Re: Attached Comments and Responses on Draft Environmental Impact Report Case No. 2005.0555E: California Pacific Medical Center (CPMC) Long Range Development Plan

Attached for your review please find a copy of the Comments and Responses document for the Draft Environmental Impact Report (Draft EIR) for the above referenced project. This document has been provided either on a CD or as a hard copy. This document is also available for download on the Planning Department's website http://tinyurl.com/sfceqadocs. This document, along with the Draft EIR, will be before the Planning Commission for Final EIR certification on April 26, 2012. Please note that the public review period ended on October 19, 2010.

The Planning Commission does not conduct a hearing to receive comments on the Comments and Responses document, and no such hearing is required by the California Environmental Quality Act. Interested parties, however, may always write to the Commission members or to the President of the Commission at 1650 Mission Street, Suite 400, San Francisco, CA, 94103, and express an opinion on the Comments and Responses document, or the Commission's decision to certify the completion of the Final EIR for this project. The certification of the EIR does not indicate a decision by the City to approve or disapprove the proposed project. Approval hearing would occur after the EIR certification.

Please note that if you receive the Comments and Responses document in addition to the Draft EIR published on July 21, 2010, you technically have the Final EIR. If you have questions concerning the Comments and Responses document or the environmental review process, please contact Devyani Jain at (415) 575-9051 or Devyani.Jain@sfgov.org.

Thank you for your interest in this project and your consideration of this matter.

1. INTRODUCTION

1.1 PURPOSE OF THE COMMENTS AND RESPONSES DOCUMENT

The purpose of the Comments and Responses (C&R) document is to respond in writing to the substantive comments received on the Draft Environmental Impact Report (Draft EIR) for the proposed California Pacific Medical Center (CPMC) Long Range Development Plan (LRDP) EIR. Pursuant to Section 15088 of the California Environmental Quality Act (CEQA) Guidelines, the San Francisco Planning Department (Planning Department) has considered both written and oral comments on environmental issues received from agencies, organizations, and persons who reviewed the Draft EIR and prepared written responses to those comments. Written comments were received during the 90-day public comment period from July 21 to October 19, 2010, and oral testimony was received before the Planning Commission at the public hearing on the Draft EIR held on September 23, 2010. All written comments are included herein in their entirety, as well as a complete transcript of proceedings from the public hearing on the Draft EIR, including all oral testimonies (see Appendices A and B, respectively). A complete list of those contributing comments is provided in C&R Chapter 2.

The Draft EIR, together with this C&R document, will be considered by the Planning Commission at a noticed public hearing and will be certified as a Final Environmental Impact Report (FEIR) if deemed adequate with respect to accuracy, objectiveness, and completeness. The FEIR will consist of the Draft EIR, the comments received during the public review period, responses to the comments, and any revisions to the Draft EIR that result from public agency and public comments as well as staff-initiated text changes.

1.2 ENVIRONMENTAL REVIEW PROCESS

The EIR process provides an opportunity for the public, decision-makers, and agencies to review and comment upon the project's potential environmental effects and is intended to further inform the environmental analysis. As a first step in complying with the procedural requirements of CEQA, the Planning Department published and circulated a Notice of Preparation (NOP) of an Environmental Impact Report (EIR) on July 1, 2006 that solicited comments regarding the scope of the EIR for the proposed project. The NOP and its 30-day public review comment period were advertised in the San Francisco Examiner and mailed to public agencies, organizations, nearby property owners, and other individuals likely to be interested in the potential impacts of the proposed project. A public scoping meeting during the NOP public review period was held at the Cathedral Hill Hotel on July 18, 2006. However, as planning for the CPMC LRDP continued, additional components were added to the LRDP that resulted in a reissuance of a revised NOP for a 30-day public review period on May 27, 2009. An additional public scoping meeting was also held on June 9, 2009 to accept oral comments on the revised and refined proposed LRDP. In addition, the City, during public review of the NOP, extended the comment period an

additional 30 days, ending on July 26, 2009. A total of 96 comment letters regarding the NOP were received by July 26, 2009, in addition to the verbal comments made by individuals at the June 9, 2009 public scoping meeting.

The Draft EIR was subsequently prepared and circulated to the public, other interested parties, agencies, nearby property owners, individuals likely to be interested in the potential impacts of the proposed project, people who submitted comments during the NOP public review comment period, and to those who requested a copy of the Draft EIR. Copies of the Draft EIR were available for public review during normal business hours at the San Francisco Planning Department, 1650 Mission Street, Suite 400, San Francisco, California 94103. The Draft EIR was also posted for public review at http://www.sfplanning.org.

The Draft EIR was circulated for public review and comment starting on July 21, 2010, for an initial 60-day public review period that was then extended to 90 days. During the public review period, the City accepted comments related to the adequacy, accuracy, or completeness of the Draft EIR from agencies, decision-makers, and interested members of the public. The public review and comment period on the Draft EIR to solicit public comment on the adequacy and accuracy of information presented in the Draft EIR concluded at 5:00 p.m. on October 19, 2010. Comments received beyond the close of the public comment and review period were also considered and responded to during the preparation of this C&R document. The comments received during the public comment and review period are the subject of this C&R document, which addresses all substantive written and oral comments on the Draft EIR.

The City has revised the EIR as appropriate and will present it to the Planning Commission for certification. The Planning Commission will certify the EIR as final, if it is deemed adequate with respect to accuracy, objectiveness, and completeness. The City decision-makers will consider the certified FEIR, along with other information and the public process, to determine whether to approve, modify, or disapprove the proposed project and to specify any applicable environmental conditions as part of project approvals.

If the City decides to approve the proposed project with any significant effects that are identified in the FEIR, which are not avoided or reduced to a less-than-significant level, the City must indicate that any such unavoidable significant effects are acceptable due to overriding considerations as described in CEQA Guidelines Section 15093. This is known as a Statement of Overriding Considerations. In preparing this statement, the City must balance the benefits of a proposed project against its unavoidable environmental risks. If the benefits of a project outweigh the unavoidable adverse environmental effects, the adverse environmental effects may be considered acceptable (CEQA Guidelines Section 15093). If an agency makes a Statement of Overriding Considerations, the statement must be included in the record of project approval.

1.3 DOCUMENT ORGANIZATION

The C&R document is organized into the following sections that make up **Volume 1**:

Chapter 1: Introduction—This chapter describes the purpose of the C&R document, provides a summary of the environmental review process through certification of the EIR, and describes the organization of the C&R document.

Chapter 2: List of Persons Commenting—This chapter presents a list of the agencies, organizations, and individuals who submitted written comments during the public review period or spoke at the public hearing on the Draft EIR. The names of persons who spoke at the public hearing are presented in the order of the speakers at the hearing. Written comments are organized chronologically and numbered according to the date on which each letter was received by the Planning Department. **C&R Table 2-1, Commenters on the Draft EIR (Numeric by Letter Number)**, page C&R 2-1, shows the letter number, commenter, and date of the comment letter. **C&R Table 2-2, Commenters on the Draft EIR (By Commenter Type)**, page C&R 2-5, groups and presents a list of the commenters according to commenter type, beginning with state or local agencies, then boards and commissions, organizations, and individuals. A cross-referenced table, Appendix I. Cross Reference Matrix Of Draft EIR Comments, provides a guide to show where each bracketed comment per letter or transcript has been addressed and the code for each topic raised.

Chapter 3: Comments and Responses—This chapter has been organized by topic, and topics are addressed in the same order as they are addressed in the Draft EIR. Each environmental issue area is addressed in the same order as in the Draft EIR (i.e., beginning with Land Use and ending with Other CEQA Issues), and Chapter 3 contains responses to all comments raised with respect to the contents of the Draft EIR. An additional section, entitled "Other Issues," is included as part of Chapter 3 to address comments regarding health care and other miscellaneous social, economic, or other non-environmental issues that were received during the public comment and review period for the Draft EIR.

Each comment letter has been assigned a number, and comments in each letter are bracketed and assigned a secondary comment-specific number. For example, the letter from the Cathedral Hill Neighbors Association is Letter 15, and the bracketed comments in this letter are numbered 15-1 through 15-4. Each oral comment from the September 23, 2010 Planning Commission hearing transcript is denoted by “PC” and is identified with a number denoting its sequence within comments received at the public hearing (e.g., PC-45).

Within each issue area section of Chapter 3, the bracketed comment or groups of bracketed comments are presented first, followed by the response to that comment or group of comments. The responses to comments

within each section are coded by topic and numbered after each comment or comment grouping in consecutive order within each topic section (e.g., Response LU-1).

The Response Category Codes are as follows:

INTRO: Introduction
PD: Project Description
LU: Land Use and Planning
AE: Aesthetics
PH: Population, Employment, and Housing
CP: Cultural and Paleontological Resources
TR: Transportation and Circulation
NO: Noise
AQ: Air Quality
GH: Greenhouse Gas Emissions
WS: Wind and Shadow
RE: Recreation
PS: Public Services
UT: Utilities and Service Systems
BI: Biological Resources
GE: Geology and Soils
HY: Hydrology and Water Quality
HZ: Hazards and Hazardous Materials
ME: Mineral and Energy Resources
AG: Agricultural and Forest Resources
ALT: Alternatives
HC: Healthcare
OTH: Miscellaneous Other

The commenter's name and comment code are also included at the beginning of each comment. To avoid redundancy and in the cases where the Planning Department received duplicate letters, all responses are provided for the first occurrence (according to comment letter number) of such a comment letter or email. If a duplicate comment exists for a particular comment, the duplicate comment number is also listed at the beginning of the comment for reference. The comment letters are presented in their entirety in Appendix A. Comment Letters of the C&R document. The transcript of the Planning Commission hearing is presented in Appendix B. Planning Commission Transcript of the C&R document.

The responses in many cases provide clarification of the EIR text but some revisions to the Draft EIR text have been made in response to comments received. Single-underlined text is used to represent language added or modified in the Draft EIR; ~~strikethrough~~ is used to represent language deleted from the Draft EIR. The subject matter of one topic may overlap with that of other topics, so the reader must occasionally refer to more than one group of comments and responses to review all the information on a given subject. Cross-references are provided where necessary.

Chapter 4: Draft EIR Revisions—This chapter presents text changes to the EIR that reflect both text changes made as a result of a response to a comment as well as staff-initiated text changes identified by the San Francisco Planning Department staff to update, correct, or clarify the EIR text. The changes have not resulted in significant new information with respect to the proposed project, including any new significant environmental impacts that cannot be mitigated to a less-than-significant level, or new mitigation measures that the project sponsor has declined to adopt.

This C&R document, together with the Draft EIR, will constitute the Final EIR. As such, the changes to the Draft EIR's text set forth in Chapter 4, "Draft EIR Revisions," will be incorporated into the Final EIR.

Chapter 5: References—This chapter includes the references for the Comments and Responses document.

Appendices – The Appendices are included in **Volume 2** and consists of the following.

Appendix A. Comment Letters
Appendix B. Planning Commission Transcript
Appendix C. Amended Construction Emissions
Appendix D. GHG Checklist
Appendix E. Cathedral Hill Supplemental Sensitivity Analyses
Appendix F. Transportation Demand Management
Appendix G. Cathedral Hill Medical Office Building Design Modifications
Appendix H. Modern Context Statement Memo
Appendix I. Cross Reference Matrix Of Draft EIR Comments

2. LIST OF PERSONS COMMENTING

C&R Table 2-1 lists the agencies, boards or commissions, organizations, or persons commenting on the CPMC LRDP Draft EIR, in writing during the public comment period from July 21, 2010 through October 19, 2010. This table presents the letters or e-mails, for the most part, in the order that they were received by the City, and each item is presented with consecutive numbering (e.g., Letter 1, Letter 2, Letter 3, etc.). Duplicate letters received are indicated with an asterisk. A scanned copy of the letters and emails are included in Volume 2: Appendix A. Comment Letters.

3. COMMENTS AND RESPONSES

3.1 INTRODUCTION

In this chapter, comments on the Draft EIR, including written comments received by the Planning Department and oral testimony transcript comments from the hearing on the Draft EIR, are bracketed, numbered, and grouped by topic, similar to the organization of topics in the Draft EIR, under their respective headings. Each comment or group of comments is followed by a response.

Several comments were received during the public comment and review period for the Draft EIR that addressed issues related to the organization of the Draft EIR, CEQA procedures, and next steps in the EIR process. As the Introduction chapter of the Draft EIR identifies the general organization of the document, general steps of the CEQA process, and noticing requirements, it is considered appropriate to address these as comments regarding the Introduction chapter of the Draft EIR, itself.

3.1.1 APPENDIX G OF THE STATE CEQA GUIDELINES

Comment

(Rose Hillson—Jordan Park Improvement Association, September 23, 2010) [18-33 INTRO, duplicate comment was provided in 30-33 INTRO]

"20. The DEIR refers to Appendix G of CEQA. For the layperson, it would be helpful to have 'Appendix G, Environmental Checklist Form' which can be found at the following link: http://ceres.ca.gov/ceqa/guidelines/AppendixG.html on one page without having it scattered in the Impacts and Mitigation Measures Table S-2."

Response INTRO-1

As noted in the comment, Appendix G of the State CEQA Guidelines can be viewed at the following California Natural Resources Agency website: http://ceres.ca.gov/ceqa/guidelines/Appendix_G.html. Also, as noted on page 4-1 of the Draft EIR, the significance criteria used in the EIR are based on the guidance of the San Francisco Planning Department's Environmental Planning Division (formerly Major Environmental Analysis or MEA). The criteria are based on the broad questions that are contained in the environmental checklist in Appendix G of the State CEQA Guidelines, but these have been made more specific to the environment and conditions in the City and County of San Francisco. This is appropriate under CEQA. As is stated in State CEQA Guidelines section 16064.5(b):

> The determination of whether a project may have a significant effect on the environment calls for careful judgment on the part of the public agency involved, based to the extent possible on scientific and factual data. An ironclad definition of significant effect is not always possible because the significance of an activity may vary with the setting.

In each environmental resource section of the Draft EIR, under the Significance Criteria subheading, thresholds of significance specific to that environmental issue are described. For example, Section 4.13.4 of the Draft EIR, page 4.13-16, identifies the thresholds that were used to determine whether implementing the proposed CPMC LRDP would result in a significant impact on biological resources.

Comments

(Barbara Kautz—CHNA and Bernal Heights Neighborhood Center, October 19, 2010) [87-9 INTRO, duplicate comment was provided in 108-9 INTRO]

"7. The DEIR limits its consideration of significant impacts to City-defined 'criteria of significance,' which in many cases omit potentially significant impacts or permit significant impacts to occur."

(Barbara Kautz—CHNA and Bernal Heights Neighborhood Center, October 19, 2010) [87-58 INTRO, duplicate comment was provided in 108-58 INTRO]

"I. The DEIR Improperly Limits Its Consideration of Significant Impacts to City- Defined 'Criteria of Significance,' Thereby Failing to Consider Actual Impacts The DEIR confines its evaluation of potential environmental impacts to City-defined 'criteria of significance,' which are often the same as the questions asked in Appendix G of the CEQA Guidelines. A threshold of significance, however, is not conclusive evidence of the level of impact *(Mejia* v. *City of Los Angeles,* 130 Cal. App. 4th 322, 342 (2005)); and Appendix G states specifically that the 'sample questions *do not necessarily represent thresholds of significance*' (emphasis added). Nonetheless, the DEIR uses the Appendix G criteria and other City-defined criteria to limit its discussion of significant impacts. Examples follow."

Response INTRO-2

These comments state that the CPMC LRDP Draft EIR improperly limits the consideration of significant impacts of the proposed LRDP, which could permit significant impacts to occur. The comment further states that the Draft EIR improperly omits potentially significant impacts or confines its evaluation of potential environmental impacts to City-defined "criteria of significance," which are based on Appendix G of the State CEQA Guidelines, when Appendix G states that the "sample questions do not necessarily represent thresholds of significance."

In each environmental resource section of the CPMC LRDP Draft EIR, the significance criteria or relevant standards of significance are presented, under the "Significance Criteria" subheading. These standards are used in the Draft EIR to establish the magnitude of environmental impact of a project that is considered "significant." In many cases, the definition of significance varies from community to community, based on the unique environmental characteristics of that community's location. Appendix G of the State CEQA Guidelines presents sample questions that lead agencies are encouraged to use to evaluate whether a proposed project may have a significant effect on the environment, but are not presumptive standards of significance. The Draft EIR and other environmental documents prepared by the Lead Agency, San Francisco Planning Department, include several questions and thresholds in addition to those presented in Appendix G (e.g., Section 4.9, "Wind and Shadow," of the Draft EIR). These specified thresholds were specifically adopted by the City, and incorporated into its Administrative Code (Chapter 13 of the Code), to provide specific guidance on consideration of environmental impacts particularly pertinent to City and County of San Francisco. As such, in each resource section, after presenting the relevant checklist questions that are based on the guidance of the San Francisco Planning Department's Environmental Planning Division (formerly MEA), which is generally based on State CEQA Guidelines Appendix G, the Draft EIR presents a discussion of the specific standards of significance that are used for that environmental resource area.

Under CEQA, the establishment of standards of significance unique to a particular setting is encouraged. Section 15064(b) of the State CEQA Guidelines addresses this issue by stating that:

> [T]he determination of whether a project may have a significant effect on the environment calls for careful judgment on the part of the public agency involved, based to the extent possible on scientific and factual data. An ironclad definition of significant effect is not always possible

> because the significance of an activity may vary with the setting. For example, an activity which may not be significant in an urban area may be significant in a rural area.

In this case, the City and County of San Francisco has established standards of significance that are used in EIR documents for projects in the City that reflect the unique setting, goals, and values of the community. As noted in the Draft EIR, page 4-1, the significance criteria included were based on the guidance of the San Francisco Planning Department's Environmental Planning Division (formerly MEA) and Chapter 31 of the San Francisco Administrative Code and generally based on the environmental checklist in Appendix G of the State CEQA Guidelines. The standards were objectively applied to specific near-term and long-term projects under the proposed LRDP and the level of significance of impacts was determined.

For example, Section 4.5.3 of the Draft EIR, page 4.5-53, identifies the thresholds that were used to determine whether implementing the proposed CPMC LRDP would result in a significant impact on transportation and circulation. Please also see Response OTH-88 (page C&R 3.23-301) for further discussion of what is required to be evaluated in an EIR under CEQA.

Because the Draft EIR evaluated potential impacts in compliance with guidance provided by the San Francisco Planning Department and Appendix G of the State CEQA Guidelines, in compliance with Section 15064 of the State CEQA Guidelines, the analysis contained in the Draft EIR is considered to adequately evaluate and disclose all of the potential physical environmental impacts of the proposed CPMC LRDP.

3.1.2 GLOSSARY

Comment

(Rose Hillson—Jordan Park Improvement Association, September 23, 2010) [18-86 INTRO, duplicate comment was provided in 30-86 INTRO]

"As a note, please define 'MEIR' in the Glossary as it is not there but in the small print of the table described above."

Response INTRO-3

The comment requests that the definition of "MEIR" be included in the glossary of the Draft EIR. The term "maximally exposed individual receptor" (MEIR), found in the Draft EIR on pages 4.7-35 and 4.7-67, is defined as the off-site location where the highest incremental cancer risk due to project construction or operational emissions is calculated. Incremental means the potential additional cancer risk posed by the proposed activities above the background cancer risk already present (e.g., breathing existing air pollutants).

In response to this comment, the following text has been added to the Glossary contained within the Table of Contents in the Draft EIR, page xxiii, as follows:

Term	Definition
maximally exposed individual receptor (MEIR)	The off-site location where the highest incremental cancer risk is calculated resulting from project construction or operational emissions. Incremental means the potential additional cancer risk posed by the proposed activities above the background cancer risk already present (e.g., breathing existing air pollutants).

3.1.3 NEAR-TERM VERSUS LONG-TERM

Comment

(Paul Wermer—CPMC Neighbors Coalition and Pacific Heights Residents, October 18, 2010) [67-12 INTRO, duplicate comments were provided in 67-14 INTRO, 67-17 INTRO, 67-30 INTRO, 67-33 INTRO, 67-35 INTRO, and 67-46 INTRO]

"We understand that the Pacific site plans are still substantially undeveloped, and suggest that the final EIR expressly call this out as an issue to address in the Pacific site project level CEQA assessment."

Response INTRO-4

This comment requests that the CPMC LRDP Final EIR specifically state that the proposed site plans at the Pacific Campus are substantially undeveloped, and also state that this issue would be addressed in the future project-level CEQA assessment of CPMC's Pacific Campus. As stated in Section 1.3, "CEQA Analysis of CPMC Long Range Development Plan: Near-Term Versus Long-Term Project Components" of the Draft EIR on pages 1-12 and 1-13, long-term projects are analyzed at the program level, pursuant to State CEQA Guidelines Section 15168. The proposed long-term projects at the Pacific Campus would require additional or supplemental project-level environmental review, as necessary. At such time, specific project-level site plans would be provided in the additional/supplemental environmental review documents for Pacific Campus. Also at that time, the environmental issues associated with the long-term development at the Pacific Campus including those requested in the comment—will be considered at a project level and impacts will be evaluated, as necessary and required under CEQA.

3.1.4 NOTICING REQUIREMENTS UNDER CEQA

Comment

(Bobbi Lopez—La Voz Latina, September 23, 2010) [20-1 INTRO]

"La Voz Latina has spent the last five years working with Latino families in the Tenderloin. We engage in parent trainings; meetings; and parent leadership development in the neighborhood. Attached please find information on the demographic shifts in the neighborhood, via Urban Solutions, that indicate the large population of families residing near and around the proposed Sutter CPMC hospital. The area [sic] along Geary and O'Farrell are highly populated by families and Latino families at that.

When we asked families, living a mere blocks from the site, if they had heard of the proposed hospital, only one person had confirmed that they heard about it (please note our membership includes tenant council members and PTA presidents). We are concerned about outreach to our community, which numbers in the thousands. As you know, the Tenderloin has the highest density of children in the city and county of San Francisco, with the least amount of services."

Response INTRO-5

The above excerpted comment is the introductory paragraph in the comment letter from the La Voz Latina organization and refers to supporting attachments to the comment letter, which include background information regarding the distribution of Latino families within the Tenderloin and surveys of families in the area regarding their current level of healthcare, health concerns, and level of knowledge of the proposed CPMC LRDP and are shown as part of Comment Letter 20 in Appendix A of this C&R document. The comment also appears to question the noticing procedures followed by the Planning Department for informing neighbors, neighborhood groups and interested members of the public of the preparation and availability of the CPMC LRDP Draft EIR for public review, the public scoping meetings and hearings held for the Draft EIR, as well as information disseminated to these same groups regarding the CPMC LRDP project in general that was performed with respect to the Draft EIR and the proposed LRDP in general.

The Planning Department published a Notice of Preparation (NOP) of an EIR for the proposed CPMC LRDP on July 1, 2006. The NOP, which was published in local newspapers and posted at various locations near the project sites, solicited comments regarding the scope of the EIR and was circulated for a period of 30 days. Consistent with the City's public-noticing procedures, the San Francisco Planning Department sent a copy of the public notice to property owners and residents within a 300-foot radius of each existing / proposed CPMC campus, posted public notices within affected neighborhoods, advertised the public notice in the local newspaper, and posted the NOP on the City's website. A public scoping meeting, notice of which was given along with the NOP, was held at the Cathedral Hill Hotel on July 18, 2006 to solicit oral comments from members of the public. However, as planning of the CPMC LRDP continued, additional components were added to the plan that necessitated reissuance of the NOP. As stated on page 1-5 of the Draft EIR, an updated NOP was issued by the Planning Department for the revised and refined proposed CPMC LRDP on May 29, 2009, and a scoping meeting, notice of which was given along with the updated NOP, was held at the Cathedral Hill Hotel on June 9, 2009.

The Planning Department considered the comments received during the review period following issuance of the NOP and the public scoping meeting, and subsequently prepared the Draft EIR for the proposed CPMC LRDP in accordance with the State CEQA Guidelines (California Code of Regulations, Title 14, Division 6, Chapter 3, Sections 15000–15387) and Chapter 31 of the San Francisco Administrative Code (CEQA Procedures and Fees). The Draft EIR was made available to the public; agencies, individuals, and organizations that submitted comments during the NOP public comment review period; and, those individuals and organizations who requested a copy of the Draft EIR. The Draft EIR was circulated for public review and comment starting on July 21, 2010, for an initial 60-day public review period that was subsequently extended to 90 days. The public review and comment period for the Draft EIR concluded at 5:00 p.m. on October 19, 2010.

Pursuant to State CEQA Guidelines Section 15087(a), as lead agency, the City of San Francisco Planning Department was required to provide notice of availability (NOA) of the Draft EIR to the last known address of individuals and organizations who previously requested such notice in writing, and by a least one of the following three methods:

(1) Publication at least one time by the public agency in a newspaper of general circulation in the area affected by the proposed project. If more than one area is affected, the notice shall be published in the newspaper of largest circulation from among the newspapers of general circulation in those areas.

(2) Posting of notice by the public agency on and off the site in the area where the project is to be located.

(3) Direct mailing to the owners and occupants of property contiguous to the parcel or parcels on which the project is located. Owners of such property shall be identified as shown on the latest equalized assessment roll.

The Planning Department complied with State CEQA Guidelines Section 15087(a) by using all three methods of noticing.

As required by State CEQA Guidelines Section 15087, a Notice of Completion (NOC) was filed with the State Clearinghouse, and NOA of the Draft EIR was published in the San Francisco Examiner on July 21, 2010. That same day, the Draft EIR was posted on the Planning Department Web site (http://www.sfplanning.org), was sent to interested and nearby property owners, and was posted at the proposed project sites and their vicinities. Consistent with the requirements of State CEQA Guidelines Section 15087(a)(1), both the NOP and NOA were sent via direct mail to occupants and property owners within a 300-foot mailing radius of the proposed project sites. Notices were mailed to approximately 90 federal, state, and local agencies, 193 local organizations and neighborhood groups, approximately 3,300 individuals. Mailing lists were determined based on historic public involvement (i.e. groups and individuals that have indicated interest in the CPMC LRDP project since its inception), historic interest expressed in the proposed CPMC LRDP, and mailing lists based upon Radius Services 300-foot mailing radius around the LRDP project sites[1]. It should also be noted that the NOA of the Draft EIR was mailed to the Tenderloin Housing Clinic, with which La Voz Latina is affiliated, to the attention of Randy Shaw. Copies of the Draft EIR were also available for public review during normal business hours at the San Francisco Planning Department, 1650 Mission Street, Suite 400, San Francisco, California 94103.

Since January 2008, the project sponsor, CPMC, has conducted community outreach efforts about the proposed LRDP development project at Van Ness Avenue and Geary Boulevard/Street (Cathedral Hill Campus development) in the nearby Tenderloin neighborhood, including going door-to-door to merchants and business owners, engaging in conversations with residents of affordable housing buildings and single-room occupancy (SRO) hotels, given presentations at public neighborhood group meetings, and conducted project outreach during a number of public community events in the Tenderloin neighborhood.

On October 23, 2008, CPMC facilitated a community forum to educate and engage the public about the proposed development project and Van Ness Avenue and Geary Boulevard/Street. Prior to the event, CPMC mailed 3,000 postcards to the residences and businesses within a four-block radius around the proposed Cathedral Hill Campus site to invite any interested parties to the event. Spanish and Chinese advertisements regarding the event were placed in local publications, including El Mensajero and SingTao, respectively. Additional advertisements were also placed in neighborhood publications including Bay Area Reporter, New Bernal Journal, New Fillmore News, Noe Valley Voice, and Sun Reporter. During the October 23rd, 2008 event, Spanish, Tagalog, and Chinese translators were available and utilized to answer questions about the LRDP project.

CPMC has participated in community outreach during public events in the Tenderloin and Civic Center neighborhoods hosted by third-parties including:

- Asian Heritage Festival (May 15, 2010)
- Juneteenth Celebration (June 19, 2010)
- Sunday Streets – Civic Center (October 24, 2010)

During these events, CPMC displayed renderings and images of the proposed LRDP development project and provided literature and information about the development project in English, Spanish, and Chinese.

[1] Radius Services

Spanish and Chinese speakers were available at all of these events to answer questions or clarify any information about the project.

On September 12, 2010, CPMC facilitated an open house event at the development site of the proposed Cathedral Hill Campus for neighbors, merchants, and community members in the surrounding area to explain the LRDP project and ask any questions about the project. Leading up to the open house, CPMC went door-to-door to residences and businesses surrounding the proposed Cathedral Hill Campus with literature and information about the event in English, Spanish, Chinese, and Vietnamese. On behalf of the project sponsor, CPMC, Spanish and Chinese speakers participated in these door-to-door communications and were available to answer any questions about the event in those respective languages. If no one was home, literature about the open house was left under the property's gate or at the door. The project sponsor, CPMC, also requested permission from all businesses to post a flyer about the event in visible areas of their property, which many businesses allowed. CPMC also placed print advertisements about the open house in community publications, including Central City Extra, New Fillmore, SingTao, World Journal, Philippine News, and Castro Courier at least two weeks prior to the event. The following media outlets received a media advisory regarding the event:

- San Francisco Chronicle
- San Francisco Examiner
- Bay Citizen
- Bay Area Reporter
- KGO
- KCBS
- Central City Extra
- World Journal
- SingTao

During the September 12, 2010 event, Spanish, Tagalog, and Chinese translators were available and utilized to answer questions about the development project.

To date, CPMC has made initial contact with and provided education materials to residents of about 20 housing buildings in the Tenderloin area. During each of these contacts, representatives of the project sponsor, CPMC, explained to the Tenderloin housing building representatives about resources that would be provided as part of the LRDP project for nearby Tenderloin area building residents and tenants, including accessibility for low income populations, acceptance of Medi-Cal, Medi-Care, Healthy Families, and Healthy San Francisco by CPMC. A number of building managers noted that their building's residents hold regular meetings and events that could be potential opportunities for CPMC to provide information about the proposed LRDP project.

The project sponsor, CPMC, conducted door-to-door and ground outreach regarding the proposed LRDP project in the Tenderloin neighborhood on the following dates: August 20, 2010, August 23, 2010, August 24, 2010, August 26, 2010, August 27, 2010, September 1, 2010, January 6, 2011, January 13, 2011, January 14, 2011.

A comprehensive list of public meetings, gatherings, forums, and events that CPMC has attended or participated in has been provided below. (The level of participation is noted specifically after each listing.)

- Middle Polk Neighborhood Association January 21, 2008 – CPMC presentation
- Lower Polk Neighbors February 5, 2008 – CPMC presentation
- Lower Polk Neighbors April 1, 2008 – CPMC presentation
- Lower Polk Neighbors August 5, 2008 – CPMC presentation
- Polk Corridor Business Association September 9, 2008 – CPMC presentation CPMC presentation
- Community Forum at Cathedral Hill Hotel October 23, 2008 – presentation hosted by CPMC
- Lower Polk Neighbors May 5, 2009 – CPMC presentation
- Tenderloin Futures Collaborative September 9, 2009 – CPMC presentation

- Alliance for a Better District 6 presentation September 9, 2009 – CPMC presentation
- Good Neighbor Coalition meeting December 2009 – meeting
- Good Neighbor Coalition meeting January 2010 – meeting
- Lower Polk Neighbors January 5, 2010 – attended
- Alliance for a Better District 6 January 12, 2010 – attended
- Tenderloin Futures Collaborative April 21, 2010 – attended
- Informational session with Van Ness/Geary site neighbors April 2010 – meeting
- Asian Heritage Festival outreach, Civic Center/Little Saigon May 15, 2010 – information table
- Lower Polk Neighbors June 1, 2010 – CPMC presentation
- Good Neighbor Coalition meeting June 2010 – meeting
- Juneteenth Celebration outreach – Civic Center June 19, 2010 – information table
- Middle Polk Neighborhood Association – June 21, 2010 – attended
- Tenderloin Futures Collaborative July 21, 2010 – CPMC presentation
- Van Ness/Geary Open House September 12, 2010 – Facilitation and door-to-door outreach leading up to event.
- Lower Polk Neighbors September 21, 2010 – CPMC presentation
- Tenderloin Futures Collaborative October 20, 2010 – attended
- Sunday Streets Civic Center outreach October 24, 2010 – information table
- Lower Polk Neighbors October 5, 2010 – attended
- Lower Polk Neighbors November 9, 2010 – attended
- Lower Polk Neighbors January 11, 2011 – attended
- Middle Polk Neighbors January 17, 2011 – attended
- Alliance for a Better District 6 January 19, 2011 – attended
- Middle Polk Neighbors February 9, 2011 – attended
- Tenderloin Futures Collaborative February 16, 2011 – attended
- Middle Polk Neighbors March 9, 2011 – attended
- Project Homeless Connect March 16, 2011 – participated

3.1.5 PROCEDURES FOR REVIEW OF C&R AND QUESTIONS REGARDING PROCESS FOR RECIRCULATION OF THE DRAFT EIR

Comments

(Barbara Kautz—CHNA and Bernal Heights Neighborhood Center, October 19, 2010) [87-2 INTRO, duplicate comment was provided in 108-2 INTRO]

"In our view, the DEIR is seriously deficient, fundamentally flawed, and fails to comply with long-established principles relating to review under the California Environmental Quality Act (public Resources Code §§ 21000 - 21177) (CEQA) and adopted implementing regulations (14 California Code of Regulations §§ 15000 - 15387) (CEQA Guidelines). The DEIR is 'so fundamentally and basically inadequate and conclusory' as to preclude meaningful public review and comments. It should be redrafted in conformance with CEQA and recirculated so that the public may have the opportunity to understand the environmental impacts of the CPMC Long Range Plan and, in particular, to develop serious mitigation measures and alternatives that will mitigate *devastating impacts on health care* provided to underserved communities located south of Market Street and *devastating impacts on the communities* near the proposed monster Cathedral Hill hospital."

(Barbara Kautz—CHNA and Bernal Heights Neighborhood Center, October 19, 2010) [87-10 INTRO, duplicate comment was provided in 108-10 INTRO]

"CEQA requires that EIRs be redrafted and recirculated when a DEIR is 'so fundamentally and basically inadequate and conclusory in nature that meaningful public review and comments were precluded' (CEQA Guidelines section 15088.5(a)(4)). Despite the length of the DEIR, its analysis of the project impacts is inadequate and does not provide an opportunity for meaningful public review of the *CPMC Long Range Plan*. The DEIR

should be redrafted in conformance with CEQA and recirculated so that the public may have the opportunity to understand the environmental impacts of the CPMC Long Range Plan."

(Barbara Kautz—CHNA and Bernal Heights Neighborhood Center, October 19, 2010) [87-65 INTRO, duplicate comment was provided in 108-65 INTRO]

"Conclusion

CEQA requires that EIRs be redrafted and recirculated when a DEIR is 'so fundamentally and basically inadequate and conclusory in nature that meaningful public review and comments were precluded.' The DEIR prepared for the CPMC Long Range Plan is fatally flawed. It rejects the environmentally superior alternative without substantial evidence, fails to analyze many impacts at all, defers mitigation, and fails to develop mitigation measures. It should be redrafted in conformance with CEQA and recirculated so that the public may have the opportunity to understand the environmental impacts of the CPMC Long Range Plan and be able to respond to the proposal as fully informed citizens."

(Gloria Smith—California Nurses Association, October 19, 2010) [90-17 INTRO]

"Substantively, as best as we can discern given the DEIR's impenetrable nature, the document did not comply with CEQA because it:

- Failed to accurately describe the Project and its environmental setting;
- Failed to disclose significant environmental impacts;
- Employed misleading and illegal baselines;
- Deferred mitigation;
- Failed to identify effective and enforceable mitigation for each significant impact; and,
- Recommended that the City override some 100 significant Project impacts absent any attempt to mitigate these impacts.

Based on the above deficiencies, the City failed, as a matter of law, to inform the public and decision makers about the Project's significant impacts on air quality, traffic and transit, land use, the loss of access to affordable health care, and soil and ground water contamination at the Project's various sites."

(Gloria Smith—California Nurses Association, October 19, 2010) [90-90 INTRO]

"III. CONCLUSION

The City's DEIR failed to satisfy CEQA's fundamental mandate of informing the public and decision makers of the potentially significant environmental impacts of a proposed project, and imposing all feasible alternatives and measures to mitigate those impacts to less than significant. This is especially true here given the myriad of undisclosed and unmitigated impacts, City-wide and regionally, this hopelessly confusing DEIR presented. The DEIR must be revised to address the deficiencies described herein and in the attached documents and re-circulated for public review."

(Gloria Smith—California Nurses Association, October 19, 2010) [93-4 INTRO]

A revised DEIR must be prepared with full and adequate project description and environmental setting sections. Once this key information is available to fully analyze all of the Project's potentially significant impacts, then the City will be in a position to ensure that is has required all feasible measures and/or alternatives to mitigate the Project's identified impacts.

(Gloria Smith—California Nurses Association, October 19, 2010) [93-24 INTRO]

A revised DEIR must not only disclose these likely significant impacts, it must also include a reasonable range of alternatives capable of reducing or eliminating significant impacts.

(Stephanie Barton, et al—Hastings Civil Justice Clinic for the Good Neighbor Coalition, October 19, 2010) [104-75 INTRO]

"**VII. Conclusion: The DEIR's analysis is inadequate and has to be revised and recirculated to better account for the project's true impacts, especially in the Tenderloin**

A. The DEIR fails to provide city officials with all the information they need to make an informed project decision and to explain the reasons for their decision.

The first listed CEQA criterion is that an EIR is inadequate if it does not allow for informed decision making.[196] Another criterion is to '[d]isclose to the public the reasons why a governmental agency approved the project in the manner the agency chose if significant environmental effects are involved.'[197] This DEIR as written fails to meet both criteria.

[196] CEQA Guidelines § 15002(a)(I).
[197] CEQA Guidelines § 15002(a)(4)."

(Stephanie Barton, et al—Hastings Civil Justice Clinic for the Good Neighbor Coalition, October 19, 2010) [104-80 INTRO]

"**C. The DEIR has to be amended and then re-circulated for an additional round of public comments.**

Significant new information must be added to the DEIR. As detailed in this comment letter, the DEIR sidesteps any serious consideration of housing and affordable housing impacts; ignores entirely the traffic impacts for the Tenderloin neighborhood, especially regarding pedestrian safety; dismisses any serious concern about significant and unavoidable air quality and greenhouse gas emissions impacts; fails to address the need for a first source hiring program; and presumes that building a hospital and medical building complex is its own justification without any regard as to its impact on healthcare accessibility and distribution. In addition, the DEIR dismisses alternatives, including the environmentally superior alternative, in a formulaic and mechanical way without examining the underlying merits of a principal project objective-the centralization of services at the Cathedral Hill Campus.

Such a substantial revision will require a recirculation of the DEIR. California Public Resources Code section 21092.1 mandates that a lead agency re-circulate a DEIR for public comment when significant new information is added after public notice is given. CEQA Guidelines section 15088.5(a)(1) requires that a DEIR be re-circulated when information added after public notice is given recognizes that 'a new significant environmental impact would result from the project or from a new mitigation measure proposed to be implemented.' Any new studies identified or undertaken also affect the DEIR's analysis of mitigation measures and alternatives. Accordingly, when this new information is added, the DEIR must be re-circulated to ensure that the public and decision makers have a meaningful opportunity to evaluate and comment on the proposed project's true environmental impacts."

Commissioner Sugaya, September 23, 2010) [PC-388 INTRO]

"Anyway, and I just have a question for staff, which is a procedural thing, so I think it's okay, it's not about the EIR per se. Can you give me some idea, if we wanted to, for example, suspend the comment period and ask that the EIR be re-circulated, at what point do we do that? Can we do that today?

> MS. JAIN: Devyani Jain, Planning Department staff. I need to check with the City Attorney's Office about this.

MR. RAHAIM: I don't have the answer to that either, I'm sorry. We can find out.

COMMISSIONER SUGAYA: I'm not saying that we'll do it, I'm just asking a question.

MR. RAHAIM: I think my understand, I mean, is that if there were substantial enough changes to an EIR, the EIR would have to be re-circulated.

MS. JAIN: No, I think – sorry, Devyani Jain, Planning Department staff. I think the question that Commissioner Sugaya was asking, that if they wish to suspend the period of comment, and come to some sort of understanding of re-circulation, would they have to take the decision right now? I don't think they were asking what was the basis of –

COMMISSIONER SUGAYA: Yeah. I'm just saying, if, for example, I'm not saying that the Commission is going to do this, or even is thinking about it, but the comment by Commissioner Olague triggered something in my mind, which is, so we have the comment period which ends on October 19th, everything comes in, obviously at that point we have all the comments and from public testimony and written comments, and then staff and the EIR consultants will go ahead and prepare the responses, and then there will be a Comments and Responses document that will circulate back to us, combined with the Draft will be the Final EIR, at which time we – I understand at that point we can say that we feel that both documents are inadequate and here is why, and it needs to be re-circulated, but that's going to be months away.

MR. RAHAIM: If I could add, I mean, the ERO could also make a determination somewhere before the end of that process that, if there was the decision that there was enough new information required, he could make the decision that the EIR would have to be re-circulated. And that would happen after the comment period, but before the final document. By as to whether you could do it right now, I'm sorry, I just don't know.

COMMISSIONER SUGAYA: Maybe I was asking the wrong question, or positing the wrong situation. But does that come back to us as a staff recommendation, then, through MEA and the Department?

MR. RAHAIM: I believe and, again, we'll check to be certain, I believe it is the call of the ERO."

MS. JAIN: The ERO.

COMMISSIONER SUGAYA: All right, thank you"

Response INTRO-6

The above comments state that the Draft EIR is deficient, fundamentally flawed, inadequate and conclusory. The comments also stated the Draft EIR fails to comply with CEQA Statute and the CEQA Guidelines, and that the EIR must be redrafted, revised and recirculated. These comments appear to misunderstand the procedures for responding to comments on the Draft EIR under CEQA and the specific requirements under Section 15088.5 of the State CEQA Guidelines that dictate the circumstances under which the content included in the Comments and Responses (C&R) document require additional public noticing and circulation, as well as potential recirculation of the EIR.

<u>CEQA Requirement for Recirculation</u>

There are very specific criteria outlining when information included in an EIR, after circulation of the Draft EIR must be recirculated for public review, and these criteria are clearly articulated in Section 15088.5 of the State CEQA Guidelines. This section of the State CEQA Guidelines declares that when "significant new information" is added to an EIR after the Draft EIR public review period, but before

certification of the Final EIR, that information must be noticed and circulated for public review in the same way as the Draft EIR noticing and circulation is implemented. Such additional noticing and circulation, or "recirculation," is only required when the new information added to an EIR is considered "significant." Under Section 15088.5(a), significant new information constitutes:

> "New information added to an EIR…that deprives the public of a meaningful opportunity to comment upon a substantial adverse environmental effect of the project or a feasible way to mitigate or avoid such an effect (including a feasible project alternative) that the project's proponents have declined to implement."

Section 15088.5(a) of the Guidelines provides further clarification of the types of information and changes to a Draft EIR that may fall into the definition of "significant new information," including

> "(1) A new significant environmental impact would result from the proposed project or from a new mitigation measure proposed to be implemented;
>
> (2) A substantial increase in the severity of an environmental impact would result unless mitigation measures are adopted that reduce the impact to a level of insignificance;
>
> (3) A feasible project alternative or mitigation measure considerably different from others previously analyzed would clearly lessen the significant environmental impacts of the project, but the project's proponents decline to adopt it; or
>
> (4) The draft EIR was so fundamentally and basically inadequate and conclusory in nature that meaningful public review and comment were precluded."

Additionally, Section 15088.5(b) of the CEQA Guidelines states that recirculation of the EIR is not warranted "where the new information added to the EIR merely clarifies or amplifies or makes insignificant modifications in an adequate EIR."

In light of these specific parameters for recirculation of a previously circulated Draft EIR, it is clear that the CPMC LRDP Draft EIR does not require recirculation. Although revisions have been made to the CPMC LRDP Draft EIR since publication of the document, those revisions do not rise to the level of "significant new information." More specifically, no new significant impacts have been identified. An unmitigated substantial increase in the severity of one or more environmental impacts has not been determined to occur. None of the comments on the CPMC LRDP Draft EIR have led to the identification of new feasible mitigation measures that would clearly lessen any of the significant environmental impacts of the project and which have not already been incorporated into the LRDP project, nor have any new feasible alternatives been identified that would achieve most of the objectives of the project sponsor while lessening the environmental effects of the proposed project. Finally, while this Comments and Responses document provides meaningful responses to all comments raised on the Draft EIR, and in doing so provides additional information about issues raised by the public, the provision of that additional information is not indicative that the CPMC LRDP Draft EIR was fundamentally inadequate or conclusory.

The above comments state that the Draft EIR should be amended and then re-circulated on the basis that new information should be added to the Draft EIR. In particular, the comment states that the Draft EIR "sidesteps" housing and affordable housing impacts, traffic impacts in the Tenderloin neighborhood, air quality and greenhouse gas emissions impacts, impacts to soil and groundwater contaminants, fails to address the first source hiring program, and impacts on healthcare accessibility and distribution. In addition, the above comments state that the Draft EIR dismisses alternatives (including the

environmentally superior alternative) without examining the merits of the centralization of services at the Cathedral Hill Campus.

For a discussion regarding housing and affordable housing impacts, please see Response PH-10 (page C&R 3.5-39). For a discussion regarding pedestrian safety in the Tenderloin neighborhood, please see Response TR-64 (page C&R 3.7-119). Please also see Response TR-83 (page C&R 3.7-152) for a discussion of parking related impacts in the Tenderloin, and Response TR-124 (page C&R 3.7-207) for traffic related impacts in the Tenderloin neighborhood. Please also see Response AQ-20 (page C&R 3.9-48) for a discussion of significant and unavoidable air quality impacts and Response GH-1 (page C&R 3.10-3) for a discussion of significant and unavoidable greenhouse gas emissions impacts. Please also see Response PH-26 (page C&R 3.5-90) for a discussion regarding CPMC's participation with the City's "First Source Hiring Program." For further discussion regarding impacts on healthcare accessibility and distribution, please see Major Response HC-8 (page C&R 3.23-32). Please also see Major Response HC-2 (page C&R 3.23-8) for a discussion regarding centralization of services at the Cathedral Hill Campus. Please also see Response HZ-5 (page C&R 3.18-7) regarding a discussion of the Draft EIR's analyses of soil and groundwater contaminants.

The information provided in this Comments and Responses document serves as clarification, explanation, and, in some cases, further refinement of environmental information provided in the Draft EIR, clarification of feasible mitigation measures that the project sponsor has already agreed to adopt, and information regarding social and economic issues which are not physical environmental issues that are required to be included in an EIR. Thus, the information contained in this Comments and Responses does not involve disclosure of new or substantially more severe significant environmental effects. None of the criteria for recirculation as articulated in Section 15088.5(a) of the State CEQA Guidelines have been met; therefore, recirculation of all or any portion of the CPMC LRDP Draft EIR is not warranted.

General Adequacy of the Draft EIR

The EIR process is intended to facilitate the objective evaluation of potentially significant direct, indirect, and cumulative physical environmental impacts of a proposed project, and to identify feasible mitigation measures and alternatives that would reduce or avoid the project's significant impacts. In addition, CEQA specifically requires that an EIR identify those adverse impacts determined to be significant after implementation of all feasible mitigation measures. The analysis in the Draft EIR identifies the significant impacts and provides feasible mitigation in Chapter 4.0, "Environmental Setting, Impacts, and Mitigation," and discusses alternatives that would reduce or avoid significant impacts in Chapter 6.0, "Alternatives."

In response to the statement in Comment 87-2 above that the project alternatives fail to mitigate potential impacts on health care services for underserved communities and thus additional alternatives need to be developed and therefore the EIR should be recirculated, CEQA is concerned solely with whether or not a project may have adverse physical environmental effects; it is not concerned with socio-economic effects, unless they result in indirect or secondary adverse physical impacts. See Response INTRO-7 (page C&R 3.1-17) regarding requirements under CEQA to evaluate social and economic impacts of a project, including those related to health care services. As noted in Response INTRO-7 (page C&R 3.1-17), the State CEQA Guidelines provide that "[e]conomic and social changes resulting from a project shall not be treated as significant effects on the environment."[2] Accordingly, under CEQA, the analysis of a project's social and economic impacts, including the distribution of health care services, is not required.

[2] *See* Guidelines Section 15064(e). *See also id.* at Section 15382. An economic or social change by itself is not considered a significant effect on the environment. *Goleta Union Sch. Dist. v. Regents*, 37 Cal. App. 4th 1025, 1031 (1995) (school overcrowding without link to a physical environmental change is not a significant effect on the environment); *Citizen*

As stated in the Draft EIR, page 6-1, and explained in further detail in Response ALT-1 (page C&R 3.22-11), "Section 15126.6(a) of the State CEQA Guidelines requires analysis of a range of reasonable alternatives to the project, or to the project's location, that would feasibly attain most of the project's basic objectives, but would avoid or substantially lessen any of its significant effects." The analysis of the alternatives in Chapter 6 of the Draft EIR is consistent with CEQA's "rule of reason" which requires that the EIR set forth only those alternatives necessary to permit a reasoned choice, as stated in the State CEQA Guidelines Section 15126.6(f). The environmental impacts of the proposed CPMC LRDP and a reasonable range of project alternatives have been analyzed in the Draft EIR and these are adequate for CEQA purposes. The social and economic concerns raised by commenters regarding the provision of health care services may be considered by decision-makers in determining whether or not to approve a project as proposed or approve a modified version of the project, but they do not require further analysis as a separate EIR topic or require an additional project alternative in the EIR under CEQA. The environmental impacts of the CPMC LRDP and a reasonable range of project alternatives have been analyzed in the Draft EIR, Chapter 6. See Major Response HC-8, C&R page 3.23-32, for a discussion of the effects of the proposed project on access to health care in general, and information on the charity care provided by CPMC.

As stated on page 6-403 of the Draft EIR, other than the No Project Alternative (Alternative 1A or 1B), Alternative 3A would be the environmentally superior alternative. A discussion of Alternative 3A and how it would or would not meet the project objectives is included on pages 6-399 and 6-400 of the Draft EIR. As concluded in the Draft EIR (on page 6-403) "the overall development program at the CPMC campuses under this alternative [3A] would be less than under the proposed LRDP and would result in fewer significant and unavoidable impacts." The Draft EIR does not reject Alternative 3A; rather it includes an analysis of the comparative environmental effects of that alternative compared to the proposed LRDP, and presents an assessment of the relationship of the alternative to the objectives of the project sponsor. If the decision-makers certify the Final EIR as adequate and complete under CEQA, they may then consider the merits of the proposed project, including all requested entitlements. They may also choose to approve an alternative instead of the proposed project. See also Response ALT-1 regarding Alternative 3A (page C&R 3.22-11).

After certification, the decision-makers, as part of their deliberations on the proposed project, may approve, modify, or disapprove the project as proposed, or may select one of the project alternatives presented in the document, if determined feasible. If the decision-makers decide to approve the proposed project or an alternative, they would be required to make written findings that document the reasoning behind their decision, including findings pertaining to any significant impacts of the project or alternative to be approved, findings that provided the basis for rejection of any feasible mitigation measures, and findings explaining and documenting the rejection of any environmentally superior alternatives. In particular, Section 15091(a)(3) of the State CEQA Guidelines states that the findings must identify "[s]pecific economic, legal, social, technological, or other considerations, including provision of employment opportunities for highly trained workers, make infeasible the mitigation measures or project alternatives identified in the final EIR." The findings must be supported by substantial evidence in the record. The EIR may serve as a source of evidence, but is not necessarily the embodiment of all evidence pertaining to the project, especially evidence related to non-environmental issues. Thus, under CEQA, is it not the role of the EIR to document the acceptance or rejection of any alternative, including the environmentally superior alternative. Appropriately, the Draft EIR for the proposed CPMC LRDP provides information pertaining to the significant environmental impacts of the proposed project and alternatives, but the approval or rejection of any one of those alternatives is a determination made by the decision-makers and documented in the findings, and supported by evidence in the record.

Action to Service All Students v. Thornley, 222 Cal. App. 3d 748, 757 (1990) (social effect of school closure on disadvantaged students was not a significant effect on the environment).

Further comments above state that the Draft EIR fails to provide city officials with all the information they need to make an informed decision and to explain the reasons for their decisions. The comment further states that the government agency responsible for approving the project must disclose reasons to the public why the project was approved with significant environmental effects.The Draft EIR was prepared in accordance with CEQA Guidelines Sections 15000 et seq. with respect to process, content, and level of analysis. More specifically, the organizational structure of the Draft EIR was prepared in accordance with CEQA Guidelines Article 9, Sections 15120 through 15132, which stipulate specific requirements for the content and organization of each section of an EIR. The Draft EIR also followed regulations set forth in Chapter 31 of the City's Administrative Code, which are based upon the CEQA Guidelines. The standards by which the CPMC LRDP's environmental impacts were assessed were consistent with the environmental topics checklist included in Appendix G of the State CEQA Guidelines that has been modified and supplemented with additional checklist questions, where appropriate, to reflect potential areas of analysis specific to San Francisco, consistent with Section 15125(c) of the CEQA Guidelines. Section 15063(f) of the CEQA Guidelines state that sample forms, such as Appendix G of the CEQA Guidelines, are only suggested, and public agencies are free to devise their own format. Furthermore, Section 15120(a) of the CEQA Guidelines states that EIRs shall contain the information outlined in the Guidelines regarding contents of EIRs, but the format of the document may be varied at the lead agency's discretion to allow for incorporation of local characteristics and considerations. CEQA Guidelines Section 15121 states that an EIR is an informational document which will inform public agency decision makers and the public generally of the significant environmental effect of a project, identify possible ways to minimize the significant effects, and describe reasonable alternatives to the project. The public agency shall consider the information in the EIR along with other information which may be presented to the agency. While the information in the EIR does not control the agency's ultimate discretion on the project, the agency must respond to each significant effect identified in the EIR by making findings under Section 15091 and if necessary by making a statement of overriding consideration under Section 15093, which specifically states:

> (a) CEQA requires the decision-making agency to balance, as applicable, the economic, legal, social, technological, or other benefits, including region-wide or statewide environmental benefits, of a proposed project against its unavoidable environmental risks when determining whether to approve the project. If the specific economic, legal, social, technological, or other benefits, including region-wide or statewide environmental benefits, of a proposed project outweigh the unavoidable adverse environmental effects, the adverse environmental effects may be considered "acceptable."
>
> (b) When the lead agency approves a project which will result in the occurrence of significant effects which are identified in the final EIR but are not avoided or substantially lessened, the agency shall state in writing the specific reasons to support its action based on the final EIR and/or other information in the record. The statement of overriding considerations shall be supported by substantial evidence in the record.
>
> c) If an agency makes a statement of overriding considerations, the statement should be included in the record of the project approval and should be mentioned in the notice of determination. This statement does not substitute for, and shall be in addition to, findings required pursuant to Section 15091.

Please also see Reponse HC-7 (page C&R 3.23- 74) regarding the need to develop alternatives related to the project's potential impacts to health care services. With respect to the baseline/existing conditions used in the Draft EIR, refer to Response TR-9 (page C&R 3.7- 11). Also, refer to Response INTRO-10 (page C&R 3.1- 21), which addresses the commenters' concerns regarding the provision of adequate and enforceable mitigation for the CPMC LRDP project as part of the Draft EIR, and Response PH-26 (page C&R 3.5-90) for a discussion of CPMC's hiring plan/practices. Also, refer to Major Response HC-8

(page C&R 3.23-32) for a discussion regarding access to CPMC healthcare services. Please also see Response HZ-5 (page C&R 3.18-7) regarding a discussion of the Draft EIR's analyses of soil and groundwater contaminants. Please also see Response LU-1 (page C&R 3.3-1) regarding land use compatibility.

3.1.6 SOCIAL AND ECONOMIC ISSUES

Comments

(Gloria Smith—California Nurses Association, October 18, 2010) [96-23 INTRO, duplicate comment was provided in 110-23 INTRO]

"VII. The Draft EIR Fails to Evaluate Potentially Significant Adverse Social and

Economic Impacts Associated with the CPMC LRDP

Elsewhere the CEQA Guidelines, Section 15382, define a significant effect on the environment to mean:

> ... a substantial, or potentially substantial, adverse change in any of the physical conditions within the area affected by the project, including land, air, water, minerals, flora, fauna, ambient noise, and objects of historic or aesthetic significance. An economic or social change by itself shall not be considered a significant effect on the environment. *A social or economic change related to a physical change may be considered in determining whether the physical change is significant.*

The above discussed reduction of licensed beds at three of the CPMC hospitals and the change in service resulting from the restricted access to service provided by the new Cathedral Hill Hospital would result in direct environmental impacts *(e.g.,* increased vehicle miles traveled and associated increased air pollutant and greenhouse gas emissions) and would result in adverse economic and social effects. These effects must be analyzed under CEQA. Title 14, Section 15064, Subsection (e) of the California Administrative Code provides the following guidance for evaluating the changes:

> Economic and social changes resulting from a project shall not be treated as significant effects on the environment. Economic or social changes may be used, however, to determine that a physical change shall be regarded as a significant effect on the environment. Where a physical change is caused by economic or social effects of a project, the physical change may be regarded as a significant effect in the same manner as any other physical change resulting from the project. Alternatively, economic and social effects of a physical change may be used to determine that the physical change is a significant effect on the environment. *If the physical change causes adverse economic or social effects on people, those adverse effects may be used as a factor in determining whether the physical change is significant. For example, if a project would cause overcrowding of a public facility and the overcrowding causes an adverse effect all people, the overcrowding would be* regarded *as a significant effect.*"

(Gloria Smith—California Nurses Association, October 18, 2010) [96-24 INTRO, duplicate comment was provided in 110-23 INTRO]

"The Court in Bakersfield for Local Control v. City of Bakersfield (5 Dist. 2004), Cal. App. 4 1184 [22 Cal Rptr. 3d 203], affirmed:

> Subdivision (e) of Guidelines section 15064 provides that when the economic or social effects of a project cause a physical change, this change is to be regarded as a significant effect in the same manner as any other physical change resulting from the project. (...) *Conversely, where economic and social effects result from a physical change that was itself caused by a proposed project, then these economic and*

social effects may be used to determine that the physical change constitutes a significant effect on the environment."

(Dr. Ted Lee, September 23, 2010) [PC-244 INTRO]
"MR. LEE: Good afternoon, President Miguel and members of the Commission. My name is Dr. Ted Lee. I am a primary care physician and also the Associate Medical Director at the Northeast Medical Services. We are also known as NEMS, N-E-M-S. We are the largest federally qualified health center in San Francisco targeting the medically underserved Asian population, for almost 38 years. I believe that every resident of San Francisco should have access to the best medical care. NEMS has collaborated with CPMC over the years to provide specialty care services to our underserved population, including the delivery of more than 400 babies, NEMS newborns, at CPMC each year."

Response INTRO-7

The comments above state that project-related changes in access to health care would have adverse physical environmental effects because they would result in changes in commute patterns with resultant indirect/secondary effects on air quality and greenhouse gas emissions. The comments further state that these changes fall within the range of social and economic effects, which could be a result of physical changes to the environment under development of the proposed project, that should be considered under CEQA.

The significant environmental impacts of the proposed LRDP, including those related to transportation, air quality, greenhouse gas emissions, and public services, have been fully evaluated and presented in the CPMC LRDP Draft EIR. The analyses compare the future conditions after proposed LRDP implementation with baseline conditions before the proposed LRDP, and consider the environmental effects of all patients, visitors, and employees who would be treated at, work at, or travel to and from the proposed LRDP campuses. Appropriately, the Draft EIR evaluates the effects of all people associated with the proposed LRDP campuses and does not differentiate between the environmental impacts of patients, visitors, or employees of different income levels. Such issues are of a social and economic nature and are only relevant in an EIR insofar as they connect the proposed project to a substantial adverse physical environmental effect or represent a measure of the magnitude of such an impact.

The State CEQA Guidelines (14 California Code of Regulations Section 15000 et. seq.) establishes the scope of analysis of social and economic impacts of a project and their indirect effects that is required under CEQA. These provisions, which are described below, provide a framework for considering many of the comments received on social and economic effects of the project, including issues such as health care, job opportunities, property values, and other socio-economic impacts. In some instances, the comments suggested that these socio-economic impacts of the CPMC LRDP would, in turn, result in indirect physical environmental impacts.

CEQA is concerned solely with whether a project may have adverse physical environmental effects. Accordingly, the State CEQA Guidelines provide that "[e]conomic and social changes resulting from a project shall not be treated as significant effects on the environment. Economic or social changes may be used, however, to determine that a physical change shall be regarded as a significant effect on the environment."[3] Although social and economic effects are not physical environmental effects, they can be used to connect a proposed project to a physical environmental effect. Section 15131 of the State CEQA Guidelines states that "economic and social effects of a project shall not be treated as significant effects

[3] *See* Guidelines Section 15064(e). *See also id.* at Section 15382. An economic or social change by itself is not considered a significant effect on the environment. *Goleta Union Sch. Dist. v. Regents*, 37 Cal. App. 4th 1025, 1031 (1995) (school overcrowding without link to a physical environmental change is not a significant effect on the environment); *Citizen Action to Service All Students v. Thornley*, 222 Cal. App. 3d 748, 757 (1990) (social effect of school closure on disadvantaged students was not a significant effect on the environment).

on the environment, [a]n EIR may trace a chain of cause and effect from a proposed decision on a project through anticipated economic or social changes resulting from a project to physical changes caused in turn by the economic or social changes."

In evaluating the environmental impacts of a project, an EIR must evaluate indirect physical effects, in addition to the direct effects of a project.[4] Direct effects are effects that are caused by a project and occur in the same time and place.[5] An indirect environmental effect is a change in the physical environment that is not immediately related to a project, but that is caused indirectly by a project.[6]

CEQA does not require the analysis of generalized social and economic effects related to a range of health care and other issues, such as job opportunities and property values, as suggested by many of the comments.[7] A lead agency is also not required to analyze conclusory statements regarding social and economic impacts that are not supported by substantial evidence in the record.[8]

Some comments suggest the possibility of future secondary significant effects on the environment arising from implementation of the proposed CPMC LRDP and associated changes in the local health care system, related to potential transfers of patients and changes in health care services, business displacement, changes in tax revenues, affordable housing, or urban decay. Responses to specific health care comments are addressed in responses to individual health care comments and in Health Care Major Responses 1 through 9 (pages C&R 3.23-1 through 3.23-38). In particular, the Health Care Major Responses address the following issues raised with respect to the CPMC LRDP:

- Major Response HC-1: Acute-Care Beds;
- Major Response HC-2: Location, Size, and Scope of Services at Cathedral Hill, St. Luke's, and Davies;
- Major Response HC-3: Impacts on Other Hospitals;
- Major Response HC-4: Psychiatric Beds;
- Major Response HC-5: Effect on Emergency Services;
- Major Response HC-6: Skilled Nursing Facilities (SNF);
- Major Response HC-7: Access to Single-Occupancy Rooms;
- Major Response HC-8: Access to Health Services; and
- Major Response HC-9: Health Care Master Plan.

A number of other social and economic issues raised by commenters in relation to the CPMC LRDP are addressed in Section 3.5, "Population, Employment and Housing." More specifically, Section 3.5 on page 3.5-1 contains responses to the following key social and economic issues:

- Response PH-1: Population and Housing Scope of Analysis;
- Response PH-9: Housing Affordability;
- Responses PH-14 to PH-16: Displacement of Residential Uses;
- Responses PH-17 to PH-19: Housing Mitigation;
- Response PH-25: Indirect and Induced Economic Impacts; and
- Responses PH-26 and PH-27: Hiring Plan/Practices.

[4] *See* Guidelines Section 15126.6(a).
[5] *See* Guidelines Section 15358(a)(2).
[6] *See* Guidelines Section 15064(d)(2).
[7] Indirect effects may occur later in time or further removed in distance, but must still be considered and analyzed, if they are a reasonably foreseeable impact which may be caused by the project. *See* 14 Guidelines Section 15358(a)(2), (3).

3.1.7 ORGANIZATION

Comment

(Gloria Smith—California Nurses Association, October 19, 2010) [90-12 INTRO]

"**III. THE DEIR DID NOT COMPLY WITH CEQA**

A. The DEIR Is So Poorly Organized and Poorly Written It Precludes Informed Decision Making

CEQA requires agencies to inform the public and responsible officials of the environmental consequences of their decisions before they are made, thereby protecting the environment and informed self-government.[2] A well-prepared and fully documented EIR is the 'heart' of this requirement.[3] The following are examples of how DEIR failed to satisfy these purposes:

- The DEIR is so poorly written and so poorly organized that it is largely comprehensible to even the most seasoned CEQA practitioners.
- The DEIR created confusing and unconventional terms to describe the significance of a particular environmental impact. In nearly 15 years of reviewing CEQA documents, our office has never seen, for instance, an EIR describe an environmental impact as 'potentially significant and unavoidable.' This term in oxymoronic. Environmental impacts can only be deemed significant and unavoidable at the end of the process after the lead agency has imposed all feasible alternatives and/or measures to mitigate significant impacts.
- The City did not need to invent nine different ways to distinguish between significant and insignificant impacts. These terms served no other purpose than to confuse readers.
- The DEIR employed far too many acronyms for any reviewer to keep track of. There is no reason why the preparers could not take the time to spell out infrequently used terms.

[2] CEQA Guidelines § 15002(a)(1);Berkeley Keep Jets Over the Bay Com. v. Board of Port Comrs. (2001) 91 Cal.App.4th 1344, 1354.
[3] No Oil, Inc. v. City of Los Angeles (1974) 13 Cal.3d 68, 84."

Response INTRO-8

The comment suggests that the CPMC LRDP Draft EIR does not allow the reader to make an informed decision regarding the potential environmental impacts of the proposed CPMC LRDP. The Draft EIR was prepared in accordance with CEQA Guidelines Sections 15000 et seq. with respect to process, content, and level of analysis. More specifically, the organizational structure of the Draft EIR was prepared in accordance with CEQA Guidelines Article 9, Sections 15120 through 15132, which stipulate specific requirements for the content and organization of each section of an EIR. The Draft EIR also followed regulations set forth in Chapter 31 of the City's Administrative Code, which are based upon the CEQA Guidelines. Pursuant to State CEQA Guidelines Section 15122, a table of contents is included in each volume of the Draft EIR "to assist the readers in finding analysis of different subjects and issues." In addition, a list of acronyms and abbreviations is included after the table of contents in each volume of the Draft EIR to assist readers in reading the Draft EIR. Each environmental topic analysis section of the Draft EIR is structured consistently with subheadings for Introduction, Environmental Setting, Regulatory Framework, Cumulative Conditions discussion, Significance Criteria, Impact Evaluations, and Cumulative Impacts. The standards by which the CPMC LRDP's environmental impacts were assessed were consistent with the environmental topics checklist included in Appendix G of the State CEQA Guidelines that has been modified and supplemented with additional checklist questions, where

appropriate, to reflect potential areas of analysis specific to San Francisco, consistent with Section 15125(c) of the CEQA Guidelines. Section 15063(f) of the CEQA Guidelines state that sample forms, such as Appendix G of the CEQA Guidelines, are only suggested, and public agencies are free to devise their own format. Furthermore, Section 15120(a) of the CEQA Guidelines states that EIRs shall contain the information outlined in the Guidelines regarding contents of EIRs, but the format of the document may be varied at the lead agency's discretion to allow for incorporation of local characteristics and considerations.

The Draft EIR was written and edited to present technical analyses and information in language, consistent with Section 15140 of the State CEQA Guidelines. The use of acronyms is considered a standard convention to improve readability of an analysis that repeatedly refers to proper names (agencies, regulations, or otherwise) and the list of acronyms was included to provide a comprehensive legend to which a reader could refer when reviewing the Draft EIR. Furthermore, in accordance with Section 15140 of the State CEQA Guidelines, the Draft EIR includes numerous tables and figures to increase the readability of the analysis.

Due to the relative complexity of the proposed LRDP, which includes project-level and programmatic components at five CPMC campuses, it was necessary to include several terms to differentiate not only between the relative significance of the impact but also the likelihood of occurrence of the impact. The commenter's criticism of the use of the term "potentially significant and unavoidable" is noted. Although in some cases slightly different wording was used, the terms used to describe level of impact were substantially similar to what is used in other DEIRs.

Comment

(Gloria Smith, California Nurses Association, October 19, 2010) [91-11 INTRO]

"**III.A The Draft EIR's Organization of Impact Sections Is Inconsistent with Common Use and CEQA Guidelines**

The Draft EIR discusses the potential environmental impacts of implementing the CPMC LRDP in Sections 4.1 through 4.18 *(e.g.,* 4.1 Land Use, 4.2 Aesthetics, 4.3 Population, Employment, and Housing, 4.4 Cultural and Paleontological Resources, etc.). Rather than following an alphabetical order as suggested by the CEQA Guidelines, Appendix G, and which is commonly used in CEQA documents, there is no discernible order in which the Draft EIR presents its 18 impact sections. This random order makes it more difficult to find information in various impact areas as one has to constantly refer back to the table of contents rather than just following the alphabet. If this were the only organizational issue with the Draft EIR, it would not pose a problem; unfortunately, as it is, it contributes to a host of other issues that ultimately render the document impenetrable."

Response INTRO-9

The comment suggests that the organization of Chapter 4.0, "Environmental Setting, Impacts, and Mitigation" of the Draft EIR does not allow for ease of readability. Environmental review under CEQA is administered for all departments and agencies of the City and County of San Francisco by the Environmental Planning Division of the Planning Department. The order of the potential environmental impacts in Sections 4.1 through 4.18 of the Draft EIR follow the order used in the Initial Study Checklist provided by the Environmental Planning Division, an approach generally used in EIRs for projects located in and under the jurisdiction of the City and County of San Francisco.[9] Furthermore, as noted above in Response INTRO-8, p. C&R-3.1-19, Section 15120(a) of the CEQA Guidelines states that EIRs shall contain the information outlined in the Guidelines regarding contents of EIRs, but the format of the document may be varied at the lead agency's discretion to allow for incorporation of local characteristics

[9] http://www.sf-planning.org/index.aspx?page=1570.

and considerations. As such, the Draft EIR is considered to be prepared and organized in accordance with Environmental Planning Division's guidelines and CEQA Guidelines. A table of contents was also provided in each volume of the Draft EIR to assist readers in following the organization of the document.

3.1.8 ENVIRONMENTAL IMPACTS AND MITIGATION

Comments

(Barbara Kautz—CHNA and Bernal Heights Neighborhood Center, October 19, 2010) [87-8 INTRO, duplicate comment was provided in 108-8 INTRO]

"6. Mitigation measures contained in the DEIR often do not actually mitigate project impacts."

(Barbara Kautz—CHNA and Bernal Heights Neighborhood Center, October 19, 2010) [87-29 INTRO, duplicate comment was provided in 108-29 INTRO]

"A fundamental purpose of an EIR is to identify how significant effects can be mitigated or avoided. (Public Resources Code § 21001.1(a).) The DEIR makes no effort to do this. 'A gloomy forecast of environmental degradation is of little or no value without pragmatic, concrete means to minimize the impacts.' *Environmental Council of Sacramento* v. *City of Sacramento* (2006) 142 Cal. App. 4th 1018, 1039."

Response INTRO-10

The comments state that the CPMC LRDP Draft EIR often does not actually mitigate LRDP impacts. These comments do not, however, raise specific issues regarding the LRDP Draft EIR's mitigation measures or how they do not actually mitigate the LRDP's significant impacts identified in the Draft EIR. No evidence or information to support the questions and concerns raised regarding mitigation is presented by the commenter or where they believe this occurs in the Draft EIR.

All feasible and enforceable mitigation measures that would avoid or reduce the magnitude of significant impacts of the LRDP are presented and discussed in Sections 4.1 through 4.18 of the Draft EIR (see Table S-2 on pages S-37 through S-80 for a summary of mitigation measures). Notwithstanding these measures, the Draft EIR concludes that the proposed LRDP would result in significant unavoidable impacts to transportation and circulation, noise, air quality, and greenhouse gases, which are summarized in Table 5-1 on pages 5-2 to 5-7 in Chapter 5, "Other CEQA Considerations," of the Draft EIR. To approve the project, the decision-makers would be required to adopt a statement of overriding considerations, supported by substantial evidence in the record, documenting that the perceived benefits of the project would outweigh the project's identified significant and unavoidable environmental impacts. The MMRP would ensure enforcement of adopted mitigation measures included in the certified Final EIR.

Comment

(Barbara Kautz—CHNA and Bernal Heights Neighborhood Center, October 19, 2010) [87-54 INTRO, duplicate comment was provided in 108-54 INTRO]

"H. The DEIR Improperly Defers Mitigation of Numerous Impacts or Proposes Mitigation that Does Not Mitigate Project Impacts to a Level of Insignificance. Mitigation measures must be fully enforceable or incorporated into a project (CEQA Guidelines section 15126.4(a)(2). A DEIR can defer providing precise mitigation measures only when it: (I) commits itself to mitigation; (2) provides performance standards that the mitigation must meet; and (3) provides alternative approaches to mitigation *(Endangered Habitats League, Inc.* v. *County of Orange,* 131 Cal. App. 4th 777, 793-94 (2005). Numerous mitigation measures in the DEIR do not meet these standards or rely on adopted plans that lack any commitment to implementation."

(Gloria Smith—California Nurses Association, October 19, 2010) [90-71 INTRO]

"**E. The DEIR Must Describe Effective Mitigation Measures for Each Significant Environmental Impact**

An EIR must propose and describe mitigation measures sufficient to minimize the identified significant adverse environmental impacts.[37] Also, mitigation measures must be designed to minimize, reduce or avoid an identified environmental impact or to rectify or compensate for that impact.[38] Where several mitigation measures are available to mitigate an impact, each should be discussed and the basis for selecting a particular measure should be explained.[39] The City may not rely on mitigation measures of uncertain efficacy or feasibility.[40] 'Feasible' means capable of being accomplished in a successful manner within a reasonable period of time, taking into account economic, environmental, legal, social and technological factors.[41] Mitigation measures must be fully enforceable through permit conditions, agreements or other legally binding instruments.[42] A lead agency may not make the required CEQA findings unless the administrative record clearly shows that all uncertainties regarding the mitigation of significant environmental impacts have been resolved.

Here, the DEIR lacks effective mitigation for impacts associated with site contamination, affordable housing, traffic congestion and public transit, and toxic air emissions. Additional mitigation measures must be included and a full EIR recirculated for public review.

37 CEQA sections 21002.1(a), 21100(b)(3).
38 CEQA Guidelines section 15370.
39 *Id.* at section 15126.4(a)(1)(B).
40 *Kings County Farm Bureau v. City of Hanford* (1990) 221 Cal.App.3d 692, 727 (finding groundwater purchase agreement inadequate mitigation measure because no record evidence existed that replacement water was available).
41 CEQA Guidelines section 15364.
42 *Id.* at section 15126.4(a)(2)."

Response INTRO-11

The comments state that the CPMC LRDP Draft EIR improperly defers mitigation of numerous impacts by not committing to future mitigation, by not providing performance standards that must be met, and by not providing alternative approaches to mitigation. The comment also states that several of the CPMC LRDP Draft EIR's proposed mitigation measures do not meet the standards for fully enforceable mitigation and/or rely on planning documents that are not enforceable.

Pursuant to State CEQA Guidelines Section 15126.4, feasible mitigation measures are required to reduce a project's significant environmental impacts; however, mitigation measures are not required for impacts which are found to be less than significant or have no impact at all. Mitigation measures in the CPMC LRDP Draft EIR are not deferred, although in some cases where impacts of the proposed CPMC LRDP are programmatic in nature, the mitigation measures are also programmatic in nature with performance standards established to ensure that future actions are protective of the environment. (For example, Mitigation Measure M-CP-N2 requires the preparation of site-specific testing programs to determine the potential presence of archaeological resources. Based on the findings, additional recommendations may be made to ensure that any potentially affected archaeological deposit would be identified, evaluated, and as appropriate, subject to data recovery by a qualified archaeologist, thereby causing a less-than-significant impact on archaeological resources.) Section 15126.4(a)(1)(b) of the State CEQA Guidelines recognizes that mitigation measures may not be able to be articulated in full detail at the time of an early stage or plan level EIR but also states:

> Formulation of mitigation measures should not be deferred until some future time. However, measures may specify performance standards which would mitigate the significant effect of the project and which may be accomplished in more than one specified way.

The mitigation measures identified in the Draft EIR meet the standards established in the State CEQA Guidelines, because they reduce the potentially significant impacts of the project to less-than-significant levels, where feasible, and create mitigation obligations that are enforceable by the San Francisco Planning Department and other responsible agencies, consistent with the requirements of Section 15126.4(a)(2) of the State CEQA Guidelines. For example, Mitigation Measure M-NO-N1 commits CPMC to achieving the noise standards established in the San Francisco Noise Control Ordinance through implementation of various measures, such as temporary noise barriers, maintenance of equipment, and other equipment-specific noise attenuating features, which satisfies the three criteria presented in this comment. As such, the CPMC LRDP Draft EIR is considered to meet the standards for mitigation of potentially significant impacts under CEQA. Additional measures are not necessary with respect to site contamination, affordable housing, traffic congestion and public transit, and toxic air emissions to reduce the potential impacts of the proposed CPMC LRDP to the extent feasible.

Comment

(Sheila Mahoney and James Frame, October 19, 2010) [88-10 INTRO]

"This DEIR needs a lot more work! If this is the plan, our neighborhood should not be destroyed. There needs to be a much more inclusive analysis of all the impacts on the adjoining residential streets."

Response INTRO-12

The comment expresses opposition to the proposed LRDP, states that the Draft EIR needs more work, and suggests that a more inclusive analysis of LRDP impacts on adjoining residential streets in the vicinity of the St. Luke's Campus should be included in the EIR. The commenters identified themselves as residing across the street from the St. Luke's Monteagle Medical Center. The Draft EIR evaluated the potential impacts of LRDP development on the physical environment in the vicinity of the proposed LRDP development at the St. Luke's Campus, including adjoining residential and other streets in the vicinity of the St. Luke's Campus. The CPMC LRDP Draft EIR evaluated environmental impacts from the proposed St. Luke's Campus development at the neighborhood level by focusing on construction and operations impacts related to land use, aesthetics, transportation, noise, and air quality, because these types of impacts evaluate the local scale. While other environmental resource areas also evaluate local residential impacts related to the proposed St. Luke's Campus development, during construction and operation, impacts related to aesthetics, transportation, noise, and air quality would be most notable on a daily basis for residential uses. The Draft EIR evaluates the proposed LRDP's impact on neighborhood character and land use around the St. Luke's Campus on pages 4.1-59 through 4.1-63 and concludes that the LRDP project would have less-than-significant impacts related to these topics. Please also see discussion of this issue in Response LU-30, page C&R 3.3-146. The aesthetic impacts associated with the proposed St. Luke's Campus, including perimeter changes, were analyzed in Draft EIR Impact AE-3, pages 4.2-172 through 4.2-187. Specifically, on page 4.2-184, the Draft EIR discusses the aesthetic impact of the proposed St. Luke's replacement hospital building from the perspective of adjacent residences, stating that a new six-story-tall building would replace the open expanse of the existing on-campus surface parking lot and its trees and close in the view from the side and rear of the residential buildings. As noted in the Draft EIR (page 4.2-184), the adjacent residences would not face or front toward the proposed St. Luke's replacement hospital building. In addition, while the replacement hospital building would be noticeable among existing surrounding development, the visual contrast would not be substantial or adverse, since the site is currently developed with a large hospital. As such, no potentially significant impact on the environment related to changes to the visual character of adjacent residential uses because of LRDP development was identified in the Draft EIR. Impacts related to transportation and circulation at the St. Luke's Campus are discussed in Section 4.5 of the Draft EIR, beginning on page 4.5-197. As shown in Impacts TR-84 (Draft EIR page 4.5-200) and TR-85 (Draft EIR page 4.5-201), 15 intersections in the vicinity of the St. Luke's Campus were evaluated as part of the Draft EIR, and the impacts of the proposed CPMC LRDP on the flow of traffic in the neighborhood, including residential

streets, were determined to be less than significant. Section 4.6 in the Draft EIR includes discussions of the St. Luke's Campus and associated Impacts NO-1 through NO-5. Please see a discussion of noise-related impacts on the surrounding residential streets of St. Luke's Campus in Response NO-68, page C&R 3.8-74. During construction, residences along Duncan Street between Guerrero and Valencia Streets would experience construction noise levels equivalent to 69 dB, which would be less than the 80 dB maximum noise level/threshold established in the San Francisco Noise Control Ordinance, and impacts were determined to be less than significant. Section 4.7 in the Draft EIR includes discussions of the St. Luke's Campus and associated Impacts AQ-1 through AQ-10, which includes impacts to the adjacent residential neighborhood.

Comment

(Gloria Smith—California Nurses Association, October 19, 2010) [90-2 INTRO]

"CNA has been actively involved in every aspect of CPMC's long range planning efforts. Most recently, CNA spoke at the Planning Department's June 9, 2009, scoping meeting and submitted written comments on June 26, 2010. CNA's scoping comments pointed out the need for the City to properly address, among other things, project alternatives, cumulative impacts, traffic congestion and the need for the City to not present the public with an overly complicated EIR given its wish to combine both project-specific and programmatic issues into one CEQA document."

Response INTRO-13

The comment states that the California Nurses Association/National Nurses United (CNA) pointed out the need for the San Francisco Planning Department to properly address project alternatives, cumulative impacts, and traffic congestion in the CPMC LRDP Draft EIR. The comment further states that the CPMC LRDP EIR is overly complicated, given that it is both a project-level EIR and program-level EIR.

As noted in the Draft EIR, page 6-1, pursuant to State CEQA Guidelines Section 15126.6, the Draft EIR examines a range of reasonable alternatives that "would feasibly attain most of the basic objectives of the project, but would avoid or substantially lessen any of the significant effects of the project, and evaluate comparative merits of the alternatives." The Draft EIR provides a thorough analysis and comparison of the LRDP alternatives (Alternative 1A, Alternative 1B, Alternative 2, Alternative 3A, and Alternative 3B), such that the advantages and disadvantages of each alternative, compared with the proposed LRDP, can be weighed and analyzed.

As noted in the CPMC LRDP Draft EIR, page 4-3, cumulative impacts are analyzed in Chapter 4, "Environmental Setting, Impacts, and Mitigation," pursuant to State CEQA Guidelines Section 15130, under each environmental resource area discussed in Sections 4.1 through 4.18.

The analysis in Section 4.5, "Transportation and Circulation," of the CPMC LRDP Draft EIR was prepared in accordance with the San Francisco Planning Department's standards for all environmental documents which addresses traffic congestion. The individual transportation impact studies for each campus were prepared under the guidance of San Francisco Planning Department staff and reviewed by the San Francisco Planning Department staff, and they were used as the basis for environmental review of Section 4.5.

Please see Response INTRO-4 (page C&R 3.1-4) for a discussion of programmatic impacts in the Draft EIR and pages 1-13 and 1-14 of Chapter 1, "Introduction and Background," of the Draft EIR for a discussion of program- and project-level CMPC LRDP developments analyzed in the EIR. Please see Response INTRO-8 (page C&R 3.1-19) for a discussion on the organization of the document and how it conforms to the State CEQA Guidelines with respect to the presentation of an analysis in and the organizational structure of an EIR. As noted in Response INTRO-8, the Draft EIR was prepared in

accordance with the State CEQA Guidelines and includes numerous measures to increase the readability and reduce the perceived complexity of the analysis.

Comment

(Gloria Smith—California Nurses Association, October 19, 2010) [90-3 INTRO]

"Unfortunately, as explained below, the City's DEIR did not reflect the myriad of substantive comments from numerous members of the public submitted after the Notice of Preparation for the DEIR. Nor did the DEIR comply with the requirements of the California Environmental Quality Act ('CEQA').[1] Accordingly, the City may not approve the Project or grant any permits for it until it revises the EIR in a manner that makes it understandable to the reader and addresses all of the Project's environmental impacts. The City must recirculate a revised EIR for public review and comment.

[1] Public Resources Code §§ 21000 et seq."

Response INTRO-14

The comment states that the CPMC LRDP Draft EIR did not reflect the substantial number of Draft EIR Notice of Preparation of an EIR (NOP) comments received from the public. As noted in the Draft EIR, page 1-5, written and oral comments received during the CPMC LRDP NOP comment period were accepted from May 27 to June 26, 2009. Comment letters in the NOP and a transcript of all oral testimony received at the public scoping meeting are on file and available for public review at the Planning Department, 1650 Mission Street, Suite 400, San Francisco 94103. A summary of comments received on the NOP that were considered during the evaluation of the Draft EIR are provided on page 1-5 of the Draft EIR.

Environmental issues raised during the CPMC LRDP's EIR public scoping/NOP process were considered during the preparation of the CPMC LRDP Draft EIR and are addressed in Chapter 4, "Environmental Setting, Impacts, and Mitigation," in the Draft EIR. A summary of other comments received in the public scoping/NOP process of the proposed CPMC LRDP that were not relevant to the project's environmental analysis and were beyond the scope of a CEQA document is included in Section 5.7, "Unresolved Issues and Areas of Controversy," in the CPMC LRDP Draft EIR, beginning on page 5-22 in Chapter 5, "Other CEQA Considerations." The Draft EIR provides a detailed analysis of all potential environmental impacts. The comment does not present justification to support suggestions that the Draft EIR needs to be recirculated. Please also see Response INTRO-6 (page C&R 3.1-11) for a discussion of the conditions under which recirculation of all or a portion of a Draft EIR is required.

3.2 PROJECT DESCRIPTION

3.2.1 LRDP

3.2.1.1 GENERAL

Comments

(Gloria Smith—California Nurses Association, October 19, 2010) [90-5 PD]

"**II. PROJECT DESCRIPTION**

The DEIR is both a project-specific and 20-year, long range development plan that encompasses CPMC's multi-phased plan to meet state seismic safety requirements. In addition to changes at its four existing medical facilities, the DEIR proposes a new hospital complex, the Cathedral Hill Campus. The four existing CPMC medical campuses are the Pacific Campus in the Pacific Heights area, the California Campus in the Presidio Heights area, the Davies Campus in the Duboce Triangle area, and the St. Luke's Campus in the Mission District."

(Gloria Smith—California Nurses Association, October 19, 2010) [90-6 PD]

"**A. Cathedral Hill Campus**

At this site, the existing Cathedral Hill Hotel and 1255 Post Street Buildings would be demolished and CPMC would design, construct, and operate the proposed Cathedral Hill Campus. This campus would include a newly constructed 15-story, 555-bed hospital at the northwest comer of the intersection of Van Ness Avenue and Geary Boulevard and a medical office building ('MOB') at the northeast comer of the intersection of Van Ness Avenue and Geary Street, across Van Ness Avenue from the proposed Cathedral Hill Hospital site. A pedestrian tunnel beneath Van Ness Avenue would connect the hospital and MOB.

An existing MOB at the intersection of Sutter and Franklin Streets, currently partially used as an MOB, would be fully converted for use as an MOB."

(Gloria Smith—California Nurses Association, October 19, 2010) [90-7 PD]

"**B. Pacific Campus**

At this campus, CPMC would convert an existing hospital into a new ambulatory care center, including a new building, additional underground parking, renovation of other existing buildings and demolition of four existing buildings. The existing acute-care services and Women's and Children's Center would be relocated to the proposed Cathedral Hill Hospital."

(Gloria Smith—California Nurses Association, October 19, 2010) [90-8 PD]

"**C. Davies Campus**

New development would include the construction of a new Neuroscience Institute building, a new MOB, and related parking improvements."

(Gloria Smith—California Nurses Association, October 19, 2010) [90-9 PD]

"**D. St. Luke's Campus**

Development would include demolition of the existing St. Luke's Hospital tower, Redwood Administration Building, and magnetic resonance imaging trailer; construction of the new 80-bed, acute-care St. Luke's

Replacement Hospital; and construction of the proposed MOB/Expansion Building and associated underground parking."

(Gloria Smith—California Nurses Association, October 19, 2010) [90-10 PD]

"**E. California Campus**

The existing acute-care services and Women's and Children's Center would be relocated to the proposed Cathedral Hill Hospital. CPMC would sell the California Campus by 2020, after relocating that campus's inpatient services (i.e., care of all patients staying longer than 24 hours) to the proposed Cathedral Hill Hospital and its other services to the Pacific Campus. Some existing on-site medical activities would continue at the California Campus in a relatively small amount of space that CPMC would lease back from the new property owner indefinitely."

(Gloria Smith—California Nurses Association, October 19, 2010) [90-11 PD]

"The DEIR/LRDP would be implemented in two phases: the *near-term* phase (Cathedral Hill Campus and St. Luke's Campus projects and Neuroscience Institute at Davies Campus) and the *long-term* phase, *i.e.*, projects that would commence significantly after 2015 or are contingent upon the completion of near-term projects (including projects the Pacific Campus and California Campus and Castro Street/14th Street MOB at Davies Campus)."

(Gloria Smith—California Nurses Association, October 19, 2010) [91-2 PD]

"**Background**

The LRDP is CPMC's multi-phased strategy to meet state seismic safety requirements for its hospitals and create a 20-year framework and institutional master plan for CPMC's four existing medical campuses and one proposed new medical campus, the Cathedral Hill Campus, in San Francisco. The four existing CPMC medical campuses are the Pacific Campus in the Pacific Heights area, the California Campus in the Presidio Heights area, the Davies Campus in the Duboce Triangle area, and the St. Luke's Campus in the Mission District.

Cathedral Hill Campus: Under the LRDP, the existing Cathedral Hill Hotel and 1255 Post Street Buildings would be demolished and CPMC would design, construct, and operate the proposed Cathedral Hill Campus. This campus would include a newly constructed 15-story, 555-bed hospital at the northwest corner of the intersection of Van Ness Avenue and Geary Boulevard and a medical office building ('MOB') at the northeast comer of the intersection of Van Ness Avenue and Geary Street, across Van Ness Avenue from the proposed Cathedral Hill Hospital site. A pedestrian tunnel beneath Van Ness Avenue would connect the hospital and MOB. An existing MOB at the intersection of Sutter and Franklin Streets, currently partially used as an MOB, would be fully converted for use as an MOB.

Pacific Campus: Implementing the LRDP would result in the interior renovation and conversion of an existing hospital into a new ambulatory care center ('ACC'), a new ACC building addition, additional underground parking, renovation of other existing buildings and demolition of four existing buildings. The existing acute services and Women's and Children's Center would be relocated to the proposed Cathedral Hill Hospital.

Davies Campus: New development would include the construction of a new Neuroscience Institute building, a new MOB, and related parking improvements.

St. Luke's Campus: Development would include demolition of the existing St. Luke's Hospital tower, Redwood Administration Building, and magnetic resonance imaging ('MRI') trailer; construction of the new 80-bed, acute-care St. Luke's Replacement Hospital; and construction of the proposed MOB/Expansion Building and associated underground parking.

California Campus: The existing acute-care services and Women's and Children's Center would be relocated to the proposed Cathedral Hill Hospital. CPMC would sell the California Campus by 2020, after relocating that campus's inpatient services (i.e., care of all patients staying longer than 24 hours) to the proposed Cathedral Hill Hospital and its other services to the Pacific Campus. Some existing on-site medical activities would continue at the California Campus in a relatively small amount of space that CPMC would lease back from the new property owner indefinitely.

CPMC's LRDP would be implemented in two phases: the *near-term* phase (Cathedral Hill Campus and St. Luke's Campus projects and Neuroscience Institute at Davies Campus) and the *long-term* phase, i.e., projects that would commence significantly after 2015 or are contingent upon the completion of near-term projects (including projects at the Pacific Campus and California Campus and the Castro Street/14th Street MOB at Davies Campus).

The Draft EIR for the proposed CPMC LRDP purports to analyze impacts associated with near-term projects at the project-level pursuant to Section 15161 of the State CEQA Guidelines. The EIR is also a programmatic EIR for analysis of long-term projects pursuant to Section 15168 of the State CEQA Guidelines to the extent that impacts associated with those projects can be reasonably forecasted. These long-term projects will require additional or supplemental project-level environmental review at a later date.[2]

[2] Draft EIR, pp. 1-1 – 1-3 and pp. 2-1 – 2-3."

(Gloria Smith—California Nurses Association, October 20, 2010) [96-2 PD, duplicate comment was provided in 110-2 PD]

"CPMC consists of four hospitals in San Francisco, CA, and is affiliated with Sutter Health ('Sutter'). The LRDP is CPMC's multi-phased strategy to meet state seismic safety requirements for its hospitals and create a 20-year framework and institutional master plan for CPMCs four existing medical campuses and one proposed new medical campus, the Cathedral Hill Campus. The four existing CPMC medical campuses are the Pacific Campus in the Pacific Heights area, the California Campus in the Presidio Heights area, the Davies Campus in the Duboce Triangle area, and the St. Luke's Campus in the Mission District."

(Matt Hagemann—California Nurses Association, November 24, 2010) [119-3 PD-CH]

"The CPMC Long Range Development Plan provides for a 20 year development strategy to meet State seismic safety requirements for hospitals and to develop a master plan for its four existing medical campuses:

- Pacific Campus at Sacramento and Buchanan Streets;
- California Campus at Maple and California Streets;
- Davis Campus at Castro and 14th Streets; and
- St. Luke's Campus at Cesar Chavez and Valencia Streets.

A new medical campus (Cathedral Hill) is proposed at Van Ness Avenue and Geary Boulevard for completion by 2015. To construct the new campus, CPMC would demolish the existing Cathedral Hill Hotel and 1255 Post Street Office Building and construct the proposed new Cathedral Hill Hospital, a 15-story, 555-bed hospital at the northwest intersection of Van Ness Avenue and Geary Street. Implementation of the Long Range Development Plan at Pacific Campus would result in the decommissioning of an existing nine-story hospital building and its renovation and conversion to a ambulatory care center (ACC), construction of a new nine-story ACC building addition and new structured parking, and renovation of other existing buildings at this campus."

(Matt Hagemann—California Nurses Association, November 24, 2010) [119-4 PD-DV]

"New development at Davies Campus would include the construction of a new four-story Neuroscience Institute building at the corner of Noe Street and Duboce Avenue, currently occupied by a 206-space surface parking lot. A new three-story Castro/14th Street MOB (and related parking improvements) would also be developed at Davies

Campus after demolition of the existing on-site 290-space structured parking garage, currently located at the corner of 14th and Castro Streets."

(Matt Hagemann—California Nurses Association, November 24, 2010) [119-5 PD-SL]

"Development at St. Luke's Campus would include construction of a new five-story, 80-bed, acute-care replacement hospital at the site of the existing 3615 Cesar Chavez Street Surface Parking Lot, and demolition of the existing 1970's St. Luke's Hospital tower and construction of a five-story MOB/Expansion Building (and related parking improvements) on this former hospital site."

Response PD-1

The comments above summarize development that would be part of the proposed CPMC LRDP. The comments are noted. The comments do not raise issues regarding the adequacy, accuracy, or completeness of the Draft EIR. Additional details about development projects that are part of the proposed CPMC LRDP can be found in the "Project Description" chapter of the Draft EIR, beginning on page 2-1.

Comment

(Gloria Smith—California Nurses Association, October 19, 2010) [92-2 PD]

"The CPMC Long Range Development Plan proposes significant changes to five medical campuses in San Francisco, with projects planned for completion in Years 2015, 2020, and in 2030. According to the Draft EIR, the Project generally includes:

- Cathedral Hill Campus would be developed with a new hospital, new medical office building (MOB), and conversion of an existing office building from a partial MOB to a full MOB as follows: a vacant hotel and office building would be demolished and replaced by a new 1,163,800 square foot hospital with 555 beds; seven existing buildings would be demolished and a new MOB would be constructed; and interior modifications would convert the 1375 Sutter facility to a full MOB.

- Pacific Campus would be converted to outpatient care to serve the area north of Market Street. The existing acute care and emergency functions would be transferred to the Cathedral Hill Campus after completion of the hospital in 2015. The Ambulatory Care Center (ACC) would then be expanded and onsite parking would be added.

- California Campus would not be changed in the near term. After the new Cathedral Hill Hospital opens in 2015 and after the ACC expansion at the Pacific Campus in Year 2020, the California Campus would close.

- Davies Campus functions would continue, together with construction of a Neuroscience building in the near term and a second MOB in the longer term.

- St. Luke's Campus would include construction of a replacement hospital with 145,000 square feet and 80 beds, and a new MOB/Expansion Building."

Response PD-2

The comment is paraphrasing and summarizing development projects that would be part of the proposed CPMC LRDP. The comment is correct in noting that the California Campus would not change in the near term and would close after 2020, when most CPMC-related uses would cease; however, the campus may still be used. As stated in the Draft EIR beginning on page 2-131, "A small amount of CPMC-operated space (approximately 2,400 square feet [sq. ft.]) at the 3838 California Street MOB (primarily outpatient imaging and blood drawing) would be leased from the buyer of the California Campus property

indefinitely. Thus, it is expected that by about 2020 almost all CPMC-related use of the California Campus would cease. Future uses by subsequent purchasers are speculative in nature. It is assumed that a prospective purchaser would ultimately seek to renovate and/or redevelop the California Campus; however, the nature, timing, and extent of development are unknown at this time and are therefore beyond the scope of this EIR." Additional details about the proposed CPMC LRDP can be found in the "Project Description" chapter of the Draft EIR, beginning on page 2-1.

Comment

(Gloria Smith—California Nurses Association, October 19, 2010) [93-31 PD]

A financing plan for the proposed Project and a discussion of whether such a financing plan would include sale of the California campus to finance the project. The financing plan would necessarily result in disclosure of related environmental impacts and alternatives."

Response PD-3

The comment is noted. This comment, which requests information regarding a financing plan for the LRDP, involves social and economic considerations. The comment will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project. Please also see Response INTRO-7 (page C&R 3.1-17) regarding the appropriate consideration of social and economic impacts under CEQA.

Although the comment suggests that the description of a financing plan "would necessarily result in disclosure of related environmental impacts and alternatives," the comment provides no supporting evidence to suggest that the financing plan for the proposed LRDP could result in direct or indirect physical environmental impacts or to explain why the financing plan would result in disclosure of such impacts, and the comment gives no indication as to the types of environmental impacts and alternatives that potentially would be disclosed as the result of the inclusion of a discussion of a financing plan in the EIR.

Please note that the Project Description in the Draft EIR discloses on page 2-131 that "CPMC plans to sell the California Campus as early as possible after the relocation of inpatient functions."

Comments

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-10 PD, duplicate comment was provided in 30-10 PD]

"4. Speaking of helicopters, will you be running a hospital transport service with helicopters?"

(Barbara Kautz—CHNA and Bernal Heights Neighborhood Center, October 19, 2010) [87-61 PD, *duplicate comment was provided in 108-61 PD*]

"The Draft EIR should also indicate whether a helipad is proposed at any of the hospitals included in the Long Range Development Plan."

Response PD-4

The comments ask whether the CPMC LRDP proposes a helipad at any of the hospitals in the CPMC LRDP, includes the use of helicopters for hospital transport service, or whether helicopters would be used during project construction and operations. The comments request additional details as part of the Draft EIR regarding the use of helicopters as a hospital transport service. The CPMC LRDP does not propose to use helicopters for hospital transport service or to construct helipads on any of the proposed hospital

buildings. Therefore, no such additional details are necessary. Please refer to Response PD-19, page C&R 3.2-19, for information regarding use of helicopters during LRDP construction and operations.

Comment

(Gloria Smith—California Nurses Association, October 19, 2010) [92-28 PD]

"Construction of the proposed Cathedral Hill tunnel under Van Ness Avenue, a State Highway, requires Caltrans approval and a permit."

Response PD-5

The comment is correct in stating that the California Department of Transportation (Caltrans) would need to review and approve construction of the CPMC LRDP proposed tunnel under Van Ness Avenue, because Van Ness Avenue is part of U.S. Highway 101. As stated in the Draft EIR, page 4.5-156, "Construction activities across and beneath Van Ness Avenue would be subject to both City and Caltrans review and approval." As stated in the Draft EIR in Table 2-3, page 2-15, the Van Ness Avenue Pedestrian Tunnel would require "encroachment permits (construction) and long-term lease or other agreement (long-term occupancy) for subsurface right-of-way for Van Ness Avenue Pedestrian Tunnel."

Comment

(David Meckel, September 19, 2010) [PC-209 PD]

"The CPMC planning work is smart, sustainable, and urbanistically sophisticated. It puts hospital beds and services where transit and people are located, and does so in a way that enhances streetscapes, route stops and solar access. The Long Range Development Plan places facility enhancements scaled appropriate to the surrounding urban context in the Pacific Heights, Duboce Triangle, and Mission District neighborhoods, while concentrating the highest density of beds and services at the Van Ness location where the highest density of people and urban fabric will accommodate them."

Response PD-6

The comment expresses general support for the proposed CPMC LRDP and states that this project includes appropriate distribution of medical services within the urban context of CPMC campus neighborhoods. The comment is noted. This comment does not raise issues regarding the adequacy, accuracy, or completeness of the Draft EIR. The comment will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project.

3.2.1.2 ADEQUACY OF PROJECT DESCRIPTION/OBJECTIVES

Comments

(Barbara Kautz—CHNA and Bernal Heights Neighborhood Center, October 19, 2010) [87-3 PD, duplicate comment was provided in 108-3 PD]

"1. The Draft EIR contains such a detailed and constrained list of project objectives that only CPMC's proposed project could possibly satisfy those objectives, effectively precluding any project alternatives."

(Barbara Kautz—CHNA and Bernal Heights Neighborhood Center, October 19, 2010) [87-11 PD, duplicate comment was provided in 108-11 PD]

"Detailed Comments on the DEIR

A. The Defined Project Objectives Are Too Narrow and Seek to Preclude the Consideration of Environmentally Superior Projects.

The DEIR on pages 2-7 to 2-9 (repeated on pages 6-5 to 6-7) contains such a detailed list of project objectives as to preclude any project alternatives inconsistent with the Long Range Plan proposed by CPMC. While the 'Overarching Objectives,' to construct seismically safe hospital facilities and provide the highest quality of patient care, may be appropriate, many of the 'Specific Objectives' simply describe the plan that CPMC is proposing, such as:

- Consolidating a long list of specialty services with the Women's and Children's Center.
- Rebuilding St. Luke's as a 'community hospital' with limited defined specialties.
- Locating facilities on sites owned or easily purchased by CPMC consistent with the mandates of SB 1953. (Note that SB 608, effective January 1, 2011, will extend the former SB 1953 limits by up to five additional years.)
- Locating facilities on a site big enough to accommodate the consolidation of services proposed by CPMC.

When a project and its objectives are defined too narrowly, the EIR may fail to examine a reasonable range of alternatives. (*See City of Santee v. County of San Diego* (1989) 214 Cal. App. 3d 1438, 1455 (alternatives inadequate and unduly narrow because project objectives inaccurate)). A project sponsor like CPMC may not seek to limit the scope of environmental review by proceeding with investments in a project (such as the purchase of land) and then declaring that any change in its proposal is infeasible. 'The CEQA reporting process is not designed to freeze the ultimate proposal in the precise mold of the initial project. . .' Otherwise, CEQA's mandate to consider alternatives would be meaningless.' (*Kings County Farm Bureau v. City of Hanford* (1990) 221 Cal. App. 3d 692, 736-37 (citing *County of Inyo v. City of Los Angeles* (1977) 71 Cal. App. 3d 185, 199)).

The constrained nature of these objectives severely limits the consideration of alternatives. No objectives are included relating to access to health services by target populations, the highest priority in the Public Health Department's strategic plan. The project objectives should be redefined in the EIR so that they do not 'freeze the ultimate proposal in the precise mold' of the proposed CPMC Long Range Plan and include broader community objectives for the provision of health services."

(Gloria Smith—California Nurses Association, October 19, 2010) [90-30 PD]

"The Project's centerpiece is the proposed 555-bed Cathedral Hill campus from which all other Project components derive. The presumed inevitability of the Cathedral Hill campus permeates the entire EIR and resulted in a cursory and deficient alternatives analysis, especially with respect to larger, viable St. Luke's campus.

The DEIR's alternatives section enumerates CPMC's 'core medical' objects for the project,[17] among those are:

- Consolidating CPMC's campuses by consolidating specialized services and Women's and Children's services into one centralized acute-care hospital;
- Distributing inpatient capacity among campuses which includes 'an optimal number' of smaller, community based hospitals, ambulatory care facilities, and medical offices;

- Ensuring that consolidation minimizes redundancies in terms of staffing, equipment, support spaces, central processing and other facilities to avoid inefficiency and unnecessary costs;
- Rebuilding St. Luke's into a community hospital that provides medical/surgical care, critical care, emergency care and gynecologic and low-intervention obstetric care;
- Maintaining CPMC's prominent role in San Francisco and the greater Bay Area in terms of research and medical education; and,
- Enhancing CPMC's role as a provider of medical and administrative jobs.

[17] DEIR at page 6-6, 7."

(Gloria Smith—California Nurses Association, October 19, 2010) [93-2 PD]

"As described in detail below, the DEIR fails to address the impacts of the whole Project, including all aspects of the Project capable of generating significant impacts. Specifically, key elements of the proposed Project are apparently not complete or not yet available[1] rendering the project description incomplete and inadequate to support disclosure and analysis of Project-related impacts. Other information about the Project was disclosed in the DEIR, but was extremely difficult to locate.[2] This approach violates the information gathering purpose of CEQA.

1 Examples of project description information that is not included in the DEIR or the administrative record include but is not limited to: 1) the proposed detailed text of plan and policy amendments; and 2) the project's specific proposal for replacement housing.

2 For example, information about the construction workforce was buried in the Transportation and Circulation section of the DEIR and not described in the project description. See DEIR Table 4.5-10. Another source of useful information concerning project details is the Alternatives chapter. See DEIR, Chapter 6. For example, it is in the Alternatives chapter that tables can be found describing key details such as: a) building square footage by specific use; b) proposed project square footage compared with existing uses; and c) staffing. See e.g. Tables 6-1, 6-10a and 6-11. These numbers, and the assumptions underlying them, are necessary to assess the Project's various environmental impacts, especially those that are estimated based on square footage (e.g. employment generation, parking, and transportation). As such, these and other 'numbers' set forth in the various sections of the DEIR must be presented clearly in one place in a revised DEIR; the project description."

(Gloria Smith—California Nurses Association, October 19, 2010) [93-16 PD]

"**II. Project Background**

The DEIR's project description sections describe the existing Project sites in a fair amount of detail. However, understanding the Project as proposed requires reviewing numerous sections of the DEIR in order to get a sense of the whole Project, as the key elements are not adequately or clearly described in the project description section (e.g., construction activities, workforce, and health care services to be provided at each campus). Table 1 below, provides a comparison of the existing CPMC campuses to the proposed Project assembled from a view of the entire DEIR to inform the comments in this letter.

According to the DEIR, CPMC's long range strategy is to meet state seismic safety requirements for hospitals and create a 20-year framework and institutional master plan (IMP) for CPMC's four existing medical campuses and one proposed new medical campus in San Francisco, the Cathedral Hill Campus. The four existing CPMC medical campuses are the Pacific Campus in Pacific Heights, the California Campus in the Presidio Heights area, the Davies Campus in the Duboce Triangle area, and the St. Luke's Campus in the Mission District. DEIR at page 1-1. The Project's objectives do not address how the proposed Project results in benefiting the overall health care services system for the San Francisco community."

(Stephanie Barton, et al.—Hastings Civil Justice Clinic for the Good Neighbor Coalition, October 19, 2010) [104-71 PD]

"**VI. The DEIR's alternatives analysis hinges on project objectives that are impermissibly narrow, fails to address a sufficient range of alternatives, and does not adequately analyze the given alternatives.**

A. The project objectives are impermissibly narrow.

While many of the project objectives are broadly written, several objectives are impermissibly narrow. These narrow objectives seriously limit the range of alternatives that the DEIR discusses and curtail meaningful consideration of the feasibility of examined alternatives. This use of objectives to dismiss alternatives is a severe flaw in the DEIR's methodology.

CEQA requires a 'statement of the objectives sought by the project.'[179] These objectives are used by the lead agency in developing a reasonable range of alternatives. Narrow objectives can limit this range, inhibiting the purpose of CEQA. [180] While the overarching objectives of the project are anything but narrow, several of the core medical services objectives are so drawn as to exclude any option other than the preferred project. Notably, the project seeks to consolidate women's and children's services and a broad range of specialty medical services at a single location. [181] This framing always favors maximizing development on the Cathedral Hill Campus. Alternative 3 proposes moving women's and children's services away from Cathedral Hill, but it inevitably fails as an alternative because it is contrary to the project's consolidation objective. The same holds true for Alternative 2, which because it does not centralize services to the extent of the preferred project cannot compete.

CEQA requires consideration of alternatives that will 'feasibly attain most of the basic objectives.'[182] For this project, a single objective—consolidation—trumps all other considerations. The reason is that consolidation is a feature or method of providing medical services, not a beneficial outcome, such as having seismically safe hospitals, providing quality care, or serving particular populations. Making consolidation a project objective leaves no room for evaluating how different alternatives compare in meeting a range of substantive outcomes. The answer is always going to be the alternative that permits the greatest centralization of services in a single location. The practical effect is to render meaningless the alternatives analysis.[183]

[179] CEQA Guidelines §15124(b).

[180] The California Supreme Court has confirmed that overly narrow project objectives can violate CEQA. *In Re Bay Delta Coordinated Environmental Impact Report Coordinated Proceedings* 43 Cal. 4th 1143, 1166 (2008) ('a lead agency may not give a project's purpose an artificially narrow definition').

[181] DEIR 2-7 & 6-6.

[182] CEQA Guidelines §16126.6(a).

[183] Several Court of Appeal decisions place limits on the ability of project objectives to dictate the feasibility of alternatives. *See Preservation Action Council v. City of San Jose* 141 Cal App 4th 1336, 1351-2 (2006); *Uphold Our Heritage v. Town of Woodside* 147 Cal. App. 4th 587, 595 fn. 4 (2007); and *Save Round Valley Alliance v. County of lnyo* 157 Cal. App. 4th 1437, 1460 (2007)."

(Stephanie Barton, et al.—Hastings Civil Justice Clinic for the Good Neighbor Coalition, October 19, 2010) [104-78 PD]

"**B. A decision on a project should not be based on narrowly tailored and self-serving project objectives, but on consideration of the project's true impacts including those impacts that are ignored or under-analyzed in the DEIR.**

The DEIR rejects alternatives for no reason other than the applicant's preferences as expressed in narrowly drafted project objectives, in particular its insistence that all women's and children's services and specialized medical services be consolidated at the Cathedral Hill Campus. Rejecting alternatives because they are inconsistent with self-serving project objectives is incompatible with the purpose of CEQA. For this project, there needs to be a full and honest discussion of its potential substantive benefits across a reasonable range of

alternatives, not just a narrow focus on CPMC's preferred method for providing hospital services. If alternatives are rejected based on policies *underlying* project objectives, the DEIR should have examined these rationales."

Response PD-7

The comments express concern regarding the level of specificity of CPMC's LRDP objectives and question whether they preclude the ability to develop a reasonable range of alternatives. As explained in Response ALT-1 (page C&R 3.22-11), the Draft EIR complies with the CEQA requirement to consider a reasonable range of potentially feasible alternatives. As stated in the Draft EIR, page 6-1, "Section 15126.6(a) of the State CEQA Guidelines requires analysis of a range of reasonable alternatives to the project, or to the project's location, which would feasibly attain most of the project's basic objectives, but would avoid or substantially lessen any of its significant effects." The analysis of the alternatives is consistent with CEQA's "rule of reason," which requires that the EIR set forth only those alternatives necessary to permit a reasoned choice (State CEQA Guidelines, Section 15126.6[f]). The environmental effects of the proposed LRDP and a reasonable range of alternatives have been analyzed in the Draft EIR at a level adequate for CEQA purposes. The project objectives thus did not limit the choice of alternatives considered in the Draft EIR.

Additionally, as explained in Response ALT-1 (page C&R 3.22-11), with the exception of those alternatives initially rejected as infeasible during the scoping process (as discussed on Draft EIR page 6-8 in Section 6.3, "Alternatives Considered But Rejected"), the Draft EIR did not eliminate from consideration any of the project alternatives on the basis of infeasibility or because the alternatives did not meet a certain project objective. These above-mentioned alternatives were rejected as infeasible because they would cause disruption to medical services, have lengthy (multiple-phase) construction timelines, and because potential alternative sites would not serve community needs. The determination as to whether the alternatives to the project analyzed in the Draft EIR are feasible or infeasible will be made by City decision-makers at the time they consider the merits of the project and decide whether or not to approve, modify, or carry out the LRDP as proposed. The decision-makers could choose to approve one of the project alternatives and not the CPMC LRDP.

Some of the comments suggest that while the overarching objectives of the project are not narrow, several of the core medical services objectives are so drawn and geared towards consolidation of medical services as to exclude any option other than the proposed project. Please see Major Response HC-2 (page C&R 3.23-8) regarding the consolidation of medical services as part of the proposed CPMC LRDP. The State CEQA Guidelines provide that "[t]he range of potential alternatives to the proposed project shall include those that could feasibly accomplish *most* of the basic objectives of the project and could avoid or substantially lessen one or more of the significant effects" (State CEQA Guidelines, Section 15126.6[c]). The State CEQA Guidelines provide that "the discussion of alternatives shall focus on alternatives to the project or its location which are capable of avoiding or substantially lessening any significant effects of the project, *even if these alternatives would impede to some degree the attainment of the project objectives,* or would be more costly" (State CEQA Guidelines, Section 15126.6[b], emphasis added). Therefore, there is no legal requirement that the project alternatives selected meet *every* objective, or even every core objective of the project.[1] It is sufficient for the EIR to analyze alternatives that meet most of the core project objectives.[2]

The project alternatives studied in the Draft EIR would meet many, but not all of the project objectives. For example, the Draft EIR explained, beginning on page 6-31, that both Alternative 3A and Alternative 3B would meet the overarching objective to "construct modern, seismically safe hospital facilities that would remain operational in the event of a major disaster, both to serve CPMC's patients and to play an

[1] *Cal. Native Plant Soc'y v. City of Santa Cruz*, 177 Cal. App. 4th 957, 991–992 (2009) (rejecting claims that project objectives were too narrow because "the alternatives discussed in an EIR need not *fully* accomplish all of the project objectives").
[2] *Ibid.* at 991 (citing *Mira Mar Mobile Cmty. v. City of Oceanside*, 119 Cal. App. 4th 477, 489 [2004]).

important role in San Francisco's disaster response and preparedness system, through the development of a new CPMC campus and the redevelopment of existing campuses in a manner that is fully compliant with the Alfred E. Alquist Hospital Seismic Safety Act and SB 1953, as mandated by the State of California."

Unique constraints and planning considerations that apply to hospital/medical institution projects in general, and the LRDP in particular (i.e., continuum of emergency/community medical services, program needs, and space allocation for hospital/medical institutions), resulted in a more specific set of project objectives for the LRDP than might be applicable to a typical housing, office, or commercial development project. The CPMC LRDP is driven largely by the need for CPMC's hospital projects to comply with state-mandated deadlines for meeting seismic safety standards under SB 1953 as modified by subsequent legislation, while at the same time, CPMC needs its hospitals to remain operational during the implementation and construction of the proposed CPMC LRDP, providing uninterrupted acute care and other services to meet patient demand. The project objectives were also shaped by the desire to create a long-term plan for the St. Luke's Campus, consistent with the recommendations of the Blue Ribbon Panel, the San Francisco Health Commission, and the Health Commission Task Force, to continue serving existing patient populations at this campus. Lastly, the objectives were shaped in part by the need to plan facilities in a manner that would (1) enable CPMC to provide health care that would meet existing and future patient demands, (2) optimize patient safety and clinical outcomes, and (3) be cost effective and operationally efficient.[3]

A project like the CPMC LRDP that is subject to a very specific project scope and development requirements (i.e., seismic safety requirements of SB 1953, continuum of emergency/community medical services, program needs, and space allocation for hospital/medical institutions) would have some parallel constraints on the range of potentially feasible alternatives that would accomplish most of the project's basic objectives.[4]

In addition, CEQA requires that an EIR's project description contain a statement of the objectives sought by the project sponsor to assist the lead agency in developing a reasonable range of alternatives to evaluate in the EIR.[5] The statement of project objectives should include the underlying purpose of the project.[6] Thus, the project objectives included in the Draft EIR are those of the LRDP, and not citywide health care services-related policy objectives.

Relevant citywide policy objectives were discussed elsewhere in the Draft EIR (see Draft EIR page 3-1 in Chapter 3, "Plans and Policies"), but they would not have been appropriate to discuss as an element of the sponsor's project objectives and the project description. The project description contained in the Draft EIR states the project objectives of the LRDP in accordance with CEQA requirements. As stated in CEQA Guidelines Section 15124, the description of the project shall contain a clearly written statement of objectives that will help the lead agency develop a reasonable range of alternatives to evaluate in the EIR and will aid the decision-makers in preparing findings or a statement of overriding considerations, if necessary. The statement of objectives should include the underlying purpose of the project, but should not supply extensive detail beyond that needed for evaluation and review of the environmental impact.

---

[3] Comments by Dr. Mitch Katz, DPH, at November 19, 2009 IMP Hearing for California Pacific Medical Center's 2008 Institutional Master Plan.

[4] *Save S.F. Bay Ass'n v. S.F. Bay Conservation & Dev. Comm'n*, 10 Cal. App. 4th 908, 922 (1992) (upholding an EIR where requirements for an aquarium project were very specific and limited in scope [waterfront access, proven attendance base, transportation, and parking], which in turn severely limited the feasible alternatives). See also *Jones v. Regents*, 183 Cal. App. 4th 818, 827 (2010) (upholding the alternatives analysis in the EIR for Lawrence Berkeley National Laboratory's long-range development plan, where the plan's size and scope limited the number of alternatives that were both feasible and would accomplish most of the project objectives, which included clustering facilities in a manner that encouraged cross-disciplinary research).

[5] See State CEQA Guidelines, Section 15124(b).

[6] *Ibid*.

Therefore, the project description is not required to include broader objectives that are not specific to the LRDP, as suggested by the comments.

CEQA does not require that an EIR substitute citywide health care policy objectives for those of the project sponsor. Similarly, CEQA does not require that an EIR consider alternatives focusing on citywide health care policy objectives, rather than on the project objectives of the proposed project.

Comment

(Sue Hestor, October 19, 2010) [89-11 PD]

"The claimed project objective is to provide seismically safe hospital facilities that will remain operational in the event of a major disaster—to serve CPMC's patients and play an important role in San Francisco's disaster response and preparedness system."

Response PD-8

The comment reiterates one of the main objectives of the proposed LRDP, which is stated in the Draft EIR on page 2-7. The comment is noted. This comment does not raise issues regarding the adequacy, accuracy, or completeness of the Draft EIR. The comment will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project.

Comment

(Gloria Smith—California Nurses Association, October 19, 2010) [90-20 OTH]

"**B. THE EIR DID NOT ADEQUATELY DESCRIBE THE PROJECT**

An accurate, stable and finite project description is the sine qua non of an informative and legally adequate EIR.[8] Without it, CEQA's objective of fostering public disclosure and informed environmental decision-making is stymied. Only thorough an accurate view of the Project may affected outsiders and public decision-making balance the proposal's benefit against its environmental cost, consider mitigation measures, assess the advantage of terminating the proposal and weigh other alternatively in the balance. 'An accurate, stable, and finite Project Description is the sine qua non of an informative and legally sufficient EIR.'[9] The adequacy of EIR's project description is closely linked to the analysis of the project's environmental effects. 'If the description is inadequate because it failed to discuss the complete project, the environmental analysis will probably reflect the same mistake.'[10]

More specifically, an EIR must include a description of the physical environmental conditions in the vicinity of the Project.[11] Conversely, an EIR violates CEQA if the description of the Project's environmental setting, including the surrounding area, is inaccurate, incomplete or misleading.[12] The DEIR omitted an overall description of the Project's environmental setting within San Francisco and the relevant Bay Area communities. The DEIR was required to describe the Project in regional terms for all of the relevant resource areas such as land use, air quality, traffic and transit, access to safe and affordable health care and public services, to name a few. Instead, the DEIR narrowly discussed the environmental settings, regulatory framework, cumulative conditions, significance criteria, and impact evaluations for each impact evaluation. This approach denied the reader of an understanding of the entire Project's overall impacts on the City and surrounding communities outside San Francisco.

8 *County of Inyo v. City of Los Angeles. (1977) 71 Cal. App.3d 185, 192.*
9 *Id.*
10 Kostka and Zischke, 'Practice Under the California Environmental Quality Act.'
11 CEQA Guidelines § 15125
12 *Bakersfield Citizens for Local Control v. City of Bakersfield* (2004) 124 Cal.App.4th 1184."

Response PD-9

The comment refers to court decisions, the CEQA Guidelines, and other documents regarding the importance of an accurate, stable, and finite project description in the EIR, and includes a statement that "[t]he DEIR omitted an overall description of the Project's environmental setting within San Francisco and the relevant Bay Area communities. The DEIR was required to describe the Project in regional terms for all of the relevant resource areas such as land use, air quality, traffic and transit, access to safe and affordable health care and public services."

As the comment accurately points out, Section 15125 of the CEQA Guidelines state that "[a]n EIR must include a description of the physical environmental conditions in the vicinity of the project…from both a local and regional perspective." The CEQA Guidelines go on to state that "[t]he description of the environmental setting shall be no longer than is necessary to an understanding of the significant effects of the proposed project and its alternatives."

The context of the environmental setting is not the same for all environmental resource areas, thus it is most effective to describe the environmental setting in the context of each environmental resource area that is addressed in the EIR. The San Francisco Planning Department's *Consultant Guidelines for the Preparation of Environmental Review Documents* suggest that the environmental setting be discussed within each topic addressed in the EIR.[7] It is noted that the CEQA Guidelines do not suggest that the description of the environmental setting be part of the project description (just part of the EIR).

For some resources areas, the regional setting is critical to the assessment of environmental impacts. For example, as indicated on Draft EIR page 4.7-1, the environmental setting and the assessment of air quality impacts considers the entire San Francisco Bay Area Air Basin, which encompasses all of Alameda, Contra Costa, Marin, Napa, San Francisco, San Mateo and Santa Clara Counties, the southern portion of Sonoma County, and the southwest portion of Solano County. For other topics such as aesthetics, wind and shadow, or recreation, the regional perspective is less relevant than the local perspective. Accordingly, the LRDP Draft EIR includes details regarding environmental setting in each environmental resource area that is appropriate for analysis of the project's impacts in that topic area.

Please see Response INTRO-7 (page C&R 3.1-17) for a response to comments regarding CEQA requirements for social and economic impacts. Please also see Major Response HC-8 (page C&R 3.23-32) for a response to comments regarding access to health care services and Major Response HC-1 (page C&R 3.23-1) regarding regional health facilities.

Comment

(Gloria Smith—California Nurses Association, October 19, 2010) [93-35 PD]

"•Justification (proposed findings) for the proposed variances"

Response PD-10

This comment is part of a bulleted list of items regarding the adequacy of the Draft EIR project description. The comment appears to suggest that information regarding justification for the variances requested for the CPMC LRDP is missing from the project description contained in the Draft EIR. The exact text leading up to the bulleted list contained in the letter is as follows: "Other information missing from the DEIR's Project Description includes, but is not limited to the following:"

[7] City and County of San Francisco, *Consultant Guidelines for the Preparation of Environmental Review Documents*, Public Review Draft, September 11, 2008, page 6-14.

The required project approvals for the proposed CPMC LRDP are shown in Table 2-3 of the Draft EIR (pages 2-13 to 2-15), and are described further in Draft EIR Section 2.2.4, "Required Project Approvals for the Cathedral Hill Campus" (pages 2-43 to 2-48). These approvals are part of the proposed LRDP. The comment refers to "variances." It should be noted that the term "variances" is used for a particular type of exception from otherwise applicable zoning requirements, and "variances" are not among the entitlements being sought for the proposed project. Furthermore, if the decision-makers decide to approve the proposed LRDP or a project alternative, they must adopt findings for the various entitlements, but CEQA does not require that such findings be included as part of the Draft EIR project description. Such findings are not part of the project proposed by the sponsor; rather, the findings document the reasoning of the decision-makers at the time that they consider the project's merits and decide whether or not to approve the proposed project.

Comment

(Gloria Smith—California Nurses Association) [93-37 PD]

"• Events schedule and visitors (e.g., CPMC currently has a robust schedule of seminars, lectures, workshops and other events). This information was used at least in part based on surveys for the transportation section of the DEIR but does not appear in the Project Description."

Response PD-11

The comment suggests that an events schedule and information regarding visitors is missing from the Draft EIR project description. As stated in Section 15124 of the State CEQA Guidelines:

> "The description of the project shall contain the following information but should not supply extensive detail beyond that needed for evaluation and review of the environmental impact.
>
> (a) The precise location and boundaries of the proposed project shall be shown on a detailed map, preferably topographic. The location of the project shall also appear on a regional map.
>
> (b) A statement of objectives sought by the proposed project. A clearly written statement of objectives will help the lead agency develop a reasonable range of alternatives to evaluate in the EIR and will aid the decision makers in preparing findings or a statement of overriding considerations, if necessary. The statement of objectives should include the underlying purpose of the project.
>
> (c) A general description of the project's technical, economic, and environmental characteristics, considering the principal engineering proposals if any and supporting public service facilities.
>
> (d) A statement briefly describing the intended uses of the EIR.
>
> (1) This statement shall include, to the extent that the information is known to the Lead Agency,
>
> (A) A list of the agencies that are expected to use the EIR in their decision making, and
>
> (B) A list of permits and other approvals required to implement the project.
>
> (C) A list of related environmental review and consultation requirements required by federal, state, or local laws, regulations, or policies. To the fullest extent possible, the lead agency should integrate CEQA review with these related environmental review and consultation requirements. "

All of the above-mentioned details have been provided in the CPMC LRDP project description to the extent necessary to evaluate traffic and other impacts. Projections of visitor trips took into account the types of activities identified in the comment because the travel surveys that were used to estimate trip generation accounted for attendees of these types of events.

3.2.1.3 SCOPE OF MEDICAL SERVICES/CAMPUS SIZE

Comment

(Jane Sandoval, September 19, 2010) [PC-275 PD]

"The ultimate patient advocacy we as nurses can do for our patients is to support an adequate sized, full service St. Luke's, not a downsized version, which is not consistent with the community need. I believe the community need has been well addressed at today's hearing, as well as the hearings of the last three years. Thank you."

Response PD-12

The comment expresses a general opinion about the location, size, and scale of projects, particularly at the St. Luke's Campus, proposed under the CPMC LRDP. These comments have been noted. Please also see Major Responses HC-1 and HC-2 (pages C&R 3.23-1 and 3.23-8) for further information about the number of licensed acute-care beds and the scope of medical services that would be offered at the CPMC campuses, including the St. Luke's Campus, under the proposed CPMC LRDP.

This comment does not raise issues regarding the adequacy, accuracy, or completeness of the Draft EIR. The comment will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project.

Comments

(Eileen Prendiville, September 19, 2010) [PC-265 PD]

"One of our concerns is the size of this proposed hospital [Cathedral Hill], where all tertiary care would be consolidated in one building. A huge hospital on busy Van Ness Avenue could be disastrous after a massive earthquake. While the building most likely would be standing, wounded patients and staff, as well, would have extreme difficulty in getting their in a timely manner, as traffic would be gridlocked. It is not good planning to have all of these services at one facility, and I disagree with my co-worker neonatologist, Chris Retajczyk, but it wouldn't be the first time that nurses and doctors disagree. Now is the time, Commissioners, before it is too late, to make sure that the health care needs of San Franciscans are met effectively, as hospitals prepare to comply with the State's Hospital Seismic law."

(Barbara Berwick, September 19, 2010) [PC-332 PD]

"As a matter of promoting public safety, one of the things that was not mentioned was, in the event of a disaster, it's very possible that rubble could block access to the mega-hospital that is being proposed. In that case, we would want emergency rooms open at other locations, just as a matter of saving lives, it is just that simple."

Response PD-13

The comments raise issues about the size of the proposed Cathedral Hill Hospital, the consolidation of tertiary care to one facility, and access to emergency care during/after a major earthquake or other disaster.

The proposed Cathedral Hill Campus would be more centrally located with respect to the existing California and Pacific Campuses and would consolidate and relocate acute care, emergency, and other

services from the California and Pacific Campuses to the proposed new Cathedral Hill Campus. Consolidation of tertiary and other services at one location would provide operational efficiencies and improved coordination and treatment as explained below and in the Draft EIR on page 2-7. Under the proposed CPMC LRDP, emergency departments would continue to operate at the Davies and St. Luke's Campuses, and the Emergency Department at the St. Luke's Campus would be 50 percent larger than the existing facility (expanded).

Under the proposed LRDP, development of the proposed Cathedral Hill and St. Luke's Campuses would not result in significant emergency vehicle access impacts. See Impacts TR-52 and TR-92 on Draft EIR pages 4.5-145 and 4.5-206, respectively, and Response TR-100 (page C&R 3.7-170) regarding whether emergency vehicle access would be compromised under the LRDP.

As explained in Response TR-100 (page C&R 3.7-170), the likely routes to the proposed Cathedral Hill Hospital would be multi-lane arterial roadways that would allow emergency vehicles to travel at higher speeds and permit other traffic to maneuver out of their path. During times when congestion is most severe, emergency vehicles would likely choose to use less congested, parallel routes, and emergency vehicles would also be permitted to travel opposite the flow of traffic or contraflow in a one-way route to bypass congestion or any physical barrier that could result from an earthquake or other disaster. With the grid street layout surrounding the proposed Cathedral Hill Campus, emergency vehicles would have multiple routes to choose to access the hospital, while avoiding the most congested routes.

Please also see Major Responses HC-2 and HC-5 (pages C&R 3.23-8 and 3.23-20) for further information about the scope of medical services to be offered, along with information about emergency services under the proposed LRDP. Please also see Response HC-25 (page C&R 3.23-131) regarding physical access to the Cathedral Hill Campus following an earthquake or other major disaster.

Please see also Response HC-68 (page C&R 3.23-224) for further information regarding seismic safety compliance.

3.2.2 CATHEDRAL HILL CAMPUS

3.2.2.1 GENERAL

Comment

(Charles McClure, July 21, 2010) [Comment 2-2 PD]

"For myself, I think the Two-Way Post Street Variant would make entering and leaving the Daniel Burnham Court garage easier. Two-way traffic between Van Ness Avenue and Gough Street would be an improvement, and the change could be implemented now."

Response PD-14

The comment indicates a preference for the Two-Way Post Street Variant and suggests that the conversion of Post Street from a one-way street to a two-way street could be implemented now. Consideration of the Two-Way Post Street Variant is a component of the CPMC LRDP and will be considered by decision-makers with the entitlements for the CPMC LRDP. The immediate implementation of a two-way Post Street between Van Ness Avenue and Gough Street in advance of the proposed CPMC LRDP schedule is beyond the scope of this EIR, and would be up to the San Francisco Municipal Transportation Agency. This comment does not raise issues regarding the adequacy, accuracy, or completeness of the Draft EIR. The comment will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project.

Comment

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-146 PD, duplicate comment was provided in 30-146 PD]

"83. Page 2-37 states that the lighting on Van Ness will be removed and replaced and new fixtures will be installed on Van Ness that are slated for the Van Ness BRT project. What happens to the historical vintage lighting (the ornamental ones that remind people of Europe) in the area?"

Response PD-15

The comment inquires about changes to the existing lighting along Van Ness Avenue. As stated in the Draft EIR, page 2-37, implementation of the proposed LRDP would not include changes to the existing light standards along Van Ness Avenue. However, it is anticipated that new standard light fixtures would be installed along Van Ness Avenue as part of the City's proposed Van Ness Avenue Bus Rapid Transit (BRT) design process. The new light fixtures would be consistent with the City's proposed Van Ness Avenue BRT design, and would be installed in addition to the existing City-standard and historic streetlights, which would remain as they are, along Van Ness Avenue. The Van Ness Avenue BRT is a project that is separate from the proposed CPMC LRDP, and the determinations to proceed with the projects are independent of one another. Regardless of the decisions about and timing of the Van Ness Avenue BRT project, the existing lights along the perimeter of the proposed Cathedral Hill Campus, if temporarily removed during construction, would be reinstalled after construction is completed. The streetlights along Geary Boulevard/Geary Street, and Post and Franklin Streets would be temporarily removed to accommodate construction of the Cathedral Hill Hospital and Cathedral Hill MOB. These streetlights would be reinstalled after construction is complete at the proposed Cathedral Hill Campus.

Comment

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-163 PD, duplicate comment was provided in 30-163 PD]

"98. The DEIR states that there will be 'significant' issues with water runoff at the CPMC Cathedral Hill Hospital project. The mitigation is to use green roofs, cisterns, etc. to remedy the excess runoff. In the City's Greening Ordinance, there are guidelines for using permeable landscaping materials. What kinds of landscaping for open areas and sidewalks will be used?"

Response PD-16

The comment states that there would be significant issues with water runoff at the proposed Cathedral Hill Hospital and that the mitigation is to use green roofs, cisterns, etc. to remedy the excess runoff. The comment further inquires about the type of landscaping materials that would be provided at the proposed Cathedral Hill Campus. As stated in the Draft EIR, page 2-36, "A new landscape plan is proposed for the Cathedral Hill Hospital and Cathedral Hill MOB, featuring distinctive groupings and compositions of plant materials set in sidewalk garden areas intended to be compatible with the solar, wind, and wet/dry-cycle conditions around the various street frontages. Strategies and design features for the landscape plan being contemplated by CPMC include the use of rainwater gardens (to filter and absorb stormwater from sidewalks and building faces) and seasonal gardens (to create changing seasonal landscapes and a buffer from traffic on Van Ness Avenue)."

The overall paving concept for the proposed Cathedral Hill Campus consists of a basic paving design that would be replicable with paving pattern overlays that would correspond to the specific sidewalk use areas around the campus. This overall paving concept would create permeable surface areas, which would mitigate excess stormwater runoff. Distinctive paving-pattern overlays are being considered for entry

plazas, kiosks, garden areas, *portes cochères*, passenger drop-off zones, multiuse areas along Cedar Street, and transit stops (Figure 2-37, "Cathedral Hill Campus—Proposed Streetscape Plan," page 2-101)." In addition, as stated in the Draft EIR, page 4.15-30:

City regulations require that Low Impact Design (LID) design elements and best management practices (BMPs), such as bioretention basins, cisterns, permeable pavement, or green roofs, be implemented to reduce the volume of stormwater runoff. The impervious surface area at the Cathedral Hill, Pacific, Davies, and St. Luke's Campuses exceed the 50 percent impervious surface coverage criteria. Therefore, as required by the San Francisco Stormwater Management Ordinance, CPMC would be required to achieve a 25 percent reduction in stormwater runoff for the 2-year, 24-hour storm. In implementing projects proposed under the LRDP, CPMC would comply with all policies and regulations related to stormwater runoff reduction adopted by the City or the San Francisco Bay RWQCB; therefore, stormwater discharges would be less than under existing conditions, resulting in a reduction in on- and off- site flooding with project implementation.

Per the above comment regarding mitigation for water runoff, Mitigation Measure M-HY-N2, on Draft EIR page 4.15-32, states that CPMC would be required to prepare and implement a stormwater control plan for each of the near-term projects under the LRDP, focusing on LID strategies and BMPs. The comment above correctly states that Mitigation Measure M-HY-N2 would use green roofs, cisterns, etc. among other measures described on Draft EIR pages 4.15-31 and 4.15-32. Implementation of Mitigation Measure M-HY-N2 would achieve the above-mentioned 25 percent reduction in stormwater runoff for the 2-year, 24-hour storm. When implementing the proposed LRDP, CPMC would be required to comply with all policies and regulations adopted by the City, including the San Francisco Public Utilities Commission's (SFPUC's) *Stormwater Design Guidelines*.

Comment

(David Meckel, September 19, 2010) [PC-210 PD]

"That location [Cathedral Hill Campus] also uses an innovative midblock drive-through and drop-off to remove traffic and killing from the surrounding streets, which to my knowledge is the first time an urban hospital in California has fully integrated this functionality into the building footprint."

Response PD-17

The comment notes that a midblock drive-through and drop-off is proposed for the Cathedral Hill Hospital, as shown in the Draft EIR, Figure 2-4, "Cathedral Hill Campus—Proposed Site Plan" (page 2-53). This comment does not raise issues regarding the adequacy, accuracy, or completeness of the Draft EIR. The comment will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project.

Comment

Commissioner Moore, September 23, 2010) [PC-370 PD]

"and I think CPMC needs to either disclose that they are 90 percent on track with getting the tunnel, or not. I think after so many years of having considered the Van Ness Avenue location, you should be closer to disclosing to everybody of what is possible, what is not possible."

Response PD-18

The comment inquires as to the stage of planning of the proposed Van Ness Avenue Pedestrian Tunnel, which is included as part of the project-level analysis of the proposed Cathedral Hill Campus. This comment does not raise issues regarding the adequacy, accuracy, or completeness of the Draft EIR. As of

January 2011, CPMC and Caltrans have entered into a formal Highway Improvement Agreement (HIA), laying out terms of Caltrans' review, oversight, and compensation for said review and oversight of the proposed Van Ness Avenue Pedestrian Tunnel. CPMC has retained an engineering firm to prepare a Project Report/Project Study Report (PR/PSR) consistent with Caltrans requirements which would contain all of the rationale and engineering for the proposed tunnel project. Subsequent to the HIA, Caltrans provided a status letter on May 19th, 2011, which outlines the progress being made on the PR/PSR application initially submitted in December 2010 (a revised submittal was provided to Caltrans in March 2011).[8] The project sponsor, CPMC, cannot receive approvals for the Van Ness Avenue Pedestrian Tunnel from Caltrans ahead of formal action by the San Francisco Planning Commission and Board of Supervisors on the Final EIR for the CPMC LRDP.

3.2.2.2 CONSTRUCTION ACTIVITIES

Comments

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-3 PD, duplicate comment was provided in 30-3 PD]

"Apologies for jumping around in my comments... In regards to the equipment that will be used to put the generators and chillers on the roofs of the proposed new buildings... It seems that only cranes will be used. However, the only other commonly used method used to put generators and HVAC equipment on the roof is a helicopter. I think if a helicopter is used, it should to be added in the 'Air Quality' and 'Noise' sections because the 'typical' construction equipment only lists cranes in 'Table 4.6-21, 'Noise Levels of Typical Construction Equipment,' on Page 4.6-42 so I assumed only a crane will be used."

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-4 PD, duplicate comment was provided in 30-4 PD]

"If a helicopter were used, how long will it take to maneuver the rooftop generators and chillers into place with the equipment to put them in place running?"

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-8 PD, duplicate comment was provided in 30-8]

"The 2 tower cranes for the Cathedral Hill Hospital project make an average of 88 dbA at 50 feet. Will these be used for the rooftop equipment installation as well? Would the use of a helicopter lessen the traffic lane and parking lanes closure impacts for a shorter period of time than the use of these cranes?"

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-72 PD, duplicate comment was provided in 30-72 PD]

"39. Per an earlier statement in this comments and questions document, please add helicopter to Table 4.6-21 if one will be used on this project or any of the other CPMC projects."

Response PD-19

The comments inquire about the manner in which rooftop equipment would be installed on proposed new buildings, as well as possible use of a helicopter during construction activities. Rooftop heating, ventilation, and air conditioning (HVAC) equipment would be installed using cranes. Helicopters would not be used as part of CPMC LRDP construction. As discussed in the Draft EIR, page 2-41, "Two tower cranes would be located on the north side of the hospital site near Post Street between Van Ness Avenue and Franklin Street. Mobile cranes would also be used occasionally to hoist materials within the boundary

[8] Letter from Dan McElhinney, P.E., Chief Deputy District Director, California Department of Transportation, to Geoffrey Nelson, Director, Enterprise Development Department, California Pacific Medical Center (May 19, 2011).

of the work area." The comments do not raise issues regarding the adequacy, accuracy, or completeness of the Draft EIR. These comments will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project.

The proposed operation of the cranes to install rooftop equipment would not result in impacts on traffic lanes and closure of parking lanes. In relation to construction-related noise from the tower cranes, as stated in the Draft EIR on page 4.6-46, implementing Mitigation Measures M-NO-N1a, M-NO-N1b, and M-NO-N1c at the proposed Cathedral Hill Campus would reduce Impact NO-1 to a less-than-significant level.

Comment

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-58 PD duplicate comment was provided in 30-58 PD]

"On Page 4.5-150, Table 4.5-29 states average (37) and maximum (72) number of workers per shift with 3 shifts stated for the Cathedral Hospital work (weekdays 7 a.m.-4 p.m., 4 p.m.-12 a.m. (midnight), 7 a.m.-5 p.m. on Saturdays); and with 2 shifts for the Cathedral MOB work (weekdays 7 a.m.-5 p.m. and 7 a.m.-5 p.m. on Saturdays) with an average of 9 workers per shift and a maximum of 11 workers per shift. The Administrative documents that accompany the CPMC DEIR indicate in the 'Biology Section, #7, CPMC Cathedral Hill Campus EIR - Construction Data' that there will be a maximum of 35 workers from October 2011 through August 2012, with an average of about 25 people from July 2013 through Feb 2014 according to the chart. Have the number of workers that will be working the tunnel portion of the project changed since this publication?"

Response PD-20

The comment suggest that there is a discrepancy in the number of construction workers at the proposed Cathedral Hill Campus based upon the discussions in the Draft EIR and background reports that are part of the CPMC LRDP Draft EIR Administrative Record. The number of anticipated construction workers has not changed since the publication of the Draft EIR, which states the correct number. Biology Section, #7, CPMC Cathedral Hill Campus EIR – Construction Data, which is part of the Draft EIR's administrative record was an earlier document that contained older construction data and had not yet been updated at the time of publication of the Draft EIR. The administrative record has since been updated. CPMC has also recently provided revised information about the number of construction worker shifts that would be used for construction of the proposed Cathedral Hill campus.[9] Please see Response NO-8 (page C&R 3.8-6) regarding changes to the proposed construction hours and shifts.

Comment

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-60 PD, duplicate comment was provided in 30-60 PD]

"What is not stated in this section appears on Page 2-40. It states that tunnel construction workers will be working from 7 p.m. - 5 a.m. during the week and on Saturdays. This time slot is selected because the traffic volume on Van Ness Avenue is low (Page 2-43). How many more workers for these 7 p.m. - 5 a.m. shifts for the tunnel construction?"

Response PD-21

The comment states that information was not provided in the Administrative Record for the project description regarding the number of construction workers for construction of the proposed Van Ness

[9] Environmental Impact Report Construction Data, CPMC Cathedral Hill Hospital and Medical Office Building, Herrero Boldt/Pankow, Version 2.x—February 4, 2011.

Avenue Pedestrian Tunnel at the Cathedral Hill Campus. However, as noted by the comment, this information can be found on page 2-40 of the Draft EIR. According to the construction plan for the Van Ness Avenue Pedestrian Tunnel,[10] only the first and fourth stages of tunnel construction would include aboveground work. Above-surface excavation (first stage of construction) would occur 7 days per week for 16 weeks and surface restoration (fourth stage of construction) would occur Monday through Friday for 4 weeks. Both the above-surface excavation and surface restoration stages would occur between the hours of 7 p.m. and 5 a.m. A maximum of 18 workers per shift would be present during the above-surface excavation stage; up to 35 workers per shift would be present during surface restoration stage.

Construction of the Van Ness Avenue Pedestrian Tunnel that would take place during the 7 a.m. to 5 p.m. shift (7 days per week) would include mainly below-surface excavation, structural work, and interior work (Second, third, and fifth stages of construction, respectively). On average, a maximum of 21 workers per shift would be present during below-surface excavation. Up to 35 workers per shift would be present during structural work, with a maximum of 25 workers per shift present during interior work.

Comment

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-64 PD, duplicate comment was provided in 30-64]

"How many more trucks for the tunnel excavation portion of the Cathedral Hill Project?"

Response PD-22

According to the construction plans for the proposed Cathedral Hill Hospital, Cathedral Hill MOB, and underground Van Ness Avenue Pedestrian Tunnel,[11] an average of 135 trucks per shift would be used during the excavation stage at the site of the proposed Cathedral Hill Hospital. An average of 50 trucks per shift would be used during excavation at the Cathedral Hill MOB site. In addition to construction of the Cathedral Hill Hospital and MOB, construction of the underground Van Ness Avenue Pedestrian Tunnel would require an additional ten trucks per day during above-surface excavation, seven trucks per day during below-surface excavation, eight trucks per day during structural work, four trucks per day during surface restoration, and five trucks per day during interior work.

Comment

(Sue Hestor, October 19, 2010) [89-5 PD]

"CPMC is not only planning to rip up those two blocks, they also want to tunnel under Van Ness."

Response PD-23

The comment expresses concern regarding construction activities related to the proposed Cathedral Hill Campus. The comment is correct in stating that CPMC proposes a tunnel under Van Ness Avenue, connecting the proposed Cathedral Hill Hospital and MOB. A description of the proposed Van Ness Avenue Pedestrian Tunnel is in the Draft EIR, page 2-32.

Comment

(Lower Polk Neighbors, October 19, 2010) [103-21 PD, duplicate comment was provided in 113-21 PD]

"Provide 24 hour / 7 days a week security around the entire blocks of the hospital and MOB."

[10] Environmental Impact Report Construction Data, Van Ness Avenue Pedestrian Tunnel, Herrero Boldt, Version 2.x—February 4, 2011.
[11] Construction Management Plan, Van Ness Avenue Pedestrian Tunnel, Herrero Boldt, Version 2.x—February 4, 2011.

Response PD-24

The comment requests 24-hours per day, 7-days per week on-site security. CPMC plans to have a security officer patrol the entire Cathedral Hill Campus 24 hours per day, including every 2 hours between 8 p.m. and 7 a.m.

Comment

(Alan Wofsey, September 23 2010) [PC-299 PD]

"As an example, the DEIR states that there is going to be construction for approximately 54 months. And I didn't hear anybody else raise this today, but the construction period for five days a week was from 7:00 a.m. to midnight. I didn't hear anybody reference that – 7:00 a.m. to midnight, I mean, 17 hours a day for 54 months, which is five and a half years."

Response PD-25

The comment expresses concern regarding the time (hours of construction in a 24-hour period) and duration of proposed construction activities at the Cathedral Hill Campus. Construction hours at the proposed Cathedral Hill Campus have been updated since publication of the Draft EIR. The hours of construction for the proposed Cathedral Hill Hospital and Cathedral Hill MOB would be from 7 a.m. to 7 p.m. on typical work days (Monday through Friday, excluding holidays). The text in the Draft EIR on page 2-40 in the last two paragraphs has been revised as follows to show the updated construction hours at the proposed Cathedral Hill Hospital, MOB, and Van Ness Avenue Pedestrian Tunnel:

> The hours of construction for the proposed Cathedral Hill Hospital and Cathedral Hill MOB would be from 7 a.m. to ~~midnight~~ 7 p.m. on typical work days (Monday through Friday, excluding holidays). Saturday shifts would be from 7 a.m. to 5 p.m.; work is not expected to be done on Sundays. Work extending past 7 p.m. will be limited to activities such as: concrete finishing, steel detailing and general production preparation. Work extending past 7 p.m. would be communicated with the neighbors on a weekly basis. Second shift work (Work occurring between 4 p.m. and midnight) is anticipated on the project only during the interior build out phase.
>
> Construction of the Van Ness Avenue pedestrian tunnel generally would occur from 7 a.m. to 7 p.m. on typical working days (Monday through Friday, excluding holidays), ~~and not on Saturday and Sunday~~. Weekend shifts would be from 7 a.m. to 5 p.m. ~~However,~~ Nighttime construction of the tunnel would occur in the evenings (including weekends) ~~and on Saturdays~~ from 7 p.m. to 5 a.m., if permitted by Caltrans and the San Francisco Municipal Transit Agency (SFMTA). ~~During aboveground improvements and surface restoration phases, work would take place from 7 p.m. to 5 a.m.~~ to allow excavation of one lane of Van Ness Avenue at a time while traffic volumes are low. Two traffic lanes in one direction at a time would be closed periodically during evening hours to complete the pedestrian tunnel.

3.2.3 PACIFIC CAMPUS

Comment

(Arthur and Jacqueline Cimento, October 19, 2010) [78-11 PD, duplicate comment was provided in 99-11 PD]

"In numerous places, the draft EIR does not go into detail on the Pacific campus, using the rationale that the design on this campus is not finalized (e.g., pages 4.2-149, 4.6-80, and 4.9-31). Therefore, we would like clarification as to what entitlements CPMC would receive for the Pacific campus should this EIR be certified.

Since many of the mitigation measures associated with the Pacific campus are vague and depend on the final design (e.g., page 4.6-82), we believe that CPMC should not have any entitlements to proceed with the Pacific campus portion of the long range plan until a Project EIR is completed. This EIR should address all of the primary and secondary impacts of the project and provide adequate mitigation."

Response PD-26

The Draft EIR is a program- and project-level EIR and addresses direct and indirect effects, as well as cumulative development of the CPMC LRDP in Chapter 4 of the Draft EIR, "Environmental Setting, Impacts, and Mitigation," Sections 4.1 through 4.18.

No entitlements for Pacific Campus development are requested as part of the near-term phase under the CPMC LRDP. For the long-term projects under the CPMC LRDP, Conditional Use (CU) authorization would be needed, and CPMC would not receive applicable future entitlements for Pacific Campus development until after applications for these are filed with the Planning Department and additional project-level CEQA review of Pacific Campus development is completed. Because the proposed changes at the Pacific Campus under the CPMC LRDP are program-level, any additional conflicts with land use plans, policies, and environmental regulations arising from more specific, project-level design issues related to long-term project components at the Pacific Campus would be addressed in the future, during detailed project-level planning. If there is a need to reduce any significant impacts to a less-than-significant level, appropriate feasible mitigation measures available would be identified during the project-level CEQA review undertaken at such time project-level entitlement applications are submitted for the long-term development at the Pacific Campus.

Comment

(Paul Wermer—CPMC Neighbors Coalition and Pacific Heights Residents Association, October 18, 2010) [67-45 PD]

"GENERAL COMMENTS ON COMMUNITY IMPACTS:

Construction Activities: For the Pacific Site, the construction schedule calls for significant activities beginning in 2015 and continuing for several years. Experience with CPMC's recent construction schedules suggests they will slip. The EIR does not adequately assess the impact of continuous construction from 2015 to beyond 2025. A 10% slip in schedule translates into an additional year of noise, disrupted parking and traffic, and dust."

Response PD-27

As discussed in the Draft EIR beginning on page 2-118, construction activities at the Pacific Campus would begin in 2015 and are anticipated to be complete by 2020. Should the CPMC LRDP approval process be delayed, the construction start date at the Pacific Campus could also be delayed. Proposed development at the Pacific Campus could not begin until after completion of the proposed Cathedral Hill Hospital, to allow existing Pacific Campus programs to be relocated to the Cathedral Hill Campus. Although the construction start date may shift, the anticipated duration of construction would remain the same (Draft EIR, Appendix B: CPMC LRDP Construction Schedule). Therefore, schedule delays would not lead to greater impacts than are disclosed in the Draft EIR. Thus, the impact conclusions for construction activities at the Pacific Campus would not change.

The comment stating that "an additional year of noise, disrupted parking and traffic, and dust" would occur is not correct. Although the timing of the construction activities may change, the duration of construction activities at the Pacific Campus would not increase as a result of a delay in the start date. While the construction duration would remain the same as under the LRDP, if the project were to be delayed, depending on the approval date, the CPMC LRDP could overlap with other currently unknown

future projects within the vicinity of the Pacific Campus. In addition, if a currently unknown project is proposed in the future in the vicinity of the Pacific Campus, the CEQA document for that project would need to consider the cumulative effects of construction activities within the vicinity of the project, including at the Pacific Campus.

A more detailed construction schedule for proposed long-term projects at the Pacific Campus would be determined when each construction project at the Pacific Campus is developed and designed. The long-term project components at the Pacific Campus would be subject to separate project-specific environmental review under CEQA, which would include analysis of cumulative impacts related to any other projects in the vicinity that are known or reasonably foreseeable at the time such project-level review is undertaken.

3.2.4 CALIFORNIA CAMPUS

Comment

(Margaret Kettunen Zegart, October 20, 2010) [97-2 PD-CA]

"The existing 4.9 acre California Campus should retain its range of services and renovate all its structures."

Response PD-28

The comment states that CPMC should retain its range of services and renovate all structures at the California Campus. The Draft EIR identifies project alternatives that involve retention of services at the California Campus, and includes a discussion of alternatives for the California Campus that were considered but rejected. See Alternative 2 and Alternative 3B in the Draft EIR, beginning on pages 6-162 and 6-264, respectively, for analysis of alternatives that would retain services at the California Campus. This comment does not raise issues regarding the adequacy, accuracy, or completeness of the Draft EIR. The comment will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project.

3.2.5 DAVIES CAMPUS

Comment

(Richard Margary, September 19, 2010) [PC-215 PD-DV]

"President Miguel and Commissioners, good afternoon. Thanks for listening to all the comments today, including my remarks. I am Richard Margary, representing today the Buena Vista Neighborhood Association. We have about 400 current members and serve about 4,500 households around Buena Vista Park. CPMC's Davies Medical Center Campus is our close neighbor and is a very highly regarded and valued resource for our neighborhood, as well as for the whole City. BVNA worked closely over the last several years, going back the better part of 10 years, I believe. We worked closely with them as part of a neighborhood group working with CPMC, especially to plan the elements for the Davies campus changes, which are in the Draft EIR. Throughout the process, CPMC was most responsive to our concerns and was a good neighbor in all respects. Many of the elements of the Davies campus plan represent neighbors' input and requests."

Response PD-29

The comment expresses a statement regarding the relationship between the Buena Vista Neighborhood Association (BVNA) and the CPMC Davies Campus. The comment also notes that CPMC was responsive to concerns raised by the BVNA regarding proposed changes at the Davies Campus over the last several years and worked closely with this neighborhood group. The comment is noted. The comment

does not raise issues regarding the adequacy, accuracy, or completeness of the Draft EIR. The comment will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project.

3.2.6 ST. LUKE'S CAMPUS

Comment

(Rachel Sater—Lost Block and Save Our Streets, October 19, 2010) [101-3 PD-SL]

"2.6 St. Luke's Campus

Page 2-181: The DEIR notes that the St. Luke's Replacement Hospital would be exempt from Chapter 13C of the City's Building Code (San Francisco Green Building Requirements), but that CPMC is 'considering implementing measures that would enable the St. Luke's Replacement Hospital to achieve LEED certification.' Elsewhere, the DEIR indicates that 'CPMC intends to attain LEED certification.' Despite this uncertainty and lack of detail, various impact analyses rely on the implementation of measures for LEED certification as substantial evidence upon which to base a conclusion of a less-than-significant impact. The project description and the pertinent impact analyses should provide the detail necessary to reach this conclusion, including the specific measures that would be implemented regardless of whether LEED certification is sought or attained, the specific LEED credit categories intended, and how these measures would avoid or reduce each potentially significant impact. In addition, the LEED certification strategy for the project should target credit categories related to potentially significant impacts on the adjacent homes to the west, including light pollution, noise, onsite open space and vegetation."

Response PD-30

The comment states that lack of detail regarding Leadership in Energy and Environmental Design (LEED®) in the Draft EIR project description could have affected the conclusions of less-than-significant impacts. Building permits for acute-care facilities, such as the Cathedral Hill Hospital and St. Luke's Replacement Hospital proposed under the LRDP, are issued by the Office of Statewide Health Planning and Development (OSHPD); therefore, such facilities are not subject to San Francisco's Green Building Ordinance. Because the proposed Cathedral Hill Hospital and St. Luke's Replacement Hospital are exempt from Chapter 13C of the City's Building Code (Green Building Ordinance), CPMC is not required under the Green Building Ordinance to attain LEED® certification at these structures.

CPMC has confirmed that the proposed hospitals at the Cathedral Hill and St. Luke's Campuses, which do not fall under the San Francisco Green Building Ordinance, would be constructed to a LEED® Certified level, at the minimum. Thus, these hospital buildings would meet the LEED® Energy and Atmosphere prerequisites related to fundamental commissioning of the buildings' energy systems, minimum energy performance, and fundamental refrigerant management. Please also see Response GH-1 (page C&R 3.10-3), which includes the CPMC LRDP GHG Compliance Checklist and shows which CPMC buildings are subject to the San Francisco Green Building Ordinance and/or would be constructed to meet which specific LEED® certification levels with respect to energy efficiency.

The text in the Draft EIR, page 2-27 (last paragraph) to page 2-28 (first paragraph), has been revised as follows to show that CPMC would attain LEED® certification for the proposed Cathedral Hill Hospital:

> CPMC ~~intends to~~ would attain at a minimum, a LEED® ~~certification~~ Certified level for the proposed hospital building, which is exempt from Chapter 13C of the City's Building Code (San Francisco Green Building Requirements).

The text in the Draft EIR, page 2-181 (first paragraph), has been revised as follows to show that CPMC would attain LEED® certification for the proposed St. Luke's Replacement Hospital:

> Additionally, CPMC ~~is considering implementing~~ would implement measures that ~~would~~ enable the St. Luke's Replacement Hospital to achieve, at a minimum, a LEED® ~~certified~~Certified level.

The purpose of LEED® certification with respect to energy is not only to limit energy use and associated emissions of greenhouse gases (GHGs) and criteria pollutants from buildings to the extent feasible, but also to reduce the amount of energy required and increase use of more benign forms of energy. If the proponent for a project like the proposed CPMC LRDP commits to construct buildings to attain LEED® certification, then with project implementation, the buildings can be assumed to meet the minimum requirements to achieve LEED® certification (i.e., LEED Certified status). Achieving these minimum requirements can affect the level of significance identified by a CEQA document in terms of energy, GHG emissions, criteria pollutant emissions, transportation, water, and solid waste.

As identified on page 4.8-22 of the Draft EIR, CPMC buildings that fall under the San Francisco Green Building Ordinance, such as the proposed medical office buildings at the Cathedral Hill and St. Luke's Campuses, would be built to meet the requirements for LEED® Silver certification. Thus, these buildings would meet the LEED® Energy and Atmosphere prerequisites related to fundamental commissioning of the buildings' energy systems, minimum energy performance, and fundamental refrigerant management. These buildings would also meet LEED® Energy and Atmosphere Credit 3 related to enhanced commissioning.

Comments

(Rachel Sater—Lost Block and Save Our Streets, October 19, 2010) [101-4 PD]

"Figure 2-59 St. Luke's Campus-Proposed Site Plan, Figure 2-60 St. Luke's Campus Variant I-Alternate Emergency Department Location, Figures 2-63 and 2-64 (elevations), 2-68 and 2-69 (sections), 2-71 and 2-72 (floor plans), and 2-77 (streetscape plan): These figures show the St. Luke's Replacement Hospital emergency department and associated ambulance bay, and the loading docks, trash and medical waste receptacles immediately adjacent to the residential uses at 26-28 27th Street and on Cesar Chavez Street. This location differs from the location shown in Figure 4.5-26 in Section 4.6, Transportation and Circulation, and used in the traffic, noise and air quality analyses, as well as potentially throughout the DEIR."

(Rachel Sater—Lost Block and Save Our Streets, October 19, 2010) [101-6 PD]

"The figures are also inconsistent with respect to the setback and configuration of the west side of the replacement hospital."

(Rachel Sater—Lost Block and Save Our Streets, October 19, 2010) [101-23 PD]

"Page 4.5-207: The location of the emergency department and associated ambulance bay, and the three loading docks, trash and medical waste receptacles shown in Figure 4.5-26 differs from the location shown in Figure 2-59, St. Luke's Campus Variant 1-Alternate Emergency Department Location, as well as Figures 2-63 and 2-64 (elevations), 2-68 and 2-69 (sections), and 2-71 and 2-72 (floor plans), and 2-77 (landscape plan), in Chapter 2, Project Description. Therefore, the analysis of traffic and noise impacts and the conclusion of less-than-significant impacts are based on incorrect plans. The analysis is therefore fundamentally flawed and must be revised and the DEIR must be recirculated for meaningful public disclosure and comment."

Response PD-31

The comments are correct in noting that Figure 4.5-26 was a different site plan than shown in the above-stated project description figures. The incorrect Figure 4.5-26 was mistakenly inserted into the Draft EIR

during print production. The impact analyses for the "Transportation and Circulation," "Noise," and "Air Quality" sections of the Draft EIR (Sections 4.5, 4.6, and 4.7, respectively) were based on the most recent, updated site plan, as shown in Chapter 2, "Project Description." The site plan shown in the Draft EIR, Figure 4.5-26, was integrated into the Draft EIR after the impact analysis was completed; therefore, the impact conclusions have not changed.

Figure 4.5-26 in the Draft EIR, page 4.5-207, has been revised for clarification to show the correct locations of the proposed passenger zones at the St. Luke's Campus under the LRDP. Refer to Chapter 4 of this C&R, page C&R 4-79, for revised Figure 4.5-26.

Comment

(Rachel Sater—Lost Block and Save Our Streets, October 19, 2010) [101-8 PD]

"Figures 2-63 through 2-65 (elevations): The St. Luke's Replacement Hospital elevations must be revised to show the adjacent residential building to the west to allow for an understanding of the relationships to these sensitive adjacent residential uses, and an adequate project-level analysis of the potentially significant impacts related to land use character, visual character, light and glare, noise and wind and shadow."

Response PD-32

The comment about adding the adjacent residential buildings to Draft EIR Figures 2-63 through 2-65 (Figure 2-63, "St. Luke's Replacement Hospital and MOB/Expansion Building—Proposed North Elevation," Figure 2-64, "St. Luke's Replacement Hospital and MOB/Expansion Building—Proposed South Elevation," and Figure 2-65, "St. Luke's Replacement Hospital—Proposed East-West Elevation"), is noted. The proposed elevation figures included in the Draft EIR, and specifically Figures 2-63 through 2-65 for the St. Luke's Campus, are intended to provide information about and to describe the heights and façades of the buildings proposed at the St. Luke's Campus. The west side of the proposed St. Luke's Replacement Hospital would be set back 2 feet from the property line at the building's northwest corner (near Cesar Chavez Street); this 2-foot building setback would continue south for approximately 78.5 feet. From there, the building setback along the west property line would increase to 15.5 feet all the way to 27th Street, a distance of approximately 145.5 feet.

The elevation of the St. Luke's Replacement Hospital and the replacement hospital's relationship to the existing adjacent residential buildings to the west are shown in Figure 4.2-27 (Draft EIR page 4.2-83) of the Draft EIR. The following additional analysis of this viewpoint is provided in the Draft EIR on page 4.2-181:

> This viewpoint (Figure 4.2-27, page 4.2-83) is looking east along Cesar Chavez Street from the northwest corner of the Guerrero Street/Cesar Chavez Street intersection. As seen in the simulated proposed view, the substantial bulk of the combined proposed St. Luke's Replacement Hospital and MOB/Expansion Building would become the dominant visual feature and would replace the dominate existing hospital building. The expansive western and northern façades of the proposed 100-foot-tall replacement hospital, with a visually prominent row of square windows in the upper floors, would fill in the view to the right depicted from this viewpoint. The roofline of the replacement hospital would rise substantially above that of the adjacent three-story residences fronting Cesar Chavez Street and the larger three-story, multi-unit residential building located closer to and on the right in the view. The broad expanse (bulk) of the western façade of the St. Luke's Replacement Hospital building would be taller in scale compared to those residential buildings.

Further analysis regarding land use character, visual character, light and glare, noise, and wind and shadow for proposed development at the St. Luke's Campus can be found in the following respective

locations in the Draft EIR: Section 4.1, "Land Use and Planning," beginning on page 4.1-1; Section 4.2, "Aesthetics," beginning on page 4.2-1; Section 4.6, "Noise," beginning on page 4.6-1; and Section 4.9, "Wind and Shadow," beginning on page 4.9-1. Adding the adjacent residential buildings to Draft EIR Figures 2-63 through 2-65 is not necessary because the relationship of the proposed new buildings to the existing adjacent residential buildings to the west was properly considered in the Draft EIR, as noted above, and is shown in other graphics contained in the Draft EIR, such as Figure 4.2-27.

3.2.6.1 CAMPUS SIZE/DEVELOPMENT AGREEMENT

Comment

(Commissioner Miguel, September 19, 2010) [PC-382 PD]

"I will have comments in writing as to parking and size and bulk, very specifically as to St. Luke's. I know the concept of a Development Agreement is not part of an EIR, necessarily, although I will—I couldn't consider a project of this complexity without a development agreement with the City."

Response PD-33

The comment raises the issue of a development agreement with the City for a project of this complexity, and acknowledges that such an agreement is not necessarily part of an EIR. The project sponsor, CPMC, is negotiating a development agreement with the City and County of San Francisco. A summary of the proposed terms of a development agreement as of the time of publication of this C&R document is included on page C&R 3.23-43 of this document. The comment does not raise a specific issue regarding the adequacy, accuracy, or completeness of the Draft EIR. The comment will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project. Please see Response TR-74 (page C&R 3.7-143) for information regarding parking at the St. Luke's Campus. Please see Major Response HC-2 (page C&R 3.23-8), Response LU-31 (page C&R 3.3-147), and Response AE-17 (page C&R 3.4-28) regarding location, size, bulk, and scope of services at the St. Luke's Campus.

3.3 LAND USE AND PLANNING

3.3.1 LRDP

3.3.1.1 CONSISTENCY WITH PLANS AND POLICIES AND LAND USE COMPATIBILITY

Comments [Overall Plan and CEQA Consistency]

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-1 LU, duplicate comment was provided in 30-1 LU]

"Thank you for this opportunity to respond to the CPMC DEIR. Below are my comments and questions on the CPMC Draft Environmental Impact Report (DEIR):

1. It is my understanding that this DEIR covers the California Pacific Medical Center (CPMC) 'Long Range Development Plan (LRDP)' and is both a program-level environmental impact report (EIR) pursuant to Section 15168 of the State CEQA Guidelines (Page S-2) as well as a project-level EIR pursuant to Section 15161 of the State CEQA Guidelines (Page S-2) where near-term projects (Cathedral Hill Campus, Davies Campus and St. Luke's Campus) and are analyzed at the project level (more detailed than program-level, per Page 1-13) based on situations that can be reasonably forecasted. And long-term projects would be analyzed at a programmatic level where impacts of these projects can be reasonably forecasted. But that long-term projects (Pacific Campus and Davies Campus) would be subject to further environmental review. In the following points, I address a few issues I believe have been overlooked in this DEIR on both of these programmatic and project levels. In addition, there are also, for example, CEQA violations, violations of the City's "General Plan" and the soon-to-be-adopted 'Better Streets Plan.' As a note, I also cover issues with the California Campus should a remodel rather than a demolition be the chosen alternative within the existing building envelopes."

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [37-1 LU]

"1. CEQA violations
2. City's General Plan violations
3. Better Streets Plan (soon to be adopted) violation"

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [PC-151 LU]

"Other issues involve CEQA violations, City General Plan violations, Better Streets Plans soon to be adopted violation."

Response LU-1

These comments correctly state that the Draft EIR is both a program-level EIR for the overall CPMC LRDP as well as a project-level EIR for near-term projects at the proposed Cathedral Hill, Davies, and St. Luke's Campuses.

The comments also state that the proposed LRDP is in violation of CEQA, the City's General Plan, and the adopted San Francisco Better Streets Plan. Each of these points are addressed below under the subheadings "CEQA," General Plan," and "Better Streets Plan."

CEQA

The comments do not specify the way in which the commenter believes that the proposed CPMC LRDP violates CEQA. As stated on page 1-1 of the Draft EIR, near-term and long-term projects under the proposed LRDP are evaluated in the Draft EIR at the program- and project-level, pursuant to Section 15168 of the State CEQA Guidelines. The comments do not appear to say that the project itself violates

CEQA, but rather that there are CEQA violations related to the contents of the CPMC LRDP Draft EIR. The comments, therefore, are logically understood as comments related to the CEQA document prepared for the LRDP. The project, the LRDP, is a proposal by CPMC, the project sponsor, a private entity. The project sponsor is not responsible for the environmental review or approval of the project. Satisfactory completion of the CEQA process is a responsibility of the Lead Agency, the San Francisco Planning Department under Chapter 31 of the San Francisco Administrative Code for CEQA. The Planning Department is the public agency that has the primary responsibility for carrying out or approving the CEQA document. As stated in section 15020 of the State CEQA Guidelines:

> "Each public agency is responsible for complying with CEQA and these Guidelines. A public agency must meet its own responsibilities under CEQA and shall not rely on comments from other public agencies or private citizens as a substitute for work CEQA requires the Lead Agency to accomplish. For example, a Lead Agency is responsible for the adequacy of its environmental documents. The Lead Agency shall not knowingly release a deficient document hoping that public comments will correct defects in the document."

The CPMC LRDP Draft EIR has been prepared in accordance with the State CEQA Guidelines, and therefore has not violated any requirements of CEQA.

General Plan

In response to the comment that states that the Draft EIR results in General Plan violations, Section 2.1.6, Required Project Approvals," beginning on page 2-11 of the Draft EIR describes the amendments to the General Plan and the Planning Code, Conditional Use (CU) authorizations, and other approvals that would be required before the proposed LRDP could be implemented. The requested approvals for all five CPMC campuses are summarized in Table 2-3 on pages 2-13 through 2-17 of the Draft EIR. All proposed near-term, project-level actions requiring City approval are described in detail in the "Required Project Approvals" of the Draft EIR section for each campus in Chapter 2, "Project Description."

Since the publication of the Draft EIR on July 21, 2010, the project sponsor has made some modifications to the requested entitlements for the proposed LRDP based upon input from the Planning Department after reviewing the initial application submittal for the near-term projects, including the proposed development at the Cathedral Hill Campus. Therefore, the required project approvals listed in the Draft EIR on pages 2-13 through 2-17, Table 2-3, "Required Project Approvals," have been updated as part of the text revisions to the Draft EIR included in Chapter 4, "Draft EIR Text Changes," on pages C&R 4-37 and C&R 4-38 of this document. Additional text revisions to Draft EIR pages 2-44 through 2-47, 2-191, 2-192, 3-9, 3-10, 3-19, 4-47, 4-48, 4-50, 6-130, and 6-300, reflecting the updated list of requested entitlements have also been included as text revisions to the Draft EIR on pages C&R 4-37 through C&R 4-58.

The Draft EIR addresses the consistency of the proposed CPMC LRDP with the San Francisco General Plan in Section 3.2.1, on page 3-2. The General Plan contains many policies and objectives. Some of these policies and objectives conflict with each other; achieving complete consistency with the General Plan is not always possible for a proposed project. Consistency with the General Plan, typically, is based upon whether, on balance, the proposed project would be consistent with General Plan policies. CEQA does not require an analysis of the proposed project in relation to all General Plan policies, but rather it asks whether a proposed project would conflict with any plan or policies adopted to protect the environment. As stated in the Draft EIR on page 3-1, "conflicts of the CPMC LRDP with policies do not, in and of themselves, constitute significant environmental impacts; they are considered environmental impacts only when they would result in direct physical effects…the consistency of the proposed development with applicable plans and policies that do not directly relate to physical environmental issues will be considered by decision-makers when they determine whether to approve or disapprove the project."

The Draft EIR also addressed potential conflicts between the proposed project and local applicable plans in Impact LU-2, and concluded that the project impacts would be less than significant (see Draft EIR pages 4.1-46 through 4.1-54). For the Cathedral Hill Campus, the Draft EIR acknowledged that the project sponsor has requested a number of amendments to the *General Plan's* VNAP and amendments to the Planning Code text and zoning and height and bulk district maps; PUD and CU authorizations; and other approvals. The Draft EIR further recognized that if "the proposed amendments are approved by decision-makers, the proposed LRDP would be consistent with the applicable plans and policies, and would therefore not conflict with any applicable land use plan, policy, or regulation." At the Davies Campus, the Draft EIR concluded that "the proposed near-term project at the Davies Campus would not conflict with any applicable land use plan, policy, or regulation." At the St. Luke's Campus, the Draft EIR stated that the proposed project included *General Plan* amendments and Planning Code text and map amendments, PUD and CU authorizations, and other approvals. The Draft EIR concluded that "if these amendments and authorizations are approved, the LRDP would be consistent with the relevant amended plans and policies, and implementing the LRDP at the St. Luke's Campus would not conflict with any applicable land use plan, policy, or regulation."

The proposed CPMC LRDP and the project approvals are subject to review and approval by the Planning Commission and the Board of Supervisors. Before issuing a permit for any project; before issuing a permit for any demolition, conversion, or change of use; and before taking any action that requires a finding of consistency with the General Plan, the City will evaluate the proposed project's consistency with the General Plan and the City's Priority Policies. In evaluating the proposed project's consistency with the General Plan, the Planning Commission and/or Board of Supervisors will make the necessary findings of consistency. This determination would not be part of the CEQA environmental review process, but would be part of the decision to approve, modify, or disapprove the project as proposed.

These comments will be transmitted to, and may be considered by, the decision-makers as part of their deliberations on the project. These comments do not require further discussion under CEQA.

Better Streets Plan

The San Francisco Better Streets Plan creates a unified set of standards, guidelines, and implementation strategies to govern how the City designs, builds, and maintains its pedestrian environment. It seeks to balance the needs of all street users, and reflects the understanding that streets serve a multitude of social, recreational, and ecological needs. The Draft EIR addresses the consistency of the proposed CPMC LRDP with the Better Streets Plan in Section 3.2.13, on page 3-24.

The Board of Supervisors approved the Better Streets Plan on December 7, 2010. At the time the Draft EIR was prepared and published July 21, 2010, the Better Streets Plan had not yet been adopted. As noted in Draft EIR Chapter 2, "Project Description," the proposed LRDP streetscape designs include features that are intended to improve the pedestrian environment surrounding the proposed Cathedral Hill, Davies, and St. Luke's Campuses. These features are summarized below. Because construction at the Pacific Campus is expected to occur in the long term, detailed streetscape and landscape plans for the Pacific Campus are not currently available, but would be prepared in the future, when and if such development projects for the Pacific Campus are proposed. The Draft EIR acknowledges that compliance with the Better Streets Plan would be required as part of the streetscape plan for each CPMC campus (Draft EIR, pages 2-48, 2-146, and 2-185). If the proposed CPMC LRDP is approved, compliance with the Better Streets Plan would be confirmed by Planning Department staff during the final design review process for the various CPMC campuses under the LRDP. The Draft EIR states on page 3-25 that, "the proposed CPMC LRDP would be generally consistent with the proposed Better Streets Plan."

Cathedral Hill Campus. As stated on page 2-34 of the Draft EIR, "CPMC proposes to upgrade the pedestrian environment by improving the street frontages of the Cathedral Hill area." To achieve this objective, walkway widths would be expanded and substantial landscaped areas would be added to

provide a buffer between pedestrians and traffic lanes. This is consistent with the main concept of the Better Streets Plan to incorporate pedestrian-oriented streetscape design. The proposed streetscape design is shown in Figure 2-37, "Cathedral Hill Campus—Proposed Streetscape Plan" (Draft EIR, page 2-101). As explained on page 2-36 of the Draft EIR, a new landscape plan is proposed for the Cathedral Hill Hospital and Cathedral Hill MOB, featuring distinctive groupings and compositions of plant materials set in sidewalk landscaped areas intended to be compatible with climatic, wind, and wet/dry-cycle conditions around the various street frontages of the proposed Cathedral Hill Campus.

Davies Campus. As presented on pages 2-146 and 2-147 of the Draft EIR and as updated per text revisions to page 2-146 included on page 4-41, landscape improvements on the eastern edge of the Davies Campus along Noe Street would include an approximately 560-foot-long improved sidewalk surface and landscaping. A portion of the northern end of the Davies Campus, nearest to Noe Street, would also include streetscape improvements such as improved sidewalk paving and landscaping (see Figure 2-56, "Davies Campus Streetscape Plan," on page 2-138 of the Draft EIR; please also see Figure 2-56 Revised on page C&R 4-59 which includes a version of the Davies Campus Streetscape Plan that has been updated since publication of the Draft EIR). A landscaped open space would also be located just north of the proposed Neuroscience Institute.

The existing Noe Street sidewalk adjacent to the Davies Campus is 15 feet 6 inches wide. CPMC has committed to funding improvements that include widening the sidewalk approximately 7 additional feet into the Davies Campus property, resulting in a 22-foot-wide sidewalk along the proposed Neuroscience Institute building frontage. A new publicly accessible entry plaza (see Figure 2-45, "Davies Campus—Proposed Site Plan," on page 2-138 of the Draft EIR) would be constructed immediately south of the proposed Neuroscience Institute. The plaza would incorporate varying pavement surfaces, plantings, and trees (see Draft EIR Section 4.13, "Biological Resources," for more information). East of the campus along Noe Street, the widened sidewalk would also have improved surfaces, plantings, and new trees. As stated in the Draft EIR on page 2-146, "compliance with the City's Better Streets Plan, which provides policies and guidelines for the pedestrian realm, would be required as part of the proposed streetscape design." These near-term landscape and streetscape improvements would be consistent with the main concept of the Better Streets Plan to incorporate pedestrian-oriented streetscape design.

St. Luke's Campus. As presented in the Draft EIR on page 2-185, near-term streetscape and landscape plans for the St. Luke's Campus are being developed as part of CPMC's community and neighborhood outreach program, and in conjunction with the City's proposed Cesar Chavez Street Design Improvement Plan (see Figure 2-77, "St. Luke's Streetscape Plan," on page 2-174 of the Draft EIR). The St. Luke's Campus streetscape would be designed to complement the improvements being made by the City on Valencia Street. As stated in the Draft EIR on page 2-185, "compliance with the City's Better Streets Plan, which provides policies and guidelines for the pedestrian realm, would be required as part of the streetscape at the St. Luke's Campus.

Long Term Projects. Impact LU-2 in the Draft EIR (on page 4.1-46) analyzes the potential impacts to applicable land use plans, policies, or regulations. As stated in the Draft EIR on page 4.1-52, "long-term projects described in this EIR would be subject to additional project-specific environmental review under CEQA, after more detailed design information is available; this subsequent environmental review would take into account any changes in the environmental setting that could affect the significance determination." Thus, the long-term projects proposed at Davies and Pacific Campuses would be evaluated for consistency with the *Better Streets Plan* at the time those projects are proposed.

The proposed CPMC LRDP would be generally consistent with the Better Street Plan. The Planning Commission and/or Board of Supervisors will make the necessary findings of consistency. This determination would not be part of the CEQA environmental review process, but would be part of the decision to approve, modify, or disapprove the project as proposed.

Comment [Recreation and Open Space Element]

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-147 LU, duplicate comment was provided in 30-147 LU]

"84. On Page 3-6 in the 'Recreation and Open Space Element' section, reference is made to 'Map 4 of the Recreation and Open Space Element.' This should be 'Map 2.'"

Response LU-2

The comment states that the reference in the Draft EIR regarding the Recreation and Open Space Element, made to Map 4 of the Recreation and Open Space Element, should be Map 2 of the General Plan Recreation and Open Space Element. The reference to Map 4 of the Recreation and Open Space Element of the General Plan, on page 3-6 of the Draft EIR, is correct. Map 4 shows existing open space and proposed public open space, including areas that would be desirable to acquire for or convert to public open space. Map 2 of the Recreation and Open Space Element shows existing public open space and open space service areas (areas within acceptable walking distance of public open space).

For clarification purposes, as part of the text revisions to the Draft EIR in Chapter 4, "Draft EIR Text Changes," on page C&R 4-3, a new sentence and reference to Map 2 has been added on Draft EIR page 3-6:

> Map 4 of the Recreation and Open Space Element identifies existing public open space, and areas that would be desirable to acquire for or convert to public open space. Map 2 of the Recreation and Open Space Element identifies existing public open space and open space service areas.

Comments [Consistency with the Housing Element]

(Calvin Welch—Council of Community Housing Organizations, October 13, 2010) [53-4 LU]

"**The CPMC DEIR Fails to Discuss in a Complete Manner the Housing Element Policies Effecting the Proposed Development**

Key Housing Element policies are ignored in the DEIR and must be discussed and information provided on how the project conforms or fails to conform with these policies. Specifically Polices 1.3, 1.6. 1.9, 2.1, 2.4, 2.5, 7.3 and 11.4 directly apply to projects of this type and are not mentioned, listed or discussed in the DEIR.

Taken as a whole these policies layout a preference for large commercial projects to meet their housing demands, not reduce the supply of housing, and not place undue pressures on existing residential uses and neighborhoods. On its face the proposed project will reduce housing place stress on existing residential neighborhoods and fail to specifically meet the demand it creates for housing (see item below).

The DEIR must completely discuss these polices and how the proposed project either meets or fails to meet them. It is impossible to accurately assess the impacts of the proposed project absent this crucial discussion."

(Stephanie Barton, et al.—Hastings Civil Justice Clinic for the Good Neighbor Coalition, October 19, 2010) [104-3 LU]

"The proposed project potentially conflicts with the Housing Element in two prominent ways, neither of which is subject to much, if any, analysis in the DEIR. First, Objective 1 of the Housing Element establishes as an overarching policy goal the following: 'to provide new housing, especially permanently affordable housing, in appropriate locations which meets identified housing needs and takes into account the demand for affordable housing created through employment demand.' Second, the proposed project potentially conflicts with Housing Element Policy 11.4. This policy, which explicitly applies to medical institutions, addresses the need to 'avoid or

minimize disruption caused by expansion of institutions, large-scale uses and auto-oriented development into residential areas.' The concern is that the development of large institutions like hospitals 'often conflict with efforts to preserve and protect the scale and character of residential neighborhoods.'"

(Stephanie Barton, et al.—Hastings Civil Justice Clinic for the Good Neighbor Coalition, October 19, 2010) [104-5 LU]

"The emphasis on the development of housing along Van Ness Avenue reflects and reinforces Policy 1.1 of the 2004 Housing Element, which states the following: "[e]ncourage higher residential density in areas adjacent to downtown, in underutilized commercial and industrial areas proposed for conversion to housing, and in neighborhood commercial districts where higher density will not have harmful effects, especially if the higher density provides a significant number of units that are affordable to lower income households.' Other Housing Element policies that similarly reflect and reinforce the VNAP's prioritization of housing include Policy 1.9, which requires 'new commercial developments ... to meet the housing demand they generate, particularly for affordable housing for lower income workers and students,' and Policy 7.3, which emphasizes 'greater investments in and support for affordable housing programs by corporations."

(Stephanie Barton, et al.—Hastings Civil Justice Clinic for the Good Neighbor Coalition, October 19, 2010) [104-30 LU]

"Overall, the DEIR's housing analysis is woefully inadequate. The report fails to recognize major inconsistencies between the proposed project and the General Plan's Housing Element. The DEIR also assumes the project will receive Conditional Use authorization to modify its residential development requirements, but fails to analyze the project's suitability to receive a conditional modification or the impacts on the surrounding neighborhoods that could result from one."

(Gloria Smith—California Nurses Association, March 8, 2011) [122-4 LU]

"In addition, the 2009 General Plan Housing element includes a number of policies for the Van Ness corridor that give preeminence to mixed use and housing. For example:

- Implementation 1.6: The Planning Department will continue to implement the Van Ness Avenue Plan which requires residential units over commercial uses.

- Implementation 2.1: The City will continue to implement the Proposition M policy that requires that existing housing and neighborhood character be conserved and protected in order to preserve the cultural and economic diversity of neighborhoods.

- Policy 2.5: Preserve the existing stock of residential hotels. Residential or single-room occupancy hotels (SRO's) represent a unique and often irreplaceable resource for thousands of lower income elderly, disabled, and single-person households. Most of these hotels are close to downtown and have been subject to strong economic pressures that led to conversion or demolition . . .The retention of remaining units of housing permanent residents should be supported.

Contrary to these and other policies articulated for the Corridor in the Housing Element and other applicable plans, the proposed Cathedral Hill campus would remove existing housing and SRO rooms, and eliminate the potential for future housing on the campus sites as envisioned by the plans."

(Commissioner Olague, September 23, 2010) [PC-378 LU]

"…so I'm not convinced that, you know, for instance, here the housing element – most of the objectives and policies in the housing element are not applicable to the proposed LRDP because the project does not include a residential development component, which I think contradicts, again, the Van Ness SUD requirements. So I find that kind of faulty, actually."

Response LU-3

The comments are regarding the consistency of the proposed CPMC LRDP with the San Francisco General Plan's Housing Element, and request that the evidence that the proposed LRDP is in compliance with General Plan Housing Element Objective 1, and with Policies 1.3, 1.6, 1.9, 2.1, 2.4, 2.5, 7.3, and 11.4, be provided in the Draft EIR. Objective 1 and the referenced policies are discussed below. One of the comments is also regarding whether the Housing Element is applicable to the proposed CPMC LRDP.

The Draft EIR considers the consistency of the proposed LRDP with the policies of the 2004 Housing Element, which was the approved Housing Element during the preparation of the Draft EIR and this C&R document. The Draft EIR and this C&R document also discuss the 2009 Housing Element, which was under development during the time that the EIR was prepared. The Planning Commission approved the 2009 Housing Element, and certified the EIR for the 2004 and 2009 Housing Elements, on March 24, 2011. The Board of Supervisors upheld the EIR for the 2004 and 2009 Housing Elements on May 10, 2011. The Board of Supervisors adopted the 2009 Housing Element on June 21, 2011.

"Objective 1: To Provide New Housing, Especially Permanently Affordable Housing, In Appropriate Locations Which Meets Identified Housing Needs And Takes Into Account The Demand For Affordable Housing Created By Employment Demand."

Objective 1 states a broad goal of the Housing Element to implement two of the General Plan's priority policies:

- "That the City's supply of affordable housing be preserved and enhanced.
- That existing housing and neighborhood character be conserved and protected in order to preserve the cultural and economic diversity of our neighborhoods."[1]

This objective is implemented through nine policies, three of which are discussed further below. Although the proposed CPMC LRDP is not a housing project, it would not conflict with Objective 1. The proposed LRDP development project sites for the Cathedral Hill Hospital and the 1375 Sutter MOB were not assumed or planned for housing development in the Van Ness Avenue Plan or the Housing Element because these sites were part of the Western Addition A-2 Redevelopment Plan Area at the time of adoption of the VNAP. The proposed Cathedral Hill MOB site was not within the Western Addition A-2 Redevelopment Plan Area and was considered a "soft site," i.e., a site with an existing building area less than 60 percent of the allowable FAR and which would accommodate low-intensity commercial activities.

The assessment of housing capacity in the Draft EIR is not based on the assumptions of the VNAP or the VNAP EIR, but rather, it is based upon the assumptions of capacity in the Housing Element. Under the 2009 Housing Element, none of the proposed CPMC LRDP development sites in the proposed Cathedral Hill Campus were assumed for residential development. The 2009 Housing Element used a more restrictive assumption about sites that would redevelop in the City, considering "soft sites" to be those with existing building area that was less than 30 percent of allowable development.[2] As a matter of clarification, the 2009 Housing Element states that "[f]or the purpose of determining remaining development potential capacity, the Planning Department does not consider any parcel developed to more than 30 percent of its capacity as a "soft site," or a candidate for additional square footage or

[1] City of San Francisco, *Housing Element, Part II: Objectives, Policies, and Implementation Programs, Introduction,* accessed March 28, 2011 via http://www.sf-planning.org/ftp/General_Plan/I1_Housing.htm.

[2] City of San Francisco, *Housing Element, Part I: Data and Needs Analysis,* page D.2. "For the purpose of determining remaining development potential capacity, the Planning Department does not consider any parcel developed to more than 30% of its capacity as a "soft site," or a candidate for additional square footage or intensification." Accessed May 25, 2001 http://housingelement2009.sfplanning.org/docs/Housing_Element_Part_I_Data_Needs_Assmt_CPC_Adopted.pdf.

intensification." None of the proposed Cathedral Hill Campus development sites would meet these criteria. Thus, the remaining potential residential development capacity in the City of San Francisco as identified in the Housing Element, which formed the basis for the Draft EIR analysis of the proposed LRDP's impacts related to housing, would not change as a result of implementation of the proposed CPMC LRDP.

In addition, the City's Jobs-Housing Linkage Program (JHLP) specifically excludes institutional uses (such as medical and hospital uses) from the requirements to create housing either directly or through the payment of an in-lieu fee. Furthermore, as described in Response PH-17 (page C&R 3.5-64), CPMC has proposed to make a contribution to the Mayor's Office of Housing of at least the equivalent of the JHLP fee for the CPMC LRDP as defined in Section 413 of the Planning Code, for the purpose of satisfying any unmet housing demand created by development of the proposed Cathedral Hill Campus. It is anticipated that the contribution to the Mayor's Office of Housing will be incorporated into the conditions of approval for the proposed project, if the project is approved, and would be memorialized in the Development Agreement for the proposed LRDP.

Because the proposed CPMC LRDP comprises development of non-residential projects on primarily non-residential sites (or, in the case of the Cathedral Hill MOB, a mixed-use site with a relatively small [25 units] amount of existing on-site residential development) that were not identified for residential development in the Van Ness Area Plan or the Housing Element, the proposed LRDP would not conflict with the ability to comply with Objective 1 of the Housing Element. Furthermore, the voluntary contribution of funds by CPMC to the Mayor's Office of Housing at a level that would be at least equivalent to the JHLP fee would facilitate the construction of housing in the City. Please see the discussion on page C&R 3.23-41, regarding CPMC's commitments in the proposed Development Agreement (Section 3.23.1.2) for the contribution to the Mayor's Office of Housing, including compensation for the loss of 25 units and subsidizing additional affordable housing. Thus, the proposed CPMC LRDP would not conflict with, but would be in compliance with, the implementation of Housing Element Objective 1.

A more detailed discussion of specifically identified policies from the Housing Element is presented below.

Policy 1.3: *"Identify opportunities for housing and mixed-use districts near downtown and former industrial portions of the City."*

Under this Housing Element policy, the City seeks to identify opportunities for housing and mixed-use districts near downtown and former industrial areas and encourage their development; it does not impose any development restrictions that would apply to the proposed LRDP, as explained below.

The proposed facilities at the Pacific, St. Luke's, and Davies Campuses would all be located within the existing campus boundaries, and thus, they would not be located on sites that provide opportunities for housing and mixed-use development.

As stated on page 4.1-3 of the Draft EIR, the proposed Cathedral Hill Campus would be a new campus located in an area that is composed primarily of high-density residential and commercial uses, with moderate-scale commercial uses located northwest of the proposed campus. The proposed Cathedral Hill Hospital would be located on the site of the 10-story, 402-room Cathedral Hill Hotel, which closed in 2009. The proposed Cathedral Hill MOB would be located on a site that contains existing retail uses, nightclubs, a restaurant, residential hotel units, and residential units. The site of the proposed Cathedral Hill Hospital (currently occupied by the former Cathedral Hill Hotel) and proposed MOB site could be used as a site for housing and mixed use development.

The sites are zoned RC-4 (Residential-Commercial, High Density), which encourages a mix of high-density residential uses with supporting commercial uses (Figure 4.1-2, "Cathedral Hill Campus Vicinity—Existing Zoning," on page 4.1-4 of the Draft EIR). The RC-4 district allows medical institutions, including hospitals and affiliated medical office buildings with CU authorizations, and allows non-institutional medical office use as a principal use on the ground floor and with CU authorization on the upper floors of buildings (Draft EIR, page 4.1-3).

The San Francisco Planning Code establishes three types of uses in any zoning district: Principal Uses, Conditional Uses, and Accessory Uses, as described below.

- Principal Uses are uses that are permitted as of right in each established district;
- Conditional Uses are uses that are reviewed on a case-by-case basis and are permitted in each established district when authorized by the City Planning Commission under Section 303 of the Planning Code; and
- Accessory Uses or related minor or subordinate uses for such permitted Principal and Conditional Uses.

The project sponsor, CPMC, has requested a CU authorization for development of the proposed Cathedral Hill Hospital and MOB on the Cathedral Hill Campus. Under the San Francisco Planning Code, amendments to the Planning Code itself and authorization of Conditional Uses are expressly allowed. More specifically, under section 302(c) of the Planning Code, the Planning Commission shall approve proposed amendments if, after a public hearing and based on evidence in the record, the Commission determines the amendments to be necessary to achieve "public necessity, convenience, and general welfare." Further, under Planning Code section 303(c), the Planning Commission shall approve the proposed Conditional Uses if evidence in the record establishes that the Conditional Use "will provide a development that is necessary or desirable for, and compatible with, the neighborhood or the community...and that such use or feature as proposed will not be detrimental to the health, safety, convenience or general welfare of persons residing or working in the vicinity, or injurious to property, improvements or potential development in the vicinity…," and that the proposed use will comply with other applicable provisions of the Planning Code and General Plan. Thus, the Planning Code allows for amendments to General Plan elements and to specific policies or sections of the Planning Code provided that the City decision-makers determine that the overall objectives of the General Plan are being satisfied. If the Planning Commission ultimately decides to approve the proposed CPMC LRDP, they would need to determine that the project is necessary and/or desirable and in furtherance of the general welfare, and that on balance the project would not conflict with or adversely affect the General Plan, which consists of a variety of elements, including, but not limited to, the Housing Element.

If approved by city decision-makers, the proposed Cathedral Hill Hospital and MOB could be developed with a CU authorization; it would thus not conflict with Planning Code regulations. Amendments to the General Plan, Van Ness Avenue Area Plan (VNAP) and Planning Code regulations, and other approvals are requested for Cathedral Hill Campus development as part of the LRDP. If they are approved by the decision-makers, the Cathedral Hill Campus development would be consistent with applicable City plans and policies. Although the proposed CPMC LRDP would involve construction of a hospital and affiliated medical-use development on a site that could otherwise be used for housing and mixed-use development, medical uses are allowed as a CU authorization at these sites under existing Planning Code regulations. The proposed Cathedral Hill Campus development would not conflict with General Plan Housing Element Policy 1.3, which primarily seeks to identify opportunities overall for housing and mixed-use development in the city and does not restrict other uses. In addition, the Cathedral Hill Hotel site was not

specifically identified in the VNAP EIR as a housing opportunity site.[3] Please see Response LU-9 for further discussion of the proposed LRDP's consistency with the General Plan.

The CPMC LRDP proposes demolition of five dwelling units and 20 residential hotel units that are on the site of the proposed Cathedral Hill MOB. This would result in the loss of housing, and construction of a medical office building. Planning Code Section 317 requires Conditional Use (CU) authorization for the demolition of three or more dwelling units. It does not require one-for-one residential unit replacement. However, CPMC has agreed to pay an in-lieu fee to compensate for demolition of the five residential dwelling units and consulted with the Mayor's Office of Housing (MOH) to identify the appropriate in-lieu fee methodology. MOH determined that (i) the in-lieu fee amount will be established based on the citywide inclusionary housing fee schedule effective as of July 15, 2008; and (ii) as applied to the residential units, the total fee is One Million Four Hundred Fifty Three Thousand Eight Hundred and Twenty Dollars ($1,453,820.00) ("Residential Unit Replacement Fee") based on the following unit type and calculation: three one bedroom units ($248,210.00 x 3), one two bedroom unit ($334,478.00) and one three bedroom unit ($374,712.00). A condition to DBI's issuance of a demolition permit for the residential units would be payment of the Residential Unit Replacement Fee. The requirement to pay this fee would also be memorialized in the proposed Development Agreement for the LRDP. Please see the discussion on page C&R 3.23-41, regarding CPMC's commitments in the proposed Development Agreement for the contribution to the MOH, including compensation for the loss of 25 units and subsidizing the affordability of additional housing.

The Cathedral Hill Campus project site falls under the Van Ness Special Use District (VNSUD), which requires the development of 3 sq. ft. of residential uses for every 1 sq. ft. of net new nonresidential development. However, the project sponsor has requested an amendment to the Planning Code Section 243 text provisions for the VNSUD or CU authorization to modify the residential requirements. Please refer to Response LU-21 (page C&R 3.3-95) regarding the modification of the 3:1 residential to non-residential uses requirements allowed under Section 243 of the Planning Code.

The proposed 1375 Sutter MOB site currently includes medical and general office uses, as well as retail space and a parking garage. The site is zoned NC-3 (Neighborhood Commercial, Moderate-Scale), which is intended by the Planning Code to serve areas beyond the immediate neighborhood (Figure 4.1-2, on page 4.1-4 of the Draft EIR). The NC-3 zoning district allows a range of uses such as retail businesses, personal services, and offices, including medical office use, and therefore, the proposed MOB would not conflict with Planning Code regulations. As with the proposed Cathedral Hill Hospital and MOB, the proposed 1375 Sutter MOB would not conflict with General Plan Housing Element Policy 1.3, which primarily seeks to identify opportunities for housing and mixed development and does not restrict other uses.

Policy 1.6: *"Create incentives for the inclusion of housing, particularly permanently affordable housing, in new commercial development projects."*

Policy 1.9: *"Require new commercial developments and higher educational institutions to meet the housing demand they generate, particularly the need for affordable housing for lower income workers and students."*

Policies 1.6 and 1.9 of the Housing Element encourage the inclusion of affordable housing in new commercial and higher educational development projects. These policies do not apply to the proposed LRDP as it is neither a commercial nor higher education development. Policy 1.9 is tied to the Jobs-Housing Linkage Program requirement; however this requirement is not applicable to Institutional Uses, including Medical Centers.

[3] City and County of San Francisco, Van Ness Avenue Area Plan Environmental Impact Report, 1987.

The 2009 Housing Element Update analyzes San Francisco's population and employment trends; existing household characteristics; overall housing needs; and the capacity for new housing development based on land supply and site opportunities. On the basis of the 2009 Housing Element Update's analysis, any additional demand for affordable housing generated by the proposed CPMC LRDP can be accommodated by existing and planned residential growth, as outlined in the 2009 Housing Element. An initial review of data released by the 2010 U.S. Census suggests that the number of vacant residential units in San Francisco is at least as high as reported in the 2009 Housing Element, and perhaps materially higher.[4] Please also see Response PH-3, including C&R Table 3.5-1 (page C&R 3.5-7).

As stated above, the CPMC LRDP proposes demolition of five dwelling units and 20 residential hotel units that are on the site of the proposed Cathedral Hill MOB. A CU authorization would be required to allow development of the medical office building use and demolition of the five dwelling units as discussed in the Draft EIR on pages 2-45 through 2-47. In addition, CPMC would request a permit under the City's Residential Hotel Conversion and Demolition Ordinance (San Francisco Administrative Code, Chapter 41) to demolish the existing 20 residential hotel units.

As stated on page 4.3-33 of the Draft EIR, CPMC would provide for relocation assistance in excess of that required by law for all affected tenants of these residential dwelling units and residential hotel units who need assistance. Chapter 41, Section 41.13 of the San Francisco Administrative Code requires that all demolished residential hotel units be replaced at a 1 to 1 ratio and provides various mechanisms for compliance by the project sponsor. As is described above, CPMC has agreed to pay an in-lieu fee to address demolition of the five residential dwelling units and consulted with the MOH to identify the appropriate in-lieu fee methodology. Please also see the discussion on page C&R 3.23-41 regarding CPMC's commitments in the proposed Development Agreement for the contribution to the Mayor's Office of Housing, including compensation for the loss of these 20 residential hotel units and five residential dwelling units.

With respect to the five residential dwelling units, the Planning Code requires the Planning Commission to consider the replacement structure that would be constructed in the location of the demolished units, in order to avoid vacant lots. No permit to demolish a residential building generally may be issued until a building permit for a replacement structure has been approved.

The tenants displaced by the removal of the five dwelling units and 20 residential hotel units for the proposed Cathedral Hill Campus would be compensated, and residents would be offered relocation assistance. As described in Response PH-16 (page C&R 3.5-60), CPMC has committed to fully meet the requirements of Section 41.13 of the San Francisco Administrative Code and Section 317 of the San Francisco Planning Code, and, therefore, the loss of the housing and residential hotel units would be a less-than-significant impact.

In mid-2009, CPMC began formal communication with the residential tenants about relocation. Several non-profits were contacted and Chinatown Community Development Center (CCDC) agreed to participate in the discussions. Over the past year, CPMC has met with the tenants and offered relocation services to help with the process and identify other appropriate publicly-available supportive services, and translation assistance. CPMC has worked with the tenants to develop a relocation financial assistance package that establishes a market rate differential for the existing units as compared to a comparable replacement unit, and multiplies that differential by 78 months. It also includes standard moving and relocation costs, including credit check fees, security deposit, etc. Consideration also has been given for elderly tenants.

[4] U.S. Census Bureau, 2010 Census, *Civilian Population Counts and Occupancy Status.* The 2010 U.S. Census Redistricting Data (Public Law 94-171) Summary File.

As of September 2011, CPMC has reached agreement with all 10 of the residential households. CPMC has assisted several households with apartment searches, landlord negotiations, and moving, all within San Francisco. Eight of the ten residential households have relocated and the remaining two have agreed to move out in early 2012.[5]

The loss of five residential dwelling units and 20 residential hotel units would not affect the larger objective of the VNAP which is to revitalize the area by encouraging new retail and housing to facilitate the transformation of Van Ness Avenue into a mixed use boulevard. Please see Response LU-21 (page C&R 3.3-95) for further discussion.

Policy 7.3: "Develop greater investments in and support for affordable housing programs by corporations, churches, unions, foundations, and financial institutions."

This policy encourages collaboration between the City and corporations, churches, unions, foundations, and financial institutions such that they participate in affordable housing programs. Options would include providing funding to the Mayor's Office of Housing and/or one or more nonprofit organization(s) to construct replacement units, the details of which are still under discussion.

As discussed in Response PH-11, San Francisco's Jobs-Housing Linkage Program (JHLP) does not apply to Institutional uses, and thus would not be formally imposed upon the short-term projects. However, in support of efforts to meet the housing demand of new development, CPMC has proposed to make a contribution to the Mayor's Office of Housing equivalent to the JHLP fee as defined in Section 413 of the Planning Code. The project's contribution to the Mayor's Office of Housing would support the production of units, including affordable units that would meet some or all of the demand for new housing in the City generated by the project over time. Therefore, CPMC would provide funding for affordable housing, which is one of a number of ways that institutions, non-profits, and businesses can collaborate to achieve the intent of and be consistent with General Plan Housing Element Policy 7.3. Please see the discussion on page C&R 3.23-41, regarding CPMC's commitments in the proposed Development Agreement for the contribution to the Mayor's Office of Housing, including subsidizing the affordability of additional housing Please also see Responses PH-14, PH-17, and PH-18 (pages C&R 3.5-53, 3.5-64, and 3.5-67, respectively) for a thorough discussion of the approach to and status of mitigation for housing displacement and demolition.

Policy 11.4: "Avoid or minimize disruption caused by expansion of institutions, large-scale uses and auto-oriented development into residential areas."

The Draft EIR addresses impacts of the proposed LRDP development related to potential disruptions to nearby residential areas for various environmental topic areas. These disruptions include the following:

Section 4.1, Land Use and Land Use Planning

Impact LU-1 addresses the potential for the project to physically divide the existing community (Draft EIR, pages 4.1-37 to 4.1-46). The Draft EIR concludes that the proposed CPMC LRDP would not physically divide or disrupt an established community at the Cathedral Hill, Davies, St. Luke's and Pacific Campuses. This LRDP impact related to development at all CPMC campuses would be less than significant. Impact LU-2 evaluated the potential for conflicts between the proposed LRDP and local and regional plans. The Draft EIR concluded that with adoption of the amendments and conditional use authorizations proposed as part of the project, the LRDP would not conflict with local plans and the impact would be less than significant. Impact LU-3 addressed the proposed LRDP's impacts on existing character (Draft EIR, pages 4.1-55 to 4.1-

[5] Memorandum from Geoffrey Nelson, AICP, California Pacific Medical Center, to Cameron Mueller & David Reel (AECOM), re: Relocation of tenants in 1034-1036 Geary Street (September 22, 2011).

65), and concluded that the proposed LRDP would have a less-than-significant impact on the existing character of the vicinity surrounding the Cathedral Hill, Davies, St. Luke's and Pacific Campuses. The analyses of all three of these land use impacts concluded that the land use impacts of the proposed LRDP would be less-than-significant at all CPMC campuses. Therefore, the proposed LRDP would be consistent with Policy 11.4, because it would not result in significant operational impacts related to the disruption of existing residential areas.

Section 4.2, Aesthetics

Impact AE-1 addresses the proposed LRDP's impacts on scenic highways or scenic vistas, and concludes that there would be a less-than-significant impact on the 49-Mile Scenic Drive or on other scenic vistas around San Francisco (Draft EIR, pages 4.2-95 to 4.2-107). Impact AE-2 concludes that the proposed LRDP would have a less-than-significant impact on scenic resources (Draft EIR, pages 4.2-107 to 4.2-116). Impact AE-3 evaluates the potential of the proposed LRDP to degrade the existing visual character or quality of the affected sites and surroundings; the conclusion is that the impacts would be either less than significant or non-existent (Draft EIR, pages 4.2-117 to 4.2-187). Impact AE-4 addresses the potential for the creation of problematic light and glare that would adversely affect day or night views, or would affect adjacent properties. The Draft EIR concludes that these impacts would be less than significant (Draft EIR, pages 4.2-187 to 4.2-192).

Section 4.3, Population, Employment, and Housing

Impact PH-1 addresses the proposed LRDP's potential to induce population growth, and concludes that the impact of the LRDP would be less than significant because the overall growth attributable to the proposed project would be within the bounds of the growth already planned for by local and regional agencies (Draft EIR, pages 4.3-18 to 4.3-31). Impact PH-2 evaluates the potential for the proposed LRDP to displace housing and create demand for additional housing. The Draft EIR concludes that the impacts of the proposed LRDP would be less than significant because CPMC has agreed to pay an in-lieu fee to address demolition of the five residential dwelling units, consulted with the MOH to identify the appropriate in-lieu fee methodology, and the overall demand for housing in the City can be readily accommodated within the City's existing housing capacity (Draft EIR, pages 4.3-32 to 4.3-43). Impact 4.3-3 examines the potential for the proposed LRDP to displace people that would necessitate the need for replacement housing elsewhere, and concludes that the impacts of the project would be less than significant, because the project would implement a relocation program consistent with City statute (Draft EIR, pages 4.3-43 through 4.3-47).

Section 4.4, Cultural and Paleontological Resources

The effects of the proposed LRDP on cultural and paleontological resources are described in Section 4.4 of the Draft EIR, in Impacts CP-1 through CP-3, are all less than significant with incorporation of mitigation that involves monitoring and recovery of resources that may be discovered during site clearing and excavation (see Draft EIR, pages 4.4-29 through 4.4-48). These impacts address effects of the project on resources, and do not concern issues of neighborhood disruption.

Section 4.5, Transportation and Circulation

Section 4.5 presents an extensive discussion of transportation and circulation impacts that would result at each CPMC campus, including impacts on traffic, transit, bicycles, pedestrians, loading, emergency vehicle access, and construction.

Cathedral Hill Campus

Impacts TR-1 through TR-58 address the proposed LRDP's impacts resulting from development of the proposed Cathedral Hill Campus (Draft EIR, pages 4.5-93 through 4.5-161). The development of the Cathedral Hill Campus would avoid or minimize disruption in nearby residential neighborhoods. Although several significant and unavoidable transportation impacts are attributable to the development of the Cathedral Hill Campus under the LRDP, these impacts are limited to major transportation corridors through heavily travelled mixed use corridors. Impacts TR-1, TR-2, TR-6, TR-7, TR-8, TR-12, TR-13, TR-17, TR-19, TR-20, TR-22 through TR-26, TR-29 through TR-36, and TR-42 all relate to the LRDP's impacts on vehicular and transit flow on major travel corridors such as Van Ness Avenue, Polk Street, Geary Street, Franklin Street, and Gough Street in mixed use areas. Impacts TR-55 through TR-58 would be construction-generated effects in and around the Cathedral Hill Campus. While these impacts are temporary in nature, Impact TR-55 was determined to be significant and unavoidable in the Draft EIR. Consistent with Policy 11.4, these effects would be minimized through implementation of mitigation measures (see MM TR-55, Draft EIR, page 4.5-159). Thus, the Cathedral Hill Campus would avoid or minimize disruptive transportation effects on nearby residential neighborhoods.

Pacific Campus

Impacts TR-59 through TR-66 address the proposed LRDP's impacts at the Pacific Campus (Draft EIR, pages 4.5-168 through 4.5-176). All of the transportation impacts associated with the Pacific Campus were deemed to be less than significant in the Draft EIR. Thus, the proposed development at the Pacific Campus would not result in significant disruptive transportation impacts on nearby residential neighborhoods.

California Campus

Impacts TR-67 through TR-73 address the project's impacts at the California Campus (Draft EIR, pages 4.5-179 through 4.5-182). All transportation impacts associated with the California Campus were deemed to be less than significant in the Draft EIR. Thus, activities at the California Campus under the proposed LRDP would not result in significant disruptive transportation impacts on nearby residential neighborhoods.

Davies Campus

Impacts TR-74 through TR-83 address the proposed LRDP's impacts at the Davies Campus (Draft EIR, pages 4.5-184 through 4.5-195). With the exception of Impact TR-75, all of the transportation impacts associated with the California Campus were deemed to be less than significant in the Draft EIR. Impact TR-75 concerns the operations of the intersection of Market/Church/14th Streets, which would operate at LOS F in the p.m. peak hour in the future. Although residences are in the vicinity, the intersection is on a major commercial corridor, and is not located in the heart of a residential neighborhood. Thus, the proposed development at the Davies Campus would not result in significant disruptive transportation impacts on nearby residential neighborhoods.

St. Luke's Campus

Impacts TR-84 through TR-94 address the proposed LRDP's impacts at the St. Luke's Campus (Draft EIR, pages 4.5-200 through 4.5-209). All of the transportation impacts associated with the St. Luke's Campus were deemed to be less than significant in the Draft EIR. Thus, the proposed

development at the St. Luke's Campus under the LRDP would not result in significant disruptive transportation impacts on nearby residential neighborhoods.

Combined LRDP Campuses

Impacts TR-95 through TR-98 address the combined impacts associated with multiple campuses (Draft EIR, pages 4.5-211 through 4.5-215). All of the transportation impacts associated with the Combined LRDP Campuses were deemed to be less than significant in the Draft EIR. Thus, the proposed development at the combined CPMC campuses under the LRDP would not result in significant disruptive transportation impacts on nearby residential neighborhoods.

Section 4.6, Noise

Impacts NO-1 through NO-5 address the proposed LRDP's noise impacts during construction, potential to increase traffic noise during construction and operation, effects from operation of stationary noise sources, and vibration effects during construction (Draft EIR, pages 4.6-41 through 4.6-95). Construction and operational noise effects of the proposed LRDP would be less than significant with the implementation of Mitigation Measures M-NO-N1, M-NO-N3, and M-NO-N4. Vibration effects are noted to be potentially significant and unavoidable even with mitigation, but would be minimized to the extent feasible through Mitigation Measure M-NO-N5. Thus, the LRDP would avoid or minimize disruptive noise and vibration impacts (to the extent feasible) on nearby residential neighborhoods.

Section 4.7, Air Quality

Impacts AQ-1 through AQ-14 address the proposed LRDP's impacts on air quality, including increases in fugitive dust during construction, increased exposure of sensitive receptors to toxic air contaminants, increased criteria pollutant emissions, and increased exposure to odors (Draft EIR, pages 4.7-29 through 4.7-85). For the most part, air quality impacts are regional in nature and are not localized to nearby neighborhoods. Impacts related to construction emissions of criteria pollutants which could be localized would be mitigated to a less-than-significant impact through implementation of Mitigation Measure M-AQ-N1(a,b). Impacts related to construction emissions of toxic air contaminants would be significant and unavoidable at the Cathedral Hill Campus even with mitigation, but would be minimized to the extent feasible through the implementation of Mitigation Measure M-AQ-N2. Thus, the LRDP would avoid or minimize air emission impacts (to the extent feasible) in nearby residential neighborhoods.

Section 4.8, Greenhouse Gases

Impacts GH-1 through GH-3 address the proposed LRDP's impacts on greenhouse gases (Draft EIR, pages 4.8-21 through 4.8-32). Greenhouse gas emissions only have adverse impacts in the atmosphere in a cumulative context, with the effects felt on a global basis. There are no impacts of greenhouse gas emissions related to LRDP development that involve neighborhood disruption as it is referred to in Policy 11.4.

Section 4.9, Wind and Shadow

Impacts WS-1 and WS-2 address the proposed LRDP's impacts on wind and shadow (Draft EIR, pages 4.9-22 through 4.9-59). Impacts WS-1, related to wind impacts on public areas, and WS-2, related to impacts due to creation of new shadows on parks and open space, were both determined to be less than significant in the Draft EIR. Thus, the LRDP development would avoid or minimize wind and shadow impacts in nearby residential neighborhoods.

Section 4.10, Recreation

Impacts RE-1 through RE-3 address the proposed LRDP's impacts on recreation facilities or the use of those facilities (Draft EIR, pages 4.10-34 through 4.10-52). These impacts consider the effects of the proposed LRDP on potential increases in use of neighborhood and regional parks, as well as on recreational facilities and opportunities, and these impacts were identified as less than significant in the Draft EIR. Thus, the LRDP would avoid or have minimal recreation impacts in nearby residential neighborhoods.

Section 4.11, Public Services

Impacts PS-1 through PS-4 address the proposed LRDP's impacts on public services, including police, fire, and emergency services; schools, and libraries (Draft EIR, pages 4.11-17 through 4.11-35). LRDP impacts on these services are considered significant if the expansion of service would result in physical impacts on the environment through the construction or operation of expanded police or fire facilities, schools or libraries. In all cases, the impacts of the proposed LRDP would be less than significant. Thus, the LRDP would avoid or minimize public services impacts in nearby residential neighborhoods.

Section 4.12, Utilities and Service Systems

Impacts UT-1 through UT-7 address the proposed LRDP's impacts on utilities and service systems, including water and wastewater treatment facilities; water supplies, stormwater drainage facilities, and solid waste facilities (Draft EIR, pages 4.12-24 through 4.12-44). Impacts on utilities and service systems are considered significant if the expansion of infrastructure or service would result in physical impacts on the environment through the construction or operation of equipment or facilities. In all cases, the impacts of the proposed LRDP would be less than significant. Thus, the LRDP would avoid or have minimal public services impacts in nearby residential neighborhoods.

Section 4.13, Biological Services

Impacts BI-1 and BI-2 address the proposed LRDP's impacts on biological resources, including effects on existing vegetation, nesting birds, and protected trees (Draft EIR, pages 4.13-17 through 4.13-29). Impact BI-1 describes those impacts associated with the removal of on-site trees and landscape vegetation, and determines that the impacts would be less than significant with implementation of Mitigation Measure M-BI-N1. Thus, the LRDP would avoid or have minimal biological resources impacts in nearby residential neighborhoods.

Section 4.14, Geology and Soils

Impacts GE-1 through GE-9 address the proposed LRDP's impacts on geology and soils, including exposure of people and structures to injury or damage during an earthquake, increased soil erosion, and placing structures on unstable soils (Draft EIR, pages 4.14-42 through 4.14-70). Impacts associated with geology and soils are, for the most part, determined to be less than significant, with the exception of the potential for erosion at all campuses (Impact M-GE-N4), the potential for seismic damage at the Pacific and Davies Campuses (Impact M-GE-N5), and the potential for subsidence because of groundwater extraction at the St. Luke's Campus (Impact M-GE-N6). Both of these impacts would be mitigated to less-than-significant levels through the implementation of Mitigation Measures M-GE-N4, M-GE-N5, and M-GE-N6. Thus, the LRDP would avoid or have minimal geology and soils impacts in nearby residential neighborhoods.

Section 4.15, Hydrology and Water Quality

Impacts HY-1 through HY-6 address the proposed LRDP's impacts on hazards and hazardous materials (Draft EIR, pages 4.15-27 through 4.15-43). The Draft EIR identifies that impacts associated with the quantity and quality of storm runoff could be significant impacts that could cause localized flooding or surface water quality degradation. Mitigation Measures M-HY-N2 and M-HY-N3 would reduce these impacts to less-than-significant levels through the development and implementation of Low Impact Development strategies, Best Management Practices, and stormwater pollution prevention plans, Thus, the LRDP would avoid or have minimal hydrology and water quality impacts in nearby residential neighborhoods.

Section 4.16, Hazards and Hazardous Materials

Impacts HZ-1 through HZ-7 address the proposed LRDP's impacts on hazards and hazardous materials (Draft EIR, pages 4.16-40 through 4.16-78). Impacts associated with the transport, use, or disposal of hazardous materials are identified as potentially significant at all LRDP campuses. These impacts would be reduced to less-than-significant levels through the implementation of site mitigation and contingency plans called for in Mitigation Measure M-HZ-N1. Thus, the LRDP would avoid or have minimal hazards and hazardous materials impacts in nearby residential neighborhoods.

Housing Element. The Housing Element is one of a number of elements of the City's General Plan. As explained in Response LU-1 (page C&R 3.3-1), before issuing a permit for any demolition, conversion, or change of use, and before taking any action that requires a finding of consistency with the General Plan, the City must determine that the proposed project is consistent with the General Plan and priority policies. During consideration of the project application, the decision-makers are responsible for considering all of the objectives and goals of the various General Plan elements and deciding whether, on the whole, the project is consistent with the General Plan. If the decision-makers ultimately determine that development of the Cathedral Hill Campus site or any other aspect of the proposed LRDP would prevent the City from meeting its housing needs or other General Plan objectives, they could find the project inconsistent with the General Plan. At this point, however, the EIR analysis has not led the Planning Department staff to reach that conclusion.

Planning Code. Zoning maps and Planning Code regulations implement the General Plan and provide for the City's various housing, commercial, industrial, institutional, recreational, and infrastructure needs. The City aims to create sufficient capacity for these uses through zoning, but typically does not rely upon specific development of any one lot or site to achieve these needs. Private land owners' decisions, development opportunities, economics, and other factors also contribute to how and which privately owned parcels ultimately develop. Please also see the discussion regarding the Development Agreement (Section 3.23.1.2) on page C&R 3.23-41, regarding CPMC's commitments in the proposed Development Agreement.

Comments [Consistency with Commerce and Industry Element]

(Alex Tom—Chinese Progressive Association, October 19, 2010) [84-2 LU]

"The Draft EIR does not adequately address the General Plan's Commerce & Industry Element, Objective 7, Policy 7.3 to: 'Promote the provision of adequate health and educational services to all geographical districts and cultural groups in the city. The General Plan acknowledges that the clustering of major health care facilities in relatively few areas creates problems such as limiting the access of residents in other parts of the City to the health care and employment opportunities which these large institutions offer. The city should actively encourage the decentralization of major institutional facilities to other areas of San Francisco, particularly those presently without adequate services."

(Emily Lee, September 23, 2010) [PC-292 LU]

"Additionally, the Draft EIR does not adequately refer to some elements of the General Plan, specifically it doesn't address the commerce industry element, Objective 7, Policy 7.3, which states that the City seeks to promote the provision of adequate health and educational services to all geographic districts and cultural groups in the City. The General Plan acknowledges that the clustering of major health facilities in relatively few areas creates problems such as limiting the access of residents in other parts of the City to the healthcare and employment opportunities that these major institutions offer. So, the City should actively encourage the decentralization of major institutional facilities to other areas of San Francisco, particularly those presently without adequate services."

(Stephanie Barton, et al—Hastings Civil Justice clinic for the Good Neighbor Coalition, October 19, 2010) [104-64 LU]

"Two San Francisco land use plans--the General Plan's Commerce and Industry Element and the Sustainability Plan for San Francisco--address the responsibilities of private health care providers. While the DEIR identifies these two plans as applicable to the project,[162] it neglects to address their health services provisions. There is also now pending before the San Francisco Board of Supervisors the Health Care Services Master Plan.[163] Though this proposed ordinance is not binding upon this project, it is instructive. Furthermore, CMPC as a non-profit hospital has an obligation to 'provide community benefits in the public interest' under California Health & Safety Code section 127340(a).[164] Accessible and equitably distributed healthcare services are major San Francisco and California priorities.

[162] DEIR 3-2
[163] Attached hereto as "Exhibit C." A hearing before the Planning Commission on the HCSMP is scheduled for October 28, 2010.
[164] Cal. Healt

h & Safety § I 27340(a) (West 2008)."

(Stephanie Barton, et al—Hastings Civil Justice clinic for the Good Neighbor Coalition, October 19, 2010) [104-65 LU]

"The DEIR states that the Commerce and Industry Element 'focuses on economic vitality, social equity, and environmental quality.'[165] Objective 7 of this element emphasizes the importance of enhancing San Francisco's position as a national and regional center for health services.[166] An important admonition in the discussion following Objective 7 is that 'future growth must be managed to achieve equitable distribution of benefits to all geographical and cultural sub-populations of the city and to minimize associated adverse effects on surrounding areas.'[167] San Francisco hospitals have an obligation to be neighborhood serving and culturally competent in addition to any regional function.

[165] *Id.*
[166] San Francisco General Plan, Commerce and Industry Element: Objective 7
[167] Id."

(Commissioner Olague, September 23, 2010) [PC-375 LU]

"Also, I don't really believe – I think that there is some conclusions that were not – to me, there's not enough analysis provided and the consistency, for instance, with the commerce and industry element, to me, is not very developed, it needs to be a little bit more robust. I know one of the speakers today spoke about the cultural groups and how some of those issues were raised in the Commerce and Industry element, and I feel that it is very dismissive of a lot of issues, there is a small paragraph, and then some justification for how the CPMC LRDP is consistent with the Commerce and Industry element, I just don't think it is a sufficient analysis there."

Response LU-4

The comments state that the Draft EIR does not adequately address the General Plan's Commerce and Industry Element provisions related to health services. The Commerce and Industry Element includes one objective (Objective 7) and two policies (Policies 7.2 and 7.3) related to health care:

> *Objective 7* *Enhance San Francisco's position as a national and regional center for governmental, health, and educational services.*
>
> *Policy 7.2* *Encourage the extension of needed health and educational services, but manage expansion to avoid or minimize disruption of adjacent residential areas.*

The General Plan's discussion of Policy 7.2 states that "[t]he continued, controlled expansion of . . . medical institutions is important to the city in the provision of valuable and needed services to residents and employment opportunities. Medical care and hospitals are important in neighborhoods which would otherwise be relatively isolated from treatment facilities. . . . These institutions also provide extensive employment opportunities and training opportunities."

The General Plan's discussion of Policy 7.2 further states that "[t]o minimize the disruption caused by institutional expansion, the city should continue its policy of reviewing expansion plans. This review examines the needs of adjacent resident areas for housing, on-street parking and safe, quiet streets as well as the need for the institution. Educational and medical institutions are required to submit master plans to the city prior to any specific expansion request. Such master plans define long-term and short-range development plans of the institution. The early review of institutional development plans will permit exploration of alternate ways to address the needs of the institution in order to minimize potential conflicts with the residential area."

> *Policy 7.3* *Promote the provision of adequate health and educational services to all geographical districts and cultural groups in the city.*

The General Plan's discussion of Policy 7.3 states that "San Francisco has a well developed public health care delivery system with well staffed and equipped public and private hospitals. Unfortunately, the clustering of many of these major facilities in relatively few areas creates problems in the adjacent residential neighborhoods. This clustering also serves to limit access of residents in other parts of the City to the health care and employment opportunities which these large institutions offer. . . .

"The city should actively encourage the decentralization of major institutional facilities to other areas of San Francisco, particularly those presently without adequate services. Vacated school sites and facilities should be examined as a potential expansion resource. There also exist areas of underused land in the city in which the physical impact of institutional development would be acceptable and might even provide the necessary impetus for desired new community development."

Framework for Reviewing General Plan Consistency

An analysis of the consistency of the project with the Commerce and Industry Element objective and policies related to health care (or with any other General Plan goals, objectives, or policies) must be conducted within the framework established by the principle that a given project need not be in perfect conformity with each and every general plan policy.[6] The "policies in a general plan reflect a range of

[6] See Sequoyah Hills Homeowners Ass'n v. City of Oakland, 23 Cal. App. 4th 704, 719-20 (1993).

competing interests" and, therefore, a city "must be allowed to weigh and balance the plan's policies when applying them, and it has broad discretion to construe its policies in light of the plan's purpose."[7]

For this reason, an assessment of the proposed LRDP's consistency with the General Plan should not view any particular General Plan policy in isolation. The relevant context for an analysis of the proposed LRDP's consistency with the General Plan's Commerce and Industry Element includes not only Policy 7.3, which is the focus of several of the comments regarding the Commerce and Industry Element, but also Objective 7 and Policy 7.2.

Thus, when applied to a particular project such as the proposed LRDP, the concerns expressed that relate to Policy 7.3 regarding the provision of adequate health and education to all geographical districts and cultural groups in the City must be weighed and balanced with the objective of enhancing San Francisco's position as a national and regional center for health services, and Policy 7.2, encouraging the extension of needed health services (and its underlying rationale, which includes the creation of job opportunities), among other countervailing or potentially competing General Plan policy concerns.

Analysis of Commerce and Industry Element, Objective 7, Policy 7.2

The (only) mechanism for advancing the aims of Policy 7.2, identified in the General Plan's discussion of that policy (i.e., encouraging the extension of needed health services and managing expansion to avoid or minimize disruption of adjacent residential areas), is the institutional master plan (IMP) review process. Planning Code Section 304.5 establishes the requirements for the contents and review of the IMP, with the recent addition of health planner review by the Department of Public Health. This review process has been complied with by CPMC, as described in Major Response HC-1 (page C&R 3.23-1) regarding supply of licensed acute-care beds, Major Response HC-2 (page C&R 3.23-8) regarding the location, size, and scope of services at the proposed Cathedral Hill, St. Luke's, and Davies Campuses, and Major Response HC-9 (page C&R 3.23-40) regarding a health care master plan.

According to the project sponsor, they have worked to address citywide health care needs through the development of their 2008 IMP and through the proposed LRDP, which implements the 10-year planning provisions of the IMP. Both the Health Commission (on July 21, 2009, with further findings on March 16, 2010), and the Planning Commission (on November 19, 2009) accepted the IMP. In its Resolution 10-09 concerning the IMP, adopted after several public hearings on the IMP, the San Francisco Health Commission accepted the IMP, subject to recommendations on the size and scope of facilities and services to be provided. The Health Commission made these recommendations to ensure that the IMP "results in the best possible health plan for the City and County of San Francisco."

A year later, the Health Commission's Task Force on CPMC's IMP published its Updates and Accomplishments concerning the recommendations in Resolution 10-09, and the Health Commission adopted Resolution 02-10, memorializing these accomplishments. As set out in these documents and Major Responses HC-2, HC-6, and HC-8 (pages C&R 3.23-8, C&R 3.23-25, and C&R 3.23-32 respectively), progress toward implementing the Health Commission recommendations has been made with respect to the LRDP.

Because of the extensive review of the IMP by the San Francisco Planning Department and Department of Public Health, embodied in implementing the Blue Ribbon Panel recommendations, and the Health Commission's recommendations and the Task Force's Updates of Accomplishments, the record contains sufficient information, demonstrating CPMC's compliance with and support of the IMP review process, consistent with the General Plan's intent for implementing Policy 7.2.

[7] Friends of Lagoon Valley v. City of Vacaville, 154 Cal. App. 4th 807, 816 (2007).

The General Plan's discussion of Policy 7.2 also explicitly recognizes the role of large institutions as major job providers. CPMC, under the proposed LRDP, would continue to be one of the largest employers in the City.

Analysis of Commerce and Industry Element, Objective 7, Policy 7.3

Some of the comments stated that services under the proposed LRDP would not be decentralized and that the LRDP would reduce services at the St. Luke's Campus, resulting in a reduction of medical services in an underserved area of the City.

This response first addresses the proposed LRDP's consistency with the General Plan's Policy 7.3 regarding encouraging decentralization, and then clarifies that adequate medical services would continue to be provided at the St. Luke's Campus under the proposed LRDP. This response also addresses alternative sites for a new CPMC campus that were considered but rejected, including vacated school sites and areas of underused land within the City.

It is important to note that Policy 7.3 is not a mandatory provision in the sense that it does not specifically require that every project involving health care facilities be decentralized or provide services to areas that presently are without adequate services. Rather, it provides that the City "should actively encourage" such decentralization. This is consistent with the principle discussed above, that a given project need not be in perfect conformity with each and every general plan policy.[8]

Nothing in the language of Policy 7.3 or the discussion in the General Plan following Policy 7.3 states that "decentralization" means that equivalently sized health care facilities must be distributed throughout the City. Rather, the concern underlying Policy 7.3 is the provision of *adequate services* to all geographical districts and cultural groups in the City.

Although certain medical services at the California and Pacific Campuses would be replaced and consolidated at the proposed Cathedral Hill Campus under the proposed LRDP, with the exception of the California Campus, all of the existing CPMC campuses would continue to provide medical care. CPMC would continue to serve communities surrounding the Mission District (St. Luke's Campus), Duboce Triangle (Davies Campus), and Pacific Heights (Pacific Campus) neighborhoods. As discussed in Major Response HC-2 (page C&R 3.23-8) regarding the size and scope of services at the proposed Cathedral Hill, St. Luke's, and Davies Campuses, the St. Luke's and Davies Campuses would generally serve as community hospitals with certain specialized services (e.g., senior care, outpatient pediatrics, and low risk obstetrics services at the St. Luke's Campus; neuroscience, AIDS/HIV, and acute rehabilitation services at the Davies Campus). These community hospitals would provide primary and secondary care (and similarly the Pacific Campus would provide a wide variety of outpatient services), serving as a point of access, with patients needing more specialized care (e.g., tertiary or quaternary services) referred to the centralized "hub" at the California Campus (or to the appropriate specialized facilities at the St. Luke's, Davies, or Pacific Campuses).

Thus, although the proposed LRDP would involve the development of a large, centralized hospital at the proposed Cathedral Hill Campus, serving as a "hub" for the CPMC San Francisco network, it would not result in the type of consolidation and centralization that is the concern underlying Policy 7.3. As described in Major Response HC-1 (page C&R 3.23-1) regarding supply of acute-care beds, Major Response HC-2 (page C&R 3.23-8) regarding the size and scope of services at the proposed Cathedral Hill, St. Luke's, and Davies Campuses, Major Response HC-4 (page C&R 3.23-19) regarding psychiatric beds, Major Response HC-5 (page C&R 3.23-20) regarding effect on emergency services, Major Response HC-6 (page C&R 3.23-25) regarding skilled nursing facilities, and Major Response HC-8 (page C&R 3.23-32) regarding access to health services, the proposed LRDP would provide adequate health

[8] See Sequoyah Hills Homeowners Ass'n v. City of Oakland, 23 Cal. App. 4th 704, 719-20 (1993).

care services to meet patient demand within the service areas of all campuses within the CPMC system. As further explained in Major Response HC-9 (page C&R 3.23-38) regarding a health care master plan, in its Resolution 10-09 concerning CPMC's 2008 IMP, the San Francisco Health Commission accepted the IMP, subject to recommendations on the size and scope of facilities and services to be provided. The Health Commission made these recommendations to ensure that the IMP "results in the best possible health plan for the City and County of San Francisco."

In addition, one of the concerns underlying Policy 7.3, as described in the General Plan, is the availability of health care facilities to areas of San Francisco "presently without adequate services." The proposed Cathedral Hill Campus would provide medical services to a currently underserved area of the City that includes the proposed Cathedral Hill Campus and Tenderloin neighborhoods, an area with a high population density of low-income households, seniors (the most frequent users of hospital care), children and youth.[9] Because the proposed LRDP would continue to provide medical services in various neighborhoods across the City, including the southeast portion of the City served by the St. Luke's Campus, and the proposed Cathedral Hill Campus would bring medical services to underserved neighborhoods (see Major Response HC-1 [C&R 3.23-1] regarding supply of acute-care beds, Major Response HC-2 [C&R 3.23-8] regarding location, size, and scope of services at the proposed Cathedral Hill and St. Luke's Campuses, and Major Response HC-8 [C&R 3.23-32] regarding access to health services), the proposed LRDP would be consistent with Objective 7, Policy 7.3 of the Commerce and Industry Element of the General Plan.

Medical Services that would be provided at the St. Luke's Campus

The comment states that services will be reduced at the St. Luke's Campus, which would result in a reduction of medical services in nearby underserved neighborhoods.

As explained above and discussed in Major Response HC-2 (page C&R 3.23-8) regarding the location, size, and scope of services at the St. Luke's Campus and Major Response HC-9 (page C&R 3.23-38) regarding a health care master plan, the project sponsor has tried to address citywide health care needs through the development of its 2008 IMP and the proposed LRDP, which would implement the 10-year planning provisions of the IMP.[10] Both the Health Commission (on July 21, 2009, with further findings on March 16, 2010) and the Planning Commission (on November 19, 2009) accepted CPMC's 2008 IMP. In its Resolution 10-09 concerning the IMP, adopted after several public hearings on the IMP, the San Francisco Health Commission accepted the IMP subject to recommendations on the size and scope of facilities and services to be provided. The Health Commission made these recommendations to ensure that the IMP "results in the best possible health plan for the City and County of San Francisco."

Before that, the City had also convened and accepted consensus recommendations from the Blue Ribbon Panel on the St. Luke's Campus, which the Health Commission incorporated into Resolution 10-09. In addition, The Camden Group and the San Francisco Health Commission Task Force determined that the St. Luke's Campus has been sized and programmed with services to adequately accommodate existing and projected future patient demand for the south of Market service area.

Thus, the development under the proposed LRDP for the St. Luke's Campus would not decrease the available health care services for southeast area residents. Under the proposed LRDP, and as more specifically described in Major Response HC-2 (page C&R 3.23-8) regarding the location, size, and scope of services at the St. Luke's Campus, the St. Luke's Campus would accommodate growth in patient census, increase the capacity of its Emergency Department, and expand primary care programs in clinical areas of demonstrated need in the community, such as senior care, outpatient pediatrics, and low-risk

[9] San Francisco Planning Department, 2009 (May), *Draft San Francisco General Plan Recreational and Open Space Element*, Figure 2, "High Needs Analysis," page 19.

[10] Draft EIR, page 2-1.

obstetrics. Therefore, the proposed LRDP would not add to health care delivery problems in the southeast area of the City.

Analysis of Alternative Sites for a New CPMC Campus

As explained above, the General Plan Commerce and Industry Element's discussion of Policy 7.3 states that "vacated school sites and facilities should be examined as a potential expansion resource. There also exist areas of underused land in the city in which the physical impact of institutional development would be acceptable and might even provide the necessary impetus for desired new community development."

CPMC's search for an appropriate and available site for a new medical center campus and the related planning process are described in Section 6.3, "Alternatives Considered but Rejected," beginning on page 6-8 of the Draft EIR. As discussed, that search process included consideration of several vacated school sites and otherwise underutilized sites (e.g., the U.S. Public Health Service Hospital site in the southwestern quadrant of the Presidio, discussed in the Draft EIR on pages 6-14 through 6-16 and page 6-19, the Mervyn's Shopping Center site at Geary Boulevard and Masonic Avenue on page 6-17, an aggregation of sites on the east side of Masonic Avenue which included parcels owned by the Catholic Church and the San Francisco Unified School District on pages 6-17 and 6-18, an aggregation of sites on the south side of Geary Avenue that included the Gateway High School site on pages 6-18 and 6-19, and the Letterman and Fort Scott District sites in the Presidio on page 6-19). As described in the Draft EIR, each of these sites was deemed either unavailable or inappropriate for a new CPMC medical center campus. Ultimately, the search and planning process resulted in the purchase of the proposed Cathedral Hill Campus site.

Therefore, although none of the alternative sites described above were deemed feasible for a new CPMC medical center, CPMC's selection of the proposed Cathedral Hill Campus site followed a process that included the consideration of vacated school sites and facilities, and other areas of underused land, consistent with Policy 7.3.

Comment 104-64 refers to the proposed citywide health care services master plan, and states that it is "now pending before the San Francisco Board of Supervisors." Please see Major Response HC-9 (page C&R 3.23-38) regarding the relationship of the proposed LRDP to the proposed health care services master plan called for in Ordinance 300-10. As explained in Major Response HC-9, Ordinance No. 300-10, effective January 2, 2011 (the Ordinance), directs the preparation of a citywide health care services master plan (Health Care Plan), which has not yet even been drafted and is anticipated to be completed by 2013 at the earliest. The recently adopted Ordinance sets out a lengthy and detailed series of requirements and processes, preceding adoption of a Health Care Plan. The Ordinance would not apply until the Health Care Plan was adopted. Furthermore, the Health Care Plan would be subject to its own review under CEQA, before adoption. The Ordinance would apply to applicable changes in medical uses after either January 2, 2013, or formal adoption of the Health Care Plan, whichever occurs later. Therefore, the Ordinance could not apply to proposed changes under the LRDP that are approved before January 2, 2013. The statement in Comment 104-64 regarding California Health and Safety Code Section 127380(a) is noted.

Please also see Major Response HC-1 (page C&R 3.23-1) regarding reduction of licensed acute-care beds, Major Response HC-2 (page C&R 3.23-8) regarding the location, size, and scope of services at the proposed Cathedral Hill, St. Luke's, and Davies Campuses, and Major Response HC-8 (page C&R 3.23-32) regarding access to health services.

Please see Response HC-56 (page C&R 3.23-206) regarding the relationship of the proposed LRDP to the Sustainability Plan of San Francisco.

Comments [Consistency with General Plan and Other Relevant Local Plans (other than the Housing Element)]

(Ben Bear, October 18, 2010) [65-3 LU]

"Allowing the project to proceed according to CPMC's plan eviscerates the plan for the Van Ness corridor. It will provide the precedent for future out-of-scale development along the Van Ness and Geary corridors."

(Linda Chapman, October 19, 2010) [76-1 LU, duplicate comment was provided in 111-1 LU]

"The CPMC proposal is inconsistent with applicable policies of the Van Ness Area Plan (VNAP). It flies in the face of a long-established area plan that is progressively achieving objectives. A traffic-inducing medical use is precluded for the Van Ness Corridor by a plan that considered traffic impacts, the special role of Van Ness as a transit corridor for Muni and Golden Gate Transit, and conflicts for a city street with inter-city traffic from Highway 101."

(Linda Chapman, October 19, 2010) [76-4 LU, duplicate comment was provided in 111-4 LU]

"There could be consistency with other planning policies not in the area plan (which should be treated as the governing document in case of conflict). Locating a hospital where it will not displace existing housing and where there is transit access could be arguments for the proposal. If a change of use is therefore allowed (in what is designed to be a residential-commercial district), then maximum adherence to other objectives and policies of the area plan must be sought."

(Linda Chapman, October 19, 2010) [76-6 LU, duplicate comment was provided in 111-6 LU]

"The EIR notes that exceeding the 130-foot height limit would exacerbate environmental impacts (which include traffic and transportation, housing and economic impacts). Additionally, it must be acknowledged that the 130-foot limit for this section of the Van Ness Corridor implements these VNAP policies: Allows building envelopes intended to meet a city-wide need for large numbers of housing units; Aims to prevent overdevelopment of housing where high rises could exacerbate traffic problems; Promotes a consistent profile for one of the city's two grand boulevards; Aims to prevent out-of-scale buildings that would dwarf historic commercial buildings. Visual effects, wind and shadow impacts of the proposed hospital should be compared to neighborhood impacts of the Holiday Inn (which VNAP policies were designed to prevent in new development)."

(Barbara Kautz—CHNA and Bernal Heights Neighborhood Center, October 19, 2010) [87-6 LU, duplicate comment was provided in 108-6 LU]

"4. The DEIR's analysis of the consistency of CPMC's plans with existing planning and zoning makes a mockery of CEQA by finding that a proposal to amend the plans eliminates the inconsistencies."

(Barbara Kautz—CHNA and Bernal Heights Neighborhood Center, October 19, 2010) [87-20 LU, duplicate comment was provided in 108-20 LU]

"E. <u>The DEIR's Analysis of the Consistency of CPMC's Plans With Existing Planning and Zoning Makes a Mockery Of CEQA by Finding That a Proposal to Amend the Plans Eliminates the Inconsistencies.</u>

The proposed CPMC Long Range Plan is entirely inconsistent with current planning and zoning provisions applicable to the proposed Cathedral Hill site, including the Van Ness Avenue Area Plan and the Planning Code. Among the significant inconsistencies are these (Table 2-3; pages 3-10 to 3-11; 3-15 to 3-16; 4.1-47 to 4.1-48):

- Proposed height more than double that permitted, 265 feet where 130 feet are permitted.
- 30% increase in permitted floor area ratio, from 7:1 to 9:1.
- Maximum permitted parking for Cathedral Hill Hospital increased from 96 spaces to 1,055 spaces.
- Bulk limits increased by a factor of 3, from 110 to 140 feet, to 265 to 405 feet.

- Exemption from requirement that residential uses be developed at a ratio of 35 sq. ft. of residential uses for each 15 sq. ft. of nonresidential uses.[4]
- Zoning code amendments allowing numerous additional exemptions.

Yet, the DEIR concludes that the project would *not* conflict with any applicable plan or policy because, *if all of these changes are approved*, the project would then be consistent.

Such a finding makes a mockery of the requirement in CEQA Guidelines § 15125(d) that the EIR discuss any inconsistencies between the proposed project and applicable plans, since no inconsistency would ever be found where the project proposed to amend the applicable plans.

Consistency with approved plans, like all environmental impacts is to be determined based on comparing the project with conditions existing *at the time the Notice of Preparation* is *issued.* (CEQA Guidelines § 15125(a), (d), and (e).) To meet the requirements of CEQA, the DEIR must acknowledge those inconsistencies and then examine the environmental effects of each inconsistency in the appropriate section of the DEIR. Inconsistency of the plan's height and bulk limits would be examined in the land use section; inconsistencies with parking limitations in the transportation section; reduced housing production in the population and housing section. By not providing this analysis, the DEIR fails completely to evaluate the environmental effects of the project's inconsistency with adopted plans.

[4] The DEIR does not even calculate the amount of housing that would be provided by a conforming project as opposed to the absence of any housing in the proposed Long Range Plan, so that the effects of this inconsistency cannot be examined."

(Gloria Smith—California Nurses Association, October 19, 2010) [90-45 LU]

"• Impacts associated with the Project's inconsistencies on local plans and policies such as amendments to the General Plan, zoning code and other departures from adopted plans, policies and regulations;"

(Gloria Smith—California Nurses Association, October 19, 2010) [90-52 LU]

"Also, because the DEIR omitted critical documents for review (*e.g.* text for proposed policy amendments), it is impossible to fully evaluate the Project's consistency/inconsistency with the City's plans and policies. Moreover, the DEIR based its findings of Project consistency on the presumption that the Project would obtain all of the myriad major entitlements, amendments and exceptions from existing plans, policies and regulations such as changes to:

- The San Francisco General Plan and all applicable elements, including the Housing Element
- Regional Plans and policies (*e.g.*, Bay Area Air Quality Management plans and regulations)
- Van Ness Avenue Area Plan ("VNAP")
- Market & Octavia Neighborhood Plan
- Mission Area Plan
- Japantown Better Neighborhood Plan
- Mission District Streetscape Plan
- Measure M

The DEIR's Project consistency 'analysis' provided only conclusory statements of consistency that are in most cases unsupported by evidence in the record. A revised EIR must include a table with the text of applicable policies and provisions and a specific description of why the Project is or is not consistent with each applicable policy or provision. As it stands, the DEIR failed to disclose significant impacts on land use."

(Gloria Smith—California Nurses Association, October 19, 2010) [93-20 LU]

"• Impacts associated with Project-Plan inconsistencies including, but not limited to, precedent setting amendments to the general plan, zoning code and other departures from adopted plans, policies and regulations that could result in significant impacts not disclosed or analyzed in the DEIR."

(Gloria Smith—California Nurses Association, October 19, 2010) [93-34 LU]

"• Actual disclosure of the wording (proposed text) of all required plan, policy and regulation amendments."

(Gloria Smith—California Nurses Association, October 19, 2010) [93-36 LU]

"• Justification (proposed findings) for all other exceptions/amendments including but not limited to parking, housing, Proposition M, etc."

(Gloria Smith—California Nurses Association, October 19, 2010) [93-39 LU]

"Without this critical project description information, the DEIR cannot disclose or analyze the project-related and cumulative impacts. In addition, the actual General Plan amendment language is essential to a determination of whether the proposed Project will result in Plan inconsistencies. A revised DEIR must be prepared when the project description is complete."

(Gloria Smith—California Nurses Association, October 19, 2010) [93-85 LU]

"E. The DEIR Fails to Adequately Analyze the Project's Significant Inconsistencies with Adopted Plans and Policies

The Project as proposed requires general plan amendments, variances from the existing Codes, Floor Area Ratio (FAR) amendments, parking reductions and other significant departures from adopted plans, policies and regulations in order to be built. DEIR Chapter 3. The lengthy list of necessary and sweeping departures from adopted plans and policies call into question whether the Project benefits and merits justify the requested departures and amendments. Because the DEIR omitted critical documents for review (e.g. proposed policy amendment text), it is impossible to fully evaluate Project consistency with adopted plans and policies, Moreover, Project consistency is based on the Project receiving all of the myriad major entitlements, amendments and exceptions from existing plans, policies and regulations. This is not the correct method for measuring Project consistency."

(Gloria Smith—California Nurses Association, October 19, 2010) [93-87 LU]

"The myriad of applicable existing plans and policies from which to evaluate Project consistency includes, but is not limited to, the following:

- The San Francisco General Plan and all applicable elements, including the Housing Element
- Regional Plans and policies (e.g., Bay Area Air Quality Management plans and regulations)
- Van Ness Avenue Area Plan (VNAP)
- Market & Octavia Neighborhood Plan
- Mission Area Plan
- Japan town Better Neighborhood Plan
- Mission District Streetscape Plan
- Measure M"

(Gloria Smith—California Nurses Association, October 19, 2010) [93-88 LU]

"The Project consistency 'analysis' contained in the DEIR provides conclusory statements of consistency that are in most cases unsupported by evidence in the record. For example, according to the DEIR, the Project is 'generally consistent with the Recreation and Open Space Element. Implementing the LRDP would result in an

increase in FTE employees and new San Francisco residents.' The paragraph points to other sections of the DEIR for further information. DEIR at page 3-7. In the place of such conclusory statements, a revised DEIR must include a table with the full text of applicable policies and provisions and a specific description of why the Project is or is not consistent with each applicable policy or provision. While other sections of the DEIR contain statements regarding Project consistency or general consistency with applicable plans, policies and regulations, these statements are largely devoid of analysis and evidence to support the conclusions of Project-plan/policy consistency even with amendments and exceptions. The table below provides just a few of the key examples of plan provisions where Project consistency has not been adequately demonstrated."

Examples of Applicable Plan, Policy, or Regulation	Comment
Van Ness Avenue Area Plan (VNAP): The focus of this visionary plan is to revitalize the area by encouraging new retail and housing to facilitate the transformation of Van Ness Avenue into an attractive mixed use boulevard. The VNAP does not encourage medical centers and instead encourages high-density mixed use development. To accomplish this the VNAP has a number of key provisions including: • Establishes a require ratio for new development of 3 square feet of residential use for every 1 square foot of nonresidential uses. • Eliminates density for residential uses. • Allowable FAR of 7.0:1.	The proposed Project requires a major general plan amendment to achieve heights and bulks that are inconsistent with VNAP, to waive housing requirements and density requirements, among other amendments and exclusions necessary for the Project as proposed to be found consistent with the VNAP. In addition the proposed Project is inconsistent with the overall vision of the VNAP and would impact its objectives for a vital pedestrian environment, lower parking ratios and mix of uses. Requested amendments would also increase the current allowable floor area ratio (FAR) of 7.0:1 to an FAR of 9.0:1. Waiver of density limits in the VNAP was intended to encourage housing, not a major medical center. The DEIR concludes that with the proposed amendments, the project is "generally consistent" with the VNAP. This could not be a greater reach. Permitting the CPMC project to completely ignore the VNAP, including its residential requirements, opens the door for further erosion of the Plan and its vision. Neither the direct Project impacts, nor the precedent set by allowing the Project to ignore the VNAP is adequately analyzed in the DEIR.
Housing Element: Applicable provisions include proposed housing on the CPMC sites (e.g. Cathedral Hill), requirements for adequate housing for the workforce and requirements for replacement housing.	The proposed Project has numerous inconsistencies with the City's Housing Element that are not analyzed or disclosed in the DEIR including but not limited to: • Inconsistencies with sites (housing site inventory) designated for housing and that would help the City meet its regional housing needs assessment. • Inconsistencies with housing element policies requiring non-residential uses to do their fair share to provide workforce housing. • Inconsistencies with replacement housing requirements.
Proposition M – Accountable Planning Initiative which added Section 101.1(b) to the Planning Code to establish eight priority policies including preservation and enhancement of affordable housing and discouragement of commuter automobiles.	The findings for consistency between the Project and Measure M priority policies are not supported by the evidence in the DEIR. Additional information and mitigation is needed to make such findings of consistency particularly with the provisions noted.

(Gloria Smith—California Nurses Association, October 19, 2010) [93-90 LU]

"A revised DEIR must include a detailed table that provides the applicable text of all policies and regulations for all applicable plans, policies and regulations and provides the rationale for a finding of Project consistency with each. If consistency can only be found because of amendment or exception to a policy or regulation, feasible alternatives and mitigation should be described that would not require the amendment or exception. For example, consistency with the VNAP housing requirements could be achieved by providing those required units or other measures described above."

(Gloria Smith—California Nurses Association, October 19, 2010) [93-91 LU]

"The DEIR contains evidence that the Project is inconsistent with a number of adopted policies. DEIR Table S-1; See also Project Description chapters for each campus site. Since the project description sections fail to describe

the proposed text of the necessary general plan amendments and the proposed text of other required exceptions and amendments, the significance of these impacts cannot be analyzed. Unless and until the Project is shown to be consistent with all applicable plans and policies, either through appropriate amendments that do not render plans internally inconsistent or through changes to the project, it cannot be approved."

(Gloria Smith—California Nurses Association, October 20, 2010) [96-28 LU, duplicate comment was provided in 110-28 LU]

"The 555-bed Cathedral Hill Hospital would require a myriad of variances, major entitlements, amendments and exceptions from existing plans, policies and regulations. The Draft EIR's consistency determination for the LRDP is based on the presumption that CPMC would successfully obtain changes to the following:

- San Francisco General Plan and all applicable elements, including the Housing Element
- Regional plans and policies *(e.g.,* Bay Area Air Quality Management *District* plans and regulations)
- Van Ness Avenue Area Plan (''VNAP'')
- Market & Octavia Neighborhood Plan
- Mission Area Plan
- Japantown Better Neighborhood Plan
- Mission District Streetscape Plan
- Measure M."

(Stephanie Barton, et al.—Hastings Civil Justice Clinic for the Good Neighbor Coalition, October 19, 2010) [104-2 LU]

"I. The DEIR provides a cursory and skewed analysis of the project's potential impacts on housing development and housing needs in San Francisco.

A. The DEIR fails to acknowledge important project conflicts with housing policy and land use planning goals of the San Francisco General Plan.

Following State CEQA Guidelines, the DEIR states that the project will have a significant impact on the environment if it 'conflict[s] with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including but not limited to the general plan, specific plan, local coastal program, or zoning ordinance).'[1] Yet the DEIR provides only a truncated analysis of the project's consistency, or lack thereof, with the San Francisco General Plan's 2004 Housing Element.[2] Instead, the DEIR simply asserts that the two are consistent because 'most of the objectives and policies in the Housing Element are not applicable to the proposed LRDP because the project does not include a residential development component.'[3] Whether or not the project has a residential component is not the measure of consistency with the General Plan's Housing Element.

[1] Project Significance Criterion 4b, DEIR 4.1-37
[2] San Francisco General Plan, Housing Element. The General Plan is available at http;//www.sf-planning.org/ftp/General_Plan/
[3] DEIR 3-6"

(Hisashi Sugaya—Planning Commission, Oct. 15, 2010) [116-2 LU]

"2. Pg. 4.1-48, 4th paragraph. I have always been perplexed with the finding that a project 'with the requested amendments and approvals would therefore not conflict with any applicable land use plan, policy, or regulation.' If one takes the 'existing condition,' the Planning Commission and Board of Supervisors have not taken any action, approval, or denial of any requested general plan amendments, code modifications, or variances. Shouldn't this existing situation form the analysis of impacts rather than some future, hypothetical condition, which may, or may not, be realized?"

(Gloria Smith—California Nurses Association, March 8, 2011) [122-3 LU]

"The City may decide to amend the General Plan; however, any land use inconsistencies proposed by the LRDP must be resolved according to the following Proposition M guiding principles:

- That existing neighborhood-serving retail uses be preserved and enhanced and future opportunities for resident employment in and ownership of such businesses be enhanced;
- That existing housing and neighborhood character be conserved and protected in order to preserve the cultural and economic diversity of our neighborhoods;
- That the City's supply of affordable housing be preserved and enhanced;
- That commuter traffic not impede Muni transit services or overburden our streets or neighborhood parking.

The proposed Cathedral Hill Campus' uses, sheer scale and resulting elimination of both existing and required housing would be irreconcilably inconsistent with Proposition M's current policies."

(Steve Woo, September 23, 2010) [PC-59 LU]

"There is no mention of the Van Ness Avenue Area Plan. It is almost a forgotten afterthought. And we want to see it addressed."

(Steve Woo, September 23, 2010) [PC-61 LU]

"And so we are really asking the Commission to take a close look at the Van Ness Avenue Area Plan and asking CPMC to really address the Van Ness Avenue Area Plan within this Draft EIR, it is almost not addressed at all."

(Commissioner Moore, September 23, 2010) [PC-365 LU]

"I would add that the response or the lack of response existing in the Van Ness Area Plan is of great concern to me, so is, I think, an inability to come to terms with the Geary BRT and the Van Ness BRT planning, including the original intent to convert or transform Van Ness Avenue in a more residentially express type of a grand boulevard of the City. I do believe that a facility the size of CPMC, and that's not an expression against the building per se, is somewhat in contradiction because, in Smart Growth, facilities like CPMC are called "LULUs," which is called a Locally Unacceptable Land Use. And I think many of the comments today speak to that issue. I think I would easily say we had 70-80 percent of people expressing major concerns and there were a relatively small orchestrated number of people who, I think, were well prompted to say what they needed to say. I'm sorry to be so critical about that. I am in principle not against a medical facility, but I do believe it needs to be sized appropriate to where it is, and if it's too big, it needs to be someplace else."

(Commissioner Sugaya, September 23, 2010) [PC-387 LU]

"Yes, just a follow-up on Commissioner Miguel's comments on the Special Use District. The whole analysis in the Land Use Zoning section really –and this has happened before in other EIRs, the analysis says that here is the current zoning, here is the current General Plan, and here is the current specific plans, and all that, and then there's the project, and then it goes on to say, 'But, we're going to make all these changes to the General Plan and the Zoning Code and the height districts, and everything else,' and therefore there's no impact. The whole analysis seems backwards to me, and I've made this comment before, especially on 555 Washington, the same argument was made, We're going to break the height limit by 200-feet, and there's no impact because the Planning Commission and the Board of Supervisors is going to approve the plan change and the height district change, and therefore there's no impact.' It seems to me the analysis first should address the current zoning situation and General Plan situation, especially Use District situation, and give us some idea. I mean, description-wise, we all know what the problem is, this building is two times higher than the height limit, or one and a half, or

whatever it is. But there is no real analysis of that. And if that is the way CEQA works, then something is wrong with the CEQA process."

Response LU-5

The comments state that the EIR should include a policy-by-policy evaluation of consistency of the proposed LRDP against a range of different local plans and policies, and suggests that failure to provide such an analysis leads to a failure to disclose significant land use impacts. The comments further state that it is necessary to include the plan amendments text in the Draft EIR and that it is necessary to include evidence in the Draft EIR to support findings for the proposed amendments.

Several comments suggest that the Draft EIR is inadequate because it assumes that the project would obtain all of the requested amendments and approvals that would be required for the development of the proposed Cathedral Hill Campus (presented in Section 2.2.4, "Required Project Approvals for the Cathedral Hill Campus," on pages 2-43 through 2-48 of the Draft EIR, and revised on pages C&R 4-37 through C&R 4-39 in this document), and consequently, the Draft EIR does not address potential conflicts of the proposed development of the Cathedral Hill Campus with the existing General Plan and the Van Ness Area Plan, as well as with Planning Code, zoning, and height and bulk regulations. The comments suggest that based on these assumptions, the Draft EIR fails to identify significant impacts.

Several comments state that the proposed Cathedral Hill Campus facilities would be out of scale with surrounding buildings along the Van Ness Avenue corridor, and they question the compatibility of the proposed facilities with the surrounding neighborhood. Several comments raised concerns that approval of the proposed Cathedral Hill Campus would set a precedent for other future out-of-scale development within the Van Ness Special Use District (VNSUD).

Finally, several comments requested that the full analysis and justification for granting of plan and code amendments and CU authorizations be included in the Draft EIR. As explained below, under CEQA, the scope of the analysis of plan and policy consistency in an EIR is focused on those plans and policies that have been adopted to protect or mitigate impacts to the environment. For the City, the analysis and findings related to approval of a CU authorization or an amendment to the City's plans or codes may be informed by the EIR analysis related to environmental issues. However, the findings that would be made by decision-makers as to whether granting the requested entitlements for the proposed CPMC LRDP are justified involve consideration of a much broader range of issues which may be addressed in plans and policies, including not only environmental issues, but also public necessity, general welfare, economics, fiscal conditions, social equity, legal considerations, and other issues. The consideration in the EIR of many of these issues would be inappropriate under CEQA. They will be fully evaluated and discussed during the decision-makers' hearings on the requested entitlements for the project, and in staff reports related to the proposed actions.

Consistency of the Project with the General Plan

The primary discussion of the project's consistency as it relates to CEQA impacts with the General Plan and Planning Code is provided on pages 4.1-46 through 4.1.54 of the Draft EIR. With respect to the proposed development at the Cathedral Hill Campus, the analysis concluded on page 4.1-48 of the Draft EIR:

> "The amendments to the General Plan's VNAP and amendments to the Planning Code text and zoning and height and bulk district maps; the PUD and CU authorizations; and other approvals, as discussed above, are part of the proposed LRDP. Therefore, if they are approved by decision-makers, the proposed LRDP would be consistent with the applicable plans and policies. The proposed LRDP at the Cathedral Hill Campus with the requested amendments and approvals

would therefore not conflict with any applicable land use plan, policy, or regulation. This impact would be less than significant."

Section 340(b) of the Planning Code states "the General Plan shall be periodically amended in response to changing physical, social, economic environmental or legislative conditions." Amendments to the General Plan are subject to approval by the Planning Commission and the Board of Supervisors. The Planning Commission shall adopt the proposed amendment if it finds that the public necessity, convenience and general welfare require the amendment. The Board of Supervisors may approve or reject the amendment by majority vote.

As noted above, some of the comments described the Draft EIR as inadequate due to the conclusion that the project would not conflict with any applicable plans and policies after the requested entitlements are approved by the decision-makers. CEQA Guidelines Section 15125(d) requires that an EIR "discuss any inconsistencies between the proposed project" and applicable General Plans, specific plans, or regional plans. The Draft EIR identified the proposed changes to the General Plan that are being sought by CPMC in conjunction with the proposed LRDP.

The required project approvals for the proposed Cathedral Hill Campus are shown in Table 2-3 on pages 2-13 through 2-15 of the Draft EIR (and revised on pages C&R 4-37 and C&R 4-42 of this document), and are further described in Section 2.2.4, "Required Project Approvals for the proposed Cathedral Hill Campus," on pages 2-43 through 2-48 of the Draft EIR (and revised on pages C&R 4-43 and C&R 4-46 of this document). These approvals are part of the proposed LRDP and the proposed amendments to existing plans are being sought because they were determined necessary in order to eliminate inconsistencies between the project and the existing plans. Therefore, the EIR has acknowledged and disclosed inconsistencies between the proposed LRDP and applicable plans, as required under CEQA Guidelines Section 15125(d). If the requested amendments and CU authorizations are not approved, then the project could not proceed as proposed.

CEQA Guidelines Section 15125(d) does not require that an EIR must conclude that an environmental impact (including but not limited to an impact related to land use) would occur whenever there is an inconsistency with an existing plan that would require an amendment to the plan in order for the project to proceed. Within the CEQA context, impacts associated with consistency of a project with applicable land use regulations adopted for the purposes of avoiding or mitigating environmental impacts are evaluated within an explicit framework, as set forth under significance criterion "b" of the Land Use and Planning section of the CEQA checklist (Appendix G to the State CEQA Guidelines). The criterion asks whether a project would "conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project adopted for the purpose of avoiding or mitigating an environmental effect" (note that this criterion was revised on page C&R 4-4 to accurately reflect the wording in Appendix G of the State CEQA Guidelines). A conflict with existing regulations is not, in itself, deemed a significant impact unless that impact results in an adverse physical impact relative to baseline conditions. Hence, impacts analyzed under CEQA must be related to a physical change, according to Section 15358[b] of the State CEQA Guidelines.

Each of the required project approvals for the proposed Cathedral Hill Campus, including General Plan and Planning Code amendments, CU authorizations, and other approvals, are discussed below. Since the publication of the Draft EIR on July 21, 2010, the project sponsor has made some modifications to the requested entitlements for the proposed CPMC LRDP based upon input from the Planning Department after reviewing the initial application submittal for the near-term projects, including the proposed development of the Cathedral Hill Campus. Therefore, the required project approvals listed in the Draft EIR on pages 2-13 through 2-17, Table 2-3, "Required Project Approvals," have been updated as part of the text revisions to the Draft EIR included in Chapter 4, "Draft EIR Text Changes," on pages C&R 4-37 and C&R 4-42 of this document. Additional text revisions to Draft EIR pages 2-44 through 2-47, 2-191,

2-192, 3-9, 3-10, 3-19, 4-47, 4-48, 4-50, 6-130, and 6-300, reflecting the updated list of requested entitlements have also been included as text revisions to the Draft EIR on pages C&R 4-37 through C&R 4-58. The discussion below is based upon the updated list of required project approvals.

General Plan Urban Design Element

As stated on page 2-44 of the Draft EIR, Map 4 of the Urban Design Element of the General Plan allows building heights of 161 to 240 feet. As part of the proposed LRDP, CPMC would request an amendment to Map 4 of the Urban Design Element to allow development under the proposed LRDP of a building up to 265 feet tall on the block bounded by Post Street, Van Ness Avenue, Geary Boulevard, and Franklin Street, the site of the proposed Cathedral Hill Hospital.

Map 4 of the Urban Design Element was adopted to "promote harmony in the visual relationships and transitions between new and older buildings" (Urban Design Element Policy 3.1). The CPMC LRDP's impacts on the existing visual character of the proposed Cathedral Hill Campus vicinity were addressed in the Draft EIR on pages 4.2-117 through 4.2-140, with a finding of less than significant impact.

As stated on page 2-44 of the Draft EIR, as revised in Chapter 4, "Draft EIR Text Changes" (page C&R 4-44), Map 5 of the Urban Design Element of the General Plan permits building bulk at the Cathedral Hill Hospital site up to a maximum plan dimension and maximum diagonal plan dimension of 110 and 140 feet, respectively, and at the Cathedral Hill MOB site up to a maximum plan dimension and maximum diagonal plan dimension of 110 and 125 feet, respectively. As part of the proposed LRDP, CPMC would request an amendment to Map 5 of the Urban Design Element to allow for development of the proposed Cathedral Hill Hospital up to a maximum plan dimension and maximum diagonal plan dimension of 385 and 466 feet, respectively, and development of the proposed Cathedral Hill MOB up to a maximum plan dimension and maximum diagonal plan dimension of 265 and 290 feet, respectively.

Map 5 of the Urban Design Element was adopted to "promote building forms that will respect and improve the integrity of open spaces and other public areas," (Urban Design Element Policy 3.4), and "relate the bulk of buildings to the prevailing scale of development to avoid an overwhelming or dominating appearance in new construction" (Urban Design Element Policy 3.6). The CPMC LRDP project's impacts on existing open spaces and other public areas in the Cathedral Hill Campus were addressed in the Draft EIR in Sections 4.9, "Wind and Shadow", and 4.10, "Recreation," which concluded that such impacts would be less than significant. As noted above, the CPMC LRDP project's impacts on the existing visual character of the proposed Cathedral Hill Campus vicinity were addressed in Draft EIR Section 4.2, "Aesthetics," and were also determined to be less than significant.

The proposed CPMC LRDP's impacts on historical resources in the vicinity of the proposed Cathedral Hill Campus were addressed in the Draft EIR on pages 4.4-30 through 4.4-32. The Draft EIR presented evidence that none of the buildings or structures located within the proposed Cathedral Hill Campus were considered historical resources (individually or as part of a district) for the purposes of CEQA, and the proposed CPMC LRDP. Therefore the proposed project is not anticipated to have a significant impact on any individual historic resources in the vicinity. The San Francisco Planning Department concurred with this finding.[11, 12] Therefore, near-term implementation of the LRDP at the proposed Cathedral Hill Campus would not cause a substantial adverse change in the significance of a historical resource as defined in Section 15064.5 of the State CEQA Guidelines, and the LRDP's impacts to historic resources were determined to be less than significant.

General Plan Amendment for the VNAP

General Plan VNAP, Map 1 (Generalized Land Use and Density Plan)

As stated on page 2-44 of the Draft EIR, as revised on pages C&R 4-43 of this document, the CPMC LRDP sponsor has requested that Map 1 of the VNAP be revised to designate the sites proposed for the new Cathedral Hill Hospital and Cathedral Hill MOB as "The Van Ness Medical Use Subdistrict," and increase the maximum allowable floor area ratio (FAR) from 7:1 to 9:1 for the Cathedral Hill Hospital site, and from 7:1 to 7.5:1 for the Cathedral Hill MOB site.

The LRDP's impacts on the existing character of the proposed Cathedral Hill Campus vicinity are addressed in the Draft EIR on pages 4.1-55 through 4.1-58. The analysis acknowledges that the proposed Cathedral Hill Hospital and Cathedral Hill MOB would substantially increase the intensity of uses on their respective sites. However, the evaluation recognizes that the new, more intense uses would be similar in character to other large-scale uses in the Van Ness Avenue corridor. Thus, the impacts of the proposed project on the character of land uses around the Cathedral Hill Campus were determined to be less than significant.

The project's impacts on the existing visual character of the proposed Cathedral Hill Campus vicinity were addressed in the Draft EIR on pages 4.2-117 to 4.2-140. As described in the Draft EIR, the site of the proposed Cathedral Hill Campus would have the appearance of a dense urban development under the LRDP, with buildings that would have greater massing bulk and height than the currently existing buildings on the site of the proposed campus. The scale and height of the LRDP buildings on the Cathedral Hill Campus would be generally large but compatible with the surrounding buildings. The proposed 265-foot-tall 15-story hospital building would be located adjacent to and in the vicinity of other high-rise buildings along Van Ness Avenue. The proposed 130-foot-tall 9-story Cathedral Hill MOB would be set back down toward its eastern side to match the height of the shorter buildings which are present in that area. The proposed Cathedral Hill Hospital and Cathedral Hill MOB would be compatible in general design, having similar form elements, modern architectural design, and similar façade materials. The result would be an integrated, visually harmonious composition for the campus as a whole. The proposed campus would appear consistent in scale with development in the surrounding areas and along the Van Ness Avenue corridor. Street trees would line all the streets surrounding the campus on each side and would be landscaped in a unified manner that does not exist at present. The landscaping plan would be consistent with the City's plan for streetscapes, and for the Van Ness Avenue corridor in particular. For these reasons, the impacts of the proposed Cathedral Hill Campus on the visual character of the Van Ness Avenue corridor were determined to be less than significant.

General Plan VNAP, Map 2 (Height and Bulk Districts)

As stated on page 2-44 of the Draft EIR, Map 2 of the VNAP, as currently adopted, allows a maximum building height of 130 feet, maximum building length of 110 feet, and maximum diagonal dimension of 140 feet at the proposed site of the Cathedral Hill Campus. The proposed Cathedral Hill Hospital would exceed these height and bulk limits. The current height and bulk designation of 130-V under Map 2 of the VNAP for the block proposed for the Cathedral Hill Hospital would be modified to a 265-V Height and Bulk District, which would allow a building measuring up to 265 feet tall. The map amendment would not modify the basic bulk limit designation, but modification of the bulk limits for the proposed Cathedral Hill Hospital and Cathedral Hill MOB would be sought under the CU application, as described below.

The CPMC LRDP's impacts on the existing visual character of the proposed Cathedral Hill Campus vicinity were addressed in the Draft EIR on pages 4.2-117 through 4.2-140, with a finding of less than significant. The analysis of LRDP impacts on visual resources assessed the same factors and drew the same conclusions as described above under Map 1. For these reasons, the effects of the development of the proposed Cathedral Hill Campus under the LRDP would not represent a significant adverse impact on the visual character of the project area.

Consistency with Local Plans

The comments request discussion of the proposed LRDP's consistency with a range of City plans and policies. All policies addressed in the comments were previously discussed in the Draft EIR, as described in greater detail below. Further, it is important to note that the case report and approval motions for the project, if the decision makers determine to approve it, would contain the Planning Department's comprehensive project analysis and findings regarding consistency of the LRDP with all relevant plans and policies. The focus of the consideration of plans and policies in an EIR involves consideration of plans and policies that were adopted for the purposes of protecting environmental resources or mitigating environmental impacts. This is a more limited perspective that the decision-makers' consideration of consistency with plans and policies in the context of a possible approval of the project, a consideration that is inherently broader than the environmental focus in an EIR. As stated on page 3-1 of the Draft EIR:

> "Conflicts of the CPMC LRDP with policies do not, in and of themselves, constitute significant environmental impacts; they are considered environmental impacts only when they would result in direct physical environmental effects. Any conflicts between implementation of the proposed LRDP and policies relating to physical environmental issues are discussed in the relevant environmental topic sections of Chapter 4, "Environmental Setting, Impacts, and Mitigation," of this EIR. The consistency of the proposed development with applicable plans and policies that do not directly relate to physical environmental issues will be considered by decision-makers when they determine whether to approve or disapprove the project."

Significance Criteria

The focus of the analysis in the EIR is reflected in the Significance Criteria established for examining policy and plan consistency. The discussion on page 4.1-36 of the Draft EIR presents the significance criteria for Land Use and Planning, stating that:

> "[t]he thresholds for determining the significance of impacts in this analysis are consistent with the environmental checklist in Appendix G of the State CEQA Guidelines, which has been adopted and modified by the San Francisco Planning Department."

The Draft EIR then proceeds to identify three significance criteria derived from the Appendix G questions. The second of those criteria (Criteria 4[b]) states that a significant impact would occur if the proposed project would:

> "conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including but not limited to the general plan, specific plan, local coastal program, or zoning ordinance)."

The last portion of significance criterion 4(b) was cut off. This criterion is regularly used by the Environmental Planning Division in EIRs throughout the City (pursuant to Chapter 31 of the San Francisco Administrative Code) and is reflective of one of the questions presented in the State CEQA Guidelines, Appendix G. Correctly stated, significance criteria 4(b) should have said:

> "Conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including, but not limited to the general plan, specific plan, local coastal program, or zoning ordinance) *adopted for the purpose of avoiding or mitigating an environmental effect*." [emphasis added]

Although this may appear to be a minor change, it is important to re-emphasize that under CEQA the focus of the analysis in an EIR is on physical adverse environmental changes to the environment. The issue of consistency or conflict with an adopted plan is mainly relevant insofar as any inconsistency could

have environmental consequences. The environmental consequences of the project as proposed, include any proposed amendments of, changes to, or inconsistencies with adopted plans, policies and regulations, relevant to environmental resource sections of the Draft EIR.

Not all plan policies relate to physical environmental effects. As an example, a project may or may not be consistent with parking policies in a plan; parking supply and demand is not considered an environmental issue under CEQA and Chapter 3 of the San Francisco Administrative Code. Similarly, many policies found in local plans relate to economic or fiscal issues, or are procedural in nature; these policies do not necessarily have environmental consequences and may not have been intended to mitigate or avoid environmental impacts. The focus of CEQA on physical environmental changes is reiterated in the State CEQA Guidelines. Under CEQA a significant effect is defined as:

> "Significant effect on the environment" means a substantial, or potentially substantial, adverse change in any of the physical conditions within the area affected by the project, including land, air, water, minerals, flora, fauna, ambient noise, and objects of historic or aesthetic significance. An economic or social change by itself shall not be considered a significant effect on the environment. A social or economic change related to a physical change may be considered in determining whether the physical change is significant." (State CEQA Guidelines Section 15382).

The emphasis on changes to physical conditions is further reiterated in State CEQA Guidelines Section 15064(d) as it describes the determination of significance of environmental effects:

> "In evaluating the significance of the environmental effect of a project, the Lead Agency shall consider direct physical changes in the environment which may be caused by the project and reasonably foreseeable indirect physical changes in the environment which may be caused by the project."

The State CEQA Guidelines do not refer to an inconsistency with a plan goal, objective, or policy as a significant effect in and of itself, separate from the connection of the inconsistency to a physical change in the environment.

CEQA requires an EIR to include a broad discussion of the relationship of the proposed project to local plans and policies, but it overtly places that requirement in the context of the environmental setting, not the impact analysis. The content of the environmental setting is outlined in Section 15125 of the State CEQA Guidelines, which states, in part:

> "The EIR shall discuss any inconsistencies between the proposed project and applicable general plans, specific plans, and regional plans. Such regional plans include, but are not limited to, the applicable air quality attainment or maintenance plan or State Implementation Plan, area-wide waste treatment and water quality control plans, regional transportation plans, regional housing allocation plans, regional blueprint plans, plans for the reduction of greenhouse gas emissions, habitat conservation plans, natural community conservation plans and regional land use plans for the protection of the Coastal Zone, Lake Tahoe Basin, San Francisco Bay, and Santa Monica Mountains."

This is then balanced by the discussion of the focus of the impact analysis contained in Section 15126.2(a) of the State CEQA Guidelines, which states that "[a]n EIR shall identify and focus on the significant environmental effects of the proposed project." That particular guideline goes on to further explain the focus on physical changes to the environment. Importantly, there is no mention of issues of consistency or inconsistency with plans and policies.

In light of the above discussion, the following text changes are made to the Draft EIR.

On page 4.1-37, the second bullet is revised to read:

> 4b—conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including but not limited to the general plan, specific plan, local coastal program, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect; or

On page 4.1-46, Impact 4.1-2 is revised to read:

> **IMPACT LU-2** The project would not conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project adopted for the purpose of avoiding or mitigating an environmental effect. (Significance Criterion 4b)

On page 4.1-48, the third full paragraph is revised to read:

> The amendments to the *General Plan's* VNAP and amendments to the Planning Code text and zoning and height and bulk district maps; the PUD and CU authorizations; and other approvals, as discussed above, are part of the proposed LRDP. ~~Therefore, i~~If they are approved by decision-makers, the proposed LRDP would be consistent with the applicable plans and policies. ~~The proposed LRDP at the Cathedral Hill Campus with the requested amendments and approvals would therefore not conflict with any applicable land use plan, policy, or regulation.~~ **This impact would be less than significant.**

On page 4.1-50, the second complete sentence is revised to read:

Therefore, the proposed near-term project at the Davies Campus would not conflict with any applicable land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect.

On page 4.1-51, the last partial paragraph (and the first partial paragraph on page 4.1-52) is revised to read:

> The *General Plan* amendments and Planning Code text and map amendments, the PUD and CU authorizations, and other approvals described above are proposed as part of development at the St. Luke's Campus under the proposed LRDP. ~~Therefore, i~~If these amendments and authorizations are approved, the LRDP would be consistent with the relevant amended plans and policies~~,~~. The proposed arrangement and design of land uses would not implicate any environmental protection objectives of the current land use designations in the applicable land use plans; thus, the inconsistencies do not give rise to a significant impact on the environment. ~~and implementing the LRDP at the St. Luke's Campus would not conflict with any applicable land use plan, policy, or regulation.~~ **This impact would be less than significant.**

On page 4.1-54, the following is added after the third sentence:

> The proposed arrangement and design of land uses would not implicate any environmental protection objectives of the current land use designations in the applicable land use plans; thus, the text amendments and CU authorization do not give rise to a significant impact on the environment.

General Plan

The Draft EIR, pages 3-2 through 3-10, contained an eight-page discussion of consistency of the proposed LRDP with the objectives and policies of the City of San Francisco General Plan, including each of the

Elements that may include policies that pertain to environmental issues: Air Quality, Commerce and Industry, Community Safety, Environmental Protection, Housing, Recreation and Open Space, Transportation, and Urban Design. Although the Draft EIR acknowledges that the detailed Planning Department evaluation of project consistency with the General Plan would be included in the draft LRDP approval documents in the event that the decision-makers decide to approve the LRDP as proposed or an alternative, the Draft EIR contained a summary evaluation of consistency with a focus on issues relevant to environmental effects, as described below.

Air Quality Element: The Draft EIR (page 3-2) identified that the proposed LRDP would be generally consistent with the Air Quality Element. Evidence that was cited included the requirements of the project to comply with federal, state, and local air quality regulations, the availability of transit service at the CPMC campuses under the LRDP, the proposed expansion of CPMC's TDM program, as well as the commitment of the project sponsor to achieve LEED® certification for the proposed Cathedral Hill Hospital, Cathedral Hill MOB, St. Luke's Replacement Hospital, and the St. Luke's MOB/Expansion Building.

Commerce and Industry Element: The Draft EIR (page 3-3) identified that the proposed LRDP would be generally consistent with the Commerce and Industry Element which focuses on managing economic growth, maintaining a sound economic base and fiscal structure, and providing expanded employment opportunities for City residents. Evidence cited include the estimates of expanded employment opportunities from the proposed LRDP, as presented in Section 4.3, "Population, Employment, and Housing," of the Draft EIR. The employment expansion that would result from the proposed project (1,800 new employees by 2015 and 4,170 new employees by 2030) is presented in Table 4.3-10 on page 4.3-16 of the Draft EIR.

Community Safety Element: The Draft EIR (pages 3-3 and 3-4) identified that the proposed LRDP would be generally consistent with the Community Safety Element which establishes objectives and policies to reduce future loss of life, injuries, property loss, environmental damage, and social and economic disruption from natural or technological disasters. Evidence cited for this conclusion regarding consistency included the identified intent of the LRDP to bring the CPMC hospitals into conformance with the requirements of SB 1953 and successor legislation, which inherently improves seismic safety in San Francisco.

Environmental Protection Element: The Draft EIR (pages 3-4 and 3-5) describes the proposed LRDP as generally consistent with the applicable policies of the Environmental Protection Element. This element establishes policies to minimize adverse effects of urbanization on the natural environment of San Francisco and surrounding environs. Evidence of this consistency that is cited in the Draft EIR discussion includes that (1) the proposed Cathedral Hill MOB and the St. Luke's MOB/Expansion Building would be built to LEED® Silver requirements and would comply with the City's Green Building Ordinance, (2) the proposed Cathedral Hill Hospital and the St. Luke's Replacement Hospital would be built to LEED® Certified standards, (3) new landscaping under the LRDP would comply with the City's Urban Forestry Ordinance, and (4) the operation of the CPMC campuses under the LRDP would conform to the City's biological resources protection policies, the BAAQMD standards, the City's noise ordinance, and the regional greenhouse gas reduction plan.

Housing Element: The Draft EIR (pages 3-5 and 3-6) describes the 2004 Housing Element, which was in place during the preparation of the CPMC LRDP Draft EIR, and the 2009 Housing Element, which was under review at the time. The Planning Commission approved the 2009 Housing Element, and certified the EIR for the 2004 and 2009 Housing Elements, on March 24, 2011. The Board of Supervisors upheld the EIR for the 2004 and 2009 Housing Elements, on May 10, 2011. The Board of Supervisors adopted the 2009 Housing Element on June 21, 2011.

Response LU-3 describes the updated Housing Element and discusses the relationship of the proposed LRDP to the relevant policies of the City's Housing Element. The discussion in the Draft EIR recognizes that most of the objectives and policies of the Housing Element, including the 2009 Housing Element, are not applicable to the proposed LRDP, because the LRDP does not include a residential development component. The proposed Cathedral Hill Hospital and Cathedral Hill MOB sites are not considered as sites with available housing capacity in the assumptions utilized in the 2009 Housing Element. However, because the project as proposed would result in the demolition of five residential dwelling units and 20 residential hotel units, would involve the need to relocate existing residents of those units, and would create a demand for new housing because of expanded employment opportunities, certain policies of the Housing Element would apply.

As described in Response PH-14 (page C&R 3.5-53), Planning Code Section 317 requires conditional use authorization for the demolition of three or more dwelling units. It does not require one-for-one residential unit replacement. However, CPMC has agreed to pay an in-lieu fee to address demolition of the five residential units and consulted with the Mayor's Office of Housing ("MOH") to identify the appropriate in-lieu fee methodology. MOH determined that (i) the in-lieu fee amount will be established based on the Citywide inclusionary housing fee schedule effective as of July 15, 2008; and (ii) as applied to the residential units, the total fee is One Million Four Hundred Fifty Three Thousand Eight Hundred and Twenty Dollars ($1,453,820.00) ("Residential Unit Replacement Fee") based on the following unit type and calculation: three one bedroom units ($248,210.00 x 3), one two bedroom unit ($334,478.00) and one three bedroom unit ($374,712.00). A condition to DBI's issuance of a demolition permit for the residential units would be payment of the Residential Unit Replacement Fee. Over the past year, CPMC met with tenants and offered relocation services and relocation financial assistance. These relocation services included a private social worker and a leasing specialist, to help with the process and identify other appropriate publicly-available supportive services as well as translation assistance. CPMC worked with tenants to develop a relocation financial assistance package that establishes a market rate differential for the existing unit as compared to a comparable replacement unit, and multiplies that differential by 78 months. The relocation financial assistance package also includes standard moving and relocation costs, such as credit check fees and security deposit. Several households have used the available resources for apartment searches, landlord negotiations, and moves to new places of residence, all within San Francisco. As of September 2011, CPMC has reached agreement with all ten of the residential households. CPMC has assisted several households with apartment searches, landlord negotiations, and moving, all within San Francisco. Eight of the ten residential households have relocated and the remaining two have agreed to move out in early 2012.[13]

The process that CPMC has undertaken to date is as follows. As properties were purchased by CPMC for site assembly, during the years 2003 to 2009, all tenants were advised of CPMC's intentions to demolish the buildings. In mid-2009, approximately 1 year before CPMC's earliest anticipation of approval hearings, CPMC began formal communication with residential tenants about relocation and invited the non-profit tenant advocacy organization, Chinatown Community Development Center (CCDC), into these communications.

In addition, as discussed in Response PH-17, page C&R 3.5-64, under Impact PH-2 the Draft EIR concluded that the impact of the LRDP on the creation of significant new housing demand that would require the construction of new housing to be less than significant for individual CPMC campuses and for the LRDP as a whole. The primary factor in making this determination was the ability of the incremental increase in housing demand created by the LRDP to be accommodated within the existing vacant capacity of rental housing in the City, as well as the capacity for additional housing to be created in the City over the life of the LRDP (see Impact PH-2 on pages 4.3-32 to 4.3.43 of the Draft EIR). Because this impact is identified as less than significant, no mitigation is required under CEQA.

[13] Memorandum from Geoffrey Nelson, AICP, California Pacific Medical Center, to Cameron Mueller & David Reel (AECOM), re: Relocation of tenants in 1034-1036 Geary Street (September 22, 2011).

Nevertheless, CPMC has proposed to make a contribution to the Mayor's Office of Housing at least equivalent to the Jobs-Housing Linkage Program (JHLP) fee as defined in Section 413 of the Planning Code, for the purpose of satisfying any unmet housing demand created by the proposed Cathedral Hill Campus. It is anticipated that the contribution to the Mayor's Office of Housing will be incorporated into the conditions of approval for the proposed project, or a development agreement, if the project is approved.

Through the implementation of actions described above, the proposed LRDP would be generally consistent with the objectives and policies of the Housing Element. Please also see Response LU-3, C&R 3.3-7, for further discussion of the Housing Element.

Recreation and Open Space Element: The Draft EIR (pages 3-6 and 3-7) describes the proposed project as generally consistent with the Recreation and Open Space Element, which establishes policies related to the preservation, access, use, and development of open space and recreational opportunities in the City, including the protection of solar access in public open spaces. As noted in Sections 4.10, "Recreation," and 4.09, "Wind and Shadow," the impacts of the proposed LRDP related to recreation and open space, and wind and shadow impacts on the surrounding area, would be less than significant, and thus the proposed project would not conflict with the goals of the Recreation and Open Space Element.

Transportation Element: The Draft EIR (pages 3-7 through 3-9) explains that the proposed project would be generally consistent with both the Transportation Element of the General Plan as well as the City's Transit First Policy. As it pertains to the Transportation Element, the Draft EIR notes that the LRDP would include a comprehensive and expanded Transportation Demand Management (TDM) program, including a shuttle service, and inclusion of bicycle facilities on all campuses meeting or exceeding Planning Code requirements. The Draft EIR discussion also notes that the proposed project is generally consistent with the City's Transit-First policy because a TDM program would be implemented to encourage alternatives to single-occupant vehicles as a primary mode of transportation—for example, by providing free shuttle service to and from each campus and subsidies to employees who carpool or vanpool. In addition, each campus is accessible by public transit. Please see Section 4.5, "Transportation," on page 4.5-61 of the Draft EIR for a discussion of public transit options; page 4.5-98 of the Draft EIR, and Response AQ-12 (page C&R 3.9-36), as well as Draft EIR pages 4.5-74 to 4.5-75, and 5-13 to 5-14, as well as Responses TR-23 (page C&R 3.7-45) and TR-29 (page C&R 3.7-51) for more details about CPMC's TDM program; and pages 4.5-117, 4.5-168, 4.5-180, 4.5-187, and 4.5-201 of the Draft EIR for analyses of the LRDP's transit impacts on each CPMC campus.

Urban Design Element: The Draft EIR (pages 3-9 and 3-10) indicates that the proposed LRDP would be generally consistent with the objectives and policies of the Urban Design Element. Those policies require proposed development projects under the LRDP to take into account the surrounding urban context through building design and placement, strive to integrate proposed LRDP buildings with existing buildings by designing building height and bulk that respects adjacent buildings, establish and protect visual relationships and transitions, and respect older or historic structures. Policies also emphasize visual amenities, including landscaping and pedestrian areas that are human scale. Notwithstanding the requested amendments to height limitations for the proposed Cathedral Hill Hospital and the St. Luke's Replacement Hospital and MOB/Expansion Building, which, if they are approved, would ensure that the proposed LRDP is in conformance with the Urban Design Element, the design of the proposed CPMC structures under the LRDP would reflect the City's design policies.

The visual character of the proposed LRDP development and potential visual and aesthetic impacts at each of the campuses are analyzed in Draft EIR Section 4.2, "Aesthetics." Historic resources are analyzed in Draft EIR Section 4.4, "Cultural and Paleontological Resources." The consistency of the proposed LRDP with the Planning Code is summarized in Section 3.2.5, "San Francisco Planning Code (Zoning

Ordinance)," on page 3-12 of the Draft EIR, and described further in Section 4.1, "Land Use and Planning."

Van Ness Avenue Area Plan (VNAP)

The VNAP is described and addressed on pages 3-10 and 3-11 of the Draft EIR. The issue of consistency of the proposed Cathedral Hill Campus is discussed on these pages, and then further discussed and clarified in Responses LU-21 (which includes a discussion of the 3 to 1 residential to net new non-residential ratio requirement), LU-22 (which includes a discussion of the residential goals of the VNAP), and LU-23 (which includes a discussion of general consistency with the VNAP) on pages C&R 3.3-95 to 3.3-135. The focus of the discussion in the Draft EIR and Responses LU-21 through LU-23 concludes that the LRDP, as proposed, would be generally consistent with the objectives and policies of the VNAP, and would not conflict with the goal of the VNAP to transform Van Ness Avenue into a vibrant corridor with a strong mix of residential and non-residential uses.

Size of Cathedral Hill Campus Facilities and Consistency with Van Ness Area Plan

Several comments raised concerns related to the size of the proposed buildings on the Cathedral Hill Campus and the LRDP's consistency with the Van Ness Area Plan.

As described in Section 2.2.4, "Required Project Approvals for the Cathedral Hill Campus" (beginning on page 2-43 of the Draft EIR), as well as on pages 4.1-47 and 4.1-48 of the Draft EIR, as these pages have been updated as text revisions to the Draft EIR on pages C&R 4-66 to 4-67, a General Plan amendment to the VNAP and other actions by the City would be required for construction of the proposed Cathedral Hill Campus. An amendment to General Plan Urban Design Element Map 4 would allow CPMC to develop a building up to 265 feet tall on the block of the proposed hospital. Map 1, "Generalized Land Use and Density Plan," of the VNAP would be revised to designate the area comprising the sites of the proposed Cathedral Hill Hospital and Cathedral Hill MOB as "The Van Ness Medical Use District," and to increase the maximum floor area ratio (FAR) of 7:1 for the proposed sites of the Cathedral Hill Hospital and Cathedral Hill MOB to 9:1 and 7.5:1, respectively. Please see the updated version of Draft EIR Appendix C "Van Ness Area Plan, Map 1," included in the text revisions on page C&R 4-142 for a map of the proposed FAR boundaries, which would only encompass the proposed Cathedral Hill Hospital and Cathedral Hill MOB sites and would not extend further along the Van Ness Avenue corridor.

The height and bulk district map (Map 2) of the VNAP would also be amended to modify the existing 130-V Height and Bulk District designation for the block proposed for the Cathedral Hill Hospital to a 265-V Height and Bulk District, which would allow a building of up to 265 feet tall (see Draft EIR, Appendix C "Van Ness Area Plan Map 2"). The map amendment would not modify the basic bulk limit designation of V, but modification of the bulk limits for the proposed Cathedral Hill Hospital and Cathedral Hill MOB would be sought under the CU application, as described below.

Required project approvals shown in Table 2-3 on pages 2-13 through 2-15 of the Draft EIR, as updated as text revisions to the Draft EIR on pages C&R 4-37 to 4-42, including project approvals related to height, are part of the proposed LRDP. If they are approved by decision-makers, the proposed LRDP would be consistent with the applicable plans and policies.

Several comments raised concerns regarding the size of the proposed Cathedral Hill Hospital. Hospitals are larger today than they were in the 1970s, when most of San Francisco's hospitals were built. For example, modern operating rooms are 20 percent to 30 percent larger to accommodate the plethora of equipment and large multi-disciplinary care teams needed for modern intensive surgeries. As little as a decade ago, operating rooms were typically 400 square feet. The organization and workflow required to deploy surgical technology while maintaining the sterile field has changed over the years. Creating a

workflow in the operating rooms that supports maximum efficiency as well as maintains all of the appropriate infection prevention criteria has resulted in a significant demand for more area in each room.

To meet current California Building Code requirements, any newly constructed operating rooms must have a minimum of 400 square feet of clear floor area which excludes any area occupied by fixed equipment or casework (per Section 1224.15.1.1 of the 2010-CBC). Currently, a majority of CPMC's current inventory of operating rooms fall below the minimum range. At CPMC's Pacific Campus, the current operating rooms range from 394 to 512 square feet. At the St. Luke's Campus, the operating rooms are all between 350 and 360 square feet. At the Davies Campus, the non-renovated operating rooms (in the Davies Hospital North Tower) range from 369-526, averaging 394 sf. While current state-of-the-art operating rooms design has yielded operating rooms ranging in the size from 500 to 1,200 square feet, experts in the field have determined that between 600-650 square feet is the optimal size for operating rooms. This size ensures maximum utilization of the room now and into the future since it can accommodate the majority of technologies and provides the required space for staff circulation and multi-disciplinary work.[14] At the Cathedral Hill Hospital, 610 sf is the proposed size for the general operating rooms. At the St. Luke's Replacement Hospital, the proposed operating room size ranges from 545 to 635 sf.

Specialty operating rooms, such as cardiovascular and orthopedic suites, require even larger footprints due to the growth in quantity and size of surgical technology and equipment commonly used today. The advanced equipment such as robotics, C-arms, video carts, microscopes, and other specialized surgical equipment require far more space. With the growth of clinical collaborations between interventional and diagnostic specialties, e.g., cardiac catheterization and interventional radiology, the need to create a seamlessly integrated environment within the operating room has become essential. The Advisory Board Company[15] recommends operating rooms sizes of 600–750, 800, 600–700, and 800 for cardiovascular, Neuro, Orthopedic, and Hybrid operating rooms, respectively.[16] At the proposed Cathedral Hill Hospital, the specialty operating rooms would range in size from 700 to 720 sf for Cardiac and Orthopedic operating rooms and approximately 920 sf for Hybrid operating rooms. At the Davies Campus, the new specialty operating rooms in the Davies Hospital North Tower are approximately 663 sf.

The Americans with Disabilities Act (ADA) and other patient care considerations have increased space requirements for everything from hallways to bathrooms. For example, the Davies Hospital public toilet room sizes increased 40 percent per occupant as the result of ADA requirements applicable to the recently completed renovations. Additional elevators, corridors, and rooms are required to maintain separation between public, patient, and service spaces. Also, private patient rooms—with sufficient room for equipment, staff, and family—are now the standard of care for hospitals.[17] A modern single-patient room requires approximately 2.15 times the square footage per bed as older, non-private patient rooms, such as the existing inpatient rooms at CPMC's Pacific Campus. The Davies Hospital North Tower renovations increased patient room area by 40 percent per patient, independent of the toilet room. This is due

[14] "Slightly smaller ORs, in the 500 to 550 SF range, may be sufficient for current needs but offer little flexibility for future equipment additions or rearrangement. Underutilization is a chief concern with operating rooms under 400 square feet, which are suitable for only a handful of simple outpatient procedures. At the other end of the spectrum, any operating rooms over 800 square feet—apart from just a few [specialized] exceptions—greatly exceeds most hospitals' needs and invites equipment overstock." The Advisory Board Company, *Facility Innovation Brief – Hospital of the Future: Lessons for Inpatient Facility Planning and Strategy*, p. 31 (2007).,

[15] The Advisory Board Company "is the leading provider of comprehensive performance improvement services to the health care and education sectors—including operational best practices and insights, business intelligence and analytic tools, management training, unbiased technology evaluation, and consulting support." The Advisory Board Company, *Who We Are* http://www.advisoryboardcompany.com/content/firm/default.asp (last accessed Mar. 25, 2011)

[16] The Advisory Board Company, *Facility Innovation Brief – Hospital of the Future: Lessons for Inpatient Facility Planning and Strategy*, p. 63 (2007).

[17] For example, the 2006 American Institute of Architects' Guidelines for Design and Construction of Health Care Facilities cites on page xx of the Preface that, for medical/surgical (including postpartum) units, "the single-bed room is the minimum standard for new construction." Also, on page 40, Section 3.1.1.1, "Capacity," the Guidelines state, "In new construction, the maximum number of beds per room shall be one unless the functional program demonstrates the necessity of a two-bed arrangement."

primarily to the conversion from shared rooms to single-patient rooms. Patient toilet room sizes increased by almost 50 percent; however, eliminating the two-person capacity associated with the shared rooms resulted in an increase in size of almost 200 percent per patient. Typical patient rooms proposed at the Cathedral Hill Hospital are 35 percent larger in size, than at the existing Pacific Campus 2333 Buchanan Street Hospital. The patient toilet rooms at the proposed Cathedral Hill Hospital would be 85 percent larger than those at the 2333 Buchanan Street Hospital; however, due to the conversion to single-patient occupancy, both room and toilet area per patient would increase by about 185 percent at the proposed Cathedral Hill Hospital. Overall, the net square footage per bed devoted to patient rooms, toilets and nursing support for a typical 60-bed patient floor at the proposed Cathedral Hill Hospital would be twice as large as a typical 72-bed patient floor at 2333 Buchanan. This reinforces the fact that patient floors for the proposed Cathedral Hill Hospital would be appropriately sized to accommodate modern standards for single-patient rooms.

Modern hospital technology also requires that hospitals have higher floor-to-floor heights than most other buildings. This is because higher spaces between the floors are necessary for the vast array of air distribution, gas, water, and electrical infrastructure specifically required for hospital services. For example, Kaiser Permanente hospital floor-to-floor standards are 17'-0" to 18'-0"' for diagnostic and treatment floors and 14'-6" to 15'-0" for patient floors.[18] UCSF is building 20'-0" high diagnostic and treatment floors and 15'-0" high patient floors at the UCSF Benioff Children's Hospital at Mission Bay per UCSF Campus Planning, and Stanford is proposing heights of 18'-0"–20'-0" for diagnostic and treatment floors, and 15'-0" for patient floors.[19] San Francisco General Hospital is building all floors at a height of 16'-0", except admitting/emergency, which will be 15'-0".[20] The proposed Cathedral Hill Hospital would provide 17'-0" heights for diagnostic and treatment floors and 14'-0" heights for typical bed floors. The proposed St. Luke's Replacement Hospital would provide 17'-0" floor heights for all but the top floor which would provide a floor to floor height of 15'-0".

Additionally, it should be noted that according to the U.S. News and World Report national rankings, the four top-ranked tertiary hospitals, Johns Hopkins, the Mayo Clinic, UCLA, and the Cleveland Clinic have 920, 1,302, 595, and 1,000 licensed beds, respectively.[21] Locally, the UCSF Parnassus hospital has 526 licensed beds.[22] The proposed Cathedral Hill Hospital would be within the low end of the range in terms of the number of licensed beds, in comparison to these other tertiary hospitals.

Please also see Major Response HC-2: Location, Size, and Scope of Services at Cathedral Hill, St. Luke's, and Davies, page C&R 3.23-8, for an explanation of the basis for the size and scope of the proposed Cathedral Hill Hospital.

One comment suggested that the size of the proposed Cathedral Hill Hospital is contrary to "smart growth" and should be considered a "LULU" or "Locally Unacceptable Land Use." While the terms "smart growth" and "LULU" are subject to individual interpretation, there are some generally accepted definitions, as discussed below.

According to The Smart Growth Network, "smart growth" principles include: (1) mix land uses, (2) take advantage of compact building design, (3) create a range of housing opportunities and choices, (4) create walkable neighborhoods, (5) foster distinctive, attractive communities with a strong sense of place, (6) preserve open space, farmland, natural beauty, and critical environmental areas, (7) strengthen and direct development towards existing communities, (8) provide a variety of transportation choices, (9) make development decisions predictable, fair, and cost effective, and (10) encourage community and

[21] CPMC, Presentation for CPMC IMP Hearing, San Francisco Planning Commission (November 19, 2009), at p. 10.
[22] Ibid.

stakeholder collaboration in development decisions.[23] The proposed CPMC LRPD's goal at the Cathedral Hill Campus is to apply those smart growth principles that encourage infill development in existing communities rather than greenfield development, including: (7) Strengthen and direct development towards existing communities, (8) provide a variety of transportation choices. In addition, CPMC has made commitments to make contributions to support the creation of affordable housing, which would be consistent with the principle of "create a range of housing opportunities." As buildings that are designed specifically for medical uses, the proposed LRDP would not directly address the principles of mixing land uses or compact building design. As infill sites, the preservation of open space and critical environmental areas would be maintained, and because the proposed CPMC Campus would become a key feature in the neighborhood would contribute to the sense of place. These principles of smart growth are broad and can be applied to a wide variety of development types and locations, but ultimately the determination of whether the proposed LRDP represents smart growth is an individual decision.

"LULU," is a term that is applied to those land uses that are unwanted by a nearby neighborhood or community. Like NIMBY (an acronym standing for Not In My Back Yard), LULU is an acronym that emerged from local land use debates over the last couple of decades. Initially the acronym was used for certain uses such as landfills, that produce certain noxious odors, loud noises, and safety hazards that would make them unwanted in any neighborhood.. However, the appropriateness of applying the term LULU to the proposed LRDP is an individual decision.

No discussion of the proposed LRDP's consistency with the existing CU authorization is provided in the Draft EIR, because no amendment to the existing CU would be necessary to allow the existing facilities to continue to operate without acute care inpatient uses. This is because, as amended as part of Planning Department-initiated code clean-up legislation enacted earlier this year, Planning Code section 209.3(a) conditionally permits medical institutions without inpatient medical services in the RM-1 and RM-2 Districts. The Pacific Campus is located within these districts; however, no new construction or significant alterations to existing structures or changes to the medical institutional uses of the existing buildings on Campus that would require a change to the existing CU authorization is proposed as part of the near-term projects under the proposed LRDP. The comment requests an explanation of the conclusion in the Draft EIR that there would be less-than-significant impacts related to changes to the existing character in the vicinity of the LRDP sites (see Draft EIR Impact LU-3, page 4.1-55), This is because, according to the comment, the proposed LRDP at the Pacific Campus would result in a denser and more intense development than found in existing conditions in the Pacific Heights neighborhood.

Market & Octavia Neighborhood Plan

As discussed on page 3-11 of the Draft EIR, the *Market & Octavia Neighborhood Plan* (MONP) area borders the Davies Campus to the north and east, along Duboce Avenue and Noe Street. The objectives and policies of the MONP do not apply to the Davies Campus, which lies outside the boundaries of the area subject to the MONP.

Mission Area Plan

As described on page 3-12 of the Draft EIR, the St. Luke's Campus is immediately south, across Cesar Chavez Street, from the geographic area subject to the *Mission Area Plan*, which extends from Cesar Chavez Street north to Division Street and from Potrero Avenue west to Guerrero Street.[24] The policies and provisions of the Mission Area Plan do not apply to the St. Luke's Campus.

[23] The Smart Growth Network, *This is Smart Growth*, p. 1. Available at http://www.epa.gov/dced/pdf/2009_11_tisg.pdf
[24] San Francisco Planning Department. 2008. *San Francisco General Plan*, Eastern Neighborhoods Plan Areas Map. San Francisco, CA.

Japantown Better Neighborhood Plan

The proposed *Japantown Better Neighborhood Plan* area is located one block west of the proposed Cathedral Hill Campus and south of the existing Pacific Campus, across California Street. Because neither the Cathedral Hill nor the Pacific Campuses would be located within the planning area, the recommendations of the *Japantown Better Neighborhood Plan* would not apply to either campus. The *Japantown Better Neighborhood Plan* is discussed on page 3-24 of the Draft EIR.

Mission District Streetscape Plan

The Draft *Mission District Streetscape Plan* is described on pages 3-25 and 3-26 of the Draft EIR. The assessment of consistency contained in the Draft EIR was based on the version of the Plan evaluated in the April 28, 2010 preliminary draft mitigated negative declaration (Planning Department Case No. 2008.1075E). Since that time, a Public Draft *Mission District Streetscape Plan* was published in October 2010. That version of the Plan calls for the widening of sidewalks and the development of a streetside pocket park on the west side of Valencia Street, between Cesar Chavez Street and Duncan Street, adjacent to St. Luke's Hospital. No aspects of the proposed LRDP would conflict with the proposed Valencia Street improvements called for in the Streetscape Plan. To account for the changes in the *Mission District Streetscape Plan* since the publication of the Draft EIR, the following revisions are made to the language of the Draft EIR.

On page 4.1-51, the second full paragraph is revised to read:

> "The ~~proposed~~ draft *Mission District Streetscape Plan*, ~~currently in the planning stages~~published for public review in October 2010, encompasses an area that includes the St. Luke's Campus.[25] The design framework of the proposed *Mission District Streetscape Plan* ~~does not~~ proposes ~~any improvements within~~ widened sidewalks and a new pocket park on the west side of Valencia Street between Cesar Chavez Street and Duncan Street, adjacent to the St. Luke's Campus.~~;~~ ~~however,~~ The *Streetscape Plan* also calls for a new pedestrian ~~it identifies a potential new public space and gateway~~ plaza at the intersection of Valencia and Mission Streets, one block southeast of the campus. All construction and demolition under the proposed LRDP would occur within the existing St. Luke's Campus. Implementing the LRDP would not alter the Valencia Street frontage and the southeastern corner of the St. Luke's Campus, which is closest to the new public space and gateway plaza proposed under the ~~*Mission District*~~ *Streetscape Plan*. No aspect of the proposed LRDP would conflict with the *Streetscape Plan's* provisions for improvements around the St. Luke's Campus. Furthermore, the proposed LRDP would create a "campus plaza," open space that would serve as an entrance between the St. Luke's Replacement Hospital and MOB/Expansion Building, creating a connection to the *Mission District Streetscape Plan's* streetscape improvements. CPMC is also working with the City to ensure consistency of the LRDP at the St. Luke's Campus with the open space and streetscape improvements underway on Valencia Street. Therefore, the proposed LRDP would not conflict with the ~~proposed~~ October 2010 Draft *Mission District Streetscape Plan's* ~~draft~~ policies encouraging the creation of improved streetscapes and public realm areas. Please refer to Section 4.5, "Transportation and Circulation," for a discussion of the proposed LRDP's street improvements and a discussion of pedestrian and bicycle access."

Available: http://www.sf-planning.org/ftp/CDG/CDG_mission_streetscape.htm ~~files/MEA/Final_042810_PMDSP_2PM.pdf.~~ Accessed ~~June 15~~, March 29, 2010.

Proposition M (Accountable Planning Initiative)

The Draft EIR describes the Accountable Planning Initiative on page 3-19, noting that it added Section 101.1(b) to the Planning Code, requiring all projects subject to a CEQA initial study to be found to be consistent with eight priority policies, noted below:

- preservation and enhancement of neighborhood-serving retail uses,
- protection of neighborhood character,
- preservation and enhancement of affordable housing,
- discouragement of commuter automobiles,
- protection of industrial and service land uses from commercial office development and enhancement of resident employment and business ownership,
- maximization of earthquake preparedness,
- preservation of landmark and historic buildings, and
- protection of open space.

The discussion on page 3-19 of the Draft EIR explains that the case report and approval motions for the LRDP would contain the Planning Department's comprehensive project analysis and findings regarding consistency of the LRDP with the priority policies. The discussion also notes that the environmental issues of the LRDP associated with the priority policies are addressed further in the Draft EIR, in Section 4.1, "Land Use and Planning"; Section 4.2, "Aesthetics"; Section 4.3, "Population, Employment, and Housing"; Section 4.4, "Cultural and Paleontological Resources"; Section 4.5, "Transportation and Circulation"; Section 4.10, "Recreation"; Section 4.14, "Geology and Soils"; and Section 4.16, "Hazards and Hazardous Materials."

To provide additional clarification, the following discussion addresses information contained in the Draft EIR related to the priority policies of the Accountable Planning Initiative.

Preservation and Enhancement of Neighborhood-Serving Retail Uses

The proposed LRDP would be expected to increase retail spending in neighborhoods around the LRDP campuses. As explained in Response PH-22, C&R 3.5-76, according to the California Board of Equalization, in 2009 the average California resident spent approximately $8,100 on retail goods and food services.[26] Converting from per capita retail expenditures to per household expenditures by applying the average household size in San Francisco results in average per household expenditures of approximately $18,200, and applying the 1.37 workers per household factor means that retail expenditures were approximately $13,200 per worker in a household (not adjusting for income).

Generally, people spend more near their places of residence than at their places of work. The International Council of Shopping Centers (ICSC 2004) performed a survey of workers to understand their spending behavior near their work. Workers averaged from $2,950 to $3,290 per year near the workplace, depending on the retail offerings available at their place of work.[27] Adjusting for inflation, workers would spend roughly from $3,450 to $3,850 per year. Thus, if roughly $3,900 a year of a worker's spending potential occurs near its place of work, then the remaining $9,300 is spent in other locations. The vast majority of the remaining purchasing power is spent in the proximity of their residence.

[26] California State Board of Equalization, Research and Statistics Section, *Taxable Sales In California (Sales & Use Tax) During 2009*, Forty-Ninth Annual Report, *Table 1. Statewide Taxable Sales, By Type Of Business, 2009*, California, 2009.

[27] International Council of Shopping Centers (ICSC), *Office Worker Retail Spending Patterns*, New York, 2004, p. 104–106.

According to Table 4.3-10 on page 4.3-16 of the Draft EIR, the proposed LRDP would increase employment on the proposed Cathedral Hill Campus from approximately 760 workers today to approximately 4,790 workers in 2015 and approximately 5,380 workers in 2030. Assuming approximately $3,900 per worker, this would translate into total worker retail spending in nearby neighborhoods of approximately $2,964,000 under existing conditions, rising to approximately $18,681,000 in 2015 and $20,982,000 in 2030. This future level of local area retail spending is the equivalent of approximately 2,000 residential units in 2015 and approximately 2,250 in 2030. Under the current land use designations, the three sites in the proposed Cathedral Hill Campus have the capacity to accommodate up to 753 units, which would generate local area spending of $7,002,900 per year.[28] This level of local area spending would be approximately $12,000,000 to $14,000,000 per year less than under the proposed LRDP uses.

Concerns about the creation of a "medical monoculture" in surrounding businesses that would adversely affect existing retail and other businesses are not supported by evidence in the record. As explained in Response PH-21, C&R 3.5-73, recent surveys indicate that a plethora of retail and service businesses operate in the vicinity of all CPMC medical campuses. For most retail or service categories, the vast majority of the businesses were local, independent entities; a very limited number of chain businesses were found in the commercial corridors near these major hospitals. The only retail category that seemed to be dominated by chains was coffee shops, where more than half of all such businesses around the CPMC campuses were chains. Thus, no evidence is provided to support the statement that the proposed LRDP would lead to an expansion of chain businesses near campus locations; the evidence shows that independent businesses thrive in the business climate near major health care campuses in San Francisco.

Protection of Neighborhood Character

As described in the discussion of Impact LU-3 on pages 4.1-55 through 4.1-58 of the Draft EIR, construction and operation of the proposed Cathedral Hill Hospital would considerably intensify the use of the site by replacing the existing hotel, office building, and associated parking garage with a new, large-scale medical use. However, the proposed hospital would be compatible with the diverse mix of uses in the project area, which currently includes some medical uses. Although there would be additional new medical uses at the site of the proposed Cathedral Hill Campus, medical uses currently exist on portions of the site and in the project vicinity. The proposed LRDP would not introduce an entirely new land use to the existing neighborhood, which is already diverse, and the proposed campus would not be out of character with existing land uses in the vicinity.

In addition, the proposed CPMC campus would include features that would improve the pedestrian environment and facilitate connections between the proposed campus and the surrounding neighborhood. Widened sidewalks along Van Ness Avenue, Geary Boulevard and Post Street would improve pedestrian circulation in the area surrounding the proposed hospital. Substantial landscaped areas would also be added to offer visual relief to pedestrians and provide a buffer between pedestrians and traffic lanes. The proposed streetscape design is shown in Figure 2-37, "Cathedral Hill Campus—Proposed Streetscape Plan" (see Draft EIR, page 2-101). The proposed entry plaza for the new hospital would also improve the pedestrian environment by providing easy pedestrian access to the proposed hospital from Van Ness

[28] Under the existing SF Planning Code, the Cathedral Hill Hospital and MOB sites are designated RC-4, for which the Code allows "[d]welling at a density ratio not exceeding one dwelling unit for each 200 square feet of lot area; provided, that for purposes of this calculation a dwelling unit in these districts containing no more than 500 square feet of net floor area and consisting of not more than one habitable room in addition to a kitchen and a bathroom may be counted as equal to ¾ of a dwelling unit." Based on this density limitation, the maximum units allowable on the 105,733 square foot Cathedral Hill Hospital site would be 529, and the maximum units allowable on the 36,180 square foot Cathedral Hill MOB site would be 181. The 1375 Sutter MOB is designated N-4 with a maximum allowable density of "[o]ne dwelling unit for each 600 sq. ft. of lot area." Based on this limitation, the 25,800-sq. ft. site could accommodate 43 units. In all cases, these are theoretical maximums that would be limited by site-specific constraints, the need to provide parking, etc. and, thus, these estimates represent conservative assessments of the residential development capacity of the Cathedral Hill Campus site.

Avenue, unlike the existing Cathedral Hill Hotel building, which has no direct pedestrian access from surrounding streets.

Ambulances entering and exiting the proposed Cathedral Hill Hospital may increase the amount of noise at nearby residences. However, as a typical practice, ambulances would turn off sirens within a few blocks of the proposed hospital to minimize the noise disturbance effects on residential uses in the vicinity.

The proposed Cathedral Hill Hospital would be 15 stories and 265 feet tall and would replace the existing 10-story, 120-foot-tall hotel and 11-story, 180-foot-tall office building. As discussed in the Draft EIR in Section 4.1.1, "Environmental Setting," buildings of this size and scale are not uncommon in the vicinity, and thus, the scale of the proposed hospital building would not be out of character with other buildings in the vicinity. Therefore, impacts on the existing character of the vicinity would be less than significant.

Section 4.2, "Aesthetics" of the Draft EIR analyzes aesthetic impacts in comparison to existing conditions. The aesthetic impact analysis of the proposed Cathedral Hill Hospital is presented on pages 4.2-118 through 4.2-125 of the Draft EIR for the north, east, south, and west elevations. The discussion concludes on page 4.2-138 of the Draft EIR that the overall visual change, although considerable, is not unexpected in a dense urban environment such as the Cathedral Hill area, and remains in context. Existing structures within the vicinity of the proposed Cathedral Hill Hospital and Cathedral Hill MOB range from an approximate height of 135 to 299 feet tall. As shown in C&R Figure 3.4-1 (page C&R 3.4-5), existing structures similar in height with the proposed Cathedral Hill Hospital include the Cathedral Hill Towers (1200 Gough Street [approximately 252 feet tall]) and the Sequoias Apartments (1400 Geary Boulevard [approximately 299 feet tall]). Existing structures comparable in height with the proposed Cathedral Hill MOB include St. Mary's Cathedral (1111 Gough Street [approximately 225 feet tall]) and the Daniel Burnham Court complex (1 Daniel Burnham Court [approximately 221 feet tall]).

The existing Cathedral Hill Hotel and 1255 Post Street office building have a simple, nondescript architectural style and are set back into the block. The proposed buildings would provide more visual interest and would be positioned along the street, which is more common throughout the Van Ness Avenue area. As stated on page 4.2-138 of the Draft EIR, "the proposed Cathedral Hill Hospital would not substantially degrade the existing visual character or quality of the area because the new building would not result in a substantial visual contrast with the area's existing buildings. Therefore, this impact would be less than significant."

Preservation and Enhancement of Affordable Housing

Section 41.13 of the San Francisco Administrative Code requires that any demolished residential hotel units be replaced on a 1:1 basis and provides various mechanisms for compliance by the project sponsor, including constructing or causing construction of comparable units, payment of an in-lieu fee to the City, or providing a contribution to a public entity or non-profit who will use the funds to construct comparable units. The proposed Cathedral Hill MOB site contains twenty units that are designated as residential hotel units under Chapter 41 of the San Francisco Administrative Code, the Residential Hotel Unit Conversion and Demolition Ordinance. Section 41.12 requires a project sponsor to obtain a Permit to Convert from the City of San Francisco Department of Building Inspection (DBI) prior to demolishing a residential hotel unit. Prior to issuing a Permit to Convert, DBI must confirm that the project sponsor has complied with the one-for-one residential hotel unit replacement requirements of Section 41.13. Section 41.13(a)(4) allows a project sponsor to comply with the one-for-one replacement requirements through payment to the City of a fee equal to 80 percent of the cost of construction of an equal number of comparable units plus site acquisition cost, as determined by the City and County of San Francisco Real Estate Division based on two independent appraisals. City and County of San Francisco Real Estate Division obtained the required appraisals and, by letter dated September 7, 2010, established the total fee for the residential hotel units as Two Million Six Hundred Eighty Four Thousand Eight Hundred Dollars ($2,684,800.00)

("Residential Hotel Unit Replacement Fee"). Therefore, a condition to DBI's issuance of the Permit to Convert, would be of satisfaction of the one-for-one replacement requirement of Section 41.13 by payment to the City of the Residential Hotel Unit Replacement Fee in accordance with the terms, timing and procedures set forth in Administrative Code Chapter 41.

CPMC also would follow Section 317, "Loss of Dwelling Units through Merger, Conversion, and Demolition," in the San Francisco Planning Code, which prescribes required Planning Commission review for granting permits for demolition of residential units.

Although not required under the City's Jobs-Housing Linkage Program (JHLP), CPMC has proposed to make a contribution to the Mayor's Office of Housing at least equivalent to the JHLP fee as defined in Section 413 of the Planning Code. The funds contributed by CPMC could be used by the City to facilitate the creation of affordable housing in and around any of the LRDP campuses, including Cathedral Hill.

Discouragement of Commuter Automobiles

CPMC currently implements a TDM program that discourages use of single occupant vehicles, and this program would be expanded with implementation of the proposed LRDP. The current and proposed future efforts to reduce single-occupant vehicle trip making associated with CPMC facilities would be incorporated in the proposed CPMC TDM Plan. The TDM program has established the following overall goals:[29]

- To reduce Single Occupant Vehicle (SOV) trips from the current baseline mode split;
- To promote the City of San Francisco's Transit First policy;
- To reduce long-term parking demand from the LRDP;
- To reduce vehicular-generated emission of criteria pollutants; and
- To reduce vehicular-generated greenhouse gas emissions.

CPMC's existing TDM Plan includes employee parking pricing, visitor/patient parking, commuter checks, a carpool program, bicycle parking, an emergency ride home program, a courtesy ride home, carsharing, a transit subsidy, onsite transit sales, and a shuttle service.

As noted in several locations in the Draft EIR, beginning on page 4.5-98, on pages 5-13 to 5-14, and in Response AQ-11, page C&R 3.9-27, CPMC has indicated that it is planning on expanding its current TDM Plan to discourage use of private automobiles. CPMC's proposed TDM program for the LRDP would expand components that would be incrementally be added over the coming years as new facilities come on line at CPMC campuses.[30] The expanded offerings in the proposed TDM program are presented in terms of Near Term (0 to 2 years), Middle Term (2 to 5 years), and Long Term (5+ years), as described below.

In the near term (0 to 2 years), CPMC's TDM program would include TDM outreach, marketing, and information; parking pricing; retention of a TDM coordinator; monitoring and increasing carpool and vanpool parking as necessary; monitoring and increasing bicycle parking, as necessary; provision of onsite transit pass sales; reinstatement of CPMC's Vanpool Program including a $2,500 subsidy per year; promotion of the 511.org rideshare service; increasing the boundaries of the Free Ride Home Program; conduct of transportation surveys; and provision of wayfinding and signage to patients and visitors identifying the locations of bicycle parking, vehicular parking, and shuttle stops as well as full shuttle schedules with maps in the lobby of each hospital.

[29] Nelson/Nygaard Consulting Associates. CPMC TDM Plan. February 15, 2011. p. 2.
[30] Nelson/Nygaard Consulting Associates. CPMC TDM Plan. February 15, 2011. p 6–10.

In the middle term (2 to 5 years), the TDM program would be further expanded to include: showers and changing facilities in all new buildings and facilities for employees who bike or walk to work; continuation of the TDM and outreach program; installation of real-time transit information signs in the lobbies of its existing; installation of bicycle lockers in both proposed and existing parking garages; allocation of additional parking spaces to carsharing services in both proposed and existing buildings based on demand; creation of an internal rideshare program (e.g., RideSpring or a 511.org interface); continuation of the provision of reserved carpool and vanpool parking at all proposed parking facilities based on demand; expansion of the transit subsidy program to include all campuses and increase the value of the monthly subsidy to be equivalent to the cost of a MUNI Fast Pass; and continued annual employee transportation surveys which would be used to track mode split as compared to the baseline mode split and to receive feedback on TDM programs.

In the long term (5 years and beyond), the TDM program would be further expanded to include: continued installation of real-time transit information signs in the lobbies of all proposed facilities and would provide links to real time transit information on the intranet as well as the public website; creation of a corporate carshare account that would enable employees to use carsharing services at reduced rates; continued monitoring of parking demand and adjustment of the monthly employee permit fee and patient/visitor hourly parking fees to balance supply and demand; continuation and improvement of the TDM and outreach program; and continued annual employee transportation surveys which would be used to track mode split as compared to the baseline mode split and to receive feedback on TDM programs.

The Construction Transportation Management Plan discussed in Mitigation Measure MM-TR-55 would, among other steps, require CPMC to identify ways to reduce construction worker vehicle trips through transportation demand management programs and methods to manage construction work parking demands (Draft EIR, pages 4.5-159 and 4.5-160).

The proposed CPMC TDM Plan has been compared to TDM plans for other major medical and other large employers in the central Bay Area. The components of the CPMC TDM plan are based upon the upper end of measures taken by these employers, both in terms of the level of investment and the end-state level of non-SOV mode use that could be expected. Further SOV trip reduction would be infeasible in light of the extremely high level of alternative mode use already inherent in trip making characteristics of commuters in San Francisco and the fact that CPMC's proposed expanded TDM Plan includes measures that would be comparable to the upper end of TDM commitments that have been made by other similar medical institutions and large Bay Area employers.

Protection of Industrial and Service Land Uses from Commercial Office Development and Enhancement of Resident Employment and Business Ownership

The proposed CPMC LRDP development project sites are not currently located in industrial or service use areas. Further, as CPMC is an institution and the LRDP represents the implementation of CPMC’s Institutional Master Plan, the proposed LRDP does not include commercial office development. It would, however, provide additional employment opportunities through the expansion of the institutional uses on the LRDP campuses.

Over the long term it is expected that the proposed LRDP would increase employment at CPMC campuses by a net of 4,170 FTE. Based on current commute patterns, it is expected that approximately 49 percent of those employees will live in San Francisco, although all employment positions would be available to San Francisco residents.

Maximization of Earthquake Preparedness

The primary intent of the proposed LRDP is to upgrade the seismic stability of CPMC's hospitals in San Francisco, consistent with the requirements of SB 1953. These standards are designed for the express purpose to ensure that hospitals and medical facilities are able to operate and provide health care services in the event of a major earthquake.

Preservation of Landmark and Historic Buildings

The Draft EIR concluded that none of the buildings or structures located within the proposed Cathedral Hill Campus site are considered historical resources (individually or as part of a district) for the purposes of CEQA, nor would the proposed LRDP development have a significant impact on any individual historical resources in the project vicinity. The San Francisco Planning Department concurred with this finding.[31, 32] Therefore, near-term implementation of the LRDP at the proposed Cathedral Hill Campus would not cause a substantial adverse change in the significance of a historical resource as defined in Section 15064.5 of the State CEQA Guidelines.

Protection of Open Space

The proposed LRDP would not convert or intrude upon any existing open spaces. As described in Section 4.9, "Wind and Shadow," on pages 4.9-22 through 4.9-64 of the Draft EIR, the proposed LRPD would not create winds or net new shadows in a manner that would substantially affect the use of any park or open space under the jurisdiction of the San Francisco Recreation and Park Department, publicly accessible open space, outdoor recreation facility, or other public area or change the climate in either the community or the region.

Office Space Allocation

In addition to Section 101.1(b), Proposition M amended Sections 320 through 322 of the Planning Code. These sections regulate the approval of office space in the City, setting an annual limit on the amount of qualifying office space that can be approved in buildings of 25,000 sf or greater. The Cathedral Hill MOB and the St. Luke's MOB/Expansion Building each would contain greater than 25,000 sq. ft. of office space,[33] and therefore both MOBs would be subject to Sections 321 and 322 (see description of approval requirements for the Cathedral Hill MOB on page 2-47 of the Draft EIR, and for the St. Luke's MOB/Expansion Building page 2-193 of the Draft EIR). Because the office space in the two medical office buildings would not be approved without the City's determination that the LRDP meets the requirements of Planning Code Sections 320 through 322, the proposed LRDP, if implemented, would be consistent with these elements of the Accountable Planning Initiative.

On page 3-19, Section 3.2.6, the following is added after the first full paragraph:

> "Proposition M also amended sections 320 and 321 of the Planning Code. These provisions regulate the approval of office space in the City, setting an annual limit on the amount of qualifying office space that can be approved in buildings of 25,000 sf or greater."

[31] California Pacific Medical Center. 2010 (February). *Historic Evaluation Report for Cathedral Hill Campus: California Pacific Medical Center*. San Francisco, CA. Prepared by Knapp Architects, San Francisco, CA. page 2.

[32] San Francisco Planning Department. 2010 (February) *Historic Resource Evaluation Response: Cathedral Hill Campus, California Pacific Medical Center*. Case 2005.0555E. Major Environmental Analysis Division. San Francisco, CA. pages 2–3.

[33] Square footage totals may be slightly different when Planning Code calculation methodology is applied for purposes of Prop M office allocation requirements.

On page 3-19, Section 3.2.6, the following is added to the end of the second paragraph:

> "The office space in the Cathedral Hill MOB and in the St. Luke's MOB/Expansion Building would need to be approved pursuant to the process established in Sections 320 and 321 of the Planning Code. Because the office space in the two medical office buildings would not be approved without the City's determination that the LRDP meets the requirements of those provisions, the proposed LRDP, if implemented, would be consistent with these elements of the Accountable Planning Initiative."

Other Local Plans

In addition to the local plans discussed above, which were specifically addressed in the comments, Chapter 3 of the Draft EIR addressed the project's consistency with the City of San Francisco's Transit Effectiveness Project, the San Francisco Bicycle Plan, the Climate Action Plan for San Francisco, the Sustainability Plan for the City of San Francisco, the San Francisco Green Building Ordinance, the Draft San Francisco Better Streets Plan, and the Draft Cesar Chavez Streetscape Plan (see pages 3-20 through 3-26 of the Draft EIR).

Regional Plans and Policies (e.g., Bay Area Air Quality Management District plans and regulations)

The relationship of the proposed LRDP to various regional plans and policies that address environmental concerns is addressed in a number of sections of the Draft EIR. In particular, in Chapter 3, the Draft EIR addressed the general consistency of the proposed LRDP with a number of plans of the BAAQMD, including the 2001 Ozone Attainment Plan and the 2000 Clean Air Plan. The discussion on page 3-28 of the Draft EIR notes that "the proposed CPMC LRDP would generally be consistent with the regional air quality plans" as well as with the BAAQMD climate protection program. It further notes that the more detailed discussion of consistency with these plans is included in Draft EIR Section 4.7, Air Quality, and Section 4.8, Greenhouse Gas Emissions. Please also see Response GH-1, page C&R 3.10-3, which describes the consistency of the proposed LRDP with the City and County of San Francisco's qualified regional greenhouse gas reduction plan.

The consistency of the proposed project with other regional plans for the protection of the environment, including water quality, biological resources, and other sensitive resources are addressed in the relevant sections of the Draft EIR and this C&R document.

Consistency with Planning Code and Other Regulations

For a discussion of the relationship of the proposed LRDP to the San Francisco Planning Code, please see Response LU-9, C&R 3.3-64.

Significance of Policy Consistency Impacts

Several comments disagreed with some of the conclusions in the Draft EIR related to aspects of the proposed project that would require amendments to local plans or codes. More specifically, they state that the EIR should present the precise proposed wording of proposed plan amendments, and that the adoption of a plan amendment should not be the basis of determining that a project would be consistent with the plan. The comments imply that a project that proposes an amendment to an existing plan is, by definition, inconsistent with the plan. These comments are part of a longer discussion stating that the project description should include additional detail.

Chapter 2, "Project Description" in the Draft EIR includes a description of plans, policies, and regulations applicable to the CPMC LRDP and all required plan, policy, or code amendments that are being requested by the project sponsor. Since the publication of the Draft EIR on July 21, 2010, the project sponsor has

made some modifications to the requested entitlements for the proposed CPMC LRDP based upon input from the Planning Department after reviewing the initial application submittal for the near-term projects, including the proposed development at the Cathedral Hill Campus. Therefore, the required project approvals listed in the Draft EIR on pages 2-13 through 2-17, Table 2-3, "Required Project Approvals," have been updated as part of the text revisions to the Draft EIR included in Chapter 4, "Draft EIR Text Changes," on pages C&R 4-37 and C&R 4-38 of this document. Additional text revisions to Draft EIR pages 2-44 through 2-47, 2-192, 3-9, 3-10, 3-19, 4-47, 4-48, 4-50, 6-130, and 6-300, reflecting the updated list of requested entitlements have also been included as text revisions to the Draft EIR on pages C&R 4-43 through C&R 4-58.

The information provided in the Draft EIR (and as updated in the text revisions included in Chapter 4 of this C&R document) is an appropriate level of detail for the EIR and is consistent with the requirements outlined in the State CEQA Guidelines. Section 15124(c) of the State CEQA Guidelines states that the project description should include "[a] general description of the project's technical, economic, and environmental characteristics…" Nevertheless, the proposed amendments to General Plan maps and policies, based on the updated list of required project approvals included in the text revisions to the Draft EIR on pages C&R 4-43 to C&R 4-46, are presented below.

Cathedral Hill Campus

The amendments to existing plans and policies that have been requested by the project sponsor for the proposed Cathedral Hill Campus are described in Section 2.2 of the Draft EIR, on pages 2-43 through 2-48, as updated in the Draft EIR text revisions on pages C&R 4-43 to C&R 4-46 of this document. More specifically, the following amendments have been requested by the project sponsor (additions are shown in underline; deletions are shown with overstrike):

Urban Design Element

The sponsor has requested an amendment to Map 4, Urban Design Guidelines for Height of Buildings, to increase the maximum height of 240 feet for the block bounded by Van Ness Avenue, Geary Boulevard, Franklin and Post Streets (i.e., the Cathedral Hill Hospital site), to 265 feet. The sponsor has also requested an amendment to Map 5, Urban Design Guidelines for Bulk of Buildings, to increase the allowable bulk to a maximum plan dimension and maximum diagonal plan dimension of 385 and 466 feet, respectively, for the Cathedral Hill Hospital site, and to a maximum plan dimension and maximum diagonal plan dimension of 265 and 290 feet, respectively, for the Cathedral Hill MOB site.

Van Ness Avenue Area Plan

The sponsor has requested amendments to the Van Ness Avenue Area Plan in order to designate the sites proposed for the new Cathedral Hill Hospital and Cathedral Hill MOB as "The Van Ness Medical Use Subdistrict" and make other amendments to certain Objectives and Policies otherwise applicable to development within the Area Plan. This request is reflected in a proposed amendment to Map 1, Generalized Land Use and Density Plan in the Van Ness Avenue Area Plan to (1) designate the sites proposed for the new Cathedral Hill Hospital and Cathedral Hill MOB as "The Van Ness Medical Use Subdistrict," and (2) increase the current maximum floor area ratio (FAR) of 7:1 for the proposed Cathedral Hill Hospital and Cathedral Hill MOB sites to 9:1 on the block bounded by Van Ness Avenue, Geary Boulevard, Franklin and Post Streets (i.e., the proposed Cathedral Hill Hospital site) and an FAR of 7.5:1 on the site of the proposed Cathedral Hill MOB. Included in these requests is a proposed amendment to Map 2, Height and Bulk Districts in the Van Ness Avenue Area Plan, to increase the building height limit applicable to the block bounded by Van Ness Avenue, Geary Boulevard, Post and Franklin Streets, from 130 feet

to 265 feet. The specific requested revisions to the text of the Van Ness Avenue Area Plan are presented below, as shown in underlined text, and requested amendments to Van Ness Avenue Area Plan maps are shown on page C&R 4-142, in Chapter 4, Section 4.2.16, Appendices.

"SUBAREA 1: Redwood to Broadway."

OBJECTIVE 1
Continue existing commercial use of the Avenue and add a significant increment of new housing.

Although there are 18 buildings containing 980 dwelling units in this subarea most of the buildings are in non-residential use.

This section of Van Ness Avenue is one of the few areas in the city where new housing can be accommodated with minimal impacts on existing residential neighborhoods and public services.

Some of the features that make the area attractive for medium density mixed use development with high density housing are as follows:

- This 16 block strip along Van Ness Avenue maintains a "central place" location and identity. The area is close to the city's major employment center, is well-served by transit, has well developed infrastructure (roadway, water, sewer and other public services), wide roadway (93+ feet) and sidewalks (16+ feet), has continuous commercial frontage and numerous attractive, architecturally outstanding buildings.
- There are a number of large parcels which are substantially under-developed.
- A height limitation of between 80 and 130 ft. would allow sufficient development to make feasible over time the construction of housing on under used parcels.
- The minor streets which bisect most of the blocks within this subarea facilitate access to and from new developments with minimal affects on major east-west thoroughfares or on Van Ness Avenue.

Development of a number of medium density, mixed use projects with continued non-residential use of non-residential buildings and would facilitate the transformation of Van Ness Avenue into an attractive mixed use boulevard.

A high-density medical center at the transit nexus of Van Ness and Geary would support Van Ness Avenue's redevelopment as a mixed use boulevard as set forth in Policy 1.6 below.

POLICY 1.1
Encourage development of high density housing above a podium of commercial uses in new construction or substantial expansion of existing buildings.

Construction of new mixed use buildings along the Avenue on those relatively few sites on which new buildings are likely to be built in the foreseeable future would both accommodate the need for housing and respect the commercial heritage of the Avenue. Subarea 1 (Redwood Alley to Broadway) should feature high density residential development with commercial space to occupy the base of the building. This commercial space should serve as a buffer between the busy street and the residential levels above.

To induce the construction of housing, the amount of non-residential space allowed should be linked to the amount of residential space provided. The provision of the required residential space could occur on site or on a separate site located within the Van Ness Plan area.

POLICY 1.2
Allow existing structures to remain in non-residential use.

In order to continue the active commercial use of the avenue, existing non-residential buildings should be permitted to contain any use — residential or non-residential — allowed in the district. These buildings should also be allowed to be expanded somewhat without triggering the housing requirement.

Non-residential development of narrow lots that do not also abut a side street should also be allowed because of the difficulty in providing residential parking on those properties.

POLICY 1.3
Allow residential densities to be established by building volume rather than lot size.

The number of units provided within individual projects would depend on the height and bulk of the building, the amount of commercial space provided under the minimum housing-to-commercial ratio, the amount of on-site parking provided and the size of the units. Minimum unit size would be established as part of the Conditional Use review process.

POLICY 1.4
Maximize the number of housing units.

An overall mix of unit sizes on Van Ness Avenue is desirable to encourage a diverse and mixed range of occupants. However, the emphasis should be on a larger number of medium sized units (1 and 2 bedroom) rather than a smaller number of large size units because Van Ness Avenue is not anticipated to be a preferred area for family housing. It is therefore more desirable to achieve greater affordability for the smaller units by building at a high density. Construction of rental housing is encouraged.

POLICY 1.5
Employ various techniques to provide more affordable housing.

The Plan allows broad design flexibility as to unit size, allowing the creation of small, compact units as a means of lowering unit cost if there is a market demand for such units. A number of design measures and marketing strategies such as "street-facing" or "no view" units and units with quality building materials yet lower cost appliances and carpeting can reduce unit costs and prices.

<u>POLICY 1.6</u>

<u>Allow a medical center at the intersection of Van Ness Avenue and Geary Boulevard.</u>

<u>A medical center at this location would support redevelopment of Van Ness Avenue as a mixed use boulevard by diversifying the mix of nonresidential uses, maximizing utilization of the major Bus Rapid Transit/transit node, locating medical care and essential emergency services in close proximity of the City’s dense urban core and at a central location for both day and nighttime population groups within the City, and by creating opportunities for streetscape and pedestrian amenities at a key transit node that are consistent with the Better Streets Plan.</u>

"**OBJECTIVE 5**
ENCOURAGE DEVELOPMENT WHICH REINFORCES TOPOGRAPHY AND URBAN PATTERN, AND DEFINES AND GIVES VARIETY TO THE AVENUE.

Topography and Street Pattern

Van Ness Avenue is the central north-south spine and one of the widest streets in the City. Bounded by Civic Center and the Bay and characterized by excellent views, the Avenue defines and links many adjacent neighborhoods, including through its substantial transit resources. In connecting Market Street to the Bay, Van Ness forms the western edge of the inner city and separates the Nob and Russian Hill neighborhoods from Pacific Heights. The Avenue also provides access between a number of focal points, including landmark buildings, cultural centers, important view corridors and the Bay. The juxtaposition on the Avenue of large monumental structures with fine-grain urban fabric to the east creates an exciting contrast within the cityscape.

"POLICY ~~5.1~~ 5.1
Establish height controls to emphasize topography, adequately frame the great width of the Avenue, and support the redevelopment of the Avenue as a diverse, mixed use boulevard and transit corridor.

"Existing height limits on the Avenue generally range from 40 feet at the northern end to 130 feet in the central portion. This height differentiation responds to topographic conditions as well as land use patterns, maintaining distinctions between areas of different character. For example, height districts are gradually tapered from 130 feet around the hilltop at Washington Street to 80 feet at Pacific Avenue and further to 65 and 40 feet towards the Bay shoreline. Although the majority of existing height controls are adequate to define both the overall topography as well as the great width of the Avenue, the height limit between California and Pacific Streets should be lowered from the existing 130/105-foot level to 80 feet in order to facilitate the transition between the greater building heights along the southern part of the Avenue and the mostly low-rise residential development north of Broadway. Development to maximum height should be closely monitored to minimize blocking views between the high slopes on both sides of the Avenue. Good proportion between the size of the street and that of its buildings is important for streets to be interesting and pleasant places. The proposed height limits, combined with the Van Ness Plan's proposed bulk controls, encourage definition of the 93-foot wide Avenue."

The height limit for the block bounded by Geary Boulevard, Franklin Street, Post Street, and Van Ness Avenue, is established at 265 feet as indicated on Map 2 to accommodate development of a medical center that will maximize the use of the major transit node at this location and give variety to the avenue by diversifying the mix of non-residential uses and enhancing the streetscape.

POLICY 5.2

Encourage a regular street wall and harmonious building forms along the Avenue. New development should create a coherent street wall along the Avenue through property line development at approximately the same height. Since block face widths are constant, a regularized street wall encourages buildings of similar scale and massing. Nevertheless, some variety of height is inevitable and desirable due to the need to highlight buildings of historical and architectural significance and meet other Objectives of the Plan.

The following controls are proposed for the various bulk districts as shown on the accompanying map:

MAP 2 - Height and Bulk Districts"

"OBJECTIVE 8
CREATE AN ATTRACTIVE STREET AND SIDEWALK SPACE WHICH CONTRIBUTES TO THE TRANSFORMATION OF VAN NESS AVENUE INTO A RESIDENTIAL BOULEVARD.

Projects located at the transit node of Van Ness and Geary will be deemed to promote and be consistent with Objective 8 and each of Policies 8.1 through 8.10 if they (i) include an integrated streetscape plan that incorporates, among other elements, plantings, sidewalk treatment, street lighting and street furniture, and that is generally consistent with the streetscape guidelines regarding such elements in Chapter 6 of the Better Streets Plan; and (ii) locate and design any sidewalk vaults or sub sidewalk spaces so that they are compatible with such streetscape plan.

Plantings

POLICY 8.1 …. "

POLICY 11.3 Encourage the retention and appropriate alteration of contributory buildings.

There is another group of buildings, listed in Appendix B, which are not of sufficient importance to justify their designation as landmarks. Nevertheless these buildings, referred to as contributory buildings, possess architectural qualities which are in harmony with the prevailing characteristics of the more significant landmark quality buildings. These buildings contribute to the character of the street and should be retained if possible.

Notwithstanding the forgoing, contributory buildings may be demolished to accommodate a medical center at the transit nexus of Van Ness Avenue and Geary Street, provided that any replacement structure or structures must be designed to contribute to the character of the street and be in harmony with the more significant landmark quality buildings in the vicinity as appropriate."

If these proposed site-specific and project-specific plan amendments were approved, the development allowed by such amendments on balance would still be consistent with the overall VNAP objective to redevelop the Avenue as a diverse mixed-use boulevard.

St. Luke's Campus

The amendments to existing plans and policies that have been requested by the project sponsor for the St. Luke's Campus are described in Section 2.6 of the Draft EIR, on pages 2-192 and 2-193, as updated in the Draft EIR text revisions on pages C&R 4-57 to C&R 4-58 of this document. More specifically, the sponsor has requested an amendment to the Urban Design Element, Map 4, Urban Design Guidelines for Height of Buildings, to increase the maximum height of 88 feet to 105 feet The requested amendment would apply to the block bounded by Cesar Chavez Street, Valencia Street, Duncan Street, and San Jose Avenue, and the eastern half of the block that is bounded by San Jose Avenue, Cesar Chavez Street, Guerrero Street, and 27th Street (see map on following page). The sponsor has also requested an amendment to the Urban Design Element, Map 5, Urban Design Guidelines for Bulk of Buildings, to increase the allowable bulk to a maximum plan dimension and maximum diagonal plan dimension of 227 and 270 feet, respectively, for the St. Luke's Replacement Hospital site, and to a maximum plan dimension and maximum diagonal plan dimension of 204 and 228 feet, respectively, for the MOB/Expansion Building site.

Effects of Proposed Amendments and Plan Consistency

The requested amendments to the Urban Design Element of the General Plan and the Van Ness Avenue Area Plan would allow for the proposed LRDP to be constructed as described in the Project Description of the CPMC LRDP Draft EIR. As stated in Section 15143 of the State CEQA Guidelines, "[t]he EIR shall focus on the significant effects on the environment." The State CEQA Guidelines define a "significant effect on the environment" as "a substantial, or potentially substantial, adverse change in any of the physical conditions within the area affected by the project, including land, air, water, minerals, flora, fauna, ambient noise, and objects of historic or aesthetic significance" (State CEQA Guidelines Section 15382). The Draft EIR has evaluated the physical effects of the LRDP as proposed, which inherently includes the physical effects of the proposed amendments to local plans and policies. If the decision-makers determine to approve the LRDP, the procedural step of actually making the amendments to the plans would create no greater or different environmental impacts than those described in the Draft EIR. Thus, the Draft EIR conclusion that by virtue of approving the LRDP and, in doing so, acting to make amendments to local plans, the proposed LRDP would not be inconsistent with the General Plan, Van Ness Avenue Plan, or other local plans is accurate and does not in any way understate the physical environmental effects of the proposed project.

Specific concern is raised that exceeding the allowable 130-foot height limit to construct the proposed Cathedral Hill Hospital would exacerbate traffic and transportation, housing, and economic impacts. In addition, Comment 76-6 in this document states that the 130-foot limit implements the VNAP policies which would prevent out of scale buildings, and that the visual and wind and shadow impacts of the proposed Cathedral Hill Hospital should be compared to the impacts of the Holiday Inn.

Impacts TR-1 through TR-58 in Section 4.5, "Transportation and Circulation," address traffic impacts that would result from development of the proposed Cathedral Hill Campus (Draft EIR, pages 4.5-93 through 4.5-161). As discussed on page 4.5-90 of the Draft EIR, the proposed Cathedral Hill Campus would generate new vehicle trips and increase the number of vehicles. Please refer to Response LU-17 (page C&R 3.3-85), which summarizes the significant and unavoidable transportation and circulation impacts at the Cathedral Hill Campus.

Impacts PH-1 to PH-3 in Section 4.3, "Population, Employment and Housing," address the proposed LRDP's housing and economic impacts (Draft EIR, pages 4.3-18 through 4.3-47). Please see Response PH-9 (page C&R 3.5-31) for a discussion of the 2009 Housing Element Update, which analyzes San Francisco's population and employment trends, existing household characteristics, overall housing needs, and the capacity for new housing based on land supply and site opportunities. The Draft EIR concluded that the Cathedral Hill Campus would not induce substantial population growth in an area, either directly or indirectly. It was determined that "with the availability of vacant housing and the additional inventory of sites for residential development that could accommodate future estimated demand for housing, the effect of the projected increase in housing demand related to development under the LRDP on San Francisco's population and housing would not be substantial" (Draft EIR, page 4.3-33).

Please see Response LU-9 (page C&R 3.3-64) for discussion of relationship of the proposed LRDP to the height and bulk requirements of the Planning Code, and previously in this response for a discussion of its consistency with the VNAP and its potential to promote out-of-scale development along the Van Ness corridor. As stated in Response LU-9, future rezoning and other projects in the area that are not part of the proposed LRDP would be subject to discretionary review and separate environmental procedures.

Section 4.2, "Aesthetics," on pages 4.2-118 through 4.2-125 of the Draft EIR analyzes aesthetic impacts of the proposed Cathedral Hill Hospital in comparison to existing conditions, in accordance with the State CEQA Guidelines. The Draft EIR concludes on page 4.2-138 that the overall visual change, while

considerable, is not unexpected in a dense urban environment such as the area around Cathedral Hill, and remains in context.

Section 4.9, "Wind and Shadow," on pages 4.9-23 through 4.9-29 and 4.9-33 through 4.9-43 of the Draft EIR, analyzes wind and shadow impacts of the proposed Cathedral Hill Campus. The Draft EIR concludes on page 4.9-28 that wind effects at the proposed Cathedral Hill Campus would not be substantial compared to existing conditions. The discussion on pages 4.9-42 and 4.9-43 of the Draft EIR concludes that the net increase in shadows near the proposed Cathedral Hill Campus in the near term (through 2015) caused by development under the LRDP would be minor in comparison to the amount of existing shadows in the proposed Cathedral Hill Campus vicinity, as shown in Figures 4.9-2 through 4.9-5 (Draft EIR, pages 4.9-35 through 4.9-38), and the LRDP would not have the potential to alter the climate in the community or the region.

Although the Draft EIR does not compare the proposed Cathedral Hill Campus development to the Holiday Inn, aesthetic and wind and shadow impacts of the proposed Cathedral Hill Campus development under the LRDP were fully analyzed in accordance with the State CEQA Guidelines. Under Section 15125 of the State CEQA Guidelines, an EIR must include a description of the physical environmental conditions in the vicinity of the LRDP. Generally this includes a description of the existing conditions at the proposed project site and the area immediately adjacent to it. The Holiday Inn is located six blocks to the north of the proposed Cathedral Hill Campus and is not within its immediate vicinity. CEQA does not require the comparison of a proposed project's impacts with another development or project.

Creation of a Precedent for Future Out-of-Scale Development

Several comments raised concerns that approval of the proposed Cathedral Hill Campus would set a precedent for other future out-of-scale development within the VNSUD that would exceed height and bulk limits. Height increases resulting from other potential rezoning and future cumulative projects are not part of the proposed LRDP. Future rezoning and other projects in the area that are not part of the proposed LRDP would be subject to their own review and hearing processes, including separate environmental procedures through the San Francisco Planning Department. These projects would be subject to applicable City plans and policies related to aesthetics and urban design, and would go through the City's entitlement process as appropriate.

As stated on page 4.2-192 of the Draft EIR, "Cumulative developments in the vicinity of the proposed Cathedral Hill Campus include a 30-story residential tower at 1333 Gough Street; a 13-story mixed use building at 1285 Sutter Street; a 28-unit condominium building at 1521 Sutter Street; two residential buildings (14 and six stories tall) at 1545 Pine Street; a 14-story mixed use building at 1634 Pine Street; a 13-story, residential mixed use building at 1581 Bush Street; a six- to eight-story, residential mixed use building at 1401 California Street." The heights of these proposed developments would be comparable to, or taller in height than, the proposed Cathedral Hill Campus. As shown in C&R Figure 3.4-1 (page C&R 3.4-5), the above-mentioned cumulative development would generally increase the height of development in the vicinity of the proposed Cathedral Hill Campus site. Additionally, most of the buildings included in these cumulative developments would be taller than the existing buildings they would replace. In general, the cumulative developments would occur in a highly urbanized area of San Francisco, with a prevalence of high-rise residential and commercial buildings, and the new buildings would not result in a substantial visual contrast with existing development in the area.

Relationship to the Proposed Van Ness and Geary BRT Lines

Section 5.1 on pages 167–177 of the *Cathedral Hill Transportation Impact Study* (Fehr & Peers 2010) evaluates the effects that the Van Ness and Geary BRT projects would have on the area around the

proposed Cathedral Hill Campus.[34] Implementation of the Geary Street/Boulevard BRT project would have less of an impact on traffic operations, because there is an existing dedicated bus lane within the study area. Implementation of the Van Ness BRT project would have a more substantial effect on traffic operations, because it would reduce the number of lanes on Van Ness Avenue, which in turn would increase delays for vehicles using the remaining lanes.

Planning for the Van Ness Avenue BRT project is progressing; however, the final design has not been selected. Some details about the project are known, and thus the transit analysis included an assessment of traffic conditions at the study intersections with implementation of both BRT projects based on available information. Under conditions with the proposed Cathedral Hill Campus project and Van Ness Avenue BRT and Geary Corridor BRT operations, average vehicle delays at intersections would increase, and the proposed Cathedral Hill Campus project was determined to contribute to significant traffic impacts at three study intersections. The financial compensation provided to SFMTA by CPMC could, in part, be used to fund implementation of the BRT projects. SFMTA would retain discretion for how to best accommodate the additional ridership and delay created by the project.

Each of these BRT projects will be subject to its own planning, analysis, environmental review, and approval process. Because of the City's Transit First Policy and the resources invested to date in the BRT projects, it is unlikely that these projects would not be completed due to the construction of the proposed CPMC LRDP. Instead, the City could view the BRT projects as even higher priority to effectively serve a new institution. Please also see Responses TR-24, page C&R 3.7-46 and TR-58, page C&R 3.7-99.

Concern also is expressed regarding the cumulative effects that could occur if CPMC and both the Van Ness and Geary BRT projects were under construction concurrently. Neither BRT projects have been approved, nor have their construction plans been identified. In the event that these projects overlap, all project sponsors, including CPMC, would be required to coordinate with SFMTA, the Planning Department, and the SFCTA to ensure that elements of each project's Construction Transportation Management Plan (TMP) would be effective and to determine what coordination would be required to ensure that construction impacts, including construction worker parking impacts on surrounding areas would be minimized, to the extent feasible. Please also see Response TR-48 (page C&R 3.7-72).

Need for a Revised or Recirculated EIR

Several comments stated that a revised EIR should be prepared, and seemingly suggested that the Draft EIR required revisions that would, in turn, require recirculation as per Section 15088.5 of the State CEQA Guidelines. The information provided in this C&R document constitutes response to comments as well as clarification and updates of information originally presented in the Draft EIR, and does not rise to the level of "significant new information" that would require recirculation. Please also see Response INTRO-6 for additional response to comments, suggesting the need for a revised or recirculated EIR.

Variances

Several of the comments state that CPMC is requesting "variances" for the proposed LRDP. Please note that no variances have been requested for the proposed LRDP. However, as explained in detail above, the project sponsor has requested General Plan amendments and changes to the text and maps of the San Francisco Planning Code that would be required to approve the associated CPMC LRDP as proposed (Table 2-3, on pages 2-14 through 2-17 of the Draft EIR, as updated in Chapter 4, "Draft EIR Text Changes," page C&R 4-37), as well as conditional use authorizations that would, consistent with the procedures in the Planning Code, exempt the project from certain otherwise applicable Planning Code requirements.

[34] Cathedral Hill Campus Transportation Impact Study, Fehr & Peers, 2010, pp. 167-177.

Comment [Consistency with City Charter]

(Ben Bear, October 18, 2010) [65-7 LU]

"According to your website, 'The City Charter states it is the function of the Planning Commission to adopt and maintain a comprehensive, long-term general plan for future improvement and development of the City. The Department's mission states: The San Francisco Planning Department is dedicated to public service, the orderly and harmonious use of land and improved quality of life for our diverse community and future generations.'

I submit that if your office approves the CPMC Long Range Plan in its current form, you will be undermining the comprehensive, long-term general plan for future improvement and development of the City. I submit that if your office approves the CPMC Long Range Plan in its current form, you will be undermining the orderly and harmonious use of land and improved quality of life for our diverse community and future generations."

Response LU-6

The comment states that implementation of the proposed LRDP would undermine the Planning Department's mission for orderly and harmonious use of land and improved quality of life. San Francisco has a General Plan as required by State law, which is monitored and updated by the San Francisco Planning Department. The Planning Department has procedures in place to review the proposed LRDP (and any other discretionary project), which includes environmental review process. The proposed LRDP is subject to environmental review under CEQA, which the Major Environmental Analysis (MEA) division of the Planning Department is responsible for administering as the lead agency. The Draft EIR includes analysis of the proposed LRDP's potential impacts related to land use compatibility and other physical environmental impacts that could affect quality of life (e.g., air quality, noise, transportation and circulation) occur, if it were implemented.

Before the proposed LRDP is considered for approval, disapproval, or modification by the decision-makers, and before any permits (i.e., demolition, conversion, change of use) are issued, the City will evaluate the proposed project's consistency with the General Plan, which is separate from the environmental review process.

In response to the comment stating that if the LRDP is approved, it would undermine the General Plan, the Draft EIR addresses the consistency of the proposed LRDP with the City's plans and policies in Section 3.2 (Draft EIR, page 3-2), which includes the General Plan. Please also refer to Response LU-3 (page C&R 3.3-7) which provides further discussion regarding General Plan Housing Element consistency and Response LU-5 (page C&R 3.3-30) regarding consistency of the project with the General Plan and other applicable plans and policies.

The comment will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project.

Comment

(Gloria Smith—California Nurses Association, October 19, 2010) [90-43 LU]

"**3. The DEIR Failed to Disclose Significant Impacts on Land Use**

The Project would have numerous potentially significant impacts on San Francisco land use, including its local planning and policies, on its population, housing and employment. None of these were adequately disclosed in the DEIR. Below is a brief example of the significant impacts CNA's land use expert Terrell Watt uncovered:"

Response LU-7

The comment states that the proposed LRDP would have potentially significant impacts on land use, and that these impacts were not adequately analyzed in the Draft EIR. The examples provided in subsequent comments included impacts on: affordable housing; inconsistency with local plans, policies and codes; cumulative impacts related to housing, public services, and air quality; and changes in the patterns of health care and associated environmental effects. This comment reflects a larger discussion listing what were perceived as significant impacts not disclosed in the Draft EIR. Please refer to Response PH-10 (page C&R 3.5-39) regarding jobs-housing balance and jobs-housing fit as it relates to the proposed LRDP. As explained in Response PH-10, the population, employment, and housing data use to develop the population and housing analysis in the Draft EIR was the best official data available at the time of the analysis. The Draft EIR analysis uses a conservative approach towards assigning population, employment, and housing to the proposed LRDP, resulting in a conservative projection and its corresponding effects to the environment. Even under this conservative approach, Section 4.3 of the Draft EIR concludes that the LRDP impacts to population, employment, and housing would be less than significant.

Response LU-5 (page C&R 3.3-30) includes a discussion regarding consistency of the proposed LRDP with the General Plan and other applicable plans and policies. The issue of consistency or conflict with an adopted plan and policies is mainly relevant for purposes of CEQA review insofar as any inconsistency could have environmental consequences. The environmental consequences of the project as proposed, including any proposed amendments of, changes to, or inconsistencies with adopted plans, policies and regulations, are presented in the relevant environmental resource sections of the Draft EIR such as Section 4.1, "Land Use and Planning."

Please refer to Response GRO-1 (page C&R 3.21-1) for a discussion regarding growth inducement impacts. Response GRO-1 also explains that because of the location of the proposed Cathedral Hill Campus within a dense urban environment, it would not cause the City to expand into new, previously unplanned areas and thus would not induce substantial growth beyond what is planned.

Refer to Response PH-13 (page C&R 3.5-50) regarding the cumulative analysis and approach. Response PH-13 explains that the cumulative analysis methodologies use projections of growth generated by ABAG and other regional agencies to address cumulative impacts. This approach is used for housing demand, public services, employment, and air quality and consistent with CEQA.

Major Response HC-9 (page C&R 3.23-38) discusses the citywide distribution of health care services. As explained in Major Response HC-9, CEQA does not require the CPMC LRDP EIR to include an analysis of citywide or regional health care service delivery systems, absent evidence that the proposed LRDP would contribute to health care service gaps that would cause a physical effect on the environment, and no such evidence has been provided by the comment.

Comments

(Gloria Smith—California Nurses Association, October 19, 2010) [93-86 LU]

"Broadly speaking, in order to protect California's land resources and improve the quality of life in the state, each California City and county must adopt a comprehensive, long-term general plan governing development."

(Lois Scott, September 23, 2010) [PC-22 LU]

"Good afternoon. I am Lois Scott, a resident of the center of the City. What is the basis for land use regulation? Health, welfare and safety of the community. What is the basis for environmental review? To protect the environment, including human life."

Response LU-8

The comments state that a comprehensive, long-term general plan must be developed by every California city and county to protect California's land resources. The comments also ask what the basis is for land use regulation and environmental review.

As stated in the California Planning and Zoning Law (Government Code Section 65030-65036.1), the intent of the planning and zoning law is to protect California's land resource, to ensure its preservation and use in ways which are economically and socially desirable to improve the quality of life in California. Although the planning and zoning law does not specifically refer to health, welfare, and safety, its intent is "to improve the quality of life in California."

San Francisco has a General Plan, as required by State law, which requires the following seven issues to be addressed: land use, circulation, housing, conservation, open space, noise and safety. According to the California State General Plan Guidelines,

> "California state law requires each city and county to adopt a general plan "for the physical development of the county or city, and any land outside its boundaries which bears relation to its planning" (§65300). The California Supreme Court has called the general plan the 'constitution for future development.' The general plan expresses the community's development goals and embodies public policy relative to the distribution of future land uses, both public and private."[35]

The intent of CEQA is stated in the California Public Resources Code Division 13, Chapter 1, Section 21000, which describes the main intent of CEQA to protect the environment, maintain a high-quality ecological system and general welfare of the people of the state.

Please refer to Response INTRO-6 (page C&R 3.1-11) regarding the EIR process and its purpose.

The comments are noted. These comments do not raise issues regarding the adequacy, accuracy, or completeness of the Draft EIR. The comments will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project.

Comments [Consistency with Planning Code]

(Jane Seleznow, October 8, 2010) [48-3 LU]

"In particular, any variance in the current planning code would have an adverse impact on the character of the existing residential neighborhood. Zoning should be kept at the current limit of 130 feet."

(Nancy Evans, October 14, 2010) [54-1 LU]

"I am writing to ask that the SFPC require Sutter Health/CPMC to build in compliance with all existing codes and regulations, from building height to noise and air quality, etc. Rules are not made to broken; they are made to protect the welfare of human beings. Residents of urban areas to not waive their right to a healthy environment. San Francisco should not allow this corporation to build and operate a medical facility which cares for the people inside it while harming those living around it."

[35] State of California, Governor's Office of Planning and Research, *State of California General Plan Guidelines*, 2003, p. 10.

(Nancy Evans, October 14, 2010) [54-3 LU]

"Sutter Health can build what they like, where they like it, but they must be held to established standards. There is nothing in their proposal that benefits our city sufficiently to justify waivers and exceptions.

Thank you for your vigilant review, and for protecting the interests of San Francisco."

(Ben Bear, October 18, 2010) [65-1 LU]

"I am a resident of San Francisco. I live in the Bernal Heights Neighborhood and I worship at the First Unitarian Universalist Society of San Francisco at 1187 Franklin near the site of CPMC's planned Cathedral Hill campus. I wish to go on the record with my concerns regarding the Draft Environmental Impact Report on this project.

The proposed project asks the people of San Francisco to grant Waivers to existing zoning codes in order to build to the liking of CPMC. Clearly, access to medical care is a concern for all of us. However, I do not believe there is enough benefit to the people of San Francisco to outweigh the negative impacts of this planned development."

(Wallace Cleland, October 17, 2010) [86-2 LU]

"Usually, zoning aspects of projected properties are reviewed separately from environmental considerations; however the aspects may be closely related. Certainly that is true of this proposal. The new hospital, projected to accommodate 550 patient beds, would be congested with several thousand employees in the course of each day, plus hundreds of visitors, suppliers, et al. The site bounded by Van Ness, Geary, Franklin and Post would be the single most densely inhabited city block (24 hours a day, 365 days a year) in San Francisco."

(Barbara Kautz—CHNA and Bernal Heights Neighborhood Center, October 19, 2010) [87-47 LU, duplicate comment was provided in 108-47 LU]

"However, the proposed Long Range Plan would double the building height limit and substantially increase the bulk limits adopted to meet these goals."

(Gloria Smith—California Nurses Association, October 19, 2010) [90-49 LU]

"As mentioned, the Project would require General Plan amendments, variances from the existing Codes, FAR amendments, parking reductions and other significant departures from adopted plans, policies and regulations. The numerous sweeping departures from adopted plans and policies call into question whether the Project benefits and merits justify all of necessary land use changes required for Project approval. Among the inconsistencies are proposals to deviate from:"

(Gloria Smith—California Nurses Association, October 19, 2010) [90-50 LU]

"Height and bulk limits: for example, an amendment is required to the Height and Bulk District map to reclassify the block for the Cathedral Hill hospital from the 130-V Height and Bulk District to a 265-V Height and Bulk District, allowing a maximum height of 265 feet.

Height limit for Cathedral Hill campus: Conditional Use authorization is required for the Cathedral Hill Hospital and Cathedral Hill MOB in an RC-4 zoning district to allow buildings taller than 40 feet within the VNSUD."

(Gloria Smith—California Nurses Association, October 19, 2010) [93-89 LU]

"Other Project inconsistencies with applicable plans, policies or regulations include, but are not limited to the following:

- Height and bulk limits for numerous campuses: For example, an amendment is required to the Height and Bulk District map to reclassify the block for the Cathedral Hill hospital from the 130-V Height and Bulk District to a 265-V Height and Bulk District, allowing a maximum height of 265 feet. DEIR at Table S-1.

- Height limit for Cathedral Hill campus: Conditional Use authorization is required for the Cathedral Hill Hospital and Cathedral Hill MOB in an RC-4 zoning district to allow buildings taller than 40 feet within the Van Ness Special Use District. DEIR at Table S-1.

- Off-street loading space dimension: The proposed Cathedral Hill campus would also require Conditional Use authorization to exceed the allowable parking. DEIR at Table S-1."

(Gloria Smith—California Nurses Association, October 19, 2010) [93-92 LU]

"Moreover, feasible alternatives and mitigation to address policy and regulation inconsistencies must be identified. For example, a reduced scale project at the Cathedral Hill campus would be more consistent with policies and regulations (e.g., Floor Area Ratio (FAR)) for those sites."

(Dina Hilliard, September 23, 2010) [PC-54 LU]

"Additionally, the Good Neighbor Coalition was surprised to find CPMC is assuming to be granted a complete exemption from the Van Ness Special Use District requirements. Assuming exemption from this plan makes the Draft EIR deficient in its analysis of this development's responsibilities around housing and neighborhood stabilization."

Response LU-9

The comments address the consistency of the proposed LRDP with existing plans, policies, and regulations. In particular, the comments focus on the proposed Cathedral Hill Campus, which would require a number of approvals, including amendments to the Planning Code as well as the Urban Design Element of the General Plan and the Van Ness Avenue Area Plan. Several of the comments express disagreement with the Draft EIR's conclusion that the LRDP, if adopted with the proposed Planning Code and plan amendments, would then be consistent with those codes and amendments. The comments state that the EIR analysis represents an inappropriate comparison to future conditions and that the LRDP should be compared to the existing provisions of the Planning Code and other applicable plans.

Consideration of Proposed Planning Code Amendments

The proposed LRDP includes several requests for amendments to the Planning Code as well as various other planning and development documents, as described in the Draft EIR and in this C&R document. Since the publication of the Draft EIR on July 21, 2010, the project sponsor has made some modifications to the requested entitlements for the proposed LRDP based upon input from the Planning Department after reviewing the initial application submittal for the near-term projects, including the proposed development at the Cathedral Hill Campus. Therefore, the required project approvals listed in the Draft EIR on pages 2-13 through 2-17, Table 2-3, "Required Project Approvals," have been updated as part of the text revisions to the Draft EIR included in Chapter 4, "Draft EIR Text Changes," on pages C&R 4-37 and C&R 4-38 of this document. Additional text revisions to Draft EIR pages 2-44 through 2-47, 2-191, 2-192, 3-9, 3-10, 3-19, 4-47, 4-48, 4-50, 6-130, and 6-300, reflecting the updated list of requested entitlements have also been included as text revisions to the Draft EIR on pages C&R 4-43 through C&R 4-58. The discussion below is based upon the updated list of required project approvals.

Proposed amendments or reclassifications (plus CU authorizations that would result in exceptions to otherwise applicable Planning Code requirements) include:

Cathedral Hill Campus

- Change the Planning Code Height and Bulk Map designation for the Cathedral Hill Hospital site from a 130-V to a 265-V Height and Bulk District, in order to increase the maximum height on the site from 130 ft. to 265 ft.;

- Amend the Planning Code Land Use Map to show the boundaries of the Van Ness Medical Use Subdistrict (VNMUSD), encompassing the proposed Cathedral Hill Hospital and Cathedral Hill MOB sites and the area where the Van Ness Avenue pedestrian tunnel would be located;

- Amending Planning Code Section 243 (Van Ness Special Use District) to create a new Van Ness Medical Use Subdistrict (VNMUSD). Specific Planning Code text amendments proposed for the new VNMUSD include provisions that would, among other things:
  - Allow modification through CU authorization of otherwise applicable bulk limits under Planning Code Sections 270 and 271 to allow for the unique massing requirements of medical facilities.
  - Increase the allowable maximum FAR on the proposed Cathedral Hill Hospital site from 7:1 to 9:1, and on the proposed Cathedral Hill MOB site from 7:1 to 7.5:1;
  - Allow modification of otherwise applicable loading standards for medical centers per Planning Code Section 154(b), to allow for the provision of adequate loading facilities unique to medical facilities;
  - Allow modification through CU authorization of otherwise applicable parking standards for medical centers per Planning Code Sections 151 and 204.5, provided that the amount of parking shall not exceed 150 percent of the number of spaces otherwise required by the Planning Code;
  - Allow modification of otherwise applicable standards for building projections per Planning Code Section 136.1 to allow for coverage of drop-off and entry areas required by medical facilities;
  - Allow modification of otherwise applicable standards for obstructions over streets or alleys per Planning Code Section 136(c)(1)(B) for vertical dimension and horizontal projections to allow architectural features to achieve appropriate articulation of building facades and to reduce pedestrian level wind currents; and
  - Allow modification through CU authorization of otherwise applicable street frontage requirements under Planning Code Section 145.1, as necessary for large-plate medical facilities on sloping sites with multiple frontages.

- Planning Code Section 243(c)(8) generally requires development projects within the Van Ness SUD to include residential uses at a 3:1 ratio to net new nonresidential uses. The project sponsor has requested a CU authorization to modify these requirements for medical center uses within the VNMUSD (alternatively, such a modification could be approved via an amendment to Planning Code Section 243's text provisions for the VNSUD); and

- A CU authorization in order to allow an exception for ground level wind currents to exceed pedestrian wind current comfort level criteria of 11 miles per hour applicable within the Van Ness SUD.

Davies Campus

- CU authorization to modify the existing CU and amend the existing PUD (under Planning Code Section 304) to allow exceptions to the rear-yard requirement.

St. Luke's Campus

- A modification of the Planning Code's height and bulk map to place the entire St. Luke's Campus, currently partially within a 105-E height and bulk district and partially within a 65-A height and bulk district, within a 105-E height and bulk district;

- Authorization for buildings higher than 40 feet in the RH-2 district;

- An exception to the otherwise applicable "E" bulk limits of 110 feet and 140 feet at 65 feet in height to allow the proposed St. Luke's Replacement Hospital to have a maximum building length of 227 feet and diagonal dimension of 259 feet;

- An amendment to the Planning Code Special Use District Map SU07 and Article 2 of the Planning Code to establish a new Cesar Chavez/Valencia Streets Medical Use Special Use District (Cesar Chavez/Valencia Streets SUD) on Assessor's Block 6576, Lot 21, Block 6575, Lots 1 and 2 and on a portion of San Jose Avenue between Cesar Chavez Street and 27th Street (i.e., the St. Luke's Campus). A basic floor area ratio (FAR) of 1.8:1 is permitted by the Planning Code for the St. Luke's Campus. The existing buildings result in an FAR of 2.25:1 at the St. Luke's Campus, a ratio that was approved under the previous PUD for the Campus. Pursuant to proposed amendments to Article 2 and a conforming amendment that would add a new subsection (k) to Planning Code Section 124, the proposed Cesar Chavez/Valencia Streets SUD would increase the allowable maximum FAR on the St. Luke's Campus site to 2.5:1;

- An exemption under the amended PUD from the otherwise required hospital parking under Planning Code Section 150 for the interim development period between completion of the St. Luke's Replacement Hospital and the MOB/Expansion Building, as well as after the construction of the MOB/Expansion Building. The exemption would allow an interim deficit of approximately 124 spaces for the interim development period (i.e., during and after construction of the St. Luke's Replacement Hospital, and before completion of the MOB) as measured against Code-required parking. The proposed MOB/Expansion Building would reduce the parking deficit to approximately 109 spaces after completion of the MOB/Expansion Building; and

- An exemption under the amended PUD from the otherwise applicable restrictions on projections into streets and alleys under Planning Code Section 136 in order to permit awnings at the St. Luke's Replacement Hospital, and to allow the awnings to project beyond the property line.

These amendments and authorizations constitute the changes to existing Planning Code regulations and CU authorizations that would be necessary to allow the proposed CPMC LRDP to be approved and implemented, as proposed and as evaluated in the Draft EIR (and as updated in the text revisions to the Draft EIR on pages C&R 4-43 to C&R 4-58). There are no physical environmental consequences to the proposed amendments beyond the environmental effects of the proposed LRDP as described in the Draft EIR. To the extent that the Draft EIR evaluated the environmental effects of the construction and operation of the proposed CPMC buildings under the LRDP, spaces and uses thereof, then the Draft EIR also evaluated the environmental effects that would be anticipated by adoption of the proposed regulatory amendments listed above.

Exceptions and amendments to the General Plan and the Planning Code are allowed in the Planning Code regulations. As stated in Section 302(a) of the Planning Code, "whenever the public necessity, convenience and general welfare require, the Board of Supervisors may, by ordinance, amend any part of this Code. Such amendments may include reclassifications of property (changes in the Zoning Map), changes in the text of the Code, or establishment, abolition or modification of a setback line."

Section 303 of the Planning Code allows the Planning Commission to authorize a CU for a medical institution if the proposed use will provide a development that is necessary or desirable for, and compatible with, the neighborhood or the community; if the proposed use will not be detrimental to the health, safety, convenience or general welfare of persons residing or working in the vicinity, or injurious to property, improvements or potential development in the vicinity; and if the proposed use will comply with the applicable provisions of the Planning Code and will not adversely affect the applicable Institutional Master Plan (Section 303[c]). The Planning Commission may prescribe such additional conditions, beyond those specified in the Planning Code, as are in its opinion necessary to secure the objectives of the Planning Code (Section 303[d]). Section 304.5 of the Planning Code allows for a CU for medical institutions under certain conditions, subject to CU authorization by the Planning Commission.

A number of comments raised questions about the Planning Code amendments and other approvals that have been requested to allow for the development of the proposed Cathedral Hill Campus. The following discussion addresses in greater detail the specific amendments to the San Francisco Planning Code that have been requested by the project sponsor related to the proposed Cathedral Hill Campus.

Planning Code Text/Map Changes

Planning Code Section 243: Van Ness Special Use District (SUD)

As stated on page 2-45 of the Draft EIR, the CPMC LRDP sponsor has requested that the Van Ness SUD be amended to include a new Van Ness Medical Use Subdistrict (VNMUSD) (see "Van Ness Special Use District Zoning Map SU02" in Appendix C in the Draft EIR). This subdistrict would:

- increase the maximum FAR for the proposed Cathedral Hill Hospital site from 7:1 to 9:1 and for the proposed Cathedral Hill MOB site from 7:1 to 7.5:1; and

- modify otherwise applicable loading, off-street parking, building projection, bulk, and street frontage standards.

The Planning Code Land Use Map would be amended to show the boundaries of the VNMUSD encompassing the sites of the proposed Cathedral Hill Hospital and Cathedral Hill MOB, and the area where the Van Ness Avenue pedestrian tunnel would be located.

The Van Ness SUD was adopted to implement the objectives and policies of the VNAP—a part of the General Plan—by creating a mix of residential and commercial uses on Van Ness Avenue; preserving and enhancing the pedestrian environment; encouraging the retention and appropriate alteration of architecturally and historically significant and contributory buildings; conserving the existing housing stock; and enhancing the visual and urban design quality of the street (Planning Code Section 243[b]).

The LRDP's impacts on the existing visual character of the proposed Cathedral Hill Campus vicinity were addressed in the Draft EIR on pages 4.2-118 through 4.2-140, and were determined to be less than significant. As described in the Draft EIR, the site of the proposed Cathedral Hill Campus would have the appearance of a dense urban development, with buildings that would have greater massing and height than the existing buildings on the campus and would have visually strong character. The scale and height of the buildings would be generally large but compatible with the surrounding buildings. The proposed 265-foot-tall 15-story hospital building would be located adjacent to and in the vicinity of other high-rise buildings along Van Ness Avenue. The proposed 130-foot-tall, 9-story Cathedral Hill MOB would be set back down toward its eastern side to match the height of the shorter buildings which are present in that area. The proposed Cathedral Hill Hospital and Cathedral Hill MOB would be compatible in general design, having similar form elements, modern architectural design and similar façade materials. The result would be an integrated, visually harmonious composition for the campus as a whole. The proposed campus would appear consistent in scale with development in the surrounding areas and along the Van Ness Avenue corridor. Street trees would line all the streets surrounding the campus on each side and

would be landscaped in a unified manner that does not exist at present. The landscaping plan would be consistent with the City's plan for streetscapes, and for the Van Ness Avenue corridor in particular. For these reasons, the effects of the Cathedral Hill Campus would not represent a significant adverse effect on the visual character of the project area, and would not be inconsistent with the intent of the Van Ness SUD.

The LRDP's impacts on historical resources in the vicinity of the proposed Cathedral Hill Campus were addressed in the Draft EIR on pages 4.4-30 through 4.4-32, and it was determined that the proposed LRDP would have less-than-significant impacts. More specifically, the Draft EIR presented evidence that none of the buildings or structures located within the proposed Cathedral Hill Campus are considered historical resources (individually or as part of a district) for the purposes of CEQA, nor would the proposed LRDP have a significant impact on any individual resources in the project vicinity. The San Francisco Planning Department concurred with this finding.[36, 37] Therefore, implementation of the LRDP at the proposed Cathedral Hill Campus would not cause a substantial adverse change in the significance of a historical resource as defined in Section 15064.5 of the State CEQA Guidelines. Thus, the amendment to Planning Code 243, proposed as part of the CPMC LRDP, would have a less-than-significant impact on historical resources, and would be consistent with the intent of the Van Ness SUD.

Planning Code Section 302: Height and Bulk Map

As stated on page 2-45 of the Draft EIR, pursuant to Section 302 of the Planning Code, the project sponsor has requested that the Planning Code Height and Bulk Map for the city block that is the proposed site of the Cathedral Hill Hospital (i.e., the block bounded by Post Street, Van Ness Avenue, Geary Boulevard, and Franklin Street) be reclassified from a 130-V height and bulk district to a 265-V height and bulk district (see Planning Code Proposed Height/Bulk Map" in Appendix C of the Draft EIR).

Section 302(a) of the Planning Code allows the Board of Supervisors to amend any part of this Code (including reclassification of a particular property) "whenever the public necessity, convenience and general welfare require."

The LRDP's impacts on the existing visual character of the proposed Cathedral Hill Campus vicinity were addressed in the Draft EIR on pages 4.2-118 through 4.2-140. As discussed above, the analysis of effects on visual resources described the ways in which the height and bulk of the proposed Cathedral Hill Hospital would be greater and more visually noticeable than the existing structures. The analysis also noted that the proposed Cathedral Hill Hospital would be compatible in general design, having form elements, architectural design and façade materials that would be compatible with the neighboring structures. The Draft EIR evaluation stated that the while the proposed Cathedral Hill Hospital would be larger and bulkier than some individual surrounding structures, it would appear consistent in scale with type of development in the surrounding areas and along the Van Ness Avenue corridor, and, thus, the impacts of the proposed change in height and bulk with development of the proposed Cathedral Hill Campus was determined to be less than significant.

Planning Code Authorizations

Section 303: Conditional Use Authorization

As stated on page 2-45 of the Draft EIR, a CU authorization would be sought for the proposed Cathedral Hill Hospital and Cathedral Hill MOB (and Van Ness Avenue pedestrian tunnel) as conditionally permitted uses in the proposed new VNMUSD, described above, and the RC-4 Zoning District. CU authorization would be sought for building height and modification of the existing bulk limits for length

[36] California Pacific Medical Center. 2010 (February). *Historic Evaluation Report for Cathedral Hill Campus: California Pacific Medical Center*. San Francisco, CA. Prepared by Knapp Architects, San Francisco, CA. Page 2.

[37] San Francisco Planning Department. 2010 (February) *Historic Resource Evaluation Response: Cathedral Hill Campus, California Pacific Medical Center*. Case 2005.0555E. Major Environmental Analysis Division. San Francisco, CA. Pages 2–3.

and diagonal dimensions applicable to the proposed Cathedral Hill Hospital and Cathedral Hill MOB sites. CU authorization would also be sought for the proposed Cathedral Hill Hospital and Cathedral Hill MOB to exceed 50 feet in height in an RC-4 District, exceptions to otherwise applicable street frontage requirements, demolition of five residential dwelling units, modification of the 3:1 ratio of residential to non-residential development restriction in the Van Ness SUD, and an exception to allow wind comfort level exceedances, as discussed below.

Medical Center Use. The project sponsor is requesting authorization of the proposed Cathedral Hill Hospital and Cathedral Hill MOB as a conditional use medical center pursuant to the provisions for the RC-4 zoning district in Planning Code Sections 209.3 and 209.8 and the provisions for the Van Ness SUD in Planning Code Section 243, as proposed to be amended, as described above.

Height. Planning Code Section 253 requires CU authorization for any building with a height over 50 feet in an RC-4 District, and Planning Code Section 253.2 requires CU authorization for any building with a height over 50 feet in the Van Ness SUD. Therefore, the projects sponsor is requesting CU authorization to allow the heights of the proposed Cathedral Hill Hospital (265 feet) and the Cathedral Hill MOB (130 feet).

Street Frontage. The CU authorization would allow modification of standards for active ground floor uses and width of curb cuts otherwise applicable under Planning Code Section 145.1, providing that, on balance, active uses and curb cuts around the perimeter of a site with multiple frontages meets the intent of Section 145.1.

Demolition of Residential Dwelling Units. As stated on page 2-47 of the Draft EIR, the CU authorization would allow demolition of five residential dwelling units that currently occupy portions of the proposed site of the Cathedral Hill MOB.[38] Planning Code Section 317 requires conditional use authorization for the demolition of three or more dwelling units. Section 317 does not require one-for-one residential unit replacement. However, CPMC has agreed to pay an in-lieu fee to address demolition of the five residential dwelling units and has consulted with the Mayor's Office of Housing ("MOH") to identify the appropriate in-lieu fee methodology. MOH determined that (i) the in-lieu fee amount would be established based on the Citywide inclusionary housing fee schedule effective as of July 15, 2008; and (ii) as applied to the residential units, the total fee would be One Million Four Hundred Fifty Three Thousand Eight Hundred and Twenty Dollars ($1,453,820.00) ("Residential Unit Replacement Fee") based on the following unit type and calculation: three one bedroom units ($248,210.00 x 3), one two bedroom unit ($334,478.00) and one three bedroom unit ($374,712.00). A condition to DBI's issuance of a demolition permit for the residential units would be payment of the Residential Unit Replacement Fee.

The project's impacts related to displacement of housing at the proposed Cathedral Hill Campus site are addressed in the Draft EIR on pages 4.3-32 through 4.3-34, and were determined to be less than significant because CPMC would provide for the relocation of all affected tenants who need assistance, in excess of the assistance required by law, and would meet the requirements of Section 317 of the Planning Code.

Modification of Residential Restrictions. As stated in Response LU-21 (page C&R 3.3-95), Planning Code Section 243(c)(8)(B)(iv) allows, through CU authorization, modification of the 3:1 residential/new new non-residential ratio requirement under the Van Ness SUD if the Planning Commission makes certain findings. These findings include, among others, (i) taking into consideration projects constructed since the effective date of the VNSUD and the housing development potential remaining in the VNSUD, a finding that the overall objective of adding a substantial increment of new housing on Van Ness Avenue will not be significantly compromised; (ii) the project provides space for an institutional, medical, cultural, or social service use meeting an important public need which cannot reasonably be met elsewhere in the area, and (iii) housing cannot reasonably be included in the project. CPMC is requesting

[38] City of San Francisco, *Planning Code*, Section 317.

modification of the 3:1 requirement pursuant to Section 243 (c)(8)(B)(iv) to allow no residential housing to be built at the proposed Cathedral Hill Hospital and Cathedral Hill MOB sites, provided fees, balanced against the community benefit of the project, are paid.

Because the proposed Cathedral Hill Hospital and Cathedral Hill MOB could be approved pursuant to such a CU authorization, these buildings would not "conflict" with existing zoning. If the CU application is not approved, then the project would not be permitted to proceed as proposed. Therefore, the Draft EIR properly concludes that the proposed LRDP development at the Cathedral Hill Campus does not conflict with a land use regulation.

The 3:1 residential/new new non-residential ratio requirement was not adopted to avoid or mitigate an environmental effect, but instead, to implement the VNAP—an element of the General Plan—by encouraging "creation of a mix of residential and commercial uses" (Planning Code Section 243[b]). Where, as here, a regulation is adopted for a purpose other than avoiding or mitigating an environmental effect, then the question of whether a particular project is consistent with zoning, or can and should be permitted for CU, variance, exemption, or amendments to the existing zoning, is considered by the decision-makers outside of the CEQA analysis, as part of their decision whether to approve or disapprove a project.

Exception for Wind Comfort Level Exceedances. The CU authorization would allow an exception for ground-level wind currents to exceed the current pedestrian wind speed comfort level criteria of 11 miles per hour (mph), applicable within the Van Ness SUD.

Planning Code Section 243(c)(9)(B) allows exceedance of the 11 mph wind speed comfort level if "the project sponsor demonstrates that the building or addition cannot be shaped or wind baffling measures cannot be adopted without unduly restricting the development potential of the building site in question. (i) The exception may permit the building or addition to increase the time that the comfort level is exceeded, but only to the extent necessary to avoid undue restriction of the development potential of the site." Because wind exceedances, that would occur due to development of the proposed Cathedral Hill Campus facilities under the LRDP, could be approved under Section 243(c)(9)(B) by a CU, they would not conflict with existing zoning.

Wind impacts at the proposed Cathedral Hill Campus are addressed on pages 4.9-22 through 4.9-29 of the Draft EIR. The analysis included wind tunnel modeling and determined that implementing the LRDP at the Cathedral Hill Campus by 2015 would not increase the total number of locations that would exceed the pedestrian-comfort criterion (11 mph), and it would not result in an exceedance of the wind-hazard criterion (26 mph). Thus, the impacts were determined to be less than significant.

Bulk Limits. The CU authorization would allow modification of the existing bulk limits under Planning Code Section 270, for length and diagonal dimensions of 110 and 140 feet, respectively, applicable to the proposed Cathedral Hill Hospital and Cathedral Hill MOB sites. This would allow length and diagonal dimensions of 385 and 466 feet, respectively, for the proposed Cathedral Hill Hospital and length and diagonal dimensions of 265 and 290 feet, respectively, for the proposed Cathedral Hill MOB.

Planning Code Sections 321/322 (Proposition M – Office Allocation)

As stated on page 2-47 of the Draft EIR, CPMC would seek to comply with the procedures of Planning Code Section 322, including Proposition M office allocation findings pursuant to Section 321. Sections 321 and 322 of the Planning Code establish a special review process for new buildings with 25,000 sq. ft. or

more of office space. The proposed Cathedral Hill MOB and the St. Luke's MOB/Expansion Building would contain over 25,000 sq. ft. of office space and would therefore be subject to Sections 321 and 322.[39]

Proposition M office allocation findings are intended to limit the amount of office development each year; Proposition M was not adopted to avoid or mitigate an environmental impact. Where, as here, a regulation is adopted for a purpose other than avoiding or mitigating an environmental effect, the question of whether a particular project is consistent with the regulation is considered by decision-makers outside of the CEQA analysis, as part of their decision whether to approve or disapprove the project.

Lot Mergers

The proposed site of the Cathedral Hill Hospital encompasses two lots in Assessor's Block 0695 and the site of the proposed Cathedral Hill MOB encompasses seven lots in Assessor's Block 0694. Because of applicable Building Code restrictions, to construct the two proposed buildings, the lots must be merged into one lot on each site, in compliance with the Subdivision Map Act and the San Francisco Subdivision Code.

Lot mergers are not intended to avoid or mitigate an environmental impact. Where, as here, a regulation is adopted for a purpose other than avoiding or mitigating an environmental effect, the question of whether a particular project is consistent with the regulation is considered by decision-makers outside of the CEQA analysis, as part of their decision whether to approve or disapprove the project.

San Francisco Administrative Code

CPMC would request a permit to convert under the City's Residential Hotel Conversion and Demolition Ordinance (San Francisco Administrative Code Chapter 41) to demolish 20 residential hotel units in buildings that currently occupy portions of the site of the proposed Cathedral Hill MOB.

The Residential Hotel Conversion and Demolition Ordinance was adopted to protect affordable housing for tenants that include the elderly, disabled, and low-income residents. The demolition of residential hotel units is regulated to avoid or mitigate impacts on housing, particularly affordable housing (significance criterion "b" under Population, Employment, and Housing). The proposed LRDP's impacts related to displacement of hotel residents at the proposed site of the Cathedral Hill Campus are addressed in the Draft EIR on pages 4.3-43 and 4.3-44. CPMC would provide for the relocation of tenants needing assistance, in excess of that required by law. CPMC has implemented a relocation assistance program that has successfully reached agreement with all of the tenants and will pay a fee for replacement of residential hotel units. Section 41.12 requires a project sponsor to obtain a Permit to Convert from the City of San Francisco Department of Building Inspection (DBI) prior to demolishing a residential hotel unit. Prior to issuing a Permit to Convert, DBI must confirm that the project sponsor has complied with the one-for-one residential hotel unit replacement requirements of Section 41.13. Section 41.13(a)(4) allows a project sponsor to comply with the one-for-one replacement requirements through payment to the City of a fee equal to 80 percent of the cost of construction of an equal number of comparable units plus site acquisition cost, as determined by the California Department of Real Estate (DRE) based on two independent appraisals. DRE obtained the required appraisals and, by letter dated September 7, 2010, established the total fee for the residential hotel units as Two Million Six Hundred Eighty Four Thousand Eight Hundred Dollars ($2,684,800.00) ("Residential Hotel Unit Replacement Fee"). Therefore, a condition to DBI's issuance of the Permit to Convert would satisfy the one-for-one replacement requirement of Section 41.13 by payment to the City of the Residential Hotel Unit Replacement Fee in accordance with the terms, timing and procedures set forth in Administrative Code Chapter 41.

[39] Square footage totals may be slightly different when Planning Code calculation methodology is applied for purposes of Prop M office allocation requirements.

For these reasons, the demolition of residential hotel units was determined to be less than significant. Please also see Response PH-14, C&R 3.5-53, for a discussion of the status of the project sponsor's relocation assistance program.

Permits Required for Streetscape Improvements

Numerous permits from San Francisco Department of Public Works (DPW), San Francisco Municipal Transportation Authority (SFMTA), and the California Department of Transportation (Caltrans) would be required for streetscape improvements. Permits required would include street tree planting and removal permits (see Planning Code Section 143), a sidewalk landscaping permit, a street improvement permit, major- and minor-encroachment permits, including encroachment permits for underground fuel storage tanks and the pedestrian tunnel, and other miscellaneous permits related to construction and operation in the public rights-of-way. Compliance with the City's Better Streets Plan, which provides policies and guidelines for the pedestrian realm, would be required as part of the streetscape plan at the proposed Cathedral Hill Campus. The City would also need to approve the change in operation of Cedar Street to two-way, west of the proposed Cathedral Hill MOB driveway.

Permits for streetscape improvements are intended to ensure that proposed streetscape alterations improve and enhance the existing visual character, among other purposes. Therefore, they are intended to avoid or mitigate impacts on the existing visual character or quality of the site and its surroundings (significance criterion "c" of the Aesthetics section). The LRDP's impacts on the existing visual character of the proposed Cathedral Hill Campus vicinity were addressed in the Draft EIR on pages 4.2-117 through 4.2-140, with particular attention to the visual effects of streetscape and landscaping on page 4.2-130. The evaluation noted that because, under the LRDP, a more continuous and integrated street-tree landscaping plan than exists at present would be implemented, particularly for the Cathedral Hill MOB site, impacts of streetscape changes related to the visual resources would be less than significant.

The Better Streets Plan seeks to balance the needs of all street users, and reflects the understanding that streets serve a multitude of social, recreational, and ecological needs. It is intended to improve traffic safety and enhance the appearance of streets in San Francisco. Therefore, it is intended to avoid or mitigate impacts related to traffic safety and the existing visual character or quality of the site and its surroundings (significance criterion "d" and "f" of the Transportation and Traffic section, and significance criterion "c" of the Aesthetics section).

The proposed LRDP's impacts related to traffic safety in the vicinity of the proposed Cathedral Hill Campus were addressed in the Draft EIR on pages 4.5-110 through 4.5-145. The Draft EIR determined that most of these impacts would be less than significant or less than significant with mitigation; however, Impact TR-42 was determined to be significant and unavoidable. This impact states that implementation of the proposed Cathedral Hill Campus project MOB Access Variant under the LRDP would result in a pedestrian hazard impact at the proposed MOB's driveway on Geary Street.

Encroachment permits are not intended to avoid or mitigate an environmental impact, but rather to require developers to obtain permission to conduct work within street rights-of-way and sidewalks to ensure that such work is done safely and in coordination with other activities. Where, as here, a regulation is adopted for a purpose other than avoiding or mitigating an environmental effect, the question of whether a particular project is consistent with the regulation is considered by decision-makers outside of the CEQA analysis, as part of their decision whether to approve or disapprove the project.

Variances

Several of the comments state that CPMC is requesting "variances" for the proposed LRDP. Please note that no variances have been requested for the proposed LRDP. However, as explained in detail above, the project sponsor has requested General Plan amendments and changes to the text and maps of the San

Francisco Planning Code that would be required to approve the associated CPMC LRDP as proposed (Table 2-3, on pages 2-14 through 2-17 of the Draft EIR, as updated in Chapter 4, "Draft EIR Text Changes", page C&R 4-37), as well as CU authorizations that would, consistent with the procedures in the Planning Code, exempt the project from certain otherwise applicable Planning Code requirements.

Code Complying Alternative

One comment requested that the EIR include an alternative to the CPMC LRDP that complies with the existing codes and would not require the requested amendments, described above. As described in Section 15126.6 of the State CEQA Guidelines, an EIR must evaluate a reasonable range of alternatives that would meet most of the basic objectives of the proposed project and which would avoid or substantially lessen one or more of the significant impacts of the project as proposed. In Chapter 6, the Draft EIR described and comparatively evaluated a reasonable range of alternatives to the proposed LRDP. In developing the reasonable range of alternatives, the Draft EIR considered but rejected a Code-Complying Alternative to the proposed LRDP. A discussion of how the Code-Complying Alternative would differ from the proposed LRDP is presented on pages 6-26 through 6-28 of the Draft EIR. As stated on pages 6-28 through 6-30 of the Draft EIR, the Code-Complying Alternative was determined to be infeasible for the following reasons described below.

Cathedral Hill Campus: Developing the proposed Cathedral Hill Hospital with a single tower under the Code-Complying Alternative would mean that the hospital could provide only approximately 90 beds (465 fewer than under the proposed LRDP). The 90-bed hospital would not be able to accommodate the majority of the acute-care uses currently provided at the Pacific and California Campuses that would be relocated to the proposed Cathedral Hill Campus under the LRDP, yet these services would cease at the Pacific and California Campuses because of noncompliance with the seismic safety requirements of SB 1953. Therefore, the Code-Complying Alternative would fail to meet the proposed LRDP's core medical services objectives—ensuring ongoing medical services and an uninterrupted continuum of care at CPMC, meeting the existing and projected acute-care and outpatient needs of CPMC's patients, and efficiently consolidating CPMC's campuses.

A potential Planning Code-compliant redesign of the proposed Cathedral Hill Hospital, to include six towers—as described on pages 6-28 and 6-29 of the Draft EIR—would also fail to meet the basic objectives of the project. Thus, it would be infeasible, primarily, because the constrained square footage within each tower floor would be insufficient to provide the required clinical support for nursing (e.g., clean utility rooms, charting areas, family space). Additionally, the discontinuity of the bed towers and the resulting size of nursing units allowable within each tower would pose significant operational issues and inefficiencies, and would increase staffing and the cost of care. Traffic and site circulation would also be severely compromised, because the tower cores would not accommodate a drive-through at the proposed Cathedral Hill Hospital for access to the patient drop-off and parking areas, and the loading dock would likely require relocation. The hospital's structural grid and required mechanical runs also would be much less efficient than those proposed under the LRDP. Therefore, even with the six-tower redesign of the proposed Cathedral Hill Hospital, the Code-Complying Alternative would fail to meet the overarching project objective of optimizing the use of CPMC's resources to provide an integrated health care system in the most cost-effective and operationally efficient manner.

As described above, the floor plan for bed towers within the proposed Cathedral Hill Hospital would be constrained by the existing bulk limits such that only minimal space would be available for a nurse core, circulation space, mechanical space, or restrooms. Thus, with either a single-tower or six-tower redesign of the proposed Cathedral Hill Hospital, the Code-Complying Alternative would not meet the proposed LRDP's core medical services objective of providing a modern, efficient, and clinically safe patient care environment in facilities based on contemporary best practices in hospital design and national hospital space and facility guidelines, including individual bathrooms, adequate common spaces for families and

staff, floor plans that allow staff to work efficiently and safely with patients, and the ability to accommodate current-day medical technologies.

As explained on page 6-27 of the Draft EIR, redesigning the proposed Cathedral Hill MOB to comply with the existing Planning Code bulk requirements would reduce usable space by approximately 75,000 square feet (sq. ft.) and result in 90 fewer physician offices than under the proposed LRDP. The proposed LRDP already includes a smaller ratio of MOB/outpatient space (in gross sq. ft.) to acute-care bed/inpatient space at the proposed Cathedral Hill Hospital than is the average for MOBs and hospitals across the CPMC system. Therefore, further reducing the size of the proposed Cathedral Hill MOB (and ratio of MOB/outpatient space to acute-care/inpatient space) would make the overall proposed Cathedral Hill Campus less viable. The proposed hospital transplant clinic, transplant foundation clinic, and women's diagnostic clinic would each require more than 17,000 sq. ft., and would not fit on any upper floor of the MOB under the Code-Complying Alternative. Therefore, the Code-Complying Alternative would not meet the project objectives of optimizing the use of CPMC's resources to provide an integrated health care system affording the highest quality of patient care in the most cost-effective and operationally efficient manner, or of ensuring that hospital facilities have the capacity to be supported with medical office space, parking facilities, and other supportive functions.

Pacific Campus: As with the six-tower redesign of the proposed Cathedral Hill Hospital under the Code-Complying Alternative, described above, operational inefficiencies would occur at the Pacific Campus under this alternative. Specifically, the proposed Ambulatory Care Center (ACC) would either be reduced in size considerably or divided into several towers to comply with the existing bulk limits. Therefore, the Code-Complying Alternative would fail to meet the overarching project objective of optimizing the use of CPMC's resources to provide an integrated health care system in the most cost-effective and operationally efficient manner.

St. Luke's Campus: Compliance with the 65-foot height limit and existing bulk limits at the proposed St. Luke's Replacement Hospital site would limit the St. Luke's Replacement Hospital to a total of approximately 34 beds and would also reduce its support services. Therefore, the Code-Complying Alternative would not meet the project objective of rebuilding and revitalizing the St. Luke's Campus as a community hospital to the same extent as under the proposed LRDP.

As stated in Response LU-5 (page C&R 3.3-30), the text of all proposed plan, policy and regulation amendments for near-term LRDP projects are available for review at the San Francisco Planning Department. The text of all required plan, policy and regulation amendments for long-term projects will be made available to the public after applications for additional project-level entitlements for those projects are submitted to the City in the future.

3.3.2 CATHEDRAL HILL CAMPUS

3.3.2.1 CONSISTENCY WITH PLANS AND POLICIES AND LAND USE COMPATIBILITY

Comment

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-148 LU, duplicate comment was provided in 30-148 LU]

"85. On Page 3-24, under '3.2.12, Japantown Better Neighborhood Plan,' the goals of the Plan were not accepted by the community and a new plan is being considered at the present time. Critical to the Japantown plan is the retention of historic and cultural character in the area. The Japantown plan will not apply to CPMC projects but the CPMC projects will impact the Japantown streets as far as traffic congestion, circulation and maybe even a business impact. As the Draft EIR states, "the plan area is in the vicinity of two CPMC campuses - one block west of the proposed Cathedral Hill Campus and directly south of the existing Pacific Campus." As such, and although

the Cathedral Hill and the Pacific campus projects will not occur concurrently, they are expected to overlap in 2015 so there is a cumulative effect to the Japantown area."

(Sheila Mohoney and James Frame, October 19, 2010) [88-6 LU]

Urban Decay

This potential effect (p. 5-7) of the St. Luke's Plan should not have been so cavalierly dismissed. Our neighbors have worked hard to improve *our streets and linked up to create a neighborhood identity. This project will serve to segregate us again into a couple of isolated small streets.*

Response LU-10

The comment states that the proposed CPMC LRDP would have a cumulative effect on the Japantown area, and states that the proposed LRDP would result in traffic congestion along Japantown streets. The comment also notes that the retention of the historic and cultural character of the area is critical to the Japantown. As indicated in Response TR-129 (page C&R 3.7-227), the Draft EIR includes an assessment of construction and operation impacts of the proposed LRDP. The conclusion of that response is that "[t]he combined impacts of overlapping construction activities and project travel demand on traffic and transit conditions [in Japantown] were determined to be less than significant."

In response to the comment stating the CPMC project would have a business impact, CEQA does not require the analysis of generalized economic impacts. Please see Response PH-20 on C&R 3.5-71 for a response to comments regarding the potential for commercial business displacement and urban decay effects in Japantown. Regarding the retention of the historic and cultural character of the Japantown area, the comment is noted. The LRDP does not propose and would not foreseeably result in any physical changes to cultural or historic resources in the Japantown plan area.

Comment

(Madlyn Stein—Seniors of Cathedral Hill, October 7, 2010) [45-1 LU]

"This letter is in response to the Environmental Impact Report filed with the Department of Planning on the Construction of a new hospital by CPMC between Post St and Geary Blvd and Van Ness and Franklin Streets in San Francisco.

Our organization was formed to voice the concerns of the many seniors (60% of the population) living in the area just west of the proposed construction on Cathedral Hill. Our concern is with the size, bulk and plan of the proposed hospital and the lack of open space in the plan and the traffic patterns that the plan would generate as well as increased noise, all of which have a negative impact on our neighborhood and on our lives."

Response LU-11

The comment raises concerns about size, bulk, lack of open space, traffic patterns, and noise with the proposed uses at the Cathedral Hill Campus. The Draft EIR for the CPMC LRDP was prepared in conformance with the provisions of CEQA and the State CEQA Guidelines. As explained in Response INTRO-1 (page C&R 3.1-1), the significance criteria used in the Draft EIR are based on Appendix G of the State CEQA Guidelines and the guidance of the San Francisco Planning Department's Major Environmental Analysis (MEA) Division. In each environmental resource section of the Draft EIR, under the Significance Criteria (or Significance Thresholds) subheading, thresholds of significance specific to that environmental issue are described.

The Draft EIR analyzes the potential impacts of the proposed Cathedral Hill Hospital that the comment expresses concerns about in Section 4.2, "Aesthetics" (for size and bulk); Section 4.10, "Recreation" (for

open space); Section 4.5, "Transportation and Circulation" (for traffic patterns); and Section 4.6, "Noise." The discussion on page 4.2-138 of the Draft EIR concludes that aesthetic impacts would be less than significant because "overall, the visual change, while considerable, is not unexpected in a dense urban environment such as this, and remains in context…the proposed Cathedral Hill Hospital would not substantially degrade the existing visual character or quality of the area because the new building would not result in a substantial adverse visual contrast with the area's existing buildings."

Potential impacts to recreational facilities and open space from the Cathedral Hill Hospital were discussed in Section 4.10 of the Draft EIR. As stated on page 4.10-2, "the CPMC LRDP would not require the construction of new recreational facilities or the expansion of existing facilities in San Francisco." The proposed Cathedral Hill Campus would provide on-campus open space amenities, which would help absorb some of the campus-related daily population demand on nearby parks and recreational facilities. Therefore, the LRDP would not result in the need to expand existing recreational facilities and potential impacts would be less than significant.

The Draft EIR provides a summary overview of the traffic impacts at the proposed Cathedral Hill Campus on page 4.5-90. The proposed LRDP at the Cathedral Hill Campus would generate new vehicle trips and increase the number of vehicles and average delay per vehicle at the 26 study intersections during both a.m. and p.m. peak hours. Significant and unavoidable impacts would occur at Van Ness/Market and Polk/Geary (Impact TR-1, Draft EIR, page 4.5-93), and six of the intersections would operate poorly under 2015 Modified Baseline No Project and 2015 Modified Baseline plus Project Conditions (Impact TR-3, Draft EIR, page 4.5-99). The Draft EIR also concluded a significant and unavoidable transportation impact related to construction vehicle traffic and construction activities at the Cathedral Hill Campus (Impact TR-55, Draft EIR, page 4.5-147).

The Draft EIR concluded that impacts related to a short-term project-related increase in traffic noise levels would be less than significant or less than significant with mitigation (Impact NO-2, Draft EIR, page 4.6-57). The same conclusion was made for impacts related to operation of stationary noise sources (Impact NO-3, Draft EIR, page 4.6-64), and traffic-related interior noise levels (Impact NO-4, Draft EIR, page 4.6-84). The project would result in a significant and unavoidable impact related to groundborne noise and vibration (Impact NO-5, Draft EIR, page 4.6-89).

Comment

(Madlyn Stein—Seniors of Cathedral Hill, October 7, 2010) [45-2 LU]

"We request that consideration be given to a new plan that would adhere to the following:

-reduction in bulk and height of the hospital and its tower

-lower the height to consistency with city guidelines and with the neighborhood

-reduce the bulk by providing open space along Post Street and Franklin Streets"

Response LU-12

The comment suggests that consideration should be given to a revised plan for the LRDP, related to the height and bulk of the proposed Cathedral Hill Hospital. In response to the compatibility of the proposed 265-foot-tall Cathedral Hill Hospital with surrounding uses in the neighborhood, Section 4.2, "Aesthetics," of the Draft EIR analyzes aesthetic impacts of the proposed Cathedral Hill Hospital development height and bulk in comparison to existing conditions. The aesthetic impact analysis of the proposed Cathedral Hill Hospital is presented on Draft EIR pages 4.2-118 through 4.2-125 for viewpoints from the surrounding area with the proposed hospital development.

In response to the comment requesting that a new plan consider a reduction in bulk and height of the hospital tower and lowering the height to consistency with City guidelines, a reduced development alternative was considered and analyzed in Chapter 6 of the Draft EIR. Alternative 3 assumed a reduced development of the proposed Cathedral Hill Campus, which would comply with the basic height requirement for the 130-V Height and Bulk District, but not the bulk requirement or floor area ratio. Please refer to Response ALT-1 (page C&R 3.22-11) regarding a reasonable range of alternatives. A reduction in height and bulk of the hospital building was considered in the planning phase of developing the alternatives. However, to provide adequate space for the short- and long-term planning, the proposed LRDP represents the most practical approach for developing the proposed Cathedral Hill Hospital site; lowering the height further would make the proposed Cathedral Hill Hospital development under the LRDP infeasible. The bulk has been carefully considered and stepped down in the design to shorter building components along Van Ness Avenue and Post Street. The setback would also be present along Post and Franklin Streets, and open space would be placed on top of the podium that would be central to the block. Further reduction in the size of the development would not accommodate the required functions and would make the project infeasible to develop.

The comment will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project.

Comments [Scale of Development]

(Bob Hamaguchi—Japantown BNP Organizing Committee, October 8, 2010) [47-11 LU, duplicate comment was provided in 50-11 LU]

"The existing towers and large parcel developments like the Sequoias building, which were implemented during Redevelopment Agency jurisdiction, are not representative of, and are actually inconsistent with, the prevalent, historical, and preferred land use and built forms in Japantown. While recognizing the significance of the Japan Center in the history of Japantown and its significance as a sample of Redevelopment's impact, the mistakes made by Redevelopment in creating large parcels and out of scale buildings should not be repeated going forward. If Cathedral Hill is approved at heights exceeding the current Van Ness height and bulk limits, it should be with the express recognition that this approval is due to exceptional circumstances, and is not to be considered as a precedent or justification for other proposed buildings in or to the west of the Van Ness corridor exceeding existing height limits.

We look forward to seeing a detailed analysis of these issues when the response to public comments is available."

(Diane and Richard Wiersba, October 11, 2010) [49-7 LU]

"Overall, we believe that CPMC's Draft EIR expects San Franciscans to ignore such impacts as mentioned above; CPMC appears to completely ignore the area residents' quality-of-life issues and in addition, out-of-hand dismisses the possibility of reducing the CPMC structure down to a reasonable and already-established maximum height for our city. The 25-storey horizon-blocking Sequoias has already been granted an exemption from existing height standards and the neighborhood is battling the proposed excessive height of the 1481 Post Street project. Cathedral Hill will be much better served if the CPMC project and all other future such projects are scaled down to meet existing height standards."

(Donald Scherl, October 18, 2010) [74-34 LU]

"7.3: Suitability of Site: The Cathedral Hill portion of the LRDP proposes the construction of structures (hospital and MOB) ill-suited to the neighborhood both by virtue of size (height and bulk) and by virtue of function. Multiple waivers would be required."

(Wallace Cleland, October 17, 2010) [86-4 LU]

"The present mid-rise zoning established has been considered carefully for prior developments proposed for this neighborhood. The conclusions have been that the height and scale are appropriate for a successful blending of housing and diverse functions."

(Wallace Cleland, October 17, 2010) [86-5 LU]

"Whatever the outcome of the Draft Environmental Impact Report in interpretation of technical rules, evident zoning violations will be cause for civil charges from distressed and affronted neighbors. I urge the professional staff of SF City Plan to consider the larger picture of what such a colossal CPMC endeavor would create for the Cathedral Hill community."

(Barbara Kautz—CHNA and Bernal Heights Neighborhood Center, October 19, 2010) [87-42 LU, duplicate comment was provided in 108-42 LU]

"3. Neighborhood Character.

The DEIR's conclusion that the Cathedral Hill Hospital would not be out of character with the neighborhood is not supported by substantial evidence. The discussion on page 4.1-57 considers only the number of stories of nearby buildings, not their *height.* Because *each* hospital story is much taller than stories in typical office buildings and high-rise residences, a 15-story hospital is much taller than a 15-story residence."

(Barbara Kautz—CHNA and Bernal Heights Neighborhood Center, October 19, 2010) [87-46 LU, duplicate comment was provided in 108-46 LU]

"The adopted height and bulk controls were intended to provide a "good proportion between [Van Ness Avenue] and that of its buildings," so that the street would be an interesting and pleasant place, to encourage definition of the 93-foot wide Avenue, and to create a coherent street wall along the Avenue through property line development at approximately the same height (Policies 5-3 and 5-4)."

Linda Chapman, September 23, 2010) [PC-281 LU]

"Now, this is a very well reasoned document. The reason for the 130-feet had to do with the land form, it graduates up from the water up to 130-feet, that allowed for development of housing, but it did not overwhelm the historic commercial buildings that are there, architecturally significant."

Response LU-13

The comments generally state that the proposed Cathedral Hill Hospital would be out of scale with other development in the Van Ness Avenue corridor, Japantown, and the vicinity. The comments state that the Sequoias building is out of scale and not representative of the preferred land use and built forms in Japantown. The comments also state that if the proposed Cathedral Hill plan is approved it should not set a precedent for other buildings regarding exceedance of height within the Van Ness Avenue corridor. One comment further states that the discussion in the Draft EIR addresses only building stories and not height, and that the conclusion reached in the Draft EIR regarding the proposed LRDP's less-than-significant impact on community character is not supported by substantial evidence.

Scale of Development

The Draft EIR analyzed the compatibility of the proposed Cathedral Hill Campus with surrounding areas, and concluded on page 4.2-138 that "the Cathedral Hill Campus would generally be consistent in terms of height and bulk with existing development located north of the site along Van Ness Avenue, and it would not result in a substantial contrast with the existing visual character with respect to height, massing, and bulk along this segment of Van Ness Avenue."

Existing structures within the vicinity of the proposed Cathedral Hill Hospital and Cathedral Hill MOB range from an approximate height of 135 to 299 feet tall. As shown in C&R Figure 3.4-1 (page C&R 3.4-5), which shows the heights of nearby buildings compared to the proposed Cathedral Hill Hospital, existing structures comparable in height with the proposed Cathedral Hill Hospital include the Cathedral Hill Towers (1200 Gough Street [approximately 252 feet tall]) and the Sequoias Apartments (1400 Geary Boulevard [approximately 299 feet tall]). Existing structures consistent in height with the proposed Cathedral Hill MOB include St. Mary's Cathedral (1111 Gough Street [approximately 190 feet tall]) and the Daniel Burnham Court complex (1 Daniel Burnham Court [approximately 221 feet tall]). The Draft EIR concludes on pages 4.2-136 through 4.2-138 that the Cathedral Hill Hospital would be taller and bulkier than the existing hotel and office building at the site, and would result in greater contrast in visual character with the existing surrounding area. However, overall the height and massing of the proposed Cathedral Hill Hospital would not be out of context with the visual character of the surrounding area. The Draft EIR concludes on page 4.2-138 that the overall visual change, although considerable, is not unexpected in a dense urban environment such as the Cathedral Hill area, and remains in context. The Draft EIR concludes on pages 4.2-238 and 4.2-239 that a visual contrast would exist between the proposed MOB and surrounding area primarily because of the difference in height and bulk. The resulting change would not be substantial and the proposed building would be consistent with the visual character of other commercial and civic buildings in the vicinity (Draft EIR, page 4.2-139).

The existing Cathedral Hill Hotel and 1255 Post Street office building have a simple, nondescript architectural style and are set back into the block. Under the LRDP, the proposed Cathedral Hill Campus buildings would provide more visual interest and would be positioned along the street, which is more common throughout the area. As stated in Impact AE-3 on page 4.2-138 of the Draft EIR, "The proposed Cathedral Hill Hospital would not substantially degrade the existing visual character or quality of the area because the new building would not result in a substantial visual contrast with the area's existing buildings. Therefore, this impact would be less than significant."

As stated on page 3-9 of the Draft EIR, the proposed CPMC LRDP would be generally consistent with the applicable General Plan Urban Design policies. The General Plan Urban Design Height Map allows for heights of up to 240 feet at the proposed site of the Cathedral Hill Hospital, and the requested General Plan amendment to the Urban Design Element Height Map, if approved, would allow the height of the proposed Cathedral Hill Hospital to extend up to 265 feet. As noted in Table 2-3 on page 2-13 of the Draft EIR, the proposed Cathedral Hill Campus would also require a General Plan amendment for the Van Ness Area Plan (VNAP), Planning Code Section 243 text and zoning map amendments, and CU authorizations. Since publication of the Draft EIR on July 21, 2010, the project sponsor has made some modifications to the requested entitlements for the proposed LRDP based upon input from the Planning Department after reviewing the initial application submittal for the near-term projects, including the proposed development of the Cathedral Hill Campus. Therefore, the required project approvals listed in the Draft EIR in Table 2-3, "Required Project Approvals," on pages 2-13 through 2-17 of the Draft EIR have been updated as part of the text revisions to the Draft EIR included on pages C&R 4-37 to C&R 4-42 of this document. Please refer to Responses LU-5 and LU-9 (page C&R 3.3-30 and C&R 3.3-64) for an explanation regarding project approvals and consistency with local plans and policies.

In response to the comment stating that approval of the Cathedral Hill Campus should not set a precedent for other proposed buildings, cumulative land use and aesthetic impacts were analyzed in the Draft EIR. As stated in the Draft EIR on page 4.1-67, "cumulative foreseeable future development would result in an intensification of land uses in the area surrounding the proposed Cathedral Hill Campus because it would include high-density developments ranging from six to 30 stories in height…the proposed LRDP, along with other foreseeable future developments in the area surrounding the proposed Cathedral Hill Campus, would not result in any cumulatively considerable land use impacts." Cumulative impacts related to aesthetics were also concluded to be less than significant. As stated in the Draft EIR on page 4.2-192, "cumulative developments would generally increase the height of development in the vicinity of the

Cathedral Hill Campus site…in general, the cumulative developments would occur in a highly urbanized area of San Francisco…as a result, the cumulative developments would not have a substantial adverse effect on a scenic vista." Please also see the discussion of the potential for creation of a precedent for future out-of-scale development that is presented in Response LU-5, page C&R 3.3-30. It should further be noted that in the future the decision-makers would have the discretion to approve, modify, or reject any future proposed project(s) based on the merits of those individual projects, and would not be bound by any precedent established by their decision on the proposed CPMC LRDP.

The comments express general concern for "quality-of-life" issues and states that the height of the proposed Cathedral Hill Hospital should be reduced. One comment also states that the Sequoias building is out of character and not appropriate for comparison with the proposed hospital. Please see Response LU-9 on C&R 3.3-64 for a discussion of the height and bulk of the proposed Cathedral Hill Campus facilities and their impacts on the existing character of the neighborhood, and Response LU-5 (page C&R 3.3-30) for a discussion of their potential to set a precedent for out-of-scale development within the Van Ness corridor. As discussed in the Draft EIR in Section 4.1.1, "Environmental Setting," buildings of this size and scale are not uncommon in the vicinity. The discussion on pages 4.1-7 through 4.1-11 discusses a wide array of building types in neighborhoods surrounding the proposed Cathedral Hill Campus. The only mention of the Sequoias Building is in Chapter 4.2, Aesthetics, page 4.2-137 of the Draft EIR, wherein it is mentioned that the 26-story Sequoias Building is visible in one of the photographs presented in the Draft EIR. No other comparison is made between the proposed Cathedral Hill Campus and the Sequoias Building. Thus, the scale of the proposed Cathedral Hill Hospital building would not be out of character with other buildings in the area.

The proposed Cathedral Hill Campus would require exceptions and amendments to otherwise applicable requirements of the San Francisco Planning Code, which are described in Section 2.2.4 on pages 2-43 through 2-48 of the Draft EIR, as these pages have been updated as text revisions to the Draft EIR on pages C&R 4-43 to 4-46 of this document. In response to the suitability of the site for the Cathedral Hill Campus, Section 4.1, Land Use and Planning analyzes the compatibility of the proposed project in its surrounding context. Impact LU-3 on page 4.1-55 of the Draft EIR concludes that although the construction and operation of the Cathedral Hill Campus would intensify the use of the site, because it is already a densely developed and active area, land use impacts would be less than significant. Please see Responses LU-5 and LU-9 on C&R 3.3-30 and C&R 3.3-64 for a detailed discussion of the proposed amendments and exceptions to the Planning Code and the environmental issues associated with such changes.

Comment 49-7 reflects a larger discussion regarding impacts related to parking, traffic, air quality, and noise. Please see Response TR-70 (page C&R 3.7-135) regarding parking supply and accommodation of demand at the proposed Cathedral Hill Campus, Responses TR-52 (page C&R 3.7-76) regarding traffic conditions in the Cathedral Hill Campus area, NO-51, and AQ-10 on C&R 3.8-57 and 3.9-26, respectively, for discussions of "quality of life" issues, including traffic, noise, and air quality impacts.

In response to the comment that the proposed LRDP at the Cathedral Hill Campus would eviscerate the plan for the Van Ness corridor, please refer to Response LU-5 (page C&R 3.3-30) for a discussion of the Cathedral Hill Campus and consistency with the Van Ness Area Plan.

The Draft EIR concludes on page 4.2-138 that the proposed Cathedral Hill Hospital would not be incompatible with the diverse mix of uses in the project area. As discussed on page 2-25 of the Draft EIR, current uses includes the existing medical office uses at 1375 Sutter Street, which occupy approximately half of the space in the building.

Please see Response LU-3 (page C&R 3.3-7) which explains how the proposed LRDP is consistent with General Plan housing policies, and Response LU-5 (page C&R 3.3-30) for a discussion regarding the

consistency of the proposed project with the General Plan, and Response LU-9 for a discussion of the relationship of the proposed LRDP to the Planning Code and explanation of the planning code authorizations in order to allow development proposed under the LRDP.

Stories and Heights

One comment states that the analysis of impacts on neighborhood character is not supported because the information on building height is provided only in the number of stories. Both building stories and heights are addressed in the Draft EIR. The discussion on those pages presents an array of data and analysis of the proposed Cathedral Hill Campus, including on square footage of uses, stories, height, as well as a discussion of changes of uses, streetscapes, pedestrian environment, and noise environment. For example, the following statements are presented in the Draft EIR:

- "Campus buildings would intensify uses on the existing area designated for Cathedral Hill Campus development, with a net increase of approximately 905,000 sq. ft. of new space" (Draft EIR, page 4.1-55)

- "Although the hospital would change the character of the site, it would include features that would improve the pedestrian environment and facilitate connections between the proposed campus and the surrounding neighborhood" (Draft EIR, page 4.1-56)

- "The proposed Cathedral Hill Hospital would be 15 stories and 265 feet tall and would replace the existing 10-story, 120-foot-tall hotel and 11-story, 180-foot-tall office building" (Draft EIR, page 4.1-57)

- "Ambulances would access the hospital from this location which may increase the amount of noise from ambulances at nearby residences. Thus, may change the character of the area and potentially result in adverse land-use noise compatibility effects" (Draft EIR, page 4.1-57).

Please also refer to C&R Figure 3.4-1 (C&R 3.4-5) which shows the heights of the proposed Cathedral Hill Campus buildings in context with the heights of the surrounding buildings.

Substantial Evidence

The same comment states that the analysis of neighborhood character, in particular building height, is not supported by substantial evidence because the discussion addresses the numbers of stories of buildings rather than the measured height of those buildings in feet. As is stated above, building height in feet is provided in several parts of the analysis in the Draft EIR. This information, along with the additional details about building stories constitutes substantial evidence. According to Section 15384 of the State CEQA Guidelines, substantial evidence is "enough relevant information and reasonable inferences from this information that a fair argument can be made to support a conclusion, even though other conclusions might also be reached." More specifically, substantial evidence includes "facts, reasonable assumptions predicated upon facts, and expert opinion supported by facts," and expressly does not include "Argument, speculation, unsubstantiated opinion or narrative, evidence which is clearly erroneous or inaccurate, or evidence of social or economic impacts which do not contribute to or are not caused by physical impacts on the environment." The analysis of scale of development, along with other environmental issues in the Draft EIR, is based on facts such as existing and proposed heights, existing and proposed uses, and the like. Therefore, to support the conclusion of a less than significant impact related to neighborhood character, in particular building height, the Draft EIR provides substantial evidence in its data and analysis of the proposed Cathedral Hill Campus.

Comment

(Donald Scherl, October 18, 2010) [74-11 LU]

"6.0 Specific Responses to Summary Subsections with particular reference to Cathedral Hill Campus (cited by EIR section):

4.1: Land Use and Planning:

Impact LU-3 ('The project would not have a substantial impact on the existing character of the vicinity.'): To claim that the insertion of this massive and tall hospital in the middle of a community of elderly housing, free standing residential condominiums and small businesses will not be severely disruptive is to ignore and belittle the obvious. The hospital would of course completely change and dominate the local community, much to the neighborhood's detriment as following sections in the draft EIR and further comments will make clear. Notwithstanding the EIR's summary sentence (above), LU-3 is labeled a clear 'SU' by the Planning Department ('significant and unavoidable impact'). Indeed, it would destroy the neighborhood."

Response LU-14

The comment states that the proposed Cathedral Hill Hospital would have significant and unavoidable impacts and would "destroy" the surrounding neighborhood.

The comment states that Impact LU-3 is labeled SU, or significant and unavoidable, by the Planning Department. This is incorrect. Impact LU-3 is labeled LTS, or less than significant, for all affected campuses (Draft EIR, page 4.1-55). Please see Response LU-13 on C&R 3.3-78 for discussion of the proposed Cathedral Hill Campus facilities and their effects on the existing character of the neighborhood, which states that buildings of the size of the proposed Cathedral Hill Hospital are not uncommon in the vicinity and thus, the scale of the proposed building would not be out of character with other buildings in the vicinity.

Comments

(Hossein Sepas, October 19, 2010) [82-8 LU]

"The Van Ness corridor is supposed to be a residential corridor with activated streets which cater to the residents. A huge medical center is not a relaxing neighbor; all of the ambulance noise is to contrary to quiet living. Pedestrian life will not be vibrant at night when the hospital is closed, it will be dead zone except the occasional visitor to a patient, but most of those visitors will use the garage and not activate the streets of use restaurants, coffee shops, stores or the local cinemas. The existing hotel on the site (which is now closed) was a much more compatible neighbor as it brought people to activate the streets and shops at all hours of the day or night. Furthermore the hospitals proposed mass does not match the goal of a grand unified boulevard; the tall buildings are supposed to go on top of the hills to make San Francisco's famous hills seem taller; Van Ness' residential corridor is supposed to be lower in height than the buildings on the surrounding hills. Van Ness is supposed to be somewhat of a gracious residential boulevard with buildings of a similar height and use."

(Patrick Carney, October 19, 2010) [83-8 LU]

"**The CPMC plan is contrary to the long established goals for the Van Ness corridor:** The Van Ness corridor is supposed to be a 'residential corridor' with activated streets which serve the residents. A huge medical center is not a relaxing neighbor; all of the ambulance noise is contrary to quiet living. Pedestrian life will not be vibrant at night when the hospital is closed, it will be dead zone except for the occasional visitor to a patient, but most of those visitors will use the garage and not activate the streets or use restaurants, coffee shops, stores or the local cinemas. The existing hotel on the site (which is now closed) was a much more compatible neighbor as it brought people to activate the streets and shops at all hours of the day or night. Furthermore the hospital's proposed mass

does not match the goal of a grand unified boulevard with similar setbacks and heights. Van Ness is supposed to be somewhat of a gracious residential boulevard with buildings of a similar height and use. The tall buildings are supposed to go on top of the hills to make San Francisco's famous hills seem taller; Van Ness' residential corridor is supposed to be lower in height than the buildings on top of the surrounding hills. CPMC will spring up from the bottom of Cathedral Hill and be as tall as buildings on top of the hill, contrary to a long established precedent intended to preserve San Francisco's unique scale and topography."

(Wallace Cleland, October 17, 2010) [86-1 LU]

"The proposed building, presented at the recent public review of the CPMC-DEIR before the Planning Commission at City Hall, depicts a new structure at the Cathedral Hill site that would be grossly oversized and functionally ineffective. Its main bulk is depicted at just over 300 feet in height or approximately twice current zoning restrictions for that property on Franklin and Van Ness, Usually, zoning aspects of projected properties are reviewed separately from environmental considerations; however the aspects may be closely related."

Response LU-15

The comments state that the proposed Cathedral Hill Campus would not be compatible with the existing land use because it is not consistent with the goals of the Van Ness Avenue corridor to have a unified boulevard with similar setbacks and heights. The comments state that a noise increase caused by ambulance travel and reduced pedestrian traffic at night would occur with the construction of the proposed Cathedral Hill Campus.

In response to the comment stating that the Cathedral Hill Campus would not be compatible with the existing land use and not consistent with the goals of the Van Ness Avenue corridor, it is presumed that this comment is referencing the Van Ness Avenue Plan (VNAP). Please refer to Response LU-13 (page C&R 3.3-78) for (1) a discussion of the land use and visual compatibility of the Cathedral Hill Campus with the surrounding neighborhood, and (2) size of the Cathedral Hill Campus facilities. The size of the uses in the proposed Cathedral Hill Hospital is also addressed in Major Response HC-2, page C&R 3.23-8. See Response LU-5 (page C&R 3.3-30) for a discussion of the consistency of the proposed LRDP with the VNAP. The discussion on page 4.2-138 of the Draft EIR concludes that the overall visual change with the proposed development, although considerable, would not be unexpected in a dense urban environment such as the Cathedral Hill Campus area and would remain in context.

As stated on pages 2-43 through 2-48 of the Draft EIR, the proposed Cathedral Hill Hospital would require an amendment to the VNAP, in addition to a number of other approvals, before it could be constructed. These pages have been updated as text revisions to the Draft EIR on pages C&R 4-43 to C&R 4-46 of this document to indicate refinements. Since publication of the Draft EIR on July 21, 2010, the project sponsor has made some modifications to the requested entitlements for the proposed LRDP based upon input from the Planning Department after reviewing the initial application submittal for the near-term projects, including the proposed development of the Cathedral Hill Campus. Therefore, the required project approvals listed in the Draft EIR in Table 2-3, "Required Project Approvals," on pages 2-13 through 2-17 of the Draft EIR have been updated as part of the text revisions to the Draft EIR included on pages C&R 4-37 to C&R 4-42 of this document. Specific approvals related to the VNAP include:

- Amendment to Map 1, Generalized Land Use and Density Plan, of the VNAP designate the sites proposed for the new Cathedral Hill Hospital and Cathedral Hill MOB as appropriate for medical institution/medical center use and to increase the maximum FAR from 7:1 to 9:1 for the proposed Cathedral Hill Hospital site and from 7:1 to 7.5:1 for the proposed Cathedral Hill MOB site.

- Amendment to Map 2, Height and Bulk Districts, of the VNAP to designate the block proposed for the Cathedral Hill site as a 265-V Height and Bulk District, which would allow buildings of up to 265 feet tall.

- Amendment to Section 243, Van Ness Special Use District (VNSUD), of the Planning Code to modify the VNSUD to include a new Van Ness Medical Use Subdistrict that would allow a medical center at the Cathedral Hill Hospital and Cathedral Hill MOB site

A CU authorization under Section 303 of the Planning Code would be sought for the proposed Cathedral Hill Hospital and Cathedral Hill MOB to allow them as conditionally permitted uses in the new Van Ness Medical Use Subdistrict and the RC-4 Zoning District. As stated on page 2-43 of the Draft EIR, these amendments and authorizations are proposed as part of the LRDP and must be approved before the proposed Cathedral Hill Campus would be implemented. The LRDP would not move forward without them. If they are approved by decision-makers, the proposed Cathedral Hill Campus would be consistent with the applicable plans and policies.

Please see the Response AE-2 (page C&R 3.4-3) for discussion of the height of the proposed buildings at the Cathedral Hill Campus under the LRDP and their impacts on visual resources.

Ambulance noise would be part of the operation of the proposed Cathedral Hill Campus. Noise impacts associated with ambulances entering and exiting the proposed Cathedral Hill Campus and potential impacts to on-site and off-site noise-sensitive receptors are analyzed on page 4.6-70 and 4.6-71 of the Draft EIR. The Draft EIR states that the use of sirens could result in a substantial increase in ambient noise levels at nearby sensitive receptors. However, as discussed on page 4.6-70 of the Draft EIR, "normal practice would be to turn off the siren within a few blocks of the proposed hospital…as a result, noise associated with the ambulance entrance/exit, without the use of sirens, would comply with the City's noise limit of 8 dB above the ambient noise level at the property line." Please see Response NO-59 on C&R 3.8-64, which includes data showing the change in ambient noise levels associated with siren usage in the Cathedral Hill Campus area. As explained in Response NO-59, the level of siren-related noise that would be experienced by receptors located in the vicinity of the proposed Cathedral Hill Campus would be similar to the level that currently exists in this part of the City and, therefore, would not make the neighborhood less livable.

The comments state that pedestrian life would not be vibrant at night when the Cathedral Hill Hospital is closed. However, like most hospitals, the proposed Cathedral Hill Hospital would operate 24 hours per day. Hospital employees, patients, and visitors would be expected to visit nearby businesses, including restaurants and coffee shops. Pedestrian circulation and activity at the Cathedral Hill Campus is discussed on pages 4.5-130 through 4.5-134 of the Draft EIR. The proposed Cathedral Hill Campus would result in an increase in pedestrian activity in the vicinity of the campus, compared to existing conditions for the a.m. and p.m. peak hour. Therefore, compared to the former hotel, pedestrian activity would not be reduced with the proposed hospital development.

Comment

(Richard Margary, September 23, 2010) [PC-218 LU]

"The new facilities fit well into the City's larger plans for the Van Ness and the Geary corridors,..."

Response LU-16

This comment states that the facilities at the proposed Cathedral Hill Campus would fit well into the City's larger plans for the Van Ness and Geary corridors. The comment is noted. The comment does not raise issues regarding the adequacy, accuracy, or completeness of the Draft EIR. The comment will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project.

Comment

(Ted Weber, October 12, 2010) [52-1 LU]

"The Draft Environmental Impact Report submitted by the California Pacific Medical Center poses many substantial negative environmental impacts---including compliance with the Planning Code and severe traffic problems (both during construction and continuing should the project be completed)."

Response LU-17

The comment states that the proposed CPMC LRDP would not be in compliance with the Planning Code, and would have a negative impact on traffic. Please see Response LU-9 (page C&R 3.3-64) for a discussion of the proposed LRDP's consistency with the Planning Code. It is acknowledged in the Draft EIR (as explained below) that construction and operation of the project would result in significant and unavoidable impacts on transportation and circulation in some cases. The proposed LRDP would result in significant and unavoidable transportation and circulation impacts for the each of the following locations:

Cathedral Hill Campus

- At the intersections of Van Ness/Market and Polk/Geary with the implementation of the proposed Cathedral Hill Campus project or the Two-way Post Street or MOB Access Variants (Impact TR-1, page 4.5-93; Impact TR-2, page 4.5-98; Impact TR-6, page 4.5-102; Impact TR-7, page 4.5-105; Impact TR-12, page 4.5-107; and Impact TR-13, page 4.5-108 of the Draft EIR)

- At the intersection of Franklin/Bush with the MOB Access Variant (Impact TR-8, page 4.5-105 of the Draft EIR);

- At the proposed MOB driveway on Geary Street with implementation of the Cathedral Hill Campus project with the MOB Access Variant (Impact TR-17, page 4.5-110; and Impact TR-42, page 4.5-135 of the Draft EIR)

- Contribution to the combined impact of the Cathedral Hill Campus and BRT projects under the proposed Cathedral Hill Campus project, or the Two-Way Post Street or MOB Access Variants at the intersection of Van Ness/Market, if the proposed Van Ness Avenue BRT and Geary Street Corridor BRT projects are implemented (Impact TR-20, page 4.5-114; Impact TR-23, page 4.5-115; and Impact TR-26, page 4.5-116 of the Draft EIR)

- Contribution to the combined impact of the Cathedral Hill Campus and BRT projects under the proposed Cathedral Hill Campus project, or the Two-Way Post Street, or MOB Access Variants at the intersection of Polk/Geary, if the proposed Van Ness Avenue BRT and Geary Street Corridor BRT projects are implemented (Impact TR-19, page 4.5-113; Impact TR-22, page 4.5-115; and Impact TR-25, page 4.5-116 of the Draft EIR)

- The proposed Cathedral Hill Campus project, or the Two-Way Post Street or MOB Access Variants would increase congestion and ridership which would impact operations of the 49-Van Ness-Mission, 38/38L-Geary, 19-Polk bus routes (Impact TR-29, page 4.5-120; Impact TR-30, page 4.5-123; Impact TR-31, page 4.5-123; Impact TR-31, page 4.5-124; Impact TR-33, page 4.5-126; Impact TR-34, page 4.5-126; Impact TR-35, page 4.5-127; and Impact TR-36, page 4.5-128 of the Draft EIR)

- Transportation impacts in the project vicinity resulting from construction vehicle traffic and construction activities under the proposed Cathedral Hill Campus project, or the Two-Way Post

Street or MOB Access Variants, that would affect the transportation network (Impact TR-55, page 4.5-147; Impact TR-56, page 4.5-160; and Impact TR-57, page 4.5-161 of the Draft EIR)

Davies Campus

- At the intersection of Church/Market/14th Street (Impact TR-75, page 4.5-186 of the Draft EIR)

Cumulative

- At the intersections of Van Ness/Market and Polk/Geary with the implementation of the proposed Cathedral Hill Campus project, or the Two-way Post Street or MOB Access Variants (Impact TR-99, page 4.5-216; Impact TR-101, page 4.5-219; Impact TR-105, page 4.5-221; Impact TR-108, page 4.5-223; Impact TR-111, page 4.5-225; and Impact TR-113, page 4.5-226 of the Draft EIR)
- At the intersection of Van Ness/Pine with the implementation of the proposed Cathedral Hill Campus project, or the Two-Way Post Street or MOB Access Variants (Impact TR-100, page 4.5-219; Impact TR-107, page 4.5-222; and Impact TR-112, page 4.5-225 of the Draft EIR)
- At the intersection of Gough/Geary, Franklin/Bush, with the implementation of the proposed Cathedral Hill Campus project with the Two-Way Post Street Variant (Impact TR-104, page 4.5-221; and Impact TR-106, page 4.5-222 of the Draft EIR)
- Contribution to the combined cumulative impacts of the Cathedral Hill Campus and BRT projects under the proposed Cathedral Hill Campus project, or the Two-Way Post Street or MOB Access Variants, at the intersection of Polk/Geary and Van Ness/Market if the proposed Van Ness Avenue and Geary Corridor BRT projects are implemented (Impact TR-117, page 4.5-228; Impact TR-118, page 4.5-229; Impact TR-120, page 4.5-230; Impact TR-121, page 4.5-230; Impact TR-123, page 4.5-231; and Impact TR-124, page 4.5-232 of the Draft EIR)
- At the intersection of Church/Market/14th Street with the implementation of the Davies Campus project (Impact TR-127, page 4.5-233 of the Draft EIR)
- The proposed Cathedral Hill Campus project, or the Two-Way Post Street or MOB Access Variants would increase congestion and ridership which would impact operations of the 49-Van Ness-Mission, 47-Van Ness, 38/38L-Geary, 19-Polk, and 3-Jackson bus routes (Impacts TR-133 through TR-147, pages 4.5-237 through 4.5-245 of the Draft EIR)
- Cumulative construction impacts in the project vicinity for the proposed Cathedral Hill Campus project and all variants (Impact TR-152, page 4.5-247 of the Draft EIR)

The comment will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project.

Comment

(Barbara Kautz—CHNA and Bernal Heights Neighborhood Center, October 19, 2010) [87-49 LU, duplicate comment was provided in 108-49 LU]

"Finally, the Van Ness Area Plan requires that the east-west minor streets should provide safe and attractive pathways for pedestrian travel (policy 9.11): Instead, the proposed Cathedral Hill Hospital would convert Post Street almost entirely to passenger and vehicle loading and unloading, while a large portion of Cedar Street would similarly be converted to passenger loading."

Response LU-18

The comment states that the VNAP calls for east-west minor streets to be safe and attractive pathways for pedestrian travel, and that the proposed Cathedral Hill Hospital's Post Street conversion and Cedar Street would be inconsistent with this policy as the proposed project would include passenger/vehicle loading and unloading on these streets.

As stated on page 2-34 of the Draft EIR, CPMC proposes to upgrade the pedestrian environment and provide safe and attractive pedestrian pathways by improving the street frontages in the Cathedral Hill Campus area, which includes portions of Post and Cedar Streets. To achieve this objective, walkway widths would be expanded and substantial landscaped areas would be added to provide a buffer between pedestrians and traffic lanes. The proposed streetscape design is shown in Figure 2-37, "Cathedral Hill Campus—Proposed Streetscape Plan" (Draft EIR, page 2-101) and described below.

Lighting treatment is proposed near the corner of Van Ness Avenue and Post Street, which is intended to create a façade that is well-lit both during the day and at night. This would be achieved by integrating light-emitting diode (LED) fixtures within the glass façade at Levels 1, 3, and 4 of the podium structure of the proposed Cathedral Hill Hospital. The LED fixtures would be positioned within the insulated glazing assembly and screened to create a soft, diffused, and uniform appearance. The LED fixtures would be controllable, allowing the light intensity to be managed and gradually dimmed as appropriate.

New pedestrian-level streetlights are proposed for installation along Cedar Street. Additional pedestrian-level lighting would be provided and installed at the sites of the proposed hospital and MOB. The building lobbies and *portes cochères* would be well lit, and light would spill from those spaces onto the sidewalks. Vehicular entrances and drop-off zones accessed from Geary Boulevard serving the proposed Cathedral Hill Hospital would be *portes cochères* that could create inviting entries for hospital users and other pedestrians.

As described on page 2-36 of the Draft EIR, the west end of Cedar Street near Van Ness Avenue would be transformed into an entry plaza for the proposed Cathedral Hill MOB, with tactile warning tiles and lighted bollards. Concrete or special paving would extend from the north side of the proposed Cathedral Hill MOB to the existing Concordia Club building north of Cedar Street. East of the entry plaza/drop-off area, Cedar Street and the adjacent sidewalk pavement would be enhanced with concrete or special pavers. In addition, Cedar Street would include landscaping (see Figure 2-37 on page 2-101 of the Draft EIR).

Sidewalks would be widened by approximately 6 feet along both Van Ness Avenue and Post Street, except at the proposed CPMC shuttle stop (located on Post Street near Van Ness Avenue). Seating would be installed along Van Ness Avenue, near the shuttle stop on Post Street and within the plaza area of the proposed Cathedral Hill MOB.

Contrary to the comment stating that a large portion of Cedar Street and Post Street would be converted to passenger/vehicle loading, a limited portion of these streets would be designated for passenger/vehicle loading and unloading activities, as shown in Figure 4.5-16 (Draft EIR, page 4.5-91) and Figure 4.5-21 (Draft EIR, page 4.5-143). Passenger/vehicle loading and unloading would be limited to areas 43 feet in length on Cedar Street (out of a total block length of approximately 400 feet) and 135 feet in length on Post Street (out of a total block length of approximately 425 feet). The discussion on page 4.5-142 of the Draft EIR concludes, "hospital passenger loading demand would be accommodated within the proposed supply," and "because the on-street passenger loading/unloading activities on Cedar Street…would be actively monitored, and since additional passenger loading/unloading would be provided within the Cathedral Hill MOB parking garage, the proposed Cathedral Hill MOB's impacts related to passenger loading/unloading activities would be less than significant."

The landscaping, lighting, and streetscape proposed for Post Street and Cedar Street would be consistent with VNAP policy 9.11, providing pathways for pedestrian travel, and passenger/vehicle loading and unloading activities would be less than significant.

Comment

(Margaret Kettunen Zegart, October 20, 2010) [97-7 LU]

"The Geary street location for the main entrance is questionable along the one way arterial, Geary and the plan needs some landscaped open areas (down town density requirement)."

Response LU-19

The comment discusses the location of the Geary Street entrance and states that, under the LRDP, the proposed Cathedral Hill Campus needs landscaped open areas to comply with a downtown density requirement.

The comment presumably references the ingress-only access to the proposed Cathedral Hill Hospital from Geary Boulevard for patient drop-off and parking, as shown in Figure 2-4 on page 2.53 and Figure 4.5-16 on page 4.5-91 of the Draft EIR. The ingress-only access to the proposed Cathedral Hill Hospital would be used for patient loading/unloading, and for emergency vehicles. As described on page 4.5-141 of the Draft EIR, the interior passenger loading/unloading zone at the Cathedral Hill Hospital would be accessible from Geary Street and Post Street. There would be a separate travel lane to allow passenger cars to bypass stopped vehicles. The discussion on page 4.5-142 of the Draft EIR concludes that the proposed Cathedral Hill Hospital loading demand would be accommodated within the proposed supply. Emergency vehicle access for the proposed Cathedral Hill Hospital is analyzed on pages 4.5-145 through 4.5-146 of the Draft EIR. Geary Boulevard/Street is identified as one of seven likely routes to the proposed Cathedral Hill Hospital. The discussion on page 4.5-146 of the Draft EIR concludes that emergency vehicle access impacts at the proposed Cathedral Hill Hospital would be less than significant. No significant impacts associated with site access were identified in the Draft EIR. It should also be noted that the Draft EIR concluded that the proposed Cathedral Hill Campus would create less-than-significant impacts related to bicycle/vehicle and pedestrian conflicts, including at the Geary Blvd main entrance (please see the discussion of Impact TR-37, DEIR page 4.5-128).

As stated in Response LU-1 (page C&R 3.3-1), the Draft EIR acknowledges that compliance with the recently adopted Better Streets Plan would be required as part of the streetscape plan for each campus (Draft EIR, pages 2-48, 2-146, and 2-185). There is no density requirement related to landscaped open space areas at the proposed project site. The San Francisco Planning Code currently requires that open space be provided to serve residential uses. The proposed Cathedral Hill Campus falls within the VNAP, which specifies that "the requirement of 36 square feet of open space for each dwelling unit should continue to apply. Development of common usable open space could substitute for private open space at a ratio of 1.33 to 1 provided that this space would be for the exclusive use of project residents. Common open space should include such uses as multipurpose rooms to be used for exercise rooms, solaria, recreational facilities, green spaces and open space play areas."[40] Because the proposed Cathedral Hill Campus is not residential in nature, it is not required to provide open space as specified above. However, the proposed Cathedral Hill Campus would include streetscape design, landscaping, and open space.

The Better Streets Plan creates a unified set of standards, guidelines, and implementation strategies to govern how the City designs, builds, and maintains its pedestrian environment. Major themes of the Better Streets Plan involve distinctive streetscape design, including street trees and lighting; improved

[40] San Francisco Planning Department. Van Ness Avenue Area Plan. http://www.sf-planning.org/ftp/General_Plan /Van_Ness_Ave.htm. Accessed March 21, 2011.

street ecology; and extensive greening, including sidewalk plantings. If the proposed LRDP is approved, compliance with the Better Streets Plan would be confirmed during final design review.

As stated on page 2-34 of the Draft EIR, CPMC proposes to upgrade the pedestrian environment by improving the street frontages in the Cathedral Hill area. To achieve this objective, walkway widths would be expanded and substantial landscaped areas would be added to provide a buffer between pedestrians and traffic lanes. The proposed streetscape design is shown in Figure 2-37, "Cathedral Hill Campus—Proposed Streetscape Plan" (Draft EIR, page 2-101). As stated on page 2-36 of the Draft EIR, a new landscape plan is proposed for the Cathedral Hill Hospital and Cathedral Hill MOB, featuring distinctive groupings and compositions of plant materials set in sidewalk garden areas intended to be compatible with the solar, wind, and wet/dry-cycle conditions around the various street frontages. The draft streetscape plan for the proposed Cathedral Hill Campus includes a planting plan for street trees along all streets bordering the sites of the proposed Cathedral Hill Hospital and Cathedral Hill MOB. New landscaping also would be placed in the interior of the hospital site, and within the roof garden, courtyards, and private open space for hospital patients, employees, and visitors.

Comments

(Stephanie Barton, et al.—Hastings Civil Justice Clinic for the Good Neighbor Coalition, October 19, 2010) [104-10 LU]

"The bottom line is that there is no reasoned analysis in support of the DEIR's assertion that the "project would not have a substantial impact on the existing character of the vicinity"[9] surrounding the proposed Cathedral Hill Campus. The DEIR ignores the degree to which intense development of housing already characterizes development on Van Ness Avenue and completely disregards the project's reasonably foreseeable future impact on housing development within the Van Ness Area Plan without mitigation. Instead, it describes the immediate neighborhood in a distorted way that downplays the area's now dominant residential character. It also overlooks the impact of the project on the Tenderloin, an adjacent neighborhood. The project involves the development of an enormous hospital and medical office complex. It borders on the absurd that the DEIR does not acknowledge and account for the project's dramatic impact on the surrounding neighborhoods.

[4] DEIR 4.1-55. "

(Dina Hilliard, September 23, 2010) [PC-53 LU]

"We were disappointed and frankly offended to find the geographic scope of their Draft EIR blatantly ignores the impacts of the development upon the Tenderloin and Central City. It is difficult to understand that CPMC makes claims of servicing our community and then denied those services have any impacts on that community."

Response LU-20

The comments state that the Draft EIR ignores the impacts of the proposed CPMC LRDP development on the Tenderloin and elsewhere in the central portion of the City.

The environmental analyses contained in the Draft EIR address the direct and indirect environmental impacts of construction and operation of the proposed LRDP. The extent to which these impacts would occur in nearby neighborhoods (and citywide where relevant) is disclosed in the Draft EIR. In addressing view effects of the project, Viewpoint #2 shown on Figure 4.2-3, page 4.2-15 of the Draft EIR, depicts the view of the project site from Geary Street near Larkin Street, in the Tenderloin. The transportation analysis evaluated traffic conditions at five intersections along Polk Street on the western edge of the Tenderloin (as shown on Figure 4.5-1 on page 4.5-2 of the Draft EIR), and analyzed potential effects on transit corridors and bicycle routes that traverse the Tenderloin (as shown on Figures 4.5-6 and 4.5-11 on pages 4.5-18 and 4.5-34 of the Draft EIR, respectively).

A supplemental analysis was prepared for intersections in the Tenderloin and Civic Center areas, as documented in the technical memorandum *Supplemental-Sensitivity Transportation Impact Analyses for the California Pacific Medical Center Cathedral Hill Campus in San Francisco, CA* (Fehr & Peers, January 6, 2011). The findings of the analysis are summarized in Response TR-64 (page C&R 3.7-119). This supplemental analysis evaluated seven additional study intersections in the Tenderloin and Civic Center neighborhoods generally bounded by Geary Street to the north, Leavenworth Street to the east, Market Street to the south, and Polk Street to the west. While the Draft EIR trip distribution assumptions were reasonable for the original analysis, and consistent with trip distribution methodology in the *SF Guidelines*, the sensitivity analysis was conducted to determine what effect, if any, would be generated if a higher percentage of motorists traveling to the proposed Cathedral Hill Campus from Superdistrict 1, Superdistrict 3, and the freeway were to use alternate routes, primarily through the SoMa and Tenderloin, rather than those assumed in the Draft EIR. The sensitivity analysis was prepared for informational purposes only; therefore, the trip distribution used in the Draft EIR was not changed because the analysis remains reasonable and accurate.[41] The results of that analysis illustrated that the proposed Cathedral Hill Campus would increase vehicle trips through the Tenderloin Neighborhood study area and as a result, could increase the number of conflicts between vehicles, pedestrians, and bicyclists. However, this increase would not result in significant impacts. Nevertheless, examples of improvements at the study intersections were identified that could reduce conflicts between various modes (see Response TR-64, page C&R 3.7-119). Although the impacts on pedestrians were determined to be less than significant, as part of implementation of Improvement Measure I-TR-40, the project sponsor could provide funding for the Tenderloin Neighborhood study or for implementation of additional streetscape, pedestrian, and related improvements in the vicinity of the proposed LRDP campuses. While not required, the sponsor understands this would improve the less-than-significant impacts to the pedestrian and bicycling environment. Please also see Response TR-124, page C&R 3.7-207).

Overall, the analyses in the Draft EIR do not fail to evaluate effects in nearby neighborhoods, including the Tenderloin. Please also see Responses PH-23 (page C&R 3.5-79) and PH-18 (page C&R 3.5-67) for a discussion of the potential effects of the proposed LRDP on businesses and residents in neighborhoods adjacent to the CPMC campuses, including the Tenderloin and Central City areas.

One comment also states that the Draft EIR fails to consider the potential effect of the project on healthcare service delivery to neighborhoods near the proposed Cathedral Hill Campus, including the Tenderloin and the Central City. Major Response HC-8 addresses the effects of the proposed LRDP on access to healthcare throughout the City as well as in specific neighborhoods such as the Tenderloin (please see page C&R 3.23-32). This same issue is also addressed in Responses HC-7 (page C&R 3.23-74), HC-10 (page C&R 3.23-86), and HC-12 (page C&R 3.23-91).

3.3.2.2 VAN NESS SPECIAL USE DISTRICT 3:1 RESIDENTIAL/NET NEW NON-RESIDENTIAL REQUIREMENT

Comments

(Calvin Welch—Council of Community Housing Organizations, October 13, 2010) [53-1 LU]

"The DEIR on CPMC is neither complete nor accurate and should be amended to:

- more completely address existing conditions in the project area, specifically the requirements of the Van Ness Ave. SUD;

- accurately address current City policy effecting developments of the proposed type;"

[41] *Supplemental-Sensitivity Transportation Impact Analyses for the California Pacific Medical Center Cathedral Hill Campus in San Francisco, CA*", which is located in Appendix E of the C&R document.

(Linda Chapman, October 19, 2010) [76-2 LU, duplicate comment was provided in 111-2 LU]

"Exemption from the zoning for housing and limited commercial uses envisaged by the area plan is a huge demand, where that plan comprises a well integrated set of policies that further interdependent objectives. VNAP objectives include: Transform a commercial corridor into an imposing boulevard, by adding residential development and landscaping; Use height limits to create the consistent profile appropriate for a grand boulevard, following topography by stepping up building heights from the waterfront to a mid-rise profile along the high ridge of the boulevard; Allow sufficient height to encourage dense housing while avoiding traffic-inducing high rise development; Foster preservation of architecturally significant commercial buildings, and CONSIDER permitted heights to avoid visual incongruity with classic buildings; Promote residential development on a transit corridor (especially affordable housing), by encouraging high density and small units; Prevent traffic-generating commercial development, such as offices; Limit new commercial space to lower stories of residential development, where it buffers street noise; Limit bulk and potential wind/shadow/view impacts of mid-rise buildings, using design features like set-backs and podiums; Break up wide building frontages; Improve traffic circulation and transit on a major highway and transit artery (contemplating subway construction as the long-range goal to avoid transit conflicts)."

(Linda Chapman, October 20, 2010) [76-3 LU, duplicate comment were provided in 111-3 LU]

"The current project undermines the purpose of an area plan elegantly designed to produce housing instead of business that generates housing demand. The proposed use creates housing demand that will put pressure on availability and prices in surrounding neighborhoods."

(Linda Chapman, October 19, 2010) [76-5 LU, duplicate comment was provided in 111-5 LU]

"The Housing Mitigation strategy proposed below could address an overarching VNAP objective to produce centrally located affordable housing. In addition to new construction, funding for nonprofit CDCs to acquire and manage existing buildings as affordable housing would be appropriate ways to mediate the 3:1 housing requirement established for the Special Use District (SUD). Funding rehabilitation is consistent with later policies encouraging sustainable development. Removal of residential hotel units to make way for the MOB is governed by the Residential Hotel Unit Demolition and Control Ordinance. Reducing scarce housing resources is a situation where renovation cannot substitute for funding construction of replacement SRO units or efficiency apartments. Mitigation for a few dwelling units proposed for demolition together with the SRO could also fund the same project."

(Barbara Kautz—CHNA and Bernal Heights Neighborhood Center, October 19, 2010) [87-45 LU, duplicate comment was provided in 108-45 LU]

"The proposed Long Range Plan includes no residential development and converts a large block to neither residential nor commercial development."

(Gloria Smith—California Nurses Association, October 19, 2010) [90-58 LU]

"• The DEIR omitted new housing required under current City regulations, which CPMC is now seeking an exemption from constructing.[28]

[28] DEIR at page 4.3-33."

(Gloria Smith—California Nurses Association, October 19, 2010) [90-74 LU]

"Generally speaking, a revised EIR must show that CPMC will replace units demolished as a result of construction of the Cathedral Hill campus. In addition, a revised EIR must show that CPMC will provide housing required under the Van Ness Avenue Area Plan and other policies calling for housing on a square footage basis based on commercial development, along with impact fees and other means of generating financing for housing that is affordable for the Project's workforce."

(Stephanie Barton, et al—Hastings Civil Justice Clinic for the Good Neighbor Coalition, October 19, 2010) [104-11 LU]

"**B. The DEIR fails to take into account or analyze properly San Francisco Planning Code provisions that require project developers to contribute to the development of housing, especially affordable housing.**

1. Virtually nothing in the DEIR helps decision makers understand the specific consequences of modifying or providing an exception to the housing development requirements of the Van Ness Special Use District (VNSUD).[10]

The VNSUD requires new construction projects to develop three square feet of residential floor space for every square foot of non-residential floor space developed.[11] Developers may reduce the amount of residential floor space they are required to build by up to 50% if they make in-lieu payments into San Francisco's Affordable Housing Fund.[12] Because the Planning Commission may, by conditional use, modify the 3: 1 housing ratio,[13] the DEIR presumes that the Planning Commission will grant the project a modification of VNSUD's residential development requirement. But the DEIR never explicitly states what modification the project is seeking.[14] As a result, the DEIR never analyzes the housing development consequences of granting a modification. Nothing in the DEIR helps a public official understand the magnitude of new housing development that *will* not be undertaken if a modification is granted, nor how much of that loss *will* be offset by a contribution to the Affordable Housing Fund.

[10] San Francisco Planning Code §243.
[11] Planning Code § 243(c)(8)(A).
[12] Planning Code § 243(c)(8)(B).
[13] Planning Code § 243(c)(8)(B)(iv)
[14] DEIR 2-45."

(Stephanie Barton, et al.—Hastings Civil Justice Clinic for the Good Neighbor Coalition, October 19, 2010) [104-12 LU]

"The DEIR also *fails* to provide necessary information for determining the amount of housing that needs to be built. This determination requires subtracting occupied floor area in existing buildings from occupied floor area in the new proposed buildings.[15] DEIR Table 2-5 provides incomplete information on relevant square footage for the existing buildings on the proposed Cathedral Hill hospital and medical office building sites.[16] Consequently, it is impossible to determine what the residential square footage requirements may be.

[15] Planning Code § 243(c)(8)(A).
[16] DEIR 2-21."

(Stephanie Barton, et al.—Hastings Civil Justice Clinic for the Good Neighbor Coalition, October 19, 2010) [104-13 LU]

"No project is automatically exempt from the 3: 1 residential development requirement of the VNSUD. There is, however, a discretionary general exception clause.[17] Four conditions need to be met to trigger its application as part of the approval process for a specific project. There must be findings that (1) granting the exception *will* not significantly compromise the 'overall objective of adding a substantial increment of new housing on Van Ness Avenue'; (2) the project meets an "important public need," for which a medical use may qualify; (3) the public need cannot reasonably be met elsewhere in the area; and (4) housing cannot reasonably be included in the project.[18] Nowhere in the DEIR is there a discussion of the effects of granting an exception on achieving the intense housing development envisioned for Van Ness Avenue as set forth in the VNAP and implemented through the VNSUD. There is also no serious identification and examination of specific sites elsewhere in the area that would be reasonably suitable for a medical campus.

[17] Planning Code § 243(c)(8)(B)(iv)
[18] *Id.*"

(Stephanie Barton, et al.—Hastings Civil Justice Clinic for the Good Neighbor Coalition, October 19, 2010) [104-14 LU]

"An EIR is supposed to help decision makers make informed choices about the environmental consequences of their decisions. According to State CEQA Guidelines, '[t]he purpose of an environmental impact report is to identify the significant effects on the environment of a project, to identify alternatives to the project, and to indicate the manner in which those significant effects can be mitigated or avoided.'[19] With respect to enforcing provisions of the VNSUD, the DEIR is silent on providing critical information necessary to determine whether an exception to the 3:1 residential requirement is permissible, what would be the consequences for housing development on Van Ness Avenue if it were justifiable, and what would be appropriate housing mitigation measures to diminish the effects of granting such an exception. The manner and degree of CPMC's compliance with the VNSUD's housing policy has direct and indirect consequences for the physical development of Van Ness Avenue. Such physical impacts have to be considered in an EIR.[20]

[19] CEQA Guidelines §21002.1.
[20] CEQA Guidelines §§ 15126.2(a), 15064(d), 15131(a)."

(Hisashi Sugaya—Planning Commission Oct. 15, 2010) [116-9 LU]

"Since the proposed project is governed, in part, by the Van Ness SUD, an evaluation of Planning Code Section 243. Van Ness Special Use District. Sec. 243.(c)(8)(A)-(C) should be included."

(Steve Woo, September 23, 2010) [PC-62 LU]

"And so, we, as community organizers, and as community members, we have been doing a lot of outreach and a lot of education about this to see what our community feels, and a lot of people are wondering, a lot of people are curious why this [VNAP housing requirement] has not been addressed, why it has been ignored, and so our community is very closely watching this situation to see what type of enforcement will be brought to already existing law and to see if this developer is going to get away with not following the law. So, we continue to watch very closely, we continue to ask CPMC and this Planning Commission to make sure that the Van Ness Avenue Area Plan is enforced and that the 3:1 housing requirement is enforced. Thank you."

Linda Chapman, September 23, 2010) [PC-280 LU]

"Linda Chapman, 1316 Larkin Street. I'm here today representing the Van Ness Plan, which I hope you will become familiar with if you aren't already. I realize it may sound old and musty, but for more than 20 years, it's been the guideline that has directed what's been developed on Van Ness, and what CPMC has proposed violates every objective of the Van Ness Plan. Now, I also believe that a win-win solution is probably, probably even though no hospital is supposed to be built, no office buildings, nothing but housing with retail beneath, you know, minimal retail. I believe that this is not a bad location for a hospital to replace an office building and a hotel, provided that, in other respects, it follows the Van Ness Plan. If it's going to completely violate the Van Ness Plan with the height limit, with not producing housing, etc., which is required of every developer at a ratio of 3:1, and of course will not all be located within the Van Ness area, but could be located on many sites in the Polk Gulch, Tenderloin, and even South of Market, if they pay for that. Otherwise, there is the No Project alternative, which means they can still build their hospital, but they can build it on the campuses where it is instead of bringing it here."

(Kevin Kitchingham, September 23, 2010) [PC-303 LU]

"Though CPMC bought their property on the Van Ness Corridor years after the Special Use District was in effect, they decided that, rather than honoring the laws and the planning code of the City requiring that the provide housing at a rate of 3:1 on the corridor, profit is what matters most."

(Kevin Kitchingham, September 23, 2010) [PC-307 LU]

"…where 100 percent of the developer's obligations under the existing code, particularly that in the Van Ness Special Use District..."

(Commissioner Olague, September 23, 2010) [PC-373 LU]

"I want to apologize in advance because I have a cold, so I'm not feeling as on top of things as usual, so I'll try to get through this quickly. And I will also be submitting written comments for staff to note. I guess the glaring omission for me was the fact that the Van Ness Special Use District, to me, was not really adhered to in any of the alternatives, really, or in the project itself. And what I guess bothered me was the Van Ness SUD Housing requirements were ignored in the Environmental Impact Report. And I hear a lot of justification for that being that, well, you know, there's this assumption that this Commission will be approving – I guess the SUD will be either approved at the Board, or that we would somehow be accommodating of the Conditional Use, which is one of the options, I guess, as far as the SUD and housing on Van Ness is concerned, but I'm not – because that is not really conclusive, it is hypothetical, I think it is problematic that analysis of that is not provided in the Environmental Impact Report. And so there is no analysis at all of the Housing requirement and how it complies with the SUD. There are no calculations. The affordable housing reductions exceptions for up to, I guess, 50 percent of the overall required 3:1 housing, I believe, is what is mandated by the SUD, so there aren't any calculations or anything of what the requirement of this project would be, should SUD not be adopted, or a Conditional Use not be allowed. So, if it were up to me, which it is not, obviously, I would actually ask that that be provided and the EIR – the Draft EIR re-circulated before moving forward with this, that is what I would prefer to see. I think it's a glaring absence that needs to be included at some point, at least."

(Commissioner Olague, September 23, 2010) [PC-381 LU]

"I might also comment that I guess at Land Use committee on Monday, there was a resolution passed, a resolution supporting existing area plan housing requirements, and they do mention here, 'Whereas the characteristic of these Area Plans is to incentivize or require production of housing units as a byproduct of any new development in the area, for example, Van Ness Area Plan, codified in the Van Ness Special Use District portion of the Planning Code which requires that housing be built to a ratio of 3:1 over commercial is an example of such a plan.' So it seems to me that this is kind of a sentiment that the – and that also the housing job linkage, you know, a lot of that stuff to me wasn't robustly looked at in this document. But, if this is kind of the direction that the Board of Supervisors is taking, to hold these projects accountable as they relate to the Plan housing requirements, then I think that we should be looking or analyzing a project that adheres to that part of the General Plan and the Code. So, I might have more comments today, but then I will also have some in writing."

(Commissioner Miguel, September 23, 2010) [PC-385 LU]

"As to the Van Ness Special Use District and the Housing requirement, it is my analysis that, if there is a Code, a law in place, regarding an area of the City, and we are having an EIR on a Development that is within that area, then that must be taken into consideration. Whether or not it is waived is an unknown, but the fact that it is a requirement could possibly be waived, but that it is in the Code, has to be taken into consideration. So, the effect of that housing that is required within a Code would affect the EIR, obviously, particularly housing of that amount. And I don't think it's analyzed, truthfully, at all in any detail whatsoever. I'm not saying it has to be built, even required directly there, but that's a lot of housing possibility that is already required by a Code, and to pretty much ignore it does not, to my mind, make a Draft EIR complete and I think that has to be analyzed without question."

(Commissioner Antonini, September 23, 2010) [PC-391 LU]

"Thirdly, in terms of the Van Ness Special Use District, my understanding is that the housing would of course be under what was in effect at the time it was applied or maybe even now, I think it's 85 percent market rate and 15 percent affordable, so that would be what would have to be built by that ratio, or whatever the ratio is, if that was required to be done. And finally, let's see, in terms of whether or not that has to be part of the analysis in the EIR,

as you know, not every alternative has to be analyzed, although it is part of the law, those projects that have been built, which are non-residential projects, or partially residential projects, have been exempted in the past, you know, along Van Ness since the passage of this. Only those that actually were residential were compliant and they generally were retail or some commercial on the bottom floors, and then residential in the upper floors, and I think that is what the SUD was proposed to analyze, and I don't know that anybody – we don't know the intent of the framers when it was first put into effect, I think, in the '80s, if I'm not mistaken, it might have been the late '70s, that, you know, it was to apply to replacing a hotel with a hospital, if it was applied to these other uses. So that would be kind of an interesting question is what is its applicability."

(Commissioner Antonini, September 23, 2010) [PC-393 LU]

"And, no, you may not need to analyze the 3:1 housing if it's totally non-viable, then if there's no hospital, there won't be any housing either. So, you know, I think one of the reasons you don't need to analyze something is if the analysis is a non-viable situation, I'm not sure about that, but I'd have to check with the City Attorney on CEQA law because…."

Response LU-21

The following is a summary of the substantive comments:

- The Draft EIR should include an evaluation of Planning Code Section 243 and Section 243 (c)(8)(A)-(C);
- The Draft EIR should demonstrate how CPMC would replace the units demolished by construction of the proposed Cathedral Hill Campus, and how CPMC would provide housing required under the VNAP.
- The Draft EIR does not take into account or analyze the San Francisco Planning Code provisions that would require the developers to contribute to the development of housing, especially affordable housing.
- The Draft EIR does not discuss whether an exception to the 3:1 requirement is permissible, and it does not consider the consequences of modifying the VNSUD's residential development and what the consequences for housing development on Van Ness Avenue would be.
- The Draft EIR does not provide the necessary information to determine what the residential square footage requirements would be for the site.
- Projects are not automatically exempt from the 3:1 ratio of residential to net new non-residential development requirement of the VNSUD. The Draft EIR does not discuss the effects of granting an exception on achieving the housing development envisioned for Van Ness Avenue as set for in the VNAP and does not identify specific sites in the area that would be reasonably suitable for a medical campus.
- The VNSUD was in effect before CPMC purchased the Cathedral Hill Hospital property, and, if the proposed hospital was constructed, the 3:1 ratio should be met in other areas of the city.
- The Draft EIR has not considered the jobs-housing linkage program.
- The Draft EIR did not include an alternative that included compliance with the 3:1 residential to net new non-residential requirement of the Van Ness SUD.

- The Draft EIR should consider the project's compliance with the VNAP, including the use and height requirements.
- The Draft EIR should consider the No Project Alternative.
- The Draft EIR may need to be recirculated.

This response first addresses the adequacy of the Draft EIR's analysis, and then provides the additional information requested by the comments.

1. Draft EIR Analysis of VNSUD 3:1 Residential/Net New Non-Residential Provision

Several comments, including those provided by Planning Commissioners, relate to the proposed LRDP's request for a CU authorization or Planning Code amendment to modify the 3:1 residential/net new non-residential ratio in Planning Code Section 243 (Van Ness Special Use District). The comments request additional analysis of the requirements of Section 243 and how the proposed LRDP or another development scenario at the proposed Cathedral Hill Hospital and Cathedral Hill MOB sites might address the 3:1 residential/net new non-residential ratio.

As described above, some of the comments suggest that the Draft EIR is inadequate because it (1) does not adequately identify Planning Code and VNSUD conflicts based on noncompliance with the 3:1 residential/net new non-residential provision; and (2) does not analyze a scenario that complies with the 3:1 residential/net new non-residential ratio requirement.

A. Consistency of Project with Planning Code

The San Francisco General Plan is the document that guides land use decisions throughout the City of San Francisco. The VNAP, a component of the General Plan, provides more precise policy guidance specific to the history, character, and planned future for the Van Ness Avenue corridor. The San Francisco Planning Code is part of the Municipal Code through which land use and development are regulated in the City. Section 15125(d) of the State CEQA Guidelines states:

> "The EIR shall discuss any inconsistencies between the proposed project and applicable general plans, specific plans, and regional plans."

Inconsistency of a proposed project with an objective or policy of the General Plan, Area Plan, or Planning Code alone is not necessarily considered a significant environmental impact, but it could be, depending on the nature of the conflict (i.e., if the conflict would result in an adverse physical impact relative to baseline conditions). CEQA does not require an analysis of all plans and policies, but rather asks whether a proposed project would conflict with any plan or policies adopted to protect the environment. Further, if the decision-makers determine to approve a project that is inconsistent with the General Plan, either the project must be altered to achieve consistency, or a general plan amendment must be granted. Similarly, if a project is proposed that is not compliant with the requirements of the Planning Code, the project must be altered to be in compliance, the code must be changed, or a variance or exception must be granted. No variances have been requested for the proposed LRDP; however, the project sponsor has requested several amendments to the VNAP and changes to the text and maps of the San Francisco Planning Code that would be required to approve the CPMC LRDP as proposed (Table 2-3, on pages 2-13 through 2-17 of the Draft EIR, These pages have been updated as text revisions to the Draft EIR on pages C&R 4-37 to 4.42 of this document), as well as Conditional Use authorizations (CU) that would, consistent with the procedures in the Planning Code, exempt the project from certain otherwise applicable Planning Code requirements.

The primary discussion of the proposed Cathedral Hill Campus development's consistency with the General Plan and Planning Code is provided on page 4.1-48 of the Draft EIR, as follows:

> "The amendments to the General Plan's VNAP and amendments to the Planning Code text and zoning and height and bulk district maps; the PUD and CU authorizations; and other approvals, as discussed above, are part of the proposed LRDP. If they are approved by decision-makers, the proposed LRDP would be consistent with the applicable plans and policies. **This impact would be less than significant.**"

Planning Code Section 243(8)(A) states:

> "In newly constructed structures, nonresidential uses shall only be permitted if the ratio between the amount of net additional occupied floor area for residential uses, as defined in this paragraph below, to the amount of occupied floor area for nonresidential uses in excess of the occupied floor area of structures existing on the site at the time the project is approved is 3 to 1 or greater."

Section 243 allows modification of the 3:1 residential/net new non-residential ratio requirement for projects that (1) meet certain affordable housing requirements (including payment of an in-lieu fee), or (2) provide important public needs, including medical services, provided that the decision makers determine that the project meets the specified criteria (Planning Code Section 243(c)(8)(B)(iii) and (iv), respectively). Criterion (iii) in Planning Code Section 243(c)(8)(B) requires the Planning Department to report annually to the Planning Commission, which would consist of evaluation and adjustments to affordability and fee calculations. Criterion (iv) in Planning Code Section 243(c)(8)(B) would allow the Planning Commission to modify the 3:1 residential/net new non-residential ratio or modify the timing and location of linked projects if the overall objective of adding new housing on Van Ness Avenue would not be significantly compromised. The project requests modification of the 3:1 requirement based on subsection (iv), which is described in detail under "B. The Project Sponsor's Conditional Use Request" below.

Because the proposed Cathedral Hill Hospital and MOB can be approved under Planning Code Section 243(c)(8)(B) for CU, it does not "conflict" with existing zoning. The Code establishes uses that are (1) permitted, (2) permitted as "conditional uses" following a discretionary approval, and (3) unpermitted. If the CU application is not approved, then the project could not proceed as proposed. Therefore, the Draft EIR properly concludes that the project does not conflict with a land use regulation.

In addition, within the CEQA context, impacts associated with consistency of a project with applicable land use regulations (including zoning) are evaluated within an explicit framework, as set forth under significance criterion "b" of Section 4.1, "Land Use and Planning," of the Draft EIR. The criterion asks whether a project would "conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project adopted for the purpose of avoiding or mitigating an environmental effect" (note that this criterion was revised on page C&R 4-5 to accurately reflect the wording in Appendix G of the State CEQA Guidelines).[42] A conflict with existing regulations is not, in itself, deemed a significant effect unless that conflict results in an adverse physical impact relative to baseline conditions. (Effects analyzed under CEQA must be related to a physical change, according to Section 15358(b) of the State CEQA Guidelines).

The 3:1 residential/net new non-residential requirement was not adopted to avoid or mitigate an environmental effect, but instead to implement the policy goals of the VNAP, an element of the General Plan, by encouraging "creation of a mix of residential and commercial uses" (see Planning Code Section 243[b]).[43] As such, the determination as to whether a project is consistent with zoning, or can and should be permitted for CU, variance, exemption, or amendments to the existing zoning, is considered by

[42] *State CEQA Guidelines,* Appendix G.

[43] Also, as noted on DEIR page 4.1-3, the Western Addition A-2 Redevelopment Plan expired on January 1, 2009. Until that time, the Cathedral Hill Hospital and 1375 Sutter Street MOB sites were subject to redevelopment controls and were not required to meet the 3:1 requirement.

decision-makers outside of the CEQA analysis, as part of their decision whether to approve, modify, or disapprove a project.

The decision-makers (i.e., the San Francisco Planning Commission and Board of Supervisors) are responsible for reviewing the consistency of the proposed LRDP with the applicable land use plans and policies. The decision-makers' consistency review occurs independently and separately from the CEQA analysis.

B. The Project Sponsor's Conditional Use Request

The project sponsor has submitted a CU application[44] that would exempt the project from the 3:1 residential/net new non-residential ratio provision based on Section 243(c)(8)(B)(iv), which provides as follows:

> "If the Commission finds that taking into consideration projects constructed since the effective date of the VNSUD and the housing development potential remaining in the District the overall objective of adding a substantial increment of new housing on Van Ness Avenue would not be significantly compromised, for CU the Commission may modify the 3:1 housing ratio or may modify the rules regarding the timing and location of linked projects if in addition to Section 303(c) standards of this Code it finds that:
>
> (1) The project is to provide space for expansion of an established business from an adjacent site (for this purpose two sites separated by an alley shall be deemed to be adjacent) or,
>
> (2) The project is to provide space for an institutional, hotel, medical, cultural or social service use meeting an important public need which cannot reasonably be met elsewhere in the area, and
>
> (3) Housing cannot reasonably be included in the project referred to in (1) and (2) above.
>
> The Commission shall consider the feasibility of requiring the project to be constructed in such a manner that it can support the addition of housing at some later time."

The CU application for the proposed Cathedral Hill Campus discusses how the proposed LRDP would meet these criteria under Planning Code Section (c)(8)(B)(iv). The CU application states that no other site in the area met the site selection criteria which were required for the medical center and housing cannot reasonably be included at the proposed hospital site. As part of this analysis, Planning Department staff would consider the information provided by the project sponsor, and would conduct their independent analysis, including updating the projects constructed to date in the VNSUD, and additional potential housing sites remaining in this district. The project sponsor and Planning Department staff would also need to address the project's compliance with the City's policy discouraging approval of projects that seek exceptions from housing production requirements, unless the project fulfills the underlying housing production goal as a condition to the exception, as established under the resolution regarding Supporting Existing Area Plan Housing Requirements, adopted by the Board of Supervisors on September 28, 2010. The Planning Commission would have this information available when it considers whether to approve, disapprove or modify the CU application for the proposed CPMC LRDP.

C. VNSUD Housing Fee and Jobs-Housing Linkage Program Fees

As discussed above, the VNSUD provides that non-residential uses must provide residential space at a 3:1 residential/non-residential ratio for any "net new" non-residential occupied floor area unless exempted

[44] The Marchese Company. 2011. California Pacific Medical Center Cathedral Hill Hospital and Medical Office Building Application for Conditional Use Authorization. resubmitted on July 10, 2011.

through the adoption of certain findings. With respect to housing potential, the following information is provided. The effective date of the VNSUD was 1988 (VNSUD added by ordinance 12/16/88). Since that time, 988 housing units have been constructed and another 538 are actively in the pipeline.[45] Per the 1987 Environmental Impact Report (EIR) for the Van Ness Avenue Master Plan (of which the Van Ness Special Use District comprises the largest part), the future development potential of the VNSUD was identified as approximately 2,028,000 gsf, or approximately 2,190 units.[46] By this measure, approximately 45 percent of the residential potential for the SUD has already been achieved (988/2,190) and another 25 percent (538/2,190) is in the pipeline. By the original potential estimate, only 674 more units need be constructed to reach full anticipated build-out. By even the most conservative standards, the remaining potential in the district exceeds this number by almost 4 times (2,565/674).[47] Further, the 1987 EIR for the VNAP specifically did not identify the proposed Cathedral Hill Hospital site for consideration as "developable" or as a potential housing site.[48]

Therefore, the project sponsor believes that the findings in 243(c)(8)(iv) above could be made, and as such, the application of the 3:1 requirement could be modified through a Conditional Use authorization (CU). Because it would be part of a hospital and medical center or other medical institution, the CPMC proposed Cathedral Hill MOB would also be exempt from the City's Job-Housing Linkage Program (JHLP) fees related to housing. However, CPMC has proposed to make a contribution to the Mayor's Office of Housing that is at least equivalent to the JHLP, as defined in Section 413 of the Planning Code, for the purpose of responding to concerns about housing demand created by the proposed Cathedral Hill Campus. It is anticipated that the contribution to the Mayor's Office of Housing would be incorporated into the conditions of approval or a mutually approved development agreement for the proposed project, if the project is approved. While the Draft EIR does not identify a significant impact to housing that would require mitigation, this contribution would support the creation of affordable housing in a manner similar to projects that are required to pay the JHLP fee. Please also see Response PH-11, page C&R 3.5-43.

D. Calculation of the 3:1 Requirement for the Cathedral Hill Hospital and Cathedral Hill MOB Sites as Proposed under the LRDP

The proposed LRDP includes two sites within the VNSUD, the proposed Cathedral Hill Hospital site (containing two existing buildings), and the proposed Cathedral Hill MOB site (containing seven existing buildings). The 1375 Sutter Street building does not fall within the VNSUD. Based on analysis by Planning Department staff and as shown in C&R Table 3.3-1 below, the approximate 3:1 requirement for the project, if it were not requested to be modified via CU, would be as follows:

Hospital site: The occupied non-residential floor area for the proposed Cathedral Hill Hospital under the LRDP is 650,894 sq. ft; Subtracting the 292,260 sq. ft. for the existing hotel and office space at the Cathedral Hill Hotel and 1255 Post Street office property produces a total of 358,634 sq. ft. of net new occupied non-residential floor area. Neither the existing or proposed uses at the Cathedral Hill Hospital site contain residential uses; therefore, the net new, occupied, non-residential floor area of the proposed Cathedral Hill Hospital for purposes of the 3:1 residential to non-residential calculation is 358,634 sq. ft. Planning Code Section 243 requires that for every 1 sq. ft. of net new non-residential area built, 3 sq. ft. of residential area must be built on a site in the VNAP area. Therefore, to meet the 3:1 residential/net new non-residential ratio, approximately 1,075,902 sq. ft. of occupied residential area (358,634 sq. ft. of net new non-residential area multiplied by 3) would be required at the Cathedral Hill Hospital site.

[45] City housing database and pipeline report, San Francisco Planning Department, per email correspondence from Teresa Ojeda, Planning Department to Ken Rich, Mayor's Office of Economic Development re: Van Ness SUD Housing Analysis (Feb. 3, 2011).
[46] Van Ness Avenue Plan Final Environmental Impact Report, Case No. 82.392E/87.586E, (final EIR certification date: Dec. 17, 1987).
[47] Planning Department report on remaining development potential in the Van Ness SUD, per email correspondence from Teresa Ojeda, Planning Department to Ken Rich, Mayor's Office of Economic Development re: Van Ness SUD Housing Analysis (Feb. 3, 2011).
[48] VNAP FEIR, page 58: "These existing buildings are generally large and contain businesses which maintain strong economic activity (e.g. Cathedral Hill Hotel, Holiday Inn, Regency Theater) and, based on past and projected economic trends, are not expected to be demolished for new construction or converted to another use."

MOB site: The occupied non-residential floor area for the proposed Cathedral Hill MOB under the LRDP is 147,432 sq. ft; subtracting the 50,554 sq. ft. for the existing non-residential floor area associated with the seven buildings, produces a total of 96,878 sq. ft. of net new occupied non-residential floor area. The existing seven buildings contain a total of 9,651 sq. ft. of occupied residential floor area, which would be subtracted from the net new occupied non-residential floor area. The net new occupied non-residential floor area of the proposed Cathedral Hill MOB for purposes of the 3:1 calculation is 87,227 sq. ft. Therefore, to meet the 3:1 residential/net new non-residential ratio, approximately 261,681 sq. ft. of occupied residential (87,227 sq. ft. of net new non-residential multiplied by 3) would be required at this site.

Total for Hospital and MOB site: Based on the calculations above, to meet the 3:1 residential/net new non-residential ratio, approximately 1,337,583 sq. ft. of occupied residential would be required.

Based on this calculation, the total net new occupied non-residential floor area of the proposed LRDP at Cathedral Hill Campus, for purposes of the Planning Code Section 243 3:1 residential to net new non-residential use calculation, is 445,861 sq. ft. (358,634 sq. ft. for hospital site and 87,227 sq. ft. for MOB site), and the required residential square footage is 1,347,234 sq. ft. (three times the total net new occupied square footage at Cathedral Hill Campus would be 445,861, plus replacement of the existing 9,651 sq. ft. of occupied area of residential uses at the MOB site).

E. Alternative 3:1 Compliance Scenario

Some comments request additional analysis of a scenario that would include compliance with the 3:1 residential/net new non-residential requirement. That additional analysis is provided below.

Chapter 6, "Alternatives" of the Draft EIR identifies alternatives to the project and discusses environmental impacts associated with each alternative. Section 15126.6(a) of the State CEQA Guidelines requires analysis of a range of reasonable alternatives to the project that would feasibly attain most of the project's basic objectives, but would avoid or substantially lessen any of its significant effects.

C&R Table 3.3-1
Cathedral Hill Hospital and MOB Site 3:1 Calculation Under the LRDP

Location	Gross Floor Area	Occupied Non-Residential Floor Area	Occupied Residential Floor Area	Total Occupied Non-Residential Floor Area
Cathedral Hill Hospital Site				
New				
Proposed Cathedral Hill Hospital	882,962	650,894	0	650,894
Existing				
Existing Cathedral Hill Hotel and Office	381,791	292,260	0	292,260
Net New Non-Residential Floor Area of Hospital Site	501,171	358,634	0	358,634
Required Residential Floor Area (Total Net New Occupied Non-Residential Floor Area x 3)				1,075,902
Cathedral Hill MOB Site				
New				
Cathedral Hill MOB	261,691	147,432	0	147,432
Existing				
1100 Van Ness	43,171	20,001	0	20,001
1020 Geary	6,559	4,847	0	4,847
1028–1030 Geary	9,321	2,484	5,126	7,610
1034–1036 Geary	8,964	3,737	2,397	6,134
1040–1050 Geary	16,263	12,724	0	12,724
1054 Geary	5,799	1,527	2,128	3,655
1062 Geary	6,960	5,234	0	5,234
Net New Non-Residential Floor Area of Hospital Site	164,654	96,878	-9,651	87,227
Required Residential Floor Area (Total Net New Occupied Non-Residential Floor Area x 3)				261,681
Total Net New Floor Non-Residential Floor Area at Hospital and MOB Sites	665,825	455,512	-9,651	445,861
Cathedral Hill Hospital and MOB Site Total				
Required Residential Floor Area (Total Net New Occupied Non-Residential Floor Area x 3)				1,337,583

Source: San Francisco Planning Department and AECOM, 2011. Data on existing floor areas provided by Liz Watty in an email to Geoffrey Nelson, CPMC, on June 14, 2011

As discussed on page 6-1 of the Draft EIR, in developing a range of reasonable alternatives, the Planning Department considered whether there was a potentially feasible alternative to the LRDP that would substantially reduce or eliminate the project's potentially significant and unavoidable impacts. Alternatives considered and rejected are discussed on pages 6-10 through 6-30 of the Draft EIR, including seven off-site and five on-site (at CPMC campuses) alternatives. A Code-Complying Alternative was discussed as an alternative considered and rejected on pages 6-25 through 6-29 of the Draft EIR. The Code-Complying Alternative did not include housing, as it would not meet the project's core medical service objectives. The discussion on pages 6-30 through 6-425 of the Draft EIR analyzes three project alternatives, including two sub-alternatives, as follows: Alternative 1: No Project, (including 1A and 1B), Alternative 2: Four-Campus Rebuilding/Retrofit/Redevelopment Alternative, and Alternative 3: Reduced Development at Cathedral Hill Campus Alternative.

No significant and unavoidable impacts related to land use or population, employment, or housing were identified in the Draft EIR (see Chapter 4.1). Therefore, the Draft EIR is not required to consider a Van Ness SUD-compliant alternative. Each of the three alternatives in the Draft EIR includes an assumption of reduced or no new development at the Cathedral Hill Campus, and therefore, the Draft EIR contains a reasonable range of reduced development scenarios to address issues raised by the public and potential impacts of the proposed LRDP.

A 3:1-compliant scenario is not required to be included in the Draft EIR as a project alternative, because a reasonable range of alternatives was analyzed. A 3:1-compliant development scenario would not meet the core medical service objectives of the project, as set forth on page 2-7 of the Draft EIR. Additionally, a 3:1-compliant scenario would have similar potential environmental impacts as the proposed LRDP or Alternative 3, and would not provide a more effective way to mitigate or avoid significant impacts of the proposed CPMC LRDP, as discussed below.

The following analysis provides a summary discussion of two hypothetical project scenarios that would comply with the 3:1 residential/net new non-residential code requirement. Both of these scenarios assume reduced development at the Cathedral Hill Campus as compared to the proposed LRDP, and the second scenario is similar to Alternative 3, which is presented in the Draft EIR.

1. Additional Information Regarding Compliance with Planning Code Section 243

Some comments state that the Draft EIR does not provide the information to determine what the residential square footage requirements would be for the site. The scenarios below represent two possible ways that development on the project sites at the proposed Cathedral Hill Campus could comply with the requirement of Section 243 of the Planning Code. This portion of the response provides additional information about compliance with Section 243 at the request of Commissioners and the public.

A. Code-Compliant Mixed Use Development Scenario

If the LDRP project for Cathedral Hill is approved as proposed, then there would be no housing constructed on either the proposed Cathedral Hill Hospital or Cathedral Hill MOB sites. To consider the implications of compliance with the land use mix requirements of Section 243, it is necessary to calculate the approximate residential square footage that could be accommodated on the two sites under the 3:1 requirement. The calculations here assume a typical commercial use constructed within the code-compliant height limit and generally consistent with other existing Planning Code controls, but with exceptions for bulk and setbacks on both sites to maximize the number of units that could be accommodated.

Thus, the proposed Cathedral Hill Hospital and Cathedral Hill MOB site under the Code-Compliant Mixed Use Development Scenario would reduce the height of the hospital to 130 feet. Please refer to

C&R Figures 3.3-1 through 3.3-8 (page C&R 3.3-105 through 3.3-119) for 3D Massing and Section Diagrams for the proposed Cathedral Hill Hospital and MOB sites.

The 3:1 requirement and calculations are based on net new occupied square footage of the site by:

- Determining the maximum building envelope by multiplying the site area by FAR.
- Once the maximum building area is calculated, a conversion factor of 75 percent is assumed to obtain the occupied sq.ft. (this is a reasonable assumption based on typical building designs, and accounts for non-occupied space such as mechanical, elevators, hallways, etc.).
- The existing occupied non-residential sq. ft. is subtracted from the proposed occupied sq. ft. to obtain the net new occupied sq. ft.
- The resulting net new occupied sq. ft. is used to calculate the 3:1 requirement.

The proposed site of the Cathedral Hill Hospital currently has a maximum 7:1 FAR. Based on the site area of 105,733 gross square feet (gsf), a 7:1 FAR would yield a maximum building area of 740,132 gsf or 555,099 occupied sq. ft. (applying the 75 percent conversion factor). After subtracting the existing occupied non-residential area of 292,260 sq. ft., the net new occupied area for the proposed Cathedral Hill Hospital site would be approximately 262,839 sq. ft. Of this amount, a maximum of 65,709 net new sq. ft. would be allowed to be non-residential in order to comply with the 3:1 ratio. To this amount, 292,260 occupied sq. ft. would be added for the existing non-residential area that would be demolished, for a total of 357,969 occupied sq. ft. of commercial. The total gsf of non-residential area for the hospital site would be 477,293 gsf assuming a conversion factor of 75 percent. Of the net new occupied area, 197,129 sq. ft. would be required to be residential to meet the 3:1 ratio. The total gsf of residential area for the hospital site would be 262,839 gsf assuming a conversion factor of 75 percent.

As depicted in C&R Figure 3.3-1 on C&R 3.3-105 for the proposed Cathedral Hill Hospital, a total of approximately 477,293 non-residential gsf and approximately 262,839 residential gsf would be constructed. To determine the residential sq. ft. required to meet the 3:1 ratio, the total gsf must be converted to occupied sq. ft. As stated above, approximately 197,129 sq. ft. of occupied residential area would be required to meet the 3:1 ratio. Using residential units of approximately 1,000 occupied sq. ft., there would be about 197 units on the proposed Cathedral Hill Hospital site.

The proposed Cathedral Hill MOB site has a maximum 7:1 FAR. Based on the site area of 36,180 gsf, a 7:1 FAR would yield a maximum building area of 253,260 gsf or 189,945 occupied sq. ft. (75 percent conversion factor). After subtracting the existing occupied area of approximately 60,205 sq. ft. from the seven buildings proposed to be demolished, the net new occupied area for the Cathedral Hill MOB site would be approximately 129,740 sq. ft. Of this amount, approximately 97,305 sq. ft. would be required to be residential to meet the 3:1 ratio. To this amount, 9,651 occupied sq. ft. would be added for the existing on-site residential use that would be demolished, for a total of 106,956 occupied sq. ft. of residential. The total gsf of residential area for the MOB site would be 142,608 (page C&R Figure 3.3-3 on C&R 3.3-109), assuming a conversion factor of 75 percent. Of the net new occupied area, a maximum of approximately 32,435 sq. ft. would be allowed to be non-residential in order to comply with the 3:1 ratio. To this amount, 50,554 occupied sq. ft. would be added for the existing non-residential that would be demolished for a total of 82,989 occupied sq. ft. of non-residential. The total gsf of non-residential area for the MOB site would be 110,652 (see C&R Figure 3.3-3) assuming a conversion factor of 75 percent.

As shown in C&R Figure 3.3-3, “3D Massing Diagram” for the proposed Cathedral Hill MOB, a total of approximately 110,652 non-residential gsf, and approximately 142,608 residential gsf could be constructed. As stated above, approximately 106,956 sq. ft. of occupied residential area would be required

to meet the 3:1 ratio. Assuming the same unit size as for the proposed Cathedral Hill Hospital site of (approximately 1,000 occupied sq. ft., there would be about 107 units on the proposed Cathedral Hill MOB site, or about 304 units total on both the proposed Cathedral Hill Hospital and MOB sites. Assuming application of the inclusionary requirements of Planning Code Section 415 for purposes of this analysis, 15 percent, or about 47, of these units would be affordable residential units. The calculations are detailed in C&R Table 3.3-2 below.

C&R Table 3.3-2
Cathedral Hill Hospital and MOB Site – 3:1 Calculation Under Code-Compliant Mixed Use Development Scenario

Hospital Site		
Site Area	105,733	gross sq. ft.

The 304 potential residential units under this hypothetical non-residential/residential scenario would not be constructed if the CPMC LRDP proceeds as proposed. The San Francisco General Plan's Housing Element includes estimates of sites available to accommodate its Regional Housing Needs Allocation (RHNA). As noted in the response to comments regarding affordable housing (Response PH-9, C&R 3.5-31), San Francisco has the capacity to accommodate approximately 73,700 new housing units under the current zoning.[49] The current Housing Element (2009) estimates another 18,200 potential housing capacity with the proposed rezoning of selected neighborhoods recommended in the Housing Element Update.[50] As explained in Response LU-3, none of the proposed Cathedral Hill Campus sites that would be developed under the proposed LRDP were considered "soft" and subject to redevelopment for residential purposes under the 2009 Housing Element, and therefore the proposed LRDP would not reduce the potential capacity reported in the Housing Element. Under either the prior Housing Element or the 2009 Housing Element, the City has the housing capacity to accommodate the projected new households generated under the proposed LRDP. For further detailed discussion of housing capacity in San Francisco, please also see Response PH-9, pages C&R 3.5-31 to C&R 3.5-35 of this document.

In terms of potential residential units at the Cathedral Hill Hospital and MOB sites and the VNAP, as described above in "C. VNSUD Housing Fee," the future development potential of VNSUD was identified as approximately 2,190 units. Based on conservative standards, the remaining potential would be 2,565 units. The 1987 EIR specifically excluded the Cathedral Hill Hospital site from consideration as "developable" and was not at that time considered a potential housing site. Therefore, if the Cathedral Hill Hospital site is not considered a potential housing site, the 107 units associated with the MOB site would constitute 4 percent of the total remaining potential.

B. Code-Compliant Residential with Reduced Cathedral Hill Hospital/Cathedral Hill MOB Development Scenario

Another potential code-complying land use scenario at the proposed Cathedral Hill Campus would involve a mix of residential and medical facilities. Under this scenario, it is assumed that buildings would be constructed within the existing height limit and would be generally consistent with the existing Planning Code controls, but with exceptions for bulk and setbacks on both sites to maximize the number of units that could be accommodated. Because of required setbacks, building code requirements, and other site planning considerations, co-location of residential and medical facility uses on the proposed Cathedral Hill Hospital site would be infeasible. Because of required building code separations between residential and medical building types, co-locating residential and medical uses at the proposed Cathedral Hill Hospital site would limit the size of the hospital and would result in inefficiencies in operation of the hospital. Therefore, this scenario assumes a hospital use on the entire Cathedral Hill Hospital site, identical to the hospital proposed under Alternative 3, with a mixed use residential/ non-residential office component on the proposed Cathedral Hill MOB site.

The total residential square footage needed to meet the 3:1 residential/net new non-residential requirement generated by both the hospital and MOB sites would not be able to be accommodated within a code-compliant building envelope on the proposed site of the Cathedral Hill MOB. Therefore, this discussion assumes that the project sponsor complies with the 3:1 residential/net new non-residential requirement through the CU authorization process under Planning Code Section 243(c)(8)(B)(iii), by providing 50 percent of the required housing for the hospital site on the proposed Cathedral Hill MOB

[49] Table I-56, San Francisco Planning Department. 2009 Housing Element Update. The Planning Commission approved the 2009 Housing Element, and certified the EIR for the 2004 and 2009 Housing Elements, on March 24, 2011. The Board of Supervisors upheld the EIR for the 2004 and 2009 Housing Elements, on May 10, 2011. The Board of Supervisors adopted the 2009 Housing Element on June 21, 2011. (Case No. 2007.172SE).

[50] Table I-66, San Francisco Planning Department. 2009 Housing Element Update. The Planning Commission approved the 2009 Housing Element, and certified the EIR for the 2004 and 2009 Housing Elements, on March 24, 2011. The Board of Supervisors upheld the EIR for the 2004 and 2009 Housing Elements, on May 10, 2011. The Board of Supervisors adopted the 2009 Housing Element on June 21, 2011. (Case No. 2007.172SE).

site, and paying an in-lieu fee for the remaining 50 percent of the obligation. Please refer to the explanation below regarding the residential and non-residential square footage required under this scenario.

The calculations are detailed in C&R Table 3.3-3 below. The following methodology was used to determine the amount of residential square footage that would be required at the hospital and MOB sites under this scenario. Assuming a reduced hospital based on the description for Alternative 3, the approximate area would be about 653,250 gsf, and the occupied sq. ft. would be approximately 489,937 (75 percent conversion factor). After subtracting the existing occupied non-residential area (hotel and office building) of approximately 292,260 sq. ft., the net new occupied area for the proposed Cathedral Hill Hospital site would be approximately 197,677 sq. ft. Of this amount, approximately 148,258 sq. ft. would be required to be residential to meet the 3:1 ratio. As stated above, this scenario assumes residential uses on the proposed MOB site only. Assuming that 50 percent of this requirement is met through an in-lieu fee payment, approximately 74,129 sq. ft. of residential occupied area would need to be constructed on the proposed Cathedral Hill MOB site to satisfy the remaining 50 percent from the site of the proposed Cathedral Hill Hospital.

The proposed site of the Cathedral Hill MOB currently has a maximum 7:1 FAR. Based on the site area of 36,180 gsf, a 7:1 FAR would yield a maximum building area of 253,260 gsf or 189,945 occupied sq. ft. (75 percent conversion factor), as shown in C&R Figure 3.3-7 (page C&R 3.3-117). After subtracting the existing occupied area of approximately 60,205 sq. ft. from the seven buildings proposed to be demolished, the net new occupied area for the proposed Cathedral Hill MOB site would be approximately 129,740 sq. ft. Of this amount, approximately 97,305 sq. ft. would be required to be residential to meet the 3:1 ratio. To this amount, 9,651 occupied sq. ft. would be added for the existing residential that would be demolished, as well as the 74,129 sq. ft. of residential occupied area that would be required from the proposed Cathedral Hill Hospital site, for a total of 181,086 occupied sq. ft. of residential. The total gsf of residential area for the MOB site would be 241,447 (see C&R Figure 3.3-7, C&R 3.3-117) assuming a conversion factor of 75 percent.

Of the 129,740 net new occupied sq. ft., 32,435 sq. ft. would be allowed to be non-residential while meeting the 3:1 ratio. To this amount, 50,554 occupied sq. ft. would be added for the existing non-residential that would be demolished, resulting in 82,989 occupied sq. ft. of non-residential space. In order to stay under the 7:1 FAR limit, the 74,129 occupied sq. ft. of residential space transferred from the hospital site would then have to be subtracted from the total amount of non-residential that could be accommodated on the site, resulting in a total of 8,860 occupied non-residential sq. ft. The 74,129 occupied residential sq. ft. represents the amount of residential space (50 percent of the hospital site residential requirements) that would be met through an in-lieu fee payment. This residential amount cannot be accommodated at the MOB site as it would exceed the maximum building area. The total gsf of non-residential area for the MOB site would be 11,813 (see C&R Figure 3.3-7, C&R 3.3-117), assuming the conversion factor from gross to occupied square footage of 75 Percent.

The result would be a building on the site of the proposed Cathedral Hill MOB containing approximately 181,085 occupied sq. ft. of residential and only 8,860 occupied sq. ft. of non-residential/medical office space. Applying residential units of approximately 1,000 occupied square feet, about 181 units could be placed upon the MOB site.

C&R Table 3.3-3 Cathedral Hill Hospital and MOB Site – 3:1 Calculation Under Code-Compliant Residential with Reduced Cathedral Hill Hospital/Cathedral Hill MOB Development Scenario

Environmental Effects of –Code-Compliant Residential with Reduced Cathedral Hill Hospital/ Cathedral Hill MOB Development Scenario

The environmental effects under this scenario would be similar to those that would occur under Alternative 3 (addressed in Chapter 6, "Alternatives" of the Draft EIR), because the building size and massing would be very similar. However, under the Code-Compliant Residential with Reduced Cathedral Hill Hospital/Cathedral Hill MOB Scenario, approximately 253,260 sq. ft., or 189,945 occupied sq. ft., of the proposed Cathedral Hill MOB space would be replaced with approximately 189 residential units. This scenario would partially meet the 3:1 residential/net new non-residential provision in Planning Code Section 243, with the remainder of the residential obligation compensated for through payment of in-lieu fees.

A discussion of the environmental effects of the Code-Compliant Residential with Reduced Cathedral Hill Hospital/Cathedral Hill MOB Scenario is provided below.

Cathedral Hill Hospital Site

Under this scenario, the proposed Cathedral Hill Hospital would be reduced in size, the same as under Alternative 3 addressed in the Draft EIR. Therefore, under this scenario, the environmental effects from the physical development of the proposed Cathedral Hill Hospital site would be similar to those under Alternative 3 (please refer to Draft EIR, pages 6-299 through 6-324). Potential impacts under the Code-Compliant Residential with Reduced Cathedral Hill Hospital/Cathedral Hill MOB Scenario related to the intensity of future uses at the Cathedral Hill Campus, specifically the MOB site, are discussed below.

Effects Anticipated to be Similar at the MOB Site Under the Code-Compliant Residential with Reduced Cathedral Hill Hospital/Cathedral Hill MOB Development Scenario

As described above, under the Code-Compliant Residential with Reduced Cathedral Hill Hospital/Cathedral Hill MOB Scenario, a residential and non-residential building would be located at the site of the proposed Cathedral Hill MOB, which is bounded by Van Ness Avenue, Cedar Street, and Geary Street. Just as would occur under the proposed LRDP and under Alternative 3, demolition of the seven existing buildings at the MOB site would occur under this scenario. The residential and non-residential building would be the same height, have the same number of stories underground, and would occupy the same footprint as the Cathedral Hill MOB in Alternative 3. The size and scale of the building constructed on the site would be nearly identical in massing compared to the MOB under Alternative 3 (Figure 6-16 on page 6-290 of the Draft EIR), and therefore, would result in the same amount of excavation and construction activities.

Because the site disturbance, demolition, excavation, and construction would be similar to what would occur under Alternative 3, impacts that would result from the physical development of the site related to biological resources, cultural resources, geology and soils, hydrology and water quality, wind and shadow, mineral resources, and agricultural and forest resources, would be the same (discussed on pages 6-299 through 6-324 of the Draft EIR). All identified mitigation measures for these resource areas that would apply to Alternative 3 would also be applicable to this development scenario. Similarly, noise, air quality, greenhouse gas, and transportation impacts related to construction activities would be similar to what would occur under Alternative 3. Mitigation measures applicable to construction-related impacts at the proposed Cathedral Hill Campus under Alternative 3 would also be applicable to this development scenario.

Unlike Alternative 3, the Van Ness Avenue pedestrian tunnel would not be constructed under this scenario because there would be considerably less foot traffic between the proposed MOB site with residential and commercial office uses and the Cathedral Hill Hospital site with medical uses across Van Ness Avenue. Therefore, impacts related to construction of the pedestrian tunnel would not occur under this development scenario.

Other Effects at the MOB Site under the Code-Compliant Residential with Reduced Cathedral Hill Hospital/Cathedral Hill MOB Development Scenario

Some environmental resource areas are affected by the type and intensity of uses on a site. Although these impacts are anticipated to be similar to those that would occur under Alternative 3, possible differences are discussed below.

Land Use and Planning

Under the Code-Compliant Residential with Reduced Cathedral Hill Hospital/Cathedral Hill MOB Scenario, the MOB site would contain residential and commercial uses, compared to Alternative 3, which would include only medical office uses. This scenario would partially meet the 3:1 residential/net new non-residential ratio provision in Planning Code Section 243, with the remainder of the residential obligation compensated for through payment of in-lieu fees. The buildings on the proposed Cathedral Hill MOB site under this scenario would occupy the same footprint and would be the same height as the building proposed under Alternative 3. This scenario would not conflict with any applicable land use plan, policy, or regulation. The impact at the proposed Cathedral Hill Campus under this scenario would be less than significant, similar to Alternative 3, and it would meet the 3:1 residential/net new non-residential provision. Under this scenario, a total of 181,085 net new residential occupied sq. ft. would be developed on the Cathedral Hill Campus based on the square footage of the hospital and MOB sites. As described above, 50 percent of the housing required from the Cathedral Hill Hospital site (74,129 occupied sq. ft.) would be provided on the Cathedral Hill MOB site, and the remaining 50 percent obligation would be met by paying an in-lieu fee.

This scenario would demolish seven existing buildings currently consisting of retail, nightclubs, a restaurant, residential units, and residential hotels, and replace them with a new residential and non-residential building. Other uses in the immediate vicinity include various commercial establishments, hotels, restaurants, and residential uses. Similar to Alternative 3, demolition of the buildings currently on the site of the proposed Cathedral Hill MOB would not have a substantial effect on the existing character of the vicinity. This scenario would not physically divide an established community, and the residential and non-residential building under this scenario would be consistent with the surrounding residential and non-residential uses in the neighborhood. Therefore, this scenario would result in less-than-significant land use impacts, similar to Alternative 3.

Aesthetics

Under this scenario, the aesthetic impacts related to building height and massing would be the same as those of Alternative 3. The residential and non-residential office space building would be 130 feet tall, same as the proposed Cathedral Hill MOB under Alternative 3. Please see Figure 6-16 on page 6-290 of the Draft EIR for a massing diagram of the proposed Cathedral Hill Campus under Alternative 3. Please see C&R Figures 3.3-6 and 3.3-8 (page C&R 3.3-115 and 3.3-119, respectively) for massing diagrams for this development scenario. Therefore, as under Alternative 3, the residential and non-residential office space building would be similar in height to surrounding buildings, which are nine to 11 stories tall (about 130 feet tall). This would not result in any blockage of important visual landscape elements that are currently seen in long-range vistas of the Cathedral Hill area from other parts of the City. This scenario would have a less-than-significant impact on scenic vistas, similar to Alternative 3. The residential and non-residential building would be within the height range and massing of existing development, and would be visually consistent with existing surrounding buildings, and therefore would not degrade the existing visual character or quality of the neighborhood.

The building design under this scenario would be similar to the MOB in Alternative 3. Window fenestration and architectural details, including the type of building materials, for the residential and non-residential/medical office building would be similar to the MOB under Alternative 3 and would,

therefore, have similar visual impacts. Aesthetic impacts would be less than significant, similar to Alternative 3.

Population, Employment, and Housing

This scenario would result in fewer CPMC FTE personnel at the proposed site of the MOB than Alternative 3, which would result in less projected growth in households and fewer new San Francisco residents related to new CPMC personnel. Under this development scenario, the City's housing stock would increase by 181 units, resulting in a greater number of permanent residents at the site than under Alternative 3. The permanent residents associated with the 181 units would result in greater net new San Francisco residents and households unlike under Alternative 3. Unlike Alternative 3, this scenario would have a larger population and household population at the MOB site that would not have to be accommodated elsewhere in the City.

As under Alternative 3, this scenario would result in the removal of five dwelling units and 20 residential hotel units. Relocation of tenants from all demolished residential dwelling and residential hotel units could be provided the same that is required by law under Alternative 3 and the proposed LRDP, although under the proposed LRDP relocation assistance would be provided above and beyond the minimum legal requirements. This scenario would contribute 189 units to the City's housing stock, a net increase of 156 units over the 25 existing dwelling units and residential hotel units that would be demolished as part of the project, and would help fulfill the housing needs in San Francisco. The residential units and related residents that would result from this scenario would be within the projected population and household growth estimated by Association of Bay Area Governments (ABAG). Population, housing, employment, and housing impacts would be less than significant.

Transportation and Circulation

During operations, this scenario would result in different traffic and circulation patterns compared to Alternative 3 because of the different type and intensity of uses that would occur at the site. Inbound CPMC-related traffic, transit, pedestrian, and bicycle trips to the MOB site during the a.m. peak hour and outbound trips from MOB site during the p.m. peak hour would be fewer compared to under Alternative 3 because of the presence of substantially fewer employees on the site under this scenario. The hospital site trips would be the same as Alternative 3 under this scenario because the hospital would be identical as under Alternative 3. However, the permanent residents associated with the 181 residential units would generate outbound traffic, transit, pedestrian, and bicycle trips from the MOB site during the a.m. peak hour, and inbound trips during the p.m. peak hour. Overall, the total inbound and outbound trips would be similar to Alternative 3. The same mitigation measures identified for transportation and circulation under Alternative 3 would be applicable to this development scenario.

Because there would be substantially less non-residential/medical office use at the proposed MOB site under this scenario compared to Alternative 3, truck loading and passenger unloading/loading demand would also be less. Although there would be fewer CPMC employees, patients and visitors under this scenario, this would not influence CPMC shuttle trips and frequencies as they would still be serving the Cathedral Hill Hospital site under this scenario.

Noise

Under this development scenario, the habitable spaces of the non-residential/medical office and residential building at the site would be exposed to traffic noise from Geary Boulevard/Geary Street, Post Street, Franklin Street, and Cedar Street. Because future traffic noise levels would result in interior noise levels greater than 45 decibels (dB), noise reduction measures would need to be incorporated into the project design to reduce this impact on the proposed new residential, non-residential/medical uses under this scenario to less-than-significant levels.

Stationary noise sources (e.g., HVAC equipment, parking garage activities, passenger and shuttle drop-offs, loading dock and delivery activities, and waste disposal activities) would be introduced at the proposed Cathedral Hill Campus under Alternative 3, but this would occur to a lesser extent at the proposed site of the MOB under this scenario. Because there would be less non-residential/medical office use at the proposed MOB site, less noise related to loading dock, delivery, and parking garage activities would occur compared to Alternative 3. The residential uses would generate demand for loading, delivery, garbage disposal, and parking, but to a lesser extent than the MOB operations that would occur under Alternative 3. Mitigation Measures M-NO-N3a through M-NO-N3e identified for Alternative 3 to require the use of practical, feasible physical impact reduction measures (e.g., equipment design) would still apply under this scenario. Stationary noise impacts would be less than significant, and less than under Alternative 3.

Air Quality

Under this scenario, regional impacts from operations would be similar to Alternative 3 because regional impacts are based on the total emissions from all CPMC campuses. Under this scenario, only the proposed Cathedral Hill MOB site would have a different mix of uses than under Alternative 3, but development would be the same size as the building proposed in Alternative 3. Therefore, as under Alternative 3, this scenario would exceed the applicable criteria pollutant threshold for particulate matter (PM_{10}). No feasible mitigation is available to reduce this impact to a less-than-significant level; as a result, this scenario would have a significant and unavoidable impact with respect to operational criteria pollutant emissions, similar to Alternative 3 under both the 1999 and the recently adopted 2010 Bay Area Air Quality Management District (BAAQMD) CEQA thresholds.

Localized impacts that would result from operations at the proposed Cathedral Hill MOB site under this scenario would be similar to what would occur under Alternative 3 because the building would be the same size under this scenario. Therefore, local carbon monoxide (CO) emissions from mobile sources, odors, and single-source and cumulative health risks from operational toxic air contaminants (TACs) would be similar to what would occur under Alternative 3 under both the 1999 and the recently adopted 2010 BAAQMD CEQA thresholds. The impact would be less than significant.

Greenhouse Gas Emissions

Under this development scenario, the residential and non-residential/medical office building at the proposed Cathedral Hill site would be similar in size to the Cathedral Hill MOB under Alternative 3, and it could be assumed that the total net new construction area would be similar to Alternative 3 and would have similar operational impacts. Operational GHG emissions are based on the total emissions from all CPMC campuses. As under Alternative 3, the GHG emissions that would result from the aggregate development at all of the CPMC campuses, including the residential and non-residential/medical office building, under this development scenario, would result in a significant and unavoidable impact with respect to operational GHG emissions. As with Alternative 3, no feasible mitigation measures are available that would reduce operational GHG impacts to a less-than-significant level.

Recreation and Public Services

Unlike Alternative 3, which proposes only medical office use at the site, this scenario would introduce 189 residential units to the site, and would have no medical office use. Under this scenario, there would be fewer CPMC personnel, visitors, and patients associated with the commercial/medical office use compared to Alternative 3. This would be offset by an increase in demand for recreational facilities because of the residential occupancy and reduction in medical office use, resulting in a greater average daily residential population compared to Alternative 3. This incremental demand associated with the uses under this scenario would be accommodated by existing recreational and public facilities in the surrounding area and is not anticipated to place undue demand on any one existing facility. In addition, expansion of existing or construction of new recreation or public service facilities in the neighborhood

would not be required under this scenario. The same mitigation measures identified for public services under Alternative 3 would apply to this scenario. The impact on recreational and public services facilities would be less than significant, but slightly greater than under Alternative 3, because new residents to the Cathedral Hill Campus would be likely to use these facilities on a regular basis.

Utilities and Services Systems

This scenario would likely result in similar or less demand for utilities and service systems compared to Alternative 3. The Cathedral Hill MOB site is already served by existing utilities and service systems. This scenario would result in substantially less medical office use at the MOB site compared to Alternative 3, and would instead include residential use. Medical uses generate greater utility and service system demands (including water and wastewater), as they typically have higher requirements than residential or mixed use buildings for electrical, mechanical, and plumbing utilities to be able to provide a healthy environment for the care of sick patients, and to be able to provide critical care in the event of emergencies. Generally, commercial and medical office uses generate greater wastewater and have higher water demands than residential uses. Thus, it can be assumed that the proposed residential use under this scenario would result in less demand for utilities and service systems compared to Alternative 3 because it would be more residential in nature. Similar to Alternative 3, this scenario would not require new water or wastewater facilities, expansion of existing facilities, or any new or expanded entitlements.

Hazards and Hazardous Materials

This scenario would require the same demolition and construction activities as under Alternative 3 for the Cathedral Hill Hospital and MOB sites. No construction activities would be associated with the pedestrian tunnel under this scenario. Therefore, impacts related to the transport, use, and disposal of hazardous materials would be slightly less under this scenario and the same mitigation measures identified for Alternative 3 would apply.

Operation of the proposed Cathedral Hill MOB site would be different under this scenario. Because only a very small amount of medical office space could be built under this scenario (a maximum of 8,890 sq. ft. of non-residential and/or medical office), workers would handle only very small amounts of potentially hazardous materials (such as medical and biological materials and associated hazardous materials). This scenario would result in substantially less medical-specific hazardous wastes, storage, and uses at the proposed MOB site than under Alternative 3. Although this development scenario would locate residential units adjacent to non-residential/medical office uses, any medical office/non-residential office uses would be required to comply with the San Francisco Hazardous Materials Unified Program Agency (HMUPA) requirements, applicable regulations and standards, and State of California requirements. The handling of medical hazardous wastes is highly regulated and subject to more stringent requirements than residential hazardous waste. Hazardous materials related to the residential component would involve relatively small quantities of hazardous materials associated with janitorial, maintenance, and repair activities (i.e., cleaners, lubricants, or paints) and other household cleaning supplies. Use of these hazardous materials would be limited, and transport, storage, use, and disposal of these materials would be subject to federal, state, and local health and safety requirements.

The potential for a release of hazardous materials from the residential and commercial/medical office space buildings under this scenario would be less than significant. However, both Alternative 3 and this scenario would follow applicable federal, state, and local regulations, and would thus result in a less-than-significant hazards and hazardous materials impacts, similar to Alternative 3.

Relationship to Project Objectives

This scenario would not meet the project sponsor's overarching and other objectives because the land use mix is fundamentally different than the type of project that the project sponsor has proposed. As CPMC is a provider of health care services, the project proposed by CPMC involves the construction of health care

facilities. The residential uses presented under this scenario are distinct and fundamentally different from the facilities proposed to be constructed under the CPMC LRDP. This development scenario would reduce the overall size and scope of medical services at the Cathedral Hill Campus. and the MOB site would provide no medical office space to support the proposed Cathedral Hill Hospital.

Consistency with the VNAP Use and Height Limits

The consistency of the relationship of LRDP development at the proposed Cathedral Hill Campus to the use, height, and other parameters of the Van Ness Avenue Plan is addressed in the Draft EIR, under Impact LU-2, pages 4.1-46 through 4.2-49, as well as in Chapter 3, "Plans and Policies," pages 3-10 and 3-11 of the Draft EIR. In addition, consistency of the proposed LRDP with the VNAP, including use and height limits, is addressed in Response LU-5, page C&R 3.3-30.

No Project Alternative

The decision-makers have the authority and discretion to approve or deny the proposed LRDP. As is required for all EIRs under CEQA, the Draft EIR considered the comparative impacts of the No Project Alternative, consistent with the requirements of section 15126.6(e) of the State CEQA Guidelines. This analysis considers the future environmental conditions in the event that the proposed LRDP is denied.

EIR Recirculation

Recirculation of all or a portion of a Draft EIR, prior to certification, is governed by the requirements of Section 15088.5 of the State CEQA Guidelines. Recirculation is required only in circumstances under which "significant new information" is added to the EIR following the Draft EIR public review and comment period. In this case, information that meets the thresholds of "substantial new information" has not been added to the EIR, and, thus, recirculation is not required. For a full discussion of this issue, please see Response INTRO-6, page C&R 3.1-11.

Comment

(Calvin Welch—Council of Community Housing Organizations, October 13, 2010) [53-3 LU]

"**DEIR's Failure Accurately and Completely Describe the Current Conditions in the Area of the Proposed Development, Specifically the Requirements Van Ness Special Use District.**

The DEIR fail to discuss the complete requirements of the Van Ness Special Use District (Section 243 of the SF Planning Code) and how that requirement effects its proposed development on Van Ness Avenue. The DEIR assumes that the developers' request for exemption from the requirement of the SUD is currently the case with no discussion of the nature of these requirements in general and specially as they relate to the proposed project on Van Ness Ave.

Needed is a full accounting of the developers' plans for the site, which lays out what footage is exempt from the Van Ness SUD, what footage is covered by the SUD and what the housing requirement is under the current requirements of the SUD. Absent such a complete accounting decision makers and the public have no way of measuring the full Impacts of the developers proposed project which seeks to avoid meeting the housing requirements of the SUD. Such a failure renders the DEIR incomplete and inaccurate."

Response LU-22

The comment states that the Draft EIR did not describe the current conditions and requirements of the VNSUD, the Draft EIR did not discuss how the VNSUD requirements affect the proposed development on Van Ness Avenue, the Draft EIR should show what proposed square footage is exempt and covered by

the VNSUD, and that the Draft EIR should evaluate the impacts associated with not meeting the residential/net new non-residential ratio requirements of the VNSUD.

Existing land use conditions in the area surrounding the proposed Cathedral Hill Campus are described in Section 2.2, "Cathedral Hill Campus" (pages 2-19 through 2-26), and in Section 4.1.1, "Environmental Setting" (pages 4.1-1 through 4.1-11) of the Draft EIR. The comment requests that the Draft EIR more completely address the requirements of the VNSUD. In response to these comments, the following text change is made to the Draft EIR.

On page 3-15 of the Draft EIR, the following new text is added below the first paragraph under the heading "Cathedral Hill Campus" for clarification:

> Section 243 of the San Francisco Planning Code established the Van Ness Special Use District (SUD). As described in the municipal code, the purpose of the Van Ness SUD is to implement the objectives and policies of the Van Ness Avenue Plan, which includes:
>
> (i) creation of a mix of residential and commercial uses on the boulevard,
> (ii) preservation and enhancement of the pedestrian environment,
> (iii) encouragement of the retention and appropriate alteration of architecturally and historically significant and contributory buildings,
> (iv) conservation of the existing housing stock, and
> (v) enhancement of the visual and urban design quality of the street, the following controls are imposed in the Van Ness Special Use District.[51]
>
> The requirements of the Van Ness SUD include the provisions of the City Planning Code applicable to an RC-4 District, except as otherwise noted in Section 243, including:
>
> - Height and Bulk Restrictions. See Height and Bulk Map No. 2H. See Section 270 of the SF Municipal Code for bulk limits.
> - Basic Floor Area Ratio. The basic floor area ratio limit shall be 7.0 to 1 in the 130-foot height district and 4.5:1 in the 80-foot height district.
> - Demolitions. All demolitions of buildings containing residential use and all conversions from residential uses to nonresidential uses above the ground floor shall be permitted only if authorized as a conditional use under Section 303 of this Code.
> - Residential Uses; Ratio Established. In newly constructed structures, nonresidential uses shall only be permitted if the ratio between the amount of net additional occupied floor area for residential uses, as defined in this paragraph below, to the amount of occupied floor area for nonresidential uses in excess of the occupied floor area of structures existing on the site at the time the project is approved is 3 to 1 or greater.
> - Reduction of Ground Level Wind Currents. New buildings and additions to existing buildings shall be shaped, or other wind baffling measures shall be adopted, so that the development will not cause year-round ground level wind currents to exceed, more than 10 percent of the time, between 7:00 a.m. and 6:00 p.m., the comfort level of 11 m.p.h. equivalent wind speed in areas of pedestrian use and seven m.p.h. equivalent wind speed in public seating areas. An exception to this requirement may be permitted but only if and to the extent that the project sponsor demonstrates that the building or addition cannot be shaped or wind baffling

[51] http://www.amlegal.com/nxt/gateway.dll/California/planning/article2usedistricts?f=templates$fn=default.htm$3.0$vid=amlegal:sanfrancisco_ca$anc=JD_243

measures cannot be adopted without unduly restricting the development potential of the building site in question.

As described on page 2-46 of the Draft EIR, as updated in the text revisions to the Draft EIR on pages C&R 4-45 to 4-46, a CU authorization under Planning Code Section 303 would be sought for authorization of a conditional use medical center and exceptions to bulk, loading, street frontage, building projection, obstruction over streets and alleys, and wind comfort-level requirements that otherwise would be applicable under the Planning Code. This CU authorization would also include approval of buildings that exceed 50 feet in height within an RC-4 District and the Van Ness SUD; modification of the 3:1 ratio of residential to net new non-residential development restriction otherwise applicable within the VNSUD for the proposed Cathedral Hill Campus; and for demolition of five residential dwelling units. Required project approvals and current code requirements for the proposed Cathedral Hill Campus are summarized in Draft EIR Table 2-3, as updated in the text revisions to the Draft EIR on pages C&R 4-37 to 4-42.

As described on pages 2-46 and 2-47 of the Draft EIR (and updated in the text revisions to the Draft EIR on pages C&R 4-45 to 4-46), CU authorization would include the following elements:

- Medical Center Use. Authorization of the Cathedral Hill Hospital and Cathedral Hill MOB as a conditional use medical center in an RC-4 District and pursuant to the provisions for the Van Ness Special Use District in Planning Code Section 243.

- Building Height. CU authorization would be sought for the proposed heights of the Cathedral Hill Hospital and Cathedral Hill MOB, which would be 265 feet and 130 feet, respectively, as defined or measured by the Planning Code. In an RC-4 district and in the VNSUD, buildings greater than 50 feet, but within the applicable height limits (130 feet for the Cathedral Hill MOB under the existing 130-V Height and Bulk District and 265 feet for the Cathedral Hill Hospital, after the Height and Bulk amendment to the 265-V Height and Bulk District being sought as a separate entitlement) require CU authorization.

- Building Bulk. Bulk limits are applicable to sections of buildings above 40 feet in height. The proposed Cathedral Hill Hospital and Cathedral Hill MOB would exceed the applicable bulk limits for building plan length and diagonal dimensions of 110 and 140 feet. An exception would be requested to allow the proposed hospital's building length and diagonal dimensions, which respectively are approximately 385 and 405 feet (tower floor) or 385 feet and 466 feet (podium floor 50 feet above Franklin Street). An exception would also be requested to allow the proposed MOB's length of approximately 265 feet with a diagonal dimension of 290 feet.

- Demolition of Residential Dwellings. The CU authorization would allow demolition of five residential dwelling units (Planning Code Sections 317 and 243(c)(8)(H)) that currently occupy portions of the proposed Cathedral Hill MOB site. Demolition of an additional 20 residential hotel units requires a separate application to the San Francisco Department of Building Inspection for a permit to convert.

- Modification of Residential Restrictions. Planning Code Section 243(c)(8) generally requires development projects within the VNSUD to include residential uses at a 3:1 ratio to net new nonresidential uses. The CU authorization would modify these requirements for medical center uses within the VNMUSD.

- Street Frontage. The CU authorization would allow modification of standards under Planning Code Section 145.1 for active ground floor uses and width of curb cuts, providing that, on balance, the active uses and curb cuts around the perimeter of a site with multiple frontages meets the intent of Section 145.1.

- Exception for Wind Comfort Level Exceedances. The CU authorization would allow an exception for ground level wind currents to exceed pedestrian wind current comfort level criteria of 11 miles per hour applicable within the Van Ness SUD.

Proposed amendments to Map 4 of the General Plan Urban Design Element and Maps 1 and 2 of the VNAP were provided in Appendix C of the Draft EIR. Since the publication of the Draft EIR on July 21, 2010, the project sponsor has made some modifications to the requested entitlements for the proposed LRDP based upon input from the Planning Department after reviewing the initial application submittal for the near-term projects, including the proposed development at the Cathedral Hill Campus. Therefore, the proposed map amendments in Appendix C of the Draft EIR have been updated as part of the text revisions to the Draft EIR included on pages C&R 4-43 to C&R 4-44 of this document. As stated on page 4.1-48 of the Draft EIR, as they have been included in the Project description, the amendments to the General Plan's VNAP and amendments to the Planning Code text and zoning and height and bulk district maps; the PUD and CU authorizations; and other approvals, as discussed above, are part of the proposed LRDP. Therefore, if approved by decision-makers, the proposed LRDP would be consistent with the applicable plans and policies. The proposed LRDP relative to the Cathedral Hill Campus with the requested amendments and approvals would, therefore, not conflict with any applicable land use plan, policy, or regulation.

Applicable City policies and the relative consistency of the proposed LRDP are discussed in Draft EIR Chapter 3, "Plans and Policies" and in Impact LU-2, in Chapter 4.1, pages 4.1-46 through 4.1-54. In Impact LU-2, the Draft EIR concluded that the impacts of the proposed LRDP related to consistency with local plans and policies were less than significant at all CPMC campuses. Section 3.2.1 of the Draft EIR addresses the proposed LRDP's consistency with applicable elements of the General Plan and is summarized below.

As stated on pages 3-10, 3-11, and 4.1-46 through 4.1-48 of the Draft EIR, the proposed Cathedral Hill Campus would generally be consistent with the VNAP and the associated Van Ness SUD. A General Plan amendment would be required for the proposed LRDP development of the up to 265-foot-tall Cathedral Hill Hospital. Specifically, amending Map 4 of the General Plan Urban Design Element and VNAP Map 2 would allow the hospital's height to extend up to 265 feet. A General Plan amendment to Map 5 of the Urban Design Element is also proposed to allow for development of the Cathedral Hill Hospital with a bulk up to a maximum plan dimension and maximum diagonal plan dimension of 385 and 466 feet, respectively, and for development of the proposed Cathedral Hill MOB with a bulk up to a maximum plan dimension and maximum diagonal plan dimension of 265 and 290 feet respectively.

Under the proposed LRDP, five residential dwelling units and 20 residential hotel units would be demolished at the site of the proposed Cathedral Hill MOB, in an area prioritized in the VNSUD for new housing development. The loss of five residential dwelling units and 20 residential hotel units would not affect the larger objective of the VNAP. In addition, the project sponsor would provide relocation and tenant support/assistance.

As of September 2011, CPMC has reached agreement with all ten of the residential households. CPMC has assisted several households with apartment searches, landlord negotiations, and moving, all within San Francisco. Eight of the ten residential households have relocated and the remaining two have agreed to move out in early 2012.[52]

The VNAP discourages parking access along Van Ness Avenue and, whenever feasible, other major streets. The proposed Cathedral Hill Hospital and Cathedral Hill MOB would provide parking entrances/exits along Geary Boulevard and Franklin Street, potentially conflicting with the VNAP. The

[52] Memorandum from Geoffrey Nelson, AICP, California Pacific Medical Center, to Cameron Mueller & David Reel (AECOM), re: Relocation of tenants in 1034-1036 Geary Street (September 22, 2011).

Draft EIR evaluates potential impacts to site access in Section 4.5, "Transportation and Circulation." The discussion on page 4.5-100 of the Draft EIR concludes that operation of the proposed Cathedral Hill Campus parking garages would have a less-than-significant impact on traffic operations.

No parking access for the Cathedral Hill Hospital, the Cathedral Hill MOB, or the 1375 Sutter MOB would be from Van Ness Avenue in compliance with this VNAP policy. Primary ingress and egress for the Cathedral Hill MOB would be from Cedar Street, a minor east-west street. The Cathedral Hill Hospital site is not adjacent to any minor streets. Ingress for the Cathedral Hill Hospital would be from Geary Boulevard and Post Street, and primary egress for the Cathedral Hill Hospital would be from Post Street. Approximately seven curb cuts on or near Van Ness Avenue would be removed as part of the proposed development at the Cathedral Hill Campus under the LRDP.

Additionally, the VNAP and VNSUD encourage a pedestrian environment and transit use and discourage commuter parking. The proposed Cathedral Hill Campus would be consistent with this policy. As described on pages 2-34 through 2-36 of the Draft EIR, CPMC proposes to upgrade the pedestrian environment by improving the street frontages of the Cathedral Hill Campus. This would include lighting treatment along Van Ness Avenue and Post Street, sidewalk widening, activity zones in the public spaces surrounding the proposed Cathedral Hill Hospital and Cathedral Hill MOB, planting design and paving concept, and furnishings (i.e., sidewalk benches, bicycle racks).

Please see Response LU-5 (page C&R 3.3-30) for further discussion of the project's consistency with existing plans and policies, including the VNAP. Response LU-9 provides a discussion of the specific entitlements requested by the project sponsor and the relationship of the proposed LRDP to the Planning Code. Also see Response LU-21 (page C&R 3.3-95) for discussion of the 3:1 residential/net new non-residential ratio requirement for projects within the Van Ness SUD.

Comments

(Stephanie Barton, et al.—Hastings Civil Justice Clinic for the Good Neighbor Coalition, October 19, 2010) [104-4 LU]

"The failure to consider Objective 1 of the Housing Element is especially striking because the site of the proposed project is in the Van Ness Avenue Area Plan ('VNAP').[4] The top policy priority for this special area plan is the intense development of new housing. The VNAP establishes the following objective and policies for the section of Van Ness Avenue between Redwood and Broadway that encompasses the site of the proposed Cathedral Hill Campus:

VNAP OBJECTIVE 1
Continue existing…and add a significant increment of new housing.

VNAP POLICY 1.1
Encourage development of high density housing above a podium of commercial uses in new construction or substantial expansion of existing buildings.

VNAP POLICY 1.4
Maximize the number of housing units.

VNAP POLICY 1.5
Employ various techniques to provide more affordable housing.

These provisions recognize a strong need for housing along Van Ness Avenue and the construction of permanently affordable housing.

[4] San Francisco General Plan, Van Ness Avenue Area Plan"

(Barbara Kautz—CHNA and Bernal Heights Neighborhood Center, October 19, 2010) [87-44 LU, duplicate comment was provided in 108-44 LU]

"Further, the DEIR does not analyze the project's inconsistency with the intended character of Van Ness Avenue as discussed in the VNAP. For example, the intent of the Plan was to have dense residential development over a podium of commercial uses (Policy 1.1) and to maximize the number of housing units (policy 1.4);"

(Barbara Kautz—CHNA and Bernal Heights Neighborhood Center, October 19, 2010) [87-48 LU, duplicate comment was provided in 108-48 LU])

"Objective 8 includes a variety of policies designed to turn Van Ness Avenue into a residential boulevard. The Cathedral Hill MOB, however, would utilize its entire Van Ness Avenue frontage for loading and unloading. The Cathedral Hill Hospital is at a scale and use that is not consistent with a residential boulevard."

(Stephanie Barton, et al.—Hastings Civil Justice Clinic for the Good Neighbor Coalition, October 19, 2010) [104-6 LU]

"While the project includes a proposed VNAP amendment to create a new sub-area where medical uses could be allowed with a conditional use permit, such a proposal does not negate the necessity in the DEIR to analyze fully the land use and planning effects of the proposed project, especially its impact on the future development of housing along Van Ness Avenue. Instead of engaging in such an analysis, the DEIR mischaracterizes the VNAP by diminishing the primary importance the plan places on housing.

The DEIR claims that 'the focus of the plan is to revitalize the area by encouraging new retail and housing to facilitate the transformation of Van Ness Avenue into an attractive mixed-use boulevard.'[5] The type of mixed-use development the Van Ness Avenue Plan envisions is 'high-density housing' above ground floor commercial uses as outlined in VNAP Policy 1.1 noted above. None of the policies presented in the Land Use section of the VNAP encourage the development of any non-residential uses along Van Ness Avenue, except for ground floor commercial uses below 'high-density housing.' The DEIR focuses on the term 'mixed-use' to sidestep the overwhelming emphasis the VNAP places on housing development. Such verbiage is no basis for avoiding a full analysis of both the project's consistency with applicable land-use plans and the planning consequences of granting project exceptions. As part of the DEIR, the project's plan inconsistencies and land-use planning impacts need to be considered carefully and fully and measured in accordance with all relevant VNAP policies.

[5] DEIR 3-10"

(Gloria Smith—California Nurses Association, March 8, 2011) [122-2 LU]

"The San Francisco General Plan Supports a Larger St. Luke's Hospital and A Correspondingly Smaller Cathedral Hill Campus As explained in my comments of October 18, 2010, the proposed Cathedral Hill campus is indisputably inconsistent with San Francisco's General Plan and the applicable Van Ness Avenue Area Plan (VNAP). These plans, along with the other elements of the General Plan, provide a clear and strong vision for the Van Ness Corridor both in terms of uses and scale. Specifically, the plans call for a mix of residential and supportive commercial uses that are appropriately scaled for the Corridor. That vision has been and continues to be successfully implemented as evidenced by the existing and emerging mix of residential and supportive commercial uses. The proposed Cathedral Hill campus would be a huge departure in both use and scale from the vision set forth in these plans.

The DEIR proposed a major General Plan Amendment to address inconsistencies between the proposed Cathedral Hill campus and the VNAP. The proposed amendment would carve out a new Subarea 4. The "Van Ness Subarea 4 Medical Use Subdistrict" would encompass both the Cathedral Hill hospital and associated Medical Office Building ("MOB"). Such a carve-out for a new sub-area would create an incompatible "island" in the middle of the Van Ness Corridor, and would both overwhelm and destroy the fabric of the diverse and thriving Polk Street and Tenderloin neighborhoods. These adjacent neighborhoods have longstanding and vibrant mixed uses, diverse residents, and distinct small businesses. A carve out for the massive Cathedral Hill would put tremendous

pressure on these neighborhoods to convert existing smaller, more pedestrian friendly services, affordable housing and small scale employment opportunities to uses that cater to the new hospital and MOB. In contrast, the neighborhood surrounding St. Luke's hospital has evolved with the hospital, thus a facility along the lines of Alternative 3A that would be reconstructed and located on the existing footprint, would present far fewer land use impacts."

(Gloria Smith—California Nurses Association, March 8, 2011) [122-5 LU]

"Finally, the proposed Cathedral Hill campus is clearly inconsistent with the already in place VNAP, because the VNAP encourages high-density mixed use development over a large scale hospital and MOB. Likewise, VNAP contains strong provisions for the preservation of existing housing resources and mixed uses. According to the DEIR, major amendments would be needed to bring the project into conformance with the City's General Plan VNAP, Planning Code – VNSUD, zoning. These amendments would create internal inconsistencies within the General Plan and create vertical inconsistencies with the code."

(Gloria Smith—California Nurses Association, March 8, 2011) [122-7 LU]

"A Smaller Cathedral Hill Campus is Essential for Neighborhood Compatibility The proposed Cathedral Hill Campus would be located is an area that is bustling with activity and composed mainly of a mix of residential and commercial uses. The area is a focal point for high-density mixed use development because of its central location within the jurisdiction of the Van Ness Avenue Area Plan (VNAP) and the associated Van Ness Special Use District (VNSUD) (Planning Code Section 243). For this reason, the General and Area plans and supporting codes (VNSUD) have strong, interwoven and internally consistent policy guidance for mixed use including residential, neighborhood commercial services and retention of affordable housing and businesses. Because of the strong and focused policies, the Corridor has evolved into a model for vibrant, walkable mixed use development.

Amendments to these plans and codes to allow an oversized, 555-bed medical center will destabilize the fabric of this area and adjacent areas such as the Tenderloin. Existing policies have already directed the retention of existing businesses, jobs, and residential and single-room occupancy hotels (SRO's), which represent unique and often irreplaceable resources that are subject to strong economic pressures that often lead to conversion or demolition."

Response LU-23

The following is a summary of the substantive comments:

- The Draft EIR does not analyze the project's inconsistency with the intended character of the VNAP.
- The proposed VNAP amendment to create a new sub-area to allow medical uses is not analyzed in terms of impact on the future development of housing along Van Ness Avenue.
- The Draft EIR fails to consider Objective 1 and its policies from the VNAP and need for housing along Van Ness Avenue and construction of affordable housing.
- The proposed Cathedral Hill Hospital is at a scale that is inconsistent with the residential boulevard envisioned in the Van Ness Avenue Plan, Objective 8.
- The policies presented in Section 4.1, "Land Use and Planning," of the Draft EIR do not include VNAP policies that encourage and development of non-residential uses along Van Ness Avenue, except for ground floor commercial uses below high-density housing.
- The proposed amendments to the General Plan, the Van Ness Avenue Plan, and the Planning Code create internal inconsistencies in the General Plan, and inconsistencies between the General Plan and the Planning Code.

- The General Plan supports a larger St. Luke's Hospital and a smaller Cathedral Hill Hospital.
- The Cathedral Hill Campus would destabilize the surrounding neighborhoods, like the Tenderloin.

Since the publication of the Draft EIR on July 21, 2010, the project sponsor has made some modifications to the requested entitlements for the proposed LRDP based upon input from the Planning Department after reviewing the initial application submittal for the near-term projects, including the proposed development at the Cathedral Hill Campus. Therefore, the required project approvals listed in the Draft EIR in Table 2-3, "Required Project Approvals," on pages 2-13 through 2-17 of the Draft EIR have been updated as part of the text revisions to the Draft EIR included on pages C&R 4-37 through C&R 4-42 of this document. As shown in the text revisions to Table 2-3, the proposed amendments to the VNAP no longer include the creation of the new subarea referenced in several of the comments.

The comments pertain to the VNAP and the Van Ness SUD. Please see Response LU-21 (page C&R 3.3-95) for discussion of the relationship of the proposed Cathedral Hill Campus with the 3:1 residential/net new non-residential ratio requirement of the Van Ness SUD. Please see Response LU-5 (page C&R 3.3-30) for a discussion regarding the consistency of the project with the General Plan, including the VNAP, and Response LU-9 for a discussion of the relationship of the proposed LRDP to the Planning Code, including the Van Ness SUD. In stating that the City intends Van Ness Avenue to be a residential boulevard, the comments appear to misinterpret the intent of the VNAP and Van Ness SUD. Rather than a purely residential boulevard, these documents present a vision of Van Ness Avenue as a vital, intense, mixed commercial/residential corridor. In implementing the VNAP, Section 243(b) of the Planning Code (Van Ness SUD) states in part that: "In order to implement the objectives and policies of the VNAP, a part of the Master Plan, which includes (i) creation of a mix of residential and commercial uses on the boulevard…"

Thus, the intent of the VNAP and the Van Ness SUD is to facilitate the addition of a significant increment of housing to the Van Ness Avenue corridor, taking what at the time the VNAP and Van Ness SUD were adopted was a primarily commercial corridor and transforming it to be a mixed use corridor with the pedestrian environment of a residential boulevard.

Objective 1 of the VNAP, addressing uses in the corridor from Redwood Street to Broadway states: "Continue existing commercial use of the avenue and add a significant increment of new housing." Further, in describing Objective 1, the VNAP states: "[d]evelopment of a number of medium density, mixed use projects with continued non-residential use of non-residential buildings would facilitate the transformation of Van Ness Avenue into an attractive mixed use boulevard." Objective 1 is implemented through five policies (1.1 through 1.5), three of which are discussed below in response to the comments. Policy 1.1 encourages the development of high density housing above a podium of commercial uses in new construction. Policy 1.4 encourages maximizing the number of housing units and Policy 1.5 encourages employing various techniques to provide more affordable housing. The housing policy is implemented by Planning Code Section 243(c)(8) (Van Ness Special Use District). which requires development projects within the Van Ness SUD to include residential uses at 3:1 ratio to net new nonresidential uses. Although the proposed LRDP is not residential in nature and does not meet the 3:1 residential/net new non-residential ratio requirement established in the VNSUD, the provisions of the VNSUD specifically allow for modifications to be made for uses like the proposed LRDP if the decision-makers find that the proposed modification would not undermine the City's commitment to creating a substantial increment of new housing in the Van Ness Avenue corridor. Approvals proposed for the Cathedral Hill Campus development under the LRDP include amendments to the VNAP and CU authorizations, as described in detail in Response LU-5, C&R 3.3-30.

The Draft EIR has evaluated the physical environmental impacts of the proposed LRDP, which includes the physical effects of the proposed amendments to local plans and policies. As explained in Response

LU-1 (page C&R 3.3-1), before issuing a permit for any project; before issuing a permit for any demolition, conversion, or change of use; and before taking any action that requires a finding of consistency with the General Plan and other applicable plans and policies, the City must determine that the proposed project is consistent with the General Plan and Priority Policies.

The proposed Cathedral Hill Campus would not be at a scale that would be inconsistent with the VNAP vision of Van Ness Avenue as a residential boulevard. Please also see the discussion of this issue in Response LU-13.

The 1987 EIR for the Van Ness Area Plan specifically excluded the Cathedral Hill Hospital site from consideration as "developable" and the site was not at that time considered a potential housing site.[53]Objective 8 of the VNAP addresses issues of streetscape design. The full wording of that objective is: "Create an attractive street and sidewalk space which contributes to the transformation of Van Ness Avenue into a residential boulevard." The proposed Cathedral Hill Campus would include several features that would help improve the pedestrian environment and facilitate connections between the proposed Cathedral Hill Campus and the surrounding community. Widened sidewalks along Van Ness Avenue, and Post Street under the LRDP proposal for the Cathedral Hill Campus would improve pedestrian circulation in the area surrounding the proposed Cathedral Hill Hospital. Substantial landscaped areas would also be added to offer visual relief to pedestrians and provide a buffer between pedestrians and traffic lanes. The proposed streetscape design is shown in Figure 2-37, "Cathedral Hill Campus—Proposed Streetscape Plan" (Draft EIR, page 2-101). The proposed entry plazas for the new hospital would mark the Van Ness Avenue and Geary Boulevard entrance to the proposed Cathedral Hill Hospital and the Van Ness Avenue and Geary Street entrance to the Cathedral Hill MOB.

The question of consistency of the proposed LRDP with local plans and policies was addressed in Impact LU-2 of the Draft EIR, pages 4.1-46 through 4.1-54. The conclusion of the Draft EIR was that the proposed LRDP would not be inconsistent with the local plans and policies related to environmental considerations and that the impact would be less than significant. Please also see Response LU-9 for additional discussion of the relationship of the proposed LRDP to the General Plan and the Planning Code.

The size of the proposed Cathedral Hill Campus and St. Luke's Campus is discussed in Major Response HC-2, page C&R 3.23-8 of this document. The General Plan does not speak to the size of specific parts of the CPMC system. The LRDP is, however, consistent with the CPMC Institutional Master Plan, which was accepted by the Planning Commission on November 19, 2009.

There is no evidence in the record to support the statement that the proposed LRDP would "destabilize" the Tenderloin neighborhood. The relationship of the proposed LRDP to the Tenderloin is addressed in several locations in this C&R document, including Response PH-12, pages C&R 3.5-47 through C&R 3.5-50, which considers the effects of the proposed LRDP on housing demand in the Tenderloin, and Responses TR-124 and TR-125, pages C&R 3.7-207 through 3.7-214), which address the effects of the proposed Cathedral Hill Campus on the transportation and circulation network in and around the Tenderloin.

[53] VNAP FEIR, page 58: "These existing buildings are generally large and contain businesses which maintain strong economic activity (e.g. Cathedral Hill Hotel, Holiday Inn, Regency Theater) and, based on past and projected economic trends, are not expected to be demolished for new construction or converted to another use."

Comment

(Stephanie Barton, et al.—Hastings Civil Justice Clinic for the Good Neighbor Coalition, October 19, 2010) [104-7 LU]

"The project's impacts on housing development along Van Ness Avenue are significant and warrant a discussion of mitigation measures. The proposed project includes no housing in direct contravention of VNAP's most important policy mandates. At a minimum, the construction of a 15-story hospital and a 9-story medical office building removes major acreage from housing development. An actual analysis has to be done to determine the foreseeable consequences for housing elsewhere in the Van Ness Avenue corridor. This analysis also must reflect the special housing requirements of the Van Ness Avenue Special Use District discussed below, which effectuate the VNAP planning objectives and policies. In short, the DEIR is seriously deficient both because of its failure to consider general plan and special area plan land use provisions affecting development on Van Ness Avenue and because of its total disregard of the extent of likely housing mitigation measures necessary."

Response LU-25

The comment states that the Cathedral Hill Campus development under the proposed LRDP would have significant impacts on housing development along Van Ness Avenue and would remove the Cathedral Hill site from having future housing. The comment also states that the Draft EIR did not consider plans and policies applicable to this area and did not provide an analysis of the effects of the proposed Cathedral Hill Campus on housing elsewhere in the Van Ness Avenue corridor. The analysis in Section 4.3, "Population, Employment, and Housing," in the Draft EIR, as further explained in Responses PH-5, PH-6, PH-7, PH-9, PH-11, PH-13, PH-16 PH-17, and PH-25, concluded that the proposed LRDP would have less-than-significant impacts related to population, employment, and housing.

The concern about the loss of potential housing that would result from the proposed LRDP is specific to the proposed Cathedral Hill Campus, which is in the VNSUD. Planning Code Section 243 (c)(8)(A) requires a 3:1 residential/non-residential ratio for development in the VNSUD. As currently zoned, the proposed Cathedral Hill Campus site presents the potential to construct approximately 304 new housing units under the 3:1 requirement (see Response LU-21, C&R 3.3-95 for the calculations). The proposed LRDP would eliminate the opportunity to construct this new housing on the Cathedral Hill Campus site. The San Francisco General Plan's Housing Element analyzes the physical capacity for housing in San Francisco, based on land supply and site opportunities to accommodate its RHNA. As noted in Response PH-9 (page C&R 3.5-31), San Francisco has the capacity to accommodate approximately 73,700 new housing units under the current and recently adopted zoning. [54] The 2009 Housing Element estimates another 18,200 units of potential housing capacity with the proposed rezoning of currently selected neighborhoods currently undergoing study.[55] Finally, the 2009 Housing Element estimates a residential development pipeline of approximately 50,200 housing units. The proposed rezoning of the Cathedral Hill site would reduce the total capacity under current zoning by approximately 0.4 percent and the rezoned capacity under the 2009 Housing Element by less than 0.3 percent. Under the estimates contained in either version of the Housing Element, after these reductions, the City would still have sufficient capacity to accommodate the projected new households generated under the proposed LRDP.

As described in Response LU-21 (page C&R 3.3-95) in "C. VNSUD Housing Fee," the future residential development potential of the entire VNSUD was identified as approximately 2,190 units. The 1987 EIR for the VNAP included criteria that excluded the Cathedral Hill Hospital and 1375 Sutter MOB sites from consideration as "soft" and, therefore, they were not considered potential future housing sites. The

[54] Table I-56, San Francisco Planning Department. 2009 Housing Element Update. The Final EIR for the San Francisco 2004 and 2009 Housing Element was certified by the Planning Commission on March 24, 2011 (Case No. 2007.172SE). The Board of Supervisors adopted the 2009 Housing Element Update on June 21, 2011.

[55] Table I-66, San Francisco Planning Department. 2009 Housing Element Update. The Final EIR for the San Francisco 2004 and 2009 Housing Element was certified by the Planning Commission on March 24, 2011 (Case No. 2007.172SE).

Cathedral Hill MOB site did meet the VNAP EIR criteria for "soft" and was considered developable for housing. Based on the analysis presented in LU-21, the Cathedral Hill MOB site could be developed with up to 107 dwelling units, which would constitute 4.8 percent of the total residential development potential estimated in the VNAP EIR.

The assessment of housing capacity in the Draft EIR is not based on the assumptions of the VNAP or the VNAP EIR, but, rather, it is based upon the assumptions of capacity in the Housing Element. Under the Housing Element, none of the proposed CPMC LRDP development sites in the proposed Cathedral Hill Campus were assumed for residential development. The Housing Element used a more restrictive assumption about sites that would redevelop in the City, considering "soft sites" to be those with existing building area less than 30 percent of allowable development.[56] As a matter of clarification, the 2009 Housing Element states that "[f]or the purpose of determining remaining development potential capacity, the Planning Department does not consider any parcel developed to more than 30 percent of its capacity as a 'soft site,' or a candidate for additional square footage or intensification." None of the proposed Cathedral Hill Campus development sites would meet these criteria. Thus, the remaining potential residential development capacity in the City of San Francisco as identified in the Housing Element, which formed the basis for the Draft EIR analysis of the proposed LRDP's impacts related to housing, would not change as a result of implementation of the proposed CPMC LRDP.

As stated in Table 2-3 on page 2-14 of the Draft EIR, as part of the proposed LRDP, the sponsor would request CU authorizations to allow demolition of five existing residential dwelling units and 20 residential hotel units and to modify application of the 3:1 residential/net new non-residential ratio requirement within the Van Ness SUD. The project could not move forward without these authorizations (or alternatively a VNSUD text amendment exempting the project from the 3:1 requirement). The discussion on page 4.3-44 of the Draft EIR concludes that the proposed Cathedral Hill Campus would have a less-than-significant impact on housing, and thus no mitigation is required. Please see Response LU-21 (page C&R 3.3-95) for additional analysis of the 3:1 residential/non-residential ratio requirement, showing scenarios in which the proposed Cathedral Hill Campus could comply with the requirement of Planning Code Section 243.

The Draft EIR provides environmental review for all discretionary approvals necessary for the proposed project. These approvals (e.g., CU authorizations) are required from the decision-makers before the development of the proposed LRDP could proceed. This determination is separate from the environmental review process and further consistency analysis would be conducted for the CU findings. This separate process is part of the decision to approve, modify, or disapprove the proposed LRDP.

Comment

(Commissioner Antonini, September 23, 2010) [PC-355 LU]

"And let's see, I had a couple of other things I wanted to mention, there was some talk about the Van Ness Special Use District, and actually it is mentioned in the documents and it does talk about situations where the Commission has the ability to exempt the hospital from this requirement by either CU or by establishment of what would be a Van Ness Avenue Medical Special Use District, and so that might be something, but I did do the research and I've heard that a number of facilities that are not hospitals have been exempted in the past, or given modifications such as the movie theatres, the AMC Theatres at 1000 Van Ness had a CU that allowed that to be converted in 1994. There is some housing, but not nearly the 3:1 ratio. And perhaps this applied, although I do not know the exact dates at the State Office Building, and there was the recent conversion of the building at Van Ness and California to a Ford auto dealership. So, I mean, the use for a hospital is one of the highest and best that we

[56] City of San Francisco, *Housing Element, Part I: Data and Needs Analysis,* page D.2. "For the purpose of determining remaining development potential capacity, the Planning Department does not consider any parcel developed to more than 30 percent of its capacity as a "soft site," or a candidate for additional square footage or intensification." Accessed May 25, 2001 http://housingelement2009.sfplanning.org/docs/Housing_Element_Part_I_Data_Needs_Assmt_CPC_Adopted.pdf,

can have, and certainly, while we need housing, we have to look at this and figure out what's going to work, what's going to make sense, and can it work out to do some of this. So, that's going to be something that we're going to have to consider as we go through the process because there is no guarantee, quite frankly, that the Sutter firm and Cal Pacific will actually have to build a hospital in San Francisco, and we are very lucky to have a major medical center being built in San Francisco, it could be built outside of the City,..."

Response LU-26

The comment discusses the Van Ness SUD and acknowledges that the Draft EIR discusses the Planning Commission's ability to exempt the hospital from the requirement of CU authorization or establishing a Van Ness Avenue Medical SUD. The comment states that other non-hospital projects in the area have been exempted in the past, and that the proposed Cathedral Hill Hospital under the LRDP would need to be considered in balance with the housing need. The comment is noted. These other projects noted have undergone separate environmental review through the San Francisco Planning Department and were subsequently approved. These projects are not connected with the proposed LRDP and the comment does not raise issues regarding the adequacy, accuracy, or completeness of the Draft EIR. Please see Responses LU-5 and LU-9 (page C&R 3.3-30 and C&R 3.3-64) for discussion of the proposed Cathedral Hill Campus facilities and the project's consistency with the VNAP and the Planning Code. Please also see Response LU-21 (page C&R 3.3-95) for a discussion of the project's consistency with the 3:1 residential/net new non-residential provision. The provisions of the VNSUD specifically allow for modifications to the 3:1 provision to be made for uses like the proposed CPMC LRDP medical facilities, if the decision-makers find that the proposed modification would not undermine the City's commitment to creating a substantial increment of new housing in the Van Ness Avenue corridor.

The decision-makers are responsible for reviewing the consistency of the proposed LRDP with the applicable land use plans and policies, such as the Van Ness SUD. The decision-makers' consistency review occurs independently and separately from the CEQA analysis.

3.3.3 PACIFIC CAMPUS

3.3.3.1 CONSISTENCY WITH EXISTING PLANS AND POLICIES AND LAND USE COMPATIBILITY

Comment

(Paul Wermer—CPMC Neighbors Coalition and Pacific Heights Residents, October 18, 2010) [67-9 LU]

"1) LAND USE AND LAND USE PLANNING

The Pacific site is adjacent to the Webster Street Historic District, one block from the Upper Fillmore NCD, one block from Lafayette Park, near local schools, and surrounded by a residential district. The adverse impact on the character of the surrounding area from inappropriately designed buildings and high traffic intensity needs to be addressed."

Response LU-27

The comment expresses concern about the effect of the design of buildings at the Pacific Campus on the character of the surrounding area and high traffic intensity in the vicinity.

Long-term LRDP projects described in the Draft EIR, including the project at the Pacific Campus, would be subject to additional project-specific environmental review under CEQA. In the event that subsequent environmental review identified significant impacts not disclosed in the CPMC LRDP EIR, the City would be required to identify feasible mitigation measures to reduce any significant impacts to a less-than-significant level.

As described in Impact LU-3 on page 4.1-63 of the Draft EIR, long-term development plans at the Pacific Campus include the demolition of four buildings (plus the Clay Street Tunnel) and construction of one new building (ACC Addition) and two new parking garages—the North-of-Clay Aboveground Parking Garage and the Webster Street/Sacramento Street Underground Parking Garage. The overall size and scale of the buildings on the Pacific Campus with implementation of the proposed LRDP would not change substantially, compared to existing conditions. Further, the shift in the type of medical use (primarily outpatient non-acute-care uses instead of inpatient acute care uses) on the campus would not have a substantial effect on the intensity of activities on the Pacific Campus, and thus there would be a less-than-significant impact on the existing character of the surrounding neighborhood (Draft EIR, page 4.1-63). Parking garages proposed as part of the Pacific Campus under the LRDP would be of similar height as other buildings within their immediate surroundings or would be buffered from residential uses by existing structures and therefore would not have a substantial adverse impact on the overall existing character of the vicinity.

The daily population at the Pacific Campus by 2015 and 2030 would be less than the daily population under existing conditions, because of the transfer of acute care medical services to the proposed Cathedral Hill Campus and other development under the LRDP, all of which would lessen the intensity of daily traffic at the Pacific Campus. This is shown in Table 4.3-10 on page 4.3-16 of the Draft EIR. The number of personnel under the proposed LRDP would decrease by 70 percent by 2015. With the development of other long-term projects, the number of personnel would increase between 2015 and 2030, but would remain below 2006 personnel levels or existing levels. As stated in Impact TR-59 on page 4.5-168 of the Draft EIR, the proposed LRDP at the Pacific Campus would result in a net increase of 71 vehicle trips during the p.m. peak hour. With the addition of the new vehicle trips, the 16 study intersections would continue to operate at acceptable levels of service. Therefore, the increase in traffic that would result from the project would be less than significant. Additionally, a net increase of 648 parking spaces would be added to the Pacific Campus by 2020 (see Draft EIR, page 4.5-168). Although parking conditions are not considered to be environmental impacts as defined by CEQA, this net increase of 648 parking spaces would accommodate the estimated parking demand at the Pacific Campus and would create a surplus of 10 spaces.

Implementing the proposed LRDP at the Pacific Campus is not anticipated to have a substantial effect on the existing character of the vicinity, and this impact would be less than significant.

Comment

(Arthur and Jacqueline Cimento, October 19, 2010 [78-3 LU, duplicate comment was provided in 99-3 LU]

"The following are comments on the draft EIR. These comments are focused on the proposed changes to the Pacific campus, which is adjacent to our home. We request that the final EIR adequately address the issues outlined below and provide further mitigation of impacts than currently proposed. Since the EIR is vague in its assessment of many aspects of the Pacific campus project, we also request that a project level, focused EIR be conducted for the Pacific campus modifications before they are approved.

1) Project violates Existing Conditional Use Permits

The draft EIR contains several references to the current conditional use permit under which the medical center is permitted to operate in a residential zone. This conditional use permit has been in place in the 1960's (page 3-16). The applicable planning code section permits this conditional use if inpatient care is the primary use (page 4.1-53). It is the stated intent of the long-range plan to convert this campus to outpatient care, which violates the terms of the existing conditional use permit. There is no analysis or discussion of why the inpatient use restrictions were originally put in place. Perhaps they were to preserve the unique character of our

neighborhood. Furthermore, there is no discussion of whether a change in the permitted use would apply to similar facilities in other residential zones in the City or just to our neighborhood.

Later in the EIR, the Pacific Heights neighborhood is described as an 'Outstanding and Unique Area' (page 4.2-34). The proposed project would result in a campus with 'denser more intense development than exists at present' (page 4.2-149). Why isn't this change considered a potentially significant impact? We believe there is inadequate discussion of this change to the conditional use restrictions which have been in place for 50 years. The project sponsors are well aware of the neighborhood opposition to the intensification of development associated with this project. Presumably the restrictions in the existing conditional use permit were intended to protect against just such development.

Further on, on page 5-8, the draft EIR states 'all construction and renovation at the Pacific, Davies, and St. Luke's campus would occur entirely within the existing campus footprint; medical uses would continue on these campuses, and therefore **no change in land use would occur**.' Since the proposed changes to the Pacific campus will violate its existing conditional use permit, this statement is inaccurate and misleading. We request that the conditional use permit for the Pacific campus not be modified until the full impact of this development on our neighborhood's essential character is understood and our community's position is considered."

Response LU-28

The comment refers to the proposed projects at the Pacific Campus and makes the following substantive remarks:

- The proposed LRDP would violate existing CU authorizations at the campus and
- Whether a change in permitted use would apply to similar facilities in other residential zones in the City or just to the Pacific Campus area neighborhood is questioned.
- The comment asks why the proposed changes at the Pacific Campus would not be considered a potentially significant land use impact.

Please note that the potential environmental impacts that would occur with the development (e.g., land use, aesthetics, transportation and circulation, etc.) at the Pacific Campus are evaluated in the Draft EIR pursuant to CEQA. Whether changes in permitted uses would apply to similar facilities in other residential zones in the City or the neighborhood in the Pacific Campus area would depend on the zoning of those particular facilities. Other projects would be subject to separate discretionary review and environmental process through the City.

No discussion of the proposed LRDP's consistency with the existing CU authorization is provided in the Draft EIR, because no amendment to the existing CU would be necessary to allow the existing facilities to continue to operate without acute care inpatient uses. This is because, as amended as part of Planning Department-initiated Code clean-up legislation enacted earlier this year, Planning Code section 209.3(a) conditionally permits medical institutions without inpatient medical services in the RM-1 and RM-2 Districts within which the Pacific Campus is located, and no new construction or significant alterations to existing structures or changes to the medical institutional uses of the existing buildings at the Pacific Campus requiring a change to the existing CU authorization is proposed as part of the near-term projects under the LRDP. The comment requests an explanation of the conclusion in the Draft EIR that there would be less-than-significant impacts related to changes to the existing character in the vicinity of the LRDP sites (see Draft EIR Impact LU-3, page 4.1-55). This is because, according to the comment, the proposed LRDP at the Pacific Campus would result in a denser and more intense development than found in existing conditions in the Pacific Heights neighborhood.

The potential impacts of proposed LRDP development at the Pacific Campus on the character of the surrounding neighborhood are analyzed in Impact LU-3 on pages 4.1-63 through 4.1-65 of the Draft EIR. This discussion reflects the proposed changes at the Pacific Campus under the LRDP and makes the following salient points in reaching the conclusion that this impact would be less than significant:

- Because medical services would still be provided and the size and scale of the buildings on the Pacific Campus would not change substantially compared to existing conditions, the shift in the type of medical use (primarily outpatient non-acute-care uses instead of acute-care inpatient uses) on the campus would not have a substantial impact on the existing character of the surrounding neighborhood;

- The proposed new structures would not substantially change the scale with the surrounding residential neighborhood and would be compatible with the size and scale of buildings on, and in the vicinity of, the Pacific Campus;

- The overall gross square footage would increase to 1,345,645 gsf under the proposed LRDP from the existing 1,117,334 gsf, with the expanded space primarily including the construction of a new Ambulatory Care Center Addition of approximately 205,000 gsf, and two parking structures comprising about 300,000 gsf, with nearly 690 parking spaces. However, some medical uses and floor area at the campus would not increase, but would decrease with implementation of the proposed LRDP. These include decreases in hospital administration, inpatient care, skilled nursing care, and emergency department uses, as shown in Table 2-7a (Draft EIR, page 2-105) and Table 2-7b (Draft EIR, page 2-109);

- The height, size, and scale of the proposed North-of-Clay Aboveground Parking Garage would not be substantially out of character with other buildings that would remain on the campus and in the area, and would be of similar height compared to other buildings within its immediate surroundings;

- The Webster Street/Sacramento Street Underground Parking Garage would have no effect on the existing character of its surroundings, because it would not be visible above ground; and

- the daily population at the Pacific Campus would be less than the population under existing conditions because of the transfer of acute care medical services to the proposed Cathedral Hill Campus and other development under the LRDP (Table 4.1-1, "Daily Populations at CPMC Campuses under Existing Conditions and the Proposed LRDP," on page 4.1-58 of the Draft EIR).

Often concerns about neighborhood character relate to the visual relationship of a proposed project to the surrounding neighborhood. This issue is addressed in detail in the Aesthetics section of the Draft EIR. As stated on page 4.2-149 of the Draft EIR, while the Pacific Campus under the LRDP would appear to have denser, more intense development than exists at present, the scale and height of the proposed new buildings would be compatible with the surrounding buildings on the campus and in the immediate vicinity of the campus. The proposed 138-foot-tall ACC Addition building would be located adjacent to buildings that are similar in height and scale, including the 138-foot-tall 2333 Buchanan Street Hospital. Because of the proposed ACC Addition Building's location downhill of the existing hospital building, it would appear to be lower in height than the existing 2333 Buchanan Street Hospital building. This design reflects the slope of the Pacific Campus, consistent with the City's urban design policy.[57] The proposed 85-foot-tall North-of-Clay Aboveground Parking Garage would be shorter than one of the two buildings which it would replace (the 92-foot-tall Annex), and therefore, it would not substantially alter the arrangement of building roofline height from existing conditions in that part of the campus. The proposed

[57] No detailed design yet exists for the LRDP developments at the Pacific Campus. The assessment contained in this discussion is based on rough conceptual design details currently available for the Pacific Campus.

North-of-Clay Aboveground Parking Garage building would appear bulkier than the existing buildings that it would replace because it would present a continuous building façade to Clay and Webster Streets.

As stated on page 1-13 of the DEIR the long-term projects that are proposed under the LRDP, including the proposed development at the Pacific Campus, would be subject to additional project-specific environmental review under CEQA once more detailed information is available. Any additional conflicts with land use plans, policies, and regulations arising from more specific, project-level design issues related to long-term project components at the Pacific Campus would also be addressed in the future, during detailed project-level planning and in the future environmental project-specific documents.

The comment disagrees with the statement on page 5-8 of the Draft EIR that reads, "all construction and renovation at the Pacific, Davies, and St. Luke's Campuses would occur entirely within the existing campus footprint; medical uses would continue on these campuses, and therefore no change in land use would occur." As stated on page 4.1-63 of the Draft EIR, because medical services would still be provided and the size and scale of the buildings on the Pacific Campus would not change substantially compared to existing conditions, the shift in the type of medical use (primarily outpatient non-acute-care uses instead of acute-care inpatient uses) on the campus would not represent a material change in land use and would not have a substantial impact on the existing character of the surrounding neighborhood. The new development proposed at the Pacific Campus would be within the existing campus boundaries, as shown in Figure 2-40, "Pacific Campus – Proposed Site Plan" (Draft EIR, page 2-123).

As stated earlier in this response, no changes to the existing CU authorization for the Pacific Campus would be required for the proposed LRDP during the near-term. The long-term development at the Pacific Campus included in the proposed LRDP, however, would require additional land use approvals that would be the subject of future entitlement applications. During the near-term, the conversion of existing facilities at the Pacific Campus to primarily outpatient uses would be consistent with the Planning Code, and the use of existing facilities for primarily outpatient uses would not violate the existing CU authorization for the Pacific Campus.

Comment

(Arthur and Jacqueline Cimento, October 19, 2010) [78-5 LU, duplicate comment was provided in 99-5 LU]

"According to the EIR, the San Francisco Planning Code incorporates the Accountable Planning Initiative which includes 'protection of neighborhood character' and 'discouragement of commuter automobiles' (page 3-19). Residents of our neighborhood are entitled to quiet enjoyment of our homes. This facility has significant potential to become an attractive nuisance. The EIR needs to reconcile the apparent conflicts of the project with existing land use, zoning, and City Codes and identify specific mitigation measures to reduce its negative impacts to insignificance."

Response LU-29

The comment references the Pacific Campus and states that the Draft EIR needs to address conflicts of the LRDP with existing land use and zoning. As stated on page 4.1-54 of the Draft EIR, implementation of long-term development at the Pacific Campus under the LRDP would be substantially consistent with the General Plan because text amendments to the Planning Code and CU would be proposed as part of the project, and if these changes are approved, the Pacific Campus would be consistent with relevant plans and policies. As stated in Response LU-28 (page C&R 3.3-142), long-term projects described in the Draft EIR, including the project at the Pacific Campus, would be subject to additional project-specific environmental review under CEQA once more detailed information is available and an application for a project-level entitlement is filed with the City. Issues related to the consistency of these future projects with land use plans, policies, and regulations arising from more specific, project-level designs of long-term project components at the Pacific Campus would be addressed during detailed project-level planning and

environmental review. The granting of a CU authorization, which would be requested as part of such future, project-level entitlements is not generally considered to be an inconsistency with the General Plan or the Planning Code; the Planning Code specifically allows certain uses as "conditional uses" pursuant to project-specific review and evaluation by the decision-makers.

As stated on page 4.1-63 of the Draft EIR, because medical services would continue to be provided and the size and scale of the buildings on the Pacific Campus would not change substantially compared to existing conditions, the shift in the type of medical use (primarily outpatient non-acute-care uses instead of acute-care inpatient uses) at the campus would not have a substantial effect on the existing character of the surrounding neighborhood.

As stated on page 4.1-65 of the Draft EIR, the daily population at the Pacific Campus under the LRDP would be less than the population under existing conditions, because of the transfer of acute-care medical services to the Cathedral Hill Campus and other development under the LRDP (Table 4.1-1, "Daily Populations at CPMC Campuses under Existing Conditions and the Proposed LRDP," on page 4.1-58 of the Draft EIR). There would be a smaller on-campus population; however, the shift to primarily outpatient uses (from acute-care inpatient uses) would generate a slightly greater number of trips to and from the Pacific Campus. As described in Impact 59 on page 4.5-168 of the Draft EIR, the Pacific Campus would result in a net increase of 71 vehicle trips during the p.m. peak hour.

As stated on page 3-19 of the Draft EIR, Section 101.1 of the Planning Code would require that the City find the proposed project to be consistent with the priority policies of the Accountable Planning Initiative before it issued a permit for any demolition, conversion, or change of use, and before it took any action that required a finding of consistency with the General Plan. In evaluating the proposed project's consistency with the General Plan, the Planning Commission and/or Planning Department would make the necessary findings of consistency. This determination would not be part of the CEQA environmental review process but would be part of the decision to approve, modify, or disapprove the proposed LRDP.

Please also see Response LU-9 for a discussion of the relationship of the proposed LRDP to the Accountable Planning Initiative.

3.3.4 CALIFORNIA CAMPUS

No comments pertaining to land use and planning and solely related to this campus were received during public review of the Draft EIR.

3.3.5 DAVIES CAMPUS

No comments pertaining to land use and planning and solely related to this campus were received during public review of the Draft EIR.

3.3.6 ST. LUKE'S CAMPUS

3.3.6.1 CONSISTENCY WITH EXISTING PLANS AND POLICIES AND LAND USE COMPATIBILITY

Comment

(Alex Bernstein, August 4, 2010) [3-2 LU]

"Our neighborhood—permit me to repeat that phrase, *our neighborhood*—is not zoned to have a large structure erected in the middle of where we live."

Response LU-30

The comment states that the neighborhood around St. Luke's is not zoned for the large structures proposed under the LRDP. As shown in Figure 2-57, "St. Luke's Campus Area," on page 2-194 of the Draft EIR, the St. Luke's Campus site is zoned RH-2. The proposed development at the St. Luke's Campus would require the creation of a new Cesar Chavez/Valencia Streets Medical Use Special Use District to increase the existing FAR limit at the St. Luke's Campus, and a CU authorization to modify the existing Planned Unit Development (PUD), to allow CPMC to construct a replacement hospital in the RH-2 District and allow exceptions to rear-yard requirements, signs, restriction on projections extending over a street or alley, and height and bulk limits for buildings taller than 40 feet in the RH-2 District (please see Draft EIR, page 2-192 and associated text revisions on page C&R 4-58). PUDs are conditionally allowed in the RH-2 District under Planning Code Section 209.9, and medical centers are currently permitted as a CU under Planning Code Section 209.3(a), and therefore are not prohibited. The Draft EIR provides environmental review for all discretionary approvals necessary for the proposed LRDP (e.g., environmental impacts from construction and operation); however, these approvals would be required from the decision-makers before the development of the proposed LRDP could proceed and would be separate from the approvals related to the environmental review process, such as certification of the EIR.

The discussion of the compatibility of the proposed LRDP land uses with existing land uses in the vicinity of the St. Luke's Campus is presented in Impact LU-3 on pages 4.1-59 through 4.1-63 of the Draft EIR, as discussed below.

The discussion of land use compatibility at the St. Luke's Campus recognizes that the changes envisioned by the proposed LRDP would improve community character in some locations and adversely affect community character in other locations around the campus. Ultimately, the Draft EIR concludes that the impact would be less than significant for the following reasons:

- The proposed MOB/Expansion Building would be seven stories shorter than the hospital currently on the site;
- The St. Luke's Campus would continue to provide medical care, as it has for more than 130 years, and the shift in the type of medical uses on campus would not substantially alter the existing character of the vicinity;
- The proposed five-story, 99-foot-tall Replacement Hospital would be a considerable reduction in height compared to the existing 12-story, 158-foot-tall St. Luke's Hospital tower proposed for demolition; and,
- The proposed LRDP would include a landscape and streetscape plan on and around the St Luke's Campus that would be compatible with the City's proposed improvements along Cesar Chavez Street.

As it relates to the residences to the west and south of the St. Luke's Campus, the Draft EIR notes that the land use compatibility impacts would be less than significant because:

- The western portion of the proposed St. Luke's Replacement Hospital would be 51 feet tall from the high point of grade to the roof deck (the top of the parapet would be 3 feet taller) and would be set back from the residential units to the west that front Guerrero Street;
- Normal practice is and would continue to be to turn off emergency vehicle sirens within a few blocks of the proposed hospital to minimize the noise disturbance effects on residential uses in the vicinity; and

- Given the urban setting of this campus, increased activity on the St. Luke's Campus would not result in a substantial adverse change in the character of the area.

It is the conclusion of the Planning Department that for the above reasons, the proposed development at the St. Luke's Campus would result in a less-than-significant impact related to changes in land use character.

Comment

(Rachel Sater—Lost Block and Save Our Streets, October 19, 2010) [101-2 LU]

"Page 1-13: The DEIR indicates that it is a project-level EIR for the four projects at the St. Luke's campus. However, as explained in the following comments, the setting, impacts, mitigations and alternatives are not sufficiently detailed with respect to the St. Luke's campus, and are inadequate for a project-level EIR. In particular, the DEIR lacks a sufficiently detailed analysis of the impacts of the St. Luke's Replacement Hospital and associated General Plan Amendment, Planning Code Amendment and Conditional Use Authorizations for use, height and bulk."

Response LU-31

The comment states that Draft EIR did not include sufficient detail for the setting, impacts, mitigation, and alternatives for a project-level EIR and that the Draft EIR lacks a sufficiently detailed association of the impacts of the proposed St. Luke's Replacement Hospital and associated General Plan amendments, Planning Code amendments, and CU authorizations. Please refer to Response LU-32 (page C&R 3.3-152) regarding the Draft EIR's analysis of impacts related to various resource areas. The existing hospital at the St. Luke's Campus is allowed under CU authorization. As part of the proposed LRDP, the project sponsor has requested Planning Code and General Plan amendments to allow the proposed development to be implemented at the St. Luke's Campus. In response to the statement that the analysis was inadequate and failed to provide sufficient details of the effects of the proposed St. Luke's projects, the purpose of the CPMC LRDP EIR and CEQA appears to be misunderstood.

Under CEQA, an EIR is required to provide a thorough but reasonable body of information about the environmental effects of the proposed project, sufficient to inform the decision-makers and support intelligent decision-making. More specifically, Section 15151 of the State CEQA Guidelines states:

> "An EIR should be prepared with a sufficient degree of analysis to provide decision makers with information which enables them to make a decision which intelligently takes account of environmental consequences. An evaluation of the environmental effects of a proposed project need not be exhaustive, but the sufficiency of an EIR is to be reviewed in the light of what is reasonably feasible…The courts have looked not for perfection but for adequacy, completeness, and a good faith effort at full disclosure."

Exceptions and amendments to the Planning Code are allowed in the Planning Code regulations. As stated in Section 302(a) of the Planning Code,

"whenever the public necessity, convenience and general welfare require, the Board of Supervisors may, by ordinance, amend any part of this Code. Such amendments may include reclassifications of property (changes in the Zoning Map), changes in the text of the Code, or establishment, abolition or modification of a setback line."

Proposed Plan and Code Amendments

The discussion below enumerates how the proposed plan and code amendments were presented in the Draft EIR.

As stated on page 4.1-30 of the Draft EIR, the entire St. Luke's Campus is zoned RH-2 (Residential, House, Two-Family) (Figure 4.1-14, "St. Luke's Campus Vicinity—Existing Zoning," page 4.1-31 of the Draft EIR). Although the zoning district applicable to the St. Luke's Campus is primarily intended for residential use, a medical center is currently permitted under CU authorization. Planning Code Section 209.3(a) states that the following uses are allowed in RH2 zones as CU:

> "Hospital, medical center or other medical institution which includes facilities for inpatient care and may also include medical offices, clinics, laboratories, and employee or student dormitories and other housing, operated by and affiliated with the institution, which institution has met the applicable provisions of Section 304.5 of this Code concerning institutional master plans."

Since the publication of the Draft EIR on July 21, 2010, the project sponsor has made some modifications to the requested entitlements for the near-term projects under the proposed LRPD based upon input from the Planning Department after reviewing the initial application submittal for the near-term projects, including the proposed development at the St. Luke's Campus. Therefore, the required project approvals for the proposed development at the St. Luke's listed in the Draft EIR in Table 2-3, "Required Project Approvals," on pages 2-16 and 2-17 and on pages 2-192 and 2-193 have been updated as part of the text revisions to the Draft EIR included in Chapter 4, "Draft EIR Text Changes", on pages C&R 4-37 to C&R 4-42 of this document.

As stated on page 2-192 of the Draft EIR, as updated in Chapter 4, "Draft EIR Text Changes," the project sponsor is requesting an amendment to the Planning Code Special Use District Map SU07 to establish a new Cesar Chavez/Valencia Streets Medical Use Special Use District for the St. Luke's Campus site, which would increase the allowable maximum FAR on the St. Luke's Campus site to 2.5:1. CU authorization would also be required for the St. Luke's Campus to modify the existing PUD to allow CPMC to construct a replacement hospital in an RH-2 District, and to allow exceptions to the rear-yard requirements, signs, restriction on projections extending over a street or alley (to allow for a canopy to provide the OSHPD-required weather protection for patients entering the St. Luke's Replacement Hospital), and height and bulk limits for buildings taller than 40 feet in an RH-2 District.

As stated on page 4.1-30 of the Draft EIR, the St. Luke's Campus is located within two height and bulk districts—105-E and 65-A (Figure 4.1-15, "St. Luke's Campus Vicinity—Existing Height and Bulk Districts," on page 4.1-32 of the Draft EIR). Most of the campus, which lies east of San Jose Avenue, is within the 105-E Height and Bulk District, and the parking lot located on the northwest corner of the campus is in the 65-A Height and Bulk District. Both districts limit building heights at 40 feet because of the residential zoning, unless CU authorization allowing a greater height is obtained. Therefore, a CU authorization would be requested to allow buildings taller than 40 feet. In addition, the Planning Code's height and bulk map would be modified so that the entire St. Luke's Campus would be within a 105-E height and bulk district.

As stated on page 2-191 of the Draft EIR, for the proposed LRDP to be implemented at the St. Luke's Campus, the sponsor would request an amendment to the Urban Design Element of the General Plan to allow the proposed St. Luke's Replacement Hospital and MOB/Expansion Building to exceed the current maximum height allowed (88 feet) on the St. Luke's Campus. Specifically, the proposed General Plan amendment would allow for development of the proposed St. Luke's Replacement Hospital and MOB/Expansion Building up to 105 feet in height under the Urban Design Element. The proposed height of the St. Luke's Replacement Hospital is approximately 99 feet, as defined by the Planning Code's methodology for building height. The proposed General Plan maximum height of 105 feet is less than the height of the existing St. Luke's Hospital tower at 158 feet. The proposed height of the MOB/Expansion Building would be approximately 100 feet, which would also be below the maximum height of 105 feet allowed if the General Plan amendment to the General Plan Urban Design Element Map 4 is approved.

As stated on page 2-191 of the Draft EIR, as updated in Chapter 4, "Draft EIR Text Changes," the project sponsor is requesting an amendment to Map 5 in the General Plan Urban Design Element to allow the proposed St. Luke's Replacement Hospital and MOB/Expansion Building to exceed the current permitted bulk requirements establishing a maximum plan dimension and maximum diagonal plan dimension of 110 feet and 125 feet, respectively. The proposed amendment to Map 5 of the Urban Design Element would allow for development of the proposed St. Luke's Replacement Hospital up to a maximum plan dimension and maximum diagonal plan dimension of 227 and 270 feet, respectively, and development of the proposed MOB/Expansion Building up to a maximum plan dimension and maximum diagonal plan dimension of 204 and 228 feet, respectively.

The Draft EIR provides environmental review for all discretionary approvals necessary for the proposed project (e.g., environmental impacts from construction and operation); however, these approvals are required from the decision-makers before the development of the proposed project could proceed and are separate from the environmental review process.

Environmental Setting

A detailed description of the environmental setting of the St. Luke's Campus is provided in Section 2.6, "St. Luke's Campus," and Section 4.1.1, "Environmental Setting," (on pages 4.1-28 through 4.1-35 of the Draft EIR). Five figures are included in the Draft EIR's description of the current environmental conditions in and around the St. Luke's site. Appropriately, the text, tables, and graphics that constitute the environmental setting at St. Luke's are presented at a level of detail that is consistent and supportive of the impact analyses presented in the Draft EIR; they do not contain excessive detail that is not pertinent to the evaluation of impacts. This is consistent with Section 15125(a) of the State CEQA Guidelines, which states that "[t]he description of the environmental setting shall be no longer than is necessary to an understanding of the significant effects of the proposed project and its alternatives."

Mitigation Measures

Under CEQA, the requirement for identification of feasible mitigation measures is triggered by the significant environmental impacts that would result from project implementation. In the Draft EIR, a total of 23 mitigation measures which would avoid or reduce the magnitude of significant impacts at the St. Luke's Campus were identified. Please refer to Table S-2 of the Draft EIR, which summarizes all of the potential impacts and mitigation measures for each CPMC campus under the LRDP. Applicable mitigation measures for the St. Luke's Campus include: Mitigation Measure M-CP-N2 to reduce potentially significant effects on buried or submerged historical resources; Mitigation Measure M-CP-N3 to reduce potentially significant effects on paleontological resources during construction-related earthmoving activities; Mitigation Measure M-NO-N1a to minimize the impacts of construction noise by implementing noise reducing measures; Mitigation Measure M-NO-N3a to measure sound levels of operating exterior equipment; Mitigation Measure M-NO-N5 to implement measures to reduce groundborne vibration levels during construction; Mitigation Measures M-AQ-N1a, M-AQ-N1b, M-AQ-N8a, M-AQ-N8b, M-AQ-N9, and M-AQ-N10c to implement BAAQMD basic and operation control measures and additional construction mitigation measures and installation of accelerated emission control devices on construction equipment; Mitigation Measure M-BI-N1 to conduct preconstruction surveys for nesting birds; Mitigation Measures M-GE-N4 and M-HY-N2 to prepare and implement a stormwater control plan; Mitigation Measure M-GE-N6 to include an excavation and dewatering program for monitoring; Mitigation Measure M-HY-N3 to submit a site-specific SWPPP; and Mitigation Measures M-HZ-N1a, M-HZ-N4e, and M-HZ-N4f to prepare and implement site mitigation and contingency plans.

Alternatives

The Draft EIR provided due consideration to a reasonable range of potential alternatives for the St. Luke's Campus. Under CEQA, the analysis of alternatives is aimed at seeking ways to achieve the project objectives while avoiding or reducing the environmental effects of the proposed project, and, importantly,

is governed by the rule of reason. More specifically, Section 15126.6(a) of the State CEQA Guidelines states:

"An EIR shall describe a range of reasonable alternatives to the project, or to the location of the project, which would feasibly attain most of the basic objectives of the project but would avoid or substantially lessen any of the significant effects of the project, and evaluate the comparative merits of the alternatives. An EIR need not consider every conceivable alternative to a project. Rather it must consider a reasonable range of potentially feasible alternatives that will foster informed decision making and public participation. An EIR is not required to consider alternatives that are infeasible. The lead agency is responsible for selecting a range of project alternatives for examination and must publicly disclose its reasoning for selecting those alternatives. There is no ironclad rule governing the nature or scope of the alternatives to be discussed other than the rule of reason."

The project objectives that must be largely met by a feasible alternative are presented in Draft EIR Section 2.1.4, pages 2.1-6 through 2.1-8 and Section 6.2, pages 6-5 through 6-7. Aside from the overarching objective of compliance with SB 1953, the Draft EIR identifies two objectives specific to the St. Luke's Campus, as stated below.

- "Rebuild and revitalize the St. Luke's Campus as a community hospital that is an integral part of CPMC's larger health care system, and that provides services such as (1) medical/surgical care, (2) critical care, (3) emergency/urgent care, and (4) gynecologic and low-intervention obstetric care.

- Provide for the development of an appropriately sized new medical office building or outpatient space at the St. Luke's Campus as the logical outgrowth of the increased utilization of the campus, to increase the availability of outpatient services meeting community needs and to better recruit and retain physicians by increasing convenience for physicians admitting patients to the hospital at the St. Luke's Campus."

As stated above, CEQA requires that the EIR include an explanation of reasons for selecting specific alternatives for consideration, and for rejecting alternatives from detailed analysis. The discussion on page 6-30 of the Draft EIR explains the rationale for rejection of a code complying alternative at the St. Luke's Campus:

> "[C]ompliance with the 65-foot height limit and existing bulk limits at the St. Luke's Replacement Hospital site, which was recommended by the Blue Ribbon Panel, would limit the St. Luke's Replacement Hospital to a total of approximately 34 beds and also would reduce its support services. Therefore, the Code-Complying Alternative would not meet the project objective of rebuilding and revitalizing the St. Luke's Campus as a community hospital to the same extent as under the proposed LRDP."

Under the Alternatives discussion in the Draft EIR, there are several alternatives for the St. Luke's Campus presented; however, in all cases, the St. Luke's Campus alternatives are in the context of alternatives for the entire CPMC LRDP, which is the project under evaluation in the EIR.

Under Alternative 1, the No Project Alternative, two reasonably foreseeable scenarios at the St. Luke's Campus are described. Under Alternative 1A, no existing buildings would be demolished and no new buildings would be constructed at the St. Luke's Campus. Alternative 1B would involve demolishing the existing St. Luke's Hospital and constructing a new outpatient facility in its place, as described in further detail in Section 6.6.1 under the St. Luke's Campus discussion (pages 6-57 through 6-63 of the Draft EIR).

Under Alternative 2, the Four-Campus Rebuilding/Retrofit/Redevelopment Alternative, the St. Luke's Campus would be identical to the campus proposed in the LRDP, which would include construction of the proposed new St. Luke's Replacement Hospital and MOB/Expansion Building at the campus.

Under Alternative 3, the Reduced Development at Cathedral Hill Campus Alternative, two different scenarios are presented for the St. Luke's Campus. Under Alternative 3A, 160 beds from the Women's and Children's service lines that are currently located at the Pacific and California Campuses would shift to a Women's and Children's facility at the St. Luke's Campus. The 160-bed St. Luke's Women's and Children's facility would be constructed as a second-phase addition to the St. Luke's Replacement Hospital (where the LRDP proposed to build the new proposed MOB/Expansion Building with underground parking). The St. Luke's Replacement Hospital proposed under Alternative 3A would be identical to that proposed under the LRDP. Alternative 3A would also include construction of a new proposed MOB and parking structure, but unlike under the proposed LRDP, the MOB and parking garage under Alternative 3A would be located on the southeast portion of the St. Luke's Campus. The new proposed MOB and parking garage would be larger than the MOB/Expansion Building proposed under the LRDP to provide services necessary to support the Women's and Children's facility.

Under Alternative 3B, which would shift the Women's and Children's services lines to the California Campus, the St. Luke's Campus proposal would remain the same as that under the proposed LRDP, except that the proposed MOB/Expansion Building would be reduced by two stories and would no longer include the approximately 31,800 sq. ft. of patient-care clinic uses.

These alternatives represent a reasonable range of alternatives to the proposed St. Luke's Campus under the LRDP.

Comments

(Rachel Sater—Lost Block and Save Our Streets, October 19, 2010) [101-9 LU]

"Pages 3-10, 3-18 and 3-19: The analysis of consistency with the General Plan and Planning Code lacks sufficient evidence upon which to conclude that the project would not conflict with applicable plans and policies related to physical environmental issues or human health. The analysis merely refers to the various impact assessments in Chapter 4, which, as explained in the following comments, are also merely conclusory and lack sufficient evidence. The project, and the St. Luke's Replacement Hospital in particular, would have a significant impact on neighborhood character for the adjacent homes along 27th Street, Guerrero Street and Cesar Chavez Street to the west, with respect to land use character, visual character, light pollution, noise, traffic, wind and shadow, and residential open space. This would conflict with the priority policies of Section 101 (b) of the Planning Code and the policies of the General Plan Urban Design Element, as well as other General Plan policies and Planning Code regulations."

(Rachel Sater—Lost Block and Save Our Streets, October 19, 2010) [101-10 LU]

"The analysis of consistency with the Planning Code merely indicates that, with approval of the required General Plan Amendment, Planning Code Amendment and Conditional Use Authorizations for use, height and bulk, the project would be consistent with the Planning Code. The analysis must be revised to evaluate the project with respect to the required findings for General Plan Amendment and Conditional Use Authorization, as they pertain to physical environmental issues or human health, including findings related to neighborhood character and livability, in light of the potentially significant impacts of the project on land use character, visual character, light pollution, noise, traffic, wind and shadow, and residential open space."

(Rachel Sater—Lost Block and Save Our Streets, October 19, 2010) [101-11 LU]

"Page 4.1-61, Impact LU-2: The DEIR discussion of the change in land use character focuses on relationships to Cesar Chavez and Valencia Streets, and on the public realm along those streets, and inadequately characterizes the

impact regarding change in character for more sensitive residential uses along 27th Street, Guerrero Street, Cesar Chavez Street, San Jose Avenue and Duncan Street. The discussion of the change in character for residential uses immediately adjacent to the west and south of the proposed St. Luke's Replacement Hospital does not support the conclusion that the change in character would be insubstantial and therefore less than significant. The discussion begins by saying there may be a change in character with the new hospital in place of the existing surface parking lot for employees. The only evidence given as to why this change would not be substantial is that, although the new hospital would stand out, its visual contrast would be less than the existing hospital, and normal practice is to turn ambulance sirens off within a few blocks of the hospital. However, whereas the existing hospital is on the east side of the campus 240 feet away from the nearest adjacent homes, the replacement hospital, and its emergency department entrance in particular, would be immediately adjacent to these homes."

(Rachel Sater—Lost Block and Save Our Streets, October 19, 2010) [101-13 LU]

"But the substantial land use change in character and associated significant impact is the result of not only the substantial visual change but also many other changes in character caused by the 99-foot tall hospital with emergency department ambulance bays, loading docks, more acute-care beds, a 1,200 person increase in the daily on-site population, new pick-up/drop-off location adjacent to the residential uses, 113 new parking spaces and associated traffic increases, as well as the new 100-foot tall medical office building."

(Rachel Sater—Lost Block and Save Our Streets, October 19, 2010) [101-14 LU]

"The DEIR needs to be revised to adequately characterize the existing land use character in terms of the location, number, height, orientation and dimensions of adjacent homes, rear yards and mid-block open space, useable open space, existing setback depths, and the views, light, air and privacy of the surface parking lot and perimeter mature screening trees. The project-level DEIR must be revised to describe adequately the existing land use character and potential project land use compatibility impacts in terms of height, bulk, setback, and the imposing length and height of the west-facing wall; screening landscaping and fencing; 24-hour emergency department activity and noise (not just siren noise but also noise from interior activities, idling emergency vehicles and emergency vehicle unloading/loading); building equipment noise; pedestrian entry; pick-up and drop-off zone; loss of sunlight, shadows and microclimate; loss of existing trees, view blockage and loss of privacy; and the increase in traffic on 27th Street, Guerrero Street and Cesar Chavez Street. All of these project-related changes contribute to a substantial change in character and thus significant land use compatibility impacts."

Response LU-32

The comments state that:

- The proposed facilities at the St. Luke's Campus would conflict with the existing General Plan and Planning Code, and that the analysis of consistency with the General Plan and Planning Code that is presented in the Draft EIR lacks sufficient evidence.
- The analysis indicates that with approval of the requested amendments and authorizations, the project would be consistent with the Planning Code.
- The proposed development at the St. Luke's Campus would conflict with the priority policies of the Planning Code and would have a significant impact on neighborhood character.
- The Draft EIR would have a significant impact on, or did not adequately describe neighborhood character, specifically related to land use, visual, light pollution, noise from interior activities and operation, traffic, wind and shadow, residential open space, loss of trees, and loss of privacy.
- The Draft EIR discussion of the change in character inadequately characterizes the impact regarding change in character for the residential uses to the west and south and does not support the conclusion that the change in character would be less than significant. The comment also questions the

conclusion in the Draft EIR that the change would not be substantial because the visual contrast would be less than the existing hospital, and normal practice is to turn ambulance sirens off within a few blocks of the hospital, considering the existing hospital is located further away from these residences to the west and south.

As part of the project, the sponsor would request General Plan and Planning Code amendments to allow the LRDP to be implemented as proposed at the St. Luke's Campus. The approvals that would be required for the St. Luke's Campus as well as the other four campuses are summarized in Table 2-3 on pages 2-13 through 2-17 of the Draft EIR and Revised Table 2-3, page C&R 4-37 of this document. Please refer to Response LU-31 (page C&R 3.3-147) regarding the proposed plan and code amendments and to Response LU-5 (page C&R 3.3-30) regarding consistency with applicable plans and policies. As explained in Response LU-1 (page C&R 3.3-1), the proposed LRDP and the project approvals are subject to review and approval by the Planning Commission and the Board of Supervisors. Before issuing a permit for any project; before issuing a permit for any demolition, conversion, or change of use; and before taking any action that requires a finding of consistency with the General Plan, the City would evaluate the LRDP's consistency with the General Plan and priority policies. In evaluating the proposed LRDP's consistency with the General Plan, the Planning Commission and/or Board of Supervisors would make the necessary findings of consistency. This determination would not be part of the CEQA environmental review process but would be part of the decision to approve, modify, or disapprove the proposed LRDP.

The comments state that the Draft EIR does not provide enough discussion on the change in character or analysis of setbacks and bulk of the proposed LRDP development at the St. Luke's Campus. Along the west elevation, the height of the proposed Replacement Hospital at the St. Luke's Campus would be 51 feet, as shown in Figure 2-65 in Section 2, "Project Description," on page 2-209 of the Draft EIR. The height of the proposed Replacement Hospital plus the 3-foot-tall roof parapet would be 54 feet (please see Draft EIR, page 2-180). The northwest corner of the proposed St. Luke's Replacement Hospital would be set back 2 feet from the west property line (at Cesar Chavez) and continue south approximately 78 feet, where the building setback would increase to 15.5 feet along the west property line all the way to 27th Street, a distance of approximately 145 feet.

Environmental Impacts

The environmental impacts from the proposed development at the St. Luke's Campus are analyzed in each environmental resources section of the Draft EIR. In particular, the impacts of the increased height and bulk limits, rear-yard requirements, and restriction on projections extending over a street or alley are addressed in the land use and aesthetic analysis, including views of the proposed structures from five viewpoints around the St. Luke's Campus (Figures 4.2-26 through 4.2-30 on pages 4.2-83 through 4.2-87 of the Draft EIR).

The comment states that the proposed LRDP at St. Luke's Campus would have a significant impact on, and the Draft EIR did not adequately describe, neighborhood character, specifically related to land use, visual, light pollution, noise from interior activities and operation, traffic, wind and shadow, residential open space, loss of trees, and loss of privacy. The Draft EIR evaluates the proposed LRDP's impact on neighborhood character and land use around the St. Luke's Campus on pages 4.1-59 through 4.1-63 and concludes that the LRDP would have a less-than-significant LRDP impact. Impacts to the existing visual character or quality of the St. Luke's Campus and surroundings are evaluated on pages 4.2-172 through 4.2-187 of the Draft EIR, and concluded to have less-than-significant impacts. The discussion on page 4.2-185 of the Draft EIR concludes that although the proposed St. Luke's Replacement Hospital would stand out among surrounding development, the visual contrast would not be substantial or adverse when compared to the existing conditions because the St. Luke's Campus is currently developed with the large 1970's St. Luke's Hospital tower and the proposed Replacement Hospital tower would be visually integrated into the surrounding development. The discussion provided Draft EIR concludes that the

proposed MOB/Expansion Building would better relate to the overall visual character of the existing buildings immediately surrounding the campus and would have a less-than-significant visual impact.

The comments regarding visual impacts appear to refer to a loss of privacy and views impacted for private residences to the west and south with LRDP development at the St. Luke's Campus. Although the proposed development at the St. Luke's Campus might result in aesthetic changes, CEQA does not mandate lead agencies to address the impact of a proposed project on private views. The alteration or interruption of private residential views for some nearby residents would be an unavoidable consequence of the proposed project and might be an undesirable change for some individuals. A project would only be considered to have a significant impact on scenic vistas if it were to substantially degrade or obstruct public scenic vistas observed from public areas.

The Draft EIR evaluates the LRPD impacts on visual character and quality at specific viewpoints for the St. Luke's Campus from public (rather than private) vantage points. View 22 (looking northeast on San Jose Avenue at Duncan Street) and View 23 (looking east on Cesar Chavez Street at Guerrero Street) takes into account public viewpoints from the residential area to the west and south of the St. Luke's Campus. The discussion of View 22 on page 4.2-181 of the Draft EIR acknowledges that the proposed buildings would substantially increase the density of development on this part of St. Luke's Campus and would fill more of the skyline directly north of the viewpoint, compared to existing conditions. The discussion of View 23 on page 4.2-181 of the Draft EIR states that the western façade of the St. Luke's Replacement Hospital would be taller and larger-scaled, compared to the nearby residential buildings; however, from this viewpoint the rectangular forms of hospital would appear visually compatible with the similar rectangular forms of the residential buildings and more compatible with surrounding development.

Light and glare impacts at the St. Luke's Campus are analyzed on pages 4.2-191 and 4.2-192 of the Draft EIR. As stated on page 4.2-191 of the Draft EIR, "because of the moderate level of lighting generated by existing buildings at the St. Luke's Campus and surrounding areas, the lighting required for the proposed new development at St. Luke's Campus would not result in a substantial increase in ambient lighting….spillover light is common and expected in dense urban environments such as this area."

The Draft EIR evaluates the proposed LRDP's impacts on wind and shadow at the St. Luke's Campus in Section 4.9, Wind and Shadow. As concluded on page 4.9-55 of the Draft EIR, the St. Luke's Replacement Hospital and MOB/Expansion Building would add net new shadows near the St. Luke's Campus; however the new shadows would not affect open space protected by Section 295 of the Planning Code, other public or publicly accessible open space not under the jurisdiction of the Recreation and Park Commission, and recreational space off campus. The discussion concludes that the proposed LRDP at the St. Luke's Campus would result in a less-than-significant wind impact on page 4.9-30 of the Draft EIR. The analysis concluded that based on the exposure, massing, and orientation of the buildings proposed at the St. Luke's Campus, that no substantial adverse changes to the wind environment would occur in pedestrian areas adjacent to or near the St. Luke's Campus.

As noted on page 4.6-17 of the Draft EIR, it is common for ambulances to turn off sirens within a few blocks of emergency access at other hospitals within the City of San Francisco. This is dependent on traffic flow and other factors, and such practice could reasonably be assumed to occur at the proposed St. Luke's Replacement Hospital. As such, in consideration of the potential change in ambient noise levels, the frequency of emergency transports that could occur, and historic practice by ambulance service providers in the City, siren-related noise impacts would be considered less than significant, consistent with the findings of the Draft EIR.

As explained in Response NO-59 (page C&R 3.8-64), ambulance and other emergency medical transport services are regulated by the San Francisco Department of Public Health (SFDPH), and 911 services are provided by the San Francisco Fire Department Division of Emergency Services (EMS), not by individual

hospitals or health care providers such as CPMC. Any findings and recommendations regarding the use of lights and sirens by emergency providers must first be reviewed and approved by these two agencies. Ambulance bay noise is evaluated on page 4.6-77 of the Draft EIR. Ambulance sirens are not expected to be required when in close proximity of residences along 27th Street. Noise associated with ambulance bays would be generated by patient drop-off events consisting of vehicle arrival, idling, occupants exiting a vehicle, door closures, conversation among passengers, occupants entering a vehicle, startup, and departure of a vehicle. Please also refer to Response NO-75 (page C&R 3.8-80), regarding ambulance noise, including siren use, which would not exceed applicable City standards and would not increase ambient noise levels by 8 dBA at adjacent sensitive receptors, in accordance with the San Francisco Noise Control Ordinance. The potential for random siren use does exist; however, these events would be isolated and short term, and would not result in a substantial increase in the 24-hour land use compatibility noise metric (L_{dn}) applied at residential uses. The existing Emergency Department (located in St. Luke's 1957 Building) is accessed from 27th Street or San Jose Avenue, and the implementation of the proposed LRDP at the St. Luke's Campus would result in similar noise conditions to existing ones for residences located along 27th Street and San Jose Avenue.

Response NO-75 (page C&R 3.8-80) also explains that loading docks would be in an internal area on Level 1 of the north side of the proposed St. Luke's Replacement Hospital building, with access to Cesar Chavez Street, and have operable bay doors. The discussion on page 4.6-76 of the Draft EIR concludes that LRDP operation of the loading dock (48 to 53 dBA L_{eq}) would not exceed applicable standards at sensitive receptors on or adjacent to the St. Luke's Campus. Short-term measurements conducted along Caesar Chavez Street measured the dominant noise source—traffic—at 64.6 dBA L_{eq}. Because the loading dock would be located inside of the St. Luke's Replacement Hospital building, would include operable bay doors, and would face Caesar Chavez Street (perpendicular to adjacent residences), loading dock noise would be minimal. Loading dock noise would travel in the direction of Caesar Chavez Street. The existing noise level attributed to traffic on Cesar Chavez Street is 11 to 16 dBA above predicted loading dock noise at adjacent residences; therefore, any loading dock noise would likely be masked by existing and future traffic noise.

In terms of loading associated with ambulance use, as shown in Figure 2-59 on page 2-197 of the Draft EIR, the ambulance bay in the St. Luke's Replacement Hospital would be located on Level 2, underneath the diagnostic and treatment unit. This location would block the open emergency doors from the sight of adjacent residences, as well as reduce idling noise levels at these locations. Impact NO-3 (Draft EIR, pages 4.6-74 through 4.6-79) discusses the effect of the proposed St. Luke's Replacement Hospital patient loading zone on the nearest sensitive receptors and determines that the ambulance-related impact would be less than significant.

Traffic impacts at the St. Luke's Campus under the LRDP are analyzed in Section 4.5, "Transportation and Circulation," of the Draft EIR. The proposed LRDP would result in a net increase of 207 vehicle trips during the p.m. peak hour, as shown on page 4.5-200 of the Draft EIR. The study intersections included 27th Street, Guerrero Street, and Cesar Chavez Street in the LRDP vicinity near the St. Luke's Campus. The Draft EIR concludes that the St. Luke's Campus development under the LRDP would have less than significant contributions at the 15 study intersections (Draft EIR, page 4.5-200 and 4.5-201).

With implementation of the proposed LRDP, there would be a net gain of 113 new parking spaces at the St. Luke's Campus. The proposed 99-foot-tall hospital and 100-foot-tall MOB/Expansion Building would be considerably shorter than the existing 158-foot-tall St. Luke's Hospital tower proposed for demolition. The proposed LRDP would include a landscape and streetscape plan on and around the St. Luke's Campus that would be compatible with the City's proposed improvements along Cesar Chavez Street (Figure 2-77, "St. Luke's Streetscape Plan," on page 2-233 of the Draft EIR). The LRDP would not result in loss of trees. As stated on page 4.13-26 of the Draft EIR, the removal of a street tree or significant tree would require an appropriate replacement tree to be planted on the St. Luke's Campus site or along the

street, or a fee be paid in lieu. CPMC would also be required to submit, to the Department of Public Works, a tree protection plan for existing trees on the St. Luke's Campus that were not planned for removal but might be affected by near-term construction. Furthermore, the proposed LRDP would incorporate pedestrian-friendly streetscape and landscape design elements along Valencia Street, compatible with City improvements along this roadway, which would help improve the character for existing land uses east of the proposed MOB/Expansion Building. The project sponsor, through the proposed development agreement, also would provide funding toward several park and streetscape improvements within the vicinity of the St. Luke's Campus that have already been proposed by and would be implemented by the City, including (a) permanently upgrading the Guerrero Park pavement to permanent public open space; (b) providing a pedestrian bulb-out at the southeast and northeast corners of the 27th Street/Guerrero Street intersection; (c) providing median extensions/thumbnails at Guerrero Street between 27th and Duncan Streets and between Duncan and 28th Streets; and (d) and providing a pocket park at the intersection of Valencia Street, Duncan Street, and Tiffany Avenue. These City-proposed and implemented improvements have been subject to prior environmental analysis under CEQA. No further environmental analysis will be required in conjunction with CPMC's contribution of funds toward these park and streetscape improvements in the vicinity the St. Luke's Campus. [58] In addition to these improvements to be implemented by the City, the project sponsor would provide funding for some additional streetscape, pedestrian, and related improvements in the vicinity of the proposed St. Luke's Campus that would provide benefits to the surrounding community. The community benefits would, for example, include sidewalk widening, bulbouts, pedestrian lighting, and street tree planting. These community benefit improvements have not been specifically identified, designed, or subject to previous environmental analysis under CEQA. However, due to the nature of the pedestrian improvements being considered, no impacts from their implementation are anticipated.

Although locating the Emergency Department and ambulance bay so that the proposed Replacement Hospital would be accessed from 27th Street near San Jose Avenue may increase the amount of noise from ambulances heard at residences, normal practice would be to turn off sirens within a few blocks of the proposed St. Luke's Replacement Hospital to minimize the noise disturbance effects on residential uses in the vicinity. Thus, this would be a less-than-significant noise impact. Although the daily population would increase, because of the urban setting of the St. Luke's Campus, the increased activity on campus would not result in a substantial adverse change in the character of the area, and, thus, the land use impact would be less than significant.

Comment

(Rachel Sater—Lost Block and Save Our Streets, October 19, 2010) [101-12 LU]

"In addition, the analysis on page 4.1-61 incorrectly states that the western portion of the replacement hospital would be 51 feet tall and set back from the adjacent homes, whereas the Project Description shows only an approximately 10-foot setback along only a portion of the west side of the building, and the building would be 99 feet tall, with a step back above 51 feet. The replacement hospital, by itself as well as together with the new medical office building, would also be more bulky than the existing comparatively slender tower, but this is not addressed in the analysis."

Response LU-33

The comment states that the analysis on page 4.6-61 of the Draft EIR incorrectly states that the western portion of the St. Luke's Replacement Hospital would be 51 feet tall. The proposed south elevation is shown in Figure 2-64 on page 2-207 of the Draft EIR. As shown in this figure, the western portion of the

[58] The Mission Streetscape Plan Mitigated Negative Declaration is on file with the San Francisco Planning Department as part of Case No. 2008.1075E.

hospital would be 51 feet tall, with the building stepped up to 82 feet in the central and eastern portion of the hospital. Thus, the Draft EIR is correct on page 4.6-61.

The Draft EIR acknowledges that the St. Luke's Replacement Hospital and MOB/Expansion Building would result in an increase in density of LRDP development on the St. Luke's Campus. As stated on page 4.2-186 of the Draft EIR, "the campus would appear to have denser development than exists at present. The scale and height of the buildings, however, would be compatible with the surrounding buildings on the campus and immediate vicinity of the campus." Comparisons of the proposed buildings to the St. Luke's Hospital Tower are also discussed, depending on the viewpoint in the "Effects on Visual Character and Quality at Specific Viewpoints for the St. Luke's Campus" (Draft EIR, pages 4.2-180 through 4.2-185). The Draft EIR concludes for View 23 that "the LRDP would increase the density of development on the St. Luke's Campus with development of two large-scaled buildings (the St. Luke's Replacement Hospital and MOB/Expansion Building), compared to one large-scale building currently on the campus (the St. Luke's Hospital tower); however, large-scale development would not be an entirely new condition for the St. Luke's Campus, with its existing 12-story hospital tower on campus."

Comment

(Gloria Smith—California Nurses Association, March 8, 2011) [122-6 LU]

"In comparison, St. Luke's is an existing medical facility which would be replaced by a new campus within the existing footprint. As such it is a superior location for additional beds and a clinical anchor. Amendments are necessary only to accommodate the proposed scale of the facilities and street configuration."

Response LU-34

The comment states that the St. Luke's Campus would be a superior location for additional beds and a clinical anchor. The comment is noted. The Draft EIR analyzed Alternative 3A, under which a larger St. Luke's Campus is proposed. Please see Response ALT-1 (page C&R 3.22-11) regarding the range of alternatives considered in the Draft EIR.

This page intentionally left blank.

3.4 AESTHETICS

3.4.1 LRDP

No comments pertaining to aesthetics and related to the entire LRDP were received during public review of the Draft EIR.

3.4.2 CATHEDRAL HILL CAMPUS

3.4.2.1 HEIGHT, BULK, AND ARCHITECTURAL COMPATIBILITY

Comment

(Donald Scherl, October 18, 2010) [74-12 AE]

"4.2: Aesthetics

Impact *AE*-3: Under this heading, the draft EIR states that the Cathedral Hill Campus (Hospital and MOB) 'would not substantially degrade the existing visual character or quality of the site [perhaps true] and surroundings...' As noted above, the character and quality of the 'surroundings' will be severely and negatively affected by the construction and operation of the proposed hospital and MOB."

Response AE-1

The comment states that the construction and operation of the proposed Cathedral Hill Hospital and Cathedral Hill Medical Office Building (MOB) would negatively affect the character and quality of the surroundings. The area surrounding the site of the proposed Cathedral Hill Campus includes other residential and commercial uses with varying styles of architecture and massing. Design features such as stepped building components and detailed window fenestration would break down the scale and massing of the proposed Cathedral Hill Hospital. As stated in Impact AE-3 on page 4.2-138 of the Draft EIR, the height and massing of the proposed Cathedral Hill Hospital building would not be out of context with the visual character of the commercial development along Geary Boulevard, which generally increases in height west of Van Ness Avenue. In addition, as shown in Draft EIR Figure 4.2-8, "Cathedral Hill Campus: View 7—Looking South on Van Ness Avenue at California Street" (page 4.2-20), the proposed Cathedral Hill Hospital would generally be consistent, in terms of height and bulk, with existing development located north of the site along Van Ness Avenue. The hospital building would also not result in a substantial contrast with the existing visual character. As shown in Figure 4.2-8, other large-scale buildings are currently located along Van Ness Avenue, including the San Francisco Towers, a 13-story residential building on the west side of the street, and several other multistory commercial and residential buildings.

As stated in Impact AE-3 on page 4.2-139 of the Draft EIR, the nine-story portion of the proposed Cathedral Hill MOB would contrast visually with the commercial and residential development adjacent to, north, and east of the site; the MOB would have a more modern appearance than the surrounding older buildings. However, the resulting change would not be substantial because other modern buildings of similar scale are located along Geary Boulevard in this area (e.g., the Archbishop of San Francisco Building, Citibank building, and new nine-story residential building at Geary and Polk Streets).

Since the publication of the Draft EIR in July 2010, the design of the Cathedral Hill MOB has been updated in order to architecturally relate more directly to adjacent buildings and respond to comments made by members of the Planning Commission. Renderings and elevations depicting these design updates are provided in Appendix G to this C&R document. The glass skin building façade previously proposed

has been replaced with a concrete cladding with an in-filled building grid and large glass openings to more closely match the appearance of surrounding older buildings (e.g., the Concordia-Argonaut Club, Regency, Opal, and 1000 Van Ness Avenue buildings). The previous asymmetrical character of the building design has been revised to be more symmetrical, similar to the designs of surrounding buildings. The updated design has incorporated different materials (glass, glass fiber reinforced concrete [GFRC], stone), a variety of colors, and more variation in depth on the building façade, in order to reduce the perceived scale of the building. The larger expanses of glass have been changed to GFRC, which has a heavier quality similar to the materials used in many of the historic buildings along the Van Ness corridor. Smaller scale window openings have been punched in the GFRC, in order to further reduce the perceived scale of the building. As a result of these revisions, the architectural relationship of the proposed Cathedral Hill MOB to the proposed Cathedral Hill Hospital is more subtle than under the previous design. The podium portion of the proposed Cathedral Hill MOB has been lowered to align with similar buildings along the Van Ness corridor (e.g., the Concordia-Argonaut Club building). The upper portion of the building has been set back from the Van Ness Avenue podium façade. The strong symmetrical façade and more clearly articulated front of the building with more solid (i.e., concrete) material wrapping around the corner of the building results in a strong presence at the corner of Geary Street and Van Ness Avenue, similar in approach to the building corner at the 1000 Van Ness Avenue building. The design changes described above did not result in any changes to the proposed height or bulk of the building, and did not increase its square footage.

The updated design also included minor revisions to the proposed streetscape adjacent to the Cathedral Hill MOB along Cedar Street. An updated streetscape plan is included in Appendix G of this C&R document. In order to accommodate the more symmetrical building design described above, the passenger drop-off on Cedar Street has been moved approximately 30 feet further east from Van Ness Avenue. The Cedar Street Entry Plaza has also been reduced in size. A significant portion of the reduction occurred due to the proposed conversion of Cedar Street west of the proposed Cathedral Hill MOB garage entrance/exit from a one-way to two-way street, which had not been reflected in the previous streetscape plan, but the symmetrical redesign of the proposed Cathedral Hill MOB resulted in further reductions to the Cedar Street Entry Plaza because the ground floor wall of the building has been moved into the plaza area. No changes to the number of on- or off-site parking or loading spaces, or to vehicle ingress/egress from the site, or internal or external circulation have been proposed, other than the minor change regarding the Cedar Street Entry Plaza/drop-off.

The updated design described above and depicted in Appendix G would result in the proposed Cathedral Hill MOB relating more directly architecturally with adjacent buildings. Thus, the updated design would further reduce the aesthetic impacts of the proposed Cathedral Hill MOB, which were already determined to be less than significant as analyzed under Impact AE-3 in the Draft EIR, and would not result in any new or different transportation and circulation, wind and shadow, cultural resources, or other impacts. Therefore, as concluded in Impact AE-3 on Draft EIR pages 4.2-138 and 4.2-139, the proposed Cathedral Hill Hospital and Cathedral Hill MOB would not substantially degrade the area's existing visual character or quality because the new buildings would not create a substantial adverse visual contrast with the area's existing buildings. In addition, development of the Cathedral Hill Campus under the proposed CPMC LRDP would not cause a substantial adverse effect on the visual character of the surrounding neighborhood because the proposed development would be similar in size, scale, and visual character to several other large-scale buildings along Van Ness Avenue and would replace an existing structure that is over 100 feet tall, itself. Therefore, impacts were determined to be less than significant with respect to changes in the visual character of the area surrounding the Cathedral Hill Campus. Refer to Response AE-4 for further clarification regarding the massing of structures that would occur at the Cathedral Hill Campus in comparison to existing development in the area.

The comment also states concern that the quality of the site and its surroundings would be severely affected by the proposed Cathedral Hill Campus. Please refer to Impacts TR-1 through TR-58, TR-99

through TR-115, and NO-1 through NO-4 in the Draft EIR (pages 4.5-93 through 4.5-166, 4.5-215 through 4.5-227, and 4.6-41 through 4.6-89, respectively) for discussions of construction- and operation-related traffic and noise associated with the proposed Cathedral Hill Hospital and Cathedral Hill MOB. All noise impacts were concluded to be less than significant; however, there are significant and unavoidable traffic impacts with respect to levels of service at nearby intersections. Please see Responses TR-123, NO-8 and NO-53 (pages C&R 3.7-203, 3.8-6 and 3.8-59, respectively) for additional discussion of construction- and operation-related traffic and noise impacts.

Comment

(Barbara Kautz—CHNA and Bernal Heights Neighborhood Center, October 19, 2010) [87-43 AE, duplicate comment was provided in 108-43 AE]

"Additionally, the discussion of scale does not include the substantial increases in bulk requested by CPMC. This discussion should include a map showing actual building *heights* (not the number of stories) in the surrounding area, as well as building bulk, to determine whether the Hospital is in character with the surrounding area."

Response AE-2

The comment suggests that the EIR include a map showing actual heights and bulk of buildings in the area surrounding the site of the proposed Cathedral Hill Campus. The approximate heights of existing structures near the proposed Cathedral Hill Hospital and MOB range from 135 to 300 feet. A new figure, C&R Figure 3.4-1 (page C&R 3.4-5), has been provided as part of this C&R document to show additional building heights. This figure shows the heights of the proposed Cathedral Hill Campus buildings in context with the heights of the surrounding buildings. As noted on the figure, building heights shown are approximate, and are measured from the low-point of the site to top of major building elements.

C&R Figure 3.4-1 provides a frame of reference to compare the existing structures to the proposed Cathedral Hill Hospital with respect to height. Specifically, the approximately 252-foot-tall Cathedral Hill Towers building (1200 Gough Street) is located one block from the proposed Cathedral Hill Hospital; and the 299-foot-tall Sequoias Apartments building (1400 Geary Boulevard) is located two blocks from the proposed Cathedral Hill Campus Hospital. Two other existing structures, the approximately 224-foot-tall St. Mary's Cathedral (1111 Gough Street) located two blocks from the proposed Cathedral Hill MOB, and the 221-foot-tall Daniel Burnham Court complex located at 1 Daniel Burnham Court, across Post Street from the proposed Cathedral Hill Campus, are also shown in C&R Figure 3.4-1. Therefore, as depicted in several views provided in the Draft EIR (Figure 4.2-6, "Cathedral Hill Campus: View 5—Looking Southeast from Alta Park," page 4.2-8; Figure 4.1-7, "View 6—Looking Northeast from Alamo Square," page 4.2-19; and Figure 4.2-8, "View 7—Looking South on Van Ness Avenue at California Street," page 4.2-20), the proposed Cathedral Hill development was determined to be generally consistent with the scale of several other larger buildings in the surrounding area.

Comments

(Margaret Kettunen Zegart, October 20, 2010) [97-9 AE]

"Partial observations result in false conclusions regarding the scale, height and mass and construction materials to the neighborhood. 'The scale and height of the buildings would be generally large but compatible elements, architectural designs and similar facade materials. The result would be an integrated, visually harmonious composition for the campus as a whole. The proposed new Cathedral Hill campus would appear consistent in scale with the development in the surrounding area...' Therefore the impact is less than significant DEIR p. 4 .... 2-139."

(Margaret Kettunen Zegart, October 20, 2010) [97-10 AE]

"Skyline views from 6 distant parks but no views from corners of St. Marks Square or the historic brick church, no views from the Unitarian Universalist stone sanctuary, the stucco appearing facade of the Hamilton Baptist Church or the elegant sculptured free form contemporary designed Cathedral of St. Mary."

Response AE-3

The comments express the opinion that partial observations included in the Draft EIR resulted in false conclusions regarding the scale, height, mass, and construction materials relative to the neighborhood. The comments suggest that views should have been taken from other church locations near the proposed Cathedral Hill Campus.

Because of the dense urban fabric of San Francisco and the location of the Cathedral Hill project site along three major transportation corridors, only partial views of the proposed Cathedral Hill Campus would be available from any particular vantage point. The seven views of the proposed campus depicted in Draft EIR Figures 4.2-2 to 4.2-8 (pages 4.2-14 to 4.2-20) were chosen as representative views from various public viewpoints that surround the project site (see Draft EIR Figure 4.2-1, page 4.2-13, for viewpoint locations).

The visual simulations included in the Draft EIR represent an appropriate level of detail to inform decision-making about the visual character of the proposed Cathedral Hill Campus buildings in the context of the Cathedral Hill area. Because San Francisco has a dense development pattern, it is not possible to include every potential view toward and from the project site in the Draft EIR, and a reasonable approach should be taken. This concept is reflected in Section 15151 of the State CEQA Guidelines, which states the following:

> "An EIR should be prepared with a sufficient degree of analysis to provide decision makers with information which enables them to make a decision which intelligently takes account of environmental consequences. An evaluation of the environmental effects of a proposed project need not be exhaustive, but the sufficiency of an EIR is to be reviewed in the light of what is reasonably feasible…The courts have looked not for perfection but for adequacy, completeness, and a good faith effort at full disclosure."

The comment notes that a simulation of the view from the St. Mary's Cathedral plaza was not included in the Draft EIR. Two eastward-looking views of the Cathedral Hill project site are depicted in the Draft EIR: a close-up view from the corner of Gough Street and Starr King Way (Viewpoint #1 in Draft EIR Figure 4.2-1, page 4.2-13) and a more distant view looking east along Geary Boulevard from Fillmore Street toward the proposed Cathedral Hill Campus (Viewpoint #4 in Draft EIR Figure 4.2-1). These two viewpoints represent a short-range and long-range view, respectively, from the west. Draft EIR Figure 4.2-2, page 4.2-14 (Viewpoint #1: Looking east on Starr King Way at Gough Street) depicts the eastward view from the sidewalk on the south side of Geary Boulevard (just west of Gough Street). Although this view is not from the St. Mary's Cathedral plaza, it provides a perspective view of the southwestern façade of the proposed Cathedral Hill Hospital from a location slightly closer to the proposed Cathedral Hill Campus. Further, although this eastward view is not a specific view from St. Mark's Square, the Unitarian Universalist Church sanctuary, or the Hamilton Baptist Church building, the simulated view from Viewpoint #1 is representative of eastward views toward the Cathedral Hill project site from a close-up vantage point.

Cathedral Hill Neighborhood Building Height

C&R Figure 3.4-1

Comment

(Hisashi Sugaya—Planning Commission, Oct. 15, 2010) [116-5 AE]

"5. Pg. 4.2-138. 1st paragraph makes the observation that the project's height and massing 'would not be out of context with the visual character of the commercial development along Geary Boulevard…as well as the civic development to the south. In addition, would generally be consistent…with existing development located north of the site.' Since Figure 4.2-8 only shows one building with some height on Van Ness, the EIR should show on a map the locations of those buildings being referred to here. Where are these buildings, what is their height/massing//bulk, provide photographs of each such building, and a bird's eye showing buildings north, south, west and east to which the project is being compared."

Response AE-4

The comment requests that the EIR include a map with the locations of buildings surrounding the Cathedral Hill project site; identify the heights, massing, and bulk of those buildings; and provide additional photographs. The structures near the proposed Cathedral Hill Hospital and Cathedral Hill MOB range in height from approximately 135 feet to 300 feet tall. As discussed in Responses AE-2 and AE-3 (pages C&R 3.4-3 and 3.4-4) and shown in C&R Figure 3.4-1 (page C&R 3.4-5), the addresses and heights of nearby buildings that are comparable to the proposed Cathedral Hill Hospital are shown for a frame of reference. Among the buildings consistent in height with the proposed Cathedral Hill Hospital are the approximately 252-foot-tall Cathedral Hill Towers building (1200 Gough Street) and 299-foot-tall Sequoias Apartments (1400 Geary Boulevard). Existing structures consistent in height with the proposed Cathedral Hill MOB include the approximately 224-foot-tall St. Mary's Cathedral (1111 Gough Street) and 221-foot-tall Daniel Burnham Court complex (1 Daniel Burnham Court).

Draft EIR Figure 4.2-8 (page 4.2-20), referred to in the comment, depicts the view looking south on Van Ness Avenue at California Street. Within this view down Van Ness Avenue, there are actually three other buildings, not just one, that are relatively tall: (1) the Holiday Inn (1500 Van Ness Avenue between Pine and California Streets), which is approximately 255 feet tall—note that the taller part of this structure is just cut out of the upper left corner of the figure; (2) San Francisco Towers (1661 Pine Street between Van Ness Avenue and Franklin Street), which is approximately 156 feet tall; and (3) Daniel Burnham Court (1 Daniel Burnham Court between Van Ness Avenue and Franklin Street), which is approximately 221 feet tall.

The bulk of the proposed Cathedral Hill Hospital would be 275-feet-wide by 385-foot-long, and the bulk of the Cathedral Hill MOB would be 120-feet-wide by 300-feet-long. Three new figures, C&R Figures 3.4-2, 3.4-3, and 3.4-4 (pages C&R 3.4-9, 3.4-11, and 3.4-13), have been provided as part of this C&R document to show additional building bulk measurements along Geary Boulevard, Van Ness Avenue south of the proposed Cathedral Hill Campus site, and Van Ness Avenue north of the proposed Cathedral Hill Campus site. These figures show the proposed Cathedral Hill Hospital and Cathedral Hill MOB in context with the bulk of other buildings in the area along Geary Boulevard and Van Ness Avenue. As noted on the figures, building width and length measurements shown are approximate and represent the base of the building. Building heights are measured from the low-point of the site to top of major building elements.

C&R Figures 3.4-2, 3.4-3, and 3.4-4 provide a frame of reference to compare the existing structures to the proposed Cathedral Hill Hospital and MOB, with respect to bulk. Specifically, C&R Figure 3.4-2 depicts the approximately 350-foot-wide by 414-foot-long St. Mary's Cathedral and approximately 240-foot-wide by 66-foot-long Cathedral Hill Plaza located along Geary Boulevard one block from the proposed Cathedral Hill Hospital and MOB; and depicts the approximately 294-foot-wide by 67-foot-long residential building (66 Cleary Street) and the approximately 278-foot-wide by 124-foot-long residential

building (888 O'Farrell Street) located along Geary Boulevard two blocks from the proposed Cathedral Hill Campus Hospital and MOB.

C&R Figure 3.4-3 depicts the approximately 120-foot-wide by 380-foot-long AMC Theater located along Van Ness Avenue one block south from the proposed Cathedral Hill Hospital and MOB; and depicts the approximately 272-foot-wide by 380-foot-long Opera Towers and the approximately 165-foot-wide by 106-foot-long office buildings (100 Van Ness Avenue) located along Van Ness Avenue four and eight blocks south, respectively, from the proposed Cathedral Hill Campus Hospital and MOB. C&R Figure 3.4-4 depicts the approximately 124-foot-wide by 387-foot-long Daniel Burnham building, the approximately 120-foot-wide by 162-foot-long office building (1388 Van Ness Avenue), and the approximately 124-foot-wide by 120-foot-long Regency Center located along Van Ness Avenue within one block north from the proposed Cathedral Hill Hospital and MOB. C&R Figure 3.4-4 also identifies the approximately 120-foot-wide by 390-foot-long San Francisco Towers and the approximately 201-foot-wide by 206-foot-long Holiday Inn, which are located along Van Ness Avenue within two and three blocks north, respectively, from the proposed Cathedral Hill Campus Hospital and MOB.

Thus, the Draft EIR concluded on page 4.2-138 that the overall visual change, though considerable, is not out of context with a dense urban environment such as the area around the site of the proposed Cathedral Hill Campus.

Comment

(Hisashi Sugaya—Planning Commission, Oct. 15, 2010) [116-6 AE]

"Pg. 4.2-132. Second paragraph. 'Replacing the existing Cathedral Hill Hotel with the proposed Cathedral Hill Hospital would create a considerable increase in the visual bulk of the structure at this site, and would replace the receding skyline with a dominant skyline form.' Is a receding skyline preferred over a dominant one?"

Response AE-5

The comment inquires about the language contained in the Draft EIR on page 4.2-132, asking whether a receding skyline is preferred over a dominant skyline. The comment also acknowledges that the proposed Cathedral Hill Hospital would be a larger structure than the hotel currently on the site and would, therefore, have a more dominant visual appearance. The EIR does not render an opinion whether a receding skyline is preferred over a dominant skyline. The EIR provides objective information to the public and decision-makers regarding the project description, setting, environmental impacts, mitigation measures, and alternatives, so that informed decisions about the proposed project can be made. Regarding aesthetics in particular, the EIR provides information for the project site and surroundings regarding height, bulk, scale, density, architectural style, views, and neighborhood character. The decision as to whether one particular type of skyline, style, or character is preferred over another is left to the reader. Please refer to Responses AE-2 through AE-4 (pages C&R 3.4-3 through 3.4-7) for a discussion about compatibility of the proposed Cathedral Hill Hospital's height and bulk with surrounding uses in the neighborhood.

The comment is noted and will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project.

Comment

(Hisashi Sugaya—Planning Commission, Oct. 15, 2010) [116-7 AE]

"'The proposed hospital would also replace the less intricate and uninteresting visual quality of the existing hotel façades with more interesting forms, patterns, color, and texture in a more contemporary architectural style.' This is purely an opinionated value judgment about architectural treatments of the two building designs and should be removed from the EIR. In fact, the two architectural treatments are not that far apart (my opinion)."

Response AE-6

The comment states that the architectural treatments of the existing and proposed building designs are not that different and the statement should be removed from page 4.2-132 of the Draft EIR. The applicable threshold of significance under CEQA for potential aesthetic impacts is whether the proposed project would adversely affect the site character and public views, as compared to existing conditions. The State CEQA Guidelines do not provide specific guidance stating how aesthetics impacts must be described or evaluated. Aesthetics is a more subjective issue area that must be analyzed under CEQA. The elements of visibility, context, form, bulk, pattern, texture, color, and composition are considered when analyzing a proposed project. The comment's statement regarding the design of the proposed project is noted. Although this comment does not raise any significant environmental issues, it will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project.

In response to this comment, the following text change has been made to the Draft EIR on page 4.2-132:

> The proposed hospital would also replace the less intricate, more uniform ~~and uninteresting~~ visual quality of the existing hotel façades with a greater variety of ~~more interesting~~ forms, patterns, color, and texture in a more contemporary architectural style.

3.4.2.2 PUBLIC VIEWS VERSUS PRIVATE VIEWS

Comment

(Charles F. McClure, July 21, 2010) [2-1 AE]

"For about twenty years, I have owned a condominium apartment at One Daniel Burnham Court located on the north side of Post Street between Van Ness Avenue and Franklin Street.

I have reviewed the Draft Environmental Impact Report for the proposed development of the California Pacific Medical Center Cathedral Hill campus on the south side of Post Street. I know that other owners in my residential complex have concerns about the size of the development. They anticipate inconvenience during construction and increased traffic. Some may have their views blocked."

(Barbara Kautz—CHNA and Bernal Heights Neighborhood Center, October 19, 2010) [87-64 AE, duplicate comment was provided in 108-64 AE]

"4. Aesthetics.

The discussion of aesthetics considers only the loss of scenic vistas and not impacts on views from existing residences. As can be seen in Figure 4.2-2, the proposed Cathedral Hill Hospital would be substantially taller than existing nearby structures, more than double the height currently allowed, and would block views from existing nearby residences and other structures. CEQA requires that impacts to private views be reviewed as a potentially significant effect. (*See Ocean View Estates Homeowners Ass'n, Inc*. v. *Montecito Water Dist.* (2004) 116 Cal. App. 4th 396.)"

Response AE-7

The comments state that CEQA requires that adverse effects on private views be reviewed as a potentially significant impact. Thus, the comments suggest that, by virtue of its height, the proposed Cathedral Hill Hospital would block private views from nearby residential structures, and further suggest that such an effect would be a significant impact. The comments also state that condominium owners specifically at Daniel Burnham Court have concerns about the size of the proposed Cathedral Hill development under the LRDP and that their views may be blocked by the proposed LRDP development at Cathedral Hill Campus. The comments also note that adjacent residents anticipate increased traffic and inconveniences during construction activities associated with the proposed Cathedral Hill Campus development.

Figure 4.2-2 (Draft EIR page 4.2-14), to which the commenter refers, shows views of the proposed Cathedral Hill Hospital as viewed from the southwest corner of Gough Street and the Starr King Way/Geary Boulevard intersection rather than views from nearby residential structures. Many private views over the project site are presently blocked by the existing Cathedral Hill Hotel structure. There would be some additional view blockage from upper stories of surrounding structures that would result from LRDP development at the Cathedral Hill Campus site. As such, it is acknowledged that views over the site from some existing nearby residential uses would be partially or wholly blocked. The commenter references *Ocean View Estates Homeowners Association, Inc. v. Montecito Water District* (2004) (*Ocean View)*.[1] The *Ocean View* decision involved a substantially different situation and cannot be used as a precedent for the proposed project for all of the following reasons:

- The site was located in a distinctly different setting in a non-urban area.
- The project was a distinctly different project, involving an aluminum cover over a 4-acre reservoir rather than the construction of new urban development.
- The project had the potential to result in significant adverse aesthetic impacts (as viewed from publicly accessible areas), which the negative declaration failed to recognize even as a potential impact.
- The majority of private views over the site, even from lower levels of nearby structures, were not already blocked by existing structures.

Therefore, in the Ocean View case, the homeowners association's concern was that aesthetic impacts on both public and private views, not solely private views, were not analyzed. Further, and of particular importance, the question addressed in *Ocean View* was whether the potential alteration of private views constituted a fair argument that a significant impact could occur, and that, thus, the preparation of a mitigated negative declaration was inappropriate and instead an EIR should have been prepared. The question of whether a fair argument exists in the context of a negative declaration or mitigated negative declaration is materially different than the question of whether, in the context of an EIR, there is substantial evidence that blockage of private views constitutes a significant impact.

A more instructive reference would be to *Mira Mar Mobile Community v. City of Oceanside*, 119 Cal. App. 4th 477 (2004) (*Mira Mar*). In the *Mira Mar* case, a planned residential development in San Diego County would have potentially blocked private views from adjacent properties. In upholding the EIR in that case, the court made the following points:

- "Under CEQA, the question is whether a project will affect the environment of persons in general, not whether a project will affect particular persons. (*Association for Protection etc. Values v. City of Ukiah* (1991) 2 Cal.App.4th 720, 734 [3 Cal. Rptr. 2d 488].)"

[1] Ocean View Estates Homeowners Ass'n v. Montecito Water Dist., 116 Cal. App. 4th 396 (2004).

- "California landowners do not have a right of access to air, light and view over adjoining property. (*Wolford v. Thomas* (1987) 190 Cal. App. 3d 347, 358 [235 Cal. Rptr. 422].)"

- "…neither state nor local law protects **private** views from **private** lands and the rights of one **private** landowner cannot prevail over the rights of another **private** landowner except in accordance with uniformly applied standards and policies as expressed in the City's general plan, redevelopment plan, local coastal program and zoning ordinances." [Emphasis added]

The situation of the proposed Cathedral Hill Hospital is comparable. Importantly, the Urban Design Element of the *San Francisco General Plan* (General Plan) contains numerous objectives and policies that protect public views, but none that protect private views. The following is a sampling of the policies and planning principles, and discussion aimed at the preservation of public views:

- "POLICY 1.1: Recognize and protect major views in the city, with particular attention to those of open space and water."

- "Tall, slender buildings near the crown on a hill emphasize the form of the hill and preserve views."

- "Building siting and massing with respect to street pattern influence the quality of views from street space.

    - A. Tall buildings on the tops of hills allow clear views down streets."

- "Views along streets and from major roadways should be protected."[2]

These and other references in the General Plan are aimed solely at the protection and preservation of major public views; conversely, the General Plan does not mention a policy to protect views from private residences or businesses. As such, the *Mira Mar* case is instructive and supportive of the approach taken in the Draft EIR.

Potential aesthetic impacts of the LRDP are evaluated in Section 4.2,5, "Impact Evaluations," in the Draft EIR, page 4.2-94, and all aesthetic impacts of the proposed Cathedral Hill Campus were determined to be less than significant. As noted in the Draft EIR, pages 4.2-137 and 4.2-138, the proposed Cathedral Hill Campus development would not substantially degrade the existing visual character of the area, including the Daniel Burnham Court residential towers, because the proposed 15-story hospital tower would be visually consistent with the 13- to 17-story Daniel Burnham Court residential towers.

The CPMC LRDP Draft EIR also evaluated the size of the proposed Cathedral Hill Hospital building, with respect to wind and shadow and consistency of scale with surrounding structures. Potential wind and shadow impacts are evaluated in Section 4.9.5, "Impact Evaluations" in the Draft EIR, page 4.2-20, and all wind and shadow impacts of the proposed Cathedral Hill Campus were determined to be less than significant. As noted in the Draft EIR, pages 4.9-27 and 4.9-28, the proposed Cathedral Hill Campus development under the LRDP would not result in an exceedance of the wind-hazard criterion (26 mph) at the Daniel Burnham Court residential towers, because wind speed would be reduced from 8 mph to 6 mph at the elevated terrace of the Daniel Burnham Court building. In addition, the shadow impact of the proposed Cathedral Hill Campus development under the LRDP would not create a net new shadow impact on the rooftop terrace at Daniel Burnham Court (see Draft EIR page 4.9-42), because the terrace is already shaded by the existing Cathedral Hill Hotel or by other nearby structures. Refer to Response AE-4 (page C&R 3.4-7) for a comparison of the size and bulk of the proposed Cathedral Hill Campus to

[2] City and County of San Francisco. 2005. *San Francisco General Plan* Urban Design Element. Amendments by Resolution 17009 adopted on May 25, 2005. San Francisco, CA. Available: http://www.sfplanning.org/ftp/General_Plan/I5_Urban_ Design.htm. Accessed December 21, 2010.

existing structures located in the vicinity of Daniel Burnham Court. Please see Response LU-9 (page C&R 3.3-64), which comprehensively responds to comments regarding the consistency of the proposed Cathedral Hill Campus with existing citywide plans, policies, and regulations pertaining to compatibility with the existing neighborhood.

With regard to anticipated increases in traffic and inconveniences during construction activities associated with the proposed Cathedral Hill Campus development, potential transportation and circulation impacts are evaluated in Section 4.5, "Traffic and Circulation" in the Draft EIR. As noted in Table 4.5-17 and 4.5-18 on Draft EIR pages 4.5-94 and 4.5-95, respectively, the proposed Cathedral Hill Campus would increase local traffic volumes at several intersections, but only two intersections (Van Ness/Market and Polk/Geary) would experience a decrease in level of service (LOS) that would be considered significant per the thresholds of significance stated on Draft EIR page 4.5-56. The comment does not identify any additional intersections or impacts to transportation beyond those identified in the Draft EIR. Further, the Draft EIR acknowledges potential impacts with respect to traffic, air quality, and noise that could be considered an "inconvenience." These impacts, which include temporary lane closures, criteria pollutant emissions, and heavy construction equipment noise, would cease upon completion of construction activities and would be reduced through the incorporation of the mitigation measures identified in the Draft EIR, as well as adherence to state and local requirements with respect to construction activities. The comment does not identify any construction impacts that would occur at and near the proposed Cathedral Hill Campus that have not already been disclosed as part of the Draft EIR.

Comment

(Margaret Kettunen Zegart, October 20, 2010) [97-8 AE]

"This is an area of four urban scenic drives along Gough Street, particularly the Cathedral of St. Mary and some of the older homes and those in the area of Pacific Heights; Franklin Street has magnificent San Francisco Bay views down to the entrance to the National Park Service, and the two of the City's 'scenic Boulevards' are Van Ness, begins from City Hall, Davies Symphony, and Veterans Building to the Maritime Museum, Geary Boulevard outbound starting a block from the hospital site. The existing plans for the Geary Boulevard upgrade extends to ocean and Cliff House and National Park lands and Lincoln Museum."

Response AE-8

The comment mentions four urban scenic drives along Gough Street, Franklin Street, Van Ness Avenue, and Geary Boulevard; however, none of these are state-designated scenic thoroughfares and only one of these (Geary Boulevard) is a locally designated scenic thoroughfare in the areas adjacent to the proposed Cathedral Hill Hospital.

The views by drivers traversing these thoroughfares would not be adversely altered by construction of the proposed Cathedral Hill Campus. In particular, the southbound drive along Gough Street to which the commenter refers is located within the lower Pacific Heights area from an undesignated street southward to Geary Boulevard; this area would not be affected by the proposed Cathedral Hill Campus because existing urban development blocks such views of the project site.

The northbound drive along Franklin Street to which the commenter refers is located within the upper Pacific Heights area, from Clay Street northward toward San Francisco Bay. This portion of Franklin Street begins six blocks north of the project site and is northbound only; thus, drivers' views would be unaffected by the proposed Cathedral Hill Campus.

The drive along Van Ness Avenue from Market Street to Golden Gate Avenue is primarily related to the Civic Center area, and this segment of Van Ness Avenue does not lie adjacent to the site of the proposed Cathedral Hill Hospital. The hospital would be visible in some views to drivers traveling northbound

along Van Ness Avenue. However, as depicted in Figure 4.2-4 (Draft EIR page 4.2-16), the small portion of the proposed Cathedral Hill Hospital that would be seen from the Civic Center area would be consistent in height with other buildings along this drive and would not materially change or adversely affect this view.

Finally, the westbound, scenic drive along Geary Boulevard (part of the San Francisco 49-Mile Scenic Drive) would not be adversely affected by the proposed Cathedral Hill Campus. The existing building along this road segment that was once the Cathedral Hill Hotel would be replaced by the proposed Cathedral Hill Hospital, which is similar urban development with several stories above the street and no setback. A proposed Geary Boulevard upgrade project that includes Bus Rapid Transit (BRT) and associated streetscape improvements is in the planning stages. However, the proposed Cathedral Hill Hospital would not adversely affect views from Geary Boulevard or the proposed BRT improvements.

Comment

(Margaret Kettunen Zegart, October 20, 2010) [97-11 AE]

"Photographs should be provided for accurate viewing of the adverse design impacts as well as that of remaining 1930's low scale buildings protected now by City codes. (MOB and hospital.)"

Response AE-9

The comment requests that photographs be provided of the remaining 1930s low-scale buildings. Photographs that depict views looking toward the proposed Cathedral Hill Campus and represent existing conditions and proposed project conditions are provided in Draft EIR Figures 4.2-2 through 4.2-8 (pages 4.2-14 through 4.2-20). These photographs were developed to assess aesthetic impacts related to construction and operation of the proposed Cathedral Hill Campus. The photographs include the remaining buildings that would be adjacent to or in the foreground or background of the proposed Cathedral Hill Campus. Several of these buildings are from the 1930s while others span development representing more recent years. In accordance with the State CEQA Guidelines, the EIR has included views of the proposed Cathedral Hill Campus from various public vantage points for purposes of determining aesthetic impacts.

Comment

(Hisashi Sugaya—Planning Commission, Oct. 15, 2010) [116-3 AE]

"3. Pg. 4.2-13, Figure 4.2-1. The evaluation of Aesthetics depends, in part, on the views from various locations as depicted on this figure. Why were these locations chosen? What other locations were considered and rejected? Two other views should be depicted: 1. Looking south from Van Ness Avenue and Bush Street; 2. Looking north from Van Ness Avenue and Ellis Street."

Response AE-10

The comment inquires why the locations for the viewpoints were chosen and suggests including two other views. The seven views of the proposed Cathedral Hill Hospital depicted in the Draft EIR (Figures 4.2-2 to 4.2-8, pages 4.2-14 to 4.2-20) were chosen as representative public scenic views and vistas from various public viewpoints, both in the vicinity and at a distance (see Draft EIR Figure 4.2-1, page 4.2-13, for viewpoint locations). The Draft EIR includes two views that are very similar to those requested by the comment. Draft EIR Figure 4.2-4 presents before-and-after views looking north on Van Ness Avenue from McAllister Street, approximately three blocks farther south than the location requested at Van Ness Avenue and Ellis Street. Similarly, Draft EIR Figure 4.2-8 (page 4.2-20) presents before-and-after views looking south on Van Ness Avenue from California Street, approximately three blocks north of the requested location at Van Ness Avenue and Bush Street.

A reasonable range of views was chosen for depiction in the Draft EIR. Views looking north and south on Van Ness Avenue change incrementally as an observer moves closer to the Cathedral Hill project site. It is not feasible or reasonable to attempt to include every possible view in the Draft EIR. Consistent with Section 15151 of the State CEQA Guidelines ("Standards for Adequacy of an EIR"), the Draft EIR has been prepared with a sufficient degree of analysis to disclose the significant environmental impacts, and is not required to be exhaustive. Please also see Responses AE-3 and AE-9 (pages C&R 3.4-4 and 3.4-19). However, for informational purposes, three new figures, one providing a map of the proposed Cathedral Hill Campus additional viewpoints (see C&R Figure 3.4-5 on page C&R 3.4-21) and two showing these additional views of the site of the proposed Cathedral Hill Hospital from Van Ness Avenue (see C&R Figures 3.4-6 and 3.4-7 on pages C&R 3.4-22 and 3.4-23), have been provided as part of this C&R document.

Comment

(Hisashi Sugaya—Planning Commission, Oct. 15, 2010) [116-4 AE]

"4. Pg. 4.2-119. Although there are plans and elevations of the proposed Cathedral Hill building provided elsewhere in the DEIR, I don't believe I saw any perspective renderings, or photographs of a model, of the preferred design. These would be of the proposed building and in addition to those shown in this section. Please provide."

Response AE-11

The comment asks whether perspective renderings or photographs of a model of the preferred design are available. Several drawings and photographs depicting existing conditions and visual simulations of the same views with the proposed Cathedral Hill Campus are provided in Draft EIR Figures 4.2-2 through 4.2-9 (pages 4.2-14 through 4.2-22). These photographs were created to assist with the assessment of potential aesthetic impacts related to construction and operation of the proposed Cathedral Hill Campus. The simulations are considered accurate and objectively representative of the future conditions of the proposed medical campus. Two additional views are provided in C&R Figures 3.4-6 and 3.4-7.

3.4.2.3 LANDSCAPE AND STREETSCAPE

Comment

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-149 AE, duplicate comment was provided in 30-149 AE]

"86. On Page 4.2-6, under the 'Aesthetics' section, the DEIR states that 'An additional row of trees and shrubs, contained in large planters, is located above street level, along the hotel's entrance drive off Geary Boulevard and elsewhere on-site.' I think it is fine to put greenery for a pleasant visitor environment but I am concerned about planters that cause a visual block for vehicles and pedestrians because of their size or placement that may cause a safety issue. So while creating a pleasing look for the project, please consider the safety issues."

Source: AECOM 2011

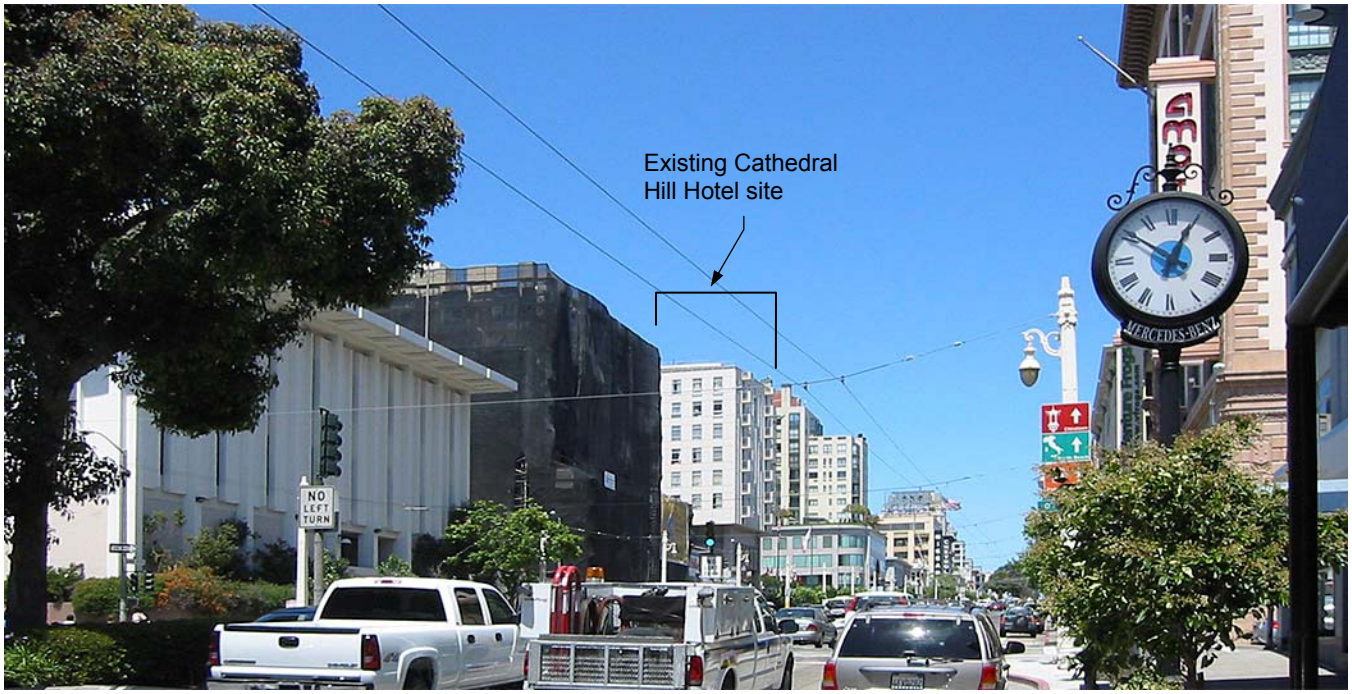
Additional View 2: Looking South on Van Ness Avenue at Pine Street

Map of Additional Cathedral Hill Campus Viewpoint Locations **C&R Figure 3.4-5**



Existing View—looking north along Van Ness Avenue from between Ellis and O'Farrell Streets toward the existing Cathedral Hill Hotel on Van Ness Avenue

Proposed View—looking north along Van Ness Avenue from between Ellis and O'Farrell Streets toward the proposed Cathedral Hill Hospital on Van Ness Avenue

Cathedral Hill Campus: Additional View 1—Looking North on Van Ness Avenue from between Ellis and O'Farrell Streets **C&R Figure 3.4-6**

Existing View—looking south along Van Ness Avenue from Pine Street toward the existing Cathedral Hill Hotel on Van Ness Avenue

Proposed View—looking south along Van Ness Avenue from Pine Street toward the proposed Cathedral Hill Hospital on Van Ness Avenue

Cathedral Hill Campus: Additional View 2—Looking South on Van Ness Avenue at Pine Street **C&R Figure 3.4-7**

Response AE-12

The comment refers to existing trees and shrubs contained in planters located along the entrance drive to the building that was once the Cathedral Hill Hotel, and expresses safety concerns about blocking views between vehicles and pedestrians. The hotel is no longer in use and will be demolished along with the planters to make way for development of the proposed Cathedral Hill Campus. The proposed streetscape plan, which indicates some of the landscape currently proposed, can be referenced in Figure 2-37 on page 2-101 of the Draft EIR. As depicted in this drawing, the drop-off locations indicate a minimal amount of landscaping to allow for pedestrian safety and a clear view of moving vehicles. Additional detailed landscaping plans would be created for the proposed Cathedral Hill Campus as the design is refined.

Planting of street trees is regulated by the Planning Code and the Public Works Code. Aesthetics, as well as access and public welfare, are taken into consideration during landscaping design and installation. The comment is noted as the final landscape plans would take vehicle and pedestrian safety into account during consideration of on-site tree placement and landscaping.

3.4.2.4 LIGHT AND GLARE

Comment

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-152 AE, duplicate comment was provided in 30-152 AE]

"89. On Page 4.2-187, the DEIR states, 'The Cathedral Hill Hospital and Cathedral Hill MOB would include lit signage, entry lighting, wayfinding lighting, roof terrace lighting, other accent lighting, street-level lighting, entry lighting, and parking entry lighting. Exterior lighting would include shielded fixtures to reduce light trespass or spillover.' Perhaps add, except for areas that will be designed to have spillover, and name these areas."

Response AE-13

The comment expresses the desire to add a statement about the exception of spillover lighting and suggests specifying the areas that will be designed this way. The lighting type and location is designed to be focused on a specific area for an intended purpose. Spillover is often described as light that extends beyond the targeted object. Areas are not typically designed to have lighting spillover. Lighting would be placed only where necessary for the hospital to function and adequate light sources would be included in the final design. On the exterior some key locations include the drop-off and pick-up areas at the primary entrances to the building and the main entrance to the Emergency Room. Other areas around the base of the building would be lit for safety reasons. Additionally, integrated lighting on the building façade, as described under Impact AE-4 of the Draft EIR (Draft EIR page 4.2-188), would be included in limited areas along the Van Ness Avenue and Post Street façades.

Comment

(Donald Scherl, October 18, 2010) [74-13 AE]

"Impact *AE*-4: The notion that lighting and glare in the neighborhood would not be adversely affected by the new 24 hour hospital is totally without foundation. Common sense would tell one that this cannot be so."

Response AE-14

The comment indicates that the neighborhood would be adversely affected by light and glare from the proposed hospital 24 hours per day. The site was previously used by a commercial hotel, including a rental car facility and parking garage, which also required lighting to provide access and safety for customers 24 hours per day. In addition, this location is fronted by the brightly lit major transportation

corridors of Van Ness Avenue and Geary Boulevard. As stated on page 4.2-2 of the Draft EIR, "a high level of ambient nighttime lighting is concentrated immediately along Van Ness Avenue, in the vicinity of the proposed campus, as a result of street lighting, illumination of building façades, and lit-up signage."

As stated on page 4.2-187 of the Draft EIR, the proposed Cathedral Hill Hospital would include lighting for signage, entrances, parking, and a roof terrace, and at the street level. Exterior lighting would include shielded fixtures to reduce light trespass or spillover. Specifically, the project would include design features limiting nighttime light and glare to the extent possible, including positioning, screening, and dimming, as described on page 4.2-188 of the Draft EIR. The anticipated nighttime light levels are depicted in Draft EIR Figure 4.2-9, "Cathedral Hill Campus: View 8—Looking Southwest on Van Ness Avenue at Post Street (close-up nighttime view)," on Draft EIR page 4.2-22. Thus, the light and glare in the neighborhood of the proposed Cathedral Hill Hospital would be similar to the current lighting character in the area. See Impact AE-3 on pages 4.2-187 and 4.2-188 of the Draft EIR for further discussion of the less-than-significant light and glare impacts associated with the proposed Cathedral Hill Hospital.

3.4.3 PACIFIC CAMPUS

3.4.3.1 NEIGHBORHOOD CHARACTER—HEIGHT, BULK, AND ARCHITECTURAL COMPATIBILITY

Comment

(Paul Wermer—CPMC Neighbors Coalition and Pacific Heights Residents, October 18, 2010) [67-13 AE]

"The Pacific Site is located in a primarily low to medium density residential neighborhood with 40 ft height limits. The design of the current CPMC buildings ignored any and all design cues from the surrounding community, with no respect for the residential architectural vocabulary of our community or for the historic character of the surrounding buildings. We are concerned because buildings proposed in the IMP and the DEIR do not respect size and bulk limits, or the architectural features, commensurate with the neighborhood character, worsening an already significant conflict that diminishes the quality of the neighborhood.

In particular, this area is adjacent to the Webster Street Historic District. This needs to be considered when addressing the impact of building heights and designs."

Response AE-15

The comment states that the design of the proposed CPMC buildings at the Pacific Campus ignored design cues from the surrounding community and did not show respect for the residential architectural vocabulary of the community or the historic character of the surrounding buildings. As described in the Draft EIR on page 4.1-53, no near-term projects are proposed at the Pacific Campus. In the long term, the interior of the 2333 Buchanan Street Hospital would be renovated to convert the hospital to an Ambulatory Care Center (ACC). One additional building (2018 Webster Street) would be renovated to create administrative offices. No exterior changes are anticipated. The other long-term projects include an ACC addition and two parking garages (North-of-Clay Aboveground Parking Garage and Webster Street/Sacramento Street Underground Parking Garage). The context of the surrounding buildings, including building heights and window fenestration, was taken into consideration in the planning of the Pacific Campus. Among the factors considered for the development, in compliance with City code requirements, were building bulk, sizes, and heights. As stated on Draft EIR page 4.1-53:

> Conversion of the 2333 Buchanan Street Hospital and 2018 Webster Street buildings would maintain the existing building heights; therefore, the renovated buildings would comply with the height and bulk districts for the campus. The proposed 138-foot ACC Addition and 85-foot

North-of-Clay Aboveground Parking Garage would be located within the 160-F Height and Bulk District and would require CU authorization to construct over 40 feet in height. The proposed Webster Street/Sacramento Street Underground Parking Garage would be entirely below ground and, therefore, would comply with the applicable height and bulk district limits.

The only new construction proposed in the immediate viewshed of the Webster Street Historic District is the North-of-Clay Aboveground Parking Garage, which would be located on the northeast corner of Clay and Webster Streets. This corner is currently occupied by the Gerbode Research Building, which would be demolished along with 2340/2360 Clay Street MOB (Annex Building), the Stanford Building, and 2324 Sacramento Street Clinic to make way for the proposed Webster Street/Sacramento Street Underground Parking Garage and the ACC Addition. The historic resource evaluation for the Pacific Campus stated that "the proposed new buildings at the site will not substantially change the existing scale and character of the site and will maintain the existing spatial relationship of the campus with the surrounding residential areas," the response concluded that it does not appear that the proposal would have a significant adverse impact on off-site historic resources, including the Webster Street Historic District.[3] Please see Response CP-16 (page C&R 3.6-15) for further discussion of the analysis of potential indirect impacts on the Webster Street Historic District. Response CP-16 addresses the question of whether the scale of the proposed new buildings would result in a significant impact to the Webster Street Historic District by virtue of changing the historic setting of the district, and concludes that there would not be a significant adverse impact on off-site historic resources, including the Webster Street Historic District. Furthermore, as stated in the Draft EIR on pages 2-118 and 2-119, because construction of the proposed ACC Addition and parking facilities at the Pacific Campus would begin in the long term (year 2018) and are not anticipated to be completed before approximately year 2020, these long-term project components at the Pacific Campus would undergo future design review and would be subject to separate, project-specific environmental review under CEQA in the future. See also Draft EIR Sections 1.3, Subsections 1.3.1 and 1.3.2, on pages 1-12 through 1-14 of the Draft EIR, which explain the distinctions between near-term projects, which the EIR analyzes at a project level of detail, and long-term projects, which are analyzed in the EIR at a programmatic level. The long-term projects would require subsequent project-specific environmental review under CEQA in the future.

The comment is noted. The comment will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project.

3.4.3.2 DEMOLITION OF THE 2333 BUCHANAN BUILDING

Comment

(Ian Berke, October 18, 2010) [69-1 AE]

"The CPMC building at 2333 Buchanan St, built in the 1970's, was constructed across the Clay Street right of way, totally blocking the Clay Street view corridor. A concrete building in the Brutalist style, it present a huge industrial looking wall that is totally incompatible with the low rise residential neighborhood surrounding the hospital. This enormous 300,000 square foot building creates a visual wall 119 feet high, or about 9 stories, seen from Clay looking west, and 12 stories high when seen from Clay looking east. This is a historic residential neighborhood with mostly 3 and 4 story homes, only a few over 40 feet tall. The Buchanan building is massive, totally out of scale with nearby buildings, ugly and jarring, destructive of neighborhood character, and completely inappropriate in this setting. The attached photographs document this judgment.

Ironically, this is the only building in the Buchanan/Webster Street complex that is not scheduled to be razed and rebuilt. The Clay Street view corridor needs to be reopened as part of the reconstruction process by removing the

[3] San Francisco Planning Department. 2009 (June 17). *Historic Resource Evaluation Response: Pacific Campus, California Pacific Medical Center*. Case 2005.05555E. Major Environmental Analysis Division. San Francisco, CA.

north eighty feet of 2333 Buchanan. The loss of square footage will be much less than might be expected, as only the top four floors of this building are used for offices, labs, or rooms. The base is simply used to support those upper floors, and have no other functional use. The removal of the north portion of 2333 Buchanan would serve to substantially improve the aesthetics of the hospital complex and greatly benefit a neighborhood that has long born a disproportionate burden from this massive CPMC complex. The DEIR should not be approved without provisions for re-opening the Clay Street view corridor."

Response AE-16

The comment states that the existing building located at 2333 Buchanan Street was constructed across the Clay Street right-of-way, which blocks the Clay Street view corridor and is incompatible with the surrounding residential neighborhood, and that a portion of the building should be removed or reconstructed. The commenter refers to the Clay Street view corridor, which is depicted in Draft EIR Figure 4.2-11 (View 9) on page 4.2-37. The existing 2333 Buchanan building (including the Clay Street view corridor and the neighborhood character within the vicinity of and including 2333 Buchanan) is part of the existing setting and is treated as such within the EIR. As such, demolition of the 2333 Buchanan building, as suggested in the comment, is not proposed by the project sponsor and is not anticipated within the timeframe analyzed in the EIR. Therefore, the EIR does not need to include this requested analysis.

For information purposes, as shown in Figure 4.2-11 and discussed under Impact AE-3 (Draft EIR pages 4.2-143 and 4.2-144), from the vantage point of the northwest corner of the Fillmore Street/Clay Street intersection, the western façade of the nine-story, 138-foot-tall ACC Addition would face the viewer and the northern façade would be seen from the side. In this view, the relatively complicated block-like forms of the existing seven-story, 99-foot-tall Stanford Building would be replaced by the relatively simplified block forms of the new ACC building (i.e., the main building and its mechanical penthouse). The proposed nine-story ACC Addition, including a mechanical penthouse on top, would not rise above the roofline of the proposed 2333 Buchanan Street Hospital building, which would rise directly behind it in this view. However, the proposed addition would block more of the façade of the nine-story, 120-foot-tall (plus 18-foot mechanical penthouse) 2333 Buchanan Street Hospital building than does the existing Stanford Building. See Response AE-15 above for a discussion of allowed bulk, size, and height at the Pacific Campus.

The detailed design for the Pacific Campus would be undertaken at a future date, and additional clearance would be sought at that time. Therefore, in the aforementioned view, the visual simulation provides only a general depiction of design elements and is intended primarily to depict the general size, bulk, and height of the building, rather than to constitute an actual final design. In addition, subsequent CEQA review would be conducted for the Pacific Campus once a project-level proposal is put forth for consideration. The comment is noted and will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project.

3.4.4 CALIFORNIA CAMPUS

No comments pertaining to aesthetics and solely related to this campus were received during public review of the Draft EIR.

3.4.5 DAVIES CAMPUS

No comments pertaining to aesthetics and solely related to this campus were received during public review of the Draft EIR.

3.4.6 ST. LUKE'S CAMPUS

3.4.6.1 HEIGHT, BULK, AND ARCHITECTURAL COMPATIBILITY

Comment

(Rachel Sater—Lost Block and Save Our Streets, October 19, 2010) [101-17 AE]

"Page 4.2-176: The description of the west side of the building is inadequate to allow for a meaningful analysis of impacts on visual character and contains confusing errors. It incorrectly indicates that west-facing windows would be located in the lower two stories facing Guerrero Street. In fact, the windows would be on the upper two stories facing the rear yards, decks and rear windows of homes on 27th Street, Guerrero Street and Cesar Chavez Street."

Response AE-17

The comment indicates that the west side of the building is incorrectly characterized and that windows would look out to homes on 27th Street, Guerrero Street, and Cesar Chavez Street. Along the western façade of the St. Luke's Replacement Hospital, there would be windows on the fourth and fifth floors, which would serve as inpatient-care rooms within the bed tower. Section 1224.4.9.1 of the California Building Code states that obscure glass is prohibited for patient rooms. However, the fourth and fifth floors are set back approximately 50 feet from the western property line. In addition, the low-roof parapet of the Emergency Department, which sits west of the bed tower, cuts off much of the sight lines.

Levels two and three would contain diagnostic and treatment rooms which, with few exceptions, would have no windows. Any windows proposed for these floors on the west side would have obscuring (frosted or translucent) glass or would have high sills (clerestory glazing) that cut off sight lines from all interior areas. Level one would be largely below grade along the west elevation and would have no windows. Further design refinements are anticipated once the EIR is certified. The comment is noted and will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project.

In response to this comment, the following text change has been made to the Draft EIR on page 4.2-176:

> Along the western façade of the St. Luke's Replacement Hospital, an earth-tone colored block-form structure would form the northwest corner of the building. West-facing windows would be located ~~in the lower two stories~~ on the fourth and fifth floors facing Guerrero Street. The upper floors would be recessed from the northwest corner of the building. At its north end, a plain stucco wall with muted color would extend to the roof. Levels two and three would contain diagnostic and treatment rooms which, with few exceptions, would have no windows. Any windows proposed for these floors on the west side would have obscuring (frosted or translucent) glass or would have high sills (clerestory glazing) that cut off sight lines from all interior areas. Level one would be largely below grade along the west elevation and would have no windows. ~~The remainder of the façade would have long rows of individual rectangular (almost square) windows on a flat, light colored, plain glass reinforced concrete façade wall.~~ The long roofline would be level and straight. Most of the lower floors of the western façade would be located directly opposite the adjacent residential properties to the west, and thus would not be visible from the street. Only the upper floors would be visible.

3.4.6.2 ADJACENT RESIDENCES

Comments

(Rachel Sater—Lost Block and Save Our Streets, October 19, 2010) [101-16 AE]

"General: The analysis focuses on overall changes in buildings on the site and changes in views from streets. The analysis completely and inappropriately omits analysis of perimeter conditions, relationships to adjacent residential properties, and the substantial degradation in visual character for adjacent residential uses. That analysis must be provided."

(Rachel Sater—Lost Block and Save Our Streets, October 19, 2010) [101-18 AE]

"The analysis of changes in visual character evaluates the same visual simulation viewpoints as the analysis of impacts on scenic vistas and omits any discussion of changes in, and substantial degradation of, visual character for adjacent homes. The DEIR must be revised to include visual simulations from sensitive residential viewpoints."

(Rachel Sater—Lost Block and Save Our Streets, October 19, 2010) [101-19 AE]

"The DEIR dismisses impacts on visual character because residential uses 'would not face or front' onto the project. The DEIR ignores that the proposed replacement hospital would substantially degrade the visual character at the rear of adjacent homes to the west on 27th Street, Guerrero Street and Cesar Chavez Street. The rear can be considered more sensitive because it contains the private living area with rear yards (required useable open space)."

Response AE-18

The comments state that the aesthetics analysis focuses on overall building changes and changes in views from streets, omits analysis of perimeter conditions and visual character for adjacent homes, and that additional viewpoints should be analyzed. The aesthetic impacts associated with the proposed St. Luke's Campus, including perimeter changes, were analyzed in Draft EIR Impact AE-3, pages 4.2-172 through 4.2-187. Specifically, on page 4.2-184, the Draft EIR discusses the aesthetic impact of the proposed replacement hospital building from the perspective of adjacent residences, stating that a new six-story-tall building would replace the open expanse of the existing CPMC surface parking lot and its trees and close in the view from the side and rear of the residential buildings. However, no potentially significant impact on the environment related to the visual character of adjacent residential uses was identified in the Draft EIR.

Under CEQA, the question is whether a project would affect the environment in general, not whether a project would affect particular individuals or property owners. CEQA does not mandate that lead agencies find significant impacts of a proposed project on private views from adjacent residential properties. The five views of the proposed St. Luke's Campus depicted in the Draft EIR in Figures 4.2-26 to 4.2-30 (pages 4.2-83 to 4.2-87) were chosen as representative views of the St. Luke's Campus project site from various public viewpoints (see Draft EIR Figure 4.2-25, page 4.2-82, for viewpoint locations). It is not feasible to include every possible view in the Draft EIR; thus, a reasonable and representative range of views was chosen for depiction. The comment is noted and will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project.

3.4.6.3 LANDSCAPE AND STREETSCAPE

Comment

(Rachel Sater—Lost Block and Save Our Streets, October 19, 2010) [101-7 AE]

"Figure 2-77, St. Luke's Streetscape Plan: Figure 2-77 shows an approximately 10-foot setback but does not indicate, and the project-level DEIR does not discuss, the type, number, density, and height at maturity of landscape plantings along the west side of the St. Luke's Replacement Hospital, or whether there would be any plantings at all. There is insufficient information upon which to conclude that the project would not cause a substantial change in character or substantially degrade visual character for the adjacent homes to the west. The DEIR should provide the necessary information."

Response AE-19

The comment inquires about the landscape plantings along the west side of the proposed St. Luke's Replacement Hospital and states there is insufficient information to make a determination whether there would be a substantial change in character. The St. Luke's streetscape plan (Draft EIR Figure 2-77 on page 2-233) represents the general conceptual design associated with landscaping and pedestrian/vehicular access. Additional design refinements would be made upon certification of the EIR. As stated on Draft EIR page 4.2-104, the moderate-sized trees and other plantings that screen the hospital drop-off area and parking lot provide a visual green buffer from the street to the paved area in front of the existing St. Luke's Hospital tower. These trees and plantings were planted as part of previous construction projects. The removal of the landscaping would be noticeable but not substantially adverse, because these trees and landscaping would be replaced as part of the development of the proposed MOB/Expansion Building. Similarly, removal of the existing moderate-sized broadleaf trees located along Cesar Chavez Street and the east side of the parking lot, as well as the tall eucalyptus along its west side, would cause a noticeable change in the view from Cesar Chavez Street. However, this change would not be substantially adverse because replacement street trees and landscaping would be provided along the entire Cesar Chavez Street frontage, in accordance with City requirements. The requirements set by the City for street-tree replacement enforce a 1:1 replacement ratio pursuant to Planning Code Section 143 along proposed development frontage. Therefore, loss of the above-noted landscape features would not cause a substantial and adverse change to scenic resources at the site. Refer to Impact AE-3, Draft EIR pages 4.2-172 through 4.2-187, for further discussion of aesthetic impacts associated with proposed development at the St. Luke's Campus.

Conceptual design and visual simulations of the project from various viewpoints are standard approaches for determining whether a project would cause a substantial adverse environmental change in the character or quality of an area. Typically, Draft EIR documents do not include additional landscaping detail beyond conceptual design. Additional design refinements, including detailed landscape plans, would be completed during the design review process.

3.4.6.4 LIGHT AND GLARE

Comment

(Rachel Sater—Lost Block and Save Our Streets, October 19, 2010) [101-20 AE]

"Impact AE-4: The DEIR evaluation of light and glare impacts from the 24-hour emergency room operation, the brightly lit open ambulance bays, upper story windows and loading area is inadequate. Light and glare is an important component of land use character and, in this case, a cause of substantial degradation in visual character, representing a significant impact. The analysis of these impacts must be revised."

Response AE-20

The comment states that the evaluation of light and glare is inadequate. The existing St. Luke's Campus has building functions that require lighting in a variety of locations. As stated on page 4.2-80 of the Draft EIR, "a high level of ambient light exists in the St. Luke's Campus vicinity as a result of required building security lights, vehicular lights, and pedestrian street light standards." The proposed St. Luke's Replacement Hospital and MOB/Expansion Building would require light sources for security, building entrances, the Emergency Department area, parking, signage, and wayfinding on the campus. The existing street-level lighting would not change. Exterior lighting fixtures would include shielding to control the lighting, to ensure that light does not spill over onto areas where lighting is not necessary.

As described in Impact AE-4 on Draft EIR page 4.2-191, because of the moderate level of lighting generated by existing buildings at the St. Luke's Campus and in surrounding areas, the lighting required for the proposed development would not result in a substantial increase in ambient lighting in the area. The proposed buildings would be located in the northern part of the campus, close to Cesar Chavez and Valencia Streets, both of which have high ambient light levels and are high-traffic areas. For these reasons, proposed development at the St. Luke's Campus would not create a new source of light that would adversely affect nighttime views in the area or that would substantially affect other people or properties, and this impact would be less than significant.

As stated on page 4.2-80 of the Draft EIR, "Glare is not currently a problem in this area because most of the façades of existing structures are composed of nonreflective materials, such as concrete, stucco, brick, or wood and low-reflection windows." The new design would also include some of the same nonreflective materials, including low-reflection metals and glass. As described in Impact AE-4 on Draft EIR page 4.2-191, exterior materials for the proposed buildings would be installed in compliance with all applicable local standards related to the use of nonreflective materials. Among these standards is Planning Commission Resolution No. 9212 (1981), which requires the use of clear untinted glass at and near street level and restricts the use of mirrored, highly reflective, or densely tinted glass except as an architectural or decorative element. As a result, the potential for reflective glare from sunlight would be minimal and within City building code requirements. For these reasons, proposed development at the St. Luke's Campus would not create a new source of glare that would adversely affect daytime views in the area or that would substantially affect other people or properties, and this impact would be less than significant.

This page intentionally left blank.

3.5 POPULATION, EMPLOYMENT, AND HOUSING

3.5.1 LRDP

3.5.1.1 POPULATION, EMPLOYMENT, AND HOUSING SCOPE OF ANALYSIS

Comments [Property Values And Taxes]

(Donald Scherl, October 15, 2010) [74-6 PH]

"Taxes: In allowing CPMC to build at the old Jack Tarr site, the city is relinquishing the taxes that site might yield were it used for private purposes (e.g., a condominium tower)."

(Donald Scherl, October 15, 2010) [74-33 PH]

"From the perspective of the city, this property would be better used by an entity that paid real estate taxes."

(Sue Hestor, October 19, 2010) [89-15b PH]

"Please explain the amount of property taxes anticipated to be paid by the entirety of CPMC facilities in San Francisco. Which aspects of CPMC are for profit and which are non-profit?"

Response PH-1

The comments request information about the tax status of CPMC facilities and make inquiries regarding the taxes that would be paid by CPMC. The comments also express opinions about the potential loss of tax revenue that could be generated from for-profit development on the proposed Cathedral Hill Hospital site. Finally, the comments express concern about loss of residential property value near the St. Luke's Campus.

Scope of Analysis

Section 4.3, "Population, Employment, and Housing" in the Draft EIR focuses on issues raised in Appendix G of the State CEQA Guidelines and is intended to address major population displacement and/or unplanned growth that would result in indirect environmental impacts. Under CEQA, an EIR must evaluate whether a project would result in significant housing displacement, and/or lead to substantial unplanned growth that would result in significant physical impacts, such as urban decay or encroachment on environmentally sensitive areas. For the purposes of this Draft EIR, examples of potential significant environmental impacts related to population, housing, and employment could be:

- Inducement of substantial population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure);
- Displacement of substantial numbers of existing housing units, or creation of demand for additional housing, necessitating the construction of replacement housing; or
- Displacement of substantial numbers of people, necessitating the construction of replacement housing elsewhere; and
- Business effects that could lead to permanent vacancy of urban commercial centers, thereby resulting in urban decay.

As discussed in Section 4.3, the proposed LRDP would not generate any of the impacts listed, and therefore, the impacts would be less than significant.

The comments regarding the effect of the proposed Cathedral Hill Campus on existing or future tax revenues and/or property values raise questions and express concerns about economic considerations, and do not address physical environmental issues. As is described in Response INTRO-7 (page C&R 3.1-17), social and economic effects are only relevant under CEQA insofar as those effects can either form a linkage between a proposed project and a physical environmental issue, or to the extent that the social or economic effect serves as a measure of the significance of a physical environmental effect. Examples of social and economic issues that typically are not evaluated under CEQA include potential effects on property values, health care services, community mental health, housing cost and affordability, local unemployment, specific businesses, and temporary building vacancy as a result of construction.

Tax Status and Revenues

Several comments inquired about the tax status of and tax revenues paid by CPMC. California Pacific Medical Center (Sutter West Bay Hospitals dba California Pacific Medical Center) is a private, not-for-profit academic medical center. As such, no "aspects of CPMC" are "for profit," as asked by the commenter. While most of CPMC's property is eligible for a property tax exemption and thus does not generate property taxes for San Francisco, some portions of existing buildings are leased to private groups who are not exempt and therefore, do generate property taxes. An example would be the 3838 California Street Medical Office Building which is almost entirely leased to for-profit physicians. In 2008, these kinds of uses on CPMC property generated approximately $373,000 in property taxes, approximately $182,800 of which went to the City of San Francisco General Fund. The LRDP contains several Medical Office Buildings (e.g., in the near term at Cathedral Hill, St. Luke's and Davies Campuses). At this time, it is assumed that these buildings would be principally owned and occupied by CPMC or its Physician Foundation, both considered not-for-profit entities; however, different ownership/occupancy structures could also occur. Therefore, it would be speculative to suggest a future amount of property tax payment by uses on CPMC property.

It should be further noted that following the relocation of medical uses from the California Campus to other CPMC campuses, it is the intent of CPMC to sell the buildings while leasing back some limited amount of space. To the extent that those buildings are purchased and/or occupied by for-profit businesses, medical or otherwise, an unknown amount of additional property tax revenue would be paid.

The comment that property values would be adversely affected by the proposed project is not supported by evidence in the record. To the contrary, as is explained in Responses PH-22 (page C&R 3.5-76) and PH-23 (page C&R 3.5-79), the evidence suggests that there would be limited if any adverse effects on vacancies during construction, and that following completion of the proposed projects vacancies would be reduced and retail spending in nearby neighborhoods would be materially increased. Although not absolute predictors of future property values, those are indicators that would suggest that properties around the proposed LRDP campuses should hold onto, and potentially increase, their value.

The comments regarding the tax status of and tax revenues paid by CPMC provide no evidence to suggest that potential changes in tax revenues or property values as a result of implementation of the proposed Cathedral Hill Campus project would have any direct or indirect adverse physical environmental effects. The comments do not raise issues regarding the adequacy, accuracy, or completeness of the Draft EIR. The comments may be considered by the decision-makers as part of their deliberations on the project.

3.5.1.2 EXISTING HOUSING SETTING

Comments

(Gloria Smith—California Nurses Association, October 19, 2010) [90-26 PH]

"Information on the housing in the areas surrounding all five campuses."

(Gloria Smith—California Nurses Association, October 18, 2010) [93-43 PH]

"• Additional information concerning the housing stock in the area surrounding the campuses (How much substandard stock is not occupied/livable? Are there current overcrowding conditions? What are the rents and for-sale prices? What are the current rental and owner profiles? What is the current jobs-housing fit in these neighborhoods? The City? Region?)"

(Gloria Smith—California Nurses Association, October 19, 2010) [93-44 PH]

"Information concerning the available construction workforce in the area by trade."

(Gloria Smith—California Nurses Association, October 19, 2010) [93-46 PH]

"• Information on the existing jobs-housing balance and jobs-housing fit in San Francisco on the region. The DEIR only provides information on employed residents-jobs. This is not an adequate surrogate for either jobs-housing balance or jobs-housing fit. Impacts that flow from a lack of jobs-housing balance and fit include but are not limited to increase in-and-commuting, impacts on air quality and greenhouse gas emissions. The distance of commutes and other information critical to a thorough impact analysis can only be determined based on adequate setting information."

(Stephanie Barton, et al.—Hastings Civil Justice Clinic for the Good Neighbor Coalition, October 19, 2010) [104-28 PH]

"The DEIR fails to analyze the character of the housing surrounding the Cathedral Hill Campus. The Downtown/Civic Center neighborhood had 962 building code violations in 2008, the highest number in the city. It also had the highest total building code violations for the number of residents in a particular area at 30.7 per 1,000 inhabitants. These numbers show a lack of quality housing surrounding the Cathedral Hill Campus. However 23% of residents in the Downtown/Civic Center neighborhood pay more than 50% of their income towards their rent, and 45% of the Downtown/Civic Center residents pay more than 30% of the income towards rent. The fair market rate for a two-bedroom apartment is $1,658 or 163% of the income for two people earning minimum wage. The low quality of a significant percentage of the housing stock in the Downtown/Civic Center area combined with its high cost relative to its residents' income demonstrates the importance of San Francisco's policies requiring developers to contribute to the development of quality, affordable housing. The DEIR dismisses such concerns by claiming that many San Francisco workers make housing decisions on a regional level unaffected by quality and cost of local San Francisco housing. To the contrary, there is every reason to expect that the project will increase demand for housing in the Downtown/Civic Center neighborhood if quality, affordable housing is available. Enhancement of housing stock is also a health care issue to the extent that substandard housing conditions negatively affect the health of San Francisco residents. The DEIR should analyze the condition of the housing stock surrounding the Cathedra l Hill Campus as well as the project's impact on that stock."

Response PH-2

The comments request additional information about housing in the neighborhoods around the CPMC campuses and throughout the City of San Francisco, including the condition of housing stock, the cost of housing, and the tenure of residents. The comments also ask for information about the construction workforce and the current jobs-housing fit in surrounding neighborhoods. The comments request that this

information be used in a more thorough analysis of jobs-housing relationships in the EIR, and that such an additional analysis be included in a revised Draft EIR. The comments state that information about jobs per employed resident is used as a "surrogate" for jobs-housing balance or jobs-housing fit, and that a lack of jobs-housing balance and fit results in effects to commute patterns, air pollution, and greenhouse gas emissions. The comments state that there is a connection between housing conditions and public health.

Scope of Environmental Setting

A discussion of the housing setting in San Francisco, and in the vicinity of each CPMC campus, is provided on pages 4.3-8 through 4.3-10 of the Draft EIR, including Table 4.3-8. The environmental setting presented in the Draft EIR establishes the analytical foundation upon which the impact analysis is based. This is consistent with the State CEQA Guidelines, which state in Section 15125(a) that "[t]he description of the environmental setting shall be no longer than is necessary to an understanding of the significant effects of the proposed project and its alternatives." As is described in Response PH-12 (page C&R 3.5-47), for a variety of reasons tied to the complex bases for housing location decisions it is not reasonable to attempt to assess the effects of the proposed project on the housing demand in specific neighborhoods, even those neighborhoods around the existing or proposed CPMC campuses. Because of the nature of housing location decision making, especially in San Francisco, if the EIR were to attempt such a location precise analysis it would be misleading, as such precision is not possible. However, it is reasonable to assume based on historic patterns that on a broader level, approximately half of future CPMC employees will choose to live in the City of San Francisco. The discussion of the housing setting in the Draft EIR provides an adequate basis upon which to consider the effects of the proposed LRDP on housing in San Francisco, and, therefore, meets the requirements of section 15125 of the State CEQA Guidelines and is adequate under CEQA.

Aside from the broader reasons for making location decisions about housing, presented in Response PH-12 (page C&R 3.5-47), prediction of the location of housing choice within San Francisco is complicated by factors such as the City's rent control ordinance that creates material economic incentives for residents to remain in their existing rental housing despite a change in employment location. Further, the location of the proposed new Cathedral Hill Campus, which would see the greatest relocation of current CPMC employees, also happens to be one of the best-served locations in San Francisco in terms of transit and other alternative modes of transportation. Numerous transportation options and a high degree of accessibility reduce the need for employees to relocate based on commute time or ease. These factors would be different for each of the CPMC campus locations. In addition, it is important to note that employee relocations from the current Pacific and/or California Campuses to the Cathedral Hill Campus are relatively close and therefore would be unlikely to result in residential relocations.

For reasons like these, precise forecasting of the future location of residence of CPMC workers at any individual campus is not practical or useful. Section 15151 of the State CEQA Guidelines states that "[a]n evaluation of the environmental effects of a proposed project need not be exhaustive, but the sufficiency of an EIR is to be reviewed in the light of what is reasonably feasible." Further, Section 15145 of the Guidelines states that "[i]f, after thorough investigation, a Lead Agency finds that a particular impact is too speculative for evaluation, the agency should note its conclusion and terminate discussion of the impact." In this case, it would be speculative to assess the effects of the proposed project on the housing supply and demand at the neighborhood level.

The conditions of the housing stock in the neighborhoods around the LRDP campuses, including such issues as building code violations, the income levels of residents, overcrowding conditions, and rental and owner profiles, are not relevant to the proposed project and the impact analysis addressed in Chapter 4.3 of the Draft EIR. These are existing conditions and there is no evidence in the record that would lead to a conclusion that such conditions would be adversely affected by the proposed project. As such, there is no

need to go into a detailed description of these factors in the EIR. Please also see Response PH-12 (page C&R 3.5-47) for a discussion of the effects of the proposed project on housing demand in adjacent neighborhoods.

Use of Jobs to Employed Residents Ratio

A discussion of employed residents and jobs/housing relationship is provided on pages 4.3-6 and 4.3-7 of the Draft EIR. The concept behind a jobs to housing ratio is that such a measure attempts to define the inflows and outflows of labor, and whether there is sufficient housing to support the employment within a given labor market area. As a proxy, planners and economists often use the number of housing units compared to the total number of jobs to understand whether there are sufficient employment opportunities (jobs) to support the existing or planned amount of housing, or vice versa.

The actual ratio of jobs to housing units is only a proxy and does not directly correlate the supply of workers to the supply of jobs. As discussed in ABAG's methodology memorandum for estimating the Regional Housing Needs Allocation Methodology (RHNA), ABAG considers the ratio of jobs to employed residents as a better measure to evaluate the jobs-housing balance because it is a direct corollary between available labor in a community and actual employment. As a further example, in another jobs-housing balance analysis performed by ABAG, ABAG referenced the imbalance of employed residents to workers in western San Mateo County.[1] For the reasons given above, and based upon the validation of its use by ABAG, it is, therefore, reasonable to use jobs-employed residents as a basis of analysis of jobs-housing relationships in San Francisco.

ABAG addressed this issue directly by stating that "[i]nclusion of local land use policies and plans and economic trends in ABAG's employment growth forecast ensures that the use of employment growth as a RHNA factor is consistent with local policies, plans, and local capacity for job growth. Employment growth in projections considers all the land protection and growth policies, physical constraints, and the employment-related factors identified by the state and the HMC (Housing Methodology Committee) for inclusion in the allocation methodology, including existing jobs centers, home-based businesses, employed residents, housing prices, household income and employment at private universities, and campuses of the California State University and the University of California."[2]

Housing Conditions and Public Health

Although there appears to be a connection that exists between the quality of public health and the amount of substandard housing in a community, no evidence is shown in the record to suggest that the proposed LRDP would have any adverse effect on the quality of housing or the amount of substandard housing in the community. An Objective of the proposed LRDP is to improve health care access to underserved populations of the City, including the vicinity near the proposed Cathedral Hill Hospital where the residential population of the City is the densest and where the highest percentages of elderly and children are found. Please also see Major Response HC-8 (page C&R 3.23-32) regarding the effects of the proposed LRDP on access to health care services.

Environmental Effects

The Draft EIR fully addresses the direct and indirect construction and operational environmental impacts of the proposed LRDP, including those on transportation and circulation (Section 4.5), air quality

[1] Association of Bay Area Governments, Coastal Subregional Planning Project, Table B, http://www.abag.ca.gov/planning/subregional/cspp/cspp4.html, 1998.

[2] Association of Bay Area Governments, *Planning Housing in the San Francisco Bay Area, Regional Housing Needs Allocation Methodology, 4th Revision. Technical Documentation*, November 2006, Revised August 3, 2007, page 9. http://www.abag.ca.gov/planning/housingneeds/pdfs/RHNA_Allocations_and_Technical_Document.pdf

(Section 4.7), and greenhouse gas emissions (Section 4.8). An expanded discussion and clarification of transportation and circulation, air quality, and greenhouse gas emissions issues are provided in this C&R document, in Sections 3.7, 3.9, and 3.10, respectively. None of the information contained in these specific sections in the Draft EIR or this C&R document meets the definition of substantial new information, pursuant to Section 15088.5 of the State CEQA Guidelines, and thus, a revised EIR is not required. For more information regarding the procedures for certification of EIRs, including a discussion of the conditions under which substantial new information needs to be circulated for public review after publication of a Draft EIR, please see Response INTRO-6 (page C&R 3.1-11).

The issues of housing demand, jobs-housing balance, and jobs-housing income/cost fit are economic issues that are not within the scope of issues considered under CEQA except insofar as they link a proposed project to an adverse physical environmental effect or provide a measure of the significance of that effect. Please see Response INTRO-7 (page C&R 3.1-17) regarding the appropriate consideration of social and economic impacts under CEQA. For more information on San Francisco's ability to accommodate affordable housing, refer to Response PH-9 (page C&R 3.5-31). For further discussion on commute patterns related to housing location, see Response PH-4 (page C&R 3.5-13).

3.5.1.3 ANALYTICAL ASSUMPTIONS AND METHODS

Comments [Employment and Housing Assumptions]

(Gloria Smith—California Nurses Association, October 19, 2010) [93-77 PH]

"The DEIR appears to grossly underestimate employment generated by the Project. According to the DEIR, the Project will generate 10,730 full time equivalent (FTE) personnel at the four campuses. For analysis purposes, the DEIR relies on an overall project impact of only 4,170 net new jobs. This figure underestimates the full employment impact of the proposed Project because it does not include construction workers, or induced and indirect jobs. Nor does the projected number include any non-medical jobs at the California campus (under the foreseeable scenario that campus will be sold and redeveloped consistent with existing plans and policies)."

(Gloria Smith—California Nurses Association, October 19, 2010) [93-78 PH]

"The DEIR underestimates new jobs generated by the Project and the impacts associated with this underestimation for reasons including, but not limited to, the following:

- Omission of total 'net' new direct and indirect and Project-induced jobs. The DEIR does not appear to include jobs that would be generated by the Project based on a reasonable multiplier effect and failure to apply that multiplier to certain key categories of population generated by the Project (e.g. to construction workers, medical services, etc).

- Jobs associated with the redevelopment/future use of the California campus sites after they are sold and reused/redeveloped.

- The actual imbalance of jobs and housing taking into consideration the salaries of new jobs with housing costs or "Jobs-Housing Fit."

(Gloria Smith—California Nurses Association, October 19, 2010) [93-79 PH]

The omission of ALL indirect and induced jobs in the DEIR's analysis of employment and population growth and jobs-housing balance has a ripple effect throughout the DEIR. Specifically, to the extent the DEIR underestimated total new jobs and population generated as a result of the Project directly and indirectly, other impacts including but not limited to traffic, parking, greenhouse gas emissions, public services, air quality, among others are also underestimated."

(Stephanie Barton, et al.—Hastings Civil Justice Clinic for the Good Neighbor Coalition, October 19, 2010) [104-19 PH]

"Second, CPMC personnel numbers are measured in terms of full time equivalent, or FTE, personnel. In other words, an employee who works half time is a 0.5 FTE. Traffic analyses, however, use a different approach that equates part- and full-time employees, because the number of vehicle trips generated by a full time and part time employee is the same (they each make one trip to and from work). The rationale that bars the use of FTE measurements in traffic projections also applies to housing projections. Each part time employee should be counted the same as a full time employee because each employee has an equal need for a housing unit. The approach in the DEIR grossly underestimates housing demand generated by the project. Thus, on page 4.3-13, the determination of whether increased personnel at CPMC would induce demand for housing should be based on a revised Table 4.3-10 that projects actual personnel, not FTE personnel."

(Stephanie Barton, et al.—Hastings Civil Justice Clinic for the Good Neighbor Coalition, October 19, 2010) [104-21 PH]

"The DEIR is also unclear as to whether the future employment projections include both hospital doctors and staff employed by CPMC directly, and the doctors and medical professionals in private practice that will be using the CPMC hospital and medical office facilities. While both groups are clearly considered in the 2006 data, this should be clarified in regards to future projected employees at 2015 and 2030."

(Stephanie Barton, et al.—Hastings Civil Justice Clinic for the Good Neighbor Coalition, October 19, 2010) [104-22 PH]

"Fourth, the DEIR bases its jobs/housing balance analysis on an outdated projection of future development and does not take into account recent legislation that aims to refocus new development in the Bay Area's most urban areas. In Table 4.3-5, *San Francisco Employed Residents and Jobs (2000-2030),* the DEIR uses population and employment data from *Projections 2007.* These projections were generated by ABAG prior to the passing of SB 375, which mandates that ABAG develop and adopt a Sustainable Communities Strategy, or 'SCS,' that reallocates future housing and employment in a manner that drastically reduces commute times across the region. ABAG's most recent projections, Projections 2009, apply the methodology adopted as part of the region's future SCS. By overestimating the jobs/employed residents ratio, the DEIR underestimates the housing need in San Francisco and, specifically, the housing need generated by the CPMC development. The DEIR should use Projections 2009, which better reflects future development patterns, as the basis for the jobs/employed residents ratio."

Response PH-3

The comments state that the population, employment, and housing analysis in the Draft EIR understates housing demand because the analysis uses full-time equivalent (FTE) measures of employment growth and employment internalization assumptions. The comments also suggest that the demand is understated because of lack of inclusion of indirect or induced employment, as well as jobs that would backfill the medical uses transferred from the California Campus. A particular concern raised in the comments addresses the use of ABAG projections in the Draft EIR, with a suggestion that using such projections could understate or dismiss the housing effects of the project. The comments suggest that the analysis is based on out-of-date regional projections of population and employment (ABAG 2007 estimates rather than the more recent 2009 ABAG estimates), and that the more recent projections should have been used because they account for future changes due to the passage of SB 375. Finally, the comments suggest that environmental impacts such as traffic, GHG, public services, etc., were understated because the employment estimates were understated.

The issues addressed in the above comments are largely related to social and economic effects. Under CEQA, social and economic effects are only relevant insofar as they either are part of the linkage between a project and a physical environmental effect, or are a measure of the significance of a physical

environmental effect. For a more thorough discussion of the issue of social and economic effects under CEQA, please see Response INTRO-7 (page C&R 3.1-17).

Conservative Approach to Employment Growth Projections

The employment growth and employment generation estimate that was developed for the proposed LRDP and presented in the Draft EIR takes a conservative approach to assigning population, employment, and housing demand. The employment growth estimates in Section 4.3 conservatively assume that 100 percent of the new personnel locating to the proposed Cathedral Hill, Pacific, St. Luke's, and Davies Campuses, other than personnel transferring from existing CPMC campus facilities, would be net new employees who would generate housing demand in San Francisco and the Bay Area. Specifically, the analysis does not take into account that many private practice doctors and their staff affiliated with CPMC are currently leasing space off-campus and would move to the medical office buildings and other CPMC facilities under the proposed LRDP. These employees would not be new to the City or the region, but rather would be shifting from an existing San Francisco workplace location to a CPMC campus in San Francisco. Those employees simply shifting from off-campus to on-campus facilities likely would already live in San Francisco or elsewhere in the greater Bay Area, and it would be reasonable to assume, for a majority of such employees, that the change in work location to a CPMC campus would not cause these employees to relocate their places of residence. However, the CPMC LRDP Draft EIR analysis conservatively assumes that all of these off-campus to on-campus transfers would be net new workers moving to San Francisco and the greater Bay Area, creating a demand for housing and other environmental effects.

An additional conservative aspect of the analysis in the Draft EIR is that employment estimates are primarily based on the potential employment *capacity* of the proposed campuses rather than personnel needed to staff CPMC and provide service to affiliated medical patients. The Draft EIR used a conservative model to ensure that no environmental effects were overlooked, the projections likely overstate the new employment that would actually be generated by the proposed LRDP.

In the near term (through year 2015), for example, nearly all of the physicians and staff that would populate the proposed Neuroscience Institute building at the Davies Campus would relocate or would be relocated from existing space within the Pacific Campus (e.g., the Forbes-Norris ALS Clinic). The vacated space, in turn, would be used to allow decompression of existing programs and staff at the Pacific Campus with no new physician or staff backfill. For purposes of population and traffic analysis, however, the proposed Neuroscience Institute building with approximately 49,000 gross square feet is analyzed as though it would generate net new employment to San Francisco, and physicians and staff at the Pacific Campus would remain constant. This approach results in a conservative estimate of housing demand and environmental impacts.

In the long term (after year 2015), it is estimated that out of the total of 1,700 CPMC-affiliated physicians in the region, the number of physicians who would locate on or near a future CPMC campus is estimated to increase from approximately 1,120 currently to approximately 1,240.[3] Therefore, the additional physicians (and associated staff) are highly unlikely to be "new" to CPMC or to San Francisco. The projected "increases" of 116 physicians and 2,502 staff members much more likely represent existing San Francisco-based offices moving from smaller off-campus practices to consolidated practices and multiple-office locations such as would be provided at 2100 Webster Street (Pacific), the ACC (Pacific), the proposed Cathedral Hill MOB, and the proposed St. Luke's Replacement Hospital and MOB, in line with

[3] "CPMC Population Estimate 45 v4" CHS Consulting for CPMC.

well-established trends away from private practice, toward practice consolidation and in the context of scarcity of new physician capacity.[4]

Therefore, the Draft EIR is very conservative in its impact analysis and likely overstates new employment and related environmental effects generated under the proposed LRDP.

Use of Full-Time Equivalent

The comments regarding the utilization of full-time equivalent (FTE) employment to determine housing impacts are noted. It is standard industry practice to use FTE employment to determine impacts to housing, as it represents a single unit of measure that can be applied to household generation factors. Use of FTE to determine impacts to housing is a reasonable methodology because use of total employment as a basis for analysis would combine full-time employees and part-time employees without regard to the fact that these differing levels of employment have very different household formation characteristics. Part-time employees may be employed at another job. Thus, many part-time jobs do not create the same level of household formation because an individual with one household may have two or three part-time jobs. FTE represents a full accounting of an employed resident, which then can be readily converted to, among other data, household growth and trip making, etc.

Notwithstanding the reasonable assumption that many part-time employees are likely to hold more than one job, it is possible that some individual part-time jobs would support a new household, especially those that represent a large portion of an FTE. To the extent that this situation could occur and result in an unspecified increase in housing demand relative to the demand reported for FTE employees, the conservative assumptions made in the Draft EIR would compensate for any potential underestimation of housing demand. Despite this limited amount of uncertainty, the City believes that the estimates of housing demand based on FTE are reasonable and appropriate for analysis in this EIR.

Please also see Response PH-6 (page C&R 3.5-17) for a discussion of the conservative characteristics of the housing demand assessment in the EIR, and Response PH-11 (page C&R 3.5-43) for a discussion of the fee that CPMC has proposed to pay in response to concerns regarding housing demand.

Clarification of Employment Projections

The comments inquire as to whether the Draft EIR analysis includes all full-time employees on site, including those not directly employed by CPMC. Future employment projections include all full-time and part-time personnel (including volunteers) who would be on site, including both those who would be employed directly by CPMC, and those who would work for other employers located on the CPMC campuses. For more information on the personnel estimates, please see Table 4.3-6 on page 4.3-6 in the Draft EIR for an explanation of employment calculations for the proposed LRDP.

Use of 2007 ABAG Projections

The comments state that the use of ABAG 2007 projections understates the housing need in San Francisco compared to the most recent ABAG 2009 projections. As to the use of ABAG 2007 data, the analysis applied the most recent data available at the time of the analysis. ABAG 2009 data was not available at the time of the initiation of the population and housing analysis.

The use of the ABAG 2007 projections represents a conservative basis on which the assessment of population, employment, and housing effects was based. As is shown in C&R Table 3.5-1, ABAG

[4] "Young Doctors Shifting Away From Private Practice, Primary Care Shortage Persists": http://www.kaiserhealthnews.org/ Daily-Reports/2010/March/26/Young-Doctors-Taking-Salaried-Jobs.aspx, accessed January 13, 2011.

C&R Table 3.5-1
ABAG Projections 2007 and 2009 Population and Household Comparison

Year	2010	2015	2020	2025	2030	Change	
						2010-15	2010-2030
Population							
ABAG 2007	808,700	823,800	857,200	888,400	922,600	15,100	113,900
ABAG 2009	810,000	837,500	867,100	900,500	934,800	27,500	124,800
Households							
ABAG 2007	348,330	357,810	367,430	377,050	386,680	9,480	38,350
ABAG 2009	346,680	359,170	372,750	386,800	400,700	12,490	54,020

Projections 2007 and 2009 Population and Household Comparison, ABAG 2009 data assumes that a larger share of population, household, and employment growth would occur in San Francisco than ABAG 2007 projections. As a result, CPMC's percentage share of the 2009 projected population and household growth for San Francisco in 2030 would actually be lower than those represented in Section 4.3, "Population, Employment, and Housing" in the Draft EIR, as discussed below.

Two ABAG data sets are referenced in Section 4.3, beginning on page 4.3-1 of the Draft EIR. The first is the 2007 ABAG population and household growth projections that include projections for 2015 and 2030, the horizon years in which impacts are evaluated in the Draft EIR. The second is ABAG's Regional Housing Needs Assessment (RHNA) that originates from the Department of Finance population projections allocated to local Bay Area jurisdictions. Both estimates are updated regularly but reflect specific planning periods. As the metropolitan planning organization for the Bay Area, ABAG projections are regularly used in City and regional plans. In the Draft EIR, the population and housing analysis evaluates the proposed LRDP's potential impact on population and housing in specific horizon years (2015 and 2030). Therefore, the analysis uses the population and household projections available from ABAG for 2015 and 2030.

The analysis evaluates the City's ability to accommodate housing, and references the currently adopted San Francisco Housing Element (2004) and the adopted 2009 Housing Element. The Planning Commission approved the 2009 Housing Element, and certified the EIR for the 2004 and 2009 Housing Elements, on March 24th, 2011. The Board of Supervisors upheld the EIR for the 2004 and 2009 Housing Elements, on May 10th, 2011. The Board of Supervisors adopted the 2009 Housing Element on June 21, 2011. The 2009 Housing Element sets forth objectives, policies and implementing strategies intended to address the City's housing needs based on the RHNA for 2007 through 2014.

Section 4.3 of the Draft EIR does not use the San Francisco RHNA to estimate the proposed LRDP's share of housing growth because the RHNA has different planning periods and is not intended as a population or housing projection, but is an assessment of projected future housing needs among different household income categories. An assessment of how much housing is needed within a particular geographic area is very different from a projection of how much housing can or will be built.

ABAG remains the most appropriate and most widely accepted and used source for projections of population, employment, and household growth in the Bay Area, and its projections are considered to be a reasonable estimate for future population and households for San Francisco and the Bay Area overall. Looking at historic ABAG projections and how they have compared to actual growth, 1990 ABAG population projections for 2000 *underestimated* actual population and household growth in San Francisco by approximately 1.2 percent and 0.4 percent, respectively. In other words, San Francisco accommodated

more households than originally projected by ABAG in 1990, but was well within a normal standard error of plus/minus 5 percent. This contradicts the comment that suggests ABAG housing growth projections typically are overly optimistic.

The Sustainable Communities Strategy (SCS) is currently under development by ABAG and the Metropolitan Transportation Commission (MTC). These agencies have established a goal of adoption of the SCS for the Bay Area by early 2012. The SCS would place an increased emphasis and support funding for additional transit-oriented housing development in transit-rich areas, including areas in San Francisco. As a result, the SCS is expected to help to facilitate additional housing development, including housing that could accommodate new CPMC workers that chose to live in San Francisco.

Finally, it is important to note that ABAG projections are useful and informative in terms of understanding and comparing a project's employment and housing characteristics to future growth projections and for performing cumulative impact analyses that consider future conditions. However, for the purposes of project-specific CEQA analysis, the EIR examines the potential impacts of the proposed LRDP project relative to the existing environmental setting. ABAG growth projections are not critical in this regard. In terms of the proposed LRDP project's relative share of ABAG's citywide and regional growth projections, depending upon which ABAG forecast is used, the LRDP project's share would vary. However, this variance would not change the analysis of the project-specific impacts relative to today's existing conditions.

Relative to consideration of future conditions in the context of the cumulative impact analysis, ABAG 2007 projections represent a reasonable and conservative basis for the analysis of potential impacts 20 years into the future.

Please see Responses PH-8 and PH-11, pages C&R 3.5-27 and C&R 3.5-43, respectively, for additional discussion on the role of ABAG projections and Regional Housing Needs Allocation estimates in considering issues on jobs/housing relationships.

2010 Census

In the time since the EIR analysis was conducted and the Draft EIR published, the U.S. Census was completed and the initial data released. As shown in C&R Table 3.5-2, according to the most recently released data, the 2010 100 percent census count identified the 2010 population of the City of San Francisco as 805,200 persons, with approximately 345,800 households. This up-to-date information is compared to the 2007 ABAG projection of the 2010 population as 808,700 persons, an over-estimate of roughly 3,500 people (or an error of less than 1 percent (0.4 percent). In terms of households, 2007 ABAG projections estimated approximately 348,300 households, approximately 2,500 households more than the 345,811 reported from the 2010 Census. In both cases, ABAG marginally overestimated the number of residents and households living in San Francisco.

C&R Table 3.5-2
City and County of San Francisco Population and Housing Estimates

Source	Population	Housing Units		
		Total	Occupied	Vacant
2010 U.S. Census	805,235	376,942	345,811	31,131
ABAG/DOF	808,700	365,434	348,300	17,134

Source: U.S. Census Bureau, 2010 Census, *Civilian Population Counts and Occupancy Status.* The 2010 U.S. Census Redistricting Data (Public Law 94-171) Summary File

Also, the Department of Finance (DOF) estimates that approximately 4.7 percent of the total housing stock in San Francisco, or roughly 17,000 units, is vacant. According to the 2010 Census, approximately 8.2 percent of the total housing stock, or roughly 31,100 units, is vacant. This is substantially higher than the DOF estimates and implies more capacity within the existing housing stock than originally reported in the Draft EIR housing capacity analysis. It further substantiates the conclusion that there is available capacity within San Francisco to accommodate all net new households that could generate housing demand from the proposed LRDP under existing conditions, and in the future.

Induced and Indirect Employment

For a response to comments related to the consideration of indirect and induced employment in the assessment of population, employment, and housing effects, please see Response PH-25 (page C&R 3.5-82).

Housing Affordability and Jobs/Housing Fit

For specific responses to comments regarding housing affordability, please see Response PH-9 (page C&R 3.5-31). For responses to comments regarding jobs/housing fit, please see Response PH-10 (page C&R 3.5-39).

Environmental Effects

As is described above, the estimates of population and employment generated by the proposed LRDP are based on a series of conservative assumptions which tend to overestimate the project employment generation. Thus, the Draft EIR evaluation of the potential physical environmental impacts associated with increased employment, such as additional vehicle miles travelled and length of trips, increased emissions of criteria pollutants, increased emission of greenhouse gases, and increased demand for public services, presented in Sections 4.5, 4.7, 4.8, and 4.11, respectively, also were conservative. Please also see responses to comments in Sections 3.7, 3.9, 3.10, and 3.13 of this C&R document regarding the transportation, air quality, global climate change, and public services impacts of the proposed LRDP.

Comments [Housing Location Assumptions]

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-153 PH, duplicate comment was provided in 30-153 PH]

"On Page 4.3-19 of the DEIR, it states that '... the net increase of approximately 1,280 new CPMC employees at the Cathedral Hill Campus would result in approximately 630 CPMC new workers that would choose to live in San Francisco. These workers would generate approximately 370 new city households and 830 new city residents ...' I do not see how with a certainty that one can determine with such certainty that that is what people will do. And basing the development on such unguaranteed premises is speculative and will create a project with significant impacts that could have been avoided since it is not necessarily the case that these workers would live in San Francisco."

(Gloria Smith—California Nurses Association, October 19, 2010) [90-56 PH]

"The DEIR failed to investigate where workers will likely live. Instead, the DEIR simply relied on the assumption from the CPMC IMP that 49% of employees reside in San Francisco, 22% in the South Bay/Peninsula, less than 19% in the East Bay, and 8% in the North Bay to extrapolate the locations where future employees will reside. Census and other information are available to more accurately project the likely places workers will live."

(Stephanie Barton, et al.—Hastings Civil Justice Clinic for the Good Neighbor Coalition, October 19, 2010) [104-20 PH]

"Third, to assume that any percentage of CPMC employees should have to look outside of San Francisco for housing ignores that fact that many CPMC employees may prefer to live in San Francisco, but are unable to find affordable or desirable housing. The percentage of CPMC employees forced to live outside of San Francisco in 2006 is wholly irrelevant to how many CPMC employees in 2015 and 2030 would prefer to live in San Francisco but may not be able to find appropriate housing. The DEIR should consider the possibility that all employees would prefer to live near their jobs, and make certain that this possibility is fully mitigated by accurately identifying the burden of the project on housing demand. Thus, after revising Table 4.3-10 to estimate actual personnel, as opposed to FTE personnel, the housing demand should then be equivalent to this number, abandoning the assumption that any employee should have to commute into San Francisco from elsewhere in the Bay Area."

(Stephanie Barton, et al.—Hastings Civil Justice Clinic for the Good Neighbor Coalition, October 19, 2010) [104-18 PH]

"Furthermore, the DEIR underestimates the demand for housing generated by the project by overestimating the percentage of CPMC employees that will not live in San Francisco. The DEIR does this in several ways: it bases commute patterns in 2015 and 2030 on commute patterns of 2006; it uses outdated ABAG projections of future population and employment growth; and it uses full-time equivalent personnel to estimate housing demand.

First, the DEIR bases future commute patterns of CPMC employees on the way in which CPMC employees commuted in 2006. In 2006, 49% of CPMC employees resided in San Francisco, while 51% of employees resided outside of San Francisco. The DEIR then applies this same split to CPMC employees in 2015 and 2030. However, the cost of commuting, as well as the time it takes to commute from outside of the City, is likely to increase dramatically between now and 20 15 and 2030, as the population of the entire region grows. Furthermore, as discussed below, to meet the mandatory carbon emissions reductions established by California Senate Bill 375, ABAG and the cities of the Bay Area are going to have to reduce new development in suburban areas and increase development in urban areas where jobs are located. Thus, the assumption on page 4.3-13 that 51% of CPMC's future employees will be commuting into San Francisco from elsewhere in the Bay Area should be abandoned because it ignores the direction that future development is most likely to go."

(Stephanie Barton, et al.—Hastings Civil Justice Clinic for the Good Neighbor Coalition, October 19, 2010) [104-57 PH]

"Currently, the percentage of CPMC workers living in San Francisco is 49%. This falls short of the City's overall rate, where 56% of the workers live in San Francisco. These figures highlight the need to implement a first-source hiring program for the project to increase job opportunities for San Francisco residents, Presently, 23% of San Franciscans must commute outside of the City to work. If provided the opportunity, these residents could potentially obtain jobs through the hiring program and subsequently increase the percentage of CPMC workers that live in San Francisco."

Response PH-4

The comments express concerns regarding a number of the analytical assumptions and the methodology used in the analysis of housing impacts in the Draft EIR. In particular, some comments raise questions about the assumptions made regarding the location of residence of future CPMC employees, and comments suggest that the analysis should consider the possibility that all future CPMC employees would prefer housing in the City of San Francisco. The comments specifically suggest that the existing commute patterns of CPMC employees are not an appropriate basis for estimating the future commute patterns, and that the Census or other sources would be more accurate.

For comments related to the need for affordable housing, please see Response PH-9 (page C&R 3.5-31).

Residence Location of Workers

As seen in Figure 4.3-1, "Employee Housing by CPMC Campus (2006)," in the Draft EIR, page 4.3-11, 49 percent of CPMC employees live in San Francisco, 22 percent live in the South Bay/Peninsula, 19 percent live in the East Bay, 8 percent live in the North Bay, and 2 percent live outside of the Bay Area. The Draft EIR uses this information to project a similar trend in the future, which is a conservative assumption for this analysis. San Francisco-wide commute patterns show a lower proportion of workers who also live in San Francisco.

The use of this data is more conservative in relation to San Francisco housing demand than use of the U.S. Census data. According to the U.S. Census Bureau's Longitudinal Employment Household Dynamics (LEHD) database, approximately 42 percent of San Francisco workers in 2008 also lived in San Francisco, which is 7 percentage points lower than existing CPMC personnel.[5] The record includes no evidence to suggest that the commute behavior of future CPMC employees would change materially from existing CPMC commute patterns and, therefore, conservatively assumes the higher household internalization threshold of 49 percent rather than using citywide averages from the U.S. Census. Further, as is discussed in Response PH-3 (page C&R 3.5-7), the employment and housing analysis in the Draft EIR assumed that all new employees would be net new employees to San Francisco. To the extent that some of those employees simply relocate from current San Francisco employment locations to CPMC campuses, the employment growth in San Francisco has been overstated. Therefore, the Draft EIR analysis is conservative in terms of assessing CPMC-induced housing demand in San Francisco in that it assumes a higher capture of housing demand than existing San Francisco-wide employee commute patterns, as well as being based on conservative assumptions about employment growth.

One comment indicates that there is a substantial difference between the percentage of San Francisco workers who live in the City (56 percent) and the percentage of CPMC workers who live in the City (49 percent). This particular comment appears to be based on less-than-current data regarding worker place of residence. The data noted by the commenter appears to be from the 2000 Census, which is now more than 10 years old and was likely skewed by the "dot com" bubble that existed at the time of that Census. The data presented in the Draft EIR is from the 2008 Longitudinal Employment Household Dynamics (LEHD) data, provided by the U.S. Census, represents more updated estimates and a different data source (the Quarterly Economic Census and IRS records). This data shows that 42 percent of San Francisco's working residents also live in San Francisco. The source of this data is the actual employment survey records provided to the California Employment Development Department (EDD) and the US Government for unemployment insurance cross-referenced with Internal Revenue Service information on place of residence. It is considered the most accurate and recent data available on residential location of workers.

3.5.1.4 POPULATION IMPACTS

Comment

(Malcolm Yeung—Chinatown Community Development Center, October 18, 2010) [68-11 PH, duplicate comment was provided in 85-11 PH]

"The EIR should determine that impact PH-1addressing population growth is 'Potentially Significant.' The present determination of 'Less than Significant' is simply untenable, particularly in light of the data provided in the EIR itself.

Based upon table 4.3-9 of the EIR, the Cathedral Hill campus would account for a staggering 30% of SF's population growth between 2006 and 2015, translating into roughly 8% of SF's household growth during this

[5] U.S. Census Bureau, Longitudinal Employment Household Dynamics (LEHD), available online: http://lehdmap.did.census.gov/

same period. The fact that one project can account for a statistically significant portion of the City's population growth over a ten year period is in and of itself significant.

In evaluating the specific near term impacts of the Cathedral Hill campus, the EIR offsets the growth induced by the Cathedral Hill campus with the unemployment created by the closure of the Pacific campus. This offset, according to the EIR, will reduce the above figures to 8% of the population growth and 2% of the household growth. Despite this, let me reiterate the above conclusion. The fact that one project can account for a statistically significant portion of the City's population growth over a ten year period must be significant."

Response PH-5

The comment states that the significance conclusion under Impact PH-1 on page 4.3-18 in the Draft EIR, based on CPMC's projected share of future population and household growth, is incorrect. Rather, the comment states that Impact PH-1 should be considered potentially significant because it identifies that the proposed LRDP would account for a "significant" portion of the City's population growth over the coming years. The comment also states the Draft EIR "offsets" new jobs at the Cathedral Hill Campus with jobs that would shift from the California Campus to the Cathedral Hill Campus.

Impact Significance

The focus of analysis in an EIR is on adverse physical environmental impacts. As such, an increase in population is only relevant under CEQA if the result of that increase in population would cause significant environmental impacts. For the purposes of CEQA, the City of San Francisco only recognizes population growth in and of itself as a significant impact if the population growth associated with a project would result in growth in population greater than the amounts planned for by the City and other regional organizations. This approach is incorporated into the standards of significance identified in the Draft EIR. Please see the discussion in the Draft EIR, beginning on page 4.3-11, for an explanation of the significance standards for population and housing.

As discussed in the Draft EIR, page 4.3-13, "substantial" population growth is defined as increases in population that are unplanned (i.e., without consideration of or planning for infrastructure, services, and housing needed to support proposed residents, employees, and visitors). Simply because a particular project accounts for a measureable amount of the City's future growth does not make the population impact significant. Under CEQA, the City requires project sponsors to undertake CEQA analysis at the earliest possible time and in consideration of all possible activities in the foreseeable future. This tends to result in EIRs on large groups of actions, like the CPMC LRDP. The question is not whether an EIR happens to cover a project or program that involves a large amount of population, employment, or housing growth, but whether that growth is within the bounds of the planned-for growth in the City. Based upon the analysis presented in Section 4.3, "Population, Employment, and Housing" in the Draft EIR, the planned capacity would be available to support the projected increase in residences and households generated under the proposed LRDP, and therefore Impact PH-1 is appropriately identified as less than significant.

Please also see Response PH-6, page C&R 3.5-17, for a discussion of the baseline used for assessment of population, employment, and housing impacts. This response explains that the use of planned growth as a measure of significance does not indicate the use of an improper baseline; rather, the Draft EIR used existing conditions as the baseline for evaluation of impacts, and compared the change over the baseline to a standard of significance based on future planned growth. Please also see Response PH-3 (page C&R 3.5-7) for an explanation of the conservative approach to CPMC employment projections. Please see Response PH-7 (page C&R 3.5-22) for supplemental information regarding housing capacity within the City of San Francisco.

Shift in Employment Location

The comment states that employment at the proposed Cathedral Hill Campus would represent 30 percent of San Francisco's population growth between 2006 and 2015 (based on information in Draft EIR Table 4.3-9), and then acknowledges that the Draft EIR also assumes "unemployment" at the Pacific Campus would partially offset the growth in employment at the proposed Cathedral Hill Campus. Although the comment is correct that the analysis acknowledges the increase in employment at the proposed Cathedral Hill Campus would be partially offset by the decrease in employment at the Pacific Campus, no evidence is shown that the proposed LRDP would result in unemployment at the Pacific Campus. Rather, some CPMC personnel working at the Pacific Campus would be transferred to other campuses. For a discussion of evaluating population and housing growth on a citywide level, please see Response PH-4 (page C&R 3.5-13), which describes existing commute patterns in San Francisco.

3.5.1.5 HOUSING DEMAND AND IMPACT ANALYSIS

Comments [Housing Baseline and Significant Impact Determination]

(Gloria Smith—California Nurses Association, October 19, 2010) [93-57 PH]

"**Incorrect Environmental Baseline for the DEIR's Housing Sections:** To reach the conclusion that the proposed Project will result in less than significant impacts on housing, the DEIR improperly relies on a comparison of the project impacts to conditions that are not relevant to a proper CEQA evaluation. For example, the analysis concludes that housing impacts will be less than significant based on future conditions rather than existing environmental conditions. The analysis concludes that because population and housing demand generated by the Project is within ABAG projects and *projected* housing supply, the Project has no significant impact. Just because the Project's employment, household creation, and population is within growth projections and future housing projections does not provide the proper comparison of the Project's impacts to existing conditions. See CEQA Guidelines Section 15125(a)."

(Gloria Smith—California Nurses Association, October 19, 2010) [93-58 PH]

"In setting the baseline for the analysis of housing and other impacts (e.g. employment, growth inducement and jobs-housing balance and jobs-housing fit) the DEIR fails to analyze the 'real conditions on the ground,' and instead compares the Project to hypothetical future environmental conditions (e.g. projected housing, population and employment growth) that do not exist. DEIR at page 4.3-29. Again, these future conditions include projected housing, population and employment growth in the project area and region. This artificial baseline creates the illusion that the Project's impacts on housing are not significant because those growth and housing projections make the Project contribute to housing demand appear small in number."

(Gloria Smith—California Nurses Association, October 19, 2010) [93-59 PH]

"When *full* Project housing demand is compared to existing availability of housing affordable to the workforce, impacts are likely significant. If the analysis also includes the loss of actual housing units plus the loss of future housing that could occur on the Project campus sites under current plans and zoning and takes into consideration jobs-housing 'fit,' Project related impacts will be much more significant than presented in the DEIR. The DEIR's baseline calculation violates the plain language of CEQA."

(Gloria Smith—California Nurses Association, October 19, 2010) [93-60 PH]

"For the housing sections, a revised DEIR must analyze the Project's *full* impacts on the existing conditions. The revised analysis must also identify the likely significant short-fall of housing affordable to the Project's direct, indirect, and Project-induced workforce as a result of the proposed Project plus cumulative projects. More detailed setting information concerning the status of affordable housing in the Project neighborhoods, City, and beyond must be a basis for this revised analysis."

(Gloria Smith—California Nurses Association, October 19, 2010) [93-76b PH]

"These conclusions are based in part on the projected employment generated by the Project being within ABAG's employment forecasts. DEIR at page 4.3-31. As described above, comparison of the Project against future population projections relies on an improper baseline. A revised DEIR must evaluate the physical and other environmental impacts of net new employment generated by the Project against existing conditions (e.g., existing supply of housing at rents/prices affordable to new employees)."

Response PH-6

The comments state that the population, employment, and housing analysis uses an improper baseline for potential significant impacts to population and housing because it compares the proposed project housing demand to projections of future housing demand. The comments state that in order to be proper under CEQA, the analysis must use existing conditions as the "baseline" for impact analysis. The comments state that the EIR uses an "artificial" baseline that minimizes the significance of the impacts. The comments also request that a more detailed setting be provided that describes affordability in neighborhoods, the City, and the region, and that the analysis should account for housing demand from indirect employment as well as jobs-housing fit.

Environmental Baseline

The analysis of population, employment, and housing impacts in the Draft EIR was based on current San Francisco General Plan and ABAG existing data as well as projections for the area. In particular, page 4.3-1 in the Draft EIR states that "[f]or purposes of this analysis, baseline conditions are represented by data mainly from 2006, the most current data consistently available across all population, employment, and housing indices for the CPMC campuses, except for St. Luke's where 2008 data is used." Existing setting information and data regarding population, employment and housing is provided on pages 4.3-1 to 4.3-10 of the Draft EIR.

The evaluation of population, employment, and housing impacts in the Draft EIR is based on a comparison of the change that would result from the proposed project against a baseline of existing conditions. In particular, Criteria 3b and 3c consider the potential displacement of existing residents that live in housing that would be demolished through implementing the proposed LRDP. Criterion 3a, evaluated under Impact PH-1, is based on Question XIII (a) in Appendix G of the State CEQA Guidelines.[6] These criteria necessitate an evaluation of the proposed LRDP compared to existing conditions as well as planned future growth, addressing the question of whether, by allowing population, housing, or employment growth beyond that amount for which the community has planned, the proposed near-term and long-term projects would exacerbate impacts and conflicts with local infrastructure and environmental plans. This evaluation is, however, based on a baseline of existing conditions, and compares the growth that would occur from existing conditions to the future without the project to the growth that would occur between existing conditions and the future with the project. In both cases, the comparison is based on a baseline of existing conditions. In this case, it is the threshold of significance that considers the future; that is, would the change from today to the future be different with or without the project.

The methodology discussion on page 4.3-12 in the Draft EIR explains:

> "The analysis below compares the population, employment, and housing that would result from implementing the proposed CPMC LRDP programwide to the existing and projected conditions for San Francisco overall. The analysis reviews the growth in these categories (population,

[6] Would the proposed project "a) Induce substantial population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure)?"

> housing, and employment) and assesses the extent to which the proposed LRDP would contribute to San Francisco's future population, housing, and employment growth. The analysis also evaluates whether the General Plan anticipates the projected population, housing, and employment growth and corresponding growth inducement."

Section 4.3, "Population, Employment, and Housing" in the Draft EIR includes information regarding the existing population, employment, and housing in the City, and the existing CPMC employment; therefore, a comparison of the proposed LRDP's impact with the existing baseline is provided. However, to determine the significance of that impact (i.e., whether demand for new homes or infrastructure would be created and, therefore, a physical indirect effect would result from the new employment created by the project), it was necessary to look at planned future growth. This type of impact can only be addressed by comparing the change in existing population, employment, and housing anticipated to be induced by the proposed LRDP with the change in existing conditions that was planned for in the growth plans of the local community.

The analysis uses the projections to understand the degree to which the proposed LRDP's share of increased population, employment, and housing over existing conditions in San Francisco compare to the increases over existing conditions that have been planned for, and whether the City has the capacity to accommodate the growth conservatively projected for the proposed LRDP. Comparing the change from existing conditions developed for the proposed LRDP to the ABAG projections of changes from existing conditions indicates whether the proposed LRDP would lead to unplanned growth not anticipated by City and regional planning organizations. For the significance criteria, the analysis uses a number of measures to determine whether the project would result in indirect environmental impacts from population and household growth. These include:

- Number of population and households projected under the proposed LRDP compared to the projected growth in population and households in San Francisco;
- Available vacant housing to accommodate more households in San Francisco;
- Number of units planned and proposed in San Francisco; and
- Available land capacity to support future growth in San Francisco.

Under the first measure, and specific to the question of 2007 ABAG projections, the conservative population, employment, and household growth estimates assigned to the proposed LRDP would be well within ABAG growth projections. These findings would not change if the population, employment, and housing analysis applied the 2009 ABAG estimates, which project an *increased* share of ABAG's total regional population, employment, and household growth projections for San Francisco.

The analysis also includes a brief discussion of the proposed LRDP's share of the population in 2015 and 2030, as the growth in population, employment, and housing would occur gradually, extended over the length of the proposed LRDP and beyond as CPMC employment needs would increase over time. Total projected employment at CPMC campuses in San Francisco in 2030 would account for approximately 2 percent of total estimated employment in 2006, the baseline year for the analysis. The projected increase in households and population from the proposed LRDP would account for 0.44 and 0.43 percent, respectively, of San Francisco's estimated household and population in 2006, the baseline year for the analysis. These percentage shares indicate marginal changes to overall population, employment, and housing in San Francisco.

Hence, the Draft EIR analysis determined that the project would not induce substantial population growth relative to the City's existing population and household numbers. The EIR also concluded that the

potential growth from this project would fall within the growth totals that the City has projected and planned for in the future. On the basis of those analyses and conclusions, the EIR ultimately concluded that the project would not result in a significant impact.

As to the use of ABAG 2007 data, the analysis applied the most recent data available at the time of the analysis. ABAG 2009 data was not available at the time of the initiation of the population and housing analysis. As discussed in previous similar responses, ABAG 2009 data assumes a larger share of the regional population, household, and employment growth would occur in San Francisco than using ABAG 2007 projections.[7] As a result, CPMC's percentage share of the 2009 baseline year projected population and household growth for San Francisco in 2030 would actually be lower than those represented in Section 4.3, "Population, Employment, and Housing" in the Draft EIR.

Please also see Response PH-5, page C&R 3.5-15, for a discussion of the significance of Impact PH-1.

Housing Setting in Nearby Neighborhoods

For further discussion on housing in neighborhoods around CPMC campuses, see Response PH-12 (page C&R 3.5-47).

Jobs-Housing Fit

For discussion of the analysis of jobs-housing fit, please see Response PH-10 (page C&R 3.5-39).

Comments [Housing Capacity, Production, and Vacancy]

Housing Capacity and Production

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-156 PH, duplicate comment was provided in 30-156 PH]

"And the argument that because ABAG's population projections, the city's vacant housing supply of approximately 17,100 units and the capacity to build 34,100 new units according to the 2004 Housing Element will accommodate the 10,730 workers at CPMC is looking at the picture idealistically as well as assuming that the housing will be available to CPMC workers vs. other company workers and prospective housing unit buyers or renters. Each year, ABAG's numbers get larger so no matter how many units are built, just because it matches ABAG's numbers and the projected Housing Element numbers, one cannot say that such a population surge has 'No Impact' or 'Less than significant' impact per Page 4.3-32."

(Malcolm Yeung—Chinatown Community Development Center, October 18, 2010) [68-13 PH, duplicate comment was provided in 85-13 PH]

"Second, the EIR suggests that SF is zoned to support development of up to additional 34,100 units over the 2009-2014 period (see EIR, p. 4.3-20) and therefore the City can easily absorb any additional population growth. The 34,100 number, however, constitutes 'potential' but UNBUILT units. Put simply, these 34,100 units do not exist. 'Someone' could build them. But until they are built, they cannot be relied upon as a housing resource to absorb population growth."

[7] ABAG 2009 Population projections, San Francisco, data accessed August 31, 2011, available online: http://www.abag.ca.gov/planning/currentfcst/#

(Barbara Kautz—CHNA and Bernal Heights Neighborhood Center, October 19, 2010) [87-35 PH, duplicate comment was provided in 108-35 PH]

"The DEIR concludes that all housing and population impacts-those due to the removal of housing, those due to failure to comply with the 3:1 housing requirements of the Van Ness Specific Plan, and those due to increased employment-are mitigated by 17,000 vacant units and the availability of sites for 34,000 housing units."

(Barbara Kautz—CHNA and Bernal Heights Neighborhood Center, October 19, 2010) [87-36 PH, duplicate comment was provided in 108-36 PH]

"Neither of these facts adequately mitigates the impact, because neither implies any commitment to actually *providing housing.* Having sites available for housing construction does not guarantee that housing will be built, nor does it guarantee that the housing that will be built will be affordable to CPMC's employees or to those displaced by housing construction."

(Gloria Smith—California Nurses Association, October 19, 2010) [90-57 PH]

"The DEIR failed to deduct from planned and projected housing, housing that would be developed on these sites under current planning and zoning, absent the proposed Project."

(Gloria Smith—California Nurses Association, October 19, 2010) [93-52 PH]

"•As estimated by the City's adopted Housing Element, San Francisco has the capacity to accommodate the approximately 1,490 households generated by the Project. The City has the capacity to accommodate cumulative housing need based on net new workforce assumptions for cumulative projects, an employed residents/household ratio of 1.37, and assumptions about housing production in the City. Specifically, according to the DEIR, the new jobs would generate demand for 1,300 housing units compared to the approved housing supply in San Francisco of 8,200 units plus vacant units and projected housing. DEIR at page 4.3-45."

(Gloria Smith—California Nurses Association, October 19, 2010) [93-64 PH]

"4) The DEIR fails to deduct from planned and projected housing, housing that would be developed on these sites under current planning and zoning. Moreover, the DEIR fails to regard the loss of this potential housing as an impact."

(Gloria Smith—California Nurses Association, October 19, 2010) [93-65 PH]

"5) The DEIR does not include housing that would be required to be built under current City regulations, but that the Project is requesting to be excused from constructing. DEIR at page 4.3-33."

(Gloria Smith—California Nurses Association, October 19, 2010) [93-76a PH]

"D. The DEIR Underestimates Project-Related Employment and Fails to Adequately Disclose and Analyze Jobs-Housing Balance and Jobs-Housing Fit Impacts. The DEIR concludes that Project-level and cumulative impacts associated with employment would be less than significant without adequate data or analysis. DEIR at page 4.3-31. Obviously, the Project's contribution to new jobs in San Francisco is a good outcome. However, these new direct, indirect, and temporary employees must be accounted for in the environmental analysis. The DEIR concludes as follows:

The total number of personnel at CPMC campuses would grow to approximately 10,730 by 2030. This would be a net new growth of 4,170 full time equivalent (FTE) personnel CPMC system wide between 2006 and 2030. This personnel growth would create population growth and household growth of approximately 3,480 people or approximately 3% and 1,409 households or approximately 3% overall, that would be within ABAG's population projections for San Francisco. Also, the increase in housing demand could be accommodated by the city's vacant housing supply (approximately 17,100 vacant units) and available capacity to build approximately 34,100 new housing units. DEIR at page 4.3-31.

(Stephanie Barton, et al.—Hastings Civil Justice Clinic for the Good Neighbor Coalition, October 19, 2010) [104-31 PH]

"Overall, the DEIR's housing analysis is woefully inadequate. The report fails to recognize major inconsistencies between the proposed project and the General Plan's Housing Element. The DEIR also assumes the project will receive CU authorization to modify its residential development requirements, but fails to analyze the project's suitability to receive a conditional modification or the impacts on the surrounding neighborhoods that could result from one. Furthermore, the DElR underestimates the impacts the project will have on housing demand. While the report asserts that San Francisco has enough vacant units and development potential to meet the demands of CPMC's workforce, no analysis of the level of affordability of vacant units or CPMC employee income levels is provided whatsoever. The DElR must address these inadequacies to afford Planning Commissioners, the Board of Supervisors, and the general public a genuine opportunity to evaluate the project's impacts."

(Reverend Arnold Townsend, September 23, 2010) [PC-198 PH]

Affordable housing is wonderful, we need it, but even affordable housing ain't free, you've got to be able to pay for it, and if you don't have a job that can pay for affordable housing, you can't live in this town anyway.

(Commissioner Olague, September 23, 2010) [PC-376 PH]

"The housing element, again, I think there's some – a little bit dismissive quality to the analysis that is provided here. A lot of it relies on 2004 Housing Elements which were obviously bound by, you know, the other one was dismissed to the 2008 – was it 2008 or 2009 – and then a lot of this, I believe, relies on ABAG projection figures and I don't feel comfortable with that because sometimes a projection in terms of the housing that is going to be supplied in the City isn't – what's the word I'm looking for – doesn't necessarily – isn't necessarily met, construction isn't necessarily met, even though the projections are there on what the needs are for the increased employment or employee population, the housing needs that are determined aren't always necessarily met."

Vacancy

(Malcolm Yeung—Chinatown Community Development Center, October 18, 2010) [68-12 PH, duplicate comment was provided in 85-12 PH]

"The EIR further dismisses the impact of the growth induced by the Cathedral Hill campus by turning to irrelevant and misleading San Francisco housing data. First, the EIR suggests that the roughly seventeen thousand (17,000) vacant units in the City can more than account for the household growth induced by the Cathedral Hill campus. The vacancy data, however, is meaningless unless compared to the average historic vacancy rate in SF. Put simply, every real estate market has a relatively stable vacancy rate because of 'natural' turnover. Vacancy rates can dip or rise based upon the market demand – but vacancy rates never actually go to '0.' Without knowing how the 17,000 number compares to SF's historic Vacancy rate, it is impossible to tell whether the SF real estate market, as is, can absorb the additional households created by the Cathedral Hill project."

(Malcolm Yeung—Chinatown Community Development Center, October 18, 2010) [68-14 PH, duplicate comment was provided in 85-14 PH]

"Third, neither the vacancy rate analysis nor the 'potential unit' analysis examines the 'jobs and income housing fit': In short, the above two approaches fail to analyze whether the new households generated by the Cathedral Hill campus can actually afford to live in the existing vacant units or the unbuilt, but 'zoned' units. Again put simply, the EIR fails to analyze whether the household growth induced by the Cathedral Hill campus will require construction of affordable housing in particular. Given this, the Planning Commission should amend the EIR to determine that the PH-l impact is 'Potentially Significant':"

(Barbara Kautz—CHNA and Bernal Heights Neighborhood Center, October 19, 2010) [87-37 PH, duplicate comment was provided in 108-37 PH]

"There is no analysis of vacant units to determine if they are actually available for rent at all, or with rents that are affordable to the needs created by the project. CPMC has proposed no plan for replacing the rent-controlled housing that will be demolished if the Long Range Plan is implemented."

Response PH-7

The comments question the comparison of the project-generated demand to the existing and future capacity to develop housing units in San Francisco, stating that this comparison represents an "idealistic" view and that the analysis should not be based on the assumption of future housing production. The comments also note that the analysis did not account for the existing housing units displaced by the proposed LRDP, and did not subtract units that could have been constructed on the project sites from estimates of future housing capacity in the City. Further, the comments suggest that the analysis may overstate the availability of housing units by not accounting for the normal level of vacancy that necessarily must exist in a healthy housing market. Finally, the comments suggest that the analysis should determine the availability of current vacant units and the affordability of such units to the proposed project workforce. The comments also state that the conclusion that the population impact is less than significant is not correct, and that the conclusion was based on inadequate data and analysis.

Affordability of housing is primarily a social and economic effect and, as such, is only relevant under CEQA insofar as it (1) serves to connect the proposed project to a physical adverse effect such as would occur if the affordable housing demand generated by the proposed LRDP would necessitate the construction of additional housing to meet the demand resulting in physical changes that created a significant indirect impact on the environment, or (2) is used as part of the measure of the significance of a physical environmental impact. Please see Response INTRO-7 (page C&R 3.1-17) regarding the appropriate consideration of social and economic impacts under CEQA. Please also see Response PH-9 (page C&R 3.5-31) for additional information regarding the capacity to develop affordable housing in San Francisco. Also see Response PH-25 (page C&R 3.5-82) for additional information regarding the induced and indirect demand for affordable housing.

San Francisco's Housing Capacity and Production

Housing Capacity

As noted on page 4.3-16 of the Draft EIR, San Francisco has an available housing unit capacity that is projected to accommodate approximately 34,100 housing units, not including its existing estimated vacant supply of 17,100 housing units. This is comparable to ABAG's projected household growth of 18,300 new households from 2006 to 2015. Thus, San Francisco has the capacity to accommodate the projected increase in households in the City in the near-term. San Francisco also could accommodate its projected share of household growth in the long-term from 2006 to 2030 (approximately 47,200 households), with its existing inventory of vacant units and its most recent estimate of housing unit capacity per the adopted 2009 Housing Element.

California's Housing Element law, enacted in 1969 and found in Section 65580-65589.8 of the Government Code, mandates that local governments adequately plan to meet the existing and projected housing needs of all economic segments of the community. The law acknowledges that, in order for the private market to adequately address housing needs and demand, local governments must adopt land use plans and regulatory systems which provide opportunities for, and do not unduly restrain, housing development. Under State law, the City and County of San Francisco must update the Housing Element periodically. According to the adopted 2009 Housing Element, San Francisco has an estimated housing

unit capacity of 61,000 additional units under its recommended rezoning plan.[8] Therefore, San Francisco is expected to continue to have the capacity to accommodate its projected share of household growth.

The Housing Element's analysis of site capacity demonstrates that the City's land use plans and regulatory systems provide sufficient site opportunities for housing development to meet the City's Regional Housing Needs Allocation (RHNA). However, production of housing on those sites is dependent upon the private market operating in conjunction with the public sector. In particular, even with the availability of sites with proper capacity, implementation of affordable housing is almost always dependent upon public funding sources or incentives, as cited in the adopted 2009 Housing Element (page I.88).[9] Table I-62 in that document identifies the public funding that might be available to San Francisco, however it notes that many sources such as state funds are subject to the budgeting process and therefore cannot be depended upon as stable funding sources. Several comments inquire as to the effect of rezoning of the Cathedral Hill Campus sites on the overall City housing capacity. This issue is fully addressed in Response LU-25 (page C&R 3.3-138). That response concludes that the proposed rezoning of the Cathedral Hill MOB site would reduce the total current capacity by approximately 0.4 percent and the rezoned capacity under the adopted 2009 Housing Element by less than a marginal 0.3 percent. With or without the housing capacity of the Cathedral Hill site, the City has the capacity to accommodate the projected new households generated under the proposed LRDP.

Housing Production

Housing capacity must be followed by housing production in order to meet the needs of the proposed LRDP and other growth anticipated to occur in San Francisco in the coming years. In the second quarter of 2010, the City and County of San Francisco had approximately 43,800 housing units included within their consolidated "pipeline."[10] The "pipeline" consists of development projects that would add residential units or commercial space, applications for which have been formally submitted to the Planning Department or the Department of Building Inspection.[11] The result of these pipeline projects would afford a sufficient supply of planned, proposed, or under-construction housing to accommodate more than San Francisco's near-term projected growth (18,300 households) and a significant share of its projected long-term growth (47,200 households). This does not include San Francisco's existing vacant supply or its additional housing unit capacity beyond those projects for which applications have been filed. The proposed LRDP's projected net increase in households (1,490) could be readily accommodated within the 43,800 housing units in San Francisco's pipeline.

Because the data support the conclusion that there is both adequate capacity and planned production of housing in San Francisco, it is reasonable to conclude that the short term and long term housing demand created by the proposed LRDP would not create significant impacts on the housing market, and would not necessitate the construction of additional units beyond those already planned for in the pipeline. Nevertheless, to respond to concerns about housing demand , the project sponsor has committed to make a contribution at least equivalent to the fee that would be required under the City's Jobs-Housing Linkage

[8] *Housing Element Part II: Objectives & Policies*, City and County of San Francisco, San Francisco Planning Department, June, 2010, http://www.sf-planning.org/, accessed September 3, 2010.

[9] *Housing Element Part I: Data and Needs Analysis*, City and County of San Francisco, San Francisco Planning Department, March 2011, available at http://housingelement2009.sfplanning.org/docs/Housing_Element_Part_I_Data_Needs_Assmt_CPC_Adopted.pdf.

[10] *Pipeline Report, Q2, 2010*, City and County of San Francisco, San Francisco Planning Department, August, 2010, http://www.sf-planning.org/, accessed September 3, 2010.

[11] Pipeline projects encompass various stages of development, from applications filed to entitlements secured, from building permits issued to projects under construction. The pipeline includes only those projects with a land use or building permit application. It does not include projects undergoing preliminary Planning Department project review or projections based on area plan analysis. To filter inactive projects, the current pipeline only includes projects filed during the last 5 years, projects approved in the last 4 years (with the exception of large projects, which are kept for 7 years), and projects for which construction has begun during the past 3 years. In addition, when a project is issued a Certificate of Final Completion by the DBI, it is taken out of the pipeline. *Pipeline Report, Q2, 2010*, City and County of San Francisco, San Francisco Planning Department, August 2010, http://www.sf-planning.org/, accessed September 3, 2010.

Program (JHLP) (although the JHLP fee does not apply to the project). It is anticipated that a contribution to the Mayor's Office of Housing would be incorporated into the conditions of approval or a mutually approved development agreement for the proposed project, if the project is approved. While the Draft EIR does not identify a significant impact to housing that would require mitigation, this contribution would support the creation of affordable housing in a manner similar to projects that are required to pay the JHLP fee. CPMC and the City have been in negotiations regarding the terms and conditions of a development agreement, that would, among other things, provide certain assurances and benefits, subject to the terms and conditions of the development agreement, with respect to the delivery of health care services. Please see Section 3.23.1.2 "Development Agreement" on page C&R 3.23-43 for additional details regarding the development agreement. Please also see Response PH-11, page C&R 3.5-43.

Vacancy

The Draft EIR presents the estimated number of vacant units in the context of an evaluation of the ability of the existing housing supply to accommodate future San Francisco households generated by the proposed LRDP. The analysis does not presume that 100 percent of the vacant supply would be absorbed, nor does it assume that all new households entering San Francisco would rent or buy an existing vacant unit. Rather, the existing vacant unit supply offers one of many available housing opportunities that could accommodate additional San Francisco workers that chose to live in the City. Other options would include purchasing or renting newly constructed units currently in the development pipeline or units yet to be constructed on one of the many sites deemed suitable for future housing construction.

The DOF estimates that approximately 17,100 units of San Francisco's housing supply are vacant, while the U.S. Census in the American Community Survey estimates that approximately 15,900 housing units were available for rent or for sale at the time of the 2009 enumeration in San Francisco.[12] According to the U.S. Census, approximately 13,900 of these units were for rent and 2,030 were for sale. Relative to the existing supply of renter and owner-occupied housing units, this results in a 6.4 percent and 1.6 percent vacancy rate, respectively. It should also be noted that the initial data released from the 2010 U.S. Census indicate that approximately 8.2 percent of the total housing stock (owner and renter) is vacant, or roughly 31,100 units.[13] This is substantially higher than the DOF estimates and implies more capacity within the existing housing stock than originally reported in the Draft EIR housing capacity analysis. It further substantiates the conclusion that there is available capacity within San Francisco to accommodate all net new households that could generate housing demand from the proposed LRDP under existing conditions, and in the future.

Some comments presume that a background level of vacancy exists and that units within that natural vacancy are essentially unavailable because the market requires a certain amount of vacancy. According to the real estate industry, the "natural vacancy rate" is the normal, average, or traditional percentage of rental properties in a community that are not leased or occupied.[14] In San Francisco, the vacancy rate has historically varied from periods when it was 5 percent or more, to periods when the rental vacancy rate was below 3 percent. For example, during the mid-2000s, the rental housing vacancy rate in the San

[12] U.S. Census Bureau, 2009 American Community Survey. Tables B25002, B25003, B25004. Note that the American Community Survey is a sample survey of housing units in San Francisco. Vacancy estimates include units for sale, units for rent, vacation units, units sold and not occupied, units for migrant workers, units rented and not occupied, and other vacant units. The American Community Survey estimates approximately 36,700 housing units were "vacant" at the time of enumeration in 2009. As estimated by the American Community Survey, approximately 13,900 housing units were available for rent and 2,000 housing units were available for sale. The Department of Finance performs a separate analysis to determine vacancy rates, accounting for migration, housing development and demolitions, and household formation. In either case, the vacancy estimates demonstrates an available housing supply above 13,000 units.

[13] U.S. Census Bureau, 2010 Census, *Civilian Population Counts and Occupancy Status.* The 2010 U.S. Census Redistricting Data (Public Law 94-171) Summary File.

[14] The Complete Real Estate Encyclopedia by Denise L. Evans, JD & O. William Evans, JD. Copyright © 2007 by The McGraw-Hill Companies, Inc.

Francisco MSA averaged around 6.5 percent,[15] but in the City of San Francisco it averaged around 2.5 percent.[16] In 2009, the Census reported that the vacancy rate for rental units had increased to approximately 6.4 percent, a level of vacancy confirmed in the 2010 Census. This increase in vacancy is consistent with the decrease in City jobs which dropped from approximately 634,430 in year 2000 to approximately 593,370 in 2010 (see Draft EIR Table 4.3-4, page 4.3-5).

For residential housing markets, the development community typically plans for a vacancy rate of approximately 5 percent.[17] If 100 percent of the estimated increase in San Francisco households generated under the LRDP from 2006 to 2030 (1,493 households) were to occupy only those rental units available for rent in 2009, the rental housing vacancy rate would decrease from approximately 6.4 percent to 5.8 percent, or an approximately 0.6 percentage point decrease that would leave the rental vacancy rate above the 5 percent that is typically planned for in project pro formas and well above the low vacancy rates of recent years. Note that the shift in vacancy assumes *all* new CPMC households living in San Francisco would rent and not buy, nor would they rent newly constructed rental or owner units likely to be constructed from 2011 to 2030. Regardless, the shift in vacancy would remain above a vacancy rate of 5.0 percent, meaning that the entire net new housing demand that could be generated by implementing the proposed LRDP could be absorbed by the existing housing stock in San Francisco.

Further, as is noted above, to to respond to concerns about housing demand created by the proposed Cathedral Hill Campus, (although the JHLP fee does not apply to the project), the project sponsor has committed to make a contribution at least equivalent to the fee that would be required under the City's JHLP. It is anticipated that the contribution to the Mayor's Office of Housing would be incorporated into the conditions of approval or a mutually approved development agreement for the proposed project, if the project is approved. While the Draft EIR does not identify a significant impact to housing that would require mitigation, this contribution would support the creation of (affordable) housing (in a manner similar to projects that are required to pay the JHLP fee). (Please also see Response PH-11, page C&R 3.5-43.)

Conditional Use Authorization

For a response regarding issues associated with the qualification of the proposed project for a Conditional Use (CU) authorization, please see Response LU-9 (page C&R 3.3-64).

Population Impact Significance

For a response to comments related to the significance of the project-related population growth, please see Response PH-5 (page C&R 3.5-15).

---

15 Census data for the SF MSA for 2005 through 2010 shows that the rental housing market has averaged approximately 6.5%. http://www.census.gov/hhes/www/housing/hvs/annual10/ann10ind.html. Accessed March 18, 2011.

16 The San Francisco Controller's Office states that "The overall housing vacancy rate in San Francisco fell over the past 10 years. About 5% of the City's housing stock was not occupied at the time of the Census in April 2000. The 2.5% rental vacancy rate and less than 1% for sale vacancy rate led to intense bidding and rising housing costs." http://www.sfcontroller.org/ftp/uploadedfiles/controller/wcm_controller/community_indicators/housing/rentalvacancy/rentalvacancyrate.htm.

17 Traditionally, rental development projects budget, or proforma, their projects with an assumed 5.0 percent vacancy rate. See Schmitz, Adrienne, et.al. *Multifamily Housing Development Handbook.* Washington, D.C.: ULI-the Urban Land Institute, 2000, page 85. At the enumeration of the 2000 Census, approximately 5,600 units were for rent and 900 units were for sale, representing a renter vacancy rate of approximately 2.6 percent and an owner vacancy rate of approximately 0.8 percent. It should be noted that 2000 had record low unemployment and substantial employment growth that resulted in a tight housing market. The vacancy data presented should not be confused with normal housing conditions but gives evidence of the easing of housing pressures in San Francisco since 2000. In 1990, approximately 5.7 percent of San Francisco rental housing stock was available for rent.

Comments [General Housing Impact/Demand Analysis]

(Barbara Kautz—CHNA and Bernal Heights Neighborhood Center, October 19, 2010) [87-34 PH, duplicate comment was provided in 108-34 PH]

"The DEIR either fails to analyze other significant impacts or concludes that impacts are insignificant when that conclusion is not supported by substantial evidence. Examples include the following."

(Gloria Smith—California Nurses Association, October 19, 2010) [90-73 PH]

"As shown above, the DEIR's impact analysis for Project-related impacts on housing was incomplete and seriously flawed. A revised DEIR that included the impacts described by CNA expert Terrell Watts, would require measures to mitigate significant housing affordability supply, including jobs-housing balance issues."

(Gloria Smith—California Nurses Association, October 19, 2010) [93-61 PH]

"**Incomplete Project Description and Assumptions for Housing**: In addition to reliance on the wrong environmental baseline to justify conclusions of less than significant impacts, the overarching conclusion that the Project would not have significant housing impacts is not supported by the facts:

1). The DEIR fails to describe all elements of the Project that generate housing demands including, but not limited to construction workforce, Project-induced and indirect employees. If all of these net new employees are included, the underestimation of the Project's housing demand is even greater than disclosed in the DEIR. A proper analysis of full housing demand would likely result in a significant shortfall of housing, particularly housing affordable to segments of the new direct, Project-induced, indirect, and long-term construction workers."

(Gloria Smith—California Nurses Association, October 19, 2010) [93-48 PH]

"Any environmental review must analyze the proposed project's potential impacts to population, housing and jobs. The DEIR includes discussions of potential housing impacts in number of chapters of the DEIR including Population, Housing and Employment; Land Use Plans and Policies, Growth Inducement and Alternatives. In every discussion, the DEIR concludes that the Project would not result in any significant impacts to housing without mitigation. Specifically the DEIR reached the sweeping conclusion that the project would not result in any significant impacts to population, employment and housing including the demand for housing or housing displacement. The DEIR reaches this conclusion without an adequate analysis of jobs and housing impacts and without analyzing the full demand for housing generated by the Project and the Project plus cumulative development. DEIR Section 4.3, pages 4.3-18 to 4.3-37.

The DEIR's significance criteria for housing-related impacts were based on whether the Project will:

- Induce substantial population growth in an area, either direction (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure);

- Displace substantial numbers of existing housing units or create demand for additional housing, necessitating the construction of replacement housing; or

- Displace substantial numbers of people, necessitating the construction of replacement housing elsewhere."

(Gloria Smith—California Nurses Association, October 19, 2010) [93-50 PH]

"The DEIR's conclusion that housing impacts will be less than significant without mitigation is based on a number of erroneous assertions including:

- The CPMC LRDP Project projected growth is within the household and population projections by the Association of Bay Area Governments (ABAG)"

(Gloria Smith—California Nurses Association, October 19, 2010) [90-54 PH]

"The DEIR failed to describe all elements of the Project that would generate housing demand; such as construction workforce, Project-induced and indirect employees. A proper analysis of full housing demand would result in a significant shortfall of housing, particularly housing affordable to segments of the new direct, Project-induced, indirect and long-term construction workforce."

(Gloria Smith—California Nurses Association, October 18, 2010) [93-56 PH]

"The conclusion reached in the DEIR concerning the lack of Project impacts on housing is flawed in the following respects: First, the DEIR evaluates impacts against incorrect baseline environmental conditions. Second, the DEIR bases the impact analysis on an incomplete and flawed description of Project elements likely to result in significant impacts related to housing demand and supply, and fails to disclose key setting information necessary to complete and adequate analysis of housing impacts. As a result of these omissions, the DEIR fails to identify any housing impacts as significant. Third, the DEIR fails to identify feasible mitigation measures for these significant impacts."

(Gloria Smith—California Nurses Association, October 19, 2010) [93-61 PH]

"**Incomplete Project Description and Assumptions for Housing**: In addition to reliance on the wrong environmental baseline to justify conclusions of less than significant impacts, the overarching conclusion that the Project would not have significant housing impacts is not supported by the facts:

1). The DEIR fails to describe all elements of the Project that generate housing demands including, but not limited to construction workforce, Project-induced and indirect employees. If all of these net new employees are included, the underestimation of the Project's housing demand is even greater than disclosed in the DEIR. A proper analysis of full housing demand would likely result in a significant shortfall of housing, particularly housing affordable to segments of the new direct, Project-induced, indirect, and long-term construction workers."

(Stephanie Barton, et al.—Hastings Civil Justice Clinic for the Good Neighbor Coalition, October 19, 2010) [104-17 PH]

"According to DEIR Significance Criterion 3b, the project will have a significant impact on the environment if it will create substantial demand for additional housing. The population growth connected to the Cathedral Hill Campus reasonably crosses this qualitative threshold. Therefore, the DEIR must acknowledge that the project will have a significant impact on the environment and put forth mitigation measures to diminish it."

Response PH-8

The comments state that the conclusion that housing impacts are less than significant is incorrect, and that analysis of housing impacts is inadequate for a number of reasons, including the use of an incomplete project description, the use of an incorrect baseline, the failure to consider the housing effects of temporary construction workers and indirect or induced employment, the failure to consider cumulative impacts as well as jobs-housing balance and jobs-housing fit. The comment states that the proposed LRDP would increase the demand for housing in the vicinity of the proposed Cathedral Hill Campus.

The discussion below addresses each of the areas of the housing analysis that are stated in the comments to be incomplete and flawed. In each case the discussion explains that the analysis undertaken by the City was a reasonable, good faith effort to consider the effects of the proposed project on the housing market in San Francisco. Section 15145 of the State CEQA Guidelines establishes the standards for adequacy of the analyses contained in an EIR. That Guideline states:

> "An EIR should be prepared with a sufficient degree of analysis to provide decision makers with information which enables them to make a decision which intelligently takes account of environmental consequences. An evaluation of the environmental effects of a proposed project need not be exhaustive, but the sufficiency of an EIR is to be reviewed in the light of what is reasonably feasible. Disagreement among experts does not make an EIR inadequate, but the EIR should summarize the main points of disagreement among the experts. The courts have looked not for perfection but for adequacy, completeness, and a good faith effort at full disclosure."

While the comments, including comments by a "land use expert," suggest flaws and incomplete analysis, they do not provide any evidence of another analysis that draws a different conclusion. Rather, they simply assume that if the EIR were to consider other factors, make different assumptions, or use a different approach the conclusion would be that housing impacts would be significant. The comments, however, provide no substantial evidence to support the conclusion that the City's analysis is inadequate. It is not enough to simply raise questions about the adequacy of the analysis and make presumptions about the outcome of a different analysis. The analysis contained in the Draft EIR was based on analysis of data. The conclusions are reasonable, are supported by substantial evidence in the record, and are not contradicted by any evidence provided by the comments.

Incomplete Project Description

The comments state that the project description is flawed, but do not contain specific references to such flaws, only asking for additional information. The same commenter's detailed comments on the project description are contained in Comments 93-29 through 93-39. Comments 93-29, 93-30, and 93-38 request additional project description information related to workforce incomes and jobs-housing fit; these comments are responded to in Response PH-10 (page C&R 3.5-39). Comment 93-31 requests a financing plan and is responded to in Response PD-3 (page C&R 3.2-5). Comment 93-32 requests specific detail on retail and commercial uses along with associated transportation characteristics, and is responded to in Response TR-27 (page C&R 3.7-50). Comment 93-33 requests additional information about emergency room and ambulance trips, and is addressed in Response HC-40 (page C&R 3.23-184). Comments 93-34 and 93-39 request specific proposed wording for plan and policy amendments, and are responded to in Response LU-9 (page C&R 3.3-64). Comment 93-35 requests draft findings for all proposed variances, and is addressed in Response PD-10 (page C&R 3.2-13). Comment 93-36 requests justification for all other policy and code amendments, and is responded to in Response LU-5 (page C&R 3.3-30). Comment 93-37 requests a schedule of events that may go on at the CPMC campuses, and is addressed in Response PD-11 (page C&R 3.2-14).

None of the issues raised by the comments pertain to information about the population or employment associated with the proposed project. Further, no corrections to the Chapter 2.0, "Project Description" in the Draft EIR have occurred that represent material changes in the analysis of population, employment, or housing.

Effects of Construction Workers

As it relates to housing demand generated from construction jobs, the analysis assumed that these workers would not make long-term housing location decisions based on a single project because of the cyclical and temporary nature of the project work. It is a common observation that construction workers typically

have a more flexible and longer commute pattern compared to other workers because of the nature of their work. As construction sites vary in their geography and a project often lasts less than 2 years, construction workers are accustomed to commuting varying distances to their temporary places of work. A relatively small portion of construction workers during the 5-year proposed [near term] LRDP construction period would work through the entirety, with most workers dedicated to one major phase of construction, such as concrete work, steel erection, mechanical, electrical, etc. Please see Section 4.6, "Noise" in the Draft EIR for a summary of the construction work program by construction phase by campus (e.g., the proposed Cathedral Hill Campus, in the Draft EIR, page 4.6-43). Furthermore, the modeling conducted for the Draft EIR's analysis of construction-generated air pollutants (Section 4.7, "Air Quality" in the Draft EIR) included assumptions with respect to vehicle miles traveled by construction-related vehicles, including workers. Section 4.5, "Transportation and Circulation" in the Draft EIR also included a detailed analysis of ride-sharing and shift schedules to ensure that potential construction workforce traffic impacts were addressed.

In addition, because construction workers rarely choose a place of residence based on the location of their work within the region, another factor that would diminish the likelihood that LRDP-related construction employment would create any material new housing demand would be the available construction labor in the region to support new construction projects. Because of the current economic recession and corresponding decline in construction projects, a labor surplus of roughly 7,000 construction workers is available within the San Francisco Metropolitan Statistical Area.[18] This estimate does not include other unemployed persons within San Francisco and elsewhere who could fill skilled and unskilled positions that would be available during the construction phase. CPMC, as part of its construction-phase workforce hiring program, has committed to a goal of a minimum of 14 percent Local Business Enterprises.[19] As is described in Response PH-26, page C&R 3.5-90, the First Source Hiring Program would cover both construction and permanent workforce minimum employment goals for the proposed project. For the construction workforce, a minimum of 50 percent of the hiring would be filled with San Francisco resident System Referrals for the following positions: Entry-Level for non-union administrative and engineering positions, non-union administrative and engineering internship positions, and union apprentice positions. A minimum of 30 percent of all new and core union journeyman and apprentice positions would be filled with San Francisco residents. These steps indicate local hiring would tend to reduce the overall level of travel to-and-from the project sites during construction, compared to a similar project without such a workforce hiring program. These commitments would ensure that the project performs at or better than the levels and nature of trips assumed in the Draft EIR analyses.

If a new housing demand was generated by construction employment, it would not be additive to the long-term housing demand discussed in the Draft EIR and Response PH-9 (page C&R 3.5-31). Peak construction years would not coincide with peak CPMC employment years. Therefore, anticipated CPMC personnel growth under the proposed LRDP would only occur on completion of new facilities that were constructed under the proposed LRDP. As construction of these facilities would be completed and related employment would end, then new long-term CPMC employees would occupy the additional space called for under the proposed LRDP. As a result, any marginal increase in temporary housing demand generated from construction employment would only partially coincide with housing demand generated from increased CPMC long-term employment.

[18] Bureau of Economic Analysis, 2010. Within the regional labor market, the San Francisco Metropolitan Statistical Area saw a 10-year high in the construction industry in 2007, with a total of 162,000 workers. Currently, 155,000 workers are in the sector, thus the industry has a local pool of 7,000 workers that could fill future industry employment needs.

[19] Source: Memo from Geoffrey Nelson re: First Source Commitment, May 26, 2011

Incomplete Environmental Setting

The comments state that the failure of the Draft EIR to include a properly comprehensive environmental setting undermines the adequacy of the housing impact analysis. For a discussion of the adequacy of the environmental setting, please see Response PH-2 (page C&R 3.5-3).

Incomplete Baseline and Significant Impact Determination

For a discussion of the environmental baseline used in the population, employment and housing analysis, please see Response PH-6 (page C&R 3.5-17).

Effects of Induced/Indirect Employment

For response to comments on housing effects of induced or indirect employment, please see Response PH-12 (page C&R 3.5-47).

Comparison to ABAG Projections

ABAG projections often are used to inform long-range planning efforts for General Plans and smaller specific plans. As such, they are a good source to determine whether proposed changes in a given community fall within the parameters of projected growth in population, employment, and housing, and thus can be accommodated under existing and planned conditions. If the growth anticipated as a result of the proposed project is materially different than the projected growth, then the proposed change could lead to *unplanned* growth that would not be accommodated by the jurisdiction's growth plans, which in turn might result in physical environmental effects. In this case, the projected change in population and housing over existing conditions resulting from implementation and operation of the proposed LRDP is well within projections of planned growth in San Francisco and the region, and, therefore, in part because of this, the impacts related to population and housing are considered less than significant. Please also see Response PH-6, page C&R 3.5-17.

Cumulative Impacts

For responses to comments on cumulative housing impacts, please see Response PH-13 (page C&R 3.5-50).

Jobs-Housing Relationship

For a discussion of the effects of the proposed project on housing affordability and jobs-housing relationships, including jobs-housing fit, please see Response PH-10 (page C&R 3.5-39).

3.5.1.6 HOUSING AFFORDABILITY AND JOBS/HOUSING FIT

Comments [General Housing Affordability]

(Lorenzo Listana, September 23, 2010) [PC-127 PH]

"The need for more housing would be more defined as the number of employees in the hospital increases. I am apprehensive that the CPMC will not provide affordable housing for its employees, it will create more housing problems because of increased demand. So far, there is no clear plan for affordable housing in the CPMC project, as mandated by the Van Ness Special District."

(Stephanie Barton, et al.—Hastings Civil Justice Clinic for the Good Neighbor Coalition, October 19, 2010) [104-25 PH]

"The DEIR also fails to demonstrate that the current and future housing supply in San Francisco will be sufficient to meet the needs of CPMC's workforce. The DEIR claims that San Francisco currently has 17,100 vacant housing units and the capacity to develop over 34,000 residential units before 2016. The DEIR uses these numbers to conclude that the project will not create substantial new demand for housing in San Francisco. These assertions mask the DEIR's utter failure to address the level of affordability of current vacant units and to provide appropriate projections for future development. These omissions, together with a complete lack of information about the income levels of CPMC workers, make it impossible for the public, or any decision maker, to assess accurately the project's impacts on housing demand in San Francisco."

(Stephanie Barton, et al.—Hastings Civil Justice Clinic for the Good Neighbor Coalition, October 19, 2010) [104-26 PH]

"The Planning Code recognizes that 'San Francisco faces a continuing shortage of affordable housing.' Between 2000 and 2004, San Francisco produced less than half of the new low-income housing units needed to meet demand and only 12% of the necessary moderate income housing units. These statistics combined with the fact that 'the San Francisco residential real estate market is one of the most expensive in the United States' makes the DEIR's lack of analysis of worker income levels and housing cost especially shocking. Furthermore, while the City may technically have the potential to develop 34,000 additional units of housing, it seems dishonest for the DEIR to suggest that any number of new housing units even approaching 34,000 will be constructed before 2016, especially given the current economic conditions."

(Stephanie Barton, et al.—Hastings Civil Justice Clinic for the Good Neighbor Coalition, October 19, 2010) [104-29 PH]

"The DEIR should also use available demographic information to analyze more completely housing need on an income level basis. The Planning Code has described San Francisco's housing needs on an income level basis as follows: '[ABAG] estimates that San Francisco's low and very low-income housing production need from 1999 through 2006 is 7,370 units out of a total new housing need of 20,372 units, or 36 % of all units built.' Within the past four years [2000-2004], only 23% of all housing built, or 49% of the previously projected housing need for low and very low-income housing for the same period, was produced in San Francisco. San Francisco has consistently fallen short of its low income housing demands. Additionally, the production of moderate-income rental units also has fallen short of the ABAG goal. Only 351 moderate income units were produced over the previous four years [2000-2004], which is only 4% of total units built compared to ABAG's call for 28% of all units to be affordable to households of moderate income. Given the need for 3,007 moderate-income units for the period 1999-2006, only 12% of the projected need for moderate income units was built between 2000 and 2004. Planning Code section 415.1 (c)(4) goes on to state that, 'extreme housing pressures face San Francisco, particularly in regard to low- and moderate-income residents.' This codified housing snapshot in all likelihood has only gotten worse since the data was compiled. Instead of analyzing housing data by income level, the DEIR states that San Francisco has a historically high ratio of jobs/employed resident ratio. This statement is sufficiently vague to give the false impression that San Francisco is meeting its market rate and affordable housing goals."

Response PH-9

The comments state that the housing analysis in the EIR should address demand by income level. The comments state that the City of San Francisco has an existing lack of affordable housing and has historically not produced the amount of affordable housing needed to meet demand. Further, the comments express concern that the proposed LRDP will create demand for housing but not meet the housing requirements of the Van Ness Special Use District.

Several comments addressed concerns about increased affordable housing needs within San Francisco as a result of the proposed LRDP as well as about some of the underlying assumptions that were used to

determine the significance of impacts related to population, employment, and housing. Specifically, the comments state that the presentation of data identifying a 34,000 housing unit capacity implies that such units will be produced by 2016. Further, the comments state that the discussion of jobs to employed residents ratio gives the impression that San Francisco is meeting its housing goals.

This response is presented in three parts to fully address the comments.

Housing Supply and Capacity

As discussed in Section 4.3, "Population, Employment, and Housing" in the Draft EIR, the proposed LRDP would not generate effects that would exceed any of the standards of significance presented on page 4.3-12 of the Draft EIR, and, therefore, the impacts would be less than significant. The following discussion summarizes the City's planning priorities and objectives related to affordable housing and the City's capacity to build additional housing, including affordable housing, as well as policies, funding mechanisms, and programs in place to facilitate achievement of this capacity.

The City of San Francisco does not generate a "housing demand" calculation or "affordable housing demand" calculation for individual project EIRs. Rather, in the 2004 General Plan, the City takes a comprehensive, citywide approach to meeting the demand for housing, and specifically affordable housing. One of the eight priority policies in the 2004 General Plan is that the City's supply of affordable housing should be preserved and enhanced. The discussion on page 4.3-16 in the Draft EIR reports that the City's General Plan Housing Element identifies the capacity for an additional 45,450 housing units in San Francisco. Because approximately 11,500 units have been constructed in San Francisco since the adoption of the 2004 Housing Element, it is reasonable to conclude that the City has the capacity to accommodate roughly 34,000 housing units. This would be more than enough capacity to absorb any level of increased demand that might be created by implementing the proposed LRDP.

To guide policy development, the City's adopted 2009 Housing Element provides detail regarding existing and forecasted conditions. The adopted 2009 Housing Element analyzes San Francisco's population and employment trends, existing household characteristics, overall housing needs, and the capacity for new housing based on land supply and site opportunities.[20]

As part of the adopted 2009 Housing Element, the City recently updated its available inventory.[21] The City has identified capacity to build approximately 73,700 additional housing units under its current zoning.[22] In addition, the adopted 2009 Housing Element estimates an additional 18,200 potential housing unit capacity with the proposed rezoning of selected neighborhoods recommended in the Housing Element.[23] Finally, the adopted 2009 Housing Element estimates a residential development pipeline of approximately 50,200 housing units. Based on this information, adequate capacity would exist to serve any additional household demands generated by the proposed LRDP.

Housing Affordability

The City's analysis concludes that under the 2004 Housing Element there are sufficient sites, available capacity, and sufficient policy and program support to accommodate the low- and moderate-income units that are needed to meet San Francisco's regional allocation.

---

[20] San Francisco Planning Department. adopted 2009 Housing Element. The Planning Commission approved the 2009 Housing Element, and certified the EIR for the 2004 and 2009 Housing Elements, on March 24, 2011. The Board of Supervisors upheld the EIR for the 2004 and 2009 Housing Elements, on May 10, 2011. The Board of Supervisors adopted the 2009 Housing Element on June 21, 2011. (Case No. 2007.172SE).

[21] *Ibid.*

[22] Table I-56, San Francisco Planning Department. adopted 2009 Housing Element.

[23] Table I-66, San Francisco Planning Department. adopted 2009 Housing Element.

This policy commitment from the 2004 Housing Element is carried forward in the adopted 2009 Housing Element, which contains specific objectives related to affordable housing. Of the twelve objectives in the adopted 2009 Housing Element, more than half are directly related to the preservation and enhancement of the City's supply of affordable housing. The adopted 2009 Housing Element describes how the City will address its identified regional housing needs allocation from 2007 through 2014, with a breakdown by income category. Based on its analysis of projects in the pipeline contained in the adopted 2009 Housing Element, the City has established housing production targets to satisfy the City's allocation for households in the extremely low- and above moderate-income categories by 2014. However, the City will not meet its Regional Housing Need Allocation for the low- and moderate-income allocations.[24]

The adopted 2009 Housing Element analyzes the physical capacity for affordable housing development in San Francisco, and also considers the availability of funding and other programs to facilitate the creation of units in different affordability categories. This analysis measures the physical capacity for affordable housing development on in-fill sites, but it recognizes that such capacity does not create a legal requirement to develop the sites as affordable housing or assess their marketability. It further recognizes that funding programs and subsidies often are required to facilitate creation of affordable units, and that currently insufficient foreseeable programs exist to support the creation of units affordable to households in the low- and moderate-income categories.

The critical element of achieving that goal is ensuring the *physical* capacity to provide the housing. The City's Housing Element, by state law, identifies future programs and policies to facilitate the creation of units in all affordability categories before approval of the Update.

Affordable Housing Policy and Program Framework

The adopted 2009 Housing Element is implemented in part through various City policies, funding mechanisms, and programs to create affordable housing throughout the City, as described next.

San Francisco's inclusionary housing ordinance requires that residential developments of five or more units (1) pay a fee according to a predetermined rate schedule, or (2) provide 15 percent of their units (or 20 percent if constructed off-site) to low- to moderate-income households. From 1999–2006, the inclusionary housing ordinance produced approximately 870 affordable units and contributed $23 million to the Affordable Housing Fund in in-lieu fees.[25]

To increase the amount of vacant land available for new construction of affordable housing, the City enacted the Surplus Property Ordinance. This policy requires that all City departments set aside vacant or underutilized land for the development of affordable housing. The City has also implemented an additional option under the inclusionary housing ordinance that allows the developer to dedicate land to the City for affordable housing currently available in eastern neighborhoods and, pending approval, in the Market and Octavia Plan area.

In requiring the construction of affordable housing, the City also implements measures to incentivize the construction of affordable housing. Two such examples are the HOPE SF program and modification of density limitations. HOPE SF is funded through $95 million in local bond financing.[26] The first phase of HOPE SF will rebuild more than 2,000 units in five public housing sites. An additional 3,000 units will be constructed on 100 acres of currently dilapidated apartments.[27]

[24] City and County of San Francisco, adopted 2009 Housing Element, Table I-64, page 90, Part I.
[25] San Francisco Planning Department, 2009 Housing Element, page A-4.

[27] http://hope-sf.org/guiding-principles.php. Accessed December 17, 2010.

Increased density can encourage affordable housing development. Almost all recently adopted area plans include policies that modify density restrictions in transit-served areas. Additionally, the City has established several special use districts (SUDs) that modify density limits and establish height exceptions for this purpose. From 1999–2006, almost all area plans included this policy, as well as affordable housing impact fees.[28]

The San Francisco Redevelopment Agency (SFRA) also has been an important source of funding and resources for the provision of affordable housing. [29] Together with the Mayor's Office of Housing, SFRA jointly administers the Citywide Tax Increment Housing Program.[30] This program dedicates a portion of tax increment, generated through the SFRA's real estate activities, to the development of affordable housing. Redevelopment agencies are mandated by the state to use a minimum of 20 percent of the total tax increment-collected finances for the construction or preservation of affordable housing within San Francisco, and at least 15 percent of all new units within redevelopment project areas are offered at below-market rates. In San Francisco, both of these legal minimums have been substantially surpassed.

On a cumulative basis, nearly 50 percent of tax increment funds generated since 1990 have been used on housing projects. The Citywide Tax Increment Housing Program has committed approximately $507 million in tax increment funding to housing development. From 1990–2008, the years for which data is available, the Citywide Tax Increment Housing Program helped fund the development of approximately 10,790 housing units, 90 percent (or approximately 9,630 units) of which are affordable units. Approximately half of these units have been created through new construction and half through the rehabilitation of existing structures.

SFRA also has provided assistance to housing development through non-tax increment funds, regulatory agreements, and multifamily bond financing. From 1990–2008, this assistance resulted in the development approximately 4,460 additional housing units, 2,520 of which were affordable.

San Francisco's Jobs-Housing Linkage Program is another tool used by the City to create additional affordable housing. In February 2001, the Office-Affordable Housing Production Program (OAHPP) was revised and expanded; it was also renamed the Jobs-Housing Linkage Program (JHLP). The original OAHPP required office development project sponsors to directly provide housing or to contribute land or in-lieu fees to a housing developer as a condition of approval for large-scale office development. The JHLP was expanded in scope and application to include all types of commercial development (e.g., hotels, entertainment, R&D, large retail etc.); monitoring and collection of fees paid was also enhanced. From 1999–2006, JHLP contributions to the Affordable Housing Fund increased to almost $42 million, compared with less than $9 million collected between the 1990 *Residence Element* reporting period of 1989-1998. During that same period, 10 development projects, totaling 743 housing units, received funds from the JHLP.[31]

As noted previously in this document, to respond to concerns regarding housing demand, the project sponsor has committed to make a contribution at least equivalent to the fee that would be required under the JHLP (although the JHLP fee does not apply to the project). It is anticipated that the contribution to the Mayor's Office of Housing would be incorporated into the conditions of approval or a mutually approved development agreement for the proposed project, if the project is approved. CPMC and the City have been in negotiations regarding the terms and conditions of a development agreement, that would, among other things, provide certain assurances and benefits, subject to the terms and conditions of the

[28] San Francisco Planning Department, 2009 Housing Element.

[29] On June 28, 2011, the Governor signed two new laws, ABX1-26 and ABX1-27. The laws eliminate redevelopment agencies subject to exemptions that involve additional tax revenue pass-throughs for school districts and other local agencies. The extent to which modification or dissolution of redevelopment agencies, including the San Francisco Redevelopment Agency, and/or the implementation of alternative economic development tools, would affect the construction of affordable housing is currently unknown.

[31] San Francisco Planning Department, 2009 Housing Element, Part 1: Data Needs and Analysis.

development agreement, with respect to the delivery of health care services. Please see Section 3.23.1.2 "Development Agreement" on page C&R 3.23-43 for additional details regarding the development agreement. While the Draft EIR does not identify a significant impact to housing that would require mitigation, this contribution would support the creation of affordablehousing in a manner similar to projects that are required to pay the JHLP fee. Please also see Response PH-11, page C&R 3.5-43.

In addition to these local policies and funding sources, many federal and state programs also facilitate the development of affordable housing in San Francisco. These programs include:

- Community Development Block Grant (CDBG) Housing Program, which averaged $2.3 million per year in grant funds from 1999–2006.[32]

- Home Investment Partnerships Program, which averaged $7.4 million in grant funds from 1992–2010. During this period, these funds helped finance 2,100 new units and provided tenant-based rental assistant to 2,693 low-income households. [33]

- Low-income housing tax credits (LHTC), which average $100.25 million per year from 2005–2009. During this period, these funds helped finance 4,070 housing units for low-income households in San Francisco.[34]

In summary, the City has made concerted efforts and developed policies to promulgate the development of affordable housing. The result is a comprehensive policy to address its affordable housing needs for the full spectrum of San Francisco residents.

Jobs-Housing Fit

For a discussion of jobs-housing fit, please see Response PH-10 (page C&R 3.5-39).

Vacancy

Please see Response PH-7 (page C&R 3.5-22) for a discussion of existing vacant units.

Comments [Jobs/Housing Fit]

(Calvin Welch—Council of Community Housing Organizations, October 13, 2010) [53-2 PH]

"…specifically re-written to accurately describe the large and unmeasured Impacts on the supply of permanently affordable housing required to meet the housing demand created by its new workforce."

(Calvin Welch—Council of Community Housing Organizations, October 13, 2010) [53-5 PH]

"DEIR Fails to Accurately Analyze the Specific Impacts of the Projects Workforce on Creating Additional Demand for Affordable Housing

The discussion on page 4.3-7 of the projects expected housing demand is laughable in its incompleteness and inaccuracy. No figures are offered as to the level of payment of the projects workforce therefore making it impossible to determine if current market rate housing available in San Francisco can be afforded by that workforce. Without such proposed workforce income information it is impossible to determine if the assertion of the developer that the current vacancy rate in San Francisco and/or the Housing Element production goals will meet the hospitals workforce housing demand.

---

32 San Francisco Planning Department, 2009 Housing Element.

34 http://www.treasurer.ca.gov/ctcac/index.asp. Accessed December 17, 2010.

The DEIR must be amended to include a complete and accurate discussion of the projects workforce, what portion of that workforce earns what portion of the median income and what levels of housing payment can be afforded by each portion of the projected new workforce. Without such information the full impacts of the proposed project cannot be measured or evaluated."

(Gloria Smith—California Nurses Association, October 19, 2010) [90-28 PH]

"Information on existing jobs-housing balance and jobs-housing fit in San Francisco and adjacent Bay Area communities."

(Gloria Smith—California Nurses Association, October 19, 2010) [90-44 PH]

"Impacts related to population, housing and jobs including an increased demand for housing affordable to the full CPMC workforce generated by the proposed Project (e.g. construction plus induced and indirect employees)."

(Gloria Smith—California Nurses Association, October 19, 2010) [90-53 PH]

"The Project will result in significant unmitigated impacts on affordable housing; specifically impacts on affordable housing that will be needed to meet the Project's workforce. The DEIR concluded that the Project would not have negative effects on housing because it relied on numerous erroneous assumptions. Conversely, the DEIR ignored important factors indicating that housing demand would be much greater than disclosed, such as the Project's full new household demand, including the construction workforce and including indirect and induced jobs (the multiplier effect); jobs-housing fit; and cumulative jobs-housing fit. Finally, the DEIR omitted key considerations which wrongly skewed the conclusion that the Project's impacts on housing impacts would not be significant. Among those were:"

(Gloria Smith—California Nurses Association, October 19, 2010) [90-59 PH]

"The DEIR failed to analyze the 'housing fit' – that is the cost of housing compared with the Project workforce's ability to pay for that housing. Various segments of the net new workforce, as well as indirect and induced jobs, are likely to fall into lower income categories.

Had the DEIR taken the above factors into consideration it would have more accurately reflected the Project's contribution to the significant demand on housing affordable to the CPMC workforce. The DEIR must be revised to take into account the above factors as fully described in Ms. Terrell's comment letter."

(Gloria Smith—California Nurses Association, October 19, 2010) [93-18 PH]

"III. Potentially Significant Impacts Were Either Not Analyzed or Inadequately Analyzed in the DEIR

A fair argument clearly can be made based on the record that the proposed Project will have a number of potentially significant impacts that were either not disclosed in the DEIR at all or were inadequately analyzed. These include, but are not limited to:"

(Gloria Smith—California Nurses Association, October 19, 2010) [93-19 PH]

- Impacts related to population, housing and jobs including an increased demand for housing affordable to the full workforce generated by the proposed Project (e.g., construction plus induced and indirect employees). The DEIR only analyzes a segment of net new employment generated by the Project, thereby underestimating the proposed Project's impact on housing. This impact in turn results in an underestimation of traffic, parking, air quality and greenhouse gas emissions impacts (see letters submitted under separate cover by Dr. Petra Pless, and Tom Brohard, P.E.). These impacts are commonly analyzed as jobs-housing balance 'and jobs-housing 'fit' impacts."

(Gloria Smith—California Nurses Association, October 19, 2010) [93-29 PH]

"Other information missing from the DEIR's Project Description section includes, but is not limited to the following:

- Profile of the 'net' new CPMC workforce by income range and job type to inform analysis of jobs-housing balance, jobs-housing fit and actual demand for additional housing affordable to the workforce. Only general information concerning the net new workforce can be gleaned from the DEIR (e.g., such as provided in Table 4.5-10 which provides no information on the income range of physicals and staff)."

(Gloria Smith—California Nurses Association, October 19, 2010) [93-30 PH]

"Income has been shown to play a significant role in where an employee lives and therefore commuting distance."

(Gloria Smith—California Nurses Association, October 19, 2010) [93-38 PH]

"The construction schedule in Appendix B provides a general overview of expected activities for near-term projects (the DEIR fails to provide adequate information on the buildout of long-term projects). Also, some sections of the DEIR provide additional details on construction activities by campus (e.g., Transportation and Noise). However, the DEIR omitted the details concerning the construction workforce, thus is it impossible to analyze impacts including housing demand, transportation, air quality and other impacts. This information would include, but is not limited to the type of worker by trade and tier status. The US Census ·provides information on the construction workforce including: area workforce characteristics by type of worker, worker residence locations, wages, and status - full or part-time. It is highly possible that given the cost of housing in the City that lower paid workers (Tier 1 or Blue Collar Construction Workers) reside outside the area and thus have long commutes to and from their residences. Again, this information is readily available and critical to complete the DEIR's Project Description."

(Gloria Smith—California Nurses Association, October 18, 2010) [93-47 PH]

"A revised DEIR must be prepared that includes this information and based on this information, analyzes the full impacts of the proposed Project on housing, jobs-housing balance, jobs-housing fit and the related impact topics of transportation, impacts on air quality and greenhouse gas emissions, among others."

(Gloria Smith—California Nurses Association, October 19, 2010) [93-49 PH]

"According to the DEIR, the population and household analysis takes into account a number of factors including CPMC employment, San Francisco employment, San Francisco households and San Francisco population growth and considers whether Project implementation would result in changed or increased housing demand and contribute substantially to residential population growth in San Francisco. DEIR at page 4.3-13. Based on this cursory and incomplete analysis, the DEIR concludes impacts will be less than significant across the board. DEIR at pages 4.3-18 to 4.3-31. However, this conclusion is mistaken. As discussed below, the Project will likely result in significant unmitigated impacts to housing in particular, impacts on affordable housing needed to meet the needs of the Project's workforce."

(Gloria Smith—California Nurses Association, October 19, 2010) [93-53 PH]

"The DEIR's conclusions in this regard [that the City has the housing capacity to meet the demand of the project] fail to consider the following reasons why housing demand will be much greater than disclosed:

- Full new household demand generated by the Project, plus the construction workforce, plus indirect and induced jobs (the multiplier effect)

- Jobs-housing fit

- Cumulative jobs-housing fit"

(Gloria Smith—California Nurses Association, October 19, 2010) [93-54 PH]

"As a result of underestimating demand for housing generated by all 'known' Project elements (e.g. net new direct, indirect, and Project-induced employees and construction workers) the proposed Project is likely to result in demand for housing in excess of supply, particularly housing at costs/rents that fit the workforce needs (i.e. housing affordable to the salaries of the CPMC direct, indirect and Project-induced workforce)."

(Gloria Smith—California Nurses Association, October 19, 2010) [93-55 PH]

"These potentially significant impacts [housing demand in excess of supply at prices affordable to CPMC workers] will in turn, likely lead to an underestimate of commute trips and length of trip as net new populations generated by the Project seek housing further from San Francisco, causing additional impacts on traffic, public services, air quality and global climate change due to greenhouse gas emissions."

(Gloria Smith—California Nurses Association, October 19, 2010) [93-63 PH]

"3) The DEIR fails to account for where workers will live and simply relies on the assumption from the CPMC IMP that 49% of employees reside in San Francisco, 22% in South Bay/Peninsula, 19% in the East Bay, 8% in the North Bay to extrapolate the locations where future employees will reside. DEIR at pages 4.3-12 to 13. Moreover, these assumptions valid or not, do not include construction workers. Census and other information are available to more accurately project the likely places workers will live. These studies clearly show a correlation between worker wages and salaries the location of their residences. A revised DEIR must do the work and not simply extrapolate from the prior Plan."

(Gloria Smith—California Nurses Association, October 19, 2010) [93-66 PH]

"6) The DEIR fails altogether to analyze the 'housing fit' – that is the cost of housing compared with the Project workforce's ability to pay for that housing. Various segments of the net new workforce, as well as indirect and induced jobs, are likely to fall into lower income categories."

(Gloria Smith—California Nurses Association, October 19, 2010) [93-67 PH]

"As a result of these and other omissions, flawed and incomplete analysis and assumptions, the Project is likely to result in significant demand for housing affordable to the workforce over supply in the immediate neighborhoods surrounding the Project's various campuses, in the City and potentially around the Bay Area (Marin, East Bay, Peninsula)."

(Gloria Smith—California Nurses Association, October 19, 2010) [93-68 PH]

"After including a complete project description and environmental setting, a revised DEIR must disclose and analyze the full impacts of the proposed Project on housing such as housing demand over supply taking into consideration jobs-housing fit, unmet demand for housing affordable to the workforce and impacts on housing supply (e.g. as a result of amending plans, zoning, and code sections). It is likely that a revised CEQA analysis along the lines described above would show significant impacts on housing requiring full alternatives and mitigation to address housing impacts."

(Gloria Smith—California Nurses Association, October 19, 2010) [93-82 PH]

"**Jobs-Housing Fit:** As a result of the omissions and flawed assumptions underlying the DEIR's analysis of employment, the DEIR's employment growth and housing demand and supply is incomplete and inadequate. If the DEIR had completed an adequate analysis as described above, it would have shown significant impacts associated with the Project in terms of jobs-housing balance, demand for housing, and related impacts."

(Stephanie Barton, et al.—Hastings Civil Justice Clinic for the Good Neighbor Coalition, October 19, 2010) [104-23 PH]

"2. The DEIR inadequately analyses the project's impacts on housing by failing to describe the income levels of CPMC workers and the levels of affordability of available housing in San Francisco.

The DEIR gives no consideration to employees' estimated income levels in analyzing the project's generation of housing demand. After reassessing the housing demand as described above (removing the assumptions that 51 % of employees will live outside of the City, and basing the housing demand on actual personnel and not FTE personnel), the DEIR should then address the income levels of estimated employees. Only by identifying the income levels of the CPMC personnel can the DEIR appropriately analyze housing demand."

(Stephanie Barton, et al.—Hastings Civil Justice Clinic for the Good Neighbor Coalition, October 19, 2010) [104-24 PH]

"Demand for affordable housing units in San Francisco, especially in the neighborhoods surrounding the proposed Cathedral Hill Hospital, is already extremely high. To ignore the demand for affordable housing that is specifically generated by this project is inappropriate. The DEIR analysis of housing demand should include a new table providing a breakdown of employee income levels and the resulting demand for affordable and market rate housing. Affordable and market rate housing should not be lumped together."

Response PH-10

The comments state that the assessment of housing impacts is inadequate because it did not address the affordability of current and future vacant units, did not include all project elements (direct, indirect, induced, and construction workers) and they request analysis of housing demand by comparing the projected income levels of the future LRDP workforce to the available housing in the current and projected future housing stock. The comments refer to this analysis as "jobs-housing fit." The comments request the analysis of jobs-housing fit for long-term workers and construction workers, as well as indirect and induced employees. The comments specifically request the preparation of a table showing a breakdown of employee income levels and the resulting demand for affordable and market rate housing. The comments state that the lack of information about jobs-housing fit, as well as additional information on housing setting, cumulative impacts, health care services, and construction workforce, undermines the adequacy of the analysis of housing demand, transportation, air quality, and other physical environmental effects. The comments state that the analysis as presented is flawed, and that if conducted as suggested, would require different analysis of physical effects such as transportation, air quality, GHG, etc., and would identify significant impacts, require mitigation measures, and require the analysis of additional alternatives.

Affordability of housing is primarily a social and economic effect and, as such, is only relevant under CEQA insofar as it (1) serves to connect the proposed project to a physical adverse effect such as would occur if the affordable housing demand generated by the proposed LRDP would necessitate the construction of additional housing to meet the demand resulting in physical changes that created a significant indirect impact on the environment, or (2) is used as part of the measure of the significance of a physical environmental impact. Please see Response INTRO-7 (page C&R 3.1-17) regarding the appropriate consideration of social and economic impacts under CEQA. Refer to Response PH-9 (page C&R 3.5-31) for additional information regarding the capacity to develop affordable housing in San Francisco. Refer to Response PH-18 (page C&R 3.5-67) for additional information regarding displacement.

Jobs-Housing Balance

The relationship between the number of jobs and the number of housing units in a geographic area is often referred to as jobs-housing balance. In and of itself, the jobs-housing relationship is not an environmental issue. However, from an environmental perspective, the concept is that if jobs and housing are in relative balance, environmental impacts will tend to be minimized because commutes will be shorter, resulting in less reliance on the automobile, less emission of air pollutants, and fewer related issues. The Draft EIR made reasonable assumptions about the housing location of future LRDP employees, as well as the commute patterns for residents and workers through San Francisco and the Bay Area region (see Response PH-4, page C&R 3.5-13). The environmental analyses presented in the Draft EIR pertaining to transportation, air quality, noise, and greenhouse gas emissions, as well as housing, public services and infrastructure, are based on these reasonable assumptions. Thus, the environmental effects of the assumed project-specific and cumulative jobs-housing relationships is evaluated and presented in the Draft EIR. Nevertheless, in response to comments on this issue, the following information is provided.

As is shown in C&R Table 3.5-3, between 2000 and 2008, the City's housing supply increased by 15,250 units, while city employment decreased by approximately 91,100 jobs. Between 2000 and 2008, the jobs-to-housing ratio decreased from 1.85:1 to 1.52:1, showing that housing production has outperformed employment in San Francisco, decreasing the pressures on housing demand.

As described above, the population, employment, and housing data used to develop the population and housing analysis in the Draft EIR was the best official data available at the time of the analysis. In each case, the Draft EIR analysis uses a conservative approach towards assigning population, employment, and housing to the proposed LRDP, resulting in a conservative projection and its corresponding effects to the environment. Despite this conservative approach, Section 4.3 of the Draft EIR concludes that the impacts to population, employment, and housing would be less than significant.

C&R Table 3.5-3
Housing Production in San Francisco 2000–2008

Year	Total Number of Housing Units	Total Number of Jobs	Jobs Housing Ratio
2000	346,527	642,500	1.85:1
2008 (DOF)	361,777	551,100 (estimate)	1.52:1
Change (2000–2008)	15,250	-91,100	

Sources:
Department of Finance (DOF) 2010, U.S. Census Bureau, LED OnTheMap Origin-Destination Database (Beginning of Quarter Employment, 2nd Quarter 2008, 2007, 2006, 2005, 2004, 2003, and 2002).

Jobs-Housing Fit

Several comments requested that the EIR include a detailed analysis of the housing demand of the LRDP workforce based on the projected income levels of CPMC workers, and suggested that the existing citywide analysis is flawed. As is described in Response PH-4 (page C&R 3.5-13), CPMC employees live in a wide array of locations around the Bay Area, with approximately 49 percent living in San Francisco. This is a higher percentage than is indicated for the general population of San Francisco working residents.. Determining the housing location of future employees is much more complex than simply examining projections of future employee salaries and location of employment. One cannot just make assumptions that each employee would choose to live nearby, in fact, while cost and proximity to

employment are considerations, housing location decisions are influenced by many factors other than work proximity. Other critical decision factors include the quality and safety of the neighborhood, availability of quality schools, transit accessibility, affordability, rent control, suitability of housing stock, and work location of an employee's partner, neighborhood preference, and lifestyle choice.

It is also important to note that the location of new housing that is built in the City is not entirely within the control of the City decision-makers. While land use planning and zoning, as well as the execution of housing construction incentive programs fall into the City's authority, for the most part, the private market determines the location and timing of housing construction based on economic factors, such as demand and supply of housing, land, financing, etc.

In light of the housing characteristics of employee residence decision making, especially given the effect of San Francisco's rent control ordinance, the analytical approach taken in the Draft EIR is both appropriate and reasonable. Further, detailed analysis of housing demand of the specific workforce at each campus is not included in the EIR as demand at such a micro level of detail cannot be accurately predicted. As explained above and reflected in the data presented in Response PH-4 (page C&R 3.5-13), it is not possible to accurately predict in what locations future CPMC workers will live due to the complexities of the housing location decision process as well as because of unique characteristics of the regulated San Francisco rental housing market and the high levels of transit availability at the Cathedral Hill Campus location. To attempt to break down the proposed project workforce by income level, and then to apply those estimates to estimates of housing availability in specific neighborhoods over the 15 year period during which the proposed project would be speculative.

Based on the information presented above, City policy also requires, for the most part, that project sponsors of most types of large commercial projects contribute in some fashion to the production of housing, particularly affordable housing. In keeping with the spirit of that general policy, although the City's Jobs Housing Linkage Program fee does not apply to institutional uses, to respond to concerns regarding housing demand, the project sponsor has committed to make a contribution at least equivalent to the fee that would be required under the City's Jobs Housing Linkage Program. It is anticipated that the contribution to the Mayor's Office of Housing would be incorporated into the conditions of approval or a mutually approved development agreement for the proposed project, if the project is approved. CPMC and the City have been in negotiations regarding the terms and conditions of a development agreement, that would, among other things, provide certain assurances and benefits, subject to the terms and conditions of the development agreement, with respect to the delivery of health care services. Please see Section 3.23.1.2 "Development Agreement" on page C&R 3.23-43 for additional details regarding the development agreement. Please also see Response PH-11, page C&R 3.5-43.

Hence, without trying to predict how much affordable housing should be built in close proximity to the project site to meet the needs according to projected employee salaries, (an analysis which would be based on and would convey a false level of precision), the EIR discusses the issue of housing demand and affordability on a citywide basis. This citywide analysis reaches reasonable conclusions, based on reasonable assumptions and substantial evidence, that the proposed project would not substantially or adversely affect the City's overall jobs/housing balance, and with anticipated contributions to the Mayor's Office of Housing (MOH) would, in fact, contribute towards the production of affordable housing to help address the citywide housing issue.

Related Environmental Effects

Several comments state concerns that potential traffic, public services, air quality, and global climate change impacts that might occur as a result of population growth attributable to the proposed LRDP have been underestimated by virtue of not considering the affordability factors requested by the comments. While the comments state that the impacts are underestimated, they provide no evidence to support

analyses that would generate different results. In fact, there is no evidence to suggest that the commute patterns that have been assumed, and which are material assumptions underpinning the analyses of transportation, air quality, GHG, and other effects, would be affected by different affordability assumptions. In fact, based on the discussion of the Draft EIR approach to employment projections, Response PH-3 (page C&R 3.5-7) describes the ways in which the analysis is conservative and, if anything, tends to overestimate the effects of the proposed project. Further, as is described in Response PH-25, (page C&R 3.5-82), the cumulative effects analysis contains all possible growth that could be attributed to indirect and/or induced employment connected to the proposed LRDP. Thus, the Draft EIR project-specific and cumulative analyses conservatively capture all of the potential environmental consequences of the proposed LRDP. See also Sections 3.7, 3.9, 3.10, and 3.13 of this C&R document for responses to concerns related to the transportation, air quality, global climate change, and public services impacts of the proposed LRDP.

Other Issues

For a discussion of the existing housing setting, please see Response PH-2 (page C&R 3.5-3). For a discussion of the construction workforce, please see Response PH-8 (page C&R 3.5-27). For a discussion of the assessment of cumulative housing impacts, please see Response PH-13 (page C&R 3.5-50). For a discussion of the effects of the proposed LRPD on access to health care services, please see Major Response HC-8 (page C&R 3.23-32).

Comments [Jobs-Housing Linkage Program]

(Stephanie Barton, et al.—Hastings Civil Justice Clinic for the Good Neighbor Coalition, October 19, 2010) [104-15 LU]

"**2. In analyzing San Francisco land-use requirements, the DEIR fails to discuss the Jobs/Housing Linkage Program.**[21]

In order to offset the housing demands generated by a new development project's permanent employees, the Jobs/Housing Linkage Program requires large-scale projects to contribute land or money to a developer or pay a fee to the City to subsidize housing development.[22] The findings in support of this requirement emphasize the 'low vacancy rate for housing affordable to persons of lower and moderate income,' and that this shortage forces employees 'to commute long distances, having a negative impact on quality of life, limited energy resources, air quality, social equity, and already overcrowded highways and public transport.' [23]

The Jobs/Housing Linkage Program applies to any office development proposed with an additional 25,000 square feet of development.[24] There is no exclusion for a medical office building. The total floor area for the proposed Cathedral Hill medical office building ('MOB') is 496,000 square feet.[25] It is designed as a distinct and separate structure from the proposed hospital. The Jobs/Housing Linkage Program clearly applies to the Cathedral Hill MOB. Yet the DEIR provides no analysis of the nature and extent of CPMC's obligation to contribute to the development of new housing in San Francisco, nor any explanation for this omission.

It may be that because the Cathedral Hill Hospital and MOB are parts of the same CU authorization application, the DEIR drafters have assumed that this stand-alone MOB, unlike other office buildings with medical offices, is not to be treated as an office building covered by the Jobs/Housing Linkage Program. Hospitals are not within the mandatory coverage of this ordinance. But to argue that this exclusion also encompasses a nearby medical office building is sophistry. To take this position given that the Cathedral Hill Hospital and MOB are two different buildings is to engage in a legally evasive subterfuge of a major San Francisco land-use requirement. The DEIR needs to be amended to include an analysis of the applicability of the Jobs/Housing Linkage Program to the Cathedral Hill MOB and the steps that need to be taken to mitigate the housing demands attributable to the MOB's workforce.

[21] Planning Code § 413.1 et seq. (formerly codified as § 313.2 et seq.)
[22] Planning Code § 413.1 (A) & (F).
[23] Planning Code § 413.1 (A) & (B).
[24] Planning Code § 413.3 (a)(3).
[25] Table 2-5, DEIR 2-21."

(Commissioner Antonini, September 23, 2010) [PC-390 PH]

"A couple other things came up, the first is that I do agree with Commissioner Olague, she did mention the housing-jobs linkage, and my understanding is that does apply to the medical office buildings, that is what I've been told, I'm not sure of that, it does not apply to the Hospital. So we could get a clarification mentioned in the document and find out exactly what that entails."

Response PH-11

The comments request clarification of the applicability of the City's Jobs-Housing Linkage Program (JLHP) to the proposed project.

The City of San Francisco's JHLP was established in 1996 to reduce the housing burden of large-scale entertainment, hotel, office, research and development, and retail development projects and is embodied in Section 413 of the San Francisco Planning Code. Section 413.1 acknowledges that there are a variety of factors unrelated to development that affect the availability of housing affordable to low and moderate income households, but recognizes that the increased demand brought about by large commercial developments contributes to the housing conditions in the City.[35]

Section 413.6 establishes the monetary value that new developments of different types must contribute to meeting affordable housing demand. The proposed new buildings that would be developed as part of the near-term projects under the proposed LRDP would not be required to pay a fee under the JHLP because no such fee is required for institutional uses. Planning Code Section 217 defines Institutional uses as those including "[h]ospital, medical center or other medical institution which includes facilities for inpatient or outpatient medical care and may also include medical offices, clinics, laboratories, and employee or student dormitories and other housing, operated by and affiliated with the institution, which institution has met the applicable provisions of Section 304.5 of this Code concerning institutional master plans."[36] Because CPMC is a medical center with an accepted Institutional Master Plan, the uses in the LRDP meet the definition of Institutional uses for purposes of application of the JHLP fee. The uses in each new building proposed as part of the near-term construction under the LRDP, including the Cathedral Hill MOB, the Davies Neuroscience Institute, and the St. Luke's MOB/Expansion Building, fall within that definition. Planning Code Section 413.6 exempts Institutional Uses from the JHLP fee by setting the fee for such Institutional uses at $0.00.[37] At the time that long-term projects are proposed and considered for approval, the applicability of the Jobs-Housing Linkage Program fee to those projects will be determined.

The JHLP fee would not apply to the short-term LRDP projects, however, to respond to concerns regarding housing demand, the project sponsor has committed to make a contribution at least equivalent to the fee that would be required under the City's JHLP. It is anticipated that the contribution to the Mayor's Office of Housing would be incorporated into the conditions of approval or a mutually approved development agreement for the proposed project, if the project is approved. While the Draft EIR does not identify a significant impact to housing that would require mitigation, this contribution would support the creation of affordable housing in a manner similar to projects that are required to pay the JHLP fee. Therefore, while there are no identified significant impacts tied to increased demand for housing, the payment of this contribution would support the creation of affordable housing in a manner similar to

[35] San Francisco Planning Code, Section 413.1(B).
[36] San Francisco Planning Code, Section 217(a)
[37] San Francisco Planning Code, Section 413.6(a), Table 413.6 , Fee Schedule For Net Additions Of Gross Square Feet.

projects that are required to pay the City's JHLP fee. CPMC and the City have been in negotiations regarding the terms and conditions of a development agreement, that would, among other things, provide certain assurances and benefits, subject to the terms and conditions of the development agreement, with respect to the delivery of health care services. Please see Section 3.23.1.2 "Development Agreement" on page C&R 3.23-43 for additional details regarding the development agreement.

3.5.1.7 NEIGHBORHOOD EFFECTS

Comments [Housing Demand In Adjacent Neighborhoods]

(Linda Chapman, October 19, 2010) [76-7 PH, duplicate comment was provided in 111-7 PH][VNAP]

"2. Housing demand and economic impacts.

The proposed campus would take land in the Van Ness Corridor from uses that benefit the area. A hotel provided customers for two commercial districts and placed less pressure on neighborhood housing stock. The Van Ness Plan identified this area as an ideal location to supply future housing demands, where new construction will not cause significant residential displacement. Development of this residential-commercial district is intended to focus on small households and favor affordable housing. Residential development allows commercial space only at lower stories. The VNAP accommodates retail, or local services, not traffic inducing institutional development. The CPMC proposal defeats the purpose of the SUD, which mandates 3:1 square feet (minimum) of housing to commercial space for development in the Van Ness Corridor. Generally, new construction will accommodate this requirement. If housing is not built on site (e.g., existing commercial building is expanded), then the same 3:1 ratio mandates housing construction elsewhere in the SUD. The proposed campus reduces potential sites for housing construction (the area plan's primary objective). Moreover, it concentrates new workers in an institutional use that VNAP land use policies do not accommodate. It multiplies the impacts of commercial enterprises because this nonconforming use will schedule hundreds of workers around the clock. A purpose of the area plan was to limit non-residential use."

(Linda Chapman, October 20, 2010) [76-8 PH, duplicate comment was provided in 111-8 PH]

"CPMC operations must be considered for housing impacts, not only city-wide, but those likely to intensify local demand. Workers in small households, especially those expecting to come and go at night, will likely put pressure on the housing stock of central city neighborhoods, where prevalent forms are studios and 1-2 bedroom units. Rental tenure dominates most neighborhoods near the site, with condominiums an increasing proportion of new construction."

(Linda Chapman, October 20, 2010) [76-9 PH, duplicate comment was provided in 111-9 PH]

"Historic impacts on Nob Hill housing of St. Francis Hospital, documented over a number of years, demonstrated significant effects, even from a smaller hospital. The hospital acquired rental buildings, on 2-3 blocks, to demolish for an office building; to house specialties like Sports Medicine (illegally); then (defeating enforcement actions) to house residents and interns when on call at night. Tenants, if not forced out, endured years of pressure. Hospital and office staff doubtless competed with other residents for centrally located rental housing in the regular market. An independent laboratory located near the hospital likewise reduced potential housing supply."

(Linda Chapman, October 20, 2010) [76-10 PH, duplicate comment was provided in 111-10 PH]

"Households in neighborhoods near the proposed campus (lower Nob Hill, Civic Center, Tenderloin) have average incomes lower than the city-wide average. Competition from CPMC staff will result in reduced housing opportunities for current and prospective residents: fewer units available to rent; upward pressure on rents; pressures to terminate tenancies. Households with higher incomes will experience housing pressure in increased rents and competition for apartments available for purchase."

(Stephanie Barton, et al.—Hastings Civil Justice Clinic for the Good Neighbor Coalition, October 19, 2010) [104-8 LU]

"Policy 11.4 of the San Francisco Housing Element directs attention to the impacts of large institutions on surrounding neighborhoods. Under this policy, the City must evaluate the needs of adjacent residential areas for housing, on-street parking and safe, quiet streets and must work to require institutions to provide housing for workers and students. The DEIR superficially analyzes the demand for neighborhood housing generated by the large new medical center campus proposed for Cathedral Hill. Its approach is to disregard the significance of the neighborhood demand by citing highly general data on citywide housing vacancies and housing goals referenced in the Housing Element.[6] Subsequent sections of these comments address deficiencies in the DEIR's analysis of CPMC workforce housing needs and San Francisco housing vacancies.[7] The DEIR's use of housing goals, which represent policy objectives, instead of looking to the actual development and availability of housing, is perplexing. At the very least, the DEIR needs to discuss the likelihood of actually meeting the housing goals, which it does not.

[6] DEIR 4.3-33
[7] *See* Sections I.B.2 & I.C. of this comment letter, *infra*."

(Stephanie Barton, et al.—Hastings Civil Justice Clinic for the Good Neighbor Coalition, October 19, 2010) [104-27 PH]

"Finally, the DEIR fails to analyze the project's impacts on housing in individual neighborhoods in San Francisco by claiming that employees make housing decisions on a regional level 'rather than simply choosing to reside near their employer.' While the criteria that individual employees use to make housing decisions clearly varies, it seems unreasonable to claim, as the DEIR does, that introducing over 3,200 new employees into a largely residential neighborhood will not affect housing demand in that neighborhood."

(Stephanie Barton, et al.—Hastings Civil Justice Clinic for the Good Neighbor Coalition, October 19, 2010) [104-9 PH]

"The DEIR gives short shrift to housing impacts on adjacent neighborhoods, particularly the Tenderloin. Overlooking the environmental effects of the proposed Cathedral Hill campus on the Tenderloin is an omission endemic to the DEIR. As discussed below, this oversight is especially glaring in the DEIR's analysis of transportation and circulation impacts. Here, the DEIR fails to address Policy 11.4 of the Housing Element and its emphasis on avoiding disruption caused by the expansion of a major institution into a new neighborhood. Other than acknowledging the need to replace housing demolished in order to build a medical office building,[8] the DEIR does not discuss any necessity to contribute to the development of new housing, especially affordable housing. In light of the scale and character of Tenderloin housing stock and reasonably foreseeable Cathedral Hill Campus workforce demands for housing nearby, this omission suggests that the project may well be inconsistent with Policy 11.4.

[8] DEIR 4.3-43, 4-44."

(Stephanie Barton, et al.—Hastings Civil Justice Clinic for the Good Neighbor Coalition, October 19, 2010) [104-16 PH]

"The proposed project would create demand for additional housing in the neighborhoods surrounding the proposed Cathedral Hill Campus, necessitating the construction of new housing. The DEIR predicts the project will cause an increase in population of over 3,200 persons at the site of Cathedral Hill Campus during the period from 2006 to 2015.[26] According to the DEIR, the number of projected workers at the Cathedral Hill Campus will be equal to 30% of San Francisco's total population growth during the period.[27] If the number of workers employed at the proposed Cathedral Hill Campus is the equivalent of that much of the total projected population growth in San Francisco for a nine year period, it is reasonable to expect a high percentage of those workers will seek housing in the residential areas surrounding the campus. The increased demand for housing caused by

Cathedral Hill employees is likely to necessitate new construction in the residential neighborhoods surrounding the campus, especially when those neighborhoods have already been identified as having a high need for housing.

[26] DEIR Table 4.3-9 at DEIR 4.3-14. For this period, the DEIR projects that there will be 1,280 new CPMC workers at the Cathedral Hill Campus and that only half (a very questionable assumption) will want to live in San Francisco. At a minimum, this means that the number of new-to-San Francisco Cathedral Hill employees represent 8% of the projected total San Francisco population growth from 2006 to 2015. DEIR 4.3-20. But the actual percentage could be as high as 16%.

[27] *Id.*"

(Steve Woo, September 23, 2010) [PC-58 PH]

"I am here to talk about the housing issue with regards to our Tenderloin neighborhood. The Draft EIR is deficient in terms of addressing the housing issue."

(Steve Woo, September 23, 2010) [PC-60 PH]

"This project would represent a huge investment of corporate dollars into our neighborhood and that is going to significantly alter our community. First of all, the impacts of the number of jobs that will be brought into the community on housing, the impact, that alone is going to force a community that is marginal and already at risk of displacement into further risk."

(Betty Huey, September 23, 2010) [PC-73 PH]

"Hello and good afternoon, Commissioners. My name is Betty Huey. I am youth leader in the Chinese Progressive Association. I am here today to urge you not to approve the CPMC's Draft EIR because it is inadequate and it does not address the negative impacts in our community."

(James Tracy, September 23, 2010) [PC-78 PH]

"And those questions have not been resolved yet primarily because the EIR, as Dina said, really only sees as far as Polk Street and we, of course, are very concerned about the impacts on Polk Street with lower Polk neighborhoods where we have started the dialogue with them, that we think will be fruitful, but we also want the City family to see beyond Polk Street, to see a neighborhood that needs to benefit from positive economic development, which means local hires for the permanent jobs, which means adequate affordable housing contributions, which have not been adequately addressed as yet in the EIR."

(James Tracy, September 23, 2010) [PC-79 PH]

"So, we can see the same results that happen when the large hotels started moving in on the other end of the neighborhood. There were similar anxieties at that time, that the Hilton and the other hotels would displace communities, but thanks to grassroots participation and community organizing, those developments provided jobs and affordable housing for the surrounding communities, and a degree of stability that the Tenderloin would be even in a worse place without that. And so we call on the City family, it is not just about Sutter/CPMC, it is about all branches from the Mayor, the Planning Commission, and the Board of Supervisors, to simply step up and make sure that this becomes an engine of empowerment and grassroots economic development."

(Commissioner Olague, September 23, 2010) [PC-377 PH]

"And so I think that there needs to be a little bit closer look at who is going to be working in this hospital. I heard 3,000 and 1,500, so that's 4,500; potentially, how many of those people will be moving into the City? What types of impacts are going to happen – the pressures that are going to be placed on the adjacent neighborhoods and those types of issues."

Response PH-12

The comments express concerns about the potential for the Cathedral Hill Campus to create housing demand in nearby neighborhoods, including the Van Ness Avenue Corridor, Lower Polk, Lower Nob Hill, the Civic Center, and the Tenderloin. The comments state that the Draft EIR does not adequately consider the project's consistency with Policy 11.4 of the Housing Element. The comments also state that the Draft EIR did not adequately consider the effects of the proposed Cathedral Hill Campus in neighborhoods beyond Polk Street. Comments express concern about medical uses displacing housing and local-serving businesses. Finally, the comments express concern about the project's compliance with local area plans and policies, such as the Van Ness Area Plan and the requirements of the Van Ness Special Use District.

Housing Demand in Nearby Neighborhoods

The evidence in the record does not support the supposition that the construction and operation of the proposed new Cathedral Hill Campus or expansion of other LRDP campuses would have a resultant and predictable effect of increasing housing demand in adjacent and nearby neighborhoods. As is described in Response PH-10, the housing location decision is based on a variety of factors in addition to place of employment. Other critical decision factors, such as the availability of quality schools, affordability, the suitability of the home, and the work location of the worker's partner, often override proximity to work.

The complexity of housing location decisions is true in all locations, and is further complicated in San Francisco by the presence of the San Francisco rent control ordinance, which creates a material financial incentive for individuals to stay in their rental home for extended periods of time rather than regularly relocating to accommodate job changes or other factors. Further, the presence of a high number of transit options make convenient and cost-effective commuting to the Cathedral Hill location practical from nearly all neighborhoods in San Francisco. Thus, if a current employee were in residence near an existing CPMC campus and their job was relocated to Cathedral Hill, the presence of transit options and the financial disincentive of moving from a rent controlled housing unit to a new uncontrolled unit or a controlled unit with a reset rental rate would mitigate against a significant number of employees moving into nearby neighborhoods. Further, a substantial portion of the housing stock near the proposed Cathedral Hill Campus (Tenderloin and Civic Center) is itself rent- or affordability-controlled, making these units somewhat protected from upward market pressure, eviction, or other displacement pressures. To the extent that there is any increased demand to live in these neighborhoods because of the proximity of the proposed Cathedral Hill Campus, tenants of rent- and affordability-controlled units are protected against such demand. See also Response PH-14.

Data on the commute patterns of San Francisco working residents demonstrates the fact that proximity to work is not a substantial driver in housing location decisions. Data on the duration of commute is self-reported through the U.S. Census; that is, individuals submitting data to the Census Bureau are asked how long it takes them to commute to work. In San Francisco, the average reported commute of working residents is approximately 29 minutes. According to the 2000 U.S. Census, only 1 percent of San Francisco workers that did not work from home reported having commutes of 5 minutes or less and about 6 percent of San Francisco working residents reported having commutes of 10 minutes or less. Eighty-five percent of San Francisco working residents reported having average commutes of 15 minutes or more and 50 percent of San Francisco working residents said that they had commutes of over 30 minutes.[38] About 10 percent of San Francisco working residents reported that they walked to their place of work and

[38] U.S. Census, 2009 American Community Survey, Commute Behavior, http://factfinder.census.gov/servlet/STTable?_bm=y&-geo_id=05000US06075&-qr_name=ACS_2009_1YR_G00_S0801&-ds_name=D&-_lang=en&-redoLog=false, accessed August 31, 2011. The 2009 American Community Survey found nearly identical commute behavior statistics for San Francisco workers, with approximately 6 percent of workers with commutes of 10 minutes or less and 15 percent of workers with average commutes of less than 15 minutes.

about 3 percent reported that they rode a bicycle to work.[39] If prospective Cathedral Hill Campus personnel conform to San Francisco commute characteristics then approximately 1 percent would choose to live within a 5-minute commute. This would result in an increase in local housing demand of approximately 48 units by 2015 and 54 units by 2030.[40] This would be a marginal increase in local housing demand and one likely not to induce substantial population displacement.

The information on commute times for San Francisco working residents is based on self-reporting through the U.S. Census, in which respondents answered a question about the length of travel time from their home to work. In fact, a 5-minute commute can be varying distances based on direction and travel mode and time of commute. A 5-minute commute by automobile could cover distances as far away as Franklin and Union to the north, Union Square to the east, or past Japantown to the west. A 5-minute walk could be as little as 2–3 blocks, or as much as .25-mile depending on the pace of the walker, the direction, terrain, and level of congestion. The information provided on travel time to work supports the conclusion that relatively few San Franciscans live in immediate proximity to their place of employment. The complicating factors described above are an example of why the City believes that attempting to predict housing demand by neighborhood would provide a false level of detail and why the analysis of housing demand at a citywide level is both more accurate and appropriate for use in an EIR.

In summary, commute characteristics of San Francisco working residents demonstrate the regional nature of housing decisions and the minimal increase in housing demand within a specific neighborhood that could be expected as a result of increased local employment. Because changes in housing demand from increased employment occurs more broadly in a housing market, the population and housing effects analysis in the Draft EIR evaluates the proposed LRDP's impact to housing demands for the City of San Francisco as a whole, and not on a neighborhood-by-neighborhood basis.

Effects in Neighborhoods

Several comments questioned the extent of the analysis in the Tenderloin district, stating that the analysis did not extend past Polk Street. The discussion above explains the rationale for consideration of housing demand effects on a citywide basis, and not at a neighborhood-by-neighborhood level. Thus, the Draft EIR consideration of housing demand goes well beyond Polk Street. In terms of transportation and transportation-related effects (air quality, noise, etc.), the EIR addressed effects at a number of intersections along Polk Street. As is described on page 4.5-90 of the Draft EIR, the study intersections on Polk Street (intersections of Polk with O'Farrell, Cedar, Polk, and Sutter Streets) would continue to operate at acceptable levels of service under future conditions with the proposed project. In light of those conclusions, and reflecting the tendency of vehicles to spread further out on the road system as one travels further from the location of the project site, there is no rationale for further examination of transportation-related effects further east than Polk Street. Nevertheless, as part of this C&R, a supplementary study of transportation impacts in the Tenderloin/Lower Polk/Little Saigon neighborhood, under more conservative assumptions than were used in the Draft EIR, was prepared. The presentation of the effects of this analysis is included in Responses TR-124 and TR-125, pages C&R 3.7-207 and 3.7-214. Through these analyses, the EIR has included sufficient analysis of effects of the proposed project on quality of life issues in the surrounding neighborhoods.

[39] U.S. Census, 2009 American Community Survey, Commute Behavior, http://factfinder.census.gov/servlet/STTable?_bm=y&-geo_id=05000US06075&-qr_name=ACS_2009_1YR_G00_S0801&-ds_name=D&-_lang=en&-redoLog=false, accessed August 31, 2011.

[40] Conservatively assuming that 1 percent of the total Cathedral Hill Campus population (4,790 in 2015, and 5,380 in 2030 (see Draft EIR Table 4.3-10, page 4.3-16) formed households within a five minute commute. One percent of the total population would be approximately 48 in 2015 and 54 in 2030.

St. Francis Memorial Hospital

The effects of the St. Francis Memorial Hospital on housing in and around Nob Hill are not addressed in the Draft EIR because they are associated with a different project, not the CPMC LRDP. Any such impacts, if correct, occurred in the past and are part of the environmental setting for this Draft EIR. The experience that the commenter describes following the St. Francis Memorial Hospital expansion is, however, distinguishable from the expected effects of the LRDP.

The City of San Francisco requires the preparation of Institutional Master Plans (IMPs), pursuant to Section 304.5 of the San Francisco Planning Code. Among other things, these IMPs are intended "[t]o provide notice and information to the Planning Commission, community and neighborhood organizations, other public and private agencies and the general public as to the plans of each affected institution at an early stage, and to give an opportunity for early and meaningful involvement of these groups in such plans prior to substantial investment in property acquisition or building design by the institution;" During the development of the IMP the public is provided the opportunity to give public input and testimony, and through the process is informed about the long-term plans for each of the relevant institutions.

In 1985, St. Francis Memorial Hospital prepared an Institutional Master Plan that described the following development projects:

- Addition of four levels to the Pierotti Pavilion. Only a one-level addition was completed in 1986.
- Addition of two levels to the 1234 Pine Street Garage. This project was completed in 1988.
- Construction of a new six story medical office building at 1199 Bush Street, replacing the former parking lot. This project was completed in 1990.

Between 1985 and 2008, in addition to the completion of the above projects, SFMH sold all of its residential properties, which included 1171 Bush, 1355 Pine, and the row of buildings on Hyde Street between 909 Hyde and the southwest corner of Pine. Also, SFMH opened a satellite location in San Francisco, the Health Center at AT&T Park, specializing in sports medicine.[41] The changes that were implemented under the SFMH IMP are likely the very land use changes referred to by the commenter.

The 2008 SFMH IMP lays out SFMH's Five Year Plan that will meet SFMH's immediate needs, and a Ten Year Plan that focuses on evaluation of various alternatives for construction of a replacement acute-care inpatient facility. The Five Year Plan includes: (1) Seismic Upgrade of the East Wing, (2) Renovation of East Wing Surgery Suites, and (3) Implementation of a Master Signage Program. The Ten Year Plan indicates that SFMH has no development plans following the projects in the Five Year Plan. However, SFMH will evaluate possible locations for a replacement acute care inpatient facility, which must be completed by 2030. Any projects undertaken consistent with the IMP require CEQA compliance which informs and provides the public the opportunity to comment on the nature of the project and related environmental and community effects.

The CPMC LRDP outlines for the public specific plans to construct a medical campus that would contain medical offices and associated clinics and facilities. The long-term plans for these campuses are included in the CPMC Institutional Master Plan, and have been incorporated into the LRDP and evaluated in this EIR. As such, it is not reasonable to assume that there would be further incremental neighborhood intrusion by CPMC that would affect housing or other uses.

[41] Saint Francis Memorial Hospital/Catholic Healthcare West, *Saint Francis Memorial Hospital Institutional Master Plan*, August 2008, page 7.

Housing demolition and displacement effects are fully articulated on pages 4.3-43 through 4.3.47 in the Draft EIR. These issues are addressed further in Response PH-16 (page C&R 3.5-60), which explains why it is unlikely that any effects from the proposed LRDP would cause displacement of residents in the vicinity of the proposed CPMC campuses.

Displacement

Please see Response PH-14 (page C&R 3.5-53) for a discussion of the potential displacement of residential uses and Response PH-23 (page C&R 3.5-79) for a discussion of displacement of neighborhood businesses.

Compliance with the Van Ness Avenue Plan and the Van Ness Special Use District

See Response LU-18 (page C&R 3.3-87) for a discussion of the relationship of the proposed Cathedral Hill Campus sites to the VNAP and VNSUD, as well as an explanation of the assumptions related to future development on the Cathedral Hill Campus sites that were contained in the Van Ness Avenue Area Plan EIR. Please see Response LU-21 (page C&R 3.3-95) for discussion of the project's consistency with the 3:1 residential/non-residential requirement of the Van Ness Special Use District.

Housing Element Policy 11.4

Housing Element Policy 11.4 establishes that the City should"[a]void or minimize disruption caused by expansion of institutions, large-scale uses and auto-oriented development into residential areas." Please see Response LU-3 (page C&R 3.3-7) for a discussion of the project's relationship to Policy 11.4 of the Housing Element.

3.5.1.8 CUMULATIVE HOUSING AND EMPLOYMENT IMPACTS

Comments

(Gloria Smith—California Nurses Association, October 18, 2010) [90-47 PH]

"• Cumulative impacts, including those related to housing demand, public services, employment and air quality within San Francisco and the greater Bay Area."

(Gloria Smith, California Nurses Association, October 19, 2010) [93-22 OTH]

"• Cumulative impacts, including those related to housing demand and potential development at the abandoned California campus."

(Gloria Smith—California Nurses Association, October 19, 2010) [93-83 PH]

"Cumulative Impacts are **Not** Adequately Analyzed: The DEIR uses forecasted employment growth as a proxy for 'related projects.' DEIR at page 4.3-6. Based on this approach, the DEIR concludes that the Project's incremental employment effect is not 'cumulatively considerable' within the meaning of CEQA and hence its cumulative employment impact is less than significant. DEIR at 4.3-31. To the contrary, there is information concerning likely future employment growth based on the cumulative list as well as planning and zoning. A revised analysis should be prepared that uses both methodologies to re-evaluate cumulative impacts to jobs and in particular jobs-housing fit."

Response PH-13

The comments state that the cumulative analysis contained in the Draft EIR was inadequate because it was based on a projection of regional growth. The comments state that the cumulative analysis should be

revised to be based on two methodologies: (1) a projection of growth and (2) a cumulative list of projects. The comments also ask that the cumulative analysis include future uses that may be located at the portions of the California Campus to be vacated by CPMC in the future. It should be further noted that the prelude to Comment 90-47 (contained in Comment 90-43) notes that the commenter's land use expert identified significant impacts related to a variety of issues, including cumulative housing impacts. The land use expert's comments specific to the issue of cumulative impacts are presented in Comment 93-83, and are responded to below.

The Draft EIR does not, as is stated in the comment, use a projection of growth as a "proxy" for a list-based analysis. Under CEQA, a lead agency has the option to use either a list-based cumulative analysis or a cumulative analysis based on a summary of growth projections. More specifically, Section 15130(b) of the State CEQA Guidelines states that the lead agency may use:

> "Either:
>
> (A) A list of past, present, and probable future projects producing related or cumulative impacts, including, if necessary, those projects outside the control of the agency, or
>
> (B) A summary of projections contained in an adopted general plan or related planning document, or in a prior environmental document which has been adopted or certified, which described or evaluated regional or areawide conditions contributing to the cumulative impact. local, regional or statewide plan, or related planning document, that describes or evaluates conditions contributing to the cumulative effect."

The City of San Francisco uses projections of growth generated by ABAG and other regional agencies to address cumulative population and environmental issues that are generated by incremental development and growth around the City and the region. This approach is used for such impacts as transportation, air pollutant emissions, traffic-generated noise, demand for public services and infrastructure, and the like. Alternatively, a list-based approach is used for such effects as cumulative effects on housing and visual resources and aesthetics. As an example, the following describes the cumulative list approach used in the Draft EIR housing analysis (see Draft EIR page 4.3-45):

> "According to the City, and as shown in Table 4.3-11, "Development Proposals on File with the San Francisco Planning Department" (page 4.3-45), proposals for approximately 30,370 residential units were on file with the San Francisco Planning Department as of the third quarter of 2009. Of those units, approximately 8,200 have been approved for construction. In addition, proposals for approximately 8.9 million sq. ft. of office; 700,000 sq. ft. of production, distribution, and repair (PDR); and 2.2 million sq. ft. of retail have been filed with the Planning Department. Of this square footage, approximately 400,000 sq. ft. of office and 200,000 sq. ft. of retail is approved. Using the employment density factors estimated by the San Francisco Planning Department,[42] the approved office and retail development would generate approximately 1,140 and 640 new jobs.[43] Based on San Francisco's average employed residents/household ratio of 1.37, the new jobs would conservatively generate demand for approximately 1,300 housing units.[44] This is compared to the approved housing supply of approximately 8,200 housing units. Thus, the cumulative housing impact for approved job-generating projects is less than the approved supply of new housing.
>
> [42] San Francisco Planning Department. 2002 (October). Transportation Impact Analysis Guidelines for Review. San Francisco, CA. Table C-1.
> [43] Assumes employment density factors of retail and MIPS (349 and 332, respectively).
> [44] This assumes no in-commuting."

The use of cumulative analysis methodologies that are appropriate to specific types of analyses is consistent with CEQA. There is no requirement that an agency use both a list-based and a projections-based method of cumulative analysis, as suggested by the comment.

As discussed in Section 4.3, "Population, Employment, and Housing" in the Draft EIR, implementing the proposed CPMC LRDP would not result in substantial additional development, population, and employment growth at the CPMC campuses, in the surrounding neighborhoods, or citywide. Further, the project would not make a considerable contribution to cumulative impacts related to housing demand or employment.

As discussed in Section 4.11.6, "Cumulative Impacts" in the Draft EIR, cumulative impacts on fire, police protection services, schools, or library services related to the proposed LRDP and foreseeable future developments in San Francisco would be less than significant. Please also see Response PS-2 (page C&R 3.13-1) for a discussion on the significance of public services effects. Impacts AQ-7 and AQ-14 in the Draft EIR, beginning on page 4.7-55 and page 4.7-80, respectively, addressed cumulative air quality impacts and concluded that cumulative impacts related to air quality would be significant and unavoidable. Please also see Responses AQ-10 regarding operational air emissions (page C&R 3.9-26), AQ-24 regarding air quality data (page C&R 3.9-66), and AQ-28 regarding thresholds of significance (page C&R 3.9-71).

3.5.1.9 DISPLACEMENT OF RESIDENTIAL USES

Comments [General Displacement]

(Gloria Smith—California Nurses Association, October 18, 2010)[93-95 PH]

"Moreover the analysis should evaluate the potential growth inducing effects of sweeping land use; zoning and code changes that could be replicated by other projects (e.g., Floor Area Ratio (FAR) and other variances). Such an analysis should also include an evaluation of the potential for the project to 'gentrify' the neighborhood thereby displacing existing housing and non-residential uses."

(Margarita Mena, September 23, 2010) [PC-115 PH]

"I am worried about if we are going to need to look for further housing, and so I don't know if this has been dealt with."

(Nella Manuel, September 23, 2010) [PC-130 PH]

"We need more affordable housing… I myself, I am afraid of displacement."

(Nella Manuel, September 23, 2010) [PC-131 PH]

"Where will they find housing? They will look to the surrounding neighborhoods where people like me are already struggling to find affordable housing. This will cause displacement of the low income residents already living in the Tenderloin."

(Mike Williams, September 23, 2010) [PC-138 PH]

"I would like to see folks in our neighborhood hired as part of this new project and, of course, I would like to see CPMC follow the City Special Land Use procedures with regard to building affordable housing. Why do I say that? Because they're taking away housing. They're taking away housing, they're taking away jobs that are already, that have existed there, and I would like to see that replaced."

(Jose Morales, September 23, 2010) [PC-166 PH]

"I think my feeling is that, ever since this corporation took over, California Medical Center took over the hospital, for me, it has been a disaster because they are only concerned with making a lot of money and in a town like ours, San Francisco, we need a lot of help because there are a lot of evictions, as you know, evictions for nothing, that's what makes it even harder and more painful to live in San Francisco."

Response PH-14

The comments discuss concerns regarding the displacement of residents within the surrounding neighborhoods of the existing and proposed CPMC campuses. Of particular concern is the potential displacement of residents in neighborhoods around the proposed Cathedral Hill Campus. One comment expresses concern regarding potential growth inducement related to land use changes associated with housing demand, induced employment, and gentrification.

The following response addresses potential effects on residents, including (1) a summary of renter protection ordinances in San Francisco that would reduce the risk of displacement; (2) a discussion of the effects of the process of gentrification; (3) displacement; (4) changes in use; (5) additional housing loss; and (6) evictions.

San Francisco Rent Control Ordinance and Tenant Protection

San Francisco currently follows a rent control and tenant protection ordinance to safeguard tenants from excessive rent increases.[42] The ordinance governs approximately 170,000 rental units citywide. Generally, these rent-controlled units were constructed before June 1979. According to the 2000 U.S. Census, approximately 196,000 rental units were constructed before 1980. Since 1980, the U.S. Census reported that a total of 18,269 renter occupied units have been constructed, only 8.5 percent of the City's reported rental stock of 214,385 units.[43] The rent control ordinance places limits on the amount of rent increases which can be charged by the landlord and on the reasons for evicting a tenant. For example, for the effective period of 2009–2010, the allowable annual rent increase amount was set at 2.2 percent. The average annual percent rent increase from 1992–2010 was approximately 2.3 percent, derived from the Bay Area Consumer Price Index.

The 190,000+ units are generally covered by rental control with only a few exceptions (e.g., the units are tied to federal subsidies, they are in a residential hotel, or they are dormitory units). The 196,000 units accounted for approximately 91 percent of San Francisco's rental housing stock in 2000. . This does not include subsidized units where rents are generally determined by the renter's income or by area median income by the income group being served. Those subsidized units are not at risk of rent spikes as their rents are guided by the affordable housing program or programs that subsidized the project. San Francisco's General Plan Housing Element does not provide a complete inventory of subsidized affordable housing units but estimates that San Francisco has approximately 21,700 federally subsidized affordable housing units and another 4,900 affordable housing units, constructed since 2000. Combined, over 90 percent of the rental housing supply in San Francisco is protected from rent spikes.

In summary, although new employment sources such as the proposed LRDP might create some marginal, localized housing demand, these impacts likely would be limited because of the dispersed nature of housing demand in relation to place of employment, and the risk of displacement would be further diminished because of the legal safeguards provided to renters in San Francisco. Thus, the proposed LRDP would not have any substantial effect on residential displacement around the proposed CPMC campuses.

[42] San Francisco Administrative Code, Section 37.3 Rent Limitations.
[43] U.S. Census Bureau, Census 2000 Summary File 3, Matrices H36, H37, H38, and H39.

Gentrification

The term "gentrification" refers to "the process of renewal and rebuilding accompanying the influx of middle-class or affluent people into deteriorating areas that often displaces poorer residents."[44] Gentrification is not a specific issue analyzed under CEQA but would broadly fall under Section 15064(e) of the State CEQA Guidelines, which calls for an evaluation of social and economic changes when those changes are linked to physical environmental effects, such as urban decay, displacement of substantial numbers of people, and/or inducement of population growth. Therefore, the issues surrounding the process of gentrification are best addressed in terms of the population and housing questions found in Appendix G of the State CEQA Guidelines and modified by the local lead agency, the San Francisco Planning Department. These issues are discussed below under Displacement, Change in Use, and Additional Housing Loss.

Displacement

Specifically, projects that generate significant impacts to population, employment, and housing can "displace substantial numbers of people, necessitating the construction of replacement housing elsewhere." Impact PH-3, Draft EIR page 4.3-43, presents an analysis of displacement impacts caused by implementation of the proposed LRDP. As noted within this impact analysis, the proposed LRDP would not displace significant numbers of people, as stated above. In addition, CPMC has been working on, and would provide for, the relocation of residential tenants in excess of that required by law. Tenants are being offered relocation assistance by CPMC.

As noted, the proposed Cathedral Hill MOB site contains 20 units that are designated as residential hotel units under Chapter 41 of the San Francisco Administrative Code, the Residential Hotel Unit Conversion and Demolition Ordinance. Section 41.12 requires a project sponsor to obtain a Permit to Convert from the City of San Francisco Department of Building Inspection (DBI) prior to demolishing a residential hotel unit. Prior to issuing a Permit to Convert, DBI must confirm that the project sponsor has complied with the 1:1 residential hotel unit replacement requirements of Section 41.13. Section 41.13(a)(4) allows a project sponsor to comply with the 1:1 replacement requirements through payment to the City of a fee equal to 80 percent of the cost of construction of an equal number of comparable units plus site acquisition cost, as determined by the City and County of San Francisco Real Estate Division on two independent appraisals.[45] The City and County of San Francisco Real Estate Division obtained the required appraisals and, by letter dated September 7, 2010, established the total fee for the residential hotel units as Two Million Six Hundred Eighty Four Thousand Eight Hundred Dollars ($2,684,800.00) ("Residential Hotel Unit Replacement Fee").[46] Therefore, a condition to DBI's issuance of the Permit to Convert, would be to satisfy the 1:1 replacement requirement of Section 41.13 by payment to the City of the Residential Hotel Unit Replacement Fee in accordance with the terms, timing and procedures set forth in Administrative Code Chapter 41.

Change in Use to Non-Residential Uses

As noted, the proposed Cathedral Hill MOB site contains a total of five dwelling units which would be demolished and the site would be developed into non-residential uses. Both the General Plan, including the Housing Element, and the Planning Code, contain a policy and regulatory framework to limit the loss of existing housing, and where it occurs, to provide for construction of new units in order to maintain the City's housing stock.

[44] Merriam Webster Online Dictionary, http://www.merriam-webster.com/dictionary/gentrification, 5-17-2011.
[45] David Tattersol & Co. Appraisal Report for 1030, 1034, and 1036 Geary Street, January 2010; Carneghi-Blum & Partners Replacement Cost Estimate, January 29, 2010.
[46] Replacement Cost Estimate Memo, John Updike, Assistant Director, Real Estate, City and County of San Francisco Real Estate Division, September 7, 2010.

In the preamble of the General Plan, two key Priority Policies relate to the protection and preservation of existing housing. Priority Policy 2 states “That existing housing and neighborhood character be conserved and protected in order to preserve the cultural and economic diversity of our neighborhoods,” and Priority Policy 3 states “That the City's supply of affordable housing be preserved and enhanced.” In the Housing Element, Objective 2 states that the City should “[r]etain the existing supply of housing.” Policy 2.1 states “Discourage the demolition of sound existing housing.” Policy 2.3 states that the City should “Restrict the conversion of rental housing to other forms of tenure or occupancy.” Policy 2.4 states that the City should “Retain sound existing housing in commercial and industrial areas,” and Policy 2.5 states that the City should “Preserve the existing stock of residential hotels.”

Planning Code Section 317 requires conditional use authorization for the demolition of three or more dwelling units. It does not require 1:1 residential unit replacement. However, CPMC has agreed to pay an in lieu fee to address demolition of the five residential units and consulted with the Mayor's Office of Housing ("MOH") to identify the appropriate in lieu fee methodology. MOH determined that (i) the in lieu fee amount was to be established based on the Citywide inclusionary housing fee schedule effective as of July 15, 2008; and (ii) as applied to the residential units. The total fee is One Million Four Hundred Fifty Three Thousand Eight Hundred and Twenty Dollars ($1,453,820.00) ("Residential Unit Replacement Fee") based on the following unit type and calculation: three one bedroom units ($248,210.00 x 3), one two bedroom unit ($334,478.00) and one three bedroom unit ($374,712.00). A condition to DBI's issuance of a demolition permit for the residential units would be payment of the Residential Unit Replacement Fee.

Tenants would be offered suitable units elsewhere. Therefore, the removal of these residential dwelling units and residential hotel units would not lead to a substantial displacement of residents, necessitating the construction of replacement housing elsewhere. The impact is considered less than significant because of the very small number of units involved compared to the size of the housing market in San Francisco and the Bay Area. The payment of the in-lieu fee by CPMC would further reduce the potential effect of the demolition of residential units, but is not directly tied to the determination of significance in this EIR. These same code provisions and plan policies would serve to discourage or prevent potential indirect loss of residential units in the future, resulting from changes in use.

Additional Housing Loss

One way that housing could be lost beyond that anticipated with the proposed LRDP would be if CPMC expanded further than is currently proposed in the LRDP. This would not be possible without future discretionary actions and approvals by the City. Further expansion of the institution would require an amendment to the CPMC Institutional Master Plan, which would be subject to City review and approval, and could only occur following a public hearing, a 6-month waiting period, and a subsequent CU authorization pursuant to Planning Code section 304.5. In the event that a future IMP would result in the loss or conversion of housing, it would require specific authorization by the Planning Commission which would have to find the proposal to be consistent with Housing Element Policy 11.4, which states that the City should “Avoid or minimize disruption caused by expansion of institutions, large-scale uses and auto-oriented development into residential areas.” Finally, any expansion of CPMC beyond the currently proposed LRDP would be subject to additional environmental review under CEQA.

Furthermore, direct displacement of substantial numbers of people from increased local employment activity would not occur under the proposed LRDP. Employee housing choices are regionally driven, as they are made with respect to workplace access as well as quality of life and housing affordability. As noted on Draft EIR page 4.3-11, this is demonstrated by approximately 49 percent of existing CPMC personnel currently living in San Francisco. Thus, the assumption that neighborhoods surrounding the campuses would be adversely affected by housing pressures is not supported by the evidence; see Response PH-10 (page C&R 3.5-39) for further discussion regarding commute behavior and housing

choice. Because employees generally decide where to live at a regional level rather than simply choosing to reside near their employer, effects on housing demand are likely to be experienced citywide and are not limited to areas surrounding each campus. Thus, the growth in employment at one campus and a decline at others would change housing demand across the entire City, rather than affecting housing demand in a specific neighborhood. Even if there would be increased demand for housing around the campuses, the San Francisco Rent Control Ordinance protects renters against unreasonable rent increases or evictions; see discussion above for further information regarding the San Francisco Rent Control Ordinance and tenant protection. Therefore, any population displacement generated from the indirect increase in housing demand due to establishing a new hospital would be less than significant.

It is important to note that to the extent that employment and housing demand projections contained in the Draft EIR are conservative, as is explained in Response PH-3 (page C&R 3.5-7), the evaluation of potential housing displacement due to increased housing demand is equally conservative. Please also see Responses PH-8 (page C&R 3.5-27) and PH-25 (page C&R 3.5-82) for discussions regarding housing demand and induced employment.

Evictions

Evictions are discouraged under San Francisco's renter protection ordinances. While they are possible in certain situations, safeguards are provided to renters in San Francisco to prevent displacement, including a "Just Cause" eviction ordinance that requires "no fault" evictions to pay relocation benefits to the displaced renter and includes an eviction process with tenant protections such as two eviction notices and the opportunity to challenge the eviction in court.[47] Eviction proceedings generally extend over 60 days if contested by the renter.

For all of the above reasons, the Draft EIR ultimately determined that residential displacement attributable to the proposed LRDP would be a less-than-significant impact.

Comments [Displacement due to Construction]

(Alex Bernstein, August 3, 2010) [3-1 PH]

"The site of the proposed hospital is behind my kitchen and my bedroom. I also rent out the unit above mine, which I'm told will go vacant when construction begins. The falloff in rent will cause me to default on my mortgage, and I will lose my home."

(Sheila Mahoney and James Frame, October 19, 2010) [88-7 PH]

"Recently renters on Duncan, San Jose, 27th and Guerrero have been moving out solely because they don't want to live in the middle of a construction zone. Owners aren't so lucky. We're stuck with homes that have become worthless and will remain so until CPMC's plans have been approved and executed, 20-some years from now. Personally Sheila has kept working so that we could pay for a lot of expensive deferred maintenance (like a new roof and paint job, stair repairs and utility porch replacement), before retiring. However, it doesn't make much sense putting good retirement money into a losing proposition. I know we are not alone in these considerations."

Response PH-15

The comment expresses concern about the impacts of construction of the proposed project on a private individual's property and the potential for subsequent loss in rental income due to the project that could result in mortgage default and foreclosure.

[47] See Section 37.9C (e)(1) of the San Francisco Administrative Code for a description of "Just Cause" eviction and Section 37.9A for a description of the "Just Cause" eviction process. San Francisco Tenants Union, *Evictions and the Evictions Process,* http://www.sftu.org/eviction.html, accessed January 13, 2010.

Exposure to construction activities is a common and unavoidable consequence of living in a dense urban community. The Building Code, in part, is intended to make sure that buildings are constructed safely, without undue adverse effects on adjacent structures and their occupants. Noise, vibration, dust, traffic disruption, and other by-products of the construction process are temporary in nature, lasting at times from days to months. Even for large projects such as those that would occur on the CPMC campuses over time, construction activity would move around the construction site and would occur immediately adjacent to a specific property, building, or window for only limited periods, not the entire construction period.

It is also important to note that, as explained elsewhere in this C&R document, the focus of an EIR is on adverse physical effects on the environment. A potential economic impact to an individual is not a physical impact on the environment. This issue may be a legitimate concern to affected parties and decision-makers, but they are not topics that are typically addressed in CEQA documents, which are focused on addressing physical effects on the environment from a proposed project.

Please see Response PH-14 (page C&R 3.5-53) for an explanation of why residential displacement around the proposed CPMC campuses is not anticipated as a result of the proposed LRDP.

In addition, please see Response NO-1 (page C&R 3.8-1) for a discussion of the potential construction noise effects on adjacent properties, and Responses NO-2 and NO-3 (pages C&R 3.8-2 and 3.8-3) which addresses comments regarding mitigation of construction noise.

Comments [Displacement/Demolition of Residential Uses Near Cathedral Hill Campus]

(Malcolm Yeung—Chinatown Community Development Center, October 18, 2010) [68-1 PH, duplicate comment was provided in 85-1 PH]

"On behalf of Chinatown Community Development Center, I submit comments to the Draft Environmental Impact Report of the California Pacific Medical Center Long Range Development Plan, Planning Department Case No. 2005.0555E (the "EIR"). Chinatown CDC builds community and enhances the quality of life for all San Francisco residents. Based in the Chinatown neighborhood, Chinatown CDC also serves other San Francisco neighborhoods, including North Beach and the Tenderloin. We are a comprehensive community development organization with many roles, serving as neighborhood advocates, organizers, planners, and as developers and managers of affordable housing.

Over the past year, Chinatown CDC has worked closely with the residential tenants of 1036 and 1054 Geary Street, both of which will be demolished to make way for the medical office building adjacent to the Cathedral Hill campus (the 'MOB'). Presently, six (6) households remain in these two buildings and the present project will certainly displace these remaining households, Unfortunately, all of these households are very-low to low-income and are among the most vulnerable to homelessness in San Francisco. The project sponsor must acknowledge this displacement impact as a significant.

All told, the proposed MOB will lead to the displacement of at least twenty-five residential units, twenty (20) of which are residential hotel rooms and five (5) of which are rental apartment units. Each of these units are significant housing resources to San Francisco residents, especially given that they have by and large served as de-facto affordable housing units to low-income San Franciscans. The demolition of these units as part of the MOB project will have a significant impact on San Francisco's housing stock and necessitate, either by legal mandate or by strong public policy considerations, replacement by the project sponsor.

While the project sponsor has initiated discussions with CCDC and residents to mitigate the impacts, they have not finalized any such plans and have not incorporated these plans formally into the project development. This DEIR, moreover, has not incorporated these any such plans as mitigations to Impacts PH1, PH2, and PH3. The DEIR, as a result, is deficient and must be amended before the City can approve it."

(Malcolm Yeung—Chinatown Community Development Center, October 18, 2010) [68-2 PH, duplicate comment was provided in 85-2 PH]

"Section 4.3, Impact PH-2 for Near-Term Projects/Cathedral Hill Campus (Demolition of 20 Residential Hotel Units and 5 Rental Housing Units): Determination of Significance Should Be 'Potentially Significant'

The MOB project will necessitate demolition of 20 single room occupancy residential hotel rooms (the 'SRO Units') and 5 rental apartment units (the 'Rental Units'). The displacement of these units will have a substantial impact on San Francisco's housing stock and, as a result, will necessitate construction of replacement housing. Consequently, the EIR should determine this impact to be 'Potentially Significant.'"

(Malcolm Yeung—Chinatown Community Development Center, October 18, 2010) [68-3 PH, duplicate comment was provided in 85-3 PH]

"The City of San Francisco has found that displacement of any residential hotel rooms constitutes a significant impact on the city's housing Stock. Section 41.3 of the San Francisco Administrative Code makes this point abundantly clear. Under this section, the City finds the following:

- there is a severe shortage of affordable housing (see subsection (a)),
- that residential hotel rooms to constitute a significant source of affordable housing (see subsection (c)), and
- that residential hotels are 'endangered housing resources and must be protected' (see subsection (f)).

Given this strong statement from the City, removal of even one SRO room constitutes a significant impact, necessitating construction of replacement units. This replacement obligation, in fact, has been codified under Section 41.13."

(Malcolm Yeung—Chinatown Community Development Center, October 18, 2010) [68-4 PH, duplicate comment was provided in 85-4 PH]

"The City has made a similar determination with regard to 'standard' rental housing stock. In short, both the City's General Plan and Section 317(a) of the San Francisco Planning Code find that 'existing housing is the greatest stock of rental and financially accessible residential units, and is a resource in need of protection.' In this instance, this statement is particularly true. The five apartment units slated for demolition presently house (or in the very near-past have housed) very-low to low-income households. As a result, the demolition of these 5 units constitutes demolition of de facto affordable housing. Given this statement of severe need for affordable housing, the demolition of these five units also constitutes a significant impact."

(Malcolm Yeung—Chinatown Community Development Center, October 18, 2010) [68-5 PH, duplicate comment was provided in 85-5 PH]

"While construction of replacement housing is not codified in this instance, public policy mitigates strongly in favor of such a requirement. This is particularly true in light of the fact that San Francisco fell far short of its affordable housing production goals between 1999 and 2006. This further points to the strong necessity to replace these unit, triggering a 'potentially significant impact.'"

(Malcolm Yeung—Chinatown Community Development Center, October 18, 2010) [68-6 PH, duplicate comment was provided in 85-6 PH]

"While the underlying basis for determining significance in this instance may be characterized as an economic or social impact (i.e., the negative impact on the city's affordable housing stock), economic and/or social impacts are in fact permitted considerations when tied to a physical change, such as demolition of housing stock. Section 15064(e) of Title 14 of the California Code of Regulations makes clear that the 'economic and social effect of a physical change may be used to determine that the physical change is a significant effect on the environment.' Here, the demolition (i.e., the physical change) will severely impact the city's stock of affordable housing (i.e., the social and economic impact), necessitating a determination of 'potentially significant impact.' As a result,

Impact PH-2 regarding the near term impact of the Cathedral Hill campus must be amended to reflect this determination."

(Malcolm Yeung—Chinatown Community Development Center, October 18, 2010) [68-7 PH, duplicate comment was provided in 85-7 PH]

"An alternative determination of 'Less than Significant with Mitigation Incorporated' is not yet justified. While the EIR discusses CPMC's replacement housing obligation under Section 41.13 of the SF Admin Code and CPMC's ongoing discussions with the SF Mayor's Office of Housing (MOH) around how to fulfill these obligation, CPMC has not proposed an actual concrete mitigation plan. The EIR merely discusses various 'options' that CPMC has raised with MOH but does not commit to them as proposed mitigations. Worse yet, the EIR includes absolutely NO discussion of how CPMC will mitigate the demolition impact of the 5 rental housing units.

Without actual proposed mitigations, the public cannot assess the degree to which the project will actually reduce the impact of the displacement of the 20 residential hotel units and 5 rental housing units."

(Malcolm Yeung—Chinatown Community Development Center, October 18, 2010) [68-8 PH, duplicate comment was provided in 85-8 PH]

"The EIR should determine that the displacement of six (6) tenant households from the Cathedral Hill MOB site is a 'Potentially Significant Impact.' Because all six (6) tenant households are all low to very low income and because there is a severe shortage of affordable housing in San Francisco, any displacement of low-income individuals must be considered significant. As with the PH-2 discussion, the EIR fails to identify concrete mitigation proposals so cannot qualify for a determination of 'Less than Significant with Mitigation Incorporated.'"

(Malcolm Yeung—Chinatown Community Development Center, October 18, 2010) [68-9 PH, duplicate comment was provided in 85-9 PH]

"Any demolition that causes displacement of low to very· low income households in San Francisco has a significant environmental impact. Because of the severe shortage of affordable housing identified above, the likelihood that displaced households will find suitable replacement housing in the area or even in San Francisco as a whole is very low. In fact, the decrease of low to very low income households between 2000 and 2006 in the project area is staggering, ranging between 45% to 58%. And while this impact is again economic and social in nature, as discussed above, economic and social factors (i.e., income level of displaced residents and unavailability of affordable replacement housing) can be used to determined the significance of any physical change [i.e., the demolition and resulting displacement). Moreover, any 'environmental effects of a project [that] will cause substantial adverse effects on human beings, either directly or indirectly' mandates a finding of significance (see Title 14, Cal. Code of Regs, Section 15065(a)(4). In this instance, the demolition will displace tenant households. Under any standard, displacement from one's home has a substantial adverse effect on a human being."

(Malcolm Yeung—Chinatown Community Development Center, October 18, 2010) [68-10 PH, duplicate comment was provided in 85-10 PH]

"As with Impact PH-2, an alternative determination of 'Less than Significant with Mitigation Incorporated' is not yet justified. The EIR states that 'CPMC would provide for the relocation of tenants needing assistance, in excess of that required by law' and that '[t]enants would be offered suitable units elsewhere under the oversight of the Mayor's Office of Housing and the Board of Supervisors' (see EIR, p. 4.3-43 to 4.3-44).

First, the EIR does not indicate whether CPMC has committed to any relocation plan as an environmental impact mitigation or whether CPMC has incorporated them into the Cathedral Hill project. And second, even if the CPMC had been incorporated them, as written the EIR does not provide sufficient detail to determine whether these proposed plans could sufficiently mitigate the impact. The relocation assistance proposal does not state what

'law' the plan will exceed so there is no way to determine from the EIR even the basics of the relocation plan. Moreover, there is no more detail regarding the proposal regarding MOH and the Board of Supervisor's oversight of the re-housing of the displacement households (not to mention any discussion of a concrete agreement reached by MOH or the BOS that they have agreed to such oversight).

As with PH-2, without actual, proposed mitigations, the public cannot assess the degree to which the project will reduce the impact of the displacement of the low-income tenant households."

(Gloria Smith—California Nurses Association, October 18, 2010) [93-26 PH]

"According to the DEIR, CPMC is continuing to work with the Mayor's Office of Housing to identify the best mechanism to meet the City's need to place the units lost and is evaluating a range of options. DEIR at pages 4.3-33. While the actual replacement number as a percent of total units in the City may be low, as a cumulative total for the income level these lost units represent, replacement units is a significant issue and as such should be a key element of the Project Description. In addition the location of these affordable units may render their loss even more significant as they are in a high-end neighborhood."

(Hisashi Sugaya, Planning Commission, October 15, 2010) [116-8 PH]

"Pg. 4.3-33. 3rd paragraph. How can an identified impact, in the case the loss of housing, be a less than significant impact when any of the five ways the loss can be mitigated as set forth in Section 41.13 (a) has not be[en] specifically identified? Tenant relocation is not one of the five methods."

(Lori Martins, September 23, 2010) [PC-241 PH]

"I do need to take this opportunity to speak for the residents who live above my business, as they have not settled. Two of them are 74-years-old, on fixed incomes, and have at this point in their lives no opportunity to earn more income. I would like to see CPMC ensure that they have a place to live for the rest of their lives."

Response PH-16

These comments state concerns about displacement of residents in existing units that would be demolished with implementation of the Cathedral Hill Campus, recognizing that all such units are considered affordable housing. The comments also request additional information about the replacement housing that would be provided by CPMC

For purposes of evaluating potential significant impacts as part of a Draft EIR, the City of San Francisco does not consider meeting requirements of ordinances and statutes to be mitigation issues. Rather, the City presumes that all projects must adhere to local ordinances and statutes. In the case of units that would be demolished to implement the proposed LRDP at the proposed Cathedral Hill Campus, the City views the potential effect as less than significant because CPMC would be required as a matter of law to follow City ordinances and statutes that would address demolition, housing relocation, and replacement.

Section 41.13 of the San Francisco Administrative Code requires that any demolished residential hotel units be replaced on a 1:1 basis and provides various mechanisms for compliance by the project sponsor, including constructing or causing to be constructed comparable units, payment of an in-lieu fee to the City, or provide a contribution to a public entity or non-profit who will use the funds to construct comparable units (CPMC would also follow Section 317, "Loss of Dwelling Units through Merger, Conversion, and Demolition," in the San Francisco Planning Code, which prescribes required Planning Commission review for granting permits for demolition and replacement of residential units).

The process that CPMC has undertaken to date is as follows. As properties were purchased by CPMC for site assembly, during the years 2003 to 2009, all tenants were advised of CPMC's intentions to demolish the buildings. In mid-2009, approximately 1 year before CPMC's earliest anticipation of approval

hearings, CPMC began formal communication with residential tenants about relocation and invited a non-profit tenant advocacy organization, Chinatown Community Development Center (CCDC), into these communications.

To provide the site for medical office space to support the physicians who would admit patients to the proposed Cathedral Hill Hospital, CPMC purchased seven properties along Geary Street between Van Ness Avenue and Polk Street, with the intent to demolish these properties. As shown in C&R Table 3.5-4, three of these properties, 1030, 1034-36, and 1054-56 Geary Street, contained a total of 25 residential units (with fourteen 1030 Geary Street residential units vacant on purchase) as follows:

C&R Table 3.5-4
Existing Residential Occupancy at Cathedral Hill

Property	Units	Occupied Units on Purchase
1054-1060 Geary Street	4 Apartments + commercial	4
1034-1036 Geary Street	6 Residential Hotel Units, 1 apartment + commercial	6
1030 Geary Street	14 Residential Hotel Units + commercial	0 (vacant on purchase)

Source: Memorandum from Geoffrey Nelson, AICP, California Pacific Medical Center, to Cameron Mueller & David Reel (AECOM), re: Relocation of tenants in 1034-1036 Geary Street (September 22, 2011).

Over the past year, CPMC met with tenants and offered relocation services and relocation financial assistance. These relocation services included a private social worker and a leasing specialist, to help with the process and identify other appropriate publicly-available supportive services as well as translation assistance.

CPMC worked with tenants to develop a relocation financial assistance package that establishes a market rate differential for the existing unit as compared to a comparable replacement unit, and multiplies that differential by 78 months. The relocation financial assistance package also includes standard moving and relocation costs, such as credit check fees and security deposit. Several households have used the available resources for apartment searches, landlord negotiations, and moves to new places of residence, all within San Francisco.

As of September 2011, CPMC has reached agreement with all ten of the residential households. CPMC has assisted several households with apartment searches, landlord negotiations, and moving, all within San Francisco. Eight of the ten residential households have relocated and the remaining two have agreed to move out in early 2012.[48]

Because of the small number of units involved compared to the size of the housing market in San Francisco and the Bay Area, as well as for the reasons described above, the Draft EIR concludes that the proposed LRDP would not result in a significant impact because of residential displacement.

Notwithstanding the replacement efforts discussed above, according to the California Department of Finance, approximately 365,000 housing units exist in San Francisco.[49] The proposed units account for approximately 0.007 percent of the total housing supply and less than 0.5 percent of the units currently

[48] Memorandum from Geoffrey Nelson, AICP, California Pacific Medical Center, to Cameron Mueller and David Reel (AECOM), re: Relocation of tenants in 1034-1036 Geary Street (September 22, 2011).
[49] California Department of Finance, 2009, *E5 County and State Population and Housing Estimates.*

under construction.[50] The residential hotel units represent approximately 0.1 percent of the estimated residential hotel supply in San Francisco, estimated at approximately 19,120 residential rooms.[51]

For more information related to the capacity of the housing stock in San Francisco to accommodate affordable housing demands potentially generated by employment from the proposed LRDP, please see Response PH-7 (page C&R 3.5-22). For a discussion of historic housing production, please see Response PH-7 (page C&R 3.5-22).

3.5.1.10 HOUSING MITIGATION

Comments [General Housing Mitigation]

(Bernard Choden, September 20, 2010) [13-2 PH, duplicate comments were provided by Jennifer Clary of San Francisco Tomorrow in 14-2 PH and 38-2 PH]

"Demonstrated means of mitigation of the long-term impacts of each development on the affordability of housing, community services and business: As economic speculation weakens community diversity, the developer and city is obliged to apriori provide a means of sufficient committable resources and means. The onus of institutionalizing such salutary means lies with the city and not with those affected by the negative impacts."

(Bernard Choden [incorrectly shown as Sherman in transcript], September 23, 2010) [PC-10 PH]

"Demonstrating means of mitigation of the long term impacts of each development as the effective affordability of housing, community services, and businesses. And economic speculation weakens community diversity. The onus of institutionalizing such salutary means lies with the City and not with those affected by the negative impacts."

(Gloria Smith—California Nurses Association, October 19, 2010) [90-75 PH]

"Other measures that must be analyzed in a revised EIR include:

A commitment to build housing for the workforce at one or more of the Project sites. Total units should be based on a nexus study or other detailed study of actual Project-related housing demand and jobs-housing fit analyses.

A revolving loan fund at no interest toward the building of new affordable units in the Project areas and/or rehabilitation of existing units by community non-profits,

An additional revolving loan fund at no interest to rehabilitate local area housing with specific attention to leveraging other funding to increase the energy efficiency of these units (thereby saving residents on energy bills and reducing greenhouse gas and air quality emission),

Creation of a 'Coalition Advisory Committee' (and specialized technical subcommittees on housing, energy efficiency and other issues). Among the considerations of the Committee should be to support local community land trust that would help to provide affordable housing in the Project areas and a rental assistance program for low-income staff and workforce."

[50] San Francisco Planning Department, 2010 (June), *Housing Element Part II: Objectives & Policies*, City and County of San Francisco, available: http://www.sf-planning.org/, accessed September 3, 2010.

[51] San Francisco Planning Department, 2010 (June), *Housing Element Part II: Objectives & Policies*, City and County of San Francisco, available: http://www.sf-planning.org/, accessed September 3, 2010.

(Gloria Smith—California Nurses Association, October 19, 2010) [93-69 PH]

"**Feasible Mitigation Measures to Address Significant Housing Impacts Including Unmet Demand for Affordable Housing:** The DEIR does not identify any mitigation measures because it finds that project-related and cumulative impacts associated with housing to be less than significant. DEIR at pages 4.3-21 to 4.3-42. As described above, these conclusions are based on incomplete and flawed analyses. A revised DEIR must include feasible mitigation measures to reduce and/or eliminate significant housing, housing affordability, housing supply, jobs-housing balance and jobs-housing fit impacts."

(Gloria Smith—California Nurses Association, October 19, 2010) [93-70 PH]

"Such measures generally include but are not limited to replacement housing on or off site for units demolished as well as for units required under the City's policies and regulations (e.g., Van Ness Avenue Area Plan (VNAP) regulations requiring development of residential square footage for each square foot of non-residential uses); impact fees and other means of generating financing for housing affordable to the workforce."

(Gloria Smith—California Nurses Association, October 19, 2010) [93-71 PH]

"The Project applicant should also consider entering into a Community Benefits Agreement with affected community residents and stakeholders and set forth enforceable benefits that could also be relied on to mitigate project housing impacts. Other measures that should be considered include: A commitment to build housing for the workforce on one or more of the Project campus sites. Total units should be based on a nexus or other detailed study of actual Project-related housing demand and jobs-housing fit."

(Gloria Smith—California Nurses Association, October 19, 2010) [93-72 PH]

"• A revolving loan fund at no interest toward the building of new affordable units in the Project areas and/or rehabilitation of existing units by community non-profits working in collaboration with a 'Coalition Advisory Committee' (see below). The size of the loan fund must be sizable enough to substantially address the full impacts of the Project particularly on affordable housing demand. As an example, a revolving loan fund of approximately $20 million over 5 years would allow for the creation or preservation of about 200 units of affordable housing, with the fund providing acquisition and/or construction loans for rehabilitation, new construction or preservation of existing subsidized properties at risk of converting to market."

(Gloria Smith—California Nurses Association, October 19, 2010) [93-73 PH]

"• An additional revolving loan fund at no interest could be established to rehabilitate housing in the areas surrounding the campuses, with specific attention to leveraging other funding to increase the energy efficiency of these units (thereby saving residents on energy bills and reducing greenhouse gas and air quality emissions)."

(Gloria Smith—California Nurses Association, October 19, 2010) [93-74 PH]

"• Creation of a "Coalition Advisory Committee" (and specialized technical sub-committees on housing, energy efficiency and other issues). Among the considerations of the Committee should be to support local community land trust that would help to provide affordable housing in the Project areas and a rental assistance program for low-income staff and workforce."

(Barbara Berwick, September 23, 2010) [PC-333 PH]

"In terms of the housing situation, it turns out that there is a building down on Van Ness, this way, that used to belong to AAA, and I think, for the City to produce a revenue bond to buy that building, rezone it, and put apartments in there, is certainly feasible, but it would be better if CPMC did it since they got that sucker, and it got rezoned for residential rentals, to accommodate that portion of the section that people are talking about with respect to providing housing for the people that work at their hospital stay in."

(Commissioner Olague, September 23, 2010) [PC-398 PH]

"Any institution should be responsible for mitigating the impacts of increased housing demand on the City, and that burden of providing for increased housing demand on the City shouldn't be placed on the shoulders of San Francisco. So, I think that's why it's important to really re-examine the conclusion that there are no significant impacts around housing, which I believe the EIR seems to conclude as it relates to the housing impacts of this project."

Response PH-17

The comments state that the EIR should identify a range of mitigation measures for housing, including (1) housing units at affordability levels to meet the demand from the project workforce, (2) revolving funds to support the construction and rehabilitation of affordable units, (3) the creation of an advisory committee to support affordable housing in the vicinity of the campuses, (4) the replacement of demolished units, and (5) the creation of community benefits in adjacent neighborhoods. One comment also states that the EIR should re-examine the conclusion regarding no significant impact around housing.

As is described in Response PH-10 (page C&R 3.5-39), and in light of current housing location data discussed in Response PH-4 (page C&R 3.5-13), the Draft EIR concluded that housing demand generated by the proposed project would not result in increased demand in specific neighborhoods. Rather, any effect would be spread out over the City and the region based on a complex set of factors that drive individual housing location choices. Under CEQA, mitigation measures are required where an adverse physical environmental effect is determined to be a significant impact. In the case of the proposed project's effects on population, employment, and housing, the Draft EIR did not identify any significant impacts, and, thus, there is no specific identification of mitigation measures that would be required under CEQA.

Housing Demolition and Replacement, and Resident Relocation

Compliance with existing ordinances and regulations is not considered mitigation. Rather, the City appropriately assumes compliance with such requirements. To the extent that such requirements avoid potential impacts or lessen potential impacts to a less-than-significant level, no mitigation is required. A relevant example of this involves the loss of five dwelling units and 20 residential hotel units demolished as a result of the construction of the Cathedral Hill MOB. San Francisco Administrative Code Section 41, Residential Hotel Unit Conversion and Demolition requires replacement of all lost residential hotel units, and San Francisco Planning Code Section 317, Loss of Dwelling Units through Merger, Conversion, and Demolition, requires the issuance of building permits for replacement structures prior to the granting of a demolition permit for residential units. Because these requirements are enforced as a matter of course in the City of San Francisco, the loss of dwelling and residential hotel units is considered less than significant. See further discussion of this issue on page 4.3-33 of the Draft EIR.

Housing Demand

Under Impact PH-2, the Draft EIR concluded that the effect of the LRDP on the creation of significant new housing demand that would require the construction of new housing to be less than significant for individual campuses and for the LRDP on an overall basis. The primary factor in making this determination was the ability of the incremental increase in housing demand created by the LRDP to be accommodated within the existing vacant capacity of rental housing in the City, the capacity of housing units in the pipeline, as well as the capacity for additional housing to be created in the City over the life of the LRDP (see Impact PH-2, Draft EIR pages 4.3-32 to 4.3.43). Because the impact is identified as less than significant, no mitigation is required under CEQA.

In addition, to further respond to concerns regarding housing demand, the project sponsor has committed to make a contribution at least equivalent to the fee that would be required under the City's Jobs-Housing Linkage Program, (although the JHLP fee does not apply to the project) It is anticipated that the contribution to the Mayor's Office of Housing would be incorporated into the conditions of approval or a mutually approved development agreement for the proposed project, if the project is approved. CPMC and the City have been in negotiations regarding the terms and conditions of a development agreement, that would, among other things, provide certain assurances and benefits, subject to the terms and conditions of the development agreement, with respect to the delivery of health care services. Please see Section 3.23.1.2 "Development Agreement" on page C&R 3.23-43 for additional details regarding the development agreement. While the Draft EIR does not identify a significant impact to housing that would require mitigation, this contribution would support the production of housing in San Francisco.

The funds contributed by CPMC would be used by the City to facilitate the production of housing in San Francisco. One comment stated that the residential conversion of the building on Van Ness Avenue that formerly housed the Automobile Association of America could be a project that could be undertaken by CPMC or funded by the CPMC contribution. The conversion of this building to residential uses has not been proposed by CPMC, the City, or any other party. If the proposed project is approved, any funds contributed by CPMC for the purposes of supporting the production of housing in San Francisco would be under the control of the City, which will determine the most appropriate and cost-effective way of using the contributed funds to support the production of housing that would meet the needs of existing and future San Francisco residents.

Hence, for all of the reasons discussed above and in the Draft EIR (e.g., City Code requirements that the project sponsor replace any demolished residential hotel and apartment units; City's housing capacity, vacancy rates, projections and pipeline of new housing projects, City's existing affordable housing production programs), the Planning Department believes that the EIR is correct in its conclusion that the proposed project would not have a significant adverse housing impact. The Planning Department believes that the project sponsor's proposed contribution of funding to support the production of housing in San Francisco as a condition of project approval further supports this conclusion.

Comments [Housing Mitigation Near Cathedral Hill Campus]

(Alan Wofsy—Emeric-Goodman Associates, September 20, 2010) [26-7 PH]

"The significant and unavoidable impacts are costs that are imposed on others by the owner and developer of the project. The Planning Commission and the EIR should be able to quantify those costs and require the developer of the project to compensate the victims of the impacts. In the case of the Emeric-Goodman Building, the developer should be required to rent any vacant residential or commercial units as a result of the negative impacts from the project and/or to compensate the tenants for the impacts during the construction process. The rationale for the compensation of costs imposed by the project on others is analogous to the compensation being paid by BP to the victims of the Gulf oil spill."

(Malcolm Yeung—Chinatown Community Development Center, October 18, 2010) [68-15 PH, duplicate comment was provided in 85-15 PH]

"Finally, the project sponsor must propose a mitigation to address the potentially significant impact of the population growth induced by the CPMC project. Towards this end (and as with residential hotel units), the existing area land use controls provide ample guidance on what that mitigation must be. CPMC must comply with the Van Ness SUD residential to non-residential production requirements or substantially fulfill that requirement."

(Linda Chapman, October 19, 2010) [76-11 PH, duplicate comment was provided in 111-11 PH]

"Housing Mitigation:

Housing impacts near a Cathedral Hill campus (or in neighborhoods easily accessible by transit) can be reduced, but not eliminated, by relocating some proposed operations to the existing campuses, thereby reducing staff concentration at one problem site. The area plan's intent to meet housing requirements within SUD boundaries cannot be met for a development like CPMC (even environmentally preferred Alternative 3). Van Ness Plan policies for affordable housing must be adapted to mitigate development-else the Cathedral Hill project must not proceed. CPMC has the option to build hospital facilities on existing campuses, or to accept requirements applied to development of the Van Ness Corridor for decades since adoption of the area plan. Mitigation through payment for new housing construction must be required at ratios reasonably related to VNAP objectives. Both rental and for-sale housing should be produced, taking into consideration needs generated by CPMC for its own staff. Funding non-profit developments on the many in-fill sites in Polk Gulch, Tenderloin, and South of Market should be the priority. New construction and the rehabilitation of needed housing (such as SROs) in districts where non-profits can acquire structures or infill sites can partly mitigate impacts from altering the permitted use and housing ratio mandated for the Van Ness Corridor. One of the few advantages of an institutional use is the opportunity to direct funding to below-market ownership and rental housing. Because this developer has no objective to profit from housing, the ratio of below-market units does not affect project feasibility like the ratio of affordable to market-rate units in for-profit residential development. It is therefore appropriate to fund a high proportion of rental housing and plan other units for sale at 'affordable' rates. Requirements to contribute substantial housing elsewhere must be imposed in return for exemptions from policies limiting the Van Ness Corridor to residential construction. Funding needed housing and amenities like parks in surrounding areas could in part mitigate the more intense environmental and economic impacts of nonresidential development, when they cannot be eliminated. (However, housing contributions cannot obviate efforts to reduce significant neighborhood impacts like traffic and noise.) Funding predominantly affordable housing and green spaces could justify reducing the VNAP 3:1 ratio for housing (the minimum required in for-profit residential-commercial development). A rationale to reduce the 3:1 ratio would be funding housing types that the private market does not support (e.g., SROs, studios, apartments with "efficiency" kitchens suited for one or two occupants).

VNAP objectives to produce affordable housing, with high-density small units (two bedrooms or less), can be met-- in substance-- by means not specified in the area plan: Fund a large number of small units, for construction or rehabilitation by non-profit developers, outside the SUD. As a proxy for the 3:1 square foot ratio imposed for residential-commercial construction in the Van Ness Corridor, this alternative can efficiently produce and manage housing for long-term affordability.

A community proposal for Nob Hill Senior Housing exemplifies how funding that multiplies community benefits can justify reducing the 3:1 ratio predicated on market-rate housing. Numerous infill sites for affordable housing can be identified in the vicinity of Polk Gulch: Among them, in a neighborhood lacking community facilities is an abandoned church with adjacent parking lot, suitable for a senior housing development to incorporate space for community activities and a senior center or children's program. Tenderloin Neighborhood Development Corporation will evaluate the proposal for low-income housing and community amenities. An identified funding source could encourage the property owner to reconsider a previous stalled development plan."

(Gloria Smith—California Nurses Association, October 19, 2010) [93-51 PH]

"CPMC is working with the Mayor's office on a plan to replace housing demolished by the Project, most likely through fees rather than construction of units."

(Nella Manuel, September 23, 2010) [PC-132 PH]

"To prevent this, we must demand that CPMC follows the Van Ness Area Plan requirements to build affordable housing. By following this plan, it will ensure that my community will have adequate affordable housing and not be displaced."

(Nella Manuel, September 23, 2010) [PC-135 PH]

"To solve this, CPMC must build more affordable housing so that people can live near where they work. This is why the Van Ness Area Plan is important. Do not approve this project, Commissioners, until CPMC agrees to give the community what it wants. Thank you."

Response PH-18

The comments state that the proposed LRDP should include mitigation for housing impacts in the neighborhoods around the Cathedral Hill Campus. In particular, comments state that the project should comply with the requirements of the Van Ness Avenue Plan and/or the Van Ness Avenue Special Use District. The comments also suggest that the proposed project should provide a variety of types of housing, including affordable rental and for-sale housing, as well as providing other community benefits such as additional open space in the nearby neighborhoods. Finally, the comments also request compensation for any construction-caused vacancies in the Emeric-Goodman Building.

As is discussed in Response PH-17, above, the Draft EIR did not identify significant housing impacts at the citywide or neighborhood level, and thus there is not a requirement for the identification of mitigation measures. Nevertheless, in order to further ensure that any potential effects on housing demand are offset, the project sponsor has proposed making a contribution to the Mayor's Office of Housing at a level that is equivalent to the payment required if the City's Jobs-Housing Linkage Program fee applied to the LRDP.

Van Ness Special Use District

The VNSUD provides that non-residential uses must provide residential space at a 3:1 residential/non-residential ratio for any "net new" occupied area unless this ratio is reduced or its applicability changed through provisions in Planning Code section 243(c)(8)(B)(iv) that allows the Planning Commission to modify the 3:1 requirement based on certain findings. These findings include, among others: (i) taking into consideration projects constructed since the effective date of the VNSUD and the housing development potential remaining in the District, and finding that the overall objective of adding a substantial increment of new housing on Van Ness Avenue will not be significantly compromised; (ii) the project provides space for an institutional, medical, cultural or social service use meeting an important public need which cannot reasonably be met elsewhere in the area; and (iii) housing cannot reasonably be included in the project.

With respect to housing potential the following information is provided: The effective date of the VNSUD is 1988 (VNSUD added by ordinance December 16, 1988 Since that time, 988 housing units have been constructed and another 538 are actively in the pipeline.[52] Per the 1987 Environmental Impact Report for the Van Ness Avenue Master Plan (of which the Van Ness Special Use District comprises the largest part), the future development potential of the VNSUD was identified as approximately 2,028,000 gsf, or approximately 2,190 units.[53] By this measure, approximately 45 percent of the residential potential for the SUD has already been achieved (988/2,190) and another 25 percent (538/2,190) is in the pipeline. By the original potential estimate, only 674 more units need be constructed to reach full anticipated build-out. By even the most conservative standards, the remaining potential in the district exceeds this number by almost 4 times (2,565/674).[54] It should also be noted that the 1987 EIR identified criteria by which the City determined whether a site within the Van Ness Avenue Area was "soft" (i.e., susceptible to

[52] Planning Department report on remaining development potential in the Van Ness SUD, per email correspondence from Teresa Ojeda, Planning Department to Ken Rich, Mayor's Office of Economic Development re: Van Ness SUD Housing Analysis (Feb. 3, 2011).
[53] Van Ness Avenue, Master Plan Final Environmental Impact Report.
[54] Planning Department report on remaining development potential in the Van Ness SUD, per email correspondence from Teresa Ojeda, Planning Department to Ken Rich, Mayor's Office of Economic Development re: Van Ness SUD Housing Analysis (Feb. 3, 2011).

development under the VNAP); using those criteria, the Cathedral Hill Hospital and 1375 Sutter MOB sites were not considered potential housing sites.[55]

For a discussion of the relationship of the proposed Cathedral Hill Campus to the 3:1 residential-to-commercial requirements of the Van Ness Special Use District, please see Response LU-21 (page C&R 3.3-95).

Community Benefits

For a discussion of community benefits that may be included in the development agreement, please see Response PH-19 (page C&R 3.5-69).

Construction Caused Vacancies

As is addressed in Response PH-15 (page C&R 3.5-56) and in Response PH-23 (page C&R 3.5-79), construction is a periodic activity that is part of the normal course of activity in a major city like San Francisco. Construction effects, including those that are described taking place near the Emeric-Goodman Building, are temporary in nature, using different types of equipment at different locations on a project site, and are not expected to create long-term disturbances that would be expected to cause long-term vacancies. Thus, such effects would be unlikely to create long-term problems that could create physical environmental effects requiring mitigation.

Comments [Community Benefits]

(Linda Chapman, October 20, 2010) [76-13 PH, duplicate comment was provided in 111-13 PH]

"Measures that directly reduce economic impacts for neighborhood businesses are not easy to identify. Mitigation could include funding to improve pedestrian experiences on shopping streets beyond project perimeters, but near enough for businesses and residents to experience impacts. Neighborhood residents, and visitors from beyond the Van Ness and Polk residential/commercial districts, would increasingly frequent the two shopping areas if street environments were more inviting. Sidewalk beautification for the Van Ness and Polk commercial corridors (greening and attractive street furniture) would enhance pedestrian environments.

Funding for small parks and plazas in a neighborhood that offers no recreational open space could transform underused public land in Polk Gulch alleys, and some underutilized commercial sites, to outdoor living rooms. Pedestrians would be encouraged by opportunities to pass public art or green space that would relieve the experience of a dense urban environment.

Public spaces located in shopping areas would attract people to meet out of doors, relax with food or reading matter, gather for scheduled performances. Sites to create significant open space we re-identified in public alleys, and at large lots with minimal private improvements (one by the intersection of Polk and Geary; two adjacent lots close to Polk on the California Street cable car line)."

(Gloria Smith—California Nurses Association, October 19, 2010) [93-75 PH]

"A Community Benefits Agreement can also provide a useful vehicle to mitigate for parking, traffic, energy, air quality and other impacts associated with the Project."

[55] VNAP FEIR, page 58: "These existing buildings are generally large and contain businesses which maintain strong economic activity (e.g. Cathedral Hill Hotel, Holiday Inn, Regency Theater) and, based on past and projected economic trends, are not expected to be demolished for new construction or converted to another use."

(Stephanie Barton, et al.—Hastings Civil Justice Clinic for the Good Neighbor Coalition, October 19, 2010) [104-45 PH]

"5. The **DEIR** fails to address the impact of the project on the quality of life **in** the Tenderloin.

The project's Cathedral Hill Campus development will impede the Little Saigon Report's goals of making the Tenderloin more livable and viable for development. It will create an influx of traffic into the areas surrounding the hospital and medical building, including the Tenderloin. The Little Saigon Report found that the speed of the high traffic volume currently endangers pedestrians and lowers the neighborhood's quality of life.[107] The project must ensure it will be a benefit to the neighborhood. Without inclusion of appropriate transportation and circulation mitigation measures, project impacts could push a struggling, largely low-income neighborhood into a downward spiral of urban decay and deterioration.[108]

[107] Little Saigon Report, at 3-3.
[108] See Bakersfield Citizens for Local Control v City of Bakersfield, 124 Cal. App. 4th 656, 697"

Response PH-19

The comments state that the project should provide community benefits in neighborhoods around the Cathedral Hill Campus in order to offset adverse effects on the businesses and quality of life in these neighborhoods. The types of community benefits mentioned in the comments include creation or improvement of open spaces, sidewalk and other streetscape improvements, public art, and circulation improvements. The comments also state a concern about adverse effects of traffic on the Tenderloin/Little Saigon neighborhood.

These comments suggest belief in several design and funding considerations that could increase the economic viability of commercial uses in the vicinity of the proposed Cathedral Hill Campus. As noted in Response PH-22 (page C&R 3.5-76), the potential economic effects of the proposed LRDP are not expected to result in significant environmental impacts under CEQA and would not necessitate implementing mitigation. These comments do not raise issues regarding the adequacy, accuracy, or completeness of the Draft EIR. The comments will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project.

CPMC has proposed to establish a fund to contribute to the City's possible future implementation of some or all of the following types of neighborhood community benefit improvements in the vicinity of the near term projects proposed for Cathedral Hill, including in the Little Saigon neighborhood, and in the vicinity of Davies and the St. Luke's campuses. CPMC and the City have been negotiating a proposed development agreement, which as of publication of this C&R document includes conditions related to these improvements. Please see Section 3.23.1.2 regarding the proposed content of the development agreement. By way of example, the proposed funds could be applied to the following types of improvements:

- Corner pedestrian bulb-outs,
- Pedestrian lighting,
- Colored Concrete "safe passages" pathways,
- Sidewalk widening and curb repairs or improvements,
- Landscape,
- Median extensions,
- Undergrounding utilities, and/or
- Select changes in one-way to two-way streets (such as on Ellis and Eddy Streets).

Under the proposed terms, CPMC would not be seeking environmental clearance for these improvements, since they are not part of the Project, nor are these improvements required as mitigation for any impacts

of the Project. The City would be responsible for obtaining future environmental clearances and for the design, scheduling and construction of the improvements and for any necessary supplemental funding. The City would have sole authority to determine whether to proceed with the Tenderloin and Little Saigon neighborhood area improvements and to issue required permits and authorizations. The City would also retain the discretion to modify or select feasible alternatives to the improvements to avoid any identified impacts or concerns that arise in connection with their further review, including any required environmental review under CEQA. Please also see Response TR-126 (page C&R 3.7-220).

The comments about the levels of traffic and pedestrian safety in the Little Saigon neighborhood reflect a concern about existing conditions which would not be substantially affected by the proposed project. Extensive analysis was conducted that examined the potential effects of the proposed project on traffic and pedestrian conditions in the Tenderloin, Polk Gulch, and Little Saigon. As described in Response TR-124 (page C&R 3.7-207), the Draft EIR transportation analysis assumed that traffic would use the roadways in the Tenderloin neighborhood consistent with trip distribution methodology in the *SF Guidelines*. The results of those evaluations are that overall, the increase in vehicle and pedestrian travel demand associated with the proposed Cathedral Hill Campus project would not be expected to result in perceptible effects on vehicle and pedestrian conflicts in the Tenderloin-Little Saigon neighborhood. Please also see Response HC-12 (page C&R 3.23-91) for a discussion of traffic and pedestrian safety in the Tenderloin and Little Saigon neighborhoods.

While the Draft EIR trip distribution assumptions are reasonable for the EIR analysis, and consistent with trip distribution methodology in the *SF Guidelines*, a sensitivity analysis was conducted to determine what effect, if any, would be generated if a higher percentage of motorists traveling to the proposed Cathedral Hill Campus from Superdistrict 1, Superdistrict 3, and the freeway were to use alternate routes, primarily through the SoMa and Tenderloin, rather than those assumed in the Draft EIR. (The sensitivity analysis was prepared for informational purposes only; therefore, the trip distribution used in the Draft EIR was not changed because the analyses remains reasonable and accurate.)[56] The results of that analysis illustrated that should the proposed Cathedral Hill Campus increase vehicle trips through the Tenderloin neighborhood study area,that could increase the number of conflicts between vehicles, pedestrians, and bicyclists, this increase would not result in significant impacts. Although the impacts on pedestrians (Impact TR-40 identified in the Draft EIR) were determined to remain less than significant, even under this supplemental analysis, as part of the community benefit contributions described above, the project sponsor would provide funding for the further study, analysis, planning and possible implementation of additional streetscape, pedestrian, and related improvements in the vicinity of the proposed LRDP campuses. This would provide funding for the improvement to the pedestrian and bicycling environment. Please also see Response TR-124, page C&R 3.7-207).

The issue of traffic circulation and pedestrian safety in the Tenderloin, Polk Gulch, and Little Saigon is discussed at some length in several responses to comments in section 3.7 Transportation of this Comments and Responses document. In particular, Response TR-63 (page C&R 3.7-110) provides discussion of the potential effect of the proposed project on pedestrian safety. Response TR-64 (page C&R 3.7-119) provides a discussion of traffic circulation effects. Response TR-83 (page C&R 3.7-152) addresses parking conditions in the neighborhood. Responses TR-124 and TR-125 (pages C&R 3.7-207 through 3.7-214) explain the analysis and conclusion of the supplementary transportation study, and Response TR-126 (page C&R 3.7-220) addresses the Tenderloin-Little Saigon Neighborhood Transportation Plan.

[56] *Supplemental-Sensitivity Transportation Impact Analyses for the California Pacific Medical Center Cathedral Hill Campus in San Francisco, CA*", which is located in Appendix E of the C&R document.

3.5.1.11 EFFECTS ON COMMERCIAL USES

Comment [Effects on Japantown]

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-124 PH, duplicate comment was provided in 30-124 PH]

"If Japantown gets overrun by hospital visitors, even the regulars who used to shop at Japantown will not visit it as often and business in Japantown will be negatively impacted."

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-133 PH, duplicate comment was provided in 30-133 PH]

"I think this will take away from the business from Japantown, a cultural center. I also think the same thing will occur at the other 2 addresses for the local merchants near them."

(Bob Hamaguchi—Japantown BNP Organizing Committee, October 12, 2010) [47-2 PH, duplicate comment was provided in 50-2 PH]

"The risks to Japantown as a cultural resource arise from actions that will damage the financial viability of the merchants who form the core of Japantown, which is the oldest of three remaining Japantowns in the United States. These merchants, and their customers, are critical contributors to this historic and cultural resource."

(Barbara Kautz—CHNA and Bernal Heights Neighborhood Center, October 19, 2010) [87-53 PH, duplicate comment was provided in 108-53 PH]

"The DEIR also has not analyzed impacts on Japantown, as referenced in the email sent to the City on October 8, 2010 by the Japantown BNP Organizing Committee."

(Hiroshi Fukuda, September 23, 2010) [PC-163 PH]

"But this is a very important issue for us because it could mean the economics of our ability of Japantown merchants, and they need to also consider seriously to phase the project so that the medical office building could be developed and the parking space used there, initially, and that way decrease the impact."

Response PH-20

The comments raise questions about the effects of the proposed Cathedral Hill Hospital and Campus on the vitality of businesses in Japantown, and the related effect of those business effects on the cultural integrity of Japantown. The comments specifically address concern about adverse effects on Japantown businesses due to excessive traffic and increased use of parking spaces, decreasing accessibility of Japantown businesses by their customers.

These comments address social and economic effects that are relevant under CEQA only insofar as they suggest a linkage between the proposed project and an adverse physical environmental effect, or to the extent that they provide a measure of the significance of an adverse physical environmental effect.

Retail Demand in Japantown and Its Urban Decay Potential

The surrounding demographic characteristics and corresponding retail purchasing power are relatively strong around San Francisco's Japantown. According to ESRI Business Analyst online, approximately 81,000 residents with average household incomes of approximately $98,000 are within a 2-minute drive time radius of the Japan Center. Furthermore, the daily population around Japantown is expected to increase with construction of the proposed Cathedral Hill Campus (estimated at approximately 9,600

persons), which could result in an increase in daytime spending and, therefore, benefit local businesses and commercial spaces in the area.

The proposed LRDP is projected to have a San Francisco jobs multiplier of 1.35.[57] Therefore, for every one job generated at one of the CMPC campuses under the proposed LRDP, an additional 0.35 indirect or induced jobs would be generated in San Francisco. While many of these jobs will be scattered throughout the City, a share of these indirect and induced jobs would likely be captured in the surrounding commercial areas because of increased business activity generated under the LRDP. In short, Japantown has strong surrounding retail market demographic conditions that would be expected to remain relatively unchanged and likely to benefit from increased activity at the proposed Cathedral Hill Campus. Thus, it is highly unlikely that the proposed LRDP would lead to long-term, permanent, and widespread commercial vacancy or other adverse economic impacts on Japantown.

Traffic and Parking in Japantown

The Draft EIR contained analyses of traffic and parking effects in and around Japantown. The conclusion of the analyses was that the traffic increases on streets in Japantown would be modest and would not adversely affect levels of congestion, and that parking effects also would not be material. CPMC has indicated that it does not intend to lease any more parking spaces than are currently leased in the Japan Center Garage. The modest effects on Japantown circulation would be unlikely to result in any material adverse effects on the business climate in Japantown. There are several responses in section 3.7 Transportation of this C&R which discuss traffic and parking impacts in Japantown. Please see Response TR-22 (page C&R 3.7-44) for a discussion of Japantown parking, Response TR-56 (page C&R 3.7-93) for a discussion of the CPMC shuttle including service to the Japan Center Garage, Response TR-76 (page C&R 3.7-146) regarding the continued future use of the Japan Center Garage, Response TR-86 (page C&R 3.7-154) regarding the analysis of traffic and parking conditions in Japantown, and Response TR-129 (page C&R 3.7-227) for an overview of the analysis of transportation effects in Japantown.

Comments [Medical Monoculture]

(David Mardis, October 17, 2010) [61-1 PH]

"I've worked at a community clinic in the Tenderloin for the past two years, and I feel that more medical resources in that area are, even with the fine print, a good thing. However, I believe that when it comes to healthy, vibrant communities, there's more to be considered than just sound, traffic and pollution studies. I think a hugely important question is will a sense of "Community" with a capital "C" be sustainable if such a gigantic structure is to be erected?

In reading the Cathedral Hill Neighbors Association and Unitarian Universalist CPMC Task Force letters, both of which I support, the thing that worried me the most about the current proposal being reviewed was summed up by the phrase 'Medical Monoculture,' or something to that effect. I've already applied to nursing school; I want to be a nurse, and it wouldn't surprise me in the least if I were to end up working in or near this hospital. However, if I were to work there, I would hope that the hospital would be deeply tied into the Community - not existing apart from it. If we consider the word "environment" from a broad, all-encompassing perspective, which I think we should, then I think that it's readily apparent that the current proposal would not maintain an environment that fosters Community.

In this day and age, with the socioeconomic gap growing ever wider, with people spending entire weekend afternoons on Twitter instead of talking to the person next to them at the bus stop, Communities are as fragile as

[57] Economic Planning Systems, *Regional Multipliers for CPMC Economic Impacts*, Memorandum from Rebecca Benassini and Tepa Banda, EPS to Geoffrey Nelson and Alan Loving, CPMC, March 23, 2011, Table 1, page 3.

ever. All neighborhoods, and this one in particular, need special consideration to help maintain the sense of human connection that make this city so great. That at least is this San Franciscan's humble opinion."

(Carol and Michael Stack, October 18, 2010) [62-4 PH]

"The sheer magnitude of the project will overwhelm the neighborhood's infrastructure: the character of the neighborhood, especially its local restaurants, will have to change entirely to meet the needed extra demand and its residents will be accordingly disadvantaged in terms of using local facilities for meals. Chain restaurants, such as Burger King, and other chain-owned operations will likely move in to service additional demand. Is it City policy to encourage chain store restaurants at the expense of locally owned dining facilities?"

(Paul Wermer—CPMC Neighbors Coalition and Pacific Heights Residents, October 18, 2010) [67-11 PH]

"The DEIR fails to adequately address potential land use changes as existing business are displaced by hospital focused businesses. In the case of 'destination' NCDs, this may have a significant negative effect on the NCD; in the case of neighborhood serving businesses key neighborhood services may be displaced."

(Linda Chapman, October 20, 2010) [76-12 PH, duplicate comment was provided in 111-12 PH]

"Economic impact of development at Van Ness and Geary on neighborhood retail and services. Impacts that a hospital 'monoculture' can have on the economy of surrounding neighborhoods require attention. Based on observations elsewhere, neighbors and merchants suggest that staff and visitors to a hospital and its medical office buildings will purchase subsidized food, instead of walking to restaurants and other local food vendors. From family experience, I expect a hospital's subsidized public food service to take some local customers for convenience meals away from small businesses. Hospital visitors and staff are expected to generate less retail traffic for the Polk Gulch/Van Ness shopping districts, where small businesses were patronized by guests of a hotel the project would supplant.

(Barbara Kautz—CHNA and Bernal Heights Neighborhood Center, October 19, 2010) [87-38 PH, duplicate comment was provided in 108-38 PH]

"2. Indirect Land Use Changes.
A large hospital, such as is proposed at Cathedral Hill, typically attracts numerous similar uses, such as additional medical and medical-related uses (as at "Pill Hill" in Oakland)."

(Barbara Kautz—CHNA and Bernal Heights Neighborhood Center, October 19, 2010) [87-41 PH, duplicate comment was provided in 108-41 PH]

"None of these potential land use changes induced by the Long Range Plan have been addressed in the DEIR."

Response PH-21

The comments state concern about the creation of a "medical monoculture" near the Cathedral Hill Campus, and related concern regarding potential displacement of existing local businesses. The comments further state that the proposed project could trigger an expansion of chain restaurants in the vicinity of the LRDP campuses. The comments also state a concern that the hospital population will spend dollars at businesses internal to the campus and not support such uses in the local neighborhood.

There is no evidence in the record to support the statements and suppositions made in the comments. The question of whether a major medical facility or health care campus attracts medical businesses to the exclusion of other business types can be readily understood by examining the business pattern around existing facilities. AECOM surveyed businesses around three major health care campuses to collect data on business type and pattern. The surveys were conducted at the CPMC California campus, the CPMC Pacific Campus, and the UCSF Parnassus Campus, and involved walking surveys of commercial uses located within a two-block radius of the CPMC campuses. For the UCSF Parnassus campus, the survey

was extended to three blocks to better capture nearby commercial corridors. C&R Table 3.5-5, page C&R 3.5-74, presents the results of the surveys.

The data collected in the survey indicate that a plethora of retail and service businesses operate in the vicinity of all campuses. For most retail or service categories, the vast majority of the businesses were local, independent entities; a very limited number of chain businesses were found in the commercial corridors near these major hospitals. The only retail category that seemed to be dominated by chains was coffee shops where more than half of all such businesses around the CPMC campuses were chains. Thus, there is no evidence to support the statement that the proposed LRDP would lead to an expansion of chain businesses near campus locations; in fact, the evidence shows that independent businesses thrive in the business climate near major health care campuses in San Francisco.

C&R Table 3.5-5

[2] Survey of businesses within a three block radius of campus.
[3] "Services" represents the number of buildings that contain services. Many of the buildings contain multiple service businesses.
Source: AECOM, March 2011

Furthermore, there is also no evidence that validates the concern that the expansion of existing or creation of a new health care campus as proposed under the LRDP would lead to the development of a medical monoculture in the local business community. Again, to the contrary, the evidence suggests that a portion of the service industry around the campuses will ultimately accommodate medical uses and related services, but not to the degree that the demand for such uses will restrict the ability of non-medical uses to operate successfully. As presented in C&R Table 3.5-6, page C&R 3.5-75, in the survey of three existing health care campuses in San Francisco, the percentage of services that contained medically-oriented uses in the blocks surrounding the campus ranged from less than 10 percent to around 35 percent; thus, a majority of the businesses around these campuses remain non-medical.

C&R Table 3.5-6
Survey of Service Uses in Medical Campus Neighborhoods

Business Type	CPMC California Campus[1]				CPMC Pacific Campus[1]				UCSF Parnassus Campus[2]			
	Total	Medical	Non-Medical	Medical %	Total	Medical	Non-Medical	Medical %	Total	Medical	Non-Medical	Medical %
Services[3]	38	13	25	34.2	55	9	46	16.3	29	2	27	6.7

[2] Survey of businesses within a three block radius of campus.
[3] "Services" represents the number of buildings that contain services. Many of the buildings contain multiple service businesses.
Source: AECOM, March 2011

Finally, there is no evidence in the record to support the conclusion that food services located within the future LRDP campuses would "out compete" food services in the neighborhoods surrounding the campuses. In fact, based on the count of such businesses in the neighborhoods, prepared food services located within the health care campus represent less than 25 percent of the prepared food businesses in the local neighborhood (see C&R Table 3.5-7, page C&R 3.5-75).

C&R Table 3.5-7

The comments are noted. The comments address primarily social and economic concerns. The comments will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project.

Comments [Other Effects on Businesses near Cathedral Hill Campus]

Other Effects

(Carolyn Abst and Ron Case—Case + Abst Architects LLP, October 19, 2010) [102-34 PH, duplicate comment was provided in 114-34 PH]

"H. Because we will be in a hospital zone parking for our clients will be very difficult and deter clients from coming."

(Linda Chapman, October 20, 2010) [76-27 PH, duplicate comment was provided in 111-27 PH]

"Economic impacts of traffic congestion and noise for small businesses and the already stressed NCO require consideration. As the pedestrian environment declines, customers from outlying neighborhoods can take their business elsewhere."

Compared to housing development, proposed rezoning for institutional use can be predicted to generate low customer traffic for neighborhood businesses. The Van Ness Area Plan would allow construction for hundreds of residents on the land proposed for a hospital and related uses."

(Lower Polk Neighbors, October 19, 2010) [103-37 PH, duplicate comment was provided in 113-37 PH]

" d. Displacement of local retail businesses with medical-related businesses

i. The economic fabric of the Polk Street at Geary area is a mix of convenience stores, liquor stores, bars, porn shops, clubs, and restaurants. Interspersed are community centers such as the Bay Area Addiction Research and Treatment center and the San Francisco AIDS Foundation Needle Exchange program office. Geary Street near the CHC site is home to hotels, gyms, a theater, and restaurants, such as Mel's Diner. The introduction of the hospital has the potential to bring new businesses, particularly those which will serve a daytime professional population and the hospital industry. As new businesses arrive it is important that the local community benefit from the economic activity and continue to preserve small scale, local business.

ii. Interim Phase:

1. Use of tented alley(s) to establish interim community centers:

a. Medical clinic with temporary, planter box medicinal herb garden
b. Soup kitchen
c. Farmers Market
d. Shelter gathering space or street game area
e. Outdoor movie house
f. Mobile community garden
g. Afterschool programs
h. Pop-up retail pods in shipping containers or other portable architecture

iii. Long-term Phase:

2. Permanent medicinal herb garden
3. Community garden to grow produce for local community shelters
4. Permanent table and seating areas for outdoor eating; closure of alleys to serve as outdoor cafes lanes, similar to the ongoing practice in the Financial district

(Dina Hilliard, September 23, 2010) [PC-51 OTH]

"Hi. Is this okay? Hello, Commissioners. I deeply appreciate this opportunity to speak before you today. My name is Dina Hilliard and I am a 12-year resident of the Tenderloin. I am also the Associate District Manager for the North of Market Tenderloin Community Benefit District. We are a core member of the Good Neighbor Coalition. The proposed CPMC development at Cathedral Hill is something that has concerned residents of the Central City for several years now, and the Good Neighbor Coalition formed as a way to directly address these concerns. We began our work at the coalition by serving over 800 Central City residents in five languages, who spoke loud and clear of their priorities and concerns regarding the proposed development."

Response PH-22

The comments regard anticipated impacts on surrounding merchants and businesses as a result of proposed LRDP construction. Specific concern is raised regarding (1) the effects of increased congestion and on-street parking on neighborhood businesses, (2) the comparative retail demand created by hospital uses compared to residential uses, (3) the effects of the proposed project on economic development in the vicinity of the Cathedral Hill Campus, and (4) the effects of the proposed project on educational and economic opportunities for youth.

Congestion Effects on Neighborhood Businesses

The supposition that higher levels of street traffic would have adverse effects on local businesses is not supported by evidence in the record. To the contrary, anecdotal observation suggests that the highest value retail stores in San Francisco are in the vicinity of Union Square where street traffic is high and congestion is common. Further, the evidence strongly suggests that higher levels of traffic are desirable to retailers. More specifically, the Journal of Property Management reported on a survey that concluded that "the more exposure a center has, the better the chances of having 'stop by' business. Thus, 47.9 percent of the respondents felt it 'very important' and 45.7 percent felt it 'somewhat important' to have high traffic counts at the center they chose."[58]

As such, the supposition that there would be adverse effects on businesses due to additional traffic on commercial streets in the neighborhoods around the proposed Cathedral Hill Campus is not supported by evidence.

Retail Demand Generated by Housing and Non-Housing Uses

The comments included statements regarding the comparative effects on nearby businesses of residential and non-residential uses. To understand the economic effect of land use decisions requires an examination of the spending patterns of people as residents and as workers. According to the California Board of Equalization, in 2009 the average California resident spent approximately $8,100 on retail goods and food services.[59] Converting from per capita retail expenditures to per household expenditures by applying the average household size in San Francisco results in average per household expenditures of approximately $18,200, and applying the 1.37 workers per household factor means that retail expenditures were approximately $13,200 per worker in a household (not adjusting for income).

Generally, people spend more near their place of residence than at their place of work. The International Council of Shopping Centers (ICSC, 2004) performed a survey of workers to understand their spending behavior near their work. Workers averaged from $2,950 to $3,290 per year near the place work, depending on the retail offerings available at their place of work.[60] Adjusting for inflation, workers would spend roughly from $3,450 to $3,850 per year. Thus, if roughly $3,900 a year of a worker's spending potential occurs near its place of work, then the remaining $9,300 is spent in other locations. The vast majority of the remaining purchasing power is spent in the proximity of their residence. In other words, there is a positive local purchasing power correlation, on average, in converting employment uses to residential uses so long as the residential densities are relatively similar to the employment densities of the subject property.

As it pertains to the Cathedral Hill Campus, according to Table 4.3-10 of the Draft EIR (Draft EIR page 4.3-16), it is conservatively estimated that the proposed LRDP would increase employment on the site from approximately 760 workers today to approximately 4,790 workers in 2015 and approximately 5,380 workers in 2030. Assuming approximately $3,900 per worker, this would translate into total worker retail spending in nearby neighborhoods of approximately $2,964,000 under existing conditions, rising to approximately $18,681,000 in year 2015 and $20,982,000 in year 2030. This future level of local area retail spending is the equivalent of approximately 2,000 residential units in year 2015 and approximately 2,250 in year 2030.

---

58 Smith, Charles A., Lloyd N. Garbarino, and John Martini. "Analyzing the leasing criteria of retail tenants." Journal of Property Management, Institute of Real Estate Management Audience, Nov-Dec, 1992, v57, n6.

59 California State Board of Equalization, Research and Statistics Section, *Taxable Sales In California (Sales & Use Tax) During 2009,* Forty-Ninth Annual Report, *Table 1. Statewide Taxable Sales, By Type Of Business, 2009,* California, 2009.

60 International Council of Shopping Centers (ICSC), *Office Worker Retail Spending Patterns*, New York, 2004, pp. 104-106.

Under the current land use designations, the three sites in the Cathedral Hill Campus have the capacity to accommodate up to 753 units, which would generate local area spending of $7,002,900 per year.[61] This level of local area spending would be approximately $12,000,000 to $14,000,000 per year less than under the proposed LRDP uses.

The above analytical exercise is based upon reasonable assumptions and was undertaken to be fully responsive to the questions raised in the comments. However, the requirement under CEQA is that an EIR evaluate the adverse physical effects of the project in light of the existing conditions that exist today. While the information provided above may be of interest and use to the public and the decision-makers, it is not relevant to the adequacy of the EIR.

Project Effects on Local Economic Development

Concerns about local economic development typically relate to the potential for additional jobs for area residents. As is described in more detail in Response PH-26 (page C&R 3.5-90), as part of its proposed LDRP, CPMC would enter into a "First Source Hiring Program" agreement with the City of San Francisco, pursuant to Chapter 83 of the Administrative Code. The purpose of the program would be the creation of employment opportunities for qualified San Francisco residents. These jobs would be available to and convenient for residents of neighborhoods around the LRDP campuses, including the neighborhoods around the Cathedral Hill Campus.

Effects on Education and Economic Opportunities for Youth

Issues related to education and economic opportunities for youth are social and economic issues that are relevant under CEQA only insofar as they link a proposed project to an adverse physical environmental effect or they provide a measure of the magnitude of such an impact (also see Response INTRO-7 (page C&R 3.1-17). The commenter provides no evidence that the proposed LRDP would impact educational and economic opportunities for young people in a manner that would or could result in a physical change to the environment, or that would provide a measure of the magnitude for a related physical environmental impact, and thus consideration of such issues in the Draft EIR is not required under CEQA.

Comments [Construction Effects On Businesses In Neighborhoods]

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-52 PH, duplicate comment was provided in 30-52 PH]

"Parking spots that used to exist for nearby merchant visitors or for residents near Polk Street, Cedar and Sutter Street, e.g. will be eliminated. How are these merchants supposed to attract customers during and after the CPMC construction project?"

[61] Under the existing SF Planning Code the Cathedral Hill Hospital and MOB sites are designated RC-4 about which the Code allows "[d]welling at a density ratio not exceeding one dwelling unit for each 200 square feet of lot area; provided, that for purposes of this calculation a dwelling unit in these districts containing no more than 500 square feet of net floor area and consisting of not more than one habitable room in addition to a kitchen and a bathroom may be counted as equal to ¾ of a dwelling unit." Based on this density limitation, the maximum units allowable on the 105,733 square foot Cathedral Hill Hospital site would be 529, and the maximum units allowable on the 36,180 square foot Cathedral Hill MOB site would be 181. The 1375 Sutter MOB is designated N-4 with a maximum allowable density of "[o]ne dwelling unit for each 600 sq. ft. of lot area." Based on this limitation, the 25,800 sq. ft. site could accommodate 43 units. In all cases, these are theoretical maximums that would be limited by site-specific constraints, the need to provide parking, etc. and thus represent conservative assessments of the residential development capacity of the Cathedral Hill Campus site.

(Bob Hamaguchi—Japantown BNP Organizing Committee, October 12, 2010) [47-9 PH, duplicate comment was provided in 50-9 PH]

"How long will it take for Japantown business to recover from customers that may have been discouraged from patronizing their businesses due to lack of parking during construction?"

Response PH-23

The comments express concern regarding impacts on surrounding merchants and businesses as a result of proposed construction at CPMC campuses. Specific concern is raised regarding the potential effects on business due to loss of on-street parking during construction.

The comments address primarily social and economic concerns which are relevant under CEQA only insofar as they provide a linkage between the proposed project and a physical environmental effect, or represent a measure of the significance of a physical environmental effect. These comments do not raise issues regarding the adequacy, accuracy, or completeness of the Draft EIR. These comments may be considered by the decision-makers as part of their deliberations on the project.

The comments raise questions about the effect of the construction activities on the economic performance of businesses in the vicinity of the CPMC campuses which would experience construction under the LRDP. It is important to note that while the comments raise questions about effects on businesses and express concern about a temporary loss of customers during construction, they do not expressly identify a connection between those potential effects and physical environmental effects. Further, the commenters opinions are unsubstantiated, and do not include or refer to substantial evidence that supports the concern about business effects.

One of the ways that an economic impact can be connected to a physical impact is through economic forces that can lead to blight or urban decay. In this case, it is not the financial or economic consequences on businesses that are relevant under CEQA, but the potential that increased competitiveness or business disruption can lead to long-term or permanent vacancies, which can in turn lead to deferred maintenance or building abandonment causing urban decay (e.g., unkempt grounds and graffiti that mars the visual environment, deterioration of historic structures, etc.). The analysis, therefore, needs to determine if the project would negatively impact commercial space to the point of causing long-term or permanently vacant commercial space, and not allow for a potential shift in the type of business that could occupy a given space but would continue to result in viable non-residential buildings. Temporary changes to building vacancy rates, or changes in lease terms, are primarily economic issues and are not considered significant environmental factors under CEQA.

Construction Project Case Study

Construction of the San Francisco Federal Building (Federal Building) is a useful comparison to the proposed CPMC project in terms of the effect of building construction on surrounding long-term vacancy rates in the central areas of San Francisco. According to project architects Morphosis, the Federal Building occupies a 605,000-square-foot space on a 2.1 acre site.[62] Construction of the Federal Building took place from 2003–2007. Using U.S. Postal Service (USPS) vacancies data, aggregated by the U.S. Department of Housing and Urban Development (HUD),[63] it is possible to compare vacancies in the

[62] http://morphopedia.com/projects/san-francisco-federal-building. Accessed December 22, 2010.

[63] The U.S. Department of Housing and Urban Development (HUD) partners with the U.S. Postal Service (USPS) to provide a database of addresses identified by the USPS as having been "vacant" or "No-Stat" in the previous quarter. These addresses are aggregated at the Census Tract level, represent the universe of all addresses in the United States, and are updated every 3 months. No-Stat addresses represent abandoned properties or those under construction.

census tract surrounding the Federal Building during the time of construction to vacancies in the same tract after the time of construction.[64]

After the first quarter of 2006, USPS recorded an 11.1 percent vacancy rate in the area around the Federal Building.[65] This vacancy rate included all addresses, including commercial, residential, and institutional. Three years after construction of the Federal Building, after the first quarter of 2010, USPS recorded an 8.66 percent vacancy rate in the area around the Federal Building.

In terms of the length of vacancies, the area around the Federal Building does not vary significantly from San Francisco as a whole. By the first quarter of 2010, 28 percent of vacancies were vacant for 36 months or longer in the area around the Federal Building, compared to a 25 percent average in San Francisco.

The experience of the area around the Federal Building suggests that construction projects in San Francisco do not create substantial long-term vacancies that result in physical urban decay or major displacement. Although differences exist between the area around the Federal Building and the Cathedral Hill neighborhood, the relevant experience around the Federal Building suggests that the strong property market in San Francisco leads to short-term vacancies, if any, during and following the completion of construction projects.

In summary, little evidence suggests that the proposed LRDP would result in long-term or permanent vacancies in surrounding and nearby non-residential buildings that would result in lasting urban decay. Although the financial performance of local businesses might be positively or negatively affected during construction, theses individual cases would not result in a physical change that would lead to indirect environmental impacts.

3.5.1.12 EMPLOYMENT MITIGATION

Comments

(Gloria Smith—California Nurses Association, October 19, 2010) [93-84 PH]

"**Feasible Mitigation Measures to Reduce or Eliminate Potentially Significant Environmental Impacts:** The DEIR does not identify any mitigation measures to address employment impacts because it finds that Project-related and cumulative impacts associated with employment to be less than significant. DEIR at page 4.3-31. A revised DEIR must include feasible mitigation measures to reduce or eliminate employment related impacts to transportation, housing and air quality, such as measures that would draw new employees from the local workforce. In addition to housing related measures (see list above), mitigation measures should consider all of the following:

1. Creation of a Local Apprentice Employment Program that involves training and other strategies to maximize the number of local entry-level opportunities for area residents in both service and construction jobs that lead to middle-income careers.

2. Establishment of a Local First Source Policy to promote the hiring of local journey-level workers (in a community agreements agreement and the development agreement).

3. Creation of a small business assistance program and funding for small businesses in the project areas that exist and could provide secondary services (to reduce the impacts of a multiplier).

[64] Vacancies refer to addresses that delivery staff on urban routes have identified as being vacant (not collecting mail) for 90 days or longer.

[65] The area around the Federal Building is defined as Census Tract 176.01.

Response PH-24

The comment suggests that the implementation of employment mitigation measures could reduce or avoid significant impacts on certain environmental resources, including transportation, air quality, etc. The comment identifies that the hiring of employees that live near the campus sites would reduce housing demand, and transportation and other-related effects, and suggests specific measures that could be put in place.

As is described in the Chapter 4.3 of the Draft EIR and elsewhere in this section of the C&R document, the expansion in employment associated with the proposed LRDP, in and of itself, would not create significant impacts that require mitigation. Separately, the Draft EIR included assessments of the transportation, air quality, noise and other impacts that are affected by employment levels at the proposed project. Where feasible mitigation for these effects exist, they are identified in the Draft EIR and clarified further in this C&R document.

While mitigation for significant employment impacts are not identified in the Draft EIR, as part of its proposed LDRP, CPMC would enter into a "First Source Hiring Program" agreement with the City of San Francisco, pursuant to Chapter 83 of the Administrative Code. The purpose of the program would be the creation of employment opportunities for qualified San Francisco residents. These jobs would be available to and convenient for residents of neighborhoods around the LRDP campuses, including the neighborhoods around the proposed Cathedral Hill Campus. This program would have the effect of facilitating CPMC employment of residents of San Francisco including nearby neighborhoods with concomitant environmental benefits. Please see Response PH-26, page C&R 3.5-90, for a discussion of the proposed hiring programs.

3.5.1.13 INDIRECT AND INDUCED ECONOMIC IMPACTS

Comments

(Gloria Smith—California Nurses Association, October 19, 2010) [90-55 PH]

"The DEIR failed to account for the additional indirect employment (based on a reasonable multiplier) generated by Project construction. As a result, net new demand for housing will likely be even greater."

(Gloria Smith—California Nurses Association, October 19, 2010) [93-62 PH]

"1. The DEIR fails to account for the additional indirect employment (based on a reasonable multiplier) generated by the construction component of the Project. As a result, net new demand for housing will likely be even greater. Table 4.5-29 provides an indication of the workers by general phase/shift. Total construction should provide a basis for applying a multiplier to determine the housing need for this element of the Project in a revised analysis."

(Gloria Smith—California Nurses Association, October 19, 2010) [93-80 PH]

"**Indirect and Project-Induced Jobs:** The impact of the proposed project on the local, regional, and even state economies is greater than the total of direct spending and direct job creation. This economic ripple effect is typically measured in an 'input-output' economic model such as IMPLAN. While these models have historically been used to describe the economic benefits of projects, they are increasingly being used in DEIR's to analyze the full job generation potential of projects and therefore the full environmental impact of projects. The multiplier effects for the proposed uses likely range from a minimum of .5 or ½ additional new job for every job created to over 1.4 under commonly applied models. Of course employment multiplier effects can vary depending on the specific types of jobs being created. The redevelopment of the St. Luke's campus may not result in as high a multiplier due to the fact a medical facility already exists and so do complimentary services in the area. However

the multiplier for a new hospital at the Cathedral Hill site could mean that a higher multiplier effect is warranted because of the introduction of a brand new facility in an area that may lack complementary services. A revised DEIR must re-analyze the multiplier based on the specific types of jobs generated by the Project and produce a revised analysis of impacts to employment, population and housing, jobs-housing balance, jobs-housing fit, traffic, greenhouse gas emissions and air quality impacts among other impacts.

A typical multiplier based on what is known about the Project would suggest that the DEIR has grossly underestimated indirect and induced jobs by a significant number. A recent Oregon Study found that the average physician in Oregon supported 14 to 48 total jobs or 25 total jobs on average. While some of those jobs are reflected in other employee categories for the Project (e.g. staffing on site) some are not and would be created off-site in support services and other jobs. A university of Kentucky Study of Rockcastle Hospital and Respiratory Care Center concluded that for every hospital job, an additional .48 jobs were created in the local economy. Not only must a revised DEIR include analysis of the impacts of all jobs – indirect, Project-induced, construction, but the multiplier should be applied to construction as well as facility jobs by classification and salary."

(Gloria Smith—California Nurses Association, October 19, 2010) [93-81 PH]

"Moreover, depending upon the location of all net new jobs (including induced and indirect), revised impact analyses for traffic, air quality, urban decay, housing demand, jobs-housing fit, and greenhouse gas emissions impacts is required. These new jobs have the potential to significantly increase the impacts of the Project as well as to influence the mitigation measures necessary to reduce or eliminate Project-related and cumulative impacts."

Response PH-25

The comments state that the employment projections do not include the indirect and induced employment generated from the proposed LRDP, nor the construction employment-related housing demand, and request that the analysis be re-conducted including those employment figures. The comment cites a study of a hospital in Kentucky and that the study indicates a very high employment multiplier for hospital jobs. Further, the comments state that revisions are necessary to the traffic, air quality, GHG, urban decay, and housing-related impact analyses.

The following response discusses the conservative methodology used to determine employment growth at the CPMC campuses in San Francisco, which conservatively internalize housing demand of many workers that might already work and live in San Francisco. The response also addresses the indirect and induced jobs generated as a result of the proposed LRDP and its corresponding household formation effects in San Francisco. Furthermore, the response provides a discussion of construction workers and their potential to generate localized housing demand in San Francisco.

Conservative Approach to Internalizing Employment Growth

The employment growth estimates in the population and housing section of the Draft EIR conservatively assume that one hundred percent of the new personnel locating to the proposed Cathedral Hill, Pacific, St. Luke's, and Davies Campuses beyond those relocating from other campuses would be net new personnel to San Francisco that would generate additional housing demand in San Francisco and the Bay Area overall. By treating all of the workers who are not simply transferring from one CPMC campus to another as net new employment, i.e., all except for the employees that are existing CPMC employees or affiliated employees that would simply be shifting their CPMC location of workplace, the proposed LRDP is extremely conservative in its assessment of environmental impacts and overstates the housing demand anticipated to be generated under the proposed LRDP. For example, if there are employees in a privately owned and operated laboratory renting space near the California campus who in the future relocate their laboratory into the Cathedral Hill MOB, those employees are treated as net new employees to San Francisco, when in fact it is likely that they are currently both employees and residents of San Francisco, conditions that would not change with a simple move from a private leased space to space in a building

owned by CPMC. For more information regarding the conservative nature of the employment estimates, please see Response PH-3 (page C&R 3.5-7).

Indirect and Induced Employment Generation

Several comments request that the EIR provide a precise estimate of indirect and induced employment generation. In this context indirect employment generation would be the jobs created by the direct purchases of goods and services in the San Francisco marketplace by CPMC. Induced employment generation would be the jobs created from the expenditures by CPMC employees on goods and services in the marketplace.

For a variety of reasons, it is not reasonable to attempt to depict detailed estimates of indirect and induced employment from projects in CEQA documents. First, each type of business has unique characteristics for employment making precise estimation of indirect and induced employment not practical. Further, and more important, the cumulative analyses contained in the Draft EIR are based on projections of regional growth. These projections capture all residential and employment growth in the Bay Area, and provide the basis for analyses of cumulative transportation effects, air pollutant emissions, greenhouse gas emissions, traffic noise generation, and demand for public services and infrastructure. Since regional growth is incorporated into these cumulative analyses, the environmental effects associated with indirect and induced employment growth have been described in the Draft EIR.

Nevertheless, in order to be as responsive as possible, the following information about "the multiplier effect" is provided. Regarding housing demand by indirect and induced employees, an analysis was performed to determine the indirect and induced job generation in the City by implementing the proposed LRDP. This economic impact analysis indicated that the proposed LRDP is expected to have a jobs multiplier of approximately 1.35.[66] In other words, for every one new job generated from the proposed LRDP, an additional 0.35 jobs would be created elsewhere within San Francisco. These additional jobs would be created as CPMC employees would spend money on goods and services in the local economy. A share of these employees would form households in San Francisco: approximately 190 additional households by 2015, and approximately 250 additional households by 2030. The new household generation was estimated as follows:

- The proposed LRDP employment projection estimates 1,800 additional employees by 2015, and 2,380 additional employees by 2030 (see Table 4.3-10 'Projections of CPMC Full-Time Equivalent Personnel and Share of Citywide Employment" in the Draft EIR, page 4.3-16.).

- The current draft indirect and induced economic multiplier for CPMC in San Francisco is 1.35. Thus, indirect and induced employees would conservatively total 630 by 2015, and an additional 833 by 2030.

- With 500,968 jobs in San Francisco and 211,939 residents working in the city, 42 percent of all jobs in the city are held by San Francisco residents (LEHD 2008). Applying this assumption to indirect and induced employees as a result of CPMC would result in 266 employees by 2015 and 352 employees by 2030 who would choose to live in San Francisco.

- Using an employed residents per household factor[67] of 1.37,[68] household formation totals 191 households by 2015 and 253 households by 2030.

[66] Economic Planning Systems, *Regional Multipliers for CPMC Economic Impacts*, Memorandum from Rebecca Benassini and Tepa Banda, EPS to Geoffrey Nelson and Alan Loving, CPMC, March 23, 2011, Table 1, page 3.

[67] This ratio is the number of employed persons per household, containing an employed person. Households that do not contain an employed person are excluded from the ratio.

With approximately 18,340 new households in San Francisco from 2006 to 2015 and 47,210 new households from 2006 to 2030[69], this household formation as a result of indirect and induced multiplier effects constitutes conservatively 1.0 percent of the City's projected growth from 2006 to 2015 and less than 1.0 percent of projected growth from 2006 to 2030. When combining the indirect and induced household formation to the direct household formation estimated under the proposed LRDP, conservatively the LRDP would account for approximately 5 percent of projected household growth from 2006 to 2015 and 4 percent of projected growth from 2006 to 2030. The cumulative increase in housing demand would remain well within ABAG projections and could be accommodated by San Francisco's existing available vacant housing supply, planned new housing supply, pipeline projects under review and new housing that would be funded as per the project sponsor's proposed commitment, as discussed in Section 4.3 in the Draft EIR, and in Response PH-11 (page C&R 3.5-43).

In summary, the marginal increase in household formation from indirect and induced multipliers combined with the conservative nature of the employment growth estimates and the nature of construction employment, the significance findings described in Section 4.3, "Population, Employment, and Housing" in the Draft EIR analysis would remain less than significant.

Multiplier Studies of Hospitals and Health Care Centers in Other Localities

The comments note several other studies of the indirect and induced employment generation from hospital jobs; however, the data from those studies is inaccurately presented, as noted below.

The comments cite a study of the economic impacts of physicians in Oregon. More specifically, the cited study appears to be an August 2010 study published by the Oregon Healthcare Workforce Institute entitled "The Economic Contributions of Oregon's Physician Practices."[70] A careful examination of that study shows that the results indicated that "[s]tatewide on average, one physician contributed 13 direct jobs to the state's labor market."[71] The study also reported that on average across the state, for each physician there were an additional 12 indirect and induced jobs created.[72] This would seem to indicate a statewide average of 0.85 indirect and induced jobs created for every direct job (the individual physician plus the direct jobs). However, it is reasonable to expect that the employment multiplier is greater in smaller communities where there are fewer complementary uses already in existence, requiring new complementary jobs to support each physician. This is confirmed by looking at the data reported for Multnomah County which contains the City of Portland and is of comparable size to San Francisco and immediately surrounding environs. The Oregon study indicates that in Multnomah County, a total of 3,453 physicians generate a total of 42,422 direct jobs and an additional 15,861 indirect and induced jobs. Thus, a total of 45,875 direct employees (physicians plus other direct jobs) generate 15,861 indirect and induced jobs, or for every direct job there are 0.35 indirect and induced jobs created somewhere in the local economy.[73] This is comparable to the estimates discussed above and substantiated in footnote 67.

The comments also cite a study of the Rockcastle County Hospital and Respiratory Care Center, noting that the study showed that there were 48 local jobs created for every hospital job. This is a vast overstatement of the multipliers actually cited in the study. More specifically, the study cited was prepared in 2005 by the University of Kentucky Department of Agriculture Cooperative Extension Program, and is entitled "Economic Impact of Rockcastle County Hospital and Respiratory Care Center,

---

68 U.S. Census, 2000, Employed Residents per Household in San Francisco.
69 ABAG Housing Forecast, 2007.
70 Isrigg, Jo, Ph.D.; Beleiciks, Nick, MA; Moorhead, John, MD; MS, Dodson, Lisa, MD; Swendsen, Jennifer; Conklin, Joy; O'Beck, Reina, MS, Oregon Healthcare Workforce Institute, *The Economic Contributions of Oregon's Physician Practices*, August 2010.
71 Ibid, page 6.
72 Ibid, page 9.
73 Ibid, Table 1, page 6, and Table 2, page 9

Inc. On Four Kentucky Counties: Fayette, Jefferson, Franklin, and Madison."[74] This study examined the economic impact of a regional hospital on four rural counties surrounding the county that houses the hospital. One county is the place of residence of 33 hospital employees, another county houses three hospital employees, and two counties are the place of residence of none of the hospital employees. These surrounding counties are estimated to have employment multipliers ranging from 1.20 to 1.53. Fayette County, home to three hospital employees, is estimated to have an employment multiplier of 1.48. The applicability of this study is very limited as it explores the effect of the regional hospital on surrounding rural counties that do not house many hospital employees. Rather, a more useful examination would be in an earlier study that was prepared by the same authors in August 2004 by the University of Kentucky Department of Agriculture Cooperative Extension Program, and is entitled "Economic Impact of Rockcastle County Hospital and Respiratory Care Center, Inc. On Rockcastle County, Kentucky."[75] Rockcastle County is home to the City of Mount Vernon which, in turn, is home to the Rockcastle Regional Hospital and Respiratory Care Center. The study reports that in Rockcastle County the hospital creates 484 direct jobs, and 104 indirect and induced jobs for an employment multiplier of 1.25. The study states that "for every Rockcastle Hospital job, an additional 0.25 jobs are created in the local economy."[76] This is a much more moderate effect than predicted for the smaller, rural surrounding counties.

Local Housing Demand Generated from Construction Employment

In terms of housing demand generated from construction jobs, the analysis assumed that these workers would not make long-term housing relocation decisions based on a single job because of the cyclical and temporary nature of the work. For additional discussion of this issue, please see Response PH-8 (page C&R 3.5-27).

3.5.1.14 HIRING PRACTICES

Comments [General Comments on CPMC Hiring]

(SEIU United Healthcare Workers Bargaining Committee, September 23, 2010) [33-2 PH]

"We are proud to announce that after 21 months of bargaining we won a new contract with unprecedented **job security at the newly rebuilt Medical Center**.

- **Jobs guaranteed:** Our new contract guarantees that all current regular full-time and part-time benefited employees affected by the Cathedral Hill building project will have jobs at the Medical Center with no cuts in wages.

- **Job training:** If an employee's current position is not available, employees will be offered a comparable job, access to funding for retraining opportunities ($100,000 for affected employees) and up to 120 days of on-the-job training.

- **Jobs protected for seven years**: CPMC has guaranteed these job protections well beyond the life of the contract through January I, 2017

[74] Scorsone, Eric, PhD, Kentucky Rural Health Works (University of Kentucky Department of Agricultural Economics, Kentucky State Office of Rural Health, University of Kentucky Center for Rural Health, University of Kentucky Cooperative Extension Service), *Economic Impact of Rockcastle County Hospital and Respiratory Care Center, Inc. On Four Kentucky Counties: Fayette, Jefferson, Franklin, and Madison*, January 2005.

This is an important victory for us. Now we need you to stand with us to protect the safety of our workplace and our ability to provide quality affordable patient care to our community."

(Sandra Manning, September 23, 2010) [31-3 PH], duplicate comment was provided in PC-122 PH]

"• 10,000 new jobs will be created. Will I be considered for one? Not if CPMC has its way."

(Sandra Manning, September 23, 2010) [31-6 PH], duplicate comment was provided in PC-125 PH]

"• Neighborhood residents get priority hiring

• CPMC has a choice to pursue a "win-win" approach

• CPMC can be a good neighbor if it chooses to be"

(Stephanie Barton, et al.—Hastings Civil Justice Clinic for the Good Neighbor Coalition, October 19, 2010) [104-56 PH]

"The DEIR must analyze specific land use plans and policies related to employment. A stated objective of the San Francisco General Plan is to 'expand employment opportunities for City resident s, particularly the unemployed and the economically disadvantaged!' The General Plan emphasizes the need to promote measures designed to increase the number of San Francisco jobs held by San Francisco residents.[142] To achieve this goal, San Francisco established the First Source Hiring Program, which seeks to provide job opportunities for the unskilled workforce in the City.[143] These opportunities include job training and retention programs. To implement this program, the First Source Hiring Administration has the authority to condition building permits based on specific requirements including: (1) hiring and retention goals, (2) first source interviews, (3) recruitment and hiring goals for all construction on the project, (4) record keeping and monitoring goals, and (5) good faith standards for complying with the first source hiring program.[144] This program should be utilized during the construction phase of the project and for subsequent permanent hiring by CPMC and its lessees and successors.

[142] *Id.*
[143] San Francisco Administrative Code § 83.2.
[144] San Francisco Administrative Code 83.11."

(Stephanie Barton, et al.—Hastings Civil Justice Clinic for the Good Neighbor Coalition, October 19, 2010) [104-58 PH]

"The health care industry is a vital and growing aspect of the San Francisco economy. This project provides a unique opportunity to implement a first source hiring program in a burgeoning industry. Job categories in a hospital and medical office building breakdown as such: healthcare practitioner and technical occupations (44%), healthcare support occupations (19%), office and administrative support (14%), and other miscellaneous jobs (23%). Within this breakdown, there is a wide variety of job opportunities for workers with different skill levels and interests. This analysis does not take into account the construction phase of the project, which will create additional job opportunities for entry level, unskilled workers as well as for experienced construction workers."

(Stephanie Barton, et al.—Hastings Civil Justice Clinic for the Good Neighbor Coalition, October 19, 2010) [104-59 PH]

"The First Source Hiring Program implements the General Plan's objective to expand employment opportunities for City residents. It is an important City policy that should be addressed in the DEIR, as the information provided will allow decision makers to determine reasonably and realistically whether the potential employment opportunities generated by the project outweigh its unavoidable and significant, adverse environmental impacts."

(Lopez Perez, September 23, 2010) [PC-48 PH]

"We are proud to announce that, after 21 months of bargaining, we won a new contract with unprecedented job security at the newly rebuilt medical center. Jobs guarantee, job training, jobs protected for seven years, CPMC has guaranteed these job protections well beyond the life of the contract through January 1st, 2017. That is an important victory for us. Now, we need you to stand with us to protect the safety of our workplace and our ability to provide quality affordable patient care to our community."

(Marc Anthony, September 23, 2010) [PC-57 PH]

"The DEIR also cites and legal around the policy settings in the area, particularly in existing local hirees. What we are trying to say is, all the people that are living in the Tenderloin or around the community area, even the Union workers that are out of work, that are registered in that area, that we are looking for them to get some of the jobs that are offered."

(Erin Chin, September 23, 2010) [PC-70 PH]

"Can you hear me? Hi. My name is Erin Chin. I am here with the Good Neighbor Coalition. For the last two years, I worked as the Tenderloin Community Convener, which means I worked with local schools and after school programs, youth serving agencies and organizations, to assess and address the needs of youth in our neighborhood. The Tenderloin is home to approximately 4,000 people under the age of 18 in an area that is approximately a half square mile, so that makes it the densest concentration of children and families in the City, actually the densest concentration of children and families West of the Mississippi."

(Erin Chin, September 23, 2010) [PC-72 PH]

"The majority of the children in the Tenderloin live in single parent or single grandparent-led households. Of the children who live with both parents, the majority of those households have both parents working two jobs each. Because of all these factors, after school programs and youth services in the neighborhood are vital…We believe that, you know, when CPMC says they're going to come into the neighborhood and provide all of these benefits, including jobs, that these jobs should be accessible to your youth in the neighborhood. Thank you very much."

(James Tracy, September 23, 2010) [PC-77 PH]

"Where I may differ is exactly how these issues are going to be resolved. Are they going to be resolved in a way that make win-win situations, that makes St. Luke's viable, that benefit the Tenderloin and Central City communities, and also recognizes people that operate in the Central City community, that Cathedral Hill has a back door, as well? And are we going to see an engine of grassroots economic development that provide the jobs and the health care? Or are we going to see an engine of displacement?"

(Peggy Lindor, September 23, 2010) [PC-101 PH]

"I'm also working with Central City with Jeff Buckley and would love trying to create jobs for this area, and it would turn them, even though they think they have the lowest voice, we are having a Tenderloin convention in 2010, so we would like California Pacific to, you know, if they want to donate funds to us and our committee, and our convention that we're having, we will be happy for them to accept their donations, so they are going to be part of our residents and our community service."

(Paul Lentz, September 23, 2010) [PC-104 PH]

"The question is, where are these jobs going to go to? Are they going to have this entity operate in our neighborhood, but not hire any of us? Again, I don't see the fairness of that."

(Yolanda Jones, September 23, 2010) [PC-106 PH]

"Herrera Bolt has an LB Program in place and they have brought my firm on, YCATC, located in Bayview Hunters Point, as a certified HRC Local Business. I will be a part of the workforce and development team. My

employees presently now are all from San Francisco, and this is a great opportunity for my firm to not only grow, but become a full paying citizen in society from a community that has normally been overlooked."

(Margarita Mena, September 23, 2010) [PC-118 PH]

"The one thing I want to talk about is also the jobs. We have a lot of people in the neighborhood, and are the people in the neighborhood going to get the jobs?"

(Lorenzo Listana, September 23, 2010) [PC-128 PH]

"We urge the CPMC to initiate dialogue with community-based organizations before it is a community partnership for a common goal, for bringing equitable development in the Tenderloin."

(Lidia Pantig, September 23, 2010) [PC-146 PH]

"We need jobs for the residents of Tenderloin. We are mostly low income families and many of us have been unable to find jobs. The proposed CPMC project will be an opportunity for many Tenderloin residents to find good jobs. We want to make sure that CPMC guarantees that they will be hired from Tenderloin residents."

(Patricia Ruiz, September 23, 2010) [PC-168 PH]

"I went to Mission Hiring Hall for help in finding a job in San Francisco. I interviewed with Herrero Bolt for a receptionist office assistant position and I have now been working with this project since April of this year."

(Patricia Ruiz, September 23, 2010) [PC-170 PH]

"For me, personally, I approve of this CPMC project, means that I have growth opportunities in a career that I can help support my family and stay in San Francisco."

(Natalie Logan, September 23, 2010) [PC-171 PH]

"I have recently become an employee through First Source as a full-time employee for Herrero Bolt, the General Contractor of the proposed Van Ness and Geary project."

(Natalie Logan, September 23, 2010) [PC-173 PH]

"It will also open up job opportunities for the residents of the San Francisco community."

(Paul Dziadij, September 23, 2010) [PC-179 PH]

"I am here today as a citizen and recipient of CPMC's free services through PEP Jobs at CPMC and, although CPMC is just a hospital, they provide me with services to find a job, as I do have Epilepsy, as a person with a disability."

(Florence Kong, September 23, 2010) [PC-191 PH]

"San Francisco needs this CPMC project. We need the construction jobs and we need to put small businesses to work. These hospital projects will create jobs for San Francisco and it will indirectly lower the crime rate, when everybody has their jobs."

(Florence Kong, September 23, 2010) [PC-192 PH]

"I look forward to construction so that my employees, all San Francisco residents, will have work to support their families and give back to the San Francisco economy."

(Reverend Arnold Townsend, September 23, 2010) [PC-196 PH]

"The hospital is needed, but in that need, there are a whole lot of other needs that can and should be addressed. We have been in some discussions with the hospital, for example, about creating now the kind of training programs that young people in our communities, especially our dispossessed communities, can come out of those training programs and work at these hospitals when they are open, or any hospital for that matter."

(Reverend Arnold Townsend, September 23, 2010) [PC-197 PH]

"This is an opportunity to do some brilliant things around hiring for people in our community. This hospital, this hospital system, and the other hospitals, have an opportunity to take this and use some of the community benefit funds to do some training and some preparation of people."

(Guillermo Rodriguez, September 23, 2010) [PC-212 PH]

"One of the conditions as part of any project that is approved by this Commission, the First Source Hiring Agreement regulations would apply to this project, and for at least the last six months, our office, OEWD, has been in direct conversation with CPMC and its lead trade partners around the development and construction of the proposed buildings."

(Guillermo Rodriguez, September 23, 2010) [PC-213 PH]

"On the part of CPMC, they have already started hiring San Franciscans in anticipation of a First Source Agreement in showing their good faith efforts."

(Guillermo Rodriguez, September 23, 2010) [PC-214 PH]

"The First Source Agreement that our office is negotiating with CPMC, which we will bring back to this Commission, consists of three components. It will cover construction, that includes training, building a strong and well qualified pipeline of economically disadvantaged San Francisco residents through a State certified apprentice programs, prioritizing those neighborhoods most impacted by the construction program. We will also be looking at permanent jobs for the completed facilities, and a voluntary commitment to you small and local businesses in the construction program."

(Kamani Hamid [phon], September 23, 2010) [PC-231 PH]

"It will have economic advantage for the residents of San Francisco in hiring, and also for us to hire people because we will be hopefully generating business from the traffic we get."

(Ramon Hernandez, September 23, 2010) [PC-233 PH]

"I believe all the building trades, we are facing a slowdown in work, we have got 10-30 percent unemployment, that would be a good project for all of us and for San Francisco."

(Brian Webster, September 23, 2010) [PC-236 PH]

"I think this is going to be – the project itself is going to be a very good thing for San Francisco, particularly in terms of employment creation, the 1,500 jobs, the Union construction jobs that are going to be created."

(Tony Gazetta, September 23, 2010) [PC-276 PH]

"I represent members of Local 38, the Plumbers and Pipefitters Union, which is part of the building trades in San Francisco. We understand some of these concerns. Mine, as well as that of many of my brothers and sisters from the building trades is jobs, construction jobs which pay a wage, which allow the workers to support their families."

(Unidentified Speaker, September 23, 2010) [PC-279 PH]

"As you know, the construction industry has been hit especially hard in this recession, and presently we have at least one third of our members under-employed or unemployed. This project would put a great many of them back to work, as well as bring a state-of-the-art hospital facility downtown."

(Rachel Ubara, September 23, 2010) [PC-296 PH]

"CPMC must also commit to hiring from the communities in which their facilities are and will be operating, not to mention cease from implementing discriminatory practices, something that is currently at the forefront for many of the Filipino nurses and workers at St. Luke's Hospital."

(Fran Taylor, September 23, 2010) [PC-316 PH]

"And as far as the jobs issue, this is not a jobs vs. neighborhood issue; I want jobs, I want those plumbers working, I want all those people who spoke about their jobs through the job training programs to keep their jobs, and I think we all want the construction workers to have their jobs. Well, nobody wants this project to die, we just want it to be fair."

(Paul Grech, September 23, 2010) [PC-328 PH]

"It will bring thousands of jobs to the area, both medium and high range on the pay scale, and it will also contribute to the City's tax base because of the huge payroll and/or gross receipts tax."

(Commissioner Antonini, September 23, 2010) [PC-356 PH]

"We are very lucky to have a major medical center being built in San Francisco, it could be built outside of the City, and you know, we talked about the number of jobs, 1,500 in construction, 3,000 full-time equivalent increase, that is a huge number of jobs that are being provided by this."

(Commissioner Olague, September 23, 2010) [PC-396 PH]

"When analyzing San Francisco's population of available workforce and need to generate employment opportunities for its residents, particularly youth, you know, permanent jobs for people in the immediate area, that is not --First Source Hiring isn't mentioned here."

Response PH-26

The comments suggest that CPMC agree to a first source hiring program and note that the proposed project could have beneficial effects by creating jobs for neighborhood residents.

These comments do not raise issues regarding the adequacy, accuracy, or completeness of the Draft EIR. The comments will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project. Although social and economic issues are not required to be discussed as part of the CEQA process, the following outlines CPMC's job hiring program and the utilization of San Francisco's priority hiring program.

CPMC is the second largest private employer in San Francisco, with approximately 5,800 FTE employees. As explained on page 4.3-10 in the Draft EIR, approximately 49 percent of those employees live in San Francisco. As part of its proposed LDRP, CPMC would enter into a "First Source Hiring Program" agreement with the City of San Francisco, pursuant to Chapter 83 of the Administrative Code. The purpose of the program would be the creation of employment opportunities for qualified San Francisco residents. The San Francisco Mayor's Office of Economic and Workforce Development (MOEWD) and the CityBuild program (CityBuild) would administer the First Source Hiring Program on behalf of the City.

The program would cover both construction and permanent workforce minimum employment goals.[77] In connection with the design and construction of the LRDP, and with respect to positions for union journeymen and apprentice candidates, CPMC would require its contractor and its subcontractors to work to fill a minimum of 30 percent of such positions with San Francisco residents. In order to achieve this goal, CPMC and its contractors would partner with the Mayor's Office of Workforce Development and CityBuild to meet the following specific local hiring goals:

a. New non-union Administrative and Engineering Candidates: With respect to new Entry-Level Positions for non-union administrative and engineering candidates, a Contractor [General or Building—capitalized terms are defined in First Source Agreement] and its Subcontractors would work to fill a minimum of 50 percent of such new Entry-Level Positions with San Francisco resident System Referrals.

b. New non-union Administrative and Engineering Internship Candidates: With respect to new Entry-Level Positions for administrative and engineering internship candidates, a Contractor and its Subcontractors would work to fill a minimum of 50 percent of such new Entry-Level Positions with San Francisco resident System Referrals.

c. New union Apprentice Candidates: With respect to new Entry-Level Positions for union apprentice candidates, a Contractor and its Subcontractors would work to fill a minimum of 50 percent of such new Entry-Level Positions with San Francisco resident System Referrals who must also be graduates of CityBuild Academy. The Contractor along with its Subcontractors and their applicable unions would confirm the number of new union apprentices that would be required for the project and the annual variability of that demand throughout the course of the project.

d. New and Core (new from union hall and core from existing workforce that has been hired from hall and is working currently for contractor or subcontractor) union Journeymen and Apprentice Candidates: With respect to new and core positions for union journeymen and apprentice candidates, a Contractor and its Subcontractors would work to fill a minimum of 30 percent of such cumulative positions (i.e., 30 percent of journeymen and apprentices positions combined, and not 30 percent in each category) with San Francisco residents. A Contractor's obligation to hire new union entry-level apprentice candidates set forth in Section 2(c) above would be credited towards the Contractor's obligation to hire San Francisco residents under this Section 2(d).

e. Local Business Enterprise Participation: CPMC would work to ensure that at least 14 percent of the cost of all contracts for the project are awarded to contractors or subcontractors that qualify as certified Local Business Enterprises.

The following discussion describes expected permanent workforce opportunities.

CPMC currently works with MOEWD's Health Care Academy (HCA) to identify and hire entry-level applicants for non-construction positions who are residents of the City and County of San Francisco. As part of the First Source Hiring Program, CPMC would expect to hire additional entry-level applicants for non-construction positions during and after the construction of the proposed LRDP, with a CPMC hiring goal of at least 40 San Francisco residents for Entry Level Positions over five years through the HCA or its successor, and will participate in the San Francisco Workforce Development System, pursuant to Chapter 83 of the San Francisco Administrative Code.

Entry Level Position. A non-construction, non-managerial, and non-supervisory position at CPMC that requires neither education above a high school diploma or certified equivalency, and no more than 2 years

[77] Geoffrey Nelson, Director, Enterprise Development, CPMC, memorandum to AECOM, May 26, 2011.

of training or specific preparation. The types of Entry Level Positions that have historically been available at CPMC are as follows:

Vocational:

a. Home Health Aide
b. Phlebotomist
c. EKG Technician
d. Medical Assistant
e. Emergency Medical Technician

Non-clinical/clerical occupations:

a. Medical Administrative Assistant
b. Health Information Technology/Billing

Internship/Externship positions:

a. Medical Assistant
b. EKG Technician
c. Phlebotomist
d. Medical Administrative Assistant
e. Youth Sector Bridge participants

Comments [Regarding Hiring Practices]

(Maria Ragairdo, September 23, 2010) [PC-189 PH]

"I don't know why they don't settle with us, working the night shift, I just wonder. Now that Local 250 is here, it made me mad knowing that they settled with them and not with us, I mean, they treat us like a second hand citizen. So, I mean, I'm a minority anyway, so I know how that feels. But anyway, keep your hearts open again, we beg you, not only the nurses, but the patients at St. Luke's, to make it a fair deal for everybody."

(Tina Shanf—National Alliance for Filipino Concerns, September 23, 2010) [41-1 PH]

"FCC- Good Neighbor Coalition - National Alliance for Filipino Concerns NorCal

Also, a now Growing Coalition - more than 40 orgs and individuals – including Filipino Community, Church, Labor, and Student leaders and other community supporters,

These groups represent thousands of Filipinos concentrated in the SOMA, Tenderloin, and Excelsior neighborhoods of SF, and also the larger SF Bay Area Filipino working community that are employed or may be potentially employed by CPMC.

We stand firmly with those who are expressing in the community and in this room alarm and outrage over a very serious socioeconomic and health impact of the CPMC's development project and the planned downsizing of St, Luke's Hospital.

The issue we are raising today specifically related to the permanent jobs that will be created by CPMC's plans for healthcare in SF, and in particular the permanent jobs of Registered Nurses.

You all may be as alarmed as we were to find out that there is evidence of an alleged practice of racial discrimination and discrimination based on national origin against hiring Filipino and foreign graduate nurses at St. Luke's hospital.

Through Signed Declarations by 3 Nursing Manages and Supervisors, we have learned that Diana Karner, the Sutter West Bay VP of Nursing, ALLEGEDLY told these supervisors and managers:

QUOTES:

When we found out about this in the Filipino community, we interviewed nurses and one of the supervisors to verify what was said and we also reviewed data provided to us by the California Nurses Association indicating a severe drop in the rate of hiring of Filipino nurses since the beginning of 2008 when these discriminatory statements were made.

Any of us who have been to hospital facilities in SF and around the U.S. know 2 things:

-One, that Filipinos are over-represented in the health care industry at rates upwards of 10, 30, 60% in some areas, and

-Two, that Filipinos provide a high quality of care, which no one here disputes.

Hospitals like St. Lukes have been actively recruiting Filipino nurses from the Philippines for the last half century, so a statement not to hire 'Foreign Graduate' nurses essentially equates to a ban on hiring Filipino nurses because of the hundreds of Philippine nationals trained and recruited to work at healthcare facilities across the US, sometimes by US hospitals themselves.

We have since submitted a letter to Sutter-CPMC's CEO Warren Browner and Diana Karner, asking them to meet with us in a month's time to account for these credible and serious allegations, but until this time, they have not agreed to a meeting time with a representative group of the Filipino Community coalition. I have copies for all commissioners, here.

We have since also created with the NAFCON an online petition which has generated more than 600 signatures from Filipinos and non-Filipinos alike, all outraged across the U.S. and internationally that in this day and age, especially in the City of San Francisco, that something like this could possibly be happening.

Zenei Cortez, a Registered Nurse, and the first Filipino Co-President of the CA Nurses Association has been invited to a Philippine medical school to speak about the experiences of Filipino Health Professionals in the U.S.

Our demands are straightforward and require that Sutter-CPMC take seriously the HEALTH and socio-economic impact - Really the INJUSTICE, that discrimination against Filipino RN's by Sutter-CPMC will create. We ask that they take this issue seriously and stop attacking CNA and dismissing the data in this issue.

Those demands are:

-Within a month's time, we asked for both Warren Browner and Diana Karner to meet with a representative cross-section of our community, not just a one-on-one meeting with me and Dr. Browner - to this day, they haven't given us a meeting day or time.

OTHER DEMANDS:

We can not turn the clock back to the 1930's when signs like this fronted hotels and stores in places like Stockton, CA.

The hiring offices of Sutter-CPMC can not look like this, and all we're asking for is equal employment opportunity for the jobs created by CPMC,

On behalf of the Filipino Community organizations, I'm here and hope to schedule the meeting with Dr. Browner and Diana Karner asap."

(Tina Shanf—National Alliance for Filipino Concerns, September 23, 2010) [41-2 PH]

"Today, Filipino community groups and the California Nurses Association (CNA) filed a complaint with the San Francisco Human Rights Commission to shed light on an apparent pattern of discrimination by Sutter Health's California Pacific Medical Center (CPMC). We, the undersigned church, community groups and leaders, are deeply concerned that Sutter Health's CPMC has a practice of discrimination against hiring Filipino Registered Nurses.

Representatives of CNA and nurses from St. Luke's Hospital, part of the Sutter CPMC system, recently shared with us their concerns about unequal treatment of Filipino RNs. Three former CPMC nurse managers have made written statements that the Sutter West Bay Vice President of Nursing Diana Karner specifically directed them not to hire Filipino or foreign graduate nurses. We have also met with a Filipina RN who applied for a nursing job, but was told there were no positions, while white nurses were hired. Based on hiring patterns at St Luke's, these directives from Diana Karner appear to have begun around February 2008. While approximately 65% of St Luke's RNs hired before 2008 were Filipino, only 10% of those hired after February 2008 were Filipino.

Additionally, we are alarmed that CPMC continues to pay lower wages to the majority Filipino nursing staff at St Luke's despite the fact that they do the same work as other CPMC RNs in San Francisco. At the same time, CPMC has already taken away several benefits won by nurses at St Luke's over the years that were better than what CPMC provided elsewhere. These include better retiree health and vacation benefits. All this has occurred while CPMC proposes to downsize services at St Luke's, a hospital that serves our community concentrated in the Excelsior and SOMA neighborhoods of San Francisco. We strongly suspect that others in the community will come forward as they learn of the courageous efforts of the nurse managers and others outraged by the discriminatory hiring directives targeting Filipinos.

Across America Filipinos are well-represented in healthcare industry jobs, exceeding 10% (and in some areas 30%) of the health care workforce, but too often we continue to face discrimination at work. From language discrimination to labor trafficking, Filipino nurses in the United States have been unjustly fired, denied jobs, receive lower pay and benefits, are overworked, abused and exploited because of blatant discrimination based on race and national origin. The recent case of 4 Filipina nurses illegally terminated this year for speaking their native language at a hospital in Maryland is just one example of the injustice that healthcare professionals in our community regularly face. As a community we stood up against such actions to ensure that an atmosphere of discrimination against Filipino health professionals does not take root.

Sutter Health employs hundreds of highly qualified and well-trained Filipino nurses and other health professionals and serves the Filipino community of more than 420,000 across Northern California. We call upon Sutter Health to stand with us against racial and national origin discrimination, both in policy and in practice."

(Tina Shanf—National Alliance for Filipino Concerns, September 23, 2010) [41-3 PH]

"As representatives of thousands of Filipino community members and health professionals, we propose the following remedies:

- We urge the SF Human Rights Commission (HRC) to conduct an immediate and thorough investigation of the apparent pattern and practice of discrimination by Sutter CPMC against Filipino Registered Nurses.
- We request Sutter CPMC's full and prompt cooperation with the HRC investigation.
- We demand a meeting with CPMC CEO Warren Browner and Vice President Diana Karner within one month to discuss discrimination against Filipino RNs and specifically the alleged discriminatory hiring directives by Vice President Karner.

- We further demand that CPMC publicly renounce this discriminatory practice and issue a public apology to Filipino nurses and the Filipino community.

- Lastly, we demand that CPMC provide equal opportunities and treatment for all job applicants regardless of race, national origin or any other protected status."

(Denise Rowe, September 23, 2010) [PC-141 PH]

"So far, I've been very concerned by CPMC. The Tenderloin is a diverse community with a growing Filipino population. The recent exposure of CPMC's discrimination against hiring Filipino nurses is appalling."

(Denise Rowe, September 23, 2010) [PC-142 PH]

"Discrimination is wrong. I do not want to see a project built in my community that will discriminate against hiring from the diverse community that surrounds it. I'm proud of the diversity of the Tenderloin and I am unsure that CPMC's new hospital will respect that. All people deserve to be hired at CPMC."

(Tina Shanf, September 23, 2010) [PC-310 PH]

"Good evening, Planning Commissioners. I am Tina Shanf standing in for Terence Valen of Filipino Community Center. I am a part of Babae of San Francisco, I am the Co-Chair of that organization, advocating for the rights and welfare for Filipinas, especially Filipinos who are underserved and advocating for their basic rights, including access to jobs. We stand in solidarity with the Filipino Community Center, a Good Neighborhood Coalition, and NAFCON, National Alliance For Filipino Concerns. Now a growing coalition of more than 40 organizations and individuals, including the Filipino Community Church, Labor, and student leaders, and other community supporters, these groups represent thousands of Filipinos concentrated in SOMA, Tenderloin, and Excelsior Neighborhoods of San Francisco, and also the larger San Francisco Bay Area Filipino working communities that are employed or may have been potentially employed by CPMC. We stand firmly with those who are expressing in the community and in this room today their alarm and outrage over a very serious socioeconomic and health impact of the CPMC's development project and the planning downsize of St. Luke's Hospital. The issue we are raising today is specifically related to the permanent jobs that will be created by CPMC's plans for healthcare in San Francisco, and in particular the permanent jobs of Registered Nurses. You all may be as alarmed as we are to find out that there is evidence of an alleged practice of racial discrimination, and discrimination based on national origin against hiring Filipino and foreign graduate nurses at St. Luke's Hospital. Through signed declarations by three nurse managers and supervisors, we have learned that Diana Karner, the Sutter West Vice President of Nursing, allegedly told these supervisors and managers, [quote], 'You are not to hire any Filipino Nurses. The Filipinos are always related and know each other, and that's not good. You're not to hire them.' [End quote]. [Quote] 'It is hard to understand them and be understood by them.' [End quote]. [Quote] 'Do not hire foreign graduate nurses.' [End quote]. These are very qualified nurses who are being discriminated against. When we found out about this in the Filipino Community, we interviewed Nurses and one of the supervisors to verify that this was said, and we also reviewed data provided to us by the California Nurses Association, indicating a severe drop in the rate of hiring of Filipino Nurses since the beginning of 2008. And when these discriminatory statements were made, any of us who have been to hospital facilities in San Francisco and around the U.S. know two things, 1) that Filipinos are over-represented in the healthcare industry at rates upward of 10, 30, 60 percent in some areas."

(Commissioner Olague, September 23, 2010) [PC-380 PH]

"Then, one thing that was disturbing, I guess, for me and maybe this doesn't relate to Draft EIRs was the number of testimonies from members of the Filipino community who raised the quote from the Sutter Health person about the discriminatory practices, and that to me, if anything, could be a Human Rights issue, a Human Rights concern, and maybe that is something that Commission, that body needs to investigate further because, if we are going to be dealing in engaging in this type of level of obvious engagement with this institution, then I want to be certain that there aren't discriminatory hiring practices against any community, certainly not the Filipino-American

Community or even if there are people who were trained elsewhere and come here to start a new life, I don't think there should be that level of discrimination against anyone, so that was really troubling."

Response PH-27

The comments claim that the project sponsor has engaged in improper hiring practices.

These comments are noted. These comments do not raise issues regarding the adequacy, accuracy, or completeness of the Draft EIR. The comments will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project. This C&R document is not the appropriate venue for discussion of these issues. The issues raised in these comments are regulated by federal, state, and local fair labor and anti-discrimination laws and ordinances. CPMC has provided a memorandum stating its position and indicating that its internal investigation determined that the allegations are incorrect and are not supported by any substantiating evidence.[78]

3.5.1.15 OTHER GENERAL COMMENTS

Comments [Project Support]

(SEIU United Healthcare Workers Bargaining Committee, September 23, 2010) [33-4 PH]

"**Build a Stronger Local Economy**: In the midst of cut-backs and layoffs, the building project will serve as an **economic stimulus for the city**, creating 1,500 new construction jobs, preserving 6,500 healthcare jobs and encouraging new business around our new hospitals.

While the city struggles with an immense budget shortfall. CPMC's plan will be **paid for almost entirely through private funds** and will require no public financing.

Absent these improvements, most of the Medical Center will be forced to close in 2015. The resulting loss of jobs and access to quality healthcare for San Franciscans would be simply devastating. We urge you to join us in making the plan to rebuild CPMC a reality. Our jobs, our patients and our community depend on your support."

(Mary Sirakaryan, September 23, 2010) [PC-50 PH]

"Good afternoon, President Miguel and Commissioners. I am going to continue on from Ms. Lopez's, where she left off. My name is Mary Sirakaryan. To follow-up with Ms. Lopez's – '…build a stronger local economy': In the midst of our cutbacks and layoffs, the building project will serve as an economic stimulus for the City, creating 1,500 new jobs, preserving 6,500 health care jobs, and encouraging new business around our new hospitals. While the City struggles with an immense budget shortfall, CPMC's plan will be paid for entirely through private funds and will require no public financing. Absent these improvements, most of the medical center will be forced to close at 2015. The resulting loss of jobs and access to quality health care for San Francisco would simply be devastating. We urge you to join us in making the plan to rebuild CPMC a reality. Our jobs, our patients, and our community depend on your support. Sincerely, the SEIU, UHW Bargaining Committee with CPMC." Thank you."

(Joe Kim, September 23, 2010) [23-1 PH, duplicate comment provided in PC-220 PH]

"Thank you president Miguel and Members of the planning commission. My name is Joe Kim. I have a small Japanese restaurant on 1233 Van Ness Ave. Since most of all the businesses in America have slowed down, Circuit City has bankrupted. Theater has closed down as well as hotel has closed down in this area. Since then, not only me but also all small businesses slowed down in this area. We are suffering from this economy slowing down and it is very painful. You can ask any of small business owners in this area and you will find out how

[78] Nelson, Geoffrey, California Pacific Medical Center, Memorandum to Brian Boxer, AECOM, March 23, 2011.

much we are looking forward to this hospital coming to this area. If the hospital is built in this area, there are 2 kinds of people getting benefit from the hospital, in my simple opinion.

A. For real property owners, they will have direct benefits because the price of properties will go up so they can build up equity. Also, vacancies will be disappeared.

B. For people who don't have properties like myself, will have indirect benefits because when the hospital comes into this area, it will create lots of jobs such as maintenance on painting, roofing, electricity and pluming that needs to be fixed or renovated. Meantime, the money that those workers made can be spent for going out for dining, shopping for their kids in school such as clothes, shoes, and school supplies. So, this movement of money will enhance the economy. I am sure it will not only make all of us in this area happy, but also the mayor of San Francisco and Washington D.C. Obama san happy.

Therefore, I support this hospital project. Thank you."

(Kamani Hamid, September 23, 2010) [PC-229 PH]

"My name is Kamani Hamid [phon] and I am a small business owner in the Tenderloin area for the last six years, and I just recently had an opportunity at a Polk and Geary location to open up a business, and I took the opportunity because I knew that CPMC was coming into the area."

(Lori Martins, September 23, 2010) [PC-240 PH]

"I will be one of the small businesses that will need to relocate due to the hospital project. I am here today to publicly acknowledge and thank California Pacific Medical Center for working with me and my staff to ensure our successful relocation;"

Response PH-28

The comments include various statements of support for the proposed project. The comments are noted. These comments do not raise issues regarding the adequacy, accuracy, or completeness of the Draft EIR. The comments may be considered by the decision-makers as part of their deliberations on the project.

Comment [No Comments]

(Paul Wermer—CPMC Neighbors Coalition and Pacific Heights Residents, October 18, 2010) [67-15 PH]

"3) POPULATION AND HOUSING: no specific comments."

Response PH-29

The comment reflects that the commenter has no comments on the population and housing analysis in the Draft EIR. The comment is noted. The comment does not raise issues regarding the adequacy, accuracy, or completeness of the Draft EIR. The comment will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project.

3.5.2 CATHEDRAL HILL CAMPUS

Comments specific to the Cathedral Hill Campus are responded to in Response PH-18 (page C&R 3.5-67).

3.5.3 PACIFIC CAMPUS

No comments pertaining to population, employment, and housing solely related to this campus were received during public review of the Draft EIR.

3.5.4 CALIFORNIA CAMPUS

No comments pertaining to population, employment, and housing solely related to this campus were received during public review of the Draft EIR.

3.5.5 DAVIES CAMPUS

No comments pertaining to population, employment, and housing solely related to this campus were received during public review of the Draft EIR.

3.5.6 ST. LUKE'S CAMPUS

No comments pertaining to population, employment, and housing solely related to this campus were received during public review of the Draft EIR.

3.6 CULTURAL AND PALEONTOLOGICAL RESOURCES

3.6.1 LRDP

Comment

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-166 CP, duplicate comment was provided in 30-166 CP]

"101. Per the Planning Department, it was explained that the paleontological information was not available to the public under California State Public Disclosure Law. Although the DEIR states that whether or not any significant archaeological resources are encountered, the inspector will make a written report to the Environmental Review Officer (Bill Wycko?), if as was explained to me the disclosure of information on paleontological and archaeological findings is closed to the public, the public will never know for sure if this project had a significant impact on such resources and any real confidence that notification to appropriate people were made or if a report was generated. The DEIR states that the CPMC projects will have a 'potentially significant' impact. It is very likely there will be Native American and other paleontological findings (e.g. in the Colma Formation) when the earthmoving activities startup."

Response CP-1

The comment states concern that information regarding paleontological resources has not been made available to the public, and that potentially significant paleontological and archaeological resource discoveries may occur during proposed LRDP construction activities.

The exact locations of certain types of cultural resources, such as archaeological sites, are exempt from public disclosure so that the individual resource will not be subject to non-scientific disturbance such as looting or collecting (Public Records Act [PRA] Section 6254.10). The fact of the discovery or impact or potential impact to an archaeological site may, however, be publicly disclosed (although the location will remain undisclosed). The implementation of LRDP mitigation measures would be documented in the Mitigation Monitoring and Reporting Program (MMRP), and would be available for public review through the San Francisco Planning Department, Major Environmental Analysis, 1650 Mission Street, Suite 400, San Francisco, CA 94103. Through use of the MMRP, the public could verify if the mitigation measures were implemented and if any resources were discovered. The MMRP would include details of the mitigation implementation, a verification or monitoring schedule, including the frequency of monitoring or reporting to the decision-making body, to ensure that mitigation implementation was adequately completed to the satisfaction of the City.

Although under Impact CP-2 on page 4.4-37 the CPMC LRDP Draft EIR notes the potential exists for the proposed LRDP to significantly affect archaeological resources, the discussion clearly states that with implementation of the archaeological mitigation measures, this potential would be reduced to a less-than-significant level.

Comment

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [37-11 CP]

"13.**I cannot comment** today on the sparse information on the paleontological and archaeological portions of this CPM C DEIR which basically outlines procedures used by the professionals in the event something is found. I respectfully wait for these documents that I requested and was originally denied but Sunshined on September 16, 2010."

Response CP-2

The comment suggests that a lack of information on paleontological and archaeological resources exists in the Draft EIR and the document basically describes the procedures to be used by professionals in investigating and treating these resources.

As noted in Response CP-1 (page C&R 3.6-1), the location of known archaeological resources is protected from public disclosure under PRA Section 6254.10. The appropriate procedures for conducting archaeological investigations that are consistent with the archaeological research design and treatment plans (ARDTPs) for the proposed CPMC LRDP are discussed in Mitigation Measure M-CP-N2 in the Draft EIR, page 4.4-38, and Mitigation Measure M-CP-N3, page 4.4-47. These procedures would be used before and during LRDP construction, consistent with professional standards in California to practically and reliably identify and consider buried archaeological and paleontological remains that could be present at proposed LRDP sites. Please see Response CP-3 (page C&R 3.6-3) for further discussion of the ARDTPs for the proposed LRDP and the procedures that would be undertaken to ensure that any paleontological and archaeological resources that are encountered would be dealt with appropriately.

Comments

(Rose Hillson—Member, Jordan Park Improvement Association, October 14, 2010) [58-1 CP, duplicate comment was provided in 98-1 CP]

"This document supplements my earlier CPMC DEIR comments document I submitted on September 23, 2010 at the Planning Commission. Thank you and Mr. Randall Dean for providing the paleontological documents which I understand had to be in redacted form based on Public Records Act, Section 6254.10 which states as follows:

> 6254.10. Nothing in this chapter requires disclosure of records that relate to archaeological site information and reports maintained by, or in the possession of, the Department of Parks and Recreation, the State Historical Resources Commission, the State Lands Commission, the Native American Heritage Commission, another state agency, or a local agency, including the records that the agency obtains through a consultation process between a California Native American tribe and a state or local agency.

As a note, some of the redacted information I read did not have to do with Section 6254.10 nor did it appear that the information was about specific addresses of persons nor any specific building that required privacy. Some of the information redacted seems to be about the general geographic direction of significant resources around and on the project sites.

This kind of information becomes important in instances when core samples are taken in places around all these areas and at depths not sufficient to reach the potentially significant resources to then arrive at a conclusion that nothing of any potential archeological/paleontological significant historic resource exists. I think, in light of the redacted information and the general idea I get from reading these documents, a more thorough up-to-date continuous core sampling at depths indicated may be warranted at all sites as recommended by the expert opinions of the 2006 Sonoma State University document which alludes to 'incomplete' samples."

(Rose Hillson—Member, Jordan Park Improvement Association, October 14, 2010) [58-7 CP, duplicate comment was provided in 98-7 CP]

"The Sonoma State University April 12, 2006 report states that for the Pacific Campus, 'incomplete sampling techniques' were used 'for the geotechnical borings.' And that 'there is no doubt that a large volume of the slope deposits will be impacted and/or completely removed, along with any unidentified paleosols that may be present in the dunes that overlie the slope deposits.' The report states that 'any attempt to identify potential buried sites will at least either require, (1) the use of a backhoe or subsurface coring device prior to construction, or (2) the use of archaeological monitors during construction.'

Since requesting the paleontological and archaeological documents for the CPMC DEIR via the Sunshine Ordinance in September 2010 (and because twice I was denied access to all of these documents), I have not seen any additional documents that show that later additional geoarchaeological testing was performed as recommended in the 2006 Sonoma State University documents nor since the ARDT was written by AECOM in January of 2010. And although the mitigation measure states that monitoring may be used it is not clear to this day if it will be. Will monitoring be done on all sites at the areas that are most likely to yield significant historic artifacts? Will additional core samplings of scientific certainty be conducted?

The Sonoma State University document recommendations included excavation of 3 or 4 backhoe trenches at depths of 14 feet or less to get 2 to 4 complete cores from each building site and supplementing with several targeted interval samples from any buried paleosols that are identified within the complete cores. This document suggested this would be cheaper than 'the costs of stopping or slowing the construction work or redesigning the project if important deposits of buried archaeological materials were found during active construction.'"

Response CP-3

The comments state that, on receiving copies of the ARDTPs prepared for the development sites contemplated under the proposed CPMC LRDP, redacted information appeared not to be the type of information protected under PRA Section 6254.10. The comments request confirmation that the recommendations of the geoarchaeological analysis of the ARDTPs (prepared by a geoarchaeologist at Sonoma State University, which include continuous geoarchaeological core samples and archaeological monitoring) have been or will be done.

The information redacted from the archaeological background reports was restricted to information protected from public disclosure under PRA Section 6254.10, including information regarding the horizontal and vertical location of documented or potential archaeological deposits and documented or potential associations of archeological deposits and of any documentation ("reports") concerning the same. Information regarding the locations of archaeological sites is exempt from public disclosure, in part to prevent non-scientific disturbance of such sites as a result of looting or vandalism. In addition, indigenous peoples frequently request that information regarding indigenous sites be withheld from public disclosure because of the patrimonial, religious, or cultural significance of such sites to associated their communities. Also see Response CP-1 (page C&R 3.6-1) for further information.

In response to the concern that continuous geoarchaeological core samples and archaeological monitoring (as recommended in the ARDTPs) be undertaken, several points should be noted. Mitigation Measure M-CP-N2 (beginning on page 4.4-38 of the Draft EIR), addressing potential effects to archaeological resources, specifically requires preparation of an archaeological testing plan for each site (consistent with the ARDTP for the site, including undertaking of continuous geoarchaeological core sampling where deeply buried prehistoric deposits are expected). Secondly, no single archaeological investigation strategy (e.g., archaeological coring, trenching, hand-excavated test units, broad exposures, or monitoring) is the most appropriate (i.e., the most likely to discover an archaeological resource) in all situations. Implementation of Mitigation Measure M-CP-N2, requiring archaeological investigations to be consistent with the ARDTPs, would ensure that the archaeological investigation strategy most appropriate to the type of archaeological resource being investigated will be undertaken.

The possibility that remains could be discovered that could require more than 4 weeks to properly investigate is acknowledged in Mitigation Measure M-CP-N2. The Environmental Review Officer could determine that construction be suspended beyond 4 weeks if such a suspension was the only feasible means to reduce potential effects on a significant archaeological resource to a less-than-significant level.

Comment

(Rose Hillson—Member, Jordan Park Improvement Association, October 14, 2010) [58-2 CP, duplicate comment was provided in 98-2 CP]

"In regards to the DEIR itself, under Section 4.4, Cultural and Paleontological Resources, Pages S-38 through S-42:

> (Page S-38) Impact CP-2 states that 'construction under the proposed LRDP could potentially adversely affect the significance of subsurface archaeological resources pursuant to Section 15064.5 of the State CEQA Guidelines.'

Again, based on the fact that potentially significant findings related to Native American tribes could exist at Davies and St. Luke's, it is suggested that CPMC would hire an archaeological monitor throughout the excavation tasks of the projects per the recommendations in the documents. Please refer to the Sonoma State University 2006 documents written for Archeo-Tec that state that some of the core samples were inadequate due to how they were collected.

The mitigation measure, M-CP-N2, states that an archaeological consultant will be retained should any findings surface with possible monitoring. If any artifacts are found, the maximum amount of time for project work suspension is stated as 4 weeks or beyond this timeframe if the suspension is the 'only feasible means to reduce to a less-than-significant level potential effects on a significant archaeological resource, as defined in the State CEQA Guidelines, Section 15064.5(a)(c).' The mitigation measure further states:

> At the completion of the archaeological testing program, the archaeological consultant shall submit a written report of the findings to the ERO. If, based on the archaeological testing program, the consultant finds that significant archaeological resources may be present, the ERO in consultation with the consultant shall determine whether additional measures are warranted.

Since no drawings for alternative construction to the campus sites are included in the CPMC DEIR in case substantial paleontological findings are encountered to the point of interfering with construction schedules for 4 weeks or beyond perhaps this DEIR is not complete. Would it be safe to assume that should resources be found and a delay of over 4 weeks occur, that CPMC will nonetheless go forward with the projects as shown in the DEIR after proper local, state and federal laws for such artifacts are followed? I am aware of incidents in which resources were reburied or filled in on other construction jobs in the City."

Response CP-4

The comment references Impact CP-2 in the Draft EIR, the 2006 Sonoma State University documents that state some of the core samples were inadequate, and Mitigation Measure M-CP-N2. The comment suggests that because no drawings for alternative construction to the campus sites are included in the Draft EIR, it might be safe to assume that even if historic or paleontological findings were to occur during construction, after a delay of over 4 weeks, the project could go forward after all laws for such artifacts were followed. The comment suggests that the Draft EIR may not be complete because drawings of alternative construction within the campuses that could avoid any paleontological resources found were not included.

Mitigation Measures M-CP-N3 and M-CP-L3 in the Draft EIR, pages 4.4-47 and 4.4-48, would reduce potential LRDP impacts on paleontological resources at the proposed Cathedral Hill Campus and existing Pacific, Davies, and St. Luke's Campuses to less-than-significant levels because construction workers would be trained by a qualified paleontologist or archaeologist regarding the possibility of encountering paleontological resources, how to identify such resources, and the proper notification procedures should such resources be encountered. In the event that resources were encountered, Mitigation Measures M-CP-

N3 and M-CP-L3 also would require that the construction crew immediately cease work near the find, and CPMC would retain qualified professionals to assess the find and prepare a recovery plan. Construction activities at the site where paleontological resources were discovered would not resume until the recommendations determined by the City to be necessary and feasible were implemented.

Comment

(Rose Hillson—Member, Jordan Park Improvement Association, October 14, 2010) [58-11 CP, duplicate comment was provided in 98-11 CP]

"I am not so sure that the archeological areas were or will be mitigated to 'less-than-significant' based on pre-project samplings taken in 2005 and 2006, the uncertainty of whether additional monitoring and substantial core samples will be taken, and on whether, if a large paleontological resource is encountered that will require a construction delay of more than 4 weeks, alternate buildings plans will commence as no plans for such a circumstances are included in the DEIR. Perhaps as part of the alternatives, there could be a mitigation measure added that will address this."

Response CP-5

The comment states uncertainty over pre-project sampling conclusions, whether additional monitoring and core samples would be taken, and whether, if a large paleontological resource was encountered, that would require a construction delay of more than 4 weeks, alternate building plans would commence. The comment further states that no such plans for this circumstance are included in the CPMC LRDP Draft EIR, and the comment suggest that a mitigation measure should be added as part of the project alternatives to address this possibility.

In response to the concern about the conclusions of the pre-project core sampling and whether additional sampling and monitoring would be performed, please see Response CP-3 (page C&R 3.6-3), which notes that Mitigation Measure M-CP-N2 (beginning on page 4.4-38 of the Draft EIR) requires preparation of an archaeological testing plan consistent with the ARDTP and that implementation of this measure would ensure that the archaeological investigation strategy undertaken is the most appropriate to the type of archaeological resource that is the subject of the investigation.

The discussion of the archaeological sensitivity of project sites under Impact CP-2 in the Draft EIR, beginning on page 4.4-36, acknowledges the potential for the presence of buried archaeological remains. Mitigation Measure M-CP-N2 in the Draft EIR, beginning on page 4.4-38, would provide for preconstruction testing, archaeological monitoring, and other tasks to be implemented for the purposes of identifying and evaluating buried cultural resources. Please see Response CP-3 (page C&R 3.6-3) for further information.

The possibility that paleontological remains could be discovered and could require more than 4 weeks to properly investigate is acknowledged in Mitigation Measure M-CP-N3 in the Draft EIR, beginning on page 4.4-47. This mitigation measure would ensure that the appropriate actions would take place if a potential paleontological resource discovery arose and would provide the procedures that would be implemented under such a scenario. As stated in this mitigation measure, "Recommendations in the recovery plan that are determined by the City to be necessary and feasible *shall be implemented before construction activities can resume* at the site where the paleontological resources were discovered" (emphasis added). This measure does not specify a time limit on how long construction might be held, but would require that it be held until the paleontological discovery was addressed according to the recovery plan. Also see Response CP-3 (page C&R 3.6-3) for further information. Because it would be speculative to assume that archaeological or paleontological resources would be found in any particular location based on known sites in the vicinity of the proposed development sites, no requirement exists under CEQA to provide alternative site configurations that would avoid such resources.

Comment

(Rose Hillson—Member, Jordan Park Improvement Association, October 14, 2010) [58-12 CP, duplicate comment was provided in 98-12 CP]

"Also, since many of the pages of the documents were redacted per 6254.10 of the Public Records Act, as suggested by the Native American Heritage Commission, it is hoped that all possible indigenous people are made aware of the plans rather than expose the City to potential problems of having failed to notify the Indian tribal community, especially in relation to St. Luke's and Davies campus project sites."

Response CP-6

The comment states concern that all possible indigenous people have been made aware of the proposed LRDP.

Native American contacts provided by the California Native American Heritage Commission were informed by letter regarding the proposed CPMC LRDP before release of the Draft EIR. Each letter invited the Native American contact to provide any information regarding sites important to Native American communities or any concerns the Native American community might have regarding the project to the Planning Department. In accordance with California Code of Regulations Section 15064.5, additional Native American consultation would be undertaken if Native American human remains were discovered or were suspected at a specific location before or during project construction, as discussed in Mitigation Measures M-CP-N2, M-CP-L2, M-CP-N4, and M-CP-L4 in the Draft EIR, beginning on page 4.4-38.

3.6.2 CATHEDRAL HILL CAMPUS

Comments

(Bob Hamaguchi—The Japantown BNP Organizing Committee, October 8, 2010) [47-1 CP, duplicate comment was provided in 50-1 CP]

"After review of the CPMC Draft EIR (2005.0555E), we are concerned that this DEIR fails to consider the impact of construction and operations on Japantown as a cultural resource. In fact, proposed 'mitigations' in the DEIR have already been demonstrated to have an adverse impact on Japantown, its merchants and its restaurants.

As recognized by the Planning Department, the Japantown Better Neighborhood Plan's first goal is to 'Secure Japantown's future as the historical and cultural heart of Japanese and Japanese-American community' (p.3, May 2009 Draft Plan), yet the 'HISTORIC RESOURCE EVALUATION REPORT For Cathedral Hill Campus' dated Sept 2008, does not recognize Japantown or its cultural significance."

(Bob Hamaguchi—The Japantown BNP Organizing Committee, October 8, 2010) [47-3 CP, duplicate comment was provided in 50-3 CP]

"Although the immediate effects arising from CPMC's activities are parking and financial, the result is significant damage to an important cultural and historic resource: San Francisco's Japantown"

(Bob Hamaguchi—The Japantown BNP Organizing Committee, October 8, 2010) [47-10 CP, duplicate comment was provided in 50-10 CP]

"5) We have serious concerns that the Cathedral Hill and other proposed CPMC projects, and the other major development projects underway in or adjacent to the Japantown Planning Area, may adversely impact Japantown's ability to maintain its unique character 'as the historical and cultural heart of the Bay Area's Japanese and Japanese American community.'"

(Hiroshi Fukuda, September 23, 2010) [PC-158 CP]

"Good afternoon, Commissioners. My name is Hiroshi Fukuda and I am the Board President of Konko-Kyo Church in San Francisco Japantown, it is on Bush and Laguna. We are concerned because the DEIR for CPMC doesn't address Japantown, or doesn't recognize Japantown as a cultural resource, and we are only three blocks away. Japantown serves as a cultural resource for many Japanese Americans who live throughout the Bay Area."

Response CP-7

The comments state concerns that the Historic Resource Evaluation Report (HRER) for the proposed Cathedral Hill Campus does not address the cultural significance of Japantown and that the CPMC LRDP Draft EIR fails to consider the impact of the proposed CPMC LRDP's construction and operation on the parking within and financial viability of Japantown. The comments also state concerns that the Draft EIR fails to recognize the cultural significance of Japantown as the "historical and cultural heart of the Bay Area's Japanese and Japanese American community."

Although the 2008 HRER did not include Japantown in its study area, a 2009 Japantown Historic Resource Survey (Japantown Survey) was prepared as part of the Japantown Better Neighborhood Plan (BNP) [1] and the findings were incorporated into the final 2010 HRER for the CPMC LRDP proposed development at the Cathedral Hill Campus.[2] The Japantown Survey covered approximately 40 city blocks in the Japantown-Fillmore neighborhood of San Francisco's Western Addition. The survey limits were Steiner Street to the west, California Street to the north, Gough Street to the east, and Ellis and O'Farrell Streets to the south. The proposed Cathedral Hill Campus and the 1375 Sutter Medical Office Building (MOB) buildings are located one full block east of the Gough Street survey limit; the other proposed MOB is one block further east.

The 2009 Japantown Survey focused on Japanese and Japanese-American ethnicity and culture, in an effort to address the unique cultural character of the neighborhood and to identify existing and potential historic and cultural resources within the boundaries of the Japantown BNP area. The intent of the Japantown Survey was to allow the Planning Department to integrate the results of this survey into Japantown BNP policies and utilize its findings to make appropriate decisions regarding new development and the preservation of historically and culturally important properties within the Japantown neighborhood.

Through this survey effort, the City identified a preliminary historic district of 95 properties along with a number of individual historically significant properties. However, the boundary of the preliminary historic district, as well as any of the individual historic properties in the preliminary historic district, each are at least three blocks away from the proposed LRDP site at Cathedral Hill.

The comment states concerns about potential impacts of the proposed CPMC LRDP development at the Cathedral Hill Campus to the Japantown historic district or individual historical resources that could be caused by increased LRDP-related traffic, increased parking demand, or financial pressures on existing properties. In relation to historical resources, the concern would be that if traffic or financial pressures resulted in vacancies that would, in turn, lead to demolition by neglect, the integrity of the historical resource could be compromised. This would be closely related to the concept of "urban decay" that is addressed in Response PH-20 (page C&R 3.5-71). Please refer to the Response PH-20 (page C&R 3.5-71) for a discussion of both urban decay and potential negative impacts from reduced parking availability. According to that analysis, the economic viability of Japantown is expected to remain relatively

[1] Glynn, M., and C. Harvey. 2009. 2009 Japantown Better Neighborhood Plan Historic Resources Survey Report. Prepared by Page & Turnbull, Inc. for the San Francisco Planning Department. Available: http://www.sf-planning.org/index.asp x?page=1692. Accessed December 2010.

[2] California Pacific Medical Center. 2010 (February). *Historic Evaluation Report for Cathedral Hill Campus: California Pacific Medical Center*. San Francisco, CA. Prepared by Knapp Architects, San Francisco, CA

unchanged and might benefit from increased activity at the Cathedral Hill Campus area. Thus, it would be unlikely that the buildings and features that make up the historic district would suffer from urban decay, and thus the integrity of the Japantown historic district would remain intact. See also Response TR-86 (page C&R 3.7-154) for a discussion of the potential circulation and parking impacts of the proposed CPMC LRDP development at the Cathedral Hill Campus on Japantown.

Comments

(Rose Hillson—Member, Jordan Park Improvement Association, October 14, 2010) [58-3 CP, duplicate comment was provided in 98-3 CP]

"After reading all these archeological research documents, a few key themes developed from prior scientific findings and historical uses of the sites. These include children/orphans history at the Cathedral Hill site, as well as Mexican-American, Chinese, Japanese, and German settlement in San Francisco. The project sites seem to have good potential for archeological resources eligible under Criterion 4 (i.e. the finding 'has yielded, or has the potential to yield, information important to the prehistory or history of the local area, California or the nation') per the California Register of Historic Resources. These resources would then be designated historical resources under the California Environmental Quality Act. It is suggested to take a serious look at these sites.

CATHEDRAL HILL CAMPUS PROJECT SITE:

For this project site, per the AECOM document, an example of unique archaeological findings would be related to children/orphans and their artifact history at the Cathedral Hill Campus site where there used to be the Ladies' Protection Home Relief Society Children's Home. This document speaks of the history of orphanages in San Francisco and the lack of archaeological materials in relation to such things as children's toys from historic periods. Garbage pits, well pits, etc. which were filled in are likely to exist at the Cathedral Hill site, especially where the rear yard of the orphanage stood. This would be about 80 feet east of the Franklin Street property line towards the center of the block but slightly north bounded by Franklin, Geary, Van Ness and Post. Please see map included in the AECOM report. Per the AECOM document, Page 44, this is the land that Horace Hawes, an influential lawyer, legislator and philanthropist donated to the Ladies' Protection Home Relief Society. Will CPMC follow the AECOM findings and carefully excavate the area of artifacts that could be from this Children's Home? There could be evidence in the filled in pits as well. An archaeological monitor should be on site during the excavations of this area."

(Rose Hillson—Member, Jordan Park Improvement Association, October 14, 2010) [58-4 CP, duplicate comment was provided in 98-4 CP]

"In addition, 'priority' buildings are noted in the AECOM report for the Cathedral Hill Project. One building is 117 Cedar which concerns a Mexican-American family; 1014 Geary which concerns a Chinese servant; and 1106 Van Ness which concerns a Japanese servant. Objects of unique archaeological significance could be encountered at these locations which could add to the cultural history and settlement of these peoples. The current Cathedral Hill Hotel may be sitting on some culturally significant findings related to these 'priority' buildings and again, a monitor should be on stand-by for the excavation and grading activities."

Response CP-8

The comments suggest that significant findings related to the history of children and orphans at the Cathedral Hill Campus site, as well as Mexican-American, Chinese, Japanese, and German settlements in San Francisco might be encountered by proposed LRDP construction at the Cathedral Hill Campus. The comments further suggest careful excavation in an area where a children's home was previously located, and also archaeological monitoring of the same area.

The discussion of the proposed Cathedral Hill Campus site under Impact CP-2 in the Draft EIR, beginning on page 4.4-36, acknowledges the potential for the presence of buried archaeological remains, and Mitigation Measures M-CP-N2 in the Draft EIR, page 4.4-38, would provide for preconstruction testing, archaeological monitoring, and other tasks to be implemented for the purposes of identifying and evaluating buried cultural resources. If, based on the findings of the archaeological testing program described in Mitigation Measure M-CP-N2, buried remains such as those described by the comments were found, an Archaeological Monitoring Program would be implemented in accordance Mitigation Measure M-CP-N2. Please see Response CP-3 (page C&R 3.6-3) for further information.

Comment

(Barbara Kautz—Bernal Heights Neighborhood Center and Cathedral Hill Neighbors Association, October 19, 2010) [87-52 CP, duplicate comment was provided in 108-52 CP]

"The DEIR does not analyze the impacts of the Cathedral Hill Hospital on the Unitarian Universalist Church, a locally significant historic resource, in particular, the effects of increased noise and traffic and reduced parking on the viability of the Church."

Response CP-9

The comment states that the Draft EIR does not consider the historical resources impacts to the Unitarian Universalist Church or pay any particular attention to the effects of increased noise, traffic congestion, and reduced parking for church members, relevant to the long-term viability of the church.

The Unitarian Universalist Church, located at 1187 Franklin Street, is designated as City of San Francisco Landmark #40, and thus qualifies as a historical resource under CEQA. As discussed in Response CP-11 (page C&R 3.6-10), the 2010 HRER assessed both direct and indirect impacts of construction and demolition activities at the proposed Cathedral Hill Campus and concluded that no impacts would occur on adjacent historical resources. This is because the proposed Cathedral Hill Campus buildings would "repeat a common condition in the Van Ness corridor of buildings of differing scale, age, and architectural character being juxtaposed. The individual resources would not suffer impairment of their integrity of setting."[3]

The comment suggests that the proposed LRDP activities at the Cathedral Hill Campus could result in noise, traffic, and parking conditions that would make conditions no longer viable for the congregation to use the church building at 1187 Franklin Street. This further suggests that, if no longer viable as a church, this could result in building abandonment and eventual demolition. Demolition resulting from neglect happens incrementally through a lack of maintenance and exposure of the building to vandalism and natural forces such as weather and infestation.

It is highly speculative to presume that any worsening of noise, traffic, or parking conditions in the area surrounding the proposed Cathedral Hill Campus would result in a loss of viability that could lead to demolition of the Unitarian Universalist Church building resulting from neglect, and thus significantly impact this historical resource. Religious institutions currently exist and thrive in close proximity to hospitals throughout the City and the Bay Area; for example, the Congregation Sherith Israel is located on the block south of the CPMC Pacific Campus. No known evidence suggests that introduction of hospital land uses would be incompatible with the viability of churches, and thus the possible loss of viability would be purely speculative. Unfounded speculation is specifically excluded and addressed in Section 15145 of the State CEQA Guidelines, which states that if "a Lead Agency finds that a particular impact is

[3] California Pacific Medical Center. 2010 (February). *Historic Evaluation Report for Cathedral Hill Campus: California Pacific Medical Center*. Page 33. San Francisco, CA. Prepared by Knapp Architects, San Francisco, CA.

too speculative for evaluation, the agency should note its conclusion and terminate discussion of the impact."

Overall, no substantial evidence exists that the changes in noise, traffic, or parking caused by the proposed LRDP at the Cathedral Hill Campus, during either the construction or operational phase, would be the cause of substantial adverse changes to the historical resource at some future, unknown time. Because such speculative analysis is outside the scope of CEQA, discussion of this impact is not included in the Draft EIR.

Comment

(San Francisco Planning Commission Special Hearing—Commissioner Hisashi Sugaya, September 23, 2010) [PC-361 CP]

"I can comment and will be commenting on very specific things, like 'I believe the historic resource evaluation for the campus being proposed on Van Ness and Geary is totally inadequate'; and I'll be telling staff why I think that's true – I mean, not true, but why I think it needs some work."

Response CP-10

The comment is noted. Please see Response CP-11 (page C&R 3.6-10), Response CP-12 (page C&R 3.6-12), Response CP-13 (page C&R 3.6-13), Response CP-22 (page C&R 3.6-20), and Response CP-16 (page C&R 3.6-15) for responses to specific comments regarding historical resources.

Comment

(Commissioner Hisashi Sugaya, October 15, 2010) [116-10 CP]

"Pg. 4.4-30. Why was the Knapp survey limited to an evaluation of 'historic architectural resources at the properties composing the site of the proposed [Cathedral Hill] campus?' Shouldn't the survey have included properties adjacent to the development site since they could potentially be affected directly or indirectly (construction impacts, vibration) by the project? Examples: Goodman Building across Geary Boulevard; the two churches to the west across Franklin Street and the properties at the NE and SE corners of Van Ness and Post Street."

Response CP-11

The comment asks why the Knapp survey was limited to an evaluation of historic architectural resources located on the properties that comprise the site of the proposed Cathedral Hill Campus. The comment states that the survey should have included properties adjacent to the Cathedral Hill development site, such as the Goodman Building, two churches west across Franklin Street, and properties at the northeast and southeast corners of Van Ness and Post Street. The comment further states that adjacent properties surrounding the proposed Cathedral Hill Campus should be included as part of the survey, because of the potential for direct or indirect effects, such as LRDP-related construction impacts or vibration impacts.

The original scope of work for the HRER (prepared by Frederic Knapp) defined the survey area as the properties on the site of the proposed Cathedral Hill Campus. However, on review of the draft HRER document, the Planning Department technical specialist expanded the scope to include an area around the development site that would allow for identification of adjacent historical resources that could be adversely affected by the construction and operation of the proposed Cathedral Hill Campus under the LRDP.

This expansion of scope is shown in the February 2010 updated HRER,[4] which includes the results of a search of records on file with the California Office of Historic Preservation's California Historical Resources Information System. The search was conducted to identify previously surveyed historical resources within an area bounded by Sutter Street, Polk Street, O'Farrell Street, and Franklin Street (inclusive of all buildings facing the boundary streets) plus an extension along Van Ness Avenue south to Eddy Street. The search revealed that fourteen previously identified historical resources are located adjacent to the sites for the proposed Cathedral Hill Hospital and Cathedral Hill MOB buildings, including each of the buildings and areas listed in the comment. The following resources were identified:

- Don Lee Building, 1000 Van Ness Avenue, 1S rating (listed in NRHP as individual property); also recorded as City Landmark #41
- Emeric Building/St. Beryl Hotel/Goodman Building, 1117 Geary Street, 1S rating
- Hamilton Square Baptist Church, 1212 Geary Boulevard, 6Y rating (determined ineligible for NRHP by consensus)
- Hotel Merit, 1105 Post Street, 3D rating (appears eligible as contributor to a district)
- 1115 Post Street, 3D rating
- 1133 Post Street, 3D rating
- Yellowstone Apartments, 1141 Post Street, 3D rating
- Jack's Turkish Bath, 1143 Post Street, 3D rating
- Omar Apartments, 1151 Post Street, 3D rating
- Thomas Starr King Sarcophagus, 1187 Franklin Street, 3S rating (appears eligible for listing in NRHP as separate property)
- Baldwin Apartments, 1036 Polk Street, 1D rating (listed in NRHP as a contributor to a district)
- New Poodle Dog Restaurant and Hotel, 1115 Polk Street, 3D rating
- First Unitarian Universalist Church, 1187 Franklin Street, City Landmark #40
- St. Mark's Evangelical Lutheran Church, 1135 O'Farrell Street, City Landmark #41

As such, the Cathedral Hill Campus HRER and the analysis of the CPMC LRDP Draft EIR include an evaluation of sites adjacent to the proposed Cathedral Hill Campus that are consistent with this comment.

With regard to the concern for LRDP construction or vibration impacts on adjacent historical resources, several points are noted. The accepted standard for determining "excessive" vibration with regards to impacts on historical buildings has been established by the California Department of Transportation (Caltrans), which has conducted extensive study of the effects of heavy vehicle traffic, construction activity, and other sources of vibration. Vibrations exceeding the Caltrans-recommended standard of 0.25 inches/second peak particle velocity (PPV) have the potential to cause physical damage to historic and old buildings.

[4] California Pacific Medical Center. 2010 (February). *Historic Evaluation Report for Cathedral Hill Campus: California Pacific Medical Center*. San Francisco, CA. Prepared by Knapp Architects, San Francisco, CA.

As shown in Table 4.6-35 in the Draft EIR, page 4.6-29, the Hamilton Square Baptist Church would be 70 feet from the proposed Cathedral Hill Hospital construction activities and could be exposed to a maximum of 0.045 inches/second PPV, which would not exceed the 0.25 inches/second PPV threshold. The First Unitarian Universalist Church (1187 Franklin Street) and the Goodman Building (1117 Geary Street) are located the same or greater distance from proposed Cathedral Hill Hospital construction activities, and also would not experience excessive vibrational impacts. Similarly, the anticipated vibration levels along Cedar Street attributable to the construction of the proposed Cathedral Hill MOB would not exceed 0.074 inches/second PPV, which would not exceed Caltrans' recommended limit of 0.25 inches/second PPV. As such, no damage to the historic structures located on the north side of Cedar Street or south side of Post Street between Van Ness Avenue and Polk Street is anticipated with development of the Cathedral Hill Campus under the LRDP.

To address unanticipated impacts of the Cathedral Hill development construction under the LRDP, a construction vibration management plan would be prepared. The preexisting condition of all buildings within a 50-foot radius and historical buildings within the immediate vicinity of proposed Cathedral Hill construction activities would be recorded in the form of a preconstruction survey. This survey would be used to evaluate damage caused by construction activities, and buildings damaged would be repaired to their preexisting conditions. For more information about this measure, please see Mitigation Measure M-NO-N5 on page 4.6-93 of the Draft EIR. For additional information regarding potetntial significance of the Cathedral Hill Hotel (formerly Jack Tar Hotel), please see Appendix H: Modern Context Statement Memo.

Comment

(Commissioner Hisashi Sugaya, October 15, 2010) [116-11 CP]

"Why was the survey limited to 'historic architectural resources?' Eligibility criteria for the California Register of Historical Resources has more criteria than architectural significance. Evaluation of Tommy's Joynt would fall under one of these other criteria."

Response CP-12

The comment asks why the Cathedral Hill HRER survey was limited to historic architectural resources and notes that architectural significance is just one of the criteria for determining eligibility for listing in the California Register of Historical Resources (CRHR). The comment also suggests that an evaluation of Tommy's Joynt would be an example of an appropriate use of one of the non-architectural criteria for significance.

Eligibility for listing in the CRHR is based on a combination of historical significance and historical integrity. There are four categories of significance: 1) association with events, trends, or patterns of history; 2) association with people who played an important role in history; 3) important trends, styles, or innovations in architectural design; and 4) the potential to yield information about important research questions about the past. The fourth area of significance is typically applied to archeological sites and rarely to historic buildings and structures. Historical integrity is generally a significant resource's ability to convey its significance through retention of location, design, materials, workmanship, feeling, setting, and association.

The 2010 Historic Evaluation Report conducted by Frederick Knapp for the proposed Cathedral Hill Campus[5] applied the three applicable criteria to each of the buildings, structures, and objects surveyed. For each resource evaluated, the Report includes a discussion of the historical trends that form the context for the resource, any known associations with historically significant people, and a description of the

[5] Ibid.

construction and use of the building. This historical narrative is followed by an evaluation under CRHR criteria, which analyzes the building against each of the first three criteria and is followed by a discussion of the current condition and historical integrity of the building. The report was reviewed by the City's professionally qualified preservation planning staff, who deemed the HRER adequate for the purpose of identification of historical resources under CEQA and concurred with Knapp's findings that no buildings exist on the project sites that meet the CRHR criteria.

Identification of historical resources adjacent to the proposed Cathedral Hill sites under the LRDP was accomplished through a review of previously documented historical resources. This was deemed to be an appropriate level of investigation, considering the low potential for LRDP activities to adversely impact adjacent historical resources. Indirect impacts associated with construction and vibration would be mitigated through Mitigation Measure M-NO-N5 (beginning on page 4.6-93 of the Draft EIR), which applies to all buildings located within a 50-foot radius of LRDP construction activities.

Therefore, based on the review of substantial evidence that was prepared by a qualified historic resources professional under the guidance of the Planning Department preservation technical specialist and meets professional standards, the proposed LRDP development at the Cathedral Hill Campus would not have adverse effects on on-site or off-site historical resources.[6]

Comment

(Commissioner Hisashi Sugaya, October 15, 2010) [116-12 CP]

"Shouldn't the newer survey of Van Ness Avenue by William Kostura also be used in 4.4 Cultural Resources?"

Response CP-13

The comment suggests that the newer survey of Van Ness Avenue by William Kostura[7] should be used in the Draft EIR, Section 4.4, "Cultural and Paleontological Resources."

The 2010 Kostura survey of a potential auto row historic district on Van Ness Avenue was being prepared at the same time that the 2010 HRER for the proposed Cathedral Hill Campus site was being prepared by Frederic Knapp.[8] The authors of the Knapp report contacted architectural historian William Kostura and obtained preliminary findings of Kostura's evaluation of automotive-related properties in the Van Ness Avenue corridor. These preliminary results were incorporated into the February 2010 HRER and thus informed the documentation that was used in the historic resources analysis in the CPMC LRDP Draft EIR. The final results of the Kostura survey are consistent with the preliminary findings incorporated into the 2010 HRER, and thus no change would be necessary to the Draft EIR analysis.

To better reflect the inclusion of the Kostura survey in the Draft EIR analysis of project impacts, and to clarify an erroneous characterization of the Van Ness Avenue Area Plan, the Draft EIR, page 4.4-31, second full paragraph will be revised as follows:

> The Van Ness Avenue Area Plan does not acknowledge any of the buildings on the proposed Cathedral Hill Campus referred to in this impact discussion as being historically significant <u>as defined by CEQA</u> ~~or contributing to the overall character of the area~~. The Van Ness Avenue corridor is characterized by remnant residential structures and distinctive automobile showrooms. The commercial buildings that also make up the streetscape are less significant because they tend

[6] San Francisco Planning Department. 2010 (March 18). *Historic Resource Evaluation Response: Cathedral Hill Campus, California Pacific Medical Center*. Case 2005.0555E. Major Environmental Analysis Division. San Francisco, CA.

[8] Knapp, op. cit.

to later be used for commercial infill. The ~~Planning Department also~~ Knapp Architects survey identified the area as a potential district composed of a cohesive group of commercial buildings associated with the reconstruction period following the 1906 San Francisco Earthquake and Fire. The Planning Department determined that the buildings on the site of the proposed Cathedral Hill Medical Office Building (MOB) did not retain sufficient integrity to qualify as a district. The Knapp Architects survey also identified a potential historic district on Van Ness Avenue, associated with trends in automotive history. However, this district was also found to not meet the CRHR criteria because of a lack of integrity.

3.6.3 PACIFIC CAMPUS

Comment

(Rose Hillson—Member, Jordan Park Improvement Association, October 14, 2010) [58-5 CP, duplicate comment was provided in 98-5 CP]

"**PACIFIC CAMPUS PROJECT SITE:**

The AECOM document, Page 30, states that there is a Chinese laundry that used to be immediately south of the Clay/Webster Street Garage. Apparently, many Chinese servants were also employed by the households in the immediate vicinity of the proposed project or moved to the project site area after the 1906 fire burned them out of the Chinatown area. In the AECOM report, via the 1910 U.S. Census data, several Chinese lived at 2117 Webster and their occupations are all listed as 'laundryman.' Based on the listing, their surname was Yee. Would the Chinese Historical Society be contacted?"

Response CP-14

The comment asks whether the Chinese Historical Society would be contacted in reference to potential Chinese cultural resources in the immediate vicinity of the Pacific Campus site. The Chinese Historical Society of America would be contacted, in the event of discovery of potentially CRHR-eligible Overseas Chinese archeological deposits. To ensure that any potential archaeological resources that might be encountered would be handled appropriately and as directed by mitigation measures in the Draft EIR, Mitigation Measure M-CP-N2 (beginning on page 4.4-38 of the Draft EIR) has been revised to include the following additional coordination with local organizations:

> *Chinese and Japanese Archaeological Sites.* In the event of discovery of a potentially CRHR-eligible Overseas Chinese or Japanese archaeological deposit, the appropriate descendent representative organization, that is, the Chinese Historic Society of America or the National Japanese American Historical Society, shall be notified and shall be allowed the opportunity to monitor and advise further mitigation efforts, including archaeological identification, evaluation, interpretation, and public interpretive efforts.

Comment

(Rose Hillson—Member, Jordan Park Improvement Association, October 14, 2010) [58-6 CP, duplicate comment was provided in 98-6 CP]

"Also, for the Pacific Campus project site, 2415 Clay is mentioned as having employed Japanese laborers. Also the building location of 2310 Sacramento Street was considered a priority site due to a Japanese servant living there. So these are picked out as highly potential areas of significant archaeological finds. Will the local Japanese National Historical Society be contacted should there be findings?"

Response CP-15

The comment asks if the Japanese National Historical Society would be contacted if cultural resources were found at the Pacific Campus site. The National Japanese American Historical Society would be contacted, in the event of discovery of potentially CRHR-eligible Japanese archeological deposits. To ensure that any potential archaeological resources that might be encountered would be handled appropriately and as directed by mitigation measures in the Draft EIR, the text of the Draft EIR has been revised as described above in Response CP-14 (page C&R 3.6-14).

Comments

(Paul Wermer—CPMC Neighbors Coalition and Pacific Heights Residents Association, October 18, 2010) [67-16 CP]

"4) CULTURAL AND PALEONTOLOGICAL RESOURCES:

The DEIR does not address potential adverse impacts on the immediately adjacent Webster Street Historic District. In particular, how will construction be managed to avoid damage to historic structures in neighboring and nearby lots? This assessment needs to include the impact of vibrations resulting from heavy vehicles; in some cases existing traffic causes undue vibration in neighboring residences, hence the concern about construction traffic.

(See also comments under AESTHETICS, above)"

(Commissioner Hisashi Sugaya, October 15, 2010) [116-14 CP]

"Pg. 4.4-35. 1st paragraph. The last sentence says there are no physical impacts. What about indirect affects?" (The referenced sentence reads: The [2008 Knapp Architects] report also includes information regarding a nearby historic district, which would not be physically affected by implementation of the LRDP at the Pacific Campus.)

Response CP-16

The comments state that the CPMC LRDP Draft EIR does not address potential adverse impacts of the proposed LRDP-related demolition and construction at the Pacific Campus on the immediately adjacent Webster Street Historic District. The comments ask how the proposed LRDP construction would be managed to avoid damage to historic structures in neighboring and nearby lots. The comments also state that the Draft EIR should include an assessment of the LRDP's impact to buildings in the Webster Street Historic District caused by vibrations resulting from heavy vehicles used during LRDP Pacific Campus construction activities, which would be even greater than existing vibration caused by normal traffic. The comments ask whether the LRDP might have indirect impacts on the Webster Street Historic District.

The Webster Street Historic District includes parcels fronting on Webster Street between Clay Street and Jackson Street, except for the following: one parcel at the northwest corner of Clay and Webster (currently occupied by CPMC), the northwest half of the block north of Clay and Webster (currently occupied by CPMC buildings), and the east side of Webster Street between Washington Street and Jackson Street. The discussion provided in the Draft EIR, page 4.4-35, notes that no physical impacts to the Webster Street Historic District are anticipated because none of those parcels are slated for demolition.

There are two points to consider with regards to indirect impacts to the Webster Street Historic District: 1) whether an impact would occur to the setting of the district and 2) whether demolition/construction activities would result in physical damage, such as damage caused by excessive vibration. The setting of the historic district would effectively remain the same, because the setting currently includes the Pacific Campus. The only proposed new construction at the Pacific Campus under the LRDP in the immediate

vicinity of the Webster Street Historic District would be the North-of-Clay Aboveground Parking Garage, to be located on the northeast corner of Clay and Webster Streets immediately adjacent to one of the boundaries of the Webster Street Historic District. This corner is currently occupied by the CPMC Gerbode Research Building at the Pacific Campus, which would be demolished. The proposed North of Clay Aboveground garage would not have a significant adverse impact on off-site historic resources, including the Webster Street Historic District, because the proposed new buildings at the Pacific Campus site would not substantially change the existing scale and character of the site and would maintain the existing spatial relationship of the Pacific Campus with its surrounding residential areas.[9] As stated in the Draft EIR, pages 2-118 and 2-119, because construction of the parking facilities at the Pacific Campus would begin in the long term (approximately 2018) and are not anticipated to be completed before 2020, long-term project components at the Pacific Campus would undergo future design review and would be subject to separate, project-specific environmental review under CEQA. Therefore, additional consideration would be paid to compatibility of the North of Clay Aboveground garage with the surrounding Webster Street Historic District during project-level review in the future.

Regarding potential impacts from vehicle-induced or construction vibration related to Pacific Campus development under the LRDP, the accepted standard for determining "excessive" vibration with regards to impacts on historical buildings has been established by the Caltrans, which has conducted extensive study of the effects of heavy vehicle traffic, construction activity, and other sources of vibration. Vibrations exceeding the Caltrans-recommended standard of 0.25 inches/second PPV have the potential to cause physical damage to historic and old buildings. Properties adjacent to the Pacific Campus site, including resources in the Webster Street Historic District, are not anticipated to be exposed to vibrations exceeding the Caltrans-recommended standard maximum threshold of 0.25 inches/second PPV. As shown in Table 4.6-36 in the Draft EIR, page 4.6-95, structures located approximately 25 feet from construction could be exposed to a maximum of 0.21 inches/second PPV, which would not exceed the 0.25 inches/second PPV thresholds. Other buildings in the Webster Street Historic District that are further removed from this 25-foot radius would experience less vibration impact, and thus LRDP construction with respect to these structures would also not exceed the thresholds. However, considering the proximity of the historic district parcels to the proposed subsurface and surface demolition and construction, the need for construction monitoring of the historic structures would be considered during project-specific environmental review in the future.

The comments are noted, and they will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project.

3.6.4 CALIFORNIA CAMPUS

Comment

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-108 CP, duplicate comment was provided in 30-108 CP]

"And 3698 California Street is also the problem of demolishing a potential historic resource."

Response CP-17

The comment states that at CPMC's California Campus a potential historic resource could be demolished by LRDP construction at 3698 California Street.

[9] San Francisco Planning Department. 2010 (March 18). *Historic Resource Evaluation Response: Cathedral Hill Campus, California Pacific Medical Center*. Case 2005.0555E. Major Environmental Analysis Division. San Francisco, CA.

Demolition of the existing building at 3698 California Street is not part of the proposed CPMC LRDP. As stated in the Draft EIR, CPMC anticipates selling the California Campus by 2020, after completion of other elements of the LRDP, and the relocation of that campus' inpatient services to the proposed Cathedral Hill Hospital and its other services to the Pacific Campus. Current expectations are that some existing on-site medical activities would continue at the California Campus in a relatively small amount of space that CPMC would lease back from the new property owner indefinitely.

In the foreseeable future, any concern about the potential demolition of the 3698 California Street structure is speculative; the project description in the Draft EIR, page 2-131, notes, "[N]o substantial changes are proposed at the California Campus in the near term; no demolition or alteration of existing structures is proposed." The plans and future actions of a currently unknown future owner are speculative and cannot be known at this time. Although forecasting the future based on substantial evidence in the record is a key part of the CEQA process, unfounded speculation is specifically excluded and addressed in Section 15145 of the State CEQA Guidelines, which states that if "a Lead Agency finds that a particular impact is too speculative for evaluation, the agency should note its conclusion and terminate discussion of the impact."

As the future of the California Campus after it might be sold by CPMC is entirely speculative, no further discussion of this issue is presented in the Draft EIR.

Comment

(Rose Hillson—Member, Jordan Park Improvement Association, October 14, 2010) [58-13 CP, duplicate comment was provided in 98-13 CP]

"**CALIFORNIA CAMPUS PROJECT SITE:**

No additional paleontological or archeological reports were provided for this site. In this regard, I conclude that no excavation will be occurring at this campus site nor would there be any plans to until such reports are provided. Historical resource information as it related to the existing buildings was provided on CD of Administrative Documents for this CPMC DEIR which did not cover the archeological/paleontological aspects of this site.

Thank you for this opportunity to comment on the paleontological and archaeological portion of this CPMC DEIR."

Response CP-18

The comment notes that no additional paleontological or archaeological reports were provided for the California Campus site. The comment is noted. No excavation is planned for the California Campus, and thus, no impacts would occur to archaeological or paleontological resources.

3.6.5 DAVIES CAMPUS

Comment

(Rose Hillson—Member, Jordan Park Improvement Association, October 14, 2010) [58-8 CP, duplicate comment was provided in 98-8 CP]

"**DAVIES CAMPUS PROJECT SITE:**

Because the Davies Campus site is close to the Mission Dolores historic landmark, and the AECOM report states that there could have been 'camps' of Native Americans as early as the beginning of the Mission Period in the area even a half mile away, it would behoove CPMC to have an archeological monitor on site for this particular

project especially since the Davies project is only 3 blocks away from Mission Dolores. I have read of shell middens being found in other publications where Native Americans could have had extensive activity. Also, please have increased security on this campus during and after breaking ground to protect the potential historic resources.

The location of the proposed CPMC Davies Campus project appears to be on sensitive land and serious archeological excavation and handling techniques may be warranted."

Response CP-19

The comment suggests that because the location of the proposed Davies Campus appears to be on sensitive land, serious archaeological excavation and handling techniques might be warranted during LRDP development at this campus. The comment also suggests having an archaeological monitor on site at the Davies Campus.

The discussion of the Davies Campus site under Impact CP-2 in the Draft EIR, beginning on page 4.4-36, acknowledges the potential for the presence of buried archaeological remains, and Mitigation Measure M-CP-N2 in the Draft EIR, beginning on page 4.4-38, would provide for preconstruction testing, archaeological monitoring, and other tasks to be implemented for the purposes of identifying and evaluating buried cultural resources. The level of security in the event of the discovery of archaeological remains would be relative to the sensitivity of the remains. In addition to the requirements for security, safety protocols would require fencing or covering of open excavation pits. Specific security and safety protocols would be identified in the Archaeological Testing Plan/Archaeological Data Recovery Plan. Please see Response CP-3 (page C&R 3.6-3) for further information.

Comment

(Rose Hillson—Member, Jordan Park Improvement Association, October 14, 2010) [58-9 CP, duplicate comment was provided in 98-9 CP]

"Due to skip samples used at this Davies campus to determine if there are any prehistoric deposits, they could have been missed. The recommendations stated to take additional boring samples especially around the concrete piers that will be constructed. The Sonoma University document states that there were 'limited number (of) geotechnical borings and the incomplete sampling techniques which could have easily skipped over prehistoric deposits, if present.' Will more current testing be done?"

Response CP-20

The comment asks if more boring samples would be conducted, to determine if prehistoric deposits are present at Davies Campus.

The discussion of the Davies Campus site under Impact CP-2 in the Draft EIR, beginning on page 4.4-36, acknowledges the potential for the presence of buried archaeological remains, and Mitigation Measure M-CP-N2 in the Draft EIR, beginning on page 4.4-38, would provide for preconstruction testing, archaeological monitoring, and other tasks to be implemented for the purposes of identifying and evaluating buried cultural resources. Please see Response CP-3 (page C&R 3.6-3) for further discussion of the ARDTPs for the proposed LRDP and the procedures that would be undertaken to insure that any paleontological and archaeological resources encountered would be dealt with appropriately.

3.6.6 ST. LUKE'S CAMPUS

Comment

(Rose Hillson—Member, Jordan Park Improvement Association, October 14, 2010) [58-10 CP, duplicate comment was provided in 98-10 CP]

"**ST. LUKE'S CAMPUS PROJECT SITE:**

From the archeological documents on the Davies Campus site, it appears that the LRDP project will run into some archeological resources very near. There is mention of the adobe ranch house that Jose Cornelio Bernal (for which Bernal Heights was named) lived in and later occupied by his wife Carmen on a map from 1861.

The report from AECOM states 'without new or comparative data, many important questions regarding chronology, settlement, and subsistence cannot be properly addressed or answered, and the current research questions cannot be confirmed, denied, or refined beyond our present understanding. Thus a reasonable amount of subsurface exploration is often needed to determine whether earth-disturbing projects will impact buried archaeological resources.' report states a recommendation to perform subsurface coring or the use of an archaeological monitor.

Overall, the mitigation measures in the DEIR give some broad guidelines as implementation measures to address how archaeologically significant areas will be handled once artifacts are found, but based on the scientific document by Sonoma State and the Holocene period soils level and the Colma formation levels, the samples should have gone deeper to really be able to come to any solid conclusions and the samples should have been more contiguous rather than shallow and random as were the samples taken. No substantial proof in the paleosols would occur if one already knows that the artifacts, e.g. are at 14 feet or deeper and the samples are taken up to 8 feet below the surface. To conclude that since these shallow and arbitrary paleosols contain no important Holocene era deposits or Colma formation artifacts or any other significant artifacts from 200 years or more ago and hence nothing of any paleontological or archaeological significance exists would be inaccurate science. That is why the Sonoma University documents suggest strongly to carry out archaeological monitoring or the subsurface coring in more contiguous spots and at the depths likely to yield the significant resources near the sensitive areas. Will additional testing be done?"

Response CP-21

The comment suggests that further archaeological monitoring or sampling should be conducted at St. Luke's Campus under the LRDP and asks if this would be done.

The discussion of the St. Luke's Campus site under Impact CP-2 in the Draft EIR, beginning on page 4.4-36, acknowledges the potential for the presence of buried archaeological remains, and Mitigation Measure M-CP-N2 in the Draft EIR, beginning on page 4.4-38, would provide for preconstruction testing, archaeological monitoring, and other tasks to be implemented for the purposes of identifying and evaluating buried cultural resources. Please see Response CP-3 (page C&R 3.6-3) for further discussion of the ARDTPs for the proposed LRDP and the procedures that would be undertaken to ensure that any paleontological and archaeological resources encountered would be dealt with appropriately.

Comment

(Commissioner Hisashi Sugaya, October 15, 2010) [116-13 CP]

"Pg. 4.4-34. 2nd paragraph. Aren't there potential impacts from demolition of the 12-story hospital tower on the historic resource such as construction activities associated with the demolition, vibration? There are standard

mitigations for these types of impacts; please include and revise the evaluation: potential impacts have been identified, but which can be mitigated."

Response CP-22

The comment references the discussion in the second paragraph in the Draft EIR, page 4.4-34, and asks about potential impacts from LRDP-related demolition to the 12-story hospital tower at the St. Luke's Campus that could impact the historic 1912 Building also on campus. The comment suggests that mitigation should be included in the Draft EIR, that the impact evaluation should be revised to reflect the potential for impacts to this 1912 Building, and that such impacts have been identified but can be mitigated.

As noted in the comment, if excessive vibration is caused by heavy vehicle traffic, pile driving, demolition of existing structures, and other construction activities at St. Luke's Campus under the LRDP, a potential would exist for such vibration to cause physical damage to nearby historic buildings. The accepted standard for determining "excessive" vibration with regards to impacts on historical buildings has been established by Caltrans, which has conducted extensive study of the effects of heavy vehicle traffic, construction activity, and other sources of vibration. Vibrations exceeding the Caltrans-recommended standard of 0.25 inches/second PPV would have the potential to cause physical damage to historic and old buildings.

The only CRHR-eligible historical resource located on the St. Luke's Campus is the 1912 Building. The 1912 Building is one building removed (approximately 100 feet) from the existing Hospital Tower, which would make it unlikely to suffer physical damage during demolition of the Hospital Tower or construction of the new St. Luke's Replacement Hospital or MOB/Expansion Building. Regarding potential impacts from vibration, Table 4.6-35 in the Draft EIR, page 4.6-35, shows that structures located approximately 55 feet from construction at the St. Luke's Campus could be exposed to a maximum of 0.064 inch/second PPV, which would not exceed the 0.25 inch/second PPV thresholds, which has the potential to cause damage to historic and old buildings. Buildings further removed from this, such as the 1912 Building located approximately 100 feet away from the demolition of the existing Hospital Tower and construction activity at the proposed St. Luke's Replacement Hospital and MOB/Expansion Building, would experience less vibration, and thus also would not exceed the vibration thresholds.

To address unanticipated potential impacts of LRDP construction, a construction vibration management plan would be prepared. The preexisting condition of all buildings within a 50-foot radius and historical buildings within the immediate vicinity of proposed LRDP construction activities would be recorded in the form of a preconstruction survey. This survey would be used to evaluate damage caused by construction activities, and buildings damaged would be repaired to their preexisting conditions. For more information about this measure, please see Mitigation Measure M-NO-N5 on page 4.6-93 of the Draft EIR.

Because the vibration levels related to LRDP development at St. Luke's Campus would not exceed the threshold which would have the potential to impact historic buildings, and because any potential vibration impacts would be purely speculative, no revision of the Draft EIR impact findings is necessary.

3.7 TRANSPORTATION

3.7.1 SETTING

3.7.1.1 STUDY AREA

Comment

(Margaret Kettunen Zegart, October 20, 2010) [97-16 TR]

"• Adverse impact of "cut through" and alternative streets used for drivers through residential neighborhoods, such as Little Saigon, Tenderloin, the 20 residential high rise senior care facilities on Post and Sutter including the Towers (noise - sirens and increased traffic) and pedestrian safety."

Response TR-1

The comment expresses concern about potential effects on traffic and pedestrian safety in the nearby Little Saigon area, in the Tenderloin, and along Post and Sutter Streets that would be associated with the proposed Cathedral Hill project, in particular "cut through" traffic or vehicles using alternate streets. Draft EIR Section 4.5, "Transportation and Circulation," identifies several cumulative traffic impacts on and near Post Street and Sutter Street that would be associated with proposed development of the Cathedral Hill Hospital and Cathedral Hill Medical Office Building (MOB): Impacts TR-101, TR-104, TR-108, TR-113, and TR-117 (pages 4.5-219, 4.5-221, 4.5-223, 4.5-226, and 4.5-228, respectively).

A supplemental analysis (C&R Appendix E) was prepared for intersections in the Tenderloin and Civic Center areas, as documented in the technical memorandum *Supplemental-Sensitivity Transportation Impact Analyses for the California Pacific Medical Center Cathedral Hill Campus in San Francisco, CA* (Fehr & Peers 2011). The purpose of this analysis was twofold: (1) to determine if implementation of the proposed CPMC LRDP at the Cathedral Hill Campus would result in any significant impacts to traffic, pedestrians, or bicycles in the Tenderloin/Little Saigon neighborhood that were not identified in the Draft EIR; and (2) to determine if an increase in the number of project-generated trips through the neighborhood beyond what was assumed in the Draft EIR would create additional transportation impacts. No additional impacts were identified, and the findings of the supplemental sensitivity analysis are summarized in Response TR-124 (C&R 3.7-207). For information on siren noise in the Tenderloin/Little Saigon neighborhood please also see Response NO-59 (page C&R 3.8-64). Potential impacts related to traffic-generated noise are addressed in Response NO-36 (page C&R 3.8-45).

3.7.1.2 GOLDEN GATE TRANSIT ROUTES

Comment

(Ron Downing—Golden Gate Bridge Highway & Transportation District, September 14, 2010) [11-1 TR]

"Golden Gate Bridge, Highway and Transportation District (District) staff has reviewed the Draft Environmental Impact Report (DEIR) for the California Pacific Medical Center (CPMC) Long Range Development Plan (Case No. 2005.0555E) and offers the following comments:

- The District requests that the description of Golden Gate Transit (GGT) bus service located on Page 4.5-30 be corrected to state that Route 92 operates in the vicinity of the California Campus. Also, a sixth bus route, Route 80, serves the Cathedral Hill Campus but is not included in Tables 4.5-6 and 4.5-7 because it operates only during evening and weekend hours. While the route listing is correct at the time of publication of the DEIR, please note that Route 73 will be discontinued effective September 12."

Response TR-2

The comment requests that revisions be made to the description of Golden Gate Transit (GGT) bus service contained in the Transportation section of the Draft EIR. Including these additional GGT lines on Page 4.5-30 of the Draft EIR does not affect the results of the transit analysis presented in the Draft EIR. The analysis of the California Campus, where medical services would be reduced, did not assume any future changes to transit ridership on Golden Gate Transit related to the project, and including Route 92 in the transit description for California Campus would only provide additional details about lines that existing transit commuters from the North Bay might use to access the campus and would not alter the transit analysis for California Campus. The transit analysis for the Cathedral Hill Campus considers weekday peak-hour ridership; therefore, Route 80 would not be operating during the hour for which transit to and from Cathedral Hill Campus was analyzed. Discontinuation of Route 73, which occurred after the release of the Notice of Preparation, would reduce total transit capacity to and from the North Bay during the peak hour; however, the remaining GGT lines are expected to have sufficient remaining capacity to absorb additional ridership.

The following row and footnote has been added to Table 4.5-6 on page 4.5-30 of the Draft EIR:

Route 80[2]	Southbound	5:43 p.m.–9:56 p.m.	–	50-60
	Northbound	7:31 p.m.–11:31 p.m.	–	30-60

"Note 3: Since the issuance of the NOP, service on Route 73 has been discontinued, effective September 2010."

In addition, on page 4.5-30 of the Draft EIR, the last sentence in the first full paragraph is revised to read:

"Golden Gate Transit is operated by the Golden Gate Bridge, Highway and Transportation District. GGT provides bus and ferry service between the North Bay (Marin and Sonoma Counties) and San Francisco. GGT operates 22 commuter bus routes, nine basic bus routes, and 16 ferry feeder bus routes into San Francisco. Basic bus routes operate at regular intervals of 15–90 minutes, depending on time and day of week. GGT also operates ferry service between Larkspur and Sausalito in the North Bay and the Ferry Building in San Francisco during the morning and evening commute periods. GGT operates five lines near the Cathedral Hill Campus. The closest stop is located at Van Ness Avenue and Geary Street. GGT Routes 10 and 92 also operate~~s~~ in the vicinity of the California Campus~~, and has~~; both routes have a stop at the intersection of Geary and Arguello Boulevards**."**

3.7.1.3 MUNI ROUTES 3-JACKSON AND 4-SUTTER

Comment

(Unitarian Universalist CPMC Task Force, October 5, 2010) [44-5 TR]

"Traffic impacts, public transportation. Volume 3, Chapter 4.5, Page 4.5-62: Regarding the 3-Jackson, the information printed is erroneous. The 3-Jackson is still in service and there are no plans to remove it from service. Regarding the 4-Sutter, this line is out of service but the report says it is in service."

Response TR-3

The comment references text on page 4.5-61 of the Draft EIR that describes the *potential changes* to various transit lines within the CPMC study area as part of the San Francisco Municipal Transportation Agency's (SFMTA's) Transit Effectiveness Project (TEP). The text is not intended to describe existing

transit services or conditions, which are described in the Draft EIR beginning on pages 4.5-16. According to the SFMTA's TEP recommendations, the 3-Jackson would be discontinued and replaced by service on the 2-Clement and 4-Sutter lines. The 4-Sutter was discontinued as part of the fiscal emergency plan implemented by SFMTA/San Francisco Municipal Railway (Muni) on December 9, 2010. Changes to service on the 4-Sutter as a result of the fiscal emergency are considered temporary, and service on the 4-Sutter could be reinstated before implementation of the TEP. Regardless, the results of the transit impact analysis would not be affected by this service change, because the 3-Jackson and 4-Sutter provide similar service and capacity along similar routes and the screenline analysis assumed that the 4-Sutter was discontinued into the future (Draft EIR Tables 4.5-1, 4.5-2, and 4.5-21, pages 4.5-23, 4.5-24, and 4.5-25, respectively).

3.7.1.4 DAVIES CAMPUS AND ST. LUKE'S CAMPUS ANALYSES

Comment

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-15 TR, duplicate comment provided in 30-15 TR]

"Although I concern myself mainly with the Cathedral Hill and Pacific campuses and although the California Campus proposal does not have a detailed analysis because it may be sold off, I believe after briefly reading the Davies and St. Luke's campus proposals that the same problems will occur for the new Davies and St. Luke's Campuses in regards to traffic congestion, diversion and parking; and should the California Campus proposal for remodeling be done by CPMC due to construction workers parking issues and related congestion, there will be similar traffic congestion and parking issues for those trying to shop at the Laurel Village Shopping Center near the California Campus."

Response TR-4

The comment states concerns about traffic congestion, diversion, and parking that could result from the CPMC LRDP proposals for the Davies and St. Luke's Campuses. The comment also states similar concerns for the California Campus. At the Davies Campus, one cumulative traffic impact at the intersection of Church Street-14th Street/Market Street was identified, Impact TR-127 on page 4.5-233, which would be associated with the proposed development of the Neuroscience Institute and the 14th Street/Castro MOB. At the St. Luke's Campus, the Draft EIR found that the proposed LRDP impacts to traffic, transit, bicyclists, pedestrians, loading, emergency access, and construction would be less-than-significant; however, two improvement measures, I-TR-87 and I-TR-88, were identified to address pedestrian and bicycle circulation around the campus.

Regarding the California Campus, it is not clear whether the comment is referring to use of the California Campus under an alternative addressed in the Draft EIR, or use of the campus after the property is sold by CPMC. As noted on page 4.5-178 of the Draft EIR, as part of the CPMC LRDP, the facilities and operations of the California Campus would remain unchanged until 2015-2020, when the majority of existing activities would be relocated to the proposed Cathedral Hill Campus (hospital uses and inpatient care) and the Pacific Campus (medical offices and outpatient care). By 2020, the remaining CPMC services at the California Campus would consist of outpatient imaging and the lab site that supports the medical office building at 3838 California Street. These two remaining CPMC services would continue indefinitely, along with all or a portion of the skilled nursing facility (SNF) beds that are currently located at the California Campus; see Major Response HC-6, "Skilled Nursing Facilities (SNF)" (page C&R 3.23-25). Once the California Campus is sold and the majority of services are transferred to the proposed Cathedral Hill Campus and the Pacific Campus, the California Campus would no longer be considered a part of CPMC. Analysis of any potential reuse or future redevelopment of the site would be speculative. Any future proposals at the site would require separate environmental review.

It should be noted that the Draft EIR conservatively assumed that in the future, the California Campus would operate in a manner similar to current campus operations. It is reasonable to assume that as activities on the California Campus are reduced or relocated to other campuses, any traffic, transit, or parking issues associated with the current California Campus and Laurel Village would be reduced.

Alternative 2, as described in Chapter 6 of the Draft EIR, would result in continued and expanded operations at the California Campus. Transportation impacts near the California Campus that would result from implementing Alternative 2 are addressed on page 6-231 of the Draft EIR. As stated on Draft EIR page 6-231, under 2030 Cumulative plus Alternative 2 conditions, vehicle trips associated with the California Campus would cause the level of service (LOS) to deteriorate from LOS D to LOS F at four intersections in the California Campus vicinity during the weekday p.m. hour: Arguello Boulevard/Geary Boulevard, Arguello Boulevard/California Street, Cherry Street/California Street, and Maple Street/California Street. It is anticipated that under Alternative 2, CPMC would implement the Construction Worker Transportation Program, which would require construction contractors to encourage construction workers to carpool and take transit, and would discourage the use of private automobiles, thereby minimizing the impacts of construction activities on the adjacent neighborhoods.

3.7.2 METHODOLOGY

3.7.2.1 LEVEL OF SERVICE—TRAFFIC ANALYSIS SOFTWARE

Comment

(Gloria Smith/Tom Brohard & Associates—California Nurses Association, October 19, 2010) [92-21 TR]

"4) Traffic Inconsistencies with January 2008 CPMC Transportation Study - Appendix B to the 2008 CPMC Institutional Master Plan is the "California Pacific Medical Center Institutional Master Plan 2008 Transportation Study" prepared by CHS Consulting Group. Both the 2008 Transportation Study and the Draft EIR utilize the same traffic count data collected in 2006. With the same traffic count data in both evaluations and under the same 'intersection geometry, calculations of delay and Level of Service would yield identical results for each intersection; but they do not match each other.

In my review, I compared Table 2 on Page 12 of the Transportation Study to Table 4.5-17 on Page 4.5-94 in the AM Peak and to Table 4.5-18 on Page 4.5-95 in the PM Peak in the Draft EIR. In most of the comparisons set forth below, delay and Level of Service are significantly better in the Draft EIR than calculated in the 2008 Transportation Study using the same data. While the comparisons below only involve the Cathedral Hill Campus, I also found other significant differences in calculated delay and Level of Service for each campus when comparing the two documents. These inconsistencies must be eliminated to develop proper traffic analyses of baseline conditions as well as for forecast conditions in 2015 and in 2030, together with appropriate traffic mitigation measures for the Project. The City must perform an accurate analysis and include all feasible alternatives and measures to mitigate traffic congestion impacts.

Cathedral Hill - AM Peak - Significant Delay/LOS Differences

Response TR-5

The comment states that there are inconsistencies in the delay and level of service results between the 2008 CPMC Institutional Master Plan 2008 Transportation Study prepared by CHS Consulting Group and the 2010 CPMC LRDP *Cathedral Hill Campus Transportation Impact Study* prepared by Fehr & Peers (on file with the San Francisco Planning Department and available for public review), the second of which was prepared for use in the Draft EIR analysis. Both the intersection analysis for the IMP and Draft EIR were prepared using TRAFFIX software, which is the software commonly used by the Planning Department in preparing EIRs, such as the recently approved *Candlestick Point–Hunters Point Shipyard Phase II Development Plan*. The TRAFFIX software platform applies the methodologies described in Chapter 16, "Signalized Intersections," and Chapter 17, "Unsignalized Intersections," from the Institute of Transportation Engineers (ITE) *Highway Capacity Manual (HCM), 2000 Edition* (Transportation Research Board). Although the software calculates intersection delay, and thus level of service (LOS), consistent with HCM methodology, it allows for a high degree of user adjustment to better calibrate the model to observed field conditions.

The LOS results from the two studies vary because of different intersection parameter adjustments made within the software, specifically:

- Signal progression factors were not used in the IMP analysis. The signal progression factor accounts for the fact that traffic signal timings are often set to promote the efficient and relatively continuous movement of traffic along a corridor (such as Franklin Street);

- Adjustments for additional intersection capacity created by peak period tow-away lanes. The methodology varies as to how best to account for tow-away lanes during peak periods and other factors that affect capacity at intersections. For the Draft EIR analysis, observations were made at intersections to ensure that the existing condition was appropriately modeled.

The intersection delay results contained in the 2008 IMP were not reviewed by the Planning Department staff before its publication, and thus the direction to revise intersection parameters to be consistent with Planning Department protocol was not given. Before initiating the intersection analysis for the Draft EIR transportation studies, Planning Department staff communicated the proper user adjustments to make, so that the Draft EIR intersection analysis would be performed consistent with standard protocol and better represent existing intersection operating conditions.

When compared to the LOS results contained in the IMP traffic study (the IMP and Draft EIR share 17 common intersections), approximately 80–85 percent of the intersection LOS in the Draft EIR are improved. For example, at the intersection of Gough/Post during the p.m. peak hour, once the proper signal progression factor was input, the reported average delay per vehicle was reduced from 23.5 seconds (as reported in the IMP) to 8.8 seconds (as reported in the Draft EIR). It is important to note that properly reflecting the signal progression factor and peak period tow-away lanes does not always result in the reduction of delay and LOS. As an example, at the intersection of Gough/Geary, the reported average delay per vehicle during the a.m. peak hour increased from 67.7 seconds (as reported in the IMP) to > 80 seconds (as reported in the Draft EIR).

3.7.2.2 ECONOMIC/SEASONAL EFFECTS ON TRAFFIC VOLUMES

Comment

(Paul Wermer—CPMC Neighbors Coalition and Pacific Heights Residents, October 18, 2010) [67-20C TR]

"3) Traffic studies need to comprehend the impact of the current economic downturn, which has temporarily reduced traffic levels. It is unreasonable to expect reduced traffic intensity to continue. Similarly, past traffic, studies by CPMC apparently failed to comprehend seasonal variations (e.g. school vacations) and so underestimated community impact in the Pacific site area. Any traffic measurements intended to establish a current baseline must comprehend these issues. It is worth noting that most data gathered for the traffic studies is several years old. The DEIR does not adequately explain how data study period and age (and hence dependence on economic conditions, interactions with school holidays, etc.) is managed in reaching conclusions."

Response TR-6

The comment states that the current economic downturn has temporarily reduced traffic in many areas. Although it is correct that traffic volumes may have decreased in some areas of San Francisco over the last few years, the existing conditions for the transportation impact study reports were established in 2006, when the economy was substantially better than the last few years. To ensure that the 2006 data set was not outdated, supplemental traffic data was collected in 2009 during the economic downturn years. Control traffic counts from 2009 were compared to older counts to ensure that traffic volumes had not substantially changed since 2006. The 2006 traffic volumes were determined to be within 10 percent of the more recently collected control counts, and therefore appropriate for use in the transportation analysis. This comparison is summarized in *2006 and 2009 Traffic Count Comparisons for Select Intersections & Weekday/Weekend Peak-Hour Count Comparison for the California Pacific Medical Center (CPMC) Master Plan EIR* (Fehr & Peers 2009), which is on file with the San Francisco Planning Department and available for public review.

The transportation/traffic data for the analyses contained in the Draft EIR was collected in May, June, and August 2006; June 2008; May and June 2009; and on days when most schools were in session (the spring semester for public schools usually ends between the first and third week of June), there were no holidays, and during the spring/summer months to account for a higher number of people in San Francisco during the tourist season. Consistent with Planning Department protocol, counts were collected at midweek (Tuesday, Wednesday, or Thursday) and summarized in 15-minute intervals. The data summaries for the traffic counts are included in Appendix C of the *CPMC LRDP Transportation Impact Study Master Appendix* for each campus. Dates on which intersection turning movement counts were collected are shown in the tables below.

3.7.2.3 FUTURE SCOPE FOR THE REUSE OF CALIFORNIA CAMPUS

Comments

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-99 TR, duplicate comment provided in 30-99 TR]

"54. In regards to the California Campus Study Area that is shown in Figure 4.5-3, Page 4.5-4, the DEIR shows only the transportation impact intersections between Arguello Blvd. and Laurel St. between Euclid Ave. and Pacific Ave. Only 12 intersections were studied with the farthest intersection studied to be only one block away. Intersections farther out from any proposed project on the California Campus need to be analyzed as well, up through the ½ -mi. project radius. The current California CPMC campus traffic impact goes well beyond these parameters out at least through the ½ -mile radius shown for the project. The transportation analysis needs to go as far as well. This is particularly important when there are big vehicle trip generating services being provided in the area such as the United States Post Office on Geary and Parker and the University of San Francisco which has lessened its on-campus parking spots so more of their students are parking on the street in the Jordan Park and Laurel Heights areas. There are also at least 4 schools catering to the pre-kindergarten through 8th grade levels among them with many parents showing up with vehicles to drop off and pick up their children on neighborhood streets that have a high capacity utilization of rather limited street parking. The current California Campus as it is today adds many vehicles that cannot be accommodated by the limited number of parking spots in the Jordan Park, Presidio Heights and Laurel Heights neighborhoods."

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-102 TR, duplicate comment provided in 30-102 TR]

"If or when a new buyer comes in for the California Campus, the transportation and congestion needs to be addressed not only on the 12 intersections in this DEIR but also farther out as stated earlier. Even with current CPMC operations at the California Campus, the hospital staff persons are running out to move their vehicles in hospital scrubs. Visitors are constantly blocking residential driveways or double-parking in the area. And, there is not a lot of enforcement on these adjacent streets."

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-103 TR, duplicate comment provided in 30-103 TR]

"Jordan Park is made of many single-family homes or duplexes and its streets were not meant to play the role of transit corridor vehicular arterials that they are being forced to become as unintended consequences of a transportation study that did not encompass a great enough distance from the proposed construction site and from expanded services at the California Campus."

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-104 TR, duplicate comment provided in 30-104 TR]

"I also do not believe that traffic enforcement of parking regulations will be the solution to mitigating congestion when a project sponsor builds something in a primarily residential area and cannot accommodate the vehicular trips generated from its business."

The traffic that is forced down these residential streets is going against the San Francisco General Plan which includes provisions that traffic should be on the main corridors, not on the residential streets adjacent to them. And, if the building will continue to be used for women's and children's health services, most of the visitors will arrive by private vehicles rather than on public transit. The area of Jordan Park and Laurel Heights, along with other development projects in the pipeline such as 3657 Sacramento Street and its 18 new residential condominiums planned as a mixed-use building and with the construction of 2 new condominiums at 331 Arguello Boulevard, the level of traffic congestion circulation will fall to an 'F' level of service with all the vehicle trips generated."

Response TR-7

The comments raise concerns related to congestion, parking availability, the viability of traffic enforcement, and cut-through traffic in the Jordan Park area and Laurel Heights as well as the study area analyzed for the California Campus. Most of the analyzed intersections are within the immediate vicinity of the project site because intersections closest to the project site would be most likely to experience impacts. However, the analysis also includes the intersection of Geary Boulevard and Arguello Boulevard. As indicated on Draft EIR page 4.4-178, as part of the proposed CPMC LRDP, the facilities and operations of the California Campus (near Jordan Park) would remain unchanged until 2015 and then gradually decreased through 2020, when the majority of existing activities would be relocated to the proposed Cathedral Hill Campus and the reorganized Pacific Campus. Once the California Campus is sold and the majority of services are transferred to the proposed Cathedral Hill and Pacific Campus, the California Campus would no longer be considered part of CPMC.

Analysis of any potential reuse or future redevelopment on the California Campus site would be speculative. Any future proposals at the site would require a separate level of environmental review. With no planned changes in facilities or operations, transportation travel demand at the California Campus would be expected to remain similar to existing conditions until 2015, and then gradually decrease between 2015 and 2020. The proposed CPMC LRDP would not result in generation of any new vehicle trips at the California Campus and, therefore, would not add to existing traffic conditions, cut through traffic, or limit parking availability, as stated in the comment. Further, the project sponsor does not have the authority to enforce traffic laws or parking regulations. Those responsibilities fall to the San Francisco Police Department and San Francisco Parking Enforcement.

3.7.2.4 CONSISTENCY IN LEVELS OF SERVICE TABLES IN DRAFT EIR

Comments

(Gloria Smith/Tom Brohard & Associates—California Nurses Association, October 19, 2010) [92-22 TR]

"5) Draft EIR Contains Numerous Inconsistencies in Traffic Analyses for Near and Long Term - As pointed out above, there are many inconsistencies in the evaluation of 2006 baseline traffic data for the Cathedral Hill Campus and the other campuses. In addition, there are also inconsistencies within the various tables in the Draft EIR that provide delay and associated Level of Service for 2006 baseline conditions, 2015 No Project and Project conditions, and 2030 Cumulative No Project and Project conditions. While the examples discussed below relate to the Cathedral Hill Campus, there are other similar inconsistencies for the campuses. The inconsistencies within Tables 4.5-17 on Page 4.5-94 and 4.5-18 on Page 4.5-95 of the Draft EIR for the Cathedral Hill Campus, as well as in tables for other campuses, must be reconciled to provide proper traffic analyses of the Project."

(Gloria Smith/Tom Brohard & Associates—California Nurses Association, October 19, 2010) [92-23 TR]

"a) Cathedral Hill Campus - AM Peak - For the intersection of Eighth/Market, Table 4.5-17 indicates delay of greater than 80 seconds and Level of Service (LOS) F for the existing baseline conditions in the AM peak in 2006. In 2015 with higher traffic volumes than 2006 and without any identified traffic improvements, delay is reduced to 78.8 seconds and performance improves to LOS E without Project traffic. In 2030 under cumulative conditions with higher traffic volumes than 2015 and without any identified traffic improvements, delay is reduced to 76.4 seconds and performance remains at LOS E without Project traffic. Without improvements, adding traffic to failing intersections or those operating at capacity does not reduce delay or improve intersection LOS performance."

(Gloria Smith/Tom Brohard & Associates—California Nurses Association, October 19, 2010) [92-24 TR]

"b) Cathedral Hill Campus PM Peak - For the intersection of Franklin/Sutter, Table 4.5-18 indicates delay of 65.5 seconds and Level of Service (LOS) E for the existing baseline conditions in the PM peak in 2006. In 2015

with higher traffic volumes than 2006 and without any identified traffic improvements, delay is reduced to 57.0 seconds and performance remains at LOS E without Project traffic. Without improvements, adding traffic to intersections operating at capacity does not reduce delay."

Response TR-8

The comments state that inconsistencies exist between the level of service tables contained in the Draft EIR. Review of the specific tables cited in Comment 92-22, Table 4.5-17 and Table 4.5-18, which present LOS at Cathedral Hill Study intersections during the a.m. and p.m. peak hour, respectively, did not reveal any inconsistencies.

Comment 92-23 and 92-24 express concern that a reduction in peak-hour average vehicle delay was reported at the intersections of Eighth/Market and Franklin/Sutter between the existing conditions and 2015 Modified Baseline/2030 Cumulative conditions. Please see the beginning of Response TR-10, page C&R 3.7-26 for a summary of the methodology that was used to forecast increases in background traffic to study intersections in future scenarios. The peak-hour delay reductions cited in the comment can be explained by a key component—the peak-hour factor—which factors into the determination of intersection delay. The peak-hour factor is a way to quantitatively express the relationship of the peak 15-minute traffic volume to the full hourly traffic volume (i.e., a measure of traffic demand fluctuations within the peak hour). The peak-hour factor used in the existing conditions was based on observed traffic counts. Because forecasted traffic volumes cannot be observed, any analysis of future intersection operations must assume a peak-hour factor. It was assumed that at intersections where the peak-hour factor was below 0.95 under the Existing conditions scenario, adding background traffic to study intersections would increase the uniformity (i.e., spread out traffic volumes throughout the peak hour). To reflect this condition, a peak-hour factor of 0.98 was assumed for 2015 Modified Baseline and 2030 Cumulative conditions. This is a standard approach used by the Planning Department because of the number of closely spaced intersections where traffic growth at adjacent intersections can have the effect of 'metering' traffic during congested periods, such as the peak hours. Under certain conditions, this can cause average delay at an intersection to improve in a future scenario, as it did at the intersection of Eighth/Market and Franklin/Sutter.

3.7.2.5 MODIFIED BASELINE FOR TRAFFIC ANALYSIS

Comments

(Barbara Kautz—CHNA and Bernal Heights Neighborhood Center, October 19, 2010) [87-23 TR, duplicate comment was provided in 108-23 TR]

"3. Baseline for Analysis Inconsistent with CEQA.

Rather than determining traffic and transportation impacts based on existing conditions, the DEIR determined these impacts using an illusory 'Modified Baseline' *projected for* 2015, 2020, and/or 2030. This 'Modified Baseline' also assumed the implementation of the Cesar Chavez Street Streetscape Plan and the SF Muni Transit Effectiveness Project (pp. 4.5-61-67), despite evidence in the DEIR itself regarding Muni cuts to existing service, let alone Muni's ability to implement the Effectiveness Project (page 4.5-17). Section l5l25(a) the CEQA Guidelines provides: 'An EIR must include a description of the physical environmental conditions in the vicinity of the project, *as they exist at the time the notice of preparation is published.* This environmental setting will normally constitute the baseline physical conditions by which a lead agency determines whether an impact is significant.' As stated by the California Supreme Court, 'a long line of Court of Appeal decisions holds ... that the impacts of a proposed project are ordinarily to be compared to the actual environmental conditions existing at the time of CEQA analysis, rather than to allowable conditions defined by a plan or regulatory framework .... [T]he baseline for CEQA analysis must be the 'existing physical conditions in the affected area,' that is, the 'real conditions on the ground' ... An approach using hypothetical allowable conditions as the baseline results in

'illusory' comparisons that 'can only mislead the public as to the reality of the impacts and subvert full consideration of the actual environmental impacts,' a result at direct odds with CEQA's intent.' *Communities for a Better Environment v. South Coast Air Quality Management Dist.* (2010) 48 Cal. 4th 310, 320·322 (citations omitted)."

(Barbara Kautz—CHNA and Bernal Heights Neighborhood Center, October 19, 2010) [87-24 TR, duplicate comment was provided in 108-24 TR]

"By using *projected* rather than *existing* traffic as the baseline, the DEIR minimizes the actual impacts of the Long Range Plan. For instance, traffic generated by the Long Range Plan, if added to existing traffic, may cause intersection levels of service to deteriorate from D to E or F, a significant impact. But if both Long Range Plan traffic and projected 2015 traffic (which may or may not occur) are added to existing traffic, the effect of Long Range Plan traffic may be masked by projected traffic. Hence, the analysis provides only the 'illusory' comparisons that the Supreme Court found unacceptable."

Response TR-9

Comment 87-24 claims that "[b]y using *projected* rather than *existing* traffic as the baseline, the Draft EIR minimizes the actual impacts" of the proposed LRDP. Comment 87-24 further states: "For instance, traffic generated by the [LRDP], if added to existing traffic, may cause intersection levels of service to deteriorate from D to E or F, a significant impact. But if both [LRDP] traffic and projected 2015 traffic (which may or may not occur) are added to existing traffic, the effect of [LRDP] traffic may be masked by projected traffic."

Contrary to Comment 87-24, the Modified Baseline approach in the Draft EIR analyzed traffic impacts by assuming certain other projected future traffic increases, as discussed in more detail below. Therefore, the Modified Baseline approach, as detailed below, would indicate either the same or a greater number of intersections operating at LOS E or F after implementation of the proposed LRDP than a more typical baseline approach analyzing existing conditions.

Supplemental Comparison of Existing to Existing Plus Project Conditions

In order to demonstrate that this is in fact the case, supplemental traffic and transit analysis was performed overlaying the trips generated by the proposed LRDP on top of Existing conditions (2006) as opposed to the Modified Baseline conditions (2015/2020). This supplemental analysis is presented in the following tables (C&R Tables 3.7-1 through 3.7-6 on pages C&R 3.7-13 through 3.7-19), which provide a comparison of Existing to Existing plus Project conditions for all study intersections (except the California campus because the proposed CPMC LRDP would essentially close services at this campus by about 2020) for transit capacity utilization and for transit delay at the Cathedral Hill Campus.

Generally, the impacts at each intersection are the same or lower under Existing plus Project conditions than under the 2015 or 2020 Modified Baseline plus Project conditions analyzed in the Draft EIR. Therefore, Comments 87-23 and 87-24 are incorrect to the extent that they suggest that use of a Modified Baseline could result in minimized impacts compared to use of existing conditions as the baseline.

At the proposed Cathedral Hill Campus, as shown in C&R Table 3.7-1, the only potentially significant impact that would occur under Existing plus Project conditions would be a level of service change from LOS D to LOS E at the Polk Street/Geary Street intersection during the a.m. peak hour. However, as explained in the discussion of Impact TR-2 on page 4.5-98 of the Draft EIR, the Polk/Geary intersection was already identified in the Draft EIR as experiencing a service change from LOS D under 2015 Modified Baseline No Project conditions to LOS E under 2015 Modified Baseline plus Project conditions during the a.m. peak hour. Thus, the impact at the Polk/Geary intersection under the Existing plus Project analysis is essentially the same as the impact described in the Draft EIR. Similar to the analysis in the

Draft EIR, the proposed project's contributions to intersections that would operate at LOS E or F under Existing Plus Project conditions were found to be less than significant.

As shown in C&R Table 3.7-6, the Existing plus Project conditions would result in one potentially significant transit delay impact near the proposed Cathedral Hill Campus. An increased delay to the 19-Polk (northbound) bus route during the p.m. peak hour of 7 minutes and 12 seconds would occur under Existing plus Project conditions as compared to Existing conditions, which would be more than half of the existing headway and, therefore, would be above the significance threshold. However, as explained in the discussion of Impact TR-31 on page 4.5-123 of the Draft EIR, the 19-Polk bus route was already identified as experiencing an increased delay of approximately 8 minutes during the p.m. peak hour under 2015 Modified Baseline plus Project conditions. Thus, the impact to the 19-Polk bus route under the Existing plus Project analysis is essentially the same as the impact described in the Draft EIR.

Conversely, unlike the 2015 Modified Baseline plus Project conditions analyzed in the Draft EIR, the Existing plus Project analysis determined that impacts at the Van Ness/Market intersection would be less than significant. Similarly, unlike the Draft EIR's analysis of 2015 Modified Baseline plus Project conditions, the Existing plus Project analysis determined that impacts to the 49-Van Ness-Mission and 38/38-L Geary bus routes would be less than significant. Therefore, the modified baseline approach used in the Draft EIR identified additional transportation impacts of the proposed LRDP at the Cathedral Hill Campus that would not have been identified using existing conditions as the baseline.

Notes:

Bold font indicates deficient LOS of LOS E or LOS F.

1. LOS = Level of Service.
2. For signalized intersections and all-way stop-controlled intersections, LOS based on average intersection delay, based on the methodology in the *Highway Capacity Manual*, 2000 Edition. For stop-controlled intersections, the delay of the worst performing approach is presented.
3. At some of the study intersections, the average delay per vehicle would remain the same or slightly decrease with the addition of project-related traffic. Using the HCM methodology, the level of service is calculated based on an average of the total vehicular delay per approach, weighted by the number of vehicles at each approach. Increases in traffic volumes at an intersection usually result in increases in the overall intersection delay. However, if there are increases in the number of vehicles at movements with low delays, the average weighted delay per vehicle may remain the same or decrease.

Source: Fehr & Peers 2011

Similar to the Draft EIR, the Existing plus Project analysis did not identify any potentially significant impacts at intersections in the vicinity of the Pacific or St. Luke's Campuses.

At the Davies Campus, as shown in C&R Table 3.7-2, the proposed LRDP under Existing plus Project conditions would exacerbate existing LOS F conditions at the Church Street/Market Street/14th Street intersection during the p.m. peak hour by making a significant contribution of additional trips to the critical southeast-bound (14th Street) through movement. As similarly explained in the discussion of Impact TR-75 on page 4.5-186 of the Draft EIR, the Church/Market/14th Street intersection was determined under 2020 Modified Baseline plus Project conditions to contribute considerably to critical movements already operating at LOS F under 2020 Modified Baseline No Project conditions. The transportation analysis for the Davies Campus also indicated that this condition would only become significant after the construction of the Castro Street/14th Street MOB and would be less than significant

under 2015 conditions after construction of the Neurosciences Institute only.[1] Thus, the impact at the Church/Market/14th Street intersection under the Existing plus Project analysis is the same as the impact described in the Draft EIR.

As shown in C&R Table 3.7-2, under Existing plus Project conditions, a change from LOS E under Existing conditions to LOS F under Existing plus Project conditions would occur at the Divisadero Street/Haight Street intersection; and the intersection of Castro Street/Duboce Street would continue to operate at LOS F under Existing and Existing plus Project Conditions (with a volume to capacity ratio of 0.87 changing to 0.88 under Existing plus Project Conditions), with the project adding 52 trips to the critical northbound through movement. Similar to above, these changes would only occur under the program-level, long-term 2020 scenario with the implementation of the long-term project of the Castro Street/14th Street MOB, which would not commence construction before 2018 and would not be completed before 2020. As stated in the Draft EIR, future project approvals for long-term development would occur only after further project-level design and refinement and subsequent environmental review.[2] With the implementation of the Neuroscience Institute only, the LOS at the Divisadero Street/Haight Street intersection would remain at LOS E.

Thus, the findings at every case except for two, as described above, impacts would be similar and in many cases less under Existing plus Project conditions than under Modified Baseline plus Project conditions support the appropriateness of the use of the Modified Baseline analysis in the Draft EIR. The exceptions noted above might arise at the Davies Campus at a program-level analysis, but only after full buildout of the long-term program at Davies (i.e., only after completion of the Castro Street/14th Street MOB), sometime after 2020.

An exception to the finding that the Modified Baseline approach is equally or more conservative than use of an existing conditions baseline might arise at the Davies Campus, but only after full buildout of the long-term program at Davies (i.e., only after completion of the Castro Street/14th Street MOB), sometime after 2020. Existing plus Project conditions reflect a scenario that would never occur. The completion of both the near-term and the long-term projects at the Davies Campus would not occur before other anticipated growth in traffic that changes existing conditions, because the long-term project at the Davies Campus would not commence construction until at least 2018 under the Project description and would not be completed until at least 2020.

Nevertheless, since the intersection of Divisadero Street/Haight Street would deteriorate to LOS F with implementation of the Castro Street/14th Street MOB, an improvement measure has been identified to improve the post-2020 operating conditions to LOS D at the intersection of Divisadero/Haight (see text revisions to the Draft EIR discussion of Impact TR-128 in Chapter 4, "Draft EIR Text Changes," on page C&R 4-80). This would consist of re-striping the Divisadero/Haight intersection to accommodate a 125-foot northbound right-turn pocket. This capacity improvement would result in the loss of up to five on-street parking spaces but would decrease average delay at the intersection to acceptable levels. The

[1] The Davies Campus Transportation Impact Study stated that the Castro Street/14th Street MOB would contribute the majority (approximately 60 percent) of the proposed LRDP's new trips at the Davies Campus (with the Neuroscience Institute generating the remaining 40 percent of new trips). As described in the study, a sensitivity test was conducted to determine whether the occupation of only the Neuroscience Institute, anticipated to occur in 2015, would result in any significant impacts before construction of the Castro Street/14th Street MOB. Under 2015 Modified Baseline conditions, the Church/Market/14th Street intersection (the only intersection at which a significant impact would occur after full buildout of the proposed LRDP at the Davies Campus under future 2020 plus Project conditions) would operate at LOS F. Although the impacted intersection would operate unacceptably in 2015, the Neuroscience Institute would not contribute significantly to the critical eastbound movement on 14th Street at this intersection. Therefore, the sensitivity analysis concluded that construction of only the Neuroscience Institute would have a less-than-significant impact under 2015 Modified Baseline plus Project conditions. Source: California Pacific Medical Center, 2010 (June), *California Pacific Medical Center, Long Range Development Plan, Davies Campus, Transportation Impact Study*, prepared by Fehr & Peers, San Francisco, CA.

[2] The Existing plus Project analysis conducted by Fehr & Peers did not factor any reduction in the number of trips at the Divisadero/Haight intersection that could occur with the implementation of CPMC's proposed expansion of its current Transportation Demand Management (TDM) program.

project sponsor has agreed to fund this improvement measure, which would also prevent the LOS change from occurring under Existing plus Project conditions.

In sum, the information and analysis presented above regarding Existing plus Project conditions does not change the impact determination for any project approvals being sought in conjunction with the proposed CPMC LRDP; no new significant impacts would occur beyond what is presented in the Draft EIR under the Modified Baseline scenario. Together with the analysis in the Draft EIR, the above analysis results in a Final EIR that provides analysis under both a Modified Baseline and Existing Conditions plus Project approach.

Reasonable Use of Modified Baseline

The Modified Baseline approach was used to provide a more accurate representation of the transportation system at the time when either all or the most substantial portion of new construction work at each campus would be completed and occupied (i.e., the times at which new development would become operational or substantially operational and the majority of new project-generated transportation demand would occur).

As stated in Comment 87-23, "An EIR must include a description of the physical environmental conditions in the vicinity of the project, as they exist at the time the notice of preparation is published. This environmental setting will normally constitute the baseline physical conditions by which a lead agency determines whether an impact is significant." The Draft EIR provides a detailed and complete description of existing conditions. CEQA, however, distinguishes between the requirement to describe the environmental setting and the requirement to describe the effects of the proposed project on the environment. A better expression of the concern is to identify "the effects of projects on the actual environment upon which the proposal will operate."[3]

Under Section 15125(a) of the State CEQA Guidelines, the physical environmental conditions in the vicinity of the project at the time the NOP is published "will *normally* constitute the baseline physical conditions by which a Lead Agency determines whether an impact is significant" [emphasis added]. However, the State CEQA Guidelines allow flexibility to utilize a different approach. The use of the term "normally" provides the lead agency with discretion to deviate from the standard time-of-review baseline.[4] As the California Supreme Court recently explained in *Communities for a Better Environment v. South Coast Air Quality Management District*, "[A]n agency enjoys the discretion to decide, in the first instance, exactly how the existing physical conditions without the project can most realistically be measured. Neither CEQA nor the CEQA Guidelines mandates a uniform, inflexible rule for determination of the existing conditions baseline."[5]

As another court has explained, "in some cases it is necessary to consider conditions over a range of time periods. In some cases, conditions closer to the date the project is approved are more relevant to a determination whether the project's impacts will be significant. For instance, where the issue involves an impact on traffic levels, the EIR might necessarily take into account the normal increase in traffic over time. Since the environmental review process can take a number of years, traffic levels as of the time the project is approved may be a more accurate representation of the existing baseline against which to

measure the impact of the project."[6] The key concern is to show the effects on the environment on which the proposal will operate, rather than a mechanical test that focuses on a particular point in time.

CEQA requires that the methodology used by the lead agency for determining the baseline condition "be supported by reasoned analysis and evidence in the record"[7] (e.g., the baseline should not assume the full buildout to the maximum extent allowed under the relevant jurisdiction's general plan).

Modified Baseline Rationale and Methodology

The decision to utilize a modified baseline for the analysis of the transportation impacts of the proposed LRDP was made based on the above baseline discussion and based on the nature and timing of the anticipated project approval process and the proposed CPMC LRDP's construction and phasing periods. Because of the relatively long approval and construction periods, an existing plus project scenario would not materialize. CEQA generally contemplates that an EIR will be completed within 1 year after publication of the NOP for an EIR, and in most cases consideration of entitlements for the project reviewed in an EIR and construction are completed shortly thereafter. In the case of the proposed CPMC LRDP, the environmental review, entitlement, and construction/phasing periods would be extended beyond what would normally occur.

After the publication of the Draft EIR, and well after the decision was made to utilize the modified baseline, the California Court of Appeal, Sixth District, published an opinion holding that the City of Sunnyvale had improperly used a modified baseline in an EIR analysis of transportation impacts.[8] Even more recently, the same court upheld the use of a modified baseline where data regarding existing conditions at the studied intersections was also provided (but without analyzing existing plus project conditions) and the methodology was supported by substantial evidence regarding anticipated future growth.[9] Unlike the modified baseline approach at issue in the earlier court decision (*Sunnyvale West*), but similar to the approach used in the subsequent decision (*Pfieffer*), the proposed CPMC LRDP's use of Modified Baseline conditions is supported by the substantial evidence in the record, relied on a tested, detailed and conservative SF-CHAMP model process. It did not assume full development of the City's General Plan or significant interim roadway improvements, and it included growth assumptions based on actual traffic counts at the study intersections. The Modified Baseline analysis provided the best description of conditions and analysis of resulting impacts that would exist at the time of the proposed LRDP would be implemented at each campus. Moreover, like the modified baseline approach upheld in the *Pfeiffer* decision, the modified baseline in the CPMC LRDP Draft EIR was based upon reasonable assumptions of growth added to data regarding existing conditions. The data regarding existing conditions is set forth in the Draft EIR in Tables 4.5-17, 4.5-18, 4.5-35, 4.5-37, 4.5-38 and 4.5-39 on pages, 4.5-94, 4.5-95, 4.5-169, 4.5-180, 4.5-185 and 4.5-202, respectively.

An NOP for the proposed CPMC LRDP, initially issued in July 2006, was updated on May 27, 2009, to incorporate the proposed Neuroscience Institute, which had been planned as a separate project, and other changes. The proposed CPMC LRDP also was required to undergo extensive review by the San Francisco Health Commission as part of the IMP process, which is a unique requirement for postsecondary and medical institution projects in San Francisco. CPMC filed an IMP update for the LRDP with the Planning Department in 2008. In addition to this review, a Blue Ribbon Panel was convened to discuss the future

of the St. Luke's Campus. The Planning Commission closed the public hearing on the IMP in November 2009, thereby accepting the IMP. [10]

Certification of the Final EIR and approval of project entitlements are anticipated in late 2012. The proposed LRDP would then require several years of construction at each CPMC campus (other than the California Campus) and multiple relocations of various uses among the CPMC campuses. Given the unusual length of the environmental review and project approval processes, the lengthy construction period at multiple campuses and multiple phases (e.g., over 4 years for the Cathedral Hill Campus), and the scale and complexity of the project, the Modified Baseline approach was selected to more accurately describe the environmental conditions at the time the LRDP would be implemented at each campus and at the time impacts would be expected to occur.

The San Francisco County Transportation Authority's (SFCTA) SF-CHAMP travel demand model, on which the Modified Baseline was based[11], is a detailed forecast of anticipated future traffic conditions in San Francisco. The Planning Department updates and maintains a land use forecast to form the basis for testing the transportation impacts of new projects or plans. The land use forecast is based on citywide projections from the Association of Bay Area Governments (ABAG), which issues biennial projections of population, jobs, and households. The Planning Department takes the citywide population and employment growth targets (control totals) developed by ABAG for San Francisco and distributes them among 981 Travel Analysis Zones (TAZs) within city and county limits. The base year for this procedure is 2005, as that year represented the best disaggregated information for housing units, households and employment counts at the time the analyses were initiated.[12]

Each of the five CPMC campuses falls within one or more of the 981 TAZs.[13] The Planning Department predicted a relatively low amount of growth in the number of dwelling units, population, and employment expected to occur between 2005 and 2015, between 2005 and 2020, and overall between 2005 and 2030.[14] Overall, as described in detail in *Assessment of No Project Cumulative Traffic Conditions – Years 2015 and 2030 Traffic Estimates, Adavant Consulting, April 2010*, the modified baseline reflected minimal changes in the population and number of dwelling units between 2005, 2015, and 2020 in the study TAZs.[15] The California Campus was not included in this comparison, as the proposed CPMC LRDP would close services at this campus by 2020.

The Planning Department provides its land use forecasts using a classification system that reflects the distinct characteristics of a given economic activity. These land use categories are then used by the SF-CHAMP model maintained by SFCTA. The most recent land use forecasts prepared by the Planning Department at the time the analyses were initiated were based on ABAG's *Projections 2007* and were developed in 5-year increments from 2005 to 2030. The land use forecasts for 2015 and 2030 were then

used by SFCTA as its "standard model input" to perform travel demand analyses using the SF-CHAMP model.[16]

The Modified Baseline used in the Draft EIR was developed by applying the growth rates from the SF-CHAMP model to actual traffic counts collected at the study intersections under existing conditions, to obtain 2015 turning movement volumes.[17] The 2020 turning movement volumes were derived by adding one-third (representing 5 years) of the traffic growth increment, from 2015 to 2030, to 2015 traffic volumes.[18]

The traffic estimates developed and used in the 2015 and 2020 Modified Baseline represented 2015 No Project volumes at the Cathedral Hill, California, and St. Luke's Campuses (i.e., future weekday peak-hour turning movement volumes, assuming no changes to the existing uses at each campus) and 2020 No Project volumes at the Pacific and Davies Campuses. Future Modified Baseline plus project traffic estimates for each campus were developed by adding the number of net new trips that would be generated by each campus.

The assumed population and employment growth from 2005 to 2015 and, in the case of the Pacific and Davies Campuses, 2005 to 2020, was quite minimal, indicating that the 2015 and 2020 Modified Baseline conditions would have similar levels of traffic as reported for Existing conditions. Thus, the City's decision to use a modified baseline was reasonable, as 2015 and 2020 conditions are substantially similar to Existing conditions, although, in connection with the long-term projects at Davies Campus, an improvement measure has been identified at the Divisadero/Haight intersection. The impacts of the proposed CPMC LRDP as presented in the Draft EIR are not diluted or masked, and the Draft EIR analysis provides an accurate assessment of the impacts of the CPMC LRDP.

Comment 87-23 TR also questions the inclusion of the Cesar Chavez Street Streetscape Plan conditions in the St. Luke's campus traffic analysis. The vehicle capacity reductions associated with the Cesar Chavez Streetscape Improvements were assumed to take place because at the time of analysis the Cesar Chavez Streetscape project was considered a near term project, being reasonably foreseeable and capacity restrictive, thus making for a more conservative analysis. The Department of Public Works and the San Francisco Public Utilities Commission have begun construction of the sewer line improvements in and around Cesar Chavez Street with the Streetscape Plan improvements planned for implementation following the utility work (likely Spring 2012) .

---

[16] Ibid. As explained in Footnote 19 on page 4.5-69 of the Draft EIR, the SF-CHAMP model is an activity-based travel demand model that has been validated to existing conditions and can be used to forecast future transportation conditions in San Francisco. Based on the criteria referenced above regarding growth in population, housing units, and employment, the model predicts person-travel by automobile, transit, pedestrian, and bicycle modes. The SF-CHAMP model also forecasts vehicular traffic on regional freeways, major arterial roads, and local roadway networks, taking into consideration the available roadway capacity, origin-destination demand, and congested travel speeds. The SF-CHAMP model travel demand estimates incorporate the ABAG land use and socioeconomic database and growth forecasts for 2030 (from ABAG *Projections 2007*), which provide forecasts of economic and population growth for San Francisco and the remaining eight Bay Area counties, as well as the Metropolitan Transportation Commission's *Regional Transportation Plan* and SFCTA's *Countywide Transportation Plan*.

[17] Ibid.

[18] Adavant Consulting used the SF-CHAMP standard model outputs containing traffic assignments for the a.m. and p.m. peak periods for 2005, 2015 or 2020, and 2030, in combination with traffic counts collected in the field to estimate future turning movement volumes for 2015 or 2020, and 2030 at the 83 study intersections. Weekday a.m. and p.m. peak-hour traffic growth rates were developed from the model output assignments for the 2005 to 2015, 2005 to 2020, and 2005 to 2030 horizon years, including the a.m. and p.m. peak periods for the Cathedral Hill Campus and the p.m. peak period for the Pacific, California, Davies, and St. Luke's Campuses. These growth factors were then applied to the existing a.m. and p.m. peak-hour turning movement volumes that were available from counts that had been previously collected in the file. Turning movement counts collected in May and June 2006 for the Cathedral Hill, Pacific, California, and Davies Campuses, and in May 2008 for the St. Luke's Campus were used. As discussed in Response TR-6, subsequent spot traffic counts collected in April 2009 in the vicinity of the CPMC campuses indicated that the 2006 and 2008 counts were generally higher (but still within an acceptable range – generally 10 percent or less) than April 2009 conditions, resulting in a more conservative approach for the analysis. (Ibid. p. 11.) This procedure is described in detail in *Assessment of No Project Cumulative Traffic Conditions – Years 2015 and 2030 Traffic Estimates*, Adavant Consulting, April 2010.

Please also see Response TR-14 (page C&R 3.7-33) for a discussion regarding the appropriateness of assuming implementation of the Muni TEP project.

3.7.2.6 PEAK-HOUR ANALYSIS

Comments

(Paul Wermer, September 23, 1010) [PC-261 TR]

"There's been a lot of discussion about traffic, and the DEIR traffic and circulation analysis is, in fact, significantly inadequate. It deals with the conventional CEQA application of looking at commute traffic at peak hours. However, CEQA does not say Thou Shalt Not Consider Other Impacts; in fact, if you read the enabling legislation, it talks about quality of life as the driver, and how the environment is important for a healthy quality of life; by the way, I'm not a lawyer, but I do try to read some of the source material to understand why something may be so. So, the problem is it looks only in many cases at the peak PM traffic, that is not when the worst impacts occur in many neighborhoods. In my area, the schools are letting out at about 3:00 p.m., there are peak traffic deliveries at that time, listening to the concern in the tenderloin with traffic in schools, increasing traffic outside of the peak PM period is going to have a direct impact on the residential environment. That is not considered in this document. The data used for the Pacific site was comparing daily averages, but you're comparing daily averages of visitors on a 24 hour operation to something that is moving to a daytime operation. Very difficult to make sense out of that, it doesn't leave us uncomfortable, and it is a data gap."

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-13 TR, duplicate comment provided in 30-13 TR]

"What are the 'peak hours'? Would not some streets have different peak hours than others and differ depending on the day of the week? How much data has been gathered, e.g., during school season, off-season, during Japantown festival days such as when the Cherry Blossom Festival Parade crosses Van Ness or even Saturdays and Sundays?"

(Paul Wermer—CPMC Neighbors Coalition and Pacific Heights Residents, October 18, 2010) [67-18A TR]

"5) TRANSPORTATION AND CIRCULATION:

(Comments apply to all sites)

Traffic Studies: The DEIR Traffic and Circulation analysis is inadequate as presented. The analysis ignored specific comments we raised about the inadequacy of LOS and peak pm/peak am analyses in our scoping comments."

(Paul Wermer—CPMC Neighbors Coalition and Pacific Heights Residents, October 18, 2010) [67-20B TR]

"2) CPMC's future operations will introduce a high level of traffic at times that are currently at lower intensity, not just at peak am/peak pm periods. The assessment must look at impacts throughout the day, as the non-commute period impact significantly affects the quality of life in surrounding residential areas."

(Barbara Kautz—CHNA and Bernal Heights Neighborhood Center, October 19, 2010) [87-21 TR, duplicate comment was provided in 108-21 TR]

"F. The DEIR's Analysis of Transportation Impacts Is Incomplete and Not Supported by Substantial Evidence.

1. Incomplete Peak Hour Analysis.

The DEIR analyzes traffic impacts only during the evening peak hour (5-6 pm), except at the proposed Cathedral Hill Hospital, where traffic impacts are also analyzed during the morning peak hour (8-9 am) (page 4.5-15). Yet nothing in the DEIR identifies the daily pattern of traffic generated by hospitals and medical office buildings (MOBs) to determine whether higher levels of traffic generated by the hospitals and MOBs at other times may also have significant effects. The examined 'peak' hours do not coincide with the pattern of hospital traffic, which peaks at shift changes (7 am, 3 pm, 11 pm; see page 4.5-73), or MOB traffic, which peaks at key appointment times (mid-morning and mid-afternoon). The effect of this differential pattern of peak traffic may be to extend periods of congestion, or, on some streets, to reduce traffic levels of service at periods other than those studied. The analysis of traffic impacts needs to extend to periods that coincide with the peak periods of the medical facilities and extends beyond the limited peak periods identified."

(Margaret Kettunen Zegart , October 20, 2010) [97-15 TR]

"• DEIR program-level should analyze current (and projected, too) congestion of Franklin, Gough, Van Ness and, Geary. Post and Sutter streets are primary traffic and transit corridors for downtown and weekday commute access and need to be studied for impacts of daily traffic and adverse impacts of "cultural congestion" at afternoon, evening, and weekends (serving the local and regional cultural I entertainment events (Symphony, SF Ballet, Opera, City Hall centered gatherings, Herbst Theater, Conservatory of Music, local theatres and the destinations of National Park Service and Presidio.) Further study of traffic and already over burdened transit is needed, not only for peak hours' users."

(Stephanie Barton et al.—Hastings Civil Justice Clinic for the Good Neighbor Coalition, October 19, 2010) [104-38 TR]

"The DEIR also needs to study traffic impacts during midday, rather than only during a.m. and p.m. peak hours, because a hospital is likely to have a greater volume of daytime traffic than most projects. Currently, the DEIR calculates expected traffic impacts for only the peak a.m. and p.m. hours. While this at times is an appropriate default methodology, San Francisco's traffic consultant guidelines acknowledge that greater analysis may be necessary depending on the nature of the project.[85]

The proposed hospital is not like most projects. The sprawling complex would border two of the busiest arterial streets in the city. In addition to the proposed Cathedral Hill Campus' numerous staff with non-traditional work hours, most patients and visitors likely would arrive during the day. This influx of traffic at irregular times may cause unacceptable traffic delays during off-peak hours. This is especially probable for streets like Van Ness Avenue, which already experiences heavy traffic all day, and for which the DEIR already found significant and unavoidable impacts during both, the a.m. and p.m. peak hours.[86] A proposed hospital located in two of the city's busiest traffic corridors needs to account for traffic patterns throughout the day in order to provide an accurate assessment of its potential impacts.

[85] Transportation Impact Analysis Guidelines, at 10.
[86] DEIR 4.5-215 to 4.5-232."

Response TR-10

The comments raise questions regarding the appropriateness of using peak-hour analysis for measuring the impacts of Cathedral Hill and other campus operations. The traffic analysis periods for each campus are consistent with the 2002 *Transportation Impact Analysis Guidelines for Environmental Review* (SF Guidelines), and the p.m. peak hour was determined and analyzed for all campuses. The SF Guidelines state on page 1, "In most cases, the department evaluates conditions in the p.m. peak hour of the p.m. peak period (4:00 to 6:00 PM). This period was chosen because it is the time period when the maximum use of much the transportation system occurs."

In addition, based on the CPMC campus surveys, the project's p.m. peak-hour demand was higher than demand during the a.m. peak hour, or other times of day, at every campus. This was confirmed by the

travel demand analysis calculations and traffic volumes observed presented in Appendix D, pages 119 and 121, of the report *CPMC LRDP: Travel Demand Estimation for the San Francisco Campuses* (Adavant Consulting, April 9, 2010). (The report is included as Appendix D of the CPMC LRDP *Transportation Impact Study Master Appendix*.)

However, for the Cathedral Hill Campus an a.m. peak-hour analysis was added for the following reasons:

- The project represented both a new and more intense land use on the site, rather than an expansion of an existing use;
- The site is adjacent to a state facility (U.S. Highway 101 [U.S. 101]);
- The California Department of Transportation (Caltrans) recommended this approach in a letter dated April 2006.

Other analysis periods were discussed for the Cathedral Hill site during the scoping process, including an afternoon peak analysis. The final decision, to not include additional analysis periods besides the weekday a.m. and p.m. peak periods, was made for the following reasons:

- A transit rider count at the Van Ness/Geary and Van Ness/Polk stops showed that the highest number of transit riders was found between 4 p.m. and 6 p.m.
- The number of hospital staff shift workers was relatively small compared to the number of employees working standard hours along with patient and visitor arrivals in the hours between 7 a.m. and 9 a.m. and between 4 p.m. and 6 p.m.

There was also discussion of a weekend analysis because of the site's location on Van Ness Avenue. However, a review of the weekend traffic volumes showed that the weekend peak-hour volumes were approximately 5 to 10 percent less than the weekday volumes (Fehr & Peers, September 2009, *2006 and 2009 Traffic Count Comparisons for Select Intersections& Weekday/Weekend Peak Hour Count Comparison for the California Pacific Medical Center Master Plan EIR*), and not all medical services are provided on the weekend. Therefore, no weekend analysis was performed.

The traffic analysis seeks to capture the most common levels of congestion in the transportation system. Analyzing "cultural congestion" does not fall into a clear pattern. The majority of large cultural events tend to occur on weekends and later on weekday evenings (i.e., at times when traffic volumes are lower than the weekday peak periods). In addition, the schedule of events varies throughout the year. For these reasons, event traffic is typically not analyzed for a project that does not hold special events. However, it should be noted that the traffic counts used for the analysis would have captured the effect of any weekday cultural events occurring at the time counts were made in the field. Additionally, although individual traffic increases may occur on local streets related to specific uses, such as schools, a p.m. peak hour analysis considers all traffic in the transportation network, which clearly increases during the p.m. peak hour from 4 p.m. to 6 p.m., with the addition of local and regional commute traffic. The 24-hour traffic volumes on Van Ness Avenue observed with the 2009 Traffic Count Comparisons analysis further confirmed that the weekday evening peak traffic volumes are, as anticipated, the highest during the p.m. peak period between 4:00 p.m. and 6:00 p.m.

The intent of analyzing the transportation network during the peak hour was to capture the network when the maximum use would occur; as such, any and all impacts that would occur during non-peak analysis time periods, weekday or otherwise, would be included in the impacts disclosed.

3.7.2.7 SECONDARY IMPACTS OF PEDESTRIAN/BICYCLE SAFETY MEASURES

Comment

(Rachel Sater—Lost Block and Save Our Streets, October 19, 2010) [101-21 TR]

"Page 4.5-204, Improvement Measure I-TR-87; Provide Pedestrian/Bicycle Improvements: CEQA requires adequate disclosure and evaluation of the environmental impacts of proposed mitigation measures--i.e., secondary environmental impacts. The flashing lights and audible signals at the garage exits recommended under this measure could cause significant noise and light pollution impacts on surrounding residential uses. The impacts of this proposed improvement measure must be disclosed and evaluated."

Response TR-11

The comment raises a concern regarding Improvement Measure I-TR-87, which recommends installing lights and audible signals at the parking garage exits at the St. Luke's Campus as a way to improve pedestrian and bicycle safety when vehicles exit the parking garage. The proposed parking garage at the St. Luke's Campus would be located at the northeast corner of the campus, below the proposed MOB/Expansion Building. Vehicles would be able to exit onto Valencia Street and Cesar Chavez Street. As shown in Draft EIR Figure 2-59, "St. Luke's Campus—Proposed Site Plan" (page 2-197), both of the proposed garage exits would be located within about 150 feet of the intersection of Valencia and Cesar Chavez Streets. As shown in Draft EIR Figure 4.1-13, "St. Luke's Campus—Surrounding Land Uses" (page 4.1-29), the nearest adjacent residential uses are south and west of the campus, more than 350 feet from the nearest proposed garage exit. At this distance, the flashing lights and audible signals at the garage exits would be far enough away from residential uses to not be visible or heard, should these added safety features be installed. It should also be noted that this improvement measure is not required mitigation for the project, but represents an improvement measure that could enhance safety for bicycles and pedestrians.

3.7.2.8 INTERSECTION SIGNIFICANCE CRITERIA

Comments

(Gloria Smith/Tom Brohard & Associates—California Nurses Association, October 19, 2010) [92-7 TR]

"In addition to the impacts that have been identified in the Draft EIR, conditions will actually be worse based upon the criteria used by the City and County. Unlike most other agencies, the San Francisco criteria used to identify significant impacts for development projects do not address incremental increases in delay at intersections once gridlock conditions occur at Level of Service (LOS) F. In other words, a development project could add a number of trips to an already failing intersection without being considered as contributing considerably to cumulative traffic increases for the most congested movements, and without requiring any mitigation measures.

Many of the intersections studied in the Draft EIR already operate at LOS F in peak hours under existing conditions, and the number of these failing intersections will Significantly increase in Years 2015, 2020, and 2030 according to Tables 4.5-17, 4.5-18, 4.5-35, 4.5-37, 4.5-38, and 4.5-39 of the Draft EIR. Adding Project trips to these failing intersections will increase vehicle delay beyond what is already being experienced, with no relief in sight."

(Gloria Smith—California Nurses Association, October 19, 2010) [90-40 TR]

"**2. The DEIR Failed to Disclose Severe Impacts on Traffic and Transit**

The DEIR minimized the Project's actual impacts on traffic congestion because unlike most California jurisdictions, the City's criteria used to identify significant impacts for development projects do not address incremental increases in delay at intersections once gridlock conditions occur at Level of Service (LOS) F. This means that a development project could add any number of trips to an already failing intersection without being considered as contributing to cumulative traffic increases for the most congested roadways. This lax criterion In turn allows a developer to minimize a project's actual impacts and allows it to avoid mitigating its worst impacts on traffic congestion.

Here, many of the intersections identified in the DEIR already operate at LOS F in peak hours under existing conditions, and the number of failing intersections will significantly increase in Years 2015, 2020, and 2030[21] The Project's contributions to additional vehicle trips to these failing intersections will increase delay well beyond existing conditions. This issue is particularly serious for a hospital project. For example, the DEIR did not analyze how the increased traffic around the Cathedral Hill Campus will affect access for ambulances, labor and delivery vehicles and others urgently trying to reach the hospital. During gridlock traffic conditions which are much of the time around Van Ness Avenue, emergency patients may face life threatening delays while waiting in traffic. The DEIR failed to consider these and other critical circumstances in the traffic analysis.

[21] DEIR Tables 4.5-17, 4.5-18, 4.5-35, 4.5-37, 4.5-38, and 4.5-39."

(Gloria Smith—California Nurses Association, October 20, 2010) [96-19 TR, duplicate comment was provided in 110-19]

"**V. Traffic and Transportation Problems Due to Increased Traffic at Cathedral Hill Campus**

The Draft EIR's traffic and transportation analyses all suffer from the same fundamental mistake, i.e., failing to recognize that the projected future levels of service at intersections in the vicinity of the CPMC campuses is *not the only relevant criterion* that needs to be analyzed and would *not be the only consequence* of implementing the LRDP."

Response TR-12

The comments raise questions about the significance criteria used to determine impacts at intersections and raises a concern that only future intersection levels of service were used to determine impacts resulting from the proposed CPMC LRDP.

As stated on Page 4.5-56 of the Draft EIR,:

> The project was determined to have a significant traffic impact at an intersection if project-generated trips would cause an intersection operating at LOS D or better under No Project conditions to operate at LOS E or LOS F, or intersections operating at LOS E under No Project conditions to deteriorate to LOS F conditions. At intersections that would operate at LOS E or LOS F under No Project conditions, and would continue to operate at LOS E or LOS F under project conditions, the increase in project vehicle trips was reviewed at the critical movements to determine whether the increase would contribute considerably to critical movements operating at LOS E or LOS F.

As the traffic methodology above indicates, the analysis included an evaluation of whether additional vehicles generated by the proposed LRDP at intersections already operating at LOS E or LOS F would result in significant impacts. Specifically, for those intersections already operating at LOS E or LOS F under the Cumulative condition, project vehicle trips were reviewed to determine whether the increase

would contribute considerably to critical movements (see discussion on page 4.5-93 of the Draft EIR). This type of analysis addresses the incremental increases in delays added by a project at intersections that are already operating with high vehicle delays. Therefore, the comment is incorrect in stating that "... a development project could add any number of trips to an already failing intersection without being considered as contributing to cumulative traffic increases for the most congested roadways."

The Draft EIR lists those intersections that are expected to operate at unacceptable levels of service (LOS E or LOS F) under the Cumulative condition at the beginning of the traffic analysis as well as in the level of service tables for each campus. For example, there are a number Cathedral Hill Campus study intersections that would operate at LOS E or F under the Cumulative condition. However, the Draft EIR states that less-than-significant impacts (i.e., less than significant project contributions to critical movements) would occur at these intersections (see Impact TR-102 on page 4.5-220 of the Draft EIR). The analysis for the Davies Campus, on the other hand, identifies a significant impact at one of the study intersections that is already operating at unacceptable levels (see Impact TR-127 on page 4.5-233 of the Draft EIR).

In light of the above, the significance thresholds and methodology clearly address incremental increases in delay at intersections already operating at unacceptable levels of service under both the Modified Baseline and the Cumulative scenarios.

Please also see Response TR-100 on page C&R 3.7-170 for a discussion regarding ambulance traffic and emergency access.

Additionally, the Draft EIR contains analyses of the proposed CPMC LRDP's effect on alternative modes, including transit, pedestrians, and bicyclists. The significance criteria for the respective modes are stated on pages 4.5-53 and 4.5-54 of the Draft EIR and excerpted below:

> **Transit**—The project would have a significant effect on the environment if it would cause a substantial increase in transit demand that could not be accommodated by adjacent transit capacity, resulting in unacceptable levels of transit service; or cause a substantial increase in delays or operating costs such that significant adverse impacts on transit service levels could result.
>
> **Bicycles**—The project would have a significant effect on the environment if it would create potentially hazardous conditions for bicycles or otherwise substantially interfere with bicycle accessibility to the site and adjoining areas.
>
> **Pedestrians**—The project would have a significant effect on the environment if it would result in substantial overcrowding on public sidewalks, create potentially hazardous conditions for pedestrians, or otherwise interfere with pedestrian accessibility to the site and adjoining areas.

3.7.2.9 ALTERNATIVE SIGNIFICANCE CRITERIA

Comments

(Paul Wermer—CPMC Neighbors Coalition and Pacific Heights Residents, October 18, 2010) [67-19 TR]

"b) The analysis is only in terms of Level of Service (LOS) which is not the appropriate metric for residential and neighborhood commercial streets. We propose alternative or supplemental metrics below."

(Paul Wermer—CPMC Neighbors Coalition and Pacific Heights Residents, October 18, 2010) [67-23 TR]

"We request that the traffic studies be revised using tools such as TIRE, the City of Portland Impact Threshold Curve; and the various approaches applied by Florida's DOT. Furthermore, we again ask that the study look at traffic outside of the peak commute periods.

At a minimum a qualitative assessment of driver behaviors on affected streets and intersections as traffic conditions change is required, as the general observation of residents in surrounding areas is that unsafe driver behaviors occur when some roads are highly congested and drivers attempt to find a less congested path.

These assessments will provide a much better assessment of the impact on residential and NCD streets than the LOS approach and Vehicle Trips Generated analysis used in the current DEIR. We urge MEA to work with affected residents to define the studies before implementing them, so that we all understand the options, the capabilities and the limitations before deciding on a final approach."

Response TR-13

The comment requests that alternative significance criteria be used to assess the traffic operations. The use of intersection LOS criteria is established in the *SF Guidelines* as the primary means for assessing the traffic impacts of a project on intersection operations. (For a discussion of how the analysis time periods were selected, see Response TR-10 on page C&R 3.7-26). However, unlike other jurisdictions, which use traffic impacts as the primary factor determining overall project transportation impacts, the San Francisco Planning Department also requires assessment of project impacts on transit, pedestrians, bicycles, freight and passenger loading, emergency access, and construction-related transportation impacts (significance criteria is included on pages 4.5-53–54 of the Draft EIR). In addition, parking conditions are presented for informational purposes. Therefore, the Planning Department's significance criteria address all modes, and do not only rely on intersection operating conditions to determine the impacts of a project.

Furthermore, tools such as TIRE (Traffic Intrusion in a Residential Environment) or Portland's Impact Threshold Curve provide a method for measuring relative increases in traffic, but generally are applicable to lower-volume suburban residential streets. Resident perception of roadway traffic depends on many variables: ambient traffic levels, speed of traffic, mix of traffic (trucks), environment (urban, suburban), etc. While more jurisdictions are moving away from solely using vehicle LOS to determine impacts and toward a more multimodal LOS approach, the transportation consulting profession has not adopted any method that would be considered a consensus approach. Alternatively, as discussed above, the City of San Francisco does analyze a project's transportation impacts based on its effects on all modes of travel, not just vehicle traffic.

3.7.2.10 TRANSIT EFFECTIVENESS PROJECT FOR FUTURE TRANSIT IMPROVEMENTS

Comments

(Unitarian Universalist CPMC Task Force, October 5, 2010) [44-4 TR]

"Traffic impacts, public transportation. Volume 3, Chapter 4, Number 3, Page 4.5-54: 'Planned transportation improvements **assumed** to be implemented by the City of San Francisco, and included in the impact assessment.' This is a fallacious assumption given that SF MUNI has recently reduced service city wide and has recently made a slight modification in evening service."

(Barbara Kautz—CHNA and Bernal Heights Neighborhood Center, October 19, 2010) [87-25 TR, duplicate comment provided in 108-25 TR]

"Similarly, the DEIR cannot include proposals for *future* improvements in transit service or street design as part of the baseline. Only conditions *existing* when the Notice of Preparation was issued can be used to determine project impacts."

(Gloria Smith—California Nurses Association, October 19, 2010) [90-42 TR]

"Concerning public transit, the DEIR made erroneous assumptions that transit service would increase once the Project was operational. However, given severe budgetary constraints which directly affect/reduce service levels for the San Francisco Municipal Transportation Agency (Muni), and given projected increases in ridership, the DEIR grossly underestimated impacts the Project would have on Muni. According to the DEIR, the City is in the process of implementing 'recommendations designed to make Muni service more reliable, quicker and more frequent.'[24] From this, the DEIR assumed that increased Muni service would accommodate increased Project-related ridership thereby mitigating any potential transit impacts. But, as shown below, these assumptions are wrong; thus, the DEIR failed to calculate and disclose the Project's actual impacts on public transit.

CNA's traffic expert, engineer Tom Brohard, determined that transit service enhancements have, in fact, been suspended given the ongoing fiscal emergency. Indeed Muni service is frequently cut and then occasionally partially restored, with only incremental losses at best but never system-wide increases. Accordingly, in Mr. Brohard's opinion, the DEIR erred in its finding that it was reasonably foreseeable that Muni would increase services in the areas serving the five CPMC campuses.[25] Where the DEIR assumed that service enhancements would be made, the transit analysis of near term and long term transit conditions was flawed. This flawed analysis in turn resulted in a significant under estimation of impacts.

Mr. Brohard also found numerous errors in the DEIR's ridership data for all five campuses. These errors were both within various tables as well as in comparison to the DEIR's forecast number of Project transit riders in the description of transit impacts. These errors are described in detail in Mr. Brohard's attached comment letter.

[24] DEIR at page 4.5-61.
[25] Transit services were dramatically reduced in December 2009 and May 2010, twice in the last 10 months, and partially restored in September 2010."

(Gloria Smith/Tom Brohard & Associates—California Nurses Association, October 19, 2010) [92-10 TR]

"More specifically, my review of the Draft EIR and the supporting traffic studies indicates a number of technical errors and inconsistencies in the Transportation and Circulation Analysis of the Project. Each of the issues identified below must be addressed and reevaluated through additional study in a revised and recirculated EIR as follows:"

(Gloria Smith/Tom Brohard & Associates —California Nurses Association, October 19, 2010) [92-13 TR]

"2) Assumptions Regarding Future Muni Service Increases Are Not 'Reasonably Foreseeable' - Page 4.5-61 of the Draft EIR states "SFMTA and the City Controller's Office are in the process of implementing the TEP, a review of the City's public transit system with recommendations designed to make Muni service more reliable, quicker and more frequent. The TEP proposals were endorsed by the SFMTA Board of Directors in October 2008.

From my review of the SFMTA website, plans to implement the TEP (Transit Effectiveness Project) and its numerous transit service enhancements have been suspended with the ongoing fiscal emergency. In my opinion, it is not reasonably foreseeable that Muni will increase transit services in the areas adjacent to the five CPMC campuses when transit services have been dramatically reduced in December 2009 and May 2010, twice in the last 10 months. As the Draft EIR has assumed that the TEP service enhancements will be made, the transit

analysis of near term and long term transit conditions is flawed. This flawed analysis in turn resulted in a significant under estimation of impacts."

Response TR-14

Data collected during the TEP planning process was used to determine transit capacity and use for Modified Baseline and Cumulative conditions in the Draft EIR (Tables 4.5-21 & 4.5-22 , pages 4.5-119 and 4.5-121 in the Draft EIR). The TEP, which was developed in 2008 after extensive data collection and public comment, identifies proposed route changes, operational adjustments, and vehicle headway changes designed to improve transit service throughout San Francisco. The TEP has been endorsed for subsequent environmental review by the SFMTA Board of Directors, and the SFMTA recently published a TEP Implementation Strategy (April 5, 2011). The TEP Implementation Strategy anticipates that many of the service improvements would be implemented sometime between the end of Fiscal Year (FY) 2013 and FY 2015 and that the remainder of the service improvements would occur in FY 2016.[19]

Although the TEP has not been formally adopted, the service plans presented in the TEP represent the most likely changes to Muni service that would occur over the next several years. Furthermore, the TEP has been used to guide recent SFMTA Board decisions to implement recent budget-neutral service changes (i.e., the Muni service plan dated December 8, 2009), including the elimination of the 26-Valencia bus line that previously served the St. Luke's Campus. Finally, at the time of proposed LRDP scoping and analysis, it was not known that the SFMTA would declare a fiscal emergency for two consecutive years and reduce service. Therefore, the transit analyses in the Draft EIR assume that the TEP recommendations represent a reasonable transit operating plan for the time when the CPMC LRDP would become operational.

The comments suggest that using service changes planned by the TEP to project future capacity is inappropriate because of recent fiscal emergencies and service reductions at SFMTA/Muni. Despite the SFMTA declarations of fiscal emergency, implementation of the TEP service changes is expected to occur at about the same time as when construction of the Cathedral Hill Campus as well as other LRDP projects would be complete.

Nevertheless, in response to this comment, a supplemental transit analysis was conducted to compare the cumulative transit analysis presented in the Draft EIR with the transit capacity operating at the time that the NOP for the CPMC LRDP was released (May 27, 2009, i.e., before December 2009) as the baseline, rather than assuming implementation of the TEP. C&R Table 3.7-8 shows the cumulative transit capacity analysis for each of the CPMC campuses. C&R Table 3.7-9 evaluates the transit delay for each of the lines near the proposed Cathedral Hill Campus using the pre-December 2009 route headways.

As shown, only one directional screenline would operate in excess of Muni's established capacity standard of 85 percent. Under Cumulative No Project Conditions, the westbound transit screenline for the Davies Campus would operate at 89 percent. With the addition of the Davies Campus projects, the screenline would continue to operate at 89 percent. The proposed projects at the Davies Campus would add 15 new transit trips to the westbound direction during the p.m. peak hour. This represents approximately 0.2 percent of future westbound ridership. Therefore, the proposed projects at the Davies Campus would continue to have a less-than-significant impact on Muni if capacity were to be measured using the existing (pre-December 2009) transit service plan as opposed to the TEP.

The transit lines serving the proposed Cathedral Hill Campus were also evaluated to determine whether operation of the proposed Cathedral Hill Campus would result in any significant impacts related to transit delays. The transit-delay impacts were evaluated using the TEP-proposed headways for each of the transit

[19] SFMTA, Draft Transit Effectiveness Project Implementation Strategy, April 5, 2011, page 3-5.

lines. The Draft EIR identified that operation of the proposed campus would result in significant impacts related to transit delays along several transit lines.

As shown above, the proposed Cathedral Hill Campus would result in operational delays on the 19-Polk and the 49-Van Ness/Mission transit lines. The Draft EIR analysis concluded that significant impacts would occur to these two transit lines (see Impacts TR-31 and TR-29, respectively, on pages 4.5-123 and 4.5-120 of the Draft EIR). As demonstrated in the analysis above, the LRDP would result in the same impacts as identified in the Draft EIR irrespective of whether the pre-December 2009 or the TEP operational plans are assumed in the analysis.

3.7.2.11 MUNI SERVICE REDUCTIONS NOT INCLUDED IN TRANSIT ANALYSES

Comment

(Gloria Smith/Tom Brohard & Associates —California Nurses Association, October 19, 2010) [92-11 TR]

"1) Muni Service Assumptions Do Not Match Existing Baseline - In discussion regarding San Francisco Municipal Transportation Agency, Page 4.5-17 of the Draft EIR states 'Figures 4.5-6 through 4.5-10 (beginning on Page 4.5-18) present Muni lines serving each campus, while Tables 4.5-1 through 4.5-5 (beginning on Page 4.5-23) present the frequency of service for the Muni bus, light rail, and cable car lines serving each study area. The information on frequency of service reflects Muni service before the December 5, 2009 service changes that resulted from SFMTA's ongoing fiscal emergency ... On December 5, 2009, Muni service changes associated with the budget deficit were implemented. The fiscal emergency declared on April 21, 2009 continued through fiscal year 2010. As a result, SFMTA is facing a shortfall in its current fiscal year, which ended on June 30, 2010. To address the continuing fiscal emergency, SFMTA implemented reductions in service beyond those implemented on December 5, 2009. As noted above, the transit service and ridership data do not reflect the recent

changes to Muni service resulting from SFMTA's ongoing fiscal emergency because ridership data for post-implementation conditions is not currently available for all lines.'

From my review of the SFMTA website, service changes included discontinued routes and route segments, extended and modified routes, and changes to service hours and frequencies. Service reductions were initially implemented on December 5, 2009 and additional reductions were made on May 8, 2010. While about 60 percent of the May 8, 2010 service reductions were subsequently restored on September 4, 2010, current Muni services are significantly reduced compared to 2006 and 2007 when the ridership data used in the Draft EIR was collected by Muni. With reduced service frequencies and the same level of transit ridership, some Muni lines are certainly experiencing higher occupancy than identified in the Draft EIR. This increase, combined with a large workforce at Project buildout, was not analyzed in the Draft EIR."

Response TR-15

The transit service baseline used in the analysis was developed to represent conditions at the time at which the NOP for the proposed CPMC LRDP was released (May 27, 2009). This represents a time before the implementation of fiscal emergency service reductions by SFMTA, which were partially restored , such as Owl Service and capacity on 13 weekday, three weekend, and nine evening routes, by September 2010. At the time of project analysis, it was not known that SFMTA would declare a fiscal emergency and reduce service, and based on SFMTA's commitment to restore service where temporary service reductions were made, the transit analysis presented in the Draft EIR is reasonable. Thus, no new analysis is required.

3.7.2.12 CUMULATIVE ANALYSIS LAND USE ASSUMPTIONS

Comments

(Paul Wermer—CPMC Neighbors Coalition and Pacific Heights Residents, October 18, 2010) [67-24 TR]

"Cumulative impacts (Pacific Site):

The EIR must assess future uses of all nearby facilities, such as the Newcomer High School site, the Smith-Kettlewell Eye Research Institute and the UOP Dental School plans for the Pacific site."

(Hiroshi Fukuda [phon], September 23, 2010) [PC-161 TR]

"The DEIR does not address the cumulative impacts on several other projects, namely the 1481 Post Street project, which is proposed for 38 stories, and that would have a significant impact, and that, if it is approved, will be in the same timeframe as the CPMC project."

Response TR-16

The comments raise concerns about other future projects near the Pacific Campus and the potential for cumulative impacts. The cumulative traffic volumes were developed using the City's travel demand forecast model, which takes into account reasonably anticipated traffic growth, based on increases in population, housing units, and employment as forecasted by ABAG and the San Francisco Planning Department. It also factors in development that could occur under existing zoning, approved area plans, an area's potential zoning capacity, and anticipated redevelopment. Therefore, to the extent that future uses around the Pacific Campus site either are reflected in approved plans or are in the development pipeline, and thus are assumed as part of the SF-CHAMP background vehicle travel forecasts, they were addressed as part of the cumulative traffic analysis. Section 4.1.3, "Cumulative Conditions," of the Draft EIR notes that there are no large-scale vacant sites in the Pacific Campus vicinity where considerable construction could occur in the future. The Smith-Kettlewell Eye Research Institute and the Arthur A. Dugoni School of Dentistry are already developed sites. To the extent that these facilities could expand beyond what is anticipated in background population and employment growth, such expansion would be considered once there is a proposed project. Newcomer High School is not located near any of the CPMC campuses. Furthermore, no proposals to redevelop any of the above sites have been submitted to the Planning Department for review, and thus, the approach to determining cumulative land use assumptions should not be altered based on speculation.

The 1481 Post Street Project is proposed, but has not yet been approved. However, to the extent that the 1481 Post Street Project would fit within the City's current or potential zoning capacity, the potential traffic effects are captured by the cumulative analysis since increases in population growth are assumed in the background traffic growth in the SF-CHAMP model. At this time, the 1481 Post Street Project is at the conceptual stage of development, thus the timing of its construction is unknown. Therefore, analysis of cumulative construction impacts relative to proposed construction at the California Campus would be too speculative for consideration.

3.7.2.13 2006–2007 TRANSIT DATA

Comment

(Gloria Smith/Tom Brohard & Associates —California Nurses Association, October 19, 2010) [92-12 TR]

"In the evaluation of traffic impacts in the Draft EIR, peak hour traffic counts at critical intersections conducted in 2006 were validated by making new peak hour counts in 2009 and comparing the traffic volumes. However in the transit analyses in the Draft EIR, ridership and occupancy validation of the data collected in 2006 and 2007 prior to the service reductions has not occurred. Without updating and comparing ridership, service levels and transit capacity, current transit occupancy after the Muni service reductions has not been determined. Further, while the Draft EIR states that SFMTA does not have current ridership data for all lines, the Draft EIR should have included a validation process for the critical transit lines, particularly those approaching capacity that serve the five campuses. Without proper baseline data, the transit analysis is flawed."

Response TR-17

The comment suggests the analysis is flawed because transit ridership data is old and does not reflect recent Muni service reductions. The detailed transit volume data by bus stop used for the transit analysis were the most recent at the commencement of the analysis. This level of data was collected to prepare the TEP; however, data at this level of detail are not collected on a regular basis. Therefore, there was no alternate source of information to perform a detailed comparison of the bus stop boardings between the 2006–2007 data and transit use in 2009, when the transportation analysis commenced. Thus, the 2006–2007 data represented the best source of information for performing the transit analysis.

C&R Table 3.7-10 shows the annual weekday bus ridership for Muni at the system level and for the routes that serve the CPMC campuses. The table shows that while there were increases in the ridership in Fiscal Year (FY) 2007 and FY 2008, there has been a decrease in ridership in FY 2010.

C&R Table 3.7-10
Muni Weekday Passenger Boardings by Fiscal Year

Fiscal Year	Weekday Passenger Boardings	Annual Growth	Boardings on CPMC Lines	Annual Growth
2006	654,292	–	455,495	–
2007	650,874	-0.5%	453,686	-0.4%
2008	687,172	5.6%	491,914	8.4%
2009	704,635	2.5%	504,016	2.5%
2010	676,780	-4.0%	485,589	-3.7%

Source: San Francisco Municipal Transportation Agency 2010, *Federal Transit Administration's National Transit Database Report*

The TEP data set is far more robust than any other data set, and thus allows for a much more comprehensive transit impact analysis than otherwise could have been performed for the Draft EIR. Additionally, the TEP data set was collected more closely to the time of the issuance of the NOP than any other subsequent data set.

3.7.2.14 ADEQUACY OF THE TRANSPORTATION IMPACT ANALYSES

Comments

(Barbara Kautz—CHNA and Bernal Heights Neighborhood Center, October 19, 2010) [87-7 TR, duplicate comment provided in 108-7 TR]

"5. The DEIR does not adequately analyze many environmental impacts. In particular, its analysis of transportation impacts does not meet the requirements of CEQA."

(Sue Hestor, October 19, 2010) [89-3 TR]

"CPMC has decided ON ITS OWN to pick up and leave or reduce certain services that are currently provided in other neighborhoods and MOVE THEM TO ONE OF THE MOST CONGESTED and CRITICAL TRANSIT INTERSECTIONS IN THE CITY. The starting point for any CITY analysis of that decision must be resolution of serious problems that converge at this area."

(Sue C. Hestor—Attorney at Law, October 19, 2010) [89-10 TR]

"THIS SIMULTANEOUS or COORDINATED CONSTRUCTION of the BRT lines and CPMC BUILDINGS SHOULD BE A GOAL OF THE PROJECT AND REQUIREMENT ANALYZED IN THE EIR."

(Stephanie Barton et al.—Hastings Civil Justice Clinic for the Good Neighbor Coalition, October 19, 2010) [104-49 TR]

"**E. The DEIR fails to provide substantial evidence that justifies overriding the proposed hospital's significant and unavoidable traffic impacts.**

While the DEIR's transportation analysis is deeply flawed and inadequate, it already admits that the proposed hospital, both by itself and in combination with the rest of the LRDP, will have significant and unavoidable environmental impacts on traffic and transit.[114] The DEIR admits that the Cathedral Hill Campus alone would cause significant and unavoidable delays at three intersections (Van Ness/Market, Polk/Geary and Franklin/Bush) and would create a traffic hazard on Geary Street.[115] The DEIR also admits that the proposed hospital, when combined with the LRDP, will result in further significant and unavoidable environmental impacts on both traffic and transit.[116] Three more intersections (Gough/Geary, Van Ness/Pine and Church/Market/14th Street) and five transit lines (49-Van Ness-Mission, 47-Van Ness, 38/38L- Geary, 19-Polk and 3-Jackson) will experience unavoidable delays due to increased traffic and congestion.

A project that acknowledges it will have such significant and unavoidable impacts should have powerful overriding considerations. Having seismically safe hospitals is vital to the quality of life for San Francisco's residents. However, the DEIR does not appear to meet the CEQA required burden of providing substantial evidence that the proposed project as presently configured sufficiently safeguards the environment of San Francisco.[117]

[114] DEIR 6-1 & 6-2.
[115] Id
[116] DEIR 6-3 & 6-4.
[117] *See* CEQA Guidelines §15093."

Response TR-18

The comments question whether the analysis of transportation impacts meet the requirements of CEQA and concerns regarding traffic impacts in the vicinity of the Cathedral Hill Campus. The transportation impact analyses presented in the Draft EIR evaluate the direct, indirect, and cumulative impacts of the projects proposed for the respective CPMC campuses on all modes of transportation in the study areas around the campus sites. The scope of the analyses conforms to the requirements of the *SF Guidelines*, which were developed to address CEQA requirements. The analysis considers the impacts on pedestrians, bicycle traffic, transit, and vehicles as well as ongoing transportation improvements projects such as the proposed Van Ness and Geary Bus Rapid Transit (BRT) projects. Because of the scale of the proposed CPMC LRDP, the Draft EIR included a specific section on the potential impacts of construction activities on the transportation network. The Draft EIR discloses the impacts on various transportation modes, identifies potential mitigation measures, and identifies impacts that are significant and unavoidable, which is the intent of the environmental document.

The comments note that a goal of the proposed LRDP should be to seek the simultaneous or consecutive construction of both the proposed Van Ness and Geary BRT projects, in concert with other LRDP construction, and this concurrent construction should be analyzed in the Draft EIR. As stated previously, the goal of the transportation impact analyses presented in the Draft EIR is to evaluate impacts of the proposed LRDP as defined in the NOP, not to bond one proposed aspect or project to another. The proposed Van Ness BRT project is currently under environmental review by the SFCTA, but the Draft EIS/EIR has not been released. The CPMC LRDP Draft EIR does analyze the impact of the project if both the proposed Van Ness and Geary BRT projects were implemented under both Modified Baseline (pages 4.5-111–114 of the Draft EIR) and Cumulative conditions (pages 4.5-228–229 of the Draft EIR).

Additionally, the comments note that the Draft EIR identifies a number of significant and unavoidable traffic and transit impacts but that it does not provide evidence as to why such impacts are acceptable.

State CEQA Guidelines Section 15093 (to which the comment refers) states that, "when a lead agency approves a project which will result in the occurrence of significant effects which are identified in the final EIR but are not avoided or substantially lessened, the agency shall state in writing the specific reasons to support its action based on the final EIR and/or other information in the record." This statement is referred to as the Statement of Overriding Considerations and is typically adopted by the decision-making body after EIR certification, in light of the whole record. It is not required by CEQA nor would it be appropriate for a Draft EIR to set forth the reasons as to why some or all of the identified significant, unavoidable impacts would be acceptable or unacceptable. Furthermore, it is the responsibility of the decision-makers (i.e., Planning Commission, Board of Supervisors, etc.), should they choose to approve the proposed LRDP, and not the responsibility of the Draft EIR to make findings regarding overriding considerations. Such findings must be based on substantial evidence in the record, which would include, but would not be limited to, the Draft EIR.

3.7.2.15 CEQA CHECKLIST

Comment

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-34 TR, duplicate comment provided in 30-34 TR]

"At any rate, in the CEQA checklist under the section entitled 'XV- TRANSPORTATION / TRAFFIC,' would the project:

a) Cause an increase in traffic which is substantial in relation to the existing traffic load and capacity of the street system (i.e., result in a substantial increase in either the number of vehicle trips, the volume to capacity ratio on roads, or congestion at intersections)?

b) Exceed, either individually or cumulatively, a level of service standard established by the county congestion management agency for designated roads or highways?

c) Result in a change in air traffic patterns, including either an increase in traffic levels or a change in location that result in substantial safety risks?

d) Substantially increase hazards due to a design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)?

e) Result in inadequate emergency access?

f) Result in inadequate parking capacity?

g) Conflict with adopted policies, plans, or programs supporting alternative transportation (e.g., bus turnouts, bicycle racks)?

I believe the answer to all of the above questions, save for possibly 'c,' unless a helicopter is used in the construction, would be 'yes.' For CEQA XV-a, when traffic is forced onto neighborhood residential streets that should not take that kind of increased capacity, it is in violation. CPMC projects will do just that. For CEQA XV-b, Highway 101 will be impacted during and after CPMC projects are completed. And there is no mitigation solution for Van Ness/Market. I suppose we can say that San Francisco is a 'Transit First' city, but not everybody will leave their vehicles, including the physicians who primarily drive to and from work alone to the hospital sites per CPMC's own surveys. Until a world-class transit system is in place with the proper infrastructure to accommodate, there will be congestion problems at not only Van Ness/Market but also at Polk/Geary as mentioned below. In fact, we are a 'Transit First' city that will have a transit impact during the construction of and at full build-out of this project. This project will impact the most heavily used transit line in the City, the

38/38L-Geary line. The more transit is impacted, the less people will rely on it. If the plan is to get SFMTA to run more buses on the impacted lines without fixing the traffic throughput, that will mean there will be more buses sitting in the traffic jam."

Response TR-19

The comment lists the prior contents of the CEQA checklist which were updated in 2007 and 2009, including the transportation section (Appendix G of the State CEQA Guidelines, can be found at www.ceres.ca.gov). Transportation-related updates included: changes to questions a) and b), listed above, to expand the analysis to other travel modes, and refer the reviewer to local/regional performance measures of the circulation system (not just Level of Service standards); and the deletion of question f) related to parking. The comment states that the CPMC LRDP would answer "yes" to most, if not all the checklist items. The CEQA checklist is used to determine whether a project would result in a significant impact and to establish whether there is a need to prepare an EIR. The Planning Department determined that an EIR would be prepared for the proposed CPMC LRDP; the Draft EIR prepared for the LRDP identified transportation impacts (including significant and unavoidable impacts) that would result from project implementation, as well as mitigation measures for those impacts, where feasible. Items a, b, c, and d of the checklist were analyzed as part of the traffic impacts section of each respective campus; item e of the checklist was analyzed as part of the emergency access impacts section of each respective campus; item f above, is no longer part of the State CEQA checklist and does not constitute a transportation impact, but a discussion regarding parking was included on pages 4.5-162 through 4.5-166 of the Draft EIR for informational purposes, and item g from the above checklist was analyzed as part of the alternative modes (including pedestrians, bicycles, and transit) section of the Draft EIR.

Specifically, the comment notes that traffic impacts would occur on Van Ness Avenue, including the intersection of Van Ness/Market and the intersection of Polk/Geary, and that transit impacts would occur on the 38/38L Geary bus line, all of which were discussed in the Draft EIR.

As noted in Section 4.5.3 of the Draft EIR on page 4.5-53, the transportation significance thresholds used for the transportation analysis follow the environmental checklist (Appendix G of the State CEQA Guidelines), which has been adopted and modified by the San Francisco Planning Department. In addition, Chapter 3 of the Draft EIR includes a discussion of the project's conformance with adopted policies, plans, and programs supporting alternative transportation.

3.7.3 TRIP GENERATION

3.7.3.1 DRIVE ALONE/CARPOOL ASSUMPTIONS

Comments

(Lisa Carboni, Caltrans (Regional), September 9, 2010) [6-1 TR, duplicate comment provided in 7-1 TR]

"Thank you for continuing to include the California Department of Transportation (Department) in the environmental review process for the California Pacific Medical Center (CPMC) Long Range Development Plan Project. The following comments are based on the Draft Environmental Impact Report (DEIR)."

Forecasting

The project proposes to replace the existing hotel, office, and retail use with a hospital and a medical office building. In Table 30 on page 66 of the Transportation Impact Study (TIS), the table states a low auto (drive alone plus carpool) rate of 53 percent and 43 percent for the hospital and medical office respectively compared to other modes of travel. Also, in Table 30, the TIS used a vehicle occupancy rate of 1.0 for physicians, 1.32 for staff, and 1.14 for patients and visitors. The Department believes the drive alone plus carpool rate is understated because

patrons to the hospital or the medical office would likely be physicians and staff which would have dedicated parking spaces or drive alone or carpool since they are too ill to take other travel modes, Therefore, we recommend the study adopt a more conservative and reasonable approach on modal split for these uses."

(Paul Wermer—CPMC Neighbors Coalition and Pacific Heights Residents, October 18, 2010) [67-20A TR]

"c) The data used to develop the traffic impact looks at daily averages, and does not assess actual traffic patterns based on intended use of the facilities.

1) The arrival and departure pattern are very dependent on actual services to be provided. For the Pacific site, comparisons of daily averages now (when the hospital is a 24 hour operation) with daily averages in the future (when operations will primarily be 7am - 6 pm is misleading."

Response TR-20

The comments question the assumptions used for the travel demand analysis. The travel demand methodology developed for the CPMC transportation impact study reports is based on the techniques outlined in the *SF Guidelines*, which are used to analyze the transportation impacts of development projects throughout the City. The approach estimates the person trips for each campus and applies mode-choice factors to determine the number of vehicle, pedestrian, bicycle, and transit trips. The mode-choice factors reflect the characteristics of the existing CPMC campuses and the travel characteristics within a given area of San Francisco. The characteristics considered for the individual campuses included the types of medical services provided; the numbers of employees, patients, and visitors; and travel data collected through a series of travel surveys, interviews, and field counts. The surveys, interviews, and field counts were used to collect information on employee, patient, and visitor arrivals at the four existing campuses. The employee data included shift information and the category of employees, including physicians, medical staff, administrative staff, and visiting physicians. The data were also broken down by hospital, medical office, and ambulatory care functions.

These data were used to develop mode-choice factors for each existing campus (Pacific, Davies, California, and St. Luke's) by type of user (employee, patient, or visitor). These mode choice factors were used to estimate the existing trip generation for each existing campus. The trip generation for the existing campuses was compared to traffic counts. This comparison showed that during the a.m. peak hour, the trip generation estimates were close to the traffic counts, but that in the p.m. peak hour, automobile use tended to be overestimated. Therefore, the traffic analysis would be more conservative. The mode-choice factors for the proposed Cathedral Hill Campus were taken from the factors for the Van Ness Commercial District that are presented in the *SF Guidelines*. The assumptions, methodology, and results of this analysis are summarized in the report *CPMC LRDP: Travel Demand Estimation for the San Francisco Campuses* (Adavant Consulting, April 9, 2010). The report is included in Appendix D of the *Cathedral Hill Transportation Impact Study*.

Future mode choice patterns for each campus were adjusted based on the services/functions that would be provided at each location. As indicated in the comment, on-site parking would be provided for all physicians; therefore, it was assumed that 100 percent of physicians would drive alone to the campus. The vehicle occupancy rates used for staff, patients, and visitors were based on the mode choice assumptions and compared to surveys at existing campuses. The vehicle occupancy rates of 1.32 for staff and 1.14 for patients reasonably reflect that (1) on-site staff parking is not guaranteed, so there would be an incentive to carpool or use alternate travel modes, and (2) patients are commonly driven by others to medical facilities. The visitor auto occupancy of 1.14, calculated from the *SF Guidelines* mode choice data, is substantially below the auto occupancy rates of 1.39 to 1.43 from the existing campus surveys conducted at Pacific, California, and Davies Campuses, and thus provides a conservative analysis in terms of vehicle trip generation. With the approach described above, the travel demand estimates for the CPMC campuses were not based solely on the land use, but also on the characteristics of existing CPMC operations and the

future uses that would be located on each campus. Similarly, the analysis based the parking demand on the existing mode choice rather than applying standard parking ratios to estimate the demand, which could have overestimated the demand in an urban area with high transit accessibility.

3.7.3.2 TRIP DISTRIBUTION

Comment

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-20 TR, duplicate comment provided in 30-20 TR]

"Why would the staff need to use their vehicles and require parking if they live in the City, considering that this is a 'Transit First' City. I think there is an assumption being made that the CPMC staff people will choose to live in the City for this project at all levels to work. I think with the salary being paid the nurses, etc. at CPMC, they can afford to live in San Francisco but nobody can force them to stay in a City if they have family for which the ''Transit First' policy is family unfriendly."

Response TR-21

The comment requests clarification of the Draft EIR's assumptions about trip distribution and assignment of CPMC staff, particularly vehicle and transit trips. The project-generated person-trips were assigned to local and regional origins and destinations: four San Francisco superdistricts (northeast, northwest, southeast, and southwest San Francisco), the East Bay, the North Bay, the South Bay, and areas outside the region. For most development projects in San Francisco, person-trips are distributed according to average trip patterns of San Francisco residents and employees, as summarized in the *SF Guidelines*. However, hospitals and medical facilities often have trip patterns that are unique to the populations that they serve. Therefore, the trip distribution for the Cathedral Hill analysis was determined using information collected by CPMC in origin-destination surveys of employees, patients, and visitors taken at CPMC's Pacific Campus in February 2001 and April 2003. Using the results of these surveys is appropriate because the emergency services and many of the other medical services that are currently located on the Pacific Campus would be transferred to or provided at the proposed Cathedral Hill Campus. The assumptions, methodology, and results of the trip generation and distribution analysis are summarized in the report *CPMC LRDP: Travel Demand Estimation for the San Francisco Campuses* (Adavant Consulting, April 9, 2010). The report is included in Appendix D of the *Cathedral Hill Transportation Impact Study*.

The transportation analysis assumed that over 50 percent of all CPMC employees would be coming from within San Francisco. The remaining employees would arrive from other regions of the Bay Area. This assumption was based on CPMC employee survey data. Furthermore, it was assumed that 50 percent of CPMC employees would use transit to access the Cathedral Hill Campus, based on the work trip patterns to the Van Ness Commercial District per *SF Guidelines*. Therefore, the analysis reasonably accounts for employees living outside San Francisco and for the CPMC employee's use of transit to access the Cathedral Hill Campus.

3.7.3.3 JAPANTOWN PARKING AND TRIP DISTRIBUTION

Comment

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-24 TR, duplicate comment provided in 30-24 TR]

"The DEIR mentions the leasing of these 400 spaces at the Japantown Garage on Page 5-14. Currently, CPMC only pays 50% of the going rate for the spaces it does lease at the Japantown Garage. This discounted parking

offering is not an incentive for staff, visitors or construction workers to take public transit or to use the CPMC shuttles. If Japantown will be impacted by the Cathedral Hill Hospital project at all levels (i.e. Hospital, MOB and Tunnel construction), perhaps the Japantown Garage could charge CPMC market rate for its spaces. Even if CPMC were to not use this garage or the other possible garages for its workers, it appears that parking will be at a shortage not only because offsite parking at Japantown will occur but also considering issues such as the 1375 Sutter Street personnel who will be using 107 spaces for parking at the Cathedral Hill Hospital parking garage. With all the personnel parking spaces being shared amongst the campus parking areas, there will still be a shortage that will impact the residential and merchant areas surrounding these campuses and this shows that people will not abandon their vehicles to take public transit. If 80% -90% of the people who worked at CPMC actually lived in the City, perhaps more of them would all take public transit once it is made super efficient; however, I have taken Muni and it is no wonder people will not abandon their vehicles, especially if they are from out of town. The CPMC workers' salaries are such that these workers can afford to live in the City but as it was shown in some recent news articles, some well-paid workers do not choose to live in San Francisco even if they work here."

Response TR-22

The comment presents concerns regarding the use of the Japan Center Garage by CPMC staff members. CPMC currently leases 400 spaces at the Japan Center Garage for off-site employee parking and provides an employee shuttle between the Japan Center Garage and the existing campuses. There is no proposal to allow construction workers or visitors to use these spaces. The 400 spaces were assumed to remain in use by CPMC in the future, but the specific campus employees who would use these spaces would change somewhat. The parking supply at the Pacific Campus would increase to accommodate the parking demand, but the proposed Cathedral Hill Campus would have a parking shortfall for staff members; therefore, as many as 162 of the 400 spaces that CPMC leases in the Japan Center Garage may be assigned to Cathedral Hill employees in the future. The overall parking deficit for the combined CPMC campuses was 41 spaces.

As stated in the parking discussion on page 4.5-162 of the Draft EIR, San Francisco does not consider parking supply as part of the permanent physical environment. Therefore, San Francisco does not consider changes in parking conditions to be environmental impacts as defined by CEQA. Parking conditions are not static, as parking supply and demand varies from day to day, from day to night, from month to month, etc. Thus, the availability of parking spaces (or lack thereof) is not a permanent physical condition but changes over time as people change their modes and patterns of travel. Parking deficits are considered to be social effects rather than impacts on the physical environment as defined by CEQA. Under CEQA, a project's social impacts need not be treated as significant impacts on the environment.

Based on the available survey data, over 50 percent of CPMC employees reside within San Francisco. For the traffic analysis, it was assumed that this pattern would continue into the future. Although transit use will vary by campus, the transit use for all CPMC employees is 39 percent. Based on the *SF Guidelines*, 50 percent of CPMC employees in the Van Ness Commercial District use public transit. Therefore, it was assumed that 50 percent of the employees at the Cathedral Hill Campus would use public transit (excluding physicians who, it was assumed, would drive) because this would be a new campus and could not be surveyed. The assumptions, methodology, and results of the trip generation, mode choice, and trip distribution analysis are summarized in the report *CPMC LRDP: Travel Demand Estimation for the San Francisco Campuses* (Adavant Consulting, April 9, 2010). The report is included in Appendix D of the *Cathedral Hill Transportation Impact Study*.

The price that a project sponsor pays for parking is not typically included in the environmental analysis, and the price that CPMC pays for parking spaces at the Japan Center Garage does not affect the transportation analysis of the proposed CPMC LRDP and would not affect any of the conclusions reached in the Draft EIR. However, for informational purposes, CPMC pays monthly rates of $135 per space and charges its employees $60 per space per month for use. The non-CPMC monthly rate is $165 per space.

3.7.3.4 HOTEL DRIVEWAY COUNTS/TRANSPORTATION DEMAND MANAGEMENT ASSUMPTIONS

Comment

(Unitarian Universalist CPMC Task Force, October 5, 2010) [44-6 TR]

Traffic impacts, Parking, Cathedral Hill: Volume 3, Page 4.5-72 & 73: 'Additional Travel-Related Criteria.' On page 4.5-73 the report says that parking analysis data included 'inbound and outbound vehicle counts at the parking garage at the Cathedral Hill Hotel.' This is like comparing apples to oranges. We need a parking impact report that approximates the number of people coming to CPMC by car and who will have to park on the street. Traffic impacts, Parking, Cathedral Hill: Volume 3, Page 4.5-77: 'Although the CPMC LRDP development plans assume an increase in parking supply with the construction of new garages, it is assumed that similar transportation management strategies to those that exist today would be in place when such facilities are opened to act as disincentives to driving by employees, patients, and visitors despite the increase in the supply of off-street parking'. This is a false assumption that the majority of CPMC employees would resort to public transportation when the Cathedral Hill facility opens."

Response TR-23

The comment questions the use of the existing Cathedral Hill Hotel driveway counts. The statement on page 4.5-73 of the Draft EIR related to inbound and outbound vehicle counts at the Cathedral Hill Hotel referred to the driveway counts that were collected to determine the amount of existing traffic accessing hotel parking. In the traffic analysis these traffic volumes were considered as automobile trips that would be removed from roadways in the study area after the hotel's closure. These volumes were not considered in the parking analysis for the proposed CPMC Cathedral Hill Campus. The mode choice for the proposed Cathedral Hill Campus was taken from the Van Ness Commercial District factors that are presented in the *SF Guidelines*, described in Response TR-20 on page C&R 3.7-42.

Parking demand considered the mode splits for each campus. The traffic analysis assumed that the future CPMC Transportation Demand Management (TDM) program would be similar to the current program; however, CPMC has proposed enhancing the existing TDM program by adding new incentives (and disincentives in the form of parking fees) to encourage use of alternative travel modes. The proposed CPMC TDM Plan, prepared by Nelson-Nygaard & Associates (2011), is provided in Appendix F. The proposed CPMC TDM Plan includes expansion or implementation of new programs to reduce drive-alone trips by 15 percent over the existing conditions. Some of the key new programs would include:

- provision of a full-time TDM coordinator to monitor the TDM program and institute improvements as needed to meet the needs of the various users;
- increased marketing and outreach efforts to employees, patients and visitors;
- improving/expanding existing transit subsidies to all campuses and increased subsidy levels;
- provision of carpool and vanpool preferential parking;
- promotion of a vanpool program with financial incentives;
- monitoring bicycle parking and creation of additional spaces as needed; and
- provision of signage to improve wayfinding for campus users.

Therefore, the future TDM program should increase the use of alternative modes over the existing levels. As is standard, the traffic analysis did not assume any additional reduction in driving (vehicle trips) as the result of the proposed enhancements to the TDM program.

3.7.3.5 PARKING AVAILABILITY AND TRIP GENERATION

Comments

(Howard Strassner—Sierra Club, October 12, 2010) [51-2 TR]

"Current EIR methodology says that land use determines driving and not the availability of parking. Users of the land, the hospital developer, say if there is not enough parking, not enough people will be able to drive to their facility. The truth is that the availability of parking determines driving. This truth is demonstrated by observation: Throughout the Bay Area over 90% of people drive to work in their own car. However, in downtown San Francisco, where parking is limited and expensive over 50% get to work without their own car. Many of both groups are neighbors and similar people. The difference is the availability of parking and when less parking is available the analysis should show less driving."

(Howard Strassner—Sierra Club, October 12, 2010) [51-3 TR]

"We are concerned that when land use predicts driving and parking is provided to accommodate the driving the City will never reduce driving to meet SB 32 and SB375 requirements. In addition the predicted additional driving may create the political straw that prevents the City from completing the adjacent proposed BRT projects."

Response TR-24

The comments question the mode-choice assumptions used in the travel demand analysis that are based on current travel patterns and suggests that parking reductions would reduce vehicle travel demand. The travel demand analysis assumed that 50 percent of the employee trips to the Cathedral Hill Campus site would be by public transit. Another 13 percent of the employees would walk or use other non-automobile modes to access the site. For the proposed Cathedral Hill Campus, it was assumed that 60 percent of patients and visitors would arrive in an automobile (driving alone or carpooling). The parking demand analysis methodology considered the population (i.e., employees, patients, and visitors) projected for each campus, then applied the appropriate mode-choice factor for driving alone and carpooling for employees, patients, and visitors. Therefore, the parking demand for each campus was estimated based on the travel characteristics of each campus and the populations they would support (i.e., physicians, staff, patients, and visitors).

Table 4.5-13 of the Draft EIR, page 4.5-80, includes the estimated parking demand by campus for the LRDP. Additional information on the parking supply and demand is provided in Responses TR-69 and TR-70 (pages C&R 3.7-129 and 3.7-135, respectively).

Draft EIR 4.5 Transportation and Circulation impact analysis, pages 4.5-111 through 4.5-114, and pages 4.5-228 through 4.5-232, and Section 5.1 on page 176-189 of the *Cathedral Hill Transportation Impact Study* (Fehr & Peers 2010) evaluates the effects that the Van Ness and Geary BRT projects would have on the area around the proposed Cathedral Hill Campus. Implementation of the Geary Street/Boulevard BRT project would have less of an impact on traffic operations because there is an existing dedicated bus lane within the study area. Implementation of the Van Ness BRT project would have a more substantial effect on traffic operations because it would reduce the number of lanes on Van Ness Avenue, which in turn would increase delays for vehicles using the remaining lanes.

Each of these BRT projects will be subject to its own planning, analysis, environmental review, and approval process. Because of the City's Transit First Policy and the resources invested to date in the BRT projects, it is unlikely that these projects would not be completed as a result of the construction of the proposed CPMC LRDP. Instead, the City could view the BRT projects as even higher priority to help serve a new institution. In any event, the viability of the BRT because of a change in the political climate is speculative.

3.7.3.6 OUTDATED SURVEY DATA

Comment

(Barbara Kautz—CHNA and Bernal Heights Neighborhood Center, October 19, 2010) [87-22 TR, duplicate comment was provided in 108-22 TR]

"2. Outdated Data.

The key surveys of employees, patients, and visitors were completed in 2001. Travel surveys and counts were completed in 2002 and 2003. (page 4.5-72). Pedestrian and bicycle counts were taken in 2006. Numerous changes in street configurations, transit service, bicycle access, etc. have occurred since this outdated data was generated, and all need to be redone."

Response TR-25

The comment questions the travel demand analysis' use of survey data that are taken from different years. When developing trip generation estimates for a proposed project, it is desirable to have survey information either from an existing facility or from facilities similar to those included in the proposed project. A diverse set of travel data for the CPMC campuses has been collected over a number of years. These data included information on the mode of travel, origins/destinations, parking locations, and parking costs. This information was collected for employees, patients, and visitors to the site. The earliest surveys were collected at the three then-existing CPMC campuses (Pacific, California, and Davies) in 2001, and additional data were collected in both 2002 and 2003. The St. Luke's Campus was surveyed in 2009, 2 years after the campus became a part of the CPMC system. Although the travel survey data are several years old, they provide important details about the specific travel characteristics of CPMC employees, patients, and visitors that are not available from other sources. The economic and seasonal effects on the intersection turning movement count data used for the Draft EIR is discussed in Response TR-6, page C&R 3.7-6.

CPMC prepared a memorandum summarizing the changes in employment and in the TDM programs at the existing campuses between 2001 and 2008. This memorandum, *CPMC Employment and Other Factors Contributing to Trip Generation, 2001-present (*December 13, 2010) is on file and available for review at the San Francisco Planning Department. C&R Table 3.7-11 below summarizes the employment levels and number of annual visits at the existing campuses. Based on this data, the campuses have remained relatively stable between 2002 and 2008 in terms of the employment and level of care provided. The largest increase in the number of employees occurred when St. Luke's joined the CPMC system in 2007. Therefore, surveys and counts conducted over this time period, including pedestrian and bicycle counts were examined and determined to be appropriate for the transportation analysis, with the exception of the St. Luke's campus where some data was missing and updated counts, including pedestrian and bicycles, were taken in 2009.

C&R Table 3.7-11
CPMC Employee Data for 2002, 2004, and 2008

Employees	Year[1]		
	2002	2004	2008
Pacific Campus	2,857	2,856	2,790
California Campus	1,315	1,283	1,540
Davies Campus	724	868	831
St. Luke's Campus	NA	NA	1,012
Total[2]	**4,895**	**5,007**	**6,173[3]**
MD/Visits			
MD Staff	1,600	1,450	1,855[4]
Acute Volume	27,329	26,452	30,405[5]
Emergency Department Visits	50,164	46,949	70,219[6]
Employee Residence			
San Francisco/Other	49%/51%	52%/48%	49%/51%

Notes:
NA = Not applicable.
[1] Years 2002, 2004, and 2008 are the dates in the source *Institutional Master Plan* document. In some cases, data were the most current available, typically from the prior year.
[2] Campus totals do not include off-campus employment (e.g., research, hospice).
[3] St. Luke's employment for 2008 was 1,012 persons. CPMC began to operate the campus in 2007.
[4] St. Luke's MD staff = 361, all other campuses = 1,644. Approx. 100 MDs assumed on both rosters, resulting in 1,855 total CPMC MD staff.
[5] St. Luke's acute discharges = 4,604, all other campuses = 25,801.
[6] St. Luke's Campus Emergency Department visits = 23,697, all other CPMC campuses = 46,522 visits.
Source: California Pacific Medical Center 2010, *CPMC Employment and Other Factors Contributing to Trip Generation, 2001-Present*

Although changes to roadways, transit service, and bicycle facilities have occurred that might make alternative modes more attractive, changes to the CPMC employee TDM program would likely have the highest potential to change commuter behavior. Since 2001, no substantial changes have been made to the CPMC TDM program, only changes to parking fees (because of increased costs) and the modification of shuttle schedules. The TDM program consists of a variety of activities, including an annual transportation fair, transit pass sales and subsidies, car-sharing/carpool facilities (parking) and promotions, vanpool subsidies and parking; private shuttles connecting to the Civic Center BART station, and an active parking pricing program. For a discussion of planned transit improvements (TEP), transit data use and how Muni service changes were addressed in the analysis, see Response TR-14 on page C&R 3.7-33 and Response TR-15 on page C&R 3.7-36.

Finally, as an additional reasonableness check to confirm that the trip generation rate estimates being proposed for this analysis were appropriate, comparable rates and travel demand data were gathered from other medical-related transportation impact study reports and sources. Specifically, trip generation data from the following sources were gathered and reviewed:

- University of California, San Francisco (UCSF) Medical Center at Mission Bay (2008);
- *San Francisco General Hospital Medical Center Master Plan* (2008);
- *Kaiser San Francisco Medical Center Master Plan* (1996);

- *Trip Generation Report, 8th Edition*, from ITE;
- *San Diego Traffic Generators* from the San Diego Association of Governments (SANDAG); and
- *Trip Ends Generation Research Counts* from Caltrans.

The results of the comparison showed that the rates generated from the CPMC data were either comparable to or slightly more conservative than the rates presented in these sources. The assumptions, methodology, and results of the trip generation analysis are summarized in the report *CPMC LRDP: Travel Demand Estimation for the San Francisco Campuses* (Adavant Consulting, April 4, 2010). The report is included in Appendix D of the *Cathedral Hill Transportation Impact Study*.

3.7.3.7 CPMC EMPLOYMENT GROWTH

Comments

(Gloria Smith—California Nurses Association, October 19, 2010) [90-41 TR]

"Concerning Project-specific impacts, the DEIR did not adequately analyze increases in both transit use and vehicle miles traveled resulting from the Project. CPMC is the second largest employer in San Francisco.[22] The total number of employees at all of the CPMC campuses will increase by 4,170 employees system-wide. This new employment, while certainly a benefit to the City, will create population growth and household growth.[23] People traveling into the City and across the City for these new job opportunities will increase traffic and further burden public transit. Because the DEIR did not factor in these new commuters, a revised EIR must analyze this impact.

[22] DEIR at page 5-16.
[23] *Id.* At page 4.3-31"

(Gloria Smith/Tom Brohard & Associates —California Nurses Association, October 19, 2010) [92-9 TR]

"Finally, the Draft EIR did not adequately analyze increases in both transit use and vehicle miles traveled resulting from the Project. According to Page 5-16 of the Draft EIR, CPMC is the second largest employer in San Francisco. The total number of employees at all of the CPMC campuses will grow to approximately 10,730 by 2030. This would be a net growth of 4,170 employees to the CPMC system between 2006 and 2030. This new employment would create population growth and household growth of approximately 3,480 people or approximately 3 percent according to Page 4.3-31 of the Draft EIR. People traveling into the City and across the City for these new job opportunities will increase traffic and further burden public transit. Thus, a revised EIR must analyze this impact."

Response TR-26

The comments suggest that the EIR did not adequately analyze the effects of employment growth that would result from the project, and the resulting increases in transit use and vehicle miles traveled. In developing the travel demand forecasts for the transportation analysis, the travel demand associated with the five study sites (Cathedral Hill, Pacific, California, Davies, and St. Luke's) was estimated on a weekday daily, a.m. and p.m. peak-hour basis using population (employees, visitors, patients). Because site population, including employees, patients, and visitors, was used as the primary basis for the trip generation, the future increase in employment is captured in the travel demand for each site. Further, the transportation impact analysis prepared for each CPMC campus included the traffic generated by each of the other CPMC campuses in the background traffic growth. Therefore, travel demand for all campuses was accounted in the analysis for each individual campus, and the transportation impact analyses considered the additional traffic on the roadways and transit use generated by the increase in employment on all of the CPMC campuses. In terms of the adequacy of the transit analysis, see Response TR-53, page C&R 3.7-80.

The project vehicle miles traveled (VMT) is referenced in Section 4.8, "Greenhouse Gas Emissions," of the Draft EIR. Total VMT were calculated by multiplying the number of trips by the average trip length for each type of trip. Vehicle trip counts were obtained from the traffic analyses prepared for each campus. URBEMIS default values for trip-type percentages (e.g., commuting, non-work, customer) and their corresponding urban trip lengths were used to determine total mileage.

3.7.3.8 RETAIL AND SERVICE COMMERCIAL TRIP GENERATION

Comment

(Gloria Smith—California Nurses Association, October 19, 2010) [93-32 TR]

"• Specific retail service and other commercial uses. This detailed information is critical to accurate trip generation assumptions, parking demand, and determining whether or not uses will actually result in reducing trips/air quality and greenhouse gas emissions or merely become attractors for additional vehicle trips."

Response TR-27

The comment questions the inclusion of retail and other commercial uses in the travel demand calculations. The proposed Cathedral Hill Campus would include 3,100 square feet (sq. ft.) of retail space on the site of the proposed hospital and several small shops totaling 7,825 sq. ft. of retail space on the site of the proposed Cathedral Hill MOB. A total of 10,925 sq. ft. would be provided on the two sites. The retail space would front onto adjacent streets and would include uses that generally support the services provided by the hospital and MOB, including small cafes. The analysis assumed that these retail spaces would not generate a substantial amount of new trips to the area because of their relatively small size. Rather, they would primarily serve the employees, patients, and visitors at the proposed Cathedral Hill Campus and from other adjacent buildings.

3.7.3.9 LABOR AND DELIVERY TRIP GENERATION

Comment

(Barbara Savitz, September 23, 2010) [PC-337 TR]

"I work Labor and Delivery at CPMC California campus. We have 18 labor beds and usually about three to five visitors for patients in labor, that would be about 54 cars coming to see the patients. After delivery, the patient goes to postpartum for mother and baby care, and there we have approximately 50 beds, so then, if we have three people visiting, three cars visiting, that's 150 cars coming to visit the patients. After this, the cars of nurses, doctors, auxiliary coming to work, what a challenge."

Response TR-28

The comment provides information about travel demand based on experience at CPMC's California Campus. The travel demand estimates for the proposed CPMC LRDP were developed based on the existing characteristics of the CPMC campuses, the types of functions at each campus, and the population of each campus (employees, patients, and visitors); therefore, the trip generation analysis captured the type of activity described in the comment. The estimates of travel demand assumed that parking would be generally available on- or off-site for staff, patients, and visitors who choose to drive. The available survey data indicates that the number of vehicles would not necessarily be a one-to-one correspondence with the number of people in a given area.

3.7.3.10 PARKING FEES TO PROMOTE TRANSIT USE

Comment

(Paul Wermer—CPMC Neighbors Coalition and Pacific Heights Residents, October 18, 2010) [67-22 TR]

"e) CPMC's Traffic Demand Management (TDM) plan for patients and accompanying visitors is flawed, as it imposes high parking fees to encourage patients to take the bus—the reality is that patients circulate looking for nearby parking, adding to congestion, or have friends or family drop them off doubling the number of vehicle trips and lane blockages due to double parking. Accepting the TDM plan as mitigation completely ignores the fact that, at least in the case of patients and visitors, the observations of nearby residents indicate the result is contrary to the stated intent."

Response TR-29

The comment states that the CPMC TDM plan is flawed and that high parking fees would encourage patients and visitors to park on the street in the neighborhoods. Where the CPMC TDM plan suggests higher parking fees, these fees are coupled with incentives to switch from single-occupancy vehicle usage to other modes of transport. Many factors in addition to parking fees would be anticipated to influence travel mode choice of visitors and patients. Travel demand for each individual campus for the transportation analysis, as described in "CPMC LRDP Travel Demand Estimation for the San Francisco Campuses" (Appendix D of the Traffic Impact Study), was based on surveys and counts of patients and visitors at each existing CPMC campus. CPMC has developed a systemwide TDM plan that was provided to the City, and is included in Appendix G. A discussion of specific items in the planned CPMC TDM plan is included in Response TR-23, page C&R 3.7-45. The CPMC TDM plan parking fee structure would be designed to discourage long-term parking at the facilities. The parking rates at the campuses would need to be high enough that a patient or visitor would use the parking to attend to their medical or business needs at the CPMC campus, but would generally choose not to use the parking for non-CPMC activities. This approach to managing the parking fees would ensure sufficient turnover in the patient and visitor parking areas to accommodate the demand. Conversely, the TDM program would use higher parking fees for employees to park on campus to encourage people to carpool if arriving by vehicle and to encourage transit use and other modes of transportation by employees. Furthermore, the TDM plan is not proposed as a mitigation measure for any of the CPMC LRDP transportation impacts. As discussed in the Draft EIR Section 4.5.3, "Significance Criteria – Person Trip Generation, Page 4.5-75," although the TDM plan would be anticipated to encourage the use of alternate travel modes, the transportation analysis did not assume any additional reduction in driving (vehicle trips) as the result of the proposed enhancements to the TDM program.

The comment also expressed a concern for increased patient and visitor vehicle trips resulting in an increased amount of blocked travel lanes and double parking from patient/passenger loading and unloading. Passenger loading demand and analysis for each campus is contained in the Draft EIR, pages 4.5-82 through 4.5-84; 4.5-141 (Cathedral Hill); 4.5-174 (Pacific); 4.5-189 (Davies); and 4.5-206 (St. Luke's). New passenger loading and unloading zones have been designed for the Pacific, Cathedral Hill, Davies and St. Luke's Campuses, which improve passenger loading and unloading conditions at all new buildings.

3.7.3.11 MEDICAL SERVICES DATA

Comment

(Gloria Smith—California Nurses Association, October 19, 2010) [93-33 TR]

"• Projected emergency room admissions and ambulance trips for both near-term and long-term project phases. This information is essential to an analysis of the adequacy of health care services and conclusions regarding impacts such as cumulative impacts on transit and traffic generated by patients having to travel greater distances for services. Details including total projected psychiatric admissions is essential for impact analyses as well."

Response TR-30

The comment indicates that information about the projected number of emergency room, ambulance, and psychiatric admissions is essential for estimating travel demand associated with the CPMC LRDP. The comment is noted. As described in Response TR-20 (page C&R 3.7-42), the trip generation and mode choice were determined based on the number of employees, patients, and visitors. These data were used to perform the transportation analyses. These person-trips included patients for all types of medical treatment, including emergency admissions, general admissions, and medical office appointments. In addition, CPMC provided information about the number of daily existing and projected future ambulance trips and data on the existing daily distribution of ambulances at the existing emergency departments. These data were used to analyze the ambulance loading areas.

The relocation of medical services between the campuses may increase trip length for some patients and shorten trip lengths for others. As noted above, it is speculative to estimate the variation in patient trip length because the location of the patients would vary over time. Therefore, the focus of the analysis was on the net new trips generated by patients and visitors to and from the campuses and the effects of these trips on the transportation network. Additional discussion of the medical services provided and the distribution of those services to the various campuses is included in the Major Response HC-8 on page C&R 3.23-32.

3.7.4 TRAFFIC IMPACTS

3.7.4.1 ADEQUACY OF TRANSPORTATION ANALYSIS

Comments

(Merle Easton, October 18, 2010) [66-1 TR, duplicate comment was provided in 73-1a TR])

"The EIR for the CPMC project is inadequate. The proposed Cathedral Hill Hospital is too large and it's environmental impacts too great. It is clear from the EIR that it isn't possible to mitigate the thousands of additional car trips to and from the Cathedral Hill buildings that will affect the intersections in the mid NE of the city. On the streets surrounding the proposed Cathedral Hill buildings cars and trucks will be trying to enter and exit the buildings and add to the gridlock. The EIR acknowledges some of these problems, referring to some as 'significant and unavoidable' without proposing mitigations, others are called 'less than significant'. Major bus routes on Van Ness (Hwy 101) and Geary (major bus and car route to downtown) will be gridlocked.

(Paul Wermer, CPMC Neighbors Coalition and Pacific Heights Residents, October 18, 2010) [67-1 TR]

"The CPMC Neighbors Coalition represents near neighbors of CPMC's Pacific site at Clay and Buchanan. We have been actively working with CPMC/Sutter Health to mitigate impacts of their existing operations since 2003, and have previously submitted comments on the scope of the never completed 2006 EIR process, and more recently (June 25, 2010) on the EEA that formed the basis for this DEIR. The Pacific Heights Residents Association represents residents in the area bounded by Bush St., Presidio Ave., Union St. and Van Ness Ave.

This area includes CPMC's Pacific Site, and PHRA has worked with the CPMC Neighbors Coalition to provide clear, consistent messages to CPMC/Sutter Health.

The comments in this letter represent the concerns of both the Pacific Heights Residents Association and the CPMC Neighbors Coalition.

We note with regret that several salient issues we raised in our June 25 scoping comments were not addressed in the DEIR, especially with respect to traffic impact assessments. We hope that this can be corrected without untoward delays in the overall process."

(Gloria Smith/Tom Brohard & Associates—California Nurses Association, October 19, 2010) [92-33 TR]

"The California Pacific Medical Center (CPMC) Long Range Development Plan (Project) in San Francisco creates significant traffic and transit impacts that have not been properly disclosed, analyzed or mitigated through alternatives and/or traffic improvements. The errors identified in this letter require that each of these issues be reanalyzed and reevaluated through additional study in a revised and recirculated EIR. If you should have any questions regarding these findings, please contact me at your convenience."

(Linda Chapman [76-17 TR duplicate comment was provided in 111-17 TR]

"Regardless of traffic studies based on LOS (selected intersections at a particular point in time), those who regularly travel city streets can report that tremendous transit delays, due to congestion around the Van Ness Corridor, are not uncommon. Viewing intersections a few times may be sufficient to estimate normal conditions (but only for hours studied). Congestion that is irregular, but not infrequent, is evidence that the proposed location cannot tolerate traffic inducing uses."

(Gloria Smith—California Nurses Association, March 8, 2011) [121-2 TR]

Many of the intersections in the vicinity of the proposed Cathedral Hill Campus are already failing during peak traffic hours as there is more vehicle demand than capacity available. These intersections currently operate at Level of Service (LOS) "F", the lowest performance measurement of efficiency. Under LOS "F" conditions, flow is forced and each vehicle moves in lockstep with the vehicle in front of it, with frequent slowing and stopping required. The number of these failing intersections will significantly increase in future years. Adding LRDP trips to these failing intersections will increase vehicle delay and gridlock beyond what is already being experienced, with no relief in sight.

Response TR-31

The comments raise concerns about intersection and transit-delay impacts that would occur as a result of implementing the proposed Cathedral Hill Campus project. The Draft EIR addresses each category contained in the comments. To summarize:

- Impact TR-1 and Impact TR-99 identify significant and unavoidable impacts that would occur at the intersection of Van Ness/Market under 2015 Modified Baseline and 2030 Cumulative conditions, respectively. No feasible mitigation was identified through the course of analysis and in consultation with the SFMTA. Potential mitigation measures that were discussed include, but were not limited to, increasing right-of-way to provide additional travel lanes, removing pedestrian walk phases to allow for overlap turning patterns, and the conversion of bus-only lanes to mixed-flow travel lanes. Through discussion with SFMTA staff, mitigation measures were deemed infeasible.

- Impact TR-2 and Impact TR-101 identify significant and unavoidable impacts that would occur at the intersection of Polk/Geary under the 2015 Modified Baseline and 2030 Cumulative conditions, respectively. No feasible mitigation was identified through the course of analysis and in consultation

with the SFMTA. Potential mitigation measures that were discussed include, but were not limited to, increasing right-of-way to provide additional travel lanes and the conversion of bus-only lanes to mixed-flow travel lanes. Through discussion with SFMTA staff, these measures were deemed infeasible.

- Impact TR-100 identifies a significant and unavoidable impact that would occur at the intersection of Van Ness/Pine under the 2030 Cumulative conditions. No feasible mitigation was identified through the course of analysis and in consultation with the SFMTA. Potential mitigation measures that were discussed include, but were not limited to, increasing right-of-way to provide additional travel lanes and the removal of on-street parking to provide additional travel lanes. Through discussion with SFMTA staff, these measures were deemed infeasible.

- Impact TR-3 and Impact TR-102 identify intersections that would operate at unacceptable peak-hour LOS before and after implementation of the proposed Cathedral Hill Campus project under 2015 Modified Baseline and 2030 Cumulative conditions, respectively. The project's contribution to the intersections' poor operating conditions was determined not to be significant, and therefore, the impacts were identified as less than significant.

- Impact TR-4 and Impact TR-103 identify intersections that would operate at acceptable peak-hour LOS before and after implementation of the proposed Cathedral Hill Campus project under 2015 Modified Baseline and 2030 Cumulative conditions, respectively, and thus the impacts were identified as less than significant.

- Impact TR-29 and Impact TR-134 identify significant impacts (increased delay) on transit vehicle operation on Van Ness Avenue as a result of increased traffic congestion and transit ridership with implementation of the proposed Cathedral Hill Campus project under 2015 Modified Baseline and 2030 Cumulative conditions, respectively. Mitigation Measure MM-TR-29 was identified to reduce the project's impact to a less-than-significant level. However, because of uncertainty about SFMTA's ability to provide the additional transit service identified in the mitigation measure, the project's impact was determined to be significant and unavoidable. Please refer to Responses TR-54 and TR-55 (page C&R 3.7-86 and 3.7-89) for a detailed discussion regarding transit corridor delay impacts and identified mitigation measures.

- Impact TR-30 and Impact TR-135 identify significant impacts (increased delay) on transit vehicle operations on Geary Street as a result of increased traffic congestion and transit ridership with implementation of the proposed Cathedral Hill Campus project under 2015 Modified Baseline and 2030 Cumulative conditions, respectively. Mitigation Measure MM-TR-30 was identified to reduce the project's impact to a less-than-significant level. However, because of uncertainty about SFMTA's ability to provide the additional transit service identified in the mitigation measure, the project's impact was determined to be significant and unavoidable. Please refer to Response TR-54 (page C&R 3.7-86) for a detailed discussion regarding transit corridor delay impacts and identified mitigation measures. Impact TR-31 and Impact TR-136 identify significant impacts (increased delay) on transit vehicle operations on Polk Street as a result of increased traffic congestion and transit ridership with implementation of the proposed Cathedral Hill Campus project during 2015 Modified Baseline and 2030 Cumulative conditions, respectively. Mitigation Measure MM-TR-31 was identified to reduce the project's impact to a less-than-significant level. However, because of uncertainty about SFMTA's ability to provide the additional transit service identified in the mitigation measure, the project's impact was determined to be significant and unavoidable. Please refer to Response TR-54 (page C&R 3.7-86) for a detailed discussion regarding transit corridor delay impacts and identified mitigation measures.

- Impact TR-40 summarizes the pedestrian impact assessment. With implementation of the proposed Cathedral Hill Campus project, the effect on the pedestrian environment would not be substantial enough to result in a significant impact. The analyses presented include evaluations of sidewalk and crosswalk capacity and conditions and potential improvements the City could pursue to improve pedestrian conditions. Improvement Measure I-TR-40, wherein the project sponsor could provide funding for the study and possible implementation of additional streetscape, pedestrian, and related improvements in the vicinity of the proposed LRDP campuses, is included as a staff-initiated text change to the Draft EIR. Please refer to Response TR-63 (page C&R 3.7-110) for a detailed discussion regarding pedestrian safety included in the Draft EIR.

- Comment 66-1 expresses concern that vehicles entering and exiting the proposed Cathedral Hill Campus buildings (Hospital, MOB, and 1375 Sutter MOB) would add to any existing gridlock. As shown in Figure 4.5-19, page 4.5-101 of the Draft EIR, the parking ticket gates would be located within the garage to accommodate internal queuing. Furthermore, as discussed on pages 4.5-100 through 4.5-103 of the Draft EIR, a vehicle queuing analysis was performed to identify whether the potential would exist for queues to spill back from the proposed Cathedral Hill Campus building driveways and affect traffic operations of the adjacent streets. The analysis showed that this would not occur, even during peak times of use of the parking garages, such as during shift changes at the facilities. Furthermore, vehicles entering and exiting the proposed Cathedral Hill building access points were shown not to have a detrimental effect on the operation of bus lines that travel on the adjacent streets, the 38/L- Geary and 19-Polk bus lines.

Additionally, Comment 66-1, which states that Van Ness Avenue and Geary Boulevard/Street would be gridlocked for both cars and buses, is conjecture. As shown in Table 4.5-18 on page 4.5-95 of the Draft EIR, during the 2030 cumulative p.m. peak-hour scenario, 70 percent (9 of 13) of study intersections on Van Ness Avenue or Geary Boulevard/Street would operate at level of service D or better, which would be considered acceptable in the City of San Francisco. In other words, during the time when the transportation network was used the most, the p.m. peak hour, with 20 years' worth of development assumed as background growth, and with the construction and operation of the proposed Cathedral Hill Campus as part of the proposed CPMC LRDP, many of the study intersections on Van Ness Avenue and Geary Street/Boulevard would still operate acceptably.

- Comment 76-17 expresses concern that the proposed location is not ideal because of the delays that would be caused to transit service by congestion on the Van Ness Avenue corridor. In an effort to remedy this existing transit delay, the SFCTA and SFMTA are proceeding forward with two projects, the Van Ness BRT and Geary BRT, that would increase both corridors' transit performance and reliability by converting two of the current six vehicle travel lanes on Van Ness Avenue for Van Ness BRT to separate transit-only lanes, making transit use more efficient and more attractive as a travel mode.

Additionally, Comment 76-17 states that the peak-period nature of the transportation analysis does not take into account "irregular congestion." The peak period was selected for study in the Draft EIR because it is the time at which there is the greatest demand on the transportation network, and thus represents the most conservative scenario upon which to analyze transportation impacts on a network-wide basis. By its nature, "irregular" congestion is difficult to define and quantify for inclusion in transportation analyses. Please refer to Response TR-10 (page C&R 3.7-26) for a detailed discussion regarding the peak hour analysis included in the Draft EIR.

The adequacy of the transportation impact analyses in the Draft EIR, as raised in Comment 67-1 TR, is also addressed in Response TR-18, page C&R 3.7-39. EIR scoping comments received from the public were considered along with City Guidelines and professional practice to develop the transportation analysis contained in the Draft EIR Section 4.5 "Transportation and Circulation."

3.7.4.2 CALIFORNIA CAMPUS INTERSECTION IMPACTS

Comment

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-16 TR, duplicate comment was provided in 30-16 TR]

"As a general comment, to state, e.g., as on Page 4.5-179 for the California Campus, Impact TR-67, that 'Implementation of the CPMC LRDP would not cause the level of service at California Campus study intersections to deteriorate from LOS D or better to LOS E or LOS F, or from LOS E to LOS F, and therefore, the project would not result in a significant traffic impact (Less than Significant),' to say that the intersections are already at a low LOS so implementing a project that exacerbates the problematic issues so that the traffic impact is deteriorated not only on the nearby adjacent streets but out farther into streets even ½-mile away is rather an illogical manner of handling problems with circulation.

Many more additions of vehicles into the area makes it worse so a solution needs to be developed to bring the LOS at these intersections such as at Gough/Post, Franklin/Geary, Van Ness/Geary, Polk/Post, etc. as on Page 4.5-100, to a more efficient LOS prior to starting the Cathedral Hill Project.

And for the DEIR to put the onus on surrounding projects that contribute to the 'poor operating conditions at these study intersections' and that are 'due to background traffic volume increases associated with other developments' in the area of the proposed Cathedral Hill Campus Project as on Page 4.5-99 should not be used as the basis to allow approval of the project without seriously fixing the intersections to better LOSs first.

I do not believe this should be in the 'Less Than Significant' category but rather should be in the 'Significant' category. I am also not sure it is 'Unavoidable.' Since the DEIR states the problem of transit impacts in the Cathedral Hill project as 'less than significant,' CPMC is then not required to give a mitigation measure.

I think there needs to be a mitigation measure because saying that they are constructing in an area of bad traffic circulation so building a structure that will make a LOS F area a worse LOS F area is not solving the traffic and circulation problem. Making a bad situation worse is not being a good neighbor to the citizens of San Francisco."

Response TR-32

The comment raises concerns whether it is appropriate or logical to determine that an impact of a project would be less than significant at an intersection that already operates poorly (LOS E or LOS F conditions). The transportation analysis performed in the Draft EIR is based on the methodology as set forth in the *SF Guidelines* and the determination of significance is based on established quantitative thresholds that are applied equally to all substantial development projects throughout the City. Furthermore, the Draft EIR does not say that the proposed CPMC LRDP would have no impact at the intersections that are already failing under 2015 or 2020 baseline conditions. Rather, it states that the additional traffic generated by the proposed LRDP, in some cases, would be below a quantitative threshold of significance at some of these failing intersections. Furthermore, it is possible to add vehicles to an already failing intersection without deteriorating its overall operations, which is why the City has quantitative thresholds for determining when the addition of new vehicles does in fact result in exacerbating already poor operating conditions.

3.7.4.3 PACIFIC CAMPUS

Comment

(Paul Wermer—CPMC Neighbors Coalition and Pacific Heights Residents, October 18, 2010) [67-10 TR]

"The DEIR fails to assess the impact of the increased traffic density resulting from the expanded ambulatory care services at CPMC's Pacific site, especially with regard to small businesses in the vicinity, and pedestrian usage of the surrounding streets as residents walk to schools, parks and use public transit. Without this assessment, it is not possible to determine whether the new operations are appropriate to this neighborhood."

Response TR-33

The comment identifies concerns about new vehicle trips at the Pacific Campus. The Pacific Campus projected daily population would be less than the population under existing conditions. Acute-care medical services would be transferred to the proposed Cathedral Hill Campus and other planned changes (i.e., expanded ambulatory care services) would be made to the campus under the CPMC LRDP, which would lessen the intensity of daily traffic at the Pacific Campus. As stated in Impact TR-59 on Draft EIR page 4.5-168, implementing the Pacific Campus project would result in a net increase of 71 vehicle trips during the p.m. peak hour. With the addition of the new vehicle trips, the 16 study intersections around the Pacific Campus would continue to operate at acceptable LOS conditions. Therefore, the impact of the traffic increase that would result from project implementation would be less than significant. Also, an additional 648 parking spaces would be added to the Pacific Campus by 2020 (Draft EIR page 4.5-168) to accommodate the parking demand on site. The additional parking spaces would reduce the number of CPMC-related drivers parking on the street in the adjacent neighborhoods, and would reduce the amount of vehicles circling around the neighborhood by patients and visitors looking for parking. The comment also expresses concerns that the Draft EIR did not evaluate other growth near the Pacific campus, specifically small businesses in the vicinity that could result from CPMC transitioning to an Ambulatory Care Center at this location. Employment growth, including medical use, is part of the land use growth projections incorporated into the transportation analysis. Furthermore, a portion of any growth in the area would replace existing businesses and would not necessarily represent new employees or person trips. The potential or extent of expanded medical-related employment in the surrounding area beyond that already projected or beyond existing business growth would be speculative in nature.

As stated in Impact TR-62 on Draft EIR page 4.5-171, the proposed LRDP would result in an increase in pedestrian traffic at the Pacific Campus. Overall, implementing the Pacific Campus project would add about 64 net new pedestrian trips to the surrounding streets during the p.m. peak hour (Draft EIR page 4.5-173). The new pedestrian trips generated by the project could be accommodated on nearby sidewalks without substantially affecting pedestrian conditions. New pedestrian access to the main entrance of the Ambulatory Care Center (ACC) would be provided at the new Campus Drive entrance. Existing pedestrian conditions on sidewalks and crosswalks were observed to be acceptable, with adequate space to accommodate additional pedestrians. Additionally, the proposed LRDP would include several improvements to the sidewalk network. The net new pedestrian trips would not result in substantial overcrowding on the sidewalks or hazardous conditions; therefore, the impact of the Pacific Campus project on pedestrian conditions would be less than significant.

The Pacific Campus project is a long-term CPMC LRDP project, and as such, would be subject to additional project-specific environmental review under CEQA.

3.7.4.4 CATHEDRAL HILL CAMPUS

Comment

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-36 TR, duplicate comment was provided in 30-36 TR]

"In addition, other transportation impacts to Van Ness/Market are TR-6 (Two-way Post St. Variant with 'significant impact' with no mitigation measure, TR-12 (MOB Access Variant), TR-20 (Cathedral Hill Campus project implementation + Van Ness & Geary BRTs), TR-23 (Two-way Post St. Variant + Van Ness & Geary BRTs), TR-26 (MOB Access Variant with Cathedral Hill Project implementation + Van Ness & Geary BRTs), TR-99 (Implementation of Cathedral Hill Campus project), TR-105 (Cathedral Hill Campus project + Two-way Post St. Variant), TR-111 (Cathedral Hill Campus project MOB Access Variant), TR-118 (Cathedral Hill project + Van Ness & Geary BRTs cumulative and significant impact), TR-121 (Two-way Post St. Variant + Van Ness & Geary BRTs + Cathedral Hill Campus project) and TR-124 (MOB Access Variant, Van Ness & Geary BRTs + Cathedral Hill Campus project). In addition there are transit impacts at Polk/Geary including 2-way Post St. option, MOB access option (see Pages S-43-59, TR-2, TR-7, TR-13, TR-17 (MOB access option possible traffic hazard on Geary St.), TR-19 (Cathedral Hill Campus project implementation + Van Ness & Geary BRTs), TR-22 (Geary and Van Ness BRT projects commencing at same times), TR-25, TR-101 (Cathedral Hill Campus project implementation cumulative impacts), TR-108 (Cathedral Hill Campus project with Two-way Post St. Variant), TR-113 (MOB Access Variant), TR-117 (cumulative impacts from combined Van Ness and Geary BRT projects), TR-120 (two-way Post St. + combined cumulative Van Ness and Geary BRT projects) and TR-123 (MOB Access Variant + Van Ness and Geary BRT projects). With all these transit impacts, it would be helpful to commence traffic calming measures in the areas of all 5 campuses - Cathedral Hill,· Davies, California, St Luke's and Pacific on the residential streets and especially on streets with schools for sensitive receptors such as elementary children."

Response TR-34

The comment states that because of the intersection and transit impacts associated with the Cathedral Hill Campus or project variants identified in the Draft EIR, it would be prudent to commence with traffic calming measures on residential streets within all five campus areas. No nexus is provided between the finding of transportation impacts at Cathedral Hill Campus and the need to provide mitigation or improvement measures at other campuses where corresponding transportation impacts would not occur. In addition, the transportation impacts listed in the comment are from different scenarios/variants, and thus would not happen concurrently. Furthermore, the project sponsor is committed to a proposed Cathedral Hill Campus Streetscape Plan, which would be consistent with San Francisco's *Better Streets Plan* standards and many of the recommendations contained in the *Little Saigon Report*. As part of the project approval process, the streetscape plan has been reviewed by City agencies to ensure that it would be consistent with the City's goals and policies related to the pedestrian environment. If approved, the project sponsor would be committed to the elements identified in the streetscape plan for the campus. See Response TR-126 (page C&R 3.7-220) for a list of the proposed streetscape improvements at the Cathedral Hill Campus.

The project sponsor, through the proposed development agreement, would also provide funding for the City to study and potentially implement additional streetscape, pedestrian, and related improvements in the vicinity of the proposed LRDP campuses that would provide benefits to the communities. The community benefits could, for example, include improvements identified in the *Little Saigon Report* as well as other sidewalk widenings, bulb-outs, and pedestrian lighting. These community benefit improvements would be permitted, designed and constructed by the City. They would not be related to any environmental impacts of the proposed LRDP and would undergo separate environmental reviews, as needed.

Comment

(Donald Scherl, October 18, 2010) [74-4 TR]

"3.1.4: Notwithstanding the above, as the draft EIR notes, there are numerous impacts that would occur if any hospital were to be built at Cathedral Hill. Listed among these is: the traffic snarl that would increase unavoidably at Market and Van Ness Ave., neighborhood noise and air pollution, the numerous Traffic and Transportation impacts listed on pages S-42-46, and subsequent pages, as 'significant and unavoidable', and a 'significant impact' (TR-44) involving 'potentially hazardous conditions on Franklin St.' CPMC complains that changing sites would delay the process beyond the State deadline, but this is a difficulty CPMC has only itself to blame and should not place the Commission in the position of feeling forced by circumstances not of its creation to approve the meritless CPMC LRDP, nor the draft EIR, as they pertain to Cathedral Hill and St. Luke's."

Response TR-35

The comment states that the proposed Cathedral Hill Hospital, if constructed, would create numerous significant impacts. The comment states that "CPMC complains that changing sites would delay the process beyond the State deadline." Please refer to Major Response HC-2 (page C&R 3.23-8) for a detailed discussion regarding the basis for the location and size of the proposed Cathedral Hill Campus and the St. Luke's Campus. The comment is correct that implementing the proposed Cathedral Hill Campus would result in a significant and unavoidable impact at the intersection of Van Ness Avenue/Market Street. As stated on page 4.5-98 of the Draft EIR, and further discussed in Response TR-31 (page C&R 3.7-53), no feasible mitigation measures exist that would reduce impacts at the Van Ness Avenue/Market Street intersection to a less-than-significant level.

Impact TR-44 regards the operation of the proposed Cathedral Hill Hospital's off-street loading facility. As described on pages 4.5-138 through 4.5-139 of the Draft EIR, the impact of loading operations for trucks larger than 46 feet in length, at the off-street loading facility on Franklin Street would be potentially significant. However, this impact would be less than significant with implementation of Mitigation Measure M-TR-44 (page 4.5-139 of the Draft EIR), which would require loading dock restrictions, ongoing monitoring, and an attendant.

Noise and air quality impacts are analyzed in Sections 4.6 and 4.7 of the Draft EIR, respectively.

Please note that the project approval process occurs after certification of the Final EIR by the City decision-makers and is separate from the environmental review process. The project approval process can only occur after certification of the Final EIR and is procedurally separate from the environmental review process. The decision-makers may select the project variants or one of the alternatives presented in the document if determined feasible, or may approve, modify, or disapprove the project as proposed.

3.7.4.5 FRANKLIN STREET IMPACTS

Comment

(Galen Workman, October 14, 2010) [55-3 TR]

"Finally, the report does not adequately address the impact on traffic flow on Franklin. Franklin is already a completely clogged mess for most of the weekday daytime hours. We cannot add ANYTHING to the configuration without negative impact to the already dismal congestion. (And, unless a new building is dropped fully formed from the sky, north-south traffic will be significantly disrupted during the construction period.)"

Response TR-36

The comment identifies concerns about existing traffic conditions on Franklin Street and impacts during construction of the proposed Cathedral Hill Hospital. The comment correctly notes that construction of proposed Cathedral Hill Campus would disrupt traffic operations. The traffic analysis evaluated six intersections along the Franklin Street corridor from O'Farrell Street to Pine Street. Impact TR-3 on Draft EIR page 4.5-99 indicated that three of the six intersections on Franklin Street would operate at LOS E or LOS F under 2015 Modified Baseline No Project and plus Project conditions; however, the project traffic would not contribute significantly to the poor operations of three of the six intersections; Franklin/O'Farrell, Franklin/Sutter, and Franklin/Bush. As identified in Impact TR-4 on Draft EIR page 4.5-100, the other three intersections on Franklin Street would operate at acceptable LOS D or better under 2015 Modified Baseline plus Project conditions (Franklin/Geary, Franklin/Post, and Franklin/Pine).

The traffic analysis also evaluated the same six intersections along the Franklin Street corridor for 2030 Cumulative plus Project conditions. Impact TR-102 on Draft EIR page 4.5-220 indicated that three of the six intersections on Franklin Street would operate at LOS E or LOS F under 2030 Cumulative plus Project conditions; however, the project traffic would not contribute significantly to the poor operations (Franklin/O'Farrell, Franklin/Sutter, Franklin/Bush). As identified in Impact TR-103 on Draft EIR page 4.5-220, the other three intersections would operate at an acceptable LOS D under 2030 Cumulative plus Project conditions (Franklin/Geary, Franklin/Post, Franklin/Pine).

Impact TR-55 on Draft EIR page 4.5-147 identifies that there would be a significant and unavoidable transportation impact during construction of the proposed Cathedral Hill campus. Mitigation Measure MM-TR-55 (on page 4.5-159 of the Draft EIR) requires that CPMC prepare a construction transportation management plan before beginning construction. This plan would be reviewed by the appropriate City agencies to reduce the impacts on traffic, transit, and the adjacent neighborhood during the construction period. However, the Draft EIR concluded that this impact would remain significant and unavoidable after implementation of Mitigation Measure MM-TR-55 because of the extent and duration of construction activities. Additional information about construction impacts and the construction worker transportation plan is provided in Response TR-106 on page C&R 3.7-185.

Comments

(Barbara Kautz- CHNA and Bernal Heights Neighborhood Center, October 19, 2010) [87-26 TR, duplicate comment was provided in 108-26 TR]

"4. No Effort to Identify Feasible Mitigation Measures.

The DEIR identifies numerous significant traffic and transportation effects yet makes no effort to identify feasible mitigation measures for these impacts. For instance, pages 4 4.5-93 to 4.5-116 identify 26 significant impacts yet identify only *one* mitigation measure, declaring the rest of the impacts to be 'significant and unavoidable.' There is no serious discussion of potential mitigation. Instead, the same language is repeated throughout: that physical modifications would require narrowing of sidewalks or demolition of buildings, which is infeasible; and that changes in signal timing would 'likely' be infeasible. No analysis whatsoever of either of these mitigations is included in the DEIR, nor of any other typical measures to mitigate traffic impacts, such as changes in lane configurations, removal of on-street parking, etc."

(Gloria Smith—California Nurses Association, October 19, 2010) [90-76 TR]

"**3. The DEIR Lack Effective Measures to Mitigate the Project's Impacts on Traffic Congestion and Public Transit**

The DEIR identified over 150 traffic impacts associated with the LRDP. For the near term, years 2015 and 2020, the DEIR identified 98 traffic impacts, with 58 of those associated with the Cathedral Hill Campus alone. For the long term, year 2030, the DEIR identified 53 cumulative traffic and transit impacts, with 42 of these associated with the Cathedral Hill Campus alone. The intense development proposed for the Cathedral Hill Campus creates nearly two-thirds of all of the Project's overall impacts to the roadway and transit system. Of the 100 traffic impacts associated with the Cathedral Hill Campus, the DEIR indicated that 30 impacts are significant, unavoidable, and cannot be mitigated. Worse, in Mr. Brohard's expert opinion, the DEIR's estimate of unmitigable impacts is likely low.

For 2015, the DEIR identified the intersections of Van Ness/Market and Polk/Geary as significantly impacted by traffic generated by the Cathedral Hill Campus.[44] For both, the DEIR found that mitigation in terms of increasing vehicular capacity at the intersections was not feasible. Therefore, the DEIR omitted any mitigation measures to reduce Project impacts to less than-significant levels aside from hoping that CPMC would expand its current transportation demand management program ('TDM') to discourage use of private automobiles. Although this may reduce the number of trips through the intersection, the extent of this program or reduction to impacts is not known, is vague and wholly unenforceable.

CEQA requires that the City impose all feasible alternatives and/or mitigation measures before concluding that traffic impacts are 'significant and unavoidable' as it did here. The DEIR must document the geometry of both intersections that the City finds to have significant and unavoidable traffic impacts, then identify the specific traffic measures or alternatives evaluated, and discuss why each of these options cannot feasibly be implemented. Without adding this analysis to a revised EIR for public review, the City may not dismiss the potential mitigation measures as infeasible."

(Gloria Smith/Tom Brohard & Associates —California Nurses Association, October 19, 2010) [92-4 TR]

"The Draft EIR identifies over 150 traffic impacts associated with the CPMC Long Range Development Plan. For the near term in Years 2015 and 2020, the Draft EIR identifies 98 traffic impacts, with 58 of those associated with the Cathedral Hill Campus. For the long term in Year 2030, the Draft EIR identifies 53 cumulative traffic and transit impacts, with 42 of these associated with the Cathedral Hill Campus. From this summary of traffic and transit impacts alone, the intense development proposed for the Cathedral Hill Campus creates nearly two-thirds of all of the Project's overall impacts to the roadway and transit system. Of the 100 traffic impacts associated with the Cathedral Hill Campus, the Draft EIR indicates that 30 impacts are significant, unavoidable, and cannot be mitigated. My review indicates that the Draft EIR's estimate of unmitigable impacts is likely low."

(Sue Hestor, October 19, 2010) [89-1 TR]

"I am submitting these comments on the DEIR my own behalf.

Cathedral Hill Transportation Impacts

CPMC proposes to dramatically transform the intersection of two major arterials, one of them US Rte 101 and two major transit streets - Van Ness and Geary. The transportation analysis for Cathedral Hill is replete with Impact analyses that conclude as it does for Impact TR-1 (significant impact at the intersection of Van Ness/Market – 'no feasible measures are available for Impact TR-1')."

(Donald Scherl, October 18, 2010) [74-14 TR]

"4.5: Transportation and Circulation: In this section, the impacts are multiple and severe, with numerous impacts labeled SU ('significant and unavoidable').

Impacts TR-1, TR-12, TR-20, TR-23, TR-26, TR-105, TR-111, TR-118, TR-121, TR-124: As noted in the draft EIR, 'Implementation of the Cathedral Hill Campus would result in a significant impact at the intersection of Van Ness/Market.' The report correctly notes that there are 'no feasible mitigation measures' for this calamity (my word). Were this not sufficient, the report notes the adverse and substantial impacts the proposed Cathedral Hill Campus (Hospital and MOB) would have at the intersection of Post/Geary (e.g., Impacts TR-2, TR-6&7, TR-19, TR-22, TR-25, TR-108, TR-123), as well as Franklin and Bush (Impacts, TR-106) - none of which can be mitigated or avoided.

In addition, Impact-100 Identifies unavoidable and severe impacts at Polk/Geary (TR-19, TR-108, TR-113, TR-117, TR-120) and possibly Franklin/Bush, Van Ness/Pine (TR-107, TR-112), and Gough/Geary (TR-104)."

Response TR-37

The comments raise concerns that the Draft EIR either did not properly identify mitigation measures or provide an analysis of their feasibility. Comments 87-26, 90-76, and 92-4 sum the number of transportation impacts contained in Draft EIR as a means of overstating the transportation impacts generated by the proposed CPMC LRDP, without noting that the transportation impacts that are being grouped together are from different scenarios/variants, and thus could not happen concurrently. For example, Comment 87-26 states that on pages 4.5-93 through 4.5-116 of the Draft EIR, 26 significant impacts are identified. This total groups together significant and less than significant transportation impacts associated with the proposed Cathedral Hill Campus, MOB Access Variant, Two-Way Post Variant and consideration of the project in combination with BRT projects. As a point of reference, the number of transportation impacts generated by the proposed LRDP at the Cathedral Hill Campus in the same referenced pages of the Draft EIR (4.5-93 through 4.5-116) is five significant and less than significant impact statements. In total, not considering the cumulative analysis, there are 17 traffic impact statements related to the proposed LRDP development at Cathedral Hill and of those 17, eight are significant and unavoidable impacts and nine are less than significant impacts. Comments 89-1 and 74-14 are slightly different in that they do not state the Draft EIR did not identify feasible mitigation measures, but state that the Draft EIR includes significant impacts without feasible mitigation measures.

Comment 90-76 also references CPMC's proposal to enhance its existing TDM program. CPMC has proposed this as part of the proposed LRDP and not as part of a mitigation or improvement measure. The enhanced TDM program might be required by City decision-makers as a condition of approval, but it has been integrated as a component of the proposed LRDP.

Appendix F of the *CPMC LRDP Transportation Impact Study Master Appendix* contains intersection LOS analysis calculations that document intersection geometry—the combination of through/turn lanes by approach and Muni-only lanes, peak-hour intersection traffic volumes, signal timing, etc.—for all scenarios evaluated in the Draft EIR. This document is on file with the San Francisco Planning Department and available for public review.

In all cases where significant project impacts were identified, authors of the Draft EIR, in consultation with the SFMTA, explored options to mitigate the impact. This included examination by a traffic engineer of the intersection geometry, signal timing, turn restrictions and related operational aspects, at every location where an impact was identified, to determine what mitigations, if any, could be made. Options that did not require additional right-of-way, such as removal of parking or implementation of time-limited parking restrictions, were considered. In most cases, however, peak-period parking restrictions are already in place to provide the maximum capacity on the major streets such as Franklin Street and Geary Street. Similarly, although signal timing adjustments at intersections were considered, peak-period signal timing is already optimized for the congested vehicular movements. In general, substantial physical impediments (such as narrowing of sidewalks and/or demolition of adjacent private property) and City policy (the City's Transit-First Policy, wherein alternative modes of travel are promoted over private vehicles)

rendered many improvements infeasible, such as adding vehicle capacity at intersections or arterials; thus, the project impacts were determined in the Draft EIR to be significant and unavoidable. This conclusion was reached largely because the project is located within the urban core of San Francisco, where space allocation for travel modes (pedestrians, bicycles, transit, and automobiles) is constrained by existing development. Given the project's urban location, providing additional through lanes or turning lanes is infeasible without incurring substantial cost, land acquisition, and potentially compromising the environment for other modes of travel.

Under CEQA, using the term "unavoidable" to describe an impact means that the impact would be significant even after application of all feasible mitigation. The methodology used to analyze the potential traffic impacts associated with the proposed CPMC LRDP and project variants is presented on Draft EIR pages 4.5-93 through 4.5-247. Each impact determination was based on the significance criteria presented in Section 4.5.4, "Impact Evaluations," of the Draft EIR. Significant traffic impacts were determined to be "unavoidable," as defined by CEQA, if the mitigation measure(s) included in the Draft EIR would not reduce the identified impact of the LRDP to a less-than-significant level or if no feasible mitigation measure was available to reduce the impacts.

3.7.4.6 MITIGATION—FAIR SHARE CONTRIBUTION (CALTRANS)

Comment

(Lisa Carboni, California Department of Transportation, September 9, 2010) [6-2 TR, duplicate comment was provided in 7-2 TR]

"Highway Operations

On page 4.5-93 in the DEIR, the proposed project would cause 'Significant and Unavoidable' impact at the intersection of Van Ness Avenue/Market Street (Impact TR-l). Since no feasible mitigation measures have been identified to reduce project impacts to less than significant levels, the Department recommends contributing a fair share for future improvements."

Response TR-38

The comment requests a fair-share contribution to improvements at the intersection of Van Ness/Market. On Draft EIR page 4.5-93, Impact TR-1 identifies a significant and unavoidable impact at the intersection of Van Ness/Market. Under 2015 Modified Baseline plus Project conditions, operating conditions at the intersection would change from LOS D to LOS E. To mitigate the poor operating conditions at this intersection, it would be necessary to provide additional capacity through the intersection. Increasing the number of lanes is infeasible without creating additional right-of-way area to maintain adequate pedestrian facilities. Because there are no currently planned or programmed improvements at this intersection, there is no basis for calculating a fair-share contribution. Therefore, it is not possible to estimate the amount of the project's contribution for future undefined improvements.

3.7.4.7 MITIGATION—VAN NESS AVENUE CORRIDOR INTERSECTIONS

Comment

(Lisa Carboni, California Department of Transportation, September 9, 2010) [6-3 TR, duplicate comment was provided in7-3 TR]

"In addition, in Tables 4.5,17 and 4.5c 18 on pages 4.5-94 and 4.5-95, the proposed project will also degrade level of service (LOS) at various intersections on Van Ness Avenue (listed below) for AM and/or PM peak. The Department recommends providing mitigation measures to reduce these impacts.

- Intersection #10 - Van Ness Avenue/Market Street
- Intersection #11- Van Ness Avenue/Fell Street
- Intersection #12 -Van Ness Avenue/Hayes Street
- Intersection #13 - Van Ness Avenue/O'Farrell Street
- Intersection #14 - Van Ness Avenue/Geary Boulevard
- Intersection #18 - Van Ness Avenue/Pine Street"

Response TR-39

The comment requests the implementation of mitigation measures at six intersections along Van Ness Avenue. On Draft EIR page 4.5-93, Impact TR-1 identifies a significant and unavoidable impact at the intersection of Van Ness Avenue/Market Street. Under 2015 Modified Baseline plus Project conditions, operating conditions at the intersection would change from LOS D to LOS E. Providing additional capacity through this intersection would be necessary to mitigate the poor operating conditions at the intersection. Increasing the number of lanes is infeasible without creating additional right-of-way area to maintain adequate pedestrian facilities. Additionally, signal timing changes are not feasible because of required minimum timing for pedestrians and coordinated timing along the corridor, and these changes alone would not fully mitigate the impact on the intersection. Therefore, this impact would be significant and unavoidable.

On Draft EIR page 4.5-100, Impact TR-4 indicates that under 2015 Modified Baseline plus Project conditions, the remaining study intersections on Van Ness Avenue (Van Ness/Fell, Van Ness/Hayes, Van Ness/O'Farrell, Van Ness/Geary, and Van Ness/Pine) would operate at LOS D or better. Therefore, based on the intersection significance criteria, the impacts of the proposed Cathedral Hill Campus project at these intersections would be less than significant. Because project-specific impacts at these intersections were not identified, the project would not be required to provide mitigation measures.

3.7.4.8 MITIGATION—VAN NESS AVENUE/MARKET STREET TRAFFIC CIRCLE

Comment

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-32 TR, duplicate comment was provided in 30-32 TR]

"Page S-42, Impact TR-1: Implementation of the Cathedral Hill Campus project would result in a significant impact at one of the nearby intersections -- Van Ness/Market. The DEIR states that no mitigation measure is available for this impact. I think that Van Ness/Market can be reconfigured by SFMTA to improve circulation before the start of this CPMC project. What about a traffic circle?"

Response TR-40

The comment suggests reconfiguring the intersection of Van Ness/Market to a traffic circle. Because of the heavy volume of traffic using this intersection (more than 5,000 existing vehicles during both the a.m. and p.m. peak hours) and existing streetcars along Market Street, converting this intersection to a roundabout (traffic circle) would require a multilane roundabout with a diameter of approximately 200 feet. Therefore, the roundabout would require the taking of right-of-way, land acquisition, and probably the removal of at least one existing building. Further, large roundabouts are generally not conducive to pedestrian, bicycle, and transit access, because they make it more difficult for these alternative modes to easily cross the flow of traffic without introducing designated additional facilities for these modes and additional traffic control devices. Therefore, a roundabout would likely be incompatible with the existing streetcar use on Market Street and the proposed Van Ness Avenue BRT project. Therefore, a roundabout at this location would be considered infeasible, and the project impact at this intersection would remain significant and unavoidable.

3.7.4.9 MITIGATION—CHURCH STREET/MARKET STREET/14TH STREET

Comments

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-46 TR, duplicate comment was provided in 30-46 TR]

"Impact TR-75 on Page S-52 states that there will be a 'significant impact' at the intersection of Church/Market/14th Street that would operate at LOS F under the 2020 Modified Baseline No Project conditions. LOS (level of service) 'F' is the worst case with bad congestion, and there is no mitigation measure associated with this impact. What transportation changes have been studied that would change the LOS to a better grade with the '2020 Modified Baseline No Project' conditions? Traffic circles? Other?"

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-47 TR, duplicate comment was provided in 30-47 TR]

"In addition, TR-127 (Davies Campus implementation) will have significant impact at Church/Market/14th Street under both the 2030 Cumulative No Project and 2030 Cumulative plus Project conditions to a LOS F. No mitigation measure for this either.

What are some of the assumptions made to conclude that this intersection will operate at this poor level?"

Response TR-41

The comments indicate concerns about the existing operations and significant impacts associated with the Davies Campus project at the intersection of Church/Market/14th. This intersection currently operates at LOS F during the p.m. peak hour. The increase in delay, and thus degradation of level of service under 2020 Modified Baseline and 2030 Cumulative conditions, can be attributed primarily to the increase in the forecasted background traffic and traffic generated by implementation of the Davies Campus project. Although other potential improvements were considered at this 5-leg intersection, such as revision to traffic signal timings and expansion or reconfiguration of travel lanes to reduce the peak-hour average vehicle delay, additional right-of-way for vehicle travel lanes would have to be added to the intersection to accomplish this. Because of the presence of Class II bicycle lanes on the eastbound and westbound approaches, a passenger boarding island for the historic F-Market & Wharves streetcar on the eastbound approach, passenger boarding islands for Muni bus lines on the northbound and southbound approaches, and Muni Metro subway portals located at the northwest and southwest quadrants of the intersection, providing additional right-of-way or conversion of the intersection to a traffic circle was determined to be infeasible. Traffic signal timing is already maximized and coordinated along Market Street to allow vehicles, pedestrians and transit to move efficiently. Therefore, the impact of the Davies Campus project at this intersection would be significant and unavoidable.

3.7.4.10 MITIGATION—VAN NESS AVENUE/PINE STREET

Comments

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-49 TR, duplicate comment was provided in 30-49 TR]

"25. Page S-54, Impact TR-100 (Cathedral Hill Campus project implementation results in significant and cumulative impacts to Van Ness/Pine intersection). There not being a mitigation measure from this will result in the commuter traffic to eke out onto the adjacent smaller streets."

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-50 TR, duplicate comment was provided in 30-50 TR]

"26. On Page S-54, Impact TR-107 states that the Two-way Post St. Variant will result in significant project and cumulative impacts at Van Ness/Pine. Again, no mitigation measure is in place."

Response TR-42

The comments indicate concerns about significant cumulative impacts associated with the proposed Cathedral Hill Campus project at the intersection of Van Ness/Pine. Although potential improvements were considered, such as a second northbound left-turn lane, the removal of on-street parking on Pine Street, and traffic signal timing revisions to allow for more green time for vehicles on Van Ness Avenue, it was decided in consultation with the SFMTA that these measures were infeasible. To mitigate the poor operating conditions at the intersection, additional capacity would be necessary. Additionally, traffic signals on Van Ness Avenue are coordinated to allow for efficient vehicle progression (one green light after the other) through the corridor, and thus revising signal timings at an isolated intersection would be at the detriment of the corridor. Providing additional lanes would reduce the available sidewalks (and also increase pedestrian crossing distances) and/or require demolition of existing adjacent buildings. Further, adding vehicular capacity to the intersection would conflict with the goals and physical improvements that are a part of the Van Ness Avenue BRT project, which is currently undergoing environmental analysis. The goal of the Van Ness Avenue BRT project is to increase the corridor's transit performance and reliability by converting two of the current six vehicle travel lanes on Van Ness Avenue to separate transit-only lanes. For these reasons, no feasible mitigation measure was identified, and this cumulative transportation impact was determined to be significant and unavoidable.

3.7.4.11 MITIGATION—FRANKLIN STREET/POST STREET

Comments

(Helene Dellanini, DBC MOA, October 18, 2010) [71-2 TR, duplicate comment was provided in 72-2]

"Project Management Advisors, Inc., along with subject matter expert consultants, Veneklasen Associates (acoustics), and Wilsey Ham (civil), have reviewed the CPMC LRDP DEIR on behalf of the Daniel Burnham Court Master Owner's Association (DBC) and have the following comments for submission to the City planning staff.

TR-4: Implementation of the Cathedral Hill Campus project would have less-than-significant impacts at 18 study intersections that would operate at LOS D or better under 2015 Modified Baseline plus Project conditions.

TR-4 Comments: Although the intersection of Franklin and Post was not predicted to drop to a Level of Service below acceptable thresholds, it is recommended that some measure of mitigation be prescribed to alleviate the additional trips at the intersection due to traffic related to the hospital. We recommend that a portion of the curbside area (50 ft) should become a dedicated right turn lane. Currently, vehicles are allowed to park in this area, except during peak PM traffic hours on weekdays."

(Helene Dellanini, DBC MOA, October 18, 2010) [71-24 TR, duplicate comment was provided in 72-24]

"Wilsey Ham has performed a review of the traffic related information for the Cathedral Hill Campus (CHC) as described in the CPMC EIR. This review has been performed to understand the impacts of the project as they will affect the Daniel Burnham Court Owners Association, and to assess how the proposed mitigation measures will minimize the effect of those impacts on the neighborhood. Our comments are as follows:

Impact Comment

TR-4 To make a right turn onto Post, northbound vehicles on Franklin currently make the turn from the easternmost through-lane, or from the curbside metered parking spaces that are also striped for a right turn lane. Parking is prohibited in these spaces from 4 pm - 6 pm on weekdays (and from 8 am- 10 am on Wednesdays for street sweeping). Due to the increase in northbound traffic approaching the hospital on Franklin, a portion of this curbside parking area should be a dedicated right-turn lane on Franklin to Post Street to help facilitate the flow of traffic. We recommend a length of approximately 50 feet."

(Helene Dellanini, DBC MOA, October 18, 2010) [71-5 TR, duplicate comment was provided in 72-5]

"TR-103: Implementation of the Cathedral Hill Campus project would have less-than-significant impacts at eight study intersections that would operate at LOS D or better under 2030 Cumulative plus Project conditions.

TR-103 Comment: Same as comment for TR-4."

Response TR-43

The comments state that the proposed Cathedral Hill Campus would not result in significant traffic impacts, but request extending the existing p.m. peak hour curb right-turn-only lane to occur at all times at the approach of Franklin Street to Post Street. The comments correctly state that under Impact TR-4 and Impact TR-103, no mitigation measures would be required at the intersection of Franklin/Post under either 2015 Modified Baseline plus Project or 2030 Cumulative plus Project conditions because these impacts are less-than-significant. During off-peak periods, when there are no parking restrictions, four lanes are available on Franklin Street in the northbound direction. Adding a 24-hour right-turn lane on Franklin Street at the approach to Post Street, as suggested by the comment, would require removing three to four on-street parking spaces now available to the public during off-peak hours between the Emergency Department driveway and Post Street. Although this improvement was considered by Planning and SFMTA staff, it is not recommended, as the intersection currently operates and is projected to continue to operate at an acceptable level of service during both a.m. and p.m. peak hours with the proposed LRDP in place.

3.7.4.12 MITIGATION—FRANKLIN STREET/BUSH STREET

Comment

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-66 TR, duplicate comment was provided in 30-66 TR]

"32. Gough/Geary will be impacted by the Two-way Post St. Variant with no mitigation measure available. Some of the traffic may go southbound or northbound along Laguna St. when Gough at Geary gets clogged up. During the evening and morning commutes, this will impact Japantown.

33. The intersection of Franklin/Bush will be affected with the Two-way Post Street Variant per Impact TR 106 on Page S-54. Again, Laguna Street may get cut-through traffic which may need to be mitigated for the Japantown area.

34. Van Ness/Pine will result in significant and cumulative impacts with the implementation of the Cathedral Hill Campus project MOB Access Variant as per Impact TR-112 on Page S-55."

Response TR-44

The comment correctly states that significant and unavoidable cumulative project impacts would occur at the intersection of Gough/Geary (Impact TR-104) with implementation of the proposed Cathedral Hill

Campus Two-Way Post Street Variant, and the intersections of Franklin/Bush (Impact TR-106) and Van Ness/Pine (Impact TR-112) with implementation of the proposed Cathedral Hill Campus MOB Access Variant and Two-Way Post Street Variant, respectively. Although potential improvements were considered, such as traffic signal timing revisions to allow for more green time for vehicles on Geary Boulevard (Geary/Gough), Franklin Street (Franklin/Bush) and Van Ness Avenue (Van Ness/Pine), a second northbound right-turn lane (Franklin/Bush), and the removal of on-street parking on the northern leg of Franklin/Bush, it was decided in consultation with the SFMTA that these measures were infeasible. Geary Boulevard, Van Ness Avenue and Franklin Street's traffic signals are coordinated to allow for efficient vehicle progression (one green light after the other) through the corridors, and thus revising signal timings at isolated intersections would be to the detriment of the corridor. To mitigate the project variant impacts, additional travel lanes would be required. Providing additional lanes would reduce the available sidewalks (and thus increase pedestrian crossing distances) and/or require demolition of existing adjacent buildings.

At the Gough/Geary intersection, the approach that operates at an unacceptable LOS is the eastbound approach. Because no left turns are permitted from Geary Boulevard to Laguna Street, traffic would not be able to shift to Laguna Street to avoid the Gough/Geary intersection. During the evening commute, the northbound approach operates at LOS A because of the coordination of traffic signals on Franklin Street and the peak period tow-away lane, thus it would be unlikely anyone traveling north would divert to Laguna Street. Furthermore, in the San Francisco General Plan, Gough Street, Geary Boulevard, Van Ness Avenue and Franklin Street are classified as Major Arterials in the Congestion Management Plan Network, and as such are designed to accommodate evening and morning commuter traffic.

3.7.4.13 MITIGATION—TRANSPORTATION DEMAND MANAGEMENT PLAN

Comments

(Gloria Smith/Tom Brohard & Associates —California Nurses Association, October 19, 2010) [92-25 TR, duplicate comment was provided in 90-77 TR]

"6) Traffic Impacts and Mitigation Measures - Impact TR-1 and Impact TR-2 on Page 4.5-98 of the Draft EIR identify the intersections of Van Ness/Market and Polk/Geary as significantly impacted by traffic generated by the Cathedral Hill Campus in Year 2015. For each, the Draft EIR states 'Providing additional traffic lanes or otherwise increasing vehicular capacity at this intersection is not feasible because it would require narrowing of sidewalks to substandard widths, and/or demolition of buildings adjacent to these streets. Signal timing adjustments may improve intersection operations, but would likely be infeasible due to traffic, transit or pedestrian signal timing requirements. Therefore, no feasible mitigation measures have been identified to reduce project impacts to less-than-significant levels. CPMC has indicated that it is planning on expanding its current transportation demand management program (TDM) to discourage use of private automobiles; although this may reduce the number of trips through this intersection, the extent of this program or reduction to impacts is not known. The traffic impact at the intersection would therefore remain significant and unavoidable.'

CEQA requires lead agencies to impose all feasible alternatives and/or mitigation measures before concluding that traffic impacts are 'significant and unavoidable.' The Draft EIR and the supporting Traffic Study for the Cathedral Hill Campus must document the geometry of both intersections that the City finds to have significant and unavoidable traffic impacts, then identify the specific traffic measures or alternatives evaluated, and discuss why each of these options cannot feasibly be implemented. Without doing this; the Draft EIR may not dismiss the potential mitigation measures as infeasible.

All feasible mitigation measures must also include enhancements to the current CPMC TDM plan. The Draft EIR acknowledges that 'CPMC has indicated that it is planning on expanding its current TDM program ... ' but offers no specifics or evaluation of potential vehicle trip reductions that could be achieved. Enhancements to the existing

CPMC TDM Plan were included on Pages 117 through 119 of the 2008 Transportation Study prepared by CHS Consulting Group, and include the following:

- Designate a TDM Coordinator
- Promotion of the TDM Program
- Increase financial incentives to transit use and disincentives to SOV use
- Provide amenities to transit and bicycle users
- Expanded shuttle bus program

At a minimum, the Draft EIR must evaluate the potential effectiveness of these additional TDM measures and others that also may be appropriate. CPMC must be required to implement necessary additional TDM measures to mitigate traffic impacts considered to be 'significant and unavoidable'."

(Gloria Smith—California Nurses Association, October 19, 2010) [90-77 TR, duplicate comment was provided in 92-25 TR]

"All feasible mitigation measures must also include enhancements to the current CPMC TDM plan. The DEIR acknowledged that 'CPMC has indicated that it is planning on expanding its current TDM program...' but offers no specifics or evaluation of potential vehicle trip reductions that could be achieved. Enhancements to the existing CPMC TDM Plan include the following:

- Designating a TDM Coordinator
- Promoting the TDM Program
- Increasing financial incentives to transit use and disincentives to single occupancy vehicle ('SOV') use
- Providing amenities to transit and bicycle users
- Expanding shuttle bus program

The Project's traffic mitigation strategy requires much, much more. Still, at a minimum, the DEIR must evaluate the potential effectiveness of these TDM measures and many others. CPMC must be required to implement necessary additional TDM measures to mitigate traffic impacts considered to be 'significant and unavoidable.'"

(Barbara Kautz (1)) [87-27 TR, duplicate comment was provided in 108-27]

"More importantly, the DEIR utterly fails to consider mitigations that would reduce trip generation-additional shuttles provided by CPMC, reduced parking, greater incentives for transit use, etc."

Response TR-45

The comments request that the transportation analysis evaluate the potential effectiveness of CPMC's proposed TDM Plan and discuss all feasible mitigation measures. A similar comment and response related to the consideration of feasible mitigation measures is provided in Response TR-37 on page C&R 3.7-62.

As the comments note, the Draft EIR included an explanation that CPMC would expand its TDM program with the implementation of the proposed CPMC LRDP in order to reduce the number of private vehicles driven to the campuses (see Draft EIR pages 5-14 to 5-15). However, it is important to note that CPMC already has a TDM program in place for its employees (see Draft EIR pages 4.5-74 to 4.5-75), including a shuttle system that serves employees, patients, and visitors. Since the trip generation used for the transportation analyses was based on CPMC travel surveys, the traffic analysis already assumes some reduced level of private vehicle use by employees, patients and visitors because of the continued implementation of existing TDM measures. Based on the surveys and the *SF Guidelines*, it was assumed that 20 to 40 percent of employees and 30 percent of the patients would use public transit for their trips to CPMC campuses, depending on their destination campus. Due to the types of services provided at hospitals, medical office buildings, and other health care service facilities, there is a limit to the number of

patient, staff, and visitor trips that can be reduced or diverted from single-occupant vehicles. The Draft EIR recognizes that the TDM program would be expanded, but does not assume an increase in effectiveness (vehicle trip reduction) of that program.

Please see Response TR-23 (page C&R 3.7-45), Response TR-45 (page C&R 3.7-69), and Response AQ-12 (page C&R 3.9-36), for additional discussion on the effectiveness of CPMC's proposed expanded TDM program, prepared and documented in a memorandum by Nelson-Nygaard & Associates (2011) and provided in Appendix G.

Comment

(Madlyn Stein—Seniors of Cathedral Hill, October 5, 2010) [45-5 TR]

"-have all entrances on Van Ness and Geary coordinated so that traffic flow from the current campus, proposed as an outpatient facility, will come down Van Ness Blvd and NOT ON POST STREET."

Response TR-46

The comment requests that the proposed Cathedral Hill Campus entrances be located on Van Ness Avenue and Geary Boulevard/Street and be designed to minimize the use of vehicles traveling to the campus on Post Street and maximize the use of Van Ness Avenue. With the exception of vehicles that would enter or exit the Cathedral Hill Hospital, which represent approximately 25 percent of the Cathedral Hill Campus project-generated vehicle trips during the a.m. peak hour or 15 percent of the project-generated vehicle trips during the p.m. peak hour, there is no evidence to support the notion that Post Street would be unduly impacted by the proposed LRDP. This is confirmed by the fact that all Post Street study intersections, as documented in Tables 4.5-17 and 4.5-18 located on pages 4.5-103 and 4.5-104 of the Draft EIR, operate at acceptable LOS B or better in the 2030 Project Cumulative Conditions scenario.

The Two-Way Post Street Variant would result in a slightly higher percentage of project-generated vehicles on Post Street, but all Post Street study intersections, as documented in Tables 4.5-19 and 4.5-20 on pages 4.5-103 and 4.5-104 of the Draft EIR, operate at acceptable LOS D or better in the 2030 Two-Way Post Street Variant Cumulative conditions scenario.

Comments requesting that the Cathedral Hill Campus project Two-Way Post Street Variant not be adopted will be transmitted to decision-makers as part of the administrative record proceeding the project approval process.

3.7.4.14 TWO-WAY POST STREET OPERATION

Comments

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-48 TR, duplicate comment was provided in 30-48 TR]

"24. Page S-43, Impact TR-8 (Cathedral Hill Campus implementation with Two-way Post Street Variant will have a 'significant impact' at the Franklin/Bush intersection. Bush is a major commute street that runs in the west-to-east direction. There is no mitigation measure for this issue. When one lane of Post Street is blocked off between Franklin and Van Ness, drivers who cannot avoid congestion at Geary/Franklin and Van Ness will turn north on Laguna to Bush eastbound. If you make Post a two-way street and close one lane (one side of the street), you end up with one lane in only one direction. So what is the point of making Post a two-way street when the trucks will be taking up the parking lane (and probably one lane of traffic for safety reasons) for almost 6.4 years (332 weeks) per the Administrative documents that accompany the CPMC DEIR by Herrero-Boldt?"

(Helene Dellanini, DBC MOA, October 18, 2010) [71-6 TR, duplicate comment was provided in 72-6]

"TR-6, 7, 8, 22, 23, 24, 56, 104, 105, 106, 107, 108, 120, 121: Implementation of the Two-way Post Street Variant (TWPSV) would result in significant impacts to various intersections.

TR-6, 7, 8, 22, 23, 24, 56, 104, 105, 106, 107, 108, 120, 121 Comment: Since this variant is an option and not part of the baseline project, and since it has been found to create numerous significant and unavoidable impacts, it does not appear to be environmentally superior to the baseline project as proposed and thus should not be adopted."

(Helene Dellanini, DBC MOA, October 18, 2010) [71-27 TR, duplicate comment was provided in 72-27]

"TR-6, TR-7, TR-23,

TR-8, TR-22, TR-23,

TR-26, TR-104, TR-105,

TR-106, TR-107, TR-108,

TR-120, TR-12 The DEIR indicates that implementation of the Two-way Post Street Variant (TWPSV) would result in a number of significant impacts to traffic in the vicinity of the project, and states that 'No feasible mitigation measures are available...' Due to the number of significant impacts that do not have feasible mitigations, and since the TWPSV is an optional feature that is not required for implementation of the project, it seems reasonable and appropriate that the TWPSV should not be approved as part of the project."

Response TR-47

The comments state that implementing the Two-Way Post Street Variant when the proposed Cathedral Hill Campus is under construction would result in additional congestion. The comments further state this access variant would result in a significant impact at the intersection of Franklin/Bush, and that the variant should not be approved as part of the proposed Cathedral Hill Campus project.

The Two-Way Post Street Variant was one of two access variants analyzed in the Draft EIR. The Two-Way Post Street Variant was designed to provide full access (in both the eastbound or westbound directions) on Post Street from the Hospital driveway; ingress from Geary Boulevard would continue to be allowed. If this access variant were selected, Post Street would not be converted to two-way operation until construction of the proposed Cathedral Hill Hospital is completed, and the full width of Post Street would be available for vehicular traffic. The comment is correct that if the access variant were implemented, the project would result in one new significant and unavoidable impact (Impact TR-106, Draft EIR page 4.5-222), when compared to the number of transportation impacts generated by the proposed Cathedral Hill Campus project. However, it is important to note that during the a.m. peak hour the Franklin/Bush intersection without the project (Modified Baseline 'No Project') is already operating at the high end of the LOS E range, with only 1.7 additional seconds of delay remaining before operations become LOS F. The Two-Way Post Street variant adds 2.3 seconds of delay to the intersections operations, , a small amount, but which would trigger the identification of a significant impact. Essentially, any differences in the intersection operating conditions of the Proposed Project, the Two-Way Post Street, and the MOB Access Variant would be imperceptible.

Comments requesting that the Cathedral Hill Campus project Two-Way Post Street Variant not be adopted will be transmitted to decision-makers as part of the administrative record proceeding the project approval process.

3.7.4.15 TRAFFIC IMPACTS AND BUS RAPID TRANSIT OPERATIONS

Comment

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-67 TR, duplicate comment was provided in 30-67 TR]

"In general, for some of these impacts, there is the assumption in this DEIR that if there were the Van Ness and Geary BRTs already running, the various alternatives to the CPMC campus build-outs will be 'less than significant.' For example, on Page S-55, Impact TR-119 states that the five intersections around the Cathedral Hill project (Franklin/Geary, Franklin/Pine, Van Ness/Bush, Van Ness/Pine, and Polk/Sutter) are at LOS 'D' and are 'less than significant impact' and five intersections (Gough/Geary, Franklin/O'Farrell, Van Ness/Fell, Van Ness/Hayes, and Van Ness/Broadway) will be at LOS 'E' or 'F' with the Two-way Post St. Variant. I think the five intersections at LOS 'E' and 'F' should have separate 'Impact TR-xxx' items in the 'Table S-2, Summary of CPMC LRDP Impacts and Mitigation Measures.' These 5 intersections for each of the variants should say 'significant' impact or 'significant and unavoidable' but there could be a mitigation measure that would not make it 'unavoidable.' These need to be added to Table S-2. See also Pages 4.5-229 - 4.5-230 for details on TR-119 where the intersections are mentioned. The impacts from the BRTs also have to be looked at from intersections farther away from just the project sites because traffic congestion will move into streets at least a half-mile or even up to a mile away. This also will occur when the CPMC project tasks coincide with BRT construction work."

Response TR-48

The comment notes that the structure of presenting the impacts of the proposed Cathedral Hill Campus project with implementation of the Van Ness Avenue and Geary Corridor BRT projects is different from presenting conditions without the BRT projects. Also, the comment notes that the BRT projects may shift traffic to other streets. Because detailed information about the BRT design and impacts on the transportation network were not available from SFCTA at the time the analysis for the proposed Cathedral Hill Campus project was conducted, a sensitivity analysis of traffic impacts was conducted to assess the potential combined effects of the proposed Cathedral Hill Campus and the two BRT projects. The analysis methodology for the sensitivity analysis is presented on Draft EIR page 4.5-112. The same approach was taken to this sensitivity analysis as was for the project, wherein less-than-significant impacts for the selected intersections would be presented within one impact statement, and that intersections where the combined effects were identified as significant would be called out as separate impacts. Therefore, for both 2015 Modified Baseline plus Project and 2030 Cumulative plus Project conditions, the less-than-significant combined impacts of the BRT projects and CPMC LRDP are presented in Impacts TR-18 and TR-116 for the proposed Cathedral Hill Campus project, including Impacts TR-21 and TR-119 for the Two-Way Post Street Variant and Impacts TR-24 and TR-122 for the MOB Access Variant.

The comment also states that cumulative effects could occur if CPMC and both the Van Ness and Geary BRT projects were under construction concurrently. Neither of the BRT projects have been approved, nor have their construction plans been identified. At the time that these projects overlap, all project sponsors, including CPMC, would be required to coordinate with SFMTA, the Planning Department, and the SFCTA to ensure that elements of each project's Construction Transportation Management Plan (TMP) were effective and what coordination would be required to ensure that construction impacts, including construction worker parking, on surrounding areas was minimized. This coordination process is described further in Response TR-105 (page C&R 3.7-180).

At the time of analysis, detailed information was not available regarding the BRT design and impacts on the transportation network; however, the environmental review of the BRT projects would, in the case of the Geary BRT project, and does, in the case of the Van Ness BRT, analyze the potential shift of traffic to

other streets. Similar to the environmental analysis for the CPMC LRDP, the environmental analysis for the BRT projects would need to consider planned and reasonably foreseeable projects.

3.7.4.16 MOTOR VEHICLE CODE ENFORCEMENT

Comment

(Paul Wermer, CPMC Neighbors Coalition and Pacific Heights Residents, October 18, 2010) [67-28 TR]

"Mitigations:

CPMC/Sutter's mitigation for most traffic and parking issues suffer from a significant defect: they assume that patients, visitors, contractors and CPMC/Sutter will obey the Motor Vehicle Code, and that there is adequate enforcement to ensure compliance with regulations. Unfortunately, over 15 years of experience at Pacific site have demonstrated that all entities—including CPMC/Sutter—routinely violate these regulations and related Use Conditions, and that there, is no effective enforcement. The final EIR must demonstrate how this issue will be resolved."

Response TR-49

The comment raises a concern that there is an existing problem with enforcement of the Motor Vehicle Code (i.e., the California Vehicle Code) in the area around the Pacific Campus. Although it is not within CPMC's ability to enforce the California Vehicle Code, CPMC has worked over the years to address the community's concerns within site constraints. As part of the design development process for the CPMC LRDP, the Pacific Campus was designed to proactively reduce impacts on the adjacent neighborhood. For example, the project would add new parking spaces on the campus to reduce patient, visitor, and staff reliance on on-street parking in the neighborhood; would expand on-site loading facilities (the Draft EIR includes additional improvement measures to minimize the potential for impacts); and would provide for additional on site and on-street passenger loading zones to accommodate the projected demand for the new program. Similarly, efforts were made to integrate features into the design of other campuses that would proactively minimize impacts to the surrounding neighborhood, specifically: internal drop-off zones and loading docks, on-site parking, a TDM program, and an enhanced shuttle program.

Additionally, non-compliance with traffic laws is not an environmental impact, nor is it ultimately the responsibility of CPMC to enforce. No evidence exists that employees, patients, or visitors to the Pacific Campus would be any more likely to violate traffic laws than drivers to any other proposed project or existing building in San Francisco.

3.7.4.17 NOISE AND AIR QUALITY

Comment

(Linda Chapman October 19,2010) [76-28, duplicate comment was provided in 111-28]

"Automobile noise and air pollution will multiply when cars are trapped in congestion, or circulate in residential areas."

Response TR-50

The comment raises concerns about an increase of noise and degradation of air quality in the areas adjacent to the proposed Cathedral Hill Campus as a result of traffic congestion. Project impacts related to noise and air quality are addressed in Sections 4.6 and 4.7 of the Draft EIR. The noise and air quality analyses used the traffic volume data and intersection analysis results as inputs into the analysis. The assessment of impacts of additional traffic on noise levels determined that future traffic noise levels

would not exceed the significance thresholds, and that impacts on noise levels at the proposed Cathedral Hill Campus would be less than significant (see Impact NO-4 on pages 4.6-58 to 4.6-60 of the Draft EIR). Similarly, operations of the proposed Cathedral Hill Campus under the LRDP would not exceed the significance thresholds for air quality impacts related to toxic air contaminants, and the impact would be less than significant (see Impact AQ-12 on Draft EIR page 4.7-73).

3.7.4.18 MITIGATION AND MONITORING

Comments

(Helene Dellanini, DBC MOA, October 18, 2010) [71-4 TR, duplicate comment was provided in 72-4]

"To verify accurate traffic modeling, as well as to hold CPMC accountable for validating its environmental analysis, findings, and the effectiveness of mitigation measures, the EIR should include a requirement for CPMC to perform traffic counts and LOS monitoring at Franklin and Post. If the LOS at that intersection is found to be worse than anticipated and below D, then additional mitigation measures should be imposed."

(Helene Dellanini, DBC MOA, October 18, 2010) [71-26 TR, duplicate comment was provided in 72-26]

"We also recommend that a mitigation measure be included in the EIR requiring CPMC to perform traffic counts and LOS monitoring of the Post Street intersections 6-months after occupancy of the hospital. If the measured LOS at the intersections of Post/Franklin or Post/Geary have deteriorated to LOS E or F, the City of San Francisco should require additional traffic mitigation measures."

Response TR-51

The comments request that a mitigation measure be added to require additional mitigation measures if the intersection LOS deteriorates to LOS E or LOS F at the intersections of Franklin/Post and Post/Geary. The comments refer to the intersection of Post/Geary, which does not exist. It is assumed that the comment intends to refer to the intersection of Post/Gough. Under 2015 Modified Baseline plus Project and 2030 Cumulative plus Project conditions, the intersections of Franklin/Post and Gough/Post are anticipated to operate at LOS D or better (see Impact TR-4 on Draft EIR page 4.5-100 and Impact TR-103 on Draft EIR page 4.5-220). The same is true of the Cathedral Hill Campus variant scenarios. Because the intersections are projected to operate at acceptable LOS under both 2015 buildout conditions and 2030 Cumulative conditions scenarios, mitigation measures are not required; therefore, including monitoring activities is not needed.

Additionally, the commenter indicates they want the City to hold CPMC accountable for validating its environmental review. The project sponsor is not responsible for the environmental analyses contained in the Draft EIR. The City, with the SF Planning Department acting as the Lead Agency, is responsible for the contents of the Draft EIR.

3.7.4.19 GENERAL TRANSPORTATION STATEMENTS

Comments

(Diane and Richard Wiersba, October 11, 2010) [49-3 TR]

"Van Ness is a major highly-travelled, US route and placing a traffic-attracting monster hospital on this route is going to exacerbate an already unsafe traffic situation. At first glance, having a hospital adjacent to public transit seems positive but, in thinking of the times we have had to reach a hospital as soon as possible, we realize the use of public transit for this purpose is unlikely. Effective public transit is affected by traffic conditions and CPMC will be placed right in the middle of an already difficult traffic situation; it will, in fact, be the cause of increased and bottlenecked traffic."

(Charles Freas (1), October 19, 2010) [79-1 TR, duplicate comment was provided in 100-1]

"The EIR for the CPMC project contains too many convenient assumptions that will come back to haunt the City if implemented. The gargantuan Cathedral Hill Hospital as Sutter proposed is too problematic and it's environmental impacts too great.

The EIR acknowledges that a significant number of traffic problems are significant, unavoidable (SU) and impossible to mitigate. Further, these issues impact a concentration of critical east/west and north/south arterials - Geary, Van Ness (Hwy 101), Franklin, and Gough. The streets surrounding this area that are expected to drain off this impacted flow are not efficient distributors and will simply exacerbate the problem."

(Wallace Cleland, October 19, 2010) [86-3 TR]

"The fact that this structure would be imposed on three of our most traffic-congested streets would affect adversely every aspect of the neighborhood (noise, air quality, safety, aesthetics.)"

(Linda Chapman October 19, 2010) [76-14 TR, duplicate comment was provided in 111-14]

"4. Traffic and transportation

The stated purpose for building on Van Ness Avenue is easy access for drivers from the North Bay, patients and doctors. Adding Highway 101 drivers to the Van Ness Corridor is sufficient reason to downsize a hospital campus, if it is to locate there at all.

From my experience, traffic congestion on Highway 101 spills over from Van Ness to Polk Street, clogging two Muni preferential streets: Traffic circulating around a hospital, medical office buildings, and garages will impede through traffic on Van Ness (Highway 101), on Geary Boulevard, and other major automobile routes like Franklin, Gough and Post.

Circulation on streets of the Polk Street Neighborhood Commercial District (NCO), lower Nob Hill, and the Tenderloin will be affected by cars driving to the hospital and MOB, by adding emergency vehicles, by increasing service vehicles at the site, including trucks."

(Maria (last unknown), September 19, 2010) [PC-117 TR]

"And also, I want to talk about the traffic."

(Linda Chapman, September 23, 2010) [PC-282 TR]

"It [the Van Ness Plan] also would avoid producing a great deal of traffic on a street that is already at an impasse of traffic, that would occur with either a great deal of high-rise development or office development, or this development. It was determined that this was the most important boulevard in San Francisco besides Market Street, that it deserved this kind of consistent treatment, and that, in addition, it was the perfect place for housing. It was near downtown, it was on transit, and there were a lot of infill spaces for that. So, that is what we should have for the most part. If they are going to build this here, we must consider the fact that Van Ness is prone to be completely tied up with traffic. How are these people, who is it so important to get them all immediately to care, it took me two hours this winter to get from Pine Street to 22nd and Mission. How fast will people from the Mission be able to get over to the hospital? And that was only because it rained in the morning, you know? The bus driver said, 'Get off and walk to Market,' and everybody did because, you know, the traffic was just completely tied up."

(Linda Chapman, September 19, 2010) [PC-284 TR]

"Now, I've ridden in on Highway 101 when it is all blocked up and people go over to Polk Street and drive down and block up Polk Street, the whole area around there could be blocked up."

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-51 TR, duplicate comment was provided in 30-51 TR]

"27. Earlier in my comments, I mentioned the 'Transit First' policy that the Planning Department believes will be the way most everyone will get around the City. I think that it is very 'family unfriendly' for the Planning Department to promote 'family-sized housing' and presume that these same families will take transit all over the City instead of driving. Not only does the Planning Department promote such development but it also allows them to be built without realizing that more families will leave after building these so-called 'family sized units' with no parking.

If one really wants to eliminate vehicles in the City to get people to take Muni, a taxicab or shared rides, perhaps street parking should be prohibited after 11 p.m., for example, just as done in Golden Gate Park.

One caveat is that people who are seniors and disabled may not be able to take public transit so these people may be given an exception."

(Hiroshi Fukuda) September 23, 2010 [PC-164 TR]

"And also, another factor is that CPMC should force their contractors to obey—abide by the San Francisco Transit First Policy. They need to make them follow the policy. Please have CPMC mitigate those factors. Thank you."

(Joel Koppell) September 23, 2010 [PC-224 TR]

"And one thing the project does have working for it is the amount of one way streets that will encourage easier transition from streets into the property. It is a lot more difficult the more intersections there are, and the more two-way traffic there is. But CPMC told me about their Transit Demand Management Plan, which made me feel a lot better about things, and the fact that they're going to use multi-level driveways and incorporate loading stations that are designed to get vehicles off the roads. So, Van Ness and Geary, Post and Franklin, one way streets are going to help mitigate any of these issues. So, once again, we urge the approval, we think this document is adequate, and thanks for your time."

Response TR-52

The comments express personal experience with traveling in San Francisco, concerns regarding the siting and size of the proposed Cathedral Hill Campus, existing and future congestion levels, and the number of significant impacts associated with the proposed project. The proposed Cathedral Hill Campus project is located in a centralized area of the City where existing traffic conditions are on occasion congested because adjacent streets are major thoroughfares. Siting a project in an area served by major arterials and abundant transit options encourages the use of transit and reduces the use of local streets for vehicular access. Additionally, the Construction Transportation Management Plan that CPMC must develop as part of the project approval process, and as required by Mitigation Measure TR-55, would seek to minimize the impacts of construction activities on adjacent neighborhoods, including promoting the use of transit by construction workers.

Comment PC-282 shares a personal anecdote regarding an unpredictable circumstance in traveling from the general area of the Cathedral Hill Campus to the Mission District, and then asks how quickly patients could travel from the Mission District to the Cathedral Hill Hospital. It is not the goal of the transportation analyses contained in the Draft EIR to predict or capture every potential trip origin or destination in analyzing the impacts of the proposed CPMC LRDP. Trip distribution methodology for the analysis was based on the SF Guidelines, as discussed in more detail in C&R Response TR-21. Several modes of transport, of varying speeds, would be available to travel from the Mission District to the proposed Cathedral Hill Campus, including private vehicles, transit, taxis, etc.

Comment PC-282 states that the Planning Department believes that because of SF's Transit First Policy, almost everyone is expected to travel in the City via transit. This is not the stated intention of the policy; rather, the policy seeks to inform modal equity decisions in the City and prioritize the movement of people rather than the movement of private vehicles. Furthermore, the Transit First Policy did not play a role in the transportation analyses contained in the Draft EIR, as data collected in San Francisco, including mode shares, formed the basis for analyzing the transportation impacts of the proposed CPMC LRDP.

The remainder of the comments are noted; however, they do not raise issues regarding the adequacy, accuracy, or completeness of the Draft EIR. The comments will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project.

3.7.5 TRANSIT IMPACTS

3.7.5.1 TRANSIT SCREENLINE CAPACITY METHODOLOGY

Comments

(Paul Wermer, CPMC Neighbors Coalition and Pacific Heights Residents, October 18, 2010) [67-25 TR]

"Transit:

The assessment of the impact on MUNI capacity is flawed, in part because MUNI's load data methodology is inadequate to capture actual demand as it affects transit riders and influences decisions to take transit. We already see crush loads on many MUNI services—even though average load is reported as under 90% of capacity. This defect is significant, as it means many potential transit riders will in fact opt to drive—vitiating critical assumptions in the overall traffic analysis and TDM mitigations.

Furthermore, it is unclear that MUNI will increase capacity to meet increased service demands at peak periods."

(Gloria Smith/Tom Brohard & Associates —California Nurses Association, October 19, 2010) [92-14 TR]

"3) Numerous Errors in Muni Corridor Analyses for Near and Long Term - There are many errors in the ridership data, both within various tables as well as in comparison to the Draft EIR's forecast number of Project transit riders in the description of transit impacts. While the first two examples discussed in detail relate to the Cathedral Hill Campus, there are other similar errors for each campus that are also summarized below. The inconsistencies between the impact statements and the tables, together with internal errors in the tables, void the subsequent calculations of transit capacity utilization as well as all transit mitigation measures that have been based on these flawed analyses."

(Gloria Smith/Tom Brohard & Associates —California Nurses Association, October 19, 2010) [92-15 TR]

"a) Cathedral Hill Campus - AM Peak - Impact TR-27 on Page 4.5-118 of the Draft EIR indicates that the Cathedral Hill Campus will generate 586 new transit trips in the AM peak hour. In comparing the forecast ridership in Table 4.5-21 in 2015 under 'No Project' and 'Project' conditions in the AM peak hour, 479 new transit riders will be generated by the Cathedral Hill Campus (the difference between the sum of the ridership in all directions in 2015 with Project and without Project - 9,499 minus 9,020 equals 479). In comparing the forecast ridership in 2030 under 'No Project' and 'Project' conditions, 479 new transit riders will be generated by the Cathedral Hill Campus (the difference between the sum of the ridership in all directions in 2030 with Project and without Project - 10,183 minus 9,704 equals 479). The 586 new transit riders at the Cathedral Hill Campus in

2015 and 2030 as stated in Impact TR-27 must be used to evaluate transit impacts, not the 479 new transit riders in Table 4.5-21."

(Gloria Smith/Tom Brohard & Associates —California Nurses Association, October 19, 2010)
[92-16 TR]

"b) Cathedral Hill Campus - PM Peak - Impact TR-27 on Page 4.5-118 of the Draft EIR indicates that the Cathedral Hill Campus will generate 551 new transit trips in the PM peak hour. In comparing the forecast ridership in Table 4.5-21 in 2015 under 'No Project' and 'Project' conditions in the PM peak hour, 498 new transit riders will be generated by the Cathedral Hill Campus in the PM peak hour (the difference between the sum of the ridership in all directions in 2015 with Project and without Project - 9,667 minus 9,169 equals 498). In comparing the forecast ridership in 2030 under 'No Project' and 'Project' conditions, 289 new transit riders will be generated by the Cathedral Hill Campus in the PM peak hour (the difference between the sum of the ridership in all directions in 2030 with Project and without Project - 10,852 minus 10,563 equals 289). The number of new transit riders in the PM peak hour at the Cathedral Hill Campus in 2015 and in 2030 in Table 4.5-21 should be the same, not 209 less in 2030. The 551 new transit riders at the Cathedral Hill Campus in 2015 and 2030 as stated in Impact TR-27 must be used to evaluate transit impacts, not the 498 new transit riders in 2015 and the 289 new transit riders in 2030 in Table 4.5-21."

(Gloria Smith/Tom Brohard & Associates—California Nurses Association, October 19, 2010)
[92-17 TR]

"c) St. Luke's Campus - PM Peak - Impact TR-86 on Page 4.5-201 of the Draft EIR indicates that the St. Luke's Campus will generate 39 new transit trips in the PM peak hour. In comparing the forecast ridership in Table 4.5-21 in 2015 and in 2030 under 'No Project' and 'Project' conditions in the PM peak hour, 67 new transit riders will be generated by the St. Luke's Campus in the PM peak hour. The new transit riders forecast in the PM peak hour at the St. Luke's Campus in Impact TR-86 should be the same in Table 4.5-21 to properly evaluate transit impacts at the St. Luke's Campus in 2015 and in 2030."

(Gloria Smith/Tom Brohard & Associates—California Nurses Association, October 19, 2010)
[92-18 TR]

"d) California Campus - PM Peak - In the southbound direction, the baseline ridership in Table 4.5-21 is 1,421, the same number of riders for existing conditions and for ridership forecasts in both 2015 and 2030. The lack of southbound baseline ridership growth is not a reasonable assumption..."

(Gloria Smith/Tom Brohard & Associates—California Nurses Association, October 19, 2010)
[92-19 TR]

"e) Pacific Campus - PM Peak - Impact TR-60 on Page 4.5-168 of the Draft EIR indicates that the Pacific Campus will generate 37 new transit trips in the PM peak hour. In comparing the forecast ridership in Table 4.5-36 in 2015 and in 2030 under 'No Project' and 'Project' conditions in the PM peak hour, 190 new transit riders will be generated by the Pacific Campus in the PM peak hour. The new transit riders forecast in the PM peak hour at the Pacific Campus in Impact TR-60 should be the same in Table 4.5-36 to properly evaluate transit impacts at Pacific in 2015 and in 2030."

(Gloria Smith/Tom Brohard & Associates—California Nurses Association, October 19, 2010)
[92-20 TR]

"f) Davies Campus - PM Peak - In the southbound direction, the baseline ridership in Table 4.5-21 is 1,421, the same number of riders for existing conditions and for ridership forecasts in both 2015 and 2030. The lack of southbound baseline ridership growth is not a reasonable assumption. Even though the Davies Campus is several miles from the California Campus, existing ridership and forecasts for 2015 and 2030 in the southbound, eastbound, and westbound directions for the Davies Campus are identical to the existing and the forecast ridership for the California Campus, without and with Project riders added. This cannot be correct."

(Stephanie Barton et al. Hastings Civil Justice for the Good Neighbor Coalition, October 19, 2010) [104-39 TR]

"**3. The DEIR's transit analysis is inadequate because it ignores the disproportionate crowding and delays that the proposed hospital will likely cause in the Tenderloin.**

Transit routes in the Tenderloin are already crowded and reliability is below average. Therefore, the neighborhood is likely to experience the most significant transit impacts caused by the proposed hospital. As outlined in the Little Saigon Report, Muni buses in the Tenderloin are some of the most crowded and unreliable because they are in the middle of very long routes with many opportunities for passenger loading and delays.[87] Two lines through the Tenderloin already exceed Muni's load standards, and all lines but one are less reliable than the Muni average.[88] Even the DEIR's own draft traffic study found that over half of all studied lines were at their maximum load point ('MLP') at stops within or bordering the Tenderloin.[89]

The DEIR measured the proposed hospital's effects on transit by combining multiple bus lines into north/south and east/west transit corridors on the assumption that people: will choose to walk to a line that is less crowded even if it is farther away.[90] The DEIR determined that an increase in demand would be a significant impact if the number of passengers rose above 85% of a corridor's total capacity during the a.m. or p.m. peak hours or if any individual lines needed more buses in order to maintain their usual time between stops.[91] The DEIR never mentions the locations of the MLPs for each bus route even though that information is in the draft version of the DEIR's underlying transportation impact study, which found that one-third of the respective a.m. and p.m. MLPs were within the Tenderloin.[92] In addition, when expanded by only two blocks in each direction, the area contained nearly half of the a.m. and nearly two-thirds of the p.m. MLPs for the studied routes.[93]

(Stephanie Barton et al., Hastings Civil Justice for the Good Neighbor Coalition, October 19, 2010) [104-40 TR]

"An EIR should consider 'coverage, speed, convenience, reliability safety and comfort' when evaluating transit impacts.[94] An EIR may study transit routes individually, as groups or in some combination of the two, depending on the nature of the project.[95] EIRs typically: account for the project's location in relation to each transit line's MLP.[96] The DEIR's method of analyzing transit impacts better applies to projects in certain Downtown, SOMA and Mission Bay districts.[97] The proposed hospital is not in any of those districts. Consequently, the DEIR should tailor its transit analysis to the nature of the proposed hospital and their nature of its surrounding neighborhoods in order to adequately evaluate its potential transit effects.[98]

98 *Id*."

(Stephanie Barton et al., Hastings Civil Justice for the Good Neighbor Coalition, October 19, 2010) [104-41 TR]

"The DEIR's transit analysis needs to account for the disproportionate number of MLPs that are within or bordering the Tenderloin as well as the neighborhood's current transit conditions. It is not accurate to assume that people will walk to less crowed lines that are farther away, because the mere act of walking is more likely to be difficult for people who need to travel to a hospital. Moreover, it does not take into account that the Tenderloin

has a large number of disabled and elderly residents who depend on transit, as well as a large number of small children who also depend on transit to get to and from school."

(Stephanie Barton et al., Hastings Civil Justice for the Good Neighbor Coalition, October 19, 2010) [104-42 TR]

"Grouping lines together does not tell the community and decision makers which lines are most crowded. Nor does measuring ridership capacity for the entire route indicate whether there is an especially high concentration of riders along one part of the route while other parts may be virtually empty. The DEIR's reliability analysis similarly does not take into account whether certain sections of the route have longer delays for which the bus must compensate along more sparse sections. As the Little Saigon Report outlined, the Tenderloin already suffers from crowded, unreliable transit service, and therefore is likely to have a disproportionate amount of significant impacts due to the proposed hospital. To study adequately the potential transit effects the proposed hospital will have on the Tenderloin, the DEIR needs to examine each transit route individually and should at least determine the transit impacts of the proposed hospital for the stops at and near the MLPs."

(Carol and Michael Stack, October 17, 2010) [62-3 TR]

"It [The project] will put an insupportable burden on the area's public transportation system—the buses now are notoriously overcrowded at all times during most of the day."

Response TR-53

The comments raise concerns about the screenline methodology used to assess impacts on transit capacity and the location of the maximum load points used in the transit analysis. The comments also identify discrepancies in the number of transit trips generated by the individual campuses and reflected in the screenline analysis. The transit analysis presented in the Draft EIR was developed consistent with the methodology for transit analyses presented in the City's *Transportation Impact Analysis Guidelines for Environmental Review* ("SF Guidelines") and in consultation with the SFMTA. The *SF Guidelines* allow analysis of transit based on the location and character of the development, including the direction and distribution of trips to and from a project site. A project's impact on transit capacity may be analyzed using a screenline and/or direction link analysis, both of which assume that certain transit lines are grouped together by a common characteristic—most typically direction of travel. The rationale for using this type of capacity analysis is that someone traveling on transit in a certain direction will choose one of the transit lines that collectively serve the corridor or that direction of travel. It also assumes that if one line is overloaded, the transit user could shift to another line headed in the same general direction.

All of the CPMC projects are located outside of the downtown area (for which the *SF Guidelines* presents established screenlines); therefore, to tailor the transit analysis to the proposed LRDP, the transit analysis in the Draft EIR grouped Muni transit routes located within one-half mile of each campus by direction (i.e., northbound, southbound, eastbound, westbound). These groupings reflect that persons riding transit to each of the campuses may choose a transit route based on frequency of service and usage, as well as whether a certain line connects to a transfer point for other Muni or regional transit providers. For example, BART transit riders to and from the Davies Campus may take BART to the Civic Center station and transfer to the N Judah to reach the campus; transit riders from the Richmond District may take the 24 Divisadero north and transfer to another east-west line such as the 1 California. Furthermore, the transit analysis assumed that some project-generated transit trips would use Muni to access regional transit hubs, even though CPMC plans to operate private shuttles between the proposed Cathedral Hill Campus and existing Pacific Campus and the Civic Center BART/Muni Metro station, and between the St. Luke's Campus and the 24th Street BART station.

Each directional screenline represents the sum of the total ridership at the maximum load point (MLP) during the peak hour for each route, obtained from SFMTA's TEP. The data set from SFMTA's TEP

includes ridership data, including boardings and alightings, at each stop along each Muni transit lines. The MLP represents the point along the line with the largest number of riders, and therefore, the highest capacity utilization during the a.m. and p.m. peak hours being analyzed. The MLP may not necessarily fall within the one-half-mile transit study area because project-generated transit riders may continue to ride a line beyond that radius; however, the MLP represents the highest utilization of the Muni route that the project could be contributing to. Utilization of the line at points other than the MLP is indeed lower and additional riders would not necessarily cause capacity utilization issues at points farther from the MLP.

Comment 104-42 suggests that the Draft EIR should have evaluated the project's impact on individual lines in the Tenderloin because several transit lines have MLPs located in or near the Tenderloin. An individual line(versus directional) analysis would be difficult and speculative because it would require assigning a certain number of trips to lines that might or might not serve streets where employees or patients lived, i.e., a substantial amount of data would need to be collected about transit preferences of future and unknown hospital and MOB patients, visitors, and employees. As discussed in Response TR-21 (trip distribution) (page C&R 3.7-43), the distribution of the project's transit trips were based on known data that is based on larger areas or regions from where employees, patients, and visitors would commute to the campus. Because many transit lines serve each area or region, the screenline analysis presents a more reasonable transit capacity impact analysis for the project; transit riders would likely ride different lines. The transportation impact studies do, however, present the MLP for each line for informational purposes.

As indicated in Comments 104-39 and 104-41 and in the transportation impact studies for each campus, several of the MLPs for individual lines near the proposed Cathedral Hill Campus are located east of Van Ness Avenue, within the Tenderloin neighborhood. The transit analyses account for this by including these MLP ridership statistics within the study area as part of the directional screenline analysis. As discussed in the Draft EIR, implementing the proposed Cathedral Hill Campus project would not cause any screenline to exceed Muni's established standard, 85 percent capacity. Some individual lines may reach 85 percent capacity during the peak hours, but riders have several transit options heading in the same direction. Therefore, the screenline represents that at any time during the peak hour, some capacity is available for passengers headed northbound, southbound, eastbound, or westbound. Because capacity exists in all directions, overcrowding on any one line was not considered to affect overall transit use and capacity utilization.

Comment 104-41 states that the MLP screen line analysis does not acknowledge disabled and elderly residents who depended on transit would be disproportionally affected by over-crowding on transit lines because they would be less able to walk to other less crowded lines; however, the comment does not note any specific transit lines where this would be of particular concern. Muni buses have designated priority seating, identified by blue decals above the seats, located at the front of each bus, and these seats are to be surrendered for seniors and people with disabilities. For people with more severe disabilities, Muni operates a paratransit service, available to those who request such service.

Furthermore, as shown in Tables 5 and 6 of the *Cathedral Hill Transportation Impact Study*, on file and available for review at the San Francisco Planning Department, only one bus line—the 38L-Geary—has an individual capacity utilization that exceeds available capacity at its MLP; the remaining bus lines through the Tenderloin generally operate below 82 percent of available capacity in all directions during the peak hours, suggesting that available space would exist for bus riders on all lines.

Several comments identified inconsistencies in the transit corridor analysis for each of the CPMC campuses. Discrepancies between the transit trip generation, as prepared by Adavant Consulting, and the project transit trip assignment were identified in Draft EIR Tables 4.5-21 and 4.5-36 (pages 4.5-119 and 4.5-172, respectively). Specifically, there was an error in the reported number of net new transit trips generated by the St. Luke's Campus project, and an error in ridership under the p.m. peak-hour 2030

Cumulative No Project scenario for the proposed Cathedral Hill Campus project. Additionally, the assumptions for transit ridership were not clearly outlined in the Draft EIR in a way that would enable a reader to recreate the transit analysis using the net new project trip generation.

The transit corridor analysis discussion for each CPMC campus has been updated to clarify the analysis.

Cathedral Hill Campus—As presented in the Draft EIR, the proposed Cathedral Hill Campus would generate 551 net new a.m. peak-hour transit trips and 586 net new p.m. peak-hour transit trips. However, the transit corridor analysis presented in the Draft EIR assumed that the proposed Cathedral Hill Campus project would add 479 and 498 net new transit trips during the a.m. and p.m. peak hours, respectively, to the screenlines near the campus. This difference is partially the result of a reasonable transit analysis assumption that some CPMC transit riders would use the CPMC shuttles to travel between the Civic Center BART/Muni Station and the campus, and would thereby not cross the Muni screenlines. Altering Table 4.5-21 in the Draft EIR to assume employees and visitors would not take advantage of the CPMC shuttle, does not substantially alter the capacity utilization percentages which would continue to operate at less than Muni's 85 percent capacity utilization standards under Modified Baseline plus Project or Cumulative 2030 plus Project conditions, as stated in Impact TR-27, page 118) in the Draft EIR.

Comment 92-16 notes a discrepancy between 2015 and 2030 project transit trips during the p.m. peak hour. Table 4.5-21 incorrectly stated 2030 No Project ridership for the eastbound and westbound screenlines. The table has been revised to show 3,242 eastbound riders and 4,143 westbound riders under Cumulative 2030 No Project conditions. This revision does not affect the results of the analysis. This update to Table 4.5-21 in the Draft EIR would slightly lower the capacity utilization numbers under Cumulative 2030 No Project and Cumulative 2030 Project conditions and would therefore, not alter the cumulative impact analysis presented in the Draft EIR.

St. Luke's Campus—Table 4.5-11 on page 4.5-77 of the Draft EIR indicates that the St. Luke's Campus project would generate 39 net new p.m. peak-hour transit trips. As shown in the trip generation forecasts prepared by Adavant Consulting and included in Appendix D of the *St. Luke's Campus Transportation Impact Study*, the St. Luke's Campus project would generate 71 net new p.m. peak-hour transit trips. This change does not alter the analysis conclusion in the Draft EIR, which were drawn from the Transportation Impact Study that correctly analyzed the higher amount of transit trips. The transit corridor analysis presented in the Draft EIR assumes that the St. Luke's Campus project would add 67 net new transit trips to the screenlines near the campus. This difference is the result of the reasonable assumption that because a shuttle would be available, some CPMC transit riders would use the CPMC shuttles to travel between the 24th Street BART Station and the St. Luke's Campus, and would thereby not cross the Muni screenline. Table 4.5-21 on page 4.5-119 of the Draft EIR, has been updated to reflect 71 net new transit trips, instead of the 39 net new transit trips previously reported. Table 4.5-11 in the Draft EIR (page 4.5-77) has been revised as shown below to clarify transit trips.

In addition, page 4.5-204 of the Draft EIR is revised as follows:

> The St. Luke's Campus project would result in an increase in pedestrian activity in the vicinity of the campus, including walk trips to and from the proposed uses, plus walk trips to and from Muni bus stops and 24th Street BART Station. Overall, during the p.m. peak hour the project would add about 64 net-new pedestrian trips (an increase of 25 walk trips, and ~~39~~ 71 net-new trips that account for walk trips to and from the transit stops) to the surrounding streets (see Table 4.5-11, page 4.5-77).

Table 4.5-11
Net-New Peak-Hour Person Trips by Mode and Vehicle Trips by Campus [1]

	Person Trips by Mode					
Campus	Auto	Transit	Walk	Other 2	Total	Vehicle Trips
Cathedral Hill Campus						
a.m. peak hour	682	586	108	54	1,430	593
p.m. peak hour	689	551	107	50	1,399	609
Pacific Campus						
p.m. peak hour	114	37	27	20	198	71
Davies Campus						
p.m. peak hour	224	138	10	34	406	202
St. Luke's Campus						
p.m. peak hour	~~251~~223	~~39~~71	~~25~~23	~~6~~9	~~321~~326	207

Notes:
[1] The analysis does not assume any new travel demand at the California Campus because campus activities would remain unchanged until 2015, and would then be gradually relocated to the Pacific and Cathedral Hill Campuses. By 2020, almost all CPMC-related uses at the California Campus are expected to cease.
[2] "Other" includes bicycle, motorcycle and taxi trips.
Source: Data compiled by Adavant Consulting and Fehr & Peers in 2010

Pacific Campus—Table 4.5-36 on Draft EIR page 4.5-172 indicates that the Pacific Campus project would generate 190 net new p.m. peak-hour transit trips. As shown in Table 4.5-11 on Draft EIR page 4.5-77, the Pacific Campus project would actually generate 37 net new p.m. peak-hour transit trips. Table 4.5-36 in the Draft EIR (page 4.5-77) has been revised as shown below to clarify the Muni Corridor Analysis for the Pacific Campus.

The change would not substantially affect the results of the analysis, and the capacity utilization would slightly decrease. The impacts of the Pacific Campus project on transit capacity would continue to be less than significant.

Davies Campus—Table 4.5-36 on Draft EIR page 4.5-172 assumed that the Davies Campus project would generate 138 net new p.m. peak-hour transit riders. This is consistent with the trip generation forecasts prepared by Adavant Consulting and presented in the Draft EIR. No change is required to address the transit analysis for this campus.

Some of the comments note that the Draft EIR assumed little to no growth between Modified Baseline and Cumulative conditions on certain transit screenlines, specifically at the Davies and California Campuses. Cumulative transit ridership growth was based on output from the SFCTA's SF-CHAMP model, which accounts for projected land use changes and growth in the City, including increases and decreases in population, housing unit, and employment forecasts from the Association of Bay Area Governments (ABAG) that have been refined by the City. The model also considers available capacity, congestion, and travel speed when assigning ridership to specific routes. Although ridership along many routes might increase in the future, that ridership growth likely would be spread over the entire length of the line and would not be concentrated at the MLP. Overall ridership at the MLP might remain relatively stable. For more information about how transit ridership under Modified Baseline and Cumulative Conditions was determined, see Response TR-9 (page C&R 3.7-11).

Notes:
Capacity utilization calculations reflect capacity changes associated with the TEP project. Service changes resulting in capacity increases are proposed for the 5-Fulton, 12-Folsom-Pacific, 19-Polk, 21-Hayes, 22-Fillmore, 24-Divisadero, 27-Bryant, 31-Balboa, 38L-Geary Limited, 44-O'Shaughnessy, 47-Van Ness, 49-Van Ness-Mission, F-Market & Wharves, J-Church, L-Taraval, and N-Judah.
Service changes resulting in decreases in capacity are proposed to occur on the 1BX-California Express, 2-Clement, 16AX/BX-Noriega Expresses, 38BX-Geary Express, 48-Quintara-24th Street, and M-Ocean View
Source: Data compiled by Fehr & Peers in 2011

Upon review of the transit tables, the transit ridership identified for the California Campus in Table 4.5-21 of the Draft EIR was incorrect for Southbound, Eastbound, and Westbound directions. Table 4.5-21 on Draft EIR page 4.5-119 was be updated for the California Campus as shown below. Overall, transit ridership is lower than what was shown in the Draft EIR, and therefore, no new impacts would result from the change.

Notes:
Capacity utilization calculations reflect capacity changes associated with the TEP project. Service changes resulting in capacity increases are proposed for the 5-Fulton, 12-Folsom-Pacific, 19-Polk, 21-Hayes, 22-Fillmore, 24-Divisadero, 27-Bryant, 31-Balboa, 38L-Geary Limited, 44-O'Shaughnessy, 47-Van Ness, 49-Van Ness-Mission, F-Market & Wharves, J-Church, L-Taraval, and N-Judah.
Service changes resulting in decreases in capacity are proposed to occur on the 1BX-California Express, 2-Clement, 16AX/BX-Noriega Expresses, 38BX-Geary Express, 48-Quintara-24th Street, and M-Ocean View

3.7.5.2 TRANSIT DELAY

Comments

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-126 TR, duplicate comment was provided in 30-126 TR]

"68. On Page 4.5-123, Impact TR-30 states, implementation of the Cathedral Hill Campus project would increase congestion and ridership along Geary Street, which would increase travel times and impact operations of the 38/38LGeary bus routes. (Significant and Unavoidable with Mitigation).' As discussed earlier in this document, the mitigation measure is to compensate SFMTA for the 'cost of providing the service needed to accommodate the project at proposed levels of service.' Although some people may get on the bus to visit the Hospital, the MOB and 1375 Sutter Street Building areas, the vehicular traffic may not diminish by much because the drivers are not all visiting the hospital area. They are on their way to some other place but are still using Geary. When the LOS of Geary falls to 'F,' people will find the neighboring streets to get to their destination. This is what is happening to the California Campus as it is today. The small residential streets surrounding the California

Campus get as much traffic as one direction of traffic on Geary in a few cases such that the neighborhood association had to install and pay for speed humps. It was not all CPMC and the California Campus as there were also the UCSF shuttles almost continuously traversing the residential streets of Jordan Park. This was mitigated by having the UCSF shuttles become 'good neighbors' and not overburden the residential streets and adhere to the street Muni already runs on (more commercial streets) on a fixed route transit basis. CPMC needs to let the public know what routes will be used in the neighborhood. This was never addressed in the DEIR."

(Linda Chapman, October 19, 2010) [76-15 TR, duplicate comment was provided in 111-15]

"The campus is ideally situated for its vehicle traffic to impede transit services: Golden Gate Transit and two major Muni lines on Van Ness; the 38 on Geary and O'Farrell (the nation's most heavily traveled line); two lines running on Post and Sutter. Autos that slow traffic as they enter and exit garages, or execute turns onto streets with garage entries, cannot fail to affect transit on the same streets."

(Linda Chapman, October 19, 2010) [76-19, duplicate comment was provided in 111-19]

"Garage entries on Geary require drivers approaching from the west to navigate various one-way streets. Drivers forced to turn onto Van Ness or Polk in order to head west at Geary will add congestion to several transit preferential streets."

Response TR-54

These comments address the transit delay impact of the Cathedral Hill Campus on Van Ness Avenue and Geary Street, potential traffic spillover to adjacent streets because of congestion, and shuttle routes on local residential streets. Traffic spillover onto adjacent streets is discussed in Responses TR-5 and TR-31 (Methodology and Traffic Impacts, respectively, pages C&R 3.7-5 and 3.7-53). Shuttle routing is discussed in Response TR-56 (CPMC Shuttle Service, page C&R 3.7-93).

As discussed in the Draft EIR, a transit-delay analysis was conducted for Muni transit lines near the Cathedral Hill Campus because of the complexity and scale of the development, and because of the location of the proposed medical campus at a transit hub. The amount of new development would be greater at the proposed Cathedral Hill Campus than at any other CPMC campus. In addition, because of the site's location along major transit lines along Van Ness Avenue and Geary Street/Boulevard, more existing transit lines would carry more daily passengers near the proposed Cathedral Hill Campus than near the other CPMC campuses. Finally, the Cathedral Hill Campus is the only location where the proposed CPMC LRDP would introduce a local and regional medical center as an entirely new land use.

The transit-delay analysis in the Draft EIR identified transit-delay impacts on several Muni lines which included such inputs as: project-generated vehicles navigating around the campus on roadways with transit lines, background traffic and traffic growth between existing conditions, Modified Baseline conditions and Cumulative 2030 conditions, and passenger boarding delays associated with CPMC transit riders. The transit-delay calculation for the 38/38L-Geary also includes adjustments to account for delays associated with the project driveway on Geary Street. The SFMTA also analyzed the impact of the project on operational costs of transit lines in the transit study area.

Impacts were identified where the added transit delay would increase transit travel times by more than half of the scheduled headway or where SFMTA's Muni cost/scheduling tool showed that the project would result in increased operational costs associated with running additional vehicles. The impact analysis indicates that the proposed Cathedral Hill Campus project would increase transit delay, requiring Muni to operate additional transit vehicles along the 3-Jackson, 19-Polk, 38/38L-Geary, 47-Van Ness, and 49-Van Ness-Mission bus lines.

3.7.5.3 TRANSIT MITIGATION MEASURES

Comments

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-53 TR, duplicate comment was provided in 30-53 TR]

"If the transit lines will be impacted as stated in the DEIR, not many people will be relying on the buses to get places not the families, not the workers. This City will only become more congested and fewer families will stay in the City. The recourse for the transit delays caused by the CPMC projects is to solve it through financial payouts to the SFMTA. This is what seems to be stated in Mitigation Measure MM-TR-29 as stated on Page S-45. This mitigation measure only allows for a 'financial contribution' between CPMC and the SFMTA to resolve the increase in travel times on the Muni bus routes.

Any amount of money paid to SFMT A to get more buses to run on already clogged streets only adds more buses being stuck in traffic. Will Muni be running shuttles around the project areas? What other mitigation measure will be used to ensure that transit will not be impacted?"

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-54 TR, duplicate comment was provided in 30-54 TR]

"Page S-46, Impact TR-30 states how the 38/38 L-Geary lines will be impacted with increased travel times. Again, only a 'financial contribution' mitigation measure is mentioned with a 'Transit Mitigation Agreement' to be entered into to bring the level of service to a proposed level as stated in Mitigation Measure MM-TR-29, Page S-45. What proposed level would that be? What are these financial contributions supposed to pay for? Will more buses be run? Where will they go? Will they be allowed to go off route? If so, on what streets? If no additional buses will be run, will there be alternate solutions that this 'financial contribution' will pay for? If so, what would these be? Impacting the City's most used 38/38-L Geary bus line is a bad idea that will get worse. Will people be routed over to streets that parallel Geary and be shuttled in the north-south direction in some loop route? That will minimize having to run extra buses (conserve fuel) and only have to run short loop services.

The 38/38L-Geary line will also be impacted by the Two-way Post St. Variant because it will increase ridership along Geary per Impact TR-33. The 38/38L-Geary line will also be impacted by the MOB Access Variant adding to the congestion and travel times as per Impact TR-36."

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-55 TR, duplicate comment was provided in 30-55 TR)]

"This same page says the same impact to the 19-Polk line. This is a major line for people from the southeast portion of the City to the northeast portion of the City. With all the impacts to the bus lines being resolved with the 'financial contribution' mitigation measure mentioned earlier, perhaps there could be an outline of a foreseeable new transit rerouting/addition of buses or shuttles to mitigate the lengthened travel time people will be experiencing. The Two-way Post St. Variant would also cause a problem on Polk St. adding to the 19-Polk line travel time as per Impact TR-34 on Page S-46."

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-56 TR, duplicate comment was provided in 30-56 TR]

"Per Impact TR-133, Page S-57, the impact on the 49-Van Ness Muni line will be 'significant' and 'unavoidable' (SU) but will be addressed again by MM-TR-29 as mentioned earlier.

Per Impacts TR-134 through TR-147 (Pages S-57 through S-59), bus lines 47-Van Ness, 38/38L-Geary, 19-Polk, 3-Jackson, and 49-Van Ness will all be 'significantly and unavoidably' (SU) impacted with all the mitigation measures for each of these the same as MM-TR-29 which involves the financial 'Transit Mitigation Agreement' between CPMC and SFMTA. Each of the mitigation measure numbers assigned to the impact may be different but it is all the same solution by way of this financial arrangement. Also, if the 3-Jackson is impacted, so would the 2-Clement line. The 2-Clement has not been written up as being impacted in the executive summary. Perhaps I missed it."

(Sue Hestor, October 19, 2010) [89-7 TR]

"The EIR - as insufficient as it may be - shows substantial impacts on transportation and transit. Shifting patients, visitors and staff around means that CPMC must take ENORMOUS steps to really encourage transit usage. Which best occurs when transit is accessible, reliable and fast. CPMC must make that happen, again because they have chosen to 'blow out' the Geary and Van Ness intersection."

(Barbara Kautz, CHNA and Bernal Heights Neighborhood Center, October 19, 2010) [87-28 TR, duplicate comment was provided in 108-28 TR]

"The failure to identify any serious mitigation for traffic impacts carries over into the analysis of impacts on transit. Numerous significant and unavoidable transit impacts are related to the increased traffic congestion created by the Long Range Plan; yet, the DEIR identifies no mitigation measures that could reduce traffic generation from the project."

(Lois Scott, September 23, 2010) [PC-25 TR]

"A big issue for Cathedral Hill, itself, is transportation, and the future capacity of our already stressed public transit system. This impact needs serious mitigation, both capital and operating costs."

(Felicidad Afenir, October 23, 2010) [PC-34 TR]

"Traffic will be congested in this area, considering that this area is a main route of public transportation, transportation will be much—it will be impacted and traffic will be congested, and people who commute daily in their respective destinations will experience hardship. There are solutions to be made by CPMC to mitigate the problems."

(Donald Scherl, October 18, 2010) [74-15 TR]

"Impacts TR-29, TR-30, TR-31+TR-32-36, TR-99, TR-133-147: The Cathedral Hill campus project would 'increase congestion and ridership along Van Ness Ave., which would increase travel times...' for both cars and buses. While the draft report says this is serious and unavoidable, it suggests CPMC could somehow mitigate this by financially compensating the SFMTA for the cost of providing ... additional services' as if this would resolve either the bus or auto problems. It could not. In fact, it might make it worse."

(Sue Hestor, October 19, 2010) [89-2 TR]

"Another 'reply' is as for **Impact TR-29** (increase congestion and ridership along Van Ness Avenue, which would increase travel times and impact operations of the 49-Van Ness-Mission bus route (for which the response is 'financially compensating the SFMTA for the cost of providing the service needed to accommodate the project at proposed levels of service. The financial contribution shall be calculated and applied in a manner that is consistent with the SFMTA cost/scheduling model. The amount and schedule for payment and commitment to application of service needs shall be set forth in a Transit Mitigation Agreement between CPMC and SFMTA.' Similar language is used for the impacts on other streets with buses.

There needs to be a much STRONGER analysis and requirement."

(Sue Hestor, October 19, 2010) [89-4 TR]

"The City has had on its books for MANY years planned resolution of Van Ness Avenue congestion/delays by construction of the Van Ness Bus Rapid Transit. This route extends to Van Ness and Market (the intersection with 'no feasible measures') and beyond to Mission Street.

Similarly, Muni has problems on Geary Street/Boulevard for which the City knows that an important solution is construction of the Geary Street BRT.

Once CPMC made a PRIVATE decision to impose its PRIVATE facilities in the middle of these public transportation problems, it became responsible and should be required by the City to make sure that the SOLUTIONS ARE IMPLEMENTED. They are planning to change the circulation pattern, around the west and east blocks on the north side of Van Ness and Geary. The project will not only affect busses running on Van Ness and Geary, but those on Post and Polk in the immediate area, and other lines that connect to Geary and Van Ness several blocks away."

Response TR-55

The comments raise concerns about the transit impacts related to increased delays to transit lines in the proposed Cathedral Hill Campus vicinity, and the effectiveness of the transit mitigation agreement required under Mitigation Measure MM-TR-29 (on page 4.5-122 of the Draft EIR).

The Planning Department, in consultation with SFMTA, is responsible for determining appropriate mitigation measures to address the transit impacts of a proposed project. The SFMTA sets forth its recommendations using a cost/scheduling tool that determines the costs required to provide the level of transit service needed to accommodate future transit demands and the cost to maintain the proposed Muni transit headways along the length of the affected Muni route. The SFMTA cost/scheduling tool has been developed and calibrated by Muni and accounts for the maintenance and operational costs, as well as capital costs, for each line analyzed. As described in the Draft EIR, the cost/scheduling tool accounts for transit travel delay, passenger boarding delay, and operational needs (e.g., bus layovers, driver breaks).

The Draft EIR and *Cathedral Hill Transportation Impact Study* identify Mitigation Measures MM-TR-29 through MM-TR-31 (Draft EIR pages 4.5-122, 4.5-123, and 4.5-124), MM-TR-134 (Draft EIR page 4.5-238), and MM-TR-137 (Draft EIR page 4.5-240). These mitigation measures would ensure that CPMC would financially compensate SFMTA for the cost of providing additional service along these bus lines.

As explained on Draft EIR page 4.5-117, although this mitigation measure would reduce the impact to a less-than-significant level, the ability of SFMTA to provide additional service for the project is uncertain. Therefore, the Draft EIR concluded that the transit impacts of the CPMC LRDP would be significant and unavoidable.

CPMC's financial contribution to mitigate the transit-delay impacts on the bus lines identified above would be calculated and applied in a manner that is consistent with SFMTA's existing cost/scheduling tool. The final financial compensation package would include CPMC's fair share of costs associated with operating additional transit vehicles along certain lines over an extended amount of time, operation costs to cover any additional transit drivers, maintenance of transit vehicles along impacted lines, and capital costs to purchase new vehicles where needed (including costs allocated for construction of additional transit vehicle storage facilities). The financial compensation provided to SFMTA by CPMC would also be used, in part, to fund implementation of the BRT projects, including CPMC's fair share of funding the cost of BRT improvements along the proposed Cathedral Hill Campus frontage. SFMTA would retain discretion for how to best accommodate the additional ridership and delay created by the project.

Pursuant to the Draft EIR mitigation measures identified above, the amount and schedule for payment related to the proposed CPMC LRDP would be set forth in a transit mitigation agreement between CPMC and SFMTA or other appropriate documentation, and may be included in the development agreement between CPMC and the City of San Francisco.

3.7.5.4 CPMC SHUTTLE SERVICE

Comments

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-37 TR, duplicate comment was provided in 30-37 TR]

"A few areas not considered at all by the DEIR are the impacts of traffic and congestion and shuttle system impact to the areas outside of the CPMC project sites such as the Western Addition neighborhood, and specifically Japantown; the Richmond District (specifically mid-Richmond Geary merchant area, Jordan Park, Laurel Heights), Presidio Heights and Pacific Heights. CPMC shuttles will be running frequently through Japantown, mid-Richmond, Jordan Park, Laurel Heights, Presidio Heights and Pacific Heights on neighborhood streets to get

to outlying parking structures such as the Japan Center Garage on Post Street and the use of the Kabuki Hotel area at 1625 Post Street for convenient pickups and drop offs. Japantown is a heritage cultural center. It should not be used as a transportation mitigation measure for CPMC. In the Richmond District, the shuttles drop off and pick up people at the Geary & 16th Avenue Garage so the workers take up parking from people who want to shop the Geary Street merchants and cannot because the mid Richmond is one of the hardest places to find parking nowadays. The shuttles running to the California Campus where workers already use the parking structures mentioned in Item 18 above (Cherry St., etc.) from the Pacific Campus will cause parking and congestion issues in Laurel Heights, Jordan Park, Presidio Heights and Pacific Heights. The DEIR has not addressed the greater issue of the moving impacts of CPMC's vehicular use and leasing of spaces in various neighborhoods throughout San Francisco. This traffic study has not been done for the CPMC users and its impact on the residents and shoppers who cannot use the parking spaces because CPMC has them reserved. CPMC cannot create new parking at the new site sufficient for its proposed plan so it will be taking up more spaces in the neighborhoods?"

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-38 TR, duplicate comment was provided in 30-38 TR]

"What I believe is occurring is that CPMC has created its own "bus service" instead of having its workers use Muni. It has taken over the neighborhood streets with all of its shuttles that do not even stick to fixed routes on streets that are transit use streets. They have created their own van/shuttle/bus service and is probably also impacting the SFMTA Muni revenue stream. Why would the City cater to a private for-profit entity and allow the neighborhoods to be overtaken basically by a transit service that does not put in to the City's coffers? The least they can do is to be good neighbors and stick to the streets that Muni presently runs on vs. zigzagging all over town even down strictly residentially-zoned streets. They should especially stay off of streets with schools for young children. MITIGATION MEASURE: I think all the shuttles should be staged outside of the City at the BART stations so that the workers will be forced to take public transit (BART, Muni) if coming in from out of town. They can get off at the Van Ness Station or the Civic Center Station to get to work on the Cathedral Hill projects. All those who live in the City should take Muni. CPMC should learn from UCSF which has shuttles on routes that stick as much as possible to the large streets that already carry Muni bus traffic. UCSF has a good neighbor policy in place that allows a transportation manager to get input on rogue shuttles going off course without any transit blockage on their regular fixed route. And this is also necessary for the CPMC shuttles which do not always travel on the large main streets or those on which Muni already runs."

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-39 TR, duplicate comment was provided in 30-39 TR]

"Granted, CPMC is not the only one running its own "bus service" as so is Genentech, Google, etc. However, there must be a trade-off to the community for increased greenhouse gases, congestion, noise and vibration and the negative impacts to sensitive receptors for these institutions that use their own transportation services. Perhaps an ordinance is required to curb institutions and "bus service" on neighborhood primarily residential streets unless they have a pickup or drop-off of disabled patients on the particular streets. Otherwise, these shuttles and vans become all day cut-through traffic to the neighbors."

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-40 TR, duplicate comment was provided in 30-40 TR]

"If CPMC does not wish to relinquish all the parking spaces they take up from City lots that could be used by people who actually shop and live in the City and keep the businesses viable, the prices of the parking spaces should not be increased because of the currently artificial demand that is created by CPMC for the local public. (See Item 64 below.) In addition, with the number of projected FTEs to CPMC being 10,720 (See Item 91), more CPMC personnel will use the parking facilities to squeeze out those who wish to conduct business at the associated shopping center garages but cannot and cause the residential streets to become congested and overburdened with traffic. Please reference the following CPMC shuttle information and use of public garages for their 8 shuttle lines:

C-line: California Campus - Pacific Campus

-Every 15 minutes 6:30 am - 6:15 pm
-Courtesy stops on California St.; Walnut, Locust, East Campus
-Courtesy stops all day: Maple and Sacramento

D-line: Davies Campus - Pacific Campus

-Every 15 minutes 6:15 am - 6:15 pm
-Services Japan Center parking lot 6:25 am – 8:55 am
-Courtesy stops: Post and Pierce (before 9:00 am); Sutter and Scott (after 9:00 am)
-Courtesy stops all day on Scott St: O'Farrell, McAllister, Hayes, Haight

F-line: Pacific Campus – Folsom building

-Every 30 minutes 7:15 am – 5:30 pm
-Pick up and drop off will be in the white zone at 633 Folsom, except after 3:30 pm, when pick up and drop off will take place on Hawthorne.

JC-Express: Japan Center – Pacific Campus

-Every 10 minutes 5:05 am – 10:55 am and 2:40 pm – 8:50 pm

GMG Line: Geary Mall garage at 16th Ave – California Campus

-Every 15 minutes 6:15 am – 9:30 am
-Every 15 minutes 3:15 pm – 6:15 pm

BV-Line: Civic Center BART Station – Pacific Campus

*-Every 15 minutes** 5:35 am – 7:05 pm*
***Every 10 minutes 6:30 am – 9:30 am and 3:30 pm – 5:30 pm*

St. Luke's Shuttle: Davies Campus – St. Luke's Campus

-Every 30 minutes 8:30 am -3:45 pm (no services from 12:15 pm to 1:15 pm)
-Davies first services at 8:30 am and last Davies service at 3:30pm
-St. Luke's first service at 8:45 am and last St. Luke's service at 3:45 pm

K Line: Pacific Campus To – Hotel Kabuki (1625 Post) To – Cathedral Hill Office Building (1255 Post) To – 1825 Sacramento To – 1700 California Street

-Every 20 minutes from each location between the hours of 6:30 am to 6:20 pm
-Departures occur at the same time each hour from each location: Pacific at :10, :30, :50; Kabuki at :13, :33, :53; Cathedral Hill at :15, :35, :55; 1825 Sacramento at :00, :20, :40; and 1700 California at :05, :25, :45.

Source: *http://www.cpmc.org/visiting/shuttle.html* (as of Sept. 21, 2010)

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-110 TR, duplicate comment was provided in 30-110 TR]

"Page 4.5-31 speaks of the existing CPMC shuttle service. It states that the shuttles run from 5 a.m. to 9 p.m. about every 20 minutes per day. I believe this has changed from that to start around 6 a.m. and run until about 6 p.m. or 7 p.m. and only once every 30 minutes instead of 20 minutes. On Page 4.5-32, Table 4.5-8 shows the shuttle service daily capacity utilization for the Japan Center Garage to have 381 riders daily. The California Campus has 414 riders daily with a daily capacity utilization of 62%. The Civic Center BART and Van Ness/Market shuttle has 503 daily riders with a capacity utilization of 56%. How many of these riders will still

have to rely on the shuttles for their daily commute when the new campuses are completed? How many of the 381 riders from the Japan Center Garage will have to still use the Japan Center Garage after CPMC completes its projects? How many riders out of the 82 that use the Geary Mall Garage will need to use that garage after the completion of the CPMC projects?"

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-117 TR, duplicate comment was provided in 30-117]

"63. Pages 4.5-84 and 4.5-85 indicate that CPMC will have 14-passenger shuttles running with 8 routes over the 6 routes in existence today. It also indicates that at least 15 shuttles will be required to service the estimated ridership. What is still not determined are the "non-CPMC private shuttle services" that "would be provided by a private garage operator as demand for off-campus parking increases." On Page 4.5-214, there is mention of the "12th Street Garage Shuttle," as a private operated shuttle. The daily passenger demand for this shuttle is 750 riders assuming that a total of 375 staff from St. Luke's and from Davies park in other off-site garages. Which garages would those be?"

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-118 TR, duplicate comment was provided in 30-118 TR]

"64. On Page 4.5-86, Table 4.5-16 ("Daily CPMC Shuttle Demand") shows that the existing demand of the "Cathedral Hill/Pacific/Japantown/BART" shuttle of 172 daily riders will balloon to 1,756 - 2,004 riders daily. And the overall shuttle ridership will go from 2,005 riders daily to 7,542 - 8,001 riders daily. When it is discovered more shuttles need to be procured to accommodate the increase of ridership, is CPMC going to procure more shuttles? If so, where will they be parked without impacting the parking being taken away from the public? And how will these shuttles which could be running almost 24/7 be kept on the main commercial transit corridors without cutting through residentially zoned areas?

The DEIR shows that all 14 shuttles will be parked at the Cathedral Hill Hospital when not in service but I think these shuttles should not be parked at the Hospital. Instead, they should lease spaces at other underutilized parking structures throughout the City so that these 14 spaces are made available to the paying public. Overall, if CPMC has to have this many shuttles for this LRDP, the size of all the proposed garages is not sufficient for the workers, visitors and patients that this project is going to attract. It is also telling that this many shuttles are necessary because the transit in the areas will not accommodate these visitors in a timely fashion or be able to support the sheer number of people who will be accessing these campuses."

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [37-6 TR]

8. When the **major streets** such as Van Ness, Franklin and Geary have their lanes blocked depending on construction conditions, the cut-through traffic into adjacent areas will be impacted. So even the parking at St. Luke's and Davies will have an effect on the other areas because it is all dependent on how many people CPMC employs who will drive to work. As a "Transit First City," it does not mean to drive in and then take up neighborhood or merchant parking and shuttle it in to the campuses. **MITIGATION MEASURE**: Shuttles to stay out of SF. Perhaps those CPMC workers should BART it in and take the Muni if they live out of town and those living in the City should take the bus unless they are 24-hour on-call/emergency personnel.

Reference: 31,000 acute discharges (33% of SF total)
7,300 births (50% of SF)
74,300 Emergency Department visits (32% of SF)
541,200 Outpatient visits
1,200 medical staff (largest in SF)"

(Bob Hamaguchi—Japantown BNP Organizing Committee, October 8, 2010) [47-8 TR, duplicate comment was provided in 50-8 TR (Richard Matsuno, October 12, 2010]

"For example, will CPMC's TDM policy and shuttle services inadvertently increase CPMC staff, patient or visitor demand on the Japantown parking? Will peak p.m. traffic have an effect on evening visitation to Japantown?"

(Paul Wermer, CPMC Neighbors Coalition and Pacific Heights Residents, October 18, 2010) [67-27 TR]

"CPMC Shuttle Services:

CPMC's shuttle services will run on a significantly increased frequency. Absent a detailed analysis of the proposed shuttle routes and schedules, it is not possible to evaluate how this will affect the overall traffic issues at the various sites. Based on observations at Pacific site, shuttle operations can have adverse impacts on pedestrian crosswalks and traffic flow."

(Helene Dellanini, DBC Master Owner Association, October 18, 2010) [71-3 TR, duplicate comment was provided in 72-3 TR]

"The Cathedral Hill Campus Transportation Impact Study indicates that the hospital shuttle will generate 36 trips per hour, or 1.7 trips per minute. The proposed shuttle drop-off area is located immediately east of the one and only egress from the hospital's passenger drop off area and parking garage. All normal, non-emergency vehicular traffic exiting the hospital will be required to turn right onto Post in essentially the same location that the shuttle drop-off traffic will transition from the traffic lane into the shuttle drop-off. A Muni lane that runs buses #2 and #3 is also adjacent to the proposed shuttle drop-off area and each bus route averages 10 minutes between buses of the same route number during peak periods. This equates to a combined average of one bus every five minutes. The combined traffic movements of the bus traffic, shuttle traffic and egress traffic from the hospital will add significant congestion on Post during peak-hour traffic periods. Therefore, it is recommended that the shuttle drop-off be relocated from Post and combined with the main internal shuttle drop-off area that is access from Geary."

(Helene Dellanini, DBC Master Owner Association, October 18, 2010) [71-25 TR, duplicate comment was provided in 72-25 TR]

"TR-4 The proposed site plan for the Cathedral Hill Campus includes a curbside, shuttle drop-off area on Post Street west of Van Ness. The Cathedral Hill Campus Transportation Impact Study indicates that the shuttle traffic will result in 36 shuttle trips per hour, or approximately one shuttle every 1.7 minutes. The proposed drop-off area is located immediately east of the egress for the internal CHC drop-off and parking garage. All normal, nonemergency, vehicular traffic exiting the hospital will be required to turn right onto Post in essentially the same location that the shuttle drop-off traffic will transition from the traffic lane into the shuttle drop-off. A Muni diamond lane is also adjacent to the proposed shuttle drop-off area which provides for bus routes #2 and #3. Each bus route averages 10 minutes between buses of the same route number during peak periods, which equates to a combined average of one bus every five minutes. The combined traffic movements of the bus traffic, shuttle traffic and egress traffic from the hospital will add significant congestion on Post Street during peak-hour traffic periods. As a result of this anticipated congestion, it is recommended that the shuttle drop-off be relocated from Post and combined with the main internal shuttle drop-off area that is accessed from Geary."

Response TR-56

The comments generally express concern about the impact of the CPMC shuttle service. Specifically, the comments address: existing shuttle service; shuttle demand and planned capacity; the use of shuttle service rather than Muni; conflicts at shuttle loading/unloading areas; shuttle routing within residential neighborhoods; and the use of shuttles to serve off-site parking lots.

Comments 18-40 and 18-110 discuss existing shuttle service. As described on page 4.5-31 through 4.5-32 of the Draft EIR, CPMC currently provides free shuttle bus service during daytime operating hours (approximately 5 a.m. to 9 p.m.) for doctors, staff, visitors, and patients: between the Davies, California, and Pacific Campuses; off-site parking at the Japantown Garage and Geary Mall Garage (1600 Geary); Civic Center BART/Muni Metro station; 24th Street BART Station; and the future site of the proposed Cathedral Hill Campus (existing Cathedral Hill Hotel and office building), where some administrative offices are currently located. Shuttles run every 15 to 30 minutes between approximately 5 a.m. and 6 p.m. After 6 p.m., extended service (until 9:00 pm) is provided to the Japan Center Garage.

Seven existing "full-service" fixed shuttle routes operate through the day and three limited service shuttle routes operate during employee shift changes. A detailed map of the existing system can be found in Appendix F of the *CPMC LRDP Transportation Impact Study Master Appendix*. These shuttles are part of CPMC's TDM program, which is designed to reduce private vehicle trips between campuses and encourage transit ridership by serving regional transit hubs. As summarized in Table 4.5-8 on page 4.5-32 of the Draft EIR, the existing shuttles have a daily capacity utilization from 17 percent (CH-Line between the existing Pacific Campus and Cathedral Hill administrative offices) to 63 percent (D-Line between the Pacific Campus, the Japantown Garage, and the Davies Campus).

Several comments express concern about the ability of the proposed shuttle system to accommodate the expected demand. With the shifting of primary hospital and inpatient-care uses from the Pacific Campus to the proposed Cathedral Hill Campus, the CPMC shuttle system would be reconfigured with several new routes serving the site (see Appendix F). The system would include eight routes that would serve the four future campuses—Cathedral Hill, Pacific, Davies, and St. Luke's—and BART and Caltrain. The following routes, as described on page 4.5-85 of the Draft EIR, are proposed and routes shown in C&R Figure 3.7-1 (page C&R 3.7-96) which follows:

- The Pacific-BART line would serve the Pacific campus, the Japantown Garage, the proposed Cathedral Hill campus, and the Civic Center BART station at approximately 6-minute headways. The route is assumed to operate between approximately 5:30 a.m. and 7 p.m. (similar to the existing BV-Line). Approximately five shuttles would be needed to operate the shuttle route at 6-minute headways, depending on traffic conditions.

- The Cathedral Hill-BART line would serve the proposed Cathedral Hill Campus and the Civic Center BART station at approximately 3-minute headways. The route is assumed to operate between approximately 5 a.m. and 11 a.m. and between 2:30 p.m. and 9 p.m. (similar to the existing JC-Express shuttle route serving commuting hours). Approximately five shuttles would be needed to operate the shuttle route at 3-minute headways, depending on traffic conditions.

- The Folsom/Caltrain line would serve the proposed Cathedral Hill Campus, the Fourth Street Caltrain Station, and CPMC offices located at 633 Folsom Street at approximately 30-minute headways. This route is assumed to operate between approximately 6 a.m. and 9 a.m. and between 3 p.m. and 6 p.m. and would require one shuttle to operate the route at 30-minute headways.

- The Cathedral Hill-Davies line would serve the proposed Cathedral Hill Campus and the Davies Campus at approximately 30-minute headways. This route is assumed to operate between approximately 6 a.m. and 6.p.m. (similar to the existing D-Line). One shuttle would be needed to operate the shuttle route at 30-minute headways.

- The Cathedral Hill-St. Luke's line would serve the proposed Cathedral Hill Campus and the St. Luke's Campus at approximately 30-minute headways. This route is assumed to operate between approximately 6 a.m. and 6 p.m. (similar to the existing SL-Line). One shuttle would be needed to operate the shuttle route at 30-minute headways.

- The Davies-St. Luke's line would serve the Davies and St. Luke's Campuses and the 24th Street BART station in San Francisco at approximately 30-minute headways. One shuttle would be needed to operate the shuttle route at 30-minute headways.

- The Davies-Pacific line would serve the Pacific Campus and the Davies Campus at approximately 30-minute headways. One shuttle would be needed to operate the shuttle route at 30-minute headways.

For the future shuttle system, CPMC is considering use of a system fleet with individual shuttle capacities of 14, 20, or 35 passengers per shuttle. It was assumed that an individual shuttle capacity of 14 passengers per shuttle for the entire fleet would be used for all routes. As discussed in Impact TR-97 on page 4.5-213 of the Draft EIR, the proposed shuttle system was designed to and could accommodate the proposed ridership demand of the proposed LRDP (7,542–8,001 daily trips, including intra-campus trips), and therefore, would be a less-than-significant impact. As shown in Table 4.5-40 on page 4.5-214 of the Draft EIR, the proposed shuttle routes would operate at approximately 60 percent of proposed shuttle capacity.

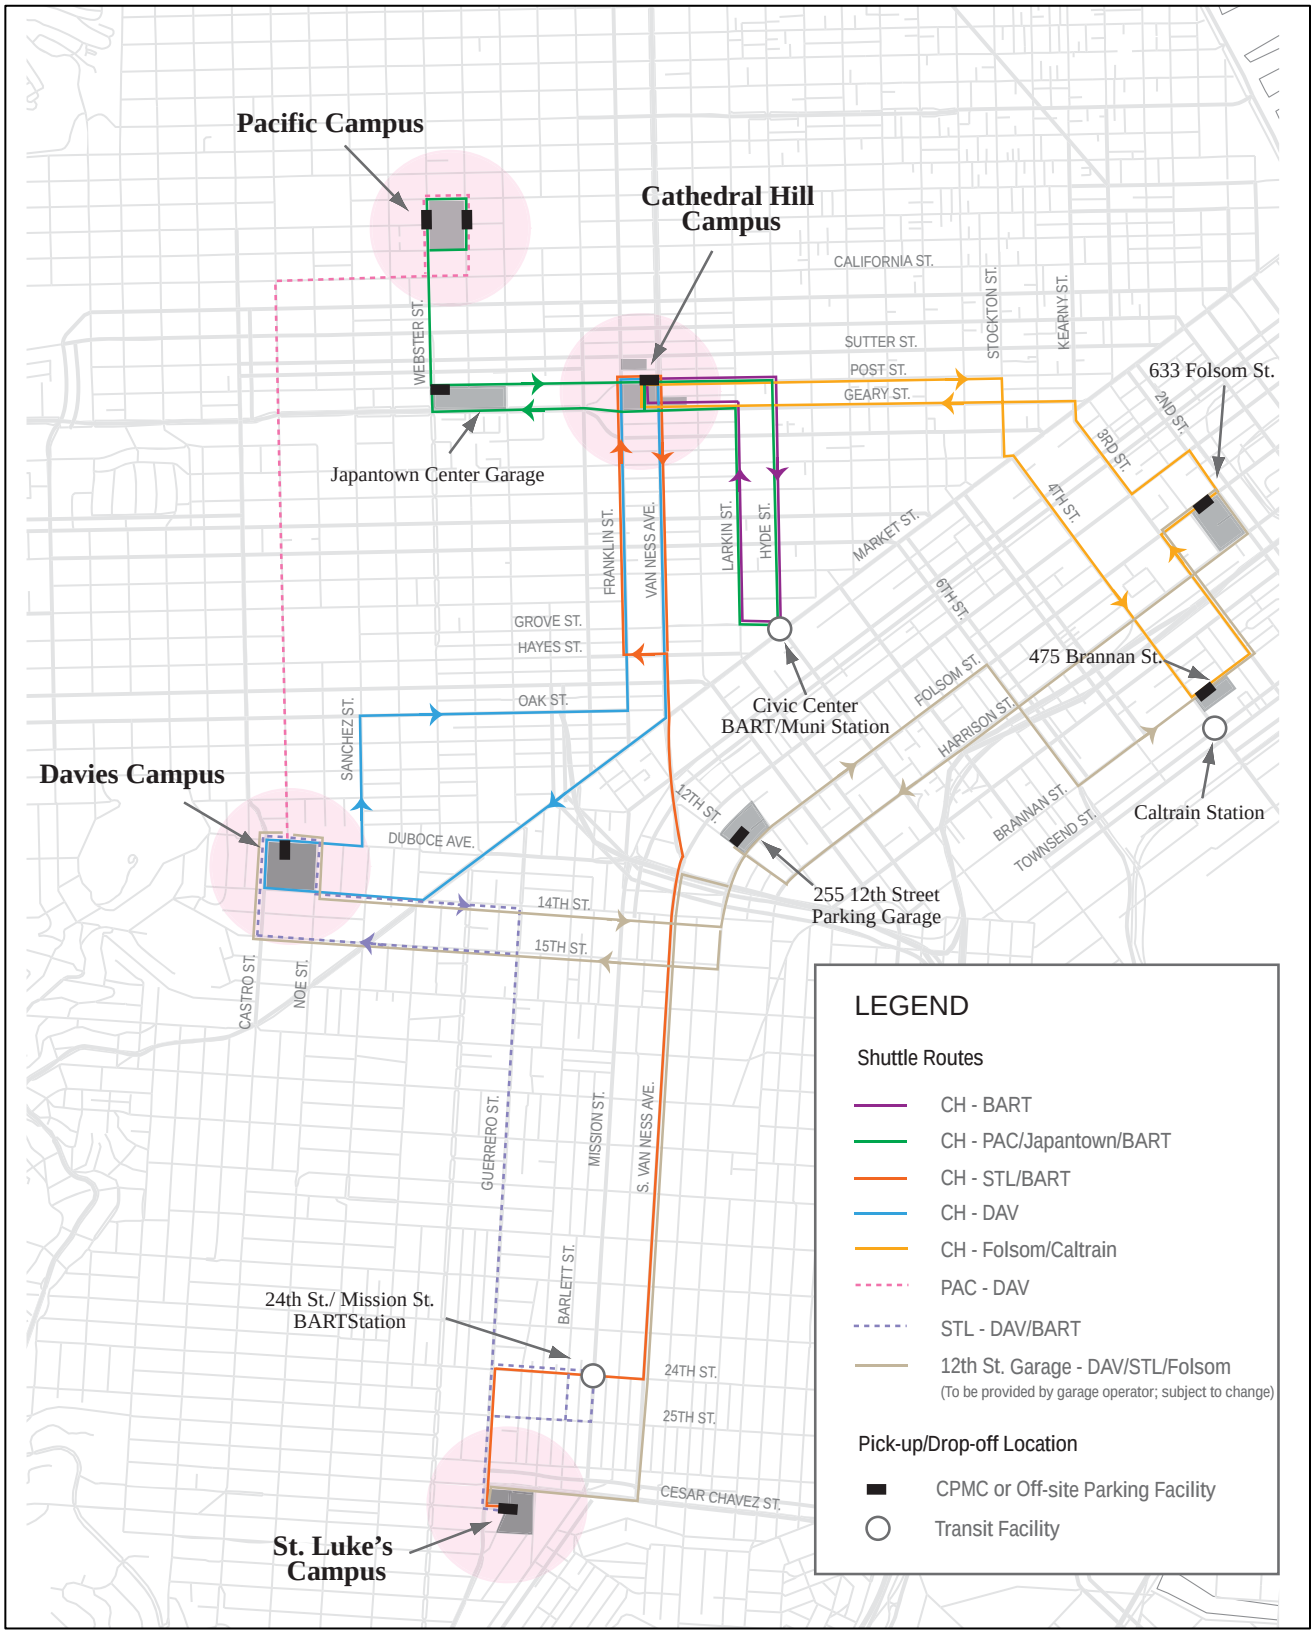
Comment 18-118 specifically addresses the increase in demand for the CH-Line serving the Cathedral Hill Campus, Pacific Campus, Japantown Garage, and Civic Center BART. This shuttle route, the Pacific-BART line described above, would operate at approximately 60 percent of its available capacity. CPMC actively monitors its shuttle fleet and maintains extra shuttles that can be used to meet observed increases in shuttle demand.

In general, the CPMC shuttle routes would be set routes and would continue to use major city streets to access the various destinations and nearby transit hubs, including Post Street, Geary Street, Larkin Street, Hyde Street, Van Ness Avenue, Franklin Street, Oak Street, Market Street, 14th Street, 15th Street, Guerrero Street, Cesar Chavez Street, 24th Street, California Street, Third Street, and Fourth Street. Due to the location of some of the CPMC campuses, shuttles would continue to use some neighborhood streets immediately adjacent to the campuses, including Scott Street, Duboce Street, Sanchez Street, and Webster Street. The shuttle's use of residential streets surrounding each campus is an existing condition that would not change as a result of the changes to the CPMC shuttle system. A map showing the routes of the proposed shuttle system is on file and available for review at the San Francisco Planning Department.

Shuttles would continue to operate primarily between 5 a.m. and 6 p.m., with limited service between 6 p.m. and 9 p.m. The system would not operate "24/7" as described in Comment 18-118. Currently, the City has no restrictions on private shuttle service operations; however, it is recommended that shuttle services coordinate with SFMTA. The San Francisco County Transportation Authority is currently investigating ways to manage private shuttle routes and their impact on residential neighborhoods throughout the City, including CPMC's existing service. Therefore, shuttle impacts on residential streets are expected to be less than significant.

As described in the Draft EIR, each campus would have a dedicated passenger loading area for CPMC shuttles, to permit shuttles to pull out of traffic to load and unload, and these facilities were determined to be adequate to accommodate the shuttle demand. Shuttle loading areas would be provided at the following locations:

- Cathedral Hill Campus—Post Street near Van Ness Avenue (approximately 100 feet) and within the interior passenger drop-off/pick-up area
- Davies Campus—Interior to the campus between the existing 45 Castro Street MOB and Davies Hospital North Tower
- Pacific Campus—Webster Street between Sacramento Street and Clay Street, and Buchanan Street between Sacramento Street and Clay Street
- St. Luke's Campus—San Jose Avenue at 27th Street (approximately 40 feet)



Source: CPMC 2011

Proposed CPMC Shuttle Routes **C&R Figure 3.7-1**

Comments 67-27, 71-3, and 71-25 express concern about on-street conflicts between CPMC shuttles, Muni vehicles, private vehicles, and pedestrians. All shuttle loading at the Davies Campus would occur interior to the site; therefore, minimal on-street conflicts would occur, aside from shuttles entering and exiting the site via Duboce Avenue as occurs at present. The St. Luke's Campus would have one shuttle arriving per hour, as at present; therefore, minimal conflicts would occur with other roadway users. Comment 67-27 is particularly concerned about shuttle conflicts on the Pacific Campus. The Pacific Campus currently serves as the hub of the existing CPMC shuttle system. After construction, the proposed Cathedral Hill Campus would become the hub of the CPMC shuttle system. The proposed shuttle plan includes one shuttle between the Pacific Campus, Japantown Garage, Cathedral Hill Campus, and BART at 6-minute headways, and one shuttle between the Pacific Campus and Davies Campus at 30-minute headways. This would be a net reduction in shuttle service to the Pacific Campus; therefore, impacts to pedestrian and vehicle traffic in the area would be less than what occurs at present.

The proposed Cathedral Hill Hospital would have a shuttle loading zone, located on the south side of Post Street near Van Ness Avenue. This zone would be the main staging area for the six shuttle routes serving the Cathedral Hill Campus. During the morning and afternoon peak periods, an average of one shuttle would arrive at the zone every 3 minutes. These shuttles would have to cross the transit-only lane on Post Street; however, once in the zone, the shuttles would not conflict with Muni transit on Post Street.

The Cathedral Hill Hospital shuttle loading zones is located approximately 25 feet east of the hospital parking garage driveway/egress. and set into the sidewalk to separate stopped shuttles from transit on Post Street. The shuttle loading zone is separated from the driveway by a curb extension. While some conflicts may occur between vehicles exiting the garage and shuttles pulling into the loading zone, exiting vehicles would be required to yield. Based on the project trip assignment, this exit from the hospital parking garage would serve 43 vehicles during the a.m. peak hour and 157 vehicles during the p.m. peak hour. During these peak hours, traffic exiting the garage may have to yield to through traffic onto Post Street, including transit and shuttle vehicles. During the a.m. peak hour, less than one vehicle per minute would exit the garage, and substantial conflicts or internal queuing is not expected to occur. During the p.m. peak hour, two to three vehicles exiting the garage per minute may need to yield to traffic on Post Street and some queuing internal to the parking garage may occur; however, there would be sufficient distance within the building for this to occur.

Comments 18-38 and 37-6 suggest that one method for CPMC to reduce the impact of shuttles on local residents would be to stage shuttles at major transit stops outside of San Francisco and require employees to use Muni to access each campus. The CPMC shuttle system serves two purposes. First, it allows employees who take regional transit to San Francisco to avoid the need to transfer to Muni to access the campus. Because CPMC employees live throughout the Bay Area, it would be infeasible for CPMC to operate a shuttle system in outlying cities that serve a limited number of employees. Providing the shuttle service within San Francisco allows CPMC to serve a critical mass of its employees who choose to take transit rather than drive. Second, the shuttle system allows patients, visitors, and employees to travel between campuses for free. Even with a system outside of San Francisco, CPMC would still likely operate a shuttle system between campuses, and shuttles would continue to use streets immediately surrounding the campuses. Intercampus shuttle frequency would be no different than what is described in the Draft EIR.

Several comments note that many shuttle routes would serve off-site parking garages where CPMC would lease parking spaces for its employees. One comment notes that as CPMC increases its use of shuttles and TDM measures, demand for these parking spaces may increase. As shown in Table 4.5-34 on page 4.5-164 of the Draft EIR, CPMC would lease 400 parking spaces at the Japantown Garage; 180 spaces at the Geary Street Garage; and 43 spaces within a garage at 2015 Steiner Street. These are the same number of parking spaces that CPMC leases in these facilities today; therefore, there would be no substantial change in demand for shuttle service to these parking facilities. Implementation of the proposed LRDP also

would not impact availability of parking in these garages to local residents and business because CPMC has the same number of lease parking spaces at present. CPMC employees without parking permits at these facilities would not be allowed to park unless they paid for parking without assistance from CPMC. For a discussion of how CPMC parking at off-campus lots impacts local parking supply and demand, see Response TR-69 (page C&R 3.7-129).

Comment 30-117 notes the Draft EIR discussion that CPMC would lease 375 parking spaces at the Kissling Street Garage (255 12th Street). At the time the Draft EIR was being prepared, CPMC was negotiating to lease spaces in a parking garage in this area of South of Market to meet the forecast parking demand at St. Luke's and Davies Campuses. Shuttle service to a garage in this area would be operated by a private shuttle service or by the parking garage operator. However, to be conservative, Table 4.5-40 on page 4.5-214 of the Draft EIR assumed that CPMC would provide this service. As shown, CPMC shuttles would continue to have adequate capacity.

The total fleet would operate with 15 active shuttles. When not in service, CPMC shuttles would be parked on CPMC property. Comment 18-118 notes that these spaces should be available to the general public and shuttles should park in leased garages. CPMC currently proposes to have approximately 15 shuttles in active service and some reserve shuttles. Greatest shuttle storage demand generally overlaps with periods of greater parking supply availability (7 p.m.–7 a.m.) and, depending on parking availability at various campuses, shuttles may be parked where capacity exists. Therefore, using these parking spaces for shuttles would not result in a substantial change in the visitors, employees, or patients parking availability (15 to 20 spaces, which would represent less than 2 percent of available parking supply at the Cathedral Hill Campus).

3.7.5.5 IMPACT ON GEARY STREET/BOULEVARD MUNI SERVICE

Comment

(Quivner Zabeles, October 19, 2010) [77-1 TR, duplicate comment was provided in 81-2 TR]

"Thank you for the opportunity to comment on the CPMC EIR. I have public comments related to the Cathedral Hill campus, Please confirm receipt of these comments.

The EIR does not adequately address impacts to Muni transit service on Geary Street. Due to the proposed new driveways on Geary, the project would relocate the existing 38 Geary bus stop to the far Side of Van Ness. This would cause a significant transit impact to transit, for the following reasons:

1) Moving the bus to the far side would add delay to Muni because it now has to sit through the light before stopping again on the far side

2) Cars entering the hospital garage will have to turn in front of the bus. This will lead to collisions with Muni vehicle

3) The bus would have to start from a much steeper grade, which decreases the acceleration of the bus, and also causes undue wear on the bus motor and transmission.

These three factors will cause a significant impact to Geary transit service, which the EIR fails to disclose.

The appropriate mitigation for this impact would be to remove the driveways for both the hospital and the Medical Office Building, which would allow the bus stop to stay where it is currently located. This would prevent the three impacts listed above."

Response TR-57

The comment states concerns about relocating the bus stop on Geary Street, and about the locations of the proposed Cathedral Hill Hospital and Cathedral Hill MOB garage driveways. The project sponsor has indicated that provision of vehicular ingress into the MOB and Hospital Parking Garages from Geary Street (in addition to vehicular access from Cedar and Post streets, respectively) is an important aspect of the project. As part of the traffic and transit analysis conducted for the CPMC LRDP, CPMC met with the San Francisco Planning Department, SFMTA, and SFCTA to evaluate potential options for accommodating the existing bus stops alongside the proposed new driveways on Geary Street/Boulevard. As described in the Draft EIR, the Planning Department developed a microsimulation of Geary Street, the project entrances, and nearby cross streets. The results of that analysis, presented in Impact TR-17 on Draft EIR pages 4.5-10 and 4.5-11, describes the significant impacts on pedestrians and traffic that would result from the Cathedral Hill MOB's driveways onto Geary Street. The same simulation was also used to evaluate the location of transit stops along Geary Boulevard and included vehicles turning into proposed campus facility driveways. The analysis showed that buses loading on the near (east) corner of Van Ness Avenue (which was the originally proposed bus stop location) would experience some delay as a result of queued vehicles turning right onto Van Ness Avenue.

Relocating the bus stop to the far side of the intersection was conceived to address this delay problem, although the Planning Department did note the issues the comment addresses, including signal timing, vehicles entering the hospital, and the grade of the roadway. None of these issues were considered to create as substantial an impact as not relocating the bus stop from the near corner of the intersection. At this intersection, the far side stop would reduce delays by allowing the bus to bypass the right-turn queue onto Van Ness Avenue. Although vehicles would enter the hospital in front of the bus stop, only 55 vehicles are expected to use this driveway during the a.m. peak hour (12 in the p.m. peak hour), and the analysis presented in the Draft EIR confirms that a queue is not expected to form that would block the bus at the stop. Although restarting on a hill after making a stop would require additional startup time by the bus, this would be similar to other diesel buses that operate on steep hills throughout the city, such as the 27 Bryant.

A discussion of the revocable nature of the MOB and Hospital driveways and curb cuts on Geary Street can be found in Response TR-80, page C&R 3.7-149.

Based on the results of the simulation, SFMTA and the San Francisco Planning Department determined that relocating the existing transit stop to the far side of Van Ness Avenue would minimize impacts to Muni while providing vehicular access for the MOB and Hospital from Geary Street.

3.7.5.6 FUNDING OF OTHER TRANSIT PROJECTS

Comment

(Sue Hestor, October 19, 2010) [89-8 TR]

"The CPMC development project must be TIED TO and significantly FUND construction of the Van Ness and Geary BRT lines which shall be open at the same time CPMC opens on Cathedral Hill."

Response TR-58

The comment states that the proposed Cathedral Hill Campus project must be tied to and significantly fund the proposed Van Ness Avenue BRT and Geary Corridor BRT projects. Although the Van Ness BRT service is currently being studied by a project team including SFCTA and SFMTA, substantial elements of the project's planning, design, and environmental review have not yet been completed. The transit analysis included an assessment of the capacity of the transit system to accommodate the demand

generated by CPMC LRDP and, as presented in Impact TR-27 on Draft EIR page 4.5-118, determined that the impact of the added demand would be less than significant.

However, the Draft EIR did identify transit-delay impacts associated with occupation of the proposed Cathedral Hill Campus. The impacts indicate that the proposed Cathedral Hill Campus project would increase transit delay, requiring Muni to operate additional transit vehicles along the 3-Jackson, 19-Polk, 38/38L-Geary, 47-Van Ness, and 49-Van Ness-Mission bus lines. As described in Mitigation Measures MM-TR-29 through MM-TR-31 (Draft EIR pages 4.5-122, 4.5-123, and 4.5-124), MM-TR-134 (Draft EIR page 4.5-238), and MM-TR-137 (Draft EIR page 4.5-240), CPMC would be required to financially compensate SFMTA for the cost of providing some additional services along these bus lines. As explained on Draft EIR page 4.5-117, although this mitigation measure would reduce the impact to a less-than-significant level, the ability of SFMTA to provide additional service for the project is uncertain. Therefore, the Draft EIR concluded that the LRDP's transit impacts would be significant and unavoidable.

Planning for the Van Ness Avenue BRT project is progressing; however, the final design has not been selected. Some details about the project are known, and thus, the transit analysis included an assessment of traffic conditions at the study intersections with implementation of both BRT projects based on available information. Under conditions with the proposed Cathedral Hill Campus project and Van Ness Avenue BRT and Geary Corridor BRT operations, average vehicle delays at intersections would increase, and the proposed Cathedral Hill Campus project was determined to contribute to significant traffic impacts at three study intersections. However, no new project-specific impacts were identified.

The financial compensation provided to SFMTA by CPMC could, in part, be used to fund implementation of the BRT projects. SFMTA would retain discretion for how to best accommodate the additional ridership and delay created by the project.

3.7.5.7 GENERAL MUNI COMMENTS

Comments

Linda Chapman, October 19, 2010 [76-16 TR, duplicate comment was provided in 111-16 TR]

"EXAMPLE OF EXISTING CONDITIONS:

Absent CPMC impacts, one morning this year when Van Ness was congested, it took me two hours to catch a 49 at Pine and travel to 22nd Street. With traffic at a standstill, the driver advised passengers heading for Market Street to get off and walk several blocks in the rain. After waiting about an hour to board at Pine, I saw the driver of this packed vehicle leave passengers stranded at subsequent stops-- maybe waiting an hour for the next 49 (after waiting the hour I'd waited for this one)."

Response TR-59

These comments are noted; they do not raise issues regarding the adequacy, accuracy, or completeness of the Draft EIR. The comments will be transmitted to and may be considered by the decision-makers as part of their deliberations on the project.

3.7.5.8 GOLDEN GATE TRANSIT

Comments

(Golden Gate Bridge Highway and Transportation District, September 14, 2010) [11-2 TR]

"Impacts TR-29, TR-32, TR-35, TR-133, TR-134, TR-138, TR-139, TR-143, and TR-144 indicate that the Cathedral Hill Campus project will increase travel times of Muni's 47 and 49 bus lines. Because GGT Routes 10, 70, 73, 93, and 101 also operate on Van Ness Avenue in the study area during congested periods, the District would expect a similar disclosure of impact to its operations. It is unclear why no impacts or mitigation measures are identified for GGT. The District requests clarification on this matter."

(Golden Gate Bridge Highway and Transportation District, September 14, 2010) [11-3 TR]

"Impacts TR-l00, TR-107, and TR-112 indicate that significant and unavoidable impacts will occur at the Van Ness/Pine intersection. GGT operates several bus routes through this intersection and is sensitive to increased travel times resulting from additional congestion. Excess congestion can adversely impact GGT operations and ultimately increase operating costs.

Thank you for providing the District with the opportunity to submit comments on the CPMC DEIR. You may contact David Davenport, Associate Planner, at 415.257.4546 if you have any questions regarding these comments."

(Linda Chapman, September 23, 2010) [PC-283 TR]

"Also, on other occasions, it is Highway 101, that is a consideration, too, as well as being the local transit agency is a major street, and for the Golden Gate transit."

Response TR-60

These comments suggest that the Draft EIR should consider how project traffic could affect Golden Gate Transit (GGT) routes on Van Ness Avenue. The transit-delay analysis in the Draft EIR identified transit-delay impacts on several Muni lines as a result of increased traffic along transit routes and because of increased transit ridership. Impacts were identified where the added transit delay would increase transit travel times by more than half of the scheduled headway, resulting in increased operational costs associated with running additional vehicles (as calculated using SFMTA's Muni cost/scheduling mode). Although GGT routes operating along Van Ness Avenue (GGT Routes 10, 70, 73, 93, and 101) would experience similar increases in delay as a result of traffic increases and ridership increases, a transit-delay analysis for these routes was not completed. GGT typically operates its vehicles at much longer headways (e.g., 30–60 minutes) that would not be substantially affected by much smaller increases in delay at relatively few intersections.

Based on the transit-delay analysis that was completed for the Muni routes running along Van Ness Avenue, the increase in vehicle trips on Van Ness Avenue would result in an increase in delay for GGT routes of less than 1 minute in either direction during both the a.m. or p.m. peak hour, and most delay would be incurred during passenger boarding. Assuming that all transit trips to and from the North Bay used one of the GGT routes near the campus, the proposed LRDP would increase delay for GGT vehicles in the peak direction during the peak hour, as shown in C&R Table 3.7-12. However, these increases in travel time delay would not be significant because they would be less than half of the route's headway.

C&R Table 3.7-12 Transit Corridor Delay Analysis—Golden Gate Transit		
	Increase in Travel Time between Modified Baseline No Project and Project Conditions (minutes:seconds)	
Peak Hour	Northbound	Southbound
a.m. p.m.	1:24 3:24	2:36 0:25
Source: Fehr & Peers 2011		

3.7.6 BICYCLE

3.7.6.1 ST. LUKE'S CAMPUS

Comment

Francis Taylor, October 29, 2010 [117-2 TR]

"The proposed garage will have ramps spilling traffic onto both Cesar Chavez Street and Valencia. Valencia currently has a very busy bike lane, and Cesar Chavez is slated for major bicycle and pedestrian improvements in the next few years, including bike lanes. This garage will endanger more residents that the hospital will serve patients!"

Response TR-61

The comment expresses a concern that the proposed project at St. Luke's Campus will have a parking garage with ingress and egress driveways on Cesar Chavez Street and Valencia Street. Bicycle traffic observed in the area as part of the analysis during the p.m. peak period indicated a much higher amount of bicycle traffic on Valencia Street than Cesar Chavez Street. The analysis completed as part of the Draft EIR assumes that the bike lane improvements identified in the Cesar Chavez Streetscape Improvement Project would be in place by the time the proposed new facilities at St. Luke's, including the proposed parking garage, were operational. As discussed in Impact TR-87 on page 4.5-203 of the Draft EIR, project-generated vehicle trips to this facility would result in increased vehicle/bicycle conflicts on a street that is designed to facilitate bicycle travel. During the p.m. peak hour, more project vehicles would be exiting from the Cesar Chavez Street driveway than the Valencia Street driveway of the MOB. As noted in the document, these conflicts, although greater, would be similar to those that occur at the existing hospital driveways on both Cesar Chavez Street and Valencia Street, and the impact was considered to be less than significant. Although bicycle impacts would be less than significant, the Draft EIR identified Improvement Measure I-TR-87 on Draft EIR page 4.5-204 to further reduce less-than-significant impacts, by requiring pedestrian and bicycle warning signals at the proposed garage exits, warning signage for drivers, and a colored bicycle lane treatment on Cesar Chavez Street near the St. Luke's Campus driveway.

3.7.6.2 BICYCLE PARKING

Comment

(Ryan Bresnick, August 1, 2010) [57-3 TR]

"I am one of a hand full of people who bicycle to work everyday. The hospital seems to give no mind to cyclist, and I think many of us feel marginalized. The only real bicycle parking is the city-mandated spots they put in the parking garage that is over a block away from the main hospital. Posted up around this bike rack are grainy photos

of people in the process of stealing employees' bikes. Not a safe spot. There is also a bike rack that you can slide your wheel into close to the main lobby, but this type of bike rack is known as a 'wheel bender', is not secure, and I would never lock my bike up here. Lately, the hospital's proposal has been in the news lately, with congestion being one of the major concerns. I hope you will be able to demand CPMC to create some sort of thought out plan for bicycle accessibility. If CPMC promoted cycling in any way at all, they could easily have a high percentage of employees who cycle to work, lowering congestion considerably. With CPMC's current way of thinking though, I expect the only bike amenities will be the city-mandated spots down in the parking garage. Thank you for taking the time to consider my opinions."

Response TR-62

As part of the proposed CPMC LRDP, CPMC would provide both Class 1 and Class 2 bicycle parking spaces at all of the campuses. CPMC would provide Class 1 facilities for use by employees, which would include a fenced-off secured storage area, and secured bicycle parking rooms. Class 1 bicycle parking includes facilities that protect the entire bicycle, its components, and accessories against theft and against inclement weather, including wind-driven rain. Examples of Class 1 spaces include lockers, check-in facilities, monitored parking, restricted access parking, and personal storage. Class 2 bicycle parking spaces include bicycle racks that permit the rider to lock the bicycle frame and one wheel to the rack and that support the bicycle in a stable position without damage to wheels, frame, or components.

The proposed Cathedral Hill Hospital would have 150 bicycle parking spaces, of which 100 would be for staff in a secured facility, located on Level 1/P1 of the parking garage and accessible from Post Street. At the proposed Cathedral Hill MOB, 62 bicycle parking spaces would be provided, of which 34 would be for staff in a secured facility, on Level 1 of the parking garage and accessible from Cedar Street. Twelve bicycle parking spaces would be provided at the proposed 1375 Sutter MOB.

St. Luke's Campus would provide a secure bicycle room, sufficient to contain space for 20 bicycles in the proposed MOB/Expansion Building and accessible from Valencia Street. Seven bicycle parking spaces would be available in the Campus Plaza between the existing St. Luke's building at 1570 Valencia Street and existing building at 555 San Jose Avenue, and accessible from San Jose Avenue, Cesar Chavez Street, and Valencia Street. The Duncan Street Parking Garage would contain seven bicycle parking spaces, accessible from San Jose Avenue. After construction, the St. Luke's Campus would have a total of 34 bicycle parking spaces.

The Davies Campus currently has 26 bicycle parking spaces, located on Level 1 of the existing Castro Street/14th Street Parking Garage and accessible from Castro Street and Duboce Avenue. Bicycle parking would remain in this location after construction of the Neuroscience Institute. The Neuroscience Institute would provide 25 new bicycle parking spaces in the main plaza by the building's entrance. As the second element of the Davies Campus project, the Castro/14th Street MOB would be a long-term project that would replace the existing parking garage on the campus. This project would be required to replace the existing parking spaces removed when the parking garage was demolished, as well as provide bicycle parking as required by the SF *Planning Code* at the time of its project-level approval by the Planning Department.

The proposed Pacific Campus would be a long-term project and details on bicycle parking would be required at the time that project-level environmental review was conducted. Bicycle parking would be included on site to at least meet the Planning Code requirements, which would be an increase over existing conditions.

3.7.7 PEDESTRIAN IMPACTS

3.7.7.1 PEDESTRIAN SAFETY

Comments

(Marvis Phillips—Alliance for a Better District 6, August 6, 2010) [4-4 TR]

"3) Foot traffic going between Pacific outpatient services and Cathedral Hill services esp at the east campus at Geary +Van Ness. Senior + person with disabilities have a tendancy to walk slower than the light is run espe. if that make out the island for the Van Ness line (SFMTA). Senior + persons with disabilities will have no where to stand if caught in the middle of the street."

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-43 TR, duplicate comment was provided in 30-43 TR]

"In addition, when pedestrians are walking along Franklin, what safety measures will be in place when the vehicles are going across the sidewalk into the Hospital? People walking northbound on Franklin will have their backs to traffic. With 3 curb cuts on Franklin St., the measures taken to protect pedestrians must be more than just blinking lights and audible signals. The proposed plan to use a fulltime attendant to watch and guide pedestrians in an area that could have a high incidence of pedestrian and vehicular conflict may or may not work."

(Unitarian Universalist CPMC Task Force, October 5, 2010) [44-9 TR]

"Regarding Traffic, how can there be 152 'significant and unavoidable' traffic impacts listed in the Summary on pages S42 - S57 but no negative effects for pedestrians, especially given the preponderance of senior housing in the area? Already existing traffic problems will be exacerbated by drivers circling for parking and back ups on Franklin Street accommodating the loading dock."

(Jane Seleznow, October 8, 2010) [48-4 TR]

"Increased traffic will endanger pedestrians and increased siren noise will have a detrimental effect on those of us who live nearby, especially affecting our sleep.

I do not believe the current DEIR adequately addresses all the issues."

(Merle Easton, October 18, 2010) [66-1 TR, duplicate comment was provided in 73-1b TR])

"Pedestrian safety isn't even addressed."

(Rev. Fred Rabidoux—First Unitarian Universalist Church, October 14, 2010) [59-1 TR]

"There are many aspect of the proposed hospital that seem inappropriate to Cathedral Hill, as well as the needs of the city and the existing distribution of health care services. Increase traffic is particularly worrisome, not only for the air pollution, noise, and congestion, but for the immediate personal safety of the many elderly residents.

As Minister of Pastoral Care at the First Unitarian Church, I am acutely aware of the anxieties already suffered by seniors coming to community events at the UU Center on 1187 Franklin Street or simply trying to take care of their local shopping needs.

Residents of Martin Luther Towers must cross four busy intersections on Franklin Street to reach the nearest grocery store, and Sequoia's residents are already intimidated by the Geary Street traffic and miss out on many events that are only a block away.

Parents picking up children from the House of Montessori and Up On Top have no safe parking zones on the south side of Geary and must manage to get their young children across the street during rush hour traffic. What will happen when this traffic doubles?

Leaving the UU Church and Center is perilous for all of us, as cars driving North on Franklin turn left on Geary while looking at traffic from the right. Our church staff has witnessed both traffic and pedestrian accidents, and many close calls.

The impact of thousands more vehicles daily is distressing. Cathedral hill has many senior housing complexes, schools and churches, but the DEIR does not consider them. If CPMC builds this mega hospital, priority must be given to pedestrian safety. I see no acknowledgement of these issues in the DEIR, and ask for further study and mitigations."

(Paul Wermer—CPMC Neighbors Coalition and Pacific Heights Residents, October 18, 2010) [67-21 TR]

"d) The assessment of bicycle and pedestrian impacts are inadequate.

1) The DEIR only looks at the capacity of sidewalks and crosswalks. That ignores the very real interaction between pedestrians and wheeled traffic In 'the vicinity of CPMC facilities, and ignores the reduced mobility of many pedestrian visitors to the sites. For I examples, standard assumptions about how quickly pedestrians can cross a street fail to consider those with disabilities of various sorts.

2) The Pacific Campus' new design calls for high-volume traffic crossings sidewalks at 3 new points, yet the DEIR ignores altogether the likely impact of this change on traffic (lanes blocked while vehicles wait for pedestrians to clear a driveway) and pedestrians, many of whom will be disabled or ill, and who will now have to contend with cars crossing sidewalks frequently. The labor actions that clog CPMC's sidewalks occasionally will only worsen the effects of this new design.

3) Vehicular traffic data is inadequate, and so there is no way to assess the increase or decrease in pedestrian/bicycle/vehicle interactions in the residential and commercial streets covered in the study. Furthermore, there has been no assessment of increased hazardous driver behaviors induced by traffic issues in these streets - yet such behavior changes are readily observable when congestion develops."

(Donald Scherl, October 18, 2010) [74-16 TR]

"Impact TR-42: Proceeding with the project would even create a 'pedestrian hazard ...'"

(Barbara Kautz—CHNA and Bernal Heights Neighborhood Center, October 19, 2010) [87-30 TR, duplicate comment was provided in 108-30 TR]

"The DEIR states that the proposed project would have no significant impacts on pedestrians or pedestrian safety, yet the evidence in the DEIR belies those conclusions. The DEIR reveals that:

- Virtually the entire street frontage along Franklin and Post Streets adjacent to the proposed Cathedral Hill Hospital will be used for loading docks: passenger drop-offs, ambulance bays, parking garage entrances, and shuttle drop-offs. A large drive-through extends from Geary Blvd. to Post St.

- The proposed Cathedral Hill MOB proposes to convert virtually its entire Van Ness frontage to a passenger drop-off; extending around the corner to Cedar Street.

The DEIR's conclusion that these obvious conflicts between pedestrians and vehicles create no conflicts or safety hazards is unsupported by any analysis. It is also contrary to the numerous letters sent to the City regarding the number of seniors in the Cathedral Hill area and existing pedestrian hazards. CPMC proposes an underground pedestrian tunnel between its proposed MOB and the Cathedral Hill Hospital. Clearly CPMC itself recognizes

that even crossing Van Ness Avenue poses a significant obstacle to pedestrians, made worse by the increasing congestion and traffic created by the proposed Hospital."

(Barbara Kautz—CHNA and Bernal Heights Neighborhood Center, October 19, 2010) [87-31 TR, duplicate comment was provided in 108-31 TR]

"This absence of any substantial evidence to support conclusions regarding pedestrian safety and the pedestrian environment is repeated throughout in the analysis of pedestrian impacts at other facilities. For instance, at the Pacific Campus, although street frontage would be converted to a new shuttle stop, new driveway, and new parking garage entrance, the DEIR simply states that there will be no effects on pedestrians, without analysis."

(Barbara Kautz—CHNA and Bernal Heights Neighborhood Center, October 19, 2010) [87-39 TR, duplicate comment was provided in 108-39 TR]

"Also, the increases in traffic, loading, noise, and disruptions to the pedestrian environment can all be expected to combine to make the area less desirable for pedestrians, residents, local-serving retail businesses, and nearby churches and schools."

(Margaret Kettunen Zegart, October 20, 2010) [97-6 TR]

"Smaller scale / mass and height of structures with increased setbacks from property lines and Class I bicycle lanes should be added in planning as well as transit pull outs."

(Stephanie Barton, et al.,—Hastings Civil Justice Clinic for the Good Neighbor Coalition, October 19, 2010) [104-36 TR]

"The DEIR's failure to analyze pedestrian safety impacts in the Tenderloin also disregards provisions of the San Francisco General Plan that promote pedestrian safety and comfort throughout the city.[73] Policy 18.4 discourages high-speed traffic on local streets through calming measures.[74] In accordance with this policy, the Little Saigon Report's proposals include calming measures, one of which is to convert one-way streets to two-way streets. The Little Saigon Report concludes that this change is not likely to increase congestion or cause vehicle delay but would (1) reduce average travel speeds and (2) reduce traffic volume thus making conditions safer for pedestrians.[75] Another proposal calls for additional pedestrian lighting to improve pedestrian conditions by implementing pedestrian street light fixtures as a part of standard street lighting infrastructure.[76] Additionally, the General Plan specifically designates Van Ness Avenue and Hyde Street as parts of the city-wide pedestrian network. A Citywide Pedestrian Network Street is defined as 'an inter-neighborhood connection with citywide significance.'[77] On these streets especially, pedestrian movement is a priority and should not be compromised.[78] Pedestrian safety is too important of an issue to have received such little attention in the DEIR.

[73] General Plan, Transportation Element, Policy 1.2.
[74] General Plan, Transportation Element, Policy 18.4.
[75] Little Saigon Report, at 3-4.
[76] *Id.* at 5-1.
[77] General Plan, Transportation Element, Policy 18.4.
[78] *Id.*"

(Lower Polk Neighbors, October 19, 2010) [103-33 TR, duplicate comment was provided in 113-33 TR]

"**Summary:** Construction of the Cathedral Hill Campus ("CHC") of CPMC represents both a major transition for the Lower Polk Street Neighborhood, which lies immediately east, and a great opportunity for revitalizing and improving the public space network of the area. Given that the campus construction will cause a large disruption to neighborhood life over several years, and that several of the impacts identified in the Draft Environmental Impact Report cannot be mitigated, or will adversely affect pedestrians, cyclists and transit riders regardless of mitigation, the neighborhood requests that the following approach and measures be considered by CPMC as part of its construction plan. We recommend the following as an effective and innovative strategy for learning through

interim, iterative design during the initial phase of construction, followed by long-term, permanent improvements to the neighborhood public space network, based on information gained during the interim phase.

"**1) Approach**

a. Two-Phased Approach
We recommend a two-phased approach for implementing public space improvements in the Lower Polk Street area, consisting of "interim" and "long-term" improvements. These two phases should overlap in time, but generally begin immediately with interim improvements, which will be exploratory and temporary/reversible in nature and inform the design of long-term improvements, which will take place over several years during and following completion of the CHC project. Interim improvements should be made with the intent of evolving eventually into long-term, permanent improvements, if successful in the short-term.

b. Escrow account
An escrow account should be set up to fund the various streetscape projects which will take place over the short- and long-term. The escrow account would allow the improvements to stretch out over a longer period than is typically considered for capital projects, and possibly longer than the construction of the CHC itself.

c. Interim improvements
"Interim improvements" can be implemented both during and immediately after the CHC construction project. They would be exploratory in nature, reversible, temporary and/or portable, and aim to physically test various approaches to streetscape improvements through a process of iterative design. Examples of interim improvements include San Francisco's *Pavement To Parks* program pilot projects, the *Market Street Trials* of bicycle, pedestrian and vehicle traffic control changes, and *Park(ing) Day*, which temporarily converts metered parking spaces to parks. Interim improvements would generally not permanently change infrastructure such as curbs, paving materials and utility lines, but rather use portable "add-on" designs that test the functionality of various streetscape designs without committing large amounts of funding.

d. Long-term improvements
"Long-term improvements" should be durable and permanent changes to the streetscape, potentially implicating changes to infrastructure such as curbs, utilities and paving surfaces. Their specific design and approach should be informed by explorations and the iterative design process in the interim improvement phase. They should also be consistent with the goals set out in applicable specific plans and, especially, the *Better Streets Plan*. Long-term improvements would commit larger proportions of funding to new streetscape designs than interim improvements.

e. Scoping Committee
We recommend the formation of a committee to outline the scope of the streetscape improvement project, including the delineation of both the interim and long-term efforts. The group should include representatives of CPMC, the City of San Francisco, the neighborhood and design consultants."

(Lower Polk Neighbors, October 19, 2010) [103-36 TR, duplicate comment was provided in 113-36 TR]

"c. Increased vehicular traffic and congestion

i. The proposed CHC project would add vehicles to the street network and riders to the Muni lines, adversely impacting bicyclists, pedestrians, and transit riders. The increased congestion and ridership would cause operational delays to Muni lines 49-Van Ness-Mission (a.m. and p.m. peak hours), 38/38L-Geary (a.m. and p.m. peak hours), and 19-Polk (p.m. peak hour), requiring additional vehicles to maintain proposed levels of service (4.5-117). Providing additional traffic lanes or otherwise increasing vehicular capacity at this intersection is not feasible because it would require narrowing of sidewalks to deficient widths, and/or demolition of adjacent buildings. Signal timing adjustments may improve intersection operations, but would likely be infeasible due to traffic, transit or pedestrian signal timing requirements (4.5-219). <u>Pedestrians and bicyclists</u>

will experience a more crowded, dangerous and time-consuming transit experience in the Lower Polk area as the CHC project generates more vehicle trips which compete for space and time with other modes of transportation. Even with the proposed mitigation measures, transit riders will also experience "significant and unavoidable" impacts (4.5-124). Therefore we recommend that additional streetscape improvements addressing pedestrian, bicycle and transit rider comfort, convenience and safety are undertaken in the Lower Polk area to offset unavoidable degradations due to the CHC project.

ii. Interim Phase:
1. Portable bike racks and bike corrals which can be transported around the neighborhood to test the most effective locations
2. Widen sidewalks into the parking lane using portable sidewalk extensions similar to Pavement to Parks "parklet" trials
3. Pedi-cab trials for local area
4. Close alleys to vehicle traffic, create pedestrian zones (delivery traffic excepted, can be restricted to certain times of day)
5. Test "Shared Street" conditions where sidewalks and street are combined; pedestrians are given priority in all areas of street but automobiles still have access
6. Bollards to delineate increased pedestrian or transit rider zones.
7. Raised pavement surface (flush curb) conditions
8. Wider bike lanes
9. Pedestrian lighting to create safer/comfortable conditions

iii. Long-term Phase:
10. Replace street surfaces with special pavement that slows traffic
11. Relocate curbs to increase sidewalk width, provide bulb-outs, midblock crossing, etc.
12. Pursue other designs recommended in the Better Streets Plan"

(Lower Polk Neighbors, October 19, 2010) [103-39 TR, duplicate comment was provided in 113-39 TR]

" 3) Site-specific proposals

a. Polk Street

i. Sidewalk extensions - The sidewalks along Polk are narrow for a Neighborhood Commercial street and do not provide adequate space for a comfortable throughway zone between the frontage zone and the edge zone. The Better Streets Plan sets a sidewalk width recommendation of fifteen feet for Neighborhood Commercial streets. In addition, use of the following sidewalk improvements from the Better Streets Plan would increase the quality of pedestrian life on Polk:
1. Interim Phase:
a. Parklet and Walklet installations to explore how an expanded throughway zone affects pedestrian traffic and life on Polk Street
2. Long-term Phase:
a. Curb corner extensions at Polk/Geary; Polk/Post; Polk/Sutter; Polk/Bush
b. Transit bulb outs
c. Extended and/or midblock bulb outs with landscape design and public seating

ii. Landscaping - Polk Street at Geary has a low tree density. What trees are there lack the height, foliage, and beauty that make great streets. Polk is located in the Bay climate zone and can therefore accommodate trees up to 50 feet tall.
1. Interim Phase: installation of moveable planter boxes and Parklets with shrubbery, flowers, and small trees
2. Long-term Phase:
a. Propagation of large shade-giving trees
i. Stormwater treatment landscaping

iii. Bicycle infrastructure
1. Interim Phase:
a. Portable bike racks and corrals
b. Public Pump on Polk (PPonP) to serve bicycle commuters using bicycle Route 16
c. Public bicycle repair station
2. Long-term Phase:
a. Permanent bike racks, corrals based on success of portable versions
b. Trash receptacles – Polk Street is lacking in trash receptacles between Geary Street and Sutter, even though the Better Streets Plan calls for a receptacle every 200 feet in commercial zones
c. Pedestrian-scale street lights

b. Geary Street
i. Interim Phase:
1. Parklets and pocket parks
2. Planter boxes
ii. Long-term Phase:
1. Pedestrian-scale lighting
2. Stormwater treatment landscaping

c. O'Farrell Street
i. Interim Phase:
1. Parklets and pocket parks
2. Planter boxes
ii. Long-term Phase:
1. Pedestrian-scale lighting
2. Stormwater treatment landscaping

d. Post Street
i. Interim Phase:
1. Parklets and pocket parks
2. Planter boxes
ii. Long-term Phase:
1. Pedestrian-scale lighting
2. Stormwater treatment landscaping

e. Sutter Street
i. Interim Phase:
1. Parklets and pocket parks
2. Planter boxes
ii. Long-term Phase:
1. Pedestrian-scale lighting
2. Stormwater treatment landscaping

f. Bush Street
i. Interim Phase:
1. Parklets and pocket parks
2. Planter boxes
ii. Long-term Phase:
1. Pedestrian-scale lighting
2. Stormwater treatment landscaping

g. California Street
i. Interim Phase:
1. Parklets and pocket parks
2. Planter boxes
ii. Long-term Phase:

1. Pedestrian-scale lighting
2. Stormwater treatment landscaping"

(Lower Polk Neighbors, October 19, 2010) [103-40 TR, duplicate comment was provided in 113-40 TR]

"h. Alleyways – the Alleyways in general should receive treatment according to the Better Streets Plan recommendations for Alleys, which would convert them into shared public ways with low traffic speeds, and limited parking, if they are not converted to pedestrian-only walkways.

1. Interim Phase:
   a. Tented multi-purpose community "center" and market area.
   b. Temporary/movable parking lane planters with ornamental and edible plant elements including flowers which attract birds, butterflies, and honeybees.
   c. Parklets.
   d. High density bicycle parking racks.
   e. Flexible seating.
   f. Bird, pollinator and bat nesting installations.
   g. Large mobile planters that can be moved with trucks, providing lawn or ornamental garden areas.
   h. Potentially portable food garden containers, given appropriate sunlight, protection and security.
   i. Pop-up retail providing amenities to attract users to alleys, including coffee, lunch food, etc.
2. Long-term Phase:
   a. Trees and green sidewalks.
   b. Curb corner bulb outs at intersections with Geary and Polk Streets.
   c. More lighting and more pedestrian-scale lighting.
   d. Pollinating animal gardens, edible landscaping including fruit trees."

(Paul Wermer, September 23, 2010) [PC-262 TR]

"The assessment of the bicycle and pedestrian impacts is inadequate. It looks at how pedestrians fit on the sidewalk, it doesn't look at the vehicle interaction with the pedestrians – it is a big deal."

(Commissioner Moore, September 23, 2010) [PC-369 TR]

"Given that we have short blocks, I believe that if CPMC is not getting that tunnel underneath a state highway, which is a very difficult thing to do, and the EIR does not make a commitment that will occur, given the short blocks that we are creating, other impacts with people on foot moving across a rather difficult street relative to movement of traffic and people needing to cross, I think that particular analysis is not adequately addressed."

Response TR-63

The comments state concerns regarding pedestrian safety in the vicinity of the proposed Cathedral Hill Campus and other campuses, and the adequacy of the pedestrian analysis included in the Draft EIR. The pedestrian impact analysis included in the Draft EIR assessed the projected increase in pedestrian, transit, bicycle, and vehicle trips associated with the proposed Cathedral Hill Campus within the existing transportation network, and also considered the proposed improvements that would be part of the proposed LRDP. The impact analysis identified additional improvements that would further enhance pedestrian and bicycle conditions in the Cathedral Hill Campus vicinity. Therefore, the analysis adequately considers the anticipated interaction between pedestrians, bicyclists, and vehicles. The increase in pedestrian trips at nearby intersections are presented on pages 4.5-133 and 4.5-134 of the Draft EIR, and traffic volume data is provided on pages 4.5-94 and 4.5-95 of the Draft EIR.

As described in the Cathedral Hill Campus pedestrian impact analysis on pages 4.5-130 to 4.5-132 in the Draft EIR, the proposed Cathedral Hill Campus would include the following improvements to sidewalks in the vicinity of the campus:

- Along Van Ness Avenue, sidewalks would be widened into the adjacent parking lane. On the west side of Van Ness Avenue, sidewalks would be widened from 16 feet to 22–24 feet.

- Along Geary Boulevard between Van Ness Avenue and Franklin Street, sidewalks would be widened into the adjacent parking lane to 19 feet in width for approximately 130 feet west of the intersection of Geary Boulevard with Van Ness Avenue. This widening would accommodate the proposed bus stop that would be relocated from the east side of Van Ness Avenue.

- Along Geary Street between Van Ness Avenue and Polk Street, sidewalks would be widened into the parking lane to 12 feet because the existing midblock bus stop would be removed, and the sidewalk on this portion of Geary Street would be a uniform 12 feet in width.

- Along Post Street between Van Ness Avenue and Franklin Street, the sidewalk would be widened into the adjacent parking lane, from 10 feet to 17 feet.

- At the intersection of Cedar Street with Van Ness Avenue and with Polk Street, a raised crosswalk, creating a level street crossing, would be provided to facilitate pedestrian crossings, increase driver visibility of pedestrians, and reduce vehicle speeds across the crosswalk.

These improvements were developed as part of an extensive public outreach process to community groups and public agencies, including those shown in C&R Figure 3.7-2. These improvements were developed to facilitate pedestrian travel, including reducing pedestrian-vehicle conflicts at intersections, consistent with policies contained in San Francisco's *Better Streets Plan* and *General Plan*. The proposed improvements support, and do not conflict with, designation in the General Plan of Van Ness Avenue as a Citywide Pedestrian Network Street. Provision of Class I off-street bicycle paths adjacent to the project site, as suggested, would not be appropriate as they would not connect with any existing or planned bicycle routes identified in the San Francisco Bicycle Plan and would reduce the sidewalk area available to pedestrians. Bicycle lanes (Class II facilities) are provided on Polk Street for Bike Route 25, and Sutter and Post Streets are designated as Class III (signed routes only) bicycle facilities (Bike Route 16).

As part of the proposed Cathedral Hill Campus, a pedestrian tunnel under Van Ness Avenue would be constructed between the proposed hospital and MOB. The process for review and approval of the pedestrian tunnel within the Caltrans right-of-way is underway. In January 2011, CPMC and Caltrans concluded a formal Highway Improvement agreement, which laid out the terms of Caltrans review and oversight of the design and approval process. CPMC has retained an engineering firm to prepare a Project Report/Project Study Report consistent with Caltrans requirements which would contain all of the rationale and engineering for the proposed tunnel project. The purpose of the proposed pedestrian tunnel under Van Ness Avenue is to provide a convenient internal connection between the proposed hospital and MOB. The Van Ness pedestrian tunnel is not proposed because the surface street crossing of Van Ness Avenue represents a significant obstacle to pedestrians. The tunnel is anticipated to be used by patients, visitors, physicians, and CPMC staff members, allowing them a direct connection between the two buildings. It would also be used for the movement of records, equipment and materials.

As part of the improvements at Polk Street, one parking space on Polk Street directly north of Cedar Street would be eliminated, and a sidewalk extension would be constructed to improve sight distance and reduce the potential for bicycle-vehicle conflicts. In addition, as part of Improvement Measure I-TR-40, the project sponsor could provide funding for the study and possible implementation of additional streetscape, pedestrian, and related improvements in the vicinity of the proposed LRDP campuses that would improve the less-than-significant impacts to the pedestrian and bicycle environment.

Workshop Attendees

Workshop #1 – Design Professionals
May 21, 2009

David Baker, David Baker & Partners Architects – Design Professional
John Bela, Rebar Group – Design Professional

Workshop #2 – Design Professionals
June 15, 2009

Ron Case, Case & Abst Architects – Design Professional
Carolyn Abst, Case & Abst Architects – Design Professional
Merle Easton, Unitarian Church – Design Professional
Peter Winkelstein, Design Professional

Cathedral Hill Streetscape Workshops Held & Attendees **C&R Figure 3.7-2**

Although these pedestrian improvements would facilitate travel for all users on the sidewalk, additional improvements to accommodate senior citizens and people with disabilities could be implemented by SFMTA. Some pedestrian improvements along Van Ness Avenue would occur with the Van Ness BRT project. Senior citizens and people with disabilities face challenges at intersections with multiple travel lanes, especially on streets where median refuges are not available. On Van Ness Avenue, the existing median provides refuge for pedestrians with slower walking speeds than the standard the signal timing allows. Seniors and persons with disabilities would be able to cross one direction of traffic and could remain on the median within a safe zone while waiting for the next signal for pedestrians. Recent installations of pedestrian countdown signals throughout San Francisco have improved pedestrian crossings by providing pedestrians with an indication of the available time at the start of the green signal phase.

Any such signal timing modifications would affect traffic and bus operations at the intersections by reducing green time available for vehicles (e.g., because of a leading pedestrian interval) or by redistributing green time from one approach to another to accommodate the extended minimum green times, and would need to be approved by SFMTA. Other design solutions similar to the special signage that school zones receive (as part of SFMTA's School Area Safety Program) could assist senior citizens and people with disabilities by calling drivers' attention to their presence. Determination of the need and extent of changes in signal timing or other improvements would be conducted and implemented by SFMTA as part of the agency's Livable Streets Program. A substantial number of patients and visitors are not anticipated to walk between the Pacific Campus and the proposed Cathedral Hill Campus, as the campus sites are located about a mile apart and a shuttle service would be provided. For those pedestrians that do choose to walk between the sites, adequate pedestrian facilities would connect the two campuses.

See Response TR-63 (page C&R 3.7-110) regarding pedestrian conditions in the Tenderloin-Little Saigon neighborhood.

Impact TR-40, beginning on page 4.5-130 in the Draft EIR, presents the pedestrian impact assessment for the proposed Cathedral Hill Campus. Based on the impacts assessment of the proposed Cathedral Hill Campus project on the pedestrian environment, the project would not result in substantial overcrowding on sidewalks or crosswalks, or result in hazardous conditions. In general, the addition of pedestrians, vehicles, and bicycles to the roadway network would result in increased conflicts; however, it would not result in significant safety impacts or result in increased hazardous driver behavior.

Impact TR-42, beginning on page 4.5-135 of the Draft EIR, identifies a significant pedestrian hazard impact for the for the MOB Access Variant at the proposed Cathedral Hill Campus. The MOB Access Variant would reconfigure the proposed Cathedral Hill MOB access driveway on Geary Street to permit both ingress and egress. The proposed LRDP would provide MOB garage egress onto Cedar Street only, and therefore would not result in this pedestrian hazard condition.

Convenient and properly placed passenger zones are essential components of medical facilities to support patients and visitors, and to ensure pedestrian safety. Passenger zones provide a protected place for passengers to get into and out of vehicles. The passenger zones for the proposed Cathedral Hill Campus were located and designed with input from SFMTA to address safety concerns. The Van Ness Avenue passenger zone would be within the existing recessed bay and would support taxis so that vehicles would not double park on Van Ness Avenue or Geary Street. The hospital drive-through would take the passenger loading function out of the public right-of-way and reduce pedestrian-vehicle conflicts. The functions associated with the Emergency Department and loading were placed on Franklin Street because this street would have lower pedestrian volumes than other streets and would minimize conflicts with pedestrians. Driveways and loading facilities are expected in urban areas and, therefore, they would not represent unusual conflicts or unsafe conditions. The loading facilities at the Cathedral Hill Hospital would be actively managed and most deliveries would occur during non-peak periods. Pedestrians

walking northbound on Franklin Street would be able to see vehicles exiting the project site as they approached the driveway. Because of the relatively low volume of trips to and from the driveways on Franklin Street, additional measures are not recommended or required. Impacts of increased noise in the vicinity of the proposed Cathedral Hill Campus are discussed in Impact NO-2 on pages 4.6-57 and 4.6-68 in the Draft EIR. The use of emergency sirens, horns, and lights could cause a temporary elevation of ambient noise levels on an intermittent basis at nearby noise-sensitive land uses. See Response NO-59 (page C&R 3.8-64) regarding noise impacts related to emergency response vehicles.

Comments 103-33, 103-36, 103-39, and 103-40 provide suggestions for public realm improvements both directly adjacent Cathedral Hill Campus and the surrounding neighborhood. As previously mentioned at the beginning of this response, the Project Sponsor has developed a set of improvements to the public realm in the vicinity of the campus as part of an extensive public outreach process to community groups and public agencies. While not linked to specific impacts caused by the Proposed Project (see discussion of Impact TR-40 on previous page and in Response TR-64, below) or conditions changed by the Proposed Project, potential improvements the City could implement include additional streetscape elements or amenities in and around Polk Street and the Tenderloin neighborhood to improve upon pedestrian safety (including considering more pedestrian lighting, bulbouts, and pavement treatments), and calm traffic, and other suggestions may be considered by the City as funding sources, typically grants, are identified.

Comment 59-1 describes an existing condition wherein parents or guardians picking up children on Geary Boulevard from the House of Montessori School or the Up On Top afterschool program must cross with their children to/from the north side of Geary Boulevard during the p.m. peak period due to the hour restrictions on the two existing passenger loading areas near the school**.** Operating hours of the Montessori School are from 9 a.m. to 3 p.m., with an afternoon daycare program from 2:30 p.m. to 6:00 p.m., so a majority of the passenger drop-off/pick-up activity related to the school would be anticipated to be able to use existing passenger zones (36 feet on the west side of Franklin Street, 36 feet on Geary Boulevard, plus a small (1 space) inset area on Geary Boulevard when they are available during off-peak hours. However, the commenter is correct that these zones and passenger zones on the north side of the Geary Boulevard are restricted (tow-away zones) during the p.m. peak period (4 p.m.–6 p.m.). Observations indicate that some traffic still attempts to use these zones during p.m. peak hour restrictions, a traffic violation, causing a hazardous traffic condition.

The commenter also suggests the traffic following the CPMC LRDP would potentially double on Geary Boulevard and Franklin Street. Traffic generated by the Cathedral Hill Campus will contribute 4 percent and 3 percent to the westbound traffic on Geary Boulevard during the p.m. peak hour under the Modified Baseline and Cumulative scenarios, respectively. Additionally, assuming the Cathedral Hill Campus is constructed and occupied under the Modified Baseline (year 2015) and Cumulative (year 2030) scenarios, the Geary Boulevard westbound approach at Franklin Street is expected to increase in total by 48 vehicles per peak hour (from 996 to 1044 vehicles) between existing conditions and year 2015 and by 211 vehicles per peak hour (from 1044 to 1255 vehicles) between year 2015 and year 2030. This represents a total growth increase in westbound traffic of 5 percent and 20 percent, respectively, not a doubling, as the comment suggests.

Since it is unlikely that the p.m. peak hour tow-away lanes along Geary Boulevard and Franklin Street would be altered to address the commenter's concern, the school and afterschool program, could request that SFMTA install signage to advise motorists that children are present in order to alert drivers to this condition, such as "watch for children" or "children crossing" traffic safety signs. However, this is an existing condition that is part of the baseline for the project, and the Draft EIR concluded that the project's impact on pedestrians, including at the intersection in question (Franklin/Geary), would be less than significant.

Although the project's impact on pedestrians was found to be less than significant at this (Franklin Street/Geary Boulevard) intersection, as part of I-TR-40, the project would improve the pedestrian crossing at this intersection by installing pedestrian countdown signals.

Comment 67-21 states the vehicular traffic data contained in the draft EIR is inadequate. As part of the transportation impact analysis, traffic data was collected at each campus and at 70+ intersections for the LRDP campus areas. This data collection effort included observations of the existing vehicle/pedestrian interactions on each campus and at each study intersection. The study was thus quantitative in nature, as it accounted for not only the growth in traffic generated by each campus, but also the increase in background traffic between the existing condition and the years 2015 and 2030. As such, the analysis contained sufficient data to inform the analysis and determine project- related impacts in the Draft EIR. See Response TR-49 (page C&R 3.7-73) for a discussion of drivers responsibility to obey traffic laws.

See Response AE-4 (page C&R 3.4-7) regarding the level of massing and height of structures that currently exists in the project area and how implementation of the proposed CPMC LRDP would result in the development of similarly scaled structures. As such, the need to provide smaller scale/mass and height of structures with increased setbacks is not considered necessary to reduce aesthetic impacts to less than significance. Also, as noted above, adjacent to the proposed Cathedral Hill Hospital and MOB, the sidewalks would be widened along Van Ness Avenue and Geary Street/Boulevard.

At the Pacific Campus, the overall number of pedestrians and vehicle trips destined to and from the campus on a daily basis would decrease once the acute-care hospital and related uses were relocated to the proposed Cathedral Hill Campus. As indicated in Table 4.5-10 on page 4.5-76 of the Draft EIR, on a daily basis about 4,700 fewer person-trips would be generated by Pacific Campus LRDP uses. However, during the p.m. peak hour, the number of pedestrian and vehicle trips would increase slightly over existing conditions, to about 27 more walk trips and 71 more vehicle trips. The Pacific Campus proposed design addresses the inadequate existing parking supply, which results in patients and visitors circling in the vicinity trying to locate on-street parking (which is metered or subject to residential permit parking restrictions) and walking to CPMC facilities. The proposed provision of on-site parking to meet the demand and the proposed internal passenger loading/unloading within the new North-of-Clay Parking Garage would reduce the bicycle-vehicle and pedestrian-vehicle conflicts at nearby intersections that are associated with vehicles circling around the campus looking for parking and patients and visitors walking from those parking spaces. Although the number of vehicles crossing the sidewalk would increase at some locations, overall, the pedestrian and vehicle trips would be reduced. The labor actions referenced in one of the comments refers to picketing activity that has occasionally taken place. Future activity of this type, if any, would likely be similar, occurring occasionally and not on a daily basis, and would not worsen with implementation of the proposed LRDP.

3.7.7.2 TENDERLOIN–LITTLE SAIGON NEIGHBORHOOD CONDITIONS

Comments

(Bobbi Lopez—La Voz Latina, September 23, 2010) [20-3 TR]

"Latino families often walk around the neighborhood, often to drop their children to and from school or at afterschool programs. The Tenderloin is one of the most dangerous neighborhoods for pedestrian safety and in our survey, 86% felt unsafe crossing the streets in the area. Upon hearing that the CPMC project would bring tens of thousands more cars to the neighborhood, these are some of the reactions: 'this will make it more dangerous for us; we need more count-downs; this is not good to hear; this will bring more pollution; We deserve to feel safe with our children and they need to realize the affect this will have on us; where are they gonna put all these cars?; and this is a problem for the neighborhood.'"

(Stephanie Barton, et al.,—Hastings Civil Justice Clinic for the Good Neighbor Coalition, October 19, 2010) [104-34 TR]

"**1. The DEIR fails to adequately assess what impact increased traffic through the Tenderloin poses on pedestrian safety.**

The Tenderloin has the lowest car ownership rate in San Francisco at 18%.[64] Tenderloin residents are a transit-dependent population who must walk to access public transit. Consequently, safe pedestrian conditions are especially important to residents. Even now, without a voluminous hospital facility in the vicinity of the Tenderloin, the neighborhood has hazardous traffic-and pedestrian conditions. The streets of the Tenderloin are currently designed to move large volumes of traffic going through the Tenderloin.[65] These multi-lane, one-way arterials cause drivers to speed and make careless turn movements. As a result, pedestrian accident rates are six times higher in the Tenderloin then in San Francisco at large.[66] In the 'Downtown/Civic Center' area which includes the Tenderloin, there were 519 pedestrian injuries or deaths between 2004 and 2008.[67] In addition, the Little Saigon report found that pedestrian accident rates were especially high at Market Street intersections and the intersection of McAllister, and, Leavenworth Streets.[68] This analysis was not provided in the DEIR. These statistics are particularly disconcerting due to the fact that approximately 3,500 children reside in the Tenderloin.[69] The DEIR does not recognize, analyze, or discuss how the project proposal will magnify the already hazardous pedestrian conditions in the Tenderloin.

(Stephanie Barton, et al.,—Hastings Civil Justice Clinic for the Good Neighbor Coalition, October 19, 2010) [104-35 TR]

"The DEIR Transportation and Circulation section does address the need to examine potential .conflicts between pedestrians and vehicles.[70] The DEIR states, '[t]he project would have a significant effect on the environment if it' among other things would 'create potentially hazardous conditions for pedestrians....'[71] However, it carries out its analysis within too narrow a geographic frame. As a result, the DEIR incorrectly and sweepingly concludes that because an additional 600 hospital-related pedestrian trips during each of the peak hours time frames 'would not result in substantial overcrowding on the sidewalks and crosswalks, or result in hazardous conditions, the project's impact on pedestrians would be less than significant.'[72] What also needs to be examined is the extent to which additional traffic from CPMC Cathedral Hill Campus' staff, patients and visitors will exacerbate already hazardous pedestrian conditions in the Tenderloin.

(Sister Elaine Jones, September 23, 2010) [PC-27 TR]

"Good afternoon. My name is Sister Elaine Jones and I live in the Tenderloin. I am here to let you guys know that my husband and I, Mr. Arthritis and I, have a very hard time getting across streets. I was coming down Van Ness to take the 47 Bus, it took me 65 seconds to get across the street, and then this guy decides he wanted, because he saw a parking space, he wanted to cut in front of me, almost killing me just to get this parking space, I mean, it is based on common sense, the seniors in that area, it takes time to get across the street. The common sense, the impact on these seniors, it is not going to help us, it's gonna make it worse. We're going to end up isolating because we can't get out of our rooms to go down the street because we're in fear of our lives."

(Erin Chin, September 23, 2010) [PC-71 TR]

"Despite this fact, there is only one local elementary school and no middle or high school in the neighborhood. What this means is a large number of our children must travel in and out of the neighborhood daily, usually using mass transit or on foot, so when I was listening to some of the seniors talking about their concerns with traffic in the neighborhood and getting across the street, as somebody who has tried to cross the street with 30 kind of ditzy five-year-olds, it's a huge concern for safety in the neighborhood."

(Peggy Lindrod, September 23, 2010) [PC-100 TR]

"I also want to say that I've been here for a year in San Francisco, and even I know, and I pretty much haven't drove in it, that it's the compact that they are going to take Geary and Larkin every time, and during the commute hour, it's very congested, and when you go from a one-way street on Larkin and you turn on Geary to go towards Van Ness, usually when you're ready to cross the street, the cars – people in the cars are going to use that as their corner, as a right-hand turn, they will not stop. So, I think it would cause a problem and it would take in consideration, I guess, the studies of this neighborhood traffic safety report that was done because it also implement maybe having more crosswalks with actually numbers going across because some of it in those areas do not, they just turn green, or just turn red, and some of the streets that they are not projecting, but they will go on, and the second thing, create more of a barrier to the space on the sidewalk so that the residents will have more space because we do have a lot of residents that are handicapped, that have wheelchairs, so all that can be in consideration, and I don't think that anyone will necessarily site a hospital coming in,"

(Margarita Mena, September 23, 2010) [PC-113 TR]

"Buenos Tardes. [Spanish] TRANSLATOR: Good afternoon, my name is Margarita and I live in the Tenderloin. I am a mother. I know that you guys are here because you are talking about building a hospital, but I just want to share some of my concerns. A lot of us live in the area and we walk in that area that you are talking about, and I am really concerned about the danger that is going to happen for our children because we walk in that area. My biggest concern, of course, is the fact that because we walk in the area, you know, it is already dangerous to begin with. What are we going to do about the traffic situation?"

(Catalina Dean, September 23, 2010) [PC-155 TR]

"Good day, my name is Catalina Dean. And I would like to I guess jut recap because everything that everybody has said has already been said, so the first gentleman that spoke, he thanked this Board for being here. I know some of you members because I have worked with some of you, and I guess what I'm trying to say is that I can only tell you what my experience is."

(Catalina Dean, September 23, 2010) [PC-156 TR]

"I live here in the Tenderloin and my last experience was very horrible. I took a real giant scream over somebody who, when I was trying to cross the street when it said "Walk," he almost ran me over, and the thing that saddened me the most is he was an older gentleman like I was, and he grabbed his head like this. I felt his sorrow of almost running me over, and I felt my heart pounding, thinking I was going to be under that car."

(Barbara [Unidentified Last Name], September 23, 2010) [PC-269 TR]

"But the other thing that really came across, which really talked to the EIR, is the traffic and the contamination issue. I know that before you have been a million and one pedestrian reports, in the Tenderloin, it is one of the most dangerous pedestrian areas to walk through, it is also the highest density of children, and so, for us, it is very disconcerting to see that we're going to have another 10-20,000 more cars coming through the neighborhood where we already have one of the highest pedestrian deaths, and you know, I had a family years ago where the child was killed, two-years-old, and so it's something that affects us when we work in the community, we see our families get hit by cars, and I've got to tell you, the traffic thing is a very serious issue, as is the pollution, the

construction. Again, the map that is one of the packages shows that a lot of our families live on the block at Larkin and Geary, how is that construction going to handle it?"

Response TR-64

The comments state that the Draft EIR fails to adequately analyze the impacts of the proposed Cathedral Hill Campus project on pedestrian conditions in the Tenderloin-Little Saigon neighborhood and identifies existing pedestrian concerns in the Tenderloin-Little Saigon neighborhood. The issues associated with travel within the Tenderloin-Little Saigon neighborhood have been assessed by the San Francisco Transportation Authority and documented in the *Tenderloin-Little Saigon Neighborhood Transportation Plan*.[20] The comments refer to this transportation plan and additional information in the comments underscores existing concerns related to pedestrian safety in the Tenderloin-Little Saigon neighborhood. The *Tenderloin-Little Saigon Neighborhood Transportation Plan* identified transportation needs related to improved pedestrian safety, improved public transit service reliability and accessibility, and reductions in vehicular travel speeds through the neighborhood.

Through a process involving both community outreach and technical analysis, the *Tenderloin-Little Saigon Neighborhood Transportation Plan* identified a number of priority improvements and actions. Some specific improvements and actions proposed in this transportation plan include:

- Improve pedestrian safety: Construct intersection bulb-outs to reduce crossing distances, make crosswalks more visible with improved markings, install red light runner cameras to reduce travel speeds, install pedestrian countdown signals at intersections, and install on-street Class II (separate bicycle lane) or Class III (within travel lane) bicycle lanes when possible.

- Calm traffic: Narrow travel lanes, install designated bicycle or bus-only lanes, convert one-way streets to two-way streets, retime signal progressions to reduce average vehicle travel speeds, reduce the number of overall travel lanes, and plant trees at uniform distances within the parking lane (four per block).

- Improve public transit service: Install bus bulb-outs to decrease bus reentry times and improve reliability, add colored pavement for Geary Street and O'Farrell Street bus-only lanes, alter the street circulation network (one-way to two-way streets) to consolidate bus routes, and upgrade and improve bus stops.

- Enhance the streetscape: Install pedestrian-scale sidewalk lighting, widen sidewalks, plant trees at uniform distances within the parking lane (four per block), and install pedestrian-scale directional signs to improve wayfinding.

Since publication of the Tenderloin-Little Saigon Neighborhood Transportation Plan in 2007, a number of improvements have been implemented (e.g., corner bulb-out at the intersection of McAllister/Jones, and sidewalk extension on C J Brenham Place), several improvements are currently under construction (e.g., sidewalk bulbs at Ellis/Hyde, Eddy/Hyde, Ellis/Mason, and Eddy/Jones, and road diets on Eddy and Ellis Streets), and funding for additional improvements is being pursued. In response to comments on the Draft EIR, additional analysis was conducted to clarify the impact of the proposed Cathedral Hill Campus project on traffic, bicycle, and pedestrian conditions at additional intersections in the Tenderloin-Little Saigon neighborhood, and to conduct a sensitivity analysis of the transportation impacts if a higher percentage of motorists traveling to the Cathedral Hill Campus were to travel through the South of Market and the Tenderloin neighborhoods, rather than the routes assumed in the Draft EIR. The assessment is documented in the technical memorandum included as C&R Appendix E: *Supplemental-Sensitivity*

[20] SFCTA, 2007 (March), Tenderloin-Little Saigon Neighborhood Transportation Plan Final Report.

Transportation Impact Analysis for the CPMC Cathedral Hill Campus in San Francisco[21] and is also addressed in Responses TR-124 (page C&R 3.4-207) and TR-125 (page C&R 3.4-214).

Pedestrian trips associated with the proposed Cathedral Hill Campus would generally be limited to the area in the immediate vicinity of the campus, with the exception of walk trips between the new facility and residences in adjacent neighborhoods. Pedestrian trips would primarily be along Van Ness Avenue, Geary Street, Polk Street, and Post Street, and would primarily include trips to and from the nearby public transit stops; however, they would also include trips to nearby restaurants, parking facilities, and other area businesses. Because of the area topography, a substantial number of pedestrian trips that would include pedestrians walking through the Tenderloin-Little Saigon neighborhood are not anticipated to be generated by the proposed Cathedral Hill Campus project.

The discussion on page 4.5-132 in the Draft EIR presents the pedestrian volumes generated by the proposed Cathedral Hill Campus project. During the a.m. peak hour, the project would add about 694 new pedestrian trips—an increase of 108 walk trips, and 586 trips that would account for walk trips to and from public transit stops. During the p.m. peak hour, the project would add about 660 new pedestrian trips—an increase of 107 walk trips and 553 walk trips to public transit stops. The proposed Cathedral Hill Campus project would result in increased traffic volumes as drivers traveled through the Tenderloin-Little Saigon neighborhood to and from the campus.

The increase in traffic volumes at the supplemental study intersections and the percent contribution to the total traffic volumes are documented in the technical memorandum *Supplemental-Sensitivity Transportation Impact Analysis for the CPMC Cathedral Hill Campus in San Francisco* and further discussed in C&R Response TR-124 (page C&R 3.4-207). Based on the supplemental analysis, the number of Cathedral Hill Campus project-generated vehicles at the Tenderloin-Little Saigon Report study intersections would range between five and 31 vehicles during the a.m. peak hour, and between two and 77 vehicles during the p.m. peak hour. The greatest number of CPMC-related vehicles would be on Polk Street. At intersections along Market Street at Ninth/Larkin and Seventh Street, an additional 10 to 14 vehicles would travel in the a.m. peak hour, and three to four vehicles in the p.m. peak hour. At the intersection of Leavenworth/Geary, an additional 31 vehicles would travel in the a.m. peak hour and six vehicles in the p.m. peak hour.

Similar to the conclusion in Impact TR-40 on page 4.5-130 of the Draft EIR, the supplemental and sensitivity analysis found that the proposed Cathedral Hill Campus project impacts on bicyclists and pedestrians would be less than significant. In general, under the supplemental analysis, the Cathedral Hill Campus would increase vehicle trips through the supplemental study area, which could increase the number of conflicts between vehicles, pedestrians, and bicyclists; however, this increase would not be substantial enough to result in significant impacts. Continued implementation of the recommendations included in the *Tenderloin-Little Saigon Neighborhood Transportation Plan*, and additional improvements such as curb extensions, leading pedestrian intervals, installation or increased all-red phases, and high-visibility crosswalks by SFDPW and SFMTA would serve to alleviate the existing deficiencies identified in the comments and enhance safety in this neighborhood. Although impacts on the pedestrian (Impact TR-40 identified in the Draft EIR) and bicycle environment were determined to remain less than significant, the project sponsor has agreed as part of the development agreement negotiations to provide certain funding for the study and possible implementation of additional streetscape, pedestrian, and related improvements in the vicinity of the proposed Cathedral Hill Campus, beyond what is being done immediately adjacent to the project site as part of the proposed project, that would improve the less-than-significant impacts to the pedestrian and bicycle environment. Improvements would be consistent with those identified in the Little Saigon Report as well as other potential sidewalk improvements such as bulb-outs, lighting and pedestrian signal modifications, advance stop bars, right

[21] Fehr and Peers, 2011 (April 27), Supplemental-Sensitivity Transportation Impact Analyses for the California Pacific Medical Center Cathedral Hill Campus in San Francisco, CA.

turn vehicle turn restrictions and other safety facilities, at such intersections as Polk Street/Ellis Street, Larkin Street/Geary Street, Larkin Street/Grove Street, Larkin Street/9th Street, Hyde Street/O'Farrell Street, and Leavenworth Street/Geary Street. Funding would allow City agencies, including the San Francisco Planning Department, SFMTA, and DPW, to conduct additional investigations, analyze and possibly implement these or other similar improvements.

Improvement Measure I-TR-40 on page 4.5-134 of the Draft EIR has been revised as follows:

Improvement Measure I-TR-40 Pedestrian Improvements

As an improvement measure to facilitate pedestrian movements, SFMTA should install pedestrian countdown signals for all directions at the signalized intersections of Franklin/Sutter, Franklin/Post, Franklin/Geary, Van Ness/Sutter, Van Ness/Post, and Polk/Post.

In addition to the above, although the project would have less than significant impacts on the pedestrian and bicycle environment, the project sponsor has agreed as part of the development agreement negotiations to provide certain funding for City agencies, including Planning, SFMTA, and DPW to study and possibly implement additional streetscape, pedestrian, and related improvements in the vicinity of the proposed Cathedral Hill Campus that would improve the less-than-significant impacts to the pedestrian and bicycle environment. Improvements under consideration by the City would be consistent with those identified in the Little Saigon Report as well as other potential sidewalk improvements such as bulb-outs, lighting and pedestrian signal modifications, advance stop bars, right turn vehicle turn restrictions and other safety facilities, at such intersections as Polk Street/Ellis Street, Larkin Street /Geary Street, Larkin Street /Grove Street, Larkin Street /9th Street, Hyde Street /O'Farrell Street, and Leavenworth Street/Geary Street. The City would have sole authority to determine whether to proceed with the Tenderloin and Little Saigon neighborhood area improvements and to issue required permits and authorizations. The City would also retain the discretion to modify or select feasible alternatives to the improvements to avoid any identified impacts or concerns that arise in connection with their further review, including any required environmental review under CEQA.

Also see Response AQ-22 (page C&R 3.9-61) regarding the public health effects of air quality impacts related to the proposed project, and Response TR-63 (page C&R 3.7-110) above, related to the safety of senior citizens and people with disabilities at intersections. In addition, CPMC and the City have been in negotiations regarding the terms and conditions of a development agreement, that would, among other things, provide certain assurances and benefits, subject to the terms and conditions of the development agreement, with respect to the delivery of health care services. Please see Section 3.23.1.2 "Development Agreement" on page C&R 3.23-41 for additional details regarding the development agreement.

3.7.7.3 BETTER STREETS PLAN POLICIES

Comments

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-41 TR, duplicate comment was provided in 30-41 TR]

"21. The 'Better Streets Plan' to be adopted by the City with a 'Mitigated Negative Declaration' discusses the creation of safe and non-conflicting spaces for pedestrians and vehicles. It will be an adopted plan of the City of San Francisco; and this CPMC DEIR will be in violation on certain portions of it. I think that TR-17 with the pedestrians on the sidewalk coming and going and having the traffic come from in back of the pedestrians is going to cause not only a traffic jam on Geary but possible injuries of pedestrians. Traffic should not be allowed

to cross the sidewalk there unless there is a separate lane or island made for pedestrians only. Under CEQA, the situation with TR-17 will be violating "g" in that it will be in conflict with a City-adopted plan. I think more study and alternatives need to be considered prior to having this approved. On Page S-44, per MM-TR-17, flashing yellow lights for pedestrians to cross will not be enough nor will an audible signal for those who are both deaf and blind. An additional vibrating device may need to be installed for the blind and deaf. When traffic starts to extend into adjacent intersections, the mitigation measure will not be working. The situation here will become as bad as that already seen at Geary and Divisadero with the Kaiser vans and westbound Geary traffic coming to a standstill because people will double-park next to the vans and drop off passengers since they cannot get into the garage because the queue is backed out to the street or there are no more spaces to park on the street because the parking spaces in the structured garages are all taken. Then one sees the vans double-parked next to other vans. Geary at that spot turns into a one-lane (only open lane is the leftmost lane) from a three-lane thoroughfare. I think it will be worse on the narrower section of Geary at the CPMC site."

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-68 TR, duplicate comment was provided in 30-68 TR]

"35. Page S-47, Impact TR-42 states the implementation of the Cathedral Hill Campus project MOB Access Variant would result in a pedestrian hazard impact at the MOB's driveway on Geary St. Again, as per Page S-41, the mitigation measure is MM-TR-17, which, as I mentioned earlier, involves a flashing light and an audible signal to warn drivers and pedestrians of the pedestrian-vehicle conflict at this location. This is in violation of the 'Better Streets Plan' to make streets safe for pedestrians. The dangerous condition that will be set up may be better mitigated with either an underground tunnel for pedestrians or a pedestrian bridge. How often will the audible signal and flashing lights be triggered in a given day? I think the pedestrian traffic between the MOB and the Cathedral Hill Hospital will be almost constant so Geary will face considerable congestion. All construction projects should not impact the City transportation system to this degree. One of the "Priority Policies" of the City's 'General Plan' is that 'commuter traffic not impede Muni transit services or overburden our streets or neighborhood parking.' The 38/38L-Geary Muni line travel times will be increased if one lane on Geary is blocked due to pedestrians crossing."

Response TR-65

The comments state concerns that the proposed Cathedral Hill Campus project would be in violation of Better Streets Plan policies and that Mitigation Measure M-TR-17 (on page 4.5-111 of the Draft EIR) is not sufficient to address all pedestrian conflicts, particularly from the garage driveways on Geary Street. The proposed Cathedral Hill Campus project, which would provide MOB garage egress onto Cedar Street only, would not result in this traffic hazard impact. Impact TR-17 on pages 4.5-110 and 4.5-111 in the Draft EIR identifies a traffic hazard impact at the Geary Street driveway under the MOB Access Variant, not the proposed LRDP project, related to peak period queuing on Geary Street at the approach to Van Ness Avenue, increased pedestrians on Geary Street, and peak period vehicles entering and exiting the MOB garage at this location.

The proposed LRDP is not anticipated to substantially increase the number of hearing- and visually impaired people in the vicinity of the proposed Cathedral Hill Campus or at the other campuses. No warning devices (such as a vibrating device, noted in the comment) are currently in place at any driveways in San Francisco for persons that are both hearing- and visually impaired, and SFMTA is not aware of any requirements for such technology. Hearing- and visually impairedpersons walking in the area are anticipated to have assistance, such as the use of a support service provider (SSP) who would be trained to relay visual and environmental information to a hearing- and visually impairedperson, or a service dog that would be specially trained to recognize audible and visual alerts. Considering the above, no additional mitigation measures are required or improvement measures are proposed. Also see Response TR-63 (C&R 3.7-110), related to the safety of senior citizens and people with disabilities at intersections.

The transportation analysis determined (on pages 4.5-100 through 4.5-102 of the DEIR) the average and maximum lengths of queues of cars entering both the MOB and Hospital garage entrances, as a result of the ticket dispensing machines. The analysis concluded that the driveway length of both buildings, from the sidewalk to the ticket dispensing machine, would be long enough to contain vehicle queues.

However, queues could potentially result if the garage were to be fully occupied and appropriate actions were not taken to redirect incoming cars elsewhere, which the comment states occurs at the Kaiser hospital (on Geary Street west of Divisadero Street). To ensure that queues would not spill onto the street if the garage were to become full, an improvement measure, I-TR-5, has been developed which would require the operator of the garage to take appropriate actions to ensure that such queues would not occur. (See Response TR-89 on page C&R 3.7-157 for the added improvement measure I-TR-5.)

Furthermore, the curb cuts and associated driveways on Geary Street could be revoked by the City if it was determined that they substantially interfered with street operations (including transit and pedestrian movements). See Response TR-80 on page C&R 3.7-149.

Pedestrian crossing of Van Ness Avenue would occur within the crosswalks currently provided at the adjacent intersections at Geary Street and at Post Street, and pedestrians would not block any travel lanes on Geary Street. Therefore, pedestrian crossings would not conflict with any Better Streets Plan or General Plan policies related to public transit or pedestrians.

3.7.7.4 PORTE COCHERE CLARIFICATION

Comment

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-129 TR, duplicate comment was provided in 30-129 TR]

"In the 'Project Description' section of the CPMC DEIR, Chapter 2, on Page 2-35, an explanation is given that 'portes cocheres' would 'create inviting entries for hospital users and other pedestrians. The proposed Emergency Department drop-off zone (off of Franklin Street) would be designed to be more like a pedestrian plaza than a vehicular drive-through area. Similarly, the Cathedral Hill MOB would have passenger drop-off zone on Cedar Street near Van Ness Avenue.' There will still be pedestrian and vehicle conflict in these "portes cocheres." Again, the safety of the pedestrians may need to be mitigated by not just flashing lights and audible signals as proposed in MM-TR-17."

Response TR-66

The comment notes concern about pedestrian and vehicle conflicts within passenger loading zones. The on-site Emergency Department drop-off area on Franklin Street and curb passenger loading zone for the MOB on Cedar Street would be designed to safely accommodate passenger loading/unloading activities, and would not result in significant impacts. CPMC has indicated that the MOB drop-off area would have a staff person to assist with vehicle circulation. (Additional information regarding the Emergency Department loading area is provided in Response TR-88, page C&R 3.7-156.) Therefore, mitigation measures would not be required. The flashing lights and audible signals proposed in Mitigation Measure MM-TR-17 on page 4.5-111 in the Draft EIR would be for the MOB garage driveway on Geary Street under the MOB Access Variant, where peak period congestion on Geary Street and vehicles entering and exiting the driveway would result in a traffic hazard impact. Flashing lights and audible signals would not be appropriate for curbside or internal on-site passenger zones.

3.7.7.5 MIDBLOCK CROSSING ON POST STREET AT FORMER OCTAVIA STREET

Comment

(Madlyn Stein—Seniors of Cathedral Hill, October 7, 2010) [45-6 TR]

"-provide a blinking yellow light at the crossing on Post Street where former Octovia Street crossed so that seniors crossing between two large facilities, the Sequoias and the Carlisle, will not be run over."

Response TR-67

The comment's request to provide a flashing yellow light at the unsignalized midblock crosswalk on Post Street between Gough Street and Laguna Street (at former Octavia Street) has been reviewed with SFMTA. SFMTA has reviewed the community request for flashing yellow lights, in-street pedestrian crossing signs, STOP signs, and consolidation of crosswalks, and has indicated that installation of a solar-powered, push button-activated flashing beacon on existing poles would be possible. SFMTA is exploring funding possibilities for installation of the flashing beacon. The pedestrian impact analysis for the proposed Cathedral Hill Campus, as presented in Impacts TR-40 through TR-42 on pages 4.5-130 through 4.5-136 of the Draft EIR, did not identify any significant pedestrian impacts along Post Street. Therefore, providing a flashing yellow light at the existing midblock crosswalk is not required as a mitigation measure.

3.7.7.6 CALIFORNIA CAMPUS CONDITIONS

Comment

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-105 TR, duplicate comment was provided in 30-105 TR]

"Not only that, but the Jordan Park area also has a very high number of children as well as schools for little children up to middle school age. Having too much traffic congestion and cut-through traffic will endanger their lives. We have already had to resort to traffic calming measures which are being circumvented in this area."

Response TR-68

The comment states concerns related to congestion and cut-through traffic in the Jordan Park area. As indicated on page 4.4-178 in the Draft EIR, as part of the proposed LRDP, the facilities and operations of the California Campus (in the vicinity of Jordan Park) would remain unchanged until 2015, when the majority of existing activities would be relocated to the Pacific Campus and the proposed Cathedral Hill Campus. Once the majority of services are transferred to the proposed Cathedral Hill and Pacific Campuses, the California Campus would no longer be considered part of CPMC. Analysis of any potential reuse or future redevelopment on the site would be speculative. Any future proposals at the site would require a project-specific, project-level environmental review. With no planned changes in facilities or operations, transportation travel demand at the California Campus would be expected to remain similar to existing conditions until 2015, and then gradually decrease after 2015. The proposed LRDP would not result in any new vehicle trips and, therefore, would not add to existing traffic congestion or cut-through traffic in the area.

3.7.8 PARKING

Comments

3.7.8.1 PARKING – GENERAL CPMC LRDP

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-31 TR, duplicate comment was provided in 30-31 TR]

"Page S-22 states that one of the 'Project Objectives' for 'Site Planning' and 'Site Selection' is to 'ensure that all hospital facilities· are located so that they have the capacity to be supported with medical office space, parking facilities, and other supportive functions.' I think the site selection and proposed builds lack the capacity to support the parking needs of visitors, staff and delivery personnel. In fact the following statistics will show that the total proposed maximum parking at the campuses themselves at 3,890 spaces will not support the 2008 figures as follows:

- 31,000 acute discharges (33% of SF total) .
- 7,300 births (50% of SF)
- 74,300 Emergency Department visits (32% of SF)
- 541,200 Outpatient visits
- 1,200 medical staff (largest in SF)

This came from www.rebuildcpmc.org/assets/CPMC CommunityForum.pdf. CPMC thus must rely on City-owned garages and private garages to address parking for their people.

The parking facilities fall way short of the projected number of people who will work, visit and use this facility. This is what will cause the visitors/patients who arrive in vehicles (many of them because they are ill and cannot take public transportation) to keep circling the campuses and cause congestion when the garages/parking structures are full. That is why this CPMC project requires a Conditional Use (CU) authorization for excess parking at the Cathedral Hill Hospital as noted on Page S-25; however the excess parking request is still not enough. Again, this is evidenced by the need to still lease out garage space at some other off-site locations. And when these lots are transformed from a parking use to some other use, CPMC will lose those parking spots and get into a worse situation with parking to such a large hospital that is planned in a very busy area of town."

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-111 TR, duplicate comment was provided in 30-111 TR]

"58. On Page 4.5-80, Table 4.5-13 ('Parking Demand by Campus') shows that for the Cathedral Hill Campus for all 3 projects (hospital, MOB and 1375 Sutter), there will be a net demand of 1,389 .spaces assuming the California Campus does not have any new demand. The Pacific Campus is shown to have less demand by 229 spaces, the Davies Campus shows new demand of 264 spaces and the St. Luke's Campus shows net new demand of 240 spaces. In total, there will be a demand of 1,664 parking spaces (1,389+264+240-229). Will there be sufficient parking spaces for the physicians and the other staff and visitors at all the campuses?"

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-154 TR, duplicate comment was provided in 30-154 TR]

"91. On Page 4.3-31 in the 'Population, Employment, and Housing' section, the following statistics for the year 2030 are given:

- 5380 FTEs at Cathedral Hill Campus
- 2060 FTEs at Pacific Campus
- 1750 FTEs at Davies Campus
- 1530 FTEs at St. Luke's Campus
- 10,720 FTEs at above campuses...

It states, 'The total number of personnel at all CPMC campuses would grow to approximately 10,720 by 2030. This would be a net new growth of 4,170 FTE personnel for CPMC system-wide between 2006-2030 (See Table 4.3-10 on Page 4.3-16.). In 2006, there were 5,801 FTEs. For 2015, the FTE count is expected to be 8,350. With a total of 3,890 parking spaces for all projects, parking will be severely inadequate for all the staff, patients' visitors, users of the medical facilities. That is again the reason CPMC has all the extra leases with several garages. (See Item 20.)"

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-155 TR, duplicate comment was provided in 30-155 TR]

"Some garages used by the CPMC California Campus, e.g., like the 17th & Geary Garage, are causing a big problem with vehicles circling .in the area and causing more vehicle/pedestrian conflicts. In addition, having streets in the Richmond District that allow free parking all day need to be metered if we are all going to the 'Transit First' mode of operation; however, not while allowing favorable uses to a for-profit entity at the expense of the neighbors. The total of the above equals 10,720 FTEs. The additional 10 FTEs to arrive at the 10,730 FTE figure are from the California Campus that is not described with the above bullet points under the 'CPMC LRDP Projects at Full Build-out (2006-2030)' section; rather, they are on Page 4.3-29."

PUBLIC PARKING GARAGES/LOTS	more public spaces used	neighborhoods	impacted			

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [37-5 TR]

"7. So when the parking demand at the new CPMC project is changed so that it cannot support the projected FTEs (10,700+ by 2030) + (see 2008 figures below for reference) and visitors that will utilize the services, the impact is not only a block or two away but on neighborhoods. The resulting congestion in traffic in the neighborhood is a serious concern. Part of the problem is with all the people working at CPMC who drive and take up the spaces in the neighborhood lots so that the local merchants have less business and people will circle around looking for street parking which also is becoming increasingly rare."

(Linda Chapman, October 19, 2010) [76-23 TR, duplicate comment was provided in 111-23]

"Even the reduced Alternative 3 proposes more than one-third increase in square footage for parking, compared to existing conditions. This is unacceptable in the transit-rich central city-- when city policy has advanced to contemplating auto use limited to out of town trips and grocery shopping. The Planning Code eliminated obsolete 1:1 residential requirements for downtown and additional parts of the northeast quadrant, Octavia Boulevard, and some other transit-rich areas. The VNAP should be updated consistent with newer area plans (inasmuch as its intent was to produce a transit-rich residential district). Meanwhile, it is inconsistent with recent policy direction for a planning rule to impose minimum parking spaces for new medical campuses."

(Gloria Smith—California Nurses Association, October 19, 2010) [90-51 TR]

"Off-street loading space dimension: the proposed Cathedral Hill campus would also require Conditional Use authorization to exceed the allowable parking."

(Gloria Smith/Tom Brohard & Associates —California Nurses Association, October 19, 2010) [92-30 TR]

"9) Parking Impacts Will Be Significant - Table 4.5-34 on Page 4.5-164 summarizes the parking supply and demand for each campus. As shown, the Cathedral Hill Campus is proposed to have a parking shortage where demand exceeds supply by 162 spaces. Other parking shortages will occur at the Davies Campus (203 spaces) and at the SI. Luke's Campus (309 spaces). Without the 623 "off-campus" parking spaces, the Project shortage is 664 parking spaces, about 15 percent of the overall parking demand."

(Stephanie Barton, et al.,—Hastings Civil Justice Clinic for the Good Neighbor Coalition, October 19, 2010) [104-43 TR]

"4. The DEIR incorrectly analyzed parking conditions as a social impact rather than focusing on the potential physical impacts on the Tenderloin.

The parking conditions as described in the DEIR will potentially result in physical impacts in the Tenderloin. The DEIR estimates the peak parking demand shortfall for the Cathedral Hill Campus to be 162 spaces.[99] In addition, the proposed sidewalk widening and other pedestrian improvements would result in the displacement of 26 standard metered spaces, one handicapped-accessible space, and ten commercial vehicle loading/unloading spaces.[100] The DEIR concludes that parking conditions are considered to be social impacts rather than physical impacts on the environment.[101] This conclusion relies on the assumption that "the secondary effect of drivers searching for parking is typically offset by a reduction in vehicle trips due to some drivers, who are aware of the constrained parking conditions in a given area, shifting to other modes."[102] However, the DEIR recognizes '[t]he

loss of parking may cause potential social effects, which would include cars circling and looking for a parking space in neighboring streets.'[103]

[99] DEIR 4.5-163.
[100] *Id.*
[101] DEIR 4.5-162.
[102] DEIR 4.5-166.
[103] DEIR 4.5-166."

Stephanie Barton, et al.,—Hastings Civil Justice Clinic for the Good Neighbor Coalition, October 19, 2010) [104-44 TR]

"The DEIR does not analyze what impact the parking shortfall will have on the parking demand in the Tenderloin neighborhood, CEQA provides that, '[e]conomic or social effects of a project may be used to determine the significance of physical changes caused by the project;'[104] Although 'the social inconvenience of having to hunt for scarce parking spaces is not an environmental impact, the secondary effect of scarce parking on traffic and air quality is.'[105] Accordingly, the DEIR needs to fulfill its CEQA-mandated purpose by identifying ways in which the secondary environmental impacts resulting from the project parking deficits can be mitigated.[106] The Tenderloin is close to downtown, which leads to a significant number of commuters parking in the neighborhood. The consequences of Cathedral Hill's parking shortfall could overflow into the Tenderloin causing an increase in traffic on the streets of the Tenderloin and a decrease in parking spaces available for non-hospital related drivers and local residents. The DEIR must analyze the potential physical impacts on the Tenderloin of increased traffic caused by CPMC staff, patients, and visitors seeking parking in the neighborhood.

[104] *CEQA* Guidelines §15131(b).

(Charles Freas, October 19, 2010) [79-2 TR, duplicate comment was provided in 100-2]

"Parking challenges are given short shrift and yet what will be their real traffic friction flow impact?"

(Commissioner Antonini, September 23, 2010) [PC-348 TR]

"There is also a lot of concerns that have been voiced about parking, and in reading the DEIR, it appears that the parking is being increased in all the facilities that are part of the hospital, other than the one that is California, which is slated to be closed in the distant future, and I think that's important because we've heard about the amount of traffic involved and, certainly, while we've encouraged people to take public transit, realistically they are going to be a lot of people who will be driving to all of the hospitals and we need to be able to accommodate them. And as I see being a Kaiser member, there are a lot of people who, you know, have limited mobility and have to be able to drive right into the facility, even for out-patient services, and sometimes be assisted. So, that's an important consideration. One thing – oh, I guess that's it!"

Response TR-69

The comments summarize information contained in the Draft EIR regarding the CEQA analysis of the CPMC LRDP parking demand and supply, express concern related to the parking supply and accommodation of demand, and request provision of fewer or more parking spaces at the CPMC campuses.

Significance Criteria—As explained on pages 4.5-162 and 4.5-163 in the Draft EIR, San Francisco does not consider parking supply as part of the permanent physical environment and, therefore, does not consider changes in parking conditions to be environmental impacts as defined by CEQA. The San Francisco Planning Department acknowledges, however, that parking conditions may be of interest to the

public and the decision-makers. Therefore, a parking analysis and discussion for the proposed LRDP is presented in the Draft EIR for informational purposes.

Parking conditions are not static, as parking supply and demand varies from day to day, from day to night, from month to month, etc. Hence, the availability of parking spaces (or lack thereof) is not a permanent physical condition, but changes over time as people change their modes and patterns of travel. Parking deficits are considered to be social effects, rather than impacts on the physical environment as defined by CEQA. Under CEQA, a project's social impacts need not be treated as significant impacts on the environment. Environmental documents should, however, address the secondary physical impacts that could be triggered by a social impact. (State CEQA Guidelines, Section 15131[a])

The social inconvenience of parking deficits, such as having to hunt for scarce parking spaces, is not an environmental impact, but there may be secondary physical environmental impacts, such as increased traffic congestion at intersections, air quality impacts, safety impacts, or noise impacts caused by congestion. In the experience of San Francisco transportation planners, however, the absence of a ready supply of parking spaces, combined with available alternatives to auto travel (e.g., public transit service, taxis, bicycles, or travel by foot) and a relatively dense pattern of urban development, induces many drivers to seek and find alternative parking facilities, shift to other modes of travel, or change their overall travel habits. Any such resulting shifts to public transit service in particular would be in keeping with the City's "Transit-First" policy. The City's Transit-First Policy, established in the City's Charter Article 8A, Section 8A.115, provides that "parking policies for areas well served by public transit shall be designed to encourage travel by public transportation and alternative transportation."

The transportation analysis and the traffic assignments used to prepare the intersection analysis accounts for potential secondary effects, such as cars circling and looking for a parking space in areas of limited parking supply, by assuming that all drivers would attempt to find parking at or near the proposed CPMC campuses and then would seek parking farther away if convenient parking was unavailable. Moreover, the secondary effects of drivers searching for parking typically would be offset by a reduction in vehicle trips because of others who would be aware of constrained parking conditions in a given area. As a conservative assumption, the transportation analysis did not account for this reduction in vehicle trips traveling to the study area. Any secondary environmental impacts which might result from a shortfall in parking in the vicinity of the proposed LRDP would be minor, and the traffic assignments used in the transportation analysis, as well as in the associated air quality, noise and pedestrian safety analyses, reasonably address potential secondary effects.

As noted above, the effect of patients, visitors and staff accessing CPMC parking facilities was assessed as part of the traffic impact analysis, and therefore the impacts of parking on traffic flow are reflected in the intersection LOS analysis. In addition, at the proposed Cathedral Hill Campus garages, a queuing analysis was conducted for the three parking garages to determine whether vehicles accessing the garages would queue out into the adjacent travel lanes and impact traffic flow. The discussion of parking operations on traffic flow is presented in Impact TR-5 on page 4.5-100 to 4.5-102 in the Draft EIR, and the potential impact from garage operations on traffic flow was determined to be less than significant. Even though impacts were found to be less than significant, an improvement measure, I-TR-5, has been developed which would require the operator of the garage to take appropriate actions to ensure that such queues would not occur. See Response TR-89 (page C&R 3.7-157).

CPMC LRDP Parking Supply—The parking supply at each campus is presented in Table 4.5-34 in the Draft EIR on page 4.5-164. This supply would include vehicle parking spaces, including wheelchair-accessible spaces. The parking spaces would not include motorcycle, carshare, or bicycle spaces. Each CPMC garage would provide the Planning Code-required number of bicycle and carshare spaces or more, and would meet the requirements regarding dimensions of parking and loading spaces. Although motorcycle spaces would be provided, the Planning Code does not specifically require motorcycle spaces.

None of the CPMC campuses are located in zoning districts that have vehicle parking maximums, and the Planning Department does not have any proposed changes to zoning districts in which the campus sites are located to specify maximum permitted parking requirements (for example, such as within the Eastern Neighborhood Mixed Use zoning districts), with the exception of legislation currently pending before the Planning Commission (File No. 110859) which would potentially establish a maximum permitted parking requirement applicable only to residential projects within the Van Ness Special Use District. While the total number of accessory parking spaces at the Cathedral Hill Campus would be within the maximum currently allowed under the Planning Code; the legislation (File No. 110859) currently pending before the Planning Commission would reduce amount of permitted accessory parking, which the Cathedral Hill Campus would exceed. If applicable to the CPMC LRDP, revisions to Draft EIR Table 2-3, "Project Approvals", are included in Chapter 4, "Draft EIR Text Changes," on page C&R 4-38, in which CPMC has requested an amendment to Planning Code Section 243 that would allow modification of accessory parking requirements here through a CU authorization, provided that the amount of parking at the Cathedral Hill Campus does not exceed the current accessory parking maximum of 150 percent of the number of spaces otherwise required by the Planning Code. If the pending legislation is applicable to the CPMC project, CPMC would seek a CU authorization to allow any spaces that would exceed the accessory use threshold as modified by the legislation.[22] This authorization could be denied or approved as part of the Planning Department and Planning Commission review of the project. At the St. Luke's Campus, as part of the PUD approval process, CPMC would seek an exception to the Planning Code to provide fewer than the minimum required number of parking spaces, since parking is already provided on-site.

As part of the proposed CPMC LRDP, three of four existing campuses would have an increase in off-street parking supply. In addition, the proposed Cathedral Hill Campus will provide off-street parking. The estimated amount of off-street parking was based on the Planning Code requirements, the projected parking needs generated by the programs at each individual campus (based on existing experience), consideration of existing conditions related to parking supply and needs at the four existing campuses, and site constraints associated with each campus. The CPMC LRDP development process, including the determination of parking supply, was conducted in consultation with the Planning Department and with input from the community through various workshops related to the proposed LRDP.

It is reasonable to assume that the identified CMPC LRDP parking supply would be available for use by patients, visitors, staff, and doctors, and it would be speculative to assume that the off-street parking facilities leased by CPMC would be converted to other uses.

In addition to parking supply provided on the campuses, CPMC also has long-standing arrangements in place to lease parking spaces in nearby garages. To use the proposed Cathedral Hill Campus as an example; long-term leases are in place at the Japantown Center and 855 Geary Street (described in Response TR-56). CPMC has from time to time confirmed the presence and commercial availability of additional parking both in the neighborhood of the campus. More fully described in Response TR-86, a survey of available parking within walking distance of the Cathedral Hill Campus revealed approximately 480 spaces, over and above existing garage volumes, that were potentially available for lease. CPMC also has access to more distant reserves of parking., such as the Jazz Center, and the 12th /Kisling garage, at which CPMC has recently leased 375 spaces.If the spaces at the Japantown garage were no longer available, CPMC would contract a comparable amount of off-site parking in whatever the most convenient physical location and favorable lease terms were available.

Convenient and readily available off-street parking for patients and visitors is a critical component of any medical facility to ensure that the patient and visitor experience at the facility supports the patient and

[22] Under the current Planning Code provisions, per Section 204.5, accessory parking equivalent to 150 percent of the required supply could be provided without special authorization.

contributes to the patient's well-being (e.g., walking long distances between a garage and medical office or circling around the neighborhood to find on-street parking does not support a patient's or visitor's well-being). Similarly, providing parking for some physicians and staff, particularly when these individuals are on-call, also is required to support their ability to serve patients. In general at hospitals and medical facilities, however, parking is not provided for the majority of staff, primarily to encourage alternate modes of travel. Therefore, taking the City's Transit-First policy into consideration, each campus would provide parking for patients, visitors, and some staff and physicians. By policy, CPMC would provide the most convenient and nearest parking spaces to its patients and visitors, then to physicians, and lastly to staff.

3.7.8.2 PARKING – CATHEDRAL HILL CAMPUS

Comments

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-17 TR, duplicate comment was provided in 30-17 TR]

"6. On Page S-4, are the 17 parking spaces on Level 1/P1 (connects to southeast corner of Geary & Van Ness) for hospital support uses or just the 14 van spaces?

7. What other parking spaces are reserved for hospital staff out of the 513 parking spaces at Cathedral Hill Hospital who will be working at this hospital?

8. On Page S-6, with the MOB having seven levels of parking with 542 parking spaces, how many of these are reserved for staff?

9. On Page S-6, the 1375 Sutter St. building currently has 172 parking spaces which will be kept and any additional parking needs of the 1375 Sutter MOB will be provided at the Cathedral Hill Hospital garage. How many staff people from 1375 Sutter MOB will use the parking spaces at the Cathedral Hill Hospital?"

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-25 TR, duplicate comment was provided in 30-25 TR]

"The counting of parking spaces is rather puzzling and vague in certain areas. If one looks at the drawings of the available parking spaces in the DEIR, e.g. 257 spaces on Level P3 (Page 2-69) at Cathedral Hill Hospital, one must deduct 24 spaces to net only 233 spaces for the regular general public and staff use because the 24 spaces are for disabled parking only. On Level P2 shows 239 spaces but 22 are disabled spaces. On LeveI1/P1, the DEIR shows 31 spaces but 14 are for vans/loading spaces, 4 spaces for motorcycles, and 2 spaces for disabled parking. So on Level 1/P1, there will be only 11 parking spaces for regular vehicle parking. In fact, the 14 van parking spaces are NOT included in the CU authorization for parking in addition to that allowed under Planning Code Section 157 for accessory parking (Page S-24). The CPMC project asks ONLY for 513 spaces under CU and it should be 527 spaces which will then include the spaces for their 14 vans. See Cathedral Hill Hospital parking summary in the chart below:

Level	*Total Parking*	*Disabled*	*Vans*	*Motorbikes*
P3	*257*	*24*		
P2	*239*	*22*		
1/P1	*31*	*2*	*14*	*4*
Total	*527*	*48*	*14*	*4*

Total = 527-14 van spaces = 513 spaces per

Page 2-28 for Cathedral Hill Hospital parking.

Of the 513 spaces, 4 are motorcycles so 509 vehicle spaces left

Of the 509 spaces, 48 are disabled spaces so 461 spaces are left for regular parking.

TOTAL regular vehicle parking is **461** spaces."

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-26 TR, duplicate comment was provided in 30-26 TR]

"The 'Project Description' for the Cathedral Hill MOB parking states that there will be 542 parking spaces on seven levels (Page 2-31). Are the 2 loading spaces be included in these parking spaces? Also, on Page 2-95, there is a diagram (Figure 2-31) which gives a 'typical parking level (G5)' for the MOB. This DEIR does not provide diagrams of all the parking levels in the Cathedral Hill MOB -- how many disabled spots, how many motorcycle spots, how many van slots and how many slots for regular vehicles?

Per Page 2-217, Figure 2-69, St. Luke's replacement hospital has 4 levels of parking. The DEIR shows only 2 levels of parking, Level Pi and Level 1 on Page 2-219 (Figure 2-70) and on Page 2-220 (Figure 2-71), respectively. Figure 2-70 shows 43 regular parking spaces and 10 disabled spaces. Figure 2-71 shows 8 disabled parking spaces. I do not see that the total available structured and surface parking spaces required by staff and visitors to the Cathedral Hill Hospital will be adequate.

With info from the Administrative documents for the CPMC DEIR, more thoughts as below in Items 71 and 72 below in this document."

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-27 TR, duplicate comment was provided in 30-27 TR]

"18. On various pages in this DEIR, the number of parking spaces is stated for the existing and proposed CPMC campuses. Page 2-14, Table 2-3, 'Required Project Approvals' states that a 'conditional use' authorization will be required for 513 Cathedral Hill Hospital parking spaces (again, per Item 17 above, I believe this should be 527 on conditional use) and 542 parking spaces at the Cathedral Hill MOB. On Page 2-16, St. Luke's Replacement Hospital and its MOB/Expansion Building together will provide 450 parking spaces. The Planning Code requires 559 spaces. On Page 2-21, 1375 Sutter Street Medical Building will retain its 172 parking spaces after conversion. The Cathedral Hill project on all levels (Hospital, MOB, 1375 Sutter) will have a total of 1,227 parking spaces. The Cathedral Hill MOB will have 542 parking spaces per Page 2-31 but it is not broken down as to how many besides the 2 loading/service spaces are for disabled, motorcycle, van or regular spaces. Although on Page 2-95 and 2 96, there are drawings of the parking for the MOB, the DEIR gives only a diagram for 'Level G1' (Page 2-96) and 'Typical Parking Level (G5)' on Page 2-95. I do not see any disabled parking spaces marked out and all the spaces appear to be for vehicles vs. motorcycles. The Cathedral Hill project will have no spaces available as surface parking."

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [37-3 TR]

"5. The CPMC DEIR analyzes **transportation circulation impacts** in the immediate vicinity -- intersections located at very short distances from the project sites -- but when the proposed CPMC campuses project alters the number of parking spaces at these newly built buildings and continues to use the existing parking spaces at various other CPMC owned sites and leases parking spaces from neighborhood garages, it has an impact in all the neighborhoods with these facilities.

In the Richmond District, we have impacts on the Laurel Village Shopping Center because currently there are not enough parking spaces at CPMC garages and nearby lots. This spills over into the Jordan Park residential neighborhood and the Laurel Heights neighborhood. Then you have CPMC using the Geary & 16th Avenue

Garage by the Rite-Aid. When CPMC takes the parking spaces in that garage as they have been for years, nobody can shop along Geary and this hurts the Geary Blvd. Merchants. And, the residents are circling since they cannot even find parking as far away as 21st Avenue and as far north as Fulton and as far south as Lake Street sometimes when CPMC uses up the spaces at this 16th & Geary garage. CPMC is mitigating its parking problems by infiltrating these neighborhood garages and putting additional burdens on the residents. Why are the neighbor-residents in the Richmond having to suffer parking and congestion issues for a hospital that cannot meet its parking demand? And the idea of taking away residential parking zones by SFMTA will hit even harder on the Richmond residents with CPMC people parking all day in 'free zones' in the Richmond."

(Diane and Richard Wiersba, October 11, 2010) [49-2 TR]

"Traffic in this area is already extremely heavy as it includes the intersection of Van Ness and Geary Street and also inbound Post Street and southbound Gough. We gave up our car about 15 years ago in part because traffic is so heavy and parking is so difficult. To bring such a structure as the originally proposed CPMC to this area, even with adequate parking for the large number of employees necessary to operate such a medical center, would make a dangerous situation much worse, especially considering this area has the highest density of seniors in San Francisco. No parking for hospital employees (which we understand is proposed) is foolhardy; parking is already difficult to find in this area."

(Carol and Michael Stack, October 17, 2010) [62-5 TR]

"Parking for guests and visitors will become essentially impossible in one of the few areas of the City where parking is generally reasonably obtained – either on the street or in public garages. The quality of life for residents in terms of their social lives will be adversely affected. This is a not unimportant consideration for the substantial elderly and handicapped community living here."

(Linda Chapman, October 19, 2010) [76-18 TR, duplicate comment was provided in 111-18 TR]

"Where seemingly insignificant temporary conditions (like rain, illegal parking, or holiday events) cause paralyzing congestion, the result shows how vulnerable the Van Ness Corridor is to traffic disruption. Inadequate impact analysis could saddle the area with permanent results from hospital development.

Drivers converging on the campus will circulate through surrounding streets, some hoping to park at offsite garages or curbside, others navigating the one-way street patterns to reach hospital and MOB entries. The more drivers depend on campus garages, the more those garages will tie up traffic when cars waiting for entry back up into the street, and the more drivers will circle surrounding streets when unable to stop in traffic waiting for garage entry. A Polk Gulch resident recounted this condition at an existing CPMC garage, which results in his circling through the neighborhood. Absent other evidence, it is reasonable to assume that conditions at a location *already* more congested than CPMC's problem garage will be worse."

(Linda Chapman, October 19, 2010) [76-21 TR, duplicate comment was provided in 111-21 TR]

"Converting Cedar Alley to access for the MOB garage cannot be allowed.

Alternative 3 proposes reducing the Cathedral Hill campus- essential for traffic impacts. However, with proposed garages, traffic impacts will inevitably remain significant. Traffic impacts can be reduced by limiting CPMC parking, on-site and off-site. CPMC proposes spaces for 1,055 cars at the Van Ness/Geary site-- where the existing hotel and office building total 405. Two large garages are not needed, in addition to spaces for CPMC at the Sutter Street MOB."

(Linda Chapman, October 19, 2010) [76-24 TR, duplicate comment was provided in 111-24 TR]

"For the Cathedral Hill campus, there should be no approval to build parking, beyond replacing spaces from the hotel and office site. If CPMC wants suburban amenities, they cannot locate a campus in the central city.

Attracting autos disrupts not just transit and circulation, but the pedestrian environment and living environment of residents already subjected to urban density and commute traffic.

CPMC articulated a desire to relocate to a transit-rich area. They need to encourage customers and staff to use this amenity. CPMC argues (inconsistently) that people need auto transport to get medical care. The reality for this transit-rich area is that residents found about two-thirds of Nob Hill households had no vehicle. People living in such areas take public transit to medical providers- including Kaiser and CPMC, where garages invite car owners to drive regardless of need (like that Polk Gulch resident who described circling all over another neighborhood when he uses a CPMC garage).

Parking to serve Cathedral Hill construction must not exceed 405 spaces. Further reduction is desirable, to reduce adverse impacts in the overburdened Van Ness Corridor and surrounding neighborhoods. Compared to hotel and office use, auto traffic to CPMC garages could drive through our neighborhood many more times (for patient appointments all day, for staff turnover day and night). In contrast to this intense use for round-the-clock medical operations, commuters are likely to enter and leave the neighborhood once a day, hotel guests may just store cars overnight, hotels rarely rent rooms to capacity, and garage spaces rented for evening events likely won't turn over like CPMC garages."

(Beth Pewthur, October 19, 2010) [80-1 TR]

"I support the position of the Unitarian Church and as a member of that church am very concerned about the hospital plan which does not provide enough off street parking for it's activities."

(Linda Chapman, September 23, 2010) [PC-285 TR]

"so we don't need to have a lot of extra parking there, which will only bring in more cars."

(Paul Grech, September 23, 2010) [PC-329 TR]

"As far as so-called Bureau of Traffic problem, the one-way streets have worked flawlessly in the 37 years that I've been here. The hospital will have their five-story underground parking system, and that will take care of the parking problem. The Kaiser parking system on Geary and Divisadero works fine whenever I go to the Kaiser on Geary and Divisadero, I never have encountered a problem. And, again, I urge you to approve the proposed hospital project. Thank you."

Response TR-70 (Parking – Cathedral Hill Campus)

The comments summarize information contained in the Draft EIR regarding parking supply, express concern related to the parking supply and accommodation of demand, and request provision of fewer or more parking spaces at the CPMC campuses. The comments also suggest that the problem of vehicle queuing at garages needs to be addressed.

Detailed engineering plans for the campus were not developed, nor are they required to be developed, as part of the environmental review analysis. The plans included for the below-grade levels of the proposed structures are illustrative, with sufficient detail developed to ensure that adequate circulation space is provided and that the proposed number of parking spaces could be accommodated. Precise floor-by-floor designation of parking spaces have not been finalized, and will be included in the construction plans when submitted for building permit approval. With implementation of the proposed CPMC LRDP, the proposed Cathedral Hill Campus would provide a total of 1,227 parking spaces, including 513 spaces at the proposed Cathedral Hill Hospital, 542 spaces at the proposed Cathedral Hill MOB, and 172 spaces at the 1375 Sutter MOB. Of the total of 1,227 parking spaces, 620 would be reserved for patients and visitors, 260 would be reserved for physicians, and 347 would be reserved for staff.

Approximately 161 of the 513 vehicle parking spaces in the proposed Cathedral Hill Hospital garage would be reserved for staff, and an additional 107 spaces would be reserved for physicians. The proposed hospital garage would include 316 full-size parking spaces, 144 compact spaces, 46 wheelchair-accessible spaces, and 7 van-accessible spaces. In addition, 18 motorcycle parking spaces and 150 bicycle parking spaces (100 staff bicycle spaces and 50 public bicycle spaces) would be provided. Precise floor-by-floor designation of parking spaces have not been finalized, and will be included in the construction plans when submitted for building permit approval.

The 17 vehicle parking spaces (13 standard and 4 handicapped-accessible) proposed to be provided on Level 1/P1 of the Cathedral Hill Hospital garage would be available for patients and visitors, and not for hospital support uses. The van parking spaces identified on Level 1/P1 would be part of the 161 parking spaces that would be provided for staff, and would be part of the 513 parking spaces proposed for the Cathedral Hill Hospital garage that would be included as part of the CU authorization. Truck loading spaces are also not included as part of the 513 vehicle parking spaces proposed for the Cathedral Hill Hospital garage.

Approximately 113 of the 542 parking spaces in the proposed Cathedral Hill MOB garage would be reserved for staff, and an additional 114 spaces would be reserved for physicians. This MOB garage would include 244 full-size parking spaces, 269 compact spaces, 25 wheelchair-accessible spaces, and 4 van-accessible spaces. In addition, 18 motorcycle parking spaces and 66 bicycle parking spaces (34 staff bicycle spaces and 32 public bicycle spaces) would be provided.

The 1375 Sutter Street garage currently contains 172 parking spaces, and these spaces would be retained. Approximately 73 of the 172 parking spaces in the 1375 Sutter Street garage would be reserved for staff, 39 spaces would be reserved for physicians, and 60 would be available for patients and visitors. No staff from the 1375 Sutter MOB would be accommodated at the proposed Cathedral Hill Hospital garage. However, as indicated on page 4.5-163 of the Draft EIR, some visitors to the 1375 MOB who were unable to find parking in the building would likely park at the proposed Cathedral Hill Campus MOB garage and walk to the 1375 Sutter MOB.

Table 4.5-34 in the Draft EIR, page 4.5-164, presents a comparison of the proposed supply to the estimated parking demand by population, including physicians and employees as well as patients and visitors. At buildout, the peak parking demand would be about 1,389 spaces, compared with a total supply of 1,227 spaces. At the proposed Cathedral Hill Campus, an overall parking shortfall of 162 spaces would occur, including a parking shortfall of 212 spaces for employees and an overall surplus of 50 spaces for patients and visitors (and would include a parking shortfall at the proposed 1375 Sutter MOB). It is anticipated that short-term visitors to the 1375 Sutter MOB who were unable to find parking within the building would likely park at the proposed Cathedral Hill Hospital and walk to the 1375 Sutter MOB, or park in any available on-street parking space around the campus, although some visitors also might choose to take public transit, use a bicycle, or walk instead of driving. Employees who were unable to park at the campus could take public transit, use a bicycle, walk to the campus, or park off-site at the Japan Center Garage at existing CPMC leased spaces. As analyzed, employees who chose to park at the Japan Center Garage would increase the demand for CPMC shuttle services. The effect of patients, visitors and staff accessing the proposed Cathedral Hill Campus garages on traffic operations was assessed as part of the traffic impact analysis. In addition, a queuing analysis was conducted for the three proposed Cathedral Hill Campus garages to determined whether vehicles accessing the garages would queue out into the adjacent travel lanes, and the potential impact from garage operations on traffic flow was determined to be less than significant (see discussion in Impact TR-5 on page 4.5-100 of the Draft EIR).

See Response TR-121(page C&R 3.7-200) regarding use of Cedar Street for access to the proposed MOB garage. As part of the proposed LRDP, Cedar Street would be converted to two-way operations west of the proposed MOB garage driveway.

3.7.8.3 PARKING – PACIFIC CAMPUS

Comments

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-18 TR, duplicate comment was provided in 30-18 TR]

"10. 0n Page S-10, the proposed Webster St. / Sacramento St. Garage on the Pacific Campus, to be completed in 2018 will have 248 parking spaces. How many of these parking spaces will be used by staff on the Pacific Campus? How many of these parking spaces will be used by staff from the other campuses?

11. On Page S-11, the DEIR states that the North-of-Clay Above-ground Parking Garage will be 85 feet tall with 6 stories and will have 715 parking spaces (Webster/Sacramento + North-of-Clay = 688 plus 27 spaces on Buchanan St. surface lot - also Page 2-117). With 248 parking spaces at the Webster/Sacramento and 440 spaces at the North-of Clay structure, there still will not be enough parking spaces to accommodate the number of visitors that use the facility."

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-19 TR, duplicate comment was provided in 30-19 TR]

"12. On Page S-11, it mentions that the parking spaces at Pacific Campus will total 1,587 spaces by 2020, '648 parking more spaces than under existing conditions.' Typo error -- please switch the words "spaces" and "more" in the sentence. How many of the 1,587 spaces will be used by staff at Pacific Campus? And by staff from other campuses?"

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-23 TR, duplicate comment was provided in 30-23 TR]

"Who from CPMC uses the Japantown Garage? Is it the staff at St. Luke's? at Davies? at Pacific? at California? or at all of the above?"

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-28 TR, duplicate comment was provided in 30-28 TR]

"The existing parking spaces at the Pacific Campus totals 847 spaces (411 at 2405 Clay St. and 400 at 2100 Webster St.) with 92 surface parking spaces (32 at 2333 Buchanan Hospital, 41 at 2300 California St., 9 at 2329 Sacramento St., and 10 for the Clay St. Tunnel). This total of 92 spaces will be lessened to 77 spaces of surface parking at the Pacific Campus. I would request a clarification of the distribution of these surface spaces across buildings at the proposed Pacific Campus. There will be 4 loading spaces all at the Pacific Campus ACC per Page 2-105. The total proposed structured parking spaces at Pacific Campus is 1,510 spaces per Page 2-109 of which 248 spaces will· be at the newly built Webster/Sacramento Underground Parking (mentioned again on Page 2-116), and 440 spaces at the North-of-Clay Parking Garage and 822 spaces to be retained in structured parking (on Page 2-109, Table 2-7b). On Page 2- 113, the DEIR breaks down the several parking lots that CPMC owns on the Pacific Campus:

- 32 parking spaces in the lot north of 2333 Buchanan St.
- How many parking spaces in the former Clay Street Hill parking lot (not shown in Fig. 2-39?)
- 41 parking spaces at 2300 California Street parking lot
- 11 parking spaces at the 2315 Sacramento St. Residential Building

As noted, and although not part of the Pacific Campus, as listed on Page 2-114, CPMC also has:

- 400 parking spaces at the Japan Center Garage leased at 1610 Geary Blvd., 1/2-mile south of the Pacific Campus. Where are the locations of the 822 spaces to be retained? It is not clear to me. Please explain. Also, on Page 2-114, the DEIR states that there are currently 930 off-street parking spaces around the Pacific Campus. How many will be left after the loading zones, bicycle racks, street trees, curb cuts, etc. are put in place?"

(Paul Wermer—CPMC Neighbors Coalition and Pacific Heights Residents, October 18, 2010) [67-26 TR]

"Parking: Notwithstanding the policy that parking is a social, not environmental factor, we maintain that because of parking problems related to CPMC operations there is a quantifiable increase in unsafe driver behaviors in response to congestion problems. Furthermore, as noted in the Japantown Better Neighborhood Plan Organizing Committee e-mail (October 8, 2010), parking demand from CPMC's operations can have a significant and adverse impact on the viability of Japantown – a significant f cultural resource. ·Both of these are CEQA concerns, yet the DEIR fails to address these issues."

(Arthur and Jacqueline Cimento, October 19, 2010) [78-8 TR, duplicate comment was provided in 99-8]

"The draft EIR's analysis of the parking requirements and visitation patterns is inconsistent with the addition of 688 parking spots on the Pacific campus. On page 4.5-49, the draft EIR states that 1,095 parking spaces for CPMC employees and 410 parking spaces for visitors already exist. This parking supply is adequate for the existing use (pages 4.5-47 to 4.5-49).

In the traffic analysis, there is an estimated reduction in net new parking demand at the Pacific campus of 229 parking spaces (Table 4.5-13) and an expected reduction of trips by 4,700 as a result of the proposed change in usage (Table 4.5-10). Even at peak hours, there are only 71 new vehicle trips at the Pacific campus (Table 4.5-11). This analysis is used to support the premise that there will be little impact On surface street traffic from the project.

- The EIR cannot have it both ways. It is inconsistent to state that current parking provisions are adequate, there is a reduction in parking demand, and the proposed project reduces the number of trips, but then propose 688 additional parking spaces at the campus. Yet the project calls for excavation of two city blocks and construction of a seven story parking facility across an entire city block. We request that a revised EIR be issued that addresses a reduction, not an increase, in parking capacity to reflect the draft EIR's stated reduction in auto trips.

- We question whether the motive of the project sponsor is to support the medical mission of the campus or run a commercial parking business. There are no alternatives to this scheme considered in the EIR. Alternatives could include no parking facility at all or addition of additional underground parking which could eliminate the need for an above ground structure."

Response TR-71 (Parking – Pacific Campus)

The comments summarize information contained in the Draft EIR regarding parking supply, express concern related to the parking supply and accommodation of demand, and request provision of fewer or more parking spaces at the Pacific Campus.

The Pacific Campus currently contains 939 off-street parking spaces, 847 in structured parking and 92 in surface lots. With implementation of the proposed CPMC LRDP, a total of 1,587 off-street parking spaces would be provided: 715 spaces would be in the proposed Webster/Sacramento and North-of-Clay Parking Garages, 41 spaces in the existing 2300 California Street lot, 11 spaces in the existing 2323 Sacramento Street lot, nine spaces in the existing 2329 Sacramento Street lot, 411 spaces in the existing 2405 Clay Street garage, and 400 spaces in the existing 2100 Webster Street garage. Therefore, with the proposed CPMC LRDP, 61 parking spaces would be provided within surface lots (41 parking spaces at

the 2300 California Street lot, 11 spaces at the 2323 Sacramento Street lot, and nine spaces in the 2329 Sacramento Street lot). The former Clay Street Hill parking lot (the Clay Street stub east of Webster Street) does not currently contain any parking spaces. The Clay Street stub is used for access to the off-street loading facilities, and staging for temporary loading activities.

As indicated in Table 4.5-34 on page 4.5-164 in the Draft EIR, approximately 721 of the 1,587 total spaces proposed at the Pacific Campus would be reserved for staff, and an additional 260 spaces would be reserved for physicians. In the proposed Webster/Sacramento and North-of-Clay Parking Garages containing a total of 715 spaces (248 spaces in the Webster/Sacramento Underground Parking Garage and 467 in the North-of-Clay Parking Garage), 341 spaces would be reserved for staff, and 374 spaces would be provided for patients and visitors. No other campuses would use the parking facilities at the Pacific Campus. The Pacific Campus would have a peak parking demand of about 1,577 spaces, compared with a total supply of 1,587 spaces. Overall, the Pacific Campus would have a small parking surplus of 10 spaces.

The increase in the number of on-site parking spaces under the proposed LRDP for the Pacific Campus is proposed to ensure that adequate on-site parking would be provided for patients, visitors, staff and physicians. Under existing conditions, the parking demand exceeds the existing parking supply, which results in patients, visitors and staff parking on-street where parking spaces are metered or subject to residential permit parking restrictions. Therefore, no inconsistency would exist between an increase in the parking supply to address an existing shortfall in on-site parking spaces and a minimal increase in vehicle trips to the area. The purpose of the additional parking supply at the Pacific Campus, whether it was aboveground or below grade, would be to accommodate the parking demand generated by the proposed LRDP uses at the Pacific Campus, and it would not be intended for use as a commercial parking business. An alternative that did not include additional parking supply would perpetuate the parking shortfall and, therefore, was not considered by CPMC. Also refer to Response ALT-1 on page C&R 3.22-11 regarding discussion of a reasonable range of alternatives addressed in the DEIR.

As indicated on page 4.5-167 in the Draft EIR, implementation of the Pacific Campus project would include changes to the street network in terms of new driveways and shuttle stops that would require the removal of nine on-street parking spaces. In addition, six on-street parking spaces on Buchanan Street would be converted to a time-limited (e.g., between 8 a.m. and 6 p.m.) curb-side passenger loading and unloading zone.

Also refer to Response TR-75 on page C&R 3.7-145 regarding a discussion of capacity utilization at the Japan Center Garage, and Response TR-129 (beginning on page C&R 3.7-227) regarding the impact of the proposed Cathedral Hill Campus on transportation conditions in Japantown.

Consistent with Comment 18-19, the paragraph below, which appears on page S-11 and page 2-117 of the Draft EIR, is revised to read as follows:

> A total of 715 new ~~structured~~ parking spaces (Webster Street/Sacramento Street Underground Parking Garage and North-of-Clay Aboveground Parking Garage combined, 688 spaces; Buchanan Street surface parking lot, 27 spaces)[23] would be <u>added</u> ~~provided~~ at the Pacific Campus by about 2020. Twenty-five (25) existing structured spaces (associated with 200 Webster) would be demolished. The project would ~~also~~ reduce the total number of surface parking spaces at the Pacific Campus by 15 spaces. ~~This~~ <u>These changes</u> would bring the parking total at the Pacific Campus to 1,587 spaces by 2020, 648 more parking spaces than existing conditions. In addition, six on-street parking spaces currently located on Buchanan Street, between Clay and Sacramento Streets, would be converted to a white-zone curb-side passenger loading and unloading zone.

[23] The existing Clay Street/Webster Street Parking Garage and the other surface parking spaces that would be retained at 2300 California Street (41 spaces) would not change.

3.7.8.4 PARKING– CALIFORNIA CAMPUS

Comments

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-29 TR, duplicate comment was provided in 30-29 TR]

"For the California Campus, per Page 2-127, the following parking spaces exist currently:

- 7 structured parking spaces at 3700 Calif. St. Hospital
- 290 structured parking spaces at 460 Cherry St.
- 120 structured parking spaces at 3838 Calif. St. MOB
- 36 structured parking spaces at 3773 Sacramento St.
- 81 surface parking spaces at 3698 Calif. St. (Marshall Hale)
- 25 surface parking spaces at 3905 Sacramento St.
- 1 loading space at 3801 Sacramento St. Outpatient Research Building (OPR)
- 2 loading spaces at 3698 California St. (Marshall Hale).

This results in a total of 453 structured parking spaces and 106 surface parking spaces and 3 loading spaces for the California Campus.

On Page 2-132, the DEIR states that the parking garages at 3773 Sacramento and 460 Cherry will be kept. That means 36 structured parking spaces (3773 Sacramento St.) plus 290 structured parking spaces (460 Cherry St.) to equal 326 structured parking spaces to be retained at the California Campus."

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [PC-150 TR]

"MS. HILLSON: Good afternoon, Commissioners, President Miguel, Director Rahaim, my name is Rose Hillson. I am a member of the Jordan Park Improvement Association, a long time resident of the Richmond District, and I am not going to go into all the bullet points, I have submitted a document and e-mailed them to you, as well, and to the Secretary, Ms. Linda Avery. I have a few points here. Let's start with the CPMC DEIR analyzes transportation circulation impacts in the immediate vicinity, intersections located at very short distances from the project site, but when the proposed CPMC campus project alters the number of parking spaces, totaling 3,890 spaces in the end, at these newly built buildings, and continues to use the existing parking spaces at various other CPMC20 sites, and leases parking spaces from neighborhood garages, it has an impact in all the neighborhoods with these facilities. In the Richmond District, we have impacts on the Laurel Hill Village Shopping Center because currently there are not enough parking spaces at CPMC garages and nearby lots. This spills over into the Jordan Park area, as well as the Laurel Heights neighborhoods. Then, you have CPMC using the 16th and Geary garage by the Rite Aid and Ross Stores. When CPMC takes the parking spaces in that garage, as they have been for years, nobody can shop along Geary and this hurts the Geary merchants. And the residents around that area are actually circling as far out as 21st Avenue, as far south as Fulton, and as far North as Lake. Why are the neighborhood residents in the Richmond having to suffer parking and congestion issues for a hospital that cannot meet its parking demand? The idea of taking away residential parking zones by SFMTA will hit even harder on the Richmond residents with CPMC people parking all day in so-called 'free zones.'"

Response TR-72 (Parking – California Campus)

The comments summarize information contained in the Draft EIR regarding parking supply, and express concern related to the parking supply and accommodation of demand at the California Campus.

As indicated on page 4.4-178 in the Draft EIR, as part of the proposed CPMC LRDP, the facilities and operations of the California Campus (in the vicinity of Jordan Park) would remain unchanged until 2015, when the majority of activities would be relocated to the Pacific Campus and the proposed Cathedral Hill

Campus. Once the California Campus, including on-site parking facilities, was sold and the majority of services were transferred to the proposed Cathedral Hill Campus and the Pacific Campus, the California Campus would no longer be considered part of CPMC. Analysis of any potential reuse of future redevelopment on the site would be speculative. Any future proposals at the site would require a project-specific, project-level environmental review.

The discussion on page 2-132 of the Draft EIR indicates that determining potential reuse of the California Campus facilities would be speculative; however, it notes that only modest changes and entitlements might be required for some buildings, including the 460 Cherry Street and 3773 Sacramento Street Parking Garages. The discussion in the Draft EIR does not indicate that parking spaces within these garages would be the only parking spaces retained for future uses.

As indicated on page 4.5-182 of the Draft EIR, with implementation of the proposed CPMC LRDP, vehicle trips to and from the California Campus, and associated parking demand, might decrease. Implementation of the proposed CPMC LRDP would not substantially change parking conditions in the California Campus vicinity.

SFMTA is not aware of any proposals to take away residential permit parking (RPP) zones in the vicinity of the California Campus or nearby Richmond neighborhoods.

3.7.8.5 PARKING – DAVIES CAMPUS

Comments

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-21 TR, duplicate comment was provided in 30-21 TR]

"13. On Pages S-13-14, the Davies Campus surface parking lot of 206 spaces at Noe and Duboce will be demolished and a Neuroscience Institute Building erected in its place. Then on Page S-15, a MOB with 490 parking spaces will be built for the Davies Campus. How many of these spaces will be used by staff at Davies? How many of these spaces will be reserved for staff from other campuses?"

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-30 TR duplicate comment was provided in 30-30 TR]

"On Page 2-139, Per Table 2-11, 'Davies Campus: Project Summary Table,' the campus has 290 structured parking spaces (Castro St./14th St. Parking Garage) and will have 490 structured parking spaces at the proposed new Castro St. /14th St. MOB. The Davies Campus also has 206 surface parking spots at the North and South Towers of which 136 will be retained. Davies Campus currently has 3 loading spaces and 1 new loading space will be provided at the new Neuroscience Institute building."

Response TR- 73 (Parking – Davies Campus)

The comments summarize information contained in the Draft EIR regarding parking supply, and request clarification of parking supply at the Davies Campus.

The Davies Campus currently contains 496 off-street parking spaces, including 290 in structured parking and 206 in surface lots. With implementation of the proposed CPMC LRDP, a total of 626 parking spaces would be provided, including 490 spaces provided in the 14th Street/Castro Street MOB parking structure, and 136 spaces in Noe Street surface lots. Of the 626 parking spaces, 105 spaces would be reserved for physicians, 307 spaces would be reserved for staff, and 214 spaces would be available for patients and visitors. No other campus would use the parking facilities at the Davies Campus.

At buildout, the Davies Campus would have a peak parking demand of about 833 spaces, compared with a total supply of 626 spaces. Overall, a shortfall of 207 spaces would occur, including a shortfall of 171 spaces for employees and 36 spaces for patients and visitors. Short-term visitors to the Davies Campus who were unable to find parking on the campus would be likely to park in any available on-street parking space around the campus, although some might also choose to take public transit, use a bicycle, or walk instead of driving. Employees who were unable to park at the campus could take public transit, use a bicycle, or walk to the campus, or park in one of CPMC's other campus parking facilities or within other facilities such as the Japan Center Garage, where CPMC is anticipated to continue to lease 400 parking spaces. Employees who chose to park in off-site facilities might increase the demand for CPMC shuttle services.

3.7.8.6 PARKING– ST. LUKE'S CAMPUS

Comments

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-22 TR, duplicate comment was provided in 30-22 TR]

"14. Pages S-17-18, in the new 5-story, 100-ft. tall St. Luke's MOB/Expansion Building, there will be 220 parking spaces on 4 below-ground parking levels. Of these, what is the number of spaces that will be used by St. Luke's staff? How many will be used by staff from the other campuses?

15. Page S-18, how many parking spaces of the 215 parking spaces at the Duncan Street Parking Garage will be used by St. Luke's staff?

16. Page S-18, 15 parking spaces will be available in surface parking elsewhere on the St. Luke's Campus, How many of these will be for staff at St. Luke's and how many for staff from other campuses?

17. Page S-18 states that there will be a total of 450 parking spaces at St. Luke's. The old count for St. Luke's parking capacity was 239. So with the new 5-story St. Luke's MOB/Expansion Building, having an addition of 121 spaces will be insufficient for staff and visitors at this place. In fact, on Page S-27, Planning Code requires 559 spaces."

(Rachel Sater—Lost Block and Save Our Streets, October 19, 2010) [101-27 TR]

"Page 4.5-210: The parking discussion identifies a shortfall in parking of 309 spaces (41 percent of demand), notes that on-street parking occupancy adjacent to the St. Luke's campus ranges between 80 and 100 percent during the day and 70 percent after 8:00 p.m., and states that '[e]mployees unable to park at the campus would take transit, bicycle or walk to the campus or park in one of CPMC's off-site parking facilities.' The DEIR also assumes that any secondary environmental impacts that might result from the shortfall in parking, such as traffic, air quality, noise and pedestrian safety impacts of drivers circling for parking, would be minor and are accounted for in the transportation, air quality arid noise analyses. However, elasticity of parking demand is relatively low for a hospital use. Whereas employees may more readily change their travel behavior, patients and visitors accompanying patients, as well as physicians, which together account for more than half the parking demand, may be less able to use alternate modes. The parking discussion and the secondary traffic, air quality and noise impacts of the shortfall in parking need to be reevaluated. In addition, given the existing nearly 100 percent utilization of on-street parking, the impact of the 309-space parking shortfall on neighborhood character and livability must be considered in the land use character/compatibility and plans and policies consistency evaluations."

(Rachel Sater—Lost Block and Save Our Streets, October 19, 2010)) [101-28 TR]

"Page 4.5-210: CPMC has acknowledged that the new medical office building may not be built due to the strong possibility of a lack of sufficient hospital use or market demand for medical office space at the St. Luke's Campus. However, the DEIR does not contain any analysis of the potential impacts of the LRDP without the new medical office building. Without construction of the new medical office building and associated underground

parking garage, there would be a total of only 230 parking spaces provided at the St. Luke's Campus, compared to a parking demand of 759 spaces. (The DEIR does not indicate the portion of the St. Luke's Campus parking demand that would be generated by the new medical office building.) Thus, there would be a parking shortfall of 529 spaces, potentially including a shortfall of spaces for physicians. The parking discussion and the secondary traffic, air quality and noise impacts of the 529-space shortfall in parking must be reevaluated. The DEIR should also evaluate the impacts of a 529-space parking shortfall on neighborhood character and livability, land use character/compatibility, and plans and policies consistency."

(Francis Taylor, October 29, 2010) [117-1 TR]

"I am a neighbor of St. Luke's Hospital who has been working for several years on traffic calming on Cesar Chavez Street. I am the cochair of the community organization CC Puede, which has taken the lead on this effort, though I speak only for myself and not for the group.

The proposal for St. Luke's basically prioritizes parking over patients. The proposed 80-bed hospital will replace a facility currently licensed for over 200 beds, while the proposed 200-space parking garage will replace the current 80 or so surface parking spaces. So a third as many patients will share space with three times more cars! This turns the mission of a healthcare organization on its head."

Response TR-74 (Parking – St. Luke's Campus)

The comments summarize information contained in the Draft EIR regarding parking supply, demand, request clarification of the parking supply, and express concern related to the parking supply and accommodation of demand at the St. Luke's Campus.

As presented on pages 2-179 and 2-180 of the Draft EIR, under the proposed CPMC LRDP, St. Luke's Campus would contain an 80-bed hospital and a 201,000 square foot MOB. The proposed CPMC LRDP facilities would replace the existing hospital containing 229 licensed beds, 139 of which are operational. The proposed CPMC LRDP would result in an increase in the daily population at the St. Luke's Campus by about 1,260 persons (see Table 4.5-10 on page 4.5-76 in the Draft EIR), which would increase the parking demand at the campus. As shown on Table 4.5-10 on page 4.5-80 in the Draft EIR, parking demand would increase from about 520 spaces under Existing conditions (for the 229-bed hospital), to about 760 spaces under the proposed CPMC LRDP (80-bed hospital, plus 201,000 square feet of MOB)—an increase of 240 spaces.

The St. Luke's Campus currently contains 329 off-street parking spaces, including 215 parking spaces in the Duncan Street Garage, and 114 spaces in the existing surface lots and reserved on-street spaces. At buildout of the St. Luke's Campus, a total of 450 parking spaces would be provided. Of the total of 450 parking spaces, 98 spaces would be reserved for physicians, 165 spaces reserved for staff, and 187 spaces would be available for patients and visitors. As indicated in Response TR-69 (page C&R 3.7-129), which responds to comments related to the Planning Code, as part of the PUD process for St. Luke's Campus, CPMC would seek an exception to the Planning Code to provide fewer than the minimum required number of parking spaces (i.e., 450 parking spaces proposed, versus 559 parking spaces required).

- With implementation of the proposed CPMC LRDP, a new parking structure containing 220 spaces would be constructed under the proposed MOB/Expansion Building. About 29 spaces would be reserved for physicians, 50 spaces would be reserved for staff, and 141 parking spaces would be available for patients and visitors.

- Within the existing Duncan Street garage containing 215 parking spaces, 54 spaces would be reserved for physicians, 115 spaces would be reserved for staff, and 46 parking spaces would be available for patients and visitors.

- About 15 surface parking spaces would be reserved for physicians.

No other campus would use the parking facilities at the St. Luke's Campus. In addition, to facilitate traffic flow within the garages and reduce around-the-block movements, CPMC would install electronic "FULL" signs near all garage entrances, and directional signage within the proposed MOB garage, directing drivers to use the Cesar Chavez Street exit for access to U.S. 101. To ensure that queues would not spill onto the street if the garage were to become full, an improvement measure, I-TR-5, has been developed which would require the operator of the garage to take appropriate actions to ensure that such queues would not occur. See Response TR-89 (page C&R 157).

At buildout of the St. Luke's Campus, a peak parking demand of about 759 spaces would occur, compared with a total supply of 450 spaces. Overall, a parking shortfall of 309 spaces would exist, including 172 spaces for employees, and 137 spaces for patients and visitors. Since parking would be used by employees, visitors and patients, parking spaces would be used to meet both long- and short-term demand. Short-term visitors to the campus who were unable to find parking on the campus would be likely to park in any available on-street parking space in the campus vicinity, but because of the difficulty in finding on-street parking in the area, some also might choose to take public transit, use a bicycle, or walk instead of drive. On-street parking adjacent to the proposed LRDP site is currently well-utilized, with parking occupancy ranging between 80 and 100 percent between 1 p.m. and 5 p.m., and about 70 percent occupied at 8 p.m. However, transit lines in the St. Luke's Campus vicinity (e.g., the 12-Folsom, 14-Mission, 27-Bryant, and the nearby BART lines) have available capacity to accommodate additional riders, and some patients and visitors may shift to transit to access the campus. Employees who were unable to park at the campus could switch travel modes to public transit, use a bicycle, or walk to the campus, or park in one of CPMC's off-site parking facilities. Employees who chose to park in off-site facilities might increase demand for CPMC shuttle services.

As indicated in Response TR-69, changes in parking conditions are considered to be social impacts rather than impacts on the physical environment. The transportation analysis accounts for potential secondary effects on the physical environment, such as cars circling and looking for a parking space in areas of limited parking supply, by assuming that all drivers would attempt to find parking at or near the St. Luke's Campus and then would seek parking farther away if convenient parking was unavailable. Moreover, the secondary effects of drivers searching for parking typically would be offset by a reduction in vehicle trips because of others who would be aware of constrained parking conditions in a given area. Hence, any secondary environmental impacts which might result from a shortfall in parking in the vicinity of St. Luke's would be minor, and the traffic assignments used in the transportation analysis, as well as in the associated air quality, noise and pedestrian safety analyses, reasonably address potential secondary effects.

The proposed LRDP for St. Luke's Campus would include a new hospital and medical office space, as well as a new underground parking structure containing 220 spaces. The medical office space is a component of the proposed LRDP at the St. Luke's Campus, and the Draft EIR does not state, as implied in Comment 101-28, that "the new medical office building may not be built due to the strong possibility of a lack of sufficient hospital use or market demand for medical office space at the St. Luke's Campus."As discussed in the Draft EIR, the peak parking demand would be 759 spaces and a supply of 450 spaces, resulting in a shortfall of 309 spaces. The parking supply that would be provided if the proposed MOB was not constructed would include the 215 parking spaces in the Duncan Street Garage and a portion of the 114 spaces on existing surface lots. As indicated in the comment, if the proposed parking garage was not constructed, the parking shortfall would increase from 309 spaces to

approximately 360 spaces. The reason for this modest increase is that if the parking garage was not constructed the new medical office building also would not be constructed. This would reduce total parking demand at the campus because the parking demand associated with the new medical office building doctors, staff, and patients would be removed from the demand equation.

3.7.8.7 PARKING – OFF-CAMPUS PARKING FACILITIES

Comment

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-119 TR, duplicate comment was provided in 30-119 TR]

"Also, when the shuttles select a garage such as the Japantown Garage, it is not only the taking up of the spaces for merchant and Japantown users but also a problem because all the shuttles will be frequently circling to and from Cathedral Hill and the BART station. The Japantown garage, a City-owned garage, should not be assisting a private company (CPMC) with running its business at the detriment of the private businesses at Japantown who have been able to sustain business despite past development impacts. Some other garages and lots owned by the City such as those listed below should be considered that are underutilized:

- Yerba Buena Gardens Garage - maybe 50% utilized
- Ellis-O'F arrell Garage
- Sutter-Stockton Garage
- Union Square Garage
- Other City-owned surface parking lots
- Port properties
- City public school parking lots (when not being used)

If the City wants to assist CPMC in their project, it would only be fair that the City provide parking in places that do not impact the financial viability of the merchants in the nearby areas of the projects."

Response TR-75 (Parking – Off-Campus Facilities)

The comment expresses concerns related to the continued use of the Japan Center Garage as a off-campus parking facility for staff, and suggests use of other City-owned facilities.

The 623 off-campus parking spaces identified in Table 4.5-34 in the Draft EIR, page 4.5-164, would be dedicated to CPMC uses. CPMC currently has a lease at the Japan Center Garage for 400 parking spaces through 2015, and a lease at the 855 Geary Street Garage for 180 parking spaces through 2020. CPMC intends to continue these leases and staff would continue to park at these two facilities. The 2105 Steiner Street facility, containing 43 parking spaces, is owned by the Sutter Pacific Medical Foundation, a non-profit organization affiliated with CPMC. Therefore, 623 off-campus spaces would be available for exclusive CPMC use. Staff at the proposed Cathedral Hill Campus and the Davies Campus could park at the Japan Center Garage. However, the St. Luke's Campus would have a staff parking shortfall of 172 spaces, and some St. Luke's staff also might choose to park at these facilities.

The CPMC shuttle currently makes stops at the Japan Center Garage and, therefore, its operations are reflected in existing conditions. Based on information contained in the Japantown Better Neighborhood Plan, capacity is available throughout the day in the garage to accommodate additional vehicles and, therefore, consideration of leases by CPMC at alternate facilities would not be warranted. Because capacity would be available within the Japan Center Garage, parking demand generated by private businesses in Japantown would be adequately accommodated. CPMC does not have plans to lease more than 400 spaces at the Japan Center Garage, and if additional off-site parking was needed, CPMC would seek to lease additional facilities elsewhere. The use of other City-owned parking facilities would not be practical because

parking supply would be available at the nearby Japan Center Garage and other City-owned facilities would be located substantially further away. Because most facilities would be smaller than the Japan Center Garage, it is unlikely that 400 parking spaces in City-owned facilities would be available for CPMC use on a daily basis. Also refer to Response TR-129 (beginning on page C&R 3.7-227) regarding the impact of the proposed Cathedral Hill Campus on transportation conditions in Japantown.

3.7.8.8 AVAILABILITY OF JAPAN CENTER GARAGE

Comment

(Hiroshi Fukuda, September 23, 2010) [PC-160 TR]

"This, in effect, will have almost the same kind of impact as the plan to build 400 condos on the Japan Center. That would close, demolish the garage for several years – two to five years. This will be somewhat similar unless CPMC has adequate and satisfactory mitigations on the parking issue. One of the mitigations was to reserve 400 spaces in the Japan Center, well, they already have 400 spaces in the Japan Center, that is for staff presently. So, I don't quite understand how they could have another 400 unless they have plans to redirect the workers there, the staff, to another site. That hasn't been explained, and it needs to be."

Response TR-76

The comment requests clarification regarding CPMC's use of the Japan Center Garage. CPMC currently has a lease for 400 parking spaces (of the 920 parking spaces in the garage) through 2015. Additional parking spaces beyond the 400 parking spaces would not be leased. An overlap of parking at the Japan Center Garage by construction workers and staff at the Pacific Campus is not anticipated. The Construction Worker Transportation Program (CWTP) prepared by CPMC in December 2010, following publication of the Draft EIR outlines measures that would be required by the construction contractors to encourage construction workers to carpool and take public transit, and to discourage the use of private auto. Thirteen parking facilities in the vicinity of the proposed Cathedral Hill Campus and two satellite parking facilities were identified for use by construction workers driving to the site. Also refer to Response TR-106 (page C&R 3.7-185) for information regarding the use of area parking facilities during construction.

Please refer to Response TR-69 (page C&R 3.7-129) for a discussion of other potentially available parking within the vicinity of the Cathedral Hill Campus that CPMC could seek to contract with if the parking spaces in the Japan Center Garage were no longer available.

3.7.8.9 NORTH-OF-CLAY GARAGE

Comments

(Arthur and Jacqueline Cimento, October 19, 2010) [78-1 TR, duplicate comment was provided in 99-1 TR]

"We are responding to the invitation for public comment on the draft Environmental Impact Report (EIR) for the California Pacific Medical Center (CPMC) Long Range Development Plan.

For over 20 years, my family and I have owned our home on Washington Street which shares the northern property line of CPMC's Pacific campus. In reviewing the draft EIR, there appear to be glaring inconsistencies between the facts presented and the intentions of the project. In particular, there is a disconnect between the size of the proposed North of Clay aboveground parking facility and its stated usage. Given the primary (construction-related) and secondary (long term project induced) impacts of this parking structure, we request that further alternatives be considered. It is not apparent whether the purpose of the parking facility is to support the hospital's staff and patients or introduce a commercial development in violation of existing land use policies for our

neighborhood. Further, the project as currently defined fails to achieve the CEQA requirement of reducing impacts to the point of insignificance."

(Arthur and Jacqueline Cimento, October 19, 2010) [78-4 TR, duplicate comment was provided in 99-4 TR]

"The draft EIR does not adequately address any induced development from the project. Such development could arise from a shift from inpatient to outpatient care (discussed above) and the addition of 688 new parking spots in the middle of a residential neighborhood (Table 2-7b).

The project is located two blocks off of the commercial district of Fillmore Street, which sees many visitors on most weekends and evenings. The availability of a large parking facility close to this district will undoubtedly attract more traffic into the neighboring streets, well above what is required for the medical facility. Also, it is of concern that the character of this traffic may differ from the traffic associated with an in-patient facility, since many users of the facility will be patronizing bars and restaurants at night. In addition, the facility is located on transit lines that are convenient to downtown, making the parking facility a magnet for commuter automobiles. The EIR is inadequate in that it does not consider such changed usage patterns."

(Arthur and Jacqueline Cimento, October 19, 2010) [78-7 TR, duplicate comment was provided in 99-7 TR]

"We would also request additional mitigation measures such as limiting the parking facility's hours of operation to exclude evenings and weekends or restricting its use to bona fide users of the medical facility."

Response TR-77

The comments request information regarding the North-of-Clay parking facility at the Pacific Campus, express concerns regarding potential induced development, ask about the purpose of the parking facility, and also request mitigation measures. The purpose of the North-of-Clay Parking Garage would be to serve as an accessory parking facility to the medical services provided at the Pacific Campus. Providing adequate on-site parking supply would reduce the number of visitors and staff parking on-street, where parking spaces are metered or subject to residential permit parking restrictions. Similar to existing conditions, CPMC would continue its commitment to adjacent residents and nearby businesses and would allow use of the parking spaces at night and on weekends. Visitors to the area would be able to park within the North-of-Clay garage. CPMC would not intentionally limit the hours of operations at the facility or have garage users prove that they were destined to CPMC-related uses. Although CPMC-related overnight parking demand would be substantially lower than during the day, the parking facility would need to remain open to accommodate the demand.

The shift from inpatient to outpatient medical care or the provision of parking spaces to serve the Pacific Campus uses are not anticipated to result in substantial economic changes or induced development in the area. In response to the specific concerns raised in the comment:

- As indicated in Table 4.5-34 in the Draft EIR, page 4.5-164, the Pacific Campus parking demand of 1,577 spaces would be adequately accommodated within the proposed supply of 1,587 spaces. Because the demand would be met within the supply, with a limited surplus of 10 spaces, the proposed supply would not exceed what would be needed by anticipated uses.

- Visitors parking at the proposed North-of-Clay Garage would likely be similar to those currently using the 2405 Clay Street Parking Garage that is located on the southwest corner of the intersection of Clay/Webster. The change from a hospital and inpatient facility to providing predominantly ACC would not substantially alter the evening parking demand at the existing and proposed facilities, and no reason exists to presume that it would alter the character of the visitors using the parking garage during the evening hours.

- The parking rates at the proposed North-of-Clay garage would be similar to those at the existing 2405 Clay Street garage (currently a maximum daily rate of $20 per day), and it is unlikely that a substantial number of commuters to downtown would pay that rate to park and then take a bus downtown. No supporting evidence indicates that the existing garage is used for commuter parking.

Please also see Response PH-25 (page C&R 3.5-82) regarding the discussion of indirect and induced employment and development resulting from the proposed CPMC LRDP.

Mitigation measures are warranted when a project results in a significant impact. As described in Response TR-69 (page C&R 3.7-129), San Francisco does not consider parking supply as part of the permanent physical environment and, therefore, does not consider changes in parking conditions to be environmental impacts as defined by CEQA. Therefore, mitigation measures are not required. In general in San Francisco, parking deficits are considered to be social impacts. The social inconvenience of parking deficits, such as having to hunt for scare parking spaces, is not an environmental impact, but secondary physical environmental impacts might occur, such as increased traffic congestion at intersections, air quality impacts, safety impacts, noise impacts caused by congestion, or transit impacts associated with a shift in mode. Because the Pacific Campus demand would be adequately accommodated within the proposed supply, secondary physical environmental impacts would not result and, therefore, mitigation measures would not be required.

3.7.8.10 CPMC OFF-CAMPUS PARKING FACILITIES

Comment

(Gloria Smith/Tom Brohard & Associates —California Nurses Association, October 19, 2010) [92-31 TR]

"From Footnote 1 to Table 4.5-34, the 623 'off-campus' parking spaces include 400 spaces at the Japan Center Garage, 180 spaces at 855 Geary Street Garage, and 43 spaces in the garage at 2015 Steiner Street. The discussion in this portion of the Draft EIR does not disclose if the 'off-campus' parking spaces at the three locations have been leased by CPMC and would therefore be available to make up a portion of the overall parking shortage. To consider these 'off-campus' spaces as part of the parking supply, the Draft EIR must require that CPMC guarantee that the 623 spaces are available and that adequate shuttle service to and from their campuses will be provided."

Response TR-78

The comment requests information regarding the status of off-campus parking facilities. The 623 off-campus parking spaces identified in Table 4.5-34 in the Draft EIR, page 4.5-164, would be dedicated to CPMC uses. CPMC has a lease at the Japan Center Garage through 2015, and a lease at the 855 Geary Street Garage through 2020. Presumably the leases at these two facilities would be extended before expiration, and CPMC employees would continue to park at these facilities. The 2105 Steiner Street facility is owned by the Sutter Pacific Medical Foundation, a non-profit organization affiliated with CPMC and, therefore, the 623 off-campus spaces are available for exclusive CPMC use. The existing CPMC shuttle serves the Japan Center Garage, and the 855 Geary Street and 2015 Steiner Street facilities are within walking distance of the proposed Cathedral Hill Campus site and the Pacific Campus, respectively.

As part of its "Transit First" policy, the City and County of San Francisco do not require the supply of parking spaces to equal the demand. If the proposed LRDP were not to include provision for these off-campus parking facilities, a parking shortfall would result. However, this shortfall would not be considered a significant environmental effect because it would be considered a social impact and, therefore, no mitigation measures would be required under CEQA.

3.7.8.11 CONSTRUCTION WORKER PARKING

Comment

(Gloria Smith/Tom Brohard & Associates —California Nurses Association, October 19, 2010) [92-32 TR]

"In the parking discussion for the individual campuses, the Draft EIR notes that on-street parking nearby is not available during most hours. In conflict with this, the Draft EIR then suggests that motorists can locate parking on these streets. Available off-street parking at certain campuses will also be limited during construction, and the Draft EIR does not provide mitigation for these significant impacts."

Response TR-79

The comment suggests a conflict in the Draft EIR regarding availability of on-street parking during construction. Although on-street parking in the vicinity of a number of the proposed CPMC campuses would be well-utilized, many of the parking spots would be time limited (either metered or with residential permit parking restrictions), which would result in turnover of parking spaces. Although parking spaces might be difficult to find, they would generally be available, although drivers might need to park further from their destinations.

The Construction Worker Transportation Program (CWTP) developed by CPMC would be required to be implemented by the construction contractors. The program outlines measures that would be required to encourage construction workers to carpool and take public transit, and to discourage the use of private autos. Also refer to Response TR-106 (page C&R 3.7-185) for information regarding the use of area parking facilities during construction.

As indicated on page 4.5-162 in the Draft EIR, San Francisco does not consider parking supply as part of the permanent physical environment and, therefore, does not consider changes in parking conditions to be environmental impacts as defined by CEQA. The parking analysis and discussion of the proposed CPMC LRDP is presented for informational purposes, and mitigation measures are not required.

3.7.8.12 REVOCABLE PERMITS

Comment

(Quevner Zabeles, October 19, 2010) [81-1 TR]

"My apologies, I have an additional comment on the CPMC EIR.

The EIR says that the Geary street driveways for both the hospital and the MOB are "revocable". What does this mean? Who would revoke them, and under what circumstances? Does Cpmc waive it's right to sue if the driveways are revoked?"

Response TR-80

The comment requests clarification regarding revocable permits. Because of concerns regarding driveway operations on Geary Boulevard, the Planning Department specified on page 4.5-87 in the Draft EIR that the "Geary Boulevard parking garage curb cut permit would be revocable, and this condition would be recorded as a Special Restriction on the deed of the Hospital." All permits issued by the Department of Public Works are revocable at the will of the Director of Public Works.

If the Geary ingress driveway for the hospital were to be revoked, the ingress driveway would become an emergency-only ingress driveway (similar to the adjacent emergency-only egress driveway). Access would be restricted by a gate or similar mechanism, and non-emergency ingress and egress to the hospital

garage would continue to be provided via Post Street. If the Geary ingress driveway for the MOB were to be revoked, DPW would request the project sponsor to return the sidewalk and curb in the public right-of-way to conditions that existed before the permit.

Should the City pursue revocation of one or both of the Geary Street driveways and driveway permits at the proposed Cathedral Hill Campus, CPMC could appeal this decision. However, CPMC is expected to proactively work to ensure that conflicts with transit, traffic, and pedestrians would be minimized at these driveways.

3.7.8.13 HOSPITAL PARKING SUPPLY REQUIREMENTS

Comment

(Linda Chapman, October 19, 2010) [76-22 TR, duplicate comment was provided in 111-22 TR]

"The legislative Analyst found that Manhattan limits hospitals to 100 parking spaces. Therefore: What is the rationale for this city to require many times more spaces for any hospital campus? What medical need could justify outsized garages in a transit-rich area with severe traffic impacts? What conditions made it possible for hospitals in other cities to offer less public parking?"

Response TR-81

The comment states that the off-street parking requirements in New York City limit parking for hospitals to 100 spaces, and the comment poses questions regarding similar restrictions for the proposed CPMC LRDP. While it is correct that the New York City Zoning Resolution specifies that for hospitals in Manhattan community districts, a maximum parking supply of 100 spaces is permitted, the requirements for community districts outside of Manhattan (e.g., in Brooklyn or Queens which both have a population density that is greater than San Francisco) are similar to the *San Francisco's Planning Code* requirements. Manhattan has very unique conditions related to density, daytime population, and availability of public transit that are not found in any other city in the United States. Therefore, comparisons in parking requirements between Manhattan and San Francisco are not appropriate.

The New York City Zoning Resolution's off-street parking requirements for hospitals outside of Manhattan community districts range between one space per five beds to one space for 10 beds, depending on the commercial district in which the hospital is to be located.[24] The San Francisco Planning Code requirement for hospitals is one space for each eight beds or one for each 2,400 square feet of gross square feet devoted to sleeping rooms, whichever results in the greater requirement. The Planning Code requirements for hospitals are therefore comparable to New York City, outside of Manhattan.

3.7.8.14 CATHEDRAL HILL NEARBY RELIGIOUS SERVICES AND COMMUNITY ACTIVITIES

Comments

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-139 TR, duplicate comment was provided in 30-139 TR]

"And, when the demolition and construction phases are in full swing, will there be enough parking for the church members? Even though the churches have parking lots, some of them may have used street parking which will be eliminated during the CPMC project. Has this been taken into consideration? Will people from churches/synagogues from Cathedral Hill Hospital project area migrate to the north and take street spaces away from church-goers in the northern streets such as at the Buddhist Church of San Francisco bounded by Pine, Gough, Austin and Octavia (Page 4.1-11)?"

[24] City of New York, Zoning Resolution, Off-Street Parking for Hospitals.

(Galen Workman, October 14, 2010) [55-2 TR]

"[The plan] fails to address the impact on street parking in the area - especially for religious services on Sunday mornings and in the evenings when our community activities occur at the church."

Response TR-82

The comments question the impact (on-going and construction-related) of the proposed Cathedral Hill Campus project on existing parking conditions on Sundays and weekday evenings. Similar to existing conditions at the proposed site, the off-street parking facilities at the proposed Cathedral Hill Hospital and MOB would be available for use by residents and visitors to the area during operating hours. The discussion on page 4.5-163 in the Draft EIR identifies the effect of the proposed Cathedral Hill Campus project on the on-street parking supply. Proposed sidewalk widening and other pedestrian improvements would result in the displacement of 26 standard metered spaces, one wheelchair-accessible space, and 10 commercial loading spaces. The parking demand associated with the permanent displacement would be accommodated on other streets in the campus vicinity and would result in increased parking occupancies (the parking occupancy of the existing on-street spaces adjacent to the project sites varies throughout the day, ranging between 57 percent in the mid-afternoon to about 77 percent at 8 p.m.). Some residents and visitors to the area would have to walk further between their parking spaces and destinations.

Additional field surveys were conducted in December 2010 and January 2011 on Sunday mornings to assess on-street parking utilization. During field surveys, on-street parking spaces were readily available on the east-west streets (e.g., Geary Boulevard, Post Street, O'Farrell Street, Ellis Street) between Van Ness Avenue and Gough Street, and along Van Ness Avenue. Before church services, some on-street parking spaces also were available on Franklin Street (LCW Consulting, 2011). CPMC hospital-related parking demand on Sundays and evenings would be substantially lower than on weekdays, and would be accommodated by the on-site parking supply. Some visitors might park on a street, which would reduce the on-street supply that would be available for religious services and other community activities; however, as indicated above, parking supply would be available in the proposed hospital and MOB garages in the evenings and on weekends.

Although construction of the proposed Cathedral Hill Campus project would not occur on Sundays when services were held at nearby churches/synagogues or at the Buddhist Church on Pine Street, construction activities would require the use of parking lanes adjacent to the proposed hospital (as described on pages 4.5-152 and 4.5-153 in the Draft EIR). The parking demand on Sundays, currently accommodated by these spaces, would need to be accommodated elsewhere in the area and would increase the parking utilization of on-street parking on Sundays, which, based on field surveys described above, would be lower than on weekdays. Visitors who drove to the area for Sunday services might have a longer distance to walk from their parking spaces to their destinations.

3.7.8.15 TENDERLOIN-LITTLE SAIGON CONDITIONS

Comments

(Lower Polk Neighbors, October 19, 2010) [103-27 TR, duplicate comment was provided in 113-27 TR]

"H. Help fund an additional parking garage within the neighborhood (or within a few blocks from the LPN boundaries, but at least 4 blocks away from the hospital and MOB.)"

(Lower Polk Neighbors, October 19, 2010) [103-17 TR, duplicate comment was provided in 113-17 TR]

"F. Because we will be in a heavily-visited hospital zone, parking for our residents and businesses will be very difficult to come by which will deter potential customers from coming to our area. especially for 'pick up' items. (an economic and livelihood issue)"

(Hiroshi Fukuda, September 23, 2010) [PC-162 TR]

"Alternative parking mitigations need to be explored more fully, the need to explore the downtown garages, the Port of San Francisco, Candlestick Park, Cow Palace, possibly the Presidio, etc."

Response TR-83

The comments state a need and recommend additional mitigation for parking in the Tenderloin-Little Saigon and Lower Polk neighborhoods. As described in Response TR-69 (C&R 3.7-129), San Francisco does not consider parking supply as part of the permanent physical environment and, therefore, does not consider changes in parking conditions to be environmental impacts as defined by CEQA. Table 4.5-34 in the Draft EIR, page 4.5-164, presents the parking supply and demand for the proposed CPMC LRDP facilities. Overall, the projected parking demand would be accommodated within the proposed parking supply. At the proposed Cathedral Hill Campus, the parking shortfall associated with employees that drive could be accommodated at off-campus parking facilities (i.e., the Japan Center Garage) and additional parking facilities would not be required. Furthermore, the CPMC TDM Plan would encourage employees to take public transit or other modes, and would discourage auto use. The parking supply for visitors at the proposed Cathedral Hill Campus would be adequate to meet the demand and, therefore, it is not anticipated that visitors would need to rely on on-street parking. Because the campus parking supply would accommodate the demand, it is unlikely that other parking facilities in the vicinity would be affected or that potential customers to neighborhood businesses would be discouraged from driving to the area. Therefore, the need, as a result of the proposed LRDP, would not exist for additional public parking facilities in the area, or the need for the project to help fund additional public parking. Employees of and visitors to the proposed Cathedral Hill Campus would likely patronize businesses in the vicinity of the campus, and these potential customers would be walking to the businesses.

As part of its "Transit First" policy, the City and County of San Francisco does not require the supply of parking spaces to equal the demand. If the Cathedral Hill Campus were to provide fewer parking spaces, a parking shortfall would result. This shortfall would not be considered a significant environmental effect because it would be considered a social impact and, therefore, no mitigation measures would be required under CEQA.

3.7.8.16 LAUREL VILLAGE AND JORDAN PARK CONDITIONS

Comment

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [37-4 TR]

6. The **California Campus**, depending on the extent of the remodel options, will cause more traffic congestion for the Laurel Village shopping center, Laurel Heights and Jordan Park if the parking is not remedied.

Response TR-84

The comment states concerns related to parking and traffic conditions in the Laurel Heights/Jordan Park area. As indicated on page 4.4-178 in the Draft EIR, as part of the proposed LRDP, the facilities and operations of the California Campus (in the vicinity of Jordan Park) would remain unchanged until 2015, when the majority of existing activities would be relocated to the Pacific Campus and the proposed Cathedral Hill Campus. Once the California Campus was sold and the majority of services were transferred to the proposed Cathedral Hill Campus and the Pacific Campus, the California Campus would no longer be considered part of CPMC. Analysis of any potential reuse of future redevelopment on the site would be speculative. Any future proposals at the site would require a project-specific, project-level environmental review. With no planned changes in facilities or operations, transportation travel demand at the California Campus would be expected to remain similar to existing conditions until 2015, and then

gradually would decrease between 2015 and 2020. The proposed LRDP would not result in any new vehicle trips, and, therefore, would not add to existing traffic congestion as within the Laurel Heights or Jordan Park areas.

3.7.8.17 POLK STREET CONDITIONS

Comment

(Carolynn Abst and Ron Case—Case + Abst Architects LLP, October 19, 2010) [102-29 TR, duplicate comment was provided in 114-29 TR]

"F. We currently have two parking spaces in front of our building. It is proposed that one of these spaces be eliminated, for visibility reasons. This will be a negative impact on our business due to reduced client parking availability."

Response TR-85

The comment states concern regarding displacement of one on-street parking space on Polk Street and negative impact to business at 1033-1037 Polk Street. As indicated on page 4.5-165 in the Draft EIR, to improve sight distance for drivers exiting Cedar Street eastbound at Polk Street of southbound bicyclists, one metered parking space immediately north of Cedar Street on the west side of Polk Street would be removed and converted into a sidewalk extension. On Polk Street between Post Street and Geary Street, four metered and three unmetered parking spaces are on the west side of the street, and five metered parking spaces are on the east side of the street. Displacement of one parking space to improve sight distances would reduce the parking supply, and the demand would need to be accommodated elsewhere, thereby increasing the occupancy of other spaces. However, because on-street parking spaces are available to all drivers and not just to those patronizing the businesses in front of which the parking spaces are located, the displacement of one space on Polk Street would not substantially reduce client parking availability over existing conditions for businesses at 1033–1037 Polk Street.

3.7.8.18 JAPANTOWN CONDITIONS

Comment

(Nihonmachi Terrace, October 18, 2010) [75-1 TR]

"We, the residents of Nihonmachi Terrace Apartments, write this letter to raise concerns about the deficiencies of the draft CPMC EIR. Our major concerns are in regards to traffic, parking, air quality, and noise pollution to our residents. The DEIR only addresses peak commute period impacts during demolition and construction. We have an objection to the increase in traffic as well as the parking impact after construction to our neighborhood.

Traffic is already a serious problem with regard to speed and inadequate yielding from the drivers. Pedestrian right of way is too often ignored at the intersections of Octavia/Sutter and Octavia/Post Streets. We believe that the CPMC must make every effort to mitigate these affects. Although we have some off-street parking for our residents, many visitors to our community will be seriously impacted in their quest for parking. The garages in this neighborhood are already at capacity and will be severely stressed during demolition and construction. There must be a serious look at mitigation measures that will address some kind of off-site parking for the Construction Company and sub-contractor as they come to work and return home in the evenings. Sub-contractors in particular are most insensitive to neighborhood concerns. The general contractor must establish an enforceable agreement from all sub-contractors that require them to abide by traffic and parking mitigation measures."

Response TR-86

The comment states concerns related to traffic impacts on Japantown streets, and location of construction worker parking, and incorrectly states that the transportation impact analysis only addresses peak commute impacts during demolition and construction. The Draft EIR includes an assessment of construction-related transportation impacts as well as operation impacts of the proposed LRDP. The transportation analysis conducted for the Draft EIR included analysis of traffic and transit conditions for 2015 Modified Baseline and 2030 Cumulative conditions, both with and without the proposed CPMC LRDP. The impacts associated with intersection operations are presented in Impact TR-1 through Impact TR-23 for 2015 conditions (Draft EIR, pages 4.5-93 through 4.5-115), and Impact TR-99 through Impact TR-124 for 2030 Cumulative conditions (Draft EIR, pages 4.5-216 through 4.5-232). The impacts on traffic operations during the peak of the construction activities are described in Impact TR-55 (Draft EIR, pages 4.5-147 through 4.5-160). Also please refer to Response AQ-27 (page C&R 3.9-71) for air quality, and Response NO-36 (page C&R 3.8-45) for noise.

Concerns regarding unsignalized midblock crosswalks and the request in Comment 45-6 TR in Response TR-67 (page C&R 3.7-124) to provide a flashing yellow light at the unsignalized midblock crosswalk on Post Street between Gough Street and Laguna Street (at former Octavia Street) was forwarded to SFMTA for its review, which would address the issue identified in the comment regarding existing failure to yield to pedestrians at this location. As indicated in Response TR-129 (page C&R 3.7-227), the majority of vehicle trips destined to and from the proposed Cathedral Hill Campus would use major arterials to access the site, including Van Ness Avenue, Franklin Street, Gough Street, and Geary Boulevard. West of Gough Street, Sutter and Post Streets are local streets, and CPMC LRDP-generated vehicles would be dispersed over multiple streets. The nominal increase in vehicles on local streets in Japantown would not substantially affect operating conditions at the two unsignalized midblock crossings on Post Street and Octavia Street. SFMTA has reviewed the community request for flashing yellow lights, in-street pedestrian crossing signs, STOP signs, and consolidation of crosswalks, and has indicated that installation of a solar-powered, push button-activated flashing beacon on existing poles would be possible. SFMTA is exploring funding possibilities for installation of the flashing beacon. The pedestrian impact analysis for the Cathedral Hill Campus, as presented in Impacts TR-40 through TR-42 on pages 4.5-130 to 4.5-136 of the Draft EIR, did not identify any significant pedestrian impacts along Post Street. Therefore, providing a flashing yellow light at the existing midblock crosswalk is not required as a mitigation measure.

CPMC and its contractors would develop the CWTP to ensure that the parking demands for construction workers were met without impacting parking availability for patients, employees, visitors, or other local merchants and residents near each campus. The goal of the CWTP would be to reduce the number of workers driving to construction sites and to manage the use of available parking supply so as to not unreasonably impact parking availability for patients, employees, local merchants, residents, and visitors. Workers would be encouraged to use public transportation, carpool, or vanpool, or use shuttles to access construction sites, consistent with the City's Transit-First policy. The implementation of the CWTP would minimize the potential that construction workers would park in residential neighborhoods. CPMC has indicated that all construction personnel would be instructed not to park on-street, and penalties would be assigned where this was not followed.

Following publication of the Draft EIR, CPMC identified and contacted 13 parking facilities within walking distance of the proposed Cathedral Hill Campus to determine parking availability during construction of the campus. In aggregate, the facilities contained about 480 available spaces, of which approximately 75 percent, or 360 spaces would be pursued for construction parking use.[25] CPMC would work with garage management to monitor overall garage occupancies, and if maximum capacities were exceeded, CPMC would redirect its parking demand to other facilities, further from the campus site.

[25] EIR Construction Data Report (Revised 2011), Sheet CO-5- Parking Locations, prepared by Herrero Boldt.

CPMC envisions the use of parking passes to be issued to individual drivers with staggered start times between 6:30 a.m. and 8:30 a.m., spreading out arrivals. Any lot within walking distance but greater than a 10-minute walk from the construction site would be linked to the site by shuttle service, provided by CPMC. Two satellite parking facilities have been identified to supplement facilities closer to the proposed Cathedral Hill Campus. The Performing Arts Garage and the 12th Street/Kissling Garage have a combined capacity of 1,400 spaces, and approximately 800 of these spaces were identified by the operators to be available on a regular basis. CPMC has long-term leases at these facilities for use in its operations as well as for construction projects. In the event that these facilities would need to be used, shuttles between these facilities and campus sites would be provided.

3.7.8.19 CATHEDRAL HILL CAMPUS PARKING SUPPLY AND VEHICLE TRIPS

Comments

(Jack Scott, September 23, 2010) [19-3 TR, duplicate comment was provided in 40-3 TR]

"The current plan proposes to construct 2 separate parking garages one for the hospital and one for the medical office building. Combined they would represent +/- 1,000 spaces. 1,000 spaces equal 1,000 cars and approximately 10,000 ADDITIONAL vehicle trips per day to the already congested Van Ness corridor."

(Lois Scott, September 23, 2010) [PC-7 TR]

"The current plan proposes to construct two separate parking garages, one for the hospital, and one for the medical office building; combined, they would represent plus or minus a thousand parking places. A thousand parking places equates to a thousand cars, which equate to 10,000 daily automobile trips. The already congested Van Ness corridor, Franklin Street, Post Street, and Geary Blvd. would be further impacted with these garages and these numbers of cars."

Response TR-87

The comments state concern over the supply of off-street parking spaces at the proposed Cathedral Hill Campus and the number of vehicle trips generated by the proposed campus project. The Cathedral Hill Campus project would provide a total of 1,227 off-street parking spaces, including 513 spaces at the Hospital, 542 spaces at the MOB facility, and 172 spaces at 1375 Sutter Street. The Cathedral Hill Campus project would displace 405 parking spaces at 1133 Van Ness Avenue that are part of the existing Cathedral Hill Hotel uses on the project site. The Cathedral Hill Campus project, including the 1375 Sutter MOB, was estimated to create 8,220 net new daily vehicle trips (inbound and outbound). The proposed Cathedral Hill Campus project would generate 593 a.m. peak hour vehicle trips, and 609 p.m. peak hour vehicle trips. The impact of the additional vehicle trips for the project and variant access options is presented in Impact TR-1 through Impact TR-26 on pages 4.5-93 to 4.5-116 in the Draft EIR.

The proposed Cathedral Hill Campus project would result in significant and unavoidable impacts at the intersections of Van Ness/Market and Polk/Geary, and feasible mitigation measures have not been identified. At six intersections that would operate poorly under 2015 No Project and 2015 plus Project conditions, the project contributions to the poor operating conditions would be less than significant. At 18 of the 26 study intersections, operating conditions would remain at LOS D or better under 2015 plus Project conditions. Therefore, although the proposed Cathedral Hill Campus project would increase the number of vehicles and average delay per vehicle at nearby intersection, the majority of the intersections would continue to operate at acceptable levels of service.

3.7.9 LOADING

3.7.9.1 PASSENGER LOADING

Cathedral Hill Hospital Parking Structure—Loading Area

Comment

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-115 TR, duplicate comment was provided in 30-115 TR]

"On Page 4.5-84, Table 4.5-15 ('Peak Hour Passenger Loading/Unloading Zone Demand by Campus'), it shows that the peak-hour demand in the AM would be 60 linear feet and the loading demand is 75 feet. If the vehicles arrive on the Geary side, the vehicles may start to queue up in the hospital 'drop-off' zone depending on the activity going on in the drop-off zone. Sometimes a disabled person is dropped off and these people require more time than others so the 'drop-off' zone itself appears to be a total of about 200 feet for both sides of the island (Page 2-75). How long is it? This area needs to be very well-lit, have pedestrian-triggered lights and sound and a vibrating pole or other device for people who are both deaf and blind.

Are there disabled ramps in this 'passenger drop-off' zone (Page 2-75)?"

Response TR-88

The comment states concerns regarding the internal passenger loading/unloading facilities at the proposed Cathedral Hill Hospital. The passenger loading demands for the proposed hospital, presented in Table 4.5-15 in the Draft EIR (page 4.5-84), would be 60 linear feet during the a.m. peak hour and 75 linear feet during the p.m. peak hour. An analysis of the passenger loading is also presented in Section 4.7.2 on pages 104–105 of the *Cathedral Hill Transportation Impact Study*, which is on file and available for public review at the San Francisco Planning Department. The length of the proposed passenger drop-offs are shown in Figure 19, on page 117 of the study. As shown in Figure 19, the passenger drop-off would be located approximately 150 feet from the entrance at Geary Street and the dedicated passenger drop-off area would have 125 linear feet of curb, which would exceed the projected peak demand of 75 linear feet. Drop-offs would not be allowed on the median island that would separate the drop-off area from the parking circulation lanes. The drop-off area would have two lanes so that vehicles could exit once their passengers were dropped off. This design would improve the efficiency of drop-offs. Furthermore, CPMC proposes to use attendants at their drop-off areas, to manage vehicles that would be loading and unloading patients as well as to provide assistance to patients once they were dropped off. If drop-offs took more time and a queue formed, CPMC would be required to address any queue issues to meet the requirements of Improvement Measure I-TR-5 (Queue Abatement). For more information on this Mitigation Measure, see Response TR-89. The proposed hospital design would conform to the American with Disabilities Act (ADA) design standards; therefore, the loading areas would be designed with the appropriate lighting and safety and include ADA ramps. The final configuration of the passenger loading area would be submitted to the City, and ADA compliance would be part of the plan review process. Also see Response TR-65 (page C&R 3.7-122), which addresses concerns regarding hearing- and visually impaired individuals.

Cathedral Hill Hospital Geary Access—Queue Spillback

Comment

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-116 TR, duplicate comment was provided in 30-116 TR]

"In addition, a vehicle may block the proposed Geary BRT lane which is located closest to the hospital if it queues into the lane. The BRT will have to wait for the vehicle to get out of the BRT lane before proceeding so there could be a transit impact. If the BRT is blocking the entrance to the hospital 'drop off' zone, the vehicles will start to double up next to a 38/38l-Geary bus until it passes. This will cause the traffic in the lane the vehicle is in to come to standstill because it will become a double-parked vehicle for the time it takes for the bus to clear. For these instances, the 3 lanes of Geary will turn into 1 lane and cause traffic to back up across the intersection of Geary and Van Ness. One must also account for the right turning vehicles off of Van Ness onto Geary who want to go to the hospital. They will also be affected in that they will not be able to turn so the backup grows on Van Ness down to Post St. and possibly farther north to Hemlock St. and Sutter St. This is similar to the commuter traffic at Laguna and Geary where there is a 'no right turn' sign so the traffic southbound on Laguna and the traffic turning from Post St onto southbound Laguna gets backed up. I think this hospital traffic scenario will be even worse than that on Laguna. The other example of how this will not work occurs today at Kaiser Permanente Hospital at Geary and Divisadero. The drop-off lanes are filled with parked vehicles so that the shuttles cannot use them and nobody enforces the white zone. So the shuttles double park on Geary Boulevard westbound and the 38/38L-Geary has to maneuver around the double-parking and swerve almost to the Number 1 (closest to the median) lane and back to the Number 3 lane (closest to the curb). Vehicles are jockeying for position to get around the traffic congestion simultaneously."

Response TR-89

The comment states concerns related to queue spillback from the proposed Cathedral Hill Hospital Parking Garage that could impact local street operations. The transportation analysis considered the potential of queuing at the ticket dispensers and at the passenger loading area as shown in Figure 4.5-19, page 4.5-101 of the Draft EIR, and how these activities could affect traffic operations on the adjacent streets. The detailed analysis summarized in the Draft EIR, of the ticket dispenser operations is included in the *Cathedral Hill Transportation Impact Study* (Section 4.6.4, "Queuing at Parking Garage Entrances due to Ticket Machine," pages 119–121). The ticket dispenser analysis indicated that a maximum of three vehicles would queue behind the ticket dispenser at the hospital parking structure. Because the ticket dispenser would be located on Level P-1(first parking level below grade) of the parking structure (more than 450 feet within the hospital building), queue spillback from the ticket dispensers would not encroach onto Geary Boulevard. As summarized in Response TR-88 (page C&R 3.7-156), the passenger loading area would have sufficient space to accommodate the loading/unloading demand, and thus, no queue spillback would occur from the hospital passenger loading area that would cause a spillback onto Geary Street. Although some vehicles might encounter interruptions because of pedestrian activity, they would be short in duration and then the vehicle would be free to enter the parking structure without further delay. Therefore, the Draft EIR properly concluded that the traffic impact of spillback into adjacent traffic lanes from garage operations would be less than significant. To further insure that queuing would not adversely affect traffic operations on adjacent streets, the an improvement measure is proposed, which identifies specific actions that would be taken in the event that queues form on adjacent public streets.

Page 4.5-102 of the Draft EIR is revised to include the following the text and improvement measure related to Impact TR-5:

<u>Although the impact of queuing (queue spillback) from the Cathedral Hill parking garages would be less than significant, implementation of Improvement Measure I-TR-5 below would further reduce the less-</u>

than-significant impact by specifying actions that would be required should queues form on adjacent streets.

Improvement Measure I-TR-5 – Off-Street Parking Queue Abatement

It shall be the responsibility of the owner/operator of any off-street parking facility primarily serving a non-residential use, as determined by the Planning Director, with more than 20 parking spaces (excluding loading and car-share spaces) to ensure that recurring vehicle queues do not occur on the public right-of-way. A vehicle queue is defined as one or more vehicles blocking any portion of any public street, alley or sidewalk for a consecutive period of three minutes or longer on a daily or weekly basis.

If a recurring queue occurs, the owner/operator of the parking facility shall employ abatement methods as needed to abate the queue. Suggested abatement methods include but are not limited to the following: redesign of facility layout to improve vehicle circulation and/or on-site queue capacity; employment of parking attendants; installation of LOT FULL signs with active management by parking attendants; use of valet parking or other space-efficient parking techniques; use of off-site parking facilities or shared parking with nearby uses; use of parking occupancy sensors and signage directing drivers to available spaces; travel demand management strategies such as additional bicycle parking, customer shuttles or delivery services; and/or parking demand management strategies such as parking time limits, paid parking or validated parking.

If the Planning Director, or his or her designee, suspects that a recurring queue is present, the Department shall notify the property owner in writing. Upon request, the owner/operator shall hire a qualified transportation consultant to evaluate the conditions at the site for no less than seven days. The consultant shall prepare a monitoring report to be submitted to the Department for review. If the Department determines that a recurring queue does exist, the facility owner/operator shall have 90 days from the date of the written determination to abate the queue.

Cathedral Hill Campus Emergency Department Passenger Loading Area

Comment

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-128 TR, duplicate comment was provided in 30-128 TR]

"69. On Page 4.5-143, Franklin St. has 3 curb cuts, one for Emergency Department Drop-off, one service entrance for trucks that use the loading dock and an additional service exit for these trucks. A 'porte cochere' is shown on Page 2- 101. I do not see how the vehicular and pedestrian circulation will work here in the porte cochere area at the Emergency Drop-off even when looking at Page 2-77, Figure 2-19. Will there be pedestrian islands? With all the traffic on this Franklin Street side, I am concerned with this area. Even the shuttles would be allowed in the Emergency Drop-off area per Page 4.5-143. Would there be a more detailed diagram of the pedestrian and vehicle flow?"

Response TR-90

The comment requests clarification related to proposed Cathedral Hill Hospital operations along Franklin Street. As stated in the comment, three driveways would be located along on Franklin Street between Geary Boulevard and Post Street. The two southern driveways would provide access and egress to the off-street truck loading area. The northern-most driveway would provide public access by private vehicles to the Emergency Department. Emergency vehicles (ambulances) would have a separate loading area that would be accessed via Post Street (see Figure 4.5-16 on page 4.5-91 in the Draft EIR).The CPMC intercampus shuttles would utilize the shuttle loading area located within a recessed passenger loading bay on Post Street, and would not therefore be utilizing the Emergency Department loading area. Figure

4.5-21 on page 4.5-143 in the Draft EIR is revised to clarify the types of activities allowed in each loading area and the emergency vehicle (ambulance) loading area is added to the figure. The revised figure shows that the Emergency Department drop-off area would have five angled parking spaces, one accessible drop-off space along the curb, and room for two additional vehicles to allow drop offs at the curb. CPMC would have an attendant monitor the loading area to maintain access for patients. A sidewalk would be provided for pedestrians to access the Emergency Department lobby directly from Franklin Street.

In addition to this drop-off area, the Emergency Department would have 10 dedicated parking spaces located on Level 1 in the parking structure (see Figure 2-17 on page 2-73 in the Draft EIR). These spaces would be located immediately below the Emergency Department, which would be easily accessible via a nearby elevator. These spaces would be used by private vehicles; emergency vehicles would use the Post Street access. Two of the spaces would be designated for 5-minute parking for drop-off and pick-up of patients. The other eight spaces would be designated for Emergency Department use only, without specific time restrictions.

3.7.9.2 SERVICE LOADING

Pacific Campus Truck Loading Peak

Comment

(Paul Wermer—CPMC Neighbors Coalition and Pacific Heights Residents, October 18, 2010) [67-18B TR]

"5) TRANSPORTATION AND CIRCULATION:

Unfortunately, the PM commute period is not when the worst traffic impacts are felt in the hospital vicinity. In the case of Pacific site, for example, there are interactions with delivery of goods to the site as well as interactions with school drop-off and pick-up. These occur outside of the peak commute periods, yet have significant adverse impacts - notably in the increase of unsafe driver behaviors, which threaten pedestrians and other drivers."

Response TR-91

The comment expresses concern that the worst traffic impacts at the Pacific Campus occur at times other than the p.m. peak hour. The comment is correct that the peak truck loading activity at the Pacific Campus, similar to city-wide conditions, would occur outside the p.m. commuter peak. Based on truck loading surveys conducted at the Pacific Campus (*Pacific Campus Transportation Impact Study*, Appendix C5), and as described under Impact TR-63, page 4.5-173 of the Draft EIR, the existing peak loading demand (13 percent of daily activity) occurred between 10 a.m. and 11 a.m., outside the commuter morning and evening peak periods and school peak periods. During the afternoon school peak periods of 2 p.m. to 4 p.m., 10 percent of the daily activity occurs between 2 p.m. to 3 p.m. and 8 percent of the daily trips occur between 3 p.m. and 4 p.m. The truck loading analysis for the Pacific Campus considered the number of daily trucks that would access the site, based on the *SF Guidelines* and the size of the project. The daily truck trips were used to determine that the maximum number of trucks at the site would be nine trucks during the peak hour and that the average hourly truck loading demand would be seven vehicles per hour. For the overall transportation network, the p.m. peak hour is generally considered the time period when maximum use and the most traffic congestion occurs and, therefore, generates the greatest number of potential traffic impacts. See Response TR-10, page C&R 3.7-26, for additional information on the p.m. peak-hour analysis period.

A new truck loading area would be constructed as part of the proposed renovations to the campus. A total of nine commercial parking spaces would be provided, either within the loading area or on the street. Additionally, with the change in services at the facility, it was estimated that fewer large trucks would need to access the facility and deliveries could be performed with smaller trucks. CPMC currently

maintains receiving facilities off-site to serve the CPMC campus system. The off-site facilities accommodate large truck loading/unloading and warehousing. Many deliveries to the CPMC campuses would be consolidated at the receiving center and loaded onto smaller, single-unit trucks (35 feet long) for delivery.

The creation of a new off-street loading area with nine loading spaces and the use of smaller trucks would reduce the potential for interactions between CPMC trucks and private autos on the public streets during the afternoon school pick-up period.

Truck Entry Maneuvers Blocking Traffic

Comments

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-11 TR, duplicate comment was provided in 30-11 TR]

"5. And overall, on a programmatic level, there appears to be a significant impact with transportation and circulation in and about the new Cathedral Hill proposed development of the new 15-story, up to 265-ft. tall (excluding 16-ft. tall exhaust stacks on roof, 269 ft. to top of mechanical screens per Page 2-27), 555-bed hospital and 9-story above grade (excluding mechanical roof level), 130-ft. tall medical office building (MOB) as well as for the other campuses. I think there needs to be a better traffic study not only in the limited area shown in the DEIR, e.g. for Cathedral Hill Campus, on Pages 4.5-96 and 4.5-97, but also in the area to the west towards Japantown which will be impacted by diverted traffic when the Loading Dock deliveries are made and traffic tries to go around them onto a street that will continue northbound or when there are problems on the Post St. entrance or on Geary. Comments on this issue will also appear later on in this document."

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-42 TR, duplicate comment was provided in 30-42 TR]

"22. For the same reason, there could be pedestrian and vehicle conflict at the Loading Dock on Franklin St. On Page S-47, Impact TR-44 (Implementation of the Cathedral Hill Campus project and subsequent operation of the Cathedral Hill Hospital off-street loading facility could result in potentially hazardous conditions on Franklin Street.). The mitigation measure, MM-TR-44 (Loading Dock Restrictions and Attendant) that places restrictions on trucks longer than 46 feet to use the Loading Dock only between 10 p.m. and 5 a.m. and for CPMC to monitor and document truck deliveries between 10 p.m. and midnight for 6 months after full building occupancy and to have an attendant present to stop oncoming traffic for delivery trucks to maneuver into the Loading Dock will cause all three lanes of northbound Franklin St. to come to be blocked and people will start cutting through the neighborhood to get around. Traffic may flow down Laguna St. next to the Japantown Peace Plaza, the first northbound street west of Franklin and continue north on Laguna or a right turn made at Post Street eastbound back to Van Ness to bypass the 'loading dock gridlock.' It is not likely that the traffic will divert east since Geary only goes westbound at that location. Westbound Geary traffic may also start to pile up if vehicles do not go around to Laguna St. Laguna will start to back up into the Geary/Laguna intersection until the drivers start cutting through the other streets in Japantown I think this mitigation measure will impact Japantown businesses and residents along Laguna St. and Post St. and does not take into account that due to the one-way (in the wrong direction) nature of the streets adjacent to Franklin, people will go west towards Japantown when the Loading Dock blocks traffic on Franklin. The mitigation measures do not address how the traffic will be resolved going into Japantown."

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-45A TR, duplicate comment was provided in 30-45 TR]

"According to Page S2-77, the Loading Dock is in the southwest corner of the proposed hospital building at Geary St. / Franklin St. The loading dock door is also located at the most southerly portion of the Loading Dock, closest to the Geary/Franklin corner. I think having this loading dock door at the very southwest location closest

to the Geary/Franklin corner is worse than having the loading dock door farther north on Franklin because vehicles that want to make a right turn off of westbound Geary will be blocked by the truck getting into or out of the Loading Dock and cause Geary to get congested as well as Franklin at the same time. Moreover, if the Geary BRT is running westbound in the lane closest to the Hospital, it can be blocked by a truck maneuvering into or out of the Loading Dock. An unsafe situation is probable where the vehicular traffic flows around the stuck BRT or those who want to make a right off of Geary onto northbound Franklin."

(Helene Dellanini—DBC Master Owner's Association, October 18, 2010) [71-7 TR, duplicate comment was provided in 72-7 TR]

"TR-43: Implementation of the Cathedral Hill Campus project would not result in a loading demand during the peak hours of loading activities that could not be accommodated within the proposed loading supply or within on-street loading zones.

TR-43 Comment: The length, slow moving nature, and wide turning radii, of the anticipated delivery trucks pulling in and out of the loading docks at Franklin was not analyzed for significant impacts to the flow of traffic on Franklin during peak traffic hours. We are concerned this will cause major delays and recommend that CPMC is restricted from having deliveries occur during peak traffic times. In addition, a traffic controller should be required to be stationed in the area to facilitate the safe entry and exit of such trucks at all times."

Response TR-92

The comments state concerns about the operations of the proposed Cathedral Hill Hospital off-street loading area located off Franklin Street. The centralized truck loading area on Franklin Street would contain one loading space for trucks up to 55 feet in length, and three spaces for trucks up to 45 feet in length. In addition, 14 spaces for vans and smaller vehicles 20 feet or shorter would be provided in the Level 1 parking garage. The Franklin Street loading area also would include two dedicated trash loading docks. Mitigation Measure MM-TR-44 on page 4.5-139 of the Draft EIR requires that trucks longer than 46 feet would only be allowed to access the loading area during the off-peak hours between 10 p.m. and 5 a.m., when traffic volumes on Franklin Street would be lower. This mitigation measure would reduce the number of large vehicles at the loading area during peak traffic periods on Franklin Street and Geary Street. Mitigation Measure MM-TR-44 also would require that CPMC provide attendants at the loading area on a 24-hour basis to monitor truck loading activity and report to the City on loading operations.

The Franklin Street loading area was designed to allow trucks of all sizes to enter the loading area from Franklin Street cab first. Therefore, slower backing maneuvers would only occur once the truck was inside the loading area and not on Franklin Street, where trucks could potentially block traffic on Franklin and Geary Streets. CPMC provided a summary of the proposed Cathedral Hill loading dock operations that included turning templates, showing how trucks of various sizes would access the loading docks. (Memorandum from CHS Consultants, April 14, 2010, *CPMC LRDP Transportation Impact Study*, Appendix I.)

Because trucks would be able to enter cab first and turn around within the loading area, the amount of time that a large truck would block the flow of traffic on Franklin Street or Geary Street would be minimized. CPMC would staff the loading area 24 hours per day and would have an attendant available to control traffic on Franklin Street when a large vehicle entered or exited the loading area. Because of the anticipated short durations of traffic interruption and the relatively low traffic volume on Franklin Street during the off-peak hours, a relatively small number of vehicles using Franklin Street, if any, might choose to take an alternate route because of the presence of a truck entering or exiting the proposed Cathedral Hill Hospital loading area. Therefore, no impact would occur to Japantown because of the CPMC truck activity at the Franklin Street loading area.

Oxygen Tank Access/Recharging

Comment

(Hisashi Sugaya—Planning Commission, October 15, 2010) [116-1 TR]

"1. Pg. 2-53, Figure 2-4 and Pg. 2-77, Figure 2-19. The O2 Tank is shown as being on Level 3. Please clarify how the O2 tank will be refilled/replenished. At St. Francis Hospital a truck with oxygen (liquid?) routinely blocks Pine Street. Any such 'deliveries' should not take place on either Geary Street or Franklin Street; please clarify O2 deliveries at this site."

Response TR-93

The comment requests clarification on how deliveries of oxygen would occur at the proposed Cathedral Hill Campus. The oxygen delivery truck would occupy the right lane of Franklin Street near the corner of Geary Boulevard. Oxygen replenishment delivery would occur at most twice each week. The complete process would takes less than an hour, with pumping taking place for approximately 20-25 minutes. CPMC would be notified 72 hours in advance of a needed delivery and would restrict delivery and filling to the hours when church activities do not typically take place. Restricting this activity to times when church activities do not typically take place, and outside peak travel periods would limit local vehicle and transit disruptions at this location. For further information on truck loading hours, see Response TR-94, below.

Truck Loading Hours

Comment

(Helene Dellanini—DBC Master Owner's Association, October 18, 2010) [71-28 TR, duplicate comment was provided in 72-28 TR]

"TR-43. The mitigation measure for TR-55 also requires CPMC to coordinate temporary and permanent changes to the transportation network within the City of San Francisco. The proposed loading docks for the Cathedral Hill Hospital are located on Franklin Street. After completion of construction and during normal operations of the hospital, truck deliveries to these loading docks will continue to have an impact on the flow of traffic on Franklin Street. Therefore, the hours for truck deliveries to the hospital should be restricted to occur between 8 AM and 5 PM to minimize the traffic impacts to the project vicinity."

Response TR-94

The comment states that after construction activities, normal operational deliveries to the proposed Cathedral Hill Hospital should be restricted. The Truck Management Plan for the proposed Cathedral Hill Campus was designed to minimize the impact of truck operations on the adjacent streets. The description of the plan is included as Appendix I, Loading Analysis in the *Cathedral Hill Transportation Impact Study*. The Truck Management Plan includes several key features; including maximizing the use of the loading areas, including 24-hour use when feasible; actively managing loading areas; and allowing evening deliveries of some services, including those from a centralized-CPMC distribution center.

In addition to the Truck Management Plan, Mitigation Measure MM-TR-44 would require that large trucks (longer than 46 feet) use the loading area between 10:00 p.m. and 5:00 a.m., to reduce the potential for interruptions of traffic on Franklin Street. By operating 24 hours per day and restricting many of the deliveries to the evening hours, the Truck Management Plan would minimize the number of trucks accessing the campus during commuter peak periods or in the middle of the day when traffic volumes on the adjacent streets would be at their highest levels. Restricting deliveries to between 8 a.m. and 5 p.m., as

suggested by the comment, would concentrate the truck activity and increase the traffic impacts on the adjacent roadways during the peak travel periods.

Truck Loading Operations Mitigation

Comments

(Donald Scherl, October 18, 2010) [74-17 TR]

"Impacts-44 and 48: Last but by no means least, implementation and operation of the project at Cathedral Hill could 'result [in] potentially hazardous conditions on Franklin St.' In an attempt to mitigate this potential hazard, CPMC is to conduct an unsupervised study the results of which will be reported to the Planning Department and the SFMTA. Given no city on-site supervision, there is no reason to believe the results of such a 'study.'"

(Barbara Kautz—CHNA and Bernal Heights Neighborhood Center, October 19, 2010) [87-33 TR, duplicate comment was provided in 108-33 TR]

"Even assuming that these reductions in truck deliveries can be achieved, the analysis does not fully analyze all potential impacts. At the Cathedral Hill site, for instance, the DEIR indicates that trucks longer than 46 feet entering the loading dock from Franklin Street have the potential to significantly disrupt traffic, but provides no analysis of the impacts of smaller trucks, which undoubtedly will also slow down traffic considerably, especially during the peak demand when 19 trucks at one time will be loading and unloading. No analysis is provided of delays when trucks must wait for other trucks to enter or leave the facility. Mitigation Measure MM-TR-44 both creates new impacts and improperly defers mitigation. It requires only that CPMC submit a report on deliveries by large vehicles to the City, and neither provides a commitment to mitigation nor any performance standards that the mitigation must meet; nor does it provide alternative approaches to mitigation. Requiring that deliveries by large trucks occur between 10 pm to 5 am creates additional noise impacts, which are not analyzed in the DEIR."

Response TR-95

The comments state concerns regarding assessment of loading impacts and Mitigation Measure MM-TR-44 in the Draft EIR, page 4.5-139. Impacts of increased noise in the vicinity of the proposed Cathedral Hill Campus are discussed in Impact NO-2 on pages 4.6-57 and 4.6-68 in the Draft EIR. Regarding the analysis of the impacts of small and single unit trucks entering and exiting the loading facility at the proposed Cathedral Hill Campus, the Truck Management Plan is designed to minimize the number of trucks that would make deliveries during normal weekday commute peak periods. Based on surveys at the existing CPMC campuses, the peak delivery periods tend to occur in the late morning or early afternoon. Although the peak loading demand is 19 vehicles, these vehicles would typically arrive and depart at different times within a given hour. Therefore, although some interruption of traffic could occur when these delivery vehicles entered or exited the facility, the level of interruption would be considered normal occurrence in an urban environment.

The proposed Truck Management Plan also would allow CPMC to manage when their vehicles arrive from the central warehouse locations. Therefore, although the peak demand was determined to be 19 vehicles based on the current conditions at existing facilities, the arrival patterns could be altered in the future to reduce the number of peak truck deliveries. It is estimated that 60 percent of the truck traffic would be less than 20 feet in length. The remaining 40 percent of the vehicles would be between 25 and 55 feet in length.

Mitigation Measure MM-TR-44 would require CPMC to limit hours of delivery for large trucks (greater than 46 feet in length) and to monitor deliveries between 10:00 pm and midnight. The required monitoring of deliveries between 10:00 p.m. and midnight is not a deferment of mitigation. The restriction of large truck deliveries between 10 p.m. and 5 a.m. was selected based on existing evening

traffic patterns measured on Franklin Street, which were found to substantially decrease after 10 p.m., and even more after midnight. Additional monitoring of deliveries between 10 p.m. and midnight was added to the mitigation to further document deliveries that occur, effects on travel lanes, and operations of the Franklin/Geary intersection between the hours of 10 p.m. and midnight. The City, on review, might further limit delivery times. If the City desired, independent monitoring of the truck activity could be included in the Mitigation Monitoring Program. The Mitigation Monitoring Program would be used by the City to track the compliance of the proposed CPMC LRDP in terms of the mitigations identified in the Final EIR. Considering the restricted hours, provision of an attendant, and monitoring, the impacts from truck deliveries would be mitigated.

Cathedral Hill MOB Delivery Truck Parking

Comment

(Carolynn Abst and Ron Case—Case + Abst Architects LLP, October 19, 2010) [102-26 TR, duplicate comment was provided in 114-26 TR]

"This problem [MOB deliveries shown to be next to the parking entry] will be magnified because the DEIR identifies that the loading space demand for the MOB is 4 spaces and the available supply is only two spaces. The DEIR asserts, with no data to support the assertion that this situation will be mitigated by scheduling deliveries and by parking on street when necessary. The on street parking will only further amplify the traffic and exhaust impacts near our property."

Response TR-96

The comment states that the number of loading spaces for the proposed Cathedral Hill MOB would not be adequate to meet the demand, further amplifying the associated traffic, noise and exhaust effects. With the proposed Cathedral Hill Campus project, two off-street loading spaces would be provided within the MOB parking structure and two on-street loading spaces would remain on Cedar Street. As discussed under Impact TR-43, page 4.5-136 of the Draft EIR, during the peak delivery period, trucks could meet demand through the use of available on-street loading areas for their delivery or, if no on-street spaces were available, these deliveries could use the two off-street spaces in the MOB parking structure. For more information on the noise and air quality analyses, please also see Response TR-50 (C&R 3.7-73) and Sections 4.6 "Noise" and 4.7 "Air Quality" of the Draft EIR, respectively.

Cathedral Hill Trash Pickup

Comment

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-113 TR, duplicate comment was provided in 30-113 TR]

"60. How often will trash be picked up between 4AM and 5AM at Cathedral Hill (Page 4.5-82)? What is the difference between 'trash pickup' and 'trash haulers' who would be scheduled before 7a.m. or after 7 p.m. (Page 4.5-82)?"

Response TR-97

The comment requests information related to waste pickup. Trash haulers are flat bed trucks that lift a trash compactor onto the bed and drive it to a transfer station, empty it, and return it to be refilled. Trash pickup is collected using tipper trucks that are commonly used in residential areas. The proposed Cathedral Hill MOB would require trash pickup only. Both trash hauling and trash pickup (composting) would be required for the proposed Cathedral Hill Hospital. The area east of Franklin Street is considered a non-residential zone by the trash collection provider, Recology, and is not restricted by specific

collection times. However, CPMC would have some flexibility in selecting pickup hours that would meet hospital needs and accommodate adjacent neighbors. Trash pickup would occur once daily, Monday through Saturday. Trash hauling (hospital only) would occur once daily, Monday through Saturday.

Truck Management Plan

Comments

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-45B TR, duplicate comment was provided in 30-45 TR]

"There are 4 building posts/piers within the Loading Dock parking area for the large trucks. Per Page 2-21, the DEIR states that there are going to be 6 spaces for the loading dock at the proposed Cathedral Hill Hospital in addition to the 14 spaces for vans and 2 loading spaces for the MOB. If all 6 spaces at the loading dock were to be occupied for deliveries, and another truck shows up at the Hospital, how will the traffic jam on Franklin St. be resolved? Will the trucks double-park on the nearby residential areas waiting for their turn to get into the loading dock? In addition, both the Two-way Post St. Variant and the MOB Access Variant of the Cathedral Hill Project will cause a "significant" and "potentially hazardous" condition on Franklin St. as described in Impact TR-46 and Impact TR-48. Both of these impacts are also suggested to be mitigated by hiring an attendant and having him/her direct the oncoming traffic when trucks are in the service loading area. The mitigation measure is also to possibly modify the deliveries of trucks longer than 46 feet in length (MM-TR-44, Page S-47)."

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-112 TR, duplicate comment was provided in 30-112 TR]

"59. Page 4.5-81 speaks of service vehicles and truck loading and unloading demand. It states in Item 3 that 'some service deliveries would be eliminated due to operational changes at the campuses.' Yes, where the campus would be closed or operations moved to Cathedral Hill, e.g., that is true. But when the operations get moved to Cathedral Hill, would the number of trucks be more? Would there be larger service trucks to accommodate larger deliveries since there will be a heavier concentration of departments in one building?"

(Barbara Kautz—CHNA and Bernal Heights Neighborhood Center, October 19, 2010) [87-32 TR, duplicate comment was provided in 108-32 TR]

"At each proposed CPMC campus, there will be extensive loading and unloading activities on busy streets. At the proposed Cathedral Hill campus, during the peak loading period, up to 19 trucks will be loading and unloading at one time; at the Pacific campus, up to 9 trucks. However, these projections are based on implementation of a proposed master delivery plan designed to reduce the number of trucks that would otherwise enter the sites based on current use patterns. Such a plan has not been implemented by CPMC, and its success cannot be accurately predicted. A more conservative analysis should be provided indicating the impacts if delivery patterns mirror existing conditions at CPMC's existing campuses."

Response TR-98

The comments request clarification regarding the proposed Truck Management Plan and loading operations at the proposed Cathedral Hill Hospital loading area accessed from Franklin Street. This centralized loading area would include four loading docks for large trucks (greater than 25 feet in length) and two dedicated trash loading docks. In addition, 14 spaces for vans and smaller vehicles 20 feet long or shorter would be provided within the first below-grade level of the hospital garage. The purpose of the proposed Truck Management Plan is to ensure that trucks, particularly large trucks, would have a loading dock or parking space available when they arrived at the proposed Cathedral Hill Campus. The proposed Truck Management Plan would also have CPMC manage when their vehicles arrived from the central warehouse locations. Therefore, the arrival patterns could be altered to ensure loading space availability and to reduce the number of peak truck deliveries. Implementation of this plan would minimize the

number of trucks that would access the site during the hours between 7 a.m. and 7 p.m., when traffic on the adjacent street would be highest. With 24-hour management of the loading facility, trucks would not need to double-park on adjacent residential streets. As a part of the 24-hour management plan, and as required by Mitigation Measure MM-TR-44 (on page 4.5-139 of the Draft EIR), CPMC would provide an attendant who would control traffic when large trucks arrived or departed. The Truck Management Plan and a description of the truck loading operations at the Cathedral Hill Campus are summarized under Impact TR-43, page 4.5-136–139 in the Draft EIR and in more detail in Appendix I of the *Cathedral Hill Transportation Impact Study*.

To estimate future truck activity volume at the proposed Cathedral Hill Campus, CPMC provided an analysis of truck activity at the existing California and Pacific Campuses because the proposed Cathedral Hill Campus would combine functions that are currently performed at these existing campuses. These estimates were compared to the truck loading rates from the *SF Guidelines*. The Truck Management Plan (*CPMC LRDP Transportation Impact Study*, Appendix I) describes the analysis process used to estimate the demand and how many truck deliveries could be reduced with the creation of the proposed Cathedral Hill Campus. The following paragraph from the plan describes the analysis approach:

> "The CPMC Materials Management staff and its consultants reviewed the list of vendors who are currently serving the hospitals in the Pacific and California Campuses and identified A) potential vendors who could consolidate two separate trips into one trip to CH Hospital, and B) the deliveries that would be shifted to the West Bay Distribution Center in Burlingame and services that would no longer be needed at the CH Campus because of operational changes. Such vendors in the "A" category included FedEx, Office Depot, Ownes Minor, and Aramark, and the trips generated by these vendors were reduced by half and were subtracted from the total truck trips. The vendors in the "B" category included USPS, Stericycle and Angenlica, and their trips were removed from the total truck trips. It should be noted that the USPS mail deliveries to the CH Hospital would be directed to the West Bay Distribution Center in Burlingame where many of the hospital deliveries would come from."

The truck analysis assumed the needs of all the functional departments and operations that would be located in the proposed hospital and MOB. The results of this process reduced the combined deliveries at the existing Pacific and California Campuses from a total of 206 average daily trips to 113 average daily trips that would be needed to access the proposed Cathedral Hill Campus. The 113 average daily trips would be nine trips fewer than the current 122 average daily trips to the Pacific Campus. Consolidation of loads would occur at the West Bay Distribution Center in Burlingame to minimize the number of truck trips and maximize the loads on each truck. The Truck Management Plan uses an analysis methodology that is based on available data for the CPMC operations. Therefore, no need exists for a more conservative approach to be developed.

One of the primary purposes of the Truck Management Plan is to reduce the need for, and number of, large trucks accessing the proposed Cathedral Hill Campus. The plan uses remote warehousing as a means to move only the needed medical supplies to the proposed Cathedral Hill Campus, which would minimize the load that individual trucks would carry. Therefore, no need would exist to use larger trucks for medical supply deliveries to the proposed Cathedral Hill Campus. Furthermore, Mitigation Measure MM-TR-44 would limit trucks larger than 46 feet to using the loading facility during evening hours.

In order to ensure that trucks larger than 46 feet would not arrive concurrently, CPMC would invest in a communication system (using cell phones and two-way radios) that would provide direct communication between the truck drivers and the Materials Management staff at the Cathedral Hill Campus site. If the loading dock area is unable to receive a truck larger than 46 feet, due to the unavailability of dock space, drivers would be informed in advance and would be instructed to stage at an off-site/available location

until directed by the CPMC Materials Management staff to proceed to the Cathedral Hill Campus site. If for some reason, the communication system failed and a truck greater than 46 feet arrived at the Cathedral Hill Campus site and was unable to be received, the shuttle pick-up area on Post Street could be used as a temporary wait station until it could be received (with engines turned off for up to 45 minutes), since deliveries by trucks of this size would be limited to between the hours of 10 p.m. and 5 a.m (when shuttles are not in operation).

Truck Management Plan—Truck Loading Noise

Comment

(Rachel Sater—Lost Block and Save Our Streets, October 19, 2010) [101-22 TR]

"Pages 4.5-82 and 4.5-83: The DEIR indicated that on a daily basis approximately 66 trucks up to 55 feet in length would use the loading area; the loading dock would operate 24 hours per day; and CPMC deliveries, laundry services and trash haulers would be scheduled between 9:30 p.m. and 5:00 a.m. to minimize conflicts with other deliveries. These levels and hours of loading area activity would occur immediately adjacent to adjoining sensitive residential uses on the west, and in the more noise-sensitive evening and early morning hours. However, they are not, and must be, described and analyzed in the noise (Section 4.1) and land use character (Section 4.1) analyses."

Response TR-99

The comment states concern about the effects of truck loading noise on sensitive residential uses near the St. Luke's Campus and specifically mentions the number of trucks (66) that are expected at the St. Luke's Campus each day, as noted in Table 4.5-14 on page 4.5-83 of the Draft EIR. Noise impacts associated with loading activities at the St. Luke's Campus are addressed on page 4.6-76 of the Draft EIR. The St. Luke's Replacement Hospital would have an enclosed loading dock located off Cesar Chavez Boulevard. To reduce the impact of large trucks accessing the loading area during commute hours, large trucks would be scheduled for deliveries in the evening hours and would enter an enclosed loading area. The discussion also addresses noise impacts associated with the Alternative Emergency Department Location Variant, which would locate the loading area adjacent to 25th Street (see page 4.6-78 of the Draft EIR). Under both the proposed LRDP and the Variant, all truck maneuvering and loading/unloading would occur within the enclosure. This would reduce the impacts of noise on the adjacent residents. See Response NO-75, page C&R 3.8-80, for additional information regarding noise impacts associated with loading activities at the St. Luke's Campus.

3.7.10 EMERGENCY ACCESS

3.7.10.1 EMERGENCY VEHICLE ACCESS AND TRAFFIC CONGESTION

Comments

(Marvis Phillips—Alliance for a Better District 6, August 6, 2010) [4-3 TR]

"2) Emergency vehicle access during evening and morning commute periods.

(Diane and Richard Wiersba, October 11, 2010) [49-4 TR]

"Even those being driven to hospital treatment will cause problems, partly due to the confusion of the one-way streets which intersect and parallel Van Ness. Ambulances will no doubt run into traffic snarls as they try to reach CPMC, also."

(Linda Chapman, October 19, 2010) [76-29 TR, duplicate comment was provided in 111-29 TR]

"Supporters of the current proposal argued prompt medical intervention for birthing and emergency conditions as justification for locating a campus in the Van Ness Corridor. In view of congestion impacts described above, public safety could be the best reason to decentralize emergency and critical care units.

Transportation impediments between the Cathedral Hill campus and the city's southern sector include long Muni trips, traffic delays and meltdowns like an experience described above, which would equally affect patients (or all the important doctors) heading for Cathedral Hill from Marin."

(Patrick Carney, October 19, 2010) [83-6 TR]

"Traffic is already grid locked on Van Ness. Gough and Franklin are not much better. It will not be easy to get there quickly when traffic is frequently at a standstill. O'Farrell already has a great deal of traffic to the point it is often a standstill (especially with the new 38 Geary dedicated traffic lane) and more than its share of ambulance noise."

(Gloria Smith—California Nurses Association, October 19, 2010) [90-24B TR]

"For example, the DEIR did not analyze how the increased traffic around the Cathedral Hill Campus will affect access for ambulances, labor and delivery vehicles and others urgently trying to reach the hospital. During gridlock traffic conditions which are much of the time around Van Ness Avenue, emergency patients may face life threatening delays while waiting in traffic. The DEIR failed to consider these and other critical circumstances in the traffic analysis."

(Gloria Smith—California Nurses Association, October 19, 2010) [90-83 TR]

"Similarly critical intersections in the vicinity of the Cathedral Hill Campus currently operate at LOS E or LOS F under existing conditions in one or both peak traffic hours. The DEIR also indicated additional critical intersections in the vicinity of the Cathedral Hill Campus would degrade to LOS E or LOS F in 2015 and in 2030 with the addition of Project traffic. For capacity conditions at LOS E and under gridlock conditions at LOS F, vehicles will be queued back significant distances in all traffic lanes on the approaches to congested signalized intersections. Stopped vehicles will not be able to simply 'maneuver out of the path of the emergency vehicle' as the adjacent lanes on the approaches to the gridlocked traffic signals will already be occupied by other vehicles. This is a significant impact for a hospital project and one that must be fully evaluated and mitigated.

Given that the proposed Project is a ***hospital***, with numerous dispatched and private emergency vehicles requiring access each day, the City cannot simply find that these impacts are unavoidable. Instead, in a revised EIR, the City must fully explain and support the DEIR's broad statement that '... the proposed Cathedral Hill Campus project emergency vehicle access impact would be less than significant.' A revised EIR must show that the City has analyzed both LOS E and gridlock conditions at LOS F all around the vicinity of the Cathedral Hill Campus and has mitigated these impacts to significantly reduce or eliminate health and safety risks resulting from delays to emergency and labor and delivery vehicles."

(Gloria Smith/Tom Brohard & Associates—California Nurses Association, October 19, 2010) [92-8 TR]

"This issue is particularly critical for a hospital project. For example, the Draft EIR does not analyze how the increased traffic around the Cathedral Hill Campus will affect access for ambulances and labor and delivery vehicles. During gridlock traffic Conditions which are much of the time on Van Ness Avenue, emergency patients could face life threatening delays while waiting in traffic."

(Gloria Smith—California Nurses Association, October 19, 2010) [96-20A TR, duplicate comment was provided in 110-20 TR]

"The Draft EIR does not adequately analyze how the increased traffic around the Cathedral Hill Campus will affect access for ambulances, patients being transferred to and from other Sutter hospitals, patients attempting to

reach the emergency room, and labor and delivery vehicles. The traffic engineer Tom Brohard concludes in his comments on the Draft EIR:

> Many of the intersections studied in the Draft EIR already operate at LOS F[23] in peak hours under existing conditions, and the number of these failing intersections will significant increase [in future years] ... Adding [LRDP] ... trips to these failing intersections will increase vehicle delay beyond what is already being experienced, with no relief in sight. This issue is particularly critical for a hospital project. For example, the Draft EIR does not analyze how the increased traffic around the Cathedral Hill Campus will affect access for ambulances and labor and delivery vehicles. During gridlock traffic conditions which are much of the time on Van Ness Avenue, emergency patients could face life threatening delays while waiting in traffic.[24]

In other words, due to the location of the Cathedral Hill Campus as it sits in a high-density neighborhood at the intersection of two major traffic corridors experiencing heavy use and congestion and the fact that most patients and employees would be concentrated at one campus rather than being spread out across several campuses, chances are that in a bad traffic jam on Van Ness Avenue babies will be born in traffic and patients will die trying to get to the emergency room. Such patient safety hazards will be a daily event during rush hour, and potentially worse in the event of an accident, construction, or other disruption as occurred last year one block away.[25] This cannot be the intention of a health care provider for providing optimal care for its patients.

[23] Level of Service ("LOS") F is the lowest measurement of efficiency for a road's performance. Flow is forced; every vehicle moves in lockstep with the vehicle in front of it, with frequent slowing required. Facilities operating at LOS F generally have more demand than capacity.

[24] Letter from Tom Brohard and Associates to. Law Offices of Gloria Smith, Re: Review of Draft Environmental Impact Report for the California Pacific Medical Center Long Range Development Plan Transportation and Circulation Comments, October 18, 2010.

[25] San Francisco Chronicle, PG&E Says 1920s Power Line Sparked SF Fire, July 16, 2009; http://artjcles.sfgate.com/2009-07-16/bay-area/17217311 1 power-line-pg-e-underground-fire."

(Merle Easton, October 18, 2010) [66-1 TR, duplicate comment was provided in 73-1c TR])

"In case of a disaster cars and buses will be unable to get to the hospital and the rest of the traffic won't be able to get around the hospital."

(Gloria Smith/Tom Brohard & Associates—California Nurses Association, October 19, 2010) [92-26 TR]

"7) Emergency Vehicle Access Will Be Significantly Impacted - Impact TR-52 on Pages 4.5-145 and 4.5-146 of the Draft EIR lists various streets that would be used by emergency vehicles to transport patients to the Cathedral Hill Campus and states 'These streets are multi-lane arterial roadways that allow the emergency vehicles to travel at higher speeds and permit other traffic to maneuver out of the path of the emergency vehicle. Because Franklin Street, Van Ness Avenue, Post Street, and Bush Street have multiple lanes, vehicles would be able to yield to emergency vehicles destined to the proposed Cathedral Hill Campus. Given the above, the proposed Cathedral Hill Campus project emergency vehicle access impact would be less than significant.'

Several critical intersections in the vicinity of the Cathedral Hill Campus currently operate at LOS E or LOS F under existing conditions in one or both peak traffic hours as reported in Tables 4.5-17 on Page 4.5-94 and 4.5-18 on Page 4.5-95 of the Draft EIR. These tables also show that additional critical intersections in the vicinity of the Cathedral Hill Campus will degrade to LOS E or LOS F in 2015 and in 2030 with the addition of Project traffic.

Under capacity conditions at LOS E and under gridlock conditions at LOS F, vehicles will be queued back significant distances in all traffic lanes on the approaches to congested signalized intersections. Stopped vehicles will not be able to simply "maneuver out of the path of the emergency vehicle" as the adjacent lanes on the approaches to the gridlocked traffic signals will already be occupied by other vehicles. This is a significant impact for a hospital project and must be fully evaluated and mitigated. In this instance, the City cannot simply find that these impacts are unavoidable. Instead, in a revised EIR, the City must fully explain and support the Draft EIR's broad statement that "the proposed Cathedral Hill Campus project emergency vehicle access impact would be less

than significant." A revised EIR must show that the City has analyzed both LOS E and gridlock conditions at LOS F all around the vicinity of the Cathedral Hill Campus and has mitigated these impacts to significantly reduce or eliminate health and safety risks resulting from delays to emergency and labor and delivery vehicles."

(Margaret Kettunen Zegart, October 20, 2010) [97-18 TR]

"Emergency vehicles cannot meander - or speed - through present traffic jams."

(Hossein Sepas, October 19, 2010) [82-6 TR, duplicate comment was provided in 107-4 TR]

"Traffic is already grid locked on Van Ness. Gough and Franklin are not much better. It will not be easy to get there quickly when traffic is frequently at a standstill. O'Farrell already has a great deal of traffic to the point it is often standstill (especially with the new 38 Geary dedicated traffic lane) and more than its share of ambulance noise."

(Peggy Lindrod, September 23, 2010) [PC-99 TR]

"MS. LINROD [phon]: Good afternoon. My name is Peggy Linrod [phon]. I am also – I am at Ground Zero at this project where it would impact traffic. I live right on the corner of Geary and Larkin. I've seen all the time when there was emergencies, and they had accidents where cars actually ran over residents right there on Geary and Larkin, it took exactly 20 to 30 minutes for any EMTs any ambulance to get to them, and that is very important that they take that into consideration, even though the hospital might be right down the street, it might be a problem getting to it."

(Gloria Smith—California Nurses Association, March 8, 2011) [121-3 TR]

Transportation gridlock is particularly critical for a hospital project. Access for ambulances and for labor and delivery vehicles to the proposed Cathedral Hill Campus will be adversely impacted by the severe congestion. Intersections and roadways near the Cathedral Hill Campus, located in a high-density neighborhood at the intersection of two major traffic corridors, already experience heavy use, congestion and lengthy delays. Adding hospital patients and employees concentrated at one very large hospital campus, rather than spreading medical services across several campuses, would present unnecessary health risks for patients stuck in traffic on Van Ness Avenue trying to reach the emergency room or labor and delivery. Excessive delays for patients requiring immediate care could be a daily event during rush hour, and potentially worse in the event of an accident, routine construction, or other disruption. Such circumstances pose unacceptable and avoidable health and safety risks and should have been examined in the Draft EIR.

Response TR-100

The comments state concern that patient and emergency vehicle access to the hospital would be compromised because of existing and future traffic conditions on the roadways surrounding the proposed Cathedral Hill Campus. As described in Impact TR-52 in the Draft EIR (page 4.5-145), development of the proposed Cathedral Hill Campus would not result in a significant emergency vehicle access impact. Patients that required emergency transport typically would be delivered to the nearest emergency room provided the receiving hospital has available space and capability to address that patient's need for medical care (e.g., burn victims divert almost exclusively to St. Francis Memorial Hospital because of that hospital's capability to treat that type of injury). The proposed Cathedral Hill Campus site is centrally located along major routes to many neighborhoods, and these roadways would facilitate access from any point in the City, should a patient require care at the proposed Cathedral Hill Hospital. Patients in the Richmond District would continue to be served by emergency rooms at St. Mary's Hospital, Kaiser Medical Center, and UCSF Parnassus Campus. Patients in the southeastern portion of the City would be served by emergency rooms at San Francisco General Hospital and UCSF Mission Bay Medical Center, as well as the St. Luke's Campus. The Davies Campus would also retain its emergency room.

In the event of an emergency or natural disaster, which are by their nature not predictable, protocol exists to prioritize the use of roadways. Emergency services, such as the Fire Department, Police, or other first responders use of roadways are prioritized. Patients needing emergency care would be taken to the closest available emergency room. Emergency vehicles typically choose travel routes based on several factors, including congestion, speed, and terrain. As described in the Draft EIR and *Cathedral Hill Transportation Impact Study*, emergency vehicles coming to the proposed Cathedral Hill Campus would likely use Franklin Street, Gough Street, or Van Ness Avenue as north-south routes and Geary Street, O'Farrell Street, Pine Street, or Bush Street as east-west routes. These streets are multi-lane arterial roadways that typically allow emergency vehicles to travel at higher speeds because roadway width allows other vehicles to move out of their paths. The California Vehicle Code, Section 21806, requires that vehicles yield to emergency vehicles and remain stopped until an emergency vehicle passes with active sirens and emergency lights, as follows:

> 21806. Upon the immediate approach of an authorized emergency vehicle which is sounding a siren and which has at least one lighted lamp exhibiting red light that is visible, under normal atmospheric conditions, from a distance of 1,000 feet to the front of the vehicle, the surrounding traffic shall, except as otherwise directed by a traffic officer, do the following:
>
> (a) (1) Except as required under paragraph (2), the driver of every other vehicle shall yield the right-of-way and shall immediately drive to the right-hand edge or curb of the highway, clear of any intersection, and thereupon shall stop and remain stopped until the authorized emergency vehicle has passed.
>
> (2) A person driving a vehicle in an exclusive or preferential use lane shall exit that lane immediately upon determining that the exit can be accomplished with reasonable safety.
>
> (b) The operator of every street car shall immediately stop the street car, clear of any intersection, and remain stopped until the authorized emergency vehicle has passed.
>
> (c) All pedestrians upon the highway shall proceed to the nearest curb or place of safety and remain there until the authorized emergency vehicle has passed."
>
> (Amended Sec. 68, Ch. 1154, Stats. 1996. Effective September 30, 1996.)

In addition, as stated in the TransOptions report,[26] the San Francisco Fire Department (SFFD) staff does not have preferred routes to minimize the traffic impact of 911 ambulances; however, they do follow a general route selection process, but crews could and would vary the streets used. SFFD's basic tenet is that they "…dynamically deploy, and then converge over the route of least impedance to the hospital emergency department of choice."

During peak times of the day (7:00 a.m.–9:00 a.m., 4:00 p.m.–6:00 p.m.), major arterials near the proposed Cathedral Hill Campus, such as Geary Boulevard, Van Ness Avenue, Franklin Street, and Gough Street, are sometimes congested. If an emergency vehicle was en route to the proposed Cathedral Hill Campus when congestion was most severe, it would likely use less congested, parallel routes, such as Polk Street (north-south) and Post Street, Sutter Street, or Ellis Street (east-west).

Additionally, according to California Vehicle Code ,Section 21055, when responding to an emergency , authorized emergency vehicles are exempt from California Vehicle Code, Section 21657, which governs that vehicles travel in the proper direction of the roadway. This exemption allows emergency vehicles to

[26] TransOptions, 2010, *City of San Francisco Fire Department 911 Emergent Transports to CPMC Campuses*, Cathedral Hill Campus Transportation Impact Study, Appendix J, available on file at the San Francisco Planning Department as part of Case File No. 2005.0555, 1650 Mission Street #400, San Francisco, CA 94103.

travel opposite the flow of traffic to bypass congestion. For example, if southbound Van Ness Avenue became too congested, emergency vehicles could travel southbound in the northbound lanes. Emergency vehicles also could travel contraflow on a one-way route. For example, emergency vehicles could travel westbound on Post Street to bypass congestion on Geary Street.

With the grid street layout around the proposed Cathedral Hill Campus, emergency vehicles would have multiple routes to access the proposed hospital and would be able to avoid the most congested routes. The TransOptions report also addresses the approach followed by SFFD crews in selecting a route to the site of a 911 call and the follow-up transport to the hospital Emergency Department, is generally guided by these basic principles:

- Routes with the least traffic and fastest travel time—this differs based on time of day, day of week, and whether it is a holiday or shopping day as determined by each crews' personal knowledge of the City, because GPS systems do not address these issues on a dynamic basis;
- Flatter streets are preferred over hilly streets to minimize the effect of gravitational forces on patients—for example, despite California Street being a fast east-west route to the Pacific Campus, alternate streets such as Turk Street or Clay Street are preferred for Code 2 transports;
- For Code 3 emergency light and siren transports crew prefer streets with more traffic lights, major thoroughfares over residential streets, and the least amount of travel time possible—this is done to reduce the risk of harming anyone in the oncoming path of the ambulance;
- Less turns are preferred and left-hand turns in front of oncoming traffic are always avoided—patient safety and comfort are critical; and
- SFFD crew prefer easy flow of traffic, less lights, and short-cuts that avoid traffic and shorten drive time—less eventful and less challenging transport routes are always preferred. Additional information on how emergency services would be provided is included in Major Response HC-5, page C&R 3.23-20.

3.7.10.2 EMERGENCY ACCESS—TRAVEL DISTANCE

Comment

(Gloria Smith—California Nurses Association, October 20, 2010) [96-20B TR, duplicate comment was provided in 110-20 TR]

"In other words, due to the location of the Cathedral Hill Campus as it sits in a high-density neighborhood at the intersection of two major traffic corridors experiencing heavy use and congestion and the fact that most patients and employees would be concentrated at one campus rather than being spread out across several campuses, chances are that in a bad traffic jam on Van Ness Avenue babies will be born in traffic and patients will die trying to get to the emergency room. Such patient safety hazards will be a daily event during rush hour, and potentially worse in the event of an accident, construction, or other disruption as occurred last year one block away.[25] This cannot be the intention of a health care provider for providing optimal care for its patients.

To mitigate access problems at the Cathedral Hill Campus, Mr. Brohard recommends:

> To reduce these impacts and better serve the community, CPMC should spread the proposed development to several other campuses including to the St. Luke's Campus rather than concentrating services at the Cathedral Hill Campus. Access to and from St. Luke's Campus is closer to Highway 101 for vehicles and to major transit facilities such as the 24th Street BART Station for transit patrons. Moreover, the St. Luke's Campus is the most accessible CPMC facility for those Sutter patients traveling from San Mateo and Santa Clara counties. From a transportation perspective, a Project alternative that distributes patients and services equally across the City should be evaluated in a revised EIR.

Since more patients come to CPMC from San Mateo County than from Marin County, shifting services to St. Luke's Hospital would reduce this traffic impact. A bigger St. Luke's Hospital also makes more sense for CPMC's patient population and would reduce the above discussed health care access issues for patients currently frequenting St. Luke's Hospital.

[25] San Francisco Chronicle, PG&E Says 1920s Power Line Sparked SF Fire, July 16, 2009; http://artjcles.sfgate.com/2009-07-16/bay-area/17217311 1 power-line-pg-e-underground-fire."

Response TR-101

The comment states concerns related to the location of the proposed Cathedral Hill Campus and provision of emergency health care in San Francisco. As described in Impact TR-52 on page 4.5-145 in the Draft EIR, development of the proposed Cathedral Hill Campus would not result in a significant emergency access vehicle impact. With implementation of the proposed CPMC LRDP, the Emergency Department at the proposed Cathedral Hill Hospital would replace existing emergency care services at the California and Pacific Campuses. However, St. Luke's and Davies Campuses would continue to provide emergency care. Therefore, patients coming from San Mateo County could continue to receive emergency services at St. Luke's.

Patients in emergency transport are typically delivered to the nearest emergency room with available space and capability to address a patient's need for medical care. For example, not all hospitals can treat trauma, neurological, or stroke patients. The proposed Cathedral Hill Campus site is centrally located along major routes to many neighborhoods, and it would be accessible from any point in the City, should a patient require care at the proposed Cathedral Hill Hospital Emergency Department. Response TR-100, page C&R 3.7-170 provides additional information on emergency vehicle access to the proposed Cathedral Hill Campus.

Although the proposed Cathedral Hill Hospital Emergency Department would replace or relocate some existing emergency care services, it would not reduce access to emergency care facilities. The proposed Cathedral Hill Hospital would be slightly less than three-quarters mile from the existing Pacific Campus Emergency Department, which it would be functionally replacing. Patients in the Richmond District would continue to be served by emergency rooms at St. Mary's Hospital, Kaiser Medical Center, and UCSF Parnassus Campus. Patients in the southeastern portion of the City would be served by emergency rooms at San Francisco General Hospital and UCSF Mission Bay Medical Center. Both the Davies Campus and St. Luke's Campus also would retain their emergency care services. Additional information on how emergency services would be provided is included in Major Response HC-5, page C&R 3.23-20.

3.7.10.3 EMERGENCY DEPARTMENT ACCESS

Comments

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-44 TR, duplicate comment was provided in 30-44 TR]

"Having the ambulances drive to the Emergency Department on Franklin also poses a threat to pedestrians and to possible stacking up of ambulances in the emergency zone that may cause blockage of the easternmost traffic lane of Franklin."

(Sister Elaine Jones, September 23, 2010) [PC-29 TR]

"If you take your time and sit out there, or walk down Van Ness, that's one of the busiest streets other than Market Street, and I just don't understand it, you know, where are you going to put the ambulance? Where are you going to put the people? Where are you going to put the trucks and all this stuff? Where are you going to put them?"

Response TR-102

The comments request clarification regarding Emergency Department operations at the proposed Cathedral Hill Hospital, and expresses concerns for emergency and other traffic on Franklin Street and Van Ness Avenue. The Emergency Department would be located in the northwest quadrant of the proposed hospital, as shown in Figures 2-4 and 2-19 in the Draft EIR (pages 2-53 and 2-77, respectively). The private vehicle (public) drop-off and parking area would have inbound access from Franklin Street and outbound egress to Post Street. Ten parking spaces on Level 1 of the proposed parking garage would be designated for the Emergency Department use, with access via an elevator. Emergency vehicles would have a separate loading area, accessed via their own driveway located on Post Street. This design would eliminate the potential for conflicts between pedestrians, private vehicles, and emergency vehicles at the Emergency Department driveways on both Franklin Street and Post Street. Emergency vehicles would have their own loading area off Post Street with a separate access driveway; therefore, emergency vehicles would not use the Franklin Street driveway to access the hospital Emergency Department. Therefore, queuing of emergency vehicles on Franklin Street when accessing the ambulance loading area would not occur. Response TR-100, page C&R 3.7-170 provides additional information on emergency vehicle access to the proposed Cathedral Hill Campus.

3.7.11 CONSTRUCTION

3.7.11.1 METHOD USED TO SUPPORT FINDINGS OF SIGNIFICANCE

Comments

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-6 TR, duplicate comment was provided in 30-6 TR]

"Also, what are the transportation congestion impacts when the generators and chillers are put into place by crane or helicopter (e.g. traffic congestion during the operation of placing the large equipment atop the roof). Also, when the 2 tower cranes are used for the installation of structural steel (per Administrative document for 'Biology, #7'), would the lanes that will be closed be in addition to the following during the Hospital construction?

- Geary Boulevard parking lane 400 ft. x 19 ft.
- Post Street parking lane 400 ft. x 18 ft.- 4 in.
- Franklin Street one lane 300 ft. x 10ft.
- Van Ness Avenue one lane 300 ft. x 10 ft.

(2 lanes when installing the fuel tank ... per this document, emergency generator fuel storage tanks are "proposed to be beneath the Geary Boulevard parking lane ... 22 ft. (on west end towards Franklin St) to 17 ft. deep (on east end towards Geary/Van Ness Avenue) by 15 ft. wide (edge of hospital property line)) From the Administrative documents to the DEIR, only the above lanes will be closed."

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-130 TR, duplicate comment was provided in 30-130 TR]

"70. Per Page 4.5-149, Figure 4.5-22, when one lane of Geary westbound will be closed (the bus-only lane), all the traffic will try to get around the construction activity using only 2 available lanes left."

(Donald Scherl, October 18, 2010) [74-18 TR]

"The list of unavoidable and serious problems continues:

Impact-55: Refers to project impact from construction vehicle traffic and construction activities on the transportation network in the vicinity. Although enumerated as "SU" (significant and unavoidable impact), there is a lengthy 'mitigation' procedure. Essentially, CPMC is to develop a Construction Management plan (TMP) which would 'inform' contractors, require use of best practices, coordinate with and require approval of SFMTA, SFDPW, and the Planning Department.

However, the point is that the Dept. of Planning has NOW already determined that there are NO mitigation measures that will actually deal with the real world problem, hence the assignment of an 'SU' code (significant and unavoidable impact). Under these circumstances, it would be poor public policy to approve this project with these severe adverse impacts on the community and the city."

(Donald Scherl, October 18, 2010) [74-20 TR]

"Impact TR-152 summarizes that construction of the Cathedral Hill Campus, all variants, 'would contribute to cumulative construction impacts in the project vicinity.'"

(Sheila Mahoney and James Frame, October 19, 2010) [88-11 TR]

"Too often the DEIR says that impacts are substantial and unavoidable even with mitigation, but that it doesn't matter because they are 'short-term.' The cumulative effect of the 20+ years of construction proposed for our neighborhood is not 'short-term.'"

(Rachel Sater—Lost Block and Save Our Streets, October 19, 2010) [101-26 TR]

"Impact TR-94 concludes that, because potential construction traffic and parking impacts would be temporary, they would be less than significant. It is not correct under CEQA to conclude that any impact, no matter how severe, would not be significant only because it would be temporary. In other sections of Chapter 4, the DElR correctly finds temporary construction noise, construction dust, construction criteria air pollutants; and construction toxic air contaminants impacts to be significant and to require mitigation, despite being temporary. In addition, the temporary construction period for the four St. Luke's campus projects is proposed to begin in 2011 and last for seven years and, like many major construction projects, could experience delays and last even longer. This impact conclusion must be changed and the DEIR must be recirculated."

(Marianna Ferris, September 23 2010) [PC-18 TR]

"MS. FERRIS: President Miguel and Commissioners, thank you for this opportunity to make public comment. My name is Marianna Ferris, F-e-r-r-i-s. I live at 3631 Caesar Chavez, next to the proposed St. Luke's Hospital site. I am here today representing a coalition of neighbors and neighborhood groups surrounding the St. Luke's Hospital campus. I represent the Lost Block Association, Tiffany Neighbors, and the San Jose Guerrero Coalition to Save our Streets. Many of the families in our Coalition live adjacent to the hospital campus and along the proposed truck routes that wind their way through our residential streets. All of our lives will be impacted both during construction and after the building is finished."

(Marianna Ferris, September 23 2010) [PC-20 TR]

"We are particularly concerned because there are very young, elderly and infirm residents who live in the buildings that border the proposed construction site, truck routes, and in the immediate neighborhood surrounding both."

Response TR-103

The comments question the conclusion of the Draft EIR to identify construction-related transportation impacts at the proposed Cathedral Hill Campus as "significant and unavoidable," while impacts at St. Luke's Campus are labeled as less than significant. In San Francisco, construction-related impacts generally would not be considered significant because of their temporary and limited duration. However,

depending on a project's location and timing, in circumstances involving large development plans where construction occurs over long periods of time, construction-related impacts may be considered significant. Transportation impacts related to construction at the proposed Cathedral Hill site were identified as significant and unavoidable because of the complex transportation environment around the proposed Cathedral Hill Campus; the proposed 54-month construction period (approximately 4.5 years); the nighttime lane closures related to the construction of the pedestrian tunnel; and because construction would require the entire campus (one city block for the hospital and a quarter of a city block for the MOB) to be constructed simultaneously.

As described in Impact TR-55 (in the Draft EIR, beginning on page 4.5-147), the transportation system surrounding the proposed Cathedral Hill Campus would be significantly impacted during simultaneous construction of the hospital and MOB. The analysis presented in this impact statement is based on intersection operations during the excavation phase of construction—the phase that would experience the greatest number of truck trips. As shown in Table 4.5-31 in the Draft EIR, page 4.5-151, the construction site would generate an average of 185 trucks during each shift, or about 28 trucks per hour. As identified in Impact-55, the construction project would result in significant impacts at nine study intersections.

In addition, Impact TR-55 identified that the sidewalk closures required for construction would result in a significant impact to pedestrians; that transit-only lane closures near the construction site would result in significant impacts to Muni transit lines on Geary Street and Post Street; and that parking lane closures on Geary Street, Post Street, Franklin Street, and Van Ness Avenue would impact parking in the area.

Although the traffic impacts identified in Impact TR-55 would be a result of truck trips generated by project construction activities, the sidewalk closures and lane closures that would result in impacts to pedestrians and public transit would be required to maintain a safe worksite for both construction workers and nearby residents. Closure of sidewalks and parking lanes would not impact mixed-flow traffic (or congestion as noted in Comment 30-6). Closure of transit-only lanes would require buses to use a mixed-flow lane for one block as they passed the construction site. This was described in Impact TR-55 as a significant impact. Although closure of a transit-only lane would impact transit in the area, it would not have a substantial impact on vehicle traffic in the area because this traffic already uses two mixed-flow lanes on Geary Street.

Therefore, as per the mitigation measures described in the Construction Transportation Management Plan, no feasible mitigation exists that would result in a less-than-significant impact at the Cathedral Hill Campus construction site.

As described in Impacts TR-66, TR-73, TR-83 and TR- 94 (on pages 4.5-175, 4.5-182, 4.5-192, and 4.5-208, respectively, of the Draft EIR), construction at the Pacific, California, Davies, and St. Luke's Campuses would result in less-than-significant impacts. Construction of the Pacific Campus would be phased to occur over 4 years and would be required to develop a construction management plan as part of a project-level environmental document (Impact TR-66). No construction would occur at the California Campus; therefore, no construction-related impacts would occur in the area surrounding the campus (Impact TR-73). Construction at the Davies Campus would occur in two separate phases (Impact TR-83). The first phase would be construction of the Neuroscience Institute on the northeast quadrant of the campus. This construction would occur over a 2-year period and construction staging would be contained within the campus boundaries. Construction of the Castro/14th Street MOB would occur on the southwest quadrant of the campus after construction of the Neuroscience Institute and would last approximately 2 years. Construction of the St. Luke's Campus would occur in separate phases over 7 years (Impact TR-94). Construction on these four campuses would be contained primarily to CPMC property; except where sidewalks and/or parking lanes would need to be closed for safety reasons. Pedestrian detours around these campuses would be signed and in place during construction, as described in the Herrero-Boldt construction management plans for each campus. No vehicular traffic detours, lane closures, or

emergency access issues are anticipated with construction of these projects. Because construction of these campuses would occur in phases; and only portions of each campus would be under construction at any given time; and because construction would be contained on site except for the adjacent sidewalk closures for safety purposes, impacts at other campuses, including St. Luke's Campus, would be less than significant.

3.7.11.2 CUMULATIVE CONSTRUCTION IMPACTS

Comments

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [37-7 TR]

"9. **Cumulative effects** of Pacific Hts & Cathedral construction on J-town; cumulative effects for Richmond area with other campus buildouts, Bernal Heights area, Castro areas impacted."

(Bob Hamaguchi—The Japantown BNP Organizing Committee, October 8, 2010) [47-6 TR, duplicate comment was provided in 50-6 TR]

"3) The DEIR also fails to consider the cumulative impact of construction projects affecting transit to, and parking in, Japantown. In addition to CPMC's construction activities detailed in the DEIR, there is likely to be construction on any or all of the following large projects: Geary BRT (2013 to 2014?); Van Ness BRT (2012 - 2013?); 1481 Post. Each of these activities will aggravate the problems related to construction parking and roadway obstructions. This is a significant omission in the current DEIR."

(Lisa Carboni (Caltrans (Regional)), September 9, 2010) [6-6 TR, duplicate comment was provided in 7-6 TR]

"Under 5.3 Construction Issues on page 189 of the TIS, it states the construction of the Bus Rapid Transit projects can overlap with the construction of the Cathedral Hill Campus and CPMC would be required to coordinate with the City and County of San Francisco to minimize disruption from two major construction projects. Please discuss potential mitigation measures to minimize impacts to Van Ness Avenue. Specifically, what measures will be taken so construction activity will not exacerbate already poor LOS operation on Van Ness Avenue?"

(Sue Hestor, October 19, 2010) [89-6 TR]

This EIR, as part of its analysis, must do the analysis for tieing mandatory construction of the Van Ness BRT and the Geary BRT (at least as far west as Divisadero so that Geary busses can connect with the north-south lines that connect to other campuses) to the massive work CPMC contemplates for their own benefits.

Response TR-104

The comments express concern about the effect of simultaneous construction at CPMC campuses, construction of other nearby proposed projects, and the cumulative impacts of construction on the surrounding neighborhoods.

As described in Impact TR-98 on page 4.5-213 of the Draft EIR, construction at Cathedral Hill Campus, Davies Campus, and St. Luke's Campus might overlap with one another. However, because each of these campus locations is in relative isolation from the others, each one would rely on different access routes for construction vehicles. Therefore, overlapping construction at these campuses is considered to be less than significant. The proposed Cathedral Hill Campus and the existing Pacific Campus are located near one another and would share access routes; however, construction at the Pacific Campus would not begin until after construction at the Cathedral Hill Campus was complete and inpatient acute care and emergency services could be transferred from Pacific Campus to the Cathedral Hill Campus. Construction at these two campuses would not overlap, nor would construction staging areas be shared.

Comments 47-6 and 6-6 refer to the potential for the construction projects at the proposed Cathedral Hill and existing Pacific Campuses to overlap with Van Ness BRT and Geary BRT project construction as well as construction at 1481 Post Street. The non-CPMC projects have not yet been approved, nor have their construction plans been identified. If these projects were to overlap, all project sponsors, including CPMC, would be required to coordinate with SFMTA and the Planning Department to ensure that elements of each construction TMP was effective and that coordination would occur to ensure that construction impacts, including construction worker parking, on surrounding areas would be minimized. Construction worker parking management at the Cathedral Hill Campus is discussed further in Response TR-79 (page C&R 3.7-149).

To maintain traffic flow on Van Ness Avenue during construction, three travel lanes would be maintained in each direction except during hours when trenching is done for the subterranean pedestrian tunnel, as discussed in Response TR-105 (page C&R 3.7-180). The unacceptable levels of service at intersections near the Cathedral Hill Campus during construction would be the result of construction trucks arriving to and departing from the site. To minimize this impact, the Construction Transportation Management Plan proposes to coordinate truck deliveries, as described below in Response TR-105 (page C&R 3.7-180).

3.7.11.3 CONSTRUCTION TRANSPORTATION MANAGEMENT PLAN

Comments

(Lisa Carboni (Caltrans (Regional)), September 9, 2010) [6-4 TR, duplicate comment was provided in 7-4 TR]

"The proposed project will cause significant impacts during the 54 month construction period. In particular, it will cause significant delays on Van Ness Avenue. We recommend that the project provide additional mitigation measures to reduce these impacts. For example, provide signage to vehicles users to use parallel roadways."

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-57 TR, duplicate comment was provided in 30-57 TR]

"For the 4 variants of the Cathedral Hill Project mentioned -- Impact TR-55 on Page S-48 and Impacts TR-56 through TR-58 on Page S-50 - there will be a 'significant and unavoidable' (SU) impact due to 'construction vehicle traffic and construction activities that would affect the transportation network.' In order to bring this impact to a 'less-than-significant' impact, the DEIR states that Mitigation Measure TR-55 will be implemented. This calls for a "Construction Transportation Management Plan (TMP) which will 'disseminate appropriate information to contractors and affected agencies with respect to coordinating construction activities to minimize overall disruptions and ensure that overall circulation ... pedestrian, transit, and bicycle program would supplement and expand, rather than modify or supersede, any manual, regulations, or provisions set forth by Caltrans, SFMTA, DPW, or other City departments and agencies.'

It goes on to say that the remedy would include, 'identifying ways to reduce construction worker vehicle trips through transportation demand management programs and methods to manage construction work parking demands,' 'identifying best practices for accommodating pedestrians, such as temporary pedestrian way-finding signage or temporary walkways,' 'identifying ways to accommodate transit stops located at sidewalks slated for closure during construction,' 'identifying ways to consolidate truck delivery trips, including a plan to consolidate deliveries from a centralized construction material and equipment storage facility,' and 'identifying best practices for managing traffic flows on Van Ness Avenue during the nighttime hours for the period when tunnel construction would involve surface construction activities.'"

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-63 TR, duplicate comment was provided in 30-63 TR]

"As part of the effort to assist pedestrians during construction, way-finding signage may be OK for the sighted, but how will the blind and deaf be guided in this area? I suggest any way-finding signs to be posted at a good

distance away from the construction site so that people do not end up walking unnecessarily only to find that the sidewalk is closed or that they have to walk out into traffic."

(Alan Wofsy—Emeric-Goodman Associates, September 23, 2010) [26-2 TR]

"Following are examples of the absence of mitigation measures from 3 of the chapters and my proposals to include real mitigation measures in the Final EIR:

DEIR

4.5 TRANSPORTATION AND CIRCULATION

Construction Workers by Shift-During construction of the Cathedral Hill Campus the maximum worker population would range between 80 (during demolition) and 735 workers (during interior finishing). A majority of these workers (about 80 percent) would be working on the Cathedral Hill Hospital. Work shifts would occur 7 a.m. to 4 p.m. and 4 p.m. to midnight on weekdays, and between 7 a.m. and 5 p.m. on Saturdays. 4.5-147

The proposed Cathedral Hill Hospital and Cathedral Hill MOB would be constructed over approximately 54 months. Construction activities would take place generally between 7 a.m. and midnight on weekdays and between 7 a.m. and 5 p.m. on Saturdays, depending on the phase of construction, and whether rafter-hour construction permits, when required for work after 8 p.m., are approved by the City. 4.5-147

Construction Truck Delivery Schedule-Table 4.5-30, 'Cathedral Hill Campus-Average Trucks per Day and per Shift by Construction Phase' (page 4.5-151), summarizes the average number of trucks needed to haul excavated materials and for equipment and materials deliveries to the Cathedral Hill Campus during construction. Trucks would only arrive at the campus during construction shifts. As indicated in Table 4.5-30, between 100 and 320 trucks would travel to the Cathedral Hill site per day, with the greatest number of trucks arriving during the excavation and foundation phases. 4.5-148

Approximately 185 trucks per shift [= 370 per day] would arrive at the construction site during the excavation phase, and assuming that 15 percent of these trucks would arrive during the peak hours, a total of 28 trucks would arrive during the peak a.m. and p.m. peak hours. Since a significant portion of the construction vehicle trips would be via large and heavy vehicles, the number of vehicles added to the intersection analysis was adjusted to reflect the impact of larger trucks on roadway capacity. 4.5-151

Because of the number of temporary closures of sidewalks adjacent to the project sites necessitating pedestrian detours, the proposed project would result in a significant impact on pedestrians during construction. 4.5-155

DISCUSSION

The massive impacts of the proposed project are well summarized in Section 4.5.

The DEIR adduces the following statistics during construction:

1. Up to 735 workers.
2. Construction between 7AM and midnight weekdays (17 hours per day) and 7 AM to 5 PM on Saturday during 54 months of construction.
3. Up to 370 truck arrivals and departures between 7 AM and Midnight, or more than one truck every 3 minutes for 17 hours per day.

The DEIR does not analyze the environmental and health impacts on the resident and businesses in our building as a result of these overwhelming statistics. It is likely that many will be unwilling to live or work in the building during the 54 months of construction and the DEIR should have proposed a method to compensate the property

owner for lost income due to the impacts of the project and/or to have to compensated tenants who are willing to remain in the building during the construction period."

(Sue Hestor, October 19, 2010) [89-9 TR]

"Coordinating construction so that it occurs in the shortest amount of time possible will reduce construction impacts on nearby residents and businesses, on MUNI and other transit lines, and on traffic. [The EIR should discuss the impacts of serial construction of CPMC, then BRT(s) later."

Response TR-105

The comments state concerns with Mitigation Measure MM-TR-55 (Construction Transportation Management Plan) in the Draft EIR, page 4.5-159. Mitigation Measure MM-TR-55 was developed in response to the finding that construction activity at the proposed Cathedral Hill Campus would result in several significant impacts (Impact TR-55 in the Draft EIR, beginning on page 4.5-147), including impacts to traffic, pedestrians, and public transit. Given the magnitude of the proposed construction activities and the location of the project, construction impacts of the proposed Cathedral Hill Campus would be significant and unavoidable. To reduce these impacts to the extent possible, CPMC and its contractors would be required to develop a Construction Transportation Management Plan (TMP). As stated in Mitigation Measure MM-TR-55:

"CPMC shall develop and implement a Construction Transportation Management Plan (TMP) to anticipate and minimize impacts of various construction activities associated with the Proposed Project."

The Plan would disseminate appropriate information to contractors and affected agencies with respect to coordinating construction activities to minimize overall disruptions and ensure that overall circulation is maintained to the extent possible, with particular focus on ensuring pedestrian, public transit, and bicycle connectivity. The program would supplement and expand, rather than modify or supersede, any manual, regulations, or provisions set forth by Caltrans, SFMTA, DPW, or other City departments and agencies.

Specifically, the plan would:

- Identify construction traffic management best practices in San Francisco, as well as others that, although not being implemented in the City, could provide valuable information for the project. Management practices include, but are not limited to

  - Identifying ways to reduce construction worker vehicle trips through transportation demand management programs and methods to manage construction work parking demands.

  - Identifying best practices for accommodating pedestrians, such as temporary pedestrian wayfinding signage or temporary walkways.

  - Identifying ways to accommodate public transit stops located at sidewalks slated for closure during construction. This may include identifying locations for temporary bus stops, as well as signage directing riders to those temporary stops.

  - Identifying ways to consolidate truck delivery trips, including a plan to consolidate deliveries from a centralized construction material and equipment storage facility.

  - Identifying best practices for managing traffic flows on Van Ness Avenue during the nighttime hours for the period when tunnel construction would involve surface construction activities. This may include coordination with Caltrans on appropriate traffic management practices and lane closure procedures.

- Describe procedures required by different departments and/or agencies in the city for implementation of a Construction TMP, such as reviewing agencies, approval processes, and estimated timelines. For example,

  - CPMC shall coordinate temporary and permanent changes to the transportation network within the City of San Francisco, including traffic, street and parking changes and lane closures, with the SFMTA. Any permanent changes may require meeting with the SFMTA Board of Directors or one of its sub-Committees. This may require a public hearing. Temporary traffic and transportation changes must be coordinated through the SFMTA's Interdepartmental Staff Committee on Traffic and Transportation (ISCOTT) and would require a public meeting. As part of this process, the Construction Plan may be reviewed by SFMTA's Transportation Advisory Committee (TASC) to resolve internal differences between different transportation modes.

  - Caltrans Deputy Directive 60 (DD-60) requires TMP and contingency plans for all state highway activities. These plans should be part of the normal project development process and must be considered during the planning stage to allow for the proper cost, scope and scheduling of the TMP activities on Caltrans right-of-way. These plans should adhere to Caltrans standards and guidelines for stage construction, construction signage, traffic handling, lane and ramp closures and TMP documentation for all work within Caltrans right-of-way.

- Require consultation with other Agencies, including SFMTA and property owners on Cedar Street, to assist coordination of construction traffic management strategies as they relate to bus-only lanes and service delivery on Cedar Street. CPMC should proactively coordinate with these groups prior to developing their Plan to ensure the needs of the other users on the blocks are addressed within the construction TMP for the project.

- Identify construction traffic management strategies and other elements for the project, and present a cohesive program of operational and demand management strategies designed to maintain acceptable levels of traffic flow during periods of construction activities. These include, but are not limited to, construction strategies, demand management activities, alternative route strategies, and public information strategies.

- Develop a public information plan to provide adjacent residents and businesses with regularly-updated information regarding project construction, including construction activities, peak construction vehicle activities (e.g., concrete pours), travel lane closures, and other lane closures.

The Construction Transportation Management Plan shall be submitted to SFMTA, SFDPW, and the Planning Department for review and approval."

Several elements of this Construction TMP have already been developed by CPMC and its construction management company, Herrero-Boldt. Based on the construction plan prepared by Herrero-Boldt,[27] the Construction TMP would include the following elements that specifically relate to comments about construction work hours, truck management, pedestrian way-finding signage, and vehicle signage:

- Construction on both the Hospital and MOB would occur during one shift between 7 a.m. and 7 p.m. on Monday through Friday and between 7 a.m. and 5 p.m. on Saturday. Work extending past 7:00 p.m. will be limited to activities such as concrete finishing, steel detailing, and general production preparation, and will be communicated with the neighbors on a weekly basis. Second shift work (work occurring between 4:00 p.m. and Midnight) is anticipated, pursuant to City approval, only during the interior build out phase of the hospital. Second shift work is not anticipated on the MOB project. Excavation of the Van Ness pedestrian tunnel would occur between 7 p.m. and 5 a.m.,

[27] Revised Construction Plan prepared by Herrero-Boldt dated February 2011 on file with the Planning Department.

pursuant to Caltrans approval, to reduce impacts associated with lane closures required to complete the work.

- CPMC and Herrero-Boldt have developed a truck management plan to coordinate truck deliveries to and from the construction site. In summary, up to eight trucks could be accommodated within the construction site. If delays occur, a logistics manager would be in communication with off-site trucks and would request any trucks not able to enter the construction site to hold at or return to their construction yard. The logistics manager would be in constant communication with both trucks and the construction job site.

- Construction would require the closure and pedestrian detours on all sidewalks immediately adjacent to the construction site. To accommodate pedestrians, temporary covered pedestrian walkways would be constructed within the parking lane along both sides of Van Ness Avenue. Wayfinding signage and required pedestrian facilities would be provided. As mentioned in Response TR-123 (page C&R 3.7-203), although some pedestrians might have special needs, the SFMTA is not aware of special technologies that could further aid these pedestrians, and these pedestrians typically would have devices that would aid them in navigating city streets, including poles and trained guide dogs.

- During construction of the hospital, one parking lane would be closed and all travel lanes on Van Ness Avenue would remain open, and construction of the Van Ness Avenue pedestrian tunnel would require closure of up to two travel lanes in addition to the parking lane. As discussed in Impact TR-55, the closure of the peak hour travel lane/parking lane on Franklin Street between Geary Street and Post Street would result in increased delay at Franklin/Geary and Franklin/Post intersections. Construction of the pedestrian tunnel under Van Ness Avenue would require sequential lane closures of two lanes at a time between 7 p.m. and 5 a.m., when traffic is typically lighter. As discussed in Impact TR-55, vehicle delay would increase at the intersections of Van Ness/Post and Van Ness/Geary. No other vehicle travel lanes would be closed during construction. CPMC and Herrero-Boldt would work with the City of San Francisco to identify appropriate locations for signage alerting drivers to these construction closures.

- The transit-only lane on Post Street between Franklin Street and Van Ness Avenue would be closed during construction for safety reasons. As a result, Muni would be required to share a mixed-flow travel lane for one block. Muni's overhead wires would be relocated to the north side of the street. Conflicts between construction vehicles and Muni vehicles would be minimal because construction vehicles would enter the construction site from the southern-most lane on Post Street. This mitigation measure would be coordinated with Muni to ensure that impacts to public transit would be minimal.

Several comments refer to the potential for construction of the proposed Cathedral Hill Campus to overlap with other major projects in the area, including the Van Ness Avenue BRT and Geary Corridor BRT routes. These projects have not yet been approved, nor have their construction plans been identified. CPMC and Herrero-Boldt would be required to consult with the SFMTA, DPW, SFCTA, Caltrans, and Planning Department during construction to ensure that the elements of the TMP would be effective, and any coordination between these projects and the proposed CPMC LRDP to minimize construction impacts would be addressed when a construction plan for the BRT projects was developed. These cumulative traffic impacts related to construction are addressed in Response TR-104 on page C&R 3.7-177.

The comment further states that the Draft EIR does not analyze the environmental and health impacts on the resident and businesses near the Emeric-Goodman Building. Please see Response INTRO-7 on page C&R 3.1-17 for further discussion of this issue.

3.7.11.4 CONSTRUCTION WORKER TRANSPORTATION PROGRAM

Comments

(Bernard Choden, September 20, 2010) [13-3 TR, duplicate comments were provided in 14-3 TR and 38-3 TR]

"**Demonstrated commitment and means of mitigation of interim construction phase impacts:** For example, construction parking and staging areas will very likely impair each site's livability and commercial viability. Japan town could face commercial disaster."

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-59 TR, duplicate comment was provided in 30-59 TR]

"In these same Administrative documents that supplement the CPMC DEIR, the table mentioned in this 'Biology Section, #7, shows that there will be a maximum of about 680 workers from July/August 2012 through October 2014 with an average of about 550 workers from July 2012 through October 2014 to build the Cathedral Hill Campus Hospital; and for the MOB the 'maximum number of workers on site per day' is 158 from May 2013 through August 2014 with an average of about 100 workers from October 2011 through August 2014. Will they park other than at 1375 Sutter, 855 Geary, 1600 Geary and CH MOB? If so, how many more parking spaces will be leased as part of this 'transportation demand management program'?"

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-120 TR, duplicate comment was provided in 30-120 TR]

"Also, in the Administrative documents that accompany this CPMC DEIR, the consultant, Herrero-Boldt, indicates that 70-75% of the construction workers on the Cathedral Hill Hospital and MOB projects are lone drivers. And these drivers will be parking in one of the 400 parking spaces at Japantown and the merchants cannot get customers who arrive from the East Bay, Peninsula and North Bay communities to visit and shop at Japantown because of the lack of parking in this historical resource area. It is difficult to get construction workers to 'truck-pool' but perhaps this needs to be done for these workers to leave their vehicles outside of San Francisco. This would be one mitigation measure. (See also Item 20 above.)"

(Rose Hillson—Jordan Park Improvement Association, September 23, 2010) [18-131 TR, duplicate comment was provided in 30-131 TR]

"71.ln looking at Table 4.5-29, Page 4.5-150, how many construction workers will be parking at the Japantown Garage? Based on the workers expected to be on site per day at the Cathedral Hill Hospital, MOB and Tunnel projects, and according to the "Biology Section, #7" report in the Administrative documents, if the maximum workers at the site per day is per the following:

- 680 at Hospital
- 158 at MOB
- 35 at Tunnel

The total of workers maximum per day equals 873 workers."

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-132 TR, duplicate comment was provided in 30-132 TR]

"72. Table 4.5-29 lists only 1375 Sutter, 855 Geary, 1600 Geary and the Cathedral Hill MOB as potential parking areas for the workers. The 'Biology Section, #7' report states the following number of parking spaces for the above:

- 1375 Sutter 175 parking stalls for the construction workers
- 855 Geary 200 parking stalls for the construction workers
- 1600 Geary 400 parking stalls for the construction workers

This gives a total of 775 parking stalls for the construction workers with almost 100 spaces short. Even if, as the Administrative document shows, CPMC will be running 4-5 shuttles to hold 30-workers and be running continuously for 2 hours, the workers will still bring their private vehicles as close to the shuttle pickup places as possible; and that would indicate that they will be parking at the above 3 bulleted addresses. If we assume that 400 workers will use, e.g., the 1600 Geary garage in Japantown, people who want to visit the Japan Center will not shop because at least 400 spaces are taken by construction workers who are not conducting business or shopping in Japantown; and during construction, people cannot park on street either since there will be displaced vehicles that will encroach into the onstreet parking spaces around Japantown."

(Bob Hamaguchi—The Japantown BNP Organizing Committee, October 8, 2010) [47-4 TR, duplicate comment was provided in 50-4 TR]

"Specific issues that need to be addressed include:

1) Use of the 1610 Geary (aka Japantown) garage for construction parking, as proposed by the DEIR and the HerreroBoldt analysis (CPMC Cathedral Hill Hospital and Medical Office Building Environmental Impact Report, Construction Data, Version 2.x - February 5, 2010).

This document references the existing 400 spaces CPMC has reserved at this location as available for construction use. However, they are already in use by CPMC staff at the Pacific Campus, and are not available for construction parking. Due to overwhelming demand, CPMC has had to create a waiting list for this popular program. The Japantown merchants have experienced the loss of parking spaces from other construction projects - reaching premature capacity, and as a result customers cannot find parking during peak afternoon especially on Fridays and Saturdays. The resulting drop in customers has an immediate and adverse impact on revenues, and hence threatens the future financial viability of Japantown merchants.

We urge you to consider mitigations that focus on leasing space in underutilized garages (e.g. For the month of August 2010, 5th &Mission Garage has 2,585 parking spaces and averaged only 45% peak occupancy Mondays through Fridays; San Francisco Port may well have pier parking available and Candlestick Park may be another resource). We feel that there has not been enough research performed on parking alternatives. San Francisco MTA has data relating to capacity, and perhaps is a resource to help find solutions. San Francisco's Transit First policy is .aggressively applied in Planning 's review of projects once occupied and operational. We urge that this same diligence in reducing passenger vehicle traffic be applied to the construction phase of projects. In applying the 'Transit First' policy to the construction phase, CPMC could consider shuttles from locations outside of San Francisco."

(Rachel Sater—Lost Block and Save Our Streets, October 19, 2010) [101-24 TR]

"Page 4.5-209. Impact TR-94: The conclusion of less-than-significant construction traffic impacts is not supported by sufficient evidence. This is another instance of the project level DElR relying on ambiguous and inadequately detailed description of important components of the proposed project to conclude an impact would be less than significant. The DElR states that '[c]arpooling and transit use by construction workers would be encouraged throughout the construction to reduce parking demand,' and '[e]xisting offsite public parking garages and lots would be utilized.' The DElR acknowledges that, '[specific locations of these off-site facilities have not been, identified by CPMC. A shuttle service would be provided between the St. Luke's construction site and the offsite public parking garages and lots.' Are lots with sufficient unused capacity available within a reasonable distance? What parking supply impacts would the project cause in the vicinity of those lots? Under CEQA, the DEIR needs to provide sufficient evidence to support the feasibility and effectiveness of such an approach. Accordingly, the DElR must be revised to include this information and analysis."

(Bernard Sherman, September 23 2010) [PC-11 TR]

"A demonstrated commitment in means of mitigation of interim construction phase impacts, for example, the construction of parking and staging areas will likely impair each site's livability and commercial viability. Japantown, on whose organizing committee I serve, could face commercial disaster."

Response TR-106

The comments state concerns about the adequacy of transportation demand management measures developed by CPMC and Herrero-Boldt to address construction worker parking needs. The comments also request clarifications regarding the number of construction workers that would be on site during construction. Herrero-Boldt, in conjunction with CPMC, would develop a CWTP to ensure that the parking demands for construction workers would be met without impacting parking availability for patients, employees, visitors, or other local merchants and residents near each campus. The goal of the CWTP would be to reduce the number of workers driving to construction sites and to manage the use of available parking supply so as to not unreasonably impact parking availability for patients, employees, local merchants, residents, and visitors.

Workers would be encouraged to use public transportation, carpool, or vanpool, or use shuttles to access construction sites, consistent with the City's Transit-First Policy. To encourage this behavior, the CWTP would:

- Provide subsidized or reduced-cost public transit passes to workers who use public transportation, bicycle, or walk;
- Provide secure bicycle parking on job sites;
- Designate special priority parking areas for carpools and vanpools;
- Provide a rideshare matching program operated by the project sponsor to match drivers and riders;
- Fully or partially subsidize tolls, gas, and parking for carpools or vanpools based on the number of occupants per vehicle;
- Provide lunch vouchers to workers using public transportation or who walk or bike; and
- Provide a shuttle between off-site parking lots and the job site at 15 minute headways between 6 and 9 a.m. and 2 and 4 p.m.

Parking for construction workers driving or participating in a carpool or vanpool would be provided in off-site public parking lots within the vicinity of each job site and, if necessary, in satellite parking lots served by shuttles at times scheduled with phases and shifts of the construction activities. The off-site parking lots identified for construction workers would be separate from the parking lots used by CPMC employees. Construction workers who drove, carpooled, or vanpooled would be given parking passes for these off-site garages.

All personnel (administrative, skilled trade, and labor) would be instructed that available on-street parking near campus was not to be used during the day, and that penalties would be assigned if anyone was found to be parking on the street. All proposed CPMC campuses would be located within residential parking permit zones or surrounded by on-street metered parking. Therefore, any construction worker who chose to park on the street would remain subject to any posted parking regulation in effect during that worker's shift.

At the proposed Cathedral Hill Campus, the maximum number of workers at the construction site during the 54-month construction period is expected to be 735 workers. One comment notes that the sum of the maximum number of construction workers would exceed 735; however, because of project phasing at the proposed Cathedral Hill Campus, the maximum number of workers for the proposed hospital, MOB, and tunnel would not occur simultaneously. Exclusive of the Japan Center Garage and the 1375 Sutter garage, CPMC has identified 13 parking lots containing a total of 480 available monthly spaces, within walking distance of the construction site that could be used for construction worker parking. Construction workers would not be permitted to use parking areas, including the Japan Center Garage that would be reserved for CPMC employees. Approximately 360 spaces would be used initially for construction worker parking. The construction site also would have about 20 on-site spaces reserved for essential personnel.

At the St. Luke's Campus, the maximum number of construction workers at the construction site during the phased 4-year construction period is expected to be about 150 workers. CPMC has identified 50 available monthly parking spaces within walking distance of the St. Luke's Campus at 3500 Cesar Chavez Street that could be used for construction worker parking. Approximately 35 spaces would be used initially for construction parking. The construction site also would have about 10 on-site spaces reserved for essential personnel.

At the Davies Campus, the maximum number of workers at the construction site during construction of the Neuroscience Institute building is expected to be about 105 workers. CPMC has identified 190 available monthly parking spaces within walking distance of the Davies Campus that could be used for construction worker parking. Approximately 70 spaces would be used initially for construction parking. The construction site also would have about 10 on-site spaces reserved for essential personnel.

CPMC would negotiate with garage management at the off-site parking garages where it would lease spaces to monitor overall garage occupancies, and would determine if maximum capacities would be exceeded. If demand exceeded supply, CPMC would redirect its construction workers to other parking lots with available supply. Any lot within walking distance but greater than a 10-minute walk from the jobsite would be linked to the jobsite by a shuttle, contracted by the project sponsor. When not in use, shuttles would not park at the jobsite but would be stationed in the contractor's shuttle yard.

In additional to the parking garages located near each campus, satellite parking garages at the intersections of 12th Street/Kissling and Franklin/Grove (Performing Arts Center Garage) have capacity to provide up to 800 additional spaces for construction worker parking. CPMC already maintains leases with these facilities, and a shuttle could be provided to construction workers parked at them. Because of these existing leases, CPMC would not need to pursue additional parking leases at the 5th and Mission Garage, Candlestick Park, or the Port of San Francisco.

The construction phases of the proposed LRDP are expected to occur over multiple years, and no phase where the maximum number of workers for each campus would be reached is anticipated to occur simultaneously. Even if construction on the campuses did overlap, CPMC would operate or lease approximately 1,265 parking spaces exclusively for construction workers. If the most intense construction period on all the campuses occurred simultaneously, approximately 990 construction workers would be on CPMC property. Therefore, although the CWTP would provide measures to reduce the number of workers driving to construction sites, CPMC would be able to accommodate all construction workers without displacing patient, visitor, employee, or local merchant or resident parking.

Construction of the Pacific Campus and the 14th Street/Castro Street MOB at the Davies Campus would be long-term projects that would occur only after completion and occupation of the proposed Cathedral Hill Campus, the St. Luke's Campus, and the proposed Neuroscience Institute building at the Davies Campus. Given that those projects would be long-term projects, the availability, pricing, and supply of

parking available during their construction phases would be different, and an analysis at this time would be speculative and would not necessarily represent an accurate assessment.

As described in the Draft EIR, supply and lack of parking is not considered a significant impact; however, information about parking is provided for informational purposes.

3.7.11.5 VAN NESS AVENUE TUNNEL CONSTRUCTION LANE CLOSURES

Comments

(Lisa Carboni (Caltrans (Regional)), September 9, 2010) [6-5 TR, duplicate comment was provided in 7-5 TR]

"On page 145 of the TIS, it states that the tunnel construction work will be limited to 7PM to 5AM daily for a 10 month period. Would the lane closure only occur during these hours and fully reopen (three travel lanes) or would the closure be continuous throughout the day and only tunneling work be limited to those hours? The Department is particularly concerned with a lane closure that will significantly impact AM and PM peak hour traffic."

(Helene Dellanini—DBC Master Owner's Association, October 18, 2010) [71-10 TR, duplicate comment was provided in 72-10 TR]

"Van Ness Tunnel: Given the levels of traffic volume on Van Ness that remain after 7 PM (Table 4.5-32), lane closure for construction of the tunnel should occur after 9 PM, when traffic volume is shown to decrease significantly."

(Helene Dellanini—DBC Master Owner's Association, October 18, 2010) [71-30 TR, duplicate comment was provided in 72-30 TR]

"Construction of the Van Ness tunnel will require lane closures on Van Ness. To minimize the impact, these lane closures will be required to be performed at night. Currently, the lane closures are proposed to begin at 7 pm. However, in looking at the average midweek traffic volumes on Van Ness (table 4.5-32), it can be seen that the traffic volumes for both the northbound and southbound directions remain very high during the 7 pm to 8 pm time period and drop modestly from 8 pm to 9 pm. Due to the continued high volume of traffic at this time of day, it is recommended that the lane closures begin no earlier than 9 pm to minimize the impacts to the neighborhood."

(Gloria Smith/Tom Brohard & Associates—California Nurses Association, October 19, 2010) [92-29 TR]

"Open cutting of Van Ness Avenue to construct the tunnel together with the lane closures outlined in Table 4.5-33 on Page 4.5-158 will result in significant congestion and traffic impacts during construction of the tunnel over 10 months. To mitigate these significant traffic impacts, the Draft EIR must confine the lane closures and construction activities to hours that meet the San Francisco's LOS D standard (no lane closures northbound before 10 PM and no lane closures southbound before midnight). The Draft EIR must also consider mitigating traffic impacts of the tunnel construction by boring underground to avoid lane closures rather than open cutting of Van Ness Avenue."

Response TR-107

The comments state concern regarding the impact and timing of travel lane closures on Van Ness Avenue during construction of the proposed pedestrian tunnel. Construction of the proposed underground pedestrian tunnel between the proposed Cathedral Hill Hospital and Cathedral Hill MOB would be a "cut and cover" project and would occur over a period of 18 months, with only 10 months of work affecting Van Ness Avenue. Tunneling using boring techniques was considered and rejected because of site constraints and the soils and geology in the tunnel area.

At the proposed pedestrian tunnel location, Van Ness Avenue has three travel lanes and a parking lane in each direction. Construction of the proposed pedestrian tunnel would require sequential closures of no

more than two lanes at a time in 100-foot segments of the lane along Van Ness Avenue, between 7 p.m. and 5 a.m. All travel lanes on Van Ness Avenue would reopen at 5 a.m. each day, and construction would not recommence until the end of the p.m. peak traffic period at 7 p.m. The interior tunnel work would occur between 7 a.m. and 7 p.m.;[28] however, the interior work would not require any lane closures along Van Ness Avenue.

Comments 71-10, 71-30 and 92-29 suggest that, based on the Van Ness Avenue traffic volumes presented in Table 4.5-32 of the Draft EIR, construction of the underground tunnel be restricted to later hours (ranging from after 9:00 p.m. to after midnight), to minimize impacts to surrounding neighborhoods. As shown in Table 4.5-32 on page 4.5-157 of the Draft EIR, traffic volumes between 7:00 p.m. and 8:00 p.m. are 86 percent of traffic volumes during the p.m. peak hour. Seven p.m. was chosen because it is the earliest hour in which traffic on Van Ness Avenue substantially decreases compared to the peak hour. As shown in Table 4.5-33 on page 4.5-158 of the Draft EIR, when construction occurred on the northbound side of Van Ness Avenue, the intersections of Van Ness/Geary and Van Ness/O'Farrell would operate at LOS F and the intersection of Van Ness/Post between 7:00 p.m. and 8:00 p.m. The intersection of Van Ness/Geary would operate at LOS F until 9:00 p.m. in the northbound direction. After 9:00 p.m., all intersections impacted by construction would operate at acceptable levels of service. When construction occurred on the southbound side of Van Ness Avenue, the intersection of Van Ness/Geary would operate unacceptably until midnight. The intersection of Van Ness/Post would operate at LOS E until 8:00 p.m. The other intersections along Van Ness Avenue would not be substantially impacted by the construction of the tunnel, and as shown in Table 4.5-33, Van Ness/Bush and Van Ness/Sutter intersections would operate at LOS B after 7:00 p.m. The tunnel's construction would only impact one side of Van Ness at any given time and would be localized to the segments immediately adjacent to the construction site. Although restricting certain construction activities such as material deliveries to after 9 p.m., 10 p.m., or midnight could improve later evening traffic operations at some intersections, the construction impacts identified in the EIR would not substantially change the significant and unavoidable impact identified in Draft EIR. Through the City review of the CMP, the TASC may further reduce construction hours or activities.

Construction-related impacts of the pedestrian tunnel construction were identified as significant and unavoidable in the Draft EIR, with Mitigation Measure MM-TR-55 (on page 4.5-159 of the Draft EIR) identified, and the Construction Transportation Management Plan would include the best management practices for overseeing this localized traffic impact.

The proposed construction hours and lane closure periods would be subject to City and Caltrans review and approval. In general, lane and sidewalk closures as a part of construction activity must meet *City's Requirements for Working in San Francisco Streets* (SFMTA Blue Book) and are subject to review and approval by the City's Transportation Advisory Staff Committee (TASC) which is chaired by an SFMTA Traffic Engineering staff member and consists of representatives of other City departments (including Public Works, Fire, Planning, Police, Public Health, Port and the Taxi Commission).

3.7.11.6 TRUCK MANAGEMENT

Comments

(Charles Freas, October 19, 2010) [79-3 TR, duplicate comment was provided in 100-3]

"Construction impacts are particularly challenging, such as the proposed 185 truck trips per day which averages over 20 trucks per hour or 3 minutes per load time - an efficiency I have never seen in my over 30 years of

[28] Revised sheets submitted for Construction Plan prepared by Herrero-Boldt dated December 13, 2010 and January 11, 2011 on file with the Planning Department

engineering and construction management - is fiction. Particularly true for such a congested and compact construction site."

(Alan Wofsy, September 23, 2010) [PC-300 TR]

"During part of the project, there's going to be 370 trucks coming during that 17-hour period, which means one truck every three minutes, for 17 hours a day."

(Rose Hillson—Member, Jordan Park Improvement Association, September 23, 2010) [18-61 TR, duplicate comment was provided in 30-61 TR]

"For the Cathedral Hill Hospital project, with 55 trucks per day during demolition, 220 trucks per day during excavation, 152 trucks for the foundation work, 110 trucks per day for the building of the structure, and 25 trucks each per day for the exterior and interior work, there will be a problem with trucks queuing up at the site. These trucks need to be told in advance of approaching the work site that no more trucks can get into the area until a truck has left or the gridlock in the area will be exacerbated. In fact, adding the Cathedral Hill MOB project at the same time, for each of the above categories (e.g. demolition, excavation, etc.), there will be a total of 95 trucks per day for demolition, 320 trucks for excavation, 312 trucks for foundation work, 240 trucks to build the structure, 50 trucks for exterior work and 40 trucks for interior work per Page 4.5-151.

With the sheer number of trucks coming and going, and with just the one statement on Page 4.5-152 – 'if trucks begin to stack, other trucks would be advised to return to their construction yard by the contractor's logistics superintendent' - it did not seem like a good plan was in place. However, after reading the Administrative document by Herrero-Boldt dated May 27, 2009, 'CPMC Cathedral Hill Hospital EIR - Construction Data Version 2.x,' it appears that a better explanation was given to allay any issues with the smooth operation of the arrivals and departures of the construction trucks that will be at this site. Per this document, the 'Logistics Superintendent will be in constant radio contact with the jobsite to coordinate deliveries continuously during all hours of operation.' It explains that 'there is planned room for a total of 8 trucks at the site while only 3 are planned to be offloaded at a time. This will allow for 3 trucks to be offloaded while 5 are queued. If a truck cannot reach the site in a reasonable amount of time or not at all, the truck will return to the construction yard by the most plausible alternate route based on the current circumstances. The use of technology (GPS, traffic reports, police scanners) and constant communication between construction yard, drivers, and construction site will help to reduce difficulties in trucking.'

In addition, this document states that 'schedules for the cranes and hoists will be coordinated with the delivery schedule in order to make the most efficient use of the equipment.' When, according to this document, the construction yard locations will be at:

- 550 Townsend
- 450 Toland
- 2020 Cesar Chavez
- 2065 Oakdale Avenue
- 955 Cesar Chavez

And the materials will be trucked in from warehouses in:

- Mission Bay
- Central Waterfront.
- Bayview District"

Response TR-108

The comments address concerns about the amount of construction truck trips and how the construction site would manage trips to and from the site. Comments 79-3 and PC-300 suggest that truck deliveries to

the proposed Cathedral Hill Campus would occur every 3 minutes; however, this is not correct. The planned frequency of truck deliveries to the campus is discussed below.

The Construction Transportation Management Plan indicates that the proposed Cathedral Hill Campus construction site would generate 185 truck trips per day—135 to the Cathedral Hill Hospital construction site and 50 to the MOB construction site. Although an average of over 20 trucks would travel to both sites during each hour, it is incorrect to estimate 3 minutes per load time because some trucks would be traveling to the hospital construction site and others would be traveling to the MOB construction site.

The hospital construction site would generate 135 truck trips over a 9-hour day, or 15 truck trips per hour. The hospital construction team would require use of two loaders for the hospital. Each loader would load an average of 7.5 trucks per hour (15 trucks/two loaders); therefore, the duration for a truck on the hospital construction site would be 8 minutes per load (60 minutes/7.5 trucks).

The MOB construction site would generate 50 truck trips over a 10-hour day, or five truck trips per hour. If one loader was used for the MOB, the loader would load an average of five trucks per hour, and the duration for each truck on the MOB construction site would be 12 minutes per load (60 minutes/five trucks).

To maximize the efficiency of each truck's run and prevent queuing of trucks outside the construction site, as Comment 18-61 notes, a logistics superintendent would be in constant radio contact with the construction site to coordinate truck routes. This person would be responsible for monitoring truck locations, traffic reports, and GPS to reduce delays, and for maintaining communication between construction yards, the site, and truck drivers. In the case of unforeseen delays, the site would be designed to accommodate up to eight trucks. Any trucks that could not make it to the site in the appropriate scheduled slot would be redirected back to the construction yard. This logistics support would be an element of the Construction Transportation Management Plan (Mitigation Measure MM-TR-55 summarized on page 4.5-159 of the Draft EIR and in Response TR-105, page C&R 3.7-180).

3.7.11.7 OTHER SPECIFIC COMMENTS

Comment

(Helene Dellanini—DBC Master Owner's Association, October 18, 2010) [71-9 TR, duplicate comment was provided in 72-9 TR]

The intersection at Franklin and Post is reported to deteriorate from LOS B to LOS F during the five year construction phase, which is the largest deterioration among all of the intersections analyzed. However, TR-55 asks for a Transportation Management Plan in which CPMC identifies for themselves the best practices that might address construction traffic issues, without listing any tangible restrictions or modifications and without requiring proof from CPMC that such measures are working. We recommend the following additional mitigation measures:

- In order to relieve the significant impacts of construction related traffic on all nearby areas, restrict the following construction operations to occur only during non-peak hours, 9 AM – 5 PM weekdays: concrete pours (staging/queuing of concrete trucks), material deliveries, excavation import/offhaul, fire proofing (staging of pump trucks) and demolition (staging of debris trucks).

- In order to relieve the significant impacts of construction related traffic on the heaviest hit intersection of Franklin and Post, the following activities should be restricted on Post during non-peak hours: staging/queuing of concrete trucks and demolition debris trucks, material deliveries, and excavation import/offhaul site access entry/exit. Displacement of trips would be spread out to intersection that, according to the DEIR, would be operating at or above LOS D. In addition, displacement would occur during non-peak hours.

- The DEIR reports that an average of 135 trucks per shift will be accessing the Cathedral Hill Campus during excavation. For a nine hour shift, this equates to an average of 15 trucks per hour. However, the construction site is planned to have room for parking only eight trucks. Therefore, it is highly likely that trucks will be queuing around the block and causing more traffic than anticipated in the analysis. Truck trips were considered but truck queuing was not. Therefore, in order to avoid queuing and misrepresentation of the actual impacts in the DEIR per the study, the mitigation measure should require that all trucks accessing the site, for all operations, be controlled and staged at a remote location and dispatched to the site only when space onsite is available.

- CPMC plans on closing both the southern parking lane and Muni lane on Post. The Muni lane will be relocated to the northern normal traffic lane. In addition, CPMC plans on using the last remaining normal traffic lane as their truck route (135 trucks per shift). These changes to the transportation network will have a devastating impact to Post Street, evidence in part by the study's finding of a significant deterioration in LOS at Franklin and Post. In order to mitigate these impacts, construction vehicle traffic should be required to use the bus lane on Post that the Project already plans to take for its own uses, instead of using the normal traffic lanes.

- Given the anticipated congestion in the area of Franklin and Post (LOS B to F), CPMC should be required to station a flagman at the intersection to facilitate smooth traffic flow throughout the work day, even for operations that do not require flagmen per encroachment permits.

(Helene Dellanini—DBC Master Owner's Association, October 18, 2010) [71-29 TR, duplicate comment was provided in 72-29 TR]

"TR-55 TR-55 states that the construction activities for the project will have a transportation impact on the project vicinity that will affect the transportation network. The mitigation measure requires the implementation of a Construction Transportation Management Plan (TMP) that contains a number of specific action items.
