Introduction

What you ought to know!

This manual is part of a user documentation organized in modules. The PMC system consists of several partial functions which can be used together or separately. The functions of the PMC system are described in separate manuals which, in some cases, build on each other.

The manuals listed in the table below describe the PMC system from the point of view of the programmable controller.

| Manual Title | Required Manuals | Purpose and Contents |
|---|---|--|
| PMC/LS-B: Communications System (Corresponds to KOM-OS) | None | Basic description of the PMC software in the programmable controller Communication for operating and monitoring |
| PMC/LS-B: Message Function | PMC/LS-B: Communications System | Description of the PMC message system |
| PMC/LS-B: Status, Standard Displays and Objects | PMC/LS-B: Communications System PMC/LS-B: Message Function | Description of the PMC objects, object types, displays and status processing; reference of the standard displays and object types |
| PMCPRO or K OMOSPRO | PMC/LS-B: Communications System | Programming the data structure in the PLC using the PMCPRO software |
| PMC_581 | PMC/LS-B: Communications System | Description of the PMC user interface for higher level languages |

Setup of the Manual

The individual sections of the manual are self-contained and contain as few cross references to other sections as possible. To the extent possible, each section builds on the material contained in preceding sections and does not cover material contained in later sections.

| Section1 | Scope of supply Files and catalogues on the supplied disk |
|-----------|---|
| Section 2 | PMC object definition Concept, structure and task of object types and objects Overview of the predefined object types Standard displays (standardized displays) and standardized operator guidance User-specific objects and displays |
| Section 3 | Status processing - Status monitoring - Status messages - Status suppression - Status acknowledgement - Data blocks - Function and program blocks |
| Section 4 | Functional descriptions of the PMC object types Description of the predefined object types with their functionality for the automation program |
| Section 5 | Reference part of the PMC object blocks Description of the data structures (objects data block) for the predefined PMC object types |
| Section 6 | Reference part of standard displays Appearance and control possibilities of the standard displays for visua- lizing the predefined PMC object types |
| Section 7 | Technical data - Runtimes - Storage loading |
| Appendix | Summarized PMC status processing data blocks |

Understood Stipulations

Emphasis of Important Notes

In this manual, the pictogram shown below is used to indicate precautions which, when not adhered to, can cause damage.

| | Caution |
|--|--|
| | Indicates that property damage can result if appropriate measures are not taken. |

Indicates important information requiring particular attention.

- Abbreviations Abbreviations which are not part of everyday usage are written out in full the first time they appear.
- **Cross references** Cross references to parts of other sections are not made unless the repetition of facts would require too much space and it can be assumed that the description at another location is sufficient. Only the section number (e.g., \rightarrow section 4.2.1) is provided for cross references to parts of other sections.

Scope of Delivery

1

The PMC objects, status processing and standard displays package is stored on the enclosed disk.

The files are arranged in several catalogues:

| Catalogue PMC_NORA: | Standard displays and display elements for displaying the PMC objects. The PMC_NORA catalogue is further subdivided into the following subca- talogues: | | |
|------------------------|---|--|--|
| | • BEREICH: | Area display | |
| | • BOXEN: | Graphics boxes | |
| | • MELD: | Message programming | |
| | • NORA_SBB: | Standard displays | |
| | • TASTEN: | Key sets | |
| | • UEBERSI: | Overview displays | |
| | • ZUSTAND: | Status indicators | |
| Catalogue PMC_DATA | | a structures and examples for implementing user object eir callup interfaces in the user program. | |

File:

• DRIVERST.S5D

| Catalogue | PMC standard function blocks |
|-----------|------------------------------|
| PMC_STAT | |
| | |

Files:

- STA941ST.S5D/S5B (for CPU 941 to CPU 943)
- STA945ST.S5D/S5B (for CPU 945)
- STA944ST.S5D/S5B (for CPU 944)
- STA928ST.S5D/S5B (for CPU 928)
- STA946ST.S5D/S5B (for CPU 946/947)
- STA948ST.S5D/S5B (for CPU 948)

The PMC status processing is composed of function blocks and data blocks.

| Function | FB STATUS | |
|----------|-------------|----------|
| blocks | FB S-ANLAUF | (FB 209) |
| | FB STATQUIT | (FB 222) |
| | FB STATMELD | (FB 223) |
| | | |

| Data blocks | DB OBJ-STAT |
|-------------|-------------|
| | DB STAT-DIS |

FB STATUS, DB OBJ-STAT and DB STAT-DIS are generated by PMCPRO (any number can be assigned).

2 PMC Object Definition

2.1 General Concept

The general concept of PMC is based on the PMC objects. The PMC objects are formed in the programmable controller by object data blocks (DB).

All variable data of a measuring or control function of the automation program are contained in an object data block:

- Inputs
- Outputs
- Parameters
- · Auxiliary variables for operating and observing

The object data block is connected through the process via an automation function (object function block).

All PMC functions are based on the object data blocks (PMC objects). Each measuring and control function can be made accessible to the PMC function through an object DB.

The associated process displays for visualization which access the data structure of the PMC objects, stand in close connection with the PMC objects.

A distinction is made between the standard objects and the user-specific objects.

| Standard objects | The structure of the object DBs is already determined for a large number of |
|------------------|---|
| | measuring and control functions (object types). Finished standard displays |
| | can be used for visualization for these functions. |

User-specific For user-specific automation functions, the structure of the PMC object can be designed freely. The associated display for visualizing is programmed according to the selected object structure.

A distinction is made in PMC between objects and object types:

Object types determine the data structure for a certain type of measuring or control function.

A PMC object refers to a concrete measuring or control function and takes over the data structure of the corresponding object type.

Up to 200 objects can be programmed for each SIMATIC-CPU (up to 750 objects with CPU 946/947).

The user programs the relations between:

OBJECT DB, OBJECT NUMBER and OBJECT TYPE

by means of PMCPRO.

PMCPRO tests whether the stated object types are present in PMC. In the case of faulty programming, the entries are rejected with a corresponding error message. It is possible to define own user objects with PMCPRO (for CPU 945, 946/7, 948 up to 750 objects).

2.2 PMC Objects

2.2.1 Data Structure

The object data block always includes the following information:

- Name of the object
- Object-specific information
- Status information

The name of the object consists of 16 ASCII characters, arranged in 2 lines of 8 ASCII characters each.

Object-specific information covers operatable and observable process variables including additional information such as dimension of the process variables and standardization parameters.

The purpose of status information is to indicate an irregular status of an object. The status information is filed in the form of a status byte:

| x | S F | R E S | x | Н | L | H H | L L | |
|---|--------|-------------|---|---|---|--------|--------|--|
|---|--------|-------------|---|---|---|--------|--------|--|

| Alarm/Warning | HH: | Infringing an upper alarm limit |
|---------------|-----|-----------------------------------|
| | H: | Infringing an upper warning limit |
| | L: | Infringing a lower warning limit |

LL: Infringing a lower alarm limit

Control system SF: Control system fault

The status information does not serve to display operating statuses.

Meaning of the bits X and RES:

X: not reserved

RES: reserved bit. This bit may not be changed by a user function!

Not all object types have all status information. The corresponding status bits are not supplied by the object function in these cases. An object with switching function, for instance, has no alarm or warning limits.

2.2.2 Object Operation

Operator-controllable objects and also not operator-controllable objects can be defined in PMC. Not operator-controllable objects serve exclusively for preparation for visualization.

Object data are divided generally into operating data and observation data.

Observation data always indicate the value processed by the object. Operating data can flow back again as observation values only after processing by an object function. This guarantees that those operating values which are actually processed by the corresponding object function in the automation program are displayed by observation.

Example: Only the actual setpoint processed by a controller is displayed.

Operating concepts

- Operator control via operator control bit: An operator control bit exists for operator control of object parameters. The transferred parameters are activated firstly by setting the operator control bit. Both single parameters can have an operator control bit and parameter groups a common operator control bit.
- Direct operator control: Object values are written directly into the associated storage cells on direct operator control and further processed immediately without further activation. The value transfer is not synchronized to a certain time in contrast to operator control with operator control bit.
- Identification of the operator control by the object function: An operator control value number and the associated operator control value are written into always unchanging storage cells. The object function itself registers the operator control performed and takes over the operator control value. The operator control value is processed depending upon the operator control value number.

2.2.3 Overview of the Predefined Object Types

A large number of object types is already defined for PMC. Standard displays for visualization and function blocks which perform the measuring and control functions in the programmable controller exist for these object types.

| Туре No. | Function | Block type designation |
|----------|--|------------------------|
| 01 | Continuous controller "R64" | RegR64K |
| 02 | Step controller "R64" | RegR64S |
| 03 | Measuring points "R64" | MPR64 |
| 04 | Continuous controller "Standard" | SRS S |
| 05 | Step controller "Standard" | SRS_K |
| 06 | Continuous controller "IP 260" | IP260_K |
| 07 | Step controller "IP 260" | IP260_S |

| 20 | Bin | SF | 8 | 2 | | |
| 21 | Reg115K | A/W/SF | 188 | 2 | | |
| 22 | Reg115S | A/W/SF | 188 | 2 | | |
| 23 | ModRegK | A/W/SF | 87 | 2 2 | | |
| 24 | ModRegS | A/W/SF | 87 | 2 | | |

Overview of the most important data of the PMC object types:

Explanations of the table

| Status information | A: | Display and acknowledgement for alarm above and alarm below | |
|----------------------------|-----|--|--|
| | W: | Display and acknowledgement for warning above and warning below | |
| | SF: | Display and acknowledgement for control system fault | |
| Operator control method | 1: | Direct value operator control | |
| | 2: | Operator control with operator control bit | |
| | 3: | Operator control with operator control value and operator control value number | |

2.3 Standard Displays

The purpose of standard displays is to visualize PMC objects in the process control interface of the operator station. The following principles simplify process control:

- high recognition value by using the same symbolism
- same function means same display
- same function means same operator control concept

2.3.1 Screen Subdivision

The screen contents of a process display are divided into three areas:

| Area overview |
|-----------------------|
| Working area |
| Operator control area |

Area overview The area overview provides the user an overview of all areas. In hierarchic systems, the names of the areas and the associated status information (alarm, warning, fault) are normally displayed as area-specific group displays.

The message line in which arriving and departing as well as acknowledgement messages are displayed, can display a further part of the area overview.

Working area The different process displays are opened up in the working area.

The process displays offer inter alia the following possibilities:

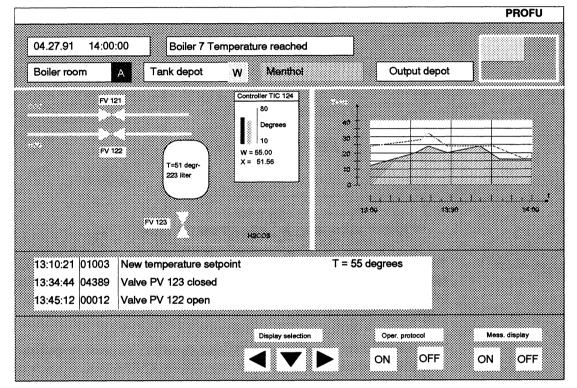

- · Window technique with overlapping displays
- · Operator control possibility via value input fields
- Display selection of lower ranking detail displays

In the process displays, a distinction is made between standardized displays (NORA) and free displays (FRANZ).

Operator control The operator control area has the following tasks: area

- Display selection by branching in a hierarchic selection structure
- Selection of the central message display
- Calling up the operator control strips for the active process display (password protection possible)
- Setting the system time
- Quitting process control

Example of screen division (free user display):

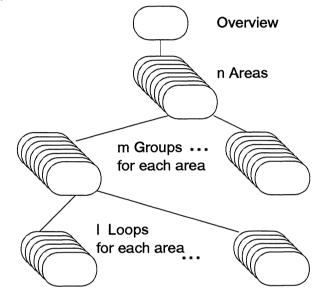

2.3.2 Standardized Operator Guidance

The components of standardized operator control are process displays in the form of standardized displays and a hierarchic selection function with fixed structure for the process displays.

The display hierarchy isdivided into: in:

- Overview display
- Area display
- Group display
- Loop display

Several areas can be selected from the overview display. One area in each case gives the possibility of selecting between several groups. One group contains several loops.

The displays have their own structure and contents in each level of the hierarchy.

2.3.3 Displays of the Grouping Levels

For the displays of the standardized indications, the following applies in the display of process statuses:

- Normal statuses are displayed covered, are not conspicuous
- critical or extraordinary statuses are displayed conspicuously and emphasized even stronger by flashing (alarms, warnings, pending messages).

2.3.3.1 Overview Display

The overview display can be designed freely by the user.

2.3.3.2 Area Display

The area display covers the most important information on the status of the visualized objects:

Example for an area display:

| 60000 | ggered 01.01.90 11:10:23 | | | |
|----------------|--------------------------|----------------------|-----------------------|---|
| 01.01.99 11:12 | 2 | | | |
| Group 1 | Group 2 | Group 3 | Group 4 | |
| +-+-+ | X X | | | |
| GROUP 1 | GROUP 2 | | | |
| Group 5 | Group 6 | Group 7 | Group 8 | |
| | | | | |
| | | | | |
| 1 GROUP1 2 GR | | DUP4 \$ GROUP5 6 GRC | UP6 7 GROUP7 8 GROUP8 | 3 |
| 9 10 | 11 MESSAGE12 | 13 14 | 15 16 OVIEW | |

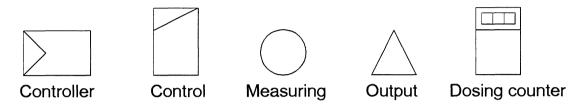

The area display enables a fault or an alarm to be detected in which case the single object concerned can already be localized.

The associated single objects are represented with an information field under each group.

Possible operator controls in the area display are:

- Selection of detailed displays (groups)
- · Selection of free process displays
- Selection of message displays
- Return to the overview

Measuring and control functions are displayed by standardized symbols in the area display:

2.3.3.3 Group Display

The group display summarizes the most important information on the visualized objects:

- Operating statuses
- Process values as bars
- Value display with dimension
- Status of the objects
- Names of the objects

AREA 1 01.09.91 11:11 GROUP 1 CONTR CONTR CONTR EXHAUST BINARY STIBRING LOOP 1 LOOPZ LOOP2 DEVIATION FUNCTION BOILERS 50.000 S₽∞ 44.990 SPo SET VAL 0.600 8ELT1 1] 0] PV-40.570 PV-41.996 PV-∝ **44**.990 ١. BELT2 [1] [9] READY ON ON DEGREE G 86173 🗓 🔨 DEGREE C DEGREE C DEGREE C ACT VAL LILI OFF RE -41,990 BELT4 11 0 DEGREE C MV-65 00 MU 50 00 BELTS 1 AUTO 100 MV-MAN BELTS 11 0 *6 0 9.990 * ~ 100 0 860 AUTO AUTO INT 46 VMR Operating . < > 1 Λ

Example for a group display:

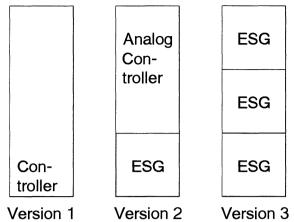

Possible operator controls in the group display:

- Value settings (e.g. manual value, setpoint)
- Operating mode switch-over (e.g. manual/auto, on/off)
- Change into another display

It is possible to branch from the group display into the following displays:

- associated overview display
- associated area display
- other group
- lower ranking loop
- process displays
- message display

7 object columns can be displayed in a group display. An object column can be divided into 3 different versions:

- Version 1 Display of a complete controller
- Version 2 Display of a controller or of an analog value and a series connected individual control element (ESG) (e.g. valve).

Version 3 Display of 3 individual control elements (ESG) in one object column.

Up to 21 individual objects can be displayed in the group display (7 object columns with version 3: 7*3 = 21).

Object display in the group display:

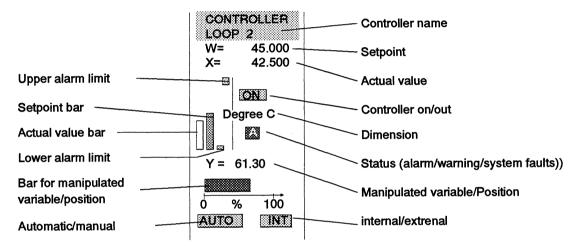

- Process values such as setpoint, actual value and manipulated variable are displayed as bars **and** as value stating the dimension
- Limit values are visualized as bars
- Operating statuses (e.g. on/off, auto/manual, ext/int) are implemented as dynamic fields.

For example, the following relation can apply for a dynamic field:

| Bit AUTO = 1: | AUTO |
|---------------|--------|
| Bit AUTO = 0: | MANUAL |

• The name of the object serves for assigning the standardized display to the plant

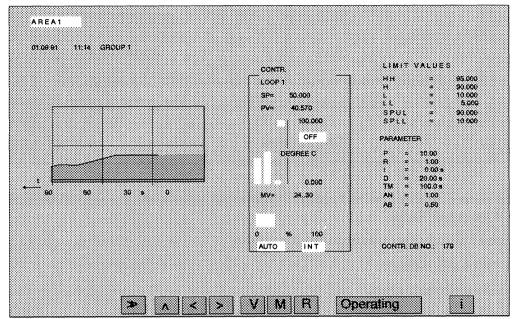

Example for an object display in the group display:

2.3.3.4 Loop Display

The loop display offers the most accurate object display in the hierarchy of the standardized displays. All data of the visualized object are displayed.

The loop display exists only for extensive objects such as controllers, analog value monitors, dosers etc. The displayed values are operator-controllable corresponding to their function.

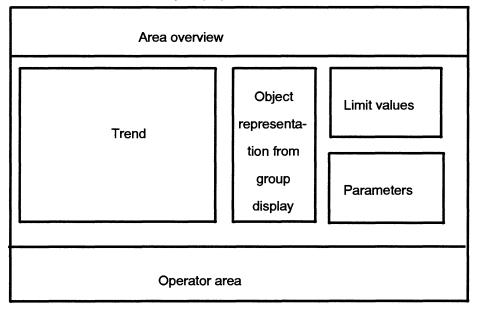

Example for a loop display:

Possible operator controls in the loops display:

Value settings Setpoint Manual value . Parameters • Setting the limits ٠ **Operating modes** Manual/Auto • On/Off **Display change** associated overview display into · associated area display associated group display • other loop display of the same group process displays ٠ message display

Example for the subdivision into a loop display:

The loop display consists essentially of the display of the object which corresponds to the object display in the group display.

The following can also be contained in the loop display:

- Block with parameters
- Block with limit values
- Block with trend curves

Parameters For instance, the control parameters of a controller object are displayed in the parameter block.

In general, all parameters are operator-controllable. In practice, implementation of operator control via password is customary for safety reasons.

Example for a parameter block

| PARAME | TER | | |
|--------|-----|-----------|--|
| | | | |
| Р | = | 10.00 | |
| R | = | 1.00 | |
| I I | = | 0.00 sec | |
| D | = | 20.00 sec | |
| TM | = | 100.0 sec | |
| AN | = | 1.00 | |
| AB | = | 0.50 | |

Parameters for controllers:

- KP: Proportional coefficient
- TN: Integral-action time
- TV: Derivative action time

Additional parameters for step controllers

- TM: Runtime of the actuated valve
- AN: Start value of dead band
- AB: End value of dead band

Limit values The predetermined limits applying for status monitoring stand in the limit value block.

All limit values are generally operator-controllable. In practice, implementation of operator control via password is customary for safety reasons.

Example for a limit value block:

| LIMITS | | | |
|--------|---|--------|--|
| нн | = | 95.000 | |
| н | = | 90.000 | |
| L | = | 10.000 | |
| LL | = | 5.000 | |
| SPUL | = | 90.000 | |
| SPLL | = | 10.000 | |
| | | | |
| | | | |

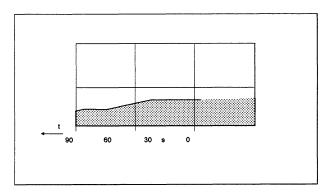

For instance, limit values of an object for a controller are:

- HH: Upper danger limit
- H: Upper warning limit
- L: Lower warning limit
- LL: Lower danger limit
- SPUL: Upper limit of the setpoint
- SPLL: Lower limit of the setpoint

In continuous controllers, there are the following real limitations:

- MVUL: upper value of manipulated variable limitation
- MVLL: lower value of manipulated variable limitation
- Trend curves Trend curves are supplied from the measured value archive of the operators unit. As a rule, process variables (setpoint, actual value and/or manipulated variable) are displayed as trend values.

Example for a trend curve:

2.4 User-Specific Objects and Displays

PMC objects can be defined freely for functions of the automation program for which no predefined PMC object types exist.

Freely defined PMC objects can be reused as macros like the predefined standard object types.

Object definitions take place in three places:

- in the programmable controller
- in PMCPRO
- in COROS LS-B

| Programmable controller | Definition of a data structure including status byte | | |
|-------------------------|---|--|--|
| | Writing an object function which executes the automation function and knows corresponding control value processing. | | |

| PMCPRO | Object type determination in the status processing | | |
| COROS LS-B | Input of the data structure in KOMED as object parameter | | |

• Production of standard display blocks

3 Status Processing

3.1 General

Under status signals are understood the events which lead to status displays requiring acknowledgement at the level of operator control and observation.

A distinction is made between the following types of status signals:

| Alarm/Warning | HH: H: L: LL: | Infringing an upper alarm limit Infringing an upper warning limit Infringing a lower warning limit Infringing a lower alarm limit |
|----------------|------------------------|--|
| Control system | SF: | Control system fault |

The actual monitoring function is at the level of the measuring and control functions of the user program. The result of the monitoring function is filed in the object data block.

The PMC status processing performs the following tasks:

- Cyclical enquiry of the monitoring signals from the object data blocks
- Administration of separate signals for control system fault, alarm/warning, as well as the acknowledgement information for each object
- Facilitating the selective suppression of the status signals via a user function (status suppression)

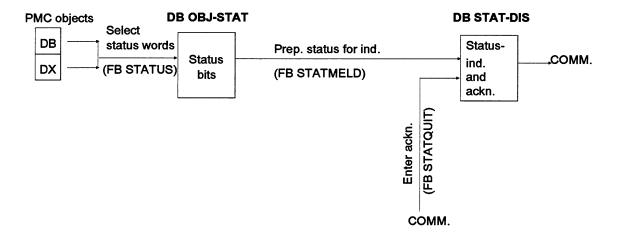

It is guaranteed by the PMC definitions that a general signalling and acknowledgement concept is created.

If the operator control and observation function of an object is multiple programmed (e.g. locally and centrally), it is ensured that an event does not have to be acknowledged several times.

3.2 Status Monitoring

The status signals form the PMC objects are transferred into a DB OBJ-STAT cyclically by the PMC program block FB STATUS.

Depending upon the object type, a control system fault signal or an alarm/warning signal is transmitted.

The following information is filed object-specifically in the DB OBJ-STAT

- HH: Upper alarm limit infringed
- LL: Lower alarm limit infringed
- H: Upper warning limit infringed
- L Lower warning limit infringed
- SF: Control system fault
- SSU: Status suppression

The data from the data block DB OBJ-STAT are processed by the function block FB STATMELD for display in the O+M unit and filed in the data block DB STAT-DIS.

Possible number of objects for status monitoring:

Up to 200 PMC objects can be monitored with the status monitoring. When the SIMATIC PC 155U with the CPU 946/947 is used, up to 750 PMC objects can be monitored for status.

The data blocks DB OBJ-STAT and DB STAT-DIS administer a maximum of 250 objects. They must therefore be set up several times if necessary (3 times for 750 objects). The status of up to 750 PMC objects can be monitored while using CPU 945, 946/7, 948.

| | Acknowledgement byte | | | | | | Display byte | | | | | | | | | | |
|---|---|-------------|---|---|--|--------|--------------|---------------|---|--------|-------------|---|---|---|--------|--------|--|
| | x | A S F | x | x | A H | A L | A H H | A L L | x | S F | S S U | x | н | L | H H | L L | |
| AL Acknowledgement AHH Acknowledgement | | | | | of warning, upper limit of warning, lower limit | | | | | | | | | | | | |
| Display byte | | | SFFault queuedSSUStatus suppressionHWarning, upper limit, queuedLWarning, lower limit, queuedHHAlarm, upper limit, queuedLLAlarm, lower limit, queued | | | | | | | | | | | | | | |
| In the acknowledgement byte: | | | | | | | | | | | | | | | | | |
| Bit value 0 | Bit value 0 means status is not acknowledged. The indication of the status in the O+ unit is flashing. | | | | | | | ıs in the O+M | | | | | | | | | |

The structure of an object word in the DB STAT-DIS is displayed below:

Bit value 1 means status is acknowledged. The indication of the status in the O+M unit is static.

The status display is updated due to the following events:

- A 0/1 change of HH, LL, H, L or SF in the DB OBJ-STAT causes HH, LL, H, L or SF to be set in the DB STAT-DIS and resetting of the acknowledgement bit AHH, ALL, AH, AL or ASF.
- The acknowledgement bits in the DB STAT-DIS are set according to the acknowledgement information.
- The signal STU is set in the DB OBJ-STAT according to the status.

If at least one object status has changed, then the contents of the DB STAT-DIS are processed and transmitted as status telegram. The status telegram contains the entire status of all objects. Transmission is made through the programmed communication channels to those operator stations which have registered for the PMC function of status. The status telegram contains the complete status information of a segment. The size of a segment depends on the communication media applied.

With the status telegram, the operator station has all information on the status indications to be displayed.

The following are programmed with PMCPRO for status processing:

- Object numbers
- Object type
- Object data block
- Selection of the communication channels for the status transmission

3.3 Status Messages

Apart from the PMC functions of status processing, a status change can also be processed as status message.

Status messages are generated in the O+M system. The status message is acknowledged in the O+M unit and is sent to the corresponding programmable controller and forwarded through the PMC message processing system to all connected communication partners.

Message texts can be programmed for status messages in the same way as for status signals.

3.4 Status Suppression

On startup of the plant or defined changes of the working area, it is also desirable that the corresponding status signal does not display a fault of the plant due to the calculated or predictable limit value infringements.

PMC offers the possibility of activating a status suppression.

Two types of status suppression are possible:

| selective | For each individual PMC object, the status suppression can be activated independently. |
|-----------|---|
| central | Switching out the entire status monitoring at a central point. In the case of central status suppression, a system message is sent. |
| | Central status suppression is intended for the starting and test phase of the automation system. |

In the case of selective status suppression, the following steps are performed:

- Setting the bit STU to 1 (= status suppression active)
- Resetting the status word concerned in the DB STAT-DIS (corresponds to: no status signal pending). Possibly pending status signals are declared invalid.
- Sending a message "Status suppression active" with the status of arrived
- The disabled status word is no longer updated

Resetting selective status suppression:

- Activating status monitoring for the object concerned
- Resumption of display updating
- Sending a message "Status suppression active" with the status of departed

In the case of central status suppression, a bit is set in the DB STAT.IND (DW 1) and a system message "central status suppression active" is generated with the status of arrived.

After the central status suppression is reset, a system message "central status suppression reset" is generated.

3.5 Status Acknowledgement

In status acknowledgement, a distinction is made between acknowledgement of status messages and acknowledgement in status processing:

Acknowledgement Acknowledgement takes place in the message system. The reported status exclusively is acknowledged.

Acknowledgement All status messages assigned to the relevant object are acknowledged. in status processes

If a status change for the object concerned occurs while an acknowledgement is being processed, then the acknowledgement does not refer to the new status but to the indicated status at the time of the acknowledgement.

The acknowledgement entry in the data block DB STAT-DIS is always reset at each entry of a new status.

Acknowledgement in status processing results in a status acknowledgement telegram with the following information:

- Number of the object
- Status displayed at the time of acknowledgement

3.6 Data Blocks

3.6.1 DB OBJ-STAT

| DW 0 | KM | Change flag |
|--------|----|----------------------------|
| DW 1 | KM | Central status suppression |
| DW 2 | | free |
| DW 3 | | free |
| DW 4 | | free |
| DW 5 | | free |
| DW 6 | KM | Status of object 1 |
| DW 7 | KM | Status of object 2 |
| | | , |
| | | |
| | | |
| | | 1 |
| | | |
| | | |
| DW n+5 | KM | Status of object n |

| re DW 0 | Bit 0 = 1 : A change has occurred |
|--------------------------|--|
| re DW 1 | Bit 15 = 1 : Status suppression is active for all objects |
| Status of the objects | Bit $0 = 1$: Lower alarm limit infringed Bit $1 = 1$: Upper alarm limit infringed Bit $2 = 1$: Lower warning limit infringed Bit $3 = 1$: Upper warning limit infringed Bit $6 = 1$: Control system fault pending Bit $15 = 1$: Status suppression active |

The length of the DB OBJ-STAT is in accordance with the number of programmed objects.

The DB OBJ-STAT administers a maximum of 250 objects. If more than 250 objects are monitored, the data block must be set up several times (3 times for the maximum number of 750 objects).

Monitoring more than 200 objects is possible only with CPU945, 946/7 and 948.

3.6.2 DB STAT-DIS

The data block DB STAT-DIS contains all status indications of the objects in the form of the status telegram.

| 4 | | | |
|-------------------------------------|--|----------|---|
| | DL 0 | KH | Telegram type identifier 37H |
| | DR 0 | KH | Telegram body length (max. DW No.) |
| | DW 1 | KM | Central status suppression and offset |
| | DL 2 | KH | 1/100 seconds |
| | DR 2 | KH | Seconds |
| | DL3 | KH | Minutes |
| | DR 3 | KH | Hours |
| | DL 4 | KH | Day |
| | DR 4 | KH | Month |
| | DL 5 | KH | Year |
| | DR 5 | KH | 0 |
| | DW 6 | KM | Status display of object 1 |
| | DW 7 | KM | Status display of object 2 |
| | | | |
| | | | |
| | | | |
| | DW n+5 | KM | Status display of object n |
| | | | |
| re DW 1 | Bit 15 | = 1 : Si | tatus suppression is active for all objects |
| | All other bits of DW1 indicate the offset for the status area. | | |
| DL2 to DR5 | Time and date of status acquisition Format: BCD | | |
| Status indication of the objects | Bit 0 = 1 : Lower alarm limit infringed (LL) Bit 1 = 1 : Upper alarm limit infringed (HH) Bit 2 = 1 : Lower warning limit infringed (L) Bit 3 = 1 : Upper warning limit infringed (LL) Bit 5 = 1 : Status suppression active (SSU) Bit 6 = 1 : Control system fault pending (SF) Bit 8 = 1 : Acknowledgement for lower alarm limit (ALL) Bit 9 = 1 : Acknowledgement for lower warning limit (ALH) Bit 10 = 1 : Acknowledgement for upper warning limit (AL) Bit 11 = 1 : Acknowledgement for upper warning limit (AH) Bit 14 = 1 : Acknowledgement for control system fault (ASF) | | |

The length of the DB STAT-DIS is in accordance with the number of programmed objects.

The DB STAT-DIS administers a maximum of 250 objects. If more than 250 objects are monitored, the data block must be set up several times (3 times for the maximum number of 750 objects.

Monitoring more than 200 objects is possible only with CPU945, 946/7 and 948.

In data word 0, the DB STAT-DIS contains the head of the status telegram. This enables the FB PUT to send the DB STAT-DIS unchanged as status telegram to all registered operator stations.

The value 37H signals to the FB PUT that a telegram ready for sending is standing by. If the FB PUT has executed the transmission, FB PUT writes the value FFH in DL 0.

3.7 Function and Program Blocks

3.7.1 FB STATUS

| Block number | Programmable with PMCPRO | | |
|--------------------------|--|--|--|
| Presetting | FB 1 | | |
| Callup | The FB STATUS is called up unconditionally in the PB COMMUN (SPA FB). | | |
| Transfer parameters | none | | |
| Description | The FB STATUS is generated with PMCPRO. It transfers the status words of the PMC objects into the DB OBJ-STAT. | | |
| Contained FB/PB calls | none | | |
| Data blocks used | DB OBJ-STAT, object DBs | | |
| Flags used | Scratchpad flags in the area FY 200 - 255 | | |

3.7.2 FB STATMELD

| Block number | FB 223 |
|--------------------------|--|
| Callup | The FB STATMELD is called up unconditionally in the PB COMMUN (SPA FB). |
| Transfer parameters | The DB PMC-KON contains the parameters to be processed. |
| Description | The FB STATMELD compares the entries in the DB OBJ-STAT and DB STAT-DIS object by object and determines from these the new status indication which is entered in the DB STAT-DIS |
| | Status changes and acknowledgements are also entered in the DB M-NUM- BER, in which case the "Status message" bit is set. |
| Contained FB/PB calls | none |
| Data blocks used | DB PMC-KON, DB OBJ-STAT, DB STAT-DIS |
| Flags used | Scratchpad flags in the area FY 200 - 255 |

3.7.3 FB STATQUIT

| Block number | FB 222 |
|--------------------------|---|
| Callup | The FB STATQUIT is called up in the FB INTERPRE, if a status acknow- ledgement telegram has arrived. |
| Transfer parameters | The DB PMC-KON contains the parameters to be processed. |
| Description | The FB STATMELD enters the acknowledgement information in the DB STAT-DIS. |
| Contained FB/PB calls | none |
| Data blocks used | DB PMC-KON, DB STAT-DIS |
| Flags used | Scratchpad flags in the area FY 200 - 255 |

3.7.4 FB S-ANLAUF

| Block number | FB 209 |
|--------------------------|--|
| Callup | The FB S-ANLAUF is called up unconditionally in the PB STARTUP (SPA FB). |
| Transfer parameters | The DB PMC-KON contains the parameters to be processed. |
| Description | The task of the FB S-ANLAUF is the generation and default selection of the data blocks DB OBJ-STAT and DB STAT-DIS in the suitable length. |
| Contained FB/PB calls | none |
| Data blocks used | DB PMC-KON, DB PMC-VAR, DB OBJ-STAT, DB STAT-DIS |
| Flags used | Scratchpad flags in the area FY 200 - 255 |

4 Functional Descriptions

The predefined object types with their functionality for the programmable controller are described in this chapter.

Several object types belonging to one subject are summarized in the common subchapters.

4.1 R64 Controller Structures (Object Type 1 to 3)

Object type 1 Object type 2

Object type 3 Measuring points of the R64 controller The measuring points of the R64 serve for visualization of the most important controller characteristics. The controller status is held as status information.

Control systems with a maximum of 64 individual control loops can be assembled with the controller structure R64 for the CPUs 928/928B. The R64 is of very compact structure, i.e. all important functions are already contained in the controller and can thus be programmed simply by switching the individual partial functions in and out.

The controllers can be used as quasi-continuous (Conti) controllers and as step controllers for integrating final controlling elements. The parameterizing package COM REG is used for parameterization.

The controller is called up automatically by the operating system of the CPU via the parameterization in the controller list (DB 2).

| Setpoint sequence | A setpoint curve is generated from 1 to 10 interpolation points. Here it is |
|-------------------|---|
| | possible to select between a step-shaped and a linearly interpolated course |
| | of the curve. The generated profile is repeated periodically. |

- When one interpolation point is input, a constant setpoint is output.
- Ramp-functionThe ramp-function generator generates for a setpoint step change at the
input an output signal changing ramp-shaped up to the wanted setpoint. The
course can be influenced by high-, low- and cancel-keying.

In the case of manual/automatic change-overs as well as on new start/restart, the ramp-function generator starts at the current actual value.

- **Smoothing** A first-ordered time delay is simulated for smoothing an analog variable. For manual/automatic change-over as well as new start/restart, the smoothing starts in the setpoint branch at the current actual value.
- PolygonThis function can be defined through up to 10 value pairs and filed in a table.
The abscissa values are equidistant. There is linear interpolation between
the values. The function value is equal to the first value below the first value
and equal to the last value above the last value.
- **Plausibility check** Disturbances which exceed an inputtable value are suppressed with this module. If a deviation is present longer than three sampling periods, then the input value is interpreted as valid. The output value is brought up to the input value with a power function or set immediately to the input value.
- **PID controller** The connection between the system deviation and the manipulated variable of the continuous controller is simulated by a quasi-continuous PID controller by calculating a positioning increment from the system deviation. The manipulated variable is output as sum of the previously formed increments.

Due to the parallel structure of the controller, the controller factor R, the integral-action time I and the derivative action time D can be set separately in each case. In addition, the proportional coefficient P, which is valid for all three parallel branches, can still be parameterized.

The branches of the PID controller can be switched off individually.

Changing over between the operating modes is performed via control bits.

Pulse interval
outputA pulse shaper stage converts the calculated quasi-continuous positioning
signal into binary signals for controllers with two-step or three-step output.
Pulse length modulation is performed. Pulses are output if an inputtable
response value is exceeded.

In the case of a three-step controller, final controlling elements acting differently can be corrected with an adaption factor.

- **Step controller** The step controller has three-step behaviour and can act only together with a motor driven final controlling element (=integrator). The system deviation firstly runs through a dead band with hysteresis, in order to mask out small control deviations and so that the positioning device is not unnecessarily loaded. The dead band is symmetrical around the zero point. A positioning increment is formed from the output size of this dead band.
- Pulse shaper sta-
geThe number of actuating pulses calculated by the step controller is converted
by the pulse shaper stage into two binary signals for actuating a motor driven
final controlling element (e.g. for opening and closing a servo-valve).

The minimum pulse duration can be selected (<= sampling time), shorter pulse times are stored.

Limit monitor Controller values can be checked for a maximum of six limit values in two freely connectable limit monitors. Limit value infringements are signalled by corresponding bits.

Moreover, two permanently connected limit monitors can be integrated in the controller structure.

4.2 Standard Controller Interface (Object Type 4 and 5)

The object types 4 and 5 describe a standardized interface for compact controller structures. The interface corresponds to the coupling of SIPART DR compact controllers to the SIMATIC S5 through the SIPART SW S5 coupling software.

Arbitrary control functions can be imaged on the standardized data structure via the object types 4 and 5. An advantage of the standardized interface is the memory-optimal compact structure.

Operating controll values is implemented via operator values and operator value numbers. After operator control is completed, the corresponding operator value number is reset in the data block.

The software package SIPART S5 can be used for supplying the object types 4 and 5.

4.3 Control Module IP 260 (Object Type 6 and 7)

The object types 6 and 7 describe the control module IP260.

Functions of the control module

The control module IP 260 is a single-channel controller as intelligent peripheral module in the SIMATIC S5 spectrum. It can be used for different control tasks such as controlling pressure, flow etc.

The central processor unit of the programmable controller is relieved in time and the control function is maintained even on failure of the central unit by the use of an intelligent peripheral module (IP). To increase the availability, a second IP 260, which takes over the control smoothly on failure of an IP 260, can be used in master/slave mode.

The process signals required for control are acquired through 4 analog input channels. Additional digital information such as controller disable, preferential mode and limit switches are read-in and evaluated through 4 digital inputs.

The module and the control system are controlled in a microprocessor. The controller is implemented in the firmware of the module as PID controller.

The following controller types can be parameterized:

- Continuous controller with analog manipulated variable output
- Continuous controller with pulse output
- Step controller with positioning increment output

The calculated manipulated variable is output to the process according to the type of controller either through two positioning outputs digitally or through the analog output.

Two further digital outputs are provided for indicating the ready status (controller ready) and for exceeding limit values.

A serial interface is available for connection of a programming unit for the parameterization of the module on startup.

O+M interface of the IP 260

The object data block is the data block DB IP260, to which the following characteristics are added:

- Object name
- Status strip
- Operator bit strip

Certain operator bits are set for operator control of the module and a command input is made in DW 1 and DW 2 by program. Calling up the FB PER:REG (FB 170) transfers the operator-controlled parameters to the IP 260 module.

For the cyclical monitoring of the IP 260, the controller characteristics must be transferred into the object data block for monitoring the module by calling up the FB 170.

Please refer to the IP 260 manual for further information on operating the controller module.

Generating the status byte

The status byte is generated by the FB 131 with the following command sequence (Example):

| FB 131 | | | D:DRIVE1ST.S5D | LEN=27 PAGE 1 |
|----------|-----|-----------|----------------|------------------|
| SEGMENT | | 0000 | | |
| BEZ:DBRE | | /B/T/Z: B | | |
| 8000 | :B | =DBRE | | |
| 0009 | :L | DW 110 | Indicator word | |
| 000A | :L | KH 000F | | |
| 000C | :UW | | | |
| 000D | :T | MW 249 | | |
| 000E | :L | DR 111 | | |
| 000F | :T | MB 251 | | |
| 0010 | :0 | M 251.4 | | |
| 0011 | :0 | M 251.5 | | |
| 0012 | := | M 250.6 | Generate fault | |
| 0013 | :L | MB 250 | | |
| 0014 | :T | DR 133 | Status word | |
| 0015 | :BE | | | |

4.4 Analog Measured Values (Object Type 8)

The object type 8 describes a standardized file for analog process variables. The display of up to 5 words is possible for visualization.

The measured values must be read and standardized by the user. The value display is in fixed point. The extension parameter indicates the number of places after the decimal point.

The output values are provided with a value designation (name) and a dimension statement.

Value operator control of the visualized measured values is not intended.

The measured value supply is provided by calling up the PB ERFASS (Example):

| PB 213 | | D:DRIVERST.S | 5D LEN=18 PAGE 1 |
|-------------|-----|-------------------------------|------------------------|
| SEGMENT | 1 | 0000 Standardize/monitor valu | e |
| 0000 | : | | |
| 0001 | :L | FW 100 | Load process value |
| 0002 | :L | KF +300 | Add-in offset |
| 0004 | :+F | | |
| 0005 | :L | KF +2 | Extend value |
| 0007 | :XF | | |
| 8000 | :C | DB 108 | Open DB measured value |
| 0009 | :T | DW 13 | File process value |
| A000 | :BE | | |

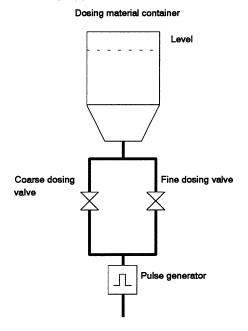

4.5 Dosing Apparatus (Object Type 9)

The object type 9 describes a dosing apparatus.

The designations of the commands, words and parameters for object type 9 correspond to the designations of the dosing module IP 261.

4.5.1 Description of Function

Mechanical construction of the dosing apparatus:

Material is taken from a storage tank (dosing tank) through the coarse dosing valve and the fine dosing valve. The quantity of the dosed material is monitored by a pulse-generating flow measuring device.

A certain preset material quantity (setpoint) should be taken by dosing.

The dosing process can be divided into three phases:

- Main flow phase
- Fine flow phase
- Dribbling acquisition phase

These phases are controlled by certain signals:

- Preliminary end value reached
- Main end value reached
- End of dosing

The following parameters and variables are important for the dosing apparatus:

| Input variables | GZU : FAUF : FZU : FRA : | "Coarse flow open" indication "Coarse flow closed" indication "Fine flow open" indication "Fine flow closed" indication Enable the outputs Count input |
|------------------|---|--|
| Output variables | FV : PVR : MVR : DOSE : MCR : CFM : | Positioning output for coarse flow Positioning output for fine flow Preliminary end value reached Main end value reached End of dosing Dosing module ready Group error signal Shortcircuit-proof generator supply BERO24V |
| Parameters | VAW: Prelir | minary end value |
| | When the preliminary end value is reached, the coarse flow valve is closed. The preliminary end value is programmed as difference value to the mai end value. | |
| | HAW: Main | end value |
| | | nain end value is reached, the fine flow valve is closed. The main s the setpoint of the dosing apparatus. |
| | NK: Dribblir | ng correction value |
| | After the dosing valves are closed, a certain quantity of material runs from the pipe (dribbling). | |
| | | ng correction value corresponds to the dribbling and has the effect e flow valve is already closed by the dribbling value before e setpoint. |
| | NFAK: Star | ndardization factor NFAK |
| | | rdization factor describes how many pulses of the measuring espond to a certain physical unit (e.g. pulses per kilogram) |

EFAK: Influencing factor

The influencing factor takes a density correction into account.

NLZ: Dribbling time

The dribbling time indicates the period in which pulses may still arrive after reaching the main end value. It starts with closing the fine flow value and ends with the dosing end signal DOSE.

IMPAZ: Pulse failure time

The pulse failure time indicates the period in which at least one count pulse is expected. When the pulse failure time is exceeded, the dosing process is shut down.

VANZ: Valve response time

The valve response time indicates the period in which the acknowledgement of the valve to a control command is expected. When the valve response time is exceeded, the dosing process is shut down.

4.5.2 O+M Interface of the Dosing Apparatus

The object data block for object type 9 is DB DOSAGE.

The following can be used for the data exchange between the object data block DB DOSAGE and the dosing apparatus:

• FB PER:DOS (FB 171) in connection with the dosing module IP 261,

The mechanisms of operator control correspond to operator control of the IP 260 (see Chap. 4.3 for object type 6 and 7).

• An arbitrary user block which uses the prefabricated data format and the mechanisms of the DB DOSAGE.

4.6 Individual Control Elements ICM (Object Type 10 to 18)

| Object type 10 | Individual control element: Motor 2 loops | | |
|----------------|---|--|--|
| | Actuation of 2 motors. The status and operator control information runs through an interface. | | |
| Object type 11 | Individual control element: Reversing drive | | |
| Object type 12 | Individual control element: Motor with 2 speeds, controlled acceleration | | |
| Object type 13 | Individual control element: Motor with 2 speeds, automatic acceleration | | |
| Object type 14 | Individual control element: Motor star-delta | | |
| | Actuation of a motor with star-delta switch-over. | | |
| Object type 15 | Individual control element: Valve 2 loops | | |
| | Actuation of two valves. The status and operator control information run for both valves through an interface | | |
| Object type 16 | Individual control element: Valve slide | | |
| | Actuation of a valve slide. | | |
| Object type 17 | Individual control element: Latched switching device | | |
| | Actuation of a latched switching device | | |
| Object type 18 | Individual control element: Valve slide with ESB | | |
| | Actuation of a valve slide. Compared with object number 16 (valve slide), object number 18 has additional information on the readiness of the individual control element to be switched on. | | |

O+M interface of the individual control elements ICM:

The PMC object types for individual control elements ICM contain the following blocks:

| DB ICM | Working data |
|--------|--------------|
|--------|--------------|

- Statuses
- Name
- Status byte

FB ICM Tasks:

- Supplying the DB ICM with status information
- Passing on the operator controls
- Evaluation of the statuses
- Production of the status byte for the PMC status processing

4 bytes are available in each case for data from the ICM and 4 bytes for data to the ICM for the communication with the individual control elements.

According to ICM function, different information is evaluated or controlled from the communication data bytes.

In operator control, the control bit (D 8.0) is set in the DB ICM. The control bit is evaluated in the FB ICM by the following sequences (Example):

| FB 132 | | | | D:DRIVE1ST.S | 5D | LEN=41 |
|--|-----------------------------------|---------------|-------------------------|--------------|----------------------------------|--------------|
| SEGMENT 1 0000 NAME :ICM BEZ:DBIC E/A/D/B/T/Z:B | | | | | | |
| 0008 0009 000A 000B 000C 000D 000E 000F | :B : : : :L :T ::L :T :T | DR | 0 250 | | read data (programmed | by the user) |
| 0010 0011 0012 | :0 :0 :0 | M M M | 249.1 249.2 249.3 | | | |
| 0013 0014 | := :L | M MB | 250.6 250 | | fault | |
| 0015 0016 0017 | :T :L :T | DR DR | 9 | | status word | |
| 0018 0019 001A | :UN :BEB : | М | 250.0 | | operator control bit set ? no | |
| 001B 001C | : | | | | write data (programmed | by the user) |
| 001D 001E 001F | :L :T :U | DR MB M | 8 250 250.0 | | operator control bit reset | |

| 0020 | :R | М | 250.0 |
|------|-----|----|-------|
| 0021 | :L | MB | 250 |
| 0022 | :T | DR | 8 |
| 0023 | :BE | | |

A set control bit has the consequence that the data bytes for data for the ICM are sent to the individual control element and then the control bit is reset.

Status information of the ICM 560:

A group error signal must be generated from the bits D 14.1, D 14.2 and D 14.3:

4.7 Analog Value Function (Object Type 19)

Object type 9 (analog value function) contains the following blocks:

| DB ANALOG | Working data: |
|-----------|---|
| | Process value |
| | Limit values |
| | Dimension |
| | Name |
| | Status byte |
| FB ANALOG | Monitoring the process value for two limit value pairs: |
| | Warning limit above/below |
| | Alarm or danger limit above/below |
| | The limit value infringements are noted in the status byte which can be processed further by the PMC status processing. |
| PB ERFASS | Acquisition and standardization of the process variable |

Function block FB ANALOG (Example):

| FB 133 | | D:DRIVE1ST.S5 | D | LEN=49 PAGE 1 |
|--|--------------------|---------------|--|------------------|
| SEGMENT 1 NAME :ANALOG BEZ:DBAN E/A/D | 0000 D/B/T/Z: B | | Analog value function | |

4.8 Binary Function (Object Type 20)

The object type 20 describes a standardized file for bit sizes. Up to 5 values can be displayed and operator-controlled. The bit sizes must be read by the user. The values must be provided in each case with a name (value designation).

The function block FB BIN takes over the supply and disposal of the O+M interface (DB binary) (Example:

| FB 134 | | D:DRIVERST.S | 5D | LEN=82 PAGE 1 |
|------------------|------------------|---------------|----------------------------|------------------|
| SEGMENT 1 | 0000 | | | TAGET |

4.9 Control System S5-115U (Object Type 21 and 22)

Control systems with up to 8 individual controllers can be assembled for the PLC 115 U with the CPUs 942, 943 and 944 with the "Control system S5-115U" control system package.

The individual controllers are implemented as compact controller structures which can be programmed simply with relatively large flexibility. The controllers can be used optionally as quasi-continuous PID controllers (Conti controllers) or as step controllers.

The control loops can change in their functions and thus adapt to the control task by switching part functions in or out or branching through software switches.

Implementable control system types:

- Fixed value control
- Sequential control
- Ratio control
- Cascade control
- Mixing control

The controller test is programmed using COM REG 115U.

Please refer to the control system 115U manual for information on calling up the controller.

Functions of the controller

The PID algorithm integrated in the CPUs is used for calculating the manipulated variable.

| Parameters | P : Proportional coefficient I : Integral-action time D : Derivative action time MVUL : Upper limitation of the manipulated variable MVLL: Lower limitation of the manipulated variable |
|------------------------------|---|
| Switching possi- bilities | Manual/automatic change-over Input of the manual value Y Hand in manual mode |
| Actual value | The actual value is read and standardized by periphery, the read signal is monitored for wire breakage. |
| Equivalent actual value | Instead of the actual value, for instance, an equivalent actual value can be input for test purposes. |
| Polygon | The read actual value can be corrected (e.g. linearized) using a table. |

| Smoothing | Noisy signals can be smoothed. |
|------------------------------|---|
| Limit signal ele- ment | The actual value is monitored for 4 settable limits. |
| Dead band with hysteresis | The actual value is compared with the setpoint. As long as the difference lies within certain limits, the set setpoint is output as actual value. |
| Setpoint | The setpoint can be input internally or externally. |
| Setpoint adjuster | The new setpoint is moved to incrementally using the setpoint adjuster. |

Generating the PMC status byte:

The status word of the control system 115U must be converted into the PMC status word for further processing (Example):

| FB 135 | | D:DRIVE1ST.S5D | LEN=31 PAGE 1 |
|--------------------------|----------------|----------------|------------------|
| SEGMENT 1 NAME :STA11 | 0000 | 0000 | |

| 0016 := | M 249.6 | | |
| 0017 :L | MB 249 | | |
| 0018 :T | DR 188 | | |
| 0019 :B | | | |

4.10 Modular Control System (Object Type 23 and 24)

Modular control is a standard function block package with efficient modules for implementing control engineering tasks. Subdivision of the tasks into modules facilitates flexible use of the functions.

The multiple use of a controller structure (standard controller) offers advantages:

- The controller structure must only be present once in the PLC which saves memory space.
- Visualization of the controller structure must only be implemented once in the operator station (multiple use of one standard display).
- Only one PMC object must be typified for the controller structure.
- Management of the controller in the communication and status processing is simplified.

4.10.1 System Frame for the Controller Modules

The blocks of the modular control are called up through a system frame.

Constituents of the system frame:

| DB ODAT | organizational data block |
|-----------|---|
| | The DB ODAT contains the information as to which data block contains the internal controller data of a control system structure, which program blocks access the data and at which time the corresponding program blocks must be called up. |
| FB ORGANI | organizational function block |
| | The FB ORGANI ensures that the control system structures (program blocks) are called up at the sampling times. It is called up in the 100 ms grid. |
| FB ANLAUF | Function block for starting up the programmable controller |
| | The FB STARTUP ensures at startup that the internal data blocks of the controller structures have default settings. It is called up in the startup organization blocks of the programmable controller. |

The blocks of the system frame are called up in the startup organization blocks and in the organization block 100 ms of the PLC.

| OB 20 OB 21 | Startup blocks | | | |
|----------------|---|--|--|--|
| OB 22 | The following sequence must be included in all three startup blocks: | | | |
| | :JU FB 63 NAME :STARTUP PLC :KF+3 TYPE : 0 :BE | | | |
| OB 100 ms | Organization block 100 ms | | | |
| | Call sequence in OB 13 | | | |
| | :JU FB 38 NAME :SAVE DB :DB 40 :JU FB 69 NAME :ORGANI ODAT :DB 255 :JU FB 39 NAME :LOAD DB :DB 40 :BE : : | | | |

The status byte for the modular control system is generated by the function block FB MRSTAT.

A status byte can be generated only if a limit value monitoring (GRENZSIG block) is programmed in the modular control system.

A data word must be reserved for the status word.

Structure of the FB MRSTAT (Example):

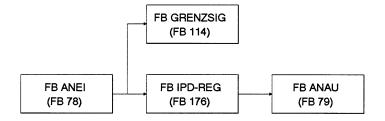

| FB 136 | | D:DRIVE1ST.S | 5D | LEN=39 PAGE 1 |
|--|--|--------------------------------|--|------------------|
| SEGMENT 1 NAME:MRSTAT BEZ:DBRE E/A/ BEZ:GRNZ E/A/ BEZ:STRG E/A/ | D/B/T/Z:E | BI/BY/W/D: BY BI/BY/W/D: BY | | FAGE I |

R

To promote multiple use of the MRSTAT block, attention should be paid that the control and message byte (STEB) of the limit signal element GRENZSIG as well as the status byte are always filed at the same place in the data block DB INTER. Under this condition, the above command sequence can be programmed exactly the same in the PB ABTAST.

4.10.2 Structure Example: Continuous Controller

The basic structure K-REG represent a continuous controller with its most important basic functions. The part functions are performed by function blocks (modules):

FB ANEI Analog input block. Reading in the process value.

FB GRENZSIG Limit signal block. Monitoring the process value for two limit value pairs

- FB IPD-REG PID controller with automatic/manual switch-over
- FB ANAU Analog output module. Output of the process value

All blocks are processed at the sampling time. The blocks (modules) of the controller structure are called up by the program blocks PB ABTAST and PB 100 ms.

Structure of the PB 100 ms:

4.10.4 Examples for Extending the Controller Structures

Adding smoothing in the actual value branch

The signal is smoothed by the function block FB GLAETTEN (FB 61).

Callup:

| | : | | |
|------|-----|------|--------|
| | :JU | FB | 61 |
| NAME | | :GL/ | AETTEN |
| E1 | : | DD | 29 |
| E2 | : | DD | 19 |
| NE3 | : | DD | 19 |
| A1 | : | DD | 17 |
| A2 | : | DD | 17 |
| A(0) | : | DD | 96 |
| T1 | : | DD | 98 |
| ERU | : | DD | 94 |
| Α | : | DD | 94 |
| STEE | 3 | : DF | 3100 |
| | : | | |

The analog value (DD 29) of the analog input block is used as input signal of the smoothing block. The input signal of the controller and of the limit signal element is gained, instead of from DD 29 directly, from the output signal (DD 94) of the smoothing block.

The starting value for the internal working data of the controller (DW 16 in DB INTER) must be increased, in which case the correct length of the DB INTER must be observed. Internal working data are past and auxiliary variables.

The structure of the data to be visualized is not changed by inserting the smoothing block.

Interconnection to follower controllers:

In the interconnection to follower controller structures (e.g. controller cascades), a possibility of switching over between external setpoint (of the master controller) and internal setpoint should be created. Both values are filed in different memory cells.

The possibility of switching over can be implemented according to the program section below in PB ABTAST.

| · | | | |
|-----|----|--------------|-----------------------------|

5 Reference Part of the Object Data Blocks

The data structures (object data blocks) of the individual PMC objects are described in the following chapter.

The object data blocks are located on the supplied disk in the file

DRIVERST.S5D.

A fixed assignment scheme applies for the assignment between data block number and object number:

No. of the object data block = Object type number + 100

5.1 R64 Controller Structures

| Object type No. | 1 | 2 | 3 |
|-----------------|--------|--------|--------|
| Data block | DB 101 | DB 102 | DB 103 |

| Data block | DB 115 | DB 116 | DB 117 | DB 118 | |

All data blocks (DB ICM) of the individual control elements have the same structure. The meanings of the bits in the four data exchange words differ (DW 11, DW 12, DW 13 and DW 14).

Structure of a DB ICM:

| DW No. | Format | Meaning |
|--------|------------------------|-----------------------------|
| 0: | KS ='ICM_560 xxxxxxx'; | Object name of the 1st loop |
| 8: | KM = 00000000 0000000; | Operator bit = D 8.0 |
| 9: | KM = 00000000 0000000; | Status |
| 10: | KH = 0000; | free |
| 11: | KM = 0000000 0000000; | Data to the ICM |
| 12: | KM = 0000000 0000000; | Data to the ICM |
| 13: | KM = 00000000 0000000; | Data from the ICM |
| 14: | KM = 0000000 0000000; | Data from the ICM |
| 15: | KH = 0000; | free |
| 16: | KH = 0000; | free |
| 17: | KS ='ICM 560 xxxxxxx'; | Object name of the 2nd loop |
| 25: | | |

5.6.1 Object Type 10 (DB 110)

Individual control element: Motor 2 loops

Information from the motor:

| on/off motor 1 | D | 14. 7 |
|----------------|---|-------|
| on/off motor 2 | D | 14.15 |
| ready 1 | D | 13.0 |
| ready 2 | D | 13.8 |
| test 1 | D | 13. 1 |
| test 2 | D | 13.9 |
| fault motor 1 | D | 13.4 |
| fault motor 2 | D | 13.12 |

Information to the motor:

| acknowledgement | D | 12. 8 |
|-----------------|---|-------|
| on motor 1 | D | 11.7 |
| off motor 1 | D | 11. 5 |
| on motor 2 | D | 11.15 |
| off motor 2 | D | 11.13 |
| manual | D | 12. 2 |

5.6.2 Object Type 11 (DB 111)

Individual control element: Reversing drive

Information from the drive:

| left right test ready fault | | 14.7 14.15 13.1 13.0 13.4 |
|---|---|---------------------------------------|
| Information to the drive: | | |
| acknowledgement | D | 12.8 |

| D | 12.8 |
|---|-------|
| D | 11.7 |
| D | 11.15 |
| D | 12. 2 |
| | D |

5.6.3 Object Type 12 (DB 112)

Individual control element: Motor with 2 speeds and controlled acceleration

Information from the motor:

| n 1 | D | 14. 7 |
|-------|---|-------|
| n 2 | D | 14.15 |
| ready | D | 13. 0 |
| test | D | 13. 1 |
| fault | D | 13. 4 |
| | | |

Information to the motor:

| acknowledgement | D | 12. 8 |
|-----------------|---|-------|
| n 1 | D | 11.7 |
| n 2 | D | 11.15 |
| manual | D | 12. 2 |
| off | D | 11.5 |

5.6.4 Object Type 13 (DB 113)

Individual control element: Motor with 2 speeds and automatic acceleration

Information from the motor:

| n 1 | D | 14. 7 |
|-------|---|-------|
| n 2 | D | 14.15 |
| ready | D | 13. 0 |
| test | D | 13. 1 |
| fault | D | 13. 4 |

Information to the motor:

| D | 12. 8 |
|---|-------|
| D | 11.7 |
| D | 11.5 |
| D | 12. 2 |
| | D |

5.6.5 Object Type 14 (DB 114)

Individual control element: Motor star-delta

Information from the motor:

| star | D | 14. 7 |
|-------|------------|-------|
| delta | D | 14.15 |
| ready | D | 13. 0 |
| test | . D | 13. 1 |
| fault | D | 13.4 |

Information to the motor:

| acknowledgement | D | 12. 8 |
|-----------------|---|-------|
| on | D | 11.7 |
| off | D | 11.5 |
| manual | D | 12. 2 |

5.6.6 Object Type 15 (DB 115)

Individual control element: Valve 2 loops

Information from the valve:

| valve 1 open | D | 14.7 |
|---------------|---|-------|
| valve 2 open | D | 14.15 |
| test 1 | D | 13. 1 |
| test 2 | D | 13.9 |
| fault valve 2 | D | 13.4 |
| fault valve 2 | D | 13.12 |

Information to the valve:

| D | 11.7 |
|---|------------------|
| D | 11.5 |
| D | 12. 8 |
| D | 11.15 |
| D | 11.13 |
| D | 12. 2 |
| | D D D D |

5.6.7 Object Type 16 (DB 116)

Individual control element: Valve slide

Information from the slide:

| slide open slide closed test stop | | 14.7 14.15 13.1 13.13 |
|--|---|--------------------------------|
| fault | D | 13.4 |

Information to the slide:

| acknowledgement | D | 12. 8 |
|-----------------|---|-------|
| slide open | D | 11.7 |
| slide closed | D | 11.5 |
| manual | D | 12. 2 |

5.6.8 Object Type 17 (DB 117)

Individual control element: Latched switching device

Information from the switching device:

| on | D | 14.7 |
|-------|---|-------|
| off | D | 14.15 |
| test | D | 13. 1 |
| fault | D | 13.4 |

Information to the switching device:

| acknowledgement | D | 12. 8 |
|-----------------|---|-------|
| on | D | 11.7 |
| off | D | 11.5 |
| manual | D | 12. 2 |

5.6.9 Object Type 18 (DB 118)

Individual control element: Valve slide with ESB

Information from the slide:

| slide open slide closed ready test stop | D D D D | 14.7 14.15 13.15 13.1 13.1 |
|---|------------------|--|
| Information to the slide: | | |
| acknowledgement slide open slide closed manual | D D D | 12.8 11.7 11.5 12.2 |

5.7 Analog Value Function

| Object ty | be No. | 19 |
|-----------|-----------------------|---------------|
| Data bloc | k | DB 119 |
| DW No. | Format | Meaning |
| 0: | KH = 0000; | free |
| 1: | KH = 0000; | free |
| 2: | KH = 0000; | free |
| 3: | KS ='Litre '; | Dimension |
| 6: | KG = +1000000+01; | Elongation |
| 8: | KF = +00000; | Process value |
| 9: | KF = +10000; | BMax |
| 10: | KF = +00000; | BMin |
| 11: | KF = +09500; | PVHH |
| 12: | KF = +00500; | PVLL |
| 13: | KF = +09000; | PVH |
| 14: | KF = +01000; | PVL |
| 15: | KM = 0000000 0000000; | Status word |
| 16: | KS ='Analog DB 212 '; | Object name |
| 24: | KH = 0000; | free |
| 25: | KH = 0000; | free |
| 26: | KH = 0000; | free |
| 27: | KH = 0000; | free |
| 28: | KH = 0000; | free |
| 29: | KH = 0000; | free |
| 30: | | |

The data double word elongation (DD 6) states a factor with which the process variable is multiplied for its display.

5.8 Binary Function

| Object typ | be No. | | 20 | |
|------------|---------------------|--------|----------------|----------------|
| Data bloc | k | D | B 120 | |
| DW No. | Format | | Meaning | |
| 0: | KS ='Name of the ob | ojecť; | Object name | |
| 8: | KM = 00000000 000 | 00000; | Status word | |
| 9: | KM = 00000000 000 | 00000; | DL: Operate/[| DR: Indication |
| 10: | KM = 00000000 000 | 00000; | D 10.0: Opera | ator bit |
| 11: | KS ='Field 1 '; | | Name of the 1 | l st value |
| 15: | KH = 0000; | | free | |
| 16: | KS ='Field 2 '; | | Name of the 2 | 2nd value |
| 20: | KH = 0000; | | free | |
| 21: | KS ='Field 3 '; | | Name of the 3 | Brd value |
| 25: | KH = 0000; | | free | |
| 26: | KS ='Field 4 '; | | Name of the 4 | 4th value |
| 30: | KH = 0000; | | free | |
| 31: | KS ='Field 5 '; | | Name of the \$ | 5th value |
| 35: | KH = 0000; | | free | |

DW 9

36:

States

| D 9.0 | Staus value 1 |
|-------|----------------|
| D 9.1 | Status value 2 |
| D 9.2 | Status value 3 |
| D 9.3 | Status value 4 |
| D 9.4 | Status value 5 |

Operating

| D 9.7 | Operating value 1 |
|--------|-------------------|
| D 9.8 | Operating value 2 |
| D 9.9 | Operating value 3 |
| D 9.10 | Operating value 4 |
| D 9.11 | Operating value 5 |

The operating is fetched by the user from DL 9 with the operating bit set, and the operating bit is reset. The additionally processed value is written in DR 9 as response message.

5.9 Control System S5-115U

| Object type No. | 21 | 22 |
|-----------------|--------|--------|
| Data block | DB 121 | DB 122 |

5.10 Modular Control system

| Object type No. | 23 | 24 |
|-----------------|--------|--------|
| Data block | DB 123 | DB 124 |

The controller data block DB INTER (DB 123 or DB 124) contains the working data of a controller structure. The contents of the data block depend in part upon the controller structure.

5.10.1 Controller Structure: Continuous Controller (KREG)

Structure of the controller data block DB INTER for the controller structure of continuous controllers:

6 Reference Part for Standard Displays

This chapter describes the finished existing standard displays for the predefined PMC object types.

The following types of integration are available for the standard displays.

- Integration in a group display
- Integration in a circle display
- Integration as graphic box

6.1 Standard Displays for Controllers

Standard display blocks exist for controller objects for displaying the controller itself and, as extension possibility, standard display blocks for visualizing the limit values of a controller.

For R64 controller structures, a standard display for visualizing the measuring points of the R64 controller (object type 3) exists in addition.

Display example for displaying a controller:

| LOOP | · Object name |
|----------------------|--|
| | Max. of range Alarm limits Warning limits |
| 0m | Dimension Actual value PV |
| ecoso | Setpoint SP BMin Actual value PV |
| SP 0000 | Setpoint Limitation for MV |
| £., | Manipulated variable MV |
| MN/ 000 Auto | Manipulated variable MV Automatic/manual external/internal |

Fig. 6.1: Continuous controller in COROS LS-B

Example for limit value display of a controller:

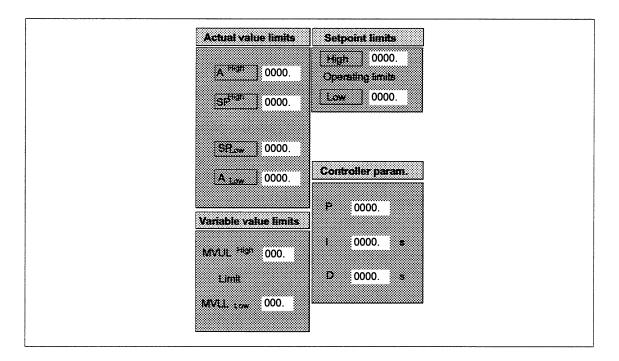

Fig. 6.2: Limit values for a continuous controller

The standard display blocks are stored in separate files. Depending upon whether the limit value display should be incorporated as element of a loop display or as process box, another file must be used in each case.

| Object type | Controller display file | Limit value display file |
|-------------|-------------------------|--------------------------|

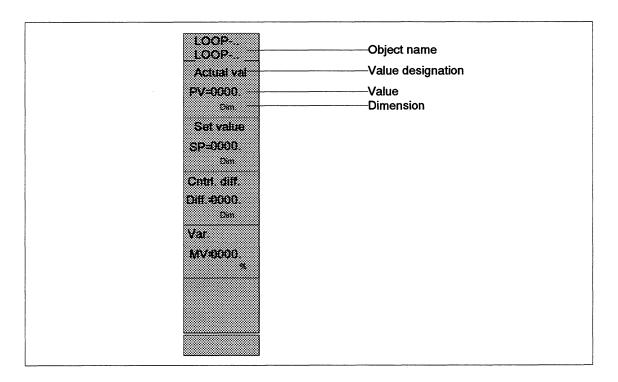

Fig. 6.3: Standard display block

File of the standard display block for object type 3 (measuring point R64):

MPR 64.SBB

6.2 Standard Display for Analog Measured Values

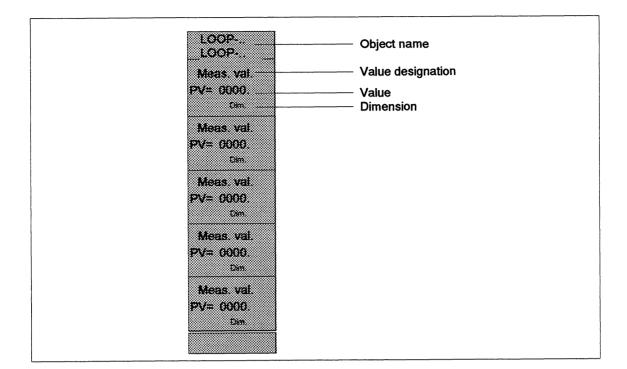

Fig. 6.4: Standard display block

File of the standard display block for object type 8 (analog measured values):

MW.SBB

6.3 Standard Displays for Dosing Apparatus

For the standard object of dosing apparatus (object type 9) there is a standard display block for displaying the dosing apparatus itself, and a standard display block for displaying additional values of the dosing apparatus (factors, end values, dribbling correction factor).

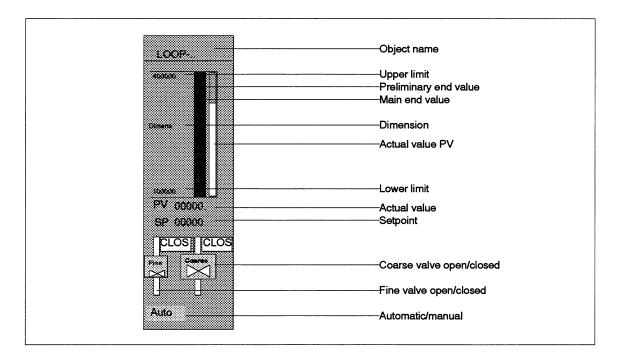

Fig. 6.5: Standard dosing apparatus display

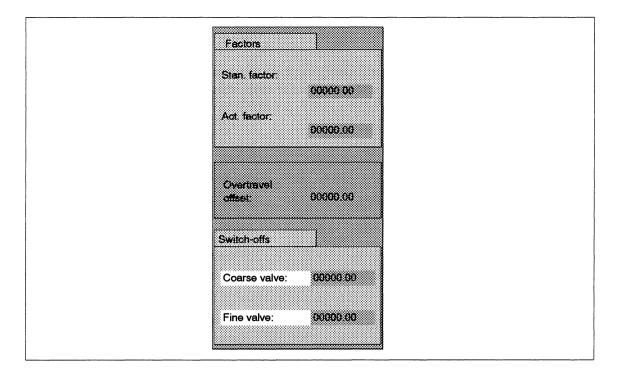

Fig. 6.6: Standard additional values display

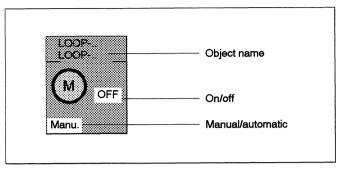

The standard display blocks are stored in separate files.

| Standard Display Block | File |
|------------------------|-------------|
| Doser | DOS.SBB |
| Additional values | DOSPARA.SBB |

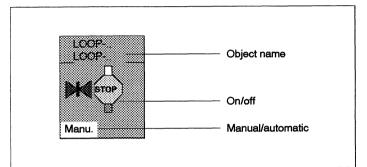

6.4 Standard Displays for Individual Control Elements

Display examples for displaying individual control elements:

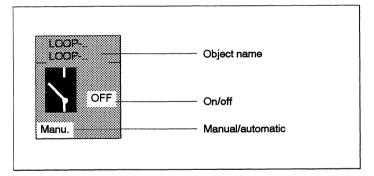

Motor

Valve

Switch

Valve slide

V_1.SBB (1st loop) V_2.SBB (2nd loop)

Schieb.SBB

Schalt.SBB

SchiebE.SBB

6.5 Standard Displays for the Analog Value Output

For the analog value function (object type 19), displaying limit values is possible in addition to the standard display block of the analog value output.

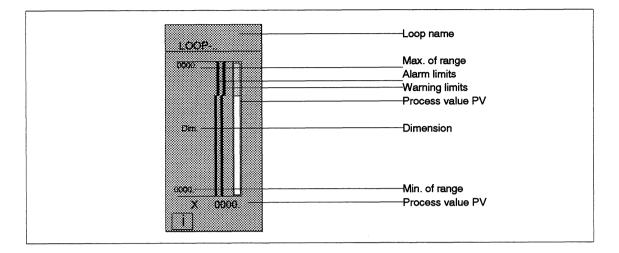

Fig. 6.7. Display example for analog value display

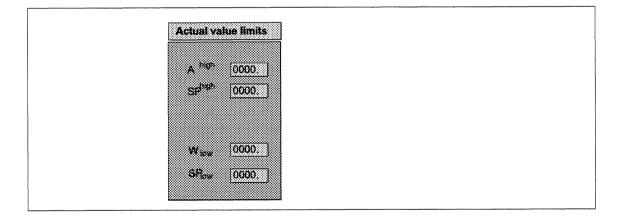

Fig. 6.8: Limit values of an analog value

The standard display blocks are stored in separate files:

| Standard display block | File | |
|------------------------|-------------|--|
| Analog value display | Analog.SBB | |
| Limit value display | GAnalog.SBB | |

6.6 Standard Display for Binary Values

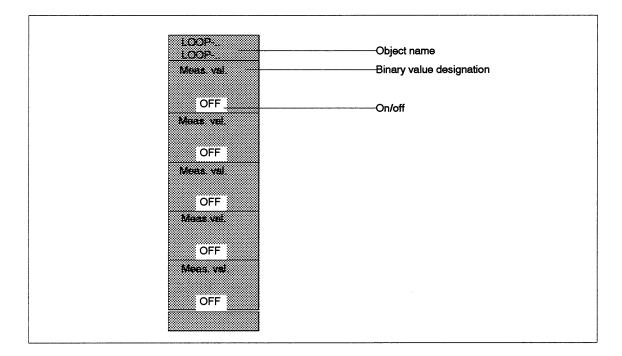

Fig. 6.9: Standard display block

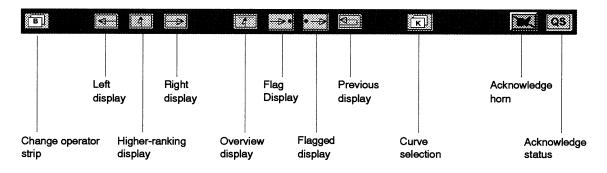

File of the standard display block for object type 20 (binary values):

BINAER.SBB

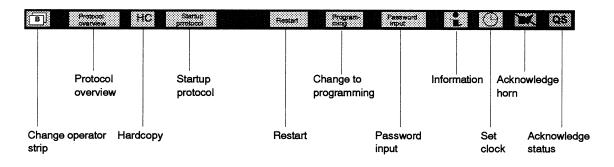

6.7 Operator Strips

Predefined operator strips exist for operator control of the standard displays, as well as of the loop, group and overview displays.

Operator strip for display switch-over:

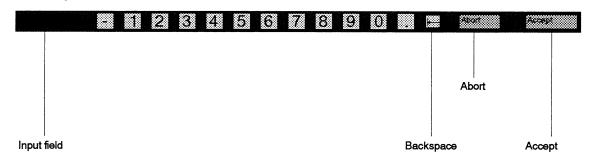

Operator strip for selecting basic functions:

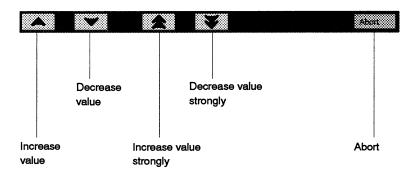

Numerical operator strip:

The numerical operator strip serves for entering numerical values.

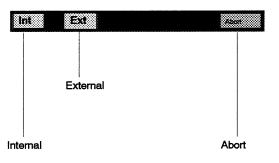

Control strip for adjusting a value:

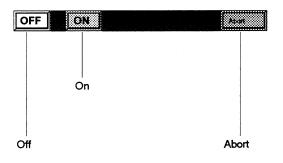

The value is changed by operating up/down key fields.

Control strip for internal/external switch-over:

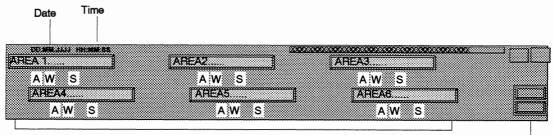

Control strip for switching on/off:

6.8 Standard Display for Area Overview

In the standard display for the area overview, 6 areas are displayed with short information on the status.

Area displays

6.9 Information on Setting the COROS LS-B On-Line

If the standard display blocks specified in Chapter 6 are used, the following files have to be specified additionally, when the COROS LS-B is set on-line:

7 **Technical Specifications**

This chapter contains tables and calculation bases for determining the necessary storage space requirement, as well as the required runtimes when using the PMC status processing system.

7.1 Storage Space Requirement

The storage space requirement can be divided into required storage space for:

function blocks

- + program blocks (approx. 60 data words)
- + data blocks

With the preconditions for the application of status elaboration which are PMC System Functions, Operating and Monitoring Functions and Message Functions. For detailed information about the contents and storage space requirement of the blocks for Communications system, Operating and Monitoring Functions and Message Functions please refer to the respective manual (Section: Technican Specifications).

Storage space requirements of the function block (All information in data words)

| FB-Nr. | FB-Name | CPU 941-943 | CPU 944 | CPU 945 | CPU 928 | CPU 946/47 | CPU 948 |
|---|----------------------------------|-----------------|-----------------|--------------------|------------------|--------------------|--------------------|
| Communication, O+M | total | 9619 | 9619 | 11727 | 7470 | 19038 | 11838 |
| FB 209 FB 222 FB 223 | S-ANLAUF STATQUIT STATMELD | 82 80 699 | 82 80 699 | 158 117 1357 | 72 113 565 | 156 110 1383 | 156 110 1383 |
| Status | total | 861 | 861 | 1632 | 750 | 1649 | 1649 |
| Communckation, Messa- ges and Status | total | 10490 | 10490 | 13359 | 8220 | 20687 | 13487 |

PMC/LS-B V 2.0: Status

The function block FB STATUS (created by PMCPRO) needs in addition to its total storage requirement 4 data words per monitored PMC object of additional storage space (for type 1, 2 and 3 (R 64): 6 DW, while accessing to > DW 255: 8 DW are required).

Storage space requirement of the additionally required data blocks for status elaboration (All information in data words):

| Dat ablock | Number of data words | Remark |
|----------------------------|---------------------------------------|--|
| DB OBJ-STAT DB STAT-ANZ | · · · · · · · · · · · · · · · · · · · | Acc. to number of objects Acc. to number of objects |

7.2 Runtimes

The runtimes of function blocks for PMC system communication depend on the utilities in elaboration and on the jobs the PMC system communication of COROS LS-B or PMC_581 have to accomplish: The higher the demand for communication jobs to be accomplished by the CPU, the longer CPU runtimes of PMC system communication.

The table below shows standard values which occur during normal service and extreme values which occur during high-duty service.

System communication and different number of status objects

Standard values:

| System communication and | CPU 943B | CPU 944B | CPU 945 | CPU 928A | CPU 928B | CPU 946/947 | CPU 948 |
|-----------------------------|---------------------|---------------------|---------|---------------------|--------------------|----------------|---------|
| 50 Objects | 57 | 22 | 2 | 71 | 23 | 20 | 5 |
| 100 Objects | 80 | 33 | 3 | 91 | 34 | 24 | 6 |
| 200 Objects | 126 | 44 | 6 | 132 | 57 | 32 | 8 |
| 400 Objects | only 200 Objects | only 200 Objects | 9 | only 200 Objects | only 200Objects | 48 | 11 |
| 750 Objects | only 200 Objects | only 200 Objects | 11 | only 200 Objects | only 200Objects | 74 | 17 |

Max. values:

| System communication and | CPU 943B | CPU 944B | CPU 945 | CPU 928A | CPU 928B | CPU 946/947 | CPU 948 |
|-----------------------------|---------------------|---------------------|---------|---------------------|---------------------|----------------|---------|
| 50 Objects | 80 | 80 | 10 | 180 | 50 | 40 | 10 |
| 100 Objects | 100 | 80 | 10 | 200 | 60 | 50 | 10 |
| 200 Objects | 160 | 100 | 10 | 240 | 80 | 70 | 20 |

Index

Α

Acknowledgement byte, 3-3 Analog measured values, 4-7, 5-12 Analog value function, 4-14, 5-20 Area display, 2-10 Area overview, 2-7

В

Binary function, 4-17, 5-21

С

Central status suppression, 3-6 Continuous controller, 4-23, 5-26 Control module IP 260, 4-5, 5-9 Control system S5-115U, 4-18, 5-22

D

Data blocks, 3-8 Direct operator control, 2-4 Disk, 1-1 Display hierarchy, 2-9 Dosing apparatus, 4-8, 5-13

F

FRANZ, 2-7 Function blocks, 3-11

G

Group display, 2-11 Grouping levels, 2-9

I

ICM, 4-12, 5-14 Indicator byte, 3-3 Individual control elements, 4-12, 5-14 IP 260, 4-5, 5-9

κ

KREG, 4-23, 5-26

L

Limit value block, 2-18 Loop display, 2-15

М

Modular control system, 4-20, 5-26

Ν

NORA, 2-7 Number of objects, 3-2

0

Object data block, 2-1, 2-3, 5-1 Object display, 2-14 - 2-15 Object operation, 2-4 Object type, 2-2, 2-5 Object word, 3-3 Observation data, 2-4 Operating concepts, 2-4 Operator control area, 2-8 Operator control bit, 2-4 Operator control bit, 2-4 Operator control value number, 2-4 Overview display, 2-10

Ρ

Parameter block, 2-17 PMC data blocks, 1-1 PMC objects, 2-1, 2-3, 4-1, 5-1

R

R64 controller, 4-1, 5-1 Runtimes, 7-2

S

Scope of delivery, 1-1 Selective status suppression, 3-6 SREG, 4-25, 5-29 Standard controller interface, 4-4, 5-7 Standard displays, 2-7 Standard objects, 2-1, 4-1 Standardized operator guidance, 2-9 Standardized symbols, 2-11 Status acknowledgement, 3-7 Status byte, 2-3 Status indication, 3-9 Status information, 2-3 Status messages, 3-5 Status monitoring, 3-2 Status processing, 3-1 Status signals, 3-1

Status suppression, 3-6 Status telegram, 3-4 Step controller, 4-25, 5-29 Storage space requirement, 7-1

Т

Technical data, 7-1 Trend curve, 2-18

U

User-specific displays, 2-19 User-specific objects, 2-1, 2-19

W

Working area, 2-7
