6.38. Dangerous Substances Water Solubility Code

GS1 Code List	DangerousSubstancesWaterSolubilityCode
GS1 Code List Version	R1
Managing Agency	GS1
Based on Code List	n/a
Type Of Management	n/a
Code Value	Code Definition
DISPERSIBLE	Dispersing agents have been added to the substance. Dispersing agents are added to process liquids to prevent unwanted deposits by keeping them finely dispersed. They function in both aqueous and non-aqueous media.
EMULSIFIABLE	An emulsion is a mixture of two immiscible (unblendable) liquids. One liquid is dispersed in the other. Many emulsions are oil/water emulsions, with dietary fats being one common type of oil encountered in everyday life. Examples of emulsions include butter and margarine, milk and cream, and vinaigrettes. In butter and margarine, fat surrounds droplets of water (a water-in-oil emulsion). In milk and cream, water surrounds droplets of fat (an oil-in-water emulsion).
INSOLUBLE	The substance is not capable of being dissolved in a solvent.
NOT_OR_HARDLY_MISCIBLE	The substance is immiscible or nearly immiscible. Substances are said to be immiscible if in any proportion, they do not form a solution. For example, diethyl ether is fairly soluble in water, but these two solvents are not miscible since they are not soluble in all proportions.
SUSPENDED	The substance is in suspension. A suspension is a homogeneous fluid containing solid particles that are sufficiently large for sedimentation. When the solid is mixed with liquid, suspended particles will eventually settle. An example of a suspension would be sand in water. The suspended particles are visible under a microscope and will settle over time if left undisturbed.
WATER_SOLUBLE	The substance is soluble. Solubility is the ability of a given substance to dissolve in a solvent. It is measured in terms of the maximum amount of solute dissolved in a solvent at equilibrium. Certain liquids are soluble in all proportions with a given solvent, such as ethanol in water.

64	Pound per square inch - Gauge	Psig (pound-force per square inch gauge) is a unit of pressure relative to the surrounding atmosphere. At sea level, Earth's atmosphere actually exerts a pressure of 14.7 psi. Humans do not feel this pressure because internal pressure of liquid in their bodies matches the external pressure. If a pressure gauge is calibrated to read zero in space, then at sea level on Earth it would read 14.7 psi. Thus a reading of 30 psig, on Earth, on a tire gauge represents an absolute pressure of 44.7 psi (lb/in ²).
80	Pound per square inch - Absolute	Psia (pound-force per square inch absolute) is a unit of pressure pressure relative to a vacuum (such as that in space). At sea level, Earth's atmosphere actually exerts a pressure of 14.7 psi. Humans do not feel this pressure because internal pressure of liquid in their bodies matches the external pressure. If a pressure gauge is calibrated to read zero in space, then at sea level on Earth it would read 14.7 psi. Thus a reading of 30 psig, on Earth, on a tire gauge represents an absolute pressure of 44.7 psi (lb/in ²).

SI uses the becquerel rather than the second for the unit of activity measure to avoid dangerous mistakes: a measurement in becquerels is proportional to activity, and thus a more dangerous source of radiation gives a higher reading. A measurement in seconds is inversely proportional.
BTU	British thermal unit	The British thermal unit (BTU or Btu) is a traditional unit of energy. It is approximately the amount of energy needed to heat one pound of water one degree Fahrenheit. One Btu is equal to about 1.06 kilojoules. It is used in the power, steam generation, heating and air conditioning industries.

A mole will possess mass exactly equal to the substance's molecular or atomic weight in grams. Because of this, one can measure the number of moles in a pure substance by weighing it and comparing the result to its molecular or atomic weight

Polyurethane can also be used to make synthetic fibers.
POLYMER_PVA	Polyvinyl Alcohol (PVA)	Polyvinyl alcohol (PVA or PVOH) is a biodegradable and highly water soluble polymer with high gas and grease barrier. Common uses for PVA are paper adhesives, paper coatings, as a self-standing water soluble films as well as blends to improve processability of thermoplastic starch.

WIRE	Wire	A non-specific material made of metal in the form of a very flexible thread or slender rod.
WOOD_HARDBOARD	Hardboard	Hardboard (not to be confused with hardwood), also called High-Density Fiberboard (HDF), is a type of fiberboard, which is similar to particle board and medium-density fiberboard, but is denser, much stronger and harder because it is made out of exploded wood fibres which

		<p>have been highly compressed. Consequently, the density of hardboard is 31 lbs or more per cubic foot (500 kg/m³)[2] and is usually about 50-65 lbs per cubic foot (800–1040 kg/m³). It differs from particle board in that the bonding of the wood fibres requires no additional materials, although resin is often added. Unlike particle board, it will not split or crack.</p>
WOOD_HARDWOOD	Hardwood	<p>A general term referring to any variety of broad-leaved, deciduous trees, and the wood from those trees. The term has nothing to do with the actual hardness of the wood; some hardwoods are softer than certain softwood (evergreen) species.</p>
WOOD_MEDIUM_DENSITY_FIBREBOARD	Medium Density Fibreboard	<p>Medium-Density Fibre board (MDF) is an engineered wood product made by breaking down hardwood or softwood residuals into wood fibres, combining them with wax and a resin binder, and forming panels by applying high temperature and pressure. MDF is generally denser than plywood. It is made up of separated fibres, but can be used as a building material similar in application to plywood. It is stronger and much more dense than particle board.</p>
WOOD_ORIENTED_STRANDBOARD	Oriented Strand Board	<p>Oriented Strand Board (OSB), also known as sterling board, sterling OSB, aspenite, and smartply, is an engineered wood particle board formed by adding adhesives and then compressing layers of wood strands (flakes) in specific orientations. OSB may have a rough and variegated surface with the individual strips of around 2.5 × 15 cm (1" × 6"), lying unevenly across each other and comes in a variety of types.</p>
WOOD_OTHER	Wood	<p>A non specific material made from the hard fibrous lignified substance under the bark of trees.</p>
WOOD_PARTICLE_BOARD	Particle Board	<p>Particle Board, also known as particleboard, chipboard, and Low-Density Fiberboard (LDF), is an engineered wood product manufactured from wood chips, sawmill shavings, or sawdust, and a synthetic resin or other suitable binder, which is pressed</p>

		and extruded. Particle board is a composite material.
WOOD_PLYWOOD	Plywood	Plywood, a manufactured wood panel similar to LDF, MDF, and HDF, is made from layering thin sheets of wood. Plywood layers (called veneers or plies) are glued together, with adjacent plies having their wood grain rotated relative to adjacent layers up to 90 degrees. All plywoods bind resin and wood fiber sheets (cellulose cells are long, strong and thin) to form a composite material.
WOOD_SOFTWOOD	Softwood	General term used to describe lumber produced from needle and/or cone bearing trees (Conifers).
VINYL	Vinyl	A non-specific polymer of a vinyl compound or a product (as a resin or a textile fiber) made from such a polymer

DIESEL	Any liquid fuel used in diesel engines. The most common is a specific fractional distillate of petroleum fuel oil, but alternatives that are not derived from petroleum, such as biodiesel, biomass to liquid (BTL) or gas to liquid (GTL) diesel, are increasingly being developed and adopted.
ELECTRICITY	A movement or flow of electrically charged particles, typically measured in amperes.
FUEL_OIL	Any liquid petroleum product that is burned in a furnace or boiler for the generation of heat or used in an engine for the generation of power, except oils having a flash point of approximately 40 °C (104 °F) and oils burned in cotton or wool-wick burners. Fuel oil is made of long hydrocarbon chains, particularly alkanes, cycloalkanes and aromatics. The term fuel oil is also used in a stricter sense to refer only to the heaviest commercial fuel that can be obtained from crude oil, heavier than gasoline and naphtha.

GASOLINE	Gasoline or petrol is a transparent petroleum-derived liquid that is primarily used as a fuel in internal combustion engines. It consists mostly of organic compounds obtained by the fractional distillation of petroleum, enhanced with a variety of additives. Some gasolines also contain ethanol as an alternative fuel. In North America the term "gasoline" is often shortened in colloquial usage to "gas" but some people use the term "petrol".
NATURAL_GAS	A naturally occurring hydrocarbon gas mixture consisting primarily of methane, with other hydrocarbons, carbon dioxide, nitrogen and hydrogen sulfide. Natural gas is widely used as an important energy source in many applications including heating buildings, generating electricity, providing heat and power to industry, as fuel for vehicles and as a chemical feedstock in the manufacture of products such as plastics and other commercially important organic chemicals.
PROPANE	A three-carbon alkane with the molecular formula C ₃ H ₈ , normally a gas, but compressible to a transportable liquid. A by-product of natural gas processing and petroleum refining, it is commonly used as a fuel for engines, oxy-gas torches, barbecues, portable stoves, and residential central heating. Propane is one of a group of liquefied petroleum gases. The others include butane, propylene, butadiene, butylene, isobutylene and mixtures thereof.
OTHER	A physical resource other than those listed in the Physical Resource Type Code List.
WATER	A chemical substance with the chemical formula H ₂ O. A water molecule contains one oxygen and two hydrogen atoms connected by covalent bonds. Water is a liquid at ambient conditions, but it often co-exists on Earth with its solid state, ice, and gaseous state (water vapor or steam). Water also exists in a liquid crystal state near hydrophilic surfaces.

AMERICAN_MECHANICAL_JOINT	An American Mechanical Joint is a rubber gasket is compressed by a ductile iron gland drawn up with low-alloy steel bolts which affords liberal deflection and allows expansion and contraction of the line without leakage and is rated for a water working pressure of up to 350 psi.
BELLED	The end length of increased diameter into which a pipe end can be fitted
BUTT	The connection is a flat cut end designed to mate directly to the end of another product. This connection is to connect the same sized pipes or valve ends together.
COMPRESSION_JOINT	A compression joint kind of tubing or pipe connection where a nut, and then a sleeve or ferrule is placed over a copper or plastic tube and is compressed tightly around the tube as the nut is tightened, forming a positive grip and seal without soldering. Also a flexible compression fitting.
CRIMPED	This type of joint requires the joint be crimped once sections are fit together. Some of the necessary connection parts must be added or acquired separately.
FEMALE_THREADED	Female Threaded
FLARE_JOINT	A Flare Joint is where a pipe or tube is widened to join with a larger diameter pipe, for example between a copper tube and a main water feed line.
FLANGED_JOINT	Flange generally refers to the actual raised rim or lip of a fitting which can be bolted to the flange of an opposite unit.
GROOVED_JOINT	Outer diameter of item has a groove which is designed to be joined together using external gaskets and couplings.
LUG	The lug body has protruding lugs that provide bolt holes matching those in the flanges. An advantage of the lug body type is that piping on one side of the valve may be disassembled while the valve remains bolted in place, allowing for the remainder of the system to continue in operation.
MALE_THREADED	Male Threaded
MECHANICAL_JOINT	A Mechanical Joint is a joint which typically consists of: (a) a flange which is integrally cast with the bell of the pipe, (b) a rubber gasket which fits into the recess in the socket, (c) a follower ring which compresses the gasket, and (d) nuts and bolts used to tighten the joint.
NO_HUB_IRON	A connector for no-hub iron pipe consisting of a rubber sleeve and a stainless steel band secured by hose clamps. A variation, a neoprene sleeve with two adjustable steel bands, is used for connecting dissimilar materials, as when connecting new plastic pipe to an existing cast iron drain pipe.

PACK_JOINT	Pack Joint
PLAIN	SPG - Spigot, FTG- Fitting, M- Male Pipe Size- Straight end to connect or insert into the bell end or fitting to join to connecting pipe.
PRESS	This type of joint requires the joint be crimped once sections are fit together. All of the necessary connection parts are present.
PUSH	A joint which can be pushed onto the opposite end manually to form a solid connection. This type of connection fits around an inserted pipe or fitting end.
QUICK_CONNECT	A connection which has the ability to joined and un-joined repeatedly or at will. This type of joint does not degrade the product over time. This type of joint is not considered by the industry to be a push joint.
SOCKET	The connection is a female socket end designed to allow for the insertion of straight pipe/tubing and joined using soldering, sweating, brazing, welding, or cementing. This connection is also called solder cup, hub, or slip joint.
SWIVEL_JOINT	This type of joint uses a pressure type seal while allowing rotation of the units being joined.
UNION_JOINT	This type of joint can connect and disjoint two pipes very easily without deformation to the pipe or tube.
WAFER	A wafer is a seal using a tightly fitting seal, i.e., gasket, o-ring, precision machined, and a flat valve face on the upstream and downstream sides of the valve.
YOKE_JOINT	A connection whereby a piece is expanded on one end into a seal face to form a joint.

AS_DRAINED	The state of the product after it has been separated from any liquid within the package” – For example, a can of apricots in syrup would have a different nutritional composition if the apricots are consumed with the syrup rather than if the syrup is drained before consuming the apricots (because of the high sugar and energy content of the syrup).
BAKE	Cooking food in an oven by dry heat applied evenly throughout the oven.
BARBECUE	Method of cooking meat with the heat and hot gasses of a fire.
BLANCH	Food preparation wherein the food substance is rapidly plunged into boiling water and then removed after a brief, timed interval and then plunged into iced water or placed under cold running water.
BLIND_BAKE	Baking a pie crust or other pastry without the filling.

BRAISE	Cooking with "moist heat", typically in a covered pot with a small amount of liquid.
BROIL	Cooking food with high heat with the heat applied directly to the food, most commonly from above. Heat transfer to the food is primarily via radiant heat.
COMBI_HEAT	Type of preparation in devices in which the heating of food is possible with different methods used together. For example: <ul style="list-style-type: none"> • Microwave combined with hot air: Use this function to rapidly bake the foods. • Grill combined with fan: Use this function to bake evenly the food and at the same time brown their surface.
COMBI_STEAM	Type of preparation in a device that additional to the function of a convection oven is able to generate steam. By transmitting the temperature to the food via steam and convection cooking, times in Combi ovens are shorter than in general preparation types and the product loses less moisture.
CONVECTION	A cooking method which utilizes a convection oven which imparts heat assisted by fans to force air movement, as opposed to a conventional oven, which relies on convective heat transfer unassisted by fans. By moving fast hot air past the food, a convection oven operates at a lower temperature than a conventional oven. The air circulation, or convection, tends to eliminate "hot spots" and thereby cooking food more quickly and evenly.
DEEP_FRY	Cooking method whereby food is submerged in hot oil or fat.
DOUBLE_STEAM	Cooking technique to prepare delicate food such as bird nests, shark fins etc. The food is covered with water and put in a covered ceramic jar.

6.221. Sterilisation Type Code

GS1 Code List	SterilisationTypeCode
GS1 Code List Version	R1
Managing Agency	GS1
Based on Code List	n/a
Type Of Management	n/a
Code Value	Code Definition
AUTOCLAVE	Autoclave (Steam) is a method of sterilisation that utilizes pressure and heat to achieve a sterile environment.
BETA_RADIATION	Beta particles are able to penetrate living matter to a certain extent (radiation intensity from a small source of radioactive material decreases as one over the distance squared) and can change the structure of struck molecules.
CHLORINE_DIOXIDE	Gaseous chlorine dioxide systems for sterilization of healthcare products are not mutagenic or carcinogenic in humans. As the chlorine dioxide concentration increases, the time required to achieve sterilization becomes progressively shorter.
DRY_HEAT	This method should be used only for materials that might be damaged by moist heat or that are impenetrable to moist heat (e.g., powders, petroleum products, sharp instruments). There are two types of dry-heat sterilizers: the static-air type and the forced-air type.
ELECTRON_BEAM_IRRADIATION	A commercially successful technology for sterilizing a variety of disposable medical devices with a wide range of densities. The e-beam inactivates micro-organisms either by causing microbial death as a direct effect of the destruction of a vital molecule or by an indirect chemical reaction. This is the same mechanism as in gamma irradiation, and the dose required is the same.
ETHANOL	A chemical sterilisation method that utilizes ethanol as the sterilisation method.

ETO_ETHYLENE_OXIDE	A gas that is commonly used to sterilize objects sensitive to temperatures greater than 60 °C such as plastics, optics and electrics. Ethylene oxide treatment is generally carried out between 30 °C and 60 °C with relative humidity above 30% and a gas concentration between 200 and 800 mg/L for at least three hours. Ethylene oxide penetrates well, moving through paper, cloth, and some plastic films and is highly effective.
FORMALDEHYDE	A chemical sterilisation agent used to provide sterilisation. Items being sterilized are usually immersed in the formaldehyde for a pre determined time period.
GAMMA_RADIATION	Gamma rays are very penetrating and are commonly used for sterilisation of disposable medical equipment, such as syringes, needles, cannulas and IV sets. Gamma radiation requires bulky shielding for the safety of the operators; they also require storage of a radioisotope (usually Cobalt-60), which continuously emits gamma rays (it cannot be turned off, and therefore always presents a hazard in the area of the facility).
GLUTERALDEHYDE	A colourless liquid with a pungent odour used to sterilize medical and dental equipment. It is also used for industrial water treatment and as a chemical preservative. Glutaraldehyde is an oily liquid at room temperature (density 1.06 g/mL), and miscible with water, alcohol, and benzene.
HIGH_INTENSITY_OR_PULSE_LIGHT	Pulsed light is a non-thermal sterilization method that uses brief intense pulses or flashes of white light to kill micro-organisms.
HIGH_LEVEL_DISINFECTANT	A germicide that inactivates all microbial pathogens, except small numbers of bacterial endospores.
HYDROGEN_PEROXIDE	Another chemical sterilizing agent. It is relatively non-toxic once diluted to low concentrations (although a dangerous oxidizer at high concentrations), and leaves no residue.
LIQUID_CHEMICAL	A sterilization process that uses liquid chemical as its sterilant to kill microorganisms.
MICROWAVE_RADIATION	Microwaves are used in medicine for disinfection of soft contact lenses, dental instruments, dentures, milk, and urinary catheters for intermittent self-catheterization. However, microwaves must only be used with products that are compatible (e.g., do not melt). Microwaves are radio-frequency waves, which are usually used at a frequency of 2450 MHz.
NITROGEN_DIOXIDE	A sterilization process that uses nitrogen dioxide radicals that are formed from dinitrogen tetroxide dimers to kill microorganisms.
OZONE	Is a method often times used in industrial settings to sterilize water and air, as well as a disinfectant for surfaces. It has the benefit of being able to oxidize most organic matter. It is a toxic and unstable gas that must be produced on-site, so it is not practical to use in many settings.
PERACETIC_ACID	A chemical in the organic peroxide family. It is a bright, colorless liquid with a characteristic acrid acetic acid type odor. It has a strong oxidizing potential, is highly corrosive, and can explode at temperatures exceeding 110 °C.

PLASMA	A method of sterilisation that utilizes hydrogen peroxide vapour to sterilize heat sensitive equipment.
SOUND_WAVES	Sound waves of frequency >20,000 cycle/second kills bacteria and some viruses on exposing for one hour. High frequency sound waves disrupt cells. They are used to clean and disinfect instruments as well as to reduce microbial load.
SUPERCRITICAL_CARBO N _DIOXIDE	A sterilization process that uses supercritical carbon dioxide in combination with a small percentage of additive to kill microorganisms.
UNSPECIFIED	Trade Item Manufacturer has not specified the sterilisation method(s) of the trade item.
UV_LIGHT	Useful for sterilisation of surfaces and some transparent objects. Many objects that are transparent to visible light absorb UV. UV irradiation is routinely used to sterilize the interiors of biological safety cabinets between uses.

7.3. Measurement Rules (Music and Film Publishing Industries)

CubiScan[®] 30

The music and film publishing industries have a long history of utilizing a specific measurement orientation for CDs and DVDs. The method of measurement and orientation of these trade items has been incorporated into a measurement tool manufactured by Quantronix, Inc. The tool is called CubiScan[®] 30. This tool has emerged as a standard for these industries and is consistent with the National Association of Recording Merchandisers (NARM) method of measurement.

In this measurement system, the dimensional measurements of CDs and DVDs are derived as follows:

The trade item is laid flat in the upper left corner of the CubiScan[®] 30, with the spine along the left edge of the CubiScan[®] 30, and the front of the CD or DVD facing up.

NARM Height = Thickness

NARM Length = Bottom left to bottom right

NARM Width = Top left to bottom left

The information providers are expected to populate the appropriate EAN.UCC dimensional attributes per the chart below. Standard measurements for CDs and DVDs:

CubiScan [®] 30	GS1	CD	DVD
NARM Height	Depth	.25 in	.375 in
NARM Width	Height	4.75 in	5.375 in
NARM Length	Width	5.50 in	7.000 in

The illustrations below show how the product is oriented and measured:

Peg Hole Measurements

Please use the following method for populating peg hole information for those trade items for which the packaging has more than one peg hole (this example is for a package with two peg holes):

Attribute	Value
Peg Hole Number	1
Peg Horizontal and UOM	1 in
Peg Vertical and UOM	2 in
Peg Hole Number	2
Peg Horizontal and UOM	4 in
Peg Vertical and UOM	2 in

Horizontal measurement is from left edge to the centre of the hole

Vertical measurement is from the top to the centre of the hole

Note: While the GS1 standard was revised to identify that a package may have more than one peg hole, at this time it incorrectly prohibits multiple iterations of these attributes. A request has been submitted to Align Data to consider an errata revision to correct this in the published standard.

7.4. GTIN Allocation Rules for Ingredient and Allergen Information

Breaking down ingredient information and allergy statements

Not all suppliers are currently able to break down the ingredient declaration or the allergy statement. That is why ingredients can also be specified in the 'ingredientStatement' attribute and allergen statement in the 'allergenStatement' attribute.

The ingredient (and allergen) split however is needed:

To enable structured searches

To enable specification of related information per ingredient, such as the content percentage and country of origin.

Production variant, GTIN allocation rules and minor ingredient changes

The GTIN Allocation rules state (<http://www.gs1.org/gtinrules/>) that:

The following changes warrant the allocation of a new GTIN:

1. Formulation change where the consumer is expected to distinguish the new from the old product and order accordingly.
2. Where regulations or other requirements dictate the ability to distinguish the old formulation from the new, e.g. healthcare
3. Where the changes alter the fundamental consumer benefit, e.g. new flavour, aroma, etc
4. Changes that result in a different description (declaration to the consumer)

The following changes do not warrant the allocation of a new GTIN:

5. Minor formulation or characteristic changes that will replace the existing trade item and does not involve any change in the declaration to the consumer (e.g. is not covered by legislation). Examples include: changes for cost reduction reasons without changing the trade item characteristics (e.g. taste, viscosity, minor ingredients change, etc.); changes to the button colour used on fashion items, etc
6. Changes to ingredients as a result of seasonal variations, e.g. yoghurt with seasonal fruit, where the actual fruits within are dependent on the season

The theory of changing a GTIN for every change in product formulation is sound and logical. However it must be remembered that changing a GTIN also requires a change to packaging with subsequent design/packaging and write off consequences. Many formulation changes might not actually require a change to packaging design other than to change the barcode. For instance one might change the technical specification of an ingredient such that the product might now exceed or fail a current allergen claim. This would require a change to a products declaration through GDS but not to packaging. A manufacturer will need to decide whether such a change warrants a change to GTIN with its subsequent costs.

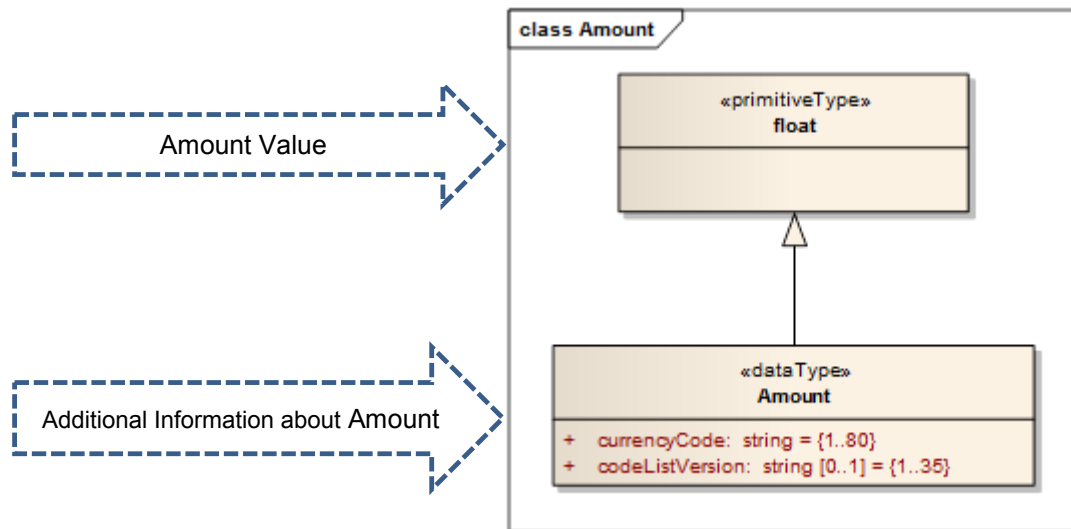

The buyer of a particular product will also need to be able to manage changes of GTINs through their systems carefully. Buyers (in a GDS sense) rightly or wrongly do not like changes to GTINS and tend to treat them all as new listings with subsequent costs and the hassles of introducing the product and changing many systems to accommodate.

The best practice is to use the best before date of a product to distinguish between different variants of the same product. If manufacturers get calls from consumers about allergens etc and manufacturers know that they have multiple variants then they have to ask the consumer to tell the best before date on the consumer unit as well as the GTIN.

8. Appendices

8.1. Understanding Data Type Class Diagrams

To reduce nesting in XML Schemas, all code and compound data types (e.g. description, measurement, amount) in 3.x are designed to inherit the value for the data type (e.g. Amount Value, Description Text). In other words, the class diagrams do not specifically identify the value as a distinct attribute as before.

In XML representation, an amount would look like this:

```
<dutyFeeTaxBasisAmount currencyCode="EUR">500</dutyFeeTaxBasisAmount>
```

In the example, 500 represents the value for the dutyFeeTaxBasisAmount.
