**Directions For Use:**

- Use enclosed Hex Key and loosen the Set Screw on the collar. (Fig. 1)
- Pull the tip back & make sure you have selected the right size One Way Screw Remover. (Fig. 2)
- The collar should fit tightly around the One Way Screw Head! If you have selected the right size Remover and the collar is tightly on the One Way Screw Head, Proceed as Follows! While the Set Screw is loose, slide the collar back & rotate the tip until it seats into the head of the One Way Screw! (Fig. 3)
- Once the tip is seated into the Screw Head, Slide the collar down flush with the surface, then tighten the screw. (Fig. 4)
- If the screw head is slightly larger than the inside of the collar and the collar will not go flush to the surface, slide a piece of pipe while the set screw is loose over the tip and rest it on the collar (The pipe is used to protect the shaft of the Screw Remover from the Tapping of Hammer). Gently tap on the end of the pipe and the outer ring of the collar until the collar is flush with the surface. (Fig. 5)
- When collar is flush to the surface, tighten the set screw and press on the One Way Remover while rotating counter clockwise to remove the screw. (Fig. 6 For use on Stripped Nuts & Bolts, again choose the proper size Remover. If the Nut or Bolt is slightly larger than the inside diameter of the collar and the collar will not go flush to the surface, Again use a piece of pipe as depicted in Figure 5. When flush with the surface, tighten the set screw and press on the One Way Remover while rotating in a counter clockwise direction to remove the screw.
