## Symbols and Abbreviations

The following symbols and abbreviations, and others approved for the Système International d'Unités (SI), are used without definition in the following reports by the Divisions of Sport Fish and of Commercial Fisheries: Fishery Manuscripts, Fishery Data Series Reports, Fishery Management Reports, and Special Publications. All others, including deviations from definitions listed below, are noted in the text at first mention, as well as in the titles or footnotes of tables, and in figure or figure captions.

| Weights and measures (metric) |  | General |  | Mathematics, statistics |  |
| :---: | :---: | :---: | :---: | :---: | :---: |

## FISHERY MANAGEMENT REPORT NO. 22-11

# 2019 LOWER COOK INLET AREA FINFISH ANNUAL MANAGEMENT REPORT 

by

Glenn Hollowell, Edward O. Otis, and Ethan Ford<br>Alaska Department of Fish and Game, Division of Commercial Fisheries, Homer

The Fishery Management Reports series was established in 1989 by the Division of Sport Fish for the publication of an overview of management activities and goals in a geographic area, and became a joint divisional series in 2004 with the Division of Commercial Fisheries. specific Fishery Management Reports are intended for fishery and other technical professionals, as well as lay persons. Fishery Management Reports are available through the Alaska State Library and on the Internet: http://www.adfg.alaska.gov/sf/publications/. This publication has undergone regional peer review.

Product names used in this publication are included for completeness and do not constitute product endorsement. The Alaska Department of Fish and Game does not endorse or recommend any specific company or their products.

#### Abstract

The Lower Cook Inlet consists of all coastal waters and inland drainages entering waters north of Cape Douglas, west of Cape Fairfield, and south of Anchor Point. In 2019, commercial harvest was approximately 2.4 million salmon and was composed of 2.0 million pink Oncorhynchus gorbuscha, 311,696 sockeye O. nerka, 55,508 chum O. keta, 12,712 coho $O$. kisutch, and 736 Chinook salmon $O$. tshawytscha. Approximately $85.7 \%$ of the harvest ( 2.0 million) salmon were sold as common property harvest, and 337,000 salmon were sold for hatchery cost recovery, including carcass sales. Homepack and donated fish ( 1,913 salmon) accounted for less than $1 \%$ of the harvest. Based on fish ticket reporting of prices, the preliminary value of the commercial salmon harvest was $\$ 5.3$ million, including hatchery sales. This amount does not include postseason adjustments, bonuses, etc. During the 2019 season, 20 set gillnet and 22 purse seine permit holders reported deliveries. Set gillnet harvest value was an estimated $\$ 405,000$, with average permit earnings of $\$ 20,255$. Purse seine fishery exvessel harvest value was an estimated $\$ 3.2$ million, with average permit earnings of $\$ 145,044$. Revenue generated by cost recovery for hatchery operations was approximately $\$ 1.7$ million. An additional $\$ 448,553$ was disbursed to Cook Inlet Aquaculture Association from a $2 \%$ salmon enhancement tax in Area H. A total of 2,795 salmon were harvested in personal use and subsistence fisheries. Approximately 183 subsistence and personal use permits were issued to Alaska residents, in addition to 1,561 coho salmon landed by sport fish permit holders in a derby in Seward. Although these fish were subsequently sold commercially, they were not included in the total commercial harvest. The commercial Pacific herring Clupea pallasii fishery in the Kamishak Bay District remained closed in 2019 for the 21 st consecutive year to allow the spawning population to continue rebuilding.

Keywords: Sockeye salmon Oncorhynchus nerka, pink salmon O. gorbuscha, chum salmon O. keta, Chinook salmon $O$. tshawytscha, coho salmon $O$. kisutch, Pacific herring Clupea pallasii

## INTRODUCTION

## Lower Cook Inlet Management Area Commercial Salmon and Herring Fisheries

The Lower Cook Inlet (LCI) Management Area is composed of waters of the Cook Inlet Management Area (Area H) south of the latitude of Anchor Point, including the western shore of Cook Inlet south to Cape Douglas, and the eastern shore of Cook Inlet along the Kenai Peninsula to Cape Fairfield. (Figures 1-14).

This salmon management area is divided into 5 districts that correspond to local geography and distribution of the 5 species of Pacific salmon (Oncorhynchus spp.) harvested by commercial fisheries (Figure 2). These districts are further divided into subdistricts and sections for management and harvest reporting purposes (Figures 3-13). The primary management objective for all districts is to achieve spawning escapement goals for major salmon stocks and allow orderly fisheries to harvest fish surplus to spawning requirements. In addition, Alaska Department of Fish and Game (ADF\&G) follows regulatory guidelines to both manage fisheries and allow private nonprofit hatcheries to achieve cost-recovery and broodstock objectives from harvests conducted within special harvest areas.

Four hatcheries currently contribute to the area's salmon fisheries. The Trail Lakes Hatchery at Mile 29 of the Seward Highway (Figure 1) produces sockeye O. nerka and coho salmon O. kisutch and is operated by the Cook Inlet Aquaculture Association (CIAA). ${ }^{1}$ ADF\&G operates the Ship Creek Hatchery Complex near Anchorage that produces Chinook O. tshawytscha and coho salmon, which are released in the LCI Area. In 2011, the Tutka Bay Lagoon Hatchery (TBLH) once again began incubating pink salmon $O$. gorbuscha eggs for release into Kachemak Bay. In

[^0]2015, the Port Graham Hatchery (PGH) also began incubating pink salmon eggs for release in Port Graham Bay.

Gear utilized in commercial salmon fisheries includes purse seine and set gillnet. Purse seine gear is permitted to fish in the Southern, Outer, Eastern, and Kamishak Bay Districts (Figure 1). Set gillnet gear is permitted to fish in the Southern District. The Barren Islands District is closed by regulation to salmon harvest.

When Pacific herring Clupea pallasii spawning biomass allows for a commercial fishery in the Kamishak Bay District, annual harvest level ranges are established in regulation (5 AAC 27.465) and divided between the commercial purse seine sac roe fishery in that district $(90 \%)$ and the Shelikof Strait food and bait fishery ( $10 \%$ ) in the Kodiak Management Area. Other districts in LCI were closed to commercial herring harvest by the Alaska Board of Fisheries (BOF) in 2002, pending an increase in stock levels sufficient to ensure that a commercial herring fishery can be conducted in a sustainable manner.

## Overview of Areawide Salmon and Herring Fisheries

In 2019, the LCI commercial harvest of 2.4 million salmon included $1,980,124$ pink, 311,696 sockeye, 55,508 chum $O$. keta, 12,712 coho, and 736 Chinook salmon (Table 1 ; Figure 15). Hatchery runs of sockeye and pink salmon in general were below forecast at hatchery release sites. Commercial harvests of sockeye, coho, and pink salmon were above the 10 -year (2009-2018) averages (Table 2). Approximately $86 \%$ of the harvest ( $2,021,725$ fish) was attributed to the common property fishery, whereas $14 \%$ ( 337,138 fish) came from hatchery cost recovery. An additional 6,941 sockeye and 166,677 pink salmon were harvested by hatcheries for broodstock (Appendices F1, F2, and F3). Homepack harvest ( 629 fish) accounted for less than $1 \%$ of the commercial harvest from LCI districts (Table 1). The 2019 preliminary exvessel value estimates by gear group from the common property fishery for both wild and enhanced salmon were $\$ 3.2$ million ( $88.7 \%$ ) for purse seine and $\$ 405,098$ ( $11.3 \%$ ) for set gillnet (Table 3; Figure 16). The average price per pound paid to fishers was generally above the 10 -year average for all salmon species, with the exception of chum salmon (Table 4). The combined harvest value for purse seine and set gillnet in 2019 was $\$ 3.6$ million, which was above the 10 -year average of $\$ 2.4$ million (Table 5). Hatchery harvest in 2019 was estimated at $\$ 1.7$ million. Of that, $\$ 1.5$ million was from sockeye salmon sales and much of the remainder from pink salmon sales.
No commercial fisheries for herring occurred in 2019 to allow the population further opportunity to rebuild from historically low abundance.

## SALMON SEASON SUMMARY BY DISTRICT

## SOUTHERN DISTRICT

The Southern District includes the waters of eastern Cook Inlet south of Anchor Point and north of a line from Cape Elizabeth to Cape Douglas, excluding waters east of a line from Point Adam to the tip of Cape Elizabeth (Figures 3 and 6). Commercial fishing in this district is restricted by regulation to waters primarily along the south shore of Kachemak Bay from Chugachik Island near the terminus of Kachemak Bay to Point Bede approximately 4 miles south of the village of Nanwalek (English Bay; Figures 4 and 5). Purse seine gear is permitted in all open waters of this district during periods established by emergency order (EO). Commercial set gillnet harvest is restricted to approximately 15 miles of shoreline in 5 subdistricts in this district: the east shore of

Ismailof Island near Halibut Cove; waters surrounding McDonald Spit extending to Jakolof Bay; waters east of Barabara Point extending approximately 1.4 miles; waters along the west shore of outer Seldovia Bay; and waters of a portion of the south shore of Port Graham and English Bay (Figures 3, 4, and 5). Although any Cook Inlet area (Area H) commercial set gillnet permit holder may register to fish in these areas, this registration would preclude that permit holder from fishing in the Northern District and Upper Subdistrict of the Central District for the remainder of that calendar year. Other areas in the "Greater Cook Inlet Area," as defined in 5 AAC 21.345, may be fished in a given year by set gillnet permit holders in the Southern District. The primary target species in this district for both purse seine and set gillnet permit holders are sockeye and pink salmon, although modest numbers of chum and coho salmon are also harvested. The major producer of wild sockeye salmon in this district is the English Bay River. Pink salmon historically have returned in large numbers to Humpy Creek and Seldovia River, as well as numerous smaller streams in the Southern District.

## Preseason Outlook and Harvest Strategy

The 2019 commercial wild stock salmon harvest forecast for the Southern District was 126,500 pink and 80,700 sockeye salmon (Appendix G1). The enhanced sockeye salmon run to CIAA release sites was forecast to be 467,400 fish. A total of 2.1 million hatchery-produced pink salmon were anticipated to return to the LCI Area in 2019 from the 2018 release of 50.0 million fry from TBLH, and 21.2 million fry from PGH (Appendix F1).
As specified in regulation, the set gillnet fishing season in the Southern District opens on or after June 1 with two 48 -hour periods per week unless modified by EO. The seine fishing season and fishing periods are opened and closed by EO, depending on the available harvestable surplus of both wild and hatchery stock salmon. Given that cost-recovery objectives were not anticipated to be met by sockeye salmon returns to Resurrection Bay, all returning hatchery sockeye and pink salmon in excess of broodstock requirements in other areas were anticipated to be required for cost-recovery harvest. Because of recent good runs of sockeye salmon to the Port Graham Subdistrict, the commercial set gillnet fishery opened on June 1.
Early season management of the Southern District (excluding the Port Graham Subdistrict) was based on actual harvest versus anticipated harvest. Port Graham Subdistrict management was based on anticipated run strength versus actual run strength to the English Bay Lakes, as measured by the English Bay River weir. Environmental conditions, fishing effort, and harvest consistency throughout the period were also taken into account. By early July, ground survey estimates of chum and early pink salmon escapement began to weigh more heavily when scheduling commercial fishing periods. These surveys became primary tools in late July and August when management focus shifted to pink salmon in this district.

## Season Summary

The 2019 Southern District total sockeye salmon commercial common property harvest, excluding homepack, was 76,280 fish, with 29,274 (38.4\%) harvested by the set gillnet fleet and 47,006 harvested by seine permit holders (Appendices A1-A3). In addition, CIAA harvested 10,596 and 1,990 sockeye salmon from the Tutka Bay Lagoon and China Poot special harvest areas (SHA) for cost recovery and 1,226 for broodstock purposes (Appendix F2). Total common property pink salmon harvest was 29,345 fish, with 22,934 ( $78.2 \%$ ) harvested by the seine fleet and 6,411 harvested by set gillnet permit holders. In addition, CIAA harvested 179,639 pink salmon from the Tutka Bay Lagoon SHA for cost recovery, none from the Port Graham SHA, and 20 from the

China Poot SHA while targeting hatchery sockeye salmon returns at that location (Appendix F3). A total of 490 Chinook salmon were harvested by the common property fishery in the Southern District, with 350 harvested by set gillnet permit holders and the remaining by seine permit holders. A total of 4,206 chum salmon were harvested, with 3,908 by set gillnet and 298 by seine permit holders. In addition, 5,882 coho salmon were harvested, with 2,817 by set gillnet and 3,065 by seine permit holders (Table 1; Appendices A1 and A2). A total of 62 Chinook, 311 sockeye, 166 coho, 59 pink, and 31 chum salmon were retained by 17 commercial permit holders ( 10 seine, 7 set gillnet) for personal homepack use from this district and were not sold (Table 1; Appendix E7).

## Set gillnet

The Southern District set gillnet commercial fishing season was opened by EO at 6:00 AM on Monday, June 3 (Table 6). This and all following commercial set gillnet fishing periods were 48 hours in length. There is only 1 sockeye salmon sustainable escapement goal (SEG) in the Southern District, which is an SEG of 6,000-13,500 fish (Table 7), assessed via a weir in the English Bay River.

Early season sockeye salmon harvest in the Southern District and escapement through the English Bay weir were both within expectations. Prior to June 15, a total of 797 sockeye salmon had been counted at the weir versus an anticipated range of 755-1,700 fish by this date in order to achieve the SEG on July 31 (Table 7; Appendix A4). Through June 29, sockeye salmon passage through the English Bay weir was estimated at 6,364 fish, which remained within the anticipated level (2,836-6,382; Appendices A4 and A5) required to achieve the SEG. Weir passage through July remained steady with 24,044 sockeye salmon counted through July 24 . This was the last date that counts were reported and is above the upper end of the $6,000-13,500$ fish SEG range.

The commercial set gillnet salmon season in the Southern District was closed by regulation on October 1, with a total harvest of 350 Chinook, 29,274 sockeye, 2,817 coho, 6,411 pink, and 3,908 chum salmon (Appendix A3).

## Purse seine

The Southern District commercial purse seine season was opened by EO on Monday, June 17, with a fishing schedule of 3 weekly 16-hour periods (6:00 AM to 10:00 PM) on Mondays, Wednesdays, and Fridays in portions of the district east of McDonald Spit (Table 6).

Harvest in the early portion of the season prior to mid-July targets enhanced sockeye salmon returns to hatchery release sites in the Southern District. Much of this effort occurs outside of the hatchery SHAs while cost-recovery and broodstock harvest is occurring. In mid-July the focus shifts to pink salmon harvest targeting returns to TBLH as well as wild returns to Humpy Creek, Seldovia Creek, and the Port Graham River. Pink salmon returns to wild systems in the Southern District was disappointing in comparison to the greater-than-expected returns in the Outer District where much of the fleet fished from late July through August. There were no deliveries of salmon from the Southern District after the first week of August.

Hatchery cost-recovery harvest occurred in SHAs in the Tutka Bay and China Poot subdistricts. This is described in the hatchery section of this report.

## Escapement

Of the 6 pink salmon index streams in the Southern District, 3 had final escapement estimates that were above the SEG ranges (Tutka Lagoon Creek, Barabara Creek, and Port Graham River), and

2 fell below the assigned SEG range (China Poot and Seldovia Creeks). Humpy Creek was within its assigned SEG. The only chum salmon SEG in the Southern District is for the Port Graham River. The final chum salmon escapement in this system was below the SEG range (Table 7; Appendices A7 and A8). The final spawning escapement for the English Bay River was 24,044 sockeye salmon, which was above the SEG range of $6,000-13,500$ (Table 7). The 10 -year average spawning escapement was 11,458 sockeye salmon for this system (Appendix A6). In addition, 131 adult sockeye salmon were observed in Hazel Lake.

## Summary

The total 2019 Southern District common property commercial harvest of 76,280 sockeye salmon was well above the 10-year average harvest of 54,778 and slightly below the anticipated wild-only harvest of 80,700 (Appendices A3 and G1). The pink salmon commercial common property harvest of 29,345 was well below the anticipated wild-only harvest of 126,500 , and also well below the 10-year average harvest of 157,393 (Appendix A3 and G1).

## OUTER DISTRICT

The Outer District includes the waters of LCI along the Kenai Peninsula south and east of a line from Point Adam to Cape Elizabeth, and east of the longitude of Cape Elizabeth to the longitude of Aligo Point, which is 35 miles southwest of Seward (Figures 1, 2, and 6-9). Purse seine gear is permitted in all open waters of this district during periods established by EO. Historically, the primary target species have been sockeye and pink salmon. The major producers of wild sockeye salmon in this district are Delight, Desire, and Delusion Lakes. All 3 of these lakes were reported to have been glaciated in the early part of the 20th century, with the McCarty Glacier terminus stretching from James Lagoon on the west to McCarty Lagoon on the east (Cook and Norris 1998, page 251). Pink salmon return in large numbers to Rocky, Port Dick, and Windy Bays, as well as several smaller systems. In addition, chum salmon are regularly harvested from Dogfish Lagoon and Port Dick.

## Preseason Outlook and Harvest Strategy

The 2019 commercial wild stock harvest forecast for the Outer District was 5,700 sockeye and 2.2 million pink salmon (Appendix G1). As specified in regulation, the seine fishing season and periods are opened and closed by EO depending on the available harvestable surplus of wild stock salmon returning to spawning systems in the Outer District.
Historically, management of commercial sockeye, pink, and chum salmon fisheries in this district has relied heavily on aerial and ground surveys of major spawning systems for those species. From 1997 to 2014, daily monitoring of sockeye salmon returning to Delight Lake was conducted using a picket weir staffed by ADF\&G field personnel. Funding for the weir was cut in 2015 and escapement monitoring through 2017 was conducted using aerial surveys. However, in 2018 and 2019, CIAA staffed the weir and provided daily inseason escapement counts to ADF\&G fishery managers in Homer. Typically, sockeye salmon runs to this lake, as well as to Desire and Delusion Lakes, peak in late July. Escapement into these lakes is frequently driven by rain events, with weeks of limited passage followed by a significant spike in escapement as the result of increased water volume in the lake outflow. By early August, chum and pink salmon runs to this district may increase to harvestable levels.

## Season Summary

The weir at Delight Lake was installed on July 2 . An aerial survey of the lake prior to weir installation (June 28) counted 80 sockeye salmon. The current SEG for this system, established at the 2016 BOF meeting using the 3 -tier Percentile Approach (Clark et al. 2014), is 5,100-10,600 fish (Otis et al. 2016a) and was calibrated to aerial surveys, which is a less efficient method of enumerating salmon than weirs. When functioning, weirs essentially provide a census of all fish entering a system. The SEG previously used when the weir was in place was $7,500-17,650$ fish. That goal was calibrated to weir counts and it is a more appropriate escapement goal during years when the weir is used to monitor escapement (Otis et al. 2010), so it was used to manage the Delight Lake fishery in 2019. If the weir continues to be operated, this weir-based goal may need to be updated using the 3-tier Percentile Approach (Clark et al. 2014) to be consistent with other LCI goals (Otis et al. 2016a). No fish were passed during the first half of July as a result of the Delight Lake outlet stream being dry due to lack of rainfall in this area. From July 15 to July 20, over 8,000 sockeye salmon were counted at the weir. Shortly thereafter, the West Nuka Subdistrict opened to commercial harvest and remained open for regular periods for the remainder of the 2019 fishing season. The final count at the weir when it was removed on July 29 was 16,695 sockeye salmon, which is within the weirbased SEG for this system (Table 7; Appendices B3, B4). The peak aerial survey count for Delight Lake in 2019 was 1,130 fish (Appendix B8), which is well below the aerial survey calibrated SEG of 5,100-10,600 fish. Without the weir in place, the East Nuka Subdistrict would have remained closed in 2019. Similarly, aerial surveys in 2018 counted only 3,700 sockeye salmon in Delight Lake, whereas the weir counted 13,428 fish (Hollowell et al. 2019).
Western portions of the Outer District opened on Monday, July 15, on a schedule of Monday, Wednesday, and Friday 6:00 AM to 10:00 PM fishing periods and remained on this schedule until August 12, when a Monday-Friday schedule of 6:00 AM to 10:00 PM fishing periods was established as a result of strong pink salmon returns to this area and consistent commercial harvest (Appendix B1). This schedule was further expanded the following week to 7 days per week (Table 6).
Of the 9 pink salmon index streams in the Outer District monitored for escapement, 2 were within SEG ranges (Windy Left Creek, Desire Lake), 6 exceeded their SEG range (Dogfish Bay Lagoon, Port Chatham, Windy Creek Right, Rocky River, Port Dick Creek, and Island Creek), and 1 failed to meet the minimum SEG range (South Nuka Creek). There are 4 chum salmon index streams with SEGs in the Outer District. Of these, 1 was above the SEG range (Rocky River), and 3 were within their SEG ranges (Dogfish Bay Lagoon, Port Dick Creek, Island Creek; Table 7; Appendices B6, B7, B9).

Both sockeye salmon index systems in the Outer District (Delight Lake and Desire Lake) were within their respective SEG ranges (Table 7; Appendices B3 and B8). The range for Desire Lake is calibrated for aerial surveys and was modified at the 2016 BOF meeting (Otis et al. 2016a) using the 3-tier Percentile Approach (Clark et al. 2014). At that time, the aerial survey-based goal for Delight Lake $(5,100-10,600)$ was adjusted as well. The SEG used in $2019(7,500-17,650)$ to manage Delight Lake sockeye salmon returns, as measured by a weir, was the historic weir-based goal that was established in 2010 (Otis et al. 2010; Table 7; Appendices B3-B5).
Total harvest from this district was 184 Chinook, 15,482 sockeye, 2,889 coho, 1.7 million pink, and 19,460 chum salmon (Table 1; Appendices B1 and B2).

## Eastern District

The Eastern District includes all state waters of the Gulf of Alaska between the longitudes of Aligo Point and Cape Fairfield (Figures 1, 2, and 10). Purse seine gear is permitted in all open waters of this district during periods established by EO. Historically, the primary target species have been sockeye and pink salmon with commercial harvests occurring irregularly (Appendix C2). Harvests of chum salmon were larger in this district during the 1980s. The largest producers of wild sockeye salmon in this district have historically been Bear and Aialik Lakes. Sockeye salmon production in Aialik Lake is a relatively recent event because this lake was covered by the Pedersen Glacier as late as 1909 (Cook and Norris 1998).

Pink salmon production in the Eastern District has been the result of natural spawning. The largest pink salmon producers in this district are Salmon Creek, with a 10 -year (1980-1989) average escapement of 6,100, and Bear Creek, with a 10-year (1997-2006) average escapement of 11,800. In addition, Thumb Cove and Humpy Cove together produced an average of 10,500 pink salmon per year (1997-2006; Appendix C9). Ground surveys of this area in recent years have been curtailed due to budgetary constraints and historically low runs (Appendix C9).
Since the early 1960s, coho salmon production in Resurrection Bay has been supplemented by enhancement efforts. Since 2001, commercial harvests of this species in the Eastern District were minimal (Appendix C2). In 1966, commercial harvest of coho salmon north of a line from Cape Resurrection to Callisto Head was prohibited, and in 1968 this regulatory line was moved south to its current position at Aialik Cape. Beginning in 1985, commercial harvest of this species north of a line from Cape Resurrection to Aialik Cape was prohibited. In addition, since 1989 the Resurrection Bay Salmon Management Plan (5 AAC 21.376) directed commercial fishery managers to conduct those fisheries in a manner that does not interfere with recreational fisheries for enhanced Chinook and coho salmon in Resurrection Bay. Consequently, the majority of coho salmon in this area have been harvested by sport fishermen and runs of pink and chum salmon have generally been insufficient to target for commercial harvest. Since 1956, the Seward Chamber of Commerce has conducted a fishing derby that focuses on enhanced and wild coho salmon returning to local spawning systems at the head of Resurrection Bay. Beginning in 1990, coho salmon harvested by participants in the derby have been sold commercially by the Chamber of Commerce to a local processor as a fundraiser for that organization (Appendix C2).

## Preseason Outlook and Harvest Strategy

The 2019 enhanced sockeye salmon run to CIAA release sites in Resurrection Bay was forecast to be 305,600 fish (Appendix G1). As specified in regulation, the seine fishing season and fishing periods are opened and closed by EO, depending on the available harvestable surplus of both wild stock and enhanced salmon returning to the Eastern District. CIAA announced preseason that the majority of the sockeye salmon run anticipated to return to Resurrection Bay release sites would be required to meet corporate cost-recovery harvest and broodstock needs. Early season management of the Eastern District is based on actual harvest versus anticipated harvest, as well as passage at the Bear Creek weir, which is located $8 \mathrm{~km}(5 \mathrm{miles})$ from saltwater at the outlet of Bear Lake (Figures 1 and 10). Beginning in July, management is based on aerial surveys of sockeye salmon runs to Aialik Lake. Historically, runs of pink and chum salmon to this district have been below the level required to support consistent and sustainable commercial harvests.

## Season Summary

The total 2019 Eastern District sockeye salmon commercial common property harvest was 4,307 fish harvested by 4 permit holders (Appendix C1, C2). CIAA harvested 82,685 sockeye salmon for cost recovery from Resurrection Bay in the Bear Lake SHA, and 41,415 at the Bear Lake weir (Appendix F2). An additional 863 excess sockeye (Appendix C3 and F2) and 1,183 coho salmon (Appendix F4) were donated to members of the public at the Bear Creek weir.
The Bear Lake SHA opened by regulation to corporate cost-recovery harvest and broodstock collection at 6:00 AM on May 15. Although the first delivery did not occur until May 23, sockeye salmon began arriving at the Bear Creek weir on May 18. Through June 13, a total of 12,760 fish were counted versus an anticipated minimum of 2,766 fish past the weir by this date (Appendices C3 and C4). Fish that arrived at the weir following this date were sold for cost recovery or donated to the public (Appendix F4).
Cost recovery from saltwater was completed on Friday, June 21 (Table 6). Following this, common property fishing periods were established beginning Monday, June 24, on a Monday-throughFriday schedule of 6:00 AM to 10:00 PM fishing periods. Commercial common property deliveries of hatchery-produced sockeye salmon continued through July 1 (Appendix C1). The 863 sockeye salmon that arrived at the weir in an unmarketable condition or were too few in number to warrant commercial sale, were documented on fish tickets and donated to members of the public (Appendices C3 and F2).

Final passage into Bear Lake was 12,760 sockeye salmon with 3,575 harvested for broodstock (Appendices C3, C4, and F2). The remaining 9, 185 fish were allowed to spawn naturally in the lake. This escapement was above the SEG range of 700-8,300 (Table 7), and below the 10-year spawning escapement average of 9,346 (Appendix C7).
In 2019, a total of 1,416 coho salmon were passed through the weir and into Bear Lake and 1,934 fish were harvested at the weir (Appendices C5 and C6). Of those, 443 were harvested for CIAA and ADF\&G broodstock. An additional 225 fish were holding mortalities or were unripe. Fish tickets documented that 1,183 coho salmon were donated to members of the public (Appendix F4). Also, 83 coho salmon were unaccounted for. These were probably donated to members of the public without fish tickets.
In 2019, there were 7 aerial surveys of Aialik Lake. Sockeye salmon were counted in the lake with a peak count of 5,000 fish on August 15 (Appendix C8). This was within the current SEG range of 3,200-5,400 for this system (Table 7). The previous 10-year average escapement to Aialik Lake is 3,100 sockeye salmon (Appendix C9).
A total of 1,561 coho salmon were donated to the Seward Chamber of Commerce by sport users participating in the annual silver salmon derby; these fish were sold to local processors to benefit the Chamber (Appendix C2).

## KAMISHAK BAY DISTRICT

The Kamishak Bay District includes all state waters on the west side of Cook Inlet south of the latitude of Anchor Point and north of a line from Cape Douglas to Elizabeth Island (Figures 1, 2, and 11-13). Purse seine gear is permitted in all open waters of this district during periods established by EO. Historically, the primary target species have been naturally occurring chum, sockeye, and pink salmon.

## Preseason Outlook and Harvest Strategy

The 2019 commercial wild stock harvest forecast for the Kamishak Bay District was 39,300 sockeye, 9,800 chum, and 106,900 pink salmon (Appendix G1). The enhanced CIAA sockeye salmon run to Kirschner Lake was forecast to be 39,000 fish (Appendices G1 and F1). As specified in regulation, the fishing season in the Kamishak Bay District opens from June 1 until closed by EO. Historically, the Kamishak Bay District has been opened for extended 7-day periods, with specific areas closed as needed by EO to address anticipated escapement shortfalls (e.g., McNeil River chum salmon) or to allow for hatchery cost-recovery harvest. CIAA announced preseason that all of the sockeye salmon anticipated to return to the Kirschner Lake release site would probably be required to meet cost-recovery goals. Early-season management of the Kamishak Bay District is based on actual harvest versus anticipated harvest as well as escapement past the Mikfik Lake and Chenik Lake video monitoring sites. In addition, aerial surveys are flown, weather permitting, to monitor sockeye and chum salmon escapement to index streams and to recover recording media from video monitoring sites for inseason review in the Homer office. Beginning in July, management is also based on aerial surveys of pink and chum salmon runs to spawning systems in this district. Aerial surveys continued into late August and September to monitor progress of coho salmon runs to select streams in this district.

## Season Summary

The total 2019 Kamishak Bay District commercial common property harvest was 59,069 sockeye, 31,629 chum, 3,349 coho, and 59,008 pink salmon harvested by 7 seine permit holders (Table 1; Appendices D1 and D2).
Waters of the Kamishak Bay District opened to commercial common property harvest on Friday, June 1, on a schedule of Monday through Sunday fishing periods, 24 hours per day. On June 17, waters of the Paint River and McNeil River subdistricts were closed to commercial harvest to prevent interception of chum salmon returning to the McNeil River (Table 6), which were designated as a stock of concern at the 2016 BOF meeting (Otis et al. 2016b). Additionally, on June 17 , ADF\&G opened the waters of Chenik Lagoon up to lat $154^{\circ} 08.33^{\prime} \mathrm{N}$. In many recent years this system had sockeye salmon escapements in the upper end or above the SEG (Appendix D10). Escapement past the video monitoring station and into Chenik Lake was similar in numbers and timing to that seen in recent years with fewer fish than anticipated in the early portion of the return. The Chenik Subdistrict was closed to commercial harvest on July 12. This was in response a cumulative video count of fewer than 1,000 sockeye salmon in the lake versus an anticipated passage target of 2,300 fish in order to meet the minimum SEG of 2,900 fish by the end of August. Shortly thereafter, on July 14, the video system counted 1,969 sockeye salmon entering the lake and an additional 2,818 fish entering the following day. Total passage when video was retrieved on July 16 was approximately 4,300 fish and within the SEG. Because the SEG was achieved, the Chenik Subdistrict reopened to commercial fishing.

Similar to recent years, managing other areas of the Kamishak Bay District has been uneventful compared to managing the Chenik sockeye salmon return. The Kirschner Lake SHA was closed to common property harvest on June 17 and reopened on August 3. Total CIAA cost-recovery harvest during this time was 18,698 sockeye salmon (Appendices F1 and F2). An additional 1,929 pink (Appendix F3) and 4 chum salmon were harvested in the SHA and were sold for cost recovery.

Given the difficulty of fishing in the Kamishak Bay District, combined with the good pink and sockeye salmon returns to the Outer District, there was only modest effort in this area in 2019; in many weeks fewer than 3 permits reported deliveries (Appendix D1).

Salmon escapement to index streams in the Kamishak Bay District was fair with most streams meeting minimal SEG levels (Table 7; Appendices D8-D10). Anadromous waters restrictions (closed waters around the mouths of streams) were removed from several systems to facilitate harvest and reduce the possibility of exceeding the upper end of the SEG (Table 7).

A total of 2,901 sockeye salmon were counted from video at Mikfik Lake through late August (Appendices D4 and D6). The last date of recorded passage into the lake was June 18. Aerial and foot surveys of the Mikfik River following this date documented portions of the river had dried up as a result of lack of rainfall. The final count was below the SEG range of 3,400-11,000 (Table 7) and below the 10-year average of 7,765 (Appendices D7 and D10).
Final sockeye salmon escapement into Chenik Lake was 12,079 on August 27 (Appendices D3, D5, and D7). The SEG range for Chenik Lake is 2,900-13,700 (Table 7), and the 10-year average escapement is 15,522 fish (Appendices D7 and D10).

The peak aerial survey count for Amakdedori Creek was 1,620 sockeye salmon (Appendix D9). This was within the SEG range of 1,200-2,600 (Table 7) and below the 10-year average of 2,200 fish (Table 7; Appendix D10).
All 3 pink salmon SEGs in the Kamishak Bay District were achieved in 2019. Of the 7 chum salmon index streams, all but 2 (McNeil River and Cottonwood Creek) had final escapements above the minimum SEG (Table 7; Appendix D10).

There were 59,069 sockeye salmon harvested by the commercial common property fleet from the Kamishak Bay District in 2019 (Table 1; Appendices D1 and D2). The anticipated preseason harvest was 39,300 wild sockeye salmon (Appendix G1), slightly below the 10 -year average harvest of 42,594 (Appendix D2). The total coho salmon harvest of 3,349 was above the 10 -year average harvest of 1,041 fish (Appendix D2) and below the preseason anticipated harvest of 4,100 fish (Appendix G1). The total pink salmon harvest from this district was 59,008 fish (Table 1; Appendices D1 and D2) versus an anticipated harvest of 106,900 fish (Appendix G1). The 10-year average annual harvest was 47,425 pink salmon (Appendix D2). The total chum salmon harvest of 31,629 fish (Table 1; Appendices D1 and D2) was above the 10-year average of 17,462 fish (Appendix D2). CIAA harvested 18,698 sockeye salmon for cost-recovery purposes from the Kirschner Lake SHA (Appendices F1 and F2); this was below the anticipated harvest of 39,000 fish (Appendices F1 and G1).

## LOWER COOK INLET SUBSISTENCE, PERSONAL USE AND HOMEPACK COMMERCIAL FISHERIES

The Cook Inlet subsistence management area ( 5 AAC 01.550 ) includes all state waters between Cape Douglas and Cape Fairfield, excluding waters of the upper Susitna River (5 AAC 01.550). Superimposed on this area is the Anchorage-Matsu-Kenai Nonsubsistence Area described in 5 AAC 99.015(a)(3). This area makes up more than $90 \%$ of the area described in 5 AAC 01.550 . Under Alaska Statute 16.05 .258 (c), the BOF may not permit subsistence fishing in nonsubsistence areas. A portion of the LCI Management Area is outside the nonsubsistence areas and includes the southwest tip of the Kenai Peninsula and the communities of Seldovia, Port Graham, and

Nanwalek, as well as portions of the western shore of the Northern District of Upper Cook Inlet near Tyonek. However, in order to provide harvest opportunity in addition to sport fishing to Alaska residents within these nonsubsistence areas, the BOF has provided 2 personal use salmon fisheries in LCI, and defined seasons and gear types for personal use herring and smelt fisheries. In addition, both resident and nonresident commercial permit holders have been allowed to retain legally harvested fish from their commercial catch for their own use as homepack (5 AAC 39.130(b)(12)).

## NANWALEK/PORT GRAHAM SUBSISTENCE FISHERY

Subsistence fishing is allowed in the Port Graham and Koyuktolik (Dogfish Bay) subdistricts from April 1 through September 30, and in the Port Chatham and Windy Bay subdistricts from April 1 through August 1. Fishing periods in these areas are defined in regulation, occurring from 10:00 PM Thursday to 10:00 AM Wednesday ( 132 hours) each week. Set gillnets up to 35 fathoms in length, 6 inches in mesh size, and 45 meshes in depth may be used. There is no bag or annual possession limit for subsistence salmon in the Port Graham, Port Chatham, Windy Bay, or Koyuktolik (Dogfish Bay) subdistricts.
In 2019, 50 permits were sent to the Nanwalek Traditional Council, 40 permits were sent to the Port Graham Village Council, 10 permits were sent to the Anchorage ADF\&G office, and 10 permits were kept at the Homer ADF\&G office. All permits were serially numbered and printed on Rite in the Rain paper. Representatives from the village councils were asked to dispense these permits to village residents who intended to harvest salmon for subsistence use so that those households would be in compliance with 5 AAC 01.580 . Prior to 2012, a village resident was paid to dispense and collect permits from both of these communities and provide ADF\&G with a final harvest estimate. This practice was discontinued due to budget cuts. Permits were not actively distributed from ADF\&G offices prior to 2012.

In 2019, the English Bay River weir was operated by residents of Nanwalek for the fourth year since 2011. From 2012 to 2015, CIAA supervised operation of the weir. Sockeye salmon run timing past the English Bay River weir in 2019 was generally as anticipated. In spite of the weir starting a week later than normal on June 7 and also ending a week early on July 24, weir counts exceeded the $6,000-13,500$ SEG range with a final count of 24,044 sockeye salmon (Appendix A4).
Three permits were returned by Port Graham residents in 2019. The total reported harvest was 547 salmon. Harvest reporting in Port Graham has declined in recent years with 1 permit returned in 2018. The 10 -year average was 10 households reporting a harvest of 23 Chinook, 786 sockeye, 78 coho, 296 pink, and 147 chum salmon (Appendix E1).
In 2019, ADF\&G received 3 permits back from Nanwalek residents with a total harvest of 1 Chinook, 480 sockeye, 14 coho, and 52 pink salmon reported harvested (Appendix E2). Harvest reporting has been irregular in recent years, with 2 households reporting in 2012 and 2015, and only 1 household reporting fishing activity in 2017, and 2018. The 10 -year average harvest for Nanwalek was 11 households reporting a combined harvest of 6 Chinook, 1,358 sockeye, 680 coho, 579 pink, and 106 chum salmon (Appendix E2). Unlike all other set gillnet fisheries in Cook Inlet, and many other subsistence fisheries in Alaska, subsistence fishing gear in the Port Graham Subdistrict may be fished unattended. Subsistence harvest reports are due in the Homer office by November 30. Reports submitted after December 31 will be included in the following year's Annual Management Report as harvested the previous year.

## Seldovia Subsistence Fishery

There are 2 subsistence fishing seasons specified in regulation that take place each year in the waters of the Seldovia Bay Subdistrict. The first season consists of two 48-hour periods each week beginning at 6:00 AM on Monday and Thursday from April 1 through May 30. The second season consists of two 36 -hour periods on the first 2 weekends in August. Legal gear is set gillnets up to 35 fathoms in length, 6 inches in mesh size, and 45 meshes in depth.
A subsistence set gillnet fishery for salmon was created in Seldovia Bay by the BOF in 1995. The harvest of Chinook salmon was limited to 200 fish to avoid impacting the stocked Chinook salmon fishery in Seldovia Bay. The annual possession limit is 20 Chinook salmon per household. The fishery is opened for two 48 -hour periods per week from April 1 to May 30 and one 36-hour period each of the first 2 weekends in August. In February 1998, the BOF adopted a proposal extending the April/May period by 10 days to May 30. The highest reported subsistence harvest was 189 Chinook salmon in 2000 and the lowest was 12 reported in 2006 (Hammarstrom and Dickson 2007). Regulation requires that permit holders be physically present at the net while deployed to avoid underreporting of harvested fish.
Chinook salmon released into the Seldovia Harbor are funded under the federal Dingell-Johnson Sport Fish Restoration Fund. Allowing a subsistence harvest of these Chinook salmon would violate the intent of this federal program. Furthermore, there are no significant wild runs of Chinook salmon to the Seldovia area (or other locations in LCI south of the Anchor River). The customary and traditional use worksheet submitted to the BOF in 2005 identified Chinook salmon as the least important salmon species to residents of Seldovia as far as traditional subsistence use was concerned. In addition to structuring the timing of the fishery to avoid this hatchery run, the BOF also imposed an annual possession limit of 20 Chinook salmon per household and an overall guideline harvest level of 200 Chinook salmon per year. There is no bag or annual possession limit for other salmon species in the Seldovia subsistence fishery. A permit issued by ADF\&G is required prior to setting gear, and catches are recorded on the permit.

In 2019, 40 permits for the spring fishery were sent to the Seldovia harbormaster's office, 10 permits were retained at the Homer ADF\&G office, and 10 were sent to the Anchorage ADF\&G office. An additional 20 permits for the fall fishery were sent to the Seldovia harbormaster's office. All permits were serially numbered and printed on Rite in the Rain paper. The Seldovia harbormaster was instructed to have Alaska residents complete the name and address portion of the permits while under witness of a harbormaster employee and then have that employee send a copy of the completed permit back to the Homer ADF\&G office.

In 2019, 6 permits were dispensed to Alaska residents for the early season and 5 were returned. Of those, all 5 reported having fished (Appendix E3). A total harvest of 6 Chinook, 53 sockeye, and 1 pink salmon was reported, compared to the 10 -year average of 8 permits issued, 5 permits returned, and 3 that reported not fishing with an average harvest of 6 Chinook, 48 sockeye, and 1 pink salmon. One permit was issued for the August weekend fishery and was not returned. The 10 -year average for the August weekend fishery was 5 permits issued and 3 permits returned, with a harvest of 1 Chinook, 19 sockeye, 4 coho, 19 pink, and 18 chum salmon (Appendix E3). Total harvest for both the early and late season combined was 60 salmon versus a 10 -year harvest average of 116 salmon. Currently, there is no specific customary and traditional allocation for this subsistence fishery as there are for other LCI subsistence fisheries (5 AAC 01.566(d)).

## China Poot Personal Use Dip Net and Personal Use Coho Salmon Fisheries

There are 2 personal use salmon fisheries currently specified in regulation in LCI. These are the China Poot personal use dip net fishery and the Southern District personal use coho salmon gillnet fishery.

The China Poot dip net fishery started in 1980. Under the guidance of 5AAC 77.545 Kachemak Bay Personal Use Dip Net Fishery Management Plan, this fishery is managed by ADF\&G, Division of Sport Fish. Prior to 1996, harvest from this fishery was documented as part of the Alaska Sport Fishing Survey, often called the Statewide Harvest Survey. Currently, there are no reporting requirements to monitor overall harvest from this fishery. The daily bag and possession limit for this fishery is 6 sockeye salmon.
In addition to holding a valid sport fishing license and being an Alaska resident, participants in the personal use coho salmon fishery must obtain a fishery-specific permit from the Homer ADF\&G office. Beginning in 1999, ADF\&G has requested that permit holders voluntarily report their harvest daily to facilitate inseason management (1) to ensure that the $1,000-2,000$ salmon guideline harvest range specified in 5 AAC 77.549 is observed, and (2) to provide opportunity for harvest to reach at least the lower end of the range. Harvest during the 2019 season was 1,287 coho, 147 sockeye, 9 Chinook, 162 pink, and 27 chum salmon, with 156 permits issued, 151 permits returned, and 109 reported as actively fished (Appendix E4). Similar to the 5 previous years, the coho salmon personal use fishery was relatively brief, with only two 48 -hour fishing periods ( 96 hours total) required to meet the guideline harvest range. The season opened on Monday, August 19, beginning at 6:00 AM, and closed via EO at 6:00 AM on Saturday, August 24, at the conclusion of the second fishing period. The 10 -year average was 142 permits issued and 1,544 coho salmon harvested (Appendix E4). Although harvest rates were generally considered good in most areas, some long-time participants expressed concern about low coho salmon catches adjacent to local small stock streams in the China Poot/Neptune Bay area.

Coho salmon harvest data from the personal use fishery showed that catches were most robust along the shore from Fritz Creek to Swift Creek, with 499 coho salmon reported by 23 permit holders (Appendix E6). This was followed by the east side of the Homer Spit with 267 coho salmon reported by 31 permit holders. Although harvest from the shore from Mud Bay to Fritz Creek (244 coho salmon by 24 permit holders) was lower than that on the east side of the Homer Spit, catch per permit holder was higher. Harvest was significantly lower in the remaining 3 areas: 18 permit holders reporting 189 coho salmon in the Bear Cove-Neptune Bay area, 8 permit holders reporting 56 coho salmon from the shore between Neptune Bay and Little Tutka Bay, and 5 permit holders reporting 32 coho salmon between Troublesome Creek and the tip of the Homer Spit (Appendix E6).
Without a harvest sampling program in place, it is difficult to estimate the portion of the harvest that could be attributed to hatchery fish returning to the Nick Dudiak Fishing Lagoon on the Homer Spit. Of the 156 permits issued, $80 \%$ were held by Homer area residents, $6 \%$ by Anchorage-area residents, and the remaining $14 \%$ by residents of Anchor Point and other locations in Alaska (Appendices E5 and E8).

## Commercial Homepack

Historically, both resident and nonresident commercial permit holders have been allowed to retain legally taken fish from their commercial catch for their own use. In 2007, the BOF amended 5 AAC $39.130(\mathrm{c})(12)$ to require that the number of fish of any species retained by commercial fishers for their own use be documented on a fish ticket. Previously, these fish had been voluntarily noted on fish tickets by some permit holders.

In 2019, 7 set gillnet and 10 purse seine permit holders reported retaining 62 Chinook, 311 sockeye, 166 coho, 59 pink, and 31 chum salmon for their own personal use (Appendix E7). Of those, 6 were residents of Homer, 3 permit holders were Seldovia residents, and the remaining 8 permit holders were Anchorage, Port Graham, Halibut Cove, Ninilchik, Anchor Point, and lower 48 residents (Appendix E8).

## COOK INLET SALMON FISHERY ENHANCEMENT

## Tutka Bay Lagoon Hatchery

The 2019 pink salmon run to the TBLH was only the seventh year of returns since resuming pink salmon production after a 7-year hiatus. Of the 50.0 million BY (brood year) 2017 fry released in 2018, an estimated 1.5 million adults ( $3 \%$ ) were anticipated to return (Appendices F1 and G1). The actual run was estimated at 334,357 fish (Appendix F1). Of these fish, CIAA reported that 85,252 were harvested for broodstock (Appendix F3).

Total pink salmon cost-recovery harvest from this facility in 2019 was 179,639 fish.

## PORT GRAHAM HATCHERY

In 2019, a total of 10.1 million pink salmon fry that had been incubated at the Port Graham Hatchery (PGH) were held in net pens in the SHA and released on May 31, 2019. This marks the fourth year in which fry released in the PGH SHA were incubated in the PGH facility. Releases from 2013 to 2015 were incubated at the TBLH facility. A total of 17,469 pink salmon were harvested for broodstock from the PGH SHA in 2019 (Appendices F1 and F3).
Although waters of the Port Graham Subdistrict were open from Monday, August 19, through the end of the 2019 season on a regular schedule of fishing periods, no commercial common property or cost-recovery deliveries were reported. Harvest opportunity was restricted in Port Graham because chum salmon returns to the Port Graham River were below expectations and failed to achieve the lower bound of the SEG range (1,200-2,700 fish) for this system.
Total return to this facility was estimated at only 17,469 pink salmon and was less than the anticipated return of 625,500 fish (Appendices F1 and G1).
Of the 17,469 harvested for broodstock, only 9,929 ( $56.8 \%$ ) were utilized with 8.0 million eggs collected. The high level of mortality of adult fish may have been related to unusually warm temperatures that occurred in this area in 2019.

## Trail Lakes Hatchery

In 2019, the total run of adult sockeye salmon to remote release sites from this Cook Inlet hatchery was 208,873 fish, below the CIAA forecast of 498, 142 fish (Appendix F1). The 156,247 sockeye salmon sold for hatchery cost recovery or donated to members of the public were worth
$\$ 1.5$ million (Tables 2 and 3; Appendix F1). A total of 6,078 sockeye salmon were collected for broodstock across all TLH sites, and of those, only 5,597 fish (92.1\%) were viable broodstock. The remainder were holding mortalities ( 172 fish) or otherwise unsuitable for egg harvest (309) and were subsequently donated to members of the public (Appendix F2). The common property fishery harvested approximately 30,706 of the total TLH sockeye salmon run of 208,873 (Appendix F1). This is based on area of harvest and not otolith marks. Harvests outside of SHAs may be underrepresented. These harvests include remote releases at Kirschner Lake, Resurrection Bay, and sites in Kachemak Bay, as well as harvests associated with the Hidden Lake release in Upper Cook Inlet. Currently, TLH has a permitted capacity of 4 million Chinook, 30 million sockeye, and 6 million coho salmon eggs.

In 2019, a total of 8.2 million sockeye salmon eggs composed of 3 stocks were collected from 3 sites in Cook Inlet (Appendices F1 and F2).
In 2019, a total of 3,350 adult coho salmon returned to the Bear Creek weir (Appendix C5). CIAA collected 245 fish for broodstock, 240 of which were viable (Appendix F4). An additional 30 fish were used in the Salmon in the Classroom program, and an additional 173 fish were used for broodstock at the ADF\&G Anchorage hatchery. The remaining 1,183 fish were donated to members of the public (Appendix F4). A total of 1,416 adult coho salmon were passed through the weir and into Bear Lake where they spawned naturally (Appendices C5 and C6). Of the fish used for broodstock, a total of 604,869 green eggs were harvested, which was fewer than the 4.0 million eggs that CIAA was permitted for (Appendix F1). The majority of the coho salmon run originated from the BY 2016 fry release (223,000 fry; Appendix F1).

## Lower Cook Inlet Remote Releases

## Leisure Lake and Hazel Lake

In 2019, overall sockeye salmon returns to Hazel and Leisure Lakes were derived from 2015 (BY 2014; 1.6 million) releases because there was no release in 2016 due to a shortfall in 2015 broodstock harvests. Total run was estimated at 17,949 (Appendix F1). The 2015 release was English Bay Lake stock fish.

## Kirschner Lake

Sockeye salmon harvest in 2019 was below the anticipated level of 39,000 fish (Appendix F1) with 18,698 harvested for cost recovery, and 4,824 fish harvested in the commercial common property fishery (Appendix F1). The 2019 run is the result of 2015 (BY 2014 English Bay) and 2016 (BY 2015 English Bay) fry releases (Appendix F1).

## Tutka Bay Lagoon

The overall sockeye salmon adult run to this release site in 2019 was estimated to be 14,450 fish (Appendix F1). Of these, 10,596 were reported on fish tickets as being harvested for cost recovery from the Tutka Bay SHA, 1,226 were harvested for broodstock, and an additional 2,628 were harvested commercially (including homepacks) in the Tutka Bay Subdistrict (Appendices F1 and F2).

## Paint River Fish Ladder

In 2017, CIAA purchased 3,969 pink salmon harvested in the nearby Bruin Bay Subdistrict and collected 1.5 million eggs from them. These eggs were incubated at PGH and the 305,000 resulting
fry were released in the Paint River system on May 15, 2018. As a result of below-normal rainfall in this area during the summer of 2019, the ladder was dry during a significant portion of the season. CIAA staff on the ground and ADF\&G staff conducting aerial surveys documented several thousand pink salmon schooling at the base of the ladder at this time.

## Bear Lake and Resurrection Bay

The sockeye salmon runs to Resurrection Bay in 2019 originated primarily from the 4.1 million BY 2014 and 4.2 million BY 2015 releases of smolt and fry into Bear Lake and the net pens in Resurrection Bay (Appendix F1).
In 2019, 3,350 adult coho salmon returned to the Bear Creek weir during its period of operation through October 14 (Appendix C5). CIAA collected 203 coho salmon for broodstock for a total of 604,869 green eggs, which was fewer than the 4.0 million eggs that CIAA was permitted for this species. There were 1,183 fish donated to members of the public. An additional 83 coho salmon were unaccounted for and probably donated to the public without being documented on a fish ticket (Appendices F1 and F4).

## LOWER COOK INLET COMMERCIAL HERRING FISHERY

## 2019 SEASON SUMMARY

ADF\&G did not conduct aerial or vessel surveys to assess the Kamishak Bay herring stock in 2019.
Information regarding previous years' harvests can be found in the herring section of the 2018 Lower Cook Inlet Annual Management Report (Hollowell et al. 2019).

## ACKNOWLEDGEMENTS

The authors gratefully acknowledge the entire Homer ADF\&G staff for their many contributions that are essential to the management of the various fisheries and the completion of this report.

${ }^{\text {a }}$ Numbers of fish and numbers of permit holders delivering are from the ADF\&G statewide electronic fish ticket database [Internet]. 1985- . Juneau, AK. [URL not available as some information is confidential]. These numbers do not include sportcaught fish from the Seward salmon derby that were later sold. Historical numbers in this table include commercial homepack fish.

Table 3.-Mean price and estimated exvessel value of the total commercial salmon harvest (excluding homepack) by gear type, Lower Cook Inlet, 2019.

Note: The value used for the final escapement index for each stock is in parentheses at the top of the column. Final counts include fish observed in bays on the last survey of the season if no further harvest occurred.
${ }^{\text {a }}$ Fish days $\left(\mathrm{A}_{\mathrm{b}}\right)=[$ Days between surveys $\times($ prev. count + current count $)] \div 2$. AUC equations from Bue et al. 1998.
${ }^{\text {b }}$ Escapement index $=\mathrm{A}_{b} / 17.5$-day stream-life estimate.
c Area-under-the-curve (AUC) estimate equals the cumulative escapement index.
${ }^{\mathrm{d}}$ Final escapement index.

Appendix A8.-Estimated pink and chum salmon escapements, in thousands of fish, for the major spawning systems in the Southern District of the Lower Cook Inlet Area, 1975-2019.

|  |  |  |  | Pink salmon |  |  |  |  |  |  |  | Chum salmon |
| :--- | ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: | :---: | :---: | :---: | :---: |
|  |  | Humpy | China | Tutka |  |  | Port | Total pink |  |  |  |  |

Note: Area-under-the-curve escapement indices are derived from periodic ground surveys with a 17.5 -day stream-life factor applied.

| $2019^{\mathrm{e}}$ |  | 17,410 |

Note: ND = no data. Weir not operated at Delight Lake in 2000 and 2015-2017.
${ }^{\text {a }}$ Weir present for only 2 years at Desire Lake.
b Weir operated from June 7 to August 26.
c Weir operated from June 20 to August 18.
d Weir operated from June 26 to August 27.
e Weir operated for the month of July.
${ }^{f}$ An additional 400 fish were observed in the lake during an aerial survey prior to weir installation, and 2,310 were observed below the weir site after the weir was removed for the season. These 2,710 fish are not included in the 2011 weir total.
g An additional 430 fish were observed in the lake during an aerial survey prior to weir installation; this does not include the 147 fish that were observed below the weir site after the weir was removed for the season.

Appendix B6.-Pink and chum salmon escapements measured by aerial survey using area-under-the-curve (AUC) estimation (and peak aerial survey counts as noted) in Outer District, 2019.

Note: The value used for the final escapement index for each stock is in parentheses at the top of the column. AUC equations from Bue et al. 1998. Final counts include fish observed in bays on the last survey of the season if no further harvest occurred.
${ }^{\text {a }}$ Fish days $\left(\mathrm{A}_{\mathrm{b}}\right)=[$ Days between surveys $\times($ prev. count + current count $)] \div 2$. AUC equations from Bue et al. 1998.
Escapement index $=\mathrm{Ab}_{\mathrm{b}} / 17.5$-day stream-life estimate.
c Area-under-the-curve (AUC) estimate equals the cumulative escapement index.
${ }^{d}$ Final escapement index.

Appendix B7.-Pink and chum salmon escapements measured by ground survey using area-under-the-curve (AUC) estimation (and peak live plus carcass counts as noted) in the Outer District, 2019.

Note: Bear Creek sustainable escapement goal is $700-8,300$ sockeye salmon. CIAA broodstock goal is 3,750 for a desired inriver run of 4,450-12,050 fish.
a Projected daily goal based on expected run timing applied to minimum and maximum cumulative goals at the end of the run.
b Weir harvest is cost recovery and donations of excess fish above daily SEG plus broodstock needs.
c A total of 3,575 sockeye salmon were beach seined from the lake for use as broodstock.

Appendix C4.-Sockeye salmon counts at the Bear Creek weir compared to minimum and maximum desired inriver run, 2019. Minimum and maximum inriver goal is the Board of Fisheries-assigned Bear Lake sockeye salmon SEG combined with the Trail Lakes Hatchery broodstock goal, then apportioned over time using recent run timing.

Note: A total of 44,686 sockeye salmon returned to the Bear Creek weir in 2019. Of those, 12,760 were passed through the weir into Bear Lake. An additional 41,415 were harvested at the weir for cost recovery and 863 were donated to the public. A total of 3,575 were harvested from Bear Lake for use as hatchery broodstock. Total estimated wild spawning escapement is estimated at 9,185 fish. The "desired inriver run" is the CIAA hatchery broodstock goal $(3,750)$ added to the sustainable escapement goal range ( $700-8,300$ ) for this species.

Note: Blank cells indicate no data were collected.
a Weir counts.
${ }^{\text {b }}$ Beginning in 1994, Bear Lake escapement figures are derived from total weir count minus number of fish collected for hatchery broodstock.

## APPENDIX D: KAMISHAK BAY DISTRICT

Appendix D1.-Kamishak Bay District commercial salmon harvest (excluding homepacks) by period, 2019.

[^4]a Confidential data. Fewer than 3 permits reporting.
b Waters of McNeil Subdistrict, Paint River Subdistrict, and Kirschner Lake SHA closed after June 16.
c Portions of Chenik Lagoon open after June 17.
d Kirschner SHA closed beginning June 24.
e Chenik Lagoon closed beginning July 5.
f Chenik Subdistrict closed beginning July 12.
g Chenik Subdistrict including eastern portion of the Chenik Lagoon reopened beginning July 18.
${ }^{h}$ Anadromous closed waters rescinded for Chenik Lagoon beginning August 2.
i Anadromous closed waters rescinded for Brown's Peak Creek, Sunday Creek beginning August 3.
j Kirschner SHA reopened beginning August 3.
${ }^{k}$ Closed waters reestablished for Brown's Peak Creek, Sunday Creek, and Chenik Creek effective August 31.

Appendix D2.-Total commercial common property harvest (excluding homepacks) by species in the Kamishak Bay District, 2000-2019.

Appendix D8.-Page 5 of 5.

Note: Note: The value used for the final escapement index for each stock is in parentheses at the top of the column. AUC equations from Bue et al. (1998). The value used as the final escapement index if underlined.
${ }^{\text {a }}$ Fish days $\left(\mathrm{A}_{\mathrm{b}}\right)=[$ Days between surveys $\times$ (prev. count + current count $\left.)\right] \div 2$. AUC equations from Bue et al. 1998.
${ }^{\text {b }}$ Escapement index $=\mathrm{A}_{\mathrm{b}} / 17.5$-day stream-life estimate (except McNeil River chum calculations use a 13.8 -day stream-life estimate plus a run-timing adjustment).
c The McNeil River chum salmon area-under-the-curve (AUC) index is not the final escapement index. After applying a run-timing expansion factor, the final escapement index was 9,205 . For all other stocks, the AUC estimate equals the cumulative escapement index.
${ }^{d}$ Final escapement index.

Note: Blank cells indicate no data were collected. Unless otherwise noted, estimated escapements are derived from aerial surveys.
${ }^{\text {a }}$ Escapement derived from weir counts.
$\stackrel{b}{ } \quad$ Escapement derived from video counts.
\& c Escapement derived from a combination of weir, video, and/or aerial counts.
d "Ursus Cove" is the sum of Ursus Lagoon RH Creek and Ursus Lagoon Creek.
${ }^{\text {e }}$ Escapement is derived from aerial counts.

a Limited reporting from Nanwalek residents in 2012-2019 may have resulted in a conservative estimate of harvest.
b Confidential data. Fewer than 3 permits reporting.
c Harvest recorded on permits that are received after December 31 will be reported in the following year's annual management report as harvested in the previous year.

a TLH = Trail Lakes Hatchery, TBLH = Tutka Bay Lagoon Hatchery, PGH = Port Graham Hatchery.
b Hidden Lake personal use, sport, educational fisheries hatchery contribution based on otolith sampling. Leisure and Hazel Lakes based on harvest location.
c Commercial Common Property Fisheries (CCPF). Harvest estimate for sockeye salmon based on harvest location, not on otolith sampling
d Hatchery cost-recovery sales in number of fish. Also includes donated fish that could not be sold due to quantity or quality available.
e Tutka Bay Lagoon Hatchery has not produced sockeye salmon since 2004. Returns of this species are from remote releases from the Trail Lakes Hatchery. Sockeye salmon eggs collected at this facility were taken back to the Trail Lakes Hatchery for incubation.

Phone: (907) 235-8191

## 2019 LOWER COOK INLET SALMON FISHERY OUTLOOK

## General Information

This outlook is provided to assist the commercial salmon industry in planning for the 2019 season in the Lower Cook Inlet (LCI) Management Area. Area-wide preseason forecasts for each species were derived by fitting historical commercial common property harvest data to 4 trend forecast models and selecting the model with the best performance metrics (e.g., bias, mean square error, mean absolute percentage error, etc.). Forecasts for LCI can be found on the Alaska Department of Fish and Game (ADF\&G) web site:
http://www.adfg.alaska.gov/index.cfm?adfg=commercialbyarealci.salmon\#forecasts
Cook Inlet Aquaculture Association (CIAA) manages the Trail Lakes Hatchery (TLH), Port Graham Hatchery (PGH), and Tutka Bay Lagoon Hatchery (TBLH). Hatchery forecasts can be found by contacting CIAA directly or through the CIAA web site:

## http://www.ciaanet.org

Inseason modifications to harvest projections, season opening dates, and strategies for weekly fishing periods may occur as fisheries develop.

The LCI management area forecast for commercial common property fishery (CCPF) harvests by species are summarized in Table 1. The wild-stock pink salmon harvest forecast was derived from an exponentialsmoothing (ES) model based on historical odd-year harvests (1961-2017). The wild-stock sockeye and Chinook salmon harvest forecasts were derived from ES models based on historical, log-transformed harvests from 1960-2018 (all years). The chum and coho salmon forecasts were derived by ES and 2-year running average models, respectively, using non-transformed historical harvest data from 1960-2018 (all years). Because these models generate area-wide forecasts, we used the recent 5-year average CCPF harvest (by district and gear type) to apportion the area forecast into harvest projections by district and gear type (Table 2). Projected runs of hatchery-origin salmon were provided by CIAA (Tables 1 and 2). Together, these projections of hatchery and wild stock runs will provide the basis for early-season management in all districts, with other management tools such as aerial survey estimates, weir counts, remote video monitoring and anticipated run strength used as the season progresses.

Management of LCI commercial salmon fisheries is based in the Homer ADF\&G area office. Fishery announcements from the Homer office will routinely occur on Fridays at 2:00 p.m., or earlier, if possible. Announcement recordings will be available for commercial fisheries at 907-235-7307. Emergency order announcement information is also transmitted by email to all registered processors, local radio stations, news media and interested members of the public. Harvest information and fisheries announcements are located on the ADF\&G web site: http://www.adfg.alaska.gov/index.cfm?adfg=commercialbyarealci.salmon

In addition, interested individuals may sign up to receive email announcements:
http://www.adfg.alaska.gov/index.cfm?adfg=cfnews.main
The first announcement is anticipated to be released at 2:00 p.m., Friday, April 26.
CIAA anticipates a total of 467,400 hatchery-produced sockeye and 2.1 million pink salmon to return to LCI release sites in 2019. CIAA anticipates harvesting 5.2 million dollars of hatchery-produced salmon with the remainder available to common property fisheries. The overall commercial common property harvest from Lower Cook Inlet is anticipated to be 3.7 million salmon, of which $29.0 \%$ are anticipated to be of hatchery origin harvested from SHAs. Additional hatchery-origin fish are harvested with wild fish outside of SHAs (Table 2).

## Set Gillnet Fishery

The Southern District is anticipated to open for the 2019 season on Monday, June 3 at 6:00 a.m. for a 48hour period. Following periods will likely be 48 -hours in length beginning at 6:00 a.m. on Monday and Thursday, as specified in regulation. Harvests for 2019 are anticipated to be similar to the historic average. The harvest projections for this district and gear are 400 Chinook, 6,700 coho, 5,200 chum, 30,300 sockeye, and 20,000 pink salmon (Table 2). The Port Graham Subdistrict is anticipated to open to commercial set gillnet harvest on June 3 and remain on a schedule concurrent with other areas in the Southern District for this gear. Fishing time in the Port Graham Subdistrict will be closely linked to escapement levels in English Bay and Port Graham rivers. Management priority will be to provide for subsistence needs (4,800-7,200 salmon). Further information regarding previous years' hatchery releases and commercial harvests may be found in Annual Management Reports for this area at:

## http://www.adfg.alaska.gov/index.cfm?adfg=commercialbvarealci.salmon\#management

## Purse Seine Fishery

Portions of the Southern District are anticipated to open to purse seine harvest in mid-June, coinciding with enhanced runs to Leisure and Hazel lakes. Historically, this run peaks from July 14-20 (week 29). CIAA anticipates a return of 69,400 sockeye salmon to Leisure and Hazel lakes combined, as well as 53,400 sockeye salmon to Tutka Bay.

Commercial fishing time after mid-July will be correlated to pink salmon escapement at Humpy Creek, Seldovia Bay, Port Graham and other locations in this district. A total of 2.1 million hatchery-produced pink salmon are anticipated to return to release sites in the Southern District.

Hatchery sockeye salmon runs to the Eastern District are forecasted by CIAA to be 305,600 fish. Of those, 61,900 may be available for CCPF harvest with the balance required for cost recovery and broodstock purposes. Wild stock harvest opportunity in the Eastern District will be linked to aerial survey observations of wild sockeye and pink salmon escapements to Aialik Lake and other spawning systems in this district. In addition, surveys of chum salmon stocks in Resurrection Bay and Day Harbor may be flown, weather and time permitting.

Portions of the Outer District may open to CCPF harvest in mid-July focusing on sockeye salmon runs to McCarty Fjord lakes. In recent years, escapement to these systems has been monitored by aerial survey (Delight, Desire, and Delusion lakes). Sockeye salmon escapement into Delight Lake may be monitored by CIAA using a weir in 2019. In addition, waters in the western portion of this district may be open by mid-July, focusing on pink and chum salmon runs to Port Dick, as well as Windy and Rocky bays. There are numerous other smaller stocks in the Nuka Passage area that are also monitored for chum and pink salmon. In the far west end of this district, stocks with the latest run timing, i.e., Dogfish Bay, Chugach Bay and Port Chatham, will be evaluated for chum and pink salmon harvest potential from August to early September. The harvest projections for this district are 5,700 sockeye, 68,100 chum, and approximately 2.2 million pink salmon.
Portions of the Kamishak Bay District typically open by regulation to commercial harvest on June 1. Commercial common property harvest projections for this district are 39,300 sockeye, 9,800 chum salmon, and 106,900 pink salmon. The majority of the sockeye salmon harvest is expected to come from the Chenik Lake run and the chum salmon harvest has historically been spread throughout the district. Chenik Lagoon is anticipated to open in mid-June and remain open throughout the season. Hatchery-released sockeye salmon to the Kirschner Lake outfall remote release site are anticipated to be 39,000 fish, all of which will likely be required for hatchery cost recovery. The department tracks salmon escapement in this district using remote video monitoring sites at Chenik and Mikfik lakes, as well as regular aerial survey observations of pink and chum salmon index streams (e.g., Big and Little Kamishak rivers, Bruin River, Cottonwood Creek). In 2018, CIAA released 305,000 pink salmon into upper Paint Lake; of those, approximately 9,200 are anticipated to return in 2019.

Table 1.-Lower Cook Inlet management area commercial common property fishery (CCPF) harvest forecast summary, 2019 (thousands of fish).

| Production <br> Type | Species | Forecast <br> Type | Point <br> Forecast | Forecast Range | \% Above/Below Recent 5- <br> yr Average |
| :---: | :--- | :---: | :---: | :---: | :--- |
| Wild | Pink Salmon | Harvest | $2,403.7$ | $892.2-3,915.3$ | $25 \%$ Above |
| Hatchery | Pink Salmon | Harvest | 944.2 | $233.3-1,663.1$ | N/A |
| Wild | Sockeye Salmon | Harvest | 125.8 | $49.2-321.6$ | $3 \%$ Above |
| Hatchery | Sockeye Salmon | Harvest | 131.4 | $62.3-178.2$ | N/A |
| Wild | Chum Salmon | Harvest | 84.8 | $6.3-163.4$ | $16 \%$ Below |
| Wild | Coho Salmon | Harvest | 13.7 | $3.7-23.8$ | $104 \%$ Above |
| Wild | Chinook Salmon | Harvest | 0.5 | $0.2-1.1$ | $24 \%$ Below |
| All | All | Harvest | $3,704.1$ | $1,247.2-6,266.5$ |  |
