

SY88403BL

3.3V 4.25 Gbps CML Low-Power Limiting Post Amplifier with TTL LOS

Features

- · Multi-Rate up to 4.25 Gbps Operation
- 5 mV_{PP} Input Sensitivity
- Low Noise 50Ω CML Data Outputs
 - 800 mV_{PP} Output Swing
 - 60 ps Edge Rates
 - 1ps_{RMS} Typ. Random Jitter
 - 10pspp Typ. Deterministic Jitter
- · Chatter-Free Loss-of-Signal (LOS) Output
 - 3.5 dB Electrical Hysteresis
 - OC-TTL Output with Internal 4.75 kΩ Pull-Up Resistor
- Programmable LOS Sensitivity Using Single External Resistor
- Internal 50Ω Data Input Termination
- · TTL /EN Input Allows Feedback from LOS
- · Wide Operating Range:
 - Single 3.3V ±10% Power Supply
 - Industrial Temperature Range: −40°C to +85°C
- · Available in a 16-pin QFN Package

Applications

- 1.062 Gbps, 2.125 Gbps, and 4.25 Gbps Fibre Channel
- Cable Driver
- Small Form Factor (SFF) and Small Form Factor Pluggable (SFP) Transceivers
- · High-Gain Line Driver and Line Receiver

General Description

The SY88403BL is a low-power limiting post amplifier optimized for copper applications. The device connects to typical transimpedance amplifiers (TIAs). The linear signal output from TIAs can contain significant amounts of noise and may vary in amplitude over time. The SY88403BL quantizes these signals and outputs typically 800 mV_{PP} voltage-limited waveforms.

The SY88403BL operates from a single $+3.3V \pm 10\%$ power supply, over an industrial temperature range of -40° C to $+85^{\circ}$ C. With its wide bandwidth and high gain, signals with data rates up to 4.25 Gbps and as small as 5 mV_{PP} can be amplified to drive devices with CML inputs or AC-coupled PECL inputs.

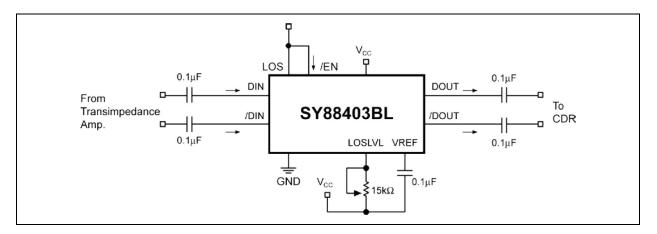

The SY88403BL incorporates a loss-of-signal (LOS) open-collector TTL output with internal 4.75 k Ω pull-up resistor. A programmable loss-of-signal level set pin (LOSLVL) sets the sensitivity of the input amplitude detection.

LOS asserts high if the input amplitude falls below the threshold set by LOSLVL and de-asserts low otherwise. LOS can be fed back to the enable bar (/EN) input to maintain output stability under a loss of signal condition. /EN de-asserts the true output signal without removing the input signal. Typically, 3.5 dB LOS hysteresis is provided to prevent chattering.

- **Note 1:** Amplifier in limiting mode. Input is a 200 MHz square wave.
 - 2: Deterministic jitter measured using 4.25 Gbps K28.5 pattern, V_{ID} = 20 m V_{PP} .
 - 3: Random jitter measured using 4.25 Gbps K28.7 pattern, V_{ID} = 20 mV_{PP}.
 - **4:** Differential output swing measured at 4.25 Gbps with 20 mV_{PP} input and PRBS-23 data pattern and 50Ω load.
 - **5:** See "Typical Operating Characteristics" for a graph showing how to choose a particular R_{LOSLVL} for a particular LOS assert and its associated de-assert amplitude.
 - **6:** This specification defines electrical hysteresis as 20log(LOS De-assert/LOS Assert). The ratio between optical hysteresis and electrical hysteresis is found to vary between 1.5 and 2 depending on the level of received optical power and ROSA characteristics. Based on that ratio, the optical hysteresis corresponding to the electrical hysteresis range 2 dB to 4.5 dB shown in the AC characteristics table will be 0.5 dB to 3 dB Optical Hysteresis.

TEMPERATURE SPECIFICATIONS (Note 1)

Parameters	Sym.	Min.	Тур.	Max.	Units	Conditions
Temperature Ranges						
Junction Temperature Range	T _J	-40	_	+120	°C	_
Ambient Temperature	T _A	-40	_	+85	°C	_
Lead Temperature	_	_	_	+260	°C	Soldering, 10 sec.
Storage Temperature	T _S	-65	_	+150	°C	_
Package Thermal Resistance (Note 2)		•	•	•	•	
QFN (Still-Air)	θ_{JA}	_	61	_	°C/W	_
QFN	ΨJB	_	38	_	°C/W	_

- Note 1: The maximum allowable power dissipation is a function of ambient temperature, the maximum allowable junction temperature and the thermal resistance from junction to air (i.e., T_A, T_J, θ_{JA}). Exceeding the maximum allowable power dissipation will cause the device operating junction temperature to exceed the maximum +85°C rating. Sustained junction temperatures above +85°C can impact the device reliability.
 - 2: Thermal performance assumes the use of a 4-layer PCB. Exposed pad must be soldered (or equivalent) to the device's most negative potential on the PCB.

2.0 TYPICAL PERFORMANCE CURVES

Note: The graphs and tables provided following this note are a statistical summary based on a limited number of samples and are provided for informational purposes only. The performance characteristics listed herein are not tested or guaranteed. In some graphs or tables, the data presented may be outside the specified operating range (e.g., outside specified power supply range) and therefore outside the warranted range.

3.0 PIN DESCRIPTIONS

Package Type

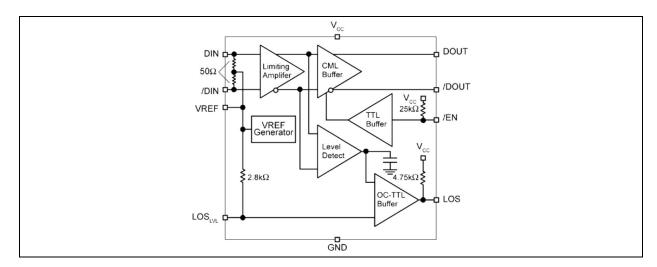

The descriptions of the pins are listed in Table 3-1.

TABLE 3-1: PIN FUNCTION TABLE

		. •	
QFN Pin Number	Pin Name	Туре	Description
1, 4	DIN, /DIN	Differential Data Input	Differential Data Input. Each pin internally terminates to REF through 50Ω .
2, 3,10, 11 Exposed Pad	GND	Ground	Device Ground. Exposed pad must be soldered (or equivalent) to the same potential as the ground pins.
5, 8, 13, 16	VCC	Power Supply	Positive Power Supply. Bypass with 0.1 μ F 0.01 μ F low ESR capacitors. 0.01 μ F capacitors should be as close as possible to VCC pin.
6	VREF	_	Reference Voltage. Bypass with 0.01 μ F low ESR capacitor from VREF to VCC to stabilize LOS _{LVL} and V _{REF} .
7	LOS	Open Collector TTL Ouput with Internal 4.75kΩ Pull-Up Resistor	Loss-of-Signal: Asserts high when the data input amplitude falls below the threshold set by LOSLVL.
9, 12	DOUT, /DOUT	Differential CML Output	Differential Data Output.
14	LOSLVL	Input: Default is maxi- mum sensitivity.	Loss-of-Signal Level Set: A resistor from this pin to VCC sets the threshold for the data input amplitude at which the LOS output will be asserted.
15	/EN	TTL Input: Default is high.	Enable Bar: De-asserts true data output when high. Incorporates 25 k Ω pull-up to VCC.

4.0 FUNCTIONAL DESCRIPTION

4.1 Functional Block Diagram

4.2 Detailed Description

The SY88403BL low-power limiting post amplifier operates from a single +3.3V power supply, over temperatures from -40°C to +85°C. Signals with data rates up to 4.25Gbps and as small as 5 mV_{PP} can be amplified. Figure 4-1 shows the allowed input voltage swing. The SY88403BL generates an LOS output, allowing feedback to /EN for output stability. LOSLVL sets the sensitivity of the input amplitude detection.

4.2.1 INPUT AMPLIFIER/BUFFER

The SY88403BL's inputs are internally terminated with 50Ω to REF. If not affected by this internal termination scheme, upstream devices need to be AC-coupled to the SY88403BL's inputs. Figure 4-2 shows a simplified schematic of the input stage.

The high-sensitivity of the input amplifier allows signals as small as 5 mV $_{PP}$ to be detected and amplified. The input amplifier allows input signals as large as 1800 mV $_{PP}$. Input signals are linearly amplified with a typically 38 dB differential voltage gain. Since it is a limiting amplifier, the SY88403BL outputs typically 800 mV $_{PP}$ voltage-limited waveforms for input signals that are greater than 20 mV $_{PP}$. Applications requiring the SY88403BL to operate with high-gain should have the upstream TIA placed as close as possible to the SY88403BL's input pins to ensure the best performance of the device.

4.2.2 OUTPUT BUFFER

The SY88403BL's CML output buffer is designed to drive 50Ω lines. The output buffer requires appropriate termination for proper operation. An external 50Ω resistor to V_{CC} or equivalent for each output pin provides this. Figure 4-3 shows a simplified schematic of the output stage and includes an appropriate

termination method. Of course, driving a downstream device with a CML input that is internally terminated with 50Ω to V_{CC} eliminates the need for external termination. As noted in the previous section, the amplifier outputs typically $800~\text{mV}_{PP}$ waveforms across 25Ω total loads. The output buffer thus switches typically 16~mA tail-current. Figure 4-4 shows the power supply current measurement, which excludes the 16~mA tail-current.

4.2.3 LOSS-OF-SIGNAL

The SY88403BL incorporates a chatter-free loss-of-signal (LOS) open-collector TTL output with internal 4.75 k Ω pull-up resistor as shown in Figure 4-5. LOS is used to determine that the input amplitude is too small to be considered a valid input. LOS asserts high if the input amplitude falls below the threshold set by LOSLVL and de-asserts low otherwise. LOS can be fed back to the enable (/EN) input to maintain output stability under a loss of signal condition. /EN de-asserts low the true output signal without removing the input signals. Typically 3.5 dB LOS hysteresis is provided to prevent chattering.

4.2.4 LOSS-OF-SIGNAL LEVEL SET

A programmable loss-of-signal level set pin (LOSLVL) sets the threshold of the input amplitude detection. Connecting an external resistor between VCC and LOSLVL sets the voltage at LOSLVL. This voltage ranges from V_{CC} to $V_{REF}.$ The external resistor creates a voltage divider between V_{CC} and V_{REF} as shown in Figure 4-6. If desired, an appropriate external voltage may be applied rather than using a resistor. The relationship between V_{LOSLVL} and R_{LOSLVL} is given by:

SY88403BL

EQUATION 4-1:

$$V_{LOSLVL} = V_{CC} - \left(1.3 \frac{R_{LOSLVL}}{R_{LOSLVL} + 2.8}\right)$$

Where:

Voltages are in volts and resistances are in $k\Omega$.

The smaller the external resistor, implying a smaller voltage difference from LOSLVL to VCC, lowers the LOS sensitivity. Hence, larger input amplitude is required to de-assert LOS. "Typical Operating Characteristics" contains graphs showing the relationship between the input amplitude detection sensitivity and $R_{\text{LOSLVL}}. \label{eq:loss_loss}$

4.2.5 HYSTERESIS

The SY88403BL provides typically 3.5 dB LOS electrical hysteresis. By definition, a power ratio measured in dB is 10log (power ratio). Power is calculated as $V_{\rm IN}^2/R$ for an electrical signal. Hence the same ratio can be stated as 20log (voltage ratio). While in linear mode, the electrical voltage input changes linearly with the optical power and hence the ratios change linearly. Therefore, the optical hysteresis in dB is half the electrical hysteresis in dB given in the datasheet. The SY88403BL provides typically 1.75 dB LOS optical hysteresis. As the SY88403BL is an electrical device, this datasheet refers to hysteresis in electrical terms. With 3.5 dB LOS hysteresis, a voltage factor of 1.5 is required to de-assert LOS.
