

REF_5BR3995CZ_16W1

About this document

Scope and purpose

This document is a reference design for a 16 W auxiliary power supply for single-phase electric meter with the latest fifth-generation Infineon fixed-frequency (FF) CoolSET™ ICE5BR3995CZ. The power supply is designed with ultra-wide input compatible with most geographic regions and three isolated outputs (12 V/1 A, 5 V/0.2 A, 5 V/0.2 A).

Highlights of the auxiliary power supply for smart metering are:

- Tightly regulated output voltages, high efficiency under light load and low standby power
- Comprehensive protection for a robust system
- 950 V rated MOSFET for ultra-wide input range
- Input line overvoltage protection (OVP)

Intended audience

This document is intended for power supply design engineers who are designing auxiliary power supplies for a single-phase electric meter or ultra-wide input range flyback converter.

System introduction

1 System introduction

With the advancement of technology, the energy meter had also been undergoing continuous development to improve accuracy, power consumption, communication interfaces, measuring parameters, anti-tempering features, etc. These requirements are driving the demand for more innovative power supply designs to power electric meters. Infineon has introduced the latest fifth-generation FF CoolSET™ to address this need in an efficient and cost-effective manner.

An auxiliary SMPS is needed to power the various modules, which typically operate from a stable DC voltage source. The Infineon CoolSET[™] (as shown in **Figure 1**) forms the heart of the system, providing the necessary protection and AC-DC conversion from the mains to multiple regulated DC voltages to power the various blocks.

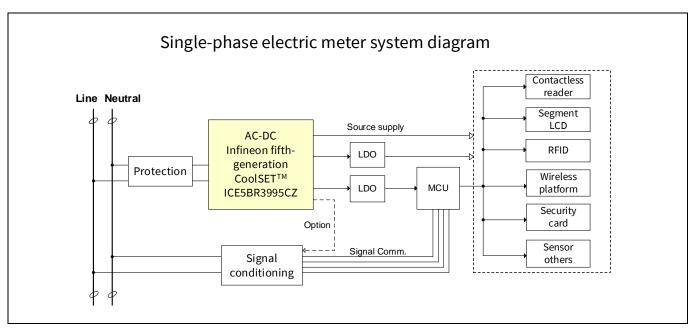

Figure 1 Simplified electric meter system diagram

Table 1 lists the system requirements for an auxiliary power supply for an electric meter, and the corresponding Infineon solution is shown in the right-hand column.

Table 1 System requirements and Infineon solutions

	System requirement for electric meter	Infineon solution – ICE5BR3995CZ
1	High efficiency under light load and low standby power	Digital frequency reduction and active burst mode (ABM)
2	Robust system and protection features	Comprehensive CoolSET™ protection feature in DIP-7 package
3	Line voltage fluctuation	950 V rated CoolMOS™ integrated for ultra-wide input voltage

1.1 High efficiency under light load and low standby power

Low power consumption of the meter is a key operating criterion. Smart meters in the field are consuming energy, which is a cost that must be paid by the end user. And in most cases, the system will reside in an idle state, in which the loading toward the auxiliary power supply is low. It is crucial that the auxiliary power supply operates as efficiently as possible, because it will be in this particular state for most of the time. Under light-

System introduction

load conditions, losses incurred with the power switch are usually dominated by the switching operation. The choice of switching scheme and frequency plays a crucial role in ensuring high conversion efficiency.

In this reference design, ICE5BR3995CZ was primarily chosen due to its frequency reduction switching scheme. Compared with a traditional FF flyback, the CoolSET™ reduces its switching frequency from medium to light load, thereby minimizing switching losses. Therefore, an efficiency of more than 80 percent is achievable under 25 percent loading conditions and nominal input voltages.

1.2 Simplified circuitry with good integration of power and protection features

To relieve the designer of the complexity of PCB layout and circuit design, CoolSET™ is a highly integrated device with both a controller and a 950 V MOSFET integrated into a single, space-saving DIP-7 package. These certainly help the designer to reduce component count as well as simplifying the layout into a simple PCB design for ease of manufacturing.

1.3 Auto-restart protection scheme to minimize interruption to enhance end-user experience

For a commercial electric meter unit, it would be annoying to both the end user and the manufacturer if the system were to halt and latch after protection. To minimize interruption, the CoolSET™ implements autorestart mode for all protections.

Reference board design

Reference board design 2

This document provides complete design details including specifications, schematics, bill of materials (BOM), PCB layout and transformer design. Performance results pertaining to line/load regulation, efficiency, transient load, thermal conditions, conducted EMI scans and so on are also included.

Circuit description

5 Circuit description

In this section, the design circuit for the SMPS unit will be briefly described by the different functional blocks. For details of the design procedure and component selection for the flyback circuitry please refer to the IC design guide [2] and calculation tool [3].

5.1 EMI filtering and line rectification

The input of the power supply unit is in the range of 85 V AC ~ 460 V AC. The fuse F1 is directly connected to the input line to protect the system in case of excess current entering the system circuit due to any fault. Following is the varistor R27, which is connected across the input to absorb excess energy during line-surge transient. Thermistor R26 is placed to reduce inrush current during the turning-on period. The X-capacitor C30 reduces EMI noise. The bridge rectifier D3 rectifies the AC input into DC voltage, filtered by the Pi circuit, which reduces the EMI noise.

5.2 Flyback converter power stage

The flyback converter power stage consists of transformer TR1, CoolSET[™], secondary rectification diodes D1, D4 and D6, and secondary output capacitors C2, C15 and C23.

When the primary HV MOSFET turns on, energy is stored in the transformer. When it turns off, the stored energy is discharged to the output capacitors and into the output load.

For the output rectification, lower forward voltage and ultrafast recovery diodes can improve efficiency. There are two separate 5 V outputs from low dropout (LDO) regulator (U2, U4), and these outputs are not affected by cross-regulation. However, their inputs should be maintained within the operating range of the LDO.

5.3 Control of flyback converter through fifth-generation FF CoolSET™ ICE5BR3995CZ

5.3.1 Current sensing

The ICE5BR3995CZ is a current mode controller. The primary peak current is controlled cycle-by-cycle through the current sense (CS) resistors R20 and R22 in the CS pin (pin 3). Transformer saturation can be avoided through peak-current limitation (PCL); therefore, the system is more protected and reliable.

5.3.2 Feedback and compensation network

Resistor dividers R30 and R32 are used to sense the V_{OUT} and send the reference voltage to the feedback (FB) pin (pin 2) via error amplifier TL431(U6) and optocoupler (U5). A Type II compensation network (C25, C26 and R29) is implemented to stabilize the system.

The FB pin of ICE5BR3995CZ is a multifunction pin, which is used to select the entry burst power level (there are three levels available) through the resistor at the FB pin (R31) and also the burst-on/burst-off sense input during ABM. Here R31 is not placed for default ABM configuration.

Circuit description

5.4 Unique features of the fifth-generation FF CoolSET™ ICE5BR3995CZ

5.4.1 Fast self-start-up and sustaining of V_{cc}

The IC uses a cascode structure to fast-charge the V_{CC} capacitor. Pull-up resistor R3 connected to the GATE pin (pin 4) is used to initiate the start-up phase. At first, $I_{VCC_Charge1}$ is used to charge the V_{CC} capacitor from 0 V to V_{CC_SCP} . This is a protection which reduces the power dissipation of the power MOSFET during V_{CC} short-to-GND condition. Thereafter, a much higher charging current of $I_{VCC_Charge2}$ will charge the V_{CC} capacitor until the V_{CC_ON} is reached.

After start-up, the IC V_{CC} supply is usually sustained by the auxiliary winding of the transformer, which needs to support the V_{CC} to be above undervoltage lockout (UVLO) voltage (10 V typ.).

5.4.2 CCM, DCM operation with frequency reduction

ICE5BR3995CZ can be operated in either discontinuous conduction mode (DCM) or continuous conduction mode (CCM) with frequency-reduction features. This reference board is designed to operate in DCM at operating input voltage and load conditions. When the system is operating at high output load, the controller will switch at 65 kHz FF. In order to achieve a better efficiency between light load and medium load, frequency reduction is implemented as a function of V_{FB} , as shown in **Figure 4**. Switching frequency will not reduce further once the minimum switching frequency of 28 kHz is reached.

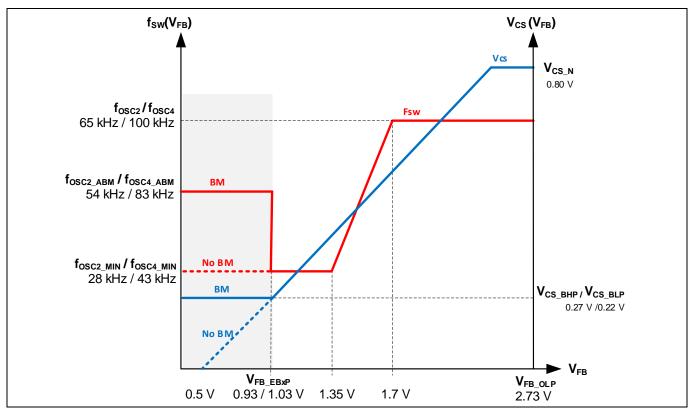

Figure 4 Frequency reduction curve

5.4.3 Frequency jittering with modulated gate drive

The ICE5BR3995CZ has a frequency jittering feature with modulated gate drive to reduce the EMI noise. The jitter frequency is internally set at 65 kHz (±4 percent), and the jitter period is 4 ms.

Circuit description

5.4.4 System robustness and reliability through protection features

Protection is one of the major factors in determining whether the system is safe and robust – therefore sufficient protection is necessary. ICE5BR3995CZ provides comprehensive protection to ensure the system is operating safely. This includes line overvoltage protection (LOVP), V_{cc} OV and undervoltage (UV), overload, overtemperature and V_{cc} short-to-GND. When those faults are found, the system will enter protection mode. Once the fault is removed, the system resumes normal operation. A list of protections and failure conditions is shown in the table below.

Table 3 Protection functions of ICE5BR3995CZ

Protection function	Failure condition	Protection mode	
V _{IN} LOVP	V _{VIN} greater than V _{VIN_LOVP}	Non-switch auto-restart	
V _{cc} OV	V _{VCC} greater than V _{VCC_OVP}	Odd-skip auto-restart	
V _{cc} UV	V _{VCC} less than V _{VCCoff}	Auto-restart	
Overload	V_{FB} greater than V_{FB_OLP} and lasts for $t_{FB_OLP_B}$	Odd-skip auto-restart	
Overtemperature	T _J greater than 140°C (40°C hysteresis)	Non-switch auto-restart	
V _{cc} short-to-GND	V_{VCC} less than V_{CC_SCP} , $I_{VCC_Charge1} \approx -0.2$ mA	Common to the set of the	
$(V_{VCC} = 0 \text{ V}, R_{start-up} = 50 \text{ M}\Omega, V_{DRAIN} = 90 \text{ V})$		Cannot start up	

5.5 Clamper circuit

A clamper network (D2, C7, R2, R6, R9) is used to reduce the switching voltage spikes across the DRAIN pin of the integrated HV MOSFET of the CoolSET™, which are generated by the leakage inductance of the transformer TR1. This is a dissipative circuit; therefore, the value of clamper devices need to be fine-tuned depending on the voltage derating factor and efficiency requirement.

5.6 PCB design tips

For a good PCB design layout, there are several points to note.

• The switching power loop needs to be as small as possible (see **Figure 5**). There are four power loops in the reference design; one on the HV side and three on the output side. The HV side loop starts from the bulk capacitor (C10) positive terminal, primary transformer winding (pin 7 and pin 5 of TR1), CoolSET™, CS resistors and back to the C17 negative terminal. The first output side loop (12 V output) starts at the transformer winding (pin 8 of TR1), output diode D1, output capacitor C2 and back to pin 9 of TR1. The second output side loop (8 V output) starts at the transformer winding (pin 11 of TR1), output diode D4, output capacitor C15 and back to pin 12 of TR1. The third output side loop (8 V output) starts at the transformer winding (pin 13 of TR1), output diode D6, output capacitor C23 and back to pin 14 of TR1.

Circuit description

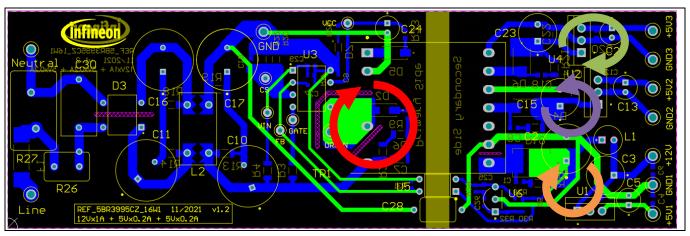

Figure 5 PCB layout tips

- Star-ground connection should be used to reduce high-frequency (HF) noise coupling that can affect the functional operation. The ground of the small-signal components should connect directly to the IC ground (pin 8 of U3).
- Separating the HV components and LV components, e.g., clamper circuit, main switching circuit can help to reduce spark-over chance of the high energy surge during a lightning surge test.
- Make the PCB copper pour on the DRAIN pin of the MOSFET act as a heatsink.

5.7 EMI reduction tips

EMI compliance is always a challenge for the power supply designer. There are several critical points to consider in order to achieve a satisfactory EMI performance.

- A proper transformer design can significantly reduce EMI. Low leakage inductance can incur a low switching spike and HF noise. Interlaced winding technique is the most common practice to reduce leakage inductance. Winding shield, core shield and whole transformer shield are also some of the techniques used to reduce EMI.
- Input CMC greatly reduces EMI, but this is costly and impractical especially for low-power applications.
- Short-switching power-loop design in the PCB (as described in section 5.6) can reduce radiated EMI due to the antenna effect.
- An output diode snubber circuit can reduce HF noise.
- Ferrite beads can reduce HF noise, especially on critical nodes such as the DRAIN pin, clamper diode and output diode terminals. There is no ferrite bead used in this design, as this can reduce the efficiency due to additional losses, especially on high-current terminals.

Note:

Single-output (+12 V) configuration efficiency measurement was done by removing two LDO outputs; the actual board comes with LDO circuits. The overall circuit is not optimized for single-output configuration; the above efficiency data is for illustration only.

9.4 ESD immunity (EN 61000-4-2)

This system was subjected to ESD testing according to EN 61000-4-2 for both contact and air discharge. A test failure was defined as non-recoverable.

• Air discharge: pass ±8 kV; contact discharge: pass ± 6 kV.

Table 7 System ESD test result

	ECD L I		Number of strike		
Description	ESD test	Level	V ₀₁	GND	Test result
115/2201/ 40	Contact	±6 kV	10	10	Pass
115/230 V AC	Air	±8 kV	10	10	Pass

9.5 Surge immunity (EN 61000-4-5)

The reference board was subjected to a surge immunity test (±2 kV DM and ±6 kV CM) according to EN 61000-4-5. It was tested at full load (resistive load). A test failure was defined as non-recoverable.

Table 8 System surge immunity test result

Description	Test	Lovel	N	lumbe	Test result		
Description	1620	Test Level		90°	180°	270°	restresutt
115/230 V AC	DM	±2 kV	3	3	3	3	Pass
113/230 V AC	СМ	±6 kV	3	3	3	3	Pass

Measurement data and graphs

9.6 Conducted emissions (EN 55022 class B)

The conducted EMI was measured by Schaffner (SMR4503) and followed the test standard of EN 55022 (CISPR 22) class B. The reference board was tested at full load (resistive load) at an input voltage of 115 V AC and 230 V AC.

- 115 V AC: pass with greater than 10 dB margin for quasi-peak measurement
- 230 V AC: pass with greater than 10 dB margin for quasi-peak measurement

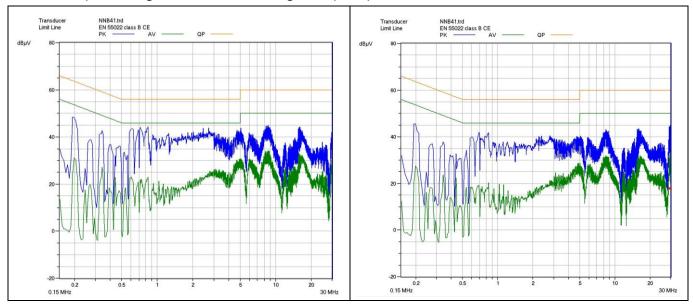

Figure 12 Conducted emissions at 115 V AC and full load on line (left) and neutral (right)

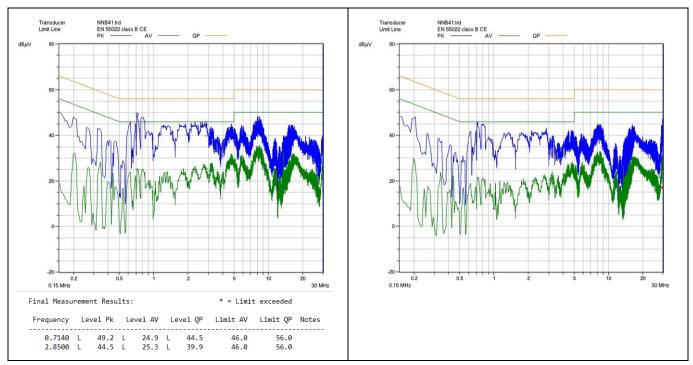

Figure 13 Conducted emissions at 230 V AC and full load on line (left) and neutral (right)

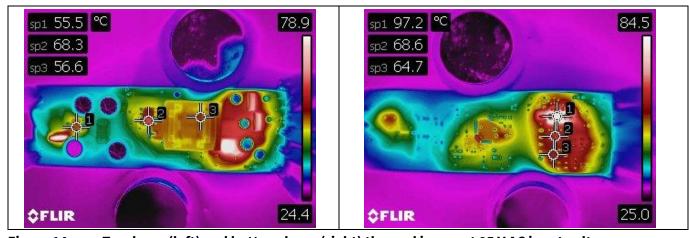

Measurement data and graphs

9.7 Thermal measurement

Thermal measurement was done using an infrared thermography camera (FLIR-T62101) at an ambient temperature of 25°C taken after one hour running at full load. The temperature of the components was taken in an open-frame set-up.

Table 9 Thermal measurement of components (open-frame)

No.	Components	Temperature at 85 V AC (°C)	Temperature at 460 V AC (°C)
1	U3 (ICE5BR3995CZ)	68.3	83.1
2	D3 (bridge diode)	55.5	37.4
3	TR1 (transformer)	56.6	65.5
4	D1 (output 1 diode)	97.2	97.8
5	D4 (output 2 diode)	68.6	69.8
6	D6 (output 3 diode)	64.7	65.6

Appendix A: Transformer design and spreadsheet

Result	Total MOSFET loss at minimum AC input voltage	Eq. 100	P _{MOSMinAC}	[W]	1.0127
Result	Switch-on loss at maximum AC input voltage	Eq. 101	P _{SONMaxAC}	[W]	0.5221
Result	Conduction loss at maximum AC input voltage	Eq. 102	$P_{condMaxAC}$	[W]	0.1434
Result	Total MOSFET loss at maximum AC input voltage	Eq. 103	P _{MOSMaxAC}	[W]	0.6655
Result	Total MOSFET loss (from minimum or maximum AC)		P _{MOS}	[W]	1.0127

Controller

Input	Controller current consumption		I _{VCC_Normal2}	[mA]	2
Result	Controller loss	Eq. 104	P _{Ctrl}	[W]	0.027

Efficiency after losses

Result	Total power loss	Eq. 105	P _{Losses}	[W]	3.70
Result	Post calculated efficiency	Eq. 106	η _{Post}	%	81.68%

CoolSET™/MOSFET temperature

CoolSET™/MOSFET temperature

Input	Enter thermal resistance junction-ambient (include copper pour)		R _{thJA_As}	[°K/W]	80
Result	Temperature rise	Eq. 107	ΔΤ	[°K]	81.1
Result	Junction temperature at T _{amax}	Eq. 108	Tjmax	°C	131.1

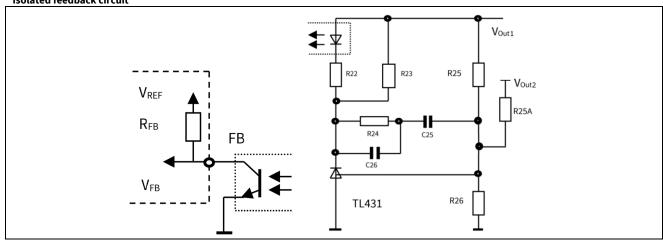

Line OVP

Line OVP

Input	Select AC input LOVP		V _{OVP_AC}	[V AC]	500
Input	High-side DC input voltage divider/resistor (R3A, R3B, R3C)		R _{I1}	[ΜΩ]	5
Input	Controller LOVP threshold		V _{VIN_LOVP}	[V]	2.85
Result	Low-side DC input voltage divider/resistor	Eq. 109	R _{I2Cal}	[kΩ]	20.23
Input	Select low-side DC input voltage divider/resistor (R7)		R ₁₂	[k Ω]	20.5
Result	Post-calculated LOVP	Eq. 110	Vovp_acpost	[V AC]	493.54

Output regulation (isolated using TL431 and optocoupler)

Isolated feedback circuit

Output regulation

	9				
Input	TL431 reference voltage		V _{REF_TL}	[V]	2.5
Input	Weighted regulation factor of V _{Out1}		W ₁		1
Input	Current for voltage divider/resistor R26		I _{R26}	[mA]	0.25
Result	Calculated voltage divider/resistor	Eq. 111	R26 _{Cal}	[k Ω]	10
Input	Select voltage divider/resistor value		R26	[k Ω]	10
Result	Calculated voltage divider/resistor	Eq. 112	R25 _{Cal}	[k Ω]	38.00
Input	Select voltage divider/resistor value		R25	[k Ω]	38.0

Optocoupler and TL431 bias

Input Current transfer ratio (CTR)	Gc	[Percent]	200%
------------------------------------	----	-----------	------

Appendix A: Transformer design and spreadsheet

Input	Optocoupler diode forward voltage		V _{FOpto}	[V]	1.25
Input	Maximum current for optocoupler diode		I _{Fmax}	[mA]	50
Input	Minimum current for TL431		I _{KAmin}	[mA]	1
Result	Calculated minimum optocoupler bias resistance	Eq. 114	R22 _{Cal}	[k Ω]	0.1650
Input	Select optocoupler bias resistor		R22	[k Ω]	1
Input	FB pull-up reference voltage V _{REF} from datasheet		V _{REF}	[V]	3.3
Input	V _{FB_OLP} from datasheet		V _{FB_OLP}	[V]	2.75
Input	R _{FB} from datasheet		R _{FB}	[kΩ]	15
Result	Calculated maximum TL431 bias resistance	Eq. 115	R23 _{Cal}	[kΩ]	1.27
Input	Selected TL431 bias resistor		R23	[kΩ]	1

Regulation loop

Regulati	он тоор				
Result	FB transfer characteristic	Eq. 116	K _{FB}		30.00
Result	Gain of FB transfer characteristic	Eq. 117	G _{FB}	[db]	29.54
Result	Voltage divider transfer characteristic	Eq. 118	K _{VD}		0.208333
Result	Gain of voltage divider transfer characteristic	Eq. 119	G _{VD}	[db]	-13.62
Result	Resistance at maximum load pole	Eq. 120	R _{LH}	[Ω]	8.73
Result	Resistance at minimum load pole	Eq. 121	R _{LL}	[Ω]	48.00
Result	Poles of power stage at maximum load pole	Eq. 122	fон	[Hz]	36.47
Result	Poles of power stage at minimum load pole	Eq. 123	foL	[Hz]	6.63
Result	Zero frequency of the compensation network	Eq. 124	fом	[Hz]	15.55
Input	Zero dB crossover frequency		fg	[kHz]	5
Input	PWM-OP gain from datasheet		A _V		2.03
Result	Transient impedance	Eq. 117	Z _{PWM}	[V/A]	2.2
Result	Power stage at crossover frequency	Eq. 118	F _{PWR} (fg)		0.043
Result	Gain of power stage at crossover frequency	Eq. 119	G _{PWR} (fg)	[db]	-27.31
Result	Gain of the regulation loop at fg	Eq. 120	Gs(ω)	[db]	-11.389
Result	Separated components of the regulator	Eq. 121	Gr(ω)	[db]	11.389
Result	Calculated resistance value of compensation network	Eq. 122	R24 _{Cal}	[k Ω]	29.38
Input	Select resistor value of compensation network		R24	[k Ω]	22
Result	Calculated capacitance value of compensation network	Eq. 123	C26 _{Cal}	[nF]	1.447
Input	Select capacitor value of compensation network		C26	[nF]	1
Result	Calculated capacitance value of compensation network	Eq. 124	C25 _{Cal}	[nF]	464.17
Input	Select capacitor value of compensation network		C25	[nF]	220

Final design Electrical

cai		
Minimum AC voltage	[V]	85
Maximum AC voltage	[V]	460
Maximum input current	[A]	0.23
Minimum DC voltage	[V]	95
Maximum DC voltage	[V]	651
Maximum output power	[W]	16.5
Output voltage 1	[V]	12.0
Output ripple voltage 1	[mV]	0.9
Output voltage 1	[V]	8.0
Output ripple voltage 1	[mV]	0.0
Transformer peak current	[A]	0.92
Maximum duty cycle		0.46
Reflected voltage	[V]	81
Copper losses	[W]	0.17
MOSFET losses	[W]	1.01
Sum losses	[W]	3.70
Efficiency	[Percent]	81.68%

Transformer

E25/13/7

Appendix A: Transformer design and spreadsheet

Core material		N87
Effective core area	[mm²]	52
Maximum flux density	[mT]	222
Inductance	[μH]	730
Margin	[mm]	0
Primary turns	Turns	58
Primary copper wire size	AWG	28
Number of primary copper wires in parallel		1
Primary layers	Layer	2
Secondary 1 turns (N _{S1})	Turns	9
Secondary 1 copper wire size	AWG	22
Number of secondary 1 copper wires in parallel		1
Secondary 1 layers	Layer	1
Secondary 2 turns (N _{S2})	Turns	6
Secondary 2 copper wire size	AWG	26
Number of secondary 2 copper wires in parallel		1
Secondary 2 layers	Layer	1
Auxiliary turns	Turns	10
Leakage inductance	[µH]	7.3

Components

Input capacitor (C1)	[μF]	47.0
Secondary 1 output capacitor (C152)	[μF]	1000.0
Secondary 1 output capacitor in parallel		1.0
Secondary 1 LC filter inductor (L151)	[μH]	4.7
Secondary 1 LC filter capacitor (C153)	[μF]	220.0
Secondary 2 output capacitor (C102)	[μF]	330.0
Secondary 2 output capacitor in parallel		1.0
V _{CC} capacitor (C3)	[μF]	22.0
Sense resistor (R8A, R8B)	[Ω]	0.87
Clamping resistor (R4)	[k Ω]	400.0
Clamping capacitor (C2)	[nF]	1
High-side DC input voltage divider/resistor (R3A, R3B, R3C)	[MΩ]	5000.0
Low-side DC input voltage divider/resistor (R7)	[kΩ]	20.5

Regulation components (isolated using TL431 and optocoupler)

Voltage divider	R26	[k Ω]	10.0
Voltage divider (V _{out1} sense)	R25	[k Ω]	38.0
Optocoupler bias resistor	R22	[k Ω]	1.00
TL431 bias resistor	R23	[k Ω]	1.0
Compensation network resistor	R24	[k Ω]	22.0
Compensation network capacitor	C26	[nF]	1.00
Compensation network capacitor	C25	[nF]	220.0

IMPORTANT NOTICE

The information contained in this application note is given as a hint for the implementation of the product only and shall in no event be regarded as a description or warranty of a certain functionality, condition or quality of the product. Before implementation of the product, the recipient of this application note must verify any function and other technical information given herein in the real application. Infineon Technologies hereby disclaims any and all warranties and liabilities of any kind (including without limitation warranties of non-infringement of intellectual property rights of any third party) with respect to any and all information given in this application note.

The data contained in this document is exclusively intended for technically trained staff. It is the responsibility of customer's technical departments to evaluate the suitability of the product for the intended application and the completeness of the product information given in this document with respect to such application.

For further information on the product, technology, delivery terms and conditions and prices please contact your nearest Infineon Technologies office (www.infineon.com).

WARNINGS

Due to technical requirements products may contain dangerous substances. For information on the types in question please contact your nearest Infineon Technologies office.

Except as otherwise explicitly approved by Infineon Technologies in a written document signed by authorized representatives of Infineon Technologies, Infineon Technologies' products may not be used in any applications where a failure of the product or any consequences of the use thereof can reasonably be expected to result in personal injury.
