## a准 Allied Telesis

## FS200 Series <br> 2-Port Fast Ethernet Speed/Media Converting Switch

## Extend Networks

FS200 Series switches are the ideal solution when the time comes to upgrade a traditional 10Mbps Ethernet network or extend a 100Mbps Fast Ethernet network. The FS200 Series is designed to extend the distance of the network by converting Fast Ethernet data between twisted pair cabling and single-mode fiber-optic cabling. The FS200 features a 100FX fiber-port and a 10/100TX twisted-pair port. The fiber-optic port features an SC connector and an operating distance of 2 kilometers (6,561 feet) to 40 kilometers ( 24.9 miles) depending on the model. The twisted-pair port has an RJ-45 connector with a maximum operating distance of 100 meters (328 feet).

The Allied Telesis AT-FS238 media converter is a $10 / 100 \mathrm{Mbps}$ copper to single-mode fiber media converter which can send and receive on single strand fiber (1310nm TX/1550nm RX) or (1550nm TX/1310nm RX). These units are designed to be used in pairs in a network topology to provide point-to-point access. The AT-FS238 converts 10/100TX (RJ-45) to 100FX (SC) and will transmit up to 15 km on high quality fiber optic cable. Both ports feature full- and half-duplex operation. The AT-FS238 is easy to install and does not require software configuration or management. Additionally, it can be used almost anywhere due to its small physical size, choice of external power supplies and rack-mounting options.

## VLAN Support

Many new backbone switch products now support the industry-standard IEEE 802.1Q specification for Virtual LANs (VLANs) that send extra-long data packets on the network. FS200 Series switches are fully compatible with these long packets, enabling them to be used in modern networks. Switches not supporting this feature will discard these extra-long packets, making them unsuitable for modern networks.

## Small and Flexible

The small size and external power supply of the FS200 Series allows them to be used almost anywhere. Additionally, they can be mounted in a chassis along with Allied Telesis media converters, allowing users to construct any mix of network conversions when they add the optional redundant power supply.

## MissingLink ${ }^{\text {TM }}$ and Smart MissingLink ${ }^{\top \mathrm{M}}$ (SML)

The MissingLink feature allows the ports on the media converter to pass the Link status of their connections to each other. When the media converter detects a problem with a port-such as the loss of connection to a node-it shuts down the connection to the other port, thereby notifying the node that the connection has been lost. The Smart MissingLink (SML) feature monitors network connections and provides notification when network segments fail, allowing network managers to quickly identify the source and location of failed segments and minimize downtime.

## Key Features

- Convert speed as well as media type
- Auto MDI/MDI-X
- MissingLink (ML) (AT-FS232 only)
- Smart MissingLink (SML) (AT-FS232 only)
- Supports 1532 bytes frame
- Support for multi-mode and singlemode fiber
- Supports half- and full-duplex operation
- 2 k MAC address tables
- Store-and-forward switching mode
- Transparent to IEEE 802.1Q packets
- Standalone or rack-mountable
- Rack-mountable using optional AT-MCR12, AT-TRAY4 or AT-TRAY1 chassis
- Wall-mountable using AT-WLM
- DIP switches for port configuration
