Air-cooled Inverter Modular Chiller
for Diverse Customer Needs

UNIVERSAL SMART X Series *EDGE*

Inverter Modular Chiller for Europe

Better Air Solutions

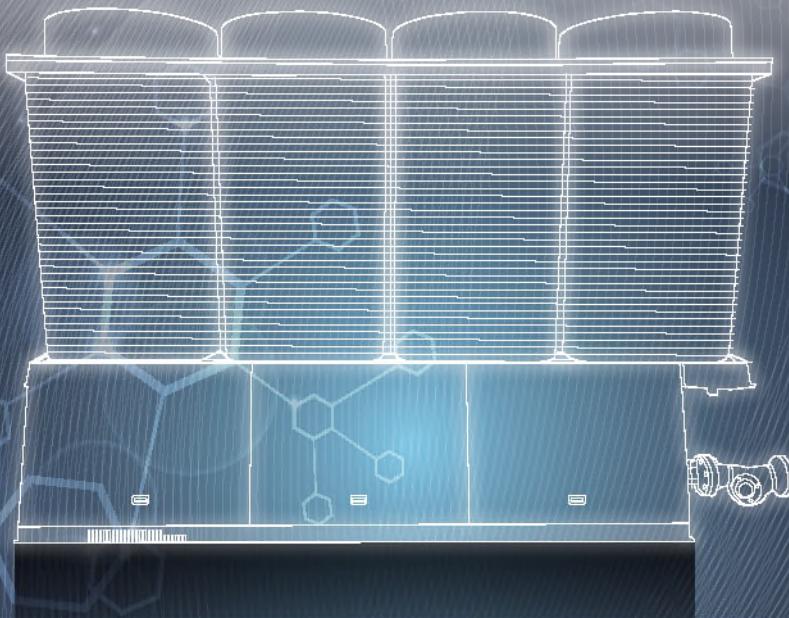

Made in Japan
All-new innovative chiller system

UNIVERSAL SMART X Series EDGE

Toshiba's first air-cooled inverter modular chiller designed for Europe.

High efficiency combined with cutting-edge space-saving design.

Internal inverter pump / Pumpless / Brine			
Model	Use	Type	Power supply
Series EDGE (Standard Model) 50HP/60HP/70HP	Cooling only	Standard	3 phase 4 wires 50Hz/60Hz 380-415V
		High EER	
	Heat pump	Standard	
		High EER	
Powerful Heating Type (Apply this to all the following text.) 50HP/60HP	Heat pump	Standard	3 phase 4 wires 50Hz/60Hz 380-415V
		High EER	

■ Models

- 1: Internal Pump (pump output 1.5kW)
- 2: Internal Pump (pump output 2.2kW)
- 3: Internal Pump (pump output 3.7kW)
- 5: Internal Pump (pump output 5.5kW)
- 7: Internal Pump (pump output 7.5kW)

■ Operation range

Series EDGE 50HP 60HP 70HP

Leaving water temperature	Cooling ^{Note 1)}	°C	4~30
	Heating ^{Note 2+3)}		25~55
	Temperature difference (inlet/outlet)		5~10
Outside air temperature	Cooling	°C	-15~52 ^{Note 4)}
	Heating ^{Note 2+3)}		-15~21DB, 15.5WB

Note 1: LWT not higher than 35°C at cooling or not lower than 20°C at heating operation is allowable till 1 hour after starting up. After then, however, LWT must be within the operating range. Control it with bypass pipe if needed.

Note 2: For heat pump models only. -20°C is for 60HP powerful heating.

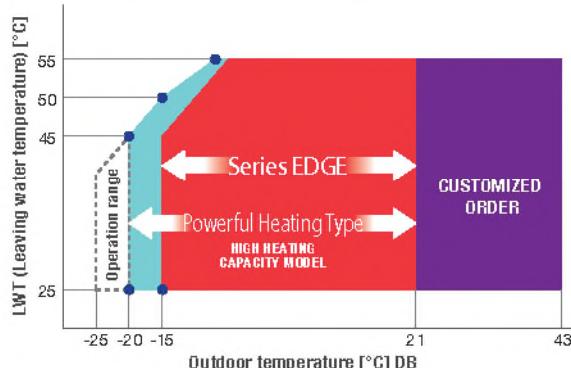

Note 3: Depending on the outdoor air temperature, leaving hot water temperature is limited as below.

Powerful Heating Type 50HP 60HP

Leaving water temperature	Cooling ^{Note 1)}	°C	4~30
	Heating ^{Note 2+3)}		25~55
	Temperature difference (inlet/outlet)		5~10
Outside air temperature	Cooling	°C	-15~52 ^{Note 4)}
	Heating ^{Note 2+3)}		-20~21DB, 15.5WB

Note 4: The range of water temperature control may become larger when the cooling operation load is low.

■ Leaving water temperature range

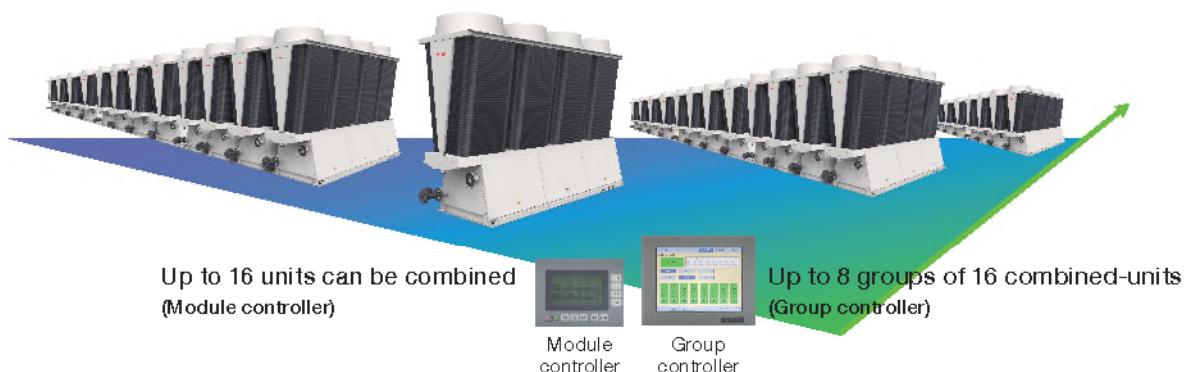

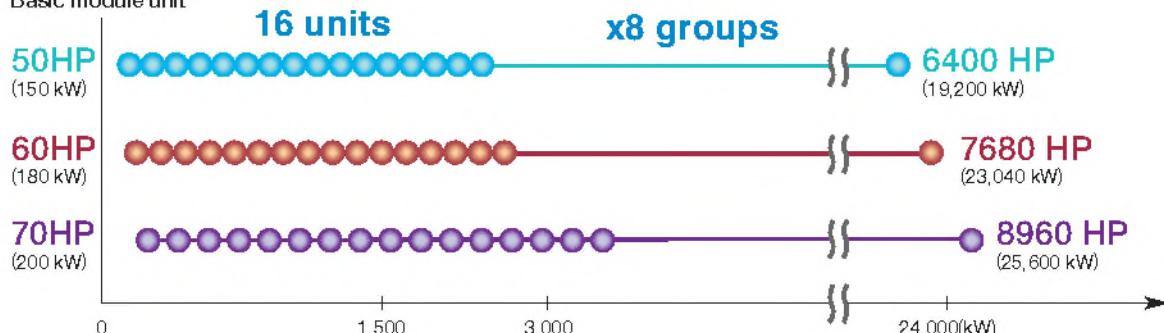

■ Operating range for water spray device

Water dispersing water temperature range	°C	10~30
Water dispersing preset outdoor air temperature	°C	20~40

■ Capacity range

Basic module unit

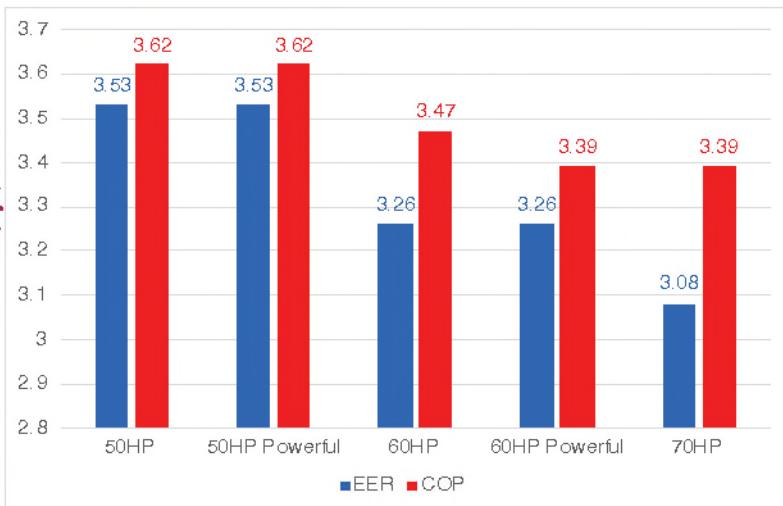

Feature

1

High Energy Efficiency

- Extremely high full load and part load energy efficiency as a result of the combination between low GWP refrigerant R32 and newly developed DC inverter compressor.
- 50HP model is a top class energy efficient model.
- Precise adjustment of water flow volume and water pressure based on required load by using internal pump module with variable flow bypass control resulting in even higher system efficiency.

*Conditions:

Cooling EER LWT 7C, EWT 12C, OAT 35C

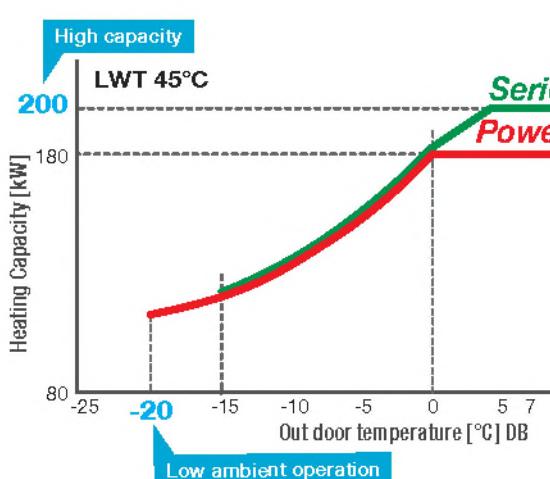

Heating COP LWT 45C, EWT 40C, OAT 7CDB, 8CWB

Feature

2

Large Capacity DC Inverter Twin Rotary Compressor

Impressive heating capacity and operation range even in low ambient temperature by using world's largest capacity DC twin rotary compressor equipped with R32 refrigerant.

Series EDGE 70HP

Powerful Heating Type

HIGH HEATING CAPACITY MODEL

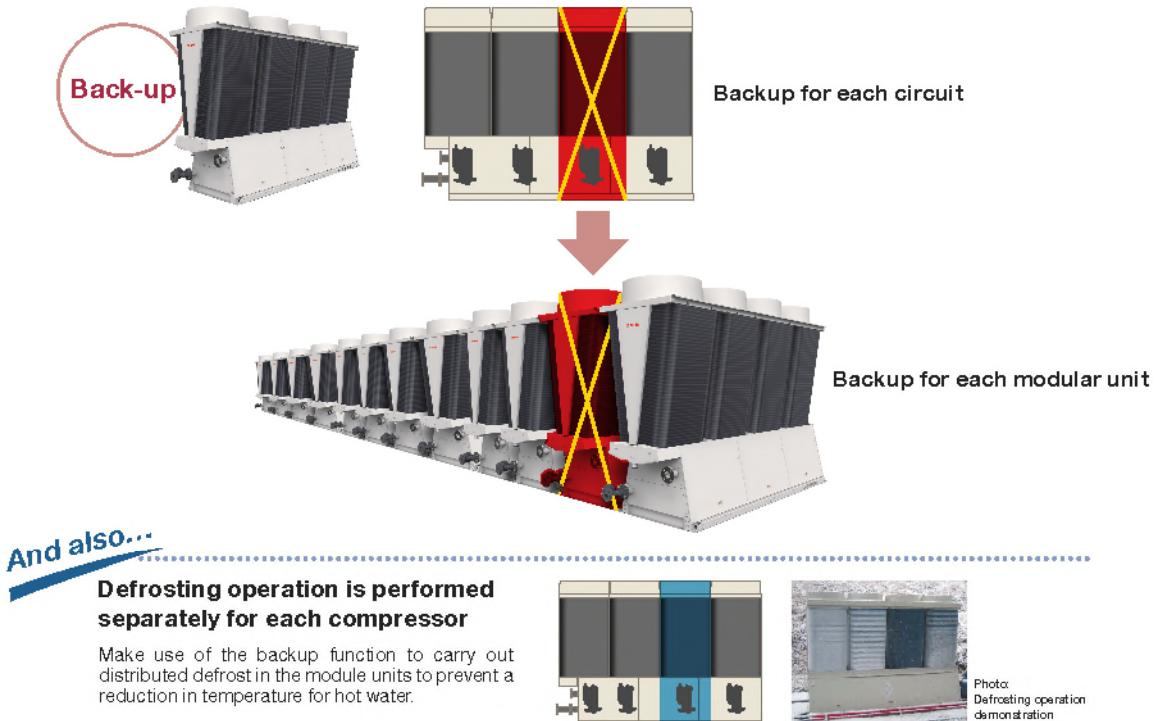

100 CC Twin Rotary Compressor

Feature **3**

Highly reliable module system

- Four independent refrigerant cycles available in each module promising excellent risk diversification.
- Economical solution with low initial cost for backup.

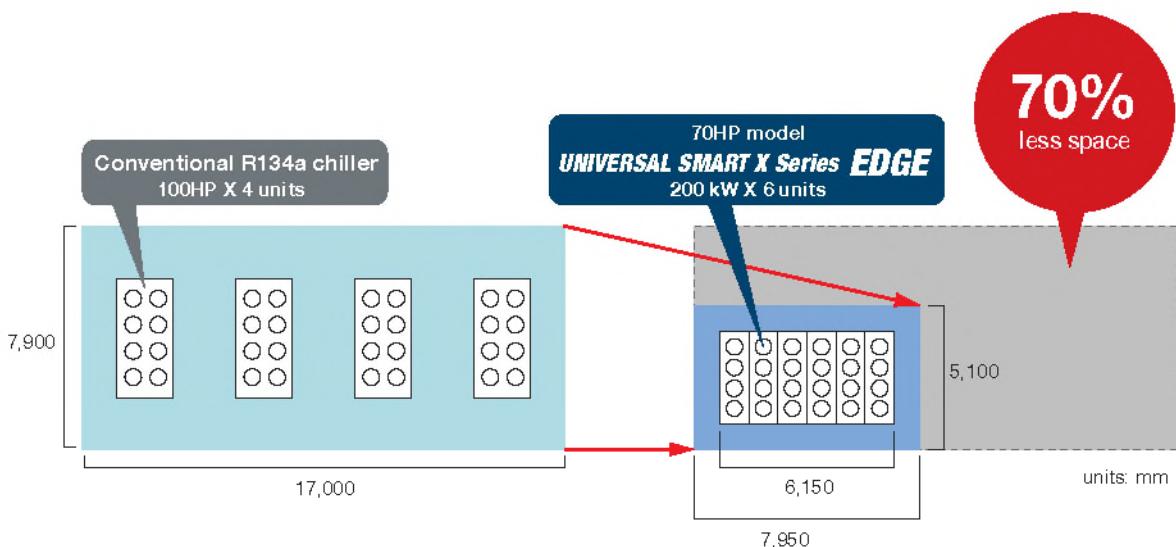

Feature **4**

Installation Friendliness

- Optimized airflow by unique X frame design.
- Easy installation even in small spaces due to compact design.
- Easy replacement and installation in stages due to modular design.
- Installation space reduced by 70% compared to conventional R134a model*.

*Compared to the space needed to install a system for a 1200 kW cooling load. Comparison with four RUA-SA30001H units and six 200 kW module units.

Feature

5

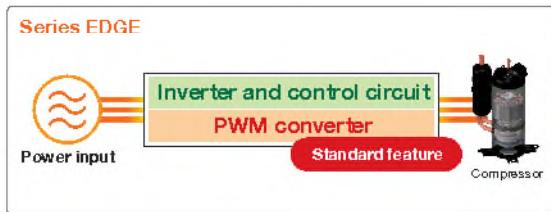

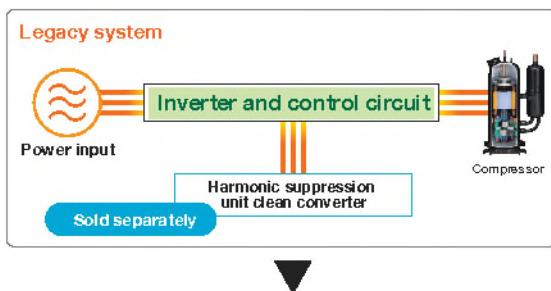

Outstanding Harmonic Suppression

Unique to Toshiba

The harmonic suppression function is installed as a standard feature on all models and achieves a power factor of up to 99%. This decreases electric transformer volume as well as reducing installation costs.

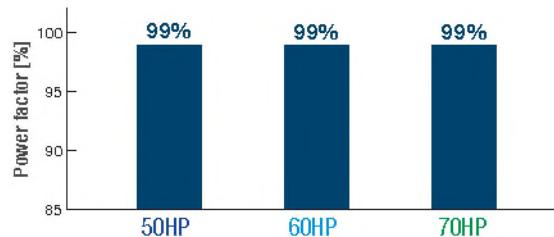

PWM Converter Benefits

- ① Eliminates problems caused by harmonic current
- ② Reduces consumption volume of power generator and electrical equipment

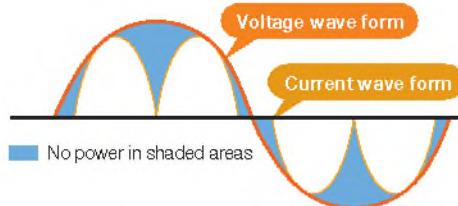

99% Power Factor Benefits

- ① Reduction in power loss through load current
- ② Improved efficiency of electrical equipment through reductions in current

Efficiency reduction projection

Feature

6

Reinforced heating capacity in low ambient temperatures

Powerful Heating Type achieves high level heating capacity, even in outdoor temperatures as low as -25°C, and minimises capacity drop during defrost operations.

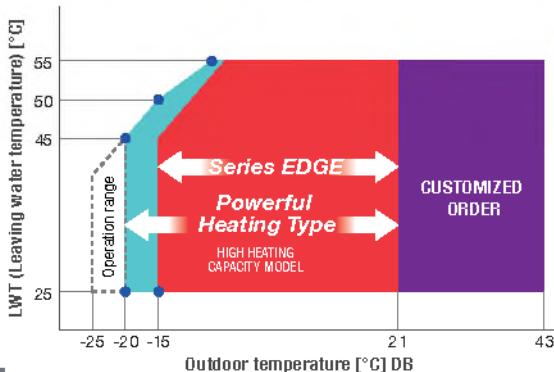

Powerful Heating Type **HIGH HEATING CAPACITY MODEL**

In outdoor temperatures down to -15°C, the system is still capable of producing hot water up to 50°C. At -20°C hot water produced is up to 45°C.

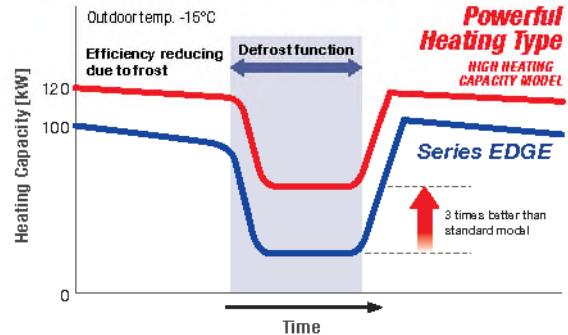

Performance between -20°C and -25°C is not guaranteed.

Exceptional environmental factors such as blizzard conditions or ice may inhibit operation in temperatures of -20°C or lower.

Thanks to a new, advanced controller, the Powerful Heating Type model is capable of reducing capacity loss by three times during defrost than standard models.

Energy Usage During Defrost (1 module)

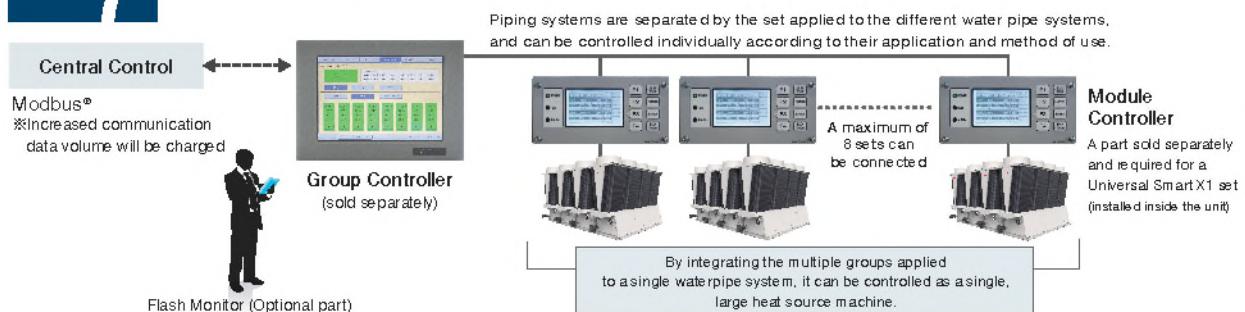

Feature

7

Excellent Control System

Easy to use and collect data with several types of control available.

Group Controller

Batch control of heat source unit using the group controller

Up to eight sets, total 128 units, can be controlled at once from a single controller. Individual settings and operation states can be controlled and displayed via a touch panel, supporting customer energy management.

Function List

	Item	Notes
Operating status display	For each model	Start/Stop, Operational mode, Fault occurrence, Operational capacity, LWT/BWT, Flow rate, Simple production heat capacity, Basic integral power, Basic capabilities, Basic input, Basic COP
	For each module controller	Start/Stop, Operational mode, Error code, Operational capacity, LWT/EWT, Flow conversion volume, Basic capabilities, Basic input, Basic COP
	For each module	Start/Stop, Operational mode, Error code, Operational capacity, LWT/EWT, Flow conversion volume, Basic capabilities, Outside air temperature, Basic input, Basic COP
	For each circuit	Refrigeration cycle information, Compressor operation time, Compressor startup counts
Operational state output (Total)	Start/Stop, Failure, Operational capacity, Basic capabilities, Basic input, Operational pattern	
Start/Stop	For entire system, Each model, and Each module controller	
Pattern settings (Switch)	Enables setting and switching operating pattern of group controller	
Operational mode settings (Switch)	Enables setting and switching the operation mode for entire system.	
Preset temperature changes	All model temperature setting can be changed.	
Current demand settings	Electrical current demand can be configured.	
System settings	All connected modules can be systematically classified. (for each module controller system)	
Schedule settings	Operational schedule can be configured. (monthly, weekly, daily)	
Error history display	Error history can be verified.	
Operational data savings	Displayed data can be saved to MMC.	
Trend display	Water temperature, outside air temperature, operational capacity, basic capabilities, basic input, basic COP, basic production heat capacity and basic integral power can be displayed on a graph.	
Power saving	Enables switching the demand setting to validation or invalidation.	

Wifi Data Analysis

Wireless LAN-Equipped - Operating data can be obtained with tablet

The tablet improves the convenience of operation and management.

Wireless LAN comes as standard in the module controller.

Information can be collected without opening service panel.

Confirm run time Confirm run pressure Confirm breakdown history

Supported tablets: Android 5.0 or higher 10.1" screen recommended

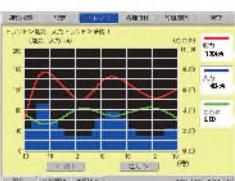

*The machine is not designed for use in all regions. Please contact a representative for details.

Operating Status/Main Screen

Operating Status/System Data Confirmation Screen

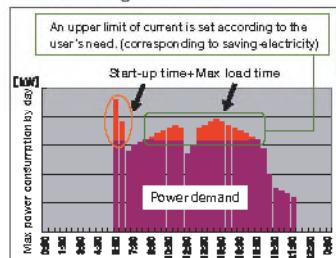

Operating Trends
(capacity, input, COP)
Confirmation Screen
Data displayed over a time frame which is easy to confirm or adjust

Visualize the operating status of module controller and unit controller!
It allows safe and quick operations even in bad weather!!

Users can set an upper limit of current (demand) using the Group Controller and peak shave.

Peak Shaving Scenario

The upper limit of current (demand) can be set in units of 1 amp for each system.

UNIVERSAL SMART X Series *EDGE*

	R32 charge	(kg)	8.8 x 4
	Control		Electric expansion valve
	Capacity control steps	(%)	0~5~100
Operation control		Microprocessor control based on leaving water temperature and temperature difference	
Defrost system		Distributed reverse cycle system	Distributed reverse cycle system
Protective device		High-pressure switch, Over current protection, Inverter overload protection (compressor, fan, pump), Crankcase heater, Open-phase protection, Microprocessor control (compressor line guard, freeze protection, high water temp. cutout, low flow rate, discharge gas overheated protection, low pressure cutout, thermistor error, high water pressure error)	
Rings/leads	Cold/Hot water inlet	(A)	2-1/2" flange (JIS10K)
	Cold/Hot water outlet	(A)	2-1/2" flange (JIS10K)
	Coil drain	(A)	PT1-1/2" external thread
Sound power level		dB(A)	83.8
83.8			

(Note 1) Rated conditions, such as capacity, electrical data, and standard flow rate are as follows.

For cooling: 12°C entering water (EWT), 7°C leaving water (LWT), 38°C DB, 24°C WB outdoor air (OAT) and 21°C feed-water temperature

For heating: 40°C entering water (EWT), 46°C leaving water (LWT), 7°C DB, 6°C WB outdoor air (OAT)

Same capacities, outdoor air temperature, and supplied water temperature (only for High EER type) as indicated above.

Design water flow rate must be within the range of 6 to 10°C water temperature difference. Capacities and performance values are based on (EU)No2016/2281 and (EU)No813/2013.

(Note 2) Dimensions do not include projections of water pipe connections.

(Note 3) Even when there is a fluctuation in supply voltage, do not exceed ±10% and keep imbalances between the supply voltages within 2%.

(Note 4) The power supply differs from pump capacity. Please refer to pump information table to design power supply correctly.

(Note 5) Always install an earth leakage circuit breaker. This machine includes an inverter, so please use a high-frequency-compatible product to prevent malfunction.

(Note 6) Power factors may vary depending on site conditions.

(Note 7) Electrical data does not include inbuilt pump.

(Note 8) The supply water quality may cause scales and other matter to adhere to the coil/water face. If necessary, install a water softener on the supply water side. (Provided locally)

(Note 9) Adjust the flow rate to become close to the supply water pressure with the manual flow adjustment valve on the water spray system inlet if sufficient supply water pressure is not available, install a pressure pump. (Provided locally)

(Note 10) Working pressure is below 0.7 MPa.

(Note 11) Range of capacity control sometimes can vary depending on the unit's operating condition.

(Note 3) Even when there is a fluctuation in supply voltage, do not exceed ±10% and keep imbalances between the supply voltages within 2%.

(Note 4) The power supply differs from pump capacity. Please refer to pump information table to design power supply correctly.

(Note 5) Always install an earth leakage circuit breaker. This machine includes an inverter, so please use a high-frequency-compatible product to prevent malfunction.

(Note 6) Power factors may vary depending on site conditions.

(Note 7) Electrical data does not include inbuilt pump.

(Note 8) The supply water quality may cause scales and other matter to adhere to the coil surface. If necessary, install a water softener on the supply water side. (Provided locally)

(Note 9) Adjust the flow rate to become close to this supply water pressure with the manual flow adjustment valve on the water spray system inlet. If sufficient supply water pressure is not available, install a pressure pump. (Provided locally)

(Note 10) Working pressure is below 0.7 MPa.

(Note 11) Range of capacity control sometimes can vary depending on the unit's operating condition.

Defrost system		Distributed reverse cycle system	
Protective device		High-pressure switch, Over current protection, Invertor over load protection (compressor, fan, pump), Ground fault protection, Open phase protection, Microprocessor control (compressor time guards, freeze protection, high water temp. cutout, low flow rate, discharge gas overheat protection, low pressure cutout, thermometer error, high water pressure error)	
Piping parts	Cold/Hot water inlet (A)	2-1/2" flange (JS10K)	2-1/2" flange (JS10K)
	Cold/Hot water outlet (A)	2-1/2" flange (JS10K)	2-1/2" flange (JS10K)
	Col drain (A)	PT1-1/2" external thread	PT1-1/2" external thread
Sound power level (dB(A))		87.4	87.4

(Note 1) Rated conditions, such as capacity, electrical data, and standard flow rate are as follows.

For cooling: 12°C entering water (EWT), 7°C leaving water (LWT), 38°C DB, 24°C WB outdoor air (OAT) and 21°C feed-water temperature

For heating: 40°C entering water (EWT), 45°C leaving water (LWT), 7°CDB, 6°CWB outdoor air (OAT)

Same capacities, outdoor air temperature, and supplied water temperature (only for High EER type) as indicated above.

Design water flow rate must be within the range of 5 to 10°C water temperature differences. Capacities and performance values are based on (EU)No2016/2281 and (EU)No2013/2013.

(Note 2) Dimensions do not include projections of water pipe connections.

(Note 3) Even when there is a fluctuation in supply voltage, do not exceed ±10% and keep imbalances between the supply voltages within 2%.

(Note 4) The power supply differs from pump capacity. Please refer to pump information table to design power supply correctly.

(Note 5) Always install an earth leakage circuit breaker. This machine includes an inverter, so please use a high-frequency-compatible product to prevent malfunction.

(Note 6) Power factors may vary depending on site conditions.

(Note 7) Electrical data does not include in-built pump.

(Note 8) The supply water quality may cause scales and other matter to adhere to the coil surface. If necessary, install a water softener on the supply water side. (Provided locally)

(Note 9) Working pressure is below 0.7 MPa.

(Note 10) Range of capacity control sometimes can vary depending on the unit's operating condition.

Operation control			
Defrost system			
Protective device			
Piping components	Cold/Hot water inlet	(A)	2-1/2" flange (JIS10K)
	Cold/Hot water outlet	(A)	2-1/2" flange (JIS10K)
	Coil drain	(A)	PT1-1/2" external thread
Sound power level		dBA	83.8

(Note 1) Rated conditions, such as capacity, electrical data, and standard flow rate are as follows.

For cooling: 12°C entering water (EWT), 7°C leaving water (LWT), 36°C DB, 24°CWB outdoor air (OAT) and 21°C feed-water temperature

For heating: 40°C entering water (EWT), 45°C leaving water (LWT), 7°CDB, 6°CWB outdoor air (OAT)

Same capacities, outdoor air temperature, and supplied water temperature (only for High-EER type) as indicated above.

Design water flow rate must be within the range of 8 to 10°C water temperature differences. Capacities and performance values are based on (EU)No2016/2281 and (EU)No2013/2013.

(Note 2) Dimensions do not include projections of water pipe connections.

(Note 3) Even when there is a fluctuation in supply voltage, do not exceed ±10% and keep imbalance between the supply voltages within 2%.

(Note 4) Always install an earth leakage circuit breaker. This machine includes an inverter, so please use a high-frequency-compatible product to prevent malfunction.

(Note 5) Power factors may vary depending on site conditions.

(Note 6) Electrical data does not include inbuilt pump.

(Note 7) The supply water quality may cause scales and other matter to adhere to the coil surface. If necessary, install a water softener on the supply water side. (Provided locally)

(Note 8) Adjust the flow rate to become close to this supply water pressure with the manual flow adjustment valve on the water spray system inlet. If sufficient supply water pressure is not available, install a pressure pump. (Provided locally)

(Note 9) Working pressure is below 0.7 MPa.

(Note 10) Range of capacity control sometimes can vary depending on the unit's operating condition.

For heating: 40°C entering water (EW), 45°C leaving water (LW), 7°CDB, 0°CWB outdoor air (OAT)

Same capacities, outdoor air temperature, and supplied water temperature (only for High EER type) as indicated above.

Design water flow rate must be within the range of 6 to 10°C water temperature differences. Capacities and performance values are based on (EU)No2016/2281 and (EU)No21/2013.

Note 2) Dimensions do not include projections of water pipe connections.

Note 3) Even when there is a fluctuation in supply voltage, do not exceed ±10% and keep imbalances between the supply voltages within 2%.

Note 4) Always install an earth leakage circuit breaker. This machine includes an inverter, so please use a high-frequency-compatible product to prevent malfunction.

Note 5) Power factors may vary depending on site conditions.

Note 6) Electrical data does not include in-built pump.

Note 7) The supply water quality may cause scales and other matter to adhere to the coil surface. If necessary, install a water softener on the supply water side. (Provided locally)

Note 8) Adjust the flow rate to become close to this supply water pressure with the manual flow adjustment valve on the water spray system inlet. If sufficient supply water pressure is not available, install a pressure pump. (Provided locally)

Note 9) Working pressure is below 0.7 MPa.

Note 10) Range of capacity control sometimes can vary depending on the unit's operating condition.

(Note 1) Rated conditions, such as capacity, electrical data, and standard flow rate are as follows.

For cooling: 12°C entering water (EWT), 7°C leaving water (LWT), 38°C DB, 24°CWB outdoor air (OAT) and 21°C feed-water temperature

For heating: 40°C entering water (EWT), 45°C leaving water (LWT), 7°CDB, 6°CWB outdoor air (OAT)

Same capacities, outdoor air temperature, and supplied water temperature (only for High EER type) as indicated above.

Design water flow rate must be within the range of 8 to 10°C water temperature differences. Capacities and performance values are based on (EU)No2016/2281 and (EU)No2013/2013.

(Note 2) Dimensions do not include projections of water pipe connections.

(Note 3) Even when there is a fluctuation in supply voltage, do not exceed ±10% and keep imbalances between the supply voltages within 2%.

(Note 4) The power supply differs from pump capacity. Please refer to pump information table to design power supply correctly.

(Note 5) Always install an earth leakage circuit breaker. This machine includes an inverter, so please use a high-frequency-compatible product to prevent malfunction.

(Note 6) Power factors may vary depending on site conditions.

(Note 7) Electrical data does not include in-built pump.

(Note 8) The supply water quality may cause scales and other matter to adhere to the coil surface. If necessary, install a water softener on the supply water side. (Provided locally)

(Note 9) Adjust the flow rate to become close to this supply water pressure with the manual flow adjustment valve on the water spray system inlet. If sufficient supply water pressure is not available, install a pressure pump. (Provided locally)

(Note 10) Working pressure is below 0.7 MPa.

(Note 11) Range of capacity control sometimes can vary depending on the unit's operating condition.

Note 1: The values shown in the table above are for an inlet / outlet chilled water temperature differential of 7°C.

Note 2: The cooling capacity has been measured when the module was operating at the rated frequency.

Note 3: This table is subject to change without notice.

■ Water Volume for set of modules

Standard Water Flow Rate / Water Volume Range

(Leaving (LVG)/Entering (ETG) water temperature difference = 7°C)

50HP Series EDGE

Powerful Heating Type

Internal inverter pump

Number of modules	Standard flow rate (L/min) (Note 2)	Flow rate range (L/min) (Note 3 - 6)	Minimum water loop volume (L) (Note 4 - 5 - 6)	In-unit water volume (L)
1	307	150~600	717	36
2	614	150~1200		72
3	921	150~1800		108
4	1,229	150~2400		144
5	1,536	150~3000		180
6	1,843	150~3600		216
7	2,150	150~4200		252
8	2,457	150~4800		288
9	2,764	150~5400		324
10	3,071	150~6000		360
11	3,379	150~6600		396
12	3,686	150~7200		432
13	3,993	150~7800		468
14	4,300	150~8400		504
15	4,607	150~9000		540
16	4,914	150~9600		576

Note 1: For both at cooling/heating. Indicates the flow rate and water pressure loss when leaving/entering water temperature difference is 7°C at rated capacity. (water pressure loss is only for pumpless models)

Note 2: Within the indicated flow rate range, the flow rate automatically changes from the pump integrated into each module. (only for internal inverter pump models)

Note 3: Value indicated for retained water amount is with a standard flow amount. (Rated capacity, change in water outlet/inlet temperature difference = 7°C)

When calculating the retained water amount, calculate the greatest water loss in the piping flow channel, giving consideration to the bypass channel etc.

Note 4: Please make a separate inquiry if you would like to control the effect of a temperature reduction in the water supply due to the defrost operation.

Note 5: When operating at the rated flow capacity, even with internal inverter pump models, set the flow amount range and system retained water amount to the same value as the pumpless model.

60HP Series EDGE

Number of modules	Standard flow rate (L/min) (Note 2)	Flow rate range (L/min) (Note 3 - 6)	Minimum water loop volume (L) (Note 4 - 5 - 6)	In-unit water volume (L)
1	369	150~600	860	36
2	737	150~1200		72
3	1,106	150~1800		108

Note 2: Within the indicated flow rate range, the flow rate automatically changes from the pump integrated into each module. (only for internal inverter pump models)

Note 3: Value indicated for retained water amount is with a standard flow amount. (Rated capacity, change in water outlet/inlet temperature difference = 7°C)

When calculating the retained water amount, calculate the greatest water loss in the piping flow channel, giving consideration to the bypass channel etc.

Note 4: Please make a separate inquiry if you would like to control the effect of a temperature reduction in the water supply due to the defrost operation.

Pump Characteristics / Internal Inverter Pump

50HP, 60HP Series EDGE and Powerful Heating Type,
70HP Series EDGE internal pump 60Hz performance curve

Pump specification values

Pump output	50HP, 60HP model				70HP model			
	1.5	2.2	3.7	5.5	2.2	3.7	5.5	
Flow rate range ⁽¹⁾ (L/min)	150~600				150~650			
External lifting height ⁽²⁾ (kPa)	43~151	92~198	190~315	284~422	64~198	158~315	247~422	
Max. operation current ⁽³⁾ (A)	3.3	4.5	7.3	10.5	4.5	7.3	10.5	
Max. power consumption ⁽⁴⁾ (kW)	2.0	2.8	4.5	8.4	2.8	4.5	8.4	
Max. allowable boost pressure (MPa)	0.52	0.47	0.36	0.25	0.47	0.36	0.25	
Max. suction head (water temp. 60°C or less) (kPa)	40	40	40	40	40	40	40	

Note 1: Flow rate range (upper limit), max. current and max. power consumption in the table above are values for a single pump. Multiply the number of pumps (modules) by these values depending on the unit size. When selecting anything other than rated output, you can also use values outside of the flow amount range shown in the graph. Use the formula below to find the flow amount range outside of the rated capacity.

Minimum flow rate = capacity × 260/60/10 (maximum temperature difference)

*However, minimum flow amount must be at or above 75 L/min

Maximum flow amount = capacity × 260/60/5 (minimum temperature difference)

*However, maximum flow amount must be at or below 600 L/min for the 60HP model, and at or below 650 L/min for the 70HP model

Note 2: Lifting height outside of the unit shown in the table is the value when the pump frequency is 60Hz at the flow rate range above.

The pump lift outside of the machine is the value reached when subtracting the resistance inside the machine from the total pump lift.

Note 3: Max. current and max. power consumption are the max. values when the pump operation frequency is 60Hz.

Note 4: 60Hz pumps are commonly used in the 60Hz area.

Note 5: Select a pump that can handle the needed lift and flow amount.

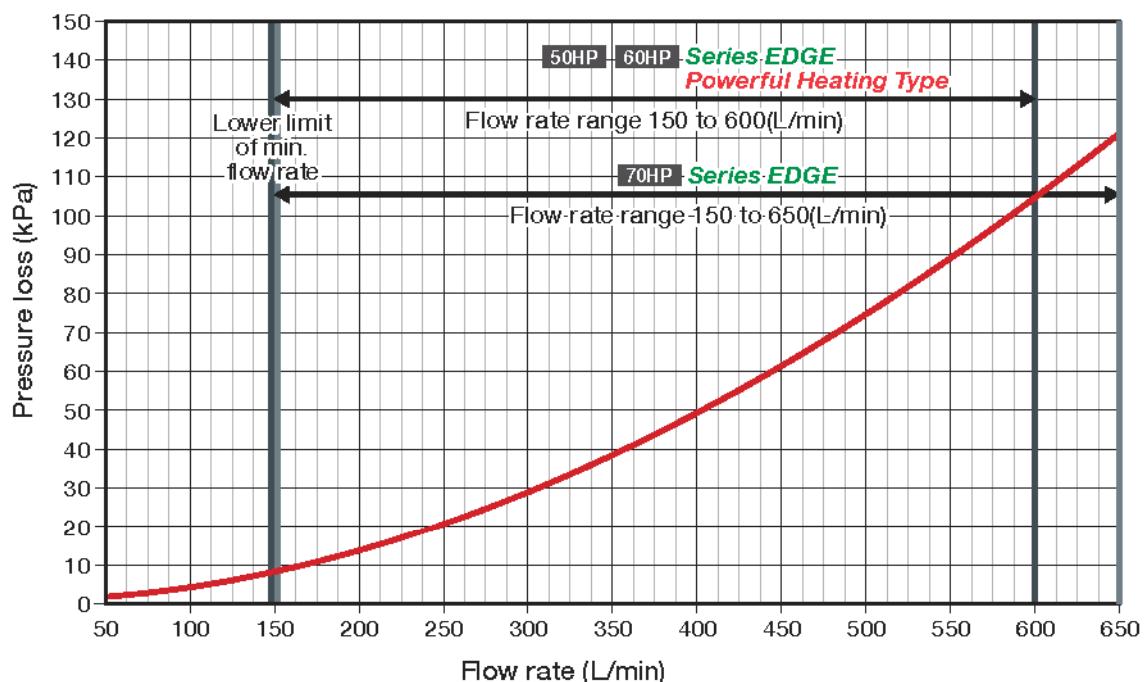

Note 6: In case the nominal current is 380V.

Note 7: Check databook for 7.5kW pump information.

■ Pump Characteristics / Internal Resistance Curve (For pumpless)

Internal resistance curve (For pumpless) 50HP, 60HP Series EDGE and Powerful Heating Type, 70HP Series EDGE

Note: For a unit without a pump, select a pump outside of the heat pump unit considering internal resistance below

■ Power Supply Design

Displayed below are the electrical power design specifications for each module unit.

● Power supply design (380V/400V/415V specifications)

(Internal inverter pump/Pumpless) (Heat pump/Cooling-only)
(Standard type and High-EER type in common)

		50HP Series EDGE Powerful Heating Type				60HP Series EDGE					
Internal Pump		50/60Hz 380V/400V/415V				50/60Hz 380V/400V/415V

Earth Leakage Circuit Breaker (Sensitivity) (mA)		200				200				200

*1.The internal pump can be replaced with another pump with appropriate output according to the lifting height outside of the unit required by a custom option. Since power supply design is different depending on the pump output, be sure to see the values in the corresponding field.

*2.The pump operates at a maximum frequency of 60Hz at the maximum flow rate (per module).

*3.A leakage breaker must be installed. Use one that conforms to higher harmonics to prevent malfunction since this unit includes an inverter.

*4.Standard Current is the value considering the imbalance of 2% between power supply voltages.

Note.1: The thickness of the ground lead is the value for when using IV wire shown in the table for power supply wire. Refer to IEC60204-15.2 depending on the thickness of the wire used.

Table 1-Minimum cross-sectional area of the external protective copper conductor

Cross-sectional area of copper phase conductors supplying the equipment S mm ²	Minimum cross-sectional area of the external protective copper conductor Sp mm ²
S≤16	S
16<S≤36	16
S>36	S/2

* Fuse capacities in the tables are for B class fuses.

* Select a power supply transformer that can support values greater than those shown in the tables.

* Power supply line thickness values are for metal conduits with three or fewer wires inside a single conduit. (or six or fewer wires when two wires are used for one pole)

* Selected based on Japanese regulations. Select the appropriate unit based on the laws and regulations of the location where the unit is to be installed.

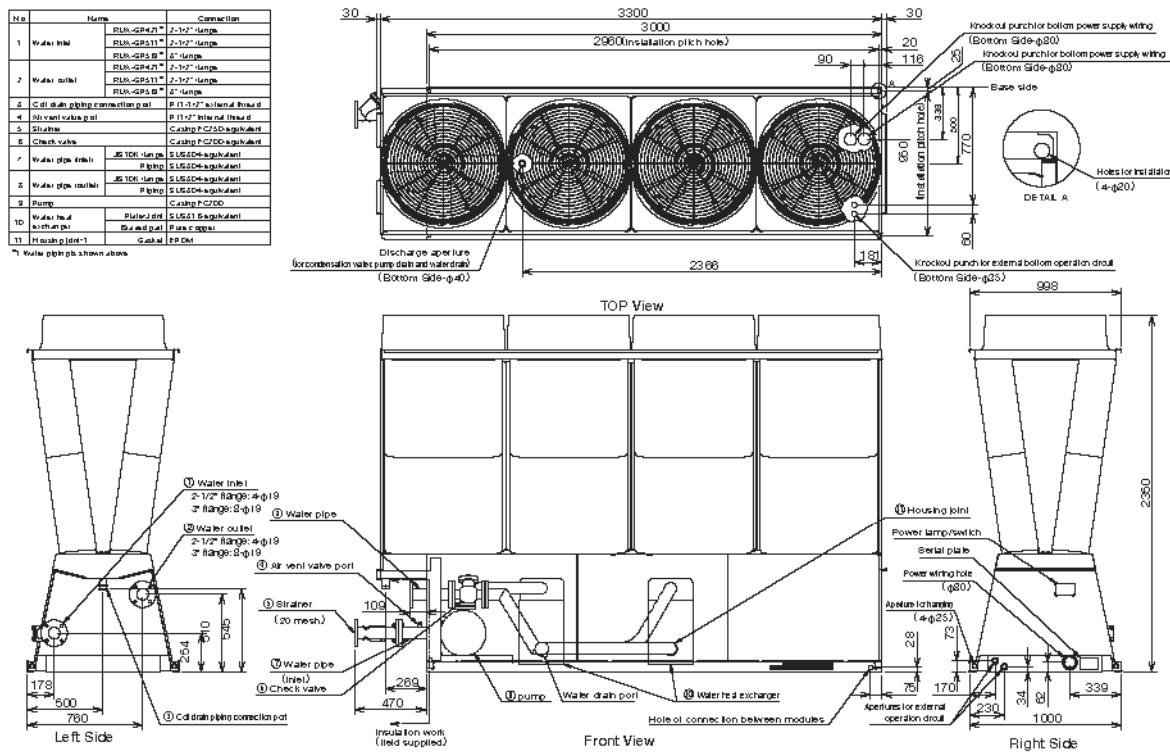

Note 2: Check databook for 7.5kW pump and Module controller power supply information.

■ System Examples for Internal Inverter Pump Units

- As a cold (hot) water circulation pump is built in, test run adjustment which includes the whole piping system is necessary. (Forced open/close of auto control valve in A/C is required.)
- The system detects the required flow rate on load side, and automatically fluctuates the number of internal cold (hot) water circulating pumps and the operating frequency. Refer to "Pump Characteristics" and select an internal pump by considering the required max. flow rate and max. lift for the system.
- Also consider construction on the suction side of internal pumps (boost pressure/pipe resistance). While internal pumps are stopped, ensure that the pressure on the suction side is not negative to prevent the air from entering the pumps from mechanical seals. Ensure that the suction side main water pipes are higher than the heat pump cold (hot) water inlet piping to prevent the air from accumulating in the heat pump. Closer attention is required when an open-type tank is set up as an expansion tank on the heat pump inlet side.
- To improve energy saving abilities, we recommend that you make a variable flow system using 2 way valves on the secondary side etc.
- If the heat pump is located at the highest point in the system, install an automatic air vent valve (with a check valve function) at the inlet pipe for each module.
- Secure a sufficient holding water volume between the heat pump and the bypass circuit to ensure water temperature controllability. The water volume described in the specifications table is required to operate a module for two minutes, the minimum running time. The values in the table show the minimum holding water volume required to protect the unit. Ensure as much holding water volume as possible to minimize the variation of supply water temperature.
- Differential pressure regulating valves or flow meters may be required depending on the system. In that case, use different power supply from that of the heat pump. Follow instructions by the manufacturer for how to wire the valves or flow meters.
- For any system not listed below, please contact us.

1. Example of duplex pump system

(load side: variable flow, heat pump side: variable flow)

● List of equipment for control

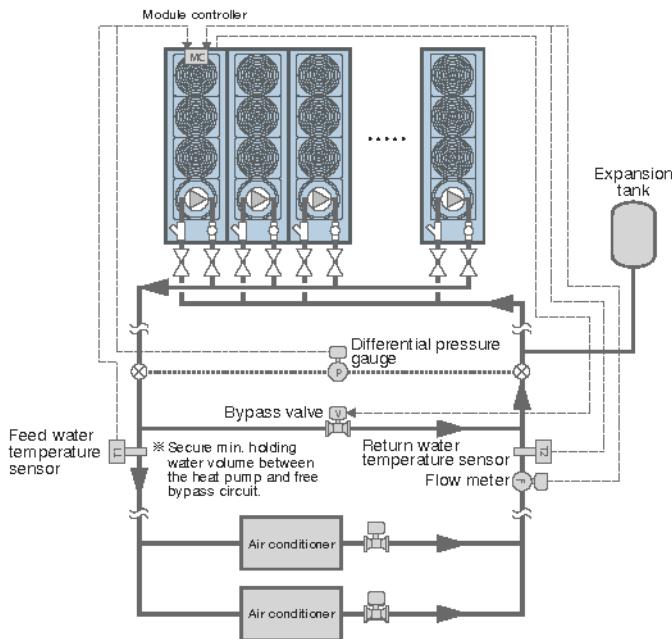

Part name	Specifications	Quantity	Provided locally	Constructed locally
Water temperature sensor (mandatory)	10 kΩ external sensor	2	Attached to module controller	○
Flow meter	Able to measure instantaneous value support voltage/current output* (Able to adjust input range span: DC 0 to 5V)	1	○	○

* Attach $250\Omega \pm 1\%$ metal film resistor (provided locally) when the signal has current 4-20mA. (In that case, input range span is DC 1 to 5V)

■ System Examples for Internal Inverter Pump Units

2. Single Pump: Example of standard system

(load side: variable flow, heat pump side: variable flow)

1. LWT/EWT sensor in heat pump and water temperature sensor on feed/return water pipes detect the temperature balance inside the system, and control the number of internal pumps for cold/hot-water circulation and the frequency to minimize the imbalance between the estimated load side flow rate and the heat pump side flow rate.
2. If there is a flow meter F (provided locally) in the system, connect its output to the module controller. This enables control which directly detects flow rate on the load side (mounting of external sensors on feed/return water pipes is required even when using a flow meter).
3. The module compressor with internal pump for cold/hot-water circulation controls the number of compressors and frequency so that the leaving water temperature approaches the set temperature.
4. As there may be an imbalance in the load side required flow rate and the heat pump flow rate, construct a bypass valve V (provided locally) which is operated according to detection of differential pressure between the feed/return water pipes. The bypass valve V is controlled by a module controller.
5. While the operation is stopped, the freeze protection control may automatically operate the internal pump. The bypass valve may be forcibly opened to secure the flow path. In this case, water may not be supplied to equipment on the load side (to feed water to the equipment on the load side, be sure to open the 2-way valve on the load side in accordance with freeze protection control of the heat pump, instead of configuring settings not to open the bypass valve).

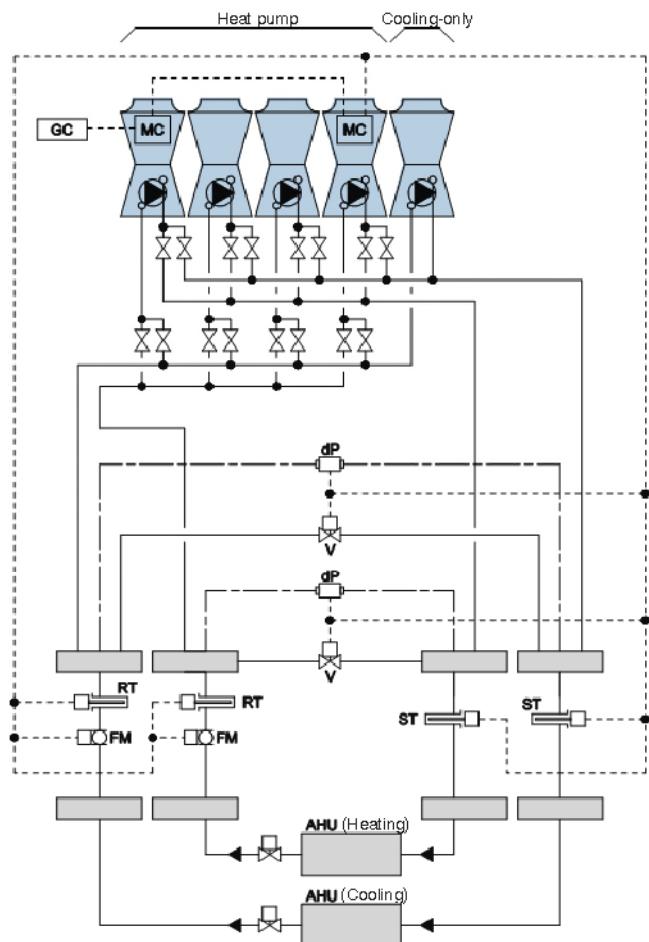

● List of equipment for control

Part name	Specifications	Quantity	Provided locally	Constructed locally
Water temperature sensor (mandatory)	10kΩ external sensor	2	Attached to module controller	<input checked="" type="radio"/>
Flow meter	Able to measure instantaneous value support voltage/current output* (Able to adjust input range span: DC 0 to 5V)	1	<input checked="" type="radio"/>	<input checked="" type="radio"/>
Differential pressure gauge (mandatory)	Pressure gauge (mandatory). Able to measure instantaneous value support voltage/current output* (Able to adjust input range span: DC 0 to 5V)	1	<input checked="" type="radio"/>	<input checked="" type="radio"/>
Bypass valve (mandatory)	Globe valve which can perform proportional control at current input DC 4 to 20mA (Able to adjust span)	1	<input checked="" type="radio"/>	<input checked="" type="radio"/>

* Attach 150Ω±1% metal film resistor (provided locally) when the signal has current 4-20mA. (In that case, input range span is DC 0.6 to 3V)

■ System Examples for Internal Inverter Pump Units

3. Example of Chilled/Warm Water Simultaneous Use System

1. Install a valve for switching between the inlet and outlet of heat pumps that switch between chilled and warm water. (If it is a motor-operated valve, ensure it works with the local instrumentation panel.)
2. Connect each cooling and heating component (FM, ST, RT, dP, V) to the module controller (MC).

■ Option List

Option Parts		Locally constructed (*Note 2)	Factory assembly
Module Controller (MC)	For Standard model	Required	Available
	For Powerful Heating type	Required	Available
Group Controller (GC)		Required	n/a
Connect fitting Kit		Required	n/a
Fin Guard Kit		Required	Available
External sensor (*note 1)		Required	n/a
SD card for Flash Monitor		Required	n/a
Flange kit for hood and net installation		Required	Available

Note 1: Module controller with internal inverter pump contains external sensor (2 sensors for feed/return water temperature) for controlling one system of the water pipe systems. If an external sensor to control a secondary circuit of water pipes is required, an additional order must be placed. You also need to place an order for an external sensor for monitoring the temperature of return and condensation water for module controllers in pumpless models, which do not have external sensors.

Note 2: On-site installation work is needed. (Not included in seller's work description.)

Installation and the use of refrigerants not specified by Toshiba Carrier Corporation

Toshiba refrigeration and air-conditioning units are designed and manufactured on the assumption that the product is used with a specific refrigerant suitable for each unit.

The type of refrigerant used for each of our products is shown in the accompanying owners manual, or on the product label attached to the product itself.

Toshiba Carrier corporation shall not assume any liability for failures, malfunctions or safety in its products if the refrigerant used is different from the one specified.

SAFETY PRECAUTIONS

Please see the technical Document for details.

Notice : Toshiba is committed to continuously improving its products to ensure the highest quality and reliability standards, and to meet local regulations and market requirements. All features and specifications are subject to change without prior notice.
