidly, but Quality Varies, October 17, 2010; Sacramento Bee, California's Higher Hospital Costs Add to Health Insurance Hikes, April 18, 2010."

Response HC-50

The comment is noted. This comment states that the Draft EIR is incomplete if it does not address the ways in which the proposed LRDP might affect the cost of health care generally, and requests consideration of "appropriate" mitigation measures. The comment does not raise issues regarding the adequacy, accuracy, or completeness of the Draft EIR. The comment will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project.

The Draft EIR addresses all of the environmental impacts of the proposed LRDP and associated mitigation measures. Please see Response INTRO-7 (page C&R 3.1-17) regarding the appropriate consideration of social and economic impacts under CEQA.

[460] CPMC memorandum re: Overview of new seismic compliance options available under Senate Bill 90, prepared by Geoffrey Nelson, CPMC, March 21, 2012.

Comment

(Margaret Kettunen Zegart, October 20, 2010) [97-4 HC]

" 'A growing Concern Improving overall health and reducing health inequities between people of different races, geographies and socio-economic statuses has been a growing interesting public health circles. The reasons for these differences are varied but include lack of access to health care and unhealthy conditions in neighborhoods, such as high rates of violence and a dearth of affordable, nutritious food options.' *Report Card, Community Benefit Partnership and Community Health Matters groups, 09/2010"*

Response HC-51

The comment is noted. This comment does not raise issues regarding the adequacy, accuracy, or completeness of the Draft EIR. The comment will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project. See Major Response HC-8 (page C&R 3.23-32) regarding access to health care services and Major Response HC-2 (page C&R 3.23-8) regarding the size and scope of services at the proposed St. Luke's Campus.

Issues related to the demographics of health care are social and economic in nature. Please see Response INTRO-7 (page C&R 3.1-17) regarding the appropriate consideration of social and economic impacts under CEQA. No specific evidence has been provided by the comment that shows the project would result in or increase any health inequities between people of different races, located in different geographic areas of the city, or of different socio-economic status, As explained in Major Response HC-2, the proposed LRDP would not result in a major shift of patients currently receiving services at the St. Luke's Campus or other CPMC campuses to other Sutter Health or non-CPMC hospitals in the region. As explained in detail in Major Response HC-8 (page C&R 3.23-32), there is no difference in policies regarding access to medical services between any of the CPMC hospitals. All CPMC hospitals are equally open to the receipt of under-insured and uninsured patients and decisions on the granting of financial assistance and waivers to patients are made on a uniform policy basis across all campuses.[461] CPMC's coverage of care for under- and uninsured patients is available to families with incomes up to 400 percent of the federal poverty level, which is a higher level than any other San Francisco hospital.[462] Therefore, there is no indication that the proposed LRDP would reduce or fail to provide local access to health care in any particular area of San Francisco, including the southeastern area of the City served by the St. Luke's Campus. Major Response HC-8 provides additional information regarding CPMC's charity care programs and access to CPMC health care services for underserved and lower-income populations such as those in the Tenderloin neighborhood and the southeastern portion of the City.

Comment

(Margaret Kettunen Zegart, October 20, 2010) [97-17 HC]

"Ill persons/ parents and sick or small children cannot be assumed to use public transit from the distance and transfers necessary from the range of the medically under served and tourists. Study of shuttle-on-demand or the taxi script service currently is insufficient, and cannot be a successful mitigation of the children's and women's at Cathedral Hill."

---

461 CPMC, Memorandum from Geoffrey Nelson, Director, EDP, to Brian Boxer (AECOM) re: Access to Healthcare Services (May 13, 2011)..

462 San Francisco Department of Public Health, Healthy San Francisco, *Participant Handbook*, page 13. See also CPMC, patient financial assistance application form, dated May 31, 2007.

Response HC-52

The comment expresses concerns regarding the ability of ill persons and parents of sick or small children to reach CPMC campuses generally, and the Cathedral Hill Campus, in particular, using public transit.

The assumptions about the percentages of future patients, staff, and visitors to the proposed LRDP campuses that would use different modes of transportation were calibrated based on surveys taken by CHS Consulting Group in 2002 and 2003. Travel surveys of existing CPMC staff, patients, and visitors conducted from 2001 through 2009 were used to develop origin-destination, travel mode split, and average vehicle occupancy assumptions for the Draft EIR analysis. Survey information was determined to be valid for estimating LRDP travel demand, because existing CPMC campuses are located in established neighborhoods with limited land use changes anticipated, and with limited roadway networks, transit services, and parking supply changes.

As discussed in detail in the Draft EIR, pages 4.5-75 through 4.5-77:

> Mode split is the relative proportioning of project-generated trips to various travel modes, including automobile, transit, walking and other, where "other" includes bicycle, motorcycle and taxi. An average vehicle occupancy factor was applied to the number of automobile person trips to determine the number of vehicle trips. Mode split and average vehicle occupancy assumptions were based on information contained in the *SF Guidelines*, as well as the data described earlier that was collected at other CPMC campuses. This analysis also assumes that all physicians drive to campus.
>
> The methodology assumes that the modal share would be appropriate to represent both existing and future travel conditions at the CPMC campuses, that is, mode shifts between existing conditions and future conditions are not expected. Although the CPMC LRDP development plans assume an increase in parking supply with the construction of new garages, it is assumed that similar transportation management strategies to those that exist today would be in place when such facilities are opened to act as disincentives to driving by employees, patients and visitors despite the increase in the supply of off-street parking.

Thus, to the extent that current patients traveling to CPMC facilities use transit, the Draft EIR assumes that a similar proportion of patients would use transit in the future.

Please see Major Response HC-2 (page C&R 3.23-8) regarding the role of the proposed Cathedral Hill Hospital as a centralized hub for CPMC's San Francisco network and the size and scope of services at the proposed St. Luke's Campus. As explained in Major Response HC-2, the proposed Cathedral Hill Campus would be at the intersection of two major transit corridors and would be closer than the existing California and Pacific hospitals to the [Tenderloin] area of San Francisco with the highest residential population density, including the highest population density of low-income households, seniors (the most frequent users of hospital care), children and youth.[463] Please also see Major Response HC-5 (page C&R 3.23-20) regarding effects on emergency services.

Comment

(Rachel Sater—Lost Block and Save Our Streets, October 19, 2010) [101-45 HC]

"Blue Ribbon Panel Options: In 2008, San Francisco Supervisor Michela Alioto-Pier and Mitch Katz, M.D., director of San Francisco's Department of Public Health, convened a `blue ribbon' panel of experts to look at the health care needs of San Francisco, and in particular the role that St. Luke's plays in meeting those needs. The

[463] S.F. Planning Department, 2009 (May), *Draft San Francisco General Plan Recreation and Open Space Element*, p. 19, Fig. 2, "High Needs Analysis." The proposed Cathedral Hill Hospital would be located only about a half-mile from the existing Pacific Hospital and would actually be further away from the existing Kaiser Hospital than the existing hospital.

Blue Ribbon Panel recommended that the CPMC Board consider Option 5 (building over San Jose Street) and Option 3 (the 1912 Building and preserving the chapel and tree), with a preference for Option 5, because it better met identified value criteria: continuity of service to patients, low neighborhood impact, an accessible and welcoming presence, and lowest life cycle costs. In public hearings, CPMC has repeatedly claimed that it is following all of the Blue Ribbon's recommendations, and its Board formally resolved to follow the BRP's recommendations. Nevertheless, and despite an associated long public process involving dozens of stakeholder groups and an implied overall environmental impact-reducing objective, neither of the 'blue ribbon' options was evaluated in the DEIR. As was recommended by the Blue Ribbon Panel, these alternatives should be thoroughly evaluated in the DEIR as a means of understanding project impacts and reducing or avoiding potentially significant impacts on the adjacent residential neighborhood to the west and south."

Response HC-53

The Blue Ribbon Panel evaluated several options regarding replacement of the existing 1970 Hospital Tower at the St. Luke's Hospital tower. The comment accurately states that the Blue Ribbon Panel recommended for the CPMC Board to consider Option 5 (building over San Jose Street) and Option 3 (the demolition of the 1912 Building, while preserving the chapel and tree), with a preference for Option 5 because of its better attainment of all of the value criteria considered by the Panel.[464]

CPMC's Board of Directors adopted the Blue Ribbon Panel's preferred option (i.e., Option 5) of building over San Jose Avenue.[465] However, the design of the proposed LRDP evolved as more detailed design studies were conducted, and as CPMC refined its proposal for the St. Luke's Campus, it became clear that a wider building footprint would be necessary to accommodate the services programmed for the St. Luke's Campus than had been understood to be the case at the time of the Blue Ribbon Panel's evaluation.[466] Therefore, although the proposed St. Luke's Replacement Hospital would be partially located over the portion of San Jose Avenue between 27th Street and Cesar Chavez Street that is proposed to be vacated, it also would extend west of San Jose Avenue into CPMC's existing surface parking lot.[467]

The comment also states that Option 3 (construction on the 1912 Building site and preserving the chapel and tree) should be evaluated. State CEQA Guidelines Section 15126.6(a) provides that "[a]n EIR need not consider every conceivable alternative to a project." Under the "rule of reason" governing the selection of the range of alternatives, an EIR is required "to set forth only those alternatives necessary to permit a reasoned choice" (see State CEQA Guidelines Section 15126.6[f]). This is also phrased as presenting a reasonable range of alternatives. Chapter 6, "Alternatives" in the Draft EIR evaluates a reasonable range of alternatives, including two variations of the No Project Alternative at the St. Luke's Campus and Alternatives 3A and 3B, each of which would result in a different level of development at the St. Luke's Campus.

Although an EIR must consider a reasonable range of potentially feasible alternatives, it does not have to identify and analyze alternatives that would not meet most of a project's basic objectives, nor does it have to discuss every possible variant or permutation of alternatives,[468] or alternatives that would not further reduce or eliminate significant effects. Because the Draft EIR has considered a reasonable range of alternatives, it is not necessary to analyze an alternative that would involve constructing the St. Luke's Replacement Hospital at the site of the 1912 Building.

---

464 The Blue Ribbon Panel, 2008, Consensus Positions for Recommendations to CPMC's Board of Directors.

465 Resolution of the California Pacific Medical Center (CPMC) Board of Directors Regarding Its Response to the Recommendations of the Blue Ribbon Panel on the Future of St. Luke's Hospital (Sept. 25, 2008).

466 CPMC, Memorandum from Geoffrey Nelson, AICP, to David Reel (AECOM) & Brian Boxer (AECOM) re: Health Care Response #53 to comment on Blue Ribbon Panel Options (101-45 HC) (Apr. 13, 2011).

467 Ibid.

468 *Jones v. Regents*, 183 Cal. App. 4th 818, 827 (2010); *see also Mira Mar Mobile Cmty. v. City of Oceanside*, 119 Cal. App. 4th 477 (2004). (EIR need not consider in detail every conceivable variation of alternatives stated).

Moreover, as explained in the Draft EIR, page 4.4-33, the historical evaluation of the St. Luke's Campus conducted by Knapp Architects indicated that the 1912 Building (3555 Cesar Chavez Street) appears to be eligible for listing in the California Register of Historical Resources under Criterion 3 (architecture) as an early San Francisco work of a master architect, Lewis P. Hobart, and for embodying the distinctive characteristics of the unified hospital design from the early 20th century.[469] The Planning Department preservation technical specialist concurred with this finding.[470] An alternative that would involve construction of the St. Luke's Replacement Hospital on the site of the existing 1912 Building likely would result in significant and unavoidable impacts to a historical resource.

Furthermore (as described above), according to CPMC, the footprint necessary for the proposed St. Luke's Replacement Hospital is larger than was understood to be the case at the time the Blue Ribbon Panel evaluated the proposed development at the St. Luke's Campus. Therefore, in addition to demolition of the 1912 Building, Option 3 would require the demolition of either the 1957 Building or the Monteagle Medical Center to accommodate the Replacement Hospital, resulting in displacement of services that would need to be replaced elsewhere on the St. Luke's Campus.[471]

Comment

(Carolyn Abst and Ron Case—Case + Abst Architects LLP, October 19, 2010) [102-36 HC, duplicate comments were provided in letter-comment 114-36 HC (Carolyn Abst and Ron Case, October 19, 2010]

"Health studies of the neighborhood surrounding UCSF has shown that there is a larger percentage of health related issues than outlining neighborhoods. Then there is the issue of hospital patience contracting infections and diseases while in the hospital. Some of this must carry outside the medical facility."

Response HC-54

The comment expresses concerns regarding the potential for increased health-related issues in neighborhoods surrounding the proposed CPMC hospitals, because of transmittal of infections and diseases from hospital patients to the surrounding neighborhoods. The comment states that health studies of the neighborhood surrounding UCSF have indicated a larger percentage of health-related issues than in outlying neighborhoods. However, the comments do not reference any specific studies, and neither the Planning Department nor CPMC is aware of any studies showing that UCSF's campuses have a negative impact on the health of surrounding residences. There is also no evidence to support the speculative comment that diseases and infections contracted by hospital patients are likely to spread to the neighborhood surrounding a hospital.

Comment

(Stephanie Barton, et al—Hastings Civil Justice clinic for the Good Neighbor Coalition, October 19, 2010) [104-66 HC]

"CPMC promotes the proposed Cathedral Hill Hospital as a tertiary care facility and establishes as a primary objective for that location the consolidation of all its specialized medical services as well as all women and children's services. With respect to the Cathedral Hill Campus, the DEIR provides no information about how CPMC intends to meet the healthcare needs of residents in surrounding neighborhoods. Nor does the DEIR address the compatibility of CPMC's approach to consolidation with the city's policy of 'actively encouraging the decentralization of major institutional facilities to ... areas ... without adequate services.'[168] The Tenderloin, for

Comment

(Stephanie Barton, et al—Hastings Civil Justice clinic for the Good Neighbor Coalition, October 19, 2010) [104-67 HC]

"The San Francisco Sustainability Plan became official City policy in 1997.[171] It serves as a blueprint for environmentally sound development broadly understood. DEIRs commonly review projects in accordance with provisions of this plan.[172] The analysis in the CPMC DEIR is cursory at best.[173] It briefly discusses consistency with only physical environmental topics, such as greenhouse gas emissions. The Sustainability Plan covers not only such environmental topics, but also broader issues having significant effects on the lives of both present and future generations. One of its fifteen topics is human health: 'To achieve a sustainable society, environmental, cultural, and institutional barriers to good health must be removed and appropriate health care services must be equitably distributed throughout the city. A primary value underlying these goals is that no individual or group should bear a disproportionate health burden.'[174] With respect to healthcare delivery, the Sustainability Plan stresses the importance of both removing barriers to healthcare access and the equitable distribution of health care services throughout San Francisco. As a city plan, it provides further support for why the DEIR in considering the impacts of CPMC's proposed reconfiguration of hospital facilities needs to examine both neighborhood-based and citywide healthcare access and distribution issues.

[171] Sustainability Plan, The Department of the Environment, San Francisco, July 1997.
[172] *See, e.g.,* Treasure Island and Yerba Buena Island Redevelopment Plan, case 2007.0903E; San Francisco 2004 and 2009 Housing Element Draft Environmental Report, case 2007.1275E.
[173] DEIR 3-2.
[174] Sustainability Plan, http:// www.sustainable.city.orglPlanlHeallh/intro.htm."

Response HC-56

The comment states that the Draft EIR's analysis of the *Sustainability Plan for the City of San Francisco* (Sustainability Plan) "is cursory at best, suggests that this analysis should have been expanded to include a discussion of consistency with the human health topic in the Sustainability Plan, states that the Sustainability Plan stresses the importance of removing barriers to health care access and the equitable citywide distribution of health care services, and suggests that the Draft EIR should have considered impacts of the proposed LRDP related to neighborhood-based and citywide health care access and distribution issues.

Adequacy of Draft EIR Discussion of Consistency with the Sustainability Plan

The Draft EIR discusses the consistency of the proposed LRDP with the Sustainability Plan within Chapter 3, "Plans and Policies," on pages 3-22 through 3-23. As explained on page 3-1 of the Draft EIR, "[c]onflicts of the CPMC LRDP with policies do not, in and of themselves, constitute significant environmental impacts; they are considered environmental impacts only when they would result in direct physical environmental effects. . . The consistency of the proposed development with applicable plans and policies that do not directly relate to physical environmental issues will be considered by decision-makers when they determine whether to approve or disapprove the project."

As explained on page 3-22 of the Draft EIR, "[a]lthough the Sustainability Plan became official City policy in July 1997, the Board of Supervisors has not committed the City to perform all of the actions addressed in the plan. The Sustainability Plan serves as a blueprint, with many of its individual proposals requiring further development and public comment."

The same principles that apply to the determination as to whether a given project is consistent with a City's General Plan should be applied to the determination of a project's consistency with the Sustainability Plan, particularly given the nature of the Sustainability Plan as a blueprint, without City commitments to perform all of the actions addressed in the plan, making the Sustainability Plan less of a compulsory document than a General Plan. An analysis of the consistency of the project with General Plan goals, objectives, or policies must be conducted within the framework established by the principle that a given project need not be in perfect conformity with each and every general plan policy.[472] The "policies in a general plan reflect a range of competing interests" and, therefore, a city "must be allowed to weigh and balance the plan's policies when applying them, and it has broad discretion to construe its policies in light of the plan's purpose."[473] A similar weighing and balancing must be applied to the determination of a project's consistency with the goals and policies of the Sustainability Plan.

Comment 104-67 quotes language from the "Introduction" chapter of the Human Health topic within the Sustainability Plan, which states that "To achieve a sustainable society, environmental, cultural, and institutional barriers to good health must be removed and appropriate health care services must be equitably distributed throughout the city. A primary value underlying these goals is that no individual or group should bear a disproportionate health burden." However, the comment does not cite to any specific goals, objectives, or actions related to human health set forth in the Sustainability Plan as raising any potential inconsistencies with the proposed LRDP.

Please also see Response INTRO-7 (page C&R 3.1-17) regarding the appropriate consideration of social and economic impacts under CEQA. As explained in Response INTRO-7, CEQA is concerned solely with whether a project may have adverse physical environmental effects. Accordingly, the State CEQA Guidelines provide that "[e]conomic and social changes resulting from a project shall not be treated as significant effects on the environment. Economic or social changes may be used, however, to determine

[472] See *Sequoyah Hills Homeowners Ass'n v. City of Oakland*, 23 Cal. App. 4th 704, 719-20 (1993).
[473] *Friends of Lagoon Valley v. City of Vacaville*, 154 Cal. App. 4th 807, 816 (2007).

that a physical change shall be regarded as a significant effect on the environment." In evaluating the environmental impacts of a project, an EIR must evaluate indirect physical effects in addition to the direct effects of a project. Direct effects are effects that are caused by a project and occur in the same time and place. An indirect environmental effect is a change in the physical environment that is not immediately related to a project, but that is caused indirectly by a project. CEQA does not require the analysis of generalized social and economic impacts, as implied or suggested by many of the comments regarding a range of health care issues, A lead agency is also not required to analyze conclusive statements regarding social and economic impacts that are not supported by substantial evidence.

Please also see Major Response HC-1 (page C&R 3.23-1) regarding supply of licensed acute-care beds, Major Response HC-2 (page C&R 3.23-8) regarding the location, size, and scope of services, Major Response HC-6 (page C&R 3.23-25) regarding skilled nursing facilities, and Major Response HC-8 (page C&R 3.23-32) and Responses HC-2 (page C&R 3.23-52), HC-7 (page C&R 3.23-74), HC-12 (page C&R 3.23-91), HC-16 (page C&R 3.23-101), HC-17 (page C&R 3.23-111), HC-29 (page C&R 3.23-149), and HC-31 (page C&R 3.23-160) regarding access to health services. As explained in the Major Responses listed above, the proposed LRDP would not result in an inequitable distribution of health care services or place a disproportionate health burden on any individual or group, and the LRDP would not create any barriers to health care access and would replace existing acute-care facilities at the California and Pacific Campuses by moving them to the proposed Cathedral Hill Campus, which would be closer to the City's highest population and the largest citywide concentrations of low-income households, seniors (the most frequent users of hospital care), children, and youth, thereby improving access to modern medical facilities for those populations.[474] As explained in detail in Major Response HC-8, there is no difference in policies regarding access to medical services between any of the CPMC hospitals. All CPMC hospitals are equally open to the receipt of under-insured and uninsured patients and decisions on the granting of financial assistance and waivers to patients are made on a uniform policy basis across all campuses.[475] CPMC's coverage of care for under- and uninsured patients is available to families with incomes up to 400 percent of the federal poverty level, which is a higher level than any other San Francisco hospital.[476] Therefore, there is no indication that the proposed LRDP would reduce or fail to provide local access to health care in any particular area of San Francisco, including the southeastern area of the City served by the St. Luke's Campus. Thus, the proposed LRDP would be consistent with the policies of the San Francisco Sustainability Plan, related to human health.

The Draft EIR concluded on pages 3-22 to 3-23 that the proposed CPMC LRDP would generally be consistent with the Sustainability Plan, primarily because of the LEED® components, TDM program, and greenhouse-gas reducing features incorporated into the proposed LRDP. Given the principle that City's must weigh and balance the various policies in a planning document such as the Sustainability Plan in determining a project's consistency with them, that no evidence has been presented to suggest that the proposed LRDP would be inconsistent with Sustainability Plan goals, policies or actions related to human health, and that no evidence has been presented that any such inconsistency would result in a physical environmental impact, the Draft EIR's analysis of the proposed LRDP's consistency with the Sustainability Plan and conclusion that the proposed LRDP would generally be consistent with the Sustainability Plan constituted an adequate analysis for purposes of CEQA.

Analysis of Health Care Access and Distribution

The suggestion that the Draft EIR should have analyzed neighborhood-based and citywide health care access and distribution issues raises concerns similar to other comments suggesting that the Draft EIR analysis is incomplete without prior completion of a health care services master plan or an equivalent analysis of citywide health care services. Please see Major Response HC-9 (page C&R 3.23-38) regarding a health care master plan and Response HC-7 (page C&R 3.23-31) for a detailed response to these comments.

As explained in Major Response HC-9, CEQA does not require the CPMC LRDP EIR to include an analysis of citywide or regional health care service delivery systems, absent evidence that the proposed LRDP would contribute to health care service gaps that would cause a physical impact on the environment, and no such evidence has been provided by any of the comments. As further explained in Major Response HC-9, the proposed LRDP would not result in any transfer or displacement of services at other non-CPMC health care facilities that could result in a physical environmental impact of the LRDP that is not analyzed in the Draft EIR. Please also see Major Response HC-1 (page C&R 3.23-1) and Major Response HC-2 (page C&R 3.23-8), which explain that the proposed LRDP would provide adequate capacity to meet CPMC's current and projected demand and, therefore, would not contribute to any cumulative impacts (or indirect effects associated with shifts in patients or services). Please also see Major Response HC-3 (page C&R 3.23-17) and Responses HC-7 (page C&R 3.23-74) and HC-31 (page C&R 3.23-160) regarding potential impacts to other health care services, including impacts related to competition. As explained in Major Response HC-3, the comments present no substantiating evidence that increased competition would occur or that any shift in patients from one hospital to the other would result in any physical impact to the environment.

Major Response HC-9 also explains that no further information is necessary regarding the delivery of health care services systemwide to adequately identify and analyze the environmental impacts of the proposed LRDP. All air quality and traffic impacts associated with the proposed LRDP (including cumulative impacts) were analyzed in the Draft EIR in Sections 4.5 and 4.7. To the extent that changes in CPMC's patient and employee travel patterns (travel distances, types of trips, etc.) are relevant to the project's direct or indirect environmental impacts (including cumulative impacts), that information has been factored into the analysis in the Draft EIR.

Comment

(Stephanie Barton, et al—Hastings Civil Justice clinic for the Good Neighbor Coalition, October 19, 2010) [104-79 HC]

"Because the DEIR downplays or overlooks significant environmental impacts, city decision makers lack important and necessary information for determining whether the overriding considerations or justifications for the project outweigh the negative impacts. As discussed in this comment letter, this project especially warrants heightened justification given its potential impacts on myriad environmental and related non-environmental issues, including affordable housing, neighborhood traffic and transit, air quality and greenhouse gas emissions, job opportunities for San Francisco residents, and the accessibility and equitable distribution of healthcare services."

Response HC-57

The comment states that the Draft EIR downplays or overlooks potential significant environmental impacts of the proposed LRDP. This statement represents an apparent misunderstanding of the contents of the Draft EIR. The Draft EIR addresses all of the physical environmental impacts of the proposed LRDP, including direct, indirect, and cumulative impacts for all topics set forth in Appendix G of the State CEQA Guidelines as well as Chapter 31 of the Administrative Code of the City and County of San

Francisco. It is not the role of an EIR to document the benefits of a project. However, if the decision-makers decide to approve the proposed LRDP, they would be required to adopt a statement of overriding considerations in which they would document the benefits of the proposed LRDP, which might, in their minds, outweigh the significant environmental impacts. The decision-makers may choose to approve, disapprove, or modify the proposed project or may choose to approve an alternative to the project. Pursuant to Section 15093 of the State CEQA Guidelines, the statement of overriding considerations must be based on substantial evidence in the record.

The comment includes a statement regarding the proposed LRDP's potential impacts on "the accessibility and equitable distribution of health care services." The suggestion that the Draft EIR should have analyzed the potential impacts related to the accessibility and equitable distribution of health care services raises concerns similar to other comments that suggest that the Draft EIR analysis is incomplete without prior completion of a health care services master plan or an equivalent analysis of citywide health care services. Please see Major Response HC-9 (page C&R 3.23-38) regarding a health care master plan for a detailed response to these comments.

As explained in Major Response HC-9, CEQA does not require the CPMC LRDP EIR to include an analysis of citywide or regional health care service delivery systems, absent evidence that the proposed LRDP would contribute to health care service gaps that would cause an adverse physical impact on the environment, and no such evidence has been provided by any of the comments. As further explained in Major Response HC-9, the proposed LRDP would not result in any transfer or displacement of services at other non-CPMC health care facilities that could result in a physical environment effect of the LRDP that is not analyzed in the Draft EIR. Please also see Major Response HC-1 (page C&R 3.23-1) and Major Response HC-2 (page C&R 3.23-8), which explain that the proposed LRDP would provide adequate capacity to meet CPMC's current and projected demand and, therefore, would not contribute to any cumulative impacts on citywide or regional health care services (or indirect effects associated with shifts in patients or services). Please also see Major Response HC-3 (page C&R 3.23-17) regarding potential impacts to other health care services, including impacts related to competition. As explained in Major Response HC-3, the comments present no substantiating evidence that increased competition would occur or that any shift in patients from one hospital to the other would result in any physical impact to the environment.

Major Response HC-9 also explains that no further information is necessary regarding the delivery of health care services systemwide to adequately identify and analyze the environmental impacts of the proposed LRDP. All air quality and traffic impacts associated with the proposed LRDP (including cumulative impacts) were analyzed in the Draft EIR in Sections 4.5 and 4.7. To the extent that LRDP-related changes in CPMC's patient and employee travel patterns (travel distances, types of trips, etc.) are relevant to the project's direct or indirect environmental impacts (including cumulative impacts), that information has been factored into the analysis in the Draft EIR

Comment

(Iris Biblowitz, October 26, 2010) [115-1 HC]

"Hello-I'm a nurse and have lived in the Mission (26 St and Florida), not far from St. Lukes, for over 30 years. I was a home health nurse, mainly in the Mission, BayView, and Tenderloin, for over 5 years and have a grasp of what health resources are needed in the southeast part of San Francisco. You don't need to be a nurse to know that there's a desperate need for health care in the southeast. SFGH is a wonderful and overwhelmed hospital. Ambulances are diverted from SFGH over 50% of the time. Patients may wait months for an MRI, mammogram, clinic appointment. Patients typically wait 6-12 hours to be seen in the ED, unless they have chest pain or are brought in by ambulance.

St. Lukes Hospital is the only other hospital in the area and it can serve a critical function, if CPMP/Sutter, the planning department, and other city officials are committed to responding to the needs of city residents."

Response HC-58

The comment is noted. Concerns regarding delivery of health care services at San Francisco General Hospital (SFGH) are not relevant to the LRDP EIR, unless the proposed LRDP would contribute to the burden at SFGH in a manner that would result in direct or indirect adverse physical environmental impacts. Please see Major Response HC-3 (page C&R 3.23-17) and Response HC-2 (page C&R 3.23-52) for detailed responses to comments regarding potential impacts of the proposed LRDP to SFGH.

As explained in Major Response HC-5, the proposed LRDP would increase the effective Emergency Department capacity at the St. Luke's Campus from approximately 26,000 visits per year currently to accommodate approximately 31,600 visits per year. According to the San Francisco Health Commission Task Force in CPMC's IMP Updates and Accomplishments document, the increased Emergency Department capacity at the St. Luke's Campus under the proposed LRDP "will be able to handle many more visits than envisioned by the Blue Ribbon Panel and will provide significant backup capacity for SFGH."[477] As explained in Major Response HC-5 (page C&R 3.23-20), emergency capacity in the southeastern portion of San Francisco will be increased by the new UCSF Mission Bay Hospital and the replacement of the existing SFGH hospital with a new SFGH main hospital (which will have 33 percent more emergency room capacity), which would reasonably be expected to reduce the need for diversions from SFGH.[478]

The statement in the comment that "[a]mbulances are diverted from SFGH over 50% of the time" is not supported by the evidence in the record. A hospital (such as SFGH) would be on divert status if its Emergency Department was full or temporarily unavailable.[479] Currently, SFGH is on diversion 20 percent of the time for non-trauma cases (no trauma cases are diverted from SFGH and all trauma cases brought to SFGH are treated there).[480] The St. Luke's Campus is located approximately 1.4 miles from SFGH and the new UCSF Mission Bay Benioff Children's Hospital will be located approximately 1.5 miles from SFGH. The UCSF Emergency Department/Urgent Care is expected to be approximately 16,000 square feet, with 14 treatment stations, three observation rooms, one decontamination room, plus two trauma stations and two triage rooms. Using industry standards of 1,700–2,000 visits/year/station, this new Emergency Department at UCSF could accommodate 23,800–28,000 visits per year (approximately 10 percent fewer visits per year than the St. Luke's Campus under the proposed LRDP). Therefore, some portion of non-trauma cases currently diverted from SFGH to St. Luke's Hospital would be expected to be diverted to UCSF Mission Bay. Diversions from SFGH currently may be directed to the St. Luke's Campus, but may also be directed to other hospital Emergency Departments throughout the city, depending on several factors.[481]

As explained in Major Response HC-5, the proposed LRDP would not only increase Emergency Department capacity at the St. Luke's Campus, but would also increase the total combined emergency and urgent care capacity within the entirety of the CPMC system from 88,000 visits/year currently to over 100,000 visits/year at the Cathedral Hill, Davies, and St. Luke's Hospitals. Therefore, emergency service

[480] San Francisco Planning Department, 2008 (June 4), San Francisco General Hospital Seismic Compliance, Hospital Replacement Program EIR, *Comments and Responses*, page 55.

[481] *See* TransOptions4Healthcare, 2011 (February 28), *City of San Francisco Fire Department 911 Emergent Transports to CPMC Campuses: 2004, 2008, 2015*, prepared for California Pacific Medical Center, pages 14-16.

vehicles would not be forced to transport patients to hospitals located further away and would not result in additional pressure on dispatch capacity at the San Francisco Police Department (SFPD) and San Francisco Fire Department (SFFD) or increase the average response time associated with delivery of emergency cases to acute care hospitals. The discussions of Impacts PS-1 and PS-2 on pages 4.11-17 to 4.11-30 of the Draft EIR analyze the potential for the proposed LRDP to result in substantial adverse physical impacts associated with the provision of or the need for new or physically altered fire, emergency, and police services, identified mitigation measures where needed, and concluded that these impacts would be less than significant.

For all of the above reasons, the evidence in the record indicates that the proposed LRDP would not contribute to the burden at SFGH in a manner that would result in direct or indirect adverse physical environmental impacts. The comment does not raise issues regarding the adequacy, accuracy, or completeness of the Draft EIR. The comment will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project.

Comments

(Hisashi Sugaya—Planning Commission, October 15, 2010) [116-15 HC]

"Also, refer to my comments at the Planning Commission's DEIR public hearing. I made verbal comments at our hearing on the Draft Environmental Impact Report requesting information about health care plans. Please provide an inventory, or something like that in the Comments and Responses document, about other cities' health care/services master plans with a short summary description of each. I also asked how such master plans are used to inform environmental impact reports for medical facilities in these other communities."

(Commissioner Sugaya, September 23, 2010) [PC-363 HC]

"And there are some other areas that I think we should probably get some insight on, and one thing I was wondering – which I'll also put in my notes and comments – is that, whether or not other communities have a healthcare plan, it's probably not required under State Law or anything, so why would anybody do one otherwise, because nobody has any money, but I'm curious to know if other California cities have done such a thing and, if other California cities have done something like a healthcare plan for their community, how has it been used and integrated into any kind of environmental analysis on hospitals? Either long range plans for hospitals, or for specific hospital facilities. So, that's all I have for now, but I'll be submitting comments before the 19th. Thank you. I appreciate everybody coming out. It wasn't that long a hearing! We were prepared for 9:00, I think."

Response HC-59

The following discussion is intended to provide information regarding health care planning in other jurisdictions.

According to the American Health Planning Association, Certificate of Need (CON) programs for health care facilities are still in effect in a majority of states (although not in California).[482] These programs require sponsors of medical facility projects to secure a certificate of need from the state agency or department administering the program before initiating such projects. Certificates are granted based on criteria that typically include requirements to demonstrate demographic and geographic need for the facilities being proposed. Consequently, it is relatively rare for local governments to adopt specific planning prescriptions, such as health care services master plans, for expanding or building new health care facilities.

The American Planning Association's Planning Advisory Service found no local government effort comparable to the health care services master plan that the City is now required to prepare because of the

[482] American Health Planning Association, available http://www.ahpanet.org/copn.html, accessed Dec. 22, 2010.

recent adoption of Ordinance No. 300-10.[483] The typical role for local governments in health care planning, in both states that have CON programs and states, such as California, which do not have CON programs, is to create and implement goals and policies for health care facilities in their general plans or equivalent documents. In California, state law requires non-profit hospitals to prepare and provide community benefit plans, and perform community needs assessments every 3 years. This information, together with the applicable general plan policies, provides local governments with the background information necessary to make decisions on proposed health care facilities projects.

Most local general plan goals and policies addressing health care facilities are broad[484] and focus on facilitating the availability of health care in appropriate locations with respect to local residents, without providing specific guidance regarding the location of health care facilities within particular neighborhoods or areas. For example:

- The City of Walnut Creek 2025 General Plan sets out the following policy statement on health care services: "Facilitate the availability of high-quality health care—routine and advanced—including trauma and other clinical services in appropriate locations close to Walnut Creek residents."[485]
- The City of San José Draft General Plan Update, Chapter 4, "Quality of Life" offers general guidance on the siting of health care facilities. For example, the Draft Plan Update sets out 14 policies for meeting Goal ES-6—Access to Medical Services: "[p]rovide for the health care needs of all members of the San José community."[486] The policies specify land use districts where health care facilities would be appropriately considered (including residential, commercial and mixed districts) (Policy ES-6.2); recommends that the City "[r]espond to changing technology, changes in the City form, and changes in how health care is provided by maintaining and updating, as necessary, regulations for where and how health care can be provided and where health care facilities can be located (Policy ES-6.4); encourage locating new health care facilities in proximity to existing or planned public transit services (Policy ES-6.5) and in areas that are underserved and lack adequate health care facilities (Policy ES-6.6); and encourage major land use planning efforts to consider strategies to address health care needs as part of the planning process (Policy ES-6.14)."[487]

  Other policies in the San José Draft General Plan Update complement policies for meeting Goal ES-6, such as Emergency Management Policy ES-4.6, "Coordinate with other public, private, and non-profit organizations to ensure that emergency preparedness and disaster response programs serve all parts of the City equitably with regards to access to health care."[488]

- The City of San Diego 2008 General Plan, Public Facilities, Services and Safety Element offers general guidance on providing health care services within the City. The Plan establishes three policies to achieve its goal for health care services, "[p]ublic and private health care services and facilities that are easily accessible and meet the needs of all residents."[489] The Plan's discussion of this goal states that the City of San Diego "should continue to coordinate with public, private, and non-profit health care facility and service providers to help ensure that health care services and facilities are available to residents and that siting decisions are integrated with the City's growth strategy. For example, equitably and carefully locating these facilities and services in communities with village

characteristics can help meet the health care needs of a growing population in a manner that increases accessibility, reduces driving trips, and provides for educational, employment, and training opportunities."[490] The policies in place to achieve this goal include "encouraging the provision of diverse, adequate, and easily accessible health care facilities and services to meet the needs of all residents (Policy PF-O.1); striving to locate health care facilities and services near public transit; (Policy PF-O.1.a); and coordinating with providers so that the expansion or construction of new health care facilities addresses General Plan and community plan goals (Policy PF-O.3)."[491]

- Sacramento County, California, has adopted "Good Neighbor" policies for County-owned or leased hospital and medical facilities, which sets out guidance for minimizing impacts on surrounding areas.[492] As expressly set out in the policy document, the County does not use the document to make policy on the propriety of the location of a facility or program in an otherwise properly zoned neighborhood or community.[493]

Two examples of jurisdictions outside of California that have adopted some form of land use planning guidance for hospitals and medical centers are Loudon County, Virginia and Seattle, Washington (both states with a CON program).

- In Loudon County, although medical services providers are required to seek a CON before initiating projects, the County undertook a needs assessment of health services within the County to provide a basis for making health care services policy recommendations to be incorporated into its countywide Comprehensive Plan.[494] This process and the resulting final policies, referred to by the County as its "Health Care Facilities Plan," were designed to provide policy direction on location and type of health care facilities and health care-related businesses throughout the County, among other things.[495] The final policy guidance provided through the County's planning process is similar to that provided in the California jurisdictions discussed above. For example, the policies advise that:

  - health care facilities to be developed within the County should take into consideration area, population, topography, transit and geographic socioeconomic, cultural and transportation characteristics of the area to be served (Policy 3);

  - the County will encourage the location of a variety of health care facilities in those areas where needs have been identified that may be underserved [and] the County will establish incentives [such as density bonuses, expedited review and special zoning districts] to facilitate the private development of primary medical care services in locations across the County (Policy 4);

  - the County will encourage co-location of services and location of health-care related businesses in proximity to established and proposed medical centers and establishment of health-care related zoning districts (discussed below) (Policies 5, 7 and 8);

  - the County will support incentives to encourage the private sector to provide psychiatric, geriatric and indigent care services to satisfy unmet needs (Policy 10);

495 Ibid., pages 2–3.

- the County will encourage development of multiple health care facilities and sites that support regional disaster planning efforts that can provide medical support in the event of a catastrophe, including dispersal of facilities (Policy 14);

- health care facilities should be considered in the County's transportation and land use planning (Policy 15).[496]

► The City of Seattle, Washington (also a CON state) takes an approach somewhat similar to San Francisco, in that its Comprehensive Plan establishes goals and general policy guidance for the City's approach to locating institutional uses (such as medical centers), and its zoning code requires City-approved, detailed institutional master plans for planned expansion of institutions within the City.[497] Comprehensive Plan Policy LU200 states that a master plan is required for each Major Institution proposing development which could affect the livability of adjacent neighborhoods or has the potential for significant adverse impacts on the surrounding areas. The institutional master plan is the City's tool for comprehensive review of benefits and impacts of proposed expansion.[498] The master plan also is intended to give clear guidelines and development standards on which major institutions can rely for long-term planning and development (Policy LU201.1).[499] As part of the master plan process, underlying zoning can be modified or rezoned to facilitate a better relationship between the institution and surrounding uses (Policy LU204).[500]

  Other than the foregoing, the Seattle Comprehensive Plan provides only general guidance concerning health care services, similar to those jurisdictions previously discussed. For example, Comprehensive Plan—Human Development Element Policy HD24 states that the City should seek to improve the quality of, and access to, health care, by collaborating with community organizations and health providers to advocate for quality health care and broader accessibility to services and by pursuing co-location of programs and services, particularly in underserved areas and in urban village areas.[501] Policy HD25 states that the City should work with other jurisdictions, institutions, and community organizations to develop a strong continuum of community-based long-term care services.[502]

According to the American Planning Association (APA): "[a]part from general plan goals and policies for new health care facilities, a number of communities address specific issues of site design for hospitals and medical centers in their local land-use regulations. In many zoning ordinances new hospitals are listed as conditional uses in certain nonresidential districts subject to general conditional use review criteria and, at times, specific use standards. Typically, these standards include bulk controls (e.g., setbacks, lot sizes, coverage limits, and heights) and considerations for development review to ensure functionality and compatibility with nearby properties while mitigating traffic effects.

"Alternately, communities may create a special hospital or medical center zoning district to ensure a compatible mix of uses and to mitigate the effects of these major institutions on surrounding neighborhoods. Rezoning requests (and sometimes any development within the district) are then subject

[502] Ibid.

to a development plan review similar to a planned unit development process."[503] The San Francisco Planning Code provides the City with similar authority to proceed in this manner.

Because no examples of other planning requirements appear that are similar to the health care services master plan required under Ordinance 300-10, it does not seem that any such plans inform environmental review in other jurisdictions. However, as part of the environmental review process under CEQA, lead agencies in California generally are required to discuss a proposed project's consistency with existing, applicable general plans and their policies.[504] That requirement would encompass a discussion of a health care facilities project's consistency with relevant general plan policies. Similarly, environmental review documents prepared by the City of Seattle under the Washington State Environmental Policy Act (SEPA), in connection with its review of hospital institutional master plans, also contain discussions of consistency with the City's Comprehensive Plan land use and health care-related policies. Virginia does not have an environmental review statute similar to CEQA and, therefore, Loudon County's Health Care Facilities Plan would not be used as part of any similar environmental review process.

Please also see Major Response HC-9 (page C&R 3.23-38) and Response HC-7 (page C&R 3.23-74) regarding a health care services master plan or an equivalent analysis of citywide health care services. As explained in Major Response HC-9, Ordinance No. 300-10, effective January 2, 2011 (the Ordinance), directs the preparation of a citywide health care services master plan (Health Care Plan), which is anticipated to be completed by 2013 at the earliest. The recently adopted Ordinance sets out a lengthy and detailed series of requirements and processes, preceding adoption of a Health Care Plan. The Ordinance would not apply until the Health Care Plan was adopted. Furthermore, the Health Care Plan would be subject to its own review under CEQA, before adoption. The Ordinance would apply to applicable changes in medical uses after either January 2, 2013, or formal adoption of the Health Care Plan, whichever occurs later. Therefore, the Ordinance could not apply to proposed changes under the LRDP that are approved before January 2, 2013. As explained in Major Response HC-9, CEQA does not require the CPMC LRDP EIR to include an analysis of citywide or regional health care service delivery systems, absent evidence that the proposed LRDP would contribute to health care service gaps that would cause a physical effect on the environment, and no such evidence has been provided.

Comments

(Felicidad Afenir, September 23, 2010) [PC-35 HC]

"We demand CPMC must upgrade each existing hospitals, affiliated existing hospitals like Davies, Sutter and St. Luke's, instead of downgrading. We don't want to lose these hospitals because they have already earned their good service to the community and they should also increase primary care access in our community-based clinics and long term commitments to partner with community-based clinics in providing secondary care in their hospitals."

(Jessica Weimer, September 23, 2010) [PC-43 HC]

"My name is Jessica Weimer and I have been a Registered Nurse for 38 years. I have spent 33 of those years with CPMC. And I would like to discuss with the published San Francisco health goals that were in the *Chronicle's* paper today and how that is at odds with what CPMC proposes. The first goal on the list is to increase access to quality medical care. With the closing of CPMC, the downsizing of both St. Luke's and the Pacific campus, it is going to make it much more difficult for the underserved to get their health care."

[503] David Morley, AICP, Research Associate, Planning Advisory Service Coordinator, American Planning Association, 2010 (November 16), E-mail correspondence to Geoffrey Nelson, CPMC.
[504] State CEQA Guidelines Section 15125(d).

(Jessica Weimer, September 23, 2010) [PC-45 HC]

"Also, to raise healthy children – the California campus has one of the only pediatric ER's in the City and that would be closed down, eliminating access for people to bring their children into the ER. Also, to have improved health and access to health care for people with disabilities – by eliminating beds in hospitals in the outlying areas and where it is also underserved, decreasing the services at St. Luke's, eliminating California Pacific Medical Center, it will be even more difficult for patients to get to the hospital. They are also eliminating the sub acute and acute rehab services, and they are closing the dialysis that was already mentioned. And another goal that is on the list is to eliminate health disparities."

(Lisa Cleis, September 23, 2010) [PC-83 HC]

"The Good Neighbor Coalition is asking this hospital to make a serious commitment to serving poor people. We want CPMC to have a multi-decade plan and partner with community-based clinics. CPMC should bolster primary care in these clinics, who see a bulk of Medi-Cal patients, then create a clear path of referral into CPMC Hospitals for secondary care. This will guarantee that many government insured and uninsured patients will have access to CPMC Hospitals and this will ensure low income patients are not referred off to San Francisco General. Thank you."

(Denise Rowe, September 23, 2010) [PC-144 HC]

"What CPMC should do is increase primary care access in our community-based clinics and make long term commitments to partner with community-based clinics in providing secondary care in their hospital. This would help ensure many Medi-Cal and Medi-Care patients like myself that are able to use CPMC facilities. So far, CPMC has not agreed to any of this. Our communities have the right to compete for jobs, as well as health care at CPMC. Thank you."

(Jane Sandoval, September 23, 2010) [PC-275 HC]

"The ultimate patient advocacy we as nurses can do for our patients is to support an adequate sized, full service St. Luke's, not a downsized version, which is not consistent with the community need."

Response HC-60

The comments raise concerns regarding "upgrading" rather than "downgrading" the existing Davies, St. Luke's, and "Sutter" Hospitals, and "downsizing" of the St. Luke's and Pacific Campuses and the "elimination of beds in hospitals in outlying and underserved areas," which is presumably a reference to the reduction of beds that would occur at the St. Luke's Campus under the proposed LRDP. It is not clear which CPMC campus Comment PC-35 is referring to as the "Sutter" hospital. The comments also express concerns regarding CPMC increasing primary care access in community-based clinics and long-term commitments to partner with community based clinics in providing secondary care at CPMC hospitals, access to health care for underserved populations, closure of the pediatric emergency room at the California Campus, the "closure" or "elimination" of CPMC, elimination of subacute-care services, elimination of acute rehab services, and closure of CPMC's dialysis unit. Each of these issues is addressed below.

St. Luke's Campus

Please see Major Response HC-1 (page C&R 3.23-1) regarding licensed acute-care beds and Major Response HC-2 (page C&R 3.23-8) regarding the size and scope of services at the St. Luke's Campus under the proposed LRDP.

Major Response HC-1 explains that the 80 beds proposed to be provided at the St. Luke's Hospital would provide sufficient capacity to meet the current and projected demand at the St. Luke's Campus, with additional capacity to meet peak demand periods. Major Response HC-1 also explains that with the shift

from multi-patient to single-patient rooms under modern hospital guidelines, newer facilities such as the St. Luke's Replacement Hospital are projected to have a higher occupancy rate (i.e., a higher percentage of licensed beds that are expected to be used) than existing facilities with multi-patient rooms such as the 1970 Hospital Tower that the St. Luke's Replacement Hospital would replace. Therefore, fewer licensed beds are required to serve the same number of patients. In addition, as explained in detail in Major Response HC-1, over time, the demand for hospital bed capacity has been reduced because of technological and clinical advances that reduce the average length of hospital stays and allow more medical services to be provided on an outpatient basis.

Major Response HC-2 further explains that the proposed LRDP would not exacerbate any shortage of inpatient acute-care beds for the south of Market Street area traditionally served by the St. Luke's Campus, in part because the Health Commission Task Force has determined that the St. Luke's Replacement Hospital would be appropriately sized to accommodate existing and projected future patient demand for that service area,[505] and because the St. Luke's Replacement Hospital would accommodate growth in patient census, increase its Emergency Department and surgery capacity, and expand primary care programs in clinical areas of demonstrated need to the community.

As explained in more detail in Major Response HC-2, with the exception of inpatient pediatrics (to be provided at the Cathedral Hill Hospital), skilled nursing facilities (to be continued at the Davies Campus and at the California Campus, consistent with CPMC's overall 100 SNF bed commitment), and subacute care (to be discontinued), all services currently provided at the St. Luke's Campus are proposed to be maintained or expanded at the St. Luke's Campus under the LRDP, including various outpatient pediatric services; chronic disease management; comprehensive women's care; senior care including orthopedic surgery, medical cardiology, ophthalmic surgery, and a diabetes center; diagnostic services; family-oriented urgent care (which would be a new service at the St. Luke's Campus); and Emergency Department.

For the above reasons, the proposed LRDP would not result in "downgrading" or "downsizing" of the St. Luke's Campus.

Pacific Campus

As explained on page 2-114 of the Draft EIR, under the proposed LRDP, "the Pacific Campus would be converted to the primary outpatient-care campus for the area north of Market Street." As explained on page 2-115 of the Draft EIR, all of the inpatient acute care and Emergency Department functions at the Pacific Campus's existing 2333 Buchanan Street Hospital would be decommissioned and transferred to the Cathedral Hill Campus under the LRDP. However, this would not result in "downsizing" of the Pacific Campus. As shown on Table 2-7a, "Pacific Campus: Project Summary Table-Existing Conditions by Building" on page 2-105 of the Draft EIR, the total square footage of existing uses at the Pacific Campus is approximately 1,117,334 square feet. As shown on Table 2-7b, "Pacific Campus: Project Summary Table" on page 2-109 of the Draft EIR, the total square footage of uses at the Pacific Campus under the proposed LRDP would be approximately 1,345,645. Therefore, the total square footage of CPMC uses at the Pacific Campus would increase by approximately 228,311 square feet under the LRDP.

Davies Hospital

Please see Major Response HC-1 (page C&R 3.23-1) regarding licensed acute-care beds and Major Response HC-2 (page C&R 3.23-8) regarding the size and scope of services at the Davies Campus under the proposed LRDP.

[505] San Francisco Health Commission Task Force on CPMC's IMP Addressing Resolution No. 10-09, 2010 (Mar. 2), *Updates and Accomplishments.*

As explained in Major Response HC-1, according to OSHPD data for the most recent year with data available (2009), the average daily census for acute-care beds at the Davies Campus was 42 acute-care patients (29 percent overall occupancy).[506] Under the proposed LRDP, 63 licensed acute-care beds would be located in the Davies Hospital North Tower in single-patient rooms. With acute-care bed occupancy increased to 80 percent, approximately 50 acute-care patients could regularly be accommodated at the Davies Campus. Thus, the Davies hospital would accommodate existing and projected demand at Davies with capacity to meet peak periods.

As explained in Major Response HC-2, the proposed Neurosciences Institute building at the Davies Campus under the LRDP would not require the demolition of any existing buildings on Campus, and no functions or physicians currently in the Davies Hospital or 45 Castro Street Medical Office Building would be displaced as a result of the proposed Neuroscience Institute building project. The long-term project at the Davies Campus under the LRDP, the Castro Street/14th Street MOB, would be constructed on the parking garage site and would include medical offices and four levels of parking.

Major Response HC-2 further explains that the service lines currently available at the Davies Campus would continue to be available under the proposed LRDP. Primary and specialist physicians associated with the Davies Campus service lines, and their respective offices and patient visits, are similarly assumed to stay at the campus, primarily at the 45 Castro Street Medical Office Building under the LRDP. In some cases, services would be expanded, such as those related to the provision of additional neurosciences clinical space in the proposed Neuroscience Institute building. The proposed LRDP calls for the creation of approximately 50,000 gross square feet (gsf) of new clinical area and new post-surgical recovery capacity in the proposed Neuroscience Institute building, and a future medical office building, the Noe Street MOB (as described in the Draft EIR, pages 2-143 to 2-148).

As of 2010, 232 licensed beds were in the Davies Hospital (North and South Towers combined). Davies Hospital South Tower contains some inpatient facilities, including 32 licensed, acute-care inpatient beds, and contains skilled nursing facilities, outpatient care and diagnostic and treatment space (Draft EIR page 2-141). After December 31, 2012, consistent with the requirements of SB 1953, all acute-care functions within the Davies Hospital South Tower are expected to cease or be relocated to the Davies Hospital North Tower, and under the proposed LRDP, the Davies Hospital South Tower would then be used for outpatient care, diagnostic and treatment services, and licensed skilled nursing beds, which would remain at 38.

As stated in the DEIR (page 2-141) the North Tower is currently used primarily for inpatient care, diagnostic and treatment space, education and conference space and support. It also has an Emergency Department. Under the proposed LRDP, the inpatient care uses at the Davies Hospital North Tower would include 61 licensed acute-care beds and 48 licensed rehabilitation beds. All CPMC rehabilitation beds are, and would continue to be, located at the Davies Hospital North Tower. The Emergency Department would also remain in the Davies Hospital North Tower under the LRDP.

The proposed LRDP would expand care and services for patients with neurological conditions, such as stroke, migraines, and ALS (Lou Gehrig's disease), and would enhance rehabilitation services at the Davies Campus to allow patients to receive same-site treatment. According to OSHPD statistics, the 2009 average daily census for acute rehabilitation beds at CPMC (at the Davies Campus) was 23.3.[507]

---

[506] For acute rehabilitation beds, it was 23 (48% occupancy), and for skilled nursing beds it was 31 (82%). Average daily census across all service lines was 97 (42% occupancy).
Source: OSHPD, ALIRTS. Annual Utilization Report of Hospitals, Davies Campus, 2009, available at http://www.alirts.oshpd.ca.gov, accessed Apr. 7, 2011.

[507] OSHPD, ALIRTS, Annual Utilization Report of Hospitals, California Pacific Med Ctr–Davies Campus, 2009, available at http://www.alirts.oshpd.ca.gov, accessed Apr. 6, 2011.

Therefore, the number of rehabilitation beds at the Davies Campus would be sufficient to meet demand. Please see Major Response HC-2 for additional detail.

For the above reasons, the proposed LRDP would not result in "downgrading" of the St. Luke's Campus.

Community-Based Clinics/Access to Health Care Services for the Underserved

Please see Major Response HC-8 (page C&R 3.23-32), which provides detailed information regarding access to health services for the underserved, including information regarding CPMC's commitments to partner with community-based clinics and to increase charity care. Major Response HC-8 includes a detailed list of some of CPMC's current partnerships in delivering low- or no-cost care to the medically underserved, and explains that CPMC also supports community health through initiatives such as Operation Access, Lions Eye Foundation, the Hep B Free Campaign, and Project Homeless Connect.

Major Response HC-8 further explains that CPMC provides direct service to Healthy Kids patients through:

- The pediatrics clinic at the Family Health Center (currently at the California Campus, to be relocated to the Cathedral Hill Campus under the LRDP).
- St. Luke's Health Care Center (existing and to remain under the LRDP)
- Bayview Child Health Center – (existing and to remain)

Beyond direct care delivery through the clinics above, a wide array of primary care and specialty physicians in the CPMC system are available to Healthy San Francisco/Healthy Kids patients. Two of the six provider groups offered to Healthy Kids patients are Brown & Toland and North East Medical Services (NEMS), both of which are affiliated with CPMC.

Closure of the California Campus Pediatric Emergency Room

Under the proposed LRDP, the pediatric emergency room at the California Campus, which began its existence in October 2008, would be replaced by the emergency room at the proposed Cathedral Hill Campus.

Closing or Elimination of CPMC

Comment PC-43 refers to "the closing of CPMC" and Comment PC-45 similarly refers to "eliminating California Pacific Medical Center." The proposed LRDP would not include the closing or elimination of CPMC. As explained on page 2-1 of the Draft EIR, the proposed LRDP is a multi-phased strategy proposed by CPMC to meet state seismic safety requirements for hospitals, and the LRDP would create a 20-year framework and implement CPMC's institutional master plan (IMP) for CPMC's four existing medical campuses and one proposed new medical campus in San Francisco.

Subacute Care Services

Please see Major Response HC-6 (page C&R 3.23-25) for a detailed discussion regarding subacute-care beds. CPMC currently maintains 60 subacute-care beds at the St. Luke's Campus, but would no longer provide subacute-care beds under the proposed LRDP.

As explained in Major Response HC-6, according to a study by The Camden Group, almost all of the subacute patients in the existing 60-bed subacute care unit at the St. Luke's Campus have been direct admit patients residing in areas outside of the South of Market, and often outside San Francisco

County.[508] The Blue Ribbon Panel, therefore, did not recommend that CPMC provide replacement subacute-care beds for those in the existing St. Luke's Hospital. Instead, the Blue Ribbon Panel recommended that "CPMC should replace lost subacute beds with placements for all individuals currently in those beds."[509] Further, the San Francisco Health Commission has memorialized its agreement with CPMC that "When the St. Luke's inpatient tower is decommissioned, CPMC will place all remaining subacute-care patients in its other hospital campuses, or in community facilities."[510] Consistent with the Blue Ribbon Panel's recommendations and its agreement with the Health Commission, CPMC would gradually remove the existing 60 subacute-care beds at the St. Luke's Hospital from service, through attrition or transfers to other facilities between now and when the existing St. Luke's Hospital tower would be demolished.[511] The proposed St. Luke's Replacement Hospital under the LRDP would not have subacute-care beds. Any patients not able to be transferred to other subacute care facilities by that time would be placed, as appropriate, in a CPMC acute care or SNF bed.[512]

Acute Rehabilitation Services

CPMC's acute rehabilitation services, currently located at the Davies Campus, were recently expanded and would remain as they are at the Davies Campus under the proposed LRDP. As shown in Table 2-2 on page 2-10 of the Draft EIR, and the updated version of Table 2-2 included in the text revisions in Chapter 4 of this C&R document (page C&R 4-36), CPMC increased the number of rehabilitation beds at the Davies Campus from 32 to 48 between 2008 and 2009, and CPMC would continue to maintain 48 rehabilitation beds at the Davies Campus under the proposed LRDP.

Dialysis Unit

Comment PC-45 states that CPMC is "closing" its dialysis unit. Although CPMC has recently sold its dialysis units to DaVita, the dialysis units have not been closed. Please see Response HC-21 (page 3.23-127) above for a detailed response to comments regarding the sale of the CPMC dialysis unit to DaVita. As explained in Response HC-21, the transfer of CPMC's dialysis services to DaVita, which became effective on February 1, 2011, has not resulted in any physical change to the environment. Regardless of the provider of dialysis services, all are held to the same regulatory standards and are overseen by the California Department of Health. The process of stabilizing and transporting dialysis patients to an Emergency Department remains the same, regardless of the transfer of dialysis services operations from CPMC to DaVita. Therefore, the sale of the dialysis unit has not contributed to any cumulative impacts on City services or traffic. Response HC-21 further explains that dialysis services and staff, and the location of dialysis services all remain mainly unchanged. CPMC has indicated that dialysis services have not been materially reduced or cut, nor are they planned to be materially reduced or cut in the future.

Comments

(Margarita Lopez Perez, September 23, 2010) [PC-49 HC]

"We support the Cathedral Hill building project because it will improve safety. Our new hospitals will nearly double the number of earthquake-safe beds in the City. San Francisco currently only has 600 of the 1,500 earthquake-safe beds that the City requires on a daily basis. To ensure quality patient care, our new hospitals will improve patient care by incorporating the medical advancements that reduce infection, shorten overall hospital stays, and increase access for patients with disabilities. The new facility will also centralize services at the Cathedral Hill and Davies campuses, which will prevent sick patients from having to shuttle from one campus to

[508] The Camden Group, 2009 (April 28), *San Francisco Blue Ribbon Panel: Utilization Projections and Assumptions for St. Luke's Campus*, page 10.

[512] Ibid.

another to receive the services they need. Enhanced community access – CPMC will expand services most utilized by the community. This includes a 25 percent increase in overall ER capacity and an overall increase in the number of staffed acute-care beds throughout the medical center. To make health care more affordable for the community, CPMC has committed to the City to increase contributions to charity care by 79 percent and will increase its uncompensated care for Medi-Cal patients by 22 percent in the next five years. Additionally, the St. Luke's rebuild and the new Cathedral Hill will provide access to the state-of-the-art acute care for the underserved Mission, Tenderloin, and Western Addition neighborhoods, build a stronger local economy in the midst of the cuts and layoffs."

(Natalie Logan, September 23, 2010) [PC-174 HC]

"…as well as providing us with the assurance and the comfort of knowing that, in the event of an emergency, we as residents and visitors of San Francisco can be adequately covered by the state-of-the-art medical facility. Thank you."

(Richard Margary, September 23, 2010) [PC-219 HC]

"…and they will provide world class, state-of-the-art medical care that we need in San Francisco for the neighbors and the facilities around St. Luke's, in the proposed new Cathedral Hill location, and for our neighbors in the Davies area. Thank you very much."

Response HC-61

The comments are noted. These comments do not raise issues regarding the adequacy, accuracy, or completeness of the Draft EIR. The comments will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project.

Comment

(Raven Allen, September 23, 2010) [PC-89 HC]

"Because there has been a cut in services, a drastic cut in services within San Francisco, the church has been forced to step up in return to becoming a social service providers, however, we have not had a great deal of assistance in doing that. And, for many families within this area, the church has been their means of psychosocial support, even physical support in terms of giving food and clothing. CPMC has not been completely honest because it has not, for one thing, contacted and dealt with in an open dialogue with those churches that are going to be immediately in this construction area, which is going to be at Ground Zero."

Response HC-62

The comment is noted. The comment states that CPMC has not contacted churches that are immediately in the construction area. Please see Response INTRO-5 (page C&R 3.1-5) regarding the NOP process, including the public scoping meeting, and soliciting public comments. Response INTRO-5 details the public noticing and outreach to the communities in the vicinity of the project that that were undertaken before and during the preparation of the Draft EIR. This comment does not raise issues regarding the adequacy, accuracy or completeness of the Draft EIR. The comment will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project.

Comment

(Michael Theriault—San Francisco Building and Construction Trades Council, September 23, 2010) [PC-149 HC]

"I will also bring a personal note to this and that is, when my youngest son was born at what was then Pacific Presbyterian Hospital, and what is now California Pacific Medical Center, with an umbilical cord wrapped around

his neck and with a heartbeat that came and went, it was a tremendous comfort to have a full range of services available in that hospital for him, and that is what this institution at Cathedral Hill would do. So, I ask you to bear those things in mind, also, when you consider this. Thank you."

Response HC-63

The comment is noted. This comment does not raise issues regarding the adequacy, accuracy, or completeness of the Draft EIR. The comment will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project.

Comment

(Reiko Furuya, September 23, 2010) [PC-175 HC]

"My name is Reiko Furuya, San Francisco resident. I am a Registered Nurse in Intensive Care Unit at St. Luke's Hospital. There are lots of CPMC and St. Luke's nurses here, and I ask them to stand up so you can see. The number of patients in ICU fluctuates because of the nature of service, just like any other Critical Care Unit. But when CPMC says they have 15 ICU licensed beds in our ICU, in reality, we do not have sufficient nurses to operate 15 ICU beds. Once my patient's family say to me, 'Last time, when my mother was ill, you guys were full, so she had to be sent to Seton,' and he told me how difficult was for a family with limited transportation to be with their elderly mother, who spoke only Spanish during her hospitalization away from home."

Response HC-64

The average daily census of ICU beds at the St. Luke's Campus was approximately 5.8 in 2009, 6.0 in 2008, and 6.6 in 2007.[513] Therefore, the eight licensed ICU beds proposed at the St. Luke's Campus under the LRDP would provide sufficient capacity to meet demand at the St. Luke's Campus. According to CPMC, although no information is available regarding the specific instance described in the comment, the possibility exists that some patient transfers would occur at times when the ICU beds at the St. Luke's Campus were at capacity. Transferring patients due to a particular bed type being at capacity is a regular occurrence at most hospitals, including CPMC's existing hospitals. For instance, the Davies Campus hospital currently has eight ICU beds and there is a fairly regular need to transfer patients to the Pacific or St. Luke's Campuses. If ICU capacity is full and another ICU admission is needed, the normal procedure is to identify any patients in the ICU that appropriately could be moved to a "Tele" or "Step Down" bed. If no patients in the ICU meet that criteria, the patient needing admission would be transferred to another facilitiy. Under the proposed LRDP, a patient needing to be transferred due to the St. Luke's Campus being at capacity could be transferred to the Davies Campus (especially if the patient requires specialized treatment involving neurosciences), to the Cathedral Hill Campus, or to a non-CPMC hospital.

The comment is noted. This comment raises social and economic concerns and does not raise issues regarding the adequacy, accuracy, or completeness of the Draft EIR. The comment will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project. Please see Response INTRO-7 (page C&R 3.1-17) regarding the appropriate consideration of social and economic impacts under CEQA.

Comments

(Dr. Ted Lee, September 23, 2010) [PC-244 HC]

"MR. LEE: Good afternoon, President Miguel and members of the Commission. My name is Dr. Ted Lee. I am a primary care physician and also the Associate Medical Director at the Northeast Medical Services. We are also

[513] OSHPD, ALIRTS, Annual Utilization Report of Hospitals, St. Lukes Hospital, 2007 and 2008, and California Pacific Medical Center - St. Lukes Campus, 2009, available at http://www.alirts.oshpd.ca.gov, accessed Apr. 8, 2011.

known as NEMS, N-E-M-S. We are the largest federally qualified health center in San Francisco targeting the medically underserved Asian population, for almost 38 years. I believe that every resident of San Francisco should have access to the best medical care. NEMS has collaborated with CPMC over the years to provide specialty care services to our underserved population, including the delivery of more than 400 babies, NEMS newborns, at CPMC each year."

(Dr. Ted Lee, September 23, 2010) [PC-245 HC]

"The proposed centralized location for its new campus at Van Ness and Geary will be in closer proximity to the patients that we serve, particularly those in Chinatown. This means fewer bus trips for those taking public transit, and more accessible healthcare. This means less distance for our families to go to deliver their babies. The proposed Van Ness and Geary campus also locates a full service Pediatrics and Emergency Department and also inpatient hospital next to the highest density of infants and children in the City, as healthcare just begins for our NEMS babies upon their delivery."

(Dr. Ted Lee, September 23, 2010) [PC-246 HC]

"Additionally, CPMC and NEMS have developed a referral process for inpatient care to actually all of NEMS 1,100 healthy San Francisco patients, this is roughly 25 percent of the overall healthy San Francisco Program population. CPMC recently also announced that it is further expanding its commitment and participation to the Health San Francisco Program."

Response HC-65

The comments state general support for the location of the proposed Cathedral Hill Hospital, stating that the centralized location of this hospital would provide more accessible health care. The comment is correct in stating that the proposed Cathedral Hill Hospital would provide pediatric services, an Emergency Department, and would be an inpatient medical facility, as discussed in the Draft EIR, beginning on page 2-26. Please also see Major Response HC-2 (page C&R 3.23-8) regarding the location, size, and scope of services at the proposed Cathedral Hill Campus.

These comments raise social and economic concerns and do not raise issues regarding the adequacy, accuracy, or completeness of the Draft EIR. The comments will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project. Please see Response INTRO-7 (page C&R 3.1-17) regarding the appropriate consideration of social and economic impacts under CEQA.

Comments

(Lance Toma, September 23, 2010) [PC-249 HC]

"The proposed location for this new campus at Van Ness and Geary is within two blocks of my agency, where many of my clients and patients reside. The Tenderloin is a neighborhood, as you know, composed of many Asians and Pacific Islanders, as well as transgender community. This proposed Cathedral Hill location will allow for increased access for many of our clients and patients, as well as providing more accessible healthcare options."

(Lance Toma, September 23, 2010) [PC-250 HC]

"API Wellness Center is currently expanding our services by becoming a free primary care community clinic, and we have been working with CPMC, who has been supporting our efforts. CPMC has, in particular, provided us with support to conduct a neighborhood needs assessment in the Tenderloin, to better understand the healthcare needs for the API community in the Tenderloin. It is important that we understand these needs of those in our communities who have not historically accessed the healthcare system, so that we can work together to correct this. The proposed Van Ness and Geary location provides a platform for CPMC to expand its existing programs. I also see that their long term engagement with us and others in the Tenderloin will ensure that CPMC is attentive

to community needs, and that the many community-based assets in the Tenderloin are in partnership with CPMC's long term plans."

Response HC-66

The comments state an opinion that the centralized location of the proposed Cathedral Hill Campus would provide more accessible health care options. The comments are noted. These comments raise social and economic concerns and do not raise issues regarding the adequacy, accuracy, or completeness of the Draft EIR. The comments will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project. Please see Response INTRO-7 (page C&R 3.1-17) regarding the appropriate consideration of social and economic impacts under CEQA.

Comment

(Eileen Prendiville, September 23, 2010) [PC-264 HC]

"MS. PRENDIVILLE: Good evening. Can you hear me? My name is Eileen Prendiville, and I am a Registered Nurse, and I work in the Newborn Intensive Care Unit at the California Campus of CPMC. I have been here with some of my co-workers from my unit and from the Pediatric ICU, and many of them had to leave either to go to work or to pick up kids. We take care of the most fragile infants and children during their often long and protracted hospitalization, and between us, and there are 10 of us, we have over a combined service of 244 years at the California Pacific Medical Center. We have seen a great deal of change in healthcare over the last few years. I can safely say that we became nurses because we care about each other and we want to make a difference in people's lives in their time of need. We care passionately about our patients and our community, especially when it comes to health care."

Response HC-67

The comment is noted. This comment raises social and economic concerns and does not raise issues regarding the adequacy, accuracy, or completeness of the Draft EIR. The comment will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project. Please see Response INTRO-7 (page C&R 3.1-17) regarding the appropriate consideration of social and economic impacts under CEQA.

Comment

(Nato Green, September 23, 2010) [PC-319 HC]

"Secondly, I just wanted to note that the whole argument about seismic compliance is fraudulent and that CPMC recently has been in the Capitol lobbying for SB 289, which passed, to extend their seismic deadlines. And what they were telling people in the Capitol is we don't want to have to risk, we're not going to be able to comply because there's too much opposition to this plan, so we need an extension. They are completely capable of complying with the existing seismic deadlines if they are willing to resolve their conflicts with their critics and detractors, but rather than doing that, they would rather risk that the buildings fall down on the patients and change the rules on all of us. We don't think that's fair, we don't think that CPMC should get preferential treatment under the seismic deadlines compared to hospitals that have worked out their issues to get their buildings approved on time, but it gives the lie that there is some issue, that there is a real concern about the hospitals being seismically safe. Thank you for your time."

Response HC-68

The comment is noted. This comment does not raise issues regarding the adequacy, accuracy, or completeness of the Draft EIR. The comment will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project.

As described in the Responses ALT-1 (page C&R 3.22-11) regarding Alternative 3A and Alternative "3A Plus," alternatives or new plans under the LRDP for the proposed Cathedral Hill and St. Luke's Campuses would take time to develop, both in terms of design and permit approvals (including OSHPD approvals). According to the project sponsor, a major re-design of the proposed LRDP as suggested by such comments likely would add at least 5 years to the schedule, because of redesign and OSHPD repermitting requirements for replacement hospital facilities becoming available, resulting in the closure of existing acute-care hospital facilities at the California, Pacific, and St. Luke's Campuses before replacement facilities would be operational.[514] Under SB 1953, unless the deadline is extended (potentially out to 2020) by SB 90 or successor legislation, if replacement hospitals are not available by January 1, 2013, the Pacific, California and St. Luke's Hospitals would face delicensure.

One of the key project objectives is compliance with the seismic safety standards of SB 1953 for acute-care hospitals. CPMC is seeking to comply with these requirements and has sought reasonable extensions to SB 1953 deadlines to maintain the ability to continue to provide health care during any interim period before replacement facilities could be constructed and become operational. The comment states that SB 289 passed and implies that it has become law in California. This is a misunderstanding of the legislative history of SB 289. Although SB 289 did pass out of the State Legislature, it was vetoed by Governor Schwarzenegger on October 7, 2010. More recent legislation, SB 608 (Alquist), was approved on August 31, 2010, and signed by the Governor on September 30, 2010, and provided for a one-year extension. However, CPMC's facilities are no longer eligible for the SB 608 extension.[515] Even more recently approved, SB 90 allows extensions up to 2020, provided that certain milestone and reporting requirements are met. Nevertheless, a major redesign of the proposed LRDP likely would result in the inability to complete design, permitting, and construction of new facilities before state-mandated deadlines or require a significantly longer time period to complete, increasing the duration of exposure of acute care facilities to seismic risk.

Comments

(Suzanne Girardo, September 23, 2010) [PC-320 HC]

"Our work in the Tenderloin has gone on for approximately 10 years. We have partnered for pediatric services with Demariac Academy, St. Anthony's Foundation, as well as Glide. We are now in Glide's Preschool serving three and four-year-olds. We are currently in discussion and have been for the last year with many of the Tenderloin Community providers, to identify the gaps in pediatric services for children and families, and within this community work group, are coming up with a definitive plan to address those gaps. As you Commissioners are fully aware, the Tenderloin is the largest concentration of children and families in the city and county of San Francisco, and as a result of that, this is where CPMC's Child Development Center has really focused within the last 10 years, our efforts to be able to serve that community."

(Suzanne Girardo, September 23, 2010) [PC-321 HC]

"In closing, I just want to state that we will continue our commitment to and expand our services to the children, not only of the Tenderloin, but to the other communities in San Francisco. We are currently partnering with the Multi-Disciplinary Assessment Center at San Francisco General to be able to treat those children birth to five that need services."

[514] CPMC, construction schedule re: "Sub Alternative 3A – St. Luke's Campus – 80 Bed Replacement, 160 Bed Women & Children & 200KSF MOB W- Parking," transmitted to the Planning Department.

[515] See "Status of CPMC Hospitals and SB 1953 Compliance in San Francisco," a memorandum prepared by Geoffrey Nelson, CPMC, with input from Carl Scheuerman, Director of Regulatory Affairs for Sutter Health, December 1, 2010, transmitted to the San Francisco Planning Department.

Response HC-69

The comments are noted. These comments raise social and economic concerns and do not raise issues regarding the adequacy, accuracy, or completeness of the Draft EIR. The comments will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project. Please see Response INTRO-7 (page C&R 3.1-17) regarding the appropriate consideration of social and economic impacts under CEQA.

Comments

(Mary Lanier, September 23, 2010) [PC-324 HC]

"I am also here, though, today to address CPMC's continuing commitment to skilled nursing beds for patients in the future. We are very much committed to continuing our skilled nursing bed service now and for future patient populations. In 2009, we at CPMC saw an average of 87 skilled nursing patients in our facility each day, over our three campuses that have skilled nursing. As a result of discussions that we have had with the Health Commission, the Long Term Health Coordinating Council, the Department of Aging and Adult Services, over the last 18 months, about, we are again – I am reiterating, this is not the first time I've said this – we are fully committed to providing up to 100 skilled nursing beds, which is more than we're currently using, now and in the future. There are plans underway to try and identify exactly where these are, but we don't have it fully utilized yet. In addition, we will not exacerbate the bed shortage for skilled patients in the City, we agree that that is a concern, that everybody else has closed their skilled nursing beds, and so we don't want to exacerbate that problem either, and so we have committed publicly, and I see again tonight, that we are not going to convert existing community-based beds to our need, that would not be a reasonable alternative. I also commit to maintaining our what I think is very helpful and productive conversations with the Health Commission, these conversations will go on. We will continue operation of the SNF beds, the 19 SNF beds at St. Luke's, and the beds at California campus, until we can fully identify where those beds should be for the long term."

(Mary Lanier, September 23, 2010) [PC-325 HC]

"Table 2.2 in the DEIR is going to be updated to reflect that no SNF beds have been relocated, which is consistent with CPMC's commitment not to reduce SNF beds."

(Mary Lanier, September 23, 2010) [PC-326 HC]

"In addition to traditional SNF care, which I have just talked about, we are committed to continuing our work with all the community agencies and the pilot that we're testing for alternatives to SNF care, other ways to treat patients post-acutely, so that they're not always in a hospital bed, and we think that we have to do more of that in the future. Thank you for your time and attention."

Response HC-70

The comments state CPMC's commitment with respect to provision of 100 SNF beds, and are noted. These comments raise social and economic concerns and do not raise issues regarding the adequacy, accuracy, or completeness of the Draft EIR. The comments will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project. Please see Response INTRO-7 (page C&R 3.1-17) regarding the appropriate consideration of social and economic impacts under CEQA.

Comment PC-325 is correct in stating that Table 2-2 in the Draft EIR, page 2-10, has been updated to reflect the most recent bed counts (see Response PD-6 [page C&R 3.2-6]). Please also see Major Response HC-6 (page C&R 3.23-25) regarding SNF beds.

Comment

(Dionne Miller, September 23, 2010) [PC-330 HC]

"MS. MILLER: Good evening. My name is Dionne Miller. I am the Chief Administrative Officer at St. Luke's Campus and I will be brief, as it seems I'm the last speaker. A few points I'd like to reiterate, I was here before, but that the plan for St. Luke's is a viable one. I've been closely involved with the architectural design, as well as the Business Planning, and I'd just like to remind folks that, prior to CPMC acquiring St. Luke's, it was also about to close. The plan will allow for growth. If you come and visit today, the decisions that you make will impact our campus, and there is a census of about 40 to 45 – we are building 80 beds, so I can attest to you that there's room for growth. And we have a vibrant partnership with SFGH for orthopedic surgery. We are making changes today. And it's evident in that we had a recent joint commission survey which was one of the best in the history of St. Luke's, as well as in the system of Sutter, so I'm very proud of that. Our nurses work very hard. You've heard some of them today and there are others there who are supportive of the plan, who didn't present today. But I invite you to come and visit us and know that St. Luke's is here for the entire community, the underserved as well as the insured, and it is also supposed to be affordable, and how do we do that? By having a hospital that actually functions well. Thank you for your time."

Response HC-71

The comment states that the LRDP will be sufficient to meet demand at the St. Luke's Campus and is noted. This comment raises social and economic concerns and does not raise issues regarding the adequacy, accuracy, or completeness of the Draft EIR. The comment will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project. Please see Response INTRO-7 (page C&R 3.1-17) regarding the appropriate consideration of social and economic impacts under CEQA.

Comment

(Mary Michellcci, September 23, 2010) [PC-341 HC]

"I also would like to ask the Commission to please recall what the Blue Ribbon process did suggest, that there would be a Center of Excellence for St. Luke's, and I haven't heard any mention of plans for our sub acute patients, which number 40. Any time anybody tells you they have 47, or 57, or 67 patients automatically what is taken away is the sub acute patients and the skilled nursing patients, and I really don't know what's going to happen to the very sensitive group of patients who basically have nowhere to go, and we are their home. Thank you very much."

Response HC-72

The comment expresses concerns regarding the Blue Ribbon Panel (BRP) recommendation for a Center of Excellence at St. Luke's and plans for the subacute patients and skilled nursing patients at the St. Luke's Campus.

Blue Ribbon Panel Center of Excellence Recommendations

The BRP recommended the creation of three centers of excellence at the St. Luke's Campus: Women's Health (i.e., gynecology and low-intervention obstetrics), Senior Health Care, and Community Health.[516] The March 2, 2010, San Francisco Health Commission Task Force Update on CPMC's IMP states the following with respect to CPMC's compliance with the Blue Ribbon Panel's recommendation regarding these Centers of Excellence: "CPMC is committed to organize and expand existing programs, both inpatient and outpatient, to serve the three areas noted by the BRP as described below:

[516] The Blue Ribbon Panel, 2008, Consensus Positions for Recommendations to CPMC's Board of Directors.

Community Health Center: health promotion, prevention, and primary care for general population

- Health First Center for Education and Prevention
- St. Luke's Pediatric Clinic
- Child Development Center
- St. Luke's Neighborhood Clinic provides primary care services to adults

Women's Health Center: a system of care for women across the care continuum

- St. Luke's Women's Center offering outpatient prenatal care, midwifery care and support, gynecological care, breastfeeding support, childbirth and yoga classes
- Women's and Children's Inpatient Floor providing labor and delivery, postpartum care, and gynecologic surgery
- St. Luke's Breast Center

Senior Health Center: health promotion, prevention, and primary care for seniors

- St. Luke's Diabetes Center
- Orthopedic Surgery Clinic
- St. Luke's Neighborhood Clinic provides primary care service to seniors
- St. Luke's Heart Services."[517]

Please see Major Response HC-2 (page C&R 3.23-8) for additional detailed information regarding the scope of health care services that would be provided at the St. Luke's Campus under the proposed LRDP.

St. Luke's Campus Subacute-care Patients

Please see Major Response HC-6 (page C&R 3.23-25) regarding subacute-care beds. As explained in Major Response HC-6, according to a study by The Camden Group, almost all of the subacute patients in the existing 60-bed subacute care unit at the St. Luke's Campus have been direct admit patients residing in areas outside of the South of Market, and often outside San Francisco County.[518] The Blue Ribbon Panel, therefore, did not recommend that CPMC provide replacement subacute-care beds for those in the existing St. Luke's Hospital. Instead, the Blue Ribbon Panel recommended that "CPMC should replace lost subacute beds with placements for all individuals currently in those beds."[519]

Further, the San Francisco Health Commission has memorialized its agreement with CPMC that "[W]hen the St. Luke's inpatient tower is decommissioned, CPMC will place all remaining subacute-care patients in its other hospital campuses, or in community facilities."[520] Consistent with the Blue Ribbon Panel's recommendations and its agreement with the Health Commission, CPMC would gradually remove the existing 60 subacute-care beds at the St. Luke's Hospital from service, through attrition or transfers to other facilities between now and when the existing St. Luke's Hospital tower would be demolished.[521] The proposed St. Luke's Replacement Hospital would not have subacute-care beds under the LRDP. Any

[517] San Francisco Health Commission Task Force on CPMC's IMP Addressing Resolution No. 10-09, 2010 (Mar. 2), *Updates and Accomplishments.*
[518] The Camden Group, 2009 (Apr. 28), *San Francisco Blue Ribbon Panel: Utilization Projections and Assumptions for St. Luke's Campus*, page 10.
[519] The Blue Ribbon Panel, 2008, Consensus Positions for Recommendations to CPMC's Board of Directors
[520] S.F. Health CommissionResolution No. 02-10.
[521] CPMC, Memorandum from Malia Weinberg to David Reel (AECOM) & Brian Boxer (AECOM) re: Subacute Care (May 26, 2011).

patients not able to be transferred to other subacute care facilities by that time would be placed, as appropriate, in a CPMC acute care or SNF bed.[522]

Major Response HC-2 further explains that most of the patients utilizing CPMC's existing subacute-care facilities at the St. Luke's Campus do not reside in the south of Market Street area but rather come from other areas of the City or outside the City. Therefore, it is anticipated that patients would, in the future, seek services across a wide geographic area and would not cluster at any one facility or area. Furthermore, the patient transition plan for the current patient population utilizing the existing subacute-care beds at St. Luke's Hospital anticipates that a limited number of patients would be transitioning at any given time from St. Luke's Hospital to other non-CPMC hospital or other health care facility.

St. Luke's Campus Skilled Nursing Facility Patients

Please see Major Response HC-6 (page C&R 3.23-25) regarding SNF beds, which describes CPMC's commitment to continue to maintain 100 SNF beds system wide (38 at the Davies Campus and 62 at another yet-to-be-determined on-campus or off-campus location). Major Response HC-6 explains that until a plan for providing the additional 62 beds needed to meet the 100 SNF bed commitment is ready to be implemented, SNF beds would continue to be provided at the St. Luke's Campus (until demolition of the existing hospital) and at the California Campus. In the interim, the existing facilities, which would continue to provide SNF beds, would be adequate and no legal (e.g., SB 1953) constraints exist on their continued utilization.

Major Response HC-6 further explains that acute-care patients who continue to require SNF in-hospital care would be accommodated at the Davies Campus. Other patients require less acute-care services would be served in other on-campus or off-campus facilities.

Comment

(Jason Fried, September 23, 2010) [PC-344 HC]

"And I just want to add one thing that always frustrates me when I hear someone from CPMC get up here and say, "Oh, we only have a census of 40 beds," or whatever it is. The thing to remember is, they used to have a lot higher census there until they started pulling all the services out of the hospital. You put the Center of Excellences, and I would say not just one, there should be multiple centers of excellence in St. Luke's. You would have – you build the beds, you would have what you need there. So I would encourage you to do a multiple prong approach so we are not delaying a hospital being built because we do need it built here. Thank you."

Response HC-73

The comment states that the existing St. Luke's Hospital "used to have a lot higher census there until they started pulling all the services out of the hospital." This statement is not supported by the evidence in the record. CPMC acquired the St. Luke's Campus in 2007, and the average daily census of inpatients at the St. Luke's Hospital has not substantially decreased in the time since CPMC acquired the campus. As explained in Major Response HC-1 (page C&R 3.23-1), according to OSHPD data, the average daily census of acute-care beds at the St. Luke's Campus for the 8-year period from 2002 through 2009 was 60 patients (40 percent occupancy), ranging from a low of 50 (33 percent occupancy) in 2008 to a high of 71

[522] Ibid.

(47 percent occupancy) in 2003.[523] For the most recent year available, 2009, St. Luke's Hospital averaged 51 acute-care patients (34 percent occupancy).[524]

As explained in Master Response HC-1 (page C&R 3.23-1), the 80 beds proposed to be provided at the St. Luke's Hospital under the LRDP would provide sufficient capacity to meet the current and projected demand at the St. Luke's Campus, with additional capacity to meet peak demand periods. Major Response HC-1 also explains that with the shift from multi-patient to single-patient rooms under modern hospital guidelines, newer facilities with single-patient rooms, such as the St. Luke's Replacement Hospital, are projected to have a higher occupancy rate (i.e., a higher percentage of licensed beds that are expected to be used) than existing facilities with multi-patient rooms, such as the 1970 Hospital Tower that the St. Luke's Replacement Hospital would replace. Therefore, fewer licensed beds are required to serve the same number of patients. In addition, as explained in detail in Major Response HC-1, over time the demand for hospital bed capacity has been reduced because of technological and clinical advances that reduce the average length of hospital stays and allow more medical services to be provided on an outpatient basis.

Please also see Major Response HC-2 (page C&R 3.23-8), which further explains that the proposed LRDP would not exacerbate any shortage of inpatient acute-care beds for the south of Market Street area traditionally served by the St. Luke's Campus, in part because the Health Commission Task Force has determined that the St. Luke's Replacement Hospital would be appropriately sized to accommodate existing and projected future patient demand for that service area[525], and because the St. Luke's Replacement Hospital would accommodate growth in patient census, increase its Emergency Department and surgery capacity, and expand primary care programs in clinical areas of demonstrated need to the community.

Please also see Response HC-72 (page C&R 3.23-227) regarding the provision of Centers of Excellence at the St. Luke's Campus.

Comment

(Commissioner Antonini, September 23, 2010) [PC-347 HC]

"Well, thank you, just a few reflections on a long day of very interesting comments and I thank you all for your input. Just a few reflections on some of the things. I can't help but believe that a new hospital at Cathedral Hill will not improve access for people in the area and, you know, it's a hospital for all of San Francisco, of course, but it's very important that those close by have the advantages and, as everyone probably knows, in emergency situations, hospitals are obliged to take anyone in critical condition, or with critical needs, and I think with an area that we've heard has the highest concentration of children and people where that might be a consideration more often than not, I mean, I think that's a very big benefit, and as is the case with any hospital, although you may receive your emergency care there, or some care there, you know, you may end up if hospitalization is necessary at another facility just as I have Kaiser, and I have had occasion to have to go to other hospitals with family members in emergency situations, but once, if they did have to end up in the hospital, or further care was needed, of course, they would go to Kaiser for the rest of their care. And so, but I think it is a big advantage to have that hospital there."

525 San Francisco Health Commission Task Force on CPMC's IMP Addressing Resolution No. 10-09, 2010 (Mar. 2), *Updates and Accomplishments.*

Response HC-74

The comment is noted. This comment does not raise issues regarding the adequacy, accuracy, or completeness of the Draft EIR. The comment will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project.

Comment

(Commissioner Antonini, September 23, 2010) [PC-349 HC]

"I think if you look at the overall picture here, you have a small increase in the whole CPMC system and the number of licensed beds relative to the present situation, but you do have an increase in outpatient services and square footage, and I think that's really important because we're seeing a situation where people are living longer, being more active to a greater age, and you know, I think a lot of the problems that we have in healthcare today are things that, you know, are not going to require hospitalization, but will require outpatient services, and particularly some of the problems we see with some of the diseases caused by obesity or by diabetes, or by other things, you know substance problems, they're going to be treated on an outpatient basis and hopefully will keep them from having to be in acute hospital care."

Response HC-75

The comment reflects the changing nature of health care delivery, with increasing use of outpatient services compared to the past, when more health care services were delivered on an inpatient basis. The comment notes that a small increase in licensed beds would occur relative to the present situation. To clarify and as shown in the updated version of Table 2-2 (Draft EIR, page 2-10) provided in Chapter 4, "Draft EIR Text Changes" (page C&R 4-36), under the proposed LRDP, licensed beds would actually decrease from 1,174 beds to 955 beds. However, unlike the existing CPMC hospitals that provide licensed beds in mulit-patient rooms, all licensed beds at the new hospital facilities under the proposed LRDP would be provided in single-occupancy rooms. Therefore, the proposed LRDP would increase capacity overall and meet demand. Please see Response PD-6 (page C&R 3.2-6) for a discussion of text revisions to Table 2-2 and licensed beds under the proposed LRDP.

The comment correctly notes that an increase would occur in medical services and square footage under the proposed LRDP. C&R Table 3.23-2 (below) notes the existing and proposed square footage totals under the proposed LRDP, as shown in the Draft EIR in Table 2-5, page 2-21 (Cathedral Hill Campus), Tables 2-7a and 2-7b, pages 2-105 to 2-109 (Pacific Campus), Table 2-9, page 2-127 (California Campus), Table 2-11, page 2-139 (Davies Campus), and Table 2-13, page 2-175 (St. Luke's Campus).

C&R Table 3.23-3
CPMC LRDP Existing and Proposed Square Footage

Campus	Existing Sq. Ft.	Proposed LRDP Sq. Ft.	Difference in Total Sq. Ft.
Cathedral Hill (proposed)	167,400	1,827,468	1,660,068
Pacific	1,117,334	1,345,645	228,311
California	942,187	2,400	(939,787)
Davies	500,016	702,408	202,392
St. Luke's	451,868	605,735	153,867
TOTAL	**3,178,805**	**4,473,856**	**+1,304,851**

Please also see Major Response HC-1 (page C&R 3.23-1) regarding supply of licensed acute-care beds.

Comment

(Commissioner Antonini, September 23, 2010) [PC-352 HC]

"And I said, particularly at St. Luke's in looking at the numbers, it looks like the outpatient square footage is going from 50,000 to 200,000, so in a lot of ways, while the number of beds that will exist in the new hospital are fewer, there will be a four time increase in the outpatient service and the medical office building, and so I think that is a real important thing, and that is the kind of thing that really benefits the neighborhood, in my mind, more than the number of hospital beds you have, assuming you can meet the demand for those who need critical care."

Response HC-76

The comment is noted. Please see Major Response HC-1 (page C&R 3.23-1) regarding supply of licensed acute-care beds, Major Response HC-2 (page C&R 3.23-8) regarding the size and scope of services at the St. Luke's Campus, and Table 2-13, "St. Luke's Campus: Project Summary Table" on page 2-175, for detailed information regarding the square footage increases that would occur with respect to various types of outpatient uses at the St. Luke's Campus under the proposed LRDP.

Comments

(Commissioner Antonini, September 23, 2010) [PC-353 HC]

"And a few other things, I think there was a question about the whole sub acute issue and the skilled nursing, and I was happy that someone from Cal Pacific came up and mentioned that, although the documents referred to, I believe, a number in the 80's of skilled nursing, they were committed to 100, I think was said. So, you know, and I think it has to be worked out that whatever the need is, is the need that we should be able to meet in the system. But it doesn't mean that, if there are situations where one does not need to be hospitalized, and it's always a difficult situation because a patient may need hospitalization for a while and may be able to either go home or to go to a traditional convalescent facility, it has to be worked out, there needs to maybe be some intermediary care someplace to bridge that gap, and also work with other facilities that have those available. And with the sub acute care, we talked about this the other time, I think it was said there are only three hospitals in the Bay Area that are doing it and only one in San Francisco, and that's St. Luke's right now. And I think somehow this responsibility has to be spread between all the hospitals in San Francisco, the four major hospital groups, and everyone should have to do a little bit on this, as well as facilities outside of San Francisco because it is a situation that is probably very costly and I think it should not only be St. Luke's and not only Cal Pacific that has to do this, but it has to be balanced, and I think that is a place where the City could get involved and see what the story on that is."

(Commissioner Antonini, September 23, 2010) [PC-359 HC]

"So those are the things and, you know, we talked about the St. Luke's situation and I want the dialysis thing should be talked about, the skilled nursing, and an intermediary facility. So, I thought it was a very good commentary and I'm looking forward to comments and responses and to hearing more comments as they're submitted in writing in the next, I believe it's seven days, I think, we have until the end of the comment period?

COMMISSIONER MIGUEL: October 19th.

COMMISSIONER ANTONINI: Oh, so it's still along – okay, I thought the document said sometime in September, but, okay, good, it was extended, okay, very good. Thank you."

(Commissioner Sugaya, September 23, 2010) [PC-360 HC]

"Yes, I think Commissioner Antonini raised some interesting questions, which have been going through my mind also when he was talking about meeting whatever the need might be, and discussing things that might have to do with intermediate care that we're not too sure about. And I'm not in the medical profession, so I don't know anything about sub acute care and all that stuff, but mentioning that perhaps something like that, I think, is what

the Commissioner was referring to might be spread around to other hospitals. It just points out that this Commission is ill-equipped to analyze the needs of this particular hospital. We have no community San Francisco Health Care Plan, we have no idea how sub acute works in this City, we have no idea how SNF beds work in the City, and now we're being asked to look at these kinds of things in the context of an Environmental Impact Report. And the Environmental Impact Report is an extremely clumsy way to be able to get at these kinds of issues because it's basically looking at physical activities and the manifestation of all of the programs and policies in a physical kind of context, at least that's the way I see it. And it's very difficult to get at the programmatic aspects of this through the EIR, and I know the Long Range Institutional Master Plan was presented to us, but even then it has no context either because we have no overall community health care plan. And so trying to fit this in some kind of context is really really difficult, at least for me."

(Commissioner Moore, September 23, 2010) [PC-366 HC]

"I also believe that it is very difficult for this Commission to fully evaluate the healthcare needs and the balanced healthcare needs in the 21st Century changing field of healthcare provision and make sure that we are on target, doing what cities only do every 50 or whatever years."

(Commissioner Miguel, September 23, 2010) [PC-384 HC]

"This Commission, as far as I'm concerned, and both Commissioner Sugaya and Commissioner Olague spoke to it, is under a great strain, although San Francisco has put into effect Healthy San Francisco, and from all reports that I've had, it is working, or starting to work, we have failed miserably – City Government of San Francisco has failed miserably to create a comprehensive plan addressing the healthcare distribution in the City, basically a healthcare Master Plan. If we had one, this Commission and the Department would have had a referential guide, and as it is, we're in limbo, you know, we're out in the rowboat in the ocean without any oars, we have nothing to guide us on, other than perhaps instinct, and that is what we're going to have to go on, which is extremely unfortunate and extremely annoying, actually."

(Commissioner Miguel, September 23, 2010) [PC-386 HC]

"So, as I say, I will have additional comments as to the SNF beds, sub acute beds. Again, if the City had a Master Plan, we'd know what was at least anticipated to happen on it. So we're just going to have to make the comments as we feel them, that's all we have to go by. The City has let us down a great deal on this one. Commissioner Sugaya."

Response HC-77

The comments express concerns regarding the preparation of a citywide health care services master plan or an equivalent or similar analysis of subacute care and/or skilled nursing facility needs, citywide shortages of subacute care and skilled nursing facility services, and the sale of CPMC's dialysis services.

Health Care Services Master Plan

The suggestion in Comment PC-353 that the responsibility for determining a way to meet the need for subacute care and/or skilled nursing facility (SNF) services should be spread between all other hospitals in San Francisco and the region, and that the City potentially could get involved, is at least somewhat similar to, or could be part of, what is envisioned Ordinance No. 300-10, effective January 2, 2011 (the Ordinance), which directs the preparation of a citywide health care services master plan (Health Care Plan). Similarly, several of the other comments discuss or allude to the lack of an overall community health care plan to provide context for addressing citywide issues related to subacute care and SNF services.

The Health Care Plan is anticipated to be completed by 2013 at the earliest. As explained in Major Response HC-9 (page C&R 3.23-38), the recently adopted Ordinance sets out a lengthy and detailed

series of requirements and processes, preceding adoption of a Health Care Plan. The Ordinance would not apply until the Health Care Plan was adopted. Furthermore, the Health Care Plan would be subject to its own review under CEQA, before adoption. The Ordinance would apply to applicable changes in medical uses after either January 2, 2013, or formal adoption of the Health Care Plan, whichever occurs later. Therefore, the Ordinance could not apply to proposed changes under the LRDP that are approved before January 2, 2013.

As explained in Major Response HC-9, CEQA does not require the CPMC LRDP EIR to include an analysis of citywide or regional health care service delivery systems, absent evidence that the proposed LRDP would contribute to health care service gaps that would cause a physical effect on the environment, and no such evidence has been provided by the comments. As further explained in Major Response HC-9, the proposed LRDP would not result in any transfer or displacement of services at other non-CPMC health care facilities that could result in a physical environment effect of the LRDP that is not analyzed in the Draft EIR. Please also see Major Response HC-1 (page C&R 3.23-1) and Major Response HC-2 (page C&R 3.23-8), which explain that the proposed LRDP would provide adequate capacity to meet CPMC's current and projected demand and, therefore, would not contribute to any cumulative impacts (or indirect effects associated with shifts in patients or services). Major Response HC-9 also explains that no further information is necessary regarding the delivery of health care services systemwide to adequately identify and analyze the environmental impacts of the proposed LRDP.

Subacute Care Services

With respect to subacute-care services, please also see Major Response HC-6 (page C&R 3.23-25), which explains that the Blue Ribbon Panel did not recommend that CPMC provide new replacement subacute-care beds in the proposed new replacement hospital at St. Luke's Campus for those in the existing St. Luke's Hospital. Instead, the Blue Ribbon Panel recommended that "CPMC should replace lost subacute beds with placements for all individuals currently in those beds."[526] Consistent with the Blue Ribbon Panel's recommendations, CPMC would gradually remove the existing 60 subacute beds from service at St. Luke's Hospital, through attrition or transfers to other facilities between now and when the existing St. Luke's Hospital tower would be demolished.[527] Any patients not able to be transferred to other subacute-care facilities by that time would be placed, as appropriate, in a CPMC acute-care or SNF bed.[528] As presented in the Major Response HC-1 discussion of licensed or acute care bed capacity, this volume could be accommodated by the CPMC system under the LRDP.

Skilled Nursing Facility Services

With respect SNF services, please also see Major Response HC-6 (page C&R 3.23-25), which explains that CPMC has committed to maintain sufficient SNF beds (a total of 100) to meet its actual patient demand. CPMC has also committed that no existing community-based beds would be utilized to provide these 100 SNF beds, and that to provide the 62 beds needed in addition to the 38 beds that would remain at Davies, it would utilize either new community-based facilities or replacement capacity provided on one of its campuses. Furthermore, the text revisions in Chapter 4 of this C&R document to Draft EIR Table 2-2, "CPMC Existing and Proposed Licensed Hospital Bed Uses," clarify that, in order to ensure that sufficient beds would remain available to meet its actual patient demand of 100 beds, CPMC would continue to maintain the 101 existing licensed beds at the California Campus unless and until an

[526] The Blue Ribbon Panel, 2008, Consensus Positions for Recommendations to CPMC's Board of Directors.
[527] CPMC, Memorandum from Malia Weinberg to David Reel (AECOM) & Brian Boxer (AECOM) re: Subacute Care (May 26, 2011).
[528] Ibid. With the future decommissioning of the St. Luke's Hospital tower after construction of the St. Luke's Replacement Hospital, CPMC would place all remaining subacute-care patients in the hospital or in community facilities. By doing so, CPMC would comply with the Blue Ribbon Panel's recommendations related to subacute-care beds. S.F. Health Commission Task Force on CPMC's IMP Addressing Resolution No. 10-09, *Updates and Accomplishments*, Mar. 2, 2010; *CPMC Interim Report to the San Francisco Health Commission Regarding Progress Toward Commission Recommendation in Resolution No. 10-09*, Sept. 30, 2010.

alternative plan for providing the additional 62 beds is identified. Therefore, the proposed LRDP would not exacerbate any existing citywide SNF bed shortage .

Accordingly, The Lewin Group's report regarding CPMC's IMP concluded that although CPMC's plan to eliminate SNF beds would not reduce the potential citywide need for skilled nursing services, "given the extent of potential need, a broader, citywide plan will likely be needed to appropriately address the shortage."[529]

Major Response HC-6 also includes detailed discussion of issues related to the continuity of care/intermediary care for SNF patients, and explains that under the proposed LRDP, patients who continue to require SNF in-hospital care would be accommodated by the 38 beds at the Davies Campus, and other patients in less severe conditions, would be served in the 62 additional SNF beds to be provided at other on-campus or off-campus facilities (as explained above, such patients would be accommodated by the 101 existing SNF beds that would remain licensed at the California Campus, unless and until an alternative plan for providing the additional 62 beds necessary to meet CPMC's commitment to provide 100 SNF beds is identified). Major Response HC-6 further explains that a nationwide trend of decreased in-hospital SNF beds and an increase in community-based off-campus facilities (for SNF beds) has been occurring for several reasons, including the following: (1) hospital rooms are the most costly to build, (2) staffing requirements in hospitals are often much higher than what is necessary in an SNF, and (3) many patient health outcomes are better in more home-like settings. Accordingly, CPMC is exploring a collaborative relationship with community providers of transitional care to accomplish appropriate and safe home discharges for patients who do not need to be cared for in hospital-based SNF beds.[530]

The Long Term Care Coordinating Council (LTCCC) acknowledged that CPMC is in the process of developing "a program of transitional care services that will facilitate the move of vulnerable adults from acute-care services to post-acute services, provided either by CPMC or other health care institutions in San Francisco, or provided at home or in the community. . . ."[531] A resolution adopted by the LTCCC also "urges all stakeholders, including the Health Commission, Planning Commission, and Aging and Adult Services Commission, to work to preserve and expand access to a comprehensive continuum of services and support that optimizes an individual's best chance of returning from hospital to home or to the most integrated setting, provides alternatives to hospitalization, as well as minimizing re-admission to an acute-care setting."[532]

Additionally, as explained in Major Response HC-6, the Blue Ribbon Panel recognized that a broader citywide and regional Bay Area plan would be needed to address improved transitional care citywide from acute to subacute to rehab facilities overall. Through the Blue Ribbon Panel consensus process, CPMC has committed with the LTCCC and the San Francisco Hospital Council to find ways that the City of San Francisco can expand the community's capacities to offer appropriate skilled nursing beds.

Dialysis Services

Comment PC-359 also requests discussion of issues related to dialysis services. Please see Response HC-21 (page C&R 3.23-127) for a detailed response to comments regarding the sale of the CPMC dialysis

[529] The Lewin Group, 2009 (June 26), *California Pacific Medical Center Institutional Master Plan Review*, prepared for the San Francisco Department of Public Health, at page 23.

[530] The San Francisco Health Commission Task Force on CPMC's IMP stated that it "supports CPMC's collaboration with the Department of Aging and Adult Services (DAAS), the San Francisco Senior Center, St. Francis Memorial Hospital on a pilot to provide comprehensive support to senior patients with transition services such that many can successfully be restored to their own homes with appropriate support services." San Francisco Health Commission Task Force on CPMC's IMP Addressing Resolution No. 10-09, 2010 (Mar. 2), *Updates and Accomplishments*.

[531] Long Term Care Coordinating Council, *LTCCC resolution affirming the need for citywide health planning, and optimizing an individual's return from hospital to home, or to the most integrated setting*, revised draft, June 15, 2009.

[532] Ibid.

unit to DaVita. As explained above in Response HC-21, the transfer of CPMC's dialysis services to DaVita became effective on February 1, 2011, and has not resulted in any physical change to the environment. Regardless of the provider of dialysis services, all are held to the same regulatory standards and are overseen by the California Department of Health. The process of stabilizing and transporting dialysis patients to an Emergency Department remains the same, regardless of the transfer of dialysis services operations from CPMC to DaVita. Therefore, the sale of the dialysis unit has not contributed to any cumulative impacts on City services or traffic. Response HC-21 further explains that dialysis services and staff, and the location of dialysis services all remain mainly unchanged. CPMC has indicated that dialysis services have not been materially reduced or cut, nor are they planned to be materially reduced or cut in the future.

Comment

(Commissioner Olague, September 23, 2010) [PC-397 HC]

"And then, finally, I did a little bit of looking into with some – I asked some folks to help me with this, and the Tenderloin, I guess it goes without saying, lacks sufficient primary and secondary healthcare services, heart disease, stroke, and diabetes hospitalizations and avoidable emergency room visits are nearly twice the rate of other San Francisco residents. So, a significant percentage of citywide demand for charity care, I guess, might originate in that particular neighborhood, I'm not sure how accurate that is, but that's what I've heard. So, CPMC's record, as it relates to providing charity care is apparently significantly worse than Catholic Healthcare West and in 2008, CPMC campuses, not counting St. Luke's, reported charity care expenditures of $7,270 per bed, while CHW reported expenditures of $17,000 per bed, so it seems that the comparison to some of the other healthcare providers is quite significant. So, if CPMC does ultimately become a luxury care facility, in light of the fact that we have UCSF on Parnassus and Stanford in Palo Alto, then one needs to question in terms of the best hospital practices that, in the event of a disaster, then, you know, someone else mentioned that, too, I believe, one of the speakers today, what kind of plan would there be in the case of a disaster and how would these institutions play into it because it seems in many ways it is unlikely that, given their track record that it is going to be a community serving facility, given some of their track record in other municipalities and counties in this area like Marin and Alameda and others."

Response HC-78

The comment states that a significant demand for charity care citywide is in the Tenderloin area of the City. The comment raises concerns regarding access of Tenderloin area residents to health care services, CPMC's record of providing charity care, and that a plan be in place for the CPMC facilities in the event of a disaster. The comment expresses hope that the Cathedral Hill Hospital would serve the community rather than become a "luxury care facility."

Provision of Service to the Community and Access to Tenderloin Residents at the Cathedral Hill Campus

Please see Major Response HC-8 (page C&R 3.23-32), which provides detailed information regarding access to health services for the underserved, including information regarding CPMC's commitments to partner with community-based clinics, and access to services by patients that are on Healthy Kids and/or Medi-Cal, and/or are Tenderloin residents. Please also see Responses HC-2 (page C&R 3.23-52), HC-7 (page C&R 3.23-74), HC-12 (page C&R 3.23-91), HC-16 (page C&R 3.23-101), and HC-31 (page C&R 3.23-160), which provide detailed information regarding the charity care provided by CPMC in comparison to other hospitals in San Francisco.

Although the proposed Cathedral Hill Hospital would provide tertiary, specialized medical services to patients referred from other CPMC community hospitals at the Davies and St. Luke's Campuses, the Cathedral Hill Hospital itself would operate as a full-service, community hospital. Therefore, it would

provide similar services to members of the surrounding community as would a typical community hospital. The proposed Cathedral Hill Hospital would include a women's and children's center with a full range of inpatient pediatrics programs, as well as an Emergency Department that would include a dedicated treatment area for pediatric care, as well as general care, critical care and triage, and a secured psychiatric area. As explained in Major Response HC-5 (page C&R 3.23-20), the Emergency Department at the proposed Cathedral Hill Campus would have 32 treatment stations and would be able to serve about 64,000 visits per year. Therefore, the Cathedral Hill Campus would provide all the services of a community hospital, would serve the needs of children, and would include an emergency room.

CPMC provides direct service to Healthy Kids patients through:

- The pediatrics clinic at the Family Health Center (currently at the California Campus, to be relocated to the Cathedral Hill Campus under the LRDP).
- St. Luke's Health Care Center (existing and to remain under the LRDP)
- Bayview Child Health Center (existing and to continue)[533]

Beyond direct care delivery through the clinics above, a wide array of Primary Care and specialty physicians are available to Healthy San Francisco/Healthy Kids patients.[534] Two of the six provider groups offered to Healthy Kids patients are Brown & Toland and North East Medical Services (NEMS) both of which are affiliated with CPMC.[535]

CPMC only has direct control over a small subset (approximately 13 percent) of the currently approximately 1,700 physicians affiliated with the CPMC campuses. CPMC hospitals and all physicians under the direct control of a CPMC entity (e.g., Sutter Pacific Medical Foundation physicians and the St. Luke's HealthCare Center physicians) do at present and would continue under the LRDP to accept Medi-Cal patients.

As explained in Major Response HC-8 (page C&R 3.23-32), the financial makeup of the patient population of a particular hospital is a combination of location, private physician ability or preference for a particular insurance type, historical admitting patterns, and other factors not analyzed in this EIR.[536] CPMC has limited control over many of these factors but does have control over (1) whether or not CPMC hospitals accept Medi-Cal for hospital charges, and (2) whether or not its clinics, staffed with CPMC physicians (e.g., at the approximately 15 San Francisco Sutter Pacific Medical Foundation Clinics[537] and the St. Luke's Healthcare Center) accept Medi-Cal. As part of its commitments made to the Health Commission, CPMC committed to (1) continue to accept Medi-Cal, as it always has, at all of its hospitals, (2) to guarantee access to Medi-Cal patients through all of the clinics controlled by CPMC as described above, and (3) to increase the amount of unpaid Medi-Cal shortfall systemwide by 22 percent over a 5-year period, from $53,369,000 in 2007 to $65,000,000 by 2012.[538]

According to the project sponsor, CPMC cannot compel private practice physicians who are not part of the Sutter Pacific Medical Foundation to see or not see Medi-Cal patients. Brown and Toland Medical

[534] CPMC, Memorandum from Geoffrey Nelson, Director, EDP, to Brian Boxer (AECOM) re: Access to Healthcare Services (May 13, 2011).
[535] Ibid.
[536] Ibid.
[537] For a list of 15 San Francisco and over 50 regional locations of Sutter Pacific Medical Foundation Clinics, see http://www.sutterpacific.org/locations/
[538] San Francisco Health Commission Task Force on CPMC's IMP Addressing Resolution No. 10-09, 2010 (Mar. 2), *Updates and Accomplishments*.

Group physicians, many of whom practice at CPMC facilities, for example, currently accept Medi-Cal patients, but this is a matter of personal physician choice.

Additionally, San Francisco Health Commission Resolution 02-10 memorialized CPMC's agreement to increase its amount of Medicaid shortfall (the uncompensated portion of providing care to Medicaid patients) by 22 percent in a 5-year period, from $53,369,000 in 2007 up to $65,000,000 by 2012.[539]

Major Response HC-8 includes a detailed list of some of CPMC's current partnerships in delivering low- or no-cost care to the medically underserved, and explains that CPMC also supports community health through initiatives such as Operation Access, Lions Eye Foundation, the Hep B Free Campaign, and Project Homeless Connect.

Comment PC-397 also raises the concern that CPMC could ultimately become a "luxury care facility." In addition to the above discussion of CPMC's commitments to provide health care services to the surrounding communities and the discussion below regarding CPMC's charity care commitments, please see Major Response HC-7 (page C&R 3.23-31). Major Response HC-7 explains that the current patient standard of guidelines recommend single-occupancy hospital rooms regardless of patient income level, and that Medicare rules would allow patients receiving Medicare to be placed in single-patient rooms at facilities such as the Cathedral Hill Hospital and St. Luke's Replacement Hospital that have only single-patient rooms.

Charity Care

Please see Major Response HC-8 (page C&R 3.23-32) regarding access to health services, which includes a discussion of CPMC's delivery of charity care. San Francisco Health Commission Resolution 02-10, approved on March 16, 2010, memorialized CPMC's commitment to increase it charity care contribution by 79 percent in a 5-year period, from approximately $5,315,000 in 2007 to $9,500,000 by 2010.[540] As explained in Major Response HC-8, according to the latest reporting by CPMC, in 2009, CPMC provided over $80 million in services for the poor and underserved.[541] The 2009 report on community benefits shows an increase in traditional charity care,[542] from $7,584,000 in 2008 to $10,215,000 in 2009. Traditional charity care at CPMC for 2007 was approximately $5,300,000.[543] From 2007 to 2008, traditional charity care increased approximately 31 percent, and from 2008 to 2009, an additional increase of 35 percent in charity care has occurred.[544] Preliminary reporting of 2010 total charity care provided by CPMC is approximately $14.9 million, an approximately $4.7 million increase over the 2009 total of approximately $10.2 million, representing an approximately 46 percent increase from 2009 to 2010.[545]

The comment includes a comparison of charity care provided by CPMC to Catholic Healthcare West, based upon charity care expenditure per bed. As explained in Major Response HC-1, the number of beds that are actually used for patient care on a daily basis in the CPMC system is substantially less than the

[539] S.F. Health Commission Resolution No. 02-10.
[540] Ibid..
[541] California Pacific Medical Center: *Report to the Community 2009,* page 8.
[542] Traditional charity care is the care CPMC provides for people who come to the emergency room but are uninsured and unable to pay. In 2009, CPMC extended this community benefit to more than 3,500 people. CPMC's total provision of "services to the poor and underserved" includes this amount, plus CPMC's contributions to Healthy San Francisco, unpaid Medi-Cal costs, health programming provided directly by CPMC or through partnerships with other providers, and grants and sponsorships. CPMC, *Report to the Community 2009*, pages 4–9.
[543] S.F. Health Commission Task Force on CPMC's IMP Addressing Resolution No. 10-09, *Updates and Accomplishments*, Mar. 2, 2010.
[544] CPMC, 2010 (Sept. 30), *Interim Report to the San Francisco Health Commission Regarding Progress Toward Commission Recommendation in Resolution No. 10-09*.
[545] CPMC, 2011 (Jan. 26), *Fourth Quarter 2010 Report to the San Francisco Health Commission Regarding CPMC's Progress Toward Commission Recommendations in Resolution No. 10-09*.

number that is actually licensed.[546] For this reason, the ratio of charity care expenditure to the number of licensed beds provided by a health care services provider is not considered an appropriate metric for determining the level of charity care expenditures made by that provider. A more appropriate metric is the ratio of charity care expenditures to net patient revenue, as utilized by the San Francisco Department of Public Health in its annual charity care reports analyzing the amount of charity care expenditures by different health care providers in San Francisco.[547]

According to the *San Francisco Charity Care Report Fiscal Year 2009* published by the San Francisco Department of Public Health, CPMC provided approximately $11.45 million in traditional charity care in the City in 2009, compared to $10.4 million for UCSF. $6.6 million for St. Francis Memorial Hospital, and $360,343 for Chinese Hospital.[548] In October 2011, DPH published its San Francisco Hospitals Charity Care Report for fiscal year 2010, which states that CPMC provided approximately $16.6 million in traditional charity care in fiscal year 2010 , compared to $11.2 million for UCSF and $7.8 million for St Francis Memorial Hospital. [549] When measured in terms of net patient revenue, CPMC provided approximately 1 percent of net patient revenue in traditional charity care in fiscal year 2009, increasing to 1.38 percent in 2010. This compares to 0.64 percent for UCSF in both years and 4.13 and 4.43 percent for SFMH in fiscal years 2009 and 2010, respectively. [550] Over the time period 2006 to 2009, the number of charity care patients at CPMC systemwide increased from 3,156 to 3,683.[551] This number further increased to 9,801 charity care patients in 2010 from 2009 and 2006, respectively.[552]

Furthermore, whereas all of San Francisco's hospitals provide free care to patients up to 200 percent of the federal poverty level (FPL), CPMC provides free care to patients earning up to 400 percent of FPL.[553]

Disaster Planning

Comment PC-397 raises the issue of the plan that would be in place in the event of a disaster and how CPMC's institutions would play into such a plan.

The proposed Cathedral Hill Hospital would be centrally located within the area of San Francisco with the highest density of population, reducing the amount of travel by being within walking distance of more people than the existing California and Pacific Campuses Emergency Departments. The proposed Cathedral Hill Hospital would also be located closer than the California and Pacific Campuses to the areas with the greatest risk of experiencing damage from a major earthquake and, thus, would move Emergency Department services closer to the areas likely to have the highest number of persons needing emergency

[546] CPMC's occupancy rate for 2009 systemwide was 48%, e.g. approximately 1 in 2 beds was actually in use on average. OSHPD, ALIRTS, Annual Utilization Reports for California Pacific Med Ctr-Pacific Campus, 2009, California Pacific Med Ctr-California West, 2009, California Pacific Med Ctr-California East, 2009, California Pacific Med Ctr-Davies Campus, 2009, and California Pacific Med Ctr-St. Lukes Campus, 2009, available at http://www.alirts.oshpd.ca.gov, accessed accessed Apr. 6, 2011.

[547] *See e.g.*, San Francisco Department of Public Health, 2010 (October), *San Francisco Charity Care Report Fiscal Year 2009*, at pp. 22-23.

[548] Ibid.

[549] San Francisco Department of Public Health, 2011 (Oct.), *San Francisco Charity Care Report Fiscal Year 2010, 10 Years of Charity Care Reporting*, p.26, Table 5, "Charity Care Expenditures by Hospital, FY10. " (CPMC and St. Luke's numbers consolidated)

[550] Ibid. 2009 Charity Care Report, p. 23, Table 6, "Ratio of Charity Care to Net Patient Revenue."; 2010 Charity Care Report, p. 31, Table 7 "Charity Care as Compared to Net Patient Revenue" (CPMC and St. Luke's numbers consolidated).

[551] 2010 Charity Care Report, Attachment A- Report Chart Pack, p.4.

[552] Ibid. (CPMC and St. Luke's numbers consolidated)._CPMC representatives indicated that "[t]he substantial increase in CPMC's charity care for 2010, as compared to previous years, is due to a change in the method used to process patient care applications. In 2010, CPMC implemented a major change – we streamlined the application process so that, for the most patients, eligibility was determined at the initial point-of-service. Prior to 2010, the charity care eligibility process required the patient to complete the application after the service was provided, "2010 Charity Care Report, p.23.

[553] Ibid. p. 15 (the *San Francisco Charity Care Report Fiscal Year 2009* published by the San Francisco Department of Public Health also states that many San Francisco Hospitals go up to 350 percent of FPL, citing Chinese Hospital as an example).

medical care.[554] Please also see Major Response HC-2 (page C&R 3.23-8) regarding the location of hospital facilities for disaster response, which explains CPMC's rationale for selecting Van Ness and Geary as the location for the new Cathedral Hill Campus.

In the event of an earthquake or other major disaster, not only CPMC's emergency bays, but all of its inpatient and outpatient facilities would be used to provide emergency care. Although the location of Emergency Departments is one factor in determining capacity for responding to disasters, physicians and specialized equipment also provide such capacity regardless of whether they are located within an Emergency Department or elsewhere.[555]

In addition to the proposed Cathedral Hill Hospital, CPMC would be providing emergency room services in other CPMC Campus locations, and CPMC's hospitals are not the only hospitals that would be available to provide emergency services in San Francisco in the event of a disaster. As explained in Major Response HC-5 (page C&R 3.23-20), in addition to the emergency room at the proposed Cathedral Hill Campus, the LRDP would increase the capacity of the emergency room at the St. Luke's Campus. Emergency services would also continue to be provided at the Davies Campus. In addition to the CPMC emergency rooms (and urgent care facilities at the CPMC campuses that would be available to provide services in the event of an emergency), other emergency rooms in San Francisco that would be available to provide services in the event of a major disaster would include Chinese Hospital, the Kaiser Permanente San Francisco Medical Center, Saint Francis Memorial Hospital, St. Mary's Medical Center, San Francisco General Hospital, San Francisco Veterans Affairs Medical Center, UCSF at Parnassus Heights, and the proposed UCSF Mission Bay hospital.

As explained in Major Response HC-2, from a citywide hospital distribution perspective, the proposed LRDP has been planned in the context of other proposed and pending medical campus projects in the City. Three new hospital facilities have been recently planned in the south of Market Street area: CPMC's proposed St. Luke's Replacement Hospital, San Francisco General Hospital's replacement hospital, and the University of California, San Francisco's new hospital/medical campus at Mission Bay. CPMC's proposed Cathedral Hill Campus is the only new acute care facility currently proposed in the north of Market Street area. Therefore, given the proposed and pending medical campuses in the south of Market Street area, the proposed LRDP would not result in a concentration of medical services on the north side of the City in a manner that would adversely affect the southern portion of the City in the event of a disaster.

Moreover, the proposed LRDP is intended to increase the seismic safety of CPMC patients that would receive inpatient medical services at the proposed new Cathedral Hill Campus, many of whom currently receive inpatient services at the California and Pacific Campuses, which have medical facilities and buildings that are rated SPC-1, the lowest seismic safety rating, and are expected to close by January 1, 2013, unless extended by SB 90 (potentially out to 2020) or successor legislation. To do this, the proposed LRDP includes the replacement of existing acute-care facilities at the California and Pacific Campuses (that would be required to close under SB 1953) with new, seismically compliant, acute-care facilities at the proposed Cathedral Hill Campus that could remain open beyond 2030.

Please see Section 1.5.2, "Seismic Requirements for Hospitals" and Section 1.5.3, "Review Process for Compliance with Seismic Requirements" in the Draft EIR, pages 1-17 to 1-20, for detailed information regarding State seismic safety requirements under SB 1953 and related laws and regulations, including

Borcherdt et. al., *Integrated Strong-Motion, Soil-Response Arrays in San Francisco California*, U.S. Geological Survey, available: http://nsmp.wr.usgs.gov/Presentations/San_Francisco_Array/San_Francisco_Array_Presentation_s.html, last updated September 23, 1999; accessed December 16, 2010; Figure 1b, map showing estimated losses for a repeat of the 1906 earthquake (Mw = 7.7), from Risk Management Solutions, Inc., Shah, et al. 1995.

555 American Journal of Emergency Medicine. 2004 Sep;44(3):253-61. "Health care facility and community strategies for patient care surge capacity." Hick JL, Hanfling D, Burstein JL, DeAtley C, Barbisch D, Bogdan GM, Cantrill S.

the structural ratings of acute-care hospital buildings by Structural Performance Category (SPC). The proposed Cathedral Hill Hospital and St. Luke's Replacement Hospital would both meet the highest seismic safety rating, SPC-5, which would enable it to be used as an acute-care facility through 2030 and beyond. The existing California, Pacific, and St. Luke's Campus hospitals are rated SPC-1, the lowest seismic safety rating, and would be required to close by January 1, 2013, under SB 1953, unless extended by SB 90 (potentially out extension to 2020) or successor legislation. In addition, the Davies Hospital North Tower was recently seismically retrofitted to meet SPC-2, enabling it to be used as an acute-care facility until 2030. Therefore, the proposed LRDP would increase the City's preparedness for an earthquake or other natural disaster and would increase the safety of the patient population that currently receives inpatient services at the California and Pacific Campuses by relocating such services to newer facilities that would meet the highest seismic safety standards under State law.

The Draft EIR included an analysis of the proposed LRDP's potential impacts related to earthquakes, seismicity, emergency response and evacuation plans in Section 4.14, "Geology and Soils" and Section 4.16, "Hazards and Hazardous Materials," as discussed in more detail below.

The discussion of Impact HZ-6 on pages 4.16-72 to 4.16-76 of the Draft EIR concluded that the project would not conflict with emergency response or evacuation plans during the proposed LRDP's construction and operational periods because CPMC is integrated into the continuous citywide preparation for emergencies and disasters, each CPMC campus would have an emergency operations and evacuation plan, the current emergency operations and evaluation plans at the existing campuses would continue to be maintained during construction and the San Francisco Fire Department (SFFD) and Police Department would be notified by CPMC of all temporary changes to campus access during construction, and CPMC would continue to work with the Hospital Council Emergency Preparedness Partnership, Emergency Medical Services, and SFFD on updated emergency planning. Therefore, the Draft EIR concluded that Impact HZ-6 would be less than significant.

The analysis of Impact GE-1 on pages 4.14-42 to 4.14-45 of the Draft EIR, which concluded that the proposed LRDP would not expose people or structures to the risk of loss, injury, or death involving rupture of a known earthquake fault or strong seismic ground shaking, because no earthquake zones have been mapped in the city, no evidence of fault rupture was observed at the Cathedral Hill, Pacific, Davies, and St. Luke's Campuses, because the proposed LRDP is intended to ensure that all existing and proposed CPMC campus structures are in full compliance with SB 1953 and subsequent seismic safety legislation, as applicable, which require that acute-care hospitals remain life-safe and operational after a seismic event, because the proposed new hospitals would be subject to OSHPD design review to ensure such compliance, and because all new structures proposed under the LRDP that would not provide acute care services would be required to comply with California Building Code, San Francisco Department of Building Inspection, and San Francisco Building Code seismic standards

Similarly, the analysis of Impact GE-2, on pages 4.14-45 to 4.14-49 of the Draft EIR, concluded that the proposed LRDP would not expose people or structures to the risk of loss, injury, or death involving ground failure, including liquefaction, or be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the proposed LRDP, and potentially result in liquefaction or lateral spreading, because the Cathedral Hill, Pacific, Davies, and St. Luke's Campuses are not located within a liquefaction zone as identified by the California Geological Survey and the potential for liquefaction or lateral spreading is very low at the Cathedral Hill, Pacific, Davies, and St. Luke's Campuses,

Additionally, the analysis of Impact GE-5, on pages 4.14-55 to 4.14-58 of the Draft EIR, concluded that the proposed LRDP would not expose people to the risk of loss, injury, or death involving ground failure, including densification or seismic settlement because excavation for the planned basements of the proposed near-term projects at the Cathedral Hill, Davies, and St. Luke's Campuses would extend well below the zones of loose geologic material, and because Mitigation Measure MM-GE-L5 (on page 4.14-

58 of the Draft EIR) would ensure that geotechnical studies are updated and prepared once the design-level plans for long-term projects at the Pacific and Davies Campuses are finalized, and that all recommendations in the geotechnical studies would be implemented and followed.

For the above reasons, the Draft EIR concluded that the proposed LRDP would have less than significant impacts related to such risks associated with earthquakes and seismicity analyzed under Impacts GE-1, GE-2, and GE-3.

3.23.2 MISCELLANEOUS OTHER

3.23.2.1 LRDP

Comments

(Marvis Phillips—Alliance for a Better District 6, May 19, 2010) [1-1 OTH]

"My name is Marvis J. Phillips. I'm the Land Use Chair of the Alliance For A Better District 6 and I am writing you on behalf of our Board of Director's regarding the upcoming California Pacific Medical Center Hearing on the DEIR.

The Board of Director's of the Alliance For A Better District 6 voted in the majority to stay neutral on this issue and there-by allowing our member to either support or not support this proposed project.

Again the Alliance For A Better District 6 is neutral on this project."

(Marvis Phillips—Alliance for a Better District 6, August 6, 2010) [4-1 OTH]

"The Board of Directors have taken a neutral position on Case No. 2005.0555E CPMC Long Range Development Plan. There-by allowing it's member to voice their own opinion. The comments below therefore are my personal opinions.

Overall the proposed Long Range Plan for CPMC is really quite good. My concerns however are few."

Response OTH-1

The comments are noted. These comments do not raise issues regarding the adequacy, accuracy, or completeness of the Draft EIR. The comments will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project.

Comment

(Marvis Phillips—Alliance for a Better District 6, August 6, 2010) [4-11 OTH]

"A new neuroscience is cool but if you cannot afford to get there what good is it."

Response OTH-2

The comment states concern regarding traveling affordably to the Davies Campus. As shown in Figure 4.5-9 on Draft EIR page 4.5-21 and listed in Table 4.5-4 on Draft EIR page 4.5-26, 16 Muni lines are located within a 0.5-mile radius of the Davies Campus and can reasonably be considered to serve the Davies Campus. Therefore, the location of the Davies Campus and the proposed facilities at this campus under the proposed CPMC LRDP would be sufficiently accessible by public transit, which is provided by the City and County of San Francisco as a means of affordable travel throughout San Francisco. The proposed CPMC LRDP would not adversely affect the capacity or reduce the functionality of existing transit opportunities, including the San Francisco Muni transit system. Impact TR-77 on page 4.5-187 in Section 4.5, "Transportation and Circulation," of the Draft EIR provides a summary of the potential impacts, including improvements to the Davies Campus, on transit capacity, concluding that implementation of the proposed CPMC LRDP would represent a less-than-significant impact on transit capacity.

Comment

(Scott Morgan, Office of Planning and Research—California State Clearinghouse, September 9, 2010) [8-1 OTH]

"The State Clearinghouse submitted the above named Draft EIR to selected state agencies for review. On the enclosed Document Detail Report please note that the Clearinghouse has listed the state agencies that reviewed your document. The review period closed on September 3, 2010, and the comments from the responding agency (ies) is (are) enclosed. If this comment package is not in order, please notify the State Clearinghouse immediately. Please refer to the project's ten-digit State Clearinghouse number in future correspondence so that we may respond promptly.

Please note that Section 21104(c) of the California Public Resources Code states that:

'A responsible or other public agency shall only make substantive comments regarding those activities involved in a project which are within an area of expertise of the agency or which are required to be carried out or approved by the agency. Those comments shall be supported by specific documentation.'

These comments are forwarded for use in preparing your final environmental document. Should you need more information or clarification of the enclosed comments, we recommend that you contact the commenting agency directly.

This letter acknowledges that you have complied with the State Clearinghouse review requirements for draft environmental documents, pursuant to the California Environmental Quality Act. Please contact the State Clearinghouse at (916) 445-0613 if you have any questions regarding the environmental review process."

Response OTH-3

This comment acknowledges that the City has complied with the State Clearinghouse review requirements for draft environmental documents. The State Clearinghouse also forwarded a comment letter on the Draft EIR that was submitted by Caltrans regarding traffic forecasting, highway operations, and construction, addressed in the Draft EIR in Section 4.5, "Transportation and Circulation."

Comment

(Scott Morgan, Office of Planning and Research—California State Clearinghouse, September 10, 2010) [9-1 OTH]

"The enclosed comment (s) on your Draft EIR was (were) received by the State Clearinghouse after the end of the state review period, which closed on September 3, 2010. We are forwarding these comments to you because they provide information or raise issues that should be addressed in your final environmental document.

The California Environmental Quality Act does not require Lead Agencies to respond to late comments. However, we encourage you to incorporate these additional comments into your final environmental document and to consider them prior to taking final action on the proposed project.

Please contact the State Clearinghouse at (916) 445-0613 if you have any questions regarding the environmental review process. If you have a question regarding the above-named project, please refer to the project's ten-digit State Clearinghouse number (2006062157) when contacting this office."

Response OTH-4

The State Clearinghouse forwarded a comment letter on the Draft EIR that was submitted by Caltrans, Division of Aeronautics, regarding airport-related noise, safety, and regional land use planning. This

comment is addressed in Section 3.18, "Hazards and Hazardous Materials," of this C&R document; please refer to Response HZ-2 for further information (page C&R 3.18-2).

Comments

(Jack Scott, September 23, 2010) [19-1 OTH, duplicate comment was provided in 40-1 OTH]

"We represent the neighbors of Cathedral Hill and strongly object to the construction of the mammoth hospital project planned by CPMC on the proposed site."

(Donald Scherl, October 18, 2010) [74-40 OTH]

"7.9: I recommend the Planning Commission reject the draft EIR as it pertains to the entire CPMC LRDP. While this would force CPMC to receive a temporary waiver and time extension under the State's retrofit regulations, given the significance of the decisions involved here, the flaws in the current plan (only some of which have been cited in this memorandum), and the good intentions of CPMC to comply with State regulations, I believe it would be possible to work it out with the CA DOH. Surely this would be better than destroying one neighborhood (Cathedral Hill) and short changing another (St. Luke's)."

Response OTH-5

These comments express opposition to the proposed CPMC LRDP. The comments also suggest that the Cathedral Hill Campus would be detrimental to the surrounding neighborhood, and that the St. Luke's Campus would not adequately serve its neighborhood. They also state that if the Planning Commission rejects the proposed CPMC LRDP, the project would be required to obtain a temporary waiver and time extension for seismic compliance. These comments do not raise specific issues on the adequacy, accuracy, or completeness of the analysis presented in the Draft EIR.

Concerning the general comments, there is no formal or informal waiver process as is suggested by the comment. Senate Bill (SB) 1953, as amended by successor legislation, states what constitutes compliance and noncompliance. SB 1953 establishes an applicable compliance deadline of January 1, 2013. SB 90 was approved on April 13, 2011, and would authorize extensions of up to 7 years (i.e., potentially out to 2020) if certain milestones and other requirements were met. In response to the time extension under the state's retrofit regulations, refer to Response HC-68 (page C&R 3.23-224). Regarding the relative sizes of the CPMC campuses, refer to Response ALT-1 (page C&R 3.22-11) concerning Alternative 3A and the sizes of the Cathedral Hill and St. Luke's Campuses. Refer to Responses AE-1 to AE-14, TR-1, TR-9, TR-10, TR-14, and TR-20 for discussion of the aesthetic and traffic impacts of the Cathedral Hill Campus, and Major Responses HC-1 and HC-2 (pages C&R 3.23-1 and 3.23-8) concerning the adequacy of health care services provided at the St. Luke's Campus. These comments will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project.

Comment

(Barbara Ann Berwick, September 23, 2010) [36-7 OTH]

"Thank you very much for your efforts in addressing these matters. I understand that there are conflicts and that your job of addressing the concerns of everyone will necessarily make a large number of people unhappy. You have my sympathy and understanding and I hope that the public will grant you sympathy and understanding as well. Thank you and bless you."

Response OTH-6

The comment is noted. This comment does not raise any specific issues on the adequacy, accuracy, or completeness of the analysis presented in the Draft EIR. The comment will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project.

Comment

(Unitarian Universalist CPMC Task Force, October 5, 2010) [44-1 OTH]

"We wish to do our part to support quality health care for all San Franciscans. However, we have serious concerns about the environmental impacts of the Long Range Development Plan. In addition, there are sections of the Draft Environmental Impact Report that are remarkably brief and inadequate; there are also some obvious errors."

Response OTH-7

The comment states that the organization wishes to support quality health care for all San Franciscans, but has concerns regarding the proposed CPMC LRDP and the Draft EIR. The comment also states that some sections of the Draft EIR are brief and inadequate, with errors. However, the comment does not raise any specific issues on the adequacy, accuracy, or completeness of the analysis presented in the Draft EIR. The Draft EIR includes evaluations of all the environmental topics listed in Appendix G of the State CEQA Guidelines, which have been adopted by the San Francisco Planning Department and are applied to the environmental reviews of all development projects in the City and County of San Francisco. The impact analysis sections in Chapter 4 of the Draft EIR are consistent with State CEQA Guidelines and considered appropriate for the corresponding project- and program-level components. The comment will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project.

Comment

(Madlyn Stein—Seniors of Cathedral Hill, October 7, 2010) [45-7 OTH]

"Please include our comments in the Environmental Impact Report and answer our concerns."

Response OTH-8

This comment is located at the end of Comment Letter 45 and requests that the comments related to land use, alternatives, and transportation and circulation be responded to in the Final CPMC LRDP EIR. The comments and concerns referenced in this comment letter are addressed in this C&R document along with all of the written and oral comments submitted to the City during the Draft EIR public review and comment period, or made through testimony at the Draft EIR public hearing. Refer to Responses LU-11 (page C&R 3.3-75), LU-12 (page C&R 3.3-76), ALT-1 (page C&R 3.22-11), TR-46 (page C&R 3.7-70), and TR-67 (page C&R 3.3-124) for responses to the substantive comments of Comment Letter 45 (Comments 45-1 LU, 45-2 LU, 45-3 ALT, 45-4 ALT, 45-5 TR, and 45-6 TR, respectively).

Comment

(Ryan Bresnick, August 1, 2010) [57-2 OTH]

"My concern is CPMC's ability to follow through with its promises of caring for the community and the environment. Since I have worked in the Pacific campus, I have seen no steps to lower the environmental impact of the hospital (except when for economic gains, that is then touted as 'green'). Right now there is a public relation blitz, with PR people coming to work and telling us how great the new building will be and how environmentally friendly it is. They then want us to sign a petition of support. I hope the city looks at these claims seriously and doesn't except them at face value."

Response OTH-9

The comment expresses concern regarding CPMC's ability to follow through with its commitments of caring for the community and environment. CPMC and the City have been in negotiations regarding the terms and conditions of a development agreement, that would, among other things, provide certain assurances and benefits, subject to the terms and conditions of the development agreement. Please see Section 3.23.1.2 "Development Agreement" on page C&R 3.23-41 for additional details regarding the development agreement. In addition, as stated in the Draft EIR, page 1-12, a mitigation monitoring and reporting plan (MMRP) must be adopted as part of an approval action if mitigation measures are made part of the project. State CEQA Guidelines Section 15126.4 (a) (2) requires that "mitigation measures must be fully enforceable through permit conditions, agreements, or other legally binding instruments." All of the mitigation measures contained in the Draft EIR would be fully enforceable and would require future legal action or compliance and proof to be shown in the MMRP. As stated in State CEQA Guidelines Section 15097, "In order to ensure that the mitigation measures and project revisions identified in the EIR or negative declaration are implemented, the public agency shall adopt a program for monitoring or reporting on the revisions which it has required in the project and the measures it has imposed to mitigate or avoid significant environmental effects." The MMRP would be included as part of the Findings of Fact for the project and would be adopted by the decision-makers if the proposed LRDP or one of the alternatives was approved.

Comment

(Donald Scherl, October 18, 2010) [74-1 OTH]

"I write as the former President (equivalent to a UC Chancellor) of an academic medical center in New York City, the State University of New York (SUNY) Downstate Medical Center. The campus, of which I was President for 12 years, included a University Hospital, as well as a medical school, school of nursing, school of allied health and PhD programs in the basic medical sciences. Thus, I am fully familiar with the unique characteristics and difficulties of running a hospital and, as it happens, of major construction (which took place during my tenure).

I am also the former Chairman of the Greater New York Hospital Association and served as well on its executive committee for over five years. I also served as a member of the Board of the NY Sate Hospital Association. I am therefore familiar with both hospital operations and with community health planning.

I include this background information in an attempt to establish credibility for the remarks that follow.

General remarks Regarding the Draft EIR/CPMC with particular relevance to the Cathedral Hill and St. Luke's Campuses.

1.0 The draft EIR is remarkably well done, notwithstanding the many disagreements I have with it."

Response OTH-10

The comment is noted. This comment does not raise any specific issues on the adequacy, accuracy, or completeness of the analysis presented in the Draft EIR. The comment will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project.

Comment

(Arthur and Jacqueline Cimento, October 19, 2010) [78-2 OTH, duplicate comment was provided in 99-2 OTH]

"Specific comments on the draft EIR are attached. We request that the project sponsors address these comments and provide adequate answers before the City makes its determination on the EIR.

It is unfortunate that the project sponsors have chosen to introduce a negative amenity into our neighborhood. While we support the overall mission of CPMC, we wish they would take the opportunity to provide more open space and improve the quality of life in our area.

Please contact us if you need any clarification and keep us informed as this project develops. Thank you for the opportunity to comment."

Response OTH-11

This comment states opposition to the proposed CPMC LRDP and provides specific comments in an attached document. The comment also expresses an interest in providing more open space in the vicinity of the Pacific Campus. This opposition to the LRDP is noted, and the comment will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project. Specific responses to the individual comments from Letter 78 are responded to in Responses for 78-1 TR (page C&R 3.7-146), 78-3 LU (page C&R 3.3-141), 78-4 TR (page C&R 3.7-147), 78-5 LU (page C&R 3.3-144), 78-6 NO (page C&R 3.8-73), 78-7 TR (page C&R 3.7-147), 78-8 TR (page C&R 3.7-138), 78-9 RE (page C&R 3.12-10), 78-10 OTH (page C&R 3.23-310), and 78-11 PD (page C&R 3.2-22). The comment also states that CPMC should provide more open space in the Pacific Campus area. Figure 4.10-3 on page 4.10-14 of the Draft EIR indicates the existing parks and open space within .5 mile of the Pacific Campus. In addition, the campus contains four open space areas and a garden. Refer to Draft EIR pages 4.10-10 through 4.10-13 for a description of parks and open spaces near the Pacific Campus. Refer to Draft EIR pages 4.10-36 through 4.10-39 in Section 4.10, "Recreation," for the Pacific Campus impact analysis of parks/open spaces. As noted in the Draft EIR, implementation of the proposed CPMC LRDP would represent a less-than-significant impact on citywide recreational opportunities.

Comment

(Barbara Kautz—CHNA and Bernal Heights Neighborhood Center, October 19, 2010) [87-1 OTH, duplicate comment was provided in 108-1 OTH]

"This letter transmits the comments of our clients, the Cathedral Hill Neighbors Association (CHNA) and the Bernal Heights Neighborhood Center (Bernal) regarding the Draft Environmental Impact Report (DEIR) prepared by the City of and County of San Francisco for the proposed California Pacific Medical Center (CPMC) Long Range Development Plan. CHNA supports sustainable urban development in the 36-square block neighborhood bounded by Grove, Sacramento, Polk, and Fillmore Streets that includes over 44,000 dwellings, churches, schools, and many large and small businesses. Bernal is a membership based, nonprofit public benefit corporation formed in 1978 with an all-volunteer board of directors elected from its membership base of over 1,000 and works to preserve and enhance the ethnic, cultural, and economic diversity of Bernal Heights and surrounding neighborhoods, prioritizing community action to build a just and equitable community for all and focusing on the needs of people with low and moderate incomes. Despite their diverse geographical locations and missions, CHNA and Bernal are united in their view of the proposed Long Range Development Plan and the deficiencies of the DEIR."

Response OTH-12

The comment states that there are deficiencies in the CPMC LRDP Draft EIR. This comment, however, does not raise any specific issues on the adequacy, accuracy, or completeness of the analysis presented in the Draft EIR; rather, it presents an introduction to the Cathedral Hill Neighbors Association (CHNA) and states that the CHNA's comments are in agreement with those of the Bernal Heights Neighborhood Center. The comment will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project.

Comments

(Gloria Smith—California Nurses Association, October 19, 2010) [90-4 OTH]

"CNA is one of California's oldest nonprofit social welfare institutions. Founded in 1903, today CNA represents over 80,000 members throughout the country. CNA has represented its members on nursing and public health issues before municipal, county, and state bodies for over 100 years. CNA members provide professional care for patients in medical facilities in San Francisco and throughout the Bay Area. CNA's comments are made in its representative capacity of CNA members and their families who currently reside in San Francisco County, on behalf of its members and their families throughout California, and on behalf of health care consumers generally who are directly affected in their health and general we fare by the availability of, access to, and quality and safety of health care services.

In addition, like the public at large, CNA members are concerned about sane and sustainable land use and development in San Francisco. CNA members live in the communities that suffer the impacts of environmentally detrimental and poorly planned projects. Ill-conceived development, in turn, may jeopardize human health and safety. This is particularly true here because numerous CNA members work in or live near Project facilities and will be negatively impacted by, among other things, increased traffic, poor air quality, undisclosed and unmitigated ground water and soil contamination, and impacts on affordable housing. Finally, CNA members are harmed by the fact that the City failed to comprehensively address the Project's effects on various communities' access to safe and affordable medical care. CAN therefore has a strong interest in enforcing environmental laws such as CEQA to protect its members.

We have prepared these comments with the assistance of four technical experts: Dr. Petra Pless, Ms. Terrell Watt, Mr. Tom Brohard, P.E. and Mr. Matt Hagemann, P.E. The comments of each of these experts along with their curriculum vitae are attached herein. Please note that this letter merely discusses only a small portion of each expert's comments; therefore, each expert's letter should be addressed and responded to separately."

(Stephanie Barton, et al.—Hastings Civil Justice Clinic for the Good Neighbor Coalition, October 19, 2010) [104-46 OTH]

"The purpose of CEQA is to regulate activities with environmental impacts 'so that major consideration is given to preventing environmental damage, while providing a decent home and satisfying living environment for every Califomian.'[109] The CEQA guidelines state that economic or social effects on people can be used to determine whether a physical effect is significant. For example, if a project would cause overcrowding of a public facility and the overcrowding causes an adverse effect on people, the overcrowding would be regarded as a significant effect. [110] Additionally, the DEIR must discuss 'health and safety problems caused by the physical changes' that the proposed project will produce.[111]

[109] CEQA Guidelines §2100(g).
[110] CEQA Guidelines §15064(e). *See also El Dorado Union High School District v. Placerville,* 144 Cal App. 3d 123 (3d Dist. 2003).
[109] *Bakersfield, supr* n. 108, 124 Cal. App. 4th at 1219; CEQA Guidelines §15126.2(a)"

Response OTH-13

The comments provide background on the CNA as part of an introduction to specific comments on the Draft EIR. The comment also introduces the technical experts used by CNA to assist in commenting on the technical analysis in the Draft EIR. Refer to Letters 91, 92, 93, and 119 of this C&R document for comments received from the technical experts. The information presented in these comment is noted. It does not raise issues regarding the adequacy, accuracy, or completeness of the Draft EIR, and will be transmitted as part of the C&R document to and may be considered by the decision-makers as part of their deliberations on the project.

The comment also states that CNA members would be negatively affected with respect to traffic, air quality, geology and soils, and affordable housing impacts as a result of implementation of the proposed CPMC LRDP because they work and live near the CPMC campuses that would be developed. The comment also notes that CNA members would be harmed, because the CPMC LRDP Draft EIR did not analyze access to safe and affordable medical care.

As noted in Section 4.5, "Transportation and Circulation," of the Draft EIR, beginning on page 4.5-93, the proposed CPMC LRDP would result in significant and unavoidable traffic impacts on the intersections of Van Ness Avenue/Market Street, Polk Street/Geary Street, and Church Street/Market Street/14th Street. All other impacts would be considered less than significant and would not represent a substantial adverse (negative) impact on the areas surrounding the CPMC campuses. As noted in Section 4.7, "Air Quality," of the Draft EIR, beginning on page 4.7-38, implementation of the proposed CPMC LRDP would result in operational air emissions that exceed Bay Area Air Quality Management District (BAAQMD) thresholds of significance but would not exceed established standards for carbon monoxide (CO) hotspots or toxic air contaminants (TACs). Section 4.16, "Hazards and Hazardous Materials," of the Draft EIR provides a detailed discussion of hazards and hazardous materials impacts (including groundwater and soil contamination) and mitigation measures related to the proposed LRDP. As noted in that section of the Draft EIR, with inclusion of the mitigation measures identified, implementation of the proposed LRDP would not result in a substantial adverse impact on the surrounding area. For information on San Francisco's ability to accommodate affordable housing, refer to Response PH-9 (page C&R 3.5-31). Please also see Major Response HC-9 (page C&R 3.23-39) regarding the effects of the proposed LRDP on access to health care in San Francisco.

Comment

(Gloria Smith—California Nurses Association, October 19, 2010) [90-14 OTH]

"• The EIR omitted credible analysis and substantial evidence for its conclusions regarding the significance of Project impacts. Instead, conclusions are based on bare and unverifiable assertions."

Response OTH-14

This comment states an opinion and does not provide any facts to support the statement that the Draft EIR omitted credible analysis and substantial evidence for its conclusions related to CPMC LRDP impacts analyzed in the Draft EIR. The environmental analyses provided in Chapter 4, "Environmental Setting, Impacts, and Mitigation," through Chapter 6, "Alternatives," in the Draft EIR are thorough and based on substantial, objective evidence that has been placed into the administrative record. The information on which the impact assessments were based is objective and unbiased, and is cited in the Draft EIR, consistent with the requirements of Section 15148 of the State CEQA Guidelines.

Comments

(Gloria Smith—California Nurses Association, October 19, 2010) [90-15 OTH]

"• The DEIR omitted a mitigation monitoring and reporting plan ('MMRP'). Instead, mitigations measures lack specificity, performance objectives, enforceability and timelines for implementation."

(Gloria Smith—California Nurses Association, October 19, 2010) [91-8 OTH]

"**II. The Draft EIR Fails to Provide a Mitigation Monitoring and Reporting Plan**

The Draft EIR does not provide a mitigation monitoring and reporting plan ('MMRP') as is customary for CEQA documents for large projects. An MMRP identifies the measures included in the project, the entities responsible

for carrying out the measures, and timing of implementation. Adoption of a mitigation monitoring and reporting program is required as a matter of law. The Governor's Office of Planning and Research explains:

> Despite CEQA's emphasis on mitigation, until 1988 the Act did not require that agencies take actions to ensure that required mitigation measures and project revisions were indeed being implemented. When reports of gross disregard for mitigation requirements reached the State Legislature in that year, it responded by enacting AB 3180 (Cortese). Section 21081.6 of the Public Resources Code, added by this bill, provides that whenever a mitigated negative declaration is adopted or a public agency is responsible for mitigation pursuant to an EIR, the 191-80TH 1 agency must adopt a program for monitoring or reporting on project compliance with the adopted mitigation. The legislation was signed into law by Governor Deukmejian in September of 1988 (Chapter 1232, Statutes 1988) and took effect on January 1, 1989.[12]

The CEQA Guidelines were revised to reflect the requirements of AB 3180 and state in pertinent part:

> Prior to the close of the public review period for a draft environmental impact report or mitigated negative declaration, a responsible agency, or a public agency having jurisdiction over natural resources affected by the project, shall either submit to the lead agency complete and detailed performance objectives for mitigation measures which would address the significant effects on the environment identified by the responsible agency or agency having jurisdiction over natural resources affected by the project, or refer the lead agency to appropriate, readily available guidelines or reference documents."[13]

[12] Governor's Office of Planning and Research, CEQA Technical Advice Series, Tracking CEQA Mitigation Measures Under AB 3180, *emphasis* added; http://ceres.ca.gov/ceqa/more/tas/CEQA Mitigation/CEQA Mil.html.

[13] California Public Resources Code § 21081: Findings Necessary for Approval of Project, § 21081.6(c): Adoption of Reporting or Monitoring Program for Changes, 2009."

(Gloria Smith—California Nurses Association, October 19, 2010) [91-9 OTH]

"Here, the Draft EIR neither contains complete and detailed performance objectives for its proposed mitigation measures nor does it reference any readily available guidelines or reference documents. One or the other should be included in the Draft EIR for public review. While the Draft EIR recognizes that '[a] mitigation monitoring and reporting plan ... must be adopted as part of the approval action if mitigation measures are made part of the project,' the City does not provide such a plan.[14] While the MMRP need not necessarily be part of the EIR, its inclusion would provide the public an opportunity to review and comment.

I recommend that Draft EIR be revised to include an MMRP that identifies the required mitigation measures, the entities responsible for carrying out the measures, and the timing of their implementation. Including the MMRP in the CEQA document for review would ensure that mitigation measures are specific enough to be monitored effectively.

[14] Draft EIR, p. 1-12."

Response OTH-15

The comments state that the CPMC LRDP Draft EIR does not include a mitigation monitoring and reporting program (MMRP). The comments are general in nature and do not provide input or criticism concerning any specific mitigation measures or related performance standards. Thus, a response to concerns for a particular mitigation measure is not included.

The requirement for an MMRP is established in Section 15097 of the State CEQA Guidelines. According to Section 15097(a) of the State CEQA Guidelines:

> This section applies when a public agency has made the findings required under paragraph (1) of subdivision (a) of Section 15091 relative to an EIR or adopted a mitigated negative declaration in conjunction with approving a project.

Thus, an MMRP is triggered by the decision to approve a project and is to be included as part of the findings related to such an approval; the MMRP is not required to be part of a Draft EIR.

Consistent with the Guidelines, the Draft EIR, page 1-12, states that an MMRP must be adopted as part of an approval action if mitigation measures are made part of the project. A summary of potential impacts and proposed mitigation measures for the proposed LDRP are included in Table S-2 in the Draft EIR, page S-37. This information will be incorporated into the MMRP as required and approved by decision-makers. Also, it should be noted that a draft MMRP was prepared prior to the issuance of the Draft EIR, was available for review as part of the administrative record of the CPMC LRDP EIR, and was provided to the commenter.

State CEQA Guidelines Section 15126.4(a)(2) requires that "mitigation measures must be fully enforceable through permit conditions, agreements, or other legally binding instruments." All of the mitigation measures contained in the CPMC LRDP Draft EIR are fully enforceable and would require future legal action or compliance, and proof would be shown in the MMRP. As stated in State CEQA Guidelines Section 15097, "In order to ensure that the mitigation measures and project revisions identified in the EIR or negative declaration are implemented, the public agency shall adopt a program for monitoring or reporting on the revisions which it has required in the project and the measures it has imposed to mitigate or avoid significant environmental effects." The MMRP would be included as part of the Findings of Fact for the project and would be adopted by the decision-makers, if the proposed LRDP or one of the alternatives was approved.

Comments

(Gloria Smith—California Nurses Association, October 19, 2010) [90-16 OTH]

"Given the intense public interest surrounding this project from all quarters of the City, as evidenced by the large turnouts at both the scoping and Planning Commission hearings, it is unconscionable for the City to issue a CEQA document that no one can understand.

Indeed, while the Project is large, and will affect numerous San Francisco communities, it is not a particularly complicated project *per se*. Had the City taken the time to prepare a decently organized CEQA document, it would not have precluded an untold number of interested residents from even understanding what it is CPMC is proposing to do. Shamefully, the City's substandard work has done just that. However, if, on the other hand, the City did view the Project as so complicated that it was unable to issue an EIR that anyone could comprehend, then the Project itself is too large and complicated to be considered under a single CEQA document and the Project requires several smaller actions. Either way, the City's EIR has made a mockery of informed decision making and must be withdrawn and properly revised."

(Gloria Smith—California Nurses Association, October 19, 2010) [90-21 OTH]

"Then, within the DEIR's narrow impact evaluations, it first provided a summary of the level of significance for each campus including mitigation, if required, and then discussed impacts associated with construction and operation of the Project components and their mitigation measures separately for *Near-Term Projects* at the Cathedral Hill, Davies, and St. Luke's Campuses and *Long-Term Projects* at the Pacific and Davies Campuses.[13] In some sections project-specific individual and cumulative impacts were discussed in separate sections (*e.g.*, land use), in other instances they are discussed in the same paragraph (*e.g.*, air quality). In short, the DEIR contains an impermissibly narrow description of the Project's environmental setting depriving readers of the Project's regional impacts.

[13] Draft EIR at pages 4-1 - 4-3."

(Gloria Smith—California Nurses Association, October 19, 2010) [91-10 OTH]

"**III. The Draft EIR's Organization Is Impenetrable and Fails to Fulfill Its CEQA Mandate to Effectively Inform the Public and Decisionmakers of the Project's Potential Adverse Impacts on the Environment**

CEQA mandates that an EIR must be 'organized and written in a manner that will be meaningful and useful to decisionmakers and to the public.'[15] Here, the organization of the Draft EIR is impenetrable and, consequently, fails to effectively inform the public and decisionmakers of the potential adverse impacts on the environment associated with construction and operation of the Project.

[15] Pub. Resources Code, §2JO03(d)."

(Gloria Smith—California Nurses Association, October 19, 2010) [91-12 OTH]

"**III.B The Draft EIR's Discussion of Environmental Setting, Impacts, and Mitigation Measures and Is Repetitive and Impenetrable**

For each environmental impact in these sections, the Draft EIR discusses the environmental setting, regulatory framework, cumulative conditions, significance criteria, and impact evaluations. Within the impact evaluations, the Draft EIR first provides a summary of the level of significance for each campus including mitigation, if required, and then discusses impacts associated with construction and operation of the Project components and their mitigation measures separately for *Near-Term Projects* at tile Cathedral Hill, Davies, and St. Luke's Campuses and *Long-Term Projects* at the Pacific and Davies Campuses.[16] In some sections project-specific individual and cumulative impacts are discussed in separate sections *(e.g.*, land use), in other instances they are discussed in the same paragraph *(e.g.,* air quality).

[16] Draft EIR, pp. 4-1—4-3."

(Gloria Smith—California Nurses Association, October 19, 2010) [91-13 OTH]

"By more or less blindly following the above discussed formulaic organization, the Draft EIR's analysis of the Project's environmental impacts becomes repetitive and impenetrable and fails to provide an easily understandable discussion of impacts *prior to* and *after* implementation of the proposed mitigation measures for tile various near-term and long-term project components. Unfortunately, the poor formatting of the Draft EIR's environmental impact analysis sections does little to assist or guide the reviewer. The 43-page summary table of "CPMC LRDP Impacts and Mitigation Measures" provided with the Draft EIR's Executive Summary is equally confusing, replete with unnecessary abbreviations, and poorly formatted."

(Gloria Smith—California Nurses Association, October 19, 2010) [91-58 OTH]

"The Draft EIR is among the poorest CEQA documents I have reviewed in my practice. It is simply not acceptable that a project as large and complex as the implementation of the CMPC LRDP is not as adequately analyzed and, more importantly, mitigated, as most small-scale residential or commercial developments undergoing CEQA review. This is inexcusable, especially for a hospital development plan which strives "to bring the next generation of health care to the residents of San Francisco and surrounding areas."[71] I recommend that the Draft EIR be extensively revised to more adequately discuss Project impacts and require adequate mitigation to reduce significant impacts to the extent feasible. The revised Draft EIR should contain adequate discussion of all mitigation measures that were evaluated for their feasibility.

[70] Bay Area Air Quality Management District. California Environmental Quality Act, Air Quality Guidelines, June 2010, Table 8-3. p. 8-5.
[71] California Pacific Medical Center, Building Beyond; http://rebuildcpmc.org/plans/."

(Gloria Smith—California Nurses Association, October 19, 2010) [93-3 OTH]

"As a result of missing and incomplete information concerning the proposed Project, as well as flawed assumptions and analyses, the DEIR fails to disclose and analyze potentially significant impacts from this

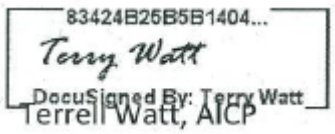
expansive Project on the region, the City and local neighborhoods including, but not limited to: 1) significant unmet demand for housing, and in particular, housing affordable to the workforce; 2) jobs-housing imbalance and related impacts on transportation, air quality, growth inducement and public services; and 3) other impacts that would be generated by the proposed Project as well as the Project plus cumulative projects. In short, the release of this DEIR was premature because information critical to the disclosure and analysis of Project-related impacts has not yet been provided to the public for review."

(Gloria Smith—California Nurses Association, October 19, 2010) [93-99 OTH]

"**CONCLUSION**

For all the above reasons, the City must prepare and recirculate a revised DEIR based on a complete project description and environmental setting that addresses these omissions.

Very truly yours,



"

(Stephanie Barton, et al—Hastings Civil Justice Clinic for the Good Neighbor Coalition, October 19, 2010) [104-79 OTH]

"Because the DEIR downplays or overlooks significant environmental impacts, city decision makers lack important and necessary information for determining whether the overriding considerations or justifications for the project outweigh the negative impacts. As discussed in this comment letter, this project especially warrants heightened justification given its potential impacts on myriad environmental and related non-environmental issues, including affordable housing, neighborhood traffic and transit, air quality and greenhouse gas emissions, job opportunities for San Francisco residents, and the accessibility and equitable distribution of healthcare services."

Response OTH-16

The comments relate to the organization and quality of the CPMC LRDP Draft EIR. The comments state that the Draft EIR evaluated a limited/narrow set of potential impacts against an "impermissibly narrow description of the … environmental setting," thereby limiting the public's ability to review the analysis. The comments also state that due to the "impenetrable" and "repetitive" language and structure of the document, the Draft EIR "fails to provide an easily understandable discussion of impacts." The comments also raise concerns regarding the level of detail, and consequently the analysis of certain aspects of the proposed CPMC LRDP, including those that are supposed to be evaluated at a project level. The comments raise concerns over the adequacy of the Draft EIR as an informational document for the public and decision-makers. One comment suggests the proposed CPMC LRDP requires "heightened justification" based on the potential impacts on both environmental and non-environmental issues. Finally, the comments also state general perceptions that the Draft EIR contains "flawed assumptions and analyses."

Chapter 2, "Project Description," in the Draft EIR provides a detailed description of the project sites and existing on-site conditions, the LRDP proposal for each CPMC campus, CPMC's project objectives, and approvals required to implement the project. The project description is consistent with the requirements of State CEQA Guidelines Section 15124 and environmental review requirements set out in Chapter 31 of the San Francisco Administrative Code. The project description first provides an overview of the LRDP as a whole and then provides separate subsections on each of the existing and proposed campuses.

Not every detail related to the LRDP or the proposal for each campus is contained in the project description. In some cases details that pertain specifically to certain environmental issue areas are provided in those [environmental issue analysis sections] of the Draft EIR to facilitate understanding and ease of reading. For example, there are details of the proposed project's trip generation characteristics and proposed TDM programs that are introduced in the Transportation chapter, because they are most relevant and appropriately discussed in the context of the evaluation of transportation impacts. This is standard practice in EIRs prepared by San Francisco Planning Department, such as the Candlestick Point–Hunters Point Shipyard Phase II Development Plan Project EIR and the Parkmerced Project EIR, for which the San Francisco Planning Department serves as the lead agency under CEQA. This is consistent with the directions of the State CEQA Guidelines, which state in Section 15124(c) that the project description should include, "[a] general description of the project's technical, economic, and environmental characteristics, considering the principal engineering proposals if any and supporting public service facilities."

As stated in the Draft EIR, page 1-3, all 18 of the environmental issue areas identified in the CEQA checklist (Appendix G of the State CEQA Guidelines and Chapter 31 of the San Francisco Administrative Code) have been addressed and are ordered in accordance with City practices in Chapter 4 of the Draft EIR. The Chapter 4 impact analysis sections provide thorough evaluations of the potential physical environmental impacts that would occur with implementation of the proposed CPMC LRDP. These sections are organized as follows: first by environmental setting (tailored to the resource area being evaluated), regulatory framework, and significance criteria, and then impact analysis, including project-level and cumulative impacts. The issue area–specific environmental settings provided within each section of Chapter 4 are considered to be of an appropriate level of detail to evaluate the potential impact on the physical environment that may result from implementation of the proposed CPMC LRDP. Each impact is summarized in a numbered impact statement that addresses the preceding previously identified significance criteria; the appropriate number(s) for the significance criterion or criteria are presented in parentheses. The ultimate level of significance[1] of the impact at the proposed Cathedral Hill, Pacific, California, Davies, and St. Luke's Campuses is presented immediately below the impact statement.

For each impact question/topic, the analysis is split into separate discussions of near-term and long-term projects. The proposed LRDP includes near-term projects at the Cathedral Hill, Davies, and St. Luke's Campuses, most of which are scheduled for completion before January 2015 (at the St. Luke's Campus, the MOB/Expansion Building would not be constructed until after demolition of the existing St. Luke's Hospital tower). These near-term projects (and the project variants proposed for the Cathedral Hill and St. Luke's Campuses) are analyzed at a project-specific level. The effects of the No Van Ness Avenue Pedestrian Tunnel Variant for the proposed Cathedral Hill Campus, and the Alternate Emergency Department Location Variant and the Cesar Chavez Street Utility Line Alignment Variant are analyzed for all resource areas, but the effects of the Two-Way Post Street Variant and the MOB Access Variant at the proposed Cathedral Hill Campus are analyzed only in Section 4.1, "Land Use and Planning," Section 4.5, "Transportation and Circulation," and Section 4.6, "Noise," because only land use and planning, and traffic and circulation effects (including related noise effects) would result from these variants.

Long-term projects to be initiated at the Pacific and Davies Campuses after January 1, 2015, are analyzed at a programmatic level. The long-term projects would require additional or supplemental project-level CEQA environmental review and approval at a later date, which is discussed in the Draft EIR.

Each impact statement and list of significance level is followed by a detailed impact analysis, generally in the following format:

[1] The "ultimate level of significance" means the level of significance of an impact after mitigation is applied, if implementing a mitigation measure is required. The ultimate level of significance presented will be either "no impact" or "less than significant" (if no mitigation is required) or "less than significant with mitigation" or "significant and unavoidable" (if the impact would be potentially significant or significant, thus requiring mitigation).

- Near-Term Projects
  - Cathedral Hill Campus (including a brief separate discussion of the No Van Ness Avenue Pedestrian Tunnel Variant for this campus in all resource sections, and discussions of the Two-Way Post Street Variant and the MOB Access Variant in Section 4.1, "Land Use and Planning," Section 4.5, "Transportation and Circulation," and Section 4.6, "Noise")
  - Davies Campus (Neuroscience Institute building)
  - St. Luke's Campus (Replacement Hospital and MOB/Expansion Building, including brief separate discussions of the Alternate Emergency Department Location Variant and the Cesar Chavez Street Utility Line Alignment Variant for this campus)
- Long-Term Projects
  - Pacific Campus
  - Davies Campus (Castro Street/14th Street MOB)

In some instances, the impact for a certain resource area and significance criterion would be identical under both near-term and long-term projects. In this case, the impact discussion for the long-term project simply states that the impact(s) would be identical and provides a cross-reference to the discussion of near-term impact(s).

Pursuant to State CEQA Guidelines Section 15125(a), the "Environmental Setting" sections in Sections 4.1 through 4.18 in the Draft EIR provide the "baseline condition" against which the project-related impacts are compared. The baseline condition is normally the physical conditions that existed at the time the notice of preparation is published, which for the CPMC LRDP was in May 2009 (see Appendix A, "Notice of Preparation"). For some analyses in the Draft EIR, such as the transportation impacts evaluation, the Draft EIR included an evaluation based on both existing conditions and a modified future baseline condition. The modified baseline is presented as a point of comparison in situations where the City believes that comparison to only existing conditions would underestimate or obscure the magnitude of the environmental impacts. Please also see Response TR-9 (page C&R 3.7-11) for further information regarding the use of a modified baseline to appropriately evaluate the impacts of the CPMC LRDP.

The thresholds for determining the significance of impacts are consistent with the environmental checklist in Appendix G of the State CEQA Guidelines and Chapter 31 of the San Francisco Administrative Code, which has been adopted and modified by the City and County of San Francisco. The City and County of San Francisco use the same thresholds of significance for each environmental issue area regardless of the perceived magnitude of potential project impacts, as suggested by the comment. A heightened standard of analysis based on the potential number of impacts is not required under CEQA. The State CEQA Guidelines address the standard of adequacy in Section 15151, which states that "[a]n EIR should be prepared with a sufficient degree of analysis to provide decision makers with information which enables them to make a decision which intelligently takes account of environmental consequences. An evaluation of the environmental effects of a proposed project need not be exhaustive, but the sufficiency of an EIR is to be reviewed in the light of what is reasonably feasible." In fact, the level of detail of analysis in an EIR is appropriately based on the level of detail of the project, as directed in section 15146 of the State CEQA Guidelines, which addresses the degree of specificity in an EIR, and which states that "The degree of specificity required in an EIR will correspond to the degree of specificity involved in the underlying activity which is described in the EIR." All potentially significant impacts and feasible mitigation measures are discussed in Sections 4.1 through 4.18 of the Draft EIR and are summarized in Table S-2, starting on Draft EIR page S-37.

The comments state that the Draft EIR presents significant and unavoidable impacts without attempting to propose mitigation for these impacts. Each potentially significant impact in the Draft EIR was evaluated for availability of potential mitigation measures that would be feasible, enforceable, and that would serve to reduce the potential impact of the proposed LRDP to less-than-significant levels, if possible. When environmental impacts are concluded to be significant and unavoidable, the Draft EIR notes whether any feasible mitigation measures would be available to reduce the potential impact, regardless of the ultimate significance determination in Chapter 4, "Environmental Setting, Impacts, and Mitigation," of the Draft EIR, and in Table S-2, starting on Draft EIR page S-37.

The comment states that mitigation measures are impermissibly deferred, but do not identify any examples of such deferred mitigation measures. Mitigation measures in the Draft EIR are not deferred. However, in some cases where the full extent and nature of project-specific environmental impacts cannot yet be precisely predicted, mitigation measures may be presented in a manner that permits flexibility in application as those impacts become more specifically identified. As an example, Mitigation Measure M-NO-N1a, identified to mitigate construction noise impacts, identifies a range of types of noise measures that are to be included in future construction contracts in order to ensure that the proposed LRDP construction activities meet the requirements of the City of San Francisco Noise Control Ordinance. In this case, and in others in the Draft EIR, the mitigation measure identifies the required performance standard (compliance with the Noise Control Ordinance) but provides flexibility in the specific steps to be taken to achieve the performance standard. In this case, while the measure calls for installation of noise barriers, it does not dictate the specific type of barrier (i.e., noise blankets or wood barriers). A further example is contained in Mitigation Measure M-NO-N1c, which requires noise monitoring during construction in order to measure the effectiveness of noise attenuation measures, and indicates that if the measures prescribed in M-NO-N1a are not effective to ensure compliance with the Noise Control Ordinance, then additional measures would be required to be implemented which "may include erecting additional temporary noise barriers at either the source or the receptor; building large temporary enclosures to shield receptors from the continuous engine noise of delivery trucks during offloads (e.g., concrete pump trucks during foundation work); or lining temporary noise barriers with sound absorbing materials." These measures to not improperly defer mitigation, but rather acknowledge that there are factors that cannot be accurately predicted in an EIR and identify steps that are to be taken in the future based on real world conditions. Please also see Response INTRO-11 (page C&R 3.1-22) for further clarification of what would constitute deferred mitigation versus the mitigation presented in the Draft EIR. The MMRP (a draft of which is available) would provide additional detail regarding mitigation measures and would be adopted as part of the approval action for certifying the EIR.

There is no evidence to support the statement that the City "… failed, as a matter of law, to inform the public and decision makers about the project's significant impacts on air quality, traffic and transit, land use, the loss of access to affordable health care, and soil and groundwater contamination." The Draft EIR provides a comprehensive analysis of air quality impacts (see Section 4.7.5, "Impact Evaluations," in the Draft EIR, page 4.7-26), transportation and circulation impacts (see Section 4.5.4, Impact Evaluations," in the Draft EIR, page 4.5-87), land use and planning impacts (see Section 4.1.5, "Impact Evaluations," in the Draft EIR, page 4.1.37), geology and soils impacts (see Section 4.14.5, "Impact Evaluations," in the Draft EIR, page 4.14-41), and hazards and hazardous materials impacts (see Section 4.16.5, "Impact Evaluations," in the Draft EIR, page 4.16-37). The Draft EIR provided adequate analysis of all of the environmental resource areas in the Draft EIR, which was based on substantial evidence that was provided in the technical reports, modeling, and references used for the Draft EIR and part of the administrative record for the EIR and available for public review.

The comment states that the Draft EIR does not analyze the LRDP's impacts on affordable housing, job opportunities for San Franciscans, or equitable access and distribution of health care services. These are social and economic impacts. CEQA is concerned solely with whether a project may have physical environmental effects (e.g., air quality, biological resources, cultural resources). Accordingly, CEQA

would not require the analysis of the proposed LRDP's social and economic impacts, except to the extent that they might provide a linkage to physical changes in the environment. Please also see Response INTRO-7 (page C&R 3.1-17) for a further discussion of why social and economic impact evaluations are not provided as part of the Draft EIR, consistent with CEQA requirements.

Please also see Major Response HC-9 (page C&R 3.23-39) and Response HC-57 (page C&R 3.23-208) for a discussion of the potential effects of the proposed CPMC LRDP on citywide health care services, including accessibility and distribution.

Comment

(Gloria Smith—California Nurses Association, October 19, 2010) [90-18 OTH]

"In addition, the DEIR identified a number of significant and unavoidable environmental impacts associated with the construction and operation of the Project. The City may adopt a Statement of Overriding Considerations only **after** it has imposed all feasible mitigation and analyzed all feasible alternatives to reduce the Project's impact to less than significant levels.[4] CEQA prohibits the City from approving the Project with significant environmental impacts when feasible mitigation measures or alternatives can substantially lessen or avoid its impacts.[5]

Finally, if a mitigation measure or alternative would itself cause one or more significant effects in addition to those that would be caused by the Project as proposed, the effects of the mitigation measure must be analyzed.[6]

[4] CEQA Guidelines §§ 15126.4, 15091.
[5] CEQA § 21002.
[6] CEQA Guidelines, at § 15126.4(a)(1)(D)."

Response OTH-17

The comment cites specific sections of CEQA and the State CEQA Guidelines. The comment is noted. The CPMC LRDP Draft EIR and its environmental review process are in conformance with State CEQA Guidelines Sections 15126.4 and 15091 and CEQA Section 21002, as cited in this comment. This comment does not raise issues regarding the adequacy, accuracy, or completeness of the Draft EIR. The comment will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project.

Comment

(Gloria Smith—California Nurses Association, October 19, 2010) [90-19 OTH]

"**A. THE EIR FAILS TO INCLUDE ALL THE RELEVANT DATA IN A SINGLE REPORT**

An EIR must be 'a compilation of all relevant data into a single formal report which would facilitate both public input and the decision making process.'[7] The City failed to provide the public with the DEIR's appendices and supporting documentation despite this data being an integral and inseparable component of the EIR itself. In our experience, DEIR appendices are physically attached to the DEIR and include traffic counts, air quality data and other supporting studies and information on which the preparers relied in their analyses and conclusions. Here, the City separated the supporting documentation from the DEIR and would only provide this information in compact disc ('CD') format after a member of the public pre-paid $10.00 per CD. Creating extra red tape and charging the public for information it is freely entitled to violates CEQA.

[7] (*Russian Hill Improvement Association v. Board of Permit Appeals* (1975) 44 Cal.App.3d 158, 168.)"

Response OTH-18

The comment expresses concerns regarding the public's access to supporting documentation and technical reports referenced in the CPMC LRDP Draft EIR. Under CEQA, it is proper and allowable for the Draft EIR to contain summaries and synthesis of highly technical information that is included in the record through separate appendices or technical reports on file with the lead agency. Furthermore, it is common, especially on larger and more complex EIRs, for the document to be published with multiple volumes. These practices are specifically allowable under CEQA, as addressed in Section 15147 of the State CEQA Guidelines: "Placement of highly technical and specialized analysis and data in the body of an EIR should be avoided through inclusion of supporting information and analyses as appendices to the main body of the EIR. Appendices to the EIR may be prepared in volumes separate from the basic EIR document, but shall be readily available for public examination and shall be submitted to all clearinghouses which assist in public review."

Furthermore, it is proper and allowable under CEQA for a public agency to charge the public for the cost of reproduction of reports (media recovery cost). As is stated under Section 15045 of the State CEQA Guidelines, "Public agencies may charge and collect a reasonable fee from members of the public for a copy of an environmental document not to exceed the actual cost of reproducing a copy."

Thus, the structure and style of the Draft EIR is entirely in keeping with the requirements and standards of CEQA and the State CEQA Guidelines.

Comment

(Gloria Smith—California Nurses Association, October 19, 2010) [90-36 OTH]

"**D. The DEIR Failed to Disclose and/or Analyze All Potentially Significant Impacts**

An EIR must disclose all of a project's potentially significant environmental impacts, because CEQA requires public agencies to avoid or reduce environmental damage by requiring alternatives and/or mitigation measures, and disclosing these requirements prior to project approval.[19] Here, the DEIR failed to disclose and/or analyze numerous potentially significant impacts. Instead, the DEIR contains only cursory analyses of impacts associated with soil and groundwater contamination, traffic and transit, land use, air quality, and access to affordable and safe healthcare. With these omissions, the City violated one of CEQA's most critical components because only after the City investigates and discloses these impacts can it move to the next step of showing it has imposed all feasible alternatives and/or measures to mitigate the Project's significant impacts. In short, unless these impacts are properly analyzed, they will not be fully addressed through either mitigation or alternatives, all in violation of CEQA.

[19] CEQA section 21100(b)(1); CEQA Guidelines § 15002(a)(2) and (3); see also Citizens of Goleta Valley v. Board of Supervisors (1990) 52 Ca1.3d 553, 564; Laurel Heights Improvement Ass'n v. Regents of the University of California (1988) 47 Cal.3d 376, 400)."

Response OTH-19

The comment provides a broad and unspecific critique of the breadth of the impact analysis contained in the CPMC LRDP Draft EIR. The Draft EIR contains a very detailed analysis of all potential physical environmental effects of the proposed LRDP, presented in hundreds of pages of text, tables, and graphics.

Regarding additional comments made in Comment Letter 90, the breadth and depth of analysis of the Draft EIR, please see Response HZ-5 (page C&R 3.18-7) for a discussion of impacts related to soil and groundwater contamination. Response TR-12 (page C&R 3.7-29) evaluated the comment's concerns regarding the Draft EIR's discussion of impacts related to traffic and transit. Please see Response LU-6 (page C&R 3.3-60) for a discussion of the comment's concerns regarding the Draft EIR's evaluation of

impacts related to land use and Response AQ-13 (page C&R 3.9-36) for a discussion of concerns raised related to potential air quality impacts. Please also see Major Response HC-8 (page C&R 3.23-32) for a discussion of how the proposed CPMC LRDP would not reduce access to affordable and safe health care in San Francisco. In addition, Response OTH-16 (page C&R 3.23-254) provides discussion on the appropriate level of detail of the mitigation measures presented in the Draft EIR.

The Draft EIR meets the CEQA requirement for analyzing a "reasonable range of alternatives." Under State CEQA Guidelines Section 15126.6(1), "[A]n EIR need not consider every conceivable alternative to a project." Under the "rule of reason" governing the selection of the range of alternatives, the EIR is required, "to set forth only those alternatives necessary to permit a reasoned choice," as stated in State CEQA Guidelines Section 15126.6(f). Although an EIR must consider a reasonable range of potentially feasible alternatives, it does not have to identify and analyze alternatives that would not meet a project's objectives nor does it have to discuss every possible variant or permutation of alternatives.

Comment

(Gloria Smith—California Nurses Association, October 19, 2010) [90-81 OTH]

"**F. The DEIR Failed to Propose Feasible Mitigation Measures Before**

Concluding That Numerous Project Impacts Were Unavoidable, Relying Instead Upon A Statement of Overriding Considerations

The DEIR listed 62 significant and unavoidable impacts on traffic congestion; 29 significant and unavoidable impact on air quality and greenhouse gases.[50] These appalling numbers are worsened by the fact that the DEIR omitted any meaningful analysis of mitigation measures studied but rejected on grounds they were infeasible. The public is entitled to know whether the City made any effort to mitigate numerous significant impacts on traffic congestion, air quality and climate.

Under CEQA, a lead agency may not conclude that an impact is significant and unavoidable without requiring the implementation of all feasible mitigation measures to reduce the impact to less than significant levels.[51] If an agency is unable to provide a specific mitigation measure, CEQA requires the articulation of performance criteria at the time of project approval.[52] CEQA Guidelines make clear that a lead agency must make a 'fully informed and publicly disclosed' decision that 'specifically identified expected benefits from the project outweigh the policy of reducing or avoiding significant environmental impacts of the project.'[53] Here the City did no such thing, it simply gave up on taking any steps to curb the nearly 100 significant impacts on traffic, air quality, noise and climate change.

50 DEIR at pages 5.1—5.7.
51 CEQA Guidelines sections 15126.4, 15091.
52 Sacramento Old City Association v. City Council of Sacramento (1991) 229 Cal.App.3d 1011, 1028-1029.
53 CEQA Guidelines section 15043(b)."

Response OTH-20

The comment states that the Draft EIR identified almost 100 significant and unavoidable impacts, and did not provide a detailed discussion of potential mitigation measures that were considered but deemed infeasible. The comment also provides several citations of the State CEQA Guidelines with respect to findings and the mitigation of potential significant environmental impacts and states that the City did not comply with the State CEQA Guidelines, Sections 15043(b), 15126.4, and 15091.

Table 5-1, page 5-2 of the Draft EIR, presents a summary of the significant and unavoidable impacts identified in the Draft EIR, and includes significant and unavoidable impacts of the LRDP as proposed, as well as the significant and unavoidable impacts of the Cathedral Hill Campus variants evaluated in the

transportation section of the Draft EIR. In total, the Draft EIR identified 53 significant and unavoidable impacts of the project as proposed, 56 significant and unavoidable impacts of the Two-Way Post Variant, and 54 significant and unavoidable impacts of the MOB Access Variant. The commenter's notation of "nearly 100" significant and unavoidable impacts appears to represent a tally of all impacts noted in Table 5-1, including significant and unavoidable impacts of the proposed LRDP, the Two-Way Post Variant, and the MOB Access Variant.

All feasible and enforceable mitigation measures have been identified to reduce the physical environmental impacts of the proposed CPMC LRDP, and are discussed in Sections 4.1 through 4.18 of the Draft EIR (see Table S-2 in the Draft EIR, page S-37 for a summary of mitigation measures), consistent with the requirements of Section 15126.4. Under Section 15126.4, an EIR is required to describe "feasible" mitigation measures that would reduce potentially significant adverse impacts of a particular project. However, Section 15126.4 also stipulates that a lead agency may determine that a measure cannot be legally imposed or is infeasible, and in that case, the measure need not be proposed or analyzed. CEQA explicitly recognizes that an EIR may identify significant and unavoidable impacts that cannot be mitigated below the level of significance or where no feasible mitigation measures are possible to implement and enforce. Pursuant to the requirements of section 15093, if the decision-makers determine to approve the project despite the acknowledgement of significant and unavoidable impacts, they must adopt a statement of overriding considerations that documents how the decision-makers "balance, as applicable, the economic, legal, social, technological, or other benefits, including region-wide or statewide environmental benefits, of a proposed project against its unavoidable environmental risks…. If the specific economic, legal, social, technological, or other benefits, including region-wide or statewide environmental benefits, of a proposed project outweigh the unavoidable adverse environmental effects, the adverse environmental effects may be considered acceptable."

Section 15091 of the State CEQA Guidelines relates to the preparation of findings, which occurs later in the CEQA process during consideration of the EIR for certification and the project for approval. Therefore, the statement in this comment that the City did not comply with this requirement as part of the Draft EIR analysis is not correct. Similarly, Section 15043(b), as cited by the comment, relates to the certification of the EIR and adoption of a statement of overriding considerations, which also has yet to occur and would not occur until certification/approval hearings on the EIR and the CPMC LRDP.

However, the Draft EIR concludes that the proposed CPMC LRDP would result in significant, unavoidable impacts to transportation and circulation, noise, air quality, and greenhouse gases, which are summarized in Table 5-1 in the Draft EIR, pages 5-2 to 5-7. To approve the proposed CPMC LRDP, the decision-makers must adopt a statement of overriding considerations, indicating that the benefits of the project would outweigh the significant environmental impacts, and make findings with respect to the significant and unavoidable impacts of the project, as analyzed in the EIR.

Please see Responses AQ-20 (page C&R 3.9-48), GH-1 (page C&R 3.10-3), and TR-31 (page C&R 3.7-53) for detailed responses to specific comments on significant and unavoidable impacts of the CPMC LRDP and the evaluation of potential mitigation measures during preparation of the EIR to reduce those impacts. As noted in these responses, the San Francisco Planning Department evaluated potential mitigation measures that could reduce the significance of the identified impacts and suggested mitigation where feasible and enforceable, as required by the State CEQA Guidelines and Chapter 31 of the San Francisco Administrative Code. There are not 29 significant and unavoidable impacts on air quality and greenhouse gases, as suggested by the comment. The Draft EIR identifies seven significant and unavoidable air quality impacts and one significant and unavoidable impact with respect to greenhouse gas emissions, which is the result of a thorough analysis.

Comments

(Gloria Smith—California Nurses Association, October 19, 2010) [90-84 OTH]

"**G. Cumulative Impacts Are Significant and Unmitigated**

An EIR must investigate and disclose all potentially significant "cumulative impacts."[56] Cumulative impacts can result from individually minor but collectively significant projects taking place over a period of time."[57] A legally adequate 'cumulative impacts analysis' views a particular project over time and in conjunction with other related past, present, and reasonably foreseeable probable future projects whose impacts might compound or interrelate with those of the project at hand. 'Cumulative impacts can result from individually minor but collectively significant projects taking place over a period of time.'[58]

[56] CEQA Guidelines section 15130(a);
[57] Communities for a Better Environment v. Cal. Resources Agency (2002) 103 Cal.App.4th 98, 117.
[58] CEQA Guidelines § 15355(b)."

Response OTH-21

These comments state that an EIR must investigate and disclose all potentially significant cumulative impacts. These comments also state that the LRDP Draft EIR needs to include cumulative impacts related to housing demand and potential development at the California Campus.

Pursuant to State CEQA Guidelines Section 15130(a)(1), "A cumulative impact consists of an impact which is created as a result of the combination of the project evaluated in the EIR together with other projects causing related impacts." The Draft EIR evaluated cumulative impacts in accordance with State CEQA Guidelines Section 15130, for all short-term and long-term LDRP projects for all relevant environmental topics. As discussed in the Draft EIR, pages 4-1, 4-3, and 4-4, cumulative conditions and cumulative impacts were presented for each environmental resource area in Sections 4.1 through 4.18. The analysis of the potential for the proposed LRDP's effects to contribute considerably to a cumulative effect or to be cumulatively considerable is based on a combination of a list of related projects identified by the Lead Agency, San Francisco Planning Department (see pages 4-3 and 4-4 in Section 4, "Environmental Setting, Impacts, and Mitigation," of the Draft EIR) and projections of growth expected in San Francisco (see page 4.3-11 in Section 4.3, "Population, Employment, and Housing," of the Draft EIR). This topic is discussed in each cumulative conditions subsection in Sections 4.1 through 4.18 of the Draft EIR. The geographic scope of the cumulative impact analysis varies, depending on the resource area being analyzed and the cumulative context area.

Comment

(Gloria Smith—California Nurses Association, October 19, 2010) [91-1 OTH]

"Per your request, I have reviewed the Draft Environmental Impact Report ('Draft EIR') for the California Pacific Medical Center ('CPMC') Long Range Development Plan ('LRDP' or 'Project') published by the City of San Francisco ('City') as the lead agency under the California Environmental Quality Act ('CEQA') for potential impacts on the environment.[1]

My qualifications as an environmental expert include a doctorate in Environmental Science and Engineering ('D. Env.') from the University of California Los Angeles. In my professional practice, I have reviewed and commented on hundreds of CEQA documents for commercial developments including hospitals. My resume is attached to this letter.

Comments

(Gloria Smith—California Nurses Association, October 19, 2010) [91-16 OTH]

"**III.C The Draft EIR's Definition of Project Impact Levels Is Confounding and Does Not Follow Standard CEQA Terminology**

The Draft EIR's terminology for determining the significance of Project impacts does not follow standard CEQA terminology and is confusing. The Draft EIR defines the following nine levels of significance:

- less than significant ('LTS')
- less than significant with mitigation ('LTSM')
- no impact ('NI')

- potentially significant ('PS')
- potentially significant and unavoidable ('PSU')
- potentially significant and unavoidable after mitigation ('PSU/M')
- significant impact ('SF')
- significant and unavoidable ('SU')
- significant and unavoidable impact after mitigation ('SU/M')[17]

The use of nine levels of significance is confusing and contains too many redundant definitions *(e.g.,* PSU =SU, PSU/M =SU/M) for the reviewer to readily understand the Project's impacts. Further, the Draft EIR uses the definition *significant and unavoidable* for determining the significance of impacts both *prior to* and *after* implementation of the proposed mitigation measures. This makes no sense because a significant impact can only be found unavoidable *after* evaluating and requiring all feasible mitigation.

[17] Draft EIR, p. *S-80.*"

(Gloria Smith, California Nurses Association, October 19, 2010) [91-17 OTH]

"Based on CEQA Guidelines Sections 15126 and 15126.2, the *CEQA Deskbook,* a widely recognized authoritative guidebook on CEQA implementation, recommends the following definitions for significance of impacts:

> In describing the significance of impacts, the Lead Agency should identify whether the impacts are *less than significant* (where the environmental effect of the proposed project does not reach the threshold of significance); *avoidable* (where the environmental effect of the proposed project reaches the threshold of significance but feasible mitigation measures are available to reduce the impact to a less-than-significant level); *unavoidable* (where the environmental effect of the proposed project reaches the threshold of significance but no feasible mitigation is available to reduce the impact to a less than-significant level); or *beneficial* (where the environmental effect the proposed project will improve the environment regardless of the threshold of significance.[18]

The *CEQA Deskbook* further advises:

> In preparing the impact analysis, the Lead Agency should avoid using unclear terminology that may confuse the reader. Using modifiers such as 'somewhat,' 'potentially,' 'very,' 'major,' 'minor,' or 'partially' for impacts does not provide significant information as to whether the Lead Agency determines the impact to be significant.[19]

Most CEQA documents follow these recommendations and use the following levels of significance for a) impacts prior to implementation of mitigation measures: *less-than-significant* ('LTS') and *significant* ('S'); and b) impacts after implementation of mitigation measures: *less-than significant* ('LTS') and *significant and unavoidable* ('SU').

[18] Bass, R.E., Herson, A.I., Bogdan, K.M., CEQA Deskbook, A *Step-by-Step Guide on How 10 Comply with the California Environmental Quality Act.* 1999, p. 98; *emphasis* added.

[19] *Ibid.*"

Response OTH-24

These comments question whether the project-level impact terminology in the CPMC LRDP Draft EIR meets established CEQA standards.

In an effort to clearly disclose the nature of the environmental consequences of the proposed LRDP as well as the nature of the conclusions of the analyses, the Draft EIR employs a series of carefully worded conclusions that differentiate conclusions about significance. These conclusions are presented below:

- no impact ("NI"): after conducting the analysis, it was concluded that the project would not have any adverse effect on the particular environmental resource.

- less than significant ("LTS"): after conducting the analysis, it was concluded that the environmental change caused by the project would be adverse, but would not exceed the established standard of significance.

- less than significant with mitigation ("LTSM"): after conducting the analysis, it was concluded that the environmental change caused by the project would be significant, but, by implementing identified mitigation measures, would be reduced to a less-than-significant level.

- potentially significant ("PS"): after concluding the analysis, it was concluded that there may be an adverse environmental change caused by the project that would exceed the established standard of significance. Because of uncertain conditions in the future or unknown characteristics about long-term projects, the term potential is used to convey uncertainty as to whether the impact would occur.

- potentially significant and unavoidable ("PSU"): after concluding the analysis, it was concluded that there may be an adverse environmental change caused by the project that would exceed the established standard of significance and no feasible mitigation measures would be available. Because of uncertain conditions in the future or unknown characteristics about long-term projects, the term potential is used to convey uncertainty as to whether the impact would occur.

- potentially significant and unavoidable after mitigation ("PSU/M"): after concluding the analysis, it was concluded that there may be an adverse environmental change caused by the project that would exceed the established standard of significance, even after implementing available feasible mitigation measures. Because of uncertain conditions in the future or unknown characteristics about long-term projects, the term potential is used to convey uncertainty as to whether the impact would occur.

- significant impact ("SI"): after concluding the analysis, it was concluded that there would be an adverse environmental change caused by the project that would exceed the established standard of significance.

- significant and unavoidable ("SU"): after concluding the analysis, it was concluded that there would be an adverse environmental change caused by the project that would exceed the established standard of significance.

- significant and unavoidable impact after mitigation ("SU/M"): after concluding the analysis, it was concluded that there would be an adverse environmental change caused by the project that would exceed the established standard of significance, even after implementing available feasible mitigation measures.

It is not the intent of the lead agency (San Francisco Planning Department) to create any level of confusion but simply to be precise and clear about the nature of each impact conclusion. Although the term "potentially significant impact" and other similar terms are not found in the State CEQA Guidelines, the term "potential" is commonly used in CEQA documents to differentiate between impacts that the lead agency can say with certainty "would" occur and those impacts that the lead agency believes "could" occur. In both cases, the impacts are treated as significant impacts under CEQA, and become the basis for the identification of available feasible mitigation measures and alternatives. Further, if findings were

prepared to support approval of the short-term and long term CPMC LDRP projects or an alternative, all significant impacts, including all potentially significant impacts, would be addressed.

Comments

(Gloria Smith—California Nurses Association, October 19, 2010) [91-18 OTH]

"**III.D The Draft Uses Redundant Acronyms for Mitigation Measures and Introduces Irrelevant Improvement Measures**

Further confounding the already confusing organization is the Draft· EIR's use of a number of different acronyms for the same mitigation measures. For example, in the air quality impact section, the Draft EIR designates mitigation measures for impacts on air quality as 'M-AQ' to mitigate impacts from near-term ('M-AQ-N') and long-term ('M-AQ-L') project components using seven acronyms (M-AQ-N2, M-AQ-N9, M-AQ-L9, M-AQ-NI0a, M-AQ-N10b, M-AQ-N10c, M-AQ-L10) to require the same mitigation measure to reduce construction equipment exhaust, *i.e., Install Accelerated Emission Control Device* on Construction *Equipment.* Likewise, the Draft EIR uses four acronyms (M-AQ-N1a, M-AQ-L1a, M-AQ-N8a, M-AQ-L8a) to require the same mitigation measure to reduce fugitive dust, *i.e., Implement BAAQMD Basic and Optional Control Measures and Additional Construction Mitigation Measures during Construction* and four more acronyms (M-AQ-N1b, M-AQ-L1b, M-AQ-N8b, MAQ- L8b) to require the same mitigation measure to reduce construction equipment exhaust, *i.e., Implement Equipment Exhaust Control Measures during Construction. (See* attached Table A-I.) These numerous redundant acronyms contribute to the impenetrability of both the Draft EIR's air quality section and the summary table presented in the Executive Summary. The same problem with redundant acronyms persists in other sections, *e.g.,* the noise and biological resources sections."

(Gloria Smith, California Nurses Association, October 19, 2010) [91-19 OTH]

"In addition, in the air quality section, the Draft EIR suggests so-called improvement measures designated as 'I-AQ' to mitigate impacts from near-term ('I-AQ-N') and long-term ('I-AQ-L') project components. Since these improvement measures (which appear only within the air quality section itself but not in the respective section of the Summary Table S-2; compare, e.g., Impact AQ-2), are apparently optional they should either be unambiguously required or deleted from the Draft EIR. As it is, their presence implies that more mitigation would be required than would actually the case."

Response OTH-25

The comment states that the CPMC LRDP Draft EIR uses redundant or confusing acronyms for mitigation measures. The comment also states that the improvement measures in the Draft EIR seem to be optional and should either be clearly required or removed from the EIR. Lastly, the comment states that the improvement measures imply that more mitigation would be required than is actually the case.

The San Francisco Planning Department prepares EIRs for many different projects. As the lead agency for CEQA purposes, the Planning Department has established an approach to environmental documentation to assure consistency in its environmental review. The Planning Department has the following requirement pertaining to identification of impacts and mitigation measures:

> Each significant impact shall be keyed to a subject area abbreviation (e.g., LU, AE, PH) and an impact number (e.g., 1, 2, 3) for a combined alpha-numeric code (e.g., Impact LU-1, Impact LU-2, Impact LU-3). Similarly, each mitigation measure shall be keyed with a combined alpha-

> numeric code with an "M" in front to signify it is a mitigation measure (e.g., Mitigation Measure M-LU-1 for a mitigation measure for Impact LU-1).[2]

Other EIRs in San Francisco utilize the same numbering system because the Planning Department is the lead agency, and they have adopted similar guidelines for the preparation of environmental review documents.

The key provides a unique designation to impacts and mitigation measures pertaining to each component of the proposed LRDP discussed in the Draft EIR, ensuring that the decision-makers and the public are clearly informed of the impacts of and mitigation measures required for each component of the proposed LRDP. The LRDP contains a complex set of requirements, and the Draft EIR necessarily contains a similar level of complexity to ensure that the proposal can be comprehensively evaluated and decision-makers will have adequate information to consider approval of any and all parts of the proposal.

Similarly, improvement measures are commonly used in EIRs prepared by the Planning Department to supplement required mitigation measures or are included as stand-alone measures to further reduce less-than-significant impacts. Pertaining to identification of impacts and improvement measures, the Planning Department has the following requirement:

> Although not required, improvement measures may be recommended to reduce or avoid impacts that are identified as being less than significant. Each improvement measure, however, shall be keyed with a combined alphabetic code with an "I" in front to signify it is an improvement measure and a letter, beginning with "A," indicating the order of improvement measure (e.g., Improvement Measure I-LU-A for the first improvement measure identified for a less-than-significant land use impact).[3]

In the case of the CPMC LRDP Draft EIR, the letters "N" and "L" are used to identify near- and long-term impacts, respectively.

While the comment correctly states that the improvement measures are not included in Summary Table S-2, the comment is mistaken with regard to implementation requirements of improvement measures stated in the Draft EIR. The proposed LRDP would be required to implement the Mitigation Monitoring and Reporting Program (MMRP) and an Improvement Measures Monitoring and Reporting Plan (IMMRP) for the proposed LRDP. Pertaining to the organization of the MMRP and the IMMRP, the Planning Department has the following requirement:

> The mitigation and improvement measures shall be organized and grouped as follows, using the same environmental topic order as appears in the Planning Department's Initial Study checklist for each group of measures: (A-1) Mitigation Measures Agreed to be Implemented by Project Sponsor; (A-2) Mitigation Measures Not Agreed to be Implemented by Project Sponsor or Feasibility of Mitigation Implementation Uncertain; (B-1) Improvement Measures Agreed to be Implemented by Project Sponsor; and (B-2) Improvement Measures Not Agreed to be Implemented by Project Sponsor.[4]

If the decision-makers were to certify the Final EIR and then determine to approve the LRDP as proposed, with a variant, or an alternative, the City would adopt an MMRP and an IMMRP that includes both the mitigation measures required under CEQA to reduce the magnitude of or avoid significant environmental impacts, as well as other "improvement measures" identified in the EIR. It is important to

[3] *Ibid.*

[4] *Ibid.*, Page 6-21.

note that the improvement measures would not be required pursuant to CEQA, but are measures that the Planning Department has identified which could further reduce less-than-significant impacts identified in the EIR and which the project sponsor will implement as agreed to or imposed as conditions of approval by the City. In accordance with San Francisco Planning Department guidelines, all such measures are to be included in the MMRP. The MMRP and IMMRP may be attached to the EIR findings document.

Comment

(Gloria Smith—California Nurses Association, October 19, 2010) [92-1 OTH]

"At your request, I have reviewed the July 21, 2010 Draft Environmental Impact Report (Draft EIR) prepared for the San Francisco Planning Department for the California Pacific Medical Center (CPMC) Long Range Development Plan (Project). My review focused on Section 4.5 of the Draft EIR, Transportation and Circulation. I have also reviewed various other documents including the June 2010 Traffic Impact Studies prepared by Fehr & Peers for each of the five campuses in the Project and the 'California Pacific Medical Center Institutional Master Plan 2008 Transportation Study' prepared by CHS Consulting Group.

Education and Experience

Since receiving a Bachelor of Science in Engineering from Duke University in Durham, North Carolina in 1969, I have gained over 40 years of professional engineering experience. I am licensed as a Professional Civil Engineer both in California and Hawaii and as a Professional Traffic Engineer in California. I formed Tom Brohard and Associates in 2000 and now serve as the City Traffic Engineer for the City of Indio and as Consulting Transportation Engineer for the Cities of Big Bear Lake, Mission Viejo, and San Fernando. I have extensive experience in traffic engineering and transportation planning. During my career in both the public and private sectors, I have reviewed numerous environmental documents and traffic studies for various projects. Several recent assignments are highlighted in the enclosed resume."

Response OTH-26

The comment is noted. The comment introduces the qualifications of Mr. Tom Brohard. This comment does not raise issues regarding the adequacy, accuracy, or completeness of the Draft EIR. The comment will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project.

Comment

(Gloria Smith—California Nurses Association, October 19, 2010) [93-1 OTH]

"RE: Comments on the Draft Environmental Impact Report for the proposed California Pacific Medical Center Long Range Development Plan

Dear Ms. Smith:

The purpose of this letter is to provide you with comments on the Draft Environmental Impact Report (hereinafter DEIR) for the proposed California Pacific Medical Center Long Range Development Plan (hereinafter CPMC LRDP or proposed Project). My qualifications as a planning expert include a Bachelor's Degree in Environmental Studies from Stanford University, a Master's Degree in City and Regional Planning from the University of Southern California and over twenty years as a professional planning consultant and paralegal. My resume is attached to this letter, Attachment 1.

These comments focus on the following sections of the DEIR:

- Land Use
- Plans and Policies
- Population, Employment and Housing

In preparing these comments, I have reviewed the following documents:

- The proposed CPMC LRDP DEIR and appendices
- The Administrative Record to the DEIR, provided by the City of San Francisco
- Applicable Plans, Policies and Codes"

Response OTH-27

The comment provides information regarding the qualifications of Terrell Watt, outlines the topic addressed in the comments that follow in the letter, and indicates the documents that were reviewed. The comment is noted. This comment does not raise issues regarding the adequacy, accuracy, or completeness of the Draft EIR. The comment will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project.

Comment

(Margaret Kettunen Zegart, October 20, 2010) [97-20 OTH]

"Culture is week in CEQA required analysis. Concerts and programs and meetings in St. Marks, UUSF and Cathedral of St. Mary and Hamilton Baptist activities are frequent."

Response OTH-28

The comment is noted. This comment does not raise specific issues regarding the adequacy, accuracy, or completeness of the Draft EIR. It is assumed that the comment is referring to special events at local churches and other facilities. It is uncertain exactly how the comment is relating concerts and programs to the CPMC LRDP Draft EIR analysis and whether the comment provided is referring to CEQA analysis in general or to the analysis in the Draft EIR. The comment will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project.

Comment

Stephanie Barton, et al.—Hastings Civil Justice Clinic for the Good Neighbor Coalition, October 19, 2010) [104-1 OTH]

"These comments on the Draft Environmental Impact Report ('DEIR') for the California Pacific Medical Center ('CPMC') Long Range Development Plan ('LRDP') are submitted on behalf of the Good Neighbor Coalition ('GNC') and its member organizations. The GNC is a coalition of more than twenty, mainly Tenderloin and central city community organizations. The member organizations include the North of Market/Tenderloin Community Benefits District, Community Housing Partnership, Tenderloin Neighborhood Development Corporation, Shih YuLang Central YMCA, Tenderloin Housing Clinic, and Central City SRO Collaborative.

The GNC's main concerns focus on the environmental and land use planning impacts and consequences for Tenderloin residents, businesses, and community-serving organizations of the LRDP's centerpiece—the proposed new Cathedral Hill Campus. The streets most often used to mark the boundaries of the Tenderloin neighborhood are Post Street to the north, Powell Street to the east, Market Street to the south, and Van Ness Avenue to the west. This area consists of four U. S. census tracts. Within but near its boundaries, the Tenderloin includes Civic

Center buildings, San Francisco's theater district, the South East Asian commercial area known as Little Saigon, and the proposed site of the Cathedral Hill medical office building.

CPMC's LRDP is an enormous project with major short-term and long-term consequences for San Francisco across a broad range of public policy issues. These comments on the DEIR specifically address the following issues: housing and affordable housing; transportation and circulation; air quality and greenhouse gas emissions; local hiring and employment; healthcare access and distribution; and the DEIR's discussion of project alternatives."

Response OTH-29

The comment is noted. The comment presents an introduction to the Good Neighbor Coalition's comment letter and references further comments. The comment states that the Good Neighbor Coalition's comments focus on environmental and land use planning impacts and more specifically on the following topics: housing and affordable housing; transportation and circulation; air quality and greenhouse gas emissions; local hiring and employment; health care access and distribution; and alternatives. The comment provides introductory information regarding the substantive comments that follow in the rest of Comment Letter 104. Please refer to the issue area-specific responses to Comment Letter 104 contained throughout this C&R document and divided according to the environmental resource area to which a particular comment is related.

Comment

Stephanie Barton, et al.—Hastings Civil Justice Clinic for the Good Neighbor Coalition, October 19, 2010) [104-77 OTH]

"The DEIR does not provide sufficient support for city decision makers to draft a statement of overriding considerations. While the bases for such a statement need not necessarily be a part of the final EIR, such grounds must be a part of the record.[200] To inform the Planning Commission fully, and to allow for meaningful public comment, the DEIR notwithstanding its bulk needs to be substantially augmented with additional studies and analysis. The importance and magnitude of this project's impact on healthcare delivery in San Francisco demand full and careful consideration of all relevant environmental factors.

[200] CEQA Guidelines § 15093(b)."

Response OTH-30

The comment states that the CPMC LRDP Draft EIR contains insufficient evidence for decision-makers to prepare a statement of overriding considerations, and also notes while the supporting materials are not required in the EIR, such evidence must be added to the administrative record. The comment does not specifically discuss or contain evidence of impacts of the CPMC LRDP that have been insufficiently documented or analyzed in the CPMC LRDP Draft EIR. The comment also states the importance and extent of the proposed project's impact on health care in San Francisco necessitates full and careful consideration of all environmental issues.

In the event that the decision-makers decide to approve a project, as part of the project approval they are required to adopt findings pursuant to section 15091 of the State CEQA Guidelines and, in light of the presence of significant and unavoidable impacts, a statement of overriding considerations pursuant to section 15093 of the State CEQA Guidelines. The statement of overriding considerations must document the balancing of environmental and other factors that formed the basis of the approval decision. According to Section 15093(b) of the State CEQA Guidelines:

> When the lead agency approves a project which will result in the occurrence of significant effects which are identified in the final EIR but are not avoided or substantially lessened, the agency shall state in writing the specific reasons to support its action based on the final EIR and/or other information in the record. The statement of overriding considerations shall be supported by substantial evidence in the record.

It is important to note that the statement of overriding considerations must be based on evidence in the entirety of the record, not simply evidence limited to that contained in the Draft EIR. In fact, because the statement of overriding considerations represents documentation of the balancing of "the economic, legal, social, technological, or other benefits, including region-wide or statewide environmental benefits, of a proposed project against its unavoidable environmental risks," it is likely that some of the evidence may pertain to issues that would not be appropriate for inclusion in the EIR.

The Draft EIR is considered a full-scope EIR in accordance with the suggested environmental impact areas in Appendix G of the State CEQA Guidelines and Chapter 31 of the San Francisco Administrative Code. The Draft EIR contains and cites evidence in the record regarding the environmental conditions and consequences of implementation of the proposed CPMC LRDP at and in the vicinity of each development site in accordance with state and local guidance regarding the type and degree of analysis that should be completed. In addition, the impact analysis sections in Chapter 4 of the Draft EIR are consistent with the State CEQA Guidelines and appropriate for a project- and program-level EIR to fully inform the decision-makers (San Francisco Planning Commission) of the potential physical environmental impacts of the proposed CPMC LRDP. In the event that the decision-makers decide to approve a project, the administrative record, including the CPMC LRDP Draft EIR, will provide substantial evidence upon which the decision-makers can base a statement of overriding considerations. The Draft EIR appropriately focused on environmental factors, contained a proper level of analysis, and no additional studies would be required in order to fully inform the public and decision-makers of the potential environmental impacts of the project.

With respect to the comment's statements regarding impacts on the accessibility and provision of health care services within San Francisco as a result of implementation of the proposed CPMC LRDP, see Major Responses HC-8 and HC-9 on pages C&R 3.23-32 and 3.23-39, respectively. Evidence related to the project's health care and other social, economic, and legal factors that might be considered by the decision-makers would be placed in the record and relied on in a statement of overriding considerations, if such a statement were adopted. With respect to the level of detail of analysis of the project, please see Response OTH-16, page C&R 3.23-254).

Comments

(Kent Woo—NICOS Chinese Health Coalition, Nov. 2, 2010) [118-1 OTH]

"On behalf of NICOS Chinese Health Coalition, I am writing in response to the Environmental Impact Report (EIR) that California Pacific Medical Center (CPMC) has recently submitted to your department.

NICOS Chinese Health Coalition is a public-private-community partnership of more than 30 health and human service organizations and concerned individuals. The mission of NICOS is to enhance the health and well-being of the San Francisco Chinese community. Since 1985, NICOS has been engaged in advocacy, research, training, coalition-building and program implementation for the benefit of this population and the organizations that serve it.

NICOS is taking a neutral position on the report. We commend CPMC for its continuing support and partnership in improving the health and wellbeing of the Chinese community, and maintain faith that the current endeavor is well-intended. At the same time, we realize that projects of this size and scope have the potential to greatly impact immediate and surrounding communities, positively or negatively, and this is impossible to vet or foresee from a report alone. As such, we hold no position, but trust that CPMC will work collaboratively with NICOS and its

member organizations to maximize community benefit and prevent or minimize impact in any identified areas of concern that may arise.

Thank you for the opportunity to provide comment. If you have any questions, please feel free to contact me at 415.788.6426 or kentwoo@nicoschc.org."

(Dick Shrum, September 23, 2010 [PC-1 OTH]

"I want to thank the Commission for all your consideration, your goodness, and your kindness shown me. I resided at 1054 Geary Street not many years, only 49. And I am a young senior citizen, just 86. But I want to thank them for all you have done, all the people on the staff, and made it possible, now I am residing at the Grenada on Sutter Street. Thank you for everything, your goodness, your kindness, thank you."

Response OTH-31

These comments are noted. These comments do not raise issues regarding the adequacy, accuracy, or completeness of the Draft EIR. The comments will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project.

Comment

(Lois Scott, September 23, 2010) [PC-21 OTH]

"As a group, we are actively engaged in a productive dialogue with CPMC to gain clarity and explore agreement, given that the existing Site Plan places a high intensity commercial building adjacent to small scale residential housing. Due to the complexity of the DEIR and the proposed project, discussions are ongoing and require more time. We respectfully request that public comment remain open at the end of today's hearing and that the hearing be continued to accommodate ongoing discussions. Thank you very much for your time."

Response OTH-32

The comment from the representative from the Lost Block Association, Tiffany Neighbors, and the San Jose Guerrero Coalition to Save our Streets is noted. The comment will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project. Please refer to Section 3.3.6 in Section 3.3, "Land Use and Planning," Responses LU-31 to LU-33 on pages C&R 3.3-147 to 3.3-156 of this C&R document, for specific comments and responses for Letter 101 from Lost Block and Save our Streets regarding the consistency of the proposed St. Luke's Campus under then LRDP with existing plans and policies and land use compatibility. Please refer to Section 3.4.6 in Section 3.4, "Aesthetics," Responses AE-17 to AE-20 on pages C&R 3.4-28 to 3.4-31, for specific comments and responses from Letter 101 from Lost Block and Save Our Streets regarding the height, bulk, and architectural compatibility of the proposed St. Luke's Campus, the aesthetic impacts of the proposed St. Luke's Campus related to adjacent residences, the proposed St. Luke's Campus's landscape and streetscape, and the proposed campus's light and glare impacts.

Comments

(Felicidad Afenir, September 23, 2010) [PC-33 OTH]

"Good afternoon, Mr. Commissioner. My name is Felicidad Afenir, a resident of 201 Turk Street and a member of the Tenderloin Filipino American Community Association. We are here today to voice our concern regarding the proposed CPMC project to construct a health care facility in Van Ness and Geary. Considering this development in our community, but this development should go to the advantage of the residents."

Response OTH-33

The comment is noted. This comment does not raise issues regarding the adequacy, accuracy, or completeness of the Draft EIR. The comment will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project.

Comment

(Rosa Marquez, September 23, 2010) [PC-37 OTH]

"Mi nombre es Rosa Marquez. No hablo mucho Ingles, pero—yo tengo 45 anos, mi madre, mi—todos los servicios [My name is Rosa Marquez. I don't speak much English, but—I am 45 years old, my mother, me—all the services]."

Response OTH-34

The comment is noted. This comment does not raise issues regarding the adequacy, accuracy, or completeness of the Draft EIR. The comment will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project.

Comments

(Helene Dellanini, September 23, 2010) [PC-40 OTH]

"CPMC has indicated that they are willing to make certain accommodations to address our concerns. We are hopeful that those discussions will result in certain specific mitigations."

(Helene Dellanini, September 23, 2010) [PC-42 OTH]

"We will be submitting a letter of comment which will describe and support our suggestions. We hope the planning staff, Commission, and Board adopt these practical solutions into the project's Condition of Approval if they are not enveloped into the final EIR. We look forward to continuing this dialogue with our perspective new neighbors and remain optimistic that CPMC will do the right thing for its closest and most heavily impacted neighbors. Thank you."

Response OTH-35

These comments are noted. Comment Letters 71 and 72 were received from Helene Dellanini of Daniel Burnham Court, which is located adjacent to the proposed Cathedral Hill Campus, during the public comment period for the Draft EIR and have been responded to as part of this C&R document. These comments do not raise issues regarding the adequacy, accuracy, or completeness of the Draft EIR. The comments will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project.

Comment

(Marc Anthony, September 23, 2010) [PC-56 OTH]

"Good afternoon, Commissioners. My name is Marc Anthony. I am part of the Good Neighbor Coalition, as well, and also part of the Community Housing Partnership. I am also a community organizer here in San Francisco and a resident in the Tenderloin for the last seven years. And I would like to reach out and touch you with a little information in regards to the Good Neighbor Coalition, which is focused on maximizing the local hiring in the community around the surrounding hospitals."

Response OTH-36

The comment is noted. This comment does not raise issues regarding the adequacy, accuracy, or completeness of the Draft EIR. Although social and economic issues are not required to be discussed as part of the CEQA process, see Response PH-26 (page C&R 3.5-90) for details regarding CPMC's job hiring program and the utilization of San Francisco's priority hiring program. The comment will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project.

Comment

(James Tracy, September 23, 2010) [PC-76 OTH]

"Good afternoon, Commissioners. My name is James Tracy. I am part of Community Housing Partnership and we are a proud member of the Good Neighbor Coalition. It may actually surprise you, but I actually agree with CPMC on some points, this is a very important project for the future of San Francisco for jobs, for economic development, and for, most importantly, the health care question."

Response OTH-37

The comment is noted. This comment does not raise issues regarding the adequacy, accuracy, or completeness of the Draft EIR. The comment will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project.

Comment

(Raven Allen, September 23, 2010) [PC-88 OTH]

"Good afternoon. My name is Raven Allen. I am the lay health advocate of San Francisco Lighthouse Church and, in the name of the Church and Jesus Christ, peace and greetings to you. Pretty much everything that needs to be said has been said. What disturbs me about CMPC is that there has not been what I would call a BPSI, a biological bio-psychosocial Impact Report, that there has not been an impact reporting regarding how it would not only affect psychologically the residents of this area, but physically."

Response OTH-38

The comment is noted. The comment states that a "biological bio-psychosocial impact report" has not been prepared that analyzes the psychological and physical impacts on residents near the proposed Cathedral Hill Campus with development of the CPMC LRDP. The type of impact analysis or report as suggested by the comment is beyond the scope and requirements of environmental analysis under CEQA. However, physical environmental impacts on residents in the Cathedral Hill Campus area are evaluated as part of the CPMC LRDP Draft EIR, as required by CEQA. This comment does not raise issues regarding the adequacy, accuracy, or completeness of the Draft EIR. The comment will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project.

Comments

(Raven Allen, September 23, 2010) [PC-90 OTH]

"My church, San Francisco Lighthouse Church and two others are actually at Ground Zero in that project. That project not only disrupts our service, it disrupts our ability to deliver services to those that are the marginalized working class of the City. It also has potential to dislodge families and create greater racial tensions within the city between Hispanics and African-Americans, so that it impacts not only us in the Western Addition, but it also impacts the Polk Gulch area."

(Raven Allen, September 23, 2010) [PC-91 OTH]

"We have not been contacted and dealt with in terms of how to be integrated into this entire process, in terms of being provided with funding for moving, if necessary, acquiring another building, if necessary, and continuing to provide increased services to those individuals that no longer receives because there are no services left in the City to receive. I believe that until CPMC has actually integrated the churches into its overall plan of services that it is able to ethically deliver services, and therefore it should not have its plan approved because it has not been with respect to the church, and therefore the community serving the church. Thank you."

Response OTH-39

The comment states that the CPMC LDRP would disrupt services at the San Francisco Lighthouse Church and the church's ability to provide services to the working class of the City. The comment suggests that the CPMC LDRP has the potential to dislodge families, not only in the Western Addition, but also in the Polk Gulch area. The comment states the San Francisco Lighthouse Church has not been contacted and dealt with regarding the proposed Cathedral Hill Campus project. In particular, the comment notes funding has not been discussed with the church for moving or acquiring another building, if necessary, so they can continue to provide services to individuals who cannot receive services elsewhere. The CPMC LRDP Draft EIR acknowledges significant and unavoidable impacts in the vicinity of the proposed Cathedral Hill Campus, with respect to transportation at the intersections of Polk Street/Geary Street and Van Ness Street/Market Street, neither of which is located within three blocks of the San Francisco Lighthouse Church. All other intersections would not be significantly affected by operation of the proposed Cathedral Hill Campus, and as such, the project would not disrupt the ability of the church to provide services to its parishioners.

The comment does not provide evidence on how the CPMC LDRP would dislodge families or create racial tension; thus, a response to this comment is not possible. Impacts from racial tension are not considered in the CPMC LRDP Draft EIR, because these types of impacts are not considered environmental impacts in CEQA documents. The San Francisco Lighthouse Church is on the CEQA distribution list for the proposed Cathedral Hill Campus project, and a Notice of Preparation of an EIR (NOP) and Notice of Availability of an EIR when the Draft EIR was published were sent to the church. There are no plans in the CPMC LRDP to acquire the church; thus, no funding to move the church is necessary. No information or evidence was provided in the comment about providing increased services to individuals; therefore, no further response is necessary. Please see Major Response HC-2 regarding the location and scope of services at the Cathedral Hill Campus under the LRDP (page C&R 3.23-8). These comments do not raise issues regarding the adequacy, accuracy, or completeness of the Draft EIR. The comments will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project.

Comments

(Randy Shaw, September 23, 2010) [PC-92 OTH]

"Well, I didn't know how far we'd gone in my journey up from the North Light Court. Thank you, President Miguel. Randy Shaw, Director of a Tenderloin Housing Clinic. You know, I've been coming to Planning Commission meetings for almost 30 years and we have an overwhelming throng here, I mean, you can't see it here, I wish we could all be in a stadium because you would see this—we have a huge group down in the North Light Court, and I can assure you, at least 80 percent, if not 90–95 percent of the people here are opposing the project as it is currently constituted. And if you've noticed, what happened in other cities where CPMC always said, 'See, the people support us, see all these people,' we've got them beaten by about 90:10, percentage wise here, and I think it's because there are so many moving parts in this project."

(Randy Shaw, September 23, 2010) [PC-93 OTH]

"And I want to just focus really on ones that are of particular interest to me because I've worked so hard over the last 30 years to improve the uptown Tenderloin. We have had a lot of issues we work with, I've been before you many many times to try to improve it. I know you have been very sympathetic."

(Randy Shaw, September 23, 2010) [PC-98 OTH]

"And the last thing I'll say is, people keep saying to me, 'Randy, CPMC loves to talk, they want to negotiate and sit down.' I've never heard of them. I've never heard of anyone from CPMC contacting us. Thank you."

(Yolanda Jones, September 23, 2010) [PC-105 OTH]

Good afternoon, President Miguel and members of the Planning Commission. My name is Yolanda Jones. I am a community partner. I represent YCATC, which is Yolanda's Construction Administration, and I am a local resident, born and raised in Bayview Hunters Point. The document fully discloses the project's impacts and adequately meets the California Environmental Quality Act. I believe the project and the project alternatives were thoroughly analyzed in the DEIR."

(Yolanda Jones, September 23, 2010) [PC-107 OTH]

"I ask that you please—and request that the Planning Commission move forward with the process and the DEIR is a thorough and comprehensive document, and I pledge to hire community locals because I am a born and raised and high school graduate from this city and I believe in this City. Thank you."

(Retilah [phon] Patel, September 23, 2010) [PC-110 OTH]

"And I know everybody doesn't—it is not maybe the right day to drive, but I drive every single day in the City, and I park in the City, I live in the City, and I enjoy our City. And I think that we have to be just a little bit more alert. If CPMC is doing such a great project, it is a large project scale, I don't think the Cathedral Hill is built well, anyways, and so this project is going to be a nice asset to the City for myself and for my generations to come, my two boys are going to see the next phase of this..."

(Nella Manuel, September 23, 2010) [PC-129 OTH]

"Good afternoon, Commissioners. My name is Nella Manuel and I have been a resident of the Tenderloin for almost 20 years. I am very concerned with the CPMC project."

(Denise Rowe, September 23, 2010) [PC-140 OTH]

"Good day, Commissioners. My name is Denise Rowe and I have lived in the Tenderloin for the past 22 years. As a long time resident, I'm proud of my community and I want to see it improve for the residents that live here now."

(Gaudioso Galicia, September 23, 2010) [PC-145 OTH]

"Good afternoon, your Honor, ladies and gentlemen. Well, I am proud to introduce myself. My name is Gaudioso Galicia who resides in Tenderloin area for almost 20 years. And ever since I live there, ask any people from any government officials because I know, I understand the situation, we must also help the government, not only us helping the government to help us, we must be giving back, but it so happened that one day, or rather, three days ago, okay, I was invited by our neighbor that I must join this group or this organization, and I ask him quickly, he said, 'Oh, it is good organization that will prepare us for building big huge hospital and housing,' and, 'Oh, yeah? Is that so?' So, I said, okay, I will join the group, so that is why I am here in front of you ladies and gentlemen. Maybe before I ask any people from any government official but because very soon this very year, my big family is coming soon, and then you cannot—you know, it is the government who force me to live here in America and then that is why, you know, I am sorry to mention the situation in the Philippines is quite difficult, you know, it is really bad, really, and that is why I prepared my family to join me, that's why I only want to ask to your

government to consider our plea to give us that opportunity so that I can house my family, big family, and then not totally free, it should be affordable, and understand let my family live in house, or else, otherwise, we will get evicted and when my big family will come, we will be out on the street, so that is big problem, so that is why, if you will be considerate enough to give us the time to approve our plea. Thank you so much."

Response OTH-40

The comments are noted. These comments do not raise issues regarding the adequacy, accuracy, or completeness of the Draft EIR. The comments will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project.

Comment

(Lidia Pantig, September 23, 2010) [PC-147 OTH]

"We also deserve to work at CPMC. I demand CPMC to initiate dialogue with community-based organizations in order to come up with a common agreement on this issue. We want CPMC to assure us by signing a complete agreement. Thank you."

Response OTH-41

Although social and economic issues are not required to be discussed as part of the CEQA process, see Response PH-26 (page C&R 3.5-90) for details regarding CPMC's job hiring program and the utilization of San Francisco's priority hiring program. The comment will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project.

Comment

(Michael Theriault, September 23, 2010) [PC-148 OTH]

"Commissioners, Michael Theriault, San Francisco Building and Construction Trades Council. The Environmental Impact Report for the California Pacific Medical Center Project certainly appears to be the standard environmental impact report, they hit all the usual stuff, they do it as well as any environmental impact report could be asked to do. I am confident that there are paths available for California Pacific Medical Center to address the legitimate concerns being raised by the neighbors, and so on. And I have seen them in action and know they will continue to work to do so. I will caution that, however, having been before you many times before, I've seen that questions about environmental impact reports can multiply out infinitem and that we should consider actually a little bit of a limit to that, that is imposed by the type of project we're looking at. This is a project that is well along in design. It is a hospital project which is far more complex than other projects that we commonly build in San Francisco. It is not sized up or down as readily as a condominium project, for example. It involves demanding structural considerations and interlocking dense mechanical and electrical systems. These are not easily changed. In addition, the project has already been approved by the State Office of Health Services, and that approval would—the process would have to start all over again if the project were substantially changed. So, any major change that you propose in the project is going to set it back possibly years. There are, of course, state deadlines in that regard, but there is a deadline that is far more important in that regard, and that is the one that none of us control, that could come any day, so I ask you to bear that in mind when you consider the possible multiplication of concerns about an environmental impact report."

Response OTH-42

The comment is noted. This comment does not raise issues regarding the adequacy, accuracy, or completeness of the Draft EIR. The comment will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project.

Comment

(Catalina Dean, September 23, 2010) [PC-157 OTH]

"And so this is a town of sanctuary and this is the reason why I'm here, and so, you know, welcome the hospital, sure we need them, you know? But, like the first statement, 'I thank this Board for being here and existing here,' and what I depend on them, because they are a lot smarter than I am and know this job better than I could ever even guess it, you know, is to be accountable, and to be clearer about everything, that everything is very clear and accountable with the hospital and with the feelings of the community, and with people like Bobby who is concerned about the children, the families, you know, the fresh air, all of these things, it's what we depend on you to do that, you know? And I'm sorry to say this, and I don't mean this as a threat because I totally respect you, but, you know, somebody has got to be accountable for it and I depend on you to do it, and I thank you for this time."

Response OTH-43

The comment is noted. This comment does not raise issues regarding the adequacy, accuracy, or completeness of the Draft EIR. Refer to Response AQ-10 (page C&R 3.9-26) for a discussion of the potential air quality impacts associated with operation of the hospital campuses included as part of the proposed CPMC LRDP. The comment will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project.

Comment

(Patricia Ruiz, September 23, 2010) [PC-169 OTH]

"I had asked the Planning Commission project forward with their review and approval for the EIR because I have seen the project team work long hours putting together this document."

Response OTH-44

The comment is noted. This comment does not raise issues regarding the adequacy, accuracy, or completeness of the Draft EIR. The comment will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project.

Comment

(Natalie Logan, September 23, 2010) [PC-172 OTH]

"I ask that the Planning Commission proceed forward with their review of the Draft Environmental Impact Report because I believe this project's alternatives have been thoroughly analyzed. I have sat through countless internal meetings on this project and believe that my colleagues have put their hearts into this. Many of them have stayed in the office working nights and weekends to assure that all aspects of the EIR were covered and addressed. I have reviewed the document and it discloses the project's impacts and it adequately meets the California Environmental Quality Act. I ask that you please accept the Draft EIR and allow us to move forward with this building of the five-campus project."

Response OTH-45

The comment is noted. This comment does not raise issues regarding the adequacy, accuracy, or completeness of the Draft EIR. The comment will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project.

Comment

(Paul Dziadij, September 23, 2010) [PC-177 OTH]

"Good afternoon, President Miguel and all members of our Planning Commission. My name is Paul Dziadij and I am a resident of San Francisco, and a client of the CPMC PEP Jobs Program. I support CPMC's proposed Long Range Development Program Plan as represented in this Draft Environmental Impact Report."

Response OTH-46

The comment is noted. This comment does not raise issues regarding the adequacy, accuracy, or completeness of the Draft EIR. The comment will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project.

Comment

(Paul Dziadij, September 23, 2010) [PC-178 OTH]

"And I believe that the Planning Department did a thorough and comprehensive job analyzing the proposed project and its alternatives."

Response OTH-47

The comment is noted. This comment does not raise issues regarding the adequacy, accuracy, or completeness of the Draft EIR. The comment will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project.

Comment

(Paul Dziadij, September 23, 2010) [PC-180 OTH]

"I urge you to go forth with this project because I want you to realize that CPMC is not just a hospital, that they have services to offer like PEP Jobs, for people like myself, and I want others to benefit from these services, as I have. Thank you very much."

Response OTH-48

The comment is noted. This comment does not raise issues regarding the adequacy, accuracy, or completeness of the Draft EIR. The comment will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project.

Comments

(Rigo Rodriguez, September 23, 2010) [PC-185 OTH]

"Hello and thank you, President Ron Miguel and the Commission. My name is Rigo Rodriguez and I work for the General Contractor, Herrera Bolt, as an intern, doing mostly administration things. And I want to say there is a vast experience from United States, from around the world, in construction and medical issues, and this is what these two companies have, a vast experience. This project didn't start out of the blue, there was a lot of planning, there was a lot of consideration of the laws, all the community, as well, it was expected to have situations, so even this is planned, even this situation right now is what is planned. I have been part of the team that the gentleman just a little while ago mentioned, the mechanical, the electrical, and the structural, I belong to the Mechanical, Electrical and Plumbing, and every week we have a meeting of what the things we have to do, and every single week and every single day, these issues are addressed—the community, the pollution, the traffic impact, and all that."

(Rigo Rodriguez, September 23, 2010) [PC-186 OTH]

"It is a work in progress for us, and this is the reason why we are here, but it's been planned thoroughly, every square inch of that hospital is being planned. The Environmental Report is a document that addresses every single one of those issues and one fact for me is that I am working there because my interaction with Mission Hiring Hall, which is a community agency, and City College of San Francisco, in turn deals with Mission Hiring Hall, which in turn they deal with CCSF students. I take all these affairs as a transparent way of credible and medical parties involved, as a transparent way of engaging with the community. Therefore, I would like to see this Environmental Report accepted. Thank you very much."

Response OTH-49

The comment is noted. This comment does not raise issues regarding the adequacy, accuracy, or completeness of the Draft EIR. The comment will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project.

Comment

(Florence Kong, September 23, 2010) [PC-190 OTH]

"My name is Florence Kong. Good afternoon, President Miguel and Planning Commissioners. I am the President of Kwan Wo Ironworks [ph.] and the President of the Asian American Contractors Association. I believe this project and alternatives are thoroughly analyzed in the EIR Report."

Response OTH-50

The comments are noted. These comments do not raise issues regarding the adequacy, accuracy, or completeness of the Draft EIR. The comments will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project.

Comment

(Chris Poland, September 23, 2010) [PC-194 OTH]

"These projects have been working toward a goal for a long time and they will make their goal by 2015, and that is great; if they are approved, that is 45 years since we found that there was a problem, if these projects are set back to be redesigned, my experience as a structural engineer over 40 years working on hospital projects, it takes eight, 10, 15, 20 years to get these projects done, it is very complex, it is hard to do, you can't downsize them easily, if they go back to redesign, we can expect another 10–15 years of delay, that is 60 years since we found out that there was a problem. This is getting to be too long. I urge you to keep this process moving forward toward approval so San Francisco will be better prepared to recover from our next major earthquake. Thank you."

Response OTH-51

The comment is noted. This comment does not raise issues regarding the adequacy, accuracy, or completeness of the Draft EIR. The comment will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project.

Comments

(Reverend Arnold Townsend, September 23, 2010) [PC-195 OTH]

"Reverend Arnold Townsend. Very quickly, I'm representing San Francisco NAACP. You received a letter from our President. I am a Vice President of that organization. I wanted to encourage you to approve this Draft EIR. We certainly believe that it is adequate, that it adequately addresses California Environmental Codes. And I want

to remind folks that, you know, this is talking about the adequacy of the EIR, it is not talking about whether you agree with the development or not. Agreement will come later, we hope."

(Reverend Arnold Townsend, September 23, 2010) [PC-199 OTH]

"Sure, we can do a lot of good things, but this project and this hospital desperately needs to be built, and not only because, you know, there is going to be an earthquake, but if there is going to be an earthquake, hospitals are going to be needed. Of course, if it occurs in 30 years or more, I'm certain it won't be my problem; I'd like to live to be 100, but I'm pretty sure the 1960's killed all chances of that. Some of you will get that on the way home. But—a lot of chemicals. But the reality is, quite frankly, that this is important to this City. Yes, it will change that corner, it will change the neighborhood, I think it will change it for a good thing."

(Reverend Arnold Townsend, September 23, 2010) [PC-201 OTH]

"…it is in the City with all of the good and the bad that comes with living in the City, so I think we need to accept that, see how this hospital can improve not only the Tenderloin community, this hospital, actually, I started meeting with the people building this hospital about five years ago because it was in the former redevelopment project area. Thank you so much for your attention."

Response OTH-52

The comments are noted. These comments do not raise issues regarding the adequacy, accuracy, or completeness of the Draft EIR. The comments will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project.

Comment

(Benjamin Aune, September 23, 2010) [PC-203 OTH]

"Furthermore, I believe CPMC plays a critical role in the area's overall economy and health infrastructure. I believe its long range plan and this proposed project will upgrade our City's health facilities, can help ensure access to the best possible medical care into the future. So, please accept the Draft EIR and move it along. Thank you very much."

Response OTH-53

The comment is noted. This comment does not raise issues regarding the adequacy, accuracy, or completeness of the Draft EIR. The comment will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project.

Comment

(Mark Schroer, September 23, 2010) [PC-204 OTH]

"Good afternoon, President Miguel and members of the Planning Commission. My name is Mark Schroer and I have lived half a block from CPMC Davies Campus on Scott Street for 21 years. I personally support CPMC's proposed Long Term Development Plan, as evidenced in the Draft Environmental Impact Report, and I believe that the Planning Department did a thorough and comprehensive job analyzing the proposed project and its alternatives."

Response OTH-54

The comment is noted. This comment does not raise issues regarding the adequacy, accuracy, or completeness of the Draft EIR. The comment will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project.

Comments

(David Meckel, September 23, 2010) [PC-208 OTH]

"Good afternoon, President Miguel and Commissioners. My name is David Meckel. I am the Director of Research and Planning at the California College of the Arts, where I founded San Francisco's first professional architecture program 25 years ago. My expertise is in City Planning, Urban Design, and Architecture. I have reviewed the contents and findings of the Draft EIR. I find that this report more than adequately addresses the potential impact of the CPMC projects."

(David Meckel, September 23, 2010) [PC-211 OTH]

"In summary, I find that, in the Draft EIR, the project and project alternatives are thoroughly analyzed, the project impacts are disclosed, and the CEQA requirements are adequately met. I respectfully request that the Planning Commission support the Draft EIR so that our City and citizens can be served as soon as possible by these seismically safe and urbanistically appropriate CPMC facilities. Thank you."

Response OTH-55

The comments are noted. These comments do not raise issues regarding the adequacy, accuracy, or completeness of the Draft EIR. The comment will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project.

Comment

(Richard Margary, September 23, 2010) [PC-216 OTH]

"We urge you to move forward with the Draft EIR, it is thorough and comprehensive, it adequately addresses key issues, and provides mitigations for understandable concerns. There are appropriate amendments to the final version that can address comments that you heard today and during the current comment period. We further urge you to move forward for final approval of the citywide CPMC project, as proposed. Shovels need to get in the ground right away on this project. Please, enough stalling and deferrals, would all stakeholders of this project please take the attitude to move forward positively to make this project happen? That can be done if people want it to happen and if they want the benefits for our community."

Response OTH-56

The comment is noted. This comment does not raise issues regarding the adequacy, accuracy, or completeness of the Draft EIR. The comment will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project.

Comment

(Joel Koppell, September 23, 2010) [PC-221 OTH]

"Good evening, Commissioners. Joel Koppell, San Francisco Electrical Construction Industry. The partnership of our Electrical Contractors Association and our Local 6, trained electrical workforce. We build buildings. We build two-story, single-family homes, we build 60-story residential buildings, we build stadiums, and we build hospitals. There is no more important building you can ever build than a hospital. Building hospitals is the single most important investment we can make in this City. I don't want to reiterate too much of the structural engineer's words, but in the worst case scenario, in the case of a natural disaster, not only do these hospitals need to still be there, they still need to be functioning 100 percent in order to take care of everyone else."

(Joel Koppell, September 23, 2010) [PC-222 OTH]

"I am speaking to you as a San Francisco resident property owner, my office is at 55 Fillmore, blocks away from the Davies campus and the Neurosciences Building to be at Noe and Duboce, and we are really looking for forward to this project. I am telling you that this is going to be a completely positive impact on the environment of San Francisco, overall. I please urge you to move this through the process of the Planning Commission. I have been following this since the multiple hearings at the Health Commission."

Response OTH-57

The comments are noted. These comments do not raise issues regarding the adequacy, accuracy, or completeness of the Draft EIR. The comment will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project.

Comments

(Ed Vitsitch [phon], September 23, 2010) [PC-225 OTH]

"Good afternoon, President Miguel and members of the Planning Commission. My name is Ed Vitsitch [phon]. I am a principal of Cambridge CM, it is a construction management company. And I have managed health care projects, planning, designing construction, for better than 30 years, including several hospitals, some in San Francisco. In that capacity, I have been heavily involved in the development of Environmental Impact Reports for those hospitals. I have followed the Sutter project, and our firm does not do any work for Sutter. I have followed the Sutter project and have had an opportunity to review the Environmental Impact Report mitigation section and plans as they relate to construction at the various sites, also I have reviewed the Contract Construction Coordination Plan. The project impacts have been fully disclosed, thoroughly analyzed in a very professional manner. The EIR is thorough, all impacts have been addressed in a very thoughtful way, and mitigation measures have been skillfully addressed."

(Ed Vitsitch [phon], September 23, 2010) [PC-227 OTH]

"All of it has an extensive communication plan and the appointment of a construction coordination manager who can quickly and authoritatively deal with issues as they arise."

(Ed Vitsitch [phon], September 23, 2010) [PC-228 OTH]

"I have worked with the contractor, Herrera Bros. before, also with the designers, SmithGroup, and found them to be innovative, professional, and responsive. The challenge of this project was planned in a highly professional way and the team is committed to accomplish it with the minimum feasible impact. I urge the Commission to move this project ahead. Thank you very much."

Response OTH-58

The comments are noted. These comments do not raise issues regarding the adequacy, accuracy, or completeness of the Draft EIR. The comments will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project.

Comment

(Kamani Hamid [phon], September 23, 2010) [PC-230 OTH]

"…and I support the project and I think it will do good for the neighborhood and it will lower the crime rate in the area. As you probably know, that area is not really friendly, so I think it will change for the better and it will be positive."

Response OTH-59

The comment is noted. This comment does not raise issues regarding the adequacy, accuracy, or completeness of the Draft EIR. The comment will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project.

Comments

(Ramon Hernandez, September 23, 2010) [PC-232 OTH]

"Good afternoon, Commissioners. My name is Ramon Hernandez, the District Manager of the Local 261 Labor in San Francisco. I represent over 3,000 members, men and women that live here in the City, and I urge you guys to support this project, it will be a good project for our San Franciscans."

(Ramon Hernandez, September 23, 2010) [PC-234 OTH]

"I tell you guys, I am speaking in favor of that project, I would appreciate it if you guys would support it. Thank you."

Response OTH-60

The comments are noted. These comments do not raise issues regarding the adequacy, accuracy, or completeness of the Draft EIR. The comments will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project.

Comments

(Brian Webster, September 23, 2010) [PC-235 OTH]

"Hello, my name is Brian Webster. I am a resident of San Francisco and I would like to thank President Miguel and the members of the Planning Commission. I am the Chief of Staff at the Institute of Laboral de La Raza, a community-based organization here in the Mission District of San Francisco. We have been around for almost 30 years now. We provide legal services to the working poor, helping to enforce the California labor laws. Our Board of Directors is made up of members of Labor Unions, including the Laborers International Union of North America and many others. I am a member of Local 510, the Sign and Display Workers Union, and I just wanted to say that I believe that the project and the project alternatives have been pretty well analyzed by the Draft Environmental Impact Report, and that the document discloses the project's impacts and adequately meets the California Environmental Quality Act."

(Brian Webster, September 23, 2010) [PC-237 OTH]

"I think that is going to be great for San Francisco and for the economy right now. We at the Institute are big supporters of green building projects and also environmentally focused operation systems, and we know that CPMC is committed to that."

(Brian Webster, September 23, 2010) [PC-238 OTH]

"I would also like to echo Mike Theriault [phon]—some of Mike Theriault's [phon] comments from the Building Trades Council. This project is definitely well along in this process, it has been approved by the State Office of Health Services, and I would just urge you to approve the Draft Environmental Impact Report, and I am sure that the City Supervisors and the other City bodies can deal with the other issues. Thank you very much."

Response OTH-61

The comments are noted. These comments do not raise issues regarding the adequacy, accuracy, or completeness of the Draft EIR. The comments will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project.

Comments

(Lori Martins, September 23, 2010) [PC-242 OTH]

"I also live five blocks from the proposed hospital project and would like to see CPMC partner with community organizations, such as the Good Neighbor Coalition, to ensure that they are active members of our community, and don't just plop down and not be involved."

(Lori Martins, September 23, 2010) [PC-243 OTH]

"Again, I would like to thank CPMC for their help in moving my business, and hope their project moves forward. Thank you."

Response OTH-62

The comments are noted. These comments do not raise issues regarding the adequacy, accuracy, or completeness of the Draft EIR. The comments will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project.

Comment

(Dr. Ted Lee, September 23, 2010) [PC-247 OTH]

"So, I want to thank you for your time and I request that you accept CPMC's DEIR without delay. Thank you."

Response OTH-63

The comment is noted. This comment does not raise issues regarding the adequacy, accuracy, or completeness of the Draft EIR. The comment will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project.

Comments

(Lance Toma, September 23, 2010) [PC-248 OTH]

"Good afternoon, President Miguel and members of the Planning Commission. My name is Lance Toma. I am the Executive Director of Asian and Pacific Islander Wellness Center. We are a health services education research and policy organization. Our mission is to educate, support, empower, and advocate for Asian and Pacific Islander Communities, particularly API's living with and at risk for HIV and AIDS. We have two offices in the Tenderloin, one that focuses on Asian and Pacific Islander health and one that focuses on transgender health. I am here to voice support for CPMC's proposed Long Range Development Plan, as evidenced in the Draft Environmental Impact Report, and after I did review this report, I do believe that the Planning Department did a comprehensive job of analyzing the project and its alternatives."

(Lance Toma, September 23, 2010) [PC-251 OTH]

"I respectfully ask that you, the planning Commission proceed forward with this process. Thank you very much for your time."

Response OTH-64

The comments are noted. These comments do not raise issues regarding the adequacy, accuracy, or completeness of the Draft EIR. The comments will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project.

Comments

(Unidentified Speaker, September 23, 2010) [PC-267 OTH]

"Hi, good afternoon, Commissioners. Thank you for listening to all the testimony you've heard thus far, I'm sure you have another hour or two of it. My name is Barbara and I've been working in the Tenderloin for the last five years with Latino families. And so what I wanted to just share is you heard some testimony from some of our families, a lot of our families had to leave, like the nurse before me said, 3:00 is pick-up hour, and people must get there. But I wanted to share one thought that one of the moms who wasn't able to speak, who wanted me to communicate to you. Her name is Bianca and she lives at Geary and Larkin, and what she said to me is, as of last week, that was the first time she'd heard about the hospital. And for me, I really have to ask the Commissioners, what has been the process of CPMC reaching out to the community, particularly in a multi-lingual fashion? Because a lot of the families—and I actually did a survey of our families—only one person had heard about the hospital. And we're talking about Geary and O'Farrell. I also submitted one packet with the surveys and I submitted a report from Urban Solutions indicating that the Geary and O'Farrell corridor has the highest density of Latino families of all the Tenderloin, and so, for me, it is a very serious concern with Latino families, that a lot of these families weren't noticed about the hospital, and are going to be deeply impacted by this project. I'm not going to repeat a lot more. I want to actually kind of go over what some of the survey says since I don't feel like CPMC has really outreached to our community, I thought, well, we had a meeting on Friday, let's find out what our families think about the hospital and what they think about this plan, and so I did a survey just to the 27 folks that were there, or 26 folks that were there, and this is just the outcome because I don't know if this helps, but I just want to share it, of the 26 there, 20 live in the Tenderloin, four live along the Franklin corridor, which is on the other side, folks forget a lot of folks live along Franklin Street."

(Unidentified Speaker, September 23, 2010) [PC-270 OTH]

"And I don't believe there's been a open and meaningful community process, so we definitely ask you to listen to what the Tenderloin has to say. I think a lot of folks that came before you haven't been outreached to in a very meaningful way, and that's something that's going to really effectively shift between this hospital with the community, and I've got to be honest, the folks that I did see come forward, a lot of them seem to be connected to CPMC in some financial way or another, and so that really bothers me. I mean, I think there are a lot of families and we really need to address their needs. Thank you for your time."

(Commissioner Olague, September 23, 2010) [PC-379 OTH]

"Let's see, there is—I guess I was a little concerned, I'm going to probably have to do a little bit of my own research on the impacts that this project is—I know that this is not something that necessarily is studied in the Environmental Impact Report, but on the Latino populations in both areas, and we heard a lot of Latino families here today speak from the Tenderloin and certainly St. Luke's, and so those are things I'll certainly have to be researching."

Response OTH-65

The comments state concerns regarding CPMC's level of effort with respect to community outreach, especially regarding multilingual dialogue. Another comment states that there has not been an open and meaningful community process. The comments note that Latino residents in the Tenderloin, who would be affected by the CPMC LRDP, have not been sent notices of the community outreach efforts. CPMC has conducted ground and grassroots outreach in the Tenderloin neighborhood since January 2008 in

efforts to engage and educate neighbors, merchants, and residents regarding the proposed LRDP development at Cathedral Hill Campus at Van Ness and Geary, CPMC has participated in community outreach efforts about the proposed project in the neighborhood, including going door to door to Tenderloin merchants and business owners including discussions with residents of affordable housing units and single-room occupancy (SRO) hotels. Presentations were made by CPMC staff at public meetings with neighborhood groups including during public community events in the Tenderloin neighborhood.

On October 23, 2008, CPMC facilitated and promoted a community forum to educate and engage the public about the proposed project at Van Ness Avenue and Geary Street. Prior to the event, CPMC mailed 3,000 postcards to the residences and businesses within a four-block radius of the Cathedral Hill Campus to invite any interested parties to the event. Spanish and Chinese advertisements regarding the event were placed in local publications including *El Mensajero* and *SingTao*, respectively. Additional advertisements were placed in neighborhood publications including the *Bay Area Reporter, New Bernal Journal, New Fillmore News, Noe Valley Voice, and Sun Reporter.* During the event, Spanish, Tagalog, and Chinese translators were available and utilized to answer questions about the project.

CPMC has actively participated in community outreach during public events in the Tenderloin and Civic Center neighborhoods hosted by third parties including:

- Asian Heritage Festival (5/15/2010)
- Juneteenth Celebration (6/19/2010)
- Sunday Streets—Civic Center (10/24/2010)

During these events, CPMC displayed renderings and images of the proposed project and provided literature and information about the project in English, Spanish, and Chinese. Spanish and Chinese speakers were available at all of these events to answer questions or clarify any information about the project.

On September 12, 2010, CPMC facilitated an open house event at the proposed Cathedral Hill Campus site of the CPMC LRDP to provide an opportunity for neighbors, merchants, and community members to understand and ask any questions about the project. Leading up to the open house, CPMC went door to door to residences and businesses surrounding the project site with literature and information about the event in English, Spanish, Chinese, and Vietnamese. Spanish and Chinese speakers participated in these door-to-door communications and were available to answer any questions about the event in those respective languages. If no one was home, literature about the open house was left under the property's gate or at the door. CPMC also requested permission from all businesses to post a flyer about the event in visible areas of their property, which an overwhelming amount of businesses allowed. CPMC also placed print advertisements about the open house in community publications including the *Central City Extra, New Fillmore, SingTao, World Journal, Philippine News, and Castro Courier* at least 2 weeks prior to the event. The following media outlets received a media advisory regarding the event:

- *San Francisco Chronicle*
- *San Francisco Examiner*
- *Bay Citizen*
- *Bay Area Reporter*
- KGO
- KCBS
- *Central City Extra*
- *World Journal*
- *SingTao*

During the event, Spanish, Tagalog, and Chinese translators were available and utilized to answer questions about the project.

To date, CPMC has made initial contact and provided educational materials with 20 residential housing buildings in the Tenderloin. During each of these contacts, CPMC representatives expressed to the building representative their desire to provide education opportunities and resources about the proposed CPMC LRDP—including accessibility for low-income populations and acceptance of Medi-Cal, Medicare, Healthy Families, and Healthy San Francisco by CPMC—to building residents and tenants, and to answer questions about the projects. A number of building managers noted that their buildings already have existing meetings and regularly sponsored events that could be potential opportunities for CPMC to provide information about the proposed CPMC LRDP.

Please find below a comprehensive list of public meetings, gatherings, forums, and events that CPMC has attended or participated in. *(The level of participation is noted specifically after each listing.)*

- Middle Polk Neighborhood Association, 1/21/2008—*CPMC presentation*
- Lower Polk Neighbors, 2/5/2008—*CPMC presentation*
- Lower Polk Neighbors, 4/1/2008—*CPMC presentation*
- Lower Polk Neighbors, 8/5/2008—*CPMC presentation*
- Polk Corridor Business Association, 9/9/2008—*CPMC presentation*
- Community Forum at Cathedral Hill Hotel, 10/23/2008—*presentation hosted by CPMC*
- Project Homeless Connect, 2/11/2009—*participated*
- Lower Polk Neighbors, 5/5/2009—*CPMC presentation*
- Tenderloin Futures Collaborative, 9/9/2009—*CPMC presentation*
- Alliance for a Better District 6 presentation, 9/9/2009—*CPMC presentation*
- Good Neighbor Coalition meeting, December 2009—*meeting*
- Good Neighbor Coalition meeting, January 2010—*meeting*
- Lower Polk Neighbors, 1/5/2010—*attended*

- Asian Heritage Festival outreach, Civic Center/Little Saigon, 5/15/2010—*information table*
- Lower Polk Neighbors, 6/1/2010—*CPMC presentation*
- Good Neighbor Coalition meeting, June 2010—*meeting*
- Juneteenth Celebration outreach, Civic Center, 6/19/2010—*information table*
- Middle Polk Neighborhood Association—6/21/2010—*attended*
- Tenderloin Futures Collaborative, 7/21/2010—*CPMC presentation*
- Van Ness/Geary Open House, 9/12/2010—*Facilitation and door-to-door outreach leading up to event*
- Lower Polk Neighbors, 9/21/2010—*CPMC presentation*
- Tenderloin Futures Collaborative, 10/20/2010—*attended*
- Sunday Streets Civic Center outreach, 10/24/2010—*information table*
- Lower Polk Neighbors, 10/5/2010—*attended*
- Lower Polk Neighbors, 11/9/2010—*attended*
- Lower Polk Neighbors, 1/11/2011—*attended*
- Middle Polk Neighborhood Association, 1/17/2011—*attended*
- Alliance for a Better District 6, 1/19/2011—*attended*
- Lower Polk Neighbors, 2/9/2011—*attended*
- Tenderloin Futures Collaborative, 2/16/2011—*attended*
- Lower Polk Neighbors 3/9/2011—*attended*
- Project Homeless Connect 3/16/2011—*participated*

Comment

(Jane Sandoval, September 23, 2010) [PC-274 OTH]

"Also, a concern is the lack of labor peace at the hospital, it is an ongoing issue for the last three years, as well. We, the members of the California Nurses Associations, unlike our counterparts who spoke earlier, cannot and will not agree to a contract that limits our patient advocacy. Parity is not only with the community of the underserved, but also with the staff nurses of St. Luke's; it is a common goal, or asked of CPMC, as well as transparency."

Response OTH-66

The comment is noted. This comment does not raise issues regarding the adequacy, accuracy, or completeness of the Draft EIR. Further, the comment raises concerns regarding existing labor agreements between CPMC and its employees, which is not applicable to the consideration of the merits of the LRDP for the five CPMC campuses. Refer to Response PH-26 for further clarification of CPMC's contractual obligations to its employees and current hiring practices. The comment will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project.

Comment

(Paul Lentz, September 23, 2010) [PC-102 OTH]

Good afternoon, my name is Paul Lentz and I'm a resident in the Tenderloin and also work as a Tenant Organizer at the Central City SRO Collaborative. A lot of good points have been made today concerning people's concerns and outright opposition to the CPMC. So, I'm not going to repeat what has been said, but I will make two points…"

(Retilah [phon] Patel, September 23, 2010) [PC-108 OTH]

"Good afternoon, Commissioners. My name is Retilah [phon] Patel. I am a landlord in San Francisco. I have several buildings in the District that are going to be impacted by CPMC's new site. I am in support of the site because I think the development is a positive..."

(Unidentified Speaker, September 23, 2010) [PC-278 OTH]

"Good afternoon. I am a Local 377 Ironworkers Business representative representing over 2,500 Ironworkers in the greater Bay Area with a great many of them being San Francisco residents. I am here today on behalf of these members who support CPMC's project."

Response OTH-67

The comment is noted. This comment does not raise issues regarding the adequacy, accuracy, or completeness of the Draft EIR. The comment will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project.

Comment

(Linda Chapman, September 23, 2010) [PC-287 OTH]

"I will conclude by saying that, yes, they've been doing community outreach and they've done some with lower Polk neighbors, but the other night they came to lower Polk neighbors, they heard many concerns about impacts on traffic, on retail, and on noise, and then they told everybody not to come here, they convinced everyone not to come because they would have to sit in the overflow room, and they would be better off watching it on a

television at home. Now, is that community outreach as you understand it? Or they e-mail me only to come and support it, but they don't e-mail us when they're doing a presentation."

Response OTH-68

The comment is noted. This comment does not raise issues regarding the adequacy, accuracy, or completeness of the Draft EIR. The comment will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project.

Comment

(Rachel Ibarra, September 23, 2010) [PC-297 OTH]

"In essence, if CPMC expects to reap the benefits of operating as a nonprofit corporation and touts itself as a community-minded entity, then their plans should reflect that, and the current Draft EIR unfortunately does not adequately do so."

(Barbara Berwick, September 23, 2010) [PC-335 OTH]

"Oh, whatever decision you make, I'm sure you're going to make a lot of people unhappy, and you have my sympathy and understanding for that, and if elected Supervisor, I can have a long conversation with you guys about why you decided whatever it is you decided, so I can explain it to my constituents. Have a good day and thank you very much."

Response OTH-69

The comment is noted. This comment does not raise issues regarding the adequacy, accuracy, or completeness of the analysis of the Draft EIR. The comment will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project. For informational purposes, CPMC, a Sutter Health affiliate, is one of the largest private, not-for-profit, academic medical centers in California.

Comment

(Suzanne Girardo, September 23, 2010) [PC-322 OTH]

"So, in this vein, I encourage your support of the CPMC project, particularly for the children and families. Thank you."

Response OTH-70

The comment is noted. This comment does not raise issues regarding the adequacy, accuracy, or completeness of the Draft EIR. The comment will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project.

Comment

(Mary Lanier, September 23, 2010) [PC-323 OTH]

"Good evening, President Miguel and Commissioners. My name is Mary Lanier. My name was called a little bit earlier. I am a nurse and currently Vice-President for all post-acute services at California Pacific Medical Center. I appreciate the time to address you again on these important issues. I do believe that the CPMC project has been thoroughly analyzed and I do respectfully urge you to accept it."

Response OTH-71

The comment is noted. This comment does not raise issues regarding the adequacy, accuracy, or completeness of the Draft EIR. The comment will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project.

Comment

(Manny Flores, September 23, 2010) [PC-345 OTH]

"Thank you, President Miguel, fellow Commissioners, Manny Flores, Carpenters Local 22. Well, you heard all the issues and concerns tonight—today, I should say—and I guess at this point what is important is that the dialogue continue between CPMC and the neighborhoods and the various groups. That's the key to this because it's the people that are the ones that are going to make this hospital go, and it's very important because still there are a lot of issues out there. But with that working together, we can make this doable and possible because it is a great project, obviously, for the City and County of San Francisco, and we would like to see it move forward. But we have got to see that dialogue continue between the various neighborhood and CPMC, very important. And with that, thank you very much and go Giants!"

Response OTH-72

The comment is noted. This comment does not raise issues regarding the adequacy, accuracy, or completeness of the Draft EIR. The comment will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project.

Comment

(Unidentified Speaker, September 23, 2010) [PC-346 OTH]

"Commissioners, I am sorry, I was a little nervous getting up here. I also turned in a paper from Michael Lyon, the co-convener of the Gray Panthers, couldn't be here, he gave me a paper, a statement, and that was one of the papers that I turned in for you. Thank you."

Response OTH-73

The comment is noted. This comment does not raise issues regarding the adequacy, accuracy, or completeness of the Draft EIR. The comment will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project.

Comments

(Commissioner Moore, September 23, 2010) [PC-364 OTH]

"Thank you, everybody who came out. It's very difficult with so many moving pieces to respond to what comments for an EIR really require from us, and I hope that our staff knows how to put it into those questions and into those kind of answers which need to be derived from many, I think, very valid questions. I think there are many parts about this Draft EIR which are fine and which are right on, however, it is the magnitude of too many moving pieces, which make it almost impossible to create a complete set of answers. I would agree with many observations Commissioner Sugaya just made."

(Commissioner Antonini, September 23, 2010) [PC-354 OTH]

"And we know, I think it mentions 15 out of 20 of the buildings are SPC1 or worse, which means they're in pretty bad shape right now, the existing facilities, so it's important to get those upgraded or replaced, if necessary, by 2015."

Response OTH-74

The comments are noted. These comments do not raise issues regarding the adequacy, accuracy, or completeness of the Draft EIR. The comments will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project.

Comment

(Commissioner Moore, September 23, 2010) [PC-372 OTH]

"I think there are a number of written comments I will submit. I am not against a hospital by a long shot, but I need to see it in balance with a lot of other things."

Response OTH-75

The comment is noted. This comment does not raise issues regarding the adequacy, accuracy, or completeness of the Draft EIR. The comment will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project.

Comments

(Commissioner Antonini, September 23, 2010) [PC-392 OTH]

"And finally, I think it's really important that we continue to work on this, I think this is potentially a great project for San Francisco, a necessary project, and while we have concerns, we have things we want to see done, we have to make sure that what we do makes it viable for this to happen."

(Commissioner Antonini, September 23, 2010) [PC-394 OTH]

"…you know, we have to be careful, a lot of industries we've driven out of San Francisco, particularly certain businesses, by some of our policies, we've been pretty lucky with the health care facilities in the past, but I think we have to try to be supportive and work with them to make a solution."

Response OTH-76

The comments are noted. These comments do not raise issues regarding the adequacy, accuracy, or completeness of the Draft EIR. The comments will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project.

Comment

(Commissioner Miguel, September 23, 2010) [PC-399 OTH]

"I would just like to thank everyone who spoke today and that came today, it is greatly appreciated. Just so the general public understand that the concept of an EIR, in my mind anyway, I don't know if it's written down anywhere this way, is to analyze the maximum impacts and how any impacts can be mitigated; it doesn't mean that the project will be built to that max, but will be built somewhere inside it, so the public should not presume that the maximum that is analyzed is necessarily what is going to result with the project. And with that, this hearing to take testimony is over. Thank you very much."

Response OTH-77

The comment is noted. This comment does not raise issues regarding the adequacy, accuracy, or completeness of the Draft EIR. The comment will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project.

3.23.2.2 CATHEDRAL HILL CAMPUS

Comment

(Marlayne Morgan—Cathedral Hill Neighbors Association, September 21, 2010) [15-1 OTH, duplicate comment was provided in 39-1 OTH]

*"**Cathedral Hill Neighbors (CHNA)*** asserts that the DEIR on this project is incomplete, is lacking in supporting documents and evidence and does not include feasible mitigation measures and alternatives. We will be submitting detailed comments on these issues at a later date."

Response OTH-78

The comment states that the Draft EIR is incomplete, lacking substantial evidence, and does not include feasible mitigation measures and alternatives. Please refer to Response ALT-1 (page C&R 3.22-11) for a discussion of an analysis of "Alternative 3A Plus" or of a modified Alternative 3A or Alternative 3A with a different mix of services. Because the comment does not provide specific information regarding the inadequacies suggested by the comment (i.e., lack of substantial evidence and feasible mitigation measures), it is not possible to provide a specific response. The Draft EIR was prepared consistent with the requirements of Chapter 31 of the Administrative Code of the City and County of San Francisco, CEQA (California Public Resources Code 21000–21177), and the State CEQA Guidelines (California Code of Regulations, Title 14, Division 6, Chapter 3, Sections 15000–15387), as well as relevant case law.

Comment

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-127 OTH, duplicate comment was provided in 30-127 OTH]

"It is one thing to build a world-class for-profit hospital but not at the expense of the adjacent residents, homeowners and merchants within a 1/2-mile radius of the campus. (See Item 20 and Item 64 above.)"

Response OTH-79

The comment is noted. This comment does not raise specific issues regarding the adequacy, accuracy, or completeness of the Draft EIR. The comment will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project. As a point of clarification, CPMC, a Sutter Health affiliate, is one of the largest private, not-for-profit, academic medical centers in California.

The comment references items 20 and 64 in the comment letter, which are numbered as multiple comments in this C&R document. The following comment numbers are part of item 20 in Letter 18: 18-33 INTRO, 18-34 TR, 18-35 AQ, and 18-36 TR to 18-40 TR. The following comment numbers are part of item 64 in Letter 18: 18-118 TR, 18-119 TR, and 18-120 TR. Please refer to Responses INTRO-1 and TR-19 (page C&R 3.1-1 and page C&R 3.7-41, respectively), which address the use of Appendix G of the State CEQA Guidelines in the Draft EIR and respond to comments 18-33 INTRO and 18-34 TR, respectively. Please refer to Response AQ-10 (page C&R 3.9-26), which addresses comments on operational emissions and responds to comment 18-35 AQ. Please refer to Response TR-34 (page C&R 3.7-58), which addresses traffic calming measures on residential streets within each respective campus area and responds to comment 18-36 TR. Please refer to Response TR-56 (page C&R 3.7-93), which addresses the impact of the CPMC shuttle service and responds to comments 18-37 to 18-40 TR and 18-118 TR. Please refer to Response TR-75 (page C&R 3.7-145), which addresses potential off-site parking lots to which CPMC could provide shuttle service and responds to comment 18-119. Please refer to Response TR-106 (page C&R 3.7-185), which addresses the adequacy of transportation demand

management measures developed by CPMC and Herrero Boldt to address construction worker parking needs and responds to comment 18-120 TR.

Comment

(Alan Wofsy—Emeric-Goodman Associates, September 23, 2010) [26-1 OTH]

"My firm owns and manages the Emeric-Goodman Building, possibly the oldest wood frame building in the City, parts of which date from 1869. It is designated as Official City Landmark, No. 71 and is listed on the National Register of Historic Places. Between 1983–1985 we renovated the building to comply with the requirements of the U.S. Department of the Interior and the City's Landmarks Board. It contains 31 residential units and 5 commercial storefronts and is right across the street from the proposed automobile entrance of the project which is the subject of this DEIR hearing.

The DEIR discusses the many negative environmental impacts which the proposed project will cause but comes up short on proposing realistic and sensible mitigation measures. The DEIR takes almost a fatalistic approach with this passive statement:

> Therefore, the Cathedral Hill Campus cumulative construction impacts would be significant and unavoidable.

The DEIR misses the mark in dealing with the negative environmental impacts on the neighborhood by failing to propose meaningful mitigation measures, notably compensation to the Victims of the project."

Response OTH-80

The comment states their building, the Emeric-Goodman Building, which is adjacent to the proposed Cathedral Hill Campus development, is designated as Official City Landmark No. 71 and is listed on the National Register of Historic Places. The comment states that the Draft EIR does not provide feasible or reasonable mitigation measures for significant adverse impacts, especially concerning impacts to the neighborhood surrounding the proposed Cathedral Hill Campus development. As noted in Response CP-11 (page C&R 3.6-10), the Draft EIR incorporated the analysis of the Historic Resources Evaluation Report (HRER) conducted by Knapp Architects, in which the Emeric-Goodman Building is noted as being a designated historically significant structure. Regarding the comment's statement regarding the provision of meaningful mitigation, refer to Response OTH-9 (page C&R 3.23-247) for further explanation of how the Draft EIR complied with the requirements of CEQA with respect to the evaluation and commitment to feasible mitigation of the potentially significant impacts of the proposed CPMC LRDP.

Comment

(Barbara Ann Berwick, September 23, 2010) [36-4 OTH]

"4. While the mega-hospital plan enhances productivity thereby reducing potential costs to patients, it offends local residents who have environmental concerns. Cathedral Hill Neighborhood Association of District 2 is most affected by this project in District 2; they need to be listened to and their concerns addressed. They don't want building variances granted and they don't want to live in the shade. Additional capacity could be maintained at sites where that capacity already exists. There are other neighborhood associations in many other Districts that need to be listened to as well."

Response OTH-81

The comment states that Cathedral Hill Neighborhood Association of District 2 does not want building variances granted for the proposed CPMC LRDP. The comment states that the Cathedral Hill

Neighborhood Association does not want to live in the shade of the proposed Cathedral Hill Campus development. Lastly, the comment suggests that additional capacity could be maintained at sites where that capacity already exists.

The proposed Cathedral Hill Campus would require variances from the San Francisco Planning Code, as described in Section 2.2.4 of the Draft EIR, pages 2-43 through 2-48. In response to the suitability of the site for the Cathedral Hill Campus, Section 4.1, "Land Use and Planning," analyzes the compatibility of the proposed LRDP in its surrounding context. Impact LU-3 (Draft EIR page 4.1-55), concludes that although the construction and operation of the Cathedral Hill Campus would intensify the use of the site, because it is already a densely developed and active area, land use impacts would be less than significant. The comment's statement expressing a preference for the denial of building variances associated with the proposed Cathedral Hill Campus is noted.

Please see Response WS-3 (page C&R 3.11-10) regarding shadow impacts surrounding the proposed Cathedral Hill Hospital and MOB. Under CEQA, the question is whether a project would affect the environment in general, not whether a project would affect particular individuals or property owners. CEQA does not mandate that lead agencies find significant impacts of a proposed project on private views from adjacent residential properties. The analysis as discussed in the Draft EIR, pages 4.9-33 through 4.9-43, determined that the small amount of increase in net new shadows on sidewalks and publicly accessible plazas near the proposed Cathedral Hill Campus would not substantially alter their use. Therefore, the shadow impacts from the proposed Cathedral Hill MOB would be less than significant.

As it relates to the capacity of the proposed Cathedral Hill Campus, the number of beds planned for the proposed Cathedral Hill Campus is based on several factors, including accommodation of annual growth based on population projections and assumed growth in particular services, the projected health care needs of an aging population, average occupancy projections, and the need to provide capacity for seasonal and other fluctuations in hospitalization rates. In addition, the proposed CPMC LRDP and proposed development plan for the Cathedral Hill Campus would aid CPMC in complying with SB 1953, which places seismic requirements on hospital facilities throughout California, while maintaining an adequate level of health care services in San Francisco. With respect to the comment's statement regarding an alternative to the proposed CPMC LRDP that distributes the capacity of the Cathedral Hill Campus across the existing CPMC campuses, please refer to Response ALT-1 (page C&R 3.22-11) for discussion about the range of alternatives and the reason no additional analysis is required under CEQA.

Comment

(Diane and Richard Wiersba, October 11, 2010) [49-1 OTH]

"We are seniors living on Cathedral Hill. Our analysis of the effects of the upcoming Van Ness Avenue CPMC project as proposed by CPMC are all negative."

Response OTH-82

This comment states opposition to the proposed LRDP and provides specific comments in an attached document. This opposition to the LRDP is noted, and the comment will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project. Specific responses to the individual comments are responded to throughout this C&R document, in sections specific to the environmental issue areas to which they pertain. See Major Responses HC-1 and HC-2 (pages C&R 3.23-1 and 3.23-8, respectively) for a discussion of the size and location of health care services at the proposed Cathedral Hill Campus and how the level of development evaluated in the Draft EIR was determined.

Comment

(Alan Wofsy—Emeric-Goodman Associates, August 7, 2010) [56-1 OTH]

"You did nothing the whole week to deal with the graffiti and debris at your property on Geary between Franklin and Van Ness. The graffiti has now expanded and the debris is still there. In your various PR presentations to the public, CPMC said you would be vigilant in not letting the site degrade.

Attached are a few cell phone pictures from this week.

The City is now reviewing your environmental impact report. If you cannot even maintain your property now, the City certainly needs to have stringent and enforceable conditions for the futures.

Yours,

Alan Wofsy
CEO

Subject: RE: Status of CPMC Geary/Van Ness Project

Hi Alan,

Sorry for not getting back to you yesterday, this EIR has us all working into the night. Please see my responses below. I've been focused on St. Luke's so if you have Van Ness and Geary related questions please contact Alan (contact info below).

Regards,
-V

Dear V,

Is this (Oct. 6, 2009) your last communication to me? Yes, I believe so.

What is the status of the EIR and demolition schedule? The City is trying to get the draft of the EIR published this month. No exterior demolition activity can commence until the EIR is certified and authorizations are granted by the Planning Commission and Board of Supervisors.

Could any of your team members use a 1142 sq. ft. ground floor office across the street from the project at 1121 Geary? Once we get the necessary approvals to actually break ground, there will be dozens of small to medium sized trade partners (along with our large general contractors for the hospital and medical office building) vying for space immediately adjacent to the job sites. I'm not aware of any need yet since the project is not yet approved.

Due to the negative impacts of your large vacant building and impending demolition and construction, we have not found a tenant for that space. I had asked CPMC to rent the space in conjunction with your project to mitigate the damages we are suffering, and as an efficient quid pro quid. We're not in a position to rent space until we have approvals to support the demand that a project of this size will warrant. Please contact my colleague Alan Loving at 415-600-7639 to discuss your particular concerns with our project and how it may affect your property.

Yours,

AlanWofsy
CEO

Planning Commission Chamber
City Hall Room 400"

Response OTH-83

The comment presents e-mail correspondence between Emeric-Goodman Associates and Sutter Health regarding graffiti and trash at the proposed Cathedral Hill Campus. The comment also provides e-mail correspondence between Emeric-Goodman Associates and Sutter Health regarding the Draft EIR and demolition schedules. Because the comment does not raise any specific issues on the adequacy, accuracy, or completeness of the analysis presented in the Draft EIR, no response is required.

Comment

(Ryan Bresnick, August 1, 2010) [57-1 OTH]

"COMMENTS: Dear Supervisor Dufty, I am writing you in regards to CPMC's proposal to build a new hospital on Van Ness Street. As an employee at CPMC, I realize the need for improved and modem facilities, and ultimately I hope the new structure is approved."

Response OTH-84

This comment expresses general support for the proposed LRDP, but does not raise any specific issues on the adequacy, accuracy, or completeness of the analysis presented in the Draft EIR. The comment will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project.

Comments

(Trudy Lionel, October 15, 2010) [60-1 OTH]

"I am writing to protest the Draft of the Environmental Impact Report for the California Pacific Medical Center Long Range Development tan Project. I support the Unitarian Universalist CPMC Task Force letter regarding concerns with vibration levels, gas lines, traffic impacts on public transportation, parking on Cathedral Hill, air quality, hazardous waste and loading dock noise."

(Rev. Alyson Jacks—First Unitarian Universalist Church, October 17, 2010) [63-1 OTH]

"I am writing in opposition to CMPC's proposal for a colossal Cathedral Hill Hospital and loading dock. I stand in support of the letters written by the Cathedral Hill Neighbors Association and the Unitarian Universalist CPMC Task Force."

Response OTH-85

These comments express opposition to the proposed LRDP but do not raise any specific issues on the adequacy, accuracy, or completeness of the analysis presented in the Draft EIR. The comments will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project. The comments support the comments from the Unitarian Universalist CPMC Task Force (Letter 44) and the Cathedral Hill Neighbors Association (Letter 15). Please refer to issue area-specific responses to Letters 15 and 44 throughout this C&R document for further clarification.

Comments

(Helene Dellanini—DBC Master Owner's Association, October 18, 2010) [71-22 OTH, duplicate comment was provided in 72-22 OTH]

"**Safety—General**: We were unable to locate an evaluation of the potential safety impacts the project would have to the surrounding area. Construction sites typically attract vandalism, theft, and other impacts to safety. CPMC should be required to provide 24 hour dedicated, manned security at the hospital, MOB, and 137S construction sites and neighboring areas."

(Carolyn Abst and Ron Case, October 19, 2010) [102-18 OTH, duplicate comment was provided in 114-18 OTH]

"J. We are concerned with day and night security, not only within the construction site but all along the block. We need 24 hour security to prevent graffiti, vandalism and homeless encampments."

(Lower Polk Neighbors, October 19, 2010) [103-10 OTH, duplicate comment was provided in 113-10 OTH]

"LPN is concerned with day and night security, not only within the construction site but in the adjacent and radiating neighborhood. We need 24-hour security to prevent graffiti, vandalism, homeless encampments, and garbage dumping by citizens from outside the neighborhood. (work and living issue)."

Response OTH-86

These comments express concern with safety and security at construction sites related to the proposed CPMC LRDP. One comment states construction sites attract vandalism, theft, and other impacts on safety. While construction site crime, such as theft or vandalism, is considered a socioeconomic issue, not an environmental issue, the Draft EIR analyzed impacts to maintain acceptable ratios and response times of the police to the proposed LRDP campuses on pages 4.11-23 to 4.11-30 in Section 4.11, "Public Services." CEQA analysis regarding impacts on police protection and other emergency services is not required to evaluate specific incidents of crime, such as vandalism or theft. In addition, the construction management plans for both the proposed Cathedral Hill Hospital and MOB include provisions for 24-hour security and safety lighting. CPMC would have a security officer make rounds of the entire campus, including the MOB, between 8 p.m. and 7 a.m., when less exterior construction activity would be planned. Refer to Response INTRO-7 (page C&R 3.1-17) for a discussion of social and economic impact discussion requirements under CEQA.

Comment

(Donald Scherl, October 15, 2010) [74-32 OTH]

"7.0: Conclusions

7.1: The draft EIR for CPMC should be rejected as it pertains to Cathedral Hill and St. Luke's."

Response OTH-87

The comment does not provide any specific information to support the suggestion that the CPMC LRDP EIR regarding the Cathedral Hill and St. Luke's Campuses should be rejected; thus, no response is possible. The comment is noted, and it will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project.

Comment

(Charles Freas, October 19, 2010) [79-4 OTH, duplicate comment was provided in 100-4 OTH]

"While well detailed in some respects, the EIR contains recurring statements about the CEQA process not needing to address certain environmental aspects which are all too real to the surrounding Cathedral Hill community. The EIR analysis appears to conveniently support the desired outcome in too many instances, while making assumptions that may not come true."

Response OTH-88

The comment states that certain environmental issues related to the Cathedral Hill community were not addressed in the Draft EIR. As discussed in the Draft EIR, page 1-3, the purpose of an EIR is to provide decision-makers, public agencies, and the public with an informational document that fully discloses the environmental effects of the proposed project. The EIR process is intended to facilitate the objective evaluation of potentially significant direct, indirect, and cumulative impacts of the proposed project, and to identify feasible mitigation measures and alternatives that would reduce or avoid the project's

significant effects. The Draft EIR addressed all of the physical environmental issues within the purview of CEQA, as articulated by the State CEQA Guidelines, including Appendix G, and relevant case law.

At times, issues are raised by interested parties that fall outside of this purview; these are primarily of a social and economic nature. Under CEQA, these social and economic issues are relevant only insofar as they provide a linkage between the proposed project and a physical environmental impact or provide a measure of the significance of a physical environmental impact. Such issues are appropriately considered by the decision-makers, based on evidence in the record, as part of their deliberations on the project, but do not have a bearing on the adequacy of the EIR under CEQA.

The comment also suggests that the impact analysis of the CPMC LRDP Draft EIR appears to support desired outcomes and therefore may not be objective, and makes assumptions that may not be borne out. The comment does not provide any specific instances of bias or of invalid assumptions found in the Draft EIR. The environmental analyses provided in Chapter 4 "Environmental Setting, Impacts and Mitigation" through Chapter 6, “Alternatives,” in the CPMC LRDP Draft EIR are thorough and based on substantial, objective evidence that has been placed into the administrative record. The information on which the impact assessments were based is objective and unbiased, and is cited in the Draft EIR, consistent with the requirements of Section 15148 of the State CEQA Guidelines.

Because this comment does not raise any specific issues on the adequacy, accuracy, or completeness of the analysis presented in the Draft EIR, no further response is required.

Comments

(Carolyn Abst and Ron Case—Case + Abst Architects LLP, October 19, 2010) [102-1 OTH, duplicate comment was provided in 114-1 OTH]

“Thank you for the opportunity to comment on the subject Draft Environmental Impact Report (DEIR) for the California Pacific Medical Center (CPMC) Long Range Development Plan. CEQA, a law which emphatically provides for involvement of the general public in assessment and mitigation of the impacts of development projects, affords the general public a rightful ‘place at the table’ in the City’s consideration of this Project. I hope and expect that the City, in response to these comments, will continue to closely include the public in further evaluation of the Project’s environmental impacts, and in structuring alternatives to and/or mitigation for those impacts.

Background

Our comments are directed at how [1] constructing and [2] operating the new Cathedral Hill Campus will affect our property located at 1033-37 Polk Street [adjacent to the proposed Medical Office Building, see enclosed map]. 1033 Polk Street is the street-level commercial floor of a two-story building owned by Ron Case and Carolynn Abst. Our firm, Case+Abst Architects, is located at 1033 Polk Street. 1037 Polk Street is the second floor above 1033 Polk, and is the only residence of Ron Case and Carolynn Abst. Thus we, Ron Case and Carolynn Abst, occupy the entire building of 1033-37 Polk Street on a 24-hour basis, 7 days a week.

Our comments are directed at the environmental [and economic] impacts as described in CPMC’s draft Environmental Impact Report, published July 21, 2010. The comments listed below are related to the following draft E.I.R. impacts: [most with ‘significant impact’ listing]

Comments

4.5 Transportation and Circulation
Impact TR -1 thru 2
Impact TR- 3 thru 7

Impact HZ-l"

(Lower Polk Neighbors, October 19, 2010) [103-1 OTH, duplicate comment was provided in 113-1 OTH]

*"***Lower Polk Neighbors**

The proposed Cathedral Hill Campus will be built and operated within the boundaries of LowerPolk Neighbors (LPN). LPN is a registered nonprofit community organization that was established in 2002. LPN's defined boundaries ore both sides of California Street on the North, Von Ness Avenue on the West, Ellis Street on the South, and only the West side of Hyde Street on the East.

(see enclosed map)

The following are comments and what we feel are acceptable mitigation measures that we, as a neighborhood organization of residents and merchants desire to achieve in partnership with California Pacific Medical Center (CPMC), to mutually benefit our shared community.

All comments are directed to the environmental (and economic) impacts as mentioned in the draft Environmental Impact Report, published July 21, 2010. The comments listed below are related to the following draft E.I.R. impacts (most with 'Significant and Unavoidable impact (SU)' listing and others, which we feel are mis-designated, as 'Less then Significant Impact (LTS)' listing).

4.1 Land Use and Planning
Impact LU-1 thru 3

4.2 Aesthetics
Impact AE-1 thru 4

4.5 Transportation and Circulation
Impact TR -1 thru 2
Impact TR- 3 thru 7
Impact TR-9 thru 17
Impact TR-27 thru 31

4.12 Utilities and Service Systems
Impact UT-1 thru 4
Impact UT-6

4.15 Hydrology and Water Quality
Impact HY-3

4.16 Hazards and Hazardous Materials
Impact HZ-1"

Response OTH-89

The comments do not raise any specific issues on the adequacy, accuracy, or completeness of the analysis presented in the Draft EIR; rather, they present an introduction to the Case+Abst Architects LLP and the Lower Polk Neighbors comment letters, and state that their comments in Letter 102 are directed at construction and operations of the proposed Cathedral Hill Campus and "acceptable mitigation measures" in Letter 103 are directed at environmental and economic impacts. The comments list specific impacts that were analyzed in the Draft EIR and are referenced in the specific comments for Letters 102 and 103. Refer to the responses to the specific comments made in Letters 102 and 103 throughout this C&R document. The comments are noted, and will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project.

Comment

(Carolyn Abst and Ron Case—Case + Abst Architects LLP, October 19, 2010) [102-39 OTH, duplicate comment was provided in 114-39 OTH]

"**Option #1**

It is our belief that after review of the draft EIR and design documents the new hospital and MOB construction and operation will create an intolerable living and working condition. For our health and well being we would like to permanently move from our location. We would like help from CPMC for this endeavor.

Option #2

If option # 1 is unachievable we would like the following mitigation measures provided based on our having to live and work with less than desirable conditions both during construction and after MOB and hospital occupancy:

1. Health and Safety

A. For the duration of the construction pay for relocation of our office and residence with similar accommodations [size space arrangement and amenities]. Cost to include all rents and relocation expenses:

[1] New office set-up [phones, stationery, packing & moving expenses, utilities, etc.]

[2] Living arrangements similar to our current arrangement [packing & moving, utilities, etc.]

B. At the completion of construction pay for all expenses associated with returning to our existing location.

C. At the end of construction [and before moving bock]

[1] Provide for new acoustical windows [1" thick] and doors throughout. Provide for clear replaceable film on exterior of all first floor windows and doors.

[2] Provide [design; equipment necessary and installation] of total air conditioning system for both 1st & 2nd floors. System[s] to have a superior filtration component.

[3] Repair and paint the total exterior of the building [same paint and colors as existing].

[4] Replace existing roof with like system

2. Protection and Care of Property [during construction]

A. Secure existing building [1033-37 Polk] from vandalism and miscellaneous damage.

B. Remove all graffiti within 24 hours.

C. Repair any damaged areas within a few days time.

D. Protect and care for the 4 palm trees and ground cover on the exterior of the building.

3. Use of Properly [after construction]

A. Install metering lights at MOB parking exit on Cedar Street so that we can halt exiting traffic briefly while we enter or exit our garage.

B. Provide four [4] free parking space in the MOB for our clients to use [with validation at no cost to us.

C. Establish a committee or group who will meet quarterly to work out conflicts and issues that arise. [Also, establish a person we can call at anytime to resolve matters that won't wait until our quarterly meetings.]"

Response OTH-90

The comment states that the construction and operation of the proposed Cathedral Hill Campus would create intolerable living and working conditions at the commenter's residence. The comment states that CPMC should assist the commenter in permanently moving away from the site (Option #1) or requests a specific set of measures to reduce the effects of the project on the commenter's property (Option #2).

The construction of the proposed Cathedral Hill Hospital and Cathedral Hill MOB would be consistent with the standards set forth for construction of new buildings in an urban environment and would comply with the mitigation measures set forth in the Draft EIR for the proposed CPMC LRDP. The proposed Cathedral Hill Campus would not result in any operational impacts that would significantly affect human health and safety. Temporary construction impacts would occur but would not necessitate relocation assistance for off-site uses. However, this comment is noted and will be forwarded to the project sponsor for its consideration. Furthermore, the comment may be considered by the decision-makers as part of their deliberations on the project.

Option #2 presents a list of measures requested by the commenter. The suggested measures are subjective requests made by a single local property owner that fall outside of the objective standards set forth by CEQA. Mitigation measures can only be identified and imposed on a project when necessary to avoid or reduce the magnitude of a significant environmental impact. The measures suggested by the comments do not meet these criteria. These comments therefore reflect proposed conditions and are noted. Nonetheless, it should be noted that the project sponsor, through the development agreement (see Section 3.23.1.2 on page C&R 3.23-41 for additional information), would provide funding for some additional streetscape, pedestrian, and related improvements in the vicinity of the proposed LRDP campuses that would provide benefits to the communities, consistent with the requests made under Option #2. The project sponsor would provide parking within the Cathedral Hill MOB at market rates to the public during normal business hours, and would be available to meet quarterly, consistent with the request made in the comment, to address conflicts that arise from the operations of the proposed Cathedral Hill Campus. Furthermore, measures would be taken to ensure that surrounding structures are monitored during construction and structural damage as a result of project construction is repaired, as required by Mitigation Measure M-NO-N5. Also, Mitigation Measure TR-55 would require the preparation of a construction traffic management plan that would continually evaluate construction traffic in the project area. In addition, coordination with local property owners along Cedar Street would take place to ensure that traffic flow is maintained to the extent feasible during Cathedral Hill development under the LRDP; all traffic activity along Cedar Street would be monitored once construction is completed to determine what, if any, improvements are necessary to maintain and improve traffic flows.

Comments

(Lower Polk Neighbors, October 19, 2010) [103-23 OTH, duplicate comment was provided in 113-23 OTH]

"D. Because of extensive senior housing in the neighborhood, convert the existing shelter (Next Door) into a senior health, fitness, and social center, with health and exercise classes, a senior fitness center, and on-going classes, etc."

(Lower Polk Neighbors, October 19, 2010) [103-24 OTH, duplicate comment was provided in 113-24 OTH]

"A. Fund the Lower Polk Neighbors (LPN) attempt to pass a neighborhood CBD. (Include funds for an employee(s) to prepare. coordinate. and submit necessary documents.)

B. Become an active and participating member of Lower Polk Neighbors (LPN)

C. Establish an on-going partnership with LPN with monthly meeting to monitor impacts and issues that arise (with reports going to the Board of Supervisors and appropriate city agencies)

D. Sponsor four Neighborhood events with LPN. such as farmers markets, alley closings for neighborhood block parties, etc."

(Lower Polk Neighbors, October 19, 2010) [103-26 OTH, duplicate comment was provided in 113-26 OTH]

"G. Fund enhancement streetscape along Polk Street. Enhancements to include additional trees (in planters where under-sidewalk vaults prohibit in-ground planting) and decorative plants, seasonal decorations, banners, seating and lighting. (Funds to include maintenance and replacement when necessary.)"

(Lower Polk Neighbors, October 19, 2010) [103-30 OTH, duplicate comment was provided in 113-30 OTH]

"A. Help finance design and construction upgrades to existing neighborhood SRO (Single Room Occupancy) buildings."

(Lower Polk Neighbors, October 19, 2010) [103-31 OTH, duplicate comment was provided in 113-31 OTH]

"B. Help finance relocation of the existing shelter (Next Door) to a more suitable and humane building with more helpful amenities such as outdoor seating areas. Open courts and less crowding (less warehousing) of clients."

(Lower Polk Neighbors, October 19, 2010) [103-32 OTH, duplicate comment was provided in 113-32 OTH]

"C. Help finance (design and construction) of senior housing. (Location potential: abandoned site of St. John's Church at Clay and Larkin Streets and similar sites."

Response OTH-91

The comments make a number of recommendations regarding mitigation measures and improvements. Mitigation measures are only identified and imposed on a project when necessary to avoid or reduce the magnitude of a significant environmental impact (see State CEQA Guidelines Section 15064.4). The measures suggested by the comments do not meet these criteria. These comments, therefore, reflect proposed conditions and are noted. These comments do not raise issues regarding the adequacy, accuracy, or completeness of the Draft EIR. Nonetheless, it should be noted that the project sponsor (CPMC), through the development agreement (see Section 3.23.1.2 on page C&R 3.23-41 for additional information), would provide funding for some additional streetscape, pedestrian, and related improvements in the vicinity of the proposed LRDP campuses that would provide benefits to the communities, consistent with the requests made in these comments. The comments will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project.

Comment

(Jack Scott, September 23, 2010) [PC-5 OTH]

"Mr. President, Commissioners, my name is Jack Scott and I represent Neighbors of Cathedral Hill. We strongly object to the construction of a mammoth hospital project planned by CPMC on the proposed site."

Response OTH-92

The comment is noted. This comment expressed general opposition to the proposed Cathedral Hill Hospital but does not raise issues regarding the adequacy, accuracy, or completeness of the Draft EIR. The comment will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project.

Comment

(Margarita Lopez Perez, September 23, 2010) [PC-47 OTH]

"Our future depends on Cathedral Hill. We need hospitals that are earthquake safe and provide more and better service to our patients and to our community. We write you today because we need your support to make that happen. If CPMC is not permitted to build seismically compliant hospitals by 2015, the majority of the medical center will be forced to close. We will lose our jobs as a community, and we will lose critical access to health care."

Response OTH-93

The comment is noted. This comment does not raise issues regarding the adequacy, accuracy, or completeness of the Draft EIR. The comment will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project. It should be noted that all written comments received during the public review comment period pertaining the Draft EIR are responded to as part of this C&R document.

Comment

(Dina Hilliard, September 23, 2010) [PC-55 OTH]

"The Good Neighbor Coalition believes this is a wonderful opportunity for CPMC to engage with Tenderloin and Central City neighbors, and come to a legally binding resolution that reflects the community's concerns. But we cannot engage in these discussions if this EIR will not validate or acknowledge that our community exists. Thank you."

Response OTH-94

These comment is noted. The comment does not raise issues regarding the adequacy, accuracy, or completeness of the Draft EIR. The comments will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project.

Comment

(Lorenzo Listana, September 23, 2010) [PC-126 OTH]

"Good afternoon, Commissioners. My name is Lorenzo Listana and I have lived in the Tenderloin for five years now, and I am also a member of the Tenderloin Filipino American Community Association. As a resident of the Tenderloin, I am proud of my community and I want to see it improve for the residents, however, I am very concerned about the proposed Cathedral Hill hospital because of its great impact on our neighborhood."

Response OTH-95

The comment is noted. This comment does not raise issues regarding the adequacy, accuracy, or completeness of the Draft EIR. The comment will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project.

Comment

(Paul Grech, September 23, 2010) [PC-327 OTH]

"My name is Paul Grech. I've run a business on the corner of Polk and Ellis for 37 years and I'm here to urge you to okay the proposed hospital project at Van Ness and Geary."

Response OTH-96

The comment is noted. This comment does not raise issues regarding the adequacy, accuracy, or completeness of the Draft EIR. The comment will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project.

3.23.2.3 PACIFIC CAMPUS

Comment

(Paul Wermer—CPMC Neighbors Coalition and Pacific Heights Residents, October 18, 2010) [67-3 OTH]

"• Many issues related to the Pacific site are inadequately addressed in this DEIR, and will require far more detailed attention in a project specific EIR.

• Specifically, we believe that the DEIR contains insufficient or misleading data about project impacts in the areas of land use and land use planning, aesthetics, transportation and circulation, noise, wind and shadow, and other areas.

• We propose adoption of alternative metrics to aid the City in projecting the true impact of this proposed project."

Response OTH-97

The comment states that a more detailed analysis of the Pacific Campus development under the LRDP is required in a project-specific EIR. As stated in Section 1.3, "CEQA Analysis of CPMC Long-Range Development Plan: Near-Term versus Long-Term Project Components," of the Draft EIR, pages 1-12 and 1-13, long-term projects under the CPMC LRDP would be analyzed at a program level, pursuant to State CEQA Guidelines Section 15168. The proposed long-term projects at the Pacific Campus under the LRDP would require additional or supplemental project-level environmental review in the future, as necessary to gain approval.

The comment provides a summary of the more specific comments presented later in Letter 67, which include comments on impacts related to land use and planning, aesthetics, transportation and circulation, noise, and wind and shadows. Please refer to the environmental topic-specific responses to the comments made in Letter 67 in Sections 3.1 ("Introduction"), 3.2 ("Project Description"), 3.3 ("Land Use"), 3.4 ("Aesthetics"), 3.5 ("Population, Employment, and Housing"), 3.6 ("Cultural Resources"), 3.7 ("Transportation and Circulation"), 3.8 ("Noise"), 3.9 ("Air Quality"), 3.11 ("Wind and Shadow"), 3.12 ("Recreation"), 3.18 ("Hazards"), and 3.23 ("Other Issues") of this C&R document (see Appendix I: Cross Reference Matrix of Draft EIR Comments). The metrics (i.e., thresholds of significance) that were used to determine the significance of the impacts of the proposed CPMC LRDP are in accordance with Appendix G of the State CEQA Guidelines, San Francisco Planning Department Guidelines for the Preparation of Environmental Review Documents, and standard City practice with respect to CEQA documents. As such, the metrics used in the Draft EIR are considered appropriate, and the use of alternative metrics is not considered warranted or necessary to properly evaluate the potential physical environmental impacts of the project.

Comment

(Arthur and Jacqueline Cimento, October 19, 2010) [78-10 OTH, duplicate comment was provided in 99-1 OTH]

"**4) Primary Impacts Cannot Be Mitigated**

There are numerous project impacts at the Pacific campus where no mitigation is provided. Construction noise could reach 90 Vdb in our home, which the draft EIR notes 'could be significant' (page 4.6-95). The EIR notes additional primary impacts associated with construction (e.g., air quality) which are 'significant and unavoidable' (section 4.7).

In addition, several primary impacts from the facility are noted without any mitigation provided. These include light from vehicle head lamps which will shine into homes (page 4.2-89) and noise from ventilation units. There are other impacts which are not discussed such as the noise from traffic entering and leaving the above ground parking facility and the increase in C02 from vehicles idling in the garage.

Again, our understanding of CEQA is that project impacts must be mitigated to the point of insignificance. The draft EIR does not attain this standard."

Response OTH-98

The comment states that the Draft EIR does not include mitigation measures for numerous potential project impacts at the Pacific Campus, including construction vibration, light from vehicle headlamps, noise from on-site ventilation units, traffic at on-site parking facilities, and idling emissions from vehicles.

The Pacific Campus is analyzed in the Draft EIR at the program level, and project-level mitigation is not possible nor appropriate as part of the Draft EIR. A more detailed analysis of the Pacific Campus, including analyses of potential construction vibration, heating, ventilation, and air conditioning (HVAC) noise, vehicle air emissions, light spillover, and local traffic impacts, would be required in a project-specific EIR in the future. As stated in Section 1.3, "CEQA analysis of CPMC Long-Range Development Plan: Near-Term versus Long-Term Project Components," in the Draft EIR, pages 1-12 and 1-13, long-term projects would be analyzed at a program-level, pursuant to State CEQA Guidelines Section 15168. The proposed long-term projects at the Pacific Campus under the LRDP would require additional or supplemental project-level environmental review in the future.

The comment is incorrect in stating that project impacts "must" be mitigated to a level of insignificance. Rather, an EIR must identify feasible mitigation measures that could avoid or reduce the magnitude of significant effects. Under CEQA, ultimately, the determination of feasibility and the applicability of mitigation measures is made by the decision-makers. In fact, in making findings on a project, one of the possible findings that is specifically identified in the State CEQA Guidelines (Section 15091[a][3]) is that:

> Specific economic, legal, social, technological, or other considerations, including provision of employment opportunities for highly trained workers, make infeasible the mitigation measures or project alternatives identified in the final EIR.

Thus, it is clear that, under CEQA, in some situations some impacts might not be feasibly mitigated to a less-than-significant level. Nonetheless, as noted above, once more specific development plans for the Pacific Campus have been developed, a project-level environmental review would be conducted in accordance with CEQA requirements. At such time, the project-level impacts of the Pacific Campus development would be evaluated, and mitigation measures would be proposed, where appropriate.

Comment

(Paul Wermer, September 23, 2010) [PC-260 OTH]

"Good afternoon, Commissioners. My name is Paul Wermer and I am here tonight wearing hats of both Pacific Heights Residents Association and the CPMC Neighbors Coalition, which is a group that has worked with the Pacific site facility since 2002, on planning the new activities, as well as local operational issues. I will start by saying something new, which is that we do appreciate the outreach CPMC has just begun to our neighborhood, on plans for that site, so with luck, when the project level EIR for that activity comes forward, we won't have so much to bicker about. There is a lot of stuff here that's already been covered by other people, but I want to frame it a little bit differently."

Response OTH-99

The comment is noted. This comment does not raise issues regarding the adequacy, accuracy, or completeness of the Draft EIR. The comment will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project.

3.23.2.4 CALIFORNIA CAMPUS

No miscellaneous comments solely related to this campus were received during public review of the Draft EIR.

3.23.2.5 DAVIES CAMPUS

No miscellaneous comments solely related to this campus were received during public review of the Draft EIR.

3.23.2.6 ST. LUKE'S CAMPUS

Comment

(Alex Bernstein, August 4, 2010) [3-3 OTH]

"The fact is CPMC failed to retro-fit St. Lukes when it could have. Now, they want to erect a new hospital alongside the old one, placing their continuity of operation, a temporary issue, over the detriment the building would cause to our permanent quality of life.

Families' permanent quality of life should take priority over St. Luke's desire to stay open during its construction period.

The neighborhood's wishes make the most sense. Build the new hospital where the present, obsolete one stands.

These are my wishes, for the record. Thank you for giving me the chance to tell you this."

Response OTH-100

The comment states that CPMC did not retrofit the St. Luke's Campus previously and that now the proposed LRDP development at the St. Luke's Campus would negatively affect the permanent quality of life of the surrounding neighborhood. The comment also expresses a preference for building new hospital structures that directly replace the existing structures (i.e., on the site of former structures that would be demolished). It is assumed based on this comment that there is a concern related to the height and bulk of the proposed new structures. "Quality of life" is a broad, nonspecific term that generally refers to health and well-being; however, the comment's concerns regarding placement of structures implies concerns regarding visual character and shade and shadow. With respect to aesthetics, the proposed structures at the St. Luke's Campus under the LRDP would not be as tall as the existing on-campus hospital structure;

in addition, as noted on Draft EIR page 4.2-106, the proposed LRDP development would not substantially alter long-distance views in the area, and as noted on Draft EIR page 4.2-185, the development would not represent a substantial change in visual character. Furthermore, as shown in Draft EIR Figures 4.9-8 through 4.9-11 (pages 4.2-49 through 4.9-52), the proposed LRDP development at the St. Luke's Campus would incrementally increase shadows in the project area, but would not increase shadows at local public open space or nearby residences. As a result, no substantial changes in the level of shading in the local community are anticipated. Therefore, the aspects of quality life described in this comment would not be considered to be permanently negatively impacted by implementation of the proposed CPMC LRDP at St. Luke's Campus, as alluded to in this comment. This comment represents the commenter's opinion regarding the size and scale of development at the St. Luke's Campus but does not raise issues regarding the adequacy, accuracy, or completeness of the Draft EIR. The comment will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project.

Comment

(Margaret Kettunen Zegart, October 20, 2010) [97-12 OTH]

"**No project waivers** because present restrictions at St. Lukes and Cathedral Hill shall have many advantages - including shorter distances in seismic events and more circulation opportunities. The codes offer protection of ambiance of neighborhoods housing, opportunities and scale for a viable tourist/commuter VanNess to and along Lombard to Presideo/Marin's GGNRA, and Japan Town and the four worship centers."

Response OTH-101

The comment is noted. The comment states a preference that no variances or exemptions should be allowed under the San Francisco General Plan or Planning or Police Codes. This comment does not raise issues regarding the adequacy, accuracy, or completeness of the Draft EIR. The comment will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project.

Comment

(Rachel Sater—Lost Block and Save Our Streets, October 19, 2010) [101-1 OTH]

"We represent property owners and residents of a neighborhood located on the western end of the block currently occupied by St. Luke's Hospital, and west of the proposed St. Luke's Replacement Hospital. This neighborhood group, known as the Lost Block, along with the San Jose/Guerrero Coalition to Save Our Streets, submit the following comments on California Pacific Medical Center's ('CPMC') Long Range Development Plan ('LRDP') Draft Environmental Impact Report ('DEIR').

The Lost Block and the San Jose/Guerrero Neighborhood Coalition will be heavily impacted by the St. Luke's Campus proposal, both in the construction phase and after build-out. Unfortunately, the DEIR fails to adequately analyze potentially significant land use compatibility, plans and policies consistency, visual character, traffic, noise, light, wind, and shadow impacts, associated mitigation measures, and alternatives related to residential uses in the area of the Lost Block and surrounding neighborhood. As explained in the following comments, the additional evaluations and information necessary to collect these deficiencies and produce an adequate EIR would likely present new significant impacts and new mitigation measures requiring recirculation under CEQA in order to allow meaningful public disclosure and comment. The following analysis is organized by DEIR section."

Response OTH-102

This comment presents an introduction to the Lost Block and Save Our Streets comment letter and lists the sections of the Draft EIR in which it believes the document has inadequately analyzed potentially significant impacts on land use compatibility, consistency with plans and policies, visual character, traffic, noise, light, and wind and shadow; associated mitigation measures; and alternatives related to

residential uses in the area of the Lost Block. Lastly, the comment suggests that the additional analysis for the deficiencies in the CPMC LRDP Draft EIR would identify new impacts and new mitigation measures that would require recirculation of the EIR.

Please refer to Section 3.3.6 in Section 3.3, "Land Use and Planning," Responses LU-32 to LU-34 on pages C&R 3.3-151 to 3.3-156 of this C&R document, for specific comments and responses for Letter 101 regarding the consistency of the proposed St. Luke's Campus under then LRDP with existing plans and policies and land use compatibility. Please refer to Section 3.4.6 in Section 3.4, "Aesthetics," Responses AE-17 to AE-20 on pages C&R 3.4-28 to 3.4-31, for specific comments and responses from Letter 101 regarding the height, bulk, and architectural compatibility of the proposed St. Luke's Campus, the aesthetic impacts of the proposed St. Luke's Campus related to adjacent residences, the proposed St. Luke's Campus's landscape and streetscape, and the proposed campus's light and glare impacts. Please refer to Section 3.7, "Transportation and Circulation," Response TR-11 (page C&R 3.7-28), Response TR-74 (page C&R 3.7-143), Response TR-103 (page C&R 3.7-175), Response TR-106 (page C&R 3.7-185), and Response TR-110 (page C&R 3.7-193) for specific comments and responses from Letter 101 regarding transportation and circulation impacts. Please refer to Section 3.8, "Noise," Response NO-40 (page C&R 3.8-49), Response NO-59 (page C&R 3.8-64), and Responses NO-69 to NO-78 (pages C&R 3.8-74 to 3.8-82) for specific comments and responses from Letter 101 regarding noise impacts. Please refer to Section 3.11, "Wind and Shadow," Response WS-1 (page C&R 3.11-1) for specific comments and responses from Letter 101 regarding the significance thresholds used for wind and shadow in the Draft EIR. Also, please see Response ALT-1 (page C&R 3.22-11) regarding an alternative related to the residential uses surrounding St. Luke's Hospital. Please also see Response INTRO-6 (page C&R 3.1-11) for a discussion of the conditions under which recirculation of all or a portion of a Draft EIR is required.

Comment

(Bruce Hicks, September 23, 2010) [PC-288 OTH]

"My name is Bruce Hicks and I work at St. Luke's Hospital, but I am not a Nurse, and I noticed from listening to this that it's pretty clear that the Nurses don't support the project, at least they certainly don't support the downsizing of St. Luke's. Now, as CPMC seems to be desperate to provide evidence that some workers somewhere support this project, so we've been asked for our supervisors many times over the years to sign these little cards, or make some statement that we support the project and, of course, everybody wants to support their supervisor, they want to make their supervisors happy, but they still haven't gotten that many signatures. So, they found the SEIU, which is the top down run Union, run from Washington, D.C., to support them in this effort to try to provide evidence that there are some workers somewhere that support this project, but SEIU hasn't managed to come up with the presentations like the Nurses just did, they just have a few of the top leaders saying we support this, but not a whole line of people. So I want to tell you what happened to me. I was told there was a party across the hall and that they'd be serving punch and there would be a raffle, a drawing, and there would be cake and ice-cream and everything, so I took a break and went over, and they asked us to sign up for the raffle, so I signed up for the raffle. Well, guess what? I didn't look closely, there were a whole bunch of people signing up for this party, the fine print said when you signed up for this, that you are signing that you support this project. So, in other words, they are using all kinds of sneaky methods to try to pretend like they have workers supporting the project, but people who work at St. Luke's don't support it because they can see they're being downsized out of existence."

Response OTH-103

The comment is noted. This comment does not raise issues regarding the adequacy, accuracy, or completeness of the Draft EIR. The comment will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project. Please see Major Responses HC-1 and HC-2 regarding the downsizing of the St. Luke's Campus (pages C&R 3.23-1 and 3.23-8, respectively).

Comment

(Commissioner Antonini, September 23, 2010) [PC-351 OTH]

"There was a couple of mentions of some other things, the first is within the document they talk about a school of nursing that now exists at St. Luke's not part of the Cal Pacific ownership, it's actually Samuel Merritt School of Nursing, and it might be wise to encourage their continuance, even though, you know, because I know there are many people who want to get into Nursing today, many are forced to go out of San Francisco for their training, so where we can encourage that, I think it is a beneficial thing."

Response OTH-104

The comment is noted. This comment does not raise issues regarding the adequacy, accuracy, or completeness of the Draft EIR. The comment will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project. CPMC currently leases space in the Hartzell Building on the St. Luke's Campus to the Samuel Merritt School of Nursing. CPMC noted to the City that it is not aware of any plans for the nursing school to relocate and CPMC does not have plans to seek other tenants for that space.

Comment

(Commissioner Antonini, September 23, 2010) [PC-358 OTH]

"I also heard concerns from Japantown and those sorts of things. And finally, there was a little bit of mention about some kind of development agreement, and hopefully whatever needs to be done to assure that whatever is promised is actually done, then it should be done, in some ways it should be worked out."

Response OTH-105

The comment is noted. CPMC will be required to enter into a development agreement with the Lead Agency, San Francisco Planning Department, which will specify CPMC and City obligations for implementation and construction of the proposed LRDP. This comment does not raise issues regarding the adequacy, accuracy, or completeness of the Draft EIR. The comment may be considered by the decision-makers as part of their deliberations on the project.

4. DRAFT EIR TEXT CHANGES

This section presents text changes for the California Pacific Medical Center Long Range Development Plan Draft Environmental Impact Report. The text changes shown below reflect modifications/clarification to the Draft EIR, which were developed either in response to comments or were staff-initiated text changes to clarify information. The revisions are organized according to the type of text change that they represent (i.e., resulting from responses to comments versus staff-initiated) and by Draft EIR section. As in the responses in this C&R document, deleted text is shown in strikethrough and new text is shown in single underline. The text additions and revisions presented below clarify and expand on the information presented in the Draft EIR. The revised text does not identify mitigation measures that, if implemented, would result in significant environmental impacts. The revised text does not provide new information that identifies new significant environmental impacts. The revised text does not identify any considerably different alternatives and/or mitigation measures that would clearly lessen the significant environmental impacts of the proposed project, but which the project sponsors declined to adopt.

4.1 TEXT CHANGES AS A RESULT OF RESPONSES TO COMMENTS

4.1.1 GLOSSARY (WITHIN TABLE OF CONTENTS)

An additional term has been added to the Glossary in alphabetical order within the Table of Contents in the Draft EIR, page xxiii, as follows:

Term	Definition
maximally exposed individual receptor (MEIR)	The off-site location where the highest incremental cancer risk is calculated resulting from project construction or operational emissions. Incremental means the potential additional cancer risk posed by the proposed activities above the background cancer risk already present (e.g., breathing existing air pollutants).

4.1.2 EXECUTIVE SUMMARY

Conforming changes to the Summary Chapter related to text, impact determination, and mitigation measure revisions are noted throughout Chapter 4 under the appropriate environmental impact sections.

Mitigation Measure MM-TR-55 has been amended to revise the following bullet on page S-50 of the Draft EIR as shown below:

> Require consultation with other Agencies, including Muni/SFMTA and property owners on Cedar Street, to assist coordination of construction traffic management strategies as they relate to bus-only lanes and service delivery on Cedar Street. CPMC should proactively coordinate with these groups prior to developing their Plan to ensure the needs of the other users on the ~~Islands~~ blocks addressed within the construction TMP for the project.

4.1.3 PROJECT DESCRIPTION (CHAPTER 2)

The text in the Draft EIR, pp. 2-27 (last paragraph) to 2-28 (first paragraph) has been revised as follows to show that CPMC would attain LEED® certification for the proposed Cathedral Hill Hospital:

> CPMC ~~intends to~~ would attain at a minimum, a LEED® ~~certification~~Certified level for the proposed hospital building, which is exempt from Chapter 13C of the City's Building Code (San Francisco Green Building Requirements).

The text in the Draft EIR, p. 2-40 last two paragraphs have been revised as follows to show the updated construction hours at the proposed Cathedral Hill Hospital, MOB, and Van Ness Avenue pedestrian tunnel:

> The hours of construction for the proposed Cathedral Hill Hospital and Cathedral Hill MOB would be from 7 a.m. to ~~midnight~~ 7 p.m. on typical work days (Monday through Friday, excluding holidays). Saturday shifts would be from 7 a.m. to 5 p.m.; work is not expected to be done on Sundays. Work extending past 7 p.m. will be limited to activities such as: concrete finishing, steel detailing and general production preparation. Work extending past 7 p.m. would be communicated with the neighbors on a weekly basis. Second shift work (Work occurring between 4 p.m. and midnight) is anticipated on the project only during the interior build out phase.
>
> Construction of the Van Ness Avenue pedestrian tunnel generally would occur from 7 a.m. to 7 p.m. on typical working days (Monday through Friday, excluding holidays), ~~and not on Saturday and Sunday~~. Weekend shifts would be from 7 a.m. to 5 p.m. ~~However,~~ Nighttime construction of the tunnel would occur in the evenings (including weekends) ~~and on Saturdays~~ from 7 p.m. to 5 a.m., if permitted by Caltrans and the San Francisco Municipal Transit Agency (SFMTA). ~~During aboveground improvements and surface restoration phases, work would take place from 7 p.m. to 5 a.m.~~ to allow excavation of one lane of Van Ness Avenue at a time while traffic volumes are low. Two traffic lanes in one direction at a time would be closed periodically during evening hours to complete the pedestrian tunnel.

The text in the Draft EIR, page 2-140, first sentence of the first paragraph, has been revised as follows to clarify the updated existing bed count at the Davies Hospital North and South Towers:

> The Davies Campus is recognizable by the Davies Hospital North and South Towers. There are currently ~~201~~ 232 licensed beds in the Davies Hospital (North Tower and South Tower, combined) (Table 2-2, "CPMC Existing and Proposed LRDP Licensed Hospital Bed Uses," page 2-10).

The text in the Draft EIR, page 2-143, final two sentences in the second paragraph, has been revised as follows to show the updated bed count at the Davies Campus under the proposed CPMC LRDP. The existing licensed acute care beds and skilled nursing beds also have been updated to correct previous number error in the Draft EIR:

> The inpatient-care uses at the Davies Campus~~North Tower~~ under the LRDP would include ~~115~~ 63[38a] acute-care beds, and 48 rehabilitation beds in the North Tower, and 38 beds for skilled nursing in the South Tower ~~under the LRDP~~. This compares to the existing ~~150~~ 146 licensed acute care beds, 48 rehabilitation beds, and ~~79~~ 38 skilled nursing beds (see Table 2-2, "CPMC Existing and Proposed LRDP Licensed Hospital Bed Uses," page 2-10). The existing South Tower would continue to be used for skilled nursing, outpatient care, and diagnostic and treatment space.
>
> [38a] Bed number changed from 115 to 114 per footnote 2 in Table 2-2, above.

The text in the Draft EIR, p. 2-181 first paragraph has been revised as follows to show that CPMC would attain LEED® certification for the proposed St. Luke's Hospital:

> Additionally, CPMC ~~is considering implementing~~ would implement measures that ~~would~~ enable the St. Luke's Replacement Hospital to achieve, at a minimum, a LEED® ~~certification~~Certified level.

4.1.4 PLANS AND POLICIES (CHAPTER 3)

For clarification purposes, a new sentence and reference to Map 2 has been added on page 3-6:

> Map 4 of the Recreation and Open Space Element identifies existing public open space, and areas that would be desirable to acquire for or convert to public open space. Map 2 of the Recreation and Open Space Element identifies existing public open space and open space service areas.

The text in the Draft EIR, page 3-15, has been revised with the addition of the following text, added below the first paragraph under the heading, "Cathedral Hill Campus," to more completely address the requirements of the Van Ness Special Use District:

> Section 243 of the San Francisco Planning Code established the Van Ness Special Use District (SUD). As described in the municipal code, the purpose of the Van Ness SUD is to implement the objectives and policies of the Van Ness Avenue Plan, which includes:
>
> (i) creation of a mix of residential and commercial uses on the boulevard,
>
> (ii) preservation and enhancement of the pedestrian environment,
>
> (iii) encouragement of the retention and appropriate alteration of architecturally and historically significant and contributory buildings,
>
> (iv) conservation of the existing housing stock, and
>
> (v) enhancement of the visual and urban design quality of the street, the following controls are imposed in the Van Ness Special Use District.[1]
>
> [1] http://library.municode.com/index.aspx?clientId=14139&stateId=5&stateName=California
>
> The requirements of the Van Ness SUD include the provisions of the City Planning Code applicable to an RC-4 District, except as otherwise noted in Section 243, including:
>
> - Height and Bulk Restrictions. See Height and Bulk Map No. 2H. See Section 270 of the SF Municipal Code for bulk limits.
> - Basic Floor Area Ratio. The basic floor area ratio limit shall be 7.0 to 1 in the 130-foot height district and 4.5:1 in the 80-foot height district.
> - Demolitions. All demolitions of buildings containing residential use and all conversions from residential uses to nonresidential uses above the ground floor shall be permitted only if authorized as a conditional use under Section 303 of this Code.
> - Residential Uses; Ratio Established. In newly constructed structures, nonresidential uses shall only be permitted if the ratio between the amount of net additional occupied floor area for residential uses, as

defined in this paragraph below, to the amount of occupied floor area for nonresidential uses in excess of the occupied floor area of structures existing on the site at the time the project is approved is 3 to 1 or greater.

- Reduction of Ground Level Wind Currents. New buildings and additions to existing buildings shall be shaped, or other wind baffling measures shall be adopted, so that the development will not cause year-round ground level wind currents to exceed, more than 10 percent of the time, between 7:00 a.m. and 6:00 p.m., the comfort level of 11 m.p.h. equivalent wind speed in areas of pedestrian use and seven m.p.h. equivalent wind speed in public seating areas. An exception to this requirement may be permitted but only if and to the extent that the project sponsor demonstrates that the building or addition cannot be shaped or wind baffling measures cannot be adopted without unduly restricting the development potential of the building site in question.

Page 3-19, section 3.2.6, the following is added after the first full paragraph:

"Proposition M also amended sections 320 and 321 of the Planning Code. These two sections regulate the approval of office space in the City, setting an annual limit on the amount of qualifying office space that can be approved in buildings of 25,000 sf or greater."

Page 3-19, section 3.2.6, the following is added to the end of the second paragraph:

" The office space in the Cathedral Hill MOB and in the St. Luke's MOB/Expansion Building would need to be approved pursuant to the process established in Sections 320 and 321 of the Planning Code. Because the office space in the two medical office buildings would not be approved without the City's determination that the LRDP meets the requirements of those provisions, the proposed LRDP, if implemented, would be consistent with these elements of the Accountable Planning Initiative."

4.1.5 LAND USE AND PLANNING (CHAPTER 4.1)

The text in the Draft EIR, page 4.1-37, second bullet, has been revised as follows to read:

4b—conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including but not limited to the general plan, specific plan, local coastal program, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect; or

The text in the Draft EIR, page 4.1-46, Impact 4.1-2, has been revised as follows to read:

IMPACT LU-2 The project would not conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project adopted for the purpose of avoiding or mitigating an environmental effect. (Significance Criterion 4b)

The text in the Draft EIR, page 4.1-48, third full paragraph, has been revised as follows to read:

The amendments to the *General Plan's* VNAP and amendments to the Planning Code text and zoning and height and bulk district maps; the PUD and CU authorizations; and other approvals, as discussed above, are part of the proposed LRDP. ~~Therefore, i~~If they are approved by decision-makers, the proposed LRDP would be consistent with the applicable plans and policies. ~~The proposed LRDP at the Cathedral Hill Campus with the requested amendments and approvals would therefore not conflict with any applicable land use plan, policy, or regulation.~~ **This impact would be less than significant.**

The text in the Draft EIR, page 4.1-50, third complete sentence, has been revised as follows to read:

Therefore, the proposed near-term project at the Davies Campus would not conflict with any applicable land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect.

The text in the Draft EIR, page 4.1-51, last partial paragraph (and first partial paragraph on page 4.1-52), has been revised as follows to read:

The *General Plan* amendments and Planning Code text and map amendments, the PUD and CU authorizations, and other approvals described above are proposed as part of development at the St. Luke's Campus under the proposed LRDP. ~~Therefore, i~~If these amendments and authorizations are approved, the LRDP would be consistent with the relevant amended plans and policies~~,~~. The proposed arrangement and design of land uses would not implicate any environmental protection objectives of the current land use designations in the applicable land use plans; thus, the inconsistencies do not give rise to a significant impact on the environment. ~~and implementing the LRDP at the St. Luke's Campus would not conflict with any applicable land use plan, policy, or regulation.~~ **This impact would be less than significant.**

The text in the Draft EIR, page 4.1-51, the second full paragraph is revised to read:

The ~~proposed~~ draft *Mission District Streetscape Plan*, ~~currently in the planning stages~~ published for public review in October 2010, encompasses an area that includes the St. Luke's Campus.[1] The design framework of the proposed *Mission District Streetscape Plan* ~~does not~~ proposes ~~any improvements within~~ widened sidewalks and a new pocket park on the west side of Valencia Street between Cesar Chavez Street and Duncan Street, adjacent to the St. Luke's Campus.~~; however,~~ The *Streetscape Plan* also calls for a new pedestrian ~~it identifies a potential new public space and gateway~~ plaza at the intersection of Valencia and Mission Streets, one block southeast of the campus. All construction and demolition under the proposed LRDP would occur within the existing St. Luke's Campus. Implementing the LRDP would not alter the Valencia Street frontage and the southeastern corner of the St. Luke's Campus, which is closest to the new public space and gateway plaza proposed under the ~~*Mission District*~~ *Streetscape Plan*. No aspect of the proposed LRDP would conflict with the *Streetscape Plan's* provisions for improvements around the St. Luke's Campus. Furthermore, the proposed LRDP would create a "campus plaza," open space that would serve as an entrance between the St. Luke's Replacement Hospital and MOB/Expansion Building, creating a connection to the *Mission District Streetscape Plan's* streetscape improvements. CPMC is also working with the City to ensure consistency of the LRDP at the St. Luke's Campus with the open space and streetscape improvements underway on Valencia Street. Therefore, the proposed LRDP would not conflict with the ~~proposed~~ October 2010 Draft *Mission District Streetscape Plan's* ~~draft~~ policies encouraging the creation of improved streetscapes and public realm areas. Please refer to Section 4.5, "Transportation and Circulation," for a discussion of the proposed LRDP's street improvements and a discussion of pedestrian and bicycle access.

The text in the Draft EIR, page 4.1-54, has been revised with the addition of the following new text, added after the third sentence:

The proposed arrangement and design of land uses would not implicate any environmental protection objectives of the current land use designations in the applicable land use plans; thus, the text amendments and CU authorization do not give rise to a significant impact on the environment.

[1] San Francisco Planning Department. October 2010 ~~2009. Preliminary Mitigated Negative Declaration for the *Mission District Streetscape Plan*~~. San Francisco, CA. Available: http://www.sf-planning.org/ftp/CDG/CDG_mission_streetscape.htm ~~files/MEA/Final_042810_PMDSP_2PM.pdf.~~ Accessed ~~June 15~~, March 29, 2010.

4.1.6 AESTHETICS (CHAPTER 4.2)

The text in the Draft EIR, page 4.2-132, second sentence of first complete paragraph, has been revised as follows to read:

> The proposed hospital would also replace the less intricate, more uniform ~~and uninteresting~~ visual quality of the existing hotel facades with a greater variety of ~~more interesting~~ forms, patterns, color, and texture in a more contemporary architectural style.

The text in the Draft EIR, page 4.2-176, second paragraph, has been revised as follows to read:

> Along the western façade of the St. Luke's Replacement Hospital, an earth-tone colored block-form structure would form the northwest corner of the building. West-facing windows would be located ~~in the lower two stories~~ on the fourth and fifth floors facing Guerrero Street. The upper floors would be recessed from the northwest corner of the building. At its north end, a plain stucco wall with muted color would extend to the roof. Levels two and three would contain diagnostic and treatment rooms which, with few exceptions, would have no windows. Any windows proposed for these floors on the west side would have obscuring (frosted or translucent) glass or would have high sills (clerestory glazing) that cut off sight lines from all interior areas. Level one would be largely below grade along the west elevation and would have no windows. ~~The remainder of the façade would have long rows of individual rectangular (almost square) windows on a flat, light colored, plain glass reinforced concrete façade wall.~~ The long roofline would be level and straight. Most of the lower floors of the western façade would be located directly opposite the adjacent residential properties to the west, and thus would not be visible from the street. Only the upper floors would be visible.

4.1.7 CULTURAL AND PALEONTOLOGICAL RESOURCES (CHAPTER 4.4)

The text in the Draft EIR, page 4.4-31, the second full paragraph, has been revised as follows to better reflect the inclusion of the 2010 William Kostura historic resources survey in the Draft EIR analysis of project impacts, and also to clarify an erroneous characterization of the Van Ness Avenue Area Plan:

> The Van Ness Avenue Area Plan does not acknowledge any of the buildings on the proposed Cathedral Hill Campus referred to in this impact discussion as being historically significant as defined by CEQA ~~or contributing to the overall character of the area~~. The Van Ness Avenue corridor is characterized by remnant residential structures and distinctive automobile showrooms. The commercial buildings that also make up the streetscape are less significant because they tend to later be used for commercial infill. The ~~Planning Department also~~ Knapp Architects survey identified the area as a potential district composed of a cohesive group of commercial buildings associated with the reconstruction period following the 1906 San Francisco Earthquake and Fire. The Planning Department determined that the buildings on the site of the proposed Cathedral Hill Medical Office Building (MOB) did not retain sufficient integrity to qualify as a district. The Knapp Architects survey also identified a potential historic district on Van Ness Avenue, associated with trends in automotive history. However, this district was also found to not meet the CRHR criteria because of a lack of integrity.

The text of Mitigation Measure M-CP-N2, beginning on page 4.4-38 and on pages S-38 to S-42 of the Draft EIR, has been revised as follows to add a provision for notifying and involving the appropriate descendent representative organization in the event of a discovery of a potentially CRHR-eligible Overseas Chinese or Japanese archaeological deposit:

Chinese and Japanese Archaeological Sites. In the event of discovery of a potentially CRHR-eligible Overseas Chinese or Japanese archaeological deposit, the appropriate descendent representative organization, that is, the Chinese Historic Society of America or the National Japanese American Historical Society, shall be notified and shall be allowed the opportunity to monitor and advise further mitigation efforts, including archaeological identification, evaluation, interpretation, and public interpretive efforts.

4.1.8 TRANSPORTATION AND CIRCULATION (CHAPTER 4.5)

Draft EIR Table 4.5-6 on page 4.5-30 of the Draft EIR are revised to add a row and footnote as follows:

Table 4.5-6 (Revised)
Golden Gate Transit Lines in the Vicinity of the Proposed Cathedral Hill Campus—Existing Conditions

Route	Direction	Hours of Operation	Frequency of Service (average time between buses in minutes)	
			A.M.	P.M.
Route 10	Southbound	6:38 a.m.–7:47 p.m.	60	30–60
	Northbound	6:32 a.m.–8:27 p.m.	30–60	60
Route 70	Southbound	5:27 a.m.–9:01 p.m.	30–60	50–60
	Northbound	5:18 a.m.–1:55 a.m.	30–60	30–60
Route 73[3]	Southbound	4:59 a.m.–9:51 a.m.	45–60	–
	Northbound	2:58 p.m.–6:43 p.m.	–	30–60
Route 80[2]	Southbound	5:43 p.m.–9:56 p.m.	–	50-60
	Northbound	7:31 p.m.–11:31 p.m.	–	30-60
Route 93[1]	Southbound	7:10 a.m.–8:35 a.m.	10–15	–
	Northbound	4:07 p.m.–5:31 p.m.	–	30
Route 101[1]	Southbound	4:33 a.m.–7:14 p.m.	60	60
	Northbound	7:04 a.m.–8:38 p.m.		

Note:
[1] Route provides commuter service on weekdays only.
[2] Route provides commuter service on evenings and weekends only
[3] Since the issuance of the NOP, service on Route 73 has been discontinued, effective September 2010.
Source: Data provided by Golden Gate Transit and compiled by Fehr & Peers in 2009

The text in the Draft EIR, page 4.5-30, the last sentence in the first full paragraph has been revised to read as follows:

Golden Gate Transit is operated by the Golden Gate Bridge, Highway and Transportation District. GGT provides bus and ferry service between the North Bay (Marin and Sonoma Counties) and San Francisco. GGT operates 22 commuter bus routes, nine basic bus routes, and 16 ferry feeder bus routes into San Francisco. Basic bus routes operate at regular intervals of 15–90 minutes, depending on time and day of week. GGT also operates ferry service between Larkspur and Sausalito in the North Bay and the Ferry Building in San Francisco during the morning and evening commute periods. GGT operates five lines near the Cathedral Hill Campus. The closest stop is located at Van Ness Avenue and Geary Street. GGT Routes 10 and 92 also operate~~s~~ in the vicinity of the California Campus~~, and has~~; both routes have a stop at the intersection of Geary and Arguello Boulevards.

The text in the Draft EIR, page 4.5-75, first bullet point at the top of the page, has been revised to clarify that there would be a monthly parking fee for physicians and employees, as follows:

- a monthly parking fee charge of $110 ~~by~~for CPMC staff and physicians who drive ~~(although physicians receive free parking)~~;

Table 4.5-11 in the Draft EIR (page 4.5-77) has been revised as shown below to clarify transit trips:

Table 4.5-11
Net-New Peak-Hour Person Trips by Mode and Vehicle Trips by Campus [1]

	Person Trips by Mode					
Campus	Auto	Transit	Walk	Other 2	Total	Vehicle Trips
Cathedral Hill Campus						
a.m. peak hour	682	586	108	54	1,430	593
p.m. peak hour	689	551	107	50	1,399	609
Pacific Campus						
p.m. peak hour	114	37	27	20	198	71
Davies Campus						
p.m. peak hour	224	138	10	34	406	202
St. Luke's Campus						
p.m. peak hour	~~251~~223	~~39~~71	~~25~~23	~~6~~9	~~321~~326	207

Notes:
[1] The analysis does not assume any new travel demand at the California Campus because campus activities would remain unchanged until 2015, and would then be gradually relocated to the Pacific and Cathedral Hill Campuses. By 2020, almost all CPMC-related uses at the California Campus are expected to cease.
[2] "Other" includes bicycle, motorcycle and taxi trips.
Source: Data compiled by Adavant Consulting and Fehr & Peers in 2010

The text in the Draft EIR, page 4.5-77, last sentence prior to Table 4.5-11 is revised as follows:

> "At the St. Luke's Campus, about 71~~78~~ percent of trips would be by auto, 20~~12~~ percent would be by transit, and 9~~10~~ percent by walking, bicycling, and other modes."

The text in the Draft EIR, page 4.5-201, first paragraph under Impact TR-86 is revised as follows:

> "The St. Lukes Campus project would generate 71~~39~~ p.m. peak-hour net-new transit trips (13~~9~~ inbound and 58~~30~~ outbound), as shown in Table 4.5-11 (page 4.5-77)."

The text in the Draft EIR, page 4.5-204 of the Draft EIR is revised as follows:

> The St. Luke's Campus project would result in an increase in pedestrian activity in the vicinity of the campus, including walk trips to and from the proposed uses, plus walk trips to and from Muni bus stops and 24th Street BART Station. Overall, during the p.m. peak hour the project would add about 64 net-new pedestrian trips (an increase of 25 walk trips, and ~~39~~ 71 net-new trips that account for walk trips to and from the transit stops) to the surrounding streets (see Table 4.5-11, page 4.5-77).

The text in the Draft EIR, page 4.5-102 has been revised as follows to include the following the text and improvement measure related to Impact TR-5:

Although the impact of queuing (queue spillback) from the Cathedral Hill parking garages would be less than significant, implementation of Improvement Measure I-TR-5 below would further reduce the less-than-significant impact by specifying actions that would be required should queues form on adjacent streets.

Improvement Measure I-TR-5 – Off-Street Parking Queue Abatement

It shall be the responsibility of the owner/operator of any off-street parking facility primarily serving a non-residential use, as determined by the Planning Director, with more than 20 parking spaces (excluding loading and car-share spaces) to ensure that recurring vehicle queues do not occur on the public right-of-way. A vehicle queue is defined as one or more vehicles blocking any portion of any public street, alley or sidewalk for a consecutive period of three minutes or longer on a daily or weekly basis.

If a recurring queue occurs, the owner/operator of the parking facility shall employ abatement methods as needed to abate the queue. Suggested abatement methods include but are not limited to the following: redesign of facility layout to improve vehicle circulation and/or on-site queue capacity; employment of parking attendants; installation of LOT FULL signs with active management by parking attendants; use of valet parking or other space-efficient parking techniques; use of off-site parking facilities or shared parking with nearby uses; use of parking occupancy sensors and signage directing drivers to available spaces; travel demand management strategies such as additional bicycle parking, customer shuttles or delivery services; and/or parking demand management strategies such as parking time limits, paid parking or validated parking.

If the Planning Director, or his or her designee, suspects that a recurring queue is present, the Department shall notify the property owner in writing. Upon request, the owner/operator shall hire a qualified transportation consultant to evaluate the conditions at the site for no less than seven days. The consultant shall prepare a monitoring report to be submitted to the Department for review. If the Department determines that a recurring queue does exist, the facility owner/operator shall have 90 days from the date of the written determination to abate the queue.

Improvement Measure I-TR-40 on page 4.5-134 of the Draft EIR has been revised as follows:

Improvement Measure I-TR-40 Install Pedestrian Countdown Signals

As an improvement measure to facilitate pedestrian movements, SFMTA should install pedestrian countdown signals for all directions at the signalized intersections of Franklin/Sutter, Franklin/Post, Franklin/Geary, Van Ness/Sutter, Van Ness/Post, and Polk/Post.

In addition to the above, although the project would have less than significant impacts on the pedestrian and bicycle environment, the project sponsor has agreed as part of the development agreement negotiations to provide certain funding for City agencies, including Planning, SFMTA, and DPW to study and possibly implement additional streetscape, pedestrian, and related improvements in the vicinity of the proposed Cathedral Hill Campus that would improve the less-than-significant impacts to the pedestrian and bicycle

> environment. Improvements under consideration by the City would be consistent with those identified in the Little Saigon Report as well as other potential sidewalk improvements such as bulb-outs, lighting and pedestrian signal modifications, advance stop bars, right turn vehicle turn restrictions and other safety facilities, at such intersections as Polk Street/Ellis Street, Larkin Street /Geary Street, Larkin Street /Grove Street, Larkin Street /9th Street, Hyde Street /O'Farrell Street, and Leavenworth Street/Geary Street. The City would have sole authority to determine whether to proceed with the Tenderloin and Little Saigon neighborhood area improvements and to issue required permits and authorizations. The City would also retain the discretion to modify or select feasible alternatives to the improvements to avoid any identified impacts or concerns that arise in connection with their further review, including any required environmental review under CEQA.

Mitigation Measure MM-TR-55 in the Draft EIR, page 4.5-160 is amended to revise the following bullet list as shown below:

- Require consultation with other Agencies, including Muni/SFMTA and property owners on Cedar Street, to assist coordination of construction traffic management strategies as they relate to bus-only lanes and service delivery on Cedar Street. CPMC should proactively coordinate with these groups prior to developing their Plan to ensure the needs of the other users on the ~~Islands~~ blocks addressed within the construction TMP for the project.

4.1.9 NOISE (CHAPTER 4.6)

The text in the Draft EIR, page 4.6-27, the second sentence of the second full paragraph, has been amended to reflect the inclusion of residential uses along 27th Street and Cesar Chavez Avenue in the Draft EIR analysis:

> The noise- and vibration-sensitive land uses located near the campus are the surrounding residential buildings and units on San Jose Avenue and Cesar Chavez, 27th, Duncan, and Guerrero Streets.

Data in the Draft EIR, in Table 4.6-22 "Exposure of Sensitive Receptors near the Proposed Cathedral Hill Campus to Demolition/Excavation/Construction Noise," page 4.6-44, has been revised as follows to reflect a distance correction between source and receptor from 100 to 75 feet, as stated under Comment 71-11:

Table 4.6-22
Exposure of Sensitive Receptors near the Proposed Cathedral Hill Campus to Demolition/Excavation/Construction Noise

Sensitive Receptor	Existing Noise Level (dB, L_{eq})	Distance (feet)	Modeled Construction Noise Level (dB, L_{eq})	Exceeds Ambient (dB)
Geary Boulevard residences (across from hospital site)	70	**90**	**81**	+11
Hamilton Square Baptist Church	70	**80**	**82**	+12
1 Daniel Burnham Court (residential/mixed use)	68	~~**100**~~**75**	~~**81**~~**82**	+1~~3~~4
1142 Van Ness Avenue (Concordia Argonaut)	70	**50**	**87**	+17
1001 Polk Street (Episcopal Community Services- residential)	66	**75**	**83**	+17
990 Geary Avenue (Rex Arms Apartments)	70	150	77	+7
990 Polk Street (Senior Apartments)	65	190	75	+10
The Opal San Francisco Hotel—1050 Van Ness Avenue	70	**90**	**81**	+11
Super 8 Hotel—1015 Geary Street	70	**90**	**81**	+11
First Unitarian Church—1187 Franklin Street	72	180	75	+3

Note: dB = (A-weighted) decibels; L_{eq} = equivalent noise level (hourly)
Boldface indicates noise level in excess of 80 dB at 100 feet or less from the noise source.
Source: Data calculated by AECOM in 2010

Mitigation Measure M-NO-N1, beginning on Draft EIR page 4.6-46 and pages S-59 to S-61, has been revised as follows to provide additional clarifications for implementation of the measure and incorporate recommended measures under Comments 71-15 and 71-16, which would be feasible and assist the project with reducing noise complaints:

M-NO-N1a CPMC shall minimize the impacts of construction noise where feasible by implementing the measures listed below in accordance with the San Francisco Noise Control Ordinance. These measures shall be required in each contract agreed to between CPMC and a contractor under the LRDP and shall be applied to all projects and programs covered by th~~is~~e CPMC LRDP EIR.

- Construction equipment shall be properly maintained in accordance with manufacturers' specifications and shall be fitted with the best available noise suppression devices (e.g., mufflers, silencers, wraps). All hand-operated impact tools shall be shrouded or shielded, and all intake and exhaust ports on power equipment shall be muffled or shielded.

- Construction equipment shall not idle for extended periods (no more than 5 minutes) of time near noise-sensitive receptors.

- Stationary equipment (compressors, generators, and cement mixers) shall be located as far from sensitive receptors as feasible. Sound attenuating devices shall be placed adjacent to individual pieces of stationary source equipment located within 100 feet of sensitive receptors during noisy operations to prevent line-of-sight to such receptors , where feasible.

- Temporary barriers (noise blankets or wood paneling) shall be placed around the construction site parcels and, to the extent feasible, they should break the line of sight from noise sensitive receptors to construction activities. If the use of heavy construction equipment is occurring on-site within 110 feet of an adjacent sensitive receptor, the temporary barrier located between

source and sensitive receptor shall be no less than 10 feet in height. For all other distances greater than 110 feet from source to receptor, the temporary noise barrier shall be no less than 8 feet in height. For temporary sound blankets, the material shall be weather and abuse resistant, and shall exhibit superior hanging and tear strength with a surface weight of at least 1 pound per square foot. ~~Placement~~Procedures for the placement, orientation, size, and density of acoustical barriers shall be reviewed and approved by a qualified acoustical consultant.

- When temporary barrier units are joined together, the mating surfaces shall be flush with each other. Gaps between barrier units, and between the bottom edge of the barrier panels and the ground, shall be closed with material that would completely close the gaps, and would be dense enough to attenuate noise.

M-NO-N1b A community liaison shall be designated by CPMC. The community liaison shall be available to manage and respond to noise complaints from nearby sensitive receptors. The community liaison shall keep a log of all relevant and appropriate complaints and responses to those complaints through a website that can be accessed and viewed by the public. The log or a copy of the log shall also be available upon request to any affected citizen or their representative. The community liaison shall produce a weekly and six-week schedule of construction operations and shall provide this schedule in advance and upon request to any affected citizens or their representatives. Contact information for the community liaison shall be posted in a ~~conspicuous~~ location ~~so~~ that ~~it~~ is clearly visible to the nearby receptors most likely to be disturbed. The community liaison shall be responsible for ensuring that reoccurring noise complaints are evaluated by a qualified acoustical consultant to determine and implement appropriate noise control measures that would be taken to meet applicable standards. The community liaison shall contact nearby noise-sensitive receptors and shall advise them of the construction schedule.

M-NO-N1c A construction noise management plan shall be prepared by a qualified acoustical consultant. The noise management plan shall include, but shall not be limited to, the following tasks:

- A detailed evaluation of nighttime tunnel construction at noise-sensitive receptors shall be prepared. The evaluation shall include calculations of construction noise levels based on detailed information regarding construction methods and duration. If it is determined that construction noise levels would exceed City noise ordinance standards, a qualified acoustical consultant shall review and approve additional mitigation measures to minimize prolonged sleep disturbance (e.g., using acoustical treatments to existing buildings, such as upgraded weatherstripping, or determining the feasibility of constructing a cantilevered overhang along temporary barriers around the construction area to reduce construction noise levels at elevated receptors).

- Long-term (24-hour) and short-term (15-minute) noise measurements shall be conducted at ground level and elevated locations to represent the noise exposure of noise-sensitive receptors adjacent to the construction area. The measurements shall be conducted for at least 1 week during the onset of each of the following major phases of construction :demolition, excavation, and structural steel erection. Measurements shall be conducted during both daytime and nighttime hours of construction, with observations and recordings to document combined noise sources and maximum noise levels of individual pieces of equipment.

- If noise levels from construction activities are found to exceed City standards (daytime [80 dB at a distance of 100 feet] or nighttime [5 dB over ambient]) and result in complaints that are lodged with the community liaison, Aadditional noise mitigation measures shall be identified. These measures shall be prepared by the qualified acoustical consultant. These measures shall identify the noise level exceedance created by construction activities and identify the anticipated noise level reduction with implementation of mitigation. ~~provided if noise levels from construction~~

~~activities are found to exceed City standards and result in complaints that are lodged with the community liaison.~~ These measures may include, among other things, additional temporary noise barriers at either the source or the receptor; operational restrictions on construction hours or on heavy construction equipment where feasible; temporary enclosures to shield receptors from the continuous engine noise of delivery trucks during offloads (e.g., concrete pump trucks during foundation work); or lining temporary noise barriers with sound absorbing materials. Measures such as these have been demonstrated to be effective in keeping construction noise levels within 80 dB at a distance of 100 feet.

Data in the Draft EIR, in Table 4.6-24 "Exposure of Sensitive Receptors near the St. Luke's Campus to Construction Noise," page 4.6-52, and in Table 4.6-35 "Modeled Vibration Levels Resulting from Near-Term LRDP-Related On-Campus Demolition Activities-Cathedral Hill, Davies, and St. Luke's Campuses," page 4.6-92, has been revised as follows to clarify the appropriate block number of residents located along Duncan Street, as stated under Comment 88-1 NO:

Table 4.6-24
Exposure of Sensitive Receptors near the St. Luke's Campus to Construction Noise

Sensitive Receptor	Existing Noise Level (dB)	Distance (feet)	Modeled Construction Noise Level (dB, L_{eq})	Exceeds Ambient (dB)
On-site sensitive receptors (patients, staff)	65	170	76	+11
1450–1600 blocks of Guerrero Street	70	**65**	**84**	+14
3400–3700 blocks of Cesar Chavez	70	175	76	+6
~~1600–1700~~0-100 block of Duncan Street	62	380	69	+7
578–643 blocks of San Jose Avenue	62	**100**	**81**	+19
000–100 blocks of 27th Street	63	125	76	+11

Notes: dB = (A-weighted) decibels; L_{eq} = equivalent noise level (hourly)
Boldface indicates noise level in excess of 80 dB at 100 feet or less from the noise source.

[2] Where L_v is the root mean square velocity expressed in VdB, assuming a crest factor of 4.
[3] Thresholds recommended for human annoyance and structural damage by the Federal Highway Administration and California Department of Transportation.
Source: Data compiled by AECOM in 2010

The text in the Draft EIR, page 4.6-52, first paragraph, has been revised as follows to clarify proposed construction hours at the St. Luke's Campus, as stated under Comment 101-31:

> The proposed St. Luke's Replacement Hospital would be completed and occupied by 2015. As stated above, the loudest construction noise would occur during excavation, land preparation, and demolition. Demolition would include removal of trees and pavement at the existing parking lot. Excavation of a pit for the hospital foundation and lower floor would follow and include removal of 15,200 cubic yards of material. About 7,800 cubic yards of soils would be excavated and hauled away for the utilities. Thus, the loudest noise during construction of the St. Luke's Replacement Hospital would occur in the first 20 months. The next phases of activities (structural work, exterior finishing, and interior finishing) would occur for 32 months, and would have lower noise levels, because activities would be shielded by the structure and use of heavy-duty construction equipment would be limited. Demolition of the existing St. Luke's Hospital tower would occur during the last 5 months.

All construction work for the proposed St. Luke's Replacement Hospital is proposed to occur between 7 a.m. and 5 p.m., Monday–Friday, excluding holidays~~. Work may continue to 8 p.m. on typical work days and select Saturdays, as required. Saturday shifts would be from 7 a.m. to 5 p.m., if needed.~~ Construction may also occur on select Saturdays from 7 a.m. to 5 p.m., if needed. Work is not expected to be done on Sundays. The hours of operation would vary slightly during the project's various stages. Construction of the MOB/Expansion Building would begin after the St. Luke's Replacement Hospital construction is completed. Excavation for the MOB/Expansion Building would be much deeper than that for the St. Luke's Replacement Hospital, with removal of 42,000 cubic yards of soil.

The text in the Draft EIR, page 4.6-70, last sentence of the last paragraph on the page, has been amended to include the following clarification of potential siren noise levels in the vicinity of the proposed Cathedral Hill campus, as requested under Comment 87-60:

As a result, noise associated with the ambulance entrance/exit, without the use of sirens, would comply with the City's noise limit of 8 dB above the ambient noise level at the property line.~~; however, such noise could result in a substantial increase in ambient noise levels at nearby sensitive receptors, above existing levels with the frequent use of sirens.~~ With respect to siren noise and as stated above, ambulances accessing the proposed Cathedral Hill Campus could require the use of their sirens. The use of emergency sirens could cause a temporary elevation of ambient noise levels up to 106 dB on an intermittent basis at nearby noise-sensitive land uses adjacent to the ambulance route. Emergency services are prevalent throughout the City under existing conditions, and the use of sirens is a common element of the urban noise environment in the City of San Francisco, including the neighborhoods around the site of the proposed Cathedral Hill Campus, and is considered a necessary part of negotiating traffic congestion on local roadways when responding to public needs within an urban environment within appropriate emergency response times. It should be noted that the proposed CPMC LRDP is not anticipated to increase the total number of emergency transport requests within the City, as those are driven by the location of San Francisco residents and businesses, and not the location or availability of emergency facilities.

Only 702 (4.5 percent) of the total emergency calls for service (15,610) to all CPMC facilities or fewer than two per day (1.7) between January 2008 and February 2009 were Code 3 responses, which necessitate the use of sirens, per the SFFD records. Under the proposed CPMC LRDP, the proposed Cathedral Hill Campus would accept the emergency transports currently directed to the Pacific and California Campuses. Based on the projected emergency medical service needs associated with the proposed Cathedral Hill Campus, the number of Code 3 emergency transports which require the use of a siren would average less than 1.5 Code 3 transports per day or 535 annual Code 3 transports. This calculation reflects a high-end estimate of the total number of emergency transports (9,562) projected for the proposed Cathedral Hill Campus in 2015. Assuming that the highest percentage (5.6 percent) shown in C&R Table Noise Response 3.8-2 of this total would consist of Code 3 emergency transports, up to 535 Code 3 transports could reasonably be anticipated on an annual basis with operation of the proposed Cathedral Hill Campus.

Assuming that a receptor in the vicinity of the proposed Cathedral Hill Campus would experience siren-related noise for no more than 15 seconds per emergency transport, L_{dn} noise levels would experience less than a 0.1-dBA increase, and hourly L_{eq} would experience an increase of up to approximately 0.4 dBA, as shown in Table 4.6-30. These estimates are based on the hourly L_{eq} values obtained at Site B on Post Street during noise monitoring. Furthermore, the estimates provided above represent the greatest potential change in hourly L_{eq} by evaluating siren noise during the quietest observed hourly period in the vicinity of the proposed Cathedral Hill campus (59.1 dBA L_{eq}).

Table 4.6-30
Change in Ambient Noise Levels Associated with Siren Usage in Cathedral Hill Campus Area

	L_{eq}	L_{dn}
Existing[1]	59.1	70.3
With Project	59.5	70.3
Change	*0.4*	*< 0.1*
Significant Impact	No	No

Notes:
[1] Lowest measured hourly L_{eq} was used to allow for the greatest potential change in hourly L_{eq} as a result of a 30-second siren event. Noise measurements taken on May 29, 2009.

As noted above, the proposed LRDP would add approximately one emergency vehicle travelling under siren and lights (Code 3) per 24-hour day, of which nighttime events would average fewer than one per three nights. While the proposed LRDP would represent an increase in the annual frequency of events in the vicinity of the proposed Cathedral Hill campus, the level of siren-related noise that would be experienced by sensitive receptors located in the vicinity of the proposed Cathedral Hill Campus would not be distinguishable from the level of urban noise in the project vicinity.

Furthermore, as noted on page 4.6-17 above, it is common for ambulances to discontinue the use of their sirens within a few blocks of emergency access at other hospitals within the City of San Francisco. This is dependent on traffic flow and other factors, and such practice could reasonably be assumed to occur at the proposed Cathedral Hill Campus. As such, in consideration of the potential change in ambient noise levels, the frequency of emergency transports that could occur, and historic practice by ambulance service providers in the City, impacts would be considered less than significant.

The text in the Draft EIR, page 4.6-71 and S-61, second and fourth sentences under Mitigation Measure M-NO-N3a, has been revised to clarify requirements for exterior equipment complying with noise level standards, as stated under Comment 71-44:

> If exterior equipment meets daytime and nighttime sound-level standards, no further action is required. If exterior equipment does not meet sound-level standards, CPMC shall replace and/or redesign the exterior equipment to meet the City's noise standards. Results of the measurements shall be provided to Hospital Facilities Management/ Engineering and the City to show compliance with daytime and nighttime standards.

Mitigation Measure M-NO-N3b, on Draft EIR pages 4.6-71 and S-61, has been revised as follows to provide additional clarifications for implementation of the measure:

> M-NO-N3b Bay doors shall be required to be closed during Aduromed operations, to the extent feasible.

Mitigation Measure M-NO-N3c, on Draft EIR pages 4.6-71 and S-61, has been revised as follows to provide additional clarifications for implementation of the measure:

> M-NO-N3c In the event that it is determined to be infeasible for bay doors to be closed ~~If bay doors are open~~ during Aduromed operation, a noise-absorptive material shall be applied (prior to initiation of Aduromed operations with open bay doors) to the entire ceiling structure of the loading-dock area to reduce noise levels from Aduromed operations. The material shall have a minimum Noise Reduction Coefficient of 0.75.

The text in the Draft EIR, page 4.6-91, has been amended to include the following sentences at the bottom of the page, immediately preceding the last sentence on the page:

> Furthermore, as shown in Table 4.6-35 (page 4.6-92), construction-related vibration could exceed 65 VdB, which, as stated previously, could affect the operation of certain types of sensitive equipment, including medical equipment. Nearby land uses that may include potential vibration-sensitive medical equipment include 1 Daniel Burnham Court adjacent to the proposed Cathedral Hill Campus.

The text in the Draft EIR, pages 4.6-93 and S-62 to S-63, under Mitigation Measure M-NO-N5, has been revised with the addition of a third bullet point as follows to address concerns stated under Comment 71-48:

- As part of the vibration management plan, vibration levels shall be monitored at the nearest interior location of adjacent [medical uses] containing vibration-sensitive equipment, to monitor potential impacts from the project site. In the event that measured vibration levels exceed 65 VdB and would disturb the operation of sensitive medical equipment, additional measures shall be implemented to the extent necessary and feasible, including provision of notice to medical tenants in order to coordinate the timing of construction activities showing vibration levels above 65 VdB, possible temporary relocation of medical tenants with sensitive equipment, and/or installation of isolation equipment.

The text in the Draft EIR on page 4.6-95 has been amended to include the following text within the first full paragraph on page 4.6-95 of the Draft EIR:

> Predicted groundborne noise and vibration levels would range from 77 to 94 VdB, and up to 0.210 in/sec PPV, at the Pacific Campus and would range from 58 to 79 VdB, and up to 0.037 in/sec PPV, at the Davies Campus. As a result, for both campuses, attenuated vibration-inducing construction activities at the locations of on-site and off-site sensitive receptors would not exceed Caltrans's building damage threshold of 0.25 in/sec PPV. However, predicted groundborne noise and vibration levels would exceed FTA's standard for human response (i.e., annoyance) at nearby on-site and off-site vibration-sensitive uses. Furthermore, as shown in Table 4.6-36 (page 4.6-95), construction-related vibration could exceed 65 VdB, which, as stated previously, could affect the operation of certain types of sensitive equipment, including medical equipment. Nearby land uses that may include potential vibration-sensitive medical equipment include the University of the Pacific School of Dentistry adjacent to the Pacific Campus. Therefore, this **impact would be significant**.

4.1.10 AIR QUALITY (CHAPTER 4.7)

The text in the Draft EIR, pages 4.7-35 and S-65, under Mitigation Measure M-AQ-N2, has been amended to reflect the addition of a second, third, and fourth bullet point as follows to provide additional clarifications regarding the timing/use of accelerated emission control devices on construction equipment:

> **M-AQ-N2** Install Accelerated Emission Control Device on Construction Equipment.
>
> To reduce risk associated with exhaust emissions of DPM by construction equipment during construction of the Cathedral Hill Campus and all other LRDP sites, CPMC and its construction contractor shall implement the following BAAQMD-recommended control measures during construction:

- ~~Implement Accelerated Emission Control Device Installation on Construction Equipment. To minimize the potential impacts on residents living near the CPMC campuses from the construction activities in that area, CPMC shall make reasonable efforts to ensure that all construction equipment used at these campuses would use equipment that meets the EPA Tier 4 engine standards for PM and NOX control (or equivalent) throughout the entire duration of construction activities, to the extent that equipment meeting the EPA Tier 4 engine standards is available to the contractor at the time construction activities requiring the use of such equipment occur.~~
- Where sufficient electricity is available from the PG&E power grid, electric power shall be supplied by a temporary power connection to the grid, provided by PG&E. Where sufficient electricity to meet short-term electrical power needs for specialized equipment is not available from the PG&E power grid, non-diesel or diesel generators with Tier 4 engines (or equivalent) shall be used.
- During any construction phase for near-term projects, at least half of each of the following equipment types shall be equipped with Level 3-verified diesel emission controls (VDECs): backhoes, concrete boom pumps, concrete trailer pumps, concrete placing booms, dozers, excavators, shoring drill rigs, soil mix drill rigs, and soldier pile rigs. If only one unit of the above equipment types is required, that unit shall have Level 3 VDECs retrofits.
- For long-term projects, which are presumed to begin when Tier 4 equipment would be widely available, all diesel equipment of all types shall meet Tier 4 standards.

The data in the Draft EIR, page 4.7-39, Table 4.7-6, "Emissions of Criteria Air Pollutants and Precursors Attributable to Operations under the LRDP – Modeled Daily Net Changes from Existing Conditions," have been revised as follows to accurately reflect particulate emissions from stationary source equipment:

Table 4.7-6

Notes: BAAQMD = Bay Area Air Quality Management District; lb/day = pounds per day; NA = not applicable; NO_X = oxides of nitrogen; PM_{10} = respirable particulate matter with an aerodynamic diameter of 10 micrometers or less; $PM_{2.5}$ = fine particulate matter with an aerodynamic diameter of 2.5 micrometers or less; ROG = reactive organic gases.

[a] Area and Mobile source emissions modeled using the URBEMIS 2007 (Version 9.2.4) computer model, based on proposed land uses identified in Chapter 2, "Project Description," and trip generation rates obtained from the traffic analysis in Section 4.5, "Transportation and Circulation," of this EIR.

[b] Negative values indicate a net reduction in emissions compared to existing conditions.

[c] Totals may not add exactly because of rounding.

[d] No new stationary sources are planned for Pacific Campus.

[e] $PM_{2.5}$ emissions are compared against proposed significance thresholds under Impact AQ-11.

Source: Area and mobile source emissions modeled by AECOM in 2010; stationary source emissions modeled by ENVIRON 2009–1~~0~~1. Information on these calculations is on file with the San Francisco Planning Department, 1650 Mission Street, Suite 400, San Francisco 94103, and is available for public review as part of the project file, in Case No. 2005.0555E

The text in the Draft EIR, beginning at the bottom of page 4.7-38, has been revised as follows to accurately reflect particulate emissions from stationary source equipment:

> As shown in Table 4.7-6, "Emissions of Criteria Air Pollutants and Precursors Attributable to Operations under the LRDP—Modeled Daily Net Changes from Existing Conditions" (page 4.7-39), and Table 4.7-7, "Emissions of Criteria Air Pollutants and Precursors Attributable to Operation of Projects under the LRDP—Modeled Annual Net Changes from Existing Conditions" (page 4.7-40) the net change in operational PM_{10} emissions from implementation of projects under the CPMC LRDP (~~119~~128 pounds/day, ~~2~~23 tons/year) would exceed BAAQMD's applicable daily and annual emission significance criteria (80 pounds/day, 15 tons/year).

The data in the Draft EIR, page 4.7-40, Table 4.7-7, "Emissions of Criteria Air Pollutants and Precursors Attributable to Operations under the LRDP – Modeled Annual Net Changes from Existing Conditions," have been revised as follows to accurately reflect particulate emissions from stationary source equipment:

[a] Area and mobile source missions modeled using the URBEMIS 2007 (Version 9.2.4) computer model, based on proposed land uses identified in Chapter 2, "Project Description," and trip generation rates obtained from the traffic analysis in Section 4.5, "Transportation and Circulation," of this EIR. Stationary source emissions

[b] Negative values indicate a net reduction in emissions compared to existing conditions.

[c] Totals may not add exactly because of rounding.

[d] No new stationary sources are planned for Pacific Campus.

[e] $PM_{2.5}$ emissions are compared against proposed significance thresholds under Impact AQ-11.

Source: Area and mobile source emissions modeled by AECOM in 2010; stationary source emissions modeled by ENVIRON 2009-1~~0~~1. Information on these calculations is on file with the San Francisco Planning Department, 1650 Mission Street, Suite 400, San Francisco 94103, and is available for public review as part of the project file, in Case No. 2005.0555E

The text in the Draft EIR, page 4.7-41, first paragraph, has been revised as follows to accurately reflect particulate emissions from stationary source equipment:

> Net Changes from Existing Conditions" (page 4.7-40) the net change in operational PM_{10} emissions from implementation of projects under the CPMC LRDP (~~119~~128 pounds/day, ~~22~~23 tons/year) would exceed BAAQMD's applicable daily and annual emission significance criteria (80 pounds/day, 15 tons/year). No feasible mitigation is available to reduce this impact to less than significant. Therefore, operation of proposed LRDP projects would result in or contribute to a violation of air quality standards. Thus, under the applicable (1999) BAAQMD CEQA significance criteria, no feasible mitigation is available to reduce this impact to a less-than-significant level and **this impact would be significant and unavoidable**.

The first sentence of the second paragraph on Draft EIR page 4.7-72, has been revised as follows to accurately reflect particulate emissions from stationary source equipment:

> Based on the emissions summary shown previously in Table 4.7-6, "Emissions of Criteria Air Pollutants and Precursors Attributable to Operations under the LRDP—Modeled Daily Net Changes from Existing Conditions" (page 4.7-39), and Table 4.7-7, "Emissions of Criteria Air Pollutants and Precursors Attributable to Operation of Projects under the LRDP—Modeled Annual Net Changes from Existing Conditions" (page 4.7-40), both under Impact AQ-3, the net change in operational PM_{10} emissions from implementation of projects under the CPMC LRDP (1~~19~~128 pounds/day, ~~22~~3 tons/year) would exceed BAAQMD's applicable daily and annual emission significance criteria (82 pounds/day, 15 tons/year).

The first sentence of the second paragraph on Draft EIR page 4.7-74, has been revised as follows to accurately reflect particulate emissions from generators at the Cathedral Hill Campus:

$PM_{2.5}$ from diesel generators: Impact AQ-5 presented screening-level air dispersion modeling for emissions from four emergency diesel generators at the Cathedral Hill Campus, which estimated a maximum DPM (using $PM_{2.5}$) incremental concentration of ~~0.02~~0.001 µg/m^3.

The first sentence of the first paragraph on Draft EIR page 4.7-76, has been revised as follows to accurately reflect particulate emissions from generators at the Davies Campus:

$PM_{2.5}$ from diesel generators: Impact AQ-5 presented screening-level air dispersion modeling for emissions from an emergency diesel generator at the Davies Campus, which estimated a maximum $PM_{2.5}$ incremental concentration of ~~0.008~~0.016 µg/m^3.

The first sentence of the fifth paragraph on Draft EIR page 4.7-76, has been revised as follows to accurately reflect particulate emissions from generators at the St. Luke's Campus:

$PM_{2.5}$ from diesel generators: As discussed under Impact AQ-5, the net incremental emissions from diesel generators are below the trigger threshold for air toxics. As described above, emissions from the Davies Campus generator (which did exceed the threshold) produced $PM_{2.5}$ concentrations on the order of ~~0.008~~0.016 µg/m^3.

4.1.11 GREENHOUSE GAS EMISSIONS (CHAPTER 4.8)

The text in the Draft EIR, page 4.8-17, fourth bullet point has been deleted to clarify proposed project design features that could yield further GHG emission savings as part of the CPMC LRDP, as follows:

- ~~*Diversion of cooling tower water from wastewater treatment:* The efficient design of the Cathedral Hill Hospital's cooling tower system would prevent approximately 98% of total cooling tower water from requiring wastewater treatment. The volume of cooling tower water requiring treatment was not available to quantify the GHG impacts of this feature.~~

The text in the Draft EIR, page 4.8-21, under Impact GH-1, has been revised as follows because it was incorrectly labeled to refer to the 1999 BAAQMD Guidelines versus the State CEQA Guidelines, although it was described correctly in the Draft EIR text:

IMPACT GH-1 Direct and indirect CPMC LRDP-generated GHG emissions would not have a significant impact on the environment, nor would they conflict with an applicable plan, policy or regulation adopted for the purpose of reducing GHG emissions (State CEQA ~~1999 BAAQMD~~ Guidelines, Appendix G). (Significance Criteria 8a and 8b).

The text in the Draft EIR, pages 4.8-31 and 4.8-32, under Impact GH-3, has been revised as follows, following MEA's approval of the CPMC LRDP GHG Compliance Checklist:

IMPACT GH-3 Direct and indirect CPMC LRDP–generated GHG emissions would have a significant impact on the environment or conflict with an applicable plan, policy, or

regulation adopted for the purpose of reducing GHG emissions (~~Recently adopted~~2010 BAAQMD Guidelines). (Significance Criteria 8a and 8b)"

Levels of significance:

Cathedral Hill: Significant and unavoidable
Pacific: Significant and unavoidable
Davies (near term and long term): Significant and unavoidable
St. Luke's: Significant and unavoidable

Near-Term Projects and Long-Term Projects

All Campuses Except California Campus

As described previously, the proposed LRDP would be required to comply with San Francisco's GHG Reduction Strategy, which would reduce operational GHG emissions. Given that the City's GHG Reduction Strategy adopts numerous GHG reduction strategies recommended in the *Climate Change Scoping Plan*; that it includes binding, enforceable measures to be applied to development projects; and that the strategy has produced measurable reductions in GHG emissions, the proposed LRDP would be consistent with state and local GHG reduction strategies. In addition, the proposed LRDP would not conflict with any plans, policies, or regulations adopted for the purpose of reducing GHG emissions.

The BAAQMD has identified the following three alternative thresholds for determining whether a project's GHG emissions are significant:

1) Compliance with a Qualified Greenhouse Gas Reduction Strategy; or
2) Whether a project's GHG emissions exceed 1,100 metric tons of carbon dioxide equivalents ($MTCO_2e$); or
3) Whether a project's GHG emissions exceed 4.6 $MTCO_2e$ per service population.

A lead agency may choose the threshold against which to analyze a project in order to determine the significance of a project's GHG emission impacts; however, BAAQMD encourages lead agencies to prepare a Qualified GHG Reduction Strategy and then to use Threshold #1, above, as the standard of significance for GHG emissions.[43] Thus, on August 12, 2010, the San Francisco Planning Department submitted a draft of the *City and County of San Francisco's Strategies to Address Greenhouse Gas Emissions* to BAAQMD. This document presents a comprehensive assessment of policies, programs, and ordinances that collectively represent San Francisco's Qualified GHG Reduction Strategy. The BAAQMD reviewed San Francisco's GHG reduction strategy and concluded that the strategy meets the criteria for a Qualified GHG Reduction Strategy as outlined in BAAQMD's 2010 CEQA Guidelines.[44] Therefore, projects that are determined to be consistent with San Francisco's GHG reduction strategy would result in a less-than-significant GHG emissions impact.

As shown in Table 4.8-2, the proposed LRDP's net operational GHG emissions would be approximately 22,503 $MTCO_2e$/yr, which exceeds BAAQMD's recently adopted second alternative GHG emissions threshold of 1,100 $MTCO_2e$/yr. In addition, a net increase in SP of nearly 3,819 full-time or full-time equivalent employees (i.e., the average number of employees and volunteers on a given work day) would result in a GHG-efficiency value of 5.9 $MTCO_2e$/SP/yr. Therefore, the proposed LRDP would exceed BAAQMD's recently adopted third alternative GHG emissions threshold of 4.6 $MTCO_2e$/SP/yr for project-level analysis.

As noted in this section, several sustainability attributes that would serve to reduce GHGs were not accounted for in the calculation of operational GHG emissions, because of the unavailability of sufficient methodologies to accurately account for associated GHG emission reductions. In order to facilitate a determination of project compliance with San Francisco's GHG reduction strategy, in November 2010 the San Francisco Planning Department Environmental Planning division released a Greenhouse Gas Analysis Compliance Checklist that is required to be completed for each proposed project. Thus, a checklist breaking down LRDP compliance by building for near-term projects has been completed. Based on the CPMC LRDP GHG Compliance Checklist, on December 14, 2010 Environmental Planning determined that the proposed CPMC LRDP would be in compliance with the City's Qualified GHG Reduction Strategy (see CPMC LRDP GHG Compliance Checklist included as C&R Appendix D).[45] Because it has been determined to be consistent with the BAAQMD-approved GHG Reduction Strategy, the proposed LRDP has been shown to satisfy BAAQMD's mitigation guidance and to have identified all applicable, feasible mitigation measures. ~~The proposed LRDP would be above BAAQMD's recently adopted GHG efficiency criterion of 4.6 $MTCO_2e$/SP/yr for project-level analysis.~~ However, the Planning Department has determined that because the significance conclusion in the CPMC LRDP Draft EIR regarding operational greenhouse gas emissions was made prior to a determination of equivalency with a qualified GHG reduction strategy, and the LRDP would exceed the 2010 BAAQMD GHG quantitative threshold of significance (which the Planning Department determined applied), the proposed LRDP should conservatively be considered to result in a significant and unavoidable impact, despite the determination that the proposed LRDP would be consistent with the BAAQMD-approved GHG Reduction Strategy. Therefore, **this impact would be significant and unavoidable**.

~~Although this proposed LRDP exceeds the efficiency metric of 4.6 $MTCO_2e$/SP/yr, additional factors were considered. First, it was not clear whether the BAAQMD efficiency metric applies to facilities such as hotels and hospitals, whose large numbers of visitors are not included in the service population (which includes employees and residents only). Second, as noted in this section, several sustainability attributes would serve to reduce GHGs that were not accounted for because of the unavailability of sufficient methodologies to accurately account associated GHG emission reductions.~~

~~It is not likely that additional increases in the energy savings and sustainability goals would be able to reduce emissions below BAAQMD's significance criteria. Accordingly, **this impact would remain significant and unavoidable, based on BAAQMD's recently adopted GHG thresholds.**~~

4.1.12 RECREATION (CHAPTER 4.10)

The text in the Draft EIR, page 4.10-42, last sentence of the first paragraph and first sentence in the second paragraph, have been revised as follows to accurately reflect the outdoor courtyard at the Cathedral Hill Hospital would be a private space:

The near-term projects under the LRDP include the addition of privately owned, publicly accessible open space at the proposed ~~Cathedral Hill,~~ Davies~~,~~ and St. Luke's Campuses.

A privately owned~~, publicly accessible~~ outdoor courtyard (approximately 6,600 sq. ft.) would be located on the podium component of the Cathedral Hill Hospital, with access from Level 5 (Figure 2-21, "Cathedral Hill Hospital—Level 5," page 2-81).

4.1.13 UTILITIES AND SERVICE SYSTEMS (CHAPTER 4.12)

The text in the Draft EIR, page 4.12-19, following the San Francisco Mandatory Recycling and Composting Ordinance No. 100-09 paragraph, has been revised with the addition as follows to reflect adoption into law:

Commercial Water Conservation Ordinance No. 77-09

Effective July 1, 2009, the City of San Francisco passed the Commercial Water Conservation Ordinance (No. 77-09) updating building code guidelines to retrofit all commercial properties with water-efficient plumbing fixtures. Commercial properties must be retrofitted when undergoing certain tenant improvements, but not later than January, 1 2017. The new ordinances are expected to save San Francisco up to 4 million gallons a day by 2017. The new conservation ordinances establish the following guidelines for commercial properties:

1. All showerheads have a maximum flow of 2.5 gallons per minute (gpm)
2. All showers have no more than one showerhead per valve
3. All faucets and faucet aerators have a maximum flow rate of 2.2 gpm
4. All Water Closets (toilets) have a maximum rated water consumption of 1.6 gallons per flush (gpf)
5. All urinals have a maximum flow rate of 1.0 gpf
6. All water leaks have been repaired

Compliance with San Francisco's water conservation ordinances must be completed through the San Francisco Department of Building Inspection (DBI).

Proposed Water Efficient Irrigation Ordinance

The San Francisco Public Utilities Commission (SFPUC) is proposing a water efficient irrigation ordinance to bring the City into compliance with state law AB 1881, the Water Conservation in Landscaping Act. The ordinance would require all property owners with landscaping projects over 1,000 square feet to submit landscape documentation to the SFPUC to ensure water efficient irrigation of the space. If over 2,500 square feet of landscape is planned at a given location, the SFPUC will require applicants to submit full landscape design and irrigation plans, a soil management report, water budget worksheet, and a grading design plan. Landscapes over 2,500 square feet will require the services of a licensed landscape professional to certify the necessary documentation. The SFPUC anticipates that the water efficient irrigation ordinance will go into effect early 2011.

The text in the Draft EIR, page 4.12-21, last two sentences in the first complete paragraph, has been revised as follows to reflect adoption into law:

The San Francisco Board of Supervisors adopted the *San Francisco Stormwater Design Guidelines* in the form of the San Francisco Stormwater Management Ordinance on April 6, 2010, and adopted into law May 22, 2010.[44] ~~Adoption and~~ Implementation of this ordinance will improve San Francisco's environment by reducing pollution in stormwater runoff in areas of new development and redevelopment.

SFPUC staff members are currently developing additional guidance for achieving LEED® SS Credit 6.1 in combined sewer areas.

The text in the Draft EIR, page 4.12-21, above the heading "San Francisco Electricity Resource Plan," has been revised with the addition as follows:

San Francisco Stormwater Management Ordinance

The San Francisco Stormwater Management Ordinance was enacted into law on May 22, 2010. This new ordinance requires that all projects disturbing over 5,000 square feet of land surface comply with the Stormwater Design Guidelines (SDG) and submit a Stormwater Control Plan (SCP). As stated in the Stormwater Design Guidelines, a project will meet the requirements of the Stormwater Management Ordinance for all project sites located in the combined sewer system areas.

4.1.14 HAZARDS AND HAZARDOUS MATERIALS (CHAPTER 4.16)

The text in the Draft EIR, pages 4.16-4 through 4.16-6, under Section 4.16.1, "Environmental Setting," has been revised as follows to clarify the difference between recognized environmental conditions (RECs) and potential environmental conditions:

1062 Geary Street

Although the Phase I ESA identified no RECs associated with past or current uses of this building, the past site operations as an auto repair business and the possible presence of earthquake fill indicate potential environmental ~~concerns~~ conditions.

1054–1060 Geary Street

The Phase I ESA did not identify any RECs or potential ~~RECs~~ environmental conditions associated with past or current uses of the building.

1034–1036 Geary Street

The Phase I ESA for this property did not identify any RECs or potential ~~RECs~~ environmental conditions associated with the former or current uses of the property.

The text in the Draft EIR, pages 4.16-9 and 4.16-10, under Section 4.16.1, "Environmental Setting," has been revised as follows to clarify the difference between recognized environmental conditions (RECs) and potential environmental conditions:

2200 Webster Street

Although no RECs were identified during the Phase I ESA, the two hydraulic elevators and demolished residential structures represent potential ~~RECs~~ environmental conditions.

2340–2360 Clay Street

Although no RECs were identified during the Phase I ESA, the demolished residential structures represent a potential ~~RECs~~ environmental condition.

The text in the Draft EIR, pages 4.16-11 and 4.16-12, under Section 4.16.1, "Environmental Setting," has been revised as follows to clarify the difference between recognized environmental conditions (RECs) and potential environmental conditions:

2405 Clay Street

Although no significant RECs were identified during the ESA, the former laundry facility, carpentry and machine shop, and demolished residential structures represent potential ~~RECs~~ environmental conditions.

The text in the Draft EIR, pages 4.16-12 and 4.16-13, under Section 4.16.1, "Environmental Setting," has been revised as follows to clarify the difference between recognized environmental conditions (RECs) and potential environmental conditions:

2323 Sacramento Street

Although no RECs were identified during the Phase I ESA, the two hydraulic elevators and demolished residential structures represent potential ~~RECs~~ environmental conditions.

The text in the Draft EIR, pages 4.16-14 and 4.16-15, has been revised as follows to describe the conditions at the off-site cleaner site:

3773 Sacramento Street

The Phase I ESA for 3773 Sacramento Street (an existing parking garage constructed in 1971) found no significant indications of releases of hazardous materials or petroleum products at the site and no evidence of possible past releases.[58] The parcel was previously occupied by mixed residential and commercial buildings and Art~~s and~~ Craft~~s~~ Cleaners. Cleaners typically use hazardous materials in the form of chlorinated solvents, which would have affected the soil and groundwater beneath the parcel during a spill or release; however, it is unknown if this cleaner performed dry cleaning on-site, or if there were releases of hazardous materials into the environment. The former presence of this establishment does not represent a material threat of release of hazardous materials and is not a recognized environmental condition, because the site has been substantially excavated and redeveloped since the former dry cleaning use existed on-site. ~~Accordingly, t~~ The Phase I ESA included sampling and analysis of an existing groundwater monitoring well on the parcel. Sampling results revealed VOC concentrations in the groundwater, which were judged unlikely to have been the result of releases from Art Craft Cleaners; ~~however~~ in addition, the levels were well below primary drinking water standards and do not represent an REC. Accordingly, it was determined that soil sampling was not required.[59]

A French Laundry & Cleaners is located uphill and approximately 100 feet east of the site. The French Laundry & Cleaners is cross-gradient with respect to groundwater flow at the 3773 Sacramento Street site and, therefore, does not represent a material threat of a release and is not an REC. French Laundry & Cleaners, however, was identified as a possible off-site source of contamination in the Phase I ESA completed for the Marshall Hale Hospital at 3698 California Street.[60] A limited Phase II ESA was performed to evaluate this potential environmental condition and indicated that the Marshall Hale Hospital site also has not likely been impacted by the French Laundry & Cleaners.

[60] California Pacific Medical Center. 2008 (February 8). Phase I/Phase II Environmental Site Assessment (Updated and Revised), Marshall Hale Hospital, 3698 California Street, San Francisco, California. San Francisco, CA. Prepared by Treadwell & Rollo, Inc., San Francisco, CA.

The text in the Draft EIR, page 4.16-16, under Section 4.16.1, "Environmental Setting," has been revised as follows to clarify the difference between recognized environmental conditions (RECs) and potential environmental conditions:

> Off-Site Uses
>
> Past activities at the cleaners may have involved processing cleaning solvent, which represents a potential ~~REC~~ environmental condition.

The text in the Draft EIR, page 4.16-43, under Impact HZ-1, has been revised as follows to clarify the difference between recognized environmental conditions (RECs) and potential environmental conditions:

> The ESAs recommended that the ECPs identify known RECs and potential ~~RECs~~ environmental conditions at the campuses, including contaminated soils and groundwater, and:

The text in the Draft EIR, page 4.16-44, under Impact HZ-1, has been revised as follows to clarify the difference between recognized environmental conditions (RECs) and potential environmental conditions:

> The ESAs recommended that the ECPs identify known RECs and potential ~~RECs~~ environmental conditions at the campuses, including USTs, and provide instruction on their removal.

The text in the Draft EIR, page 4.16-58, under Impact HZ-3 in the first bullet, has been revised as follows to include a listing for the Montessori House of Children School (1187 Franklin Street):

- Cathedral Hill Campus: Sacred Heart Cathedral Prep (1055 Ellis Street), Stewart Hall High School (1715 Octavia Street), Redding Elementary School (1421 Pine Street), Alemany College (750 Eddy Street), ~~and~~ Academy of Arts College (1561 Pine Street), and Montessori House of Children School (1187 Franklin Street).

4.1.15 MINERALS ENERGY (CHAPTER 4.17)

The text in the Draft EIR, page 4.17-7, under Impact ME-2 in the second to the last sentence in the paragraph, has been revised as follows to clarify CPMCs commitment to LEED® certification at the proposed Cathedral Hill Hospital and St. Luke's Replacement Hospital:

> Although the proposed hospitals at the Cathedral Hill and St. Luke's Campuses would not be subject to the Green Building Ordinance, CPMC ~~intends to~~ would attain LEED® ~~certification~~ Certified status for the proposed Cathedral Hill Hospital and St. Luke's Replacement Hospital.

The text in the Draft EIR, page 4.17-8, the bulleted list under Impact ME-2, has been revised as follows regarding implementation of energy efficiency elements:

> In addition, CPMC ~~intends to~~ would implement ~~the following~~ elements of energy efficiency into the proposed Cathedral Hill Hospital and St. Luke's Replacement Hospital by optimizing energy performance of the facilities.~~:~~
>
> ~~- optimizing energy performance,~~

- ~~using on-site renewable energy,~~
- ~~enhancing commissioning,~~
- ~~enhancing refrigerant management,~~
- ~~using green power, and~~
- ~~devising and implementing overall measurement and verification methods, as well as measurement and verification methods for the base building and for tenant submetering.~~

4.2 STAFF-INITIATED TEXT CHANGES

4.2.1 EXECUTIVE SUMMARY

Conforming changes to the Summary Chapter related to text, impact determination, and mitigation measure revisions are noted throughout Chapter 4 under the appropriate environmental impact sections.

The text in the Draft EIR, page S-4, first paragraph, has been amended to reflect a clarification regarding the proper methodology used to measure the maximum diagonal dimension of the Cathedral Hill Hospital for purposeds of Planning Code bulk limit restrictions (however, there have been no changes to the physical design of the building):

> The diagonal measurement would be 405 feet for the tower floors and ~~475~~466 feet for the podium. Because of its architectural design, different portions of the hospital building would have varying heights on the project block.

The text in the Draft EIR, page S-11, last two sentences in the first paragraph, has been revised as follows to correct how the parking spaces are referred to at the Pacific Campus:

> A total of 715 new structured and surface parking spaces (Webster Street/Sacramento Street Underground Parking Garage and North-of-Clay Aboveground Parking Garage combined, 688 spaces; Buchanan Street surface parking lot, 27 spaces)[1] would be ~~provided~~ added at the Pacific Campus by the year 2020. ~~This~~These changes would bring the parking total at the Pacific Campus to 1,587 spaces by 2020, 648 ~~more~~ parking spaces more than under existing conditions.

The text in the Draft EIR, page S-16, first sentence, has been revised to update the square footage at the St. Luke's Replacement Hospital, as follows:

> The CPMC LRDP would result in the construction of the five-story, 99-foot-tall, approximately 154,800-~~145,000~~-sq.-ft., seismically compliant St. Luke's Replacement Hospital, adjacent to and west of the existing St. Luke's Hospital tower.

[1] The existing Clay Street/Webster Street Parking Garage and the other surface parking spaces that would be retained at 2300 California Street (41 spaces) would not change.

The text in the Draft EIR, page S-17, the first paragraph after the bullet points, has been revised to update the square footage at the St. Luke's Replacement Hospital, as follows:

> Once completed, the approximately 154,800 ~~145,000~~-sq.-ft. replacement hospital would contain a total of 80 licensed beds and would provide acute-care (approximately ~~76,800~~65,200 sq. ft.), diagnostic and treatment facilities (~~17,500~~18,700 sq. ft.), and an Emergency Department (~~12,000~~11,500 sq. ft.), including two critical-care bays, 6 standard bays, and 4 fast-track bays, including a triage room. Other uses would include hospital administration (approximately ~~2,000~~ 3,200 sq. ft.), cafeteria (1,800 sq. ft.), support facilities (~~14,000~~ 15,900 sq. ft.), lobby (~~2,500~~ 6,300 sq. ft.), education/conference (1,000 sq. ft.) and loading area (~~1,000~~ 8,500 sq. ft.). In addition, the St. Luke's Replacement Hospital would have about 3,000 sq. ft. of utility plant space and about ~~14,400~~19,800 sq. ft. of building infrastructure (e.g., shafts, elevators, and stairways), distributed among all the building levels.

The text in the Draft EIR, Table S-2, pages S-65 and S-66, have been revised to clarify updated air quality impact determinations, as follows:

This page intentionally left blank.

Table S-2
Summary of CPMC LRDP Impacts and Mitigation Measures

Impact(s)[2]	Proposed LRDP Level of Significance								Mitigation Measure(s)	Level of Significance after Mitigation Measure(s)							
	CH	CH w/ variants	Pac (long-term)	Cal	Dav	Dav (long-term)	StL	StL w/ variants		CH	CH w/ variants	Pac (long-term)	Cal	Dav	Dav (long-term)	StL	StL w/ variants
4.7: Air Quality																	
Impact AQ-2: Construction activities associated with the LRDP would expose sensitive receptors to substantial concentrations of toxic air contaminants (1999 BAAQMD Guidelines).	SU	SU	LTS		LTS	LTS	LTS	LTS	**M-AQ-N2 (Cathedral Hill Campus)**: Install Accelerated Emission Control Device on Construction Equipment. To reduce risk associated with exhaust emissions of DPM by construction equipment during construction of the LRDP sites, CPMC and its construction contractor shall implement the following BAAQMD-recommended control measures during construction: Implement Accelerated Emission Control Device Installation on Construction Equipment. In order to minimize the potential impacts on residents living near the CPMC campuses from the construction activities in that area, CPMC shall make reasonable efforts to ensure that all construction equipment used at these campuses would use equipment that meets the EPA Tier 4 engine standards for particulate matter and NO_X control (or equivalent) throughout the entire duration of construction activities, to the extent that equipment meeting the EPA Tier 4 engine standards is available to the contractor at the time construction activities requiring the use of such equipment occur.	~~SU/M~~ LTS/ M	~~SU/M~~ LTS/M	LTS		LTS	LTS	LTS	LTS
Impact AQ-9: Near-term and long-term construction activities associated with the LRDP would exceed the recently adopted (6/2/10) BAAQMD CEQA significance thresholds for mass criteria pollutant emissions and would contribute to an existing or projected air quality violation.	SU	SU	SU		SU	SU	SU	SU	**M-AQ-N9 (Cathedral Hill, Davies[near-term], St. Luke's)** This mitigation measure is identical to Mitigation Measure M-AQ-N1a for Impact AQ-1 and M-AQ-N2 for Impact AQ-2. **M-AQ-L9 (Pacific and Davies [long-term])** This mitigation measure is identical to Mitigation Measure M-AQ-N9.	SU/M	SU/M	~~SU/M~~ LTS/ M		~~SU/M~~ LTS/ M	SU/M	SU/M	SU/M
Impact AQ-10: Construction activities associated with the LRDP would result in short-term increases in emissions of diesel particulate matter that exceed the recently adopted (6/2/10) BAAQMD CEQA significance criteria and expose sensitive receptors to substantial concentrations of toxic air contaminants and PM2.5.	SU	SU	SU		SU	SU	SU	SU	**M-AQ-N10a (Cathedral Hill Campus)** This mitigation measure is identical to Mitigation Measure M-AQ-N2 for Impact AQ-2. **M-AQ-N10b (Davies Campus [near-term])** This mitigation measure is identical to Mitigation Measure M-AQ-N2 for Impact AQ-2. **M-AQ-N10c (St. Luke's Campus)** This mitigation measure is identical to Mitigation Measure M-AQ-N2 for Impact AQ-2. **M-AQ-L10 (Pacific Campus)** This mitigation measure is identical to Mitigation Measure M-AQ-N2 for Impact AQ-2. **M-AQ-L10 (Davies Campus [long-term])** This mitigation measure is identical to Mitigation Measure M-AQ-N2 for Impact AQ-2. Please note that the grey area indicates that section is not applicable.

This page intentionally left blank.

4.2.2 INTRODUCTION AND BACKGROUND (CHAPTER 1)

The text in the Draft EIR, page 1-3, first sentence in the first paragraph, has been revised as follows to correct a typographical error:

> This EIR has been prepared in conformance with the provisions of CEQA and the State CEQA Guidelines (California Public Resources Code, Section 21000 et seq., and California Code of Regulations Title 14, Section 15000 et seq.), as amended.

The text in the Draft EIR, page 1-11, first and second sentences in the second paragraph, has been revised as follows to reflect the extension of the public review and comment period:

> This DEIR will be circulated for public review and comment for ~~60~~ 90 days. During this period, written comments concerning the accuracy and adequacy of the DEIR will be accepted and a public hearing will be held before the Planning Commission to receive oral comments.

4.2.3 PROJECT DESCRIPTION (CHAPTER 2)

The text in the Draft EIR, page 2-9, last paragraph, has been revised as follows to show the updated bed count totals under both existing conditions and the proposed CPMC LRDP:

> Operational beds refer to beds that are licensed, set up, and staffed or in use. As shown in Table 2-2, "CPMC Existing and Proposed LRDP Licensed Hospital Bed Uses" (page 2-10), the Cathedral Hill Hospital is proposed to have 555 acute-care licensed beds. Existing licensed beds from the Pacific and California Campuses would be transferred to the Cathedral Hill Hospital by 2015, thus leaving the Pacific and California Campuses with no acute-care licensed or operational beds (18 psychiatric beds would remain at the Pacific Campus and CPMC has committed to continue to maintain the existing 101 licensed skilled beds at the California Campuses as needed until CPMC is successful in opening 62 replacement beds/facilities, consistent with its overall 100-bed skilled nursing commitment). At the Davies Campus, 32 licensed acute care beds in the South Tower would be de-licensed in 2013 as required under SB 1953, and all currently licensed semi-private rooms in the North Tower would be converted to private, single-patient rooms, resulting in a total reduction of 83 acute care licensed beds, from 232 licensed beds (145 acute care, 48 rehabilitation, and 38 skilled nursing) under existing conditions to 149 licensed beds (63 acute care, 48 rehabilitation, and 38 skilled nursing) under the LRDP. The number of licensed beds at the St. Luke's Campus would be reduced by 149 (70 acute-care and 79 skilled nursing), from 229 licensed beds (150 acute-care and 79 skilled nursing) under existing conditions to 80 licensed beds under the LRDP. CPMC intends to operate all 80 beds at the St. Luke's Campus. Overall, licensed beds on all five CPMC campuses in San Francisco would decrease by approximately ~~178~~271 beds with LRDP development, from approximately ~~1,032~~ 1,174 licensed beds under existing conditions to ~~854~~903 licensed beds under the LRDP.

Table 2-2 in the Draft EIR, page 2-10, has been revised to show the updated bed count totals under both existing conditions and the proposed CPMC LRDP:

Notes:
[1] Bed count number changed from 0 to 101 because 3698 California Street (former Marshall Hale Hospital) SNF beds to stay licensed until such time as an alternative location for these beds are identified at an existing or proposed CPMC facility.
[2] Bed count number changed from 115 to 146 because 32 beds in the Davies Hospital South Tower, originally assumed to be de-licensed in 2009, were not de-licensed. Original number of 115 beds reflected math error of 1 bed. Therefore, 114 beds added to the 32 beds equals 146 beds. The 32 Davies Hospital South Tower beds must be de-licensed in 2013, per Senate Bill 1953.
[3] Bed number changed from 115 to 63 because: CPMC plans to run all semi private rooms as private rooms (at this point all beds in CPMC system will be single-patient).
Sources: Data provided by CPMC and compiled by AECOM in ~~2010~~2011.

Table 2-3, "Required Project Approvals," beginning on page 2-13 of the Draft EIR and Table S-1, beginning on page S-23 of the Draft EIR, have been revised as follows to reflect updates to required project permits:

Notes: Caltrans = California Department of Transportation; CU = conditional use; FAR = floor area ratio; General Plan = *San Francisco General Plan*; MOB = Medical Office Building; PUD = planned unit development; sq. ft. = square feet; SUD = Special Use District; VNAP = *Van Ness Avenue Area Plan*
Source: Data compiled by AECOM in 2009

[4] Lot merger requires only priority policies application.

The text in the Draft EIR, page 2-21, Table 2-5 "Cathedral Hill Campus: Project Summary Table", has been revised to add a footnote clarifying the building height shown for 1100 Van Ness, as follows:

> [4] The existing 1100 Van Ness building is approximately 40 feet tall, not including an approximately 18 foot-tall mechanical penthouse.

The text in the Draft EIR, page 2-27, second paragraph, third sentence, has been amended to reflect a clarification regarding the proper methodology used to measure the maximum diagonal dimension of the Cathedral Hill Hospital for purposeds of Planning Code bulk limit restrictions (however, there have been no changes to the physical design of the building):

> The proposed hospital's building length and diagonal dimensions respectively would be approximately 385 and 405 feet for the tower floors and 385 and ~~475~~466 feet for the podium floor (50 feet above ~~Van Ness Avenue~~Franklin Street). Because of its architectural design, different portions of the hospital building would have varying heights on the project block.

The text in the Draft EIR, page 2-44 under "**Van Ness Avenue Area Plan *Map 1, "Generalized Land Use and Density Plan***" has been revised to clarify FAR (floor-to-area ratio), as follows:

> Map 1 of the VNAP would be revised to designate the sites of the proposed Cathedral Hill Hospital and Cathedral Hill MOB as "The Van Ness Medical Use Subdistrict ~~create a new subarea within the VNAP area (Subarea 4) along Van Ness Avenue between Geary Boulevard./Geary Street, Franklin Street, Post Street, and Polk Street~~ (see "Van Ness Area Plan, Map 1" in Appendix C)~~.~~ ~~The VNAP would be revised to designate the new Subarea 4 (comprising the sites of the proposed Cathedral Hill Hospital and Cathedral Hill MOB) as appropriate for medical institution/medical center use. Creation of this Subarea 4 would also~~ and to increase the current maximum FAR of 7:1 for the Cathedral Hill Hospital site to 9:1 and the current maximum FAR for the Cathedral Hill MOB site to 7.5:1. ~~would allow Planning Department and Planning Commission discretion for certain development standards.~~

The text in the Draft EIR, page 2-44 under "**Van Ness Avenue Area Plan *Map 2, "Height and Bulk Districts***" has been revised to clarify high and bulk limits, as follows:

> Under Map 2 of the VNAP,[5] as currently adopted, the proposed Cathedral Hill Hospital would exceed currently applicable height and bulk limits (maximum building height of 130 feet, maximum building length of 110 feet, and maximum diagonal dimension of 140 feet). ~~With the creation of VNAP Subarea 4, t~~The height and bulk district map for the block proposed for the Cathedral Hill Hospital (i.e., the block bounded by Post Street, Van Ness Avenue, Geary Boulevard, and Franklin Street) would be modified to a 265-V Height and Bulk District, which would allow a building of up to 265 feet tall~~Hospital~~ (see "Van Ness Area Plan Map 2" in Appendix C). The map amendment would not modify the basic bulk limit designation of V, but modification of the bulk limits for the Cathedral Hill Hospital and Cathedral Hill MOB would be sought under the CU application, as described below.

The following text has been added to the Draft EIR, on page 2-44 under the "**Van Ness Avenue Area Plan *Map 2, "Height and Bulk Districts***" discussion:

[5] Ibid., Map 2, "Height and Bulk Districts."

VNAP Text

The VNAP's Objectives and Policies would be amended to allow a medical center at the transit nexus of Van Ness Avenue and Geary Boulevard.

The following text has been added to the Draft EIR, on page 2-44 just above the "**Van Ness Avenue Area Plan**" discussion:

General Plan Urban Design Element Map 5, "Urban Design Guidelines for Bulk of Buildings"

As specified in Map 5 in the Urban Design Element of the General Plan, the permitted bulk of buildings at the Cathedral Hill Hospital site is a maximum plan dimension and maximum diagonal plan dimension of 110 and 140 feet, respectively, and the permitted bulk of buildings at the Cathedral Hill MOB site is a maximum plan dimension and maximum diagonal plan dimension of 110 and 125 feet, respectively. An amendment to Map 5 of the Urban Design Element would allow for development of the proposed Cathedral Hill Hospital up to a maximum plan dimension and maximum diagonal plan dimension of 385 and 466 feet, respectively, on the block bounded by Post Street, Van Ness Avenue, Geary Boulevard, and Franklin Street, and development of the proposed Cathedral Hill MOB up to a maximum plan dimension and maximum diagonal plan dimension of 265 and 290 feet, respectively, on the Cathedral Hill MOB site.

The text in the Draft EIR, page 2-45 under "**Section 243: Van Ness Special Use District,"** has been revised to clarify FAR, as follows:

~~In order to implement the VNAP amendment to create the new VNAP Subarea 4 as described above, t~~The Van Ness SUD would be amended to include a new Van Ness Medical Use Subdistrict (VNMUSD) encompassing the proposed Cathedral Hill Hospital and Cathedral Hill MOB sites, and the area where the proposed Van Ness Avenue pedestrian tunnel would be located (see "Van Ness Special Use District Zoning Map SU02" in Appendix C). This subdistrict would:

- ~~specifically permit a medical institution use (medical center) with a CU authorization;~~
- ~~potentially modify residential restrictions otherwise applicable to medical center development along Van Ness Avenue (unless modified by the CU authorization described below);~~
- increase the maximum floor are ratio (FAR) for the hospital site from 7:1 to 9:1 and for the Cathedral Hill MOB site from 7:1 to 7.5:1~~; and~~
- modify otherwise applicable off-street parking and~~, loading, parking setback,~~ bulk and street frontage~~, and signage~~ standards with a CU authorization; ~~for medical institutions to standards established on a case-specific basis with discretionary review by the Planning Commission.~~
- allow modification of otherwise applicable standards for building projection to allow for coverage of drop-off and entry areas;
- allow modification of otherwise applicable standards for obstructions over streets or alleys to allow architectural features to achieve appropriate articulation of building facades and to reduce pedestrian level wind currents; and
- allow modification of otherwise applicable loading standards for medical centers.

The text in the Draft EIR, page 2-46, under the Planning code Authorization Section 303: Conditional Use Authorization discussion, has been revised to clarify the CU authorization requirements for the Cathedral Hill Hospital and MOB sites, as follows:

> A CU authorization would be sought for the proposed Medical Center consisting of the Cathedral Hill Hospital and Cathedral Hill MOB (and Van Ness Avenue pedestrian tunnel) as conditionally permitted uses in the new VNMUSD, described above, and the RC-4 Zoning District.
>
> Subject to the Planning Code and map amendments described above, CU authorization would be sought for building height and bulk, ~~off-street parking and loading,~~ street frontage, and exceedance of ground-level wind comfort level~~exterior signs as shown on the plans submitted with the CU application~~; ~~potentially~~ for modification of residential requirements otherwise applicable within the Van Ness SUD; and for demolition of five residential dwelling units. More specifically, the CU authorization would include the following elements:

- **Medical Center Use.** Authorization of the Cathedral Hill Hospital and Cathedral Hill MOB as a conditional use medical center in the RC-4 district and Van Ness SUD.

- **Building Height.** CU authorization would be sought for the proposed heights of the Cathedral Hill Hospital and Cathedral Hill MOB, which would be 265 feet and 130 feet, respectively, as defined or measured by the Planning Code. In an RC-4 district and in the Van Ness SUD, buildings greater than ~~40~~ 50 feet, but within the applicable height limits (130 feet for the Cathedral Hill MOB under the existing 130-V Height and Bulk District and 265 feet for the Cathedral Hill Hospital, after the Height and Bulk amendment to the 265-V Height and Bulk District as described above) require CU authorization.

- **Floor Area Ratio.** ~~An i~~Increases in maximum FAR from 7:1 to 9:1 for the Cathedral Hill Hospital site and from 7:1 to 7.5:1 for the Cathedral Hill MOB also would be sought.

- **Building Bulk**. Bulk limits are applicable to sections of buildings above 40 feet in height; at 40 feet (taken at the corner of Geary Street and Van Ness Avenue). The Cathedral Hill Hospital and Cathedral Hill MOB would exceed the applicable bulk limits for building plan length and diagonal dimensions of 110 and 140 feet. An exception would be requested to allow the proposed hospital's building length and diagonal dimensions, which respectively are approximately 385 and 405 feet (tower floor) or 385 feet and ~~475~~466 feet (podium floor 50 feet above ~~Van Ness Avenue~~Franklin Street). An exception would also be requested to allow the proposed MOB's length of approximately 265 feet with a diagonal dimension of 295 feet.

- ~~**Off-Street Parking.** The Planning Code requires a minimum of 64 and allows up to 96 parking spaces as an accessory use for the Cathedral Hill Hospital. CPMC is proposing 513 parking spaces at the Cathedral Hill Hospital. The Planning Code requires a minimum of 669 and allows up to 1,004 parking spaces as an accessory use for the Cathedral Hill MOB. CPMC is proposing 542 parking spaces for the Cathedral Hill MOB, which would be 127 fewer parking spaces than required. CU authorization under Planning Code Section 157 would consider the Cathedral Hill Hospital and Cathedral Hill MOB as a medical center and requests approval of 513 parking spaces for the hospital and 542 under the MOB, a total of 1055 spaces. The CU authorization would allow these spaces as accessory parking for the medical center although the total number is greater than permitted under the normal accessory standards of the Planning Code. The existing Pacific Plaza Office Building (1375 Sutter Street) includes a 172-space parking garage. With the proposed conversion of office space in this building to exclusive use as an MOB, Planning Code Section 159(c) would require a total of 279 parking spaces for the medical office use. To meet Section 159(c) code requirements, 107 spaces would be provided off-site in the Cathedral Hill Hospital's parking garage.~~

- **Demolition of Residential Dwellings**. The CU authorization would allow demolition of five residential dwelling units (Planning Code Section 317 and Section 243 [c] [8] [E]) that currently occupy portions of the proposed Cathedral Hill MOB site. Demolition of an additional 20 residential hotel units requires a separate application to the San Francisco Department of Building Inspection for a permit to convert, discussed below.

- **Modification of Residential Restrictions.** Planning Code Section 243(c)(8) generally requires development projects within the Van Ness SUD to include residential uses at a 3:1 ratio to net new nonresidential uses. ~~Unless modified by the Planning Code text amendments creating the new VNMUSD within the Van Ness SUD as described above, t~~The CU authorization would modify these requirements for medical center uses within the VNMUSD.

- **Exception for Wind Comfort Level Exceedances.** The CU authorization would allow an exception for ground level wind currents to exceed pedestrian wind current comfort level criteria of 11 miles per hour applicable within the Van Ness SUD.

- **Street Frontage.** The CU authorization would allow modification of standards for active ground floor uses and width of curb cuts that otherwise would apply pursuant to Planning Code Section 145.1.

Figure 2-5, "Cathedral Hill Hospital-Two-Way Post Variant" in the Draft EIR, page 2-55, has been revised to correctly depict the portion of Post Street that would be converted to two-way traffic:

Figure 2-18, "Cathedral Hill Hospital-Level 2" in the Draft EIR, page 2-75, has been revised to correct an error regarding garage egress as follows:

Figure 2-37, "Cathedral Hill Campus – Proposed Streetscape Plan" in the Draft EIR, page 2-101, has been updated.

Table 2-7b, "Pacific Campus: Project Summary Table," in the Draft EIR, page 2-109, has been revised to show updated building heights and methodology for measurement at the 2333 Buchanan Street – ACC, the ACC Addition, and the North-of-Clay Parking Garage, as follows:

This page intentionally left blank.

The text in the Draft EIR, page 2-117, the last sentence in the first paragraph incorrectly states the height of the North-of-Clay Parking Garage. The text has been revised as follows:

> The open space north of the parking structure would be retained. The Buchanan Street parking lot, east of the Stern Building, would be partially retained; this lot would be reconfigured to allow access to the North-of-Clay Aboveground Parking Garage from Buchanan Street, north of the Stern Building. This parking garage would be six stories (plus top deck) with a height of ~~70~~85 feet.

The text in the Draft EIR, page 2-117, first two sentences in the second paragraph, has been revised as follows to clarify how the parking spaces are referred to at the Pacific Campus:

> A total of 715 new ~~structured~~ parking spaces (Webster Street/Sacramento Street Underground Parking Garage and North-of-Clay Aboveground Parking Garage combined, 688 spaces; Buchanan Street surface parking lot, 27 spaces)[6] would be added ~~provided~~ at the Pacific Campus by about 2020. Twenty-five (25) existing structured spaces (associated with 200 Webster) would be demolished. The project would ~~also~~ reduce the total number of surface parking spaces at the Pacific Campus by 15 spaces. ~~This~~ These changes would bring the parking total at the Pacific Campus to 1,587 spaces by 2020, 648 more parking spaces than existing conditions. In addition, six on-street parking spaces currently located on Buchanan Street, between Clay and Sacramento Streets, would be converted to a white-zone curb-side passenger loading and unloading zone.

The text in the Draft EIR, page 2-119, has been revised to clarify required project approvals needed at the Pacific Campus as part of the CPMC LRDP, as follows:

2.3.4 REQUIRED PROJECT APPROVALS FOR THE PACIFIC CAMPUS

> ~~CPMC would require an amendment to Planning Code Section 209.3(a) to allow medical uses without acute-care inpatient uses once acute-care uses cease at the existing 2333 Buchanan Street Hospital (proposed ACC). Once the acute-care functions at the 2333 Buchanan Street Hospital are relocated to the proposed Cathedral Hill Hospital, a text amendment to Planning Code Section 209.3(a) would be required for CPMC to continue operating the Pacific Campus's previously-approved medical center use without acute-care inpatient services. The Mental Health Center would continue to operate with 18 psychiatric beds under the LRDP.~~
>
> Based on the initial massing studies for the long-term projects, it does not appear that they would require any additional amendments to the General Plan or Planning Code height or bulk maps. When additional design detail is available in the future, CPMC and the San Francisco Planning Department will review those plans and identify any additional entitlements that could be required. Any necessary analysis of

[6] The existing Clay Street/Webster Street Parking Garage and the other surface parking spaces that would be retained at 2300 California Street (41 spaces) would not change.

those additional entitlements will be included in any project-specific environmental review of the long-term projects that may be required in the future under CEQA.

The text in the Draft EIR, page 2-131, after the fourth sentence in the last paragraph, has been revised with an addition as follows to clarify that CPMC would continue operations of the 101 licensed SNF beds at the California Campus:

> CPMC would also continue to operate the 101 licensed SNF beds at 3698 California Street (former Marshall Hale Hospital). [35a]
>
> [35a] The 101 licensed SNF beds at 3698 California Street (former Marshall Hale Hospital) would stay licensed until such time as an alternative for these beds is identified.

The text in the Draft EIR, page 2-132, has been revised to clarify required project approvals needed at the California Campus as part of the CPMC LRDP, as follows:

2.4.4 REQUIRED PROJECT APPROVALS FOR THE CALIFORNIA CAMPUS

As noted earlier, CPMC plans to sell the California Campus after nearly all medical functions have been relocated to the proposed Cathedral Hill Campus, and to lease back space for certain CPMC-operated medical uses and programs from the buyer of the California Campus property until approximately 2020. ~~As at the Pacific Campus, once the major inpatient functions at the California Campus are relocated to the proposed Cathedral Campus, a Planning Code text amendment would be required for CPMC to continue operating the California Campus's previously approved medical center use without inpatient care. CPMC would require an amendment to Planning Code Section 209.3(a) to allow previously approved medical uses to continue without inpatient care in a residential district once inpatient uses cease. Additional~~ eEntitlements required for any future proposed change in use at the California Campus would be identified at the time the change is proposed and would be subject to separate project-specific environmental review under CEQA.

The text in the Draft EIR, page 2-146, first sentence in the second-to-last paragraph has been revised to clarify the length of landscaping at Davies Campus, as follows:

> Landscape improvements on the eastern edge of the Davies Campus along Noe Street would include an approximately ~~500~~560-foot-long set of terraced landscaped hedges, intended to resemble the teak screening pattern on the façade of the proposed Neuroscience Institute building.

The text in the Draft EIR, page 2-151, has been revised to clarify that a Conditional Use authorization for valet parking at the Davies Campus is no longer necessary, as follows:

> A CU authorization to modify the previously approved PUD would be required for CPMC to construct a new approximately 51,000-sq.-ft. Neuroscience Institute building in an RH-3 (Residential, House Districts, Three-Family) District. An amendment to the existing PUD (under Planning Code Section 304, which is required for projects exceeding 50,000 sq. ft.) would be required to allow exceptions to the rear-

yard requirement ~~and the requirement for independently accessible off-street parking (to allow for valet parking)~~.

The text in the Draft EIR, page 2-179, the first sentence, has been revised to update the square footage at the St. Luke's Replacement Hospital, as follows:

> The CPMC LRDP would result in the construction of the approximately 154,800 ~~145,000~~-sq.-ft., seismically compliant St. Luke's Replacement Hospital, adjacent to and west of the existing St. Luke's Hospital tower.

The text in the Draft EIR, page 2-180, the description of the height measurement at the St. Luke's Replacement Hospital have been revised to clarify the various heights of the St. Luke's Replacement Hospital and MOB/Expansion Building, as follows:

- ~~99~~54 feet, as measured at the site's northwest corner from the top of the sidewalk on Cesar Chavez Street (Figure 2-63, "St. Luke's Replacement Hospital and MOB/Expansion Building—Proposed North Elevation," page 2-205) (north elevation);
- 82 feet, as measured at the site's southeast corner from the top of the sidewalk on 27th Street (Figure 2-64, "St. Luke's Replacement Hospital and MOB/Expansion Building—Proposed South Elevation," page 2-207) (south elevation);
- 98 feet, as measured from the top of the sidewalk, midblock on Cesar Chavez Street (Figure 2-65, "St. Luke's Replacement Hospital—Proposed East-West Elevation," page 2-209) (east elevation); and
- 54 feet, as measured at top of the sidewalk on the site's southwest corner at 27th Street (~~Figure 2-66, "St. Luke's MOB/Expansion Building – Proposed East-West Elevation," page 2-211~~Figure 2-64, "St. Luke's Replacement Hospital and MOB/Expansion Building – Proposed South Elevation," page 2-207) ~~(~~west elevation).

The text in the Draft EIR, page 2-181, the last paragraph, has been revised to update the square footage at the St. Luke's Replacement Hospital, as follows:

> Once completed, the approximately 154,800 ~~145,000~~-sq.-ft. replacement hospital would contain a total of 80 licensed beds and would provide acute-care (approximately ~~76,800~~65,200 sq. ft.), diagnostic and treatment facilities (~~17,500~~18,700 sq. ft.), and an Emergency Department (~~12,000~~11,500 sq. ft.), including two critical-care bays, 6 standard bays, and 4 fast-track bays, including a triage room. Other uses would include hospital administration (approximately ~~2,000~~ 3,200 sq. ft.), cafeteria (1,800 sq. ft.), support facilities (~~14,000~~ 15,900 sq. ft.), lobby (~~2,500~~ 6,300 sq. ft.), education/conference (1,000 sq. ft.) and loading area (~~1,000~~ 8,500 sq. ft.). In addition, the St. Luke's Replacement Hospital would have about 3,000 sq. ft. of utility plant space and about ~~14,400~~19,800 sq. ft. of building infrastructure (e.g., shafts, elevators, and stairways), distributed among all the building levels.

The text in the Draft EIR, page 2-183, the third bullet from the top of the page, has been revised to refer to Figure 2-64 and not Figure 2-65, as follows:

- 100 feet, as measured at the site's southeast corner from the top of the sidewalk on Valencia Street (~~Figure 2-65. "St. Luke's MOB – Proposed East-West Elevation," page 2-205~~Figure 2-64, "St. Luke's Replacement Hospital and MOB/Expansion Building – Proposed South Elevation," page 2-207) (east elevation); and

The text in the Draft EIR, page 2-191, has bern added just above the "**Street Vacation, Transfer, and General Plan Referral**" heading:

> **General Plan Amendment - Urban Design Element Map 5, "Urban Design Guidelines for Bulk of Buildings"**
>
> As specified in Map 5 in the Urban Design Element of the General Plan, the permitted bulk of buildings at the St. Luke's Campus is a maximum plan dimension and maximum diagonal plan dimension of 110 feet and 125 feet, respectively. An amendment to Map 5 of the Urban Design Element would allow for development of the proposed St. Luke's Replacement Hospital up to a maximum plan dimension and maximum diagonal plan dimension of 227 and 270 feet, respectively, and development of the proposed MOB/Expansion Building up to a maximum plan dimension and maximum diagonal plan dimension of 204 and 228 feet, respectively.

The text in the Draft EIR, page 2-192, has been revised to add a new discussion heading, "Special Use District Map SU07," to clarify FAR at the St. Luke's Campus, and to move the discussion of the campus-wide FAR to beneath the added heading, as follows:

> **Special Use District Map SU07**
>
> A basic FAR of 1.8:1 is permitted for the St. Luke's Campus. Under existing conditions, the campus-wide FAR is 2.3:1; this FAR was approved by the City under the previous PUD for the campus. The actions proposed for the St. Luke's Campus under the CPMC LRDP—to merge the area of San Jose Avenue between Cesar Chavez Street and 27th Street with the existing campus area, construct a replacement hospital, demolish the existing St. Luke's Hospital tower, and construct the MOB/Expansion Building—would result in a new overall FAR of 2.5:1 for the campus. Therefore, CPMC would seek an amendment to the Planning Code Special Use District map to establish a new Cesar Chavez/Valencia Streets Medical Use Special Use District on the St. Luke's Campus, which would increase the maximum FAR on the St. Luke's Campus to 2.5:1. ~~a FAR exception as part of the new PUD application.~~

Figure 2-56, "Davies Campus Streetscape Plan," in the Draft EIR, page 2-171, has been revised to reflect the updated Streetscape at Davies Campus, as follows:

Table 2-13, "St. Luke's Campus: Project Summary Table," in the Draft EIR, page 2-175, has been revised to reflect the correct height for the Duncan Street Parking Garage, as well as update the square footage at the St. Luke's Replacement Hospital, as follows:

Figure 2-64, "St. Luke's Replacement Hospital and MOB/Expansion Building – Proposed South Elevation," Draft EIR, page 2-207, has been revised to clarify the correct building height at the proposed St. Luke's Replacement Hospital and MOB/Expansion Building, as follows:

Note: LRDP = *Long Range Development Plan*; MOB = Medical Office Building; sq. ft. = square feet.
[1] The 106 surface parking spaces associated with the St. Luke's 1957 Building are located across San Jose Avenue and scattered throughout the campus.
[2] The project proposes to transfer existing Emergency Department (7,060 sq. ft.) and diagnostic and treatment uses (14,124 sq. ft.) in the 1957 Building and replace them with support uses. This 21,184-sq.-ft. total is accounted for in 42,829 sq. ft. of support use under existing uses to be retained.
[3] The existing St. Luke's Hospital Tower is 158 feet tall, not including an 11-foot-tall mechanical penthouse.
[4] The existing 1957 Building is 53 feet tall, not including an 14-foot-tall mechanical penthouse.
[5] The existing 1580 Valencia Street (Monteagle Building) is 102 feet tall, not including an 11-foot-tall mechanical penthouse.
[6] The existing Duncan Street Parking Garage height does not include an approximately 10-foot-tall stair enclosure on the top deck.

St. Luke's Replacement Hospital and MOB/Expansion Building – Proposed South Elevation **Figure 2-64 (Revised)**

This page intentionally left blank.

4.2.4 PLANS AND POLICIES (CHAPTER 3)

The text in the Draft EIR, page 3-9, second paragraph under "Urban Design Element" has been revised to reflect revisions to VNAP Map 2, "Height and Bulk Districts" and Map 4 of the Urban Design Element.

> ***Consistency:*** The proposed CPMC LRDP would be generally consistent with the applicable Urban Design policies. The General Plan would allow for heights up to 161–240 feet at the Cathedral Hill Hospital site.[7] As specified in Map 4 of the Urban Design Element, the currently allowed height of buildings in the Cathedral Hill project area is 161–240 feet. A General Plan amendment to Map 4 of the Urban Design Element (and to VNAP Map 2) ~~create VNAP Subarea 4~~ would allow the height of the Cathedral Hill Hospital to extend up to 265 feet. As noted in Table 2-3, "Required Project Approvals" (page 2-13), the proposed Cathedral Hill Campus would require a General Plan amendment for the VNAP, Planning Code Section 243 text and zoning map amendments, and ~~a~~ CU authorizations. (See Appendix C for amendment to ~~the~~ VNAP ~~m~~Map 2 and General Plan Urban Design Element Map 4 at the Cathedral Hill Campus).

The text in the Draft EIR, page 3-10, third paragraph under 3.2.2 Van Ness Avenue Area Plan has been revised to reflect revisions to VNAP Map 2, "Height and Bulk Districts."

> A General Plan amendment would be required for the proposed development of the Cathedral Hill Hospital up to 265 feet in height. Specifically, amending the ~~General Plan to create~~ VNAP ~~Subarea 4~~ Map 2 (Height and Bulk Districts) would allow the hospital's height to extend to 265 feet.

The text in the Draft EIR, in the third paragraph on page 3-18, has been revised to include discussion of the Cesar Chavez/Valencia Streets Medical Use Special Use Districts.

> Proposed near-term development includes construction of the new five-story St. Luke's Replacement Hospital, which would be approximately 99 feet in height, based on the Planning Code's methodology for measurement. The existing 12-story St. Luke's Hospital tower would then be demolished and the new five-story, 100-foot-tall MOB/Expansion Building would be constructed. The St. Luke's Replacement Hospital would be located east of San Jose Avenue, within the existing 65-A Height and Bulk district. Therefore, in addition to the General Plan amendment (noted on page 3-9), a Planning Code amendment from 65-A to 105-E would be required for the construction of the 99-foot tall St. Luke's Replacement Hospital, which would be consistent with the eastern part of the project site, where the proposed 100-foot-tall St. Luke's MOB/Expansion Building would be located. With CU authorization, ~~and~~ approval of the height and bulk amendment, and the creation of the new Cesar Chavez/Valencia Streets Medical Use Special Use District, implementation of the proposed CPMC LRDP at the St. Luke's Campus would be consistent with zoning, adopted plans and policies of the General Plan, and the Planning Code. Table 2-3, "Required Project Approvals" (page 2-13), indicates the required approvals for the proposed St. Luke's Replacement Hospital and MOB/Expansion Building. The requested project approvals and the consistency of St. Luke's Campus development under the LRDP with the Planning Code are described in Section 4.1, "Land Use and Planning," beginning on page 4.1-50.

[7] San Francisco Planning Department. 2005. *San Francisco General Plan*. Urban Design Element. Available: http://www.sfgov.org/site/planning_index.asp?id=41416. Map 4, "Urban Design Guidelines for Height of Buildings."

4.2.5 LAND USE AND PLANNING (CHAPTER 4.1)

Beginning on Draft EIR page 4.1-47, the second, third, and fourth paragraphs have been revised to reflect the modifications to the requested entitlements for the proposed LRDP that have been made by the project sponsor, based upon input from the Planning Department after reviewing the initial application submittal for the proposed Cathedral Hill Campus, as follows:

> The proposed Cathedral Hill Campus would be constructed within the area covered by the VNAP, which does not specifically encourage medical centers but does encourage high-density mixed-use development, including nonresidential uses in the Cathedral Hill Campus area. The proposed Cathedral Hill Hospital would exceed the currently applicable height and bulk limits for the site, as described previously in this section. The proposed LRDP project approvals would include an amendment to the VNAP to allow a medical center at the transit nexus of Van Ness Avenue and Geary Boulevard ~~request creation of a new Van Ness Medical Center District (Subarea 4) (see Appendix C for amendment to VNAP map)~~, as discussed in Section 2.2.4, "Required Project Approvals for the Cathedral Hill Campus" (beginning on page 2-43). The ~~subarea~~ amendment, if ~~allowed~~ approved by decision-makers, would allow medical uses at the proposed Cathedral Hill Hospital and Cathedral Hill MOB sites and a related amendment to VNAP Map 2 (see Appendix C) would create a new 265-V Height and Bulk District to accommodate the proposed height of the hospital. The VNAP amendment would also ~~exempt medical uses within Subarea 1A from the required development of residential uses at a certain ratio (35 sq. ft. of residential use for every 15 sq. ft. of nonresidential uses) along Van Ness Avenue and would~~ increase the current allowable floor area ratio (FAR) of 7.0:1 for the Cathedral Hill Hospital and Cathedral Hill MOB to a maximum ~~an~~ FAR of 9:1 and 7.5:1 for the hospital and MOB, respectively.
>
> The proposed VNAP amendment would be accompanied by corresponding changes to the Planning Code, including the creation of a new Van Ness Medical Use ~~Institution~~ ~~s~~Subdistrict within the existing Van Ness SUD. This new subdistrict would be located on two different blocks: both the site of the proposed Cathedral Hill Hospital and the site of the proposed Cathedral Hill MOB, and the area where the Van Ness Avenue pedestrian tunnel would be located (see Appendix C for new subdistrict map). This new subdistrict would ~~allow medical institution use (medical center) as a CU, modify residential requirements (development of 3 sq. ft. of residential uses for every 1 sq. ft. of nonresidential development) applicable to nonresidential uses, and~~ increase the maximum FAR to 9:1 for the Cathedral Hill Hospital site and 7.5:1 for the Cathedral Hill MOB site, and allow modification of other applicable loading, building projection, obstructions over streets and alleys, bulk, and street frontage requirements. The Height and Bulk District map (see Appendix C for the Height and Bulk District changes for the VNAP Map 2) would be amended to reclassify the block that composes the site of the proposed Cathedral Hill Hospital from the 130-V Height and Bulk District to a 265-V Height and Bulk District, which would allow a maximum building height of 265 feet.
>
> The project approvals would include CU authorization ~~for a Planned Unit Development (PUD)~~ for the proposed Cathedral Hill Hospital and Cathedral Hill MOB as a conditional use medical center in an RC-4 zoning district and the Van Ness SUD, to allow buildings taller than ~~40~~ 50 feet within the RC-4 District and the Van Ness SUD, and an exception to otherwise applicable street frontage, ground-level wind comfort level, and bulk standards. CU authorization would also be required for demolition of five residential dwelling units at the Cathedral Hill MOB site and to modify requirements under the Van Ness SUD for the development of residential uses at a 3:1 ratio to net new non-residential uses. ~~from the minimum off-street loading space dimension. The proposed project would also require CU authorization to exceed the allowable parking, as allowed under Planning Code Section 151, for accessory parking at the Cathedral Hill Hospital.~~ The Cathedral Hill MOB would also require Proposition M office allocation findings under Planning Code Sections 321 and 322, which would allow development of office space.

With the proposed LRDP, CPMC would convert and demolish the existing 20 residential hotel units at the proposed MOB site under Chapter 41 of the Administrative Code (which requires 1:1 replacement of the residential hotel units). The Cathedral Hill Campus development would also require lot merger subdivision approvals.

The text in the Draft EIR, in the fourth paragraph on page 4.1-48, has been revised to reflect the modifications to the requested entitlements for the proposed LRDP that have been made by the project sponsor based upon input from the Planning Department after reviewing the initial application submittal for the proposed Cathedral Hill Campus, as follows:

The amendments to the *General Plan's* Urban Design Element and VNAP; ~~and~~ amendments to the Planning Code text and zoning and height and bulk district maps; the ~~PUD and~~ CU authorizations; and other approvals, as discussed above, are part of the proposed LRDP. Therefore, if they are approved by decision-makers, the proposed LRDP would be consistent with the applicable plans and policies. The proposed LRDP at the Cathedral Hill Campus with the requested amendments and approvals would therefore not conflict with any applicable land use plan, policy, or regulation. **This impact would be less than significant.**

Beginning on Draft EIR page 4.1-50, the fourth and fifth paragraphs have been revised to reflect the amendments to the Urban Design Element and the new Cesar Chavez/Valencia Streets Medical Use Special Use District, as follows:

The proposed St. Luke's Replacement Hospital would be approximately 99 feet in height and would exceed the current height and bulk limits of the new hospital site (currently zoned 65-A), described previously in this section. An amendment to the *General Plan* Urban Design Element ~~m~~Map 4 (see Appendix C for *General Plan* Map 4) would be required to increase the maximum allowable height for development to 105 feet to permit development of the new hospital in the area on campus that is bounded by Cesar Chavez Street, Valencia Street, 27th Street, and the 1912 Building. An amendment to the General Plan Urban Design Element Map 5 would be required to increase the allowable bulk for the St. Luke's Replacement Hospital to a maximum plan dimension and maximum diagonal plan dimension of 227 and 270 feet, respectively, and for the MOB/Expansion Building to a maximum plan dimension and maximum diagonal plan dimension of 204 and 228 feet, respectively. ~~This~~ These *General Plan* amendments would also necessitate text changes to the Planning Code, to reclassify the area that includes the St. Luke's Replacement Hospital site as a 105-E Height and Bulk District, which would allow a maximum building height of 105 feet. The proposed MOB/Expansion Building would be 100 feet tall and would comply with the existing 105-E Height and Bulk District classification that is applicable to the portion of the campus where the proposed MOB/Expansion Building would be developed.

The near-term projects proposed for the St. Luke's Campus would require the creation of a new Cesar Chavez/Valencia Streets Medical Use Special Use District to increase the maximum FAR on the St. Luke's Campus to 2.5:1, CU authorization to modify the existing PUD to allow for medical uses in the RH-2 District, and exceptions to rear-yard requirements and height and bulk restrictions for buildings taller than 40 feet in the RH-2 District. ~~and an exemption from off-street parking requirements to allow valet and off-site parking during the interim period until completion of the St. Luke's Replacement Hospital~~

4.2.6 AESTHETICS (CHAPTER 4.2)

The text in the Draft EIR, page 4.2-93 (first paragraph) has been revised as follows to show that CPMC would attain LEED® certification for the proposed Cathedral Hill Hospital and St. Luke's Replacement Hospital:

> The proposed Cathedral Hill Hospital and St. Luke's Replacement Hospital are under the jurisdiction of the Office of Statewide Health Planning and Development (OSHPD) and are not subject to the Green Building Ordinance. However, CPMC ~~intends to~~ would attain at a minimum, Leadership in Energy and Environmental Design (LEED®) ~~certification~~ Certified level for these projects.

The text in the Draft EIR, page 4.2-114, first sentence under "St. Luke's Campus" heading has been revised to update the square footage at the proposed St. Luke's Replacement Hospital, as follows:

> A new, five-story, 99-foot-tall (including the mechanical penthouse), approximately 154,800~~145,000~~-sq.-ft. St. Luke's Replacement Hospital and a five-story, 100-foot-tall (including the mechanical penthouse), approximately 201,000-sq.-ft. MOB/Expansion Building would be built at the St. Luke's Campus in the near term under the LRDP.

The text in the Draft EIR, page 4.2-138, last sentence of first paragraph, has been revised as follows to read:

> In addition, the building would replace the existing ~~uninteresting,~~ set back buildings with more ~~interesting~~ development, focus and interest at the street level.

The text in the Draft EIR, page 4.2-173, first sentence under "Overview of St. Luke's Replacement Hospital" heading has been revised to update the square footage at the proposed St. Luke's Replacement Hospital, as follows:

> The approximately 154,800 ~~145,000~~-sq.-ft., seismically compliant St. Luke's Replacement Hospital would be located adjacent to and west of the existing St. Luke's Hospital tower.

The text in the Draft EIR, page 4.2-184, first sentence under "St. Luke's Replacement Hospital" heading has been revised to update the square footage at the proposed St. Luke's Replacement Hospital, as follows:

> The near-term development of the St. Luke's Campus would include a new, approximately 154,800~~145,000~~-sq.-ft., five story, 99-foot-tall St. Luke's Replacement Hospital located on the northwest corner of the campus (see Impact AE-1 for further details).

4.2.7 CULTURAL AND PALEONTOLOGICAL RESOURCES (CHAPTER 4.4)

The text in the Draft EIR, page 4.4-42, second sentence under "St. Luke's Campus" heading has been revised to update the square footage at the proposed St. Luke's Replacement Hospital, as follows:

> The CPMC LRDP would result in the construction of the five-story, approximately 154,800 ~~145,000~~-sq.-ft. St. Luke's Replacement Hospital adjacent to and west of the existing St. Luke's Hospital tower.

4.2.8 TRANSPORTATION AND CIRCULATION (CHAPTER 4.5)

Table 4.5-10 in the Draft EIR, page 4.5-76, has been revised to clarify Daily and Peak-Hour Person Trip Generation by Population Group, as follows:

Notes: ACC = Ambulatory Care Center; MOB = Medical Office Building

[1] The analysis does not assume any new travel demand at the California Campus because campus activities would remain unchanged until 2015, and would then be gradually relocated to the Pacific and Cathedral Hill Campuses. By 2020, almost all CPMC-related uses at the California Campus are expected to cease.

[2] For the Cathedral Hill Campus, the a.m. peak-hour travel demand is presented in (parentheses).

Source: Data compiled by Adavant Consulting and Fehr & Peers in 2010.

[1] Off-campus parking supply of 623 spaces includes 400 spaces at the Japan Center Garage, 180 spaces at 855 Geary Street Garage, and 43 spaces at garage within 2015 Steiner Street.
Source: Data compiled by CHS Consulting Group and Fehr & Peers in 2010

The text in the Draft EIR, page 4.5-147, first paragraph under "Impact TR-55" has been revised to update construction hours, as follows:

> The proposed Cathedral Hill Hospital and Cathedral Hill MOB would be constructed over approximately 54 months. Construction activities would take place generally between 7 a.m. and 7 p.m.~~midnight~~ on weekdays and between 7 a.m. and 5 p.m. on Saturdays~~, depending on the phase of construction, and whether after-hour construction permits, when required for work after 8 p.m., are approved by the City~~. Work extending past 7 p.m. will be limited to activities such as concrete finishing, steel detailing, and general production preparation, and will be communicated with the neighbors on a weekly basis. Second shift work (work occuring between 4 p.m. and midnight) would occur only during the interior buildout phase of the Cathedral Hill Hospital construction. The proposed underground tunnel between the Cathedral Hill hospital and MOB would be located under Van Ness Avenue between Post Street and Geary Street, approximately 50 feet north of Geary Street. Construction staging for the hospital and MOB would occur on site, with some materials and equipment stored at off-site facilities outside of the City of San Francisco. Preliminary construction information for the Catheral Hill Campus was prepared by Herrero Boldt.

The text in the Draft EIR, page 4.5-147, second to last paragraph has been revised to update construction hours, as follows:

> *Construction Workers by Shift*—During construction of the Cathedral Hill Campus the maximum worker population would range between 80 (during demolition) and 735 workers (during interior finishing). A majority of these workers (about 80 percent) would be working on the Cathedral Hill Hospital. Work shifts would occur 7 a.m. to ~~4 p.m~~7 p.m. ~~and 4 p.m. to midnight~~ on weekdays, and between 7 a.m. and 5 p.m. on Saturdays, except as noted above.

The text in the Draft EIR, page 4.5-167, first bullet point, has been deleted to show that the new shuttle stop for the Pacific Campus would be located in the North-of-Clay Parking Garage drop-off area, rather than on Sacramento Street. The shuttle stop would not affect the street network and the three on-street parking spaces on Sacramento described in the Draft EIR bullet point as being removed, as follows:

> ~~► A new CPMC shuttle stop would be provided on Sacramento Street near the proposed Campus Drive (approximately midblock between Webster Street and Buchanan Street). This shuttle stop would require the removal of about three on-street parking spaces on Sacramento Street.~~

The text in the Draft EIR, page 4.5-173, third paragraph, has been revised to clarify truck access to the loading dock area at the Pacific Campus, as trucks would enter only from Sacramento Street (not from Clay Street), and also incorrectly states that large trucks would be accommodated along Clay Street, as follows:

> Trucks ~~accessing the loading dock area would enter from either Clay Street and turn onto Campus Drive or~~ would access Campus Drive directly from Sacramento Street, and would back into the loading dock space from Campus Drive. Campus Drive is currently designed to be 24-feet wide and thus, a 35-foot long truck would have sufficient turning radius to back into a large truck loading space, provided it can use both lanes of Campus Drive. This maneuver would briefly interrupt traffic flow on Campus Drive. However, it is not likely that stopped traffic on Campus Drive would impact circulation on-site or on Sacramento Street. Larger trucks (e.g., 50 feet in length), would not be accommodated within the loading dock, and instead would be accommodated off-street along ~~the Clay Street stub or~~ Campus Drive. The number of larger truck deliveries (primarily linens) at the Pacific Campus would decrease as part of the project because these deliveries would be redirected to the proposed Cathedral Hill Campus.

Improvement Measure I-TR-63.1 in the Draft EIR, page 4.5-174, has been deleted due to the infeasibility of implementation, based on the site constraints on the western side of Campus Drive, as follows (The improvement measure suggests widening Campus Drive to "allow for an 8-foot-wide loading lane, 10-foot-wide sidewalk, 6-foot-wide landscaping and planting area, in addition to two 12-foot wide travel lanes," which would result in a total of 48 feet. However, Campus Drive cannot be widened beyond 34 feet, because of site constraints on the western side of Campus Drive):

- ~~**Improvement Measure I-TR-63.1 Provide Additional On-site Loading Spaces**~~

  ~~CPMC shall design Campus Drive between 2100 Webster Street and the ACC Addition to provide for at least one 8-foot-wide loading lane, to provide for one additional on-site loading space. Although detailed plans are not available at this time, and the Pacific Campus project would be a long-term project under the CPMC LRDP, the preliminary proposed width of 24 feet of Campus Drive (too narrow to accommodate two travel lanes and a loading lane) could be widened as part of further design efforts. The clearance width between the 2100 Webster Building and the ACC Annex is approximately 48 feet, which could potentially allow for an 8-foot-wide loading lane, 10-foot-wide sidewalk, 6-foot-wide landscaping and planting area, in addition to two 12-foot wide travel lanes.~~

The text in the Draft EIR, page 4.5-175, second sentence under Impact TR-65, has been revised to clarify that the existing ambulance/emergency room loading area at 2333 Buchanan would not just be used for patient and visitor loading, but would also be used for some medical transfers, as follows:

> The existing ambulance/emergency room loading area on Sacramento Street west of Buchanan Street would be repurposed to serve primarily for as patient and visitor loading, including urgent care drop-off. Ambulances and other vehicles would also continue to use this loading area for medical transfers.

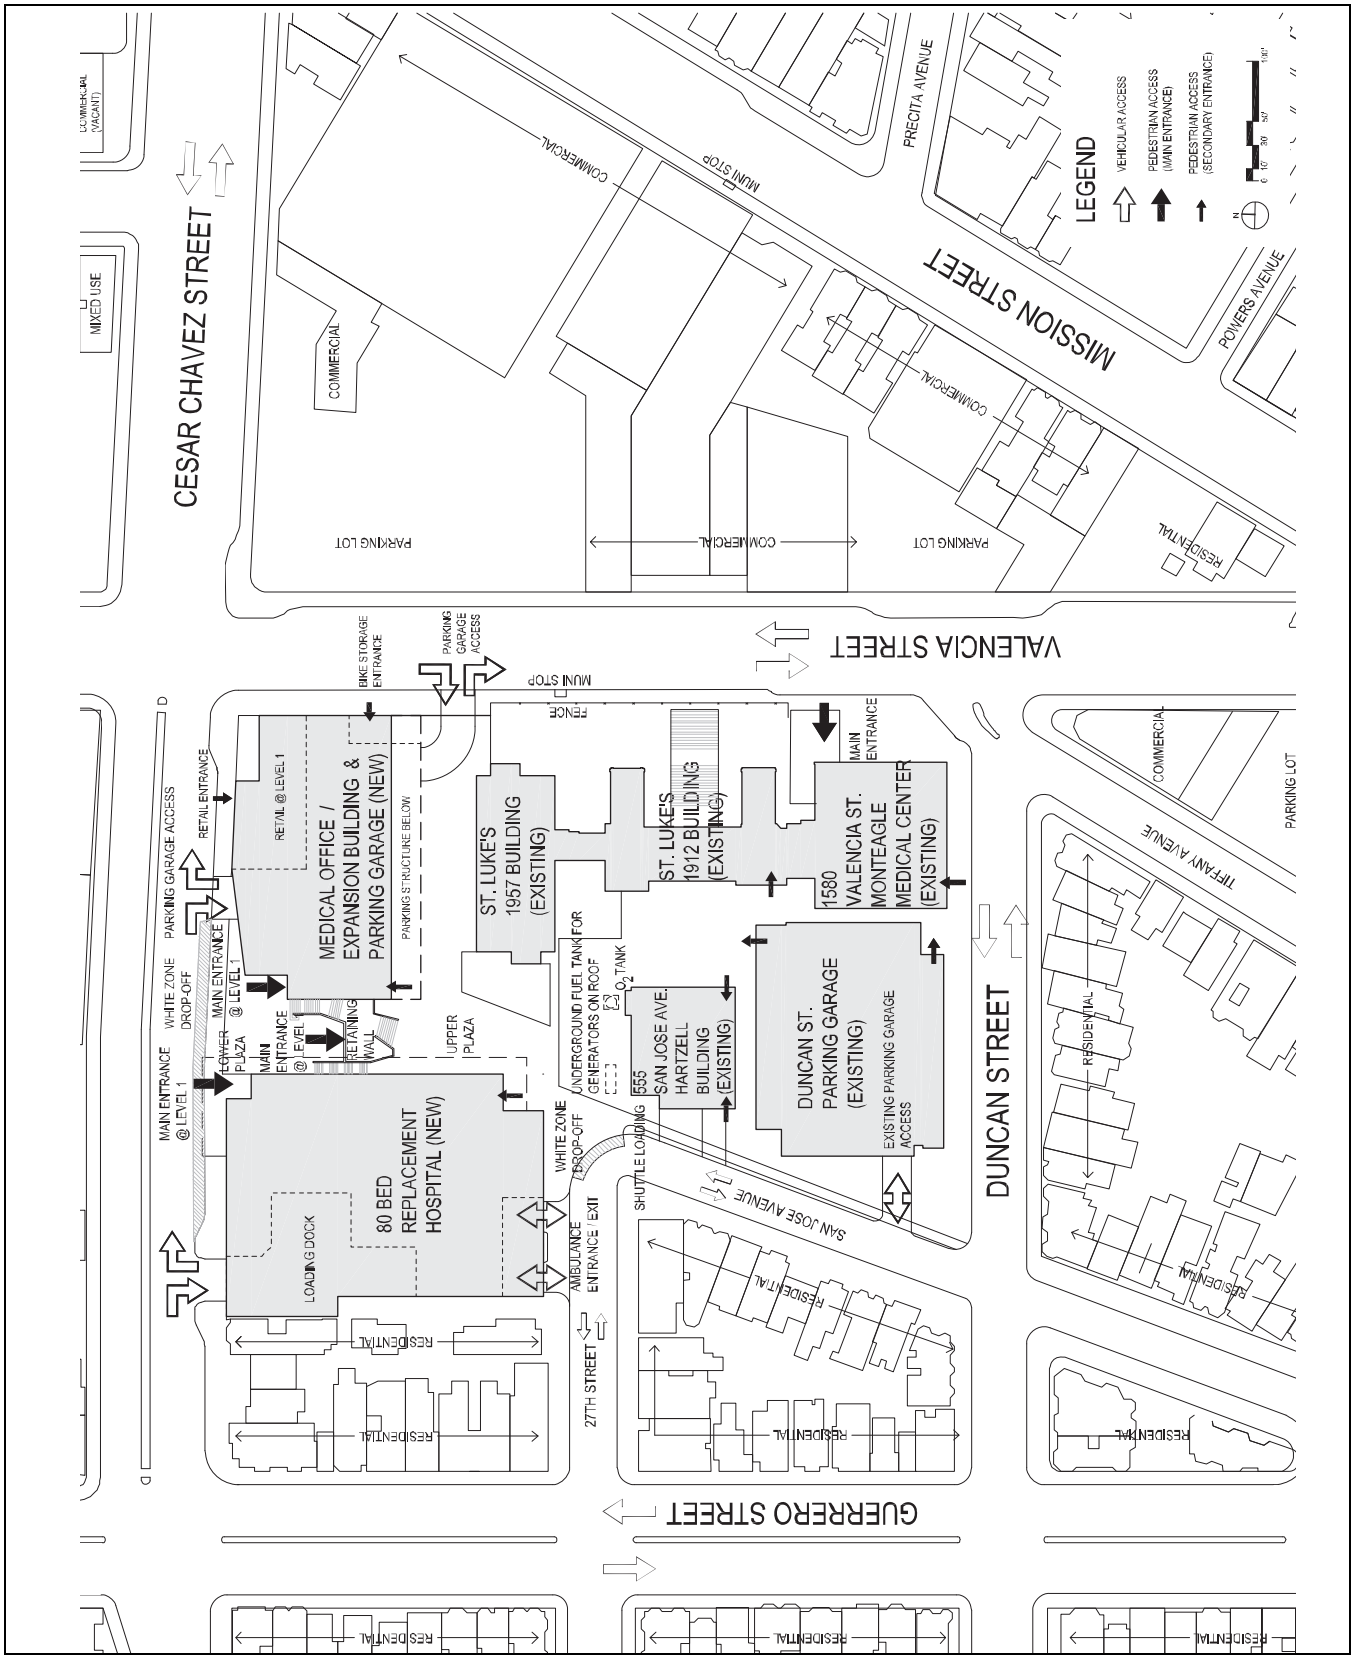
The text in the Draft EIR, page 4.5-197, first sentence in the last paragraph has been revised to update the square footage at the proposed St. Luke's Replacement Hospital, as follows:

> An approximately 80-bed, 154,800 ~~145,000~~-sq.-ft., St. Luke's Replacement Hospital is proposed on the project site, west of the existing St. Luke's Hospital tower.

Page 4.5-204 of the Draft EIR has revised as follows:

> The St. Luke's Campus project would result in an increase in pedestrian activity in the vicinity of the campus, including walk trips to and from the proposed uses, plus walk trips to and from Muni bus stops and 24th Street BART Station. Overall, during the p.m. peak hour the project would add about 64 net-new pedestrian trips (an increase of 25 walk trips, and ~~39~~ 71 net-new trips that account for walk trips to and from the transit stops) to the surrounding streets (see Table 4.5-11, page 4.5-77).

Figure 4.5-26 in the Draft EIR, page 4.5-207 "St. Luke's Campus – Proposed Passenger Zones" has been revised for clarification to show the correct passenger zones at the St. Luke's Campus under the proposed CPMC LRDP. The revised figure is presented below:



Source: SmithGroup/Boulder Associates 2010

St. Luke's Campus Proposed Passenger Zones **Figure 4.5-26 (Revised)**

The text in the Draft EIR, page 4.5-219 and S-54 for Impact TR-100 has been revised as follows because the Van Ness/Pine intersection would only be impacted under the cumulative scenario:

> *Impact TR-100 Implementation of the Cathedral Hill project would result in significant ~~project and~~ cumulative impacts at the intersection of Van Ness/Pine. (Significant and Unavoidable)*

The text in the Draft EIR, page 4.5-234, has been updated to include Improvement Measure I-TR-128

Improvement Measure I-TR-128 Divisadero/Haight Intersection Improvement

> As an improvement measure to improve the operating conditions from LOS E or LOS F to LOS D at the intersection of Divisadero/Haight, the project sponsor would provide funds to re-stripe the Divisadero/Haight intersection to accommodate a 125-foot northbound right-turn pocket. This capacity improvement would result in the loss of up to five on-street parking spaces but would decrease average delay at the intersection to acceptable levels.

The text in the Draft EIR page 4.5-238 and S-57 for Mitigation Measure MM-TR-134 has been revised as follows to make this measure consistent with the other mitigation measures requiring a Transit Mitigation Agreeement with SFMTA:

Mitigation Measure MM-TR-134

> CPMC shall ensure that the transit delay impact related to the Cathedral Hill Campus project on the 47-Van Ness is reduced to a less-than-significant level by financially compensating the SFMTA for the cost of providing the additional service needed to accommodate the project at ~~existing~~ proposed levels of service. The financial contribution shall be calculated and applied in a manner that is consistent with the SFMTA cost/scheduling model. The amount and schedule for payment and commitment to application of service needs shall be set forth in a Transit Mitigation Agreement between CPMC and SFMTA.

4.2.9 NOISE (CHAPTER 4.6)

Data in the Draft EIR, page 4.6-31, Table 4.6-16 "Summary of EPA-Recommended Noise Level Standards," has been revised to correct a typographical error, as follows:

Table 4.6-16
Summary of EPA-Recommended Noise Level Standards

Effect	Level	Area
Hearing loss	$L_{eq(24)} \leq 70$ dB	All areas
Outdoor activity interference and annoyance	$L_{dn} \leq 55$ dB	Outdoor in residential areas and farms and other outdoor areas where people spend widely varying amounts of time and other places in which quiet is a basis for use.
	$L_{eq(24)} \leq 55$ dB	Outdoor areas where people spend limited amounts of time, such as school yards, playgrounds, etc.
Indoor activity interference and annoyance	$L_{\text{~~eq~~}dn} \leq 45$ dB	Indoor residential areas
	$L_{eq(24)} \leq 45$ dB	Other indoor areas with human activities such as schools, etc.

Notes:
dB = decibels; EPA = U.S. Environmental Protection Agency; L_{dn} = day-night noise level (L_{eq} with a 10-dB nighttime weighting); $L_{eq(24)}$ = equivalent noise level (the sound energy averaged over a 24-hour period)
Source: U.S. Environmental Protection Agency, 1974 (March). *Information on Levels of Environmental Noise Requisite to Protect Public Health and Welfare with an Adequate Margin of Safety.* Washington, DC. Page 3.

Data in the Draft EIR, page 4.6-32, Table 4.6-17 "Summary of FTA-Recommended Groundborne Vibration Impact Criteria," has been revised to correct a typographical error, as follows:

Table 4.6-17
Summary of FTA-Recommended Groundborne Vibration Impact Criteria

Land Use Category	Impact Levels (VdB; relative to 1 microinch per second)		
	Frequent Events[1]	Occasional Events[2]	Infrequent Events[3]
Category 1: Buildings where vibration would interfere with interior operations	65[4]	65[4]	65[4]
Category 2: Residences and buildings where people normally sleep	72	75	80
Category 3: Institutional land uses with primarily daytime uses	75	78	83

Notes: FTA = Federal Transit Administration; VdB = vibration decibels
[1] Defined as more than 70 vibration events of the same source per day. Most rapid transit projects fall into this category.
[2] Defined as between 30 and 70 vibration events of the same source per day. Most commuter trunk lines have this many operations.
[3] Defined as fewer than 30 vibration events of the same kind per day. This category includes most commuter rail branch lines.
[4] This criterion limit is based on levels that are acceptable for most moderately sensitive equipment such as optical microscopes. Vibration-sensitive manufacturing or research will require detailed evaluation to define the acceptable vibration levels. Ensuring lower vibration levels in a building often requires special design of the heating, ventilation, and air conditioning systems and stiffened floors.
Source: Federal Transit Administration. 2006 (May). *Transit Noise and Vibration Impact Assessment.* Washington, DC. Page 8-3.

The text in the Draft EIR, page 4.6-43, end of the third paragraph, has been revised as follows because during the review of the Draft EIR and continued planning of the proposed project, CPMC, in consultation with its construction partners, continued to evaluate and refine the proposed construction plan:

> Hours of operation during the Cathedral Hill and the MOB construction phases would extend from 7 a.m. to 7 p.m. Monday through Friday ~~midnight on all typical work days, using two shifts~~. Saturday work would occur from 7 a.m. to 5 p.m.; work is not expected to be done on Sunday. ~~The hours of operation would vary slightly during the development projects' various stages.~~ Construction work extending past 7 p.m. would be limited to activities such as: concrete finishing, steel detailing and general production preparation. Construction work extending past 7 p.m. would be communicated with the neighbors on a

> weekly basis. Second shift work (work occurring between 4 p.m. and midnight) is anticipated only during interior build out phase of the Cathedral Hill Hospital.

The text in the Draft EIR, page 4.6-45, first paragraph, has been revised as follows because during the review of the Draft EIR and continued planning of the proposed project, CPMC, in consultation with its construction partners, continued to evaluate and refine the proposed construction plan:

> Most of the construction activities at the proposed Cathedral Hill Campus would occur between 7 a.m. and 7~~8~~ p.m. Demolition of the existing buildings and site excavation for the Cathedral Hill Hospital would generally occur between 7 a.m. and 7~~4~~ p.m., Monday–Friday. At both the Cathedral Hill Hospital site and the Cathedral Hill MOB site, construction on Saturdays is proposed for generally between 7 a.m. and 5 p.m. No construction is planned on Sundays. There are no second shifts proposed for construction activity associated with demolition, excavation and erection of the proposed buildings. Nighttime construction would occur during the interior finishes phase. ~~However, CPMC also proposes a second construction shift during the demolition and excavation phase at the hospital and MOB sites to aid in off-site disposal of the demolished material and allow excavated material to be hauled off during lighter traffic periods. The second shift would be from 4 p.m. to midnight, Monday–Friday.[34] Extended work hours (until midnight on weekdays) are also proposed for the foundation and structural stages, during concrete placement and finishing activities and the pouring of concrete decks. Welding activities on the structural steel tower could also extend into a second shift, depending on the availability of certified welders.~~
>
> ~~[34] Herrero Boldt. 2009 (December). CPMC Cathedral Hill Hospital and Medical Office Building Construction Data. San Francisco, CA. These data are on file with the Planning Department, 1650 Mission Street, Suite 400, San Francisco 94103, and are available for public review as part of the project file, in Case No. 2005.0555E.~~

The text in the Draft EIR, page 4.6-45, fourth and fifth sentences of the second paragraph, has been deleted as follows because during the review of the Draft EIR and continued planning of the proposed project, CPMC, in consultation with its construction partners, continued to evaluate and refine the proposed construction plan:

> ~~Also, the second shift of construction at the Cathedral Hill Hospital and Cathedral Hill MOB sites, and construction of the Van Ness Avenue pedestrian tunnel, conducted between 8 p.m. and midnight, would exceed the ambient noise levels by 5 dBA, as measured at the property line. This nighttime construction would occur during the initial 11–15 months of the demolition/construction phase; and as noted above, a special permit would be required to allow construction work after 8 p.m. or before 7 a.m.~~

The text in the Draft EIR, page 4.6-46, second full sentence in the first paragraph, has been revised as follows because during the review of the Draft EIR and continued planning of the proposed project, CPMC, in consultation with its construction partners, continued to evaluate and refine the proposed construction plan:

> Construction of the tunnel foundation and structure, as well as construction of the tunnel interior, would be performed between 7 a.m. and 7~~5~~ p.m., Monday–Friday.

The text in the Draft EIR, page 4.6-49, fifth through seventh sentences in the first paragraph, has been revised as follows because during the review of the Draft EIR and continued planning of the proposed project, CPMC, in consultation with its construction partners, continued to evaluate and refine the proposed construction plan:

All construction work for the proposed Neuroscience Institute building is proposed to occur between 7 a.m. and 5 p.m., Monday– Friday, excluding holidays. ~~Work may continue to 8 p.m. on typical work days and select Saturdays, as required.~~ Saturday shifts are not anticipated.

Data in the Draft EIR, page 4.6-59, Table 4.6-26 "Predicted Future Traffic Noise Levels-Cathedral Hill Campus," has been revised to correct a typographical error, as follows:

Table 4.6-26 (Revised)
Predicted Future Traffic Noise Levels—Cathedral Hill Campus

Roadway	Segment		L_{dn} at 50 Feet, dB							
	From	To	Baseline (2015) No Project	Baseline (2015) Plus Project	Net Change	+3 dB Increase	Cumulative (2030) No Project	Cumulative (2030) Plus Project	Net Change	+3 dB Increase

Cedar St	Polk St	Van Ness Ave	52.0	62.3	10.3	No[1]	52.0	62.3	10.3	No[1]

Notes: dB = (A-weighted) decibels; L_{dn} = day-night average noise level
Traffic noise levels are predicted at a standard distance of 50 feet from the roadway centerline and do not account for shielding from existing noise barriers or intervening structures. Traffic noise levels may vary depending on actual setback distances and localized shielding.
[1] Existing measured noise levels on Cedar Street were 60.8 dB L_{eq} as shown in Table 4.6-4 "Existing Ambient Noise Levels—Cathedral Hill Campus." Therefore, comparing measured ambient noise levels to future modeled traffic noise levels, the increase (+2.3 dB) in traffic noise levels would be less than significant.
Source: Data modeled by AECOM in 2010

The text in the Draft EIR, page 4.6-78, first sentence at the top of the page, has been amended to include the following clarification of potential siren noise levels in the vicinity of the St. Luke's campus:

As a result, noise associated with the ambulance entrance/exit, without the use of sirens, would comply with the City's noise limit of 8 dB above the ambient noise level at the property line~~; however, such noise could result in a substantial increase in ambient noise levels at nearby sensitive receptors above existing~~

~~levels with the frequent use of sirens~~. With respect to siren noise and similar to the analysis presented above for the proposed Cathedral Hill campus, the St. Luke's campus would continue to accept Code 3 emergency transports that necessitate the use of sirens with implementation of the proposed CPMC LRDP. Based on the projected emergency medical service needs associated with the St. Luke's campus, the number of Code 3 emergency transports which require the use of a siren would average approximately 0.6 Code 3 transports per day or 219 annual Code 3 transports. This calculation reflects a high-end estimate of the total number of emergency transports (6,239) projected for the St. Luke's campus in 2015, as well as the percentage of Code 3 transports of total ambulance transports accepted by St. Luke's in 2009. Based on the ambient noise level measurements shown in Table 4.6-14, this would represent up to a 0.2 dBA increase in hourly Leq and would occur less than once per day on average. This would not be considered a substantial increase in ambient noise levels resulting from implementation of the proposed CPMC LRDP. As a result, impacts would be considered less than significant.

4.2.10 AIR QUALITY (SECTION 4.7)

The text in the Draft EIR, page 4.7-27, footnote 39, has been revised to reflect updated air quality analysis performed after publication of the Draft EIR, as follows:

39 Construction emissions and stationary-source emissions modeling was conducted for the proposed CPMC LRDP by ENVIRON in 2010 and 2011. This information is on file with the San Francisco Planning Department, 1650 Mission Street, Suite 400, San Francisco 94103, and is available for public review as part of the project file, in Case No. 2005.0555E.

The text in the Draft EIR, page 4.7-34, has been updated to reflect the impact determination for Impact AQ-2, as follows:

IMPACT AQ-2 *Construction activities associated with the LRDP would not expose sensitive receptors to substantial concentrations of toxic air contaminants (1999 BAAQMD Guidelines). (Significance Criteria 7b and 7d)*

Levels of Significance:

- *Cathedral Hill (with or without project variants): ~~Significant and unavoidable with mitigation~~ Less than significant with mitigation*
- *Pacific: Less than significant*
- *Davies: Less than significant*
- *St. Luke's (with or without either project variant): Less than significant*

The text in the Draft EIR, page 4.7-34, last paragraph, has been updated to accurately reflect Estimated Excess Cancer Risk, based upon the refined estimates of construction emissions from the proposed LRDP included in Appendix C to this C&R document, as follows:

The results of the risk analysis for the MEI (i.e., resident child) are summarized in Table 4.7-5, "Screening-Level Analysis of Health Risks from Construction Emissions for All Campuses" (page 4.7-35). These results reflect a conservative, screening-level estimate; additional, more refined modeling would better characterize risk associated with construction at Cathedral Hill Campus and would result in smaller impacts. According to the analysis, the LRDP's construction-related TAC emissions at the proposed Cathedral Hill Campus would generate a cancer risk of approximately ~~17~~8.3 in a million at the maximally exposed off-site individual, assuming the receptor is a resident child. This level ~~exceeds~~is below the threshold of 10 in a million; therefore, **this impact would be less than signifcant**. ~~These results reflect a conservative, screening-level estimate; additional, more refined modeling would better characterize risk associated with construction at Cathedral Hill Campus and would result in smaller impacts. However, based on the screening-level evaluation, the LRDP's construction-related DPM emissions would be considered potentially significant under BAAQMD's applicable (1999) Air Quality Guidelines. Due to the scale of the construction activities and proximity to adjacent receptors,~~ ~~**the health risk impacts from construction of the Cathedral Hill Campus could be above BAAQMD's significance threshold and therefore would be potentially significant**~~.~~

The text in the Draft EIR, page 4.7-35, second paragraph, has been updated to reflect the revised impact determination for Impact AQ-2 at the Cathedral Hill Campus based upon the refined estimates of construction emissions from the proposed LRDP included in Appendix C to this C&R document, as follows:

Cathedral Hill Campus with Project Variants: As detailed in "Methodology for Assessing Impacts under CEQA and Applicable (1999) BAAQMD Significance Criteria" on page 4.7-26, none of the project variants for Cathedral Hill Campus are expected to significantly change the construction or operations (including the number and duration of vehicle trips) associated with the campus. Hence, the project variants are not expected to significantly change emission estimates, associated health risks, or the impact determinations derived from them. For the Cathedral Hill Campus project variants, for the same reasons as described previously, **this impact would be ~~potentially~~less than significant**.

The data in the Draft EIR, page 4.7-35, Table 4.7-5, "Screening-Level Analysis of Health Risks from Construction Emissions for All Campuses," have been revised as follows based upon the refined estimates of construction emissions from the proposed LRDP included in Appendix C to this C&R document, to accurately reflect Estimated Excess Cancer Risk at the maximally exposed individual receptor (MEIR):

Table 4.7-5
Screening-Level Analysis of Health Risks from Construction Emissions with Mitigation for All Campuses *(1999 Criteria)*

Campus and Project	Estimated Excess Cancer Risk at MEIR – Adult Exposure Parameters (per million)	Estimated Excess Cancer Risk at MEIR – Child Exposure Parameters (per million)
Cathedral Hill Campus	~~9~~4.3	~~17~~8.3
Davies Neuroscience Institute	~~1~~0.4	~~2~~0.7
Davies Castro Street/14th Street MOB	~~0~~0.3	~~1~~0.6
Pacific Campus	~~2~~0.3	~~3~~0.5
St. Luke's Replacement Hospital	~~2~~1.9	~~4~~ 3.6
St. Luke's MOB	~~1~~0.2	~~1~~0.3
BAAQMD Threshold	10	10

Notes: BAAQMD = Bay Area Air Quality Management District; MEIR = maximally exposed individual receptor; MOB = medical office building.
Source: Modeling performed by ENVIRON in 2011. Refer to ENVIRON memo dated March 7, 2011 entitled "Revisions to CPMC Construction Emissions and Health Risk Analysis." This information is on file with the San Francisco Planning Department, 1650 Mission Street, Suite 400, San Francisco 94103, and is available for public review as part of the project file, in Case No. 2005.0555E.

The text in the Draft EIR, page 4.7-36, second paragraph, has been revised to reflect updates to the impact determinations to Impact AQ-2 based upon the refined estimates of construction emissions from the proposed LRDP included in Appendix C to this C&R document, as follows:

> The proposed CPMC construction management plan includes measures consistent with the above mitigation measures, thereby incorporating them into the proposed LRDP. Nevertheless, to ensure that these measures would be legally binding under CEQA, they have been included as Mitigation Measure M-AQ-N2. Implementation of~~While it is possible that~~ Mitigation Measure M-AQ-N2 ~~could~~would reduce the carcinogenic risk and chronic noncarcinogenic health hazards posed by DPM emissions below the thresholds., ~~it is unknown at this time to what extent such equipment will be available at the time of construction. In light of this uncertainty, this~~ **~~impact would remain significant and unavoidable~~** Therefore, this **impact would be less than significant with mitigation**.

The text in the Draft EIR, page 4.7-36, third, fourth, and fifth paragraphs, and Draft EIR page 4.7-37, first sentence and first two complete paragraphs, have been revised to accurately reflect Estimated Excess Cancer Risk at the Davies and St. Luke's Campuses, based upon the refined estimates of construction emissions from the proposed LRDP included in Appendix C to this C&R document, as follows:

◆ Davies Campus

According to the risk analysis summarized in Table 4.7-5 (page 4.7-35), the construction-related TAC emissions that would result from development of the proposed Neuroscience Institue at the Davies Campus would result in an estimated excess cancer risk of approximately ~~2~~0.7 in a million at the MEI

(e.g., resident child). This level is below the threshold of 10 in a million; therefore, **this impact would be less than significant**.

Improvement Measure for Davies Campus (Near Term)

I-AQ-N2 This improvement measure is identical to Mitigation Measure M-AQ-N2 for the Cathedral Hill Campus.

Implementing Improvement Measure I-AQ-N2 at the Davies Campus would ~~further~~ reduce the carcinogenic risks and chronic noncarcinogenic health hazards posed by DPM emissions during construction activities associated with development.

◆ St. Luke's Campus

According to the risk analysis summarized in Table 4.7-5 (page 4.7-35), the LRDP's construction-related DPM emissions at the St. Luke's Campus would result in an estimated excess cancer risk of approximately ~~4~~ 3.6 in a million at the MEI (e.g., resident child) associated with the proposed Replacement Hospital and approximately 0.3 in a million associated with the proposed MOB/Expansion Building. This level is below the threshold of 10 in a million; therefore, **this impact would be less than significant.**

The same group of receptors will be impacted by both the hospital and the MOB construction projects at St. Luke's Campus; therefore, the risk estimates for both projects should be considered cumulatively. A conservative estimate of overall risk from construction for these receptors would be the sum of the risks calculated for each construction project. As shown in Table 4.7-5, the sum of the estimated excess cancer risks for both St. Luke's projects is approximately ~~5~~3.9 in a million at the MEI (e.g., resident child); therefore, **this impact would be less than significant**.

Improvement Measure for St. Luke's Campus (Near Term)

I-AQ-N2 This improvement measure is identical to Mitigation Measure M-AQ-N2 for the Cathedral Hill Campus.

Implementing Improvement Measure I-AQ-L2 would ~~further~~ reduce the carcinogenic risks and chronic noncarcinogenic health hazards posed by DPM emissions during construction activities associated with development.

The text in the Draft EIR, page 4.7-37, fourth and fifth paragraphs, has been revised to accurately reflect Estimated Excess Cancer Risk under long-term projects at the Pacific Campus, based upon the refined estimates of construction emissions from the proposed LRDP included in Appendix C to this C&R document, as follows:

◆ Pacific Campus

According to the risk analysis summarized in Table 4.7-5 (page 4.7-35), the LRDP's construction-related TAC emissions at the Pacific Campus would result in an estimated excess cancer risk of approximately ~~3~~0.5 in a million at the MEI (e.g., resident child); therefore, **this impact would be less than significant**.

Improvement Measure for Pacific Campus (Long Term)

I-AQ-L2 This improvement measure is identical to Mitigation Measure M-AQ-N2 for the Cathedral Hill Campus.

Implementing Improvement Measure I-AQ-L2 would ~~further~~ reduce the carcinogenic risks and chronic noncarcinogenic health hazards posed by DPM emissions during construction activities associated with development.

The text in the Draft EIR, page 4.7-38, first, second, and third paragraphs, have been revised to accurately reflect Estimated Excess Cancer Risk under long-term projects at the Davies Campus, based upon the refined estimates of construction emissions from the proposed LRDP included in Appendix C to this C&R document, as follows:

◆ Davies Campus

According to the risk analysis summarized in Table 4.7-5 (page 4.7-35), the construction-related TAC emissions that would result from development of the proposed Castro Street/14th Street MOB at the Davies Campus would result in an estimated excess cancer risk of approximately ~~1~~0.6 in a million at the MEI (e.g., resident child); therefore, **this impact would be less than significant**.

The same group of receptors will be impacted by both near-term and long-term construction projects at the Davies Campus; therefore, the risk estimates for both projects should be considered cumulatively. A conservative estimate of overall risk from construction for these receptors would be the sum of the risks calculated for each construction project. As shown in Table 4.7-5, the sum of the estimated excess cancer risks for both Davies projects is approximately 1.3~~3~~ in a million at the MEI (e.g., resident child); therefore, **this impact would be less than significant**.

Improvement Measure for Davies Campus (Long Term)

I-AQ-L2 This improvement measure is identical to Mitigation Measure M-AQ-N2 for the Cathedral Hill Campus.

Implementing Improvement Measure I-AQ-L2 would ~~further~~ reduce the carcinogenic risks and chronic noncarcinogenic health hazards posed by DPM emissions during construction activities associated with development.

The text in the Draft EIR, page 4.7-44, footnote 48, has been revised to reflect updated air quality analysis performed after publication of the Draft EIR, as follows:

[48] Modeling provided by ENVIRON in ~~2010~~2011. This information is on file with the San Francisco Planning Department, 1650 Mission Street, Suite 400, San Francisco 94103, and is available for public review as part of the project file, in Case No. 2005.0555E.

The text in the Draft EIR, page 4.7-46, Table 4.7-8 "Screening Evaluation of Health Risks Associated with Diesel Particulate Matter (DPM) Emissions from Proposed Generators—Cathedral Hill Campus" has been revised to reflect updated air quality analysis, as follows:

Table 4.7-8
Screening Evaluation of Health Risks Associated with Diesel Particulate Matter (DPM) Emissions from Proposed Generators—Cathedral Hill Campus[a]

Receptor Height (meters)[b]	Incremental DPM Concentration ($\mu g/m^3$)[c]	Chronic Noncancer Hazard Index[c]	Inhalation Risk (excess cancer cases per million)[c]
0	~~0.001~~0.0004	~~2E-04~~8E-05	~~0.6~~0.2
20	~~0.001~~0.0004	~~2E-04~~8E-05	~~0.6~~0.2
60	~~0.003~~0.001	~~6E-04~~2E-04	~~1.5~~0.6
Applicable BAAQMD significance threshold [d]		*1.0*	*10*

Notes: $\mu g/m^3$ = micrograms per cubic meter

[a] Evaluation performed with the USEPA's SCREEN3 air dispersion model using worst-case meteorological data, emission stack parameters provided by CPMC, and estimated annual DPM emissions from new generators at (a) Cathedral Hill Hospital and (b) Medical Office Building. Separate analyses were performed for the two buildings; for a conservative estimate of total risk, the individual risk estimates at each receptor height for both buildings were summed.

[b] Receptor heights relative to ground surface were based on roof heights of surrounding buildings.

[c] Risks at each height are compared separately to the BAAQMD significance thresholds; the risks for different receptor heights are not additive.

[d] Significance thresholds are from the 1999 BAAQMD CEQA Guidelines.

Source: Modeling provided by ENVIRON in ~~2010~~2011. This information is on file with the San Francisco Planning Department, 1650 Mission Street, Suite 400, San Francisco 94103, and is available for public review as part of the project file, in Case No. 2005.0555E

The text in the Draft EIR, page 4.7-49, Table 4.7-10 "Screening Evaluation of Health Risks Associated with Diesel Particulate Matter Emissions from Proposed Generator—Davies Campus" has been revised to reflect updated air quality analysis, as follows:

Table 4.7-10
Screening Evaluation of Health Risks Associated with Diesel Particulate Matter Emissions from Proposed Generator—Davies Campus[a]

[d] Significance thresholds from the 1999 BAAQMD CEQA Guidelines.
Source: Modeling provided by ENVIRON in 2010. This information is on file with the San Francisco Planning Department, 1650 Mission Street, Suite 400, San Francisco 94103, and is available for public review as part of the project file, in Case No. 2005.0555E

The text in the Draft EIR, page 4.7-50, second paragraph, has been revised to reflect updates to generator equipment at the St. Luke's Campus, as follows:

> **Diesel-Fueled Generators:** Two existing generators (rated at 600 kilowatts [kW] and 250 kW, respectively) would be removed from the St. Luke's Hospital tower, ~~two~~one new ~~1,500~~2,000-kW generator~~s~~ would be installed at the St. Luke's Replacement Hospital, and one new 250-kW generator would be installed at the St. Luke's MOB/Expansion Building.

The text in the Draft EIR, page 4.7-50, Table 4.7-11 "Diesel Particulate Emissions from Emergency Generators—St. Luke's Campus" has been revised to reflect updated air quality analysis, as follows:

Table 4.7-11
Diesel Particulate Emissions from Emergency Generators—St. Luke's Campus

Status	Quantity	Equipment/Model	DPM (lb/yr)
To be removed	1	Generator, 250 kW (installed ~1969)	-9
To be removed	1	Generator, 600 kW (installed ~1969)	-20
Proposed	1	Generator, 250 kW (to be installed in 2018)	0.2
Proposed	~~2~~1	Generator~~s~~, Caterpillar, ~~1500~~2000 kW ~~(to be installed by 2015)~~	~~13~~1
Net change in emissions			**~~-15~~ -27**

Notes: DPM = diesel particulate matter; lb/yr = pounds per year. Total does not add exactly because of rounding.
Source: Modeling provided by ENVIRON in ~~2010~~2011. This information is on file with the San Francisco Planning Department, 1650 Mission Street, Suite 400, San Francisco 94103, and is available for public review as part of the project file, in Case No. 2005.0555E

The text in the Draft EIR, page 4.7-62, has been updated to reflect the revised impact determination for Impact AQ-9 for the long-term projects at the Pacific and Davies Campuses, based upon the refined estimates of construction emissions from the proposed LRDP included in Appendix C to this C&R document, as follows:

IMPACT AQ-9

Near-term ~~and long-term~~ construction activities associated with the LRDP would exceed recently adopted (June 2, 2010) BAAQMD CEQA significance thresholds for mass criteria pollutant emissions and would contribute to an existing or projected air quality violation. (Significance Criteria 7b and 7c)

Levels of Significance:

- *Cathedral Hill (with or without project variants): Significant and unavoidable with mitigation*
- *Pacific: ~~Significant and unavoidable with mitigation~~ Less-than-significant with mitigation*
- *Davies (near-term): Significant and unavoidable with mitigation*
- *Davies (long-term): Less-than-significant with mitigation*
- *St. Luke's (with or without either project variant): Significant and unavoidable with mitigation*

The data in the Draft EIR, page 4.7-63, Table 4.7-12, "Near-Term Modeled Average Daily Emissions of Criteria Air Pollutants and Precursors Associated with Construction under the LRDP," have been replaced as follows to accurately reflect particulate emissions from stationary source equipment:

Table 4.7-12
Near-Term Modeled Average Daily Emissions of Criteria Air Pollutants and Precursors Associated with Construction under the LRDP (with Mitigation)

Activity	Emissions (lb/day)[a]			
	ROG	NO_X	PM_{10}[b]	$PM_{2.5}$[b]
Cathedral Hill Campus				
Off-road equipment	5	42	0.9	0.9
Asphalt paving	0.003	–	–	–
Application of architectural coatings	25	–	–	–
Worker commuting	3	7	0.6	0.6
On-road truck hauling	1	21	0.3	0.3
Cathedral Hill Campus Total [c]	**34**	**70**	**1.8**	**1.8**
Davies Neuroscience				
Off-road equipment	0.2	1.5	0.04	0.04
Asphalt paving	0.002	–	–	–
Application of architectural coatings	0.7	–	–	–
Worker commuting	0.2	0.6	0.05	0.05
On-road truck hauling	0.05	0.5	0.01	0.01
Davies Neuroscience Total [c]	**1.2**	**2.6**	**0.1**	**0.1**
St. Luke's Hospital				
Off-road equipment	0.7	5	0.1	0.1
Asphalt paving	0.001	–	–	–
Application of architectural coatings	2	–	–	–
Worker commuting	0.6	2	0.1	0.1
On-road truck hauling	0.1	2.2	0.03	0.03
St. Luke's Hospital Total [c]	**3.4**	**8.6**	**0.3**	**0.3**
Total average daily emissions, all campuses (lb/day)[d]	39 lb/day	**81** lb/day	2 lb/day	2 lb/day
Recently adopted BAAQMD significance criterion	54 lb/day	54 lb/day	82 lb/day[e]	54 lb/day[e]

Notes: BAAQMD = Bay Area Air Quality Management District; lb/day = pounds per day; NO_X = oxides of nitrogen; PM_{10} = respirable particulate matter with an aerodynamic diameter of 10 micrometers or less; $PM_{2.5}$ = fine particulate matter with an aerodynamic diameter of 2.5 micrometers or less; ROG = reactive organic gases.

[a] Mitigation measures for offroad equipment: During any construction phase, all diesel generators meet Tier 4 emission standards and at least 50% of excavators, dozers, backhoes, soil mix drill rigs, soldier pile rigs, shoring drill rigs, concrete boom pumps and concrete trailer pumps would meet Tier 2 plus CARB certified Level 3 verified diesel emission controls (VDECs). In addition, on-road hauling truck diesel emissions would be equivalent to the emissions performance of model year 2007 or later.

[b] For a conservative estimate, all particulate matter exhaust emissions were assumed to be $PM_{2.5}$, which is a subset of PM_{10}. Therefore, all particulate matter exhaust emissions are also considered PM_{10}.

[c] Average daily emissions were calculated by dividing the total near-term emissions for each campus by the total number of construction days in the near-term period. Total daily emissions values may not add up to the sum of individual sources due to number rounding.

[d] "All campuses" for 2011–2015 refers to all three CPMC campuses with near-term projects.

[e] These criteria apply to exhaust emissions only.

Source: Analysis performed by ENVIRON in 2011. Refer to ENVIRON memo dated March 7, 2011 entitled "Revisions to CPMC Construction Emissions and Health Risk Analysis." This information is on file with the San Francisco Planning Department, 1650 Mission Street, Suite 400, San Francisco 94103, and is available for public review as part of the project file, in Case No. 2005.0555E.

The text in the Draft EIR, page 4.7-64, fourth paragraph, has been revised as follows to reflect added text regarding refinements to the proposed CPMC construction management plan related to implementation of Mitigation Measure M-AQ-N9:

M-AQ-N9 Implement Construction Mitigation under Recently Adopted Thresholds of Significance.

CPMC shall implement Mitigation Measure M-AQ-N1a, "Implement BAAQMD Basic and Optional Control Measures and Additional Construction Mitigation Measures during Construction," discussed under Impact AQ-1 (page 4.7-31), and Mitigation Measure M-AQ-N2, "Install Accelerated Emission Control Device on Construction Equipment," discussed under Impact AQ-2 (page 4-17), to reduce emissions of criteria pollutants from construction equipment exhaust. The proposed CPMC construction management plan includes measures consistent with the above mitigation measures, thereby incorporating them into the proposed LRDP. Nevertheless, to ensure that these measures would be legally binding under CEQA, they have been included as Mitigation Measure M-AQ-N9.

The text in the Draft EIR, page 4.7-65, has been revised to refect updated text regarding refinements to the proposed CPMC construction management plan related to implementation of Mitigation Measure M-AQ-L9, as well as updates to impact determinations under Impact AQ-10 based upon the refined estimates of construction emissions from the proposed LRDP included in Appendix C to this C&R document, as follows:

LONG-TERM PROJECTS

◆ Pacific and Davies Campuses

Table 4.7-13, "Long-Term Modeled Average Daily Emissions of Criteria Air Pollutants and Precursors Associated with Construction under the LRDP," summarizes the average daily emissions of criteria air pollutants (i.e., PM_{10} and $PM_{2.5}$) and precursors (i.e., ROG and NO_X) that would be generated during the construction period for long-term projects.

~~Emissions associated with long-term campus construction under the LRDP would exceed the recently adopted BAAQMD significance criteria for construction-related NO_X. Implementation of long-term projects under the LRDP could result in or substantially contribute to an air quality violation for NO_X. As a result, **this impact would be significant under the recently adopted BAAQMD CEQA significance criteria**.~~ The construction management plan for the proposed LRDP would include BAAQMD Basic and Optional Control Measures and Additional Construction Mitigation Measures, consistent with Mitiagation Measure M-AQ-N1a, and installation of emission control devices on construction equipment consitent with Mitigation Measure M-AQ-N2. Therefore, these measures have been incorporated as part of the

proposed LRPD. Nevertheless, to ensure that these measures would be leagally binding under CEQA, they have been included as the following mitigation measure:

M-AQ-L9 Implement Construction Mitigation under Recently Adopted BAAQMD Thresholds of Significance

This potential mitigation measure is identical to potential Mitigation Measure M-AQ-N9, above.

~~Even with~~With implementation of the mitigation described above, the criteria pollutant emissions from construction equipment sources associated with long-term campus construction under the LRDP are predicted to ~~remain above~~be below the recently adopted (2010) significance thresholds. Hence, the impact associated with criteria pollutant emissions from long-term construction would ~~remain~~be **less-than-significant ~~and unavoidable~~with mitigation under the recently adopted BAAQMD CEQA significance criteria**.

IMPACT AQ-10 *Construction activities associated with the LRDP would result in short-term increases in emissions of diesel particulate matter that exceed the recently adopted (June 2, 2010) BAAQMD CEQA significance criteria and expose sensitive receptors to substantial concentrations of toxic air contaminants and $PM_{2.5}$. (Significance Criteria 7b and 7d)*

Levels of Significance:

- *Cathedral Hill (with or without project variants): Significant and unavoidable with mitigation*
- *Pacific: ~~Significant and unavoidable~~Less-than-significant with mitigation*
- *Davies (near-term): Less-than-significant with mitigation*
- *Davies (long-term): Significant and unavoidable with mitigation*
- *St. Luke's (with or without either project variant): Significant and unavoidable with mitigation*

The data in the Draft EIR, page 4.7-66, Table 4.7-13, "Long-Term Modeled Average Daily Emissions of Criteria Air Pollutants and Precursors Associated with Construction under the LRDP," have been replaced as follows to accurately reflect particulate emissions from stationary source equipment, based upon the refined estimates of construction emissions from the proposed LRDP included in Appendix C to this C&R document:

Table 4.7-13
Long-Term Modeled Average Daily Emissions of Criteria Air Pollutants and Precursors Associated with Construction under the LRDP (with Mitigation)

Activity	Emissions (lb/day)[a]			
	ROG	NO_X	PM_{10}[b]	$PM_{2.5}$[b]
Pacific Campus

Application of architectural coatings	2	–	–	–
Worker commuting	0.1	0.4	0.05	0.05
On-road truck hauling	0.06	0.6	0.02	0.02
St. Luke's Campus Total [c]	**2.5**	**1**	**0.08**	**0.08**
Total average daily emissions, all campuses (2015 and beyond)[a, d]	22 lb/day	9 lb/day	0.5 lb/day	0.5 lb/day
Recently adopted BAAQMD significance criterion	54 lb/day	54 lb/day	82 lb/day [e]	54 lb/day [e]

Notes: BAAQMD = Bay Area Air Quality Management District; lb/day = pounds per day; MOB = medical office building; NO_X = oxides of nitrogen; PM_{10} = respirable particulate matter with an aerodynamic diameter of 10 micrometers or less; $PM_{2.5}$ = fine particulate matter with an aerodynamic diameter of 2.5 micrometers or less; ROG = reactive organic gases.

[a] For long term projects (St. Luke's MOB, Davies Castro St. MOB, and all Pacific projects), when Tier 4 equipment is presumed to be widely available, all equipment would meet Tier 4 standards. In addition, on-road hauling truck diesel emissions would be equivalent to the emissions performance of model year 2007 or later.

[b] For a conservative estimate, all particulate matter exhaust emissions were assumed to be $PM_{2.5}$, which is a subset of PM_{10}. Therefore, all particulate matter exhaust emissions are also considered PM_{10}.

[c] Average daily emissions were calculated by dividing the total long-term emissions for each campus by the total number of construction days in the long-term period. Total daily emissions values may not add up to the sum of individual sources due to number rounding.

[d] "All campuses" for 2015 and beyond refers to CPMC campuses with long-term projects: Pacific Campus, Davies Castro Street MOB, and St. Luke's MOB.

[e] These criteria apply to exhaust emissions only.

Source: Analysis performed by ENVIRON in 2011. Refer to ENVIRON memo dated March 7, 2011 entitled "Revisions to CPMC Construction Emissions and Health Risk Analysis." This information is on file with the San Francisco Planning Department, 1650 Mission Street, Suite 400, San Francisco 94103, and is available for public review as part of the project file, in Case No. 2005.0555E.

The data in the Draft EIR, page 4.7-67, Table 4.7-14, "Screening-Level Analysis of Health Risks from Construction Emissions with Mitigation for All Campuses under Recently Adopted BAAQMD Significance Criteria," have been replaced as follows to accurately reflect estimated excess cancer risks under the proposed LRDP, based upon the refined estimates of construction emissions included in Appendix C to this C&R document:

Table 4.7-14
Screening-Level Analysis of Health Risks from Construction Emissions with Mitigation for All Campuses under Recently Adopted BAAQMD Significance Criteria

Campus and Project	Estimated Excess Cancer Risk at MEIR – Adult Exposure Parameters[1] (per million)	Estimated Excess Cancer Risk at MEIR – Child Exposure Parameters with ASFs[1] (per million)	Annual Average $PM_{2.5}$ Concentration at MEIR ($\mu g/m^3$)
Cathedral Hill Campus	~~9~~ 4.3	~~111~~ 63	~~0.4~~ 0.3
Davies Neuroscience Institute	~~1~~ 0.4	~~20~~ 7	~~0.1~~ 0.08
Davies Castro Street/14th Street MOB	~~0~~ 0.3	~~7~~ 6	~~0.1~~0.05
Pacific Campus	~~2~~ 0.3	~~23~~ 3	~~0.1~~0.05
St. Luke's Hospital	~~2~~ 1.9	~~13~~ 25	0.1
St. Luke's MOB	~~1~~ 0.2	~~13~~ 3	~~0.1~~0.01
BAAQMD Threshold	10	10	0.3

Notes: ASF = age sensitivity factor; BAAQMD = Bay Area Air Quality Management District; MEIR = maximally exposed individual receptor; MOB = medical office building; $PM_{2.5}$ = particulate matter with diameter of 2.5 µm or less.

[1] Cancer risks for a resident child were adjusted using the age-sensitivity factor (ASF) approach described in the OEHHA Technical Support Document (TSD) and the population-specific ASFs recommended by BAAQMD. For this assessment, it was conservatively assumed that the child exposure period begins when a child is in its 3rd trimester in utero. ~~For example, at the proposed Cathedral Hill Campus, where the overall construction duration is 4.7 years~~ Therefore, an ASF of 10 is applied for the first 2.25 years of construction, and an ASF of 3 is applied for the balance of the construction period. No ASFs are applied for adult risk.

Source: Modeling performed by ENVIRON in 2011. Refer to ENVIRON memo dated March 7, 2011 entitled "Revisions to CPMC Construction Emissions and Health Risk Analysis." This information is on file with the San Francisco Planning Department, 1650 Mission Street, Suite 400, San Francisco 94103, and is available for public review as part of the project file, in Case No. 2005.0555E.

The text in the Draft EIR, page 4.7-68, first paragraph, has been revised to accurately reflect Estimated Excess Cancer Risk at the Cathedral Hill Campus, based upon the refined estimates of construction emissions from the proposed LRDP included in Appendix C to this C&R document, as follows:

NEAR-TERM PROJECTS

◆ Cathedral Hill Campus

The results of the risk analysis for the MEI (i.e., resident child) are summarized in Table 4.7-14, "Summary of Screening-Level Analysis of Risk from Construction Emissions for All Campuses under Recently Adopted BAAQMD Significance Criteria" (page 4.7-67). According to the analysis, the near-term TAC emissions from construction at the Cathedral Hill Campus would generate a cancer risk of approximately ~~111~~63 in a million at the maximally exposed off-site individual, assuming the receptor is a resident child (the estimated cancer risk is ~~9~~4.3 in a million assuming the receptor is a resident adult). Furthermore, the incremental increase in annual $PM_{2.5}$ is ~~0.4~~0.3 µg/m^3. These levels exceed the threshold of 10 in a million (in the case of the resident child) and 0.3 ug/m^3, respectively

The text in the Draft EIR, pages 4.7-68 (last paragraph) and 4.7-69, has been revised to update language associated with Mitigation Measures M-AQ-N10a and M-AQ-N10b and to reflect an update to the impact determination under Impact AQ-10 for the Davies Campus (near-term), based upon the refined estimates of construction emissions from the proposed LRDP included in Appendix C to this C&R document, as follows:

M-AQ-N10a Install Accelerated Emission Control Device on Construction Equipment

This mitigation measure is identical to Mitigation Measure M-AQ-N2 for Impact AQ-2 (see page 4-17).

While ~~it is possible that~~implementation of Mitigation Measure M-AQ-N10a ~~could~~would reduce the carcinogenic risk and chronic noncarcinogenic health hazards posed by DPM emissions as indicated in Table 4.7-14, this impact would remain above ~~below~~ the thresholds.~~,~~ Therefore, ~~it is unknown at this time to what extent such equipment will be available at the time of construction. In light of this uncertainty,~~ **Impact AQ-10 would remain significant and unavoidable**.

Davies Campus

According to the risk analysis summarized in Table 4.7-14, "Summary of Screening-Level Analysis of Risk from Construction Emissions for All Campuses under Recently Adopted BAAQMD Significance Criteria" (page 4.7-67), the construction-related TAC emissions that would result from development of the proposed Neuroscience Institute at the Davies Campus would generate a cancer risk of approximately ~~20~~7 in a million at the off-site MEI, assuming the receptor is a resident child. This level ~~exceeds~~is below the threshold of 10 in a million. These results reflect a conservative, screening-level estimate; additional, more refined modeling would better characterize risk associated with construction at the Davies Campus

and would result in smaller impacts. The screening-level evaluation shows that this impact would be **less than significant under the recently adopted BAAQMD CEQA significance criteria**.

Mitigation Measures for Davies Campus (Near Term)

M-AQ-N10b Install Accelerated Emission Control Device on Construction Equipment

This mitigation measure is identical to Mitigation Measure M-AQ-N2 for Impact AQ-2 (see page 4-17).

~~While it is possible that~~ The proposed CPMC construction management plan includes measures consistent with the above mitigation measures, thereby incorporating them into the proposed LRDP. Nevertheless, to ensure that these measures would be legally binding under CEQA, they have been included as Mitigation Measure M-AQ-N10b. Implementation of Mitigation Measure M-AQ-N10b ~~e~~would reduce the carcinogenic risk and chronic noncarcinogenic health hazards posed by DPM emissions below the thresholds~~,~~. ~~it is unknown at this time to what extent such equipment will be available at the time of construction. In light of this uncertainty,~~Therefore, **Impact AQ-10 would be less than significant with mitigation.** ~~**remain significant and unavoidable.**~~

St. Luke's Campus

Because the same group of receptors will be impacted by both the hospital and the MOB construction projects at St. Luke's Campus, the risk estimates for both projects should be considered cumulatively. A conservative estimate of overall risk from construction for these receptors would be the sum of the risks calculated for each construction project. According to the risk analysis summarized in Table 4.7-14, "Summary of Screening-Level Analysis of Risk from Construction Emissions for All Campuses under Recently Adopted BAAQMD Significance Criteria" (page 4.7-67), the near-term TAC emissions from construction at the St. Luke's Campus would generate a cancer risk of approximately ~~43~~28 in a million at the off-site MEI, assuming the receptor is a resident child. This level exceeds the threshold of 10 in a million. These results reflect a conservative, screening-level estimate; additional, more refined modeling would better characterize risk associated with construction at St. Luke's Campus and would result in smaller impacts. The screening-level evaluation shows that **this impact would be significant under the recently adopted BAAQMD CEQA significance criteria**.

The text in the Draft EIR, page 4.7-70, third and fourth paragraphs, has been revised to reflect refinements to the proposed CPMC construction management plan related to implementation of Mitigation Measure M-AQ-N10c, as well as an update to the impact determination under Impact AQ-10 for the Pacific Campus (long-term), based

upon the refined estimates of construction emissions from the proposed LRDP included in Appendix C to this C&R document, as follows:

M-AQ-N10c Install Accelerated Emission Control Device on Construction Equipment

This mitigation measure is identical to Mitigation Measure M-AQ-N2 for Impact AQ-2 (see page 4-17).

~~While it is possible that~~ The proposed CPMC construction management plan includes measures consistent with the above mitigation measure, thereby incorporating it into the proposed LRDP. Nevertheless, to ensure that this measure would be legally binding under CEQA, it has been included as Mitigation Measure M-AQ-N10c. While implementation of Mitigation Measure M-AQ-N10c ~~e~~would reduce the carcinogenic risk and chronic noncarcinogenic health hazards posed by DPM emissions, ~~below~~as indicated in Table 4.7-14, this impact would remain above the thresholds~~,~~. ~~it is unknown at this time to what extent such equipment will be available at the time of construction. In light of this uncertainty,~~Therefore, **Impact AQ-10 would remain significant and unavoidable.**

LONG-TERM PROJECTS

◆ Pacific Campus

According to the risk analysis summarized in Table 4.7-14, "Summary of Screening-Level Analysis of Risk from Construction Emissions for All Campuses under Recently Adopted BAAQMD Significance Criteria" (page 4.7-67), the long-term TAC emissions from construction at the Pacific Campus would generate a cancer risk of approximately ~~23~~3 in a million at the off-site MEI, assuming the receptor is a resident child. This level ~~exceeds~~is below the threshold of 10 in a million. These results reflect a conservative, screening-level estimate; additional, more refined modeling would better characterize risk associated with construction at the Pacific Campus and would result in smaller impacts. The screening-level evaluation shows that **this impact would be less than significant with mitigation under the recently adopted BAAQMD CEQA significance criteria**.

The text in the Draft EIR, page 4.7-70, last paragraph, and page 4.7-71 have been revised to reflect refinements to the proposed CPMC construction management plan related to implementation of Mitigation Measure M-AQ-L10, as well as an update to the impact determination under Impact AQ-10 for the Pacific Campus (long-term), based upon the refined estimates of construction emissions from the proposed LRDP included in Appendix C to this C&R document, as follows:

M-AQ-L10 Install Accelerated Emission Control Device on Construction Equipment

This mitigation measure is identical to Mitigation Measure M-AQ-N2 for Impact AQ-2 (see page 4-17).

~~While it is possible that~~ The proposed CPMC construction management plan includes measures consistent with the above mitigation measure, thereby incorporating it into the proposed LRDP. Nevertheless, to ensure that this measure would be legally binding under CEQA, it has been included as Mitigation Measure M-AQ-L10. Implementation of Mitigation Measure M-AQ-L10 ~~e~~would reduce the carcinogenic risk and chronic noncarcinogenic health hazards posed by DPM emissions below the threshold~~,~~. ~~it is unknown at this time to what extent such equipment will be available at the time of construction. In light of this uncertainty,~~Therefore, **Impact AQ-10 would be less than significant with mitigation.** ~~**remain significant and unavoidable.**~~

Davies Campus

Because the same group of receptors will be impacted by both near-term and long-term construction projects at Davies Campus, the risk estimates for both projects should be considered cumulatively. A conservative estimate of overall risk from construction for these receptors would be the sum of the risks calculated for each construction project. According to the risk analysis summarized in Table 4.7-14, "Summary of Screening-Level Analysis of Risk from Construction Emissions for All Campuses under Recently Adopted BAAQMD Significance Criteria" (page 4.7-67), the construction-related TAC emissions that would result from development of the proposed Neuroscience Institute building and Castro Street/14th Street MOB at the Davies Campus would generate a cancer risk of approximately ~~27~~13 in a million at the off-site MEI, assuming the receptor is a resident child. These results reflect a conservative, screening-level estimate; additional, more refined modeling would better characterize risk associated with construction at the Davies Campus and would result in smaller impacts. The screening-level evaluation shows that this impact would be **significant under the recently adopted BAAQMD CEQA significance criteria**.

Mitigation Measure for Davies Campus (Long Term)

M-AQ-L10 Install Accelerated Emission Control Device on Construction Equipment

This mitigation measure is identical to Mitigation Measure M-AQ-N2 for Impact AQ-2 (see page 4-17).

~~While it is possible that~~ The proposed CPMC construction management plan includes measures consistent with the above mitigation measures, thereby incorporating them into the proposed LRDP. Nevertheless,

to ensure that these measures would be legally binding under CEQA, they have been included as Mitigation Measure M-AQ-L10. Implementation of Mitigation Measure M-AQ-L10 ~~e~~would reduce the carcinogenic risk and chronic noncarcinogenic health hazards posed by DPM emissions. However, this impact would remain above ~~below~~ the thresholds. ~~, it is unknown at this time to what extent such equipment will be available at the time of construction. In light of this uncertainty,~~ Therefore, **Impact AQ-10 would remain significant and unavoidable**.

4.2.11 WIND AND SHADOW (CHAPTER 4.9)

Tables 4.9-2 and 4.9-3 in the Draft EIR, pages 4.9-24 and 4.6-60, respectively, have been updated to reflect wind speed updates at locations 32 and 45 for project-level wind analysis, as follows:

Table 4.9-2
Results of the Wind Tunnel Analysis for the Proposed Cathedral Hill Campus

		Existing*				Proposed*

Average	–	10.6	–	**1**	–	10.5	–	**0**	–

Notes: mph = miles per hour

[a] Wind velocity refers to the speed at which the wind moves in a particular direction.

[b] The term "equivalent wind speed" (EWS) denotes the mean hourly wind speed adjusted to account for the expected turbulence intensity or gustiness at the site.

* Exceedances of the comfort criterion are shown in **bold**.

4.2.12 RECREATION (CHAPTER 4.10)

Figure 4.10-1 in the Draft EIR, page 4.10-2, "Parks and Open Spaces within One-Half Mile of All CPMC Campuses" has been revised for clarification to show the correct public schoolyards that are publicly accessible within one-half mile of all CPMC campuses under the proposed CPMC LRDP. The revised figure is presented below:

Source: SmithGroup/Boulder Associates 2010

Parks and Open Spaces within One-Half Mile of All CPMC Campuses **Figure 4.10-1 (Revised)**

Figure 4.10-2 in the Draft EIR, page 4.10-5, "Parks and Open Spaces within One-Half Mile of the Proposed Cathedral Hill Campus" has been revised for clarification to show the correct public schoolyards that are publicly accessible within one-half mile of the proposed Cathedral Hill Campus under the proposed CPMC LRDP. The revised figure is presented below:

The text and data in the Draft EIR, page 4.10-6, Table 4.10-1, "Parks and Related Facilities within One-Half Mile of the Proposed Cathedral Hill Campus," have been revised as follows to accurately reflect public schoolyard acreage within one-half mile of the proposed Cathedral Hill Campus:

Table 4.10-1
Parks and Related Facilities within One-Half Mile of the Proposed Cathedral Hill Campus

Facility	Park Acres	Acres within One-Half Mile
Facilities Operated by SFRPD		
Buchanan Street Mall	1.81	0.68
City Hall	0.81	0.50
Cottage Row Mini Park	0.13	0.13
Father Alfred E. Boeddeker Park	0.97	0.97
Japantown Peace Plaza and Pagoda	0.71	0.71
Jefferson Square	5.64	5.64
Joseph L. Alioto Performing Arts Piazza (Civic Center Plaza)	4.43	3.65
Lafayette Park	11.49	11.49

~~Spring Valley Elementary School~~	~~0.94~~	~~0.43~~
TOTAL	**~~42.21~~40.42**	**~~36.25~~34.97**

Notes: SFRPD = San Francisco Recreation & Park Department. Non-SFRPD lands refer to land owned by other agencies such as the Golden Gate National Recreation Area, State of California, San Francisco Department of Public Works, San Francisco Redevelopment Agency, San Francisco Water Department, Port of San Francisco, San Francisco Municipal Railway, and private entities. Schoolyards listed include those affiliated with SFRPD. Acreage totals do not include parks with less than 0.1 acre.
Source: Data compiled by AECOM in 2010 based on GIS data provided by San Francisco Planning Department.

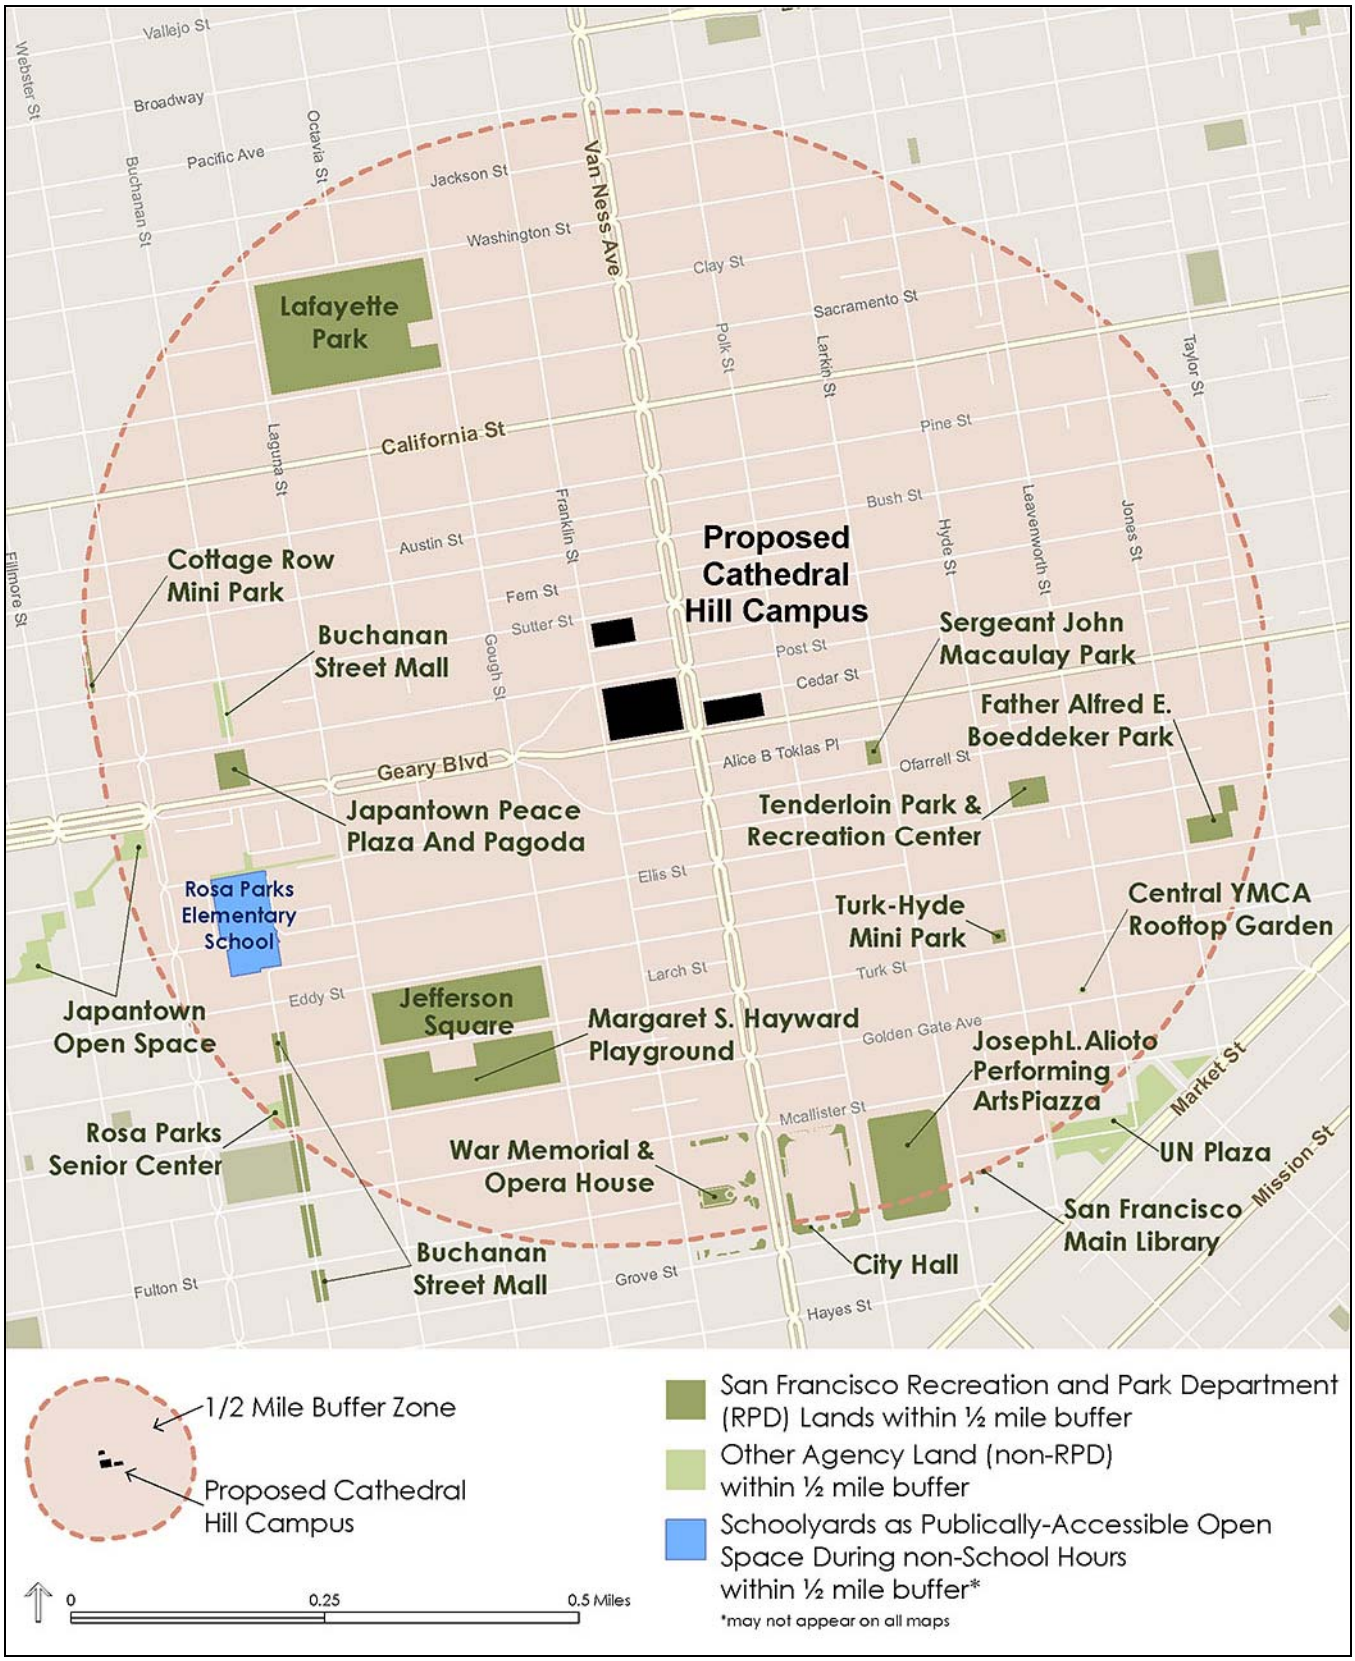
The text in the Draft EIR, page 4.10-7, first paragraph under Nearby Parks and Open Space Facilities, has been revised as follows to reflect the same revisions made to Table 4.10-1 "Parks and Related Facilities within One-Half Mile of the Proposed Cathedral Hill Campus" (shown above):

> As shown in Figure 4.10-2 and listed in Table 4.10-1, "Parks and Related Facilities within One-Half Mile of the Proposed Cathedral Hill Campus," 14 SFRPD facilities, five non-SFPRD facilities, and ~~three~~ one schoolyard~~s~~ are located within one-half mile of the location of the proposed Cathedral Hill Campus.

The text in the Draft EIR, page 4.10-8, last two sentences, has been revised as follows to reflect the same revisions made to Table 4.10-1 "Parks and Related Facilities within One-Half Mile of the Proposed Cathedral Hill Campus" (shown above):

> In addition to the parks and recreational facilities mentioned above, one SFRPD-affiliated school yard~~s~~ are~~is~~ ~~located at Redding Elementary School (1421 Pine Street) and Spring Valley Elementary School (1451 Jackson Street).~~[31] Rosa Parks Elementary School, located at 1501 O'Farrell Street~~, is also~~ and open on the weekends for the community's use.[32]

Figure 4.10-4 in the Draft EIR, page 4.10-14, "Parks and Open Spaces within One-Half Mile of the California Campus" has been revised for clarification to show the correct public schoolyards that are publicly accessible within one-half mile of the proposed the California Campus under the proposed CPMC LRDP. The revised figure is presented below:



Source: SmithGroup/Boulder Associates 2010

Parks and Open Spaces within One-Half Mile of the Proposed Cathedral Hill Campus

Figure 4.10-2 (Revised)

Parks and Open Spaces within One-Half Mile of the California Campus **Figure 4.10-4 (Revised)**

Text and data in the Draft EIR, page 4.10-15, Table 4.10-3 "Parks and Related Facilities within One-Half Mile of the California Campus," have been revised as follows to accurately reflect public schoolyard acreage within one-half mile of the California Campus:

Table 4.10-3
Parks and Related Facilities within One-Half Mile of the California Campus

Facility	Park Acres	Acres within One-Half Mile
Facilities Operated by SFRPD		
Angelo J. Rossi Playground	6.47	3.30
Julius Kahn Playground	12.37	12.37
Laurel Hill Playground	1.47	1.47
Mountain Lake Park	12.78	1.96
Presidio Heights Playground	0.44	0.44
Non-SFRPD Facilities		
The Presidio	1,488.96	135.30
University of San Francisco	22.95	8.88
~~**Public Schoolyards**~~		
~~George Peabody School (Elementary)~~	~~0.82~~	~~0.82~~
~~Roosevelt Middle High School~~	~~2.18~~	~~2.18~~
TOTAL	~~**1,548.44**~~**1,545.44**	~~**166.72**~~**163.72**

Notes: SFRPD = San Francisco Recreation & Park Department. Non-SFRPD lands refer to land owned by other agencies such as the Golden Gate National Recreation Area, State of California, San Francisco Department of Public Works, San Francisco Redevelopment Agency, San Francisco Water Department, Port of San Francisco, San Francisco Municipal Railway, and private entities. ~~Schoolyards listed include those affiliated with SFRPD.~~ Acreage totals do not include parks with less than 0.1 acre.
Source: Data compiled by AECOM in 2010 based on GIS data provided by San Francisco Planning Department.

The text in the Draft EIR, page 4.10-16, last sentence in the first paragraph under Nearby Parks and Open Space Facilities, has been revised to reflect the same revisions made to Table 4.10-3 "Parks and Related Facilities within One-Half Mile of the California Campus" (shown above):

> ~~The Roosevelt Gym and the George Peabody Schoolyard are also located within a half-mile vicinity of the site.~~

The text in the Draft EIR, page 4.10-17, the sentence above Recreational Resources at the California Campus, has been revised to reflect the same revisions made to Table 4.10-3 "Parks and Related Facilities within One-Half Mile of the California Campus" (shown above):

~~The SFRPD-affiliated schools include the Roosevelt Gym, located at the Roosevelt Middle High School at 460 Arguello Boulevard (approximately two blocks south of the campus) and the George Peabody Schoolyard, located at 251 6th Avenue (approximately six blocks southwest of the campus).~~[52]

Figure 4.10-5 in the Draft EIR, page 4.10-18, "Parks and Open Spaces within One-Half Mile of the Davies Campus" has been revised for clarification to show the correct public schoolyards that are publicly accessible within one-half mile of the proposed the Davies Campus under the proposed CPMC LRDP. The revised figure is presented below:

Source: SmithGroup/Boulder Associates 2010

Parks and Open Spaces within One-Half Mile of the Davies Campus **Figure 4.10-5 (Revised)**

Data and information in the Draft EIR, page 4.10-19, Table 4.10-4 "Parks and Related Facilities within One-Half Mile of the Davies Campus," have been revised as follows to accurately reflect public schoolyard acreage within one-half mile of the Davies Campus:

Table 4.10-4
Parks and Related Facilities within One-Half Mile of the Davies Campus

Facility	Park Acres	Acres within One-Half Mile
Facilities Operated by SFRPD		
Alamo Square	12.69	5.67
Buena Vista Park	36.05	36.05
Corona Heights Park (including Peixotto Playground & States Street Playground)	16.78	16.78
Duboce Park	4.31	4.31
Eureka Valley Playground (also known as Collingwood Park)	1.93	0.31
Koshland Park	0.82	0.78
Panhandle Park	24	4.28
Noe & Beaver Mini Park	< 0.1	< 0.1

Notes: SFRPD = San Francisco Recreation & Park Department. Non-SFRPD lands refer to land owned by other agencies such as the Golden Gate National Recreation Area, State of California, San Francisco Department of Public Works, San Francisco Redevelopment Agency, San Francisco Water Department, Port of San Francisco, San Francisco Municipal Railway, and private entities. ~~Schoolyards listed include those affiliated with SFRPD~~. Acreage totals do not include parks with less than 0.1 acre.
Source: Data compiled by AECOM in 2010 based on GIS data provided by San Francisco Planning Department.

The text in the Draft EIR, page 4.10-20, last sentence in the first paragraph under Nearby Parks and Open Space Facilities, has been revised as follows to reflect the same revisions made to Table 4.10-4 "Parks and Related Facilities within One-Half Mile of the Davies Campus" (shown above):

Several non-SFRPD properties ~~and John Muir Schoolyard~~ are also located nearby.

The text in the Draft EIR, page 4.10-21, last two sentences in the last paragraph, has been revised as follows to reflect the same revisions made to Table 4.10-4 "Parks and Related Facilities within One-Half Mile of the Davies Campus" (shown above):

~~The John Muir Schoolyard, located at John Muir Elementary School on 380 Webster Street, is approximately nine blocks northeast of the Davies Campus.[70] The McKinley Elementary School, located nearby at 1025 14th Street, is approximately 0.1 mile southwest of the Davies Campus.~~

~~70 San Francisco Recreation & Park Department. 2009. Facility Listings. Available: http://ci.sf.ca.us/site/recpark_index.asp?id=1503. Accessed December 2009.~~

Figure 4.10-6 in the Draft EIR, page 4.10-18, "Parks and Open Spaces within One-Half Mile of the St. Luke's Campus" has been revised for clarification to show the correct public schoolyards that are publicly accessible within one-half mile of the proposed the St. Luke's Campus under the proposed CPMC LRDP. The revised figure is presented below:

Source: SmithGroup/Boulder Associates 2010

Parks and Open Spaces within One-Half Mile of the St. Luke's Campus **Figure 4.10-6 (Revised)**

Text and data in the Draft EIR, page 4.10-24, Table 4.10-5, "Parks and Related Facilities within One-Half Mile of the St. Luke's Campus," have been revised as follows to accurately reflect public schoolyard acreage within one-half mile of the St. Luke's Campus:

Table 4.10-5
Parks and Related Facilities within One-Half Mile of the St. Luke's Campus

Facility	Park Acres	Acres within One-Half Mile
Facilities Operated by SFRPD		
Bernal Heights Park (including community garden)	26.32	20.71
Coleridge Mini Park	0.21	0.21
Coso & Precita Mini Park	0.15	0.15
Garfield Square	2.93	2.81
Good Prospect Community Garden	0.11	0.11
Juri Commons Open Space	0.32	0.32

Notes: SFRPD = San Francisco Recreation & Park Department. Non-SFRPD lands refer to land owned by other agencies such as the Golden Gate National Recreation Area, State of California, San Francisco Department of Public Works, San Francisco Redevelopment Agency, San Francisco Water Department, Port of San Francisco, San Francisco Municipal Railway, and private entities. ~~Schoolyards listed include those affiliated with SFRPD~~. Acreage totals do not include parks with less than 0.1 acre.
Source: Data compiled by AECOM in 2010 based on GIS data provided by San Francisco Planning Department.

The text in the Draft EIR, page 4.10-25, last sentence in the first paragraph under Nearby Parks and Open Space Facilities, has been revised as follows to reflect the same revisions made to Table 4.10-5 "Parks and Related Facilities within One-Half Mile of the St. Luke's Campus" (shown above):

> Several non-SFRPD properties ~~and the Horace Mann Gym~~ are also located nearby.

The text in the Draft EIR, page 4.10-26, last sentence in the second paragraph, has been revised as follows to reflect the same revisions made to Table 4.10-4 "Parks and Related Facilities within One-Half Mile of the Davies Campus" (shown above):

> ~~The Horace Mann Gym, located at the Horace Mann Junior High School at 3351 23rd Street, is approximately four blocks north of the campus.~~[84]

4.2.13 BIOLOGICAL RESOURCES (CHAPTER 4.13)

The text in the Draft EIR page 4.13-19 and S-69 for Mitigation Measure M-BI-N1 has been revised as follows to correct a reference to the California Fish and Game Code:

M-BI-N1 Before any demolition or construction activities occurring during the nesting season (January 15 through August 15) that involve removal of trees or shrubs, CPMC shall conduct a preconstruction survey for nesting birds at each of its medical campuses. The surveys shall be conducted by a qualified wildlife biologist no sooner than 14 days before the start of removal of trees and shrubs. The survey results shall remain valid for 21 days after the survey; therefore, if vegetation removal is not started within 21 days of the survey, another survey shall be required. The area surveyed shall include the construction site and the staging area for the tree or shrub removal. If no nests are present, tree removal and construction may commence. If active nests are located during the preconstruction bird nesting survey, CPMC shall contact DFG for guidance on obtaining and complying with ~~the~~ Section ~~1081~~1801 of the California Fish and Game Code, which may include setting up and maintaining a line-of-sight buffer area around the active nest and prohibiting construction activities within the buffer; modifying construction activities; and/or removing or relocating active nests.

4.2.14 HAZARDS AND HAZARDOUS MATERIALS (CHAPTER 4.16)

The text in the Draft EIR, page 4.16-15, third sentence in the paragraph, has been revised as follows to clarify that a 550-gallon underground storage tank (UST), not a 55-gallon UST, was removed in 1989:

> ***3698 California Street***
>
> An existing loading dock was previously the location of a 550-gallon UST installed in 1969 and removed in 1989.

The text in the Draft EIR, page 4.16-55, the beginning of the paragraph under the heading "Davies and St. Luke's Campuses" has been revised to update the square footage at the proposed St. Luke's Replacement Hospital, as follows:

> The existing medical uses at the Davies and St. Luke's Campuses include the handling, storage, use, and disposal of medically related hazardous materials (e.g., medical wastes, sharps, radioactive waste) and cleaning supplies. As a result of the proposed CPMC LRDP, medical facilities at the Davies Campus in the near term would increase by 10% (an increase of 50,100 square feet [sq. ft.]). The St. Luke's Campus medical facilities would increase by 33~~31~~% (an increase of 153,867~~144,067~~ sq. ft.). These increases would be expected to result in related increases in the amount of hazardous materials used, stored, and produced at the campuses. However, the increase at the Davies Campus would be in the form of nonacute medical care and office space. Generally, nonacute medical care and office space would not be expected to require the use of or generate as much hazardous materials and wastes as acute-care services. Although the existing acute-care services at the Davies Campus would remain, the addition of Neuroscience Institute space would not be expected to result in a significant increase in the use or generation of hazardous materials and wastes. The increase at the St. Luke's Campus would be in the form of an approximately 154,800 ~~145,000~~-sq.-ft. acute-care hospital and an approximately 201,050-sq.-ft. MOB/Expansion Building (of which 111,000 sq. ft. would be a belowground parking structure).

The text in the Draft EIR, page 4.16-66 and pages S-78 to S-79 for Mitigation Measures M-HZ-N4e and M-HZ-N4f has been revised as follows because it incorrectly referred to the Cathedral Hill Campus, rather than St. Luke's Campus:

M-HZ-N4e This mitigation measure is identical to M-HZ-N1a for near-term impacts and requires the preparation of site mitigation plan (SMPs) for the near-term projects at the St. Luke's Campus~~Cathedral Hill Campus~~.

M-HZ-N4f This mitigation measure is identical to M-HZ-N1b for near-term impacts and requires the preparation of unknown contingency plans for the near-term projects at the St. Luke's Campus~~Cathedral Hill Campus~~.

4.2.15 OTHER CEQA CONSIDERATIONS (CHAPTER 5)

The text in the Draft EIR, pages 5-5 through 5-7 in Table 5-1, have been revised to reflect updates to impact determinations for Imacts AQ-2, AQ-9 and AQ-10, based upon the refined estimates of construction emissions from the proposed LRDP included in Appendix C to this C&R document, as follows:

CATHEDRAL HILL CAMPUS
4.7: Air Quality
~~**Impact AQ-2:** Construction activities associated with the LRDP would expose sensitive receptors to substantial concentrations of toxic air contaminants (1999 BAAQMD Guidelines).~~
Impact AQ-9: Near-term ~~and long-term~~ construction activities associated with the LRDP would exceed the recently adopted (6/2/10) BAAQMD CEQA significance thresholds for mass criteria pollutant emissions and would contribute to an existing or projected air quality violation.
PACIFIC CAMPUS
4.7: Air Quality
~~**Impact AQ-9:** Near-term and long-term construction activities associated with the LRDP would exceed the recently adopted (6/2/10) BAAQMD CEQA significance thresholds for mass criteria pollutant emissions and would contribute to an existing or projected air quality violation~~
~~**Impact AQ-10:** Construction activities associated with the LRDP would result in short-term increases in emissions of diesel particulate matter that exceed the recently adopted (6/2/10) BAAQMD CEQA significance criteria and expose sensitive receptors to substantial concentrations of toxic air contaminants and PM2.5.~~
DAVIES CAMPUS
4.7: Air Quality
Impact AQ-9: Near-term ~~and long-term~~ construction activities associated with the LRDP would exceed the recently adopted (6/2/10) BAAQMD CEQA significance thresholds for mass criteria pollutant emissions and would contribute to an existing or projected air quality violation.
Impact AQ-10: Long-term ~~C~~construction activities associated with the LRDP would result in short-term increases in emissions of diesel particulate matter that exceed the recently adopted (6/2/10) BAAQMD CEQA significance criteria and expose sensitive receptors to substantial concentrations of toxic air contaminants and PM2.5.
ST. LUKE'S CAMPUS
Impact AQ-9: Near-term ~~and long-term~~ construction activities associated with the LRDP would exceed the recently adopted (6/2/10) BAAQMD CEQA significance thresholds for mass criteria pollutant emissions and would contribute to an existing or projected air quality violation.

4.2.16 ALTERNATIVES (CHAPTER 6)

The text in the Draft EIR, pages 6-4 and 6-5, under the heading "Air Quality", has been revised to clarify updated environmental impact determination, based upon the refined estimates of construction emissions from the proposed LRDP included in Appendix C to this C&R document, as follows:

AIR QUALITY

► ~~Construction activities associated with the LRDP would expose sensitive receptors to substantial concentrations of toxic air contaminants. *(Significant and unavoidable only at the Cathedral Hill Campus, with or without project variants)*(1999 BAAQMD Guidelines).~~

► Operation of the LRDP would exceed Bay Area Air Quality Management District (BAAQMD) CEQA significance thresholds for mass emissions of criteria pollutants and would contribute to an existing or projected air quality violation at full buildout (1999 BAAQMD Guidelines).

- The LRDP's long-term operation criteria air pollutant emissions would contribute to a cumulative considerable impact, but its toxic air contaminant emissions would not be cumulatively considerable (1999 BAAQMD Guidelines).

- Near-term ~~and long-term~~ construction activities associated with the LRDP would exceed the recently adopted (June 2, 2010) BAAQMD CEQA significance thresholds for mass criteria pollutant emissions and would contribute to an existing or projected air quality violation.

- Construction activities associated with the LRDP would result in short-term increases in emissions of diesel particulate matter that exceed the recently adopted (June 2, 2010) BAAQMD CEQA significance criteria and expose sensitive receptors to substantial concentrations of toxic air contaminants and $PM_{2.5}$ [fine particulate matter with an aerodynamic resistance diameter of 2.5 micrometers or less] (Significant and unavoidable at the Cathedral Hill Campus, Davies Campus (long-term only), and St. Luke's Campus).

- Operation of the LRDP would exceed the recently adopted (June 2, 2010) BAAQMD CEQA significance thresholds for mass criteria pollutant emissions and would contribute to an existing or projected air quality violation.

- The proposed LRDP's construction emissions of toxic air contaminants would potentially contribute to a cumulatively considerable impact on sensitive receptors (Recently adopted BAAQMD Guidelines).

The text in the Draft EIR, page 6-27, the first paragraph has been revised to clarify the Code Complying Alternative would meet the 7:1 FAR for both the Cathedral Hill Hospital the Cathedral Hill MOB sites, as follows:

> The Cathedral Hill MOB, which as proposed under the LRDP, complies with the existing Planning Code height ~~and FAR~~ limits, would be redesigned under the Code-Complying Alternative to comply with the existing FAR of 7:1 and the existing bulk limits (maximum building length of 110 feet and maximum diagonal dimension of 140 feet, for portions of the building above 50 feet). This redesign would limit MOB floors four through nine of the building to approximately 10,000 sq. ft. per floor (as compared to the proposed LRDP-MOB, where floors range from 18,000 to 30,000 sq. ft.). Accounting for elevators, two stairwells, mechanical shafts, and electrical rooms, the Cathedral Hill MOB would have approximately 8,000 sq. ft. of usable office space per floor. In total, approximately 75,000 fewer sq. ft. of usable space and 90 fewer physician offices would be available in the Cathedral Hill MOB under this alternative than under the proposed LRDP. The 1375 Sutter MOB would be the same as under the proposed LRDP.

Table 6-1 in the Draft EIR, page 6-33 has been updated to reflect the changes in square footage of the proposed LRDP's St. Luke's Campus Replacement Hospital and under Alternative 3B.

The text in the Draft EIR, page 6-58, second and third sentences of the second paragraph has been revised as follows to correct the total square footage under Alternative 1B and to reflect changes in square footage of the LRDP's St. Luke's Campus Replacement Hospital:

> Under the LRDP, the St. Luke's Campus would occupy approximately 605,700 ~~595,900~~ sq. ft. The total square footage at the St. Luke's Campus under No Project Alternative 1B (453,300~~454,900~~ sq. ft.) would be about 152,400 ~~141,000~~ sq. ft. less than under the proposed LRDP.

Table 6-9 in the Draft EIR, page 6-60 has been updated to reflect the changes in square footage of the LRDP's St. Luke's Campus Replacement Hospital.

Source: Data compiled by AECOM in 2010

The text in the Draft EIR, page 6-129, second sentence of the first paragraph under the subheading "Alternative 1B (St. Luke's)-Land Use Planning" has been revised to correct the square footage difference:

> Under Alternative 1B, the St. Luke's Campus floor area would increase by approximately 1,400 ~~3,000~~ sq. ft. relative to existing conditions (approximately 451,900 sq. ft.).

The text in the Draft EIR, page 6-130, the second sentence in the second paragraph has been revised to clarify FAR, as follows:

> Unlike the proposed LRDP, the No Project Alternative 1B would not require amendments to the General Plan, zoning map and Planning Code street vacation approval, or lot merger because the St. Luke's Replacement Hospital proposed under the LRDP would not be constructed; however, it would require the creation of a new Cesar Chavez/Valencia Streets Medical Use Special Use District to increase the FAR limit, and a CU authorization to modify an existing PUD ~~to allow exceptions to FAR limits~~ (as discussed in Section 2.6.4, "Required Project Approvals for the St. Luke's Campus" [page 2-191 in Chapter 2, "Project Description"]).

The text in the Draft EIR, page 6-131, first sentence of the second paragraph has been revised to correct the square footage difference:

> Compared to existing conditions, the development program at the St. Luke's Campus under No Project Alternative would be approximately 1,400~~1,500~~ sq. ft. larger; however, this development program would be approximately 152,400~~143,000~~ sq. ft. smaller than that of the proposed LRDP.

Table 6-13 in the Draft EIR, pages 6-163 and 6-164 has been updated to reflect the changes in square footage of the LRDP's St. Luke's Campus Replacement Hospital.

Source: Data compiled by AECOM in 2010

The text in the Draft EIR, page 6-279, third sentence of the first bullet point has been revised as follows to reflect changes in square footage of the LRDP's St. Luke's Campus Replacement Hospital:

- At approximately 157,900 sq. ft., the St. Luke's Replacement Hospital would be slightly (3,100~~12,900~~ sq. ft.) larger under Alternative 3A than under the LRDP, to accommodate additional diagnostic and treatment services to support the Phase 2 Women's and Children's Center. Similar to the LRDP, the replacement hospital would not have any below grade levels.

The text in the Draft EIR, page 6-280,second sentence of the first paragraph has been revised as follows to reflect changes in square footage of the LRDP's St. Luke's Campus Replacement Hospital:

> As a result, St. Luke's Campus development would be approximately 296,000~~305,800~~ sq. ft. larger under this alternative than under the LRDP (901,700 sq. ft. versus 605,700~~595,900~~ sq. ft.), as shown in Table 6-30, "Alternative 3A and Proposed LRDP Buildout at the St. Luke's Campus" (page 6-282).

Table 6-30 in the Draft EIR, page 6-282 has been updated to reflect the changes in square footage of the St. Luke's Campus Replacement Hospital under the proposed LRDP.

Stories Underground	NA		4	–	–	1	–	1	NA	NA	NA	NA

Notes: sq. ft. = square feet. Convert = Would be converted to a different use under the proposed project; New = Would be new construction under the proposed project; Retain = Would be retained as it is currently being used under the proposed project.
[1] The "Existing Uses to be Retained" totals reflect the demolition of the following buildings, representing 201,983 sq. ft.: the St. Luke's Hospital Tower (197,983 sq. ft.), the MRI Trailer (1,600 sq. ft.), and the Redwood Administration Building (2,400 sq. ft.). Detailed information regarding the square footage of uses within each of these buildings is provided in Table 2-13, "St. Luke's Campus: Project Summary Table."
[2] Under Alternative 3B, the area vacated by the existing Emergency Department (7,060 sq. ft.) and diagnostics and treatment uses (14,124 sq. ft.) in the 1957 Building would be converted to General Support uses.
[3] New building heights are approximations based on the 2009 studies for purpose of analysis, because the buildings have not been designed.
[4] The existing Duncan Street Parking Garage height does not include an approximately 10-foot-tall stair enclosure on the top deck.
Source: Data compiled by AECOM in 2010

This page intentionally left blank.

The text in the Draft EIR, page 6-300 in the last sentence of the first paragraph and the first sentence of the second paragraph has been revised as follows to clarify requirements of the General Plan Urban Design Element.

> In contrast with the proposed LRDP, ~~a~~ height amendments under the General Plan Urban Design Element and the *Van Ness Avenue Area Plan* would not be required under Alternative 3.
>
> All other approvals associated with the proposed LRDP (discussed on page 4.1-47 in Section 4.1, "Land Use and Planning")—including non-height-related amendments to the ~~creation of~~ *Van Ness Avenue Area Plan* ~~Subarea 4~~, Planning Code text amendments, CU authorization for a new medical institution ~~and additional parking~~ at the proposed Cathedral Hill Campus, and exceptions to bulk street frontage, ~~parking setbacks, parking~~ loading, building projection, obstructions over streets and alleys, wind comfort level, and residential development~~and unloading requirements and signage~~ requirements—would still be required under Alternative 3.

The text in the Draft EIR, page 6-324,first sentence under the subheading "Alternative 3A (St. Luke's)-Land Use Planning" has been revised as follows to reflect changes in square footage of the LRDP's St. Luke's Campus Replacement Hospital:

> Considerably more building demolition (approximately 425,600 sq. ft.[101]) and new construction (875,500 sq. ft.[102]) would occur at the St. Luke's Campus under Alternative 3A than under the proposed LRDP (approximately 202,000 sq. ft. of demolition and 355,850~~346,100~~ sq. ft. of construction).

The text in the Draft EIR, page 6-324, second sentence of the second paragraph has been revised as follows to reflect changes in square footage of the LRDP's St. Luke's Campus Replacement Hospital:

> The St. Luke's Replacement Hospital proposed under Alternative 3A would be on the same site as the replacement hospital proposed for this campus under the LRDP. However, the version of the St. Luke's Replacement Hospital proposed under this alternative would be bigger, by 3,100~~12,700~~ sq. ft., and at 115 feet tall (including mechanical penthouse), it would be 16 feet taller than under the LRDP.

The text in the Draft EIR, page 6-344, third sentence in the first paragraph, has been revised as follows to correct a typographical error:

> Therefore, implementation of Improvement Measure ~~xx-xx-xx~~ I-BI-N2 related to protection of the landmark fig tree would be required under Alternative 3A.

The text in the Draft EIR, page 6-399, sixth sentence under Alternative 3A, has been revised as follows to correct a typographical error:

> Because the St. Luke's Replacement Hospital would ~~be~~ not include specialized services, and because the St. Luke's Campus is not as centrally located as the Cathedral Hill Campus, Alternative 3A would not meet the project objective of efficiently consolidating specialized services and Women's and Children's services into one centralized acute-care hospital.

The text in the Draft EIR, Table 6-37 on pages 6-420 and 6-421, have been revised to reflect updates to the environmental impact determinations related to Air Quality for certain campuses under Impacts AQ-2, AQ-9, and AQ-10, based upon the refined estimates of construction emissions from the proposed LRDP included in Appendix C to this C&R document, as follows:

Table 6-37
Comparison of Impacts of the Proposed LRDP to Impacts of Each Alternative

		Proposed LRDP					Alternative 1: No Project					Alternative 2					Alternative 3									
																	Alternative 3A					Alternative 3B				
	CH	Pac	Cal	Dav (near-term)	Dav (long-term)	SL	CH	Pac	Cal	Dav	SL 1A/1B	CH	Pac	Cal	Dav	SL	CH	Pac	Cal	Dav	SL	CH	Pac	Cal	Dav	SL
Air Quality																										
Impact AQ-1: Construction activities associated with the LRDP would not result in short-term increases in fugitive dust that exceed BAAQMD CEQA significance criteria (1999 BAAQMD Guidelines).																										
Significance of Alternative Compared to Project							<	<	=	<	</<	<	>	>	<	=	<	=	=	=	>	<	=	>	=	<

Impact AQ-9: Near-term and long-term construction activities associated with the LRDP would exceed recently adopted (June 2, 2010) BAAQMD CEQA significance thresholds for mass criteria pollutant emissions and would contribute to an existing or projected air quality violation.																										
Significance of Alternative Compared to Project							<	<	=	<	</<	<	>	>	<	=	<	=	=	=	>	<	=	>	=	<
Level of Significance	SU/M	~~SU/M~~ LTSM	NI	SU/M	LTSM	SU/M	NI	NI	NI	NI	NI/SU/M	NI	SU/M	SU/M	NI	SU/M	SU/M	SU/M	NI	SU/M	SU/M	SU/M	SU/M	SU/M	SU/M	SU/M
Impact AQ-10: Construction activities associated with the LRDP would result in short-term increases in emissions of diesel particulate matter that exceed the proposed BAAQMD CEQA significance criteria and expose sensitive receptors to substantial concentrations of toxic air contaminants and PM2.5 (Recently adopted BAAQMD Guidelines).																										
Significance of Alternative Compared to Project							<	<	=	<	</<	<	>	>	<	=	<	=	=	=	>	<	=	>	=	<
Level of Significance	SU/M	~~SU/M~~ LTSM	NI	~~SU/M~~ LTSM	SU/M	SU/M	NI	NI	NI	NI	NI/SU/M	NI	SU/M	SU/M	NI	SU/M	SU/M	SU/M	NI	SU/M	SU/M	SU/M	SU/M	SU/M	SU/M	SU/M

Note[1] The project would have significant and unavoidable operational impacts related to criteria air pollutants, but less-than-significant impacts related to construction criteria air pollutants and construction and operational toxic air contaminants.

4.2.17 APPENDICES

The text in the Draft EIR, "Van Ness Area Plan, Map 1" in Appendix C: "General Plan and Zoning Maps" has been revised to reflect updated floor-to-area ratio at the proposed Cathedral Hill MOB, as follows:

The text in the Draft EIR, "Proposed Height and Bulk Map HT07" in Appendix C: "General Plan and Zoning Maps" has been revised to reflect updates at the St. Luke's Campus, as follows:

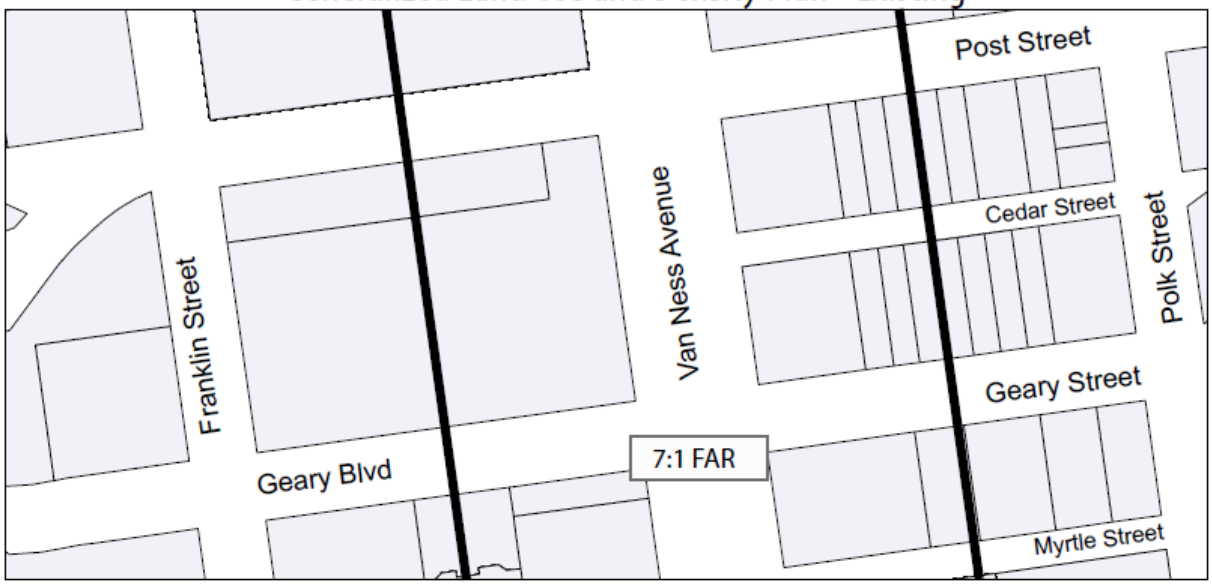
The text in the Draft EIR, "Proposed General Plan Urban Design Height - Map 4" in Appendix C: "General Plan and Zoning Maps" has been revised to reflect updates at the St. Luke's Campus, as follows:

The text in the Draft EIR, Appendix C: "General Plan and Zoning Maps" has been revised to include an additional map "Proposed Special Use District SU07" as follows:

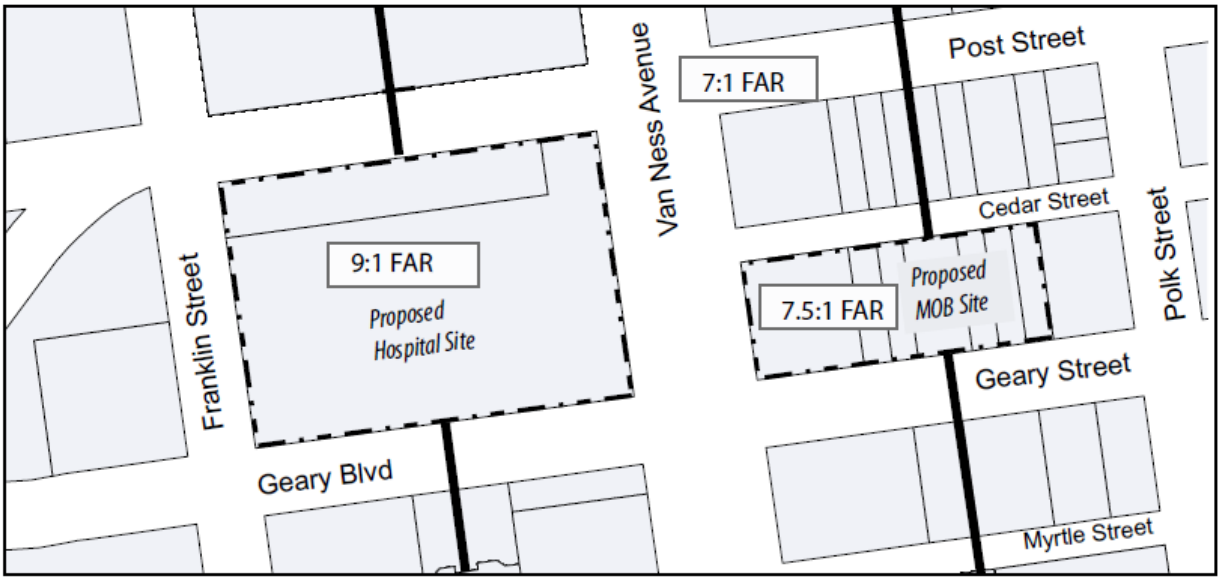
Van Ness Area Plan, Map 1

REVISED 5/3/2011

Generalized Land Use and Density Plan - Existing



Generalized Land Use and Density Plan -PROPOSED



0 200 400 Feet

Existing Land Use and Density Boundaries

Proposed FAR Boundary

The proposal is to amend Map 1 in the Van Ness Area Plan to modify the existing FAR from 7: 1 to 9: 1 in the Proposed Hospital Site, and to 7.5:1 in the Proposed MOB Site.
