Basic Applications for T1 E1 Analyzer

Monitoring Applications

Monitor T1/E1 Status

Monitor line sync loss, HDB3 violation, carrier loss, frame error, distant MF, alarm indication signal (AIS), ES, and so on.

Four Wire VF Interface with Drop & Insert

Control the gain of the signal, feed the PCM signal on a timeslot to the VF Out jack or to an onboard speaker.

Clock options: Internal, External, & Recovered

Internal clock using an internal oscillator, recovered clock using the clock derived from the received signal, and external clock as provided at the SMB input.

Connection Options: Terminate, Bridge, Monitor

Input signal (the signal connected to the "T1/E1 In" jack) may be terminated using impedance, monitored, or bridged depending on user requirements.

Bytes Values Display for all time slots

Displays data values for each time slot in HEX data format.

Binary Byte Values Display for all time slots

Displays the data values for each time slot in binary data format.

Monitor signaling bits

Displays signaling bits associated with each timeslot are displayed in real-time.

Power Level Display for all time slots

Displays the rms (root-mean-square) value of the digital codewords (after expansion from μ -law or A-law) for each timeslot continuously in dBm.

DC Offset Display for all time slots

Displays DC offsets for all timeslots.

Frequency Display for all time slots

Displays signal frequency in each timeslot continuously.

Multiframe Byte Display

Permits viewing of a complete multiframe. For T1 systems, twelve (12) frames are displayed per multiframe in D4 (193S) framing format, and twenty-four (24) frames in ESF (193E) framing format. For E1 systems, 16 frames are displayed per multiframe.

Real Time Multiframe Monitoring

Permits viewing of multiframe in real-time. The data is refreshed for about every second.

Real Time Bitmap Monitoring

Permits a graphical view of complete multiframe as a real-time bitmap.

Time Slot Byte Display

Displays the timeslot value for about '1' second for a desired timeslot.

ASCII Time slot Display

Permits viewing of real-time ASCII events that are present on the T1 or E1.

Real Time Oscilloscope Display of DS0

PCM codes (amplitude of the incoming signal) of any selected timeslot are displayed in real-time graphically as a function of time.

Real Time Power Spectral Display of DS0

Permits viewing the data received on a specified timeslot spectral domain (spectral amplitude Vs frequency).

Audio Monitoring

Allows the control of VF output (speakers) of all T1/E1 cards connected to a PC under a single program.

Active Voice Level Monitoring
