The greatest impact from construction will be experienced on the streets immediately adjacent to the project. The intersection operating conditions for Franklin/Post are projected to deteriorate from LOS B to LOS F during the A.M. and P.M. peak hours, which is the largest deterioration of all of the intersections analyzed. There are a number of construction operations that will contribute to this traffic impact such as large, slow moving trucks that require wide turning movements and obstruct more than one lane. In addition to construction work vehicles, material delivery trucks, and excavation import/offhaul trucks that were considered in the DEIR's evaluation, the construction operations will require staging and/or queuing of concrete pumping trucks, fire proofing pump trucks, demolition debris carrying trucks, and various other operations. We request that MM TR-55 be amended to include further practical measures which will reduce the impact the construction operations will have to nearby traffic flow, including:

- Prohibit the following construction operations during the busiest commute hours of 6 am to 8 am, and from 5 pm to 8 pm on weekdays: staging/queuing of concrete trucks, material deliveries, excavation import/offhaul, and staging of fire proofing pumps and demolition debris trucks.

- In order to relieve some of the impact on the intersection of Franklin and Post, prohibit the following activities from being conducted on Post during non-peak hours: staging/queuing of concrete trucks, material deliveries, excavation import/offhaul, and staging of fire proofing pumps and demolition debris trucks. Displacement of trips to other intersections will be spread out to intersections that, according to the study, would be operating at their current LOS or at least above D. Also, displacement would occur during non-peak hours.

- Table 4.5-30 states that an average of 135 trucks per shift will travel to the Cathedral Hill Hospital site during the excavation phase (averaging 220 trips per day over two shifts). For the 9-hour daytime shift, this equates to 15 trucks per hour. In addition, the MOB will average another 50 trips per shift (100 per day). The EIR also

states that the Cathedral Hill Hospital site would have room for 8 trucks to queue on site. Since a truck will arrive to the hospital site on the average of every three minutes during excavation, it is very evident that there will not be sufficient staging onsite. Therefore, the mitigation measure should require that all truck activity (concrete, material deliveries, import and offhaul, etc.) be controlled and staged at a remote location and dispatched to the site as-needed, and when space is available onsite to provide for a managed truck staging that avoids truck staging on the surrounding streets and facilitates the flow of local traffic. .

- Since CPMC plans on closing the parking lanes and bus lanes on Post Street and Geary, construction vehicle traffic should be required to use the bus lanes on Post and Geary instead of using the normal traffic lanes. This will remove the slow moving construction traffic (and right turn movements) from the normal traffic lanes which will help minimize the significant and unavoidable impacts of construction on the local traffic.

- Given the anticipated congestion in the area (from LOS B to F), we recommend that at a minimum, CPMC provide a flagman to be stationed at the corner of Franklin and Post to facilitate all traffic movement during construction hours (not just for operations that require flagmen per encroachment permits)."

Response TR-109

The comment states that the Construction Transportation Management Plan should include tangible requirements for proof that the plan is working. The comment also lists alternative mitigation measures.

As discussed in Response TR-105 (page C&R 3.7-180), the Construction Transportation Management Plan includes a list of action items that CPMC would have to address. Because of the complexity of constructing a medical facility in a dense urban environment, after being prepared by CPMC's construction management company, Herrero-Boldt, the plan would be submitted to the SFMTA, SFDPW, and Planning Department, among other departments for review and approval. During this review, City departments would ensure that plan elements addressed safety and traffic concerns and are consistent with City requirements. As discussed in the Draft EIR and the *Cathedral Hill Transportation Impact Study*, the plan details the hours of work, truck management plans, lane and sidewalk closures, and lane and sidewalk detour plans, including wayfinding signage. At the time of approval, City departments could require that the project sponsor submit monitoring reports that document specific traffic flow or safety concerns.

The following bullets respond directly to each of the mitigation measures proposed in the comment.

- **Restricting construction hours for truck activities to non-peak hours (9 a.m. to 5 p.m.):** Although restricting certain construction activities such as material deliveries to off peak hours, such as 9 a.m. to 5 p.m. could improve the peak operations at some intersections, overall truck trips nor other vehicle traffic, or related vehicle/parking lane closures would not be reduced or altered and would therefore not substantially change the significant and unavoidable impact identified in TR-55 of the Draft EIR. Staging of trucks on the site would occur in the parking or transit lanes proposed to be closed as part of the Construction Transportation Management Plan, and barricades closing these lanes would remain in place during the duration of construction (i.e., parking lanes would still be closed when construction was not occurring). Through the City review of the CMP, the TASC may further construction hours or activities.

- **Restricting construction traffic and activities on Post Street to occur during non-peak hours to reduce the construction impact to Franklin/Post and dispersing construction traffic to intersections operating at LOS D or better:** The intersection that the comment references is located immediately adjacent to the construction site and would operate at LOS F during the peak hours under construction conditions. Restricting truck activity along Post Street to non-peak hours would require all trucks to enter or exit the site via Geary Street, Franklin Street, or Van Ness Avenue.

Unacceptable operations at this intersection primarily would be caused by the closure of the peak-hour tow-away lane on the east side of Franklin and adjacent to the construction site. This lane closure would be required to accommodate construction activities on the site and would already be in place during non-peak hours, irrespective of whether or not trucks were entering or exiting the site.

- **Dispatching trucks from a central staging facility to avoid truck queues:** As discussed on page 4.5-152 of the Draft EIR, the Construction Transportation Management Plan includes a logistics superintendent who would be responsible for coordinating truck deliveries to and from the construction site. This person would be responsible for monitoring truck locations, available space, and for maintaining communication between construction yards, the site, and truck drivers. In the case of unforeseen delays, the site would be designed to accommodate up to eight trucks. This logistics support is summarized in Mitigation Measure MM-TR-55 on page 4.5-159 of the Draft EIR and in Response TR-105, page C&R 3.7-180).

- **Requiring trucks to use the closed transit-only lane on Post Street, rather than mixed-flow travel lanes:** The comment requests clarification regarding the use of the closed transit-only lane on Post Street. The comment suggests that the closed transit-only lane on the south side of Post Street be used for truck traffic and not construction staging. The transit-only lane on Post Street would be utilized by construction truck traffic during construction, however trucks proceeding to this block would still use other vehicle travel lanes, so truck traffic patterns outside the immediate vicinity of the project site would remain and the impacts identified in the EIR would not change.

- **Requiring a flagman at the intersection of Franklin/Post:** It is unclear how this measure would improve operations at the intersection of Franklin/Post Streets. The signal timing at this intersection is coordinated with the Franklin Street corridor and optimized to make movements as efficient as possible during the p.m. peak period. As indicated in the Draft EIR discussion, unacceptable operations would primarily be caused by closure of a peak-hour tow-away lane on Franklin Street. Although a flagman could ensure that potential queuing would not block the intersection during peak hours, no basis exists to assume that queuing from downstream intersections would occur. The intersections of Franklin/Bush and Van Ness/Post are expected to operate at acceptable levels of service during peak hours under construction conditions.

Comment

(Rachel Sater—Lost Block and Save Our Streets, October 19, 2010) [101-25 TR]

"The DElR notes that construction deliveries may cause congestion on 27th Street. The existing emergency department and ambulance access is on 27th Street, The DEIR states that, '[c]onstruction deliveries would be scheduled and coordinated to not hinder emergency vehicle access.' How is it possible to schedule emergencies? Again, insufficient evidence is provided to conclude a less than significant impact."

Response TR-110

The comment questions whether the Construction Transportation Management Plan in place at St. Luke's Campus would schedule construction deliveries in such a way that would minimize the impact construction traffic would have on emergency access to the hospital. Although the comment correctly states that emergencies are never scheduled, construction deliveries and traffic would be scheduled and managed to maintain emergency access at all times, including ground personnel directing traffic on 27th Street and scheduling of deliveries during times of day with fewer on average emergency admissions (TransOptions, 2009). The construction team and the hospital operations staff would have regularly scheduled meetings to address and correct any issues that might occur during construction.

Comment

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-7 TR, duplicate comment was provided in 30-7 TR]

"How many existing on-street parking spaces from Post Street will be eliminated for the 400 ft. closure? How many existing on-street parking spaces from Geary Blvd. will be eliminated for the 400 ft. closure? The reason for these questions is that vehicles that used to park in these spaces will be shifted elsewhere, possibly to Larkin, Polk, Japantown streets."

Response TR-111

The comment requests clarification regarding the impact of parking lane closures on Post Street and Geary Boulevard during construction. Six existing metered parking spaces and four existing metered loading zone spaces on the south side of Post Street would be impacted by the 400-foot closure. On Geary Boulevard, the construction closure would remove eight metered parking spaces. Existing parking demand resulting from the temporary loss of these fourteen (plus four loading zone) spaces could be accommodated on adjacent streets. Although some people could shift to parking on Polk and Larkin Streets, it is unlikely that they would park on Japantown streets because Japantown, west of Octavia Street, is over a quarter-mile away from the campus. This would not be considered to be a reasonable walking distance to the Van Ness corridor.

Comment

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-65 TR, duplicate comment was provided in 30-65 TR]

"On Page S-50, there is mention of 'consultation with other Agencies, including Muni/SFMTA and property owners on Cedar Street, to assist coordination of construction traffic management strategies as they relate to bus-only lanes and service delivery on Cedar Street. CPMC should proactively coordinate with these groups prior to developing their Plan to ensure the needs of the other users on the islands addressed within the construction TMP for the project.' What islands?"

Response TR-112

The comment identifies a misprint in the text of the Draft EIR. Consistent with this comment, Mitigation Measure MM-TR-55 is amended to revise the following bullet on pages S-50 and 4.5-160 of the Draft EIR as shown below:

> Require consultation with other Agencies, including Muni/SFMTA and property owners on Cedar Street, to assist coordination of construction traffic management strategies as they relate to bus-only lanes and service delivery on Cedar Street. CPMC should proactively coordinate with these groups prior to developing their Plan to ensure the needs of the other users on the ~~Islands~~ blocks addressed within the construction TMP for the project.

Comment

(Helene Dellanini—DBC Master Owner's Association, October 18, 2010) [71-8 TR, duplicate comment was provided in 72-8 TR]

"**TR-55: Implementation of the Cathedral Hill Campus project would result in a transportation impact in the project vicinity resulting from construction vehicle traffic and construction activities that would affect the transportation network. (Significant and Unavoidable with Mitigation)**

According to page 2-40, construction of the interior improvements to CPMC's MOB at 1375 Sutter will occur coincident with the construction of the main hospital building and the MOB on Van Ness Avenue. However, trips from that part of the construction were not factored into the analysis of the overall construction traffic impact."

Response TR-113

The comment questions the construction phasing used in the traffic analysis. The proposed Cathedral Hill Campus project would include renovations to the existing medical office building at 1375 Sutter Street. However, this facility would undergo a phased renovation, and CPMC-affiliated physicians and their practices would occupy space in the building as existing tenants vacated. The new tenant improvements and interior renovations proposed would not require extensive demolition or excavation. No substantial changes to the exterior of the building, beyond routine maintenance and window systems, are anticipated. Because of the low level of construction activity anticipated at any one time at 1375 Sutter Street, construction traffic to the building is not expected to result in any significant impacts not identified as part of Impact TR-55 in the Draft EIR, page 4.5-147. Any construction activity at 1375 Sutter Street that would require work within the public right of way, including lane and sidewalk closures as a part of construction activity, would meet the *City's Regulations for Working in San Francisco Streets (SFMTA Blue Book)* and would be subject to review and approval by the Department of Public Works (DPW) and the City's TASC.

Comment

(Donald Scherl, October 18, 2010) [74-19 TR]

"Impact-58: With respect to the pedestrian tunnel under Van Ness Ave., the EIR correctly notes the unavoidable and severe impact this would have on transportation in the project vicinity. This tunnel is a CPMC convenience luxury that offers little if any public benefit compared to the construction chaos it would create."

Response TR-114

The comment states that the pedestrian tunnel connecting the proposed Cathedral Hill Hospital and MOB is not essential, and that traffic impacts associated with its construction would be severe. The comment is noted. The comment does not raise issues regarding the adequacy, accuracy, or completeness of the Draft EIR. The comment will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project. The pedestrian tunnel would be used by patients, visitors, physicians, and CPMC staff, allowing them direct connection between the two buildings, particularly during inclement weather. It also would be used for the movement of records and materials. Although the pedestrian tunnel would primarily serve patients, visitors, and employees of CPMC, the tunnel would reduce the pedestrian demand at the intersection of Van Ness/Geary. Without the tunnel, CPMC patients, visitors, and employees would cross at street-level at the intersection of Van Ness/Geary, which would increase the number of pedestrians within the crosswalk.

Comment

(Lisa Carboni (Caltrans (Regional)), September 9, 2010) [6-7 TR, duplicate comment was provided in 7-7 TR]

"Please continue to coordinate with the Department for the Highway Improvement Agreement (HIA) for the proposed pedestrian tunnel. Please note the HIA must be approved by the Department prior to the tunnel construction."

Response TR-115

The comment suggests that approval from Caltrans would be required before construction of the proposed pedestrian tunnel under Van Ness Avenue. This approval process was noted in Table 2-3 on page 2-15 of the Draft EIR.

Comment

(Sheila Mohoney and James Frame, October 19, 2010) [88-3 TR]

"Construction Truck Route

At a recent neighborhood meeting a CPMC representative informed us that they hoped to underground their utilities on Duncan (excavating to a depth of 23') and that Duncan would be the route for all the construction trucks. which they estimated at 70 a day. Even excluding Alternative 3A, which would place more years of intensive construction literally on our doorstep, the impacts of the proposed-but not mentioned--construction circulation pattern will be significant and should have been studied from a Duncan Street perspective."

Response TR-116

The comment suggests that the Draft EIR should analyze construction-related circulation impacts on Duncan Street. The proposed underground work for Duncan Street includes:

- sewer relocation due to abandoned San Jose Avenue street section;
- relocation of electrical lines due to abandoned San Jose Avenue street section; and
- new AT&T service for new hospital (starts at manhole in front of the Monteagle Medical Center).

As proposed in the St. Luke's Campus Construction Management Plan, trucks would primarily access the construction site via Cesar Chavez Street, Guerrero Street, and 27th Street. Construction material will also be delivered off Guerrero and 27th Streets, as indicated in the Material Delivery and Offloading Plan (Sheet M1 of the St. Luke's Construction Management Plan). CPMC has indicated that trucks will be split between 27th and Duncan Streets, subject to review and approval by the Department of Public Works.

As described in the Construction Management Plan, the site would generate a maximum of 35 trucks per day during the excavation phase and exterior phase construction (13 weeks) of the hospital and 80 trucks per day during the excavation phase construction (13 weeks) of the MOB. Even if half of the trucks used Duncan Street during the day, this would equate to about one truck every 30 minutes during construction of the hospital and one truck every 15 minutes during construction of the MOB. The site would generate fewer trucks during other phases of construction. The proposed route for construction vehicles will not be limited to Duncan Street and will be reviewed and approved by DPW and the City's TASC before the start of construction.

Comment

(Gloria Smith/Tom Brohard & Associates—California Nurses Association, October 19, 2010) [92-27 TR]

"8) Significant Construction Impacts Can Be Mitigated - Page 4.5-154 of the Draft EIR states 'for the 4-month period when there is overlap in excavation between the proposed Cathedral Hill Hospital and MOB, Level of Service would be LOS E or LOS F at up to nine of the study intersections. Thus, the project's construction impacts on intersection operations at these nine study intersections would be significant' To reduce or eliminate the significant traffic impacts at nine intersections, the Draft EIR must analyze traffic impacts that would occur without any overlap in construction of the Hospital and MOB."

Response TR-117

The comment states that the Draft EIR must analyze traffic impacts that would occur without any overlap in construction of the proposed hospital and MOB, to reduce or eliminate the significant traffic impacts. As noted in the comment, the transportation analysis of construction activities at the proposed Cathedral Hill Campus focuses on a 4½ -month construction period when an overlap would occur in excavation between the proposed Cathedral Hill Hospital and MOB, consistent with the construction schedule proposed by CPMC. This period also represents the most conservative scenario with respect to potential traffic impacts. If the hospital and MOB were excavated separately, the number of truck trips that would result from excavation of just the proposed hospital site or the MOB site individually would be less than what was analyzed in the Draft EIR; however, they would still be considered significant and unavoidable because of the other construction-related impacts occurring for the duration of construction.

Comment

(Carolynn Abst and Ron Case—Case + Abst Architects LLP, October 19, 2010) [102-14 TR, duplicate comment was provided in 114-14 TR]

"Even with shuttles being available for construction workers, they will need to drop off their equipment and tools at the site. This additional traffic noise, vehicle exhaust, and dirt will be a burden placed on our office, the employees, and our residence."

Response TR-118

The comment states concerns regarding the need for construction workers to drop off their equipment and tools at the proposed Cathedral Hill Campus construction site. Construction workers generally would not be allowed to drop off equipment at the construction site before proceeding to off-site parking areas. Because of the complex nature of medical center construction, most tools and equipment would be kept in secure storage on site permanently during the various phases of construction. When work was occurring inside the building, the garage levels and loading docks would be utilized for the movement of tools and equipment. Additional information related to construction worker parking at the Cathedral Hill Campus and Construction Transportation Management Plan as it relates to construction worker travel patterns and impacts is provided in Response TR-79 and Response TR-105, respectively.

3.7.12 CEDAR STREET

3.7.12.1 MAINTAINING ACCESS AND ROAD CONDITION

Comments

(Carolynn Abst and Ron Case—Case + Abst Architects LLP, October 19, 2010) [102-9 TR, duplicate comments were provided in 103-5 TR, 113-5 TR, and 114-9 TR]

"C. The access to our parking is in Cedar Street [bordering the MOB site]. Our access to and from will be limited and interrupted due to construction material, deliveries, trucks, etc. [work and living issue]"

(Carolynn Abst and Ron Case—Case + Abst Architects LLP, October 19, 2010) [102-17 TR, duplicate comment was provided in 114-17 TR]

"As construction progresses, Cedar Street will become blocked at times and the paving will become torn up. This is our only means to get to our garage. We will have to endure five years of delays and accelerated wear and possible damage to our car."

(Lower Polk Neighbors, October 19, 2010) [103-9 TR, duplicate comment was provided in comment 113-9 TR]

"LPN is concerned that as construction progresses the streets and alleys will become somewhat torn up causing wear and tear to our own vehicles. (work and living issue)."

Response TR-119

The comments state concerns regarding the use of Cedar Street during construction of the proposed Cathedral Hill MOB, and the potential damage to the Cedar Alley and other adjacent streets because of construction activity.

As stated on pages 4.5-132 of the Draft EIR, construction activities would likely require sidewalk, parking lane, and bus-only lane closures during construction. The comments state concern with access to garage/storage areas on the north side of Cedar Street (the opposite side of construction). As discussed on page 4.5-133 in the Draft EIR, the construction plan calls for the closure of the southern side parking lane and sidewalk of Cedar Street for the duration of construction activity, leaving the northern portion of the street open to eastbound vehicular traffic. The MOB construction site would feature four gates through which materials or deliveries might access the site, two on Cedar Street, and two on Geary Street. Should any construction-generated delivery truck hinder the access of garage/storage area on the north side Cedar garage, a trained flagman, whose duty would be to assure the safety of workers and movement of material and equipment into and out of the project site, would coordinate the movement of the truck to an alternate location on Cedar Street or into the site via a construction site gate. The combination of having the northern portion of Cedar Street open to vehicular traffic and having a trained flagman at the construction site would allow users access to the garage in question at all times.

CPMC would be responsible for following the rules established in the SFMTA Blue Book, the City's manual for City agencies, utility crews, private contractors, etc. while working in City streets. As such they would be responsible for repairing any damage to city streets or sidewalks in accordance with the policies outlined in the Blue Book caused directly by construction of the proposed Cathedral Hill Campus, including on Cedar Street.

3.7.12.2 INADEQUATE QUEUING ANALYSIS

Comments

(Nick Mironov—Gayner Engineers , September 27, 2010) [43-1 TR]

"Gayner Engineers is a business located at 1133 Post St. with the rear access at 140 Cedar St. (between Van Ness and Polk). Our rear access includes a garage which houses 17 vehicles. I estimate that we have 40 to 60 daily in/out trips on a typical day, and sometimes more.

I have reviewed the CPMC LRDP Draft EIR. The emphasis of my review was on the MOB garage Cedar Alley traffic effect on Gayner Engineers' business. Although I saw the two Cedar alley traffic options, I did not see any detailed analysis how either option will affect the two delivery truck locations (Concordia Club and the homeless shelter) as well as Gayner Engineers' garage access and the other 7 garages along the north side of Cedar."

(Carolynn Abst and Ron Case—Case + Abst Architects LLP, October 19, 2010) [102-19 TR, duplicate comment was provided in 114-19 TR]

"A. With entry and exit of the MOB parking less than 50 feet away from our parking entry we will experience long waits and traffic congestion to get in and out of our own garage. The garage is use throughout the day and evening. This problem will be greater if the queue areas for cars entering the MOB parking garage on Cedar are inadequate. The DEIR fails to contain an adequate analysis of the required queuing space for the Cedar entrance.

If the MOB parking is open in the evenings we will experience this problem continually."

(Lower Polk Neighbors, October 19, 2010) [103-11 TR, duplicate comment was provided in 113-11 TR]

"II. Comments directed at the long term affects to our Neighborhood and Community (Once Hospital and MOB are occupied):

A. For Post, Polk, and Cedar Street residents and businesses with new two-way Cedar Street entry and exit lanes to access the MOB parking entry on Cedar Street, we will experience long waits and traffic congestion to get in and out of our own garages. Our garages are used throughout the day and evening. If the MOB parking is open the evenings we will experience this problem continually."

Response TR-120

The comments state concerns about the proposed Cathedral Hill MOB project's impact on Cedar Street. A queuing analysis of the proposed MOB Cedar Street Parking Garage entry is shown on Figure 4.5-19, page 4.5-101 of the Draft EIR, and details provided in Section 4.6.4 of the *Cathedral Hill Transportation Impact Study*. To summarize a worst-case scenario 95th percentile vehicle queue analysis was performed for all garage entry points based on the speed with which tickets would be processed, location of entry ticket machines (approximately 100 feet from vehicle entry), and number of entering vehicles during the a.m. peak period. The a.m. peak period was selected as it represents the time when the most vehicles would enter the MOB garage. The analysis for the Cedar Street entry showed that more than enough storage length would exist internal to the garage to prevent any queue from forming external to the entry, on Cedar Street. As stated, this analysis was for a worst-case scenario in which all vehicle trips associated with the Cathedral Hill Campus were assumed to enter CPMC garages, when it would be likely that a percentage would be patients/visitors who would be dropped-off/picked-up external to CPMC garages.

As stated on page 4.5-142 in the Draft EIR, the Cedar Street passenger loading/unloading zone would be actively managed, and if demand exceeded supply, drivers would be instructed to enter the MOB garage on Cedar Street to avoid a queue or block of access to other Cedar Street garages.

Although the queuing analysis shows that vehicle queues into the parking garages on the proposed Cathedral Hill Campus would not back up into the public right of way, CPMC would be subject to a condition of approval requiring them to address any queue that continually extended into the public right-of-way. If such a queue occurred, CPMC would be required to institute measures that would reduce the queue length, including but not limited to actively managing the queue (as is already proposed), to instituting measures that would discourage driving to the proposed Cathedral Hill Campus, including adjusting the price of parking.

3.7.12.3 MOB GARAGE ACCESS OPTIONS – CEDAR TRAFFIC METERING MITIGATION

Comments

(Nick Mironov—Gayner Engineers, September 27, 2010) [43-3 TR]

"I am further led to believe that the only MOB entry/exit option that the City is interested in is the one where all MOB garage traffic is via the Cedar Alley (no entry/exit at Geary)."

(Patricia Rosenberg—Concordia Argonaut, October 18, 2010) [64-1B TR]

"The Concordia Argonaut is a private membership club located at 1142 Van Ness Avenue (southeast corner of Van Ness and Post). The club has been at this location since 1891.

While we are in support of the opportunity to introduce a state of the art medical facility into our area, we encourage the city to allow CPMC to have both an entry and exit along Geary in order to more evenly distribute the number of cars entering and leaving the garage to their proposed medical office building. This will maximize the opportunity for a more pedestrian-oriented environment to be created along Cedar Street."

Response TR-121

The comments reference information related to proposed MOB garage access options at the Cathedral Hill Campus. These options (proposed CPMC LRDP and MOB Access Variant) are described on pages 4.5-88 and 4.5-90of the Draft EIR.

The proposed CPMC LRDP would provide vehicle ingress to the Cathedral Hill MOB from Geary Street and Cedar Street and egress onto Cedar Street. As part of the proposed LRDP, Cedar Street would be converted to two-way operations west of the MOB garage access point, allowing egress towards both Polk Street and northbound Van Ness Avenue. The Post Street Variant described in the Draft EIR would not change the access to the Cathedral Hill MOB. The MOB Access Variant would allow ingress and egress from both Geary Street and Cedar Street. As part of this variant, Cedar Street would remain one-way eastbound, as under existing conditions. Each of these variants, as well as their corresponding impacts, are addressed in the Draft EIR. Therefore, City decision-makers would be able to approve either the access proposed by the CPMC LRDP or the MOB Access Variant without further environmental review.

Comment 63-1B suggests that the MOB Access Variant would be superior to the proposed LRDP access plan because it would more evenly distribute vehicle traffic exiting the site, and that less vehicle traffic on Cedar Street would make the street more pedestrian friendly. Although the MOB Access Variant would reduce the number of vehicles exiting the site using Cedar Street, it would result in a significant and unavoidable impact (Impact TR-17) and traffic hazard, including pedestrian-vehicle conflicts on Geary Street at the project's driveway. Neither the proposed LRDP nor the MOB Access Variant would have a significant impact on pedestrians along Cedar Street because both the proposed LRDP and the MOB Access Variant would provide similar pedestrian accommodations along Cedar Street.

Cedar Street Analysis

Comments

(Nick Mironov—Gayner Engineers, September 27, 2010) [43-2 TR]

"During previous presentations to the community by CPMC and the design team, I understood that a number of mitigation measures were being considered, such as stacking incoming cars within the MOB garage (to minimize backing up into the street), metered intersection stoplight controls at Post/Polk, Cedar/Polk, Geary/Polk to maintain flow and avoid street jams, not allowing a left turn from Cedar onto Polk, diversion to the Geary exit if the Cedar exit is backed up, etc., but I did not find these mitigation measures mentioned, analyzed, or discussed in the EIR."

(Nick Mironov—Gayner Engineers, September 27, 2010) [43-4 TR]

"Having all MOB garage entry/exit via the Cedar Alley, no analysis of the effects on the Concordia Club and homeless shelter delivery truck locations, no analysis of the traffic effects on Gayner Engineers' garage access and the remaining 7 garages, no analysis of the MOB loading dock/delivery effects, no mitigation measures of how traffic is to be managed at the MOB garage entry/exit and street intersections, and no mitigation measures of the MOB loading dock effects, is not acceptable to Gayner Engineers, This will surely result in a significant negative impact on Gayner Engineers to effectively do business from our location."

(Nick Mironov—Gayner Engineers, September 27, 2010) [43-5 TR]

"Gayner Engineers insists that a complete analysis of the Cedar Alley traffic (during construction and in the finished configuration) be performed and that appropriate mitigation measures that meet Gayner Engineers' and our neighbors' needs be studied, reviewed with and approved by Gayner Engineers and our neighbors, and approved mitigation measures be implemented into the project."

Response TR-122

The comments reference potential impacts to Cedar Street and state concerns regarding business access along Cedar Street. As described on page 4.5-89 of the Draft EIR, the proposed LRDP includes construction of raised sidewalks at the unsignalized intersections of Cedar at Van Ness Avenue and Polk Street and the removal of one parking space on Polk Street north of Cedar Street to improve sight distances for vehicles exiting Cedar Street. As described in the Draft EIR, these project elements are designed to benefit pedestrians, bicyclists and vehicles at Cedar Street intersections.

The comments mention potential "stacking" of vehicles within the MOB Parking Garage to address potential queues onto nearby streets. As discussed in the Draft EIR, the ticket gate would be located 100 feet from the vehicle entry and under the worst-case scenario, the 95th percentile queue into the MOB would not extend back to the street at the entrance, and the impact would be less than significant.

The comments identify the potential for metered lights in lieu of traffic signals at the intersections of Polk/Post, Cedar/Polk, and Polk/Geary to reduce the possibility of vehicle queues on Cedar Street: The stop-controlled intersection of Polk/Cedar was analyzed during the a.m. and p.m. peak hours for all access scenarios and was found to operate at an acceptable level of service (LOS C). This analysis included some vehicles making a left turn; however, the analysis determined that most vehicles would make a right turn because of the configuration of the intersection and because of the proposed LRDP's trip distribution. As stated previously, the intersection of Polk/Cedar was analyzed during the a.m. and p.m. peak hours for all access scenarios and found to operate at LOS C. Because the intersection of Cedar/Polk is anticipated to operate at an acceptable levels of service, no further mitigation was identified.

However, in the event that queuing did occur on Cedar Street, a condition of approval/improvement measure has been developed that would require the garage operator to abate any reoccurring vehicle queues blocking driveways and access to businesses on Cedar Street. A revision to page 4.5-102 of the Draft EIR, includes Improvement Measure I-TR-5 – Offstreet Parking Queue Abatement, in which CPMC would be required to abate any reoccurring queue of one or more vehicles blocking Cedar Street for three minutes or longer on a daily or weekly basis. CPMC would be required to hire a qualified transportation consultant to evaluate the conditions occurring on the site, develop and implement a set of abatement strategies within 90 days of being notified that a reoccurring queue is blocking the public right of way. CPMC would also be required to submit monitoring reports to the Planning Department for review. Potential abatement methods for queues exiting the garage include installing metering lights at the exit gate that hold vehicles in the garage until queues on Cedar Street clear the right of way. If non-CPMC vehicles could not use designated loading spaces remaining on Cedar Street, the abatement plan would need to address alternative loading areas, such as relocating the spaces onto Van Ness Avenue or Polk Street. See Response TR-89 on page C&R 3.7-157 for the added Improvement Measure I-TR-5.

The comments note a diversion of exiting vehicle traffic from the Cedar Street exit to Geary Street exit if queuing occurred on Cedar Street: This would only be possible under the MOB Access Variant because egress onto Geary Street would be prohibited under the proposed LRDP and the Post Street Variant. As noted previously, the MOB Access Variant was analyzed in the Draft EIR.

The comments are concerned that the proposed LRDP did not analyze and would impede access to parking garages on Cedar Street. As discussed in Response TR-121 (page C&R 3.7-200) and on page 4.5-

88 of the Draft EIR, the proposed LRDP would convert Cedar Street to two-way operations west of the MOB garage entrance and maintain one-way access east of the garage entrance to Polk Street. Therefore, the proposed LRDP would not prohibit or change how visitors or employees would access the Gayner Engineers' garage because access from Van Ness Avenue would be maintained as a public right-of-way.

The comments are concerned that changes to Cedar Street may affect existing on-street loading and unloading operations on Cedar Street. Cedar Street currently includes one wide eastbound travel lane with some parking, including commercial parking on the south side of Cedar Street. Existing deliveries on Cedar Street were observed to both use the commercial loading spaces (for smaller vehicles) and park within at least part of the existing travel lane and/or north sidewalk to load/unload. While it is not legal to block a vehicle travel lane or sidewalk, the current alley width does allow for this activity since traffic can traverse this activity. Continuation of this type of loading activity (blocking travel lanes and/or sidewalks) is not recommended and would be far more difficult without blocking vehicle traffic and/or the sidewalk after the proposed Cedar Street conversion to two-way operations west of the MOB garage. However, other commercial loading parking spaces are available (several on Van Ness Avenue and one on adjacent Polk Street block). As discussed under Impact TR-43 beginning on page 4.5-136 of the Draft EIR, the MOB loading demand shortfall was a less-than-significant impact, with active management and availability of other commercial spaces in the area. The MOB would have two loading spaces located interior to the parking garage. The proposed LRDP includes a Truck Management Plan for the Cathedral Hill Campus to manage loading facilities and ensure that demand would be accommodated. As identified in the plan, a majority of service deliveries would occur at the hospital's loading dock off Franklin Street; CPMC distributions (to and from the central distribution facility) would be consolidated and would occur only between 7:00 p.m. and 7:00 a.m., and loading zones would be actively managed to ensure that loaded vehicles would not remain in loading spaces for an extended period of time so as to impact nearby streets.

Because impacts to Cedar Street and at proposed LRDP driveways are expected to be less than significant, mitigation measures are not required. Mitigation measures, reviewed by City decision makers as part of the CEQA review process, are only required in the event that a significant impact would result from the proposed LRDP. The comments do not identify any significant impact that would require mitigation measures. The recommendations contained in the comments will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project.

Traffic Impacts

Comments

(Patricia Rosenberg—Concordia Argonaut, October 18, 2010) [64-1A TR]

"The Concordia Argonaut is a private membership club located at 1142 Van Ness Avenue (southeast corner of Van Ness and Post). The club has been at this location since 1891.

We are in support of the proposed new hospital and medical office building being proposed by California Pacific Medical Center at Van Ness and Geary. CPMC has presented its plans to our membership and continues to keep us informed of its progress. While the project will result in a high-quality medical center in our neighborhood, we want to ensure that the operation of our facilities will not be negatively impacted by its interim construction and the on-going operations.

One of the features to the development described to us was the improvement of Cedar Street into a pedestrian-oriented area with a vehicular drop-off serving the proposed medical office building. Our understanding was that vehicles would be able to enter and exit the building on both Geary and Cedar Streets and that Cedar would continue to be one-way (eastbound). Improvements to Cedar including enhanced paving materials, street trees and

other features would have greatly improved the area and continued to easily accommodate deliveries through our existing rear door.

In reviewing the Draft EIR, we were disappointed to see that the plans for the project now reflect Cedar as a two-way street serving as the primary vehicular access to the garage of the office building. Such a design would from our perspective, make Cedar a much more congested street; limiting our loading and delivery access and would create a safety hazard for pedestrians crossing the "plaza" area. This design would also in our view, add to congestion at the intersections of Polk Street and Cedar (across a bike lane), Polk and Geary and Geary and Van Ness as people exiting the proposed building garage who would like to go westbound would be required to exit onto Polk Street before turning right onto Geary.

While we are in support of the opportunity to introduce a state of the art medical facility into our area, we encourage the city to allow CPMC to have both an entry and exit along Geary in order to more evenly distribute the number of cars entering and leaving the garage to their proposed medical office building. This will maximize the opportunity for a more pedestrian-oriented environment to be created along Cedar Street."

(Linda Chapman, October 19, 2010) [76-20 TR, duplicate comment was provided in 111-20 TR]

"Converting Cedar Alley to garage access creates traffic conflicts. This street is narrow, now lightly used-and accessed from two transit preferential streets that are sometimes congested, without added traffic from a CPMC campus. Cars turning east from the garage would enter Polk at midblock, interrupting traffic flow (including buses) on a relatively narrow street. Results could be delays, and unexpected conflicts confusing drivers, as cars emerge in mid-block. Drivers exiting on Polk intending to head east or north would circulate among one-way streets in Polk Gulch.

Similar conflicts are predictable if significant numbers of cars use the mid-block alley at Van Ness for garage access. Alleys running between Van Ness and Polk are little used for auto traffic."

(Carolynn Abst and Ron Case—Case + Abst Architects LLP, October 19, 2010) [102-27 TR, duplicate comment was provided in 114-27 TR]

"D. The amount of car and truck traffic next to our building, stopping and starting, trying to pull out on to Polk Street, will, overtime damage our exterior finishes [roof, walls and windows."

(Carolynn Abst and Ron Case—Case + Abst Architects LLP, October 19, 2010) [102-28 TR, duplicate comment was provided in 114-28 TR]

"E. As with all hospital campuses, there will be cars circling the neighborhood waiting to pick up, drop off, and/or looking for parking. A major part of the neighborhood circling will be down Cedar Street, at our building. The situation will be exacerbated by the significant and unavoidable impact at intersection of Polk and Geary near our office. Again, a major health and noise issue."

Response TR-123

The comments state concerns (traffic, congestion, loading access, pedestrian and bicyclist safety) related to the proposed Cathedral Hill MOB access. The proposed Cathedral Hill MOB's initial vehicle access plan included full access via Geary Street and via one-way eastbound Cedar Street. As part of the transportation impact analysis of the proposed LRDP, the San Francisco Planning Department completed an analysis and recommended a series of project design changes intended to (1) address potentially significant pedestrian/vehicle conflicts on Geary Street; (2) address potential conflicts to future transit operations on Geary Street; and (3) address potential conflicts associated with the LRDP's egress and ingress. In response to this analysis, CPMC altered access to the MOB, including restricting egress from Geary Street and converting Cedar Street to two-way operations.

As stated on page 4.5-132 of the Draft EIR, the proposed LRDP would include several improvements to address pedestrian safety including improvements at the crosswalk on Van Ness Avenue, crossing Cedar Street, as is noted in the comment. The crosswalk would be shortened by installing bulb-outs, the sidewalk would be raised to increase drivers' ability to see pedestrians, and the sidewalk would be widened into what is now an adjacent parking lane.

As stated in Impact TR-37 on page 4.5-129 of the Draft EIR, the proposed LRDP would include the removal of one on-street parking space on the west side of Polk Street immediately north of Cedar Street, to ensure visibility for drivers and bicyclists at the intersection of Polk/Cedar. This project feature would minimize the potential for vehicle-bicycle conflicts.

Vehicles exiting the MOB garage onto Cedar Street and intending to proceed west on Geary Street would not add to congestion at the intersection of Van Ness/Geary, in a way that would otherwise not occur if egress was permitted from Geary Street as the comments state, because under both scenarios they would be approaching Van Ness Avenue from Geary Street. The operation of Van Ness Avenue/Geary Street does not substantially improve under the MOB Access Variant (where similar to the project it is a less than significant impact).

As stated previously, the stop-controlled intersection of Polk/Cedar was analyzed for a.m. and p.m. peak hour conditions for all access scenarios (including the MOB Access Variant which allows for egress onto Geary Street), and intersection operations were LOS C. Similarly, as discussed in Impact TR-13 on page 4.5-108 of the Draft EIR, a significant unavoidable impact would still occur at the intersection of Polk Street/Geary Street under the MOB Access Variant.

With respect to the comment that Cedar Street would bear the brunt of any vehicle queuing, no evidence suggests that this situation would occur. However, as stated on page 4.5-162 in the Draft EIR, the transportation analysis accounts for potential secondary effects, such as cars circling and looking for a parking space in areas of limited parking supply, by assuming that all drivers would attempt to find parking at or near the project site and then seek parking farther away if convenient parking was unavailable. In addition, the associated air quality and noise analyses reasonably address potential secondary effects associated with cars circling and looking for parking in the area; the same traffic assignments used in Section 4.5, "Transportation and Circulation" in the Draft EIR were used for air quality and noise modeling. Additional information about traffic circulation on Cedar Street, including existing loading operations and the parking garage exit is provided in Response TR-122 (page C&R 3.7-201). In summary, a condition of approval has been developed for the project that requires CPMC to implement measures that eliminate any reoccurring vehicle queue from its parking structure that blocks the public right of way, including access to any existing vehicle loading spaces on Cedar Street.

3.7.13 TENDERLOIN-LITTLE SAIGON

3.7.13.1 SUPPLEMENTAL ANALYSIS

Comments

(Sandra Manning, September 23, 2010) [31-1 TR]

"The E.I.R's ignores the project's traffic impacts in the Uptown Tenderloin. CPMC plans turn the Tenderloin streets into speedways, bringing thousands of cars rushing through the community each day to reach the new hospital."

(Stephanie Barton, et al.,—Hastings Civil Justice Clinic for the Good Neighbor Coalition, October 19, 2010) [104-32 TR]

"**II. The DEIR needs to be substantially amended to take into account the project's transportation and circulation impacts on the Tenderloin.**

A. The geographic scope of the transportation and circulation analysis is too narrow.

The DEIR neglects to analyze or even mention the Tenderloin as a neighborhood in the vicinity of the proposed Cathedral Hill Campus, One particularly glaring consequence is that the DEIR fails to address the onerous traffic volume that already exists on Tenderloin streets, especially those leading to Van Ness Avenue. This omission defies common knowledge that traffic going to and from South of Market flows through the Tenderloin.

A DEIR is required to discuss significant impacts that the proposed project will cause in the area affected by the, project.[54] CEQA guidelines require the DEIR to "define the geographic scope of the area affected by the cumulative effect and provide a reasonable explanation for the geographic limitation used."[55] The San Francisco Transportation Impact Analysis Guidelines ("SF Guidelines") provide that the normal vicinity is a radius between two blocks and a quarter-mile. However, these mechanical figures are simply guidelines and a larger area needs to be used when reasonable to account for well-known traffic patterns.[56] The DEIR's overall transportation study area for the Cathedral Hill Campus for some purposes is a somewhat larger circular area with a half-mile radius and a perimeter marked by Webster, Fulton, Jones and Washington :Streets.[57] These boundaries too are formalistic and exclude an analysis of traffic leading into the circumscribed area. However, in examining congestion levels, the scope of analysis uses the narrow two-block benchmark. As a consequence, the DEIR does not examine congestion at traffic intersections east of Polk Street thereby eliminating almost entirely consideration of transportation and circulation impacts of major concern to Tenderloin residents. The DEIR provides no explanation for its virtual exclusion of the Tenderloin, a neighborhood directly abutting the proposed Cathedral Hill Campus., from its transportation and circulation analysis.

By limiting the analysis area, the DEIR fails to analyze how streets in the Tenderloin currently function as arterials or quasi-arterials for moving traffic through the Tenderloin. The City's Congestion Management Program (CMP) defines Golden Gate Avenue and Hyde Street as arterials.[58] Arterials are defined as "cross-town thoroughfares whose primary function is to link districts within the city and to distribute traffic from and to the freeways; these are routes generally of citywide significance; of varying capacity depending on the travel demand for the specific direction and adjacent land uses."[59] Tenderloin streets specifically designated as arterials and additional streets that function as arterials (*e.g.*, Leavenworth Street) are not identified by the DEIR. Several freeway exits lead cars through the Tenderloin as a means of entry and departure for Van Ness Avenue, especially when there are high traffic volumes on Van Ness Avenue. To illustrate, cars originating from the East Bay and South Bay regularly exit 7th Street from 101 and then drive to Leavenworth Street, where they will take one of the Tenderloin's one way streets to Van Ness Avenue. Instead of using a formulaic quarter- or half-mile radius for the boundaries of analysis, the DEIR should examine the actual flow of traffic on arterial and quasi-arterial Tenderloin streets. This analysis would provide the community and decision makers with a much more complete picture of the potential traffic impacts of the project on the Tenderloin.

(Stephanie Barton, et al.,—Hastings Civil Justice Clinic for the Good Neighbor Coalition, October 19, 2010) [104-37 TR]

"**2. The DEIR's traffic analysis is incomplete and inadequate because it fails to examine the potential traffic impacts oil the Tenderloin as well as traffic impacts midday;**

The DEIR fails to examine the traffic impacts that the Cathedral Hill Campus will have on Tenderloin streets, even though the site borders the neighborhood. San Francisco's General Plan calls for discouraging "excessive automobile traffic on residential streets by incorporating traffic-calming" measures.[79] The Little Saigon Report is the latest of at least nine separate studies conducted by public and private organizations in the Tenderloin since 1997 that recommend traffic-calming measures due to negative impacts from current traffic conditions.[80] Most streets in the Tenderloin are designed to move cars through as quickly as possible.[81] Because of problems caused by over-prioritizing traffic flow ahead of other neighborhood needs, the Little Saigon Report focuses on traffic calming recommendations. One example is convening Ellis/Eddy and Leavenworth/Jones to two-way streets.[82] San Francisco public agencies are now in the process of implementing various Little Saigon Report recommendations.[83]

Yet the DEIR does not study vehicular routes east of Polk Street and north of Market Street that go through the Tenderloin, even though the Tenderloin is clearly a neighborhood "in the vicinity" of the Cathedral Hill Campus.[84] As-a result, the DEIR fails to consider to what extent traffic generated by the Cathedral Hill Campus complicates implementation of the Little Saigon Report's recommendations; which aim to improve Tenderloin neighborhood development and liability, Conversely, it also fails to consider the extent to which traffic calming measures to be implemented as part of the Little Saigon Report's recommendations, like the two-way conversion of Ellis and Eddy, may affect the DEIR's previous traffic estimates by increasing traffic on other thoroughfares.

(Stephanie Barton, et al.—Hastings Civil Justice Clinic for the Good Neighbor Coalition, October 19, 2010) [104-47 TR]

"The cumulative effect of traffic from the proposed Cathedral Hill site would exacerbate the pedestrian safety, traffic, parking, and transit problems that already plague the residents of the Tenderloin. More traffic and pedestrian collisions create an unsafe environment for residents, specifically the elderly, the disabled, and children."

(Sandra Manning, September 23, 2010) [PC-120 TR]

"MS. MANNING: Hello, I am Sandra Manning. This is Joe Brown. We are residents of the Pier Hotel that is in the Tenderloin, 540 Jones Street. The EIR ignores the project's traffic impacts in uptown Tenderloin. CPMC plans to turn the Tenderloin streets into speedways, bringing thousands of cars rushing through the community each day to reach the new hospital."

(Nella Manuel, September 23, 2010) [PC-133 TR]

"Additionally, traffic impacts in the Tenderloin will be huge because of the CPMC."

(Mike Williams, September 23, 2010) [PC-136 TR]

"Good afternoon, Commissioners. I would like to thank you for your time. My name is Mike Williams. I have been a resident of the Tenderloin Neighborhood since 2001 and, as a resident, of course, I'm very familiar with the neighborhood and pretty much everything that goes on in it, and I'm very active in the neighborhood, also. CPMC, there is no question that there is going to be – that this hospital is going to be built, okay, the questions that I have regarding it is, or some of the things I'd like to see is,…"

(Mike Williams, September 23, 2010) [PC-137 TR]

"Some of the things I'd like to see is, 1) that they actually recognize that there are people living in Central City, that being the Tenderloin where I live. There will be an impact, definitely, on traffic, there already is an impact on traffic, believe it or not, because I live at the corner of Eddy and Taylor, and there are constant crashes there, pedestrians are run over, cars are constantly slamming into each other, in other words, a lot of car wrecks and so forth. A lot of people currently that come into the City use that whole area where I live as a – it's like a speed zone, okay? And people just fly through there. I feel that this hospital basically is going to increase that problem, okay, so the notion somehow that it's not going to be impacted, our neighborhood, is a false one."

(Magdalena Marcias, September 23, 2010) [PC-165 TR]

"MS. MAGDALENA MARCIAS [phon]: [Spanish] TRANSLATOR: Hi, my name is Magdalena and I have eight years living in the Tenderloin. I am a mother with three children, of which my children go to Redding Elementary over there by Pine and Post. And as you know, we walk a lot through the neighborhood, and we are walking in the area where you are planning to build the hospital. And that's one of our concerns, is that it's going to generate a lot more traffic, which is going to be much more dangerous for pedestrians, particularly families walking in that area. I just want to share with you, I've had a lot of bad experiences with cars in the Tenderloin, and various times I feel like cars often don't respect pedestrians or respect stop lights, or respect the velocity in the neighborhood. And, actually, just yesterday I was actually walking, picking up my children from school, and the driver did not want to respect my green light and the right for me to walk at the crosswalk, so I just want to share with you that I'm just really concerned about the traffic issue."

(Commissioner Olague, September 23, 2010) [PC-374 TR]

"Also, as Commissioner Moore pointed out, there are no LOS calculations for many of the Tenderloin intersections, even though most streets are configured as one-way streets to hasten traffic through the neighborhood, including to and from Van Ness, so I think there are a lot of the outer arterials that are considered, but some of the more interior ones aren't. I guess there was comment here by many members of the public about the Saigon Tenderloin Study."

Response TR-124

The comments state concerns regarding the impact of the proposed Cathedral Hill Campus project on the Tenderloin-Little Saigon neighborhood. In response to written and oral comments regarding the depth of analysis as related to the Tenderloin and Civic Center neighborhoods included in the Draft EIR, a supplemental transportation impact analysis was conducted. This supplemental analysis was performed for traffic, pedestrian, and bicycle conditions using the same analysis scenarios (project and variants for 2015 Modified Baseline and 2030 Cumulative conditions) analyzed in the Draft EIR. The supplemental analysis is documented in the "*Supplemental-Sensitivity Transportation Impact Analyses for the California Pacific Medical Center Cathedral Hill Campus in San Francisco, CA,*" which is located in Appendix E of the C&R document.

In the original analysis for the Draft EIR, traffic was assumed to pass through the Tenderloin Neighborhood consistent with trip distribution methodology in the *SF Guidelines*. Similarly, analysis intersections were selected based on the proposed project's diffusion of traffic. Due to their location

farther from the Cathedral Hill Campus, no intersections in the Tenderloin Neighborhood were therefore, selected for analysis. In general, impacts to intersections east of or more distant than those analyzed in the Draft EIR would be anticipated to be less due to the further diffusion of project related traffic. However, in response to comments received and for informational purposes, as part of the supplemental analysis, seven additional study intersections located in the Tenderloin and Civic Center neighborhoods were analyzed. The specific intersections that were studied were: Polk/Ellis, Larkin/Geary, Hyde/O'Farrell, Leavenworth/Geary, Larkin/Grove, Ninth/Larkin/Market, and Seventh/Market.

The supplemental analysis did not revise the vehicle trip distribution or assignment assumed in the Draft EIR; rather, it included additional intersections further from the project area, but along routes by which project-generated vehicle trips to and from the freeway and the southeastern quarter of San Francisco might travel. Approximately 10 and 18 percent of project-generated vehicle trips during the a.m. and p.m. peak hours, respectively, are expected to travel through the Tenderloin-Little Saigon neighborhood. A separate analysis was performed to alter and determine the sensitivity of the trip distribution of the project trips and is described in TR-125, page C&R 3.7-214.

The supplemental traffic analysis evaluated the operational characteristics during the weekday a.m. (between 7 and 9 a.m.) and p.m. (between 4 and 6 p.m.) peak hours at the seven additional study intersections. Weekday a.m. and p.m. peak hour intersection turning movement counts and pedestrian and bicycle condition observations were conducted at the additional study intersections in October and November 2010. It is standard procedure in San Francisco to perform analysis of transportation impacts during the p.m. peak hour, as this time period would best represent when the maximum use of the transportation network occurs. The a.m. peak hour was also analyzed because of the proposed campus's location next to a state facility (U.S. 101) and the large conversion of land use that the project would represent on the site. Care was taken to select days during which conditions would best be described as "normal." As such, no traffic counts were collected on days coinciding with the Major League Baseball playoffs games or events in San Francisco.

A comparison of intersection turning movement counts between those conducted in 2006 and November 2010 at the intersection of Eighth/Market shows that the total number of eastbound vehicles has decreased approximately 15 and 40 percent in the a.m. and p.m. peak hours, respectively. Additionally, an increase was observed in eastbound vehicles turning right at Eighth Street, and a decrease in southbound vehicles turning left onto Market Street from Hyde Street, particularly during the a.m. peak hour.[29] These changes are likely the direct result of SFMTA's actions to reduce the number of vehicles traveling eastbound on Market Street through a number of forced right turns.

Levels of service were calculated at each supplemental study intersection for the weekday a.m. and p.m. peak hours for Existing, 2015 Modified Baseline (with and without the project), 2015 Modified Baseline plus Post Street Variant, and 2015 Modified Baseline plus MOB Access Variant scenarios.

As noted, the existing pedestrian and bicycling environment near the supplemental study intersections was observed. Pedestrian facilities include sidewalks, crosswalks, curb ramps, and pedestrian signals and countdown timers. Bicycle facilities include bike routes, bike lanes, and sharrows. Pedestrian and bicycle facilities and conditions were qualitatively analyzed for the supplemental study area. The original Draft EIR describes three bike routes that pass through the study area: Route 16, 20, and 25.However, the two following bicycle routes were identified for consideration as part of the supplemental analysis:

[29] It should be noted that at the time that the original existing conditions for the Draft EIR were completed, the SFMTA had not instituted an effort to discourage private vehicle traffic on eastbound Market Street on a trial basis. The trial started in December 2009. As part of the trial, eastbound drivers are required to turn right at Tenth Street, and vehicles entering eastbound Market Street between Tenth Street and Seventh Street are required to turn right at Sixth Street. This effort is not expected to alter westbound Market Street or cross Market Street traffic. The trial is expected to become a permanent installation in 2011.

- *Route 23* on Eighth Street (southbound) and Seventh Street (northbound) south of Market Street (Class II facility)

- *Route 50* on Market Street between 17th Street–Steuart Street.
  Between Van Ness Avenue and Ninth Street–Larkin Street this route is a Class II facility (painted green); between Ninth Street–Larkin Street and Eighth Street–Hyde Street it is a Class II facility on the north side and Class III facility on the south side of Market Street; east of Eighth Street–Hyde Street it is a Class III facility.

The following observations were made at the supplemental study intersections during the a.m. and p.m. peak hours:

Polk/Ellis: This intersection has crosswalks on all four sides of the intersection and no pedestrian countdown signals. At the time of field observations, the curb ramps on all four corners were being reconstructed with new directional ramps and truncated dome sections. In general, pedestrian volumes were low to moderate, with about zero to 10 pedestrians crossing per traffic signal cycle during both a.m. and p.m. peak hours. Polk Street has Class II bike lanes in both directions, and about five cyclists were observed traveling through the intersection during each traffic signal cycle. Vehicles yielded to pedestrians and bicyclists, and no substantial conflicts were observed.

Geary/Larkin: This intersection has crosswalks on all four sides of the intersection and countdown pedestrian signals on all approaches. A bus stop is located on the west side of the intersection. In general, pedestrian volumes were low to moderate, with about 5 to 10 pedestrian crossings per traffic signal cycle. Very few cyclists were observed (along Geary Street). Vehicles yielded to pedestrians and bicyclists, and no substantial conflicts were observed.

Hyde/O'Farrell: This intersection has crosswalks on all four sides of the intersection and countdown pedestrian signals on all approaches. A bus stop is located on the east side of the intersection. In general, pedestrian volumes were moderate, with about 10 to 15 pedestrians crossing per traffic signal cycle. Vehicles yielded to pedestrians, and no substantial conflicts were observed.

Leavenworth/Geary: This intersection has crosswalks on all four sides of the intersection and countdown pedestrian signals on all approaches. In general, pedestrian volumes were moderate during both the a.m. and p.m. peak hours, with about 10 to 15 pedestrians crossing each side of the intersection during each traffic signal cycle. Bus stops on south and west legs of the intersection increased the amount of foot traffic. Vehicles yielded to pedestrians; however, some conflicts were observed when pedestrians would cross outside of the crosswalk on the west side of the intersection, after exiting a bus at the stop on that corner.

Larkin/Grove: This intersection has wide crosswalks on all four sides of the intersection and countdown pedestrian signals on all approaches. In general, pedestrian volumes were moderate during both the a.m. and p.m. peak hours, with about 10 to 15 pedestrians crossing each side of the intersection during each traffic signal cycle. Grove Street has a Class II bike lane in the eastbound direction at this intersection. The intersection had several bicyclists headed eastbound during each traffic signal cycle during the a.m. peak hour. Vehicles yielded to pedestrians and bicyclists, and no substantial conflicts were observed.

Ninth/Larkin/Hayes/Market Street: This intersection has wide decorative crosswalks on all four sides of the intersection and countdown pedestrian signals on all approaches. In-lane bus boarding islands are on both the east and west sides of the intersection. In general, pedestrian volumes were moderate during both the a.m. and p.m. peak hours, with about 15 to 20 pedestrians crossing each side of the intersection during each traffic signal cycle. This intersection also had a substantial number of bicyclists headed eastbound during the a.m. peak hour and westbound during the p.m. peak hour along Market Street. During the a.m.

peak hour, up to 15 bicyclists would travel through the intersection during certain traffic signal cycles. In general, vehicles yielded to pedestrians and bicyclists. Eastbound, private vehicle traffic is temporarily restricted between Tenth Street and Ninth Street as part of the temporary forced right turns discussed earlier; therefore, bicyclists tended to use the entire lane when heading eastbound. During the p.m. peak hour, vehicles turning right from Market Street onto either Hayes Street or Larkin Street tended to block bicyclists who were proceeding westbound on Market Street, causing the cyclists to weave through queued vehicles at the approach.

Seventh/Market: This intersection has wide decorative crosswalks on all four sides of the intersection and countdown pedestrian signals on all approaches. In-lane bus boarding islands are on the east, west, and south sides of the intersection, and a bus bulb-out is on the north side of the intersection. In general, pedestrian volumes were moderate to high during both the a.m. and p.m. peak hours, with about 20 pedestrians crossing each side of the intersection during each traffic signal cycle. This intersection also had a substantial number of bicyclists heading eastbound during the a.m. peak hour and westbound during the p.m. peak hour along Market Street. During the a.m. peak hour, up to 15 bicyclists would travel through the intersection during certain traffic signal cycles. Bicyclists tended to use the entire curbside lane when heading eastbound or westbound though the intersection. In general, vehicles yielded to pedestrians and bicyclists and no substantial conflicts were observed. Bicyclists tended to advance into the crosswalk before stopping; however, most yielded to pedestrians in the crosswalk.

Traffic: In general, with the addition of project-generated vehicle traffic, only minor changes in the average delay per vehicle at the supplemental study intersections resulted, and all study intersections continued to operate at the same acceptable level of service as under 2015 Modified Baseline and 2030 Cumulative No Project conditions, resulting in no significant project impacts. Under 2015 Modified Baseline conditions for the project and project variants, all seven of the supplemental study intersections operate at LOS C or better during both the a.m. and p.m. peak hours.

One of the supplemental study intersections, Seventh/Market, would operate at LOS E during the p.m. peak hour under 2030 Cumulative No Project and Cumulative plus Project Conditions. The critical northbound through movement operates at LOS E. The project would add one vehicle trip to the critical northbound through movement at the intersection during the p.m. peak hour, which represents 0.1 percent of the movement's volume. Therefore, the project's contribution to this critical movement would not be considered significant. The critical westbound through movement operates at acceptable levels of service. Therefore, the project's impact at this intersection would be considered *less than significant*. As stated earlier, a separate analysis was performed to determine the sensitivity of the trip distribution of the project trips which is described in Response TR-125, page C&R 3.7-214.

Bicycle: As presented in the Draft EIR, the proposed Cathedral Hill Campus project would have a significant impact to bicycles if it would create potentially hazardous conditions for bicyclists or otherwise substantially interfere with bicycle accessibility to the site and adjoining areas. The proposed Cathedral Hill Campus project would add vehicle trips to the supplemental study intersections. As discussed earlier, some cyclists travel through these intersections, particularly along Polk Street. Aside from the additional trips through the intersections, the vehicle-bicycles conflict would be similar to existing conditions. Along the bicycle routes with the heaviest observed bicycle volumes—Market Street and Polk Street—the proposed Cathedral Hill Campus project would increase traffic volumes less than three percent, which would not be considered significant. Specifically, during the a.m. and p.m. peak hours, the project would add vehicle trips to the following streets with designated bicycle facilities:

- approximately 85 vehicle trips to Polk Street south of O'Farrell Street;
- approximately 100 vehicle trips to Polk Street north of Sutter Street;
- approximately 15 vehicle trips to Sutter Street west of Polk Street;

- approximately 55 vehicle trips to Post Street east of Polk Street; and
- approximately 20 vehicle trips to 8th Street south of Market Street

The project would add vehicle trips primarily to the major through movements at the supplemental intersections (e.g., northbound on Ninth Street, southbound on Eighth Street, and northbound or southbound on Polk Street) and would not necessarily increase the number of vehicles turning right or left into a bicycle lane or route.

Class II bicycle lanes and Class III bicycle routes are already provided on designated streets per the San Francisco Bike Plan, and no other specific bicycle improvements were identified in the Little Saigon Report. Therefore, the proposed Cathedral Hill Campus project would have a less-than-significant impact to bicyclists in the supplemental study area.

Pedestrian: As presented in the Draft EIR, the proposed Cathedral Hill Campus project would have a significant impact on pedestrians if it would result in substantial overcrowding of sidewalks, create potentially hazardous conditions for pedestrians, or otherwise interfere with pedestrian accessibility to the site or adjoining areas.

C&R Table 3.7-13

C&R Table 3.7-13
Existing, Modified Baseline, and Cumulative Intersection LOS – Supplemental Intersection Analysis

Intersection	Peak Hour	Existing		Modified Baseline No Project		Modified Baseline Plus Project		Cumulative No Project		Cumulative Plus Project	
		Avg. Delay	LOS[1,2]	Avg. Delay	LOS[1,2]	Avg. Delay	LOS[1,2]	Avg. Delay	LOS[1,2]	Avg. Delay	LOS[1,2]

Notes:

Bold font indicates deficient LOS of LOS E or LOS F

1. LOS = Level of Service
2. For signalized intersections and all-way stop-controlled intersections, LOS based on average intersection delay, based on the methodology in the *Highway Capacity Manual*, 2000 Edition. For stop-controlled intersections, the delay of the worst performing approach is presented.
3. At some of the study intersections, the average delay per vehicle would remain the same or slightly decrease with the addition of project-related traffic. Using the HCM methodology, the level of service is calculated based on an average of the total vehicular delay per approach, weighted by the number of vehicles at each approach. Increases in traffic volumes at an intersection usually result in increases in the overall intersection delay. However, if there are increases in the number of vehicles at movements with low delays, the average weighted delay per vehicle may remain the same or decrease

Source: Fehr & Peers, 2011

As discussed under existing conditions, the supplemental study intersections have low to moderate levels of pedestrian activity and vehicles generally yielded to pedestrians as required by the California Vehicle Code. Aside from the general increase in vehicle traffic that would result from the proposed Cathedral Hill Campus project, it would not create unsafe conditions for pedestrians at these intersections. Furthermore, with the proposed LRDP, traffic volumes would increase at the supplemental study intersections by less than 5 percent. Therefore, the proposed Cathedral Hill Campus project would result in a less-than-significant impact to pedestrians.

Polk/Ellis is the only supplemental study intersection that does not currently have pedestrian countdown signals; however, new ADA-mandated curb ramps were being installed at the time of field observations. Although additional pedestrian improvements, such as bulb-outs, leading pedestrian intervals, or "NO RIGHT TURN ON RED" restrictions could be installed along Geary Street or O'Farrell Street, these improvements would need to be coordinated with the Geary BRT project to ensure that these improvements do not preclude future transit or traffic lane improvements. The Geary BRT project is currently considering several options for public transit stops along these streets and would improve public transit service and pedestrian conditions through the Tenderloin. The additional traffic generated by the project that would pass through the Tenderloin Neighborhood would not preclude the implementation of the improvements proposed in the Little Saigon Report.

In summary, the analysis in the Draft EIR assumed that trips destined to and from the Cathedral Hill Campus would travel through the Tenderloin neighborhood. However, this was not readily apparent because the Draft EIR did not include any study intersections through this neighborhood. In response to comments made during the Draft EIR public review period, the Planning Department added seven supplemental study intersections to the original 26 Cathedral Hill Campus study intersections. The inclusion of these intersections allowed Planning Department staff to illustrate that the Cathedral Hill Campus would increase vehicle trips through the Tenderloin neighborhood study area and as a result, could increase the number of conflicts between vehicles, pedestrians, and bicyclists. However, as the discussion above indicates, this increase would not result in significant impacts. Nevertheless, examples of improvements at the study intersections were identified that could reduce conflicts between various modes (see C&R Response TR-64). Although the impacts on pedestrians (Impact TR-40 identified in the

Draft EIR) were determined to remain less than significant, as part of implementation of Improvement Measure I-TR-40, the project sponsor could provide funding for the study and possible implementation of additional streetscape, pedestrian, and related improvements in the vicinity of the Cathedral Hill Campus that would improve the less-than-significant impacts to the pedestrian and bicycling environment. The City would have sole authority to determine whether to proceed with the Tenderloin and Little Saigon neighborhood area improvements and to issue required permits and authorizations. The City would also retain the discretion to modify or select feasible alternatives to the improvements to avoid any identified impacts or concerns that arise in connection with their further review, including any required environmental review under CEQA.

Further, the analysis of the intersections revealed that under 2015 Modified Baseline plus Project conditions, all seven study intersections would operate at an acceptable level of service. Under the 2030 Cumulative plus Project conditions, one intersection (Seventh/Market) would be expected to operate at an unacceptable LOS E during the p.m. peak hour; however, the proposed project's contribution to the failing conditions at this intersection would not be considered cumulatively significant. The six remaining supplemental intersections would operate at acceptable levels of service during the 2030 Cumulative plus Project conditions.

Trip Distribution Sensitivity Analysis

Comments

(Jeff Buckley, September 23, 2010) [PC-64 TR]

"So, we take issue with two parts of the Draft EIR. The first is in terms of the way that the EIR assesses traffic flow and the impact that traffic is going to have within the Tenderloin area. The EIR assumes that those coming to CPMC from Mission Bay, SOMA, or Potrero Hill will take Van Ness to reach the facility, and it projects a big traffic impact at Van Ness and Market. But the reality is that drivers know that the fastest route is either to go up Seventh Street, which becomes Leavenworth north of Market, or up Ninth, which becomes Larkin. Most avoid driving on Market, or they avoid driving on Van Ness whenever possible. So, the EIR's assumption that the Tenderloin will be spared from massive increased traffic really is ignorant of reality."

(Randy Shaw, September 23, 2010) [PC-94 TR]

"But now we face a situation where they are going to route several thousand cars through the Tenderloin and have no mitigations and, in fact, the EIR doesn't even mention it. If you heard Mr. Buckley's testimony before mine, the EIR has – the people who wrote that never drive, apparently, because how would anybody coming from Mission Bay, Potrero Hill, the South of Market, and get off the Bay Bridge, somehow make a left turn on Market Street at 7th and 9th, and decide to go up Van Ness? That is exactly the opposite direction. What anyone who drives there, you guys know, you know, Dr. Antonini, you drive up 7th, and you make a left on Geary, or you drive up 9th and make a left on Geary, and then you go back down O'Farrell, that is logical. You won't find that in the EIR, no, there are no impacts at all, and that needs to be rewritten, and that's why we think CPMC needs to step up and actually mitigate these significant impacts."

(Retilah [phon] Patel, September 23, 2010) [PC-109 TR]

"I think I understand that there are going to be impacts that this EIR is not addressing, specifically traffic, and for me, as a business owner in the corridor with residential hotels and apartments, particularly Little Saigon, which there is a traffic report, a study that has been done, the traffic right now, the way it is set up is it's going to go down Geary and O'Farrell, and I'm a San Franciscan, born and raised, first generation, I travel in the City, I live in the inner Sunset for 20 years now, moved out to inner Richmond the last five, and I'll tell you, I try not to take O'Farrell and not try to take Geary. The only reason I do is I take my kids to school right there on O'Farrell and Franklin. But, to say that people from out of town that are going to be coming in to take the service of CPMC will just go up O'Farrell and Van Ness is not the truth; the truth is, they are going to go up Larkin with a straight shoot

of three lanes, and that's the heart of Little Saigon, and there is a going to be Eddy, Ellis, as our exits and entrances to that corridor. People will also go up towards, I think, Bush and those other streets, and come wrap back around because people won't realize, with the new bus lanes that have been added in the recent years on both of those streets, Geary and O'Farrell, they have become very congested and, even through the 4:00 to 6:00 p.m. no parking time, there are a lot of businesses that utilize that lane for drop offs, deliveries, and I think that is a very important fact that San Francisco is a transit city first."

(Commissioner Antonini, September 23, 2010) [PC-357 TR]

"Certainly, traffic is a big issue, and I think that was really brought up very well by a number of speakers that made the point that people will cut through the Tenderloin and we have to figure out a way to route the traffic more, even without the new hospital on Cathedral Hill, I think it's an area that we have to look at because there are traffic problems already, and there might be ways that that could be dealt with and it's something the parking and traffic will have to try to deal with."

(Commissioner Antonini, September 23, 2010) [PC-362 TR]

"And I think that the issues that were raised with respect to the Cathedral Hill Hospital proposal and transportation through the Tenderloin, I've only read a portion of the transportation analysis, but I did notice there's a heavy emphasis on the use of Van Ness Avenue and, just to repeat what everybody else said, if I'm south of Market and I'm going north, I come up Ninth or Seventh, I would never use Van Ness, and so that analysis, I think, staff probably has all the notes on that already, so I don't need to go into that too much."

(Commissioner Moore, September 23, 2010) [PC-368 TR]

"I am concerned that traffic analysis does not fully address the secondary ripple effects of alternative routing beyond what is described for Larkin and Leavenworth. I know for a fact that the effects of people needing to go out to the new Van Ness, CPMC facility will also affect all streets coming up from the freeway and from the south part of the City, coming up Taylor, Mason, etc., Taylor, Mason, Powell, which even now are alternative routes for people to move across the City because, as far as I'm concerned, the level of service on Van Ness is – I call it – impossible, that is not even within the level of service descriptions anymore."

(Commissioner Miguel, September 23, 2010) [PC-383 TR]

"I've lived South of Market for 34 years now. I'm a driver, as is my wife. I must come north of Market probably eight or nine times a week, at least. I would have been out of my mind and have never taken Van Ness Avenue. We take Seventh Avenue or Ninth. You never take Van Ness Avenue. It's absolutely ridiculous. And to consider that as part of a traffic plan means someone doesn't look at the traffic patterns of the City."

Response TR-125

The comments state concerns regarding the number of vehicle trips routed on Van Ness Avenue and through the Tenderloin-Little Saigon neighborhood, and states that the Draft EIR vehicle trip assignment is not accurate. In response to written and oral comments regarding the transportation analysis included in the Draft EIR with respect to the South of Market (SoMa) and Tenderloin-Little Saigon neighborhoods, a trip distribution sensitivity analysis was conducted.

As described in Response TR-124 (page C&R 3.7-207), the Draft EIR transportation analysis assumed that traffic would use the roadways in the Tenderloin neighborhood consistent with trip distribution methodology in the *SF Guidelines*. Due to their location farther from the Cathedral Hill Campus, no intersections were analyzed within the Tenderloin neighborhoods. Response TR-124 describes the results of a supplemental analysis of vehicle, bicycle, and pedestrian traffic in the Tenderloin assuming the trip distribution used for the original analysis. While the Draft EIR trip distribution assumptions are reasonable for the original analysis, and consistent with trip distribution methodology in the *SF*

Guidelines, a sensitivity analysis was conducted to determine what effect, if any, would be generated if a higher percentage of motorists traveling to the proposed Cathedral Hill Campus from Superdistrict 1, Superdistrict 3, and the freeway were to use alternate routes, primarily through the SoMa and Tenderloin, rather than those assumed in the Draft EIR. The sensitivity analysis was prepared for informational purposes only; therefore, the trip distribution used in the Draft EIR was not changed because the analyses remains reasonable and accurate. The sensitivity analysis is located in the second half of the memo entitled, "*Supplemental-Sensitivity Transportation Impact Analyses for the California Pacific Medical Center Cathedral Hill Campus in San Francisco, CA*," which is included in Appendix E of the C&R document.

Based on the trip distribution and trip assignment used in the Draft EIR, approximately 9 percent of all northbound vehicle trips and 17 percent of all southbound vehicle trips generated by the campus were assigned to routes through the SoMa and Tenderloin neighborhoods to reach the Cathedral Hill Campus. This represents approximately 51 and 100 of project-generated vehicle trips in the a.m. and p.m. peak hour, respectively, assigned to routes through SoMa and the Tenderloin neighborhoods. For the sensitivity analysis, it was assumed that 25 percent of all northbound vehicle trips were assigned to the Tenderloin and SoMa roadways, an increase of 64 percent above what was assumed in the EIR. The reassignment was based on the general geographic areas of each Superdistrict or Region in relation to the SoMa/Tenderloin alternative routes and in such a way as to determine how sensitive the analysis is to the trip distribution and assignment. The result was an analysis in which 108 and 112 of all project-generated northbound and southbound vehicle trips in the a.m. and p.m. peak hour, respectively, were assigned to routes that traveled through SoMa and the Tenderloin neighborhoods.

Travel behavior is affected by several factors, including travel time, travel distance, and general knowledge of potential routes to and from a destination. For example, employees familiar with multiple routes to and from the proposed Cathedral Hill Campus area might be more likely to choose secondary routes to the campus to avoid congestion. Patients or visitors who might be less familiar with the area might be more likely to chose major roadways or rely on online directions which would direct drivers to major roadways. The percentages assigned to SoMa/Tenderloin streets for the purposes of the sensitivity analysis therefore, presents a reasonable scenario of the split of traffic between streets in the Tenderloin and other streets because many East Bay, South Bay, and out of region drivers would still use the Central Freeway, Van Ness Avenue, Franklin Street, and Gough Street to access the campus.

The sensitivity analysis was conducted and potential impacts assessed using the City of San Francisco significance thresholds, as described in the Draft EIR. The sensitivity analysis adjusted the proposed Cathedral Hill Campus net-new a.m. and p.m. peak hour vehicle trips as described above, which were then added to both Modified Baseline and Cumulative No Project intersection volumes to determine if the proposed campus would lead to intersection impacts using the adjusted traffic assignment for Tenderloin neighborhood study intersections. It should be noted that 2015 Modified Baseline and 2030 Cumulative No Project intersections volumes were developed consistent with the approach and methodology presented in the Draft EIR.

In general, the sensitivity analysis addition of project-generated traffic resulted in minor changes in the average delay per vehicle at the Tenderloin supplemental study intersections, and most of the study intersections continued to operate at the same levels of service as under the 2015 Modified Baseline and Cumulative No Project conditions, as shown in C&R Table 3.7-14. Under Modified Baseline No Project and Modified Baseline plus Project ten of the 13 study intersections (Franklin/Geary; Van Ness/Post; Polk/O'Farrell; Polk/Post; Larkin/Geary; Hyde/O'Farrell; Leavenworth/Geary; Larkin/Grove; 9th Street/Larkin/Market Street; and 7th Street/Market Street) operated at the same acceptable service level during both the a.m. and p.m. peak hours. Similarly the intersection of Polk Street/Geary Street would continue to operate unacceptably (LOS E during both the a.m. and p.m. peak hours).

Notes:

Bold font indicates LOS E or LOS F

1. LOS = Level of Service

2. For signalized intersections and all-way stop-controlled intersections, LOS based on average intersection delay, based on the methodology in the *Highway Capacity Manual*, 2000 Edition. For stop-controlled intersections, the delay of the worst performing approach is presented.

3. At some of the study intersections, the average delay per vehicle would remain the same or slightly decrease with the addition of project-related traffic. Using the HCM methodology, the level of service is calculated based on an average of the total vehicular delay per approach, weighted by the number of vehicles at each approach. Increases in traffic volumes at an intersection usually result in increases in the overall intersection delay. However, if there are increases in the number of vehicles at movements with low delays, the average weighted delay per vehicle may remain the same or decrease

Source: Fehr & Peers, 2010

The intersection of 8th Street/Hyde Street/Market Street, with the sensitivity analysis traffic assignment, would continue to operate unacceptably at LOS E during the a.m. peak hour and LOS F during the p.m. peak hour and project's contribution to these unacceptable operating conditions under the sensitivity analysis traffic assignment would still be less than significant. Under the sensitivity analysis one intersection, Polk/Ellis Street, operations would degrade from LOS B during the p.m. peak hour to LOS C with a slight increase in average delay. However, this would still represent acceptable operating conditions at this intersection.

Under Cumulative No Project and Cumulative plus Project ten of the 13 study intersections (Franklin/Geary; Van Ness/Post; Polk/O'Farrell; Polk/Post; Polk/Ellis; Larkin/Geary; Hyde/O'Farrell; Leavenworth/Geary; Larkin/Grove; and 9th Street/Larkin/Market Street) operated at the same acceptable service level during both the a.m. and p.m. peak hours. The intersection of 8th Street/Hyde Street/Market Street, with the sensitivity analysis traffic assignment, would continue to operate unacceptably at LOS E during the a.m. peak hour and LOS F during the p.m. peak hour. The proposed project's contribution to these unacceptable operating conditions under the sensitivity analysis traffic assignment was therefore examined, and found to still be less than significant. Similarly the intersection of 7th Street/Market would continue to operate unacceptably (LOS E during the p.m. peak hour).

The proposed project causes the intersection of Polk Street/Geary Street to deteriorate from acceptable LOS D operations to unacceptable LOS E operations during the p.m. peak hour under 2015 Modified Baseline Plus Project and 2030 Cumulative Conditions with the Draft EIR trip assignment. As described under Modified Baseline and Cumulative Conditions in the Draft EIR, this was identified as a significant and unavoidable project impact (Impact TR-2 & Impact TR-101). Under Cumulative Plus Project Conditions with the sensitivity analysis trip assignment, the intersection would operate at LOS F during the a.m. peak hour and LOS E during the p.m. peak hour. Although a worsening of intersection operations, this would be a similar significant impact as identified in the Draft EIR, and the sensitivity analysis would therefore, not result in any additional impacts to the intersection.

The proposed project with the trip assignment presented in the sensitivity test would have a significant impact to bicycles if it would create potentially hazardous conditions for bicyclists or otherwise substantially interfere with bicycle accessibility to the site and adjoining areas. The proposed project with the sensitivity test trip assignment would add vehicle trips to the supplementary study intersections. As discussed earlier, some cyclists travel through the supplementary intersections, particularly along Polk Street. Aside from the additional vehicle trips through the intersections, the vehicle/bike conflict would be similar to what occurs today. Along the bicycle routes with the heaviest observed bicycle volumes—Market Street and Polk Street—the proposed project would increase traffic volumes less than three percent, which would not be considered significant.

The proposed project with the sensitivity test trip assignment would add vehicle trips primarily to the major through movements at the supplementary intersections (e.g., northbound on 9th Street, southbound on 8th Street, and northbound or southbound on Polk Street) and would not necessarily increase the number of direct conflicts due to vehicles turning right or left into a bicycle lane or route.

Class II bicycle lanes and Class III bicycle routes are already provided on designated streets per the San Francisco Bike Plan, and no other specific bicycle improvements were identified in the Tenderloin-Little Saigon Transportation Plan.

Therefore, similar to the Draft EIR analysis, the proposed project with the sensitivity analysis trip assignment would have a less-than-significant impact to bicyclists in the supplemental study area.

The proposed project, with the sensitivity test trip assignment, would have a significant impact to pedestrians if it would result in substantial overcrowding of sidewalks, create potentially hazardous

conditions for pedestrians, or otherwise interfere with pedestrian accessibility to the site or adjoining areas. As discussed, the supplementary study intersections have low to moderate levels of pedestrian activity and vehicles generally yielded to pedestrians as required by the California Vehicle Code. The proposed project with the sensitivity analysis trip assignment would add vehicle trips to the movements at the supplementary study intersections; however, its contribution would not expected to be significant . Although the project would only minimally increase traffic volumes on the streets through the neighborhood, the Better Streets Plan identifies several pedestrian safety improvements that could be used at intersections to which the Project adds vehicle traffic. Potential improvements include:

- Leading pedestrian intervals for pedestrian movements, which increases likelihood that turning vehicles will yield to pedestrians;
- Increase all-red signal phases, which enhances the transfer of right-of-way between vehicles and pedestrians;
- NO RIGHT TURN ON RED restrictions, which reduces conflicts between pedestrians in a crosswalk and turning vehicles;
- Red-light camera enforcement, which improves signal compliance;
- High-visibility crosswalks;

Any such improvements would need to be reviewed by SFMTA. The previously presented recommendations/improvements are not subject to change in light of the sensitivity test trip assignment.

In summary, the sensitivity analysis considered how a 64 percent increase in the number of northbound project vehicle trips routed through SoMa and the Tenderloin would impact traffic, bicycle and pedestrians. The adjustments tested in the sensitivity analysis only affect northbound vehicle trips because the location of the Project egress would not result in a substantial number of vehicles driving to the southeast through the Tenderloin or SoMa. The sensitivity test results indicate that the Project would still result in impacts to the intersection of Polk/Geary; however, the impact would be similar to impact identified in the Cathedral Hill Draft EIR. Impacts to bicycles and pedestrians are expected to be less than significant. The supplemental analysis did not result in any new significant project impacts at study intersections that are not already identified in the Draft EIR. Please refer to Response TR-64 (page C&R 3.7-119) for a detailed discussion regarding pedestrian safety and Improvement Measure I-TR-40 included in the Draft EIR.

3.7.13.2 TENDERLOIN-LITTLE SAIGON NEIGHBORHOOD TRANSPORTATION PLAN

Comments

(Sandra Manning, September 23, 2010) [31-4 TR]

"Funding the recommendations of the Tenderloin-Little Saigon Transit Study. This will not only slow traffic through the neighborhood, but also divert traffic away by reducing the time drivers can save by using Larkin and Leavenworth Streets rather than Van Ness."

(Lower Polk Neighbors, October 19 , 2010) [103-25 TR, duplicate comment was provided in 113-25 TR]

"F. Along with Cedar Street fund alley enhancements for Hemlock, Alice B. Toklas/Myrtle, and Fern Streets (from Van Ness to Larkin Street). Enhances to include stamped concrete paving in lieu of current asphalt), bollards, trees (landscaping), play equipment where these can be located, better lighting, and; murals."

(Stephanie Barton, et al.—Hastings Civil Justice Clinic for the Good Neighbor Coalition, October 19, 2010) [104-33 TR]

"**B. The DEIR fails to consider traffic plans for the Tenderloin including the plans proposed by the Tenderloin-Little Saigon Neighborhood Transportation Study.**

In 2004, the San Francisco County Transportation Authority ('SFCTA') in partnership with community organizations initiated a study to identify high priority transportation needs and develop conceptual designs and strategies for transportation improvements to the overlapping Tenderloin and Little Saigon neighborhood. The final report, published in March 2007, is entitled the Tenderloin-Little Saigon Neighborhood Transportation Plan Final Report ("Little Saigon Report").[60] Key among the issues identified by the Little Saigon Report were "the need for enhanced pedestrian safety" and measures "to slow and 'calm' traffic traveling through the neighborhood" and "improve transit reliability."[61] Projects proposed under this plan were adopted before notice of this DEIR's preparation, The DEIR has to consider the potential consequences of increased traffic in the Tenderloin attributable to the Cathedral Hill Campus on effectuating the implementation goals of the Little Saigon Report. While a number of the Little Saigon Report's project proposals have been implemented, several projects remain incomplete due to financial constraints.

The Better Streets Plan ("BSP") is a citywide effort implemented by the San Francisco Planning Department and the San Francisco Municipal Transportation Agency to develop street typology and determine what amenities should be provided, While the BSP is mentioned in the DEIR, the DEIR fails to address various aspects of the plan's implementation in the Tenderloin.[62] Recommendations of the Tenderloin-Little Saigon Report are now being implemented as part of the BSP. CEQA guidelines require EIRs to "discuss any inconsistencies between the proposed project and applicable general plans and regional plans."[63] Accordingly, the DEIR needs to analyze potential inconsistencies between the project's transportation and circulation impacts and the recommendations of the Little Saigon Report that are now part of the BSP.

[60] SFCTA, Tenderloin-Little Saigon Neighborhood Transportation Plan Final Report 1-1 (2007) (attached hereto as "Appendix A").
[61] *Id* at 3-1.
[62] DEIR 3-24.
[63] *CEQA Guidelines 15125(d)."*

(Jeff Buckley, September 23, 2010) [PC-63 TR]

"Hello. My name is Jeff Buckley. I am the Director of the Central City SRO Collaborative. We are a member of the Good Neighbor Coalition. So, I wanted to first give you each a copy of the Little Saigon Tenderloin Traffic Study so you can read it, it is going to be instrumental in what I am discussing in a moment."

(Jeff Buckley, September 23, 2010) [PC-68 TR]

"And so, I think what we'd ask is that they fund the recommendations of the Tenderloin Little Saigon transit study, this will not only slow traffic through the neighborhood, it'll also divert traffic away by reducing the time that drivers can save by using Larkin and Leavenworth, rather than Van Ness."

(Randy Shaw, September 23, 2010) [PC-95 TR]

"Fortunately, we have this Little Saigon transit plan that has already been done to address the already existing excess traffic with the one-way streets, which need to be two-way streets, with the wider sidewalks, really to improve the neighborhood, and we need CPMC to fund that study –- not fund the study -- implement the study, which can be done for a very small amount of money in light of a $2 billion project."

(Randy Shaw, September 23, 2010) [PC-96 TR]

"and it really allows CPMC to say, "Oh, no, we're not wrecking your community by building this, we're improving it." And I have copies of the study, there's a lot of interest – when the study was complete in 2007, the plan was implemented, but we've had a little bit of financial problems in the last few years, as you know."

(Retilah [phon] Patel, September 23, 2010) [PC-111 TR]

"but I think that they need to bring back and support this study in Little Saigon, specifically, for traffic needs and to make it a neighborhood, and remember that the Tenderloin is a neighborhood, and is one of the up and coming neighborhoods just like every neighborhood in San Francisco, and I would urge that anything passed would have to do with supporting and funding Little Saigon's traffic study, and I think you guys hold the power to do that, and I would appreciate that. Thank you."

(Sam Patel, September 23, 2010) [PC-112 TR]

"MR. PATEL: Good afternoon, Commissioners. My name is Sam Patel, I am a resident, an owner of a resident hotel in the Tenderloin on Ellis Street. I am also the President of a the Independent Hotel Owners and Operators Association. Several members of the Association own residential hotels in the area that, in the Tenderloin area. The residents of these hotels are going to be impacted by the traffic created by this project and I urge you to ask CPMC to fund the traffic calming and pedestrian safety improvements that are needed. Thank you."

(Sandra Manning, September 23, 2010) [PC-123 TR]

"CPMC can address these issues by funding the recommendations of the Tenderloin Little Saigon transit study. This will not only slow traffic through the neighborhood, but only divert traffic away by reducing the time that drivers can save by using Larkin and Leavenworth Street, rather than Van Ness."

Response TR-126

The comments state that CPMC should fund the recommendations of the Tenderloin-Little Saigon Neighborhood Transportation Plan, or other similar improvements, and that the Draft EIR does not identify inconsistencies between the project's impacts and the Tenderloin-Little Saigon Transportation Plan or Better Streets Plan. The need to improve the pedestrian, bicycle, and public transit user experience in the Tenderloin-Little Saigon area is also addressed in C&R Response TR-64.

As described in TR-124 and TR-125, two supplemental analyses of the Tenderloin Neighborhood were conducted to address comments received during the public review period of the Draft EIR. The first supplemental analysis added seven new intersections in the Tenderloin and Civic Center to the locations studied for potential project impacts. The second supplemental analysis tested the sensitivity of the local trip distribution and assignment assumptions used in the Draft EIR through the supplemental study area for potential project impacts to supplemental study intersections. Neither of these two supplemental analyses identified new project impacts related to vehicular traffic, pedestrians, or bicycles within the Tenderloin study area. Further, the development of the project does not preclude the implementation of the proposed Tenderloin-Little Saigon improvements, so the project is consistent with the current planning for the area. No CEQA nexus exists within the environmental report that could be used to require the project to pay for the improvements identified in the Tenderloin-Little Saigon Study as a mitigation measure. However, as discussed below, it is proposed as part of the CPMC LRDP Development Agreement that CPMC fund improvements within the Tenderloin area as a supplemental community benefit.

As background, the March 2007 the *Tenderloin-Little Saigon Neighborhood Transportation Plan Final Report* ("Little Saigon Report") was prepared by the San Francisco County Transportation Authority ("SFCTA"). The report's aim was to "prioritize community transportation needs and develop near and mid-term improvements in the Tenderloin and Little Saigon neighborhoods." The study area was generally bounded by Van Ness Avenue, Market Street, Powell Street, and Post Street, generally overlaps with the supplementary analysis area.

Through a process involving both community outreach and technical analysis, the Little Saigon Report identified a number of priority improvements and actions ranging in benefits and costs to improve

pedestrian safety, calm traffic, improve public transit service, and enhance the streetscape. Some specific improvements or actions proposed in the plan included:

> **Improve pedestrian safety**: construct intersection bulb-outs to reduce crossing distances, make crosswalks more visible with improved markings, install red-light running cameras to reduce vehicle speeds, install pedestrian countdown signals at intersections, and install on-street Class II (separate bicycle lane) or Class III (within traffic lane) bicycle lanes when possible.
>
> **Calm traffic**: narrow traffic lanes, install designated bicycle or bus-only lanes, convert one-way streets to two-way streets, retime signal progressions to reduce average vehicle travel speeds, reduce the number of overall travel lanes, and plant trees at uniform distances within the parking lane (four per block).
>
> **Improve public transit service**: Install bus bulb-outs to decrease bus reentry times and improve reliability, add colored pavement for Geary Street and O'Farrell Street bus-only lanes, alter the street circulation network (one-way to two-way streets) to consolidate bus routes, and upgrade and improve bus stops.
>
> **Enhance the streetscape**: Install pedestrian-scale sidewalk lighting, widen sidewalks, plant trees at uniform distances within the parking lane (four per block), and install pedestrian-scale directional signs to improve wayfinding.

A list of the proposed improvements from the Little Saigon Report is provided in the supplemental analysis report, which is Appendix E to the C&R document. The list includes the specific improvements, categorized by near-term, mid-term, and long-term phases, that were proposed in the report.

The SFMTA confirmed the status of the following improvements, as identified in the Tenderloin-Little Saigon Study, which have been or are being implemented:

The following improvements identified in the Tenderloin-Little Saigon Study have been implemented:

- Curb extensions have been installed on the northwest corner of McAllister Street/Jones Street; and
- A bus bulb-out was installed on the east side of 7th Street between Market Street and McAllister Street

The following improvements are under construction as of March 2011:

- New curb extensions on all corners at the intersections of Ellis Street/Hyde Street, Eddy Street/Hyde Street, and Ellis Street/Mason Street;
- New curb extensions on the southeast and northeast corners of the intersection of Eddy Street/Jones Street;
- Eddy Street—A road diet (reduction from three to two travel lanes) from Mason Street to Larkin Street as part of the road resurfacing of Eddy Street;
- Ellis Street—A road diet (reduction from three to two travel lanes) from Mason Street to Polk Street as part of the road resurfacing of Ellis Street; and
- The installation of decorative crosswalks at selected locations along Eddy Street and Ellis Street.

Will require further transportation analysis/environmental review:

- The conversion of Eddy and Ellis Streets from a one-way couplet to two-way roadways

In connection with other near term projects, CPMC has offered to contribute to City's possible future implementation of some or all of the following types of public improvements in the vicinity of the Cathedral Hill Campus, including in the Little Saigon Neighborhood. CPMC and the City have been in negotiations regarding the terms and conditions of a development agreement, that would, among other things, provide certain assurances and benefits, subject to the terms and conditions of the development agreement, with respect to the delivery of health care services. Please see Section 3.23.1.2 "Development Agreement" on page C&R 3.23-41 for additional details regarding the development agreement.

- Corner pedestrian bulb-outs;
- Pedestrian lighting;
- Colored concrete "safe passages" pathways;
- Sidewalk widening and curb repairs or improvements;
- Landscape;
- Median extensions;
- Undergrounding utilities; and
- Select changes in one way to two way streets (such as on Ellis and Eddy Streets).

CPMC is not seeking environmental clearance for any of these possible improvements since they are not part of the project nor are these improvements required as mitigation for any impacts of the project. The City would be responsible for obtaining future environmental clearances and for the design, scheduling, and construction of the improvements, and for any necessary supplemental funding. The City would have sole authority to determine whether to proceed with the Tenderloin and Little Saigon neighborhood area improvements and to issue required permits and authorizations. The City would also retain the discretion to modify or select feasible alternatives to the improvements to avoid any identified impacts or concerns that arise in connection with their further review, including any required environmental review under CEQA.

The streetscape plan proposed for the Cathedral Hill Campus is consistent with many of the recommendations contained in the Little Saigon Report and conforms to the City of San Francisco's Better Streets Plan standards. As a result, the proposed CPMC LRDP would improve the pedestrian experience in the Cathedral Hill Campus area. Specifically, the proposed streetscape plan[30] identifies the following improvements:

Geary Boulevard and Van Ness Avenue (Commercial Throughways)

Standard Improvements for block faces and intersections directly adjacent to project site:

- Marked crosswalks with curb ramps

[30] WRT, 2010. Memorandum to Vahram Massehian Re Better Streets Plan Elements at CPMC Campus at Van Ness and Geary. This memo is on file with the San Francisco Planning Department, 1650 Mission Street, Suite 400, San Francisco 94103, and is available for review as part of the project file, in Case No. 2005.0555E.

- Pedestrian signals
- Corner curb extensions: provided wherever possible while meeting vehicular circulation needs
- Street trees
- Sidewalk planters: extensive "seasonal gardens" on Van Ness to also serve as stormwater management zones
- Site furnishings: on Van Ness, proposed extensive seating within the "seasonal garden" and "kiosk market" areas, and on Geary, a proposed bus shelter at the bus stop
- Pedestrian-scale lighting: building-mounted fixtures on Geary and historic-style, pole-mounted lights on Van Ness
- Special paving in furnishings zone: permeable paving proposed along the tree strip (i.e., furnishings zone)
- High visibility crosswalks at Geary/Van Ness: in addition to standard crosswalk markings across Geary, decorative concrete crosswalks proposed across Van Ness
- Extended bulb-out: extended bulb-out along the full length of the west side of Van Ness (i.e., the sidewalk would be widened) between Post and Geary and on the east side between Cedar Street and Geary
- Improvements to the existing center median on Van Ness
- Improvements to the existing pedestrian refuge island on Van Ness
- Transit bulb-out (on Geary, just west of Van Ness)

Franklin Street (Residential Throughway)

Standard Improvements (for block faces and intersections directly adjacent to project site):

- Marked crosswalks with curb ramps
- Pedestrian signals
- Street trees: street trees proposed to be planted in a trench with "structural soil" and permeable paving to support healthy root growth in the restricted sidewalk width.
- Stormwater control measures: permeable paving proposed along the tree-planting strip
- Pedestrian-scale lighting: building-mounted fixtures

Post Street (Neighborhood Commercial)

All of the standard improvements listed in the Better Streets Plan are proposed for block faces and intersections directly adjacent to project site:

- Marked crosswalks with curb ramps
- Pedestrian signals
- Corner curb extensions: provided at Van Ness but not feasible at Franklin because of required vehicular turning movements
- Street trees
- Sidewalk planters

- Stormwater control measures: all sidewalk planters proposed on Post also would serve as stormwater control zones; special paving also would serve as permeable paving
- Pedestrian-scale lighting: provided as building-mounted fixtures
- Special paving in furnishings zone: permeable paving proposed along the tree strip (i.e., furnishings zone)
- Site furnishings: seatwalls proposed in the shuttle drop-off area

Cedar Street (Alley)

Standard Improvements:

- Curb ramps
- Street trees
- Stormwater control measures: permeable paving proposed along the tree-planting strip
- Pedestrian-scale lighting: lighted bollards and pole-mounted fixtures proposed
- Special paving (entire roadway): unit pavers proposed

All of the standard improvements listed in the Better Streets Plan are proposed in the design, though corner curb extensions would be limited to locations where they would not affect traffic flow, per the City's requirements.

3.7.13.3 CATHEDRAL HILL CAMPUS PEDESTRIAN TUNNEL

Comments

(Linda Chapman, October 19, 2010) [76-31 TR, duplicate comment was provided in 111-31 TR]

"7. Pedestrian tunnel

The proposal conflicts with the long-range VNAP goal for a subway to reduce traffic conflicts and transit delays. The CPMC plan would divide the right-of-way and could post conflicts for the subway entries near the Van Ness/Geary intersection.

MTA's current proposal for 'Bus Rapid Transit,' is a cheaper, less effective alternative. The VNAP is still the planning document that identifies long-range goals for the corridor."

(Linda Chapman, October 19, 2010) [76-32 TR, duplicate comment was provided in 111-32 TR]

"The BRT alternative, still in the planning stage, is dismissed by some transportation planners, and observers of traffic conditions in the corridor. BRT cannot fix street networks paralyzed by congestion. A subway could avoid notorious problems transit riders face on Van Ness.

A pedestrian tunnel would affect a published goal for resolving conflicts affecting Highway 101, traffic in densely populated central city neighborhoods, heavily travelled arteries, Muni and Golden Gate Transit. CPMC's plan cannot be allowed to prejudice this outcome, when a published long-range goal was deferred for funding consideration."

(Linda Chapman, October 19, 2010) [76-33 TR, duplicate comment was provided in 111-33 TR]

"Tunnels for Muni Metro and BART make a subway now considered for Stockton Street expensive to build and less practical for users because a deep route is required to avoid underground structures. The same impediment to a VNAP goal is posed by a pedestrian tunnel."

(Commissioner Antonini, September 23, 2010) [PC-389 TR]

"A couple of other points that I neglected to bring up the first time, and I think are important, we've talked about traffic and I've also brought up the question before that, as we talk about this tunnel under Van Ness, which I think is very important for the project, that we also look at it with the future eye towards any subway that may go below Van Ness Avenue in the future, as well as perhaps one coming along Geary, because we had asked – I think that should be what the City is looking at in the future. But the law of physics is you can't put two objects in the same spaces and, you know, there's only on Van Ness Avenue and it is only so wide, and if you really want to improve traffic and safety, you've got to avail yourself of some other use of subterranean to at least move your transit down there and free up the surface level for other uses, so that would be a great thing, but we are a ways from that. It certainly doesn't have anything to do with this particular project but I think it's important that we at least take that into consideration when talking about where the tunnel is going to be."

Response TR-127

The comments state concerns related to potential conflicts between the proposed Van Ness Avenue pedestrian tunnel and a potential future Van Ness Avenue subway system, and references that such a subway system is called for the by the Van Ness Avenue Area Plan (VNAP). Specifically, the comments state that the proposed pedestrian tunnel could pose a conflict with a future entry point to a Van Ness/Geary subway station, that a Bus Rapid Transit (BRT) system on Van Ness Avenue, currently under study by the SFCTA and SFMTA, would be an inferior option for transit separation when compared to a subway system, and that the proposed pedestrian tunnel precludes any future subway system along Van Ness Avenue because of the required depth of the tunnel.

The VNAP stated that a subway option for Van Ness Avenue should be explored for feasibility and desirability. Currently, no known plans exist to conduct such a study; therefore, the statement that a pedestrian tunnel could conflict with an entry point to a future unplanned, or unstudied subway station is speculative. Further, presumably any subway entry point, should it ever be necessary, could be located south of Geary.

The comment that subway systems are superior to BRT systems is noted. The comment does not raise issues regarding the adequacy, accuracy, or completeness of the Draft EIR for the CPMC LRDP.

As noted on Draft EIR page 2-32, the bottom of the proposed pedestrian tunnel would be approximately 25 feet below ground level of Van Ness Avenue. As a point of reference, the top of the Muni Metro subway beneath Market Street is 25 feet below ground level. Similarly, the Central Subway tunnel design, currently under construction, would be 40 feet below ground level at its high point, descending in location to approximately 100 feet below ground level.

3.7.13.4 ORGANIZATION OF DRAFT EIR SECTION 4.5 TRANSPORTATION AND CIRCULATION

Comments

(Gloria Smith—California Nurses Association, October 19, 2010) [90-13 TR]

"The DEIR's structural and organizational flows render the document nearly incomprehensible. For example, the DEIR's Transportation and Circulation chapter is organized by topic such as roadway network, intersection operations, transit operations, bicycle facilities, parking, impact evaluations, and mitigation measures. Discussions of each campus are presented one after the other under the individual topic rather than continuously as a complete discussion of each campus. Such organization makes it extremely difficult and unnecessarily complex to follow the analysis of the individual projects proposed for each of the five campuses. This technique demonstrates nothing more than lazy drafting."

(Gloria Smith—California Nurses Association, October 19, 2010) [92-3 TR]

"Transportation Issues
Section 4.5 of the Draft EIR, Transportation and Circulation, is organized by topic such as roadway network, intersection operations, transit operations, bicycle facilities, parking, impact evaluations, and mitigation measures. Discussions of each campus are presented one after the other under the individual topic rather than continuously as a complete discussion of each campus. This organization of the Draft EIR makes it extremely difficult and unnecessarily complex to follow the analysis of the individual projects for each of the five campuses."

Response TR-128

The comments state that Section 4.5, "Transportation and Circulation" in the Draft EIR is difficult to understand and unnecessarily complex. Because the transportation assessment covers multiple topics, it was determined that the result of the analysis would be best presented by campus, rather than by topic. This organization was intended to make it easier for a reader interested in one particular campus to find the analysis of all modes or circulation issues related to a specific campus in one section rather than having to search for the discussion of a particular campus in each topic section. For example for the proposed Cathedral Hill Campus, traffic impacts are presented in Impacts TR-1 through TR-23, immediately followed by transit impacts (Impacts TR-24 through TR-36), bicycle impacts, etc.

3.7.14 JAPANTOWN

3.7.14.1 ANALYSIS WEST OF CATHEDRAL HILL

Comments

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-12 TR, duplicate comment was provided in 30-12 TR]

"If the study areas as represented on these pages go 5 blocks to the east as denoted by the dashed blue lines, there should be at least a study of 5 blocks to the west as well. Geary runs westward so people will try to find a street on the westward side through Japantown. A current traffic count of vehicles in Japantown on Octavia St., Laguna St., Buchanan St., Webster St., Post St., Sutter St., Bush St. and Pine St. (the "Japantown streets" I refer to later) needs to be initiated to see the impact on the residents and businesses in and around Japantown."

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-14 TR, duplicate comment was provided in 30-14 TR]

"The Pacific Campus project and the Cathedral Hill/MOB projects, although they will not run concurrently, will run consecutively and will cumulatively impact the Japantown area as well the streets to the east within the blue dashed lines. On Page 4.5-218, the traffic impact on the intersections for the year 2030 is shown as deteriorated

and therefore the Japantown streets will also have to be looked at as well as at least the 5 blocks east of Van Ness such as Larkin St., Hyde St., Leavenworth St. and Jones St."

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-96 TR, duplicate comment was provided in 30-96 TR]

"53. Volume 3, Section 4.5: TRANSPORTATION AND CIRCULATION:

Page 4.5-1 indicates that 81 intersections over the 4 proposed project locations were studied for transportation impacts. On page 4.5-2, Figure 4.5-1 entitled "Cathedral Hill Campus - Study Area and Project Location" shows a 1/2-mile radius around the campus but the parking study area only extends from Eddy to Pine between Laguna and Hyde. The parking study needs to include the intersections that fall within the 1/2-mile radius so that Webster and Buchanan as well as Leavenworth and Jones between Washington and Fulton are included for cut-through traffic which may occur during construction and after full build-out."

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-123c TR, duplicate comment was provided in 30-123 TR]

"People will try to park in Japantown and go to the hospital and take parking spaces in the Japantown garage and on-street in Japantown by people who are not going to help the Japantown businesses."

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-125 TR, duplicate comment was provided in 30-125 TR]

"67. Per Page 4.5-93, the Cathedral Hill Campus project would result "in an increase of 593 vehicle trips during the a.m. peak hour (598 inbound and 85 outbound trips), and 609 vehicle trips during the p.m. peak hour (42 inbound and 567 outbound trips). On page 4.5-94, Table 4.5-17, and on Page 4.5-95, Table 4.5-18, the tables do not say what the LOS will be on Post or Sutter, e.g., in Japantown would be. The LOS grades are for the 26 intersections on the study but do not analyze the Japantown streets."

(Bob Hamaguchi—The Japantown BNP Organizing Committee, October 8, 2010) [47-7 TR, duplicate comment was provided in 50-7 TR]

"4) In addition, the DEIR needs to assess whether or not there are potential impacts on Japantown from CPMC's ongoing operations at all proposed CPMC projects from the issues identified above, especially when considered with the cumulative effects of other planned major projects within or adjacent to the Japantown Planning Area, such as the Geary BRT, Van Ness BRT, and 1481 Post Street."

(Hiroshi Fukuda, September 23, 2010) [PC-159 TR]

"Public transit is not a good option for many of them, and if they cannot come visit and support Japantown merchants, they will be threatened."

Response TR-129

The comments state that the Draft EIR fails to adequately analyze the impacts of the proposed CPMC LRDP (specifically, the proposed Cathedral Hill Campus) on Japantown, and that streets and intersections in Japantown should have been included in the traffic impact analysis. Comment 18-96 TR also refers to intersections on Leavenworth and Jones Streets. Intersections in this area were addressed in C&R Responses TR-124 and TR-125, related to traffic through the Tenderloin neighborhood. The 26 study intersections were selected for analysis for the proposed Cathedral Hill Campus project because they would be most likely to experience increases in peak-hour traffic associated with the proposed CPMC LRDP, and because they typically would be congested during peak periods. Franklin Street and Gough Street are major arterials that would serve as the primary north-south routes to the proposed Cathedral Hill Campus. The north-south streets to the west of Gough Street in Japantown are local streets,

predominantly with one travel lane in each direction and, in some cases such as Octavia and Buchanan Streets, are not continuous; they would not be expected to serve longer distance traffic from north and south of the campus. Geary, Pine and Bush Streets are the major east-west routes, and intersections on these streets west of Gough Street operate at acceptable levels. Traffic associated with the proposed Cathedral Hill Campus on these east-west streets would be through trips, and because of signal progression on these streets, the additional trips would be accommodated without substantially altering intersection operations.

East of Gough Street, Post Street is one-way eastbound, with two mixed-flow lanes and one bus-only lane. West of Gough Street, Post Street is a local street and serves the Japantown commercial area. Traffic traveling southbound on Gough Street, or northbound on Franklin Street destined for the proposed Cathedral Hill Campus, would turn onto Post Street eastbound, and both of the intersections with Post Street are included in the traffic analysis. Similarly, vehicles leaving the proposed campus via Geary Boulevard and destined to the north would turn onto Franklin Street northbound, and this intersection is included in the traffic analysis. Because left turns are not permitted from Geary Boulevard westbound onto Gough Street southbound, vehicles destined to the south would travel on Van Ness Avenue or would access Gough Street north or south of Geary Boulevard.

During the a.m. peak hour, the transportation analysis assumed that the proposed Cathedral Hill Campus project would add 12 eastbound through vehicles on Post Street at the approach to Gough Street, and one westbound through vehicle on Sutter Street at the approach to Gough Street. During the p.m. peak hour, there would be two eastbound through vehicles on Post Street at the approach to Gough Street, and 11 westbound through vehicles on Sutter Street at the approach to Gough Street. During both the a.m. and p.m. peak hour, with the proposed Cathedral Hill Campus project increases in eastbound and westbound volumes (as well as southbound volumes on Gough Street), the intersections of Gough/Post and Gough/Sutter would continue to operate at LOS C or better under both 2015 Modified Baseline and 2030 Cumulative conditions. West of Gough Street, the project-generated vehicles would be more dispersed, and the nominal increase in project vehicle trips would not substantially alter intersection operating conditions. Based on the low number of project vehicle trips that would travel on streets within Japantown, additional analysis of intersections within Japantown is, therefore, not warranted.

The Japan Center Garage, containing 920 parking spaces, is a public parking garage owned by the City of San Francisco, open for all users. Because it is located about one-half mile from the proposed Cathedral Hill Campus, it is very unlikely that patients and visitors would park at the Japan Center Garage and walk or take the shuttle to the campus. Instead, visitors would likely park within the on-site parking garages at the proposed Cathedral Hill Hospital and MOB. These garages would provide a total of 620 spaces for visitors, 347 spaces for staff, and 260 spaces for physicians. As indicated in Table 4.5-34 on page 4.5-164 of the Draft EIR, the proposed Cathedral Hill Campus would experience a shortfall of 163 spaces, primarily because of a shortfall in employee parking spaces. Employees would likely continue to park at the Japan Center Garage, primarily during the daytime shift.

Visitors unable to find parking within the proposed hospital and MOB garages would likely park in any available on-street parking spaces around the campus, although some visitors might also choose to take public transit, use a bicycle, or walk instead of driving. Employees who were unable to find parking at the campus could take public transit, use a bicycle, or walk to the campus, or park off-site at the Japan Center Garage. CPMC has held a lease at the Japan Center Garage for 400 spaces for the past 6 years and has a lease through 2015. It can be presumed that the lease would be extended beyond 2015, and that employees would continue to park at the Japan Center Garage.

The loading facilities for the proposed Cathedral Hill Hospital on Franklin Street, ambulances, or the shuttle service are not anticipated to substantially affect operations on streets in Japantown. As noted above, multi-lane arterials in the immediate vicinity of the proposed Cathedral Hill Campus would be

used to access the campus. CPMC shuttles currently travel to the Japan Center Garage, and operations would not change substantially from existing conditions. See Responses TR-90, TR-92, and TR-93 (pages C&R 3.7-158 through 3.7-161) regarding service loading.

CPMC's ongoing operations are included in the description of existing conditions, and CEQA does not require mitigation for impacts of existing operations that are part of the environmental baseline. The combined impacts associated with the development at multiple campuses under the proposed CPMC LRDP are presented for traffic, transit, shuttle service, and construction impacts on pages 4.5-211 and 4.5-212 in the Draft EIR. The combined impacts of overlapping construction activities and project travel demand on traffic and transit conditions were determined to be less than significant.

Future year 2030 cumulative impacts of the proposed CPMC LRDP for traffic, transit, and construction impacts are presented on pages 4.5-215 through 4.5-247 in the Draft EIR (the proposed Cathedral Hill Campus impacts are presented on pages 4.5-215 through 4.5-232 in the Draft EIR). The approach to the impact analysis, including the transportation improvements assumed for cumulative conditions, is presented on pages 4.5-55 through 4.5-86 in the Draft EIR.

3.7.14.2 CONSTRUCTION

Comments

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-97 TR, duplicate comment was provided in 30-97 TR]

"It should be noted that transportation and circulation will be impacted on the Japantown streets due to the one-way configuration of the streets around the Cathedral Hill project which also includes the MOB project and the pedestrian tunnel.

Another important note is that the Japantown streets will be impacted twice because of the Pacific Campus construction that is part of the long-term project list. I believe that because Japantown is within the ½ -mile radius of both projects and sits within both areas of the project radii, that Japantown will be cumulatively impacted. I thought cumulative impacts were a CEQA item and needed to be mitigated.

When the Pacific Campus project is done sequentially to the Cathedral Hill project, Japantown streets are impacted for a longer duration. The Cathedral Hill project (all levels) is estimated to go from 2011 through mid-2015 per Page 2.5, Table 2-1. Then the Pacific Campus project starts with renovations from the beginning of 2015 through 2019. In effect, the Japantown streets will be impacted to varying degrees from 2011 through 2019, a total of 9 years straight or possibly even up to 10 years per Page 4.7-29, "Near-Term Projects - Cathedral Hill, Davies, and St. Luke's Campuses." When the smaller residential streets in Japantown get clogged, such as Laguna, traffic will try to find alternate routes to avoid the congestion that was discussed earlier to be at a very bad level of service for transit and for congestion."

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-98 TR, duplicate comment was provided in 30-98 TR]

"Furthermore, with the Van Ness BRT construction anticipated to be running by 2014 (Page 4.5-67), the construction of that project would impact the streets of Japantown. Consecutively to the Van Ness BRT, SFMTA will begin the Geary BRT construction and it is anticipated to be running by 2015-2016 (Page 4.5-67). The Geary BRT project occurring simultaneously with the Cathedral Hill Campus and Pacific Campus projects will further impact negatively the streets of Japantown. With the Van Ness BRT project coinciding with the CPMC project at Cathedral Hill and the Geary BRT following the Van Ness BRT project and also coinciding with the CPMC Cathedral Hill project, Japantown and the streets even a mile away from the construction sites will have very bad congestion problems. This will hurt the Japan Center area as well as traffic circling in surrounding streets. So

there needs to be a study of the transportation and circulation impacts on the Japantown streets and how they are impacted from not only Cathedral Hill but also the Pacific campus and both the Van Ness and Geary BRT projects as that analysis is not in this DEIR."

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-123b TR, duplicate comment was provided in 30-123 TR]

"This is going against the City's General Plan. The Plan says to keep the vehicle traffic on the major corridors but since during construction the corridors will be blocked up, people will go to the smaller arterial streets with negative impacts."

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-135 TR, duplicate comment was provided in 30-135 TR]

"73. On Page 4.5-156, "Van Ness Avenue Tunnel Construction" is discussed. Since Post and Van Ness will also be affected during the tunnel construction, and if Post is turned into a 2-way street, Japantown may end up taking much of the traffic. There needs to be a mitigation measure for the Japantown street intersections between Geary and Pine. Even the analysis provided takes into consideration only the pm; hours of a mid-day of the week. I think the analysis for the streets already studied should also be done for a whole week rather than just one day mid-week. The sample week should be a week without a holiday in it and the study should go for a whole week."

(Bob Hamaguchi—Japantown BNP Organizing Committee, October 8, 2010) [47-5 TR, duplicate comment was provided in 50-5 TR]

"2) Japantown is a regional attraction, with many if not most Greater Bay Area residents driving to Japantown. The Cathedral Hill project introduces a significant bottleneck in the standard routes to Japantown, whether arriving from the East Bay or the Peninsula. The project calls for significant construction during evenings and on Saturdays - peak times and seasons for visits to Japantown, and hence peak revenue periods. Traffic and parking problems that discourage visitors have a direct impact on the revenues, and hence the viability, of this cultural and historic resource. This potential threat to Japantown's survival is not even considered in the DEIR. This requires analysis, and appropriate mitigations."

(Caryl Ito—Japantown Task Force, October 18, 2010) [70-1 TR]

"I am sending this email as a VP for the Japantown Task Force, whose mission is to preserve, and promote the cultural, historical and economic vitality of the oldest Japantown in this USA. I fully support the comments sent in my the Better Neighborhood Planning Committee.

I have been involved in this preservation process of our Japantown for over 10 years and wish to state that the CPMC EIR does not adequately address the parking/traffic impacts of their construction phase as well as when they actually open for business. Yes they are on a major transit corridor but there are many patients, employees and others who will need parking and the plans are Inadequate.

This will impact parking resources in the nearby Japantown garage and street parking and thus, impact the accessibility for the commercial areas general everyday patronage. The economic vitality of this vital 100 plus year old community will be severely impacted negatively unless these issues are addressed/amended in the plan."

Response TR-130

The comments state concerns regarding impacts during construction of the proposed Cathedral Hill and Pacific Campuses and suggest that cumulative construction impacts are not adequately analyzed. Impact TR-55, presented on pages 4.5-147 to 4.5-160 in the Draft EIR, provides the assessment of impacts associated with construction of the proposed Cathedral Hill Campus. Because of the magnitude of the proposed LRDP, and the duration of the construction period, the project's transportation-related construction impacts were found to be significant and unavoidable. Mitigation Measure MM-TR-55 on

page 4.5-159 in the Draft EIR, development and implementation of a Construction Transportation Management Plan, would minimize impacts of various construction activities, but not to a less-than-significant level.

In general, construction impacts would be most noticeable in the immediate vicinity of the proposed hospital and MOB. Figure 4.5-22, "Cathedral Hill Campus—Construction Activity Summary" on page 4.5-149 in the Draft EIR, presents the sideway and travel lane closures as well as the truck routes to and from the sites. Trucks would arrive to the site from regional freeways and from within San Francisco via Van Ness Avenue northbound (rather than local streets such as Laguna Street), to Geary Boulevard or to Cedar Street, and would also leave the sites via Van Ness Avenue. Construction trucks would not travel through Japantown to access the project sites.

Impact TR-152 on page 4.5-247 of the Draft EIR presents the assessment of cumulative transportation-related construction impacts. The overlapping construction activities would increase the number of construction worker vehicles and trucks traveling to and from the vicinity of the proposed Cathedral Hill Campus. In addition, implementation of the BRT improvements on Van Ness Avenue would require travel lane closures that would temporarily and permanently affect roadway capacity. These impacts would be evaluated as part of the ongoing environmental review for the BRT projects. Impacts TR-95 through TR-98 on pages 4.5-211 to 4.5-215 of the Draft EIR present the assessment of the combined impacts associated with multiple campuses under the proposed CPMC LRDP related to traffic, transit, shuttle service, and construction activities. The combined impacts were determined to be less than significant, including those related to construction activities at the Cathedral Hill Campus and the Pacific Campus. Although the Pacific Campus and Cathedral Hill Campus are in relatively close proximity and would share some of the same construction vehicle access routes such as Geary Street and Van Ness Avenue, the construction schedules of work at these two campuses would not overlap; namely, the construction at the Pacific Campus would not begin until construction at the Cathedral Hill Campus was completed. Neither campus would share construction staging areas or have concurrent sidewalk or travel lane closures.

Implementation of Mitigation Measure TR-55 would minimize impacts associated with the proposed Cathedral Hill Campus project and reduce the project's contributions to cumulative impacts in overlapping areas. However, given the magnitude of these projects, some disruption and increased delays would still occur, even with implementation of the mitigation measure, and it is possible that temporary, but significant construction-related transportation impacts on roadways in the vicinity of the proposed Cathedral Hill Campus would still occur. As noted above, the majority of impacts associated with the construction activity would be localized to the immediate vicinity of the proposed hospital and MOB sites; however, some diversion of vehicles could be anticipated to occur to other arterials, such as Pine Street, Bush Street, and Franklin Street. Through traffic using Geary Boulevard and Van Ness Avenue would not be anticipated to divert to local streets.

The localized congestion associated with temporary construction activities and potential diversion of vehicles to other corridors would not be considered to conflict with General Plan policies.

In San Francisco, traffic volume counts for an EIR analysis are typically conducted for a 1-day period and also are based on 2-hour counts to identify the peak hour. Intersection turning movement traffic volume counts are not conducted over a 7-day period for EIRs in San Francisco, but they could be if warranted for unusual conditions (such as at locations where, because of adjacent land uses, traffic volumes vary significantly from day to day); however, such conditions do not apply to the proposed LRDP. For further discussion of the logic behind using peak hour traffic counts see Response TR-10 (page C&R 3.7-26). Traffic volumes during the p.m. peak hour, the hour of analysis, vary throughout the week but are generally greatest and consistent midweek—Tuesday, Wednesday, Thursday—on the days that the SF Guidelines recommend that traffic counts be conducted for p.m. peak-hour analyses. The traffic volume

counts are reviewed to ensure conservation of flow between adjacent intersections. Traffic volume counts conducted for the proposed LRDP were reviewed and determined adequate for the analysis by the San Francisco Planning Department.

3.7.14.3 REVOCABLE DRIVEWAYS

Comments

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-121 TR, duplicate comment was provided in 30-121 TR]

"65. Page 4.5-87 states that the 'Geary Boulevard parking garage curb cut permit would be revocable, and this condition would be recorded as a Special Restriction on the deed of the Hospital.' If the Geary Boulevard parking garage curb cut is revoked, all traffic to the hospital for drop off of visitors will be on the Post Street side. Post Street is one-way eastbound (inbound to downtown). For people to get to Post Street, they will cut through Japantown due to the traffic patterns in the area. See Figure 2-4 on Page 2-53 for the "Cathedral Hill Campus - Proposed Site Plan" which shows traffic directions around the Hospital but not the Japantown streets immediately adjacent to these streets. If or when Post Street is turned into a two-way street, there will be traffic congestion on the Post Street side. This will add to the congestion and air quality in this area. Again, this DEIR does not study the impacts on Japantown and it should."

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-122 TR, duplicate comment was provided in 30-122 TR]

"66. On Page 2-53, one also sees a potential traffic obstruction point at the Geary St. Parking Entrance of the MOB. On Page 2-101, Figure 2-37, the curb cut is shown with 3 lanes on Geary, the lane closest being the 'diamond bus only' lane. Figure 2-37 does not show the proposed Geary BRT lane. This BRT lane will be closest to the Hospital. If people are walking on the sidewalk by this curb cut, the vehicular traffic will have to stop for the buses and the pedestrians, potentially causing a traffic jam that could leave only one lane of westbound traffic moving because a second lane next to the BRT lane will have traffic stopped for the conflict. Not only would this curb cut be almost as bad as the one at the Hospital Geary Boulevard revocable curb-cut but this cut at the MOB will have traffic flowing out of it which will not be for emergency exits only. So with the additional vehicular traffic in and out of this opening, one may think that this cut would also be revocable; however, the traffic patterns will shift to Post Street if that is done and, again, the Japantown streets will likely see cut-through traffic. Polk Street will also see cut-through traffic due to the surrounding one-way streets in the area. And with the added off-street Loading Facility and Emergency Department, with ambulances using the Post Street entrance, it is likely that Post Street in the Japantown shopping area will become congested. The CPMC shuttles will also be using the Post Street driveway."

Response TR-131

The comments state concerns regarding impacts on Japantown in the event that the proposed Cathedral Hill Hospital's Geary Boulevard Parking Garage curb cut is revoked and vehicular access to the proposed Cathedral Hill Hospital garage would be provided only from Post Street. In addition, the comment notes that a similar situation would occur if the MOB's Geary Street parking curb cut was revoked.

The proposed Cathedral Hill Hospital is designed to allow for ingress-only on Geary Boulevard, and ingress and egress on Post Street. In the event that the Geary Boulevard driveway permit was revoked and access into the garage via Geary Boulevard was no longer permitted, traffic would need to access the garage via Post Street. For vehicles accessing the site from the east or from northbound or southbound Van Ness Avenue via Geary Boulevard, drivers would continue to Franklin Street northbound, to Post Street eastbound to access the site. Access from Franklin Street northbound, Gough Street southbound via Post Street would remain unchanged. If the driveway permit was revoked, the number of vehicles on Post

Street between Franklin Street and Van Ness Avenue and at the intersections of Geary/Franklin and Post/Franklin would increase; however, traffic volumes at intersections further away would remain similar to those analyzed for the proposed Cathedral Hill Campus project in the Draft EIR. An increase in traffic on streets in Japantown (i.e., on streets west of Gough Street) would not occur.[31]

A discussion of the revocable nature of the driveway/curb cut can be found in Response TR-80, page C&R 3.7-149. The proposed Cathedral Hill MOB Parking Garage entrance on Geary Street would be inbound only; all vehicles exiting the garage would exit onto Cedar Street. The traffic impact analysis of driveway operations did not indicate that entering vehicles would result in queues on Geary Street, nor would Geary Street operations be reduced to one westbound lane. If the Geary Street driveway was closed, drivers destined to the MOB garage would drive around the block (continue on Geary Street westbound to Van Ness Avenue northbound, to Cedar Street eastbound) to the Cedar Street entrance. Neither Post Street nor any streets in Japantown would be affected by closure of the Geary Street driveway, as the closure would only affect the streets directly adjacent to the MOB (i.e., Cedar Street, Polk Street, Geary Street, and Van Ness Avenue). As indicated in the transportation analysis, Polk Street would serve traffic generated by the proposed Cathedral Hill Campus, and impacts are discussed in Section 4.5, "Transportation and Circulation" in the Draft EIR.

3.7.14.4 POST STREET VARIANT

Comment

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-123a TR, duplicate comment was provided in 30-123 TR]

"When the shuttles start to stack up along with the vehicular traffic, ambulance traffic and the 38/38L-Geary buses in the BRT lane and the vehicles waiting to get in on the Geary Street side, one will get congestion on both Geary and Post. The 'Two-way Post Street Variant,' described on Page 4.5-89, may exacerbate the cut-through traffic if people are allowed to go into Japantown westbound on Post Street."

Response TR-132

The comment states concerns regarding operations on Geary Street and Post Street under the proposed Cathedral Hill Campus Project and the Two-Way Post Street Variant. Potential queuing of vehicles onto Geary Street from the Cathedral Hill Hospital garage under the proposed project is addressed in Response TR-88 (page C&R 3.7-156). Under the Two-Way Post Street Variant, Post Street between Van Ness Avenue and Gough Street would be revised from one-way eastbound to two-way operations. For vehicles exiting the site and destined to the north or south, drivers would be able to travel westbound on Post Street, and would turn on either Franklin Street to go northbound or to Gough Street to go southbound. Drivers destined to the west would be able to travel westbound on Post Street to Gough Street, turn left onto Gough Street, and then right onto Geary Boulevard westbound. Alternatively, drivers headed westbound could turn right onto Post Street, right onto Van Ness Avenue, and then right onto Geary Boulevard.

With the exception of local trips destined to Japantown, which would be facilitated under the Two-Way Post Street Variant, drivers would be unlikely to use Japantown streets to access their destinations. Under the Two-Way Post Street Variant, the number of vehicles on Post Street between Gough Street and Van Ness Avenue would increase; however, traffic volumes at intersections further away would remain similar to those analyzed for the proposed Cathedral Hill Campus project in the Draft EIR. An increase in traffic

[31] Fehr & Peers. 2011 (March 31). Technical Memorandum. Cathedral Hill Campus Revocable Driveways on Geary Street/Boulevard. This information is on file with the San Francisco Planning Department, 1650 Mission Street, Suite 400, San Francisco, CA 94103, and is available for public review as part of the project file, in Case No. 2005.0555E.

on streets in Japantown (i.e., on streets west of Gough Street) is not anticipated. Similar to the Two-Way Post Street Variant, the proposed project and the MOB Access Variant would be unlikely to increase traffic on streets in Japantown. In fact, because Post Street would remain one-way eastbound in both scenarios, the likelihood of any increase in traffic in Japantown will be even less.

Under the Two-Way Post Street Variant, shuttles would continue to stop within the recessed passenger loading bay on Post Street west of Van Ness Avenue, and shuttles would not be anticipated to conflict with the operation of the adjacent travel lane. The Two-Way Post Street Variant would result in additional intersection impact at Gough Street/Geary Boulevard that is further described in Response TR-47 (page C&R 3.7-71).

3.8 NOISE

3.8.1 LRDP

3.8.1.1 CONSTRUCTION NOISE

Comments

(Lower Polk Neighbors, October 19, 2010) [103-4 NO, duplicate comment was provided in 113-4 NO]

"The construction noise will penetrate living and work areas, making it hard to concentrate, talk, and sleep and to conduct business. In other words, difficult to perform normal daily functions. (health issue, see attached noise report and noise article)."

(Lower Polk Neighbors, October 19, 2010) [103-35 NO, duplicate comment was provided in 113-35 NO]

"b. Increased noise

i. The neighborhood will be impacted by increased noise both during the construction phase and, permanently, by the increased level of traffic and operations of the CHC. During construction, noise in the immediate vicinity would increase by 3 to 7 dB, up to 87 dB, and would exceed SF Noise Control Ordinance compliance levels at the 7 nearby sensitive sites (4.6-44). LRDP-related traffic noise would result in a noticeable (+3 dB or greater) increase in ambient traffic noise levels along Cedar Street (between Polk Street and Van Ness Avenue). This increase most likely would be perceivable to existing, nearby noise-sensitive receptors; noise may exceed 45dB in nearby residences if windows are open (4.6-58).

ii. Interim Phase:
   1. Use of green walls to act as sound absorbers
   2. Use of portable, tree planters along Alleys to absorb ongoing construction noise
   3. Potential use of temporary water features to mask noise

iii. Long-term Phase:
   1. Green walls and vertical gardens on hospital buildings and in park alley ways to absorb ongoing noises
   2. Use of permanent trees in Alleys and along Van Ness and Franklin to absorb ongoing hospital noise"

Response NO-1

The comments raise general concerns about noise impacts on adjacent sensitive receptors. Impacts NO-1 and NO-5 in the Draft EIR address noise and groundborne vibrations that would be caused by LRDP-related construction. Significant construction noise impacts were identified at sensitive receptors adjacent to proposed construction activities under the LRDP. Mitigation Measures M-NO-N1a and M-NO-N1c involve implementing noise reduction measures to reduce exterior construction noise at adjacent sensitive receptors. With the reduction of exterior construction noise, interior construction noise levels would also be reduced. The Draft EIR analysis determined that implementing the mitigation measures outlined in the construction noise impact discussion would reduce construction noise impacts to a less-than-significant level. A daytime representative noise level of 80 A-weighted decibels (dBA) at a distance of 100 feet or an equivalent sound level at another representative distance and a nighttime construction noise level that does not exceed ambient noise levels by 5 dB are considered acceptable by the City, as shown in the City and County of San Francisco Police Code, Article 29, Section 2907, "Construction Noise." Implementation of Mitigation Measures M-NO-N1a–c would require on-site measures to be implemented that would limit the ability for project-related noise to be perceived by adjacent receptors. These include, but are not limited to, regular and proper maintenance of construction equipment, limitations (no more

than 5 minutes) on idling of equipment, shielding and staging of stationary equipment away from sensitive receptors, temporary noise barriers (e.g., temporary walls or fencing with noise insulating material), and a community liaison to address noise complaints that may occur during construction. As such, exterior construction-related noise levels would be reduced; therefore, interior noise levels would be reduced, resulting in a less-than-significant impact. See also Responses NO-8, NO-13, and NO-26 on pages C&R 3.8-6, 3.8-20, and 3.8-35, respectively, for further discussion of potential increases in ambient noise levels associated with construction under the proposed LRDP.

Comment

(Alan Wofsy, September 23 2010) [PC-301 NO]

"I have prepared—how many copies should I give you—I prepared an analysis of some of those uncompensated, unmitigated impacts, and I'd like you to possibly read these and sort of try to address how CPMC can reimburse, or compensate the people who can't live in their apartments because of noise 17 hours a day for five and a half years."

Response NO-2

The comment requests that CPMC review an analysis of unmitigated impacts and suggests that reimbursement be provided to affected parties for these impacts. In response to the comment regarding noise analysis and impacts, Draft EIR Impacts NO-1 and NO-5 address noise and groundborne vibrations that would be caused by construction of the proposed CPMC LRDP. The LRDP construction period proposed is 4.5 years in duration, not 5.5 years as stated by the commenter. It is also worth noting, although not specifically raised in this comment, that LRDP construction, per revisions to the construction schedule since issuance of the Draft EIR, would generally occur between the hours of 7 a.m. and 7 p.m. Monday through Friday, and 7 a.m. to 5 p.m. on Saturdays. Nighttime construction noise would be limited to the activities and period of construction pertaining to the Van Ness Avenue Pedestrian Tunnel and interior finishings for the buildings.[1] Refer to Response NO-8 (page C&R 3.8-6) for additional details.

Impact NO-1 in the Draft EIR determined that construction noise impacts would be less than significant with incorporation of feasible mitigation and adherence to the San Francisco Noise Control Ordinance. The most intrusive noise levels to which nearby residents would be exposed would occur during the LRDP-related demolition, excavation, and foundation phases, or during the first 1.5 years of LRDP construction. It is anticipated that for the majority of the demolition phase, nearby residents would be shielded from noise by the existing building shell, while internal fixtures and nonload-bearing walls are removed. Noise levels during the LRDP-related excavation stage would be potentially reduced by the excavated pit that would be formed as excavation activities progress. The foundation stage of LRDP construction would also experience some noise reduction from the excavated pit formed for the foundation itself, because the pit would restrict the line of sight, thereby reducing noise levels at those sensitive receptors that do not have a line of sight toward construction activities. Mitigation Measures M-NO-N1a–c involve implementing noise reduction measures to reduce construction noise at adjacent sensitive receptors. Implementing Mitigation Measures M-NO-N1a through M-NO-N1c, which are briefly summarized in Response NO-1 (page C&R 3.8-1), would reduce construction noise impacts to less-than-significant levels. See also Responses NO-8, NO-13, and NO-26 on pages C&R 3.8-6, 3.8-20, and 3.8-35, respectively, for further discussion of potential increases in ambient noise levels associated with construction under the proposed LRDP.

[1] Revised sheets submitted for Construction Plans prepared by Herrero-Boldt dated December 13, 2010 and January 11, 2011 on file with the Planning Department.

The comment further states how CPMC can reimburse, or compensate the people who can't live in their apartments because of noise during construction activities. As is addressed in Response PH-15 (page C&R 3.5-56) and in Response PH-23 (page C&R 3.5-79), construction is a periodic activity that is part of the normal course of activity in a major city like San Francisco. Construction effects, including those that are described taking place at nearby apartments adjacent to the proposed LRDP campuses, are temporary in nature, using different types of equipment at different locations on a project site, and are not expected to create long-term disturbances that would be expected to cause long-term vacancies. Thus, such effects would be unlikely to create long-term problems that could create physical environmental effects requiring mitigation.

Mitigation of Construction Noise

Comment

(Ed Vitsitch, September 23, 2010) [PC-226 NO]

"While most mitigation measures reflected in the plan are in keeping with best industry practices, some of them go beyond to address the concerns of neighbors of the project, especially at the Cathedral Hill site. Examples are noise and vibration monitoring, the use of equipment that generates the least vibration noise and pollution, staging and sequencing that produces noise and vibration to the extent possible on a project of that size and complexity."

Response NO-3

The comment acknowledges the two types of mitigation measures (physical and operational) that are included in the Draft EIR and required for the proposed CPMC LRDP to reduce noise and vibration levels related to the project. The comment will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project.

3.8.1.2 CONSTRUCTION VIBRATION

Comment

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-83 NO, duplicate comment was provided in 30-83 NO]

"I have not analyzed St. Luke's proposed campus street widths, Pacific Campus street widths, or the Davies campus street widths to determine if the same 50-foot radius construction damage zone is being offered to the adjacent building owners of the Cathedral Hill Hospital project by CPMC."

Response NO-4

The comment expresses concern regarding the potential for LRDPconstruction-related vibration damage at properties adjacent to all CPMC campuses and whether the 50-foot radius construction damage zone would also apply to those campuses. There are sensitive receptors adjacent to CPMC campuses—identified in Tables 4.6-35 and 4.6-36 on pages 4.6-92 and 4.6-95, respectively, of the Draft EIR—that would be exposed to LRDP construction-induced vibration levels that exceed applicable thresholds. Mitigation Measure M-NO-N5 in the Draft EIR requires that the preconstruction survey for buildings located within 50 feet of proposed LRDP construction activities at all CPMC campuses (Cathedral Hill ,St. Luke's and Davies) be documented as well. Mitigation Measure M-NO-L5 would require preconstruction surveys for the long-term projects at the Pacific and Davies Campuses.

Comment

(Unitarian Universalist CPMC Task Force, October 5, 2010) [44-2 NO]

"Vibration levels. Volume 3, Chapter 4, Page 15, Table 4.6-17, 'Summary of FTA recommended Ground borne Vibration Impact Criteria.' In the table there is the following sentence regarding acceptable vibration levels: 'vibration-sensitive manufacturing or research will require detailed evaluation to define the acceptable vibration levels.' It does not address the methodology for how such an evaluation will be carried out."

Response NO-5

The comment states that Table 4.6-17 in the Draft EIR does not provide information on how a detailed vibration analysis would be completed. Table 4.6-17 is a vibration reference table that presents information developed by the Federal Transit Administration (FTA) regarding acceptable vibration levels for different types of receptors. The note referenced by the comment is related to FTA Category 1 receptors, which represent buildings where vibration would interfere with operations. The note is intended to illustrate that for this general category of vibration-sensitive receptors, an additional vibration study may be required to determine the level of vibration that would adversely affect a specific use or operation. Mitigation Measure M-NO-N5 in the Draft EIR has been modified to include provisions for and monitoring of construction-related vibration that could disturb the operation of potentially sensitive equipment. Refer to Response NO-31 (page C&R 3.8-42) for a more detailed discussion of the additional analysis that would be conducted to prevent disturbance of vibration-sensitive equipment in the vicinity of each development site.

3.8.1.3 OPERATIONAL NOISE

Comment

(Reverend Arnold Townsend, September 23, 2010) [PC-200 NO]

"Finally, let me say this, the hospital will create some noise, you give up things when you live in the City, but you get some other things. Hospitals are noisy, but they're close to you. You know, street cars are noisy, but you can get back and forth relatively simply. You know, sirens make a lot of noise, but you don't have to wait two hours for the fire truck or the ambulance to get there. When you live around California and Van Ness, or Geary and Van Ness, that is not a cul-de-sac in Napa,..."

Response NO-6

The comment acknowledges that in an urban environment, certain types and levels of noise—including those associated with hospital activities—are to be expected. The comment is noted and may be considered by the decision-makers as part of their deliberations on the project.

3.8.2 CATHEDRAL HILL CAMPUS

3.8.2.1 CONSTRUCTION NOISE AND VIBRATION

Comment

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-138 NO, duplicate comment was provided in 30-138 NO]

"76. When the Cathedral Hill Hotel and the 1255 Post Street buildings are demolished, there will be physical noise and vibration impacts to the Hamilton Square Church (Franklin & Geary, northwest corner), the First

Unitarian Universalist Church (Geary & Franklin, southwest corner), and the Church Office on Sutter Street and Van Ness, northwest corner (Page 4.1-2)."

Response NO-7

The comment states that the Hamilton Square Church, First Unitarian Universalist Church, and the church office on Sutter Street and Van Ness Avenue would experience noise and vibration impacts during construction activities conducted for the proposed LRDP. The potential noise and vibration impacts on adjacent sensitive receptors are addressed as part of the Draft EIR analysis. For example, Tables 4.6-22 and 4.6-35 on pages 4.6-44 and 4.6-92 of the Draft EIR, respectively, state the projected noise and vibration levels that could occur at the Hamilton Square Church and First Unitarian Church during construction activities, including demolition. Office uses are not considered sensitive receptors and as noted in Response NO-21 (page C&R 3.8-29), it is appropriate to consider the closest sensitive receptors, and the most substantial change that would occur at those receptors as a result of project implementation. The church office is not one of the closest receptors. Table 4.6-35 of the Draft EIR was not intended to present a list of only the nearby uses that would experience noise and vibration impacts from project construction. However, Table 4.6-35 does include all nearest sensitive receptors, as well as a selection of other nearby uses that could experience noise and vibration impacts. Based upon the information in the table, it can be generally concluded for the Cathedral Hill Campus, for example, that no buildings near the site would experience physical damage, but uses within approximately 75 feet of the site could experience noise levels that exceed human annoyance thresholds during portions of the construction period. Uses at a distance of 80 feet or further from the Cathedral Hill Campus site are not expected to experience noise in excess of human annoyance thresholds. Furthermore, the Draft EIR acknowledges that construction vibration impacts would remain significant and unavoidable after implementation of feasible Mitigation Measure M-NO-N5.

Comments

(Helene Dellanini—DBC Master Owner's Association, October 12, 2010) [71-1 NO, duplicate comment was provided in 72-1 NO]

"The Daniel Burnham Court Master Owners Association and Homeowner's Association consists of 245 residential units and approximately 100,000 square feet of commercial space. Our residential population includes numerous ethnic backgrounds and socio-economic status, including quite a few children and elderly. Our commercial tenants include a number of medical offices that utilize highly sensitive equipment such as lasers for eye surgery and ultrasound technology.

Daniel Burnham Court is literally surrounded by CPMC's Cathedral Hill project. On the south side of our building is the main hospital site. On the north side of Daniel Burnham Court is the medical office building at 1375 Sutter. And across Van Ness diagonally from Daniel Burnham Court is the Medical Office Building.

Naturally our residents and tenants have a number of concerns both about what it will be like to be surrounded by this extraordinary construction project for the next five years as well as the long term impacts that the hospital and medical buildings will create for our community.

We have been in discussions with CPMC and have expressed our reasonable and rational concerns about those anticipated impacts. We remain hopeful we can come to an agreement on what measures need to be taken to ensure that the development of the hospital campus is done responsibly. However, ultimately we look to both CPMC and our elected officials and government to ensure that the hospital's construction and operation are sensitive to the real and numerous impacts it will have on the environment, including its neighbors.

We have retained the services of consultants to review the draft EIR. Their letters are attached herein (summarized in the letter from Project Management Advisors, Inc.). In short, we are respectfully requesting the impacts to the quality of life and work in the surrounding community be mitigated with curtailed work hours set

to reasonable residential-sensitive and traffic-sensitive times of day, with additional conditions tied to intrusive construction operations related to noise, vibration, traffic and access. We have also suggested specific and practical traffic mitigations to significant impacts, where none were prescribed. Finally, we are requesting transparency and accountability through a robust communication program coupled with monitoring of the most intrusive physical impacts of noise, vibration, dust, and traffic (beyond that currently required in the draft). At the very least, CPMC should evidence that the project is in compliance with representations in the environmental review and that prescribed mitigation measures are working as anticipated."

(Diane Smith, September 23, 2010) [PC-311 NO]

"Hi, my name is Diane Smith. I am with Project Management Advisors and we were retained by Daniel Burnham Court at One Daniel Burnham Court. You heard from their General Manager, Helene Dellanini. And they chose PMA because we have numerous projects around the country and especially in San Francisco. We managed the development of One Rincon Hill, the Argenta on Polk, and One Embarcadero across from the Ballpark, and they wanted to take a pragmatic approach to understanding their concerns relative to being surrounded by CPMC's Cathedral Hill Campus. So, for instance, their concerns are all under the purview of CEQA, in terms of vibration and noise and dust, and as Helene noted, we've reviewed the EIR and we are planning on submitting our formal comments, and I won't go over them here. We submitted our concerns also directly to CPMC and we are currently in discussions and we are very hopeful that we will come to an agreement on how to mitigate them."

(Helene Dellanini, Daniel Burnham Court Association, September 23 2010) [PC-38 NO]

"MS. DELLANINI: Good afternoon. My name is Helene Dellanini. I am the Association Manager for Daniel Burnham Court, a residential and commercial condominium building on the corner of Van Ness and Post. We have 245 residential units and 103,000 square feet of commercial space. Our residential population is approximately 325 people, including a number of children, as well as some seniors. Our commercial tenants include a number of medical offices that utilize highly sensitive equipment such as lasers for eye surgery and ultrasound technology. Daniel Burnham Court is literally surrounded by CPMC's Cathedral Hill Project. On the south side of our building is the main hospital site, on the north side of Daniel Burnham Court is the medical office building at 1375 Sutter. And across Van Ness, diagonally from Daniel Burnham Court, is a medical office building at Van Ness and Geary."

(Helene Dellanini, Daniel Burnham Court Association, September 23 2010) [PC-39 NO]

"Naturally, our residents and tenants have a number of concerns, both about what it would be like to be surrounded by this extraordinary construction project for the next five years, as well as the long term impacts that the hospital and the medical buildings will create for our community. Earlier this year, we initiated discussions with CPMC. We have voiced our reasonable and rational concerns about specific impacts that the project will have on our residents and tenants now and in the future. Our dialogue continues with CPMC and its construction team."

(Helene Dellanini, September 23, 2010) [PC-41 NO]

"Our team has reviewed the Environmental Impact Report and has many practical solutions for the findings that were significant to Daniel Burnham Court, but were not assigned any mitigation, especially relating to noise and traffic."

Response NO-8

The comments express concerns regarding potential vibration, construction and operational noise from implementation of the proposed LRDP, including noise associated with second-shift construction activities. The area around Daniel Burnham Court would be exposed to exterior construction noise at the proposed Cathedral Hill Hospital site, and to a lesser extent, the site of the proposed Cathedral Hill Medical Office Building (MOB). The anticipated effects of project construction noise on Daniel Burnham

Court occupants is discussed on pages 4.6-43 through 4.6-47 of the Draft EIR. Renovation of the existing Pacific Plaza Office Building (1375 Sutter Street) to become the 1375 Sutter MOB would be completed within the interior of the building. Exterior construction that could be attributable to the 1375 Sutter MOB would consist of typical maintenance activities. No substantial exterior construction is proposed for 1375 Sutter Street. Mitigation Measures M-NO-N1a–c involve implementing both physical (e.g., M-NO-N1a—noise shielding) and operational (e.g., M-NO-N1b—construction complaints coordinator) impact reduction measures that are considered practical and feasible. Mitigation Measure M-NO-N1c requires that long-term and short-term noise measurements be taken during each major construction phase, and that additional mitigation measures identified in the construction noise management plan be implemented if noise levels from construction activities are found to exceed City standards and result in complaints provided to the community liaison. As such, mitigation measure M-NO-N1c allows for adaptability in the mitigation that would most benefit those sensitive receptors most affected by construction activities.

Operational impacts associated with the proposed Cathedral Hill Campus are discussed in Impact NO-3 on pages 4.6-64 through 4.6-72. Mitigation Measures M-NO-N3a–e involve implementing physical (e.g., M-NO-N3a—mechanical equipment design) and operational (e.g., M-NO-N3e—truck delivery schedule to minimize noise) impact reduction measures that are considered practical and feasible. These measures are intended to reduce operational noise levels of the LRDP for the residences adjacent to and near the proposed Cathedral Hill Campus.

With respect to nighttime construction noise, the comments expressed concern about noise that would be generated from project construction activities at the proposed Cathedral Hill Campus, especially from the construction of the proposed Cathedral Hill Hospital, the nearby medical office building (proposed Cathedral Hill MOB), and the proposed Van Ness Avenue Pedestrian Tunnel. In particular, comments requested further consideration of issues related to proposed nighttime construction and made a number of suggestions for additional mitigation measures that they believe could reduce nighttime construction noise effects.

The Draft EIR identified the standard of significance for construction noise impacts as occurring if "noise generated by construction were to violate Sections 2907 and 2908 of the San Francisco Noise Control Ordinance."

As noted on page 4.6-41 of the Draft EIR, construction activities for development projects under the proposed CPMC LRDP would include site preparation (e.g., demolition, excavation, grading, and clearing), basement excavation, trenching, pouring of concrete foundations, paving, erection of steel structures and exterior enclosures, interior buildout, equipment installation, finishes, and cleanup. The noisiest construction activities would be demolition and excavation, although no pile driving or rock blasting would occur.

Construction of the proposed Cathedral Hill Campus is anticipated to begin in 2012 and conclude in 2016, with the loudest noise (i.e., greatest potential increase in ambient noise levels) occurring during the demolition and excavation phases of construction, which would occur during the first 13 months of construction activities at the proposed Cathedral Hill Campus. The Draft EIR stated that:

"[h]ours of operation during construction phases would extend from 7 a.m. to midnight on all typical work days, using two shifts. Saturday work would occur from 7 a.m. to 5 p.m.; work is not expected to be done on Sunday. The hours of operation would vary slightly during the development projects' various stages."

As stated on page 4.6-41 of the Draft EIR, construction noise between the hours of 7 a.m. and 8 p.m. would be considered significant if it would exceed 80 dB at 100 feet. In addition, any construction work conducted between 8 p.m. and 7 a.m. would be considered significant if it exceeds ambient noise levels

by 5 dBA unless a special permit is granted before such work by the Director of Public Works or the Director of Building Inspection.

The Draft EIR identified that noise levels generated during the aforementioned construction activities would be approximately 81 dBA L_{eq} when measured at a distance of 100 feet, which would be in excess of the San Francisco Noise Control Ordinance's 80 dBA maximum continuous noise level. Further, construction noise would exceed the ambient noise level by more than 5 dBA. Therefore, this impact was identified as potentially significant.

Mitigation Measure M-NO-N1 in the Draft EIR requires the implementation of both physical (e.g., noise shielding) and operational (e.g., construction complaints coordinator) impact reduction measures to be instituted between the hours of 7 a.m. and 8 p.m. before and during construction to reduce noise levels, in compliance with the San Francisco Noise Control Ordinance. As shown in Chapter 4 of this C&R document, Mitigation Measure M-NO-N1 has been slightly modified as follows to provide additional clarification detail regarding the measures that would be implemented to reduce construction noise:

M-NO-N1a CPMC shall minimize the impacts of construction noise where feasible by implementing the measures listed below in accordance with the San Francisco Noise Control Ordinance. These measures shall be required in each contract agreed to between CPMC and a contractor under the LRDP and shall be applied to all projects and programs covered by th~~is~~e CPMC LRDP EIR.

- Construction equipment shall be properly maintained in accordance with manufacturers' specifications and shall be fitted with the best available noise suppression devices (e.g., mufflers, silencers, wraps). All hand-operated impact tools shall be shrouded or shielded, and all intake and exhaust ports on power equipment shall be muffled or shielded.
- Construction equipment shall not idle for extended periods of time (no more than 5 minutes) near noise-sensitive receptors.
- Stationary equipment (compressors, generators, and cement mixers) shall be located as far from sensitive receptors as feasible. Sound attenuating devices ~~enclosures~~ shall be ~~used~~ placed adjacent to individual pieces of stationary source equipment located within 100 feet of sensitive receptors during noisy operations ~~on-site~~ to prevent line-of-sight to such receptors, where feasible.
- Temporary barriers (noise blankets or wood paneling) shall be placed around the construction site parcels and, to the extent feasible, they should break the line of sight from noise sensitive receptors to construction activities. If the use of heavy construction equipment is occurring on-site within 110 feet of an adjacent sensitive receptor, the temporary barrier located between source and sensitive receptor shall be no less than 10 feet in height. For all other distances greater than 110 feet from source to receptor, the temporary noise barrier shall be no less than 8 feet in height. For temporary sound blankets, the material shall be weather and abuse resistant, and shall exhibit superior hanging and tear strength with a surface weight of at least 1 pound per square foot. ~~Placement~~ Procedures for the placement, orientation, size, and density of acoustical barriers shall be reviewed and approved by a qualified acoustical consultant.
- When temporary barrier units are joined together, the mating surfaces shall be flush with each other. Gaps between barrier units, and between the bottom edge of the barrier panels and the ground, shall be closed with material that would completely close the gaps, and would be dense enough to attenuate noise.

M-NO-N1b A community liaison shall be designated by CPMC. The community liaison shall be available to manage and respond to noise complaints from nearby sensitive receptors. The community liaison shall keep a log of all relevant and appropriate complaints and responses to those

complaints through a website that can be accessed and viewed by the public. The log or a copy of the log shall also be available upon request to any affected citizen or their representative. The community liaison shall produce a weekly and six-week schedule of construction operations and shall provide this schedule in advance and upon request to any affected citizens or their representatives. Contact information for the community liaison shall be posted in a ~~conspicuous~~ location ~~so~~ that ~~it~~ is clearly visible to the nearby receptors most likely to be disturbed. The community liaison shall be responsible for ensuring that reoccurring noise complaints are evaluated by a qualified acoustical consultant to determine and implement appropriate noise control measures that would be taken to meet applicable standards. The community liaison shall contact nearby noise-sensitive receptors and shall advise them of the construction schedule.

M-NO-N1c A construction noise management plan shall be prepared by a qualified acoustical consultant. The noise management plan shall include, but shall not be limited to, the following tasks:

- A detailed evaluation of nighttime tunnel construction at noise-sensitive receptors shall be prepared. The evaluation shall include calculations of construction noise levels based on detailed information regarding construction methods and duration. If it is determined that construction noise levels would exceed City noise ordinance standards, a qualified acoustical consultant shall review and approve additional mitigation measures to minimize prolonged sleep disturbance (e.g., using acoustical treatments to existing buildings, such as upgraded weatherstripping, or determining the feasibility of constructing a cantilevered overhang along temporary barriers around the construction area to reduce construction noise levels at elevated receptors).
- Long-term (24-hour) and short-term (15-minute) noise measurements shall be conducted at ground level and elevated locations to represent the noise exposure of noise-sensitive receptors adjacent to the construction area. The measurements shall be conducted for at least 1 week during the onset of each of the following major phases of construction: ~~(i.e., demolition, excavation, and structural steel erection)~~. Measurements shall be conducted during both daytime and nighttime hours of construction, with observations and recordings to document combined noise sources and maximum noise levels of individual pieces of equipment.
- If noise levels from construction activities are found to exceed City standards (daytime [80 dB at a distance of 100 feet] or nighttime [5 dB over ambient]) and result in complaints that are lodged with the community liaison, ~~A~~additional noise mitigation measures that will bring the project into compliance with the City Noise Control Ordinance standards shall be identified. These measures shall be prepared by the qualified acoustical consultant and shall identify the noise level exceedance created by construction activities and identify the anticipated noise level reduction with implementation of mitigation. ~~provided if noise levels from construction activities are found to exceed City standards and result in complaints that are lodged with the community liaison.~~ These measures may include, among other things, ~~erecting~~ additional temporary noise barriers at either the source or the receptor; operational restrictions on construction hours or on heavy construction equipment where feasible; ~~building large~~ temporary enclosures to shield receptors from the continuous engine noise of delivery trucks during offloads (e.g., concrete pump trucks during foundation work); or lining temporary noise barriers with sound absorbing materials. Measures such as these have been demonstrated to be effective in keeping construction noise levels within 80 dB at a distance of 100 feet.

As required by Mitigation Measure M-NO-N1a, temporary noise barriers would be placed around the construction site to break line of site from nearby sensitive receptors to construction activities. Installation of a temporary noise barrier, 8 to 10-feet in height depending on distance from the noise source and adjacent buildings, would yield a reduction of 5–8 dBA. This reduction would decrease noise levels at

sensitive receptors located on upper floors, as required by Mitigation Measure M-NO-N1a, which would result in a 2.2-5.0 dBA reduction in noise levels at elevated sensitive receptors. As noted above, unmitigated construction noise levels would be approximately 81 dBA during demolition and excavation phases, which would occur for approximately the first 13 months of LRDP construction. With installation of the aforementioned noise barrier, noise levels would be reduced to less than 80 dB at a distance of 100 feet, in accordance with the thresholds established by the San Francisco Noise Control Ordinance, and impacts would be considered less than significant with mitigation, as noted in the Draft EIR.

During public review of the Draft EIR and continued planning of the proposed LRDP, CPMC—in consultation with its construction partners—further evaluated the proposed construction plan for the project and has updated and refined the proposed schedule for construction activities.[2] These refinements would allow the proposed CPMC LRDP to meet statutorily required deadlines, as well as implement strategies and work schedules to ensure that construction practices minimize construction noise at night and do not create violations of the San Francisco Noise Control Ordinance.

The refinements to the construction management plan clarify that the potential second shift of construction activity would only occur during interior finishing to the proposed structures at the Cathedral Hill Campus and during the construction of the proposed Van Ness Avenue Pedestrian Tunnel. The second shift would not take place during demolition, excavation, or erection of the proposed buildings, and would only start after the building shell has been completed.

Nighttime construction of interior finishes would occur within the previously constructed shell of each proposed structure and would not involve the use of heavy construction equipment, including on-site haul trucks or loading/unloading equipment. Assuming a 20-dBA reduction afforded by the shells of the proposed structures and a distance of 100 feet (based on the proposed location of structures in relation to existing receptors) from a receptor and interior construction activity, nighttime construction noise levels at adjacent sensitive receptors would not be expected to exceed 60 dBA. The typical noise levels of equipment—including pneumatic tools, man lifts, and compressors—that could be used for internal finishes are presented in Table 4.6-21 of the Draft EIR. All equipment utilized during the interior phase would be electric or propane powered. This would represent a 0.9-dBA increase from the lowest hourly L_{eq} (59.1 dBA) observed in the vicinity of the proposed Cathedral Hill Campus during 24-measurements. Potential construction noise associated with these activities would not be considered perceptible, would not exceed the 5-dBA threshold for nighttime activities established in the City of San Francisco Noise Control Ordinance, and thus, would be less than significant.

With respect to nighttime tunnel underground construction, the Draft EIR also acknowledged that a special permit that allows proposed construction activities to be conducted after 8 p.m. would need to be issued by the Director of Public Works or the Director of Building Inspection because construction noise could exceed ambient noise levels by more than 5 dBA. The Draft EIR stated that by including the aforementioned mitigation and receiving the special permit, the impact of project construction noise during the first and second shifts would be reduced to a less-than–significant level.

Noise generated by surface excavation during construction of the proposed Van Ness Avenue Pedestrian Tunnel would occur periodically between the hours of 7 p.m. and 5 a.m. Nighttime work is considered necessary in this location because construction requires the closure of traffic lanes on Van Ness Avenue; conducting this work during the day would be highly disruptive to the traffic network and would cause additional impacts. Nighttime construction of the open-cut tunnel would allow for closure of the Van Ness Avenue lanes during periods of time when traffic volumes are relatively low.

[2] Revised sheets submitted for Construction Plans prepared by Herrero-Boldt dated December 13, 2010 and January 11, 2011 on file with the Planning Department.

In total, approximately 102 nights of surface work would be required for construction of the proposed pedestrian tunnel, and would be conducted as follows:

1. At the commencement of tunnel construction, there would be 11 nights of site preparation work followed by 25 nights of temporary utility support work.

2. Over a period of approximately 21 nights, holes would be drilled into the street and steel beams (soldier beams) lowered into the holes. Concrete would then be placed into the holes to hold the beams in place. This operation would not require extended lane closures as the traffic lanes would be reopened to traffic each morning.[3]

3. After the soldier beams are installed across all lanes, the surface excavation would commence. First, the existing road surface of Van Ness Avenue would be removed, the soil below the road bed would be excavated to 4 feet below the street surface, and a sheet of very thick steel would be installed and welded in place over the excavation, creating a temporary road bed capable of handling the existing traffic loads for the remainder of tunnel construction. This phase would require approximately 25 nights of activity. Construction activities would then move below the roadway surface.

4. Once the surface layer is removed from above, soil would be excavated from below, removed from the tunnel via the hospital construction site with a loader, and placed onto trucks. No nighttime surface work would be needed during this phase, nor would any lane closures be required.

5. After the pedestrian tunnel has been completed, restoration of the road surface to preconstruction conditions would require approximately 20 nights of surface work.

At various points during these activities—primarily the second, third, and fifth phases—it is anticipated that an excavator, an air compressor, a skid steer, a fork lift, a mobile crane, a paver, and/or a roller may be required to be in operation at varying points. When in operation, these types of equipment typically generate between 80 and 85 dBA at a reference distance of 50 feet, which would be equivalent to 74 to 79 dBA at 100 feet. However, as is required under Section 2708 of the San Francisco Noise Control Ordinance, this equipment would be maintained and fitted with best available noise suppression devices, and would be turned off instead of left idling for extended periods.

Additional feasible noise suppression measures and temporary sound barriers, such as sound-insulating blankets(where appropriate), would be used around the construction area to reduce further potential increases in ambient noise levels, as required by Mitigation Measure M-NO-N1a. It should also be noted that because of the timing of construction activities during this period of the day, potential increases in temporary traffic would be minimized and impacts from associated mobile-source noise increases (such as those caused by horns) attributable to increased congestion would be reduced. If during the implementation of M-NO-N1c (monitoring) additional measures are determined to be necessary, they will be implemented in cooperation with the City and disclosed by the community liaison. (See Mitigation Measure M-NO-N1b.)

Thus, as noted above, implementation of Mitigation Measure M-NO-N1a through M-NO-N1c would ensure that construction activities occurring between the hours of 7 a.m. and 7 p.m. for the proposed Van Ness Avenue Pedestrian Tunnel, would implement feasible noise attenuation to reduce impacts to a less than significant level, as required by the San Francisco Noise Control Ordinance. The Draft EIR also acknowledged that a special permit from the Director of Public Works or the Director of Building

[3] As the soil is removed, wood beam material (called lagging) would be installed to support each side of the road where the soils have been removed. Lagging is a daytime activity that would not require lane closures. The activity would take approximately 40 days.

Inspection would be required to conduct construction activities after 8 p.m. As is specifically noted in section 2708 of the San Francisco Noise Control Ordinance, a special permit is appropriately granted when circumstances unique to a construction site make daytime construction impractical or undesirable. The need to maintain traffic flow on Van Ness Avenue is representative of the type of situation that was anticipated in the San Francisco Noise Control Ordinance, which states that a special permit should be granted "…if construction noise in the vicinity of the proposed work site would be less objectionable at night than during daytime because of different population levels or different neighboring activities if obstruction and interference with traffic, particularly on streets of major importance, would be less objectionable at night than during daytime;…" It should be noted that the special permit, if granted, could include additional provisions that may require stopping unshielded equipment operation after 8 p.m. to ensure compliance with the San Francisco Noise Control Ordinance. See also Response NO-13 on page C&R 3.8-20.

The revisions to the planned activities for the second shift of construction included in the updated construction data sheets, as they relate to interior construction, in combination with implementation of Mitigation Measure M-NO-N1 and the required application for and receipt of a special permit from the Director of Public Works or the Director of Building Inspection. This would ensure that noise levels would not create significant noise impacts and would be in compliance with the San Francisco Noise Control Ordinance.

With respect to transparency and accountability, Mitigation Measure M-NO-N1c requires a construction management plan as part of the project's mitigation monitoring and reporting program (MMRP). The MMRP requires monitoring and reporting on field findings regarding the effectiveness of mitigation measures implemented and this would be made available to the public at the San Francisco Planning Department. If noise standards are exceeded, as determined through noise monitoring and declared by the City to be an exceedance of City standards, an acoustical consultant would work with CPMC and its contractors to implement additional measures for noise reduction. This procedure would provide a process to respond to issues raised by the community through the community liaison and the project Web site, as described in more detail under Response NO-23 on page C&R 3.8-32.

Please refer to Response NO-31 on page C&R 3.8-42 for a description of the clarifications to Mitigation Measure M-NO-N5 that include specific considerations of vibration sensitive equipment at nearby medical office facilities. See Response TR-43 on page C&R 3.7-67 in Section 3.7, "Transportation and Circulation," for a discussion of potential traffic impacts to the adjacent Daniel Burnham Court development. Please also refer to Response NO-27 (page C&R 3.8-37) regarding construction-related vibration impacts.

Comment

(Helene Dellanini—DBC Master Owner's Association, October 18, 2010) [71-11 NO, duplicate comment was provided in 72-11]

"NO-1: Short-term noise generated by project-related construction and/or demolition activities could temporarily expose existing nearby noise-sensitive receptors to substantial increases in ambient noise levels (Significance Criteria 6a and 6dl)

NO-1 Comments: We have noted several discrepancies in the analysis of short-term construction noise:

1. Distance to Daniel Burnham Court: The DEIR's study identified the property at 1 Daniel Burnham Court to be a candidate for a worst-case scenario and evaluated the noise impacts at that location, per CEQA. However, it evaluated noise levels there using a distance of 100 feet, when the distance of sensitive noise receptors (residential unit on Post) to an offending source (hoe-ramming the footing of the existing office building on Post), is

approximately 75 feet away. Therefore, predicted noise levels reported at Daniel Burnham Court which were underestimated at 81 dBA should be reported as 82 dBA. On a logarithmic scale, this is a difference of:"

DEIR Predicted Average Construction Noise Level at Daniel Burnham	Predicted Average Construction Noise Level at Daniel Burnham, adjusted for accurate distance from source (75')
81 dBA	82 dBA

Response NO-9

The comment states that 1 Daniel Burnham Court (DBC) is located 75 feet from the project site, not 100 feet as stated in the Draft EIR, and could be exposed to noise levels of approximately 82 dBA equivalent noise energy level (L_{eq}) instead of the stated 81 dBA L_{eq}. As requested by the comment, the data in Table 4.6-22 pertaining to 1 Daniel Burnham Court has been amended to reflect a distance of 75 feet and a modeled construction noise level of 82 dB, as shown below and also included in Chapter 4 of this C&R document.

Table 4.6-22
Exposure of Sensitive Receptors near the Proposed Cathedral Hill Campus to Demolition/Excavation/Construction Noise

Sensitive Receptor	Existing Noise Level (dB, L_{eq})	Distance (feet)	Modeled Construction Noise Level (dB, L_{eq})	Exceeds Ambient (dB)
1 Daniel Burnham Court (residential/mixed use)	68	~~100~~75	~~81~~82	+1~~3~~4

It should be noted that although some project construction activities may occur within 100 feet of 1 DBC, because the Cathedral Hill Campus site is more than 275 feet deep and more than 385 feet in length, it is also true that much of the construction would occur at distances much farther than 100 feet, toward the center of the block. The 81 dBA L_{eq} as reported in the DEIR exceeds the threshold of significance for construction noise at Daniel Burnham Court during daytime construction. Thus, the impact would be potentially significant at Daniel Burnham Court, however, would be mitigated to a less-than-significant level with the implementation of mitigation measures M-NO-N1a through M-NO-N1c. This finding would not change whether using 81 or 82 dBA L_{eq} at 75 or 100 feet in distance.

The 100-foot measurement is also relevant because it reflects the threshold established in the San Francisco Noise Control Ordinance. Page 4.6-36 of the Draft EIR reports that Section 2907(a) of the San Francisco Noise Control Ordinance limits noise levels from construction equipment as specified under the ordinance to 80 dB [decibels] L_{eq} at 100 feet (or other equivalent noise level at a convenient distance) from construction equipment between 7 a.m. and 8 p.m. It should be noted that a threshold of 80 dB L_{eq} at 100 feet is equal to a higher dB L_{eq} threshold at a shorter distance and a lower dB L_{eq} threshold at a further distance. Thus, a slightly higher level of noise observed at a distance of less than 100 feet does not necessarily indicate a greater level of exceedance over the San Francisco Noise Control Ordinance threshold. Rather, as it pertains to Daniel Burnham Court, construction noise levels up to 82.5 dB L_{eq} at a distance of 75 feet would be considered in compliance with the San Francisco Noise Control Ordinance.

Comments

(Helene Dellanini—DBC Master Owner's Association, October 18, 2010) [71-12 NO, duplicate comment was provided in 72-12]

"2. Maximum Noise Level and the SF Noise Ordinance: Anticipated theoretical average noise levels were evaluated for significant impacts by comparison against the San Francisco Noise Ordinance criterion of 80 dBA at a distance of 100 feet from the source construction equipment. However, per section 2901(g) of the code, this criterion should be compared against maximum noise levels produced by construction equipment measured at such a distance. On a recent assignment, Veneklasen Associates noted maximum noise levels from construction equipment as on average 9 dBA higher than time-averaged levels. If this is also true for CPMC's construction site, then the predicted average noise level of 82 dBA at 75 feet (see above) would be equivalent to a maximum noise level of 91 dBA at 75 feet, which would be squarely out of compliance with the SF Noise Ordinance (adjusted to 81 dBA at 75')."

DEIR Predicted Average Construction Noise Level at Daniel Burnham, adjusted for distance (75')	Potential Predicted Maximum Noise Level at Daniel Burnham (75')	SF Noise Ordinance – Limit of Maximum Noise at 75'	Consequence
82 dBA	91 dBA	81 dBA	Project is out of compliance

(Helene Dellanini—DBC Master Owner's Association, October 18, 2010) [71-31 NO, duplicate comment was provided in 72-31 NO]

"Veneklasen Associates, Inc. (VA) has been contracted to review the noise section of the EIR developed for the CPMC Cathedral Hill campus, specifically with regard to the noise impact to the adjacent residential building, Daniel Burnham Court (DBC). We have reviewed section 4.6, Noise, dated July 21,2010.

We have attempted where possible to translate the technical quantities of sound pressure level into the corresponding measures of approximate subjective loudness. See "Sound and the Human Ear", page 4.6-3 of the EIR, for additional information.

1. Impact NO-l. Short-Term Construction Noise

Short-term noise generated by project-related construction and/or demolition activities could temporarily expose existing nearby noise-sensitive receptors to substantial increases in ambient noise levels.

1.1 Criteria

1.1.1. CEQA significance criterion 6a defines a significant impact if the project results in noise levels in excess of standards established in the San Francisco Noise Ordinance (SFNO). The relevant section of the SFNO is section 2907(a) of the City of San Francisco Police Code, which defines as unlawful noise from construction equipment 'in excess of 80 dBA when measured at a distance of 100 feet from such equipment, or an equivalent sound level at some other convenient distance.'

The EIR interprets this criteria that the L_{eq} (i.e., the average noise level) of 80 dBA at the nearest receptor location. However, section 2901(g) defines noise level in as 'the maximum continuous sound level or repetitive peak sound level, produced by a source or group of sources as measured with a sound level meter.' This corresponds to the L_{max} at the receptor location. (Noise descriptors are defined on page 4.6-6 of the EIR.) Obviously the maximum noise level (L_{max}) will be louder than the average noise level (L_{eq}). For example, in a recent construction noise monitoring project performed by VA [Veneklasen Associates], the logged L_{max} was on average 9 dBA higher than the L_{eq} during earth-moving operations. It is not appropriate to utilize an L_{max} criteria SFNO as an L_{eq} criteria.

The closest receptor from the residential portion of DBC is less than 100 feet from the CPMC property line. Exact survey was not available, but from the plans in the EIR and aerial photos, the distance is approximately 75 feet. Assuming a point noise source (6 dB per doubling of distance), which is reasonable for nearby pieces of equipment, 80 dB at 100 feet corresponds to 82 dB at 75 feet. This corresponds to the 'equivalent sound level at some other convenient distance' in the SFNO.

Therefore, the requirement of the SFNO, and therefore the requirement for the EIR per CEQA criteria 6a, as it relates to DSC, is that the L_{max} from powered construction equipment measured at the nearest exterior façade of DBC should not exceed 82 dBA."

(Helene Dellanini—DBC Master Owner's Association, October 18, 2010) [71-34 NO, duplicate comment was provided in 72-34 NO]

"1.2.3. It is not possible to predict exactly how much the L_{max} will exceed the L_{eq} during construction. As mentioned above, in one construction project VA has measured recently, the L_{max} was 9 dB on average above the L_{eq}. If the CPMC construction is similar, the L_{max} will be around 90 dBA. This would be a substantial violation of the SFNO limit of 80 dBA. (A 10 dB difference would be perceived as approximately twice as loud.)"

Response NO-10

The comments state that the Draft EIR incorrectly assessed the type of noise level that could occur by using a metric of L_{eq} versus L_{max}. Section 2901(g) of the San Francisco Noise Control Ordinance states that a noise level is defined as "the maximum *continuous* sound level or *repetitive* peak sound level," not the instantaneous maximum sound level. Also, as noted in FTA's *Transit Noise and Vibration Impact Analysis* manual on page 12-3, "[t]he *descriptor* used for construction noise is the L_{eq}." As such, and for the purposes of assessing significance under CEQA in compliance with the direction of the San Francisco Noise Control Ordinance, using L_{eq} as a metric is considered appropriate. Furthermore, the measured equipment noise levels used in the Draft EIR analysis are based on FTA's *Transit Noise and Vibration Impact Analysis* manual, which is commonly used throughout the state as the basis for determining noise impacts with respect to construction. Please refer to Response NO-9 (page C&R 3.8-13) for additional clarification of the 100-foot source-to-sensitive receptor distance expressed in the Draft EIR and the 75-foot distance expressed in this comment.

Comments

(Helene Dellanini—DBC Master Owner's Association, October 18, 2010) [71-13 NO, duplicate comment was provided in 72-13 NO]

"3. Significance Criterion: The significance criterion ultimately used in the DEIR is compliance with the SF Noise Ordinance. However, the CEQA significance criterion 6d on page 38 defines an impact as being significant when the project results in a substantial temporary increase in ambient noise in the project vicinity above levels existing without the project. Industry practice considers this to be an increase of 5 dBA above ambient. Since noise level in dBA is in a logarithmic scale, an increase in 5 dBA is actually an increase of 40 percent in loudness or perceived sound volume. The predicted noise level at Daniel Burnham Court is 82 dBA (modified for 75' distance), while the ambient noise level was measured to be 66 dBA. This increase in 16 dBA results in an increase in loudness between 150-200 percent, or 4 times the ambient. Therefore, per CEQA, the project poses significant impacts to the environment that are required to be mitigated and monitored appropriately."

Ambient average daytime noise level at Daniel Burnham	DEIR Predicted Average Noise Level at Daniel Burnham, adjusted for distance	Change in Loudness
66 dBA	82 dBA	150-200%

(Helene Dellanini—DBC Master Owner's Association, October 18, 2010) [71-18 NO, duplicate comment was provided in 72-18]

"Since it is not feasible to restrict noise-generating construction operations at all hours or from all property boundaries, and other on-site measures such as sound barriers will not work for sensitive receptors above the heights of such walls, the impacts associated with construction phase noise, given their predicted levels above ambient, should be considered Significant and Unavoidable, with onsite and/or conventional mitigations."

(Helene Dellanini—DBC Master Owner's Association, October 18, 2010) [71-32 NO, duplicate comment was provided in 72-32 NO]

"1.1.2. CEQA significance criteria 6d defines a significant impact if the project results in a substantial temporary increase in ambient noise in the project vicinity above levels existing without the project. This is not quantified in the EIR. The EIR does include in Table 4.6-20 a significance criteria of 3 or 5 dB LDN, but it is only applied to long-term noise increases. A similar criteria should be used for temporary noise impact as well, consistent with industry practice. Note that a 5 dB increase in noise level corresponds to a 30-40 percent increase in subjective loudness. As noted on page 4.6-5 of the EIR, 'a noise-level increase of 3 dB or more is typically considered a substantial degradation of the existing noise environment.'"

(Helene Dellanini—DBC Master Owner's Association, October 18, 2010) [71-35 NO, duplicate comment was provided in 72-35 NO]

"1.2.4. The EIR states that the noisiest activity would be scheduled for the daytime of weekdays, and that quieter activity would take place at night and on Saturdays. Assuming an average hourly L_{eq} of 82 dBA from 7 am - 8 pm, and an L_{eq} of 75 dBA from 9 pm to midnight, the resultant LDN will be about 80, or 10 dBA higher than the existing condition.

1.2.5. As discussed above, the EIR claim that the significance criteria is L_{eq} 80 dBA at 100 feet is not appropriate. The typical threshold is 5 dBA above the existing condition, or 75 LDN. The L_{eq} increase of about 15 dBA is a very large increase, corresponding to a subjective increase in loudness of 180-200 percent (i.e., 3 times as loud as the ambient)."

(Helene Dellanini—DBC Master Owner's Association, October 18, 2010)[71-36 NO, duplicate comment was provided in 72-36]

"1.2.6. Mitigation in EIR. The mitigation measures described in the EIR are typical for construction noise and VA takes no exceptions. However, we note that while some of the equipment and staging can be located away from DBC, for some portions of the construction, the noisiest equipment will have to operate near the Post property line. Also, while temporary construction barriers can be erected at some locations, the height of the DBC makes it impractical to shield most of the construction site from many of the residential units. Significant noise reductions will not be feasible for at least some portions of the construction program. Therefore, Impact NO-l should be modified to indicate that the impact will remain significant and unavoidable with mitigation (considering only mitigation measures on construction operations)."

(Donald Scherl, October 15, 2010) [74-21 NO]

"4.6: Noise

The Planning Department and I have very significant differences over the matter of Noise. The noise the Cathedral Hill Hospital and MOB will generate during construction will be immense and is completely unavoidable. There will also be continuing substantial noise from hospital mechanical, delivery, and rubbish removal operations, to name but three."

Response NO-11

The comments state that noise levels from construction would exceed applicable standards and require mitigation. The significance criteria used in the Draft EIR outlined by the comments do not appear to follow established guidance of the San Francisco Noise Control Ordinance by the City. As explained on page 4.6-39 of the Draft EIR, which is based on the significance criteria in Appendix G of the CEQA Guidelines, a short-term construction noise impact would occur if noise generated by construction were to violate Sections 2907 and 2908 of the San Francisco Noise Control Ordinance. Section 2907(a) of the San Francisco Noise Control Ordinance states that construction noise should be limited to 80 dBA L_{eq} at a distance of 100 feet. The day-night average noise level (L_{dn}) metric is typically used only for transportation noise sources and would not be applicable to an hourly standard, such as that for construction. As stated on page 4.6-45 of the Draft EIR, noise levels would exceed the San Francisco Noise Control Ordinance requirements and Mitigation Measures M-NO-N1a–e on pages 4.6-46 through 4.6-48 would be required to reduce LRDP-related construction noise to a less-than-significant level during construction. The aforementioned mitigation measures represent actions to be taken during construction of the proposed LRDP, consistent with the City's direction, and would reduce construction noise levels to below the San Francisco Noise Control Ordinance threshold of 80 dB L_{eq} at 100 feet. See also Response NO-8 (page C&R 3.8-6) for a description of clarifications to construction-related mitigation, Response NO-9 (page C&R 3.8-13) for a discussion of equivalent noise level thresholds at 75 feet and 100 feet as established in the San Francisco Noise Control Ordinance, and Response NO-10 (page C&R 3.8-15) for a discussion of why the use of L_{eq} is appropriate when assessing construction noise. See Response NO-13 (page C&R 3.8-20) for further explanation of the City's use of the Noise Control Ordinance in its CEQA documents.

Comment

(Helene Dellanini—DBC Master Owner's Association, October 18, 2010) [71-33 NO, duplicate comment was provided in 72-33 NO]

"1.2. Analysis

1.2.1. The EIR Table 4.6-5 reports existing ambient noise levels on Post Street as LDN 70, daytime L_{eq} of 66 (on the 11th floor). Table 4.6-4 reports a short duration measurement at street level on Post Street where the L_{eq} was 68 dBA.

1.2.2. In the EIR, noise levels were calculated using the Federal Highway Administration's Roadway Construction Noise Model. This software calculates an L_{eq} based on the noise level and usage factors of the expected construction equipment, as reported in Table 4.6-21. The output of the RCNM model is that the L_{eq} will be 81 dBA at 100 feet. VA does not take exception to the method or the source noise levels used to generate this value. A noise level of L_{eq} 81 dBA at 100 feet is consistent with VA's expectations. This translates to approximately 82 dBA at 75 feet, which is 14–16 dBA louder than the existing condition (about 180-200 percent increase in subjective loudness)."

Response NO-12

The comment states that the construction noise prediction method is acceptable and that ambient noise levels created by project activities would exceed existing ambient noise levels. This comment is noted. The comment and the Draft EIR concur on predicted construction noise levels that would exceed ambient noise levels. Furthermore, at a distance of 75 feet, it is reasonable to conclude that construction noise level could be 82 dBA L_{eq}. Refer to Response NO-9 (page C&R 3.8-13) for a discussion of what an equivalent construction noise limit would be other than 80 dB at 100 feet in accordance with the San Francisco Noise Control Ordinance.

Comment

(Helene Dellanini—DBC Master Owner's Association, October 18, 2010) [71-14 NO, duplicate comment was provided in 72-14 NO]

"4. Context for Understanding Significance- Interior Noise levels: Interior noise levels were not reviewed as part of the EIR, however, since patios constitute the only outdoor living space, interior noise levels are ultimately what sensitive receptors will experience. Understanding interior noise levels provides the context with which to understand the significance of the construction noise and how it will affect the daily life of nearby residents.

Daytime: Daytime interior noise level criteria were provided in the DEIR from the World Health Organization as well as from the EPA (45 dBA). Consistent with those values, the San Francisco's General Plan provides daytime exterior noise criteria which can be translated into interior noise criteria between 35 and 44 dBA with windows open. Interior noise levels above these thresholds will interfere with speech communication and other daily living and working activities. Existing conditions at Daniel Burnham Court meet these criteria with windows closed. The predicted noise level inside Daniel Burnham Court due to construction is 56 dBA with windows closed, which again, is a 4x increase above ambient, but additionally is 2x above industry-wide acceptable interior noise levels. We are concerned that noise levels of 4x above the existing urban noise levels might cause the stress induced diseases listed on page 4.6-7, and also other issues such as headaches and the inability to concentrate.

Nighttime: For nighttime noise, ANSI S12.9 defines a method to calculate sleep disturbance given a noise level. The DEIR reported that CPMC plans to conduct a second shift (4 pm until midnight) for demolition, excavation, foundation, structural, concrete placement, and welding. Veneklasen calculated that given such activity, the probability of an individual awakening from the noise would be 50 percent with windows closed and 61 percent with windows open.

Measured Ambient Daytime Average Noise Level at Interior Space in Daniel Burnham with windows closed	Predicted Average Construction Noise Level at Interior Space of Daniel Burnham with windows closed	Daytime Acceptable Average Noise Level Criterion	Significance
41 dBA	56 dBA	45 dBA	4x ambient; 2x+ acceptable levels; Interference with Speech Communication, with a concern about potential health affects

Predicted Construction Related Nighttime Sound Exposure Level (SEL) at Daniel Burnham, windows open	Probability of Awakening	Predicted Construction Related Nighttime Sound Exposure Level (SEL) at Daniel Burnham, windows closed	Probability of Awakening
72	61%	65	50%

Conclusion: Increased noise levels due to CPMC's construction must not be understood in context. The predicted noise levels established in the DEIR's study point to serious consequences such as sleep deprivation, difficulty hearing speech communication, a concern about potential health affects, and an overall degradation of the quality of life for neighboring residents."

(Helene Dellanini—DBC Master Owner's Association, October 18, 2010) [71-40 NO, duplicate comment was provided in 72-40 NO]

"1.3.7. Nighttime Noise Level Evaluation. Of all the potential noise impacts, sleep disturbance is probably the most severe, in terms of effects on the well being of the residents. This applies to construction activity extending past 10 pm. According to the EIR, construction activity is planned until midnight on weekdays.

ANSI S12.9 Part 6 (2008), Methods for Estimation of Awakenings Associated with Outdoor Noise Events Heard in Homes, defines a method to calculate sleep disturbance given noise level. The standard allows computation of the probability that 'a person of average sensitivity to awakening' will be awakened by a noise event. The method is based on Sound Exposure Level (SEL), which quantifies the effect of single noise events. Sound exposure includes both the noise level and duration of an event.

SEL's for the existing condition were calculated from the measurement data. For the windows closed condition, there were only two events logged during the night that exceeded SEL 60. Using the calculations in the ANSI standard, this corresponds to a probability of awakening of 4 percent. Naturally, the windows open condition had a greater number of events (four events with SEL over 60), corresponding to a probability of awakening of about 6 percent.

The EIR (page 4.6-45) indicates that a second shift (4 pm until midnight) will be employed during demolition and excavation, foundation and structural, concrete placement and finishing and pouring decks, and welding. Associated equipment, such as bulldozers, excavators, and dump trucks, may be operating near the Post Street property line. If an 'event,' such as a bulldozer scooping a load and dumping into a truck, has duration of 10 seconds, then the interior SEL (based on the levels in Table 4.6-21) would be about 65 (windows closed) and 72 (windows open). If there are 50 such events between 10 pm and midnight, the calculated probability of awakening is 50 percent (windows closed) and 61 percent (windows open).

This procedure is imprecise, as it depends on identifying an 'event' which may not be well defined when multiple pieces of equipment are operating simultaneously. Additionally, the calculations in the ANSI standard are based on averages over a large number of studies with many different noise sources, not just construction noise. Its usefulness is not in predicting an absolute number but in quantifying the order of magnitude of the increase in expected sleep disturbance. It is evident that the anticipated noise levels will result in sleep disturbance for a high percentage of the residents."

(Helene Dellanini—DBC Master Owner's Association, October 18, 2010) [71-41 NO, duplicate comment was provided in 72-41 NO]

"1.3.8. Mitigation. The EIR does not address interior noise. This is typical, because the increase in interior noise level compared to the background of course follows the increase in exterior noise level. In this project, however,

the exterior noise levels per se are relatively unimportant, as there is little exterior living space on the DBC. What the occupants will be exposed to is the resultant interior noise level. With windows open, the interior noise level tracks the exterior noise level. The exterior noise level due to construction noise is significant and unavoidable even with mitigation (see section 1.2.5), and accordingly, the interior noise level with the windows open is significant and unavoidable even with mitigation (considering only mitigation measures on construction operations)."

(Sheila Mahoney and James Frame, October 19, 2010) [88-4 NO]

"Health Concerns

The secondary impacts on physical and mental health caused by the noise and air pollution also need to be better addressed and mitigated, considering the population affected."

Response NO-13

Some of the comments state that interior noise levels at DBC from construction were not considered as part of the Draft EIR and would result in a significant and unavoidable impact to interior noise levels at DBC and potentially sleep disturbance. The comments also state proposed alternate methodologies for assessing construction-related noise impacts. The comments appear to have misinterpreted that the construction of the proposed Cathedral Hill Campus would result in daytime noise levels in excess of the EPA's and World Health Organization's daytime acceptable interior noise level of 45 dBA. The "EPA-Recommended Noise Level Standards" shown in Table 4.6-16 reflect 24-hour standards (L_{dn}), not daytime standards. In addition, in order to implement CEQA, local jurisdictions are given the authority to establish reasonable and appropriate standards and thresholds for significant impact determinations, particular to each jurisdiction. In San Francisco, given that the City is a dense urban place, where construction activity in proximity to adjacent residents is a frequent occurrence, the City adopted its Noise Control Ordinance which, among other things, establishes criteria that place limits on construction noise, balancing the realities and necessities of construction activity against the health and safety needs of the public. The City has a long established practice of using the criteria established within the Noise Control Ordinance as the threshold for determining significant impacts in its CEQA documents. This is in recognition of the fact that construction noise at any one location is not a permanent condition, San Francisco is a dense urban place where construction in close quarters is oftentimes a necessity, and construction noise in proximity to residences and other sensitive receptors has occurred in the City for decades without any established substantial adverse health or safety impacts to the general public.

As noted by the commenter in Comment 71-37, which is addressed by Response NO-19 (page C&R 3.8-27), the observed interior L_{dn} with windows open at DBC is 50 dBA L_{dn}, which does not meet the interior noise level criteria of 35 to 44 dBA that the comment requests be used to assess significance of the LRDP's noise impacts. The EIR is responsible for assessing the significance of impacts against existing/baseline conditions rather than using a more general noise standard that does not take into account differences between rural, suburban, and urban environments. The use of the term stress-induced diseases appears to be out of context. The Draft EIR states on page 4.6-7 that noise may contribute to stress-based disease. However, the impact analysis in the Draft EIR, pages 4.6-39 through 4.6-53 ultimately concluded that with mitigation measures described in the Draft EIR, the project would not result in significant noise impacts and therefore, stress-induced disease related to construction noise is not anticipated for this project. See also Responses NO-8 through NO-12 on pages C&R 3.8-6 through 3.8-18, above.

As stated in Response NO-8 (page C&R 3.8-6) and as part of the ongoing planning process, the proposed schedule of construction activities has been updated and refined. The need for construction activities to extend to the more noise sensitive hours of the day (after 7 p.m.) has been largely removed. with the exception of construction work associated with the proposed underground Van Ness Pedestrian Tunnel.

Extended construction hours would be required for this portion of the project, because it is a major thoroughfare and nighttime construction is more conducive for accommodating traffic. Other construction activities would occur internal to the proposed Cathedral Hill Campus facilities and would not be anticipated to require the use of heavy equipment in close proximity to adjacent sensitive receptors. Any noise that could occur during these activities would be shielded from adjacent receptors by the external walls of the respective structure. Nighttime construction would predominantly involve the completion of interior finishes. As a result, potential sleep disturbance/deprivation is not anticipated from this type of internal building construction under the LRDP.

Construction of the proposed underground Van Ness Pedestrian Tunnel would occur no less than 300 feet from the property boundary at Daniel Burnham Court. Based on the unmitigated noise levels identified for tunnel construction, which is described in Response NO-8 (page C&R 3.8-6), estimated noise levels are anticipated between 74 and 79 dB at a distance of 100 feet, and as such, exterior noise levels at the DBC property boundary would not be expected to exceed 70 dB. Assuming a similar exterior-interior noise reduction with windows open as observed by Veneklasen Associates and noted in Comment 71-37, interior nighttime noise construction levels would not exceed 50 dB. As noted by Veneklasen Associates in Comment 71-40, the method by which to calculate potential sleep disturbance from construction activities is not precise. However, using the sleep disturbance calculations shown in "A Predictive Model of Noise Induced Awakenings from Transportation Noise Sources" (Finegold and Bartholomew, 2001) and assuming that noise levels due to construction of the proposed tunnel would not exceed 79 dBA at a distance of 100 feet, there would be a less than 1 percent chance that a sleeping individual at DBC would be awakened by construction of the proposed tunnel. There is a stronger possibility that a DBC resident could be awoken by a San Francisco Municipal Bus which can have sound levels of approximately 80 dB at a distance of 50 feet. As such, the LRDP-related potential for sleep disturbance at Daniel Burnham Court, even without calculation of the potential reductions afforded by implementation of Mitigation Measure M-NO-N1, would be considered a less-than-significant impact. See Response NO-8 (page C&R 3.8-6) for further clarification and additional description of nighttime construction activities and hours.

As noted above, the comments also recommend American National Standards Institute (ANSI) S12.9 Part 6 (2008), "Methods for Estimation of Awakenings Associated with Outdoor Noise Events Heard in Homes." This method evaluates the propensity of sleep awakenings resulting from noise events. Sleep disturbance issues would be mitigated as stated on page 4.6-47 of the Draft EIR in Mitigation Measure M-NO-N1c. As acknowledged by the commenter, the method is not always precise in terms of defining what an event is and the sensitivities experienced per individual may vary; thus, additional mitigation measures would have to be developed and implemented by CPMC if exceedances were determined.

By using the typical noise levels at 50 feet presented in Table 4.6-21 and applying a usage factor of 20 percent and a duration of 10 seconds, an SEL may be calculated. SEL calculations utilize the calculated L_{eq} expected from a noise source and then compress the event into a 1-second interval. When compressing all the noise energy into a 1-second noise event (i.e., SEL), the calculation is usually about 8–10 dBA higher than the actual L_{max} produced by the noise source. Long-term operation of heavy construction equipment adjacent to the DBC building is not expected to occur. It is expected that short-term operation of heavy construction equipment would occur adjacent to the Daniel Burnham Court building and that a reasonable distance to evaluate exterior construction noise at the proposed Cathedral Hill Campus would be 100 feet because of site restrictions and the amount of space required to operate large pieces of heavy-duty construction equipment and because that is the significance criteria based on the San Francisco Noise Ordinance. Noise levels at a distance of 100 feet versus 50 feet would be 6 dBA lower; Mitigation Measures M-NO-N1a–e involve implementing both physical and operational impact reduction measures that are considered practical and feasible, and the wall of the proposed new structure would help further shield noise levels.

The City does not specify an interior noise level standard, but the Draft EIR does consider the impact of construction noise to be potentially significant prior to implementation of mitigation. The Draft EIR also takes into account the "worst-case" scenario when evaluating impacts. The construction noise levels presented in the Draft EIR are conservative in that they anticipated the majority of heavy construction equipment usage towards the outer limits of the site rather than internal to the site, which is more likely to occur. Consistent with this methodology, noise attenuation from the building façade of Daniel Burnham Court would be approximately 30 dB, consistent with the information provided on Draft EIR page 4.6-6 due to its masonry construction. Thus, construction noise levels during daytime hours could potentially reach as high as 52 dBA in a residence with closed windows, assuming no more than a 30 dB exterior-to-interior level of attenuation. It should be noted that this assumes the 82 dBA construction noise levels, as noted by the commenter in Comment 71-13. Thus, as stated in the Draft EIR, the impact would be potentially significant. Mitigation Measures M-NO-N1a through M-NO-N1e would be implemented to reduce construction noise levels by approximately 5–8 dB, through the use of noise-attenuating features such as a temporary noise wall and temporary enclosures for stationary equipment that would limit line-of-sight to nearby receptors and thereby noise levels. As a result, daytime noise levels associated with construction activities would be reduced to 44-47 dBA in a residence at DBC with closed windows.

Another comment expresses concern about the secondary impacts on physical and mental health caused by the noise and air pollution and states it should be addressed and mitigated. This response and Response NO-8 on page C&R 3.8-6 describe the noise mitigation proposed and Response AQ-9 on page C&R 3.9-20 discusses potential health impacts evaluated as part of the Draft EIR.

Comment

(Donald Scherl, October 15, 2010) [74-22 NO]

"As noted earlier, the 'noise-sensitive receptors' to which the draft EIR makes repeated reference, are actually human beings living and working in that neighborhood. As stated, a high proportion of these people live in projects of various kinds for the elderly. The draft EIR, if approved as written, would impose on these seniors all the elements of loud and serious noises over both short and long term; first the construction and then the functioning facilities.

This is completely unreasonable for a relatively quiet, mostly residential neighborhood as Cathedral Hill is presently. As the draft EIR states, 'short-term noise generated by project-related construction and/or demolition could [would] expose local residents to substantial increases in ambient noise levels.' While the Draft EIR calls this 'possibly significant,' that considerably understates the case. It is highly significant and unavoidable if construction is permitted."

Response NO-14

The comment states that sensitive receptors are mainly residents and concludes that the noise effects would be unreasonable. It further states that that the significance of construction noise is understated in the Draft EIR, and would be significant and unavoidable. The Draft EIR recognizes that sensitive receptors include residents and describes the residential and non-residential uses in buildings adjacent to and nearby the proposed Cathedral Hill Campus and how they were analyzed. As stated in the Draft EIR, the construction noise impact would be less than significant with implementation of the proposed mitigation measures and City permits are obtained by CPMC. Please refer to Response NO-8 on page C&R 3.8-6 for a additional discussion on refinements to the schedule of construction activities and how construction noise levels would be mitigated in accordance with the requirements of the San Francisco Noise Control Ordinance.

Comment

(Barbara Kautz—CHNA and Bernal Heights Neighborhood Center, October 19, 2010) [87-59 NO, duplicate comments was provided in 108-59 NO]

"1. Construction Noise.

The City's adopted threshold of significance for daytime construction noise is 80 dB. Yet, for sensitive receptors such as churches and residences, noise levels above 65 dB are normally unacceptable. The 80 dB threshold does not recognize the significant increases in noise levels that would occur during construction, especially given that the noisiest phase of construction is intended to be done in two shifts, between 7 am and midnight, and on Saturdays between 7 am and 5 pm."

Response NO-15

The comment states that the significance criteria of 80 dBA L_{eq} used is insufficient. The comment states that noise environments for churches and residences are typically considered normally unacceptable at 65 dBA. The term "normally unacceptable" originates from the State of California Office of Planning and Research (OPR) General Plan Guidelines, which have been incorporated into numerous General Plans across the State. The 2003 General Plan Guidelines prepared by OPR are the most recent version of the guidelines. As shown in Figure 2 of Appendix C of that OPR document, "normally unacceptable" conditions are considered an appropriate designation at 70 dB, not 65 as stated in this comment. Furthermore, it is worth noting that the terminology used in this comment and as applied in OPR's General Plan Guidelines refers to a measure of 24-hour average noise levels or L_{dn}. L_{dn} is typically used for transportation impacts, which are long-term and represent a permanent change in the ambient noise environment in which people live and work. Construction impacts, which are not permanent, are analyzed using hourly L_{eq}. Because the noise is not permanent, most communities—including San Francisco—typically allow a higher level of noise from temporary construction than long-term traffic conditions. Construction noise standards are set by City policy. Pursuant to section 15064(b) of the State CEQA Guidelines, the determination of whether a project may have a significant effect on the environment calls for careful judgment on the part of the public agency involved, based on scientific and factual data. An ironclad definition of significant effect is not always possible because the significance of an activity may vary with the setting. In this case, the City's use of standards (80 dB at a distance of 100 feet or other equivalent noise level at some other convenient distance) established in its San Francisco Noise Control Ordinance is appropriate and consistent with the City's established practice. Furthermore, construction hours have been refined since issuance of the Draft EIR. Refer to Response NO-8 on page C&R 3.8-6 for a discussion of revisions to planned activities that would occur during the second shift of construction and the anticipated noise levels associated with those activities.

Comment

(Carolyn Abst and Ron Case—Case + Abst Architects LLP, October 19, 2010) [102-7 NO, duplicate comment was provided in 114-7 NO]

"B. Our office windows are not acoustical. The construction noise will penetrate our working areas, making it hard to concentrate, talk on the phone, and communicate within the office. In other words, difficult to perform daily office functions. [health issue: also see attached noise report and noise article]."

Response NO-16

The comment states that the work/live space does not have acoustical windows and construction noise would make performing daily tasks difficult. The work/live space referenced in the comment is located at 1033 Polk Street. This work/live space is approximately 100 feet from the proposed construction activity.

As shown in Table 4.6-22 on page 4.6-44 of the Draft EIR, construction noise levels at 100 feet would result in a noise level of 81 dBA L_{eq}. Mitigation measures for construction noise would result in a noise reduction of 5–8 dBA and would be required to operate within the City's exempted hours or obtain an exemption permit. Furthermore, the work/live space at 1033 Polk Street would also benefit from shielding provided by intervening structures as this address would not have a direct line of sight to construction noise, reducing noise levels by another 3 dBA. Implementation of construction mitigation measures and accounting for the lack of line of site to the live/work space would result in an 8-18 dBA reduction of construction noise levels, resulting in construction-related noise levels that range between 63 and 73 dBA L_{eq}. It should be noted that these noise levels would be under the significance criterion for daytime construction noise of 80 dBA L_{eq} at 100 feet established under the San Francisco Noise Ordinance. Furthermore, as shown in Table 4.6-4 on Draft EIR page 4.6-14, these noise levels would not be inconsistent with ambient noise levels (60.8–74.4 dBA L_{eq}) that currently exist in the vicinity of the proposed Cathedral Hill Campus. Refer to Response NO-8 (page C&R 3.8-6) for further discussion of the refined construction period and modified nighttime construction activities.

Comment

(Carolyn Abst and Ron Case—Case + Abst Architects LLP, October 19, 2010) [102-8 NO, duplicate comment was provided in 114-8 NO]

"In additional, the DEIR at Table 4.6-20 identifies significance thresholds as an increase existing ambient noise by 5 db or greater when existing ambient noise is less than 60 db and an increase of 3 db when existing ambient noise exceeds 60 db. In addition, the significance criteria identifies that the project could have a significant effect on noise if it would result in substantial permanent increase in ambient noise levels in the project vicinity above levels existing without the project or result in substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project.

The proposed construction of the Cathedral Hill Hospital and MOB would begin in early 2011 and would continue for approximately 4-1/2 years: the demolition time period would be 6-9 months: the excavation time period would be 5-6 months: the foundation work would take another 3-6 months: and the structural work would take an additional 16-18 months. The DEIR notes that the excavation and hauling associated with the Medical Office Building would involve 92,000 cubic yards excavated from the Medical Office Building site. Thus, the EIR concludes the loudest construction noise at the proposed Cathedral Hill campus would occur in the first 11-15 months of construction. Table 4.6-22 indicates that the ambient existing noise level near our property is 66 db and would increase to 83 db, an increase of 17 db during demolition, excavation, and construction noise. Similarly, property close to ours would increase from 65 db to 75 db, or an increase of 10 db during that same time period. The EIR also acknowledges the maximum noise level generated by project construction activities at the exterior of these land uses could be up to 87 db.

In addition, The EIR identifies that CPMC is proposing a second construction shift during the demolition and excavation phase at the MOB and Hospital. This second shift would be from 4 p.m. to midnight, Monday through Friday. This second shift would be proposed for demolition and excavation, foundation and structural stages, and welding activities again, extending years into the construction time period, The DEIR further acknowledges that in summary, the proposed construction would create noise that would be out of compliance with noise levels for daytime construction established by the San Francisco Noise Ordinance and would also be out of compliance for the proposed second shift nighttime construction.

The DEIR does contain some mitigation measures in an attempt to modify noise to a level of less than significant. These mitigation measures, and, specifically, M-No-N 1C, involve the subsequent preparation of a construction noise management plan. This Construction Noise Management Plan should have been part of the EIR that has been circulated and made available for public comment. The proposed Construction Management Plan anticipates that if noise levels do actually exceed City noise standards, that the Management Plan and the retained consultant would review and approve additional mitigation measure to minimize prolonged sleep disturbance. The efficacy

of these mitigation measures is, however, not able to be reviewed since the actual mitigation measures and the actual implementation of those measures have not been analyzed in this document. CEQA requires that all appropriate mitigation measures be fully analyzed as part of the EIR and not improperly delayed especially for the "project" level component of this development, which includes the hospital and MOB."

Response NO-17

The comment restates project construction information and associated noise levels reported in the Draft EIR and requests that the construction management plan be available to the public for review and commenting opportunities. The construction management plan is in the process of development based on feasibility, actual reduction of noise levels, and public reaction to the Draft EIR and proposed construction schedule and activities. As noted in Response NO-8 (page C&R 3.8-6), Mitigation Measure M-NO-N1 has been amended to provide additional clarifications with regard to implementation and effectiveness of mitigation, as requested in this comment. Mitigation Measures M-NO-N1a and b identify standard construction noise mitigation that is considered feasible. Mitigation Measure M-NO-N1c specifically requires measurement of construction noise levels at adjacent sensitive receptors and modification of on-site measures, if necessary, to maintain the project's compliance with the San Francisco Noise Control Ordinance. The recommended noise measurements are intended to verify the conservatively predicted construction noise levels reported in the Draft EIR and then develop additional noise reduction measures based on actual noise levels to which residences are exposed during the construction of the proposed Cathedral Hill Campus. Also refer to Response NO-8 on page C&R 3.8-6 for a discussion of revisions to planned activities that would occur during the second shift of construction.

Alternative Equipment

Comment

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-9 NO, duplicate comment was provided in 30-9 NO]

"How much noise would the helicopter generate? Would it be less than the cranes at 88 dBA?"

Response NO-18

The comment inquires as to the potential noise levels from a helicopter and how those levels would compare to a construction crane as it pertains to installation of rooftop equipment. The use of a helicopter for construction is not part of the proposed LDRP. Tower cranes generate noise levels equivalent to 76 dBA at a distance of 50 feet.[4] The comment inquires as to whether using helicopters for rooftop equipment placement would generate less noise than operating cranes. Per the FAA's 2004 Nonmilitary Helicopter Urban Noise Study, helicopter flyovers typically generate noise levels ranging from 81–85 dBA at a distance of more than 1,000 feet.[5] This would be considered much greater than noise levels generated by cranes (76 dBA at 50 feet) and would thus be considered a greater noise impact due to the intensity of helicopter noise and the consistent generation of that noise. Cranes operate for short periods of time at their peak noise level, whereas helicopters operate at a consistent high level for their entire period of operation. Furthermore, an airborne helicopter's noise levels would not benefit from line-of-sight restrictions and attenuation of noise levels provided by existing structures to the extent that a crane would. Thus, the use of a helicopter would have the potential to affect a greater number of receptors at higher noise levels than the proposed crane operations.

Interior Noise Levels

Comments

(Helene Dellanini—DBC Master Owner's Association, October 18, 2010) [71-37 NO, duplicate comment was provided in 72-37 NO]

"1.3. Interior Noise Levels.

1.3.1. The interior noise levels within the condominium units of DBC are a concern not addressed in the EIR. As discussed above, the exterior noise levels will be significant and unavoidable with mitigation. The units have small balconies, but the primary noise impact on the residents will be increase in interior noise levels. Further, the DBC units are not mechanically ventilated but rely on open windows.

1.3.2. VA performed noise measurements at the site to quantify the existing condition and to obtain data to aid in the analysis of future noise levels. VA measured the noise reduction from exterior to interior with both windows closed and open, as well as daytime exterior and interior levels and interior 24-hour noise levels. Measurement details are included in the Appendix. The summary results are presented in the following table for a unit facing Post Street. VA also has included the levels reported in Table 4.6-5 of the EIR. The "windows open" condition was measured with the window opened to the first detent, about 1 inch.

Table 1 – Existing Noise Levels at Residences

		Exterior (VA)	Exterior (EIR)	Windows closed	Windows open
Typical hourly L_{eq}	Day	67	66	41	47
	Night	61	63	36	41
L_{max}	Day	*	83	81	83
	Night	*	76	63	66
LDN		71	70	45	50

* - Not measured.

1.3.3. Estimated future noise levels. Based on the predicted construction noise levels (see section 1.2.2 and 1.2.4 above), VA predicted the resultant interior noise level in the units.

Table 2 – Predicted Construction Noise Levels at Residences

		Exterior	Windows closed	Windows open
Typical hourly L_{eq}	Day	82	56	62
	Night	75	49	55
LDN		80	54	60

1.3.4. LDN Criteria and Evaluation. The EPA recommendation in Table 4.6-16 of the EIR is for the interior LDN to not exceed 45 dBA. This matches the California Building Code requirement (section 1207) for habitable rooms in multifamily construction projects. The existing noise level in Unit 211 with the windows closed meets the criteria. The predicted level with construction noise (Table 2) is LDN 54 with the windows closed, about twice as loud as the standard. There is no separate requirement in the EIR for interior LDN, as the increase in interior LDN matches the increase in exterior LDN. As previously described, this increase in exterior LDN is significant and unavoidable."

(Helene Dellanini—DBC Master Owner's Association, October 18, 2010) [71-38 NO, duplicate comment was provided in 72-38 NO]

"1.3.5. Daytime Noise Level Criteria. Several interior noise criteria are given in the EIR. The WHO recommendation in Table 4.6-2 is for an hourly L_{eq} of 35 dBA during the day and 30 dBA at night.

The San Francisco General Plan has no specific recommendation for interior noise levels, but approximate standards can be inferred from the exterior noise level recommendations. Table 4.6-19 in the EIR indicates that residential uses are satisfactory (no special noise insulation requirements) up to an exterior noise level of LDN 60. Assuming a similar traffic distribution as at the DBC, this corresponds to a daytime exterior noise level of about 56 dBA. VA measured noise reductions between 14 and 21 dBA with windows open, depending on how widely the window was opened. A noise reduction of 12 dBA with windows open is a traditional industry rule-of-thumb (see, for example, County of Orange, California, General Plan, Land Use/Noise Compatibility Manual). Therefore, the General Plan recommendations correspond to a daytime interior noise level between 35 and 44 dBA with the windows open.

This is in general agreement with VA's experience for offices and other spaces where speech communication is important. Typically, traffic noise levels in the low-40's dBA is considered acceptable.

Taking all of the above into account, a daytime interior noise level (hourly L_{eq}) of less than 45 dBA will be generally considered acceptable. As noise levels increase above 45 dBA, they will begin to interfere will speech communication and other daily living and working activities."

Response NO-19

The comments provide additional ambient noise level monitoring data and state that interior noise levels at DBC would exceed 45 dBA L_{dn} as a result of construction of the proposed CPMC LRDP and would interfere with speech intelligibility. Based on the results of the noise monitoring conducted for the Draft EIR analysis, the monitoring results shown in this comment appear reasonable and accurate. Please see Response NO-13 on page C&R 3.8-20 for a description of projected interior noise levels as a result of construction activities and the potential impacts to residents at DBC (expected to be in the range of 44-47 dBA with windows closed). Response NO-13 also provides an explanation of the City's use of its Noise Control Ordinance when determining potential impact significance. In addition, the comment infers that L_{max} construction noise level attenuation from exterior-to-interior would be approximately 2-6 dBA (See "Table 1: Existing Noise Levels at Residences" in Comment 71-37 NO), which would be much less than a masonry building built in 1988 would be expected to provide. Please also see Response NO-8 on page C&R 3.8-6 regarding the conclusion that construction noise levels would be mitigated to a less-than-significant level. Refer to Response NO-9 (page C&R 3.8-13) for an explanation of why assessing construction noise against a threshold of 80 dB at a distance of 100 feet or an equivalent noise level at a more convenient distance (i.e., 82.5 dBA at 75 feet) is considered appropriate.

To clarify, as stated by the EPA in their Protective Noise Levels study, the highest noise level that permits relaxed conversation with 100 percent sentence intelligibility throughout a room is 45 dBA L_{eq}. It should also be noted that 95 percent of sentence intelligibility is maintained during relaxed conversation at 65 dBA L_{eq}.[6] The Draft EIR analysis is consistent with this statement.

[6] Environmental Protection Agency, Protective Noise Levels Study, available at http://www.nonoise.org/library/levels/levels.htm, accessed September 2011.

Comment

(Helene Dellanini—DBC Master Owner's Association, October 18, 2010) [71-39 NO, duplicate comment was provided in 72-39]

"1.3.6. Daytime Noise Level Evaluation. The existing daytime interior noise level is 41 dBA with the windows closed and 47 with the windows open. Therefore, the recommended level is met with the windows closed and slightly exceeded with the windows open. The noise in the unit measured (Unit 211) is largely due to noise from traffic on Van Ness Avenue. Units that are further and/or shielded from Van Ness Avenue will have lower noise levels.

With construction, the noise is predicted to increase by about 15 dBA, to 56 dBA with windows closed and 62 dBA with the windows open. Even with the windows closed, the construction noise will be more than 10 dBA higher than the recommended level (more than twice as loud). There is no specific discussion in the EIR for interior noise level, as it matches the increase in the exterior noise level."

Response NO-20

The comment states that existing daytime interior noise levels measured 41 dBA (no descriptor, such as L_{dn}, L_{eq}, L_{max}, is provided within the comment) and 47 dBA with windows open. It was stated in Comment 71-37, which is addressed by Response NO-18 (page C&R 3.8-25), that exterior noise levels were also measured to be 67 dBA L_{eq}. This demonstrates a 26-dBA exterior-to-interior reduction with windows closed and a 20-dBA reduction with windows open, because of the existing wall façade and materials. Construction noise at the site of the proposed Cathedral Hill Campus was considered potentially significant in the Draft EIR, as stated on page 4.6-45. Furthermore, Mitigation Measures M-NO-N1a through M-NO-N1e, as amended and shown in Response NO-8 (page C&R 3.8-6), would reduce construction exterior noise levels by approximately 5–8 dB, reducing the impact to a less-than-significant level. The measure also requires exterior and interior noise level measurements at the onset of differing phases of proposed Cathedral Hill Campus construction; in the event that construction noise levels remain above the City's significance criteria, Mitigation Measure M-NO-N1c requires that additional considerations be developed and implemented by the project expeditiously.

The comment appears to misunderstand the different thresholds of significance that are used when referring to operation-related impacts and construction impacts. Reliance on the City's Noise Control Ordinance together with the temporary and intermittent nature of construction noise is considered a valid and appropriate justification for the conclusion that construction noise would be contained to the extent practicable, comparable to other construction projects in the City, and less than significant, especially when additional mitigation measures are incorporated into the project to further reduce construction noise impacts on surrounding properties.

It should also be noted that while the construction activities or equipment at any of the sites to be developed under the proposed CPMC LRDP may not be unique or atypical, it is also true that the proposed CPMC LRDP is a large project and that construction activities will continue for extended periods of time. Nevertheless, construction noise would remain a temporary impact, as opposed to an ongoing operational impact. The noise levels identified under Impact NO-1 of the Draft EIR, beginning on page 4.6-41, would not occur for the entire construction period, nor would they occur at any one location for the entire construction period. These activities would be intermittent and temporary, though, as acknowledged in the Draft EIR, they would occur over the course of the construction period.

Mitigation of Construction Noise

Comment

(Rose Hillson—Member Jordan Park Improvement Association, September 23, 2010) [18-69 NO, duplicate comment was provided in 30-69 NO]

"36. On Page S-59, Impact NO-1 is 'potentially significant' and states that 'short-term noise generated by project-related construction and/or demolition activities could temporarily expose existing nearby noise-sensitive receptors to substantial increases in ambient noise levels.' Mitigation Measure M-NO-N1a for Cathedral Hill, St. Luke's, Davies and Pacific campuses long-term, contains statements about maintenance of construction equipment, minimization of operation of equipment and construction of barriers with blankets and wood panels. Also Mitigation Measure M-NO-N1b states that a community liaison will be assigned for noise complaints. Mitigation Measure M-NO-N1c states that nighttime noise from construction will be evaluation in a 'construction noise management plan' and measurements will be taken. For residences, educational buildings, churches and other sensitive noise receptors, would there be a working number that these people can call 24/7 for noise complaints relating to the construction project? Have all the sensitive noise receptors— 'schools, preschools, hospitals, convalescent facilities, hotels, motels, churches, libraries, and other uses where low interior noise levels are essential'— as defined on Page 4.6-10 been determined? If so, could there be a list provided for those in the Cathedral Hill project area? Is the list of 10 buildings in Table 4.6-35 on Page 4.6-92 is the all-inclusive list of these receptors?"

Response NO-21

The comment inquires about the availability of the proposed construction noise liaisons, the identification of the surrounding noise-sensitive receptors, and whether Draft EIR Table 4.6-35 is inclusive of all Cathedral Hill noise sensitive receptors. The noise liaison would have a working number for lodging noise complaints available 24 hours per day during all construction activities. When assessing significance under CEQA, it is considered appropriate to assess the most substantial change that would occur as a result of implementation of a particular project. With respect to construction noise, the impact of the proposed CPMC LRDP as a whole is determined by assessing impacts at those receptors that would be most substantially affected, which typically occurs at those closest to a project site. Noise monitoring locations were chosen based on observations of the area's noise sources and their proximity to project components and existing noise-sensitive receptors. The receptors identified in Tables 4.6-22 and 4.6-35 are not all-inclusive but are considered appropriate representative sensitive receptors for the purposes of determining significance. Additional receptors in the project area may experience construction noise generated by the LRDP, but to a lesser degree than those presented in Tables 4.6-22 and 4.6-35 because of a variety of factors, including greater distance between source and receptor and intervening structures. Construction noise impacts at such receptors would also be considered less than significant with mitigation. Such receptors would be able to contact the community liaison if noise complaints arise, regardless of whether or not they are specifically listed in Tables 4.6-22 and 4.6-39.

Comments

(Alan Wofsy—Emeric-Goodman Associates, September 23, 2010) [26-4 NO]

"DEIR

4.6 NOISE

Mitigation Measure for Cathedral Hill Campus (with or without project variants) M-NO-N1a CPMC shall minimize the impacts of construction noise where feasible by implementing the Measures listed below in accordance with the San Francisco Noise Control Ordinance. . . .

M-NO-N1b A community liaison shall be designated by CPMC. The community liaison shall be available to manage and respond to noise complaints from nearby sensitive receptors. 4.6-47

DISCUSSION
There is no specificity to these goals. There is no discussion of any of the 'receptors' and our building, right across the street from the proposed project, is not even mentioned in the DEIR. It makes no sense to wait until construction begins to develop a plan to minimize noise and to identify 'receptors.'

The DEIR should have identified the buildings and occupants that will be impacted by noise during construction and developed a plan to minimize the noise and/or to compensate the owners for lost income and the tenants for damages due to the noise."

(Donald Scherl, October 15, 2010) [74-23 NO]

"The draft conceives that the huge increase in noise that will occur is less than significant given the suggested mitigation steps (Impact NO-l). This is simply absurd. None of the listed mitigators would in real life make the slightest dent in the noise levels. For example, it is suggested that stationary equipment be located as far from neighboring residents as possible. Exactly where could that possibly be? The site is virtually surrounded by condominium towers, large housing projects for the elderly and small businesses."

Response NO-22

The comment states that the Mitigation Measures M-NO-N1a and M-NO-N1b do not have specific goals that all receptors should be identified, and that construction mitigation plans should be identified prior to construction and CPMC should compensate affected receptors financially.

Sensitive receptors are defined on page 4.6-9 and 4.6-10 of the Draft EIR. Specifically, for the proposed Cathedral Hill Hospital site, the Draft EIR recognizes that "the noise- and vibration-sensitive land uses located near the proposed Cathedral Hill Campus are the residential buildings on all four blocks surrounding the campus." While the Emeric-Goodman building is not explicitly identified in the Draft EIR, it is recognized as a sensitive receptor along with other residential buildings surrounding the project site. When assessing significance under CEQA, it is considered appropriate to assess the most substantial change that would occur as a result of implementation of a particular project. Additional receptors in the project area may experience construction noise generated by construction of the proposed CPMC LRDP, but to a lesser degree than those presented in Tables 4.6-22 and 4.6-35 because of a variety of factors, including greater distance between source and receptor and intervening structures. Construction noise impacts at such receptors would also be considered less than significant with mitigation. See Response NO-21 (page C&R 3.8-29) for further clarification.

Mitigation Measure M-NO-N1a identifies specific equipment and noise abatement measures and how they should be used for maximum effectiveness, and ensures compliance with the requirements of the San Francisco Noise Control Ordinance. Under Mitigation Measure M-NO-N1a, temporary noise barriers would be erected along the exterior of the project site to shield adjacent sensitive receptors from heavy construction equipment operating close to the boundaries of the construction site. In addition, temporary devices would be erected around stationary equipment to reduce potential noise levels associated with their operation. Based on these two noise abatement measures from Mitigation Measure M-NO-N1a, noise levels would be reduced between 5–8 dBA, depending on the height of the receptor, but should ensure that noise levels do not exceed the daytime construction noise limits (80 dB at 100 feet or other equivalent noise level at a representative distance) of the San Francisco Noise Control Ordinance.

The comments also request clarification as to where equipment, such as generators, could be placed during construction to reduce noise levels. Areas internal to the site and away from surrounding receptors could reduce noise levels, although the degree to which this could be achieved is dependent on which

parts of the proposed Cathedral Hill Campus are under construction at a particular time. This measure is considered feasible, and as noted on page 4.6-5 of the Draft EIR, noise would attenuate to a lower level by 6 dB for every doubling of distance (e.g., a stationary source that generates 70 dBA of noise at 75 feet would generate 64 dBA at 150 feet.)

Mitigation Measure M-NO-N1b identifies a community liaison that would be available to all affected sensitive receptors, including the residents of the Emeric-Goodman building. The purpose of the liaison is to ensure that citizen complaints are heard and that feasible mitigation is put in place to reduce construction noise to a less-than-significant level; this may include the additional mitigation outlined in Mitigation Measure M-NO-N1a and Mitigation Measure M-NO-N1c.

Construction mitigation measures, including noise barriers and operational restrictions, are identified in M-NO-N1a. The purpose of Mitigation Measure M-NO-N1c is to ensure that the proposed LRDP would monitor noise levels during each phase of construction and implement feasible measures to control and reduce construction noise to a less-than-significant level from the very beginning to the very end of construction. It allows for adaptability in the mitigation that would benefit those sensitive receptors most affected by construction activities, and establishes the significance criteria under the San Francisco Noise Control Ordinance as the performance standard that must be met.

Because Mitigation Measures M-NO-N1a through M-NO-N1c would reduce the potentially significant construction noise impact to a less-than-significant level, additional mitigation, such as financial compensation, is not required. Further, under CEQA, financial compensation would not be considered a mitigation measure as it would not avoid or reduce the magnitude of a significant effect. Lastly, since the CPMC LRDP would comply with San Francisco Noise Control Ordinance requirements with respect to its established limits for construction noise levels, no financial compensation would be required under City statute, unless otherwise stipulated as part of a special permit request from the City Department of Public Works.

Comments

(Helene Dellanini—DBC Master Owner's Association, October 18, 2010) [71-15 NO, duplicate comment was provided in 72-15 NO]

"Given the above concerns about the predicted noise levels at neighboring locations to the project site, we have the following recommendations:

General and M-NO-N1b - Community Liaison: CPMC should also be required to host a website during the construction phase and make available an up-to-date log of all submitted comments and concerns. Such log shall be updated daily with comments that are received through the website, the community liaison, or other means. Each logged comment shall have a response and progress update from CPMC's team on how they are addressing the issue.

CPMC shall provide weekly construction progress bulletins in hard copy format to neighbors outlining construction activities that will generate traffic congestion, noise, dust, vibration, light after sunset, utility disruptions, mass transit and pedestrian route changes, etc. The weekly bulletin shall also contain information regarding impactful activities for the next six weeks."

(Donald Scherl, October 15, 2010) [74-24 NO]

"The draft suggests that neighbors complain to a "community liaison" when feeling bothered. Exactly what would such a complaint accomplish? (S-60)."

(Donald Scherl, October 15, 2010) [74-26 NO]

"Impact NO-5." Groundborne vibration levels attributable to construction activities...could..." expose land uses sensitive to vibrations (i.e., residential and small businesses) to "levels that exceed acceptable thresholds." Again, the mitigation proposed is to locate vibrations away from neighbors (clearly impossible in the real world) and establish a community liaison to listen to, but have no authority to act upon, community complaints. This is not mitigation; in real life, this is absolutely nothing."

(Diane Smith, September 23, 2010) [PC-312 NO]

"But, particularly to our experience in construction, we are providing through our formal comments some more specific mitigations that can reduce the impacts of noise and vibration that may not have been identified, or that were not identified in the EIR, and these are practical and rational and they come from working in the construction industry and development managers and real estate. So we hope that those considerations are adopted. Thank you."

Response NO-23

The comments recommend clarification and enhancement of Mitigation Measure M-NO-N1b to include a website for comments and additional specificity on how comments are addressed and how area receptors are notified of construction activities. The ideas recommended under comment 71-15 would be feasible and would assist the project with reducing noise complaints. Therefore, Draft EIR Mitigation Measure M-NO-N1b, listed on page 4.6-47, is revised to state:

> A community liaison shall be designated by CPMC. The community liaison shall be available to manage and respond to noise complaints from nearby sensitive receptors. The community liaison shall keep a log of all relevant and appropriate complaints and responses to those complaints through a website that can be accessed and viewed by the public. The log or a copy of the log shall also be available upon request to any affected citizen or their representative. The community liaison shall produce a weekly and six-week schedule of construction operations and shall provide it in advance and upon request to any affected citizen or their representative. Contact information for the community liaison shall be posted in a ~~conspicuous~~ location ~~so~~ that ~~it~~ is clearly visible to the nearby receptors most likely to be disturbed. The community liaison shall be responsible for ensuring that reoccurring noise complaints are evaluated by a qualified acoustical consultant to determine and implement appropriate noise control measures that would be taken to meet applicable standards. The community liaison shall contact nearby noise-sensitive receptors and shall advise them of the construction schedule.

These revisions would expand the roles already designated for the community liaison. The intent of the creation of a community liaison is to provide transparency about implementation of noise and vibration mitigation measures, and to provide a process for nearby residents to ask questions or to receive information about project construction activities. The community liaison would also be responsible for coordination with a qualified acoustical consultant to implement appropriate implementable noise and vibration control measures to meet applicable standards once a complaint is received. The intent of Mitigation Measure M-NO-N1b is to ensure that noise impacts are identified and addressed on an on-going basis.

Comment

(Helene Dellanini—DBC Master Owner's Association, October 18, 2010) [71-16 NO, duplicate comment was provided in 72-16 NO]

"M-NO-N1c - Monitoring and Additional Mitigation Measures: Under this measure CPMC would be required to monitor noise for one week prior to each major phase in construction. We recommend modifying this requirement to monitor for one week prior to each new potentially offensive activity within each phase. For instance, during

demolition, measurements should be taken at the start of the building being taken down by excavators, and then at the start of hoe-ramming of the existing building foundations. Also, during excavation/earthwork operations, measurements should be taken at the start of excavation and offhaul and at the start of import and grading."

Response NO-24

The comment recommends modifying a mitigation measure to include additional noise monitoring for various construction activities. The comment expresses a concern that the minimum 1-week monitoring period during each major phase of construction would not be adequate to capture the maximum noise levels from different types of equipment that may be used. It is important to note that the mitigation calls for "at least" 1 week of monitoring and does not place a maximum limit on the amount of time that noise is monitored. However, to address the concern raised by the comment, the following revision is made to the second bullet under Mitigation Measure M-NO-N1c on page 4.6-47 of the Draft EIR:

> Long-term (24-hour) and short-term (15-minute) noise measurements shall be conducted at ground level and elevated locations to represent the noise exposure of noise-sensitive receptors adjacent to the construction area. The measurements shall be conducted for at least 1 week during the onset of each of the following major phases of construction: ~~(i.e.,~~ demolition, excavation, and structural steel erection~~)~~. Measurements shall be conducted during both daytime and nighttime hours of construction, with observations and recordings to document combined noise sources and maximum noise levels of individual pieces of equipment.

Comments

(Helene Dellanini—DBC Court Master Owner's Association, October 18, 2010) [71-17 NO, duplicate comment was provided in 72-17 NO]

"Other mitigation measures that should be required include:

- The following noise-generating construction operations should be restricted from occurring before 9 AM and after 5 PM everyday: material deliveries, concrete pours, excavation, import/offhaul, grading, fire proofing, crane activities, jack hammering, hoe ramming and all demolition activities, arid Welding, sawing and pneumatic tools (prior to the building skin being installed).

- The following noise-generating construction activities should be restricted from occurring on Post Street, due to the sensitive commercial and residential receptors: placement of generators, staging of concrete pumping activities, earthwork import/offhaul site access point, staging of fire proofing pump truck, crane picks, and demolition debris chutes.

- Noise monitoring results should be required to be submitted to Daniel Burnham Court and the City within 5 business of measurement, so that proper actions can be taken to mitigate offending construction operations. It should be clear in the EIR that the Project is required to suspend operations immediately when it finds that measured noise levels exceed the SF Noise Ordinance and any additional requirements that might be added to the EIR (noise levels before 9 AM or after 5 PM, etc.)"

(Helene Dellanini—DBC Master Owner's Association, October 18, 2010) [71-42 NO, duplicate comment was provided in 72-42 NO]

"In addition to the mitigation in the EIR, VA recommends that the following procedures be considered to reduce both exterior and interior noise levels.

1.3.8.1. Stage stationary equipment, in particular cranes, generators, air compressors, lifts, and pumps, away from the Post Street property line, as much as possible. The Post Street property line is less than 100 feet from DBC, whereas the midpoint of the Franklin Street property line is 200 feet away, and the Geary Boulevard property line

is over 300 feet away. For a given piece of equipment, a location on the Franklin or Geary sides of the project would result in a reduction in noise level of 9-12 dB, or about half as loud, compared with locating the same piece of equipment on the Post Street side.

1.3.8.2. Locate materials and concrete delivery locations that are not near the Post Street property line. Develop truck routes so that entrances and exits for offhaul dump trucks, concrete and material delivery trucks, etc., are not on Post Street.

1.3.8.3. When necessary for noisy activity such as demolition and excavation to occur near the Post property line, restrict the hours to weekdays between 9 am and 5 pm.

1.3.8.4. Restrict nighttime activities after 8 pm to locations away from the property line. Enforce this by adding more stringent noise criteria for nighttime activity as part of the construction noise management plan. For example, the Noise Ordinance requirement that the equipment noise not exceed 80 dBA at 100 feet can be strengthened, so that the equipment noise cannot exceed 72 dBA at 100 feet after 8 pm."

Response NO-25

The comments recommend additional mitigation measures, including additional restrictions on construction hours and more stringent maximum noise levels beyond those established by the San Francisco Noise Control Ordinance for various construction activities. As stated on page 4.6-34 of the Draft EIR, the City of San Francisco, through its Noise Control Ordinance, recognizes noise as an environmental pollutant that must be managed and mitigated through the planning and development process, and the ordinance is intended to maintain noise levels through all practicable means to preserve community health. Compliance with the San Francisco Noise Control Ordinance would be expected to adequately address the potential effects of construction noise. As stated in Section 2908 of the San Francisco Noise Control Ordinance, time between the hours of 8:00 p.m. and 7:00 a.m. is considered to be outside of daytime construction hours. Therefore, it is reasonable to conclude that any construction activities conducted between the hours of 7:00 a.m. and 8:00 p.m. are subject to the requirements of Section 2907 of the San Francisco Noise Control Ordinance and do not require further time restrictions, as suggested by the commenter, in order to achieve the goals and intent of the San Francisco Noise Control Ordinance and insure that impacts would be less than significant with incorporation of Mitigation Measure N-NO-N1.

The comments also suggest additional restrictions with respect to equipment location and coordination with DBC. Stationary equipment, such as generators, would be required under Mitigation Measure M-NO-N1a to be located as far as practicable from nearby receptors, consistent with this comment. With respect to the additional coordination with DBC specifically, as noted above in Response NO-23 on page C&R 3.8-32, CPMC will maintain a community liaison who will be available to address issues raised by affected neighbors and who will keep a log of complaints received and produce a schedule of construction operations. The additional suggested measures concentrate on reducing potential noise impacts by locating all construction noise producing equipment and activities as far from residents as possible. This recommendation does not take into account that there are similar receptors adjacent to suggested relocation areas for the concentration of construction activities. Mitigation Measure M-NO-N1a would require the location of stationary equipment as far away as feasible from all sensitive receptors adjacent to the project, and the incorporation of local barriers for stationary equipment inside the recommended construction site parcel. In addition, as part of its compliance with the San Francisco Noise Control Ordinance, Mitigation Measure M-NO-N1c would require regularly monitoring of construction noise levels and adjustment of noise abatement measures, as necessary, to insure that, in the event of a momentary exceedance of the Noise Control Ordinance occurs, noise levels are regular maintained in accordance with City requirements. As a result, construction noise impacts were determined to be less than significant in the Draft EIR (page 4.6-48) and further mitigation is not considered necessary to

maintain noise levels through all practicable means to preserve community health in accordance with the requirements of the San Francisco Noise Control Ordinance.

Comment

(Barbara Kautz - CHNA and Bernal Heights Neighborhood Center, October 19, 2010)
[87-55 NO, duplicate comment was provided in 108-55 NO]

"1. Construction Noise.

The noisiest phase of construction includes site preparation, demolition, and excavation (page 4.6-41). During this period, CPMC proposes two shifts of construction, extending from 7 am to midnight on all work days, plus Saturday construction from 7 am to 5 pm (page 4.6-43). The DEIR accurately states that noise from construction would exceed the City's standard of 80 dB during the day at sensitive receptors, but provides no analysis of noise increases in the evening or on weekends. Mitigation Measure M-NO-N1a is proposed to mitigate this impact. Although, as discussed below, even the 80 dB standard is too high for sensitive receptors, the proposed mitigation measure *does not even require that noise levels be reduced to the City's 80 dB standard, or to the standard of* 5 *dB above ambient levels at night.* Reduction of construction noise is required only "where feasible." The "construction noise management plan" requires only that *nighttime* construction noise be evaluated, and even this plan for nighttime noise does not *require* that noise levels be reduced to 5 dB above ambient levels. An obvious mitigation measure-limiting construction exceeding noise standards to 7 am to 5 pm Monday through Friday-is not even examined. Unless the mitigation requires *actual* reduction of construction noise, rather than *attempts* to mitigate noise, the impact is not mitigated."

Response NO-26

The comment states that mitigation measures for construction noise are insufficient and that impacts would be significant and unavoidable without further mitigation. As stated above in Response NO-8 (page C&R 3.8-6), the mitigation measures for construction noise shown in the Draft EIR, beginning on page 4.6-46, would result in a noise reduction of 5–8 dBA and would require construction to occur within the hours permitted by the San Francisco Noise Control Ordinance. The Draft EIR acknowledges that noise from construction would be potentially significant without mitigation, and that by implementing Mitigation Measure M-NO-N1a through c and obtaining required permits, noise from construction would be controlled. The comment references the 80 dB standard as being too high; however, the threshold of 80 dB is identified as part of the San Francisco Noise Control Ordinance, which establishes the City's significance criteria for analyzing impact of noise from construction equipment. Reliance on the City's Noise Control Ordinance together with the temporary and intermittent nature of construction noise is considered a valid and appropriate justification for the conclusion that construction noise would be contained to the extent practicable, comparable to other construction projects in the City, and less than significant, especially when additional mitigation measures are incorporated into the project to further reduce construction noise impacts on surrounding properties.

Furthermore, as explained in Response NO-8 (page C&R 3.8-6), the schedule of construction activities has been updated and refined and no exterior nighttime construction activities, other than certain activities related to the Van Ness Tunnel, would occur. Therefore, with the exception of the tunnel (which would require a special permit), construction associated with the proposed project would comply with the restrictions of the San Francisco Noise Control Ordinance, which establishes the daytime period for construction as the hours between 7 a.m. and 8 p.m. Further restriction of hours beyond those required by the San Francisco Noise Control Ordinance is not considered necessary to achieve the goals and intent of the San Francisco Noise Control Ordinance, as long as the noise level standards of the ordinance are achieved.

It should also be noted that while the construction activities or equipment at any of the sites to be developed under the proposed CPMC LRDP may not be unique or atypical, it is also true that the proposed CPMC LRDP is a large project and that construction activities will continue for extended periods of time. Nevertheless, construction noise would remain a temporary condition, as opposed to an ongoing operational condition. The noise levels identified under Impact NO-1 of the Draft EIR, beginning on page 4.6-41, would not occur for the entire construction period, nor would they occur at any one location for the entire construction period. These activities would be intermittent and temporary, though, as acknowledged in the Draft EIR, would occur over the course of the construction period.

The comment also demonstrates a misunderstanding of Mitigation Measure M-NO-N1c by stating that the construction noise mitigation plan requires that nighttime construction noise be evaluated. Rather, the construction noise mitigation plan requires on-going monitoring of nighttime activities (i.e., tunnel construction) to ensure that, as construction activities continue, no additional noise abatement measures are necessary to insure compliance with the Noise Control Ordinance. M-NO-N1c , at page 4.6-47, states that in addition to study:

> "If it is determined that construction noise levels would exceed City noise ordinance standards, a qualified acoustical consultant shall review and approve additional mitigation measures to minimize prolonged sleep disturbance (e.g., using acoustical treatments to existing buildings, such as upgraded weather stripping, or determining the feasibility of constructing a cantilevered overhang along temporary barriers around the construction area to reduce construction noise levels at elevated receptors)."

Furthermore, the construction noise mitigation plan would not only apply to nighttime construction activities, but also to daytime construction activities. In summary, Mitigation Measure N-NO-N1c would establish a mitigation program, which would require regular evaluations of on-site construction noise, such that the project applicant could determine if additional noise abatement measures are necessary and implement those measures to insure that construction noise complies with the City's Noise Control Ordinance.

3.8.2.2 CONSTRUCTION VIBRATION

Comments

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-78 NO, duplicate comment was provided in 30-78 NO]

"45. Page S-62, 'Groundborne vibration levels attributable to construction activities could exceed the threshold of significance for exposing noise- and vibration-sensitive land uses to vibration levels that exceed applicable thresholds.' For this 'significant and unavoidable' impact, the mitigation measure, M-NO-N5, is to make available a community liaison to resolve vibration complaints."

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-79 NO, duplicate comment was provided in 30-79 NO]

"It also states that 'the pre-existing condition of all buildings within a 50-foot radius and historical buildings within the immediate vicinity of proposed construction activities shall be recorded in the form of a preconstruction survey. The preconstruction survey shall determine conditions that exist before construction begins and shall be used to evaluate damage caused by construction activities. Fixtures and finishes within a 50-foot radius of construction activities susceptible to damage shall be documented (photographically and in writing) before construction. All buildings damaged shall be repaired to their pre-existing conditions.' Assuming the construction of the Cathedral Hill campus includes the hospital, the MOB and the conversion of the Pacific Plaza

Medical Office Building at 1375 Sutter Street, there are very few buildings that could potentially fall within this 50-foot radius of the construction sites at Cathedral Hill."

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [37-9 NO]

"11. Very few buildings fall within the CPMC offer to fix damage caused by vibrations near the construction site. Covered in more detail in larger document."

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010)[18-81 NO, duplicate comment was provided in 30-81 NO]

"Getting back to the two streets that may meet the "50-ft. repair radius," if one included the sidewalk widths as part of the street, only the buildings on Cedar St. and Daniel Burnham Ct. would meet the criteria to potentially have any construction damage fixed by CPMC if needed. What are the addresses of the buildings that fall within these parameters suggested by CPMC?

I referred to the drawing on Page 2-53 for the Cathedral Hill Campus - Proposed Plan for the three buildings and the surrounding streets but it is unclear."

(Margaret Kettunen Zegart, October 20, 2010) [97-22 NO]

"The DEIR should request a bond to finance / refurbish stained glass of the churches in the event of continues drilling and vibration caused damage although recent seismic restoration has been made."

Response NO-27

The comments state that very few buildings would fall within the 50-foot radius required under Mitigation Measure M-NO-N5. Table 4.6-35 identifies the closest sensitive receptors to each of the proposed campuses, and identifies the modeled vibration levels due to project construction activities. As noted in Impact NO-5, beginning on Draft EIR page 4.6-89, none of the modeled locations (i.e., closest sensitive receptors) would experience construction vibration levels close to or exceeding the Caltrans thresholds for building damage (0.5 in/sec PPV for new residential buildings, and 0.25 in/sec PPV for older or historically significant buildings). As an example, the modeled results for construction vibration at the 1142 Van Ness Avenue Concordia Club building, located 40 feet at the nearest point from proposed construction activities, indicate vibration levels of 0.104 in/sec PPV, less than half of the threshold for older and historically significant buildings, and only 20 percent of the threshold for new residential buildings. Based on the modeled analysis, building damage from construction activities is not expected and Mitigation Measure M-NO-N5 provides additional protection by requiring a construction vibration management plan and monitoring of all buildings within a 50-foot radius and any historical structures in the project vicinity. The 50-foot radius has been established because acoustical and vibration experts believe that this represents the maximum distance at which vibration could potentially impact nearby structures. While only a few buildings exist within this radius, Mitigation Measure M-NO-N5 will help ensure that buildings are not damaged by construction operations. These building include the Concordia Club at 1142 Van Ness Avenue (Cathedral Hill Campus vicinity), the Stern Building at 2330 Clay Street (Pacific Campus vicinity), the Smith Kettleman Eye Research Institute (Pacific Campus vicinity), and several multi-family residences along Washington Street (Pacific Campus vicinity). No churches or other religious structures were identified as being located within 50 feet of the limits of construction at any of the proposed development sites and thereby not subject to potential construction vibration damage.

Comments furtherrequest that a bond to finance the refurbishing of stained glass of the churches in the event that vibration causes damage. No churches or other religious structures were identified as being located within 50 feet of the limits of construction at any of the proposed development sites and thereby not subject to potential construction vibration damage.

As required by Mitigation Measure M-NO-N5, a survey documenting fixtures and finishes potentially subject to damage from project-related construction activities would be conducted prior to the initiation of construction activities, but has yet to occur. Under Mitigation Measure M-NO-N5, if damage were to occur as a result of construction vibration associated with implementation of the CPMC LRDP, structures that are damaged would be repaired to their pre-existing condition by the project sponsor.

Comments

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-80 NO, duplicate comment was provided in 30-80 NO]

"The following are official sidewalk and widths of streets surrounding the Cathedral Hill project:

STREET NAME	BETWEEN WHAT TWO STREETS	WHOLE STREET INCLUDING SIDEWALK	SIDEWALK WIDTH	CURB-TO-CURB WIDTH
Geary	Van Ness & Franklin	68.75	10.00	48.75
Post	Van Ness & Franklin	68.75	10.00	48.75
Daniel Burnham Ct.	Van Ness & Franklin	35.00	7.00	21.00
Sutter St.	Van Ness & Franklin	68.75	12.00	44.75
Franklin	Geary & Sutter	68.75	9.00	50.75
Van Ness	Geary & Sutter	125.00	16.00	93.00
Cedar St.	Van Ness & Polk	35.00	7.00	21.00

(Source: DPW-BSM-Subdivisions & Mapping)

If the distance of 50 feet were measured from a spot on the perimeter of the Cathedral Hill project closest to a particular building, it seems there will only be about 12 properties that could fall under the statements of having construction- related damage fixed if one uses only the 'curb-to-curb' width measurements. If not, what number of buildings would be affected and what are their addresses? It should be noted, however, that the Hamilton Square Baptist church falls outside the '50-ft. radius of potential repair' because Franklin Street is 50.75' wide curb-to-curb. Including the sidewalks on both sides of the street, Franklin would be 68.75 feet away from the closest perimeter point from which a 50-ft. radius could be mapped. The church will not fit into this potential repair category. However, if the Hamilton Square Baptist Church on the southwest corner of Franklin and Geary is historic or an older building, it is recommended by Caltrans that there be a limit or threshold for damage to structures of '0.25 in/sec PPV (peak particle velocity in in/sec) for older or historically significant buildings' per CA Dept of Transportation, 2004, 'Transportation and Construction-Induced Vibration Guidance Manual,' Sacramento, CA, Table 19, Page 27. And, since, as stated on Page 4.6-10, the 'more stringent vibration damage thresholds are recommended for these ('historical or lightweight') building types,' I would think that some careful surveying and recordation of the structural and cosmetic condition of this old church is required prior to the Cathedral Hill construction job. On Page 4.6-44, the DEIR calculates the source of noise at a point much farther since in Table 4.6-22, for the Hamilton Square Baptist Church, the distance stated is 80 feet. Would you please clarify where the source of the noise on each of the construction sites is calculated for this '50-foot repair radius.' Perhaps I missed an explanation of it."

"The impact of noise and vibration is considered 'significant' in that the noise and vibration are annoyances as it relates to the FTA's standard for human response as stated on Page 4.6-91, and as shown in Table 4.6-35 on Page 4.6-92. The remedy proposed in the DEIR is to take a survey and implement the previously mentioned '50-ft. radius repair zone.' I think the survey should include all the buildings that have equaled or exceeded the threshold of 'human annoyance' for noise and vibration. Specifically, the following buildings:

(a) Hamilton Square Baptist Church
(b) Concordia Club (1142 Van Ness Ave.)
(c) Episcopal Services (1001 Polk St.)

On Page 4.6-38, it states in Table 4.6-20 that for any ambient noise level >60dB, if there is an increase of 3dB or greater, then that increase is considered 'significant.'

For the church listed in (a) above, the increase in dB over the ambient noise level of 70 dB is 11 dB. This is a 367 percent increase over the amount of the 3dB change considered to be significant.

For the Concordia Club, (b), the change in dB over the ambient noise level of 70dB is 17 dB. This is a 567 percent increase over the amount of the 3dB change considered to be significant.

For the Episcopal Services, (c), the change in dB over the ambient noise level of 66 dB is 17 dB. This is also a 567 percent increase over the amount of the 3dB change considered to be significant.

I do not think that due to the increase in the dB measurements during construction that these people will be able to function without added aggravation in noise and vibrations.'

(Sheila Mahoney and James Frame, October 19, 2010) [88-2 NO]

"Because we are seniors, who probably won't live to see the completion of the LRDP, our comments focus on the construction period impacts on our street: noise, vibration and air pollution.

Housing Stock and Population

The eleven buildings on our block are mostly owner occupied. The houses date back 100 years, so our old foundations and leaky windows will have significant ground vibration damage issues. Ours was an ideal SF neighborhood with very little turnover—affordable for the middle-class, racially and ethnically diverse. Seniors, who won't be able to escape the noise and the pollution, live in a quarter of the buildings. There is an infant living next door to us."

Response NO-28

The comments state that the Hamilton Square Baptist Church may be exposed to excessive vibration exceeding the Caltrans-recommended standard of 0.25 in/sec PPV for historic and old buildings. Construction vibration effects were specifically modeled for the Hamilton Square Baptist Church. As shown in Table 4.6-35 on page 4.6-92 of the Draft EIR, the Hamilton Square Baptist Church is reported to be 70 feet from proposed construction activities and could be exposed to a maximum vibration of 0.045 in/sec PPV, which would not exceed the 0.25 in/sec PPV threshold for older and historically significant buildings.

The comments also state that the 50-foot radius stated in the construction vibration mitigation should be extended to include those buildings that are within the 80-VdB radius. The 50-foot radius refers only to the radius where structural damage could occur from construction operations. The VdB scale is used for human annoyance vibration assessment, not for structural damage, and therefore a pre-construction building survey related to structural damage is not warranted. The buildings referenced by the comment are not anticipated to be structurally impacted because they are not within the radius where structural damage could occur from construction operations. The mitigation for these buildings (Hamilton Square Baptist Church, Concordia Club, and Episcopal Services) is designed to reduce human annoyance only; these buildings would not be impacted by vibration that could cause structural damage, and impacts would be less than significant. Please also see Response NO-27 on page C&R 3.8-37 for a discussion of structural damage as a result of construction.

In addition, the comments state that the noise levels generated by construction of the proposed Cathedral Hill Campus would exceed a threshold of +3 dB increase by 367-567 percent. The comment is correct in that construction noise would increase ambient noise levels in the project vicinity. However, the standard

to which the comment refers is expressed in terms of L_{dn}, which is a 24-hour noise measurement. As stated on page 4.6-36 of the Draft EIR, Section 2907 of the San Francisco Noise Control Ordinance establishes L_{eq} as the standard of measurement for assessing construction noise because it measures average noise levels over a stated time period, usually one-hour. In general, a 24-hour noise measurement will be much lower than a periodic (L_{eq}) noise measurement because it includes those hours where human activity is dramatically less. Furthermore, as stated in Impact NO-1, construction noise between 7 a.m. and 8 p.m. in the City of San Francisco is regulated by limiting the noise levels generated at the source. Therefore, the +3 dB standard at the receptor does not apply to project-generated construction noise. For construction that would take place between 8 p.m. and 7 a.m., Mitigation Measure M-NO-N1a through M-NO-N1c would reduce construction noise levels to the extent feasible and require the project sponsor to seek and obtain a special permit from the Director of DPW if the project is not able to comply with the San Francisco Noise Control Ordinance's requirements for construction at night. The construction liaison designated by Mitigation Measure M-NO-N1b would address citizen complaints and assist in mitigating any unforeseen construction noise issues that would arise to ensure that community activities could proceed with limited disturbances. See also Response NO-13 on page C&R 3.8-20 regarding anticipated noise levels at nighttime from construction of the Van Ness Avenue Pedestrian Tunnel. As a result and as stated in Impact NO-1 (Draft EIR page 4.6-41), noise impacts associated with construction activities would be less than significant with mitigation.

Please also see Response AQ-9 on page C&R 3.9-20 for a discussion of potential construction impacts associated with the proposed project.

Comment

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-82 NO, duplicate comment was provided in 30-82 NO]

"47. Page 4.6-91 states that for the Cathedral Hill Campus, the vibration levels would be 'from 69 VdB (vibration decibels) to 88 VdB, and up to 0.104 in/sec PPV (peak particle velocity)' and would indicate that it would not exceed Caltrans' threshold of 0.25 in/sec PPV at 25 feet but that it could be a noise annoyance under Federal Transit Administration. Would some of the surfaces of the proposed Cathedral Hill Hospital be made so that the glass would not reflect the noise so much? Use other sound deadening materials for the neighbors."

Response NO-29

The comment recommends that the façade of the proposed Cathedral Hill Hospital should be modified to reduce vibration levels (stated on page 4.6-91) in the area surrounding the project. The vibration levels stated on page 4.6-91 are for construction activities only and would be temporary in nature. Changing the façade of the hospital would have no effect on construction-generated vibration levels since the sources of those vibration levels (demolition, excavation, etc.) would be completed prior to application of the exterior surfaces of the proposed structures, and would cease entirely once hospital construction has been completed. With respect to the types of materials to be used for the building's exterior, the design and selection of materials of the proposed structures are ongoing. However, it should be noted that the future noise levels associated with the proposed project were determined to be less than significant (refer to Impacts NO-2, NO-3, and NO-4.) When noise is reflected by a particular surface, a portion of the noise is absorbed by the reflecting material. In addition, noise reflection is considered a part of any existing urban environment where typically hard surfaces, such as roadways, concrete sidewalks, and buildings, reflect ambient noise to a greater extent than an area dominated by soft surface, such as lawns or other permeable surfaces. Furthermore, the proposed project would include substantial landscaping, which would aid in the reduction of reflected noise.

Comment

(Carolyn Abst and Ron Case—Case + Abst Architects LLP, October 19, 2010)
[102-11 NO, duplicate comment was provided in 114-11 NO]

"E. Construction will result in vibration levels near our building that reach 82 (VdB) which the DEIR identifies as exceeding human annoyance thresholds and characterizes as a significant and unavoidable impact. (See Table 4.6-35) [health issue]."

Response NO-30

The comment states that vibration levels attributable to the proposed Cathedral Hill Campus construction would result in a significant and unavoidable impact, as stated in the Draft EIR. Construction vibration impacts are discussed on pages 4.6-90 through 4.6-94 of the Draft EIR and a significant and unavoidable impact would remain with implementation of all feasible mitigation measures. The comment is noted.

Mitigation of Construction Vibration

Comments

(Helene Dellanini—DBC Master Owner's Association, October 18, 2010) [71-19 NO, duplicate comment was provided in 72-19 NO]

"NO-5 Groundborne vibration levels attributable to construction activities could exceed the threshold of significance for exposing noise- and vibration-sensitive land uses to vibration levels that exceed applicable thresholds. (Significance Criterion 6b)

NO-5 Comment: The DEIR predicts vibration levels at Daniel Burnham Court to be 78 VdB. However, Daniel Burnham Court contains medical uses that are sensitive to vibration, on the order reported in table 4.6-17, or 65 VdB. Therefore, vibration is anticipated to inhibit those sensitive medical uses from performing vital functions for their financial livelihood. Given this impact, we recommend CPMC be required to:

- Coordinate its vibration-generating activities with the sensitive operations of the medical tenants at Daniel Burnham Court and other neighbors.

- Include in the prescribed Vibration Management Plan a requirement to monitor at Daniel Burnham Court, specifically at its property line, at the lowest residential level on the Post side of both towers, and at the nearest commercial use with sensitivity to vibration. CPMC shall monitor vibration continuously throughout demolition, excavation, foundations, and erection. Measurements shall be evaluated on a daily basis by a third party consultant and reported to the City and Daniel Burnham Court the following day. CPMC shall suspend operations that show vibration levels above 65 Vdb during hours agreed upon between CPMC and the collection of medical use facilities at Daniel Burnham Court (per the bullet above).

- To prevent vibration from interrupting the sleep of DBC residents, vibration generating activities such as the use of vibratory rollers, truck deliveries, etc shall not be conducted after 7 PM M-Sat.

- If vibration persists that prevents medical uses within Daniel Burnham Court from conducting work, CPMC should be required to provide individual instrument/equipment isolation, where feasible."

(Helene Dellanini—DBC Master Owner's Association, October 18, 2010) [71-48 NO, duplicate comment was provided in 72-48 NO]

"3.4. Additional mitigation. The EIR assumes only residential use at DBC; however, there are some medical offices in the retail levels of DBC. Medical offices, especially those with optical equipment, would qualify as

sensitive uses, with a recommended criterion of 65 VdB. The impact to these uses is significantly more severe than to the residences. The construction management plan in the mitigation should include the following additional measures:

3.4.1. Perform vibration level measurements at the sensitive locations before construction. Monitor levels during construction.

3.4.2. If, as predicted, the vibration exceeds the level required for the equipment use, attempt to identify the source of the vibration.

3.4.3. Depending on the use required by the medical offices, require additional restrictions on the construction. The construction should be required to schedule and coordinate the use of equipment that generates the highest vibration levels (vibratory rollers, hoe rams) with the operation of vibration-sensitive uses in the medical offices.

3.4.4. If scheduling and coordination is not sufficient to prevent vibration levels in the offices from exceeding the criteria, install vibration isolation tables and mounts for the sensitive equipment in the medical offices."

Response NO-31

The comments express concern about potential construction vibration effects on uses sensitive to vibration, and recommends additional mitigation that would ensure that sensitive uses and medical equipment at Daniel Burnham Court would not be exposed to excessive vibration. Consistent with this comment, Mitigation Measure M-NO-N5 is amended to include the following bullet on page 4.6-93 of the Draft EIR:

> As part of the vibration management plan, vibration levels shall be monitored at the nearest interior location of adjacent medical uses containing vibration-sensitive equipment, to monitor potential impacts from the project site. In the event that measured vibration levels exceed 65 VdB and would disturb the operation of sensitive medical equipment, additional measures shall be implemented to the extent necessary and feasible, including provision of notice to medical tenants in order to coordinate the timing of construction activities showing vibration levels above 65 VdB, possible temporary relocation of medical tenants with sensitive equipment, and/or installation of isolation equipment.

The following text has also been added to the bottom of Draft EIR page 4.6-91, immediately preceding the last sentence on the page:

> Furthermore, as shown in Table 4.6-35 (page 4.6-92), construction-related vibration could exceed 65 VdB, which, as stated previously, could affect the operation of certain types of sensitive equipment, including medical equipment. Nearby land uses that may include potential vibration-sensitive medical equipment include 1 Daniel Burnham Court adjacent to the proposed Cathedral Hill Campus.

In addition, the following discussion has been added to the first full paragraph on page 4.6-95 of the Draft EIR:

> Predicted groundborne noise and vibration levels would range from 77 to 94 VdB, and up to 0.210 in/sec PPV, at the Pacific Campus and would range from 58 to 79 VdB, and up to 0.037 in/sec PPV, at the Davies Campus. As a result, for both campuses, attenuated vibration-inducing construction activities at the locations of on-site and off-site sensitive receptors would not exceed Caltrans's building damage threshold of 0.25 in/sec PPV. However, predicted groundborne noise and vibration levels would exceed FTA's standard for human response (i.e., annoyance) at nearby on-site and off-site vibration-sensitive uses. Furthermore, as shown in Table 4.6-36 (page 4.6-95),

construction-related vibration could exceed 65 VdB, which, as stated previously, could affect the operation of certain types of sensitive equipment, including medical equipment. Nearby land uses that currently may include potential vibration-sensitive medical equipment include the University of the Pacific School of Dentistry adjacent to the Pacific Campus[7]. Therefore, **this impact would be significant.**

With respect to potential nighttime construction vibration impacts that may cause sleep disturbance, the planned nighttime construction activities, as discussed in Response NO-8 on page C&R 3.8-6, have been substantially revised such that potential vibration causing activities have been reduced. During nighttime construction of the proposed pedestrian tunnel, the use of a vibratory roller would be located no less than 250 feet from Daniel Burnham Court, which would be equivalent to 64 VdB and would not require modified/clarified mitigation to insure that residents at Daniel Burnham Court would not be disturbed from sleep.

Comment

(Helene Dellanini—DBC Master Owner's Association, October 18, 2010) [71-45 NO, duplicate comment was provided in 72-45 NO]

"3. Impact NO-5. Ground vibration

Groundborne vibration levels attributable to construction activities could exceed the threshold of significance for exposing noise- and vibration-sensitive land uses to vibration levels that exceed applicable thresholds.

3.1. Criteria. The criteria for ground vibration is given in the EIR Table 4.6-17, and sets limits of 65 VdB for sensitive uses such as some medical equipment, 72-80 VdB for residential. VA agrees with this criteria."

Response NO-32

The comment concurs with the vibration criteria used in the Draft EIR. The comment is noted.

Comment

(Helene Dellanini—DBC Master Owner's Association, October 18, 2010) [71-46 NO, duplicate comment was provided in 72-46 NO]

"3.2. Table 4.6-35 in the EIR predicts modeled ground vibration levels from construction to be 78 VdB at DBC. VA takes no exceptions to methodology."

Response NO-33

The comment concurs with the level of vibration predicted at DBC presented in the Draft EIR. The comment is noted.

[7] The University of Pacific Dental School is currently in planning to move its facilities to the South of Market neighborhood in San Francisco.

Comment

(Helene Dellanini—DBC Master Owner's Association, October 18, 2010) [71-47 NO, duplicate comment was provided in 72-47 NO]

"3.3. The mitigation in EIR involves scheduling and location of vibration generating equipment. VA agrees that this is the only feasible mitigation. VA agrees that the impact will remain significant and unavoidable with mitigation."

Response NO-34

The comment concurs with the results of the vibration impact assessment presented in the Draft EIR. The comment is noted.

3.8.2.3 NOISE MEASUREMENTS

Comment

(Helene Dellanini—DBC Master Owner's Association, October 18, 2010) [71-49 NO, duplicate comment was provided in 72-49 NO]

"Appendix - Description of Noise Measurements

1.1.1. Measurements were performed in Unit 211, with is on the Post Street side of the eastern tower. The unit is approximately five floors above street level and has exposure to traffic noise from Van Ness. VA measured the existing interior noise level in the unit in the living room of Unit 211, which faces Post Street and has exposure to traffic noise from Van Ness Avenue. The results are shown in the following tables. The LDN was 45.

Measurements were performed with a Bruel & Kjaer type 2260 sound level meter mounted at 5 feet above finish floor at the approximate center of the living/dining room area. The living room had 2 horizontal sliding windows, approximately 5 x 6 feet in size. The glass was dual glazed, 1/8" -3/8" airspace -1/8". There was a sliding glass door on the west facade that did not appear to contribute significantly to the overall level, as it was shielded from Van Ness (the primary noise source). The door was dual glazed, 3/16" - 5/8" airspace - 3/16".

		Unit 211 Living Room Windows closed
Median hourly Leq	Day	41
	Night	36
Overall Leq	Day	44
	Night	37
Lmax	Day	81
	Night	63

1.1.1. VA also measured in one of the bedrooms in 211, in which the window is on a west-facing wall and is therefore shielded from traffic noise from Van Ness. It is also about 20 feet farther back from Post Street than the living room windows. The daytime L_{eq} exterior noise level at this location was 5 dB lower than at the living room. VA measured the noise level in this room with the window open to the first detent (about 1 inch). The results are shown in the following tables. The LDN was 45.

Measurements were performed with a Bruel & Kjaer type 2260 sound level meter mounted at 5 feet above finish floor at the approximate center of the bedroom. The bedroom had a single horizontal sliding window of the same size and construction as those in the living room.

		Unit 211 Bedroom Windows open
Median hourly Leq	Day	42
	Night	37
Overall Leq	Day	43
	Night	37
Lmax	Day	83
	Night	66

1.1.2. VA also measured the noise reduction across the existing facade with windows both open and closed. with both windows open and windows closed. Measurements were performed by simultaneously measuring the noise levels on the interior and exterior of the facade under test. Both high time resolution (1 second intervals) and 1 minute intervals were used for this measurement, with consistent results. Both the living room and bedroom windows were measured, with consistent results. The following table shows the measured A-weighted noise reduction."

	Windows open 9"	Windows open 1"	Windows closed
Noise reduction	17	21	28

"

Response NO-35

The comment provides background information on the noise measurements conducted for the Daniel Burnham Court Master Owner's Association comment letter. The comment is noted.

3.8.2.4 OPERATIONAL NOISE

Land Use Compatibility

Comment

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010)[18-70 NO, duplicate comment was provided in 30-70 NO]

"37. On Page 4.6-35, Table 4.6-19, it appears that the Cathedral Hill project will be contrary to the 'City and County of San Francisco Land Use Compatibility Chart for Community Noise.' For 'residential, all dwellings,' any noise exposure over 65 dB means that new construction or development should be discouraged. And for 'schools, churches, libraries, hospitals and nursing homes,' any project over 65 dB should generally not be undertaken. From all appearances, this Cathedral Hill project will be very noisy and leave the neighbors experiencing a high level of annoyance based on the projected dB level exposures."

Response NO-36

The comment inquires about the noise environment in the Cathedral Hill vicinity, and the noise effects of the proposed Cathedral Hill Campus construction and operation, stating that noise levels from the project would cause the ambient noise levels to exceed City noise land use compatibility standards for residential uses. As shown in Table 4.6-4 and 4.6-5, the existing ambient noise levels in the Cathedral Hill neighborhood exceed the City's noise land use compatibility standards by 5–10 dB. Noise sources in the vicinity of the proposed Cathedral Hill Campus are typical of urban areas in San Francisco, and include vehicular traffic, emergency vehicle sirens, activity at loading docks, and operation of HVAC systems. Existing noise source measurements taken in the vicinity of the proposed Cathedral Hill Campus range

from approximately 61 dB L_{eq} to 74 dB L_{eq}, with L_{max} ranges from 74 dB to 96 dB (see Table 4.6-4, "Existing Ambient Noise Levels—Cathedral Hill Campus," on page 4.6-14 of the Draft EIR).

The primary intent of the 'City and County of San Francisco Land Use Compatibility Chart for Community Noise' is to inform the evaluation of whether each proposed development site is an appropriate site for locating a hospital due to existing noise levels and whether additional measures pertaining to noise insulation would be required for CPMC-related structures. As noted in Impact NO-4 (Draft EIR page 4.6-84), this impact would be considered potential significant based on existing noise monitoring in the vicinity of the existing and proposed CPMC campuses. However, with the incorporation of Mitigation Measure M-NO-N4, additional on-site sound insulating features would be determined during the further planning of the proposed facilities and incorporated into the design of each structure, and such that interior noise levels would not exceed acceptable interior noise levels (45 dBA L_{dn}). As such, impacts would be considered less than significant with mitigation.

It should also be noted that, and as detailed in the discussions for Impacts NO-2 and NO-3, the proposed Cathedral Hill project would not cause a substantial perceptible increase in L_{dn} roadway noise levels due to project-related traffic or stationary sources. Furthermore, the proposed project includes Mitigation Measures M-NO-N3a through M-NO-N3e, which serve to limit potential noise-generating activities associated with the proposed Cathedral Hill Campus. As shown on page 4.6-71 of the Draft EIR, these measures include monitoring and additional shielding, as necessary, of exterior equipment, scheduling of hospital deliveries to accommodate neighborhood noise-sensitive periods, and additional noise attenuation measures at loading/unloading areas. These measures are consistent with the City's direction, as shown in Table 4.6-19, to include noise insulation/reduction features in the design of a project when noise levels exceed "satisfactory" L_{dn} levels. Therefore, the overall neighborhood noise levels that exceed land use compatibility standards are generated by existing sources and not an impact resulting from the construction of the proposed Cathedral Hill development.

Loading Dock/Refuse Collection Noise

Comment

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-75 NO, duplicate comment was provided in 30-75 NO]

"42. Page S-61, Impact NO-3 states that 'operation of stationary noise sources associated with the CPMC LRDP could expose on-site and off-site noise-sensitive receptors to noise levels that would exceed applicable standards, and/or result in a substantial increase in ambient noise levels.' This impact is shown as 'significant.' And various mitigation measures are outlined such as not delivering oxygen tanks during church service hours for Hamilton Square Baptist Church. Perhaps other noisy deliveries could be postponed during service hours as well."

Response NO-37

The comment inquires about the noise levels from deliveries at adjacent interiors of buildings and whether additional mitigation similar to that proposed for oxygen deliveries could be proposed for all deliveries. Most deliveries would use the enclosed parking and loading areas and would not exceed noise standards at surrounding buildings. The only activities that would take place outside of the loading dock facility would be the delivery of liquid oxygen. The Draft EIR (page 4.6-70) recognizes this as a potentially significant impact by stating that "delivery of liquid oxygen would expose church users to periodic increases in ambient noise levels and may result in excessive interior noise levels that would exceed applicable noise standards, if oxygen deliveries and church services coincide." The postponement of other loading dock activities to "off-peak traffic hours" is not considered necessary to ensure a less-than-significant impact with respect to operational noise. Please also see Response NO-40 (page C&R 3.8-49).

Comment

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-76 NO, duplicate comment was provided in 30-76 NO]

"43. On Page S-61, M-NO-N3c, what is an 'Aduromed' operation?"

Response NO-38

The comment inquires about the definition of an Aduromed. As stated in footnote 40 on page 4.6-65 of the Draft EIR, an Aduromed is a medical waste disposal system composed of an autoclave sterilizer, a shredder with a cart lift, a dumpster, a floor scale, and controls.

Comment

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-114 NO, duplicate comment was provided in 30-114 NO]

"61. On what days will the streets be mechanically swept around Cathedral Hill? Will neighbors hear more noise on days other than their garbage and street-sweeping days? Will the schedule be such that every day of the week there will be some maintenance noise from either the garbage collection or the street sweeping or loading and unloading of service trucks?"

Response NO-39

The comment inquires about the frequency and levels of noise from street sweeping, garbage collection, deliveries, and other loading dock activities. The existing street sweeping schedule is determined by the City and would not be changed due to the implementation of the proposed project. Implementation of the proposed project would not increase the frequency or duration of street sweeping activities in the project area, and as such, no increase in noise levels associated with street sweeping would be anticipated with implementation of the proposed project. With respect to refuse collection and as noted in Response TR-97 (page C&R 3.7-164), CPMC would have some flexibility in selecting pickup hours that would meet hospital needs and accommodate adjacent neighbors. Trash hauling (hospital only) would occur once daily, Monday through Saturday. As stated in Impact NO-3, loading dock and waste collection activities typically generate noise levels ranging from 60 to 65 dB L_{eq}. With respect to the proposed Cathedral Hill Campus, these activities would occur within the enclosed loading dock area and would not exceed applicable standards from the San Francisco Noise Control Ordinance (e.g., Section 2904) or increase noise substantially in the project area. Therefore, project noise is anticipated to generate lower noise levels than existing garbage and street sweeping activities.

Comments

(George Mayer, September 23, 2010) [32-1 NO]

"Good afternoon. My name is George Mayer. I live at 2660 Great Highway, out in Carmen Chu's district.

But I spend most Sunday mornings attending religious services at the Unitarian Universalist church on Cathedral Hill.

For more than four years I have chaired a task force at the church focused on CPMC's construction plans and developments with a special focus on protecting our historic sanctuary and minimizing the negative impacts on congregational and neighborhood life.

Our task force has met frequently with CPMC representatives: Geoffrey Nelson, Ralph Marchesse and their associates. We sincerely appreciate their help in addressing many of our concerns and correcting some of our misunderstandings. One of the issues that remain unresolved is of serious concern to me. That issue is the Loading Dock and the noise it will generate.

The Loading Dock will be a concrete structure shaped like a band shell; noise from inside this band shell will echo through the neighborhood. The U.U. sanctuary, diagonally across the intersection, has huge stained glass windows that will, unfortunately, transfer this noise quite effectively into the church.

I had been most concerned about back up beepers on delivery trucks that will go BEEP, BEEP, BEEP during our religious services. I learned from the Draft EIR that two other processes will be even worse: a medical waste trash compactor called Adouromed and the repetitive revving of engines to off-load oxygen. Mitigations listed in this EIR for reducing these horrible impacts seem quite inadequate."

(George Mayer, September 23, 2010) [32-3 NO]

"Mandating that wall and ceiling surfaces inside the loading dock be covered with a reverberation reducing coating would help. Requiring coordination with neighborhood churches when scheduling these and other noisy operations would seem appropriate. Restricting deliveries during religious services would be environmentally and ethically responsible."

(Galen Workman, October 14, 2010) [55-1 NO]

"I am writing to express my concern about the inadequacies of the draft Environmental Impact Report prepared for the CMPC building plans.

The plan fails to address the impact of construction, operation, and traffic vibration on the historic First Unitarian Universalist church at 1187 Franklin Street. It fails to address the noise from the loading dock that will disrupt our worship services."

(Unitarian Universalist CPMC Task Force, October 5, 2010) [44-10 NO]

"Noise created by the loading dock is of special concern to us. The loading dock will be shaped like a concrete band shell and is located just across the intersection from our sanctuary, with its large stained glass windows which will transfer noise easily. We have specific concerns about the mitigations proposed on pages 4.6-71 and 4.6-72. MNO-N3b calls for a noise absorptive material to be applied to the interior of the loading dock area <u>only</u> if bay doors are open during Aduromed operation. Yet Geoffrey Nelson, CPMC's Director of Enterprise Development, has assured us that loading dock wall surfaces will be coated with a reverberation reducing material as part of the construction process. Why not include that in your mitigations?"

(Unitarian Universalist CPMC Task Force, October 5, 2010) [44-11 NO]

"M-NO-N3e states that 'delivery of oxygen to the proposed Cathedral Hill Campus shall not be scheduled during hours when church activities are typically taking place' and calls for communication between CPMC and the adjacent churches to determine a mutually acceptable time for oxygen delivery.

Why not apply that standard to the Aduromed activities, too? According to a technical report prepared by SM&W, as noted on page 4.6-69, Aduromed medical waste equipment would 'dominate the loading dock's noise environment during use.' In fact, why not include those requirements, or the pursuit of them, for all deliveries?"

(Rachel Sater—Lost Block and Save Our Streets, October 19, 2010) [101-22 TR]

"<u>Pages 4.5-82 and 4.5-83</u>: The DEIR indicated that on a daily basis approximately 66 trucks up to 55 feet in length would use the loading area; the loading dock would operate 24 hours per day; and CPMC deliveries, laundry services and trash haulers would be scheduled between 9:30 p.m. and 5:00 a.m. to minimize conflicts

with other deliveries. These levels and hours of loading area activity would occur immediately adjacent to adjoining sensitive residential uses on the west, and in the more noise-sensitive evening and early morning hours. However, they are not, and must be, described and analyzed in the noise (Section 4.1) and land use character (Section 4.1) analyses."

(George Mayer, September 23, 2010) [PC-85 NO]

"Good afternoon. My name is George Mayer. I live at 2660 Great Highway out in Carmen Chu's District, but I spend most of my Sunday mornings attending religious services at the Unitarian Universalist Church on Cathedral Hill. For more than four years, I have chaired a task force at the church, focused on CPMC's construction plans and developments, with a special focus on protecting our historic sanctuary and minimizing negative impacts on congregational and neighborhood life. Our task force has met frequently with CPMC representatives, Geoffrey Nelson, Ralph Marchese, and their associates. We sincerely appreciate their help in addressing many of our concerns and correcting some of our misunderstandings. One of the issues that remains unresolved and is of serious concern to me is the loading dock and the noise that it will generate. The loading dock will be a concrete structure shaped like a bandshell. Noise from inside this bandshell will echo through the neighborhood. The U.U. sanctuary diagonally across the intersection has huge stain glass windows that will, unfortunately, transfer this noise quite effectively into the church. I had been most concerned about back-up beepers on delivery trucks that will go beep, beep, beep, during our religious services; I learned from the Draft EIR that two other processes will be even worse, a medical waste trash compactor called Aduromed, and a repetitive revving of engines to offload oxygen. Mitigations listed in the EIR for reducing these horrible impacts seem quite inadequate."

(George Meyer, September 23, 2010) [PC-87 NO]

"…mandating that sealing surfaces inside the loading dock be covered with reverberation reducing coating would help, requiring coordination with neighborhood churches when scheduling these and other noisy operations would seem appropriate. Restricting deliveries during religious services would be environmentally and ethically responsible. Thank you."

Response NO-40

The comments state that noise from the proposed Cathedral Hill Hospital loading dock would adversely affect worship services at the adjacent Unitarian Universalist Church. Unlike the "bandshell" design suggested by the comment, the loading dock area–which is depicted in Figure 2-4 on page 2-53 of the Draft EIR—would be fitted with doors that would be closed during noise-generating activities. As stated on Draft EIR page 4.6-68, loading dock activities (including Aduromed operations) would take place within the enclosed loading dock area and loading dock doors would be closed during all loading/unloading activities that take place at the proposed Cathedral Hill Hospital. In addition, Mitigation Measures M-NO-N3b would ensure that loading dock bay doors are closed to the extent feasible while Aduromed operations are taking place. In the event that loading dock bar doors are unable to be closed prior to operation of Aduromed operations, a noise-absorptive material with a minimum Noise Reduction Coeffecient of 0.75 would be applied to the entire ceiling structure of the loading dock area to ensure that loading dock noise does not exceed the standards established by the San Francisco Noise Control Ordinance.

Furthermore, Mitigation Measures M-NO-N3b and M-NO-N3c have been clarified to demonstrate that, first and foremost, the loading dock bay doors would remain closed, but in the unlikely event that they had to remain open during Aduromed operations, a noise-absorptive material would be installed prior to operations to insure that noise levels do no exceed 70 dB at the CPMC property line. Mitigation Measures M-NO-N3b and M-NO-N3c on DEIR page 4.6-68 have been modified as follows:

M-NO-N3b Bay doors shall be required to be closed during Aduromed operations, to the extent feasible.

M-NO-N3c In the event that it is determined to be infeasible for bay doors to be closed ~~If bay doors are open~~ during Aduromed operation, a noise-absorptive material shall be applied (prior to initiation of Aduromed operations with open bay doors) to the entire ceiling structure of the loading-dock area to reduce noise levels from Aduromed operations. The material shall have a minimum Noise Reduction Coefficient of 0.75.

The only activities that would take place outside of the loading dock facility would be the delivery of liquid oxygen. The Draft EIR (page 4.6-70) recognizes this as a potentially significant impact by stating that "delivery of liquid oxygen would expose church users to periodic increases in ambient noise levels and may result in excessive interior noise levels that would exceed applicable noise standards, if oxygen deliveries and church services coincide." Mitigation Measure M-NO-N3e would ensure that oxygen delivery would only occur during times that the church is not typically in use. Mitigation Measure M-NO-N3e also requires that oxygen delivery be coordinated with surrounding places of worship (including the Unitarian Universalist Church) so that disturbance of services would not occur.

There is no need to apply similar coordination requirements to the operation of the Aduromed equipment because it would be operated only after loading dock doors are closed to the extent feasible (as required by Mitigation Measure M-NO-N3b), reducing noise generation to levels that would not be disruptive of nearby church functions. Furthermore, if bay doors were to be open during Aduromed operation, mitigation measure M-NO-N3c would require that a noise-absorptive material with a minimum Noise Reduction Coefficient of 0.75 be applied to the entire ceiling structure of the loading dock area to reduce noise levels from Aduromed operations. Refer to Response NO-28 (page C&R 3.8-39) for a description of potential vibration impacts to the First Unitarian Church. As noted in this response, implementation of the proposed CPMC LRDP would not exceed established thresholds for structural damage or human annoyance, as enumerated by Caltrans, and impacts would be less than significant.

The comments inquire as to why inclusion of a reverberation-reducing material referred to by Geoffrey Nelson was not included as part of the suggested mitigation on page 4.6-71 of the Draft EIR. The reverberation-reducing material to which the commenter refers to is the noise-absorptive material referred to in Mitigation Measure M-NO-N3c.

Comments

(Barbara Kautz—CHNA and Bernal Heights Neighborhood Center, October 19, 2010) [87-50 NO, duplicate comment was provided in 108-50 NO]

"4. Stationary Noise Sources.

The analysis of noise generated by loading docks in Chapter 4.6 considers only loading docks at the proposed hospital facilities. Yet, the discussion of the need for loading docks on pages 4.5-80-83 reveals substantial use of loading docks at the MOBs and, in fact, a plan to use the loading docks at the Cathedral Hill MOB and the 1375 Sutter MOB 24 hours a day, with deliveries from CPMC's Burlingame facility purposefully scheduled *between 9:30 pm and 4:00 am* and numerous other deliveries scheduled before 7 am and after 7 pm. Trash pickup would occur between 4 am and 5 am. Vehicles longer than 55 feet would be prohibited from entering the hospital's loading dock and so would idle on the street and block traffic."

(Carolyn Abst and Ron Case—Case + Abst Architects LLP, October 19, 2010) [102-25 NO, duplicate comment was provided in 114-25 NO]

"C. With the MOB deliveries shown to be next to the parking entry this will be an additional traffic, noise and exhaust issue. This renders our few operable windows unusable."

(Lower Polk Neighbors, Oct 19, 2010) [103-13 NO, duplicate comment was provided in 113-13 NO]

"C. With the MOB deliveries shown to be next to the parking entry this will be an additional traffic, noise and exhaust issue."

Response NO-41

The comments state that loading dock impacts from the proposed Cathedral Hill MOB and the renovation of the 1375 Sutter Street building were not addressed. However, as part of the analysis shown in Impact NOI-3, the Draft EIR (page 4.6-68) evaluated the potential impacts associated with loading dock activities from the proposed Cathedral Hill MOB and 1375 Sutter Street building, including those associated with CPMC's Burlingame facility. Table 4.5-14 of the Draft EIR, page 4.5-83, identifies 70 service vehicles/trucks that would be associated with operation of the Cathedral Hill MOB and 1375 Sutter MOB. 1375 Sutter is an existing medical office space and would be upgraded under the proposed CPMC LRDP. It would continue to function as medical offices upon completion of construction. The Cathedral Hill MOB site is currently occupied with retail uses, nightclubs, a restaurant, residential units, and two hotels, as stated on Draft EIR page 2-24. The existing uses at both MOB sites currently generate service vehicle/truck trips to and from their respective sites. Furthermore, as stated on page 4.6-68 of the Draft EIR, no changes to loading activities would occur at the 1375 Sutter MOB; the loading activities at the proposed Cathedral Hill MOB would occur within the garage near the service entrance accessed from Cedar Street, and would be comparable to the activities that occur at the site under existing conditions.

As such, no additional service/vehicle truck trips would occur with implementation of the proposed LRDP at either the 1375 Sutter MOB or the Cathedral Hill MOB sites, and no substantial increases in ambient noise levels attributable to loading dock activities associated with either MOB would occur. Operation of the MOBs' loading docks would not render nearby residences' windows "unusable." See Response AQ-30 on page C&R 3.9-74 for a discussion of potential loading dock air quality and Response TR-98 on page C&R 3.7-165, for a discussion of potential loading dock transportation issues including the potential for commercial vehicles to block traffic during loading/unloading periods.

Comments

(Barbara Kautz—CHNA and Bernal Heights Neighborhood Center, October 19, 2010) [87-57 NO, duplicate comment was provided in 108-57 NO]

"Further, the DEIR reviews stationary noise sources at the proposed Cathedral Hill Hospital separately, rather than examining the cumulative noise environment from all sources. It fails to consider alternative mitigation measures to further reduce impacts, such as: building larger oxygen tanks so that deliveries may take place less frequently;[5] restricting oxygen deliveries to Monday through Friday from 9 am to 5 pm; designing the loading dock with revolving turnarounds for trucks (as at the downtown Nordstrom's dock), eliminating beeping; constructing sound walls around the Aduromed equipment; relocating the loading dock to a less sensitive location. Given the size of the facility and peak hour loading demand of 19 delivery trucks at one time (Table 4.5-14), realistically the bay doors will be open most of the time, and mitigation measures should not assume that the bay doors will be closed.

[5] The proposed Oakland Kaiser facility anticipates oxygen deliveries only every 3 weeks due to use of larger tanks."

Response NO-42

The comments state that loading dock activities are not mitigated sufficiently. Mitigation Measure M-NO-N3 contains measures that would limit loading dock noise to required noise standards. The proposed LRDP design includes an enclosure (sound wall) for the Aduromed operations and the ceiling of the loading dock area would be treated with a sound-absorbing material if the bay doors were left open during Aduromed operations, as described in Mitigation Measure M-NO-3c. However, as required by Mitigation Measure M-NO-N3b, unless required due to physical constraints or mechanical failure, the loading dock

bay doors would remain closed during Aduromed operation. No additional mitigation is necessary to comply with the standards established by the City of San Francisco with inclusion of these measures, and a less-than-significant impact would occur.

The commenter suggests installing larger oxygen tanks to minimize the number of deliveries of re-stock oxygen and restricting delivery times. However, the refill capacity of the tanks are matched to the capacity of delivery trucks. Therefore, increasing the size of the tanks would not necessarily result in decreased number of deliveries. Oxygen deliveries to the proposed Cathedral Hill Campus would occur on Franklin Street, across from the existing Hamilton Square Baptist Church at 1212 Geary Boulevard. As noted on page 4.6-69 of the Draft EIR, delivery trucks would rev their engines during the pumping of liquid oxygen supplies to the proposed hospital, which would generate noise levels equivalent to 81 dB at 50 feet. Such pumping is expected to occur for less than a 30 minute period, once or twice per week. The nearest receptors to and within direct line of site of potential oxygen delivery activities include the Hamilton Square Baptist Church (65 feet west of the project site) and the First Unitarian Universalist Church (110 feet southwest of the project site) and, as noted on Draft EIR page 4.6-69, periodic increases in ambient noise levels could occur. Due to the potential for disturbance associated with these activities to church-goers and church services, CPMC would restrict the period during which oxygen deliveries to the site could occur in accordance with Mitigation Measure M-NO-3e, as shown on Draft EIR page 4.6-71, which requires that oxygen deliveries not be scheduled during hours when church activities are typically taking place.

No other receptors are located in proximity to or within direct line of sight of the proposed oxygen delivery location such that periodic increases in noise above Noise Control Ordinance standards are expected to occur at any receptors beyond the two aforementioned churches. As such, this activity is not expected to cause noise levels within the closest residential units that would exceed the limits established in the City's Noise Control Ordinance, as stated on Draft EIR page 4.6-37. Based on the information discussed above, increasing the capacity of the tanks is not necessary.

As stated on page 4.5-82 of the Draft EIR, a delivery plan would be implemented to consolidate truck trips and distribute them throughout the day, consistent with the commenter's request to sequester certain deliveries to particular days and hours. The truck management plan would allow delivery times to be staggered to reduce potential traffic and noise impacts in the vicinity of the loading dock. The timing of deliveries is intended to reduce the number of times the operable doors would be opened, allowing for doors to be closed during loading and unloading activities. Further restriction of delivery times is not considered necessary to insure that loading and unloading operations do not substantially affect local receptors and could contribute to queuing and associated vehicle noise along Franklin Street should oxygen delivery be restricted to Monday through Friday from 9 a.m. to 5 p.m., as suggested by the commenter. With respect to the commenter's request for a revolving truck turnaround, the space required for such a facility makes this option infeasible due to space considerations for all activities and operations deemed necessary by the project sponsor at the proposed Cathedral Hill Campus. Furthermore, OSHA requirements necessitate the use of back-up beepers for commercial vehicles. Therefore, the elimination of their use is not considered feasible. In addition, the proposed Cathedral Hill Campus was designed in such a manner that the impact of truck loading and unloading activities would be reduced to the extent possible. The area surrounding the proposed Cathedral Hill Campus includes sensitive receptors in several directions, as acknowledged in Section 4.6 "Noise." Therefore, redesigning the project to relocate the proposed loading dock would not likely yield a different result in terms of significance. The mitigation measures listed on page 4.6-71 would ensure a less-than-significant impact to nearby receptors due to loading and unloading activities. Additional mitigation measures would not be required to ensure a less-than-significant impact.

Comment

(Lower Polk Neighbors, Oct 19, 2010) [103-14 NO, duplicate comment was provided in 113-14 NO]

"D. Medical, hazardous, green, recycled, and normal garbage pickup from the MOB will be accessed from Cedar Street. This will involved garbage truck reverse-gear 'beeping' noise when ever garbage trucks back out from the MOB (there is no interior turn around space for garbage trucks). This is going to play havoc on residents and businesses having to listen to these hugely increased and irritating sounds, especially when residents are at home and are sleeping. No statistics are available as to how many garbage pickups and reverse beeping will happen per hour, per daytime, per nighttime, per week."

Response NO-43

The comment states that an increase in back-up beeper noise attributable to garbage removal at the Cathedral Hill MOB would occur as a result of the proposed project, and requests truck circulation data. Based on the project description for the proposed Cathedral Hill MOB, discussed on page 2-31 of the Draft EIR, parking level G1 would be located underground at Van Ness Avenue, but aboveground farther east because of sloping topography. The loading area would be within the G1 level of the building structure, and as shown in Figure 2-32 on page 2-96 of the Draft EIR, internal circulation provided within the G1 level would allow garbage trucks to circulate through the MOB garage without need to reverse direction. Therefore the use of backup beepers would not occur. Furthermore, the analysis assumes that trash removal would be conducted within the G1 level and not on the street, and as noted in Response TR-97 (page C&R 3.7-164), trash hauling would occur no more than once daily, Monday through Saturday. As such, the noise associated with trash collection at the proposed MOB would be restricted to vehicles moving forward when entering and exiting the MOB. As a result, substantial increases in ambient noise levels as a result of garbage removal are not anticipated.

Mechanical Equipment Noise

Comment

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010)[18-71 NO, duplicate comment was provided in 30-71 NO]

"38. For the HVAC air handlers, chillers and generators, how many dB above the ambient noise levels will they be operating at the noisiest?"

Response NO-44

The comment inquires about noise levels generated by HVAC systems at the proposed Cathedral Hill Campus, and how much above ambient conditions they would be. According to the Shen Milsom and Wilke (SM&W) report prepared for the CPMC LRDP Draft EIR, noise levels from HVAC systems would be approximately 70 dB L_{eq} at the Cathedral Hill property line. In comparing this noise level to those presented in Tables 4.6-4 and 4.6-5, noise levels would not exceed 8 dB above ambient levels, in accordance with the requirements of San Francisco Noise Control Ordinance 2909(b).

Comment

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-73 NO, duplicate comment was provided in 30-73 NO]

"On Page 4.6-66, how often will the generators be run for scheduled testing for the 'typical 30 minutes' of testing?"

Response NO-45

The comment inquires about how often emergency electrical generators would be tested. Based on similar facilities at existing CPMC campuses and standard CPMC practices, each emergency generator would typically be tested twice per month (for 30 minutes and an estimated 15 minute cool down), which would be equivalent to three times per month at the proposed Cathedral Hill Campus and one time per month at the proposed Cathedral Hill MOB.

Comment

(Helene Dellanini—DBC Master Owner's Association, October 18, 2010) [71-43 NO, duplicate comment was provided in 72-43 NO]

"2. Impact NO-3. Long-term Operational Noise

Operation of stationary noise sources associated with the CPMC LRDP could expose onsite and off-site noise-sensitive receptors to noise levels that would exceed applicable standards, and/or result in a substantial increase in ambient noise levels.

2.1. Criteria. Section 2909(b) limits commercial noise to 8 dBA above the ambient, where the ambient is the minimum level measured, but not less than 35 dBA for interior locations. Additionally, section 2909(d) limits the interior noise level in bedrooms to 45 dBA at night, 55 dBA during the day, with the windows open.

The SM&W reports referenced in the EIR generally utilize an ambient of 58 dBA, with a resultant criteria of 66 dBA, which is approximately the same level as the daytime ambient (L_{eq}). At this level, the noise from the mechanical equipment will be audible but would not be considered loud or intrusive to most people.

2.2. VA has reviewed the 5 M&W reports referenced in the EIR, and the sound power data reported therein. VA takes no exception to the analysis in the SM&W reports, and the conclusions will be valid as long as the sound power levels of the equipment reported by the manufacturer are accurate. The loudest equipment in the review are the cooling towers; the noise level at DBC from the central plant cooling towers is about 62 dBA. This satisfies the City Noise Ordinance."

Response NO-46

The comment agrees with the information provided in the Draft EIR related to the stationary noise source assessment. This comment is noted.

Comment

(Helene Dellanini—DBC Master Owner's Association, October 18, 2010) [71-44 NO, duplicate comment was provided in 72-44 NO]

"2.3. Additional mitigation. The noise level from the cooling towers is 5 dB below the daytime ambient, which should be acceptable. However/ if the cooling towers operate at night, they may be at or slightly above the ambient noise level, particularly at the quieter locations of DBC shielded from Van Ness. At these locations, the cooling tower noise may cause annoyance with windows open.

Therefore, VA recommends that the screen around the cooling towers and other equipment should not be just visual, but should be solid (not louvered) so as to double as a sound barrier. Opening at the bottom of the screen for ventilation is acceptable as long as there is no direct line of sight from the cooling towers to all residential units of DBC."

Response NO-47

The comment recommends additional mitigation for the proposed Cathedral Hill Hospital cooling towers to ensure that nighttime noise standards are met. Mitigation Measure M-NO-N3a addresses operations of operating exterior equipment, including cooling towers, and would ensure that any necessary additional mitigation to reach applicable noise standards would be installed, including installation of additional barriers surrounding the cooling towers. In order to clarify that the mitigation measure would ensure compliance with both daytime and nighttime noise standards, Mitigation Measure M-NO-N3a on page 4.6-71 of the DEIR is revised to read as follows:

> CPMC shall retain the services of a qualified acoustical consultant to measure the sound levels of operating exterior equipment within 30 days after installation. If exterior equipment meets daytime and nighttime sound-level standards, no further action is required. If exterior equipment does not meet sound-level standards, CPMC shall replace and/or redesign the exterior equipment to meet the City's noise standards. Results of the measurements shall be provided to Hospital Facilities Management/ Engineering and the City to show compliance with daytime and nighttime standards.

Comment

(Barbara Kautz—CHNA and Bernal Heights Neighborhood Center, October 19, 2010) [87-56 NO, duplicate comment was provided in 108-56 NO]

"2. Noise from Stationary Sources.

The City's standards for stationary sources require both that noise increases not exceed 8 dB (a standard we believe is too high; see below) and that interior spaces in sensitive receptors, such as nearby churches and residences, not exceed -specified standards. Yet, proposed Mitigation M- NO-N3a proposes only that noise generated by mechanical equipment be measured, not that noise within those sensitive receptors be verified. The impact is not mitigated to a level of insignificance unless it is sufficiently reduced in *all* sensitive receptors."

Response NO-48

The comment states that noise from stationary sources would not meet interior noise standards at adjacent sensitive receptors. Interior noise levels at adjacent sensitive receptors are discussed on page 4.6-67 of the Draft EIR. Based on the Shen Milsom and Wilke (SM&W) report prepared for the CPMC LRDP Draft EIR, noise levels from HVAC systems would be approximately 70 dB L_{eq} at the Cathedral Hill property line. Assuming a conservative exterior-to-interior noise level reduction of 25 dB for existing structures with windows closed, noise levels would not exceed 45 dB L_{dn}. It should be noted that the assumed reduction shown above is less than the reduction measured by Veneklasen Associates (71 dB L_{dn} to 45 dB L_{dn}), who submitted comments on behalf of Daniel Burnham Court. Furthermore, measured ambient noise levels conducted by Veneklasen Associates under existing conditions identify an interior noise level of 50 dB L_{dn} with windows open. As the measured exterior L_{dn} at Daniel Burnham Court under the same conditions is 71 dB and stationary source noise levels associated with the proposed CPMC LRDP would not exceed 70 dB L_{eq} at the CPMC property line, stationary source noise associated with the operation of the proposed Cathedral Hill Campus would not substantially increase interior noise levels at adjacent sensitive receptors. As the ambient noise measurements conducted by Veneklasen Associates are similar to those conducted for the Draft EIR, it is reasonable to conclude that the analysis of stationary source noise shown in the Draft EIR on pages 4.6-65 through 4.6-67 is reasonable and accurate. Furthermore, since the City regulates noise by limiting the noise levels generated at the source, measurements conducted within the limits of the CPMC property are considered appropriate for verification purposes. Noise measurements conducted off-site can be influenced by sources, including transportation sources, other than the source intended to be measured. As such, implementation of Mitigation Measure M-NO-N3a as identified in the analysis of the Draft EIR and verified by the measurements conducted by

Veneklasen Associates, would insure that adjacent sensitive receptors do not experience substantial increases in ambient noise levels as a result of the proposed CPMC LRDP, and impacts would be less than significant.

Comments

(Barbara Kautz—CHNA and Bernal Heights Neighborhood Center, October 19, 2010) [87-62 NO, duplicate comment was provided in 108-62 NO]

"3. Noise from Stationary Sources.

The DEIR assumes that a noise increase of 8 dB due to stationary equipment is acceptable and 'insignificant' because that is the standard in the City's noise ordinance. However, Table 4.6-1 shows that an increase of 8 dB is somewhere between 'clearly noticeable' and 'twice as loud.'

(Barbara Kautz—CHNA and Bernal Heights Neighborhood Center, October 19, 2010) [87-63 NO, duplicate comment was provided in 108-63 NO]

"For traffic noise, an increase of only 3 dB is sufficient to create a significant impact. From the viewpoint of an affected person, there is no justification for allowing greater increases in noise levels from mechanical equipment than from traffic, especially since the mechanical equipment and other stationary sources at the hospital will operate 24 hours per day."

Response NO-49

The comments state that an 8 dB or greater increase in ambient noise level from stationary noise sources is a substantial audible increase. The Draft EIR recognizes that noise increases of 8 dBA are audible. However, the 8-dB noise standard referred to by the commenter is measured at the property line of the project, unlike the 3 dB traffic noise standard, which is measured at the receptor, and, as stated on page 4.6-72 of the Draft EIR, mechanical equipment at the site of the proposed Cathedral Hill Campus will be designed—as required by Mitigation Measure M-NO-N3a through M-NO-N3e—such that that noise levels would not exceed applicable standards at adjacent properties. This may include modifications to installation locations and barrier construction, if determined necessary, during implementation of Mitigation Measure M-NO-N3a. Furthermore, the noise standard used for stationary sources is taken directly from the City's Noise Control Ordinance. As the measurement for stationary source noise is taken at the source and not the receptor, an 8-dB threshold does not account for any distance or topographic features that may occur between source and receptor and serve to attenuate stationary source noise. As noted in Response NO-48 (page C&R 3.8-55), by limiting stationary source noise to 70 dB when measured at the project site boundary, interior residential noise levels in the area would not be expected to exceed existing ambient noise levels (or 45 dB L_{dn} with windows closed), and as such, the impact of the proposed stationary equipment would be considered less than significant.

Comment

(Carolyn Abst and Ron Case—Case + Abst Architects LLP, October 19, 2010) [102-24 NO, duplicate comment was provided 114-24 NO]

"In addition, the DEIR discusses noise from stationery equipment. Specifically, the DEIR indicates that on-site sensitive receptors, such as our home and our business, which do rely on windows for ventilation, would experience a significant impact in that the resulting stationery noise for our property would be in excess of 45 db as the sound attenuation that would occur would be 15 db from the 70 db that is anticipated and identified at the property lines for the proposed Cathedral Hill campus. The DEIR should include mitigation for this significant effect on our property."

Response NO-50

The comment states that mitigation measures for interior operational noise levels at the work/live space located at 1033 Polk Street should be implemented. As currently configured, the limits of the proposed stationary source equipment (including screening) at the proposed Cathedral Hill MOB, which is the closest structure to the property referred to by the commenter, would be located approximately 120 feet west of the structure's eastern boundary and 20 feet from its northern and southern boundaries. Taking into account the Shen Milsom and Wilke (SM&W) report prepared for the CPMC LRDP, which stipulates that the stationary equipment shall not exceed 70 dB at any property line, the mechanical equipment located on site would be shielded so as to achieve 70 dB at a distance of 20 feet. Taking into account attenuation for doubling of distances, this noise level would correspond to approximately 58.2 dB at the receptor identified in this comment. As noise levels associated with the on-site stationary mechanical equipment would not exceed ambient noise levels (60.8 dBA L_{eq}) that were measured along Cedar Street during preparation of the Draft EIR (refer to Table 4.6-4 on Draft EIR page 4.6-14), the proposed stationary source noise would not be considered perceptible and would not increase ambient levels at the receptor in question. As a result, impacts would be considered less than significant. Further, Mitigation Measure M-NO-N3a requires monitoring of installed equipment to ensure that the equipment meets the noise standards established by the City. If necessary, additional shielding can be implemented to reduce noise levels to within the standards of the San Francisco Noise Control Ordinance.

Mobile Source Noise

Comment

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-77 NO, duplicate comment was provided in 30-77 NO]

"44. On Page S-62, Impact NO-4 describes 'future traffic-related interior noise levels could exceed applicable land use compatibility standards.' This is shown to be a 'significant' issue and the mitigation, M-NO-N4 for Cathedral Hill campus is to reduce the interior noise level to 45 db with insulation, etc. However, no mention is made of reducing the noise level of adjacent properties or those of the sensitive noise receptor category. Even though the interior of the hospital is quieter and shielded from the future traffic noise, the other buildings are not. Do they get upgrades, too?"

Response NO-51

The comment inquires about why, under Impact NO-4, additional interior noise insulation for adjacent buildings exposed to excessive traffic noise is not proposed as mitigation for the project. The Draft EIR describes a variety of noise impacts related to project construction as well as long-term noise generated by traffic and from stationary operations of the project. In particular, Impact NO-4 describes the noise impacts on the sensitive receptors (patients, visitors, and employees) located in the area of the proposed Cathedral Hill Campus. The purpose of Impact NO-4 is to evaluate effects of the noise environment on new sensitive receptors by comparing the modeled future noise levels to the land use compatibility standards of the City's Noise Element. Impact NO-2 evaluates the noise effects of future traffic levels on existing sensitive receptors in the project vicinity. As noted in Table 4.6-26 on page 4.6-59 of the Draft EIR, noise levels under existing conditions already exceed the land use compatibility standards for residential uses, and the project would not substantially contribute to that exposure. Therefore, because the project contribution to excessive noise at surrounding sensitive receptors would not meet the City's threshold of significance, Impact NO-2 is deemed to be less than significant, and no additional mitigation—such as upgrades to other buildings surrounding the site of the proposed Cathedral Hill Campus—is required.

Comments

(Carol and Michael Stack, October 17, 2010) [62-1 NO]

"As senior citizen residents living next to St. Mary's Cathedral on Geary Boulevard, we wish to add our voices in opposition to the proposed CPMC project particularly with regard to its size and location.

The project will unquestionably result in vastly increased traffic and congestion on one of this City's admittedly noisiest major thoroughfares, Geary Blvd.

This neighborhood is already plagued with emergency vehicles careening down Geary Boulevard with sirens wailing at all hours of the night. This project will add substantially to the clamor with attendant health consequences for seniors and children."

(Barbara Kautz—CHNA and Bernal Heights Neighborhood Center, October 19, 2010) [87-51 NO, duplicate comment was provided in 108-51 NO]

"Traffic impacts due to these policies and increases in night noise generation at sensitive receptors are nowhere discussed in Chapter 4.6."

Response NO-52

The comments raise concerns regarding the level of increased traffic along Geary Boulevard as a result of the construction of the proposed Cathedral Hill Campus. As noted on page 4.5-59 of the Draft EIR, the proposed LRDP would increase ambient noise levels along local roadways, including Geary Boulevard, as a result of increased vehicle trips to and from the proposed Cathedral Hill Campus but would not increase ambient noise levels in excess of 3 dB, which would be considered significant and adverse. During the course of evaluating the potential impacts of the proposed CPMC LRDP, the Draft EIR took into consideration both near-term (2015) and long-term (2030) conditions that would occur along local roadways, including Geary Boulevard, and found that ambient noise levels would increase by no more than 2.3 dB (along Cedar Street between Polk Street and Van Ness Avenue). As such, traffic noise level impacts would be considered less than significant, contrary to the comments' statements. It should be noted that Table 4.6-26 on Draft EIR page 4.6-59 has been amended to correct two typographical errors. Refer to Chapter 4 of this C&R document for further clarification.

The comments also state that emergency vehicle noise is already a problem in the area and that the proposed LRDP would dramatically increase ambient noise levels that could affect the health of seniors and children. Refer to Response NO-59 on page C&R 3.8-64 for a description of the level to which ambient noise levels would be affected by sirens associated with the proposed Cathedral Hill Campus. Sirens are currently used along Geary Boulevard and those associated with the proposed LRDP would not substantially affect noise levels in the area; therefore, the potential for health effects attributable to the use of sirens are not anticipated. See also Responses NO-8 (page C&R 3.8-6) for a discussion of nighttime construction impacts and Responses TR-120 and TR-122 on pages C&R 3.7-199, and 3.7-201, respectively, for additional discussion of traffic issues, including the potential for extended queuing of commercial vehicles to block traffic. Please also see Responses PD-12 (page C&R 3.2-15), LU-4 (page C&R 3.3-19), and Major Responses HC-1 and HC-2 (pages C&R 3.23-1 and C&R 3.23-8) for a discussion of the size and location of the proposed Cathedral Hill Campus.

Comment

(Donald Scherl, October 15, 2010) [74-25 NO]

"The draft suggests at NO-2, that the permanent increase in traffic noise is less than significant. Not if you're living there. Further, at NO-3, the draft concedes that '...noise levels...would result in a substantial increase in

ambient noise.' The recourse offered the neighbors is to complain to the 'noise liaison' who, if the complaints are 'excessive' (undefined), might warrant 'further action' (undefined). Here are a few ideas: require the beds of trucks removing the debris from demolishing the hotel to have padded bottoms to decrease the noise of dumping the debris into the trucks; require idling cement mixers to be stationed completely outside the neighborhood; do not permit any construction before 8 AM or after 5 PM nor at all on Saturdays, Sundays and holidays; enclose generators and the like in sound proofed structures built for this purpose. There are more real world possibilities that persons trained in these matters could suggest if CPMC were required to collect such ideas."

Response NO-53

The comment states that traffic noise and stationary noise would be substantial and recommends additional construction and operational mitigation. As explained in Impact NO-2, existing traffic noise in the Cathedral Hill neighborhood already exceeds noise standards and the project would not cause a substantial increase (in excess of 3 dB) above existing noise levels. Operational stationary noise sources would be enclosed, screened, or muffled to ensure that exposure to excessive noise levels would not occur. Further, in accordance with Mitigation Measure M-NO-N3a, CPMC would validate the ability of the screening to reduce noise levels in accordance with San Francisco Noise Control Ordinance requirements and make adjustments as necessary to insure compliance.

The padding of haul trucks, as suggested by the comment, is not considered standard industry practice or a conventional way of mitigating construction noise. The volume of padding material added to a truck bed will replace some volume of off-haul debris in that truck bed, resulting in less off-haul per truck trip and generate additional debris (padding material) to dispose. This will extend the construction debris/material hauling stage and add additional truck trips to local roadways, which would have secondary air quality, GHG, noise, and transportation impacts. The loudest part of loading concrete and brick debris occurs during the first placement of material within the bed of each truck, which in turn cushions and dampens the sound of the remaining fill activity. Therefore, the period of time that could be mitigated by padding a truck bed would only occur during the initial loading of each truck. Further, the introduction of padding material(s) could contaminate the soil or debris, triggering removal to a controlled landfill rather than a conventional re-use site, again adding substantial cost. As such, the padding of haul trucks is not considered a feasible measure for reducing potential construction noise due to its limited effect at reducing noise compared to the potential secondary effects that could occur with its implementation.

In addition, construction Mitigation Measure M-NO-N1a in the Draft EIR requires enclosing or shielding generators, turning off idling equipment, and restricting construction operations to those allowed by the San Francisco Noise Control Ordinance. Please refer to Response NO-23 on page C&R 3.8-32 for a description of the community liaison complaint responsibilities and to Response NO-8 on page C&R 3.8-6 for a description of daytime hours of construction, which would be in compliance with the San Francisco Noise Control Ordinance. The comment suggests that idling cement mixers be stored outside of the "neighborhood." Mitigation Measure M-NO-N1a states that idling construction equipment shall be located away from nearby sensitive receptors on site. As cement mixers may be required at varying times during a particular day and are required to idle while continually stirring cement, sending an idling cement mixer off-site during periods of idling would result in additional air emissions due to engine revving, and could result in further traffic impacts beyond those identified in the Draft EIR. As such, it is considered infeasible to include storage of mixers outside the neighborhood as additional mitigation for the LRDP and would not reduce impacts associated with implementation of the proposed LRDP.

Comment

(Linda Chapman, October 19, 2010) [76-26 NO, duplicate comment was provided in 111-26 NO]

"Impacts of increasing ambient traffic noise on pedestrians and residents of our dense neighborhoods, already subjected to downtown commute traffic, must be considered, in addition to the concerns raised about sirens.

Using sidewalks, or rooms with windows facing the street, is a different quality of experience, at times of heavy traffic."

Response NO-54

The comment expresses concern about traffic noise generated by motor vehicles associated with the proposed CPMC LRDP. As noted in Impact NO-2 on page 4.6-57 of the Draft EIR, the proposed LRDP was evaluated for its potential impact on local roadway volumes and associated roadway noise, taking into account cumulative growth in the project area. As stated under Impact NO-2, the proposed LRDP would not result in a substantial increase (3+ dB) in ambient roadway noise. See Response NO-59 on page C&R 3.8-64 for a discussion of siren noise.

Comments

(Carolyn Abst and Ron Case—Case + Abst Architects LLP, October 19, 2010) [102-20 NO, duplicate comment was provided in 114-20 NO]

"B. If the MOB parking is open in the early morning and evening we will be forced to endure noise throughout the entire day. If the evening use is allowed we will be forced to the noise of people coming and going to their cars, plus the car noises and emissions."

(Lower Polk Neighbors, Oct 19, 2010) [103-12 NO, duplicate comment was provided in 113- 12 NO]

"B. Again for Post, Polk and Cedar Street residents and businesses, if the MOB parking is open in the early morning and evening we will be forced to endure noise throughout the entire day. If the evening use is allowed we will be forced to endure added noise of people coming and going to their cars, plus the car noises and emissions."

(Lower Polk Neighbors, Oct 19, 2010) [103-15 NO duplicate comment was provided in 113-15 NO]

"E. As with all hospital campuses, there will be cars circling the neighborhood waiting to pick up, drop off, and/or looking for parking. A major part of the neighborhood circling will be down our streets. Again, a major health and noise issue."

Response NO-55

The comments state that if the proposed MOB parking is open in the early morning and evening hours, the commenters would endure noise generated by people travelling to and from their cars, and car noise emissions, all day. Currently there are 10 access points along Cedar Street serving existing building occupants. The proposed LRDP would eliminate all but three of these access points along Cedar Street, which would serve the underground parking lot. Adjacent residences would be exposed to noise from vehicles accessing the proposed MOB underground parking; however, these residents are currently exposed to vehicles accessing parking at the existing property. As noise associated with people travelling to and from their vehicles would be enclosed and located underground, potential noise levels at nearby receptors associated with such activities would be minimal. Furthermore, as noted in Response NO-52 (page C&R 3.8-58), the proposed CPMC LRDP would not cause a substantial increase (more than 3 dB) in ambient noise levels associated with motor vehicle usage along Cedar Street between Van Ness Avenue and Polk Street. Impacts would be less than significant, as stated on page 4.6-60 of the Draft EIR.

As noted in the Draft EIR, page 4.5-166, the secondary effect of drivers circling the area, potentially searching for parking, is typically offset by a reduction in vehicle trips due to some drivers, who are aware of the constrained parking conditions in a given area, shifting to other modes. Therefore, mode shifts by commuters to and from CPMC facilities would offset any potential additional air emissions or noise associated with vehicles that might travel additional distances in the vicinity of a particular hospital campus. See also Response TR-69 (page C&R 3.7-129) for a discussion of operational parking provisions

and Response AQ-3 (page C&R 3.9-2) for a further discussion of potential air emissions associated with vehicles circling the vicinity of a particular hospital campus.

Comment

(Carolyn Abst and Ron Case—Case + Abst Architects LLP, October 19, 2010) [102-21 NO, duplicate comment was provided in 114-21 NO]

"In addition to the construction noise, the operation of the hospital and the MOB will also significantly increase traffic noise. Specifically, the EIR notes that the increased traffic volumes could result in a noticeable 3 db or greater increase in traffic noise along roadways on or near the campus. The EIR further notes that the LRDP-related traffic noise would result in a noticeable 3 db or greater increase in the ambient traffic noise levels along Cedar Street between Polk and Van Ness. This increase would likely be perceivable to existing nearby noise sensitive receptors, such as our residential and commercial building."

Response NO-56

The comment states that increased traffic noise attributable to proposed MOB operation would be perceivable at existing nearby noise sensitive receptors, such as residences and commercial buildings. As demonstrated in Table 4.6-26 on page 4.6-59 of the Draft EIR, because measured noise levels along Cedar Street were considerably higher than modeled traffic noise levels based on daily traffic volumes, the measured noise level is used for evaluation of traffic noise increases due to the project. When accounting for the difference in measured to modeled noise levels by applying a corrective noise level offset built into existing noise models, the increase of traffic noise due to the project is 2.3 dBA when compared to ambient noise levels for the roadway segment. The increase would be less than the significance threshold of 3 dBA, and therefore, would be considered less than significant. Please see Response NO-57 (page C&R 3.8-61) for additional information regarding the analysis methodology.

Comments

(Carolyn Abst and Ron Case—Case + Abst Architects LLP, October 19, 2010) [102-22 NO, duplicate comment was provided in 114-22 NO]

"The actual net increase in db is an amazing 10.3 from the baseline existing condition of 52 along Cedar to a proposed cumulated plus project of 62.3. The 10.3 increase violates existing City policy, which provides that increases in ambient noise of 5 db are considered significant impacts."

(Carolyn Abst and Ron Case—Case + Abst Architects LLP, October 19, 2010) [102-23 NO, duplicate comment was provided in 114-23 NO (Carolyn Abst and Ron Case, October 19, 2010]

"There is a brief discussion in the EIR which suggests that the ambient noise level along Cedar Street is actually higher than the amount recorded during the noise analysis of 52 db as a result of noise flowing from Van Ness and Polk Streets down and along Cedar Street. Because of this noise that originates off different streets, the DEIR asserts that the actual increase along Cedar Street is approximately 2 db. Thus, the DEIR requires no mitigation for this 10.3 db increase in the ambient conditions. The DEIR should have identified mitigation measures that would have been applicable to minimize the impact of the 10.3 actual increase in db along Cedar Street."

Response NO-57

The comments state that the Draft EIR should have identified mitigation measures that are applicable to minimize the impact of a 10.3-dBA actual increase along Cedar Street and that the modeled traffic noise level along Cedar Street (52 dBA L_{dn}) should be used as the baseline level versus the measured ambient noise level on Cedar Street (60.8 dBA L_{dn}). As stated in the land use compatibility chart for community noise under transportation noise in the City's General Plan, "since the sound levels shown on the maps

are estimates based on both traffic data and on a sample of sound level readings, actual sound levels for the site, determined by accepted measurement techniques, may be substituted for them." The methodology used to evaluate traffic noise increases along Cedar Street is consistent with the General Plan guidelines for establishing existing conditions. When the measured noise level is higher than the modeled noise level using traffic data and appropriate assumptions, it is considered the actual ambient noise level. Modeling then requires an offset to account for the difference between actual and modeled noise levels. There would not be an actual increase of 10.3 dBA from existing conditions. As explained on page 4.6-59 of the DEIR, the existing ambient noise level is 60.8 dBA L_{eq}, which encompasses all noise sources in the area of the measurement site. Therefore, only a 2.3-dBA increase in noise would be experienced, which would not be considered a substantial increase in ambient noise levels. As such, impacts would be less than significant, as stated in the Draft EIR.

It should also be noted that because the Draft EIR evaluated the potential impact of the proposed CPMC LRDP against 2015 traffic conditions without the project, a minor supplemental analysis was performed subsequent to the issuance of the Draft EIR to insure that these impacts would not substantially increase in severity or significance if existing, rather than Modified Baseline, conditions were used. The use of Existing Plus Project versus Modified Baseline (2015) Plus Project conditions would result in a maximum 0.2 dB increase in the level of impact attributable to implementation of the proposed LRDP. This would occur at Clay Street between Webster Street and Buchanan Street, where the total increase in ambient roadway noise levels would be 1.6 dB under Existing Plus Project conditions, compared to 1.4 dB under Modified Baseline Plus Project conditions. The increases in noise associated with the implementation of the proposed CPMC LRDP would not exceed 3 dB under either the Existing Plus Project or Modified Baseline (2015) Plus Project scenarios. Impacts would remain substantially the same under Existing Plus Project conditions as those acknowledged in the Draft EIR. It should be noted that the majority of roadway segments modeled as part of the Draft EIR analysis exhibit less than a 0.05 dB increase in ambient roadway noise levels when evaluating Existing Plus Project versus Modified Baseline (2015) Plus Project conditions. Therefore, and as noted in Response TR-9 (page C&R 3.7-11), the use of the Modified Baseline (2015) in the Draft EIR is considered appropriate based on the dates at which project-related traffic would be added to the local street networks and based upon traffic conditions that are reasonably anticipated at such times.

Patient Drop-Off Noise

Comment

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-74 NO, duplicate comment was provided in 30-74 NO]

"41. On Page 4.6-68, all noises (e.g. door closures, conversations, vehicle startups, etc.) from patient drop-offs from vehicles and shuttles are expected to not exceed 45 dB in the interior of adjacent buildings. Would the audible backup alarms on the shuttles and other delivery vehicles increase the dB measurement higher than 45 dB. If so, by how much?"

Response NO-58

The comment inquires about whether or not audible backup alarms were accounted for in the proposed Cathedral Hill Campus drop-off noise levels evaluation and if not, how much of an increase in interior noise levels could occur for nearby adjacent buildings from the proposed Cathedral Hill Campus drop-off activity. As stated on page 4.6-68 of the Draft EIR, measurements of similar noise levels at the site of the proposed Cathedral Hill Campus were observed to have a 71-dB SEL at a distance of 50 feet. The activities observed included passenger and shuttle drop-offs (vehicle arrival and vehicle departure) similar to what would occur at the site of the proposed Cathedral Hill Campus, including back-up beeps from

larger shuttle vehicles. As such, an increase or exceedance at nearby receptors would not be expected to exceed interior noise levels of 45 dB, as noted in the Draft EIR.

Siren Noise

Comments

(Diane and Richard Wiersba, October 11, 2010) [49-6 NO]

"With Mount Zion, California Pacific and St Francis hospitals already in the surrounding area, we have more than our share of noise from emergency vehicles. More sirens won't make this area more livable."

(Barbara Kautz - CHNA and Bernal Heights Neighborhood Center, October 19, 2010) [87-60 NO, duplicate comment was provided in 108-60 NO]

"2. Noise from Emergency Vehicles.

The DEIR (pages 4.6-70-71) states that ambulance sirens could generate up to 106 dB, but does not include any consideration of noise due to emergency sirens and horns in its calculations of traffic noise impacts because this noise is exempt from the noise provisions of the San Francisco Municipal Code (page 4.6-57 to 58). However, this exclusion does not mean that these noise sources have no physical impact! The analysis of traffic noise increases due to the Long Range Plan cannot accurately reflect future conditions unless it includes these significant sources of future noise."

(Rachel Sater—Lost Block and Save Our Streets, October 19, 2010) [101-39 NO]

"The DEIR states that sirens associated with the ambulance entrance/exit could result in a substantial increase in ambient noise levels above the City significance threshold of 8 dB. But it does not state that this would be a significant impact. The mitigation measure calls for "implementing physical (e.g., equipment design) impact reduction measures related to stationary equipment and ambulance entrance/exit that are considered practical and feasible," and would reduce the impact to a less-than-significant level. However, the mitigation measures referred to (Mitigation Measure M-NO-N3 for the Davis Campus and Mitigation Measure M-NO-N3a for the Cathedral Hill Campus) include no mention of measures for ambulance noise. Thus, the mitigation measure is missing. This omission must be addressed by either a new mitigation measure or the identification of a new significant and unavoidable impact, both requiring recirculation of the DEIR."

Hossein Sepas, October 19, 2010 [82-7 NO, duplicate comment was provided in 107-5 NO]

"Concentrating so many medical services in one area will have a huge impact on noise in an already noisy area. The dense residential corridor surrounding the Geary/O'Farrell corridor is already very noisy, as is the Van Ness, Franklin, Gough corridor. These areas take more than their fair share of noise from ambulances traveling back and forth."

(Patrick Carney, October 19, 2010) [83-7 NO]

"Noise:

Concentrating so many medical services in one area will have a huge impact on noise in an already noisy area. The dense residential corridor surrounding the Geary/O'Farrell corridor is already very noisy, as is the Van Ness, Franklin, Gough corridor. These areas take more than their fair share of noise from ambulances traveling back and forth."

Response NO-59

The comments state that emergency vehicle noise would represent a substantial increase in ambient noise levels and would make their neighborhood less livable. The comments also state that the additional ambient noise would represent a new significant impact and require mitigation and recirculation of the Draft EIR. As stated on page 4.6-15 of the Draft EIR, traffic noise is the dominant existing noise source in the campus area and is expected to remain the dominant noise source in the future. As noted by the Federal Highway Administration (FHWA), roadway traffic noise is generally dependent on three factors: (1) the volume of the traffic; (2) the speed of the traffic; and (3) the number of trucks/buses in the flow of traffic. The loudness of traffic noise is increased during periods of heavier traffic volumes, higher speeds, and greater numbers of trucks/buses. Individual vehicle noise involves a combination of engine noise, tire friction noise, and noise associated with a vehicle's exhaust.[8] In the vicinity of the proposed Cathedral Hill Campus and during preparation of the Draft EIR, two 24-hour noise measurements were taken in order to accurately depict the existing noise environment in the project area and to better characterize the level of vehicle noise under existing conditions. C&R Table 3.8-1 identifies the hourly L_{eq} values and the L_{dn} value for the two 24-hour monitoring events taken in the project area. As stated on page 4.6-6 of the Draft EIR, L_{eq} is an average noise level over a selected period, which in this case is a 1-hour interval. L_{dn} is a 24-hour average noise level that accounts for the period between 10 p.m. and 7 a.m. as being "noise-sensitive."

As shown in C&R Table 3.8-1, the existing noise environment in the vicinity of the proposed Cathedral Hill Campus is typical of an urban environment and generally experiences noise levels in excess of the suggested levels shown in Table 4.6-19 (City and County of San Francisco Land Use Compatibility Chart for Community Noise) of the Draft EIR.

As stated in the Draft EIR, depending on the severity of a particular patient's medical emergency, ambulances accessing the proposed Cathedral Hill Campus could require the use of their sirens. The use of emergency sirens could cause a temporary elevation of ambient noise levels on an intermittent basis at nearby noise-sensitive land uses adjacent to the ambulance route. As noted on page 4.6-70 of the Draft EIR, emergency vehicle sirens can generate intermittent L_{max} noise levels up to 106 dB.

Emergency services are prevalent throughout the City under existing conditions, and the use of sirens is a common element of the urban noise environment in the City of San Francisco, including the neighborhoods around the site of the proposed Cathedral Hill Campus. As stated in Chapter 4.11 of the Draft EIR, the proposed Cathedral Hill Campus would be located approximately 1.5 blocks west of the existing San Francisco Fire Department (SFFD) Station 3 (Battalion 2), which is located at 1067 Post Street. The San Francisco Police Department's (SFPD) Northern District Station is located approximately 1.0 mile southwest of the proposed Cathedral Hill Campus. These public services utilize the streets in the project area when responding to calls for emergency service, as well as (in the case of the SFPD), when patrolling their respective service area. This is particularly true of Van Ness Avenue, Franklin Street, and Gough Street, major north-south connectors through the north of Market area of the City.

C&R Table 3.8-1
Monitored Noise Levels in the Vicinity of the Proposed Cathedral Hill Campus

Period of Measure	Noise Descriptor	Along Geary Street	Along Post Street
Hourly			
12:00 a.m. to 12:59 a.m.	L_{eq}	65.6	61.4
1:00 a.m. to 1:59 a.m.	L_{eq}	64.4	60.3
2:00 a.m. to 2:59 a.m.	L_{eq}	62.9	59.9
3:00 a.m. to 3:59 a.m.	L_{eq}	63.3	60.2
4:00 a.m. to 4:59 a.m.	L_{eq}	60.8	59.1
5:00 a.m. to 5:59 a.m.	L_{eq}	64.7	61.9
6:00 a.m. to 6:59 a.m.	L_{eq}	70.1	64.6
7:00 a.m. to 7:59 a.m.	L_{eq}	72.0	66.1
8:00 a.m. to 8:59 a.m.	L_{eq}	72.0	66.6
9:00 a.m. to 9:59 a.m.	L_{eq}	70.4	66.3
10:00 a.m. to 10:59 a.m.	L_{eq}	69.4	65.4
11:00 a.m. to 11:59 a.m.	L_{eq}	68.5	68.4
12:00 p.m. to 12:59 p.m.	L_{eq}	67.1	65.8
1:00 p.m. to 1:59 p.m.	L_{eq}	67.3	66.2
2:00 p.m. to 2:59 p.m.	L_{eq}	76.6	65.5
3:00 p.m. to 3:59 p.m.	L_{eq}	67.7	65.4
4:00 p.m. to 4:59 p.m.	L_{eq}	68.2	66.2
5:00 p.m. to 5:59 p.m.	L_{eq}	68.5	66.3
6:00 p.m. to 6:59 p.m.	L_{eq}	73.3	65.4
7:00 p.m. to 7:59 p.m.	L_{eq}	67.3	71.4
8:00 p.m. to 8:59 p.m.	L_{eq}	68.8	65.4
9:00 p.m. to 9:59 p.m.	L_{eq}	66.4	64.0
10:00 p.m. to 10:59 p.m.	L_{eq}	66.2	64.6
11:00 p.m. to 11:59 p.m.	L_{eq}	66.1	64.2
Average Daily			
12:00 a.m. to 11:59 p.m.	**L_{dn}[1]**	**74.9**	**70.3**

Notes:
[1] As stated on page 4.6-6 of the Draft EIR, L_{dn} represents the 24-hour L_{eq} with a 10-dB "penalty" for noise events that occur during the noise-sensitive hours between 10 p.m. and 7 a.m. In other words, 10 dB is "added" to noise events that occur in the nighttime hours.
Source: AECOM, 2009

The use of ambulance sirens is common in the proposed LRDP area, and is considered a necessary part of negotiating traffic congestion on local roadways when responding to public needs within an urban environment within appropriate emergency response times. SFFD ambulances deploy, after patient assessment and pickup, to other hospitals near the proposed Cathedral Hill location such as Kaiser's Geary Street facility, St. Francis (especially for burn victims), the existing CPMC Pacific Campus, and, to a lesser extent, Chinese Hospital.

CPMC, as part of the planning process for the proposed LRDP, undertook a comprehensive evaluation of emergency transports associated with the CPMC facilities considered in the LRDP. This evaluation involved the tabulation of all SFFD emergency transports to CPMC campuses between January 1, 2008 and February 2009. This data was then compared against data from a similar study that evaluated the period from January 1, 2004 through February 2005 and used to project emergency calls for service attributable to the CPMC facilities considered as part of the proposed LRDP. It should be noted that the proposed LRDP is not anticipated to increase the total number of emergency transport requests within the City, as those are driven by of San Francisco residents and businesses, and not the location or availability of emergency facilities.

Following the response to a 911 call, the SFFD staff on site will assess the patient's medical conditions, and generally assign one of two code designations to distinguish the type of call for service. The two most common designations are Code 2 and Code 3.

The number of Code 2 responses significantly outnumber Code 3 responses. A Code 2 call for service generally requires an expedited response but does not necessitate the use of sirens and lights from the patient location to a hospital emergency department. A Code 3 response, however, is associated with a potential risk to human life and warrants the use of lights and sirens for the patient's transport. It is only during a Code 3 response that residents and businesses adjacent to the proposed Cathedral Hill Campus would experience potentially elevated noise levels associated with the use of a siren.

Only 3.5 percent to 5.6 percent of the total emergency calls for service to all CPMC facilities between January 2008 and February 2009 were Code 3 responses per the SFFD records supplied for this analysis. This is fewer than two Code 3 emergency transports per day (1.7) that are routed to all CPMC facilities. Furthermore, the Pacific and California Campuses—which together experienced the highest number of existing emergency transports—averaged fewer than one emergency transport per day (0.94) over the 14-month period that was evaluated (approximately 420 days). C&R Table 3.8-2 provides the observed emergency transports associated with CPMC facilities in San Francisco.

C&R Table 3.8-2
Emergency Transports to CPMC Facilities[1]

Facility	Emergency Transports		Percentage of Total Calls for Service that were Code 3
	Code 3	Total	
Pacific/California Campuses	396	7,088	5.6
Davies Campus	111	2,899	3.8
St. Luke's Campus	195	5,623	3.5
Total (across CPMC facilities)	**702**	**15,610**	**4.5**

Note
[1] Data presented in this table corresponds to a 14-month period (420 days) between January 1, 2008 and February 2009. As such, it should be noted that this table presents a greater number of emergency transports than were actually received on an annual basis.
Source: TransOptions4Healthcare. 2011 (February 28). City of San Francisco Fire Department 911 Emergent Transports to CPMC Campuses: 2004, 2008, 2015.

It is expected that the proposed Cathedral Hill Campus would accept the emergency transports currently directed to the Pacific and California Campuses. Based on the projected emergency medical service needs associated with the proposed Cathedral Hill Campus, the number of Code 3 emergency transports which require the use of a siren would average less than 1.5 Code 3 transports per day. This calculation reflects a

high-end estimate (9,562) of the total number of emergency transports projected for the proposed Cathedral Hill Campus in 2015. Assuming that the highest percentage (5.6 percent) shown in C&R Table 3.8-2 of this total would consist of Code 3 emergency transports, up to 535 Code 3 transports could reasonably be anticipated on an annual basis with operation of the proposed Cathedral Hill Campus.

Further, the data provided by TransOptions and summarized above in C&R Table 3.8-2 indicate that approximately 153 of the 702 Code 3 emergency transports to CPMC facilities between January 2008 and February 2009 took place between the hours of 10 p.m. and 7 a.m., considered by most to be the most noise-sensitive period of the day. This equates to approximately 21.8 percent of the total number of Code 3 emergency transports. Applying this percentage to the projected number of annual Code 3 emergency transports at the proposed Cathedral Hill Campus, approximately 117 emergency transports would be reasonably anticipated to occur between the hours of 10 p.m. and 7 a.m. on an annual basis, which is equivalent to fewer than one emergency transport every three nights during the aforementioned period.

Assuming that a receptor in the vicinity of the proposed Cathedral Hill Campus would experience siren-related noise for no more than 15 seconds per emergency transport, L_{dn} noise levels would experience less than a 0.1-dBA increase, and hourly L_{eq} would experience an increase of up to approximately 0.4 dBA, as shown in C&R Table 3.8-3. These estimates are based on the hourly L_{eq} values obtained at Site B on Post Street during noise monitoring conducted for the Draft EIR analysis. Refer to Figure 4.6-3 of the Draft EIR for clarification regarding the selected noise-monitoring location. Furthermore, the estimates provided above represent the greatest potential change in hourly L_{eq} by evaluating siren noise during the quietest observed hourly period along Post Street (59.1 dBA L_{eq}).

As noted above, Post Street and other immediately adjacent roadways such as Van Ness Avenue, Geary Street, and Franklin Street are heavily travelled urban arterials which are regularly travelled by SFPD and SFFD vehicles, and by emergency medical vehicles traveling to emergencies or to existing hospitals.

As described above, the proposed LRDP would add approximately one emergency vehicle travelling under siren and lights (Code 3) per 24-hour day, of which nighttime events would number fewer than one per three nights. While the proposed LRDP would represent an increase in the annual frequency of events, the level of siren-related noise that would be experienced by sensitive receptors located in the vicinity of the proposed Cathedral Hill Campus would not be distinguishable from the level of urban noise in the project vicinity.

The proposed location of the Cathedral Hill Campus is actually more optimal for 911 transports than the Pacific and California Campuses. This is supported by an SFFD-supplied dot map of all 911 incoming transports to the current CPMC campuses where a red letter “N” represents each hospital in San Francisco, not just CPMC campuses. It illustrates that the proposed Cathedral Hill Hospital location is more central to sites of 911 origin than the Pacific Campus. This implies shorter transport times and less SFFD ambulance traffic on streets and roads in 2015 than exists today.

C&R Table 3.8-3
Change in Ambient Noise Levels Associated with Siren Usage in Cathedral Hill Campus Area

	L^{eq}	L^{dn}
Existing[1]	59.1	70.3
With Project	59.5	70.3
Change	*0.4*	*< 0.1*
Significant Impact	No	No

Notes:
[1] Lowest measured hourly L_{eq} was used to allow for the greatest potential change in hourly L_{eq} as a result of a 30-second siren event. Noise measurements taken on May 29, 2009.

Furthermore, as noted on page 4.6-17 of the Draft EIR, it is common for ambulances to discontinue the use of their sirens within a few blocks of emergency access at other hospitals within the City of San Francisco. This is dependent on traffic flow and other factors, and such practice could reasonably be assumed to occur at the proposed Cathedral Hill Campus. As such, in consideration of the potential change in ambient noise levels, the frequency of emergency transports that could occur, and historic

practice by ambulance service providers in the City, impacts would be considered less than significant, consistent with the findings of the Draft EIR.

It should also be noted that in San Francisco ambulance and other emergency medical transport services are regulated by the San Francisco Department of Public Health (SFDPH) and 911 services are provided by the San Francisco Fire Department Division of Emergency Services (EMS), not individual hospitals or health care providers such as CPMC. Any findings and recommendations regarding the use of lights and sirens by emergency providers must first be reviewed and approved by these two city agencies. Any restrictions that could be imposed on the use of ambulance sirens would be in direct conflict with San Francisco Emergency Medical Services (EMS) Agency policy and would violate California Department of Motor Vehicle codes. Healthcare providers like CPMC have no direct authority over a dispatcher or emergency responder's use of sirens.

As such, the level of siren-related noise that would be experienced by receptors located in the vicinity of the proposed Cathedral Hill Campus is similar to the level that currently exists in this part of the City and therefore, would not make the neighborhood less livable, and impacts would be considered less than significant, consistent with the findings of Impact NO-2 (Draft EIR page 4.6-57). See also Response INTRO-6 (page C&R 3.1-11) for a discussion of the requirements for recirculation of an environmental document under CEQA. It should also be noted that the text of the Draft EIR has been amended to reflect the analysis shown above. Please refer to Chapter 4 of this C&R document for further clarification. Please also see page C&R 4-15 for text changes to the Draft EIR, page 4.6-70, last sentence of the last paragraph on the page, which has been amended to include clarification of potential siren noise levels in the vicinity of the proposed Cathedral Hill campus, as requested under Comment 87-60.

Comment

(Margaret Kettunen Zegart, October 20, 2010) [97-19 NO]

"Sirens penetrating the neighborhood and the churches, noises of loading docks and oxygen can be reduced by 9 lower size of Cathedral Hill Hospital complex and the health of neighborhoods. A mitigation to reduce during Sunday worship Sunday services is meaningless since church facilities are used week round by different groups. For example, 5 congregations use space in the Unitarian Universalist sanctuary and center."

Response NO-60

The comment states that sirens, loading docks, and oxygen delivery would disturb places of worship and that the mitigation proposed is insufficient. Siren noise was addressed as part of Impact NO-3 on page 4.6-70 of the Draft EIR; however, additional clarification of the Draft EIR's conclusion of less than significant is provided in Response NO-59 on page C&R 3.8-64. Further, it should be noted that the potential use of sirens in the vicinity of places of worship currently exists in the proposed CPMC LRDP area, and is determined by individual need. With respect to loading/unloading activities at the proposed Cathedral Hill Campus, loading docks would be located inside enclosed structures and would not disturb worship services. Furthermore, as required by Mitigation Measure M-NO-N3e, the delivery of oxygen would be coordinated with local places of worship so that disturbance does not occur, regardless of time or day of worship. Refer to Response NO-40 (page C&R 3.8-49) for further clarification.

Comment

(Lower Polk Neighbors, Oct 19, 2010) [103-20 NO, duplicate comment was provided in 113-20 NO]

"1. Health and Security

A. Sponsor a pilot project for behavioral and technical methods for reducing emergency vehicle (fire and ambulance) siren noise. (see enclosed noise report and health article). In addition, help create a 'siren free' zone. This 'free' zone establishes a 4 block radius around the hospital where emergency vehicles cannot use sirens."

Response NO-61

The comment recommends noise reduction for sirens. See Response NO-59 on page C&R 3.8-64 for a discussion of sirens. Sirens are required to be sounded under law (California Vehicle Code, Section 27000–27007) for emergency operations and have minimum noise requirements:

3.8.2.5 SENSITIVE RECEPTORS

Comment

(Donald Scherl, October 15, 2010) [74-5 NO]

"3.1.5. 'Noise Sensitive Receptors:' With all due respect, it is insulting to refer in the noise section to 'noise sensitive receptors,' when the 'receptors' referred to are PEOPLE whose lives and tranquility will be severely upset by the construction and operation of this huge hospital at Cathedral Hill. There are very large numbers of elderly among those in the noise 'receptor' area. No mitigation factor proposed would in fact alter significantly the noise that would ensue from the proposed construction and operation of the hospital. Under alternative 3A, with the amount of construction reduced a bit, the noise of construction at least would presumably be slightly less."

Response NO-62

The comment states that the use of the term "receptor" to refer to those who would hear noise generated by the proposed CPMC LRDP is inappropriate and that none of the mitigation measures are sufficient for reducing noise. The comment further suggests that Alternative 3A would produce slightly less noise than the proposed LRDP.

The term "sensitive receptor" is employed by experts in the environmental noise industry to describe any person or use that would be sensitive to increased noise or vibration. The range of feasible mitigation measures that are proposed for noise and vibration impacts would reduce noise generated from construction of the proposed Cathedral Hill Campus by approximately 5-8 dB from the anticipated noise levels shown in Table 4.6-22 and would not exceed the noise limits established within the San Francisco Noise Control Ordinance for construction activities (80 dB at a distance of 100 feet or other equivalent noise level at a similarly representative distance between the hours of 7 a.m. and 8 p.m. and 5 dB above ambient at nearby receptors between the hours of 8 p.m. and 7 a.m.). Included in Mitigation Measures M-NO-N1a through M-NO-N1e are requirements that community liaisons and acoustical consultants be continually involved in the construction and operation of the proposed CPMC LRDP to ensure that feasible mitigation measures are undertaken to reduce noise to less-than-significant levels and assist area citizens in resolving noise complaints resulting from perceived violations of the San Francisco Noise Control Ordinance.

With respect to construction of Alternative 3A, a reduction in the overall square footage of the proposed Cathedral Hill Campus—attributed to a reduced building height—would require less construction in terms of overall effort and would reduce the period of time required for construction. However, as noted

on page 6-312 of the Draft EIR, the loudest construction phases (demolition, excavation, and land preparation) would likely require the same amount of time and equipment because the building footprints are similar and the existing structures that occupy the site of the proposed Cathedral Hill Campus would still be demolished. Therefore, the construction of Alternative 3A would not be anticipated to significantly reduce noise levels in the vicinity of the proposed Cathedral Hill Campus when compared to the proposed LRDP, but may reduce the overall time period associated with construction noise.

Comments

(Margaret Kettunen Zegart, October 20, 2010) [97-21 NO]

"The Catholic school complex, Up on Top, and Montessori Schools require minimal noise. New Sutter Health structures are able to provide sound resistant glazing."

(Lower Polk Neighbors, Oct 19, 2010) [103-22 NO, duplicate comment was provided in 113-22 NO]

"Establish a fund to help replace residents' windows with acoustical windows, for units with windows on O'Farrell, Alice B. Toklas/Myrtle, Geary, Cedar, Post, Hemlock, Sutter, Fern, and Pine Streets (on blocks extending from Van Ness to Larkin Street)"

Response NO-63

The comments state that certain land uses, including local schools (Catholic and Montessori) and residences (such as those located along O'Farrell Street, Alice B. Toklas Place/Myrtle Street, Geary Boulevard, Cedar Street, Post Street, Hemlock Street, Sutter Street, Fern Street, and Pine Street) are more sensitive to noise levels than other uses, such as commercial and office buildings and should be considered to receive funding for acoustic shielding of their windows. The Draft EIR acknowledges that residents, places of worship, and schools are sensitive receptors and identifies feasible mitigations that would reduce project-related noise to less-than-significant levels. The requested mitigation of providing sound glazing or sound-dampening windows identified by the commenters is not necessary in order to reduce the impacts of the proposed CPMC LRDP to a less-than-significant level. The proposed CPMC LRDP would design, construct, and maintain the proposed facilities in accordance with the requirements of the San Francisco Noise Control Ordinance so as to not expose adjacent receptors to substantial increases in noise levels, and therefore, mitigation, such as that suggested in the comments, is not required.

3.8.3 PACIFIC CAMPUS

Comment

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-137 NO, duplicate comment was provided in 30-137 NO]

"75. Some Saturdays will also be work days for the CPMC construction. For the Pacific Campus, will there be renovation work on Saturdays near the Congregation Sherith Israel Synagogue (Page 4.1-12)? According to Page 2-5, the renovation of 2018 Webster Street will start in 2015 and last approximately 6 months. On Page 2-121, although the synagogue is not listed as a 'sensitive receptor' for the Pacific Campus project in Table 4.6-36 on Page 4.6-95 because 2018 Webster is not a 'demolition,' I think that the synagogue is a sensitive receptor. Organizations in synagogues usually have Saturday as their religious day. Would the 2018 Webster renovation work not be done on religious service days at the synagogue?"

Response NO-64

The comment inquires about the Congregation Sherith Israel Synagogue and why it is not considered a sensitive receptor in the Draft EIR. The vacant building at 2018 Webster Street (formerly retail use) would be converted to administrative offices (approximately 5,300 square feet) for the Institute for Health and Healing. Although page 4.6-54 states that of long-term projects at the Pacific Campus, construction may occur on select Saturdays from 7 a.m. to 5 p.m., no work related to the conversion of the 2018 Webster Street building to office uses would be scheduled to occur on Saturdays or Sundays. With respect to the comment's statement that the synagogue is not listed as a sensitive receptor, please refer to Response NO-21 (page C&R 3.8-29). As stated in that response, when assessing significance under CEQA, it is considered appropriate to assess the most substantial change that would occur as a result of implementation of a particular project. With respect to construction noise, the impact of the proposed CPMC LRDP as a whole is determined by assessing impacts at those receptors that would be most substantially affected, which typically occurs at those closest to a project site. The receptors identified in Tables 4.6-36 are not all-inclusive but are considered appropriate representative sensitive receptors for the purposes of determining significance. Additional receptors in the project area may experience construction noise generated by the LRDP, but to a lesser degree than those presented because of a variety of factors, including greater distance between source and receptor and intervening structures.

Comment

(Paul Wermer—CPMC Neighbors Coalition and Pacific Heights Residents, October 18, 2010) [67-29 NO]

"Noise issues from all sources—construction activities and routine operations, as well as extraordinary events such as strikes, have resulted in excessive noise. Absent detailed plans for Pacific site, it is not possible to assess this in the DEIR."

Response NO-65

The comment states that noise from construction and operation of the Pacific Campus, including worker strikes, have historically resulted in excessive noise. The comment further states that more detailed site plans are necessary to accurately evaluate the potential noise impacts of the proposed CPMC LRDP. Noise generated at the Pacific Campus is discussed at the program level in Impacts NO-1 through NO-5 on pages 4.6-79 to 4.6-82. The program-level portions of the Draft EIR contain analysis and evaluation at an appropriate level of detail; changes to the Pacific Campus would not occur until after 2015. Under CEQA, encouragement is provided to conduct environmental analysis at the earliest possible stage in project development. In program-level EIRs (as is the analysis of the Pacific Campus in the Draft EIR, impact analysis and the identification of mitigation is required only as far as is feasible based on the amount of detail currently known about the project. Because certain aspects of the project description are expected to be unknown, the preparation of a program-level EIR anticipates that there will be subsequent CEQA environmental analysis on the later details of project design, and that the subsequent analysis would contain any additional mitigation required at that time. A separate project-level CEQA analysis would be performed in the future once more detailed plans have been developed, and would be commensurate with the level of detail required for approval, in accordance with the comment's request.

Comment

(Arthur and Jacqueline Cimento, October 19, 2010) [78-6 NO, duplicate comment was provided in 99-6 NO]

"As a minimum, we expect the facility will comply with existing noise regulations at the property boundary."

Response NO-66

The comment states that noise levels from the Pacific Campus should meet noise standards at the property boundary. As stated in Impacts NO-1 through NO-4, noise associated with the proposed LRDP would, after the mitigation measures have been incorporated, meet the standards and requirements of the San Francisco Noise Control Ordinance. As a result, noise impacts at the Pacific Campus would be less than significant with mitigation.

3.8.4 CALIFORNIA CAMPUS

Comment

(Joel Koppell, September 19, 2010) [PC-223 PD]

"I did want a couple of items addressed, specifically, which has happened, CPMC actually reached out to me and personally worked at the California campus and Pacific campus for years at a time as a foreman inside wireman, and day in and day out had noticed that there were some issues with the loading dock in these locations, and I want for my own sake to be comfortable speaking to you tonight to know that those issues will be handled."

Response NO-67

The comment is a statement regarding existing issues with the loading docks at both the California and Pacific Campuses. Neither construction activities nor new loading dock operations are proposed for the California Campus under the CPMC LRDP. The Draft EIR discussed proposed noise impacts related to loading dock operations at the Pacific Campus (please see Draft EIR, pages 4.6-80 through 4.6-82) and determined that implementation of the proposed CPMC LRDP at the Pacific Campus would not cause a substantial increase in ambient noise levels as a result of loading dock activities. This comment does not raise issues regarding the adequacy, accuracy, or completeness of the Draft EIR. The comment will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project.

3.8.5 DAVIES CAMPUS

No comments pertaining to noise and solely related to this campus were received during public review of the Draft EIR.

3.8.6 ST. LUKE'S CAMPUS

3.8.6.1 CONSTRUCTION NOISE

Comment

(Sheila Mahoney and James Frame, October 19, 2010) [88-1 NO]

"We own and live in our home just across the street from St. Luke's Monteagle Building and parking garage. The DEIR so-called analysis of the impacts on Duncan Street is entirely inadequate. It even identifies our unit block as a 'sensitive receptor,' but mislabels it as '1600-1700 Duncan' (see Tables 4.6-24 and 4.6-35). The various

analyses mainly focus on the two busy (freeway-like) junctions of Cesar Chavez with Guerrero and Valencia—not our quiet residential block of Duncan.

Frankly I'm not surprised, because from the convening of the Blue Ribbon Panel until recently (with the release of the DEIR), the adjoining neighbors have been ignored."

Response NO-68

The comment states that noise and vibration impacts would occur at their home on Duncan Street and that the analysis of the Draft EIR is inadequate for not considering receptors along Duncan but focusing solely on busier streets, such as Cesar Chavez, Guerrero, and Valencia. Duncan Street is recognized as having sensitive receptors, and noise levels and mitigation are presented for this location in Section 4.6 in the Draft EIR, which includes discussions of the St. Luke's Campus and associated Impacts NO-1 through NO-5. During construction, residences along Duncan Street between Guerrero and Valencia Streets would experience construction noise levels equivalent to 69 dB, which would be less than the 80 dB maximum noise level/threshold established in the San Francisco Noise Control Ordinance, and impacts were determined to be less than significant. With respect to operational noise, Table 4.6-28 evaluates the potential increases in roadway noise levels along Duncan Street between Guerrero and Valencia Streets and determined, based on projected roadway volumes, that receptors along Duncan Street would experience up to a 0.1 dBA increase in L_{dn}, which would be considered less than significant (i.e., it would not exceed 3 dB, which would be considered a perceivable increase.) With respect to stationary source operational noise, these noise levels are evaluated at the source, not the receptor, and mitigation measures were imposed in order to insure that noise levels in excess of the standards established in the San Francisco Noise Control Ordinance do not expose adjacent receptors, including those along Duncan Street, to substantial increases in ambient noise levels. As it pertains to vibration, the 0-100 block of Duncan Street was evaluated for potential impacts resulting from project construction in Table 4.6-35 of the Draft EIR, page 4.6-92. As shown in this table, construction-related vibration associated with implementation of the proposed CPMC LRDP would not expose receptors along Duncan Street to vibration thresholds associated with potential structural damage or human annoyance. As such, the analysis of the Draft EIR evaluates the potential impacts to the 0-100 block of Duncan Street and is considered adequate for the purposes of CEQA. See also Response INTRO-6 for a discussion of adequacy of analysis under CEQA.

The comment is correct that the block adjacent to the St. Luke's Campus was mislabeled in Tables 4.6-24 and 4.6-35 of the Draft EIR. These tables have been amended as part of the Final EIR to reflect "0-100 Duncan Street." This change is included in the Section 4, "Draft EIR Text Changes," of this document.

Comment

(Rachel Sater—Lost Block and Save Our Streets, October 19, 2010) [101-31 NO]

"Page 4.6-52, Impact NO-1: The DEIR indicates that construction work would occur Monday through Friday, 7:00 a.m. to 5:00 p.m. except holidays, but may continue to 8:00 p.m. on weekdays and Saturdays. The DEIR then states that work may occur on Saturdays but would stop at 5:00 p.m., if needed. These confusing inconsistencies need to be corrected. Additionally, Mitigation Measure M-NO-N1 for construction noise allows for nighttime construction. Would there be a possibility of nighttime construction at the St. Luke's campus? This must be clarified."

Response NO-69

The comment states that construction operation hours are inconsistent and should be clarified. Work shifts at the St. Luke's Campus would be from 7 a.m. to 5 p.m. Monday through Friday and from 7 a.m. to 5 p.m. on select Saturdays, with no work conducted on Sundays. No work past 5 p.m. would occur at the St.

Luke's Campus. Nighttime construction at the St. Luke's Campus is not proposed. As part of Mitigation Measure M-NO-N1, area residences would have access to a community liaison for information and to discuss construction issues. Notifications of construction schedules would be provided as requested. In order to clarify the proposed construction hours at the St. Luke's Campus, the first paragraph on page 4.6-52 is revised to read as follows:

> The proposed St. Luke's Replacement Hospital would be completed and occupied by 2015. As stated above, the loudest construction noise would occur during excavation, land preparation, and demolition. Demolition would include removal of trees and pavement at the existing parking lot. Excavation of a pit for the hospital foundation and lower floor would follow and include removal of 15,200 cubic yards of material. About 7,800 cubic yards of soils would be excavated and hauled away for the utilities. Thus, the loudest noise during construction of the St. Luke's Replacement Hospital would occur in the first 20 months. The next phases of activities (structural work, exterior finishing, and interior finishing) would occur for 32 months, and would have lower noise levels, because activities would be shielded by the structure and use of heavy-duty construction equipment would be limited. Demolition of the existing St. Luke's Hospital tower would occur during the last 5 months. All construction work for the proposed St. Luke's Replacement Hospital is proposed to occur between 7 a.m. and 5 p.m., Monday–Friday, excluding holidays~~. Work may continue to 8 p.m. on typical work days and select Saturdays, as required. Saturday shifts would be from 7 a.m. to 5 p.m., if needed.~~ Construction may also occur on select Saturdays from 7 a.m. to 5 p.m., if needed. Work is not expected to be done on Sundays. The hours of operation would vary slightly during the project's various stages. Construction of the MOB/Expansion Building would begin after the St. Luke's Replacement Hospital construction is completed. Excavation for the MOB/Expansion Building would be much deeper than that for the St. Luke's Replacement Hospital, with removal of 42,000 cubic yards of soil.

Comment

(Rachel Sater—Lost Block and Save Our Streets, October 19, 2010) [101-32 NO]

"Page 4.6-52, Impact NO-1: The City's Noise Ordinance is not an adequate significance criterion given the level and duration of project-related noise exposure, the sensitivity of the affected uses, and inherent flaws in the applicability of the Ordinance to the St. Luke's campus and Lost Block neighborhood situation."

Response NO-70

The comment states that the San Francisco Noise Control Ordinance is not adequate as the basis for noise impact standards because of the level and duration of the project effects and because of the sensitivity in the vicinity of the St. Luke's Campus. The San Francisco Noise Control Ordinance is used as the basis for thresholds of significance and for impact analysis consistently across the City. Reliance on the City's Noise Control Ordinance together with the temporary and intermittent nature of construction noise is considered a valid and appropriate justification for the conclusion that construction noise would be contained to the extent practicable. This is comparable to other construction projects in the City, and less than significant, when mitigation measures are incorporated into the project to further reduce construction noise impacts on surrounding properties.

It should also be noted that while the construction activities or equipment at any of the sites to be developed under the proposed CPMC LRDP may not be unique or atypical, it is also true that the proposed CPMC LRDP is a large project and that construction activities will continue for extended periods of time. Nevertheless, construction noise would remain a temporary impact, as opposed to an ongoing operational impact. The noise levels identified under Impact NO-1 of the Draft EIR, beginning on page 4.6-41, would not occur for the entire construction period, nor would they occur at any one location for the entire construction period. These activities would be intermittent and temporary; athough,

as acknowledged in the Draft EIR, they would occur over the course of the construction period. See Responses NO-8 and NO-13 on pages C&R 3.8-6 and 3.8-20, respectively, for further clarification regarding the appropriateness of the thresholds established in the City's Noise Control Ordinance.

Comment

(Rachel Sater—Lost Block and Save Our Streets, October 19, 2010) [101-33 NO]

"It is not clear where the construction equipment were assumed to have been placed for the noise modeling. This must be clarified. No existing noise measurements were taken adjacent to residential uses on 27th Street, Guerrero Street, Cesar Chavez Street, San Jose Avenue or Duncan Street. What is the basis for determining the baseline existing conditions against which to compare the project effects?"

Response NO-71

The comment states that the assumed location of noise-generating construction equipment is unclear and that the assessment of existing ambient noise levels is insufficient. Construction noise levels (L_{eq}) were assessed by locating noise-generating equipment at a measured distance of approximately 30 feet from the property boundary in addition to the distance from the property boundary to nearby sensitive receptor locations. As the majority of construction activities would occur more central to a particular development site, the use of 30 feet from the property boundary is considered conservative in that it accounts for multiple pieces of equipment operating simultaneously at that location, and based on the size of each proposed development site, the ability for two pieces of equipment to operate simultaneously in one location is limited.

Contrary to the claim of the comment, existing ambient noise levels were established from short-term measurements taken on Valencia and Cesar Chavez Streets (in May and June 2009, respectively) and from review of the San Francisco Department of Public Health (SFDPH) noise map (see discussion on page 4.6-29 of the Draft EIR) and are considered representative of ambient noise levels in the project area. The short-term noise measurements were used to confirm the noise levels shown in the SFDPH noise map because traffic noise was determined to be the dominant noise source in the project vicinity. If the short-term measurements had differed substantially from the levels shown in the SFDPH noise map, additional monitoring at the locations suggested by the comment would have been warranted and performed as part of the Draft EIR analysis. Both Cesar Chavez Street and Guerrero Street are four-lane streets that carry a considerable amount of daily traffic, exposing residences to traffic noise from both roadways.

Comment

(Rachel Sater—Lost Block and Save Our Streets, October 19, 2010) [101-34 NO]

"Construction at the St. Luke's campus would occur continuously for at least seven years, including approximately four years for the replacement hospital and an additional approximately three years for the medical office building. Many homes on 27th Street, Guerrero Street and Cesar Chavez Street are located immediately adjacent to the construction site for the replacement hospital and thus would be continuously exposed to excessive noise levels for at least four years. Given the utilities work within the rights-of-way of 27th Street, Guerrero Street and Cesar Chavez Street, they would be effectively surrounded by construction noise on all sides. Exposure to noise levels up to (and exceeding, as explained below) 80 dB for up to 13 hours per day for up to four years or more could not reasonably be considered a less-than-significant impact.

Moreover, the Noise Ordinance standard of 80 dB at 100 feet means numerous residences within 100 feet of the project site would continue to experience unacceptable noise levels above 80 dB, up to 13 hours per day for approximately four years. Nearly the entire new replacement hospital building would be located within 100 feet of

the western property line and the abutting residences on 27th Street, Guerrero Street and Cesar Chavez Street. Therefore, all replacement hospital construction activities would occur within 100 feet of these noise-sensitive residences. According to the analysis in the DEIR, all of these homes would likely still be subject to noise levels exceeding 80 dB even with the identified mitigation up to 13 hours per day for approximately four years or more. These construction noise effects clearly amount to a significant unavoidable impact requiring recirculation and evaluation of alternatives to the proposed project that would move the replacement hospital at least 100 feet away from sensitive residential uses immediately adjacent to the construction site.

The DEIR evaluation of construction noise impacts at the Cathedral Hill campus says a City permit would be needed for nighttime construction and obtaining the permit would make the impact less than significant. However, the issuance of a permit would not avoid or reduce the physical impact and the adverse health effects experienced. The DEIR should correctly disclose this impact as significant and unavoidable. Would there be a possibility of nighttime construction at the St. Luke's campus? If so, that must be disclosed and evaluated."

Response NO-72

The comment states that the Draft EIR is insufficient in its analysis of construction noise impacts, specifically at the St. Luke's Campus and proposed Cathedral Hill Campus, and that obtaining a special permit from the City is not sufficient to mitigate impacts to a less-than-significant level. Mitigation measures for construction noise would result in a noise reduction of 5–8 dBA and the only exterior work proposed at any campus that would require a permit to operate outside the hours of 7:00 a.m. to 8:00 p.m. would be certain construction work related activities for the Van Ness Tunnel at the proposed Cathedral Hill Campus. Nighttime work is not proposed at the St. Luke's Campus and construction work is anticipated to be conducted during daytime hours only.

While the construction activities or equipment at any of the sites to be developed under the proposed CPMC LRDP may not be unique or atypical, it is true that the proposed CPMC LRDP is a large project and that construction activities will continue for extended periods of time. Nevertheless, construction noise would remain a temporary condition, as opposed to an ongoing operational condition. The noise levels identified under Impact NO-1 of the Draft EIR, beginning on page 4.6-41, would not occur for the entire construction period, nor would they occur at any one location for the entire construction period. These activities would be intermittent and temporary, though, as acknowledged in the Draft EIR, would occur over the course of the construction period.

The Draft EIR acknowledges that noise from construction would be potentially significant without mitigation; however, with the implementation of Mitigation Measure M-NO-N1, noise from construction would be reduced to a less-than-significant level. Installing temporary barriers around the construction site parcels would effectively reduce construction noise levels by 5–8 dBA at adjacent residences. Sound attenuating devices for stationary equipment would provide additional construction noise level reductions. Incorporating these mitigation measures into the proposed LRDP would effectively reduce construction noise levels to less than the 80 dB at 100 feet threshold established by the San Francisco Noise Control Ordinance. It should be noted that, as stated in Response NO-8 (page C&R 3.8-6) and as permitted by the San Francisco Noise Control Ordinance, an equivalent noise level at some other convenient distance equates to a noise threshold of 86 dB at 50 feet and 74 dB at 200 feet for compliance with the City's noise standards. It should also be noted that the noise levels evaluated in the Draft EIR represent the noisiest activities on site and within an average distance of 30 feet from the project boundary. This is considered a conservative evaluation of potential impacts as the majority of daily construction activities between 7 a.m. and 7 p.m. would be located at a much greater distance than that from a particular receptor. Additional discussion of potential construction noise levels during the limited nighttime construction period at the proposed Cathedral Hill Campus and further justification for the determination of a less than significant impact with respect to construction noise can be found in Responses NO-8 and NO-13 on pages C&R 3.8-6 and 3.8-20, respectively.

Mitigation of Construction Noise

Comment

(Rachel Sater—Lost Block and Save Our Streets, October 19, 2010) [101-35 NO]

"Page 4.6-53: There is insufficient evidence to demonstrate the effectiveness of mitigation measure M-NO-N1 in reducing construction noise levels to within City Noise Ordinance levels. The mitigation measure contains vague and unenforceable language that renders it ineffective, such as 'as far as feasible,' 'for extended periods,' 'best available, 'where feasible." Mitigation measure M-NO-N1b, community liaison, calls for reoccurring complaints to be evaluated by a qualified acoustical consultant. However, reoccurring is not defined and would presumably be left to the construction contractor or CPMC to define. Measure Nc says that noise may 'exceed standards and result in complaints,' yet action would only be taken if there are complaints, presumably reoccurring complaints, at each individual construction phase. If these mitigation measures cannot be shown to be effective, they may not be relied upon to reduce impacts in the impacts analysis."

Response NO-73

The comment states that mitigation measures for construction noise are vague, unenforceable, and insufficient. Mitigation measures for construction noise would result in a noise reduction of 5–8 dBA, and construction noise levels would be restricted to the parameters established by the City of San Francisco Noise Control Ordinance. The Draft EIR acknowledges that noise from construction would be significant; however, by implementing Mitigation Measure M-NO-N1, noise from construction would be reduced to a less-than-significant level. Recognizing that there are certain uncertainties regarding construction noise, Mitigation Measure M-NO-N1c requires ongoing monitoring at new phases of construction, and the identification and implementation of additional noise-mitigating measures if the monitoring measurements indicate that construction noise exceeds City standards. The mitigation measures listed in the Draft EIR require proper maintenance of on-site equipment (to be stated in construction specifications and monitored/enforced by the construction contractor and the City), idling restrictions (to be stated in construction specifications and BAAQMD rules and monitored/enforced by the construction contractor and the City), staging of equipment away from receptors (to be stated in construction specifications and monitored/enforced by the construction contractor and the City), erection and maintenance of temporary noise barriers between local receptors and construction activities (to be stated in construction specifications and monitored/enforced by the construction contractor and the City.) The level of specifity provided is appropriate and typical at this stage of project review (i.e., prior to final project consideration/decision or permit issuance.) Each of these measures are considered enforceable and feasible for the purposes of yielding quantifiable reductions in ambient noise levels, which, when monitored, would yield between 5–8 dBA reductions in construction noise levels, depending on the location of the receptor. Further discussion can be found in Response NO-8 on page C&R 3.8-6.

3.8.6.2 NOISE MEASUREMENTS

Comment

(Rachel Sater—Lost Block and Save Our Streets, October 19, 2010) [101-30 NO]

"Page 4.6-29: The noise measurements used to characterize the baseline and calibrate the noise models are inadequate. Only two noise measurements were conducted. No 24-hour noise measurements were conducted, only far less accurate 15-minute noise measurements. Additionally, the two noise measurements were taken on Cesar Chavez and Valencia Street, which is not representative of the more noise-sensitive, quieter residential noise environment along 27th Street, San Jose Avenue and Duncan Street. The two 15-minute noise measurements therefore represent an inadequate baseline against which to evaluate impacts, particularly with the DEIR application of narrow significance thresholds of 3 dB and 5 dB to this substantial, complex use with multiple,

discrete, noise-generating activities operating 24 hours per day within the midst of a noise-sensitive residential neighborhood and immediately adjacent to several homes. Additional noise measurements must be taken to increase the accuracy of the baseline and the analysis must be revised and recirculated."

Response NO-74

The comment states that existing ambient noise measurements are insufficient for the St. Luke's Campus. The noise measurements conducted at the St. Luke's Campus were consistent with traffic noise modeling results and with the SFDPH noise map, and therefore, are considered representative of ambient noise levels in the project area and reasonable for the purpose of impact determination. The short-term noise measurements conducted as part of the Draft EIR analysis were used to confirm the noise levels shown in the SFDPH noise map because traffic noise was determined to be the dominant noise source in the project vicinity. If the short-term measurements had differed substantially from the levels shown in the SFDPH noise map, additional monitoring at the locations suggested by the comment would have been warranted and performed as part of the Draft EIR analysis. As such, the two short-term noise measurements with verification via the SFDPH map represent an adequate baseline against which to evaluate impacts, therefore, additional noise measurements, including 24-hour measurements at and around the St. Luke's Campus, are not required to adequately evaluate the potential noise impacts of the proposed CPMC LRDP at this location.

3.8.6.3 OPERATIONAL NOISE

Ambulance Entrance/Exit

Comments

(Rachel Sater—Lost Block and Save Our Streets, October 19, 2010) [101-5 NO]

"Therefore, the impact assessment, and in particular, the analysis of noise impacts and the conclusion of less-than-significant noise impacts related to the emergency department and loading area, are based on incorrect plans and must be revised accordingly."

(Rachel Sater—Lost Block and Save Our Streets, October 19, 2010) [101-15 NO]

"Page 4.1-62: The analysis of the Alternate Emergency Department Variant is deficient for the same reasons outlined above. Additionally, the analysis of the variant indicates that relocating the emergency department to Cesar Chavez Street would reduce ambulance siren noise impacts on residences. However, this conclusion ignores the immediately adjacent homes to the west on Cesar Chavez Street. In addition, this conclusion contradicts the discussion on page 4.1-61 which relies on the claim that normal practice is to turn ambulance sirens off within a few blocks of the hospital, in order to reach a conclusion of a less-than-significant impact. Further, the analysis does not indicate if turning sirens off is required by law or hospital policy. If not, it is not a reliable basis for a conclusion of less-than-significant impact. Notably, this practice is not identified in Section 4.6, Noise."

(Rachel Sater—Lost Block and Save Our Streets, October 19, 2010) [101-38 NO]

"The location of the emergency department and associated ambulance bay considered in the noise analysis (Figure 4.5-26) differs from the location shown in Figure 2-59, St. Luke's Campus-Proposed Site Plan, Figure 2-60, St. Luke's Campus Variant I—Alternate Emergency Department Location, as well as Figures 2-63 and 2-64 (elevations), 2-68 and 2-69 (sections), and 2-71 and 2-72 (floor plans), and 2-77 (landscape plan), in Chapter 2, Project Description. Therefore, the analysis of noise impacts and the conclusion of less-than-significant impacts are based on incorrect plans."

Response NO-75

The comments state that the noise impact assessment for the St. Luke's Campus used different site plans for assessment of loading dock and ambulance bay noise than those presented in the Project Description of the Draft EIR (Figures 2-59 and 2-60, Draft EIR pages 2-197 and 2-199, respectively). On pages 4.6-76 through Page 4.6-78 of the Draft EIR, the potential impacts to surrounding receptors caused by loading dock and ambulance bay noise are discussed and evaluated under both the currently proposed site plan and variant conditions. Current site plans (as shown in Figure 2-59, Draft EIR page 2-197) were used during the analysis of impacts; the figure referenced by the comment (Figure 4.5-26, Draft EIR page 4.5-207) was not used to determine the noise impacts associated with the St. Luke's Hospital Proposed Site Plan or St. Luke's Campus Variant 1-Alternate Emergency Department presented in the Draft EIR. Furthermore, the discrepancies cited by the commenter pertain to the addition of a second lane for ingress/egress into the emergency department and the extension of a pedestrian loading/unloading area. These changes would not affect the analysis presented on pages 4.6-76 through Page 4.6-78 of the Draft EIR as they do not represent a change in capacity or future activities beyond those identified within the text of the Draft EIR. The figure cited by the comment is located in the transportation and traffic section of the Draft EIR and has been amended as shown in Chapter 4 of this C&R document to be consistent with Figure 2-59 of the Draft EIR.

Loading docks would be located in an internal area on Level 1 of the north side of the building, with access to Cesar Chavez Street, and have operable bay doors. The analysis of loading dock noise on page 4.6-76 of the Draft EIR determined that operation of the loading dock (48 to 53 dBA L_{eq}) would not exceed applicable standards at sensitive receptors. Short-term measurements conducted along Caesar Chavez Street measured the dominant noise source—traffic—at 64.6 dBA L_{eq}. Because the loading dock would be located inside of the building, would include operable bay doors, and would face Caesar Chavez Street (perpendicular to adjacent residences), loading dock noise would be minimal. Loading dock noise would travel in the direction of Caesar Chavez Street. The existing noise level attributed to traffic on Cesar Chavez Street is 11 to 16 dBA above predicted loading dock noise at adjacent residences; therefore, any loading dock noise would likely be masked by existing and future traffic noise.

Ambulance bay noise is evaluated on Page 4.6-77 of the Draft EIR. Ambulance sirens are not expected to be required when in close proximity of residences along 27th Street as they would be entering the hospital at this poin,t and the need to use a siren for traffic control purposes would be considered minimal. Furthermore, use of a siren would not be required for ambulances idling or parked at the hospital. Noise associated with ambulance bays would be generated by patient drop-off events consisting of vehicle arrival, idling, occupants exiting the vehicle, door closures, conversations among passengers, occupants entering the vehicle, startup, and departure of the vehicle. As noted in Response NO-59 on page C&R 3.8-64, ambulance noise, including siren use, would not exceed applicable City standards and would not increase ambient noise levels by 8 dBA at adjacent sensitive receptors, in accordance with the San Francisco Noise Control Ordinance. The potential for random siren use does exist; however, these events would be isolated and short term, and would not result in a substantial increase in the 24-hour land use compatibility noise metric (L_{dn}) applied at residential uses because of the anticipated isolated and infrequent occurrence of such events. The existing Emergency Department (located in St. Luke's 1957 Building) is accessed from 27th Street or San Jose Avenue, and the implementation of the proposed LRDP would result in similar noise conditions for residences located along 27th Street and San Jose Avenue.

Comment

(Rachel Sater—Lost Block and Save Our Streets, October 19, 2010) [101-36 NO]

"Pages 4.6-74 through 4.6-79: Each noise source (increases in traffic, stationary equipment, air handling equipment, cooling towers, emergency generators and exhaust fans, parking garage activities, passenger and

shuttle drop-offs, loading dock and delivery activity, bulk liquid oxygen delivery, waste disposal activity, and ambulance entrance/exit activity) was considered individually. The DEIR omits evaluation of the additive noise levels of all of these new and additional noise sources together. This piecemeal approach substantially underestimates the noise impacts of the project and represents an inadequate evaluation under CEQA. This evaluation must be revised to consider the aggregate impacts of these noise sources."

Response NO-76

The comment states that project-generated noise from various transportation and stationary noise sources should be analyzed together. Because stationary noise sources are separated by frequency spectrum, height, distance, barriers, and enclosures, their combined noise levels would be similar to individual noise levels. Similarly, transportation noise levels are inherently different from stationary noise levels (line source versus point source) and cannot be combined because of location, frequency, and intervening structures. Furthermore, stationary noise sources are evaluated using an hourly standard while transportation noise sources are evaluated using a 24-hour standard.

Comment

(Rachel Sater—Lost Block and Save Our Streets, October 19, 2010) [101-37 NO]

"Page 4.6-77 and 4.6-78: The DEIR assumes that, except for sirens, emergency department and ambulance entrance/exit noise would be the same as typical parking lot noise. This is an inappropriate assumption. Ambulance entrance/exit noise is different than typical parking lot activity in terms of the size and type of vehicle, number of people, equipment, involvement of loud diesel vehicles, possible use of sirens, and frequency of activity, and also involves noise transmitted from the interior of the emergency department out the building doors.

The DEIR states that the ambulance entrance/exit would be located across the street from residential uses, but ignores the immediately adjacent residential uses to the west on the same side of the street. The analysis must be revised to reflect these immediately adjacent residential uses."

Response NO-77

The comment states that the noise characteristics of ambulance loading and unloading, even without the use of sirens, would not be comparable to parking lot noise as stated in the Draft EIR, and that the proposed St. Luke's Replacement Hospital patient loading zone should be analyzed for adjacent sensitive receptors. Ambulance bay activities are assumed to be similar to parking lot noise because of the nature of the events. These would be short-term events because of the urgency to get the patient into the hospital. See Response NO-59 on page C&R 3.8-64 for further clarification. Furthermore, as shown in Figure 2-59, Draft EIR page 2-197, the ambulance bay would be located on Level 2, underneath the diagnostic and treatment unit. This location would block the open emergency doors from the sight of adjacent residences, as well as reduce idling noise levels at these locations. Impact NO-3 discussed the effect of the proposed St. Luke's Replacement Hospital patient loading zone on the nearest sensitive receptors and determined the impact to be less than significant. Therefore, impacts to any other sensitive receptors at farther distances would also be less than significant.

3.8.6.4 SENSITIVE RECEPTORS

Comment

(Rachel Sater—Lost Block and Save Our Streets, October 19, 2010) [101-29 NO]

"Page 4.6-27: The Existing Noise- and Vibration-Sensitive Land Uses discussion omits mention of residences on 27th Street or Cesar Chavez Street. Additionally, it incorrectly states that '[t]he closest of these residences are along San Jose Avenue and Duncan Street across from the St. Luke's campus, approximately 75 feet from campus buildings.' In fact, the nearest residential noise-sensitive receptors are located immediately adjacent to the campus on the west, on 27th Street, Guerrero Street and Cesar Chavez Street. The analysis must be revised accordingly."

Response NO-78

The comment states that sensitive receptors on 27th Street and Cesar Chavez have not been identified by the Draft EIR. While receptors on 27th Street and Cesar Chavez are not explicitly stated in the environmental setting, they are assessed in the impact analysis (see Tables 4.6-24 and 4.6-35 of the Draft EIR). The text in the Draft EIR, page 4.6-27, the second sentence of the second full paragraph, has been amended to reflect the inclusion of residential uses along 27th Street and Cesar Chavez Avenue in the Draft EIR analysis as follows:

> The noise- and vibration-sensitive land uses located near the campus are the surrounding residential buildings and units on San Jose Avenue and <u>Cesar Chavez, 27th,</u> Duncan<u>,</u> and Guerrero Streets.

3.9 AIR QUALITY

3.9.1 LRDP

3.9.1.1 CONSTRUCTION EMISSIONS

Comment

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-5 AQ, duplicate comment was provided in 30-5 AQ]

"What are the additional ROG, NO_x, PM_{10} and $PM_{2.5}$ emissions that will be generated from this crane? or [sic] from a helicopter should one be used? In conjunction with the already calculated amounts that will impact air quality in the CPMC project area, what is the additional amount of fuel/energy expended for this task?"

Response AQ-1

The comment requests additional information regarding potential air emissions associated with the use of a crane or helicopter during LRDP-related construction (at various CPMC campuses) to install rooftop equipment. Emissions generated by cranes used during LRDP construction (including the installation of rooftop equipment at Cathedral Hill, Davies, and St. Luke's Campuses) were included in the Draft EIR construction air quality analysis, and as such, would not result in additional emissions beyond those already acknowledged in the Draft EIR. See Table 4.7-12 in the Draft EIR, page 4.7-63, for a summary of the criteria pollutant emissions that would occur during LRDP construction at Cathedral Hill, Davies, and St. Luke's Campuses, including the operation of a crane.

The use of a helicopter is not part of the plan for construction of any of the proposed LRDP facilities and, therefore, was not included in the EIR analysis.

Comment

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-134 AQ, duplicate comment was provided in 30-134 AQ]

"Also, if the construction workers are riding these shuttles, what measures will be taken to mitigate the potentially hazardous effects of construction debris or dust on the workers from being spread onto the shuttles and into the enclosed structured garages?"

Response AQ-2

This comment requests information about measures that would be employed to reduce the amount of construction debris or dust being spread by workers for development of the LRDP (at various CPMC campuses). During LRDP construction, to limit potential exposure of construction workers to dust and/or other construction debris, standard construction practices related to dust suppression would be implemented and monitored, as required by Mitigation Measure M-HZ-N1a in the Draft EIR, beginning on page 4.16-46. Furthermore, Mitigation Measures M-HZ-N1a and M-HZ-N1b would require sampling of potential contaminants before excavation, to ensure that soil could be transported directly off-site rather than stockpiled on site. If contaminated soils were discovered, they would be treated as hazardous material in accordance with the site mitigation plan required by Mitigation Measure M-HZ-N1a, and removed from the site (Cathedral Hill, Davies, and St. Luke's Campuses) using special handling procedures. This approach would minimize worker exposure on site.

Additionally, Mitigation Measure M-AQ-N1a would require the regular removal of visible mud or dirt trackout onto adjacent public roads by the use of street cleaning equipment. All paved access roads, parking areas, and staging areas for development of the LRDP (at various CPMC campuses) would be swept daily to minimize potential dirt trackout. Implementation of these measures would prevent the migration of construction debris and dust by construction workers or otherwise into surrounding areas, including shuttles and enclosed structured garages.

Comment

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [37-8 AQ]

"10. Additional analysis needed for greenhouse gas emissions, air quality impacts when lanes of traffic and parking closed and unknown number of parking spaces removed from existing conditions for construction as well as the proposed 3,890 overall number of parking spaces total proposed that will be inadequate for all CPMC campus parking lots with the projected number of almost 800+ construction workers at peak and existing patient visitor and staff parking without considering future FTE hiring projected to hit over 10,700+ by 2030. As a note the **CU asks for 513 parking spaces at the CH Hospital but the 14 van spaces are not included in this total…so it sh/b 527.**"

Response AQ-3

This comment requests additional analysis for greenhouse gas emissions, air quality impacts associated with street lane and parking closures, and existing and proposed parking spaces. The construction emissions analysis for the LRDP for all CPMC campuses accounts for criteria pollutant emissions and greenhouse gas (GHG) emissions associated with worker vehicles as they travel to and from the LRDP construction sites. In addition, the LRDP operational emissions analysis for all CPMC campuses accounts for criteria pollutant emissions and GHG emissions associated with future employee commuting. As noted in the Draft EIR, page 4.5-162, any "environmental impacts which may result from a shortfall in parking in the vicinity of the proposed project would be minor, and the traffic assignments used in the transportation analysis, as well as in the associated air quality, noise, and pedestrian safety analyses, reasonably addresses potential… effects." This would include potential impacts during LRDP construction. Furthermore, as noted in the Draft EIR, page 4.5-166, "[t]he secondary effect of drivers searching for parking is typically offset by a reduction in vehicle trips due to some drivers, who are aware of the constrained parking conditions in a given area, shifting to other modes." Therefore, mode shifts by commuters to and from CPMC facilities would offset any potential additional emissions associated with vehicles that might travel additional distances while searching for a parking space. See also Response TR-69 (page C&R 3.7-129) for a discussion of operational parking provisions and Response TR-79 (page C&R 3.7-149) for a description of construction parking demand and availability and current plans for addressing parking needs during LRDP construction. Furthermore, lane closures that may occur during LRDP construction would be coordinated and planned through the Construction Transportation Management Plan for each CPMC campus to maintain the flow of traffic in and around the proposed LRDP development at various CPMC campuses. As noted in Chapter 2, "Project Description" in Table 2-5 (see page 2-21 of the of the Draft EIR), 513 structured parking spaces are proposed for the Cathedral Hill Hospital. The loading spaces for the proposed Cathedral Hill Hospital, which includes 14 van spaces, would not be included in the required number of off-street parking spaces.

Comments

(Helene Dellanini—Daniel Burnham Court Master Owner's Association, October 18, 2010) [71-20 AQ, duplicate comment was provided in 72-20 AQ]

"**AQ-2: Construction activities associated with the LRDP would expose sensitive receptors to substantial concentrations of toxic air contaminants.**

AQ-2 Comment: The DEIR's analysis of construction-related emissions did not consider the significant impacts related to toxic substances contained in the project's fill soil made air born by earthwork operations. Although BAAQMD best practices are required to a certain degree, they do not guarantee that air born dust will not migrate beyond project site boundaries. Section 4.16.1 reported that the Phase II ESA identified lead in the fill soil which would require disposal off-site as a hazardous waste. Lead-tainted air born dust particles exposed to nearby residents, including the elderly and children, throughout the 5 years of construction, must be evaluated and appropriate mitigation measures prescribed."

(Helene Dellanini—Daniel Burnham Court Master Owner's Association, October 18, 2010) [71-21 AQ, duplicate comment was provided in 72-21 AQ]

"M-AQ-N1a: Although the DEIR has prescribed the BAAQMD's best practices for dust mitigation, unfortunately the practical reality on a construction site is that if the measures are not enforced on a daily basis then they are not effective. We recommend the following additional requirements:

- The BAAQMD's optional and additional measures should be made mandatory. Wheel washing and suspending operations during gusty winds are considered minimum best practices in the industry for controlling dust migration off site. In addition, all stock piles that are not in use for more than 2 days should be tarped and covered.

- The City shall assign an inspector to monitor the project during earthwork operations to enforce the required mitigation measures. CPMC should be required to reimburse the City for the direct costs associated with the onsite inspector.

- CPMC's Dust Management Plan shall include total particulate dust monitoring at its site boundary and adjacent residential property boundaries. Continuous measurements shall be taken throughout demolition until building erection. CPMC should be required to retain the services of a third party environmental consultant to conduct the testing and evaluation of data, as well as establish a threshold of particulate dust concentration consist with BAAQMD regulation and the toxicity of any hazardous substances (such as lead) found in the fill material. Results should be reported to the City on a weekly basis and construction operations found to generate dust above the concentration threshold shall be suspended until mitigations are made."

Response AQ-4

The comments refer to management of the potential generation and off-site migration of airborne dust during LRDP construction activities at various CPMC campuses involving fill soil that might contain elevated levels of lead. The Draft EIR adequately and accurately assessed the potential effects of construction-generated airborne dust from the proposed LRDP.

In clarifying the analysis contained in the Draft EIR, several items should be noted. First, soil excavation at the proposed Cathedral Hill Campus would occur during fewer than 10 months of the total 4.5-year construction period. Second, several of the construction air quality mitigation measures proposed in the comment are already incorporated in the CPMC LRDP Draft EIR and the September 2009 Environmental Contingency Plan (ECP), for the proposed Cathedral Hill Medical Campus.

Comment 71-21 expresses concerns regarding enforcement of mitigation measures at the proposed construction sites and recommends specific additional requirements. With respect to the commenter's enforcement concern, the discussion provided in the Draft EIR, page 4.7-30, states, "[t]o ensure that BAAQMD's Basic and Optional Control Measures included in the project's construction management plan would be legally binding under CEQA, these measures have been included as Mitigation Measure M-AQ-N1a." Mitigation Measure M-AQ-N1a (in the Draft EIR, beginning on page 4.7-31) would require the proposed LRDP to implement BAAQMD's Basic Control Measures, Optional Control Measures, and Additional Construction Mitigation Measures (as specifically set forth in the Draft EIR, pages 4.7-31 through 4.7-32) at the proposed Cathedral Hill Campus, as well as at all other CPMC sites of near-term projects under the proposed LRDP. Therefore, the inclusion of BAAQMD's Optional Control Measures and Additional Construction Mitigation Measures in Mitigation Measure M-AQ-N1a makes these measures mandatory, consistent with the commenter's recommendation.

The comment recommends wheel washing and suspending operations during gusty winds as "minimum best practices" for controlling dust migration. As stated on page 4.7-30 of the Draft EIR, the Operational Control Measures required under Mitigation Measure M-AQ-N1a include the following: "Install wheel washers for all exiting trucks, or wash off the tires or tracks of all trucks leaving the site" and "Suspend excavation and grading activity when winds (instantaneous gusts) exceed 20 mph." Additionally, as explained on page 4.7-33 of the Draft EIR, all requirements of the San Francisco Construction Dust Control Ordinance would also be implemented as part of the project, per CPMC"s construction management plan. As stated on page 4.7-19 of the Draft EIR, installation of wheel washers to clean truck tires and termination of construction activities when winds exceed 25 mph are measures that are required to be included in the site-specific dust control plan that must be approved by the director of the San Francisco Department of Public Health pursuant to the Construction Dust Control Ordinance. Therefore, these measures have been included and made mandatory as part of Mitigation Measure M-AQ-N1a and would also be included in CPMC's construction management plan as required to comply with the City's Construction Dust Control Ordinance.

The commenter also recommends that all stockpiles that are not in use for more than two days should be tarped and covered. This recommendation is not included in Mitigation Measure M-AQ-N1a. The Construction Dust Control Ordinance requires that inactive stockpiles be tarped and covered when not in use for more than seven days, rather than two days. A more stringent requirement for tarping and covering stockpiles is not required because, as explained on pages 4.7-33 and 4.7-61 of the Draft EIR, implementing Mitigation Measures M-AQ-N1a and M-AQ-N1b at the proposed Cathedral Hill Campus, as well as the Davies and St. Luke's Campuses, would reduce fugitive dust impacts to a less-than-significant level under both the 1999 and 2010 BAAQMD CEQA Guidelines. As shown in the updated version of Table 4.7-12 included in Chapter 4, "Draft EIR Text Changes" of this Comments and Responses document (page C&R 4-92), after implementation of the mitigation measures identified in the EIR, PM_{10} and $PM_{2.5}$ emissions associated with construction at the Cathedral Hill Campus each would be reduced to 1.8 lbs/day, well below the BAAQMD significance threshold under the 2010 BAAQMD CEQA Guidelines of 82 lb/day for PM_{10} and 54 lb/day for $PM_{2.5}$. Further, overall emissions from the proposed near-term projects at the Cathedral Hill, Davies, and St. Luke's Campuses would be reduced to 2 lbs/day for both PM_{10} and $PM_{2.5,}$ well below the BAAQMD significance thresholds. Therefore, the additional mitigation suggested by the commenter is not necessary in order to reduce the project's impacts related to construction dust to a less than significant level.

The commenter recommends that the City assign an inspector to monitor the project during earthwork operations to enforce the required mitigation measures. An additional inspector to monitor earthwork is not necessary because the Construction Dust Control Ordinance already requires a designated dust control monitor and because, as explained above, the mitigation measures included in the Draft EIR will be mandatory and enforceable conditions of approval. The Construction Dust Control Ordinance requires that the project sponsor designate a person or persons who will be responsible for monitoring compliance

with dust control requirements. The designated person(s) must be on the site or available by telephone or other means during all times that site preparation, demolition, or construction activities may be in progress. Upon receipt of complaints, the Director of Building Inspection may enforce the provisions of the Construction Dust Control Ordinance by any lawful means available, and the Department of Building Inspection has established a fee for compensating the Department for the costs of enforcement.

The commenter also recommends that CPMC's dust management plan should include total particulate dust monitoring, with continuous measures taken throughout demolition until building erection, retention of a third party environmental consultant to conduct the testing and evaluation of data, to establish thresholds of particlute dust conscetration and the toxicity of any hazardous substances found in the fill material, and to report results to the City on a weekly basis, with construction operations generating dust above the threshold suspended until mitigations are added. Monitoring and reporting of particulate dust from construction in this manner would go beyond the requirements of the mitigation measures identified in the Draft EIR and the San Francisco Construction Dust Control Ordinance. As explained above, these requirements are not necessary because the EIR air quality analysis has determined that with the imposition of Mitigation Measures M-AQ-N1a and M-AQ-N1b, particulate matter emissions from construction of the near-term projects under the LRDP would be well below the BAAQMD significance thresholds.

Furthermore, the Environmental Contingency Plan ("ECP") for the project would require that the performance of dust control measures related to hazardous substances found in fill material be observed and documented by a third party. As explained in the Draft EIR, page 4.16-43, to address potential hazards related to known contaminated soil and groundwater conditions at the proposed Cathedral Hill Campus, including earthquake fill containing elevated levels of lead at the proposed Cathedral Hill Hospital and Cathedral Hill MOB development sites (see Draft EIR, page 4.16-42), the Phase I/II environmental site assessments (ESAs) for these sites recommended the preparation of an ECP for the Cathedral Hill Campus. The ECP that has been prepared for these LRDP development sites specifically addresses the management of potential health impacts associated with chemically impacted soil, including lead. The ECP states that a health and safety plan would be prepared by a certified industrial hygienist for implementation by the site contractor and would address potential threats to the health and safety of both site construction workers and the public during LRDP related excavation and grading. Air monitoring would be implemented, if required, by the Health and Safety Plan. The ECP also states that dust suppression measures would be implemented when chemically impacted soil was being managed; these measures might include wetting or treating with dust suppressants, covering stockpiles when not being actively worked, and covering of surfaces of impacted soil when not being worked.

Additionally, Mitigation Measure M-HZ-N1a, as set forth in the Draft EIR, beginning on page 4.16-46, would require the ECP to be submitted to the San Francisco Department of Public Health (SFDPH) for review and approval as a site mitigation plan (SMP) for the proposed Cathedral Hill Campus. The SMP would need to include certain measures and procedures specified in the Draft EIR, pages 4.16-46 to 4.16-47, including a requirement that "[f]ill shall be sampled and analyzed before excavation to allow excavation, loading, and transportation off-site without stockpiling, which would minimize soil handling." Mitigation Measure M-HZ-N1a also includes requirements for the handling, hauling, and disposal of contaminated soils, including specific requirements for work practices, dust suppression, surface water runoff control, and soils replacement. Finally, Mitigation Measure M-HZ-N1a would require the project sponsor to prepare and submit a closure/certification report to SFDPH after LRDP construction activities at Cathedral Hill Campus were complete. The report would need to include the mitigation measures in the SMPs for handling and removing contaminated soils from the Cathedral Hill Campus development, a discussion of whether the construction contractor modified any of these mitigation measures, and how and why any such modifications occurred. The Draft EIR concluded on page 4.16-49 that "adherence to the site-specific health and safety plans (i.e., the ECP and SMP) and

implementation of Mitigation Measure M-HZ-N1a would reduce impacts related to known soil . . . conditions at the Cathedral Hill, Davies, and St. Luke's Campuses to a less-than-significant level."

Comment

(Donald Scherl, October 18, 2010) [74-28 AQ]

"4.7: Air Quality

Impact AQ-l: The draft EIR states that construction 'fugitive dust' will not increase. However, in the accompanying table, this is listed as PS (potentially significant). Common sense would tell you there will be a large increase in ambient dust. Among the mitigation actions listed is limiting idling time of machines to 5 or 2 minutes 'to the extent feasible [who decides what is feasible?].' This really means that CPMC construction can pollute the air with fugitive dust at will. That is not acceptable."

Response AQ-5

The comment requests clarification regarding fugitive dust emissions during construction and how the feasibility of limiting the idling time is determined. The Draft EIR does not claim that there would be no increase in fugitive dust, but rather, that the proposed LRDP would not generate increases in fugitive dust that would exceed the BAAQMD CEQA significance criteria used in the Draft EIR (1999 BAAQMD Guidelines).

Fugitive dust emissions are associated with earth movement and not with machine engine idling time. It is important to note that BAAQMD 1999 significance thresholds assessed potential construction impacts of a project based on fugitive dust control measures, as noted in the Draft EIR, page 4.7-30. In an effort to further reduce construction emissions, the Draft EIR included mitigation (i.e., idling restriction) as part of Impact AQ-1 (Draft EIR, page 4.7-29) that was not solely related to a reduction in fugitive dust emissions. Please see Response AQ-4 (page C&R 3.9-3) regarding fugitive dust mitigation, Response AQ-28 (page C&R 3.9-71) regarding truck idling controls, and Response AQ-9 (page C&R 3.9-17) regarding construction equipment mitigation measures.

With respect to the length of time that a particular piece of equipment would be permitted to idle and who determines whether it would be 5 or 2 minutes, a 5-minute limit on equipment idling time, as stated in Mitigation Measure M-AQ-N1a on Draft EIR page 4.7-32, is required by Title 13, Section 2485 of the California Code of Regulations (CCR). In order to further reduce potential criteria pollutant emissions associated with fuel use, a 2-minute limit on equipment idling time would be implemented to the extent feasible. The on-site construction contractor would be responsible for enforcing the 5-minute restriction in compliance with CCR requirements and for determining the feasibility of implementing the 2-minute idling restriction measure. The degree of feasibility of this measure will be largely determined by the type of equipment in question and the activity that is being undertaken at that time.

Comments

(Carolynn Abst and Ron Case—Case + Abst Architects LLP, October 19, 2010) [102-2 AQ, duplicate comment was provided in 114-2 AQ]

"A. We have one operable window on our 1st [office] floor for fresh air/air circulation for the entire office. The operable window is adjacent to new MOB site.

In summary, we are seriously concerned about:

1. The loss of the use of this window due to construction dust. [health issue]

2. The loss of the use of this window due to construction noise. [health and work issue]

3. The loss of the use of this window in order to keep out exhaust fumes from construction truck traffic and trucks and vans idling while waiting to be sequenced into the construction site for pick-up or delivery of materials. [health and work issues]

4. The loss of ventilation to the conference room and office in general. [health and work issue]

5. Uncomfortable raised temperatures at interior spaces due to the need to close this window due to noise and dust and exhaust fumes. [health and work issue]

6. The loss of natural light to the conference room due to the amount of construction dust on the window. [health issue]."

(Lower Polk Neighbors, October 19, 2010) [103-2 AQ, duplicate comment was provided in 113-2 AQ]

"Comments directed at the construction effects to our Neighborhood and Community:

A. In the immediate area of the Cathedral Hill Campus (within a few surrounding blocks) we are concerned about the following -

1. The loss of the use of operable windows due to construction dust. [health issue]

2. The loss of the use of operable windows due to construction noise. [health and work issue]

3. The loss of the use of operable windows due to the need to keep out vastly increased exhaust fumes from cars and trucks on Geary, Van Ness, Cedar, Polk, and Post Streets. [health and work issue]

4. The loss of the use of operable windows to prevent heat gain and to provide adequate ventilation to the residents and businesses in general due to the need to close windows due to vastly increased noise and dust and exhaust fumes from cars and trucks on Geary, Van Ness, Cedar, Polk, and Post Streets. [health and work issue]"

"F. Even with shuttles being available for construction workers they will need to drop off their equipment and tools at the site. This additional traffic noise, vehicle exhaust, and dirt will be a burden placed on our residences and businesses. [health and work issue]"

(Carolyn Abst and Ron Case—Case + Abst Architects LLP, October 19, 2010) [102-4 AQ, duplicate comment was provided in 114-4 AQ]

"We are also concerned with the conclusions contained throughout the draft EIR's Air Quality section with respect to the Cathedral Hill project. Generally, it appears that the conclusion that a number of the impacts will be reduced to a less than significant level appears cursory and based on impacts over a larger region. Our property's location on Cedar Street will result in a number of these 'less than significant' impacts still having potentially significant impacts on our health, our business and our property.

For example, mitigation measures for Impact AQ-1 and AQ-8 identify actions to reduce fugitive dust before trucks leave the Cathedral Hill MOB construction site. Although this dust reduction could potentially reduce overall impacts for the area, the actions do not appear to reduce those impacts for residences and businesses located in immediate proximity to construction sites. It appears that the majority of the fugitive dust reduction measures would not lessen the impact to properties in close proximity to the construction sites, but rather only for those potential impacts realized from trucks transporting the fugitive dust."

(Carolyn Abst and Ron Case—Case + Abst Architects LLP, October 19, 2010) [102-6 AQ, duplicate comment was provided in 114-6 AQ]

"These conclusions are particularly concerning given the location of our property. Not only is our property directly across the street from the future Cathedral Hill MOB construction site, it is also downwind of the majority of the Cathedral Hill construction. As a result, all significant air impacts will directly affect our business and residence. Further, as mentioned above our business has one operable window on the Cedar street level that provides the entire office with ventilation. We do not have an internal air circulation system. We rely on the natural wind patterns to provide air circulation for the business. As a result, all potentially harmful air pollutants would be carried into our business. Given the potential harmful effects of the air quality impacts, the apparently small amount of mitigation measures for these significant but unavoidable impacts is troubling for our health and business."

Response AQ-6

The comments express concerns regarding fugitive dust as a result of the LRDP's Cathedral Hill Campus construction and construction-related traffic. Impacts TR-55 through TR-58 (in the Draft EIR, beginning on page 4.5-147) address impacts from construction traffic. Impacts AQ-1 and AQ-8 (in the Draft EIR, beginning on pages 4.7-29 and 4.7-59, respectively) address impacts associated with dust generated by construction. Impacts NO-1 and NO-5 (in the Draft EIR, beginning on pages 4.6-41 and 4.6-89, respectively) address noise and groundborne vibrations that would be caused by construction. The evaluation of air quality impacts (Impact AQ-1) concludes that implementation of all feasible

construction dust control measures would reduce impacts related to construction fugitive dust emissions to less-than-significant levels. Therefore, the proposed LRDP would not create adverse health effects related to fugitive dust emissions, and no reason exists that windows could not be left open; however, individual residents might want to keep their windows closed to reduce perceived noise, exhaust, and dirt. For a discussion of potential construction-related concerns about health risks from equipment exhaust at Cathedral Hill Campus under the LRDP, please see Responses AQ-9 (page C&R 3.9-17) and AQ-10 (page C&R 3.9-20).

Furthermore, the significance conclusions for the proposed Cathedral Hill Campus and all existing CPMC campuses were based on guidance and significance thresholds developed by the applicable air quality management district (i.e., the BAAQMD). As discussed in the Draft EIR, the 1999 and 2010 BAAQMD CEQA Guidelines recommend that all projects implement a minimum level of fugitive dust mitigation to reduce impacts to less-than-significant levels. The Draft EIR prescribes Mitigation Measure M-AQ-N1a (in the Draft EIR, beginning on page 4.7-31) to reduce impacts related to Cathedral Hill Campus construction-related fugitive dust emissions to less-than-significant levels, which would fulfill the requirements of the 1999 and 2010 BAAQMD CEQA Guidelines. Therefore, pursuant to the BAAQMD guidance, Impact AQ-1 and AQ-8 would be considered less-than-significant impacts.

Mitigation Measures M-AQ-N1a, M-AQ-N1b, and M-AQ-N2 (in the Draft EIR, beginning on page 4.7-35) would reduce on-site construction-related air quality impacts to receptors adjacent to the proposed Cathedral Hill Campus as well as receptors in proximity of LRDP development sites. Measures contained within Mitigation Measure M-AQ-N1a would require best management practices (BMPs) for actions occurring on these development sites as well as transport of soil materials to off-site locations. Mitigation of fugitive dust and exhaust emissions on Cathedral Hill development sites would reduce the amount of air pollutant emissions dissipating from these development sites that could affect nearby receptors. Therefore, the on-site mitigation measures also would reduce construction air quality impacts on residents and businesses located in immediate proximity to Cathedral Hill construction sites under the LRDP.

With respect to the potential for the accumulation of off-site debris, as discussed under Impact UT-6 in the Draft EIR, page 4.12-37, solid waste, such as wood, scrap metal, or plasterboard that would be generated at the CPMC campuses during LRDP-related demolition of existing structures on site and the construction of new structures would be transported off-site and delivered to a registered construction recycling facility. Trucks carrying this type of debris would have their loads covered or tied down to prevent spillage onto streets surrounding LRDP development sites. Furthermore, as noted in the Draft EIR, pages 4.7-31 and 4.7-32, surrounding streets would be maintained regularly as part of Mitigation Measure M-AQ-N1a to ensure that debris, fugitive dust, or other loose material from construction activities associated with the proposed LRDP would not accumulate on local roadways.

In addition, Mitigation Measure M-HY-N3 (in the Draft EIR, beginning on page 4.15-36) would require CPMC to submit a storm water pollution prevention plan (SWPPP) for each LRDP construction site before initiating construction activities. The SWPPPs would employ best management practices (BMPs) to minimize erosion and discharge of sediment from LRDP construction sites. Vehicle and equipment washing would take place on the construction sites, and tracking controls would be used to stabilize the LRDP construction site entrances to prevent tracking of sediment onto public roads by construction vehicles. Therefore, the potential for accumulated debris and fugitive dust to occur near each proposed construction site under the LRDP would be minimal with implementation of the mitigation measures listed in the Draft EIR.

In addition, the project sponsor has committed to implementing the BAAQMD's Basic and Optional Dust Control Measures from the 1999 CEQA Guidelines and the BAAQMD's 2010 Basic Construction Mitigation Measures, which would be provided by Mitigation Measures M-AQ-N8a and M-AQ-N8b in the Draft EIR, page 4.7-60. As discussed in Impact AQ-1 and Impact AQ-6 (in the Draft EIR, beginning

on page 4.7-53), construction activities would be intermittent, temporary, and short-term in nature. Therefore, it is unlikely that a constant plume of exhaust emissions and fugitive dust would be generated from Cathedral Hill development sites throughout the entire Cathedral Hill Campus construction period. Rather, construction emissions would occur incrementally throughout the construction period and would cease following buildout of the Cathedral Hill Campus. The incremental generation of emissions would allow emissions to be diluted and transported with varying wind directions and speeds. The nature of construction emissions (i.e., intermittent, varying locations on Cathedral Hill development sites, at various intensities) would also cause them to occur such that a single source in proximity to Cathedral Hill development would not be exposed to 100 percent of all emissions.

The comments also state concerns regarding potential construction noise impacts on local receptors that open their windows. Please see Response NO-10 on page C&R 3.8-15 for a discussion of how the construction of the proposed Cathedral Hill Campus would not exceed San Francisco Noise Control Ordinance standards. In addition, the comments state that additional traffic congestion that would occur in the vicinity of the proposed Cathedral Hill Campus could impact local receptors. Please see Response TR-31 on page C&R 3.7-53 for a discussion of potential traffic congestion in the vicinity of the proposed Cathedral Hill Campus.

Comment

(Carolyn Abst and Ron Case—Case + Abst Architects LLP, October 19, 2010) [102-13 AQ, duplicate comment was provided in 114-13 AQ]

"F. The entire building is a major economic investment for us; the building will be coated with construction dirt and dust damaging the finishes [roof. walls and windows] and hastening the durable life of the building and its components. [economic issue]"

Response AQ-7

The comment states that 1033-37 Polk Street will be coated with construction dirt and dust, which would damage the finishes of the existing structure and hasten the durable life of the building and its components. As is described in detail in Response AQ-4 (page C&R 3.9-3), implementation of Mitigation Measure M-AQ-N1a (in the Draft EIR, beginning on page 4.7-31) would reduce construction-related fugitive dust to a less-than-significant level through the implementation of an array of measures to control construction-generated particulate matter. These measures would prevent dust that could result from construction of the proposed Cathedral Hill MOB from affecting buildings in the vicinity. Because the effects would be less-than-significant, no evidence is shown in the record to substantiate that adverse fugitive dust effects would occur to nearby buildings and their building systems, such as HVAC.

The durable life of a building is a social and economic issue. Under CEQA, social and economic effects are evaluated only insofar as they provide a linkage between the proposed project and significant adverse environmental effects or are used to measure the significance of an adverse physical effect. No evidence is shown in the record to support the assertion that construction dust and other emissions would lead to short- or long-term business disruption, vacancies, or building abandonment. As such, the concern about the durable life of buildings is a purely social and economic matter and not subject to analysis under CEQA. Please also see Response INTRO-7 (page C&R 3.1-17) regarding the appropriate considerations of social and economic impacts under CEQA, and Response PH-14 (page C&R 3.5-53) in regards to business displacement and commercial impacts.

3.9.1.2 CONSTRUCTION-RELATED TOXIC AIR CONTAMINANTS

Comments

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-84 AQ, duplicate comment was provided in 30-84 AQ]

"48. Page S-65, Impact AQ-2 states 'Construction activities associated with the LRDP would expose sensitive receptors to substantial concentrations of toxic air contaminants (1999 BAAWMD [sic] Guidelines)' and indicates that there will be 'significant and unavoidable' impact at the Cathedral Hill Campus projects. The mitigation measure, M-AQ-N2 states that 'emission control devices on construction equipment' by 'making every reasonable effort to ensure that all construction equipment used at these campuses would use equipment that meets the DPA [sic] Tier 4 engine standards for particulate matter and NOx control (or equivalent) throughout the entire duration of construction activities, to the extent that equipment meeting the DPA [sic] Tier 4 engine standards is available to the contractor at the time construction activities requiring the use of such equipment occur.'"

(Nihonmachi Terrace, October 18, 2010) [75-2 AQ]

"Air quality for our senior residents is also of major concern since our buildings are not part of a closed circulation system. Those with respiratory and other medical problems could have their situation seriously compromised. Therefore mitigation measures to assure healthy air quality for our residents is essential.

Enclosed please find a petition signed by residents of Nihonmachi Terrace looking for your help in finding a reasonable solution. We hope that you will recognize our need and take serious consideration in assisting our community.

Should you have any questions, please feel free to contact the management office at (415) 346-1200. We look forward to your response."

(Sheila Mahoney and James Frame, October 19, 2010) [88-5 AQ]

"For example, Impact AQ-10 regarding short-term increases in emissions of diesel particulate matter (page 4.7-65) which is rated as <u>significant and unavoidable with mitigation</u> is paramount to this household of seniors, since one of us is asthmatic."

(Gloria Smith—California Nurses Association, October 19, 2010) [90-78 AQ]

"**4. The DEIR Lacks Effective Measures to Mitigate the Project's Health Impacts Related to Toxic Emissions from Diesel-Powered Construction Equipment**

The Project would be built out over a period of 20 years employing a variety of diesel-powered construction equipment such as air compressors, backhoes, cranes, delivery trucks, dozers, drill rigs, excavators, generators, fork-lifts, tractors, loaders, rollers, scrapers, water trucks, paving equipment, pile drivers, rollers, etc. In addition, the Project would be constructed concurrently with many other construction projects in the City and the region. During this time, heavy-duty diesel-powered construction equipment would emit considerable amounts of diesel particulate matter, which would travel into nearby residential areas, increase ambient concentrations of this carcinogen, and result in adverse health impacts.

Diesel exhaust emitted from this equipment is a complex mixture of gaseous and solid materials. The visible emission in diesel exhaust are known as diesel particulate matter ('DPM'), which includes carbon particles or 'soot.' Diesel exhaust also contains a variety of harmful gases and over 40 other known cancer-causing substances and is estimated to contribute to more than 75% of the added cancer risk from air toxics in the United States. Diesel exhaust has been linked to a range of serious health problems including an increase in respiratory disease, lung damage, cancer, and premature death. Fine diesel particles are deposited deep in the lungs and can result in

increased respiratory symptoms and disease; decreased lung function, particularly in children and individuals with asthma; alterations in lung tissue and respiratory tract defense mechanisms; and premature death.[45]

The DEIR acknowledged that diesel particulate matter is a toxic air contaminant and carcinogen. It further acknowledged that lifetime cancer risks for child exposure at all five Project campuses attributable to construction equipment diesel exhaust would greatly exceed the significance threshold of ten in one million adopted by the Bay Area Air Quality Management District ('BAAQMD').[46]

[45] California Air Resources Board, Health Effects of Diesel Exhaust; http://www.arb.ca.gov/research/diesel/diesel-health.htm, accessed July 22, 2010; California Air Resources Board, Initial Statement of Reason for Rulemaking, Proposed Identification of Diesel Exhaust as a Toxic Air Contaminant, Staff Report, June 1998.

[46] The excess lifetime cancer risk due to diesel exhaust emissions during construction of the Cathedral Hill Campus is estimated at 111 in one million. Draft EIR, Table 4.7-14, at page 4.7-67 (the table fails to include "per million"), and Memorandum from Sharon Libicki, Elizabeth Miesner, Michael Keinath, and Jennie Louie, ENVIRON, to Vahram Massehian, Sutter Health, Re: CPMC Construction Health Risk Analysis, July 2, 2010; provided as administrative record PDF file "33 08010089.AQ.ENVIRON.2010."

(Gloria Smith—California Nurses Association, October 19, 2010) [90-79 AQ]

"To mitigate this significant health risk, the DEIR proposed to implement essentially one mitigation measure to reduce diesel-caused particulate matter:[47]

- Implement Accelerated Emission Control Device Installation on Construction Equipment. To minimize the potential impacts on residents living near the CPMC campuses from the construction activities in that area, CPMC shall make reasonable efforts to ensure that all construction equipment used at these campuses would use equipment that meets the EPA Tier 4 engine standards for PM and NOx control (or equivalent) throughout the entire duration of construction activities, to the extent that equipment meeting the EPA Tier 4 engine standards is available to the contractor at the time construction activities requiring the use of such equipment occur.[48]

This measure is wholly inadequate because even the DEIR acknowledged that the above measure was unlikely to reduce carcinogenic risks, because it is unknown whether such equipment would even be available by Project construction. Worse, the measure is vague and unenforceable because it only requires CPMC to 'make reasonable efforts' to mitigate toxic emissions.

[47] *See* DEIR pp. 4.7-36 – 4.7-37, M-AQ-N10a, M-AQ-10b, M-AQ-10c, and M-AQ-L10, which are identical to mitigation measure N-AQ-N2 and M-AQ-N9.

[48] Draft EIR at pages 4.7-36 – 4.7-37."

(Gloria Smith—California Nurses Association, October 19, 2010) [90-80 AQ]

"A revised EIR must include recently adopted BAAQMD measures that are much more stringent than the above measure for reducing construction equipment exhaust. These include:

- Project plans demonstrating that the off-road equipment (more than 50 horsepower) to be used in the construction project (i.e., owned, leased, and subcontractor vehicles) would achieve a project wide fleet-average 20 percent NOx reduction and 45 percent PM reduction compared to the most recent California Air Resources Board fleet average. Acceptable options for reducing emission include the use of late model engines, low-emission diesel products, alternative fuels, engine retrofit technology, after-treatment products, add-on devices such as particulate filters, and/or other options as such become available.

- Requiring that all construction equipment, diesel trucks, and generators be equipped with Best Available Control Technology for emission reductions of NOx and PM.

- Requiring all contractors use equipment that meets CARB's most recent certification standard for off-road heavy duty diesel engines.[49]

These mitigation measures are feasible and must be required to reduce the Project's significant health risks associated with diesel particulate matter emissions from construction equipment exhaust.

[49] Bay Area Air Quality Management District, California Environmental Quality Act, Air Quality Guidelines, June 2010, Table 8-3, page 8-5."

(Gloria Smith—California Nurses Association, October 19, 2010) [91-3 AQ]

"As discussed in my comments below, the Draft EIR is not adequately documented, internally inconsistent, and its analyses of the Project's impacts on air quality and global climate change are severely deficient. In addition, even though the Draft recognizes significant adverse impacts on air quality and global climate change, it fails to propose all feasible mitigation as required by CEQA."

(Gloria Smith—California Nurses Association, October 19, 2010) [91-53 AQ]

"**VII. The Draft EIR Fails Adequately Mitigate Significant Health Risks Associated with Toxic Air Contaminant Emissions from Diesel-Powered Construction Equipment**

The Project would be built out over a period of 20 years employing a variety of diesel-powered construction equipment such as air compressors, backhoes, cranes, delivery trucks, dozers, drill rigs, excavators, generators, fork lifts, tractors, loaders, rollers, scrapers, water trucks, paving equipment, pile drivers, rollers, etc."

(Gloria Smith—California Nurses Association, October 19, 2010) [91-54 AQ]

"Diesel exhaust emitted from this equipment is a complex mixture of gaseous and solid materials. The visible emissions in diesel exhaust are known as diesel particulate matter ('DPM'), which includes carbon particles or 'soot.' Diesel exhaust also contains a variety of harmful gases and over 40 other known cancer-causing substances and is estimated to contribute to more than 75% of the added cancer risk from air toxics in the United States. Diesel exhaust has been linked to a range of serious health problems including an increase in respiratory disease, lung damage, cancer, and premature death. Fine diesel particles are deposited deep in the lungs and can result in increased respiratory symptoms and disease; decreased lung function, particularly in children and individuals with asthma; alterations in lung tissue and respiratory tract defense mechanisms; and premature death.[59, 60]

[60] California Air Resources Board, Initial Statement of Reasons for Rulemaking, Proposed Identification of Diesel Exhaust as a Toxic Air Contaminant, Staff Report, June 1998."

(Gloria Smith—California Nurses Association, October 19, 2010) [91-55 AQ]

"On August 27,1998, after extensive scientific review and public hearing, the California Air Resources Board ('CARB') formally identified particulate emissions from diesel-fueled engines as a toxic air contaminant ('TAC'), regulated pursuant to Health and Safety Code section 39650 et seq.[61] In May 2002, the U.S. EPA, after another exhaustive review, concluded that 'long-term *(i.e.,* chronic) inhalation exposure is likely to pose lung cancer hazard to humans, as well as damage the lung in other ways depending on exposure. Short-term *(i.e.,* acute) exposures can cause irritation and inflammatory symptoms of a transient nature... The assessment also indicates that evidence for exacerbation of existing allergies and asthma symptoms is emerging.'[62]

Lagging emission standards and very old equipment in the fleet have made construction equipment one of the largest sources of toxic diesel particulate matter (soot) pollution in California. An estimated 70% of California's construction equipment is currently not covered by federal and state regulations because it is too oId.[63] Clouds of soot emitted with the exhaust from construction equipment can travel downwind for miles, then drift into heavily populated areas.

An analysis by the Union of Concerned Scientists found that air pollution from construction equipment is already taking a staggering toll on the health and economic wellbeing of Californians. For the San Francisco Bay Area Air Basin, 2005 estimates for health and economic damage from construction equipment emissions included 154 premature deaths, 117 hospitalizations for respiratory and cardio-vascular disease, almost 3,500 incidences of asthma attacks, acute bronchitis, and other lower respiratory symptoms, about 25,700 days of lost work, about 18,500 school absences, and almost 170,000 restricted activity days. This loss of life and productivity cost South Coast Air Basin residents an estimated $1.2 billion.[64] These estimates are conservative because they do not include emissions from a large number of smaller construction projects (residential and commercial and projects smaller than one acre in size and because multi-story buildings were treated as one-story buildings). Further, John Hakel, Vice President of the Associated General Contractors, an organization representing construction equipment fleet owners and general contractors, indicated that the analysis appeared to underestimate the sheer volume of construction equipment in use.[65]

The entire City of San Francisco including the Project site is located in the highest risk zone (dark red) for construction equipment emissions, as shown in Figure 7.[66]

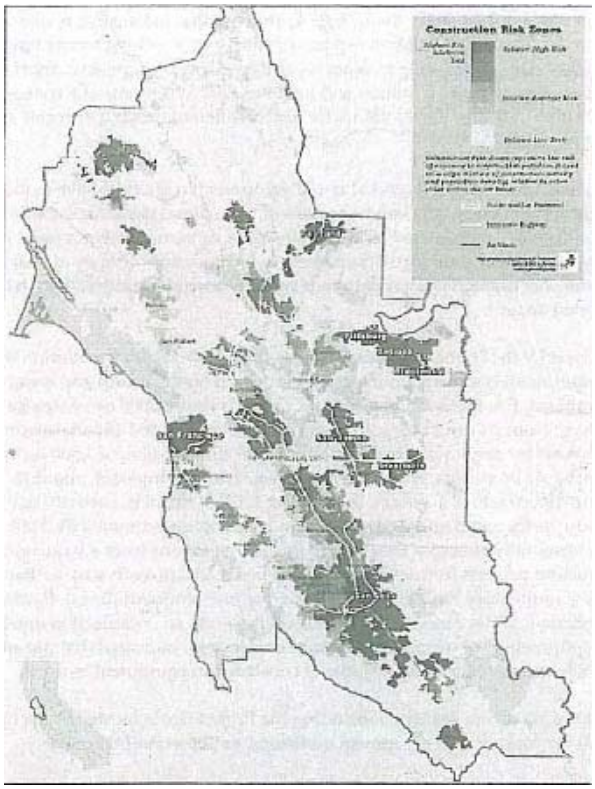

Figure 7: Construction Pollution Health Risk in the San Francisco Bay Area Air Basin

From: Union of Concerned Scientists, Digging Up Trouble, The Health Risk of Construction Pollution in California, November 2006: http://www.ucsusa.org/assets/documents/clean_vehicles/digging-up-trouble.pdf

The Project would be build out over a period of two decades, concurrently with many other construction projects in the City and the region. During this time, heavy-duty diesel-powered construction equipment would emit considerable amounts of diesel particulate matter, which would travel into nearby residential areas, increase ambient concentrations of this carcinogen, and result in adverse health impacts.

[66] *Ibid*, p. 13."

(Gloria Smith—California Nurses Association, October 19, 2010) [91-56 AQ]

"The Draft EIR recognizes that diesel particulate matter is a toxic air contaminant and carcinogen and finds that excess lifetime cancer risks for child exposure at all campuses attributable to construction equipment diesel exhaust emissions would by far exceed the significance threshold of ten in one million adopted by the BAAQMD CEQA Guidelines. The excess lifetime cancer risk due to diesel exhaust emissions during construction of the Cathedral Hill Campus is estimated at 111 in one million.[67] To mitigate this significant health risk, the Draft EIR proposes to implement mitigation measure M-AQ-N10a, M-AQ-10b, M-AQ10c, and M-AQ-L10, which are identical to mitigation measure M-AQ-N2 and M-AQ-N9 *'Install Accelerated Emission Control Device on Construction Equipment.'* This measure requires:

> To reduce risk associated with exhaust emissions of DPM by construction equipment during construction of the Cathedral Hill Campus and all other LRDP sites, CPMC and its construction contractor shall implement the following BAAQMD-recommended control measures during construction:
>
> ► Implement Accelerated Emission Control Device Installation on Construction Equipment. To minimize the potential impacts on residents living near the CPMC campuses from the construction activities in that area, CPMC shall make reasonable efforts to ensure that all construction equipment used at these campuses would use equipment that meets the EPA Tier 4 engine standards for PM and NOx control (or equivalent) throughout the entire duration of construction activities, to the extent that equipment meeting the EPA Tier 4 engine standards is available to the contractor at the time construction activities requiring the use of such equipment occur.[68]

The Draft EIR concludes that '[w]hile it is possible that Mitigation Measure M-AQ-N2 could reduce the carcinogenic risk and chronic noncarcinogenic health hazards posed by DPM emissions below the thresholds, it is unknown at this time to what extent such equipment will be available at the time of construction. In light of this uncertainty, this impact would remain significant and unavoidable.'[69] This finding is not acceptable because the Draft EIR fails to require all feasible mitigation as required by CEQA. *(See* Comment VI.)

First, the mitigation measure proposed by the Draft EIR is vague and not enforceable. Requiring CPMC to 'make reasonable efforts' without any specification what is 'reasonable' and without requiring verification that reasonable efforts have been made is meaningless.

Second, the measure proposed by the Draft EIR is not, as claimed, recommended by the BAAQMD. In fact, the BAAQMD's recently adopted CEQA Guidelines contain considerably more stringent requirements for reducing construction equipment exhaust. These include:

► The project shall develop a plan demonstrating that the off-road equipment-(more than 50 horsepower) to be used in the construction project *(i.e.,* owned, leased, and subcontractor vehicles) would achieve a project wide fleet-average 20 percent NOX reduction and 45 percent PM reduction compared to the most recent ARB fleet

average. Acceptable options for reducing emissions include the use of late model engines, low-emission diesel products, alternative fuels, engine retrofit technology, after-treatment products, add-on devices such as particulate filters, and/or other options as such become available.

- Requiring that all construction equipment, diesel trucks, and generators be equipped with Best Available Control Technology for emission reductions of NOx and PM.

- Requiring all contractors use equipment that meets CARB's most recent certification standard for off-road heavy duty diesel engines.[70]

These mitigation measures are feasible and must be required to reduce the Project's significant health risks associated with diesel particulate matter emissions from construction equipment exhaust.

[67] Draft EIR, Table 4.7-14, p. 4.7-67 (the table fails to include 'per million'), and Memorandum from Sharon Libicki, Elizabeth Miesner, Michael Keinath, and Jennie Louie, ENVIRON, to Vahram Massehian, Sutter Health, Re: CPMC Construction Health Risk Analysis, July 2, 2010; provided as administrative record PDF file '33 08010089.AQ.ENVIRON.2010.'

(Jean Roggenkamp—Bay Area Air Quality Management District, October 20, 2010) [109-3 AQ, duplicate comment was provided in 112-3 AQ]

"*Impact AQ-9*

The DEIR states that construction activities would exceed BAAQMD 2010 CEQA thresholds for criteria pollutants and contribute to existing air quality violations. In response, the DEIR refers to Mitigation N-2, which states that CPMC would:

> Implement Accelerated Emission Control Device Installation on Construction Equipment. .. [and] CPMC shall *make reasonable efforts* to ensure that all construction equipment used at these campuses would use equipment that meets the EPA Tier 4 engine standards for PM and NOx control (or equivalent) throughout the entire duration of construction activities, to the extent that equipment meeting the EPA Tier 4 engine standards is available to the contractor at the time construction activities requiring the use of such equipment occur. (DEIR p. 4.7-36) (emphasis added)

Staff realizes that there is uncertainty about when specific types of equipment will be available with Tier 4 engines. Our understanding is that as of year 2011, Tier 4 Interim engines will be available for all off-road equipment, with the exception of equipment engines with 75 to 175 horsepower, and that by 2015, Tier 4 engines will be available for all off-road engines, regardless of horsepower.

District staff supports the objective of using the cleanest available construction equipment, and believes it should be a requirement. District staff recommends 'make reasonable efforts' be stricken from the clause above and Mitigation N-2 be revised to require Tier 4 or equivalent equipment for all uses where such equipment is available."

(Jean Roggenkamp—Bay Area Air Quality Management District, October 20, 2010) [109-4 AQ, duplicate comment was provided in 112-4 AQ]

"Staff also recommends that diesel generators for construction activity be prohibited as a condition of Project approval. Where it is not possible to plug into the electric grid for construction purposes, the City should require use of solar powered generation, and only as a last resort, the City should require the cleanest diesel generators and control technology available. In addition, the City should require all on-road haul trucks utilized during construction be model year 2007 engines equipped with DPFs or newer engines."

Response AQ-8

Several comments above express concern about the production of diesel particulate matter (DPM) from construction activities on proposed LRDP development sites at various CPMC campuses. They suggest several additional mitigation measures should be included in the Draft EIR.

The BAAQMD's guidance on construction mitigation measures has been continually evolving over the past year (2010-2011). In the BAAQMD CEQA Guidelines that were adopted on June 2, 2010, the BAAQMD presented a tiered mitigation approach, starting with 45 percent control on DPM and ending with the requirement of best available control technology (BACT) for all sources. However, no guidance was provided on how to calculate the emissions baseline to allow the quantification of the 45 percent reduction, and no description of BACT was provided. In their comment letter received October 20, 2010 (Letter 109), the BAAQMD requested the following, different set of mitigation measures specific to the proposed LRDP:

- Tier 4 or equivalent equipment for all uses where such equipment is available;
- replacement of diesel generator power by power from the electricity grid or by solar power generation (When neither of these options was available, BAAQMD requested the cleanest diesel generators and control technology available); and
- restriction for on-road haul trucks utilized during construction to model year 2007 engines, equipped with diesel particulate filters (DPFs) or newer engines.

Based on the BAAQMD's evolving guidance, BAAQMD comment letter, and other comments, CPMC's construction partners re-evaluated the construction equipment assumptions for the proposed LRDP at the existing campuses at St. Luke's, Davies, and Pacific, and at the proposed Cathedral Hill Campus site where construction would take place, to determine whether assumptions regarding equipment usage could be refined to reduce emissions. This re-evaluation, which included a detailed assessment of the type, horsepower, quantity, fuel, use schedule, and hours of operation for each type of equipment, led to a number of refinements to the construction plan and reduced the emission estimates for DPM, the major contributing factor to public health risk at construction sites. These refinements include: (1) electrification of certain types of equipment; (2) greater usage of propane-fueled equipment instead of diesel-fueled models; and (3) reduction in estimated operating hours for certain equipment, based on a detailed review of planned construction operations. Additional factors that substantially refined the construction emissions estimate, as well as the potential risk effects associated with implementing the proposed mitigation measures are discussed in Response AQ-10 (page C&R 3.9-20). It should be noted that construction at any particular campus would be less than 20 years in duration.

The feasibility of the latest BAAQMD mitigation request was evaluated. The evaluation included analysis of the technical and practical limitations associated with mandating Tier 4 equipment, review of studies associated with retrofit equipment, and consultation with CPMC's construction partners and equipment manufacturers. Based on this analysis, the proposed CPMC construction management plan was clarified (as detailed below) to include modifications that address feasibility issues regarding the efficacy and availability of control technology for specific equipment types. Furthermore, the requested mitigation has been added to Mitigation Measure M-AQ-N2 to provide additional clarification regarding the timing/use of accelerated emission control devices on LRDP-related construction equipment. As shown in Chapter 4 of this C&R document (page C&R 4-17), Mitigation Measure M-AQ-N2 has amended to include a second, third, and fourth bullet as follows:

- <u>Where sufficient electricity is available from the PG&E power grid, electric power shall be supplied by a temporary power connection to the grid, provided by PG&E. Where sufficient</u>

electricity to meet short-term electrical power needs for specialized equipment is not available from the PG&E power grid, non-diesel or diesel generators with Tier 4 engines (or equivalent) shall be used.

- During any construction phase for near-term projects, at least half of each of the following equipment types shall be equipped with Level 3-verified diesel emission controls (VDECs): backhoes, concrete boom pumps, concrete trailer pumps, concrete placing booms, dozers, excavators, shoring drill rigs, soil mix drill rigs, and soldier pile rigs. If only one unit of the above equipment types is required, that unit shall have Level 3 VDECs retrofits.
- For long-term projects, which are presumed to begin when Tier 4 equipment would be widely available, all diesel equipment of all types shall meet Tier 4 standards.

It should be noted that this clarification of the Draft EIR's mitigation is consistent with the mitigation requested in Comment 91-56 above. Please see Appendix C of this document for an amended construction analysis that identifies the criteria pollutant emissions inventory as a result of implementation of the revised mitigation plan for the CPMC LRDP.

Explanation for Revised Mitigation Measure:

Diesel Generators

Most electricity needs would be met with temporary grid power from PG&E, avoiding the need for powered generators. Where sufficient electricity to meet short-term power needs for specialized equipment would not be available from the grid, temporary diesel generators that could meet Tier 3 (with VDECs) or Tier 4 requirements would be used. The use of solar powered generation would not be feasible for applications that would require reliable, uninterrupted power supply at the scale required for construction of the proposed LRDP.[1]

Off-Road Diesel Construction Equipment

After consultation with CPMC's construction partners, the following equipment types are considered the most suitable for retrofits, based on their operating modes and on the DPM emission reductions that would result from their use:

- Excavators
- Backhoes
- Dozers
- Concrete boom pumps
- Concrete trailer pumps
- Concrete placing boom
- Soil mix drill rigs
- Soldier pile rigs
- Shoring drill rigs

For near-term construction projects at various CPMC campuses under the LRDP, typically no more than one unit from each equipment group listed would be scheduled for use during a given construction phase. Under these circumstances, those individual units would be retrofitted to meet emission standards for

[1] Solar panels typically supply 150 watts of electricity. Some construction equipment power requirements are in excess of 400 horsepower, which converts to 300 kilowatts. Accordingly, over 2,000 panels would be required to supply electricity. The panels are approximately 1 square meter in size. Such an installation would require 2,000 square meters of horizontal space, or an area of 44 meters squared. In addition, the energy supply would only be possible during peak solar periods. Typical energy supply would be lower, necessitating even large solar arrays. Furthermore, in winter when solar insulation would be low, the power supply would be unreliable and, therefore, infeasible.

Tier 2 plus California Air Resources Board-certified Level 3 verified diesel emission controls (VDECs), which would reduce DPM emissions by a minimum of 85 percent. When multiple units of a given equipment type would be required, at least half of the equipment from each group listed above would be retrofitted. This stipulation would be intended to give the construction managers some flexibility in the event that the control devices malfunctioned and needed to be replaced, or that controlled equipment was difficult to find. These measures would effectively control approximately 75 percent of these types of equipment for all near-term projects. Refer to Response AQ-10 (page C&R 3.9-20) for further clarification.

For long-term projects, which are presumed to begin during a time period when Tier 4 equipment would be widely available, all diesel equipment of all types would meet Tier 4 standards.

As the BAAQMD acknowledges in its comment letter (Comment 109-3), uncertainty exists about when specific types of equipment equipped with Tier 4 and interim Tier 4 engines would be available. For mitigation during near-term projects, because of the uncertainty surrounding availability, it would not be feasible to require Tier 4 equipment. A realistic alternative would be for contractors to retrofit a portion of their existing fleet with Level 3 VDECs, which would reduce particulate matter (PM) emissions from retrofitted units by at least 85 percent.

The availability and suitability of Level 3 VDECs for off-road construction equipment would vary by equipment type and engine size. Their effectiveness also would be dependent on the operational characteristics of a given equipment type. Diesel particulate filters (DPFs) are the most common type of VDEC. Active and passive DPFs allow the gaseous component of the exhaust to pass through while the solid DPM particles are trapped on the walls. Both require high temperatures to regenerate the filter by oxidizing the material collected on the filter walls. DPFs cannot be used on all engines. The exhaust temperature is a significant factor in determining whether and what type of DPF can be used on a specific vehicle or type of equipment.[2] An active DPF differs from a passive device in that it can raise the temperature of the exhaust stream. Although active DPFs are technically more reliable for off-road equipment applications, they require periodic off-line maintenance to remove the non-combustible components collected as ash on the filter.

On-road Trucks

Diesel emissions from on-road hauling trucks would be equivalent to the emissions performance of model year 2007 vehicles or later.

The revised construction emissions and risk analysis described in Response AQ-9 (page C&R 3.9-20) found that on-road haul trucks would contribute from one-quarter to one-half of DPM emissions relative to off-road equipment. However, most of the emissions associated with on-road trucks would be emitted distant from LRDP construction sites and would be highly dispersed among the travel routes to the LRDP construction sites from trip origins around the Bay Area. These emissions would not add appreciably to public health risks at or near the LRDP construction sites. Accordingly, more stringent controls on these engines would do little to reduce air-related construction public health risks at or near the construction sites. As stated previously, Appendix C of this document includes an amended construction analysis that identifies the resultant criteria pollutant emissions inventory as a result of implementation of the revised mitigation plan for the CPMC LRDP. Therefore, as noted above and quantified in Appendix C, the proposed LRDP would incorporate all feasible mitigation to reduce potential impacts related to the LRDP's construction emissions, including DPM. However, consistent with the conclusion in the Draft EIR, even with the implementation of all feasible mitigation, this impact would remain significant and unavoidable.

Comments

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-85 AQ, duplicate comment was provided in 30-85 AQ]

"On Page 4.7-34, it states that the toxic air contaminants (TACs) from the construction phase of the Cathedral Hill Campus will have a cancer risk of 17 in one million which is 7 over the allowable 10 in one million risk level as determined by BAAQMD's 1999 Guidelines. When new modeling is done beyond the screening level, when would those be available? Will periodic testing be done to protect the most likely person affected - a resident off-site child? On Page 4.7-35, Table 4.7-5, for the Cathedral Hill Campus cancer risk at the 'maximum exposed individual risk (MEIR)' for adults is 9 parts per million. So both the adult and child rates will be in violation of the BAAQMD's 1999 Guidelines. How will some of these toxic air contaminants be cleaned off buildings, vehicles, objects that are within 300 feet of the area? Would the wash water be going into the sewer system?"

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-88 AQ, duplicate comment was provided in 30-88 AQ]

"50. Some of the equipment used today may not be the equipment used when the actual construction takes place. So for Impact AQ-10 on Page 4.7-65 which states, 'construction activities associated with the LRDP would result in short-term increases in emissions of diesel particulate matter that exceed the recently adopted (June 2, 2010) BAAQMD CEQA significance criteria and expose sensitive receptors to substantial concentrations of toxic air contaminants and $PM_{2.5}$ (Significance Criteria 7b and 7d).' When more is known about the actual equipment that will be used, a revised analysis of the cancer risk would be helpful for the public. And until such determination, there is no impact mitigation besides the M-AQ-N10a of installing accelerated 'emission control devices on construction equipment' per Page 4.7-68."

Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-142 AQ, duplicate comment was provided in 30-142 AQ]

"79. On Page 4.7-67, the Cathedral Hill Campus will have an excess cancer risk of 111 per million. I believe on Page 4.7-68, it states that the threshold is 10 per million for the 'maximally exposed individual receptor (MEIR)' of a child. The Cathedral Hill Campus will also exceed the fine particulate matter with an aerodynamic diameter of 2.5 micrometers or less ($PM_{2.5}$) of 0.4 microgram/m^2."

Response AQ-9

Several comments express concern about the emission of toxic air contaminants (TACs), raise questions about the criteria used to determine significance of the effects, and question the adequacy of the mitigation measures presented in the Draft EIR.

The assessment of the cancer risk from emitted TACs that is included in the Draft EIR was based on the best available methodology at the time the analysis was conducted and the Draft EIR was prepared. In particular, the calculations presented in the Draft EIR were based on the construction mitigation plan initially proposed by CPMC, and were assessed during a period when no specific guidance regarding construction health risk methodology was available from the BAAQMD.

Subsequent to publication of the Draft EIR, construction health risk impacts were re-evaluated for multiple reasons: (1) to refine the cancer risk estimates, based on revised equipment load factors from the California Air Resources Board (ARB); (2) to quantify the change in risk associated with the updated and refined construction plan and updated mitigation measures (as set forth in Response AQ-8 (page C&R 3.9-17) and on page 4-17 in Chapter 4, Text Revisions); and (3) to present acute, non-cancer hazard

estimates, based on an updated methodology approved by the BAAQMD immediately before the Draft EIR was released. The updating of the proposed mitigation measures is described as part of Response AQ-8 (page C&R 3.9-17).

More specifically, a refined analysis of construction TAC emissions and related health impacts was deemed necessary for several reasons, as summarized below:

- *Bay Area Air Quality Management District (BAAQMD) adoption of revised CEQA Guidelines.* In June 2010, the revised BAAQMD CEQA Guidelines were adopted, of which evolving drafts had been published in November 2009, December 2009, and May 2010. The May 2010 draft Guidelines, on which the BAAQMD Board of Directors ultimately based its decision to adopt revised CEQA thresholds of significance in June 2010, and the accompanying tools/manuals were not available before the bulk of the previous construction analysis was conducted in early 2010. Therefore, the revised analysis reflects the guidance that was published in May and June 2010 to support the thresholds of significance approved by BAAQMD in June 2010, including the evaluation of certain mitigation measures and analysis of acute health impacts. As noted in Response AQ-23 (page C&R 3.9-64), the Draft EIR identified that, based on specific guidance from the BAAQMD, the 1999 BAAQMD significance criteria was used in the Draft EIR for the proposed LRDP. However, in the interests of full disclosure, the Draft EIR also included an analysis of the proposed LRDP's potential effects compared to updated June 2010 BAAQMD significance criteria. The analysis in the Draft EIR uses both the 1999 guidelines and the updated June 2010 thresholds of significance and methodologies from the BAAQMD CEQA Air Quality Guidelines to evaluate the potential air quality impacts of the proposed Project.[3] Although BAAQMD adoption of the significance thresholds are the subject of recent judicial actions, the Planning Department has determined that Appendix D of the BAAQMD CEQA Air Quality Guidelines, in combination with BAAQMD's Revised Draft Options and Justification Report provide substantial evidence to support the BAAQMD-recommended thresholds and, therefore, has determined they are appropriate for use in this analysis.[4] The use of both the 1999 and the updated June 2010 BAAQMD CEQA Air Quality Guidelines in both the Draft EIR and the subsequent refined analysis of construction TAC emissions therefore continues to represent a conservative approach that provides full disclosure regarding the potential air quality impacts of the proposed LRDP.

- *Refinements to construction timeline and assumptions*. CPMC's construction partners re-evaluated the construction equipment assumptions at the existing campuses at St. Luke's, Davies, and Pacific, and at the proposed Cathedral Hill Campus site where construction would take place. This re-evaluation led to a number of refinements to the construction plan and reduced construction emission estimates. The refinements, as described in Response AQ-8 (page C&R 3.9-17), were based on a detailed review of construction operations, in consultation with CPMC's construction partners, and included (1) electrification of certain types of equipment; (2) greater usage of propane-fueled equipment; and (3) refinement in estimated operating hours for certain equipment.

- *Correction of California Air Resources Board (ARB) overestimates*. In September 2010, ARB announced that its recommended methods used to estimate the load factor for off-road equipment were incorrect and had led to an overestimate of emissions by a factor of at least 33 percent. ARB is currently revising its emissions model, OFFROAD, which has not yet been released. In the meantime, the City has received direction from ARB to reduce the load factors by a minimum of 33 percent to

[3] BAAQMD, 2011 (May), California Environmental Quality Act Air Quality Guidelines, App. D: Threshold of Significance Justification (June 2, 2010).

[4] Bay Area Air Quality Management District. *Revised Draft Options and Justification Report, California Environmental Quality Act Theresholds of Significance*. October 2009. Document available on line at; http://baaqmd.gov/divisions/Planning-and-Research/CEQA-GUIDELINES/updated-CEQA-GUIDELINES.aspx

correct this overestimate. Refer to Appendix C of this C&R document for a detailed description of the interim methodology that was used to calculate off-road equipment emissions.

- *Removal of emission factor adjustments associated with the ARB In-Use, Off-Road, Diesel Vehicle Rule*. Per ARB's February 2010 Regulatory Advisory (No. 10-414), ARB delayed the enforcement of this regulation. This was followed by ARB's decision on December 17, 2010, to delay compliance with this regulation to no earlier than 2014.[5] Because of uncertainty regarding the schedule for implementation, the effect of this regulation was not included in the revised emissions inventory.

- *Correction of air dispersion modeling and emissions estimation errors.* In reviewing the Draft EIR, the City's EIR team identified technical errors in certain calculations, including an error in the air dispersion modeling that under-predicted results, and one in the emissions estimation that double-counted certain pieces of equipment and, therefore, overestimated results. These errors have been corrected in this revised analysis, which is shown in Appendix C of this C&R document.

For the second part of this analysis, an additional health risk analysis was performed for the mitigated emissions scenario. The development of refined mitigation measures is described in detail in Response AQ-8 (page C&R 3.9-17). Mitigation Measure M-AQ-N2 (in the Draft EIR, beginning on page 4.7-35) has been amended to include additional clarification of on-site off-road diesel construction equipment as follows:

M-AQ-N2 Install Accelerated Emission Control Device on Construction Equipment.

To reduce risk associated with exhaust emissions of DPM by construction equipment during construction of the Cathedral Hill Campus and all other LRDP sites, CPMC and its construction contractor shall implement the following BAAQMD-recommended control measures during construction:

- ~~Implement Accelerated Emission Control Device Installation on Construction Equipment. To minimize the potential impacts on residents living near the CPMC campuses from the construction activities in that area, CPMC shall make reasonable efforts to ensure that all construction equipment used at these campuses would use equipment that meets the EPA Tier 4 engine standards for PM and NO_x control (or equivalent) throughout the entire duration of construction activities, to the extent that equipment meeting the EPA Tier 4 engine standards is available to the contractor at the time construction activities requiring the use of such equipment occur.~~

- Where sufficient electricity is available from the PG&E power grid, electric power shall be supplied by a temporary power connection to the grid, provided by PG&E. Where sufficient electricity to meet short-term electrical power needs for specialized equipment is not available from the PG&E power grid, non-diesel or diesel generators with Tier 3 (with VDEC retrofits) or Tier 4 engines (or equivalent) shall be used.

- During any construction phase for near-term projects, at least half of each of the following equipment types shall be equipped with Level 3-verified diesel emission controls (VDECs): backhoes, concrete boom pumps, concrete trailer pumps, concrete placing booms, dozers, excavators, shoring drill rigs, soil mix drill rigs, and soldier pile rigs. If only one unit of the above equipment types is required, that unit shall have Level 3 VDECs retrofits.

[5] Air Resources Board. 2010. In-Use Off-Road Diesel Vehicle Regulation. Available: http://www.arb.ca.gov/msprog/ordiesel/ordiesel.htm. Accessed January 2, 2011

- For long-term projects, which are presumed to begin when Tier 4 equipment would be widely available, all diesel equipment of all types shall meet Tier 4 standards.

Mitigation Measure M-AQ-N2 in the LRDP Draft EIR has been amended as a staff-initiated Draft EIR text change to include the aforementioned bullets, as noted in Chapter 4, "Text Changes to the Draft EIR" of this C&R document. As part of this amendment, the first bullet of Mitigation Measure M-AQ-N2 has been removed to avoid redundancies as a result of the clarified measures listed above.

In addition to the revised cancer risk analysis, the $PM_{2.5}$ analysis was revised based on the changes in emissions estimates, and a calculation of non-cancer (acute and chronic) hazard indices was performed. These non-cancer hazard indicators were based on speciation profiles for organic gas components of diesel and propane fuel exhaust. The technical details of the refined analysis are part of the record and available for public review at the Planning Department, 1650 Mission Street, Suite 400, San Francisco, California 94103.

C&R Table 3.9-1 summarizes the refined construction analysis, including the risk analysis for mitigated emissions.

C&R Table 3.9-1
Summary of Construction Health Risk Analysis for the Proposed LRDP

Campus/ Proposed LRDP Projects	With Cancer Adjustment Factors (CRAFs)			(Unmitigated Emissions) Chronic Non-cancer Hazard Index (-)	(Unmitigated Emissions) Acute Non-cancer Hazard Index (-)	(Unmitigated Emissions) Annual Average Incremental PM2.5 Concentration (µg/m3)	Mitigated Annual Average Incremental $PM_{2.5}$ Concentration (µg/m^3)
	Draft EIR Risk Estimate	(Unmitigated Emissions) Estimated Excess Cancer Risk per Million—Child Exposure Parameters	Mitigated Estimated Excess Cancer Risk per Million—Child Exposure Parameters

Source: Environ. 2011 (March 7). Revisions to CPMC Construction Emissions and Health Risk Analysis.

In the Draft EIR, all proposed LRDP near-term and long-term projects were conservatively deemed significant with respect to cancer risk; these significance findings still apply to the unmitigated refined emission estimates. The unmitigated refined estimates for the proposed Davies Campus Neuroscience Institute and proposed long-term development at the Pacific Campus are lower than the Draft EIR estimates, while they are higher at the proposed Cathedral Hill Campus, Davies Castro Street/14th Street MOB (long term), St. Luke's Replacement Hospital, and St. Luke's MOB/Expansion Building. However, when the mitigation measures are factored into the analysis, the estimated cancer risks decrease by 40 percent to over 85 percent, compared to the cancer risks reflected in the Draft EIR (on page 4.7-67). In all cases, the cancer risk shown after mitigation is lower than the cancer risk reflected in the Draft EIR. As noted in Response AQ-8 (page C&R 3.9-17), there would be a greater level of mitigation for long-term projects because of the increased availability of lower-emitting Tier 4 construction equipment in later years. The risk estimates at four of the six sites of the CPMC LRDP development are below the significance threshold after mitigation. Cancer risks are estimated to continue to exceed the threshold at the proposed Cathedral Hill Campus and for the St. Luke's Replacement Hospital, although the estimated cancer risks and the exceedances of the threshold are smaller than indicated in the Draft EIR.

Consistent with the conclusions of the Draft EIR, the refined unmitigated chronic non-cancer indices are estimated to be below the significance thresholds for all near-term and long-term projects under the CPMC LRDP. In addition, consistent with the conclusions of the Draft EIR, the refined unmitigated $PM_{2.5}$ concentrations during construction would be below the significance threshold for all LRDP development projects except at the proposed Cathedral Hill Campus. Development at the proposed Cathedral Hill Campus site would emit $PM_{2.5}$ emissions at the BAAQMD threshold and is therefore conservatively considered to remain above the $PM_{2.5}$ threshold after construction mitigation measures are implemented. Acute non-cancer indices are estimated to be below the significance thresholds for all CPMC LRDP near-term and long-term projects with or without mitigation incorporated.

Several factors in this analysis contribute to overestimation of risk. Both the assumption that no reduction of particulate matter would occur as it transits from the outside air to the indoors environment, and the exposure assumption (the receptor always would be home, breathing outside air at the portion of the residence nearest to the construction) are very conservative and contribute to overestimates of risk. The use of screening meteorological data also contributes to overestimated risks. However, in large part due to these conservative assumptions, the analysis continues to consider the construction risk impacts significant and unavoidable at the proposed Cathedral Hill Campus, the same conclusion reached in the Draft EIR.

The revised analysis presented herein is intended to clarify and refine the analysis of air-borne health risks presented in the Draft EIR. For all CPMC campuses, after application of recommended mitigation measures, the impacts identified related to the LRDP document in the refined analysis are estimated to be equal to or less than those that were provided in the Draft EIR on page 4.7-67.

One comment asks whether on-site monitoring of emissions of diesel particulate matter (DPM) would be conducted. No monitoring for DPM would be conducted at CPMC LRDP construction sites because no known methods exist to effectively measure ambient air concentrations of DPM that is generated from a construction site. The reasons for this are (1) DPM is not a well-defined compound and cannot be distinguished by monitoring equipment from other forms of elemental carbon in the air, and (2) if it were possible to monitor DPM in the first place, it would be impossible to distinguish DPM that was emitted from the specific construction equipment at each proposed LRDP construction site from DPM that was already in the ambient air from other regional sources.

Although DPM is considered to be a TAC, it is not known to contaminate buildings or water. Therefore, no cleaning program for DPM is proposed.

3.9.1.3 OPERATIONAL EMISSIONS

Comments

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-35 AQ, duplicate comment was provided in 30-35 AQ]

"Congestion will be a big issue and will get worse as indicated by the DEIR 2030 projection. Congestion causes air quality to decline and is therefore going to affect many sensitive receptors when this project gets underway."

(Diane and Richard Wiersba, October 11, 2010) [49-5 AQ]

"We are well aware of the dust, dirt and pollution in the air in this area, primarily due to high-volume traffic. More traffic will definitely affect the quality of life for Cathedral Hill residents."

(Carol and Michael Stack, October 17, 2010) [62-2 AQ]

"It will also add to the overall level of pollution in this heavily-trafficked region."

(Paul Wermer—CPMC Neighbors Coalition and Pacific Heights Residents, October 18, 2010) [67-31 AQ]

"Given the increase in stop and go traffic, the amount of vehicle-generated particulate matter needs to be clearly addressed in the final EIR. However, given the deficiencies in the traffic analysis, it is not clear how the air quality assessments can be accurate. As such, this is a deficiency in the DEIR."

(Stephanie Barton, et al.—Hastings Civil Justice Clinic for the Good Neighbor Coalition, October 19, 2010) [104-48 AQ]

"Pollution and air quality as a result of increased traffic is also a concern. The DEIR states that according the San Francisco Department of Health the combined traffic volumes from Van Ness Avenue, Geary Boulevard, O'Farrell Street and Franklin Street exceed 137,000 vehicles a day.[112] Now, even without the increased traffic attributable to the proposed Cathedral Hill Campus, 100% of households in the Downtown/Civic Center live within a traffic-related air quality hazard area.[113] The Cathedral Hill campus is expected to generate an additional 8,220 daily vehicle trips on the surrounding streets, which will result in an approximately six percent additional traffic volume. These estimates do not include traffic going through the Tenderloin. Not taking into account Tenderloin impacts, the DEIR needs to undertake further studies not only with respect to impacts on pedestrian safety, traffic circulation, and public transit, but also how increased traffic volume affects air pollution in the neighborhood. For more detailed comments regarding the air quality impacts of the project in the Tenderloin, see Section III, *infra.*

[112] DEIR 4.7-75.
[113] Measured as 'Proportion of households living within 150 meters f streets with 0/2 ug/m3 or greater of PM2.5.' Sixty-eight percent of households live within potential traffic-related air quality hazard areas in San Francisco at-large. San Francisco Dep't of Public Health, *Proportion of household s living within potential traffic-related air quality hazard area*, Healthy Development Measurement Tool. http://thehdmt.org/indicators//view/40.
[114] DEIR 6-1 & 6-2."

(Nella Manuel, September 23, 2010) [PC-134 AQ]

"Many CPMC employees will be commuting to work at this hospital, causing more traffic and more pollution in my community."

(Robert Barham, September 23, 2010) [PC-153 AQ]

"My name is Robert Barham and I stay at the McAllister Hotel, just two blocks away. I understand that the need for progress as far as trying to create jobs and everything, but we also have to think about the health and the safety of the people that live within the community. And if we increase the traffic, you're going to aggravate the asthma and the heart condition of people that already have these existing illnesses."

Response AQ-10

Several comments express concern regarding potential impacts associated with operational air emissions under the proposed LRDP. Implementation of the proposed LRDP would increase the daily vehicle trips generated from two of CPMC's existing campuses (i.e., Davies and St. Luke's), increase daily vehicle trips compared to existing on-site uses at the one proposed new Cathedral Hill Campus, and decrease the vehicle trips of one existing campus (i.e., Pacific). When considering the proposed LRDP's total impact, a net increase of vehicles traveling to and from the CPMC campuses would occur. The Draft EIR evaluated the net change in operational emissions generated by traffic at the Cathedral Hill, Davies, Pacific, and St. Luke's Campuses planned for development and change under the proposed LRDP. As described in Table 4.7-6 and Table 4.7-7 (in the Draft EIR, pages 4.7-39 and 4.7-40), despite the implementation of feasible transportation control measures noted in Response AQ-11 (page C&R 3.9-27), the proposed LRDP would cause an increase in mobile-source criteria, air pollutant emissions and would result in an increase in emissions that would exceed the 1999 and 2010 BAAQMD thresholds of significance for PM_{10}. The CPMC LRDP impact with respect to long-term operational emissions was determined to be significant and unavoidable.

The relevant localized air pollution impact caused by LRDP-related traffic congestion on local streets and intersections would be the creation of high levels of carbon monoxide (CO). As evaluated under Impact AQ-4 in the Draft EIR, page 4.7-42, the contribution of LRDP traffic to roadways under cumulative conditions would not cause an exceedance of California or national ambient CO air quality standards. A CO exceedance, or CO hotspot, typically occurs when a large volume of vehicles are idling at an intersection with stagnant (i.e., low wind speeds) meteorological conditions. Increased vehicle volumes or congestion could contribute to a potential CO hotspot. Impact AQ-4 analyzes the proposed LRDP's contribution to future cumulative traffic conditions and determined that CO exceedances related to the LRDP would not occur at any of the studied intersections.

More traffic also could cause increases in airborne concentrations of very small particles, as measured by particulate matter less than 2.5 micrometers in aerodynamic diameter ($PM_{2.5}$). Particulates of this size are of special concern because, as they are breathed in, they may become lodged in the lungs. The 1999 BAAQMD significance criteria did not include thresholds for $PM_{2.5}$, but such thresholds were included in the 2010 BAAQMD criteria. As described in Response AQ-23 (page C&R 3.9-64), although the BAAQMD's 1999 criteria were applied to the proposed LRDP, it was also evaluated under the 2010 criteria. Impact AQ-12 in the Draft EIR, page 4.7-73 includes an evaluation of the incremental increase in ambient $PM_{2.5}$ concentrations resulting from additional traffic associated with the proposed LRDP. As discussed under Impact AQ-12, the proposed near-term and long-term development projects under the CPMC LRDP would not contribute to vehicle volumes that would generate an increase in $PM_{2.5}$ concentrations above the BAAQMD's newly adopted 0.3 $\mu g/m^3$ $PM_{2.5}$ threshold, the "risk and hazards" threshold under the BAAQMD 2010 criteria now used to identify the public health effects associated with $PM_{2.5}$.

The analysis in the Draft EIR uses both the 1999 guidelines and the updated June 2010 thresholds of significance and methodologies from the BAAQMD CEQA Air Quality Guidelines to evaluate the potential air quality impacts of the proposed Project.[6] Although BAAQMD adoption of the significance

[6] BAAQMD, 2011 (May), California Environmental Quality Act Air Quality Guidelines, App. D: Threshold of Significance Justification (June 2, 2010).

thresholds are the subject of recent judicial actions, the Planning Department has determined that Appendix D of the BAAQMD CEQA Air Quality Guidelines, in combination with BAAQMD's Revised Draft Options and Justification Report provide substantial evidence to support the BAAQMD-recommended thresholds and, therefore, has determined they are appropriate for use in this analysis.[7] The use of both the 1999 and the updated June 2010 BAAQMD CEQA Air Quality Guidelines in both the Draft EIR and the subsequent refined analysis of TAC emissions therefore continues to represent a conservative approach that provides full disclosure regarding the potential air quality impacts of the proposed LRDP.

Finally, when considering the LRDP's cumulative mobile source impacts, as analyzed under Impact AQ-14 in the Draft EIR, page 4.7-80, the proposed LRDP's operational emissions of TACs (which includes consideration of $PM_{2.5}$) would not contribute to a cumulatively considerable impact on sensitive receptors. Therefore, as stated and analyzed in the Draft EIR on page 4.7-81, the increase in mobile source emissions generated by traffic increases caused by the proposed LRDP would be considered less than significant under existing State and national CO standards, the BAAQMD's newly adopted thresholds for roadway $PM_{2.5}$ concentrations, and significance criteria for cumulative roadway toxic air contaminants.

With respect to additional traffic volumes attributable to the proposed LRDP entering the Tenderloin, a supplemental analysis was prepared for intersections in the Tenderloin and Civic Center areas, as documented in the technical memorandum *Supplemental-Sensitivity Transportation Impact Analyses for the California Pacific Medical Center Cathedral Hill Campus in San Francisco, CA* (Fehr & Peers 2011), which is included as Appendix E of this C&R document. The purpose of this analysis was twofold: (1) to determine if implementation of the proposed CPMC LRDP at the Cathedral Hill Campus would result in any significant impacts to traffic, pedestrians, or bicycles in the Tenderloin/Little Saigon neighborhood that were not identified in the Draft EIR; and (2) to determine if an increase in the number of project-generated trips through the neighborhood would create additional impacts to traffic, pedestrians, or bicyclists. No additional impacts were identified, and the findings of the analysis are summarized in Response TR-124 (page C&R 3.7-207).

Comment

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-87 AQ, duplicate comment was provided in 30-87 AQ]

"49. On Page S-65, Impact AQ-3 states 'operation of the LRDP would exceed BAAQMD CEQA significance thresholds for mass emissions of criteria pollutants and would contribute to an existing or projected air quality violation at full build-out (1999 BAAQMD Guidelines).' Per Page 4.7-41, the PM_{10} emissions will be 7 tons over the 15 tons (i.e. 22 tons) allowed by BAAQMD for all four campus projects and the Cathedral Hill Campus will have 19 tons out of the total 22 tons projected - 86.4% of the PM_{10} emissions will come from the Cathedral Hill project and there will be no mitigation measures. PM_{10} particulates are those that are 'respirable with an aerodynamic diameter of 10 micrometers or less' per the Glossary in the DEIR. I think that the workers should all be issued respirator masks and any nearby residents adjacent to the building project should also be issued these masks, starting with those with lung ailments and pregnant women. In addition, filters for HVAC systems in immediately adjacent buildings may need to be changed out more frequently due to the project."

Response AQ-11

As described in Response AQ-20 (page C&R 3.9-48), PM_{10} is the only criteria air pollutant for which a calculated exceedance of the BAAQMD significance thresholds exists when operational emissions are

[7] Bay Area Air Quality Management District. *Revised Draft Options and Justification Report, California Environmental Quality Act Theresholds of Significance*. October 2009. Document available on line at; http://baaqmd.gov/divisions/Planning-and-Research/CEQA-GUIDELINES/updated-CEQA-GUIDELINES.aspx

summed over all four LRDP campuses (three existing and one proposed campus). If each campus were evaluated independently, only the proposed Cathedral Hill Campus would have PM_{10} emissions exceeding the BAAQMD significance thresholds. For the Pacific Campus, a net reduction in operational PM_{10} emissions would occur after implementation of the proposed LRDP.

It should be noted that the 19 tons per year (TPY) of PM_{10} emissions is attributed to mobile sources, which would extend away from the Cathedral Hill Campus development sites and not be localized at the proposed Cathedral Hill Campus. These traffic-generated fugitive dust emissions would be distributed through the City and the region, rather than be concentrated within a particular local area. For these reasons, although the overall operational PM_{10} emissions could contribute to violations of the PM_{10} ambient standards regionally, given San Francisco's meteorology and the dispersed nature of these traffic-generated emissions, the issuance of respirator masks to construction workers and air filters to adjacent structures would not be considered necessary and would not be included as mitigation for the proposed Cathedral Hill Campus.

A number of comments, in addition to comment 18-87, questioned the Draft EIR's conclusion that there were no feasible mitigation measures for the LRDP's traffic-generated impacts on congestion, mobile-source air pollutant emissions, and traffic-generated noise. These impacts would be generated by the number of vehicle trips that are projected to be created by the proposed LRDP at full operation in the future. Trip generation for the proposed LRDP is described on pages 4.5-73 through 4.5-77 of the Draft EIR. As is explained in the Draft EIR, the trip generation rates used to estimate total trip generation for the proposed LRDP were developed based on surveys of CPMC campuses, as well as other medical institutions in the Bay Area. CPMC already has an effective Transportation Demand Management (TDM) program in place for its employees, as well as shuttles that are also available to patients and visitors ."[8] The current TDM program is described on pages 4.5-74 and 4.5-75 of the Draft EIR. Since the trip generation used for the transportation analyses was based on CPMC travel surveys, the traffic analysis already assumes reduced level of private vehicle use by employees, patients and visitors. Based on the surveys, it was assumed that 50 percent of the employees and 30 percent of the patients would use public transit for their commute. The Draft EIR stated that "[t]he vehicle trip generation rates for CPMC are comparable and slightly higher than other San Francisco medical centers, but slightly lower than SANDAG and ITE sources.

With implementation of the proposed LRDP, CPMC has indicated its intention to expand the current TDM program with a staged set of new and increased measures that would be implemented as new CPMC facilities are brought on line. The expanded program is presented on pages 5-14 and 5-15 of the Draft EIR, and is further discussed below. Due to the types of services provided at a hospital and MOB (e.g., at Cathedral Hill), there is a limit to the number of patient and visitor trips that can be reduced. The Draft EIR recognizes that the TDM program would be expanded, but for purposes of the Draft EIR the analysis conservatively does not assume an increase in effectiveness of that program. Making this assumption presents a conservative assessment of the effects of the proposed LRDP on the transportation system, emissions of criteria pollutants and greenhouse gases, and traffic noise, and results in significant and unavoidable impacts.

The only feasible way to reduce the magnitude or avoid these LRDP effects is to reduce the number of vehicle trips generated by the proposed LRDP. In most of San Francisco, mitigation of congestion can only be achieved through elimination of vehicular trips on the city streets. Other strategies to relieve congestion through increased roadway capacity are typically not feasible in San Francisco, because the dense urban development of the City creates limitations on land availability for such capacity increases. Mitigation of air emissions can be achieved only through reduction in the number of trips, or through the generation of less pollution during vehicular operations. CPMC has agreed to convert its shuttle fleet to

[8] CPMC LRDP Draft EIR, page 4.5-74.

lower emissions from this particular mobile source (please see Response GH-1 [page C&R 3.10-3]). Reducing the emission production of the vehicular fleet used privately by CPMC employees, visitors and patients, however, is not a strategy that can be implemented by CPMC; it must be implemented by the federal and state governments through their establishment and implementation of vehicular emissions standards. The mitigation of traffic-generated noise can, likewise, only be mitigated through the reduction in vehicular trips.

The expanded TDM program is and would be an inherent part of the proposed LRDP and would be required as a condition of approval. Thus, the expanded TDM program is not identified as a separate mitigation measure in the Draft EIR.

The current and proposed future efforts to reduce single-occupant vehicle trip making associated with CPMC facilities are incorporated in the CPMC TDM Plan. The TDM program has established the following overall goals:[9]

- To reduce Single Occupant Vehicle (SOV) trips from the current baseline mode split;
- To promote the City of San Francisco's Transit First policy;
- To reduce long-term parking demand from the LRDP;
- To reduce vehicular-generated emission of criteria pollutants; and
- To reduce vehicular-generated greenhouse gas emissions.

CPMC's existing TDM program[10] includes the following components (see pages 4.5-74 and 4.5-75 of the Draft EIR):

- Employee Parking Pricing – employees may request to purchase monthly parking passes for CPMC garages and lots for $110. CPMC also subsidizes a number of off-site parking lots at 50 percent of the cost up to $100 per month.

- Visitor/Patient Parking Pricing – the hourly rate is $4 for the first hour and $2 every half-hour thereafter. There is a daily maximum of $30 per day. However, patients and family members of patients are eligible to a voucher that limits the daily maximum to $10.

- Commuter Checks – Employees may elect to participate in the Commuter Checks program, which enables employees to purchase up $230 worth of transit fares pre-tax per month.

- Carpool Program – CPMC offers free parking for registered carpools and vanpools (3 or more participants). St. Luke's is the only campus which has reserved parking spaces for carpools. Currently there are five reserved parking spaces for carpools, of which two are assigned.

- Bicycle Parking – CPMC provides bicycle racks at each of the campuses that can accommodate between 7 and 18 bicycles depending on the campus. Bicycle parking is typically located near the entrances to the public parking facilities.

- Emergency Ride Home Program – CPMC participates in the City of San Francisco's Emergency Ride Home program that provides a free or low cost ride home in cases of emergency for San Francisco employees who use alternative transportation, such as carpooling, vanpooling, public transit, bicycling, and walking.

[9] Nelson/Nygaard Consulting Associates. CPMC TDM Plan. March 24, 2011. page 2.

[10] The various cost figures reflected in the existing TDM program represent current pricing and are subject to periodic adjustment based on market conditions.

- Courtesy Ride Home – CPMC security staff provides CPMC employees with a ride home or to transit or parking during the evening/night-time hours within a four-block radius of each campus.

- Carsharing – Carshare vehicles are located at or near all four campuses.

- Transit Subsidy – The Davies Campus provides a $20 per month transit subsidy to participating employees. The subsidy is added to each employee's Clipper Card.

- On-site Transit Sales – The Davies Campus provides on-site transit sales.

- Shuttle Service – CPMC's free shuttle service typically operates from 5am until 9pm, depending on the route. Shuttle services are available to physicians and staff, and are occasionally used by patients and visitors. The shuttle serves the four existing campuses, as well as remote parking lots and BART stations.

The Construction Transportation Management Plan called for in Mitigation Measure MM-TR-55 would, among other steps, require CPMC to identify ways to reduce construction worker vehicle trips through TDM programs and methods to manage construction work parking demands (see Draft EIR pages 4.5-159 to 4.5-160).

As noted in several locations in the Draft EIR, beginning on page 4.5-98, and pages 5-14 to 5-15, CPMC has indicated that they are planning on expanding their current TDM program to discourage use of private automobiles. CPMC's proposed enhanced TDM program for the LRDP expands components that would be incrementally added over the coming years as new facilities come on line at CPMC campuses.[11] The expanded offerings in the TDM program are described below in terms of Near Term (0–2 years), Middle Term (2–5 years), and Long Term (5+ years).

TDM Components in the Near Term (0 to 2 years)

- *TDM Outreach, Marketing, and Information*

  - **Reinstate Transportation Services Newsletter** – Reintroduce the Parking Services Newsletter and rebrand it as a transportation newsletter that markets the various TDM programs available.

  - **Provide TDM Communication Boards in each Campus Cafeteria** – Information on TDM programs, transit schedules and maps, bicycle routes, as well as upcoming events would be posted on boards and periodically updated in each cafeteria.

  - **Enhance the TDM Site on Intranet** – CPMC would update its employee intranet to emphasize TDM programs as well as provide enrollment forms for commuter checks, shuttle schedules and maps, links to BART, MUNI, and 511.org, and parking and carsharing information.

  - **Enhance the TDM Information on Public Website** – CPMC would review its existing public website and modify it to better publicize alternative transportation options to visitors and patients. The visitor and patient portion of the website would be updated to provide information on biking to the campus as well as taking BART and MUNI.

  - **Reinstate and Expand the Annual Transportation Fair** – The fair would include representatives from local and regional transportation agencies, the Bicycle Coalition, 511.org, and carshare companies, and provide information about transit, ridesharing and bicycling.

[11] Nelson/Nygaard Consulting Associates. CPMC TDM Plan. March 24, 2011. pages 6-10.

- **Promote the Existing Free Ride Home Program**
- **Increase Marketing of the City of San Francisco's Emergency Ride Home Program**
- **Design an Outreach Program** – An outreach program would be designed emphasizing the time savings, reduction in greenhouse gas emissions, health benefits, and other positive outcomes of adopting alternative transportation modes.
- **Develop a TDM Operations and Maintenance Budget** – CPMC would establish a fully funded budget for the TDM program and report the results on an annual basis to the City.

- *Parking Pricing* – CPMC would evaluate and may increase employee parking prices as necessary to achieve increased trip reductions.
- *TDM Coordinator* – CPMC would retain a full-time experienced TDM coordinator to coordinate, monitor and publicize TDM activities for the campus including the following:
  - Develop an information package of transportation services and benefits offered by CPMC, and participate in employee orientation training.
  - Promote attendance at the Transportation Fair by providing incentives for employees to attend the Fair, such as free transit fast passes.
  - Maintain and update the TDM communication boards.
  - Monitor and update, as appropriate, the TDM program.
  - Track participation rates in TDM program components.
  - Conduct employee travel surveys on an annual basis.
  - Coordinate parking management and the shuttle program.
  - Create a central database of shuttle utilization data.
  - Oversee the rebranded transportation newsletter.
- *Carpool and Vanpool Parking* – The number and location of reserved carpool and vanpool parking would be monitored annually and increased as necessary.
- *Bicycle Parking* – The number and location of bicycle racks would be monitored annually and increased as necessary. Both secure long-term parking as well as short-term parking would be provided.
- *On-site Transit Pass Sales* – CPMC would provide on-site transit pass sales at all campuses.
- *Vanpool Program* – CPMC would reinstate their vanpool program which included a $2,500 subsidy per year.[12] CPMC would aggressively market the vanpool program to employees via the monthly newsletter, website, and other appropriate channels.

[12] The various cost figures reflected in the existing TDM program represent current pricing and are subject to periodic adjustment based on market conditions.

- *Rideshare Program* – CPMC would encourage employees to rideshare by promoting the 511.org rideshare service.

- *Free Ride Home Program* – CPMC would increase the boundaries of the program to cover major transit stops and also promote and market the Free Ride Home program.

- *Transportation Surveys* – CPMC would conduct an employee transportation survey at all campuses, which would be used to establish a more current baseline commute mode split. CPMC would achieve a minimum of 30% response rate at each campus. Furthermore, a patient/visitor transportation survey would be collected from at least 200 patients and visitors at each of the four main campuses (other than the California Campus) to establish a baseline visitor mode split. The commuter survey would be conducted annually, and the visitor survey would be conducted every three years.

- *Wayfinding and Signage* – CPMC would provide on-site signage for patients and visitors identifying the locations of bicycle parking, vehicular parking, and shuttle stops as well as full shuttle schedules with maps in the lobby of each hospital.

TDM Components in the Middle Term (2 to 5 years)

- *Shower Facilities* – Showers and changing facilities would be included in all new buildings and facilities for employees who bike or walk to work.

- *Marketing and Outreach* – CPMC would continue the TDM and Outreach program detailed above and would investigate and implement methods for improving marketing materials and outreach methods.

- *Real Time Transit Information* – CPMC would install real-time transit information signs in the lobbies of its existing facilities and would provide links to real time transit information on the intranet as well as the public website.

- *Bicycle Parking* – The number and location of bicycle racks would be monitored annually and increased as necessary. CPMC would install bicycle lockers in both new and existing parking garages.

- *Carsharing* – CPMC would allot additional parking spaces to carsharing services in both new and existing buildings based on demand.

- *Rideshare Program* – CPMC would create an internal rideshare program (e.g. RideSpring or a 511.org interface). CPMC would also explore the feasibility of coordinating a rideshare program with other large institutions in order to increase the pool of carpoolers and vanpoolers.

- *Carpool and Vanpool Parking* – CPMC would continue to provide reserved carpool and vanpool parking at all new parking facilities based on demand.

- *Transit Subsidy* – CPMC would expand the transit subsidy program to include all campuses and increase the value of the monthly subsidy to be equivalent to the cost of a MUNI Fast Pass.

- *Transportation Surveys* – CPMC would continue to conduct an annual employee transportation survey which would be used to track mode split as compared to the baseline mode split and to receive feedback on TDM programs. CPMC would achieve at a minimum a thirty percent response rate. Each three years, a patient/visitor survey would also be conducted to track visitor mode split.

TDM Components in the Long Term (5+ years)

- *Real Time Transit Information* – CPMC would continue to install real-time transit information signs in the lobbies of all new facilities and would provide links to real time transit information on the intranet as well as the public website.

- *Carsharing* – CPMC would create a corporate carshare account that would enable employees to use carsharing services at reduced rates.

- *Parking Pricing* – CPMC would continue to monitor parking demand and adjust the monthly employee permit fee and patient/visitor hourly parking fees to balance supply and demand.

- *Marketing and Outreach* – CPMC would continue the TDM and Outreach program detailed above and would investigate and implement methods for improving marketing materials and outreach methods.

- *Transportation Surveys* – CPMC would continue to conduct an annual employee transportation survey which would be used to track mode split as compared to the baseline mode split and to receive feedback on TDM programs. CPMC would achieve at a minimum a thirty percent response rate. Each three years, a patient/visitor survey would also be conducted to track visitor mode split.

Shuttle Restructuring

CPMC operates a shuttle system that provides transport between the existing and proposed LRDP campuses, and between the campuses and local transit nodes. With the construction of the Cathedral Hill Campus, the relocation of existing services from several campuses to Cathedral Hill, and the eventual closure of the California Campus, CPMC has proposed significant restructuring of its shuttle service. First, the Civic Center BART station would be served by two routes instead of one. These two lines would have very high frequencies at 6 and 3 minutes, respectively. The other routes would all have 30-minute frequencies. Second, the 24th Street BART station would have all-day service as opposed to its current peak-hour service in the morning and afternoon. Third, the new line to the Folsom Street offices would also provide service south to the 4th and King Caltrain station. Fourth, the Van Ness Muni Metro would no longer be served as is currently done by the BV Line.

As discussed in the Draft EIR, Table 4.5-16 on page 4.5-86, it is estimated that the proposed shuttle system would quadruple the daily shuttle ridership compared to current service.

Effectiveness

The proposed additions to the CPMC TDM program would result in both reduced vehicle trips and parking demand as compared to the projected trip and parking generation that was calculated as part of LRDP in the Draft EIR (see pages 4.5-194 and 4.5-209). The estimated percentage reduction in peak hour vehicle trips and parking demand that would be achieved as a result of the proposed enhanced TDM program in the near, mid, and long term would range between approximately 15–20 percent. The greatest reductions would be seen at the Davies and Cathedral Hill Campuses.[13]

Feasibility

Under CEQA, an EIR must present feasible mitigation measures, where they exist, for all significant impacts. The State CEQA Guidelines explain that "[a]n EIR shall describe feasible measures which could minimize significant adverse impacts,…" (see section 15126.4(a)(1)). The term "feasible" is defined

[13] Nelson/Nygaard Consulting Associates, CPMC TDM Plan. March 24, 2011.

under CEQA as being "capable of being accomplished in a successful manner within a reasonable period of time, taking into account economic, environmental, legal, social, and technological factors" (see section 15364).

The CPMC TDM program has been compared to TDM plans for other major medical and other large employers in the central Bay Area. The components of the plan represent the upper end of measures taken by these employers, both in terms of the level of investment and the resulting level of non-single occupancy vehicle (SOV) mode use that could be expected. Further SOV trip reduction would be infeasible in light of the extremely high level of alternative mode use already inherent in trip making characteristics of commuters in San Francisco and the fact that CPMC's proposed expanded TDM program includes measures that go significantly beyond the TDM commitments that have been made by other similar medical institutions. The expanded TDM program, as described herein, therefore, represents the maximum feasible mitigation of traffic-generated environmental impacts; no further feasible mitigation is available to CPMC or the City of San Francisco. Because trip reduction is the only reasonably foreseeable measure to reduce traffic-generated environmental impacts, no further feasible mitigation is available to reduce or avoid significant impacts.

Comments

(Gloria Smith—California Nurses Association, October 19, 2010) [90-60 AQ]

"**5. The DEIR Failed to Disclose and Adequately Mitigate Significant Impacts on Air Quality**

In its air quality section, the DEIR failed to identify and mitigate significant impacts on air quality because it failed to provide an analysis after buildout of all near-term projects in 2015. Instead, the DEIR only provided emission estimates and conclusions as to their significance for the year 2030, long after all LRDP-related projects will be build [sic] out. Consequently, the DEIR fails to require mitigation for those significant impacts it failed to identify."

(Gloria Smith—California Nurses Association, October 19, 2010) [91-36 AQ]

"Review of the Administrative Record obtained in response to a number of PRA requests (*see* Comment I) reveals that operational emissions had been estimated for both the interim year 2015 after buildout of all near-term Project components and for the year 2030 after buildout of long-term Project components.[32,33] Yet, even though the Draft EIR purports to provide project-level review for near-term Project components, it presents only emission estimates for after buildout of long-term Projects is presumably anticipated to be completed in 2030. It appears that analyses for the interim year 2015 have been deliberately omitted. As demonstrated below, emissions estimated for 2015 are considerably higher than in 2030, resulting in exceedance of quantitative thresholds of significance established by the BAAQMD.

[32] Administrative Record, Email from Snigdha Mehta, AECOM, to John Koehler and Jayni Allsep, Re: Completion of Review of CPMC AQ Section, June 25, 2010; provided as PDF file '34 08010089.AQ.Environ.201006' and attachments in folder '34 08010089.AQ.Model Runs.'

[33] Administrative Record, Memorandum from Snigdha Mehta, AECOM, to Jessica Range, San Francisco Planning Department, Re: Area and Mobile Source Emissions Methodology, June 17, 2010; provided as PDF file '35 08010089.AQ.CPMC Operational Air Emissions - URBEMIS Runs.'"

(Gloria Smith—California Nurses Association, October 19, 2010) [91-37 AQ]

"Table 2 summarizes net emission changes of criteria pollutant and precursors attributable to area and mobile sources for the Cathedral Hill, Davies, and St. Luke's Campuses for the year 2015 as estimated by the EIR consultant Environ. Stationary source emissions were assumed to be the same for the year 2015 as for the year 2030. Net emission changes at Pacific Campus were assumed to be zero, as no construction would occur and no change in operations is expected before 2015.

Table 2
Net emission changes of criteria pollutants and precursors in 2015 attributable to operations under the CMPC LRDP (based on documents prepared in support of the Draft EIR) and net emission changes as presented in the Draft EIR for 2030

b From Draft EIR, Table 4.7-6, p. 4.7-39

c No net change in emissions was assumed until 2015

d Mobile source emissions only

e Draft EIR, Table 4.7-6, p. 4.7-39

Table 2 shows that, compared to 2030, total net unmitigated emission changes attributable to Project operations are considerably higher in 2015. The difference is mostly associated with anticipated decreases in emissions from mobile source between 2015 and 2030. Table 2 demonstrates, based on emission estimates performed in support of the Draft EIR, that in 2015, in addition to the previously identified significant PM10 emissions, net changes in unmitigated operational emissions of a) CO would exceed the threshold of significance established in the 1999 BAAQMD CEQA Guidelines of 550 lb/day and b) NOx would exceed the threshold of significance established in the 2010 BAAQMD CEQA Guidelines of 54 lb/day. These are new significant impacts that the Draft EIR failed to identify and mitigate."

Response AQ-12

The comment states that the Draft EIR did not evaluate potential operational air quality impacts associated with operation of the proposed near-term LRDP projects in 2015 and omitted disclosure of significant impacts by presenting analysis of such effects in 2030 in the Draft EIR.

The Draft EIR, as part of Impact AQ-3 beginning on page 4.7-38, acknowledges significant and unavoidable impacts with respect to near-term (2015) operational emissions associated with the proposed LRDP, although it does not provide the specific numeric values of emissions that would occur in 2015. This is partly because, as correctly noted by the comment, the majority of emissions associated with near-term operations would be associated with mobile source (vehicular) emissions. It also should be noted that quantified emission levels in 2015 were included as part of the administrative record supporting the analysis of the Draft EIR, and thus they are not considered new impacts needing to be discussed as part of the Draft EIR. See Response AQ-10 (page C&R 3.9-26) for a discussion of potential CO concentrations and impacts.

Contrary to the comment, all feasible mitigation was evaluated for near-term and long-term projects and has been incorporated into the proposed LRDP as part of the proposed expanded TDM program, described in the Draft EIR (pages 5-14 to 5-15) and further explained in this C&R document (see Response AQ-11, page C&R 3.9-27). CPMC already implements and would implement further improvements to its TDM program, which would serve to reduce Vehicle Miles Traveled (VMT) and thereby air quality emissions from vehicular sources by reducing the number of vehicle trips. No reliable methodology exists for quantifying the reduction in vehicle trips and corresponding reduction in air quality emissions that would result from implementation of the proposed enhancements to CPMC's TDM program. See Response AQ-11 (page C&R 3.9-27). The key elements of CPMC's existing TDM program are described on pages 4.5-74 to 4.5-75 in the Draft EIR. No other feasible measures have been identified that would serve to potentially reduce criteria pollutants associated with the significant and unavoidable impact with respect to near-term (2015) operational criteria air pollutants.

Comments

(Gloria Smith—California Nurses Association, October 19, 2010) [90-66 AQ; duplicate comments were provided in 96-10, 110-10]

"The increased vehicle miles traveled associated with the longer trips of patient, visitor, and emergency vehicles to and from other hospitals would also increase the regional air pollutant and greenhouse gas emissions and associated adverse impacts on public health."

Response AQ-13

The comment states that vehicles travelling to and from CPMC facilities under the proposed LRDP would result in longer vehicle trips and greater air quality and GHG emissions than under existing conditions. Please refer to Response HC-7 to comments suggesting that the LRDP would result in increased or longer trips to and from other hospitals (page C&R 3.23-74). See also Response AQ-11 (page C&R 3.9-27) with regard to CPMC's proposed enhanced TDM program.

Comments

(Gloria Smith—California Nurses Association, October 19, 2010) [91-31 AQ]

"**V.B The Draft EIR Fails to Adequately Discuss Impacts Attributable to Project Operational Emissions**

The Draft EIR provides two summary tables for net changes of emissions of criteria pollutants from existing conditions for the year 2030 and the respective thresholds of significance established in the 1999 BAAQMD

CEQA Guidelines in Impact AQ-3: Table 4.7-6 summarizes emissions in pounds per day ('lb/day') and Table 4.7-7 summarizes emissions in tons per year ('ton/year'). In order to interpret these tables, the Draft EIR provides a 10-line discussion for near-term project-components at the Cathedral Hill, Davies, and St. Luke's Campuses, finding that PM_{10} emissions would *exceed* the daily and annual significance thresholds established in the 1999 BAAQMD CEQA Guidelines, no feasible mitigation measures are available and therefore the impact would remain significant and unavoidable."

(Gloria Smith—California Nurses Association, October 19, 2010) [91-32 AQ]

"Similarly, the Draft EIR provides an eight-line discussion for the Cathedral Hill and St. Luke's Campuses with Project variants finding that none of the identified variants are expected to significantly change operations and hence, for the same reasons as described before, impacts would be significant and unavoidable. For long-term project components at the Pacific and Davies Campuses, the provides an even shorter discussion, three lines, stating that impacts would be similar to short-term projects, that no feasible mitigation is available, and, therefore, that impacts would remain significant and unavoidable.[27]

[27] Draft EIR, pp. 4.7-38 - 4.7-41."

(Gloria Smith—California Nurses Association, October 19, 2010) [91-33 AQ]

"The discussion in Impact AQ-11 some 44 pages later, comparing PM10 emissions to the 2010 BAAQMD CEQA Guidelines, is exactly the same.[28] These brief 'discussions' are entirely inadequate for a CEQA review document, especially, considering the size and scope of the Project at hand and its lasting impacts.

First, the Draft EIR addresses in its discussion of emissions and impacts only the one pollutant, PM10, which would exceed the 1999 and 2010 BAAQMD thresholds of significance. The Draft EIR does not provide any discussion of pollutants below the significance thresholds. This leaves reviewers with having to compare the emission estimates presented in Tables 4.7-6 and 4.7-7 against the presented thresholds of significance themselves. Because the Draft EIR fails to provide the levels of significance for operational emissions established in the 2010 BAAQMD CEQA Guidelines anywhere in the air quality section, a reviewer unfamiliar with the BAAQMD's guidelines has to simply trust the Draft EIR's conclusions.

[28] Draft EIR, pp. 4.7-72 - 41.7-73."

Response AQ-14

Section 15126.2 of the CEQA Guidelines states that "[a]n EIR shall identify and focus on the significant effects of the proposed project." In the interest of providing succinct yet informative analyses of the potential air quality impacts of the proposed LRDP, detailed discussion of impacts was largely limited to those criteria pollutants that were projected to exceed the BAAQMD thresholds of significance. The Draft EIR (under Impacts AQ-3 and AQ-11, pages 4.7-38 and 4.7-72) summarizes the potential operational criteria air pollutant emissions of the proposed LRDP and compares those emissions to both the 1999 and 2010 BAAQMD significance criteria. However, as noted in Response AQ-20 (page C&R 3.9-48), Table 4.7-7 of the Draft EIR (page 4.7-40) mistakenly references the significance thresholds as the "2010 BAAQMD significance criterion" rather than the "1999 BAAQMD significance criterion." This typographical error has been corrected, as shown on page C&R 4-21 in Section 4.1.10 of Chapter 4 of this C&R document. Contrary to statements made in these comments, the Draft EIR evaluates the potential impacts of the proposed CPMC LRDP against BAAQMD's 2010 CEQA Guidelines, beginning on page 4.7-57 with a statement of the revised thresholds of significance and methodologies for determining air quality impacts and continuing with Impacts AQ-8 through AQ-14.

~~Recently adopted~~ 1999 BAAQMD significance criterion	15	15	15	–

Notes: BAAQMD = Bay Area Air Quality Management District; NA = not applicable; NO_X = oxides of nitrogen; PM_{10} = respirable particulate matter with an aerodynamic diameter of 10 micrometers or less; $PM_{2.5}$ = fine particulate matter with an aerodynamic diameter of 2.5 micrometers or less; ROG = reactive organic gases; TPY = tons per year.

[a] Area and mobile source missions modeled using the URBEMIS 2007 (Version 9.2.4) computer model, based on proposed land uses identified in Chapter 2, "Project Description," and trip generation rates obtained from the traffic analysis in Section 4.5, "Transportation and Circulation," of this EIR. Stationary source emissions

[b] Negative values indicate a net reduction in emissions compared to existing conditions.

[c] Totals may not add exactly because of rounding.

[d] No new stationary sources are planned for Pacific Campus.

[e] $PM_{2.5}$ emissions are compared against proposed significance thresholds under Impact AQ-11.

Source: Area and mobile source emissions modeled by AECOM in 2010; stationary source emissions modeled by ENVIRON 2009-~~10~~1. Information on these calculations is on file with the San Francisco Planning Department, 1650 Mission Street, Suite 400, San Francisco 94103, and is available for public review as part of the project file, in Case No. 2005.0555E

The analysis in the Draft EIR uses both the 1999 guidelines and the updated June 2010 thresholds of significance and methodologies from the BAAQMD CEQA Air Quality Guidelines to evaluate the potential air quality impacts of the proposed Project.[14] Although BAAQMD adoption of the significance thresholds are the subject of recent judicial actions, the Planning Department has determined that Appendix D of the BAAQMD CEQA Air Quality Guidelines, in combination with BAAQMD's Revised Draft Options and Justification Report provide substantial evidence to support the BAAQMD-recommended thresholds and, therefore, has determined they are appropriate for use in this analysis.[15] The use of both the 1999 and the updated June 2010 BAAQMD CEQA Air Quality Guidelines in both the Draft EIR and the subsequent refined analysis of TAC emissions therefore continues to represent a conservative approach that provides full disclosure regarding the potential air quality impacts of the proposed LRDP.

Furthermore, as noted in Response AQ-12 (page C&R 3.9-36), the majority of emissions associated with operation of the proposed LRDP would be mobile source (vehicular) emissions, and any reductions/mitigations that could be implemented as part of the proposed LRDP are already included aspart of the TDM program that CPMC has developed and included as a component to the proposed LRDP. Please also see Response AQ-11 (page C&R 3.9-27) for further discussion of the components of the TDM program.

Also see Response AQ-20 (page C&R 3.9-48) for a more complete discussion of the air quality impact conclusions in the Draft EIR, which includes tables that more clearly identify the proposed LRDP's emissions as they relate to the 1999 and 2010 BAAQMD significance criteria.

Comment

(Gloria Smith—California Nurses Association, October 19, 2010) [91-34 AQ]

"**V.C The Draft EIR Fails to Include Estimates of PM2.5 Emissions from Stationary Sources in Emission Estimates of PM10**

The Draft EIR treats emissions of particulate matter smaller than or equal to 2.5 micrometers ('PM2.5') from stationary sources as if they did not contribute to PM10 emissions: for example, for stationary sources at the Cathedral Hill Campus, the Draft EIR reports emissions of 7.7 pounds per day ('lb/ day') of PM2.5 but reports zero lb/ day of PM10 emissions.[29,30] The fine or respirable fraction of particulate matter, PM2.5, is a *subset* of PM10, the thoracic fraction of particulate matter and, thus X pounds of PM2.5 emissions are also X pounds of PM10 (the reverse is not necessarily true). Thus, PM2.5 emissions must be included in the emission estimates of PM10; in other words 7.7 lb/day of PM2.5 emissions equal 7.7lb/day of PM10 emissions.

[29] Sec Draft EIR, Table 4.7-6, p. 4.7-39.

[30] Particulate Matter is a mixture of extremely small particles and liquid droplets found in the air. Sources of particulate pollution include woodstoves, fires, wind-blown dust, automobiles, and industry. PM10 refers to particulate matter with an aerodynamic diameter of 10 micrometers or smaller, whereas PM2.5 refers to particulate matter with an aerodynamic diameter of 2.5 micrometers or smaller. (In general, particles have irregular shapes with actual geometric diameters that are difficult to measure. The aerodynamic diameter is an expression of a particle's aerodynamic behavior as if it were a perfect sphere with unit-density and diameter equal to the aerodynamic diameter.)"

Response AQ-15

The comment refers to the contribution of $PM_{2.5}$ emissions as a subset of PM_{10} emissions from stationary sources. The comment is correct that $PM_{2.5}$ emissions are a subset of PM_{10} emissions and that the Draft EIR understated stationary source PM_{10} emissions by not including an equivalent level of $PM_{2.5}$ to PM_{10} emissions. Table 4.7-6 and Table 4.7-7 in the Draft EIR, on pages 4.7-39 and 4.7-40, respectively, and the text description of data in those tables on pages 4.7-41 and 4.7-72 of the Draft EIR, have been revised as shown below and on pages C&R 4-19 to 4-22 to reflect the requested changes.

> The projected PM_{10} emissions listed in the first paragraph at the top of Draft EIR page 4.7-41 and in the second full paragraph on Draft EIR page 4.7-72 has been amended to state:
>
> …the net change in operational PM_{10} emissions from implementation of projects under the CPMC LRDP (~~119~~128 pounds/day, ~~22~~23 tons/year) would exceed BAAQMD's applicable daily and annual emission significance criteria….

The revisions to Tables 4.7-6 and 4.7-7 represent relatively small changes in the overall estimate of PM_{10} emissions. No change is necessary to the estimated emissions at the Pacific Campus, and the changes in total PM_{10} emissions at the Davies and St. Luke's Campuses are approximately 0.02 lbs/day and 1.7 lbs/day, respectively. The increase in PM_{10} at the proposed Cathedral Hill Campus would be approximately 7 lbs/day. These changes to the PM_{10} emissions estimates from stationary sources do not substantially increase the level of emissions that would occur or alter any significance determinations related to criteria air pollutant mass thresholds or risk thresholds. Please also see Response AQ-20 (page C&R 3.9-48) for a description of other changes to Draft EIR Tables 4.7-6 and 4.7-7 that have been incorporated as part of the text revisions shown on pages C&R 4-19 to 4-22.

Information on these calculations is on file with the San Francisco Planning Department, 1650 Mission Street, Suite 400, San Francisco 94103, and is available for public review as part of the project file, in Case No. 2005.0555E

Comment

(Gloria Smith—California Nurses Association, October 19, 2010) [91-35 AQ]

"**V.D The Draft EIR Fails to Analyze Interim Year Operations and Fails to Identify Significant Impacts on Air Quality**

The Draft EIR contains no explanation whatsoever why full buildout of the Project in the year 2030 was chosen for analysis and why no analysis of any interim years was provided. Since the Draft EIR purports to analyze near-term project components at the project level pursuant to Section 15161 of the State CEQA Guidelines, it should have provided analyses of these near-term projects at the time they become operational. Yet, it only provides an analysis for 2030 when all project components, including near-term and long-term projects would be operational. Review of the construction schedule provided in Appendix B of the Draft EIR shows that construction of most near-term projects including the Cathedral Hill Hospital, the Cathedral Hill MOB, the tunnel, St. Luke's Hospital, and the Davies Neuroscience Institute is anticipated to begin immediately after approval and is expected to be finalized within 2 to 4 ½ years. Construction of the St. Luke's MOB would be started when St. Luke's Hospital becomes operational and would last about 3 ½ years. That means, if construction of near-term projects (with the exception of the St. Luke's MOB) were started in 2011, these project components would be operational in 2015 and St. Luke's MOB would be operational by 2018. Thus, the Draft EIR should have provided project-level analyses of near-term projects for the years 2015 and 2018. In other words, the Draft EIR fails to provide project-level review. Since timing and project-specific details of the proposed long-term projects are undetermined and

these projects will have to undergo separate CEQA review, the analyses for 2030 can only provide a best-guess estimate of conditions in 2030. Further, based on the construction schedule provided in the Notice of Preparation for the Draft EIR, construction for the long-term projects is anticipated to be finalized in 2020 (the Draft EIR only provides a construction schedule for near-term project components in Appendix B).[31] Thus, the 2030 horizon is not fitting for analysis of long-term projects but should be revised to 2020.

[31] Appendix A. Table 1 "CPMC Long Range Development Plan Schedule," p. 11."

Response AQ-16

The comment states that the Draft EIR did not provide analyses of LRDP near-term projects for the years 2015 and 2018 (although it provided analysis for 2030), and that the Draft EIR "fails to provide project-level review." The comment suggests that the determinative factor as to whether the impacts associated with a particular development project under the proposed LRDP have been analyzed at the project- or the program-level is the horizon year in which those impacts are analyzed.

The determining factor as to whether or not a particular development project under the proposed LRDP can be considered for project-level review is whether sufficient detail regarding the project was available at the time of preparation of the Draft EIR to have fully analyzed the potential environmental impacts of the project. According to Section 15161 of the State CEQA Guidelines, in a project EIR "[t]he EIR shall examine all phases of the project including planning, construction, and operation." Section 15146 of the State CEQA Guidelines further states that "[t]he degree of specificity required in an EIR will correspond to the degree of specificity involved in the underlying activity which is described in the EIR." For near-term projects under the LRDP, sufficient project information is available to accomplish an examination of all aspects of the proposed near-term projects; for long-term projects under the LRDP, such detailed analysis cannot be included in the EIR because the projects have not been sufficiently defined at this time.

Therefore, the determination as to whether a particular project was analyzed at the project-level or program-level is based on the level of detail of the analysis in the Draft EIR of that project's impacts, not on the year selected to analyze those impacts. For near-term projects under the proposed LRDP (all proposed development at the Cathedral Hill and St. Luke's Campuses, and the Neuroscience Institute building at the Davies Campus) sufficient detail was available for the Draft EIR to analyze impacts at the project-level, and these projects were evaluated under near-term (2015) conditions. This data was presented as part of the administrative record and made available for public review. The proposals for long-term projects (all proposed development at the Pacific Campus and the Castro Street/14th Street MOB at the Davies Campus) have not yet been designed to the same level of detail and, therefore, were analyzed at the program-level. In accordance with the timing requirements of SB 1953 and to establish consistency with the City's traffic model, 2030, not 2020, was determined to be the reasonably achievable buildout condition date for the proposed LRDP and the appropriate buildout condition date for long-term impact evaluation.

With respect to the comment's proposed evaluation of year 2018 operation of the proposed St. Luke's MOB, evaluation of the MOB under 2015 conditions, consistent with other near-term components under the proposed LRDP, represents a more conservative analysis by considering potential impacts for the entire St. Luke's Campus at one time and assesses a larger potential change associated with those impacts. For example, with respect to traffic and noise, the Draft EIR assesses the potential decrease in LOS and increase in ambient noise levels against 2015 conditions, which would reasonably be considered to be lower than 2018 conditions due to growth within the City and County of San Francisco. As a result, the proportional change in LOS and ambient noise levels resulting from development at the St. Luke's Campus would be greater in 2015 compared to 2018. Therefore, the analysis of the proposed St. Luke's MOB under 2015 conditions is considered adequate and appropriate for determining the potentially significant impacts of the proposed LRDP.

Comment

(Paulett Taggart—Paulett Taggart Architects, October 19, 2010) [106-1 AQ]

"I do support quality health care for all San Franciscans. However, I have serious concerns about the environmental impacts of the Long Range Development Plan. The proposal for CPMC as described will have a significant environmental impact effect with regard air quality as well as wind and shadow."

Response AQ-17

This comment states opposition to the proposed LRDP and reiterates that the LRDP would result in significant air quality impacts. The comment states that the proposed LRDP would result in significant wind and shadow impacts; however, as evaluated in Section 4.9, "Wind and Shadow" in the Draft EIR, wind and shadow impacts for all campuses would be less than significant. The comment will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project.

3.9.1.4 TOXIC AIR CONTAMINANTS

Comment

(Unitarian Universalist CPMC Task Force, October 5, 2010) [44-7 AQ]

"Regarding Air Quality: we read on page 4.7 - 46 that CPMC's own medical patients were identified as the 'sensitive receptors.' The hazards were then determined to be 'insignificant' because their stay is temporary. Why not consider the 110 children at the Montessori School year round, usually 8 am to 6 pm, and only 250 feet away, or the many neighborhood residents? Impact AQ-3 on page S-65 reiterates that 'the operation of the LRDP would exceed BAAQMD CEQA significance thresholds for mass emission of criteria pollutants' and offers no mitigations."

Response AQ-18

The comment states concerns about potential toxic air contaminants (TACs) and suggests that reference to the Montessori School and the surrounding neighborhood residents to project sites should be included in the mitigation discussion in the Draft EIR.

The cited reference of CPMC's own patients as "sensitive receptors" on page 4.7-46 in the Draft EIR is in a section discussing the "Impact of Off-Site Sources on On-Site Receptors" with respect to TACs from roadway traffic. For the purposes of this portion of the assessment, the on-site patients would be the on-site sensitive receptors. The "Impact of On-Site Sources on Off-Site Receptors" with respect to operational TAC emissions from the proposed Cathedral Hill Campus is discussed on pages 4.7-43 through 4.7-46 in the Draft EIR. The Montessori House of Children at 1187 Franklin Avenue is one of the off-site sensitive receptors included in this assessment.

For all sensitive receptors, including the Montessori school and the surrounding neighborhood residents, the proposed LRDP was found to have a less-than-significant impact from operational TAC emissions. The Impact AQ-3 (Draft EIR, beginning on page 4.7-38) finding that proposed LRDP operations would exceed the BAAQMD CEQA significance thresholds for criteria pollutant mass emissions (as opposed to TACs) was a finding based on particulate matter (PM_{10}) emissions from project-related traffic increase. Please see Response AQ-20 (page C&R 3.9-48) for further discussion of this significant and unavoidable impact finding. As described therein, all feasible traffic mitigations, were incorporated in the project-related traffic projections analyzed in the Draft EIR, with the exception of CPMC's proposed enhanced TDM program, which was not incorporated into the Draft EIR traffic projections in order to produce a

conservative analysis. See Response AQ-11 (page C&R 3.9-27) for further discussion of the proposed enhanced TDM program.

Comments

(Lower Polk Neighbors, October 19, 2010) [103-18 AQ, duplicate comment was provided in 113-18 AQ]

"G. We are concerned about the continuing health issues surrounding hospitals and medical facilities. We are concerned that the emissions and discharges from biohazards, ventilation of sterilization equipment and surgical by-products from laser use, and general ventilation of a hospital itself and medical building will create a health hazard. Small amounts of toxins and hazardous materials over a long period can cause major health issues."

(Lower Polk Neighbors, October 19, 2010) [103-19 AQ duplicate comment was provided in 113-19 AQ]

"Health studies of the neighborhood surrounding UCSF has shown that there is a larger percentage of health-related issues than outlying neighborhoods. Then there is the issue of hospital patients contracting infections and diseases while in the hospital. Some of this must carry outside the medical facility to the surrounding neighborhood."

Response AQ-19

The comments state concerns regarding airborne and other TACs associated with operation of the proposed LRDP CPMC campuses that could affect nearby sensitive receptors. Impact AQ-5 in the Draft EIR, beginning on page 4.7-43, evaluates the potential for TACs that could reasonably be expected to result from operations on the proposed CPMC campuses to affect adjacent, off-site receptors. The Draft EIR analysis concludes that the proposed LRDP would not exceed the BAAQMD standards at any off-site receptors located near or adjacent to any of the existing or proposed CPMC campuses.

Furthermore, as noted in the Draft EIR, page 4.16-33, the management of medical wastes and other hazardous materials would continue to be regulated under a wide array of laws at federal, state, and local levels through programs administered by the U.S. Environmental Protection Agency (EPA), agencies within the California Environmental Protection Agency (Cal/EPA) such as the California Department of Toxic Substances Control (DTSC) and the San Francisco Bay Regional Water Quality Control Board (RWQCB), U.S. Department of Transportation (DOT), California Highway Patrol (CHP), U.S. Occupational Safety and Health Administration (OSHA) and California Occupational Safety and Health Administration (Cal/OSHA), and the San Francisco Department of Public Health (SFDPH). Existing and future operations at CPMC campuses would adhere to existing regulations and requirements regarding the storage, use, handling, and transport of medical wastes and other potentially hazardous materials. As stated under Impact HZ-2 in the Draft EIR, page 4.16-53, the proposed LRDP would not pose a substantial public health risk or safety hazard to the surrounding area, and all on-campus activities involving medical wastes and other potentially hazardous materials would be conducted in accordance with CPMC's approved hazardous waste and hazardous materials plan. The comments do not identify or mention any particular health studies or data from health studies related to the University of California, San Francisco (UCSF) or other medical facilities, and neither the Planning Department nor CPMC is aware of any studies showing that UCSF's campuses have a negative impact on the health of surrounding residences.

3.9.1.5 SIGNIFICANT AND UNAVOIDABLE IMPACTS/MITIGATION EVALUATION

Comments

(Donald Scherl, October 15, 2010) [74-29 AQ]

"Impacts AQ-2 and 3: AQ-2 simply states that construction activities would expose the people living and working in the neighborhood to 'substantial concentrations of toxic air contaminants,' and that operations 'would exceed ...significance thresholds for mass emission of criteria pollutants and would contribute to a projected air quality violation at full buildout.' Similar statements recur at Impacts AQ-7-11. These, in summary and in lay language, say the people in the neighborhood would be subjected to levels of criteria air pollutants exceeding 'thresholds for mass criteria pollutant emissions,' and would expose people 'to substantial concentrations of toxic (emphasis added) air contaminants'....that would 'contribute to an existing or projected air quality violation at full buildout.'

There are no mitigation actions that would reduce these problems in real world terms. Were construction on the LRDP to proceed as requested by CPMC, simply put, people in the neighborhoods would be breathing contaminated and toxic air. There is no criteria under which this can be viewed as acceptable."

(Gloria Smith—California Nurses Association, October 19, 2010) [90-82 AQ]

"For example, the DEIR concluded that emissions of criteria pollutants associated with operation of the Project's near-term and short-term project components would exceed the daily thresholds of significance for PM10 and would therefore be significant.[54] The DEIR omitted a discussion of the feasibility of any mitigation measures whatsoever; instead, it merely stated that '[n]o feasible mitigation is available to reduce this impact to less than significant.'[55] However, the DEIR lacked any foundation for this claim, because it failed to identify or evaluate any potential mitigation measures and provide analysis to support its conclusion that no feasible mitigation measures were available. The DEIR then determined that operational criteria pollutant emissions associated with implementation of the Project's near-term and long-term components would result in *significant and unavoidable* impacts on air quality by contributing to or resulting in a violation of air quality standards. This finding and the utter lack of a discussion of the feasibility of any mitigation measures is not acceptable under CEQA.

[54] See Draft EIR, Table S-2, at pages S-65 and 4.7-41.
[55] Draft EIR at page 4.7-41."

(Gloria Smith—California Nurses Association, October 19, 2010) [91-27 AQ]

"**V. The Draft EIR's Analysis of Criteria Pollutant and Precursor Emissions Attributable to Project Operations Is Severely Flawed and Fails to Identify and Adequately Mitigate Significant Impacts on Air Quality**

In Impacts AQ-3 and AQ-l1, the Draft EIR provides analyses of operational emissions of criteria pollutants[24] and precursors[25] associated with the various near-term and long-term Project components for the year 2030 under the 1999 BAAQMD CEQA Guidelines (Impact AQ-3) and the 2010 BAAQMD CEQA Guidelines (Impact AQ-l1). There are a number of problems associated with this analysis and, as a result, the Draft EIR fails to identify and adequately mitigate significant adverse impacts on air quality attributable to operational emissions from the various Project components.

[24] Criteria air pollutants include the six most common air pollutants in the U.S.: carbon monoxide *('CO'),* lead, nitrogen dioxide ('NOx'), ozone, particulate mailer ('PM'), and sulfur dioxide ('SO_2'). Congress has focused regulatory attention on these six pollutants because they endanger public health and the environment, are widespread throughout the U.S., and come from a variety of sources. Criteria air pollutants are responsible for many adverse effects on human health, causing thousands of cases of premature mortality and lens of thousands of emergency room visits annually. They also cause acid rain and can significantly harm ecosystems and the built environment.
[25] Reactive organic gases ('ROG') and NOx are precursors for ozone."

(Gloria Smith—California Nurses Association, October 19, 2010) [91-38 AQ]

"**VI. The Draft EIR's May Not Find Significant and Unavoidable Impacts due to Operational Emissions of Criteria Pollutants and Greenhouse Gases without Requiring all Feasible Mitigation**

CEQA requires that agencies adopt feasible mitigation measures (or feasible environmentally superior alternatives) in order to substantially lessen or avoid otherwise significant adverse environmental impacts.[34]

Here, the Draft EIR in Impacts AQ-3 and AQ-11, finds that emissions of criteria pollutants associated with operation of the Project's near-term and short-term project components would exceed the daily thresholds of significance for PM10 set forth in the 1999 BAAQMD CEQA Guidelines and the annual thresholds of significance for PM10 set forth in the 2010 BAAQMD CEQA Guidelines and would therefore be significant.[35] The Draft EIR fails to discuss the feasibility of *any* mitigation measures whatsoever instead merely stating that '[n]o feasible mitigation is available to reduce this impact to less than significant.'[36] However, the Draft EIR lacks any foundation for this claim. The Draft EIR fails to identify or evaluate any potential mitigation measures and provides no analysis to support its conclusion that no feasible mitigation measures are available. The Draft EIR then finds that operational criteria pollutant emissions associated with implementation of the Project's near-term and long-term components would result in *significant and avoidable* impacts on air quality by contributing to or resulting in a violation of air quality standards. This finding and the utter lack of a discussion of the feasibility of any mitigation measures is not acceptable under CEQA.

[34] Pub. Resources Code, §21002.
[35] See Draft EIR, Table S-2, p. S-65, and 4.7-41. See also Table 1.
[36] Draft EIR, p. 4.7-41."

(Carolyn Abst and Ron Case—Case + Abst Architects LLP, October 19, 2010) [102-5 AQ, duplicate comment was provided in 114-5 AQ]

"Further, we are concerned with the prevalence of a conclusion that there are significant, yet unavoidable impacts without a thorough consideration of mitigation measures or alternatives. For example, Impacts AQ-2, AQ-3, and AQ-9 through AQ-11 state that there are significant, but unavoidable impacts, mostly due to the uncertainty of equipment availability. There does not seem to be evidence that CPMC fully explored all if [sic] its options to mitigate potentially significant impacts."

(Stephanie Barton, et al.—Hastings Civil Justice Clinic for the Good Neighbor Coalition, October 19, 2010) [104-52 AQ]

"The table below identifies the significant impacts of the project pursuant to the 1999 Guidelines and the 2010 Guidelines, as identified in the DEIR. As indicated in the table, the 2010 Guidelines identify new or increase the prior significance thresholds for long term annual emissions of PM10, construction emissions of NOx, and short and long term GHG emissions.[124]

Significance Thresholds & Project Impacts Comparison Under 1999 BAAQMD Guidelines and 2010 BAAQMD Guidelines

Description of Air Pollutant or Impact	1999 and 2010 Significance Thresholds	Significant Project Impact as Identified in the DEIR
Increased cancer risk in nearby children due to construction	10 in one million, per 1999 Guidelines	17 in one million
Long term daily emissions of PM_{10}	80 pounds/day, per 1999 Guidelines	104 pounds/day
Long term annual emissions of PM_{10}	15 tons/year, per 2010 Guidelines	19 tons/year
Construction emissions of NO_X	54 pounds/day, per 2010 Guidelines	261 pounds/day in the near term, and 84 pounds/day over the long term
Direct and indirect greenhouse gas emissions	1,100 metric tons/year of CO_2 equivalent per 2010 Guidelines	22,503 metric tons per year of CO_2 equivalent

Thus, under both the 1999 and the 2010 BAAQMD CEQA Guidelines, the project poses significant and unavoidable impacts, including: (1) increased cancer risk to nearby children due to construction;[125] (2) long term daily emissions of PM_{10};[126] (3) long term annual emissions of PM_{10};[127] and (4) construction emissions of NOx.[128]

Significant air quality impacts have health and quality of life implications for the surrounding neighborhoods, including the more than 3,500 children living in the Tenderloin.[129] The project's significant and unavoidable impacts include both temporary construction emissions and long-term operational emissions of PM_{10}.[130] PM_{10} has well documented health-effects, and the significance threshold for PM_{10} was established to protect the public from adverse health impacts resulting from exposure.[131] Similarly, the project has a significant and unavoidable impact of NOx emissions.[132] NOx is a gas compound resulting from the combustion of fuels, and when exposed to sunlight, NOx reacts with other pollutants to form ozone.[133] Ozone's adverse health effects include manifestation and worsening of asthma in both children and adults. Ozone can also alter lung function by increasing respiratory rates, throat dryness, headaches, nausea and impairment of the body's immune system.[134] While air pollution impacts may be unavoidable in urban areas, the Planning Commission should consider the health impacts on the project's surrounding neighborhoods in determining whether or not the project truly has overriding considerations that necessitate its approval.

(Jean Roggenkamp—Bay Area Air Quality Management District, October 16, 2010) [109-1 AQ, duplicate comment was provided in letter 112- 1 AQ]

"Bay Area Air Quality Management District (District) staff reviewed your agency's Draft Environmental Impact Report (DEIR) for the California Pacific Medical Center (CPMC) Long Range Development Plan (project). The proposed Project is the multi-phased strategy to meet State seismic safety requirements for hospitals (SB1953)

and create a 20-year plan for CPMC's four existing medical campuses and a proposed new medical campus at Van Ness Avenue and Geary Boulevard. Major Project components include:

- At the Cathedral Hill Campus site (Van Ness Avenue and Geary Boulevard): Demolition of the existing Cathedral Hill Hotel and 1255 Post Street Office Building, construction of the proposed Cathedral Hill Hospital, a medical office building (MOB) and an underground pedestrian tunnel connecting the two, and renovation of an existing MOB.

- At the Pacific Campus (Sacramento and Buchanan Streets): Construction of a new building and parking structure, and renovation of other existing buildings.

- At the Davies Campus (Castro and 14111 Streets) and St. Luke's Campus (Cesar Chavez and Valencia Street): Demolition of existing structures at each campus, and construction of medical facilities, a MOB and parking improvements."

(Jean Roggenkamp—Bay Area Air Quality Management District, October 20, 2010) [109-2 AQ, duplicate comment was provided in 112-2 AQ]

"District staff is concerned about the significant and unavoidable air quality impacts identified in the DEIR that are associated with Project construction and operation emissions. The San Francisco Bay Area region is currently in nonattainment for state and federal ozone standards and fine particulate matter (PM2.5) standards, and for state PM_{10} standards. The emissions associated with this Project need to be mitigated to the maximum extent feasible to ensure the Project does not adversely affect the region's ability to attain heath-based [sic] ambient air quality standards."

(Elaine Jones, September 23, 2010) [PC-28 AQ]

"And also, the health and safety of the senior citizens, it's just like you're telling them, 'Well, let's breath in all that bad air,' you know?"

Response AQ-20

These comments express concern regarding significant and unavoidable air quality effects of the LRDP, requesting clarification as to why the effects could not be avoided or reduced in magnitude through the adoption of mitigation measures, and as to the public health, including potential carcinogenic effects of significant and unavoidable air quality impacts for "criteria air pollutants" with applicable BAAQMD significance thresholds including reactive organic gases (ROG), nitrogen oxides (NO_X), particulate matter greater than 10 micrometers in aerodynamic diameter (PM_{10}), and particulate matter greater than 2.5 micrometers in aerodynamic diameter ($PM_{2.5}$).

The Draft EIR summarized the net change in operational emissions associated with four LRDP campuses (three existing and one proposed campus) under Impact AQ-3, in Table 4.7-6 and Table 4.7-7 (pages 4.7-39 and 4.7-40). Table 4.7-7 mistakenly references the significance thresholds as the "2010 BAAQMD significance criterion" rather than the "1999 BAAQMD significance criterion." This typographical error has been corrected, as shown on page C&R 4-21 in Section 4.1.10 of Chapter 4 of this C&R document. Thus, in Table 4.7-7, the last line before the footnotes is revised to read:

~~Recently adopted~~ 1999 BAAQMD significance criterion

The Draft EIR also summarizes total near-term LRDP project daily construction emissions under Impact AQ-9 in Table 4.7-12 (page 4.7-63) associated with three campuses, and long-term project daily construction emissions under Impact AQ-10 in Table 4.7-13 (page 4.7-66) associated with two campuses.

All of these impacts are discussed below, along with explanations of feasible mitigation measures that are proposed. In addition, the public health effects of residual significant and unavoidable effects, with a focus on the surrounding neighborhoods, are described.

Operational Emissions

Significance Findings. The Draft EIR presents a discussion of the mass emissions of criteria pollutants resulting from the operation of the proposed CPMC LRDP under Impact AQ-3 (pages 4.7-38 through 4.7-41). As shown on pages C&R 4-21 and 4-89 to 4-91, Tables 4.7-7, 4.7-8, 4.7-10, and 4.7-11 of the Draft EIR (on Draft EIR pages 4.7-39. 4.7-40. 4.7-46, 4.7-49, and 4.7-50, respectively), as well as the text descriptions of data within these tables on Draft EIR pages 4.7-41, 4.7-50, 4.7-72, 4.7-74, and 4.7-6, have been revised as staff-initiated text changes in response to changes in California Air Resources Board (ARB) regulations for stationary diesel emergency generators that have occurred since the publication of the Draft EIR. C&R Table 3.9-2 (below) summarizes the data from these revisions to the Draft EIR regarding the predicted net changes in operational emissions with full implementation of the proposed LRDP:

C&R Table 3.9-2
Summary of Net Operational Criteria Air Pollutant Emissions Changes

Emissions/Criteria	ROG		NOx		PM10		PM2.5	
	lb/day	ton/yr	lb/day	ton/yr	lb/day	ton/yr	lb/day	ton/yr
Total Net Emissions Change	33	6.4	48	9.4	128	23	23	4.2
1999 BAAQMD Significance Criteria	80	15	80	15	80	15	--	--
2010 BAAQMD Significance Criteria	54	10	54	10	82	15	54	10

Source: Data compiled by AECOM in 2011

As shown in C&R Table 3.9-2, the total increases in net emissions for ROG, NO_X, and $PM_{2.5}$, summed across the four proposed LRDP campuses (Cathedral Hill, Pacific, Davies, and St. Luke's), would be below the 1999 and 2010 BAAQMD significance criteria; thus, impacts for those pollutants would be less than significant. However, the total net PM_{10} emission increase would exceed both the 1999 and 2010 BAAQMD significance criteria. It should be noted that the emissions currently associated with the California Campus that would not occur with implementation of the proposed LRDP were not deducted from the criteria pollutant emissions calculations in order to present a more conservative analysis.

For PM_{10}, the 1999 daily threshold is slightly more stringent than the 2010 daily threshold, although the annual thresholds for both sets of criteria are the same. Because the more stringent 1999 PM_{10} significance criteria would be exceeded when operational emissions were summed over the four CPMC campuses, the impact of the proposed LRDP would be significant and unavoidable. PM_{10} mitigations proposed under the 1999 criteria would also apply under the 2010 criteria because the impact would be significant under either criterion (1999 and 2010 significance thresholds for PM_{10}). Additional discussion as to why both 1999 and 2010 BAAQMD significance criteria are included in the Draft EIR is provided in Response AQ-23 (page C&R 3.9-64). In summary, the 1999 significance criteria were the applicable criteria for PM_{10} emissions used in the Draft EIR, per the BAAQMD policy; however, the proposed LRDP was also evaluated under the 2010 criteria.

The analysis in the Draft EIR uses both the 1999 guidelines and the updated June 2010 thresholds of significance and methodologies from the BAAQMD CEQA Air Quality Guidelines to evaluate the potential air quality impacts of the proposed Project.[16] Although BAAQMD adoption of the significance thresholds are the subject of recent judicial actions, the Planning Department has determined that Appendix D of the BAAQMD CEQA Air Quality Guidelines, in combination with BAAQMD's Revised Draft Options and Justification Report provide substantial evidence to support the BAAQMD-recommended thresholds and, therefore, has determined they are appropriate for use in this analysis.[17] The use of both the 1999 and the updated June 2010 BAAQMD CEQA Air Quality Guidelines in both the Draft EIR and the subsequent refined analysis of TAC emissions therefore continues to represent a conservative approach that provides full disclosure regarding the potential air quality impacts of the proposed LRDP.

As shown in the revised versions of Draft EIR Table 4.7-6 and Table 4.7-7 on pages C&R 4-19 to 4-22, PM_{10} emissions would have localized impacts if each campus was evaluated separately, as the BAAQMD policy would apply in the evaluation of individual stationary emission sources; only the proposed Cathedral Hill Campus would exceed either the 1999 or 2010 BAAQMD significance criteria for PM_{10} emissions. Calculations for the proposed Pacific Campus indicate that a net reduction in PM_{10} emissions would occur for that campus.

Mitigation Measures. The PM_{10} emissions associated with the future operation of all campuses would largely result from mobile source activity, primarily the operation of cars and trucks. In general, a reduction in operational emissions would involve a similar reduction in vehicular traffic attributed with a particular development. With respect to the proposed LRDP, estimated project traffic would be reduced as much as feasible by implementing the traffic reduction components of CPMC's TDM program. Moreover, CPMC has proposed enhancements to the TDM program which would further reduce estimated LRDP traffic. For purposes of the Draft EIR, estimates of proposed LRDP traffic conservatively assumed continued implementation of only the existing TDM measures. Refer to Response AQ-11 (page C&R 3.9-27) for further information regarding CPMC's proposed enhanced TDM program.

Further mitigation of particulate matter emissions would be dependent on the technological advancement of vehicular and light truck engines and fuels, which are regulated by the state and/or federal government. As such, improvements to the vehicle fleet and fuels would not be feasible to implement by CPMC as part of or as mitigation to the operational emissions of the proposed LRDP.

With respect to operational PM_{10} emissions associated with stationary sources under the proposed LRDP, stationary sources would comply with all BAAQMD and ARB regulatory requirements in effect at the time equipment is procured for each stationary source.

At the proposed Cathedral Hill Campus, the Draft EIR analysis of air quality impacts related to stationary sources was based on the assumption that the new emergency diesel generators at the proposed Cathedral Hill Hospital would comply with the interim Tier 4 engine standards, which were anticipated to be in effect at the time completion of construction.[18] This was because at the time the Draft EIR was being prepared, ARB had announced its intention to require Interim Tier 4 (Tier 4i) engine standards after January 1, 2011, and Tier 4 engine standards after January 1, 2015, for Stationary Diesel Emergency Standby Generators. This would have made California the only state that required such standards for this

[17] Bay Area Air Quality Management District. *Revised Draft Options and Justification Report, California Environmental Quality Act Theresholds of Significance*. October 2009. Document available on line at; http://baaqmd.gov/divisions/Planning-and-Research/CEQA-GUIDELINES/updated-CEQA-GUIDELINES.aspx

[18] California Air Resources Board, Regulatory Advisory (Nov. 2010) re: Amendments to Requirements for Stationary Compression-Ignition (Diesel) Engines.

type of generators. All other states exempt stationary diesel emergency standby generators from the Tier 4i and Tier 4 engine standards.

Based on the assumption that Tier 4i and Tier 4 engine standards would be required by ARB, the project sponsor had proposed to use emergency diesel generators that met Tier 2 engine standards with the addition of EPOD Emission Control Devices which include Selective Catalytic Reduction (SCRs) and verified diesel emission controls (VDECs). More specifically, the VDECs proposed were Diesel Particulate Filters (DPFs). The manufacturer, however, indicated that their engines alone could not meet the Tier 4i/4 engine standards and that the application of SCRs in conjunction with VDECs to Tier 2 equipment would be the only available means of compliance with the pending Tier 4i/4 requirements.[19]

On October 21, 2010, ARB's Board of Directors voted to amend the Airborne Toxic Control Measures, which had established the requirement for stationary diesel emergency standby generators to meet Tier 4i emission standards beginning on January 1, 2011, and Tier 4 after January 1, 2015.[20] These amendments more closely aligned the California Standards with the rest of the country, meaning that Stationary Emergency Generators would remain at their current tiered engine standards (i.e., Tier 3 for engines up to 751 horsepower and Tier 2 for engines with greater horsepower).[21]

Subsequent to the preparation and publication of the Draft EIR, ARB indicated that SCRs do not work very well for emergency standby generator applications since the engine has to come up to temperature before activating the SCRs.[22] Since the majority of all the generator run time is for purposes of testing and maintenance and since the testing is limited to 30 minutes every two weeks, SCRs would not be very effective. (On the other hand, SCRs have been found to work very well in long-term or continuous periods of generator operation).

To comply with ARB requirements as proposed to be amended, as anticipated to be in effect at the time of equipment procurement, with respect to the emergency diesel generators at the proposed Cathedral Hill Hospital, Cathedral Hill MOB, and St. Luke's Replacement Hospital, the project sponsor proposes to install generators that would comply with Tier 2 engine standards. Additionally, CPMC has proposed that the diesel generators at the proposed Cathedral Hill Hospital, Cathedral Hill MOB, and St. Luke's Replacement Hospital would be equipped with Level 3 VDECs (specifically, DPFs). At the St. Luke's Replacement Hospital, the project sponsor's proposal, as analyzed in the Draft EIR, included two 1500 kilowatt (kW) generators. However, the project sponsor now proposes to instead install one 2000 kW generator at the St. Luke's Replacement Hospital.

The emergency diesel generators at the Davies Neurosciences Institute and St. Luke's MOB/Expansion Building would be below 750 horsepower and, therefore, the project sponsor would meet ARB requirements by installing generators that would comply with Tier 3 engine standards.[23] Additionally, CPMC has proposed that the diesel generators at the Davies Neurosciences Institute and St. Luke's MOB/Expansion Building would be equipped with Level 3 VDECs. ENVIRON has prepared a supplemental analysis regarding these changes to the proposed diesel generators, which is included as Appendix C of this C&R document. The supplemental analysis is reflected in the text revisions to Draft

EIR Tables 4.7-6 and 4.7-7 and the text descriptions of data within these tables on Draft EIR pages 4.7-41 and 4.7-72 which are shown on pages C&R 4-19 to 4-22. As shown on the revised versions of Tables 4.7-6 and 4.7-7 on pages C&R 4-19 to 4-22, the supplemental analysis demonstrates that operational impacts related to NOx, ROGs, $PM_{10,}$ and$PM_{2.5}$ would remain substantially the same as analyzed in the Draft EIR.

As a result, for the proposed CPMC LRDP, despite the implementation of all feasible mitigating strategies included as part of the CPMC TDM program and through compliance with the applicable regulatory requirements for stationary sources anticipated to be in effect at the time of equipment procurement, a significant and unavoidable impact would occur from operational PM_{10} emissions, as measured by the BAAQMD regional significance thresholds.

Public Health Impacts. A description of particulate matter and related public health effects is included on pages 4.7-6 and 4.7-7 in the Draft EIR.

For further clarification, particulate matter is the term used for a mixture of solid particles and liquid droplets found in the air. PM_{10} is composed of very small particulate matter,[24] but within this size range both coarse and fine particle size fractions exist. Coarse particles (larger than 2.5 micrometers but smaller than 10 micrometers) come from a variety of sources including windblown and tire-stirred dust, and grinding operations. Fine particles (less than 2.5 micrometers) often come from fuel combustion, power plants, and diesel buses and trucks.

In the urban environment of the proposed LRDP, the mitigation of the emission of coarse particles would involve the reduction of vehicular traffic and increased street sweeping. Estimated LRDP traffic has been reduced as much as feasible through the application of traffic reduction mitigation measures, such as Mitigation Measure TR-55 in the Draft EIR, page 4.5-159, which would include implementing a construction transportation management plan (TMP) at the proposed Cathedral Hill Campus, and other components of the proposed LRDP at existing CPMC campuses, such as CPMC's proposed enhancements to its existing TDM program. As noted above, CPMC has proposed enhancements to the TDM program, which would further reduce estimated project traffic. For purposes of the Draft EIR, estimates of the LRDP traffic conservatively assumed implementation of only the existing TDM measures. With respect to other measures that could reduce roadway particulate matter, increased street sweeping is not practicable, given the fiscal constraints that currently exist in the City of San Francisco and other jurisdictions throughout California.

The mitigation of fine particulate matter emissions would be dependent on the technological advancement of vehicular and light truck engines and fuels; as discussed above, none of these measures would be feasible to implement as part of the proposed CPMC LRDP.

The EPA and the California Air Resources Board (ARB) have established national and state ambient air quality standards for small particulate matter. To facilitate achievement of those standards, the BAAQMD has set significance criteria for use in CEQA documents. The intent of this regulatory structure is to reduce and ultimately eliminate the adverse public health effects of high levels of particulate pollutants. According to the EPA, the health effects of small particulate matter include respiratory-related hospital admissions and emergency room visits; aggravated asthma; acute respiratory symptoms, including aggravated coughing and difficult or painful breathing; chronic bronchitis; decreased lung function that can be experienced as shortness of breath; and work and school absences.[25] The EPA reports that particulate matter most commonly has adverse health effects for the elderly, individuals with preexisting heart or lung disease, children, asthmatics, and asthmatic children.

[24] PM_{10} is composed of particulate matter with aerodynamic diameters of 10 micrometers or less. A width of 10 micrometers is about 1/7th the diameter of a human hair.

[25] http://www.epa.gov/ttn/oarpg/naaqsfin/pmhealth.html, accessed January 11, 2011.

The San Francisco Bay Area Air Basin (SFBAAB) is currently in attainment of the national PM_{10} standard, but in nonattainment of the more-stringent California 24-hour and annual PM_{10} standards. PM_{10} emissions not only contribute to ambient concentrations in the vicinity of their emissions, but because PM_{10} is composed of very small particulate matter, in a well-ventilated area such as the City of San Francisco, prevailing winds transport PM_{10} downwind from local emission sources, thereby resulting in generally cleaner air in San Francisco than elsewhere in the SFBAAB. Exceedances of the California 24-hour PM_{10} standard in the SFBAAB tend to occur in the late fall and winter months, when the atmosphere tends to be more stable (i.e., less air pollutant dispersion potential) and wind speeds are lower on average than at other times during the year. On days when there are exceedances of the California 24-hour PM_{10} standard in the City of San Francisco, ambient PM_{10} concentrations in the City tend to be lower than PM_{10} concentrations elsewhere in the SFBAAB.[26]

Nonetheless, despite the implementation of CPMC's TDM program plus the proposed enhancements to that program and implementation of all feasible mitigations, a significant and unavoidable impact would occur from operational PM_{10} emissions attributable to the CPMC LRDP, as measured by the BAAQMD significance thresholds.

As explained in the above discussion of mitigation measures for operational impacts, ENVIRON has prepared a supplemental analysis regarding certain changes to the diesel generators for the Cathedral Hill, Davies, and St. Luke's Campuses in response to regulatory changes adopted by ARB since the publication of the Draft EIR. The supplemental analysis is included as Appendix C to this Comments and Responses document.[27]

As shown in the revised versions of Draft EIR Tables 4.7-8, 4.7-10, and 4.7-11, on pages C&R 4-89 to 4-91, and the text revisions to Draft EIR pages 4.7-74 and 4.7-76 on pages C&R 4-22 and 4-23, the revised data regarding $PM_{2.5}$ emissions provided in the supplemental analysis indicates that the risks associated with DPM emissions at the Cathedral Hill, Davies, and St. Luke's Campuses would remain below the significance threshold of 10 cancer cases per million for health risks associated with DPM emissions. Therefore, the supplemental analysis did not result in any change in the significance findings in the Draft EIR for impacts related to health risks from stationary sources.

Construction Emissions

Significance Findings. The Draft EIR addressed the construction emissions from the near-term and long-term projects separately.

Near-Term Construction Emissions

The Draft EIR estimated near-term emissions from LRDP construction at the proposed Cathedral Hill, Davies, and St. Luke's Campuses. The 1999 BAAQMD significance criteria did not include mass emissions thresholds for criteria air pollutants from construction, but relied on a project's ability to implement dust control measures for significance determinations. Mitigations were identified in the Draft EIR, as part of Mitigation Measure M-AQ-N1a, to adopt BAAQMD's best management practices (BMPs) for construction emissions. Under the 1999 criteria, as long as these BMPs are followed, a project's impact would be considered less than significant. However, to be fully informative, the total daily construction emissions reported in the Draft EIR for all three campuses (Cathedral Hill, St. Luke's, and Davies) were also compared against the 2010 BAAQMD significance criteria, which have mass emission thresholds for construction, as summarized in C&R Table 3.9-3.

[26] CARB, 2010, available: http://www.arb.ca.gov/adam/select8/sc8display.php, accessed September 8, 2011.

[27] The supplemental analysis also includes other minor corrections to the data provided in the Draft EIR regarding PM_{10} emissions, as explained above in Response AQ-16.

Total daily near-term LRDP construction emissions of ROG, PM_{10}, and $PM_{2.5}$, summed across the three campuses on which near-term construction would occur, would be less than the 2010 BAAQMD significance criteria. However, total construction emissions of NO_X would be greater than the 2010 BAAQMD significance criteria and, thus, the impact would be significant under the 2010 criteria.

C&R Table 3.9-3
Summary of Near–Term Project Construction Criteria Air Pollutant Emissions

Emissions/Criteria	ROG lb/day	NOX lb/day	PM10 lb/day	PM2.5 lb/day
Total Construction Emissions (as shown in the Draft EIR)	**47**	**324**	**17**	**17**
2010 BAAQMD Significance Criteria	54	54	82	54

Source: Data compiled by AECOM in 2011

CPMC has made project refinements to the estimated construction emissions of the LRDP by reconfirming construction equipment assumptions, re-evaluating feasibility construction mitigation (including Mitigation Measure TR-55, which has been amended as shown on page C&R 4-1), and developing additional construction mitigation details, described below and included in Responses AQ-9 and AQ-10 (pages C&R 3.9-17 and 3.9-20, respectively). As a result, the daily NO_x construction emissions estimate for near-term LRDP projects has been reduced from 324 lb/day (unmitigated) to 81 lb/day after accounting for mitigation measures and refinement of LRDP construction details. Notwithstanding the implementation of the Draft EIR mitigation measures, near-term construction emissions of NO_x would remain "significant and unavoidable" under the 2010 BAAQMD significance criteria.

Long-Term Project Construction Emissions

Long-term construction emissions were estimated for the proposed LRDP in the Draft EIR. The average daily construction emissions for the proposed LRDP are shown in C&R Table 3.9-4, compared with the 2010 BAAQMD significance criteria. The 1999 BAAQMD significance criteria did not include mass emissions thresholds for criteria air pollutants from construction, but relied on BMPs for significance determinations.

C&R Table 3.9-4
Summary of Long–Term Project Construction Criteria Air Pollutant Emissions

Emissions/Criteria	ROG lb/day	NOX lb/day	PM10 lb/day	PM2.5 lb/day
Net Emissions (as shown in the Draft EIR)	**19**	**102**	**4**	**4**
2010 BAAQMD Significance Criteria	54	54	82	54

Source: Data compiled by AECOM in 2011

With respect to long-term construction emissions, for ROG, PM_{10}, and $PM_{2.5}$, the total daily emissions under the proposed LRDP estimates summed across the Davies and Pacific Campuses would be substantially less than the 2010 BAAQMD significance criteria. For NO_X, total emissions for the Davies and Pacific Campuses would be greater than the 2010 BAAQMD significance criteria and thus, the impact would be significant under the 2010 criteria. The construction mitigation measures were since

refined after further review and assessment of feasible construction methods and are shown as staff-initiated text changes on pages 4-17 through 4-18 of this C&R document. As a result, the NO_X total construction emissions for the long-term projects under the proposed LRDP (at the Davies and Pacific Campuses) have been reduced from 102 lb/day (unmitigated) to 9 lb/day after accounting for refinement of mitigation measures and project construction data. As a result, under the refined and mitigated conditions, impacts related to long-term construction emissions of NO_X with LRDP development would be reduced from "significant and unavoidable" under the 2010 BAAQMD significance criteria to less than significant.

Mitigation. As discussed in Response AQ-8 (page C&R 3.9-17), CPMC has continued to coordinate with its construction partners since publication of the Draft EIR. As a result and as shown in Response AQ-8 (page C&R 3.9-17), a refined construction mitigation program has been developed to provide the feasible mitigation measures. This effort represents all feasible measures to reduce construction NO_X emissions from the proposed LRDP, consistent with current BAAQMD direction. Augmented construction mitigations are described in detail in Responses AQ-8 and AQ-9 (pages C&R 3.9-17 and 3.9-20, respectively), and would reduce long-term LRDP construction impacts from criteria air pollutants to less than significant, as noted above.

Public Health Effects. A discussion of nitrogen oxides (NO_x), including nitrogen dioxide (NO_2), and related public health effects is presented on page 4.7-7 in the Draft EIR. Furthermore, NO_X is a precursor pollutant that, along with ROG in the presence of sunlight, goes through atmospheric photochemical reactions to create ozone. Ozone and its related health effects are described on pages 4.7-4 and 4.7-5 in the Draft EIR. In summary, acute NO_2 exposures can cause difficulty in breathing, headache, and eye irritation; symptomatic NO_2 intoxication after acute exposure has been linked with such symptoms as chronic bronchitis and decreased lung function. High ozone levels, created during a photochemical reaction of NO_x and ROG combined with sunlight, are linked to symptoms such as throat dryness, chest tightness, headache, nausea, exacerbation of the symptoms of respiratory disease, and suppression of the immune system.

The San Francisco Bay Area has attained the national and state NO_2 standards for more than 20 years.[28] The NO_X significance thresholds in the 2010 BAAQMD criteria were based on NO_X as a precursor to ground-level ozone. Ozone concentrations in the SFBAAB are highest on days with high temperatures and stagnant meteorological conditions, typically found during the late spring through early fall months (i.e., the "ozone season"). These atmospheric photochemical reactions require reaction time to form ground-level ozone. Thus, NO_X emitted from sources in the City of San Francisco reacts with other NO_X and ROG emissions as it travels downwind during the ozone formation process. The overwhelming majority of exceedances of ozone standards within the SFBAAB occur at prevailing downwind locations from San Francisco, where temperatures also are typically higher during the ozone season, predominately in the Livermore area, but also in Santa Clara and southern Alameda Counties.[29]

In the City of San Francisco, since 1973 two exceedances of the currently revoked (in 2005) national 1-hour ozone standard[30] have been recorded, one in 1976 and one in 1983, and three recorded exceedances of the more-stringent state 1-hour ozone standard, one in 1983, one in 1984, and one in 2004. For comparison, the total number of exceedances of the former national 1-hour ozone standard anywhere within the SFBAAB in those same years (1976 and 1983) was 17 and 22, respectively. As for the more

[28] CARB, 2010, ARB Almanac 2009 – Chapter 4: Air Basin Trends and Forecasts – Critera Pollutants, p. 4-29, available: http://www.arb.ca.gov/aqd/almanac/almanac09/pdf/chap409.pdf, accessed January 11, 2011

[29] CARB, 2010, available: http://www.arb.ca.gov/adam/select8/sc8display.php, accessed September 8, 2011.

[30] As was described in the Draft EIR, the national 1-hour ozone standard was revoked 2005 and replaced with a national 8-hour ozone standard. In March 2008, the national 8-hour ozone standard was lowered to 0.0075 parts per million by volume (ppmv). The BAAQMD adopted a final Clean Air Plan on September 15, 2010, which included new control measures geared toward attainment of the revised 8-hour national ozone standard.

stringent state 1-hour ozone standard, the total number of exceedances anywhere in the SFBAAB was 35, 53, 55, and 7, respectively, for 1976, 1983, 1984, and 2004. The downward trend in these numbers reflects the overall improvement in ground-level ozone in the Bay Area over the past several decades. Peak ozone concentrations in the San Francisco Bay Area have decreased by about 18 percent over the past 20 years, despite the population increasing by 22 percent and vehicle miles travelled (VMT) increasing by 29 percent. [31]

Projected NO_x emissions associated with construction of the proposed LRDP are not expected to lead to localized exceedances of ozone standards in the neighborhoods surrounding the proposed CPMC campuses; however, because the summed NO_x emissions from all CPMC campuses would exceed the 2010 BAAQMD NO_x significance criterion, they would contribute regionally to ozone levels, and thus, impacts related to localized exceedances of ozone standards were identified as "significant and unavoidable" in the Draft EIR when compared with the BAAQMD 2010 regional significance criteria. Although the LRDP long-term project construction NO_x emissions could contribute to regional air quality impacts, construction emissions are accounted for in regional air quality planning. The current *Bay Area 2010 Clean Air Plan*[32] has taken construction activities into account in regional ozone photochemical modeling, along with other proposed control measures and higher future percentages of cleaner vehicles with vehicle fleet turnover, in developing an air basin strategy to achieve reasonable progress toward attainment of the new national 8-hour ozone standard.

As stated under Impact AQ-2 in the Draft EIR, page 4.7-34, LRDP construction activities also pose potential localized health impacts because of diesel particulate matter (DPM) exposure. DPM is a pollutant listed by ARB as a potential human carcinogen and is distinct from criteria pollutants. Responses AQ-9 and AQ-10 (pages C&R 3.9-17 and 3.9-20, respectively) discuss refinements to construction mitigation measures which would assist in lowering the potential community health risks of DPM.

3.9.1.6 TECHNICAL DATA/TERMINOLOGY

Comments

(Gloria Smith—California Nurses Association, October 19, 2010) [90-1 AQ]

"On behalf of the California Nurses Association/National Nurses United ('CNA'), this letter provides preliminary comments on the draft environmental impact report ('DEIR') for the CPMC Long Range Development Plan ('Project'). These comments are preliminary because the applicant, California Pacific Medical Center, and the City's Planning Department have failed to provide CNA with foundational data and information the City relied upon to draft its analyses and to support its conclusions in the DEIR. Requests for DEIR background data and studies were either greatly delayed by unnecessary back and forth or were denied altogether. As a result, CNA was unable to ascertain exactly what it is the City is proposing to do; it was in many instances impossible to verify many of the DEIR's technical analyses, assumptions and conclusions. If and when we obtain the withheld data, we will supplement these comments accordingly."

(Gloria Smith—California Nurses Association, October 19, 2010) [91-5 AQ]

"To comply with CEQA, an EIR's significance determinations must be supported by credible analysis and substantial evidence.[3] Here, the EIR is deficient because it fails to provide credible analysis and substantial evidence for its conclusions regarding the significance of Project impacts. For example, in the air quality section, the Draft EIR simply presents summary tables and draws conclusions without providing any supporting analyses

[31] CARB, 2010, ARB Almanac 2009 – Chapter 4: Air Basin Trends and Forecasts – Critera Pollutants, p. 4-21, available: http://www.arb.ca.gov/aqd/almanac/almanac09/pdf/chap409.pdf, accessed January 11, 2011.

[32] BAAQMD, 2010, available: http://www.baaqmd.gov/Divisions/Planning-and-Research/Plans/Clean-Air-Plans.aspx, accessed January 11, 2011.

or adequate discussion. Unlike any other EIR I have reviewed, the Draft EIR fails to include *any* of the supporting reports and background information it relied upon in forming its conclusions for its technical impact analyses. These documents should have been provided in technical appendices; in this case, they were not part of the EIR but had to be separately requested from the City as "administrative records" via a number of Public Records Act ('PRA') requests.

[3] Pub. Resources Code, §21 OSI (a); CEQA Guidelines, §15091(b)."

(Gloria Smith—California Nurses Association, October 19, 2010) [91-6 AQ]

"Your office submitted a request for supporting documentation for the Draft EIR's air quality and greenhouse gas emissions sections on July 21, 2010, the same day the City made the Draft EIR publicly available for review.[4] This request asked for a) the Draft EIR on a CD; h) all spreadsheets and modeling files supporting the emission estimates and conclusions in the Draft EIR's air quality section regarding construction and operational emissions and health risk assessments; and c) all documents cited in the Draft EIR's air quality section supporting results and conclusions. In response, the City made available for purchase two CDs ($10/CD) containing a) copies of the Draft EIR and c) those background studies that were cited in the Draft EIR and available in electronic format. Background studies that were cited in the Draft EIR but were only available to the City as hardcopies were not provided on these CDs but were only made available for review at the City's office.[5] The CDs also did not include b) any of the requested spreadsheets and modeling files supporting the emission estimates and health risk assessments or all of the methodologies that were used.

[4] Email from Law Offices of Gloria Smith to Devyani Jain, City of San Francisco, Planning Department, Re: CMPC Hospital GP: Request for Documentation, July 21,2010.
[5] See Email from Devyani Jain, City of San Francisco Planning Department Re: CMPC Hospital GP: Request for Documentation, July 22, 2010."

(Gloria Smith—California Nurses Association, October 19, 2010) [91-7 AQ]

"In the following weeks, your office requested multiple times electronic files of the spreadsheets and modeling files in their native format supporting the Draft EIR's emission estimates and health risk assessments.[6,7] I also explained to the City why these files are needed for independent review of the Draft EIR's results and conclusions and requested them several times.[8,9] At long last, after more than six weeks of dialogue, the City provided access to a) memoranda pertaining to the methodologies used by the consultants to prepare air quality and greenhouse gas emission analyses for the Draft EIR and b) Microsoft Excel spreadsheets supporting construction emission estimates as PDF printouts.[10] On October 6, 2010, less than two weeks before the end of the comment period, the City provided access to some modeling files but stated that the consultant's Excel spreadsheets used to calculate emissions cannot be made available in their unprotected, native format because they:

> '... contain data that is used to calculate emissions data and which constitutes trade secrets, and are thus exempt from disclosure under Government Code section 6253.9(f). In addition, because the unprotected, native format Excel spreadsheets are intrinsically linked to Environ's proprietary data management system, release of the unprotected, native format Excel 91-7 AQ spreadsheets would jeopardize or compromise the integrity of the files and of the proprietary software in which it is maintained, and thus are not subject to disclosure under Government Code section 6253.9. In any event, the City is not in possession of these spreadsheets in the format you request.'[11]

Frankly, I am perplexed as to which data contain trade secrets as all emission calculations for this Project should be based on publicly available databases and information. Unlike in the case of an existing refinery or power plant, the emission calculations for new commercial buildings such as a hospital do not require nor should they be based on any trade-secret data. Trade secret with respect to emission sources is usually reserved for data supplied by a manufacturer or operator of custom-build or unique emission sources. The CPMC would have no such emission sources. With respect to Environ's proprietary data management system, the Excel spreadsheets, which are based on publicly available, for-purchase software (Microsoft Excel), could have been unlinked from this

system and provided as standalone spreadsheets. I wouldn't have repeatedly asked for those files if the Excel printouts that were provided to me as PDF files had a) contained all assumptions and had been clearly linked and b) been complete for all emission sources. Unfortunately, that was not the case. Thus, for some of the presented results, the City expects the reviewer to accept them in blind faith without a possibility of independent review. This is not acceptable for CEQA review.

Response AQ-21

These comments concern requests for certain supporting and background information related to the Draft EIR's analysis of air quality impacts of the LRDP, including numerous specific files and "[a]ll spreadsheets and modeling files supporting the emission estimates and conclusions in the Draft EIR 'Air Quality' section regarding construction and operational emissions and health risk assessment . . . in their native electronic format (e.g., Excel, URBEMIS, ISCST3, AERMOD, etc.) as non-protected files."[33] Over the course of the 90-day public review period for the Draft EIR, the Planning Department received various document requests. As noted in the Draft EIR throughout Chapter 4, "Environmental Setting, Impacts, and Mitigation," and on page 7-1 of Chapter 7, "References and Persons Consulted," reference and other documents, including technical reports that were prepared for the CPMC Long Range Development Plan or the Draft EIR, are on file with the Planning Department, 1650 Mission Street, Suite 400, San Francisco, CA 94103, and are available for public review as part of the project file. The San Francisco Planning Department staff provided a memorandum to the Planning Commission at the Draft EIR public hearing on September 23, 2010, regarding the CNA's request for background data and what the City provided related to this request.

As discussed in detail below, the Planning Department complied with the commenters' air quality data requests and provided all of the data requested by the comments. With the exception of one set of files, all requested documents or files were provided in the requested format (e.g., Excel, URBEMIS, ISCST3, AERMOD, etc.).

Although not required to do so under CEQA, the Public Records Act (PRA), or any other law or regulation, the Planning Department obtained from the environmental subconsultant that conducted the air quality analysis all of the requested files in electronic (PDF) format, which was the electronic format in which the Planning Department received the files. In response to the comments' requests, the Planning Department also obtained from the environmental subconsultant and made available unprotected, native format versions of SCREEN3 and ISCST3 modeling files. Although it is the Planning Department's understanding that ENVIRON and other air quality experts do not normally make such files available to outside consultants as unprotected, native format files and they had not been submitted to the Planning Department in this format, the subconsultant, ENVIRON, agreed to the City's request to make them available.[34]

[33] E-mail correspondence from the Law Offices of Gloria D. Smith to Devyani Jain, City of San Francisco, Planning Department, regarding CPMC Hospital GP: request for documentation, July 21, 2010.
[34] E-mail correspondence from Devyani Jain, City of San Francisco, Planning Department, MEA, to Petra Pless, Pless Environmental, Inc., regarding CPMC EIR – Request for Information. October 6, 2010.

The only requested files that were not provided in unprotected, native format were certain Microsoft Excel spreadsheets (which were provided to the commenters as PDF files). The unprotected, native format Excel spreadsheets are exempt from disclosure because the unprotected, native format Excel spreadsheets are intrinsically linked to ENVIRON's proprietary data management system, and their release would jeopardize or compromise the integrity of the files and the proprietary software in which it is maintained. Public agencies are not required to release an electronic record in the electronic form in which it is held by the agency if its release *would jeopardize or compromise the security or integrity of the original record or of any proprietary software in which it is maintained*. (Government Code Section 6253.9[f]) Moreover, data which constitute trade secrets and which are used to calculate emission data are not public records.[35] ENVIRON has developed tools (i.e., database structures, programming code) within spreadsheet and database software to conduct air quality and greenhouse gas technical analyses. These tools were developed and incorporated into ENVIRON's executable electronic files and, thus, the native format electronic files are considered to be proprietary.

Therefore, even if the Planning Department had the requested Excel spreadsheet files in its possession as native format, unprotected files (which is not the case), the files would not be subject to disclosure because their release would jeopardize ENVIRON's proprietary software.

Although the proprietary process used by ENVIRON to calculate the proposed LRDP's emissions has not been provided to the commenters, all underlying data used to conduct the analysis has been provided. This includes source data from publicly available emissions estimation tools created by ARB, such as OFFROAD and EMFAC. As a result of the disclosures described above, raw data, calculation methods, and assumptions have been made available. Input and output files from publicly available modeling software also have been included in the materials provided to the commenters. Persons familiar with the software would therefore be able to reproduce the modeling input files, based on the data and methodology details provided.

CEQA requires that a lead agency provide notice regarding the address where copies of a draft EIR "and all documents referenced in the draft environmental impact report" are available for review.[36] Although any appendices to an EIR or documents incorporated by reference in the EIR must be made available for public review, CEQA does not require that underlying spreadsheets and modeling files supporting those documents be made available for public review, or that they must be made available in their native electronic format as non-protected files even if not in the lead agency's possession in that format or in the lead agency's possession at all.[37] The same is true of the PRA (California Government Code Section 6250 et seq.). The non-protected electronic files supporting the Draft EIR's emission estimates requested by the comments are not "documents referenced in the draft environmental impact report" and, therefore, are not subject to that requirement.

In this case, the native format, unprotected files were prepared by an environmental consultant, not by a state or local agency, and the files have never been used, retained, or owned by the Planning Department.

---

[35] California Government Code Section 6254.7(e). The Public Records Act (PRA) provides protection for proprietary materials such as trade secrets and like matter under its "catch-all" provision, which prohibits the disclosure of "records, the disclosure of which is exempted or prohibited pursuant to federal or state law, including, but not limited to, provisions of the Evidence Code relating to privilege." (California Government Code Section 6254(k); *see also Cal. Sch. Employees Ass'n v. Sunnyvale Elementary Sch. Dist.*, 36 Cal. App. 3d 46, 66 (concluding PRA catch-all exemption was "broad enough to include trade secrets"). Under California law, the owner of a trade secret has a privilege to refuse to disclose it and to prevent others from disclosing it. (Cal. Evid. Code § 1060.) A trade secret is "information, including a formula, pattern, compilation, program, device, method, technique, or process" that derives its value to a company because of its confidential nature. (Cal. Civ. Code § 3426.1(d).) These protections also extend to ENVIRON's proprietary tools.

[36] Cal. Pub. Res. Code § 21092(b)(1).

[37] *See* Cal. Pub. Res. Code § 21092(b)(1); CEQA Guidelines § 15150(b); *El Morro Cmty. Ass'n v. Cal. Dep't of Parks & Recreation*, 122 Cal. App 4th 1341, 1354 fn. 5 (2004) (documents that are not incorporated by reference in an EIR need not be made publicly available); *see also* Kostka & Zischke, *Practice Under the California Environmental Quality Act* § 9.18 (noted CEQA commenters observe that there is no requirement that documents simply cited in an EIR be made available for public inspection).

Therefore, they are not public records under the PRA.[38] Moreover, the native format, non-protected spreadsheets and modeling files supporting the emission estimates and conclusions in Section 4.7, "Air Quality" in the Draft EIR were not documents "in the possession of" the Planning Department and, therefore, were not required to be made available.[39]

Government Code Section 6253.9(a) provides that any agency that has disclosable information that constitutes an identifiable public record that is in an electronic format shall make that information available in an electronic format when requested by any person. The PRA further requires that "[t]he agency shall make the information available in any electronic format *in which it holds the information*."[40] The PRA also states that "[e]ach agency shall provide a copy of an electronic record in the format requested *if the requested format is one that has been used by the agency to create copies for its own use or for provision to other agencies*."[41] The files requested by the comments, to the extent they were held in any electronic format by the Planning Department, were held as PDF files rather than as native format, unprotected files. The Planning Department did not create copies of these files in unprotected native format for its own use or for provision to any other agency. Therefore, the Planning Department's provision of the requested Excel spreadsheet files in PDF format fully satisfied the Planning Department's obligation under the PRA.

Nevertheless, the Planning Department obtained and provided to the commenters native format, non-protected files from the Draft EIR's environmental consultants to the extent such files were disclosable under the PRA. Specifically, the Planning Department went above and beyond its legal obligations to provide requested public records in the electronic format in which they were held (i.e., PDF files), by obtaining and providing to the commenters the unprotected, native format SCREEN3 and ISCST3 modeling files.

Comments

(Gloria Smith—California Nurses Association, October 19, 2010) [91-14 AQ]

"For example, in Section 4.7, Air Quality, the Draft EIR provides an 89-page discussion of the Project's environmental setting, regulatory framework, cumulative conditions, significance criteria, analyzes 14 impacts on air quality and related health risks associated with construction and operation of the various Project components and proposes 15 mitigation measures. Rather than analyzing impacts from similar activities together, the Draft EIR discusses construction-related impacts in Impacts AQ-l, AQ-2, AQ-6, AQ-7, AQ-8, AQ-9, AQ-10, AQ-13, and AQ-14 and impacts related to Project operation in Impacts AQ-3, AQ-4, AQ-5, AQ-7, AQ-11, AQ-12, AQ-13, and AQ-14 (several impacts discuss both construction and operational emissions). The organization of Section 4.7 is confusing at best and fails to guide the reviewer through the analysis, conclusions, and effectiveness of proposed mitigation measures. Despite having reviewed hundreds of CEQA documents in my professional practice, I had to read the Draft EIR's air quality section (and other sections) multiple times to understand its organization; ultimately, I had to resort to creating a table that summarizes the Draft EIRs findings of significance prior to and after implementation of the proposed mitigation measures. *(See* Comment IV.B, Table 1.) In my opinion, neither the lead agency nor the public will be able to easily understand the significance of the Project's impacts on air quality or determine whether the Draft EIR proposes adequate mitigation. Therefore, the Draft EIR fails to fulfill its mandate under CEQA to effectively inform the public and decision makers of the Project's adverse environmental impacts and the proposed mitigation measures to reduce these impacts to the extent feasible."

[38] *See* Cal. Gov't Code § 6252(e).
[39] *See* Cal. Gov't Code section 6253(c).
[40] California Government Code Section 6253.9(a)(1).
[41] California Government Code Section 6253.9(a)(2).

(Gloria Smith—California Nurses Association, October 19, 2010) [91-15 AQ]

"The actual background analyses, as far as I can tell from the printouts I was provided with, appear to be well done. However, the translation of their results and modeling into the Draft EIR suffers from severe flaws. I suggest revising the Draft EIR's air quality section to discuss impacts attributable to construction and operational emissions separately and include the discussion of applicable significance criteria at the beginning of each of these segments. Other impact sections in the Draft EIR that suffer from similar organizational impenetrability should be similarly revised.

A revised EIR must eliminate all this confusing terminology and present its analysis following a logical organization."

Response AQ-22

The observations made in these comments regarding the organization of Section 4.7, "Air Quality" in the Draft EIR are noted. Unlike previous EIRs that included air quality analyses performed solely under the 1999 BAAQMD significance thresholds, and other recent EIRs for which the 2010 BAAQMD significance thresholds are clearly applicable, the proposed CPMC LRDP EIR was prepared during a period of evolution between these two sets of criteria. A discussion as to why both 1999 and 2010 BAAQMD significance criteria are included in the proposed CPMC LRDP Draft EIR can be found in Response AQ-23 (page C&R 3.9-64). In summary, the 1999 criteria were the applicable criteria for the Draft EIR based on established BAAQMD policy, which directed that EIRs for which the Notice of Preparation of an EIR was published before June 2, 2010 use the 1999 criteria; however, to be fully informative and disclose all potential impacts, including those that might occur under the most up-to-date thresholds, the Draft EIR also evaluated the proposed project's effects compared with the 2010 significance thresholds which were adopted the month before the publication of the Draft EIR. This led to a unique but consistently parallel structure for the proposed CPMC LRDP's air quality discussion in the Draft EIR, with the analysis of Impacts AQ-1 through AQ-7 applying the 1999 criteria and Impacts AQ-8 through AQ-14 applying the 2010 criteria. Significance findings under both sets of criteria were provided in the impact discussions and were intended to provide a comprehensive evaluation of the potential significant effects of the proposed LRDP, thus furthering the achievement of the informational role of the Draft EIR as required under CEQA (see State CEQA Guidelines Section 15121[a]).

The analysis in the Draft EIR uses both the 1999 guidelines and the updated June 2010 thresholds of significance and methodologies from the BAAQMD CEQA Air Quality Guidelines to evaluate the potential air quality impacts of the proposed Project.[42] Although BAAQMD adoption of the significance thresholds are the subject of recent judicial actions, the Planning Department has determined that Appendix D of the BAAQMD CEQA Air Quality Guidelines, in combination with BAAQMD's Revised Draft Options and Justification Report provide substantial evidence to support the BAAQMD-recommended thresholds and, therefore, has determined they are appropriate for use in this analysis.[43] The use of both the 1999 and the updated June 2010 BAAQMD CEQA Air Quality Guidelines in both the Draft EIR and the subsequent refined analysis of TAC emissions therefore continues to represent a conservative approach that provides full disclosure regarding the potential air quality impacts of the proposed LRDP.

The comments' point that applicable significance criteria could have been better identified in the impact discussions is noted. These are delineated in a clearer fashion in Responses AQ-10, AQ-21, and AQ-24 (pages C&R 3.9-20, 3.9-48, 3.9-64, respectively). However, with respect to the organization of the Draft

[42] BAAQMD, 2011 (May), California Environmental Quality Act Air Quality Guidelines, App. D: Threshold of Significance Justification (June 2, 2010).

[43] Bay Area Air Quality Management District. *Revised Draft Options and Justification Report, California Environmental Quality Act Theresholds of Significance*. October 2009. Document available on line at; http://baaqmd.gov/divisions/Planning-and-Research/CEQA-GUIDELINES/updated-CEQA-GUIDELINES.aspx

EIR, the City respectfully disagrees. The Draft EIR adheres to the City of San Francisco's Guidelines for Preparation of Environmental Review Documents and the City of San Francisco's modified environmental review checklist.

3.9.1.7 THRESHOLDS OF SIGNIFICANCE

Comments

(Gloria Smith—California Nurses Association, October 19, 2010) [91-20 AQ]

"**IV. The Draft EIR's Analyses of the Project's Impacts on Air Quality Are Inconsistent and Not Adequately Supported**

The Draft EIR states that for purposes of its air quality analysis, the relevant significance criteria and thresholds, are those established by the environmental checklist in Appendix G of the state CEQA Guidelines and guidance from the Bay Area Air Quality Management District ('BAAQMD'), respectively. The Draft EIR determines that the BAAQMD's CEQA Guidelines released in December 1999 constitute the 'applicable' version because the more recent 2010 BAAQMD CEQA Guidelines (which include new thresholds of significance and new impact areas) were adopted after the Notice of Preparation ('NOP') for the Project was published or environmental analysis began.[20]

[20] Draft EIR. p. 4.7-16."

(Gloria Smith—California Nurses Association, October 19, 2010) [91-21 AQ]

"**IV.A The Draft EIR Analyzes the Significance of Project Emissions Based on the 1999 and 2010 BAAQMD CEQA Guidelines without Adequate Discussion Why It Relied on Two Sets of Guidelines**

Despite finding the 1999 BAAQMD CEQA Guidelines to be the 'applicable' version, the Draft EIR then proceeds to analyze the five impact criteria (7a through 7e) established by Appendix G of the State CEQA Guidelines for all near-term and long-term project components under both the 1999 BAAQMD CEQA Guidelines (Impacts AQ-l through AQ-7) *and* the recently adopted 2010 BAAQMD CEQA Guidelines (Impacts AQ-8 through AQ-14) without discussing why it provided both analyses and what the reviewer is supposed to take away from this discussion.

It would have been explicable, had the Draft EJR [sic] provided an analysis of near-term project components under the 1999 BAAQMD CEQA Guidelines (because the NOP for the EIR was published and analysis began before the 2010 version of the guidelines was adopted) and a discussion of long-term project components (which have to undergo additional CEQA review in the future) under the newly adopted 2010 CEQA Guidelines. To analyze both near-term and both long-term Projects under both sets of guidelines is confusing at best."

(Gloria Smith—California Nurses Association, October 19, 2010) [91-22 AQ]

"It is unclear why the Draft EIR not simply relies only on the recently adopted 2010 BAAQMD CEQA Guidelines for analyzing all Project impacts, since it appears, in review of the background documentation in the administrative record provided by the City, that all analyses have already been performed conforming to the new guidelines. Clearly, the BAAQMD had good reason to update its two decades old CEQA guidance document. Therefore, for a project such as the CMPC LRPD with a timeframe extending over the next two decades, it is appropriate to use the recently adopted guidelines for analysis and proposed mitigation rather than relying on the outdated more than two-decades old 1999 guidelines."

(Gloria Smith—California Nurses Association, October 19, 2010) [91-24 AQ]

"Elsewhere, the Draft EIR seems to waiver in whether an impact should or should not have been analyzed under the 2010 BAAQMD CEQA Guidelines, For example, in Impact AQ-14 the Draft E1R [sic] presents an analysis

under the 2010 BAAQMD CEQA Guidelines but includes the disclaimer that the analysis "is not applicable to the proposed project, and is provided ... for in purposes" only; yet, mitigation for significant impacts found under this analysis are nonetheless proposed (Mitigation Measure M-AQ-N2).[22,23]

[21] Draft EIR. p. 4.7-72
[22] Draft EIR, p. 4.7-80.
[23] Draft EIR, Table 5-2, p.5-67."

(Gloria Smith—California Nurses Association, October 19, 2010) [91-25 AQ]

"In light of scale of the CMPC [sic] LRDP and its future contribution to the air quality of San Francisco for decades to come, the Project should be analyzed and mitigated based on the recently adopted and more stringent 2010 BAAQMD CEQA Guidelines even though this is not expressly required by BAAQMD for the CMPCs [sic] near-term projects. Given that all air quality and greenhouse gas analyses have already been conducted to conform with the 2010 BAAQMD CEQA Guidelines, a revision (and simplification) of the Draft EIR would require minimal effort."

(Gloria Smith—California Nurses Association, October 19, 2010) [91-28 AQ]

"**V.A The Draft EIR's Analysis of Project Impacts on Air Quality Is Internally Inconsistent, Ambiguous, and Incomplete**

The Draft EIR is inconsistent and fails to unambiguously define which BAAQMD CEQA Guidelines and significance thresholds it uses to evaluate Project impacts. For example, Impact AQ-3 claims to analyze operational emissions based on the 1999 BAAQMD CEQA Guidelines, yet, Table 4.7-6 (incorrectly) cites to the recently adopted, i.e., 2010, BAAQMD CEQA Guidelines but (correctly) presents levels of significance established in the 1999 BAAQMD CEQA Guidelines."

(Gloria Smith—California Nurses Association, October 19, 2010) [91-30 AQ]

"Further, while the Draft ELR [sic] purports to analyze seven impacts under the 2010 BAAQMD CEQA Guidelines, it nowhere provides the thresholds of significance established by these guidelines for the reviewer to compare emission estimates to. This lack of information is further complicated by the fact that the Draft ELR [sic] fails to discuss the significance of pollutants but only provides a very limited discussion for those pollutants whose emissions would result in significant impacts. Thus, the reviewer, lacking thresholds to compare emissions to, has no choice but to trust that the Draft EIR correctly discusses all pollutants that would exceed thresholds of significance. This problem could have been be avoided by presenting all emission estimates in a table along with the quantitative significance thresholds established in both the 1999 and the 2010 BAAQMD CEQA Guidelines.

These inconsistencies, lack of information, and pick-and-choose approach to which guidelines are applied make it almost impossible to follow the Draft EIR's analysis and cast doubt on the Draft EIR's conclusions."

(Stephanie Barton, et al.—Hastings Civil Justice Clinic for the Good Neighbor Coalition, October 19, 2010) [104-50 AQ]

"**III. The DEIR does not adequately assess air quality and greenhouse gas impacts or present project alternatives sufficient to mitigate those impacts.**

In assessing the air quality impacts of the project, the more stringent significance thresholds of the 2010 Bay Area Air Quality Management District (BAAQMD) CEQA Guidelines should apply. The BAAQMD is the regional government agency that regulates sources of air pollution within the nine counties of the Bay Area.[118] It requires that projects for which an EIR notice of preparation is published after June 2, 2010 apply the most recent 2010 CEQA Guidelines over the prior 1999 CEQA Guidelines.[119] Although the notice of preparation in this case was issued a year earlier, the City has the discretion to apply the 2010 Guidelines to this project.[120]

[118] See www.baaqmd.gov for more information.
[119] The adopted CEQA thresholds of significance are effective June 2, 2010, with the exception of risk and hazards thresholds for new receptors, which are effective January 1, 2011. It is BAAQMD's policy to require application of the new thresholds of projects with a notice of preparation published after the applicable effective date.
[120] Id."

(Stephanie Barton, et al.—Hastings Civil Justice Clinic for the Good Neighbor Coalition, October 19, 2010) [104-51 AQ]

"The BAAQMD CEQA Guidelines recommend air quality significance thresholds, analytical methodologies, and mitigation measures for cities within the San Francisco Bay Area to use when evaluating air quality impacts under CEQA. The updated 2010 Guidelines "seek to better protect the health and well-being of Bay Area residents by addressing new health protective air quality standards, exposure to toxic air contaminants, and adverse effects from global climate change."[121] To do this, the updated 2010 Guidelines pose additional or more stringent air quality regulations than are included in the 1999 Guidelines. Most specifically, the more recent guidelines include updated thresholds for particulate matter (PM) and ozone, both of which cause adverse health impacts in humans, including increased risk for cardiovascular disease, asthma, reduced birth weight, and mortality.[122]

Application of the 2010 Guidelines would not require additional analysis, as the 2010 thresholds are already provided in the DEIR for information purposes.[123] The thresholds established by the 1999 Guidelines are more than a decade old and do not appropriately reflect modern and acceptable standards in air quality. As a City that touts its green credentials, San Francisco should seek to apply air quality standards based on the most recent air quality science available.

[121] Id."

Response AQ-23

Several comments state that the use of two sets of significance criteria for air quality impacts was confusing, used inconsistently and interchangeably depending on which set provided the most favorable results, and that the 2010 BAAQMD significance criteria should be used because they are the most recent. In summary, and as explained in further detail below, the proposed CPMC LRDP Draft EIR was written and published at a time of evolution in the development and adoption of revised significance thresholds for criteria air pollutants and health risks. Significance thresholds were used (the 1999 significance criteria) that are applicable to the proposed LRDP based on BAAQMD policy; however, so as to be fully informative, the Draft EIR also applied the significance thresholds in the 2010 BAAQMD significance criteria that were adopted in the weeks immediately before publication of the Draft EIR.

The Draft EIR identified that the 1999 BAAQMD significance criteria apply to the proposed LRDP based on specific guidance from the BAAQMD. The BAAQMD's stated policy is that the 2010 significance criteria apply to projects for which a Notice of Preparation of an EIR (NOP) has not been published or environmental analysis begins on or after the applicable effective date.[44] At the time the NOP for the Draft EIR was issued, May 27, 2009, the BAAQMD was still in the process of updating its 1999 CEQA Air Quality Guidelines. Over a year later, on June 2, 2010, shortly before publication of the Draft EIR (on July 21, 2010), the BAAQMD adopted its revised CEQA Air Quality Thresholds of Significance. The environmental analysis for the Draft EIR was substantially complete at that time and the Draft EIR was in final preparations to be published when the BAAQMD adopted its 2010 significance thresholds. As discussed on page 4.7-16 in the Draft EIR, the 2010 BAAQMD thresholds of significance became immediately effective on June 2, 2010, for EIRs on which an NOP had not yet been published, with the exception of the risk and hazard thresholds for new receptors, which will not become effective until May 1, 2011. Although originally delayed until January 1, 2011, the BAAQMD recently decided to delay implementation of the risk and hazard thresholds for new receptors further until May 1, 2011.[45]

[44] BAAQMD, 2011 (May), California Environmental Quality Act Air Quality Guidelines, Table 2-1.
[45] BAAQMD, available: http://www.baaqmd.gov/Divisions/Planning-and-Research/CEQA-GUIDELINES/Updated-CEQA-Guidelines.aspx, accessed December 28, 1010. On December 21, 2010, the following update was provided: "At the December 15, 2010 Board Meeting, the

Consequently, consistent with the BAAQMD guidance, the thresholds of significance under the 1999 BAAQMD Guidelines are the applicable and effective thresholds for use in the proposed CPMC LRDP Draft EIR.

Although the air quality section in the Draft EIR included an analysis of the proposed LRDP impacts under the 1999 BAAQMD significance thresholds, in the interests of full disclosure, the Draft EIR also included an analysis of the project's potential effects compared with the 2010 BAAQMD significance criteria. Although not required by the BAAQMD policy, this analysis was provided to give the public and decision-makers additional information to assess the proposed LRDP, allowing an understanding of the new thresholds and the significance determinations related to the proposed LRDP under them.

Contrary to the comment, the use of both sets of thresholds of significance was based on objective logic and current City direction. No effort occurred to minimize or avoid the identification of significance impacts. To the contrary, the use of thresholds in the air quality analysis provided full disclosure of potential impacts of the proposed LRDP under both sets of guidelines.

The analysis in the Draft EIR uses both the 1999 guidelines and the updated June 2010 thresholds of significance and methodologies from the BAAQMD CEQA Air Quality Guidelines to evaluate the potential air quality impacts of the proposed Project.[46] Although BAAQMD adoption of the significance thresholds are the subject of recent judicial actions, the Planning Department has determined that Appendix D of the BAAQMD CEQA Air Quality Guidelines, in combination with BAAQMD's Revised Draft Options and Justification Report provide substantial evidence to support the BAAQMD-recommended thresholds and, therefore, has determined they are appropriate for use in this analysis.[47] The use of both the 1999 and the updated June 2010 BAAQMD CEQA Air Quality Guidelines in both the Draft EIR and the subsequent refined analysis of TAC emissions therefore continues to represent a conservative approach that provides full disclosure regarding the potential air quality impacts of the proposed LRDP.

For operational emissions, the only criteria air pollutant found to exceed either the 1999 and/or 2010 BAAQMD significance criteria was respirable particulate matter (PM_{10}), primarily because of increased mobile source emissions; this impact is further discussed in Response AQ-20 (page C&R 3.9-48). To the extent that measures would be implemented to reduce traffic congestion through reduction of trips or trip lengths, such measures have been incorporated into the proposed LRDP and are identified in Section 4.5, "Transportation and Circulation" in the Draft EIR. Please also see Response AQ-11 (page C&R 3.9-27). In the case of PM_{10}, the 1999 criteria are actually slightly more stringent than the 2010 criteria (80 lb/day versus 82 lb/day, respectively), thus mitigation measures applied under the 1999 criteria are equally effective and adequate under the 2010 criteria.

For project construction emissions, the 1999 BAAQMD criteria did not have mass emission thresholds for criteria air pollutants in construction exhaust emissions, but rather relied on best management practices (BMPs) for significance determinations. Mitigation measures have been included in the Draft EIR that would require the implementation of all feasible BMPs. Under the 1999 criteria, as long as these

---

District's Board of Directors revised the effective date for the risk and hazards thresholds for new receptors from January 1, 2011 to May 1, 2011. These additional months will provide more time for lead agencies and others to become fully prepared to implement the risk and hazards thresholds. Staff will continue to expand and refine the screening tables and technical support tools to assist implementation of the CEQA Guidelines. All other CEQA thresholds of significance adopted by the Board of Directors on June 2, 2010 remain effective as of June 2, 2010."

[46] BAAQMD, 2011 (May), California Environmental Quality Act Air Quality Guidelines, App. D: Threshold of Significance Justification (June 2, 2010).

[47] Bay Area Air Quality Management District. *Revised Draft Options and Justification Report, California Environmental Quality Act Theresholds of Significance*. October 2009. Document available on line at; http://baaqmd.gov/divisions/Planning-and-Research/CEQA-GUIDELINES/updated-CEQA-GUIDELINES.aspx

BMPs are implemented, the BAAQMD would consider the potential impacts to be less than significant, which was the conclusion indicated in the Draft EIR.

To be conservative, the total daily construction emissions reported in the Draft EIR for all three proposed campuses also were compared against the 2010 BAAQMD significance criteria, which includes mass emission thresholds for construction (see Response AQ-20 [page C&R 3.9-48] for additional details). For TACs, health risks from proposed construction at each campus site were calculated using risk calculation procedures pursuant to both the 1999 BAAQMD CEQA Guidelines, as the applicable criteria, and the 2010 BAAQMD CEQA Guidelines.

As part of further consideration of these issues, feasible construction mitigation measures were reviewed with the 2010 BAAQMD CEQA Guidelines, as described in Response AQ-8 (page C&R 3.9-17). Additional refinements to the mitigation measures of the Draft EIR were considered and reviewed in terms of potential health risk impacts, as described in Response AQ-9 (page C&R 3.9-20). These refinements of construction mitigation measures, which clarify the types of construction equipment that would be used on site are stated in further detail in Responses AQ-8 and AQ-9 (pages C&R 3.9-17 and 3.9-20, respectively), also lowered construction NO_X emissions, which were compared against both the 1999 and 2010 BAAQMD thresholds of significance, as stated in Response AQ-20 (page C&R 3.9-48).

Comments

(Gloria Smith—California Nurses Association, October 19, 2010) [91-23 AQ]

"In some instances, it appears that the Draft EIR picks and chooses whichever guideline is more convenient. For example, in Impact AQ-4, the Draft EIR claims to analyze the impacts of carbon monoxide ('CO') emissions from motor vehicle exhaust under the 1999 BAAQMD CEQA Guidelines. Yet, the text of the impact analysis relies on a screening methodology for peak hourly traffic volumes at affected intersections established by the 2010 BAAQMD CEQA Guidelines rather than the numeric emission threshold of 550 lb/day CO established by the 1999 BAAQMD CEQA Guidelines.[21]

[21] Draft EIR, p. 4.7-72."

(Gloria Smith—California Nurses Association, October 19, 2010) [91-29 AQ]

"In the heading for Impact AQ-4, the Draft EIR claims to analyze the impacts of CO emissions from motor vehicle exhaust under the 1999 BAAQMD CEQA Guidelines. Yet, the text of the impact analysis relies on a screening methodology for peak hourly traffic volumes at affected intersections established by the 2010 BAAQMD CEQA Guidelines rather than the quantitative emission threshold of 550 lb/ day CO established by the 1999 BAAQMD CEQA Guidelines.[26]

[26] Draft EIR, p. 4.7-72."

Response AQ-24

The comments state that the Draft EIR "…picks and chooses whichever guideline is more convenient," referring to the 1999 and 2010 BAAQMD CEQA significance criteria. This is addressed in Response AQ-23 (page C&R 3.9-64). The comments also state that under Impact AQ-4 in the Draft EIR (page 4.7-42), the discussion assesses CO emissions from motor vehicles under the 1999 BAAQMD CEQA Guidelines, but then uses a screening methodology from the 2010 BAAQMD Guidelines rather than a numeric threshold of 550 lb/day for CO from the 1999 BAAQMD CEQA Guidelines.

The 550 lb/day criterion from the 1999 BAAQMD CEQA Guidelines is one of three screening methods for determining the significance of project-related carbon monoxide concentrations. The 1999 BAAQMD

CEQA Guidelines (page 16) address CO under the heading of ***Thresholds of Significance for Impacts From Project Operations*** as follows**:**

> **Local Carbon Monoxide Concentrations.** Localized carbon monoxide concentrations should be estimated for projects in which: (1) vehicle emissions of CO would exceed 550 lb./day; (2) project traffic would impact intersections or roadway links operating at Level of Service (LOS) D, E or F or would cause LOS to decline to D, E or F; or (3) project traffic would increase traffic volumes on nearby roadways by 10 percent or more (unless the increase in traffic volume is less than 100 vehicles per hour). A project contributing to CO concentrations exceeding the State Ambient Air Quality Standard of 9 parts per million (ppm) averaged over 8 hours and 20 ppm for 1 hour would be considered to have a significant impact.

Thus, under the 1999 BAAQMD CEQA Guidelines, the 550 lb/day numeric criterion is one of three methods by which a project's relative level of localized CO concentrations can be estimated and not an actual threshold for determining significance of localized CO concentrations. The CO significance threshold under the 1999 BAAQMD CEQA Guidelines, as clearly stated in the last sentence of the excerpt above, is whether a project meets the California CO Ambient Air Quality Standards.

Projects that are below any one of these three screening methods are not considered as contributing to a CO concentration exceedance. If the screening method set forth in the 2010 BAAQMD Guidelines had not been available, dispersion modeling or its equivalent (which is essentially what was used to create the screening methodology in the 2010 Guidelines) would typically be performed to assess whether the significance criteria of the California CO Ambient Air Quality Standards would be exceeded on all proposed LRDP near-term and long-term projects.

The 2010 BAAQMD significance thresholds, as adopted by the Board of the BAAQMD on June 2, 2010, are only the actual numeric thresholds (a two-page document), and in the case of CO, the significance thresholds remain as the California CO Ambient Air Quality Standards. The much longer 2010 BAAQMD *CEQA Air Quality Guidelines* document presents recommended methodologies to assist in assessments against the adopted 2010 significance criteria. The screening-level methodology for CO contained in this document was used in the proposed CPMC LRDP Draft EIR to assess whether California CO Ambient Air Quality Standards (i.e., the threshold established in both the 1999 and 2010 BAAQMD Guidelines) would be exceeded. This was appropriate for this purpose, as it is the result of recent BAAQMD work using current information for the assessment of CO impacts. Thus, no contradiction has occurred here. The 1999 significance thresholds are being used (which, in this case, are the same as the 2010 significance thresholds), and a more up-to-date screening tool was used to assess potential impacts compared with these significance thresholds.

The analysis in the Draft EIR uses both the 1999 guidelines and the updated June 2010 thresholds of significance and methodologies from the BAAQMD CEQA Air Quality Guidelines to evaluate the potential air quality impacts of the proposed Project.[48] Although BAAQMD adoption of the significance thresholds are the subject of recent judicial actions, the Planning Department has determined that Appendix D of the BAAQMD CEQA Air Quality Guidelines, in combination with BAAQMD's Revised Draft Options and Justification Report provide substantial evidence to support the BAAQMD-recommended thresholds and, therefore, has determined they are appropriate for use in this analysis.[49] The use of both the 1999 and the updated June 2010 BAAQMD CEQA Air Quality Guidelines in both the Draft EIR and the subsequent refined analysis of TAC emissions therefore continues to represent a

conservative approach that provides full disclosure regarding the potential air quality impacts of the proposed LRDP.

Comment

(Gloria Smith—California Nurses Association, October 19, 2010) [91-26 AQ]

"**IV.B Revised Summary of Impacts on Air Quality Associated with Near-Term and Long-Term Project Components**

Table 1 below provides a summary of the Draft EIR's conclusions with respect to a) the level of significance of the Project's impacts on air quality associated with near-term and long-term project components *prior to* mitigation; b) the mitigation measures proposed to reduce the Significant impacts; and c) the level of significance of the Project's impacts on air quality associated with near-term and long-term project components *after* implementation of proposed mitigation measures.

In accordance with the discussion in Comment III.A, the terminology for levels of significance has updated as follows:

Table 1: Revised summary of Draft EIR air quality impact analysis and proposed mitigation measures

Impact	Project Components	a) Level of Significance Prior to Proposed Mitigation	b) Proposed Mitigation/ Improvement Measures (for description see attached Table A-1)	c) Level of Significance with Proposed Mitigation
1999 BAAQMD CEQA Guidelines				
AQ-1: Construction activities associated with the LRDP could result in short-term increases in fugitive dust that exceed BAAQMD CEQA significance criteria. *(Significance Criteria 7a and 7b)*	All Near-Term All Long-Term	S S	M-AQ-N1a, M-AQ-N1b M-AQ-L1a, M-AQ-L1b	LTS LTS
AQ-2: Construction activities associated with the LRDP could expose sensitive receptors to substantial concentrations of toxic air contaminants. *(Significance Criteria 7b and 7d)*	Near-Term • Cathedral Hill • Davies • St. Luke's All Long-Term	 S LTS LTS LTS	 M-AQ-N2 I-AQ-N2 I-AQ-N2 I-AQ-L2	 SU LTS LTS LTS
AQ-3: Operation of the LRDP could exceed BAAQMD CEQA significance thresholds for mass of criteria pollutants and could contribute to an existing or projected air quality violation at full buildout. *(Significance Criteria 7a and 7c)*	All Near-Term All Long-Term	S S	none proposed none proposed	SU SU
AQ-4: Operation of the LRDP could cause local concentrations of CO from motor vehicle exhaust to exceed state and federal ambient air quality standards. *(Significance Criterion 7b)*	All Near-Term All Long-Term	LTS LTS	none required none required	LTS LTS
AQ-5: Operations at the LRDP could expose sensitive receptors to substantial concentrations of toxic air contaminants. *(Significance Criterion 7d)*	All Near-Term All Long-Term	LTS LTS	none required none required	LTS LTS
AQ-6: Construction activities associated with the LRDP could expose a substantial number of people to objectionable odors. *(Significance Criterion 7e)*	All Near-Term All Long-Term	LTS LTS	none required none required	LTS LTS
AQ-7: The LRDP's short-term construction and long-term operational emissions could contribute to cumulatively significant toxic air contaminant, criteria air pollutant or precursor emissions in the region. *(Significance Criterion 7c)*				
• **Operational** criteria air pollutant emissions	All Near-Term All Long-Term	S S	none required none required	SU SU
• **Construction** and **operational** toxic air contaminant emissions and construction criteria air pollutant emissions	All Near-Term All Long-Term	LTS LTS	none required none required	LTS LTS

Table 1 contd.: Revised summary of Draft EIR air quality impact analysis and proposed mitigation measures

Impact	Project Components	a) Level of Significance Prior to Proposed Mitigation	b) Proposed Mitigation/ Improvement Measures (description see attached Table A-1)	c) Level of Significance with Proposed Mitigation
2010 BAAQMD CEQA Guidelines				
AQ-8: Construction activities associated with the LRDP could result in short-term increases in fugitive dust that exceed BAAQMD CEQA significance criteria. *(Significance Criteria 7a and 7b)*	All Near-Term All Long-Term	S S	M-AQ-N8a, M-AQ-N8b M-AQ-L8a, M-AQ-L8b	LTS LTS
AQ-9: Near-term and long-term **construction** activities associated with the LRDP could exceed BAAQMD CEQA significance thresholds for mass criteria pollutant emissions and could contribute to an existing or projected air quality violation. *(Significance Criteria 7b and 7c)*	All Near-Term All Long-Term	S S	M-AQ-N9 M-AQ-L9	SU SU
AQ-10: Construction activities associated with the LRDP could result in short-term increases in emissions of diesel particulate matter that exceed BAAQMD CEQA significance criteria and expose sensitive receptors to substantial concentrations of toxic air contaminants and PM2.5. *(Significance Criteria 7b and 7d)*	All Near-Term All Long-Term	S S	M-AQ-N10a, M-AQ-N10b M-AQ-L10a, M-AQ-L10b	SU SU
AQ-11: Operation of the LRDP could exceed the BAAQMD CEQA significance thresholds for mass criteria pollutant emissions and could contribute to an existing or projected air quality violation at full buildout. *(Significance Criteria 7a and 7c)*	All Near-Term All Long-Term	S S	none proposed none proposed	SU SU
AQ-12: Operation of CPMC campuses under the LRDP could expose sensitive receptors to substantial concentrations of toxic air contaminants. *(Significance Criterion 7d)*	All Near-Term All Long-Term	LTS LTS	none required none required	LTS LTS
AQ-13: Construction and **operation** under the LRDP could expose a substantial number of people to objectionable odors. *(Significance Criterion 7e)*	All Near-Term All Long-Term	LTS LTS	none required none required	LTS LTS
AQ-14: The LRDP's short-term construction and long-term operational emissions could contribute to cumulatively significant toxic air contaminant, criteria air pollutant or precursor emissions in the region. *(Significance Criterion 7d)*				
• **Construction** criteria air pollutant and toxic air contaminant emissions	All Near-Term All Long-Term	S S	none required none required	SU SU
• **Operational** criteria air pollutant and toxic air contaminant emissions	All Near-Term All Long-Term	LTS LTS	none required none required	LTS LTS

- For the significance of impacts *prior* to implementation of proposed mitigation measures: *no impact* ('NI') has been replaced with *less than significant* ('LT5') *potentially significant* ('PS') has been replaced with *significant ('S') significant impact* ('SI') has been replaced with *significant ('S') significant and unavoidable impact* ('5U') has been replaced with *significant ('5')*

- For the significance of impacts *after* implementation of proposed mitigation measures: *less than significant with mitigation* ('LTSM') has been replaced with *less than significant* ('LTS') *potentially significant and unavoidable after mitigation* ('PSU/M') has been replaced with *significant and unavoidable* ('SU') *significant and unavoidable impact after mitigation* ('SU/M') has been replaced with *significant and unavoidable* ('SU')

Response AQ-25

The comment provides an alternative to Table S-2, "Summary of CPMC LRDP Impacts and Mitigation Measures," in the Summary Chapter provided as part of the Draft EIR (see pages S-37 to S-80). The table provided reflects a preference related to the presentation of impact determinations within the summary chapter and is noted. However, although the issue is not raised in the table and the significance conclusions in the table are consistent with those in the Draft EIR, contrary to this comment, a material difference exists between a finding of no impact versus a less-than-significant impact determination. No impact is typically identified as no change, no effect; whereas a determination of less than significant indicates an adverse impact that does not exceed established thresholds of significance.

Comment

(Gloria Smith—California Nurses Association, October 19, 2010) [91-57 AQ]

"As discussed in my comments above, the Draft EIR is not properly documented and its analyses are severely deficient. Specifically, the Draft EIR fails to properly analyze the adverse individual and cumulative impacts on local and regional air quality and global climate change that would be caused by emissions associated with the Project's construction and operation. Most importantly, however, the Draft EIR fails to fulfill its mandate under CEQA to require all feasible mitigation to minimize the Project's significant adverse impacts. Mitigation measures are available that would reduce criteria pollutant, greenhouse gas, and toxic air contaminant emissions, are routinely required for other projects in California, and must be required here to reduce the Project's substantial contribution to the already compromised local and regional air quality and protect the health of its patients, employees and residents in the local and regional vicinity."

Response AQ-26

The comment summarizes earlier comments made in Letter 91. Individual and cumulative air quality and greenhouse gas impacts were analyzed, pursuant to the procedures discussed in Responses GH-1 (page C&R 3.10-3) and AQ-24 (page C&R 3.9-64). The comment states that the Draft EIR failed to include all feasible mitigation measures to reduce criteria pollutant, greenhouse gas (GHG), and toxic air contaminant (TAC) emissions. For criteria air pollutants, the only pollutant exceeding the BAAQMD's significance thresholds for construction was NO_X. Construction mitigation measures were described in the Draft EIR and enhanced after further discussions with CPMC LRDP construction partners. These refined mitigation measures are discussed in Responses AQ-8 and AQ-9 (pages C&R 3.9-17 and 3.9-20, respectively) and Chapter 4 of this C&R document (page C&R 4-17). After the application of all feasible construction mitigation measures, overall project construction NO_X emissions would remain significant and unavoidable for near-term projects under the LRDP.

For operations, the only criteria air pollutant exceeding the 2010 BAAQMD significance thresholds was PM_{10}, primarily because of proposed LRDP-related traffic increases. All feasible traffic mitigationswere incorporated in the project-related traffic projections analyzed in the Draft EIR, with the exception of CPMC's proposed enhanced TDM program, which were not incorporated into the traffic projections in order to produce a conservative analysis. See Response AQ-11 (page C&R 3.9-27) for further discussion of the proposed enhanced TDM program.

For GHG emissions, the proposed LRDP was found to conform with the *City and County of San Francisco's Strategies to Address Greenhouse Gas Emissions*, although found to still exceed numeric thresholds in the 2010 BAAQMD significance criteria, despite implementation of all feasible mitigation measures as discussed in Response GH-1 (page C&R 3.10-3). For TACs, proposed LRDP operational emissions were found to be less than significant for potential public health risks, but construction emissions were found to present significant and unavoidable potential public health risks due to diesel exhaust from construction equipment. The diesel construction equipment assessed in the Draft EIR incorporated all feasible mitigation measures identified at the time the Draft EIR was published. CPMC has since made project refinements by reconfirming construction equipment assumptions, re-evaluating feasibility construction mitigations, and developing additional construction mitigation details. Refined mitigation measures are discussed in Responses AQ-8 and AQ-9 (pages C&R 3.9-17 and 3.9-20, respectively) and Chapter 4 of this C&R document (page C&R 4-17).

3.9.2 CATHEDRAL HILL CAMPUS

3.9.2.1 CONSTRUCTION EMISSIONS

Comment

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-62 AQ, duplicate comment was provided in 30-62 AQ]

"In order not to pollute these areas as well as the construction yard areas due to a wasted truck run or to trucks idling to wait for their green light to deliver to the Cathedral Hill project, such a system of keeping in constant contact via this Logistics Superintendent is an excellent idea to minimize the impact on air quality and sensitive receptors in these areas."

Response AQ-27

The comment expresses concern regarding potential impacts associated with idling delivery trucks at a Cathedral Hill Campus construction sites and supports the use of a "Logistics Superintendent" to coordinate truck deliveries. With respect to idling emissions, ARB and the BAAQMD have established regulations that limit the length of time heavy-duty trucks and construction equipment can idle unnecessarily. Necessary idling may include time in which truck-mounted equipment that needs generator-created electricity is running, such as the use of a cement mixer or truck-mounted hydraulics. Mitigation Measure M-AQ-N1b in the Draft EIR, page 4.7-32, would require LRDP construction equipment, including heavy-duty trucks, to limit idling to no more than 2 minutes (to the extent feasible) consistent with the BAAQMD Guidelines, which would be more stringent than the limits established by ARB and would further reduce potential emissions associated with equipment operation. Signage also would be provided at all access points to the Cathedral Hill Campus construction sites, instructing equipment operators to adhere to the idling time restriction while queuing or otherwise. As noted in the comment, the "Logistics Superintendent" (as termed in the February 4, 2011, HerreroBoldt, Pankow Environmental Impact Report Construction Data document from the administrative record) will coordinate deliveries to optimize the delivery schedule and reduce queuing times. Coupled with Mitigation Measure M-AQ-N1b, impacts related to potential emissions associated with idling delivery trucks at the Cathedral Hill Campus construction sites and impacts to local sensitive receptors would be reduced to less-than-significant levels.

Comment

(Donald Scherl, October 18, 2010) [74-35 AQ]

"7.4: LRDP Harm: Both the construction of the buildings and the subsequent operation of the hospital will bring substantial daily harm (e.g., air pollution, noise, traffic congestion) to residents and small businesses, particularly in the Cathedral Hill neighborhood."

Response AQ-28

As discussed under Impact AQ-1 in the Draft EIR, page 4.7-29, near-term project construction at the proposed Cathedral Hill Campus is estimated to occur over a 4.5-year period. Construction-related emissions of fugitive dust, criteria air pollutants, and TACs would be generated intermittently and temporarily over this time. As an example, demolition and excavation of the proposed Cathedral Hill Hospital construction site would take place during 10 months of the 4.5-year construction period. To mitigate fugitive dust emissions during construction at the proposed CPMC campuses, including the Cathedral Hill Campus, Mitigation Measure M-AQ-N1a in the Draft EIR, page 4.7-31, would require

implementation of all of the basic, optional, and additional construction mitigation measures under both the 1999 and the 2010 BAAQMD Guidelines.

For operational emissions at the proposed Cathedral Hill Campus, TAC emissions from the proposed operations (i.e., natural gas boilers and water heaters, diesel-fueled generators, loading dock) would not exceed the human cancer risk or non-cancer hazard index thresholds, as shown in Table 4.7-8 in the Draft EIR, page 4.7-46. A screening health risk assessment (HRA) was prepared, utilizing these thresholds. With the exception of the new 0.3 ug/m3 $PM_{2.5}$ concentration threshold, the risk thresholds (cancer and non-cancer risk) did not change between the 1999 and the 2010 BAAQMD Guidelines.

The June 2010 BAAQMD Guidelines included changes to the recommended procedure for calculating cancer risk. The 2010 BAAQMD Guidelines require that the calculations include "age sensitivity factors" (ASFs), which increase the calculated lifetime cancer risk by a factor of 1.7 times for residential receptors as compared to calculations under the 1999 BAAQMD Guidelines, for operational emissions. Construction ASF varies depending on the length of the construction period and must be calculated on a project-by-project basis. Thus, although the BAAQMD significance threshold that is triggered when the risk of cancer due to TAC inhalation is 10 out of every million did not change under the 2010 BAAQMD Guidelines, the revisions to the calculation methodology in the 2010 Guidelines would result in more projects exceeding the threshold.

The analysis in the Draft EIR uses both the 1999 guidelines and the updated June 2010 thresholds of significance and methodologies from the BAAQMD CEQA Air Quality Guidelines to evaluate the potential air quality impacts of the proposed Project.[50] Although BAAQMD adoption of the significance thresholds are the subject of recent judicial actions, the Planning Department has determined that Appendix D of the BAAQMD CEQA Air Quality Guidelines, in combination with BAAQMD's Revised Draft Options and Justification Report provide substantial evidence to support the BAAQMD-recommended thresholds and, therefore, has determined they are appropriate for use in this analysis.[51] The use of both the 1999 and the updated June 2010 BAAQMD CEQA Air Quality Guidelines in both the Draft EIR and the subsequent refined analysis of TAC emissions therefore continues to represent a conservative approach that provides full disclosure regarding the potential air quality impacts of the proposed LRDP.

The HRA evaluated the potential non-cancer hazard impacts of off-site stationary and mobile sources to on-site receptors (i.e., patients) within the proposed Cathedral Hill Campus. As shown in Table 4.7-9 in the Draft EIR, page 4.7-47, off-site sources would not cause a significant impact with respect to the acute non-cancer hazard index threshold for any proposed CPMC campus.

These screening HRAs included conservative assumptions such as worst-case meteorological conditions to avoid underestimating impacts. Furthermore, the total risk evaluated in Table 4.7-8 includes the sum of individual risk estimates at each receptor height for the proposed Cathedral Hill Hospital and Medical Office Building. Therefore, during operation, neither on-site nor off-site receptors at the proposed Cathedral Hill Campus are anticipated to be exposed to significant concentrations of TACs.

The Draft EIR discusses noise from construction and operation of the proposed LRDP under Impact NO-1 and Impact NO-3 in the Draft EIR, pages 4.6-41 and 4.6-64, respectively. With respect to construction noise, it was determined that construction noise at the proposed Cathedral Hill Campus would be potentially significant, but would be reduced to a less-than-significant level through implementation of

[50] BAAQMD, 2011 (May), California Environmental Quality Act Air Quality Guidelines, App. D: Threshold of Significance Justification (June 2, 2010).

[51] Bay Area Air Quality Management District. *Revised Draft Options and Justification Report, California Environmental Quality Act Theresholds of Significance*. October 2009. Document available on line at; http://baaqmd.gov/divisions/Planning-and-Research/CEQA-GUIDELINES/updated-CEQA-GUIDELINES.aspx

Mitigation Measures M-NO-N1a, M-NO-N1b, and M-NO-N1c (in the Draft EIR, beginning on page 4.6-46).

As discussed under Impact TR-55 in the Draft EIR, beginning on page 4.5-147, "[i]mplementation of the Cathedral Hill Campus project would result in a transportation impact in the project vicinity resulting from construction vehicle traffic and construction activities that would affect the transportation network." To minimize the effects that LRDP-related construction activities would have on traffic at the proposed Cathedral Hill Campus, CPMC would be required to implement Mitigation Measure TR-55 (in the Draft EIR, page 4.5-159).

CPMC would develop and implement a construction TDM program to anticipate and minimize impacts of various construction activities associated with the proposed LRDP. The plan would disseminate appropriate information to contractors and affected agencies with respect to coordinating construction activities, to minimize overall disruptions and ensure that overall circulation was maintained to the extent possible, with particular focus on ensuring pedestrian, transit, and bicycle connectivity. The TDM program would supplement and expand, rather than modify or supersede, any manual, regulations, or provisions set forth by the California Department of Transportation (Caltrans), San Francisco Municipal Transportation Agency (SFMTA), San Francisco Department of Public Works (DPW), or other City departments and agencies. If a conflict between the plan and an applicable manual, regulation, or provision from the aforementioned agencies was noted, the direction/requirements of the manual, regulation, or provision in question would prevail over the plan.

Although the above mitigation measure would reduce the magnitude of impacts related to LRDP construction traffic at the proposed Cathedral Hill Campus, the impacts would remain significant and unavoidable. If the decision-makers decide to approve the proposed LRDP, they would be required to adopt a statement of overriding considerations, based on substantial evidence in the record, indicating that the benefits of the project outweighed the significant environmental impacts of the proposed LRDP.

Comment

(Alan Wofsy, September 23, 2010) [PC-298 AQ]

"Good evening, President Miguel and members. My name is Alan Wofsy and I am the CEO of Emeric Goodman Associates. We own the building that is going to be the most impacted by this project on Cathedral Hill, the Emeric Goodman Building, it is probably the oldest wood frame building in downtown San Francisco. It survived the Earthquake and fire because it was on the west side of Van Ness. We renovated it after eight years of development and construction in 1985, and it has been serving residences and businesses for the last 25 years. Your staff presented you, which I saw for the first time today, an August 27th four-page Executive Summary which I did not hear anybody reference today, and in the Executive Summary, it mentions the significant unmitigated environmental impacts, and those are the items which should have been addressed in the EIR, is how those impacts, which from an economic sense are called "external costs." External costs mean, the simplest example is pollution, where you'd have a polluting facility putting dust and pollution in people's houses, and that's an external cost, instead of, in the old days before they had filters in cleaning facilities, it would go to the other people, it became an internal cost of the person causing the damage once they were required to reduce the pollution. And the Cathedral Hill Project is sort of analogous to that, that there are external costs being imposed on other people."

Response AQ-29

The comment states a general objection to physical environmental impacts that would occur as a result of development under the proposed LRDP to the surrounding environment (i.e., existing development within the City of San Francisco.) The comment is noted. The potential significant environmental impacts of the proposed LRDP, including those related to dust during construction and operation, are analyzed in

Chapter 4, "Environmental Setting, Impacts, and Mitigation" in the Draft EIR and air quality impacts analyzed in Section 4.7, "Air Quality" in the Draft EIR, in conformance with CEQA, which would require any activity that might result in a change in the existing physical environment to disclose such changes in a publicly available document to be considered before approval of the activity.

3.9.3 PACIFIC CAMPUS

No comments pertaining to air quality and specific to this campus were received during public review of the Draft EIR.

3.9.4 CALIFORNIA CAMPUS

No comments pertaining to air quality and solely related to this campus were received during public review of the Draft EIR.

3.9.5 DAVIES CAMPUS

No comments pertaining to air quality and solely related to this campus were received during public review of the Draft EIR.

3.9.6 ST. LUKE'S CAMPUS

3.9.6.1 OPERATIONAL EMISSIONS

Comment

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-140 AQ, duplicate comment was provided in 30-140 AQ]

"77. On Page 4.7-50, Table 4.7-11, 'Diesel Particulate Emissions from Emergency Generators – St. Luke's Campus' shows that after 3 new generator units are installed, compared to what exists today, there will be a net decrease by 15 'diesel particulate matter (DPM)' lb/yr. The problem with this argument is that the 2 old units combined put out less at -29 DPM lb/yr. It appears from the data that the old units were more efficient at -9 DPM lb/yr. and at -20 DPM lb/yr. A new generator proposed to be installed in 2018, puts out 0.2 DPM lb/yr. 2 other generators combined will put out 13 DPM lb/yr. The result is a positive 13.2 DPM lb/yr.

The new generators put out more DPM lb/yr. than the old model generators which were 250 kW and 600 kW rated generators installed in 1969.

This argument of the BAAQMD trigger thresholds not being exceeded because the old generator emissions will cancel out the additional DPM lb/yr of the new generators does not make sense, especially because the old generators are going to be removed. Any emissions from the new generators will only be additive emissions."

Response AQ-30

The comment inquires about the data presented in Table 4.7-11 in the Draft EIR, page 4.7-50 regarding development at St. Luke's Campus under the LRDP. To clarify, the negative values in Table 4.7-11 indicate a net decrease in emissions, associated with the removal of the old generators at St. Luke's Campus. The existing emission levels are 9 lb/yr and 20 lb/yr, not -9 lb/yr and -20 lb/yr. The new generators would produce less DPM than the old generators because of more stringent emissions limits. Furthermore, according to the 2010 BAAQMD CEQA Guidelines, "[i]f a proposed project involves the removal of existing emission sources, BAAQMD recommends subtracting the existing emissions levels

from the emissions levels estimated for the new proposed land use."[52] Because these units would continue to operate in the absence of the proposed LRDP and were operating at the time of the Notice of Preparation of an EIR (NOP), for this analysis it is appropriate to subtract the emissions of the old generators from the future operational emissions.

3.10.1 LRDP

3.10.1.1 BAAQMD GUIDELINES/THRESHOLDS AND CORRESPONDING OPERATIONAL IMPACTS

Comments

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-89 GH, duplicate comment was provided in 30-89 GH]

"51. Page S-67, Impact GH-3, states 'direct and indirect LRDP-generated GHG emissions would have a significant impact on the environment or conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing GHG emissions (Recently adopted BAAQMD Guidelines)'. This is a 'significant and unavoidable' impact for all 4 projects and does not have any mitigation measure associated with it. Per Page 4.8-31, the BAAQMD's efficiency criterion is 4.6 $MTCO_2e$/SP/yr and on this page, it refers to Table 4.8-2 on Page 4.8-20 that there will be a 'net increase in GHG emissions resulting from Proposed LRDP (year 2030)' of 22,503 MT/yr CO_2e. On Page 4.8-32, the DEIR goes on to state that 'several sustainability attributes would serve to reduce GHGs that were not accounted for because of the unavailability of sufficient methodologies to accurately account associated GHG emission reductions.' What are these 'sustainability attributes'?"

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-143 GH, duplicate comment was provided in 30-143 GH]

"80.On Pages 4.8-31 - 4.8-32, a summary of the Greenhouse Gas Emissions for all CPMC campus projects except for the California Campus are explained. The DEIR states that the total greenhouse gas (GHG) emissions will be about 22,503 $MTCO_2e$/yr. The BAAQMD's threshold is 1,200 $MTCO_2e$/yr. This is almost 19 times the threshold allowed by BAAQMD. It was my assumption that CPMC, with adherence to the City and County of San Francisco's Green Building Ordinance which states that 'buildings over 5,000 square feet, residential buildings over 75 feet in height, and renovations on buildings over 25,000 square feet to be subject to an unprecedented level of required Leadership in Energy and Environmental Design (LEED) Green Building Rating System certifications,' per Page 4.8-11, does not make the new CPMC campuses spew out fewer $MTCO_2e$/yr. but rather more."

(Donald Scherl, October 15, 2010) [74-30 GH]

"The same holds for Impact GH-3 which states that the project would have a significant negative impact on the environment or conflict with existing rules."

(Gloria Smith—California Nurses Association, October 19, 2010) [91-39 GH]

"Similarly, the Draft EIR finds significant impacts due to the Project's operational emissions of greenhouse gases ('GHGs') from both near-term and long-term projects when analyzed under the 2010 BAAQMD CEQA Guidelines. Again, the Draft EIR fails to discuss the feasibility of any potential mitigation measures instead simply stating that '[i]t is not likely that additional increases in the energy savings and sustainability goals would be able to reduce remissions below BAAQMD's significance criteria. Accordingly, this impact would remain *significant and unavoidable*, based on BAAQMD's recently adopted GHG thresholds.'[37] This finding and the lack of any discussion of mitigation measures is not acceptable under CEQA and apparently based on the invalid assumption that if mitigation measures would not reduce emission below a threshold, they are worth adopting. In fact, the lead agency has the obligation to require that the Project reduce emissions *to the extent feasible*, i.e., any reduction in emissions that would result from on or a combination of several mitigation measure(s) is preferable over no reduction, irrespective of whether emissions would be reduced to below a threshold.

[37] Draft EIR, p. 4.8-32."

(Gloria Smith—California Nurses Association, October 19, 2010) [91-40 GH]

"The Draft EIR's failure to identify and evaluate potential mitigation measures for greenhouse gas emissions is a prima facie violation of CEQA. CEQA prohibits agencies from approving projects with significant environmental impacts when feasible mitigation measures can substantially lessen or avoid such impacts.[38] Specifically, an agency is prohibited from approving a project unless it has '[e]liminated or substantially lessened all significant effects on the environment where feasible.'[39] Accordingly, an agency may only adopt a statement of overriding considerations only *after* is has imposed all feasible mitigation measures to reduce a project's impact to less than significant levels.[40]

[38] Pub. Res. Code 21002.
[39] CEQA Guidelines Section 15092(b)(2).
[40] CEQA Guidelines Sections 15126.4, 15091."

(Rachel Sater—Lost Block and Save Our Streets, October 19, 2010) [101-40 GH]

"Page 4.8-32: The DEIR found that projected LRDP operational greenhouse gas ('GHG') emissions would exceed the Bay Area Air Quality Management District ('BAAQMD') significance thresholds and would therefore represent a significant impact. The DEIR notes that it is not likely that the energy reduction and sustainability measures intended for the project, but not accounted for in the GHG emissions modeling, would reduce GHG emissions below the BAAQMD significance thresholds, and that the impact would be significant and unavoidable. The DEIR neglects the City's obligation to identify and evaluate the effects of feasible mitigation measures to reduce GHG emissions. CEQA requires that a Lead Agency implement all feasible mitigation measures to reduce a significant impact, even if it concludes that the impact would be significant and unavoidable even after mitigation. Accordingly, the DEIR must be revised to include additional mitigation measures for this impact and recirculated."

(Stephanie Barton, et al.—Hastings Civil Justice Clinic for the Good Neighbor Coalition, October 19, 2010) [104-53 GH]

"The more than 22,500 metric tons of greenhouse gas (GHG) emissions generated by the project on an annual basis will have a significant impact on the environment. Under the 1999 BAAQMD Guidelines, the project's direct and indirect green house gas (GHG) emissions would have a significant impact on the environment. Using the 1999 BAAQMD Guidelines' threshold levels of significance, a project's GHG emissions significantly impact the environment if the proposed project will 'generate GHG emissions, either directly or indirectly, that may have a significant impact on the environment; or conflict with an applicable plan, policy, or regulation of an agency adopted for the purpose of reducing the emissions of GHGs.'[135] While the DIER states that the project does not conflict with any existing GHG emissions reduction plans or policies, the DEIR presents no analysis of why the projects GHG emissions will not surpass the qualitative threshold of 'may have a significant impact on the environment."

Whether or not the proposed project conflicts with an applicable GHG emissions reduction plan or policy, it will generate the equivalent of more than 22,500 metric tons of CO_2 per year. The DEIR should recognize that this level of emissions would cause the project to have a significant environmental impact based on the qualitative standard. 22,500 metric tons of GHG emissions arc more than 20 times the recently adopted 2010 BAAQMD Guidelines for EIR GHG significance thresholds.[136] Operational GHG emissions per service population at the Cathedral Hill Campus will also exceed the new guidelines by over 25 percent.[137] The DEIR admits that the Cathedral Hill Campus' GHG emissions will easily surpass the threshold levels established by the 2010 BAAQMD Guidelines. However, the DEIR still claims that the project's GHG emissions would not have a significant impact on the environment under the 1999 BAAQMD Guidelines, Given how greatly the Cathedral Hill Campus' GHG emissions would exceed the recently adopted 2010 BAAQMD Guidelines, it is more than reasonable to find that the campus' GHG emissions would surpass the qualitative threshold of "may have a significant impact on the environment," as used under the 1999 BAAQMD Guidelines. The DEIR should

acknowledge that the project's GHG emissions would have a significant impact on the environment under the 1999 BAAQMD Guidelines and put forth mitigation measures to diminish it.

[135] DEIR 4.8-13.
[136] DEIR 4.8-31.
[137] Id."

(Stephanie Barton, et al.—Hastings Civil Justice Clinic for the Good Neighbor Coalition, October 19, 2010) [104-54 GH]

"It is important that the DEIR acknowledge the project will have a significant impact on the environment under the 1999 BAAQMD Guidelines, so that decision makers are able to accurately evaluate the project's costs and benefits. By falsely claiming the project will not have a significant impact on the environment under the 1999 BAAQMD Guidelines, the DEIR is essentially downplaying the effects of the project's GHG emissions. State CEQA Guidelines establish that '[t]he purpose of an environmental impact report is to identify the significant effect s on the environment of a project, to identify alternatives to the project, and to indicate the manner in which those significant effects can be mitigated or avoided.'[138] By denying that the project's GHG emissions 'may have a significant impact on the environment,' the DEIR fails to comply with the fundamental objectives of an EIR. Failing to recognize a significant impact not only mischaracterizes a project's environmental cost, but also distorts the DEIR's discussion of alternatives, and mitigation measures. The DEIR must recognize that the project's GHG emissions will have a significant impact on the environment under the 1999 BAAQMD Guidelines, as well as the 2010 version. Failure to do so downplays the project's impacts on the environment, distorts the DEIR's discussion of alternatives and mitigation measures, and therefore inhibits Planning Commissioners, Supervisors, and the general public's ability to properly evaluate the project.

[138] CEQA Guidelines 21002.1."

Response GH-1

The comments suggest that the Draft EIR fails to identify and evaluate feasible mitigation measures for significant and unavoidable GHG emissions impacts and that it distorts the discussion of alternatives. Per State CEQA Guidelines Section 15064.4(b), a lead agency should consider the following factors, among others, when assessing the significance of impacts from GHG emissions on the environment: (1) the extent to which the project may increase or reduce GHG emissions as compared to the existing environmental setting, (2) whether the project emissions exceed a threshold of significance that the lead agency determines applies to the project, or (3) the extent to which the project complies with regulations or requirements adopted to implement a statewide, regional, or local plan for the reduction or mitigation of GHG emissions. The degree to which these factors are considered is often refined and/or further determined by methodologies developed by regional air districts, such as the BAAQMD.

The comments also refer to 1999 BAAQMD significance findings under both BAAQMD's 1999 and 2010 CEQA Air Quality Guidelines with respect to GHG significance criteria. The comments state that the CPMC LRDP Draft EIR failed to acknowledge a significant and unavoidable GHG impact under 1999 BAAQMD CEQA Guidelines and thereby limited its ability to identify alternatives to the significant and unavoidable impacts of the LRDP. It should be noted that no GHG significance thresholds were included as part of BAAQMD's 1999 CEQA Guidelines. The GHG significance criteria that were directly applicable to the proposed LRDP at the time of preparation of the Draft EIR were criteria 8a and 8b of Appendix G of the State CEQA Guidelines. Under these criteria, significant GHG impacts potentially could occur if a project would: (1) generate GHG emissions, either directly or indirectly, that may have a significant impact on the environment; or (2) conflict with an applicable plan, policy, or regulation of an agency adopted for the purpose of reducing the emissions of GHGs. Impact GH-1 incorrectly labeled these significance criteria as coming from the 1999 BAAQMD Guidelines, though they were described

correctly on Draft EIR page 4.8-29. Therefore, the impact statement under Impact GH-1 on Draft EIR page 4.8-21 is clarified as follows:

> *IMPACT GH-1 Direct and indirect CPMC LRDP-generated GHG emissions would not have a significant impact on the environment, nor would they conflict with an applicable plan, policy or regulation adopted for the purpose of reducing GHG emissions (State CEQA ~~1999 BAAQMD~~ Guidelines, Appendix G). (Significance Criteria 8a and 8b).*

In addition, and as noted by the comments, on June 2, 2010, BAAQMD adopted new and revised CEQA air quality thresholds of significance and issued revised guidelines that replace the 1999 CEQA Air Quality Guidelines. The BAAQMD 2010 CEQA Air Quality Guidelines provide for the first time CEQA thresholds of significance for greenhouse gas emissions that are specific to the San Francisco Bay Area Air Basin.[1] The Draft EIR included an analysis that applied the 2010 BAAQMD CEQA Air Quality Guidelines greenhouse gas emission significance criteria to the LRDP. As stated on Page 4.8-28 of the Draft EIR "the adopted GHG thresholds are intended to apply only to those projects for which environmental analyses have begun on or after the June 2, 2010 adoption date. Although the recently adopted GHG thresholds are not intended to apply to the proposed LRDP, in recognition of BAAQMD's adoption of these thresholds, an analysis was performed of the proposed LRDP development's impacts with respect to the recently adopted CEQA thresholds for GHGs."

The analysis in the Draft EIR uses pre-existing guidance and the updated June 2010 thresholds of significance and methodologies from the BAAQMD CEQA Air Quality Guidelines to evaluate the potential greenhouse gas impacts of the proposed Project.[2] Although BAAQMD adoption of the significance thresholds are the subject of recent judicial actions, the Planning Department has determined that Appendix D of the BAAQMD CEQA Air Quality Guidelines, in combination with BAAQMD's Revised Draft Options and Justification Report provide substantial evidence to support the BAAQMD-recommended thresholds and, therefore, has determined they are appropriate for use in this analysis.[3] The use of both pre-existing guidance and the updated June 2010 BAAQMD Guidelines in the Draft EIR therefore continues to represent a conservative approach that provides full disclosure regarding the potential GHG impacts of the proposed LRDP.

The BAAQMD 2010 Guidelines recognize that "[n]o single project could generate enough GHG emissions to noticeably change the global average temperature."[4] Accordingly, BAAQMD's approach to developing thresholds of significance for GHG emissions was "to identify the emissions level for which a project would not be expected to substantially conflict with existing California legislation adopted to reduce statewide GHG emissions needed to move us towards climate stabilization."[5]

5 Ibid.

The 2010 BAAQMD CEQA Air Quality Guidelines identify the following three alternative thresholds for determining whether a project's operational-related GHG emissions are significant:

1) Compliance with a Qualified Greenhouse Gas Reduction Strategy; or
2) Whether a project's GHG emissions exceed 1,100 metric tons of carbon dioxide equivalents ($MTCO_2e$); or
3) Whether a project's GHG emissions exceed 4.6 $MTCO_2e$ per service population.[6]

Per State CEQA Guidelines Section 15064.4(a), a lead agency shall have discretion to determine, in the context of a particular project, whether to: (1) use a model or methodology to quantify GHG emissions resulting from a project, or (2) rely on a qualitative analysis or performance-based standards. As such, a lead agency may choose the threshold against which a project can be analyzed to determine whether the project's GHG emissions are significant. However, BAAQMD encourages local governments to adopt a qualified GHG Reduction Strategy that is consistent with the goals of Assembly Bill 32, the California Global Warming Solutions Act of 2006, which requires that statewide GHG emissions be reduced to 1990 levels by 2020.[7] The recently adopted (June 2010) BAAQMD CEQA Guidelines provide that "[i]f a project is located in a community with an adopted qualified GHG Reduction Strategy . . . , the project may be considered less than significant if it is consistent with the GHG Reduction Strategy. A project must demonstrate its consistency by identifying and implementing all applicable feasible measures and policies from the GHG Reduction Strategy into the project."[8] In other words, "[i]f a project is consistent with an adopted GHG Reduction Strategy that meets the standards [set forth in the June 2010 BAAQMD CEQA Guidelines], it can be presumed that the project will not have significant GHG emissions impacts."[9]

At the time the Draft EIR was issued, the City and County of San Francisco did not have a qualified GHG reduction strategy. Accordingly, to analyze whether the CPMC LRDP could generate GHG emissions that may have a significant impact under the 2010 BAAQMD significance thresholds, the Draft EIR compared the LRDP against the numeric GHG significance criteria contained in the 2010 BAAQMD significance thresholds and concluded that there would be a significant and unavoidable GHG emissions impact. Therefore, the Draft EIR did not fail to recognize a significant impact nor distort the discussion of LRDP alternatives and mitigation measures, as one of the comments suggests.

Per CEQA Guidelines Section 15126.4(c), measures to mitigate the significant effects of GHG emissions may include, among other measures, reductions in emissions resulting from a project through implementation of project features, project design, or other measures. The proposed LRDP includes numerous design features that would reduce GHG emissions. These features, which are referred to as "sustainability attributes" on Draft EIR page 4.8-32, are described in detail on Draft EIR pages 4.8-16 through 4.8-20 under the sub-section entitled, Project Design Features Whose Emissions Reductions Were Not Incorporated into the Analysis but Could Yield Further GHG Emissions Savings. These sustainability attributes were not accounted for, in terms of quantified reductions for purposes of the inventory of GHG emissions from the proposed LRDP, due to the unavailability of sufficient methodologies to accurately quantify potential LRDP GHG emission reductions associated with their implementation. Furthermore, by not including quantified reductions for these attributes, the Draft EIR

[6] Ibid., p. 2-4.
[7] Ibid., p. 4-7; see also Appendix D: Threshold of Significance Justification, p. D-24 ("[M]any local agencies have already undergone or plan to undergo efforts to create general or other plans that are consistent with AB 32 goals. The Air District encourages such planning efforts and recognizes that careful upfront planning by local agencies is invaluable to achieving the state's GHG reduction goals."); San Francisco Planning Department. 2010. Greenhouse Gas Analyses Pursuant to CEQA Memorandum from Jessica Range, Environmental Planner, to Major Environmental Analysis and Environmental Consultants, November 12.
[8] Bay Area Air Quality Management District. 2010 (May). *California Environmental Quality Act Draft Air Quality Guidelines*, p. 4-4. Available at: http://www.baaqmd.gov/~/media/Files/Planning%20and%20Research/CEQA/Draft_BAAQMD_CEQA_Guidelines_June_2010_Final.ashx.
[9] Ibid., p. 4-7.

conservatively overestimated the potential GHG emissions associated with the proposed LRDP. These sustainability attributes are features of the proposed project to which CPMC has committed and include the following:

- Reduced water consumption;
- Construction waste recycling and landfill diversion;
- Reduction in use of steel building materials for the Cathedral Hill Hospital by 25 percent;
- Green roof (Cathedral Hill Hospital and Cathedral Hill MOB);
- Zero potable water used for irrigation (Cathedral Hill Hospital is collecting rainwater to use for irrigation demand throughout the year, reducing GHGs off-site); and
- Cathedral Hill Hospital refrigeration systems utilizing glycol.

Additionally, as explained on page 4.8-28 of the Draft EIR, under the proposed LRDP, CPMC would seek LEED® certification for the Cathedral Hill Hospital, Cathedral Hill MOB, St. Luke's Replacement Hospital, and the St. Luke's MOB/Expansion Building. The Cathedral Hill MOB, the St. Luke's MOB/Expansion Building, and the buildings proposed as long-term developments at the Davies and Pacific Campuses would be required under the City's Green Building Ordinance to achieve LEED® Silver certification. The proposed LRDP includes LEED® features that would reduce the direct and indirect GHG emissions associated with operation of the LRDP, compared with standard building methods and the existing structures proposed for demolition. In addition, indoor and outdoor water consumption would be reduced through LEED® features.

The determination in the Draft EIR that the proposed LRDP would result in a significant and unavoidable impact under the 2010 BAAQMD numeric significance criteria for GHG emissions was made in part on the basis that although CPMC had committed to incorporating the project design features intended to reduce operational GHG emissions, described above, the reduction of LRDP GHG emissions that would result from these project design features could not be quantified.

Subsequently, after release of the Draft EIR for public review on October 28, 2010, BAAQMD reviewed and concurred that the City and County of San Francisco's Strategies to Address Greenhouse Gas Emissions [10] meet BAAQMD's criteria for a Qualified GHG Reduction Strategy as outlined in BAAQMD's 2010 CEQA Air Quality Guidelines.[11] The purpose of the City and County of San Francisco's Strategies to Address Greenhouse Gas Emissions document is to present San Francisco's assessment of policies, programs, and ordinances that collectively represent San Francisco's Qualified Greenhouse Gas Reduction Strategy in compliance with BAAQMD's June 2, 2010, *CEQA Air Quality Guidelines* and thresholds of significance.[12] Therefore, projects that are consistent with San Francisco's qualified GHG Reduction Strategy would result in a less-than-significant GHG emissions impact. That is, projects built in conformance with the qualified GHG Reduction Strategy, which are therefore considered to be below BAAQMD's threshold of significance, are considered to be part of the collective solution to the cumulative problem related to GHG emissions, and not part of the continuing problem.[13] According to BAAQMD, "even though such projects will add an incremental amount of [GHG] emissions, their incremental contribution will be less than 'cumulatively considerable' because they are helping to achieve

[12] San Francisco Planning Department. 2010 (November). San Francisco's *Strategies to Address Greenhouse Gas Emissions*, p. I-2. Available at: http://www.sf-planning.org/index.aspx?page=1570.

[13] Bay Area Air Quality Management District. 2010 (May). *California Environmental Quality Act Draft Air Quality Guidelines*, Appendix D: Threshold of Significance Justification, p. D-28. Available at: http://www.baaqmd.gov/~/media/Files/Planning%20and%20Research/CEQA/Draft_BAAQMD_CEQA_Guidelines_June_2010_Final.ashx.

the cumulative solution, not hindering it."[14] Such projects would be considered to have implemented all applicable, feasible mitigation measures.[15]

According to the City's qualified GHG Reduction Strategy, "New development and major renovations in San Francisco are required to comply with San Francisco's ordinances that reduce greenhouse gas emissions. . . . Depending upon a proposed project's size, use, and location, a variety of controls are in place such that new development would not impair the State's ability to meet statewide GHG reduction targets outlined in AB 32, nor impact the City's ability to meet San Francisco's local GHG reduction targets."[16] The City's GHG Reduction Strategy concluded that "[g]iven that (1) San Francisco has implemented regulations to reduce greenhouse gas emissions specific to new construction and renovations of private developments and municipal projects; (2) San Francisco's sustainable policies have resulted in the measured success of reduced greenhouse gas emissions levels, (3) San Francisco has met and exceeded AB 32 greenhouse gas reduction goals for the year 2020, and (4) current and probable future state and local greenhouse gas reduction measures will continue to reduce a project's contribution to climate change, projects that are consistent with San Francisco's regulations would not contribute significantly, either individually or cumulatively, to global climate change."[17]

According to the BAAQMD, "compliance with a Qualified Greenhouse Gas Reduction Strategy (or similar adopted policies, ordinances and programs), would provide the evidentiary basis for making CEQA findings that development consistent with the plan would result in feasible, measureable, and verifiable GHG reductions consistent with broad state goals such that projects approved under qualified Greenhouse Gas Reduction Strategies or equivalent demonstrations would achieve their fair share of GHG emission reductions."[18]

In order to facilitate determination of project compliance with San Francisco's GHG reduction strategy, in November 2010 the San Francisco Planning Department Environmental Planning Division (formerly MEA) released a Greenhouse Gas Analysis Compliance Checklist that is to be completed for each proposed project. A checklist breaking down LRDP compliance by building for near-term projects and by campus for long-term projects has been completed. The CPMC LRDP GHG Compliance Checklist is included in this document as C&R Appendix D).

As set forth in the CPMC LRDP GHG Compliance Checklist (and as described in more detail in C&R Appendix D), CPMC would comply with the applicable requirements of the City's qualified GHG Reduction Strategy in the following manner:

- All CPMC campuses would offer a pre-tax election consistent with 26 U.S.C. Section 132(f), allowing employees to elect to exclude from taxable wages and compensation, employee commuting costs incurred for transit passes or vanpool charges, as required under the City's Commuter Benefits Ordinance (Environment Code, Section 421).

- All CPMC campuses would comply with the City's Emergency Ride Home Program.

[15] Bay Area Air Quality Management District. 2010 (May). *California Environmental Quality Act Draft Air Quality Guidelines*, p. 4-4. Available at: http://www.baaqmd.gov/~/media/Files/Planning%20and%20Research/CEQA/Draft_BAAQMD_CEQA_Guidelines_June_2010_Final.ashx.
[16] San Francisco Planning Department. 2010 (November). San Francisco's *Strategies to Address Greenhouse Gas Emissions*, p. X-4. Available at: http://www.sf-planning.org/index.aspx?page=1570.
[17] Ibid., p. X-5.
[18] Bay Area Air Quality Management District. 2010 (May). *California Environmental Quality Act Draft Air Quality Guidelines*, Appendix D: Threshold of Significance Justification, p. D-14. Available at: http://www.baaqmd.gov/~/media/Files/Planning%20and%20Research/CEQA/Draft_BAAQMD_CEQA_Guidelines_June_2010_Final.ashx.

- All CPMC campuses would comply with the requirement under Planning Code Section 163 to implement Transportation Management Programs.

- Although the City's Transit Impact Development Fee (under Administrative Code, Chapter 38) technically would not be applicable to CPMC as a non-profit organization, CPMC would be required under EIR Mitigation Measures MM-TR-29 through MM-TR-31, MM-TR-134, and MM-TR-137 to make a financial contribution to mitigate the transit delay impacts to the bus lines that were determined in the EIR to be significantly impacted by the LRDP project. The financial contribution would be calculated and applied in a manner that is consistent with SFMTA's existing cost/scheduling model, which SFMTA developed in conjunction with the City and County of San Francisco's existing Transit Impact Development Fee program. Therefore, CPMC would be required to pay a fee in the amount necessary to mitigate transit delay impacts, consistent with the intent of and in substantial compliance with the Transit Impact Development Fee program.

- Even though the proposed Cathedral Hill Hospital and St. Luke's Replacement Hospitals are not commercial uses, and therefore, are not subject to the requirements under Planning Code Section 155.4 for bicycle parking in new and renovated commercial buildings, 150 bicycle parking spaces are anticipated to be provided for the proposed Cathedral Hill Hospital, exceeding the City's minimum requirements under Planning Code Section 155.4, and a minimum of 12 bicycle spaces would be provided at the St. Luke's Replacement Hospital, meeting the minimum requirements of Section 155.4. The Cathedral Hill MOB, St. Luke's MOB/Expansion Building, and Davies Neuroscience Institute would comply with the requirements of Section 155.4 by providing a minimum of 34, 12, and 25 bicycle parking spaces on campus, respectively. Although the 1375 Sutter MOB at the Cathedral Hill Campus and the St. Luke's 1957 Building renovation are not subject to the requirements of Section 155.4, a minimum of 12 and six bicycle spaces, respectively, would be provided for users of these buildings, meeting the minimum requirements of Section 155.4.

- The proposed LRDP would comply with the requirements under Planning Code Section 155.2 for bicycle parking in parking garages by providing 150 bicycle parking spaces in the Cathedral Hill Hospital parking garage (exceeding the City's minimum requirements), 62 bicycle spaces in the Cathedral Hill MOB parking garage (exceeding the minimum requirements),[19] at least nine bicycle spaces within the 1375 Sutter MOB parking garage (meeting the minimum requirements), and at least one bicycle space for every 20 automobile spaces within the St. Luke's MOB/Expansion Building parking garage (meeting the minimum requirements). Although the St. Luke's Replacement Hospital would not include a parking garage, and therefore is not subject to the requirements of Section 155.2, employees, visitors, and patients at the Replacement Hospital would utilize the existing Duncan Street Parking Garage, which would provide at least 11 bicycle spaces and, therefore, would comply with the minimum requirements of Section 155.2.

- The Cathedral Hill MOB and St. Luke's MOB/Expansion Building, which are subject to the City's Green Building Ordinance (San Francisco Building Code Chapter 13C), would comply with the Ordinance's requirements for energy efficiency by being at a minimum 15 percent more energy efficient than either Title 24 or American Society of Heating, Refrigerating, and Air-Conditioning Engineers (ASHRAE) energy efficiency requirements.[20] These buildings would also have their energy systems commissioned, and enhanced commissioning would be completed in accordance with LEED

[19] Specifically, 27 of the total 62 spaces would be counted towards meeting the Planning Code Section 155.2 requirement for minimum number of bicycle parking spaces that should be provided in the proposed parking garage. The other 35 spaces would be counted towards meeting the Planning Code Section 155.4 requirement and would also happen to be located within the proposed parking garage.

[20] At the time Draft EIR was published in July 2010, the Green Building Ordinance required that new buildings subject to the ordinance and achieve an energy efficiency of 14% better than Title 24- 2005 or ASHRAE 90.1-2004. The Green Building Ordinance has since been revised effective in 2011 to require that new buildings subject to its requirements achieve an energy efficiency of, 15% better than Title 24-2008 by the alternative calculation method, or both compliance with Title 24 -2008 and 15% better than ASHRAE 90.1 – 2007 by cost.

EA credit 3. Although the Cathedral Hill Hospital and St. Luke's Replacement Hospital are not subject to the Green Building Ordinance, both buildings would target 14 percent energy efficiency over either Title 24 or ASHRAE 90.1-2004 requirements.

- The Cathedral Hill Hospital, Cathedral Hill MOB, St. Luke's Replacement Hospital, St. Luke's MOB/Expansion Building, and Davies Neurosciences Institute would comply with the City's Stormwater Management Ordinance (SMO). With respect to the Cathedral Hill Hospital, A rainwater storage system in combination with permeable landscaping at the street level and 25 percent of the roof area covered in vegetation together would satisfy the City's SMO requirements. The remaining CPMC LRDP buildings listed above would be served by combined rainwater-sewer systems and would be designed to meet the SMO requirements through implementing measures to decrease the volume of stormwater runoff from the two-year, 24-hour design storm by 25 percent from existing conditions.

- The Cathedral Hill MOB and St. Luke's MOB/Expansion Building, which are subject to the City's Green Building Ordinance, would comply with the Ordinance's requirements for water efficient landscaping by reducing the amount of potable water used by landscaping by 50 percent. This would be accomplished through plant selection and efficient irrigation systems. Although the Cathedral Hill Hospital and St. Luke's Replacement Hospital are not subject to the Green Building Ordinance, both buildings would adhere to the Ordinance's water efficient landscaping requirements through plant selection and a high-efficiency irrigation system to reduce potable water needs for landscaping.

- The Cathedral Hill MOB and St. Luke's MOB/Expansion Building, which are subject to the City's Green Building Ordinance, would comply with the Ordinance's requirements for water use reduction by reducing the amount of potable water used for plumbing fixtures by 20 percent through the use of low-flow plumbing fixtures. Although the Cathedral Hill Hospital is not subject to the Green Building Ordinance, it would adhere to the Ordinance's water use reduction requirements by reducing potable water use for plumbing fixtures through a combination of low-flow plumbing fixtures, high-efficiency medical equipment, high-efficiency kitchen fixtures and dishwashing systems, high-efficiency mechanical equipment, and a high-efficiency irrigation system. Although the St. Luke's Replacement Hospital is not subject to the Green Building Ordinance, it would reduce potable water use for plumbing fixtures through the use of low-flow plumbing fixtures.

- The 1375 Sutter MOB and St. Luke's 1957 Building renovation would comply with the requirements of the City's Commercial Water Conservation Ordinance (San Francisco Building Code Chapter 13A) for existing commercial buildings undergoing tenant improvements.

- The Cathedral Hill MOB and St. Luke's MOB/Expansion Building, which are subject to the City's Green Building Ordinance, would comply with the Ordinance's requirements for solid waste, as these buildings would have provisions for recycling, composting, trash storage, collection, and loading that would be convenient for all building users. Although the Cathedral Hill Hospital, 1375 Sutter MOB, St. Luke's Replacement Hospital, St. Luke's 1957 Building renovation, and Davies Neuroscience Institute are not subject to the Green Building Ordinance, these buildings would adhere to the Ordinance's requirements because they also would have provisions for recycling, composting, trash storage, collection, and loading that would be convenient for all building users.

- All CPMC campuses would comply with the City's Mandatory Recycling and Composting Ordinance (Environment Code, Chapter 19) because recycling and composting systems would be established, which would include staff training, varying container sizes and accessibility consistent with program demand, dedicated compactors for these added waste streams, and pick up contracts with the waste management company to be added adjacent to trash containers and to be located appropriately to allow all persons to manage waste as directed.

- The Cathedral Hill MOB and St. Luke's MOB/Expansion Building, which are subject to the City's Green Building Ordinance, would comply with the Ordinance's requirements for construction and demolition debris recycling, as at least 75 percent of the construction and demolition debris related to these projects would be diverted. Although the Cathedral Hill Hospital and St. Luke's Replacement Hospital are not subject to the Green Building Ordinance, both buildings would adhere to the Ordinance's construction and demolition debris recycling requirements by requiring construction and demolition recycling and targeting a 75 percent diversion rate.

- The Cathedral Hill Hospital, Cathedral Hill MOB, and the St. Luke's MOB/Expansion Building (i.e., the near-term projects that would require demolition of existing structures) would comply with the requirement under the City's Construction and Demolition Debris Recovery Ordinance (San Francisco Environment Code, Chapter 14) to submit a waste diversion plan to the Director of the Environment which provides for a minimum of 65 percent diversion from landfill of construction and demolition debris, including materials source separated for reuse or recycling. The Cathedral Hill Hospital would require construction and demolition debris recycling, and is targeting a 75 percent diversion rate and would at least meet the minimum 65 percent diversion rate. CPMC would submit Demolition Debris Recovery Plans (DDRPs) for the Cathedral Hill MOB, and St. Luke's MOB/Expansion Building to the San Francisco Department of the Environment that would provide for a minimum of 75 percent diversion from landfill of construction and demolition debris.

- The Cathedral Hill Hospital, Cathedral Hill MOB, St. Luke's Replacement Hospital, St. Luke's MOB/Expansion Building, and Davies Neurosciences Institute would comply with the City's street tree planting requirements for new construction under Planning Code Section 428.

- All CPMC campuses would comply with the requirements for regulation of diesel backup generators under San Francisco Health Code, Article 30, because all diesel-fueled emergency generators would meet federal, state, and local emissions standards in effect at the time the generators are installed. Prior to installation, all diesel-fueled emergency generators would receive approval from BAAQMD and would submit an application to the San Francisco Department of Public Health in accordance with San Francisco Health Code, Article 30. All diesel-fueled emergency generators would be operated in accordance with requirements of their respective Bay Area Air Quality Management District Permits to Operate and San Francisco Department of Public Health Certificates.

Based on the CPMC LRDP GHG Compliance Checklist, on December 14, 2010, MEA determined that the proposed CPMC LRDP would be in compliance with the City's GHG Reduction Strategy (see CPMC LRDP GHG Compliance Checklist included as C&R Appendix D).[21] Because it has been determined to be consistent with the BAAQMD-approved GHG Reduction Strategy, the proposed LRDP has been shown to satisfy BAAQMD's mitigation guidance and to have identified all applicable, feasible mitigation measures.

With a determination of compliance with San Francisco's Qualified GHG Reduction Strategy, the LRDP would comply with regulations or requirements adopted to implement both a regional (BAAQMD) and local (City and County of San Francisco) plan for the reduction or mitigation of GHG emissions. Therefore, the impact of the proposed project on greenhouse gas emissions would support a finding of less than significant, and no further mitigation would be required. However, the Planning Department has determined that because the significance conclusion in the Draft EIR was made prior to a determination of equivalency with a qualified GHG reduction strategy, and the LRDP would exceed the 2010 BAAQMD GHG quantitative threshold of significance (as determined in the Draft EIR and which the Planning Department determined would be the appropriate 2010 BAAQMD GHG threshold at the time of publication of the Draft EIR), the proposed LRDP should conservatively be considered to result in a

[21] San Francisco Planning Department. 2010 (December 14). California Pacific Medical Center Long Range Development Plan Greenhouse Gas Compliance Checklist Approval by Jessica Range, Environmental Planner.

significant and unavoidable impact, despite the determination that the proposed LRDP would be consistent with the BAAQMD-approved GHG Reduction Strategy. Therefore, the Draft EIR is adequate with respect to the analysis and significance determination related to greenhouse gas emissions impacts. Nevertheless, because of the proposed LRDP's compliance with the San Francisco qualified GHG Reduction Strategy, no additional mitigation is required.

A lead agency has the obligation to require that a proposed project reduce GHG emissions to a less-than-significant level, if feasible, as determined by the lead agency. In this case, the proposed LRDP has incorporated all feasible mitigation measures and is consistent with the City's BAAQMD-approved GHG Reduction Strategy, and therefore has been shown to satisfy BAAQMD's mitigation guidance. Furthermore, since the greenhouse gas emissions impact under Impact GH-3 (see Draft EIR pages 4.8-31 and 4.8-32) is conservatively considered to be significant and unavoidable despite implementation of all feasible GHG reduction measures, the comment is correct that a statement of overriding considerations would be necessary with respect to greenhouse gas emissions impact for the proposed project.

Based on the discussion above and on MEA's approval of the CPMC LRDP GHG Compliance Checklist, Impact GH-3, Draft EIR pages 4.8-31 through 4.8-32, is revised to read as follows:

> *IMPACT GH-3 Direct and indirect CPMC LRDP–generated GHG emissions would have a significant impact on the environment or conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing GHG emissions (~~Recently adopted~~2010 BAAQMD Guidelines). (Significance Criteria 8a and 8b)"*
>
> *Levels of significance:*
>
> - *Cathedral Hill: Significant and unavoidable*
> - *Pacific: Significant and unavoidable*
> - *Davies (near term and long term): Significant and unavoidable*
> - *St. Luke's: Significant and unavoidable*
>
> **Near-Term Projects and Long-Term Projects**
>
> **All Campuses Except California Campus**
>
> As described previously, the proposed LRDP would be required to comply with San Francisco's GHG Reduction Strategy, which would reduce operational GHG emissions. Given that the City's GHG Reduction Strategy adopts numerous GHG reduction strategies recommended in the *Climate Change Scoping Plan*; that it includes binding, enforceable measures to be applied to development projects; and that the strategy has produced measurable reductions in GHG emissions, the proposed LRDP would be consistent with state and local GHG reduction strategies. In addition, the proposed LRDP would not conflict with any plans, policies, or regulations adopted for the purpose of reducing GHG emissions.
>
> The BAAQMD has identified the following three alternative thresholds for determining whether a project's GHG emissions are significant:
>
> 1) Compliance with a Qualified Greenhouse Gas Reduction Strategy; or
> 2) Whether a project's GHG emissions exceed 1,100 metric tons of carbon dioxide equivalents ($MTCO_2e$); or
> 3) Whether a project's GHG emissions exceed 4.6 $MTCO_2e$ per service population.

A lead agency may choose the threshold against which to analyze a project in order to determine the significance of a project's GHG emission impacts; however, BAAQMD encourages lead agencies to prepare a Qualified GHG Reduction Strategy and then to use Threshold #1, above, as the standard of significance for GHG emissions.[43] Thus, on August 12, 2010, the San Francisco Planning Department submitted a draft of the *City and County of San Francisco's Strategies to Address Greenhouse Gas Emissions* to BAAQMD. This document presents a comprehensive assessment of policies, programs, and ordinances that collectively represent San Francisco's Qualified GHG Reduction Strategy. The BAAQMD reviewed San Francisco's GHG reduction strategy and concluded that the strategy meets the criteria for a Qualified GHG Reduction Strategy as outlined in BAAQMD's 2010 CEQA Guidelines.[44] Therefore, projects that are determined to be consistent with San Francisco's GHG reduction strategy would result in a less-than-significant GHG emissions impact.

As shown in Table 4.8-2, the proposed LRDP's net operational GHG emissions would be approximately 22,503 $MTCO_2e$/yr, which exceeds BAAQMD's recently adopted second alternative GHG emissions threshold of 1,100 $MTCO_2e$/yr. In addition, a net increase in SP of nearly 3,819 full-time or full-time equivalent employees (i.e., the average number of employees and volunteers on a given work day) would result in a GHG-efficiency value of 5.9 $MTCO_2e$/SP/yr. Therefore, the proposed LRDP would exceed BAAQMD's recently adopted third alternative GHG emissions threshold of 4.6 $MTCO_2e$/SP/yr for project-level analysis.

As noted in this section, several sustainability attributes that would serve to reduce GHGs were not accounted for in the calculation of operational GHG emissions, because of the unavailability of sufficient methodologies to accurately account for associated GHG emission reductions. In order to facilitate a determination of project compliance with San Francisco's GHG reduction strategy, in November 2010 the San Francisco Planning Department Environmental Planning division released a Greenhouse Gas Analysis Compliance Checklist that is required to be completed for each proposed project. Thus, a checklist breaking down LRDP compliance by building for near-term projects has been completed. Based on the CPMC LRDP GHG Compliance Checklist, on December 14, 2010 Environmental Planning determined that the proposed CPMC LRDP would be in compliance with the City's Qualified GHG Reduction Strategy (see CPMC LRDP GHG Compliance Checklist included as C&R Appendix D).[45] Because it has been determined to be consistent with the BAAQMD-approved GHG Reduction Strategy, the proposed LRDP has been shown to satisfy BAAQMD's mitigation guidance and to have identified all applicable, feasible mitigation measures. ~~The proposed LRDP would be above BAAQMD's recently adopted GHG efficiency criterion of 4.6 $MTCO_2e$/SP/yr for project-level analysis.~~ However, the Planning Department has determined that because the significance conclusion in the CPMC LRDP Draft EIR regarding operational greenhouse gas emissions was made prior to a determination of equivalency with a qualified GHG reduction strategy, and the LRDP would exceed the 2010 BAAQMD GHG quantitative threshold of significance (which the Planning Department determined applied at that time), the proposed LRDP would conservatively be considered to result in a significant and unavoidable impact.

~~Although this proposed LRDP exceeds the efficiency metric of 4.6 $MTCO_2e$/SP/yr, additional factors were considered. First, it was not clear whether the BAAQMD efficiency metric applies to facilities such as hotels and hospitals, whose large numbers of visitors are not included in the service population (which includes employees and residents only). Second, as noted in this section, several sustainability attributes would serve to reduce GHGs that were not accounted for because of the unavailability of sufficient methodologies to accurately account associated GHG emission reductions.~~

~~It is not likely that additional increases in the energy savings and sustainability goals would be able to reduce emissions below BAAQMD's significance criteria. Accordingly,~~ **~~this impact would remain significant and unavoidable, based on BAAQMD's recently adopted GHG thresholds.~~**

Comment

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-144 GH, duplicate comment was provided in 30-144 GH]

"81. This 'Greenhouse Gas Emissions (GHG)' section also goes on to state on Page 4.8-32 that 'several sustainability attributes would serve to reduce GHGs that were not accounted for because of the unavailability of sufficient methodologies to accurately account associated GHG emission reductions' such as those on Page 4.8-16 and on Page 4.8-47 as the following:

- the proportion of total water consumption attributed to irrigation was not available to quantify the reduction in GHG emissions
- the green roof would increase the site's carbon sequestration capacity relative to current conditions...insufficient data are available to quantify this
- the volume of cooling tower water requiring treatment was not available to quantify the GHG impacts of this feature

In addition, the DEIR states that allowances for the reduction of 'embodied energy' by diverting 'at least 75 percent (and up to 90 percent) of construction debris from the site of the proposed Cathedral Hill Hospital....the associated GHG reductions were not deducted from the development's operational emissions inventory.' Finally, the DEIR mentions that due to the 'reduction in use of steel building materials by 25 percent' and it not being 'deducted from the development's operational emission inventory,' that the total GHG emissions for the CPMC campuses could not be calculated. Then the DEIR is not adequate and cannot be adopted."

Response GH-2

The comment refers to a lack of quantification of certain GHG reduction measures, and suggests that, as a result, *total* GHG emissions were not quantified. The CPMC LRDP Draft EIR included a quantification of the total GHG emissions from both the construction and operational phases of the proposed LRDP (see Tables 4.8-1 and 4.8-2 on pages 4.8-18 and 4.8-19 of the Draft EIR). However, as explained on pages 4.8-16, 4.8-17, and 4.8-32 of the Draft EIR, there are no reliable methodologies available to account for the additional GHG reductions that would be achieved by many of the LRDP design features. Specifically, as stated on page 4.8-17 of the Draft EIR, the associated GHG reductions of some project design features were not deducted from the development's operational emissions inventory, because the features would reduce embodied energy and not direct emissions from the proposed LRDP development or because

insufficient data was available for quantification purposes. Because certain reductions are not subtracted in the GHG emission calculations, the estimate can be considered conservative (i.e., an overestimate). If reliable methodologies existed, quantification of the additional LRDP GHG emission reductions that could be achieved through incorporation of the design features listed on pages 4.8-16, 4.8-17, and 4.8-20 of the Draft EIR would refine the GHG estimate, but it is not necessary for the purposes of the conservative estimate of total GHG emissions provided in the Draft EIR. Therefore, the Draft EIR analysis and significance determination related to greenhouse gas emissions impacts are adequate, and no further quantitative analyses of the emissions reductions that would be achieved through implementation of the proposed project design features need to be conducted.

3.10.1.2 GHG OPERATIONAL EMISSIONS INVENTORY

Comment

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-141 GH, duplicate comment was provided in 30-141 GH]

"78. As a general comment, in relation to the generators spoken of on Page 4.7-50 in Table 4.7-11, what are the greenhouse gas emissions produced by the new generators? What type of diesel fuel will be used?"

Response GH-3

This comment inquires about the type of diesel fuel and quantity of GHG emissions associated with the emergency generators at various CPMC campuses under the LRDP. The fuel used for the LRDP-related emergency diesel generators would comply with the applicable fuel requirements specified in regulations and/or operating permits issued by California Air Resources Board (ARB) and BAAQMD. As shown in the calculation below, the estimated GHG emissions associated with emergency diesel generators are well below the 10,000 metric tonne/year threshold for stationary sources, and represent less than 1 percent of the total operational GHG inventory for the proposed LRDP. Note, however, that the emissions from the LRDP-related generators are not included in the operational inventory in the DEIR because they are subject to the separate 10,000 metric tonne/year GHG emissions threshold for stationary sources, per BAAQMD CEQA guidance.

The CO_2 emission factor for diesel generator sets from ARB's OFFROAD database is 568.3 g/hp-hr. Using this emission factor and equipment details presented in the memo entitled "CPMC Stationary Source Emissions and Health Risk Analysis (July 2, 2010)" (which is available on public file), the net CO_2 emissions from the LRDP-related emergency diesel generators would be 207 metric tons/year. This is less than 1 percent of the total emission inventory for the LRDP and well below the 10,000 metric ton/year threshold for stationary sources.

Comment

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-145 GH, duplicate comment was provided in 30-145 GH]

"82. It is surprising that a hospital does not know how much water is used in irrigation at its campuses. A green roof engineer should be able to provide the water and carbon sequestration data for current conditions. The cooling tower water volume could be calculated by a water treatment specialist who knows cooling tower loops. The chemicals used to treat the water can be estimated fairly accurately knowing the volume of the closed loop cooling system water. This should be a foreseeable impact that can be calculated. Perhaps a thorough analysis of the above missing data categories for this GHG emissions section was not done because the outcome would still be that the GHG threshold level will far exceed the BAAQMD's guidelines. If not, there should be an analysis done as an addendum to this DEIR or it is inadequate and cannot be adopted."

Response GH-4

The comment suggests that a thorough analysis of GHG emissions with respect to the cooling water system was omitted from the Draft EIR because the GHG threshold level "will far exceed BAAQMD guidelines." Please see Response GH-1 (page C&R 3.10-3) for a discussion of the significance of greenhouse gas emissions from the proposed LRDP. As shown in Table 4.8-2 on pages 4.8-19 through 4.8-20 of the Draft EIR and discussed under Impact GH-1 on pages 4.8-25 to 4.8-26 of the Draft EIR, total water usage—including water used for irrigation of landscaping—was accounted for in the water energy estimate used for the GHG inventory. The eventual end-use of the water is not relevant for purposes of determining significance of potential GHG impacts under CEQA. Furthermore, the comment states that the cooling tower water volume could be calculated by a water treatment specialist. Since publication of the Draft EIR, the diversion of cooling tower blowdown water from the municipal wastewater stream for reuse on site is no longer an LRDP design feature for the proposed Cathedral Hill Hospital and MOB as part of the proposed CPMC LRDP. This design feature was not incorporated into the impact analysis and therefore would not affect GHG emission savings. The text in the Draft EIR, page 4.8-17, fourth bullet point has been deleted to clarify that diversion of cooling tower water from wastewater treatment is not among the proposed LRDP design features that could yield further GHG emission savings as part of the CPMC LRDP, as follows:

- ~~*Diversion of cooling tower water from wastewater treatment:* The efficient design of the Cathedral Hill Hospital's cooling tower system would prevent approximately 98% of total cooling tower water from requiring wastewater treatment. The volume of cooling tower water requiring treatment was not available to quantify the GHG impacts of this feature.~~

3.10.1.3 LEED MEASURES VERSUS CEQA MITIGATION

Comment

(Gloria Smith—California Nurses Association, October 19, 2010) [91-41 GH]

"For greenhouse gas emissions, the Draft EIR appears to be under the mistaken assumption that the Project's compliance with the City's Green Building Ordinance requirement for certification under the Leadership in Energy and Environmental Design ('LEED') Green Building Rating System developed by the U.S. Green Building Council ('USGBC') would suffice to satisfy CEQA mitigation measures. This assumption is unsupported for the following reasons:

a) The City's Green Building Ordinance requires the Cathedral Hill MOB and the St. Luke's MOB/Expansion Building, as well as the buildings proposed to be constructed in the long term at the Pacific and Davies Campuses, to obtain a level 'Silver' certification;[41] 'Gold' and 'Platinum' LEED certification, which are also available, are not pursued by CPMC.

b) The Draft EIR states that although the proposed Cathedral Hill Hospital and St. Luke's Replacement Hospital would not be subject to the City's Green Building Ordinance, CPMC intends to attain LEED certification for these buildings;[42] yet the Draft EIR fails include this intention as an enforceable mitigation measure and fails to specify to which LEED level (Certified, Silver, Gold, Platinum) these buildings would be certified.

c) LEED certification (at any level) does not guarantee that energy use and emissions of criteria pollutants and greenhouse gases associated with buildings would be reduced to the maximum extent feasible as required under CEQA to reduce the Project's significant impacts on air quality and global climate change. (*See* Comments VI.A and VI.B.)

d) Other mitigation measures that would reduce the Project's criteria pollutant and greenhouse gas emissions are available that are not addressed by LEED certification. (*See* Comment VI.C.)

[41] Draft EIR, page 4.8-22.
[42] Ibid."

Response GH-5

The comment states that the "Draft EIR appears to be under the mistaken assumption that the Project's compliance with the City's Green Building Ordinance requirement for [LEED] certification . . . would suffice to satisfy CEQA mitigation measures." The comment is correct that the Draft EIR considers the fact that the Cathedral Hill MOB and the St. Luke's MOB/Expansion Building (and all new buildings constructed as long-term projects at the Davies and Pacific Campuses) would be subject to the Green Building Ordinance requirement for LEED® Silver certification as one of the feasible means for reducing the project's GHG emissions. However, compliance with the Green Building Ordinance is only one of many project design features and City-imposed requirements that would reduce the project's GHG emissions. In addition to mandatory compliance with LEED® Silver requirements for the two MOBs identified above, CPMC is also voluntarily seeking, at a minimum, LEED® Certified status for the Cathedral Hill Hospital and St. Luke's Replacement Hospital. The Draft EIR outlines several programs, initiatives, and proposed design features that could reduce GHG emissions, as set forth on pages 4.8-16 through 4.8-20 of the Draft EIR. Please also see Response ME-2 on pages C&R 3.19-5 to 3.19-9 for additional information regarding energy efficiency measures and other potentially GHG emission-reducing design features that have been incorporated into the proposed LRDP.

Furthermore, the project is subject to many City requirements to reduce GHG emissions that are not specifically described in the Draft EIR, but which are set forth in the Greenhouse Gas Analysis Compliance Checklist breaking down LRDP compliance by building for near-term projects and by campus for long-term projects that was completed by CPMC and submitted to Environmental Planning subsequent to the publication of the Draft EIR. Based on the CPMC LRDP GHG Compliance Checklist, Environmental Planning determined on December 14, 2010, that the proposed CPMC LRDP would be in compliance with the City's GHG Reduction Strategy (see CPMC LRDP GHG Compliance Checklist included as C&R Appendix D).[22] Because it has been determined to be consistent with the BAAQMD-approved GHG Reduction Strategy, the proposed LRDP has been demonstrated to satisfy BAAQMD's mitigation guidance and to have identified all applicable, feasible mitigation measures.

It should be noted that sufficient methodologies to quantify the reductions that could be achieved through implementation of many of the identified design features are not available. Therefore, the Draft EIR conservatively did not account for the GHG emissions reduction due to such project features in the inventory of GHG emissions under the proposed LRDP. For the same reason, these features were not assumed to fully mitigate the LRDP's operational impacts related to GHG emissions that, as explained on Draft EIR pages 4.8-31 and 4.8-32, were considered to be significant and unavoidable under the quantitative thresholds set forth in the 2010 BAAQMD Guidelines.

LEED® certification, in and of itself, is not necessarily intended to meet the CEQA requirement of reducing emissions of greenhouse gases and criteria pollutants associated with building energy use to a less-than-significant level. As explained above, a range of LEED® requirements, project design features, and City requirements would be implemented in order to reduce GHG emissions impacts to the extent feasible. However, LEED® certification is intended to reduce the amount of energy consumed and to use more benign forms of energy, which is one means of reducing GHG emissions. If a project, such as the CPMC LRDP, commits to construct buildings to achieve LEED® certification, then the minimum

[22] San Francisco Planning Department. 2010 (December 14). California Pacific Medical Center Long Range Development Plan Greenhouse Gas Compliance Checklist Approval by Jessica Range, Environmental Planner.

requirements to achieve LEED® certification can be assumed as part of project implementation and can affect the level of significance a CEQA document identifies in terms of impacts related to energy, GHG emissions, criteria pollutant emissions, transportation, water, and solid waste.

As identified on page 4.8-22 of the Draft EIR, CPMC buildings that are subject to the San Francisco Green Building Ordinance, such as the medical office buildings (MOBs) at Cathedral Hill and St. Luke's Campuses, would be built to LEED® Silver certification requirements and, thus, would meet the LEED® Energy and Atmosphere prerequisites related to fundamental commissioning of the building energy systems, minimum energy performance, and fundamental refrigerant management, as well as LEED® Energy and Atmosphere Credit 3 related to enhanced commissioning.

In addition, CPMC has confirmed that the proposed hospitals at Cathedral Hill and St. Luke's Campuses, which are not subject to the San Francisco Green Building Ordinance, would be constructed to LEED® Certified requirements. Thus, these hospital buildings would meet the LEED® Energy and Atmosphere prerequisites related to fundamental commissioning of the building energy systems, minimum energy performance, and fundamental refrigerant management. Please also see Response GH-1 on page C&R 3.10-3, which includes the CPMC LRDP GHG Compliance Checklist that shows which CPMC buildings are subject to the Green Building Ordinance and/or LEED® certification requirements, with respect to energy efficiency.

Under CEQA the goal of mitigation measures for greenhouse gas emissions is to reduce potentially significant adverse GHG impacts to less-than-significant levels. Please see Response GH-1 on page C&R 3.10-3 for a discussion of the significance of greenhouse gas emissions from the proposed CPMC LRDP. As is explained in that response, with a determination of compliance with San Francisco's Qualified GHG Reduction Strategy, the LRDP would not conflict with the applicable plan adopted for the purpose of reducing GHG emissions. Because it has been determined to be consistent with the BAAQMD-approved GHG Reduction Strategy, the proposed LRDP has been demonstrated to satisfy BAAQMD's mitigation guidance and to have identified all applicable, feasible mitigation measures, and no additional mitigation is required. However, the Planning Department has determined that, because the significance conclusion in the Draft EIR was made prior to a determination of equivalency with a qualified GHG reduction strategy and the LRDP would exceed the 2010 BAAQMD GHG quantitative threshold of significance (as determined in the Draft EIR and which the Planning Department determined applied), the proposed LRDP should conservatively be considered to have a significant and unavoidable impact, despite the determination that the proposed LRDP would be consistent with the BAAQMD-approved GHG Reduction Strategy.

Comment

(Gloria Smith—California Nurses Association, October 19, 2010) [91-43 GH]

"**VI.A LEED Certification Alone Fails to Limit Energy Use from Buildings to the Extent Feasible**

Because buildings consume almost half the energy used in the U.S. annually, it is imperative to reduce their energy use and associated emissions of both greenhouse gases and criteria pollutants to the extent feasible. (*See* Figure 2.)

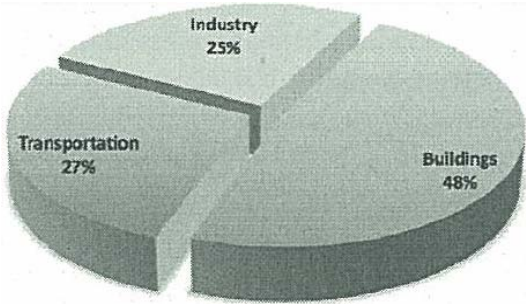

Figure 2: U.S. energy use by sector
From: architecture30.org"

Response GH-6

The comment provides the statistic that buildings consume nearly half of the annual energy used in the U.S., and provides a figure from "architecture30.org" to support this statement. Buildings consume approximately 37 percent of the energy produced in the U.S. annually, according to the U.S. Department of Energy, and not the 48 percent stated in the comment. Specifically, residential buildings account for 20 percent of all U.S. energy use and commercial buildings account for 17 percent of all U.S. energy use. With respect to GHG emissions, building energy use within the City and County of San Francisco accounts for 45 percent of energy use.[23] See Response GH-8 (page C&R 3.10-22) for a discussion regarding how hospitals are generally more intensive in terms of energy use than most other types of buildings.

CEQA requires the identification of any feasible mitigation measures that could reduce any adverse energy impacts identified in an EIR as potentially significant to a less-than-significant level. On pages 4.17-7 to 4.17-9 of the Draft EIR, Impact ME-2 determined that energy use associated with LRDP implementation would be a less-than-significant impact. This is due to an improvement of overall energy efficiency at the CPMC campuses, with the decommissioning, demolition, and replacement of older, energy intensive on-campus buildings as well as implementation of the minimum prerequirements for the Energy and Atmosphere LEED® category listed above on page C&R 3.10-18 and described in detail under Impact ME-2 (see pages 4.17-7 and 4.17-9 of the Draft EIR). Because it has been determined that the LRDP would result in less-than-significant energy impacts, no energy specific mitigation is required. See Response GH-5 for a discussion regarding why no additional GHG emissions-specific mitigation is required.

3.10.1.4 ADDITIONAL MITIGATION REQUESTED FOR OPERATIONAL EMISSIONS

Comments

(Gloria Smith—California Nurses Association, October 19, 2010) [91-50 GH]

"**VI.C Additional Mitigation Measures Are Feasible and Must Be Required to Reduce the Project's Significant Operational Emissions to the Extent Feasible**

Contrary to the Draft EIR's assumption, there are many opportunities available for meaningful mitigation of the Project's greenhouse gas and air quality impacts, including off-site mitigation measures:

[23] San Francisco Department of Environment. 2011. San Francisco Energy Information. Available at: http://www.sfenergywatch.org/energy.html. Accessed on March 14, 2011.

- **Energy Audits and Retrofits at Existing CPMC Buildings:** Mitigation could include offsetting the Project's greenhouse gas emissions through a comprehensive audit of existing buildings owned by CPMC and processes to identify and implement energy saving measures, including improving the efficiency of existing equipment so that it uses less electricity or burns less fuel. As an example, in September 2007, the California Attorney General's office came to an agreement with ConocoPhillips, by which ConocoPhillips agreed to mitigate greenhouse gas emissions for a planned hydrogen facility by, among other measures, undertaking an energy efficiency audit and carbon emissions audit for all of its California facilities.[57]

[57] ConocoPhillips and California Attorney General Settlement Agreement, September 10, 2007; http://ag.ca.gov/globalwarming/pdf/ConocoPhillips_Agreement.pdf, accessed September 17, 2010."

(Gloria Smith—California Nurses Association, October 19, 2010) [91-51 GH]

"**Community Energy Efficiency Building Retrofits**: Mitigation could include funding programs that provide for energy efficiency retrofits of existing buildings and housings in the City, with a particular focus on rental and low-income housing. As one example, the Chula Vista Energy Upgrade Project included $210,000 worth of mitigation funds 'for energy efficiency and related improvements to local homes and business,…intended to directly benefit the residents potentially most affected by the proposed project.'[58] These upgrades could include installation of a heat-reflecting 'cool roof' and heat-reducing window awnings, high-efficiency air conditioning systems with programmable thermostats, and energy-saving fluorescent lighting fixtures that feature daylight and occupancy sensors.

[58] California Energy Commission, Docket No. 07-AFC-4, Chula Vista Energy Upgrade Project, Final Staff Assessment, Addendum, p. 3, September 30, 2008; http://www.energy.ca.gov/sitingcases/chulavista/documents/2008-09-29-FINAL-STAFF_ASSESSMENT_ADDENDUM_TN-48266.PDF, accessed September 17, 2010."

(Gloria Smith—California Nurses Association, October 19, 2010) [91-52 GH]

"**Funding of Carbon Offset Programs**: Mitigation could include providing funds to the BAAQMD, Audubon Society, California Wildlife ReLeaf, or other organizations to fund carbon reduction or sequestration projects. For example, the 2007 ConocoPhillips settlement included an agreement to mitigate and offset greenhouse gas emissions by providing (1) $7 million to the BAAQMD to create a fund for carbon offsets, (2) $200,000 to the Audubon Society for restoration of wetlands in the San Pablo Bay for purposes of carbon sequestration, and (3) $2.8 million to California Wildlife ReLeaf for reforestation projects, estimated to sequester 1.5 million metric tons of CO_2 over the lifetime of the forest.

These measures are just a few examples that could serve as inspiration for feasible mitigation measures to reduce the Project's significant greenhouse gas and criteria air pollutant emissions."

Response GH-7

The comments suggest that there are additional opportunities that have not been explored with respect to mitigation for proposed CPMC LRDP GHG and air quality impacts. The Draft EIR outlines several programs, initiatives, and proposed design features (see Draft EIR pages 4.8-16 to 4.8-20), including LEED® certification, which could reduce GHG emissions. However, sufficient methodologies to quantify the reductions that could be achieved through implementation of many of the identified design features are not available. Therefore, as explained in Response GH-2 on page C&R 3.10-13, the Draft EIR conservatively did not account for those project features in the inventory of GHG emissions under the proposed LRDP. For the same reason, these features were not assumed to fully mitigate the LRDP's operational impacts related to GHG emissions which, as explained on Draft EIR pages 4.8-31 and 4.8-32, would be considered to be significant and unavoidable under the quantitative thresholds set forth in the 2010 BAAQMD Guidelines. In addition, as explained in the CPMC LRDP GHG Compliance Checklist (see C&R Appendix D), the proposed new hospitals at Cathedral Hill and St. Luke's would meet LEED® Certified requirements and the new Cathedral Hill MOB and St. Luke's MOB/Expansion Building would

meet LEED® Silver certification standards and 2) LEED® Energy and Atmosphere Prerequisite 1 and Credit 3 require, among other tasks, developing and implementing a commissioning plan and verifying the installation and performance of commissioned energy systems.[24] The Cathedral Hill Hospital and St. Luke's Replacement Hospital would be built, at a minimum, to LEED®-certified requirements, and the proposed Cathedral Hill MOB and St. Luke's MOB/Expansion Building would be built to LEED® Silver certification requirements. As such, all four of these buildings would meet LEED® Energy and Atmosphere Prerequisites 1 through 3 related to fundamental commissioning of the building energy systems, minimum energy performance, and fundamental refrigerant management. The Cathedral Hill MOB and St. Luke's MOB/Expansion Building would also meet LEED® Energy and Atmosphere Credit 3 related to enhanced commissioning, in addition to other additional credits necessary to attain LEED® Silver status.

Also, as stated on Draft EIR pages 4.17-7 and 4.17-8, to obtain LEED® certification pertaining to energy, the proposed hospitals and medical office buildings would: (1) conduct fundamental commissioning of building energy systems to verify that the project's energy related systems are installed, calibrated, and performing according to the owner's project requirements, basis of design, and construction documents; (2) demonstrate 10 percent improvement in the proposed building performance rating for new buildings compared with the baseline building performance rating; and (3) use no chlorofluorocarbon-based refrigerants in new based building, ventilating, air conditioning, or refrigeration systems.

Please also see Response ME-2 on pages C&R 3.19-5 to 3.19-9 and Response GH-1 on page C&R 3.10-3 for additional information regarding energy efficiency measures and other potentially GHG emission-reducing design features that have been incorporated into the proposed LRDP.

Comment 91-51, above, suggested that mitigation could include a comprehensive audit of existing buildings owned by CPMC and processes to identify and implement energy saving measures. CPMC has already undertaken such an effort. CPMC partnered with PG&E in late 2007, launching a comprehensive energy audit of its existing buildings at all four existing campuses (California, Davies, Pacific, and St. Luke's). This audit informed the development of CPMC's California Pacific Medical Center Environmental Impact Reduction Plan.[25]

Energy savings measures completed to date include:

Lighting Upgrades, New Lamps/Ballasts, and Motion Detectors

- California Campus – 3698 California Street, 3700 California Street, 3905 Sacramento Street, 3838 California Street and 460 Cherry Street Garage
- Pacific Campus – 2333 Buchanan Street, 2351 Clay Street, 2340-2360 Clay Street, 2300 California Street, 2323 Sacramento Street, 2395 Sacramento Street and Clay/Webster Street Garage
- Davies Campus – North Tower, South Tower and 45 Castro Street
- St. Luke's Campus – 3555 Cesar Chavez Street, 1912 Building and 1957 Building and Monteagle Medical Center
- Reduction of 31 billion BTUs/year or 6.5 million pounds of CO_2 not released into the atmosphere

[24] U.S. Green Building Council. 2007. LEED New Construction & Major Renovation Version 2.2 Reference Guide, third edition.
[25] Alternative Energy Systems Consulting, Inc. 2010 (October 13). *Integrated Energy Audit: California Pacific Medical Center, 2333 Buchanan St. San Francisco, CA 94115.* Prepared for Customer Energy Efficiency, Pacific Gas and Electric Company.

Insulation for Piping, Steam, and Hot Water Lines

- California Campus – 3698 California Street and 3700 California Street
- Pacific Campus – 2351 Clay Street
- Davies Campus – North Tower
- St. Luke's Campus – 3555 Cesar Chavez Street
- Reduction of 18.7 billion BTUs/year achieved or 2.1 million pounds of CO_2 not released into the atmosphere

Energy savings measures that have been identified through the audit process and that CPMC plans to implement in the future include a building controls upgrade at the Pacific Campus facilities for monitoring and optimizing energy use, and a retrofit of chillers at the Pacific Campus to improve their efficiency. Additionally, CPMC recently completed an air compressor project at the Pacific Campus that is anticipated to save an estimated 1.3 million gallons of water annually.

Furthermore, Environmental Planning approved the CPMC LRDP GHG Compliance Checklist on December 14, 2010 and determined that the proposed LRDP meets the intent of the San Francisco GHG Reduction Plan through project design features and compliance with applicable City requirements. Because it has been determined to be consistent with the BAAQMD-approved GHG Reduction Strategy, the proposed LRDP has been shown to satisfy BAAQMD's mitigation guidance and to have identified all applicable, feasible mitigation measures. According to the BAAQMD, compliance with a Qualified Greenhouse Gas Reduction Strategy (or similar adopted policies, ordinances and programs) would provide the evidentiary basis for making CEQA findings that development consistent with the plan would result in feasible, measureable, and verifiable GHG reductions consistent with broad state goals such that projects approved under qualified Greenhouse Gas Reduction Strategies or equivalent demonstrations would achieve their fair share of GHG emission reductions.[26] Therefore, no additional mitigation is required for the LRDP, such as conducting energy audits, funding programs that provide for energy efficiency retrofits of existing buildings and housings in the City, and funding carbon off-set programs. Please see Response GH-1 on page C&R 3.10-3 for a discussion of the significance of greenhouse gas emissions from the proposed LRDP.

Comment

(Jean Roggenkamp—Bay Area Air Quality Management District, October 19, 2010) [109-5 GH, duplicate comment was provided in 112-5 GH]

"Impact GH-3

District staff understands that the Project will comply with the City's measures to help reach climate projection goals, including the Transit First Policy, Sustainability Plan, Climate Action Plan and Green Building Ordinance. We also support CPMC's additional commitments to energy efficiency, reduced water consumption, green roofs, construction waste recycling, and reduction in use of steel building materials.

The Project's GHG's emissions are reported at 5.9 metric tons of CO2-e per service person per year (MTCO2e/SP/yr). This is above the threshold of 4.6 MTCO2e/SP/yr established by the BAAQMD's 2010 CEQA Guidelines and therefore the DEIR finds that Impact GH-3 is significant. District staff considers additional

[26] Bay Area Air Quality Management District. 2010 (May). *California Environmental Quality Act Draft Air Quality Guidelines*, Appendix D: Threshold of Significance Justification, p. D-14. Available at: http://www.baaqmd.gov/~/media/Files/Planning%20and%20Research/CEQA/Draft_BAAQMD_CEQA_Guidelines_June_2010_Final.ashx.

measures to be feasible and recommends that the following measures be required as a condition of Project approval:

- Adjusting parking prices to further discourage vehicle trips to the Project.
- Providing an alternative-fueled shuttle service with the cleanest technology available for employees traveling between the campuses and transit centers.
- Adding on-site renewable energy sources, such as wind turbines or solar panels, and committing to powering a specific percentage of the Project with this renewable energy source.
- Meeting LEED for Healthcare green building standards.
- Instead of increasing energy efficiency 14 percent beyond Title 24 as stated in the DEIR, committing to a percentage reduction greater that 14 percent beyond Title 24.
- Electrifying loading docks and prohibiting idling of all trucks.

In addition to the specific measures above, the City could establish an offsite mitigation program to fund emission reductions projects if on-site construction and/or operation emission reduction cannot lower emissions to the less-than-significant level.

District staff is available to assist the City in addressing these comments. If you have any questions, please contact Alison Kirk, Senior Environmental Planner, at (415) 749-5169."

Response GH-8

The comment recommends additional measures that BAAQMD considers feasible. Some of these measures are already proposed as components of the LRDP. For example, the comment suggests parking price adjustment to further discourage vehicle trips. As explained on page 5-14 of the Draft EIR, a performance-based parking fee structure to discourage single-occupant vehicle usage would be included as part of the enhanced Transportation Demand Management (TDM) Plan under the proposed LRDP. In addition, as part of its enhanced TDM Plan, CPMC is committing to develop a 10-year plan to replace its existing shuttle fleet with Green Vehicles.[27] See Response TR-23 (page C&R 3.7-45) for further discussion regarding the proposed LRDP TDM Plan.

As stated on page 4.8-16 of the Draft EIR, under the heading entitled "Project Design Features Whose Emissions Reductions Were Incorporated into the Analysis," CPMC has committed to 14 percent greater efficiency than either Title 24 or ASHRAE 90.1-2004 energy efficiency requirements for energy uses at the proposed Cathedral Hill Hospital and St. Luke's Replacement Hospital. With respect to the proposed Cathedral Hill MOB and St. Luke's MOB/Expansion Building, which are subject to the City's Green Building Ordinance (San Francisco Building Code Chapter 13C), CPMC would comply with the Ordinance's requirements for energy efficiency by being at a minimum 15 percent more energy efficient than Title 24 or ASHRAE energy efficiency requirements.[28] Further energy reduction beyond the current target is difficult to achieve with any certainty due to hospital air change requirements and medical equipment loads.

[27] Nelson/Nygaard Consulting Associates. 2011 (March 24). CPMC TDM Plan: TDM Components in the Mid Term (2 to 5 years).

[28] At the time Draft EIR was published in July 2010, the Green Building Ordinance required that new buildings subject to the ordinance and achieve an energy efficiency of 14 percent better than Title 24- 2005 or ASHRAE 90.1-2004. The Green Building Ordinance has since been revised effective in 2011 to require that new buildings subject to its requirements achieve an energy efficiency of, 15 percent better than Title 24-2008 by the alternative calculation method, or both compliance with Title 24 -2008 and 15 percent better than ASHRAE 90.1 – 2007 by cost.

The comment recommends electrifying loading docks and prohibiting idling of all trucks. The Planning Department's understanding is that this measure is typically recommended for projects that have a large number of refrigerated trucks making deliveries to loading docks, because such trucks often idle to continue chilling their cargo until all offloading has been completed. Electrifying loading docks allows refrigerated trucks to turn off their motors and use the docks' electrical systems as the energy source to continue chilling their cargo. CPMC currently has a relatively low number of refrigerated trucks making deliveries to its loading docks on various CPMC campuses, and this is not anticipated to change as a result of the LRDP project. Nevertheless, CPMC is investigating the possibility of electrifying the loading docks as suggested by the comment.

The comment recommends adding on-site renewable energy sources, such as wind turbines and solar panels under the LRDP. It is worth noting that on page 4.17-8, the Draft EIR stated that CPMC intended to implement on-site renewable energy and use of green power as energy efficiency measures at the proposed Cathedral Hill Hospital and St. Luke's Replacement Hospital. This statement has been corrected in the text revisions to the Draft EIR in this document, as the project sponsor, CPMC has not committed to adding on-site renewable energy or to using green power (except as made available to the CPMC campuses through the City's energy grid) for the reasons stated below within this response. Therefore, the bulleted list in the Draft EIR, page 4.17-8, under "Impact ME-2" has been revised as follows to clarify CPMC's commitments regarding implementation of energy efficiency elements:

> In addition, CPMC ~~intends to~~ would implement ~~the following~~ elements of energy efficiency into the proposed Cathedral Hill Hospital and St. Luke's Replacement Hospital by optimizing energy performance of the facilities.~~:~~
>
> ~~► optimizing energy performance.~~
>
> ~~► using on-site renewable energy,~~
>
> ~~► enhancing commissioning,~~
>
> ~~► enhancing refrigerant management,~~
>
> ~~► using green power, and~~
>
> ~~► devising and implementing overall measurement and verification methods, as well as measurement and verification methods for the base building and for tenant submetering.~~

Hospitals are more intensive in terms of energy use than most other types of buildings. On-site renewable energy sources, such as photovoltaic (PV) cells, solar hot water heating systems, and wind turbines on the roofs of the proposed LRDP buildings would not provide a substantial amount of supplemental electricity to make these sources cost effective. A large portion of the Cathedral Hill Hospital tower roof would be dedicated to complex hospital mechanical and electrical systems equipment, and the podium roof would be in shadow for much of the year. Further, building-integrated photovoltaic panels (BIPVs), which were studied to be incorporated in the building skin on the south façade of the proposed Cathedral Hill Hospital, do not allow for rapid change-out to implement advancing PV technologies that are anticipated to become available over the life of the building. The proposed Cathedral Hill Hospital would utilize the limited amount of equipment-free space on the roof (approximately 25 percent of total roof area) for soil and plantings, which would treat and reduce stormwater runoff, in addition to reducing building energy use. Vegetated roofs would also provide a natural aesthetic benefiting building users and adjacent neighbors by reducing glare and heat often caused by bare roof membranes or rooftop equipment such as PV panels and other rooftop equipment. Portions of the proposed Cathedral Hill MOB roof are also proposed to be vegetated.

The roof of the proposed St. Luke's Replacement Hospital would have a limited amount of area that would not be occupied by equipment or would be free from shade during part of the day. The St. Luke's MOB/Expansion Building could utilize PV panels and solar hot water heating systems on the roof. CPMC has indicated that it would explore this potential as the design of the mechanical and electrical systems for this building development.

PV panels and solar hot water heating systems would not be utilized on the roof of the proposed Davies Neuroscience Institute, because such equipment would add to the height of the project, potentially increasing the new net shadows on the adjacent park and neighboring properties. Additionally, the roof of the Neuroscience Institute building would be in partial shade from the adjacent Davies Hospital North Tower in the afternoon during much of the year, reducing the effectiveness of rooftop PV panels.

Co-generation systems, as sources of renewable energy, are more effective for campus systems with shared central utility plants, making them less economical for the proposed new buildings at the CPMC campuses (which would not have shared central utility plants).

However, as is proposed as part of the project, energy savings and other sustainability goals could be achieved by utilizing the available roof area on the proposed Cathedral Hill Hospital to establish a vegetated roof for soil and plantings, which treats and reduces stormwater runoff. According to the June 2010 BAAQMD CEQA Guidelines, installation of green (i.e., vegetated) roofs are considered by BAAQMD to be feasible energy efficiency mitigation measures to reduce GHG emissions.[29] Vegetated roofs also provide a more attractive, natural aesthetic than PV panels and other rooftop equipment, and they therefore can also potentially provide aesthetic and positive health benefits to patients[30] and aesthetic benefits to adjacent neighbors.

Since LEED® for Healthcare (LEED-HC) rating system was not approved until November 2010, and was under draft review for public comment from late 2007 until mid-2010, CPMC utilized the LEED® for New Construction (LEED-NC) and Major Renovation Version 2.2 rating system for the proposed Cathedral Hill Hospital and St. Luke's Replacement Hospital. It should be noted that many of the LEED® prerequisites are the same under both of these LEED® rating systems. In other words, many of the strategies and credits in the LEED-NC rating system that would be utilized for the proposed Cathedral Hill Hospital and St. Luke's Replacement Hospital align with those in the LEED-HC rating system. In addition, the design team for Cathedral Hill Hospital continues to reference LEED-HC as a guide to understand more fully how to manage refrigerants, plug loads of equipment, analyze anesthetic gas use, and understand the complexities of energy and water use by the system. The CPMC LRDP GHG Compliance Checklist (see C&R Appendix D) indicates which CPMC LRDP buildings would be subject

[29] Bay Area Air Quality Management District. 2010 (May). *California Environmental Quality Act Draft Air Quality Guidelines* at p. 4-15. Available at: http://www.baaqmd.gov/~/media/Files/Planning%20and%20Research/CEQA/Draft_BAAQMD_CEQA_Guidelines_June_2010_Final.ashx.

[30] Jerry Smith, ASLA LEED AP, Director of Healthcare & Sustainable Initiatives, MSI Design, 2007 (October), Health and Nature: *The Influence of Nature on Design of the Environment of Care: A Position Paper for the Environmental Standards Council of The Center for Health Design*, Columbus, OH, p. 6 ("Wherever possible, views of nature from patient rooms and public spaces should be considered throughout the design process of healthcare facilities. . . . Green roof technology . . . is being implemented for environmental reasons and supports therapeutic garden design concepts for healthcare facilities as well."); Ibid., p. 14 ("The American Institute of Architects (AIA) Guidelines for Design and Construction of Health Care Facilities is updated every 4 years . . . . In the most recent update, The Environmental Standards Council of The Center for Health Design drafted and submitted additions to The Environment of Care chapter, which outlines, among other things, the environmental factors that contribute to patient, staff and family satisfaction. The additions were unanimously accepted by the Committee and are now part of the 2006 Guidelines. As a result of these new additions, access to nature is now recommended for hospitals and long term care facilities. Likewise, natural daylight and views to nature is now recommended to bring natural light into the facility for the positive health benefits that natural lighting brings to patients and staff work areas."); Clare Cooper Marcus, 2005 (August 29), *Healing Gardens in Hospitals* p. 1 ("For a patient, visitor, or member of staff, spending long hours in a hospital can be a stressful experience. Nearby access to natural landscape or a garden can enhance people's ability to deal with stress and thus potentially improve health outcomes."); Ibid., p. 9 ("Architects and landscape architects need to work closely together to ensure that, as much as possible, there are views out to gardens on the natural landscape from patient rooms, waiting areas, staff offices, and corridors. Views out can also assist in way-finding, thus reducing the stress of finding one's way around a strange building.").

to the SF Green Building Ordinance and/or LEED® certification requirements. CPMC intends to achieve (at the minimum) LEED®-certified level for the proposed Cathedral Hill Hospital and the St. Luke's Replacement Hospital.

Furthermore, this comment was submitted before approval of the San Francisco GHG Reduction Strategy, which has since been approved by BAAQMD as described in a letter dated October 29, 2010. In this letter, BAAQMD stated that "District staff believes the City's Strategy meets the criteria for a qualified GHG reduction strategy as described in the District's CEQA Guidelines." The City of San Francisco has reviewed CPMC's GHG reduction measures and concluded that the LRDP is in compliance with the San Francisco GHG Reduction Strategy. Thus, the LRDP has demonstrated that it satisfies BAAQMD's GHG mitigation guidance by demonstrating consistency with the BAAQMD-approved GHG Reduction Strategy and, therefore, all applicable feasible mitigation measures have been identified and no additional mitigation is required. Please see Response GH-1 on page C&R 3.10-3 for a discussion of the significance of GHG emissions from the proposed LRDP.

3.10.2 CATHEDRAL HILL CAMPUS

3.10.2.1 ADDITIONAL MITIGATION REQUESTED FOR OPERATIONAL EMISSIONS

Comment

(Gloria Smith—California Nurses Association, October 19, 2010) [91-42 GH]

"As shown in Figure 1, at the Cathedral Hill Campus, greenhouse gas emissions (reported as CO_s-equivalent [$CO_{2\text{-}eq}$] emissions) attributable to energy use including area sources (landscape equipment, consumer products, etc.), electricity generation, natural gas combustion, and solid waste and water consumption account for 61 percent of total greenhouse gas emissions attributable to Project operations; mobile source emissions account for 39 percent.

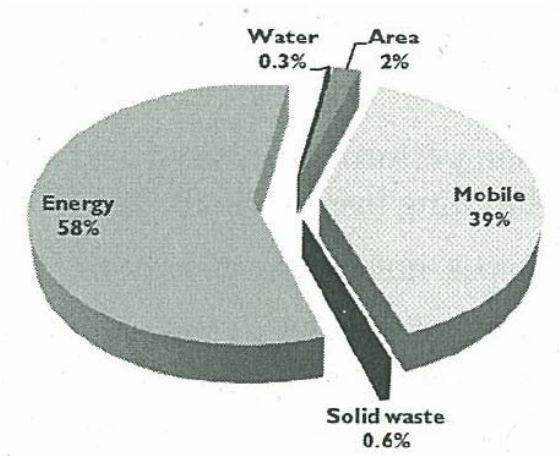

Figure 1: Greenhouse Gas Emissions (in $CO_{2\text{-}eq}$) attributable to Cathedral Hill Campus in 2030"
Data from Draft EIR, Table 4.7-7, page 4.7-40

Thus, effective mitigation for the Project's greenhouse gas emissions must address both energy consumption associated with building operation and mobile source emissions."

Response GH-9

The comment states that mitigation for GHG emissions for the proposed Cathedral Hill Campus should include measures addressing both energy consumption associated with building operation and mobile

source emissions. GHG emissions (reported as CO_2-equivalent emissions) related to the proposed Cathedral Hill Campus, which are attributable to area sources, electricity generation, natural gas combustion, solid waste disposal, and water consumption-related energy use, would account for approximately 60 percent of annual GHG emissions attributable to operations. GHG emissions attributable to mobile sources would account for approximately 40 percent of annual GHG emissions attributable to operations (see Table 14.8-2 on pages 4.8-19 and 4.8-20 of the Draft EIR).

On pages 4.17-7 to 4.17-9 of the Draft EIR, Impact ME-2 determined that energy use associated with LRDP implementation would be a less-than-significant impact. This is due to an improvement of overall energy efficiency on the various CPMC campuses with the decommissioning, demolition, and replacement of older, energy intensive on-campus buildings as well as implementation of the minimum requirements for the Energy and Atmosphere LEED® category described in detail under Impact ME-2 (see pages 4.17-7 and 4.17-9 of the Draft EIR). As is explained in Response GH-1 on page C&R 3.10-3, with a determination of compliance with San Francisco's Qualified GHG Reduction Strategy, the LRDP, including requirements involving energy consumption and reduction of mobile sources (including provision of an enhanced transportation demand management system, commuter benefits, an emergency ride home program, and bicycle parking), would not conflict with the applicable plan adopted for the purpose of reducing GHG emissions. Because it has been determined to be consistent with the BAAQMD-approved GHG Reduction Strategy, the proposed LRDP has been shown to satisfy BAAQMD's mitigation guidance and to have identified all applicable, feasible mitigation measures. According to the BAAQMD, "compliance with a Qualified Greenhouse Gas Reduction Strategy (or similar adopted policies, ordinances and programs) would provide the evidentiary basis for making CEQA findings that development consistent with the plan would result in feasible, measureable, and verifiable GHG reductions consistent with broad state goals such that projects approved under qualified Greenhouse Gas Reduction Strategies or equivalent demonstrations would achieve their fair share of GHG emission reductions."[31] Therefore, the impact of the proposed LRDP on greenhouse gas emissions would be less than significant, and no further mitigation is required. However, the Planning Department has determined that because the significance conclusion in the Draft EIR was made prior to a determination of equivalency with a qualified GHG reduction strategy, and the LRDP would exceed the 2010 BAAQMD GHG quantitative threshold of significance (as determined in the Draft EIR and which the Planning Department determined would be the appropriate 2010 BAAQMD GHG threshold at the time of publication of the Draft EIR), the LRDP should conservatively be considered to result in a significant and unavoidable impact, despite the determination that the proposed LRDP would be consistent with the BAAQMD-approved GHG Reduction Strategy.

3.10.3 PACIFIC CAMPUS

No comments pertaining to GHG emissions and solely related to this campus were received during public review of the Draft EIR.

3.10.4 CALIFORNIA CAMPUS

No comments pertaining to GHG emissions and solely related to this campus were received during public review of the Draft EIR.

3.10.5 DAVIES CAMPUS

3.11 WIND AND SHADOW

3.11.1 LRDP

3.11.1.1 SIGNIFICANCE THRESHOLDS

Comments

(Paul Wermer—CPMC Neighbors Coalition and Pacific Heights Residents, October 18, 2010) [67-32 WS]

"8) WIND AND SHADOW:

In shadow studies, it appears that the DEIR analysis assumes that the only shadow impact requiring consideration are those situations specified in San Francisco's Planning Code Section 295. This ignores the fact that excessive shading on other (non-park) areas can have an adverse environmental effect (as well as denial of solar resources to adjacent properties). Shadow impacts require a more comprehensive assessment, so that policy makers understand the full impacts of the project."

(Rachel Sater—Lost Block and Save Our Streets, October 19, 2010) [101-41 WS]

"Page 4.9-18: The wind and shadow significance criteria are too narrowly applied to public areas. The wind and shadow significance criteria must be modified to consider wind and shadow effects on adjacent sensitive residential uses."

(Rachel Sater—Lost Block and Save Our Streets, October 19, 2010) [101-42 WS]

"Page 4.9-30: The Draft EIR fails to consider the effects of wind on the rear yard open space of adjacent residences as well as interior living areas when windows are open, as well as these effects as a contributing factor to the land use character/compatibility and plans and policies consistency impacts discussed in Draft EIR Section 4.1."

(Rachel Sater—Lost Block and Save Our Streets, October 19, 2010) [101-43 WS]

"Page 4.9-56: The DEIR fails to consider shadow impacts on the rear yard open space of adjacent residences as well as these effects as a contributing factor to the land use character/compatibility, plans and policies consistency, and aesthetics impacts discussed in DEIR sections 4.1 and 4.2. It must be revised to consider such impacts."

Response WS-1

The comments state that the Draft EIR inadequately addresses wind and shadow significance, particularly related to their significance on non-park areas (i.e., spaces not under the jurisdiction of the San Francisco Department of Recreation and Parks per San Francisco Planning Code Section 295), private properties, and adjacent sensitive residential uses. The comments also state that the CPMC LRDP Draft EIR fails to consider the LRDP-related effects of wind on the rear yard open space of adjacent residences as well as on interior living areas when windows are open, and these effects are a contributing factor to land use character/compatibility and plans and policies consistency impacts of the LRDP discussed in Section 4.1, "Land Use and Planning" in the Draft EIR, page 4.9-30. In addition, the comments state that the CPMC LRDP Draft EIR shadow analysis ignores the LRDP's potential adverse environmental effects on solar resources of properties adjacent to CPMC LRDP development sites.

As part of an EIR, CEQA requires lead agencies to address the questions from the checklist included in Appendix G of the State CEQA Guidelines that are relevant to a project's environmental effects in the format that the applicable lead agency selects. As part of an EIR, a lead agency may also consider the

analysis of additional environmental questions relevant to the particular geographic area under the lead agency's jurisdiction. Appendix G (Initial Study Checklist) of the State CEQA Guidelines does not require the analysis of shadow impacts, but the San Francisco Planning Department's Initial Study Checklist includes questions related to wind and shadow, and requires a shadow analysis for effects that a project may have on public areas and public recreation facilities under the jurisdiction of the Recreation and Park Commission as well as on public and publicly accessible open spaces, outdoor recreational facilities and other public areas that are not under the jurisdiction of the City's Park and Recreation Commission. San Francisco Planning Code Section 295, "The Sunlight Ordinance," and the San Francisco Planning Department specific thresholds of significance derived from it pertain to public areas and public recreation facilities (i.e., property under the jurisdiction of, or designated to be acquired by, the San Francisco Recreation and Park Commission). As such, neither CEQA nor the San Francisco Planning Department's Initial Study Checklist questions require analysis of shadow impacts on adjacent or proximate private land uses that are not publicly accessible open space or areas. Regarding wind, the City of San Francisco, through Section 148 of the San Francisco Planning Code (as stated on page 4.9-15 of the Draft EIR), has established criteria for acceptable wind "comfort levels" for public seating areas and areas of substantial pedestrian use, not private spaces that are not publicly accessible. The City's performance threshold for wind impacts focuses on public areas and, in particular, whether wind hazard criterion would be exceeded or whether areas of substantial pedestrian use would be substantially affected.

As noted on page 4.9-16 of the Draft EIR, San Francisco Planning Code Section 295, "Height Restrictions on Structures Shadowing Property under the Jurisdiction of the Recreation and Park Commission," also known as The Sunlight Ordinance of 1984, was established following voter approval of Proposition K. This reflects a City policy that public open spaces are to be protected from material increases in shade and shadow effects that would diminish the usability of those spaces, and requires the Planning Commission, before issuance of a permit for a development that exceeds 40 feet in height, to make a finding that, if net new shadow is cast by the proposed development on property under the jurisdiction of the Recreation and Park Commission, such new shading would be insignificant. This finding by the Planning Commission is separate from the EIR process but, similar to EIR certification, would be necessary for the project sponsor to obtain before issuance of any development permits.

As stated on Draft EIR page 4.9-8, potential shadow impacts to additional open space, including publicly owned or controlled open space areas and privately owned, publicly accessible open space areas facilities near the existing and proposed CPMC campuses, were evaluated as part of the Draft EIR although not covered under Section 295 of the San Francisco Planning Code. As discussed in Impact WS-2, beginning on Draft EIR page 4.9-34, a Proposition K shadow fan analysis and shadow projections, which show the actual shadows that would result from a specific building design, were used to evaluate potential shadow impacts of the LRDP to open space areas in the vicinity of the existing and proposed CPMC campuses. As noted on Draft EIR pages 4.9-42, 4.9-47, 4.9-56, 4.9-58, and 4.9-59, development under the proposed LRDP would not substantially affect shading of public outdoor recreational activities or other publicly accessible open spaces and recreational spaces due, in large part because these areas are already shaded by existing structures. It was determined that the small amount of increase in net new shadows related to LRDP development on adjacent sidewalks and publicly-accessible plazas would not substantially alter the use of these facilities, and thus the shadow impact of the LRDP was considered less than significant. It should also be noted that the shadow diagrams presented in Section 4.9 of the LRDP Draft EIR depict and provide information regarding potential shading of surrounding private properties that are not publicly accessible, even though this would not be considered potentially significant.

Shadow projections for the proposed Cathedral Hill Hospital and MOB are shown in Draft EIR Figures 4.9-2 through 4.9-5 (pages 4.9-35 through 4.9-38). According to a San Francisco Planning Department Proposition K shadow study for the proposed Cathedral Hill Campus, projected winter, spring, summer, and fall shadows from the proposed Cathedral Hill Campus would not cast a net new shadow during any

time of the year on Sergeant John Macaulay Park or Jefferson Square, which are the nearest Recreation and Park Department properties to the proposed Cathedral Hill Campus. Shadow projections for the proposed Neuroscience Institute at the Davies Campus are shown in Draft EIR Figures 4.9-6 and 4.9-7 (pages 4.9-44 and 4.9-45). The proposed Davies Campus addition would cast a new shadow on a small part of the south side of Duboce Park, which is the nearest Recreation and Park Department property, for approximately 15–30 minutes during 5 weeks in December and January. Because this net new shadow would occur on approximately 0.2 percent of the total park area, add 156-square foot hours of shade to the park (an increase of 0.0003 percent), and would not fall on the playground or basketball court, the shadow would be unlikely to affect the recreational use of this park and would result in a less-than-significant impact. Shadow projections for the proposed buildings at the St. Luke's Campus are shown in Draft EIR Figures 4.9-8 through 4.9-11 (Draft EIR pages 4.9-49 through 4.9-52). The proposed St. Luke's and Pacific Campus development under the LRDP would not cast a net new shadow during any time of the year on any Recreation and Park Department properties.

According to the San Francisco Solar Map,[1] when viewed in conjunction with Draft EIR Figures 4.9-2 through 4.9-5, the projected shadow from the proposed Cathedral Hill Campus development under the LRDP would not cast net new shadow during any time of the year on any nearby solar installations. Also, according to the San Francisco Solar Map, when viewed in conjunction with Draft EIR Figures 4.9-6, 4.9-7, and 4.9-9 through 4.9-11, the projected shadow from the proposed Davies Campus development and St. Luke's Campus development under the LRDP would not cast net new shadow during any time of the year on any nearby solar installations. Although related, wind and shadow impacts are discussed separately from land use compatibility, consistency with plans and policies, and aesthetic impacts within the Draft EIR. At the proposed Cathedral Hill Campus, land use impacts of the LRDP development are analyzed with respect to the project's effects on a community, i.e., whether development physically divides an established community (Draft EIR pages 4.1-37 to 4.1-41), conflicts with applicable land use plans (Draft EIR pages 4.1-47 to 4.1-49), or adversely affects the existing character of the project vicinity (Draft EIR pages 4.1-55 to 4.1-58). The discussion in the Draft EIR regarding land use incompatibility focuses on the adverse effects that the proposed LRDP would have associated with the introduction of new uses or intensified land uses on the LRDP development sites, the effects on the existing mixed-use character, changes to the pedestrian environment, and the scale and massing of the proposed hospital and MOB compared to existing conditions.

The comments state the Draft EIR fails to consider whether wind and shadow effects were a contributing factor to land use character and compatibility. Potential wind and shadow impacts from the project were each found to be less than significant and would not contribute in any considerable way to adverse impacts on land use character or compatibility.

Aesthetic impacts of the proposed LRDP are thoroughly analyzed in Section 4.2, "Aesthetics" in the Draft EIR. Appendix G of the State CEQA Guidelines requires the analysis of aesthetics impacts, and the Initial Study Checklist includes questions related to analyzing a project's impacts to scenic vistas (Draft EIR pages 4.2-95 to 4. 2-98),, scenic resources (Draft EIR pages 4.2-107 to 4. 2-110), the existing visual character/quality of the project site and its surroundings (Draft EIR pages 4.2-117 to 4. 2-140), and the project's effects on light and glare in the project area (Draft EIR pages 4.2-187 to 4. 2-188). Shadow impacts are not included under aesthetics but were appropriately analyzed in Section 4.9, "Wind and Shadow" in the Draft EIR. As such, the Draft EIR analyzed the proposed LRDP's consistency with San Francisco Planning Code Section 295 related to shadow under Impact WS-1 (pages 4.9-33 through 4.9-63) and concluded that the proposed LRDP would have a less-than-significant shadow impact. No revisions to Section 4.1 in the Draft EIR are necessary.

[1] San Francisco Department of the Environment and CH2M HILL. 2010 (last updated September 13). San Francisco Solar Map. Available: http://sf.solarmap.org/. Accessed January 12, 2011.

San Francisco Planning Code Section 148, "Reduction of Ground Level Wind Currents," requires that proposed developments not cause ground-level wind currents to exceed 11 miles per hour (mph) equivalent wind speed in areas of substantial pedestrian use. This typically includes sidewalks and public plazas or gathering places. Appendix G of the State CEQA Guidelines does not address the potential effects of wind accelerations caused by new structures, but the San Francisco Planning Department Initial Study Checklist requires analysis of the effects that project-generated wind accelerations may have on public areas of substantial pedestrian use. This does not include the wind effects of the project on private lands that are not accessible to the public, including residential porches, windows or backyards. Thus, it is not necessary for the Draft EIR to analyze the LRDP's wind effects on adjacent private residential uses.

Wind impacts are to be considered separate from land use impacts within an EIR. The land use questions from the checklist included in Appendix G of the State CEQA Guidelines include a question regarding whether a project conflicts with any applicable land use policy. As such, the Draft EIR analyzed the proposed LRDP's consistency with San Francisco Planning Code Section 148 related to wind conditions under Impact WS-1 (pages 4.9-22 through 4.9-32) and concluded that the proposed LRDP would have a less-than-significant wind impact. No revisions to Sections 4.1 and 4.2 in the Draft EIR are necessary.

3.11.2 CATHEDRAL HILL CAMPUS

3.11.2.1 WIND AND SHADOW CONDITIONS AND IMPACTS AT THE PROPOSED CAMPUS

Comments

(Alan Wofsy—Emeric-Goodman Associates, September 23, 2010) [26-5 WS]

"DEIR

4.9 WIND AND SHADOW

This section describes wind and shadow conditions in San Francisco in general and on the various existing and proposed CPMC campuses in particular. It evaluates potential wind and shadow impacts that could result from implementation of the CPMC Long Range Development Plan (LRDP) and considers cumulative impacts of both wind and shadow. 4.9-1

DISCUSSION

There is no reference in this section to our building which is directly across the street from the proposed 3.85-acre Cathedral Hill Campus, indicated by no. 43 on the neighborhood plan (Figure 4.9-1). The EIR does not discuss the impact of wind and shadows on the Emeric-Goodman Building nor does it propose any mitigation measures."

(Hossein Sepas and Nick Wilson—The Hamilton Association, October 19, 2010) [82-4 WS, duplicate comments were provided in 83-4 WS and 107-3 WS]

"It is too windy on Cathedral Hill and the Van Ness area below it now; it will become even windier after the construction of such a large hospital. The draft E.I.R states: 'In San Francisco, wind strength is generally greater along Streets that run approximately east-west because buildings along those streets tend to act as a channel for winds.' That is certainly true of Geary and O'Farrell Streets, the west-east wind is already very strong, and coming down from the top of Cathedral Hill it is even stronger. It is sometimes difficult to walk down Geary or Starr King now with the strong winds swirling around the existing high rises; it will be even worse if the hospital is built to the mass they propose. The draft EIR also states that wind speeds at many points 'around the campus site and vicinity are currently in exceedance of the pedestrian-comfort value …as established by Section 148 of the San Francisco Planning Code (Planning Code).'"

Response WS-2

The comments state that the Draft EIR does not address the LRDP-proposed Cathedral Hill Campus development's wind and shadow impacts on the Emeric-Goodman Building or propose any wind-related mitigation measures. The comments also reference the discussion in the Draft EIR regarding wind speeds at many points around the proposed Cathedral Hill Campus site and state that they are currently in exceedance of the pedestrian-comfort criteria, established by the San Francisco Planning Code Section 148.

The Draft EIR evaluates potential wind and shadow impacts in Section 4.9, pages 4.9-20 through 4.9-63. Specifically, the discussion under Impact WS-1 in the Draft EIR, pages 4.9-22 through 4.9-29, evaluates the wind conditions and potential wind impacts of the proposed Cathedral Hill Campus under the LRDP. As stated in the Draft EIR, page 4.9-20, a quantitative wind tunnel analysis was prepared to assess the potential wind impacts of the proposed Cathedral Hill Campus and, as stated in the Draft EIR, page 4.9-25, this report is available for review at the Planning Department (1650 Mission Street, Suite 400, San Francisco, CA 94103) as part of the project case file. As part of this study, 45 wind point locations were identified and evaluated to determine the potential increase in wind velocity and duration that would occur with construction of the proposed Cathedral Hill Campus. Of the 45 locations, 16 currently exceed the pedestrian-comfort wind speed criterion for areas of substantial pedestrian use set by Section 148 of the Planning Code. As shown in Table 4.9-2, "Results of the Wind Tunnel Analysis for the Proposed Cathedral Hill Campus" on page 4.9-24 of the Draft EIR, these include locations 3, 4, 5, 7, 8, 15, 16, 22, 30, 37, 38, 39, 40, 43, and 44. The Emeric-Goodman Building is adjacent to test point location No. 43, which was identified as exceeding the pedestrian-comfort wind speed criterion under existing conditions, as shown on Draft EIR, Figure 4.9-1, "Cathedral Hill Campus—Wind Tunnel Test Point Locations" on page 4.9-26.

Note that two of the wind point locations, 32 and 45, were recorded incorrectly in Table 4.9-2 and in Table 4.9-3. These tables have been corrected and are included in pages C&R 4-101 through 4-104. The modification to these numbers does not change the outcome of the analysis.

Tables 4.9-2 and 4.9-3 in the Draft EIR, pages 4.9-24 and 4.6-60, respectively, have been updated to reflect wind speed updates at locations 32 and 45 for project-level wind analysis, as follows:

The CPMC LRDP Draft EIR concludes that the proposed Cathedral Hill Campus would have a less-than-significant wind impact on its surroundings using the significance criteria listed on page 4.9-18 (see "Significance Criteria") and further described on page 4.9-20 (see "Methodology"). An exceedance of the wind speed impact criteria would constitute a significant adverse impact related to development of the proposed Cathedral Hill Campus if:

- the proposed LRDP development at the Cathedral Hill Campus would result in the pedestrian-comfort criterion of 11 mph wind speed for areas of substantial pedestrian use being exceeded more than 10 percent of the time from 7 a.m. to 6 p.m.; or

- the proposed LRDP development at the Cathedral Hill Campus would result in the Planning Code-established wind hazard criterion of 26 mph equivalent wind speed being exceeded in the surrounding area for more than 1 hour of any year.

Notes: mph = miles per hour

[a] Wind velocity refers to the speed at which the wind moves in a particular direction.

[b] The term "equivalent wind speed" (EWS) denotes the mean hourly wind speed adjusted to account for the expected turbulence intensity or gustiness at the site.

* Exceedances of the comfort criterion are shown in **bold**.

Source: Ballanti, D. 2009 (September). *Wind Tunnel Analysis for the Proposed California Pacific Medical Center Cathedral Hill Campus Project, San Francisco, California*. El Cerrito, CA. Prepared for AECOM, San Francisco, CA. This document is available for review at the Planning Department, 1650 Mission Street, Suite 400, San Francisco 94103, as part of Case No. 2005.0555E.

The discussion in the CPMC LRDP Draft EIR, page 4.9-27, states that overall development of the proposed Cathedral Hill Campus would result in a decrease in average wind speed in the surrounding area from 10.6 mph to 10.5 mph, a slight decrease from existing conditions. In addition, wind speeds in nearby pedestrian sidewalk areas would decrease from an average speed of 6–21 mph to 5–18 mph. As shown in Table 4.9-2 on Draft EIR page 4.9-26, development of the proposed Cathedral Hill Campus would reduce wind speeds and/or the percentage of time wind speeds would exceed the daytime pedestrian-comfort criterion at 10 of the 16 locations currently exceeding the pedestrian-comfort wind speed criterion. These include locations 3, 4, 7, 8, 16, 22, 30, 37, 39, and 40. Existing exceedances of the pedestrian-comfort criterion (wind speed of 11 mph) at four (3, 4, 8, 22) of the 16 locations would be eliminated with implementation of the LRDP.

In contrast, the CPMC LRDP Draft EIR notes on page 4.9-27 that development of the proposed Cathedral Hill Campus would increase wind velocity in excess of the pedestrian-comfort criterion at 10 wind test point locations: 5 (Geary Boulevard); 10 (O'Farrell Street); 15 (Geary Boulevard); 29, 35, 36, and 38 (Geary Boulevard); 41 and 43 (Emeric-Goodman Building); and 44 (Geary Boulevard). As noted above, six of these 10 wind test point locations (5, 10, 15, 38, 43, and 44) exceed the pedestrian-comfort criterion under existing conditions. New exceedances of the 11 mph pedestrian-comfort criterion would occur at the other four locations: 29, 35, 36, and 41, where currently these wind test point locations do not exceed the pedestrian-comfort criterion. However, no exceedances of the wind-hazard criterion would occur at any of the wind test point locations.

More specifically, the Draft EIR (see Table 4.9-2, "Results of the Wind Tunnel Analysis for the Proposed Cathedral Hill Campus" on page 4.9-24–25) determined that as a result of Cathedral Hill Campus development under the LRPD, the Emeric-Goodman Building (test point location number 43) would experience increased wind velocity (from 17 mph to 18 mph) and an increased percentage of time when wind speeds would be above the pedestrian-comfort criterion (from 29 percent to 37 percent).

Source: Ballanti, D. 2009 (September). *Wind Tunnel Analysis for the Proposed California Pacific Medical Center Cathedral Hill Campus Project, San Francisco, California*. El Cerrito, CA. Prepared for AECOM, San Francisco, CA. This document is available for review at the Planning Department, 1650 Mission Street, Suite 400, San Francisco 94103, as part of Case No. 2005.0555E.

However, the Draft EIR concludes (see pages 4.9-27 to 4.9-28) that wind impacts that would result from the proposed Cathedral Hill Campus development would be less than significant, based on the following: (1) LRDP-related increases in wind velocities would occur at locations (including the Emeric-Goodman Building) that already exceed the pedestrian-comfort criterion under existing conditions and these wind speed increases with LRDP development would be small; (2) the average wind speed at all locations in the surrounding area (including the Emeric Goodman Building and along Geary Boulevard and O'Farrell Street) would decrease with proposed LRDP development at Cathedral Hill; and (3) no net increase in wind speed exceedances would occur in the surrounding area with LRDP development at Cathedral Hill (i.e., LRDP development at Cathedral Hill would result in four new wind speed exceedances but eliminate four existing wind speed exceedances). The proposed LRDP development at Cathedral Hill would therefore result in a less-than-significant wind impact, and no mitigation measures would be required.

Impact WS-2 in the Draft EIR, pages 4.9-33 through 4.9-43, evaluates the shadow conditions and potential effects of the proposed Cathedral Hill Campus and concludes that development of the Cathedral Hill Campus under the LRDP would have a less-than-significant shadow impact on the surrounding area. As stated in the Draft EIR, page 4.9-34, a Proposition K shadow study for the proposed Cathedral Hill Campus was conducted by the San Francisco Planning Department, based on the size and location of the proposed structures.

The Emeric-Goodman Building is not specifically referenced in the Draft EIR, but is depicted in Draft EIR Figures 4.9-2 through 4.9-5, which show the projected net new winter, spring, summer, and fall

shadows that would be created by the proposed Cathedral Hill Campus. These figures indicate that the proposed Cathedral Hill Campus development would not cast net new shadow on the Emeric-Goodman Building during any time of the year. Because the Emeric-Goodman Building is located south of the proposed campus and shadows in San Francisco are typically cast to the west, northwest, north, northeast, and east, no LRDP-related shadows would result on the Emeric-Goodman Building. Thus, no shadow impacts related to the LRDP would occur at the Emeric-Goodman Building, and no mitigation would be required.

Comment

(Linda Chapman, October 19, 2010) [76-25 WS, duplicate comment was provided in 111-25 OTH]

"For wind, shadow, and aesthetic impacts, the proposed hospital calls for comparison to neighborhood impacts of the Holiday Inn."

Response WS-3

The reference to comparing neighborhood shadow, wind, and aesthetic impacts of the proposed LRDP development at Cathedral Hill to the existing Holiday Inn is unclear. This comment presumably is referring to the Holiday Inn on the east side of Van Ness Avenue north of Pine Street, approximately three blocks north of the proposed Cathedral Hill Campus. The proposed Cathedral Hill Campus development would be consistent with the existing urban context that surrounds the Campus area. As shown on C&R Figure 3.4-1 (page C&R 3.4-5) and described in Response AE-4 (page C&R 3.4-7), the proposed Cathedral Hill hospital building would be approximately 23 feet taller than the existing Holiday Inn building, as measured from the lowest point of the site to the top of the major building element. However, as also shown in C&R Figure 3.4-1, the proposed hospital building would be 7 feet shorter than the existing Holiday Inn building when measured according to San Francisco City Elevation Datum. However, such a building-by-building comparison is not required by CEQA. Further discussion regarding aesthetics can be found in Section 3.4, "Aesthetics" of this C&R document. Because the Holiday Inn property is not part of the proposed CPMC LRDP development, no wind and shadow studies were conducted for the Holiday Inn property. As such, wind and shadow impacts of the proposed LRDP development at the proposed Cathedral Hill Campus site are not directly comparable to wind and shadow impacts of the existing Holiday Inn, and such a building-by-building comparison is not required by CEQA.

Furthermore, as the existing Holiday Inn is located approximately six blocks from the proposed Cathedral Hill Campus, there would be a different environmental setting for each property in terms of views, local publicly available open space, and existing wind conditions and the potential impacts of Cathedral Hill development under the proposed LRDP would therefore not combine with those of the Holiday Inn building. As such, a direct comparison of the impacts of the two structures would not provide meaningful results because of the distance and context. Rather the focus of the Draft EIR is on the immediate surrounding context of the proposed Cathedral Hill Campus and the potential impacts of the proposed LRDP.

3.11.2.2 LOSS OF NATURAL LIGHT RESULTING FROM THE PROPOSED CATHEDRAL HILL MOB

Comments

(Carolyn Abst and Ron Case—Case + Abst Architects LLP, October 19, 2010) [102-3 WS, duplicate comment was provided in 114-3 WS]

"7. The loss of natural light due to new MOB height." [health issue]

(Carolyn Abst and Ron Case—Case + Abst Architects LLP and Lower Polk Neighbors, October 19, 2010) [102-30 WS, duplicate comments were provided in 103-16 WS, 113-16 WS, and 114-30 WS]

"G. The ten story building height of the MOB will greatly reduce the natural light to our building, thus negatively affecting our work and living environment."

(Carolyn Abst and Ron Case—Case + Abst Architects LLP, October 19, 2010) [102-31 WS, duplicate comment was provided in 114-31 WS]

"The existing buildings near our property and proposed for demolition to construct the MOB contains two- and three-story buildings that are up to 40 feet in height. The proposed MOB will place a nine-story building of approximately 169 feet in that location. This proposed MOB will drastically alter the sun and shadow patterns for businesses and residences on Cedar Street and Post Street. The shadow fan analysis reveals that the MOB will cast shadows on significant portions of Cedar Street between Polk and Van Ness during all seasons except the summer equinox. Additionally, the analysis predicts that Cedar Street will be entirely covered in shadows during the afternoon in all seasons except the summer equinox. This loss of sun exposure would significantly impact our property."

(Carolyn Abst and Ron Case—Case + Abst Architects LLP, October 19, 2010) [102-32 WS, duplicate comment was provided in 114-32 WS]

"The shadow fan analysis is troubling as our property would lose a significant amount of sun exposure. Our property contains numerous windows along Cedar Street due to its southfacing orientation. Sun exposure is critical not only for economic function, as it encourages pedestrian activity, but it also affects physical and mental health. Scientific studies have demonstrated the importance that natural sun exposure serves. We are very concerned that the proposed MOB would result in placing our residence and business in shadows for the majority of the year. The intent of San Francisco Planning Code Section 295 (the Sunshine Ordinance) is to protect sunlight in open spaces. Even though Cedar Street does not encompass open space within SFPRD's jurisdiction, the proposed project would nonetheless drastically impact the sidewalks of our neighborhood, which are the public areas within San Francisco that we and our clients utilize the most."

(Carolyn Abst and Ron Case—Case + Abst Architects LLP, October 19, 2010) [102-33 WS, duplicate comment was provided in 114-33 WS]

"The loss of sunlight along Cedar Street is even more troubling given the fact that the wind analysis in the Draft EIR anticipates an increase of wind at Cedar and Van Ness beyond the pedestrian comfort level from 16 percent to 21 percent. The combination of loss of sun and increase of wind along Cedar will drastically change the character and comfort of Cedar Street. Even though the Draft EIR asserts that the impacts are less than significant for the study area, these impacts are significant for those properties within the immediate area of the MOB."

Response WS-4

The comments state concerns related to loss of natural light resulting from the proposed Cathedral Hill MOB. Specifically, the comments suggest that the proposed Cathedral Hill MOB would reduce the amount of natural light reaching some of the neighboring buildings along Cedar Street between Polk Street and Van Ness Avenue.

The proposed Cathedral Hill MOB is nine stories tall, plus a mechanical penthouse at the top level. As stated on the CPMC LRDP Draft EIR page 4.2-126, the MOB's taller western building component would be nine stories above grade, whereas the middle building component would be seven stories above grade and the eastern building component would be three stories high. Also, as stated on Draft EIR page 4.2-126, the MOB's approximate height, as measured from the locations specified below, would be:

- 145 feet to the top of the mechanical screen, as measured from the top of the sidewalk at the corner of Cedar Street and Van Ness Avenue (north elevation) (see Draft EIR Figure 2-25, page 2-89);

- 169 feet to the top of the mechanical screen, as measured from the top of the sidewalk on Geary Street at the southeast corner of the building (near Polk Street) (east elevation) (see Draft EIR Figure 2-26, page 2-90);

- 149 feet to the top of the mechanical screen, when measured from the top of the sidewalk on Van Ness Avenue at Geary Street (south elevation) (see Draft EIR Figure 2-27, page 2-91); and

- 149 feet to the top of the mechanical screen, as measured from the top of the sidewalk on Geary Street at Van Ness Avenue (west elevation) (see Draft EIR Figure 2-28, page 2-92).

The CPMC LRDP Draft EIR analyzed LRDP-related shadow impacts of the proposed Cathedral Hill Campus development on sidewalks (including Cedar Street) and on publicly-accessible, privately-owned open spaces near the proposed Cathedral Hill Hospital and MOB. As stated in the Draft EIR on page 4.9-42 and as depicted in the Draft EIR on Figures 4.9-2 through 4.9-5, (Draft EIR pages 4.9-35 through 4.9-38), the extent and duration of shadow on sidewalks along Post Street, Franklin Street, Van Ness Avenue, and Cedar Street would increase during certain periods of the day and year as a result of the proposed Cathedral Hill Hospital and MOB. Specifically, the majority of shadows along Cedar Street occur under existing conditions, although additional shading due to the proposed Cathedral Hill MOB, primarily during spring and summer months, may occur on the north side of the Cedar Street where it intersects with Van Ness Avenue. However, the net new shadow would not exceed the amount of shadow that would be normal and expected in highly urban areas. It is important to note that the proposed Cathedral Hill MOB site is separated from the neighboring buildings referred to in the comments by Cedar Street. As such, it would not block any existing windows nor would it prevent natural light from reaching interior spaces that currently receive natural light.

Appendix G of the State CEQA Guidelines does not require analysis of the loss of natural light (or shadow) impacts, the San Francisco Planning Department Initial Study Checklist questions require a shadow analysis in terms of the shadow-related effects a project may have on publicly-owned or controlled open space areas and privately-owned, publicly-accessible open space areas. As stated in the Draft EIR, page 4.9-42, the proposed Cathedral Hill Hospital and MOB would add net new shadows on the Cathedral Hill Campus itself and on nearby sidewalks, streets, and neighboring rooftops near the proposed Cathedral Hill Campus site; however, these shadow areas would not affect open space protected by Section 295 of the Planning Code (the Sunlight Ordinance) or substantially affect the usability of other non-Department of Recreation and Parks public or publicly accessible open spaces or recreational spaces not subject to Section 295 of the Planning Code. Thus, the proposed LRDP at the Cathedral Hill Campus site would not cast shadows that could significantly affect public or recreational properties, including publicly owned or controlled open space areas and privately-owned, publicly-accessible open space areas.

For a discussion regarding the less-than-significant wind impacts of the LRDP in the vicinity of the proposed Cathedral Hill Campus, see Response WS-2 (page C&R 3.11-5). Specifically, as reported in Table 4.9-2 "Results of the Wind Tunnel Analysis for the Proposed Cathedral Hill Campus" on Draft EIR pages 4.9-24 through 4.9-25, wind speeds at the intersection of Cedar Street and Van Ness Avenue (location number 27 in the Draft EIR; see Figure 4.9-1) would increase from 7 mph under existing

conditions to 8 mph under the proposed LRDP development and would be below the 11-mph-pedestrian-comfort criteria. Therefore, LRDP-related wind impacts to Cedar Street would be less than significant.

3.11.3 PACIFIC CAMPUS

No comments pertaining to wind or shadow and solely related to this campus were received during public review of the Draft EIR.

3.11.4 CALIFORNIA CAMPUS

No comments pertaining to wind or shadow and solely related to this campus were received during public review of the Draft EIR.

3.11.5 DAVIES CAMPUS

No comments pertaining to wind or shadow and solely related to this campus were received during public review of the Draft EIR.

3.11.6 ST. LUKE'S CAMPUS

No comments pertaining to wind or shadow and solely related to this campus were received during public review of the Draft EIR.

This page intentionally left blank.

3.12 RECREATION

3.12.1 LRDP

3.12.1.1 ACCESS TO RECREATIONAL FACILITIES

Comment

(Chris Schulman, October 19, 2010) [105-4 RE]

"The 1/2 mile radius used in the DEIR for 'acceptable walking distance' (Page 4.10-4) is extremely misleading and does not account for hills and grades. For example, walking from Van Ness and Geary to Lafayette Park takes approximately 20 minutes due to the steep hills. This time is reflected in Google Maps and in my experiences. Seniors and families may find that this time is increased. Tenderloin park facilities are also more than a 20 minute walk due to traffic lights and congested sidewalks. Updating the proximity map is necessary to reflect the circumstances of the area surrounding the proposed campus. The updated proximity map will show an even more severe lack of recreation space which must be updated in related charts and in the evaluations made. Additionally, the impact to nearby intersections identified in the traffic component of the DEIR (further exasperated by necessary updated projections) will lead to further pedestrian delays in accessing recreation and open space."

Response RE-1

The comment states that the 0.5-mile radius used in the CPMC LRDP Draft EIR for "acceptable walking distance" is misleading, because it does not account for hills and grades in San Francisco. In addition, the comment notes that Tenderloin park facilities are more than a 20-minute walk, because of traffic lights and pedestrian traffic. The comment states that updating parks and open space figures in the EIR, which show a 0.5-mile radius from the campuses (see Figures 4.10-1 to 4.10-6), would show a greater lack of recreational space than what is indicated in the Draft EIR. The comment also states that traffic-related impacts of the LRDP will lead to increased pedestrian delays in accessing recreational resources.

The General Plan's Recreation and Open Space Element refers to a "neighborhood service area" concept based on the distance most prospective "users" from adjacent neighborhood areas are willing to walk to take advantage of an open space.[1] A 0.5-mile radius to recreational resources was used in the analysis of the Draft EIR because the San Francisco General Plan specifies that this is an acceptable walking distance (an approximately 10-minute walk) to reach city-serving open spaces.[2]

The San Francisco Planning Department completed an analysis that focused on actual distances (in mileage) to measure park accessibility and incorporated topography into the overall walkability of a park or open space.[3] The results of this study also yielded similar acceptable walking distances as those used in the Draft EIR and are available at the Planning Department. It is understood that walking times may vary by the nature of the surrounding topography in San Francisco, traffic lights, sidewalk congestion, and by pedestrian due to age, mobility, and the health of an individual. However, based on the data collected by the City of San Francisco with respect to walkability, the 0.5-mile radius to recreational resources is considered appropriate despite the concerns voiced by the comment, and updating the parks and open space walking figures in the Draft EIR is not necessary. In addition, detailed mapping considering the various factors discussed above would be dependent on daily traffic conditions and the relative physical fitness of the pedestrian in question, and as such, determining a realistic, appropriate, and measurable

[1] San Francisco Planning Department. 1986. *San Francisco General Plan*, Recreation and Open Space Element. San Francisco, CA.
[2] San Francisco Planning Department. 1986. *San Francisco General Plan*, Recreation and Open Space Element. San Francisco, CA.
[3] San Francisco Planning Department. 2011 (expected adoption 2012). *San Francisco General Plan*, Recreation and Open Space Element Update. San Francisco, CA.

walking distance would not be feasible. Further, the 0.5-mile radius for "neighborhood service area" concept for park and open space planning is a widely accepted standard by many cities and counties.

Section 4.5, "Transportation and Circulation" of the CPMC LRDP Draft EIR evaluated the potential for the proposed LRDP to substantially increase sidewalk crowding and reduce the viability of local sidewalks as a means of travelling from an origin to a destination, such as a park or other open space area. Impacts TR-40 (Draft EIR page 4.5-130), TR-62 (Draft EIR page 4.5-171), TR-70 (Draft EIR page 4.5-181), TR-79 (Draft EIR page 4.5-188), and TR-88 (Draft EIR page 4.5-204) determined that even with the additional pedestrians on sidewalks, the proposed LRDP would not result in overcrowding of local sidewalks and potential delays in walking times. Furthermore, in response to written and oral comments regarding the depth of analysis included in the Draft EIR related to the Tenderloin and Civic Center neighborhoods, a supplemental transportation impact analysis was conducted (see Appendix E of the C&R document). This supplemental analysis was performed for traffic, pedestrian, and bicycle conditions using the same analysis scenarios analyzed in the Draft EIR. Please see Response TR-124 (page C&R 3.7-207) for a detailed discussion of pedestrian impacts in the Tenderloin neighborhood. As noted in the CPMC LRDP Draft EIR and the supplemental transportation impact analysis, the proposed CPMC LRDP would not be anticipated to prevent local pedestrians from travelling to nearby open spaces.

3.12.1.2 DEMAND FOR RECREATIONAL FACILITIES

Comment

(Chris Schulman, October 19, 2010) [105-2 RE]

"The recreation component of the draft EIR is significantly flawed due to the assumption that no housing will be built as part of the project. The Van Ness housing master plan, re-enforced recently by the Board of Supervisors requires a 3-1 ratio for housing. While this will likely be reduced as part of a compromise, significant housing will be built as part of this project within the half mile radius of the Cathedral Hill campus identified in figure 4.10-2 either directly, or through in lieu payments. The smallest environment impact and greatest public benefit will be realized if neighborhood serving recreation and open space is provided for as part of the mitigation plans for this project. Multiple common open space within buildings constructed or renovated as part of this project will not provide necessary open space."

Response RE-2

The comment states that the recreation component of the CPMC LRDP Draft EIR is flawed because of the assumption that no housing would be built as part of the proposed LRDP. The comment notes that the San Francisco Board of Supervisors requires a 3:1 residential-to-commercial provision via the Van Ness Special Use District. The comment also states that significant housing would be built as part of this project, within the 0.5-mile radius of the Cathedral Hill campus, directly or through in lieu payments. The comment proposes that additional open space be included as a mitigation measure and states common open space within buildings would not provide the necessary open space.

As stated on Draft EIR page 4.10-37 in Section 4.10, "Recreation," no housing component is proposed as part of the CPMC LRDP; therefore, there would be no direct effect on the area's population density. As stated in Table 2-3 on page 2-14 of the Draft EIR, as part of the proposed LRDP, the project sponsor would request a permit to allow modification of the 3:1 ratio of residential to non-residential development requirement within the Van Ness Special Use District. Please see Response LU-21 (page C&R 3.3-95) for additional analysis of the 3:1 housing requirement and how it applies to the proposed CPMC LRDP. It should also be noted that any housing that would be potentially funded through in lieu payments would be subject to separate CEQA review and impact evaluation, including mitigation, upon receipt or processing of an application for development. As noted on Draft EIR page 4.10-3 in Section 4.10, "Recreation," the

City and County of San Francisco has not established a citywide target ratio of parkland to residents, nor has it adopted a Quimby Act ordinance requiring land dedications or in-lieu fees.

As noted on page 4.10-29 in Section 4.10, "Recreation," of the LRDP Draft EIR, as an institutional use and based on the zoning district within which each CPMC campus is located, the proposed LRDP is not subject to any open space requirement. Thus, no mitigation measure related to open space would be required for the CPMC LRDP. Furthermore, it should be noted that no open space would be removed as a result of implementation of the proposed CPMC LRDP.

The comment states that common open space within CPMC buildings proposed under the LRDP would not provide necessary public open space within the City. The Draft EIR does not state that the on-site public open spaces under the LRDP should qualify as citywide parks and open space, but that the provision of these spaces on site would potentially offset increased demand for existing citywide parks and open space (See Impact RE-2, beginning on Draft EIR page 4.10-42).

3.12.1.3 RECREATIONAL FACILITIES ACREAGE

Comment

(Chris Schulman, October 19, 2010) [105-3 RE]

"School yards should not be included as part of the list of facilities (Table 4.10-1 and Figure 4.10-2) as they are either not open to the public or are restricted to weekend use. This adds to the park acres listed and leads the table to be misleading. Furthermore, several park facilities have severe restrictions, including open only children (Turk and Hyde Mini Park) or are open only several hours per week (Boedeker Park.)"

Response RE-3

The comment questions whether school yards should be included as part of the list of parks and related facilities (see Table 4.10-1) because some of them are not open to the public and have restricted use. In 2008, the San Francisco Unified School District and the City of San Francisco launched a pilot program which opened 11 schoolyards to neighborhoods during weekend hours. The use of schoolyards as publicly accessible open space during non-school hours increases community access to recreational space and increases the quantity of usable open space in the community. Participating schools are considered public recreational resources, and therefore, are included in the list of recreational resources within 0.5 mile of each CPMC campus. Although some park facilities or schoolyards have restrictions on use, they are considered public permanent open space for CEQA purposes. Rosa Parks Elementary School, which is located within 0.5 mile of the Pacific Campus and the proposed Cathedral Hill Campus, is a participating school in the pilot program that is considered a public recreational resource, and therefore, is included as part of the list of recreational resources within 0.5 mile of the Pacific Campus and the proposed Cathedral Hill Campus. The comment is correct in that not all schoolyards listed in the Draft EIR are open to the public. Out of the eight schoolyards listed in the Draft EIR as "public," only Rosa Parks Elementary School at 1501 O'Farrell Street is participating in the pilot program that opens its schoolyard to the public on weekends. The Draft EIR has been revised to reflect the correct names and acreages of publicly accessible schoolyards in the vicinity of CPMC facilities. See Chapter 4, Section 4.1.8 on pages 4-7 through 4-10 of this C&R document for further clarification. As noted on page 4.10-3 of the CPMC LRDP Draft EIR, the City and County of San Francisco has not established a citywide target ratio of parkland to residents. Therefore, the open space and park acres presented in Tables 4.10-1, 4.10-2, 4.10-3, 4.10-4, and 4.10-5 (see pages 4.10-6, 4.10-11, 4.10-15, 4.10-19, and 4.10-24, of the Draft EIR, respectively) are presented for informational purposes regarding the environmental setting of the CPMC LRDP campuses. The inclusion or exclusion of the Rosa Parks Elementary School schoolyard would not change the LRDP impact conclusion for Impact RE-1 on page 4.10-35 of the Draft EIR. The demand for neighborhood and regional parks or other recreational facilities that could result from

potential new households and new residences created under CPMC LRDP's near-term projects would not represent a considerable contribution to the existing citywide demand for public recreational facilities. Thus, implementation of the LRDP would not result in substantial physical deterioration of existing recreational resources. As described on Draft EIR pages 4.10-34 through 4.10-41 in Section 4.10, "Recreation," the proposed CPMC LRDP would result in less than significant impacts from all proposed CPMC LRDP development at all campuses related to substantial physical deterioration of nearby facilities or facilities citywide and the incremental use of nearby recreational facilities and open space.

Comment

(Chris Schulman, October 19, 2010) [105-6 RE]

"I am pleased to see that the DEIR noted that the Cathedral Hill campus is located in a part of the City that has been recognized for decades as a high need area. The reference however, that the campus sites are not located within areas that are desirable for conversion to public open space (page 4.10-28) is misleading. The proposed update to the open space component of the general plan clearly states that private properties are not identified for open space transition as a policy decision. There is no reason while open space could not be designated on significant parts of the campus and this reference must be struck.

I look forward to the EIR being updated to property reflect the above and other recreation related issues that are identified."

Response RE-4

The comment notes that the Cathedral Hill Campus is located in a high need area of the City. The comment suggests that a statement regarding conversion of areas to public open space made in the Draft EIR is misleading. The statement is found on Draft EIR page 4.10-28 and reads as follows: "According to Map 4 of the Recreation and Open Space Element, titled 'Citywide Recreation and Open Space Plan,' none of the existing or proposed CPMC campus sites are located within areas identified as desirable for conversion to public open space." (This map essentially identifies parcels proposed for public open space use by the City). The comment states that private properties are not identified for open space transition in the City's Recreation and Open Space Element of the General Plan. Lastly, the comment notes there is no reason why portions of the proposed Cathedral Hill Campus could not be designated as public open space.

The statement referenced above was included in the Draft EIR analysis to demonstrate that none of the CPMC campus sites—specifically the proposed Cathedral Hill Campus—were identified for open space acquisition by the City. While the updated Recreation and Open Space Element (2009)[4] does indicate that the City is now focusing on publicly owned sites to determine their feasibility for park site acquisition,[5] since the proposed CPMC LRDP is an active proposal under the Planning Department's consideration, it is reasonable to assume the City does not anticipate the Cathedral Hill Campus or any portion of it would be considered for potential conversion to open space. The 1986 Recreation and Open Space Element states that a privately owned site can be proposed for public open space use. The 1986 Recreation and Open Space Element is still considered the governing policy document with respect to recreation and open space in the City, and therefore, is referenced in the Draft EIR. As noted in the comment and in the updated 2009 Recreation and Open Space Element, private properties are not identified for open space transition. The statement regarding Map 4 on page 4.10-28 of the Draft EIR has not been removed, as it is considered accurate and because there is no City requirement for privately owned properties such as the Cathedral Hill Campus to provide public open space.

[4] At the time of the preparation of this Final EIR, the City's Recreation and Open Space Element of the General Plan has not been adopted.

[5] San Francisco Planning Department. 2009. San Francisco General Plan Recreation and Open Space Element Update. Policy 2.6 Map 3. San Francisco, CA.

3.12.2 CATHEDRAL HILL CAMPUS

Comment

(Chris Schulman, October 19, 2010) [105-1 RE]

"My comments are limited to the recreation component of the EIR as it relates to the Cathedral Hill Campus. I would also like to express my support for comments made by Lower Polk Neighbors."

Response RE-5

The comment is noted. This comment does not raise issues regarding the adequacy, accuracy, or completeness of the Draft EIR. The comments from Lower Polk neighbors to which this comment generally refers are addressed in Responses RE-1 through RE-6 of this section of the C&R document. The comment will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project.

3.12.2.1 DEMAND FOR RECREATIONAL FACILITIES

Comments

(Carolyn Abst and Ron Case—Case + Abst Architects LLP, October 19, 2010)[102-37 RE, duplicate comment was provided in 114-37 RE]

"III. Comments related to proposed community recreational facility

With regards to recreational impacts, the DEIR provides that the General Plan's Recreation and Open Space Element states that. 'To the extent it reasonably can, the City should increase the per capita supply of public open space within the City.' In addition, the Recreation and Open Space Element provides that the focus of the updated element includes 'improving access to open space and prioritizing open space acquisitions and improvements in high need areas.'

As noted on page 4.10-28, the proposed Cathedral Hill campus location is identified in a high need area where the City seeks to provide new open space. While the DEIR indicates that the proposed Cathedral Hill campus would intensify the activity and uses on campus and could generate more trips to local nearby parks than under current conditions, the only additional park facilities provided as part of the Cathedral Hill campus are a privately owned, but publicly accessible, outdoor courtyard located on the fifth floor podium level of the hospital. There are also some additional public spaces that are referenced in the DEIR and that include different activity zones, but those spaces are not further defined in the DEIR."

(Carolyn Abst and Ron Case—Case + Abst Architects LLP, October 19, 2010) [102-38 RE, duplicate comment was provided in 114-38 RE]

"While the DEIR concludes that the near-term project would result in an incremental increase in demand on nearby facilities associated with the proposed Cathedral Hill hospital and medical facility, the incremental increase in demand would not result in a need to expand the existing recreational facilities or construct new facilities or cause physical deterioration of nearby parks and open spaces. Notwithstanding these findings, we understand that CPMC is considering providing additional privately managed park space near the CPMC facility for the benefit of its employees and the adjoining area. The proposed location of the additional recreational facility may be constrained because of the unwillingness of the owner to sell the property. To that end, we recommend that CPMC look for other nearby adjacent property on which such a privately managed open space could be constructed."

(Lower Polk Neighbors, Oct 19, 2010) [103-28 RE, duplicate comment was provided in 113-28 RE]

"3. Open Space/Environment

Establish an open-space park along Polk Street that would be privately owned by CPMC with 24 hour security and monitoring. Park to have ample landscaping (with seating) and attended toilet facilities. (Currently the best location seems to be on the Southwest corner of Polk and Geary Street. If this location is not feasible for purchase then another location of similar size.)"

(Lower Polk Neighbors, October 19, 2010) [103-29 RE, duplicate comment was provided in 113-29 RE]

"B. Fund the design and construction of two parklets (mini-parks) per block along Polk Street. Parklets are to be along the existing sidewalk and take up two existing street parking spaces. (See attached "Approach" as established by Rebar)

C. Reduce the east side bus zone on Polk Street between Post and Geary to be the same size as the west side. Use the captured space for a parklet."

(Lower Polk Neighbors, October 19, 2010) [103-38 RE, duplicate comment was provided in 113-38 RE]

" e. No provision for open space in CHC plan

i. The majority of San Francisco's parkland is located within the western half of the city. San Francisco's eastern neighborhoods are considered parkland deficient compared to areas that are closer to the Pacific Ocean. The Eastern Neighborhoods Rezoning and Area Plans Environmental Impact Report indicates that it is possible to improve the parkland-to-population ratio in the eastern portions of San Francisco—or to maintain the current ratio despite projected population increases—by creating nontraditional open space, passing regulatory amendments to govern new development, issuing ecological standards for design of public and private open space, and creating an open space network (4.10-4). The National Park and Recreation Association (NPRA) formerly required 10 acres of open space per 1,000 city residents. However, the NPRA no longer recommends a single absolute "average" park acreage per population, in recognition of the fact it is more relevant for each area plan and its program facilities to be based on community need. More important than acreage is accessibility (location and walking distance) and whether the facility provides needed services to the population in question (4.10-2). The CHC project is a significant redevelopment of the Lower Polk Street area but does not provide new public recreation opportunities within its boundaries. Other uses of this site could have potentially offered such opportunities. Therefore we propose that non-traditional recreation spaces are provided in the surrounding neighborhood instead. The east-west alleyways and some areas of Polk Street are prime opportunities for such spaces.

ii. Interim Phase:

1. Parklets – site-specific parklets and installations can be designed to introduce park and recreational features

a. Mobile playgrounds
b. Flexible seating options in the alleys and along Polk Street
c. Public bicycle repair station

2. Programming in public space:

a. Mural painting programs in the alleys, and along Polk Street
b. Local community garden programs
c. Rotating public art schedule

3. Redesign of alleys (see site-specific proposals)

iii. Long-Term Phase:

4. Redesign of alleys (see site-specific proposals)"

(Chris Schulman, October 19, 2010) [105-5 RE]

"The Near-Term projects for the Cathedral Hill campus on page 4.10-42 indicate that a 'privately owned, publicly accessible outdoor courtyard' will be created at this campus. It is followed by a statement that 'the courtyard will be available for use by patients, visitors, and personnel of CPMC.' This indicates that the general public, including homeless and other socially and economically challenged persons who can most benefit from open space will not be welcome or will need to go through a visitor check in process. This is not publically available space- it will be for private use. The open space included in this project, while still significantly undeserving the community and not mitigating the effects to the neighborhood must be accessible from the street."

Response RE-6

The comments state that the proposed Cathedral Hill Campus under the LRDP would only provide one outdoor courtyard area on the fifth floor of the Cathedral Hill hospital structure and a few outdoor "activity zones" that is not well-defined in the Draft EIR, and that additional mitigation of open space/recreation impacts are necessary due to the increase in activity and use of recreational uses on site (proposed Cathedral Hill Campus) and in the LRDP vicinity. The comments also state several potential mitigations that could be incorporated into the Draft EIR that would, in the eyes of the commenters, reduce potential recreation impacts of the proposed LRDP development at Cathedral Hill. These include funding and establishing a park along Polk Street or other parcels adjacent to the Cathedral Hill Campus with amenities including 24-hour security, public benches, and restrooms, and creating parklets in the project vicinity.

As discussed in Section 4.10, "Recreation" (Draft EIR, page 4.10-49), the increased demand on parks and recreational facilities resulting from the proposed LRDP would be distributed citywide, and would not place undue pressure on or adversely affect a specific neighborhood or park. There would be no reduction in the amount of public open space currently available near any CPMC campus as a result of the proposed LRDP. Although the proposed Cathedral Hill Campus is located in a designated high-need area, there are 20 publicly accessible parks and open space areas within a 0.5-mile radius, including Lafayette Park, Jefferson Square, Margaret S. Hayward Playground, and several smaller neighborhood parks such as Cottage Row Mini Park and the Tenderloin Park and Recreation Center. The future citywide parkland-to-population ratio resulting from the proposed CPMC LRDP (7.1 acres to 1,000 residents [Draft EIR page 4.10-50]), would still be higher than the sufficient ratio for park use noted in the General Plan (5.5 acres per 1,000 residents) and the ratio considered acceptable per State regulations (3 to 5 acres per 1,000 residents). Therefore, there would be sufficient parkland and open space in the City to serve the new populations associated with the proposed CPMC LRDP. The proposed CPMC LRDP would not result in substantial physical deterioration of existing citywide recreational resources (Draft EIR page 4.10-35). However, the project sponsor is providing 6,600 square feet (sq. ft.) of privately owned outdoor courtyard, which would be available for use only by patients, visitors, and personnel of CPMC. The comment is correct that the Cathedral Hill Hospital outdoor courtyard would be a private open space area. In response to the comments, the text in the last sentence in the first paragraph and the first sentence in the second paragraph on Draft EIR page 4.10-42 has been revised as follows, to accurately reflect the outdoor courtyard at the Cathedral Hill Hospital would be a private space:

> The near-term projects under the LRDP include the addition of privately owned, publicly accessible open space at the proposed ~~Cathedral Hill,~~ Davies~~,~~ and St. Luke's Campuses.
>
> A privately owned, ~~publicly accessible~~ outdoor courtyard (approximately 6,600 sq. ft.) would be located on the podium component of the Cathedral Hill Hospital, with access from Level 5 (Figure 2-21, "Cathedral Hill Hospital—Level 5," page 2-81).

Public spaces composed of different activity zones are also proposed as part of the proposed Cathedral Hill Campus development. For more detailed information on the proposed activity zones, which include

entry plazas, transit stops, passenger drop-off zones, a kiosk market, the Cedar Street entry plaza and multiuse plaza, and retail frontage, refer to the discussion in Section 2.2 Cathedral Hill Project Description (Draft EIR pages 2-35 through 2-36). Given that on-site open space amenities would be provided at the proposed Cathedral Hill Campus, it is expected that on-site open space would help absorb some of the campus-related daily population demand on nearby parks and recreational facilities, thus offsetting any potential additional demand and physical deterioration of neighborhood parks caused by CPMC personnel and visitors due to the proposed Cathedral Hill Campus development.

The Draft EIR concluded that impacts related to parks and recreation, including those in the vicinity of the Cathedral Hill Campus, would be less than significant, because the increased citywide demand on parks and recreational facilities resulting from the proposed CPMC LRDP would not be substantial and the provision of open space as a mitigation measure is not required. A discussion of mitigation measures is required under CEQA only for significant environmental impacts. California Public Resources Code Sections 21100(b)(3), 21150; Code of Regulations, title 14, Section 15126.4(a)(3). Private land purchases for conversion to open space are outside of the scope of this EIR. Furthermore, as an institutional use and based on the zoning district where each campus is located, the proposed LRDP is not subject to any open space requirements (San Francisco Planning Code Section 209.3[a]), and impacts were determined to be less than significant with respect to demand for additional recreation space. Thus, the comment recommendation that CPMC acquire adjacent property to manage as private open space and establish and fund additional park space is not necessary under CEQA. It should also be noted that CPMC, separate from the CEQA process, is currently coordinating with Lower Polk Merchants regarding the possible provision of additional open space in the form of "parklets" as a design feature of the proposed Cathedral Hill Campus.

3.12.3 PACIFIC CAMPUS

3.12.3.1 ACCESS TO RECREATIONAL FACILITIES

Comment

(Paul Wermer—CPMC Neighbors Coalition and Pacific Heights Residents, October 18, 2010) [67-34 RE]

"9) Recreation

Comments provided during the scoping process were not addressed. Merely considering population increase is inadequate. In the case of Pacific site, for example, increased vehicular traffic and increased parking pressure may reduce access to Lafayette Park, especially for those with reduced mobility who find crossing busy streets difficult."

Response RE-7

This comment raises the concern that comments provided during the CPMC LRDP EIR scoping period were not addressed in the Draft EIR. The comment also makes a statement that assessment of impacts related to parks and recreation services should be measured by more than just an increase in population and that the ability to travel a particular distance due to other variables, including vehicle and pedestrian traffic, topography, and commuter mobility, should be considered. The comment is particularly concerned with the accessibility of Lafayette Park, due to increased vehicular traffic and parking pressures of the proposed LRDP development at the Pacific Campus and how this may present challenges for those with reduced mobility while crossing busy streets, which is a public safety/pedestrian conflict issue.

Oral and written comments were collected during the comment period for the Notice of Preparation of an EIR (NOP) for the CPMC LRDP, which was from May 27, 2009 through June 26, 2009. The comments on the content of the NOP were considered, evaluated, and used to assist in reviewing the scope and

content of the environmental impact analysis and information contained in the Draft EIR for the proposed CPMC LRDP. Therefore, the EIR public scoping process comments assisted in the preparation of the CPMC LRDP EIR.

Recreational demand is generally determined relative to an increase in population created by a project. The Draft EIR used projected increases in residential and daily population resulting from the CPMC LRDP to estimate the anticipated demand for recreational resources locally near various existing and proposed CPMC facilities as well as citywide, due to residential demand generated by the CPMC LRDP. Impacts on public parks and recreation areas were determined by evaluating whether CPMC's proposed LRDP would create or exacerbate deficiencies in citywide public parks and recreational facilities through increased demand, or whether LRDP construction activities would significantly compromise the use of nearby parks or create the need for new public parks and recreational facilities. Given that the proposed LRDP would induce an increase in housing demand in both the near-term and long-term, the Draft EIR analyzed citywide residential population projections to determine whether new recreational facilities would be needed to provide adequate future recreational facilities. The Draft EIR also evaluated the potential for localized impacts on nearby parks resulting from increases in daily population (CPMC personnel, patients, and visitors) from various CPMC facilities in particular neighborhoods that could lead to increased use of existing neighborhood parks, particularly during the lunch hour or before or after shifts at various CPMC facilities.

Development under the proposed CPMC LRDP would occur in various parts of San Francisco; therefore, project-related demand for recreational facilities would not be concentrated in a specific area, but would be spread throughout the City. Because project-related demand for open space would be distributed citywide, it would be unlikely to place excessive demand on Lafayette Park or any specific neighborhood or park. Such demand would be further reduced because hospitals and other medical facilities tend to operate in shifts, which spread out employee patterns throughout the day rather than concentrating the use of parks by CPMC employees at times when neighbors would also be likely to use parks.

As it pertains to parks and recreation facilities near the Pacific Campus—which is the focus of the comment—there would be a net decrease in the average daily population at the Pacific Campus of 1,450 people by 2030, thereby potentially reducing the number of CPMC-generated visitor trips to local parks near this campus, compared to 2006 levels. In terms of parking availability and increased traffic affecting current accessibility and also potential safety related to crossing busy streets for reduced mobility pedestrians at Lafayette Park, Pacific Campus components of the proposed LRDP include the addition of a two-level parking structure—known as the Webster Street/Sacramento Street Underground Parking Garage—that would provide approximately 248 parking spaces in 2018. Furthermore, a new street—Campus Drive (located between the existing Pacific Professional Building and the proposed Ambulatory Care Center [ACC] Addition)—would be built to support existing vehicular access to the Pacific Campus from Webster Street; to provide vehicular access to and from Clay Street for the proposed Webster Street/Sacramento Street Underground Parking Garage; and to allow egress from Sacramento Street for loading and unloading. The underground parking garage and vehicular access via Campus Drive would absorb some of the Pacific Campus-related traffic and parking needs. Therefore, it is expected that accessibility of Lafayette Park with the proposed LRDP development at Pacific Campus would be similar to current conditions. For more information on existing and proposed site access at the Pacific Campus, refer to Draft EIR pages 2-114 through 2-118. In addition, as noted in Impact TR-62 (pages 4.5-71 and 4.5-173 of the Draft EIR), proposed LRDP development at Pacific Campus would not result in substantial overcrowding on public sidewalks, create hazardous conditions for pedestrians, or otherwise interfere with pedestrian accessibility to adjoining areas, including parks.

The comment regarding access may also refer to the ability of certain individuals to travel over particular landscapes due to topography, traffic concerns, or personal physical limitations. Refer to Response RE-1 (page C&R 3.12-1) for an explanation of why the use of a modified distance metric is considered

inappropriate and the use of the citywide 0.5-mile radius parameter used in the Draft EIR is considered appropriate when considering availability of local recreational resources.

3.12.3.2 RECREATIONAL FACILITIES ACREAGE

Comment

(Arthur and Jacqueline Cimento, October 19, 2010) [78-9 RE, duplicate comment was provided in 99-9 RE]

"In particular, we would like consideration of using this footprint for more open space in our neighborhood as opposed to the current plan which reduces open space (page 4.2 -149). This project represents a rare opportunity to create open space. One viable alternative that should be considered is the elimination of the above ground portion of the garage entirely and the creation of an open space and park. Given the primary and secondary impacts of the parking facility, we believe that these are reasonable alternatives that should be considered."

Response RE-8

The comment requests that the proposed footprint of the Pacific Campus be considered for providing more open space for the neighborhood surrounding the campus. The comment makes reference to a statement made in Section 4.2, "Aesthetics" that suggests the proposed LRDP would result in less open space than currently exists. Draft EIR page 4.2-149 states that: "The [Pacific] campus would be more densely developed with somewhat less *open space* than exists at present." To clarify, the use of the term "open space" in this context is referring to the areas of private open land that create separation between the buildings at Pacific Campus. Such space is usually a limited proportion of ground space available for use by the users of the buildings and may serve as a storage site or walking corridor or to provide a general appearance of openness. These on-site open space areas are not publicly owned recreational resources, although some of them are publically accessible. For more discussion on the specific uses of these private open space areas, refer to Section 4.10, "Recreation" (Draft EIR page 4.10-13). While a reduction in private open space would occur under the proposed LRDP at the Pacific Campus, it should be clarified that these on-site open space areas are not public open spaces, and there would be no reduction in public open space in the city or nearby CPMC neighborhoods as a result of the proposed LRDP. There are no existing public open spaces or recreation areas at any of the existing CPMC campuses. All new construction and renovation at these campuses would occur entirely within the existing campus or proposed footprints. Because the Draft EIR does not identify significant impacts with respect to recreation, the provision of park space is not required under CEQA. Furthermore, as noted on page 4.10-29 in Section 4.10, "Recreation," because the CPMC campuses are institutional uses and based on the zoning districts within which each campus is located, the proposed LRDP is not subject to any open space requirement.

The comment suggests eliminating the aboveground portion of the North-of-Clay Aboveground Parking Garage and creating a new open space or park in its place. The comment suggests that this alternative for the Pacific Campus development would be a reasonable alternative considering the primary and secondary impacts of the proposed parking facility development at the Pacific Campus under the LRDP.

Pursuant to CEQA Guidelines Section 15126.6(a):

> An EIR shall describe a range of reasonable alternatives to the project, or to the location of the project, which would feasibly attain most of the basic objectives of the project but would avoid or substantially lessen any of the significant effects of the project, and evaluate the comparative merits of the alternatives.

It is assumed that the comment is referring to the direct and indirect impacts associated with the development of the proposed the North-of-Clay Aboveground Parking Garage related to noise, air quality,

and greenhouse gas emissions. Significant and unavoidable impacts for noise (groundborne vibration), air quality, and greenhouse gas emissions under the proposed LRDP are identified in the Draft EIR on pages 6-4 and 6-5. It is anticipated that with or without the aboveground portion of the proposed parking structure at the Pacific Campus under the LRDP, these impacts would not be reduced and would remain significant and unavoidable, because development of other proposed development at the Pacific Campus would still exceed thresholds of significance. As such, the elimination of the aboveground portion of the parking facility would not be required to be considered as an alternative under CEQA. Development of the suggested open space/park on top of the North-of-Clay Aboveground Parking Garage would most likely result in the same significant and unavoidable groundborne vibration impacts (Impact NO-5 on page 4.6-95 of the Draft EIR) and air quality impacts (Impact AQ-3 on page 4.7-41 of the Draft EIR) at the Pacific Campus due to the level and type of construction impacts that would occur and the distance to nearby sensitive receptors.

In addition, the proposed North-of-Clay Parking Garage would provide a substantial portion of the proposed 715 new parking spaces at the Pacific Campus, although the exact number has yet to be determined at this stage of planning of the Pacific Campus under the proposed CPMC LRDP. As explained on pages 4.5-162 and 4.5-163 in the Draft EIR, San Francisco does not consider parking supply as part of the permanent physical environment and, therefore, does not consider changes in parking conditions to be environmental impacts as defined by CEQA. The San Francisco Planning Department acknowledges, however, that parking conditions may be of interest to the public and the decision-makers. Therefore, a parking analysis and discussion for the proposed LRDP is presented in the Draft EIR for information purposes. With implementation of the proposed CPMC LRDP, a total of 1,587 off-street parking spaces would be provided, including 715 spaces in the proposed Webster/Sacramento and North-of-Clay Parking Garages. As discussed in Responses TR-69 and TR-71 (pages C&R 3.7-129 and C&R 3.7-138, respectively), the purpose of the additional parking supply, whether it was aboveground or below grade, would be to accommodate the parking demand generated by the proposed LRDP uses at the Pacific Campus. An alternative to the LRDP development at the Pacific Campus that did not include additional parking supply would perpetuate the parking shortfall and, therefore, was not considered. This comment may be considered by the decision-makers as part of their deliberations on the project.

3.12.4 CALIFORNIA CAMPUS

No comments pertaining to recreation or open space resources and solely related to this campus were received during public review of the Draft EIR.

3.12.5 DAVIES CAMPUS

3.12.5.1 IMPROVEMENTS TO RECREATIONAL FACILITIES

Comment

(Mark Schroer, September 23, 2010) [PC-205 RE]

"In addition to being a neighbor to the Davies campus, I am the past President and a current Board member of Friends of Duboce Park. And for the past four years, CPMC has been a great neighbor and a very good partner to Friends of Duboce Park. They have consistently worked with and collaborated with Friends of Duboce Park on a number of projects. They were the lead donor for the Scott Street Labyrinth that was dedicated in 2007, and they've committed a sizeable donation to the latest capital project in Duboce Park, the youth play area next to the playground. And we hope to break ground on that project early next year. Duboce Park, like other parks in other neighborhoods, is very important to the entire Duboce triangle, and their contributions to park projects benefit the entire community by improving the quality of life in our neighborhood. The proposed project as outlined in the DEIR will increase usage of Duboce Park and other parks and recreational facilities near the Davies and St.

Luke's Campuses through development and projected activation by both patients and employees. Both at Davies, as well as for other campuses, CPMC's proposed projects include street beautification efforts that include tree plantings and landscaping enhancements. Some improvements have already been made on the east side of Davies, where they did some traffic calming. I request that the project proceed forward. They are great neighbors."

Response RE-9

The comment states that the proposed CPMC LRDP would increase the use of Duboce Park and that CPMC has undertaken certain measures such as tree planting and landscaping enhancements in the vicinity of the Davies Campus in the past. The comment is noted. This comment does not raise issues regarding the adequacy, accuracy, or completeness of the Draft EIR. The comment will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project.

3.12.6 ST. LUKE'S CAMPUS

No comments pertaining to recreation or open space resources and solely related to this campus were received during public review of the Draft EIR.

3.13 PUBLIC SERVICES

3.13.1 LRDP

Comment

(Paul Wermer—CPMC Neighbors Coalition and Pacific Heights Residents, October 18, 2010) [67-37 PS]

"PUBLIC SERVICES: no specific comments."

Response PS-1

The comment is noted. This comment does not raise issues regarding the adequacy, accuracy, or completeness of the Draft EIR. The comment will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project.

Comment

(Gloria Smith—California Nurses Association, October 20, 2010) [96-21 PS, duplicate comment was provided in 110-21 PS]

"VI. The Draft EIR Fails to Evaluate Potentially Significant Adverse Impacts on Public Services Associated with the CPMC LRDP

The California Environmental Quality Act ('CEQA') Guidelines, Appendix G, require that the environmental review of a project include the assessment of impacts to public services. Specifically, Appendix G requires the lead agency to identify:

'Would the project result in substantial adverse impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered facilities…, *in order to maintain acceptable service ratios, response times, or other performance objectives for any of the public services:*

Fire Protection?
Police Protection?
Schools?
Parks?
Other public facilities?'

While the Draft EIR contains a discussion of response times of the City's Fire Department, Police Department and finds these adequate to handle the demand by the LRDP[26], it does not analyze the impacts on these services associated with the qualitative changes in the patient population described above and the associated impacts on response times due to transfer of patients to other hospitals in the region. The Draft EIR entirely fails to address the impacts on service ratios, response times, and other performance objectives to other public hospitals, including government and county-funded community hospitals, that would result from patient populations having to migrate within or out of the City.

[26] Draft EIR at Section 4.11 Public Services."

Response PS-2

This comment suggests that the CPMC LRDP Draft EIR failed to analyze the impacts of the proposed LRDP related to response times of the City's fire and police departments, associated with qualitative changes in the patient population and the associated impacts on response times due to the transfer of

patients to other hospitals in the region. Furthermore, the comment states that the Draft EIR fails to address the CPMC LRDP's impacts on service ratios, response times, and other City fire and police department performance objectives to other hospitals due to migrating patient populations within or outside of the City.

The commenter's letter has been assigned the code Letter 96. Section II of Letter 96 has been assigned comment codes 96-5 HC and 96-6 HC and discusses the CPMC LRDP's impacts on health care access and quality resulting from the citywide and regional reduction of licensed beds. This issue is addressed in Master Response HC-5 (page C&R 3.23-20), which discuss the LRDP's effect on emergency services. No substantial evidence was presented in Letter 96 that the proposed LRDP would increase demand on or otherwise weaken or undercut emergency room services at existing facilities.

Refer to Master Responses HC-1 and HC-9 (pages C&R 3.23-1 and 3.23-39, respectively) regarding the need to transfer patients to other non-CPMC health care facilities. As noted in Master Response HC-5, under the proposed LRDP, two emergency services locations would be closed (at the California and Pacific Campuses).[1] However, for the entirety of the CPMC system, total combined emergency and urgent care capacity would increase, from the current 88,000 visits per year to over 100,000 visits per year at the Cathedral Hill, Davies, and St. Luke's Hospitals. The LRDP would not result in significant adverse changes to the availability or distribution of health care services in the City. As noted in Response HC-2 (page C&R 3.23-52), the record does not support the suggestion that travel time to emergency and hospital rooms would be increased, because of the reduction in the number of licensed beds and removal of all skilled nursing services at the St. Luke's Campus under the LRDP. The record indicates that the proposed LRDP would not result in a transfer or redistribution of services or patients, including emergency department patients. As explained by The Lewin Group, independent experts selected by the City to evaluate the institutional master plan (IMP) on behalf of the Department of Public Health, "[t]he [LRDP] plan expands access to staffed acute-care beds, ambulatory care services, emergency services, diagnostic testing resources availability, and outpatient care access points without significantly altering patient access patterns.[2] These additional services represent an increase in the availability of health care services in San Francisco."[3]

No substantial evidence was presented in this comment or the remainder of Letter 96 regarding the circumstances that would dictate migrating patient populations to other locations within or outside of the City. Because the issue of migrating patients is similar to the transfer of patients, refer to Master Response HC-1 (page C&R 3.23-1) and the text above, which describe why patient services would not be reduced due to the proposed CPMC LRDP. As such, providing additional analysis of response times of the City's fire and police departments related to the qualitative changes in the patient population and transfer of or migrating patients to other hospitals in the region beyond information presented in the Draft EIR is not warranted. The CPMC LRDP Draft EIR's analysis of potential public services impacts, including response times for emergency services in the project area, is adequate and appropriate under CEQA. These impacts were determined to be less than significant, as stated in the Draft EIR.

3.13.2 CATHEDRAL HILL CAMPUS

No comments pertaining to public services and solely related to this campus were received during public review of the Draft EIR.

[1] The Pacific Campus Emergency Department would be renovated and used for urgent care. The California Campus Emergency Department and Emergency Department services at Pacific Campus would be transferred to the proposed Cathedral Hill Campus.

3.14 UTILITIES AND SERVICE SYSTEMS

3.14.1 LRDP

Comment

(Barbara Ann Berwick, September 23, 2010) [36-1 UT]

"1. Have the needs for water, gas, electricity, sewer, garbage and public transit been adequately addressed?"

Response UT-1

The comment expresses concern regarding the assessment of impacts in the CPMC LRDP Draft EIR related to water, natural gas, electricity, sewer, solid waste collection/disposal, and public transit. The anticipated LRDP-related needs for water, gas, electricity, sewer, garbage, public transit, and the capacity of the existing infrastructure to handle these needs have been addressed as part of the analysis in the Draft EIR. More specifically, Section 4.12 "Utilities and Service Systems," of the Draft EIR describes the major utilities and service systems related to the existing and proposed CPMC campuses, including evaluation of water (supply, demand, and infrastructure); wastewater and stormwater; and solid waste related to the LRDP (see pages 4.23-24 through 4.23-46 of the Draft EIR). Impacts to public transit are evaluated for the proposed Cathedral Hill Campus in Impacts TR-27 through TR-36 (Draft EIR pages 4.5-118 through 4.5-128), for the Pacific Campus in Impact TR-60 (Draft EIR page 4.5-168), for the California Campus in Impact TR-68 (Draft EIR page 4.5-180), for the Davies Campus in Impact TR-77 (Draft EIR page 4.5-187), and for the St. Luke's Campus in Impact TR-86 (Draft EIR page 4.5-201), resulting from implementation of the proposed LRDP at the existing and proposed CPMC campuses. A discussion of electricity and natural gas usage at the CPMC campuses is included on pages 4.17-7 through 4.17-10 in Section 4.17, "Mineral and Energy Resources" of the Draft EIR.

In Sections 4.5, 4.12, and 4.17 of the Draft EIR, the direct and indirect impacts of the proposed LRDP are evaluated in accordance with the requirements of State CEQA Guidelines Sections 15064(d) and 15126.2(a). Where appropriate, the CPMC LRDP Draft EIR analyses consider the effects of project construction, as well as near- and long-term operational impacts. The near- and long-term projects of the LRDP are listed in Section 1.3 of the Draft EIR on pages 1-13 and 1-14. In addition to the analysis of the proposed CPMC LRDP itself, the Draft EIR includes analyses of the potential cumulative impacts of the proposed LRDP in combination with other recent past, present, and reasonably foreseeable projects, consistent with the requirements of State CEQA Guidelines Section 15130. Lastly, where significant or potentially significant impacts are identified, the CPMC LRDP Draft EIR sections identify all feasible measures that could avoid or reduce the magnitude of the impacts, consistent with the requirements of State CEQA Guidelines Section 15126.4. For these reasons, the analyses of water, gas, electricity, sewer, garbage, and public transit are considered to be adequately addressed in the CPMC LRDP Draft EIR.

Comment

(Paul Wermer—CPMC Neighbors Coalition and Pacific Heights Residents, October 18, 2010) [67-36 UT]

"Utilities and Service Systems: no specific comments"

Response UT-2

The comment does not identify any specific comments on the utilities and service systems analyses of the CPMC LRDP Draft EIR. The comment is noted. This comment does not raise issues regarding the adequacy, accuracy, or completeness of the Draft EIR. The comment will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project.

Comment

(SFPUC Water Conservation Section, September 23, 2010) [120-2 UT]

Finally, for portions of the project that involve improvements to existing facilities, the SFPUC may be able to provide rebates for the purchase of high efficiency toilets (1.28 gpf or lower) and urinals (1.0 gpf or lower) that replace inefficient toilets (3.5 gpf or higher) and urinals (2.0 gpf or higher).

Response UT-3

The comment identifies potential rebates for energy efficient wastewater facilities. The comment is noted. The project sponsor will determine the level of participation in the San Francisco Public Utilities Commission (SFPUC) rebate program at the appropriate time. The comment does not raise issues regarding the adequacy, accuracy, or completeness of the Draft EIR. The comment will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project.

3.14.1.1 REGULATORY FRAMEWORK

Comment

(Ken Kortkamp—SFPUC Urban Watershed Management Program, September 21, 2010) [17-1 UT]

"Thank you for the opportunity to review the project referenced above. The following are the SFPUC Urban Watershed Management Program's (UWMP) comments.

Typical abbreviations: SDG: San Francisco Stormwater Design Guidelines, SCP: Stormwater Control Plan, SMO: San Francisco Stormwater Management Ordinance, BMP: Stormwater Best Management Practice, ROW: Right of Way, CSS; Combined Sewer System

General Comments:

I. Chapter 3.2, p3-26, ADD: 'San Francisco Stormwater Management Ordinance - The San Francisco Stormwater Management Ordinance was enacted into law on May 22, 2010. This new ordinance requires that all projects disturbing over 5,000 square feet of land surface comply with the Stormwater Design Guidelines (SDG) and submit a Stormwater Control Plan (SCP). As stated in the Stormwater Design Guidelines, the project will meet required stormwater management performance measure by achieving LEED® SSc6.1 for all project sites located in the combined sewer system areas'."

Response UT-4

The comment requests that additional text be added to the CPMC LRDP Draft EIR to address the San Francisco Stormwater Management Ordinance. City plans, policies, and ordinances related to water and stormwater are contained in Draft EIR Section 4.12, "Utilities" in Subsection 4.12.2, "Regulatory Framework." The following text is added to Draft EIR page 4.12-21, above the heading "San Francisco Electricity Resource Plan" to reflect the addition of the SF Stormwater Management Ordinance discussion:

San Francisco Stormwater Management Ordinance

The San Francisco Stormwater Management Ordinance was enacted into law on May 22, 2010. This new ordinance requires that all projects disturbing over 5,000 square feet of land surface comply with the Stormwater Design Guidelines (SDG) and submit a Stormwater Control Plan (SCP). As stated in the Stormwater Design Guidelines, a project will meet the required stormwater management performance

measure by achieving LEED® Sustainable Sites Credit 6.1 for all project sites located in the combined sewer system areas.

Comment

(Ken Kortkamp—SFPUC Urban Watershed Management Program, September 21, 2010) [17-2 UT]

"2. Chapter 4.12.2, p4.12-21, PI, ADD: ... April 6, 2010, 'and adopted into law May 22, 2010.' 3. Chapter 4.12.2, p4.12-21, PI, REMOVE: 'Adoption and'..."

Response UT-5

The comment suggests specific revisions to the text in the CPMC LRDP Draft EIR. The text in the first full paragraph of Draft EIR page 4.12-21 has been revised as follows, to clarify adoption of the Stormwater Management Ordinance:

> In addition, the *San Francisco Stormwater Design Guidelines* require development of an operation and maintenance plan that identifies responsible parties, funding sources, maintenance activities, and schedules for all best management practices (BMPs). The San Francisco Board of Supervisors adopted the *San Francisco Stormwater Design Guidelines* in the form of the San Francisco Stormwater Management Ordinance on April 6, 2010, which was adopted into law May 22, 2010.[1] ~~Adoption and i~~ Implementation of this ordinance will improve San Francisco's environment by reducing pollution in stormwater runoff in areas of new development and redevelopment. SFPUC staff members are currently developing additional guidance for achieving LEED® Sustainable Sites Credit 6.1 in combined sewer areas.

Comment

(SFPUC Water Conservation Section, September 23, 2010) [120-1 UT]

"Please consider the following two local ordinances that may affect planned development, as well as rebate programs for which CPMC might be eligible. First, the Commercial Water Conservation Ordinance amending Chapter 13A of the San Francisco building code requires water-efficient fixtures be installed in all commercial building by 2017, upon additions that increase floor space by 10 percent, or improvements over $150,000. The requirements also apply to new construction. The ordinance mandates the following flow rates for all fixtures:

- Low-Flow Showerheads- 2.5 gallons per minute (gpm)
- Faucets and Faucet Aerators- 2,2 gpm
- Toilets- 1.6 gallons per flush (gpf)
- Urinals- 1.0 gpf

The ordinance also requires a water conservation inspection be performed by the Department of Building Inspection's Plumbing Inspection Division to certify compliance.

Second, the SFPUC is proposing a water efficient irrigation ordinance to bring the City into compliance with state law AB 1881, the Water Conservation in Landscaping Act. The ordinance would require all property owners with landscaping projects over 1,000 square feet to submit landscape documentation to the SFPUC to ensure water efficient irrigation of the space. If over 2,500 square *feet* of landscape is planned at a given location, the SFPUC will require applicants to submit full landscape design and irrigation plans, a soil management report, water budget worksheet, and a grading design plan. Landscapes over 2,500 square feet will require the services of a licensed landscape professional to certify the necessary documentation. The SFPUC anticipates that the water efficient irrigation ordinance will go into effect early 2011."

[1] San Francisco Public Utilities Commission. 2010. Stormwater Management Ordinance (April 6, 2010).

Response UT-6

The comment suggests that additional discussion of two local ordinances that may affect the proposed CPMC LRDP be included in the Draft EIR. The proposed CPMC LRDP would comply with all local ordinances and applicable regulations, including the Commercial Water Conservation Ordinance. For long-term projects, the proposed LRDP would comply with all local ordinances and regulations applicable at the time of construction.

The text on Draft EIR page 4.12-19 has been revised as follows, to incorporate the Commercial Water Conservation Ordinance:

Commercial Water Conservation Ordinance No. 77-09

Effective July 1, 2009, the City of San Francisco Commercial Water Conservation Ordinance (No. 77-09) updated building code guidelines to require retrofit of all commercial properties with water-efficient plumbing fixtures. It states that commercial properties must be retrofitted when undergoing certain tenant improvements, but all fixtures must be updated by January 1, 2017. The ordinance is expected to save San Francisco up to 4 million gallons of water per day by the year 2017. The conservation ordinance established the following guidelines for commercial properties:

1. All showerheads have a maximum flow of 2.5 gallons per minute (gpm)
2. All showers have no more than one showerhead per valve
3. All faucets and faucet aerators have a maximum flow rate of 2.2 gpm
4. All Water Closets (toilets) have a maximum rated water consumption of 1.6 gallons per flush (gpf)
5. All urinals have a maximum flow rate of 1.0 gpf
6. All water leaks have been repaired

Certification of compliance with San Francisco's Water Conservation Ordinance must be obtained through the San Francisco Department of Building Inspection (DBI).

The text on Draft EIR page 4.12-19 has been revised as follows, to incorporate the proposed Water Efficient Irrigation Ordinance:

Proposed Water Efficient Irrigation Ordinance

The San Francisco Public Utilities Commission (SFPUC) is proposing a water-efficient irrigation ordinance to bring the City into compliance with state law AB 1881, the Water Conservation in Landscaping Act. The ordinance would require all property owners with landscaping projects over 1,000 square feet to submit landscape documentation to the SFPUC to ensure water-efficient irrigation of the space. If over 2,500 square feet of landscaping is planned at a given location, the SFPUC will require applicants to submit full landscape design and irrigation plans, a soil management report, water budget worksheet, and a grading design plan. Landscaping projects over 2,500 square feet will require the services of a licensed landscape professional, to certify the necessary documentation. The SFPUC anticipates that the water-efficient irrigation ordinance will go into effect in early 2011.

3.14.2 CATHEDRAL HILL CAMPUS

No comments pertaining to utilities and service systems and solely related to this campus were received during public review of the Draft EIR.

3.14.3 PACIFIC CAMPUS

No comments pertaining to utilities and service systems and solely related to this campus were received during public review of the Draft EIR.

3.14.4 CALIFORNIA CAMPUS

No comments pertaining to utilities and service systems and solely related to this campus were received during public review of the Draft EIR.

3.15.1 LRDP

No comments pertaining to Biological Resources and related to the entire LRDP were received during public review of the Draft EIR.

3.15.2 CATHEDRAL HILL CAMPUS

3.15.2.1 BIRD STRIKE

Comment

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-93 BI, duplicate comment was provided in 30-93 BI]

"In addition, Page 2-27 states, 'The hospital's exterior design would be primarily composed of metal and glass. Various glass materials at the hospital facade along Van Ness Avenue and Post Street would be used to create a composition intended to be intriguing both during the day and at night.' Also, on Page 4.2-188, the DEIR states, '... exterior building materials, such as low-reflection metals and glass, would be used in construction of the new buildings at the Cathedral Hill Campus site. When installed properly, these types of exterior building materials are not considered reflective.' Although not reflective, perhaps birds are attracted to them, and although, as stated on Page 4.2-188, 'mirrored, highly reflective, or densely tinted glass except as an architectural or decorative element' is allowed, perhaps it should be determined where to place them so there will be no bird-strikes."

Response BI-1

The comment refers to reflective glass materials restricted for use by Planning Commission Resolution No. 9212, as referenced on Page 4.2-188 of the Draft EIR. The comment questions where these materials would be used on the proposed Cathedral Hill Hospital under the LRDP. Highly reflective materials would not be used on the exterior of the proposed Cathedral Hill Hospital. The building skin is composed predominantly of opaque curtainwall and metal panel systems, with limited areas of clear vision glass at locations in accordance with building code requirements.

The comment also suggests that birds may be attracted to the proposed Cathedral Hill Campus buildings even though low-reflective glass would be used. Per the City's Standards for Bird-Safe Buildings (October 2011), bird impact mitigation measures incorporated in the projects include glass surface "visual noise" measures such as fritted patterns, non-reflective translucent and opaque spandrel glass in contrasting patterns, extensive and pronounced mullions throughout glazed areas, and motorized blinds behind clear glass areas. These measures serve to articulate and make visible the surface of the building's skin, which would help to mitigate potential bird strikes. In addition, the proposed Cathedral Hill development would not be adjacent, across the street, or in close proximity to a large water body, nor is it close to any substantial open space of 1 acre or greater. According to the Planning Department's Standards for Bird-Safe Buildings,[1] both of the above-noted factors are directly related to a marked increase in building-related bird strikes.

The comment is noted and does not raise issues regarding the adequacy, accuracy, or completeness of the Draft EIR. The comment will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project.

[1] Standards for Bird-Safe Buildings, San Francisco Planning Department, Ordinance 199-11, adopted October, 2011.

Comments

(Rose Hillson—Member, Jordan Park Improvement Association, September, September 23, 2010) [18-92 BI, duplicate comment was provided in 30-92 BI]

"In relation to this biological impact, what about the wild parrots of Telegraph Hill? They are very frequently seen on the tall buildings in close proximity to the Cathedral Hill Hospital/MOB area. Parrots are very intelligent birds and usually will not nest in areas that appear to be hazardous; however, if they have already found trees for nesting, I am not so sure they will take to re-nesting elsewhere if disturbed and especially if there are not enough days left in the breeding season when disturbed. If a tree with a parrot's nest is taken away, the parrot will have to find another tree. They use the tree trunk itself as a nest and they do not build flimsy nests like other birds. They do not nest in any kind of tree either. The cherry-headed conures have a nesting season around the first day of summer and the little ones may not fledge until September, perhaps around the autumnal equinox, so the CPMC 'nesting period' that ends on August 15 would be problematic for these avian ambassadors of San Francisco."

(Rose Hillson— Member, Jordan Park Improvement Association, September 23, 2010) [18-94 BI, duplicate comment was provided in 30-94 BI]

"The parrots of Telegraph Hill have crashed into glass and become stunned so my concern is about the safety of the glass used for these and other wildlife and as well the lighting of the glass at night that may be problematic for some of the higher altitude wildlife. Sure, the parrots are not 'endangered species' or 'migratory birds' but they do migrate across the length and breadth of the City to forage for food and to find nesting sites. So that is a concern I would like to see mitigated/resolved. The purpose here is not to provide nesting sites. The point is that when trees that are known to be used by certain birds are destroyed and similar species are not reintroduced in the same area, these birds will have to go elsewhere and they may not breed so that will lead to fewer of them being able to survive in this city. Although it is the standard practice for the San Francisco Planning Department's Major Environmental Review Section to only concern itself with the California Department of Fish and Game's stated breeding timeframes, I think people will think that in this City some consideration should be given to these special birds that are a huge tourist draw."

Response BI-2

These comments note concern regarding potential impacts to the wild parrots of Telegraph Hill, possible collisions with glass used in building construction, and the resulting effects on breeding and migration. Please refer to Response BI-3 (page C&R 3.15-3) regarding breeding timeframes presented in Mitigation Measure M-BI-N1, and Response BI-1 (page C&R 3.15-1) regarding potential bird collisions with buildings.

The non-native, red-masked parakeets and other feral parrots in San Francisco are not protected under the Migratory Bird Treaty Act and generally are not considered as special-status species under CEQA. Please refer to Response BI-4 (page C&R 3.15-4) for a discussion of how wildlife impacts were evaluated using the significance criteria presented in the Draft EIR. Feral parrots may be considered for protection under San Francisco Municipal Code Section 485, which states that "[i]t shall be unlawful for any person to trap, capture, kill or otherwise destroy any wild bird within the City and County of San Francisco, except that pigeons and other wild birds which become a nuisance or a hazard to public health may be trapped or captured, in a humane manner, by, or with the permission of, the Director of Public Health." However, the CPMC project is not expected to conflict with Section 485 of the San Francisco Municipal Code because no feral parrot species have been reported as nesting at the project sites, nor were any observed during surveys conducted for the proposed LRDP. Therefore, under CEQA, it is appropriate to consider impacts to feral parrots as less than significant. The commenter provides no evidence that is contrary to this conclusion.

The importance of Telegraph Hill parrots to the City and its tourists is acknowledged. However, the comment provides no evidence to support a conclusion that impacts to the birds should be considered significant under CEQA. Mark Bittner, author of *The Wild Parrots on Telegraph Hill,* reports that the parrots prefer to nest in existing cavities in eucalyptus and palm trees, specifically the canary island date palm. Based on the surveys conducted as part of the proposed LRDP, none of the CPMC campuses evaluated are considered to present a substantial percentage of either type of this tree species in the City. For example, on the proposed Cathedral Hill Campus, only one very small windmill palm was noted. The suggestion that birds may have to go elsewhere or may not breed is unsubstantiated and speculative, given that the parrots are not known to nest on any of the proposed LRDP sites at the various CPMC campuses and that they have already demonstrated the ability to successfully adapt to a largely urbanized environment.

3.15.2.2 NESTING BIRDS

Comment

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-90 BI, duplicate comment was provided in 30-90 BI]

"52. Page S-69, Impact BI-1 states, 'tree and shrub removal and vegetation clearing required at most of the CPMC campus sites during project construction may potentially disturb nesting birds and could result in destruction of bird nests, a potential violation of the California Fish and Game Code or the Migratory Bird Treaty Act,' and mitigates this with Mitigation Measure M-BI-N1 which describes the nesting season as 'January 15 through August 15.' In another DEIR I read, the nesting season for San Francisco was different. Why these dates for this DEIR? On Page 4.13-16 in the 'Biological Resources' section, the DEIR states that across all 5 CPMC sites, bird nests have been found and field surveys included rock dove (Columba livia), American crow (Corvus rachyrhynchos), American robin (Turdus migratorius), white-crowned sparrow (Zonotrichia leucophrys), Anna's hummingbird (Calypte anna), and house sparrow (Passer domesticus). As well, the DEIR states that 'birds may use the secluded ornamental grounds and vegetation on the sites.'"

Response BI-3

The comment restates information from the CPMC LRDP Draft EIR regarding potential impacts to nesting birds and mitigation proposed to reduce those impacts to a less-than-significant level. The comment also reiterates information stated in the Draft EIR, page 4.13-16, regarding birds observed during field surveys.

The comment indicates that the nesting season identified in Mitigation Measure M-BI-N1 of the Draft EIR is different from another Draft EIR that the commenter has read, without noting the difference between the two documents. The nesting season for birds varies by species. As stated in the CPMC LRDP Draft EIR, page 4.13-19, the bird nesting season in California is generally recognized to be from March 15 through August 15. The nesting season identified in Mitigation Measure M-BI-N1 (January 15 through August 15) was extended by 2 months to provide a greater level of protection for nesting birds, in recognition that a small percentage of birds in the San Francisco area begin nesting before March 15.

Comment

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-91 BI, duplicate comment was provided in 30-91 BI]

"Wildlife does not necessarily return to an area that has been severely changed and for which there is not enough mature trees or appropriate landscaping for them. It took ten years for any mourning doves to return to a site adjacent to a residential demolition job which clearly was not as massive a job as this CPMC job will be. A

project as big as the 4 campuses for CPMC may likely keep many wildlife away for years subsequent as well and may have an impact on their breeding cycles if they cannot find appropriate breeding grounds. From what I have seen, in birds, living in mature trees is not the same as living in the small plantings on the rooftops of buildings because humans are too close to them. Birds tend to not nest in greenery that are close to humans or if they do because there is no other available mature tree around, they will attack the humans. Some birds such as California quail live in the underbrush and these birds will not roost in highrises."

Response BI-4

The comment states that construction related to the CPMC LRDP might keep wildlife away for years subsequent to the LRDP development and might impact breeding cycles of wildlife. The morning dove, a very common species found throughout San Francisco, is used as an example in the comment. The comment does not make direct reference to the Draft EIR or present any information that questions that adequacy of the analysis in the CPMC LRDP. The thresholds, used to evaluate the significance of impacts on wildlife for this project, are presented in the Draft EIR, page 4.13-17. Specifically, Criteria 13a states that the proposed LRDP would have a significant effect if it would have a substantial adverse effect, either directly or through habitat modification, on any species identified a candidate, sensitive, or special-status species. Special-status species occurred historically in the project area, as acknowledged in the Draft EIR, page 4.13-1. However, as stated in the Draft EIR, page 4.13-15, the habitats and requirements for the historic special-status species are now absent at all CPMC campuses.

As stated in the Draft EIR, page 4.13-16, habitat for nesting birds is present on site at all proposed and existing CPMC campuses. As described under Mitigation Measure M-BI-N1 in the Draft EIR, page 4.13-19, before any LRDP-related demolition or construction activities occurring during the nesting season (January 15 through August 15) that would involve removal of trees or shrubs, CPMC shall conduct a preconstruction survey for nesting birds at each of its medical campuses. If active nests are located during the preconstruction bird nesting survey, CPMC would contact the California Department of Fish and Game (DFG) for guidance on obtaining and complying with the Section 1801 of the California Fish and Game Code, which might include setting up and maintaining a line-of-sight buffer area around the active nest and prohibiting construction activities within the buffer; modifying construction activities; and/or removing or relocating active nests. As stated in the Draft EIR, page 4.13-18, trees removed during demolition would be replaced after construction, in accordance with the Urban Forestry Ordinance and Section 143 of the Planning Code.

As further described under Impact BI-1 in the Draft EIR, beginning on page 4.13-18, it is unlikely that the small strips of vegetation and trees at the CPMC campuses, in an urban setting like San Francisco, would be considered a vital hub or corridor for daily or seasonal bird movements. The size of the planted areas proposed for the CPMC campuses landscaping would not provide sufficient shelter to support permanent populations, and the proposed vegetated areas would represent a very small portion of the available habitat for migratory and resident birds in San Francisco. Most of the bird species that were seen on site at various CPMC campuses and would be found nesting in the current plantings of ornamental vegetation, such as rock dove, house sparrow, and American crow, have been characterized as "urban exploiter" species that benefit overall from human restructuring of the landscape and tend to dominate densely urbanized areas, such as those that surround the existing CPMC campuses. Although the removal of these plantings might constitute a temporary loss of breeding habitat for individuals of these species, the viability of their populations within the urban landscape is anticipated to remain unaffected.

Comment

(Hossein Sepas, October 19, 2010) [82-5 BI, duplicate comment was provided in 83-5 BI]

"Birds:

Jefferson Square Park is large, is used by many birds, and is only a quarter of a mile away from the proposed tower. The 'bird issue' was used in part to stop the 555 Washington tower, next to the Transamerica Pyramid, yet the proposed 555 Washington tower was only half as tall as its immediate neighbor and much shorter than many other buildings nearby. If this rule applied at 555 Washington then it will surely apply at CPMC since it would be the only glass high rise in that area (and they are proposing blue glass). The closeness of the park ensures that migrating birds will be in the vicinity of the proposed glass tower."

Response BI-5

This comment regarding the potential effects on birds has been noted. As stated in the Draft EIR, page 4.13-18, "Although the movements of resident and migratory birds in San Francisco are poorly known, it is unlikely that the small strips of vegetation along the various CPMC campuses' parking lots in an urban setting like San Francisco would be considered a vital hub or corridor for daily or seasonal bird movements." The nearby presence of Jefferson Square Park does not change this conclusion.

All proposed projects are evaluated based on the best available information and science at the time of the preparation of the EIR. The issues that were raised in the context of the 555 Washington project are relevant only in that the City considers the specifics of potential effects on birds of all projects subject to CEQA. However, the City will consider the potential effects on birds based on the specifics of the proposed CPMC LRDP development, not the 555 Washington project. Refer to Response BI-1 (page C&R 3.15-1) for a discussion of building material and design considerations that have been and will be made with respect to birds in the vicinity of the CPMC campuses.

3.15.2.3 TREE INVENTORY

Comment

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-95 BI, duplicate comment was provided in 30-95 BI]

"As far as the species of trees on the campuses, what is the inventory of trees at each of the CPMC construction sites? The Administrative documents that supplement this CPMC DEIR showed a diagram of the trees (round circles on a map) but I could not find what trees exactly were on the campuses. I could not find a list for each campus. Is it available?"

Response BI-6

The comment inquires about the species of trees that are located at the CPMC campuses. As noted in Section 4.13, "Biological Resources" in the Draft EIR, pages 4.13-7 through 4.13-10, approximately 905 trees (over 20 species) currently exist on the four existing and one proposed CPMC campuses. The species of trees at each campus may be found in several reports, including *Final Tree Report – CPMC, Davies Campus* and *Tree Inventory, CPMC St. Luke's and Cathedral Hill*.[2] These reports are available for review at the Planning Department, 1650 Mission Street, Suite 400, as part of the project file. Additional tree inventory data for the Pacific and California campuses also is available at the Planning Department, although formal inventory reports have not been prepared.

[2] California Pacific Medical Center. 2006. *Final Tree Report, California Pacific Medical Center— Davies Campus.* San Francisco, CA. Prepared by Hortscience Inc., San Francisco, CA. AECOM. 2009. Tree Inventory Report, CPMC, St. Luke's and Cathedral Hill Campuses. November 24.

3.15.2.4 TREE REMOVAL/RETENTION

Comment

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-150 BI, duplicate comment was provided in 30-150 BI]

"87. On Page 4.2-108, the 'types and species of trees proposed to replace the existing trees are detailed in Section 4.13, Biological Resources.' The specific section should be 'Section 4.13-24' wherein the species for replacement plantings are London plane (Platanus x acerfifolia) on Geary and Brisband box (Tristania conferta) on Van Ness Avenue. It would be helpful to see the schematic of the project with these trees drawn in. In another section, reference was made to having broad-leafed trees such as maple planted. Where will those be located?"

Response BI-7

The comment requests a schematic of the proposed LRDP development at the Cathedral Hill Campus which includes the referenced tree species. Detailed landscape plans for the Cathedral Hill Campus or other CPMC campuses indicating the specific locations of proposed plantings by type of plant species have not yet been completed for the proposed LRDP. Further, such details were not necessary for the preparation of the analysis in the Draft EIR. The adverse biological effects of the proposed LRDP at the proposed Cathedral Hill Campus are primarily tied to the removal of existing vegetation, the potential for loss of bird species because of tree removal, or resulting from LRDP construction-related activities. Proposed landscaping plans, which provide documentation of the approximate location of future trees on the campus, were provided as part of the Draft EIR but do not specifically identify the precise species at each location. The City does, however, maintain the ability to review and comment on the final landscape plans, to be able to ensure compliance with regulatory requirements. As stated in the Draft EIR, page 4.13-24, "Once the landscape plan is finalized, CPMC would need to submit it to DPW for review and approval of species, as well as confirmation that the plan meets the removal permit's replacement requirements." This would occur after completion of the EIR. The landscaping plan for the proposed Cathedral Hill Campus is presented in Figure 2-37, "Cathedral Hill Campus–Proposed Streetscape Plan" in the Draft EIR, page 2-101.

The purpose of an EIR is the disclosure of significant environmental effects of a proposed action, in this case the approval and construction of the CPMC LRDP. The presentation in the Draft EIR of essentially final landscape design plans would not result in the disclosure of any new environmental impacts, nor would such plans have the potential to disclose a substantial increase in the magnitude of the environmental impacts presented in the Draft EIR. Furthermore, the nature or efficacy of mitigation measures would not be affected by the precise location of specific species of plants and trees on the proposed Cathedral Hill Campus site.

Comment

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-151 BI, duplicate comment was provided in 30-151 BI]

"88. On Page 4.2-130, the DEIR states that the following streets will have trees planted on them:

- Van Ness Avenue, east side between Geary & Cedar
- Van Ness Avenue, west side between Geary and Post
- Van Ness Avenue median
- Geary Blvd. between Van Ness & Franklin
- Franklin between Geary & Post
- Post between Franklin & Van Ness

- Geary between Van Ness &the eastern edge of the campus (to where?)
- Cedar Street between Van Ness &the eastern edge of the campus (to where?)

I would like to know if the canopy coverage of the trees that will be removed will be equivalent to the canopy coverage of the trees that will be planted. And while the trees are young and do not have as large a canopy, perhaps there could be other greenery installed to make up for the loss of canopy until the trees mature."

Response BI-8

The comment notes that the canopies of replacement trees would likely be smaller than the trees to be removed as part of the proposed LRDP development at the Cathedral Hill Campus; however, all tree replacement would be conducted in accordance with the City's adopted streetscape programs, Urban Forest Ordinance, and policies for street landscaping of new development. As described in Section 143 of the Planning Code, street trees would be a minimum of one 24-inch box tree for each 20 feet of frontage of the property along each street or alley, with any remaining fraction of 10 feet or more of frontage requiring an additional tree. The species of trees selected also would be required to be suitable for the site and, in the case of trees installed in the public right-of-way, the species and locations would be subject to approval by the Department of Public Works (DPW). Over time, the landscaping proposed by CPMC is anticipated to provide more trees and much more canopy than currently exists at the proposed Cathedral Hill Campus. Furthermore, the loss of existing tree canopy that would occur immediately from tree removal at the proposed Cathedral Hill Campus under the LRDP would be considered temporary because they would be replaced and mature over time in accordance with the City's ordinance.

Comment

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-157 BI, duplicate comment was provided in 30-157 BI]

"92. In regards to trees on the campuses ... under the 'Biological Resources' section, on Page 4.13-8 (and in the 'Aesthetics' section on Page 4.2-34), the DEIR states that for the Pacific Campus, 177 trees including a buckeye will be removed. Although none of the trees are considered significant when the survey was done in 2004, perhaps some have grown in the last 6 years to the point where they are now considered significant. Table 4.13-3 on Page 4.13-8 shows that 86 of the 177 trees will be removed. Is the buckeye one of them? The species listed for the Pacific Campus include the following but it is not clear which are being removed:

- buckeye
- incense cedar
- pittosporum
- California sycamore
- New Zealand Christmas tree"

Response BI-9

The comment inquires about the significance of the buckeye tree located at the Pacific Campus, and about which trees would be removed during LRDP construction at the Pacific Campus. Construction of the Pacific Campus is expected to result in the removal of one buckeye, 17 incense cedars, 15 pittosporum, 10 California sycamores, and 11 New Zealand Christmas trees. However, the tree removal plan under the LRDP for the Pacific Campus is considered program-level and more conceptual, and is subject to change when more detailed design and construction plans are developed in the future, after the EIR is certified. During this phase of the project, a new tree survey would be conducted. If as a result of that survey, additional trees, including the aforementioned buckeye, are determined to be significant, their removal, if necessary, would be conducted in accordance with City policy/requirements under the Urban Forestry Ordinance.

Comments

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-158 BI, duplicate comment was provided in 30-158 BI]

"93. On Page 4.13-7, Table 4.13-2, the DEIR states that 77 trees exist at the Cathedral Hill Hospital site with 7 trees to be considered significant. Of these, all 77 trees including the significant trees will be removed. In this same table, the Cathedral Hill MOB site has 7 trees of which 0 are significant. All 7 are to be removed. Also, for the 1375 Sutter MOB site, 22 trees and 22 street trees exist, with none being surveyed as being "significant" and 0 to be removed. In total, there are 106 trees of which 7 are significant. Out of the 84 that will be removed, all 7 significant trees will be removed.

It would be helpful if the DEIR identified at least the species of trees of significant trees that will be removed from the Cathedral Hill projects in this DEIR rather than having to make a separate trip to the Planning Department to read the 'Cathedral Hill Campus and MOB Tree Inventory' that was prepared by AECOM of Oakland, CA, in August of 2009. It appears that on Page 4.13-23 through Page 4.13-24, 7 significant trees 'are all junipers on the east end of the proposed hospital and 5 in the median between Van Ness Avenue and the front drive of the existing hotel north of the parking lot entrance and the other 2 south of the parking lot entrance between the building and the sidewalk. The junipers range in height from approximately 15 feet to 30 feet.'

It is hoped that the amount of pollution/carbon sequestration of the proposed trees will not be less than that taken out but sufficient to mitigate the air quality and other environmental impacts that are left unmitigated. Leaving it unmitigated should not be an option."

(Lower Polk Neighbors, October 19, 2010) [103-34 BI, duplicate comment was provided in 113-34 BI]

"**2) Neighborhood Impacts and Proposed Responses in the Lower Polk area.**

a. Loss of significant vegetation

i. Currently there are 81 trees on CHC site, 77 on hospital site, 4 on MOB site, including 53 street trees, 7 "significant trees" (4.13-2); all trees are proposed for removal at CHC campus (4.13-23). Although the CHC plan calls for the replacement of up to 99 trees, it will be many years before this vegetation attains the stature and benefits of the vegetation it replaces. Therefore, <u>the neighborhood will be impacted by decades without the benefit of vegetation it once had.</u>

ii. Interim Phase

1. Movable tree boxes
2. "Green walls" on existing buildings
3. Large portable planters for growing ornamental and/or edible plants.

iii. Long-term Phase:

1. Interim/reversible plantings will inform the location and design of long-term street trees and other plantings.
2. Planting projects could include the redesign or removal of significant portions of paving and relate to stormwater projects.

Response BI-10

The comments inquire about tree species at the Cathedral Hill Campus that have been identified as significant and would be removed under the LRDP. The comments are noted. As stated in the Draft EIR, page 4.13-24, the seven significant trees are all junipers, distributed along the east end of the site of the proposed hospital, with five in the median between Van Ness Avenue and the front drive of the existing building that was once a hotel, north of the parking lot entrance and the other two, south of the parking lot entrance between the building and the sidewalk. The specific species types of juniper observed at the

proposed Cathedral Hill Campus were not identified and this information is not considered necessary for the purposes of assessing significance to biological resources in the EIR under CEQA.

As noted on Draft EIR page 4.13-23, tree removal proposed to be conducted at any of the CPMC campuses development sites under the LRDP would be performed in accordance with the City's Urban Forestry Ordinance and Section 143 of the City Planning Code. As stated in Section 143, Subsection 806, Part (b)(3)(A), the City shall require that a street tree or trees of equivalent replacement value to the one removed be planted in the place of the removed tree. Furthermore, the LRDP includes a substantial landscaping component for proposed development at the various CPMC campuses that includes numerous trees to replace those that are slated for removal. Lastly, as noted in Response GH-1 (page C&R 3.10-3), the proposed CPMC LRDP includes numerous methods to reduce GHG and air emissions, including potential green-roofing options that would increase the carbon sequestration capabilities of each LRDP campus site on which they are implemented. Even though it is not possible to quantify the potential additional reductions that could occur at each development site with the implementation of emission reduction features such as green roofs, it is reasonable to assume that the proposed CPMC LRDP would not reduce the carbon sequestration capabilities of local landscaping due to the City requirements for the replacement of trees at an equivalent replacement value, which may exceed a 1:1 ratio, depending on the size and species of trees available for replacement.

Comment

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-160 BI, duplicate comment was provided in 30-160 BI]

"95. On the Davies Campus, out of the 287 trees, 42 of which are street trees and 81 of which are significant trees, 111 will be removed and 26 of these are significant trees that will be removed. What species will be removed?"

Response BI-11

The comment inquires about which species of trees that would be removed from the Davies Campus with proposed LRDP development at this campus. As indicated on the *Davies Campus Tree Removal Plan*, the following trees are proposed to be removed because of LRDP-related construction: tree numbers 77-127; 179-198; 204-209; 232-252; 284-287. The species of these trees are identified in the *Final Tree Report for the Davies Campus* and include the following species[3]:

- Italian stone pine
- Monterey pine
- Cordyline
- Aleppo pine
- Monterey cypress
- Blackwood acacia
- Acacia
- Myoporum
- Coast live oak
- Deodar cedar
- Victorian box
- Coast redwood
- Hollywood juniper
- Marina madrone
- New Zealand Christmas tree

Comments

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-162 BI, duplicate comment was provided in 30-162 BI]

"97. In the Administrative documents (Biology -- #5, CPMC Davies Campus) that accompany the CPMC DEIR, there was a note about manzanita (Arctostaphylos sp.) existing in the East Parking Lot of the Davies Campus. The manzanita is in 'fair overall condition,' its age is 'semi-mature' and it is noted that its 'relative abundance' is 'rare' in the August 2006 report by James Clark of HortScience. All the landscape vegetation will be eliminated in this East Parking Lot for the new Neuroscience building.

It is very troubling that CPMC would consider killing this 'rare' species of manzanita rather than allowing it to be saved and having it contribute to the perpetuation of the genes of this species that used to grow in the area. It is not very large and should not take much to move it. The plants will add to the biodiversity of the San Francisco Manzanita genotypes which are being found less and less as time goes on due to larger development projects. In the whole scheme of things, it is slated to be destroyed anyway so why not save it for the sake of this native species and to educate future generations?"

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [PC-152 BI]

"…and one thing I really would like to talk about, since we're not having too much time but 48 seconds, is there's a rare species of Manzanita at the Davies Campus and, according to CEQA, Appendix G, Section 17, Paragraph A, this will threaten to eliminate a plant, reduce the number of a rare or endangered plant or animal, and it is considered rare according to *Hort Science Consultant Report,* and I submit to you my full report. Thank you very much."

Response BI-12

The comments reference the manzanita located in the east parking lot of the Davies Campus, and suggest that the species should be relocated under the proposed LRDP. Per e-mail correspondence with James Clark of HortScience, Mr. Clark clarified that "Rare" refers to frequency of the species at the site, not in nature. The Manzanita species, while rare on site, it is not rare in general and is found or easily available in nature. He further stated that "the landscape at the Davies Campus is entirely artificial. None of the plants are indigenous to the site. The manzanita that is present is a cultivated variety, sold in the nursery trade, rather than something that was present prior to the site being constructed."[4] The comment's recommendation that the manzanita be transplanted before LRDP construction is noted, and it may be possible to relocate the manzanita to a separate location within the Davies Campus site during the development of final landscaping plans. However, the existing manzanita, which is not considered a special-status species, is located within the construction footprint of the proposed Neuroscience Institute building to be located on the Davies Campus. Furthermore, as noted by Mr. Clark, manzanita are available at several retail locations throughout the San Francisco Bay Area and its retention is not considered necessary to promote educational awareness regarding biological diversity.

Comment

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-161 BI, duplicate comment was provided in 30-161 BI]

"96. On Page 4.13-10, Table 4.13-6, shows that out of the 112 trees on the St. Luke's Campus, 9 are street trees, 37 are significant trees and 28 trees of which 14 significant trees will be removed. What are the species of trees slated for removal? It is not clear in the Administrative documents. Will the Moreton Bay fig tree, a landmark tree (Page 4.13-14), on St. Luke's Campus be felled?

[4] Email correspondence with Jim Clark of Hortscience, October 8, 2010.

In the Administrative documents that accompany the CPMC DEIR, it was noted that the Moreton Bay Fig landmark tree at St. Luke's had a branch failure after a storm; the branch has been cabled."

Response BI-13

The comment inquires about the species of trees that are proposed to be removed at the St. Luke's Campus as part of the proposed CPMC LRDP. As is described in the Draft EIR, pages 4.13-8 and 4.13-9, the St. Luke's Campus is the site of a Moreton Bay fig tree that has been designated as a landmark tree. Information on this tree is provided in Biological Resources Administrative record item number 9, "Tree Inventory, CPMC St. Luke's and Cathedral Hill," page 18, *St. Luke's Tree Inventory*,[5] tree number 797, and Figure 2, "Tree Inventory- St. Luke's Campus," page 10; and in the St. Luke's tree removal plan. The commenter correctly reiterates information from the Draft EIR, which discloses that this tree was damaged in a storm. According to a phone conversation between AECOM Biologist Sean Avent and Carla Short,[6] San Francisco Department of Public Works, Tree/Urban Forestry, the tree was cut back to the main stem. As stated in the Draft EIR, page 4.13-26, the Moreton Bay fig tree located at the St. Luke's Campus would not be removed as part of the proposed LRDP. Furthermore, Improvement Measure I-BI-N2, presented in the Draft EIR, page 4.13-27, would ensure that a tree protection plan would be implemented to protect the landmark Moreton Bay fig tree during LRDP construction at the St. Luke's Campus.

3.15.2.5 GENERAL

Comment

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [37-10 BI]

"12. **Tree issues**, rare manzanita species at Davies, nesting period for wild parrots, birdstrikes & materials, e.g. are issues for mitigation."

Response BI-14

The comment raises general concerns regarding impacts to trees that would have secondary impacts on nesting birds. Please refer to Response BI-13 (page C&R 3.15-11), related to the rare manzanita; Response BI-2 (page C&R 3.15-2), related to the nesting of wild parrots; and Response BI-1 (page C&R 3.15-1), related to bird strikes and building materials. As noted in the above responses, the proposed LRDP was determined to not impact special-status species and, therefore, mitigation under CEQA is not required.

Comment

(Paul Wermer—CPMC Neighbors Coalition and Pacific Heights Residents Association, October 18, 2010) [67-38 BI]

"12. Biological Resources: no specific comments."

[5] California Pacific Medical Center. 2009. *Final Tree Report, California Pacific Medical Center—St. Luke's Campus.* San Francisco, CA. Prepared by Hortscience Inc., San Francisco, CA.

[6] Short, Carla. Urban Forester. San Francisco Department of Public Works. March 1, 2010—telephone conversation with Sean Avent of AECOM regarding damage and repair of a landmark tree at the St. Luke's Campus.

Response BI-15

The comment is noted. This comment does not raise issues regarding the adequacy, accuracy, or completeness of the Draft EIR. The comment will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project.

Comment

(Donald Scherl, MD, October 15, 2010) [74-31 BI]

"4.13: Biological Resources: The 'amusing' element in this section is that greater concern is expressed for birds et. al., than there is for 'significant receptors.' – in other words, for people, in this section and throughout the draft EIR."

Response BI-16

This comment regarding the potential effects on people rather than on birds has been noted. As required by CEQA, an EIR addresses the potential environmental consequences of a proposed action on a wide array of environmental issues. Some sections of the EIR address effects on the human environment, considering such issues as exposure of human beings to hazardous materials, air pollution, noise, public safety risks, and the like. Other sections of the EIR focus on the effects of the project on the non-human natural environment, considering such issues as direct and indirect effects on flora and fauna, changes to water quality, etc. The biological resources section analyzes the substantial adverse effects on habitat, any species identified as a candidate, sensitive, or special-status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service. All other topic areas are analyzed on whether or not substantial adverse effects would occur to people, such as air quality, transportation, aesthetics, noise, or wind and shadow. The purpose of the EIR is to present this breadth of information in an objective, unbiased manner and allow the individual reader to understand and make determinations and value judgments as to the importance of one impact compared to the importance of another. Ultimately, it is the decision-makers, the Planning Commission, and the Board of Supervisors who determine the significance of impacts, which impacts can and should be mitigated through the imposition of mitigation measures, and whether the project warrants approval in light of the environmental effects of implementation.

This comment does not raise issues regarding the adequacy, accuracy, or completeness of the Draft EIR. The comment will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project.

3.16 GEOLOGY AND SOILS

3.16.1 LRDP

Comment

(Paul Wermer—CPMC Neighbors Coalition and Pacific Heights Residents, October 18, 2010)[67-39 GE]

"13) GEOLOGY AND SOILS: no specific comments."

Response GE-1

The comment is noted. This comment does not raise issues regarding the adequacy, accuracy, or completeness of the Draft EIR. The comment will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project.

Comment

(Margaret Kettunen Zegart, October 20, 2010) [97-13 GE]

"The location and number of additional relevant earthquake faults and their likelihood should be included in the DEIR."

Response GE-2

The comment suggests that the location and number of additional relevant earthquake faults be detailed in the CPMC LRDP Draft EIR, and that the probability of earthquakes occurring along these faults also be provided. The location and number of relevant earthquake faults, as well as the probability of earthquakes are included in the Draft EIR, beginning on page 4.14-3. Major regional earthquake faults, including their locations and estimated potential Moment Magnitudes, are presented in Figure 4.14-1 and in Table 4.14-1 on pages 4.14-4 and 4.14-5 of the Draft EIR, respectively. Additionally, Table 4.14-3 on page 4.14-7 of the Draft EIR presents the percent probability (as determined by the U.S. Geological Survey) of a magnitude 6.7 or greater earthquake occurrence for major earthquake faults in the region between 2007 and 2037. As such, the Draft EIR presented the location and number of relevant earthquake faults in the region, as well as the percent probability of a major earthquake event, consistent with the comment's request.

Comment

(Chris Poland, September 23, 2010) [PC-193 GE]

"President Miguel, members of the Planning Commission, I am Chris Poland. I am a structural engineer, earthquake engineer, with over 40 years of experience. I am the Chairman and CEO of Degenkolb Engineers, one of San Francisco's oldest and largest structural engineering firms. I am an expert in earthquake engineering. I chair two congressionally mandated committees that advise earthquake programs at the national level, one is a research program, the National Earthquake Hazard Reduction Program, and the other is related to the Veteran Affairs facilities nationwide. I also chair the San Francisco Planning Urban Research Association's Resilient City Initiative, and we are working hard and looking at what San Francisco needs to have done to be able to recover from the next great earthquake. I would also like to say that I was a member of the Hospital Building Safety Board, which advises the State Hospital Program from 1991 to 1999, right during the time that the SB 1953 requirements were being developed. The DEIR process is intended to identify harmful aspects of projects and to minimize them, and I would like to suggest to you that major earthquakes that can strike the Bay Area represents the greatest harm to the Bay Area, and this project is one of the projects that will minimize the impacts of earthquakes to the Bay Area. The USGS is predicting an earthquake occurrence for decades that has suggested in

the last couple of years that there is a 99 percent chance that means it is inevitable that we will have a major earthquake in California in the next 30 years. The Bay Area is one of the two most likely places that will occur. And we know that a repeat of the San Francisco 1906 Earthquake will cause 3,400 casualties, up to that many, it will also cause 60,000 injured in the region, and we know that the majority of our hospital beds will not be usable. This is a lesson that California learned in 1971 and that was 40 years ago, with the San Fernando Earthquake, they passed legislation, California passed legislation, and we have been building better buildings ever since. In 1994, SB 1953 came along and is aiming to bring us to fix the hospitals that have not been corrected."

Response GE-3

The comment is noted. This comment does not raise issues regarding the adequacy, accuracy, or completeness of the Draft EIR. The comment will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project.

Comment

(Richard Margary, September 23, 2010) [PC-217 GE]

"There are seismic dangers that go on daily, as you heard a few minutes ago, that require this [project]."

Response GE-4

The comment is noted. This comment does not raise issues regarding the adequacy, accuracy, or completeness of the Draft EIR. The comment will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project.

3.17 HYDROLOGY AND WATER QUALITY

3.17.1 LRDP

Comment

(Carolynn Abst and Ron Case—Case + Abst Architects LLP, October 19, 2010) [102-15 HY, duplicate comment was provided in 114-15 HY]

"H. There are no catch basins [storm and sewer inlets] at the corner of Polk and Cedar Street. Cedar Street slopes down from Van Ness to Polk. Construction water used to clean equipment, etc. will pond at our corner, next to our building entry, and construction detritus will be walked into our office and residence."

Response HY-1

The comment expresses concern that construction wash water and debris from water used during Cathedral Hill Campus construction activities under the LRDP would collect on Cedar Street, due to a lack of entries to the storm drain system (catch basins/storm and sewer inlets) in the vicinity of the proposed Cathedral Hill Campus. As detailed in Section 4.15 "Hydrology and Water Quality" on Draft EIR pages 4.15-22 and 4.15-23 of the CPMC LRDP Draft EIR, the City requires construction projects to develop and implement a Storm Water Pollution Prevention Plan (SWPPP), which includes an erosion and sediment control plan. Projects are further required to comply with the City's Construction Site Water Pollution Prevention Program in order to reduce the impacts of construction site runoff. The San Francisco Construction Site Water Pollution Prevention Program requires stormwater quality Best Management Practices (BMPs) be implemented at all construction sites. Pollution prevention measures that must be implemented would vary from site to site under the LRDP, but typically would include daily site cleanings, regular maintenance of all BMPs at the LRDP development sites, and inspection of the site regularly to ensure that BMPs are intact. The San Francisco Public Utilities Commission conducts periodic inspections to ensure compliance with the SWPPP. As stated under Mitigation Measure M-HY-N3, on pages 4.15-36 through 4.15-38 of the Draft EIR, "In compliance with the Article 4.1 of the San Francisco Public Works Code and the City's Construction Site Water Pollution Prevention Program, CPMC shall submit a site-specific SWPPP to SFPUC for approval before initiating construction activities in areas draining to the combined sewer system."

For the reasons detailed above, construction runoff and debris from water used during construction activities would not be allowed to collect on Cedar Street or other streets in the project vicinity, and should not adversely affect nearby residences and businesses.

Comment

(Paul Wermer—CPMC Neighbors Coalition and Pacific Heights Residents, October 18, 2010) [67-40 HY]

"14) HYDROLOGY AND WATER QUALITY: no specific comments."

Response HY-2

The comment is noted. This comment does not raise issues regarding the adequacy, accuracy, or completeness of the Draft EIR. The comment will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project.

3.17.2 CATHEDRAL HILL CAMPUS

3.17.4 CALIFORNIA CAMPUS

No comments pertaining to hydrology and water quality and solely related to this campus were received during public review of the Draft EIR.

3.17.5 DAVIES CAMPUS

No comments pertaining to hydrology and water quality and solely related to this campus were received during public review of the Draft EIR.

3.17.6 ST. LUKE'S CAMPUS

No comments pertaining to hydrology and water quality and solely related to this campus were received during public review of the Draft EIR.

3.18 HAZARDS AND HAZARDOUS MATERIALS

3.18.1 LRDP

3.18.1.1 GENERAL

Comment

Section 3 (Helene Dellanini—Daniel Burnham Court Master Owner's Association, October 12, 2010) [71-23 HZ, duplicate comment was provided in 72-23 HZ]

"Also as a health safety concern, we were unable to locate discussion about CPMC's requirement to maintain a rodent and pest-free site, especially prior to construction while the existing buildings are vacant. If a sudden increase in pests is noted at neighboring properties, CPMC should be notified so that they can address the problem on their site and neighboring properties."

Response HZ-1

The comment requests information regarding CMPC's requirements to maintain a rodent and pest-free site before construction. In accordance with Article 2-Health Code, Section A, and as a healthcare provider in the City, rodent and pest control is a major priority at all CPMC facilities, including the now vacant Cathedral Hill Hotel and 1255 Post Street office building, and the seven properties that make up the proposed Cathedral Hill MOB site. CPMC contracts pest control services with a private company, Matrix Pest Elimination. Pest bait stations and traps have been strategically placed around the properties and are monitored and maintained. To date, CPMC is not aware of any complaints of rodent or pest control problems at the Cathedral Hill properties.

3.18.1.2 BUILDING HEIGHT

Comment

(Sandy Hesnard—Caltrans – Department of Aeronautics, September 8, 2010) [5-1 HZ, duplicate comment was provided in 9-2 HZ]

"The California Department of Transportation (Caltrans), Division of Aeronautics, reviewed the above-referenced document with respect to airport-related noise and safety impacts and regional aviation land use planning issues pursuant to the California Environmental Quality Act (CEQA).

The proposal is for the Long Range Development Plan for four existing CPMC medical campuses including: Pacific Campus, California Campus, Davies Campus and the St. Luke's Campus; and the proposed new Cathedral Hill Campus.

California Public Utilities Code Section 21659 prohibits structural hazards near airports. Since the proposed Cathedral Hill Hospital will reach a height of 283 feet, a Notice of Proposed Construction or Alteration (Form 7460-1) will be required by the Federal Aviation Administration (FAA) in accordance with Federal Aviation Regulation, Part 77 'Objects Affecting Navigable Airspace.' Form 7460-1 is available on-line at https://oeaaa.faa.gov/oeaaaiexternal/portal.jsp and should be submitted electronically to the FAA.

These comments reflect the areas of concern to the Division of Aeronautics with respect to airport-related noise, safety, and regional land use planning issues. We advise you to contact our District 4 office concerning surface transportation issues.

Thank you for the opportunity to review and comment on this proposal. If you have any questions, please call me at (916) 654-5314 or by email at sandy.hesnard@dot.ca.gov."

Response HZ-2

The comment confirms receipt and review of the Draft EIR and identifies permitting FAA requirements that might be required of the proposed LRDP. The commenter's review of the Draft EIR and identification of FAA requirements for preparation and submittal of a Notice of Proposed Construction or Alteration (Form 7460-1) is noted. However, as described in Impact HZ-5 in the Draft EIR, pages 4.16-70 through 4.16-72, the proposed LRDP would not be located within an airport land use plan or within 8 miles of a public airport or private airstrip, and as a result, would not create a safety hazard for people residing or working in the area. Although the proposed Cathedral Hill Hospital would reach a height of 265 feet (as stated in the Draft EIR, page 2-21), Part 77 requires submittal of Form 7460-1 when a project exceeds 200 feet in height within 3 miles of a runway. As the nearest proposed or existing campus to a public use airport or private airstrip would be located considerably more than 3 miles from an existing runway, preparation and submittal of Form 7460-1 would not be required. Coordination with the Caltrans District 4 office regarding surface transportation issues has been ongoing throughout project planning and will continue.

3.18.1.3 CONSTRUCTION HEALTH RISKS

Comments

(Gloria Smith—California Nurses Association, October 18, 2010) [90-38 HZ]

"A revised EIR must include special precautions to ensure that construction workers are not put at risk when they touch and breathe contaminants through dust and vapors. Likewise a revised EIR must include protection for neighboring residents and those living along transportation corridors at risk from harmful dust and vapors generated during excavation and transport of contaminated soil in and through their neighborhoods."

(Matt Hagemann—California Nurses Association, November 24, 2010) [119-2 HZ]

"The DEIR also fails to document any communication with regulatory agencies in an attempt to address the known and suspected contaminants prior to construction. Failure to engage regulators may delay construction if contamination is found upon excavation that would require regulatory oversight of cleanup because of potential harm to construction workers and neighboring residents. Because the construction is to be undertaken in a densely populated area, the risk to neighboring residents is a potentially significant issue that needs to be addressed in a revised EIR."

Response HZ-3

The comments suggest that the EIR should provide precautions to protect construction workers and neighboring residents from contaminants generated during project construction (i.e., excavation). The Draft EIR contains extensive analysis of potential effects of the proposed LRDP's construction, including the potential exposure of construction workers to airborne hazards. As described under Impact HZ-1 in the Draft EIR (starting on page 4.16-40), construction workers and neighboring residents could be exposed to dust and vapors during demolition of existing structures, excavation of contaminated soils, and removal of underground storage tanks (USTs) and other underground structures. In the Draft EIR, page 4.16-41, the analysis explains that potential impacts to workers and neighboring residents from dust and vapors from demolition of existing structures on LRDP sites would be less than significant due to the LRDP project having to undergo regulatory compliance related to the reduction in potential exposure of people to contamination, including dust and airborne hazards, and implementation of Improvement Measure I-HZ-N1, which calls for the removal and proper disposal of mercury-containing building

materials prior to the start of construction. As noted on Draft EIR page 4.16-43, construction under the proposed LRDP would adhere to Bay Area Air Quality Management District (BAAQMD) and California Division of Occupational Safety and Health (Cal/OSHA) regulations and standards, which require proper inspection and abatement of asbestos-containing materials and lead-based paint before initiation of project-related demolition or renovation. In addition, development under the proposed LRDP would be conducted in a manner consistent with other federal and state hazardous materials guidelines that regulate exposure to and disposal of other hazardous building materials, including lead, polychlorinated biphenyls (PCBs), and mercury. Improvement Measure I-HZ-N1 under the LRDP requires the proper removal and disposal of PCB- and mercury-containing equipment from buildings and structures on LRDP development sites prior to commencement of demolition (see the Draft EIR, page 4.16-46).

Furthermore, as described in the Draft EIR on page 4.16-49, potential impacts to workers and neighboring residents from dust and vapors from excavation of contaminated soils and removal of USTs and other underground structures would be less than significant, following implementation of Mitigation Measures M-HZ-N1a and M-HZ-N1b, which would require the preparation of site mitigation plans (SMP) for each existing and proposed CPMC campus and unknown contingency plans for these campuses that address potential unforeseen circumstances, and submittal of the SMPs and unknown contingency plans to the San Francisco Department of Public Health (SFDPH) for review and approval. For further clarification, refer to the text of the Draft EIR beginning on page 4.16-46, regarding the complete procedures and requirements established in Mitigation Measures M-HZ-N1a and M-HZ-N1b. CPMC has prepared environmental contingency plans (ECPs) for each campus, which, as stated on page 4.16-46 of the Draft EIR, will serve as both the SMPs and unknown contingency plans for these campuses upon review and approval by SFDPH.

Excavation and soil, groundwater, and construction debris removal activities at the existing and proposed campuses would also be required to adhere to federal and Cal/OSHA regulations mandating initial training and subsequent annual training for hazardous waste workers and the preparation and implementation of site-specific health and safety plans by the construction contractor. Excavation, handling, and disposal of all soil and groundwater from the existing and proposed campuses would be regulated by the Occupational Health and Safety Administration (OSHA), Cal/OSHA, SFDPH, BAAQMD, San Francisco Public Utilities Commission (SFPUC), the San Francisco Bay Regional Water Quality Control Board (RWQCB), and Article 22 of the San Francisco Health Code. Removal of Underground Storage Tanks (USTs) would also be subject to the requirements of Article 22A, the RWQCB, the San Francisco Department of Public Health (SFDPH) UST Program, and procedures outlined in the site-specific health and safety plans for each existing and proposed campus prepared in accordance with Cal/OSHA regulations. Contaminated soils handling and removal would fall under the purview of SFDPH regulations and oversight, while BAAQMD regulates the handling of asbestos-containing materials.

Once contaminated soils leave the LRDP sites, safety regulations of their transport would fall under the hazardous materials transportation permit of the contractor and trucking company. As described in the Draft EIR, page 4.16-23, the transport of hazardous materials is regulated under Title 26 of the California Code of Regulations. Regulations are enforced by the California Highway Patrol (CHP) and the California Department of Transportation (Caltrans). CHP enforces the labeling of hazardous materials and hazardous wastes and packing regulations to prevent leakage and spills of material in transit and to provide detailed information to cleanup crews in the event of an accident. Vehicle and equipment inspection, shipment preparation, container identification, and shipping documentation are all part of the responsibility of the CHP, which conducts regular inspections of licensed transporters to assure regulatory compliance. Caltrans has teams to identify emergency chemical spills. In addition to the licensing, labeling, packaging, and transport regulations of Caltrans and CHP, the BAAQMD Asbestos Dust Mitigation Plan would require the CPMC LRDP to incorporate measures to control all potential emission sources, including tracking of sediment onto paved roads by vehicles and off-site transport of materials.

As noted in Section 4.16.2, "Hazards and Hazardous Materials Regulatory Framework of the Draft EIR" (beginning on page 4.6-21), there are certain regulatory requirements for coordination with agencies that the project sponsor must comply with as planning of each CPMC campus progresses. Twenty-four ESAs (20 Phase I ESAs, two Phase II ESAs (one each for the proposed sites of the Cathedral Hill Hospital and Cathedral Hill MOB), and two combined Phase I/Phase II ESAs (one each for the 3698 California Street and the 3700 California Street sites at the California Campus) were conducted over a 7-year period (2003–2010) for the five CPMC campuses, and a detailed description of the results of these ESAs is included in Section 4.16.1, "Hazards and Hazardous Materials Environmental Setting" in the Draft EIR, beginning on page 4.16-2. The Phase I ESAs prepared for each CPMC campus, as well as the Phase II and combined Phase I/Phase II ESAs prepared for the Cathedral Hill and California Campuses were submitted to the SFDPH (Stephanie Cushing, Senior Environmental Health Inspector) in 2008 and 2009, and a copy of the Draft EIR was forwarded to the SFDPH for their review during the public review period. Recommendations received from the SFDPH based on their review of the Phase I and II ESAs were incorporated into the analysis of the EIR (e.g., on page 4.16-43 of the Draft EIR, the EIR includes a recommendation from the SFDPH staff for subsurface sampling in proposed excavation areas at the Davies Campus that are located near USTs, which the project sponsor has agreed to conduct). Additional coordination with various regulatory agencies will take place at various LRDP construction and development stages when necessary and appropriate, including SFDPH, (e.g., review of environmental contingency plans [ECPs] for each campus by SFDPH), and the project will adhere to current statutory requirements/guidelines. Therefore, the Draft EIR adequately evaluates the potential hazards and hazardous materials impacts related to dust, vapors, and regulatory oversight of the proposed CPMC LRDP.

Please see Response HZ-5 (page C&R 3.18-7) to comments regarding the need to revise and recirculate the Draft EIR to include additional information regarding subsequent soils/materials studies for the CPMC LRDP in the EIR. Based on the level of analysis of the LRDP's construction-related exposure to hazardous materials contained in the Draft EIR discussed above, the evaluation of potential health risks during excavation and demolition proposed at CPMC campuses under the LRDP does not require revision. Furthermore, the EIR does not require recirculation pursuant to State CEQA Guidelines Section 15088.5, because it does not require the inclusion of additional information that would otherwise deprive the public of the opportunity to make meaningful comments or that could reduce or mitigate an otherwise significant adverse environmental impact. Please also see Response INTRO-6 on page C&R 3.1-11 regarding recirculation of the Draft EIR.

Comment

(Matt Hagemann—California Nurses Association, November 24, 2010) [119-11 HZ]

"Contaminants documented and suspected in soil in the Project area include petroleum hydrocarbons, lead, and dry cleaning solvents, such as trichloroethylene (TCE). Health effects of lead include[6]:

Long-term exposure of adults can result in decreased performance in some tests that measure functions of the nervous system. It may also cause weakness in fingers, wrists, or ankles. Lead exposure also causes small increases in blood pressure, particularly in middle-aged and older people and can cause anemia. Exposure to high lead levels can severely damage the brain and kidneys in adults or children and ultimately cause death. In pregnant women, high levels of exposure to lead may cause miscarriage. High level exposure in men can damage the organs responsible for sperm production.

Health effects for petroleum hydrocarbons include[7]:

Some of the TPH compounds can affect your central nervous system. One compound can cause headaches and dizziness at high levels in the air. Another compound can cause a nerve disorder called 'peripheral neuropathy,' consisting of numbness in the feet and legs. Other TPH compounds can cause effects on the blood, immune system, lungs, skin, and eyes. Animal studies have shown effects on the lungs, central nervous system, liver, and

kidney from exposure to TPH compounds. Some TPH compounds have also been shown to affect reproduction and the developing fetus in animals.

Health effects of TCE include[8]:

Breathing small amounts may cause headaches, lung irritation, dizziness, poor coordination, and difficulty concentrating. Breathing large amounts of trichloroethylene may cause impaired heart function, unconsciousness, and death. Breathing it for long periods may cause nerve, kidney, and liver damage. Drinking large amounts of trichloroethylene may cause nausea, liver damage, unconsciousness, impaired heart function, or death. Drinking small amounts of trichloroethylene for long periods may cause liver and kidney damage, impaired immune system function, and impaired fetal development in pregnant women, although the extent of some of these effects is not yet clear. Skin contact with trichloroethylene for short periods may cause skin rashes. The International Agency for Research on Cancer (IARC) has determined that trichloroethylene is 'probably carcinogenic to humans.'

Exposure to the known and suspected contaminants in the Project area may result in significant health impacts to construction workers who may come into dermal contact with soils or who may breathe dusts. Exposure to known and suspected contaminants may also occur when those who live close to the site, or those who live along transportation routes, breathe contaminated dust.

[7] http://www.atsdr.cdc.gov/toxfaqs/tf.asp?id=423&tid=75
[8] http://www.atsdr.cdc.gov/toxfaqs/tf.asp?id=172&tid=30"

Response HZ-4

The comment's descriptions of the health effects of lead, petroleum hydrocarbons, and dry cleaning solvents like Trichloroethylene (TCE) are noted. Beginning on page 4.16-42, the Draft EIR acknowledges that construction activities under the proposed LRDP could result in exposure of construction workers and the public to chemicals in the soil because such construction would generate dust (airborne particles), and could result in impacts on water quality and the environment, if hazardous constituents were to migrate off site. However, implementation of Mitigation Measures M-HZ-N1a and M-HZ-N1b requiring the preparation of a site mitigation plan, the proper handling, hauling, and disposal of contaminated materials, the preparation of a site closure/certification report, and preparation of an unknown contingency plan for all existing and proposed CPMC campuses, beginning on Draft EIR page 4.16-46, would reduce these impacts of the LRDP to less-than-significant levels by reducing the potential for the release of hazardous materials and subsequent potential health effects of such materials to occur. Furthermore, with respect to LRDP impacts from airborne contaminants that could affect human health, impacts AQ-1 and AQ-2 in the Draft EIR, beginning on pages 4.7-29 and 4.7-34, respectively, discuss the LRDP construction-related air emissions related to fugitive dust/particulate matter and toxic air contaminants (TACs), which include lead, under the 1999 BAAQMD CEQA Guidelines significance thresholds. Impacts AQ-8 and AQ-10 in the Draft EIR, beginning on pages 4.7-59 and 4.7-65, respectively, discuss the LRDP construction-related air emissions related to fugitive dust/particulate matter and TACs under the 2010 BAAQMD CEQA Guidelines significance thresholds. The text revisions to the Draft EIR in Chapter 4, "Draft EIR Text Changes," of this C&R document, (pages C&R 4-84 to 4-94) includes updates to the Draft EIR analysis of Impacts AQ-2 and AQ-10. As noted in Impacts AQ-1, AQ-2, AQ-8, and AQ-10, LRDP construction activities would not expose sensitive receptors to substantial pollutant loads and potential airborne health risks would not exceed the incremental health risk threshold of 10 in a million cancer risk for adults, but would exceed thresholds for child exposure at the proposed Cathedral Hill Campus under the 2010 BAAQMD CEQA Guidelines (Impact AQ-10), thereby resulting in a significant and unavoidable impact. In addition, the proposed LRDP would implement control measures (See Mitigation Measures M-AQ-N1a and M-AQ-N1b beginning on Draft EIR page 4.7-31, and M-AQ-N2 beginning on Draft EIR page 4.7-35, as revised in Chapter 4, "Draft EIR Text Revisions," on page C&R 4-17) for the LRDP's construction-related emissions, including BAAQMD's

Basic and Optional Control Measures, to reduce potential dust generated during construction activities under the proposed LRDP to less-than-significant levels. However, after implementation of all feasible mitigation measures, Impact AQ-10 related to health risks exposure of sensitive receptors to TACs from construction activities would remain significant and unavoidable at the proposed Cathedral Hill Campus under the 2010 BAAQMD CEQA Guidelines.

Please also see Response HZ-3 (page C&R 3.18-2) for further discussion of the mitigation measures, regulatory requirements, and best management practices that would ensure that the LRDP does not result in significant impacts related to potential exposure of the environment, workers, and the public to contaminants.

3.18.1.4 ENVIRONMENTAL SITE ASSESSMENT

Comments

(Gloria Smith—California Nurses Association, October 18, 2010) [90-37 HZ]

"**1. The DEIR Failed To Adequately Analyze Potential Contaminants in Soil and Groundwater**

According CNA's hazardous waste expert, Matt Hagemann, a former EPA senior scientist, CPMC has known for at least two years that all five Project sites present some level of contamination that has not been adequately investigated and disclosed. Indeed, the DEIR and its supporting documents indicate numerous instances of potential soil and groundwater contamination, along with evidence of additional widespread contamination that must be fully investigated in a revised EIR.[1] These are potentially serious problems given each of the Project sites occur in densely populated areas in very close proximity to neighboring residents, passersby, workers at nearby businesses and construction workers at the sites themselves."

[1] Matt Hagemann Letter (Oct. 18, 2010) at page 17. [Letter is included separately as Comment Letter 119.]

(Matt Hagemann—California Nurses Association, November 24, 2010) [119-1 HZ]

"I have reviewed the July 21, 2010 California Pacific Medical Center (CPMC) Long Range Development Plan Draft Environmental Impact Report (DEIR) for issues associated with hazardous substances and hazardous waste. I have identified a number of areas where the DEIR fails to adequately disclose potential contaminants in soil and groundwater and fails to address contamination through remediation and mitigation measures. Instead, that DEIR defers further assessment and remediation, i.e. removal of contaminated soils, until construction has begun, despite knowing of the presence of contaminants for at least two years."

(Matt Hagemann—California Nurses Association, November 24, 2010) [119-6 HZ]

"In my experience in the review of over three dozen DEIRs for hazardous waste issues over the past seven years, I have never seen such poor disclosure of potential contamination issues. Because of the poor disclosure and because further investigation of the contamination is deferred, construction workers may be at risk during excavation of soil."

(Matt Hagemann—California Nurses Association, November 24, 2010) [119-7 HZ]

"The failure of the applicant to disclose these issues is made even more significant by the massive scale of this development in a densely populated urban environment which may put neighboring residents at risk during construction. The public, who has the potential to be directly affected by cleanup activities when dusts and vapors may be generated, has the right to review a DEIR that adequately discloses contamination issues that have been vetted with regulatory agencies and that have been addressed by remediation and mitigation prior to excavation."

Response HZ-5

The comments state that the Draft EIR fails to adequately disclose and analyze potential contaminants in soil and groundwater for all five development sites or campuses under the proposed CPMC LRDP and that contamination is a potentially serious hazard to neighboring residents, workers, and passersby. As described in Section 4.16, "Hazards and Hazardous Materials" in the Draft EIR, 24 environmental site assessments (ESAs) were conducted over a 7-year period (2003–2010) for the five CPMC campuses (including nine ESAs at the proposed Cathedral Hill Campus, eight ESAs at the Pacific Campus, four ESAs at the California Campus, two ESAs at the Davies Campus, and one ESA at the St. Luke's Campus). For a detailed description of the results of these ESAs, please refer to Section 4.16.1, "Environmental Setting" in the Draft EIR. C&R Table 3.18-1 summarizes the degree of soil sampling per campus, including what constituents were analyzed, and whether such constituents were determined to be present in the soil. Soil sampling was not conducted in cases when the Phase I ESA did not identify a Recognized Environmental Condition (REC) per the ASTM definition included in the DEIR on page 4.16-2, "the presence or likely presence of any hazardous substances or petroleum products on a property under conditions that indicate an existing release, a past release [of these hazardous substances], or a material threat of a release of any hazardous substance or petroleum products into structures on the property or into the ground, groundwater, or surface water of the property". This analysis approach is considered reasonable and feasible because it is based on best available information to address potential soil and groundwater contamination issues that may exist at any of the five campuses included as part of the proposed CPMC LRDP.

Recommendations contained in these ESAs, including those that would reduce known and unknown soil and groundwater contamination at the existing and proposed CPMC campuses, were incorporated into the CPMC LRDP as mitigation measures (see Mitigation Measures M-HZ-N1a and M-HZ-N1b on pages 4.16-46 through 4.16-49 of the Draft EIR). These measures include requirements for the submittal of campus-specific environmental contingency plans (ECPs), which serve as both site mitigation plans (SMPs) and unknown contingency plans for the campuses, to SFDPH for review and approval. The ECPs identify procedures for the submittal of a site closure/certification report to SFDPH for closure of underground storage tanks (USTs) at the Cathedral Hill, Pacific, Davies, and St. Luke's Campuses. Such measures and requirements are intended to reduce potential impacts to a less-than-significant level. As described in the Draft EIR, pages 4.16-63 for the Cathedral Hill Campus, pages 4.16-64 through 4.16-65 and 4.16-70 for the Davies Campus, page 4.16-66 for the St. Luke's Campus, and pages 4.16-68 through 4.16-69 for the Pacific Campus, impacts related to the CPMC LRDP's location on potentially contaminated sites at the above-noted campuses would be less than significant with the implementation of ECPs for each of the existing and proposed campuses. The ECPs specifically address the management of potential health impacts associated with chemically impacted soil that would be disturbed at the CPMC campuses. The ECPs for these CPMC campuses also require that a health and safety plan that outlines the specific procedures required to safeguard the health and safety of workers while onsite be prepared by a certified industrial hygienist for implementation by the LRDP site contractor during all phases of demolition and construction at the CPMC campuses. This would address potential threats to the health and safety of both site construction workers and the public during LRDP-related construction activities. The ECPs would ensure the safe and effective removal/closure of potentially hazardous subsurface soil and groundwater conditions in accordance with local, state, and federal requirements.

Under Mitigation Measures M-HZ-N1a and M-HZ-L1a in the Draft EIR, pages 4.16-46 and 4.16-52, respectively, near-term and long-term projects under the proposed CPMC LRDP would be required to submit the previously prepared ECPs, which would serve as both SMPs and unknown contingency plans for the CPMC campuses, to SFDPH for review and approval before issuance of site, building, or other permits by City agencies for development activities involving subsurface disturbance. As described in the Draft EIR, page 4.16-46, an SMP, prepared in accordance with SFDPH regulations, requires the sampling of all soil and groundwater at a development site (in this case, CPMC campuses) to determine the proper

C&R Table 3.18-1
Summary of Proposed LRDP Soils Sampling and Analysis

Campus	Soils Sampling Conducted?	Constituents Analyzed	Constituents Determined to be Substantially Present
Cathedral Hill Hospital Site	Yes	Petroleum constituents, VOCs, metals, polychlorinated biphenyls (PCBs)	Petroleum constituents (low)
Cathedral Hill MOB Site	Yes	Petroleum hydrocarbons, VOCs, metals, semivolatile organic compounds (SVOCs), PCBs, lead	Petroleum hydrocarbons, lead
Pacific	No	N/A	N/A
California	Yes	Petroleum hydrocarbons, VOCs, metals, PCBs	None
Davies	No	N/A	N/A
St. Luke's	No	N/A	N/A

Source: Data compiled by AECOM, 2011.

handling and disposal requirements for soil and groundwater from these sites based on the presence of known and unknown analytical compounds of potential contaminants in this soil and groundwater. As stated in Mitigation Measure M-HZ-N1a in the Draft EIR, page 4.16-47, any necessary remediation or mitigation recommended by the SFDPH during their review of the ECPs for each campus, beyond those which have already been included in the ECPs, would be required to be incorporated into the ECPs. Mitigation Measure M-HZ-N1a also would require that known USTs at all campuses be removed by a licensed tank removal contractor, in accordance with all current regulations and the site-specific and tank-specific procedures previously outlined in the ECPs for each CPMC campus. As noted in the Draft EIR (beginning on page 4.7-31), the project sponsor would implement control measures (See Mitigation Measures M-AQ-N1a and M-AQ-N1b, beginning on Draft EIR page 4.7-31) for construction dust, including BAAQMD's Basic and Optional Control Measures, to reduce dust generated during construction activities. Furthermore, Mitigation Measure M-AQ-N2 would ensure that appropriate emissions control devices are installed on LRDP construction equipment in order to reduce potential health risks associated with equipment exhaust during construction activities under the LRDP.

All of the CPMC LRDP EIR mitigation measures identified above (Mitigation Measures M-HZ-N1a, M-HZ-N1b, M-HZ-L1a, M-AQ-N1a, and M-AQ-N1b on pages 4.16-46, 4.16-48, 4.16-52, 4.7-31, and 4.7-32 of the Draft EIR, respectively) for the purposes of reducing the LRDP's potential impacts related to hazards and hazardous materials are considered feasible and implementable. These mitigation measures do not inappropriately defer impact analysis or identification of mitigation measures. Section 15126.4(a)(1)(b) of the State CEQA Guidelines recognizes that mitigation measures may not be able to be articulated in full detail at the time of an early stage or plan level EIR but also states:

Formulation of mitigation measures should not be deferred until some future time. However, measures may specify performance standards which would mitigate the significant effect of the project and which may be accomplished in more than one specified way. Please also see Response HZ-11 on page C&R 3.18-19.

The mitigation measures identified in Section 4.16, "Hazards and Hazardous Materials" in the Draft EIR, as well as all other mitigation measures identified in the Draft EIR, meet the standards established in the

State CEQA Guidelines. Please also see Response HZ-3 (page C&R 3.18-2) for a description of the regulations and standards that would also serve to reduce the exposure of workers and other persons in the project vicinity to contaminants to less-than-significant levels.

State CEQA Guidelines Section 15088.5 requires a lead agency to recirculate an EIR when significant new information is added to the EIR after the Draft EIR public review period, but before certification. that information must be noticed and circulated for public review in the same way as the Draft EIR noticing and circulation is implemented Significant new information requires notication and circulation for public review in the same way as the Draft EIR when there is a new significant environmental impact, a substantial increase in the severity of an environmental impact, or a determination that the Draft EIR was fundamentally and basically inadequate and conclusory in nature that meaningful public review and comment were precluded. Recirculation is not required where the new information added to the EIR merely clarifies or makes insignificant modifications to an adequate EIR. None of the additional information about hazards and hazardous material suggested by the comment would meet the criteria that would require EIR recirculation; rather, that information falls into the category of clarification and further explanation of conditions on the site and serves to reinforce the conclusions in the Draft EIR. For additional discussion of recirculation of the Draft EIR, please refer to Response INTRO-6 on page C&R 3.1-11.

Comment

(Matt Hagemann—California Nurses Association, November 24, 2010) [119-10 HZ]

"The Phase I and Phase II reports were completed over a seven-year period beginning in 2003. Therefore the applicant has had ample time to submit the reports to SFDPH for review, under a voluntary cleanup agreement. Instead, the applicant included the reports in the DEIR without regulatory review and, as a result, I consider the status of the conditions described, including soil and groundwater contamination, to be without resolution and therefore inadequately disclosed. Moreover, the DEIR did not adequately describe the Project's environmental conditions accurately or adequately. A revised DEIR must eliminate confusing terms such as 'potentially recognized' so that reviewers can assess the Project's true impacts."

Response HZ-6

The comment expresses a preference for use of a voluntary cleanup agreement. Further, the comment states that environmental conditions of the existing and proposed CPMC campuses are not accurately or adequately described or disclosed in the Draft EIR and raises concerns over the use of the term "potentially recognized" with respect to environmental conditions. The Phase I environmental site assessments (ESAs) prepared for the five CPMC campuses covered under the proposed CPMC LRDP recommended the preparation of environmental contingency plans (ECPs) to fully mitigate the known and unknown hazards associated with existing on-campus and proposed LRDP development-related conditions. The ECPs specifically addressed the management of potential health impacts associated with the disturbance of chemically impacted soil from the CPMC campuses. The ECPs also recommended that a health and safety plan be prepared by a certified industrial hygienist for implementation during demolition and construction at the existing and proposed CPMC campuses by the site contractor. The health and safety plan would address potential threats to the health and safety of both on-campus construction workers and the public during LRDP-related construction activities. Furthermore, SFDPH review, approval, and oversight of LRDP-related construction development activities for all CPMC campuses would also occur following the project sponsor's submittal of the SMPs and unknown contingency plans to the SFDPH for each existing and proposed CPMC campus, as required by Mitigation Measures M-HZ-N1a and M-HZ-N1b in the CPMC LRDP Draft EIR, pages 4.16-46 and 4.16-48, respectively. Under the LRDP, ECPs would be prepared for each existing and proposed CPMC campus and they would serve as both the SMPs and unknown contingency plans for CPMC campuses.

These ECPs will be duly submitted to SFDPH for their review, approval, and oversight, well before commencement of LRDP-related construction activities at any existing or proposed CPMC campus.

The Phase I ESAs for the CPMC campuses did not specify whether SFDPH review, approval, and oversight should be performed as part of the Mitigation, Monitoring, and Reporting Program (MMRP), a voluntary cleanup agreement, or other process. Furthermore, a voluntary cleanup agreement is offered by SFDPH as an alternative to the California Department of Toxic Substances Control (DTSC) process and is not required. In response to State legislation, the SFDPH has implemented a program to protect human health, clean up the environment and return property back to productive use. Corporations, developers and agencies entering into a voluntary cleanup program agreement with SFDPH will be able to restore properties quickly and efficiently, rather than having their projects compete for the limited resources of the California EPA's DTSC along with other low priority hazardous waste sites. Twenty-four ESAs (20 Phase I ESAs, 2 Phase II ESAs (one each for the proposed sites of the Cathedral Hill Hospital and Cathedral Hill MOB), and 2 combined Phase I/Phase II ESAs (one each for the 3698 California Street and the 3700 California Street sites at the California Campus) were conducted over a 7-year period (2003–2010) for the five CPMC campuses. It should be noted that SFPDH reviewed the ESAs for the four existing and one proposed CPMC campuses in 2008 and 2009 and reviewed the CPMC LRDP Draft EIR in 2010, and the ECPs will be submitted for review and approval by SFDPH, prior to the commencement of any LRDP-related construction activities or site work at the five CPMC campuses. During their review of the ESAs and CPMC LRDP Draft EIR, SFDPH did not recommend a voluntary cleanup agreement for the four existing or one proposed CPMC campuses. As described in Mitigation Measures M-HZ-N1a and M-HZ-L1a in the Draft EIR, pages 4.16-46 and 4.16-52, respectively, the project sponsor would be required to submit the previously prepared ECPs (which serve as both SMPs and unknown contingency plans) to SFDPH for near-term and long-term projects at various CPMC campuses under the proposed LRDP. SFDPH approval of ECPs would be required before issuance of site, building, or other permits by City agencies for LRDP-related construction and development activities involving subsurface disturbance. Any additional recommendations from the SFDPH would be incorporated into the ECPs as a condition of the issuance of site, building, or other permits by City agencies.

Other than from the BAAQMD, no comments were received on the Draft EIR from local hazardous materials regulatory agencies with regard to the potential effects of the proposed LRDP on human health. Response HZ-3 (page C&R 3.18-2) provides a description of the role of SFDPH in the LRDP during future review and approval of the ECPs for the CPMC campuses, as well as a description of consultation with SFDPH that took place during review of the 24 Phase I, Phase II, and combined Phase I/Phase II ESAs prepared for the existing and proposed CPMC campuses under the LRDP.

The risk of exposure of construction workers and neighboring residents to hazardous materials during construction of the LRDP at various CPMC campuses has been addressed in the Draft EIR. Please see Response HZ-3 (page C&R 3.18-2) for a description of the mitigation measures and adherence to regulations and standards that would reduce the exposure of the overall environment, workers, and the public to potential contaminants from LRDP development to less-than-significant levels.

Please also see Response HZ-7 (page C&R 3.18-12) regarding the use of the term "potential environmental conditions" in the LRDP Draft EIR.

Comment

(Matt Hagemann—California Nurses Association, November 24, 2010) [119-8 HZ]

"**Hazardous Substances Issues**

To assess potential environmental contamination issues, the applicant commissioned the preparation of a number of Phase I and Phase II Environmental Site Assessments (ESAs) as summarized in the DEIR in Section 4.16, Hazards and Hazardous Materials.

The purpose of the ESAs was to:

identify recognized environmental conditions (RECs) at the Site to assist CPMC in supplying information to the City and County of San Francisco for their use in preparing sections of an Environmental Impact Report (EIR) for the Long Range Plan. **A REC is the presence or likely presence of any hazardous substances or petroleum products on a property under conditions that indicate an existing release, a past release, or a material threat of a release of any hazardous substances or petroleum products into structures on the property or into the ground, groundwater, or surface water of the property**.[1]

This definition is consistent with the American Society for Testing and Materials (ASTM) definition of a REC, an organization that develops and publishes voluntary consensus technical standards.[2] The DEIR also states (DEIR, page 4.16-2):

The ESAs also identify other known and potential environmental conditions that do not meet the definition of a REC.

As discussed below, the findings of 'potential environmental conditions' or 'potential recognized environmental conditions' (the actual term used in the Phase I ESAs) is inconsistent with ASTM guidance and is unnecessarily confusing There is no middle ground or hedging: the presence or the potential presence of hazardous substances or a material threat of a hazardous substance release into the environment constitutes a recognized environmental condition according to the ASTM definition. There is no ASTM definition for a 'potential recognized environmental condition,' the finding made numerous times in the Phase Is reports and repeated in the DEIR. (see for example, page 4.16-10 of the DEIR where 'two hydraulic elevators and demolished residential structures represent potential RECs.')

The ASTM does define the term 'potential environmental concern' for but the tem only applies to property transactions made with limited environmental due diligence, using a process that is not a rigorous as conducting a Phase I ESA. Thus that term is not appropriate here. The ASTM definition for potential environmental concern is as follows:

the possible presence of any hazardous substances or petroleum products on a property under conditions that indicate the possibility of an existing release, a past release, or a threat of a release into structures on the property or into the ground, ground water, or surface water of the property.[4]

The finding of a 'potential environmental concern' may be an impetus for additional inquiry. ASTM states, 'Upon completing the *transaction screen questionnaire*, if the *user* concludes that further inquiry or action is needed (for example, consult with an environmental consultant, contractor, governmental authority, or perform additional governmental and/or historical records review),' the user should proceed with such inquiry.[5] Such an inquiry would be the conduct of a Phase I and a Phase II ESA, as appropriate.

Therefore for this project, a finding of a 'potential recognized environmental condition' is double speak and is inconsistent with ASTM definitions. Per standard practice, as set forth in ASTM guidance, where RECs are documented in a Phase I, further full investigation is warranted to assess the potential for subsurface

contamination, and the need for mitigation and/or remediation. The additional investigations involve the collection of soil and groundwater samples in what are called Phase II ESAs. Here where the applicant found 'potential recognized environmental conditions' during the CPMC Phase Is, it did not require further Phase II investigations through soil or groundwater sampling. Therefore, the findings of potential RECs constitute inadequate disclosure and are unresolved environmental issues that warrant further investigations.

[1] See for example, August 20, 2009 Phase I Environmental Site Assessment Saint Luke's Campus Tower Area, page 1
[2] http://www.astm.org/Standards/E1527.htm
[4] http://www.astm.org/BOOKSTORE/COMPS/136.htm
[5] http://www.edrnet.com/reports/whitepapers/e1528whitepaper.pdf"

Response HZ-7

The comment objects to the use of the terms "potential environmental conditions" and "potential recognized environmental conditions" in the Draft EIR, stating that they are inconsistent with ASTM standards (which do not include the use or definitions of these terminologies). Furthermore, the comment appears to suggest that instances where the terms "potential environmental conditions" and "potential recognized environmental conditions" were used in the Draft EIR represent unresolved environmental issues that warrant further investigation, such as a Phase II ESA, including soil and groundwater sampling.

The comment correctly defines the purpose of the ESAs to identify RECs at the five CPMC campuses. The preparation of Phase I ESAs by Treadwell & Rollo used the ASTM definition of an REC which is "the presence or likely presence of any hazardous substances or petroleum products on a property under conditions that indicate an existing release, a past release [of these hazardous substances], or a material threat of a release of any hazardous substance or petroleum products into structures on the property or into the ground, groundwater, or surface water of the property" (Draft EIR, page 4.16-2). The comment also correctly defines the ASTM definition of "potential environmental concern" as "the possible presence of any hazardous substances or petroleum products on a property under conditions that indicate the possibility of an existing release, a past release, or a threat of a release into structures on the property or into the ground, ground water, or surface water of the property."

The comment incorrectly states that the "potential presence of hazardous substances" constitutes a REC. To address any case where there is a broad historical knowledge of what might be present at a given site (e.g., lead) or the existence of a feature (e.g., a tank) without any known presence or likely presence of a hazardous substance or material threat of a release at a site, the ESAs prepared for the CPMC campuses identified these conditions as "potential environmental conditions" that do not meet the definition of an REC. For example, the ESA preparers' knowledge of typical subsurface equipment for past uses informed a brief discussion on the potential subsurface presence of such equipment on the St. Luke's Campus, despite a lack of documentation or information stating that any such equipment had ever been installed on the St. Luke's Campus. Additionally, certain underground storage tanks (USTs) were identified as potential environmental conditions instead of RECs because of the inclusion of leak detection equipment on those USTs, which would reasonably be considered to provide a warning/indication if a leak occurred. Therefore, these types of on-site conditions are not RECs and do not warrant the preparation of a Phase II ESA.

The purpose of identifying potential environmental conditions was to increase awareness and ensure that the project sponsor's construction team would be prepared for the possibility that subsurface environmental contamination might be encountered during LRDP construction. In cases where potential environmental conditions were identified, the preparation of ECPs was recommended in the ESAs so that protocols could be established to safely and efficiently deal with potentially hazardous materials that could be encountered during LRDP construction. The ECPs would also require that a health and safety plan be prepared by a certified industrial hygienist for implementation by the LRDP contractor and would address potential threats to the health and safety of both LRDP construction workers and the public during

LRDP-related construction activities. To clarify the terminology used in the Draft EIR, staff-initiated text changes have been made to consistently use the term "potential environmental condition."

Text in Section 4.16.1, "Environmental Setting" in the Draft EIR, page 4.16-4 through page 4.16-6, has been revised as follows to clarify the difference between RECs and potential environmental conditions:

> 1062 Geary Street
>
> Although the Phase I ESA identified no RECs associated with past or current uses of this building, the past site operations as an auto repair business and the possible presence of earthquake fill indicate potential environmental ~~concerns~~ conditions.
>
> 1054–1060 Geary Street
>
> The Phase I ESA did not identify any RECs or potential ~~RECs~~ environmental conditions associated with past or current uses of the building.
>
> 1034–1036 Geary Street
>
> The Phase I ESA for this property did not identify any RECs or potential ~~RECs~~ environmental conditions associated with the former or current uses of the property.

Text in Section 4.16.1, "Environmental Setting" in the Draft EIR, page 4.16-9 and page 4.16-10, has been revised as follows to clarify the difference between RECs and potential environmental conditions:

> 2200 Webster Street
>
> Although no RECs were identified during the Phase I ESA, the two hydraulic elevators and demolished residential structures represent potential ~~RECs~~ environmental conditions.
>
> 2340–2360 Clay Street
>
> Although no RECs were identified during the Phase I ESA, the demolished residential structures represent a potential ~~RECs~~ environmental condition.

Text in Section 4.16.1, "Environmental Setting" in the Draft EIR, page 4.16-12, has been revised as follows to clarify the difference between RECs and potential environmental conditions:

> 2405 Clay Street
>
> Although no significant RECs were identified during the ESA, the former laundry facility, carpentry and machine shop, and demolished residential structures represent potential ~~RECs~~ environmental conditions.

Text in Section 4.16.1, "Environmental Setting" in the Draft EIR, page 4.16-13, has been revised as follows to clarify the difference between RECs and potential environmental conditions:

> 2323 Sacramento Street
>
> Although no RECs were identified during the Phase I ESA, the two hydraulic elevators and demolished residential structures represent potential ~~RECs~~ environmental conditions.

Text in Section 4.16.1, "Environmental Setting" in the Draft EIR, page 4.16-14 and page 4.16-15, has been revised and a new paragraph has been added as follows to describe the conditions at the off-site cleaner site:

> 3773 Sacramento Street
>
> The Phase I ESA for 3773 Sacramento Street (an existing parking garage constructed in 1971) found no significant indications of releases of hazardous materials or petroleum products at the site and no evidence of possible past releases.[58] The parcel was previously occupied by mixed residential and commercial buildings and Arts ~~and~~ Crafts ~~Cleaners~~. Cleaners typically use hazardous materials in the form of chlorinated solvents, which would have affected the soil and groundwater beneath the parcel during a spill or release; however, it is unknown if this cleaner performed dry cleaning on-site, or if there were releases of hazardous materials into the environment. The former presence of this establishment does not represent a material threat of release of hazardous materials and is not a recognized environmental condition, because the site has been substantially excavated and redeveloped since the former dry cleaning use existed on-site. ~~Accordingly, t~~ The Phase I ESA included sampling and analysis of an existing groundwater monitoring well on the parcel. Sampling results revealed VOC concentrations in the groundwater, which were judged unlikely to have been the result of releases from Art Craft Cleaners; ~~however~~ in addition, the levels were well below primary drinking water standards and do not represent an REC. Accordingly, it was determined that soil sampling was not required.[59]
>
> A French Laundry & Cleaners is located uphill and approximately 100 feet east of the site. The French Laundry & Cleaners is cross-gradient with respect to groundwater flow at the 3773 Sacramento Street site and, therefore, does not represent a material threat of a release and is not a REC. French Laundry & Cleaners, however, was identified as a possible off-site source of contamination in the Phase I ESA completed for the Marshall Hale Hospital at 3698 California Street.[60] A limited Phase II ESA was performed to evaluate this potential environmental condition and indicated that the Marshall Hale Hospital site also has not likely been impacted by the French Laundry & Cleaners.
>
> [60] California Pacific Medical Center. 2008 (February 8). Phase I/Phase II Environmental Site Assessment (Updated and Revised), Marshall Hale Hospital, 3698 California Street, San Francisco, California. San Francisco, CA. Prepared by Treadwell & Rollo, Inc., San Francisco, CA.

Text in Section 4.16.1, "Environmental Setting" in the Draft EIR, in the second to last sentence in the last paragraph on page 4.16-16, has been revised as follows to clarify the difference between RECs and potential environmental conditions:

> Off-Site Uses
>
> Past activities at the cleaners may have involved processing cleaning solvent, which represents a potential ~~REC~~ environmental condition.

Text under Impact HZ-1 in the Draft EIR, page 4.16-43 in the last sentence of the first paragraph, has been revised as follows to clarify the difference between RECs and potential environmental conditions:

> The ESAs recommended that the ECPs identify known RECs and potential ~~RECs~~ environmental conditions at the campuses, including contaminated soils and groundwater, and:

Text under Impact HZ-1 in the Draft EIR, page 4.16-44 in the second sentence of the second paragraph, has been revised as follows to clarify the difference between RECs and potential environmental conditions:

The ESAs recommended that the ECPs identify known RECs and potential ~~RECs~~ environmental conditions at the campuses, including USTs, and provide instruction on their removal.

See page 4-29 of Chapter 4, "Text Changes to the Draft EIR" of this C&R document for further clarification.

As described in Mitigation Measure M-HZ-N1a in the Draft EIR, beginning on page 4.16-46, before issuance of site, building, or other permits by the City for development activities involving subsurface disturbance, CPMC would be required to submit the previously prepared environmental contingency plans (ECPs), which would serve as both the site mitigation plans (SMPs) and unknown contingency plans for the CPMC campuses, to SFDPH for review and approval. The implementation of the campus-specific ECPs would limit the exposure of workers to known or unknown contaminated soil and groundwater and potentially hazardous materials in the contents and vapors of USTs, and would limit the off-site migration of contaminants in soil and groundwater, preventing exposure of the public and environment to these hazardous materials.

Comment

(Matt Hagemann—California Nurses Association, November 24, 2010) [119-26 HZ]

"**Summary and Recommendations**

The DEIR and the supporting Phase I and Phase II reports document numerous instances of soil and groundwater contamination. These documents also evidence the potential for additional widespread contaminants where the applicant must conduct proper further investigation as required by CEQA. The conditions have been known, in most instances for at least two years, yet the applicant has made no attempt to engage the SFDPH. Instead, the DEIR proposes to further delineate areas of contamination only once project construct begins. These omissions result in inadequate documentation in DEIR of the extent and severity of the contamination at numerous sites throughout the Project area. Failure to adequately disclose the contamination puts the public at risk. Construction workers may be put at risk when they touch and breathe contaminants (through dust and vapors). Neighboring residents and those living along transportation corridors may be at risk from harmful dust and vapors generated during excavation and transport of contaminated soil in and through their neighborhoods."

Response HZ-8

The comment states that further investigations of contamination at "numerous sites throughout the Project area," more engagement of SFDPH, and adequate disclosure of contamination are necessary as part of the LRDP EIR. The commenter is also concerned about potential health risks to the public and construction workers (presumably) arising from San Francisco Planning Department's (the Lead Agency) and the LRDP sponsor's lack of coordination with the SFDPH, with respect to LRDP construction and development activities. As described in Section 4.16, "Hazards and Hazardous Materials" in the Draft EIR, 24 ESAs (20 Phase I ESAs, two Phase II ESAs, and two combined Phase I/Phase II ESAs) were conducted over a 7-year period (2003–2010) for the five CPMC campuses, and a detailed description of the results of these ESAs is included in Section 4.16.1, "Hazards and Hazardous Materials Environmental Setting" in the Draft EIR, beginning on page 4.16-2. C&R Table 3.18-1, on page 3.18-8, also summarizes the degree of soil sampling conducted per CPMC campus, what contaminants the samples were tested for, and the results of the sampling. It should be noted that soil sampling (or Phase II ESAs) was not conducted if the Phase I ESAs conducted for a given LRDP campus property did not identify a REC or other known or potential environmental condition associated with past uses at that particular development site. The Phase I and Phase II ESAs prepared for each CPMC campus were submitted to the SFDPH (Stephanie Cushing, Senior Environmental Health Inspector) in 2008 and 2009. Recommendations received from the SFDPH, based on their review of the CPMC Campuses' Phase I and II ESAs, were incorporated into the analysis on page 4.16-43 of the LRDP Draft EIR. It should also be noted that a copy

of the Draft EIR was forwarded to the SFDPH for their review during the public review period, and no comments have been received to date from the SFDPH regarding the Draft EIR. Please see Response HZ-5 (page C&R 3.18-7), regarding the adequacy of the Draft EIR under State CEQA Guidelines Section 15088.5. Please also see Response HZ-3 (page C&R 3.18-2) for a description of the mitigation measures, regulations, and standards applicable to LRDP construction and development at all CPMC campuses that would reduce the impacts related to exposure of the overall environment, workers, and the public to contaminants to less-than-significant levels. Response HZ-3 (page C&R 3.18-2) provides a description of the role of SFDPH in review and approval of site mitigation and contingency plans, as well as a description of the discussions with SFDPH that have taken place to date.

3.18.1.5 MITIGATION

Comment

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-165 HZ, duplicate comment was provided in 30-165 HZ]

"100. For the entire CPMC new construction projects, what environmental contingency plan will be in place to address surprise findings of hazardous waste?"

Response HZ-9

The comment inquires about what environmental contingency plan would be in place to address unidentified hazardous waste at all CPMC LRDP campuses (development sites). Mitigation Measures M-HZ-N1b and M-HZ-L1b in the Draft EIR, pages 4.16-48 and 4.16-52, respectively, require preparation of an unknown contingency plan for each CPMC campus before issuance of site, building, or other permits for proposed development at any campus under the proposed LRDP. An unknown contingency plan would establish appropriate notification procedures for the BAAQMD, SFDPH, and San Francisco Fire Department (SFFD), as well as appropriate site control procedures. Control procedures might include, but would not be limited to, further investigation and, if necessary, remediation of such hazards or releases, including off-campus removal and disposal, containment, or treatment. Unknown contingency plans for the CPMC campuses (development sites) would be subject to the approval of SFDPH and would limit the exposure of construction workers to unknown contaminated soil and groundwater at proposed LRDP development sites on various CPMC campuses. Hazardous materials associated with USTs would limit the off-site migration of contaminants in soil and groundwater from the CPMC campus development sites, preventing exposure of the public and environment to contaminants. As described in Response HZ-3, campus-specific environmental contingency plans (ECPs), which among other things detail the requirements for the identification, handling, and disposal activities in the event of an unforeseen discovery of potential hazardous materials on-campus, and would fulfill the requirements of Mitigation Measures M-HZ-N1b and M-HZ-L1b, have already been prepared. These ECPs would serve as the unknown contingency plans (as well as the SMPs) for the CPMC campuses and would be submitted for review and approval by SFDPH prior to the issuance of site, building, or other permits for development activities involving subsurface disturbance. Once approved by SFDPH, these ECPs would be implemented to ensure that impacts related to unknown or surprise findings of hazardous waste remain less than significant, in accordance with Mitigation Measures M-HZ-N1b and M-HZ-L1b.

Comments

(Gloria Smith—California Nurses Association, October 18, 2010) [90-39 HZ]

"Not only did the DEIR fail to fully inform the public of these hazards, CPMC has not contacted the San Francisco Department of Public Health, the agency that oversees subsurface soil and water contamination of the type presented here. The SFDPH should have been contacted so that its independent assessment of any necessary

remediation or mitigation could be included in the DEIR for public review. Mr. Hagemann's attached letter details the specific contaminant risk for each DEIR site, and shows the need for SFDPH oversight."

(Gloria Smith—California Nurses Association, October 18, 2010) [90-72 HZ]

"**1. The DEIR Lacks Effective Measures to Mitigate Soil and Groundwater Contamination**

As shown above, Mr. Hagemann's review of the DEIR and associated documents evidenced widespread risks associated with soil and groundwater contamination affecting all five Project sites. Nevertheless, the DEIR proposed just one mitigation measure for this potentially significant impact. Worse, the fatally vague and unenforceable measure would defer any mitigation to just before commencement of excavation/construction work. Specifically, the DEIR proposed 'management protocols based on the site-specific environmental contingency plans once work begins.'[43] Not only is this measure completely void of meaningful specificity, it unlawfully defers mitigation to just prior to the time of actual excavation.

CEQA requires the City to fully assess and disclose the extent of the contamination before Project approval, and then propose feasible alternatives and/or measures to mitigate these impacts. In addition, in Mr. Hagemann's opinion, the applicant must immediately engage the City of San Francisco's Public Health Department through a voluntary cleanup application, and disclose that process in a revised EIR. By entering into a voluntary cleanup agreement, the applicant can be assured that assessment and cleanup of the contamination will be sufficient for a regulatory determination that no further action is warranted. This step will also ensure that the clean-up efforts are dealt with well before site excavation, thereby protecting construction workers and nearby residents. Finally, all action required by the SFDPH must be included in a revised EIR along with the results of investigations to address soil and groundwater contaminants. The SFDPH requirements must be included as mitigation measures to ensure the measures are enforceable and actually occur.

[43] See M-HZ-N1a, DEIR at page 4.16-43."

(Matt Hagemann—California Nurses Association, November 24, 2010) [119-9 HZ]

"To resolve the findings of the potential RECs, the San Francisco Department of Public Health (SFDPH), the local agency which oversees subsurface soil and water contamination of this type, should be engaged to review the Phase I and the Phase II reports. There is no indication that, to date, the SFDPH has reviewed the findings of any of the Phase Is. The SFDPH must independently assess whether further action is necessary to protect public health during excavation, grading, and transportation of contaminated soil and groundwater."

(Matt Hagemann—California Nurses Association, November 24, 2010) [119-28 HZ]

"In addition, the applicant must immediately engage the City of San Francisco's Public Health Department through a voluntary cleanup application. By entering into a voluntary cleanup agreement now, the applicant will be assured that assessment and cleanup of the contamination will be sufficient for a regulatory determination that no further action is warranted. However, all further action required by the SFDPH must be included in a revised DEIR along with the results of investigations that may be required to address known or suspected soil and groundwater contaminants. The steps that are necessary to meet SFDPH requirements must be included in a revised EIR as mitigation measures to assure the public that contaminants will be adequately addressed.

So far, the applicant appears to either hope to avoid or delay formal regulatory oversight. By doing so, the applicant not only risks delaying project construction until serious contamination issues are resolved, but also puts the public at risk because many of contamination risks have not been disclosed and thus not mitigated. The DEIR must be revised to include documentation of communication with the SFDPH and the results of any investigations that are required by the agency to protect public health. Any measures that are required by SFDPH must be stated in a revised EIR and addressed through remediation or mitigation prior to excavation."

Response HZ-10

The comments state that the Draft EIR has vague and unenforceable mitigation measures for soil and groundwater contamination that would be encountered during ground-disturbing development activities at the CPMC campuses. Another comment also emphasizes the need for engagement and discussion with the SFDPH and states that it appears that communication with SFDPH, including their review of Phase I and Phase II ESAs prepared for the CPMC campuses, has not occurred. The comments also state that mitigation for LRDP impacts related to soil and groundwater contamination at the CPMC campuses is deferred to just before the commencement of LRDP-related excavation/construction work at these campuses. Please also refer to Response HZ-3, HZ-5 (page C&R 3.18-2 and page C&R 3.18-7) for coordination requirements with the SFDPH and mitigation measures.

Impact HZ-1 in the Draft EIR (beginning on page 4.16-40) describes potentially significant impacts to the overall environment, construction workers, and others in proximity to the CPMC campuses resulting from disturbance of on-site contaminated soil and groundwater and identifies two mitigation measures, M-HZ-N1a and M-HZ-N1b (pages 4.16-46 and 4.16-48, respectively). The comments are correct that the Draft EIR specifically recommends "management protocols based on the site-specific ECPs once work begins." The Draft EIR specifically requires implementation of Mitigation Measures M-HZ-N1a and M-HZ-N1b for impacts related to contaminated soil and groundwater that would be disturbed at the LRDP development sites. As detailed in these measures, SFDPH approval of campus-specific ECPs (which would serve as both the site mitigation plans (SMPs) and unknown contingency plans for the CPMC campuses) is required before issuance of site, building, or other permits by the City, which would occur well before excavation or construction work at any of the CPMC campuses.

It should also be noted that as part of the environmental review and analysis of the CPMC LRDP, Phase I/Phase II ESAs were submitted to the SFDPH (Stephanie Cushing, Senior Environmental Health Inspector) in 2008 and 2009, and a copy of the Draft EIR was forwarded for their review during the public review period of the Draft EIR.

As stated in Mitigation Measure M-HZ-N1a in the Draft EIR, page 4.16-47, any necessary remediation or mitigation recommended by the SFDPH beyond those measures already identified by the ECPs would be required to be incorporated into the ECPs. The Phase I, Phase II, and combination Phase I/Phase II ESAs prepared for the five campuses of the CPMC LRDP recommended the preparation of ECPs to fully mitigate the known and unknown hazards associated with site-specific soil and groundwater conditions at the CPMC campuses and LRDP-related development on these campuses. In accordance with M-HZ-N1a and M-HZ-N1b, these ECPs would also require that health and safety plans for the LRDP development sites be prepared by a certified industrial hygienist for implementation by the LRDP site contractor and would address potential threats to the health and safety of both site construction workers and the public during LRDP-related construction activities. The purpose of preparing the ECPs was to obtain SFDPH review, approval, and oversight. The Phase I, Phase II, and combination Phase I/Phase II ESAs prepared for the CPMC campuses did not specify whether such review, approval, and oversight would be performed as part of the Mitigation, Monitoring, and Reporting Program (MMRP), a voluntary cleanup agreement, or other process. It should also be noted that the Phase I, Phase II, and combination Phase I/Phase II ESAs for all the CPMC campuses were reviewed by SFDPH in 2008 and 2009, and the Draft EIR was forwarded for their review during the public review period. SFDPH did not indicate during either their review of the CPMC Campuses' Phase I, Phase II, and combination Phase I/Phase II ESAs or the LRDP Draft EIR that a voluntary cleanup agreement was recommended. Additionally, Mitigation Measures M-HZ-N1a and M-HZ-N1b (pages 4.16-46 to 4.16-49 of the Draft EIR) would require additional future coordination with SFDPH during their review of the campus-specific ECPs for the LRDP. Mitigation Measures M-HZ-N1a and M-HZ-N1b would also require that any additional measures recommended by SFDPH, beyond those already included in the ECPs, are incorporated into the ECPs as a

condition of the issuance of site, building, or other permits by City agencies. Please see Response HZ-5 (page C&R 3.18-7) for further clarification.

Please also see Response HZ-6 (page C&R 3.18-9) for a discussion of voluntary cleanup agreements and how they apply to the proposed LRDP, as well as Response HZ-27 (page C&R 3.18-41) regarding the adequacy and role of the Draft EIR and the federal, state, and local regulatory process. See Response HZ-3 (page C&R 3.18-2) for a detailed discussion of the level of regulatory oversight that has occurred (especially that with SFDPH) and would occur with implementation of the proposed LRDP.

Comment

(Matt Hagemann—California Nurses Association, November 24, 2010) [119-27 HZ]

"To address known and potential soil and groundwater contamination at the proposed campuses, the DEIR proposes Mitigation Measure M-HZ-N1a (page 4.16-43) which would require the preparation and approval of soil management plans that include 'management protocols based on the site-specific environmental contingency plans.' This measure also requires air quality monitoring during tank removal activities and sampling of surrounding soils to ensure that leaks have not occurred subject at that time, finally, to SFDPH approval. This is not sufficient.

The preparation of plans to address known and suspected contamination only at the time of excavation is wholly inadequate. A revised EIR is required to immediately assess the extent of all Project-related contamination. The revised EIR must include alternatives and measures to mitigate or remediate all potentially significant contamination impacts."

Response HZ-11

The comment suggests that "soil mitigation plans" would only be prepared to address known and suspected contamination at the time of excavation at the LRDP development sites and, therefore, the Draft EIR did not adequately address the full extent of LRDP-related contamination. The comment suggests that the Draft EIR does not include measures to mitigate or remediate all potentially significant contamination impacts, presumably those impacts related to unknown soil and groundwater conditions at the LRDP development sites. As detailed in the "Environmental Setting" section of Chapter 4.16 "Hazards and Hazardous Materials" of the Draft EIR, beginning on page 4.16-2, 20 Phase I, two Phase II, and two combined Phase I/Phase II ESAs (a total of 24 reports) were prepared for the four existing CPMC campuses and one proposed CPMC campus. These ESAs were prepared to fully determine, to the extent feasible, the known and suspected soil and groundwater conditions at the CPMC campuses based on the historical and current uses of the campuses and the vicinities surrounding these campuses. Based on the recommendations in the Phase I, Phase II, and combined Phase I/Phase II ESAs, environmental contingency plans (ECPs) were prepared for each CPMC campus outlining the required procedures for the proper handling, sampling, and disposal of known and suspected contaminated soil and groundwater encountered at the CPMC campuses during all ground disturbing activities, including excavation. In accordance with Mitigation Measures M-HZ-N1a and M-HZ-L1a in the Draft EIR, pages 4.16-46 and 4.16-52, respectively, these campus-specific ECPs would serve as both SMPs and unknown contingency plans, and would be submitted to SFDPH for review and approval. Mitigation Measures M-HZ-N1a and M-HZ-L1a also require that any additional measures which SFDPH determine to be required for the LRDP related to the known and suspected soil and groundwater contamination at the development sites are incorporated into the ECPs as a condition of approval.

Because the possibility exists during redevelopment in an urban environment to encounter previously unknown contaminants, the ECPs include requirements for the proper identification, handling, sampling, and disposal of any unknown soil and groundwater contaminants which may be encountered during LRDP construction and implementation. As detailed in Mitigation Measures M-HZ-N1b and M-HZ-L1b

in the Draft EIR, pages 4.16-48 and 4.16-52, respectively, the ECPs would also serve as unknown contingency plans and would be submitted to SFDPH for review and approval. As with Mitigation Measures M-HZ-N1a and M-HZ-L1a, Mitigation Measures M-HZ-N1b and M-HZ-L1b also require that any additional measures which SFDPH determine to be required for the LRDP implementation, related to the known and suspected soil and groundwater contamination at the development sites, are incorporated into the ECPs as conditional of approval.

The ECPs (serving as SMPs and unknown contingency plans), as required by Mitigation Measures M-HZ-N1a, M-HZ-L1a, M-HZ-N1b, and M-HZ-L1b, would limit the exposure of construction workers and the public to unknown contaminated soil and groundwater related to LRDP construction on CPMC campuses and potentially hazardous materials that could be encountered during LRDP construction activities in general, and would limit the off-site migration of contaminants in soils and groundwater from the LRDP development sites, preventing exposure of the public and the overall environment to these potential contaminants. Accordingly, the measures required by the ECPs and detailed in Impact HZ-1, beginning on page 4.16-40 of the Draft EIR, and in Mitigation Measures M-HZ-N1a, M-HZ-L1a, M-HZ-N1b, and M-HZ-L1b (pages 4.16-46, 4.16-52, 4.16-48, and 4.16-48, respectively), would be sufficient to reduce impacts related to soil and groundwater contaminants at the CPMC campuses to less-than-significant levels. Additionally, please see Response HZ-5 (page C&R 3.18-7) regarding the adequacy of the Draft EIR under State CEQA Guidelines Section 15088.5.

3.18.1.6 OPERATIONAL HEALTH RISKS

Comment

(Carolyn Abst and Ron Case—Case and Abst Architects LLC, October 19, 2010) [102-35 HZ, duplicate comment was provided in 114-35 HZ]

"I. We are concerned about the continuing health issues surrounding hospitals and medical facilities. We are concerned that the emissions and discharges from the building will be a health hazard. We occupy the building 24 hours a day, 7 days a week. Small amounts of hazardous materials over a long period can be a major health issue."

Response HZ-12

The comment notes concern about health hazards caused by emissions and discharges from hospitals and medical facilities proposed at CPMC campuses under the LRDP, especially those at the proposed Cathedral Hill Campus. Emissions and discharges of hazardous materials during operation of the CPMC campuses are discussed under Impact HZ-2 in the Draft EIR, beginning on page 4.16-53, under Impact AQ-5 beginning on page 4.7-43, and under Impact AQ-12 beginning on page 4.7-73.

As discussed under Impact HZ-2, after LRDP implementation, hazardous materials present at existing CMPC campuses (related to medical uses in addition to typical cleaning supplies) and hazardous wastes created at these campuses (e.g., medical wastes, sharps, radioactive waste) would be the same substances that are currently used, discharged, and emitted on the campuses. The hazardous materials and wastes at the existing CPMC campuses would continue to be stored, handled, and disposed in accordance with current laws, regulations, existing CPMC policies, and permits under the authority of the San Francisco Hazardous Materials Unified Program Agency (HMUPA) and the State of California (i.e., the California Department of Public Health (DPH), Radiologic Health Branch [RHB]). Additionally, although hazardous materials would be routinely stored and used and wastes would be routinely produced and disposed of at the proposed Cathedral Hill Campus in amounts substantially larger than under existing conditions at this campus, this amount would be similar to existing hospitals in San Francisco, and would be similarly regulated by the above-noted authorities.

CPMC would be required to maintain and update its business plans, hazardous materials certificates of registration, radioactive materials licenses, certificates of registration for medical waste, medical waste permits, updated site maps, hazardous materials inventories, training plans, emergency operations plans, medical waste plans, and hazardous materials reduction plans for the existing campuses and create and maintain these plans for the proposed Cathedral Hill Campus. CPMC would also be required to maintain and update its hazardous materials and hazardous waste plans for the existing campuses and create and maintain these plans for the proposed Cathedral Hill Campus. These plans' instructions for proper response and timely cleanup and reporting after an accidental spill or release of hazardous materials would reflect revised campus plans, campus access, and storage locations for hazardous materials after LRDP development. Continued compliance with existing regulations and requirements would ensure that potential impacts from the use and storage of hazardous materials during LRDP-related operations at the existing CPMC campuses would be less than significant. Implementation of these requirements at the proposed Cathedral Hill Campus would ensure that the potential impacts from the increase in the use, storage, and generation of hazardous materials and wastes would be less than significant at the new campus.

Therefore, as explained in the LRDP Draft EIR under Impact HZ-2 beginning on page 4.16-53, the use of hazardous materials and generation of hazardous waste during LRDP-related operations at the existing and proposed CPMC campuses would not pose a substantial public health or safety hazard to the surrounding area, and impacts would be less than significant. Furthermore, as stated in the Draft EIR, pages 4.7-43 and 4.7-73, under the LRDP, daily operations at any of the existing CPMC campuses or the proposed Cathedral Hill Campus would not expose sensitive receptors to substantial toxic air contaminants.

3.18.2 CATHEDRAL HILL CAMPUS

3.18.2.1 CONSTRUCTION HEALTH RISKS

Comment

(Alan Wofsy—Emeric-Goodman Associates, September 23, 2010) [26-3 HZ]

"The DEIR does not analyze the environmental and health impacts on the residents and businesses in our building as a result of these overwhelming statistics. It is likely that many will be unwilling to live or work in the building during the 54 months of construction and the DEIR should have proposed a method to compensate the property owner for lost income due to the impacts of the project and/or to have compensated tenants who are willing to remain in the building during the construction period."

Response HZ-13

The comment expresses concern for potential health risks of LRDP-related construction at the proposed Cathedral Hill Campus to residents of the Emeric-Goodman Building, which is located on the south side of Geary Boulevard, across from the proposed Cathedral Hill Hospital site. The comment is not specific about what environmental and health impacts could occur on nearby residents and businesses that the commenter believes the Draft EIR has not analyzed. The LRDP's construction and operational impacts associated with traffic, noise, air quality, and hazards and hazardous materials are evaluated in the Draft EIR Sections 4.5, 4.6, 4.7, and 4.16, respectively, as discussed briefly below.

Section 4.5, "Transportation and Circulation" identifies Impacts TR-55 through TR-58 evaluate the potential impacts to local transportation and circulation that would occur during construction of the proposed Cathedral Hill Campus. Please see the Draft EIR, pages 4.5-147 through 4.5-161, for a discussion of those impacts, as well as the mitigation measures that would be implemented to reduce the significant impacts of the proposed LRDP at the Cathedral Hill Campus. Some construction-related

transportation impacts of the LRDP at the proposed Cathedral Hill Campus would be reduced to less-than-significant levels with mitigation; however, impacts TR-55 through TR-58 related to construction vehicle traffic and construction activities would remain significant and unavoidable, given the size of the proposed project and the expected duration of the construction period.

In Section 4.6, "Noise," under Impact NO-1 in the Draft EIR, beginning on page 4.6-41, the discussion addresses short-term noise impacts on nearby noise-sensitive receptors during construction of the Cathedral Hill Campus as proposed under the CPMC LRDP. As discussed, these impacts would be reduced to less-than-significant levels through implementation of Mitigation Measures M-NO-N1a, M-NO-N1b, and M-NO-N1c (Draft EIR, beginning on page 4.6-46), which would require compliance of the proposed LRDP with the San Francisco Noise Control Ordinance through implementation of noise control measures and would include the preparation and implementation of a construction noise management plan. In addition, a community liaison would be designated by CPMC to manage and respond to noise complaints from nearby sensitive receptors, such as residents and occupants of noise-sensitive uses, and would advise nearby residents/occupants of noise-sensitive uses of the LRDP construction schedule. Impact NO-5 in the Draft EIR, beginning on page 4.6-89, addresses LRDP construction-related groundborne vibration levels, which were determined in the Draft EIR to be significant and unavoidable for development at all CPMC campuses. Mitigation Measure M-NO-N5 would minimize the impacts of construction related to vibration, to the extent feasible, by implementing a construction vibration management plan and control measures, but this impact would remain significant and unavoidable.

In Section 4.7, "Air Quality" in the Draft EIR, Impacts AQ-1, AQ-2, AQ-7, AQ-8, AQ-9, and AQ-10 (beginning on page 4.7-29) address air quality impacts that would result from construction activities at the proposed Cathedral Hill Campus from implementation of the LRDP, including potential impacts related to fugitive dust, toxic air contaminants (including diesel particulate matter), and criteria air pollutants. Please see Response AQ-9, (page C&R 3.9-20) for a summary of those impacts, as well as the mitigation measures that would in some cases reduce LRDP construction-related impacts on air quality to less-than-significant levels. Some impacts on air quality during construction, however, would remain significant and unavoidable, including those related to toxic air contaminants (under BAAQMD 2010 significance thresholds) and criteria air pollutants (under BAAQMD 2010 significance thresholds). Impacts AQ-6 and AQ-13 state that construction of the LRDP would have less-than-significant impacts on people from objectionable odors related to the operation of heavy machinery and painting/paving activities, and no mitigation measures related to odors would be required.

In Section 4.16, "Hazards and Hazardous Materials" in the Draft EIR, beginning on page 4.16-40, Impact HZ-1 evaluates potential hazards to the public due to hazardous materials during LRDP construction. Mitigation Measures M-HZ-N1a and M-HZ-N1b (in the Draft EIR, beginning on page 4.16-46) would be implemented to protect the public from exposure to known and unknown hazardous materials during LRDP construction through the preparation and implementation of site mitigation plans (SMPs) and unknown contingency plans, and these would reduce this impact to a less-than-significant level.

Please see Response PH-15 (page C&R 3.5-56) and Response PH-23 (page C&R 3.5-79) for discussions of displacement of residents and commercial businesses, respectively, that may occur as a result of implementation of the proposed LRDP. With respect to the comment's statement that the proposed LRDP should provide compensation for local businesses, please see Response PH-23 (page C&R 3.5-79) for a discussion of the potential effects of construction-related activities on the local community. As discussed in these responses, exposure to construction activities is a common and unavoidable consequence of living in a dense urban community. By-products of the construction process are temporal in nature, involve using different types of equipment at different locations on a project site, and are not expected to create long-term disturbances that may cause long-term residential or commercial vacancies. Even for large projects such as those that would occur on the CPMC campuses over time, construction activities

would move around the construction site and would occur immediately adjacent to a specific property, building, or window for only limited periods, not the entire construction period. Thus, such effects would be unlikely to create long-term problems, such as urban decay, that could create physical environmental effects requiring mitigation.

Comment

(Unitarian Universalist CPMC Task Force, October 5, 2010) [44-8 HZ]

"Regarding Hazardous Waste as discussed on pages 4.16 -58, again there is no mention of the Montessori school, where young children use the playground and work and nap in classrooms that rely on open windows for ventilation, every week of the year. Was the impact on our Montessori children considered?"

Response HZ-14

The comment expresses concern that potential health impacts of the proposed Cathedral Hill Campus development on a local Montessori school were not addressed. Chapter 4.7 "Air Quality" of the Draft EIR includes an analysis of the potential impacts related to toxic air contaminants (TACs) on sensitive receptors in the vicinity of the proposed Cathedral Hill Campus under both the 1999 BAAQMD CEQA Guidelines and the 2010 BAAQMD CEQA Guidelines, under Impacts AQ-2 (beginning on page 4.7-34) and AQ-10 (beginning on page 4.7-65), respectively. The text revisions to the Draft EIR in Chapter 4, "Draft EIR Text Changes", of this C&R document (pages C&R 4-84 to 4-94) includes updates to the Draft EIR analysis of Impacts AQ-2 and AQ-10. The analysis under Impact AQ-10 concluded that activities associated with LRDP construction at the proposed Cathedral Hill Campus would result in significant and unavoidable TAC impacts to sensitive receptors, including the Montessori school, under the 2010 BAAQMD CEQA Guidelines. As described in Impacts AQ-5 (beginning on page 4.7-43) and AQ-12 (beginning on page 4.7-73), activities associated with operation of the proposed Cathedral Hill Campus, such as the operation of gas boilers, water heaters, diesel-operated generators, and diesel-operated delivery trucks, do not have the potential to result in significant TAC impacts to sensitive receptors in the vicinity of the proposed campus under either the 1999 or the 2010 BAAQMD CEQA Guidelines, and this includes the Montessori school. No modification of these analyses in the Draft EIR is necessary.

Impact HZ-3 in the Draft EIR, page 4.16-58, has been revised as indicated below to include a listing for the Montessori House of Children School at 1187 Franklin Street, which is located approximately 100 feet southwest of the proposed Cathedral Hill Campus development site:

> The Cathedral Hill, Davies, and St. Luke's Campuses are located within one-quarter mile of the following schools:
>
> > Cathedral Hill Campus: Sacred Heart Cathedral Prep (1055 Ellis Street), Stewart Hall High School (1715 Octavia Street), Redding Elementary School (1421 Pine Street), Alemany College (750 Eddy Street), ~~and~~ Academy of Arts College (1561 Pine Street), and Montessori House of Children School (1187 Franklin Street).

As discussed under Impact HZ-3 in the Draft EIR, beginning on page 4.16-57, compliance with federal, state, and local regulations and guidelines pertaining to the handling of hazardous materials, including during asbestos and lead abatement, as well as implementation of dust control measures in accordance with the City's Dust Control Ordinance, would ensure that construction and operation of the CPMC LRDP at various CPMC campuses would have a less-than-significant impact related to hazards and hazardous materials on the Montessori House of Children School.

Comment

(Matt Hagemann—California Nurses Association, November 24, 2010) [119-24 HZ]

"**Cathedral Hill Campus**

The applicant prepared nine Phase I/Phase II reports to assess the potential for environmental conditions associated with the old Cathedral Hill Hotel (1101 Van Ness Avenue), the 1255 Post Street Office Building and two parcels at 1375 Sutter Street, all proposed for development under the DEIR.

1101 Van Ness Avenue and 1255 Post Street (Proposed Cathedral Hill Hospital)

Although no RECs were found in a 2003 Phase I,[25] the applicant's consultant recommended additional sampling to address the potential for earthquake fill to contain elevated levels of lead in the northeastern part of the site, and recommended sampling of the expected area of earthquake fill in the site's southeast area (Phase I, page 15). Based on the soil sample analysis, the 2003 Phase II ESA[26] determined that no significant release of hazardous materials would trigger regulatory requirements for long-term monitoring or remediation has occurred at the site (DEIR, page 4-16.4).

In summarizing Phase II for the site, the DEIR states:

> Based on the soil sample analysis, the Phase II ESA determined that no significant release of hazardous materials that would trigger regulatory requirements for long-term monitoring or remediation has occurred at the site. Therefore, with the exception of the limited area of earthquake fill containing elevated concentrations of lead in the northeastern part of the site and the expected area of earthquake fill in the southeast part of the site, no RECs or other potential environmental conditions were found during the ESAs of the proposed Cathedral Hill Hospital.

Recommendation: The Phase II ESA determination that no regulatory intervention is needed must be confirmed by submitting the Phase II ESA to the SFDPH under a voluntary cleanup agreement for review. The regulatory determination must be included in a revised DEIR along with any measures to mitigate or remediate conditions that would pose a hazard to construction personnel or to residents adjacent to the construction or along transportation routes.

[25] California Pacific Medical Center. 2003. *Phase I Environmental Site Assessment, Cathedral Hill Hotel and Office Building: 1101 Van Ness Avenue and 1255 Post Street, San Francisco, California.* San Francisco, CA. Prepared by Treadwell & Rollo, Inc., San Francisco, CA.

[26] California Pacific Medical Center. 2003 (October 13). *Phase II Environmental Site Assessment, Cathedral Hill Hotel, 1101 Van Ness Avenue, San Francisco, California.* San Francisco, CA. Prepared by Treadwell & Rollo, Inc., San Francisco, CA."

Response HZ-15

The comment states that regulatory review of the Phase II ESA by SFDPH is needed (under a voluntary cleanup agreement) to confirm that no additional regulatory intervention would be needed. For a detailed discussion of voluntary cleanup agreements, please refer to Response HZ-6 on page C&R 3.18-9. As discussed, SFDPH did not recommend a voluntary cleanup agreement for the four existing or one proposed CPMC campus during their review of the various ESAs and Draft EIR. With respect to the comment's statement regarding additional coordination with the SFDPH being necessary, 24 ESAs (20 Phase I ESAs, two Phase II ESAs (one each for the proposed sites of the Cathedral Hill Hospital and Cathedral Hill MOB), and two combined Phase I/Phase II ESAs (one each for the 3698 California Street and the 3700 California Street sites at the California Campus) were conducted over a 7-year period (2003–2010) for the five CPMC campuses. The ESAs prepared for the CPMC campuses were submitted

to the SFDPH (Stephanie Cushing, Senior Environmental Health Inspector) in 2008 and 2009, and a copy of the Draft EIR was forwarded to the SFDPH for review during the public review period of the Draft EIR. No comments were received from SFDPH on the Draft EIR. Furthermore, as recommended in the CPMC campuses' Phase I and II ESAs, ECPs were prepared based on the RECs and potential environmental conditions that were identified for each of the CPMC campuses in these Phase I/Phase II ESAs. These ECPs will serve as both the SMPs and the unknown contingency plans required by Article 22A of the San Francisco Health Code. Mitigation Measures M-HZ-N1a and M-HZ-N1b, pages 4.16-46 and 4.16-48, respectively, of the Draft EIR, also call for the preparation of SMPs and unknown contingency plans for the CPMC campuses; in the case of CPMC LRDP, the ECPs for the CPMC campuses serve as both SMPs and unknown contingency plans. These ECPs will be submitted to the SFDPH in fall of 2011. The SFDPH will review these ECPs and could potentially add additional measures to these ECPs, as necessary. In fulfillment of measures included as part of the campus-specific ECPs, SFDPH will also monitor compliance with the approved ECP, which would be implemented during construction of the proposed LRDP at the various CPMC campuses. It should also be noted that no imminent threats to human health were identified in the 24 Phase I/Phase II ESAs prepared for the CPMC campuses.

Please see Response HZ-9 (page C&R 3.18-16) for a description of the mitigation measures that are included in the Draft EIR to reduce impacts from potential sources of contamination identified in the Phase I and II ESAs for the proposed Cathedral Hill Campus. For a description of the known potential sources of contamination, please refer to Draft EIR pages 4.6-2 through 4.6-21. Response HZ-9 also describes the role of SFDPH in the review and approval of ECPs before issuance of site, building, or other permits by City agencies for development activities at the CPMC campuses involving subsurface disturbance. The ECPs describe procedures to address known and potential unknown environmental conditions at the CPMC campuses, including appropriate notification and site control procedures, in the event unanticipated subsurface hazards or hazardous material releases were discovered during LRDP construction at various CPMC campuses. The plans would limit the exposure of construction workers to known and unknown contaminated soil and groundwater and potentially hazardous materials used at the CPMC development sites and would limit the off-site migration of contaminants in soils and groundwater at the CPMC campuses, preventing exposure of the public and environment to these contaminants. As required by Mitigation Measures M-HZ-N1a and M-HZ-N1b, as shown on Draft EIR, page 4.16-46 through 4.16-49, the campus-specific ECPs would fully mitigate the known and unknown hazards and hazardous materials impacts associated with site- and project-specific conditions at the CPMC campuses to less-than-significant levels for all campuses that would be developed as part of the CPMC LRDP.

Comment

(Matt Hagemann—California Nurses Association, November 24, 2010) [119-25 HZ]

"**1020, 1028/1030, and 1062 Geary Street and 1100 Van Ness Avenue**

A Phase II Environmental Site Assessment was completed on February 12, 2010 for an area bounded by Van Ness Avenue to the west, Cedar Street to the north, a commercial/residential mixed-use building to the east, and Geary Street to the south.27 The Phase II was completed to follow-up on findings made in Phase I ESAs that had been previously completed for the six buildings at 1020 through 1062 Geary Street and the building at 1100 Van Ness Avenue.

The applicant found earthquake fill containing high lead concentrations is present under much of the Site. During redevelopment, this material will be excavated and disposed as non-RCRA hazardous waste. This material likely underlies the buildings with no basement at 1020, 1028/1030, and 1062 Geary Street to a depth of four to six feet. Fill material underlying 1062 Geary Street shows elevated concentrations of petroleum hydrocarbons, likely as a result of activities at the former auto repair shop. This material will also be excavated during construction of the

planned medical office building. Groundwater in an adjacent well in Cedar Street contained concentrations of petroleum and cyanide exceeding their health-based regulatory screening levels.

The DEIR erroneously deferred sampling of contaminants until excavation is undertaken. Under this proposal, the site's true environmental conditions would not be adequately disclosed. For example, the DEIR makes no attempt to quantify the amount of contaminated soil that would underlie the entire two-block site, or the impact the excavation, mobilization and transport of the soil would have on the neighboring residential and commercial properties and their inhabitants.

Recommendation: The applicant must revise the EIR to include any measures to mitigate or remediate the contaminated soil to protect the health of the construction workers and the neighboring residents or the public along transportation routes. It must also document communication with the SFDPH to ensure that all necessary regulatory actions are taken, including any necessary cleanup of groundwater and soil. Finally, a revised EIR must document an application for voluntary cleanup with the SFDPH to ensure that cleanup of the known contaminants in conducted prior to construction. If cleanup and regulatory closure is deferred until construction, the applicant may encounter conditions that will require delays while regulators determine if the contaminants have been adequately addressed.

[27] California Pacific Medical Center. 2010. Phase II Environmental Site Assessment, Planned Medical Office Building California Pacific Medical Center Cathedral Hill Campus San Francisco, California. San Francisco, CA. Prepared by Treadwell & Rollo, Inc., San Francisco, CA."

Response HZ-16

The comment discusses the results of soil and groundwater sampling conducted as part of a Phase II ESA at the location of the proposed Cathedral Hill MOB (1100 Van Ness Avenue and 1062, 1028–1030, and 1020 Geary Street) and detailed in the Draft EIR on pages 4.16-6 and 4.16-7. As discussed in the comment, soil samples collected from shallow soil under the concrete slabs in the existing buildings at 1062 Geary Street, 1028–1030 Geary Street, and 1020 Geary Street were found to contain TPH-d and TPH-mo at levels exceeding their respective environmental screening levels (ESLs). Fill material throughout the location of the proposed Cathedral Hill MOB was also found to contain elevated levels of lead. Groundwater samples collected from beneath Cedar Street were found to contain TPH-d, TPH-mo, and total cyanide at levels exceeding their respective environmental screening levels (ESLs). The comment states that "[t]he DEIR erroneously deferred sampling of contaminants [presumably of lead, TPH-d, TPH-mo, and cyanide, as mentioned earlier in the comment] until excavation [for the Cathedral Hill MOB] is undertaken" and that "the DEIR makes no attempt to quantify the amount of contaminated soil that would underlie the entire two-block site [at the location of the proposed MOB." The quantification of potential contaminated soils at the proposed Cathedral Hill Campus is not possible due to the currently paved condition, and is not necessary in order to prescribe the proper procedures for the handling and removal of contaminated soils. As such, the quantification of potential contaminated soils volumes would be considered speculative and unnecessary to evaluate the potential construction impacts of the proposed Cathedral Hill Campus.

The comment recommends that the Draft EIR be revised to include mitigation to remediate contaminated soil that is excavated from the proposed Cathedral Hill Campus site to protect the health of construction workers, neighbors, residents, and the public along contaminated soil transport routes. As described in the Draft EIR on page 4.16-43, potential impacts to the health of construction workers, residents, and the public would be minimized by implementing legally required health and safety precautions. For hazardous waste workers, federal and Cal/OSHA regulations mandate an initial training course and subsequent annual training. Site-specific training may also be required for some workers. Worker safety regulations would require the preparation and implementation of site-specific health and safety plans. As discussed on page 4.16-43 of the Draft EIR, excavation, handling, and disposal of all soil and groundwater at the CPMC campuses must adhere to the regulatory requirements of OSHA, Cal/OSHA,

SFDPH, BAAQMD, SFPUC, the San Francisco Bay RWQCB, and Article 22 of the San Francisco Health Code. To further address potential hazards related to known soil and groundwater conditions at the CPMC campuses, including the proposed Cathedral Hill Campus, Mitigation Measures M-HZ-N1a and M-HZ-L1a in the Draft EIR, pages 4.16-46 and 4.16-52, respectively, would require the approval of the SFDPH for the ECPs previously prepared for the CPMC Campuses prior to issuance of site, building, or other permits by the City for development activities involving subsurface disturbance at the campuses. As described in the Draft EIR, page 4.16-46, the ECPs require additional soil sampling for a suite of common chemicals. This additional soil sampling is required by landfills and redevelopment sites accepting imported fill from other sites, to provide a chemical profile of the soil and identify the soil worker safety and disposal classification. Analytical results of the soil sampling would be submitted to SFDPH for review. Procedures for handling, hauling, and soil disposal of contaminated soils are described in Mitigation Measure M-HZ-N1a in the Draft EIR, page 4.16-47, and would include specific work practices, dust suppression, surface water runoff control, and proper hauling and disposal methods as described in the ECP to ensure that potential contaminated soil impacts to LRDP construction workers and the neighboring communities, including those located along potential haul routes, are minimized. Any trucks transporting hazardous materials off-site would be covered to prevent dispersion of hazardous materials during transport and these hazardous materials would be disposed at a permitted hazardous waste disposal facility. Implementation of the ECPs, execution of procedures for handling, hauling, and disposal of contaminated soils, and adherence to the site-specific health and safety plans prepared for the CPMC campuses would limit the exposure of construction workers to known contaminated soil and groundwater and potentially hazardous materials and would limit the off-site migration of on-campus contaminants in soil and groundwater, preventing exposure of the public and environment to these hazardous materials. With implementation of Mitigation Measures M-HZ-N1a and M-HZ-L1a, impacts would be less than significant.

The comment also suggests that a revised Draft EIR should document communication with SFDPH regarding the mitigation/remediation of contaminated soils at the proposed Cathedral Hill Campus. The comment further states that a voluntary cleanup application should be filed with SFDPH (and documented in a revised EIR) to ensure cleanup of known contamination before construction at the proposed Cathedral Hill Campus. With respect to SFDPH coordination, the Phase I and Phase II ESAs prepared for each CPMC campus were submitted to the SFDPH (Stephanie Cushing, Senior Environmental Health Inspector) in 2008 and 2009, and a copy of the CPMC LRDP Draft EIR was forwarded for SFDPH review during the public review period of the Draft EIR. The ECPs would also need to be reviewed and approved by SFDPH for their compliance with federal and state law. Additional site-specific measures and recommendations made by the SFDPH during their review of the ECPs for the CPMC campuses would be required to be included in revised ECPs for those campuses in accordance with Mitigation Measure M-HZ-N1a and M-HZ-L1a. No comments were received from SFDPH on the Draft EIR. Site cleanup would not be required to be conducted before LRDP construction, as suggested by the comment, because no imminent threats to human health were identified in the Phase I and Phase II ESAs, as described on Draft EIR pages 4.6-2 through 4.6-21. For a detailed discussion of voluntary cleanup agreement requirements, please refer to Response to Comment HZ-6 (page C&R 3.18-9).

Comments

(Bernard Sherman, September 23, 2010) [PC-12 HZ]

"In addition, I have just found, as you will, that there is a 30-inch gas line running up Franklin Street. The Fire Department was just informed of this two days ago. I am sure all of us will be surprised and we need to deal with that mitigation before we approve anything else. Thank you."

(Commissioner Moore, September 23, 2010) [PC-371 HZ]

"I do believe that the discovery of the gas line and underground utilities, which I do not think are only on Franklin, but we have equal major utilities below Van Ness, needs to be disclosed because what type of tunnel and at what level, etc. does that occur, and, well, I leave it with that."

Response HZ-17

The comments incorrectly state that a gas line is located adjacent to the proposed Cathedral Hill Campus on Franklin Street and will require mitigation. No 30-inch gas line exists at the proposed Cathedral Hill Campus, as confirmed in a letter from PG&E sent to AECOM regarding this issue on June 13, 2011.[1] Prior to excavation of the proposed Cathedral Hill Campus, existing underground services including gas, water, telecommunications, and other services, would be located and identified to ensure that LRDP construction activities do not disturb these underground utilities and services. This would avoid service interruptions, as well as the potential for the release of hazardous materials into the environment. As such, implementation of mitigation related to avoidance of existing utility lines is not necessary to ensure that appropriate procedures would be implemented so that disturbance and potential interruption of utility service would not occur. In addition, gas pipelines that do exist in the vicinity of the Cathedral Hill Campus are likely owned by Pacific Gas and Electric Company (PG&E), which has in place agreements for emergency response and ample reserves for any necessary cleanup. PG&E also encourages the use of best practices for any excavation, as established by the Common Ground Alliance. Please also see Response ME-3 on page C&R 3.19-10 for additional discussion of individual natural gas lines in the vicinity of the Cathedral Hill Campus.

3.18.2.2 ENVIRONMENTAL SITE ASSESSMENT

Comments

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-107 HZ, duplicate comment was provided in 30-107 HZ]

"56. The other reasons for not attempting the rehabilitation of the California Campus is the high cost of retrofitting as well as the hazards that are still at this campus per the Administrative documents accompanying this CPMC DEIR. Per Treadwell & Rollo's "Phase I/II Environmental Site Assessment Marshall Hale Hospital 3698 California Street," there exists the following potentially hazardous issue:

- 550-gallon underground storage tank removed in 1989 that release petroleum hydrocarbons to the soil and SFDPH considers this an active investigation case

- Transformers in the basement and the doctors' parking lot may contain dielectric fluid with PCBs, although this is considered unlikely. The composition of the fluids in these transformers should be determined prior to demolition during the development of the site (Page 10 of 12, 'Table 1: Summary of Phase I ESA Information, Marshall Hale Hospital, 3698 California Street')."

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-109 HZ, duplicate comment was provided in 30-109 HZ]

"Further, at 3700 California Street, there are the following issues:

[1] Letter from John Corona, Pacific Gas & Electric Company, to Geoffrey Nelson, CPMC, re: Gas Line Information – Cathedral Hill Vicinity SF (May 10, 2011); Letter from Dayne Johnson, PE, LEED® AP, Project Manager, BKF Engineers Surveyors Planners, to Geoffrey Nelson, AICP, Director, Enterprise Development, CPMC re: Pacific Gas and Electric (PG&E) Existing Utility Infrastructure – Proposed California Pacific Medical Center Cathedral Hill Hospital Campus (CHH) and Medical Office Building (MOB) (May 11, 2011).

- 15,000 gallon active, double-wall underground storage tank containing diesel fuel located in the planter near the intersection of California and Maple Streets... 100 feet west and equal to the lowest elevation of the site
- 4,000 gallon single wall underground storage tank... previously contained diesel fuel ... 120 feet west of the site beneath the walkway of the cafeteria near the intersection of California and Maple ... closed in place in the 1990s
- 1,000 gallon single-wall underground storage tank... previously contained diesel fuel. ..150 feet west. ..equal or higher in elevation relative to the 3698 California Street site ... closed in place in the 1990s.

As the report states the existence of 'possible presence of petroleum hydrocarbon contamination in ground water, and possibly adjacent soil, in the four identified groundwater monitoring wells' and the 'possible groundwater contamination that may be associated with possible contaminant migration from the off-site dry cleaner on Sacramento Street, ...environmental contingency plan should be prepared to be followed during excavation if unknown environmental issues are encountered,' it appears that demolition and rebuilding on a potentially problematic hazardous substances containing site should be foregone. At most, there could be a less impactful remodeling of the interior and exterior for seismic compliance."

Response HZ-18

The comments state that the high cost of retrofitting existing on-campus buildings and the existence of hazards on the California Campus, as described in the Phase I/Phase II ESAs and provided in the Administrative Record for the Draft EIR, are the reasons that the California Campus would not be rehabilitated. The comments also restate the findings of the Phase I/Phase II ESAs at the Marshall Hale Hospital site at the California Campus. The past presence of a 550-gallon UST at the California Campus is summarized in the Draft EIR, pages 4.16-15 and 4.16-16. The presence of transformers in the basement and the Doctors' Parking Lot at the California Campus, which might contain dielectric fluid with PCBs, was not described in the Draft EIR, because it was not identified as an REC or potential environmental condition. The comments also restate the findings of the Phase I/Phase II ESA at the Children's Hospital site (3700 California Street) at the California Campus. The conditions at this site are described in the Draft EIR, beginning on page 4.16-15, and because no significant evidence of release of biohazardous or radioactive materials was observed throughout the hospital and the USTs on-campus are operated under active permit and oversight, no RECs were identified for either the past or current use at the Children's Hospital site.

The contents of any transformers, as well as any additional site assessment and remediation efforts based on the past, current, and future conditions and uses of the California Campus would be determined and conducted as required before any potential redevelopment of this campus area. As described in Section 2.4, "California Campus" in the Draft EIR, beginning on page 2-131, CPMC plans to sell the California Campus after the relocation of inpatient functions to the Cathedral Hill Campus. Future uses of the existing California Campus facilities by subsequent purchasers are speculative in nature. A prospective purchaser likely would ultimately seek to renovate and/or redevelop the California Campus; however, the nature, timing, and extent of development are unknown at this time and were therefore beyond the scope of the Draft EIR. Future development at the California Campus would be subject to CEQA requirements at such time development of this campus area is proposed.

3.18.2.3 MITIGATION

Comment

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-164 HZ, duplicate comment was provided in 30-164 HZ]

"99. Are there automatic fire sprinkler fuel pumps used in the old Cathedral Hill Hotel? If so, for the demolition phase, will there be an environmental mitigation plan for it?"

Response HZ-19

The comment asks if automatic fire sprinkler fuel pumps are used in the old Cathedral Hill Hotel and whether there will be an environmental mitigation plan for such pumps during demolition of the hotel building for development of the proposed Cathedral Hill Campus. Phase I and Phase II Environmental Site Assessments (ESAs) were conducted for the Cathedral Hill Hotel site (1101 Van Ness Avenue) in July and October 2003, respectively, as described in Section 4.16, "Hazards and Hazardous Materials" in the Draft EIR. These ESAs are on file as part of the Administrative Record for the Draft EIR.[2] The automatic fire sprinkler pumps and associated tanks were not identified in the Phase I ESA as a REC or potential environmental condition. Section 6.0, "Site Reconnaissance" of the Phase I ESAs stated that:

> Mr. Robert Hornick, Director of Engineering at the Cathedral Hill developments… was questioned regarding the presence of underground and/or aboveground storage tanks (AST) at the site. He stated that the only tanks currently used at the property are the 300-gallon and 50-gallon diesel ASTs used to store fuel for the automatic fire sprinkler pump. The 300-gallon AST is connected by overhead piping to a 50-gallon diesel AST that directly fuels the pump. Both ASTs and the pump are located on the third level of the garage in the Fire Pump Room. A floor drain was observed between the two ASTs. The concrete flooring in the Fire Pump Room was not stained with petroleum hydrocarbons and appeared to be in good condition. The former 1,000-gallon diesel AST was removed from the Gas Meter Room, on the first floor of the garage, in 2002. The concrete floor in the Gas Meter room exhibited minor staining but was in otherwise good condition. No floor drains were observed in this room.[3]
>
> [3] California Pacific Medical Center. 2003 (July 24). *Phase I Environmental Site Assessment, Cathedral Hill Hotel and Office Building, 1101 Van Ness Avenue and 1255 Post Street, San Francisco, California. San Francisco, CA.* Prepared by Treadwell & Rollo, Inc., San Francisco, CA (page 12).

As described in Section 3.1, "UST Closure In-Place" of the Phase II ESA for the Cathedral Hill Hotel site, "[a] report dated 13 May 2002 by LW Environmental Services, Inc. detailed the removal of a 1,000-gallon aboveground storage tank (AST) formerly used at the proposed Cathedral Hill Campus site to store diesel fuel. The report states that the AST was pumped out and triple rinsed on May 1, 2002 under permit no. 21640. Product and rinsate were removed under State Waste Manifest Document No. 21084688 by Clearwater Environmental of Fremont, California. The AST was filled with dry ice and removed from the proposed Cathedral Hill Campus site on May 2, 2003 under supervision of the SFFD."[3] Therefore, the 1,000-gallon AST that was removed from the Cathedral Hill Hotel site in 2002 was conducted under permit and supervision of the SFFD and would not require additional mitigation or remediation during LRDP construction at the proposed Cathedral Hill Campus.

The remaining ASTs associated with the fire sprinkler pump system would be properly removed by a licensed tank removal contractor during construction for the proposed Cathedral Hill Hospital. As

[2] The ESAs are on file with the San Francisco Planning Department as part of Case No. 2005.0555E.
[3] California Pacific Medical Center. 2003 (October 13). Phase II Environmental Site Assessment, Cathedral Hill Hotel, 1101 Van Ness Avenue, San Francisco, California. San Francisco, CA. Prepared by Treadwell & Rollo, Inc., San Francisco, CA (page 3).

described in Mitigation Measure M-HZ-N1a in the Draft EIR, beginning on page 4.16-46, before issuance of site, building, or other permits by the City for CPMC LRDP development activities involving subsurface disturbance, CPMC would submit the ECPs previously prepared for all campuses, including the proposed Cathedral Hill Campus, to SFDPH for review and approval. The ECPs would serve as both the SMPs and unknown contingency plans for the CPMC campuses and include procedures for removal of USTs (known and unknown). A licensed tank removal contractor would be retained to properly remove and dispose of all tanks encountered at all CPMC development sites, in accordance with all current regulations and the site-specific and tank-specific procedures outlined in the ECP. All the necessary permits for tanks removal and closure from SFFD and SFDPH would be obtained before the tank was removed. The health and safety plans prepared for the CPMC campuses would be followed, and air monitoring would be performed during all tank removal activities. Mitigation Measure M-HZ-N1a also includes provisions for dealing with contaminated soil or groundwater if encountered during LRDP construction. After tank removal activities are completed, the project sponsor would prepare and submit a closure/certification report to the SFDPH for review and approval. No revisions have been made to the text of the Draft EIR and none are required, because no RECs or other potential environmental conditions were found in association with the presence of automatic fire sprinkler fuel pumps during preparation of the ESAs for the site (i.e.,the former Cathedral Hill Hotel site) of the proposed Cathedral Hill Hospital development.

3.18.3 PACIFIC CAMPUS

3.18.3.1 ENVIRONMENTAL SITE ASSESSMENT

Comments

(Matt Hagemann—California Nurses Association, November 24, 2010) [119-12 HZ]

"**Pacific Campus**

The applicant prepared a total of 10 Phase I ESAs for individual buildings at the eight parcels of the Pacific Campus. A summary of the Phase I findings is presented below where, in my opinion, there is the potential for environmental contamination that was not adequately addressed in the Phase I investigations.

2323 Sacramento

A January 17, 2008 Phase I[9] found two hydraulic piston-driven elevators to be located in buildings at the Site. The Phase I stated (p. 3):

> The presence of these hydraulic elevators represents a potential that petroleum hydrocarbons may have been released to the soil. However, because they do not indicate a release or imminent threat of release, they do not qualify as a recognized environmental condition.

This statement is in consistent [sic] with the ASTM definition of a REC which states that a "material threat of a release of any hazardous substances or petroleum products into structures on the property or into the ground, groundwater, or surface water of the property" constitutes a REC.[10] The Phase I also found the potential for a REC to be associated with artificial fill which may be present under the Site and which may contain residual chemicals (p. 3).

The Phase I only provides for a plan to address contamination upon development in stating (p. 3):

> Prior to redevelopment, we recommend that an Environmental Contingency Plan be prepared to describe procedures to be followed in the event environmental issues are encountered during excavation activities (i.e., discolored soil, lead based materials, or potential hazardous material releases in soil or groundwater).

In my opinion, the finding in the Phase I -- that the hydraulic elevators represent a potential for petroleum hydrocarbons to have been released to the soil -- is a REC. The finding of a "potential recognized environmental condition" in the Phase I is inconsistent with recognized definitions such as that of ASTM.

[9] California Pacific Medical Center, 2008 (January 17). *Phase I Environmental Site Assessment (Updated and Revised), Pacific Hospital, 2333 Buchanan Street, California.* San Francisco, CA. Prepared by Treadwell & Rollo, Inc., San Francisco, CA.
[10] See for example, August 20, 2009 Phase I Environmental Site Assessment Saint Luke's Campus Tower Area, p. 1"

(Matt Hagemann—California Nurses Association, November 24, 2010) [119-17 HZ]

"**2200 Webster Street**

The applicant completed a Phase I for this site on January 17, 2008. This site consists of a five-story medical research laboratory and office building.[15] The Phase I classified two hydraulic elevators as 'potential recognized environmental conditions.' These decommissioned elevators may have released petroleum products to soil or groundwater during operation. Additionally, artificial fill may be present beneath the Site from previous demolition of residential buildings at the Site (Phase I, p. 3).

Recommendation: As discussed above, we consider 'potential recognized environmental conditions' to be recognized environmental conditions that must be the subject of a Phase II sampling investigation. Results of a Phase II investigation must be disclosed in a revised EIR along with measures to remediate and mitigate these environmental hazards prior to construction and subject to the approval of the SFDPH.

[15] California Pacific Medical Center. 2008 (January 17). *Phase I Environmental Site Assessment (Updated and Revised), Gerbode Building, 2200 Webster Street, California*. San Francisco, CA. Prepared by Treadwell & Rollo, Inc., San Francisco, CA."

Response HZ-20

The comments indicate concerns regarding the potential for environmental contamination that was not adequately addressed in the Phase I ESAs for the Pacific Campus. More specifically, the comments disagree with the findings of the Phase I ESAs with regard to the hydraulic elevators at 2323 Sacramento Street and 2200 Webster Street not being considered RECs. Furthermore, the comments disagree with the findings of the Phase I ESAs for the Pacific Campus that did not recommend preparation of Phase II ESAs for artificial fill that may be located beneath the existing on-campus structures. As stated in the Draft EIR, page 4.16-12, the Phase I ESA prepared for the 2323 Sacramento site at the Pacific Campus did not reveal substantial evidence of RECs associated with current or past use. Similarly, in the Draft EIR, page 4.16-9, the Phase I ESA prepared for the 2200 Webster Street site at the Pacific Campus did not reveal substantial evidence of RECs associated with current or past use at this site, and no evidence or record of leaks was found to be associated with the hydraulic elevators located at 2200 Webster Street and 2323 Sacramento Street. The Phase I ESAs, however, recommended the preparation of ECPs to fully mitigate the known and unknown hazards associated with site conditions at the Pacific Campus. Please also refer to Response HZ-21 (page C&R 3.18-34) regarding Phase II investigations.

The suggestions in the comments that the presence of hydraulic elevators at the Pacific Campus constitute a material threat of release of a hazardous substance or petroleum product and the recommendation for its classification as an REC are not appropriate. As described in the ASTM definition of an REC (ASTM E1527),[4] RECs are "not intended to include de minimis[5] conditions that generally do not present a threat to human health or the environment and that generally would not be the subject of an enforcement action if brought to the attention of appropriate governmental agencies. Conditions determined to be de minimis are not recognized environmental conditions." As such, and in the interest of full disclosure, they are

[4] ASTM International. E1527-05 Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process. Available at: http://www.astm.org/Standards/E1527.htm
[5] De minimis indicates small or minimal.

termed as potential environmental conditions in both the Phase I ESAs and the Draft EIR. Please refer to Response HZ-7 on page C&R 3.18-12 for a discussion of Draft EIR text revisions related to the terminology used to describe potential environmental conditions.

In addition, the comments state that, "… the finding in the Phase I -- that the hydraulic elevators represent a potential for petroleum hydrocarbons to have been released to the soil -- is a REC." As described in Response HZ-7 (page C&R 3.18-12), the potential for a release of hazardous materials does not necessarily constitute an REC, because upon observation (conducted during the Phase I ESAs for the Pacific Campus), the hydraulic elevators at the Pacific Campus did not show signs of a release or imminent threat of a release of hazardous materials. An REC refers to the presence or likely presence of any hazardous substance or petroleum products on a property under conditions that indicate an existing release, a past release, or a material threat of a release of hazardous materials in the future.

Similarly, the recommendations in the comments to conduct a Phase II ESA at the suggestion in the Phase I ESA that there may be artificial fill located beneath the existing structures at 2200 Webster Street and 2323 Sacramento Street on the Pacific Campus and that the potential for artificial fill should be considered an REC are also not appropriate. This is because the site conditions that were described in the Phase I ESA are based on a broad historical knowledge of what might be present at the Pacific Campus that was gleaned from other nearby site's investigations. Furthermore, the conditions at the Pacific Campus, as described on Draft EIR pages 4.16-9 through 4.16-14, do not indicate the presence or likely presence of any hazardous substance that may represent signs of an existing release, a past release, or a material threat of a release of hazardous materials in the future. Mitigation Measures M-HZ-L1a and M-HZ-L1b (in the Draft EIR, page 4.16-52) would require that the previously prepared ECPs are submitted for approval to SFDPH, in accordance with Article 22A of the San Francisco Health Code, before issuance of site, building, or other permits by the City for development at the Pacific Campus. Mitigation Measure M-HZ-L1c (in the Draft EIR, page 4.16-52) would require that the Phase I ESA for the Pacific Campus be updated to include the results of a current environmental database search, conducted pursuant to Government Code Section 65962.5 before issuance of site, building, or other permits by the City for campus development activities involving subsurface disturbance. The results would then be incorporated into the ECP for this campus. Therefore, hazards and hazardous materials impacts at the Pacific Campus under the LRDP were determined to be less than significant with implementation of Mitigation Measures M-HZ-L1a and M-HZ-L1b that require adherence to ECPs that would be approved by SFDPH and would include appropriate procedures for handling any previously unknown hazards or hazardous materials encountered during CPMC LRDP construction at this campus.

It should also be noted (as stated in Response INTRO-4 [page C&R 3.1-4]) that the impacts of the proposed long-term projects at the Pacific Campus under the LRDP, which are evaluated at a programmatic level in the Draft EIR, would require additional project-level environmental review. At such time, as the specific project-level site plans for this campus are completed, supplemental hazards and hazardous materials evaluations, including Phase I ESAs, would be provided as part of the additional/supplemental environmental review documents for the Pacific Campus, as necessary.

Comment

(Matt Hagemann—California Nurses Association, November 24, 2010) [119-13 HZ]

"According to ASTM guidance, a finding of a REC typically results in the conduct of a Phase II investigation, to include the collection of soil samples, to further investigate the Phase I findings.[11]

Recommendation: A Phase II subsurface investigation must be conducted to investigate the potential for soil and groundwater contamination associated with the two 'potential recognized environmental concerns,' the two hydraulic elevators at the site and possible artificial fill. In our experience, we are aware of other sites where the

project EIRs analyzed impacts associated with hydraulic elevators and required a sampling investigation along with a regulatory letter of closure.[12] That is the proper protocol for this type of environmental hazard.

[11] http://en.wikipedia.org/wiki/Phase_I_Environmental_Site_Assessment
[12] http://www.wlac.edu/DEIR/Chapter%203%20Environmental%20Setting,Impacts%20and%20Mitigation.pdf"

Response HZ-21

The comment suggests that a Phase II ESA should be conducted for the two potential environmental conditions identified for the 2323 Sacramento Street site at the Pacific Campus. The comment is correct that a finding of an REC typically results in the conduct of a Phase II investigation, including the collection of soils samples, to further investigate the Phase I ESA findings. However, the Phase I ESA conducted for 2323 Sacramento Street at the Pacific Campus did not determine that the site contained any RECs and, therefore, did not state that a Phase II ESA was required. As discussed in Response HZ-7 on page C&R 3.18-12, potential environmental conditions do not meet the qualifications of a REC and were identified in order to increase awareness of the conditions of the development sites. Please see Response HZ-20 (page C&R 3.18-32) for an explanation of the determination in the Draft EIR that the hydraulic elevators and potential presence of artificial fill at the Pacific Campus do not constitute RECs. The Phase I ESA conducted for the Pacific Campus, however, recommended the preparation of an ECP to fully mitigate potential and unknown hazards that could be encountered during demolition and excavation at this campus under the LRDP. As the campus-specific ECPs would include procedures for handling/removal of any potential and unknown hazards should they be encountered, impacts related to hazards and hazardous materials were determined to be less than significant.

Comment

(Matt Hagemann—California Nurses Association, November 24, 2010) [119-14 HZ]

"**2405 Clay Street**

A Phase I for the Site was completed on August 10, 2006.[13] The Phase I found three 'potential recognized environmental conditions' (Phase I, p. 3):

- the former presence of a laundry facility;
- the former presence of the carpentry and machine shop (including a paint spray booth); and
- potential artificial fill.

According to the Phase I, two former businesses may have released chemicals to the soil or groundwater as follows (Phase I, p. 2):

- A laundry was operated in the eastern part of the Site from prior to 1913 until sometime after 1929. It was not determined during this ESA whether dry cleaning was performed at this facility, or whether dry cleaning solvents may have been released to the soil or groundwater at the Site. Therefore, this former Site use constitutes a potential recognized environmental condition.

- A carpentry and machine shop, with a paint spray booth, were operated on the Site from prior to 1950 until after 1970. It was not determined during this ESA whether lubricants, paints, solvents, or heavy metals were released to the soil or groundwater at the Site. Therefore, this former use constitutes a potential recognized environmental condition

In response to the so called 'potential recognized environmental conditions,' the Phase I proposed that an environmental contingency plan be prepared to describe procedures to evaluate and address environmental issues

encountered during excavation activities (i.e., discolored soil, lead based materials, or potential hazardous material releases in soil or groundwater).

Recommendation: As stated above, for consistency and clarity, the term "potential recognized environmental condition" must first be eliminated from a revised EIR; then, the revised EIR must include a Phase II ESA describing any identified soil and groundwater sampling at both the laundry site and the carpentry and machine shop."

Response HZ-22

The comment states that with the level of uncertainty about the presence of hazardous materials at the former laundry site and former carpentry and machine shop site at the 2405 Clay Street site at the Pacific Campus, the Draft EIR should be revised to include a Phase II ESA. The laundry and the carpentry and machine shop, which no longer exist and have been replaced with a parking garage, were identified in the Phase I ESA prepared for 2405 Clay Street at the Pacific Campus as potential environmental conditions based on a broad historical knowledge of what might be present at the Pacific Campus that was gleaned from other nearby sites' investigations. No substantial evidence of RECs associated with former or current uses was identified for the 2405 Clay Street site, as described in the Draft EIR, page 4.16-11. As noted on Draft EIR page 4.16-12, the 2405 Clay Street site was extensively excavated during construction of the existing on-campus parking structure. No evidence of the use or release of hazardous materials or petroleum products was observed during the preparation of the Phase I ESA for the 2405 Clay Street site at the Pacific Campus, Because of the lack of such evidence of releases of hazardous materials and the lack of any information regarding the way in which the excavation process was conducted, the site of the former laundry and carpentry and machine shop at the 2405 Clay Street site were considered potential environmental conditions. Please see Response HZ-7 (page C&R 3.18-12) for a discussion of the use of the term "potential environmental conditions" in the Draft EIR and how the Draft EIR has been revised to clarify the terminology used in the evaluation of impacts related to hazards and hazardous materials regarding the former laundry site and former carpentry and machine shop site at the 2405 Clay Street development site at the Pacific Campus.

The Phase I ESA recommended the preparation of an ECP to fully mitigate the known and unknown hazards that might be encountered on the 2405 Clay Street site at the Pacific Campus. Mitigation Measure M-HZ-L1b in the Draft EIR, page 4.16-52, requires the adherence to campus-specific SFDPH-approved ECPs for all CPMC campuses to address unknown subsurface contaminants, and this applies to those sites at the Pacific Campus that would include development under the CPMC LRDP. The previously prepared ECPs establish and describe procedures in the event that previously unknown subsurface hazards or hazardous material releases were discovered during construction under the LRDP at the CPMC campuses, including appropriate notification and site control procedures. These plans have already been prepared as part of campus-specific ECPs, and will be submitted to SFDPH for review and approval. Phase II ESAs were only recommended where there were indications of conditions under which potential releases of hazardous materials were likely. As a result, a Phase II ESA was determined not to be warranted at this time for the 2405 Clay Street site at the Pacific Campus. Therefore, with implementation of the campus-specific ECPs required by Mitigation Measures M-HZ-L1a and M-HZ-L1b, impacts related to hazards and hazardous materials at the Pacific Campus under the LRDP would be less than significant.

Comment

(Matt Hagemann—California Nurses Association, November 24, 2010) [119-15 HZ]

"**3773 Sacramento Street**

The applicant conducted a February 8, 2008 Phase I for the Site which includes a two-story parking garage.[14] From 1953 to 1966, 'Art Craft Cleaners' occupied the site (Phase I, p. 3). No information about the cleaners was provided in the Phase I. However, an existing groundwater well was sampled and concentrations of volatile organic compounds (VOCs) were detected as follows: tetrachloroethene (PCE) at 1.3 micrograms per liter (µg/L), trichloroethene (TCE) at 0.7 µg/L, and cis-1,2-dichloroethene (cis-1,2-DCE) at 0.6 µg/L. These concentrations are below drinking water standards and, although the detected VOCs are typically associated with dry cleaning operations, the Phase I states that the former cleaners was not a source of the contamination (p. 4):

The previous dry-cleaning operations at the former 'Art Craft Cleaners' that was at the Site between 1953 and 1966 is a less likely source as it is cross-gradient from the well, with respect to groundwater flow.

The Phase I attributes the contamination to a potential off-site, upgradient source (Phase I, p. 4). The potential impact from the 'Art Craft Cleaners' was not assessed by the groundwater sampling in the Phase I because the well was judged to be cross gradient.

Recommendation: A Phase II must be conducted to determine potential soil and groundwater contamination from the 'Art Craft Cleaners.' A Phase II is also necessary to address the potential off-site source of contamination. Without sampling, construction workers may be at risk from inhalation of VOC vapors and dermal contact with VOC-contaminated soil during excavation. A revised EIR must describe any contaminants found during the Phase II and must include measures to remediate/mitigate the contaminants.

[14] California Pacific Medical Center. 2008 (February 8). *Phase I Environmental Site Assessment and Well Sampling (revised and updated), Parking Garage, 3773 Sacramento Street, San Francisco, California*. San Francisco, CA. Prepared by Treadwell & Rollo, Inc., San Francisco, CA."

Response HZ-23

The comment states that a Phase II ESA must be completed to determine potential soil and groundwater contamination from the former Art Craft Cleaners located at the 3773 Sacramento Street site. Based on the location of this comment within Comment Letter 119, it appears that the commenter incorrectly associated the 3773 Sacramento Street site with the Pacific Campus; it is associated instead with the California Campus. However, as the commenter seems to think that the Art Craft Cleaners is associated with the Pacific Campus, it has been included here under the Pacific Campus subsection of the Hazards and Hazardous Materials responses for ease of understanding and reference by the commenter.

The comment incorrectly states that a Phase II ESA must be completed to determine potential soil and groundwater contamination from the former Art Craft Cleaners at the 3773 Sacramento Street site. As described on page 10 of the Phase I ESA prepared for the 3773 Sacramento Street site at the California Campus,[6] it is unknown whether the former Art Craft Cleaners at the 3773 Sacramento Street site performed dry cleaning on site, or if releases of hazardous materials occurred. The Phase I ESA acknowledges that, based on the time period when the cleaners was in business (1953 to 1966), if dry cleaning was done on site, chlorinated solvents such as perchloroethylene (PCE) may have been the dry cleaning solvent used. However, as noted above, the site has been extensively excavated and redeveloped with a parking garage on the California Campus. As stated on page 4 of the Phase I ESA, groundwater

[6] California Pacific Medical Center. 2008 (February 8). Phase I Environmental Site Assessment and Well Sampling (revised and updated), Parking Garage, 3773 Sacramento Street, San Francisco, California. San Francisco, CA. Prepared by Treadwell & Rollo, Inc., San Francisco, CA.

sampling conducted as part of a combined Phase I/Phase II ESA at the 3698 California Street site included sampling of groundwater wells located directly downgradient of the location of the former Art Craft Cleaners. No PCE or other VOCs were detected in the sample. Accordingly, the former presence of this dry cleaning establishment does not represent a material threat of release of hazardous materials at the California Campus, and thus it is not an REC. Because the Phase I ESA did not identify this former dry cleaning establishment as a REC, a Phase II ESA was not recommended, nor is it required. However, it is possible that a storage tank for dry cleaning solvent or contaminated soil resulting from releases of this solvent might be encountered during redevelopment of the 3773 Sacramento Street site. Therefore, the Phase I ESA recommended that an ECP be prepared before redevelopment of this site at the California Campus, and described procedures to be followed during excavation if unknown environmental issues, such as other possible USTs or soil impacted by petroleum hydrocarbons or hazardous materials, were encountered. As described in Section 2.4, "California Campus" in the Draft EIR, beginning on page 2-131, CPMC plans to sell the California Campus after the relocation of inpatient functions to the Cathedral Hill Campus. Future uses by subsequent purchasers are speculative in nature. A prospective purchaser likely would ultimately seek to renovate and/or redevelop the California Campus; however, the nature, timing, and extent of development are unknown at this time and are, therefore, beyond the scope of the Draft EIR.

The comment also states that a Phase II ESA at the 3773 Sacramento Street site is required to address a potential off-site source of groundwater contamination at the site. As stated in the comment, groundwater sampling was conducted as part of the Phase I for the 3773 Sacramento Street to evaluate if hazardous materials or petroleum products exist in the groundwater. The comment correctly summarizes the groundwater sampling results for VOCs at the 3773 Sacramento Street site. As described on page 4 of the Phase I ESA for the 3773 Sacramento Street site, three VOCs (PCE, trichloroethene [TCE], and cis-1,2-dichloroethene [cis-1,2-DCE]) were detected in a monitoring well immediately west of the site. The Phase I ESA determined that the VOCs are likely the result of an off-campus source. However, concentrations of the VOCs were well below California primary maximum contaminant levels for these compounds, as well as below the San Francisco Bay Area RWQCB's environmental screening levels. The Phase I ESA concludes that the presence of trace amounts of volatile organic compounds presents no current risks to occupants at the 3773 Sacramento Street site and also, no risks to future occupants, based on available information. Accordingly, no additional groundwater sampling at the 3773 Sacramento Street site was suggested as part of the Phase I ESA and no Phase II ESA was required.

Comment

(Matt Hagemann—California Nurses Association, November 24, 2010) [119-16 HZ]

"**2351 Clay Street**

A January 17, 2008 Phase I ESA was completed for the Site which is known as the Stanford Building, a seven-story medical clinic and office building. The Phase I found greater than two hundred chemicals to be listed as stored in the basement, 'Boiler Room' and the second floor. The Carpentry and Paint Shops in the basement of the Stanford Building contain chemicals such as various paints, thinners, methyl ethyl ketone, muriatic acids, degreasing solvents, epoxy floor coatings, and cleaners (Phase I, p. 2). No observations of floor drains or liquid waste management practices, current and historic, were provided in the Phase I.

The Phase I found no recognized environmental conditions to be associate with the Site.

Recommendation: The applicant must conduct a Phase II investigation in the basement of the Site, which includes a sampling investigation in areas where liquid wastes may have drained from the former carpentry and paint shops. Any mitigation or remediation that would be necessary to protect worker safety or the safety of residents during transportation of hazardous materials must be included in a revised DEIR."

Response HZ-24

The comment states that a Phase II ESA must be conducted for the 2351 Clay Street site to determine if soil and groundwater contamination exist from hazardous materials in the carpentry and paint shops located in the basement of the existing on-site structure at this site within the Pacific Campus and to determine if any mitigation or remediation would be necessary. As described in the Draft EIR, page 4.16-9, the Phase I ESA for 2351 Clay Street (the Stanford Building) revealed no substantial evidence of RECs and no RECs associated with current or past uses at this building. No evidence was found of facilities or activities during the history of the 2351 Clay Street site that indicated the release of hazardous materials or petroleum products, despite the site's history of storage of various chemicals and wastes. Chemicals stored in the basement of the existing building located at the 2351 Clay Street site were observed to be properly labeled and stored. No evidence of chemical releases or staining was found during the preparation of the Phase I ESA for the 2351 Clay Street site, and the presence of floor drains was not observed. Because of the conditions observed during preparation of this Phase I ESA, it was concluded that release of hazardous materials or petroleum products in the basement of the existing building located at the 2351 Clay Street site was unlikely to have occurred, and the conditions at this site did not indicate an existing, past, or material threat (in the future) of release of hazardous materials. Accordingly, no RECs were identified for this site, and it would not be appropriate to require a Phase II ESA investigation, based on information about this site at this time. Mitigation Measure M-HZ-N1b in the Draft EIR, page 4.16-48, would implement the measures contained in the ECP that put in place steps required to be taken in the event that evidence of currently unknown contaminants are discovered during demolition or excavation at the Pacific Campus related to CPMC LRDP development and this mitigation would reduce impacts related to hazardous materials at the Pacific Campus to less-than-significant levels.

Comment

(Matt Hagemann—California Nurses Association, November 24, 2010) [119-18 HZ]

"**2333 Buchanan Street**

A Phase I was completed for the Site, a hospital and a parking lot, on January 17, 2008.[16] The Phase I documented a 10,000 gallon diesel underground tank, along with an underground water tank, to be located on the east side of the hospital. The Phase I states (p. 4):

The San Francisco Department of Public Health (SFDPH) reported a pressure test violation for the diesel tank on 18 February 2003. Both tanks were removed in 2003 during construction of an access shaft for installing a linear accelerator at the hospital. The removal was approved by the SFDPH, but follow-up documentation was not obtained. Because the replacement of the tank was approved and because soil around and under the tank was removed to construct the access shaft, it is unlikely that petroleum products were released, or if released would remain, at significant concentrations in soil at the Site. Therefore, this fuel tank does not represent a recognized environmental condition.

In my opinion, unless documentation can be obtained, the former fuel tank represents a recognized environmental condition.

Recommendation: The applicant must document whether the underground diesel tank was properly resolved and closed, including a finding that the SFDPH approved these actions. If the documentation is not available, a Phase II investigation should be conducted. All of this must be described in a revised EIR.

[16] California Pacific Medical Center, 2008 (January 17). *Phase I Environmental Site Assessment (Updated and Revised), Pacific Hospital, 2333 Buchanan Street, California.* San Francisco, CA. Prepared by Treadwell & Rollo, Inc., San Francisco, CA."

Response HZ-25

The comment suggests that unless the UST that was previously located on the 2333 Buchanan Street site at the Pacific Campus can be documented as having been properly removed, a Phase II ESA should be conducted and described in the EIR. The purpose of the Draft EIR is to disclose information about potential environmental effects of the proposed LRDP, not to document all aspects of the processing of environmental regulations on the site (CEQA Guidelines Sections 15125[a] and 15151). The purpose of the Draft EIR is not to alter the federal, state, and local regulatory process that has been developed to identify, regulate, and ensure the cleanup of historically contaminated sites. Section 4.16.2, "Hazards and Hazardous Materials Regulatory Framework" in the CPMC LRDP Draft EIR, beginning on page 4.16-21, provides a description of the federal, state, and local regulations that have been developed over many years to protect the public and the environment from hazardous materials and ensure that contamination is identified and cleaned up, as required. In general, all of the proposed mitigation measures in the LRDP EIR would work in concert with environmental protection laws for various resources areas, including hazardous materials; the proposed LRDP EIR mitigation measures are intended to inform decision-makers and the public as to how those laws would be implemented and how they would address the potential for environmental impacts. As such, the level of detail and the approach taken in the CPMC LRDP EIR is appropriate and adequate under CEQA.

The LRDP Draft EIR is not required to include a case closure report for the underground diesel tank identified in the Phase I ESA for the 2333 Buchanan Street site, and it does not need to be revised to account for those documents. In general, a Phase I ESA is largely based on a review of available records from public and tribal entities out to distances specified by ASTM 1528 and AAI Standards, and a case closure report was not available for inclusion in the Phase I ESA for the 2333 Buchanan Street site. However, as noted on page 4 of the Phase I ESA for the 2333 Buchanan Street site at the Pacific Campus, the 10,000-gallon, diesel fuel tank was removed from this site in 2003 during the construction of an access shaft for installing a linear accelerator at the hospital. In addition, page 6 of 10 of Table 1 of the Phase I ESA for the 2333 Buchanan Street site cites a February 18, 2003 Inspection Report from the SFDPH that indicated that the UST's closure application was reviewed and approved by SFDPH. Furthermore, all soils that would have surrounded the UST were removed during excavation of the access shaft. Therefore, the aforementioned documentation pertaining to the UST's removal that was prepared by SFDPH, the level of excavation that occurred at the 2333 Buchanan Street site during the 2003 construction of the access shaft, and site observations summarized in the Phase I ESA and Draft EIR represent substantial evidence supporting the conclusion that the status of the removal of the UST does not represent an REC, contrary to the statements made in this comment.

Furthermore, the Phase I ESA recommended the preparation of an ECP for the 2333 Buchanan Street site at the Pacific Campus to fully mitigate the known and unknown hazards that could be encountered during LRDP-related demolition and excavation at the 2333 Buchanan Street site. In general, the campus-specific ECPs prepared for LRDP-related development at the various CPMC campuses are meant to address the issues that would be encountered during development of the campuses and were identified by the Phase I ESAs. As described in Mitigation Measures M-HZ-N1b and M-HZ-L1b in the Draft EIR, pages 4.16-48 and 4.16-52, respectively, the preparation of an ECP for the Pacific Campus and any subsequent remediation of hazardous materials that may be encountered at the this campus would be required to address and respond to the discovery of unknown contaminants from previously unidentified USTs and other subsurface facilities at the Pacific Campus.

Please also see Response HZ-5 (page C&R 3.18-7) regarding the adequacy of the Draft EIR related to hazards and hazardous materials. Based on the analysis of LRDP construction-related exposure to hazardous materials for the five CPMC campuses contained in the Draft EIR and inclusion of appropriate mitigation measures, no need exists to prepare revisions to the Draft EIR or a Phase II for the 2333 Buchanan Street site at the Pacific Campus at this time. Furthermore, this information does not require

recirculation of the Draft EIR or preparation of a revised Draft EIR, pursuant to State CEQA Guidelines Section 15088.5. Please refer to Response INTRO-6 (page C&R 3.1-11) for a discussion of Draft EIR recirculation.

3.18.3.2 FURTHER ENVIRONMENTAL REVIEW

Comment

(Paul Wermer—CPMC Neighbors Coalition and Pacific Heights Residents, October 18, 2010) [67-41 HZ]

"15) HAZARDS AND HAZARDOUS MATERIALS: We understand that the Pacific site plans are still substantially undeveloped, and suggest that the final EIR expressly call this out as an issue to address in the Pacific site project level CEQA assessment."

Response HZ-26

The comment suggests that the Draft EIR should state that a project-level CEQA assessment will address issues related to impacts from hazards and hazardous materials at the Pacific Campus. The comment is correct that specific site design plans for the long-term development projects proposed for the Pacific Campus under the LRDP are not yet finalized. As stated throughout the Draft EIR, project-level CEQA analyses will be conducted in the future for long-term development projects, once final site design has been completed. Mitigation Measures M-HZ-L1c and M-HZ-L4c in the Draft EIR, pages 4.16-52 and 4.16-68, respectively, require the preparation of updated site assessments, including the results of a current environmental database search, conducted pursuant to Government Code Section 65962.5, for long-term LRDP projects, including those proposed at the Pacific Campus. The updated assessments would evaluate any long-term LRDP project according to its final site plan and project design, to identify appropriate updates to the campus-specific ECP for the Pacific Campus. The results of such updated assessments would inform the analysis in the future project-level CEQA assessment of the long-term projects at the Pacific Campus.

3.18.4 CALIFORNIA CAMPUS

3.18.4.1 ENVIRONMENTAL SITE ASSESSMENT

Comment

(Matt Hagemann—California Nurses Association, November 24, 2010) [119-19 HZ]

"**California Campus**

3698 California Street and 3773 Sacramento Street

A February 8, 2008 Phase I[17] revealed one REC: an open environmental case with the SFDPH regarding documented releases of petroleum hydrocarbons to soil in the truck dock area caused by an underground fuel storage tank. (Phase I/II, p. 4) To address the REC, the Applicant commissioned a Phase II investigation that involved sampling three existing groundwater wells. The applicant sampled a groundwater boring in June 2006 to evaluate potential groundwater contamination from an upgradient source and sampled again in July 2006.[18] Analysis of the groundwater samples did not detect compounds that would likely be associated with potential onsite and offsite sources. On the basis of the findings, the consultant recommended that the applicant submit a report for case closure with the SFDPH. There is no documentation in the DEIR or supporting materials that such a report was prepared or submitted. The SWRCB 'Geotracker' web site, accessed in October, 2010, indicates the site is still open, and that the site will be closed only upon the abandonment of three existing monitoring wells.[19]

The DEIR omitted the consultant's Phase I recommendation for case closure. The DEIR does not discuss the open status of the site. This must be resolved.

Recommendation: A revised EIR must include documentation that a proper resolution and closure occurred.

[17] California Pacific Medical Center, 2008 (January 17). *Phase I Environmental Site Assessment (Updated and Revised), Pacific Hospital, 2333 Buchanan Street, California.* San Francisco, CA. Prepared by Treadwell & Rollo, Inc., San Francisco, CA.

Response HZ-27

The comment states that the status of the open environmental case with the SFDPH regarding an REC at the 3698 California Street and 3773 Sacramento Street sites at the California Campus must be disclosed in the EIR. The purpose of the Draft EIR is to disclose information about potential environmental effects of the proposed LRDP, not to document all aspects of the processing of environmental regulations on the site (CEQA Guidelines Sections 15125(a) and 15151). The purpose of the Draft EIR is not to alter the federal, state, and local regulatory process that has been developed to identify, regulate, and ensure the cleanup of historically contaminated sites. Section 4.16.2, "Regulatory Framework" in the Draft EIR, beginning on page 4.16-21, provides a description of the federal, state, and local regulations that have been developed over many years to protect the public and the environment from hazardous materials and ensure that contamination is identified and cleaned up, as required. In general, all of the proposed mitigation measures in the LRDP Draft EIR would work in concert with environmental protection laws for various resources areas, including hazards, biological species, water quality, air quality, and greenhouse gasses; the proposed LRDP mitigation measures are intended to inform decision-makers and the public as to how those laws would be implemented and how they would address the potential for environmental impacts. As such, the level of detail and the approach taken in the CPMC LRDP Draft EIR is appropriate and adequate under CEQA.

The Draft EIR is not required to include the case closure report for the underground fuel storage tank identified in the Phase I ESA for the 3698 California Street and 3773 Sacramento Street sites, and it does not need to be revised to account for those documents. In general, a Phase I ESA is largely based on a review of available records from public and tribal entities out to distances specified by ASTM 1528 and AAI Standards, and the case closure report to which the comment refers was not available at the time of preparation of the Phase I ESA for the 3698 California Street and 3773 Sacramento Street site. However, the case closure report relating to the underground fuel storage tank at 3698 California Street at the California Campus is being prepared by Treadwell & Rollo and is expected to be completed in fall of 2011. A work plan for abandoning the three groundwater wells on the 3698 California Street and 3773 Sacramento Street parcels will also be developed and take into account the recommendations of that report. Furthermore, CPMC plans to sell the California Campus as early as possible after the relocation of inpatient functions to the proposed Cathedral Hill Campus, as stated on Draft EIR, page 2-131. Future uses by subsequent owners would be speculative in nature. A prospective owner may ultimately seek to renovate and/or redevelop the California Campus; however, the nature, timing, and extent of development are unknown at this time and are, therefore, beyond the scope of the Draft EIR.

Comment

(Matt Hagemann—California Nurses Association, November 24, 2010) [119-20 HZ]

"**3700 California Street**

A February 19, 2008 Phase I[20] found one REC in connection with the Site: a finding of dark oily liquid and staining adjacent to a floor drain 'indicating the material threat of release of hazardous materials or petroleum products' (Phase I, p. 5). The Phase I also documented the presence of two abandoned USTs , including a

1,000-gallon and a 4,000-gallon tank (Phase I, p. 4) According to the Phase I, a SFDPH letter approved the in-place closure of one abandoned UST; however, during the Phase I file review , the applicant could not determine which tank was abandoned. Other materials reviewed during the Phase I indicted the conversion of a 4,000- gallon storage tank to water storage but the Phase I did not conclude if this plan was completed. The Phase I states that soil samples collected at the 4,000-gallon UST in 1990 did not detect petroleum hydrocarbons as diesel fuel and the Phase I concluded 'it is unlikely that past use of the tank has impacted soil at the Site' (Phase I, p. 4). No documentation that the USTs were closed was found in the files during the Phase I review.

The Phase I found one recognized environmental condition in connection with the Site: the dark oily liquid and staining observed near the floor drain in Room G200. A REC was not found in association with the former USTs for which the Phase I found no records of closure.

The applicant conducted a Phase II to address the oily staining which involved the collection of one soil sample beneath the floor drain.[21] The analysis of the sample found detectable concentrations of petroleum hydrocarbons, a PCB compound and metals. The Phase II found 'detected soil concentrations were found to not represent a significant risk to human health and would not likely be considered a hazardous waste if the Site were redeveloped and soil disposal were needed' (Phase, II, p. 8).

Recommendation:

Because the documentation in the Phase I did not include a record of UST closure, the applicant must conduct an additional Phase II investigation to confirm the presence of the 1,000- and the 4,000-gallon USTs at the site. In addition, the applicant must sample the USTs for the presence of potential contaminants and submit to SFDPH the results of the analysis for regulatory closure of the site prior to development. All of the new information must be disclosed in a revised EIR including measures to mitigate and remediate these potentially harmful conditions.

[20] California Pacific Medical Center, 2008 (February 19). *Phase I/Phase II Environmental Site Assessment (Updated and Revised), Pacific Hospital, 2333 Buchanan Street, California.* San Francisco, CA. Prepared by Treadwell & Rollo, Inc., San Francisco, CA.
[21] *Ibid."*

Response HZ-28

The comment restates the hazards and hazardous materials data provided in the Draft EIR on page 4.16-15 regarding the presence of two abandoned USTs at 3700 California Street on the California Campus; however, the comment states that the lack of documentation to support that the USTs at 3700 California Street on the California Campus were closed should qualify this as an REC and a Phase II ESA investigation should be completed and included as part of a revised EIR. Please see Response HZ-25 (page C&R 3.18-39) for a description of the adequacy of the Draft EIR, even though the status/documentation of some USTs, including USTs at 3700 California Street on the California Campus, is unknown and an explanation why the USTs at this site were not described in the ESA as an REC.

As described in Section 2.4, "California Campus" in the Draft EIR, beginning on page 2-131, CPMC plans to sell the California Campus as early as possible after the relocation of in-patient functions to the proposed Cathedral Hill Campus. Future uses by subsequent purchasers would be speculative in nature. A prospective purchaser likely would ultimately seek to renovate and/or redevelop the California Campus; however, the nature, timing, and extent of development are unknown at this time and are, therefore, beyond the scope of the Draft EIR.

3.18.5 DAVIES CAMPUS

3.18.5.1 ENVIRONMENTAL SITE ASSESSMENT

Comment

(Matt Hagemann—California Nurses Association, November 24, 2010) [119-21 HZ]

"**Davies Campus**

Two Phase Is were completed for the Davies Campus: one for the 'northeast corner' and another for the 'southern parking area.'

Northeast Corner

0n April 28, 2008, the applicant completed a Phase I for the northeastern corner of the Ralph K. Davies Medical Center Campus.[22]

The Phase I states (p. 3):

> One 7,500-gallon underground tank is closed in place at the Site, which formerly contained diesel fuel for boilers and emergency generators at the hospital west of the Site. This tank was permitted by the SFFD for abandonment in 1998, and the tank was reportedly cleaned and filled with concrete. No documentation of abandonment activities or conditions were found in the records searched.

The Phase I did not document specifically who reported that the tank was cleaned and filled with concrete.

The Phase I also states the following USTs to be present at the Site (p. 3):

> Two 2,000-gallon tanks for diesel fuel (actually one 2,000-gallon removed tank and one active 2,500-gallon underground tank south of the Site). The removal of the 2,000- gallon tank and replacement with the 2,500-gallon tank were permitted by the SFFD in 1998. No violations associated with these tanks were found in the documents examined. However, no documentation of removal activities or conditions associated with the 2,000-gallon tank were found in the records.

The Phase I found a REC to be associated with the 7,500-gallon UST but not with the other USTs at the site. Despite the identification of a REC, no Phase II was conducted.

Recommendation:

In my opinion, because a REC was identified, and because no closure records have been found for the 7,500-gallon and the 2,000-gallon USTs, the applicant must conduct a Phase II subsurface investigation must to investigate the potential for the presence of soil contamination to be associated with these tanks. The investigation must be disclosed, along with any necessary mitigation in a revised EIR to ensure that construction workers are not at risk during earthmoving activities.

[22] California Pacific Medical Center, 2008 (April 28). *Phase I Environmental Site Assessment (Updated and Revised), Noe Street Medical Office Building, San Francisco, California.* Project San Francisco, CA. Prepared by Treadwell & Rollo, Inc., San Francisco, CA."

Response HZ-29

The comment correctly states that the two Phase I ESAs (one for the Noe Street Medical Office Building and one for the South Davies Campus Parking Areas) prepared for the Davies Campus identified one

7,500-gallon UST which has been filled with concrete and abandoned in place in 1998 and one 2,500-gallon UST, which was installed in 1998 following the removal of a 2,000-gallon UST which it replaced. However, the comment incorrectly states that the existing 7,500-gallon UST on the Davies Campus was identified as a REC. The UST was described as a potential environmental condition in the Phase I ESA for the Noe Street Medical Office Building, as well as in the Draft EIR, page 4.16-18. Page 3 of the Phase I ESA for the Noe Street Medical Office Building at the Davies Campus states that no records of violations or releases associated with this UST were found and the 7,500-gallon UST was permitted to be abandoned in 1998 by the San Francisco Fire Department (SFFD). Accordingly, the Phase I did not identify the 7,500-gallon UST as a REC and a Phase II ESA was not recommended/prepared. The preparation of an ECP was recommended for the Davies Campus.

The purpose of the EIR is to disclose information about potential environmental effects of the project, not to document all aspects of the processing of environmental regulations on the site (CEQA Guidelines Sections 15125[a] and 15151). The concrete in-place abandonment of the UST in 1998 combined with the aforementioned abandonment documentation prepared by SFFD, and site observations summarized in the Phase I ESA for the Noe Street Medical Office Building and Draft EIR, represent adequate information for the Phase I ESA and Draft EIR's determination that the UST does not represent a REC at the Davies Campus.

As noted on page 3 of the Phase I ESA for the South Davies Parking Areas on the Davies Campus, the 2,000-gallon diesel fuel UST that was removed in 1998 was replaced in the same location with a 2,500-gallon UST, as permitted by SFFD in 1998. In addition, page 5 of 11 of Table 1 in the Phase I ESA for the South Davies Parking Areas cites a November 20, 1998, permit from SFFD that granted approval of the removal of the 2,000-gallon UST. Furthermore, all soils that would have immediately surrounded the UST were removed during excavation for the new tank, and SFFD's files do not indicate release of hazardous materials or petroleum hydrocarbons that would have been encountered during the excavation. Therefore, the aforementioned documentation pertaining to the tank's removal that was prepared by SFFD, the excavation that occurred at the location of the 2,000-gallon UST during the installation of the 2,500-gallon replacement UST, and site observations summarized in the Phase I ESA and Draft EIR represent substantial evidence supporting the determination that the status of the removal of the 2,000-gallon UST does not represent an REC, contrary to the statements made in this comment.

Please see Response HZ-25 (page C&R 3.18-39) for a description of the adequacy of the Draft EIR. The lack of documentation for a previously performed action separate from the proposed project does not necessarily require additional effort as part of the CEQA analysis of the potential impacts of the proposed LRDP. It is reasonable to assume, based on the available information and site observations summarized in the Phase I ESA and the Draft EIR, that the 1998 removal of the 2,000-gallon UST does not represent an REC.

Furthermore, the Phase I ESA recommended the preparation of an ECP to fully mitigate the known and unknown hazards that may be encountered during demolition and excavation at the Davies Campus. In general, the ECPs for CPMC Campuses under the LRDP are meant to address the issues that would be encountered during development of the campuses and were identified by the Phase I ESAs. As described in Mitigation Measures M-HZ-N1b and M-HZ-L1b in the Draft EIR, pages 4.16-48 and 4.16-52, respectively, the preparation of ECPs would be required to address response to the discovery of unknown contaminants from previously unidentified USTs and other subsurface facilities on the Davies Campus. Mitigation Measure M-HZ-L1c in the Draft EIR, page 4.16-52, would require that the ESA for the Davies Campus be updated to include the results of a current environmental database search, conducted pursuant to Government Code Section 65962.5 before issuance of site, building, or other permits by the City for development activities at the Davies Campus involving subsurface disturbance. The results would then be incorporated into the ECPs for the CPMC campuses under the LRDP, and impacts related to potential subsurface hazards and hazardous materials would be less than significant.

Comment

(Matt Hagemann—California Nurses Association, November 24, 2010) [119-22 HZ]

"**Southern Parking Area**

The Phase I states[23] (p. 3):

> from circa 1913 to the 1960s, a greenhouse was located near the northern boundary of the west part of the Site, which may indicate the use or release of pesticides on the site.

The Phase I also found (p. 3):

A 2,500-gallon diesel underground storage tank (UST) for supplying the emergency generator at the southern hospital is located in the upper parking lot of the eastern part of the Site (Photograph 6). This UST is operated under a permit from the San Francisco Fire Department. CPMC personnel indicated that this 2,500 gallon UST replaced a former 2,000 gallon UST in 1988. Closure documents for the previous UST were not available.

The Phase I did not find a REC to be associated with the former greenhouse. It is important to note that pre-1970s greenhouses are frequently associated with soil contaminated with organochlorine pesticides such DDT and DDE. Given the pre-1970s greenhouse and because closure documents are not available for the 2,500-gallon UST, the applicant must prepare a Phase II analysis to include soil sampling in these areas.

Recommendation:

The applicant must prepare a Phase II analysis for a revised EIR and include any measures necessary to mitigate or remediate the risk of human exposure during earthmoving activities. A Phase II must also be completed to sample for petroleum hydrocarbons in the vicinity of the 2,500-gallon UST. Coordination of the Phase II activities with the SFDPH must be documented in a revised DEIR.

[23] California Pacific Medical Center. 2008 (February 13). *Phase I Environmental Site Assessment, South Davies Campus Parking Areas, San Francisco, California.* Project San Francisco, CA. Prepared by Treadwell & Rollo, Inc., San Francisco, CA."

Response HZ-30

The comment states that the presence of a 2,500-gallon UST located in the southern parking area of the Davies Campus necessitates the preparation of a Phase II ESA investigation. It should be noted that the USTs (2,500-gallon and 2,000-gallon diesel storage tanks) to which the commenter refers were also discussed by the commenter in Comment 119-21. Please see Response HZ-29 for a discussion of why the existing 2,500-gallon UST (the location of the previous 2,000-gallon UST) and the abandoned-in-place 7,500-gallon UST were not identified as RECs in the Phase I ESAs prepared for the Davies Campus or the Draft EIR. Please also see Response HZ-25 (page C&R 3.18-39) for an explanation why the analysis of the Draft EIR is adequate.

The comment also states that the presence of a former, pre-1970s greenhouse within the southern parking area at the Davies Campus might indicate the use or release of pesticides, including DDT and DDE at this campus. The discussion in the Draft EIR, page 4.16-18, acknowledges the historical uses of the southern parking area at the Davies Campus, including the former presence of a greenhouse near the northern end of the parking garage at the corner of Castro Street and 14th Street. However, because the greenhouse was not identified as an REC or potential environmental condition in the Phase I ESA, it was not further described in the Draft EIR. As stated in the Draft EIR, page 4.16-18, the previous use of a portion of the Davies Campus as a greenhouse does not warrant preparation of a Phase II ESA investigation because, upon observation, the location of the previous greenhouse did not show signs of a past/existing release or

imminent threat of a release of hazardous materials. Furthermore, the quantity and nature of the potential pesticides used at the site are not known and their possible presence likely represents de minimis conditions that would not cause a regulatory agency to take action. Therefore, the possible presence of pesticides in soil does not qualify as an REC.

The potential presence of pesticides, including DDT and DDE in the subsurface soil/groundwater, would be addressed in the ECP for the Davies Campus. Mitigation Measures M-HZL1a and M-HZ-L1b in the Draft EIR, page 4.16-52, would require the preparation of site mitigation plans (SMP) and unknown contingency plans for the CPMC campuses, including the Davies Campus, that address known and potential unforeseen circumstances related to contaminated soil and groundwater at the campuses. These measures also require the submittal of the SMPs and unknown contingency plans to the SFDPH for review and approval before issuance of site, building, or other permits by the City. For further clarification, refer to the text of the Draft EIR, beginning on page 4.16-52 regarding the complete procedures and requirements established in Mitigation Measures M-HZ-L1a and M-HZ-L1b. CPMC has prepared ECPs for each campus, which, as stated on page 4.16-52 of the Draft EIR, will serve as both the SMPs and unknown contingency plans for these campuses upon review and approval by SFDPH. As such, with implementation of Mitigation Measures M-HZ-N1a through M-HZ-N1c, impacts related to the potential release of hazards and hazardous materials during LRDP construction would be less than significant, as stated in the Draft EIR.

3.18.6 ST. LUKE'S CAMPUS

3.18.6.1 ENVIRONMENTAL SITE ASSESSMENT

Comment

(Matt Hagemann—California Nurses Association, November 24, 2010) [119-23 HZ]

"**Saint Luke Campus**

A Phase I was completed for the tower area of the Saint Luke Campus on August 20, 2009 and found:[24]

> an inactive diesel underground storage tank at the site that was reportedly abandoned in place in 2000 by cleaning and filling with cement. This tank was 'closed' in place by with the approval of the SFDPH; no documents indicating releases of fuel from this tank were found (Phase I, p. 3).

Note: The Phase I includes no information about the contents of the UST or the capacity of the UST. The quotation marks were in the Phase I itself.

The Phase I concluded:

Several other known and potential environmental conditions, which do not meet the definition of Recognized Environmental Condition, but may impact Site redevelopment were identified at the Site. These include:

- The presence of artificial fill, which may contain elevated levels of metals, organic chemicals, and/or asbestos;
- The presence of underground tanks in an area to be excavated;
- The possible presence of an acid neutralization sump; and
- The potential presence of deposits of ash from a former hospital incinerator.

There is no documentation for the UST closure. Most important, there is no discussion in the Phase I of why the above features do not meet the definition of a REC, or whether the features are potentially significant impacts

under CEQA. These conditions may in fact meet the definition of a REC and thereby warrant the preparation of a Phase II to include sampling.

One REC was identified in the Phase I: Oily staining was observed at a utility vault indicating a release of hazardous materials or petroleum products. However, the he Phase I did not conclude that a Phase II investigation was needed, despite the finding of a REC. Instead, it recommended only that prior to Project construction an environmental contingency plan (ECP) should be prepared 'describing procedures to be followed to address known and unknown environmental conditions at the Site' (Phase I, p. 5).

Recommendation: The applicant must conduct a Phase II subsurface investigation to investigate the potential for the presence of soil contamination associated with the USTs, and to address the soil staining. The investigation must be included a revised EIR and contain mitigation or remediation measures to ensure that nearby residents or construction workers are not at risk during earthmoving activities.

[24] California Pacific Medical Center. 2009 (August 20). *Phase I Environmental Site Assessment, St. Luke's Campus Tower Area, 3555 Cesar Chavez Avenue, San Francisco, California.* San Francisco, CA. Prepared by Treadwell & Rollo, Inc., San Francisco, CA."

Response HZ-31

The comment suggests that a Phase II ESA should be conducted to investigate the presence of soil contamination associated with USTs at the St. Luke's campus and to address soil staining [presumably the oily staining observed in the emergency generator vault] at 3555 Cesar Chavez Street on the St. Luke's Campus.

The first UST cited in the comment is the abandoned-in-place diesel UST that formerly supplied fuel for an emergency generator. The 1,500-gallon UST is located east of the existing St. Luke's Hospital Tower. No record of leaks were found for this UST and closure was approved by the SFFD in 2000. Furthermore, soil sampling was conducted adjacent to the UST and no hazardous materials like TPH-d, BTEX or MTBE were detected. Refer to Page 8 of 16 of Table 1 of the Phase I ESA for 3555 Cesar Chavez Street on the St. Luke's Campus for further clarification. Based on this information, this UST does not qualify as an REC, because no known past or current release or imminent threat of a release of hazardous materials related to this UST exists. The second UST is a 3,000-gallon active UST, which replaced the 1,500-gallon UST as the emergency generator fuel supply. The 3,000-gallon UST is currently active, equipped with leak detection systems, and has not registered any leaks since its installation, as stated on page 3 of the Phase I ESA for 3555 Cesar Chavez Street on the St. Luke's Campus. With respect to the comment statement about oily staining at the north end of the Redwood administration building, the Draft EIR, page 4.16-20, states that "[o]ily staining was observed on the pipe, grating, wall, and vault associated with a utility vault for an emergency generator… Although the Phase I identified the oily staining as a REC at the St. Luke's Campus, no Phase II was recommended because the oil stain occurred within a vault structure, which likely contained the oil." It is important to note that "soil staining" (as noted by the commenter) was not observed during preparation of the Phase I ESA for 3555 Cesar Chavez Street on the St. Luke's Campus, but rather oily staining was observed on an existing pipe, grating, wall, and vault that was associated with a utility vault for an existing emergency generator located beneath the location of the proposed Replacement Hospital.

The comment also requests further discussion regarding why three additional potential environmental conditions beyond the USTs already discussed (i.e., the presence of artificial fill, possible presence of an acid neutralization sump, and the potential presence of ash deposits) described on page 3 of the Phase I ESA for 3555 Cesar Chavez Street on the St. Luke's Campus did not meet the definition of RECs. With respect to artificial fill materials, because the presence of artificial fill does not represent a release of hazardous materials or petroleum products, it does not qualify as an REC. However, the possible presence of such hazardous materials in the fill may require steps to isolate this soil from direct contact with the public, such as restricted use of this soil (i.e., not within unpaved, landscaped areas) or disposal of

excavated soil as a hazardous waste. The Phase I analysis conducted by Treadwell & Rollo for the 3555 Cesar Chavez Street site did not identify the artificial fill as an REC, but rather as a potential environmental condition that would warrant consideration in the ECP prepared for the St. Luke's Campus development under the LRDP. If contamination associated with artificial fill was present and encountered during redevelopment of the St. Luke's Campus under the CPMC LRDP, it would be addressed as set forth in the ECP, which is required by Mitigation Measures M-HZ-N1a and M-HZ-N1b (see pages 4.16-46 and 4.16-48, respectively, of the Draft EIR).

The possible presence of an acid neutralization sump and the possible presence of ash from an incinerator, represent potential but unverified facilities that, based on Treadwell & Rollo's professional experience with other hospital facilities, have been constructed at facilities similar to St. Luke's Hospital. The potential facilities identified are not supported by any existing documentation, but could be present somewhere on-campus based on the equipment found at similar medical facilities. Therefore, these do not represent "the presence or likely presence" of hazardous materials or petroleum products" at 3555 Cesar Chavez Street on the St. Luke's Campus and thus, they would not be RECs. As described above for the artificial fill, if encountered during redevelopment of the St. Luke's Campus under the CPMC LRDP, these conditions would be addressed as set forth in the ECP, which is required by Mitigation Measures M-HZ-N1a and M-HZ-N1b as stated on pages 4.16-46 and 4.16-48, respectively, of the Draft EIR, and impacts related to the presence of these conditions during development of the St. Luke's Campus under the CPMC LRDP would be less than significant.

Additionally, the Phase I ESA for the 3555 Cesar Chavez Street site recommended the preparation of an ECP to address known and unknown environmental conditions at the St. Luke's Campus. Mitigation Measures M-HZ-N1a and M-HZ-N1b in the Draft EIR, pages 4.16-46 and 4.16-48, respectively, call for preparation of an ECP for LRDP development at the St. Luke's Campus. This ECP would need review and approval by SFDPH before issuance of any site, building, or other permits by City agencies for the proposed LRDP development of the St. Luke's Campus. This ECP will contain procedures to be implemented in the event of an accidental discovery of potentially hazardous materials at the St. Luke's Campus, in accordance with SFDPH requirements. Full implementation of the above-noted mitigation measures would ensure that the LRDP's impacts at St. Luke's Campus related to hazards and hazardous materials remain less than significant.

3.19 MINERAL AND ENERGY RESOURCES

3.19.1 LRDP

3.19.1.1 ENERGY CONSERVATION

Comment

(Paul Wermer—CPMC Neighbors Coalition and Pacific Heights Residents, October 18, 2010) [67-42 ME]

"16) MINERAL AND ENERGY RESOURCES: no specific comments."

Response ME-1

The comment is noted. This comment does not raise issues regarding the adequacy, accuracy, or completeness of the Draft EIR. The comment will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project.

Comments

(Gloria Smith—California Nurses Association, October 19, 2010) [91-44 ME]

"Scientific life-cycle analyses have repeatedly found that the energy used for operation and maintenance is the single largest source of environmental damage and resource consumption attributable to buildings. In comparison, the so-called 'embodied' energy[43] of building materials accounts for only 6 to 17 percent of the total energy use of a building over a 50-year life-cycle. Despite these findings 'green design' and rating programs like LEED® are typically fixated on material choices, not reduction of energy use.[44]

[43] From Wikipedia: Embodied energy is defined as the commercial energy (fossil, fuels, nuclear, etc.) that was used ... to make any product, bring it to market, and dispose of it. Embodied energy is an accounting methodology which aims to find the sum total of energy necessary for an entire product lifecycle. This lifecycle includes raw material extraction, transport, manufacture, assembly, installation, disassembly, deconstruction and/or decomposition.

[44] John Straube, Why Energy Matters, Building Science Insights, BSI-012, September 2010; http://www.buildingscience.com/documents/insights/bsi-012-why-energy-matters/files/BSI-012_Why_Energy_Matters_rev.pdf, accessed October 11, 2010."

(Gloria Smith—California Nurses Association, October 19, 2010) [91-45 ME]

"In the past years, the LEED® program for commercial buildings has been increasingly criticized, including by its practitioners, for failing to live up to the program's stated goals to improve building performance with-respect to energy savings, water efficiency, greenhouse gas emissions reduction, improved indoor environmental quality, and stewardship of resources and sensitivity to their impacts.[45,46,47] The major criticisms of the LEED® program are that its rating system:

a) Is design-based rather than performance-based and there is no follow-up to determine whether the building lives up to its design;

b) Is fixated on material choices, not energy reduction;

c) Does not take into account metrics such as the energy efficiency of the building; or the energy intensity of the building; e.g., the energy use per unit building area[48] and occupancy loading; or the productivity of the building; and

d) Awards credits, or points, for individual components disproportionate to their comparative value with respect to energy use and regardless of the specific circumstances of the building such as location, climate; etc.

[45] *See*, for example, BuildingGreen.com, Lies, Damn Lies, and... (Another Look at LEED® Energy Efficiency), posted September 2, 2008 by Nadav Malin and reader comments; http://www.buildinggreen.com/live/index.cfm/2008/9/2/Lies-Damn-Lies-and-Are-LEED®-Buildings-iLessi-Efficient-Than-Regular-Buildings, accessed October 11, 2010,

Lstiburek, (an edited version of this Insight first appeared in the ASHRAE Journal), Prioritizing Green: It's The Energy Stupid, Building Science Insights, BSI-007, November 2008; http://www.buildingscience.com/documents/insights/bsi-007-prioritizing-green-it-s-the-energy-stupid/files/bsi-007_its_the_energy_stupid.pdf, accessed October 11, 2010.

[47] Mis-LEED®-ing, Sidebar information for BS1-007: Prioritizing Green-It's the Energy Stupid, Building Science Insights; http://www.buildingscience.com/documents/insights/mis-leed-ing/, accessed October 11, 2010.

[48] The building area of a major building structure is the sum of the areas of the several floors of the building, including basements, mezzanines, intermediate floored tiers, and all penthouses, measured from outside face to outside face of exterior walls or from the center line of common walls separating buildings."

(Gloria Smith—California Nurses Association, October 19, 2010) [91-46 ME]

"One striking example of the above discussed deficiencies of the LEED® program is its treatment of the thermal performance of the building envelope: even though windows and curtain walls[49] provide the worst energy performance of all building components (as opposed to properly insulated walls), LEED® does not reward designs that reduce the glazing[50], i.e., window-to-wall, ratio.

Glazing systems, including almost all modern high-performance ones, have very little ability to control heat flow and solar radiation. Figure 3 shows the thermal performance (effective overall wall thermal resistance or R-value[51]) of various building enclosures (walls and windows) versus the window-to-wall (glazing) ratio.

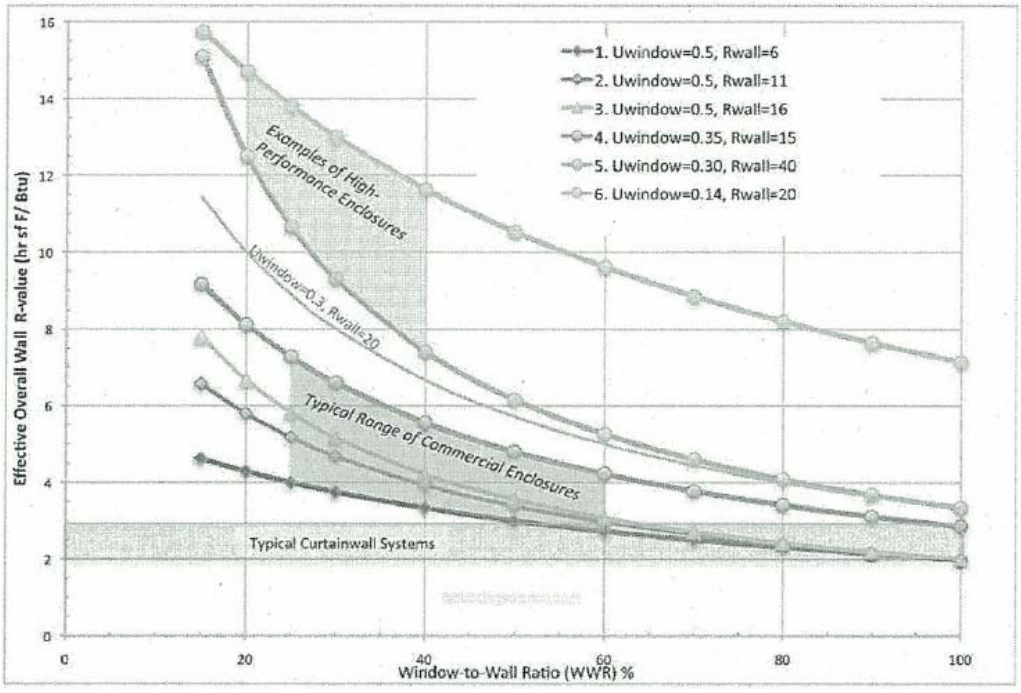

Figure 3:
Building wall R-value versus window-to-wall (glazing) ratio
From: Joseph W. Lstiburek, Prioritizing Green: It's The Energy Stupid, Insight, November 2008: http://www.buildingscience.com/documents/insights/bsi-007-prioritizing-green-it-s-the-energy-stupid/files/bsi-007_its_the_energy_stupid.pdf

Without delving into the details of this graph, it shows that regardless of how well insulated the building enclosure (y-axis), its effective overall thermal resistance (wall R-value) drops quickly when the window-to-wall ratio is increased (x-axis). The conclusion that can be drawn from this graph is that the most effective approach to energy savings is to reduce the glazing area. Or, as the author of an article on the energy efficiency of buildings succinctly put it: 'Bottom line is use less glass and use good glass and frames ... Bad glass ruins good walls.'[52]

> Another building science engineer notes:
>
> The real savings from improved window technology, more efficient equipment, and better design tools have disguised the fact that we are wasting more energy because of over-ventilated, over-glazed, and under-insulated buildings.[53]

Thus, good building designs should strive to avoid these pitfalls.

[49] A curtain wall is an outer covering of a building in which the outer walls are non-structural, but merely keep out the weather.
[50] Glazing is a transparent part of a building wall.
[51] The R-value is a measure of thermal resistance used in the building and construction industry.
[52] Joseph W. Lstiburek, (an edited version of this Insight first appeared in the ASHRAE Journal), Prioritizing Green: It's The Energy Stupid, Insight, November 2008; http://www.buildingscience.com/documents/insights/bsi-007-prioritizing-green-it-s-the-energy-stupid/files/bsi-007_its_the_energy_stupid.pdf, accessed October 11, 2010.
[53] John Straube, Why Energy Matters, Building Science Insights, BSI-012, September 2010; http://www.buildingscience.com/documents/insights/bsi-012-why-energy-matters/files/BSI-012_Why_Energy_Matters_rev.pdf, accessed October 11, 2010."

(Gloria Smith—California Nurses Association, October 19, 2010) [91-47 ME]

"VI.B High Window-to-Wall Areas in Project Buildings Should Be Decreased to Reduce Energy Consumption

As shown in the below architectural renderings, the proposed Cathedral Hill campus would make extensive use of glass and unshaded curtain walls to the south onto Geary Boulevard, east onto Van Ness Boulevard, and north onto Post Street.

Figure 4:
CMPC Cathedral Hill Hospital as seen from Van Ness Avenue at Post Street
From: Curbed, Cathedral Hill; It's Not Just About You. Monday, September 27, 2010; http://sf.curbed.com/archives/2010/09/27/cathedral_hill_its_not_just_about_you.php

Figure 5: CMPC Cathedral Hill Hospital as seen from Van Ness Avenue at Geary Boulevard
From: California Pacific Medical Center 2008 Institutional Master Plan;
http://www.rebuildcpmc.org/assets/08IMP_CPMC.pdf

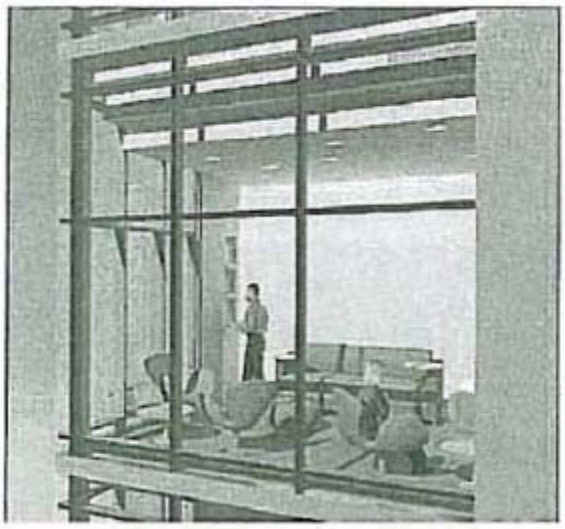

Figure 6: Interior view of the CMPC Cathedral Hill Hospital
From: California Pacific Medical Center 2008 Institutional Master Plan;
http://www.rebuildcpmc.org/assets/08IMP_CPMC.pdf

The expanse of windows and unshaded curtain walls, particularly to the south, would dramatically increase heating, ventilation and air-conditioning demand compared to a system with a lower window-to-wall ratio."

(Gloria Smith—California Nurses Association, October 19, 2010) [91-48 ME]

As one building science engineer notes:

> When I see a fully glazed, floor-to-ceiling commercial or institutional building, I see an energy-consuming nightmare of a building that requires lots of heating and cooling at the perimeter just to maintain comfort. The result, on a cold winter day, is that offices exposed to the sun require cooling, while those in the shade need heat. Unless the control system is highly tuned, too many of the occupants will also be uncomfortable.[1]

Numerous studies have shown there are no day-lighting or energy benefits with window-to-wall ratios over 60 percent, and in most cases an area of between 25 and 40 percent is optimum (this is, lowest energy consumption).[2] Thus, one effective mitigation measure to reduce the Project's greenhouse gas emissions associated with energy use would be to design all buildings with a reduced window-to-wall ratio:

> Many designers have shown that beautiful and high-performance buildings can result from a proper balance of glazing quantity and quality. All too often, however, designers appear to choose all-glass curtain walls or floor-to-ceiling strip windows because they make it easy to create a sleek impression while leaving all the tricky details in the hands of the manufacturers. How much longer can we afford to pay the energy bills that result from that choice? It's high time to revive the craft of designing beautiful facades that don't cost the earth.3

(Gloria Smith—California Nurses Association, October 19, 2010) [91-49 ME]

"Clearly, the Cathedral Hill Hospital building is not designed for sustainability and energy conservation even though it would be required to be LEED® certified. In order to address the Project's significant emissions of greenhouse gases and criteria pollutants, all planned buildings under the LRDP should be examined as to how their design could be modified to reduce energy use and associated emissions."

Response ME-2

The comments express concern regarding the use of energy during everyday operations at the CPMC campuses, and provide an opinion about the effect of LEED® certification on the energy effectiveness of CPMC buildings. The comments state that the design and materials proposed for the Cathedral Hill Campus—including glass windows and unshaded curtain walls—may not be energy efficient. One comment suggests addressing the proposed project's significant emissions of greenhouse gases and criteria pollutants by examining the design of the proposed buildings and providing potential modifications to reduce energy use and associated emissions.

LEED® Certification

Although the proposed Cathedral Hill Hospital is exempt from Chapter 13C of the City's Building Code (San Francisco Green Building Requirements), as described on page 4.17-5 of the Draft EIR, CPMC would obtain LEED® Certified status for the proposed Cathedral Hill Hospital building (as well as the St. Luke's Replacement Hospital) under the LRDP. It is not a CEQA requirement to enumerate how CPMC intends to obtain LEED® certification; however, details—some of which are described below—would be submitted to the City during the project's permitting process.

[1] John Straube, Can Highly Glazed Building Facades be Green? Building Science Insights, BSI-006, September 2008; http://www.buildingscience.com/documents/insights/bsi-006-can-fully-glazed-curtainwalls-be-green/files/bsi-006_glazed_buildings_green.pdf, accessed October 11, 2010.
[2] Ibid
[3] Ibid

Contrary to the suggestion of the comments, the proposed Cathedral Hill Hospital (and St. Luke's Replacement Hospital) would be designed with substantial attention to energy efficiency. As originally stated on Draft EIR page 4.17-8 and as amended on page 4-2 of this C&R document, the proposed development at the Cathedral Hill (and St. Luke's) Campuses will include both materials/design related energy efficiency measures and additional non-building-material energy efficiency strategies (optimizing energy performance of facilities). Furthermore, the comments appear to criticize the LEED® program's focus on materials. However, the criticisms cited in other sources and repeated by the comments are limited only to LEED® "materials credits" that focus on local sourcing or high renewability of building materials, which, the comments correctly state, may not directly contribute to building energy efficiency. However, other materials choices, such as choices made based on materials' thermal conductivity, are directly related to building energy efficiency and are fed directly into efficiency models. The LRDP, when feasible, has incorporated such materials to maximize energy efficiency.

The comments state that the LEED® rating system has been criticized for (a) being design-based rather than performance-based, (b) being fixated on material choices, not energy reduction, and (c) not taking into account metrics such as energy efficiency of the building or energy intensity of the building, etc. These statements do not take into account the energy modeling strategy outlined in LEED® for New Construction, Version 2.2, which was utilized for the proposed Cathedral Hill Hospital. Through "Whole Building Energy Simulation," as outlined in LEED® for New Construction Version 2.2 (LEED-NC 2.2), the proposed Cathedral Hill Hospital is designed to reduce energy use 14 percent over ASHRAE Standard 90.1-2004,[4] which is described in further detail on page C&R 3.19-7.

The comments do not mention LEED® Point EQ7.2, Thermal Comfort, which ensures follow-up and confirmation that the building operates as designed. The statements that the LEED® rating system is fixated on material choices rather than energy reduction and that it fails to account for metrics such as energy efficiency is incorrect. LEED® Point EA1.1, Optimized Energy Performance, specifically targets energy consumption and energy conservation measures. The energy reduction strategies proposed for the Cathedral Hill MOB include:

- Enhanced commissioning
- Green roofs covering approximately 25 percent of total roof area
- Cool roof on top story
- Low-water use plumbing fixtures
- Water savings for irrigation through the use of native and adapted species and efficient irrigation technologies
- Cistern for collection of stormwater to supply much of the irrigation needs of the green roofs and reduce loads on off-site water treatment plants by delaying entry of stormwater into the City system
- Use of energy efficient elevators that capture breaking energy and are highly efficient at managing traffic
- Evaporative condensers for the air handlers
- Variable flow pumping systems
- Variable airflow fluid cooler fans
- High efficiency heating hot water boilers

[4] Note: LEED NC, Version 2.2 requires that the annual energy cost, expressed in dollars, be used to calculate the percentage improvement in energy usage. Annual energy costs are determined by using rates for purchased energy—such as electricity, gas, oil, propane, steam, and chilled water—that are based on actual local utility rates or the state average prices published annually by the U.S. Department of Energy's Energy Information Administration, at www.eia.doe.gov.

- Water source air conditioners for the Office of Statewide Health Planning and Development (OSHPD) three floors, lobby, retail, and support areas
- Energy efficient motors
- Direct digital control system
- Investigating the potential use of LED light fixtures for the parking garage

While it is possible to suggest other efficiency measures that have been integrated into non-hospital structures in other locales, the design of a hospital or clinical medical use building requires an absolute priority be placed on the programmatic needs of the building's healthcare mission. The space, ventilation, cladding, and systems demands of clinical and acute care facilities must be balanced against the desire to achieve high levels of energy and other resource consumption efficiencies. The measures identified in the Draft EIR would ensure that CPMC would continue to work with the City, OSHPD, and other local, state, and federal agencies to ensure that long-term projects are constructed in a manner that will satisfy their healthcare missions in the most energy efficient manner possible.

Windows and Curtain Walls and LEED® Strategies

During the design of the proposed Cathedral Hill Hospital, an energy model was developed and tested with variables to determine which building envelope and HVAC system factors would demonstrate the highest level of energy efficiency. Exterior building walls (curtain walls) and window treatments along the Geary Boulevard, Van Ness Avenue, and Post Street sides of the proposed Cathedral Hill Hospital are critical components of this energy efficiency. Allowable Size Window Selection Criteria were developed to size windows and set performance, so as not to exceed HVAC requirements required by the Health Care codes. Twenty percent of the proposed Cathedral Hill Hospital exterior wall would be composed of vision glass. The entire high-performance curtain wall assembly, which includes the specified 1-inch-thick insulated vision glass, metal panel system, insulated spandrel panel system, and stone veneer system collectively calculates out to an insulative value of R-19. [5] Only 20 percent of the curtain wall for the proposed Cathedral Hill Hospital would be composed of vision glass. Code requires vision glass for natural light and views in all patient rooms and recuperation areas (Day Rooms). These windowed areas are composed of 1-inch-thick argon-filled insulated glass units with U-values in the range of 0.25 to 0.29, depending on the glass type. The shading coefficient (SC) will be in the range of 0.22 to 0.30. A detailed solar analysis of the entire building determined that shading the southwest corner would be beneficial; therefore, horizontal shades projecting from 1 foot above the windows were incorporated into the design of the south façade of this area.

Interior sun shades with appropriate translucency would be provided for all exterior windows to mitigate heat and glare and reduce mechanical system loads. Patient rooms would have manually operated shades, enabling patients and family members to control the environment of their particular room. Day Rooms, family rooms, and large assembly spaces—such as the cafeteria, meeting rooms, and seminar rooms—would have motorized shades operated by the building engineer to ensure heat gain is controlled throughout the day, as necessary. These features would allow a customized and controlled environment to further reduce the use of energy inputs on lighting and mechanical systems.

As noted above, the proposed Cathedral Hill Hospital is designed to reduce energy use 14 percent over ASHRAE Standard 90.1-2004. In conjunction with the high-performing exterior envelope, innovative building systems design enables an energy efficient project. The mechanical systems would utilize displacement ventilation, variable air volume, 100 percent outside air with heat recovery, waterside heat

[5] "R-value" signifies the ability of a material to resist heat flow. The higher the R-value, the greater the heat flow resistance. For example, it is more difficult for heat to pass through R-19 insulation than it is to pass through R-11 insulation.

recovery and food service heat reclaim measures. These systems would enable efficient air delivery throughout the building and recapture energy that would otherwise be lost in the atmosphere. To ensure occupant thermal comfort and energy efficiencies, the HVAC systems would be designed in accordance with ASHRAE Standard 55-2004. Post-occupancy surveys would also be taken to verify that the systems are operating as designed.

Advanced technologies of high efficiency lighting, including LED, would be specified for the proposed Cathedral Hill Hospital. Exterior building lighting would be minimized to provide only the illumination needed for security and way-finding. Daylighting strategies would be utilized for the interior spaces, where feasible. Innovative elevator systems would be specified to capture energy produced through cab braking and feed it into the electrical system, essentially recycling energy. Through fundamental commissioning of the building's energy systems, the installed systems would be verified to confirm they would perform to the design level.

The comment also asserts that the LEED® rating system does not reward designs that reduce the glazing (window-to-wall) ratio of buildings. It should be noted that LEED® Point EA PR2, Minimum Energy Performance, includes evaluation of the building envelope, including glazing. In addition, ASHRAE Standard 90.1-2004 provides as follows: "Vertical Fenestration. Vertical fenestration areas for new buildings and additions shall equal that in the proposed design or 40 percent of gross above-grade wall area, whichever is smaller,…" Therefore, although it may not reward designs that reduce the glazing ratio of buildings below 40 percent, the LEED® rating system penalizes projects that include more than 40 percent glazing.

While much of the façade of the proposed Cathedral Hill MOB would appear to be standard glass, more than 40 percent of the glass would actually be opaque spandrel glass backed with continuous insulation, stud furring, and gypsum board, which would effectively function as an exterior wall. Façades receiving several hours of direct sunlight would have a maximum Solar Heat Gain Coefficient of 0.36, obtained through the use of various low-e coatings and ceramic frits. The vision glass would have a maximum U-value of 0.35. Blind pockets would be provided for manual or automatic interior sunshades to be installed by future tenants.

Several LEED® strategies that would indirectly result in reduced energy use would also be included in the proposed Cathedral Hill Campus (and St. Luke's Replacement Hospital and MOB/Expansion Building) to provide energy efficiency.

- **Alternative Transportation –** The centralized location and adjacency to a public transit hub would be an important component of the energy efficiency of the proposed development at the Cathedral Hill Campus. With on-site parking provided mainly for visitors, staff would be encouraged to utilize public transit through an extensive commuter benefits program. Preferential parking for low-emitting and fuel-efficient vehicles would be provided to encourage the use of such vehicles. The proposed Cathedral Hill Campus would provide additional secure bicycle parking spaces beyond that required by the San Francisco Planning Code (150 bicycle parking spaces are proposed at the Cathedral Hill Hospital and 61 spaces are proposed at the Cathedral Hill Campus MOB), with changing rooms and shower facilities for staff, to encourage this form of relatively carbon-free transit. The close proximity of the proposed buildings to residential and community services such as shopping, restaurants and other services, integrate the campus into the neighborhood, reducing the length of trips for patients, visitors, and staff. These efficiencies would substantially reduce energy use and greenhouse gas (GHG) emissions that would otherwise be generated by a less consolidated or centralized medical center.

- **Green Roofs –** Approximately 25 percent of the Cathedral Hill Hospital roof would be covered with soil and plantings. This green roof would conserve energy in two ways. First, by acting as an

insulating and sun-barrier layer, the plant and soil materials would supplement the roofing materials to provide a barrier between the interior and exterior environments. Additionally, by treating and reducing stormwater runoff, these vegetated filters would serve to reduce the loads on off-site water treatment plants, reducing energy requirements and GHG emissions from City infrastructure. To further provide for these benefits, the proposed design would retain stormwater in cisterns, recirculating it through the vegetation for further filtration and delaying its entry into the City system.

- **Water Consumption Reduction –** Reduced water usage reduces the use of energy in ways that are similar to stormwater reduction. Irrigating the Cathedral Hill Campus green roofs' drought-tolerant plantings with captured stormwater, and the use of low-flow fixtures and the use of motion-sensor faucets and toilets in appropriate locations throughout the hospitals at the Cathedral Hill and St. Luke's Campuses, would help offset the amount of potable water needed. One of the selection criterion for building equipment and medical equipment that use water will be the equipment's capacity to use water efficiently. An analysis was done for expected use of water by all systems in the Cathedral Hill Hospital and the efforts of the design team to use water resources conservatively has resulted in an expected water use reduction of between 35 and 40 percent below a standard, code-compliant building of similar size and function. This water use reduction would also result in energy savings both on- and off-site.

- **Green Building Materials –** Approximately 20 percent of the materials specified for the proposed Cathedral Hill Hospital contain recycled content. The structural steel system, a significant percentage of the mass of the building, would be largely composed of recycled material. Additionally, the proposed Cathedral Hill Hospital would utilize "viscous wall dampers," an innovative seismic dampening structural system that would reduce the amount of steel required for the building by approximately 25 percent . Other materials would be specified on the basis of where they are mined, manufactured, or assembled. Materials local to the site would be given priority in the selection process, as long as they meet the required performance characteristics. This is because local materials have a lower "embodied energy" than materials transported from further away. Materials with low-emitting characteristics, which can reduce ventilation requirements and save energy, would also be given priority in the selection process.

Reduce Energy Use and Associated Emissions

The comments suggest that CMPC should examine the design of the proposed buildings and further study how they could be modified to reduce energy use and associated emissions. As previously described, CPMC has evaluated and incorporated, where feasible, design measures to reduce energy use and associated emissions into the design of the proposed LRDP and campus-specific developments. Refer to Draft EIR pages 4.8-16 to 4.8-17 and 4.17-7 to 4.17-9, and Responses GH-1, GH-2, GH-4, and GH-5 on pages C&R 3.10-3, 3.10-13, 3.10-15 and page 3.10-16 for a discussion of GHG emission-reducing design features that have been incorporated into the proposed LRDP. It should be noted that sufficient methodologies to quantify the reductions that could be achieved by implementing many of the project design features and City-imposed requirements are not available. Therefore, the Draft EIR conservatively did not account for those project design features in the inventory of GHG emissions under the proposed LRDP. For the same reason, these features were not assumed to fully mitigate the project's operational impacts related to GHG emissions that, as explained on Draft EIR pages 4.8-31 and 4.8-32, were considered to be significant and unavoidable under the quantitative thresholds set forth in the recently adopted Bay Area Air Quality Management District Guidelines.

3.19.2 CATHEDRAL HILL CAMPUS

3.19.2.1 GAS LINES

Comment

(Unitarian Universalist CPMC Task Force, October 5, 2010) [44-3 ME]

"Gas lines. Volume 4, Section 4.17.2. A more thorough description of the type of gas lines under and around the Cathedral Hill campus is needed, specifically referring to the type of pipes that will be used to direct gas in underground lines."

Response ME-3

The comment requests additional information regarding the type and location of gas lines in the vicinity of the proposed Cathedral Hill Campus. A more thorough description of gas line types and locations are not considered necessary to effectively evaluate the potential for the proposed LRDP to impact existing energy and mineral resources. The following information is provided for expository purposes, but is not considered necessary for the analysis of potential impacts of the proposed LRDP on the physical environment. As such, no edits to the text and/or analysis in the Draft EIR are required.

Existing gas lines located near the sites of the proposed Cathedral Hill Hospital and MOB, at Van Ness Avenue and Geary Street, include polyethylene (plastic) high-pressure gas main pipelines owned and operated by the Pacific Gas and Electric Company (PG&E). Adjacent to the site of the proposed Cathedral Hill Hospital, there is an existing 4-inch gas line running north to south on Franklin Street, an existing 2-inch line running east/west on Geary Boulevard, an existing 2-inch line running east to west on Post Street, and a 2-inch service lateral on Van Ness Avenue. Adjacent to the proposed Cathedral Hill MOB site, there is an existing 2-inch gas line running north to south on Polk Street, an existing 2-inch line running east to west on Geary Street, and an existing 2-inch line running east to west on Cedar Street.

Primary gas service to the proposed Cathedral Hill Hospital would come from the existing 2-inch polyethylene high-pressure gas main pipeline which runs east to west along Geary Boulevard. A new 2-inch polyethylene high-pressure gas pipeline would be installed from the building point of connection and would intercept the existing line. PG&E would then provide the tie-in with a 2-inch by 2-inch high-volume tapping tee.

Primary gas service to the proposed Cathedral Hill MOB would be provided via the existing 2-inch polyethylene high-pressure gas main pipeline which runs east to west along Cedar Street. A new 1.25-inch polyethylene high-pressure gas pipeline would be installed from the building point of connection and would intercept the existing line. PG&E would then provide the tie-in with a 2-inch by 2-inch high-volume tapping tee and a 2-inch by 1.25-inch plastic reducer coupling. Gas line construction and installation associated with the proposed Cathedral Hill Hospital and MOB would be required to conform to PG&E Standard A-75, the PG&E "Greenbook," and would be subject to PG&E review and approval. In addition, as noted on page 2-28 of the Draft EIR, the OSHPD-required emergency generators for the proposed Cathedral Hill Hospital would be powered by diesel fuel contained in storage tanks located under the right-turn lane and sidewalk along Geary Boulevard.

3.21 OTHER CEQA CONSIDERATIONS

3.21.1 GROWTH INDUCEMENT

3.21.1.1 LRDP

Comment

(Gloria Smith—California Nurses Association, October 19, 2010) [90-46 GRO, duplicate comment was provided in 93-21 GRO]

"• Growth-inducing impacts as a result of unmet demand for housing and particularly housing affordable to the Project workforce as well as growth inducing impacts associated with exempting this Project from applicable policies, plans and regulations. In addition, the DEIR fails to analyze the growth inducing impacts related to indirect and induced growth in employment to serve the Project and foreseeable uses at the California campus sites once sold."

Response GRO-1

The comment addresses potential growth-inducement impacts related to housing demand of the proposed LRDP workforce; affordable housing; exemption of the LRDP from application of policies, plans, and regulations to the LRDP; and future uses at the California Campus, once sold. As stated on Draft EIR page 5-16, induced growth is any growth that exceeds planned growth and results from new development that would not have taken place without the implementation of a project. Typically, a project's potential for growth inducement would be considered significant if it would result in growth or population concentrations exceeding those assumptions included in pertinent master plans, land use plans, or projections made by regional planning authorities.

According to the 2010 U.S. Census, there are 31,131 vacant housing units within the jurisdictional boundaries of the City and County of San Francisco (see C&R Table 3.5-1, "Population and Housing Estimates City and County of San Francisco," in Response PH-3 [page C&R 3.5-7]). Thus, the housing demand associated with the proposed LRDP (1,493 households) could be accommodated by the existing vacant housing supply. Therefore, implementation of the proposed LRDP is not anticipated to result in substantial, additional housing growth within the City and County of San Francisco. Please see Responses PH-9 (page C&R 3.5-31), PH-3, and PH-4 (page C&R 3.5-13), and Response PH-8 (page C&R 3.5-27) for further discussions related to housing supply and capacity, analytical assumptions and methods utilized in the population and housing impact analysis, and population and housing significance criteria and mitigation, respectively.

The demand for affordable housing is a social and economic effect that is only required to be analyzed under CEQA insofar as the effect would connect the proposed action to a physical environmental effect or where the effect would represent a measure of the magnitude of a physical environmental effect. There is no evidence in the record that effects on housing affordability would have physical environmental consequences that were not otherwise addressed in the Draft EIR. Please see Responses INTRO-7 (page C&R 3.1-17), PH-8 (page C&R 3.5-27) and PH-9 (page C&R 3.5-31), and PH-17 (page C&R 3.5-64) for further discussions related to social and economic issues, demand for affordable housing, and population and housing mitigation, respectively.

As stated on Draft EIR page 5-16, growth-inducement impacts are those that might foster economic or population growth or the construction of new housing in the surrounding environment. The proposed LRDP is not exempt from applicable policies, plans, and regulations. As described on Draft EIR page 2-13 in Table 2-3, general plan amendments and Planning Code changes/authorizations would be required

in order for the proposed LRDP to be implemented. As is addressed in Response LU-9 (page C&R 3.3-64), there are no further environmental effects of the specific plan and code amendments, Conditional Use authorizations, and other actions beyond those that are described for the proposed LRDP in Chapter 5 of the Draft EIR. As is stated on Draft EIR page 5-17, the proposed LRDP would not result in direct or indirect substantial growth inducement. Please see Response PH-25 (page C&R 3.5-82) for further discussion regarding indirect and induced employment and how related housing growth could be accommodated by San Francisco's existing available vacant housing supply and planned new housing supply as discussed in Section 4.3 of the Draft EIR.

Under CEQA, the analysis of growth inducement is focused on informing decision-makers and the public about a project's potential for inducing additional growth beyond that planned as part of the project either through the removal of an obstacle to growth (for example, by providing new infrastructure capacity) or through creating an economic stimulus However, given the location of the proposed Cathedral Hill Campus within a dense, developed urban environment, any long-term citywide plans and forecasts for growth would have assumed future development on such a presently unused site. Therefore, the LRDP would not cause the City and County of San Francisco to expand into new, previously undeveloped or unplanned areas, and thus would not induce substantial amounts of housing or employment growth beyond the amounts of growth that the City is already planning for and expecting.

Finally, the future of the California Campus is speculative, but the environmental analyses included in the Draft EIR assumed that the level of employment at that location would remain unchanged and did not reduce the level of trip generation, demand for public services and infrastructure, and other such factors. Thus, from the point of view of potential growth inducement, the environmental analysis in the Draft EIR already accounts for all backfill employment at the California Campus, the only CPMC campus that would be vacated and not demolished or reused with implementation of the proposed LRDP. Please also see Responses PH-3 (page C&R 3.5-7) and PH-25 (page C&R 3.5-82) for further discussions regarding housing demand and induced employment.

Comment

(Gloria Smith—California Nurses Association, October 18, 2010)[93-93 GRO]

"**F. The DEIR Fails to Adequately Analyze the Project's Growth Inducing Impacts**

The DEIR concludes that the Project will not result in direct or indirect substantial growth inducement. The conclusion of the DEIR's 'analysis' of growth inducement is that implementing the proposed CPMC would not induce substantial population of employment growth and the growth that is generated is within growth projections and projected housing capacity. DEIR at pages 5-16 to 5-17. This conclusion is reached notwithstanding the DEIR's admission that:

- CPMC is the second largest private employer in San Francisco;
- The analysis fails to consider all growth generated by the Project (e.g., the multiplier effect on direct construction and ongoing operations jobs including induced and indirect jobs); and
- The analysis fails to consider growth at the California Campus once sold; among other considerations."

Response GRO-2

This comment states that the Draft EIR failed to address potential growth-inducement impacts related to indirect and induced employment growth and future uses at the California Campus once it is sold.

On page 5-16, the Draft EIR states that CPMC is the second largest private employer in San Francisco. The fact that CPMC is a primary employer in San Francisco and is the entity that is proposing the LRDP is an aspect of the existing conditions and is not related to growth inducement. As discussed in Draft EIR Section 4.3, "Population, Employment, and Housing," implementing the proposed CPMC LRDP would not induce substantial citywide population or employment growth. Please see Response PH-25 (page C&R 3.5-82) for discussion regarding how the LRDP is expected to have a jobs multiplier of approximately 1.35.[1] In other words, for every one new job generated by the proposed LRDP, an additional 0.35 job would be created elsewhere within San Francisco, and these additional jobs would be created as CPMC employees spend money on goods and services in the local economy. Thus, the LRDP would incrementally increase the population in San Francisco and in the Bay Area as a whole and would be within the planned growth for both San Francisco and the Bay Area as a whole. Specifically, much of the projected growth would occur as a result of the construction of the proposed hospital at the Cathedral Hill Campus, which would replace the hospitals at the Pacific and California Campuses and where approximately 60 percent of the employees at all five CPMC campuses would be relocated in 2015 (50 percent in 2030).

On page 5-16, the Draft EIR discusses the impacts of the combination of ongoing and new operational jobs and states that under the proposed LRDP, the total number of employees for all five campuses is projected to increase from approximately 6,560 full-time equivalent (FTE) personnel to approximately 8,350 FTE personnel in 2015, and to approximately 10,730 FTE personnel by 2030. This is an estimated increase of approximately 4,170 FTE personnel from 2006 to 2030, which would account for 1.6 percent of the projected increase in employment numbers for San Francisco overall during the 24-year LRDP implementation period.[2] As concluded on Draft EIR page 5-17, implementation of the proposed LRDP would not result in substantial additional development, population, and employment growth at the CPMC campuses, in the surrounding neighborhood, or citywide, and thus would not result in direct or indirect substantial growth inducement. For more information on the personnel estimates, please see the explanation of employment calculations for the proposed LRDP in Table 4.3-6 on page 4.3-6 of the Draft EIR.

The comment is correct that the Draft EIR does not specifically assess growth induced by the LRDP with respect to the multiplier effect on construction jobs. It is anticipated that construction jobs at all proposed campus sites would be filled from the existing labor force in the Bay Area, as an ample supply of construction labor exists in the Bay Area to support the project. Overall, the growth in construction-related employment is projected to be incremental as new buildings are occupied, buildings are demolished and renovated, and CPMC service demand increases. In terms of housing demand generated from construction jobs, the analysis assumed that these workers would not make decisions about long-term housing relocation based on a single job, because of the cyclical and temporary nature of the work. For additional discussion of this issue, please see Response PH-8 (page C&R 3.5-27). Therefore, replacement, renovation, expansion, and realignment of services may temporarily increase construction-related employment in San Francisco overall, but not enough to result in direct or indirect substantial growth inducement.

Contrary to the comment's statement, the EIR does take into account indirect jobs through a multiplier effect. Refer to Response GRO-1 (page C&R 3.21-1) and Response PH-24 (page C&R 3.5-81) for a discussion of potential growth at the California Campus once sold and how the EIR took indirect jobs into account.

---

[1] Economic Planning Systems, *Regional Multipliers for CPMC Economic Impacts*, Memorandum from Rebecca Benassini and Tepa Banda, EPS to Geoffrey Nelson and Alan Loving, CPMC, March 23, 2011, Table 1, page 3.

[2] Note that the employment estimates are conservative. These estimates presume all additional CMPC workers assumed to live in San Francisco would be new to San Francisco and not moving from another location of employment in San Francisco or be current San Francisco residents.

Comment

(Gloria Smith—California Nurses Association, October 18, 2010)[93-94 GRO]

"As discussed in detail above, every CEQA document must start from a 'baseline' assumption. A revised DEIR must include an analysis of the extent to which the Project could lead to growth in the area beyond the existing conditions. At a minimum, the analysis should include: a) identification of infill parcels in the Project areas that may be underutilized or vacant; and b) the potential for additional growth of secondary services to the Project (e.g., from housing to janitorial, plumbing, repairs/maintenance and other specialized support services not provided by the Project)."

Response GRO-3

The comment expresses concern regarding potential growth inducement as it relates to the baseline utilized for impact analysis. Where appropriate, the Draft EIR analyzes impacts with reference to the change from baseline conditions at the time the EIR Notice of Preparation was published. As such, the growth-inducement analysis in Section 5.5, "Direct or Indirect Economic or Population and Growth Inducement," of the Draft EIR (pages 5-16 and 5-17) assesses induced growth as any that exceeds planned growth and results from new development that would not have taken place without implementation of the proposed LRDP. Therefore, the growth-inducement analysis is similar to the transportation analysis in that it compares the future with implementation of the project against the future without implementation of the project baseline. Refer to Response TR-9 (page C&R 3.7-11) for a discussion regarding the transportation baseline. Please also see Response PH-6 (page C&R 3.5-17) for a discussion of the environmental baseline in the analysis of population, employment and housing; this response explains how the Draft EIR evaluated potential effects on housing and related demographics based on the existing conditions, using a comparison to future planned conditions as a threshold of significance.

The comment indicates that the growth-inducement analysis should identify and take every infill parcel in the project area into account. The City of San Francisco uses projections of growth generated by ABAG and other regional agencies to address cumulative population and environmental issues that are generated by incremental development and growth around the City and the region. This approach is used for such impacts as transportation, air pollutant emissions, traffic-generated noise, demand for public services and infrastructure, and the like. Alternatively, a list-based approach is used for such effects as cumulative effects on housing and visual resources and aesthetics. The use of cumulative analysis methodologies that are appropriate to specific types of analyses is consistent with CEQA. Please also see Response PH-13 (page C&R 3.5-50) for a further discussion of the methodologies used in the cumulative analysis of population, employment, and housing, as well as other environmental factors in the Draft EIR.

The comment also expresses concern regarding growth inducement in the area as it relates to the potential for growth of secondary services. Refer to Response GRO-2 (page C&R 3.21-2) for a discussion regarding potential growth associated with employment, which includes secondary services. Please also see Response PH-25 (page C&R 3.5-82) for further discussion and calculations regarding induced employment.

3.21.1.2 CATHEDRAL HILL CAMPUS

No comments pertaining to growth inducement and solely related to this campus were received during public review of the Draft EIR.

3.21.1.3 PACIFIC CAMPUS

No comments pertaining to growth inducement and solely related to this campus were received during public review of the Draft EIR.

3.21.1.4 CALIFORNIA CAMPUS

No comments pertaining to growth inducement and solely related to this campus were received during public review of the Draft EIR.

3.21.1.5 DAVIES CAMPUS

No comments pertaining to growth inducement and solely related to this campus were received during public review of the Draft EIR.

3.21.1.6 ST. LUKE'S CAMPUS

No comments pertaining to growth inducement and solely related to this campus were received during public review of the Draft EIR.

3.22 ALTERNATIVES

3.22.1 ALTERNATIVE 3A AND "ALTERNATIVE 3A PLUS" (I.E., DIFFERENT MIX OF SERVICES AT ST. LUKE'S OR ADDITIONAL ANALYSIS)

Comments

(Evy Pearce, September 13, 2010) [10-2 ALT3A, duplicate comments were provided in 12-2 ALT3A, 16-2 ALT3A, and 46-2 ALT3A]

"In particular, CPMC's dismissal of Alternative 3A, the environmentally preferred alternative (pages 6-263 to 6-349, volume 4, DEIR) is based on fallacious arguments, and fails to consider the disadvantages to San Francisco of a too small St. Luke's facility."

(Jane Seleznow, October 8, 2010) [48-1 ALT3A]

"I offer these comments regarding the California Pacific Medical Center's (CPMC) Draft EIR. I believe that **Alternative 3A** (pages 6-263 to 6-349, volume 4, DEIR) is the best environmentally preferred alternative and feel that CPMC's dismissal of **Alternative 3A** is based on fallacious arguments. It fails to consider the disadvantages to San Francisco of an inadequate St. Luke's facility. I urge you to carefully review CPMC's assertions with unbiased experts in the field of hospital management and health care outcomes, rather than merely accepting CPMC's assertions."

(Ted Weber, Jr., October 12, 2010) [52-3 ALT3A]

"CMPC has summarily dismissed the Planning Department's suggested Alternative 3A which the Department has identified as an 'environmentally superior alternative'. This alternative would not only provide a more rational distribution of health services throughout the city. It would also result in reducing the height of the Cathedral Hill project to comply with current zoning requirements and it would reduce many of the other negative environmental impacts to the neighborhood."

(Merle Easton, October 18, 2010) [66-2 ALT3A, duplicate comment was provided 73-2 ALT3A]

"The EIR discusses Alternate 3A, which reduces the Cathedral Hill hospital building by a third and increases the size at St. Luke's by adding the children's clinics. This will reduce the number of cars and trucks by a third. The families and children would not be crossing the dangerous streets. The EIR indicates that this is the environmentally preferred option but then goes on to say that it is rejected by CPMC.

I believe that Alternative 3A is the best way to go. I urge the City to require CPMC to redesign the plan to stay within the existing zoning restrictions."

(Donald Scherl, October 18, 2010) [74-3 ALT3A]

"3.0 Alternatives Considered: The summary at pages S30-35 would appear to make clear the superiority of Alternative 3A to other alternatives and to the LRDP.

3.1 3A, as noted in the draft EIR, is the 'environmentally superior alternative' other than the Alternatives 1 A & 1 B which are not feasible. Alternative 3A would accomplish a lot:

3.1.1: it would bring to St. Luke's a viable hospital complex in contrast to the construction of a free-standing 80 bed hospital which would make no sense in today's medical/hospital world. The notion of a free-standing Children's Hospital or of a free-standing Women's and Children's hospital is one repeated all around the country. In this instance, there would also be an acute care hospital adjacent. In fact, the Children's Hospital generally considered the best in the country, the Harvard affiliated Children's Hospital in Boston is free standing.

3.1.2: As noted in the summary, 3A would reduce (to a variable extent) some of the undesirable consequences were the LRDP as proposed be implemented with all the disruptions it would cause at Cathedral Hill. As stated in the draft EIR, under this alternative, '... there would be fewer ["significant and unavoidable"] impacts at Cathedral Hill Campus and its immediate vicinity, including with respect to construction, traffic and transit compared to the LRDP.' The impacts at the St. Luke's campus would be slightly greater, but not significantly so.

3.1.3: While the summary indicates this alternative '... would not meet all of the project objectives,' it is unclear what objectives would not be met other than having the Women's and Children's Hospital be part of the Cathedral Hill Campus as currently proposed. It need not be part of the Cathedral Hill hospital from a medical/functional point of view. Indeed, the added ground space at St. Luke's would be an attractive benefit for the Women's and Children's Hospital."

(Donald Scherl, October 18, 2010) [74-27 ALT3A]

"What mitigation is actually possible? Were the project allowed to proceed, which I do not believe it should, then the only real mitigation is to reduce the size of the project at Cathedral Hill as proposed in alternative 3A (without any implication this alternative is itself acceptable. It is simply the best of the alternatives presented)."

(Donald Scherl, October 18, 2010) [74-37 ALT3A]

"7.6: 3A: Were the Planning Commission to accept the construction of a hospital at the Cathedral Hill site, alternative 3A is the preferred option. While it eliminates none of the downsides of the project from a neighborhood point of view, it would reduce virtually all the negatives a small amount and further, would create a viable medical entity at the St. Luke's site, large enough to serve as a real hospital."

(Charles Freas, October 19, 2010) [79-5 ALT3A, duplicate comment was provided in 100-5 ALT3A)]

"The EIR discusses Alternate 3A which reduces the Cathedral Hill building by a third and increases the size at St. Luke's. This will reduce the number of cars and trucks by 1/3. The EIR indicates that this is the environmentally preferred option but then goes on to say that it is rejected by CPMC.

I believe that Alternative 3A is an effective solution. I would urge the City to require CPMC to redesign the project to stay within the existing zoning restrictions and to effectively mitigate those most challenging outcomes."

(Barbara Kautz—CHNA and Bernal Heights Neighborhood Center, October 19, 2010) [87-4 ALT, duplicate comment was provided in 108-4 ALT]

"The DEIR contains no substantial evidence to support its findings that the environmentally superior alternatives to CPMC's project are infeasible, or fail to comply with project objectives."

(Barbara Kautz—CHNA and Bernal Heights Neighborhood Center, October 19, 2010) [87-12 ALT3A, duplicate comment was provided in 108-12 ALT 3A]

<u>"B. No Substantial Evidence is Provided to Support the DEIR's Conclusions that the Environmentally Superior Alternative, Alternative 3A, Does Not Meet Project Objectives.</u>

Alternative 3A is identified in the DEIR as the environmentally superior alternative. As proposed, it would relocate Women's and Children's Services to St. Luke's. The DEIR concludes (pages. 6-399 - 6-400) that Alternative 3A does not meet project objectives because, if Women's and Children's Services are relocated, the project:

- Will not provide 'the most high-quality, cost-effective, and efficient patient care.'
- Will not 'efficiently consolidat[e] specialized services.'
- Will not be 'appropriately located.'
- Will not rebuild St. Luke's as a 'community hospital' (i.e., St. Luke's will be larger than CPMC wants).

- Will not 'optimize patient safety and clinical outcomes.'
- Will not 'minimize redundancies.'

The rejection of Alternative 3A can be summarized as: unless the Cathedral Hill Hospital is as large as proposed in the Long Range Plan, and St. Luke's is as small as proposed in the Long Range Plan, project objectives are not met. Yet no evidence is included in the DEIR to demonstrate that the combination of a 555-bed hospital and an 80-bed hospital would maximize patient outcomes; improve quality of care; provide greater patient access; be more centrally located; provide greater efficiencies; or achieve other benefits to a greater extent than the combination of a 400-bed hospital at Cathedral Hill and a 240-bed hospital at St Luke's. Although the DEIR repeatedly states that the Cathedral Hill campus is more 'centrally located' and 'more accessible,' no data is provided to support these contentions."

(Barbara Kautz—CHNA and Bernal Heights Neighborhood Center, October 19, 2010) [87-14 ALT3A, duplicate comment was provided in 108-14 ALT3A]

"In addition, the constrained nature of the project objectives analyzed in the DEIR eliminates all consideration of equitable provision of health services. If added to the project objectives, Alternative 3A would be far more consistent with the project objectives than the proposed Long Range Plan.

Under the CEQA Guidelines, '[s]ubstantial evidence shall include facts, reasonable assumptions predicated upon facts, and expert opinion supported by facts.' (§ IS3S4(b)) The conclusions regarding the feasibility of Alternative 3A in the DEIR are 'at best. . . an irrelevant generalization, too vague and nonspecific to amount to substantial evidence of anything.' (*See Lucas Valley Homeowners Assn. v. County of Marin* (1991) 233 Cal.App.3d 130, 157.)"

(Gloria Smith—California Nurses Association, October 19, 2010) [90-34 ALT3A]

"The DEIR concluded that alternative 3A would be the environmentally superior alternative. This alternative entails a larger St. Luke's Hospital and smaller Cathedral Hill Hospital. However, the DEIR designed a bigger St. Luke's Hospital around a relocated women's and children's program. As Mr. Lighty explained in his attached letter, this creates an alternative that is not supportable because it would shift most women's and children's services to the southern half of the City (CPMC and U.C.S.F. Mission Bay). CNA supports the environmentally superior alternative of a larger St. Luke's, but with a different complement of services. Instead of shifting all of women's and children's services to St. Luke's, CPMC can easily centralize other services already planned at St. Luke's Hospital. CPMC currently plans to offer some level of cardiology, oncology, orthopedics, gastroenterology, respiratory, and urology at St. Luke's Hospital and to duplicate every single one of these services at Cathedral Hill Hospital with a higher standard of care for insured patients. Instead, CPMC could centralize some combination of these services for all CPMC patients at St. Luke's Hospital.[18]

[18] Camden Group Utilization Project Report at page 22."

(Emily Lee, September 23, 2010) [PC-291 ALT3A]

"Good afternoon, Commissioners. My name is Emily Lee. I'm a community organizer at the Chinese Progressive Association. We work with low income Chinese immigrant folks in San Francisco, many of whom do not have access to affordable healthcare. Our community supports the superior alternative of having a bigger St. Luke's hospital in southeast San Francisco, with a smaller Cathedral Hill Hospital. We believe that the Draft EIR is incomplete and failing to adequately analyze the healthcare implications of rejecting this alternative and having a larger St. Luke's."

(Kevin Kitchingham, September 23, 2010) [PC-305 ALT3A]

"Instead of engaging in honest, open discussion about alternative 3A which is a good start—it is a good start—they reject it because profit is what's most important."

(Marlayne Morgan—Cathedral Hill Neighbors Association, September 21, 2010) [15-2 ALT3A, duplicate comment was provided in 39-2 ALT3A]

"The DEIR does conclude that **Alternative 3A is the environmentally preferred alternative** (pages 6- 263 to 6-349, volume 4, DEIR) to the CPMC proposal to build an unsafe 555 bed hospital on Cathedral Hill and an 86 bed unsustainable hospital at the St. Luke's site. We support the concept outlined in **Alternative 3A** of distributing beds and services more equally between the proposed Cathedral Hill and and St. Luke's sites, **PLUS** we urge additional study and recommendations on the appropriate placement of medical specialties on each site."

(Marlayne Morgan—Cathedral Hill Neighbors Association, September 21, 2010) [15-4 ALT3A, duplicate comment was provided in 39-4 ALT3A]

Alternative 3A PLUS would reduce these impacts on health and the environment by:

- Redistributing services between St. Luke's and Cathedral Hill to create two approximately equal-sized hospitals. **Alternative 3A** would relocate 160 beds from the California Campus to the St. Luke's campus, creating two sustainable hospitals;
- Alternative **3A** limits development on Cathedral Hill to that permitted by the City's current height restrictions;
- **And** reduces impacts on Muni operations (now at capacity), traffic congestion, overflow neighborhood parking, decreases in pedestrian and bicycle access and walkability in the neighborhood, accessibility to emergency vehicles, accessibility in a disaster;
- **And** reduces effects of massive increase in building height, including shadows, wind, views and urban design;
- **And** reduces the effects of a 'Pill Hill' on local-serving businesses and neighborhood character, conversion of the area to a medical monoculture while improving the long-term viability of existing businesses, residences, churches and community facilities;
- **And** reduces noise caused by emergency sirens, traffic, construction, loading dock and mechanical equipment;
- **And** reduces construction impacts: dust, noise, vibrations, truck deliveries and effects of excavations.

Therefore, we urge the Planning Commission to support **Alternative 3A (PLUS additional mitigations) as the most viable alternative** to the proposed CPMC LRDP, which would significantly reduce the devastating impacts on our central city communities."

(Unitarian Universalist CPMC Task Force, October 5, 2010) [44-13 ALT3A]

"At this point, we ask that the Draft Environmental Impact Report be considered a work in progress due to errors and inadequate mitigations. There need to be additional and stronger mitigations along with further review of Alternative 3A, perhaps including studying additional alternatives."

(Madlyn Stein—Seniors of Cathedral Hill, October 5, 2010) [45-3 ALT]

"-decrease the number of beds at the Van Ness site"

(Madlyn Stein—Seniors of Cathedral Hill, October 5, 2010) [45-4 ALT]

"-increase the number of beds at the St Lukes site"

(Nancy Evans, October 14, 2010) [54-2 ALT3A]

"The Draft Environment Impact Report presents a formidable list of unresolved problems—and even then there are areas that are only touched lightly. However, it does appear that option 3A, with additional mitigations, comes closest to providing a sensible approach to development. It also provides the city and Sutter Health with TWO

seismically safe structures, allowing twice the number of people to access care in the event of a disaster that made walking or driving difficult."

(Trudy Lionel, October 15, 2010) [60-2 ALT3A]

"I support Alternative 3A to:

1) distribute healthcare throughout the city, especially where it is desparately needed in the southern portions, and to

2) reduce the height of the new hospital to within the current zoning height limit of 130 feet.

Please require the Draft Environmental Impact Report to be improved and to consider the above concerns."

(Paul Wermer—CPMC Neighbors Coalition and Pacific Heights Residents, October 18, 2010) [67-2 ALT3A]

"SUMMARY OF KEY POINTS:

- We support a more detailed investigation of an expanded 3A project alternative (3A Plus)"

(Paul Wermer—CPMC Neighbors Coalition and Pacific Heights Residents, October 18, 2010) [67-8 ALT3A]

"e) We concur with other groups calling for '3A plus'—an updated Alternative 3A developed with community input."

(Hossein Sepas, October 19, 2010) [82-2 ALT3A, duplicate comments were provided in 83-1 ALT3A and 107-1 ALT3A]

"Alternate 3A of the DEIR, concludes that the *'least amount of negative environmental impact'* would come from *'reducing'* the size of the Cathedral Hill project to 400 beds and *increasing* the size of the St. Luke's Hospital in the Mission by 160 beds. Please have them go in that direction and submit a plan which explores and improves upon that idea."

(Alex Tom—Chinese Progressive Association, October 19, 2010) [84-3 ALT3A]

"2. **Alternative 3A as a starting point**. Our community supports the environmentally superior alternative of a larger St. Luke's Hospital with a variety of services and a smaller Cathedral Hill Hospital. The Draft EIR is incomplete in failing to adequately analyze the health care implications of rejecting an environmentally superior alternative. CPMC's dismissal of Alternative 3A fails to consider the disadvantages to San Francisco of a St. Luke's facility that is too small to be viable.

Additionally, we believe that Alternative 3A is a good start because it shifts 160 beds and a significant core of services to St. Luke's Hospital, but it does not go far enough in creating equitable distribution of services for communities living in south east San Francisco. While Alternative 3A distributes some services to St. Luke's, we want to see CPMC commit to anchoring a variety of services at St. Luke's to ensure long term viability and investment."

(Barbara Kautz—CHNA and Bernal Heights Neighborhood Center, October 19, 2010) [87-15 ALT3A, duplicate comment was provided in 108-15 ALT3A]

"C. Modifications to Alternative 3A Consistent with the Recommendations of the Blue Ribbon Panel Should Be Reviewed in the FEIR

Alternative 3A, as proposed, relocated the Women's and Children's Center to St. Luke's. The Blue Ribbon Panel, however, which completed its study in 2008, recommended that a different mix of services be located at St. Luke's, including:

- Center of Excellence in gynecology and low-intervention obstetrics
- Medical/Surgical Services (e.g., cardiology, respiratory)
- Emergency Department
- ICU
- Urgent Care
- Pediatrics
- Center of Excellence in Senior Health Care (e.g., orthopedics, diabetology, oncology, rehab)
- Skilled Nursing beds to serve orthopedics, Senior Health, and Med/Surg

Alternative 3A is environmentally superior primarily because the number of licensed beds is reduced at the proposed Cathedral Hill Hospital and is increased at St. Luke's. It is also environmentally superior because it will provide substantial benefits to the public by distributing services more equitably and making more services available in underserved neighborhoods. However, these benefits can be obtained with a different distribution of services than proposed in Alternative 3A. If the DEIR concludes that relocating the Women's and Children's Center to St. Luke's may not meet the constrained and limited project objectives listed in the DEIR, then an alternative must be proposed that both reduces environmental impacts and meets project objectives, so that the examination of alternatives is not an empty exercise. One alternative may be to provide services at St. Luke's that are consistent with the recommendations of the Blue Ribbon Panel. (A broader list of project objectives may well demonstrate that Alternative 3A better meets those objectives than the proposed Long Range Plan.)"

(Gloria Smith—California Nurses Association) [90-33 ALT3A]

"In terms of reducing traffic congestion and to better serve the community, CPMC should spread the proposed development to several other campuses including to the St. Luke's Campus rather than concentrating services at the Cathedral Hill Campus. Access to and from St. Luke's Campus is closer to Highway 101 for vehicles and to major transit facilities such as the 24th Street BART Station for transit patrons. Moreover, the St. Luke's Campus is the most accessible CPMC facility for those Sutter patients traveling from San Mateo and Santa Clara counties. From a transportation perspective, a Project alternative that distributes patients and services equally across the City should be evaluated in a revised EIR."

(Gloria Smith—California Nurses Association, October 19, 2010) [90-35 ALT3A]

"In contrast to the proposed project, a smaller Cathedral Hill Hospital and a larger St. Luke's Hospital would be by far preferable in terms of health care and would also considerably reduce some of these environmental impacts. We support the environmentally superior alternative of a larger St. Luke's Hospital with a clinical anchor and a smaller Cathedral Hill Hospital."

(Gloria Smith—California Nurses Association, October 19, 2010) [92-5 ALT3A]

"To reduce these impacts and better serve the community, CPMC should spread the proposed development to several other campuses including to the St. Luke's Campus rather than concentrating services at the Cathedral Hill Campus. Access to and from St. Luke's Campus is closer to Highway 101 for vehicles and to major transit facilities such as the 24th Street BART Station for transit patrons. Moreover, the St. Luke's Campus is the most accessible CPMC facility for those Sutter patients traveling from San Mateo and Santa Clara counties."

(Gloria Smith—California Nurses Association, October 20, 2010) [96-38 ALT3A, duplicate comment was provided in 110-38 ALT3A]

"The Draft EIR concludes that the environmentally superior alternative is alternative 3A, which is a bigger St. Luke's Hospital and smaller Cathedral Hill Hospital. However, the Draft EIR designs a bigger St. Luke's Hospital around a relocated women's and children's program. This creates an alternative that is not supportable because it would shift most women's and children's services to the southern half of the City (CPMC, University of California at Mission Bay, SF General). CNA supports the environmentally superior alternative of a bigger St. Luke's, but with a different complement of services. Instead of all of women's and children's services being

moved, CPMC can easily centralize other services already planned at St. Luke's Hospital. CPMC currently plans to offer some level of cardiology, oncology, orthopedics, gastroenterology, respiratory, and urology at St. Luke's Hospital and to duplicate every single one of these services at Cathedral Hill Hospital with a higher standard of care for insured patients. Instead, CPMC could centralize some combination of these services for all CPMC patients at St. Luke's Hospital.[35]

In contrast to the proposed project, a smaller Cathedral Hill Hospital and a larger St. Luke's Hospital would be by far preferable in terms of health care and would also considerably reduce environmental impacts. We support the environmentally superior alternative of a larger St. Luke's Hospital with a clinical anchor and a smaller Cathedral Hill Hospital.

I recommend that the City require a revision of the Draft EIR that adequately discusses and mitigates these issues.

[35] Camden Group Utilization Project Report at page 22."

(Margaret Kettunen Zegart, October 20, 2010) [97-3 ALT3A]

"For the family and medically underserved in the Tenderloin, South of Market, BayView-Hunters Point (increasing its residents), Potrero Hill, Visitation Valley, the Mission etc. demographic areas of San Francisco, would be best served by **the revised larger 3A St. Lukes Hospital**."

(Margaret Kettunen Zegart, October 20, 2010) [97-14 ALT3A]

"**DEIR'S environmental choice of alternative 3A, focus to serve women and children, should have a complete EIR assessment**. (Financial gains for Sutter Health (should not be basis for retaining massive Cathedral Hill development with related offices)."

(Paulett Taggart—Paulett Taggart Architects, October 19, 2010) [106-2 ALT3A]

"I do believe there is a better option presented in the EIR, and that is Alternative 3A. Alternative 3A helps distribute healthcare throughout the City while significantly reducing some of the negative environmental impacts on Cathedral Hill. Alternative 3A reduces the height of the new hospital on Cathedral Hill, keeping the height within the current zoning height limit of 130 feet. This reduction in height decreases the negative effects of increased wind and shadow in the area. Alternative 3A is the environmentally superior solution; it reduces many negative environmental impacts on Cathedral Hill including hazardous waste, traffic with its related pedestrian safety issues, other noise intrusions, and air quality.

At this point, we ask that the Draft Environmental Impact Report be considered a work in progress. There need to be additional and stronger mitigations along with further review of Alternative 3A.

Thank you."

(Gloria Smith—California Nurses Association, March 8, 2011) [121-1 ALT3A]

At your request, I am providing additional comments on the Transportation and Circulation Section of the Draft Environmental Impact Report (Draft EIR) for the California Pacific Medical Center (CPMC) Long Range Development Plan (LRDP Project) which was published by the San Francisco Planning Department in July 2010. My prior comments, submitted on October 18, 2010, focused on an analysis of Section 4.5 of the Draft EIR which deals with transportation and circulation impacts associated with buildout under the proposed LRDP Project. These additional comments analyze transportation and circulation impacts of the LRDP Project for the Cathedral Hill and the S1. Luke's Campuses compared to those that would be associated with Alternative 3A.

These comments do not necessarily endorse all aspects of Alternative 3A. Instead, approval of Cathedral Hill and St. Luke's hospitals roughly the size of those described in Alternative 3A would significantly reduce the overall Project-related traffic impacts described in my October 18, 2010 letter.

As described in Section 6 of the Draft EIR, the size of the proposed Cathedral Hill Hospital and associated parking would be reduced under Alternative 3 compared to full buildout under the LRDP because the Women's and Children's Center would be relocated to the St. Luke's Campus. Under Alternative 3A, the Cathedral Hill Campus would provide a total of 400 beds and the St. Luke's Campus would provide 240 beds including the 160 beds for the relocated Women's and Children's Center. Significantly, this alternative reduces traffic congestion City-wide because two more equally sized hospitals would distribute services among two campuses instead of concentrating much of CPMC's resources at one site.

Page 6-403 of the Draft EIR concludes that "Alternative 3A would be the environmentally superior alternative other than the No Project Alternative." I concur with the Draft EIR's conclusion that "Alternative 3A would reduce some of the significant and unavoidable impacts on transportation and circulation identified under the proposed LRDP" and that buildout under Alternative 3A would not result in any additional transportation and circulation impacts near the St. Luke's Campus. As such, Alternative 3A is the preferred alternative for transportation and circulation.

Transportation and Circulation Impact Comparison between Alternative 3A and the LRDP Project

According to Section 6 of the Draft EIR, Alternative 3A would cause no additional significant impacts regarding transportation and circulation. Instead, it listed the following **benefits** for Alternative 3A compared to buildout under the LRDP:

Traffic Impacts

– Reduces development at the Cathedral Hill Campus in Years 2015 and 2030, thereby eliminating the significant unavoidable traffic impacts at Van Ness Avenue at Market Street.

– Avoids construction of the Two-Way Post Street Variant and the Medical Office Building (MOB) Access Variant, thereby eliminating significant unavoidable impacts at Van Ness Avenue at Market Street, Polk Street at Geary Street, and Franklin Street at Bush Street.

– Reduces vehicle delays at other intersections near Cathedral Hill Campus.

Transit Impacts

– Adds 314 fewer AM and 258 fewer PM peak hour transit trips, about half of the net-new transit trips forecast for the LRDP Project.

– Decreases demand for the CPMC shuttle service with reduced development.

– Reduces impacts to Muni transit services with reduced development.

Pedestrian Impacts

– Eliminates the significant and unavoidable pedestrian conflict impact under the LRDP Project MOB Access Variant at the proposed Cathedral Hill MOB driveway on Geary Street.

– Adds 369 fewer AM and 303 fewer PM peak hour pedestrian trips, about half of the net-new pedestrian trips forecast for the LRDP Project.

Construction Impacts

– Shortens the construction duration because of the reduced size of the Cathedral Hill Hospital under Alternative 3A.

Parking Impacts •

– Eliminates peak-period queues and spillbacks from traffic entering parking garages that would block traffic lanes on adjacent streets at the entrances to the three parking garages at the Cathedral Hill Campus.

Clearly, a number of the significant transportation and circulation impacts that would occur under the LRDP can be avoided with implementation of Alternative 3A without incurring penalties elsewhere. Six significant and unavoidable traffic impacts at three intersections in the vicinity of the Cathedral Hill Campus would be eliminated. Also, the significant and unavoidable pedestrian conflict impact at the Cathedral Hill MOB driveway on Geary Street would be avoided under Alternative 3A because the MOB Access Variant would not be required. At the same time, the corresponding increase of 160 beds at the St. Luke's Campus would not result in any additional significant unavoidable traffic impacts. In other words, Alternative 3A, which would relocate the Women's and Children's Center from Cathedral Hill Campus to St. Luke's Campus, is by far the environmentally superior alternative with respect to traffic and circulation.

(Gloria Smith—California Nurses Association, March 8, 2011) [121-4 ALT]

My prior analysis recommended spreading the proposed development to several other campuses including to the St. Luke's Campus rather than concentrating services at the Cathedral Hill Campus. Access to and from St. Luke's is closer to Highway 101 for vehicles and to major transit facilities such as the 24th Street BART Station for transit patrons. Moreover, the St. Luke's Campus is the most accessible CPMC facility for those Sutter patients traveling from San Mateo and Santa Clara counties. In my opinion, the City could eliminate all significant, Project-related traffic impacts near the Cathedral Hill Campus. With proper planning, the Cathedral Hill Campus could generate the same number of PM peak hour vehicle trips as that of the former hotel and office uses, thus avoiding the LRDP Project's projection of generating three times more PM peak hour vehicle trips than these former uses. For this to occur, the City would approve a new Cathedral Hill hospital one third the size of that proposed in the LRDP. In addition, my analysis indicates reducing development at the Cathedral Hill Campus by two thirds would also eliminate the significant transit impacts that will occur with the LRDP Project. A size reduction on this order would eliminate many of the traffic-related safety concerns expressed here and by others commenting on the Draft EIR. From a transportation perspective, CPMC should spread the proposed LRDP development away from the Cathedral Hill Campus to several other CPMC facilities including the St. Luke's Campus. In my opinion, this would better serve the entire City and could be accomplished in a manner that would minimize any significant transportation impacts near other campuses. A Project alternative that distributes patients and services more equally across the City should be evaluated in a revised EIR.

(Gloria Smith—California Nurses Association, March 8, 2011) [122-1 ALT3A]

This letter provides additional comments on the land use aspects of the California Pacific Medical Center (CPMC) Long Range Development Plan (LRDP) published by the San Francisco Planning Department in July 2010. My prior comments, submitted on October 18, 2010, focused on land use impacts associated with the entire CPMC DEIR. These additional comments analyze the LRDP's land use impacts for the Cathedral Hill and the St. Luke's Campuses compared to those that would be associated with Alternative 3A. As shown below, the DEIR's Alternative 3A is not only the environmentally superior alternative; it is the only alternative that can conform to the City's existing planning framework. Specifically, the overarching planning principles under the City's Proposition M in combination with the San Francisco General Plan support a shift of beds to St. Luke's and making it a clinical anchor, while reducing the size of the Cathedral Hill campus. Table 1 at the end of this letter summarizes the impact and policy reasons supporting such an alternative.

(Gloria Smith—California Nurses Association, March 8, 2011) [122-8 ALT]

Feasible Solution for Traffic and Housing Issues and Impacts

The City has a viable means of avoiding the above described land use impacts as well as reconciling some of the major policy inconsistencies. By simply shifting beds and services from Cathedral Hill to the St. Luke's campus, the City could create two equitably sized campuses that would greatly eliminate traffic and land use conflicts.

Under the DEIR's preferred alternative, the Van Ness Corridor will be subject to significant and avoidable traffic and housing related impacts. Many intersections along the Corridor in the vicinity of the proposed Project already operate at LOS F in peak hours and under existing conditions and the number will significantly increase in future years. Moreover, regional trips and associated air quality impacts will result from shifting the current population from the community accessible St. Luke's to the Cathedral Hill campus. Contrary to City policy, the Cathedral Hill campus will result in direct impacts to housing by requiring the demolition of five dwelling units and 20 residential hotels on MOB site. In addition, the Cathedral Hill MOB will result in the loss of "future" housing units which are currently required under existing plans and zoning requirements. The loss of housing presents both environmental impacts and policy inconsistencies. Downsizing the Cathedral Hill campus and shifting beds and services to the St. Luke's campus will result in less severe transportation impacts to the Van Ness Corridor and, depending on the configuration of the downsized campus, could also result in fewer housing impacts. The St. Luke's campus already has close access to and from Highway 101 for vehicles, and to easy access to BART, making it the most accessible campus for regional patients. A smaller Cathedral Hill campus and larger St. Luke's is a feasible solution for both housing and traffic impacts associated with the proposed Cathedral Hill campus.

(Gloria Smith—California Nurses Association, March 8, 2011) [122-9 ALT3A]

The DEIR's Alternative 3A is not only the environmentally superior alternative; it is the only alternative that can conform to the City's existing planning framework. The Cathedral Hill campus requires a major departure from the planning vision for the Van Ness Corridor; a departure that will impact existing and future uses and result in irreconcilable inconsistencies in planning policies and codes. The overarching planning principles under the City's Proposition M in combination with the San Francisco General Plan support a shift of beds to St. Luke's and making it a clinical anchor, while reducing the size of the Cathedral Hill campus.

(Bertie Campbell, September 23, 2010) [PC-13 ALT3A]

"Good afternoon, Commissioners. My name is Bertie Campbell. I am Vice President of the Cathedral Hill Neighborhood Association. I live on Cathedral Hill and have for 10 years. I am reading a letter on behalf of our organization and I have copies for each of you, as well. 'The DEIR does conclude that Alternative 3A is the environmentally preferred alternative to the CPMC proposal to build an unsafe 555-bed hospital on Cathedral Hill and an 86-bed unsustainable hospital at the St. Luke's site. We support the concept outlined in Alternative 3A of distributing beds and services more equally between the proposed Cathedral Hill and St. Luke's sites.'"

(Bertie Campbell, September 23, 2010) [PC-15 ALT3A]

"Alternative 3A+ would reduce these impacts on health and environment by redistributing services between St. Luke's and Cathedral Hill to create two approximately equal size hospitals. Alternative 3A would locate 160 beds from the California campus to the St. Luke's campus, creating two sustainable hospitals."

(Bertie Campbell, September 23, 2010) [PC-16 ALT3A]

"Alternative 3A limits development on Cathedral Hill to that permitted by the City's current height restrictions. 3A reduces impacts on Muni operations now at capacity, traffic congestion, overflow neighborhood parking, decreases in pedestrian and bicycle access and walkability in the neighborhood, accessibility to emergency vehicles, accessibility in a disaster. 3A reduces the effects of massive increase in building height, including shadows, wind, views and urban design. 3A reduces the effects of a Pill Hill on local serving businesses and neighborhood character. Conversion of the area to a medical monoculture, while improving the long term viability of existing businesses, residences, churches, and community facilities. 3A reduces noise caused by emergency sirens, traffic, construction, loading dock, and mechanical equipment. 3A reduces construction impacts, dust, noise, vibrations, truck deliveries, and the effects of evacuations—or excavations, sorry about that. Therefore, we

urge the Planning Commission to support Alternative 3A plus additional mitigations as the most viable alternative to the proposed CPMC LRDP which would significantly reduce the devastating impacts on our central City communities. Thank you very much for your time."

(Joseph Snooke, September 23, 2010) [PC-253 ALT3A]

"So, what we are asking is that the EIR study the alternative, or an alternative to what is presented as Alternative 3A. The reason is that there was a demand of the community that St. Luke's stay open and what we're seeing is that there are signs that there's going to be a continued dismantling of the charity care and of the commitment to the Southeast neighborhoods and the care that is necessary in those neighborhoods by CPMC. What Alternative 3A does is it shifts services and beds from other campuses to, instead of everything going to the in-patient facility on Cathedral Hill, that some of those beds be shifted to St. Luke's. What we don't like is that it is just women's and children's services. Those women and children's services, as the previous speaker was leading to, those services need to be dispersed, a lot of those services need to be dispersed throughout the neighborhoods of San Francisco, and what we want to see is not just a dispersing of services that are equitable and accessible in different communities throughout the City, but also there be some anchor that is more than just an emergency department and women and children's services at St. Luke's, there needs to be something..."

Response ALT-1

Numerous comments have requested that the CPMC LRDP Draft EIR be revised to include an analysis of "Alternative 3A Plus," or of a modified Alternative 3A or Alternative 3A with a different mix of services. The following is a summary of the substantive comments, which are addressed in subsections below.

Comments Summary

- The Draft EIR should include further review of Alternative 3A and did not adequately analyze this alternative.
- Another alternative, Alternative 3A "with additional mitigations" and/or a different mix of services at the Cathedral Hill, St. Luke's, and other CPMC campuses, should be evaluated as "Alternative 3A Plus".
- Services can be centralized at the St. Luke's Campus, which would be more accessible and closer to freeways and transit facilities, compared to the Cathedral Hill Campus and to patients traveling from outside of San Francisco.
- The Draft EIR dismisses Alternative 3A and does not consider the disadvantage of a St. Luke's facility that would be too small (under the proposed LRDP) to be viable and would not have a variety of services that would ensure long term viability. The comments also state that the Draft EIR does not provide evidence to demonstrate how the proposed LRDP would achieve greater access and other benefits than Alternative 3A.
- Alternative 3A would reduce impacts at the Cathedral Hill Campus compared to the proposed LRDP, and impacts at the St. Luke's Campus would be slightly greater.
- Clarify the project objectives that would not be met, other than having the Women's and Children's Hospital be part of the Cathedral Hill Campus under Alternative 3A. The project objectives in the Draft EIR eliminate all consideration of equitable provision of health services.
- Alternative 3A would shift most women's and children's services to the southern half of the City. Some comments suggest that these services need to be dispersed throughout the neighborhoods of

San Francisco and need more of an anchor than just an emergency department and women's and children's services at St. Luke's.

- Underserved areas would be best served by a larger St. Luke's Hospital under Alternative 3A.

Requests for Additional Alternative 3A Analysis or "Alternative 3A Plus"

Several comments state that the Draft EIR should include further review of Alternative 3A and did not adequately analyze this alternative. Several comments state that another alternative, Alternative 3A "with additional mitigations" and/or a different mix of services at the Cathedral Hill, St. Luke's, and other CPMC campuses, should be evaluated as "Alternative 3A Plus."

The environmental effects associated with the construction and operations of the proposed LRDP and alternatives have been analyzed for all topic areas in the Draft EIR. A range of alternatives is presented in Chapter 6 of the Draft EIR, pursuant to Section 15126.6 of the State CEQA Guidelines. As stated in the Draft EIR, page 6-1, "Section 15126.6(a) of the State CEQA Guidelines requires analysis of a range of reasonable alternatives to the project, or to the project's location, that would feasibly attain most of the project's basic objectives, but would avoid or substantially lessen any of its significant effects." Impacts of Alternative 3A are evaluated in the Draft EIR, pages 6-299 to 6-351. The analysis identifies potentially significant impacts and appropriate mitigation measures for this alternative, as applicable, and compares the alternatives to the proposed LRDP.

Other comments state that Alternative 3A would reduce impacts at the proposed Cathedral Hill Campus and impacts at the St. Luke's Campus would be slightly greater, compared to the proposed LRDP. These comments are addressed in the Draft EIR, pages 6-402, and 6-324 to 6-351.

In response to comments stating that "Alternative 3A Plus" would reduce the environmental impacts related to aesthetics, hazardous waste, transportation and circulation, pedestrian safety issues, wind and shadow, operational noise, and air quality at the Cathedral Hill Campus, the commenters are referred to the discussion in the Draft EIR, at pages 6-299 through 6-324. Alternative 3A reduces identified impacts relative to the LRDP but it is not clear or anticipated that "Alternative 3A Plus," with a similar amount of development at the Cathedral Hill and St. Luke's Campuses as Alternative A but a different mix of services, would result in any further substantial reductions in the LRDP impacts, "Alternative 3A Plus" does not need to be analyzed as a new alternative in the EIR. Please refer to Response PH-21 (page C&R 3.5-73) in response to the comments stating that the Cathedral Hill Campus would result in a creation of a medical monoculture in the business community around that campus.

Dismissal of/Feasibility Determination Regarding Alternative 3A

A number of comments expressed general support for Alternative 3A and suggested that this alternative was dismissed or rejected in the Draft EIR even though it was identified as the environmentally superior alternative. The Draft EIR concluded in Section 6.9.2 on page 6-403 that Alternative 3A would be the environmentally superior alternative other than the No Project Alternatives (Alternative 1A or 1B), as required by Section 15126.6(e)(2) of the State CEQA Guidelines. The Draft EIR does not reflect that the City has dismissed Alternative 3A. The decision-makers may select one of the alternatives presented in the document if determined feasible, or may approve, modify, or disapprove the project as proposed.

The Draft EIR also does not make conclusions regarding the feasibility of Alternative 3A. Rather than a rejection of Alternative 3A, as suggested by the comments, the Draft EIR includes an evaluation of the relative environmental effects of this alternative, compared to the proposed LRDP, and a discussion (on pages 6-399 to 6-400) of the degree to which Alternative 3A meets the stated objectives of the project. Such a discussion is required under CEQA pursuant to Section 15126.6(a).

CEQA requires that the EIR include an evaluation of the environmental consequences of the alternative, compared to those of the proposed LRDP, and a comparison of the degree of attainment of the stated project sponsor's objectives. As such, the Draft EIR discussion was intended to provide information about the ways in which Alternative 3A would or would not attain the stated project objectives, to inform the decision-makers as they consider approval of the project as proposed, or an alternative to the project.

The determination as to whether an alternative is feasible, however, is made by the lead agency's decision-makers as part of the project review process, rather than being made as a conclusion within an EIR (California Public Resources Code, Section 21081[a][3]; State CEQA Guidelines, Section 15091[a][3]). The San Francisco Planning Department, as the lead agency under CEQA, is responsible for environmental review of the proposed project and for ensuring that the EIR reflects the independent judgment of the City. The project approval process can only occur after certification of the Final EIR and is procedurally separate from the environmental review process. In making that determination, the lead agency's decision-makers independently weigh the relative advantages and disadvantages of the proposed project (in this case, the near-term and long-term projects under the LRDP) and its alternatives, and then may choose to approve, modify, or disapprove the project as proposed, or may choose to adopt one of the alternatives presented in the document, if determined feasible (California Public Resources Code, Section 21081[a][3]; State CEQA Guidelines, Section 15091[a][3]). The Draft EIR informs and provides evidence that could substantiate the decision-makers' findings, but does not itself make such findings.

Reasonable Range of Alternatives in the Draft EIR

Several comments suggest different permutations of specific health care programming for the CPMC campuses, especially for the Cathedral Hill and St. Luke's Campuses (e.g., redistributing services such that Cathedral Hill and St. Luke's are more similar in size, or increasing the number of beds at the St. Luke's Campus). The comments, however, do not suggest additional alternatives that would avoid or mitigate any potentially significant environmental impacts of the proposed LRDP while meeting most of the project sponsor's objectives, or those that would offer substantial environmental advantages, or be more feasible than the alternatives analyzed in the Draft EIR (State CEQA Guidelines, Section 15204[a]).

Section 15126.6(a) of the State CEQA Guidelines provides that "[a]n EIR need not consider every conceivable alternative to a project." Under the "rule of reason" governing the selection of the range of alternatives, the EIR is required "to set forth only those alternatives necessary to permit a reasoned choice" (State CEQA Guidelines, Section 15126.6[f]). This is also phrased as presenting a reasonable range of alternatives. Although an EIR must consider a reasonable range of potentially feasible alternatives, it does not have to identify and analyze alternatives that would not meet most of a project sponsor's basic objectives, nor does it have to discuss every possible variant or permutation of alternatives,[1] or alternatives that do not further reduce or eliminate significant impacts of the project.

As stated above, a range of alternatives is presented in Chapter 6 of the Draft EIR, pursuant to Section 15126.6 of the State CEQA Guidelines.

Under CEQA, the EIR is not required to consider permutations of Alternative 3A that would shift a different combination of services from the proposed Cathedral Hill Campus location to the St. Luke's Campus, if they would not demonstrably reduce or eliminate environmental impacts of the proposed LRDP to a greater degree than the alternatives analyzed in the Draft EIR. The Draft EIR analyzes two variations of a No Project Alternative (Alternative 1A and Alternative 1B), and Alternative 2, which involve rebuilding, retrofitting, and redeveloping facilities within CPMC's four existing campuses; and two variations of Alternative 3, which would reduce development at the proposed Cathedral Hill Campus

[1] *Jones v. Regents*, 183 Cal. App. 4th 818, 827 (2010); see also *Mira Mar Mobile Cmty. v. City of Oceanside*, 119 Cal. App. 4th 477 (2004) (EIR need not consider in detail every conceivable variation of alternatives stated).

and increase development at either the St. Luke's Campus (Alternative 3A) or the California Campus (Alternative 3B). These alternatives cover the comments' suggestion of "Alternative 3A Plus," to increase program and development intensity at St. Luke's Campus (i.e., beds and/or other services) and reduce the same at the proposed Cathedral Hill Campus.

Attainment of Project Objectives under Alternative 3A and "3A Plus"

Several comments state that it is not clear what objectives of the proposed LRDP would not be met by approval of either Alternative 3A or Alternative 3A Plus, other than not locating the Women's and Children's Center (WCC) to the proposed Cathedral Hill Campus. They also state that no evidence is provided to support the conclusion that Alternative 3A does not meet the project objectives. The Draft EIR states on pages 6-399 and 6-400 that Alternative 3A would not meet the project objectives to the same extent as the proposed LRDP for three reasons: (1) health care advantages and operational efficiencies resulting from co-locating the WCC with the large, centralized proposed Cathedral Hill Campus would not be achieved; (2) designing the proposed Cathedral Hill Hospital to comply with existing height and bulk restrictions, as per Alternative 3A, would not reduce the ability to co-locate services to and would not consolidate specialized services into one centralized acute-care hospital; and (3) Alternative 3A would disrupt the continuum of care at St. Luke's Campus, because of the need to phase construction of a larger hospital at the St. Luke's Campus. Other objectives may also not be met to the same extent as the proposed LRDP, such as those related to optimizing the use of CPMC resources to providing high quality patient care in a cost-effective and efficient manner, consolidating specialized services and Women's and Children's (WCC) services into one centralized acute-care hospital, ensuring that the new centralized acute-care hospital is appropriately located with respect to CPMC's patient base and the City's population concentration, rebuilding the St. Luke's Campus with a community hospital that is an integral part of CPMC's larger health care system, and optimizing patient safety and clinical outcomes.

Analysis of "Alternative 3A Plus" Within the Scope of Alternative 3A

Several comments suggest the need for "Alternative 3A Plus" that would provide more health services at the St. Luke's Campus and/or a different mix of programs and services than are proposed at the Cathedral Hill and St. Luke's Campuses under the LRDP or a different mix of services of programs and services than were analyzed under Alternative 3A.

The elements of an "Alternative 3A Plus" that would be different from Alternative 3A would be related to a distribution of space (square footage) by uses and would result in essentially very similar environmental impacts as Alternative 3A, which have been analyzed in the Draft EIR. The number of physicians, staff, patients, and visitors at the proposed Cathedral Hill Campus and the St. Luke's Campus under "Alternative 3A Plus" would be within the range analyzed for the proposed LRDP and alternatives in the Draft EIR. Therefore, the range of impacts that could occur with "Alternative 3A Plus" has been analyzed and is covered by the EIR analysis.

Merits of a Two-Hub Alternative

A number of comments suggest that services should be distributed more equally between St. Luke's and the proposed Cathedral Hill Campuses (a two-hub alternative), because it would improve the distribution of healthcare and would provide better healthcare access in the event of a disaster to underserved areas. Two main concerns are included in these comments: first, that the St. Luke's Replacement Hospital is too small to function well or even to be viable; and second, that the proposed Cathedral Hill Hospital is too large under the LRDP. Please refer to Major Response HC-2 (page C&R 3.23-8) regarding the scope of services proposed at the St. Luke's Campus and the basis for the size of the proposed Cathedral Hill Hospital, and Major Response HC-1 (page C&R 3.23-1) regarding the number of beds.

No substantial evidence was provided that there would be inadequate emergency capacity in the south of Market area in the event of a disaster. With respect to emergency disaster services, San Francisco General Hospital and the new University of California, San Francisco (UCSF) Mission Bay Hospital would also be located within the southeastern portion of San Francisco. Further, because the St. Luke's Emergency Department would be expanded under the proposed LRDP, within a structure that meets the strictest seismic safety requirements of Senate Bill (SB) 1953, and the proposed urgent care center at the St. Luke's Campus would provide additional capacity compared to existing conditions, the proposed LRDP would increase emergency preparedness for the southeastern portion of San Francisco.[2] Please also see Major Response HC-5 (page C&R 3.23-20) for a discussion of access to emergency care services for residents in the southeastern portion of the city**.**

The two-hub concept was adequately analyzed from a CEQA perspective by Alternatives 3A and 3B. With regard to the proposed co-location of multidisciplinary services at the proposed Cathedral Hill Hospital, Dr. Mitch Katz, former director of SFDPH, independently confirmed to the Planning Commission at the November 19, 2009, hearing on CPMC's institutional master plan (IMP), the belief of medical experts that high-volume medical centers that have the largest number of specialists provide the highest level of care. Dr. Katz also stated that the viability of the St. Luke's Campus should not be viewed independently but rather based on its functioning as a component of the CPMC health care delivery system as a whole.[3] Please see Major Response HC-2 (page C&R 3.23-8) for more detail regarding consolidation ofspecialized tertiary and quaternary services in a centralized .

No substantial evidence has been offered by the comments to support the assumption that two more similarly sized hospitals would result in improved access to health care for members of underserved communities. Therefore, the record does not indicate, and it is beyond the scope of the EIR to determine, that "Alternative 3A Plus," with a two-hub scheme would provide substantial medical service benefits over the proposed LRDP or the alternatives analyzed in the Draft EIR. The record indicates that, similar to Alternative 3A, an "Alternative 3A Plus" would not meet the project objectives to the same extent as the proposed LRDP..

Shifting Women's and Children's Services from the Cathedral Hill Campus to the St. Luke's Campus

Several comments regarding "Alternative 3A Plus" state that a St. Luke's Campus centered around WCC services, as would be the case under Alternative 3A, would not be supportable, because it would shift most women's and children's services to the southern half of the city. According to these comments, a different complement of services should therefore be considered (i.e., centralizing services at St. Luke's Campus) for all CPMC patients at this campus.

Some comments mistakenly state that only clinics or pediatrics services lines would be shifted from the proposed Cathedral Hill Campus to the St. Luke's Campus under Alternative 3A. To clarify, under Alternative 3A, all women's and children's services (inpatient and outpatient) would be located at the St. Luke's Campus instead of the proposed Cathedral Hill Campus.

Some comments suggest that centralizing services at the St. Luke's Campus would provide better accessibility to the freeways, major transit facilities, and to Sutter Health patients outside of San Francisco. Other comments have stated that underserved populations in the southeastern portion of the city would be better served under Alternative 3A or "Alternative 3A Plus."

---

2 The Camden Group. San Francisco Blue Ribbon Panel: Market Analysis Data Book (Apr. 9, 2008). El Segundo, CA.

3 Testimony of Dr. Mitch Katz, November 19, 2009, at the CPMC IMP hearing. Dr. Katz further confirmed that the proposed St. Luke's Replacement Hospital "fills a real need, including giving [the City] relief in the south east part of the City for SF General Hospital."

Alternative 3A would not meet the sponsor's objectives to the same extent as the proposed LRDP because shifting the WCC to the St. Luke's Campus would result in a plan under which neither hospital (at either the proposed Cathedral Hill or St. Luke's Campus) would function as well as under the proposed LRDP and both would be substantially more expensive to operate because of the need to duplicate services and systems. [4]In order to provide high-acuity care to mothers at both the St. Luke's and proposed Cathedral Hill Campuses, Alternative 3A (or "3A Plus") would also result in some programs having to split their operations, between the proposed Cathedral Hill and St. Luke's Campuses, reducing operational efficiencies. [5] Absent duplication of such systems and services, patient transfers would be needed to get patients to the locations where such critical services are available. [6]

Some comments state that the Women's and Children's Hospital does not need to be part of the Cathedral Hill Hospital, and would be a benefit at the St. Luke's Campus. Locating CPMC's WCC at the St. Luke's Campus would result in a heavy concentration of women's and children's care in the south of Market Street area. This is because UCSF, after it completes its Mission Bay campus, San Francisco General Hospital, and CPMC would all be providing such services in the area south of Market Street and there would be a relatively low concentration of such services in the heavily populated areas north of Market Street. See Major Response HC-2 (page C&R 3.23-8) for discussions regarding how the size and programming of the St. Luke's Campus was determined and regarding services within the south of Market Street service area.

In contrast, the proposed Cathedral Hill Campus would be more centrally located. See Major Response HC-2 (page C&R 3.23-8). The proposed Cathedral Hill Campus would also be located close to a large concentration of the City's low-income households, children, and youth.[7] These populations are underserved and could be more easily served at the proposed Cathedral Hill Campus than CPMC's other campuses.

The proposed Cathedral Hill Campus is also well located with respect to physicians that are currently providing women's and children's health care services at the California Campus. For the reasons described above, locating the WCC at the Cathedral Hill Campus as proposed under the LRDP would meet the project objectives to a greater extent than locating the WCC at the St. Luke's Campus, as would be the case under Alternative 3A.

St. Luke's Campus Size under Alternative 3A

Some comments state that by dismissing Alternative 3A, the Draft EIR fails to consider the disadvantages to San Francisco of a "too-small" St. Luke's facility. These comments suggest that (1) the St. Luke's Campus size under the proposed LRDP is not viable and does not have a variety of services that would ensure its long term viability and (2) the larger St. Luke's Campus under Alternative 3A would better meet the demand for health care services at this campus. Please refer to the discussion regarding "Dismissal or Feasibility Determination of Alternative 3A," above.

The St. Luke's Campus currently consists of a large facility that is not fully utilized. For example, the average daily census of acute-care beds at the St. Luke's Campus for the 8-year period from 2002 through 2009 was 60 acute-care patients (40 percent occupancy).[8] Under the proposed LRDP, the St. Luke's

5 *Ibid.* This is because splitting such programs would result in (a) duplication of expensive equipment, and (b) difficulty in attracting the additional number of specialists, physicians, nurses and technicians with the skill set that would be required to provide the staffing and services associated with such specialized programs at two separate locations.

6 *Ibid.*

7 Ibid.

8 OSHPD, ALIRTS, Annual Utilization Report of Hospitals for St. Lukes Hospital, 2002 through 2008 and California Pacific Medical Center - St. Lukes Campus, 2009, available at http://www.alirts.oshpd.ca.gov, accessed Apr. 7, 2011.

Replacement Hospital is anticipated to operate at 80 percent occupancy. See Major Response HC-1 (page C&R 3.23-1) for a discussion regarding the number of licensed acute-care beds at the St. Luke's Campus.

Major Response HC-2 (page C&R 3.23-8) addresses the size and range of services that would be provided at the St. Luke's Campus under the proposed LRDP, and explains that rather than determining that a larger hospital with more beds was needed at the St. Luke's Campus, the Camden Group determined that future patient demand at this campus, based upon population projections, justified a larger Emergency Department, a larger MOB, and an expansion of outpatient and ambulatory care services at the St. Luke's Campus.[9] As discussed in Major Response HC-2 (page C&R 3.23-8), the planned service mix and capacity of the new inpatient St. Luke's Replacement Hospital is consistent with these determinations, and with the recommendations of the Blue Ribbon Panel.

Continuum of Care during Construction

Alternative 3A (or "3A Plus") would not meet the core medical service project objective of ensuring ongoing medical services and an uninterrupted continuum of care at CPMC during construction to the same extent as the proposed LRDP. As explained in the Draft EIR, because of space limitations on the St. Luke's Campus, a new WCC as discussed under Alternative 3A could not be constructed until after the new St. Luke's Replacement Hospital is constructed, patients are moved into the new acute care facility, and the existing 1970 hospital tower is demolished.[10]

Development under Alternative 3A would, however, result in a period of approximately 2-3 years when, under state seismic safety regulations, the existing inpatient facilities at the Pacific and California Campuses would be closed and the proposed new WCC at St. Luke's Campus would not yet be completed and operational.

Other Issues

Some comments state that the proposed 555-bed hospital proposed for Cathedral Hill would be unsafe and the 80-bed hospital at the St. Luke's Campus would be unsustainable. There is no evidence in the record to substantiate either of these statements. The project's potential impacts are analyzed in detail in Draft EIR Sections 4.1 through 4.18. Please see Major Response HC-2 (page C&R 3.23-8) for a thorough discussion of the basis for the size and scale of all of the medical facilities planned in the proposed CPMC LRDP.

A few of the comments regarding consideration of an "Alternative 3A Plus" specifically suggested that skilled nursing and/or subacute-care beds should be included as part of a larger St. Luke's Replacement Hospital. The reasons for not providing skilled nursing or subacute-care beds as part of a new, larger SB 1953-compliant St. Luke's Replacement Hospital were identified by the Blue Ribbon Panel and are discussed in Major Response HC-6 (page C&R 3.23-25). The Blue Ribbon Panel did not recommend that CPMC provide new replacement subacute-care beds for those in the existing St. Luke's hospital, and

[9] The Camden Group. 2008 (April 9). San Francisco Blue Ribbon Panel: Market Analysis Data Book. El Segundo, CA.

[10] The development at the St. Luke's Campus under Alternative 3A as described in the Draft EIR would include a larger St. Luke's hospital constructed during two phases. The St. Luke's Replacement Hospital would be constructed during the first phase, and a Women's and Children's Center would be constructed as an addition to the hospital during the second phase. This was determined to be a more reasonable alternative than construction of a larger hospital building on the St. Luke's Campus in a single phase for several reasons. First, to provide sufficient space for a larger, single-phase hospital building, the existing 1970 hospital tower would need to be demolished before construction could begin, resulting in an interim period of several years during which there would be no hospital and no inpatient services would be provided at the St. Luke's Campus. Second, a major redesign of the St. Luke's Replacement Hospital, which would be necessary for a larger, single-phase hospital, would result in additional delays because time would need to be spent on the architectural design and the OSHPD review and approval processes. Third, a larger, single-phased hospital potentially could result in additional impacts on residential neighbors. The same would apply for Alternative 3A Plus.

instead recommended that "CPMC should replace lost subacute beds with placements for all individuals currently in those beds."[11]

Comment

(Margaret Kettunen Zegart, October 20, 2010) [97-5 ALT]

"Future television and communications services allow integration of all services in present complexes and in a reduced Cathedral Hill size and mass facility size and mass and height to comply with all City Codes."

Response ALT-2

The comment is referring to the reduced development scenario for the proposed Cathedral Hill Hospital under Alternative 3A. The comment appears to state that future technologies would allow integration of all health care services at existing CPMC campuses and in the reduced development Cathedral Hill Campus scenario. According to the project sponsor, the proposed LRDP does incorporate modern technologies and capacity to accommodate future technological trends, including telecommunications, that would improve utilization of health care services and this could reduce the future need for beds and specific services. However, as explained in Major Response HC-2 (page C&R 3.23-8), the proposed facility capacity and size under the LRDP are based on regional population growth, demographic trends (e.g., aging population), and increase in occurrence of certain diseases (e.g., obesity, diabetes), which all drive the need and planning for the proposed Cathedral Hill Campus capacity and size under the LRDP. This comment does not raise issues regarding the adequacy, accuracy, or completeness of the Draft EIR. The comment will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project.

Comment

(Jason Fried, September 23, 2010) [PC-343 ALT3A]

"You listened to the community for the most part, it wasn't perfect, 3A is not perfect, which is why you have that plus, but you listened to the community and what we were looking for, for one of the alternatives. 3A+ is—there are a few things that still need to be added. I know that the Coalition and everyone is going to be submitting a lot of, you know, land use attorneys are looking and will be submitting what the plus actually really means and I'll leave it up to them because they can speak in the language that needs to be spoken to as far as the DEIR goes, so I encourage you to take that very seriously, and I want to encourage you to take a radical approach; for San Francisco, we do radical things here. My approach would be, you know, there is all this discussion about delays, delays, you know, if we don't go down this path, it gets delayed. Why don't we take the 3A+ approach and do a full EIR around that, as well, at the same time you're doing what CPMC wants, do the 3A+ approach at the same time, this way, if the CPMC approach doesn't work, if for some reason you decide there are just too many variances and you can't go forward, or the Board of Supervisors says you've overstepped your bounds, the variances are too wide, and we're not going to allow this to move forward, we have a back-up plan, something the community wants, and something that will work for CPMC. Yes, will it cost them money? Sure, but they already make $150 million a year and they're looking to try to make $200 or plus million a year, so it's not as if they're hurting for the money, they make enough already in the City and they can continue to be a profitable organization, even though they're a nonprofit. So let's look at doing a full EIR on the 3A+ approach, make sure that we have that because the last thing any of us want to do is actually delay the hospitals being built. We actually want to see this stuff here, we're not trying to stop hospitals altogether, we want to see our brothers and sisters in the building trades being—putting the shovels in the ground and then getting to work. So let's make sure we're taking a smart approach, not doing something that's going to say, 'Oh, guess what? The alternative that you wanted isn't going to work, you're now going to get cut back and now we have to spend another three years going through this process all over again.' I actually came to the City to start working on the Davies appeal for UHW prior to its

[11] The Blue Ribbon Panel, 2008, Consensus Positions for Recommendations to CPMC's Board of Directors.

Trusteeship, I have seen this process go through and it took us, you know, three years to get here. Let's not waste another three years, let's make sure we're doing an approach that has the community's alternative, what the community would look for, and hopefully one of these days CPMC–Sutter Health will wake up and understand that is what the community will give them, this will still be a good viable option for them. And that's what I would recommend."

Response ALT-3

The comment suggests that a full EIR should be done for a "3A Plus" alternative (presumably similar to what was done for the CPMC LRDP and Alternative 3A in the current CPMC LRDP Draft EIR). The comment however, does not specify what additional elements would constitute "Alternative 3A Plus." As described in Response ALT-1 (page C&R 3.22-111), a full EIR would not be required for "Alternative 3A Plus" because it would be very similar to Alternative 3A, and every possible variant or permutation of an alternative is not required to be analyzed. Please see Response ALT-1 (page C&R 3.22-111) regarding the range of alternatives and the reason that no additional analysis is required under CEQA for a different mix of services. A full EIR for Alternative 3A or "Alternative 3A Plus" is not required under CEQA because Alternative 3A has been analyzed as an alternative in this EIR. The State CEQA Guidelines directs that the primary focus of the analysis of alternatives should be to support meaningful comparison between the impacts of the project and the impacts of the alternative, but that "the significant effects of the alternative shall be discussed, but in less detail than the significant effects of the project as proposed" (see State CEQA Guidelines Section 15126.6(d)).

Please also refer to Response LU-1 (page C&R 3.3-1) regarding the proposed approvals requested for the proposed LRDP.

The comment's general support for "Alternative 3A Plus" is acknowledged. This comment does not raise issues regarding the adequacy, accuracy, or completeness of the Draft EIR. The comment will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project.

3.22.2 SUPPORT FOR OR OPPOSITION TO ALTERNATIVE 3A

Comment

(Jack Scott—Cathedral Hill Neighbors, September 23, 2010) [19-4 ALT3A, duplicate comments were provided in 40-4 ALT3A and PC-8 ALT3A]

"Most residents understand the construction process, with certain mitigation issues adhered too, the project will start and commence to completion.

The problem is size, the reduction of local services, noise, traffic, emergency vehicles, spot zoning violations, disregard for the planning department /planning commission's established zoning restrictions and among other issues, interfering with the success of established small businesses currently in operation along the Van Ness corridor. The impact that this project will have on the, already overextended, Muni system.

We urge you to study the recommendation of the planning staff and act on adopting the environmentally sound and workable alternate 3A."

Response ALT-4

The comment expresses support for Alternative 3A The comment also states that development of the proposed Cathedral Hill Campus and related project approvals would result in spot zoning violations. This comment expresses concern regarding the potential impacts of the proposed LRDP development at the Cathedral Hill Campus related to its size, effects related to local services, noise and traffic, effects on

emergency vehicles, effects on viability of nearby small businesses along the Van Ness Avenue corridor, and impacts on transit services, such as Muni.

The proposed Cathedral Hill Campus' potential impacts related to aesthetics, traffic and emergency vehicles, noise, public services, and utilities and service systems are analyzed in detail in the Draft EIR beginning on pages 4.2-95, 4.5-93, 4.6-41, 4.11-17, and 4.12-24, respectively. The Draft EIR concluded less-than-significant impacts related to aesthetics, emergency vehicles, public services, and utilities and service systems for the Cathedral Hill Campus under the proposed LRDP. Significant and unavoidable impacts were identified for transportation and circulation, noise (groundborne vibration), air quality, and greenhouse gas emissions.

The comment states that the Cathedral Hill Campus under the proposed LRDP would result in spot zoning violations. The required project approvals for the proposed Cathedral Hill Campus are shown on Draft EIR Table 2-3, pages 2-13 to 2-15, and are further described in Section 2.2.4, "Required Project Approvals for the proposed Cathedral Hill Campus," on Draft EIR pages 2-43 to 2-48. Since the publication of the Draft EIR on July 21, 2010, the project sponsor has made some modifications to the requested entitlements for the near-term development projects under the proposed LRPD based upon input from the Planning Department such as the proposed Cathedral Hill Campus development. Therefore, the required project approvals listed in the Draft EIR in Table 2-3, "Required Project Approvals," on pages 2-13 through 2-17 and described in Section 2.2.4 on Draft EIR pages 2-43 to 2-48 have been updated as part of the text revisions to the Draft EIR included on pages C&R 4-37 to C&R 4-42 of this document. The compatibility of the proposed Cathedral Hill Campus with applicable land use plans, policies, or regulations is discussed under Impact LU-2 of the Draft EIR. The Draft EIR noted the following on page 4.1-48:

> [T]he amendments to the General Plan's VNAP [Van Ness Avenue Plan] and amendments to the Planning Code text and zoning and height and bulk district maps; the PUD and Conditional Use (CU) authorizations; and other approvals as discussed above, are part of the proposed LRDP. Therefore, if these changes are approved by decision-makers, the proposed LRDP would be consistent with the applicable plans and policies. The proposed LRDP at the Cathedral Hill Campus with the requested amendments and approvals would therefore not conflict with any applicable land use plan, policy, or regulation.

Please note that these project approvals, including the proposed amendments to the VNAP and modification of the height and bulk district for the block proposed for the Cathedral Hill Hospital, would be considered by the decision-makers following EIR certification. The decision-makers may choose to approve, disapprove, or modify the requested project approvals. Project approvals are required before the development of the proposed LRDP could proceed, and this determination is not part of the CEQA environmental process. Please refer to Responses LU-5 and LU-9 (pages C&R 3.3-30 and 3.3-64) for further explanation regarding the required project approvals, the size of the proposed Cathedral Hill Campus, and the project's consistency with the VNAP.

The potential approval of changes requested by the project sponsor to the existing zoning and height restrictions at the proposed Cathedral Hill Campus would not constitute impermissible "spot zoning." "Spot zoning" refers to instances when "a small parcel is restricted and given less rights than the surrounding property" (*Wilkins v. City of San Bernardino*, 29 Cal. 2d 332, 340 [1946]). Court cases involving spot zoning have held that a city cannot rezone a property in a manner that unfairly discriminates against a particular parcel of land, because such discrimination implicates the due process, equal protection, and takings protections of the United States Constitution. However, the approvals to allow CPMC's proposed development have been requested by the project sponsor, rather than imposed by a City-initiated rezoning, and would not discriminatorily restrict CPMC's ability to develop the Cathedral Hill Campus. Therefore, the project would not result in impermissible spot zoning. Additional discussion

regarding the amendments to General Plan Urban Design Element Map 4, VNAP Map 2, and the Planning Code height and bulk district map to allow a maximum building height of up to 265 feet is included in Responses LU-5 and LU-9 (pages C&R 3.3-30 and 3.3-64).

The comment's support for Alternative 3A is acknowledged. The project approval process occurs after certification of the Final EIR and is separate from the environmental review process. The decision-makers may select one of the alternatives presented in the Draft EIR if determined feasible, or may approve, modify, or disapprove the CPMC LRDP as proposed.

This comment does not raise issues regarding the adequacy, accuracy, or completeness of the Draft EIR. The comment will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project.

Comments

(George Mayer, September 23, 2010) [32-2 ALT3A]

"I also learned from the Draft EIR that Alternative 3A would be the Environmentally Superior alternative. Reducing the size and operational scope of this hospital would help reduce negative impacts including loading dock noise."

(Diane and Richard Wiersba, October 11, 2010) [49-9 ALT3A]

"We feel that Alternative 3A, the environmentally preferred alternative, is far-and-above the better plan for the CPMC development."

(Galen Workman, October 14, 2010) [55-4 ALT3A]

"I fully support the concerns and suggestions sent to the Planning Department by the First Unitarian Universalist Society of San Francisco in their October 4th letter. I urge the City to adopt Alternative 3A."

(David Mardis, October 17, 2010) [61-2 ALT3A]

"Please give special consideration to alternative 3A. I really think it's the perfect compromise."

(Jason Fried, September 23, 2010) [PC-342 ALT3A]

"Hi, my name is Jason Fried, I'm a founding member of the Coalition for Health Planning San Francisco. Most of what we have said today has already been heard, so I'm not going to repeat any of that. What I will say, as you know, there are a lot of people wearing a button that says '3A+,' that is what the community is looking at having, is 3A."

(Jane Martin, September 23, 2010) [PC-256 ALT3A]

"We support the environmentally superior alternative of a bigger St. Luke's that Joseph was talking about, with a clinical anchor, and a smaller Cathedral Hill. And that alternative is environmentally superior in terms of traffic and the analysis that has been done, and it is also better for healthcare."

Response ALT-5

The comments' support for Alternative 3A is acknowledged. These comments also state that the environmental superior alternative identified in the Draft EIR (Alternative 3A) would reduce impacts related to loading dock noise, traffic, and health care related to the proposed Cathedral Hill Campus.

The Draft EIR evaluated potential loading dock noise and traffic impacts for Alternative 3A in Section 6.8.2. Loading impacts at the Cathedral Hill Campus under Alternative 3 were determined to be less than

significant on page 6-310 of the Draft EIR with implementation of Mitigation Measure M-TR-44 (requirement for a loading dock attendant) and would be less than under the LRDP, because of the reduced development under this alternative at the Cathedral Hill Campus than under the LRDP. The Draft EIR also concluded on page 6-307 that transportation and circulation impacts related to intersection LOS "…under Alternative 3 would be less than under the LRDP."

In response to the comments stating that impacts related to health care at the Cathedral Hill Campus would be reduced under Alternative 3, please refer to Response INTRO-7 (page C&R 3.1-17) regarding CEQA requirements for consideration of social and economic impacts. CEQA requires that an EIR evaluate whether a project may have physical environmental effects. Social and economic effects, which include the effects on health care service delivery, are only relevant under CEQA if they provide a linkage or a measure of the magnitude of a substantial adverse physical environmental effect. Please see Major Responses HC-1, HC-2, HC-3, HC-4, HC-5, HC-6, HC-8, and HC-9 (pages C&R 3.23-1, 3.23-8, 3.23-17, 3.23-19, 3.23-20, 3.23-25, 3.23-32, and 3.23-39) As explained in those responses, the record does not indicate that LRDP's effects on health care service delivery would result in or be linked to substantial adverse physical environmental effects. Accordingly, the Draft EIR evaluated the potential physical environmental effects of the proposed LRDP and alternatives, and did not analyze social and economic effects related to changes in health care service delivery that could occur with implementation of the LRDP.

These comments do not raise issues regarding the adequacy, accuracy, or completeness of the Draft EIR. The comments will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project.

Comment

(Alan Wofsy—Emeric-Goodman Associates, September 23, 2010) [26-6 ALT3A, duplicate comment was provided in 107-6 ALT3A]

"DEIR

6.9.2 CONCLUSION

Pursuant to the State CEQA Guidelines, Alternative 3A would be the environmentally superior alternative other than the No Project Alternative (Alternative 1A or 1B). Alternative 3A would reduce some of the significant and unavoidable impacts on transportation and circulation identified for the Cathedral Hill Campus under the proposed LRDP, but would still result in significant and unavoidable impacts related to transportation, noise, and air quality. Alternative 3A would meet some core project objectives, but not all of the project objectives and its development program at the CPMC campuses would be similar to that of the LRDP. However, Alternative 3A would reduce significant and unavoidable transportation and circulation impacts compared to the proposed LRDP, and would not result in additional impacts at the California Campus. 6-403

DISCUSSION

I am in agreement with the major thesis of the conclusion, namely that Alternative 3A is superior to the massive building and construction project that would result from the proposed LRDP. However there is no need for this fatalistic conclusion: *but [3A] would still result in significant and unavoidable impacts related to transportation, noise, and air quality."*

Response ALT-6

The comment's statement of support for Alternative 3A is acknowledged. The comment also states that Alternative 3A would not result in additional impacts at the California Campus.

The concluding statement in Section 6.9.2, page 6-403 of the Draft EIR is a factual statement of the conclusion regarding significant and unavoidable impacts identified for Alternative 3A in accordance with CEQA guidance. A range of alternatives is presented in Chapter 6 of the Draft EIR, pursuant to Section 15126.6 of the State CEQA Guidelines. The analysis of the alternatives addresses each environmental topic described in the Draft EIR in a manner that allows a meaningful evaluation and comparison of the nature and level of potential impacts of the proposed LRDP. Alternative 3A is evaluated in the Draft EIR on pages 6-299 to 6-351. As stated in the Draft EIR, page 6-402, "Alternative 3A would reduce some of the proposed LRDP's significant and unavoidable impacts on transportation and circulation identified for the Cathedral Hill Campus; however, it would still result in some significant and unavoidable impacts related to transportation, noise, and air quality." The purpose of the conclusion is to provide a comparison of the level of impacts that would occur with Alternative 3A to those that would occur with the proposed LRDP, in accordance with CEQA guidance. In addition, duplicating services at the proposed Cathedral Hill Campus would result in a net increase in building square footage and therefore an increase in operational GHGs, construction impacts, energy use, material use, water use, and potential stormwater runoff increase, compared to under the LRDP. However, this would not result in significant unavoidable impacts related to these above-noted environmental topics for Alternative 3A.

The comment is correct that Alternative 3A would not result in additional impacts at the California Campus. As stated in the Draft EIR on page 6-273, the "development at the California Campus under Alternative 3A would be the same as the California Campus proposal under the CPMC LRDP." Thus, impacts at the California Campus under Alternative 3A would be identical.

Comments

(Unitarian Universalist CPMC Task Force, October 5, 2010) [44-12 ALT3A]

"We do believe there is a better option presented in the EIR, and that is Alternative 3A. Alternative 3A helps distribute health care throughout the City while significantly reducing some of the negative environmental impacts on Cathedral Hill. Alternative 3A reduces the height of the new hospital on Cathedral Hill, keeping the height within the current zoning height limit of 130 feet. This reduction in height decreases the negative effects of increased wind and shadows in the area. Another important reduced impact of 3A for the UU location is the reduced usage of loading space: same number of loading spaces, significantly fewer deliveries. Alternative 3A is the environmentally superior solution; it reduces many negative environmental impacts on Cathedral Hill including hazardous waste, traffic with its related pedestrian safety issues, other noise intrusions, and air quality."

(Ben Bear, October 18, 2010) [65-2 ALT3A]

"Alternative 3A reduces the scale of the Cathedral Hill campus: By reducing the scale of the Cathedral Hill campus, this alternative will reduce the significant impacts on traffic on the streets surrounding that facility. Reducing traffic will, in turn, help to reduce the significant negative impacts on noise, air quality and pedestrian safety which are of particular concern because of the proximity of facilities for children and seniors near the Cathedral Hill campus. Alternative 3A, as the draft EIR unequivocally states, is the environmentally superior alternative."

(George Mayer, September 23, 2010) [PC-86 ALT3A, duplicate comment provided in 32-2 ALT3A]

"I also learned from the Draft EIR that Alternative 3A would be environmentally superior. Reducing the size and operational scope of this hospital would help reduce many negative impacts, including loading dock noise…."

Response ALT-7

The comments' statement of support for Alternative 3A is acknowledged. The comments are correct that under Alternative 3A, the development of the proposed Cathedral Hill Hospital would be within the allowable height limit (130 feet) for the site, and would result in reduced impacts on transportation and

circulation, wind and shadow, noise, air quality, and hazardous materials, compared to the proposed development at the same site under the CPMC LRDP. This is because the development program at the Cathedral Hill Campus under Alternative 3A would be smaller than under the LRDP. The potential LRDP impacts at the Cathedral Hill Campus related to pedestrian safety, noise (loading dock operations and noise intrusion), wind and shadow, and hazards and hazardous materials were all determined to be less than significant in the Draft EIR and are addressed in Section 4.5, 4.6, 4.9, and 4.16, respectively. For comparison of impacts of the proposed LRDP to impacts of each alternative for transportation, please see Draft EIR Table 6-37 on pages 6-405 to 6-419. The Draft EIR also evaluated potential impacts of Alternative 3 in relation to the proposed LRDP at the proposed Cathedral Hill Campus on pages 6-299 to 6-324 of the Draft EIR.

The comments are correct that under Alternative 3A, the scale of the proposed Cathedral Hill Campus would be reduced, resulting in reduced impacts compared to the proposed LRDP, because the development program would be smaller. The Draft EIR evaluated potential impacts of Alternative 3 at the proposed Cathedral Hill Campus on pages 6-299 through 6-324. Pursuant to Section 15126.6(e)(2) of the State CEQA Guidelines, the environmentally superior alternative is identified as Alternative 3A, on page 6-403.

The decision-makers may approve, modify, or disapprove the CPMC LRDP as proposed or may select one of the alternatives presented in the Draft EIR, if determined feasible.

Comments

(Ben Bear, October 18, 2010) [65-5 ALT3A]

"Alternative 3A is more responsive to the needs of San Franciscans. It provides additional services in the Southern half of the city, currently served only by San Francisco General Hospital. I would like to note that I am not a NIMBY. As a resident of Bernal Heights, I am saying 'Yes, please, in my back yard' with respect to 3A's added capacity at St. Luke's."

(Ben Bear, October 18, 2010) [65-8 ALT3A]

"I respectfully urge you to reject the CPMC plan and to approve Alternative 3A as the one that is least harmful and most beneficial to San Francisco and its residents."

Response ALT-8

The comments statement of support for Alternative 3A is noted. The comments also state that the southern half of the City is currently served only by San Francisco General Hospital and that Alternative 3A provides additional services in the southern half of the City. However, the concept that Alternative 3A is more responsive to health care needs of San Francisco compared to the proposed LRDP is not supported by evidence in the record. Please note that in addition to San Francisco General Hospital, the UCSF Mission Bay Campus would also serve the southern half of the City. See Response ALT-1 (page C&R 3.22-11) regarding access to health care in the southern portion of the city. Please also see Major Responses HC-2 and HC-3 (pages C&R 3.23-8 and 3.23-17) regarding (1) reasons for location, size, and scope of facilities at the campuses and (2) explanation that the reduction in beds at the St. Luke's Campus under the proposed LRDP, which would accommodate all of CPMC's current and projected patient demands and, therefore, would not impact other San Francisco hospitals. See also Major Response HC-5 (page C&R 3.23-20) regarding expansion of emergency services at the St. Luke's Campus under the proposed LRDP.

This comment does not raise issues regarding the adequacy, accuracy, or completeness of the Draft EIR. The comment will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project.

Comment

(Sheila Mahoney and James Frame, October 19, 2010) [88-9 ALT3A]

"Looked at dispassionately, we don't think Alternative 3A, no matter how much the St. Luke's employees and the Cathedral Hill constituency like it, makes much sense. Segregating these specialized services from the proposed hospital on Van Ness Avenue would only make the California Campus clientele more likely to switch to UCSF's proposed Women's and Children's Hospital in Mission Bay."

Response ALT-9

This comment expresses general opposition to Alternative 3A. Please also see Response ALT-1 (page C&R 3.22-11) for a discussion on the potential implications of separating services between the proposed Cathedral Hill Hospital and the St. Luke's Campus under Alternative 3A.

The comment will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project.

Comment

(Gloria Smith—California Nurses Association, October 19, 2010) [93-97 ALT3A]

"The DEIR identifies Alternative 3A as the environmentally superior alternative other than the No Project alternatives. See DEIR at page 6-401. In describing the merits and limitations of Alternative 3A, the DEIR points to specific project elements, such as the loss of the pedestrian through connection at St. Luke's, that could be addressed with more detailed attention to the planning for that campus. Given that the alternatives analysis contains the same flaws as the DEIR's analysis of the Project as described in detail in the sections of this letter above, a revised DEIR must re-analyze Project alternatives. Such a re-analysis should focus on the environmentally superior alternatives and specifically, should modify those alternatives for re-analysis in a manner that would further reduce impacts while potentially improving performance related to project objectives."

Response ALT-10

The comment states that the limitations of Alternative 3A elements described in the CPMC Draft EIR, such as the loss of pedestrian through connection at St. Luke's, could be resolved with more detailed planning of the alternatives. The comment also suggests that the Draft EIR should be revised and should re-analyze the project alternatives and that the re-analysis should focus on the environmentally superior alternatives. Additionally, the comment states that these environmentally superior alternatives should be modified so that their impacts are further reduced, while also improving the performance of these alternatives so that they better meet the project sponsor's objectives.

The purpose of the discussion of the St. Luke's Campus and loss of a connection for pedestrians through the St. Luke's Campus facilities under Alternative 3A was to explain the difference in existing conditions and planned future construction with Alternative 3A, compared to the proposed LRDP. The Draft EIR explained, on page 6-325, "The pedestrian connection between Cesar Chavez and 27th between the Replacement Hospital and MOB/Expansion Building that would be retained under the LRDP would not be provided under Alternative 3A. This would result in a physical division of the community to some extent that does not currently exist and would not occur under the LRDP. However, this impact would be less than significant, but greater than under the LRDP. Although Alternative 3A would reconfigure the St.

Luke's Campus more than the proposed LRDP, it would still not divide or disrupt an existing community. As with the proposed LRDP, this impact would be less than significant."

In response to the comment that the environmentally superior project alternatives should be modified to better meet the project objectives, a range of alternatives is presented in Chapter 6 of the Draft EIR, pursuant to Section 15126.6 of the State CEQA Guidelines. As stated in the Draft EIR, page 6-1, "Section 15126.6(a) of the State CEQA Guidelines requires analysis of a range of reasonable alternatives to the project, or to the project's location, that would feasibly attain most of the project's basic objectives, but would avoid or substantially lessen any of its significant effects." Section 15126.6(a) also states that "an EIR need not consider every conceivable alternative to the project." As stated in Section 15126.6(c) of the State CEQA Guidelines, "the range of potential alternatives to the proposed project shall include those that could feasibly accomplish most of the basic objectives of the project and could avoid or substantially lessen one or more of the significant effects." Modification of the project alternatives studied in the Draft EIR is a determination that is up to the decision-makers. The comment will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project.

The analysis of the alternatives in the CPMC LRDP Draft EIR is consistent with CEQA's "rule of reason," which requires that the EIR set forth only those alternatives necessary to permit a reasoned choice (State CEQA Guidelines, Section 15126.6[f]). The analysis of these alternatives is consistent with CEQA, which calls for an EIR to include sufficient information about each alternative to allow meaningful evaluation, analysis, and comparison with the proposed project. If an alternative would cause one or more significant impacts, in addition to those that would be caused by the project as proposed, the significant impacts of the alternative should be discussed in the EIR, but in less detail than the significant impacts of the project as proposed. This was done in the CPMC LRDP Draft EIR. Therefore, the appropriate level of analysis was conducted in this Draft EIR to meet these requirements.

This comment is also part of a longer discussion regarding the Draft EIR analysis for the proposed LRDP and alternatives. Please see Response INTRO-6 (page C&R 3.1-11) regarding the adequacy of the Draft EIR. Response INTRO-6 also provides an explanation that that none of the criteria for recirculation as articulated in Section 15088.5(a) of the State CEQA Guidelines have been met; therefore, recirculation of all or any portion of the EIR is not warranted. Please also refer to the individual responses to comments made in Letter 93 (see C&R Table 2-3 "CPMC Commenter Matrix," page C&R 2-9), which are addressed separately in this C&R document in sections specific to the environmental issue areas to which each comment pertains.

Comments

(Rachel Sater—Lost Block and Save Our Streets, October 19, 2010) [101-48 ALT]

"Modified Campus Alternative: The DEIR should evaluate an alternative that involves expansion of the St. Luke's campus west to Guerrero Street through CPMC acquisition of the existing residential development between 27th Street, Guerrero Street and Cesar Chavez Street. This alternative would be comparatively feasible and would avoid the significant impacts on these homes."

(Rachel Sater—Lost Block and Save our Streets, October 19, 2010) [101-49 ALT3A]

"Alternative 3A: The DEIR evaluates an Alternative 3A, which would move the women's and children's center and an associated 160 beds from the Cathedral Hill campus to the St. Luke's campus. This alternative appears to have considerable support in the community around the Cathedral Hill campus, as well as more broadly in the city. The deficiencies of the DEIR described in the foregoing comments with respect to analysis, determination of significance, and mitigation of land use compatibility, plans and policies consistency, visual character, traffic, noise and vibration, light, wind, and shadow impacts are carried over into the evaluation of Alternative 3A.

The DEIR should evaluate a modified Alternative 3A that includes expansion of the St. Luke's campus west to Guerrero Street through CPMC acquisition of the existing residential development between 27th Street, Guerrero Street and Cesar Chavez Street. This comparatively feasible modified alternative would avoid and reduce significant impacts at the Cathedral Hill campus, and would allow more room for a site plan and building configuration that minimizes impacts on remaining homes on the south side of 27th Street, San Jose Avenue, and Duncan Street."

Response ALT-11

The comments above state that the concerns expressed in Comment Letter 101, with respect to deficiency of CPMC LRDP's environmental analysis, determination of significance and mitigation of LRDP impacts related to land use compatibility, plan and policy consistency, visual character, traffic, noise and vibration, light, wind and shadow impacts also apply to the evaluation of Alternative 3A in the LRDP Draft EIR. The comments also state that a modified Alternative 3A should be evaluated in the Draft EIR. The comments further state that the modified Alternative 3A should consist of expanding the St. Luke's Campus development under the LRDP to the west to Guerrero Street through CPMC acquisition of the existing residential development between 27th Street, Guerrero Street, and Cesar Chavez Street, which would reduce LRDP impacts related to the proposed Cathedral Hill Campus development presumably because the commenter believes it could be smaller. The comments also state that a modified Alternative 3A would be comparatively feasible and would avoid and reduce significant impacts at the proposed Cathedral Hill Campus, and would allow more room for a site plan and building configuration that would minimize impacts of the proposed St. Luke's Campus development on remaining homes on the south side of 27th Street, San Jose Avenue, and Duncan Street.

The CPMC Draft EIR Alternatives section identified alternatives to the proposed CPMC LRDP and discussed environmental impacts associated with each alternative. Section 15126.6(a) of the State CEQA Guidelines requires analysis of a range of reasonable alternatives to the project, or to the project's location, that would feasibly attain most of the project's basic objectives, but would avoid or substantially lessen any of its significant effects. The determination of feasibility will be made by decision-makers of the City and County of San Francisco (City). The significance criteria used for the environmental impact analysis in the Draft EIR are based on the environmental review guidelines of the San Francisco Planning Department's Environmental Planning Division, which is generally based on the environmental checklist in Appendix G of the State CEQA Guidelines. The analysis of the project alternatives in the CPMC LRDP Draft EIR is also consistent with CEQA Guidelines, which calls for an EIR to include sufficient information about each alternative to allow meaningful evaluation, analysis, and comparison with the proposed project. Please also refer to the individual responses to other comments made in Letter 101 (see Appendix I "Cross Reference Matrix Of Draft EIR Comments"), which are addressed separately in this C&R document, in sections specific to the environmental issue areas to which each comment pertains.

A range of potentially feasible alternatives is presented in Chapter 6 of the Draft EIR, pursuant to Section 15126.6 of the State CEQA Guidelines. As stated in the Draft EIR, page 6-1, "Section 15126.6(a) of the State CEQA Guidelines requires analysis of a range of reasonable alternatives to the project, or to the project's location, that would feasibly attain most of the project's basic objectives, but would avoid or substantially lessen any of its significant effects." Section 15126.6(a) also states that "an EIR need not consider every conceivable alternative to the project." As stated in Section 15126.6(c) of the State CEQA Guidelines, "the range of potential alternatives to the proposed project shall include those that could feasibly accomplish most of the basic objectives of the project and could avoid or substantially lessen one or more of the significant effects." Please see Response ALT-1 (page C&R 3.22-11) for a discussion of the adequacy of the range of alternatives considered in the Draft EIR and why a different mix of hospital programs at the St. Luke's Campus would not be required to be evaluated as a separate alternative.

Significant and unavoidable impacts related to noise, air quality, and GHGs related to construction and operations at the St. Luke's Campus would occur under the LRDP and Alternative 3A. No significant and unavoidable environmental impacts would occur related to land use, aesthetics, and wind and shadow under the LRDP or Alternative 3A at the St. Luke's Campus. Under the proposed LRDP, construction activities would result in short-term increases in emissions of diesel particulate matter that would exceed the BAAQMD CEQA significance criteria and would expose sensitive receptors to substantial concentrations of toxic air contaminants and $PM_{2.5}$ at the St. Luke's Campus (Draft EIR page 4.7-70). Residents to the west and south of the St. Luke's Campus (south side of 27th Street, San Jose Avenue, and Duncan Street) are considered sensitive receptors and would be affected. The Draft EIR concludes on page 4.7-70 that "while it is possible that Mitigation Measure M-AQ-N10c could reduce the air quality impacts related to carcinogenic risk and chronic noncarcinogenic health hazards posed by DPM emissions below the thresholds, it is unknown at this time to what extent such equipment will be available at the time of construction." Under Alternative 3A, localized air quality impacts from the proposed construction would be significant and unavoidable, and greater than under the LRDP at the St. Luke's Campus.

Under the BAAQMD CEQA significance criteria, any large urban construction project would have significant unavoidable air quality impacts to sensitive receptors, such as nearby residential units. A construction project in excess of 100,000 square feet requires a minimum offset distance of 150 meters between the fence line of construction to a nearby sensitive receptor, based on BAAQMD screening tables for construction risks. Although these are screening tables, and the minimum offset distance could be reduced substantially through mitigation, it is unlikely that a project of this size anywhere in the city would result in less than significant impacts. Thus, any construction at the St. Luke's Campus would result in a significant unavoidable air quality impact to sensitive receptors, except under the No Project Alternative 1A (Draft EIR page 6-125) where no development at the St. Luke's Campus is proposed. However, all significant and unavoidable air quality impacts of the LRDP development at the St. Luke's Campus to off-site sensitive receptors were either (a) temporary construction impacts for which mitigation would not be reasonable or feasible because CPMC would be required to acquire numerous nearby residential properties; or (b) non-localized air quality and GHG emissions impacts. These determinations would not change if the site of the St. Luke's Replacement Hospital were expanded and moved farther west toward Guerrero Street, as suggested by the comments. Therefore, the suggested relocation of the hospital would still result in significant and unavoidable air quality impacts.

This comment also presumes that environmental impacts to the 11 residential properties to the west of the St. Luke's Campus would be reduced if these homes were demolished and the expanded St. Luke's Replacement Hospital was constructed in their place under the comment's suggested modified Alternative 3A. The comment also states that a modified Alternative 3A that expands the St. Luke's Campus to the west would reduce significant impacts at the Cathedral Hill Campus presumably because reduced development would occur at the Cathedral Hill Campus under Alternative 3A. Provided that these residential properties could be obtained and the St. Luke's hospital could be redesigned, approved, and built, the site in question—in conjunction with the surface parking lot—is large enough to locate a hospital similar to or greater in capacity than the replacement hospital proposed under the LRDP or Alternative 3A. The comment infers that "acquisition of the existing residential development" adjacent to and to the west of the project site would be "completely feasible." CPMC does not own these properties and, although CPMC was approached by a single property owner offering to sell one of the 11 properties in question, it is unlikely that CPMC would be able to control or purchase all of the properties in question in a reasonable time frame or on commercially viable terms. At a minimum, this scenario would require all of the following:

- additional millions of dollars in land and property acquisition;[12]

[12] Assuming a minimum of +/- $450,000 for each of the 36 units on the block in question, the total acquisition cost is estimated to be in excess of $16 million.

- relocation of approximately 30 or more residential tenants occupying the 11 units whose willingness to relocate is unknown;

- demolition of dozens of rent-controlled units in the 11 residential properties with associated replacement/mitigation costs (in addition, all of the properties in question are greater than 50 years old, and are therefore potentially historic resources until proven otherwise); and

- additional time and cost related to a substantial redesign of the St. Luke's Campus development, including an extended environmental review potentially requiring recirculation of a revised Draft EIR, an additional public review period, and response to any additional comments submitted on the new alternative (modified Alternative 3A).

The project sponsor has indicated that extension of the LRDP schedule that would be required for acquisition, tenant relocation, demolition, redesign, and reanalysis of the expanded St. Luke's alternative under CEQA would render impossible any attempt to remain compliant with SB 1953 or any foreseeable extensions potentially allowed under successor legislation. Because of these factors, this potential alternative would fail to meet one of the major objectives of the proposed LRDP (to construct modern, seismically safe hospital facilities to meet the SB 1953 deadline), would not result in reduction of significant impacts of the LRDP (other than some temporary construction impacts), and could potentially create new impacts through the loss of additional rent-controlled housing units in San Francisco and possibly historic impacts.

A range of feasible alternatives (Alternative 1, Alternative 1B, Alternative 2, Alternative 3A, and Alternative 3B) has been sufficiently analyzed in the CPMC LRDP Draft EIR (see Draft EIR Chapter 6: "Alternatives," beginning on page 6-1) pursuant to CEQA. The comment will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project.

Comment

(Lois Scott, September 23, 2010) [PC-26 ALT3A]

"Alternative 3A, which conforms to existing regulations, the scale of the Van Ness Plan, and to the capacity of transportation in San Francisco, should be the preferred alternative, along with preparing a citywide plan so you have more context for reviewing these proposed changes. Thank you."

Response ALT-12

The comment's statement of support for Alternative 3A is acknowledged. The comment suggests that Alternative 3A should be the preferred alternative and a citywide plan (presumably meaning a health care masterplan) should be prepared to give more context for reviewing the proposed CPMC LRDP. Please refer to Major Response HC-9 (page C&R 3.23-39) for a detailed discussion regarding a citywide health care services master plan. As explained in Major Response HC-9, the proposed LRDP does not include the preparation of a citywide health care services master plan, nor is such an action a planned future phase or foreseeable component of the LRDP. A formal health care plan is to be prepared in the future under a separate City process, and is not a component of the project description for the proposed LRDP. The project description and alternatives in the CPMC LRDP Draft EIR are adequate, accurate, and complete under CEQA, and the project description includes all foreseeable components of the proposed CPMC LRDP, for both short-term and long-term project components. The alternatives analysis is presented in Chapter 6 of the Draft EIR, and is consistent with Section 15126.6 of the State CEQA Guidelines.

This comment does not raise issues regarding the adequacy, accuracy, or completeness of the Draft EIR. The comment will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project.

Comment

(Paul Wermer, September 23, 2010) [PC-263 ALT3A]

"And I want to tough on the 3A plus. The services that are alluded to earlier, both before and after care, are significant. I have dealt with this in my family, and I have dealt with the discontinuity of care when people are turfed out of a hospital because they no longer need the in-hospital beds, but are instead sent to some third-party skilled nursing facility. The continuity of care, the continuity of documentation, and the communication between the medical staffs is a disaster and causes great problems. That is another impact. Thank you."

Response ALT-13

The comment states that the before- and after-care at a hospital and continuity of care is a concern and suggests that the reduction in the number of licensed Skilled Nursing Facilities (SNF) beds throughout the CPMC system would equate to a loss of service and to the transfer or redistribution this service to other health care providers. The comment further states that the continuity of care, the continuity of documentation, and the communication between the medical staff is a disaster and causes great problems, which the comment states is another impact. This comment pertains to hospital facilities procedures related to continuity of care and health care services issues and not to the content or adequacy of the Draft EIR alternatives analysis. One of the objectives in developing the proposed LRDP was to "ensure ongoing medical services and an uninterrupted continuum of care at CPMC during construction through a carefully planned, appropriately phased project to minimize disruption." (Draft EIR page 2-7). Please refer to Response INTRO-7 (page C&R 3.1-17) regarding CEQA requirements for social and economic impacts, and the adequacy of the health care delivery system in San Francisco. Please also refer to Major Response HC-6 (page C&R 3.23-25) regarding the maintenance of SNF capacity and continuity of care at the CPMC campuses.

This comment does not raise issues regarding the adequacy, accuracy, or completeness of the Draft EIR. The comment will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project.

Comment

(Linda Chapman, September 23, 2010) [PC-286 ALT3A]

"Even the alternative 3A or B, which is the downsized alternative, increases the parking on that location by one-third, and I think we should not increase the parking at all. There was a time when, you know, you had to have a minimum amount of parking, but even with residences now, we're no longer doing one per one parking in all locations, we're considering the transit oriented policies, which I just noticed in the paper the other day, MTA is saying people should generally be using their cars in order to go grocery shopping or delivering their children to school, or, of course, if you were very sick and needed to go to the hospital, so when I say 3A, essentially I'm thinking that is pretty much 3A is in the document, green for our neighborhood, lots of housing in the areas that need it, and also maybe they need to consider distributing some of these services like the maternity services around to various hospital, rather than putting it all on one site."

Response ALT-14

This comment is part of a longer discussion by the commenter regarding the proposed Cathedral Hill Campus. The comment states that although Alternatives 3A and 3B would result in a reduced development at the Cathedral Hill Campus, these alternatives would still increase parking at the Cathedral Hill Campus compared to existing conditions and that parking should not be increased. The comment also appears to state that with the City's transit-oriented policies, Alternative 3A is "greener" and that

distributing health care services such as maternity services to various CPMC campuses medical facilities instead of putting all of maternity services at one campus should be considered.

Parking discussions for Alternatives 3A and 3B are provided for each CPMC campus in Chapter 6 of the Draft EIR. As stated in the Draft EIR, page 4.5-162, "San Francisco does not consider parking supply as part of the permanent physical environment and, therefore, does not consider changes in parking conditions to be environmental impacts as defined by CEQA." Parking conditions are not static; parking supply and demand varies from day to day, between daytime to nighttime, and from month to month. Hence, the availability of parking spaces (or lack thereof) is not a permanent physical condition, but changes over time as people change their modes and patterns of travel. Parking deficits are considered to be social effects, rather than impacts on the physical environment as defined by CEQA. Under CEQA, a project's social impacts need not be treated as significant impacts on the environment. Environmental documents should, however, address the secondary physical impacts that could be triggered by a social impact (State CEQA Guidelines, Section 15131[a]). The San Francisco Planning Department acknowledges, however, that parking conditions may be of interest to the public and the decision-makers. Accordingly, parking discussions are provided for informational purposes only, and an alternative with less parking was not analyzed. Please see Response TR-69 (page C&R 3.7-129) for a detailed description of the parking supply and analysis in the CPMC LRDP Draft EIR at the proposed Cathedral Hill Campus.

CPMC is proposing to promote the use of transit at its various campuses through its existing and proposed expanded transportation demand management (TDM) program and parking management plan. Please refer to pages 5-14 to 5-15 of the Draft EIR for further descriptions of these programs. CPMC already has a TDM program in place for its employees, and a shuttle system that serves employees, patients, and visitors. This TDM program would be enhanced for the proposed LRDP. Please also refer to Response TR-45 (page C&R 3.7-69) for a discussion regarding the enhanced TDM program under the CPMC LRDP.

The comment also states that distributing services, such as maternity services, to various CPMC campuses should be considered. It is important to note that the proposed LRDP and its distribution of services are based on CPMC's program needs and space allocation, described on page 2-9 of the Draft EIR. See Major Response HC-2 (page C&R 3.23-8) regarding the reasons for the location, size, and scope of medical services, especially at the proposed Cathedral Hill and St. Luke's Campuses under the LRDP. Please see Response ALT-1 (page C&R 3.22-11) for discussion about the range of alternatives and the reason no additional analysis is required under CEQA for a different mix of services.

3.22.3 GENERAL ALTERNATIVES COMMENTS

Comment

(Gloria Smith—California Nurses Association, October 19, 2010) [90-29 ALT]

"C. The DEIR Failed To Fully Analyze Alternatives

The DEIR failed to adequately describe a full and reasonable range of Project alternatives. CEQA requires that an EIR 'describe a range of reasonable alternatives to the project ... which would feasibly attain most of the basic objectives of the project but would avoid or substantially lessen any of the significant effects of the project, and evaluate the comparative merits of the alternatives.'[16] Here, the DEIR failed to consider feasible alternatives to the 555-bed hospital complex at the Cathedral Hill site. While the DEIR was not required to analyze an inordinate number of alternatives, it was required to consider a reasonable number with enough specificity so that the public and decision makers could fully evaluate Project options.

[16] CEQA Guidelines § 15126.6(a); Citizens of Goleta Valley v. Board of Supervisors (1990) 52 Cal.3d 553; Laurel Heights Improvement Association v. Regents of the University of California (1988) 47 Cal.3d 376."

(Paul Wermer—CPMC Neighbors Coalition and Pacific Heights Residents, October 18, 2010) [67-7 ALT]

"We concur with the points raised by the Cathedral Hill Neighbors Association (CHNA) and the Bernal Heights Neighborhood Center (Bernal) on the inadequate treatment of alternatives, as described in their joint comments on the DEIR (sent by Barbara E. Kautz, of Goldfarb & Lipman LLP)."

Response ALT-15

The comments express concern that the CPMC LRDP Draft EIR failed to consider a reasonable number of feasible alternatives with enough specificity so that the public and decision-makers could fully evaluate project options and did not adequately evaluate alternatives by presenting a reasonable range of feasible alternatives to the proposed LRDP. Please refer to Response ALT-1 (page C&R 3.22-11) for discussion about the range of alternatives considered for the CPMC LRDP, why it is adequate, and the reason why no additional alternatives analysis is required for the CPMC LRDP under CEQA.

Comment

(Stephanie Barton, et al.—Hastings Civil Justice Clinic for the Good Neighbor Coalition, October 19, 2010) [104-73 ALT]

"C. The DEIR does not adequately analyze given alternatives.

In the DEIR, alternatives are deemed inferior because they do not meet the project's self-serving consolidation objective. This treatment deemphasizes environmental concerns. In order to accept an alternative with greater environmental impact, decision makers must explain, in writing, the overriding considerations that outweigh negative environmental effects.[193] This explanation must be based on the materials in the record.[194] This DEIR does not provide the extent and level of information needed to support findings of overriding considerations.

[193] CEQA Guidelines § 15093(b).
[194] Id."

Response ALT-16

The comment states that the alternatives are deemed inferior in the CPMC LRDP Draft EIR because they do not meet the proposed LRDP's objectives, particularly the consolidation of medical services objective. According to the comment, should an alternative with greater environmental impact be chosen, decision-makers must further explain in writing, the overriding considerations that outweigh negative environmental effects of choosing such an alternative. The comment states that the Draft EIR "does not provide the extent and level of information needed to support findings of overriding considerations." The CEQA Findings and Statement of Overriding Considerations will be addressed separately, after the certification, as part of the CPMC LRDP approval process.

The comment suggests that the alternatives were deemed inferior because they do not meet the project objective to consolidate medical services. As explained in Response ALT-1 (page C&R 3.22-11), with the exception of those alternatives initially rejected as infeasible, the Draft EIR did not eliminate from consideration any of the alternatives on the basis of inferiority or infeasibility. Please also refer to Response PD-9 (page C&R 3.2-13) regarding the level of specificity of the project objectives. A range of alternatives is presented in Chapter 6 of the Draft EIR, pursuant to Section 15126.6 of the State CEQA Guidelines. As stated in the Draft EIR, page 6-1, "Section 15126.6(a) of the State CEQA Guidelines requires analysis of a range of reasonable alternatives to the project, or to the project's location, that would feasibly attain most of the project's basic objectives, but would avoid or substantially lessen any of its significant effects." Section 15126.6(a) also states that "an EIR need not consider every conceivable alternative to the project." As stated in Section 15126.6(c) of the State CEQA Guidelines, "the range of potential alternatives to the proposed project shall include those that could feasibly accomplish most of

the basic objectives of the project and could avoid or substantially lessen one or more of the significant effects." The alternatives analyzed in the Draft EIR would meet many, but not all of the project objectives.

Three alternatives, including two variations of the No Project Alternative (Alternative 1A and 1B), Alternative 2, and two variations of Alternative 3 (Alternative 3A and 3B), are analyzed in the Draft EIR (beginning on page 6-32). Pursuant to Section 15126.6(f) of the State CEQA Guidelines, the EIR examined in detail the alternatives that the lead agency (San Francisco Planning Department) determined could feasibly attain the project objectives. In determining whether alternatives are feasible, the decision-makers must be guided by the definition of feasibility in Section 15364 of the State CEQA Guidelines, which states that feasible refers to being "capable of being accomplished in a successful manner within a reasonable period of time, taking into account economic, environmental, legal, social, and technological factors." The decision-makers may select one of the alternatives presented in the document if determined feasible, or may approve, modify, or disapprove the project as proposed, as part of their deliberations on the proposed LRDP.

The environmental review process is explained in the Draft EIR on pages 1-11 and 1-12. After EIR certification, project decision-makers will consider the information in the Final EIR in their deliberations on the proposed LRDP itself. If the decision-makers decide to approve the LRDP or one of the alternatives, the approval action will include findings on the project. When a certified Final EIR identifies significant environmental effects, Sections 15091 and 15092 of the State CEQA Guidelines require the adoption of findings regarding overriding considerations to outweigh the project's significant and unavoidable environmental impacts before approval of the project. The CEQA Findings and Statement of Overriding Considerations will be addressed separately, after the certification, as part of the CPMC LRDP approval process. The Draft EIR identifies significant and unavoidable impacts resulting from implementation of the proposed LRDP or the alternatives (if one of the alternatives is selected) for transportation and circulation, noise, air quality, and greenhouse gas emissions.

CEQA requires the decision-makers to compare the benefits of a proposed project (economic, legal, social, technological, or other benefits, including region wide or statewide environmental benefits) with its significant and unavoidable environmental risks when determining whether to approve, modify, or disapprove the proposed project. If the benefits of the proposed project or alternatives (if selected) outweigh the unavoidable environmental effect, the adverse environmental effect may be considered "acceptable" (State CEQA Guidelines, Section 15093[a]). If the lead agency approves a proposed project or one of the alternatives, which would result in the occurrence of significant and unavoidable impacts that have been identified in the Final EIR but are not avoided or substantially lessened by mitigation, the lead agency would have to adopt a statement of overriding considerations, which must be based on substantial evidence in the record, including, but not limited to, evidence within the EIR. If the decision-makers determine to approve the project or an alternative, such a statement of overriding considerations would be prepared and made available for public review before adoption. This process would be followed for the CPMC LRDP.

This comment does not relate directly to the adequacy, accuracy, or completeness of the Draft EIR, but to the CEQA Findings including the Statement of Overriding Considerations necessary to approve the proposed LRDP; therefore, no changes to the Draft EIR are required.

Comment

(Stephanie Barton, et al.—Hastings Civil Justice Clinic for the Good Neighbor Coalition, October 19, 2010) [104-74 ALT]

"These comments by the Good Neighbor Coalition address important areas in which the DEIR is deficient in its analysis of the project.[195] The concerns raised regarding the project itself also need to be taken into account when

comparing the preferred project with a reasonable range of alternatives. For the Planning Commission to make an informed decision, the DEIR must revisit these critical areas and examine the relative significance of the impacts discussed for the LRDP and its alternatives.

[195] *See* Section I of this comment letter for deficiencies related to housing; Section II for deficiencies related to transportation; Section III for deficiencies related to air quality and greenhouse gases; Section IV for deficiencies related to workforce hiring programs; and Section V for deficiencies related to health care delivery."

Response ALT-17

The comment states that the concerns raised in Comment Letter 104 need to be taken into account when evaluating a reasonable range of alternatives. Each discrete comment in Comment Letter 104 by the Good Neighbor Coalition is addressed separately in this C&R document, in sections specific to the environmental topic areas to which they pertain (see C&R Table 2-3 "CPMC Commenter Matrix," page C&R 2-9). With respect to what constitutes the analysis of a reasonable range of alternatives in an EIR, please see Response ALT-1 (page C&R 3.22-11). As discussed therein, the LRDP Draft EIR considered a reasonable range of alternatives.

Comment

(Jack Scott—Cathedral Hill Neighbors, September 23, 2010) [PC-19-ALT]

"We stand together before you to make our public comment. We are concerned with the adequacy of the Alternatives Analysis, and several of the Impact Analyses, including traffic, noise, and air quality."

Response ALT-18

The comment cites concern regarding the adequacy of the alternatives analysis and the impact analysis of the traffic, noise, and air quality environmental topics in the CPMC LRDP Draft EIR. This comment is part of a larger discussion regarding the St. Luke's Campus, but it does not specify what aspect of the above-noted environmental topics analyses is of concern and why the commenter believes the Draft EIR analyses of the environmental topics may not be adequate. Specific comments received regarding the adequacy of the alternatives analysis, and traffic, noise, and air quality impacts in the CPMC LRDP Draft EIR are addressed in this C&R document. Please refer to Response ALT-1 (page C&R 3.22-11) regarding the adequacy of the alternatives analysis in the CPMC LRDP Draft EIR and range of alternatives considered. The alternatives are described and fully analyzed in Chapter 6 of the CPMC LRDP Draft EIR, pursuant to Section 15126.6 of the State CEQA Guidelines. The alternatives analysis is adequate and consistent with the State CEQA Guidelines and these alternatives do not require further evaluation. Please refer to Response TR-18 (page C&R 3.7-39) regarding the adequacy of the transportation impact analyses of the CPMC LRDP Draft EIR; Response TR-103 (page C&R 3.7-175) regarding the construction-related transportation impacts at the St. Luke's Campus; Response NO-72 (page C&R 3.8-77) regarding the sufficiency of analysis of construction noise impacts at the St. Luke's Campus as part of the CPMC LRDP; and Response AQ-23 (page C&R 3.9-64) regarding the thresholds of significance used in the air quality impact analyses of the CPMC LRDP Draft EIR. This CPMC LRDP Draft EIR has been prepared in conformance with the provisions of CEQA, the State CEQA Guidelines as amended, and Chapter 31 of the San Francisco Administrative Code.

Comment

(Howard Strassner—Sierra Club, October 12, 2010) [51-1 ALT]

"Thank you for the opportunity to comment on the subject DEIR. Working from the website was actually easier than working from a disc, because the table of contents worked well.

The Final EIR should include the addition of an alternative with a greatly reduced total parking supply in order to minimize transportation impacts. We note that an office project of this magnitude would be limited to about 360 parking spaces. A reduced parking alternative is feasible because the site is currently well served by good transit which is proposed for major improvement."

Response ALT-19

The comment, as part of a greater discussion about the proposed Cathedral Hill Campus in Comment Letter 51, requests the addition of a reduced parking alternative in an effort to minimize the LRDP's impacts on transportation at the Cathedral Hill Campus. The comment states that reducing the proposed parking supply under the LRDP would help reduce the transportation impacts of the project. The comment also states that an office project of this magnitude would be limited to 360 parking spaces.

A range of alternatives is presented in Chapter 6 of the Draft EIR, pursuant to Section 15126.6 of the State CEQA Guidelines. As stated in the Draft EIR, page 6-1, "Section 15126.6(a) of the State CEQA Guidelines requires analysis of a range of reasonable alternatives to the project, or to the project's location, that would feasibly attain most of the project's basic objectives, but would avoid or substantially lessen any of its significant effects." Section 15126.6(a) also states that "an EIR need not consider every conceivable alternative to the project." As stated in Section 15126.6(c), "the range of potential alternatives to the proposed project shall include those that could feasibly accomplish most of the basic objectives of the project and could avoid or substantially lessen one or more of the significant effects."

The comment suggests that there is too much parking proposed at the Cathedral Hill Campus under the LRDP and that an alternative with reduced parking should be considered to reduce the proposed LRDP's transportation impacts. As stated above, parking analysis is provided for informational purposes, however parking conditions and changes to parking conditions with project implementation are not CEQA issues. The EIR does consider transportation impacts that could result from parking changes with LRDP implementation as well as with implementation of project alternatives. Alternative 3 assumes a reduced development of the Cathedral Hill Campus, compared to the proposed LRDP and addresses transportation impacts. Overall, "the reduced development of the Cathedral Hill Hospital under Alternative 3 would result in one fewer [transportation] significant impact under cumulative conditions," as stated in the Draft EIR on page 6-307. Alternative 3 would generate fewer vehicle trips than the proposed LRDP due to the reduced development. Therefore, an alternative that would reduce transportation impacts of the proposed LRDP has been considered in the Draft EIR. The EIR does not need to consider multiple permutations of project alternatives that would result in the reduction of transportation impacts. Although an EIR must consider a reasonable range of potentially feasible alternatives, it does not have to identify and analyze alternatives that would not meet most of a project sponsor's basic objectives (i.e., space and program needs), nor does it have to discuss every possible variant or permutation of alternatives,[13] or alternatives that do not further reduce or eliminate significant impacts of the project. More specifically, the State CEQA Guidelines, section 15126.6(a) states that "[a]n EIR need not consider every conceivable alternative to a project. Rather it must consider a reasonable range of potentially feasible alternatives that will foster informed decision making and public participation." In section 15126.6(c), it goes on to state that "[t]he range of potential alternatives to the proposed project shall include those that could feasibly accomplish most of the basic objectives of the project and could avoid or substantially lessen one or more of the significant effects."

In response to the statement in the comment that an "office project of this magnitude would be limited to about 360 parking spaces," the following is provided for informational purposes. It is presumed that this comment is regarding the Cathedral Hill Campus development under the proposed LRDP. According to the schedule of required off-street parking spaces specified in Article 1.5, Section 151 of the San

[13] *Jones v. Regents*, 183 Cal. App. 4th 818, 827 (2010); see also *Mira Mar Mobile Cmty. v. City of Oceanside*, 119 Cal. App. 4th 477 (2004) (EIR need not consider in detail every conceivable variation of alternatives stated).

Francisco Planning Code, general office use would require one parking space for each 500 square feet of occupied floor area. Under the proposed LRDP, the Cathedral Hill Campus would be 1,171,792 gsf of occupied floor area (not including structured parking square footage). Assuming that the 1,171,792 gsf is general office use, this would mean that up to 2,344 parking spaces could be provided under the Planning Code, if an office project the magnitude of the Cathedral Hill Campus development were proposed. Therefore, substantially more parking spaces than 360 spaces could be provided if an office project was proposed of the magnitude of the Cathedral Hill Campus development.

Comment

(Gloria Smith—California Nurses Association, October 19, 2010) [92-6 ALT]

"From a transportation perspective, a Project alternative that distributes patients and services equally across the city should be evaluated in a revised EIR."

Response ALT-20

The comment appears to suggest that from a transportation perspective, a project alternative that distributes patients and services equally should be evaluated in the EIR. The comment requests the addition of a project alternative that distributes patients and services equally across the City in a revised CPMC LRDP Draft EIR, and the comment appears to suggest that this would be an environmentally superior alternative from a transportation impacts perspective. Please see Response ALT-1 (page C&R 3.22-11) for a discussion of the adequacy of the range of alternatives considered in the CPMC LRDP Draft EIR.

The concept that the EIR needs to consider a reasonable range of alternatives rather than every possible variant or permutation is reinforced in the Section 15126.6(a) of the State CEQA Guidelines, which states that "[a]n EIR need not consider every conceivable alternative to a project. Rather it must consider a reasonable range of potentially feasible alternatives that will foster informed decision making and public participation."

It is important to note that the proposed LRDP and its distribution of health care services are based on CPMC's program needs and space allocation, described on page 2-9 of the Draft EIR. This includes ensuring "that the new centralized acute-care hospital is appropriately located, taking into account CPMC's patient base and utilization patterns, and San Francisco's population concentration, on a site that (1) can accommodate a building of the requisite size to serve CPMC's program of integrated services, including adequate parking; and (2) is easily accessible by multiple transportation and transit modes" (Draft EIR, page 2-8). Please see Major Response HC-2 (page C&R 3.23-8) for a discussion regarding the basis for the size and scope of health care services at the proposed Cathedral Hill, Davies, and St. Luke's Campuses under the CPMC LRDP and how the proposed LRDP would rely on a central hub and feeder hospitals.

The proposed Cathedral Hill Campus would be centrally located to consolidate and relocate acute-care, emergency, and other services from the existing Pacific and California Campuses. The core medical service objectives of the LRDP are described on pages 2-7 and 2-8 of the Draft EIR. The centrally located acute-care hospital with consolidated services at proposed Cathedral Hill Campus would result in significant and unavoidable transportation and circulation impacts, because of its size. Accordingly, the Draft EIR analyzed Alternative 2, Alternative 3A, and Alternative 3B that reduce or avoid these significant and unavoidable impacts of the proposed LRDP's new Cathedral Hill Campus by reducing development and distributing health care services more equally to other CPMC campuses, compared to the proposed LRDP. Under CEQA the analysis of impacts on health care services conditions or policies is not required in the EIR, but the Draft EIR does evaluate the physical environmental impacts that have a demonstrable linkage to these topics, including trips to and from the proposed LRDP facilities, noise, and

air quality impacts among other environmental impacts (see Sections 4.5, "Transportation and Circulation," 4.6 "Noise," and 4.7 "Air Quality" in the Draft EIR).

Section 15126.6(a) of the State CEQA Guidelines requires analysis of a range of reasonable alternatives to the project, or to the project's location, that would feasibly attain most of the project's basic objectives, but would avoid or substantially lessen any of its significant impacts. The alternatives analyzed in the Draft EIR would result in a different distribution of patients and health care services among the various existing and proposed CPMC campuses and also a different pattern of distribution of CPMC health care services and patients across the City than the proposed LRDP. For example, under Alternative 3A, the women's and children's service line, which could not be accommodated by the smaller development at the Cathedral Hill Campus, would be relocated to the St. Luke's Campus in the southeast part of San Francisco. The physical environmental impacts related to the larger St. Luke's Campus under Alternative 3A (compared to the proposed LRDP) are analyzed in the CPMC LRDP Draft EIR. Based on the secondary physical environmental impacts resulting from changes to health care service conditions at CPMC campuses and pursuant to CEQA, Chapter 6 of the EIR evaluated alternatives that would reduce or lessen the significant and unavoidable impacts of the proposed LRDP, including transportation and circulation, noise, and air quality impacts.

This comment will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project.

Comments

(Gloria Smith—California Nurses Association, October 19, 2010) [93-96 ALT]

"G. Feasible Alternatives to the Project Exist that Mitigate Impacts

CEQA's purpose of avoiding or substantially reducing effects of a project through the adoption of feasible alternatives is defeated where an EIR fails to ensure that information about potentially feasible alternatives is subject to public and decision-maker review. The DEIR dismisses alternatives based on statements such as the CPMC decided that the alternative would not be cost effective. See, e.g., DEIR at page 6-24:

> According to CPMC, retrofitting could not bring existing on-campus structures up to 'new construction' standards of safety without prohibitive costs.

Where a project proponent asserts that various alternatives are not financially feasible or cost effective, they must disclose the financial information and economic data and analysis underlying the assertion to allow the public and decision-makers to fully understand why certain alternatives could be rejected as infeasible."

(Gloria Smith—California Nurses Association, October 19, 2010) [93-98 ALT]

"Reducing the development program at the Cathedral Hill campus while maintaining and/or expanding the health care services at the St. Luke's campus would be a likely candidate for revised analysis. Finally, a revised and recirculated DEIR must include sufficiently detailed financial and economic analysis to allow the public and decision-makers to understand why some alternatives warrant rejection, including the retrofit-only alternative."

Response ALT-21

The comments state that (1) alternatives in the CPMC LRDP Draft EIR were dismissed (that is, considered but rejected) based on cost (i.e., retrofitting the existing CPMC on-campus hospitals and medical facilities structures would have prohibitive costs); (2) where alternatives are dismissed or considered but rejected because they were not deemed to be financially feasible or cost effective, the project sponsor must disclose sufficiently detailed financial information and economic data underlying such a decision to allow the public and decision-makers to understand the decision why certain

alternatives could be rejected as infeasible and that this should be done in a revised and recirculated Draft EIR; (3) reducing the development program at the Cathedral Hill Campus while maintaining and/or expanding health care services at the St. Luke's Campus would be a candidate for revised environmental analysis presumably in a revised and recirculated Draft EIR; and (4) a revised and recirculated Draft EIR must include sufficiently detailed financial and economic analysis on why some alternatives warrant rejection.

The comments refer to page 6-24 of the Draft EIR, regarding the Four-Campus Renovation/ Retrofit of Existing Acute-Care Facilities Alternative that was considered but rejected. Please note that page 6-24 of the Draft EIR, which the comments cited, also states other reasons why this alternative would not be feasible. For example, according to CPMC and as explained in the Draft EIR on page 6-24, retrofitting a large number of buildings at existing campuses would require CPMC to either (1) work in small increments (so that disruption of medical services would be limited to a small population of patients and caregivers at any given time) or (2) shut down all existing on-campus buildings and the associated medical services (to accomplish the work more quickly). Working in small increments would occur over a longer period of time and would not be feasible, because of issues related to timely compliance with seismic safety deadlines under SB 1953 as modified by subsequent legislation. While shutting down entire existing buildings would allow for a retrofitting to occur more quickly, the lack of existing facilities that could accommodate temporary relocation of patients and medical services from buildings undergoing retrofits, and the high costs to implement such an alternative deemed it infeasible.

Available literature regarding compliance with SB 1953 also documents the extensive challenges related to retrofitting older hospital buildings. The California Seismic Safety Commission has recommended that new construction be encouraged over retrofitting: "Replacement, rather than retrofitting, of older hospitals is in the State's best interest when it is economically feasible. New hospital buildings provide 2030-level earthquake performance and reliability, rather than the 2008-level performance for retrofitted existing hospital buildings."[14] In an article describing the implementation of SB 1953, Daniel Alesch and William Petak reported that "the costs of structural and nonstructural retrofitting of the existing building were estimated to be very expensive—perhaps even more than half the costs of simply building a new building. Retrofitting while caring for patients in the same building is, at best, extremely difficult."[15] In a report prepared for the California HealthCare Foundation, the RAND Corporation found that "only a few organizations are implementing retrofits because they are expensive and disruptive to health care operations."[16] A California Healthcare Association report by the chair of the SB 1953 Seismic Compliance Committee also describes the additional costs associated with retrofitting in phases.[17]

The comments above also state that reducing the development program at the proposed Cathedral Hill Campus, while maintaining and/or expanding the health care services at the St. Luke's Campus should be a candidate for revised analysis (presumably in a revised and recirculated Draft EIR). The Draft EIR evaluated the potential environmental impacts of Alternative 3A, which consisted of a reduced development program at the Cathedral Hill Campus, and a larger development at the St. Luke's Campus. Therefore, such an alternative as requested by these comments has been analyzed in the Draft EIR.

The comment states that the Draft EIR should be revised and recirculated, and such a revised and recirculated Draft EIR must include sufficiently detailed financial and economic analysis to allow the public and decision-makers to understand why some alternatives warranted rejection in the Draft EIR. The range of alternatives required in an EIR is governed by a "rule of reason" that requires the EIR to set forth only those alternatives necessary to permit a reasoned choice. As stated in Section 15126.6(f)(1) of the State CEQA Guidelines:

> [A]mong the factors that may be taken into account when addressing the feasibility of the alternatives are site suitability, economic viability, availability of infrastructure, general plan consistency, other plans or regulatory limitations, jurisdictional boundaries (projects with a regionally significant impact should consider the regional context), and whether the proponent can reasonably acquire, control or otherwise have access to the alternative site (or the site is already owned by the proponent). None of these factors establishes a fixed limit on the scope of reasonable alternatives.

Section 6.3 of the Draft EIR identified alternatives that were considered but rejected as infeasible, pursuant to Section 15126.6(c) of the State CEQA Guidelines. The State CEQA Guidelines further state that an "EIR need not consider an alternative whose effect cannot be reasonably ascertained and whose implementation is remote and speculative." Because the retrofit alternative was considered but rejected as infeasible, no further environmental analysis of this alternative is required with regards to comments requesting financial information. Please see Response ALT-1 (page C&R 3.22-11) for additional discussion of the reasonable range of alternatives analyzed in the Draft EIR. Please also see Response INTRO-6 for a discussion of the circumstances under which a Draft EIR, or a portion thereof, requires recirculation under section 15088.5 of the State CEQA Guidelines.

With regards to the comments requesting financial information and economic data disclosure, the EIR is not required to provide economic data and financial disclosure of the comparative costs of implementing alternatives or economic feasibility data, although such information can be requested and may be considered by the decision-makers as part of their deliberations on the project.

Comment

(Rachel Sater—Lost Block and Save Our Streets, October 19, 2010) [101-46 ALT]

"Code-Complying Alternative: A code-complying alternative for the St. Luke's campus would limit the height and bulk of the replacement hospital and thereby avoid or reduce the potentially significant impacts of the replacement hospital on adjacent residential uses to the west. The DEIR indicates that a code-complying alternative for the St. Luke's Replacement Hospital was not evaluated because it would limit the number of licensed operational acute-care beds to 34, down from the 60 existing beds, and thus would not meet the objective of providing a community hospital to the same extent as the proposed LRDP. However, the code-complying alternative did not consider providing additional replacement beds within code-complying structures elsewhere on the campus. Additionally, the DEIR should evaluate a code-complying alternative for the St. Luke's campus alone, so that its feasibility is not necessarily contingent upon the feasibility of code-complying development at the Cathedral Hill campus and the other campuses."

Response ALT-22

The comment states that the code-complying alternative would limit the height and bulk of the replacement hospital at St. Luke's Campus, and thereby, avoid or reduce the potentially significant impacts of the replacement hospital on adjacent residential uses to the west.

Please first refer to Response ALT-1 (page C&R 3.22-11) regarding the CEQA requirement for analysis of a reasonable range of feasible alternatives and how the LRDP Draft EIR analyzed a reasonable range

of alternatives. As explained on page 6-28 of the Draft EIR, the site of the proposed St. Luke's Replacement Hospital is zoned to allow for a maximum building height of 65 feet. Working within this envelope, the overall hospital size would be limited to approximately 34 beds, resulting in a marked downsizing of capacity and available services, and the provision of fewer beds than recommended at the St. Luke's Campus by the Blue Ribbon Panel and the Camden Group Report. Consequently, as explained on page 6-30 of the Draft EIR, the code-complying alternative (a considered but rejected alternative) would not meet the project objective of rebuilding and revitalizing the St. Luke's Campus to the same extent as the proposed LRDP. Please also see Major Response HC-2 (page C&R 3.23-8) for a discussion of the adequacy of the planned size of the St. Luke's Campus under the LRDP.

The comment also states that the LRDP Draft EIR did not consider providing additional replacement beds within code-complying structures elsewhere on the St. Luke's Campus. The theoretical possibilities of retrofitting existing buildings and of constructing additional new code-complying buildings at St Luke's Campus to provide additional licensed and operational acute care beds are discussed below.

Retrofitting Existing Buildings on St. Luke's Campus

Additional beds in "code-complying" structures on the St. Luke's Campus could theoretically be achieved by retrofitting existing structures on-site. However, according to CPMC, from a practical standpoint, neither of the two larger buildings on campus (the 1970 St. Luke's Hospital tower and the 1970s Monteagle Medical Center building) could be feasibly retrofitted for inpatient use for the following reasons:

- *St. Luke's Hospital tower:* As described in pages 6-52 through 6-54 of the Draft EIR, retrofitting the St. Luke's Hospital tower is infeasible for the following reasons:

  - The cessation of health care delivery required for a major overhaul would not comply with the Blue Ribbon Panel recommendation of maintaining services during retrofit/rebuilding.

  - Design, approval, and completion of retrofitting could not be achieved before the statutory deadline of January 1, 2013 under SB 1953, unless extended by SB 90 (potentially out to 2020) or successor legislation.

  - Estimated costs to retrofit to Structural Performance Category 2 (SPC-2) or SPC-5 standards are $200 million and $300 million, respectively, not including substantial nonstructural costs related to the hospital's current functional obsolescence. The usable life of an SPC-2 building (up to but not beyond 2030) and the absolute cost of SPC-5 upgrades make both options prohibitively expensive, compared to new construction.

- *Monteagle Medical Center building:* Barriers to using the Monteagle Medical Center building for inpatient use are considerable, and include the following:

  - The Monteagle Medical Center building was never constructed for inpatient use. Basic health care facility planning presumes that older, formerly inpatient facilities can, at times, be successfully converted to non-acute-care or outpatient use once their inpatient functions reach the limits of functionality (an example is conversion of the Marshall Hale Hospital to a nonacute-care skilled nursing facility and near-term conversion [anticipated to occur by 2015] of the existing San Francisco General Hospital to non-acute-care medical uses and outpatient care). This is because non acute-care and outpatient facilities

are generally held to a much lower standard of structural safety due to the relatively healthy and ambulatory nature of their occupants. In addition, outpatient facilities generally have less strenuous air filtration and air conditioning requirements (see the discussion on Draft EIR page 4.7-73 to 4.7-74 in Section 4.7, "Air Quality," regarding proposed LRDP facilities' mechanical ventilation system). Accordingly, conversion of medical facilities from outpatient to inpatient use is extremely rare, because the facility must be retrofitted to higher structural (and other) standards than those under which the building was originally constructed.

- This retrofit would result in a marked discontinuation of medical services to the community. In some cases, this effect would be more pronounced (such as discontinuing primary care that otherwise would be provided via the Women's and Children's Center part of the St. Luke's Health Care Center in the Monteagle Medical Center building), than if the existing St. Luke's hospital itself were closed. The Pediatric Clinic alone currently sees more than 16,000 patients every year.[18]

- Retrofitting the Monteagle Medical Center building for inpatient use would result in the net loss of approximately 90,000 square feet of currently usable medical office and clinic space, which in large part would need to be replaced to maintain a functioning medical campus. Replacing this capacity, through new structures or retrofit of other structures on the St. Luke's Campus, would raise similar issues and constraints.

Constructing Additional Code-Complying Structures at St. Luke's Campus

The combination of building a code-complying (34-bed) hospital *plus* demolishing existing on-campus building(s) to construct more licensed operational acute-care beds in additional new structures on campus, or building additional structures without demolishing any existing structures on the St. Luke's Campus could have the following issues:

- Though not specifically suggested by the comment, it theoretically could be possible to construct, in multiple phases and multiple buildings, enough inpatient capacity to serve the patient population at the St. Luke's Campus as envisioned by the LRDP. However, this approach would limit the initial phase of hospital construction to approximately 34 beds, which would be equal to a patient census of 27 (at 80 percent occupancy), this is less than half of the current patient census at St. Luke's Campus,[19] resulting essentially in a discontinuity of service for a significant portion of the existing St. Luke's patient population. According to the project sponsor, the most feasible way of phasing a multi-building development that incrementally reaches a bed-capacity greater than 34 beds, without discontinuity of inpatient service, would be similar to Alternative 3A. The initial development would need to take place on the proposed St. Luke's Replacement Hospital site, and the additional bed tower would be built on the corner site (current location of the existing hospital bed tower at Cesar Chavez and Valencia).

- The multiple-phase scenario (constructing a 34-bed inpatient hospital on the existing surface parking lot, followed by demolition of the St. Luke's Hospital tower and construction of an additional

[18] California Pacific Medical Center. 2010 Health Care Center at St. Luke's. Available: http://www.cpmc.org/services/slh-healthcarecenter.html#Pediatric%20Clinic. Accessed January 11, 2011.

[19] According to OSHPD data, the average daily census of acute-care beds at the St. Luke's Campus for the 8-year period from 2002 through 2009 was 60 patients (40 percent occupancy), ranging from a low of 50 (33 percent occupancy) in 2008 to a high of 71 (47 percent occupancy) in 2003. For the most recent year available, 2009, the St. Luke's Hospital averaged 51 acute-care patients (34 percent occupancy). OSHPD, ALIRTS, Annual Utilization Report of Hospitals for St. Luke's Hospital, 2002 through 2008 and California Pacific Medical Center - St. Luke's Campus, 2009, available at http://www.alirts.oshpd.ca.gov, accessed Apr. 7, 2011.

inpatient, expanded-bed hospital tower) effectively would preclude the ability to use the corner site for additional medical office/clinic capacity on the campus. The corner site is currently occupied by the existing hospital tower and that is also the site of the proposed MOB/Expansion Building under the LRDP. Building a code-complying hospital at that location (to provide additional bed capacity in a code-compliant St. Luke's Campus alternative scenario) would not leave any room for an MOB/Expansion Building at that location. However, a code-compliant MOB/Expansion Building could be constructed on the south side of the St. Luke's Campus, replacing the Monteagle Medical Center and Hartzell Buildings and the Duncan Garage (similar to Alternative 3A, but without requiring any amendment to the existing on-campus height limit.)

- This approach would result in operational inefficiencies, including the need to operate nursing units in two (or more) physically separate acute care hospital structures and duplication of certain support, central plant/mechanical, and other functions necessary for acute care hospitals. These inefficiencies would result in higher per-bed construction and operational costs than would be required for a single-building acute care hospital and could result in potentially lower levels of medical care due to the operational inefficiencies.

- Building new code complying structures at the St. Luke's Campus without demolishing the existing nine on-campus structures would not be feasible, because there is not enough space at the campus to accommodate such a scenario.

Based on the above discussion, all potential "code complying" on-campus development options for St. Luke's Campus would result in greater disruption of care, a longer time to meet seismic compliance requirements, uncertain outcomes with respect to health care capacity and services, and less effective delivery of health care services to patients at St. Luke's Campus.

With respect to "needing to evaluate a code complying alternative for St. Luke's Campus alone" so that its feasibility would not be contingent on the feasibility of code-complying development at the proposed Cathedral Hill Campus or other CPMC campuses, as described above, an EIR need not analyze every variant of the alternatives to comply with the requirement to evaluate a reasonable range of alternatives in the EIR (see section 15126.6(a) of the State CEQA Guidelines). (Please also see Response ALT-1 [page C&R 3.22-11] for a discussion of the adequacy of the range of alternatives considered in the Draft EIR.) The concept that the EIR needs to consider a reasonable range of alternatives, rather than every possible variant or permutation, is reinforced in Section 15126.6(a) of the State CEQA Guidelines, which states that "[a]n EIR need not consider every conceivable alternative to a project. Rather it must consider a reasonable range of potentially feasible alternatives that will foster informed decision making and public participation."

Code-complying development at the St. Luke's Campus, along with other CPMC campuses, was included as part of the code complying alternative considered but rejected in the Draft EIR on pages 6-25 through 6-30. The Draft EIR's conclusion here that implementing the code-complying alternative at the St. Luke's Campus would not meet the project objective of rebuilding and revitalizing the St. Luke's Campus to the same extent as implementing the proposed LRDP was not dependent on development activity that would occur at other CPMC campuses. This conclusion would remain valid even if a code-complying St. Luke's Campus were evaluated separately as part of an alternative that did not include code-complying development at the proposed Cathedral Hill Campus or other CPMC campuses. Please also see Response LU-9 (page C&R 3.3-64) for a discussion of the code complying alternative for the Cathedral Hill Campus.

Comments

(Stephanie Barton, et al.—Hastings Civil Justice Clinic for the Good Neighbor Coalition, October 19, 2010) [104-55 ALT]

"As required pursuant to Section 15126.6(a) of the CEQA Guidelines, the DEIR should identify and analyze reasonable project alternatives that would attain project objectives while reducing these dangerous air quality impacts. While the project identifies several significant and unavoidable air quality impacts and acknowledges the impacts will have adverse health impacts on residents of nearby neighborhoods, the DEIR fails to identify additional alternatives that reduce these dangerous impacts. While Alternative 2 results in one less significant and unavoidable air quality and GHG emissions impact, Alternatives 3A and 3B do not result in any fewer significant and unavoidable impacts than the project itself. The significant and unavoidable project impacts are summarized in the table below. As depicted in the table below, significant and unavoidable air quality impacts are induced by every project alternative, with the exception of the no project alternative.[139]

The DEIR recognizes that the project will have the following significant impacts on the environment related to air quality and GHGs:

- Construction will expose nearby resident children to an increased cancer risk of 17 in one million. The BAAQMD threshold is 10 in one million.
- The BAAQMD threshold for daily PM10 emissions is 80 lbs/day. The Cathedral Hill Hospital will emit 104 lbs/day.
- The BAAQMD threshold for annual PM10 emissions is 15 tons/year. The Cathedral Hill Hospital will emit 19 tons/year.
- The BAAQMD threshold is 54 pounds per day of NOX emissions for both the near and long term. Construction of the Cathedral Hill Hospital will emit 261 pounds per day in the near term, and 84 pounds per day in the long term.
- Direct and indirect GHG emissions greatly exceed the BAAQMD threshold of 1,100 metric tons per year of carbon dioxide equivalent. The Cathedral Hill Hospital is anticipated to generate the equivalent of 22,503 metric tons of carbon dioxide per year.

It is critically important that San Francisco decision makers carefully examine these serious impacts when evaluating the project's merits, as well as the DEIR's claim that there are few, if any, mitigation measures available. The DEIR attempts to downplay the project's air quality and GHG impacts by using outdated guidelines as significance thresholds, and by claiming that the project's impacts do not cross qualitative thresholds notwithstanding substantial evidence to the contrary. While the DEIR does acknowledge multiple significant air quality and GHG impacts resulting from the project, it fails to present project alternatives or mitigation measures which are capable of substantially reducing the severity of these impacts. The DEIR should fully acknowledge the significance of the project's air quality and GHG impacts and present further alternatives or mitigation measures to reduce them.

[139] *See* Section VI of these comments, *infra*, for a discussion of project alternatives
[140] DEIR 6.405.

(Stephanie Barton, et al.—Hastings Civil Justice Clinic for the Good Neighbor Coalition, October 19, 2010) [104-72 ALT]

"B. The DEIR fails to address a sufficient range of alternatives.

Even though the project is a complicated, multi-site development, the DEIR only analyzes three project alternatives,[184] one of which is the required No Project Alternative.[185] Section 15126.6(a) of the CEQA Guidelines requires that an EIR describes a range of reasonable alternatives to the project that would feasibly attain most of the project objectives while avoiding or substantially lessening any of the significant environmental effects of the project.[186]

In several areas, none of the alternatives, with the exception of the No Project Alternative, substantially reduces significant impacts. For example, the Project, Alternative 2, Alternative 3(a), and Alternative 3(b) all have significant and unavoidable air quality and greenhouse gas emissions impacts. These include long term daily and annual PM_{10} emissions exceeding BAAQMD thresholds, construction emissions of NO_X that exceed the BAAQMD threshold,[188] and exposure of nearby children to an increased cancer risk.[187] Similarly, the Project, Alternative 2, Alternative 3(a), and Alternative 3(b) also all have direct and indirect GHG emissions that exceed the BAAQMD threshold. A primary purpose of CEQA is to identify alternatives that avoid or reduce environmental damage.[189] Alternatives failing to reduce these significant greenhouse gas and air quality effects are insufficient. The DEIR needs to include alternatives that lessen these impacts in order to fulfill CEQA obligations.[190] While lead agencies do have discretion in identifying alternatives, [191] they must still demonstrate that they have made a good faith effort to evaluate a reasonable range of alternatives. [192] This DEIR fails to meet this important CEQA requirement.

[184] DEIR, Chapter 6.
[185] However, Alternative 1: No Project Alternative and Alternative 3: Reduced Development at Cathedral Hill Campus have 'sub-alternatives'.

"Cathedral Hill Campus Significant and Unavoidable Air Quality And GHG Impacts for Project Alternatives 1, 2, and 3[140]

Alternative	Significant and Unavoidable Air Quality Impacts at Cathedral Hill	Significant and Unavoidable GHG Impacts at Cathedral Hill
Project	Significant and unavoidable impacts: - Exposes resident children to increased cancer risk above the acceptable threshold - Long term daily and annual PM10 emissions exceed the acceptable threshold - Construction emissions of NOX exceed the acceptable threshold	Significant and unavoidable impact: - Direct and indirect GHG emissions exceed the acceptable threshold
Alternative 1A: No Project, with no demolition at St. Luke's Campus	No impact	No impact
Alternative 1B: No Project, with demolition of St. Luke's Campus	No impact.	No impact.
Alternative 2: Four Campus Rebuilding, Retrofit, Redevelopment Alternative	Significant and unavoidable impact: - Long term daily and annual PM10 emissions exceed the acceptable threshold - Construction emissions of NOX exceed the acceptable threshold	Significant and unavoidable impact: - Direct and indirect GHG emissions exceed the acceptable threshold
Alternative 3A: Reduced Development at Cathedral Hill, with bed shifting to St. Luke's.	Significant and unavoidable impacts: - Exposes resident children to increased cancer risk above the acceptable threshold - Long term daily and annual PM10 emissions exceed the acceptable threshold - Construction emissions of NOX exceed the acceptable threshold	Significant and unavoidable impact: - Direct and indirect GHG emissions exceed the acceptable threshold
Alternative 3B: Reduced Development at Cathedral Hill, with bed shifting to	Significant and unavoidable impacts: - Exposes resident children to increased cancer risk above the acceptable threshold	Significant and unavoidable impact: - Direct and indirect GHG emissions exceed

Alternative	Significant and Unavoidable Air Quality Impacts at Cathedral Hill	Significant and Unavoidable GHG Impacts at Cathedral Hill
California Campus	- Long term daily and annual PM10 emissions exceed the acceptable threshold - Construction emissions of NOX exceed the acceptable threshold	the acceptable threshold

Response ALT-23

The comments state that (1) the Draft EIR fails to identify additional alternatives that substantially reduce the CPMC LRDP's significant and unavoidable impacts, especially air quality and GHG emissions impacts, on residents of nearby neighborhoods and that significant and unavoidable air quality impacts are induced by every project alternative, with the exception of the No Project Alternative; (2) decision-makers should carefully examine the Draft EIR's claim that "there are few, if any mitigation measures available"; (3) the Draft EIR downplays the proposed LRDP's air quality and GHG impacts by using outdated guidelines as significance thresholds and by claiming that the project's impacts do not cross qualitative thresholds notwithstanding substantial evidence to the contrary.

The comment is correct that under the project alternatives, significant and unavoidable air quality and GHG emissions impacts would occur that are similar to those caused by the proposed CPMC LRDP, with the exception of the No Project Alternative (Alternatives 1A and 1B). Multiple-campus air quality and GHG impacts (i.e., impacts of all CPMC campuses) under the Alternatives 1A, 1B, and 3A would be less than the proposed LRDP. Multiple-campus air quality and GHG impacts would be greater than the proposed LRDP under Alternatives 2 and 3B. Alternatives 1B, and 3A would not reduce all of the significant and unavoidable impacts of the proposed LRDP, but would reduce some of the impacts to a degree. The comments correctly identify the significant and unavoidable impacts as included in the attached table related to air quality and GHGs for the proposed LRDP. Under the 2010 BAAQMD CEQA significance criteria, any large urban construction project would likely have significant unavoidable Air Quality impacts on sensitive receptors, such as adjacent or nearby residential units. A construction project in excess of 100,000 square feet requires a minimum offset distance of 150 meters between the fence line of construction to a nearby sensitive receptor, based on BAAQMD screening tables for construction risks. Although these are screening tables, and minimum offset distance between the fence line of construction to a nearby sensitive receptor could be reduced substantially through mitigation, it is unlikely that a project of this size anywhere in the city would result in less than significant impacts.

The comment states that the Draft EIR downplays the project's air quality and GHG emissions impacts by using outdated guidelines as significance thresholds. The CPMC LRDP Draft EIR air quality and GHG emissions analysis was based on the most recent BAAQMD guidelines available at the time these analyses were prepared. It should be noted that the 1999 significance criteria used for the CPMC LRDP Draft EIR was based on established BAAQMD policy, which directed that EIRs for which the Notice of Preparation of an EIR was published before June 2, 2010, use the 1999 significance criteria for environmental analysis; however, to be fully informative and disclose all potential air quality impacts, including those that might occur under the most up-to-date significance thresholds, the Draft EIR also evaluated the proposed CPMC LRDP's effects based on the 2010 BAAQMD air quality significance thresholds, which were adopted the month (June 2010) before the publication of the Draft EIR. As the 1999 BAAQMD guidelines did not include methodologies or recommendations for assessing GHG emissions impacts, the CPMC LRDP Draft EIR GHG emissions analysis was based on the 2010 BAAQMD guidelines to present a comprehensive and conservative GHG emissions impact analysis, although, as noted above, they would not have been considered the applicable guidelines for the CPMC LRDP Draft EIR as directed by BAAQMD policy based on the date of issuance of the May 27, 2009 CPMC LRDP NOP. With regard to air quality impacts, please see Responses AQ-6 and AQ-23 (pages C&R 3.9-8 and 3.9-64, respectively) for a detailed discussion of air quality regarding the 1999 and 2010 air quality significance thresholds, and Response AQ-9 (page C&R 3.9-20) regarding the assessment of cancer risk from emitted toxic air contaminants. Please also see Response GH-1 (page C&R 3.10-3) for a detailed discussion regarding the BAAQMD guidelines and thresholds regarding GHG emissions.

In response to the comment stating that the CPMC LRDP Draft EIR claims "there are few, if any mitigation measures available," it is presumed that this is regarding the LRDP's significant and unavoidable air quality and GHG emissions impacts and the comments are questioning why these

significant impacts could not be avoided or reduced. The Draft EIR does not claim that "there are few, if any mitigation measures available" with regard to the significant and unavoidable air quality and GHG emissions impacts. It is presumed that this comment is regarding the conclusions for accelerated emission control devices on LRDP construction equipment. As explained in Response AQ-8 (page C&R 3.9-17), the BAAQMD acknowledges in its comment letter (Comment 109-3) that uncertainty exists about when specific types of equipment with Tier 4 modifications and interim Tier 4 engines would be available. For mitigation during near-term LRDP projects, because of the uncertainty surrounding availability of Tier 4 construction equipment, it would not be feasible to require Tier 4 equipment. A realistic alternative would be for contractors to retrofit a portion of their existing fleet with Level 3 VDECs, which would reduce particulate matter (PM) emissions from retrofitted units by at least 85 percent.

The Draft EIR concludes for Impact AQ-2, Impact AQ-10, and Impact AQ-14 on pages 4.7-36, 4.7-68, and 4.7-82 of the Draft EIR respectively that "while it is possible that Mitigation Measure M-AQ-N2 [M-AQ-N10a] could reduce the carcinogenic risk and chronic noncarcinogenic health hazards posed by DPM emissions below the thresholds, it is unknown at this time to what extent such equipment will be available at the time of construction. In light of this uncertainty, this impact would remain significant and unavoidable." Please also see Response AQ-20 (page C&R 3.9-48) regarding emissions of oxides of nitrogen (NO_X) and respirable particulate matter with an aerodynamic resistance diameter of 10 micrometers or less (PM_{10}) and clarification as to why these air quality impacts could not be avoided or reduced in magnitude through the adoption of mitigation measures.

Furthermore, equipment would be used during construction to reduce carcinogenic risk and chronic noncarcinogenic health hazards caused by DPM emissions, as discussed in Response AQ-8 (page C&R 3.9-17). For information regarding the construction air quality analysis, please see Appendix C of this document for an amended air quality construction analysis for the LRDP. This analysis identifies the resultant criteria pollutant emissions inventory as a result of implementation of a mitigation plan that has been updated to reflect changes in BAAQMD regulations that occurred subsequent to publication of the LRDP Draft EIR. The updated mitigation plan includes clarification of the proposed CPMC construction management plan to include modifications that address feasibility issues regarding the efficacy and availability of control technology for specific construction equipment types. Mitigation Measure M-AQ-N2 has been revised as follows by adding additional text to provide clarification regarding the timing/use of accelerated emission control devices on LRDP-related construction equipment:

M-AQ-N2 Install Accelerated Emission Control Device on Construction Equipment.

To reduce risk associated with exhaust emissions of DPM by construction equipment during construction of the Cathedral Hill Campus and all other LRDP sites, CPMC and its construction contractor shall implement the following BAAQMD-recommended control measures during construction:

- ~~Implement Accelerated Emission Control Device Installation on Construction Equipment. To minimize the potential impacts on residents living near the CPMC campuses from the construction activities in that area, CPMC shall make reasonable efforts to ensure that all construction equipment used at these campuses would use equipment that meets the EPA Tier 4 engine standards for PM and NO_x control (or equivalent) throughout the entire duration of construction activities, to the extent that equipment meeting the EPA Tier 4 engine standards is available to the contractor at the time construction activities requiring the use of such equipment occur.~~

- Where sufficient electricity is available from the PG&E power grid, electric power shall be supplied by a temporary power connection to the grid, provided by PG&E. Where sufficient electricity to meet short-term electrical power needs for specialized equipment is not available from the PG&E power

grid, non-diesel or diesel generators with Tier 3 (with VDEC retrofits) or Tier 4 engines (or equivalent) shall be used.

- During any construction phase for near-term projects, at least half of each of the following equipment types shall be equipped with Level 3-verified diesel emission controls (VDECs): backhoes, concrete boom pumps, concrete trailer pumps, concrete placing booms, dozers, excavators, shoring drill rigs, soil mix drill rigs, and soldier pile rigs. If only one unit of the above equipment types is required, that unit shall have Level 3 VDECs retrofits.

- For long-term projects, which are presumed to begin when Tier 4 equipment would be widely available, all diesel equipment of all types shall meet Tier 4 standards.

Please also see Response GH-1 (page C&R 3.10-3) for a discussion of the significance of GHG emissions impacts from the proposed LRDP and conclusions of the CPMC GHG Checklist (included as Appendix D). As explained in Response GH-1, after release of the Draft EIR for public review on October 28, 2010, BAAQMD reviewed and concurred that the City and County of San Francisco's Strategies to Address Greenhouse Gas Emissions[20] meet BAAQMD's criteria for a Qualified GHG Reduction Strategy as outlined in BAAQMD's 2010 CEQA Air Quality Guidelines.[21] Therefore, projects that are consistent with San Francisco's qualified GHG Reduction Strategy would result in a less-than-significant GHG emissions impact. According to BAAQMD, "even though such projects will add an incremental amount of [GHG] emissions, their incremental contribution will be less than 'cumulatively considerable' because they are helping to achieve the cumulative solution, not hindering it."[22] Such projects would be considered to have implemented all applicable, feasible mitigation measures.[23] According to the BAAQMD, "compliance with a Qualified Greenhouse Gas Reduction Strategy (or similar adopted policies, ordinances and programs), would provide the evidentiary basis for making CEQA findings that development consistent with the plan would result in feasible, measureable, and verifiable GHG emissions reductions consistent with broad state goals such that projects approved under qualified Greenhouse Gas Reduction Strategies or equivalent demonstrations would achieve their fair share of GHG emission reductions."[24]

In order to facilitate determination of project compliance with San Francisco's GHG reduction strategy, in November 2010, the San Francisco Planning Department Environmental Planning Division (formerly MEA) released a Greenhouse Gas Analysis Compliance Checklist that is to be completed for each proposed project. A checklist breaking down CPMC LRDP compliance by building for near-term projects and by campus for long-term projects has been completed. The CPMC LRDP GHG Compliance Checklist is included in this document as C&R Appendix D). As set forth in the CPMC LRDP GHG Compliance Checklist (and as described in more detail in Response GH-1 (page C&R 3.10-3) and C&R Appendix D), CPMC LRDP would comply with the applicable requirements of the City's qualified GHG Reduction Strategy.

[24] Bay Area Air Quality Management District. 2011 (May). *California Environmental Quality Act Air Quality Guidelines Updated May 2011*, pp. D13 to D14, available at http://www.baaqmd.gov/~/media/Files/Planning%20and%20Research/CEQA/BAAQMD%20CEQA%20Guidelines_May%202011_5_3_11.ashx.

With a determination of compliance with San Francisco's Qualified GHG Reduction Strategy, the LRDP would comply with regulations or requirements adopted to implement both regional (BAAQMD) and local (City and County of San Francisco) plans for the reduction or mitigation of GHG emissions impacts. This would support a finding of less than significant impact of the LRDP related to GHG emissions, and no further mitigation would be required. However, the Planning Department has determined that because the significance conclusion in the Draft EIR was made prior to a determination of equivalency with a qualified GHG reduction strategy, and the LRDP would exceed the 2010 BAAQMD GHG emissions quantitative threshold of significance (as determined in the CPMC Draft EIR and which the Planning Department determined would be the appropriate 2010 BAAQMD GHG threshold at the time of publication of the Draft EIR), the proposed LRDP should conservatively be considered to result in a significant and unavoidable GHG emissions impact, despite the subsequent determination that the proposed LRDP would be consistent with the BAAQMD-approved GHG Reduction Strategy. Therefore, the Draft EIR is adequate with respect to the analysis and significance determination related to GHG emissions impacts. Nevertheless, because of the proposed LRDP's compliance with the San Francisco qualified GHG Reduction Strategy, no additional mitigation is required.

The comments further ask why alternatives were not considered that reduce the severity of air quality and GHG emissions impacts caused by the CPMC LRDP on neighboring residents. Section 15126.6(a) of the State CEQA Guidelines also states that "an EIR need not consider every conceivable alternative to the project." As stated in Section 15126.6(c), "the range of potential alternatives to the proposed project shall include those that could feasibly accomplish most of the basic objectives of the project and could avoid or substantially lessen one or more of the significant effects." Please refer to Response ALT-1 (C&R 3.22-11) for a detailed discussion on a reasonable range of alternatives.

The No Project Alternative (Alternative 1A and 1B), Four-Campus Rebuilding/Retrofit/Redevelopment Alternative (Alternative 2), and Reduced Development at Cathedral Hill Alternative (Alternative 3A and 3B) are consistent with CEQA's "rule of reason," which requires that the EIR set forth only those alternatives necessary to permit a reasoned choice (State CEQA Guidelines, Section 15126.6[f]). The analysis of these alternatives is consistent with CEQA, which calls for an EIR to include sufficient information about each alternative to allow meaningful evaluation, analysis, and comparison with the proposed project. If an alternative would cause one or more significant effects in addition to those that would be caused by the project as proposed, the significant effects of the alternative should be discussed in the EIR, but in less detail than the significant effects of the project as proposed. A comparison of the air quality and GHG impacts of all alternatives compared to the impacts of the LRDP are presented in Table 6-37, pages 6-420 and 6-421 in the Draft EIR.

The No Project Alternative (Alternative 1A) would avoid or substantially lessen the significant air quality and GHG emissions impacts identified under the proposed LRDP. The Draft EIR identifies significant and unavoidable impacts resulting from implementation of the proposed LRDP and Alternatives 1A, 2, 3A, and 3B for air quality and GHG emissions. In such a case, CEQA requires the decision-makers to compare the benefits of a proposed project (economic, legal, social, technological, or other benefits, including region wide or statewide environmental benefits) with its unavoidable environmental risks when determining whether to approve, modify, or disapprove the proposed project (in this case, the LRDP) or an alternative. If the benefits of the proposed project or alternative (if selected) outweigh the unavoidable environmental effect, the adverse environmental effects may be considered "acceptable" (State CEQA Guidelines, Section 15093[a]). If the decision-makers approve a proposed project or one of the alternatives, which would result in the occurrence of significant effects which are identified in the Final EIR but are not avoided or substantially lessened, the lead agency would have to adopt a statement of overriding considerations before approving the proposed project.

Comment

(Stephanie Barton, et al.—Hastings Civil Justice Clinic for the Good Neighbor Coalition, October 19, 2010) [104-76 ALT]

"The DEIR identifies Alternative 3(a) as environmentally superior. The Planning Commission may not approve the project as proposed if feasible alternatives can substantially lessen significant environmental impacts. Whether 3(a), or any other alternative, including any unmentioned alternatives, will *substantially* lessen environmental impacts is unclear. Because the DEIR is deficient in several critical areas as detailed in this comment letter,[198] new or broadened analyses are required to determine the foreseeable impacts of the project and the various mitigation measures required. There then needs to be a comparison of impacts across a reasonable range of alternatives. After a more complete analysis, if the alternatives are deemed 'infeasible,' then an agency may reject them. But, the agency 'bears the burden of affirmatively demonstrating that ... the agency's approval of the proposed project followed meaningful consideration of alternatives and mitigation measures.'[199]

[198] *See* Section I of this comment letter for deficiencies related to housing; Section II for deficiencies related to transportation; Section III for deficiencies related to air quality and greenhouse gases; Section IV for deficiencies related to workforce hiring programs; Section V for deficiencies related to health care delivery; and Section IV for deficiencies related to alternatives analyses.

[199] *Mountain Lion Foundation* v. *Fish and Game Commission,* 16 Cal.4th 105, 134 (1997)."

Response ALT-24

The comment states that (1) it is unclear whether Alternative 3A in the CPMC LRDP Draft EIR or any other unanalyzed alternative would substantially lessen the LRDP's significant unavoidable environmental impacts; (2) the CPMC LRDP Draft EIR is deficient in several critical environmental topic areas and needs broadened analysis to determine the foreseeable impacts of the LRDP and the various mitigation measures required; (3) a comparison of impacts across a reasonable range of alternatives needs to be presented in the EIR; and, (4) after a more complete analysis if the alternatives are deemed infeasible, then the decision-makers may reject them; but they must be able to demonstrate that the decision-makers' approval of the proposed project followed meaningful consideration of alternatives and mitigation measures.

The comment states that the Draft EIR is deficient in several critical environmental topic areas. As stated in the Draft EIR, page 1-3, the EIR was "prepared in conformance with the provisions of CEQA and the State CEQA Guidelines (California Public Resources Code, Section 21000 et seq., and California Code of Regulations Title 14, Section 15000 et seq.), as amended." The planning process for the CPMC Institutional Master Plan (IMP) that eventually resulted in the proposed LRDP is described on pages 1-20 to 1-22 of the Draft EIR. In Chapter 4 of the Draft EIR, the proposed LRDP and its physical environment were analyzed consistent with the State CEQA Guidelines and Chapter 31 of the San Francisco Administrative Code. Mitigation measures for potentially significant impacts are identified to avoid, eliminate, or reduce potentially significant impacts of the proposed LRDP in the appropriate resource area, and improvement measures to further reduce less-than-significant impacts are identified at the end of each impact statement. As stated on page 1-6 of the Draft EIR, "this EIR is a full-scope EIR; that is, all of the CEQA and City environmental resource areas of concern are evaluated." The analysis in the Draft EIR has been determined to be adequate for CEQA purposes by the San Francisco Planning Department. The Draft EIR, together with this C&R document will be presented to the Planning Commission and will be certified as a Final EIR, if deemed adequate with respect to accuracy, objectiveness, and completeness.

The comment suggests that a new or unanalyzed alternative would substantially lessen the proposed LRDP's impacts and a comparison of impacts across a reasonable range of alternatives need to be presented in the EIR. A range of alternatives is analyzed in Chapter 6 of the Draft EIR, pursuant to Section 15126.6 of the State CEQA Guidelines. As stated in the Draft EIR, page 6-1, "Section 15126.6(a) of the State CEQA Guidelines requires analysis of a range of reasonable alternatives to the project, or to

the project's location, that would feasibly attain most of the project's basic objectives, but would avoid or substantially lessen any of its significant effects." Section 15126.6(a) also states that "an EIR need not consider every conceivable alternative to the project." As stated in Section 15126.6(c) of the State CEQA Guidelines, "the range of potential alternatives to the proposed project shall include those that could feasibly accomplish most of the basic objectives of the project and could avoid or substantially lessen one or more of the significant effects." For further discussion of the range of potentially feasible alternatives considered and evaluated in the Draft EIR, please see Response ALT-1 (page C&R 3.22-11). The analysis of the alternatives in Chapter 6 of the Draft EIR is consistent with CEQA's "rule of reason" which requires that the EIR set forth only those alternatives necessary to permit a reasoned choice, as stated in the State CEQA Guidelines Section 15126.6(f). The analysis of the alternatives is also consistent with CEQA Statute and Guidelines, which calls for an EIR to include sufficient information about each alternative to allow meaningful evaluation, analysis, and comparison with the proposed project. Chapter 6 of the Draft EIR also presents a comparison of impacts across the range of alternatives considered against the proposed LRDP for each resource area. In addition, Table 6-37 in the Draft EIR (page 6-405) presents a comparison of impacts by resource area and impact statement indicating whether the impacts under each alternative would be less than, equal to, or greater than the proposed LRDP. The environmental impacts of the proposed CPMC LRDP and a reasonable range of project alternatives have been analyzed in the Draft EIR and these are adequate alternatives for CEQA purposes.

Three alternatives, including two variations of a No Project Alternative (Alternative 1A and 1B), a Four-Campus Rebuilding/Retrofit/Redevelopment Alternative (Alternative 2), and two variations of a Reduced Development at Cathedral Hill Alternative (Alternative 3A and 3B) are analyzed in the CPMC LRDP Draft EIR (beginning on page 6-32). Pursuant to Section 15126.6(f) of the State CEQA Guidelines, the EIR examined in detail the alternatives that the lead agency (San Francisco Planning Department) determined could feasibly attain most of the objectives of the project and reduce potentially significant impacts of the proposed LRDP. In determining whether alternatives are feasible, the decision-makers are guided by the general definition of feasibility in CEQA Section 15364, as being "capable of being accomplished in a successful manner within a reasonable period of time, taking into account economic, environmental, legal, social, and technological factors." The decision-makers may select one of the alternatives presented in the EIR document if determined feasible, or may approve, modify, or disapprove the project as proposed, as part of their deliberations on the proposed LRDP. Regarding the extent to which the alternatives were considered and evaluated in the Draft EIR and meet the stated objectives of the proposed LRDP, please see Draft EIR pages 6-399 and 6-400 for a listing of the project objectives and Response ALT-1 (page C&R 3.22-11). Please also refer to Response ALT-1 for an explanation regarding the process by which the project or alternative is adopted by the lead agency's decision-makers as part of the entitlement review process for the project, rather than being made as a conclusion within an EIR.

3.22.4 OTHER ALTERNATIVES

Comment

(Sheila Mahoney and James Frame, October 19, 2010) [88-8 ALT]

"In summation

Obviously, as an adjoining neighbor our preference would be for Alternative 1B, making St. Luke's a new non-acute-care, outpatient facility. We think this is what's needed by the city and would be most financially beneficial to CPMC. However, it's long been obvious we're pawns in a political game."

Response ALT-25

The comment's support for Alternative 1B (No Project Alternative) in the Draft EIR is acknowledged. The process of public review and comment on the Draft EIR is a key part of the CEQA process. The

comment also states that Alternative 1B would be the most financially beneficial to CPMC, however this is not an EIR issue. The determination as to whether an alternative is feasible is made by the lead agency's decision-makers as part of the project review process, rather than being made as a conclusion within an EIR (California Public Resources Code, Section 21081[a][3]; State CEQA Guidelines, Section 15091[a][3]). The decision-makers may select one of the alternatives presented in the EIR document, if determined feasible, or may approve, modify, or disapprove the project as proposed. The reasons that a project may be approved and the alternatives rejected are ultimately determined by the decision-makers based on evidence in the record, including public comments, before project approval and after EIR certification of the project.

This comment does not raise issues regarding the adequacy, accuracy, or completeness of the Draft EIR. The comment will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project.

3.22.4.1 CATHEDRAL HILL CAMPUS

Comment

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-136 ALT, duplicate comment was provided in 30-136 ALT]

"Overall, I do not think that the 'transportation and circulation' section, and consequently the 'noise' and 'air quality' sections are analyzed thoroughly enough in respect to 'Alternative 3B' nor to the vehicular impact on Japantown streets that falls within both the 1/2-mi radii of the Cathedral Hill Project as well as the Pacific Campus Project."

Response ALT-26

The comment states that the transportation and circulation, noise, and air quality impacts of Alternative 3B are not analyzed thoroughly enough in the CPCM LRDP EIR. The alternatives analyzed in the CPMC LRDP EIR are consistent with CEQA's "rule of reason," which requires that the EIR set forth only those alternatives necessary to permit a reasoned choice (State CEQA Guidelines, Section 15126.6[f]). Please note that alternatives are not typically analyzed at the same level of detail as the proposed project. Rather, the analysis of the alternatives is consistent with CEQA Statute and Guidelines Section 15126.6(d), which calls for an EIR to include sufficient information about each alternative to allow meaningful evaluation, analysis, and comparison with the proposed project. If an alternative would cause one or more significant impacts in addition to those that would be caused by the project as proposed, the significant impacts of the alternative should be discussed in the EIR, but in less detail than the significant impacts of the project as proposed.

Impacts of Alternative 3B at the Cathedral Hill and Pacific Campuses for transportation and circulation, noise, and air quality are evaluated appropriately (i.e., at the appropriate level of detail) in the Draft EIR. Please refer to the Draft EIR, for discussions of transportation and circulation, noise, and air quality impacts at the Cathedral Hill Campus under Alternative 3B, starting on pages 6-305, 6-311, and 6-313, respectively. Please refer to the Draft EIR for discussions of transportation and circulation, noise, and air quality impacts at the Pacific Campus under Alternative 3B, starting on pages 6-358, 6-363, and 6-364, respectively. The analysis identified potentially significant impacts and appropriate mitigation measures as applicable for Alternative 3B. The analysis in the CPMC LRDP Draft EIR is adequate for CEQA purposes, and no further analysis or additional mitigation is required.

The comment also states that the vehicular impacts on Japantown streets within a .5-mile radius of the proposed Cathedral Hill Campus and Pacific Campus were not analyzed for the proposed LRDP or Alternative 3B. It is not clear from the comment whether they are referring to vehicular impacts to

Japantown streets from the proposed LRDP or Alternative 3B. The transportation impact analysis for the proposed LRDP and alternatives were conducted based on the methodology set forth in the San Francisco Planning Department's *Transportation Impact Analysis Guidelines for Environmental Review*, which direct the CEQA transportation impact analysis for all development projects in San Francisco. As stated in the Draft EIR, page 4.5-1:

> [T]he transportation study area includes all aspects of the transportation network that may be measurably affected by the CPMC LRDP. The transportation study area is defined by travel corridors and by facilities such as bus stops and transit stations. For this analysis 81 intersections at five different campus areas were identified as the key locations likely to be affected by the CPMC LRDP and were selected for detailed study of project impacts...

The study area and intersections were based on consultation with relevant City staff (i.e., departments including the Planning Department) and are shown for the proposed Cathedral Hill Campus and Pacific Campuses, respectively, in Figures 4.5-1 and 4.5-2, pages 4.5-2 and 4.5-3 in the Draft EIR. The transportation impact analysis for the alternatives was based on the same methodology as the proposed LRDP and also encompassed the same study area and intersections. The study area for the proposed Cathedral Hill Campus is bounded by Laguna Street, Pine Street, Eddy Street, and Hyde Street. The study area for the Pacific Campus is bounded by Steiner Street, Pacific Avenue, Gough Street, and Bush Street. The streets in the immediate vicinity of Japantown did not fall within these study areas and therefore were not evaluated. Please refer to Response TR-86 (page C&R 3.7-154), which explains that the nominal increase in vehicles on local streets in Japantown from CPMC LRDP-generated vehicles would not substantially affect operating conditions.

The same intersections that were analyzed for the LRDP were evaluated for Alternative 3B to allow a meaningful comparison of the proposed LRDP to the project alternatives. The analyses of the study intersections for all CPMC campuses for the proposed LRDP and alternatives were conducted consistent with the methodology in the San Francisco Planning Department's *Transportation Impact Analysis Guidelines for Environmental Review*.

This comment will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project.

Comment

(Gloria Smith, California Nurses Association, October 19, 2010) [90-31 ALT]

"In a nutshell, the DEIR's preferred alternative seeks to largely consolidate CPMC services into one 555-bed mega-hospital and MOB, on one tiny parcel, in one of the most diverse and gridlock-plagued sections of the City, Geary Street at Van Ness/Highway 101."

Response ALT-27

The comment states that the Draft EIR's preferred alternative is to consolidate CPMC services "into one 555-bed mega-hospital and MOB, on one tiny parcel, in one of the most diverse and gridlock-plagued sections of the City, Geary Street at Van Ness/Highway 101." The characterization of the area affected by the proposed LRDP in this comment reflects the commenter's opinion and is not substantiated through the provision of quantitative data or references in the record.

Please note that there is no "preferred" alternative identified in the Draft EIR, however there is the proposed project (i.e., LRDP) and alternatives to the LRDP that were presented and analyzed for physical environmental impacts in the Draft EIR. This CPMC LRDP EIR has been prepared in conformance with the provisions of CEQA, the State CEQA Guidelines as amended, and Chapter 31 of the San Francisco

Administrative Code. As stated in the State CEQA Guidelines, an EIR is an "informational document" intended to inform public agency decision-makers and the public of the significant effects of a proposed project, identify possible ways to minimize the significant effects, and describe reasonable alternatives to the project.

A range of alternatives is presented in Chapter 6 of the Draft EIR, pursuant to Section 15126.6 of the State CEQA Guidelines. As stated in the Draft EIR, page 6-1, "Section 15126.6(a) of the State CEQA Guidelines requires analysis of a range of reasonable alternatives to the project, or to the project's location, that would feasibly attain most of the project's basic objectives, but would avoid or substantially lessen any of its significant effects." The decision-makers may select the LRDP or one of the alternatives presented in the document if determined feasible, or may approve, modify, or disapprove the project as proposed, as part of their deliberations on the proposed LRDP.

3.22.4.2 CALIFORNIA CAMPUS

Comment

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-100 ALT, duplicate comment was provided in 30-100 ALT]

"55. Both 'Alternative 3B' and 'Alternative 2' which would demolish 3-, 4-, and 6-story buildings at 3905 Sacramento Street MOB, 3901 Sacramento Street residential building, and 460 Cherry Street parking garage (Page 6-177) and increase some of the building services at the California Campus and retain other services and increase the size of the existing buildings to the extent they desire will add too much congestion to the streets around Jordan Park and Laurel Heights. The automobile trips generated will overwhelm these nearby residential streets that are not meant for the volume of traffic generated from more capacity at the California Campus. Increasing the California Campus services from the level provided today would be a bad situation for the neighborhood and ruin the character of a primarily residential area. If CPMC implemented 'Alternative 3B' and build a 6-story, 100-foot tall, 420,000-sq. ft. building for a Women's and Children's Center at the east side of the California Campus that will attract an even greater number of visitors and without the parking garage structure in place for them (356 parking spaces at the Cherry Street MOB/parking garage (Page 6-177) will not be sufficient for this neighborhood if this alternative were carried out, especially without the 'world class' public transportation system in place. The residents in the area will suffer even more aggravation and potential health impacts from vehicle congestion and cut-through traffic on these streets."

Response ALT-28

The comment states that (1) the proposed development at California Campus would add too much congestion to the streets around Jordan Park and Laurel Heights under Alternatives 2 and 3B; (2) the vehicle trips generated by the increase in building services would overwhelm nearby residential streets not meant for the volume of traffic generated at the California Campus under these alternatives; (3) increasing the services at the California Campus would ruin the character of a primarily residential area; (4) there would not be sufficient parking for patients and visitors without the parking garage structure in place under Alternative 3B; and (5) the residents would suffer more aggravation and potential health impacts from vehicle congestion and cut-through traffic on residential streets with California Campus development under Alternative 3B. The comment is correct that under Alternative 2, the three-story 3905 Sacramento Street MOB, four-story 3901 Sacramento Street residential building, and six-story 460 Cherry Street Parking Garage would be demolished. Under Alternative 2, these demolished buildings would be replaced by a six-story Cherry Street MOB/Parking Garage. However, the comment demonstrates a misunderstanding of what would occur under Alternative 3B. Under that alternative, the 3905 Sacramento Street MOB, the 3901 Sacramento Street residential building, and the 460 Cherry Street Parking Garage would be retained and not demolished, as shown in Table 6-29 of the Draft EIR, page 6-

277. Please see C&R Table 3.22-1, below, for a comparison of buildings to be demolished or retained, and proposed new buildings under Alternative 2 and 3B at the California Campus.

C&R Table 3.22-1
Comparison of Alternatives 2 and 3B Buildings at the California Campus

Existing Buildings	Alternative 2		Alternative 3B	
	Demolish or Retain	Replaced By	Demolish or Retain	Replaced By
3905 Sacramento Street MOB	Demolish	Cherry Street MOB/Parking Garage (356 spaces)	Retain	--
3901 Sacramento Street Residential Building	Demolish		Retain	--
460 Cherry Street Parking Garage (290 parking spaces)	Demolish		Retain	--
3700 California Street Hospital	Demolish	Acute Care Hospital	Demolish	Parcel to be sold
3801 Sacramento Street Outpatient/Research Building	Demolish		Demolish	Parcel to be sold
3838 California Street MOB (120 parking spaces)	Retain	--	Retain	--
3848-3850 California Street Offices	Retain	--	Retain	--
3698 California Street	Demolish	Women's and Children's Center (477 parking spaces)	Demolish	Women's and Children's Center (197 parking spaces)
3773 Sacramento Street garage and 3698 California Street (Marshall Hale building)	Demolish		Demolish	

The comment states that the vehicle trips generated by the increase in building services at the California Campus under Alternatives 2 and 3B would overwhelm nearby residential streets not meant for the volume of traffic generated by the California Campus development and that the residents would suffer more aggravation and potential health impacts from vehicle congestion and cut-through traffic on residential streets. Please refer to Response ALT-29 (page C&R 3.22-57) regarding air quality impacts related to the California Campus. Transportation and circulation impacts related to the California Campus under Alternatives 2 and 3B are evaluated beginning on Draft EIR pages 6-231 and 6-358, respectively. The comment is correct that Alternative 2 would result in generation of increased traffic related to the California Campus development, compared to under the LRDP and existing conditions. As described in the Draft EIR, pages 6-231, under 2030 Cumulative plus Alternative 2 conditions, vehicle trips associated with the California Campus development would cause levels of service (LOS) to deteriorate from LOS D to LOS F at the Arguello/Geary, Arguello/California, Cherry/California, and Maple/California intersections, resulting in a significant impact at these intersections. No feasible mitigation measures have been identified that would reduce impacts of the Alternative 2 California Campus development on these intersections to less-than-significant levels. As stated in the Draft EIR, page 6-231, "project-level and cumulative impacts on traffic would be greater under Alternative 2 at the California Campus than under the proposed LRDP."

California Campus operations under Alternative 3B would result in greater impacts than under the proposed LRDP, but less than under existing conditions. As stated in the Draft EIR, page 6-359, "Alternative 3B would result in more vehicle trips related to development at the California Campus than

under the proposed LRDP. This is because the LRDP calls for the California Campus to effectively close by 2020. However, Alternative 3B would generate fewer trips around the California Campus than generated under existing conditions, because of the proposed demolition of the 3700 California Street Hospital and the reorganization of other services at the California Campus." Project-level and cumulative traffic impacts from implementing Alternative 3B at the California Campus would thus be less than significant and no mitigation measures would be required under this alternative. Thus, because less traffic would be generated from the California Campus under Alternative 3B than under existing conditions, nearby residential streets would not experience more through traffic than under existing conditions.

The comment states that under Alternative 3B, the California Campus would result in a greater number of visitors compared to existing conditions, and without the 356 parking spaces provided at the Cherry Street MOB/Parking Garage, parking would not be sufficient at this Campus. The comment refers to 356 parking spaces at the Cherry Street MOB/Parking Garage under Alternative 3B and cites page 6-177 of the Draft EIR. However, this is the number of parking spaces that would be included in the new Cherry Street MOB/Parking Garage that would be constructed at the California Campus under Alternative 2. To clarify the number of parking spaces that would be provided under Alternative 2, the Cherry Street MOB/Parking Garage would provide 356 structured parking spaces. In addition, under Alternative 2 the Women's and Children's Hospital would provide 477 new parking spaces underground, and the 120 existing parking spaces at the 3838 California Street MOB would be retained. Alternative 2 at the California Campus would provide a total of 953 parking spaces (existing and new parking spaces combined) at the California Campus. Please refer to Table 6-19 in the Draft EIR, page 6-181 for a summary table of the California Campus under Alternative 2.

Under Alternative 3B, 290 parking spaces at the existing 460 Cherry Street Parking Garage and 120 spaces at the existing 3838 California Street MOB would be retained. In addition, the new Women's and Children's Hospital would provide 197 new parking spaces. Alternative 3B would provide a total (existing and new parking spaces combined) of 607 structured parking spaces and 25 surface parking spaces. Please refer to Table 6-29 in the Draft EIR, page 6-277, for a summary table for the California Campus under Alternative 3B.Parking discussions for Alternatives 2 and 3B are provided beginning on Draft EIR pages 6-234 and 6-362, respectively. As stated in the Draft EIR, page 4.5-162, "San Francisco does not consider parking supply as part of the permanent physical environment and, therefore, does not consider changes in parking conditions to be environmental impacts as defined by CEQA." Parking conditions are not static; parking supply and demand varies from day to day, from day to night, from month to month, etc. Hence, the availability of parking spaces (or lack thereof) is not a permanent physical condition, but changes over time as people change their modes and patterns of travel. Parking deficits are considered by the lead agency, the San Francisco Planning Department, to be social effects, rather than impacts on the physical environment as defined by CEQA. Under CEQA, a project's social impacts need not be treated as significant impacts on the environment. Environmental documents should, however, address the secondary physical impacts that could be triggered by a social impact (State CEQA Guidelines, Section 15131[a]). This means that if parking were to result in secondary physical environmental impacts, these impacts should be evaluated and addressed. The CPMC LRDP Draft EIR adequately considered all secondary parking impacts and these were accounted for in the impact analysis of other relevant topics. The San Francisco Planning Department acknowledges, also, that parking conditions may be of interest to the public and the decision-makers. Accordingly, parking discussions are provided for informational purposes. Please also refer to Response TR-69 (page C&R 3.7-129) regarding parking supply and accommodation of parking demand. The potential secondary effects (e.g., transportation, air quality, and noise) from cars circling and looking for parking spaces have been appropriately considered in the alternatives analysis, including the analysis of the California Campus under Alternatives 2 and 3B.

The comment also states that increasing California Campus services from existing on-campus levels would "ruin the character of the primarily residential area" around this campus. Land use compatibility

under Alternatives 2 and 3B is analyzed beginning on pages 6-224 and 6-351, respectively. Under both alternatives, land use impacts would be greater than under the proposed LRDP, because use of the California Campus would continue, unlike under the LRDP where CPMC operations would mostly cease by 2020. However, neither alternative (2 or 3B) would introduce a new type of incompatible use at this Campus. The analysis concludes that neither alternative would result in a substantial adverse change to the campus area's existing character. Land use impacts at the California Campus under Alternatives 2 and 3B would be less than significant and no mitigation measures would be required at this campus, as stated on pages 6-225 and 6-352 for Alternative 2 and Alternative 3B, respectively. Aesthetic impacts and compatibility with surrounding neighborhood character and scale for the California Campus development under Alternatives 2 and 3B are analyzed beginning on pages 6-225 and 6-353, respectively. Aesthetic impacts at the California Campus under Alternative 3B would be less than under the proposed LRDP because of reduced development due to the demolition of the 3700 California Street Hospital. Aesthetic impacts at the California Campus would be greater under Alternative 2 than compared to the LRDP, due to the increased development at the California Campus under Alternative 2. The LRDP Draft EIR analysis concludes that impacts of development at the California Campus under both alternatives would be less than significant and would not substantially degrade the visual character or quality of the campus and no mitigation measures to reduce land use or aesthetic impacts would be required at the California Campus under these alternatives.

The decision-makers may select one of the alternatives presented in the document if determined feasible, or may approve, modify, or disapprove the LRDP as proposed, as part of their deliberations on the proposed LRDP.

Comment

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-101 ALT, duplicate comment was provided in 30-101 ALT]

"This 'Alternative 3B,' as described on Page 6-273 should not be seriously considered. CPMC will need to cut back on this alternative should it decide to carry it out. The same goes with 'Alternative 2.' The Jordan Park area cannot take on additional traffic and congestion on its smaller residential streets with the accompanying degradation in air quality for many sensitive receptors in the area especially near schools. In addition, Laurel Heights and Presidio Heights will be impacted negatively with the proposed scale of the build at 3698 California Street."

Response ALT-29

This comment is part of a longer discussion by the commenter regarding the California Campus development under the project alternatives analyzed in the CPMC LRDP EIR. The comment states that Alternative 2 and 3B should not be considered and, that the Jordan Park area cannot take on additional traffic congestion on its smaller residential streets with the accompanying degradation in air quality for sensitive receptors in the area surrounding the California Campus, especially nearby schools. Further, the comment states that the Laurel Heights and Presidio Heights area would be negatively impacted by the scale of the 3698 California Street Building under Alternatives 2 and 3B. Please refer to Response ALT-28 (page C&R 3.22-54) regarding traffic and circulation impacts under Alternative 2 and 3B at the California Campus.

The comment's concerns regarding Alternatives 2 and 3B are acknowledged. Please note that CPMC is not proposing that Alternative 2 or 3B be implemented. These alternatives are analyzed in the CPMC LRDP Draft EIR in order to analyze a range of reasonable alternatives, in accordance with Section 15126.6(a) of the State CEQA Guidelines, which requires analysis of a range of reasonable alternatives to the project, or to the project's location, that would feasibly attain most of the project's basic objectives, but would avoid or substantially lessen any of its significant effects. The decision-makers may select one

of the alternatives analyzed in the document, if determined feasible, or may approve, modify, or disapprove the project as proposed, as part of their deliberations on the proposed LRDP.

The comment states that Alternative 2 and 3B should not be considered and that these alternatives would result in degradation in air quality for sensitive receptors in the area surrounding the California Campus, especially nearby schools. Air quality impacts related to the California Campus development under Alternatives 2 and 3B are analyzed beginning on pages 6-236 and 6-364, respectively, and would be greater than under the proposed LRDP. Under the BAAQMD CEQA significance criteria, any large urban construction project likely would have significant unavoidable impacts to sensitive receptors. A construction project in excess of 100,000 square feet requires a minimum offset distance of 150 meters between the fence line of construction to a nearby sensitive receptor, based on BAAQMD screening tables for construction risks. Although these are screening tables, and distance could be reduce substantially through mitigation, it is unlikely that a project of this size anywhere in the city would result in less than significant impacts.

Localized impacts from construction and associated TAC emissions generated at the California Campus for both alternatives under the applicable (1999) Bay Area Air Quality Management District (BAAQMD) CEQA thresholds and the 2010 BAAQMD CEQA thresholds would be greater than under the proposed LRDP. Under Alternative 2, localized impacts from construction at the California Campus would be greater than under the LRDP and would present a significant and unavoidable health risk even with implementation of Mitigation Measures M-AQ-N2 and M-AQ-10b, under the applicable (1999) and thresholds, respectively. Under Alternative 3B, localized impacts from construction at the California Campus would be greater than under the proposed LRDP and would present a less-than-significant health risk impact under the applicable (1999) thresholds. However, localized impacts from construction would present a significant and unavoidable health risk even with implementation of Mitigation Measure M-AQ-10b under the thresholds. Localized impacts at the California Campus from campus operations under both alternatives under the applicable (1999) BAAQMD CEQA thresholds and the 2010 BAAQMD CEQA thresholds would be less than significant, but greater than under the proposed LRDP. Additional responses regarding construction-related TACs are included in Section 3.9.1.2, “Construction-Related Toxic Air Contaminants,” and operational emissions are included in Section 3.9.1.3, “Operational Emissions” in this C&R document.

The comment states that the scale of the proposed 3698 California Street Building at the California Campus under Alternatives 2 and 3B would negatively affect Laurel Heights and Presidio Heights. It is assumed that the comment is referring to development of the new Women’s and Children’s Hospital, which would replace the existing 3698 California Street Building under both Alternatives 2 and 3B. The Draft EIR evaluates the land use impacts of the new Women’s and Children’s Hospital for Alternative 2 on pages 6-224 to 6-225 and Alternative 3B on pages 6-351 to 6-352. As stated in the Draft EIR on page 6-225 regarding Alternative 2, the “increase in building heights associated with Alternative 2 [new development] may alter the appearance of the campus; however, the maximum building height on campus would not be a substantial increase [from existing on-campus and nearby development] under this alternatives…surrounding residential uses would likely notice this height increase on the California Campus under this alternative; however, the greater area would not likely experience a substantial change in land use character.” As stated in the Draft EIR on page 6-352, “the greater campus area would not likely experience a substantial change in land use character because of the taller hospital under Alternative 3B, and this impact would be less than significant, but greater than under the LRDP, which would have no impact.”

The Draft EIR also evaluates the visual impacts of the new Women’s and Children’s Hospital under Alternative 2 on pages 6-226 to 6-227 and Alternative 3B on pages 6-353 to 6-354. As stated in the Draft EIR on pages 6-227 and 6-353, the new Women’s and Children’s Hospital would be 25 feet taller than the existing 3698 California Street Building. Aesthetic impacts at the California Campus under Alternative

3B would be less than under the proposed LRDP because of reduced development due to the demolition of the 3700 California Street Hospital. Aesthetic impacts at the California Campus would be greater under Alternative 2 than compared to the LRDP, due to the increased development at the California Campus. The analysis concludes that aesthetic impacts related to development at the California Campus under both alternatives would be less than significant and would not substantially degrade the visual character or quality of the Campus and no mitigation measures to reduce land use or aesthetic impacts would be required at the California Campus.

Comment

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-106 ALT, duplicate comment was provided in 30-106 ALT]

"Furthermore, 'Alternative 3B' wants to build a structure at 3698 California/Parker Avenue that is at least 100 feet tall which is against building code of Height/Bulk District '80-E' per Page 2-125. Again, 'Alternative 3B' and 'Alternative 2' are not viable propositions for the Jordan Park area."

Response ALT-30

The comment states that the structure at 3698 California/Parker Avenue proposed under Alternative 3B is against "building code of Height/Bulk District '80-E.'" The comment also states that the California Campus under Alternatives 2 and 3B are not viable proposals for the Jordan Park area. The California Campus is located mainly within the 80-E Height and Bulk District. The new Women's and Children's Hospital at the California Campus would be 100 feet tall under Alternatives 2 and 3B. The 80-E Height and Bulk District limits building heights to 40 feet because of residential zoning, unless CU authorization is obtained.[25] Building heights of up to 80 feet are allowed with CU authorization. Under these alternatives, the 100-foot-tall Women's and Children's Hospital would exceed the height limit and would therefore require rezoning of the site. An amendment of the height and bulk map would be required for the new Women's and Children's Hospital under Alternatives 2 and 3B. Such a height and bulk district amendment for the site of the Women's and Children's Hospital building on the California Campus would be part of the approval process undertaken by the decision-makers after the EIR certification in the event that either of these alternatives were to be selected for approval. These approvals would be required from decision-makers before the development of the alternative could proceed, and this determination is not part of the CEQA environmental review process. Aesthetic impacts at the California Campus under Alternative 3B would be less than under the proposed LRDP because of reduced development due to the demolition of the 3700 California Street Hospital. Aesthetic impacts at the California Campus would be greater under Alternative 2 than compared to the LRDP, due to the increased development at the California Campus. The analysis concludes that aesthetic impacts related to development at the California Campus under both alternatives would be less than significant and would not substantially degrade the visual character or quality of the Campus and no mitigation measures to reduce land use or aesthetic impacts would be required at the California Campus. Please also see Response LU-9 (page C&R 3.3-64) for a discussion of the amendments to and authorizations under the Planning Code that have been requested as part of the proposed project and the process for obtaining approval of such amendments and authorizations.

This comment does not raise issues regarding the adequacy, accuracy, or completeness of the Draft EIR. The comment will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project.

[25] San Francisco Planning Code, Section 253.

Comment

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-159 ALT, duplicate comments was provided in 30-159 ALT]

"94. On Page 4.13-8, Table 4.13-4 states that 248 trees exist at the California Campus and 0 are proposed to be removed. However, in Alternative 3B, if there were to be a 10-story building built on the east side of the campus, how many trees would be removed?"

Response ALT-31

The comment is correct that under the proposed LRDP, none of the 248 existing trees at the California Campus are proposed for removal. No trees at the California Campus were determined to be significant based on surveys (Draft EIR page 4.13-8, Table 4.13-4). Under Alternative 3B, a total of 208 of the 248 trees at the California Campus would be affected (i.e., removed) for (1) demolition of the existing six-story 3698 California Street building and one-story below-grade 3773 Sacramento Street Parking Garage and construction of the new Women's and Children's Hospital on the east portion of the Campus; and (2) demolition of the existing 3700 California Street Hospital on the central portion of the Campus, and the parcels on which it is located would be sold by CPMC. The other 40 trees are located on the western portion of the California Campus, where they would remain as they are under Alternative 3B.

More specifically, as stated in the Draft EIR, page 6-369, "Alternative 3B at the California Campus could affect 208 trees, none of which were determined to be significant." In response to the number of trees that would be removed to accommodate the construction of the new Women's and Children's Hospital on the east side of the California Campus, approximately 70 trees (of the existing 248 trees) would be affected (i.e., removed) under Alternative 3B. Additionally, approximately 138 trees (of the existing 248 trees) would be removed during the demolition of the 3700 California Street Hospital. As stated on page 6-369, Mitigation Measure M-BI-N1 "would require preconstruction surveys [of trees] before demolition and construction activities during the nesting season (February through August)." This would reduce impacts on nesting birds to a less-than-significant level. CPMC would also be required to submit a tree protection plan to the Department of Public Works (DPW) that would also indicate trees that could be affected by Alternative 3B construction at the California Campus. Replacement trees for each street tree removed would be planted on the California Campus or along the street frontages (i.e., California, Sacramento, Cherry, and Maple Streets), or an in-lieu fee would be required pursuant to Section 143 of the Planning Code. Please also see Response BI-10 (page C&R 3.15-8) for a discussion of tree removal and replacement at the LRDP campuses.

3.22.4.3 DAVIES CAMPUS

Comment

(Donald Scherl, October 15, 2010) [74-2 ALT]

"2.0 Alternatives Not Considered (pg. S-30): The logical place for the new hospital is at the Davies Campus. Why was this alternative eliminated from further analysis?"

Response ALT-32

The comment states that the Davies Campus is a logical place for a new hospital and questions why an alternative with the new hospital located at the Davies Campus was rejected from further analysis in the LRDP's EIR. Section 6.3 of the Draft EIR identified alternatives to the proposed LRDP that were considered by the City but rejected from further analysis because they were determined to be infeasible

and did not meet the project objectives. An alternative that considered a new acute-care hospital at the Davies Campus, along with the reasons why it was rejected is included on page 6-20 of the Draft EIR.

As stated in the Draft EIR, "CPMC's initial planning efforts resulted in a three-campus plan that focused on consolidating as many of their services as feasible on a single, existing CPMC-owned campus." One of the reasons why the Davies Campus alternative was considered but rejected was that the concentration of acute-care facilities at the Davies Campus was considered to be relatively far away (2.0 and 2.2 miles, respectively) from CPMC's primary patient and physician base at the Pacific and California Campuses, respectively. The proposed Cathedral Hill Campus under the LRDP would be closer (0.2 mile and 0.8 mile, respectively) to CPMC's existing Pacific and California Campus patient and physician base. This alternative "was found to not meet the project objective of ensuring that the new centralized acute-care hospital is appropriately located, taking into account CPMC's patient base and use patterns and San Francisco's population concentration." Further, this alternative would not meet CPMC's goal for a new consolidated medical facility site north of Geary Boulevard. As described in the Draft EIR, pages 6-8 and 6-9, "only sites north of Geary Street/ Geary Boulevard were considered, consistent with CPMC's existing patient and physician distribution at and around the Pacific and California Campuses in the northern part of San Francisco, and the existing programmatic, business, service, and other relationships that exist at those campuses." Please also refer to Major Response HC-2 (page C&R 3.23-8) regarding the basis for the location and size of the proposed Cathedral Hill Hospital as the central acute-care hospital.

3.22.4.4 ST. LUKE'S CAMPUS

Comment

(Rachel Sater—Lost Block and Save Our Streets, October 19, 2010) [101-44 ALT]

"General: The alternatives evaluated in the DEIR are city-wide LRDP alternatives. Pursuant to CEQA, the DEIR must also consider project-level alternatives specific to the St. Luke's campus that would address identified significant impacts and, especially, identified significant and unavoidable impacts at the St. Luke's campus, including the potentially significant impacts of the replacement hospital on adjacent residential uses to the west. Alternative site plans, development intensities and activities at the St. Luke's campus are too inflexibly tied to the broader LRDP and thereby too readily dismissed. Therefore, the DEIR does not present a reasonable range of alternatives as required by CEQA."

Response ALT-33

The comment states that the alternatives evaluated in the Draft EIR are citywide LRDP alternatives and the Draft EIR must consider project-level alternatives specific to the St. Luke's Campus that would address especially address significant and unavoidable impacts identified for the proposed development at this Campus. The comment also states that alternative site plans, development intensities and activities at the St. Luke's Campus are too inflexibly tied to the broader LRDP and therefore too readily dismissed. Finally, the comment indicates that failure to do so leaves the CPMC Draft EIR with an inadequate range of alternatives as required by CEQA. The comment specifically refers to potentially significant and unavoidable impacts of the St. Luke's Replacement Hospital on adjacent residential uses to the west of the hospital development site, but does not provide any further remarks. The comment also states that the alternative site plans, development intensities, and activities at the St. Luke's Campus are inflexibly tied to the broader LRDP and, therefore, too readily dismissed.

CPMC delivers health care services to its patients based throughout San Francisco. The proposal for the St. Luke's Campus is part of the overall LRDP for CPMC in San Francisco. As such, the LRDP development intensities and activities that would occur at the St. Luke's Campus cannot be viewed in isolation, because if they did not occur at St. Luke's, they would need to occur on other CPMC campuses to meet a specific demand for health care services in the community. As discussed in Response ALT-1

(page C&R 3.22-11), the viability of the St. Luke's Campus should not be viewed independently, but rather based on its functionality as a component of the CPMC health care delivery system as a whole. Regarding the extent to which the alternatives were considered and evaluated in the Draft EIR to meet the stated project objectives of the proposed LRDP, please see Response ALT-1 (page C&R 3.22-11)**.** Please see Major Responses HC-2 and HC-3 (pages C&R 3.23-8 and 3.23-17) regarding the interrelationships within and between various CPMC facilities (different campuses) and other health care facilities in San Francisco.

Chapter 6 of the Draft EIR presents a range of potentially feasible alternatives that would avoid or substantially reduce the magnitude of one or more of the significant impacts identified under the proposed LRDP at the St. Luke's Campus. For example, under No Project Alternative 1A at the St. Luke's Campus, the existing St. Luke's Hospital tower and 1957 Building would be closed pursuant to the statutory mandate of SB 1953, and remaining buildings would be eventually sold and redeveloped. Under the No Project Alternative 1B at the St. Luke's Campus, all acute-care and inpatient care uses at the campus would be eliminated after January 1, 2013, pursuant to SB 1953. The existing St. Luke's Hospital tower would be demolished and redeveloped with a new outpatient facility. As concluded in the Draft EIR, pages 6-118 to 6-150, impacts under No Project Alternatives 1A and 1B would be less than impacts under the proposed LRDP. The purpose of the No Project Alternative is to allow decision-makers to compare the impacts of approving the proposed LRDP with the impacts of not approving the proposed LRDP (State CEQA Guidelines, Section 15126.6[e][1]). Alternative 2 would be identical to the development under the proposed LRDP for the St. Luke's Campus; thus, impacts would be identical. Alternative 3A, in contrast, would increase the development program at the St. Luke's Campus. Impacts identified with implementation of Alternative 3A at St. Luke's Campus would be greater than those identified with the proposed CPMC LRDP implementation at the St. Luke's Campus. Development at the St. Luke's Campus under Alternative 3B would be similar to that under the LRDP, except that the MOB/Expansion Building would be reduced in size compared to this building under the LRDP, resulting in slightly reduced impacts than the proposed LRDP.

The Draft EIR does not identify any significant and unavoidable noise impacts on residential uses adjacent to the St. Luke's Campus with implementation of the LRDP. The Draft EIR identified potentially significant noise impacts on off-site sensitive receptors, such as nearby residences, as a result of: (1) project-related construction and/or demolition activities at the residences on Guerrero Street and San Jose Avenue (Draft EIR, page 4.6-53); and (2) operation of stationary noise sources and ambulance entrance/exit at the residences located adjacent to and west of the proposed replacement hospital along 27th Street and Cesar Chavez Street (Draft EIR, page 4.6-75). However, as stated in the Draft EIR, page 4.6-53, LRDP-related construction and demolition noise impacts related to St. Luke's Campus development would be mitigated to less-than-significant levels with implementation of Mitigation Measure M-NO-N1, which involves implementing both physical (e.g., noise shielding) and operational (e.g., construction complaints coordinator) impact reduction measures that are considered practical and feasible. Noise impacts related to the operation of stationary noise sources would be mitigated to less-than-significant levels with implementation of Mitigation Measure M-NO-N3 (Draft EIR, page 4.6-78), which involves implementing physical (e.g., equipment design) impact reduction measures.

Potential air quality impacts to off-site sensitive receptors in proximity to the St. Luke's Campus with LRDP implementation are also addressed in the Draft EIR under both applicable (1999) and 2010 BAAQMD CEQA significance criteria, and described below. Health risk assessments related to temporary DPM emissions from LRDP construction activities were performed, because of the St. Luke's Campus development sites' proximity to sensitive receptors (e.g., residents). This impact would be less than significant under applicable (1999) thresholds at the St. Luke's Campus (Draft EIR pages 4.7-36 to 4.7-37). Under the 2010 BAAQMD CEQA significance criteria, construction activities at the St. Luke's Campus would result in short-term increases in emissions of diesel particulate matter (DPM) that would exceed the 2010 BAAQMD CEQA significance criteria and would expose sensitive receptors to

substantial concentrations of toxic air contaminants and $PM_{2.5}$ (Draft EIR page 4.7-70). Nearby residents are considered sensitive receptors and would be affected. The Draft EIR concludes on page 4.7-70 that "while it is possible that Mitigation Measure M-AQ-N10c could reduce the carcinogenic risk and chronic noncarcinogenic health hazards posed by DPM emissions below the thresholds, it is unknown at this time to what extent such equipment will be available at the time of construction." However, at the St. Luke's Campus under both the CPMC LRDP and alternatives, all significant and unavoidable impacts to off-site sensitive receptors were either: (a) temporary construction impacts for which mitigation would not be reasonable or feasible; or (b) non-localized air quality and GHG emissions impacts that would not be changed by moving the site of the St. Luke's Replacement Hospital farther west toward Guerrero Street, as suggested by the comments. Therefore, the suggested relocation of the hospital at the St. Luke's Campus would still result in significant and unavoidable air quality impacts under the 2010 BAAQMD CEQA significance criteria for DPM emissions.

Operational air quality emissions of the proposed LRDP at the St. Luke's Campus would contribute to a cumulatively considerable and significant unavoidable operational impact, but its toxic air contaminant (TAC) emissions would not be cumulatively considerable under the applicable (1999) BAAQMD significance criteria (Draft EIR page 4.7-56). Operational emissions of the proposed LRDP at the St. Luke's Campus would not contribute to cumulatively considerable operational impact on off-site sensitive receptors, but would have a potentially cumulatively considerable and significant unavoidable construction air quality impact on off-site receptors under the 2010 BAAQMD CEQA significance criteria (Draft EIR page 4.7-83).

Exposure of off-site sensitive receptors to TAC emissions during operation of the LRDP would be less than significant under applicable (1999) 2010 BAAQMD CEQA significant criteria for the St. Luke's Campus (Draft EIR pages 4.7-50 to 4.7-51 and pages 4.7-76 to 4.7-77, respectively).

Please see Response ALT-1 (page C&R 3.22-11) for a discussion of the adequacy of the range of alternatives included in the Draft EIR. Section 15126.6(c) of the State CEQA Guidelines states that "The range of potential alternatives to the proposed project shall include those that could feasibly accomplish most of the basic objectives of the project and could avoid or substantially lessen one or more of the significant effects." The EIR should briefly describe the rationale for selecting the alternatives to be discussed." As explained in Response ALT-1, the Draft EIR appropriately complied with the requirements of CEQA to analyze a reasonable range of alternatives to the proposed LRDP. Therefore, additional alternatives are not required under CEQA.

Comment

(Rachel Sater—Lost Block and Save Our Streets, October 19, 2010) [101-47 ALT]

"No Medical Office Building Alternative: The DEIR should evaluate an alternative with no new medical office building and the construction of the St. Luke's Replacement Hospital where the new medical office building is proposed. The existing 60 licensed operational acute-care beds could be temporarily provided at the Cathedral Hill campus and/or the other three campuses to maintain continuum of care. CPMC has acknowledged that the new medical office building may not be built due to a possible lack of sufficient hospital use or market demand for medical office space at the St. Luke's Campus. This strong possibility requires an evaluation of the potential impacts of the LRDP without the new medical office building. It also presents an opportunity to evaluate a feasible location for the replacement hospital that would avoid or reduce the potentially significant impacts and unavoidable significant impacts of the replacement hospital on adjacent residential uses to the west."

Response ALT-34

The comment states that the Draft EIR should evaluate a no new MOB alternative and construction of the St. Luke's Replacement Hospital at the site on St. Luke's Campus where the MOB/Expansion Building is

proposed under the LRDP (i.e., the site of the existing on-campus 1970s Hospital Tower) and that the Draft EIR evaluate the environmental impacts of such an alternative that reduces the St. Luke's Campus development's impacts on the adjacent residential units. The comment states that CPMC could temporarily provide the existing 60 on-campus licensed operational acute-care beds on St. Luke's Campus at one of the other CPMC campuses to maintain a continuum of care. Please refer to Response ALT-33 (page C&R 3.22-61) regarding (1) the potentially significant and significant unavoidable impacts to off-site sensitive receptors at the St. Luke's Campus under the LRDP and a brief summary of the conclusions in the CPMC LRDP Draft EIR and (2) how the CPMC LRDP Draft EIR presents a reasonable range of potentially feasible project alternatives to the CPMC LRDP that would avoid or substantially reduce the significant impacts identified under the proposed LRDP at the St. Luke's Campus. Please also see Response ALT-1 (page C&R 3.22-11) regarding the adequacy of the range of potentially feasible alternatives considered in the CPMC LRDP Draft EIR.

The comment makes the suggestion of temporarily using the proposed Cathedral Hill Campus or another CPMC campus for filling in the gap left by the loss of 60 licensed operational acute-care beds at St. Luke's Campus with implementation of an alternative under which the new St. Luke's Replacement Hospital would be constructed at the site where the MOB/Expansion Building is proposed under the LRDP (the site of the existing 1970 Hospital Tower on St. Luke's Campus). Under such a scenario, the St. Luke's Replacement Hospital would be constructed at the site where the existing St. Luke's Hospital Tower is currently located in the northeastern portion of the campus. Placement of a hospital on the site of the existing St. Luke's Hospital tower was evaluated by CPMC and the Blue Ribbon Panel, and rejected by the panel primarily on the grounds that it would require disruption of services at the St. Luke's Campus during decommissioning and demolition of the existing hospital tower under this scenario. Temporarily relocating the acute-care beds to another CPMC campus would eliminate provision of acute-care services at the St. Luke's Campus and its surrounding area and it would require St. Luke's Campus patients and visitor to travel longer distance to receive medical care in the interim. This would not meet the project objective related to continuing to provide acute-care services at St. Luke's throughout the construction period.

CPMC's Board of Directors adopted the Blue Ribbon Panel's preferred option of building the St. Luke's Replacement Hospital over San Jose Avenue (i.e., Option 5). However, the design of the proposed LRDP evolved as more detailed design studies were conducted and as CPMC refined its proposal for the St. Luke's Campus. The footprint necessary for the proposed St. Luke's Replacement Hospital is larger than was anticipated at the time the Blue Ribbon Panel evaluated the proposed development at the St. Luke's Campus. Based on the size of the proposed St. Luke's Replacement Hospital, it would not be possible to construct this new hospital building in the footprint area of the existing St. Luke's Hospital Tower.

Because the Draft EIR has considered a reasonable range of alternatives, it is not necessary to analyze an alternative that would involve constructing the St. Luke's Replacement Hospital at the site of the existing Hospital Tower. The comment further restates the argument, advanced in 2008 during the Blue Ribbon Panel process, that the current census at the St. Luke's Hospital[26] could be accommodated at another existing CPMC campus or at the future proposed Cathedral Hill Campus. The current patient census at St. Luke's could theoretically be accommodated at other CPMC campuses, with some disruption and required physical improvements, within the existing hospitals at the Pacific, California, and Davies Campuses. However, no solutions have been offered for the various impacts identified by the Blue

[26] The comment states that there are 60 "licensed operational acute-care" beds at St. Luke's. For clarity, there are currently 150 licensed acute-care beds in addition to 79 licensed skilled nursing beds. According to OSHPD data, the average daily census of acute-care beds at the St. Luke's Campus for the 8-year period from 2002 through 2009 was 60 patients (40 percent occupancy), ranging from a low of 50 (33 percent occupancy) in 2008 to a high of 71 (47 percent occupancy) in 2003. For the most recent year available, 2009, St. Luke's Hospital averaged 51 acute-care patients (34 percent occupancy). OSHPD, ALIRTS, Annual Utilization Report of Hospitals for St. Luke's Hospital, 2002 through 2008 and California Pacific Medical Center - St. Luke's Campus, 2009, available at http://www.alirts.oshpd.ca.gov, accessed Apr. 7, 2011.

Ribbon Panel on the delivery of health care to the immediate surrounding community served by the St. Luke's Campus that would result from such a relocation. These include the following concerns related to the St. Luke's Campus under the proposed LRDP:

- Patients could be disrupted, either directly because existing patients would be moved from one campus to another, or indirectly because future admitted patients would be redirected to other CPMC campuses, requiring longer patient and visitor travel routes. The Blue Ribbon Panel expressed concerns that the patient population at St. Luke's Campus is particularly susceptible to disruption in the continuity of care, because of a reduced ability to pay, reduced ability to travel to other campuses, and reduced percentage of patients with proficient English language skills as compared to patient populations served by other CPMC campuses. Additionally, the comment's suggestion that acute-care beds at St. Luke's be temporarily be relocated to other CPMC campuses would require further transfer of the same number of patients from the California and Pacific Campuses to the Cathedral Hill Campus as under the proposed LRDP, plus transfers of patients out of the existing St. Luke's Hospital to other facilities, and then back to the new St. Luke's Replacement Hospital at St. Luke's Campus once it has been completed. The overall number of patients disrupted by the LDRP (from having to be transferred systemwide from their immediate neighborhoods) would thus be increased if the LDRP included temporary relocation of acute-care beds from the St. Luke's Campus to other CPMC campuses.

- A full-service Emergency Department at St. Luke's Campus that often provides backup to San Francisco General Hospital's Emergency Department would have to close for at least 2 years.

- Primary care and other physicians who have offices at or near the St. Luke's Campus and primarily admit patients to St. Luke's could be affected. It is assumed that many of these physicians could not relocate to areas closer to their relocated patients, and that their businesses, and therefore the continuity of physician support for the St. Luke's Campus, would be jeopardized. Physicians currently providing services at the St. Luke's Campus would be unlikely to temporarily move in order to follow their patients to other hospitals, and therefore, their business could be jeopardized during the interim period when the patients are moved elsewhere. Moreover, under the scenario proposed by this comment, physicians would be required to relocate two times—first to another campus, and then back to the St. Luke's Campus. This is unlike the physicians at the California and Pacific Campuses under the proposed LRDP, some of whom would relocate first once to the new Cathedral Hill Campus. Further, doctors who choose to remain at the Pacific Campus would have the benefit of still being located on a fully active outpatient campus after 2015. With respect to the California Campus, it is assumed that specialist physicians would follow patients to the new Cathedral Hill Campus and relocate to the Cathedral Hill MOB, whereas primary care physicians may choose to remain within the California Campus neighborhood. In contrast to the Pacific Campus, St. Luke's Campus would have relatively minimal services during the 2-year period after the existing 1970 hospital closes under the scenario proposed by the comment. Some primary care physicians at the St. Luke's Campus would potentially choose to remain at the Monteagle Medical Center building even while there is no hospital at the campus, but specialists would likely either move or change markets/cities in order to stay close to a volume of patients necessary to sustain their practices. A temporary 2-year suspension of acute-care services at the St. Luke's Campus would also result in a permanent shift in services on physician referral patterns and relationships where specialists would likely move or change markets/cities. This would take considerable time and effort by the institution (CPMC) to reinstate if the St. Luke's Campus is to be successful in the future. Additionally, unlike the Cathedral Hill Campus, which would include new MOB space under the proposed LRDP, the St. Luke's Replacement Hospital development proposed by the comment (i.e., St. Luke's Replacement Hospital with no MOB/Expansion Building) would not have additional MOB space for support, following the completion of the development at the St. Luke's Campus, under this scenario.

Please also see Major Response HC-2 (page C&R 3.23-8) regarding the size and scope of medical services to be offered at the St. Luke's Campus.

Comment

(Rachel Sater—Lost Block and Save Our Streets, October 19, 2010) [101-50 ALT]

"Replacement Hospital at Existing Location: The DEIR should evaluate an alternative that involves demolition of the existing hospital tower and construction of a replacement hospital in the same location. This alternative would be comparatively feasible and would avoid or reduce the potentially significant impacts of the replacement hospital on adjacent residential uses to the west. The existing 60 licensed operational acute-care beds could be temporarily provided at the Cathedral Hill campus and/or the other three campuses to maintain continuum of care. The existing surface parking lot west of San Jose Street could continue to be used for employee parking. Or the medical office building included in the proposed LRDP could be developed on the existing surface parking lot west of San Jose Street, and thereby avoid 24-hour emergency department and loading area operations, with associated noise, lighting, visual and traffic impacts at that location. Alternatively the portion of the campus west of San Jose Street could be developed with residential uses consistent with the RH-2 zoning and compatible with existing adjacent residential uses."

Response ALT-35

The comment states that the Draft EIR should (1) evaluate an alternative that would construct the new replacement hospital on the site of the existing 1970 St. Luke's Hospital Tower, because this is a comparatively feasible alternative and would avoid or reduce the potentially significant impacts of the LRDP-proposed St. Luke's Replacement Hospital on adjacent residential uses to the west; (2) consider temporarily relocating the existing 60 licensed operational acute-care beds at the 1970 Hospital Tower on the St. Luke's Campus to one of the other existing or proposed CPMC campuses under this alternative scenario; (3) consider continuing to use the existing surface parking lot (located on the St. Luke's Campus at 3615 Cesar Chavez Street) for employee parking; (4) consider development of the St. Luke's MOB/Expansion Building on the parking lot and consider development of the portion of St. Luke's Campus west of San Jose Street (i.e., the parking lot) with residential uses, which would be consistent with the existing RH-2 zoning and compatible with existing adjacent residential uses. The comment states that one of these alternatives would be feasible and would avoid or reduce the significant impacts of the new hospital on adjacent residential uses to the west. Please see Response ALT-1 (page C&R 3.22-11) for more information regarding the range of potentially feasible alternatives considered and evaluated in the Draft EIR**.** In response to the comment's suggestion to place the replacement hospital on the site of the existing St. Luke's Hospital tower, this specific scenario was evaluated by CPMC and the Blue Ribbon Panel and was rejected by the panel primarily because of the disruption of services required by decommissioning and demolition of the St. Luke's Hospital tower under this scenario. Please See Response ALT-34 (page C&R 3.22-63) for more information regarding this suggested alternative and reasons why it was not pursued in the CPMC Draft EIR.

The alternative scenarios for St. Luke's Campus development described in this comment suggests that either an MOB or residential uses could be developed on the existing surface parking lot west of San Jose Avenue, presuming that either the MOB or residential uses could be built prior to, or in place of, the proposed replacement hospital. This would require that the existing hospital be demolished before any new hospital development capacity is available on the St. Luke's Campus and that the site of the old hospital is developed with the new replacement hospital. The comment suggests that during new replacement hospital construction on the site of the former demolished hospital, 60 licensed acute care beds at the existing 1970's St. Luke's Hospital tower would be temporarily relocated to other existing or proposed CPMC campuses. It is assumed that the comment is not suggesting that the replacement hospital at St. Luke's Campus not be built at all. The comment also states continuing employee parking (besides MOB development site or residential uses) at this lot as an option.

A scenario in which the locations of the proposed MOB/Expansion Building and Replacement Hospital buildings at St. Luke's Campus were switched would not result in substantially different physical environmental impacts. This is because the overall development program and footprint at the St. Luke's Campus would be the same if these buildings were not switched. As described in Response ALT-34 (page C&R 3.22-63), constructing the St. Luke's Replacement Hospital in the location of the existing hospital tower (where the MOB/Expansion Building is proposed under the LRDP) would not be feasible on the grounds that it would result in disruption of services at St. Luke's Campus and surrounding areas during decommissioning and demolition of the existing St. Luke's hospital under this scenario. Presuming that these relocation issues could be overcome, switching the sites of the proposed MOB/Expansion Building and St. Luke's Replacement Hospital could possibly result in some reduction, if not elimination, of operational air quality and noise impacts of the project on residential neighbors to the west of St. Luke's Campus.

However, the Draft EIR did not identify any significant unavoidable operational air quality or noise project impacts on neighbors of the St. Luke's Campus that could be reduced by such a switch. Impacts that are (1) less than significant to begin with; (2) reduced to a less-than-significant level with implementation of mitigation measures; or (3) significant and unavoidable identified in the Draft EIR for the LRDP would be the same under these scenarios suggested by the comment. Please refer to Response ALT-33 (page C&R 3.22-61) regarding potentially significant air quality and noise impacts of the LRDP to off-site sensitive receptors at St. Luke's Campus. A reasonable range of alternatives has been evaluated in the EIR for the LRDP consistent with the State CEQA Guidelines, as explained in Response ALT-1 (page C&R 3.22-11).

Comment

(Rachel Sater—Lost Block and Save Our Streets, October 19, 2010) [101-51 ALT]

"Lower Impact Emergency Department and Loading Area Location: The DEIR should evaluate alternative locations for the emergency department and loading area, two aspects of the replacement hospital that are particularly incompatible with the adjacent residential uses. This alternative would avoid or reduce some potentially significant impacts and potentially unavoidable significant impacts of the replacement hospital on adjacent residential uses to the west. The DEIR should evaluate leaving San Jose Street open so ambulance access and loading could occur away from neighboring sensitive residential uses, thereby avoiding safety conflicts between vehicles, pedestrians and bicyclists on Valencia Street and Cesar Chavez Street, and impacts of loading space on traffic flow, pedestrians and bicycles along Cesar Chavez Street. The DEIR should also evaluate location of both emergency and loading access on Cesar Chavez Street."

Response ALT-36

The comment states that the Draft EIR should evaluate alternate locations for the Emergency Department and loading area for the proposed new Replacement Hospital at the St. Luke's Campus, which would result in reducing some of this development's potentially significant and significant unavoidable impacts (e.g., air quality and noise impacts) on adjacent residential uses under the LRDP. Regarding the range of potentially feasible alternatives considered and evaluated in the Draft EIR, please see Response ALT-1 (page C&R 3.22-11). Please also refer to Response ALT-33 (page C&R 3.22-61) regarding the potentially significant impacts identified at the St. Luke's Campus under the LRDP, especially impacts on adjacent residential uses to the west. The Draft EIR did consider and analyze a project variant at the St. Luke's Campus that would reverse the proposed locations of the Emergency Department ambulance bay and the loading dock (Draft EIR page 2-186), which is shown on Figure 2-60 in the Draft EIR, page 2-199.

Potential impacts of the LRDP development on emergency access at the St. Luke's Campus are analyzed in Impacts TR-92 and TR-93 in the Section 4.5, "Transportation and Circulation," on page 4.5-206 of the Draft EIR. Potential impacts on loading activities and passenger loading are analyzed in Impacts TR-89,

TR-90, and TR-91 on pages 4.5-205 to 4.5-206 of the Draft EIR. As described in these discussions, impacts on emergency access and loading with the development of the LRDP at the St. Luke's Campus would be less than significant. Potential impacts on bicyclists and pedestrians of the LRDP at the St. Luke's Campus are presented in Impacts TR-87 and TR-88 on pages 4.5-203 and 4.5-204, respectively, of the Draft EIR. Impacts on bicyclists and pedestrians with the development of the LRDP at the St. Luke's Campus would be less than significant and further reduced by Improvement Measures I-TR-87 and I-TR-88. The comment further states that the Draft EIR should evaluate leaving San Jose Street open so that ambulance access and hospital loading could occur away from neighboring sensitive residential uses, thereby avoiding safety conflicts between vehicles, pedestrians and bicyclists on Valencia Street and Cesar Chavez Street, and avoiding impacts of hospital loading on traffic flow, pedestrians and bicycles along Cesar Chavez Street. The comment also states the Draft EIR should also evaluate the location of both emergency and loading access on Cesar Chavez Street. Because no significant unavoidable impacts were identified for emergency access, loading, bicyclists, or pedestrians at the St. Luke's Campus with LRDP development, the Draft EIR is not required to consider alternatives in the Draft EIR regarding locating emergency and loading access on Cesar Chavez Street. In addition, there is a variant regarding an alternate location for the Emergency Department for the Replacement Hospital at the St. Luke's Campus which is fully described an analyzed in the Draft EIR, Chapters 2 (page 2-186) and 3 (page 3-10), respectively. Please see Response TR-99 and TR-110 (page C&R 3.7-167 and 3.7-193) for additional information on emergency access as it relates to access, loading, and traffic flow.

Comment

(Rachel Sater—Lost Block and Save Our Streets, October 19, 2010) [101-45 ALT3A]

"Blue Ribbon Panel Options: In 2008, San Francisco Supervisor Michela Alioto-Pier and Mitch Katz, M.D., director of San Francisco's Department of Public Health, convened a 'blue ribbon' panel of experts to look at the health care needs of San Francisco, and in particular the role that St. Luke's plays in meeting those needs. The Blue Ribbon Panel recommended that the CPMC Board consider Option 5 (building over San Jose Street) and Option 3 (the 1912 Building and preserving the chapel and tree), with a preference for Option 5, because it better met identified value criteria: continuity of service to patients, low neighborhood impact, an accessible and welcoming presence, and lowest life cycle costs. In public hearings, CPMC has repeatedly claimed that it is following all of the Blue Ribbon's recommendations, and its Board formally resolved to follow the BRP's recommendations. Nevertheless, and despite an associated long public process involving dozens of stakeholder groups and an implied overall environmental impact-reducing objective, neither of the 'blue ribbon' options was evaluated in the DEIR. As was recommended by the Blue Ribbon Panel, these alternatives should be thoroughly evaluated in the DEIR as a means of understanding project impacts and reducing or avoiding potentially significant impacts on the adjacent residential neighborhood to the west and south."

Response ALT-37

The comment states that the St. Luke's Campus under Alternative 3A is not consistent with the recommendations of the Blue Ribbon Panel. Specifically, the comment states that Option 5 (building over San Jose Avenue) and Option 3 (the demolition of the 1912 Building while preserving the chapel and tree) were not considered. Please also see Response HC-53 (page C&R 3.23-203), which explains the evolution of Option 5 and reasons for not incorporating Option 3 into the proposed LRDP or alternatives. Other comments state that Alternative 3A does not include the Blue Ribbon Panel's recommendations of medical services (e.g., medical/surgical services, pediatrics, center of excellence in senior health care, and skilled nursing beds to serve orthopedics).

Over the summer of 2008, the Blue Ribbon Panel (more fully described in Response HC-53 on page C&R 3.23-203) was convened to hear public input and make recommendations about the future of the St. Luke's Campus. In meetings held on June 18, 2008, and June 25, 2008, the Blue Ribbon Panel was given

information about on-site development issues at the St. Luke's Campus[27] and the panel discussed a variety of siting options on the St. Luke's Campus. In the June 18, 2008 meeting, three site options were presented: Option 1, the site of the existing hospital ("1970 Tower site"); Option 2, the site of the existing Physician's parking lot ("Parking Lot site"); and Option 3, the site of the existing 1912 and 1957 building ("1912 site"). The Blue Ribbon Panel requested that two additional sites be evaluated: Option 4, hospital development on the site of the existing St. Luke's Campus Parking Garage ("Parking Garage site"); and Option 5 ("San Jose site"), which is located within an existing public right-of-way (San Jose Avenue) and immediately adjacent to the existing hospital in order to provide some space between the proposed St. Luke's Replacement Hospital and the neighboring residences located immediately to the west.

The Blue Ribbon Panel developed a formal recommendation on July 1, 2008, and specifically identified "Option 5" as the preferred alternative, because it best met the "value criteria" identified by the Blue Ribbon Panel, which included: Continuity of Service to Patients, Low Neighborhood Impact, An Accessible and Welcoming Presence, The Lowest Life Cycle Costs of the New Facility, Time to Entry, Future Flexibility, and Openness to New Care Models.

Once the Blue Ribbon Panel's recommendations were largely accepted by the CPMC Board of Directors, facility planning efforts began in earnest, and public meetings to provide input to this process were convened. The CPMC planning team started with the recommended Option 5 siting, but the actual hospital footprint was shifted westward to accommodate planning challenges discovered during the initial design phase.

The St. Luke's Replacement Hospital plan, discussed with the public on January 26, 2009, retained an approximately 50-foot setback from the neighboring residences to the west[28], as opposed to approximately 120 feet setback shown in the earlier Blue Ribbon Panel site planning diagrams. At the public meeting on January 26, 2009, and in direct meetings with neighbors afterwards, strong concerns about the presence of outdoor loading activities in the setback area resulted in the replacement hospital proposal being modified to enclose the loading activities within the replacement hospital, with the loading entrance proposed to be off of Cesar Chavez Street.

On June 23, 2009, another public meeting was convened to discuss the evolving St. Luke's Replacement Hospital design. An updated replacement hospital design that addressed the community response to the previous January 26, 2009 design was presented, which addressed various constraints identified during the design process.[29] This updated design proposed to enclose the hospital's loading area in order to reduce the visibility and potential noise associated with required loading activities. To accomplish this, the replacement hospital building footprint was moved further toward the western property line.

Since this design proposal, the proposed St. Luke's Replacement Hospital design evolved in two additional ways to further align with the intent of the Blue Ribbon Panel. First, the nursing tower has been oriented north-south and moved eastward, resulting in a lower podium/base along the western edge of the site. Secondly, a consistent 17-foot setback has been provided along two-thirds of the length of the western face of the podium.[30]

The proposed LRDP at the St. Luke's Campus is consistent with the intent of Blue Ribbon Panel Option 5, but is not the same as the preliminary schematic plans drawn prior to the detailed replacement hospital facility design being undertaken.

---

[27] California Pacific Medical Center St. Luke's Campus Master Planning, 2008 (June 18) *Blue Ribbon Panel Presentation* and California Pacific Medical Center St. Luke's Campus Master Planning, 2008 (June 25) *Blue Ribbon Panel Presentation.*

[28] Proposed Site Plan for St. Luke's Campus as shown in "You are invited to a Community Forum on the New St. Luke's Hospital The Future of Health Care in San Francisco" 2009 (January 26).

[29] St. Luke's Replacement Hospital Site Advantages/Constraints. 2009 (June 17),

[30] CPMC. St. Luke's Campus Update. 2009 (June 23).

The comments also state that Option 3 considered by the Blue Ribbon Panel (construction of the St. Luke's Replacement Hospital on the 1912 Building site and preserving the historic chapel and landmark tree) should be evaluated. As required by CEQA, the Draft EIR evaluates a reasonable range of alternatives, including two variations of the No Project Alternative at the St. Luke's Campus and Alternatives 3A and 3B, which would result in a different level of development at the St. Luke's Campus, compared to development at this campus under the LRDP.

Although an EIR must consider a reasonable range of potentially feasible alternatives, it does not have to identify and analyze alternatives that would not meet most of a project's basic objectives. An EIR also does not have to discuss every possible variant or permutation of analyzed alternatives,[31] or alternatives that would not further reduce or eliminate significant project effects. Because the Draft EIR has considered a reasonable range of alternatives, it is not necessary to analyze alternatives that would involve configuring the St. Luke's Replacement Hospital to the precise footprint evaluated by the Blue Ribbon Panel as Option 5, or that would involve constructing the St. Luke's Replacement Hospital at the site of the 1912 Building as per Blue Ribbon Panel's Option 3, as suggested by the comment.

Demolition and removal of the 1912 Building would also be a significant impact with respect to effects on the St. Luke's Campus historic architectural resources. As explained in the Draft EIR, page 4.4-33, the historical evaluation of the St. Luke's Campus indicated that the 1912 Building (3555 Cesar Chavez Street) appears to be eligible for listing in the California Register of Historical Resources under Criterion 3 (architecture) as an early San Francisco work of a master architect, Lewis P. Hobart, and for embodying the distinctive characteristics of the unified hospital design from the early 20th century.[32] The Planning Department's Preservation Technical Specialist concurred with this finding.[33] An alternative that would involve construction of the St. Luke's Replacement Hospital on the site of the existing 1912 Building would therefore likely result in significant and unavoidable impacts to a historical resource.

3.23 OTHER ISSUES

3.23.1 HEALTH CARE

During the Draft EIR public review and comment period, many comments related to a broad set of health care issues were received by the City. As is explained in Response INTRO-7 (page C&R 3.1-17), these issues are social and economic in nature, and under CEQA, are not required to be addressed in an EIR. Nevertheless, reflecting the intense interest in these issues expressed by the public and the decision-makers, and in the interest of responsiveness, the Planning Department has provided extensive information in response to these comments.

Many of the comments represent interconnected and interrelated questions about issues related to acute, non-acute, and emergency health care services provided by CPMC; access to health care by people of all areas and income levels in San Francisco; the relationship of proposed changes to CPMC facilities to other hospitals in the City; and the relationship of the proposed LRDP to comprehensive planning of health care services in San Francisco. To most effectively address the myriad concerns and questions raised, this section is presented in a different format than the other sections in this C&R document. The first part of this section provides comprehensive responses to major comments about health care, grouped as follows:

Major Response HC-1 Acute-Care Beds

Major Response HC-2 Location, Size, and Scope of Services at Cathedral Hill, St. Luke's, and Davies

Major Response HC-3 Impacts on Other Hospitals

Major Response HC-4 Psychiatric Beds

Major Response HC-5 Effect on Emergency Services

Major Response HC-6 Skilled Nursing Facilities (SNF)

Major Response HC-7 Access to Single-Occupancy Rooms

Major Response HC-8 Access to Health Services

Major Response HC-9 Health Care Master Plan

After these Major Responses, commencing at Section 3.23.1.3 at page C&R 3.23-44, a set of responses to all comments received on the issue of health care follows. Many of these responses to individual comments reference back to one or more of the Major Responses.

3.23.1.1 MAJOR RESPONSES TO COMMENTS

Major Response HC-1: Acute-Care Beds

Comments Overview

A number of comments state that CPMC would reduce the number of existing licensed, acute-care beds in a manner that would cause a reduction in local and regional health care services. Several of the comments suggest that the reduction might have the secondary effects of increasing demand on other health care providers, including San Francisco General Hospital, and increasing traffic, air quality, and public service impacts caused by shifting patients to other non-CPMC facilities.

Response

The proposed LRDP would reduce the number of licensed acute-care beds with the proposed shift to single-patient rooms, but this reduction in underutilized, multi-person occupancy rooms would not result in a loss of services. Sufficient licensed bed capacity would be provided within the CPMC system to meet current and projected patient demand. No direct or indirect physical environmental impacts would occur from the reduction in the total number of licensed acute-care beds, as explained below.

Reduction in Licensed Beds

Overall, licensed beds (beds that CPMC would hold a license to operate) on all CPMC campuses in San Francisco for all types of beds (i.e., acute care, skilled nursing, and psychiatric) would decrease by 271 beds under the proposed LRDP, from approximately 1,174 licensed beds (existing in 2010) to 903 licensed beds, a 23 percent reduction in total licensed beds. Licensed acute-care beds would be reduced from 890 to 698, a 22 percent reduction. No reduction in psychiatric beds would occur under the proposed LRDP (which would remain at 18). Licensed skilled nursing beds would be reduced from 218 to 139, a 36 percent reduction. See update to Table 2-2, "CPMC Existing and Proposed LRDP Licensed Hospital Bed Uses," in the Draft EIR, page 2-10, in Response PD-6 (page C&R 3.2-6), and Ch. 4, "Draft Text Changes" of this C&R document.[1]

A number of comments state that a reduction in licensed beds would equate to an equivalent loss of health care services. Although the proposed LRDP would result in a reduction in licensed acute-care beds, it would not reduce the level or capacity of care. This largely would be because the remaining number of beds would still be sufficient to deliver all of the acute-care programs and services CPMC delivers currently and plans to deliver in the future. Also, new single-patient rooms as planned under the LRDP for all CPMC campuses that would provide acute care inpatient beds would allow a more efficient utilization than the multi-patient rooms that currently exist at CPMC campuses, as explained below.

Older hospital buildings, such as the St. Luke's 1970 hospital tower and CPMC's existing acute-care facilities at the Pacific and California Campuses, generally have been licensed to enable the placement of two or more patients in the same room. However, in practice, often only one bed per room is available or even needed because of patient demand. The number of beds that are actually used for patient care on a daily basis in the CPMC system is substantially less than the number that is licensed. For example, the California Office of Statewide Health Planning and Development (OSHPD) indicates that the average daily census (actual patients in licensed beds) for all of CPMC in 2009 was 559; an occupancy rate of 48 percent for licensed beds (of the 1174 total beds) systemwide.[2] In 2010, CPMC's observed maximum systemwide census was 656; an occupancy rate of 56 percent[3] (which is substantially below the proposed total of 903 licensed beds). These low occupancy rates reflect a past industry practice of retaining licensed acute-care bed capacity beyond what the actual demand required.

With the shift from multi-patient rooms to single-patient rooms under modern hospital guidelines, newer facilities, such as the proposed St. Luke's Replacement Hospital and the proposed Cathedral Hill Hospital, are projected to have a higher occupancy rate, that is, a much higher percentage of licensed beds are expected to be used (about 80 percent, with variation by bed type) than with the current multi-bed

---

mode,[4] and thus could serve a larger number of patients than a comparable hospital with shared patient rooms. The efficient use of beds in a multi-patient room environment is limited by a number of factors, such as the gender and diagnosis of the patients, as well as infection control and privacy concerns. Compared to multi-patient rooms, single-patient rooms provide a number of benefits, including:

- superior infection control through reductions in airborne-related and contact-related nosocomial (hospital-acquired) infections;
- better patient flows and fewer patient transfers;
- increased patient safety through fewer medication errors;
- improved patient privacy, in turn encouraging more thorough consultations between patients and their care providers (Patient privacy is a personal patient-family concern, when addressing delicate issues of medical treatment, procedures, surgery and prognoses, a life and personal dignity concern, and a legal privacy concern under HIPPA.);
- reduced patient stress, promoting a more rapid return to wellness;
- increased patient satisfaction;
- increased efficiency through reduction in patient delays (matching genders and diagnoses) when deciding room placement and lower operating costs through reduced infection rates;
- easier room decontamination (as housekeeping does not have to be concerned with disturbing the other patient in the room while preparing a bed for a new admission);
- higher staff compliance with hygiene protocols; and
- more space for family and visitors.[5]

As a result, a hospital that uses single-patient beds has better control over patient placement and care delivery that, in turn, reduces operational costs, maximizes efficiency, and improves patient outcomes.[6]

The proposed LRDP would have about 700 acute-care beds. At the anticipated 80 percent occupancy rate for acute-care beds, the proposed LRDP would serve about 560 acute-care patients, as shown in C&R Table 3.23-1.

Thus, although the LRDP would reduce the total number of licensed acute-care beds, there would be adequate total capacity to accommodate all of CPMC's current and projected patient volume, including adequate capacity for peak seasonal and emergency utilization periods for acute-care beds.

CPMC Available Beds with Proposed LRDP

Bed Types	2010 Licensed Bed Count	2009 Average Daily Census	Rebuild Bed Count
CPMC—Total	1,174	559 (656 maximum in 2010)	903
Acute Care	890	388	698

Source: Data provided by CPMC and compiled by AECOM in 2011

The decreased need to retain excess hospital acute-care bed capacity is also supported by technological and other clinical advances that reduce the need for hospitalization for the delivery of medical services and treatment. Increasingly, many types of care that used to be provided in an inpatient hospital setting can be safely and more efficiently performed outside of a hospital (i.e., on an outpatient basis).[7] Hospital stays are also becoming shorter.[8] These trends are reflected in an overall national decline in both the number of hospitalizations and the average length of stay in a hospital.[9] Additional factors reducing hospital bed demand include increased provision of medical services in ambulatory care centers such as surgery centers, gastrointestinal centers, express clinics, etc., and pharmaceutical and technological advances that shift patient care to outpatient settings.[10]

Future planning assumes the following occupancy rates by bed type: Acute: 80 percent, Rehabilitation: 88 percent, Psychiatric: 85 percent, and Skilled Nursing: 94 percent.[11] Multiplying these occupancy rates by licensed beds (see Table 2-2 in the Draft EIR, page 2-10) would result in a projected normal operating capacity of 722 patients systemwide. Source: Data provided by CPMC, as excerpted in the following table.

[7] See Richard Haugh, 2006 (August), *Outpatients: Here Today, Gone Tomorrow?*, Hospitals & Health Networks, Health care consulting firm predicts that on a national level, "while inpatient care will grow 9 percent during the next 10 years, outpatient care will grow 17 percent."; *Outpatient Pulse Report 2009:* Press Ganey Associates, Inc., 2009, *Patient Perspectives on American Health Care*, "[O]utpatient services continue to gain market share as a result of technological and clinical advances and consumer and payer demand . . . [T]he federal Centers for Disease Control and Prevention reports that from 1996 to 2006, visits to specialty offices climbed by 29 percent."

[8] See Alyssa Turkewitz and Gerard Colman, 2009 (October 8), *Out-and-Out Care*, available: www.Hospitalmanagement.net, "Use of outpatient surgery, largely driven by advances in minimally invasive procedures, is also on the rise, not just in oncology but industry-wide. According to the Advisory Board, in 1980, of all surgeries performed, 20 percent were outpatient; in 2007, 59 percent were outpatient; and it is projected that in 2017, 63 percent of all surgeries will be performed in an outpatient setting, and health care organizations benefit from decreased surgical average lengths of stay, better reimbursement rates and decreased expenses."; Kara Olsen, *Outpatient Outlook*, HealthLeaders, available: www.healthleadersmedia.com, accessed October 18, 2010, "Minimally invasive and interventional procedures have decreased the need for lengthy hospital stays, and high-tech imaging equipment has moved out of hospital corridors and into easier-access locations."

[9] Total inpatient encounters in the U.S., calculated by multiplying the total number of hospital admissions by the average length of hospital stay for persons aged 18 or older (using data on hospital discharges from the National Hospital Discharge Survey), declined from well over 250,000 per year in 1980 to approximately 150,000 in 2005. The figures for rehabilitation, psychiatric, and SNF beds are provided below:

Bed Type	2010 Licensed Bed Count	2009 Average Daily Census	Rebuild Bed Count
Rehabilitation	48	23	48
Psychiatric[1]	18	12	18
Skilled Nursing[2]	218	87	139

1 Please see Major Response HC-4 (C&R 3.23-19) for further discussion of psychiatric beds.
The skilled nursing figures do not include subacute-care beds. For further information on subacute care allocation and the CPMC commitment to maintain 100 SNF beds, please see Major Response HC-6 (C&R 3.23-25). Source: Data provided by CPMC and compiled by AECOM in 2010

Distribution between Campuses

A number of comments state that the proposed LRDP would result in a citywide redistribution of patients and services, such as, for example, from south of Market Street to north of Market Street area, because of the overall reduction in total acute-care licensed beds and the reduction of licensed acute-care beds at the St. Luke's Campus. The LRDP would not result in significant adverse changes to the availability and distribution of health care services in the City because, as explained by The Lewin Group, independent experts selected by the City to evaluate CPMC's Institutional Master Plan (IMP) on behalf of the Department of Public Health, "[t]he [LRDP] plan expands access to staffed acute-care beds, ambulatory care services, emergency services, diagnostic testing resources availability, and outpatient care access points without significantly altering patient access patterns.[12] These additional services represent an increase in the availability of health care services in San Francisco.[13]

Acute-care beds are further discussed campus-by-campus in the discussion below. This discussion notes that each campus would, through utilization of single-patient rooms, have sufficient bed capacity to meet current and projected demand for CPMC facilities and accommodate peak demand periods, and that there would be no need to shift acute-care patients to other CPMC or non-CPMC facilities.

Cathedral Hill, Pacific, and California Campuses

The existing California Campus has 299 licensed acute-care beds.[14] The Pacific Campus has 295 licensed acute-care beds. Together, the California and Pacific Campus hospitals currently have 594 licensed acute-care beds, 386 of which are in multi-patient rooms. The average daily census at the California and Pacific Campus hospitals together was 295 acute-care patients for the 8-year period from 2002 through 2009 (50 percent occupancy), ranging from a low of 253 (43 percent occupancy) in 2006 to a high of 310 (52 percent occupancy) in 2007.[15] This reflects a utilization rate of approximately 50 percent for licensed beds. The proposed Cathedral Hill Hospital would have 555 licensed acute-care beds. At 80 percent occupancy, the single-patient rooms would accommodate an average daily census of 444 patients, which would more than accommodate the average daily census of 295 patients attributable to the Pacific and California Campus hospitals together and accommodate projected demand, including capacity to meet peak demand periods.

12 Lewin Group Report, 2009(June 26). *California Pacific Medical Center Institutional Master Plan Review*page 2; Ibid., page 34.
13 Ibid., page 34.
14 OSHPD, ALIRTS, Licensed Bed History, California Pacific Med Ctr-California West, http://www.alirts.oshpd.ca.gov/LFIS/bedhistory.aspx?FacilityId=417, accessed Apr. 7, 2011.
15 OSHPD, ALIRTS, Annual Utilization Report of Hospitals for California Pacific Med Ctr-California West, for years 2002 through 2009, and California Pacific Med Ctr-Pacific Campus, for years 2002 through 2009, available at http://www.alirts.oshpd.ca.gov, accessed Apr. 6-7, 2011. Does not include skilled nursing or inpatient psychiatric patients, who would not transfer to the proposed Cathedral Hill Campus.

St. Luke's Campus

The existing St. Luke's Hospital tower is licensed for 150 acute-care beds, 94 of these in multi-patient rooms. According to data from the OSHPD,[16] the average daily census of acute-care beds at the St. Luke's Campus for the 8-year period from 2002 through 2009 was 60 acute-care patients (40 percent occupancy), ranging from a low of 50 (33 percent occupancy) in 2008 to a high of 71 (47 percent occupancy) in 2003. For the most recent year with data available, 2009, St. Luke's Hospital averaged 51 acute-care patients (34 percent occupancy).

The St. Luke's Replacement Hospital would have 80 licensed acute-care beds. At 80 percent occupancy, it would accommodate 64 acute-care patients at St. Luke's Campus, which would more than accommodate the current demand at Saint Luke's, and accommodate projected demand,[17] including capacity to meet peak demand periods.

Davies Campus

The Davies Campus has 146 licensed acute-care beds, and 110 of these are in multi-patient rooms. According to OSHPD data for the most recent year with data available (2009), the average daily census for acute-care beds at the Davies Campus was 42 acute-care patients (29 percent overall occupancy).[18] Under the proposed LRDP, 63 licensed acute-care beds would be located in the Davies Hospital North Tower, in single-patient rooms. With acute-care bed occupancy increased to 80 percent, approximately 50 acute-care patients could regularly be accommodated at the Davies Campus. Thus, the Davies hospital would accommodate existing and projected demand at Davies with capacity to meet peak periods.

Regional Health Facilities

Some comments suggest that the proposed LRDP would contribute to a region-wide reduction in the number of licensed acute care and SNF beds in all Sutter Health facilities, including CPMC facilities in San Francisco, which in turn would have the cumulative effect of shifting patients to other non-Sutter Health medical facilities and result in other unidentified public services, traffic, and air quality impacts. As explained below, these comments are not supported by substantial evidence and are inconsistent with evidence that is in the existing record.

Moreover, no evidence was submitted by the comments to support the claim that the proposed LRDP would contribute to a region-wide reduction in beds in Sutter Health facilities that would, in turn, create adverse effects on other public services or other indirect effects, such as increased regional traffic and associated air quality impacts, that would require analysis in the CPMC LRDP EIR. As discussed above, the record shows that the inpatient and outpatient capacity proposed for CPMC facilities under the LRDP would be sufficient to meet CPMC's existing and projected demand for inpatient and outpatient services and that the LRDP would not result in any transfers of patients to other CPMC or non-CPMC or non-Sutter Health medical facilities, causing potential significant physical environmental impacts.

Some comments (e.g., Comments 96-4 and 110-4) provide data regarding hospital closures and reduction in licensed beds at other Bay Area hospitals. The data provided is inconsistent with OSHPD information on licensed beds for the referenced facilities and with CPMC's rebuild licensed bed count. A comparison between the number of patients currently served versus future anticipated capacity under the various

[16] OSHPD, ALIRTS, Annual Utilization Report of Hospitals for St. Lukes Hospital, 2002 through 2008 and California Pacific Medical Center - St. Lukes Campus, 2009, available at http://www.alirts.oshpd.ca.gov, accessed Apr. 7, 2011.

[17] The Camden Group, 2009 (April 28), *San Francisco Blue Ribbon Panel: Utilization Projections and Assumptions for St. Luke's Campus*, page 25.

[18] For acute rehabilitation beds, it was 23 (48 percent occupancy), and for skilled nursing beds it was 31 (82 percent). Average daily census across all service lines was 97 (42 percent occupancy).Source: OSHPD, ALIRTS, Annual Utilization Report of Hospitals, California Pacific Med Ctr-Davies Campus, 2009, available at http://www.alirts.oshpd.ca.gov, accessed Apr. 7, 2011.

Sutter Health 'rebuild' plans in the Bay Area region, as requested and referenced in several comments, is provided in C&R Table 3.23-2 below. This comparison shows that the Sutter Health regional rebuild projects cited in the comments would have sufficient capacity to accommodate Sutter Health's existing patient volume at its respective facilities, as well as varying levels of future anticipated growth.

Although certain program modifications or closures are cited in the comments, such as psychiatric services with an average daily census of eight patients being closed at Eden Medical Center, no evidence is presented in the comments or elsewhere in the record of any major transfer of services from a Sutter Health facility to a non-Sutter Health facility, or of any direct or indirect environmental impacts that might result from these hospital projects (which were necessitated to comply with state law regarding seismic upgrade of hospital facilities, SB 1953), or of any contributing impacts from the proposed LRDP. The 2008 IMP for the proposed CPMC LRDP recognized that approximately 30 percent of existing CPMC hospital patients come from outside San Francisco,[19] and no evidence exists that changes in other Sutter Health programs elsewhere would affect this pattern. Dr. Mitch Katz, former Director of the City of San Francisco Department of Public Health, acknowledged the regional pattern of CPMC being a destination hospital; "the regional dynamic is people come here for medical care."[20]

Other comments suggest that regionalization of Sutter Health's corporate governance structure would entail closures of services and increased transfers of patients between cities resulting in significant environmental impacts under CEQA. No evidence was presented in the comments, however, that internal corporate governance structures, monetary transfer policies, or other matters would result in potential physical environmental impacts that would be caused by the proposed CPMC LRDP in San Francisco. Business decisions made by Sutter Health or its affiliates in other jurisdictions do not relate to the adequacy of the Draft EIR's analysis of the LRDP or environmental effects of the LRDP under CEQA.[21]

---

[19] Type of service and breakdown in CPMC patient origin by SF/region are described in the 2008 IMP document. California Pacific Medical Center, 2008, *California Medical Center 2008 Institutional Master Plan,* San Francisco, prepared by the Marchese Company, Inc., available: http://rebuildcpmc.org/assets/08IMP_CPMC.pdf, accessed Dec. 20, 2010. Patients who come from outside San Francisco for health care at CPMC are often drawn by CPMC's noted specialty programs. See California Pacific Medical Center, 2008, available: http://rebuildcpmc.org/assets/08IMP_CPMC.pdf, at page vi, accessed Dec. 20, 2010. The proposed LRDP would allow CPMC to continue to deliver these same local and regional health care services.

[20] Testimony of Dr. Mitch Katz, November 19, 2009, at the CPMC IMP hearing.

[21] A few of the commenters have cited the transfer of one stroke patient in Novato to a CPMC hospital in San Francisco (rather than to the nearest stroke center in Greenbrae) as evidence that regional consolidation of Sutter Health facilities would result in increased transfers of patients between cities and, therefore, in potentially significant new traffic and associated air quality and greenhouse gas emissions impacts. The comments stem from articles in the Marin Independent Journal.
One patient transfer is not substantial evidence that the LRDP will increase patient transfers to such a degree that vehicle traffic would result in new, potentially significant indirect environmental impacts. CPMC provided several documents responsive to this article. These documents included an entry on the Marin Independent Journal website (dated May 20, 2010), that stated it was from the patient's family and praised the transfer decision. CPMC also provided a copy of a letter from Gordon Hunt, MD, Senior Vice President and Chief Medical Officer of Sutter Health, dated May 25, 2010, stating that physicians at Sutter make any determination regarding transfer of a patient based on what is best for that patient in the treating physician's judgment, whether or not that means the patient must be sent to a hospital within or outside of the Sutter Health network.

C&R Table 3.23-2
San Francisco Bay Area Hospital Bed Counts

Sutter Health Facility	2010 Licensed Bed Count[1]	2009 Average Daily Census[2]	Rebuild Licensed Bed Count[3]
Alta Bates Summit[4]	1,036	537	1008
CPMC	1,174	559	903
Eden Medical Center	178	113	130
San Leandro Hospital	93	47	[see note][5]
Sutter Medical Center Santa Rosa	135	62	826
Mills Peninsula Medical Center	340	246	385
TOTAL	**2,956**	**1,564**	**2,508**

Notes:
[1] Source: OSHPD "ALIRTS" licensure database: www.alirts.oshpd.ca.gov.
[2] See footnote above for licensure URL; for each facility license, click on "View Utilization Report," or "View Report" and select 2009 (most recent available data). Reports list "Patient (Census) Days." Average Daily Census (ADC) can be easily calculated by dividing total patient days by 365.
[3] All new beds would be in single patient rooms. CPMC, Memorandum from C. Scheuerman, January 7, 2011.
[4] Alta Bates Summit Medical Center consists of the Summit Campus (Providence and Merritt Pavilions) Alta Bates Campus, and Herrick Campus. The Merritt Pavilion was not included in the data provided in Response HC-36 (page C&R 3.23-179). At the Oakland-Merritt hospital, a new 309-bed patient pavilion will be developed to comply with SB 1953 requirements, replacing a 337-bed facility. The New Merritt Pavilion, like the other replacement facilities, will have all single patient rooms. Although there is an overall reduction in the total number of licensed beds, the capacity of the 309-bed replacement facility easily accommodates that hospital's patient population (2009 average daily census of 195) with room for growth.
[5] Sutter Health's intent is for the San Leandro Hospital building to be leased to Alameda County for its Acute Rehabilitation program. Sutter Health has committed to pursuing "an 18-20 bed acute rehabilitation unit" within the hospital, but overall bed capacity has not been identified and, as of this writing, an agreement with the County has not been finalized. A supply and demand analysis, prepared in connection with the review of the Eden Medical Center project, indicated that while utilization rates might rise at the Eden Medical Center replacement hospital and some other area hospitals, surplus beds would be available, and even with a complete closure of San Leandro Hospital, adequate capacity would exist to absorb emergency and acute-care demand. Therefore, little or no impact would occur on the physical environment from any change of services. See California Nurses Association v. County of Alameda, Order Denying Petition for Writ of Mandate, filed June 28, 2010, page 6-13.
[6] Building designed for initial buildout of 82 beds with ability to expand by 29 beds.

Major Response HC-2: Location, Size, and Scope of Services at Cathedral Hill, St. Luke's, and Davies

Comments Overview

A number of comments suggested that CPMC services should be distributed among the various campuses in a different way than proposed under the LRDP. In particular, it was suggested that more acute-care beds should be provided at St. Luke's Campus, and also that fewer acute-care beds should be located at the proposed Cathedral Hill Campus. Some comments also suggested that the proposed Cathedral Hill Campus would be poorly located, would be too large, would not be accessible, or would create direct or indirect environmental impacts that were not discussed in the Draft EIR. Several comments also expressed concern about the size and scope of services at the St. Luke's Campus. With respect to the Davies Campus, some comments expressed concern that the scope of the existing community hospital and other services at the existing hospital at the Davies Campus might be reduced to accommodate the proposed expansion of neuroscience and rehabilitation services.

These comments are grouped together, because they all relate to the proposed LRDP being envisioned as a system of health care that would rely on a central tertiary hospital and feeder community hospitals.

Response

A number of these comments are beyond the scope of CEQA's mandate for consideration of socioeconomic effects. The effects of the location, size, or scope of facilities on health care delivery would not necessarily result in physical environmental impacts. The environmental effects of the proposed LRDP are fully analyzed, and no evidence is offered to the contrary.

The proposed Cathedral Hill Campus would be centrally located with respect to the existing California and Pacific Campuses and would consolidate and relocate acute care, emergency, and other services from the California and Pacific Campuses. Consolidation of tertiary and other services at one location would provide operational efficiencies and improved coordination and treatment as explained below and in the Draft EIR (see pages 1-2, 2,7 through 2-9, 2-26, and 6-400 of the Draft EIR). Neither the St. Luke's nor Davies Campuses would experience reductions of services that would have adverse effects elsewhere.

Cathedral Hill Campus

i. Location

The location for the proposed Cathedral Hill Campus was determined by CPMC after considering several alternatives, including the possibilities of retrofitting existing CPMC facilities or developing alternate sites. These alternatives were rejected from further consideration for various reasons, as discussed in Section 6.3, "Alternatives Considered but Rejected" in the Draft EIR, page 6–8.

From a citywide hospital distribution perspective, the proposed LRDP has been planned in the context of other proposed and pending medical campus projects in the City. Three new hospital facilities have been recently planned in the south of Market Street area: CPMC's proposed St. Luke's Replacement Hospital, San Francisco General Hospital's replacement hospital, and the University of California, San Francisco's new hospital/medical campus at Mission Bay. CPMC's proposed Cathedral Hill Campus is the only new acute-care facility currently proposed in the north of Market Street area. Acute-care services from the Pacific and California Campuses would be relocated and consolidated at the proposed Cathedral Hill Hospital. The Cathedral Hill Hospital would be approximately .5-mile from the Pacific Campus and 2 miles from the California Campus, and would accommodate CPMC patients, especially those that currently use the California and Pacific Campuses, whose acute-care inpatient services and facilities are being relocated and consolidated at Cathedral Hill. It would also be conveniently located for CPMC's existing affiliated physicians, who currently service patients at the Pacific or California Campuses and at outpatient facilities.

The proposed Cathedral Hill Campus would be at the intersection of two major transit corridors and would be closer than the existing California and Pacific hospitals to the area of San Francisco (the Tenderloin) with the highest residential population density, including the highest population density of low-income households, seniors (the most frequent users of hospital care), children and youth.[22] Because the proposed Cathedral Hill Campus would be closer to major transportation arterials and the Tenderloin neighborhood, the Lewin Group Report recognized the possibility that, with its expanded Emergency Department, the proposed hospital would experience an increase in Medi-Cal and indigent neighborhood walk-in patients over existing levels at the California and Pacific Campuses.[23] The level of care provided to Emergency Room patients is based on the severity of the patients' physical symptoms, and not on their insurance status. In fact, under the Emergency Medical Treatment and Active Labor Act (EMTALA), a hospital is held accountable for taking care of all patients needing emergency health care treatment

[22] S.F. Planning Department, 2009 (May), *Draft San Francisco General Plan Recreation and Open Space Element*, p. 19, Fig. 2, "High Needs Analysis." The proposed Cathedral Hill Hospital would be located only about a half-mile from the existing Pacific Hospital and would actually be further away from the existing Kaiser Hospital than the existing hospital.

[23] The Lewin Group, 2009 (June 26). *California Pacific Medical Center Institutional Master Plan Review*,page 20.

according to the same standard of care, regardless of their ability to pay. Please also see the discussion on page C&R 3.23-41, regarding CPMC's commitments in the proposed Development Agreement for the provision of health care for the poor and underserved.

With regard to comments stating that CPMC should distribute beds differently across all CPMC campuses and, in particular, increase capacity at the St. Luke's Campus, the Lewin Group Report concluded that the consolidation of services at the proposed Cathedral Hill Campus location would not create any major health care services access issues from CPMC patients' perspectives, because "the [LRDP] plan expands access to staffed acute-care beds, ambulatory care services, diagnostic testing resources availability, and outpatient care access points without significantly altering patient access patterns. These additional services represent an increase in the availability of health care services in San Francisco."[24] For further discussion of this issue, please see, e.g., Response ALT-1 (page C&R 3.22-11), Major Response HC-8 (page C&R 3.23-32), Major Response HC-9 (page C&R 3.23-38), and Response HC-2 (page C&R 3.23-52), where the issues of health care services consolidation and access are discussed.

ii. Size and Co-Location of Services

The size and design of the proposed Cathedral Hill Hospital are based on replacing the inpatient bed capacity of the two existing hospitals at the California Campus and the Pacific Campus.[25] The consolidated location of services, physicians and support staff, building infrastructure systems, such as electrical/emergency power, fuel tanks, medical gasses, etc., and other facilities, at the proposed Cathedral Hill Campus would result in elimination of redundancies within the CPMC system, such as duplication in admitting, general support functions (e.g., environmental services [EVS], linen, food and nutrition, etc.) and clinical support functions (e.g., inpatient pharmacy).[26]

Operational efficiencies would result from the co-location of complementary services adjacent to one another at the proposed Cathedral Hill Campus.[27] Examples of complementary services to be co-located at the proposed Cathedral Hill Hospital would include the location of the Emergency Department adjacent to imaging, location of the Pediatric Intensive Care Unit (PICU) adjacent to the Pediatrics Unit, location of respiratory therapy in the Intensive Care Unit (ICU), location of the Neo-natal Intensive Care Unit (NICU) with C-Section rooms, and the "Integrated Invasive Services Platform" on the fourth floor, which would accommodate critical adjacencies among surgery, interventional radiology, cardiac catheterization, non-invasive cardiology, and other services.[28] The design of the proposed Cathedral Hill Hospital would also include a recovery, registration, and family lounge/waiting area, to be consolidated for use by all services, eliminating duplication and reducing transports for patients.[29]

Co-location of services would not diminish access to health care services, unlike what has been suggested in several of the comments. Co-location of services at the proposed Cathedral Hill Campus would mean that, for the first time, most CPMC patients with complex or advanced illnesses would be able to receive care in one location and be served by consolidated specialty care teams.[30] Patients who need services such as invasive cardiology, organ transplants, or newborn intensive care would find the specialty care teams and systems that support them all in one place.[31] This would improve clinical outcomes and reduce patient

[29] Ibid.
[30] Ibid.
[31] Ibid.

and caregiver travel.[32] Similarly, relocation of women's and children's services from the California Campus and adult acute care from the Pacific Campus to the new full-service tertiary hospital at the proposed Cathedral Hill Campus would improve operational and care efficiencies.[33] Although the proposed Cathedral Hill Hospital would provide tertiary, specialized medical services to patients referred from other CPMC community hospitals at the Davies and St. Luke's Campuses, the Cathedral Hill Hospital itself would also operate as a full-service, community hospital. Therefore, it would provide similar services to members of the surrounding community as would a typical community hospital.

With one exception (ALS/Neurosciences-related programs would move from the Pacific Campus to the proposed Neuroscience Institute building at the Davies Campus, as described in the Draft EIR, pages 2-143 through 2-146), the service lines currently available at the California and Pacific Campuses would be available at the proposed Cathedral Hill Campus or would remain at their existing locations (e.g., inpatient psychiatric services and outpatient oncology would remain at the Pacific Campus, and skilled nursing would remain at the California Campus indefinitely, unless and until replaced elsewhere, as discussed in Major Response HC-6 [page C&R 3.23-25]).[34] Primary and specialist physician offices would migrate to the proposed Cathedral Hill Campus or would remain at the Pacific or California Campuses, depending on individual physician preferences to relocate along with their relevant service line.[35] With respect to physical distance, the maximum distance between any existing physician office or hospital service currently available at the California Campus and the proposed Cathedral Hill Campus would be approximately 2 miles (with the Pacific Campus at a distance of about .5-mile).[36]

Several comments suggest that the size and number of beds at the proposed Cathedral Hill Hospital should be reduced from what is proposed in the Draft EIR. A number of medical centers locally and across the country operate hospitals at a scale similar to what is planned for the proposed community and tertiary Cathedral Hill Hospital (i.e., 555 licensed beds). In San Francisco, the UCSF Medical Center at Parnassus Heights operates 525 beds in its Moffitt and Long Hospital. Georgetown, Northwestern, UCLA, Kaiser Los Angeles, and Cedars-Sinai all operate single-site hospitals with over 500 beds.[37] Stanford Medical Center is proposing to build a 600-bed hospital in response to state seismic deadlines, and UCSF has broken ground on the first phase of a 550-bed hospital in the southeast portion of San Francisco.[38] A recent London School of Economics study of almost 1,200 hospitals in America, Britain,

Canada, France, Germany, Italy, and Sweden concluded that larger hospitals result in improved medical success rates.[39]

An aging population requires a multidisciplinary concentration of care for multi-system diseases, chronic disease management, and higher-level interventional treatments.[40] The proposed CPMC LRDP would include a "hub" hospital, where teams of specialists needed to meet these challenges could be provided at a single location with "feeder" hospitals (Davies and St. Luke's) providing a broad range of community hospital services, in addition to limited specialty programs appropriate to those campuses.[41]

Hospitals and certain physicians require medical office space to be on the same site or near the hospital to eliminate travel between sites.[42] Internal medicine physicians, surgeons, and obstetrics doctors are the types of doctors most likely to be found in medical buildings adjacent to hospitals.[43] These doctors need regular access to the inpatient environment, where they care for hospitalized patients, perform surgeries, and deliver babies.[44]

At the November 19, 2009, hearing on CPMC's IMP, addressing the proposed co-location of multi-disciplinary services at the proposed Cathedral Hill Hospital, Dr. Mitch Katz, former Director of the City of San Francisco Department of Public Health, stated that high volume facilities that have the largest number of specialists provide for the highest level of care.[45] Dr. Katz said, "Can you deliver great care and not all be together? Yes. But no one would do that deliberately. The evidence is that you will do a better job if it is all together."[46]

St. Luke's Campus

During 2008, a "Blue Ribbon Panel" of leaders from the health, business, and labor fields and community met and developed a plan for providing health care services at the St. Luke's Campus, in conjunction with CPMC's IMP. The panel was chaired by Bishop Marc Andrus of the California Episcopal Diocese and Dr. Stephen Shortell, Dean of the University of California, Berkeley School of Public Health.[47] The Camden Group was employed by the panel to gather, analyze, and provide relevant information.

The planned service mix and capacity of the proposed inpatient St. Luke's Replacement Hospital is in accordance with the July 2008 recommendations of the Blue Ribbon Panel and the studies prepared by The Camden Group. In September 2008, CPMC's Board of Directors accepted almost all of the Blue

39 *How to Save Lives: Five Simple Rules for Running a First-Class Hospital*, The Economist, 2010 (October 21). The London School of Economics study concluded that hospitals with the best management practices also ranked best on a standardized measure of medical success: death rates among emergency patients experiencing heart attacks. The researchers "found that bigger is better when it came to good management. Hospitals employing 1,500 or more staff are better run than those employing more than 500, which, in turn, outperform those with more than 100 staff." The proposed Cathedral Hill Hospital would be considered a large hospital, consistent with this criterion. The researchers also found that the higher medical success score of hospitals with the best management practices "works across countries and cultures, and has unambiguous results."

47 The Camden Group, 2009 (Apr. 28), *San Francisco Blue Ribbon Panel: Utilization Projections and Assumptions for St. Luke's Campus*, p. 3. Other members of the Blue Ribbon Panel are identified in Response HC-10.

Ribbon Panel's programs and services recommendations,[48] and planning for the St. Luke's Replacement Hospital has proceeded on that basis. On November 18, 2008, the San Francisco Board of Supervisors adopted Resolution No. 478-08, which endorsed the Blue Ribbon Panel's findings for the rebuilding of St. Luke's Hospital and urged the City and County and the CPMC Board to work with each other and with all stakeholders to implement its findings quickly and responsibly, to meet seismic deadlines, and to support the critical mission of St. Luke's and the City's public health care delivery system.[49]

Thereafter, on July 21, 2009, the San Francisco Health Commission adopted Resolution 10-09, which put forward several specific recommendations regarding the St. Luke's Campus, one of which was to convene a Health Commission Task Force on CPMC's IMP to discuss and analyze progress in fulfilling the recommendations of the Blue Ribbon Panel.[50] CPMC submitted interim progress reports to the Health Commission on achieving the recommendation of Resolution No. 10-09. The Task Force reported most recently on updates and accomplishments on March 2 and September 30, 2010.

Consistent with the Blue Ribbon Panel and The Camden Group's projections, the LRDP proposes for the St. Luke's Campus: (a) 53 medical/surgical beds, accommodating both the existing patient demand for 39.5 beds and the projected future demand for 49.1 beds in 2020; (b) 8 critical-care beds, sufficient to accommodate existing patient demand for 6.6 beds and the projected future demand for 8.5 such beds in 2020; and (c) 19 labor and delivery beds (5 labor/delivery/recovery and 14 postpartum) with the ability to accommodate 1,400 births each year, which would meet the existing demand for 1,145 annual births and the projected future demand for 1,359 annual births in 2020.[51]

Except for subacute care (to be discontinued), skilled nursing (to be continued at the Davies and at California Campuses, consistent with CPMC's 100 SNF bed overall commitment) (see expanded discussion on subacute and SNF services in Major Response HC-6 (page C&R 3.23-25)) and inpatient pediatrics (to be provided at the Cathedral Hill Hospital, as described below), all of the services currently provided at the St. Luke's Campus would be maintained or expanded, including:

- various pediatric services, including outpatient pediatric services such as immunizations, well-child exams, and treatment of minor infections and accidents, and community services, including a child development center for children with special needs and a clinic directed at improving health care for the children of Bayview-Hunters Point (maintained);
- chronic disease management through a model that would use community health workers to provide health education and individualized support (maintained);
- comprehensive women's care, including a new women's care floor, with labor and delivery areas (including a low intervention birth program supported by physicians and midwives), contiguous recovery and postpartum areas, as well as versatile medical/surgical rooms allowing other gynecological procedures, and a family waiting area (expanded);
- senior care, including orthopedic surgery, medical cardiology, ophthalmic surgery, and a diabetes center (expanded);

[48] Resolution of the California Pacific Medical Center (CPMC) Board of Directors Regarding Its Response to the Recommendations of the Blue Ribbon Panel on the Future of St. Luke's Hospital (Sept. 25, 2008).

[49] Board of Supervisors of the City and County of San Francisco, Resolution No. 478-08, *Resolution commending the work of the Blue Ribbon Panel and urging all City Departments to endorse the eight recommendations of the Blue Ribbon Panel* (Nov. 18, 2008).

[50] S.F. Department of Public Health, Memorandum from Barbara A. Garcia, MPA, Director of Health, to Christina Olague, Planning Commission President, and Members of the Planning Commission re: March 10, 2011 Joint Planning Commission/Health Commission Hearing (Mar. 2, 2011), Attachment A, S.F. Health Commission Resolution No. 10-09, *Resolution Declaring Findings on the California Pacific Medical Center Institutional Master Plan* (July 21, 2009) ("S.F. Health Commission Resolution No. 10-09").

[51] The S.F. Health Commission Task Force on CPMC's IMP Addressing Resolution No. 10-09, *Updates and Accomplishments*, Mar. 2, 2010; *CPMC Interim Report to the San Francisco Health Commission Regarding Progress Toward Commission Recommendation in Resolution No. 10-09*, Sept. 30, 2010.

- diagnostic services, including laboratory, mammography, MRI and colonoscopy (expanded);
- family-oriented urgent care (new); and
- the Emergency Department would be 50 percent larger than the existing facility (expanded).

The expanded Emergency Department at the St. Luke's Replacement Hospital would provide differentiated treatment in dedicated individual patient rooms, including two critical-care ambulance rooms, six standard treatment rooms, four fast track rooms, and a triage room. By creating additional capacity via an urgent care center on the St. Luke's Campus, the effective urgent and emergency capacity would increase by about 22 percent, from approximately 26,000 annually today[52] to about 31,600 visits under the proposed LRDP.

The medical office building proposal for the site of the existing St. Luke's Hospital tower (proposed to be demolished in 2015) would include outpatient and medical office space, community servicing programs, and other hospital-related functions to support the inpatient programs at the hospital. Furthermore, the existing Monteagle Medical Center would undergo interior renovations and improvements, and the addition of new practices such as primary care physicians and specialty physicians (orthopedics, cardiology, etc.).

The three outpatient operating rooms with prep and recovery and outpatient imaging on the third and fourth floors of the Monteagle Medical Center would continue to operate when the new St. Luke's Replacement Hospital opens and the existing hospital tower is demolished. The operating rooms would support surgical specialties such as eye and plastic surgery. Utilization of the Monteagle Medical Center's operating rooms would enable the four new operating rooms in the St. Luke's Replacement Hospital to run more efficiently.

The number of inpatient pediatric[53] patients at St. Luke's Hospital has been low in comparison to existing capacity. In 2009, the average daily census totaled 0.7 pediatric patients.[54] Based on research showing a clear link between pediatric patient volume and clinical outcomes, CPMC determined that this low pediatric inpatient demand would be better served at the higher volume dedicated pediatric program that is planned for the proposed Cathedral Hill Hospital.[55] The volume of pediatric inpatients who are currently under care at the California Campus and the low volume of pediatric inpatient demand at the St. Luke's Campus that would be treated at the proposed Cathedral Hill Campus in the future (after 2015) would be supported by teams of dedicated pediatric specialists who would practice together, providing better, more comprehensive care than at a hospital with extremely low pediatric inpatient volumes, such as currently at St. Luke's Hospital. The San Francisco Health Commission Task Force on CPMC's IMP concurred with CPMC that the provision of inpatient pediatric services at the proposed Cathedral Hill Hospital would provide for the inpatient pediatric services of the current St. Luke's patients, as envisioned by the Blue Ribbon Panel.[56]

---

52 2009 Emergency Department visits = 27,965. Source: OSHPD, ALIRTS, Annual Utilization Report of Hospitals, California Pacific Medical Center - St. Lukes Campus, 2009, available at http://www.alirts.oshpd.ca.gov, accessed Apr. 7, 2011. The St. Luke's Hospital Emergency Department currently runs well over capacity, with several beds regularly provided in hospital hallways.

53 Generally understood as children, ages birth to 18 years, but pediatric specialization is often related to size and weight of the individual, with some older children (e.g., 15-18 years) able to receive "adult" procedures and/or medication doses.

See also Smink, Douglas S. et al., *The Effect of Hospital Volume of Pediatric Appendectomies on the Misdiagnosis of Appendicitis in Children*, Pediatrics 2004; Vol. 113, No. 1, pp. 18-23 (Jan. 2004), available at http://www.pediatrics.org/cgi/content/full/113/1/18.

56 The S.F. Health Commission Task Force on CPMC's IMP Addressing Resolution No. 10-09, *Updates and Accomplishments*, Mar. 2, 2010.

Several of the comments express concerns regarding the financial "viability" of the St. Luke's Campus as proposed under the LRDP. These concerns were discussed at the Health Commission as part of the Blue Ribbon Panel review in 2008. Although CEQA does not require preparation of an economic analysis of the project, the following information is provided.

As described by CPMC, and discussed in the Blue Ribbon Panel review, the proposal for the St. Luke's Replacement Hospital and Campus is part of the overall CPMC LRDP. As such, the viability of the St. Luke's Campus cannot be viewed in isolation, but rather it is contingent on the viability of CPMC's health care delivery system as a whole. Operational efficiencies and elimination of redundancies gained by consolidating specialized, tertiary, and women's and children's services at the proposed Cathedral Hill Hospital would more likely contribute to, rather than detract from, the long-term viability of the St. Luke's Campus.

All CPMC campuses currently receive patients for various medical care needs. The campuses work as a system to manage the care needs of the patient. All of the CPMC Emergency Departments see patients needing care for ailments ranging from minor cuts or the common cold to those suffering from cardiac arrest or other life-threatening ailments. Whenever the needs of the patient outstrip the acuity level provided in a specific hospital or are not within the services lines delivered at that campus, patients are sent to the most appropriate campus (or hospital outside the CPMC network) for continuing their care, a decision that is made by the treating physician. For example, a woman in labor who appears at the Davies Emergency Department may deliver there and then be transferred to St. Luke's for her postpartum care because Davies does not have a maternity service line. Similarly, a patient who appears at the St. Luke's Emergency Department with severe cardiac illness may be transferred to the Pacific Campus for open heart surgery. [57]

As Dr. Mitch Katz has stated:

> I certainly understand the concern about the viability. I feel the safest thing for us to be asking, and CPMC is agreeing that their commitment to St. Luke's is not whether or not it is viable separately or not. I don't want them to say here is a viable plan and if it is not a viable, we will be closing it. I want them saying, and this is what they are saying, St. Luke's is part of CPMC, and this is part of what we do.
>
> I am not concerned about whether it is independently viable, I want to know that that hospital which fills a real need, including giving us relief in the southeast part of the City for SF General Hospital, that that hospital is there. I hear that commitment and it means a lot to us.[58]

The Health Commission Task Force, in its specific review of CPMC's responsiveness to the recommendations of the Blue Ribbon Panel, determined that the St. Luke's Hospital as planned under the proposed CPMC LRDP would be appropriately sized and programmed as a community hospital, along with services that would be provided on the St. Luke's Campus, to accommodate existing and projected future patient demand for the south of Market service area.[59] In its September 30, 2010 Interim Report, the Health Commission Task Force indicated that "CPMC has demonstrated its commitment to the long-term viability of the St. Luke's Campus by budgeting $250,000,000 for the reconstruction of the inpatient facility."[60]

---

he S.F. Health Commission Task Force on CPMC's IMP Addressing Resolution No. 10-09, *Updates and Accomplishments*, Mar. 2, 2010.

58 Testimony of Dr. Mitch Katz, November 19, 2009, at the CPMC IMP hearing.

59 San Francisco Health Commission Task Force on CPMC's IMP Addressing Resolution No. 10-09, 2010 (Mar. 2), *Updates and Accomplishments.*

60 CPMC, 2010 (Sept. 30), *Interim Report to the San Francisco Health Commission Regarding Progress Toward Commission Recommendation in Resolution No. 10-09*.

Based on this evidence, the proposed LRDP, specifically the plan for the St. Luke's Campus, is not expected to exacerbate any real or perceived shortage of inpatient acute-care beds for the south of Market Street area traditionally served by St. Luke's Hospital. Under the proposed LRDP, St. Luke's Hospital would accommodate growth in patient census, increase its Emergency Department and surgery capacity, and expand primary care programs in clinical areas of demonstrated need in the community, such as senior care and low-risk obstetrics. Therefore, the proposed LRDP would not add to health care delivery problems in the City areas south of Market Street.

Please also see Responses HC-16 (page C&R 3.23-101), HC-29 (page C&R 3.23-149), HC-30 (page C&R 3.23-154), and HC-31 (page C&R 3.23-160) for responses to individual comments concerning the viability of the St. Luke's Campus under the proposed LRDP.

Davies Campus

Comments erroneously state that bringing additional programs and physicians to the Davies Campus (associated with the proposed Neuroscience Institute building) would result in the displacement of existing community-serving programs and services or physicians associated with these or other programs at the Davies Campus. The proposed Neuroscience Institute building would not require the demolition of any existing buildings on campus, and no functions or physicians currently in the Davies Hospital or 45 Castro Street Medical Office Building would be displaced as a result of the proposed Neuroscience Institute building project. The long-term development project proposed at the Davies Campus, the Castro Street/14th Street MOB, would be constructed on the existing parking garage site and would include medical offices and four levels of parking.

The service lines currently available at the Davies Campus would continue to be available under the proposed LRDP. Primary and specialist physicians associated with the Davies Campus service lines, and their respective offices and patient visits, are similarly assumed to stay at the campus, primarily at the 45 Castro Street Medical Office Building. In some cases, services would be expanded, such as those related to the provision of additional neurosciences clinical space in the proposed Neuroscience Institute building. The proposed LRDP calls for the creation of approximately 50,000 gross square feet (gsf) of new clinical area and new post-surgical recovery capacity in the proposed Neuroscience Institute building, and a future medical office building, the Castro Street/14th Street MOB (as described in the Draft EIR, pages 2-143 to 2-148).

As of 2010, 232 licensed beds of all types (i.e., acute care, rehabilitation, psychiatric, and skilled nursing) were in the Davies Hospital (North and South Towers combined).[61] Davies Hospital South Tower contains some inpatient facilities, including 32 licensed, acute-care inpatient beds, and includes skilled nursing, outpatient care, and diagnostic and treatment space (see Draft EIR, page 2-141). After December 31, 2012, consistent with the requirements of SB 1953, all acute-care functions within the Davies Hospital South Tower are expected to cease or be relocated to the Davies Hospital North Tower. Under the proposed LRDP, the Davies Hospital South Tower would then be used for outpatient care, diagnostic and treatment services, and licensed skilled nursing (SNF) beds, which would remain at 38 beds. Please see Major Response HC-7 (page C&R 3.23-31) for further discussion of the overall SNF beds planned for CPMC systemwide under the LRDP.

As stated in the Draft EIR (page 2-141), the North Tower is currently used primarily for inpatient care, diagnostic and treatment space, education, and conference space and support. It also has an Emergency Department. Under the proposed LRDP, the inpatient care uses at the Davies Hospital North Tower would include 63 licensed acute-care beds and 48 licensed rehabilitation beds. All CPMC rehabilitation

[61] OSHPD, ALIRTS, Licensed Bed History, California Pacific Med Ctr–Davies Campus, available at http://www.alirts.oshpd.ca.gov, accessed Apr. 13, 2011.

beds are and would continue to be located at the Davies Hospital North Tower. The Emergency Department would also remain in the Davies Hospital North Tower.

The proposed LRDP would expand care and services for patients with neurological conditions such as stroke, migraines, and ALS (Lou Gehrig's disease), and would enhance rehabilitation services at the Davies Campus to allow patients to receive same-site treatment. According to OSHPD statistics, the 2009 average daily census for acute rehabilitation beds at CPMC (at the Davies Campus) was 23.3 patients.[62] Therefore, the number of rehabilitation beds at the Davies Campus would be sufficient to meet demand.

The volume of acute rehabilitation patients is expected to grow in the future. However, the use of private, single-patient rooms in the proposed acute rehabilitation units at the Davies Campus would further increase the effective number of available rooms because of the higher utilization rate, as discussed in more detail in Major Response HC-1 (page C&R 3.23-1 through 3.23-8).

Major Response HC-3: Impacts on Other Hospitals

Comments Overview

Several comments express concern that reductions in services at the St. Luke's Campus potentially would result in adverse impacts to San Francisco General Hospital (SFGH), because of increased demand on this hospital. Some comments also suggest that the CPMC LRDP EIR should evaluate whether the concentration of medical services and acute-care beds at the proposed Cathedral Hill Campus would adversely affect the viability of St. Francis Memorial Hospital (SFMH).

Response

As discussed in Major Responses HC-1 and HC-2 above, the comments presented no substantial evidence that there would be a shift of service demand to SFGH because of the assumption that the LRDP would reduce services at the St. Luke's Campus. The comments also do not present substantial evidence that the Cathedral Hill Hospital would siphon off patients from SFMH and, as suggested, potentially result in the closure of SFMH. Similarly, the comments do not present substantial evidence that any resulting indirect physical environmental effects would occur, associated with either of these suggested socioeconomic effects on SFGH and SFMH. Each is separately discussed below.

San Francisco General Hospital

As explained in Major Responses HC-1, HC-2, HC-4, HC-5, and HC-6 (page C&R 3.23-25), projected inpatient and outpatient capacity at St. Luke's Hospital under the proposed LRDP would be sufficient to meet CPMC's current and projected patient demand, with the exception discussed below, no services currently being provided at St. Luke's Hospital would be shifted to other, non-CPMC hospitals or health care service providers. As discussed in Major Response HC-6 (page C&R 3.23-25), the only exception is that subacute care would no longer be provided by CPMC at St. Luke's or other CPMC hospitals. However, for the reasons explained in Major Response HC-6, the gradual reduction of subacute-care services at St. Luke's, largely through attrition and transfer of patients over the next several years and the shifting of subacute-care facilities from CPMC to other unknown (but assumed to be geographically widespread, based on where patients are currently coming from, and not concentrated at one particular location) hospitals and/or other health care service providers over time, this is not anticipated to result in secondary impacts at any one facility, including SFGH (this is particularly so because SFGH does not offer subacute-care service).

[62] OSHPD, ALIRTS, Annual Utilization Report of Hospitals, California Pacific Med Ctr–Davies Campus, 2009, available at http://www.alirts.oshpd.ca.gov, accessed Apr. 6, 2011.

With respect to emergency services, a key recommendation of the Blue Ribbon Panel was that St. Luke's Hospital should increase its effective Emergency Department capacity and, therefore, its ability to receive Emergency Department patients diverted from SFGH or other Emergency Departments. As discussed in Major Response HC-5 (page C&R 3.23-20), under the proposed LRDP, the size and effective capacity of the St. Luke's Hospital Emergency Department would be increased and the St. Luke's Replacement Hospital would be able to receive Emergency Department patients diverted from SFGH and/or other Emergency Departments. Therefore, the implementation of the proposed LRDP at the St. Luke's Campus would not result in secondary impacts at SFGH.

Please also see Responses HC-2 (page C&R 3.23-52) and HC-8 (page C&R 3.23-82) for detailed responses to individual comments regarding potential secondary impacts of the proposed LRDP on SFGH.

St. Francis Memorial Hospital

CEQA does not require an economic analysis of the business plans of hospitals in the vicinity of CPMC facilities. The purpose of the CPMC LRDP EIR is to identify the environmental effects that would result from the proposed LRDP. Future possible changes in services at SFMH are speculative and are not related to CPMC's proposed LRDP. No substantial evidence has been presented that would support the suggestion in the comments of potential detrimental effects of the CPMC LRDP on SFMH, as a consequence of any aspect of the proposed LRDP, or of potential environmental impacts there from.

Competition

The comments suggest that locating the proposed Cathedral Hill Hospital close to SFMH might have the effect of siphoning off patients from SFMH, putting SFMH in financial jeopardy. However, the comments present no substantiating evidence that this would occur or that any shift in patients from one hospital to the other would result in physical impacts to the environment. In fact, in some health care services areas, services at the proposed Cathedral Hill Hospital would be complementary to those at SFMH. For example, SFMH has services that are not provided by CPMC or proposed to be provided at the new Cathedral Hill Campus under the LRDP, such as a burn center, and conversely the proposed Cathedral Hill Hospital would have a labor and delivery unit, a service not found at SFMH.[63]

Furthermore, where services are available at a number of hospitals in the City, a key determinant of where patient volume would be directed would be the hospital affiliation of the admitting physician.[64] In the case of SFMH and CPMC, each hospital has affiliations with different physician groups. A review of the physicians with admitting privileges to CPMC hospitals (provided by CPMC) and to St. Francis Memorial Hospital (through their "Find a Doctor" tool on the hospital's website[65]) shows that approximately 96 physicians currently have admitting privileges at both SFMH and CPMC. No evidence has been presented that the proposed LRDP would result in any change to these existing hospital-physician affiliations or existing medical referral patterns.

Under the LRDP, the proposed Cathedral Hill Hospital would be located approximately .5 mile from the existing SFMH at 1150 Bush Street. The existing Pacific Campus is approximately 1 mile from SFMH. The California Campus is approximately 2.3 miles from SFMH. No substantial evidence is presented to support the suggestion in the comments that moving the acute-care services, emergency services, or any other services the relatively short distance from the existing Pacific Campus (about .5- mile away) and

63 Saint Francis Memorial Hospital, Medical Services, http://saintfrancismemorial.org/Medical_Services/index.htm (accessed Apr. 8, 2011).

64 CPMC, 2011 (April 1), Memorandum from Geoffrey Nelson to Brian Boxer (AECOM), re: St. Francis and CPMC Physician Rosters.

65 http://www.saintfrancismemorial.org/Find_a_Doctor/Doctor_and_Specialist/index.htm (accessed Mar. 16, 2011). This Web site tool includes about 200 of the approximately 550 admitting physicians identified for SFMH.

California Campus (about 2 miles away) to the proposed Cathedral Hill Campus would result in a substantial change in existing medical use patterns that would, in turn, adversely affect the financial viability of SFMH.

Please also see Response HC-31 (page C&R 3.23-160) for detailed responses to individual comments regarding potential secondary impacts of the proposed LRDP on SFMH.

Urban Decay

Several comments state that competition from Cathedral Hill Hospital might cause the closure of SFMH and indirectly cause attendant urban decay impacts that are not analyzed in the Draft EIR.

CEQA would require analysis of potential urban decay impacts if evidence (such as a study showing economic vulnerability of competitor facilities) showed that the proposed LRDP might directly or indirectly exacerbate chronic economic distress, facility closures, and attendant urban decay.[66] Mere statements of the potential for urban decay, however, without substantiating evidence of economic vulnerability or decline that might lead to urban decay, do not require analysis.[67] No evidence in the record suggests economic or other vulnerability of SFMH that would be exacerbated by the proposed LRDP, or that the proposed Cathedral Hill Hospital would have such a deleterious effect on SFMH that it would have to close. Lacking such evidence, CEQA does not require analysis of potential urban decay effects for the proposed LRDP.

Major Response HC-4: Psychiatric Beds

Comments Overview

A number of comments state that the proposed LRDP would result in a reduction of psychiatric beds, with the result that these services would shift to other health care service providers.

Response

No reduction in psychiatric beds is proposed as part of the LRDP, and no substantial evidence to support this statement is presented in the comments with respect to a transfer of psychiatric services or associated impacts.

The proposed LRDP would not result in a reduction of the current number of psychiatric beds at CPMC facilities. CPMC currently has a total of 18 licensed psychiatric beds, all of which are located at the Pacific Campus (at the 2323 Sacramento Street Mental Health Center). As shown on Table 2-2, "CPMC Existing and Proposed LRDP Licensed Hospital Bed Uses" in the Draft EIR, page 2-10 (and as updated in Chapter 4, "Draft EIR Text Changes," (page C&R 4-36), all 18 psychiatric beds are proposed to continue to remain licensed at the Pacific Campus under the proposed LRDP, even after all inpatient care has been removed from the 2333 Buchanan Street Hospital. The California Department of Public Health allows distinct part units such as the psychiatric unit at the Pacific Campus to operate under General Acute Care Hospital Licenses so long as the main hospital facility is located within 15 miles. The 18-bed inpatient psychiatric unit that would remain at the Pacific Campus at 2323 Sacramento Street is located approximately .5 mile from the proposed Cathedral Hill Campus. The inpatient psychiatric beds are not subject to SB 1953 due to the ambulatory nature of the patients and, therefore, would be able to remain in operation after the seismic safety upgrade deadline has passed.

[66] See *Bakersfield Citizens for Local Control v. City of Bakersfield*, 124 Cal. App. 4th 1184, 1207 (2004); *Citizens for Quality Growth v. City of Mt. Shasta*, 198 Cal. App. 3d 433, 445-46 (1988).

[67] See *Melom v. City of Madera*, 183 Cal. App. 4th 41, 50 (2010).

According to OSHPD statistics, CPMC's 2009 average daily census for psychiatric beds was 10.6 patients.[68] Therefore, the provision of 18 licensed beds at the Pacific Campus would be adequate to respond to the demand for CPMC beds, based on its past demand census.[69] Furthermore, although the proposed LRDP would not reduce any citywide shortage of psychiatric beds, the proposed LRDP would not exacerbate such a shortage or contribute to any existing associated social or economic impact. All 18 existing CPMC inpatient psychiatric beds would remain under the LRDP. Therefore, the proposed LRDP would not result in any adverse effects from a shift of patients from inpatient to outpatient psychiatric treatment.

The comments accurately point out that in 2008, CPMC reduced the total number of licensed psychiatric beds at its campuses from 40 to 18, as part of the renovations at the Davies Campus, which eliminated 22 beds at the Davies Campus. Accordingly, there have been no psychiatric beds at Davies since 2008. In November 2008, the San Francisco Health Commission held a Proposition Q[70] hearing and found that the consolidation of the Davies Campus geriatric psychiatric beds (representing 22 licensed beds) into the existing 18 licensed psychiatric bed unit at the Pacific Campus would not have a detrimental effect on the provision of health care services to the community.[71]

The CPMC LRDP does not propose any further reduction in psychiatric beds for CPMC systemwide. Therefore, the LRDP would not contribute to any adverse impact related to a reduction of psychiatric beds.

Major Response HC-5: Effect on Emergency Services

Comments Overview

Several comments suggest that the proposed LRDP would result in a reduction in emergency care services or lessen access to emergency care services at non-CPMC facilities.

Response

No substantial evidence was presented in the comments that the proposed LRDP would increase demand on or otherwise weaken or undercut emergency room services at non-CPMC existing facilities. The proposed LRDP would expand the capacity of Emergency Departments or provide comparable emergency services at all the CPMC campuses.

Under the proposed LRDP, two emergency services locations would be closed (at the California and Pacific Campuses).[72] However, for the entirety of the CPMC system, total combined emergency and urgent care capacity would increase, from 88,000 visits/year currently to over 100,000 visits/year at the Cathedral Hill, Davies and St. Luke's Hospitals.[73]

Source: Data compiled by CPMC in 2011[74]

Cathedral Hill Campus

The existing Pacific Campus Emergency Department has 19 treatment stations and the California Campus has six stations, for a combined total of 25 treatment stations.[75] The Emergency Department at the proposed Cathedral Hill Campus would have 32 treatment stations.[76] Emergency Department patient volume for 2009 was 29,420 visits at the Pacific Campus and 10,324 visits at the California Campus.[77] The proposed Cathedral Hill Campus Emergency Department would be able to serve about 64,000 visits/year.[78] Therefore, the Emergency Department capacity currently provided at the California and Pacific Campuses would more than be met by the Emergency Department at the proposed Cathedral Hill Campus.

The proposed Pacific Campus urgent care center would also reduce demand for services at the proposed Cathedral Hill Campus Emergency Department and increase effective overall capacity. The Pacific Campus Urgent Care Center would be able to service about 17,300 visits/year.[79] Urgent care centers typically treat patients with non-emergency ailments, such as joint and muscle pain, skin infections, abdominal pain, urinary tract infections, headaches, infections of the ears, throat, and sinuses, and cough/bronchitis. Urgent care centers reduce volume at Emergency Departments by providing a setting for treatment of low-level, acute medical need.[80] A recent study showed that about 17 percent of

Apr. 8, 2011. Using industry-standard maximum volumes of between 1,700 and 2,000 visits per year per emergency station (Pacific = 19 stations, California = 6 stations, Davies = 9 stations, St. Luke's = 10 stations), the current maximum capacity is 88,000 visits/year. CPMC, memorandum from Malia Weinberg, Senior Project Manager, Operations, Planning and Activations, to David Reel (AECOM) & Brian Boxer (AECOM), re: System wide ED and Urgent Care (June 1, 2011).; see also The Advisory Board Company, *Efficiency Metrics Should Drive ED Expansion Decision* (2006).

79 Ibid.

80 Weinick, R. M., et al., Many Emergency Department Visits Could Be Managed at Urgent Care Centers and Retail Clinics, Health Affairs (Milliwood), 2010 (Sept. 29), 9:1633.; A study conducted by Cattaneo and Stroud, Inc., independent consultants retained by CPMC, analyzed data from UCSF, UCSD, and private data from several non-public hospitals to estimate the effect of reconfiguring the Pacific Campus to include an urgent care center. Cattaneo and Stroud concluded that, based on the proportion of cases in the lower

Emergency Department visits could be seen in an urgent care center with restricted hours (such as from 9 a.m. to 9 p.m.).[81]

Davies Campus

With respect to the Davies Campus, as stated in the Draft EIR, page 2-143, the existing Emergency Department would remain in the Davies Hospital North Tower. Annual emergency visits at the Davies Campus between 2004 and 2009 ranged from a low of 12,864 visits (in 2009) to a high of 15,673 visits (in 2007).[82] The existing Emergency Department, which has 11 treatment bays, would provide sufficient capacity to meet demand for the foreseeable future, which is not anticipated to rise above a maximum of approximately 16,000 visits per year.[83]

St. Luke's Campus

As described in detail in the Draft EIR, page 2-181, and in Table 2-13, "St. Luke's Campus: Project Summary Table," page 2-175, under the proposed LRDP, the Emergency Department at St. Luke's Hospital would be 50 percent larger in area than the existing Emergency Department at the St. Luke's Campus. The proposed Emergency Department would provide differentiated treatment in dedicated individual patient rooms, including two critical care ambulance rooms, six standard treatment rooms, four fast track rooms, and a triage room.[84]

Under the proposed LRDP, many of the non-emergency patient visits would be accommodated by expanding the existing Health Care Center, an urgent care center currently operating out of the Monteagle Medical Center.[85] By creating additional capacity via an urgent care center on the St. Luke's Campus, the effective combined Emergency Department and urgent care capacity would increase from about 26,000 visits per year today to approximately 31,600 visits under the LRDP.[86]

Some of the comments (including some of the comments supporting Alternative 3A or an "Alternative 3A Plus"), express concern that, under the proposed LRDP, emergency capacity for residents of the southeastern portion of the City would be insufficient, because, as the comments suggest, the residents might not be able to reach the proposed Cathedral Hill Campus in the event of an earthquake or other disaster. The proposed Cathedral Hill Hospital Emergency Department would be approximately 2 miles east of the existing California Campus and about .5 mile east of the Pacific Campus Emergency Departments; thus, would be closer to the southeastern portions of the City than the existing CPMC hospitals it would replace. Also, given the increased size and capacity of the St. Luke's Emergency Department under the

---

level of acuteness that end up being treated in an urgent care clinic, a percentage of potential future increase in Emergency Department volume would be partially offset by the diversion of lower acuity cases to the urgent care clinic. Cattaneo and Stroud, Inc., *Assumptions supporting estimates of future CPMC Inpatient and Outpatient Volume*, 2008 (March 20).

83 CPMC, memorandum from Malia Weinberg, Senior Project Manager, Operations, Planning and Activations, to David Reel (AECOM) & Brian Boxer (AECOM), re: System wide ED and Urgent Care (June 1, 2011).

84 Ibid.

85 Ibid. Urgent care designation is largely determined by hours of operation, staffing, and services offered. To support the urgent care center, evening hours would be extended until 10 p.m., and sufficient on-site x-ray/imaging capacity and space to treat fractures (casting room) and lacerations would be provided, or where existing, upgraded.

86 Ibid. 2009 Emergency Department visits = 27,965. Source: OSHPD, ALIRTS, Annual Utilization Report of Hospitals, California Pacific Medical Center - St. Lukes Campus, 2009, available at http://www.alirts.oshpd.ca.gov, accessed Apr. 8, 2011. The St. Luke's Emergency Department currently runs well above ideal capacity, with several beds regularly provided in the hallways of the Emergency Department. CPMC, memorandum from Malia Weinberg, Senior Project Manager, Operations, Planning and Activations, to David Reel (AECOM) & Brian Boxer (AECOM), re: System wide ED and Urgent Care (June 1, 2011). See Task Force *Updates and Accomplishments* for projection of future Emergency Department capacity at St. Luke's. (S.F. Health Commission Task Force on CPMC's IMP Addressing Resolution No. 10-09, *Updates and Accomplishments*, Mar. 2, 2010).

proposed LRDP, as well as the location of both an expanded Emergency Department at San Francisco General Hospital (SFGH) and the new Emergency Department at the new UCSF Mission Bay Hospital within the southeastern portion of San Francisco, no substantial evidence exists which indicates that an inadequate emergency capacity would exist in the southeastern portion of the City, in the event of a future disaster.

Some comments also express concern about either the possibility of increased diversions from St. Luke's Hospital to SFGH or the ability of St. Luke's Hospital to handle diversions from SFGH. No evidence of either increased diversions to or from SFGH, or inadequate capacity at the proposed St. Luke's Replacement Hospital was provided. Rather, given the expansion of the St. Luke's Hospital Emergency Department within a new structure that would meet the strictest seismic safety requirements of SB 1953, and the additional capacity that would be provided by the proposed urgent care center at the St. Luke's Campus, the LRDP would increase overall emergency preparedness for the southeastern portion of the City.

More specifically, the proposed LRDP would increase the effective Emergency Department and urgent care capacity at the St. Luke's Campus from approximately 26,000 visits per year currently to approximately 31,600. Furthermore, emergency capacity would be increased by the new UCSF Mission Bay Hospital (planned to have a new 16,000-square foot specialty emergency/urgent care department),[87] and the existing SFGH hospital that is to be replaced with a new SFGH main hospital that would provide expanded emergency capacity (72,000 annual emergency visits, compared to the approximately 54,000 annual emergency visits that can be accommodated at the existing hospital).[88] The expanded Emergency Department at the new SFGH main hospital would increase the ability of SFGH to accommodate emergency visits by approximately 33 percent, compared to existing conditions, which would reasonably be expected to reduce the need for such diversions.[89]

A hospital (such as SFGH) would be on divert status if its Emergency Department was full or temporarily unavailable.[90] Currently, SFGH is on diversion 20 percent of the time for non-trauma cases (no trauma cases are diverted from SFGH and all trauma cases brought to SFGH are treated there).[91] The St. Luke's Campus is located approximately 1.4 miles from SFGH and the new UCSF Mission Bay Hospital will be located approximately 1.5 miles from SFGH. Therefore, some portion of non-trauma cases currently diverted from SFGH to St. Luke's Campus would also be expected to be diverted to UCSF Mission Bay. Diversions from SFGH currently may be directed to St. Luke's Campus, but may also be directed to other hospital Emergency Department locations throughout the City, depending on several factors.

As explained in the TransOptions4Healthcare analysis of San Francisco Fire Department 911 emergent transports to CPMC Campuses,

> [T]ransporting a patient to a hospital emergency room following a 911 call is not a simple decision of choosing the closest hospital because there is no set geographic 'catchment' area to predetermine where a SFFD crew will transport a patient. Prior to any decision on hospital Emergency Department selection, a SFFD crew must consider at least seven factors:

87 UCSF Campus Planning, 2011 (Feb. 2), email communication with Diane Wong.
88 San Francisco Planning Department, 2008 (June 4), San Francisco General Hospital Seismic Compliance, Hospital Replacement Program EIR, *Comments and Responses*, page 56.
89 San Francisco Planning Department, 2008 (June 4), San Francisco General Hospital Seismic Compliance, Hospital Replacement Program EIR, *Comments and Responses,* pages 56-57.
90 TransOptions4Healthcare, 2011 (Feb. 28), *City of San Francisco Fire Department 911 Emergent Transports to CPMC Campuses: 2004, 2008, 2015*, prepared for California Pacific Medical Center, pp. 15-16.
91 San Francisco Planning Department, 2008 (June 4), San Francisco General Hospital Seismic Compliance, Hospital Replacement Program EIR, *Comments and Responses,* page 55.

- Paramedic Assessment – *SFFD ambulance crew proceeds on scene, attempts to treat and/or stabilize a patient, and then determines if the patient's medical condition requires transport to a hospital Emergency Department;*
- Possibility of Hospitals on Divert Status – *one or more hospital Emergency Department may be full or temporarily unavailable;*
- Patient Choice – *if the patient does not have a life threatening injury and SFFD can take the extra minutes necessary, the SFFD will generally respond to a patient's request for a particular hospital such as Kaiser, or a preferred hospital based on the patient's insurance;*
- Patient Severity – *if a patient has a severe medical condition they are generally transported to the nearest hospital Emergency Department with the shortest waiting time;*
- Type of Patient Medical Problem – *not all hospitals can treat trauma, neurological, or stroke patients so the SFFD crew must often contact dispatch for medical direction on a hospital with these higher level services or they might have to re-transport the patient later;*
- County Policies and Protocols – *SFFD crew must follow applicable EMS protocols and procedures concerning treatment of a patient in the field, treat and release if a patient refuses transport, DNR or Do Not Resuscitate orders, and other directives on appropriate patient care and transport;*
- Location of Ambulances – *SFFD crew may be stationed in geographic areas that correspond to historic patterns of 911 requests, and if a crew must transport a patient a considerable distance out of their 'zone' the crew may likely proceed to the closest hospital Emergency Department as soon as possible.*[92]

Labor and Delivery Emergencies

Several comments express concerns regarding the ability of CPMC to provide adequate treatment under the proposed LRDP to patients experiencing emergencies during births within the St. Luke's Hospital service area. Two types of concerns are raised by these comments, one regarding a perceived lack of adequate services at the St. Luke's Campus, and the other regarding potential delays to patients in emergency or private vehicles traveling from the southeastern portion of the City to the proposed Cathedral Hill Hospital.

As is current practice across the CPMC campuses, high-risk maternity patients (where it would be likely or suspected that mother or newborn would require specialized intensive care services related to the birth) are identified early in their pregnancy.[93] Such patients are referred to the dedicated women's and children's facilities (currently at the California Campus).[94] Under the LRDP, they would be referred to the proposed Cathedral Hill Hospital in the future.[95]

Normal and low-risk deliveries, including any emergencies that might occur during normal or low-risk labor and delivery, would continue to be handled at St. Luke's Hospital or the women's and children's facilities at the proposed Cathedral Hill Hospital, based on patient and physician preference. [96] If, during a

92 TransOptions4Healthcare. 2011 (Feb. 28), *City of San Francisco Fire Department 911 Emergent Transports to CPMC Campuses: 2004, 2008, 2015*, prepared for California Pacific Medical Center, pages 14-15.
93 CPMC, Memorandum from Malia Weinberg to David Reel (AECOM) & Brian Boxer (AECOM, re: Labor and Delivery Emergencies (Apr. 21, 2011).
94 Ibid.
95 Ibid.
96 Ibid.

normal or low-risk delivery at St. Luke's Hospital, a woman had complications that required a higher level of care, the mother and newborn would be stabilized at the St. Luke's Replacement Hospital and the newborn then would be transferred to the Neonatal Intensive Care Unit (NICU) at the proposed Cathedral Hill Hospital.[97] (Currently, newborns are transferred to the California Campus.)[98] In these relatively rare occurrences, the mothers typically would remain in the Intensive Care Unit (ICU) at the St. Luke's Replacement Hospital. The incidence of "normal" births that require NICU follow-up is low.[99] Between January 1, 2010, and December 31, 2010, only 1.3 percent of the births at St. Luke's Hospital (i.e., 8 out of 917 births) required such follow-up care.[100]

The St. Luke's Replacement Hospital would have all the necessary stabilization capabilities (infant resuscitation stations, Broselow crash carts, adult crash carts, etc.) to handle the immediate needs of the patient, including an intensive care unit for the mother.[101] Only after a newborn was stabilized would a neonatal transfer occur.[102] Such transfer would be conducted under the care of a registered nurse at all times, until the newborn was safely handed off to an NICU nurse at the proposed Cathedral Hill Campus (currently, such newborns are transferred to the California Campus NICU).[103] Additionally, the new UCSF Mission Bay Hospital will provide NICU services in the southeast portion of the city.[104]

Emergency and Private Vehicle Access

Under the proposed LRDP, development of the proposed Cathedral Hill and St. Luke's Campuses would not result in significant emergency vehicle access impacts. See Impacts TR-52 and TR-92 and Draft EIR pages 4.5-145 and page 4.5-206, respectively, and Response TR-100 (page C&R 3.7-170) regarding whether emergency vehicle access would be compromised under the LRDP.

As explained in Response TR-100 (page C&R 3.7-170), the likely routes to the proposed Cathedral Hill Hospital would be multi-lane arterial roadways that would allow emergency vehicles to travel at higher speeds and permit other traffic to maneuver out of their path. In addition, the majority of emergency transports would occur during non-commute hours, further reducing the risk of traffic problems associated with commuter traffic. Furthermore, during times when congestion was most severe, emergency vehicles would likely choose to use less congested, parallel routes, and emergency vehicles also would be permitted to travel opposite the flow of traffic or contraflow in a one-way route to bypass congestion. With the grid street layout surrounding the proposed Cathedral Hill Campus, emergency vehicles would have multiple routes to choose to access the hospital, while avoiding the most congested routes.

Major Response HC-6: Skilled Nursing Facilities (SNF)

Comments Overview

A number of comments were made regarding the reduction of SNF beds in the City of San Francisco generally and as proposed in the CPMC LRDP. The comments suggest that the proposed reductions in the total number of licensed SNF beds under the LRDP would equate to a loss of services and to the transfer or redistribution of

services to other providers, with a resulting potential for impacts on public services and other indirect physical environmental impacts (traffic and air quality).

For example, comments state that CPMC plans to cut 180 skilled nursing (SNF) beds, including 79 at St. Luke's and 101 at the California campus (citing Table 2-2 in the Draft EIR, page 2-10, which shows the elimination of SNF beds at the California Campus by 2010). The comments further suggest that no identified plan exists for replacement of these beds (or for providing the 62 beds needed to meet CPMC's "100 bed commitment" (described below). The comments state that CPMC should replace all of the SNF beds that are proposed to be de-licensed and eliminated at the St. Luke's and California Campuses, and that the CPMC LRDP EIR should indicate where they would be located, and analyze their additional future project impacts.

Response

CPMC has committed to maintaining sufficient SNF beds (100) to meet its actual demand.[105] Future plans for replacement of existing beds at the California Campus are unknown at this time and therefore, as explained below, are not required to be analyzed in the CPMC LRDP EIR.

Maintenance of CPMC SNF Capacity

CPMC currently has a total of 218 licensed SNF (and subacute) beds at its existing campuses. These include 79 licensed beds at the St. Luke's Campus,[106] 38 licensed beds at the Davies Campus and 101 licensed beds at the California Campus. There are no licensed SNF beds at the Pacific Campus (see Table 2-2, "CPMC Existing and Proposed LRDP Licensed Hospital Bed Uses" in the Draft EIR, page 2-10, and as revised in Chapter 4, "Draft EIR Text Changes," of this document (page C&R 4-36). Please also see Response PD-6 (page C&R 3.2-6), which discusses the revisions to Table 2-2 set forth in Chapter 4 of this document.

Current estimates, based on projections, indicate that CPMC would need to provide approximately 100 skilled nursing beds total (for all CPMC campuses) at any given time. In 2009, CPMC averaged a total of 87 skilled nursing patients at its California, Davies and St. Luke's Campuses combined. The San Francisco Health Commission Task Force, in its reports dated March 2 and September 30, 2010, affirmed CPMC's plans to maintain capacity to serve its existing patient needs by providing at least 100 skilled nursing beds, including 38 existing SNF beds at the Davies Campus and 62 at other on or off-campus locations.[107]

CPMC has committed to continue to operate the SNF beds that are currently located at both the St. Luke's (until existing hospital demolition)[108] and California Campuses as needed, unless and until CPMC is successful in opening 62 replacement beds/facilities at other locations (yet to be determined), consistent with its overall 100 SNF beds commitment. These replacement beds/facilities could be located on a CPMC campus or in off-site community facilities.[109] In Response PD-6 (page C&R 3.2-6), Table 2-2,

[105] See, e.g., The SF Health Commission Task Force on CPMC's IMP Addressing Resolution No. 10-09, *Updates and Accomplishments* (Mar. 2, 2010).

[106] Of these 79 licensed beds at the St. Luke's Campus, 19 are utilized as SNF beds. The balance (60) are utilized as subacute-care beds, as described elsewhere in this response.

[107] The S.F. Health Commission Task Force on CPMC's IMP Addressing Resolution No. 10-09, *Updates and Accomplishments*, Mar. 2, 2010; CPMC, *Interim Report to the San Francisco Health Commission Regarding Progress Toward Commission Recommendation in Resolution No. 10-09*, Sept. 30, 2010.

[108] The 79 SNF (and subacute) beds located in the existing St. Luke's Hospital would be de-licensed and eliminated in connection with the demolition of the existing hospital, which would occur after the proposed St. Luke's Replacement Hospital is completed and operational.

[109] The Health Commission Task Force concurred with CPMC that the provision of SNF beds within the CPMC system and through new community-based facilities would provide patient services envisioned by the Blue Ribbon Panel. The S.F. Health Commission Task Force on CPMC's IMP Addressing Resolution No. 10-09, *Updates and Accomplishments*, Mar. 2, 2010.

"CPMC Existing and Proposed LRDP Licensed Hospital Bed Uses" in the Draft EIR, page 2-10 has been revised, as also shown in Chapter 4, "Draft EIR Text Changes" of this C&R document.

CPMC has committed that no existing community-based beds would be utilized as replacement SNF beds.[110] CPMC has stated that it would substitute or replace its existing SNF beds either with new community-based facilities or with replacement capacity provided on one of its campuses, to not diminish the City's overall supply of skilled nursing beds.[111] CPMC would provide ongoing reports to the Health Commission concerning these options and future decisions.[112]

Some comments challenge the transfer of SNF beds to non-hospital settings.[113] As Dr. Mitch Katz, San Francisco's former Director of Public Health, stated at the November 19, 2009 public hearing regarding CPMC's 2008 IMP before the Planning and Health Commissions, however, the decision not to build new SNF beds within an acute-care facility is considered the correct decision.[114] This is because SNF beds are not required to meet the stringent seismic safety standards of SB 1953, and providing SNF beds in buildings that meet those standards would be much more expensive.[115] As Dr. Katz explained, ultimately the cost of those new hospital buildings would be passed along to patients in the form of higher insurance premiums. Dr. Katz also explained that providing assisted living in a patient's house (e.g., by installing a ramp that would facilitate such an arrangement), would be preferable to long-term care in a SNF bed.[116] Dr. Katz's recommendations are further substantiated by the analysis and recommendations of The Lewin Group, performed on behalf of the Department of Public Health in connection with its independent decision not to include SNF beds in the new San Francisco General Hospital.[117] The Health Commission

---

The Long Term Care Coordinating Council (LTCCC) also passed a resolution stating that it "supports CPMC's policy of not closing any of its 101 post-acute skilled nursing beds at the California Campus, either in 2010 or later, until reasonable alternatives are established." Long Term Care Coordinating Council, *LTCCC resolution affirming the need for citywide health planning, and optimizing an individual's return from hospital to home, or to the most integrated setting.* (Revised Draft: June 15, 2009).
The LTCCC is a City body charged to: (1) advise, implement, and monitor community-based long term care planning in San Francisco; and (2) facilitate the improved coordination of home, community-based, and institutional services for older adults and adults with disabilities. It is the single body in San Francisco that evaluates all issues related to improving community-based long-term care and supportive services. The LTCCC evaluates how different service delivery systems interact to serve people and recommends ways to improve service coordination and system interaction. Workgroups responsible for carrying out the activities in the plan provide periodic progress reports through presentations to the LTCCC.

110 S.F. Department of Public Health, Memorandum from Barbara A. Garcia, MPA, Director of Health, to Christina Olague, Planning Commission President, and Members of the Planning Commission re: March 10, 2011 Joint Planning Commission/Health Commission Hearing (Mar. 2, 2011), Attachment B, S.F. Health Commission Resolution No. 02-10, 2010 (Mar. 16), *Resolution Memorializing the Agreements Reached by the Health Commission and the California Pacific Medical Center Regarding its Institutional Master Plan* ("S.F. Health Commission Resolution No. 02-10"). The total number of licensed skilled nursing beds in the City and County of San Francisco would decline from the existing 3,179 to 2,914 with the implementation of the proposed LRDP. The elimination of 79 beds at CPMC campuses would contribute to this decline in licensed (as compared to staffed) SNF beds.

111 The S.F. Health Commission Task Force on CPMC's IMP Addressing Resolution No. 10-09, *Updates and Accomplishments*, Mar. 2, 2010, page 6.

112 A Health Commission Task Force was convened on CPMC's Institutional Master Plan to discuss and analyze CPMC's progress in fulfilling the Health Commission's recommendations. According to the Health Commission Task Force, "CPMC reported to the Task Force that its analysis of case mix, utilization, and outcomes over the last several years indicates an ongoing need for 100 skilled nursing beds." Ibid., page 3. Also see CPMC *Interim Progress Report*, Sept. 30, 2010, page 3.

113 Hospital-based SNF service availability has been declining in San Francisco as well as throughout the United States. SNF services are reimbursed by Medicare at a lower rate than general acute care services, and are typically operated at breakeven or a loss. In California, the issue is more pronounced. Because hospitals are required to meet SB 1953 standards, either through renovation or replacement, construction costs are typically two to three times the national averages on a per bed basis. Thus, hospitals are choosing not to allocate expensive facility space to a service that can be performed in a lower cost facility, where reimbursement may meet or exceed necessary operating requirements. San Francisco's high real estate values and scarcity of available space only exacerbates an already difficult situation. The Lewin Group, 2009 (June 26). *California Pacific Medical Center Institutional Master Plan Review.*, page 22.

114 Testimony of Dr. Mitch Katz, November 19, 2009, at the CPMC IMP hearing.

115 Ibid.

116 Ibid.

117 SFDPH should not include SNF capacity in new hospital construction; from "San Francisco Department of Public Health Long Range Service Delivery Planning Project," LRSD Community Committee Meeting #4, prepared by the Lewin Group, May 30, 2002, page 49.

also recognized that "institutional care is not necessarily the best option for seniors and younger adults with disabilities who need post-term care."[118]

Because CPMC has committed to providing sufficient SNF beds to meet its patients' needs, the proposed LRDP would not result in a reduction in the number of SNF beds that would, in turn, result in potential environmental impacts that could trigger analysis of additional project alternatives. The comments do not present substantial evidence to the contrary.

Location of 62 Replacement SNF Beds

Because the precise nature, location, and provider of the future 62 SNF beds are not currently known, the Draft EIR, as clarified in the revisions to Table 2-2, "CPMC Existing and Proposed LRDP Licensed Hospital Bed Uses" in the Draft EIR, page 2-10 (see Response PD-6 [page C&R 3.2-6]), assumes the continued maintenance of 101 licensed SNF beds at the California Campus and 38 licensed SNF beds at the Davies Campus, unless and until CPMC identifies another plan. A plan for providing the beds needed to meet its SNF bed commitment would be subject to review and comment by the San Francisco Health Commission, as provided in Proposition Q.[119] It would be speculative to analyze this future SNF bed provision plan in the CPMC LRDP EIR, as part of the current project, as either an alternative campus-based plan (other than continuing to provide these beds at the California and Davies Campuses) or an off-campus plan, or some combination. Any such plan for replacement SNF bed facilities within the CPMC system would, therefore, be subject to subsequent environmental review, as necessary and required under CEQA.

There is no definite, reasonably foreseeable plan or even a conceptual plan to relocate SNF beds, nor any particular schedule for when that might occur under the proposed LRDP. Among the possible approaches to meeting its SNF commitment that CPMC outlined to the Blue Ribbon Panel and to the Health Commission, are the following: (1) provide beds in CPMC facilities; (2) collaborate with other city hospitals; (3) lease renovated CPMC facilities to a SNF management company; and (4) develop collaborations with community transitional care services.[120]

The various SNF relocation plans exist at this time only as broad concepts or options for future consideration, absent any meaningful planning, decision-making or any other activity by CPMC (or others) to move one particular concept along toward implementation. They are possibilities that in the future SNF relocation plans would need to be more seriously considered if any were to be pursued. In the meantime, however, SNF beds would continue to be provided at the St. Luke's Campus (until demolition of the existing hospital), at the Davies Campus, and at the California Campus. Potential future SNF relocation plans are not in a form that could be studied as part of the CPMC LRDP EIR at this time. In the interim, the existing facilities, which will continue to provide SNF bed facilities, are adequate based upon CPMC's "100-SNF bed" commitment and no legal (e.g., SB 1953) constraints exist on their continued utilization.

---

[118] CPMC, 2010 (Sept. 30), *Interim Progress Report*.

[119] See San Francisco Department of Public Health undated information sheet describing the "Community Health Care Planning Ordinance" (also known as Prop Q), on the Department's Web site: http://www.sfdph.org/dph/files/hc/PropQ_HealthcarePlanOrd_Amend11182008.pdf, accessed Nov. 10, 2010.

[120] Transitional care and outpatient case management programs could potentially lead to a decrease in the need for institutional SNF care or support shorter lengths of stay in the SNF. Partnerships with these networks could increase the capacity for safe discharges back to community housing for socially and medically complex patients. (Wajnberg, Ania, MD et al., *Hospitalizations and Skilled Nursing Facility Admissions Before and After the Implementation of a Home-Based Primary Care Program*, Journal of the American Geriatric Society. 2010 Jun;58(6):1144-7. Epub 2010 May 7,)**.** Therefore, as further described in this Response below, in addition to meeting the 100 (SNF) bed commitment discussed above, CPMC is working on a partnership with the Department of Aging and Adult Services (DAAS) and a new Transitional Care Network, and participating in negotiations with the Independent Physician Association (IPA) for more robust care management programs for patients with chronic diseases. CPMC, Memorandum from Malia Weinberg to David Reel (AECOM) & Brian Boxer (AECOM) re: Transitional Care and Community-Based Care for Skilled Nursing Patients (Apr. 21, 2011).

Continuity of Care

Some comments suggest that CPMC's approach to providing long-term, community-based acute-care and supportive services is inadequate, because it does not assure that a higher level of hospital-based SNF care would continue. These comments suggest that the proposed LRDP fails to address the "discontinuation of care that may occur when a patient is discharged from an acute-care facility to a skilled nursing facility operated by a third party or to a home." This comment, which addresses programmatic aspects of specific health care services, does not raise an issue that concerns the adequacy, accuracy, or completeness of the Draft EIR to address the physical environmental effects of the proposed LRDP. The following discussion is provided for informational purposes.

Acute-care patients who continue to require SNF in-hospital care would be accommodated at the Davies Campus. Other patients requiring less acute-care services would be served in other on-campus or off-campus facilities.

Medical facilities throughout the country, a notable example being Laguna Honda Hospital in San Francisco, have decommissioned some or all of their hospital-based SNF beds in favor of community-based, off-campus nursing facilities for several reasons, including the following: (1) hospital rooms are the most costly to build, (2) staffing requirements in hospitals are often much higher than what is necessary in an SNF, and (3) many patient health outcomes are better in more home-like settings.[121] Accordingly, CPMC is exploring a collaborative relationship with community providers of transitional care to accomplish appropriate and safe home discharges for patients who do not need to be cared for in hospital-based SNF beds.[122]

The Long Term Care Coordinating Council (LTCCC) acknowledged that CPMC is in the process of developing "a program of transitional care services that will facilitate the move of vulnerable adults from acute-care services to post-acute services, provided either by CPMC or other health care institutions in San Francisco, or provided at home or in the community . . ."[123] The LTCCC resolution also "urges all stakeholders, including the Health Commission, Planning Commission, and Aging and Adult Services Commission, to work to preserve and expand access to a comprehensive continuum of services and support that optimizes an individual's best chance of returning from hospital to home or to the most integrated setting, provides alternatives to hospitalization, as well as minimizing re-admission to an acute-care setting."[124]

---

[121] CPMC, Memorandum from Malia Weinberg to David Reel (AECOM) & Brian Boxer (AECOM) re: Transitional Care and Community-Based Care for Skilled Nursing Patients (Apr. 21, 2011). The Camden Group recognized that inclusion of skilled nursing, psychiatric, and subacute-care services in the proposed St. Luke's Campus project "would significantly increase the total project cost, and likely reduce the overall financial performance of the hospital, potentially making it difficult for CPMC to secure financing for the project." The Camden Group, 2009 (April 28), *San Francisco Blue Ribbon Panel: Utilization Projections and Assumptions for St. Luke's Campus*, page 24.
As The Camden Group's study explained, "Due to reduced reimbursement rates and increased regulatory requirements the financial viability of providing skilled nursing, psychiatric, and subacute care services has become increasingly difficult. Generally, when those services are provided in an existing acute care hospital setting the cost structure is increased and the financial performance of the services further erodes. For these reasons, in recent years many acute care hospitals in California and other states have opted to close those services or relocate them to lower cost settings." Ibid.

[122] CPMC, Memorandum from Malia Weinberg to David Reel (AECOM) & Brian Boxer (AECOM) re: Transitional Care and Community-Based Care for Skilled Nursing Patients (Apr. 21, 2011). The Health Commission Task Force stated that it "supports CPMC's collaboration with the Department of Aging and Adult Services (DAAS), the San Francisco Senior Center, St. Francis Memorial Hospital on a pilot to provide comprehensive support to senior patients with transition services such that many can successfully be restored to their own homes with appropriate support services." The S.F. Health Commission Task Force on CPMC's IMP Addressing Resolution No. 10-09, *Updates and Accomplishments*, Mar. 2, 2010.

[123] LTCCC, *LTCCC resolution affirming the need for citywide health planning, and optimizing an individual's return from hospital to home, or to the most integrated setting.* (Revised Draft: June 15, 2009).

[124] Ibid.; A policy preference for shifting SNF beds away from hospitals and into home care and other settings also has been recognized outside of the context of the City's and CPMC's planning efforts. For example, a report by the University of California, Berkeley

The Blue Ribbon Panel recognized that a broader citywide and regional Bay Area plan would be needed to address improved transitional care from acute to subacute to rehab facilities overall. As part of this broader effort, through the Blue Ribbon Panel consensus process, CPMC has committed to collaborate with the LTCCC and the San Francisco Hospital Council to finds ways that the City of San Francisco can expand the community's capacities to offer appropriate skilled nursing care beds.[125]

Subacute Care

Subacute-care patients are individuals who do not need acute care, but who are too ill to be cared for by most skilled nursing facilities. Frequently these individuals are ventilator-dependent or require frequent respiratory treatments. Although subacute-care beds are licensed as skilled nursing beds,[126] they are reimbursed differently and are subject to additional staffing and patient criteria requirements.[127]

Many hospitals with older buildings or floors that are no longer adequate to support modern acute care, at times, have utilized their existing facilities to create inpatient long-term care facilities, usually called "subacute-care units," to provide care for patients with dementia, degenerative neurological conditions, brain damage, or severe respiratory problems.[128] Subacute-care units provide a specialized level of care to medically fragile patients. Although subacute-care units can and do make use of otherwise unusable existing inpatient facilities, for the same reasons of higher construction and staffing costs associated with acute-care facilities that was cited for SNF beds, it is not practical to create such units in a new acute-care hospital.[129] None of the current proposed acute-care hospitals under design or construction in the United States has proposed to include subacute care within a new inpatient facility.

The St Luke's Campus subacute unit has 60 beds, located in the St. Luke's Hospital tower and occupying the entire sixth floor and half of the eighth floor. The average daily census of these subacute beds for the past 3 years was 56.4 beds in 2007, 49.8 beds in 2008, and 48.9 beds in 2009.[130] The Camden Group's study stated that "[h]istorically, almost all of the subacute patients [at the St. Luke's Campus] have been direct admit patients residing in areas outside SOMA, and often outside San Francisco County."[131]

The Blue Ribbon Panel, therefore, did not recommend that CPMC provide new replacement subacute-care beds in the proposed replacement hospital at St. Luke's Campus for those in the existing St. Luke's

---

School of Public Health concluded: "Master policy shifts need to occur. To ensure continuity and coordination of care, we need integrated care delivery systems that incorporate medical and social services as well as caregiver assessment, training, and support. We also need a system that focuses on preventive care and chronic care management, not acute care. Finally, we need to make in-home care a higher priority than more expensive institutional care." (Holly Brown-Williams, *Dangerous Transitions: Seniors and the Hospital-to-Home Experience*, Health Research for Action, University of California, Berkeley School of Public Health, Perspectives Vol. 1, No. 2, Apr. 2006.)

125 The Camden Group, 2009 (April 28), *San Francisco Blue Ribbon Panel: Utilization Projections and Assumptions for St. Luke's Campus*.

126 Subacute beds are licensed as SNF beds under the California Department of Public Health's licensing practices. Therefore, utilization data for these units are not differentiated from SNF beds on the OSHPD website. Of the total of 79 SNF beds currently at St. Luke's, 60 are subacute-care beds and 19 are SNF beds. (CPMC, Memorandum from Malia Weinberg to David Reel (AECOM) & Brian Boxer (AECOM) re: Subacute Care (May 26, 2011).

127 California Hospital Association. Details on subacute admission criteria can be found at: http://files.medi-cal.ca.gov/pubsdoco/publications/masters-mtp/part2/subacutlevadufrm_m01o03p00l00.doc. See, e.g., State of California, Health & Human Services Agency, Department of Health Care Services, *Information for Authorization/Reauthorization of Subacute Care Services-Adult Subacute Program*, DHCS 6200 A (July 2009).

128 CPMC, Memorandum from Malia Weinberg to David Reel (AECOM) & Brian Boxer (AECOM) re: Subacute Care (May 26, 2011).

129 The Camden Group, 2009 (Apr. 28), *San Francisco Blue Ribbon Panel: Utilization Projections and Assumptions for St. Luke's Campus*, page 24.

130 CPMC, Memorandum from Malia Weinberg to David Reel (AECOM) & Brian Boxer (AECOM) re: Subacute Care (May 26, 2011).

131 The Camden Group, 2009 (Apr. 28), *San Francisco Blue Ribbon Panel: Utilization Projections and Assumptions for St. Luke's Campus*, page 10.

Hospital. Instead, the Blue Ribbon Panel recommended that "CPMC should replace lost subacute beds with placements for all individuals currently in those beds."[132]

Consistent with the Blue Ribbon Panel's recommendations, CPMC would gradually remove the existing 60 subacute beds from service at St. Luke's Hospital, through attrition or transfers to other facilities between now and when the existing St. Luke's Hospital tower would be demolished.[133] Inpatient operations (including any remaining subacute-care services) at St. Luke's Hospital would continue until the proposed St. Luke's Replacement Hospital was completed and in operation, and transfer of acute-care services would begin.[134] The proposed St. Luke's Replacement Hospital would not have subacute-care beds. Any patients not able to be transferred to other subacute-care facilities by that time would be placed, as appropriate, in a CPMC acute-care or SNF bed (on another CPMC campus).[135] As presented in the Major Response HC-1 discussion of licensed or acute care bed capacity, this volume could be accommodated by the CPMC system under the LRDP.[136]

Most patients utilizing CPMC's existing subacute-care facilities do not reside in the south of Market Street area, but rather come from other areas of the city or outside the city.[137] Therefore, it is anticipated that patients would, in the future, seek services across a wide geographic area and would not cluster at any one facility or area. Furthermore, the patient transition plan for the current patient population utilizing the existing subacute-care beds at St. Luke's Hospital anticipates that a limited number of patients would be transitioning at any given time from St. Luke's Hospital to other non-CPMC hospitals or other health care facilities.[138] Therefore, the future potential shift of subacute-care services from CPMC to other hospitals and/or health care service providers would not result in secondary impacts at any one facility, including San Francisco General Hospital (which does not offer this service).

Major Response HC-7: Access to Single-Occupancy Rooms

Comments Overview

Because the proposed Cathedral Hill Hospital and St. Luke's Replacement Hospital would consist entirely of single patient rooms, some comments suggest that the proposed LRDP would not provide access to patients with insurance limitations or those participating in government health care programs.

Response

The record does not support these contentions. Medicare rules provide for coverage of single-patient rooms.

Current patient standard of care guidelines recommend single-patient rooms, regardless of income level.[139] Because of the many advantages that single-patient rooms offer (see Major Response HC-1 [page

---

132 The Blue Ribbon Panel, 2008, Consensus Positions for Recommendations to CPMC's Board of Directors.

133 CPMC, Memorandum from Malia Weinberg to David Reel (AECOM) & Brian Boxer (AECOM) re: Subacute Care (May 26, 2011).

134 Ibid.

135 Ibid. With the future decommissioning of the existing St. Luke's Hospital tower after construction of the St. Luke's Replacement Hospital, CPMC would place all remaining subacute-care patients in the hospital or in community facilities. By doing so, CPMC would comply with the Blue Ribbon Panel's recommendations related to subacute-care beds. The S.F. Health Commission Task Force on CPMC's IMP Addressing Resolution No. 10-09, *Updates and Accomplishments*, Mar. 2, 2010, CPMC *Interim Progress Report*, Sept. 30. 2010.

136 CPMC, Memorandum from Malia Weinberg to David Reel (AECOM) & Brian Boxer (AECOM) re: Subacute Care (May 26, 2011).

137 Ibid.; The Camden Group, 2009 (Apr. 28), *San Francisco Blue Ribbon Panel: Utilization Projections and Assumptions for St. Luke's Campus*, page 10

138 CPMC, Memorandum from Malia Weinberg to David Reel (AECOM) & Brian Boxer (AECOM) re: Subacute Care (May 26, 2011).

139 For example, the 2006 AIA Guidelines for Design and Construction of Health Care Facilities cites on page xx of the Preface that, for medical/surgical (including postpartum) units, "the singled-bed room is the minimum standard for new construction." Also, in Section 3.1.1.1, "Capacity," page 40, the Guidelines state, "In new construction, the maximum number of beds per room shall be one unless the functional program demonstrates the necessity of a two-bed arrangement."

C&R 3.23-1]), they are recommended by the American Institute of Architects for all new medical/surgical hospitals and are a standard inclusion in modern hospital design.[140] In fact, most of the patient rooms at new Bay Area hospitals will be single-patient rooms, including San Francisco General Hospital's replacement hospital, UCSF at Mission Bay, Laguna Honda Hospital, and Stanford University Hospital.

Consistent with current Medicare policy, CPMC cannot collect room differentials and does not seek additional reimbursements from Medicare patients who stay in single-patient rooms.[141] If a patient is admitted to a hospital that only has single-patient room accommodations, as proposed under the LRDP, medical necessity would be deemed to exist for the accommodations provided, and Medicare beneficiaries would not be subjected to an extra charge for a single-patient room in an all-single-patient room facility.[142]

The use of single-patient rooms is contemplated by and fully consistent with applicable Medicare guidelines. Medicare rules would allow patients to be placed in single-patient rooms when a medical necessity existed, and such necessity would be found when the facility had only single patient rooms, as would be the case in proposed CPMC LRDP hospitals.[143] These guidelines and the exclusive utilization of single-patient rooms in proposed LRDP hospitals would ensure that patients receiving such benefits would be treated in the same manner as all other patients using these rooms.

Major Response HC-8: Access to Health Services

Comments Overview

A number of comments express concern about access to services by under-insured or uninsured patients, those that are on Healthy Kids or Medi-Cal, and Tenderloin or southeastern San Francisco residents.

Response

These comments, like many of the health care comments addressing programmatic aspects of the health care services, do not raise issues that concern the adequacy, accuracy, or completeness of the Draft EIR. These comments do not address the physical environmental effects of the proposed LRDP. The following information, however, is provided in response to the concerns raised in the comments.

Please also see Responses HC-2 (page C&R 3.23-52), HC-7 (page C&R 3.23-74), HC-10 (page C&R 3.23-86), HC-12 (page C&R 3.23-91), HC-16 (page C&R 3.23-101), HC-17 (page C&R 3.23-111), HC-19 (page C&R 3.23-124), HC-29 (page C&R 3.23-149), HC-31 (page C&R 3.23-160), HC-35 (page C&R 3.23-178), HC-40 (page C&R 3.23-184), HC-44 (page C&R 3.23-194), HC-49 (page C&R 3.23-200), HC-51 (page C&R 3.23-201), HC-55 (page C&R 3.23-205), HC-56 (page C&R 3.23-206), HC-57 (page C&R 3.23-208), HC-60 (page C&R 3.23-216), and HC-78 (page C&R 3.23-236) for responses to individual comments regarding health care access issues.

Access to CPMC by the Poor and Underserved

State law requires that all California not-for-profit hospitals prepare triennial community needs assessments that identify need for, plan for, and report their charitable community benefits.[144] All San

[142] See Medicare Benefit Policy Manual, Chapter 1, Section 10.1.5 – All Private Room Providers ("If the patient is admitted to a provider which has only private accommodations, and no semiprivate or ward accommodations, medical necessity will be deemed to exist for the accommodations furnished. Beneficiaries may not be subject to an extra charge for a private room in an all-private room provider.").
[143] Ibid.
[144] SB 697, California Health & Safety Code Sections 127340-127365.

Francisco non-profit hospitals (including CPMC), together with the San Francisco Department of Public Health (DPH), human service organizations, private philanthropic organizations, and community-based organizations collaborate on a community needs assessment for San Francisco, used for program planning and analysis within San Francisco.[145] These reports (called "Building a Healthy San Francisco," or BHSF) identify community health goals and track progress towards achieving community health goals, assess current needs, and prioritize goals for future action with specific metrics to monitor for improvement.[146] The current needs assessment data can be accessed online at Health Matters San Francisco.[147]

As part of the 2007 BHSF needs assessment, four priority areas of unmet health care need were identified:

1. Improve Access to Care
2. Prevent Chronic Disease and Increase Wellness
3. Reduce the Incidence of Communicable Disease
4. Engage in Violence Prevention

As described in the 2008 CPMC community benefit report, CPMC created or expanded programs that were specifically aimed at improving access to care, preventing chronic disease, and reducing incidence of communicable disease.[148]

Regarding general access to low- and no-cost medical care at CPMC, since January 1, 2007 (the merger of St. Luke's into CPMC), there has been no difference in medical access policies between any of the CPMC hospitals including, in particular, between St. Luke's Hospital and the 2333 Buchanan Street Hospital at the Pacific Campus).[149] All CPMC hospitals are equally open to the receipt of under- and uninsured patients and decisions on the granting of financial assistance and waivers are made on a uniform policy basis across all campuses.[150]

Some comments challenge the overall amount of charity care provided by CPMC, either as a percentage of net patient revenue or in comparison to other hospitals. CPMC's coverage of care (i.e., meaning completely free care) for under- and uninsured patients is available to individuals and families with incomes up to 400 percent of the federal poverty level.[151] In comparison, as of 2009, San Francisco General Hospital (SFGH) provided free care for under and uninsured patients to families with incomes up to $904/month (equivalent to 100 percent of the 2009 federal poverty level), St. Francis Hospital, St. Mary's Hospital, and UCSF provided free care to families with incomes up to $2,708/month (equivalent to 300 percent of the 2009 federal poverty level), and Chinese Hospital and Kaiser Permanente provided free care to families with incomes up to $3,159/month (equivalent to 350 percent of the 2009 federal poverty level).[152]

According to the *San Francisco Charity Care Report Fiscal Year 2009* (the "2009 Charity Care Report") published by DPH, CPMC provided approximately $11.45 million in traditional charity care in 2009,

152 San Francisco Department of Public Health, Healthy San Francisco, *Participant Handbook*, page 13 (updated July 2009).

compared to $10.4 million for UCSF and $6.6 million for St. Francis Memorial Hospital.[153] When measured in terms of net patient revenue, CPMC provided approximately 1 percent of net patient revenue in traditional charity care in fiscal year 2009, increasing to 1.38 percent in 2010. This compares to 0.64 percent for UCSF in both years and 4.13 and 4.43 percent for SFMH in fiscal years 2009 and 2010, respectively. [154] Over the time period 2006 to 2009, the number of charity care patients at CPMC systemwide increased from 3,156 to 3,683.[155] This number further increased to 9,801 charity care patients in 2010.[156]

With respect to Medi-Cal patient access, all of CPMC's hospitals currently accept and would continue to accept Medi-Cal.[157] As part of its negotiations with the Health Commission, CPMC also committed to retaining its Medi-Cal contract with the State of California and to provide Medi-Cal patients with access to primary, specialty, and other services available through Sutter Pacific Medical Foundation clinics and St. Luke's Health Care Center.[158] Furthermore, CPMC has committed to increase its amount of Medi-Cal shortfall (the uncompensated portion of providing care to Medi-Cal patients) by 22 percent over a 5-year period, from $53,369,000 in 2007 to $65,000,000 by 2012.[159]

CPMC's 2009 Report to the Community on its community benefit program shows an increase in traditional charity care[160] from $7,584,000 in 2008 to $10,215,000 in 2009.[161] Traditional charity care at CPMC for 2007 was approximately $5,300,000.[162] From 2007 to 2008, traditional charity care increased approximately 31 percent, and from 2008 to 2009 increased an additional 35 percent.[163] Preliminary reporting of 2010 total charity care provided by CPMC is approximately $14.9 million, an approximately $4.7 million increase over the 2009 total of approximately $10.2 million, representing an approximately 46 percent increase from 2009 to 2010.[164]

Although specific programs and affiliations may change, the following are some of CPMC's current partnerships in delivering low- or no-cost care to the medically underserved:[165]

- North East Medical Services (NEMS), one of the largest health care agencies serving Asians in the U.S., located in nearby Chinatown. Through NEMS, CPMC provides inpatient services (including labor and delivery) for 12,000 "Healthy San Francisco" (HSF) participants at various locations,[166] approximately 23 percent of the 2009 total of 52,000 HSF participants.[167] Beginning in December 2010, CPMC/Brown and Toland began providing access to these inpatient services for an additional 1,500 uninsured San Francisco adults.[168]
- Kalmanovitz Child Development Center (at Van Ness and California), which offers multidisciplinary assessment and treatment programs to help children with special needs meet their potential. No child is turned away based on ability to pay.
- Chinese Hospital: CPMC partners with Chinese Hospital to provide specialty services to its HSF patients and members of Chinese Community Health Plans, and continues to provide all labor and delivery services for Chinese Hospital and [169]
- Community Health Resource Center offers health education, health screenings, nutrition counseling and social services at CPMC sites and community settings. It offers programs at reduced fee, sliding scale, or no fee.
- Southeast Health Center San Francisco Free Clinic
- Asian Pacific Islander Wellness Center
- Tenderloin Health Center
- South of Market Health Center
- St. Anthony Free Medical Clinic
- Glide Health Services
- Conard House
- Lyon-Martin Health Services
- Curry Senior Center

CPMC supports community health initiatives such as Operation Access, Lions Eye Foundation, the Hep B Free Campaign, and Project Homeless Connect.[170] These are all more fully described, in addition to the above programs, in the above referenced 2008 Report: CPMC Community Benefit Strategy, Program and Impact, and 2009 CPMC Report to the Community.[171]

171 CPMC, *2008 Report: CPMC Community Benefit Strategy, Programs & Impact*; CPMC, *Report to the Community 2009*.

The San Francisco Health Commission Task Force report on CPMC's IMP[172] documented CPMC's commitment to continue or expand its community benefit levels and partnerships with community health care delivery providers, including a specific commitment to continue to serve Medi-Cal patients throughout the CPMC system, as described above.[173]

Tenderloin Area Access

No evidence has been presented to support the comments that the proposed LRDP would result in any reduction in Medi-Cal, Healthy Kids, or other coverage by CPMC in the Tenderloin neighborhood, or that access to the Cathedral Hill Hospital would not be available to residents of the Tenderloin neighborhood.

Under the proposed LRDP, the Cathedral Hill Hospital's Emergency Department would be within walking distance of the Tenderloin area, which has the highest density of low-income residents in San Francisco. The LRDP also would locate a full-service hospital at the proposed Cathedral Hill Campus, with full pediatric capabilities next to the City's highest densities of infants and children. CPMC has committed to expand its existing health programs in surrounding neighborhoods.

With respect to comments related to Healthy Kids coverage, it is noted that Healthy Kids functions as an extension of the San Francisco Health Plan (Healthy San Francisco), to children through age 18. Healthy Kids covers children who are:[174]

- Uninsured and under 18 years of age
- San Francisco residents, U.S. citizens, nationals, eligible qualified immigrants, or undocumented immigrants
- Not eligible for no-cost, full-scope Medi-Cal, or the Healthy Families Program
- Within the income guidelines

CPMC provides direct service to Healthy Kids patients through:

- The pediatrics clinic at the Family Health Center (currently at the California Campus but to be relocated to the proposed Cathedral Hill Campus under the LRDP).
- St. Luke's Health Care Center (existing and to remain under the LRDP)
- Bayview Child Health Center (existing and to continue)[175]

Beyond direct care delivery through the clinics listed above, a wide array of primary care and specialty physicians in the CPMC system are available to Healthy San Francisco/Healthy Kids patients.[176] Two of the six provider groups offered to Healthy Kids patients are Brown & Toland and North East Medical Services (NEMS), both affiliated with CPMC.[177]

[176] CPMC, Memorandum from Geoffrey Nelson, Director, EDP, to Brian Boxer (AECOM) re: Access to Healthcare Services (May 13, 2011).

[177] Ibid.

Please see the discussion on page C&R 3.23-41, below, regarding CPMC's commitments in the proposed Development Agreement for the provision of health care for the poor and underserved, including continuing support for community health care clinics, such as those described above, and for new clinics and other related commitments.

South East Area Access

Several comments presume that a great disparity currently exists between the ability to access low- or no-cost care at the St. Luke's Campus and other CPMC campuses. Specifically, several comments suggest that, based on current patterns of Medi-Cal, Medicare, and private insurance use at St. Luke's Campus and Pacific Campus, as well as anticipated private insurance use at the proposed Cathedral Hill Campus, low- or no-cost care will effectively be inaccessible to un- and under-insured patients, particularly those on Medi-Cal. The comments further characterize the Tenderloin neighborhood as heavily populated with those insured through Medi-Cal or Medicare.

Lower income neighborhoods generally are acknowledged to have lower prevalence of commercial insurance and higher prevalence of government insurance such as MediCal, although no specific evidence is presented with respect to the numbers of persons in any particular neighborhood, including the Tenderloin area or southest neighborhood areas, who are covered by Medi-Cal or Medicare. With respect to existing patterns of insurance usage ("payer mix"), the comments do not provide any evidence, nor is CPMC able to conclusively link rates of payer mix to specific campuses or neighborhoods.[178] Available, citywide payer mix data from OSHPD show little correlation between type of insurance within a given zip code and prevalence of that type of insurance at the hospital or hospitals in that zip code (see 2009 OSHPD Public Data Set).[179] The financial makeup of the patient population of a particular hospital is a combination of location, private physician ability or preference for a particular insurance type, historical admitting patterns, and other factors.[180]

CPMC has limited control over many of these factors but does have control over (1) whether or not CPMC hospitals accept Medi-Cal for hospital charges, and (2) whether or not its clinics, staffed with CPMC physicians (e.g., at the approximately 15 San Francisco Sutter Pacific Medical Foundation Clinics[181] and the St. Luke's Healthcare Center, referred to above) accept Medi-Cal. As part of its commitments to the Health Commission, CPMC (1) continues to accept Medi-Cal, as it always has, at all of its hospitals, (2) guarantees access to Medi-Cal patients through all of the clinics controlled by CPMC as described above, and (3) increased the amount of unpaid Medi-Cal shortfall systemwide by 22 percent between 2007 and 2012.[182]

Further, as noted above, there is no difference in charity care policy between any of the existing CPMC hospitals, and all CPMC hospitals are equally open to the receipt of under- and uninsured patients on the same basis.[183] In addition to providing free care for patients who meet income thresholds (at or below 400 percent of federal poverty level) and who seek care at the various CPMC Emergency Departments, CPMC offers a variety of low- and no-cost health services and other direct community benefit at its

[178] Ibid.

[180] CPMC, Memorandum from Geoffrey Nelson, Director, EDP, to Brian Boxer (AECOM) re: Access to Healthcare Services (May 13, 2011).
[181] Ibid. For a list of 15 San Francisco and over 50 regional locations of Sutter Pacific Medical Foundation Clinics, see http://www.sutterpacific.org/locations/
[182] The S.F. Health Commission Task Force on CPMC's IMP Addressing Resolution No. 10-09, *Updates and Accomplishments*, Mar. 2, 2010. page 2.
[183] CPMC, Memorandum from Geoffrey Nelson, Director, EDP, to Brian Boxer (AECOM) re: Access to Healthcare Services (May 13, 2011).

various campus and off-campus locations.[184] Amounts of charity care delivered by zip code, campus, and supervisorial district also are shown in the DPH 2010 Charity Care Report.[185]

The comments suggest that the historically high ratios of government-insured or uninsured patients at St. Luke's (see Comments 90-62, 96-8, and 110-8 at pages C&R 3.23-82, 3.23-82, and 3.23-82, respectively, below), in conjunction with a perceived transfer of services from St. Luke's to other non-CPMC hospitals with implementation of the proposed LRDP, would result in reduced access to health care for this population. However, as noted, the presumption that under the proposed LRDP, health care would not be available at other CPMC campuses to government-insured or uninsured patients is not consistent with CPMC policies and commitments. Furthermore, as described in Major Response HC-1 and Major Response HC-2 (pages C&R 3.23-1 and 3.23-8, respectively), none of the acute-care patient population would be displaced from St. Luke's Hospital as a result of the LRDP, and the St. Luke's Replacement Hospital would be sized to accommodate growth of its existing acute-care patient population. Additionally, the effective capacity of urgent and emergency services would grow at St. Luke's (and at CPMC overall) under the LRDP (see Major Response HC-5 [page C&R 3.23-20]).

Community health services at the St. Luke's Campus currently include and would continue to include comprehensive child development and chronic illness management. Innovative health programs would continue to be provided at St. Luke's, such as Health First (which employs community health workers to provide health education and individual support), as well as comprehensive mental and behavioral health services via the Kalmanovitz Child Development Center.[186] Pediatric services at St. Luke's would continue to include a child development center for children with special needs and a clinic with the specific goal of improving health care for children of Bayview-Hunters Point.[187]

For further detail, see Major Response HC-2 (page C&R 3.23-8), and please see also the discussion beginning on page C&R 3.23-41, below, regarding commitments to operate St. Luke's Hospital and with respect to the scope and nature of programs and services that would be provided at St. Luke's in the future under the terms of the proposed Development Agreement.

Please also see Response HC-12 (page C&R 3-23-91) for specific responses to individual comments regarding access to health care services at CPMC campuses under the proposed LRDP.

Major Response HC-9: Health Care Master Plan

Comments Overview

Several comments suggest that a health care services master plan should have been included in the Draft EIR analysis because: (1) the environmental setting of the Draft EIR is incomplete without a discussion of existing citywide health care services conditions (facilitated by information from a health care services master plan); (2) an analysis and comparison of citywide health care service conditions with the LRDP might reveal gaps in health care services that, in turn, may reveal unanalyzed environmental impacts; and (3) the Draft EIR presents piecemeal analysis, absent the inclusion of a health care services master plan in the project description. Some comments suggest that the Draft EIR should be delayed, while a citywide health care services master plan is being prepared (anticipated to be completed at the earliest by 2013).

[184] Ibid. Examples include: Free ophthalmologic procedures through Lion's Eye foundation (Pacific Campus), free medical transport (all campuses), operation access (all campuses), direct outreach and care through Project Homeless Connect (at PHC sites), support of SF Free Clinic (near the California Campus), and others as listed in "2010 CPMC programs for the poor and underserved."

Please also see Responses HC-7 (page C&R 3.23-74), HC-10 (page C&R 3.23-86), HC-28 (page C&R 3.23-143), HC-56 (page C&R 3.23-206), HC-57 (page C&R 3.23-208), HC-59 (page C&R 3.23-211), and HC-77 (page C&R 3.23-233) for responses to individual comments regarding these concerns.

Response

Ordinance No. 300-10, effective January 2, 2011 (the "Ordinance"), directs the preparation of a citywide health care services master plan ("Health Care Plan"). Under CEQA, the CPMC LRDP EIR is not required to include a discussion of the LRDP in relation to the as yet unprepared Health Care Plan as part of the existing conditions (project baseline) or in the project description. The contents of such a Health Care Plan would be speculative at this time, and the CPMC LRDP EIR is not required to be delayed, pending its development.

Social and Economic Effects

The comments focus on perceived or existing gaps in citywide health care services, how citywide health care policy objectives (which would be outlined in the anticipated Health Care Plan) might address these gaps, and whether CEQA would require that the CPMC LRDP EIR include an analysis of the citywide distribution of health care services and of any existing citywide health service gaps in relation to the LRDP, either by consideration of the forthcoming Health Care Plan or by providing a separate or equivalent citywide health care services analysis in the EIR to compare against the LRDP. The remainder of this response provides information addressing these issues. It is important to note, however, that under CEQA the focus is on disclosure of physical environmental impacts of the proposed project, and there is no requirement that an EIR analyze social or health care policy considerations such as whether and how the LRDP addresses citywide health care services conditions or policies, unless it is shown that, by virtue of its effect on such conditions or policies, the LRDP would possibly cause or exacerbate physical environmental impacts.[188] No such substantial evidence has been provided in the comments.

Major Responses HC-1, HC-2, HC-3, HC-4, HC-5, HC-6, and HC-8 (pages C&R 3.23-1, 3.23-8, 3.23-17, 3.23-19, 3.23-20, 3.23-25, and 3.23-32) demonstrate that whatever the existing or future shortfalls or "gaps" in citywide health care services might be, the proposed LRDP would not detrimentally contribute to such conditions and, therefore, would not cause, exacerbate, or be linked to any secondary physical environmental effects not already discussed in the Draft EIR. The comments do not provide substantial evidence that the Draft EIR impact analyses fail to account for or fully analyze transportation, air quality, public services, or other environmental impacts of the LRDP.

Delay Pending Development of a Health Care Plan

Some comments suggest that the CPMC LRDP EIR should be delayed, pending preparation of a Health Care Plan or its equivalent, which might identify environmental impacts not addressed in the Draft EIR. These suggestions were submitted before adoption of the Ordinance.

The recently proposed Ordinance sets out a lengthy and detailed series of requirements and processes, preceding adoption of a Health Care Plan. The Ordinance would not apply until the Health Care Plan was adopted. Furthermore, the Health Care Plan would be subject to its own review under CEQA, before adoption.

The Ordinance would apply to proposed changes in medical uses after either January 2, 2013, or formal adoption of the Health Care Plan, whichever occurs later. Therefore, the Ordinance could not apply to proposed changes under the CPMC LRDP that are approved before January 2, 2013. Under these

[188] See State CEQA Guidelines Sections 15064(c)(6),(f)(6), 15131(a). For further discussion, please also see INTRO-6 (page C&R 3.1-11) regarding the consideration of social and economic effects under CEQA.

circumstances, the suggested delay in the consideration of the CPMC LRDP Draft EIR is not warranted, particularly absent any observable environmental effect or reasonably proximate application to the LRDP.

Some comments suggest that the Draft EIR should consider the environmental impacts associated with potential inconsistencies between the LRDP and land use policies that may be developed as part of the future Health Care Plan. CEQA does not require a lead agency to speculate as to, or to rely on, proposed or draft land use plans that have not even begun to be drafted, in evaluating a project.

Project Description and Baseline

Some comments suggest that the Draft EIR analysis is incomplete and piecemeal without prior completion of the Health Care Plan or an equivalent analysis of citywide health care services. The proposed LRDP, however, does not include the preparation of a citywide health care services master plan, nor is such an action a planned future phase or foreseeable component of the LRDP. A formal Health Care Plan is to be prepared in the future under a separate City process (as referenced above) and is not a component of the project description for the proposed LRDP. The project description for the CPMC LRDP in the Draft EIR is adequate, accurate, and complete under CEQA, and includes all foreseeable components of the proposed LRDP, for both short-term and long-term project components.

Several of the comments suggest that the environmental baseline or existing setting in the Draft EIR is inadequate, because it fails to describe existing citywide or regional health care service conditions and perceived gaps therein, and that a health care services master plan (or an equivalent discussion of citywide and/or regional health care services) is needed to accurately identify these conditions and gaps. Such an analysis is beyond the scope of environmental review under CEQA for the reasons stated below.

CEQA requires that EIRs include a description of the physical environmental conditions in the vicinity of the project, from both a local and regional perspective, in sufficient detail to understand the significant environmental effects of the project and its alternatives on those conditions.[189] Regardless of any City or regional health care service gaps that may exist or be addressed by future public health planning under the proposed Health Care Plan, CEQA does not require the CPMC LRDP EIR to include a separate baseline analysis of citywide or regional health care service delivery systems, absent evidence that the proposed LRDP would contribute to citywide health care service gaps that would cause a physical effect on the environment. No such evidence has been provided in the comments.

For example, Major Responses HC-1, HC-2, HC-4, HC-5, and HC-6 (pages C&R 3.23-1, 3.23-8, 3.23-19, 3.23-20, and 3.23-25), respectively, demonstrate that, although an overall reduction of the total number of licensed acute-care and other types of beds at CPMC campuses systemwide would occur under the proposed LRDP, with the use of single-occupancy rooms, higher utilization rates, commitments with respect to SNF and psychiatric beds, and expansion of emergency services, adequate capacity would exist under the LRDP to meet CPMC's existing and projected demand for inpatient beds and other services. Therefore, despite the overall change in the number of licensed beds at CPMC systemwide, no transfer or displacement of services would occur at other non-CPMC health care facilities that might have an adverse physical environmental effect as a result of the development proposed under the LRDP. No adverse impacts would also result at other city health care facilities as a result of implementation of the LRDP. The Draft EIR adequately analyzes the potential impacts of the LRDP, including whether health services proposed as part of the LRDP would result in any impacts related to public services and emergency response planning citywide.

[189] See *County of Inyo v. City of L.A.*, 71 Cal. App. 3d 185, 192 (1977).

Existing Record

Some comments suggest that without the Health Care Plan (or an equivalent analysis), the City does not have adequate and objective information concerning the delivery of health care services citywide and by CPMC, in particular, to determine whether the proposed LRDP would result in secondary impacts that are not analyzed in the Draft EIR. However, as described in the preceding Major Responses, adequate information has been developed for analyzing the LRDP's role in citywide health care services, and the proposed LRDP would not contribute to unidentified physical environmental effects. Substantial evidence has not been presented in the comments that further information is necessary to identify or analyze the environmental impacts of the proposed LRDP.

Existing City requirements for the acceptance of the IMP state that it, among other things:

> "provide[s] the Planning Commission, community and neighborhood organizations, other public and private agencies, the general public, and other institutions with information that would help guide those entities' decisions regarding the use of, and investment in, land in the vicinity of the LRDP campuses, provision of public services, and particularly the planning of similar institutions to insure that costly duplication of health care facilities does not occur" and provides information on "the relationship of the facilities covered under the IMP to Citywide health care needs."[190]

The San Francisco Health Commission (on July 21, 2009, with further findings on March 16, 2010), accepted the IMP for the proposed CPMC LRDP, in its Resolution 10-09, subject to recommendations on the size and scope of facilities and services to be provided[191]. The Health Commission made these recommendations to ensure that the IMP "results in the best possible health plan for the City and County of San Francisco."[192] Before that, the Board of Supervisors, in its Resolution No. 478-08 of November 18, 2008, accepted consensus recommendations from the Blue Ribbon Panel on the St. Luke's Campus (as discussed above), which the Health Commission incorporated into Resolution 10-09.[193] The Planning Commission then took this Resolution as well as public testimony under review and, on November 19, 2009, accepted CPMC's IMP document as complete. Several months later, on March 2, 2010, the Health Commission's Task Force on CPMC's IMP published its *Updates and Accomplishments*, concerning the recommendations in Resolution 10-09, and the Health Commission adopted Resolution 02-10 on March 16, 2010, memorializing the progress made in furthering the Health Commission's recommendations.[194]

3.23.1.2 DEVELOPMENT AGREEMENT

CPMC and the City, including the various City departments, including, but not limited to, the Departments of Health, Public Works, the Mayor's Office of Housing, the Mayor's Office of Economic and Workforce Development, and the Metropolitan Transportation Agency, have been negotiating the proposed terms and conditions of a development agreement ("DA"). As currently envisioned, the DA would memorialize CPMC commitments with respect to the delivery of health care services (which are described for informational purposes in the preceding and following sections of this document), and other community benefits. The DA would also provide CPMC with certainty and protections with respect to the conditions and approvals to undertake the LRDP. The DA would also include specific timeframes for performance, penalties for non-performance, and terms and conditions of performance.

---

190 San Francisco Planning Code § 304.5(a)(3), (g).
191 S.F., Health Commission Resolution No. 10-09; Health Commission Resolution No. 02-10.
192 Ibid.
193 The Planning Commission accepted the IMP after a hearing November 19, 2009.
194 San Francisco Health Commission Task Force on CPMC's IMP Addressing Resolution No. 10-09, 2010 (Mar. 2), *Updates and Accomplishments*; S.F. Health Commission Resolution No. 02-10.

As previously noted, the proposed health care and community benefit commitments under the DA are, for the most part, social and economic in nature and, under CEQA, are not required to be addressed in the EIR. Nevertheless, the health care discussion and responses to health care comments found in the EIR and this C&R document have been developed to respond to concerns raised by the public and decision-makers. The Planning Department is providing additional information here on the proposed scope of health care and other community benefit commitments in the DA in order to further respond to expressed interest on this topic.

The principal health care and community benefit commitments that are proposed for the DA (as of publication of this C&R document) are described below in general terms. The DA is subject to completion of final negotiations, review and approval in the course of the review of the LRDP, and the commitments are subject to conditions as more particularly described in the DA. Furthermore, the terms of the proposed DA are subject to change until finalized. The reader is directed to the final DA itself (if approved) to the Department's staff reports, which will include a more detailed summary of the proposed DA, and other information that will be provided in advance of and in connection with the public hearings on the proposed DA for more detailed descriptions of the precise nature, scope and extent of commitments that would be provided therein.

I.	**St. Luke's Campus**
1.	Commit to construct and operate the St. Luke's Replacement Hospital as a general acute care hospital with emergency medical services.
2.	Establish a Center of Excellence in Community Health and a Center of Excellence in Senior Health.
3.	Construct a new medical office building (MOB), or provide the City with an opportunity to do so.
II.	**Services for the Poor and Support of Community Health**
1.	Continue to provide a specified level of health care services, including charity care, unpaid costs of Medi-Cal, and other benefits for the poor and underserved.
2.	Provide continued support of pediatric services in the Bayview through the Bayview Child Health Center and continued operation and support of the St. Luke's Health Care Center.
3.	Provide hospital care for additional Medi-Cal managed care beneficiaries enrolled in the San Francisco Health Plan, including Seniors and Persons with Disabilities.
4.	Establish a Fund to support health care innovations and to enhance the performance and improve the sustainability of the City's community based service providers.
III.	**Additional Health Care Commitments**
1.	Ensure an available skilled nursing (SNF) capacity of 100 beds, either on- or off-campus, not including any existing community-based beds.
2.	Work with San Francisco Department of Public Health and other hospitals to develop specific proposals for providing sub-acute services in the community.
3.	Continue service agreements with Chinese Hospital and its affiliates to provide pediatric, obstetric, and certain tertiary services.
4.	Deliver culturally appropriate services that are representative of San Francisco's diverse communities.
5.	Continue good faith efforts towards the clinical integration of medical staffs at CPMC campuses and various quality improvement initiatives.
6.	Limit fee for service rate increases to City Health Service System contracted HMOs and PPOs.

IV. Other Community Benefits

1. Housing:
   a. Payment of residential unit replacement fee.
   b. Payment to the Mayor's Office of Housing to assist in the production of affordable rental housing.
   c. Fund a City-administered down-payment loan assistance program for qualified CPMC employees.

2. Workforce Development:
   a. First Source Agreements detailing commitments around entry-level hiring practices for both construction and operational phases;
   b. Local hire commitments for both construction and operational phases;
   c. Commitments to Local Business Enterprises; and
   d. Payment to the City of San Francisco Office of Economic and Workplace Development and community-based organizations for construction-related and end-use training programs.

3. Transit:
   a. Contribute toward the construction of BRT transit facilities in the vicinity of Van Ness Avenue and Geary St./Blvd.
   b. Provide funds to address transit delay impacts described in the EIR, consistent with identified mitigations.
   c. Impose a surcharge on parking garage fees at Cathedral Hill Hospital and Cathedral Hill MOB.
   d. Provide funds for SFMTA to use for bicycle studies.

4. Pedestrian Safety and Public Improvements:
   a. Provide funds for City use to (i) study, design and construct pedestrian and streetscape improvements determined necessary or desirable by the City in the Lower Polk and the Tenderloin neighborhood areas;[i] (ii) a Tenderloin community pilot safe passage program; and (iii) formation and a seed grant for a Lower Polk community business district.
   b. Construct certain pedestrian streetscape improvements near the Davies and St. Luke's Campuses.[ii]

[i] City would have sole authority to determine whether to proceed with the Tenderloin and Little Saigon neighborhood area improvements and to issue required permits and authorizations. City would also retain the discretion to modify, or select feasible alternatives to the improvements to avoid any identified impacts or concerns that arise in connection with their further review, including any required environmental review under CEQA.

[ii] These improvements 1) are ministerial with no potential significant impact or, 2) were previously approved in connection with pending City projects, such as the Mission Streetscape Plan (Mission Streetscape Plan Mitigated Negative Declaration, San Francisco Planning Department Case No. 2008.1075E), or 3) are within the scope of other existing City programs, including DPW Standard Neighborhood Street maintenance and upgrade programs.

3.23.1.3 HEALTH CARE COMMENTS AND RESPONSES: ALL CAMPUSES

Comment

(Marvis Phillips, August 6, 2010) [4-2 HC]

"Even though discussed. I have concerns about 3 things at the new Cathedral Hill Campus.

1) Enough bed space to cover both the patients from the Pacific and the Children's Campuses."

Response HC-1

The comment states three concerns related to the proposed Cathedral Hill Campus. Two concerns are related to transportation and circulation, and they are stated and responded to in Section 3.7 of this document (Responses TR-43 and TR-100, pages C&R 3.7-67 and 3.7-170, respectively).

The health care concern expressed by the commenter is regarding whether the proposed Cathedral Hill Campus would provide sufficient bed space to meet the existing combined patient demand of the Pacific and California Campuses (the reference to the "Children's Campus" presumably is intended to reference the California Campus). The proposed Cathedral Hill Campus would have sufficient bed capacity to accommodate existing patient demand for acute-care beds currently served at the Pacific and California Campuses, as well as projected future demand. The Pacific and California Campuses currently provide 295 and 299 licensed acute-care beds, respectively, mostly in multi-patient rooms. The new Cathedral Hill Hospital would provide 555 beds in single-patient rooms. Please see Major Responses HC-1 and HC-2 (pages C&R 3.23-1 and 3.23-8) for discussion regarding the supply of acute-care beds and the size and scope of services at the proposed Cathedral Hill Campus. As explained in Major Response HC-1 (pages C&R 3.23-1 through 3.23-8), because single-patient rooms have higher utilization rates than multi-patient rooms, the 555 beds in single-patient rooms at the new Cathedral Hill Hospital would provide adequate capacity to accommodate the patient demand served by the current capacity of 594 total licensed acute care beds in multi-patient rooms at the California and Pacific Campuses, as well as the projected future demand for acute care inpatient beds.

In addition to acute-care beds at the Pacific and California Campuses, CPMC currently provides 18 psychiatric beds at the Pacific Campus and 101 skilled nursing (SNF) beds at the California Campus.

As explained in Major Response HC-4 and shown on Table 2-2, "CPMC Existing and Proposed LRDP Licensed Hospital Bed Uses" in the Draft EIR, page 2-10 (and as updated in Response PD-6 [page C&R 3.2-6]), all 18 psychiatric beds are proposed to continue to remain licensed and operational at the Pacific Campus under the proposed LRDP. Therefore, the proposed Cathedral Hill Campus would not need to include psychiatric beds to accommodate the existing demand at the Pacific Campus.

As explained in Major Response HC-6 and clarified in the text revisions to Table 2-2, "CPMC Existing and Proposed LRDP Licensed Hospital Bed Uses" on page 2-10 of the Draft EIR, and as shown in Chapter 4, "Draft EIR Text Changes," of this C&R document (see also Response PD-6, page C&R 3.2-6), the proposed LRDP assumes the continued maintenance of 101 licensed SNF beds at the California Campus, unless and until CPMC identifies another plan for providing 62 SNF beds (in addition to the 38 SNF beds that would continue to be maintained at the Davies Campus under the LRDP) necessary for CPMC to meet its commitment to provide a total of 100 SNF beds systemwide.

Please see Major Response HC-6 for further information regarding future demand for SNF beds and CPMC's 100-bed commitment.

Comments

(Marvis Phillips, August 6, 2010) [4-5 HC]

"As for the St. Lukes Campus. Currently St. Luke's takes the slack for General – I have the following 3 concerns.

1) I have a concern the 88-beds are not enough to serve the Mission and point's south and still be a back up for General."

(Marvis Phillips, August 6, 2010) [4-6 HC]

"2) There are some only one of a kind services currently at St. Lukes that are not being replaced. And that will have to wait until 2015/2020 to be at Pacific Campus which may be hard if not impossible for Mission seniors to get to."

(Marvis Phillips, August 6, 2010) [4-7 HC]

"3) I am concerned about emergency services when General diverts and St Luke is overcrowded. The limit of 88 beds but a extreme strain on ER services in the city, as the St Luke ER is the only ER in the southern part of the city if General divert's."

(Jack Scott, September 23, 2010) [19-2 HC, duplicate comments were provided in 40-2 HC]

"The project proposed is NOT good for the city and not good for the residents of the Southeast section of the city. Reduction of services at St. Luke's would further overload those of San Francisco General."

(Flavio Casoy—San Francisco General Hospital Physician Organizing Committee, September 23, 2010) [42-1 HC]

"Good Afternoon, My name is Flávio Casoy and I am psychiatrist working at San Francisco General Hospital. Today I am here on behalf of the members of the Physician Organizing Committee to share our concern over the Long Range Development Plan proposed by California Pacific Medical Center. Principally, the Plan calls for consolidation of Sutter-CPMC's acute care facilities in a 555-bed hospital in Cathedral Hill with a concurrent reduction in services at the St. Luke's facility to an 80-bed hospital, a reduction of 180 beds. I am here today in large part because the Physician Organizing Committee members who work for Sutter at St. Luke's do not feel safe to testify on the impact of further cuts to St. Luke's hospital. I am here today bearing their words."

(Flavio Casoy—San Francisco General Hospital Physician Organizing Committee, September 23, 2010) [42-2 HC]

"A priori, the Ph Org Cmte is not opposed to the new hospital in Cathedral Hill, we are very concerned about the reduction of services to the highly vulnerable population that is served by St. Luke's. This proposed 180-bed reduction at St. Luke's comes in the heels of recent closure of St. Luke's occupational medicine clinic, closure of the occupational therapy program, closure of the 32-bed inpatient psychiatric unit, closure of the neo-natal intensive care unit, dramatic reduction in number of medical ICU and medsurg beds, and closure of all outpatient psychiatric services. This has been a blow to this patient population. Further reduction of services would be catastrophic. It is critical to note that St. Luke's is one of only two hospitals that serve communities south of market street, primarily patients from Bayview Hunters Point, Mission, and Excelsior. These communities disproportionately carry a burden of poverty and underservice in San Francisco. Relocating services to Cathedral Hill, which for many patients would be require three busses to arrive, would make it impossible for these very vulnerable patients to continue getting the care they need."

(Hossein Sepas, October 19, 2010) [82-1 HC, duplicate comment was provided in 107-2 HC]

"CMPC's proposes to consolidate many services from its five campuses into one new site on Cathedral Hill and downgrade several of their other properties. Heaven help anyone who has a heart attack or other serious problem

who has to take an ambulance all the way to Cathedral Hill; they might die on the way to the enormous traffic jams in the already congested Van Ness Avenue, Gough, and Franklin corridor. It is not fair to the people of the Mission to lower the services and bed count at St. Luke's Hospital and make those CPMC patients go all the way to Van Ness and Geary. St. Luke's should be increased over what CPMC proposes and Cathedral Hill hospital should be decreased. They should be more in alignment in regard to the number of beds. A high concentration of hospital beds in one part of town and a lower number in other parts cannot be a good plan. We need more balance. CPMC says it is good for their business operation to consolidate services and since they provide a public service they should be allowed to do so, if PG&E, Pac Bell (AT&T), any bank or other private corporation which 'provides a public service' were to suggest the same logic to have a larger building they would be laughed out of town."

(Patrick Carney, October 19, 2010) [83-2 HC]

"CMPC's proposes to consolidate many services from its five campuses into one new site on Cathedral Hill and downgrade several of their other properties. St. Luke's should be increased over what CPMC proposes and Cathedral Hill hospital should be decreased. They should be more in alignment in regard to the number of beds. A high concentration of hospital beds in one part of town and a lower number in other parts cannot be a good plan. We need more balance. CPMC says it is good for their business operation to consolidate services and since they provide a public service they should be allowed to do so, if PG&E, Pac Bell (AT&T), any bank or other private corporation which 'provides a public service' were to suggest the same logic to have a larger building they would be laughed out of town. Heaven help anyone who has a heart attack or other serious problem who has to take an ambulance all the way to Cathedral Hill; they might die on the way to the hospital in the enormous traffic jams in the already congested Van·Ness Avenue, Gough, and Franklin corridor. It is not fair to the people of the Mission to lower the services and bed count at St. Luke's Hospital and make those CPMC patients go all the way to Van Ness and Geary."

(Alex Tom—Chinese Progressive Association, October 19, 2010) [84-1 HC]

"I am writing this letter to state the Chinese Progressive Association's position regarding Sutter/CPMC's Draft EIR which was heard at the September 23, 2010 Planning Commission hearing. We urge the San Francisco Planning Department and the Planning Commission to ensure that the following community concerns are adequately addressed in the Final EIR. We will base our decision to support or oppose the project on whether the following concerns are adequately addressed.

Community Concerns:

1. Clustering health services in northern sector of SF. The EIR fails to analyze how the reduction of health care services at St. Luke's Hospital, and the construction of a larger hospital at Cathedral Hill, will result in a clustering of health services in the northern sector of the city and limit access of residents in the south east sector of the city. Currently the south east sector of San Francisco has only 2 hospitals - St. Luke's and SF General - while the northern sector has 10 hospitals. Additionally, CPMC plans to reduce patient beds at St. Luke's from 229 beds to 80 beds, and San Francisco's only public hospital, SF General is already overcrowded."

(Emily Lee, September 23, 2010) [PC-293 HC]

"And as many folks have already mentioned, that's the southeast sector of San Francisco, which has the largest number of immigrants, people who speak a language other than English, children, seniors, families. And, you know, right now there are only two hospitals there, St. Luke's and S.F. General. So we feel that the Draft EIR doesn't analyze how reducing the healthcare services at St. Luke's will actually result in the clustering of health services in the northern sector of San Francisco and limiting access for residents in the southeast."

(Emily Lee, September 23, 2010) [PC-294 HC]

"And if CPMC is allowed to continue on the path that they propose with their Long Range Development Plan, we are on our way to a healthcare crisis in San Francisco. If St. Luke's is downsized and more low income and uninsured patients are pushed out, that burden undoubtedly is going to fall on S.F. General where patients already experience long wait times, and with our record budget deficit, and cuts in safety, how can San Francisco afford to pay for the additional patients that profitable corporations like CPMC are turning away? So we clearly can't afford that and we, as a community, need CPMC to pay their fair share to ensure that all residents of San Francisco can access healthcare. Thank you."

(Barbara Kautz—CHNA and Bernal Heights Neighborhood Center, October 19, 2010) [87-16 HC, duplicate comment was provided in 108-16 HC]

"The DEIR does not examine foreseeable public health impacts created by the proposed Long Range Plan, many of which Bernal and CHNA asked to have reviewed in their letter submitted in September 2009 in response to the Notice of Preparation:

- Reduction in access to medical care from underserved neighborhoods near St. Luke's Hospital, including increased travel time to emergency and hospital rooms, caused by a reduction in licensed beds at St. Luke's from 229 to 80 and removal of all obstetric and skilled nursing services from the campus."

(Gloria Smith—California Nurses Association, October 19, 2010) [90-63 HC]

"The proposed Cathedral Hill Hospital (555 beds) would barely accommodate the 594 acute-care services and Women's and Children's Center that would be relocated from the California Campus (299 beds) and the Pacific Campus (295 beds) to the proposed Cathedral Hill. It can be anticipated that few patients currently relying on the 229 beds at the existing St. Luke's Hospital would be accommodated at the new Cathedral Hill Hospital for a number of reasons:

- Not all services that are currently available at St. Luke's Hospital would be available at the Cathedral Hill Hospital, including SNF beds.

- Physicians are free to decide whether they will accept Medi-Cal patients, which constitute a large portion of St. Luke's Hospital patient population. Given the choice between higher-paying private or government insurance, they often deny Medi-Cal patients.

- Beneficiaries of government programs are often not eligible for private single occupancy room services[34] if multiple-occupancy rooms are available.

As a result, most patients with insurance coverage limitations and relying on the acute care and SNF beds at the existing St. Luke's Hospital would not have access to the services offered by the new Cathedral Hill Hospital and would have to resort to accessing other hospitals in the City, or when those hospitals are overwhelmed as is often the case, in the greater region. Many of the patients currently frequenting St. Luke's Hospital do not have access to personal transportation and would be limited to time-consuming public transportation from the City to elsewhere. This may severely affect their health care.

[34] *See*, for example, the following provisions of the Medicare Claims Processing Manual: Chapter 2: Admission and Registration Requirements, Section 10.6 - Hospitals May Require Payment for Noncovered Services, Revision 1472 dated March 6, 2008, and Chapter 3: Inpatient Hospital Billing, Section 40.22 - Charges to Beneficiaries for Part A Services, (I) Private Room Care, Revisions 1609 and 1612 dated October 3, 2008. These rules provide that private room (I-bed patient care room) care is not a Medicare covered service. Thus, private rooms may be denied by a Medicare provider to a beneficiary 'who requests it but is unable to prepay or offer the assurance of payment ...' (*see* Chapter 2, Section 10.6.)"

(Gloria Smith—California Nurses Association, October 20, 2010) [96-9 HC, duplicate comments were provided in 90-63 HC and 110-9 HC]

"The Cathedral Hill Hospital (555 beds) would barely accommodate the 594 acute-care services and Women's and Children's Center that would be relocated from the California Campus (299 beds) and the Pacific Campus (295 beds) to the proposed Cathedral Hill. It can be anticipated that few patients currently relying on the 229 beds at the existing St. Luke's Hospital would be accommodated at the new Cathedral Hill Hospital for a number of reasons:

- Not all services that are currently available at St. Luke's Hospital would be available at the Cathedral Hill Hospital, including SNF beds.

- Physicians are free to decide whether they will accept Medi-Cal patients, which constitute a large portion of St. Luke's Hospital patient population. Given the choice between higher-paying private or government insurance, they often deny Medi-Cal patients.

- Beneficiaries of government programs are often not eligible for private single-occupancy room services[19] if multiple-occupancy rooms are available.

As a result, most patients with insurance coverage limitations and relying on the acute care and SNF beds at the existing St. Luke's Hospital would not have access to the services offered by the new Cathedral Hill Hospital and would have to resort to accessing other hospitals in the City, or when those hospitals are overwhelmed as is often the case, in the greater region. Many of the patients currently frequenting St. Luke's Hospital do not have access to personal transportation and would be limited to time-consuming public transportation from the City to elsewhere. This may severely affect their health care.

The shift of the current patient population with insurance coverage limitations from the community accessible St. Luke's Hospital to other hospitals in the City and region would have a number of adverse effects and consequences. For one, it would increase the regional vehicle miles traveled as patients and visitors would be forced to travel to hospitals that are located further from their homes and out of the City. Emergency service vehicles, forced to transport patients to hospitals located further away, would be tied up longer for transports to emergency departments at other hospitals which, in turn, would put additional pressure on the dispatch capacity at the City and County's Police Department and the Fire Department and increase the average response time and associated adverse consequences on the timely delivery of emergency cases to acute care units.

[19] *See*, for example, the following provisions of the Medicare Claims Processing Manual: Chapter 2: Admission and Registration Requirements, Section 10.6 - Hospitals May Require Payment for Noncovered Services, Revision 1472 dated March 6, 2008, and Chapter 3: Inpatient Hospital Billing, Section 40.2.2 - Charges to Beneficiaries for Part A Services, (I) Private Room Care, Revisions 1609 and 1612 dated October 3, 2008. These rules provide that private room (I-bed patient care room) care is not a Medicare covered service. Thus, private rooms may be denied by a Medicare provider to a beneficiary 'who requests it but is unable to prepay or offer the assurance of payment...' *(see* Chapter 2, Section, l0.6.)."

(Gloria Smith—California Nurses Association, October 19, 2010) [90-65 HC]

"Emergency service vehicles, forced to transport patients to hospitals located further away, would be tied up longer for transports to emergency departments at other hospitals which, in turn, would put additional pressure on the dispatch capacity at the City and County's Police Department and Fire Department and increase the average response time and associated adverse consequences on the timely delivery of emergency cases to acute care units."

(Gloria Smith—California Nurses Association, October 19, 2010) [90-67 HC, duplicate comments were provided in 96-11 HC and 110-11 HC]

"Most importantly, however, the shift of patient populations from the existing St. Luke's Hospital to other hospitals, including government and county-funded community hospitals *(e.g.*, San Francisco General Hospital

and Laguna Honda Hospital and Rehabilitation Center) and the loss of an additional 109 acute-care beds would put a severe strain on the already severely overtaxed acute care capacity in the City and County. For example, because the San Francisco General Hospital is the only Level I Trauma Center in a service area of over one million people, the hospital maintains a very high patient volume and is usually on a constant 'Total Divert' status, which means that incoming emergency patients (with the exception of trauma, psychiatric, pediatrics, and obstetrics and gynecology) are diverted to other nearby hospitals. In addition, the loss of local access to acute care would result in disproportionate adverse socio-economic impacts on low-income residents who are already faced with a lack of and access to other medical care, child care, transportation, etc. Adding this extra burden of not having local access to community-based acute care would constitute environmental injustice."

(Gloria Smith—California Nurses Association, October 19, 2010) [93-7 HC]

"1. How and where lower income people will receive health care, and the corresponding range of effects on transportation, air quality and public services?"

(Gloria Smith—California Nurses Association, October 19, 2010) [93-13 HC]

"6. How will the proposed Project impact services at St. Luke's? How will proposed changes and reduced services impact the southeastern portion of the City in addition to the City at large?"

(Gloria Smith—California Nurses Association, October 20, 2010) [96-17 HC, duplicate comment was provided in 110-17 HC]

"CPMC identifies eight of San Francisco's 24 zip codes as 'primary St. Luke's service area.'[21] Those eight zip codes combined generate 42% of the City's emergency room visits; 49% if patients with no zip codes are included, many of whom are homeless. Using CPMC's benchmarking year of 2007, those eight zip codes generate about 4,200 inpatient discharges from St. Luke's Hospital, but almost 8,000 inpatient discharges from other CPMC campuses.[22] This demonstrates that there is a need for services in the southeastern part of the City that is not currently met, a fact that would be further exacerbated by reducing St. Luke's Hospital to an unsustainable 80 beds. Clearly, this argues for shifting more services into the southeastern part of the City to respond to the proportionally higher emergency room volume which would also reduce traffic impacts caused by reducing the distance patients must currently (and under the LRDP) travel to get to the emergency room. Shifting services to St. Luke's Hospital would also reduce the burden on San Francisco General Hospital's already overwhelmed emergency department.

[21] Lewin Group Report.

[22] Based on data from California Office of Statewide Health Planning and Development, Hospital Discharge Summary Reports; http://www.oshpd.ca.gov/MIRCal/Default/aspx."

(Gloria Smith—California Nurses Association, October 19, 2010) [96-25 HC, duplicate comment was provided in 110-25 HC]

"All patients depend on their local community hospitals for critical health care services, regardless of their ability to pay. Clearly, the elimination of service to a large portion of the patient population that currently frequents St. Luke's Hospital constitutes a significant effect on public health caused *directly* by the elimination of services at existing CPMC hospital and the replacement with far fewer beds at the proposed Cathedral Hill Hospital that would only be accessible to patients without insurance coverage limitations. What's more, these changes in service would not only affect the patient population with insurance coverage limitations but also all other Californians due to the increased pressure on emergency department services when beds are not available."

(Iris Biblowitz, October 26, 2010) [115-3 HC]

"There is a crying need for a SNF, a long-term facility that could be part of St. Lukes. The new LHH has fewer beds that it originally did, and the demand is, and will continue to be, greater.

There's a great need for more psychiatric units, which have been closing down at a rapid rate in SF. A rehab/detox unit would be very helpful; people are on waiting lists and relapse before they can get in to a program.

The southeast probably has a larger proportion of children than other SF neighborhoods and all-around pediatric care is needed. This is especially helpful because the BayView has one of the highest percentages of children (and adults) with asthma.

An oncology department would be a wonderful asset. BayView and Mission have more than their share of cancer (especially breast cancer) and this would enable patients who feel extremely tired and weak to go to a hospital in the neighborhood rather than travel. Many patients of SFGH and St. Lukes now travel by bus; fortunately, there are several bus routes that stop close to each of them. (Unfortunately, the #26 on Valencia was discontinued.) Riding MUNI across town after chemotherapy or just being sick is a real hardship."

(Jack Scott, September 23, 2010) [PC-6 HC]

"The project proposed is not good for the City and not good for the residents of the southeast section of the City. Reduction of services at St. Luke's would further overload those of the San Francisco General Hospital."

(Unidentified Speaker, September 23, 2010) [PC-36 HC]

"I just come to ask that they put back St. Luke's Hospital. My children were born there and all our community need it there. We don't ask for charity, we just ask for service. They were born here and they need that service, all the community there in Bernal Heights. I really thank you for letting you know, we do need that hospital. Thank you."

(Betty Huey, September 23, 2010) [PC-74 HC]

"The Draft will greatly reduce services at St. Luke's Hospital. Members of the low income community understand the difficulty of obtaining affordable health care. My father, for example, works in a restaurant as a cook and he works under pressure with sharp knives and hot stoves, so when my father gets cuts and burns, he does not go to the hospital because he does not have health insurance."

(Taffy Dollard, September 23, 2010) [PC-181 HC]

"Good afternoon. My name is Taffy Dollard and I have been a Registered Nurse for 30 years, the last 12 working in Labor and Delivery at the CPMC California campus. As we are hearing today from many people, there are points to be made regarding the multitude of problems with the current plan to rebuild CPMC on Van Ness Avenue. I would like to address specifically the issue of safe access to the facility for all patients, particularly those who would be displaced from St. Luke's."

(Taffy Dollard, September 23, 2010) [PC-183 HC]

"Of course, in all cases, I never failed to provide safe and compassionate care to all my patients, regardless of economic status. CPMC's proposed plan, as it now stands, with downsizing rather than expanding St. Luke's, will eliminate timely and safe access to medical care to much of our community,…."

(Taffy Dollard, September 23, 2010) [PC-184 HC]

". . .many of whom, including pregnant women in labor, will be forced to travel across town by crowded bus to the proposed medical center. Please do not allow this to happen. All citizens deserve safe access to medical care. Thank you."

(Barbara Savitz, September 23, 2010) [PC-336 HC]

"MS. SAVITZ: Good evening. I'm Barbara Savitz. I've been a Registered Nurse for over 35 years. My concerns are many, but I'll speak to the situation of traffic. For the safety of myself, as well as my patients, I'm going to

carry gloves with me when I take the buses around the City. As a non-driver, I use buses exclusively and travel Van Ness almost weekly. Traffic congestion is so common that I keep a book with me for the times that I have to wait for the bus to keep moving, so I have something to do."

(Barbara Savitz, September 23, 2010) [PC-337 HC]

"I work Labor and Delivery at CPMC California campus. We have 18 labor beds and usually about three to five visitors for patients in labor, that would be about 54 cars coming to see the patients. After delivery, the patient goes to postpartum for mother and baby care, and there we have approximately 50 beds, so then, if we have three people visiting, three cars visiting, that's 150 cars coming to visit the patients. After this, the cars of nurses, doctors, auxiliary coming to work, what a challenge."

(Barbara Savitz, September 23, 2010) [PC-338 HC]

"History and research has educated us to know that the support of family and patients results in a quicker recovery and better outcome, so we want people to get visitors, we want people to stay with them, yet I am very concerned with patient safety. Transporting a patient to a place far away from their community will cause unnecessary stress. We've already had a patient come to us in triage, barely making it there, to deliver in the bathroom, just coming across town to deliver with us, and barely made it because of traffic. That's why I'm keeping gloves with me when I travel the buses, and for the safety for myself and for my patients, I would please ask you to consider this in your discussions. Thank you."

(Maria Ragairdo, September 23, 2010) [PC-187 HC]

"MS. RAGAIRDO: Hello. I represent – I am a Registered Nurse from St. Luke's Hospital and I represent not only the nurses, but now the patients.

COMMISSIONER MIGUEL: Your name?

MS. RAGAIRDO: I'm sorry? My name is Maria Ragairdo. I work at St. Luke's Hospital. I have been there for 30 years, I feel like I am crawling out of the night shift again, I worked the night shift coming here to represent. We hardly ever get the limelight, so bear with me because I don't speak in groups that often. Just recently, I had a patient named Mrs. Rodriguez and I have to go home crying that morning because she was one of the patients that came to me during the night, assisting her to the commode and telling me, 'Maria, I want to thank you.' And I said, 'Why?' She said, 'Because I saw you a year or so ago.' I said, 'Where?' She said, 'On TV, and I want to thank you because, as you know, I only speak Spanish and my English is very limited, and you spoke many times and I saw you and I just want to thank you, I have never thanked you before, and you know, I've been a regular in and out of the hospital so many times, and I cannot go physically to represent myself at the City Hall with the Supervisors, so please do it for me.' So, on behalf of her, I am here also, and also because I work at St. Luke's. If you go back and see the tapes, you know that we have been here so many times, and I know, I see different faces, I don't know any of you, if you were not here the last time, it was Alioto and the others, you can clearly see that, I mean, even today, you know, Local 250, I sat there and I almost fainted. If you see those tapes, they were here standing by us, you know, together, fighting for not downsizing St. Luke's. I mean, all we want is a win-win situation, you know?"

(Maria Ragairdo, September 23, 2010) [PC-188 HC]

"Maybe make St. Luke's – with 86 beds, I mean, we pressure them to say 86 beds, they were not even saying that six or seven months ago. They put this ribbon committee, you know, at St. Luke's to make it more fair, but that's all we want is fairness in this deal. I mean, fight for St. Luke's because that side of the city only has San Francisco General and, as we stand here and speak, we only get the real bad patients, we only get the low income, you know, we get the patients that CPMC can't handle, or Davies, they send them to us because either they were too loud, or too stinky, or too whatever, but all the negativity, they come to us, and we are still not with a contract, so I congratulate Local 250 for settling their contract, but we are still fighting for ours, and it's been many years."

(Jane Martin, September 23, 2010) [PC-259 HC]

"We encourage and will continue to encourage CPMC to come to the table and engage in a real substantive dialogue around healthcare impacts, the size of St. Luke's, jobs, affordable housing. We hope that that happens, but we really need an Environmental Impact Review that looks at the healthcare impacts, and it shouldn't be approved the way it is right now. Thank you."

(Jane Sandoval, September 23, 2010) [PC-273 HC]

"There has continued to be service cuts, it has already been mentioned, the lack of psychiatric beds, the skilled nursing facility beds are in jeopardy, and most recently, the dialysis services are slotted for closure. Bottom line – things that don't generate money are not inclusive of the spectrum of services. The current rebuild of the emergency department for the rebuild of St. Luke's calls for increased square footage, but not necessarily emergency department beds. The plan for a psychiatric holding area is flawed. Psychiatric patients need placement, not an Emergency Department holding area. Often, patients stay up to 72 hours in the Emergency Department until their hold is exhausted, or placement is found, and often placement is not found. The Emergency Department continues to be full, often overflow from San Francisco General, and just a fall-out from the economic slowdown, people are coming to the Emergency Rooms because it's the only place where they can receive care."

(Rachel Ibarra, September 23, 2010) [PC-295 HC]

"Good afternoon, President Miguel and Commissioners. My name is Rachel. I am here with Bernal Heights Neighborhood Center. We are a member of the Coalition for Health Planning in San Francisco. I also a resident of Bernal and I go to St. Luke's for my medical services. Echoing some of the statements from some of our seniors who spoke earlier, and other speakers, there is a profound need for accessible healthcare services in the southeast part of the City. People need to be able to access a full range of quality medical services in the community, including the increasing medical needs of seniors as they age, such as skilled nursing facilities, health, education, and nutrition education, preventative approaches, trauma care, support for parenting teens and complex birthing, psychiatric services and treatment, including in-patient services."

(Fran Taylor, September 23, 2010) [PC-315 HC]

"Now, this is what's happening, and I just want to point out that a few of the arguments in favor of the EIR actually speak to keeping St. Luke's at a viable size. The people, the doctors who spoke about the need for speed, to get those pediatric emergency patients to a hospital quickly, every minute counts – tough luck for the Ingleside, too bad for Excelsior. The same thing for the clinics in the Tenderloin and Chinatown who were happy that this hospital would be close to them, I am happy for them that they'll have a hospital close to them; but what about us? What about the people in the whole southern part of the City who are going to have a boutique hospital for maybe a few years?"

Response HC-2

The comments express concerns that; (1) the number of beds and the services at the St. Luke's Campus under the proposed LRDP would not be sufficient to serve the Mission District and areas to the south, while continuing to serve as a "back up" for San Francisco General Hospital (SFGH); (2) that some unique services that are provided at St. Luke's would not be replaced; (3) that any such services that are replaced would not be replaced until 2015 or 2020 and would be relocated to the Pacific and/or Cathedral Hill Campuses; (4) that patients currently served at St. Luke's Hospital would have difficulty traveling to relocated services at the Pacific or Cathedral Hill Campuses; (5) that patients traveling in ambulances to the proposed Cathedral Hill Campus could [die in] be stuck in traffic; (6) that the LRDP would contribute to existing ambulance traffic and noise in the vicinity of the Cathedral Hill Campus; (7) that emergency room services in the city would be strained when SFGH diverted and the St. Luke's Replacement Hospital was overcrowded; (8) that SFGH would be "further overload[ed]," (9) that patients with

insurance coverage limitations who are currently relying on services at the St. Luke's Hospital would need to access other hospitals in the city or the region; (10) that physicians often deny Medi-Cal patients who constitute a large portion of the patient population at the St. Luke's Campus; (11) that beneficiaries of government programs would not be eligible for single-patient rooms at the proposed CPMC facilities; (12) that "environmental injustice" would result from the loss of local access to acute-care services, disproportionately affecting low-income residents; (13) that emergency vehicles would be forced to transport patients currently served at CPMC hospitals to other hospitals further away, thereby putting additional pressure on dispatch capacity at the San Francisco Police Department and San Francisco Fire Department and increasing the response time for delivery of emergency cases to acute-care hospitals; (14) that jobs and affordable housing would be affected; (15) that a lack of psychiatric beds would occur; (16) that the number of skilled nursing facility (SNF) beds at CPMC would be jeopardized; and (17) that potential closure of CPMC's dialysis services could occur. Each of these concerns is addressed below.

Please note that as stated throughout the Draft EIR (e.g., on page 2-180), the St. Luke's Campus would provide 80 licensed beds under the proposed LRDP, rather than 88 beds as stated in Comments 4-5 HC and 4-7 HC above. As shown in Table 2-2, "CPMC Existing and Proposed LRDP Licensed Hospital Bed Uses" in the Draft EIR, (and the revised version of Table 2-2 included in the text revisions in Chapter 4 of this C&R document), under the proposed LRDP, the total number of licensed beds at the St. Luke's Campus would decrease from 229 currently to 80, a reduction of 149 beds, rather than 180 as stated in Comment 42-1 HC.

Adequacy of 80 Beds at the St. Luke's Campus

Please see Major Responses HC-1 and HC-2 (page C&R 3.23-1 and 3.23-8) for detailed discussion regarding the supply of acute-care beds and size and scope of services at the St. Luke's Campus.

Major Response HC-1 explains that the 80 beds proposed to be provided at the St. Luke's Hospital would provide sufficient capacity to meet the current and projected demand at the St. Luke's Campus, with additional capacity to meet peak demand periods. Major Response HC-1 also explains that with the shift from multi-patient to single-patient rooms under modern hospital guidelines, newer facilities such as the St. Luke's Replacement Hospital are projected to have a higher occupancy rate (i.e., a higher percentage of licensed beds that are expected to be used) than existing facilities with multi-patient rooms such as the 1970 Hospital Tower that the St. Luke's Replacement Hospital would replace. Therefore, fewer licensed beds would be required to serve the same number of patients. In addition, as explained in detail in Major Response HC-1, over time the demand for hospital bed capacity has been reduced because of technological and clinical advances that reduce the average length of hospital stays and allow more medical services to be provided on an outpatient basis.

Major Response HC-2 further explains that the proposed LRDP would not exacerbate any shortage of inpatient acute-care beds for the south of Market Street area that is traditionally served by the St. Luke's Campus, in part, because the Health Commission Task Force has determined that the St. Luke's Replacement Hospital would be appropriately sized to accommodate existing and projected future patient demand for that service area,[195] and because the St. Luke's Replacement Hospital would accommodate growth in patient census, increase its Emergency Department and surgery capacity, and expand primary care programs in clinical areas of demonstrated need to the community.

Replacement of Services Currently Provided at the St. Luke's Campus

Comment 4-6 HC states that "[t]here are some only one of a kind services currently at St. Lukes that are not being replaced," but the comment does not identify what these services are. In general, please see

[195] The S.F. Health Commission Task Force on CPMC's IMP Addressing Resolution No. 10-09, *Updates and Accomplishments*, Mar. 2, 2010.

Major Response HC-2 (page C&R 3.23-8) for discussion regarding the size and scope of services at the St. Luke's Campus. As explained in more detail in Major Response HC-2, with the exception of inpatient pediatrics, skilled nursing facilities (SNF), and subacute care, which are discussed further below, all services currently provided at the St. Luke's Campus are proposed to be maintained or expanded at St. Luke's, including various outpatient pediatric services; chronic disease management; comprehensive women's care; senior care including orthopedic surgery, medical cardiology, ophthalmic surgery, and a diabetes center; diagnostic services; family-oriented urgent care (which would be a new service licensed by the California Department of Public Health at the St. Luke's Campus); and an expanded Emergency Department.

Similarly, Comment 87-16 incorrectly states that the proposed LRDP would include the removal of all obstetrics services from the St. Luke's Campus. Under the proposed LRDP, obstetrics services at the St. Luke's Campus would be continued and expanded. As indicated in the Draft EIR, page 2-8, the project objectives for the proposed LRDP include a core medical services objective to "rebuild and revitalize the St. Luke's Campus as a community hospital that is an integral part of CPMC's larger health care system, and that provides services such as . . . gynecologic and low-intervention obstetric care." As explained in Major Response HC-2 (page C&R 3.23-8), under the proposed LRDP, the obstetrics services at the St. Luke's Campus would be expanded and would include comprehensive women's care, including a new women's care floor, with labor and delivery areas (including a low intervention birth program supported by physicians and midwives), contiguous recovery and postpartum areas, as well as versatile medical/surgical rooms allowing other gynecological procedures, and a family room.

The St. Luke's Campus currently has three labor, delivery, and recovery rooms, 20 postpartum beds (in multi-patient rooms currently used as single-patient rooms, so actually providing 10 postpartum beds), three OB Triage Stations, two C-section rooms with one recovery location, and three antenatal testing chairs. Under the proposed LRDP, the St. Luke's Campus would provide five labor, delivery and recovery rooms, 14 postpartum beds, three OB Triage stations/antenatal testing chairs, and two C-Section rooms with two recovery locations.

As further explained in Major Response HC-2, the number of inpatient pediatric patients has been very low (an average daily census of 0.7) at the St. Luke's Campus. Based on research showing a link between pediatric patient volume and clinical outcomes, CPMC determined that this low pediatric inpatient demand would be better served by the higher volume, dedicated program that is planned for the proposed Cathedral Hill Hospital. The San Francisco Health Commission Task Force, when reviewing CPMC's Institutional Master Plan, concurred that the provision of inpatient pediatric services at the proposed Cathedral Hill Hospital would provide for the inpatient pediatric service demands of current St. Luke's patients, as envisioned by the Blue Ribbon Panel.[196]

Please also see Major Response HC-6 (page C&R 3.23-25) regarding skilled nursing facilities (SNF) and subacute-care beds. As explained in Major Response HC-6, current estimates indicate that CPMC would need to provide approximately 100 SNF beds total (for all CPMC campuses) at any given time. The San Francisco Health Commission Task Force, in its reports dated March 2 and September 30, 2010, and the San Francisco Health Commission, in Resolution 02-10 dated March 16, 2010, affirmed CPMC's plans to maintain capacity to serve its existing patient needs by providing a total of at least 100 SNF beds, including 38 beds currently located at the Davies Campus and adding 62 new SNF beds at other on- or off-campus locations (yet to be determined).[197] CPMC has also committed that no existing community-based beds would be utilized to provide the additional 62 SNF beds, because of the existing shortage of SNF beds in the community.[198] As explained in Major Response HC-6 and clarified in the revisions to

[196] Ibid.
[197] Ibid.; CPMC, 2010 (Sept. 30), *Interim Report to the San Francisco Health Commission Regarding Progress Toward Commission Recommendation in Resolution No. 10-09*; S.F. Health Commission Resolution No. 02-10.
[198] S.F. Health Commission Resolution No. 02-10.

Table 2-2, "CPMC Existing and Proposed LRDP Licensed Hospital Bed Uses" in the Draft EIR, page 2-10 (see Response PD-6, page C&R 3.2-6), CPMC is committed to continue maintenance of 101 licensed SNF beds at the California Campus unless and until CPMC identifies another plan for providing 62 SNF beds (in addition to the 38 SNF beds that would continue to be maintained at the Davies Campus under the LRDP) necessary for CPMC to meet its commitment to provide a total of 100 SNF beds systemwide. For this reason, there would be no need for CPMC to provide replacement beds at the Cathedral Hill Campus for SNF beds currently provided at the St. Luke's Campus, as suggested by several of the comments.

As explained in Major Response HC-6, according to a study by The Camden Group, almost all of the subacute patients in the existing 60-bed subacute-care unit at the St. Luke's Campus have been direct admit patients residing in areas outside of the south of Market Street area and often outside San Francisco County.[199] The Blue Ribbon Panel, therefore, did not recommend that CPMC provide replacement subacute-care beds for those in the existing St. Luke's Hospital. Instead, the Blue Ribbon Panel recommended that "CPMC should replace lost subacute beds with placements for all individuals currently in those beds."[200] Furthermore, the San Francisco Health Commission has memorialized its agreement with CPMC: "When the St. Luke's inpatient tower is decommissioned, CPMC will place all remaining subacute-care patients in its other hospital campuses, or in community facilities."[201] Consistent with the Blue Ribbon Panel's recommendations and its agreement with the Health Commission, CPMC would gradually remove the existing 60 subacute-care beds at the St. Luke's Hospital from service, through attrition or transfers to other facilities between now and when the existing St. Luke's Hospital tower would be demolished.[202] The proposed St. Luke's Replacement Hospital would not have subacute-care beds. Any patients not able to be transferred to other subacute-care facilities by that time would be placed, as appropriate, in a CPMC acute-care or SNF bed.[203]

Comment 4-6 HC above also expresses a concern that services currently at the St. Luke's Campus would be relocated to the Pacific Campus. This comment does not reflect a correct understanding of the proposed LRDP, because no services currently provided at the St. Luke's Campus are proposed to be relocated to the Pacific Campus. Therefore, Mission District seniors would not need to travel to the Pacific Campus under the proposed LRDP to receive services previously received at the St. Luke's Campus.

Comment 42-2 HC above expresses a concern that services currently at the St. Luke's Campus would be relocated to the Cathedral Hill Campus. Similarly, Comments 90-63 and 96-9 above state that "few patients currently relying on the 229 beds at the existing St. Luke's Hospital would be accommodated at the new Cathedral Hill Hospital," and Comment 96-25 above states that services at the St. Luke's Hospital would be "replace[d] with far fewer beds at the proposed Cathedral Hill Hospital." Concerns regarding the need to accommodate current patients of the St. Luke's Hospital at the Cathedral Hill Campus are misplaced, because, as explained above, other than inpatient pediatric services, no services currently provided at the St. Luke's Campus would be relocated to the Cathedral Hill Campus. Given the relatively minimal number of inpatient pediatric patients (an average daily census of 0.7[204]) at the St. Luke's Campus, very few patients would be required to travel from the areas served by the St. Luke's Campus to the Cathedral Hill Campus as the result of the proposed relocation.

204 OSHPD, ALIRTS, Annual Utilization Report of Hospitals, California Pacific Medical Center – St. Lukes Campus, 2009, available at http://www.alirts.oshpd.ca.gov, accessed Apr. 8, 2011.

Comment 87-16 above also expresses concerns regarding increased travel time to emergency and hospital rooms caused by a reduction of licensed beds at the St. Luke's Campus and the removal of all obstetrics and single-nursing services from the campus. Similarly, Comment PC-184 above expresses concerns that under the proposed LRDP, "pregnant women in labor will be forced to travel across town by crowded bus" to the Cathedral Hill Campus. Comments PC-336 through PC-338 above implicitly discuss the same concern; the comment states that the commenter is a labor and delivery nurse at the California Campus who would keep gloves with her when traveling on buses if the LRDP were approved as proposed, because of the traffic congestion on Van Ness, that she has already had a labor and delivery patient at the California Campus who barely made it to triage. The record does not support the suggestion that travel time to emergency and hospital rooms would be increased because of the reduction in the number of licensed beds at, and removal of all skilled nursing services from, the St. Luke's Campus.

As explained above, the record indicates that the proposed LRDP would not result in a transfer or redistribution of services or patients, including Emergency Department patients, and very few patients would be required to travel from the areas served by the St. Luke's Campus to other campuses as a result of changes in services at the St. Luke's Campus. Furthermore, evidence in the record shows that an increase would occur in St. Luke's Emergency Department capacity, as explained in detail in Major Response HC-5 (page C&R 3.23-20).

As also explained above, obstetrics services would be expanded at the St. Luke's Campus, not removed. As further explained in Major Response HC-5, the current practice across the CPMC campuses is to identify high-risk maternity patients (where it would be likely or suspected that mother or newborn would require specialized intensive care services related to the birth) early in their pregnancy.[205] Such patients are referred to the dedicated women's and children's facilities (currently at the California Campus).[206] Under the proposed LRDP, they would be referred to the Cathedral Hill Hospital with its women's and children's facilities.[207]

Normal and low-risk deliveries, including any emergencies that might occur during normal or low-risk labor and delivery, would continue to be handled at St. Luke's Hospital or the women's and children's facilities at the proposed Cathedral Hill Hospital, based on patient and physician preference.[208] If, during a normal or low-risk delivery at the St. Luke's Replacement Hospital, a woman had complications that required a higher level of care, the mother and newborn would be stabilized at the St. Luke's Replacement Hospital and the newborn then would be transferred to the Neonatal Intensive Care Unit (NICU) at the proposed Cathedral Hill Hospital.[209] (Currently, newborns are transferred to the California Campus.)[210] The St. Luke's Replacement Hospital would have all the necessary stabilization capabilities to handle the immediate needs of the patient, including an intensive care unit for the mother.[211] Only after a newborn was stabilized would a neonatal transfer occur.[212] Such transfer would be conducted under the care of a registered nurse at all times, until the newborn was safely handed off to a NICU nurse at the Cathedral Hill Campus.[213] Additionally, the new UCSF Mission Bay hospital will provide NICU services in the southeast part of the city.[214] The incidence of "normal" births that require NICU follow-up is

[205] CPMC, Memorandum from Malia Weinberg to David Reel (AECOM) & Brian Boxer (AECOM, re: Labor and Delivery Emergencies (Apr. 21, 2011).
[206] Ibid.
[207] Ibid.
[208] Ibid.
[209] Ibid.
[210] Ibid.
[211] Ibid.
[212] Ibid.
[213] Ibid.
[214] Ibid.

low.[215] Between January 1, 2010, and December 31, 2010, only 1.3 percent (i.e., 12 of 917) of the births at St. Luke's Hospital required such follow-up care.[216]

Development of the Cathedral Hill and St. Luke's Campuses under the proposed LRDP would not result in significant emergency vehicle access impacts. See Impacts TR-52 and TR-92 in the Draft EIR on pages 4.5-145 and page 4.5-206, respectively, and Response TR-100 (page C&R 3.7-170), regarding whether emergency vehicle access would be compromised under the LRDP. As explained in Response TR-100, the likely routes to the Cathedral Hill Hospital would be multi-lane arterial roadways that would allow emergency vehicles to travel at higher speeds and permit other traffic to maneuver out of their path. In addition, the majority of emergency transports would occur during non-commute hours, further reducing the risk of traffic problems associated with commuter traffic. Furthermore, during times when congestion was most severe, emergency vehicles would likely choose to use less congested, parallel routes, and emergency vehicles would also be permitted to travel opposite the flow of traffic or contraflow in a one-way route to bypass congestion. With the grid street layout surrounding the proposed Cathedral Hill Campus, emergency vehicles would have multiple routes to choose for accessing the hospital, while avoiding the most congested routes.

For all of the above reasons, under the proposed LRDP, it is very unlikely that a pregnant woman in labor "would be forced to travel across town by crowded bus" to the Cathedral Hill Campus, as suggested by Comment PC-184.

Comment 42-2 also refers to closures of the occupational medicine clinic, the "occupational therapy program," psychiatric unit, and the neo-natal intensive care unit at the St. Luke's Campus. The Occupational Medicine Clinic at the St. Luke's Campus closed in 2006, before CPMC acquired St. Luke's. The comment's reference to the "occupational therapy program" most likely concerns the outpatient physical and occupational therapy center that was on the 7th floor of the Monteagle Medical Center building. Occupational therapy services are provided to inpatients at all campuses, and continue to be provided to inpatients at the St. Luke's Campus. However, the outpatient physical and occupational therapy center at the St. Luke's Campus closed in November 2007. The psychiatric unit at the St. Luke's Campus closed in 2005 (before CPMC acquired the St. Luke's Campus), and the Neonatal Intensive Care Unit was downgraded to a Special Care Nursery in April 2008. These service changes all occurred before the Notice of Preparation of an EIR (NOP) for the proposed CPMC LRDP and, therefore, are part of the existing baseline conditions. Comment 42-2 also refers to reductions in medical ICU and medical/surgical beds at the St. Luke's Campus, but no such reductions have occurred.

Other services at the St. Luke's Campus have grown in recent years, including the Children's Health Clinic, which is the largest such facility in the City. See also Major Response HC-4 (page C&R 3.23-19) regarding psychiatric beds, which explains that the proposed total of 18 licensed psychiatric beds (all at the Pacific Campus) under the proposed LRDP would be adequate to respond to the demand for CPMC beds, based on the past demand census (average daily census of 10.6 for psychiatric beds in 2009).[217]

Comments 42-2 and 84-1 also state that the St. Luke's Hospital is one of only two hospitals that currently serve communities south of Market Street. As explained in Major Response HC-2, from a citywide hospital distribution perspective, the proposed LRDP has been planned in the context of other proposed and pending medical campus projects in the city. Although St. Luke's Hospital and San Francisco General Hospital are the only two hospitals currently located south of Market Street, as explained below, several other hospitals also serve or will soon serve this area. As explained in Major Response HC-5

[215] Ibid.
[216] Ibid.
[217] OSHPD, ALIRTS, Annual Utilization Report of Hospitals, California Pacific Med Ctr-Pacific Campus, 2009, available at http://www.alirts.oshpd.ca.gov, accessed Apr. 8, 2011; CPMC, Memorandum from Malia Weinberg, Senior Project Manager, Operations, Planning and Activations, to Brian Boxer (AECOM) re: Inpatient Psychiatric Beds (May 12, 2011).

(page C&R 3.23-20) regarding emergency services, the south of Market Street area represents the third largest service area for St Francis Memorial Hospital,[218] and Seton Medical Center (in Daly City) has also historically served San Francisco residents. A reported 17.84 percent of Seton Medical Center's patients came from zip codes within San Francisco in 2009 ,including residents of the south of Market area of the City.[219] In addition, a third hospital, the new UCSF Mission Bay Hospital, also will be located south of Market in the future. Lastly, San Francisco General Hospital is replacing its existing hospital with a new hospital that will increase the emergency capacity at SFGH in a manner that would enable it to accommodate approximately 33 percent more annual emergency visits, compared to existing conditions.[220] As explained in Major Response HC-2 (page C&R 3.23-8), CPMC's proposed Cathedral Hill Campus is the only new acute care facility currently proposed for the north of Market Street area.

Ability of Ambulances to Travel to Cathedral Hill Hospital During Periods of Traffic Congestion

Please see the discussion of Impacts TR-52 and TR-92 (in the Draft EIR on pages 4.5-145 and 4.5-206, respectively) for an analysis of impacts related to emergency vehicle access to the proposed Cathedral Hill Campus, and Major Response HC-5 (page C&R 3.23-20) and Response TR-100 (page C&R 3.7-170) for detailed responses to comments regarding emergency vehicle access to the Cathedral Hill Campus during periods of traffic congestion along Van Ness Avenue, Geary Street/Boulevard, and other roadways in the vicinity of the Cathedral Hill Campus. As explained therein, under the proposed LRDP, development of the Cathedral Hill and St. Luke's Campuses would not result in significant emergency vehicle impacts.

As explained in Response TR-100 (page C&R 3.7-170), the likely routes to the proposed Cathedral Hill Hospital would be multi-lane arterial roadways that would allow emergency vehicles to travel at higher speeds and permit other traffic to maneuver out of their path. In addition, the majority of emergency transports would occur during non-commute hours, further reducing the risk of traffic problems associated with commuter traffic. Furthermore, during times when congestion was most severe, emergency vehicles would likely choose to use less congested, parallel routes, and emergency vehicles would also be permitted to travel opposite the flow of traffic or contraflow in a one-way route to bypass congestion. With the grid street layout surrounding the proposed Cathedral Hill Campus, emergency vehicles would have multiple routes to choose for accessing the hospital, while avoiding the most congested routes.

Emergency Services Capacity and Diversions from San Francisco General Hospital (SFGH)

Please see Major Response HC-3 (page C&R 3.23-17) for detailed responses to comments regarding potential impacts of the proposed LRDP to San Francisco General Hospital, and Major Response HC-5 (page C&R 3.23-20) for detailed discussion regarding emergency services at the St. Luke's Campus.

As explained in detail in Major Response HC-5, no substantial evidence was presented in the comments that the proposed LRDP would increase demand on or otherwise put a strain on or undercut emergency services within the City. The proposed LRDP would expand the capacity of existing Emergency Departments or provide comparable replacement emergency services at CPMC campuses.

As explained in Major Response HC-5, the proposed LRDP would increase the effective Emergency Department capacity at the St. Luke's Campus from approximately 26,000 visits per year currently to

[218] The Lewin Group, 2009 (Feb. 10), *St. Francis Memorial Hospital Institutional Master Plan Review*, prepared for the San Francisco Department of Public Health, available: http://www.sfdph.org/dph/files/hc/HCAgen/HCAgen2009/files403032009/ SFMH-IMPDraftRpt2_10.pdf, accessed Dec. 19, 2010.

[219] OSHPD's 2009 unmasked data set.

[220] San Francisco Planning Department, 2008 (June 4), San Francisco General Hospital Seismic Compliance, Hospital Replacement Program EIR, *Comments and Responses*, pages 56–57.

accommodate approximately 31,600 visits per year. According to the San Francisco Health Commission Task Force in CPMC's IMP Updates and Accomplishments document, the increased Emergency Department capacity at the St. Luke's Campus under the proposed LRDP "will be able to handle many more visits than envisioned by the Blue Ribbon Panel and will provide significant backup capacity for SFGH."[221] As explained in Major Response HC-5 (page C&R 3.23-20), emergency capacity in the southeastern portion of San Francisco will be increased by the new UCSF Mission Bay Hospital and the replacement of the existing SFGH hospital with a new SFGH main hospital (which will have 33 percent more emergency room capacity), which would reasonably be expected to reduce the need for diversions from SFGH.[222]

A hospital (such as SFGH) will be on divert status if its Emergency Department is full or temporarily unavailable.[223] The need for diversions from SFGH because of its Emergency Department being full or temporarily unavailable is an existing condition and is not an effect of the proposed LRDP. Comment 90-67, and duplicate comments provided in Comments 96-11 and 101-11, state that SFGH "is usually on a constant 'Total Divert' status." This implies that SFGH is on diversion status more often than not, which is not supported by the evidence in the record. Currently, SFGH is on diversion 20 percent of the time for non-trauma cases (no trauma cases are diverted from SFGH and all trauma cases brought to SFGH are treated there).[224] The St. Luke's Campus is located approximately 1.4 miles from SFGH and the new UCSF Mission Bay Benioff Children's Hospital will be located approximately 1.5 miles from SFGH. The UCSF Emergency Department/Urgent Care is expected to be approximately 16,000 square feet, with 14 treatment stations, three observation rooms, one decontamination room, plus two trauma stations and two triage rooms. Using industry standards of 1,700–2,000 visits/year/station, this new Emergency Department at UCSF could accommodate 23,800–28,000 visits per year (approximately 10 percent fewer visits than the St. Luke's Campus under the proposed LRDP). Therefore, some portion of non-trauma cases currently diverted from SFGH to St. Luke's Hospital would be expected to be diverted to UCSF Mission Bay. Diversions from SFGH currently may be directed to the St. Luke's Campus, but may also be directed to other hospital Emergency Departments throughout the city, depending on several factors.

As explained in the TransOptions4Health care analysis of San Francisco Fire Department 911 emergency transports to CPMC Campuses:

> [T]ransporting a patient to a hospital emergency room following a 911 call is not a simple decision of choosing the closest hospital because there is no set geographic 'catchment' area to predetermine where a SFFD crew will transport a patient. Prior to any decision on hospital Emergency Department selection, a SFFD crew must consider at least seven factors:
>
> - Paramedic Assessment—*SFFD ambulance crew proceeds on scene, attempts to treat and/or stabilize a patient, and then determines if the patient's medical condition requires transport to a hospital Emergency Department;*
> - Possibility of Hospitals on Divert Status—*one or more hospital Emergency Department may be full or temporarily unavailable;*
> - Patient Choice—*if the patient does not have a life threatening injury and SFFD can take the extra minutes necessary, the SFFD will generally respond to a patient's request for a particular hospital such as Kaiser, or a preferred hospital based on the patient's insurance;*

[221] San Francisco Health Commission Task Force on CPMC's IMP Addressing Resolution No. 10-09, 2010 (Mar. 2), *Updates and Accomplishments*.
[222] San Francisco Planning Department, 2008 (June 4), San Francisco General Hospital Seismic Compliance, Hospital Replacement Program EIR, *Comments and Responses*, pages 56-57.
[223] TransOptions4Healthcare, 2011 (Feb. 28), *City of San Francisco Fire Department 911 Emergent Transports to CPMC Campuses: 2004, 2008, 2015*, prepared for California Pacific Medical Center, p. 15-16.
[224] San Francisco Planning Department, 2008 (June 4), San Francisco General Hospital Seismic Compliance, Hospital Replacement Program EIR, *Comments and Responses*, page 55.

- Patient Severity—*if a patient has a severe medical condition they are generally transported to the nearest hospital Emergency Department with the shortest waiting time;*
- Type of Patient Medical Problem—*not all hospitals can treat trauma, neurological, or stroke patients so the SFFD crew must often contact dispatch for medical direction on a hospital with these higher level services or they might have to re-transport the patient later;*
- County Policies and Protocols—*SFFD crew must follow applicable EMS protocols and procedures concerning treatment of a patient in the field, treat and release if a patient refuses transport, DNR or Do Not Resuscitate orders, and other directives on appropriate patient care and transport; and*
- Location of Ambulances—*SFFD crew may be stationed in geographic areas that correspond to historic patterns of 911 requests, and if a crew must transport a patient a considerable distance out of their 'zone' the crew may likely proceed to the closest hospital Emergency Department as soon as possible."*[225]

As explained in Major Response HC-5, the proposed LRDP would not only increase Emergency Department capacity at the St. Luke's Campus, but would also increase the total combined emergency and urgent care capacity within the entirety of the CPMC system from 88,000 visits/year currently to over 100,000 visits/year at the Cathedral Hill, Davies, and St. Luke's Hospitals. Therefore, emergency service vehicles would not be forced to transport patients to hospitals located further away and would not result in additional pressure on dispatch capacity at the San Francisco Police Department (SFPD) and San Francisco Fire Department (SFFD) or increase the average response time associated with delivery of emergency cases to acute care hospitals. The discussions of Impacts PS-1 and PS-2 on pages 4.11-17 to 4.11-30 of the Draft EIR analyze the potential for the proposed LRDP to result in substantial adverse physical impacts associated with the provision of or the need for new or physically altered fire, emergency, and police services, identified mitigation measures where needed, and concluded that these impacts would be less than significant.

Other Impacts to San Francisco General Hospital

Major Response HC-3 also explains that no services currently being provided at the existing St. Luke's Hospital would be shifted to other, non-CPMC hospitals or health care service providers. Therefore, no other impacts relating to "further overload[ing]" SFGH would occur as the result of the proposed LRDP.

Impacts to Other Hospitals

As explained in more detail in Major Response HC-3, no services currently being provided at the existing St. Luke's Hospital would be shifted to other, non-CPMC hospitals or health care service providers. Therefore, no environmental impacts related to a need for patients currently relying on services at the St. Luke's Hospital to access other hospitals in the city or the greater region would occur.

Physician Acceptance/Denial of Medi-Cal Patients

CPMC hospitals and the CPMC physicians employed by Sutter Pacific Medical Foundation and the St. Luke's Healthcare Center do at present, and would continue under the LRDP, to accept Medi-Cal patients.

As explained in Major Response HC-8 (page C&R 3.23-32), the financial makeup of the patient population of a particular hospital is a combination of location, private physician ability or preference for

[225] TransOptions4Healthcare, 2011 (Feb. 28), *City of San Francisco Fire Department 911 Emergent Transports to CPMC Campuses: 2004, 2008, 2015*, prepared for California Pacific Medical Center, pages 14-15.

a particular insurance type, historical admitting patterns, and other factors not analyzed in the CPMC LRDP EIR.[226] CPMC has limited control over many of these factors but does have control over 1) whether or not CPMC hospitals accept Medi-Cal for hospital charges, and 2) whether or not its clinics, staffed with CPMC physicians (for example, at the approximately 15 San Francisco Sutter Pacific Medical Foundation Clinics[227] and the St. Luke's Healthcare Center) accept Medi-Cal. As part of its commitments to the Health Commission, CPMC would 1) continue to accept Medi-Cal, as it always has, at all of its hospitals, 2) guarantee access to Medi-Cal patients through all of the clinics controlled by CPMC as described above, and 3) increase the amount of unpaid Medi-Cal shortfall systemwide by 22 percent over a 5-year period, from $53,369,000 in 2007 to $65,000,000 by 2012.[228]

According to the project sponsor, CPMC cannot compel private practice physicians who are not part of the Sutter Pacific Medical Foundation to see or not see Medi-Cal patients. Brown and Toland Medical Group physicians, many of whom practice at CPMC facilities, for example, currently accept Medi-Cal patients, but this is a matter of personal physician choice.

Please also see Major Response HC-8, which provides additional detailed information regarding access to health care services at CPMC under the proposed LRDP, including information regarding CPMC's commitments related to Medi-Cal patient access and CPMC's partnerships in delivering low- or no-cost care to the medically underserved.

Access to Single-Patient Rooms

Please see Major Response HC-7 (page C&R 3.23-31), which explains that the current patient guidelines recommend single-occupancy hospital rooms regardless of patient income level, and that Medicare rules would allow patients receiving Medicare to be placed in single-patient rooms at facilities such as the Cathedral Hill Hospital and St. Luke's Replacement Hospital that have only single-patient rooms.

Disproportionate Adverse Socio-Economic Impacts on Low-Income Residents

Please see Response INTRO-7 (page C&R 3.1-17) regarding the appropriate consideration of social and economic impacts under CEQA. The comment regarding "environmental injustice" refers to concerns regarding an "extra burden" or "disproportionate impact on low-income residents in the area served by the St. Luke's Campus, based on a lack of "local access to community-based health care."

No evidence shows that the project would result in such a burden or disproportionate impact on low-income communities. As explained above, with the exception of inpatient pediatrics (to be provided at the Cathedral Hill Hospital), skilled nursing facilities (SNF) (to be continued at the Davies Campus and at the California Campus, consistent with CPMC's overall 100 SNF bed commitment), and subacute care (to be discontinued), all services currently provided at the St. Luke's Campus are proposed to be maintained or expanded at St. Luke's. Therefore, the proposed LRDP would not result in a major shift of patients currently receiving services at the St. Luke's Campus or other CPMC campuses to other hospitals in the region. As explained in detail in Major Response HC-8 (page C&R 3.23-32), there is no difference in medical access policies between any of the CPMC hospitals. All CPMC hospitals are equally open to the receipt of under-insured and uninsured patients, and decisions on the granting of financial assistance and waivers are made on a uniform policy basis across all campuses.[229] CPMC's coverage of care for under-

[226] CPMC, Memorandum from Geoffrey Nelson, Director, EDP, to Brian Boxer (AECOM) re: Access to Healthcare Services (May 13, 2011).

[227] For a list of 15 San Francisco and over 50 regional locations of Sutter Pacific Medical Foundation Clinics, see http://www.sutterpacific.org/locations/.

[228] The S.F. Health Commission Task Force on CPMC's IMP Addressing Resolution No. 10-09, 2010 (Mar. 2), *Updates and Accomplishments*, p. 1.

[229] CPMC, Memorandum from Geoffrey Nelson, Director, EDP, to Brian Boxer (AECOM) re: Access to Healthcare Services (May 13, 2011)..

and uninsured patients is available to families with incomes up to 400 percent of the federal poverty level, which is a higher level than any other San Francisco hospital.[230] Therefore, there is no indication that the proposed LRDP would reduce or fail to provide local access to health care in any particular area of San Francisco, including the southeastern portion of the city served by the St. Luke's Campus. Major Response HC-8 provides additional information regarding CPMC's charity care programs and access to CPMC health care services within the southeastern portions of San Francisco.

Job Opportunities

Please see Response PH-26 (page C&R 3.5-90) for a description of CPMC hiring plan/practices.

Affordable/Low-Income Housing

Please see Responses PH- 9, PH-14, and PH-16 (pages C&R 3.5-31, 3.5-53, and 3.5-60), which address comments regarding the provision of housing for low-income families.

Psychiatric Beds

Please see Major Response HC-4 (page C&R 3.23-19) regarding psychiatric beds, which explains that the proposed total of 18 licensed psychiatric beds under the proposed LRDP (all at the Pacific Campus) would be adequate to respond to the demand for CPMC beds, based on the past demand census (average daily census of 10.6 for psychiatric beds in 2009).[231] As shown in Table 2-2 on page 2-10 of the Draft EIR, and in the updated version of Table 2-2 included in the text revisions in Chapter 4 of this C&R document, the existing 18 licensed psychiatric beds would continue to be maintained at the Pacific Campus under the proposed LRDP. As such, no psychiatric beds or services would be shifted from CPMC to other providers under the proposed LRDP.

Skilled Nursing Facility (SNF) Beds

Please see Major Response HC-6 (page C&R 3.23-25) regarding skilled nursing facilities (SNF), which explains that CPMC has committed to maintain 100 SNF beds to meet its actual demand.[232] As further explained in Major Response HC-6 and the text revisions in this C&R document, CPMC would maintain 38 SNF beds at the Davies Campus under the proposed LRDP. CPMC's plans to maintain capacity to serve its existing patient needs by providing a total of at least 100 SNF beds, including 38 beds currently located at the Davies Campus and adding 62 new SNF beds at other on- or off-campus locations (yet to be determined).[233] CPMC has also promised that no existing community-based beds would be utilized to provide the additional 62 SNF beds because of the existing shortage of SNF beds in the community.[234] As explained in Major Response HC-6, Chapter 4 of this C&R document shows revisions made to Table 2-2, "CPMC Existing and Proposed LRDP Licensed Hospital Bed Uses" in the Draft EIR, page 2-10 (see also Response PD-6, page C&R 3.2-6), to clarify CPMC's commitment to continue maintenance of 101 licensed SNF beds at the California Campus unless and until CPMC identifies another plan for providing the 62 SNF beds (in addition to the 38 SNF beds that would continue to be maintained at the Davies

[230] San Francisco Department of Public Health, Healthy San Francisco, *Participant Handbook*, page 13. See also CPMC, patient financial assistance application form, dated May 31, 2007.

[231] OSHPD, ALIRTS, Annual Utilization Report of Hospitals, California Pacific Med Ctr-Pacific Campus, 2009, available at http://www.alirts.oshpd.ca.gov, accessed Apr. 8, 2011; CPMC, Memorandum from Malia Weinberg, Senior Project Manager, Operations, Planning and Activations, to Brian Boxer (AECOM) re: Inpatient Psychiatric Beds (May 12, 2011).

[232] See, e.g., S.F. Health Commission Task Force on CPMC's IMP Addressing Resolution No. 10-09, 2010 (Mar. 2), *Updates and Accomplishments*.

[233] Ibid.; CPMC, 2010 (Sept. 30), *Interim Report to the San Francisco Health Commission Regarding Progress Toward Commission Recommendation in Resolution No. 10-09*; S.F. Health Commission Resolution No. 02-10.

[234] S.F. Health Commission Resolution No. 02-10.

Campus under the LRDP) necessary for CPMC to meet its commitment to provide a total of 100 SNF beds systemwide.

Dialysis Services

Comment PC-273 states that CPMC's "dialysis services are slotted for closure." Although CPMC has recently sold its dialysis units to DaVita, the dialysis units have not been closed. Please see Response HC-21 (page C&R 3.23-127) for a detailed response to comments regarding the sale of the CPMC dialysis unit to DaVita. As explained in Response HC-21, the transfer of CPMC's dialysis services to DaVita, which became effective on February 1, 2011, has not resulted in any physical change to the environment. Regardless of the provider of dialysis services, all are held to the same regulatory standards and are overseen by the California Department of Public Health. The process of stabilizing and transporting dialysis patients to an Emergency Department remains the same, regardless of the transfer of dialysis services operations from CPMC to DaVita. Therefore, the sale of the dialysis unit has not contributed to any cumulative impacts on City services or traffic. Response HC-21 further explains that the dialysis services and staff, and the location of dialysis services all remain basically unchanged. CPMC has indicated that dialysis services have not been materially reduced or cut, nor would they be materially reduced or cut in the future.

Comment

(Marvis Phillips, August 6, 2010) [4-8 HC]

"As to Children's:

1) The old Marshal Hale Hospital (Calif East Campus) outpatient services + skilled nursing facility was originally designed to be a medical board + care facility. These are rare in San Francisco. As we age we will need help more. And if the Governor has his way and they eliminate IHSS ten's of thousand, will need care. If not now the in the future."

Response HC-3

The comment refers to "Children's," which when read in the context of the comment letter, appears to be a reference to the California Campus. The comment expresses concerns regarding the proposed loss of outpatient and skilled nursing facility (SNF) services at the Marshall Hale Hospital on the California Campus under the LRDP. The comment also expresses concerns regarding potential changes related to the State of California's In-Home Supportive Services (IHSS) program. This comment does not raise issues regarding the adequacy, accuracy, or completeness of the Draft EIR. The comment is noted, and will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project.

Outpatient Services at the California Campus

As explained on pages 2-131 to 2-132 of the DEIR, the majority of CPMC uses and programs at the California Campus (other than inpatient acute-care beds and services, which would be transferred to the proposed Cathedral Hill Campus after that campus opens in 2015) would continue at the California Campus until completion of the proposed Ambulatory Care Center (ACC) and ACC Addition at the Pacific Campus, at which time the Pacific Campus would absorb almost all remaining CPMC-related outpatient uses at the California Campus (other than SNF beds that may continue at the California Campus unless and until relocated elsewhere as further discussed below). A small amount of CPMC-operated space at the 3838 California Street MOB (primarily outpatient imaging and blood drawing) would be leased indefinitely from the future buyer of the California Campus. Thus, it is expected that by about 2020, almost all CPMC-related use of the California Campus would cease. However, the outpatient

services currently provided at the California Campus would have been relocated to replacement facilities within the Pacific Campus ACC and ACC Addition.

SNF Beds and Services at the California Campus

Please see Major Response HC-6 (page C&R 3.23-25) for a detailed discussion related to SNF beds and services at the California Campus and within CPMC systemwide. As explained in Major Response HC-6, current estimates indicate that CPMC would need to provide approximately 100 SNF beds total (for all CPMC campuses) at any given time. The San Francisco Health Commission Task Force, in its reports dated March 2 and September 30, 2010, and the San Francisco Health Commission, in Resolution 02-10 dated March 16, 2010, affirmed CPMC's plans to maintain capacity to serve its existing patient needs by providing a total of at least 100 SNF beds, including 38 beds currently located at the Davies Campus and adding 62 new SNF beds at other on- or off-campus locations (yet to be determined).[235] CPMC has also promised that no existing community-based beds would be utilized to provide the additional 62 SNF beds because of the existing shortage of SNF beds in the community.[236] As explained in Major Response HC-6, text revisions shown in Chapter 4 of this C&R document have been made to Table 2-2, "CPMC Existing and Proposed LRDP Licensed Hospital Bed Uses" in the Draft EIR, page 2-10 (see also Response PD-6, page C&R 3.2-6), to clarify CPMC's commitment to continue maintenance of 101 licensed SNF beds at the California Campus, unless and until CPMC identifies another plan for providing 62 SNF beds (in addition to the 38 SNF beds that would continue to be maintained at the Davies Campus under the LRDP) necessary for CPMC to meet its commitment to provide a total of 100 SNF beds systemwide.

In-Home Supportive Services

The proposed LRDP would not create any changes related to IHSS. Therefore, any environmental effects resulting from budgetary changes to the IHSS program would not be an impact of the proposed LRDP.

Comment

(Marvis Phillips, August 6, 2010) [4-9 HC]

"2) Children's ER is the only pedritic ER in the city + it birth center award winning. My concern putting child ER + adult ER together esp with a birth center."

Response HC-4

The comment refers to the "Children's ER," which when read in the context of the comment letter, appears to be a reference to the Emergency Room at the California Campus. The comment appears to express a concern regarding the proposal under the LRDP to replace the Emergency Room at the California Campus with emergency room services at the Cathedral Hill Campus, which would provide emergency services to both children and adults and would also be located at the same campus as a birth center. The comment is noted. This comment does not raise issues regarding the adequacy, accuracy, or completeness of the Draft EIR. The comment will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project.

The Emergency Department currently located at the California Campus would be relocated to the proposed Cathedral Hill Hospital. Please see Major Response HC-2 (page C&R 3.23-8) regarding the co-location of services for children and adults at the proposed Cathedral Hill Hospital. Although the existing

[235] San Francisco Health Commission Task Force on CPMC's IMP Addressing Resolution No. 10-09, 2010 (Mar. 2), *Updates and Accomplishments*; CPMC, 2010 (Sept. 30), *Interim Report to the San Francisco Health Commission Regarding Progress Toward Commission Recommendation in Resolution No. 10-09*; S.F. Health Commission Resolution No. 02-10.

[236] S.F. Health CommissionResolution No. 02-10.

California Campus Emergency Department provides specialized pediatric services and is referred to as a "pediatric" Emergency Department, it is a full-service emergency unit and, as required by law, currently receives and treats adults as well as children.[237] Thus, CPMC currently provides children and adult emergency room services together at the California Campus (as it does at all CPMC emergency rooms), and this would not be a new, unique mix of emergency room patients at the proposed Cathedral Hill Hospital.[238]

At the proposed Cathedral Hill Hospital, the Emergency Department (ED) would feature separate adult and pediatric patient waiting areas and toilets, as well as a dedicated pediatric triage and dedicated pediatric treatment bays.[239] The dedicated treatment bays would be located at the front of the ED, and thus pediatric patients would not walk through adult treatment areas. The ED layout would ensure a distinct pediatric patient experience.[240]

Comment

(Marvis Phillips, August 5, 2010) [4-10 HC]

"3) Children's has 90% of the adult outpatien [sic] services + is quite convient [sic] to the eldry [sic] of the Richmond.

Putting all out patient services at Pacfic [sic] (2015-2020) while on paper looks fine but 1 out patien [sic] service for all of San Francisco. I personally wouldn't mind the cab fare is half of that of Children's, but for seniors in the outer Richmond + Sunset they simply may not be able to afford it."

Response HC-5

The comment suggests that under the proposed LRDP, CPMC would provide outpatient services at only one location, the Pacific Campus. This appears to be a misunderstanding of the proposed LRDP. As explained in Chapter 2, "Project Description" in the Draft EIR, the St. Luke's, Davies, and proposed Cathedral Hill Campuses would also provide outpatient services under the proposed LRDP, in addition to inpatient services. Please also see Major Response HC-2 (page C&R 3.23-8) regarding the location, size, and scope of services at the proposed Cathedral Hill, St. Luke's, and Davies Campuses, and Major Response HC-8 (page C&R 3.23-32) to comments regarding access to health services.

The comment also expresses a concern that the additional travel distance to the Pacific Campus, as opposed to the California Campus, could be cost-prohibitive for seniors in the Richmond and Sunset Districts. The travel cost for an additional distance of approximately 1.4 miles (or 14 blocks) that some seniors might have to travel, because of the relocation of outpatient services currently provided at the California Campus to the Pacific Campus, could not reasonably be considered prohibitive. The Outer Richmond currently has direct service to the Pacific Campus via the MUNI 1 line, along with lines 38, 31, and 5, with transfers to line 22. The Sunset District is served by N, 71 and L lines, with transfers to the 22 line. The Outer Richmond will be directly served by the 38 line and eventually by the Geary Bus Rapid Transit (BRT) replacement line to the proposed Cathedral Hill Campus. The Sunset District will be served by N, 71 and L lines, with transfers to the 47 and 49 lines, and eventually by the Van Ness BRT replacement to the proposed Cathedral Hill Campus. This comment is socioeconomic in nature and is noted. The comment does not raise issues regarding the adequacy, accuracy, or completeness of the Draft EIR. The comment will be transmitted to and may be considered by the decision-makers as part of their

[237] CPMC, Memorandum from Malia Weinberg to David Reel (AECOM) & Brian Boxer (AECOM) re: Pediatric Emergency Department (Apr. 21, 2011).

[239] Ibid.
[240] Ibid.

deliberations on the project. Please also see Response INTRO-7 (page C&R 3.1-17) regarding the appropriate consideration of social and economic impacts under CEQA.

Comment

(Marvis Phillips, August 6, 2010) [4-12 HC]

"At Pacfic:

I'm all in favor of a centralized outpatient facility but my concern is low income, senior + disabled who may not be able use this facility. A outpatient facility at Davies for the Sunsent [sic] + at St Lukes for the Mission, Hunter Point + the southern side of the City would be much more logical.

I realize that what the hospital (Sutter Health-CPMC) does is not a 'planning' area but is important when developing a plan to address 21st century medical issues."

Response HC-6

The comment suggests that under the proposed LRDP, CPMC would provide outpatient services at only one location, the Pacific Campus. This appears to be a misunderstanding of the proposed LRDP. As explained in Chapter 2, "Project Description" in the Draft EIR, under the proposed LRDP the St. Luke's, Davies, and proposed Cathedral Hill Campuses would also provide outpatient services, in addition to inpatient services. Please also see Major Response HC-2 (page C&R 3.23-8) regarding the location, size, and scope of services at the proposed Cathedral Hill, St. Luke's, and Davies Campuses, and Major Response HC-8 (page C&R 3.23-32) regarding access to health services.

The comment does not raise issues regarding the adequacy, accuracy, or completeness of the Draft EIR. The comment will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project. Please also see Response INTRO-7 (page C&R 3.1-17) regarding the appropriate considerations of social and economic impacts under CEQA.

Comments

(Evy Pierce, September 13, 2010) [10-1 HC, duplicate comments were provided in 12-1 HC, 16-1 HC, and 46-1 HC]

"I endorse the issues and critiques raised by Cathedral Hill Neighbors in their comments on CPMC's Draft EIR.

The Long Range Development Plan as proposed fails to provide local access to care to many areas of San Francisco, fails to consider the broader health care that are part of an integrated provision of health care, and will have devastating environmental impacts on the communities near the proposed monster Cathedral Hill hospital."

(Marlayne Morgan—Cathedral Hill Neighbors Association, September 21, 2010) [15-3 HC, duplicate comments were provided in 39-3 HC]

"The Long Range Development Plan as proposed would have *devastating impacts on health care* provided to underserved communities located south of Market Street, and *devastating environmental impacts on the communities* near the proposed monster Cathedral Hill hospital."

(Michael Lyon—SF Gray Panthers, September 23, 2010) [28-2 HC]

"We also demand that the City of San Francisco not approve CPMC's overall plan until these demands on SNF beds are met, as well as community concerns over the future of St. Luke's Hospital, and the impact of CPMC's planned main hospital on the proposed Cathedral Hill neighborhood."

(Sandra Manning, September 23, 2010) [31-5 HC]

"• CPMC can also easily grant health services access to nearby residents"

(Jane Seleznow, October 8, 2010) [48-2 HC]

"The Long Range Development Plan as proposed fails to provide local access to care to many areas of San Francisco, fails to consider the provision of integrated health care throughout the city, and will have *devastating environmental impacts on the communities* near the proposed huge and out of scale Cathedral Hill hospital."

(Tina Shauf—Filipino Community Center, September 23, 2010) [41-4 HC]

"We also ask that CPMC work with us to ensure that permanent job opportunities and healthcare access for the community are incorporated into CPMC's future plans as Sutter CPMC seeks to rebuild its hospitals in San Francisco."

(Ted Weber, October 12, 2010) [52-2 HC]

"Even more serious, however, is the fact that CPMC's proposal ignores the need for intelligent planning to address the issue of providing access to necessary health care facilities for wide segments of the city."

(Carol and Michael Stack, October 17, 2010) [62-7 HC]

"Lastly, there are poorer neighborhoods in the City which are egregiously under-serviced in terms of modem medical facilities. Is it not in the tradition of our great City to look after the exigent needs of our disadvantaged citizenry rather than to pander to the obligation of a Corporations to show a profit to its shareholders?

We therefore respectfully request that the proposed project be entirely disapproved, or at a minimum significantly curtailed, to take into account the burden it would place on an already-overburdened area of the City."

(Paul Wermer—CPMC Neighbors Coalition and Pacific Heights Residents, October 18, 2010) [67-4 HC]

"It is unclear to us that the distribution of medical services that will result from CPMC's proposed plan, or from any of the alternatives evaluated in the proposal, is in the best interests of San Francisco.

a) In our scoping comments (June 25, 2010 letter) we raised the question of how CPMC's plans, when considered in light of other health care provider's plans, provide the necessary health care coverage for San Francisco residents. This issue was not addressed in the DEIR, yet how the various health care providers serve San Francisco has direct, cumulative impacts of significance on the environment. CPMC's Health Care IMP was inadequate in this regard."

(Barbara Kautz—CHNA and Bernal Heights Neighborhood Center, October 19, 2010) [87-5 HC, duplicate comment was provided in 108-5 HC]

"3. The DEIR does not consider public health impacts of the Long Range Plan."

(Sheila Mahoney and James Frame, October 19, 2010) [88-12 HC]

"Practically speaking, we feel the best path for the city in this depressed economic climate is to do it right by undertaking the proposed city-wide health-needs study now and make it apply to CPMC. To do otherwise is squandering a great opportunity."

(Gloria Smith—California Nurses Association, October 19, 2010) [90-23 HC]

"2. Additional Omissions from the DEIR's Project Description

Below are examples of omitted environmental setting information from a land use perspective that must be included in a revised EIR are:

- A detailed description of the distribution of existing health care services in San Francisco and the surrounding Bay Area communities including the overall availability of general and specialized services, facilities locations and size, emergency room admissions and ambulance trips, personnel, charity care and trauma, among other factors."

(Gloria Smith—California Nurses Association, October 19, 2010) [90-24 HC]

"A complete description of both the local and regional health care service setting must provide information on any gaps or leakage of San Francisco's health care needs, accessibility of services, and other basic background information to provide 'baseline conditions' for analyzing Project impacts. [15]

[15] Without this information, very basic impact analyses cannot be performed *(e.g.*, how far will patients travel for care? What are the transportation and air quality impacts of those travel patterns?)"

(Gloria Smith—California Nurses Association, October 19, 2010) [90-25 HC]

"Projected health care services needs based on changing demographics and geographical distribution *(e.g.*, aging population, and projected growth in the City's southeastern quadrant)."

(Gloria Smith—California Nurses Association, October 19, 2010) [90-32 HC]

"The DEIR fails to justify the geographic inequity the preferred alternative would create in the City. At Project completion, patients in the City's southeast quadrant will still have to travel to other sections of the City for most specialized care; whereas, residents and local small businesses close to Cathedral Hill will be burdened by a medical facility too large for the site to adequately support in terms of land use, traffic and transit."

(Gloria Smith—California Nurses Association, October 19, 2010) [90-48 HC]

"Impacts associated with the shifts and changes in health care city-wide that would in turn change patient patterns (travel distances, types of trips, etc.), increased impacts on air quality emissions, public services and possibly other health care services *(e.g.*, competition and or the abandonment of the California Street Campus could result in loss of other existing services)."

(Gloria Smith—California Nurses Association, October 19, 2010) [90-61 HC]

"6. The DEIR Failed To Disclose Impacts on Health Care Access

Under the LRDP, CMPC is proposing to remove from service approximately 743 licensed beds at the existing St. Luke's Hospital (149 beds), California Campus (299 beds), and Pacific Campus (295 beds). The newly constructed Cathedral Hill Hospital would only provide 555 beds, exclusively in private single-occupancy rooms,[29] *i.e.*, 188 fewer beds than currently provided by the existing CPMC campuses many of which are in double-occupancy rooms.[30] This removal of beds would result in reduced access to health care and a major shift of the current hospital patient population to other hospitals in the region, particularly for patients at the St. Luke's Campus. The DEIR failed to address any of the associated impacts on traffic, transportation, parking, air quality, and public services."

(Gloria Smith—California Nurses Association, October 20, 2010) [96-7 HC, duplicate comment was provided in 110-7 HC]

"In addition to the 231 licensed beds that were removed in the past years (2006-2010) at the CPMC campuses, under the LRDP, CMPC would remove from service another 743 licensed beds at the existing St. Luke's Hospital (149 beds), California Campus (299 beds), and Pacific Campus (295 beds). The newly constructed cathedral hill hospital would only provide 555 beds, exclusively in private single-occupancy rooms,[14] *i.e.*, 188 fewer beds than

currently provided by the existing CPMC campuses many of which are in double-occupancy rooms.[15] This removal of beds would result in reduced access to health care and a major shift of the current hospital patient population to other hospitals in the region, particularly for patients at the St. Luke's Campus. The Draft EIR fails entirely to address any of the associated impacts on traffic, transportation, parking, air quality, and public services.

[14] Draft EIR at page 1-21.
[15] Draft EIR at page 2-8."

(Gloria Smith—California Nurses Association, October 19, 2010) [90-64 HC]

"The shift of the current patient population with insurance coverage limitations from community-accessible St. Luke's Hospital to other hospitals in the City and region would have a number of adverse effects and consequences. For one, it would increase the regional vehicle miles traveled as patients and visitors would be forced to travel to hospitals that are located further from their homes and out of the City."

(Gloria Smith—California Nurses Association, October 19, 2010) [90-66 HC, duplicate comments were provided in 96-10 HC and 110-10 HC]

"The increased vehicle miles traveled associated with the longer trips of patient, visitor, and emergency vehicles to and from other hospitals would also increase the regional air pollutant and greenhouse gas emissions and associated adverse impacts on public health."

(Gloria Smith—California Nurses Association, October 19, 2010) [93-5 HC]

"The proposed Project is of a scale that would reshape how health care is provided in San Francisco. Virtually eliminating services at the California Campus, reducing beds and the scope of services at St. Luke's and converting Davies into a specialty facility, among other Project proposals would generate a myriad of impacts not evaluated in the DEIR. Major flaws with this DEIR along these lines stem from two overarching deficiencies: First, the DEIR fails to describe the existing conditions with respect to health care services (e.g., the full health care system including people, facilities, services that provide health care to San Francisco's population). As such, the DEIR's analyses of Project impacts is incomplete. Second, the because the City lacks a Health Care Services Master Plan[3], the analysis of this and other health care projects is at best piecemeal and incomplete. Moreover, feasible alternatives to the proposed Project are not devised with the success of San Francisco's overall health care services system in mind.[4]

[3] Supervisor Campos's proposal for the completion of a Health Care Services Master Plan should come first, at least the overall framework, and major projects evaluated for consistency with that Plan. CPMCs proposal predetermines major outcomes that may or may not result in adequate services for San Francisco. A determination should be made whether the timeline for seismic upgrades allows completion of the Master Plan "vision" first and review of major projects second. This is the first question the City's decision-makers should ask before any further consideration of the Project.

[4] The Project's stated overarching objectives only include optimizing the use of CMPM's resources to provide an integrated health-care system affording the highest quality of patient care to CPMC's patient population in the most cost-effective and operationally efficient manner. DEIR at page 6-5. The City's objective is not represented here - to support the health care services system community-wide that affords the highest quality of patient care to all of San Francisco's population. Whether the proposed Project helps or hinders that overall goal cannot be know without - at a minimum - comparison of the Project as proposed to the existing health care services system serving the SF population. Such an evaluation would expose any gaps in services in the current system and/or gaps that would be created by the proposed Project."

Gloria Smith—California Nurses Association, October 19, 2010) [93-6 HC]

"Project impacts must be analyzed in comparison with existing health care system services currently serving the San Francisco population (e.g., in San Francisco and in adjacent communities serving San Francisco's population) so that all potentially significant impacts can be analyzed including impacts stemming from the responses to such questions as listed below. This is the environmental baseline for the Project.[5] If proposed project's [sic] like the CPMC LRDP are not evaluated based on its impacts compared with the existing health care setting (existing environmental conditions) potentially significant impacts cannot be analyzed, including but not limited to:

[5] Every CEQA document must start from a "baseline" assumption. The CEQA "baseline" is the set of environmental conditions against which to compare a project's anticipated impacts. Section 15125(a) of the CEQA Guidelines (14 C.C.R., § 15125(a)) states in pertinent part that a lead agency's environmental review under CEQA:

"…must include a description of the physical environmental conditions in the vicinity of the project, as they exist at the time [environmental analysis] is commenced, from both a local and regional perspective. This environmental setting will normally constitute the baseline physical conditions by which a lead Agency determines whether an impact is significant."

(Gloria Smith—California Nurses Association, October 19, 2010) [93-8 HC]

"2. What new gaps in health care services result from the proposed Project? Such gaps translate into physical environmental impacts, including, but not limited to additional and potentially longer trips by San Franciscan's to obtain service as well as people without adequate health care which can lead to physical environmental problems including demand for additional facilities (e.g., specialized shelters; diversion of public funding from other services; and the like). None of these impacts are addressed in the DEIR."

Gloria Smith—California Nurses Association, October 19, 2010) [93-11 HC]

"4. What are the unmet health care services needs and will these needs be impacted by the proposed Project? If needs remain unmet in the City, impacts to transportation, air quality, greenhouse gas emissions and other impacts increase."

(Gloria Smith—California Nurses Association, October 19, 2010) [93-15 HC]

"These and other questions must be analyzed and addressed in a revised DEIR containing a full description of the existing health care services.

In addition, the City's environmental review of health care project proposals like the CPMC LRDP is occurring piecemeal because the City lacks a Master Plan for health care services. The preparation of a Master Plan is critical to major health care project review, but more importantly to making decisions that will result in meeting existing and future public health care services needs. Without a Master Plan, the environmental review of the proposed Project cannot be complete."

(Gloria Smith—California Nurses Association, October 19, 2010) [93-23 HC]

"Potentially significant impacts associated with the shifts and changes in health care city-wide that would in turn change patient patterns (travel distances, types of trips, etc.), increased impacts on air quality emissions, public services and possibly other health care services (e.g., competition and or the abandonment of the California Street campus could result in loss of other existing services). These impacts are not addressed in the DEIR."

(Gloria Smith—California Nurses Association, October 19, 2010) [93-28 HC]

"Impacts such as whether CPMC will result in a loss of key services to San Francisco residents cannot be analyzed without additional information on both the proposed Project as well as existing health care services."

(Gloria Smith—California Nurses Association, October 19, 2010) [93-40 HC]

"**B. The DEIR Omits Critical Project Setting Information**

CEQA requires that an initial study contain 'an identification of the environmental setting.' Guidelines Section 15063(d)(2). Here, however, the DEIR's Environmental Setting section omits essential information.

Examples of omitted Environmental Setting information that must be included in a revised DEIR are:"

(Gloria Smith—California Nurses Association, October 19, 2010) [93-41 HC]

"A detailed description of San Francisco's existing (and surrounding Bay Area communities, if applicable) health care services including personnel, services, facilities, emergency room admissions and ambulance trips, etc. This complete description of the health care service setting should provide information on any gaps or leakage of San Francisco's health care needs to other communities, accessibility of services, and other basic background information to provide a "baseline conditions" basis for analyzing Project impacts. Without this information, very basic impact analyses cannot be performed (e.g., how far will patients travel for care? What are the transportation, air quality and greenhouse gas emissions impacts of those travel patterns?)."

(Gloria Smith—California Nurses Association, October 19, 2010) [93-42 HC]

"Projected health care services needs for the projected San Francisco population based on changing demographics (e.g., aging population, etc.)."

(Gloria Smith—California Nurses Association, October 19, 2010) [93-45 HC]

"• More detailed information concerning cumulative projects including potential cumulative development at the California campus (based on the General Plan and Zoning /other), and in particular, other health care services projects in the City and immediately adjacent communities (*e.g.,* Southern Marin, Peninsula, inner East Bay)."

(Stephanie Barton, et al—Hastings Civil Justice clinic for the Good Neighbor Coalition, October 19, 2010) [104-68 HC]

"A principal objective of the proposed Health Care Services Master Plan ('HCSMP') is to provide decision makers with sufficient information and appropriate criteria, so that they are able to evaluate specific hospital and other healthcare development proposals in accordance with citywide priorities regarding health services access and distribution. [175] Two of the plan's components are especially instructive.

First, the HCSMP requires a land use assessment. The land use assessment's function is to 'assess the supply, need and demand for medical institutions in the different neighborhoods of the City; the potential effects or land use burdens of locating such services in particular neighborhoods; and the potential for displacement of other neighborhood-serving uses that may occur as a result of the placement of medical institutions.'[176] If this assessment were to be used in reviewing CPMC's LRDP, city officials would be in a much more informed position to evaluate the relative merits for San Francisco of a large 555-bed hospital at Cathedral Hill and a downsized 80-bed St. Luke's Hospital, and the extent to which a new Cathedral Hill Hospital would threaten the continuing viability of St. Francis Hospital.

[175] Proposed Health Care Services Master Plan § 342. This provision is consistent with the San Francisco City Charter, which provides that 'the Department of Public Health and Health Commission shall provide for the preservation, promotion and protection of the physical and mental health of the inhabitants of the City and County of San Francisco.' SF Charter § 4.110.

[176] HCSMP § 342.2."

(Stephanie Barton, et al—Hastings Civil Justice clinic for the Good Neighbor Coalition, October 19, 2010) [104-69 HC].

"Second, the HCSMP requires a gap assessment. The gap assessment's purpose is to 'identify medical service gaps across the City and medically underserved areas for particular services with reference to geography, transportation/communication options, and unique barriers to accessing care, including but not limited to language, race, immigration status, gender identity, substance abuse, and public assistance.'[177] The Cathedral Hill development and changes at St. Luke's will have important effects on healthcare access in two underserved areas. Whether those effects on balance will be good or bad for underserved populations is still a large unknown.

[177] HCSMP § 342.2."

(Stephanie Barton, et al—Hastings Civil Justice clinic for the Good Neighbor Coalition, October 19, 2010) [104-70 HC]

"As articulated in the HCSMP, the City's overarching health care goals include distributing healthcare services across the city equitably and efficiently; eliminating healthcare service gaps and medically underserved areas; and placing medical institutions where they complement the needs and infrastructure of the different neighborhoods while promoting and protecting the public health, safety, convenience and general welfare.[178] These goals resonate with the healthcare objectives of the Commerce and Industry Element and the San Francisco Sustainability Plan. Although the specific terms of the HCSMP are not applicable to the CPMC project, its provisions do offer guidance as to what kinds of inquiries should have been undertaken. A land use assessment and a gap assessment are the kinds of tools the DEIR should have utilized in analyzing the impacts of the LRDP on health care access and distribution. A thoroughly prepared DEIR would have identified and weighed the healthcare access and distribution costs and benefits of CPMC's LRDP. Without such information, San Francisco decision makers are not in a position to determine whether the project taking into account its effects on San Francisco's healthcare delivery system truly outweighs its adverse environmental impacts.

[178] *Id*."

(Iris Biblowitz, October 26, 2010) [115-4 HC]

"We all know the statistics about CPMC/Sutter's higher prices, which reveal a less than sincere commitment to providing for the needs of low-income communities. That's why your work to pressure them to respond to these communities is so important."

(Bernard Chodin, September 23, 2010) [PC-9 HC]

"Thank you. My name is Bernard Chodin and I am with San Francisco Tomorrow, on whose behalf I am speaking. San Francisco Tomorrow firmly believes in the long-term importance of CPMC and major hospital development transcends any short term benefits such as professed job creation. It is incumbent upon the City and developers to demonstrate legal commitment and secured needs before approval of the EIR regarding the following issues: developments context within the overall Master Plan for health care, emergency and disaster needs. To this end, the combined efforts of the City's health providers need to pool resources, ensuring 24/7 acute care is available and evenly distributed for geography and population require them, you cannot make this incumbent solely on CPMC, everybody together."

(Bertie Campbell, September 23, 2010) [PC-14 HC]

"The Long Range Development Plan, as proposed, would have devastating impacts on health care provided to underserved communities located South of Market and devastating environmental impacts on the communities near the proposed monster Cathedral Hill Hospital."

(Sui Kwong, September 23, 2010) [PC-17 HC]

"MS. KWONG: My name is Sui [Kwong]. I come from TNDC. Today I help the senior from the Tenderloin Neighborhood. I hope CPMC can provide, you know, the healthy care for the low income seniors and the families. And I hope CPMC can provide jobs for the San Francisco residents, and I hope CPMC can provide the housing for the low income families, too. Thank you very much."

(Lois Scott, September 23, 2010) [PC-23 HC]

"A big issue in this proposed project is seismic safety, it is driving hospital rebuilding and the standards of safety for patients in the beds. The larger issue is the safety of all of the citizens of San Francisco in an emergency and their access to acute care. The Draft Environmental Impact Report should have the context of a citywide hospital plan, not just the five sites included in the DEIR. Another major issue, and I think you just heard it with the group from the near downtown neighborhoods is the medical needs of the residents, particularly in the near downtown neighborhoods in proximity to the proposed Cathedral Hill site."

(Lois Scott, September 23, 2010) [PC-24 HC]

"It is important not to shut out charitable care and to have only a high-end facility. This should be part of a citywide plan, as well."

(Jessica Weimer, September 23, 2010) [PC-46 HC]

"With the plan that CPMC has, I think this is only going to increase the disparities in health care in San Francisco, it is going to put a burden on the lower income people to try to get access to health care at the Cathedral Hill site. Thank you very much."

(Dina Hilliard, September 23, 2010) [PC-52 HC]

"They expressed four major areas of concern: access to quality health care, increased opportunities for affordable housing, local economic development, and the prioritization of educational and economical opportunities for youth within the Central City. When CPMC presented their Institutional Master Plan to this body, they declared that this development will be a tremendous opportunity and resource for the Tenderloin community."

(Jeff Buckley, September 23, 2010) [PC-69 HC]

"And CPMC can also easily grant health care access to nearby residents. And so, the idea and the concept is one in which CPMC has the choice to make a win-win situation here, and we expect them to do that, and we hold you accountable for doing that, too."

(Clifton Smith, September 23, 2010) [PC-84 HC]

"MR. SMITH: My name is Cliffton Smith and I would just like to say that I support the Good Neighbor Coalition and we need jobs and we need health care."

(Randy Shaw, September 23, 2010) [PC-97 HC]

"The other issue on the health access, which I will let other experts address, is that you can't tell people in the uptown Tenderloin that they can't access a hospital within walking distance, but have to get on our wonderful Muni system and spend four hours getting to S.F. General, back and forth. You can't tell them that."

(Paul Lentz, September 23, 2010) [PC-103 HC]

"1) my question, are we going to allow business to come into the Tenderloin, but not allow us to do business with them? Because, you know, a lot of us are on Medi-Cal, Medi-Care, low income, without any insurance, and I just don't understand how an entity can come in and only serve people basically who live outside the neighborhood."

(Sandra Manning, September 23, 2010) [PC-121 HC]

"So, while CPMC worsens the quality of life for residents like me, it also plans to deny health care services to me and other low income people who live near the planned facility. Does this make sense? Is this in the best interest of me and the neighborhood, residents of the city? I don't think so. So, is CPMC saying that low income Tenderloin residents like me will be denied access only blocks from my home? That is not right."

(Sandra Manning, September 23, 2010) [PC-124 HC]

"CPMC can also grant health services to nearby residents."

(Robert Barhan, September 23, 2010) [PC-154 HC]

"As far as being productive, if they were hired from the same community in which they are building in, and then they're commuting to a hospital benefit, but what is the sense of earning money within the community if you can't go to the hospital in which you have built? You know, so I'm just saying, take close consideration on

everything that they're offering the City in the community before deciding to get and permit in order to go on with the building. Thank you very much."

(Taffy Dollard, September 23, 2010) [PC-182 HC]

"At the California Street campus of CPMC, we primarily serve patients with private medical insurance. At the prior four hospitals where I worked, many of my patients had lower incomes and did not have private medical insurance."

(Commissioner Antonini, September 23, 2010) [PC-350 HC]

"And I think, when you look at the entire system of hospitals throughout San Francisco, which is what a lot of people have asked that we do, and I think it's very important that you look at the entire thing, and I think we're adding a new hospital, the buying off Women's and Children's Hospital Mission Bay, which wasn't mentioned tonight, but that's an important consideration, and will provide services for people geographically on the east side of the city, but for people, particularly women and children throughout the City. So that's important, and we are seeing additions to St. Mary's. So, I think we have to look at the entire picture."

Response HC-7

The comments raise concerns regarding the provision of local access to health care for areas of San Francisco, including the south of Market Street area and the area in proximity to the proposed Cathedral Hill Campus, the provision of integrated health care services throughout the City, the preparation of a study of a citywide health care services needs, impacts related to shifts and changes in citywide health services, environmental impacts on communities near the proposed Cathedral Hill Hospital, the size and scale of the Cathedral Hill Hospital, job opportunities for the community in the vicinity of the Cathedral Hill Campus and for San Francisco residents in general, provision of affordable/low-income housing, "higher prices" for services at CPMC and Sutter Health facilities, and the adequacy of the Draft EIR as a CEQA document and the suggested need for recirculation of the Draft EIR. Each of these concerns is addressed in turn below.

Local Access to Health Care Services

The comments express general concerns that the proposed LRDP "fails to provide local access to health care to many areas of San Francisco" and similar concerns regarding the provision of medical services to low-income and underserved communities within the City. Some of the comments express more specific concerns regarding local access to health care for communities in the south of Market Street area served by the St. Luke's Campus.

Please see Major Response HC-2 (page C&R 3.23-8) regarding the location, size, and scope of services at the proposed Cathedral Hill, St. Luke's, and Davies Campuses and Major Response HC-8 (page C&R 3.23-32) regarding access to health services for a detailed discussion of the distribution of CPMC health care services throughout the city under the proposed LRDP and the provision of local access to health care under the proposed LRDP. As explained in detail in Major Response HC-2, the proposed Cathedral Hill Campus would be centrally located, with respect to the existing California and Pacific Campuses, and would consolidate and relocate acute care, emergency, and other services from the California and Pacific Campuses; neither the St. Luke's nor Davies Campuses would experience reductions of services under the LRDP that would have adverse effects elsewhere. Major Response HC-2 also explains that the Cathedral Hill Campus would be closer than the existing California and Pacific hospitals to the area of San Francisco with the highest residential population density (i.e., the area including the Tenderloin),

including the highest population density of low-income households, seniors (the most frequent users of hospital care), children and youth.[241]

As explained in Major Response HC-2, a report prepared by The Lewin Group concluded that the consolidation of inpatient health care services from the California and Pacific Campuses at the Cathedral Hill Campus location would not create any major access issues from CPMC patients' perspectives.242 Major Response HC-2 also explains that the San Francisco Health Commission Task Force on CPMC's IMP determined that the St. Luke's Replacement Hospital, as planned under the proposed LRDP, would be appropriately sized and programmed as a community hospital, along with outpatient services that would be provided on the St. Luke's Campus, to accommodate existing and projected future patient demand for the south of Market service area.243 Therefore, the proposed LRDP plan for the St. Luke's Campus would not exacerbate any real or perceived health care delivery problems in the south of Market Street area.

As explained in more detail in Major Response HC-2 and in Response HC-2 (page C&R 3.23-52), with the exception of inpatient pediatrics, skilled nursing facilities (SNF), and subacute care, all services currently provided at the St. Luke's Campus are proposed to be maintained or expanded at St. Luke's. Therefore, the proposed LRDP would not result in a major shift of patients currently receiving services at the St. Luke's Campus or other CPMC campuses to other hospitals in the region, as suggested by several of the comments, and would not result in associated impacts on traffic, transportation, parking, air quality, and public services that are not analyzed in the Draft EIR. The Draft EIR included extensive analysis of transportation and circulation issues, as well as impacts related to air quality and public services. These issues were thoroughly examined from the point of view of direct and indirect construction and operational impacts of the LRDP, and the Draft EIR identified mitigation measures to reduce impacts determined to be significant to a less-than-significant level to the extent feasible. Please see Section 4.5, "Transportation and Circulation," Section 4.7, "Air Quality," and Section 4.11, "Public Services" in the Draft EIR. The issue of parking supply and demand is considered by the City of San Francisco to be a social and economic issue, and not a physical environmental issue. Please see Response INTRO-7 (page C&R 3.1-17) regarding the appropriate consideration of social and economic impacts under CEQA.

Comment 90-61 also states that "[t]he newly constructed Cathedral Hill Hospital would only provide 555 beds, exclusively in private single-occupancy rooms, i.e., 188 fewer beds than currently provided by the existing CPMC campuses many of which are in double-occupancy rooms," resulting in reduced access to health care. Please see Major Response HC-1 (page C&R 3.23-1), which explains that although the proposed LRDP would result in a reduction in licensed acute-care beds, it would not reduce the level or capacity of care. This would be largely because of the change from double-occupancy to single-patient rooms, in accordance with current patient standard of care guidelines. Major Response HC-1 further explains that single-patient rooms would allow a more efficient utilization than multi-patient rooms. Please also see HC-7 (page C&R 3.23-74), which explains that the current patient standard of guidelines recommend single-occupancy hospital rooms regardless of patient income level, and that Medicare rules would allow patients receiving Medicare to be placed in single-patient rooms at facilities such as the Cathedral Hill Hospital that have only single-patient rooms.

As explained in detail in Major Response HC-8, there is no difference in medical access policies between any of the CPMC hospitals. All CPMC hospitals are equally open to the receipt of under-insured and uninsured patients and decisions on the granting of financial assistance and waivers are made on a

[241] S.F. Planning Department, 2009 (May), *Draft San Francisco General Plan Recreation and Open Space Element*, page 19, Fig. 2, "High Needs Analysis."
[242] The Lewin Group, 2009 (June 26), *California Pacific Medical Center Institutional Master Plan Review*, p. 34.
[243] San Francisco Health Commission Task Force on CPMC's IMP Addressing Resolution No. 10-09, 2010 (Mar. 2), *Updates and Accomplishments*.

uniform policy basis across all campuses.[244] CPMC's coverage of care for under- and uninsured patients is available to families with incomes up to 400 percent of the federal poverty level, which is a higher level than any other San Francisco hospital organization.[245] Therefore, there is no indication that the proposed LRDP would reduce or fail to provide local access to health care in any particular area of San Francisco. Major Response HC-8 provides additional information regarding CPMC's charity care programs, and access to CPMC health care services within the Tenderloin neighborhood and southeastern areas of San Francisco.

Comment 62-7 erroneously suggests that CPMC has shareholders. As duly constituted, not-for-profit corporations, neither Sutter Health nor Sutter West Bay Hospitals (doing business as CPMC) have shareholders. The proposed LRDP represents an example of the direct reinvestment of profits by Sutter Health and CPMC into the communities in which they deliver care.

Comment 115-4 states that "…CPMC/Sutter's higher prices….reveal a less than sincere commitment to providng for the needs of low-income communities." For a full discussion of the impacts of the proposed LRDP on access to health care for low income patients and other issues related to charity care, please see Major Response HC-8 (page C&R 3.23-32).

Citywide Distribution of Health Care Services and Related Impacts

The comments that the proposed LRDP fails to consider the provision of integrated health care throughout the city and regarding the citywide distribution of health care services raise issues similar to other comments suggesting that the Draft EIR analysis is incomplete without prior completion of a health care services master plan or an equivalent analysis of citywide health care services. Please see Major Response HC-9 (page C&R 3.23-38), regarding a health care master plan for a detailed response to these comments. As explained in Major Response HC-9, Ordinance No. 300-10, effective January 2, 2011 (the Ordinance), directs the preparation of a citywide health care services master plan (Health Care Plan), which is anticipated to be completed by 2013 at the earliest. The recently adopted Ordinance sets out a lengthy and detailed series of requirements and processes, preceding adoption of a Health Care Plan. The Ordinance would not apply until the Health Care Plan was adopted. Furthermore, the Health Care Plan would be subject to its own review under CEQA, before adoption. The Ordinance would apply to applicable changes in medical uses after either January 2, 2013, or formal adoption of the Health Care Plan, whichever would occur later. Therefore, the Ordinance could not apply to proposed changes under the LRDP that are approved before January 2, 2013.

As explained in Major Response HC-9, CEQA does not require the CPMC LRDP EIR to include an analysis of citywide or regional health care service delivery systems, absent evidence that the proposed LRDP would contribute to health care service gaps that would cause a physical effect on the environment, and no such evidence has been provided by the comments. Although some of the comments, such as Comment 93-8 above, appear to be referring to potential gaps in citywide health services because of the LRDP that would create physical environmental effects, the comments did not offer any evidence or support as to the basis of the effects. As further explained in Major Response HC-9, the proposed LRDP would not result in any transfer or displacement of services at other non-CPMC health care facilities that could result in a physical environment effect of the LRDP that is not analyzed in the Draft EIR. Please also see Major Response HC-1 (page C&R 3.23-1) and Major Response HC-2 (page C&R 3.23-8), which explain that the proposed LRDP would provide adequate capacity to meet CPMC's current and projected demand and, therefore, would not contribute to any cumulative impacts (or indirect effects associated with shifts in patients or services).

[244] CPMC, Memorandum from Geoffrey Nelson, Director, EDP, to Brian Boxer (AECOM) re: Access to Healthcare Services (May 13, 2011).

[245] San Francisco Department of Public Health, Healthy San Francisco, *Participant Handbook*, page 13 (updated July 2009). See also CPMC, patient financial assistance application form, dated May 31, 2007.

Please also see Major Response HC-3 (page C&R 3.23-17) regarding potential impacts to other health care services, including impacts related to competition with other health care providers/facilities. As explained in Major Response HC-3, the comments present no substantiating evidence that increased competition would occur or that any shift in patients from one hospital to the other would result in any adverse physical impact to the environment. As further explained in Major Response HC-3, where services are available at a number of hospitals in the City, the key determinant of where patient volume would be directed would be the hospital affiliation of the admitting physician.[246] No evidence has been presented that the proposed LRDP would result in any change to these existing hospital-physician affiliations.

Major Response HC-9 also explains that no further information is necessary regarding the delivery of CPMC health care services systemwide to adequately identify and analyze the environmental impacts of the proposed LRDP. All air quality and traffic impacts associated with the proposed LRDP (including cumulative impacts) were analyzed in the Draft EIR in Sections 4.5 and 4.7. To the extent that changes in CPMC's patient and employee travel patterns (travel distances, types of trips, etc.) would be relevant to the LRDP's direct or indirect environmental impacts (including cumulative impacts), that information has been factored into the analysis in the Draft EIR. As explained in the Draft EIR, page 4.5-72, travel surveys of CPMC personnel, patients, and visitors were conducted to develop origin-destination assumptions for purposes of the transportation analysis. Based on this survey information, trip distribution was assigned for CPMC personnel, patients, and visitors traveling to or from the CPMC campuses from four quadrants (or "Superdistricts") of the city, from the East Bay, South Bay, North Bay, and outside the Bay Area.[247] Table 4.5-12, "Trip Distribution Patterns by Campus" in the Draft EIR, page 4.5-78, indicates the distribution of trips by San Francisco quadrant, as well as by trips originating or ending outside of San Francisco that were assumed for each of the CPMC campuses based on the survey results. The transportation analysis, based on the origin-destination assumptions developed from the travel surveys of CPMC personnel, patients, and visitors, in turn, was utilized to develop the analyses in the Draft EIR of other environmental impacts related to traffic that would be generated by the proposed LRDP (e.g., Noise [Section 4.6], Air Quality [Section 4.7], and Greenhouse Gas Emissions [Section 4.8]. An EIR is not required to further respond to comments speculating on potential impacts that are not supported by substantial evidence in the record.

Comment 90-48 appears to suggest that the Draft EIR should have analyzed "[i]mpacts associated with . . . shifts and changes in health care city-wide." The proposed project is CPMC's LRDP. The Draft EIR was not required to analyze impacts resulting from the health care or business decisions of other health care providers in the city.

Comments 90-48 and 93-23 also suggest that the Draft EIR should have analyzed impacts related to the loss of other existing health care services resulting from CPMC's "abandonment of the California Campus." Similarly, Comment 93-45 requests information concerning cumulative development at the California Campus. The potential for the loss of other existing health care services brought on by potential building abandonment around the California Campus is speculative and unsupported by the evidence in the record. As explained on page 2-132 in the Draft EIR, future uses of the California Campus, after it is sold by CPMC by 2020, are speculative in nature at this time. It is assumed that a prospective purchaser would ultimately seek to renovate and/or redevelop the California Campus; however, the nature, timing, and extent of development are unknown at this time and are, therefore, beyond the scope of the proposed LRDP. Section 15145 of the State CEQA Guidelines states that "[i]f, after thorough investigation, a Lead Agency finds that a particular impact is too speculative for evaluation, the agency should note its conclusion and terminate discussion of the impact." Because future uses and related future employment at the California Campus sites after the sale by CPMC to a

[246] CPMC, 2011 (Apr. 1), Memorandum from Geoffrey Nelson to Brian Boxer (AECOM), re: St. Francis and CPMC Physician Rosters.
[247] Adavant Consulting, 2010 (Jan. 29), *CPMC LRDP Travel Demand Estimation for the San Francisco Campuses*, prepared for the San Francisco Department of Public Works, pages 21 and 39.

subsequent purchaser are too speculative for evaluation, there is no need to provide the information regarding cumulative future development impacts at the California Campus and the potential for the future loss of other existing health care services in the vicinity of the California Campus, as suggested by the comments.

Please see the discussion of urban decay impacts at the California Campus on pages 5-20 to 5-21 of the Draft EIR. As explained on page 5-20, it is anticipated that the 3838 California Street MOB would remain in medical office use, even after the building is sold by CPMC.

Additionally, under the proposed LRDP, CPMC's health care services would be provided in an integrated manner across the CPMC campuses. This is because the proposed LRDP plans for an integrated system of health care that would rely on a central tertiary hospital serving as a "hub" (i.e., the Cathedral Hill Hospital), which would provide, at a single location, a multidisciplinary concentration of care with teams of specialists to provide health care for multi-system diseases, chronic disease management, and higher-level interventional treatments, together with "feeder" hospitals (Davies and St. Luke's), providing a broad range of community hospital services in addition to specialty programs appropriate to those campuses.

Comment 67-4 also expresses concerns regarding the citywide distribution of health care services under the alternatives "evaluated in the proposal." Please note that the alternatives evaluated in the Draft EIR are alternatives to the project sponsor's (CPMC) proposed LRDP and are not part of CPMC's proposal. Please see Response ALT-1 (page C&R 3.22-11) regarding alternatives with a different distribution of health care services than the alternatives analyzed in the Draft EIR.

Comment 93-5 also suggests that the Draft EIR should have included a project objective "to support the health care services system community-wide that affords the highest quality of patient care to all of San Francisco's population," and states that the alternatives to the proposed LRDP analyzed in the Draft EIR were not devised with the success of San Francisco's overall health care services system in mind. Please see Response PD-9 (page C&R 3.2-13) for a response to these and similar comments that suggest the project objectives and alternatives analysis should be expanded to address broader City health care policy objectives. As explained in Response PD-9 (page C&R 3.2-13), CEQA requires that an EIR's project description contain a statement of the objectives sought by the project sponsor, to assist the lead agency in developing a reasonable range of alternatives to evaluate in the EIR.[248] The statement of project objectives should include the underlying purpose of the project.[249] Thus, the project objectives included in the Draft EIR are those of the proposed CPMC LRDP, not citywide health care services-related policy objectives. Please also see Response ALT-1 (page C&R 3.22-11), for a response to additional comments regarding the Draft EIR project objectives and their relationship to the alternatives analyzed in the Draft EIR.

Citywide policy objectives were discussed elsewhere in the Draft EIR (see Draft EIR Chapter 3, "Plans and Policies"), but they would not have been appropriate to discuss as an element of the project sponsor's project objectives and the project description. The project description contained in the Draft EIR states the project objectives of the proposed LRDP, in accordance with CEQA requirements. The project description is not required to include broader objectives that are not specific to the LRDP, as suggested by the comments. CEQA does not require that an EIR substitute citywide health care policy objectives for those of the project sponsor. Similarly, CEQA does not require that an EIR consider alternatives focusing on citywide health care policy objectives rather than on the project objectives of the proposed project.

Comment 93-6 also suggests that the existing health care services serving the San Francisco population should have been analyzed as the environmental baseline condition for the proposed LRDP. Please see

[248] See State CEQA Guidelines, Section 15124(b).
[249] *Ibid*.

Response INTRO-7 (page C&R 3.1-17), regarding the appropriate consideration of social and economic impacts under CEQA. The State CEQA Guidelines establish that the baseline for purposes of the CEQA analysis normally is the physical environmental conditions on site and in the vicinity of the project as they exist at the time the Notice of Preparation of an EIR (NOP) is published (see Section 15125[a] of the State CEQA Guidelines). Existing health care services serving the San Francisco population, other than health care services at the existing CPMC campuses, are not part of the physical environmental conditions on or in the vicinity of the project site and, therefore, were not required to be included in the environmental baseline used in the Draft EIR.

Environmental Impacts on Communities near the Cathedral Hill Hospital, and Scope and Size of the Cathedral Hill Hospital

The comments make general statements regarding "devastating environmental impacts" on communities near the proposed Cathedral Hill Hospital. It is unclear as to what impacts the comments are referring. The comments refer to the "monster" and the "huge and out of scale" Cathedral Hill Campus, so the comments primary concerns could be interpreted as land use and aesthetic impacts. However, the size and scale of the Cathedral Hill Campus would potentially affect virtually every type of environmental impact analyzed in the Draft EIR, as required by CEQA (i.e., a larger building generally has increased impacts related to traffic, air quality, greenhouse gas emissions, aesthetics, utilities, public services, recreation, etc. than a smaller building). Specific environmental impacts for all CEQA Guidelines Appendix G Checklist questions are addressed in the Draft EIR and in this responses to comments document. To the extent the comments are particularly concerned about land use and aesthetic impacts related to the size and scale of the Cathedral Hill Hospital, those impacts are addressed in Draft EIR Section 4.1, "Land Use and Planning" (Draft EIR pages 4.1-46 to 4.1-49, 4.1-55 to 4.1-59, and 4.1-66 to 4.1-67), in Section 4.2, "Aesthetics" (Draft EIR pages 4.2-95 to 4.2-98, 4.2-107 to 4.2-110, 4.2-118 to 4.2-140, and 4.2-192 to 4.2-193) and in the responses to comments regarding land use and aesthetic impacts of the proposed Cathedral Hill Campus development in this C&R document (see C&R Sections 3.3 and 3.4).

Job Opportunities

Please see Response PH-26 (page C&R 3.5-90) for a description of CPMC hiring plan/practices.

Affordable/Low-Income Housing

Please see Responses PH-9, PH-14, and PH-16 (page C&R 3.5-31, 3.5-53, and 3.5-60), which address comments regarding the provision of housing for low-income families.

Adequacy of Draft EIR and Suggestion to Recirculate

The Draft EIR was prepared in accordance with the State CEQA Guidelines. The Draft EIR considers the potential physical environmental impacts of the project. Please see Response INTRO-7 (page C&R 3.1-17), regarding the appropriate consideration of social and economic impacts under CEQA. The Draft EIR identifies mitigation measures that would reduce potentially significant impacts of the proposed LRDP to a less-than-significant level to the extent feasible, and analyzes a reasonable range of alternatives that would avoid or substantially lessen the environmental impacts of the proposed LRDP. As such, the Draft EIR is not fundamentally flawed, inadequate, or conclusory.

Please also see Response INTRO-6 (page C&R 3.1-11), regarding comments stating that the CPMC LRDP Draft EIR is deficient, fundamentally flawed, inadequate, and conclusory, and fails to comply with the CEQA statute and the State CEQA Guidelines, and that the Draft EIR must be redrafted, revised, and recirculated. As explained in Response INTRO-6, these comments appear to misunderstand the specific

requirements under Section 15088.5 of the State CEQA Guidelines that dictate when an EIR must be redrafted, revised, and recirculated for additional public review.

As further explained in Response INTRO-6, there are specific criteria outlining when information included in an EIR, after circulation of the Draft EIR, must be recirculated for public review, and these criteria are articulated in Section 15088.5 of the State CEQA Guidelines. That section states that when "significant new information" is added to an EIR after the Draft EIR public review period, but before certification, that information must be noticed and circulated for public review in the same way as the Draft EIR noticing and circulation is implemented. Such additional noticing and circulation, or "recirculation," is only required when the new information added to an EIR is deemed "significant." Section 15088.5(a) states that:

> New information added to an EIR is not "significant" unless the EIR is changed in a way that deprives the public of a meaningful opportunity to comment upon a substantial adverse environmental effect of the project or a feasible way to mitigate or avoid such an effect (including a feasible project alternative) that the project's proponents have declined to implement.

Section 15088.5(a) of the Guidelines provides examples of what may fall into the definition of "significant new information," including:

> (1) A new significant environmental impact would result from the proposed project or from a new mitigation measure proposed to be implemented;
>
> (2) A substantial increase in the severity of an environmental impact would result unless mitigation measures are adopted that reduce the impact to a level of insignificance;
>
> (3) A feasible project alternative or mitigation measure considerably different from others previously analyzed would clearly lessen the significant environmental impacts of the project, but the project's proponents decline to adopt it; or
>
> (4) The draft EIR was so fundamentally and basically inadequate and conclusory in nature that meaningful public review and comment were precluded.

Additionally, Section 15088.5(b) of the CEQA Guidelines states that recirculation of the EIR is not warranted "where the new information added to the EIR merely clarifies or amplifies or makes insignificant modifications in an adequate EIR."

Although revisions have been made to the Draft EIR within this C&R document, those revisions do not rise to the level of "significant new information." More specifically, no new significant impacts have been identified. An unmitigated substantial increase in the severity of one or more environmental impacts has not been determined to occur. None of the comments have led to the identification of new feasible mitigation measures that would clearly lessen any of the significant environmental impacts of the project, but which the project sponsor (CPMC) has declined to adopt; nor have any new feasible alternatives been identified that would achieve most of the objectives of the project sponsor, while lessening the environmental effects of the proposed project. Finally, although this C&R document provides meaningful responses to all comments raised regarding the Draft EIR, and in doing so provides in-depth additional clarification and information about issues raised by the public, the provision of that information is not indicative that the Draft EIR was fundamentally inadequate or conclusory. Rather, the information provided in this C&R document serves as clarification and, in some cases, as further refinement of environmental information provided in the Draft EIR, identification of additional feasible mitigation measures that the project sponsor has agreed to adopt, and information regarding social and economic issues which are not required to be included in an EIR. Thus, this information does not involve disclosure

of new or substantially more severe significant environmental effects. None of the criteria for recirculation as articulated in Section 15088.5(a) of the State CEQA Guidelines have been met; therefore, recirculation of all or any portion of the Draft EIR is not warranted.

The EIR process is intended to facilitate the objective evaluation of potentially significant direct, indirect, and cumulative physical environmental impacts of a proposed project, and to identify feasible mitigation measures and alternatives that would reduce or avoid the project's significant impacts. In addition, CEQA specifically requires that an EIR identify those adverse impacts determined to be significant after mitigation. The analysis in the Draft EIR identifies the significant impacts and provides feasible mitigation in Chapter 4, "Environmental Setting, Impacts, and Mitigation," and discusses alternatives that would reduce or avoid significant impacts in Chapter 6, "Alternatives."

In response to the statement in Comment 87-2 that the project alternatives analyzed in the Draft EIR fail to mitigate potential impacts on health care services for underserved communities, and thus, additional alternatives need to be developed, CEQA is concerned solely with whether a project may have physical environmental effects. Please see Response INTRO-7 (page C&R 3.1-17) for a detailed discussion regarding the extent to which social and economic issues are considered under CEQA. As explained in Response INTRO-7, CEQA does not require the analysis of a project's social and economic impacts, or in this case, the distribution of health care, unless such health care impacts would in turn indirectly result in physical environmental impacts. Therefore, the analysis of the potential impacts of the proposed LRDP on health care is beyond the scope of CEQA review.

As stated in the Draft EIR, page 6-1, and explained in further detail in Response ALT-1 (page C&R 3.22-11), "Section 15126.6(a) of the State CEQA Guidelines requires analysis of a range of reasonable alternatives to the project, or to the project's location, that would feasibly attain most of the project's basic objectives, but would avoid or substantially lessen any of its significant effects." The analysis of the alternatives in Chapter 6 of the Draft EIR is consistent with CEQA's "rule of reason" which requires that the EIR set forth only those alternatives necessary to permit a reasoned choice, as stated in the State CEQA Guidelines Section 15126.6(f). The environmental impacts of the proposed CPMC LRDP and a reasonable range of project alternatives have been analyzed in the Draft EIR, and this is adequate for CEQA purposes. The social and economic concerns raised by the comment regarding the provision of health care services may be considered by the decision-makers in determining whether or not to approve a project as proposed, or to approve a modified version of the project, but they do not require further analysis as a separate EIR topic or require an additional EIR alternative under CEQA. The environmental impacts of the proposed LRDP and a reasonable range of project alternatives have been analyzed in the Draft EIR.

Comment

(Gloria Smith—California Nurses Association, October 19, 2010) [90-62 HC]

"St. Luke's Hospital provides accessible acute care and inpatient services to the local community consisting of ethnically diverse, predominantly low-income patients from neighborhoods regardless of the patients' economical [sic] class or hospital reimbursement status. The most recent available data for the St. Luke's Hospital indicate that in 74.5% of the inpatient population was covered by Medicare, Medi-Cal, Workers' Compensation, or other government health programs (38.1 % were covered by Medi-Cal, California's public health insurance program which provides needed health care services for low-income individuals including families with children, seniors, persons with disabilities, foster care, pregnant women, and low income people with specific diseases such as tuberculosis, breast cancer or HIV/AIDS[31]), and only 21.3% were covered by private insurance.[32] In contrast, the most recent available data for the Pacific Campus indicate that only 34.3% of the inpatient population was covered by government programs (7.5% by Medi-Cal) and that 63.5% of patients were covered by private insurance.[33]

[31] Medi-Cal is financed equally by the State and federal government.

Response HC-8

The comments refer to background information regarding provision of health care at St. Luke's Hospital and specifically to health insurance/program coverage, and identify differences in the rate of patient coverage of Medicare, Medi-Cal, Workers' Compensation, or other government health programs for past inpatients at St. Luke's compared to similar rates among patients at the Pacific Campus. Please see Major Response HC-8 for a response to this and similar comments regarding impacts of the proposed LRDP on access to health care for uninsured and under-insured patients and other issues related to charity care. Please also see Major Response HC-8 (page C&R 3.23-32) and Response HC-7 (page C&R 3.23-74) regarding CPMC's uniform application of its charity care policy across campuses.

Comments

(Evy Pierce, September 13, 2010) [10-3 HC, duplicate comments were provided in 12-3 HC, 16-3 HC, and 46-3 HC]

"We urge [that] the Planning Dept carefully review CPMC's assertions with unbiased experts in the field of hospital management and health care outcomes, rather than merely accepting CPMC's assertions."

(Ted Weber, Jr., October 12, 2010) [52-4 HC]

"I urge the Planning Department to review CPMC's response to these issues with experts in the field of hospital management rather than simply accepting CPMC's assertions."

Response HC-9

The comments suggest that the Planning Department should review statements made by CPMC (in response to issues raised by the commenters) with unbiased experts in the field of hospital management. The comments reflect a misunderstanding of the San Francisco Planning Department's oversight of the CEQA process for proposed development in the City and the direction of the environmental review process being provided by the State CEQA Guidelines and San Francisco Administrative Code Chapter 31. The Draft EIR was prepared by the Planning Department as the lead agency and reflects the Planning Department's independent judgment and review of all materials in the record, including materials submitted by the project sponsor, CPMC.

As discussed on page 1-3 in the Draft EIR, the purpose of an EIR is to provide decision-makers, public agencies, and the public with an informational document that fully discloses the significant environmental impacts of the project. The EIR process is intended to facilitate the objective evaluation of potentially significant direct, indirect, and cumulative impacts of the project, and to identify feasible mitigation measures and alternatives that would reduce or avoid the project's significant impacts. The EIR does not promote any particular outcome or assume adoption of any specific project. The information in the EIR is intended to be part of the record of information that informs the decision-makers in their consideration of the merits of the project.

Under CEQA, the lead agency is provided with the flexibility to use data from multiple sources, including the project sponsor. The following are pertinent portions of State CEQA Guidelines Section 15084:

> (b) The Lead Agency may require the project applicant to supply data and information both to determine whether the project may have a significant effect on the environment and to assist the Lead Agency in preparing the draft EIR.
>
> (c) Any person, including the applicant, may submit information or comments to the Lead Agency to assist in the preparation of the draft EIR. The submittal may be presented in any format, including the form of a draft EIR. The Lead Agency must consider all information and comments received. The information or comments may be included in the draft EIR in whole or in part.
>
> (e) Before using a draft prepared by another person, the Lead Agency shall subject the draft to the agency's own review and analysis. The draft EIR which is sent out for public review must reflect the independent judgment of the Lead Agency.

In reviewing the proposed LRDP and responding to the comments in the Draft EIR, the Planning Department has considered the conclusions of several unbiased experts in the health care field. The proposed LRDP would implement the 20-year planning provisions of the project sponsor's (CPMC's) 2008 Institutional Master Plan (IMP).[250] As required by Section 304.5 of the Planning Code, the IMP underwent a review process by the San Francisco Department of Public Health (DPH) and the San Francisco Health Commission, as well as the Planning Commission. On July 21, 2009, these City departments accepted the IMP as being consistent with City requirements for IMPs. Under the Planning Code, the IMP was required to, among other things, provide the Planning Commission, community and neighborhood organizations, other public and private agencies, the general public, and other institutions with information to help guide those entities' decisions regarding the use of, and investment in, land in the vicinity of the institution, provision of public services, and particularly the planning of similar institutions to ensure that costly duplication of facilities would not occur.[251] As required by the Planning Code, the DPH reviewed the IMP and the relationship of the institution's (CPMC's) facilities covered

[250] Draft EIR, page 2-1.
[251] San Francisco Planning Code Sec. 304.5(a)(3).

under the IMP to citywide health care needs. This was completed before the Planning Commission accepted the IMP.

As part of the IMP review process, The Lewin Group was selected by DPH to evaluate the IMP on its behalf. The Lewin Group is a reputed health care consulting firm with over two decades of experience in the design, implementation, and evaluation of health programs and policies, with a particular focus on providing consulting services to federal, state, and local governments.[252] The City of San Francisco has directly contracted with The Lewin Group to provide research, data, input, and expert recommendations on some of the City's most important health care planning issues, in addition to CPMC's IMP. These include:

- the DPH Long Range Service Delivery Planning Project, 2002–2003;
- the 2007–2008 local health care market assessment (in support of DPH program improvements, San Francisco General Hospital rebuild), also known as "the benchmarking analysis";
- Healthy San Francisco; and
- review and analysis of the St. Francis Memorial Hospital Institutional Master Plan (2009).[253]

As part of its review of CPMC's IMP, The Lewin Group conducted interviews with multiple citywide stakeholders including advocacy groups, academic institutions, labor, payers, community groups, and hospital CEOs, and provided unbiased, third-party analysis of CPMC's plans related to bed planning, the Blue Ribbon Panel findings related to the St. Luke's Campus, health care services, pricing, charity care, emergency preparedness, capacity, utilization, training, and education. The Lewin Report, cited in the CPMC LRDP Draft EIR and Responses to Comments, was the final document prepared by The Lewin Group on behalf of DPH in its review of CPMC's IMP.

CPMC's proposal for the St. Luke's Campus underwent extensive additional review by experts in the health care field. During 2008, City of San Francisco Supervisor Michela Alioto-Pier, former Department of Public Health Director Mitch Katz, and CPMC CEO Martin Brotman, MD convened a "Blue Ribbon Panel" of leaders in health, business, labor, and the community to develop a plan for providing health care services at the St. Luke's Campus in conjunction with CPMC's IMP. The Blue Ribbon Panel was chaired by Bishop Marc Andrus of the California Episcopal Diocese and Dr. Stephen Shortell, Dean of the University of California, Berkeley School of Public Health.[254]

[254] The Camden Group, 2009 (Apr. 28), *San Francisco Blue Ribbon Panel: Utilization Projections and Assumptions for St. Luke's Campus,* page 3. Other members of the Blue Ribbon Panel included Supervisor Michela Alioto-Pier; Damian Augustyn, M.D., CPMC Chief of Medical Staff; Kenneth Barnes, M.D., Savestlukes.org; Kevin Barnett, Dr PH, MCPA, Senior Investigator Public Health Institute; Dan Bernal, District Director for Congresswoman Nancy Pelosi, Speaker of the House; Edward Chow, M.D., Chinese Community Health Plan and San Francisco Health Commissioner; Catherine Dodd, RN, PhD, Deputy Chief of Staff, Mayor Gavin Newsom's Office; Ann Eng, Senior Organizer, Bay Area Organizing Committee; Steve Falk, President & CEO, San Francisco Chamber of Commerce; Cheryl Fama, Executive Director, Peninsula Health Care District; Jean Fraser Esq., Chief of San Mateo County Health System, Former CEO of San Francisco Health Plan; Louis Giraudo, Esq., Cofounder and Principal, GESD Capital

In support of the Blue Ribbon Panel's work, Dr. Shortell sought the assistance of an independent, consultant, The Camden Group, in gathering, analyzing, and providing relevant data. The Camden Group functioned as a data analysis group, providing information to Dr. Shortell and panel members, in advance of several Blue Ribbon Panel meetings. In addition, The Camden Group participated in five meetings, including Blue Ribbon Panel meetings, made a presentation on the relevant characteristics of and trends specific to the south of Market Street area served by the St. Luke's Campus, and prepared utilization projections specific to the St. Luke's Campus.[255]

Responsibilities of The Camden Group included:

- Identification, analysis, and interpretation of the implications of key trends specific to the south of Market population, demographics, rates of incidence and injuries, competitor activity (non-project and for profit), payer mix, and retail health care (e.g., Minute Clinic)
- Assessment of the impact on south of Market of regional and national trends specific to reimbursement, work force availability, regulatory activity, and the evolution of clinical technology and practice
- Identification, analysis, and interpretation of historical St. Luke's Campus-specific patterns of inpatient and (pending data availability) outpatient utilization, as well as variation of utilization by day and hour of the day for selected services (e.g., Emergency Department)
- Projection of 2008–2030 inpatient and outpatient care utilization by major service lines for the area served by the St. Luke's Campus and the St. Luke's Hospital's portion of the total; conversion of inpatient utilization by service line to average daily census by bed type; projection of resource requirements (e.g., operating rooms, special procedure rooms, Emergency Department stations, major pieces of imaging equipment) needed to meet the activity level
- Identification of the resource capacity available in the service area (e.g., beds by type, operating rooms, Emergency Department stations) and the ability of other providers to absorb the St. Luke's Campus activity level if that campus reduced its scope of care or closed
- Identification of medical staff needs by specialty for St. Luke's Hospital's service area[256]

In addition to the IMP and Blue Ribbon Panel review processes, the San Francisco Health Commission established a Task Force to ensure that the proposed LRDP would respond to the Health Commission's recommendations made on approval of the IMP. The Task Force was staffed by the vice president of the San Francisco Health Commission and one of its sitting members: Sonja Malara, MSW and Steven Tierney, Ed.D.[257] The Task Force has since published two updates, concerning the implementation of the

[257] Biographies are available on the San Francisco Department of Health Web site, at http://www.sfdph.org/dph/files/hc/HlthCommBios10212008.pdf (accessed Dec. 19, 2010).

Health Commission and Blue Ribbon Task Force recommendations related to the IMP and the St. Luke's Campus.[258]

The IMP, The Lewin Group Report, the Blue Ribbon Panel recommendations, the Camden Group studies, Health Care Commission Resolution No. 10-09, and the Health Commission Task Force reports are all included in the proposed LRDP record and were reviewed by the Planning Department during its preparation of this C&R document. In light of the City's review of the IMP, the implementation of the Blue Ribbon Panel recommendations, and the Task Force's Updates of Accomplishments, a sufficient informational basis and context exist in the record for the Planning Department to exercise independent judgment regarding information provided by the project sponsor (CPMC) to help analyze the potential significant environmental effects of the proposed LRDP.

Please see Major Response HC-2 (page C&R 3.23-8) regarding the location, size, and scope of services at the proposed Cathedral Hill, St. Luke's, and Davies Campuses, for more detail regarding the IMP process and the information contained in The Lewin Report, and for specific information regarding the recommendations and conclusions of the Blue Ribbon Panel, Health Commission and Health Commission Task Force, and The Camden Group studies with respect to the size and scope of services at the St. Luke's Campus.

In addition, the State of California's Office of Statewide Health Planning and Development (OSHPD) is responsible for overseeing all aspects of hospital design and construction in California for general acute-care hospitals and intermediate care hospitals. As noted in the Draft EIR, pages 2-12, 2-43, 2-141, and 2-187, the proposed hospitals under the CPMC LRDP would be subject to OSHPD regulations, review, and approval of building permits.

Comment

(Bernard Choden, September 20, 2010) [13-1 HC, duplicate comments were provided in 14-1 HC and 38-1 HC and PC-9 HC]

"[San Francisco Tomorrow firmly believes that] the long term importance of CPMC and major hospital development transcends short term benefits, such as professed job creation or political deal-making. It is incumbent upon the city and the developer to demonstrate legal commitment and secured means before approval of the DEIR regarding the following issues:

The development's context within an overall Master Plan for health care, emergency and disaster relief: To this end, the combined efforts of all the city's health providers need to pool sustainable resources, assuring 24/7 acute care is available and evenly distributed where geography and population most require them."

Response HC-10

The comment raises concerns regarding the development's context within an overall, presumably citywide, master plan for health care, emergency, and disaster relief; the availability of acute-care services on a 24-hour, 7-day-a-week basis; and the even distribution of health care resources "where geography and population most require them." The comment is noted. This comment does not raise issues regarding the adequacy, accuracy, or completeness of the Draft EIR. The comment will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project.

Comments regarding a health care master plan are addressed in detail in Major Response HC-9 (page C&R 3.23-38). As explained in Major Response HC-9, CEQA does not require the CPMC LRDP EIR to

[258] San Francisco Health Commission Task Force on CPMC's IMP Addressing Resolution No. 10-09, 2010 (Mar. 2), *Updates and Accomplishments*; CPMC, 2010 (Sept. 30), *Interim Report to the San Francisco Health Commission Regarding Progress Toward Commission Recommendation in Resolution No. 10-09*.

include an analysis of citywide or regional health care service delivery systems, absent evidence that the proposed LRDP would contribute to health care service gaps that would cause a physical effect on the environment, and no such evidence has been provided by the comments. As further explained in Major Response HC-9, the proposed LRDP would not result in any transfer or displacement of services at other non-CPMC health care facilities that could result in a physical environment effect of the LRDP that is not analyzed in the Draft EIR. Major Response HC-9 also explains that no further information is necessary regarding the delivery of health care services systemwide to adequately identify and analyze the environmental impacts of the LRDP.

Please also see Major Response HC-5 (page C&R 3.23-20), which explains that the proposed LRDP would not result in inadequate emergency capacity for residents in the southeastern portion of San Francisco, and Response HC-9, which describes the Planning Department's consideration of the conclusions of several experts in the health care field in the evaluation of the proposed distribution of health care services under the proposed LRDP as part of the review process for CPMC's 2008 Institutional Master Plan, the formulation of the Blue Ribbon Panel's findings related to the St. Luke's Campus, and San Francisco Helath Commission Task Force findings related to the proposed LRDP.

Under the proposed LRDP, acute-care inpatient services at the Cathedral Hill, Davies, and St. Luke's Campuses including, but not limited to, emergency services, would be available on a 24-hour, 7-day-a-week basis.

Please also see Major Response HC-8 (page C&R 3.23-32) regarding access to health services for a detailed discussion of the distribution of CPMC health care services throughout the city under the proposed LRDP and the provision of local access to health care under the proposed LRDP. As explained in detail in Major Response HC-2, the proposed Cathedral Hill Campus would be centrally located with respect to the existing California and Pacific Campuses and would consolidate and relocate acute care, emergency, and other services from the California and Pacific Campuses, and neither the St. Luke's nor Davies Campuses would experience reductions of services that would have adverse effects elsewhere. Major Response HC-2 also explains that the proposed Cathedral Hill Campus would be closer than the existing California and Pacific hospitals to the area of San Francisco with the highest residential population density (i.e., the area including the Tenderloin), including the highest population density of low-income households, seniors (the most frequent users of hospital care), children and youth.[259] Therefore, the proposed LRDP would not distribute health care services in a manner that is unevenly distributed in terms of geographical or demographic need.

Comments

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-2 HC, duplicate comments were provided in 30-2 HC]

"2. On Page 2-7 of the DEIR, one of the 'Core Medical Services Objectives' is stated as 'Meet the existing and future projected acute-care and outpatient needs of CPMC's patients, with appropriate physician specialties, including specialized services that are provided by a limited number of service providers in the Bay area, and, in some cases, Northern California.' The existing acute-care needs of all campuses of CPMC for the year 2010 totaled 849 beds. The new Cathedral Hill Hospital will have 750 beds for acute care, a decrease of 99 beds or decrease from the year 2010 by about 12% at full build-out. Skilled nursing at St. Luke's in 2010 has 79 beds and none will be for skilled nursing under the LRDP but 80 beds will exist for acute-care only. The total number of beds decreases from the 2010 level of 1,032 beds to 854 beds in the overall LRDP. That is an overall decrease from the 2010 level by a little over 17% although an increase in total bedcount from existing levels. If it is to meet

[259] S.F. Planning Department, 2009 (May), *Draft San Francisco General Plan Recreation and Open Space Element*, p. 19, Fig. 2, "High Needs Analysis." The proposed Cathedral Hill Hospital would be located only about a half-mile from the existing Pacific Hospital and would actually be further away from the existing Kaiser Hospital than the existing hospital.

the projected needs, somehow I see this as going the wrong way. The number of staffed beds (e.g., skilled nursing) vs. licensed beds is not clear in this DEIR and how many skilled nursing positions will be really needed at this hospital upon completion. Licensed beds, I understand, could be used for other purposes like storage. After the Lewin Group did their review on June 26, 2009 in their 'CPMC Institutional Master Plan Review' prepared for the San Francisco Department of Public Health, what is the number of staffed beds that will be provided (e.g., skilled nursing beds) and how many licensed beds will there be at each campus? I am still unclear on these numbers and knowing this may also affect the total number of FTEs proposed at CPMC in total."

(Rose Hillson—Jordan Park Improvement Association, September 23, 2010) [37-2 HC]

"Projection of FTEs based on licensed beds or staffed beds?"

Response HC-11

The comment states that the "existing acute-care needs of all campuses of CPMC for the year 2010 totaled 849 beds. The new Cathedral Hill Hospital will have 750 beds for acute care, a decrease of 99 beds or decrease from the year 2010 by about 12 percent at full buildout." This statement appears to misunderstand Table 2-2, "CPMC Existing and Proposed LRDP Licensed Hospital Bed Uses," on page 2-10 of the Draft EIR. Table 2-2 indicated that in 2010, there were 849 licensed acute-care beds within the existing CPMC campuses. However, the number of licensed acute-care beds is not the equivalent of the *need* for acute-care beds. As explained in more detail in Major Response HC-1 (page C&R 3.23-1), regarding the supply of acute-care beds under the proposed LRDP, existing demand or need for beds within the CPMC campuses is substantially less than the number of beds that are currently licensed at CPMC facilities. For example, OSHPD indicates that the average daily census (actual patients in licensed beds) for all of CPMC in 2009 was 559; an occupancy rate of 48 percent for licensed beds (of the 1274 total beds) systemwide.[260] In 2010, CPMC's observed maximum systemwide census was 656, an occupancy rate of 56 percent.[261] These low occupancy rates reflect a past industry practice of retaining licensed acute-care bed capacity beyond what the actual demand required. In addition, according to Table 2-2 in the Draft EIR, 750 would be the total number of licensed acute-care beds within all CPMC campuses, not at the proposed Cathedral Hill Hospital, which would include 555 of the 750 total acute-care beds.

Since the publication of the Draft EIR, Table 2-2 has been updated, as shown in Chapter 4, "Draft EIR Text Changes" of this C&R document. As shown in the updated version of Table 2-2, a total of 890 (rather than 849) licensed acute-care beds existed at the CPMC campuses in 2010, and the proposed LRDP would reduce this total to 698 (rather than 750), 555 of which would be provided at the proposed Cathedral Hill Hospital. Please also see Response PD-6 (page C&R 3.2-6) concerning text revisions to Table 2-2 (in the Draft EIR, page 2-10) for licensed beds under the proposed LRDP, as provided in this C&R document. The revisions to Draft EIR Table 2-2 do not result in any changes to the total number of full-time equivalent (FTE) employees at CPMC under the proposed LRDP, as shown in Table 4.3-10 in the Draft EIR, page 4.3-16.

The comment also states that "[t]he total number of beds decreases from the 2010 level of 1,032 beds to 854 beds in the overall LRDP." As per the updated version of Table 2-2, the total number of beds within the CPMC campuses would decrease from the 2010 level of 1,174 (rather than 1,032) beds to a total of 903 beds (rather than 854 beds, as the comment stated) under the proposed LRDP.

The comment expresses concerns that the decrease in total bed count from existing levels is "going the wrong way" in terms of addressing projected needs. Please see Major Response HC-1 (page C&R 3.23-1)

[260] OSHPD, ALIRTS, Annual Utilization Reports for California Pacific Med Ctr-Pacific Campus, 2009, California Pacific Med Ctr-California West, 2009, California Pacific Med Ctr-California East, 2009, California Pacific Med Ctr-Davies Campus, 2009, and California Pacific Med Ctr-St. Lukes Campus, 2009, available at http://www.alirts.oshpd.ca.gov, accessed Apr. 6, 2011.

[261] CPMC, 2010 (Apr. 5), Memorandum from Malia Weinberg to Geoffrey Nelson re: CPMC's maximum census in 2010.

regarding the supply of licensed acute-care beds under the proposed LRDP, which explains that the supply of 698 acute-care beds would be more than sufficient to meet the existing demand (average daily census of 559 acute-care beds occupied in 2009) and accommodate future growth in demand at CPMC facilities systemwide. Please see Major Response HC-2 (page C&R 3.23-8), which responds to comments regarding the size and scope of services at the CPMC campuses under the proposed LRDP. Please also see Major Response HC-4 (page C&R 3.23-19), which explains that the proposed total of 18 licensed psychiatric beds (all at the Pacific Campus) under the LRDP would be adequate to respond to the demand for CPMC beds, based on the past demand census (average daily census of 10.6 for psychiatric beds in 2009.[262]

Please also see Major Response HC-6 (page C&R 3.23-25), regarding skilled nursing facilities (SNF), which explains that CPMC has committed to maintain 100 SNF beds to meet its actual demand.[263] As further explained in Major Response HC-6, CPMC would maintain 38 SNF beds at the Davies Campus under the proposed LRDP, and the text revisions in this C&R document CPMC's plans to maintain capacity to serve its existing patient needs by providing a total of at least 100 SNF beds, including 38 beds currently located at the Davies Campus and adding 62 new SNF beds at other on- or off-campus locations (yet to be determined).[264] CPMC has also committed that no existing community-based beds would be utilized to provide the additional 62 SNF beds because of the existing shortage of SNF beds in the community.[265] As explained in Major Response HC-6, the Draft EIR, text revisions shown in Chapter 4 of this C&R document have been made to Table 2-2, "CPMC Existing and Proposed LRDP Licensed Hospital Bed Uses" in the Draft EIR, page 2-10 (see also Response PD-6, page C&R 3.2-6), to clarify CPMC's commitment to continue maintenance of 101 licensed SNF beds at the California Campus, unless and until CPMC identifies another plan for providing the 62 SNF beds (in addition to the 38 SNF beds that would continue to be maintained at the Davies Campus under the LRDP) necessary for CPMC to meet its commitment to provide a total of 100 SNF beds systemwide.

The comment also states that "[t]he number of staffed beds (e.g., skilled nursing) vs. licensed beds is not clear in this DEIR and how many skilled nursing positions will be really needed at this hospital upon completion." The words "this hospital" in the comment appear to be intended as a reference to the St. Luke's Replacement Hospital. As Table 2-2 in the Draft EIR (and as revised in the text revisions shown in Chapter 4 of this C&R document) makes clear, no licensed (and therefore no staffed) SNF beds would be provided at the St. Luke's Replacement Hospital under the proposed LRDP. As explained in detail in Major Response HC-1, because of the shift from multi-patient to single-patient rooms under the proposed LRDP, licensed beds would be more effectively utilized (occupancy rates are expected to be approximately 80 percent for acute-care beds, 88 percent for rehabilitation beds, 85 percent for psychiatric beds, and 94 percent for SNF beds).[266] There would be some variation in staffing on any given day, as staffing is adjusted based on average daily census and acuity of patient conditions (the higher the acuity of patients, the more nurses are necessary). Under the proposed LRDP, CPMC would provide sufficient staff to maintain a census of 100 occupied SNF beds systemwide.

The comment also requested information on how many staffed and licensed beds would be provided at each campus under the proposed LRDP. As explained above, all licensed beds would effectively be

staffed under the proposed LRDP. Please see the revised version of Table 2-2, "CPMC Existing and Proposed LRDP Licensed Hospital Bed Uses", in the Draft EIR text revisions in Chapter 4 of this C&R document for corrected totals of beds per campus. As shown in the updated version of Table 2-2 in the Draft EIR text revisions, the proposed LRDP would provide a total of 555 beds at the Cathedral Hill Campus (all of which would be acute-care beds), 18 beds at the Pacific Campus (all of which would be psychiatric beds), 101 beds at the California Campus (all of which would be SNF beds, which would remain licensed, unless and until an alternative plan for fulfilling CPMC's 100-bed commitment is identified), 149 beds at the Davies Campus (63 acute-care beds, 48 rehabilitation beds, and 38 SNF beds), and 80 beds (all acute care) at the St. Luke's Campus.

Comments

(Bobbi Lopez—La Voz Latina, September 23, 2010) [20-2 HC]

"Upon hearing about the meeting, we decided to survey our members. These are the results of the survey that may explain what families are thinking:

Twenty-six La Voz families took the survey on September 17, 2010 at a general meeting. Twenty live in the Tenderloin (mostly along Geary, O'Farrell, and Eddy) while the others reside along Franklin street near the proposed project. 88% of the respondents have either medi-cal, healthy kids or a combination of both and most go to General Hospital. Only three members surveyed have gone to St. Luke's. Of our members surveyed, 39% have gone to community clinics, mostly St. Anthony's to meet their medical needs. Of the La Voz members surveyed, 61% would like to see a neighborhood hospital to predominantly serves the needs of the children ;while 57% would like to see an emergency room; and 77% would like to see dental services available to adults."

(Bobbi Lopez—La Voz Latina, September 23, 2010) [20-4 HC]

"Families are concerned about the three following things; the (1) lack of access to services by those that are on healthy kids or medi-cal, which is the majority of the neighborhood; (2) the impact of traffic on public safety; and the (3) contamination created by said traffic impacts. We ask that you postpone this project until such issues are resolved and we allow for a more meaningful community process."

(Sister Elaine Jones, September 23, 2010) [PC-30 HC]

"If somebody wants to get to the hospital and they don't have a way to get there except within an ambulance, and that costs money for us. It just really don't make sense. And I want to ask you guys to look at the common sense of this whole thing, it doesn't benefit anybody but the rich."

(Sister Elaine Jones, September 23, 2010) [PC-31 HC]

"And I'm sorry, that's the way I feel because I have suffered with mental illness, they're not going to accept me into that hospital. I'm going to end up having to go all the way to San Francisco General Hospital because I am poor, and it's not benefitting me, so why do I want this? Look into it. Look deep into this because it's going to impact more seniors than anybody else, and I'm sick of them picking on the seniors. Thank you."

(Jeff Buckley, September 23, 2010) [PC-65 HC]

"The second is that, you know, I find it profoundly disturbing that they would build a facility here, outside of the Tenderloin and really deny medical access to the residents who live there and, in the mean time, create a speedway for those outside the neighborhood to be able to have the quickest access to the facility. And what we are seeing, really, is that when you exclude the Tenderloin residents, there are many of us who are trying to make this a better neighborhood, a more livable neighborhood for the residents who are there, and for the businesses who work there, and there are many excellent businesses, as well, that I think many times are forgotten."

(Margarita Mena, September 23, 2010) [PC-114 HC]

"I am also concerned because it has not been clear to me whether this hospital is going to take care of the families in the neighborhood, which are mostly on healthy kids. So what I just wanted to say, obviously this project affects a lot of people and that worries me."

(Maria [through translator, no last name given], September 23, 2010) [PC-116 HC]

"I am really concerned about the fact that this hospital might not help low income families, and particularly the families that I know will be affected how have Medi-Cal or Healthy Kids."

(Maria [through translator, no last name given], September 23, 2010) [PC-119 HC]

"And are they really going to get the medical services? And is everyone going to have access to medical services from the Tenderloin from this hospital?"

(Mike Williams, September 23, 2010) [PC-139 HC]

"I think they have a responsibility in coming to this neighborhood, and also to take insurance from, you know, like Medi-Cal, Medi-Care, whatever, that people have, we have a lot of seniors here, we have an aging population, as you all well know, and I think that they should all be considered in this plan as they go forward. Thank you."

(Denise Rowe, September 23, 2010) [PC-143 HC]

"Discrimination in hiring is wrong and discrimination in providing health care is wrong, too. When I hear about the proposed luxury care hospital at Cathedral Hill, I get worried. None of it sounds accessible to me. I am a long time Medi-Cal, a recent Medi-Care patient. What guarantees do I have that Cathedral Hill doctors will see me? So far, none."

(Barbara [last name unknown], September 23, 2010) [PC-268 HC]

"Eighty percent of the respondents that I talked to had either Medi-Cal or Healthy Kids. So, for me, it's really disconcerting to see the build of a hospital where 88 percent of our families might not have access to it. Another thing to really share is that a lot of our families go to General Hospital, they also go to community clinics. When I asked what kind of hospital they'd like to see in the neighborhood, most of them said, obviously, a hospital that serves the needs of the children, emergency rooms, and dental services was a huge thing."

Response HC-12

The comments state that 88 percent of La Voz member families who responded to a survey indicated that they have either Medi-Cal or Healthy Kids or a combination of the two. When read in context as part of the rest of Comment Letter 20, it is clear that the survey referred to in the comments was a survey regarding the proposed Cathedral Hill Campus. The comments state that 61 percent of the survey respondents indicated that they would like to see a neighborhood hospital that predominately serves the needs of children, 57 percent would like to see an emergency room, and 77 percent would like to see dental services available to adults. Additionally, Comment PC-30, when viewed in context with the rest of the oral testimony at the September 23, 2010, Planning Commission hearing regarding the Draft EIR, appears to be a comment regarding access to the proposed Cathedral Hill Hospital for residents of the neighboring communities, such as the Tenderloin area, and benefits of the proposed LRDP to persons other than "the rich."

Although the proposed Cathedral Hill Hospital would provide tertiary, specialized medical services to patients referred from other CPMC community hospitals at the Davies and St. Luke's Campuses, the Cathedral Hill Hospital itself would also operate as a full-service, community hospital. Therefore, it would provide similar services to members of the surrounding community as would a typical community hospital (or "neighborhood hospital" as referred to in the comments). The proposed Cathedral Hill

Hospital would include a women's and children's center with a full range of inpatient pediatrics programs, as well as an Emergency Department that would include a dedicated treatment area for pediatric care, as well as general care, critical care and triage, and a secured psychiatric area. As explained in Major Response HC-5 (page C&R 3.23-20), the Emergency Department at the proposed Cathedral Hill Campus would have 32 treatment stations and would be able to serve about 64,000 visits per year. Therefore, the Cathedral Hill Campus would provide all the services of a "neighborhood" or community hospital, would serve the needs of children, and would include an emergency room, in keeping with the desires of the survey respondents referenced in the comment. However, CPMC is not a provider of dental services (which in general are rarely provided in a hospital setting) and, therefore, the proposed LRDP would not include adult dental services.

The comments also express concerns regarding lack of access to health care services for persons utilizing Medi-Cal and/or Healthy Kids. Please see Major Response HC-8 (page C&R 3.23-32) for a detailed response to comments received regarding access to health services, including access to services by patients that are on Healthy Kids and/or Medi-Cal, and/or are Tenderloin area residents. The following additional information is provided regarding CPMC's provision of services to Healthy Kids patients.

Healthy Kids functions as an extension of the San Francisco Health Plan (Healthy San Francisco) to children through age 18. Healthy Kids covers children who are:

- Uninsured and under 18 years of age
- San Francisco residents, US citizens, nationals, eligible qualified immigrants, or undocumented immigrants
- Not eligible for no-cost, full-scope Medi-Cal or the Healthy Families Program
- Within the income guidelines[267]

Please note that the September 17, 2010, survey form which was submitted as an attachment to Comment Letter 20 provided several choices among insurance types, including "Healthy Kids and Emergency." Therefore, it is impossible to distinguish from this survey whether the number of respondents choosing this option solely use Healthy Kids, solely seek care at an emergency room, or use some combination of both.

CPMC provides direct service to Healthy Kids patients through:

- The pediatrics clinic at the Family Health Center (currently at the California Campus, and to be relocated to the proposed Cathedral Hill Campus under the LRDP).
- St. Luke's Health Care Center (existing and to remain under the LRDP)
- Bayview Child Health Center – (existing and to continue)[268]

Beyond direct care delivery through the clinics above, a wide array of primary care and specialty physicians are available to Healthy San Francisco/Healthy Kids patients.[269] Two of the six provider

[267] San Francisco Health Plan, Healthy Kids, http://www.sfhp.org/visitors/programs/healthy_kids/do_i_qualify.aspx, accessed Feb. 4, 2011.

[268] CPMC, Memorandum from Geoffrey Nelson, Director, EDP, to Brian Boxer (AECOM) re: Access to Healthcare Services (May 13, 2011); see also CPMC, *2008 Report: CPMC Community Benefit Strategy, Programs & Impact*; CPMC, *Report to the Community 2009*.

[269] CPMC, Memorandum from Geoffrey Nelson, Director, EDP, to Brian Boxer (AECOM) re: Access to Healthcare Services (May 13, 2011).

groups offered to Healthy Kids patients are Brown & Toland and North East Medical Services (NEMS), both of which are affiliated with CPMC.[270]

With respect to the comment that the proposed LRDP "doesn't benefit anybody but the rich," please also see Major Response HC-8 (page C&R 3.23-32), regarding access to health services, which includes a discussion of charity care contributions provided by CPMC. San Francisco Health Commission Resolution 02-10, approved on March 16, 2010, memorialized CPMC's commitment to increase it charity care contributions by 79 percent in a 5-year period, from approximately $5,315,000 in 2007 to $9,500,000 by 2010.[271] As explained in Major Response HC-8, according to the latest reporting by CPMC in 2009, CPMC provided over $80 million in services for the poor and underserved.[272] The 2009 report on community benefits shows an increase in traditional charity[273] care, from $7,584,000 in 2008 to $10,215,000 in 2009. Traditional charity care at CPMC for 2007 was approximately $5,300,000.[274] From 2007 to 2008, traditional charity care increased approximately 31 percent, and from 2008 to 2009, an additional increase of 35 percent in charity care occurred.[275] Preliminary reporting of 2010 total charity care provided by CPMC is approximately $14.9 million, an approximately $4.7 million increase over the 2009 total of approximately $10.2 million, representing an approximately 46 percent increase from 2009 to 2010.[276]

Major Response HC-8 also provides additional information regarding CPMC's commitments related to Medi-Cal patient access and CPMC's partnerships in delivering low- or no-cost care to the medically underserved. CPMC hospitals and the CPMC physicians employed by Sutter Pacific Medical Foundation and the St. Luke's HealthCare Center do at present, and will continue under the proposed LRDP, to accept Medi-Cal patients.

As explained in Major Response HC-8 (page C&R 3.23-32), the financial makeup of the patient population of a particular hospital is a combination of location, private physician ability or preference for a particular insurance type, historical admitting patterns, and other factors not analyzed in the Draft EIR. CPMC has limited control over many of these factors but does have control over 1) whether or not CPMC hospitals accept Medi-Cal for hospital charges, and 2) whether or not its clinics, staffed with CPMC physicians (e.g., at the approximately 15 San Francisco Sutter Pacific Medical Foundation Clinics[277] and the St. Luke's Healthcare Center) accept Medi-Cal. As part of its commitments to the Health Commission, CPMC promised to 1) continue to accept Medi-Cal, as it always has, at all of its hospitals, 2) guarantee access to Medi-Cal patients through all of the clinics controlled by CPMC as described above, and 3) increase the amount of unpaid Medi-Cal shortfall systemwide by 22 percent over a 5-year period, from $53,369,000 in 2007 to $65,000,000 by 2012.[278] Additionally, San Francisco Health Commission Resolution 02-10 memorialized CPMC's agreement to increase its amount of Medicaid

[270] Ibid.

[272] California Pacific Medical Center, *Report to the Community 2009*, page 8.
[273] Traditional charity care is the care CPMC provides for people who come to the emergency room but are uninsured and unable to pay. In 2009, CPMC extended this community benefit to more than 3,500 people. CPMC's total provision of "services to the poor and underserved" includes this amount, plus CPMC's contributions to Healthy San Francisco, unpaid Medi-Cal costs, health programming provided directly by CPMC or through partnerships with other providers, and grants and sponsorships. CPMC, *Report to the Community 2009*, pages 4–9.

[276] CPMC, 2011 (Jan, 26), *Fourth Quarter 2010 Report to the San Francisco Health Commission Regarding CPMC's Progress Toward Commission Recommendations in Resolution No. 10-09*.
[277] For a list of 15 San Francisco and over 50 regional locations of Sutter Pacific Medical Foundation Clinics, see http://www.sutterpacific.org/locations/
[278] S.F. Health Commission Task Force on CPMC's IMP Addressing Resolution No. 10-09, 2010 (Mar. 2), *Updates and Accomplishments.*

shortfall (the uncompensated portion of providing care to Medicaid patients) by 22 percent in a 5-year period, from $53,369,000 in 2007 up to $65,000,000 by 2012.[279]

According to the project sponsor, CPMC cannot compel private practice physicians who are not part of the Sutter Pacific Medical Foundation to see or not see Medi-Cal patients. Brown and Toland Medical Group physicians, for example, many of whom practice at CPMC facilities, currently accept Medi-Cal patients, but this is a matter of personal physician choice.

The comments also state general concerns about the impact of the CPMC LRDP-related traffic on public safety and air quality impacts associated with this traffic. Pedestrian impacts related to traffic and associated air quality impacts were analyzed in Sections 4.5 and 4.7, respectively, of the Draft EIR. Specific comments on traffic and pedestrian impacts related to the proposed Cathedral Hill Campus development under the LRDP are also addressed in Section 3.7, "Transportation and Circulation" (pages C&R 3.7-179 to 3.7-182) of this C&R document. Specific comments on air quality impacts associated with Cathedral Hill Campus-related traffic are addressed in Section 3.9, "Air Quality" (pages C&R 3.9-71 to 3.9-74) of this C&R document. The comments are noted; they will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project.

The discussion of Impact TR-40, on pages 4.5-130 through 4.5-134 of the Draft EIR, included an analysis of the proposed LRDP's impacts related to pedestrians in the vicinity of the Cathedral Hill Campus. As explained in the discussion of Impact TR-40, with implementation of the proposed Cathedral Hill Campus project, the effect on the surrounding pedestrian environment would not be substantial enough to result in a significant impact. The analyses presented in the discussion of Impact TR-40 included evaluations of sidewalk and crosswalk capacity and conditions that might be hazardous to pedestrians. Based on the assessment of Impact TR-40, the proposed development at the Cathedral Hill Campus would not result in substantial overcrowding of sidewalks or crosswalks, or result in hazardous conditions. In general, the addition of pedestrians, vehicles, and bicycles to the roadway could result in increased pedestrian/bicyclist/vehicular onflicts; however, it would not result in significant safety impacts. Improvement Measure I-TR-40, wherein pedestrian countdown signals would be installed at the intersections of Franklin/Sutter, Franklin/Post, Franklin/Geary, Van Ness/Sutter, Van Ness/Post, and Polk/Post (countdown signals are currently provided at Van Ness/Geary and Polk/Geary), was identified to further facilitate safe pedestrian movement in the area and further reduce this less than signficant impact of the LRDP (see Draft EIR, page 4.5-134).

In response to written and oral comments regarding the transportation analysis included in the Draft EIR with respect to the South of Market (SoMa) and Tenderloin–Little Saigon neighborhoods, a supplemental analysis of some Tenderloin–Little Saigon intersections and a trip distribution sensitivity analysis was conducted for this C&R document (see Appendix E of this C&R Document). Please see Response TR-64 (page C&R 3.7-119), which describes the conclusions of this sensitivity analysis and identifies additional improvement measures to fund improvements to the pedestrian environment, including in the Tenderloin–Little Saigon area. Please also see Section 3.7.7 of this C&R document (pages C&R 3.7-104 to 3.7-121) for additional detailed responses to comments regarding pedestrian impacts.

The analysis of the proposed LRDP's air quality impacts in Section 4.7 of the Draft EIR used the traffic volume data and intersection analysis results from the transportation and circulation analysis in Section 4.5 of the Draft EIR (DEIR pages 4.5-93 to 4.5-117, 4.5-147 to 4.5-161, 4.5-168 to 4.5-170, 4.5-175 to 4.5-176, 4.5-179 to 4.5-180, 4.5-182, 4.5-184 to 4.5-187, 4.5-192 to 4.5-195, 4.5-200 to 4.5-202, 4.5-208 to 4.5-209, 4.5-211 to 4.5-235 and 4.5-247) as inputs into the air quality impact analysis under the air quality thresholds of significance set forth in both the 1999 (Bay Area Air Quality Management District)

[279] S.F. Health Commission Resolution No. 02-10.

BAAQMD CEQA Guidelines and the 2010 BAAQMD Guidelines, and reached the following conclusions:

- The analysis of Impact AQ-4 on beginning on page 4.7-42 of the Draft EIR concluded that operation of the proposed LRDP at the Cathedral Hill Campus would result in a less-than-significant impact related to increases in local concentrations of carbon monoxide (CO) from motor vehicle exhaust under the 1999 BAAQMD Guidelines.
- The analysis of Impact AQ-5 beginning on page 4.7-43 of the Draft EIR concluded that operations at the Cathedral Hill Campus under the proposed LRDP would not expose sensitive receptors to substantial concentrations of toxic air contaminants under the 1999 BAAQMD Guidelines.
- The analysis of Impact AQ-7 beginning on page 4.7-55 of the Draft EIR concluded that operations at the Cathedral Hill Campus under the proposed LRDP would not result in cumulatively considerable impacts related to toxic air contaminant emissions under the 1999 BAAQMD Guidelines.
- The analysis of Impact AQ-12 beginning on page 4.7-73 of the Draft EIR concluded that operations at the Cathedral Hill Campus under the proposed LRDP would not expose sensitive receptors to substantial concentrations of toxic air contaminants under the 2010BAAQMD Guidelines.
- The analysis of Impact AQ-14 beginning on page 4.7-80 of the Draft EIR concluded that operational emissions of toxic air contaminants at the Cathedral Hill Campus under the proposed LRDP would not contribute to a cumulatively considerable impact on sensitive receptors under the 2010 BAAQMD Guidelines.

Therefore, the Draft EIR concluded that the project's air quality impacts related to Cathedral Hill Campus traffic in the surrounding area would be less than significant.

Please also note that the survey form mentioned in Comment 20-2, (which was attached to Comment Letter 20), also asked, "What do you think about 30,000 more cars passing through the area of Geary and Van Ness?" The survey question is unclear regarding the length of time during which 30,000 cars were assumed to pass through the Cathedral Hill Campus area. However, Table 4.5-11, "Net-New Peak-Hour Person Trips by Mode and Vehicle Trips by Campus," on page 4.5-77 of the Draft EIR, indicates that the proposed LRDP would add 682 auto trips during the a.m. peak hour and 689 during the p.m. peak hour. Therefore, the proposed LRDP would contribute far below 30,000 vehicle trips per day to peak hour traffic in the vicinity of the proposed Cathedral Hill Campus.

Comments

(Benjamin Aune—Operation Access, September 23, 2010) [21-1 HC]

"Operation Access (OA) mobilizes a network of medical volunteers, hospitals and referring clinics to provide low-income, uninsured people with access to outpatient surgeries and specialty care that improves their health, ability to work and quality of life. In 2010, our goal is to serve 1,200 patients within our six-county service area. OA patients are uninsured and cannot qualify for publicly funded insurance, such as Medi-Cal. Their family incomes are less than 250% of the Federal Poverty level, and many work in the service sector.

We are fortunate to have a partner in California Pacific Medical Center. CPMC has participated in the Operation Access program since 2001 and in the past nine years has donated almost 500 surgical services to uninsured OA patients. CPMC has provided more than $700,000 in donated care, at cost value. The care that OA patients receive is 100% donated and entirely free to patients. In addition to a full write-off from the medical center and professional volunteers, OA arranges for other ancillary medical groups to match the hospital's donation."

(Benjamin Aune—Operation Access, September 23, 2010) [21-2 HC]

"CPMC is a unique partner for OA, in that patients often travel from as far away as Santa Rosa or Livermore to obtain care at CPMC. If OA did not have the capacity to serve these Bay Area patients through its partnership with CPMC, many would be forced to wait an additional several months for a specialist consultation or surgery."

(Benjamin Aune—Operation Access, September 23, 2010) [21-3 HC]

"We hope that others will see the great community benefit that CPMC provides on a very regular basis by serving the community's most vulnerable individuals. Furthermore, we believe that California Pacific Medical Center plays an important role in San Francisco's healthcare infrastructure. CPMC is vital to our city's healthcare delivery and overall economy, and its long range plan will upgrade our city's health facilities to ensure that all San Franciscans have access to the best possible medical care."

(Benjamin Aune, September 23, 2010) [PC-202 HC]

"MR. AUNE: Well, good late afternoon, members of the Planning Commission. My name is Benjamin Aune. I am the President and CEO of Operation Access, it is a San Francisco-based nonprofit that arranges donated surgical and specialty care for low income uninsured people in the Bay Area. We do this work in partnership with 80 community clinics that identify and refer patients. We work with 31 hospitals, and we have over 900 medical volunteers – surgeons, nurses, anesthesiologists, and so on. And I am here to say that we are fortunate to have CPMC as one of our partners. They have participated with Operation Access since 2001. During the past five years, they have provided donated surgeries to around 500 low income, uninsured people from the Bay Area, and the charity care dollar amount is equivalent to about $3 million. We have 22 surgeons who volunteer their time and skills to serve this vulnerable population, and the care is provided at no cost to the patient. We recently conducted a patient survey and, of the 31 hospitals that see our patients, the top patient outcomes were at CPMC. Actually 100 percent reported an improved ability to work because of the care they received, and 100 percent reported improved quality of life. So, we know that these patients are getting outstanding quality medical care, even though it is free to them, it is all being donated by CPMC and the other hospitals. There have been many perspectives and concerns addressed here this afternoon, certainly, and despite some of the comments made by some of the speakers, I have seen the great community benefit that is provided to the community through CPMC, and on a regular basis. And I can assure you that CPMC is committed to providing charity care."

Response HC-13

The comments are noted. These comments do not raise issues regarding the adequacy, accuracy, or completeness of the Draft EIR. The comments will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project. Please see also Major Response HC-8 (page C&R 3.23-32) regarding access to health services.

Comments

(Dr. Chris Retajczyk, September 23, 2010) [22-1 HC]

"Thank you President Miguel & Members of the Planning Commission for the opportunity to speak this afternoon. My name is Dr. Chris Retajczyk, a proud 17 year resident of S.F.

I am also a practicing neonatal intensive care physician and the former Director of Neonatal and Pediatric Transport for California Pacific Medical Center.

I trained @ UCSF in the Peds/ICU and am a current member of the St Lukes medical staff in Pediatrics. I feel my background gives unique perspective on pediatric systems and delivery of critical care in San Francisco.

With the development of the UCSF Benioff Children's Hospital and the S.F. General Hospital inpatient pediatric services, I found the recent discussion of movement of pediatric inpatient care to the St. Lukes Campus problematic for several reasons:

1) Timing is everything in pediatric emergencies. Minutes for neonatals & children can quite literally mean life or death. Not having a localized facility that is easily accessed and that can provide critical care absolutely affect lives. In the current discussions there would be 3 children's inpatient facilities within a 2 mile radius leaving out large sections of S.F. and making it difficult to get critical pediatric services in a timely fashion.

2) That concentration of children's services puts the City at great risk in the event of a disaster - earthquakes, fire, biological attack all would stress the medical system. By having all of these facilities in close proximity would (1) limit access routes for EMS, (2) would overwhelm a small neighborhood of the city and put the pediatric population @ risk.

3) Lastly having a central location on major street & bus routes of Van Ness and Geary will allow for better [unreadable] pediatric access for the entire city. This is especially important given the recent [unreadable] report card showing increased medical needs for community [unreadable] for the Tenderloin/Chinatown/Civic Center. Thank you, Commissioners."

(Kevin McCormick, September 23, 2010) [PC-207 HC]

"Good afternoon, Commissioners. My name is Kevin McCormick. I am the Media Relations Manager at CPMC. And I would like to read the letter from Chris Retajczyk, who was called earlier, but unfortunately had to leave. It took me a couple of minutes to get here because I had to type it up because, being a doctor, I couldn't actually read his handwriting. 'Dear President Miguel and Members of the Planning Commission: Thank you for the opportunity to speak this afternoon. This is Chris Retajczyk. I am a proud 17-year resident of San Francisco, a practicing neonatal intensive care physician and the former Director of Neonatal and Prenatal Transport for California Pacific Medical Center. I trained at UCSF in the Pediatric Intensive Care Unit and I am a current member of the St. Luke's Medical Staff in Pediatrics. I feel my background gives me a unique perspective on Pediatric systems and health care delivery and critical care in San Francisco. I want the development of the UCSF Children's Hospital and San Francisco General, as well as the CPMC Hospitals at Van Ness and Geary and at St. Luke's. Timing is everything in Pediatric emergencies. Delays of just minutes can literally mean the difference between life and death. Not having a labor and delivery facility that is readily accessible and can provide critical care can cost lives. Having all our high risk deliveries concentrated in one location at Van Ness and Geary means that all the expert staff needed to handle any emergency are on hand, not just for the infant, but also for the mother. Some people have talked about an alternative to the existing plan, but that would concentrate all children's services on the South of Market and put the City at great risk in the event of a disaster, earthquake, fire, biological attack. All of these would stress the normal system. By having all of these facilities in close proximity, it would limit access routes for emergency services, concentrate neonatal services in one section of the City, and put the pediatric population at risk. Having a central location for these well served by major bus and public transportation routes allows for better access for all patients, including children. Thank you, Commissioners."

Response HC-14

The comments are noted. These comments do not raise issues regarding the adequacy, accuracy, or completeness of the Draft EIR. The comment will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project. Please also see Major Response HC-2 (page C&R 3.23-8) regarding the location, size, and scope of services at the proposed Cathedral Hill Campus; Major Response HC-5 (page C&R 3.23-20) regarding impacts on emergency services during births and pediatric emergencies; and Responses ALT-1 (page C&R 3.22-11) regarding Alternative 3A, under which the new women's and children's center would be constructed at the St. Luke's Campus rather than the proposed Cathedral Hill Campus.

Comments

(Dr. Fung Lam, September 23, 2010) [24-1 HC]

"Delivered babies in San Francisco for 25 years.

There is nothing as joyous as the birth of a baby, nor as devastating as the death of a mother. While the majority of deliveries occur without event, severe complications can arise quickly, unexpectedly and can have severe consequences for both the mother and baby.

For many years we have successfully and dramatically reduced the rate of maternal mortality. However, in the last ten years, 1996-2006, California maternal mortality rates have tripled from 5.6/100,000 to 16.9/100.000. Indeed, our Obstetrics Chair, Dr. Elliot Main could not be with us today because he is in Washington D.C. heading a task force trying to reverse the national trend of increasing maternal complications. These efforts have clearly identified the need for consolidation of acute care services for pregnant women. Whether it be intensive care services, surgical support, laboratory and blood product access or availability of interventional radiology…. The access to and ready response of all of these ancillary services are critical in ensuring the safety and well-being of mother and child.

Our pregnant patients have increasing high risk factors; they are older with more underlying medical conditions. There are higher rates of multiple gestations.

It is unacceptable and unsafe to transfer these patients across town for emergency or critical care services.

Let me be clear that I am in full support of community-based medicine. For many years we struggled to maintain a separate OB unit at Chinese Hospital.

But it became clear that the Chinese Hospital unit could not provide all the necessary services, it couldn't keep up with the technology and it could not maintain the staffing for 24/7/365 care.

Our Chinese patients are now cared for at our California Campus unit where providers like me have the resources, tools, and support to maintain their health and safety… sometimes in life and death situations. And will continue to do so at the new facility."

(Unidentified Speaker, September 23, 2010) [PC-239 HC]

"Good afternoon, I wanted to read a statement from Dr. Fung Lam, who was called earlier, but had to leave for a surgery. 'Good afternoon, President Miguel and Commissioners. My name is Fung Lam and I have been delivering babies in San Francisco for 25 years. I support the CPMC rebuild project as evidenced in the DEIR. The Planning Department has done a thorough job of evaluating the proposed project and its alternatives. There is nothing as joyous as the birth of a baby, nor as devastating as the death of a mother. While the majority of deliveries occur without event, severe complications can arise quickly, unexpectedly, and can have severe consequences for both the mother and baby. For many years, we have successfully and dramatically reduced the rate of maternal mortality, however, in the last 10 years, from 1996 to 2006, California maternity mortality rates have tripled from 5.6 per 100,000 to 16.9 per 100,000. Indeed, our Obstetrics Chair, Dr. Elliott Mayne, could not be with us today because he is in Washington, D.C., heading a task force trying to reverse the national trend of increasing maternal complications. These efforts have clearly identified the need for consolidation of a acute care services for pregnant women, whether it be intensive care services, surgical support, laboratory and blood product access, or availability of interventional radiology, access to and ready response of all of these ancillary services are critical in ensuring the safety and well being of mother and child. Our pregnant patients have increasing high risk factors. They are older, with more underlying medical conditions. There are higher rates of multiple gestations. It is unacceptable and unsafe to transfer these patients across town for emergency or critical care services. Let me be clear that I am in full support of community-based medicine. For many years, we struggled to maintain a separate OB Unit at Chinese Hospital, but it became clear that the Chinese Hospital Unit could not

provide all the necessary services. It couldn't keep up with the technology, and it could not maintain the staffing for 24/7, 365-day a year care. Our Chinese patients are now cared for at our California Campus Unit where providers like me have the resources, tools, and support to maintain their health and safety, sometimes in life and death situations, and we will continue to do so in the new facility. Thank you.'"

Response HC-15

The comments are noted. These comments do not raise issues regarding the adequacy, accuracy, or completeness of the Draft EIR. The comments will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project.

Comments

(Jimmy Nguyen—Chinese Progressive Association, September 23, 2010) [25-1 HC]

"Good afternoon Commissioners, my name is Jimmy Nguyen and I am a youth leader from the Chinese Progressive Association (CPA). I am here to urge you to send CPMC's Draft EIR back to the Planning Department, because it overlooks some negative impacts on the community.

Healthcare should be accessible for anyone who needs it. As a child, I had healthcare. I was able to visit a doctor; I was able to get preventative shots; I was able to get perscription [sic] medicine. All this, and I never worried about bills. Many in the Southeast who use St. Luke's Hospital, too, see doctors, get shots, and get medicine. And many receive charity care, so bills aren't their number one concern; St. Luke's spends more than 300% of its tax breaks on charity care. But this reality might end. CPMC plans to reallocate services from multiple campuses, St. Luke's included, and transfer them to their new Cathedral Hill project. As part of the plan, St. Luke's will be downsized and given only 80 hospital beds.

80 beds. This is simply *not* enough to maintain the quality of service at St. Luke's. For people don't just receive healthcare; they *rely* on it. People need healthcare so they can live their life, and not worry about bills if they get hurt.

For healthcare is about helping the sick, the injured, the dibilitated [sic] -insured or uninsured. CPMC's EIR must be revised. We, the community, cannot stand as the vital services we need are cut. **Healthcare is a human right, so it's only right that as humans we all have healthcare.**"

(Donald Scherl, October 18, 2010) [74-8 HC]

"4.3 Community Service: It may be well for the Planning Commission and Planning Department to consider the community service record of CPMC.

In an article published in the SF Chronicle, Jan. 29, 2008 (page D-1), it is reported that in 2007, CPMC received 'close to $70 million in tax breaks ....while spending $5.2 million on charity care.' No other SF hospital save Chinese Hospital ('where the difference amounted to about $3.8 million') received more in tax breaks than it provided in charity care. CPMC complained to the Chronicle that there were supposed mitigating factors. Even when these were taken into account (though some pertained equally to all the private nonprofit hospitals that had actually expended more than they received), CPMC 'still fell $4.6 million short on spending compared to its tax benefits.' [All quotations are from the San Francisco Chronicle].

Note: The Chronicle states that 'St. Luke's was broken out separately in the [city] charity care report because California Pacific did not own it until last year. St. Luke's received $630,000 in tax benefits and spent $2.5 million on charity care.' Even if one gave CPMC the benefit of the St. Luke's achievement, it would still fall $2,730,000 short on spending compared to its tax benefits."

(Donald Scherl, October 18, 2010) [74-9 HC]

"4.4 Cost of Services: Of course the cost of medical care with the new hospital will increase relative to the existing one. This is to be expected since the bonds must be paid off and there will be new high tech equipment, etc. However, the history at CPMC is already one of high costs. In an article in the San Francisco Chronicle, August 22, 2010, at pages D1 and D7, Section D, it states that 'Sutter Health prices [are] higher than others.' In an accompanying table illustrating charges to Aetna for select procedures, CPMC exceeds in unit costs of procedures Seton Medical Center, UCSF Medical Center, St. Mary's Medical Center and St. Francis (i.e., each of the chosen comparison hospitals). The article lists a number of routine procedures for which CPMC already charges the most of SF hospitals, including colonoscopies and abdominal CT scans to cite but two.

Thus, allowing the construction of this new facility at 550 beds could be expected to further raise the unit costs of procedures at the hospital that is already the most expensive in unit costs of those in the city, with resulting increase in cost to patients through their charges or cost of insurance, and to government through Medicare and Medical."

(Donald Scherl, October 18, 2010) [74-39 HC]

"7.8: CPMC has a documented record of well below average community service and a cost structure per procedure exceeding that of any other non-profit hospital in the city. This will only be worse with the new hospital."(Betty Huey, September 23, 2010) [PC-75 HC]

"Like most low income families, it is out of their budget to buy health insurance. This summer, our youth program, we collected over 1,000 signed postcards in the southeast neighborhood of San Francisco, demanding to keep services at St. Luke's Hospital. During our outreach, I have encountered parents who say that their sons and daughters were born in St. Luke's Hospital and have met seniors who have said St. Luke's was their hospital. There are many working class families who rely on St. Luke's Hospital, and this is why we need to maintain the charitable services there. So, please, consider the consequences of CPMC's development for the future of San Francisco. Thank you."

(Kevin Kitchingham, September 23, 2010) [PC-302 HC]

"MR. KITCHINGHAM: Good evening, Commissioners, President Miguel, my name is Kevin Kitchingham with the Bernal Heights Neighborhood Center, who is a member of the Coalition for Health Planning, San Francisco. We represent more than 30 organizations and have grown out of community members literally coming to our doorstep, concerned about the Long Range Development Plan for CPMC and its disproportionate impacts to the community. Clearly, there are many issues at stake here in the EIR document before you, as a result of a lot of work by the Planning Department. But, alas, it is not adequate in addressing myriad impacts that will be caused by the proposed development. There are numerous criticisms of the study itself, the glaring deficiencies in the report, and you will receive most of those comments in writing. This is really about fairness, whether or not San Francisco is a just and equitable community and city for all. Here we have an extremely profitable corporation that has decided access to a spectrum of health services to the poorest San Franciscans is not as important as profit. Here, we have a developer that has decided that, though they can afford to pay 100 percent of their obligation for the impacts that their projects will cause, profit is more important."

(Kevin Kitchingham, September 23, 2010) [PC-306 HC]

"Bernal Heights Neighborhood Center and the Coalition for Health Planning San Francisco demand that equity in healthcare access be mandated through an enforceable commitment . . ."

(Nato Green, September 23, 2010) [PC-318 HC]

"And we believe the evidence is that they're not. One of the key healthcare issues that we wanted to raise is the issue of cost, which is completely out of it. I don't know if you saw the article on August 20th in the Chronicle about Sutter and monopoly pricing, that this is a plan that is going to raise healthcare costs for everyone, including

the taxpayers of San Francisco and their health plans, the health plans for City employees. So, if there is not a serious analysis of the aspects of hospital design that will drive cost of healthcare for the entire population of the City, and possible mitigations from the cost point of view, the plan will be deficient."

(Commissioner Moore, September 23, 2010) [PC-367 HC]

"I am very concerned that St. Luke's location is indeed the type of hospital which is economically and, from a healthcare provider's point, a viable facility. If hospitals need to operate by bottom line and profitability which meet the bottom line, we need to make sure that what is provided in that hospital creates a possibility for that to occur, together with the need to provide charity care at the larger rate, given in the location of the City of where it is."

Response HC-16

The comments raise concerns regarding CPMC's community service record and any reduction of charity care provided at the St. Luke's Campus, the viability of the proposal for the St. Luke's Campus under the proposed LRDP, reallocation of services from the St. Luke's Campus to the Cathedral Hill Campus, and whether 80 beds would be sufficient to maintain the quality of service at the St. Luke's Campus, as well as concerns regarding the cost of medical services at CPMC. Each of these concerns is addressed in turn below. Please also see Response INTRO-7 (page C&R 3.1-17), regarding the appropriate consideration of social and economic impacts under CEQA.

Charity Care

San Francisco Health Commission Resolution 02-10, approved on March 16, 2010, memorialized CPMC's commitment to increase it charity care contribution by 79 percent in a 5-year period, from approximately $5,315,000 in 2007 to $9,500,000 by 2012.[280] Please also see Major Response HC-8 (page C&R 3.23-32) and Response HC-12 (page C&R 3.23-91), regarding access to health services, which includes a discussion of CPMC's delivery of charity care. As explained in Major Response HC-8, according to the *San Francisco Charity Care Report Fiscal Year 2009* (the "2009 Charity Care Report") published by the San Francisco Department of Public Health (DPH), CPMC provided approximately $11.45 million in traditional charity care in 2009 ($9.88 million at the Pacific, California, and Davies Campuses and $1.56 million at the St. Luke's Campus). This compares to $10.4 million for UCSF, $9.81 million for the Catholic Healthcare West system ($6.64 million at the St. Francis Memorial Hospital and $3.17 million at the St. Mary's Medical Center), and $3.63 million for Kaiser.[281] In October 2011, DPH published its San Francisco Hospitals Charity Care Report for fiscal year 2010 (the "2010 Charity Care Report"), which states that CPMC provided approximately $16.6 million in traditional charity care in fiscal year 2010 (12.40 million at the Pacific, California, and Davies Campuses and $4.23 million at the St. Luke's Campus), compared to $11.3 million for UCSF, $13.9 million for the Catholic Healthcare West system ($7.75 million as the St. Francis Memorial Hospital and $6.14 million at the St. Mary's Medical Center) and $5.49 million for Kaiser. [282]

When measured in terms of patient revenue, in fiscal year 2009, CPMC provided approximately 1 percent of net patient revenue in traditional charity care (0.94 percent at the Pacific, California, and Davies Campuses combined and 1.52 percent at the St. Luke's Campus). Increasing to 1.38 percent in 2010 (1.14 percent at the Pacific, California and Davies Campuses combined and 3.77 percent at the St. Luke's

[280] S.F. Health Commission Resolution No. 02-10.

[281] San Francisco Department of Public Health, 2011 (Oct.), *San Francisco Charity Care Report Fiscal Year 2010*, p. 20, Table 4, "Charity Care Expenditures Non-HSF & HSF." Table 4 of the 2009 Charity Care Report ot indicated that SFGH provided approximately $119.4 million in charity care in 2009. which represented 77 percent of the overall charity care spending. The 2009 Charity Care Report stated that SFGH's relatively high charity care expenditures were "not a surprise given the fact that SFGH is the primary charity care hospital in San Francisco and is the central hospital for [Healthy San Francisco]." Ibid., p. 20.

[282] San Francisco Department of Public Health, 2011 (Oct.), *San Francisco Charity Care Report Fiscal Year 2010, 10 Years of Charity Care Reporting*, p.26, Table 5, "Charity Care Expenditures by Hospital, FY10. "

Campus).[283] This compares to 0.64 percent for UCSF in both years, 4.13 percent and 4.43 percent for SFMH in 2009 and 2010, respectively.[284] Over the time period 2006 to 2009, the number of charity care patients at CPMC systemwide increased from 3,156 to 3,683.[285]

All San Francisco non-profit hospitals (including CPMC), together with the San Francisco Department of Public Health (DPH), human service organizations, private philanthropic organizations, and community-based organizations collaborate on a community needs assessment for San Francisco, used for program planning and analysis within San Francisco.[286] These reports (called "Building a Healthy San Francisco," or BHSF) identify community health goals and track progress towards achieving community health goals, assess current needs, and prioritize goals for future action with specific metrics to monitor for improvement.[287] The current needs assessment data can be accessed online at Health Matters San Francisco.[288] Further information regarding access to health care for the uninsured or under-insured is available in the BHSF reports and the San Francisco Charity Care Reports published by DPH, which are available at the DPH website,[289] and comparative data provided in Major Response HC-8, including coverage of care as a percentage of the federal poverty level, overall amounts of charity care, and Medi-Cal patient access. CPMC's 2009 report to the Community on its community benefits program shows an increase in traditional charity care[290], from $7,584,000 in 2008 to $10,215,000 in 2009. Traditional charity care at CPMC for 2007 was approximately $5,300,000.[291] From 2007 to 2008, traditional charity care increased approximately 31 percent, and from 2008 to 2009, increased an additional 35 percent.[292] Preliminary reporting of 2010 total charity care provided by CPMC is approximately $14.9 million, an approximately $4.7 million increase over the 2009 total of approximately $10.2 million, representing an approximately 46 percent increase from 2009 to 2010.[293]

Major Response HC-8 also provides additional detailed information regarding CPMC's commitments related to Medi-Cal patient access and CPMC's partnerships in delivering low- or no-cost care to the medically underserved. Additionally, San Francisco Health Commission Resolution 02-10 memorialized CPMC's agreement to increase its amount of Medicaid shortfall (the uncompensated portion of providing care to Medicaid patients) by 22 percent in a 5-year period, from $53,369,000 in 2007 up to $65,000,000 by 2012.[294] For the above reasons, CPMC's provision of charity care at the St. Luke's Campus would not be reduced and would not cease under the proposed LRDP.

[294] S.F. Health Commission Resolution No. 02-10.

The comment regarding the amount of CPMC "tax breaks" recorded in 2007 (cited from the *San Francisco Chronicle*), compared to amount of charitable care provided by CPMC, does not raise issues regarding the adequacy, accuracy, or completeness of the Draft EIR. The comment is noted and may be considered by the decision-makers as part of their deliberations on the project.

Viability of the St. Luke's Campus under the Proposed LRDP

Please see Major Response HC-2 (page C&R 3.23-8), which includes a detailed discussion of the size and scope of services at the St. Luke's Campus. As explained in Major Response HC-2, concerns regarding the viability of the St. Luke's Campus as proposed under the LRDP were discussed by the Health Commission as part of the Blue Ribbon Panel review in 2008. As described by CPMC and discussed in the Blue Ribbon Panel review, the proposal for the St. Luke's Campus and Replacement Hospital is part of the overall CPMC LRDP. As such, the viability of the St. Luke's Campus cannot be viewed in isolation, but is contingent on the viability of CPMC's health care delivery system as a whole. Operational efficiencies and elimination of redundancies gained by consolidating specialized, tertiary, and women's and children's services at the proposed Cathedral Hill Hospital would more likely contribute to, rather than detract from, the long-term viability of the St. Luke's Campus. For further discussion, please also see Response ALT-1 (page C&R 3.22-11), which responds to comments requesting the analysis of a modified version of Alternative 3A with a different mix of services at the St. Luke's Campus.

As further explained in Major Response HC-2, the San Francisco Health Commission Task Force on CPMC's IMP, in its specific review of CPMC's responsiveness to the recommendations of the Blue Ribbon Panel, determined that the St. Luke's Hospital as planned under the proposed LRDP would be appropriately sized and programmed as a community hospital, along with services that would be provided on the St. Luke's Campus to accommodate existing and projected future patient demand for the south of Market service area.[295] In its September 30, 2010, Interim Report, the Health Commission Task Force indicated that "CPMC has demonstrated its commitment to the long-term viability of the St. Luke's Campus by budgeting $250,000,000 for the reconstruction of the inpatient facility."[296]

Reallocation of Services from St. Luke's

Please see Major Response HC-2 (page C&R 3.23-8) for discussion regarding the size and scope of services at the St. Luke's Campus. Please also see Response HC-2 (page C&R 3.23-52) for a response to similar comments expressing concerns regarding the loss of existing services at the St. Luke's Campus. As explained in more detail in Major Response HC-2 and Response HC-2, with the exception of inpatient pediatrics, skilled nursing facilities (SNF), and subacute care, all services currently provided at the St. Luke's Campus are proposed to be maintained or expanded at the St. Luke's Campus.

As such, no services at the St. Luke's Campus are proposed to be transferred or reallocated from the St. Luke's Campus to the proposed Cathedral Hill Campus, except for inpatient pediatrics. As further explained in Major Response HC-2, the number of inpatient pediatric patients has been very low (an average daily census of 0.7)[297] at the St. Luke's Campus. Based on research showing a link between pediatric patient volume and clinical outcomes, CPMC determined that this low pediatric inpatient demand would be better served at the higher volume dedicated program that is planned for the proposed Cathedral Hill Hospital.[298] The San Francisco Health Commission Task Force on CPMC's Institutional Master Plan concurred that the provision of inpatient pediatric services at the proposed Cathedral Hill

[297] OSHPD, ALIRTS, Annual Utilization Report of Hospitals, California Pacific Medical Center – St. Lukes Campus, 2009, available at http://www.alirts.oshpd.ca.gov, accessed Apr. 8, 2011.
[298] CPMC, Memorandum from Malia Weinberg to Davie Reel (AECOM) & Brian Boxer (AECOM) re: Health Care Services Program at St. Luke's Campus (Apr. 21, 2011).

Hospital would provide for the inpatient pediatric service demands of current St. Luke's patients, as envisioned by the Blue Ribbon Panel.[299]

Sufficiency of 80 Beds at the St. Luke's Campus

Please see Major Responses HC-1 and HC-2 (pages C&R 3.23-1 and 3.23-8) for detailed discussion regarding the supply of acute-care beds and size and scope of services at the St. Luke's Campus.

Major Response HC-1 explains that the 80 beds proposed to be provided at the St. Luke's Hospital would provide sufficient capacity to meet the current and projected demand at the St. Luke's Campus, with additional capacity to meet peak demand periods. Major Response HC-1 also explains that with the shift from multi-patient to single-patient rooms under modern hospital guidelines, newer facilities such as the St. Luke's Replacement Hospital are projected to have a higher occupancy rate (i.e., a higher percentage of licensed beds are expected to be used than under existing conditions) than at existing facilities with their multi-patient rooms, such as the 1970 Hospital Tower that the St. Luke's Replacement Hospital would replace. Therefore, fewer licensed beds would be required to serve the same number of patients. In addition, as explained in detail in Major Response HC-1, over time the demand for hospital bed capacity has reduced, because of technological and clinical advances that reduce the average length of hospital stays and allow more medical services to be provided on an outpatient basis.

Major Response HC-2 further explains that the proposed LRDP would not exacerbate any shortage of inpatient acute-care beds for the south of Market Street area traditionally served by the St. Luke's Campus, in part because the Health Commission Task Force has determined that the St. Luke's Replacement Hospital would be appropriately sized to accommodate existing and projected future patient demand for that service area,[300] and because the St. Luke's Replacement Hospital would accommodate growth in patient census, increase its Emergency Department and surgery capacity, and expand primary care programs in clinical areas of demonstrated need to the community.[301]

Cost of CPMC Medical Services

The comments regarding the cost of medical services at CPMC are noted. These comments do not raise issues regarding the adequacy, accuracy, or completeness of the Draft EIR. These comments may be considered by decision-makers as part of their deliberations on the project. Please see Response INTRO-7 (page C&R 3.1-17) regarding the appropriate consideration of social and economic impacts under CEQA.

Comments

(Jonica Brooks, September 23, 2010) [27-1 HC]

"My name is Jonica Brooks. I have been a registered nurse at the bedside at CPMC's California Campus hospital based Skilled Nursing Floor (or S.N.F.), aka Post Acute Services, for over 15 years. CPMC has three SNF units, one on each of the California, Davis and St Lukes Campuses. Our combined census or occupied beds on the California and St Lukes Campus SNFs is about 66. We are all hospital based SNFs and we serve Medi-cal/Medicare/uninsured/poorly insured, mostly elderly and disabled persons suffering from chronic and/or acute conditions requiring multiple IV's, complex dressings and intensive nursing and medical care from a few days to up to 6 weeks or longer.

[299] San Francisco Health Commission Task Force on CPMC's IMP Addressing Resolution No. 10-09, 2010 (Mar. 2), *Updates and Accomplishments.*
[300] Ibid.
[301] See Major Response HC-2 (pages C&R 3.23-8), and Major Response HC-5 (pages C&R 3.23-21).

I am concerned over CPMC's draft EIR plans for the elderly and disabled. CPMC has committed to keeping only the 38 beds of the Davies Campus SNF open and has excluded the California and St Lukes campus SNFs from the draft EIR.

CPMC has only verbally committed to provide 62 community or campus-based beds open.

There is a difference in community based and hospital based SNF's. I have provided the commissioners an outline of those differences. From this you can see better that our patients are ill and inappropriate for community based free standing SNFs. What you don't see is that CPMC has tried in the past with pilot programs to place our patients in free standing SNF's only to see increased re-hospitalizations and even, unfortunately, death. No one wants that.

CPMC has stated the two SNFs are not in the EIR draft because they are working to develop a transitional care model for home-based care after hospital discharge. But this program is meant to provide San Francisco seniors and adults with disabilities with transitional care services to bridge the gap between hospital discharge and successful recovery at home. While good, this still only speaks to those people going home. What about the growing elderly population and the chronic SNF bed shortage in San Francisco that is estimated to be 30% over the next decade? What will happen if these vulnerable people are sent home too early or have to go outside of San Francisco for care?

It is well known in our facility that CPMC wants to close our unit and has wanted to for some time. From a business prospective, we serve a patient population that is income loosing rather than bottom line gaining. We actually would be closed now as documented in CPMCs prior plans and we have only remained open because community outrage that Sutter/CPMC would cut these services has caused CPMC to pause in these plans.

We are not asking CPMC to shoulder the whole responsibility of caring for the elderly and disabled of San Francisco. We are only asking that they not exacerbate the problem further. We do not want CPMC to quietly unburden themselves with as many SNF beds as possible and **this will happen if the existing SNF beds we have are not included in the final environmental impact report plans**.

I stand before you as a registered nurse with concerns over Citywide health care for the elderly and disabled. These people should not be thrown under the bus in leu of [sic] a new state of the art high rise hospital. I urge the Commissioners to hold CPMC to continue with their studies over successful recovery at home but to not eliminate any Skilled Nursing beds in their Final Environmental Report. Thank you."

(Jonica Brooks, September 23, 2010) [PC-277 HC]

"MS. BROOKS: Good evening. My name is Jonica Brooks. I'm a Registered Nurse at the bedside at CPMC's California campus hospital-based skilled nursing floor, aka Post-Acute Services, for over 15 years. We serve Medi-Cal, Medi-Care, uninsured, poorly insured, mostly elderly and disabled persons suffering from chronic and/or acute conditions requiring multiple IVs, complex dressings, and intensive nursing and medical care from a few days to up to six weeks or longer. I am concerned that CPMC's Draft EIR plans for the elderly and disabled only include the 38 beds at the Davies campus SNF, and has included the California and St. Luke's campus SNFs. Instead, CPMC has verbally committed to provide 62 community or campus-based beds. There is a difference in community and campus-based SNFs and I have provided the Commissioners with an outline of those differences. What you don't see in that outline is that CPMC has tried in the past with pilot programs to place our patients in freestanding SNFs, only to see increased re-hospitalizations and even, unfortunately, death, and no one wants that. CPMC has stated that the two SNFs are not in the EIR Draft because they are working to develop a transitional care model for homecare based care after hospital discharge, to bridge the gap between hospital discharge and home. While good, this still speaks only to those people going home. What about the growing elderly population and the chronic SNF bed shortage in San Francisco that is estimated to be 30 percent over the next decade? What will happen is vulnerable people are sent home too early, or have to go outside of San Francisco for care. It is well known in our facility that CPMC wants to close our unit and has wanted to for some time. From a business

perspective, we serve a patient population that is an income loser, rather than a bottom gainer. We actually would be closed now, as documented in CPMC's prior plans, and we have only remained open because community outreach that CPMC Sutter would cut these services has caused CPMC to pause in their plans. I stand before you as a Registered Nurse with concerns over citywide healthcare for the elderly and disabled, these people should not be thrown under the bus in lieu of a new state-of-the-art hospital. I urge the Commissioners to hold CMPC to continue with their studies over successful recovery at home, but to not eliminate any skilled nursing beds in their final environmental report. Thank you."

(Michael Lyon—SF Gray Panthers, September 23, 2010) [28-1 HC]

"San Francisco Gray Panthers is extremely concerned about California Pacific Medical Center's plan to eliminate 180 Skilled Nursing Facility (SNF) beds as part of its Master Plan for radically changing its healthcare facilities in San Francisco.

San Francisco has a severe shortage of (SNF) beds that accept Medi-Cal. A 1998 SF Department of Public Health study predicted that the City will have 92,000 more residents over age 65 in 2020 than in 2000, and that the City would have a shortage of 2,380 SNF beds, assuming no existing SNF beds were lost. (Options For Laguna Honda Hospital White Paper) But since that time, 732 SNF beds have been lost. The City's own Laguna Honda Hospital, soon to re-open, stopped taking SNF patients in January 2008. (Fog City Journal, 7-7-2009). California Pacific Medical Center's planned closing of its Skilled Nursing Facility, with 180 beds, would raise the total of closed beds to 912, a 24% drop since 1997. (SF Examiner. 8-4-2010) The Lewin Group projects San Francisco would face a 30% shortage of SNF beds overall over the next decade.

These SNF beds are almost entirely used by poor elderly or disabled patients on both Medicare and Medi-Cal, and are necessary for treating patients with strokes, heart and circulatory disease, hip fractures, cancer, respiratory diseases, and severe kidney diseases. (CPMC website) Without sufficient SNF beds in San Francisco, these patients will have to be placed in out-of-county facilities, away from the support of family and friends. In addition, the care at stand-alone contracted-out facilities is often inferior to care in SNFs close by hospitals where more skilled medical expertise is close at hand. In short, closing already-scarce SNF beds in San Francisco will hasten deaths for low-income San Franciscans.

Both the San Francisco Health Commission, and a Lewin Group report on CPMC's Master Plan raised questions about provision of SNF care, as well as sub-acute care and inpatient psychiatric beds. (CPMC news release.)

It is our understanding that CPMC has said it plans to replace the 180 SNF beds it plans to close, but that specific plans are lacking beyond 38 beds at Davies and a commitment to establishing and additional 62 beds somehow, somewhere. (Health Commission Task Force on CPMC IMP, 3-2-2010) This promise, if fulfilled, would still only replace 55% of our badly needed SNF beds.

San Francisco Gray Panthers stands behind the California Nurses Association, community advocates, and elder advocates in demanding that CPMC issue specific, irrevocable plans for replacing all of the closed SNF beds, that new SNF beds be located in close proximity to acute care facilities, and that SNF patients in free-standing facilities not be displaced by CPMC's SNF patients."

(Paul Wermer—CPMC Neighbors Coalition and Pacific Heights Residents, October 18, 2010) [67-5 HC]

"b) Many health care services, such as Skilled Nursing Facilities, should be provided in the various quadrants of the city. The alternatives considered fail to assess the impact of CPMC significantly reducing Skilled Nursing Care. Not only do CPMC's proposed plans not address the impact of reducing these services, they also fail to address the discontinuity of care that occurs when a patient is discharged from an acute care facility to recuperate in a skilled nursing facility operated by a 3rd party."

(Paul Wermer—CPMC Neighbors Coalition and Pacific Heights Residents, October 18, 2010) [67-6 HC]

"As a growing body of evidence shows, the discontinuity in health care when patients are discharged to home or 3rd party Skilled Nursing Facilities results in increased readmissions to the hospital or delayed recovery, compared to more integrated treatment plans. This increases costs and demands on resources - which clearly has environmental impacts. For this reason, it is critical that the evaluation of the Environmentally Preferable Alternative, 3A, be expanded to consider using facilities such as the California and Pacific sites to provide services such as skilled nursing."

(Paul Wermer—CPMC Neighbors Coalition and Pacific Heights Residents, October 18, 2010) [67-44 HC]

"18) MANDATORY FINDINGS OF SIGNIFICANCE: The DEIR fails to consider that CPMC's preferred alternative proposes to significantly reduce Skilled Nursing Facility and Psychiatric beds. This will impose additional burdens on existing services. What is the predicted cumulative impact, and how is this mitigated?"

(Barbara Kautz—CHNA and Bernal Heights Neighborhood Center, October 19, 2010) [87-18 HC, duplicate comment was provided in 108-18 HC]

"Reasonably foreseeable need for construction of additional public health facilities caused by reductions in licensed skilled nursing beds (from 218 to 38), while demand for these services is increasing in the City. *San Francisco's Strategy for Excellence in Dementia Care*[2] found that San Francisco is 'facing a crisis in dementia care,' and estimated that, in the next 20 years, there will be a 49 percent increase in the number of people with Alzheimer's related dementia. Yet, the *Strategy* also found that there is now a shortage of skilled nursing facilities (SNFs), especially those with specialized Alzheimer's units that accept Medi-Cal, and no new SNF facility has been built in San Francisco in the last 25 years. Further, the new Laguna Honda, another SNF, will have fewer licensed beds than the existing facility. The loss of an additional 180 beds as proposed in the Long Range Plan creates a foreseeable need for the construction of additional skilled nursing facilities.

[2] Department of Aging and Adult Services, Alzheimer's/Dementia Expert Panel (December 2009)."

(Barbara Kautz—CHNA and Bernal Heights Neighborhood Center, October 19, 2010) [87-19 HC, duplicate comment was provided in 108-19 HC]

"Reasonably foreseeable need for construction of additional public health facilities caused by reductions in inpatient psychiatric beds (from 40 to 18). The number of inpatient psychiatric beds in San Francisco has steadily declined, from 87 to 42 at San Francisco General, for example, and mentally ills persons are four times as likely to be housed in jails as in inpatient facilities.[3] The loss of additional inpatient psychiatric beds creates a foreseeable need for the construction of additional facilities to serve this population.

[3] 'Mentally III Californians Most Likely Jailed, Not Hospitalized,' Treatment Advocacy Center (June 2, 2010)."

(Gloria Smith—California Nurses Association, October 19, 2010) [90-68 HC]

"The EIR is inadequate because it does not analyze the burden on City services for the services CPMC has already eliminated or would not provide in the future. CPMC has already closed 55% of its psychiatric services (at the Davies Campus) over the course of the past five years and 70% over the past decade, despite a growing need for those same services. From 2000 through 2007, inpatient psychiatric census went up 20% at CPMC, before the closure at Davies Campus.[35] Instead, their psychiatric patients are shifted to other providers. Citywide there is a crisis of inpatient adult psychiatric services. Citywide inpatient psychiatric bed capacity has dropped by 23% since 2000, according to licensing data published by the Office of Statewide Health Planning and Development ('OSHPD'). CPMC is responsible for 63 of the 79 psychiatric beds that have been closed in the City since 2000. This primarily places additional burden on San Francisco General Hospital ('SF General'), but also on St. Francis Memorial Hospital ('St Francis') which is operated by Catholic Health Care West ('CHW'). The City has no data about the need for psychiatric services, let alone psychiatric emergencies, 5150s[36], substance abuse,

drug detoxification, etc. and the Draft EIR fails to provide any information how the LRDP would impact the need and supply for these services.

[35] *See* attached Letter from Michael Lighty.

[36] Section 5150 is a section of the California Welfare and Institutions Code (specifically, the Lanterman-Petris-Short Act) which allows a qualified officer or clinician to involuntarily confine a person deemed to have a mental disorder that makes them a danger to him or her self, and/or others and/or gravely disabled. A qualified officer, which includes any California peace officer, as well as any specifically designated County clinician, can request the confinement after signing a written declaration. When used as a term, 5150 (pronounced "fifty-one-fifty") can informally refer to the person being confined or to the declaration itself."

(Gloria Smith—California Nurses Association, October 20, 2010) [96-5b HC, duplicate comment was provided in 110-5b HC]

"A report by the Lewin Group that analyzed changes to inpatient services proposed by the CPMC 2008 Institutional Master Plan ("2008 IMP") within the context of citywide health needs, including emergency department capacity, transitional care, urgent care services, and behavioral health services,[9] anticipates a citywide shortage of 30% above available skilled nursing bed capacity in the next ten years based on the City's aging baby boomer population.[10] The Lewin Group Report did not distinguish among different types of SNF beds. The complexity of care for patients in SNFs connected to an acute care is much higher. Patients in units licensed as SNFs that are connected to acute care hospitals need a higher level of care than patients in freestanding SNFs. Hospital-based SNFs, often called Post-Acute units, can provide peripherally inserted central catheters (PICC or PIC lines), multiple IV medications, complex wound care, daily labs, daily diagnostic services, easy transfer to more critical units, and on-site hospitalists. CPMC claims not to track re-admissions from SNFs back to acute care or from freestanding facilities back to acute care. However, there have been pilot programs in which patients died or were readmitted because they were prematurely discharged to lower acute care facilities.

CPMC has stated publicly that it will restore 62 SNF beds to the LRDP, however, these additional beds are not reflected anywhere in the Draft EIR. Making this change requires either new construction or modification to the proposed uses of the existing sites. The Draft EIR will be incomplete if it does not make clear where and when SNF beds will be provided. Patients will be at risk if those SNF beds are not on an acute care campus. CPMC has argued that it is cost-prohibitive to build SNFs into an acute care building, because SNFs are not required to meet the same standards of seismic compliance (although the Chinese Hospital is doing just that). CPMC could easily locate 62 SNF beds on two to three floors of a non-acute care building or medical office building adjoining an acute care hospital.

[9] The Lewin Group, California Pacific Medical Center Institutional Master Plan Review, June 26, 2009 (hereafter "Lewin Group Report"); www.rebuildcpmc.or (/assets/FinaILewinReport.pdfor htll'://snipurl.com/lb9pxd [www...google_com].

[10] Lewin Group Report at page 22."

(Gloria Smith—California Nurses Association, October 20, 2010) [96-6 HC, duplicate comment was provided in 110-6 HC]

"The Lewin Group Report found that the CPMC IMP 'does not address a potential city-wide shortage of transitional and skilled nursing service capacity, nor does it aim to improve access to mental health services…'[12] Many of the licensed beds proposed to be reduced by the 2008 IMP have already been eliminated, as shown in Table 2. For example, the Davies Campus has eliminated 104 acute-care beds and 22 psychiatric care beds in 2008/2009. *(See* Table 2.)

The Lewin Group Report also found that 'full execution of the IMP will further stress the system's capacity to treat and care for patients requiring transitional care, chronic condition support and inpatient mental health services.'[12] The report concluded that '[w]ithout an alteration in how care is delivered throughout the city, a significant shortage or change in migration patterns is projected to occur.'[13]

The Draft EIR fails to address these shortages and the physical and associated social and economic impacts attributable to the migration of patient populations in and out of San Francisco including the resulting longer travel distances and reduced access to health care.

[13] Lewin Group Report at page 22."

(Gloria Smith—California Nurses Association, October 20, 2010) [96-12 HC, duplicate comments were provided in 90-68 HC and 110-12 HC]

"The Draft EIR is inadequate because it does not analyze the burden on City services for the services CPMC has already eliminated or would not provide in the future. CPMC has already closed 55% of its psychiatric services (at the Davies Campus) over the course of the past five years (*see* table 2) and 70% over the past decade, despite a growing need for those same services. From 2000 through 2007, inpatient psychiatric census went up 20% at CPMC, before the closure at Davies Campus. Instead, their psychiatric patients are shifted to other providers. Citywide there is a crisis of inpatient adult psychiatric services. Citywide inpatient psychiatric bed capacity has dropped by 23% since 2000, according to licensing data published by the Office of Statewide Health Planning and Development ('OSHPD'). CPMC is responsible for 63 of the 79 psychiatric beds that have been closed in the City since 2000. This primarily places additional burden on San Francisco General Hospital ('SF General'), but also on St. Francis Memorial Hospital ('St Francis') which is operated by Catholic Health Care West ('CHW'). The City has no data about the need for psychiatric services, let alone psychiatric emergencies, 5150s[20], substance abuse, drug detoxification, etc. and the Draft EIR fails to provide any information how the LRDP would impact the need and supply for these services.

[20] Section 5150 is a section of the California Welfare and Institutions Code (specifically, the Lanterman-Petris-Short Act) which allows a qualified officer or clinician to involuntarily confine a person deemed to have a mental disorder that makes them a danger to him or herself, and/or others and/or gravely disabled. A qualified officer, which includes any California peace officer, as well as any specifically designated County clinician, can request the confinement after signing a written declaration. When used as a term, 5150 (pronounced "fifty-one-fifty") can informally refer to the person being confined or to the declaration itself."

(Gloria Smith—California Nurses Association, October 19, 2010) [96-23 HC, duplicate comment was provided in 110-23 HC]

"VII. The Draft EIR Fails to Evaluate Potentially Significant Adverse Social and Economic Impacts Associated with the CPMC LRDP

Elsewhere the CEQA Guidelines, Section 15382, define a significant effect on the environment to mean:

> ... a substantial, or potentially substantial, adverse change in any of the physical conditions within the area affected by the project, including land, air, water, minerals, flora, fauna, ambient noise, and objects of historic or aesthetic significance. An economic or social change by itself shall not be considered a significant effect on the environment. A social or economic change related to a physical change may be considered in determining whether the physical change is significant.

The above discussed reduction of licensed beds at three of the CPMC hospitals and the change in service resulting from the restricted access to service provided by the new Cathedral Hill Hospital would result in direct environmental impacts (e.g., increased vehicle miles traveled and associated increased air pollutant and greenhouse gas emissions) and would result in adverse economic and social effects. These effects must be analyzed under CEQA."

(Gloria Smith—California Nurses Association, October 20, 2010) [96-34 HC, duplicate comment was provided in 110-34 HC]

"IX. Conclusion

As explained above, the Draft EIR is inadequate because it fails to analyze the health care implications of the LRDP and associated impacts on air quality, greenhouse gas emissions, public health, and public services. Specifically, the Draft EIR fails to include an evaluation of the potentially significant impacts due to the change in patient population resulting from loss of access to acute care to patients with insurance coverage limitations associated with the elimination of acute care and SNF at the St. Luke's Hospital."

(Jessica Weimer, September 23, 2010) [PC-44 HC]

"The next point is the stop of spread of infectious diseases. These people are going to have to rely more and travel further on public transportation while they are ill, exposing even more people to infectious diseases. And also, it may increase the use of ambulance service; the improvement of behavioral health care – they are already decreasing the beds at St. Luke's and Davies campus, and there are also plans at the Pacific campus to decrease the number of beds for psychiatric care."

(Reiko Furuya, September 23, 2010) [PC-176 HC]

"Around the time he mentioned our fully occupied and many of us worked 16 hours double-shift, nobody could afford the time to open another unit with five beds. CPUC plan is also going to take away our sub acute and SNF beds. As an ICU nurse, I have sent patients to sub acute and witnessed their slow, but successful recovery. Some even walked out from hospital after a few months of intense rehabilitation. As a nurse, as a human, I have painfully wondered where CPMC will place those patients, where those people will live. No matter what socioeconomic background people have, once they become ill or injured, they need care. Because there is population in South of Market, St. Luke's becomes essential to so many more lives in the future. We need more beds, more services, more supplies, and more sustainable care, sustainable support to continue our services in the community. Please help us. So many vulnerable people depend on us. Thank you."

(Maria Ascension Servillion, September 23, 2010) [PC-206 HC]

"MS. SERVILLION[phon]: My name is Maria Ascension Servillion [phon]. I am a Registered Nurse. I work at St. Luke's Hospital. I have been there for 35 years. I work in the ICU. I am not opposing CPMC rebuilding St. Luke's, I am opposing their plan of cutting back on some of the services, like closing sub acute and closing skilled nursing facility, and also like downsizing ICU, it would become less numbers of beds. I have worked there all these years, it is a very good place to work, we all work together. We take care of patients who are mostly medically indigent patients, and retired Vets, and to make them better, and we work very well together. So, it's my wish that it would just be the same size as it is right now, instead of cutting it back to less services, so some of the services won't be there with the plan for the new hospital. I thank you. COMMISSIONER MIGUEL: Thank you."

(Jane Martin, September 23, 2010) [PC-257 HC]

"The EIR is incomplete because it does not analyze the burden on City services, for the services that CPMC will no longer provide. CPMC has closed over 70 percent of psychiatric services, despite a growing need for these same services and, instead, their psych patients are shifted to other providers. CPMC also plans to close the vast majority of their SNF beds, long term care for the elderly and disabled, and to downsize St. Luke's. All of these would result in huge impacts on the City's public healthcare system, and that needs to be analyzed."

(Linda Carter, September 23, 2010) [PC-290 HC]

"That bothers me, but the other thing is the lack of concern for these elderly patients who are not in our SNF and also in our sub acute. Sub acute patients are patients who have long time illness, often dependent on ventilators,

and they can't be placed anywhere else, there are very few centers that take them in the Bay Area, one in Kentfield, one over in San Leandro, and we are the other one. I really really am distressed that they're not talking about replacing these. For the SNF beds that are closing, they are opening another 38 new beds at Davies, but there's nothing to say where they're going to put the rest of the patients, and patients often are leaving the hospital much more ill these days, they are going home sometimes with IVs that need to be given, or IV antibiotics that need to be given. Most patients' families don't feel comfortable giving these medications at home. So, they really need a transitional place, a skilled nursing facility that is hospital-based, so that if they do get in trouble, they're right there. We often get patients from both the SNF and the sub acute and I'm just concerned that, at the size that they're proposing for St. Luke's, we will not survive. And perhaps for another – maybe another five years, but then we would look at them closing us anyway. Thank you."

Response HC-17

The comments express concerns regarding CPMC's exclusion of skilled nursing facilities (SNF) beds at the California and St. Luke's Campuses under the proposed LRDP and their potential closure; CPMC's commitment to maintain 62 additional community or campus-based SNF beds; concerns that the Draft EIR did not analyze impacts related to the location and schedule for providing the additional 62 SNF beds; concerns regarding the appropriateness of community-based free-standing SNFs; general concerns regarding the shortage of SNF beds in San Francisco; the ability of a transitional care model to accommodate the growing elderly population and SNF bed shortage in San Francisco; the provision of subacute-care beds; the provision of inpatient psychiatric beds; a shortage of facilities with specialized Alzheimer's units that accept Medi-Cal; physical and social economic impacts attributable to the migration of patient populations from one medical facility to another associated with the elimination of licensed beds under the proposed LRDP and the resulting longer travel distances and reduced access to health care; the potential for the proposed LRDP to increase the use of ambulance service, and concerns regarding "downsizing ICU" at the St. Luke's Campus. Each of these concerns is addressed below.

SNF Beds at the California and St. Luke's Campuses under the Proposed LRDP

Comment 28-1 HC states that CPMC's "planned closing of its Skilled Nursing Facility, with 180 beds, would raise the [citywide] total of closed [SNF] beds to 912" and Comment 87-18 similarly refers to a reduction "from 218 to 38" of licensed SNF beds. CPMC currently maintains SNF beds in three locations, with a total number of 218 existing licensed SNF beds (101 at the California Campus, 38 at the Davies Campus, and 79 at the St. Luke's Campus).

Please see Major Response HC-6 (page C&R 3.23-25), regarding the loss of SNF beds. As explained in Major Response HC-6, as clarified in the text revisions to Draft EIR, page 2-10, Table 2-2, "CPMC Existing and Proposed LRDP Licensed Hospital Bed Uses", and as shown in Chapter 4, "Draft EIR Text Changes," of this C&R document (see also Response PD-6, page C&R 3.2-6), the Draft EIR assumes the continued maintenance of 101 licensed SNF beds at the California Campus, unless and until CPMC identifies another plan for providing the 62 SNF beds (in addition to the 38 SNF beds that would continue to be maintained at the Davies Campus under the LRDP) necessary for CPMC to meet its commitment to provide a total of 100 SNF beds systemwide. Therefore, the proposed LRDP would now include the continued maintenance of 101 licensed SNF beds at the California Campus, until an alternative plan for providing the remaining 62 SNF beds is identified. On the other hand, as shown in the revised version of Table 2-2, the proposed LRDP would not include the continued maintenance of any SNF beds at the St. Luke's Campus. Thus, as shown in the revised version of Table 2-2, under the proposed LRDP, 139 licensed beds would remain at the CPMC Campuses (101 at the California Campus, and 38 at the Davies Campus), resulting in a reduction of 79 SNF beds throughout CPMC systemwide.

Given CPMC's commitment to continue to maintain 100 SNF beds, CPMC's supply of licensed SNF beds would decrease from 218 to 100, a reduction of 118 beds, rather than a reduction of 180 SNF beds as suggested by some of the comments.

As explained in Major Response HC-6, current estimates indicate that CPMC would need to provide approximately 100 skilled nursing beds total (for all CPMC campuses) at any given time to adequately cover its systemwide SNF bed demand. Therefore, given CPMC's commitment to provide 100 SNF beds, the record does not support the suggestion that the reduction in licensed SNF beds, which is a social and economic condition, would contribute to any physical environmental impacts (including cumulative impacts) caused by the proposed LRDP.

CPMC's Commitment to Maintain 62 Community or Campus-Based SNF Beds

Comment 27-1 HC states that "CPMC has only verbally committed to provide 62 community or campus based beds." The comment is not accurate. The San Francisco Health Commission Task Force, in its reports dated March 2 and September 30, 2010, and the San Francisco Health Commission, in Resolution 02-10 dated March 16, 2010, affirmed CPMC's plans to maintain capacity to serve its existing patient needs by providing a total of at least 100 SNF beds.[302] CPMC's commitment to maintain a total of 100 SNF beds has been memorialized in San Francisco Health Commission Resolution 02-10, which sets forth CPMC's agreement with the Health Commission to "provide a total of 100 skilled nursing beds, retaining the 38 beds currently located at the Davies Campus and adding 62 new SNF beds."[303] The agreement with the Health Commission further provided that "[b]ecause of the shortage of SNF beds in the community, no existing community-based beds will be utilized."[304] Please see Major Response HC-6 for further information regarding future demand for SNF beds and CPMC's 100-bed commitment.

Location and Schedule for Providing 62 Additional SNF Beds

Comment 96-5b states the Draft EIR will be incomplete if it does not clarify where and when the additional 62 SNF beds would be provided that would be necessary for CPMC to meet its commitment to maintain 100 SNF beds (together with the 38 SNF beds that would continued to be maintained at the Davies Campus under the LRDP). Comment 96-5b also suggests that CPMC could locate these 62 SNF beds on two to three floors of a non-acute care building or a medical office building adjoining an acute care hospital.

Please see Major Response HC-6, which explains that because the precise nature, location, and provider of the future 62 SNF beds are not currently known, the Draft EIR, (as clarified in the Draft EIR text revisions in Chapter 4 of this document for Table 2-2, "CPMC Existing and Proposed LRDP Licensed Hospital Bed Uses" in the Draft EIR, page 2-10), assumes the continued maintenance of 101 licensed SNF beds at the California Campus and 38 licensed SNF beds at the Davies Campus, unless and until CPMC identifies another plan. A plan for providing the beds needed to meet its SNF bed commitment would be subject to review and comment by the San Francisco Health Commission, as provided in Proposition Q.[305] It would be speculative to analyze this future SNF provision plan in the CPMC LRDP EIR, as part of the current project, either as an alternative campus-based plan (other than continuing to provide these beds at the California and Davies Campuses) or as an off-campus plan, or some

Health Commission Resolution No. 02-10.

[303] S.F. Health Commission Resolution No. 02-10.

[304] Ibid.

[305] See San Francisco Department of Public Health undated information sheet describing the "Community Health Care Planning Ordinance" (also known as Prop Q), on the Department's Web site: http://www.sfdph.org/dph/files/hc/PropQ_HealthcarePlanOrd_Amend11182008.pdf, accessed Nov. 10, 2010.

combination. Any such plan for replacement SNF bed facilities within the CPMC system would, therefore, be subject to subsequent environmental review, as necessary and required under CEQA.

There is no definite, reasonably foreseeable plan or even a conceptual plan to relocate SNF beds; nor any particular schedule for when that may occur under the proposed LRDP. Among the different possible approaches to meeting its 100-bed SNF commitment that CPMC outlined to the Blue Ribbon Panel and to the Health Commission, are the following: (1) provide beds in CPMC facilities; (2) collaborate with other city hospitals; (3) lease renovated CPMC facilities to a SNF management company; and (4) develop collaborations with community transitional care services.[306] Therefore, it is possible that the 62 SNF beds could be provided at a non-acute care building or a medical office building adjoining an acute care hospital, as suggested by Comment 96-5b, although that is only one of several possible approaches for providing these additional SNF beds.

The various SNF relocation plans exist at this time only as broad concepts or options for future consideration, absent any meaningful planning, decision-making or any other activity by CPMC (or others) to move one particular concept along toward implementation. They are possibilities that in the future would need to be more seriously considered if any were to be pursued. In the meantime, however, SNF beds would continue to be provided at the St. Luke's Campus (until demolition of the existing hospital) and at the California Campus. Potential future SNF relocation plans are thus, not in a form that could be studied as part of the LRDP EIR at this time. In the interim, the existing facilities which will continue to provide SNF bed facilities are adequate and no legal (e.g., SB 1953) constraints exist on their continued utilization.

Appropriateness of Community-Based Free-Standing SNFs

Comments 27-1 and 96-5b also expressed concerns regarding the appropriateness of replacing SNF beds at CPMC with community-based, free-standing SNFs. It is important to note that CPMC has not yet identified whether the 62 additional SNF beds would be provided at one of the CPMC campuses or at an off-campus, community based facility. As explained above, the proposed LRDP, as indicated in the Draft EIR text revisions to Table 2-2, "CPMC Existing and Proposed LRDP Licensed Hospital Bed Uses," assumes the continued maintenance of the 101 licensed beds at the California Campus, unless and until an alternative plan is identified.

Please see Major Response HC-6 for a detailed discussion of issues related to the transfer of SNF beds to non-hospital settings, which explains that according to Dr. Mitch Katz, former Director of the San Francisco Department of Public Health the decision not to build new SNF beds within an acute-care facility is considered the correct decision, because SNF beds are not required to meet the stringent seismic safety standards of SB 1953, and providing SNF beds in buildings that meet those standards would be much more expensive.[307] Dr. Katz also explained that providing assisted living in a patient's house (e.g., by installing a ramp that would facilitate such an arrangement) would be preferable to long-term care in a SNF bed.[308] Dr. Katz's recommendations are further substantiated by the analysis and recommendations of The Lewin Group, performed on behalf of the Department of Public Health, in connection with its

[306] Transitional care and outpatient case management programs could potentially lead to a decrease in the need for institutional SNF care or support shorter lengths of stay in the SNF. Partnerships with these networks could increase the capacity for safe discharges back to community housing for socially and medically complex patients. (Wajnberg, Ania, MD et al., *Hospitalizations and Skilled Nursing Facility Admissions Before and After the Implementation of a Home-Based Primary Care Program*, Journal of the American Geriatric Society. 2010 Jun;58(6):1144-7. Epub 2010 May 7)**.** Therefore, as further described in this Response below, in addition to meeting the 100 (SNF) bed commitment discussed above, CPMC is working on a partnership with the Department of Aging and Adult Services (DAAS) and a new Transitional Care Network, and participating in negotiations with the Independent Physician Association (IPA) for more robust care management programs for patients with chronic diseases. CPMC, Memorandum from Malia Weinberg to David Reel (AECOM) & Brian Boxer (AECOM) re: Transitional Care and Community-Based Care for Skilled Nursing Patients (Apr. 21, 2011).

[307] Testimony of Dr. Mitch Katz, November 19, 2009, at the CPMC IMP hearing.

[308] Ibid.

independent decision not to include SNF beds in the new San Francisco General Hospital.[309] The Health Commission also recognized that "institutional care is not necessarily the best option for seniors and younger adults with disabilities who need post-term care."[310]

As explained in detail in Major Response HC-6, CPMC has committed to maintain sufficient SNF beds (a total of 100) to meet its actual patient demand. CPMC has also committed that no existing community-based beds would be utilized to provide these 100 SNF beds, and that to provide the 62 beds needed in addition to the 38 that would remain at Davies, it would utilize either new community-based facilities or replacement capacity provided on one of its campuses. Furthermore, as explained above, the text revisions in this C&R document to Draft EIR Table 2-2 clarify that CPMC would continue to maintain the 101 licensed beds at the California Campus, unless and until an alternative plan for providing the additional 62 beds is identified. Therefore, the proposed LRDP would not exacerbate any existing citywide SNF bed shortage.

Citywide Shortage of SNF Beds

Comment 28-1 HC states that "The Lewin Group projects San Francisco would face a 30 percent shortage of SNF beds overall over the next decade." The comment regarding the Lewin Group's projections is accurate, as The Lewin Group's report regarding CPMC's Institutional Master Plan (IMP) projected that in 2020, based on an estimated total of 2,774 certified SNF beds and an estimated average daily census of 3,600, the occupancy rate of SNF beds within the City would be 129.8 percent.[311]

As explained in detail in Major Response HC-6, CPMC has committed to maintain sufficient SNF beds (a total of 100) to meet its patient demand. CPMC has also committed that no existing community-based beds would be utilized to provide these 100 SNF beds, and that to provide the 62 beds needed in addition to the 38 hospital-based beds that would remain at Davies, it would utilize either new community-based facilities or replacement capacity provided on one of its campuses. Furthermore, as explained above, the Draft EIR text revisions shown in Chapter 4 (page C&R 4-36) of this C&R document to Draft EIR Table 2-2 clarify that CPMC would continue to maintain the 101 licensed beds at the California Campus, unless and until an alternative plan for providing the additional 62 beds is identified. Therefore, the proposed LRDP would not exacerbate the existing citywide SNF bed shortage.

Accordingly, The Lewin Group's report regarding CPMC's IMP concluded that although CPMC's plan to eliminate SNF beds would not support the potential citywide need for skilled nursing services, "given the extent of potential need, a broader, citywide plan will likely be needed to appropriately address the shortage."[312]

Concerns Regarding Transitional Care Model and Continuity of Care

Please see Major Response HC-6 for a detailed discussion of issues related to the continuity of care, which explains that under the proposed LRDP, patients who continue to require SNF in-hospital care would be accommodated at the Davies Campus, and other patients in less severe condition would be served in other on-campus or off-campus facilities. Major Response HC-6 further explains that a nationwide trend of decreased in-hospital SNF beds and an increase in community-based off-campus facilities (for SNF beds) has been occurring for several reasons, including the following: (1) hospital rooms are the most costly to build, (2) staffing requirements in hospitals are often much higher than what is

[309] SFDPH should not include SNF capacity in new hospital construction; from "San Francisco Department of Public Health Long Range Service Delivery Planning Project," LRSD Community Committee Meeting #4, prepared by the Lewin Group, May 30, 2002, page 49.
[310] CPMC, 2010 (Sept. 30), *Interim Report to the San Francisco Health Commission Regarding Progress Toward Commission Recommendation in Resolution No. 10-09*.
[311] The Lewin Group, 2009 (June 26), California Pacific Medical Center Institutional Master Plan Review, prepared for the San Francisco Department of Public Health, at page 22, Table IX, "Projected SNF Bed Utilization."
[312] Ibid. at page 23.

necessary in an SNF, and (3) many patient health outcomes are better in more home-like settings. Accordingly, CPMC is exploring a collaborative relationship with community providers of transitional care to accomplish appropriate and safe home discharges for patients who do not need to be cared for in hospital-based SNF beds.[313]

The Long Term Care Coordinating Council (LTCCC) acknowledged that CPMC is in the process of developing "a program of transitional care services that will facilitate the move of vulnerable adults from acute-care services to post-acute services, provided either by CPMC or other health care institutions in San Francisco, or provided at home or in the community. . . ."[314] A resolution adopted by the LTCCC also "urges all stakeholders, including the Health Commission, Planning Commission, and Aging and Adult Services Commission, to work to preserve and expand access to a comprehensive continuum of services and support that optimizes an individual's best chance of returning from hospital to home or to the most integrated setting, provides alternatives to hospitalization, as well as minimizing re-admission to an acute-care setting."[315]

Additionally, as explained in Major Response HC-6 (page C&R 3.23-25), the Blue Ribbon Panel recognized that a broader citywide and regional Bay Area plan would be needed to address improved transitional care from acute to subacute to rehab facilities overall. Through the Blue Ribbon Panel consensus process, CPMC has committed with the LTCCC and the San Francisco Hospital Council to find ways that the City of San Francisco can expand the community's capacities to offer appropriate skilled nursing beds

It should be noted that although Comment 67-6 refers to "a growing body of evidence" that the discontinuity of health care that occurs when patients are discharged to their homes or third-party skilled nursing facilities, the comment does not cite or submit for the record any evidence regarding health issues associated with such transitional care.

As explained above, in addition to the 38 licensed SNF beds that would remain at Davies, CPMC has committed to continue to maintain the 101 currently licensed SNF beds at the California Campus as needed, until CPMC is successful in opening 62 replacement beds in CPMC facilities or facilities elsewhere in the community. The 38 SNF beds would remain at the Davies Campus after 62 replacement beds/facilities were added and, therefore, would continue to provide inpatient SNF beds in a hospital setting for those patients most likely to experience difficulty if discharged to their homes or to third-party facilities.

Although Comment 67-6 raises concerns regarding costs and demands on unspecified resources because of increased hospital readmissions, the comment does not provide any evidence or explanation of how such concerns could lead to environmental impacts. Please see Response INTRO-7 (page C&R 3.1-17) regarding the appropriate consideration of social and economic impacts under CEQA. As explained in detail in Major Response HC-6 (page C&R 3.23-25), providing SNF beds in a hospital increases health care costs compared to care at home or in third-party skilled nursing facilities.

Comment 67-6 also requests an evaluation of a revised version of Alternative 3A that would include the provisions of SNF services at the California and Pacific Campuses. Please see Response ALT-1 (page

[313] CPMC, Memorandum from Malia Weinberg to David Reel (AECOM) & Brian Boxer (AECOM) re: Transitional Care and Community-Based Care for Skilled Nursing Patients (Apr. 21, 2011). The San Francisco Health Commission Task Force on CPMC's IMP stated that it "supports CPMC's collaboration with the Department of Aging and Adult Services (DAAS), the San Francisco Senior Center, St. Francis Memorial Hospital on a pilot to provide comprehensive support to senior patients with transition services such that many can successfully be restored to their own homes with appropriate support services." San Francisco Health Commission Task Force on CPMC's IMP Addressing Resolution No. 10-09, 2010 (Mar. 2), *Updates and Accomplishments*.

[315] Ibid.

C&R 3.22-11) for a detailed explanation regarding why CEQA does not require the analysis of additional alternatives beyond the reasonable range of alternatives analyzed in the Draft EIR, and why an analysis of additional variations of Alternative 3A that would include a different distribution of health care services is not necessary.

Subacute-care beds

Please see Major Response HC-6 (page C&R 3.23-25) for a detailed discussion regarding subacute-care beds. CPMC currently maintains 60 subacute-care beds at the St. Luke's Campus, but would no longer provide subacute-care beds under the proposed LRDP.

As explained in Major Response HC-6, according to a study by The Camden Group, almost all of the subacute patients in the existing 60-bed subacute care unit at the St. Luke's Campus have been direct admit patients residing in areas outside of the South of Market, and often outside San Francisco County.[316] The Blue Ribbon Panel, therefore, did not recommend that CPMC provide replacement subacute-care beds for those in the existing St. Luke's Hospital. Instead, the Blue Ribbon Panel recommended that "CPMC should replace lost subacute beds with placements for all individuals currently in those beds."[317] Further, the San Francisco Health Commission has memorialized its agreement with CPMC that "When the St. Luke's inpatient tower is decommissioned, CPMC will place all remaining subacute-care patients in its other hospital campuses, or in community facilities."[318] Consistent with the Blue Ribbon Panel's recommendations and its agreement with the Health Commission, CPMC would gradually remove the existing 60 subacute-care beds at the St. Luke's Hospital from service, through attrition or transfers to other facilities between now and when the existing St. Luke's Hospital tower would be demolished.[319] The proposed St. Luke's Replacement Hospital would not have subacute-care beds. Any patients not able to be transferred to other subacute care facilities by that time would be placed, as appropriate, in a CPMC acute care or SNF bed.[320]

Inpatient psychiatric beds

Please see Major Response HC-4 (page C&R 3.23-19) regarding psychiatric beds, which explains that the proposed total of 18 licensed psychiatric beds under the LRDP (all at the Pacific Campus) would be adequate to respond to the demand for psychiatric beds at CPMC systemwide, based on the past demand census (average daily census of 10.6 for psychiatric beds in 2009).[321] The suggestions by some comments that the proposed LRDP would include a reduction in the number of psychiatric beds provided by CPMC are incorrect. As shown in Table 2-2 on page 2-10 of the Draft EIR, and the updated version of Table 2-2 included in the Draft EIR text revisions in Chapter 4, "Draft EIR Text Changes," of this C&R document, all the existing 18 licensed psychiatric beds would continue to be maintained at the Pacific Campus under the proposed LRDP. As such, no psychiatric beds or services would be shifted from CPMC to other providers under the proposed LRDP. Therefore, the record does not support the suggestion that the proposed LRDP would contribute to any physical environmental impacts (including cumulative impacts) related to reduction in psychiatric beds.

Previous reductions in the overall number of licensed psychiatric beds at CPMC facilities, cited by Comments 90-68 and 96-12, are part of the proposed LRDP baseline and occurred before issuance of the

318 S.F. Health Commission Resolution No. 02-10.
319 CPMC, Memorandum from Malia Weinberg to David Reel (AECOM) & Brian Boxer (AECOM) re: Subacute Care (May 26, 2011).
320 Ibid.
321 OSHPD, ALIRTS, Annual Utilization Report of Hospitals, California Pacific Med Ctr-Pacific Campus, 2009, available at http://www.alirts.oshpd.ca.gov, accessed Apr. 8, 2011; CPMC, Memorandum from Malia Weinberg, Senior Project Manager, Operations, Planning and Activations, to Brian Boxer (AECOM) re: Inpatient Psychiatric Beds (May 12, 2011).

Notice of Preparation(NOP) of the CPMC LRDP EIR. The statement in Comment 90-68 that "CPMC is responsible for 63 of the 79 psychiatric beds that have been closed in the City since 2000" is not entirely accurate. The total reduction of licensed psychiatric beds in San Francisco since 2000 has been at least 90, rather than 79, as St. Mary's closed 25 beds in 2004. Since 2000, CPMC has closed 65, rather than 63, psychiatric beds (12 beds at the Pacific Campus that were closed in 1998 and removed from license in January 2005, 31 beds at the St. Luke's Campus that were closed in 2005 and removed from license in January 2007, and 22 beds at the Davies Campus that were closed in December 2008 and removed from license in January 2011).[322]

Additionally, the comments appear to misunderstand licensed bed capacity vis-à-vis actual patient care. The statements in Comments 90-68 and 96-12 that "[f]rom 2000 through 2007, inpatient psychiatric census went up 20 percent at CPMC, before the closure at Davies Campus" do not appear to be accurate. Publicly reported data on the OSHPD website is only available for the years 2002 through 2007, but according to the available OSHPD data, the average daily census for inpatient psychiatric beds at the CPMC campuses was 39.5 in 2002 and 23.4 in 2007, representing a 41 percent decrease over this five-year time period. The combined number of inpatient psychiatric discharges at the CPMC campuses overall decreased from 1,792 in 2002 to 941 in 2007.

Alzheimer's Services

CPMC currently provides adult day care Alzheimer's services at the California Campus. As shown in Table 2.7-b, "Pacific Campus: Project Summary Table," in the Draft EIR, page 2-109, these services would be fully relocated to and would continue to be provided at the Pacific Campus under the proposed LRDP.[323] Therefore, the project would not contribute to or exacerbate any shortage of services in the City for people with Alzheimer's-related dementia.

Alzheimer's patients have both medical needs (requiring treatments with medication or treatments in a memory clinic) and, depending on the severity of the illness, custodial care needs (or round the clock supervision in a locked residential unit). Medical needs are covered by Medi-Cal, but the custodial care portion of Alzheimer's care is not paid for by Medi-Cal.

Reduction in Licensed Beds, Access to Health Care and Changes to Patient Travel Patterns/Increased Vehicle Miles Traveled

Comment 96-6 states that "the Davies Campus has eliminated 104 acute-care beds and 22 psychiatric beds in 2008/2009." This statement appears to have been based upon Table 2-2 in the Draft EIR (page 2-10). Please note that as shown on page C&R 4-36 in Chapter 4 of this C&R document, revisions have been made to Table 2-2, "CPMC Existing and Proposed LRDP Licensed Hospital Bed Uses" in the Draft EIR, page 2-10 (see Response PD-6, page C&R 3.2-6), and a correction has been made regarding the existing and proposed number of licensed acute-care beds at the Davies Campus. Therefore, as shown in the updated version of Draft EIR Table 2-2, between 2008 and 2009 (before the publication of the NOP for the LRDP), a total of 73 licensed acute-care beds were eliminated at the Davies Campus, rather than 104 acute care beds, as stated by the comment. The comment that 22 psychiatric beds were eliminated from the Davies Campus between 2008 and 2009 is correct. This reduction in psychiatric beds also occurred before the publication of the NOP.

[322] CPMC, Memorandum from Malia Weinberg, Senior Project Manager, Operations, Planning and Activations, to Brian Boxer (AECOM) re: Inpatient Psychiatric Beds (May 12, 2011). Each of these closures was the subject to a separate Proposition Q hearing before the San Francisco Health Commission.

[323] Alzheimer's services at the California Campus currently require payment of cash and Medi-Cal is not accepted. No change is anticipated once these services are relocated to the Pacific Campus.

Past changes in health care services at the CPMC campuses are beyond the scope of environmental review documents under CEQA. The State CEQA Guidelines establish that the baseline for purposes of the CEQA analysis normally is the physical environmental conditions on site and in the vicinity of the project as they exist at the time the NOP is published (see Section 15125(a) of the State CEQA Guidelines). The NOP for the CPMC LRDP EIR was filed on May 27, 2009. Therefore, changes in the environmental setting that occurred prior to the publication of the NOP (May 2009) are not relevant to the analysis of the proposed LRDP's environmental impacts.

Comment 96-6 also suggests that a reduction of licensed beds under the LRDP would result in "physical and associated social and economic effects attributable to the migration of patient populations in and out of San Francisco including the resulting longer travel distances and reduced access to health care." Similarly, Comment 96-23 suggests that the reduction in licensed beds within the CPMC system and "the change in service resulting from the restricted access to service provided by the new Cathedral Hill Hospital would result in direct environmental impacts (e.g., increased vehicle miles traveled and associated increased air pollutant and greenhouse gas emissions)." As explained in more detail below, the proposed LRDP would not include any reductions in the number of licensed psychiatric beds in the CPMC system, but would include reductions in the number of licensed acute care, SNF beds, and subacute-care beds.

Please see Major Response HC-1, regarding the supply of licensed acute-care beds under the LRDP, which explains that the supply of 698 acute-care beds would be sufficient to meet the existing demand (average daily census of 559 acute-care beds occupied in 2009) and accommodate future growth in demand. Comment 96-34 incorrectly suggests that the proposed LRDP would include the "elimination of acute care . . . at the St. Luke's Hospital." As shown in Table 2-2, "CPMC Existed and Proposed LRDP Licensed Hospital Bed Uses," on page 2-10 of the Draft EIR and the updated version of Table 2-2 included in the text revisions in Chapter 4 of this C&R document (page C&R 4-36), the number of licensed acute-care beds at the St. Luke's Campus would be reduced from 150 to 80 under the proposed LRDP, but as discussed in Major Response HC-1, the supply of acute care beds at the St. Luke's Campus would be sufficient to meet demand.

Please also see Major Response HC-4 (page C&R 3.23-19), which explains that the proposed total of 18 licensed psychiatric beds (all at the Pacific Campus) under the LRDP would be adequate to respond to the demand for CPMC beds, based on the past demand census (average daily census of 10.6 for psychiatric beds in 2009).[324]
