Certification

Stanford Research Systems certifies that this product met its published specifications at the time of shipment.

Warranty

This Stanford Research Systems product is warranted against defects in materials and workmanship for a period of one (1) year from the date of shipment.

Service

For warranty service or repair, this product must be returned to a Stanford Research Systems authorized service facility. Contact Stanford Research Systems or an authorized representative before returning this product for repair.

Model numbers

This document is the User Manual for three models in the SG380 series of RF Signal Generators. The SG382, SG384 and SG386 provide front panel outputs of frequencies up to 2.025 GHz, 4.050 GHz and 6.075 GHz respectively.

Information in this document is subject to change without notice.

Safety and Preparation for Use

Line Voltage

The instruments operate from a 90 to 132 V_{AC} or 175 to 264 V_{AC} power source having a line frequency between 47 and 63 Hz. Power consumption is less than 90 VA total. In standby mode, power is turned off to the main board. However, power is maintained at all times to the installed timebase. Units with the standard ovenized quartz oscillator or the optional rubidium timebase will consume less than 15 VA and 25 VA, respectively, in standby mode.

Power Entry Module

A power entry module, labeled AC POWER on the back panel of the instrument, provides connection to the power source and to a protective ground.

Power Cord

The unit is shipped with a detachable, three-wire power cord for connection to the power source and protective ground.

The exposed metal parts of the box are connected to the power ground to protect against electrical shock. Always use an outlet which has a properly connected protective ground. Consult with an electrician if necessary.

Grounding

BNC shields are connected to the chassis ground and the AC power source ground via the power cord. Do not apply any voltage to the shield.

Line Fuse

The line fuse is internal to the instrument and may not be serviced by the user.

Operate Only with Covers in Place

To avoid personal injury, do not remove the product covers or panels. Do not operate the product without all covers and panels in place.

Serviceable Parts

There are no user serviceable parts. Refer service to a qualified technician.

Specifications

Frequency Setting (f_C)

Frequency ranges BNC output DC to 62.5 MHz Type-N output SG382 950 kHz to 2.025 GHz SG384 950 kHz to 4.050 GHz SG386 950 kHz to 6.075 GHz SMA rear-panel (Opt 2) 4.050 GHz to 8.100 GHz SG384 SG386 6.075 GHz to 8.100 GHz Frequency resolution 1 μHz at any frequency <8 ms (to within 1 ppm) Switching speed $<(10^{-18} + \text{timebase error}) \times f_{\text{C}}$ Frequency error <1:10⁻¹¹ (1 second Allan variance) Frequency stability

Front-Panel Type-N Output (50 Ω load)

Frequency range 950 kHz to 2.025 GHz SG382 SG384 950 kHz to 4.050 GHz SG386 950 kHz to 6.075 GHz Output power SG382 $+16.5 \text{ dBm to } -110 \text{ dBm } (1.5 \text{ V}_{RMS} \text{ to } 0.7 \text{ } \mu\text{V}_{RMS})$ SG384 +16.5 dBm (-3.50 dB/GHz above 3 GHz) to -110 dBm SG386 +16.5 dBm (-3.25 dB/GHz above 4 GHz) to -110 dBm Power resolution 0.01 dBm ± 1 dB (± 2 dB above 4 GHz and above +5 dBm) Power accuracy Output coupling $50 \Omega, AC$ User load 50Ω **VSWR** < 1.6 30 V_{DC}, +25 dBm RF Reverse protection

Front-Panel BNC Output (50 Ω load)

Frequency range DC to 62.5 MHz Amplitude Full specs 1.00 to 0.001 V_{RMS} (+13 dBm to -47 dBm) Derated specs 1.00 to 1.25 V_{RMS} (+14.96 dBm) Offset $\pm 1.50 \text{ V}_{DC}$ Maximum excursion $\pm 1.817 \text{ V (amplitude + offset)}$ Amplitude resolution <1% Amplitude accuracy ±5 % Offset resolution 5 mV <-40 dBc Harmonics <-75 dBc **Spurious** Output coupling DC, $50 \Omega \pm 2 \%$ User load 50Ω

 $\pm 5 V_{DC}$

Reverse protection

Spectral Purity of the RF Output Referenced to 1 GHz (1)

Sub harmonics None (No doublers are used below 4 GHz.)
Harmonics <-25 dBc with <+7 dBm on Type-N output

Spurious

Within 10 kHz of carrier <-65 dBc More than 10 kHz from carrier <-75 dBc

Phase noise

Offset from carrier Phase Noise (typical)

20 kHz

1 MHz

Residual FM 1 Hz rms, typical, over 300 Hz to 3 kHz bandwidth
Residual AM 0.006 % rms, typical, over 300 Hz to 3 kHz bandwidth

(1) Spurs, phase noise and residual FM scale by 6 dB/octave to other carrier frequencies

Phase Setting of Front-Panel Outputs

Phase range $\pm 360^{\circ}$

Phase resolution

DC to 100 MHz 0.01° 100 MHz to 1 GHz 0.1° 1 GHz to 8.1 GHz 1.0°

Internal Modulation Source

Waveforms Sine, ramp, saw, square, pulse, noise

Sine THD –80 dBc (typical at 20 kHz)

Ramp linearity <0.05 % (1 kHz)

Rate

SG382 & SG384

 $\begin{array}{ll} f_C \leq \ 62.5 \ \text{MHz} & 1 \ \mu\text{Hz} \ \text{to} \ 500 \ \text{kHz} \\ f_C > \ 62.5 \ \text{MHz} & 1 \ \mu\text{Hz} \ \text{to} \ 50 \ \text{kHz} \end{array}$

SG386

 $\begin{array}{ll} f_C \leq ~93.75~\text{MHz} & 1~\mu\text{Hz to }500~\text{kHz} \\ f_C > ~93.75~\text{MHz} & 1~\mu\text{Hz to }50~\text{kHz} \end{array}$

Rate resolution 1 µHz

Rate error $<1:2^{31}$ + timebase error

Noise function White Gaussian noise, RMS = DEV / 5

Noise bandwidth $1 \mu Hz < ENBW < 50 \text{ kHz}$

Pulse generator period 1 µs to 10 s

Pulse generator width 100 ns to 9999.9999 ms

Pulse timing resolution 5 ns

Pulse noise function PRBS length 2^5 to 2^{19} . Bit period (100 + n.5) ns

100 ns to 10 s in 5 ns steps

Modulation Waveform Output

 $\begin{array}{lll} \text{Output impedance} & 50~\Omega \text{ (for reverse termination)} \\ \text{User load} & \text{Unterminated 50}~\Omega \text{ coax} \\ \text{AM, FM, } \Phi \text{M} & \pm 1~\text{V for} \pm \text{ full deviation} \\ \text{Pulse/Blank} & \text{"Low"} = 0~\text{V, "High"} = 3.3~\text{V}_{DC} \\ \text{Connector} & \text{Rear-panel BNC} \end{array}$

External Modulation Input

Modes AM, FM, Φ M, Pulse and Blank Unmodulated level 0 V input for unmodulated carrier AM, FM, Φ M ± 1 V input for \pm full deviation Modulation bandwidth >100 kHz

Modulation bandwidth >100 kHModulation distortion <-60 dBInput impedance $100 \text{ k}\Omega$

Input Coupling AC (4 Hz high pass) or DC

 $\begin{array}{ll} \text{Input offset} & <500 \; \mu\text{V} \\ \text{Pulse/Blank threshold} & +1 \; V_{DC} \end{array}$

Connector Rear-panel BNC

5950 to 8150 MHz (Opt. 2 only)

Deviation resolution 0.1 Hz

Sweep source Internal or external

Sweep distortion < 0.1 Hz + (deviation / 1000)

Sweep offset <1:1000 of deviation

Sweep function Triangle, ramps, or sine up to 120 Hz

Phase Modulation

Deviation	0 to 360°
Deviation resolution	
$DC < f_C \le 100 \text{ MHz}$	0.01°
$100 \text{ MHz} < f_{\text{C}} \le 1 \text{ GHz}$	0.1°
$f_C > 1 \text{ GHz}$	1.0°
Deviation accuracy	
SG382 & SG384	
$f_C \le 62.5 \text{ MHz}$	<0.1 %
$f_C > 62.5 \text{ MHZ}$	<3 %
SG386	
$f_C \le 93.75 \text{ MHz}$	<0.1 %
$f_{\rm C} > 93.75 \; \rm MHZ$	<3 %
Modulation source	Internal or external
Modulation distortion	$<$ -60 dB ($f_C = 100$ MHz, $f_M = 1$ kHz, $\Phi_D = 50^\circ$)
Modulation bandwidth	
SG382 & SG384	
$f_C \le 62.5 \text{ MHz}$	500 kHz
$f_C > 62.5 \text{ MHz}$	100 kHz
SG386	
$f_C \le 93.75 \text{ MHz}$	500 kHz
$f_{\rm C} > 93.75 \; {\rm MHz}$	100 kHz

Amplitude Modulation

Pulse/Blank Modulation

Pulse mode Logic "high" turns BNC and RF on Logic "high" turns BNC and RF off Blank mode On/Off ratio BNC output 70 dB Type-N output $f_C < 1 \text{ GHz}$ 57 dB $1 \text{ GHz} \le f_C \le 4 \text{ GHz}$ 40 dB $f_C \ge 4GHz$ 35 dB Pulse feed-through 10 % of carrier for 20 ns at turn-on (typical) Turn on/off delay 60 ns RF rise/fall time 20 ns Modulation source Internal or external pulse

External I/Q Modulation (Option 3)

Modulated output Front-panel Type-N only (+10 dBm max) Frequency Range Carrier frequencies above 400 MHz

I/Q inputs 50 Ω , ± 0.5 V, (rear BNCs)

I or Q input offset $<500 \mu V$

I/Q full scale $(I^2 + Q^2)^{1/2} = 0.5 \text{ V}$

Carrier suppression >40 dBc (>35 dBc above 4 GHz)

Modulation bandwidth 200 MHz

Square Wave Clock Outputs (Option 1)

Differential clocks Rear-panel SMAs drive 50 Ω loads

Frequency range DC to 4.05 GHz
Transition time <35 ps (20 % to 80 %)

Jitter ($f_C > 62.5 \text{ MHz}$) 300 fs rms (typical, 1 kHz to 5 MHz BW at 1 GHz)

Single Sideband Phase Noise Spectra

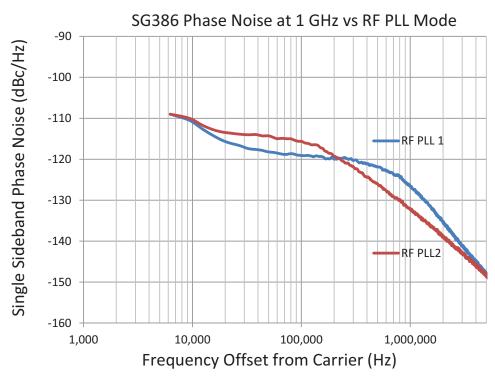

Phase Noise Spectra vs RF PLL Modes

To change the PLL mode, refer to the front panel CAL menu. See page 49 for more details. PLL 1 is the default setting.

Typical Waveforms

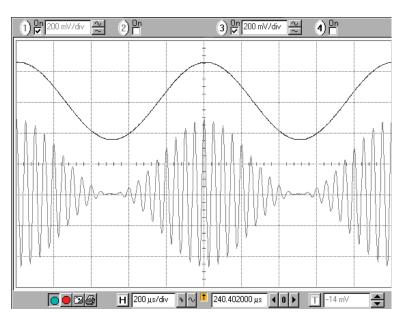

Amplitude Modulation

Waveform 1 is a 20 kHz carrier being amplitude modulated by a 1 kHz sine wave. The top trace is the rear panel Modulation output, while the bottom trace is the front-panel BNC output:

Setup:

20 kHz Frequency Amplitude BNC 1 V_{PP} Offset BNC 0 V Modulation

Type AM Function Sine Rate 1 kHz 100% Depth ON

Waveform 1: AM Modulation

FSK (Frequency Shift Keying)

In Waveform 2 the internal modulator is set to FM between 1 MHz and 3 MHz with a 100 kHz square wave. The top trace is the rear panel Modulation output, while the middle and bottom traces are the front panel BNC and Type-N outputs.

Setup:

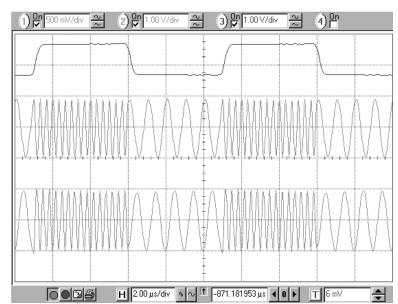

Frequency 2 MHz Amplitude

BNC $1 V_{PP}$ Type-N $2 V_{PP}$

Modulation

Type FM Function Square Rate 100 kHz Deviation 1 MHz

On

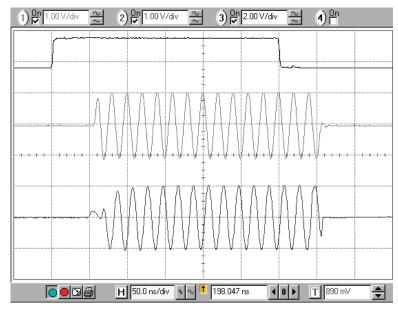

Waveform 2: FSK Modulation

Pulse Modulated Outputs

Waveform 3 is a 50 MHz carrier being pulse modulated with a 1 MHz, 300 ns pulse waveform. The upper trace is the timing signal with the middle trace being the BNC output, and the lower trace being the RF output. There are delays of 50 ns in the gating circuitry as shown.

Setup: Frequency 50 MHz Amplitude Type-N $2 V_{PP}$ **BNC** $2 V_{PP}$ Modulation Type Pulse Function Square Period $1 \mu s$ Duty Factor 30% ON

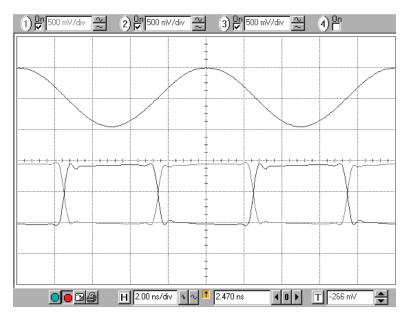

Waveform 3: Pulse Modulated Output

Differential Clock Outputs (Option 1)

Waveform 4 shows the optional rear panel clock outputs with the frequency set to 100 MHz. The top trace is front panel Type-N output with the differential clock outputs depicted by the lower traces. The displayed transition times are limited by the 1.5 GHz bandwidth of the oscilloscope.

Setup:

Frequency 100 MHz Amplitude Type-N 1 V_{PP} $1 V_{PP}$ Clock Offset Clock 0 V Modulation Off

Waveform 4: Clock Outputs

Typical Spectra

The following spectra show typical frequency domain performance for the SG380 series signal generators:

Unmodulated Carrier

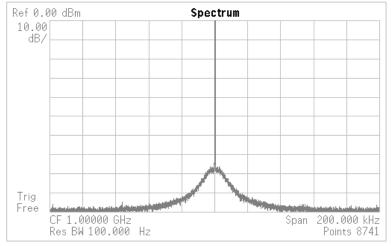

Waveform 5 shows a direct measurement taken on a spectrum analyzer with a $200~\mathrm{kHz}$ span and $100~\mathrm{Hz}$ RBW. The noise floor of the spectrum analyzer dominates over most of the $200~\mathrm{kHz}$

span.

Setup:

Frequency 1 GHz Amplitude Type-N 0 dBm Modulation OFF

Spectrum Analyzer set for: Center Frequency 1 GHz Span 200 kHz Resolution BW 100 Hz

Waveform 5: Unmodulated 1 GHz Output

Frequency Modulation with Modulation Index of 2.40477

Waveform 6 depicts a 50 MHz carrier frequency modulated at a rate of 10 kHz and a deviation of 24.0477 kHz, for a modulation index $\beta = 2.40477$. The carrier amplitude is proportional to the Bessel function $J_0(\beta)$ and has its

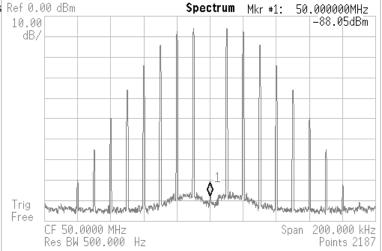

first zero at 2.40477, and thus Ref 0.00 dBm

suppresses the carrier.

Setup:

Frequency 50 MHz Amplitude Type-N 0 dBm Amplitude BNC 0 dBm Modulation

> Type FM Function Sine Rate 10 kHz Dev 24.04 kHz ON

Waveform 6: 50 MHz with FM Carrier Suppressed

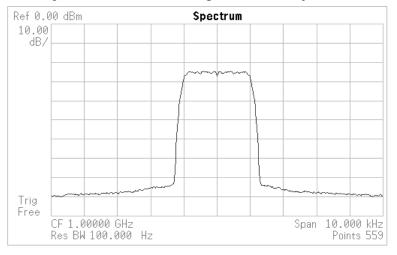

I/Q Modulation (Option 3) by an Internal Noise Source

Option 3 allows I/Q modulation for output frequencies from 400 MHz to 6.075 GHz. Two signal sources may be used for modulation: the external I & Q inputs or an internal noise generator. The external I & Q inputs are on the rear panel. The internal noise generator has adjustable noise

bandwidth from 1 Hz to 50 kHz. Waveform 7 is a 1 GHz carrier being modulated by the internal noise generator with 1 kHz noise bandwidth.

Setup:

Frequency 1 GHz Amplitude -10 dBmType-N Modulation Type I/Q Function Noise Dev (ENBW) 1.0 kHz

Waveform 7: I/Q Modulation using internal noise source

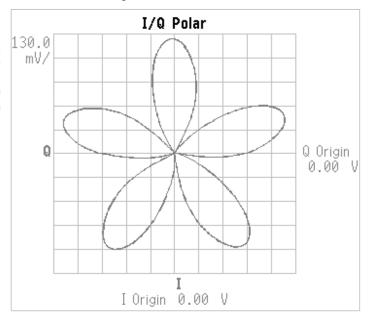

Frequency offset of 1 kHz, 100% AM at 5 kHz

An unmodulated carrier at the spectrum analyzer's reference frequency (1 GHz in this case) appears as a single dot in the I/Q plane. When the carrier frequency is offset, the single dot moves in a circle about the center of the I/Q plane. The pattern shown in Waveform 8 occurs when the carrier amplitude is modulated with 100 % depth at a rate of five times the carrier

offset frequency (creating lobes). The symmetry of the lobes indicates that there is no residual phase distortion (AM to ΦМ conversion) in the amplitude modulator. The narrow line of the trajectory is indicative of low phase and amplitude noise.

Setup:

1.000001 GHz Frequency Amplitude Type-N 0 dBm Modulation Type AMFunction Sine Rate 5.0 kHz Depth 100 % ON

Waveform 8: I/Q Polar plot of offset carrier with AM

Quick Start Instructions

This is intended to help the first time users get started with the RF Signal Generator and to help verify its functionality.

Connect the rear panel AC power to the AC mains (90 to 264 V_{AC} , 47 to 63 Hz). Then:

- 1. Push the power button "in" to turn on the unit.
 - a. The model number will be briefly displayed
 - b. Then the firmware version and unit serial number
 - c. The unit will recall the its last operating state and begin operation

It is important to realize that the SG380 series signal generators resume operating with the same settings which were active when the unit was last turned off. There is a simple way to preset the instrument to a default state without changing any of the stored settings or the communications configuration: Notice that there is a "shifted function" above each key in the NUMERIC ENTRY portion of the key pad. To initialize the unit to its default settings, in the NUMERIC ENTRY section:

- 2. Press the [SHIFT] key
 - a. The SHIFT LED will turn "on"
- 3. Press the number [0] (whose shifted function is "INIT")
 - a. The display shows" init. PrESS EntEr"
- 4. Press the "ENTER" key (lowest, rightmost key [Hz % dBm])
 - a. The instrument will be set to its default state

The default setting displays the frequency (10 MHz) and sets the AMPL of the BNC and Type-N outputs to 0 dBm (1 mW into 50 Ω or 0.63 V_{PP}). Two green LEDs indicate that both the BNC and the Type-N outputs are active, and another LED shows that the modulation is "OFF". The "LOCK" LED in the REF/SYNTH section should be "ON" (as should the "EXT" LED if the unit is connected to an external 10 MHz reference.)

Connect the front panel outputs to an oscilloscope. The oscilloscope timebase should be set for 50 ns/div and vertical sensitivity 200 mV/div with DC coupling and 50 Ω input impedance. The displayed cycle period should be 100 ns (2 divisions) and the displayed amplitude should be 630 mV_{PP}. (The displayed amplitude will be twice that if the oscilloscope input is not set for 50 Ω .)

Here are some things to try:

- 1. Change the frequency to 5 MHz by pressing [5] then [MHz V_{PP}]
- 2. Press the SELECT [] key six times to select the 1 MHz digit
- 3. Press the ADJUST $[\Delta]$ key to increase the frequency
- 4. Press the [AMPL] key to display the power at the Type-N output
- 5. Press the ADJUST $[\Delta]$ key to increase the power by 1 dB
- 6. Press the [AMPL] key again to display the power at the BNC output
- 7. Press the [MHz V_{PP}] key to change the units from dBm to V_{PP} .
- 8. Press the ADJUST $[\Delta]$ key to increase amplitude by 0.100 V

Introduction

Feature Overview

The SG380 series of RF Signal Generators consists of three models. Each instrument is based on a new frequency synthesis technique which provides low phase noise, agile modulation, fast settling and virtually infinite frequency resolution. (See Appendix A for details on the Rational Approximation Frequency Synthesis technique.)

Each of the generators has two front panel outputs with overlapping frequency ranges. The frequency resolution is 1 μ Hz at all frequencies. The front panel BNC output spans DC to 62.5 MHz. The BNC output is DC coupled with an adjustable DC offset and provides sine wave outputs from 1 mV_{RMS} to 1 V_{RMS}.

The front panel Type-N connector provides outputs from 950 kHz to 2.025 GHz (for the SG382), or 4.050 GHz (for the SG384), or 6.075 GHz (for the SG386). This AC coupled output can provide power from -110 dBm to +16.5 dBm. A rear panel option extends the frequency range of the SG384 or SG386 to 8.1 GHz.

The SG380 generators have extensive modulation capabilities. The front panel outputs can be amplitude, frequency, phase or pulse modulated by internally generated waveforms (sines, ramps, triangles, pulse and noise) or by external sources. A rear panel option allows carrier frequencies above 400 MHz to be IQ modulated by external sources with more than 100 MHz of bandwidth.

The user interface provides single-key access to the most commonly adjusted synthesizer parameters (frequency, amplitude, phase, modulation rate and modulation deviation.) In addition, there are three standard communication interfaces (GPIB, RS-232 and LAN) which allow for all instrument parameters to be remotely controlled.

To assist in the development of high speed digital devices, a rear panel option provides differential clock outputs from DC to 4.05 GHz. These SMA outputs have 35 ps transition times and can be set to standard logic levels including ECL, PECL, RSECL, CML and LVDS.

The accuracy, stability and low phase noise of the SG380 series is supported by two outstanding timebases. The standard timebase uses a $3^{\rm rd}$ overtone, SC-cut ovenized 10 MHz resonator. In addition to its remarkable stability (<0.002 ppm 0° to 45°C), and low aging (<0.05 ppm/yr), this oscillator is responsible for the low phase noise close to carrier (-80 dBc/Hz at 10 Hz offset from a 1 GHz carrier) and its short term stability (1:10⁻¹¹ 1s root Allan variance).

An optional rubidium timebase reduces the frequency aging to <0.001 ppm/yr. This timebase (a SRS PRS10 rubidium frequency standard) also improves the frequency stability to <0.0001 ppm over 0° to 45° C.

The 10 MHz output from the internal timebase is made available on a rear panel BNC connector. The user can also provide a 10 MHz timebase via a rear panel external timebase input.

Front-Panel Overview

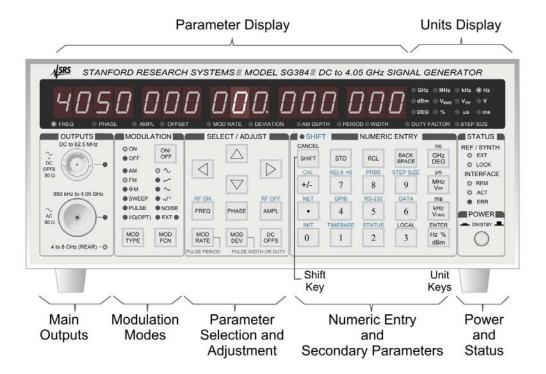

Figure 1: The SG384 Front Panel

The front panel operation of each SG380 series RF Signal Generator is virtually the same, with the only substantial difference being the model number and the maximum operating frequency.

The front panel is divided into seven sections: Parameter Display, Units Display, OUTPUTS, MODULATION, SELECT/ADJUST, NUMERIC ENTRY, and STATUS.

The power switch is located in the lower right corner of the front panel. Pushing the switch enables power to the instrument. Pushing the switch again places the instrument in stand-by mode, where power is enabled only to the internal timebase.

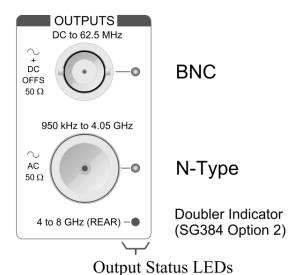

Parameter and Units Display

The front panel has a sixteen digit display showing the value of the currently displayed parameter. The LEDs below the display indicate which parameter is being viewed. Error messages may also appear in the display, briefly.

The Units Display highlights the units associated with a parameter. Note that a given parameter may have multiple views. For example, the RF output amplitude may be viewed in units of dBm, V_{RMS} , or V_{PP} .

Main Output

These are the synthesizer's main signal outputs. Two types of connectors are provided due to the bandwidths covered by the instrument.

BNC Output

Signals on this connector are active for frequency settings between DC and 62.5 MHz. The amplitude may be set independently for levels from 1 mV_{RMS} to 1 V_{RMS} (–47 dBm to 13 dBm). Increase amplitude setting of 1.25 V_{RMS} (14.96 dBm) are allowed with relaxed signal specifications. Additionally, the BNC output may be offset by \pm 1.5 V_{DC}, however non-zero offsets will reduce the maximum amplitude setting. The BNC output is protected against externally applied voltages of up to \pm 5 V.

Type-N Output

Signals on this connector are active for frequency settings between 950 kHz and 2.025 GHz, 4.050 GHz, or 6.075 GHz (for the SG382, SG384 and SG386 respectively). The output power may be set from -110 dBm to 16.5 dBm (0.7 μV_{RMS} to 1.5 V_{RMS}). The maximum output power is reduced by 3.50 dB/GHz above 3 GHz for the SG384, or by 3.25 dB/GHz above 4 GHz for the SG386. The Type-N output is protected against externally applied voltages of up to 30 V_{DC} and RF powers up to +25 dBm.

Indicators

Three LEDs are used to indicate which of the outputs are active: BNC, Type-N, and the 4 to 8 GHz (REAR) Doubler. (There is no doubler option available for the SG382). The Doubler LED is lit only when Option 2 is installed and when the frequency is greater than 4.05 GHz (for the SG384) or above 6.075 GHz (for the SG386).

Modulation Modes

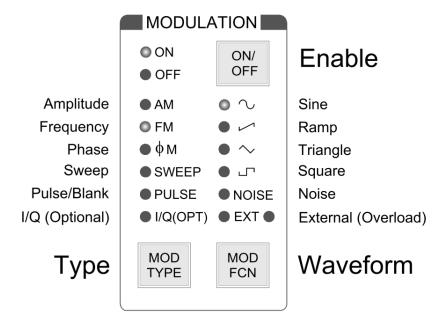

The Modulation section displays the present modulation state and enables the user to control both the type and function of the modulation.

The [ON/OFF] key enables modulation.

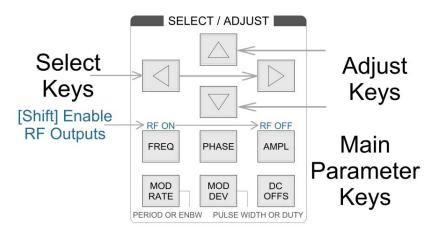

The [MOD TYPE] key allows selection of the type of modulation (via the ADJUST \triangle and ∇ keys). The types of modulation available are AM, FM, Φ M, Sweep, and Pulse. IQ modulation from an internal noise generator, or from external sources, is available as an option.

The [MOD FCN] key allows the selection of the modulation waveform (via the ADJUST \triangle and ∇ keys). The available waveforms include sine, ramp, triangle, square wave, and noise.

The rear panel external modulation input can also be used in AM, FM, Φ M or Pulse modulations. When the external source is selected, the signal level is monitored. If the external source exceeds operational limits the overload LED turns on and remains on until the condition is removed.

Parameter Selection and Adjustment

Display Navigation

The SELECT/ADJUST section determines which main parameter is shown on the front panel display. The six basic displays for viewing and modifying instrument settings are shown in Table 1. Each display is activated by pressing the correspondingly labeled key.

FREQ Frequency (f_c)

PHASE Phase

AMPL Amplitude – sequences through outputs

DC OFFS Offset – sequences through the outputs

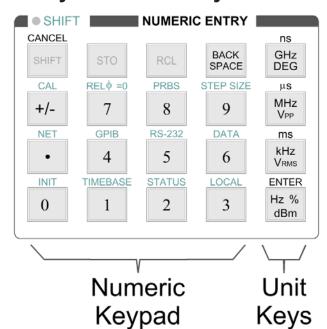

MOD RATE Modulation Rate (Pulse Period or ENBW)

MOD DEV Modulation Deviation (Pulse Width or Duty)

Table 1: Main Parameter Keys

For Parameter menus with multiple items, repeatedly pressing the Parameter key allows cycling through all of its parameters. For example, in the default configuration multiple key presses of the [AMPL] key will cycle through the various available outputs BNC, Clock, and Type-N.

Some of the parameters will have a blinking digit (the cursor). The cursor indicates which digit will be modified when the ADJUST \triangle and ∇ keys are pressed. The SELECT \triangleleft and \triangleright keys allow adjusting the cursor for the desired resolution. The step size may also set using a shifted function and a numeric entry (to set channel spacing, for example.)

Numeric Entry and Secondary Parameters

This section is used for changing the currently displayed numeric parameter directly. A parameter is entered numerically and completed by pressing any of the unit keys. Corrections can be made using the BACK SPACE or the entire entry may be aborted by pressing the CANCEL key.

For example, to set the frequency to 1.0001 GHz, press the [FREQ] key followed by the key sequence of $[1][\bullet][0][0][1][GHz$.

This section also allows access to secondary (or "Shifted") functions. The secondary functions are listed above the key in light blue text. A secondary function is accessed by first pressing the SHIFT key (indicated by the SHIFT LED being on) followed by pressing the desired secondary function key.

For example, to set the incremental value for frequency to 12 kHz press [FREQ] [SHIFT] [9 (STEP SIZE)], followed by the sequence [1] [2] [kHz].

Numeric or SHIFT entries may be CANCELed at any time by pressing the SHIFT key.

Stepping Up and Down

Most instrument settings can be stepped up or down by a programmed amount. The blinking digit identifies the current cursor position and step size. The cursor shows the digit that will change if the parameter is incremented or decremented via the ADJUST keys. Pressing the ADJUST \triangle (∇) key causes the displayed parameter to increment (decrement).

Step Size

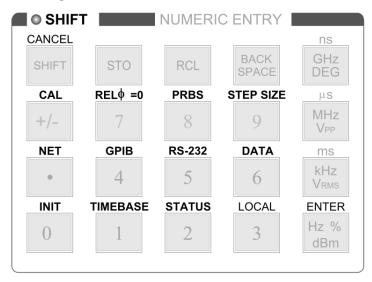

Pressing the ADJUST \triangle and ∇ keys increments or decrements the value of the selected digit on the numeric display (to change the selected digit use the SELECT \triangleleft and \triangleright keys). To view the step size use SHIFT [9] (STEP SIZE).

The step size can be changed using the numeric keypad followed by the appropriate unit. To set the step size to an arbitrary value use SHIFT [9] and enter the desired step size followed by the appropriate unit type. For example, to change the frequency's step size to 1.25 MHz, first press [Shift] then [9] followed by 1.25 and finally the [MHz] unit key. When the cursor is changed to another digit (using the SELECT \triangleleft or \triangleright keys) the step size returns to its default value.

Store and Recall Settings

The [STO] and [RCL] keys are for storing and recalling instrument settings, respectively. Instrument settings include modulation configuration and all associated step sizes. Up to nine different instrument settings may be stored in the locations 1 to 9. To save the current settings to location 5, press the keys [STO], [5], [ENTER], sequentially. To recall instrument settings from location 5, press the keys [RCL], [5], [ENTER] sequentially. Note: the INIT key is used to recall default instrument settings. See Default Factory Settings in the Operations chapter for additional details.

Secondary Functions

Many of the keys in the NUMERIC ENTRY section have secondary (or SHIFT) functions associated with them. The secondary functions are listed above the keys. The [5] key, for example, has RS-232 above it. The meaning of the secondary functions is summarized in Table 2.

Table 2: Secondary Functions

Label	Primary Key	Function Description	
CAL	+/-	Adjust the timebase, and selects the PLL filter mode	
REL Φ=0	7	Defines the current phase to be 0 degrees and displays phase	
PRBS	8	Allows access to the length of the Pseudo-Random Binary Sequence generator	
STEP SIZE	9	Set the incremental value used by the ADJUST keys	
NET	•	Configure the Ethernet interface	
GPIB	4	Configure the GPIB interface	
RS-232	5	Configure the RS-232 interface	
DATA	6	Display the most recent data received over any of the remote interfaces	
INIT	0	Load default instrument settings	
TIMEBASE	1	Displays the installed timebase and its status	
STATUS	2	View TCP/IP (Ethernet), error, or instrument status, as well as running Self-Test	
LOCAL	3	Go to local. Enables front panel keys if in remote mode.	

A more detailed description of each of the secondary functions is given in the Secondary Functions section of the Operation chapter.

The secondary functions can only be accessed when the shift mode is active, which is indicated by SHIFT LED in the main display. The SHIFT mode can be toggled on and off by pressing the [SHIFT] key. For example, to configure the PRBS length, press [SHIFT] [8] to access the PRBS secondary function.

For menu items with multi-parameter settings, the SELECT \triangleleft and \triangleright keys allow selection of the various menu items. The ADJUST \triangle and ∇ keys may be used to modify a parameter. For example, the first option in the NET menu is TCPIP ENABLE/DISABLE. Use the ADJUST \triangle and ∇ keys to change the setting as desired. Then press SELECT \triangleright to move to the next option which is DHCP ENABLE/DISABLE. Continue pressing the SELECT \triangleright until all TCPIP settings have been configured as desired.

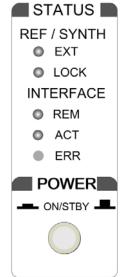

Cancel

The [SHIFT] key also functions as a general purpose CANCEL key. Any numeric entry, which has not been completed, can be canceled by pressing the [SHIFT] key. Because of the dual role played by the SHIFT key, the user may have to press [SHIFT] twice to reactivate SHIFT mode. The first key press cancels the current action, and the second key press re-activates SHIFT mode.

Power and Status

The Power and Status section encompass the power switch and displays the status of the timebase and remote interface(s):

Status Indicators

REF / SYNTH

In the upper right portion of the front panel are two groups of LED indicators. The upper group is labeled REF / SYNTH and indicates the status of the internal timebase. The EXT LED indicates that the instrument has detected an external 10 MHz reference at the timebase input BNC on the rear panel. If detected, the instrument will attempt to lock its internal clock to the external reference.

The LOCK LED indicates that unit has locked its internal frequency synthesizer at the requested frequency. Normally this LED will only extinguish momentarily when the frequency changes or an external timebase is first applied to the rear input. If the LED stays off, it indicates that the signal generator may be unable to lock to the external timebase. This is most commonly caused by the external frequency being offset by more than 2 ppm from 10 MHz.

INTERFACE

The lower group of LED indicators is labeled INTERFACE. These LEDs indicate the current status of any active remote programming interface (Ethernet, RS-232, or GPIB).

The REM (remote) LED turns on when the unit is placed in remote mode by one of the remote interfaces. In this mode, all the front panel keys are disabled and the instrument

can only be controlled via the remote interface. The user can return to normal, local mode by pressing the [3] key (also labeled [LOCAL]). The ACT (activity) LED flashes when a character is received or sent over one of the interfaces. This is helpful when troubleshooting communication problems. If a command received over the remote interface fails to execute due to either a parsing error or an execution error, the ERR (error) LED will turn on. Information about the error is available in the STATUS secondary display.

POWER

The power switch has two positions: STANDBY (button out) and ON (button in).

In STANDBY mode, power is only supplied to the internal timebase and the power consumption will not exceed 25 watts. In ON mode, power is supplied to all circuitry but the power consumption will not exceed 90 watts.

Rear-Panel Overview

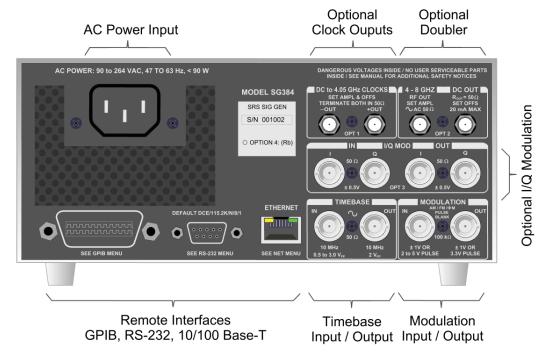

Figure 2: The SG384 Rear Panel

The rear panel provides connectors for AC power, remote computer interfaces, external frequency references, and various additional options.

AC Power

Connect the unit to a power source through the power cord provided with the instrument. The center pin is connected to the chassis so that the entire box is earth grounded. The unit will operate with an AC input from 90 to 264 V, and with a frequency of 47 to 63 Hz. The instrument requires 90W and implements power factor correction. Connect only to a properly grounded outlet. Consult an electrician if necessary.

Timebase

10 MHz IN

This input accepts an external 10 MHz reference. The external reference should be accurate to at least 2 ppm, and provide a signal of no less than 0.5 V_{PP} while driving a 50 Ω impedance. The instrument automatically detects the presence of an external reference, asserting the front panel EXT LED, and locking to it if possible. If the unit is unable to lock to the reference, the LOCK LED is turned off.

10 MHz OUT

The instrument also provides a 10 MHz output for referencing other instrumentation to the internal high stability OCXO or optional Rubidium Timebase.

Remote Interfaces

The instruments support remote control via GPIB, RS-232, or Ethernet. A computer can perform any operation that is accessible from the front panel. Programming the instrument is discussed in the Remote Programming chapter. Please refer to the respective Remote Programming Configuration section before attempting to communicate with the signal generators via any computer interface.

GPIB

The signal generators have a GPIB (IEEE-488) communications port for communications over a GPIB bus. The instruments support the IEEE-488.1 (1978) interface standard. It also supports the required common commands of the IEEE-488.2 (1987) standard.

RS-232

The RS-232 port uses a standard 9 pin, female, subminiature-D connector. It is configured as a DCE and supports baud rates from 4.8 kb/s to 115 kb/s. The remaining communication parameters are fixed at 8 Data bits, 1 Stop bit, No Parity, with RTS/CTS configured to support Hardware Flow Control.

Ethernet

The Ethernet uses a standard RJ-45 connector to connect to a local area network (LAN) using standard Category-5 or Category-6 cable. It supports both 10 and 100 Base-T Ethernet connection and a variety of TCP/IP configuration methods.

Modulation

IN

External modulation is applied to this input. The input impedance is $100 \text{ k}\Omega$ with a selectable input coupling of either DC or AC (4 Hz roll off).

For analog modulations (AM, FM, Φ M), a signal of ± 1 V will produce a full scale modulation of the output (depth for AM or deviation for FM and Φ M). It supports bandwidths of 100 kHz and introduces distortions of less than -50 dB.

For Pulse/Blank modulation types, this input is used as a discriminator that has a fixed threshold of +1 V.

OUT

This output replicates the modulation waveform and has a 50 Ω reverse termination. When using the internal source for AM, FM, and Φ M, it provides a waveform determined by the function and rate settings with an amplitude of ± 1 V_{PP} into a high impedance. During external analog modulation, this output mirrors the modulation input.

For Pulse modulation, the output is a 3.3V logic waveform that coincides with the gate signal.

Rear-Panel Optional Outputs

Two rear panel options are available on the SG382: a high speed clock outputs and IQ modulator inputs for the Type-N output. In addition, a frequency doubler for extending the frequency output to 8.1 GHz is available for the SG384 and SG386.

Option 1: Clock Outputs

The clock outputs provide a digital representation of the synthesized signal for frequencies up to 4.05 GHz on a pair of SMA type connectors. The outputs are differential signals with transition times of 35 ps (20 % to 80 %). They are adjustable for amplitudes from 0.40 to 1.00 V, offsets of ± 2 V, with a resolution of 5 mV. The amplitude and offsets are set with the front panel AMPL and DC OFFS keys.

For frequencies above 62.5 MHz (93.75 MHz for the SG386), the jitter on the clock signals will be less than 300 fs with a measurement bandwidth of 5 kHz to 5 MHz. For frequencies below 62.5 MHz (93.75 MHz for the SG386) the rms jitter will be less than $0.01 \% \times U.I$ (Unit Interval).

Option 2: 8 GHz Frequency Doubler

This option extends the frequency range to 8.1 GHz with power levels of up to 16.5 dBm. A DC output port is available for providing biasing of external circuits. Both of these signals use SMA type connectors.

RF OUT

This output is operational for frequencies from 4.05 to 8.1 GHz (on the SG384) or 6.075 GHz to 8.1 GHz (on the SG386). This output is AC coupled and is adjustable over a range of -10 to +16.5 dBm. The frequency is set with the front panel FREQ key and the amplitude is set with the front panel AMPL key. The RF output supports FM, Φ M, and SWEEP modulation.

DC OUT

This output provides DC voltage which is settable over a \pm 10 V range with 5 mV of resolution. Output currents should be limited to \pm 20 mA. The output voltage is set via the front panel DC OFFS key.

Option 3: I/Q Modulator

This option allows I/Q modulation on the front panel Type-N RF output for output frequencies above 400 MHz. Either an external source or the internal noise source may be selected via the MOD FCN key in the front panel MODULATION section.

I/Q IN

These inputs accept signals of ± 0.5 V, corresponding to full scale modulation, and have 50Ω input impedances. Both inputs support signal bandwidths from DC to 100 MHz.

I/Q OUT

These outputs duplicate the I/Q modulation waveforms (internally or externally). All I/Q signals utilize BNC connectors located on the rear panel.

Operation

Introduction

The previous chapter provided an overview of the instrument's features. This section describes the setting of the frequency, phase, amplitude, offset as well as the details of modulation, storing and recalling setups, and configuration of the computer interfaces.

Power-On

At power on, the unit will briefly display the model number followed by the firmware version and the unit serial number. When power on initialization has completed, the instrument will recall the last operational settings from nonvolatile memory.

The instrument continuously monitors front panel key presses and will save the current instrument settings to nonvolatile memory after approximately five seconds of inactivity. To prevent the nonvolatile memory from wearing out, the unit will not automatically save instrument settings that change due to commands executed over the remote interface. The remote commands *SAV (*RCL) may be used to explicitly save (recall) instrument settings over the remote interface, if desired. (See the Remote Programming section for more information about these commands.)

The signal generator can be forced to revert to factory default settings. This is accomplished by power cycling the unit with the [BACK SPACE] depressed. All instrument settings, except for the remote interface configurations, will be set back to their default values. All calibration bytes will be reset to the values set at the most recent calibration. See the Factory Default Settings section for a list of default settings.

Setting Parameters

The SELECT/ADJUST section determines which parameter is shown in the main front panel display. The six keys for selecting the display of the main instrument settings are shown in Table 3. Each display is activated by pressing the corresponding labeled key.

SELECT KeyDisplayed ValueFREQFrequency (carrier or center frequency if modulating)PHASEPhase of BNC or Type-N outputsAMPLAmplitude or Power – Type-N, BNC, Clock, DoublerDC OFFSOffset – BNC, Clock, Rear DC OutputMOD RATEModulation Rate, Pulse Period or noise bandwidthMOD DEVModulation Deviation, Pulse Width or Duty Factor

Table 3: Main Display Parameters

6.075 to 8.10 GHz

Frequency

Pressing [FREQ] displays the output frequency and turns on the FREQ LED. The frequency may be entered in any of the following units: GHz, MHz, kHz, or Hz. For example, to set the frequency to 5 MHz press the [FREQ] key then press [5] [MHz]. The frequency resolution is 1 μ Hz at all frequencies. The units for the displayed frequency may be changed by pressing the desired unit key. For example, to change the display from units of MHz to Hz simply press the [Hz] key.

The frequency setting determines which outputs may be active at any given time. The green LED next to the front panel outputs indicate which outputs are enabled. (The output is also "off" if its amplitude is set below the minimum amplitude for the output.) None of the outputs operate across the entire frequency range. Table 4 shows the frequency ranges for each output connector for all models in the series.

SG382 SG384 Model SG386 DC-62.5 MHz DC-62.5 MHz DC-62.5 MHz **Front BNC** 950 kHz to 2.025 GHz 950 kHz to 4.050 GHz 950 kHz to 6.075 GHz Type-N DC to 2.025 GHz DC to 4.05 GHz DC to 4.05 GHz **Rear SMA Clocks**

Not available

Table 4: Frequencies of Operation

4.05 to 8.10 GHz

Phase

Rear SMA Doubler

Pressing [PHASE] displays the output's phase and turns on the display PHASE LED.

The phase is displayed in degrees and is adjustable over \pm 360°. If the phase adjustment exceeds 360°, the phase is displayed modulo 360°. The displayed phase is set to 0° whenever the output frequency is changed.

The phase resolution depends upon the current setting of the frequency. For the frequencies up to 100 MHz the phase resolution is 0.01°, with reduced resolution for higher frequencies. Table 5 shows the phase resolution verses frequency:

Table 5: Phase Resolution

Frequency Range	Phase Resolution
DC to 100 MHz	0.01°
100 MHz to 1 GHz	0.1°
1 GHz to 8.1 GHz	1.0°

Rel Phase

In many situations it is useful to be able to define the present phase setting as 0° . The REL Φ =0 function ([SHIFT] [7] keys) will "REL" the phase display to zero without any change of the output's phase.

When you change the phase setting, you change the phase of all outputs from the synthesizer. This sometimes makes it difficult to see that you have done anything at all.

Phase adjustments are usually only made when there are more than one signal source in a measurement situation. For example, if you have two RF synthesizers, each connected to the same external 10 MHz timebase and set to the same frequency, you will be able to see their relative phase by viewing them simultaneously on an oscilloscope or by applying them both to a mixer and measuring the mixer's IF output.

You can also see phase changes (for frequencies which are a multiple of 10 MHz) by viewing the signal on an oscilloscope while triggering the oscilloscope from the rear panel 10 MHz timebase output.

You can also see the phase adjustment by viewing the RF signal on a polar display of a vector signal analyzer. (It will be important that the vector signal analyzer and the RF synthesizer share the same timebase.)

Amplitude and Power

Pressing [AMPL] displays the output amplitude or power and turns on the "AMPL" LED.

The amplitude has a value for each of the installed outputs, and repeated pressing of [AMPL] sequences through the amplitude for each output (Type-N, BNC, Clock, and RF Doubler). Note however, that only those outputs that are active for the current frequency setting will be accessible. If an output is set below its minimum value it will be disabled. This is indicated on the display as "off" and by extinguishing the LED which is next to the output.

All amplitudes (except for clock) may be displayed in units of dBm, V_{RMS} , or V_{PP} , with clock being restricted to V_{PP} . All stated values assume a load termination of 50 Ω . Output amplitudes will (approximately) double if not terminated.

The units used for the displayed power or amplitude may be changed with a single key press. For example, if the Type-N output power is displayed as 0.00 dBm, pressing the $[V_{RMS}]$ key will display 0.224 V_{RMS} and pressing the $[V_{PP}]$ key will display 0.632 V_{PP} .

Table 6 lists the range for the various units of the outputs:

Amplitude (V_{RMS}) Output Power Amplitude (V_{PP}) $-110 \text{ dBm} \rightarrow +16.5 \text{ dBm}$ $0.707 \mu \rightarrow 1.50 V_{RMS}$ $2 \mu \rightarrow 4.24 V_{PP}$ Front Type-N (1) (2) $.0028 \rightarrow 2.82 \text{ V}_{PP}$ Front BNC (3) $-47 \text{ dBm} \rightarrow +13 \text{ dBm}$ $0.001 \rightarrow 1.000 V_{RMS}$ -10 dBm \rightarrow +13 dBm $0.0707 \rightarrow 1.000 V_{RMS}$ Rear Doubler (4) $0.200 \rightarrow 2.82 \text{ V}_{PP}$ Rear Clocks N.A. N.A. $0.40 \text{ V}_{PP} \rightarrow 1.00 \text{ V}_{PP}$

Table 6: Output Power Ranges

- (1) For the SG384 the maximum power is reduced by 3.50 dB/GHz above 3 GHz. (The maximum power available at 4 GHz is 13 dBm.)
- (2) For the SG386 the maximum power is reduced by 3.25 dB/GHz above 4 GHz. (The maximum power available at 6 GHz is 10 dBm.)
- (3) The AMPL of the BNC may be set as high as $1.25~V_{RMS}$ (+14.96 dBm), with reduced distortion specifications, provided that the BNC DC offset is set to 0~V.
- (4) The maximum specified power from the rear panel SMA doubler output is reduced to +7 dBm above 7 GHz. Over range power up to 16.5 dBm may be achieved at lower frequencies.

DC Offset

Pressing [DC OFFS] displays output offset voltages and turns on the display OFFSET LED.

On the front panel, only the BNC output has a settable DC offset. The Type-N RF output is AC coupled and so has no DC offset setting.

There are two rear panel options which also use DC offset settings: The DC offset on the differential clock outputs (Option 1) and the DC OUT bias source (which is included with Option 2, the RF doubler).

All three DC offsets are accessed by pressing the [DC OFFS] key repeatedly. The DC offsets for the front panel BNC, the rear panel differential clock outputs, and the rear panel DC OUT bias source are always accessible and active (independent of the frequency setting).

All DC offsets are displayed in V_{DC} . Table 7 gives the DC offset range for the various outputs:

	_
Output	DC Offset Range
Type-N	N/A
BNC	±1.5V
Rear DC Offset	±10V
Clock	±2V

Table 7: Offset Range

The BNC output will support offsets up to 1.5V. The BNC's output is very linear over $\pm 1.9V$ while driving a 50 Ω load. To maintain low distortion of AC signals in the presence of a DC offset it is necessary to reduce the amplitude of the AC signal. The output provides 13 dBm (2.828 V_{PP}) at no offset, and is reduced linearly to 0 dBm (0.632 V_{PP}) for offsets of ± 1.5 V. Table 8 shows the allowed amplitude (or power settings) for the BNC output for various DC offsets:

Table 8: BNC Output vs. DC Offset

BNC DC Offset	Max Output (V _{PP})	Max Output (V _{RMS})	Max Output (dBm)
0.00 V	$2.83~\mathrm{V_{PP}}$	$1.00 V_{RMS}$	13.01 dBm
±0.25 V	2.46 V _{PP}	$0.871~\mathrm{V_{RMS}}$	11.81 dBm
±0.50 V	$2.10~\mathrm{V_{PP}}$	$0.741~\mathrm{V_{RMS}}$	10.41 dBm
±0.75 V	1.73 V _{PP}	$0.612~\mathrm{V_{RMS}}$	8.75 dBm
±1.00 V	$1.37~\mathrm{V_{PP}}$	$0.483~\mathrm{V}_\mathrm{RMS}$	6.69 dBm
±1.25 V	0.998 V _{PP}	$0.353~\mathrm{V_{RMS}}$	3.97 dBm
±1.50 V	$0.634~\mathrm{V_{PP}}$	$0.224~\mathrm{V_{RMS}}$	0.02 dBm

RF ON/RF OFF

These are shifted functions of the [FREQ] and [AMPL] keys, respectively. Press the [SHIFT] key (which lights the SHIFT LED) followed by the [AMPL] key to turn the RF "off", and press the [SHIFT] key followed by the [FREQ] key to turn the RF "on".

The RF ON and RF OFF key presses cause a momentary display of "rf on" / "rf off" on the main display, and the status LEDs for the outputs are set or cleared accordingly.

The [RF OFF] turns off all RF outputs, while setting the clock output to a static "off" state (+OUT to "low", -OUT to "high"). When an output is selected that is "off" the display will indicate the off status. For example, selecting the Type-N amplitude would display "ntype off" on the main display.

The [SHIFT] [RF ON] returns all RF outputs to their previously active levels.

Modulation and Sweeps

Introduction

This section describes the instrument's modulation capabilities. The SG380 series signal generators have powerful and flexible built-in modulation functions, capable of AM, FM, ΦM, frequency sweeps, Pulse, and I/Q modulation.

The modulation waveform may be an internally generated sine wave, square wave, pulse, ramp, triangle, noise, or, may be externally sourced via a rear panel BNC input. A rear panel BNC connector outputs the modulation waveform with a full scale range of $\pm 1.00~\rm{V}$.

In addition, signal generators with Option 3 have wideband I-Q modulation. The rear panel BNC I-Q modulation inputs and outputs have >100 MHz bandwidth, ± 0.5 V full scale range, and 50 Ω impedance.

Modulation Section

This section controls the modulation of the front panel Type-N and BNC outputs and can provide FM, Φ M, Sweep modulation for the optional rear panel doubler output to 8.10 GHz. The modulation is turned "on" or "off", and the modulation type (AM, FM, etc.), and the modulation function (sine, ramp, etc.), are selected in this section.

Modulation On/Off

The [ON/OFF] key toggles the modulation on/off and the current state is reflected by the MODULATION ON/OFF LEDs. Make sure that modulation is "OFF" if you want a CW (unmodulated) output for the signal generator. If the signal generator ever manifests "unexpected behavior" check the modulation status: Unintentionally enabling the modulation will give unexpected results.

Modulation Type

The [MOD TYPE] key allows the selection of which type of modulation will be applied to the synthesizer's output. The ADJUST \triangle ∇ keys are used to select the desired modulation type and the current selection is indicated with an LED. The types of modulation available are AM, FM, Φ M, Sweep, and Pulse. Optional I/Q modulation is also available if Option 3 is installed.

Modulation Function

The [MOD FCN] key selects one of the various functions used as the modulation waveform. The ADJUST $\triangle \nabla$ keys are used to select the desired modulation function. The current selection is indicated with an LED.

For all modulation types the rear panel external modulation source may be used. When Option 3 is installed, the I/Q modulation supports separate inputs for the I and Q signals.

Not all modulation types support all modulation functions. Table 9 shows which modulation types support which functions:

Function Type	Sine	Ramp	Triangle	Square	Noise	External
AM / FM / ΦM	✓	✓	✓	✓	✓	✓
Sweep	✓	✓	✓			✓
Pulse				✓	✓	✓
I/Q (Optional)					✓	✓

Table 9: Modulation Type vs. Function

Modulation Rate

The [MOD RATE] and [MOD DEV] keys are paired in operation and their parameters depend upon the current modulation type and function settings.

Pressing [MOD RATE] displays the modulation rate associated with the current modulation type and turns on either the MOD RATE (for AM/FM/PM and sweep) or the PERIOD (for pulse/blank) LEDs.

For the standard (AM/FM/ Φ M) and sweep modulation types, this parameter is the frequency of the applied modulation waveform. The allowable range depends on both the type of modulation and the frequency selected.

For pulse modulation, this selects the period of the pulses which modulate the carrier. The pulse period is settable in 5ns increments from 1 μ s to 10 s.

For I/Q noise modulation (available with Option 3) this key sets the equivalent noise bandwidth (ENBW) of the internal generated noise source. The ENBW may be set from 1 μ Hz to 500 kHz.

Modulation Deviation

Pressing [MOD DEV] displays the deviation of the current modulation function. Depending on the modulation type, either the MOD DEV, AM DEPTH, WIDTH, or DUTY FACTOR is displayed.

During AM modulation, the AM depth is displayed and corresponds to the peak percentage of the output envelope deviation. For example, if the amplitude is set to 1 V_{PP} and the AM DEPTH is set for 50%, the amplitude envelope would span from 0.5 V to 1.5 V.

During FM and sweep modulations, the deviation corresponds to the peak frequency excursion applied to the carrier. For example, if the carrier is set to 1.1 MHz and the deviation is set to 0.1 MHz, the carrier will span between 1 MHz and 1.2 MHz.

During ΦM modulation, the deviation corresponds to the peak phase excursion applied to the carrier. For example, if the deviation is set to 10° , then the carrier's phase deviation will span $\pm 10^{\circ}$.

During pulse/blank modulation, deviation allows the pulse width or duty factor to be changed. This parameter may be either a time ("t on" for pulse or "t_off" for blank) or a duty factor. For example, for a 1 µs pulse period, a width of 500 ns or a duty factor of 50% would be equivalent, and result in the output being on for 50% of the 1 µs period.

Modulation Waveform Generator, Inputs and Outputs

The instrument's modulation capabilities include both internal and external modulation sources. The modulating waveform is replicated on the rear panel Modulation Output connector.

Linear Modulation

For AM / FM / Φ M, and Sweep, the modulation source can be either the internal generator or the rear panel external modulation input.

The internal modulation source is capable of generating sine, ramps, triangular, or square waves, at frequencies of up to 500 kHz. The instrument limits the modulation rate to 50 kHz for carrier frequencies above 62.5 MHz (93.75 MHz for the SG386).

The rear panel external modulation input supports bandwidths of 500 kHz, but the modulation bandwidth is limited to 100 kHz for $f_{\rm C}$ greater than 62.5 MHz (93.75 MHz for the SG386). The sensitivity is set such that a 1 V signal results in a full scale deviation (depth) in the output. For example: in Φ M, if the deviation is set for 10°, applying a level of -1 V produces a -10° shift; applying 0 V produces no shift; and applying +1 V produces a $+10^{\circ}$ shift.

When modulation is enabled using an internal source, the rear panel modulation output will provide a waveform of the selected function with a full scale range of ± 1 V. When external modulation is selected the modulation output tracks the applied signal.

Pulse Modulation

There are two modes of pulse modulation: Pulse and Blank. The mode is shown in the main display and is selected with the ADJUST $\triangle \nabla$ keys after [MOD TYPE] is pressed.

In Pulse Mode, the RF signal is turned "on" by the internally generated or externally applied signal. In Blank Mode, the RF signal is turned "off" by the internally generated or externally applied signal.

The internal pulse modulation source is a digital waveform whose period and "on" time is settable from 1 μs to 10 s with 5 ns of adjustability. The period of the digital waveform is set via the [MOD RATE] key. The "on" time (for Pulse Mode) or "off" time (for Blank Mode) is set via the [MOD DEV] keys.

When an external input is selected the rear panel external modulation input is set for a threshold of 1V. The resulting signal is used in place of the internal source.

In Pulse and Blank Modes, the modulation output is a 3.3 V logic signal, which tracks the pulse waveform.

Linear Noise Modulation

For AM, FM and Φ M, the noise source is pseudo random additive white Gaussian noise (AWGN). The bandwidth of the noise is set by the [MOD RATE] and the RMS deviation is set by the [MOD DEV].

The peak deviation will be about five times the set RMS deviation. This forces limits on the maximum allowed deviation corresponding to one fifth of the non-noise counterparts. For example, at a carrier frequency of 500 MHz the maximum FM deviation for a sine wave function is limited to 4 MHz, and so the maximum deviation for noise modulation is limited to 800 kHz.

For linear modulation, the rear panel output will provide 200 mV_{RMS} that will be band limited to the selected modulation rate. Again, the peak deviation will be five times this, or $\pm 1~V_{PP}$.

Pulse Noise Modulation

For pulse modulation, the noise source is a Pseudo Random Bit Sequence (PRBS). The bit period is set by the [MOD RATE]. The PRBS supports bit lengths of 2^n , for $5 \le n \le 19$ which correspond to a noise periodicity from 31 to 524287 periods. The bit length n is set via the [Shift] [PRBS or 8] key.

During pulse PRBS modulation, the rear panel output will be a 3.3 V_{PP} waveform with a duty factor equal to $2^{n/2}/2^{n-1}$ (approximately 50 %).

Modulation Output

A rear panel BNC provides a copy of the modulation function with ± 1 V full scale range. This output will be a sine, ramp, triangle, square wave, pulse or noise depending on the selected internal modulation function.

When an external source is applied to the modulation input it will be bandwidth limited, digitized, and reproduced at the modulation output. The transfer function has a bandwidth of about 1 MHz and a latency of about 950 ns.

The modulation output is a useful source even when the RF capabilities of the instrument are not required. The sine output is exceptionally clean, with a spur-free dynamic range typically better than -80 dBc. It can be used as a pulse generator with 5 ns timing resolution, or a PRBS generator. It is a very convenient noise source, with adjustable ENBW from 1 μ Hz to 500 kHz.

The modulation output has a 50 Ω source impedance (to reverse terminate reflections from the user's load) but the output should not be terminated into 50 Ω .

Amplitude Modulation

The amplitude modulation can use either the internal modulation generator or an external source. The internal modulator can generate sine, ramp, triangle, square, or noise waveforms. Amplitude modulation is not applied to the optional rear panel doubler output or to the rear panel clock outputs.

Setting up Amplitude Modulation:

Modulation Type

Press the [MOD TYPE] key and use the ADJUST \triangle ∇ keys to select AM.

Modulation Function

Press the [MOD FCN] key and use the ADJUST $\triangle \nabla$ keys to select the desired modulation function (sine, ramp, triangle, square, noise or external).

Modulation Rate

For internally generated modulation functions, pressing [MOD RATE] displays the modulation rate and turns on the MOD RATE LED. The value may be set using the SELECT/ADJUST arrow keys or via a numeric entry and one of the [MHz] [kHz] or [Hz] unit keys.

The internal modulation supports rates of 50 kHz for f_C above 62.5 MHz (93.75 MHz for the SG386) or 500 kHz for f_C less than or equal to 62.5 MHz (93.75 MHz for the SG386). The Modulation rate supports 1 μ Hz of resolution at all frequencies.

External modulation supports bandwidths of 100 kHz.

Modulation Depth

Press [MOD DEV] to display and set the AM modulation depth, which also lights the AM DEPTH LED. The value may be set using the numeric entry and [%] unit keys, or using the SELECT/ADJUST arrow keys. This value has a range of zero to 100 % with a 0.1 % resolution.

A modulation depth of X percent will modulate the amplitudes by $\pm X$ percent. As an example, if the amplitude is set for 224 mV_{RMS} (0 dBm), with a modulation depth of 50%, the resulting envelope would traverse 112 to 336 mV_{RMS}.

NOTE: The outputs are limited to 1 V_{RMS} (+13 dBm). If the modulation is increased such that the peak envelope would exceed this limit, the amplitude will be automatically reduced, and the screen will momentarily display "output reduced".

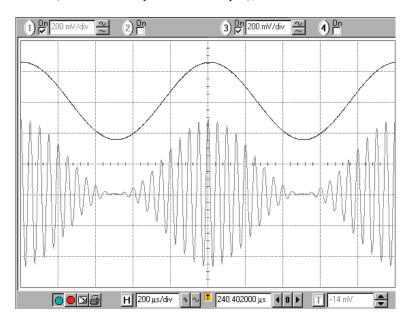

Modulation On/Off

Press the [ON/OFF] key to turn the modulation "ON".

Amplitude Modulation Example

Illustrated below is an example of amplitude modulation. A 20 kHz carrier, with amplitude of 1 V_{PP} into 50 Ω , is being amplitude modulated by an internally generated sine wave. The modulation rate is 1 kHz and the modulation depth is 100%.

Two traces are shown below. The upper trace is the 1 kHz modulation waveform (from the rear panel Modulation Output BNC), offset up two divisions. The lower trace is the modulated carrier (from the front panel BNC output), offset down one division.

Waveform 9: Amplitude modulation of a 20 kHz carrier

Frequency Modulation

The internal modulation generator or an external source may be used to modulate the frequency outputs from the front panel BNC, Type-N and (optional) rear panel RF doubler output. The internal modulator can generate sine, ramp, triangle, square, or noise waveforms.

During FM, the output frequency traverses $f_C \pm MOD$ DEV at the specified MOD RATE. For example, if the frequency is set for 1000 MHz (1 GHz), and the modulation rate and deviation are set for 10 kHz and 1 MHz, respectively, then the output will traverse from 1000 MHz, up to 1001 MHz, down to 999 MHz, and back to 1000 MHz at a rate of 10 kHz (a period of 100 μ s).

The FM modulation parameters are dependent upon the frequency setting. Table 10 and Table 11 list the FM parameters as a function of frequency. All frequency bands span octaves except for the first band. The internal FM rates correspond to the upper range that the internal function generator supports. The external bandwidth is defined as the -3 dB response referenced to the external modulation source. For the bands 2 to 8, the rates and bandwidths are similar. However, the deviation increases by a factor of two, from 1 to 64 MHz, for octaves 2 through 8.

The first band has unique FM capabilities in that it allows setting the deviation of the carrier frequency to the nearest band edge. If the carrier is set on the upper edge of 62.5 MHz, the deviation is allowed to be set to 1.5 MHz (5 % of $f_{\rm C}$). This range also supports a wider internal rate and bandwidth of 500 kHz.

For example, if the frequency is set for 100 kHz, the deviation may be set from zero to 100 kHz.

Table 10: FM Modulation vs. Frequency for SG382 and SG384

Frequency Range	Internal FM Rate. 1 µHz to:	External FM Bandwidth DC (or 4 Hz for AC) to:	FM Deviation
DC ⇔ 62.5 MHz	500 kHz	500 kHz	Smaller of f _c or 64 MHz-f _c
62.5 MHz ⇔ 126.5625 MHz	50 kHz	100 kHz	1 MHz
126.5625 MHz ⇔ 253.125 MHz	50 kHz	100 kHz	2 MHz
253.125 MHz ⇔ 506.25 MHz	50 kHz	100 kHz	4 MHz
506.25 MHz ⇔ 1.0125 GHz	50 kHz	100 kHz	8 MHz
1.0125 GHz ⇔ 2.025 GHz	50 kHz	100 kHz	16 MHz
2.025 GHz ⇔ 4.050 GHz (SG384)	50 kHz	100 kHz	32 MHz
4.050 GHz ⇔ 8.100 GHz (Opt 2)	50 kHz	100 kHz	64 MHz

Table 11: FM Modulation vs. Frequency for SG386

Frequency Range	Internal FM Rate. 1 µHz to:	External FM Bandwidth DC (or 4 Hz for AC) to:	FM Deviation
DC ⇔ 93.75 MHz	500 kHz	500 kHz	Smaller of f _c
2 0 (7) 0 17212			or 96 MHz-f _c
93.75 MHz ⇔ 189.84375 MHz	50 kHz	100 kHz	1 MHz
189.84375 MHz ⇔ 379.6875 MHz	50 kHz	100 kHz	2 MHz
379.6875 MHz ⇔ 759.375 MHz	50 kHz	100 kHz	4 MHz
759.375 MHz ⇔ 1.51875 GHz	50 kHz	100 kHz	8 MHz
1.51875 GHz ⇔ 3.0375 GHz	50 kHz	100 kHz	16 MHz
3.0375 GHz ⇔ 6.075 GHz	50 kHz	100 kHz	32 MHz
6.075 GHz ⇔ 8.100 GHz (Opt 2)	50 kHz	100 kHz	64 MHz

Setting up Frequency Modulation:

Modulation Type

Press the [MOD TYPE] key and use the ADJUST $\triangle \nabla$ keys to select FM.

Modulation Function

Press the [MOD FCN] key and use the ADJUST $\triangle \nabla$ keys to select the desired modulation function (sine, ramp, triangle, square, noise or external).

Modulation Rate

Press [MOD RATE] to display the modulation rate. The value may be set using the SELECT/ADJUST arrow keys or via a numeric entry and one of the [MHz] [kHz] or [Hz] unit keys.

Internal modulation supports rates of 50 kHz for f_C above 62.5 MHz (93.75 MHz for the SG386) or 500 kHz for f_C less than or equal to 62.5 MHz (93.75 MHz for the SG386), with 1 μ Hz of resolution.

External modulation supports bandwidths of 100 kHz.

Modulation Deviation

Press [MOD DEV] to display and set the FM deviation, which also turns on the DEVIATION LED. The value may be set using numeric entry and [MHz] [kHz] or [Hz] unit keys, or the SELECT/ADJUST arrow keys.

The deviation has a range that is dependent on carrier frequency band.

There are seven octaves above the lowest frequency range of DC to 62.5 MHz. The first octave (62.5 to 125 MHz) supports deviation of 1 MHz, with each succeeding octave doubling the deviation, thus achieving a 64 MHz of deviation at the 4 to 8 GHz octave (if the optional doubler is installed.)

NOTE: If the frequency is changed, the deviation may be adjusted as necessary to maintain limits imposed by the new frequency setting.

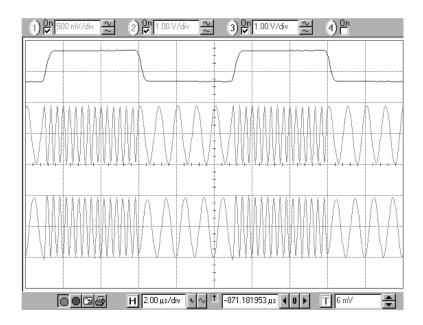

Modulation On/Off

Press the [ON/OFF] key to turn the modulation "ON".

Frequency Modulation Example

Shown below is a 2 MHz carrier being frequency modulated by a 100 kHz square wave with a 1 MHz deviation. In this example of Frequency Shift Keying (FSK) the carrier frequency is being rapidly switched between 1 MHz and 3 MHz.

The top trace is from the rear panel Modulation Output BNC which shows the 100 kHz modulating waveform. The middle trace is the front panel BNC output, whose amplitude was set to 1 V_{PP} . The bottom trace is from the front panel Type-N output, whose amplitude was set to 2 V_{PP} .

Waveform 10: FSK Modulation

Phase Modulation

The phase modulation can use either the internal modulation generator or an external source. The internal modulator can generate sine, triangle, ramp, square, or noise waveforms.

The phase of the output traverses the specified deviation at the modulation rate. For example, with a frequency of 1000 MHz (1 GHz), and modulation rate and deviation set to 10 kHz and 45 degrees, respectively, the output will be a fixed frequency with its phase traversing ± 45 degrees at a 10 kHz rate.

The optional rear panel doubler output can also be phase modulated.

Setting up Phase Modulation:

Modulation Type

Press the [MOD TYPE] key and use the ADJUST $\triangle \nabla$ keys to select ΦM .

Modulation Function

Press the [MOD FCN] key and use the ADJUST $\triangle \nabla$ keys to select the desired modulation function (sine, ramp, triangle, square, noise or external).

Modulation Rate

Press [MOD RATE] to display the modulation rate. The value may be set using the SELECT/ADJUST arrow keys or via a numeric entry and [MHz] [kHz] or [Hz] unit keys.

Modulation Deviation

Press [MOD DEV] to display and set the Φ M deviation, which turns on the DEVIATION LED. The value may be set using the numeric entry and the [DEG] unit key.

The phase deviation resolution depends on the frequency setting. For frequencies below 100 MHz, the phase deviation resolution is 0.01°. For frequencies between 100 MHz and 1 GHz the resolution is reduced to 0.1°, and is 1° for frequencies above 1 GHz.

For frequencies less than or equal to 62.5 MHz (93.75 MHz for the SG386) the accuracy of the phase deviation is 0.1 %. For frequencies above 62.5 MHz (93.75 MHz for the SG386) the accuracy is reduced to 3 %.

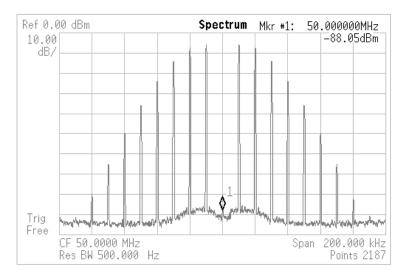

Modulation On/Off

Press the [ON/OFF] key to turn the modulation "ON".

Phase Modulation Example

Shown below is the frequency spectrum of a 0 dBm, 50 MHz carrier, being phase modulated by a 10 kHz sine with a deviation of 137.78°. Here, the modulation index, β = phase deviation = 137.78° × $2\pi/360^\circ$ = 2.40477 radians. For phase modulation by a sine, the carrier amplitude is proportional to the Bessel function $J_0(\beta)$, which has its first zero at 2.40477, which suppresses the carrier to below -88 dB.

Waveform 11: Spectrum of Phase Modulated 50 MHz Carrier

Pulse and Blank Modulation

Pulse modulation includes both pulse and blank modulation of the front panel BNC and Type-N outputs. Pulse and blank modulation are logical complements of each other—pulse modulation enables the output when the pulse waveform is "true", while blank modulation disables the output. The functions supported are square, noise (Pseudo Random Binary Sequence — PRBS), and external.

For internal square wave function the instrument has a 32-bit timing generator clocked by a 200 MHz source. This allows the period to be set from 1 μ s to 10 s with 5 ns resolution. The pulse duration can then be set from 100 ns up to the full period (less 100 ns). The internal generated pulse waveform is available at the rear panel Modulation Output BNC.

For pulse (blank) modulation, the output is turned on (off) when the source is at logic "high". Pulse modulation is not applied to the optional doubler output.

Setting up Pulse Modulation:

Modulation Type

Press the [MOD TYPE] key and use the ADJUST $\triangle \nabla$ keys to select PULSE or BLANK.

Modulation Function

Press the [MOD FCN] key and use the ADJUST $\triangle \nabla$ keys to select the desired modulation function (pulse, noise or external). If external, then CMOS logic levels applied to the rear panel modulation input control the pulse or blanking of the outputs. (See details on PRBS modulation below.)

Pulse Period

Press [MOD RATE] to display the pulse modulation period for the internal source. The value may be set using the SELECT/ADJUST arrow keys or via numeric entry plus one of the [ns] [µs] [ms] [enter] unit keys.

Pulse Width or Duty Factor

Press [MOD DEV] to display and set the pulse width of the internal source, which also turns on either the WIDTH or DUTY FACTOR LED. The value may be set using numeric entry and [ns] [μ s] [ms] [enter] or [%] unit keys, or the SELECT/ADJUST arrow keys.

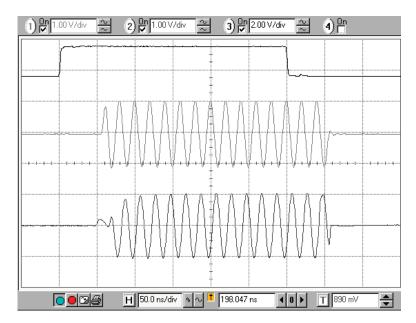

Modulation On/Off

Press the [ON/OFF] key to turn the modulation "ON".

Pulse Modulation Example

The waveforms below show the front panel BNC and Type-N outputs for a pulse modulated carrier frequency of 50 MHz. The internal pulse modulator was set to 1 μ s period, with a 300 ns "on" time (or a 30% duty cycle).

The output amplitudes were set to $2\,V_{PP}$ into $50\,\Omega$. The top trace is the rear panel Modulation Output signal. The middle trace is the BNC output. The bottom trace is the Type-N output. Both traces show about 50 ns latency in their response to the gating signal. The Type-N output also shows some gate feed-though at the leading edge if the signal.

Waveform 12: Pulse modulated 50 MHz carrier

More about PRBS Noise Modulation

When the noise function is selected for pulse modulation, the modulation source is a pseudo random binary sequence (PRBS) generator. The PRBS is used to gate the Type-N and BNC outputs.

The period of the PRBS may be set from 100 ns to 10 s, with 5 ns resolution via the [MOD RATE] key. The default PRBS period is 1 kHz. At the default setting, the RF output would be set "on" or "off", randomly, every millisecond.

The default PRBS run length is 9 bits and so the PRBS pattern repeats after 2^9 -1 = 511 periods. The PRBS run length can be changed from 5 to 19 bits for repeat cycles between 31 and 524,287 periods.

To modify the PRBS run length:

Press the [Shift] key followed by the [PBRS(8)] key to display the PRBS run length (in bits). Press the ADJUST $\triangle \nabla$ keys or enter a number, N, between 5 and 19 followed by the ENTER key. The PRBS will repeat after 2^N -1 cycles.

The PRBS is available at the rear panel Modulation Output BNC. The source is 0 to 3.3 V with 50 Ω source impedance. The output should not be terminated into 50 Ω .

Phase Continuous Frequency Sweeps

Frequency sweeps allow the traversing of an entire frequency band. The sweep modulation may use the internal sine, triangle, or ramp waveforms or an external modulation source. Sweep rates of up to 120 Hz and sweep ranges from 10 Hz up to an entire frequency band are supported with resolutions of 1 μ Hz.

Frequency sweeps can require the instrument's RF VCO to sweep through an entire octave. For the sweep to be phase continuous the RF VCO PLL must remain in "LOCK" during the sweep. This is why the maximum sweep rate is limited to 120 Hz and why the frequency slew rate is internally limited for the ramp function. The slew rate of external modulation sources should also be limited if a phase continuous sweep is required.

The RF Synthesizers have eight frequency bands as shown in Tables below:

Band **Frequency** $DC \Rightarrow 64 \text{ MHz}$ 2 $59.375 \Rightarrow 128.125 \text{ MHz}$ 3 $118.75 \Rightarrow 256.25 \text{ MHz}$ 4 $237.5 \Rightarrow 512.5 \text{ MHz}$ 5 $475 \Rightarrow 1025 \text{ MHz}$ 6 $950 \Rightarrow 2050 \text{ MHz}$ 7 (SG384) $1900 \Rightarrow 4100 \text{ MHz}$ 8 (Option 2) $3800 \Rightarrow 8200 \text{ MHz}$

Table 12: Sweep Frequency Bands for the SG382 and SG384

Table 13: Sweep Frequency Bands for the SG386

Band	Frequency
1	$DC \Rightarrow 96 \text{ MHz}$
2	$89.0625 \Rightarrow 192.1875 \text{ MHz}$
3	$178.125 \Rightarrow 384.375 \text{ MHz}$
4	$356.25 \Rightarrow 768.75 \text{ MHz}$
5	$712.5 \Rightarrow 1537.5 \text{ MHz}$
6	$1425 \Rightarrow 3075 \text{ MHz}$
7	$2850 \Rightarrow 6150 \text{ MHz}$
8 (Option 2)	$5950 \Rightarrow 8150 \text{ MHz}$

Setting up Frequency Sweeps:

Modulation Type

Press the [MOD TYPE] key and use the ADJUST $\triangle \nabla$ keys to select SWEEP.

Modulation Function

Press the [MOD FCN] key and use the ADJUST $\triangle \nabla$ keys to select either sine, ramp, triangle or external modulation function.

Sweep Rate

Press [MOD RATE] to display the modulation rate. This value may be set using the SELECT/ADJUST arrow keys or via numeric entry followed by [Hz] unit key. The Rate may be set from 1 μ Hz to 120 Hz with a resolution of 1 μ Hz.

Sweep Deviation

Press [MOD DEV] to display and set to the Sweep deviation. This turns on the 'DEVIATION' LED. The value may be set using numeric entry plus one of the hertz unit keys, or the SELECT/ADJUST arrow keys. The deviation may be set to sweep an entire band or any part thereof.

Modulation On/Off

Press the [ON/OFF] key to turn the modulation "ON".

I/Q Modulation (Option 3)

This option extends the signal generator's standard modulation suite with Inphase/Quadrature (IQ) modulation capabilities. This allows modulation of the front panel Type-N output for frequencies above 400 MHz and supports modulation bandwidths of over 100 MHz. I/Q modulation is not applied to the rear panel doubler option or BNC outputs.

To avoid output amplifier compression, the maximum output power setting is +10 dBm during I/Q modulation. This guarantees that the modulator output does not exceed the full scale output of the amplifier when both I&Q are at full scale.

This option provides four BNC connectors on the rear panel. One pair is used for the external inputs, while the second pair provides outputs of the I/Q waveforms. For external operation, the input signals are replicated on the outputs. For internally generated noise modulation, the baseband noise waveform is available on the I output with the Q output being held at zero.

The inputs are terminated with 50 Ω , and support a signal bandwidth from DC to 100 MHz. A ± 500 mV level on either input produces full scale output (full scale determined by the amplitude setting). Any combination of I and Q input levels that when added in quadrature have a level of 500 mV will likewise result in full-scale output.

Figure 3 depicts the relationship between I and Q levels when added in quadrature and the resulting output magnitude

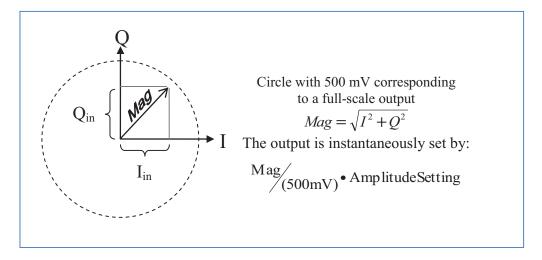

Figure 3: IQ Relationship

The inputs are designed to allow full-scale modulation. Each input is monitored and if either exceeds 525 mV (105 %) the front panel EXT overload LED is turned on and remains on until the condition is removed.

When the noise function is selected the instrument produces a spectral output with a rectangular profile. The width of the profile is determined by the ENBW setting and may range from 1 μ Hz to 50 kHz.

There are two ways to operate the IQ modulator: From the rear panel, user supplied, I&Q inputs or from an internal generated noise source (which is only applied to the I modulation input). IQ modulation operates only for carrier frequencies above 400 MHz.

Setting up External IQ Modulation:

Note that Option 3 must be installed.

Modulation Type

Press the [MOD TYPE] key and use the ADJUST $\triangle \nabla$ keys to select I/Q (OPT).

Modulation Function

Press the [MOD FCN] key and use the ADJUST $\triangle \nabla$ keys to select EXT.

Modulation Rate

When the external modulation function is selected there is no rate parameter and the unit displays the message "rate etrn".

Fixed Modulation Deviation

When the external modulation function is selected, there is no corresponding deviation parameter. The unit displays the message "dev predefined". (The scale is fixed at ± 0.5 V providing full scale on the I or Q outputs).

User modulation waveforms should be applied to the rear panel I & Q BNC inputs. The sources should be able to provide ± 500 mV full scale into a 50 Ω load. The front panel red EXT LED will indicate an overload if the inputs exceed about ± 525 mV.

Modulation On/Off

Press the [ON/OFF] key to turn the modulation "ON".

Setting up Internal Noise IQ Modulation:

Note that Option 3 must be installed)

Modulation Type

Press the [MOD TYPE] key and use the ADJUST $\triangle \nabla$ keys to select I/Q (OPT).

Modulation Function

Press the [MOD FCN] key and use the ADJUST $\triangle \nabla$ keys to select NOISE..

Modulation Effective Noise Bandwidth (ENBW)

Press the [MOD RATE] to display the noise modulation equivalent noise bandwidth (ENBW). The value may be set using the SELECT/ADJUST arrow keys or via a numeric entry completed with one of the [Hz] unit keys. The baseband noise function is available on the rear panel I-OUT BNC.

Fixed Modulation Deviation

Pressing [MOD DEV] displays the message "crest fact. 14 dB". The crest factor is fixed, and indicates that the ratio of the peak value to RMS value of the noise waveform is 14 dB (or 5×). This factor is not adjustable.

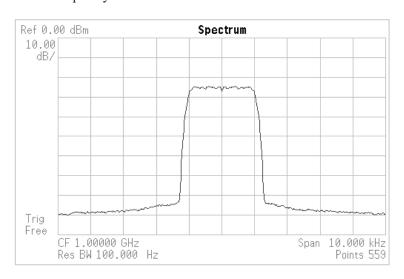

Modulation On/Off

Press the [ON/OFF] key to turn the modulation "ON".

IQ Noise Modulation Example

The RF output is being amplitude modulated by a bipolar noise signal applied to the I-channel only. In the frequency domain the output will appear as a flat band of noise centered on the carrier frequency with brick-wall filtered skirts. The width of the noise around the carrier frequency is twice the ENBW.

Waveform 13: Spectrum of I/Q modulation by internal noise source.

Secondary (Shift) Parameters

The shifted keys are used to access parameters or functions that are less frequently required. Table 14 gives a summary of the keys.

Table 14: Shifted Key Functions

Label	Primary Key	Function Description
NET	•	Configure Ethernet interface
CAL	+/-	Adjust the timebase, and selects the PLL filter mode
INIT	0	Load default instrument settings
TIMEBASE	1	Displays the timebase configuration
STATUS	2	View TCP/IP (Ethernet), error, or instrument status, as well as running Self-Test
LOCAL	3	Go to local. Enables front panel keys if the unit is in remote mode.
GPIB	4	Configure GPIB interface
RS-232	5	Configure RS-232 interface
DATA	6	Display the most recent data received over any remote interface
REL Φ =0	7	Defines the current phase to be 0 degrees and displays phase parameter (of 0)
PRBS	8	Allows access to the parameters associated with the Pseudo-Random Binary Sequence generator
STEP SIZE	9	Set the incremental value used by the ADJUST keys

Some of the keys in the Numeric Entry section of the front panel have secondary functions associated with them. The names of these functions are printed above the key. For example, the [4] key has the label "RS-232" in light blue text above it.

REL $\Phi=0$

[SHIFT] [7] sets the phase display to 0°. The phase of the output is not changed.

PRBS

[SHIFT] [8] allows setting of the PRBS (pseudo-random binary sequence) bit length (from 5 to 19) for pulse modulation with noise.

STEP SIZE

[SHIFT] [9] allows setting of the STEP SIZE for the ADJUST \triangle and ∇ keys for any displayed parameter (such as frequency, phase, amplitude, modulation rate, etc.) (The default step size is ± 1 at the blinking digit.)

Timebase

[SHIFT] [1] shows the installed timebase. This can be the standard ovenized crystal oscillator (OCXO) or an optional rubidium oscillator.

Table 15: Timebase Status Menu

Parameter	Example Display	Description
Oscillator	'Osc. ovenized'	Indicates which type of timebase is
		installed.
Rb lock	'Rb stable'	If a rubidium timebase is installed,
		this item indicates if the rubidium
		has stabilized.

NET

The NET menu, [SHIFT] [.], enables the user to configure the TCP/IP based remote interfaces (the IP address, subnet mask, and default router). To see the current TCP/IP parameters use the STATUS menu. Before connecting the instrument to your LAN, check with your network administrator for the proper configuration of devices on your network.

The NET menu (summarized in Table 16) has several options. Press the SELECT \triangleleft and \triangleright keys to cycle through the options. Use the ADJUST \triangle and \triangledown keys to change an option. Use the numeric keypad to enter an IP address when appropriate. Note that changes to the TCP/IP configuration do not take effect until the interface is reset or power is cycled.

Table 16: NET Menu Options for TCP/IP Configuration

Parameter	Example Display	Description
TCP/IP	'TCPIP enabled'	Enable or disable all TCP/IP access
DHCP	'DHCP enabled'	Enable or disable the DHCP client to
		automatically obtain an appropriate TCP/IP
		configuration from a DHCP server
Static IP	'Static IP enabled'	Enable or disable a static IP configuration.
IP	'IP 192.168.0.5'	IP address to use if static IP is enabled.
Subnet	'Subnet 255.255.0.0'	Subnet mask to use if static IP is enabled.
Default	'Def Gty 192.168.0.1'	Default gateway or router to use for routing
gateway		packets not on the local network if static IP
		is enabled
Bare socket	'Bare enabled'	Enable or disable raw socket access on
interface		TCP/IP port 5025.
Telnet	'Telnet enabled'	Enable or disable telnet access on TCP/IP
interface		port 5024.
VXI-11	'Net instr enabled'	Enable or disable the VXI-11 net instrument
Interface		remote interface.
Link speed	'Speed 100 Base-T'	Set the Ethernet link speed.
Reset	'Reset no'	Select 'Reset yes' and press 'ENTER' to
		reset the TCP/IP interface to use the latest
		TCP/IP configuration settings.

TCP/IP Configuration Methods

In order to function properly on an Ethernet based local area network (LAN), the unit needs to obtain a valid IP address, a subnet mask, and a default gateway or router address. There are three methods for obtaining these parameters: DHCP, Auto-IP, and Static IP. Check with your network administrator for the proper method of configuration of instruments on your network.

If the DHCP client is enabled, the unit will try to obtain its TCP/IP configuration from a DHCP server located somewhere on the local network. If the Auto-IP protocol is enabled, the unit will try to obtain a valid link-local IP configuration in the 169.254.x.x address space. If the static IP configuration is enabled, the unit will use the given TCP/IP configuration. When all three methods are enabled, the TCP/IP configuration will be determined in the following order of preference: DHCP, Auto-IP, and static IP. Given that Auto-IP is virtually guaranteed to succeed, it should be disabled if a static IP configuration is desired.

Please see the Status details on page 48 for details on viewing the TCP/IP address obtained via DHCP or Auto-IP methods.

TCP/IP Based Remote Interfaces

Three TCP/IP based remote interfaces are supported: raw socket, telnet, and VXI-11 net instrument. Raw socket access is available on port 5025. Telnet access is available on port 5024. The VXI-11 interface enables IEEE 488.2 GPIB-like access to the unit over TCP/IP. It enables controlled reads and writes and the ability to generate service requests. Most recent VISA instrument software libraries support this protocol.

Link Speed

The physical Ethernet layer supports 10 Base-T and 100 Base-T link speeds. The default link speed is set to 100 Base-T, but it can be set to 10 Base-T.

Reset the TCP/IP Interface

Note that changes to the TCP/IP configuration do not take effect until the TCP/IP interface is either reset or the instrument is power cycled. To reset the TCP/IP interface, navigate through the NET menu options until "reset no" is displayed. Press the ADJUST △ key to display "reset yes" and then press ENTER. Any active connections will be aborted. The TCP/IP stack will be re-initialized and configured using the latest configuration options.

GPIB

The GPIB menu enables the user to configure the GPIB remote interface. The GPIB menu has several options. Press the SELECT \triangleleft and \triangleright keys to cycle through the options. Use the ADJUST \triangle and ∇ keys to change an option. Note that changes to the GPIB configuration do not take effect until the interface is reset or the instrument is power cycled. The GPIB menu parameters are summarized in Table 17:

Table 17: GPIB Menu Options

Parameter	Example Display	Description
GPIB	'GPIB enabled'	Enable or disable all GPIB access
Address	'Address 27'	GPIB address
Reset	'Reset no'	Select 'reset yes' and press 'ENTER'
		to reset the GPIB interface.

GPIB Address

In order to communicate properly on the GPIB bus, the signal generator must be configured with a unique address. Use the Address menu option to set the unit's GPIB address. Then reset the interface to make sure the new address is active.

Reset the GPIB Interface

Note that changes to the GPIB configuration do not take effect until the GPIB interface is either reset or the instrument is power cycled. To reset the GPIB interface, navigate through the GPIB menu options until "reset no" is displayed. Press the ADJUST \triangle key to display "reset yes" and press ENTER.

RS-232

The RS-232 menu enables the user to configure the RS-232 remote interface. The RS-232 menu has several options. Press the SELECT \triangleleft and \triangleright keys to cycle through the options. Use the ADJUST \triangle and ∇ keys to change an option. Note that changes to the RS-232 configuration do not take effect until the interface is reset or the instrument is power cycled. The RS-232 menu parameters are summarized in Table 18.

Table 18: RS-232 Menu Options

Parameter	Example Display	Description
RS-232	'RS-232 enabled'	Enable or disable all RS-232 access
Baud rate	'Baud 11500'	The baud rate to use for RS-232 connections
Reset	'Reset no'	Select 'yes' and press 'ENTER' to reset the RS-232 interface.

RS-232 Configuration

In order to communicate properly over RS-232, the instrument and the host computer both must be configured to use the same configuration. The following baud rates are supported: 115200 (default), 57600, 38400, 19200, 9600, and 4800. The rest of the communication parameters are fixed at 8 data bits, 1 stop bit, no parity, and RTS/CTS hardware flow control.

Use the baud rate menu option to set the unit's baud rate. Then reset the interface to make sure the new baud rate is active.

Reset the RS-232 Interface

Note that changes to the RS-232 configuration do not take effect until the RS-232 interface is either reset or the instrument is power cycled. To reset the RS-232 interface, navigate through the RS-232 menu options until "reset no" is displayed. Press the ADJUST \triangle key display "reset yes" and press ENTER.

DATA

The DATA function enables the user to see the hexadecimal ASCII characters received by the instrument from the most recently used remote interface. This functionality is useful when trying to debug communication problems. Use the ADJUST \triangle and ∇ keys to scroll through the data. The decimal point indicates the last character received.

STATUS

The STATUS function enables the user to view status information. The instrument has four status menus: TCP/IP status, error status, instrument status, and self test. Use the ADJUST \triangle and ∇ keys to select the desired status. Then press the SELECT \triangleleft and \triangleright keys to view each item of status.

TCP/IP Status

TCP/IP status contains status information on the current IP configuration. Table 19 summarizes the TCP/IP status information.

Parameter	Example Display	Description
Ethernet mac	'Phy Adr 00.19.b3.02.00.01'	This is the Ethernet mac address
address	1 hy 7 tar 00.17.03.02.00.01	assigned to this unit at the factory.
Link status	'Connected'	Indicates if the Ethernet hardware
		has established a link to the
		network.
IP address	'IP 192.168.0.5'	The current IP address.
Subnet mask	'Subnet 255.255.0.0'	The current subnet mask.
Default	'Def Gty 192.168.0.1'	The current default gateway or
gateway		router.

Table 19: TCP/IP Status Menu

Error Status

The error status menu enables the user to view the number and cause of execution and parsing errors. Table 20 summarizes the error status items. See section Error Codes on page 84 for a complete list of error codes.

Parameter	Example Display	Description
Error count	'Error ent 1'	Indicates the number of errors detected.
Error code	'111 Parse Error'	Provides the error number and description
		of the error.

Table 20: Error Status Menu

When an error is generated the front panel error LED is turned on. The ERR LED remains on until the status is interrogated, the unit is re-initialized using INIT, or the unit receives the remote command *CLS.

Instrument Status

The instrument status menu enables the user to view the instrument configuration including reports rear panel options.

Table 21: Instrument Status Menu

Parameter	Example Display	Description
Serial Number	'Serial 001013'	Unit serial number
Version	'Version 1.00.10A'	Firmware version
Options	'Option 3 yes'	Indicates which rear options, if any,
		are installed.

Self Test

The instrument self test runs a series of tests to check the operation of the unit. It tests communication to various peripherals on the motherboard including the GPIB chip, the PLL chips, the DDS chips, the octal DACs, the FPGA, and the serial EEPROM. If errors are encountered, they will be reported on the front-panel display when detected. The errors detected are stored in the instrument error buffer and may be accessed via the error status menu after the self test completes. See section Error Codes on page 84 for a complete list of error codes.

LOCAL

When the unit is in remote mode, the REM LED is highlighted and front-panel instrument control is disabled. Pressing the [3] (LOCAL) key re-enables local front-panel control.

INIT

Executing the INIT function forces the instrument to default settings. This is equivalent to a Recall 0 or executing the *RST remote command. See Factory Default Settings on page 50 for a list of the unit's default settings.

CAL

This accesses the internal timebase user calibration parameter or the RF PLL Noise Mode setting. The user calibration parameter allows adjustment of the timebase over a range of \pm 2 ppm (10 MHz \pm 20 Hz).

The RF PLL Mode has two settings RF PLL 1 and 2. RF PLL1 optimizes the noise floor of the output within 100 kHz of the carrier. This is the default setting.

RF PLL 2 optimizes the noise floor of the output for offset greater than 100 kHz from carrier. See Phase Noise Spectra vs RF PLL Modes on page xvii of the Specifications for more spectra showing the different characteristics of the two PLL modes.

Factory Default Settings

The factory default settings are listed in Table 22. Factory default settings may be restored by power cycling the unit with the [BACK SPACE] key depressed. This forces all instrument settings except for communication parameters to the factory defaults. It is similar to the INIT secondary function and the *RST remote command, which also reset the unit to factory default settings. However the Factory Reset also performs these additional actions:

- 1. Resets *PSC to 1
- 2. Forces nonvolatile copies of *SRE and *ESE to 0.
- 3. Resets all stored settings from 1 to 9 back to default settings

Table 22: Factory Default Settings

Parameter	Value	Step Size
Display	Frequency	
Frequency	10 MHz	1 Hz
Phase	0 Degrees	1 Degree
Amplitude (BNC, NTYPE, Doubler)	0 dBm	1 dBm
	$0.224~V_{RMS}$	$0.1~\mathrm{V}_{\mathrm{RMS}}$
	$0.632~\mathrm{V_{PP}}$	$0.1 V_{PP}$
Amplitude (Clock Option)	$0.4~\mathrm{V_{PP}}$	$0.1 V_{PP}$
Offset (BNC, Clock, Rear DAC)	0 V	0.1 V
RF PLL Filter Mode	1	
Modulation On/Off	Off	
Modulation Type	FM	
Modulation Function (AM/FM/PM)	Sine	
Modulation Function (Sweep)	Triangle	
Modulation Function (Pulse/Blank)	Square	
Modulation Function (I/Q)	External	
Modulation Rate (AM/FM/PM)	1 kHz	1 kHz
Modulation Rate (Sweep)	100 Hz	10 Hz
Modulation Input Coupling	DC	
AM Depth	50 %	10 %
FM Deviation	1 kHz	1 kHz
PM Deviation	10 Degrees	10 Degrees
Sweep Deviation	1 MHz	1 MHz
AM RMS Noise Depth	10 %	10 %
FM RMS Noise Deviation	1 kHz	1 kHz
PM RMS Noise Deviation	10 Degrees	10 Degrees
Pulse/Blank Period	1000 μs	100 μs
Pulse/Blank Width	1 μs	0.1 μs
PRBS Length	9	
PRBS Period	1 μs	0.1 μs

The factory default settings of the various communications interfaces are listed in Table 23. The unit may be forced to assume its factory default communication settings by power cycling the unit with the [NET(.)] key depressed.

Table 23: Factory Default Settings for Communications Parameters

Parameter	Setting
RS-232	Enabled
RS-232 Baud Rate	115200
GPIB	Enabled
GPIB Address	27
TCP/IP	Enabled
DHCP	Enabled
Auto-IP	Enabled
Static IP	Enabled
IP	0.0.0.0
Subnet Mask	0.0.0.0
Default Gateway	0.0.0.0
Bare (Raw) Socket Interface at TCP/IP	Enabled
port 5025	
Telnet Interface at TCP/IP port 5024	Enabled
VXI-11 Net Instrument Interface	Enabled
Ethernet Speed	100 Base-T

Remote Programming

Introduction

The instrument may be remotely programmed via the GPIB interface, the RS-232 serial interface, or the LAN Ethernet interface. Any host computer interfaced to the instrument can easily control and monitor its operation.

Interface Configuration

All of the interface configuration parameters can be accessed via the front panel through shifted functions dedicated to the interface. Table 24 identifies the shifted functions that are used to configure each interface.

Shifted FunctionInterface ConfigurationNET [•]LAN, TCP/IP interfaceGPIB [4]GPIB 488.2 interfaceRS-232 [5]RS-232 serial interface

Table 24: Interface Configuration

Each interface's configuration is accessed by pressing [SHIFT] followed by one of the interface keys ([NET], [GPIB], or [RS-232]). Once a given interface configuration is activated, parameters for the interface are selected by successive SELECT \triangleright key presses. For example, pressing [SHIFT], [RS-232] activates the RS-232 configuration. The first menu item is RS-232 Enable/Disable. Pressing SELECT \triangleright moves the selection to RS-232 baud rate.

Once a parameter is selected, it is modified by pressing the ADJUST \triangle and ∇ keys. The only exception to this is for selections that require an internet address, such as static IP address, network mask, and default gateway address. In this case the address is modified by entering the new address with the numeric keys and pressing [ENTER].

All interfaces are enabled by default, but each interface may be disabled individually if desired. Any modifications made to an interface do not take effect until the interface is reset or the unit is power cycled.

GPIB

The IEEE 488 standard port is used for communicating over GPIB. The port is located on the rear panel of the unit. The configuration parameters for the GPIB interface are shown in Table 25.

Table 25: GPIB Configuration

Interface Parameter	Default	Meaning
GPIB Enable/Disable	Enabled	Enable or disable the interface
GPIB Address (0-30)	27	Primary GPIB address.
Reset interface (Yes/No)	No	Force a reset of the interface.

Any changes made will not take effect until the interface is reset or the unit is power cycled.

RS-232

An RS-232 communications port is also standard. The port is located on the rear panel of the unit. The configuration parameters for the RS-232 interface are shown in Table 26.

Table 26: RS-232 Configuration

Interface Parameter	Default	Meaning
RS-232 enable/disable	Enabled	Enable or disable the interface
Baud rate (4800-115200)	115200	RS-232 baud rate
Reset interface (yes/no)	No	Force a reset of the interface.

The RS-232 interface connector is a standard 9 pin, type D, female connector configured as a DCE (transmit on pin 2, receive on pin 3). The factory default communication parameters are set to: 115200 baud rate, 8 data bits, 1 stop bit, no parity, RTS/CTS hardware flow control. All of these communication parameters are fixed except for the baud rate. Any changes made to the interface configuration will not take effect until the interface is reset or the unit is power cycled.

LAN

A rear panel RJ-45 connector may be used to connect the instrument to a 10/100 Base-T Ethernet LAN. Before connecting the instrument to your LAN, check with your network administrator for the proper method of configuration of networked instruments on your network. The TCP/IP configuration options for the LAN interface are shown in Table 27.

Interface Parameter Default Meaning TCP/IP Enable/Disable Enabled Enable or disable all TCP/IP based interfaces. DHCP Enable/Disable Enabled Enable or disable automatic network configuration via DHCP. Auto-IP Enable/Disable Enabled Enable or disable automatic network configuration in the 169.254.x.x internet address space if DHCP fails or is disabled. Static IP Enable/Disable Enabled Enable manual configured network configuration in the event that the automatic configuration fails or is disabled. IP Address 0.0.0.0Static IP address to use when manual configuration is active. Subnet Address 0.0.0.0Network mask to use when manual configuration is active. The network mask is used to determine which IP addresses are on the local network. **Default Gateway** 0.0.0.0 Default gateway or router to use when manual configuration is active. The gateway is the IP address that packets are sent to if the destination IP address is not on the local network. Bare Socket Enabled Enable or disable raw socket access Enable/Disable to the instrument via TCP port 5025. Telnet Enable/Disable Enabled Enable or disable access via telnet at TCP port 5024. Net Instr. Enable/Disable Enable or disable access via VXI-11 Enabled net instrument protocols. Ethernet Speed 10/100 100 Base-T Ethernet physical layer link speed. Reset interface (Yes/No) Force a reset of the interface. No

Table 27: LAN Configuration

Both automatic and static network configuration is supported. When more than one configuration is enabled, the instrument selects network configuration parameters with the following priority: DHCP, Auto-IP, and finally Manual. Since Auto-IP will virtually always succeed, it should be disabled if static configuration is desired. Any changes made to the interface configuration will not take effect until the interface is reset or the unit is power cycled.

Network Security

Network security is an important consideration for all TCP/IP networks. Please bear in mind that the unit does NOT provide security controls, such as passwords or encryption, for controlling access. If such controls are needed, you must provide it at a higher level on your network. This might be achieved, for example, by setting up a firewall and operating the instrument behind it.

Front-Panel Indicators

To assist in programming, there are three front panel indicators located under the INTERFACE section: REM, ACT, and ERR. The REM LED is on when the instrument is in remote lock out. In this mode, the front panel interface is locked out and the instrument can only be controlled via the remote interface. To go back to local mode, the user must press the LOCAL key, [3]. The ACT LED serves as an activity indicator that flashes every time a character is received or transmitted over one of the remote interfaces.

The ERR LED will be highlighted when a remote command fails to execute due to illegal syntax or invalid parameters. The user may view the cause of errors from the front panel by pressing the keys [SHIFT], [STATUS], sequentially. Next press ADJUST △ until the display reads "Error Status". Finally, press SELECT ▷ successively, to view the total error count followed by the individual errors. The error codes are described in section Error Codes on page 84.

Command Syntax

All commands use ASCII characters, are 4-characters long, and are case-insensitive. Standard IEEE-488.2 defined commands begin with the '*' character followed by 3 letters. Instrument specific commands are composed of 4 letters.

The four letter mnemonic (shown in capital letters) in each command sequence specifies the command. The rest of the sequence consists of parameters.

Commands may take either *set* or *query* form, depending on whether the '?' character follows the mnemonic. *Set only* commands are listed without the '?', *query only* commands show the '?' after the mnemonic, and *query optional* commands are marked with a '(?)'.

Parameters shown in { } and [] are not always required. Parameters in { } are required to set a value, and are omitted for queries. Parameters in [] are optional in both set and query commands. Parameters listed without any surrounding characters are always required.

Do NOT send () or {} or [] or spaces as part of the command.

The command buffer is limited to 768 bytes, with 25 byte buffers allocated to each of up to 3 parameters per command. If the command buffer overflows, both the input and output buffers will be flushed and reset. If a parameter buffer overflows, a command error will be generated and the offending command discarded.

Commands are terminated by a semicolon, a <CR> (ASCII 13), or a <LF> (ASCII 10). If the communications interface is GPIB, then the terminating character may optionally be accompanied by an EOI signal. If the EOI accompanies a character other than a <LF>, a <LF> will be appended to the command to terminate it. Execution of the command does not begin until a command terminator is received.

Aside from communication errors, commands may fail due to either syntax or execution errors. Syntax errors can be detected by looking at bit 5 (CME) of the event status

register (*ESR?). Execution errors can be detected by looking at bit 4 (EXE) of the event status register. In both cases, an error code, indicating the specific cause of the error, is appended to the error queue. The error queue may be queried with the LERR? command. Descriptions of all error codes can be found in the section Error Codes, starting on page 84.

Parameter Conventions

The command descriptions use parameters, such as i, f, and v. These parameters represent integers or floating point values expected by the command. The parameters follow the conventions summarized in Table 28.

Parameter	Meaning	
i, j, k	An integer valu	ie
f	A floating poin	nt value representing a frequency in Hz.
p	A floating poin	nt value representing a phase in degrees.
t	A floating poin	nt value representing time in seconds.
V	A floating poin	nt value representing voltage in volts.
u	An identifier of units. Allowed units depend on the	
	type as identified below:	
	Туре	Allowed Units
	Amplitude	'dBm', 'rms', 'Vpp'
	Frequency	'GHz', 'MHz', 'kHz', or 'Hz'
	Time	'ns', 'us', 'ms', or 's'

Table 28: Command Parameter Conventions

Numeric Conventions

Floating point values may be decimal ('123.45') or scientific ('1.2345e2'). Integer values may be decimal ('12345') or hexadecimal ('0x3039').

Abridged Index of Commands

Common IEEE-488.2 Commands

*CAL?	Page 60	Run auto calibration routine
*CLS	Page 60	Clear Status
*ESE(?){i}	Page 60	Standard Event Status Enable
*ESR?	Page 60	Standard Event Status Register
*IDN?	Page 60	Identification String
*OPC(?)	Page 60	Operation Complete
*PSC(?){i}	Page 61	Power-on Status Clear
*RCL i	Page 61	Recall Instrument Settings
*RST	Page 61	Reset the Instrument
*SAV i	Page 61	Save Instrument Settings
*SRE(?){i}	Page 61	Service Request Enable
*STB?	Page 62	Status Byte
*TRG	Page 62	Trigger a delay
*TST?	Page 62	Self Test
*WAI	Page 62	Wait for Command Execution

Status and Display Commands

DISP(?){i}	Page 63	Display
INSE(?){i}	Page 63	Instrument Status Enable
INSR?	Page 63	Instrument Status Register
LERR?	Page 64	Last Error
OPTN? i	Page 64	Installed Options
ORNG? [i]	Page 64	Output Over Range
TEMP?	Page 64	Temperature of the RF block
TIMB?	Page 64	Timebase

Signal Synthesis Commands

AMPC(?){v}	Page 65	Amplitude of Clock
$AMPH(?)\{v\}[u]$	Page 65	Amplitude of HF (RF Doubler)
$AMPL(?)\{v\}[u]$	Page 65	Amplitude of LF (BNC Output)
$AMPR(?)\{v\}[u]$	Page 65	Amplitude of RF (Type-N Output)
$ENBC(?)\{i\}$	Page 66	Enable Clock
ENBH(?){i}	Page 66	Enable HF (RF Doubler)
$ENBL(?)\{i\}$	Page 66	Enable LF (BNC Output)
$ENBR(?)\{i\}$	Page 66	Enable RF (Type-N Output)
$FREQ(?)\{f\}[u]$	Page 66	Frequency
NOIS(?){i}	Page 66	Noise Mode of RF PLL Loop Filter
$OFSC(?)\{v\}$	Page 66	Offset of Clock
$OFSD(?)\{v\}$	Page 66	Offset of Rear DC
OFSL(?){v}	Page 67	Offset of LF (BNC Output)
PHAS(?){p}	Page 67	Phase
RPHS	Page 67	Rel Phase

Modulation Commands

$ADEP(?)\{d\}$	Page 69	AM Modulation Depth
$ANDP(?)\{d\}$	Page 69	AM Noise Modulation Depth
COUP(?){i}	Page 69	Modulation Coupling
$FDEV(?)\{f\}[u]$	Page 69	FM Deviation
$FNDV(?)\{f\}[u]$	Page 69	FM Noise Deviation
MFNC(?){i}	Page 70	Modulation Function for AM/FM/ΦM
$MODL(?)\{i\}$	Page 70	Modulation Enable
PDEV(?){p}	Page 70	ΦM Deviation
PDTY(?){d}	Page 70	Pulse/Blank Duty Factor
PFNC(?){i}	Page 70	Pulse Modulation Function
PNDV(?){p}	Page 71	ΦM Noise Deviation
$PPER(?)\{t\}[u]$	Page 71	Pulse/Blank Period
PRBS(?){i}	Page 71	PRBS Length for Pulse/Blank Modulation
$PWID(?)\{t\}[u]$	Page 71	Pulse/Blank Width
QFNC(?){i}	Page 71	IQ Modulation Function
$RATE(?)\{f\}[u]$	Page 72	Modulation Rage for AM/FM/ΦM
$RPER(?)\{t\}[u]$	Page 72	PRBS Period for Pulse/Blank Modulation
$SDEV(?)\{f\}[u]$	Page 72	Sweep Deviation
SFNC(?){i}	Page 72	Sweep Modulation Function
$SRAT(?)\{f\}[u]$	Page 72	Modulation Sweep Rate
TYPE(?){i}	Page 73	Modulation Type

List Commands

LSTC? i	Page 74	List Create
LSTD	Page 74	List Delete
LSTE(?){i}	Page 74	List Enable
LSTI(?){i}	Page 74	List Index
LSTP(?) i {, <st>}</st>	Page 74	List Point
LSTR	Page 75	List Reset
LSTS?	Page 75	List Size

Interface Commands

EMAC?	Page 76	Ethernet MAC Address
EPHY(?){i}	Page 76	Ethernet Physical Layer Configuration
IFCF(?)i{,j}	Page 76	Interface Configuration
IFRS i	Page 77	Interface Reset
IPCF? i	Page 77	Active TCP/IP Configuration

LOCK?	Page 77	Request Lock
REMT	Page 77	Go to Remote
UNLK?	Page 77	Release Lock
XTRM $i\{j,k\}$	Page 77	Interface Terminator

Detailed Command List

Common IEEE-488.2 Commands

*CAL?

Auto calibration

This command currently does nothing and returns 0.

*CLS

Clear Status

Clear Status immediately clears the ESR and INSR registers as well as the LERR error buffer.

*ESE(?){i}

Standard Event Status Enable

Set (query) the Standard Event Status Enable register {to i}. Bits set in this register cause ESB (in STB) to be set when the corresponding bit is set in the ESR register.

*ESR?

Standard Event Status Register

Query the Standard Event Status Register. Upon executing a *ESR? query, the returned bits of the *ESR register are cleared. The bits in the ESR register have the following meaning:

D.	3.6	
Bit	Meaning	۲
DIL	IVICallili	ŕ

0 OPC – operation complete

1 Reserved

2 QYE – query error

3 DDE – device dependent error

4 EXE – execution error

5 CME – command error

6 Reserved

7 PON – power-on

Example

*ESR?

A return of '176' would indicate that PON, CME, and EXE are set.

*IDN?

Identification String

Query the instrument identification string.

Example

*IDN?

Returns a string similar to 'Stanford Research Systems, SG384, s/n004025, ver1.00.0B'

*OPC(?)

Operation Complete

The set form sets the OPC flag in the ESR register when all prior commands have completed. The query form returns '1' when all prior commands have completed, but does not affect the ESR register.

*PSC(?){i}

Power-on Status Clear

Set (query) the Power-on Status Clear flag {to i}. The Power-on Status Clear flag is stored in nonvolatile memory in the unit, and thus, maintains its value through power-cycle events.

If the value of the flag is 0, then the Service Request Enable and Standard Event Status Enable Registers (*SRE, *ESE) are stored in non-volatile memory, and retain their values through power-cycle events. If the value of the flag is 1, then these two registers are cleared upon power-cycle.

Example

*PSC 1 Set the Power-on Status Clear to 1.

*PSC? Returns the current value of Power-on Status Clear.

*RCL i

Recall Instrument Settings

Recall instrument settings from location i. The parameter i may range from 0 to 9. Locations 1 to 9 are for arbitrary use. Location 0 is reserved for the recall of default instrument settings.

Example

*RCL 3

Recall instruments settings from location 3.

*RST

Reset the Instrument

Reset the instrument to default settings. This is equivalent to *RCL 0. It is also equivalent to pressing the keys [SHIFT], [INIT], [ENTER on the front panel. See Factory Default Settings on page 50 for a list of default settings.

Example

*RST

Resets the instrument to default settings

*SAV i

Save Instrument Settings

Save instrument settings to location i. The parameter i may range from 0 to 9. However, location 0 is reserved for current instrument settings. It will be overwritten after each front panel key press.

Example

*SAV 3

Save current settings to location 3.

*SRE(?){i}

Service Request Enable

Set (query) the Service Request Enable register {to i}. Bits set in this register cause the SG384 to generate a service request when the corresponding bit is set in the STB register.

*STB?

Status Byte

Query the standard IEEE 488.2 serial poll status byte. The bits in the STB register have the following meaning:

- Bit Meaning
- 0 INSB INSR summary bit
- 1 Reserved
- 2 Reserved
- 3 Reserved
- 4 MAV message available
- 5 ESB ESR summary bit
- 6 MSS master summary bit
- 7 Reserved

Example

*STB?

A return of '113' would indicate that INSB, MAV, ESB, and MSS are set. INSB indicates that an enabled bit in INSR is set. MAV indicates that a message is available in the output queue. ESB indicates that an enabled bit in ESR is set. MSS reflects the fact that at least one of the summary enable bits is set and the instrument is requesting service.

*TRG

Trigger

When the instrument is configured for list operation, this command initiates a trigger. Instrument settings at the current list index are written to the instrument and the index is incremented to the next list entry.

*TST?

Self Test

Runs the instrument self test and returns 0 if successful. Otherwise it returns error code 17 to indicate that the self test failed. Use the LERR? command to determine the cause of the failure.

*WAI

Wait for Command Execution

The instrument will not process further commands until all prior commands including this one have completed.

Example

*WAI

Wait for all prior commands to execute before continuing.

Status and Display Commands

DISP(?){i}

Set (query) the current display value {to i}. The parameter i selects the display type.

- <u>i</u> Display
- 0 Modulation Type

Display

- 1 Modulation Function
- 2 Frequency
- 3 Phase
- 4 Modulation Rate or Period
- 5 Modulation Deviation or Duty Cycle
- 6 RF Type-N Amplitude
- 7 BNC Amplitude
- 8 RF Doubler Amplitude
- 9 Clock Amplitude
- 10 BNC Offset
- 11 Rear DC Offset
- 12 Clock Offset

Example

DISP 2 Show carrier frequency

INSE(?){i}

Instrument Status Enable

Set (query) the Instrument Status Enable register {to i}. Bits set in this register cause INSB (in STB) to be set when the corresponding bit is set in the INSR register.

INSR?

Instrument Status Register

Query the Instrument Status Register. Upon executing a INSR? query, the returned bits of the INSR register are cleared. The bits in the INSR register have the following meaning:

- Bit Meaning
- 0 20MHZ UNLK 20 MHz PLL unlocked.
- 1 100MHZ UNLK 100 MHz PLL unlocked.
- 2 19MHZ UNLK 19 MHz PLL unlocked.
- 3 1GHZ UNLK 1 GHz PLL unlocked.
- 4 4GHZ UNLK 4 GHz PLL unlocked.
- 5 NO TIMEBASE installed timebase is not oscillating.
- 6 RB UNLOCK the installed Rubidium oscillator is unlocked.
- 7 Reserved
- 8 MOD OVLD external modulation overloaded.
- 9 IQ OVLD external IQ modulation overloaded.
- 10-15 Reserved

Example

INSR?

A return of '257' would indicate that an external modulation overload was detected and the 20 MHz PLL came unlocked.

LERR?

Last Error

Query the last error in the error buffer. Upon executing a LERR? query, the returned error is removed from the error buffer. See the section Error Codes later in this chapter for a description of the possible error codes returned by LERR?. The error buffer has space to store up to 20 errors. If more than 19 errors occur without being queried, the 20th error will be 254 (Too Many Errors), indicating that errors were dropped.

OPTN? i

Installed Options

Query whether option i is installed. Returns 1 if it is installed, otherwise 0. The parameter i identifies the option.

- i Option
- 1 Rear clock outputs
- 2 RF doubler and DC outputs
- 3 IQ modulation inputs and outputs
- 4 OCXO timebase
- 5 Rubidium timebase

ORNG? [i]

Output Over Range (New in firmware v1.10)

Query whether output i is over its specified range. The instrument returns one if the given output is over range, otherwise 0. The parameter i identifies the output as follows:

- <u>i</u> Output
- 0 BNC output
- 1 Type-N outputs
- 2 Rear RF doubler output

If omitted, i defaults to 1.

TEMP?

Temperature

Query the current temperature of the RF output block in degrees C.

TIMB?

Timebase

Query the current timebase. The returned value identifies the timebase.

<u>Value</u>	<u>Meaning</u>
0	Crystal timebase
1	OCXO timebase
2	Rubidium timebase
3	External timebase

Signal Synthesis Commands

Signal synthesis commands enable the user to set the frequency, amplitude, and phase of the outputs. Basic configuration can be achieved by following the steps as outlined in Table 29.

Table 29: Basic Signal Configuration

Action	Relevant Commands
Set frequency	FREQ
Set amplitude	AMPL, AMPR, AMPC, AMPH
Set offset	OFSL, OFSC, OFSD
Adjust phase	PHAS, RPHS

All of these commands are described in detail below.

AMPC(?){v} Amplitude of Clock

Set (query) the amplitude of the rear clock output $\{to\ v\}$ in V_{pp} . Unlike the other amplitude commands, units are always V_{pp} .

AMPH(?){v}[u] Amplitude of HF (RF Doubler)

Set (query) the amplitude of the rear RF doubler {to v}. If omitted, units default to dBm.

Example

 $\begin{array}{lll} \text{AMPH -5.0} & \text{Set the rear RF doubler amplitude to } -5.0 \text{ dBm.} \\ \text{AMPH 0.1 RMS} & \text{Set the rear RF doubler amplitude to } 0.1 \text{ V}_{rms}. \\ \text{AMPH?} & \text{Query the rear RF doubler amplitude in dBm.} \\ \text{AMPH? VPP} & \text{Query the rear RF doubler amplitude in V}_{pp}. \end{array}$

AMPL(?){v}[u] Amplitude of LF (BNC Output)

Set (query) the amplitude of the low frequency BNC output $\{to\ v\}$. If omitted, units default to dBm.

Example

 $\begin{array}{lll} \text{AMPL -1.0} & \text{Set the BNC output amplitude to } -1.0 \text{ dBm.} \\ \text{AMPL 0.1 RMS} & \text{Set the BNC output amplitude to 0.1 V}_{\text{rms}}. \\ \text{AMPL?} & \text{Query the BNC output amplitude in dBm.} \end{array}$

AMPR(?){v}[u] Amplitude of RF (Type-N Output)

Set (query) the amplitude of the Type-N RF output $\{to\ v\}$. If omitted, units default to dBm.

Example

AMPR -3.0 Set the Type-N RF output amplitude to -3.0 dBm. AMPR 0.1 RMS Set the Type-N RF output amplitude to 0.1 V_{rms} . AMPR? Query the Type-N RF output amplitude in dBm.

ENBC(?){i} Enable Clock

Set (query) the enable state of the rear clock output $\{to i\}$. If i is 0, the clock output is stopped in a low state. If i is 1, the clock is enabled and oscillating at the carrier frequency. Note that the query returns the current state of the output. It may return 0 even if a 1 was sent if the output is not active at the current frequency (i.e. $F_{carrier} > 4.05 \text{ GHz}$).

ENBH(?){i} Enable HF (RF Doubler)

Set (query) the enable state of the rear RF doubler output $\{\text{to i}\}$. If i is 0, the RF doubler is disabled and turned off. If i is 1, the rear RF doubler is enabled and operating at the programmed amplitude for the output. Note that the query returns the current state of the output. It may return 0 even if a 1 was sent if the output is not active at the current frequency (i.e. $F_{carrier} < 4.05 \text{ GHz}$).

ENBL(?){i} Enable LF (BNC Output)

Set (query) the enable state of the low frequency BNC output $\{to\ i\}$. If i is 0, the BNC output is disabled and turned off. If i is 1, the rear RF doubler is enabled and operating at the programmed amplitude for the output. Note that the query returns the current state of the output. It may return 0 even if a 1 was sent if the output is not active at the current frequency (i.e. $F_{carrier} > 62.5 \text{ MHz}$).

ENBR(?){i} Enable RF (Type-N Output)

Set (query) the enable state of the Type-N RF output $\{\text{to i}\}$. If i is 0, the Type-N RF output is disabled and turned off. If i is 1, the Type-N RF output is enabled and operating at the programmed amplitude for the output. Note that the query returns the current state of the output. It may return 0 even if a 1 was sent if the output is not active at the current frequency (i.e. $F_{carrier} < 950 \text{ kHz}$).

FREQ(?){f}[u] Frequency

Set (query) the carrier frequency {to f}. If omitted, units default to Hz.

Example

FREQ 100e6 Set the frequency to 100 MHz.
FREQ 100 MHz Also sets the frequency to 100 MHz.
FREQ? Returns the current frequency in Hz.
FREQ? MHz Returns the current frequency in MHz

NOIS(?){i} Noise Mode of RF PLL Loop Filter

Set (query) the RF PLL loop filter mode for the instrument.

- <u>i</u> <u>RF PLL Mode</u>
- 0 Mode 1—minimize noise at small offsets from carrier.
- 1 Mode 2—minimize noise at large offsets from carrier.

This command is identical to changing the PLL mode from the front panel via the shifted CAL function.

OFSC(?){v} Offset of Clock

Set (query) the offset voltage of the rear clock output {to v} in volts.

OFSD(?){v} Offset of Rear DC

Set (query) the offset voltage of the rear DC output {to v} in volts.

OFSL(?){v}

Offset of LF (BNC Output)

Set (query) the offset voltage of the low frequency BNC output {to v} in volts.

PHAS(?){p} Phase

Set (query) the phase of the carrier $\{to p\}$. The phase will track to $\pm 360^{\circ}$, but it may only be stepped by 360° in one step. Thus, if the phase is currently 360° , setting the phase to -90° will fail because the phase step is larger than 360° . On the other hand, setting the phase to 370° will succeed but the reported phase will then be 10° .

Example

PHAS 90.0 Set the phase to 90 degrees. PHAS -10.0 Set the phase to -10 degrees.

RPHS

Rel Phase

Make the current phase of the carrier 0°.

Modulation Commands

Modulation commands enable the user to configure different type of modulations of the carrier. Basic configuration can be achieved by following the steps outlined in Table 30.

Table 30: Basic Modulation Configuration

Modulation	Configuration	Relevant Commands
On/Off	Enable modulation	MODL
External	AC/DC input coupling	COUP
AM	Select AM modulation	TYPE 0
	Modulation function	MFNC
	Mod. rate / Noise bandwidth	RATE
	Deviation	ADEP, ANDP
FM	Select FM modulation	TYPE 1
	Modulation function	MFNC
	Mod. rate / Noise bandwidth	RATE
	Deviation	FDEV, FNDV
ΦМ	Select ΦM modulation	TYPE 2
	Modulation function	MFNC
	Mod. rate / Noise bandwidth	RATE
	Deviation	PDEV, PNDV
Sweep	Select frequency sweep	TYPE 3
	Modulation function	SFNC
	Modulation rate	SRAT
	Deviation	SDEV
Pulse/Blank	Select pulse/blank mod.	TYPE 4 or TYPE 5
	Modulation function	PFNC
	Pulse period	PPER
	Pulse width	PWID or PDTY
	PRBS period	RPER
	PRBS length	PRBS
IQ	Select IQ modulation	TYPE 6
	Modulation function	QFNC
	Noise bandwidth	RATE

All of these commands are described in detail below.

ADEP(?){d} AM Modulation Depth

Set (query) the AM modulation depth {to d} in percent.

Note: see ANDP command if noise is the selected modulation function.

Example

ADEP 90.0 Set the depth to 90 %.

ADEP? Query the current depth in percent.

ANDP(?){d} AM Noise Modulation Depth

Set (query) the AM noise modulation depth {to d} in percent. The value controls the rms depth of the modulation, not the peak deviation as the ADEP command does.

Note: see ADEP command for all modulation functions other than noise.

Example

ANDP 10.0 Set the rms noise depth to 10 %.

ANDP? Query the current rms noise depth in percent.

COUP(?){i} Modulation Coupling

Set (query) the coupling of the external modulation input {to i}. If i is 0, the input is AC coupled. If i is 1, the input is DC coupled. This setting has no affect on the input if pulse modulation is active. In that case the coupling is always DC.

FDEV(?){f}[u] FM Deviation

Set (query) the FM deviation {to f}. If omitted, units default to Hz.

Note: see FNDV command if noise is the selected modulation function.

Example

FDEV 10e3 Set the FM deviation to 10 kHz. FDEV? Query the current FM deviation in Hz.

FDEV 1 kHz Set the FM deviation to 1 kHz.

FNDV(?){f}[u] FM Noise Deviation

Set (query) the FM noise deviation {to f}. If omitted, units default to Hz. The value controls the rms deviation of the modulation, not the peak deviation as the FDEV command does.

Note: see FDEV command for all modulation functions other then noise.

Example

FNDV 10e3 Set the rms FM noise deviation to 10 kHz.
FNDV? Query the current rms FM noise deviation in Hz.
FNDV 1 kHz Set the rms FM noise deviation to 1 kHz.

MFNC(?){i} Modulation Function for AM/FM/ΦM

Set (query) the modulation function or AM/FM/ Φ M {to i}. The parameter i may be set to one of the following values:

- i Modulation Function
- 0 Sine wave
- 1 Ramp
- 2 Triangle
- 3 Square
- 4 Noise
- 5 External

Note: see SFNC, PFNC, and QFNC commands for sweeps, pulse/blank, and IQ modulations respectively.

MODL(?){i} Modulation Enable

Set (query) the enable state of modulation {to i}. If i is 0, modulation is disabled. If i is 1, modulation is enabled. This command may fail if the current modulation type is not allowed at current settings. For example, pulse modulation is not allowed at frequencies where the RF doubler is active.

PDEV(?){p} ΦM Deviation

Set (query) the ΦM deviation {to p} in degrees.

Note: see PNDV command if noise is the selected modulation function.

Example

PDEV 45.0 Set the ΦM deviation to 45.0 degrees. PDEV? Query the current ΦM deviation.

PDTY(?){d} Pulse/Blank Duty Factor

Set (query) the duty factor for pulse/blank modulation {to d} in percent. This value controls pulse modulation when the selected waveform is square (see PFNC). Use PWID? to determine the actual pulse width in time.

Example

PDTY 10 Set the duty factor to 10 %.
PDTY? Query the current duty factor.

PFNC(?){i} Pulse Modulation Function

Set (query) the modulation function for pulse/blank modulation {to i}. The parameter i may be set to one of the following values:

- <u>i</u> Modulation Function
- 3 Square
- 4 Noise (PRBS)
- 5 External

Note: see MFNC, SFNC, and QFNC commands for AM/FM/ Φ M, sweeps, and IQ modulations respectively.

PNDV(?){p} ΦM Noise Deviation

Set (query) the ΦM noise deviation {to p} in degrees. The value controls the rms deviation of the modulation, not the peak deviation as the PDEV command does.

Note: see PDEV command for all modulation functions other than noise.

Example

PNDV 10.0 Set the rms Φ M noise deviation to 10.0 degrees. PNDV? Query the current rms Φ M noise deviation.

PPER(?){t}[u] Pulse/Blank Period

Set (query) the pulse/blank modulation period {to t}. If omitted, units default to seconds. This value controls pulse modulation when the selected waveform is square (see PFNC).

Example

PPER 1e-3 Set the pulse period to 1 ms.

PPER? Query the current pulse period in seconds.

PRBS(?){i} PRBS Length for Pulse/Blank Modulation

Set (query) the PRBS length for pulse/blank modulation {to i}. The parameter i may range from 8 to 19. It defines the number of bits in the PRBS generator. A value of 8, for example, means the generator is 8 bits wide. It will generate a sequence of pseudo random bits which repeats every $2^8 - 1$ bits. This value controls pulse modulation when the selected waveform is noise (see PFNC).

Example

PRBS 10 Set the PRBS length to 10.
PRBS? Query the current PRBS length.

PWID(?){t}[u] Pulse/Blank Width

Set (query) the pulse/blank modulation width (duty cycle) {to t}. If omitted, units default to seconds. This value controls pulse modulation when the selected waveform is square (see PFNC).

Example

PWID 1e-6 Set the pulse width to 1 μs.

PWID? Query the current pulse width in seconds.

QFNC(?){i} IQ Modulation Function

Set (query) the modulation function for IQ modulation {to i}. The parameter i may be set to one of the following values:

- <u>i</u> Modulation Function
- 4 Noise
- 5 External

Note: see MFNC, SFNC, and PFNC commands for AM/FM/ Φ M, sweeps, and pulse/blank modulations respectively.

RATE(?){f}[u] Modulation Rate for AM/FM/ΦM

Set (query) the modulation rate for AM/FM/ Φ M {to f}. If omitted, units default to Hz. This command also controls the noise bandwidth for AM/FM/ Φ M and IQ modulation if a noise function is selected for the given type of modulation.

Note: use the SRAT command to control the sweep rates.

Example

RATE 400 Set the modulation rate to 400 Hz.

RATE 10 kHz Set the rate to 10 kHz.

RATE? Query the current rate in Hz.

RATE? kHz Query the current rate in kHz.

RPER(?){t}[u] PRBS Period for Pulse/Blank Modulation

Set (query) the PRBS period for pulse/blank modulation {to t}. If omitted, units default to seconds. This value controls pulse modulation when the selected waveform is noise (see PFNC).

Example

RPER 1e-3 Set the bit period to 1 ms.

RPER? Query the current bit period in seconds.

SDEV(?){f}[u] Sweep Deviation

Set (query) the deviation for sweeps {to f}. If omitted, units default to Hz. The limits for sweep deviations are controlled by the edges of the band within which the synthesizer is operating. Sweep deviations may be as large as 1 GHz in the 2 to 4 GHz band.

Example

SDEV 100e6 Set the sweep deviation to 100 MHz.
SDEV? Query the current sweep deviation in Hz.
SDEV 1 MHz Set the sweep deviation to 1 MHz.

SFNC(?){i} Sweep Modulation Function

Set (query) the modulation function for sweeps {to i}. The parameter i may be set to one of the following values:

- <u>i</u> Modulation Function
- 0 Sine wave
- 1 Ramp
- 2 Triangle
- 5 External

Note: see MFNC, PFNC, and QFNC commands for AM/FM/ Φ M, pulse/blank, and IQ modulations respectively.

SRAT(?){f}[u] Modulation Sweep Rate

Set (query) the modulation rate for sweeps $\{to\ f\}$. If omitted, units default to Hz. Note: use the RATE command to control the modulation rate of AM/FM/ Φ M.

Example

SRAT 10 Set the sweep rate to 10 Hz. SRAT? Query the current rate in Hz.

TYPE(?){i} Modulation Type

Set (query) the current modulation type $\{to\ i\}$. The parameter i may be set to one of the following values:

- <u>i</u> Modulation Type
- 0 AM
- 1 FM
- 2 ΦM
- 3 Sweep
- 4 Pulse
- 5 Blank
- 6 IQ (if option 3 is installed)

Example TYPE 2

FYPE 2 Set the modulation type to phase modulation.

List Commands

For detailed information on creating and defining lists, see the section List Mode later in this chapter. Basic steps for using lists are summarized in Table 31.

Table 31: Basic List Configuration

Action	Relevant Commands
Create list	LSTC
Set instrument state for each list entry	LSTP
Enable list	LSTE
Trigger list	*TRG or GPIB bus trigger
Delete list	LSTD

All of these commands are described in detail below.

LSTC? i List Create

Create a list of size i. If successful, 1 is returned, otherwise 0 is returned. The list is initialized to the no change state.

Example

LSTC? 20 Create a list of size 20. Returns 1 if successful, otherwise 0.

LSTD List Delete

Delete the current list and free any memory dedicated to it.

Example

LSTD Destroy a previously created list.

LSTE(?){i} List Enable

Set (query) the list enable state {to i}. If i is 1, the list is enabled. If i is 0 it is disabled. A list must be enabled before it can be triggered.

Example

LSTE 1 Enable a previously created list.

LSTE? Query the current enable state of the list.

LSTI(?){i} List Index

Set (query) the current list index pointer {to i}. The list index identifies the entry whose state will be loaded into the instrument upon the next valid trigger.

Example

LSTI 10 Set the list index to 10.
LSTI? Query the current list index.

LSTP(?) i {,<st>} List Point

Set (query) the instrument state stored in entry i of the list {to <st>}. Details on the format and meaning of instrument states <st> are discussed above in the section List Instrument States.

Example

LSTP 5, 100e6,N,N,N,N,N,N,N,N,N,N,N,N,N,N

Set list entry 5 in the list to change the frequency to 100

MHz but leave all other settings unchanged.

LSTP? 5 Query instrument state stored in list entry 5.

LSTR

List Reset

Reset the list index to zero.

LSTS?

List Size

Query the current list size. This is the size requested when the list was created with the LSTC? command.

Interface Commands

EMAC? Ethernet MAC Address

Query the Ethernet MAC address.

EPHY(?){i} Ethernet Physical Layer Configuration

Set (query) the Ethernet link speed {to i}. The parameter i may be one of the following:

<u>i</u> <u>Link Speed</u> 0 10 Base T 1 100 Base T

Example

EPHYS 1 Configure link for 100 Base T operation.

IFCF(?)i{,j} Interface Configuration

Set (query) interface configuration parameter i {to j}. The parameter i may be one of the following:

- <u>i</u> Configuration Parameter
- 0 RS-232 Enable/Disable
- 1 RS-232 Baud Rate
- 2 GPIB Enable/Disable
- 3 GPIB Address
- 4 LAN TCP/IP Enable/Disable.
- 5 DHCP Enable/Disable
- 6 Auto-IP Enable/Disable
- 7 Static IP Enable/Disable
- 8 Bare Socket Enable/Disable
- 9 Telnet Enable/Disable
- 10 VXI-11 Net Instrument Enable/Disable
- 11 Static IP Address
- 12 Subnet Address/Network Mask
- 13 Default Gateway

Set j to 0 to disable a setting and 1 to enable it. Valid RS-232 baud rates include 4800, 9600, 19200, 38400, 57600, and 115200. Valid GPIB addresses are in the range 0–30. Parameters 10–12 require an IP address in the form 'a.b.c.d' where each letter is a decimal integer in the range 0–255.

Example

IFCF 13,192.168.10.1

IFCF 6,0	Disable Auto-IP
IFCF 1,19200	Set RS-232 baud rate to 19200
IFCF 3,16	Set primary GPIB address to 16
IFCF 11,192.168.10.5	Set IP address to 192.168.10.5
IFCF 12,255.255.255.0	Set network mask to 255.255.255.0

Set default gateway to 192.168.10.1

IFRS i

Interface Reset

Reset interface i. The parameter i identifies the interface to reset:

- <u>i</u> <u>Interface</u>
- 0 RS-232
- 1 GPIB
- 2 LAN TCP/IP

When an interface is reset all connections on that interface are reset to the power-on state.

IPCF? i

Active TCP/IP Configuration

Query active TCP/IP configuration parameter i. The parameter i may be one of the following:

- <u>i</u> Configuration
- 0 Link
- 1 IP Address
- 2 Subnet Address/Network Mask
- 3 Default Gateway

The link parameter indicates whether the unit is physically connected to the LAN/Ethernet network. A value of 1 indicates the unit is connected. The rest of the parameters indicate the current TCP/IP configuration that was selected by the appropriate configuration process: DHCP, Auto-IP, or Static IP.

LCAL

Go to Local

Go back to local control of the instrument. This enables the front panel key pad for instrument control. This command is only active on raw socket, telnet and RS-232 connections. The other interfaces have built in functionality for implementing this functionality.

LOCK?

Request Lock

Request the instrument lock. The unit returns 1 if the lock is granted and 0 otherwise. When the lock is granted, no other instrument interface, including the front panel interface, may alter instrument settings until the lock is released via the UNLK command.

REMT

Go to Remote

Enable remote control of the instrument. In this mode, the front panel key pad is disabled, so that control of the instrument can only occur via the remote interface. This command is only active on raw socket, telnet and RS-232 connections. The other interfaces have built in functionality for implementing this functionality.

UNLK?

Release Lock

Release the instrument lock previously acquired by the LOCK? command. Returns 1 if the lock was released, otherwise 0.

XTRM i{,j,k}

Interface Terminator

Set the interface terminator that is appended to each response to i, j, k. The default terminator is 13, 10, which is a carriage return followed by a line feed.

Status Byte Definitions

The instrument reports on its status by means of the serial poll status byte and two event status registers: the standard event status (*ESR) and the instrument event status (INSR). These read-only registers record the occurrence of defined events inside the unit. If the event occurs, the corresponding bit is set to one. Bits in the status registers are latched. Once an event bit is set, subsequent state changes do not clear the bit. All bits are cleared when the registers are queried, with a *ESR?, for example. The bits are also cleared with the clear status command, *CLS. The bits are not cleared, however, with an instrument reset (*RST) or a device clear.

Each of the unit's event status registers has an associated enable register. The enable registers control the reporting of events in the serial poll status byte (*STB). If a bit in the event status register is set and its corresponding bit in the enable register is set, then the summary bit in the serial poll status byte (*STB) will be set. The enable registers are readable and writable. Reading the enable registers or clearing the status registers does not clear the enable registers. Bits in the enable registers must be set or cleared explicitly. To set bits in the enable registers, write an integer value equal to the binary weighted sum of the bits you wish to set.

The serial poll status byte (*STB) also has an associated enable register called the service request enable register (*SRE). This register functions in a similar manner to the other enable registers, except that it controls the setting of the master summary bit (bit 6) of the serial poll status byte. It also controls whether the unit will issue a request for service on the GPIB bus.

Serial Poll Status Byte

<u>Bit</u>	<u>Name</u>	<u>Meaning</u>
0	INSB	An unmasked bit in the instrument status register (INSR) has been
		set.
1	Reserved	
2	Reserved	
3	Reserved	
4	MAV	The interface output buffer is non-empty
5	ESB	An unmasked bit in the standard event status register (*ESR) has
		been set.
6	MSS	Master summary bit. Indicates that the instrument is requesting
		service because an unmasked bit in this register has been set.
7	Reserved	

The serial poll status byte may be queried with the *STB? command. The service request enable register (*SRE) may be used to control when the instrument asserts the request-for-service line on the GPIB bus.

Standard Event Status Register

<u>Bit</u>	<u>Name</u>	<u>Meaning</u>
0	OPC	Operation complete. All previous commands have completed. See
		command *OPC.
1	Reserved	
2	QYE	Query error occurred.
3	DDE	Device dependent error occurred.
4	EXE	Execution error. A command failed to execute correctly because a
		parameter was invalid.
5	CME	Command error. The parser detected a syntax error.
6	Reserved	
7	PON	Power on. The unit has been power cycled.

The standard event status register may be queried with the *ESR? command. The standard event status enable register (*ESE) may be used to control the setting of the ESB summary bit in the serial poll status byte.

Instrument Status Register

<u>Bit</u>	<u>Name</u>	Meaning
0	20MHZ_UNLK	The 20 MHz PLL has come unlocked.
1	100MHZ_UNLK	The 100 MHz PLL has come unlocked.
2	19MHZ_UNLK	The 19 MHz PLL has come unlocked.
3	1GHZ UNLK	The 1 GHz PLL has come unlocked.
4	4GHZ UNLK	The 4 GHz PLL has come unlocked.
5	NO TIMEBASE	An installed optional timebase is not oscillating.
6	RB_UNLK	An installed Rubidium timebase is unlocked.
7	Reserved	
8	MOD OVLD	An external modulation overload was detected.
9	IQ OVLD	An external IQ modulation overload was detected.
10-15	Reserved	
	0 1 2 3 4 5 6 7 8	0 20MHZ_UNLK 1 100MHZ_UNLK 2 19MHZ_UNLK 3 1GHZ_UNLK 4 4GHZ_UNLK 5 NO_TIMEBASE 6 RB_UNLK 7 Reserved 8 MOD_OVLD 9 IQ_OVLD

The instrument status register may be queried with the INSR? command. The instrument status enable register (INSE) may be used to control the setting of the INSB summary bit in the serial poll status byte.

List Mode

The instrument supports a powerful list mode, only available via the remote interface, which enables the user to store a list of instrument states in memory and quickly switch between states by sending GPIB bus triggers or the *TRG command.

List Instrument States

At the heart of the list configuration is the instrument state which should be loaded upon the reception of each valid trigger. The instrument state is downloaded to the unit via the command: LSTP i {, <st>}. The parameter i is the index identifying the list entry to which the instrument state, <st>, should be stored. The instrument state, <st>, consists of an ordered, comma-separated list of 15 values. The order and description of each value is summarized in Table 32.

Also listed in the table are related, non-list, commands that also change the given instrument state. For example, frequency is the first parameter. Entering a value here would change the carrier frequency to the given value just as the FREQ command would do.

The parameter for each state is set with a floating point value or integer in the default units as specified by the related commands. For example, entering a 100e6 in the first position would set the frequency to 100 MHz.

Although, all parameters in <st> must be specified, each parameter may be specified as 'N' to leave the parameter unchanged. Thus, to leave all parameters unchanged, set the state as follows:

```
<All unchanged> = N,N,N,N,N,N,N,N,N,N,N,N,N,N,N
```

This is the default for all entries when a list is created. To change just one item, simply specify that one item and leave all others unchanged. For example, to only change the BNC output amplitude use the following state:

```
<BNC ampl: -2 dBm> = N,N,-2.00,N,N,N,N,N,N,N,N,N,N,N,N,N
```

Performing scans of frequency or amplitude consists of storing successive instrument list states in which only the frequency is changed, or only the amplitude is changed, respectively. To scan frequency and amplitude simultaneously, simply specify both frequency and amplitude for each state. For example, to change the frequency to 10 MHz and the BNC output to –2 dBm use the following state:

If a given setting happens to be invalid when the triggered state occurs, the parameter will be ignored. This might happen, for instance, if one tries to enable pulse modulation with the frequency set to 7 GHz.

Table 32: List State Definitions

Position	Instrument State	Related Commands
1	Frequency	FREQ
2	Phase	PHAS
3	Amplitude of LF (BNC output)	AMPL
4	Offset of LF (BNC output)	OFSL
5	Amplitude of RF (Type-N output)	AMPR
6	Front panel display	DISP
7	Enables/Disables	
	Bit 0: Enable modulation	MODL
	Bit 1: Disable LF (BNC output)	ENBL
	Bit 2: Disable RF (Type-N output)	ENBR
	Bit 3: Disable Clock output	ENBC
	Bit 4: Disable HF (RF doubler output)	ENBH
8	Modulation type	TYPE
9	Modulation function	
	AM/FM/ ΦM	MFNC
	Sweep	SFNC
	Pulse/Blank	PFNC
	IQ	QFNC
10	Modulation rate	
	AM/FM/ΦM modulation rate	RATE
	Sweep rate	SRAT
Pulse/Blank period		PPER, RPER
11	Modulation deviation	
	AM	ADEP, ANDP
	FM	FDEV, FNDV
	ΦМ	PDEV, PNDV
	Sweep	SDEV
	Pulse/Blank	PWID
12	Amplitude of clock output	AMPC
13	Offset of clock output	OFSC
14	Amplitude of HF (RF doubler output)	AMPH
15	Offset of rear DC	OFSD

Enables/Disables

The enables/disables setting at position 7 in the state list is different from the others in that multiple commands are aggregated into one value and the polarities of the disables are opposite to that of their corresponding commands. Modulation enable is assigned to bit 0. The output disables are assigned to bits 1 to 4. The enable/disables value is then calculated as the binary weighted sum of all the bits.

For example, to enable modulation and disable the clock and RF doubler outputs, we need to set bits 0, 3, and 4. The binary weighted sum is given as $2^0 + 2^3 + 2^4 = 1 + 8 + 16 = 25$. Thus, a value of 25 in position 7 would enable the modulation and disable the clock and RF doubler outputs.

Modulation List States

Virtually all modulation parameters may be specified as part of a list state, but not simultaneously. In order to compress the size of the list, many parameters share the same position as indicated in Table 19. Thus, in order to untangle which parameters are being specified, the modulation type must be specified. Furthermore, if modulation rate or deviation is specified, then both the modulation type and modulation function must also be specified.

For example, to set AM sine wave modulation depth to 25 %, specify the list state as follows:

<Mod AM: 25%> = N,N,N,N,N,N,0,0,N,25.0,N,N,N,N

Similarly, to set FM sine wave modulation deviation to 100 kHz, specify the list state as follows:

<Mod FM: 100 kHz> = N,N,N,N,N,N,N,1,0,N,100e3,N,N,N,N

Specify a frequency sweep of 100 MHz at a 10 Hz rate with a 750 MHz carrier and modulation enabled as follows:

<Sweep: 100 MHz at 10 Hz> = 750e6,N,N,N,N,N,1,3,1,10.0,100e6,N,N,N,N

Specify pulse modulation with a 1 ms period and 10 µs width as follows:

<Mod pulse: 1 ms period, 10 μ s width> = N,N,N,N,N,N,N,4,3,1e-3,10e-6,N,N,N,N

Note that although the modulation type and modulation function must usually be specified together, the modulation itself need not necessarily be enabled. Thus, one could configure the modulation in one list entry and enable it in another entry.

Examples

Example 1: Scan frequency from 100 MHz to 1 GHz in 100 MHz steps.

Example 2: Scan RF Type-N output from 10 dBm to -10 dBm in 5 dBm steps.

LSTC? 5
LSTP 0,N,N,N,10.0,N,N,N,N,N,N,N,N,N,N,N
LSTP 1,N,N,N,N,5.0,N,N,N,N,N,N,N,N,N,N,N,N
LSTP 2,N,N,N,N,0.0,N,N,N,N,N,N,N,N,N,N
LSTP 3,N,N,N,-5.0,N,N,N,N,N,N,N,N,N,N
LSTP 4,N,N,N,-10.0,N,N,N,N,N,N,N,N,N,N,N
LSTE 1

Example 3: Configure pulse modulation with 1 ms period and scan the width from 100 µs to 900 µs in 100 µs steps.

Example 4: Configure AM modulation at 1 kHz rate and scan the depth from 25 % to 100 % in 25 % steps.

LSTC? 4
LSTP 0,N,N,N,N,N,N,1,0,0,1e3,25,N,N,N,N
LSTP 1,N,N,N,N,N,N,N,0,0,N,50,N,N,N,N
LSTP 2,N,N,N,N,N,N,N,0,0,N,75,N,N,N,N
LSTP 3,N,N,N,N,N,N,N,0,0,N,100,N,N,N,N
LSTE 1

Error Codes

The instrument contains an error buffer that may store up to 20 error codes associated with errors encountered during power-on self tests, command parsing, or command execution. The ERR LED will be highlighted when a remote command fails for any reason. The errors in the buffer may be read one by one by executing successive LERR? commands. The user may also view the errors from the front panel by pressing the keys [SHIFT], 'STATUS', sequentially, followed by ADJUST \triangle until the display reads 'Error Status.' Finally, press SELECT \triangleright successively to view the error count and individual errors. The errors are displayed in the order in which they occurred. The ERR LED will go off when all errors have been retrieved.

The meaning of each of the error codes is described below.

Execution Errors

0 No Error

No more errors left in the queue.

10 Illegal Value

A parameter was out of range.

11 Illegal Mode

The action is illegal in the current mode. This might happen, for instance, if the user tries to turn on IQ modulation with the 'MODL 1' command and the current frequency is below 400 MHz.

12 Not Allowed

The requested action is not allowed because the instrument is locked by another interface.

13 Recall Failed

The recall of instrument settings from nonvolatile storage failed. The instrument settings were invalid.

14 No Clock Option

The requested action failed because the rear clock option is not installed.

15 No RF Doubler Option

The requested action failed because the rear RF doubler option is not installed.

16 No IQ Option

The requested action failed because the rear IQ option is not installed.

17 Failed Self Test

This value is returned by the *TST? command when the self test fails.

Query Errors

30 Lost Data

Data in the output buffer was lost. This occurs if the output buffer overflows or if a communications error occurs and data in output buffer is discarded.

32 No Listener

This is a communications error that occurs if the unit is addressed to talk on the GPIB bus, but there are no listeners. The unit discards any pending output.

Device Dependent Errors

40 Failed ROM Check

The ROM checksum failed. The firmware code is likely corrupted.

42 Failed EEPROM Check

The test of EEPROM failed.

43 Failed FPGA Check

The test of the FPGA failed.

44 Failed SRAM Check

The test of the SRAM failed.

45 Failed GPIB Check

The test of GPIB communications failed.

46 Failed LF DDS Check

The test of the LF DDS communications failed.

47 Failed RF DDS Check

The test of the RF DDS communications failed.

48 Failed 20 MHz PLL

The test of the 20 MHz PLL failed.

49 Failed 100 MHz PLL

The test of the 100 MHz PLL failed.

50 Failed 19 MHz PLL

The test of the 19 MHz PLL failed.

51 Failed 1 GHz PLL

The test of the 1 GHz PLL failed.

52 Failed 4 GHz PLL

The test of the top octave PLL failed.

53 Failed DAC

The test of the internal DACs failed.

Parsing Errors

110 Illegal Command

The command syntax used was illegal. A command is normally a sequence of four letters, or a '*' followed by three letters.

111 Undefined Command

The specified command does not exist.

112 Illegal Query

The specified command does not permit queries

113 Illegal Set

The specified command can only be queried.

114 Null Parameter

The parser detected an empty parameter.

115 Extra Parameters

The parser detected more parameters than allowed by the command.

116 Missing Parameters

The parser detected missing parameters required by the command.

117 Parameter Overflow

The buffer for storing parameter values overflowed. This probably indicates a syntax error

118 Invalid Floating Point Number

The parser expected a floating point number, but was unable to parse it.

120 Invalid Integer

The parser expected an integer, but was unable to parse it.

121 Integer Overflow

A parsed integer was too large to store correctly.

122 Invalid Hexadecimal

The parser expected hexadecimal characters but was unable to parse them.

126 Syntax Error

The parser detected a syntax error in the command.

127 Illegal Units

The units supplied with the command are not allowed.

128 Missing Units

The units required to execute the command were missing.

Communication Errors

170 Communication Error

A communication error was detected. This is reported if the hardware detects a framing, or parity error in the data stream.

171 Over run

The input buffer of the remote interface overflowed. All data in both the input and output buffers will be flushed.

Other Errors

254 Too Many Errors

The error buffer is full. Subsequent errors have been dropped.

Example Programming Code

The following program can be used as sample code for communicating with the instrument over TCP/IP. The program is written in the C++ language and should compile correctly on a Windows based computer. It could be made to work on other platforms with minor modifications. In order to use the program, you will need to connect the unit to your LAN and configure it with an appropriate IP address. Contact your network administrator for details on how to do this. To identify the unit's current IP address from the front panel press [SHIFT], [STATUS], then repeat press \triangle until the 'tcp ip status' menu appears. Finally press the $[\triangleleft]$ $[\triangleright]$ to sequence to the 'ip' address.

Copy the program into a file named "sg_ctrl.cpp". To avoid typing in the program manually, download the electronic version of this manual from the SRS website (www.thinksrs.com). Select the program text and copy/paste it into the text editor of your choice. Compile the program into the executable "sg_ctrl.exe". At the command line type something like the following:

```
sg ctrl 192.168.0.5
```

where you will replace "192.168.0.5" with the IP address of the unit. You should see the something like the following:

Connection Succeeded

Stanford Research Systems, SG384, s/n001013, ver1.00.10A

Closed connection

The program connects to the unit at the supplied IP address sets several parameters and then closes. If successful, the frequency should be set to 50 MHz and the amplitudes of Type-N and BNC outputs will be set to -10 and -5 dBm, respectively.

```
/* sg ctrl.c : Sample program for controlling the SG384 via TCP/IP */
#include "Winsock2.h"
#include <stdio.h>
/* prototypes */
void init_tcpip(void);
int sg connect (unsigned long ip);
int sg close(void);
int sg write(char *str);
int sg_write_bytes(const void *data, unsigned num);
int sg_read(char *buffer, unsigned num);
SOCKET sSG384;
                             /* sg384 tcpip socket */
unsigned sg timeout = 6000; /* Read timeout in milliseconds */
int main(int argc, char * argv[])
 char buffer[1024];
  /* Make sure ip address is supplied on the command line */
  if (argc < 2 ) {
   printf("Usage: sg_ctrl IP_ADDRESS\n");
   exit(1);
  /* Initialize the sockets library */
  init tcpip();
  /* Connect to the sq384 */
  if ( sg connect( inet addr(argv[1]) ) ) {
   printf("Connection Succeeded\n");
    /* Get identification string */
   sg write("*idn?\n");
   if ( sg_read(buffer, sizeof(buffer)) )
     printf(buffer);
   else
     printf("Timeout\n");

SG380 Series Operation Verification

Overview

The operation of a SG380 series RF signal generator may be evaluated by running a series of tests designed to measure the accuracy of its inputs and outputs and comparing the results with their associated specifications. While the verification tests presented here are not as extensive as the tests performed at the factory, one can nevertheless have confidence that a unit that passes these tests is functioning properly and within specification.

The verification tests can be divided into three broad categories: output driver tests, frequency synthesis tests, and timebase calibration tests. A brief test procedure for each of the option boards is also included. The output driver tests are designed to test the integrity and accuracy of the front panel outputs by measuring the output power of the BNC and Type-N outputs. The frequency synthesis tests verify the overall frequency generation at various points in the spectrum from DC to 6 GHz. Lastly, the timebase calibration tests evaluate the accuracy and stability of the installed timebase.

Please allow the instrument under test to warm up for 1 hour before testing it to a specification.

Equipment Required

In addition to the SG380 series RF signal generator under test, the following equipment will be required to carry out the performance tests:

- Agilent U2004A power meter: 9 kHz to 6 GHz
- Agilent E4440A PSA Spectrum Analyzer
- Agilent DSO-X-2014A oscilloscope
- Agilent 34410A DVM
- SRS DS345 function generator
- SRS FS725 rubidium frequency standard
- SRS SR620 time interval counter

Equivalent equipment may be substituted as desired as long as they have similar or superior specifications. Standard BNC and shielded SMA and Type-N cables will be required to connect the test equipment to the SG380 series generators. Additionally accessories required include $50~\Omega$ terminators and various adapters.

SG380 Series Self Test

The SG380 series RF signal generators include a self test that checks the functional operation of many important internal components. If any of the tests fail, the unit will briefly display "Failed" after the test.

The SG380 series self test may be executed from the front panel by performing the following steps:

- 1. Press the keys [SHIFT], [0], and [Hz] to reset the instrument to default settings.
- 2. Press the keys [SHIFT], [2], ADJUST [\triangle], and [Hz] to run the self test.

The self test may also be run by sending the commands *RST;*TST? over a remote interface. If the unit passes it will return 0 over the remote interface. If it fails, it will return 17. Further information about the specific tests that failed may be accessed from the front panel by pressing the keys [SHIFT], [2] and pressing ADJUST $[\triangle]$ until the display reads "Error Status." Press SELECT $[\triangleright]$ successively to view each error code. The error codes are detailed in the Remote Programming section of the operation manual.

Output Power Tests

The output power tests are intended to test the integrity of the SG380 series output blocks. They test the output power of the front panel BNC and Type-N outputs at various frequencies.

BNC Output Power Test

The BNC output power test requires the setup shown in Figure 4. The power meter plus adapter should be connected directly to the BNC output with no intervening cable.

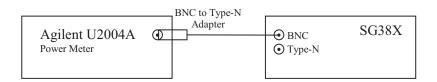

Figure 4: BNC output power test setup

To verify the integrity of the BNC output, perform the following procedures:

- 1. Before attaching the power meter to the SG380 series unit under test, calibrate and zero the power meter.
- 2. Attach the power meter to the SG380 series unit under test.
- 3. Set the calibration frequency for the power meter to the test frequency given in Table 33.
- 4. On the SG380 series generator, press the keys [SHIFT], [0], and [Hz] to reset the instrument to default settings.

- 5. Press [FREQ] to select frequency. Then enter the test frequency given in Table 33.
- 6. Press [AMPL] until the display shows "bnc". Then enter the power setting given in Table 33.
- 7. Record the power reported by the power meter. Verify that it is within the stated limits
- 8. Repeat step 3 followed by steps 5 through 7 for each frequency and power setting in Table 33.

Frequency	Power Setting (dBm)	Measured Power (dBm)	Limits (dB)
10 MHz	10.0		±2
	5.0		±2
	0.0		±2
	-5.0		±2
	-10.0		±2
50 MHz	10.0		±2
	5.0		±2
	0.0		±2
	-5.0		±2
	-10.0		±2

Table 33: Power level requirements for the BNC output

Type-N Output Power Test

The Type-N output power test requires the setup shown in Figure 5. The power meter should be attached directly to the Type-N output of the SG380 series unit under test with no intervening cable

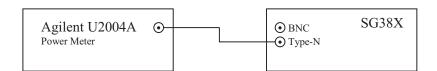

Figure 5: Type-N output power test setup

To verify the integrity of the Type-N output perform the following procedures:

- 1. Before attaching the power meter to the SG380 series unit under test, calibrate and zero the power meter.
- 2. Attach the power meter to the SG380 series unit under test.
- 3. Set the calibration frequency for the power meter to the test frequency given in Table 34.
- 4. On the SG380 series generator, press the keys [SHIFT], [0], and [Hz] to reset the instrument to default settings.
- 5. Press [FREQ] to select frequency. Then enter the test frequency given in Table 34.

- 6. Press [AMPL] until the display shows "ntype". Then enter the power setting given in Table 34.
- 7. Record the power reported by the power meter. Verify that it is within the stated limits.
- 8. Repeat step 3, followed by steps 5 through 7 for each frequency and power setting in Table 34.

Table 34: Power level requirements for the Type-N output

Frequency	Power Setting (dBm)	Measured Power (dBm)	
50 MHz	10.0		±2
	5.0		±2
	0.0		±2
	-5.0		±2
	-10.0		±2
100 MHz	10.0		±2
	5.0		±2
	0.0		±2
	-5.0		±2
	-10.0		±2
250 MHz	10.0		±2
	5.0		±2
	0.0		±2
	-5.0		±2
	-10.0		±2
500 MHz	10.0		±2
	5.0		±2
	0.0		±2
	-5.0		±2
	-10.0		±2
1000 MHz	10.0		±2
	5.0		±2
	0.0		±2
	-5.0		±2
	-10.0		±2
2000 MHz	10.0		±2
	5.0		±2
	0.0		±2
	-5.0		±2
	-10.0		±2
4000 MHz	10.0		±2
	5.0		±2
	0.0		±2
	-5.0		±2
	-10.0		±2
6000 MHz	10.0		±2
	5.0		±2
	0.0		±2
	-5.0		±2
	-10.0		±2

The measurements at 4000 MHz only apply to the SG384 and SG386. The measurements at 6000 MHz only apply to the SG386.

Frequency Synthesis Tests

Basic functionality of the SG380 series generators is verified by testing the generation of several specific frequencies from DC to 6 GHz.

Frequency Generation Tests

Frequency generation tests verify that basic frequency synthesis of the device under test is operating correctly. This is accomplished by measuring the output frequency of the SG380 series generator at several specific frequencies from DC to 6 GHz. The specific frequencies selected in the test guarantee that all crystals within the device under test are functioning properly and that all phase locked loops are locked and stable. The Agilent E4440A PSA spectrum analyzer is used to verify frequency synthesis. This test requires the setup shown in Figure 6.

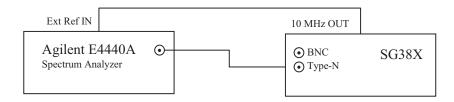

Figure 6: Setup for frequency generation tests.

To verify the frequency generation of the device under test perform the following procedures:

- 1. Connect the equipment as shown in Figure 6
- 2. Verify that the spectrum analyzer is locked to the 10 MHz external reference frequency.
- 3. Align the spectrum analyzer by pressing the keys [System], [Alignment], [Align All Now].
- 4. On the SG380 series generator, press the keys [SHIFT], [0], and [Hz] to reset the instrument to default settings.
- 5. Press [AMPL] until the display shows "ntype". Then press [0], [dBm] to set the amplitude to 0 dBm.
- 6. Press [FREQ] to select frequency. Then enter the test frequency given in Table 35.
- 7. Verify that the measured frequency is within the limits given in Table 35.
- 8. Repeat steps 6 and 7 for all the frequencies given in Table 35

Note that frequencies above 2025 MHz do not apply to the SG382. Similarly, frequencies above 4050 MHz do not apply to the SG384. All test frequencies apply to the SG386.

Test Freq. (MHz)	Measured Freq. (MHz)	Limit (Hz)
50		±2
99		±2
177		±2
250		±2
333		±2
498		±2
723		±2
1000		±2
1522		±2
2013		±2
2845		±2
3350		±2
3999		±2
4650		±2
5319		±2
6000		±2

Table 35: Test frequencies for frequency synthesis

Modulation Output Test

This is test verifies the operation of the modulation engine and the modulation output. It does not test to any specifications. This test requires the setup shown in Figure 7

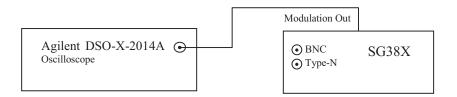

Figure 7: Setup for modulation output test.

To verify the operation of the modulation output, use the following procedure:

- 1. Connect the equipment as shown in Figure 7.
- 2. Set the scope to trigger on Ch 1, rising edge
- 3. Set the vertical scale to 500 mV/div
- 4. Set the timebase to 500 us/div
- 5. On the SG380 series generator, press the keys [SHIFT], [0], and [Hz] to reset the instrument to default settings.
- 6. Press [MOD FCN] and then press ADJUST $[\nabla]$ two times. The display should read "func triangle."
- 7. Press [ON/OFF] to turn the modulation on.

The waveform on the scope should look similar to that shown in Figure 8. It should be a 1 kHz triangle wave centered about 0 V with a peak to peak deviation of 2 V. Verify that the waveform has no discontinuities.

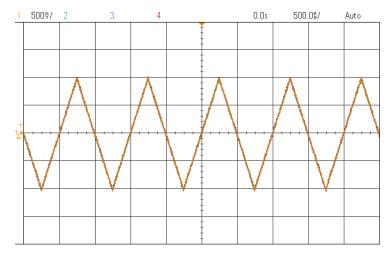

Figure 8: Modulation output waveform.

Modulation Input Test

This is test verifies the operation of the modulation engine and modulation input. It does not test to any specifications. This test requires the setup shown in Figure 9

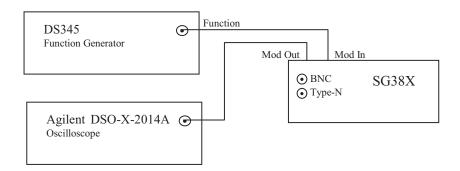

Figure 9: Setup for modulation input test.

To verify the operation of the modulation input, use the following procedure:

- 1. Connect the equipment as shown in Figure 9.
- 2. Set the scope to trigger on Ch 1, rising edge
- 3. Set the vertical scale to 500 mV/div
- 4. Set the timebase to 500 us/div
- 5. Reset the DS345 to default settings by pressing [SHIFT], [RCL]
- 6. Set the DS345 for triangle waves by pressing FUNCTION $[\nabla]$ twice.
- 7. Set the DS345 for a 1 Vpp output by pressing the keys [AMPL], [1], [Vpp].
- 8. On the SG380 series generator, press the keys [SHIFT], [0], and [Hz] to reset the instrument to default settings.

- 9. Select external modulation by pressing [MOD FCN] and then pressing ADJUST $[\nabla]$ until the "EXT" LED is highlighted. The display should read "func etrn. ac dc"
- 10. Press [ON/OFF] to turn the modulation on.

The waveform on the scope should look similar to that shown in Figure 10. It should be a 1 kHz triangle wave centered about 0 V with a peak to peak deviation of 2 V. Verify that the waveform has no discontinuities.

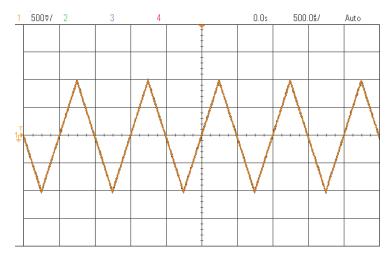

Figure 10: Modulation input test waveform.

Timebase Calibration

The accuracy of the internal timebase may be tested against a house reference if it is known that the house reference has a superior stability and accuracy than the timebase installed in the SG380 series generator. Use the setup shown in Figure 11 to test the accuracy of the timebase.

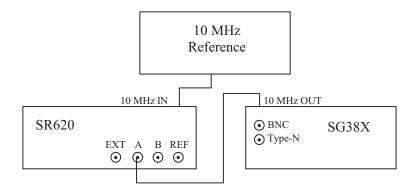

Figure 11: Setup for timebase calibration

The accuracy and stability of the SG380 series timebase depends on the type of timebase installed. An optional timebase, if installed, can be identified on the rear panel of SG380 series generator under the serial number with the label "Rubidium Timebase"

If the standard OCXO timebase is installed, an FS725 Rb frequency standard may be used as the 10 MHz reference. If a rubidium timebase is installed, a cesium based reference will be required as a reference.

SR620 Configuration

Use the following procedure to set up the SR620:

- 1. With the power off hold down the [CLR] button in the DISPLAY section and turn the power on. This resets the SR620 to default settings.
- 2. Press [SEL] in the CONFIG section until "CAL" is flashing
- 3. Press [SET] in the CONFIG section until "cloc Source" is displayed
- 4. Press SCALE[\triangle] in the SCOPE AND CHART section until "cloc Source rear" is displayed
- 5. Press MODE $[\nabla]$ button until the selected mode is FREQ.
- 6. Press [SEL] in the CONFIG section until "OUT" is flashing
- 7. Press [SET] in the CONFIG section until "Gate Scale" is displayed
- 8. Press SCALE[△] in the SCOPE AND CHART section until 100 is displayed.
- 9. Press the DISPLAY $[\triangle]$ to return to the normal display
- 10. Press the GATE/ARM [\triangle] button once to set the gate to 10 s
- 11. If a rubidium timebase is installed in the SG380 series generator, press the GATE/ARM [\triangle] button once more to set the gate to 100 s
- 12. Press the SAMPLE SIZE $[\nabla]$ button three times to set the sample size to 1.
- 13. Turn the trigger level knob above the channel A input counter clockwise until AUTO is highlighted.
- 14. Press the channel A [INPUT] button once to switch to 50 Ω termination.

Timebase Calibration Test

It is critical that the timebase be fully warmed up before measurements are taken. Allow at least 1 hour of warm-up for installed timebase to stabilize.

Record the timebase frequency reported by the SR620. Compare it to the stated one-year accuracy shown in Table 36 for the installed timebase.

Table 36: Timebase calibration test

Timebase	Freq. (MHz)	Measured Freq. (MHz)	Limit (Hz)
Standard	10		±0.5
Opt 4: Rubidium	10		±0.01

Calibration

The SG380 series internal timebase may be calibrated from the front panel using the measurements taken above. The process is iterative. Use the following procedure to calibrate the internal timebase:

- 1. Press [SHIFT], [+/-] to activate the CAL secondary function. Then press Press the SELECT [>] until the display shows "tcal."
- 2. Press the ADJUST $[\triangle]$ and $[\nabla]$ keys to adjust the timebase frequency up or down respectively.
- 3. Measure the new frequency with the SR620.
- 4. Repeat steps 2 and 3 until the desired frequency accuracy is achieved.

Option Board Verifications

The SG380 series RF signal generators may be outfitted with up to 3 options installed on the rear panel. Option 1 provides clock outputs. Option 2 provides an RF doubler for RF out to 8 GHz. Option 3 provides external IQ modulation capability.

Option 1: Clock Output Test

This test verifies the operation of option-1 clock outputs. This test requires the setups shown in Figure 12 and Figure 14. The first test merely demonstrates overall operation. The second test verifies calibration of the outputs.

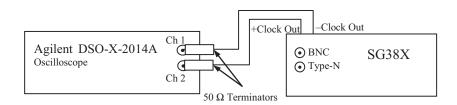

Figure 12: Clock output operation test.

To verify overall operation of the option 1 clock outputs, use the following procedure:

- 1. Connect the equipment as shown in Figure 12.
- 2. Set the scope to trigger on Ch 1, rising edge
- 3. Set the vertical scale to 200 mV/div for both Ch 1 and Ch 2.
- 4. Set the timebase to 20 ns/div
- 5. On the SG380 series generator, press the keys [SHIFT], [0], and [Hz] to reset the instrument to default settings.

The waveform on the scope should look similar to that shown in Figure 13. It should be a 10 MHz square wave centered about 0 V with a peak to peak deviation of 0.4 V. Verify that the waveform has 50% duty cycle and that the two waveforms are 180° out of phase. Please note that this scope is not fast enough to resolve the actual transition times of the clock outputs. A much higher bandwidth scope would be required for that measurement.

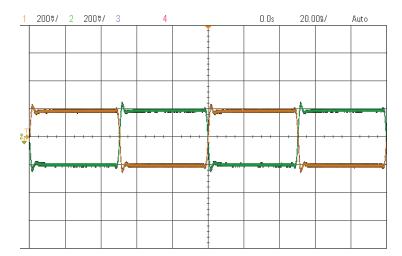

Figure 13: Clock output waveform.

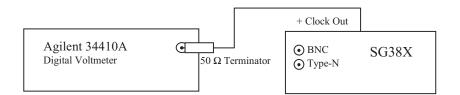

Figure 14: Clock output level test.

To verify calibration of the option 1 clock outputs, use the following procedure:

- 6. Connect the equipment as shown in Figure 14.
- 7. On the SG380 series generator, press the keys [SHIFT], [0], and [Hz] to reset the instrument to default settings.
- 8. Press the keys [FREQ], [1], and [Hz] to set the frequency to 1 Hz.
- 9. Press the key [AMPL] until the display shows "cloc."
- 10. Press [0], [.], [4], [Vpp] to set the amplitude the first entry in Table 37
- 11. Record and verify the output levels meet the limits specified in Table 37
- 12. Repeat steps 5 and 6 for the other amplitudes given in Table 37.

 +0.500
 ±0.05

Table 37: Amplitude level requirements for the option 1 clock outputs

Option 2: RF Doubler Test

This test verifies the signal generation of the option-2 RF doubler. It uses the Agilent E4440A spectrum Analyzer to verify the frequency generation of the doubler. This test requires the setup shown in Figure 15.

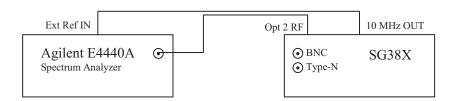

Figure 15: RF doubler frequency test.

To verify the frequency generation of the option-2 RF under test perform the following procedures:

- 1. Connect the equipment as shown in Figure 15
- 2. Verify that the spectrum analyzer is locked to the 10 MHz external reference frequency.
- 3. Align the spectrum analyzer by pressing the keys [System], [Alignment], [Align All Now].
- 4. On the SG380 series generator, press the keys [SHIFT], [0], and [Hz] to reset the instrument to default settings.
- 5. Press [FREQ] to select frequency. Then enter the test frequency given in Table 38. Note that for the SG386, only frequencies above 6 GHz apply.
- 6. Verify that the measured frequency is within the limits given in Table 38.
- 7. Repeat steps 6 and 7 for all the frequencies given in Table 38

Note that frequencies above 2025 MHz do not apply to the SG382. Similarly, frequencies above 4050 MHz do not apply to the SG384. All test frequencies apply to the SG386

Test Freq. (MHz) 1 Measured Freq. (MHz) 4000 4500 ±2 5000 ± 2 5500 ±2 6000 ± 2 6500 7000 7500 ± 2 8000 ±2

Table 38: Test frequencies for option 2 frequency synthesis

Option 2: DAC Output Test

This test verifies the operation of the option-2 DAC output. This test requires the setup shown in Figure 16.

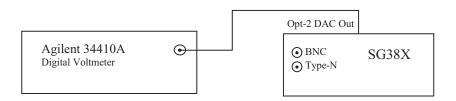

Figure 16: Option-2 DAC output test.

To verify the operation of the option-2 DAC output, perform the following procedures:

- 1. Connect the equipment as shown in Figure 16
- 2. On the SG380 series generator, press the keys [SHIFT], [0], and [Hz] to reset the instrument to default settings.
- 3. Press [DC OFFS] successively until the display reads "rear dc."
- 4. Enter the test voltage given in Table 39.
- 5. Verify that the measured voltage is within the limits given in Table 39.
- 6. Repeat steps 4 and 5 for all the voltages given in Table 39

Set Voltage (V)	Measured Voltage (V)	Limit (V)
-10.0		±0.02
-5.0		±0.02
0.0		±0.02
5.0		±0.02
10.0		±0.02

Table 39: Test voltages for option 2 DAC output

¹ Test frequencies less than or equal to 6 GHz do not apply to the SG386

Option 3: IQ Modulation

This test verifies the operation of the option-3 IQ modulator. This test requires the setup shown in Figure 17

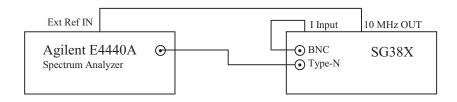

Figure 17: Option 3 IQ modulator test.

To verify the operation of the IQ modulator use the following procedure:

- 1. Connect the equipment as shown in Figure 17
- 2. Verify that the spectrum analyzer is locked to the 10 MHz external reference frequency.
- 3. Align the spectrum analyzer by pressing the keys [System], [Alignment], [Align All Now].
- 4. On the SG380 series generator, press the keys [SHIFT], [0], and [Hz] to reset the instrument to default settings.
- 5. Press [FREQ], [1], [GHz] to set the frequency to 1 GHz
- 6. Press [TYPE] and then press ADJUST $[\nabla]$ until the IQ (Opt) LED is highlighted. The display should read "iq."
- 7. Press [DC OFFS] successively until the display reads "bnc"
- 8. Press [0], [.], [5], [Vpp] to set the DC offset to 0.5 V.
- 9. Measure the amplitude of the 1 GHz signal on the Agilent spectrum analyzer.
- 10. Press [ON/OFF] to enable external IQ modulation.
- 11. Measure the amplitude of the 1 GHz signal on the Agilent spectrum analyzer.
- 12. Disconnect the BNC cable from the rear panel I input.
- 13. Measure the amplitude of the 1 GHz signal on the Agilent spectrum analyzer.

The difference between the values recorded in step 9 and step 11 should be less than 1 dB. The difference between the values recorded in step 11 and step 13 should be greater than 40 dB.

Conclusions

The tests described in this document are designed to test the basic functionality of the unit. They are not intended to be a substitute for the complete performance test which is performed at the factory. Nevertheless, one can have reasonable confidence that instruments that pass the tests described in this document are operating correctly. As always, if an instrument fails to pass a test, verify that the setup has been duplicated correctly, and that the individual procedures have been followed as specified. Instruments that have failed to meet specifications may be returned to SRS for repair.

Circuit Description

Overview

There are three RF Signal Generators in the SG380 Series: The SG382 (DC to 2.025 GHz), the SG384 (DC to 4.050 GHz) and the SG386 (DC to 6.075 GHz).

Each signal generator has extensive modulation capabilities including AM, FM, Φ M, Sweeps, Pulse, and (optional) IQ modulation. The units' low phase noise (-116 dBc/Hz at 20 kHz offset at 1 GHz) and high resolution (1 μ Hz at all frequencies) are provided by a unique synthesis technique that allows essentially zero channel spacing together with a high phase comparison frequency without the noise or spurs associated with conventional fractional-N synthesis.

Several options improve or extend the performance of the Signal Generators. Option 1 provides complimentary clock outputs with 35 ps transition times. Option 2 is a frequency doubler that provides a rear panel SMA output up to 8.1 GHz (available on the SG384 and SG386). Option 3 provides high bandwidth, rear panel I/Q modulation inputs. Option 4 improves the timebase accuracy with a rubidium oscillator.

The three models (SG382, SG384 and SG386) share a common design approach. All units use the same power supply and motherboard (which includes timebase and frequency references, DDS synthesizers, VCXO filters, modulation generator, and computer interfaces).

The RF Block for the SG382 and SG384 is identical, using a 1900 MHz to 4100 MHz VCO and digital dividers to synthesize RF frequencies. The top octave is not used (or calibrated) in the SG382, whose maximum frequency is 2.025 GHz.

The RF Block for the SG386 is different from that used in the SG382 and SG384. The VCO in the SG386 covers from 3 GHz to 6 GHz, and the output amplifier uses a pHEMT gain block instead of the InGaP gain block which is used in the SG382 and SG384.

For brevity, the circuit description which follows will refer to the SG384. Differences between the units will be detailed as required.

Block Diagram

(Schematic 1: Block Diagram)

Important sections of the instrument, and the interconnections between them, are illustrated in the block diagram. We will follow the RF signal path first, and then we will discuss the various support functions.

The RF path starts in the upper left corner with the Timebase and ends in the lower right corner with the Output Amplifiers and Attenuators. The timebase consists of a 20 MHz VCXO that is phase locked to an internal OCXO, to an internal rubidium timebase (Option 4), or to an external 10 MHz reference. A 100 MHz VCXO is phase locked to the 20 MHz timebase. The 100 MHz is divided by four to provide 25 MHz to the CPU and FPGA. The 100 MHz is also the sample clock for a 48-bit DDS (here after referred to as the LF DDS). The frequency resolution of the LF DDS is extended to 64 bits via the FSK pin of the LF DDS. The output frequency of the instrument is proportional to the frequency output of this LF DDS and so this establishes the instrument's frequency resolution.

The output of the LF DDS cannot serve directly as the reference for the RF synthesizer because spurs on the LF DDS output would appear on the RF output, increased in magnitude by 6 dB per octave between the LF DDS output and the instrument's RF output. Hence, one of three VCXOs is used to filter the LF DDS output to remove the spurs. Two of the VCXOs can be tuned by ±100 ppm (around 19.5541 MHz or 19.6617 MHz), while the third VCXO can be tuned by ±10 ppm around 19.607843 MHz (collectively referred to hereafter as 19+ MHz VCXO). These frequencies were chosen to maximize the phase comparison frequency in the RF synthesizer's PLL, as well as optimizing performance at canonical frequencies. The LF DDS is programmed to operate in one of these three ranges and the corresponding VCXO is phase locked to the LF DDS. The output of the phase locked VCXO, whose frequency can now be set with 64 bits of resolution, becomes the timebase for the RF synthesizer.

The selected 19+ MHz VCXO is multiplied up by ×51 to a frequency near 1 GHz by the PLL synthesizer in the RF Reference / Baseband DDS section of the block diagram. The 1 GHz output serves as the sample clock to a 32-bit DDS (hereafter referred to as the RFDDS). The output of the RFDDS becomes the reference frequency for the RF synthesizer. The RFDDS is programmed to divide by an integer when it is used as a reference for an unmodulated RF output. Dividing by an integer eliminates DDS spurs, as the DDS repeats the exact same sequence for every cycle of its divided output and so "spurs" collect together as harmonics which do not cause clock jitter or spurious frequency outputs. When generating frequency or phase modulated outputs the RFDDS provides agile modulation of the RF reference frequency via the 16-bit words from the FPGA modulation processor, which are updated at 125 MHz.

The output of the 1 GHz, 32-bit, RFDDS is filtered and passed differentially to the RF synthesizer in the RF Block to serve as the PLL frequency reference, $f_{\rm ref}$. A wideband VCO (1900-4100 MHz for the SG382 and SG384, or 3 GHz to 6 GHz for the SG386) is divided by N and phase locked to the reference divided by R, to produce and output a frequency of $f_{\rm ref} \times N \, / \, R$. The output of this synthesizer clocks binary dividers to provide square wave outputs in the 5 octaves below the RF VCO frequency . The square waves are low-pass filtered to provide sine wave outputs over the same frequency range. An RF multiplexer selects one of the sine waves, or the original reference sine wave (in the

case that the RF output is less than 62.5 MHz (less than 93.75 MHz for the SG386), as the source to the RF output stages. Another RF multiplexer selects the corresponding square wave to serve as the source for the rear panel clock and doubler options.

The selected RF sine wave is passed to the RF Output Amplifiers and Attenuators block. An I/Q modulator is inserted into the signal path when I/Q modulation is being used, otherwise the RF output is passed directly to a series of RF attenuators and amplifiers which provide an output amplitude range from -107 dBm to +16.5 dBm. A voltage variable attenuator is used to provide amplitude modulation. The amplified and attenuated RF sine wave, in the frequency range of 950 kHz to 2, 4 or 6 GHz, is output via the front panel type-N connector.

There is another signal path for output signals between dc and 62.5 MHz (93.75 MHz for the SG386). The 32-bit RFDDS on the mother board provides signals in this range directly. The differential signals are passed to the output block and can be amplified or attenuated to a range from 1mV_{rms} to 1V_{rms} and offset with a dc voltage. The amplified and offset output is passed out the front panel BNC connector via 50 Ω .

There are several modulation paths. As previously described, frequency and phase modulation is provided by the FPGA via the RFDDS's parallel port. The source for the modulation waveform can be a table in the FPGA, data stored in a larger memory external to the FPGA, or up-sampled and digitally filtered data streaming from an ADC which digitizes the rear panel modulation input. An analog copy of the modulation waveform is output via a rear panel BNC.

Analog signals to provide I/Q modulation can originate from a table in the FPGA, or data stored in a larger memory external to the FPGA, up-sampled to 125 MHz, digitally filtered, and output via dual 14-bit DACs. I/Q modulation can also be provided directly via rear panel BNC inputs (Option 3). Copies of the I&Q modulation waveforms can be output via rear panel BNCs (Option 3).

Amplitude modulation can originate from a table in the FPGA, data stored in a larger memory external to the FPGA, or up-sampled data streaming from an ADC which digitizes the rear panel modulation input. RF outputs above 62.5 MHz (93.75 MHz for the SG386) are amplitude modulated via a voltage variable attenuator in the RF output stages. Outputs below 62.5 MHz (93.75 MHz for the SG386) are amplitude modulated via the 16-bit parallel port on the RFDDs. An analog copy of the modulation waveform is output via a rear panel BNC.

A ColdfireTM microcontroller is used to control all aspects of the instrument's operation and to interface to external computers via the Ethernet, GPIB or RS-232. The microcontroller also responds to front panel key presses and updates front panel displays.

The front panel display is fully static (there is one latched bit per display segment or indicator lamp.) This approach eliminates the possibility of a display refresh spur in the RF output. The front panel display is written to and read from serially when a change is made or a key is pressed.

The system power supply is enclosed in a separate enclosure within the instrument for safety and shielding. A universal input power supply converts the line voltage to $+24~V_{DC}$ which is always present to provide power to the OCXO or optional rubidium timebase. An inverter operates to provide ± 15 , ± 5 , and +3.3~V when the unit is switched "on" to power the rest of the instrument.

Detailed Circuit Description

Several sub-assemblies will be described:

- 1. The front panel display
- 2. The front panel display EMI filter
- 3. The mother board
- 4. The RF synthesizer
- 5. The RF output amplifiers and attenuators
- 6. The power supply
- 7. Option 1 (high speed clock outputs)
- 8. Option 2 (4-8 GHz RF output)
- 9. Option 3 (I/Q modulation inputs & outputs)
- 10. Option 4 (Rubidium Timebase)

Front-Panel Display

(Schematic 2: Front Panel Display)

The front panel consists of 16 seven-segment displays, 47 LED lamps, and 33 key conductive rubber keypads. The front panel display is fully static in that there is one latched bit for each LED segment or lamp. Data is written to the display serially via the SPI (Serial Peripheral Interface Bus). When a key is pressed, the input to the corresponding latch is pulled high, and a KEYPRESS interrupt is sent to the CPU. Key press data is latched when the CPU responds with a -CS_FRONT. As data is being written to the display, latched key press data is also read back over the SPI.

The lamp currents (which set brightness) are equal to the +3.3 V supply, minus the ~ 2 V LED voltage, divided by resistance of the current limiting network (100 Ω). The LED display segment current (which sets segment brightness) is equal to +3.3 V supply, minus the ~ 1.5 V LED voltage, minus the 0.7 V base-emitter voltage of Q1A (for example), divided by resistance of the current limiting network (680 Ω). The intensity of a digit can be increased by turning on the other transistor in the pair (Q1B, for example) by setting Q7 of U43 low and asserting –INTENSIFY, which will cause the voltage on the common anode of U16 to increase by about 0.6 V.

Front-Panel Display EMI Filter

(Schematic 3: Display EMI Filter)

The Front panel Display is shielded from the main box via a metal panel. The SPI interface and power connections are filtered by a separate PCB. These help to eliminate EMI and reduce the display interference in the main system's sensitive electronics.

Motherboard

The motherboard is the large PCB nearest to and approximately the same size as the bottom cover of the instrument. There are eight pages of schematics for the motherboard. Circuits include 10 MHz & 20 MHz timebases, three 19+ MHz VCXOs, Coldfire CPU with Ethernet, GPIB, and RS-232 interfaces, FPGA modulation processor, modulation DACs and external modulation ADC, 1 GHz VCO, an RF reference DDS, and interfaces to the RF Block and the rear panel options.

Timebases

(Schematic 4: Mother Board 1, Frequency Refs)

The timebase reference is a 20 MHz VCXO consisting of the 3rd overtone crystal, Y100, and the Colpitts oscillator, Q100. The crystal is designed to operate with a 20 pF load which is the series combination of C110, the tank L103/C111, and the varactor D100. To provide gain, both C110 and the parallel combination of L103 & C111 must have a capacitive reactance. The L103/C111 tank has an inductive reactance below 8.9 MHz which prevents the oscillator from operating at the fundamental frequency of the crystal. The crystal is operated just above its series resonance, and so has an inductive reactance that resonates with the load capacitance. The operating frequency is controlled by the dc voltage applied to the varactor.

The oscillator's circulating current is cascoded into the emitter of Q101 through to the collector, which is held at dc ground by L105 and amplitude limited by the dual Schottky, U105. The output is amplified and buffered by the low noise amplifier, U107, which provides a (nearly) square wave output with amplitude of about 2.4 Vpp at 20 MHz. This signal is ac coupled and converted to a 3.3 V CMOS level square wave by U114, which is powered by a low noise source, U112.

The 20 MHz square wave can be phase locked to an external timebase reference or to an internal OCXO or optional rubidium oscillator by the PLL synthesizer, U106. The 10 MHz RF input to the PLL synthesizer is selected by the multiplexer U109. Another multiplexer, U103, improves isolation between the internal OCXO or rubidium reference and the external timebase reference.

The presence of an internal reference is detected by the diodes U100 and the corresponding peak detection circuit. The presence of an external reference is detected by the diodes U104 and the corresponding peak detection circuit. The CPU operates the multiplexers to select the external reference whenever it is available, the internal OCXO or rubidium next, or a fixed programming voltage to adjust the 20 MHz VCXO as a last resort.

The PLL synthesizer's charge pump output is conditioned by the loop filter U110B. The loop filter has a bandwidth of about 140 Hz. The multiplexer U108 selects between the charge pump output (when the PLL is active) or a fixed programming voltage, CAL_VCO (when no better reference is available). A lock detect signal is provided to the CPU.

The 20 MHz is divided by two by U115, which drives transformer T100 differentially. The output of the transformer is low pass filtered (with a notch at 30 MHz) to provide the 10 MHz sine wave timebase output on a rear panel BNC.

A 100 MHz VCXO, U119, is phase locked to the 20 MHz reference by U116, a CMOS PLL frequency synthesizer. The differential outputs from the VCXO are used to clock a 48-bit DDS, and converted to CMOS logic levels and divided by 4 to generate 25 MHz clocks for the CPU and FPGA sections.

LF DDS and 19 MHz Reference

(Schematic 5: Mother Board 2, 19 MHz Ref)

The singular purpose of this page of schematics is to produce a low noise "19MHZ_REF" square wave which serves as the reference frequency for the rest of the RF synthesizer chain. A DDS (hereafter referred to as the LF DDS) is used to provide a frequency reference of 19 MHz and a resolution of 1:10¹⁸. Spurs and noise outside of the PLL loop bandwidth are rejected from the DDS output by phase locking a narrowband VCXO to the LF DDS. Spurs at all frequencies are reduced by applying a PRBS (pseudo-random binary sequence) to the FSK (frequency-shift key) input of the LF DDS with a repetition rate of about 98 kHz.

There are three nearly identical VCXOs. Each uses a crystal resonator in a Colpitts oscillator. The middle VCXO (19.607843 MHz) uses a 3rd overtone crystal and so has less phase noise and a narrower tuning range than the other VCXOs. The configuration of the middle VCXO is identical to the 20 MHz timebase described above. The circulating oscillator current is cascoded into the emitter of Q204. The collector load (L204 and back-to-back Schottky diodes U204) shape the signal current into a nearly square wave with no dc offset.

One of the three VCXOs is selected to be phase locked to the LF DDS. The selected VCXO has its output amplifier (U209, U210 or U211) enabled. An output multiplexer (U206, U207 or U208) connects the selected VCXO output to the input of U213, which shapes the selected signal into a CMOS level square wave.

The 100 MHz timebase serves as the clock to a LF DDS (U215) which is programmed to generate frequencies over three ranges: 19.5541 MHz±100ppm, 19.607843 MHz±10 ppm and 19.6617 MHz±100 ppm. The frequency resolution of the 48-bit LF DDS is extended to 64-bits by toggling between two frequency tuning words with a duty cycle that has 16 bits of resolution. The differential output of the LF DDS is transformer coupled to a low pass filter (L217-222 and C252-254) that has a cutoff frequency of 24 MHz.

Spurs and broadband noise are rejected from the output of the LF DDS by phase locking one of three VCXOs to the LF DDS output. The selected VCXO is phase locked by a CMOS PLL synthesizer, U217. One of two loop filters is used: U216A, a loop filter with 400 Hz bandwidth, is used when the selected VCXO is one of the fundamental mode oscillators. U216B, a loop filter with 200 Hz bandwidth, is used when the 3rd overtone oscillator is selected.

Microcontroller and Interface

(Schematic 6: Mother Board 3, CPU)

A ColdfireTM MCF52235 microcontroller is used to control the instrument and to interface to external computers via Ethernet, GPIB or RS-232. The microcontroller uses a 32-bit data path, has 256k of program flash ROM, 32k of RAM, an octal 12-bit ADC, and operates at 60 MHz from a 25 MHz clock input.

The microcontroller's ADCs are used to detect various PLL lock states, detect 10 MHz references, measure the control voltages applied to various VCOs, sense RF block temperature, measure the detected RF output, and measure miscellaneous systems voltages.

One of the microcontroller's UARTs is translated to RS-232 levels by U311 and made available on the rear panel for control by remote computers. The microcontroller's Ethernet controller is connected directly to a RJ-45 connector, U302, which is accessible on the rear panel to connect the instrument to a local area network. An 8-bit bidirectional port is used to interface the microcontroller to a GPIB controller, U316, whose connector is also on the instrument's rear panel.

The microcontroller's SPI (serial peripheral interface bus) is expanded to 16 ports by the decoders U308 and U309. The eight devices which are selected by U309 (PLL synthesizers, RF and Option control) are designated as "quiet" SPI devices. The SPI data and clock signals are only presented to these devices when one in the group is being addressed. Doing so reduces crosstalk disturbances which can add spurs to RF outputs. The AND gates in U312 gate "off" the QSCK and QMOSI signals unless the U309 decoder is enabled.

SPI devices include:

0) Idle, 1) spare, 2) FPGA modulation processor, 3) 19 MHz DDS, 4) RF DDS, 5) cal ROM flash, 6) front panel display, 7) miscellaneous control bits, 8) 20 MHz PLL, 9) 100 MHz PLL, 10) 19 MHz PLL, 11) 1 GHz PLL, 12) 4 GHz PLL, 13) RF block control, 14) Option 1&2 control, 15) system DAC.

Modulation Processor

(Schematic 7: Mother Board 4, Modulation Processor)

A Xilinx XC3S400A in a 320-pin BGA is used as a modulation processor in the SG384. The FPGA is attached to two large memories via a 16-bit data bus. The E28F320J3D75A, U402, is a Numonyx 32 MBit flash MEMORY which is used to store FPGA configurations and user arbitrary waveforms. The CY62167DV30, U400, is a Cypress 16 MBit, 55 ns static RAM used to store and play modulation waveforms.

Several FPGA configurations are stored in the flash MEMORY. Each configuration allows the FPGA to perform a variety of modulation tasks depending on the instrument configuration. For example, when EXT FM is selected, the FPGA reads digitized data from the ADC (U502) which digitizes the rear panel modulation input, then offsets, scales, and up-samples that data, and applies the result to the RF DDS's (U605) parallel input to frequency modulate the RF synthesizer's frequency reference. Another example: When the instrument is set to provide a wide span frequency ramp (Sweep, triangle, with a set modulation rate and modulation deviation) the FPGA is configured as a DDS to provide addresses that walk though a ramp of frequency values at a precise rate and provides interpolated frequency values to the parallel input of the RF DDS (U605). The FPGA will also control the values on the data bus LVL DAC[0..13] which controls the analog signals ±RF ATTN so as to level the amplitude of the RF output during the frequency sweep. A final example (this is a hardware provision for a future product): A user provided I/Q modulation pattern can be loaded into the static RAM. Data pairs are read from the RAM at a precise symbol rate, interpolated and up-sampled to about 125 MSPS, digitally filtered (by a root-raised cosine filter, for example), and the result applied to the dual 14-bit DAC (U513). The analog outputs from the dual DAC are filtered and applied differentially to the I/Q modulator in the RF block.

The FPGA has three clock sources whose use depends on the FPGA configuration. The PDCLK (which originates at RF DSS, U605, operating at the RF DDS frequency/4 or about 250 MHz) is used whenever the FPGA provides data to the RF DDS's parallel port. Timing is very critical in this case. The parallel data to the FPGA must arrive within a ± 1 ns window with respect to the PDCLK. One of the FPGA's DCMs (Digital Clock Managers) is used to adjust the phase of the parallel output data to meet this timing requirement. The FPGA is able to measure the timing relationship between the PDCLK and the LSB of the parallel data (MD0) via IP_L32N and IP_L32P (at the upper right-hand corner of U401 on sheet 4 of 8.

The SYNC_CLK is used as the FPGA clock source when the FPGA is controlling the modulation via the profile inputs on the RF DDS (U605). Changes to the profile pins must arrive within a ±1 ns window with respect to the SYNC_CLK. One of the FPGA's DCMs (Digital Clock Managers) is used to adjust the phase of the parallel output data to meet this timing requirement. The FPGA is able to measure the timing relationship between the SYNC_CLK and the LSB of the parallel data (MD0) via IP_L32N and IP_L28N (at the upper right-hand corner of U401 on sheet 4 of 8.

The ±25 MHZ_FPGA source is used as the FPGA clock for pulse and blanking modulation. A DCM is used to multiply the 25 MHz clock to 200 MHz to provide 5 ns resolution for the pulse or blanking period and width. The FPGA can blank the RF and baseband outputs via the differential LVDS signals ±RF BLANK and ±BB BLANK.

The FPGA is initially programmed via the SPI from the CPU. Configurations are uploaded to the FPGA and stored in the flash ROM during system programming at the factory. A 6-pin JTAG connector, J400, allows direct access to the FPGA for development purposes.

Modulation ADC and DACs

(Schematic 8: Mother Board 5, Modulation ADC / DACs)

There is a rear panel modulation input BNC, J500, which allows user supplied signals to modulate amplitude, frequency, or phase of the SG384 outputs. The same input can also be used for pulse and blank modulation.

In EXT PULSE or EXT BLANK modulation modes, the rear panel modulation input is discriminated by U501 to provide a digital input, EXT_TRIG, to the FPGA. Depending on the operating mode and frequency, the FPGA will use EXT_TRIG to control ±RF BLANK and/or ±BB BLANK to pulse or blank the signal generator's outputs.

For EXT AM, FM or Φ M, the rear panel modulation input is limited by D501 & D502, buffered by U500A, ac or dc coupled through U503, and low-pass filtered by a 1 MHz, 5th order, Bessel filter (L503/L504/C511-C514). The filtered signal is buffered by U504 and digitized by U502, a 12-bit ADC operating at about 31.25 MSPS. The data from the DAC is provided to the FPGA on the 12-bit parallel data bus, ADC[0..11]. The data is offset, scaled (and linearized in the case of amplitude modulation of RF outputs) and upsampled to modulate the amplitude, frequency or phase of the signal generator outputs.

There are four high speed (125 MSPS), high resolution (14-bit) DACs that are controlled by the FPGA. The DACs have several purposes:

1. To mimic the modulation waveform on the rear panel modulation output BNC. 2. To level the RF amplitude during sweeps. 3. To level the baseband output during sweeps, or, to provide the I-component for I/Q modulation. 4. To level the doubler output during sweeps, or, to provide the Q-component for I/Q modulation.

All of the DACs have a similar configuration. The clock to each DAC is resynchronized to the PDCLK (from U605) to minimize sample jitter. The data to the DACs is loaded in parallel from the FPGA. The differential outputs are filtered by a Bessel low-pass filter (fc = 1 MHz for two of the DACs and fc = 10 MHz for the I/Q DACs). The filter outputs are buffered by differential line drivers with a fixed gain of $\times 2$ and a 49.9 Ω source impedance.

RF DDS

(Schematic 9: Mother Board 6, RF Reference)

The RF DDS has two functions: To provide a reference frequency to the RF synthesizer (located in the RF block), or, in the case that the output is below 62.5 MHz (93.75 MHz for the SG386), to synthesize the output directly. The RF DDS is an AD9910 (U605), which integrates a 1 GSPS NCO with a 14-bit DAC. The SFDR of the part is better than –65 dBc for output frequencies below 100 MHz. This is quite adequate for direct outputs (below 62.5 MHz) but would be unsatisfactory when multiplied up to higher frequencies. (For example, a spur would increase in magnitude by 40 dB when a reference is "multiplied" up from 40 MHz to 4 GHz.)

There is a neat trick to eliminate DDS spurs: If the DDS is programmed to divide by an integer, then the output will sample the exact same DAC levels on each cycle, and so each cycle will be the same as the others. Fourier tells us that a repetitive waveform can be represented by a fundamental sine and its harmonics; hence a *repetitive* waveform has only a fundamental and harmonics but no spurs. This is easily seen when observing a DDS output on a spectrum analyzer. As the FTW (Frequency Tuning Word) approaches a value that corresponds to division by an integer all of the spurs gather up to fit beneath either the fundamental or its harmonics.

The requirement to divide by an integer requires further thought. For a 32-bit DDS, one cycle or 360° corresponds to $2^{32} = 4,294,967,296$ in the phase accumulator. Division by an integer is simple if the integer is a power of 2. For example, to divide by 16 the FTW would be 4,294,967,296/16 = 268,435,456. However, to divide by 10, the FTW would be 4,294,967,29.6. Since the FTW must be an integer, there will be a truncation error of 0.6 bits per sample, a corresponding frequency error, and spurs in the output.

To fix this (in the case of division by 10) the DDS would be programmed to use a FTW of 429,496,729 for 9 sample clocks and 429,496,735 for 1 sample clock. Doing so accumulates exactly 2³² in the phase accumulator after 10 sample clocks and so provides exact division by 10 with no spurs. This trick allows the RF DDS to generate a reference frequency for the RF synthesizer that has no significant spurs and so can be "multiplied" by the RF synthesizer without adding spurs to the RF output.

The clock to the RF DDS comes from a 1 GHz VCO which is phase locked to $\times 51$ the selected 19+ MHz reference to provide precision clock rates in the ranges of 997.259 MHz ± 100 ppm, 1,000.000 MHz ± 10 ppm, or 1002.7467 MHz ± 100 ppm. The charge pump output from the PLL synthesizer, U604, is filtered by U603, a lownoise, high bandwidth op-amp. The loop bandwidth is about 6 kHz.

The RF DDS is programmed to divide by an integer between 10 and 50 to provide output frequencies between 20 MHz and 100 MHz. The differential outputs are filtered and buffered before being sent to the RF Block to serve as the reference frequency input to the RF synthesizer.

The RF DDS has a 16-bit parallel port to allow for agile amplitude, frequency and phase modulation. The data is passed to the RF DDS from the FPGA modulation processor. The data on the parallel input, which is synchronized to the PDCLK, can directly modulate the amplitude or phase, or may be scaled and added to the FTW for FM. The DDS may also be rapidly modulated via the profile input ports, in which case the data is synchronized to the SYNC_CLK.

The data presented to the parallel port can only be used to modulate one parameter. In the case of frequency sweeps below 62.5 MHz (93.75 MHz for the SG386), the parallel data provides frequency tuning data to the RF DDS. A separate path is used to amplitude level low frequency sweeps: The differential $\pm BB_LEVEL$ signal converted to a single-ended signal by U600 and used to level the amplitude of the RF_DDS synthesizer as seen at the front panel BNC output.

RF Block and Rear-Panel Options Interface

(Schematic 10: Mother Board 7, Interface)

The common mode voltage on the differential output from the RF DDS is eliminated by U700, which integrates the difference between the common mode output voltage and ground. The integrated voltage is applied to the 100 Ω terminations so as to eliminate the common mode voltage.

The differential DAC output is then filtered by a Chebyshev low-pass (L700, 701, 706, 707, etc) with a cutoff frequency of 150 MHz. The output of the filter is terminated and buffered by the differential amplifier, U702. A multiplexer, U701, passes the filtered RF DDS output to the RF block as either ±RF_REF (when the set frequency is above 62.5 MHz or 93.75 MHz for the SG386) or ±BB_OUT (when the set frequency is below 62.5 MHz or 93.75 MHz for the SG386).

The connector, J701, is used to pass signals between the motherboard and the rear panel options. Option 1 provides clock outputs at the set frequency. The RF signal required for this function comes directly from the RF block via an SMA cable, but power supplies and control signals (for controlling the amplitude and offset of the clock outputs) are provided via J701.

Option 2 provides a doubler to output a signal from 4 GHz (6 GHz for the SG386) to 8 GHz on a rear panel SMA connector. The RF signal required for this function comes directly from the RF block via an SMA cable, but power supplies and control signals (for controlling the amplitude of the doubler output) are provided via J701. Option 2 also provides a DC bias output on a rear panel SMA connector.

Option 3 provides rear panel analog inputs that can be used to directly modulate the I/Q modulator. The multiplexers U705 and U708 select between the internal I/Q modulation sources or the external I/Q modulation sources (which are provided by Option 3). This option also provides rear panel analog outputs which are copies of the I/Q modulation.

Power Conditioning

(Schematic 11: Mother Board 8, Power Supplies)

An enclosed power supply is used to provide regulated power to the motherboard via the large header, J800. Whenever the unit is plugged into the line, the un-switched +24 V will be present. This supply is used to maintain power to the timebase (an OCXO or an optional rubidium oscillator) even when the front panel power button is "off". When the unit is switched "on" the other supplies (± 15 , ± 5 , $\pm 3.3 \text{V}$) become active. The inverter that generates those other supply voltages is operated at exactly 100 kHz, synchronized by the 100 ns wide, 200 kHz PS SYNC pulses sourced from the CPU, U300.

The grounds and power supplies are all filtered and bypassed as they come onto the motherboard. In addition, there are several regulators which provide other voltages used in the system: +20, +8.5, +3.00 (which is used as a voltage reference throughout the system), +2.5, +1.8, +1.2, and -8.5 V.

An interrupt signal, -PWR_IRQ, is generated if the +24 V supply falls below +22 V or if the power switch is turned to "off". This interrupt tell the CPU to "stand down" (in particular to not start new writes to memory) as the power supplies are about to turn "off".

Motherboard to RF Block Jumper

(Schematic 12: Mother Board to RF Jumper)

This card provides the interface as well as filtering the signals to minimize any interference that could impair the signal quality. Single ended control signals implement a single order RC filter; differential signals implement a common mode choke; finally, power lines implement an LC filter.

RF Output Block

The RF Output Block refers to the milled aluminum block (and its covers) which house the type-N and BNC connectors which present the main front panel outputs of the instrument. This block establishes solid RF grounds, shields the enclosed circuitry from magnetic flux generated by the power supply and from RF signals generated by the motherboard, as well as reducing the EMI from and the susceptibility of the enclosed circuitry.

There are two circuit boards inside the RF block. Facing from the front of the instrument, the PCB on the right holds the RF synthesizer and provides connections to the motherboard via a 34-pin jumper board. The PCB on the left connects to the RF synthesizer and amplifies or attenuates the signal from the RF synthesizer. Signals on the type-N connector cover an amplitude range from -107 dBm to +13 dBm for signals from 950 kHz to 2.025, 4.050, or 6.075 GHz. The output board also provides outputs on the BNC with an amplitude range from 1 mV_{rms} to 1 V_{rms} from dc to 62.5 MHz (93.75 MHz for the SG386).

RF Synthesizer

(Schematic 13: SG384 Synthesizer 1, 2-4 GHz and Control) (Schematic 15: SG386 Synthesizer 1, 3-6 GHz and Control)

Control signals, frequency references, and power supplies are passed from the motherboard via a small jumper board to the RF synthesizer on J101. Many of the control signals flow through to the output amplifier/attenuator board via J100. The ±8.5 V power supplies are re-regulated to ±5_SYN supplies by U100 and U111. Differential blanking signals, ±RF_BLANK and ±BB_BLANK are converted to CMOS levels by U117 and U118. Serial SPI data is clocked into the shift registers U112 and U113 to provide various control signals.

For output frequencies below 62.5 MHz (93.75 MHz for the SG386) the RF DDS direct output, \pm BB_OUT, is used as the source frequency output. The differential signals are passed to the output board for conditioning before being applied to the output BNC connector. The differential signals are also buffered by U119 to provided sine wave outputs for type-N connector and discriminated by U120 to provide square wave outputs for the rear panel Option 1 & Option 2.

The RF synthesizer consists of a 1900-4100 MHz VCO (3 GHz to 6 GHz for the SG386), U105, which is phase locked by U107 to the RF reference (\pm RF_REF) from the motherboard. The differential RF reference is transformer coupled into the 100 MHz Butterworth low-pass filter (L102, C125 & C126) which is terminated by R116. The 3 V_{PP} reference is ac coupled into the PLL synthesizer's reference input into via C123. The charge pump output of the PLL synthesizer is conditioned by the loop filter, U104. The loop bandwidth is about 100 kHz for the typical phase comparison frequency of 25 MHz. The bandwidth of the loop filter, which is set to be roughly proportional to the phase comparison frequency, is adjustable by the switches U108A-D.

The output of the RF VCO is ac coupled into a high speed PECL fanout, U106. There are two sets of outputs from U106. The first output, \pm TOP_OCT, is the differential top octave output for the frequency synthesizer. The other output is used as feedback to the PLL synthesizer and to control the 50/50 symmetry of the top octave output.

The symmetry control is maintained by the differential integrator, U109. If +TOP_OCT spends more time high than -TOP_OCT, the inverting input to the integrator will ramp up, causing the non-inverting output of the integrator to ramp down, reducing the dc voltage at the non-inverting input of the fanout buffer, causing +TOP_OCT to ramp down, returning the symmetry of ±TOP_OCT to 50/50.

RF Dividers and Selectors

(Schematic 14: SG384 Synthesizer 2, Dividers and LPF) (Schematic 16: SG386 Synthesizer 2, Dividers and LPF)

The $\pm TOP_OCT$ PECL signals are fanned out by U200. Both outputs of the fanout are source-terminated with 50 Ω and can be made active by grounding the string of three series 50 Ω resistors on the open emitter outputs. (Pulling up these resistors to +3.3V turns "off" the corresponding open-emitter output.)

For outputs between 2 GHz and 4 GHz (3 GHz and 6 GHz for the SG386), –EN_RF0 is set low, enabling the top-half of the fanout U200. One of the differential outputs is selected by the RF multiplexer, U216, to drive the rear panel Option 1 & Option 2 via J201 (the SMA connector in the side of the RF Block). The other differential output of the fanout is used for the top octave output. This signal is given some high frequency pre-emphasis by the stubbed attenuator (R205-207), amplified by U201, then low-pass filtered by U202 (to remove the harmonics of the square wave) to provide a 2 GHz-4 GHz sine wave for RF multiplexer, U211, which passes the sine wave to the output amplifier/attenuator board via the RF feed-thru, J200.

For outputs in the five octaves below the RF VCO, the control line $-\mathrm{EN}_1\mathrm{ST}_D\mathrm{IV}$ is set low, enabling the bottom half of the fanout, U200. (The top half is disabled by setting $-\mathrm{EN}_R\mathrm{F0}$ high.) This also enables the digital divider, U206, which will provide outputs via the gate U205 for outputs between 1 GHz and 2 GHz (1.5 GHz and 3 GHz for the SG386). Other dividers (U209, 212, 215, 218) are enabled for lower octaves. As before, each differential square wave source has a 50 Ω source impedance, with one-half of the differential pair being passed directly to the RF multiplexer, U216, while the other half is low-pass filtered to provide a sine to the other RF multiplex, U211. Unused dividers are disabled to eliminate sub-harmonic distortion.

The RF multiplexers (U211 & U216) are non-reflective multiplexers and so unselected inputs are terminated via 50 Ω to ground. These RF multiplexers operate with a VEE of $-5~V_{DC}$ and so it is necessary to translate the control signals to swing between ground and $-5~V_{DC}$. A triple 1:2 analog switch, U213, is used to translate CMOS control signals to the 0~V/-5V levels.

RF I/Q Modulator, Amplifiers and Attenuators

(Schematic 17: SG384 Output 1, Attenuation & Controls) (Schematic 20: SG386 Output 1, Attenuation & Controls)

The PCB on the left side of the RF Block I/Q modulates, amplitude modulates, amplifies, and attenuates the selected RF signal before passing it out the front panel connectors. This PCB receives power, control and differential modulation signals from the RF synthesizer PCB via J101. The selected RF signal is passed from the RF synthesizer to this PCB via the RF feed-thru, J100.

The signal path toward the type-N connector begins at J100. If the carrier frequency is between 400 MHz and 4.05 GHz (6 GHz for the SG386), the signal at J100 may be multiplexed to the I/Q modulator, U110. If the signal is outside of this range, or if I/Q modulation is not enabled, the SPDT switches, U103 and U104, bypass the I/Q modulator.

The carrier signal is ac coupled into the I/Q modulator via C116. The modulator converts the input signal into two phase-shifted square waves, I & Q. The each square wave can be amplitude modulated the corresponding differential modulation inputs, $\pm I$ _MOD and $\pm Q$ _MOD. The amplitude modulated components are summed together and appear at the RF output. The RF output is attenuated (to match its input carrier level), given high frequency pre-emphasis (via the stubs in the pi-attenuator legs) and low pass filtered (to remove harmonics) and directed back into the RF signal path by the SPDT switch, U104.

Two RF voltage variable attenuators (VVA), U111 & U112, are used to amplitude level or amplitude modulate the RF signal. The attenuation is controlled by a dc voltage applied to the V1 input of each VVA. The attenuation increases as V1 becomes more negative. The attenuation characteristic is not linear, which requires compensation to the control voltage, especially for deep amplitude modulation.

The attenuator control voltage is sourced from $\pm RF_ATTN$, which is converted to a single-ended voltage by U114 and low-pass filtered (for noise reduction) by L106 and C128. These attenuators are used to provide attenuation between the digital attenuator steps and to correct for the differential non-linearity of the digital attenuators. They are also used to amplitude level sweeps and for amplitude modulation.

The first of three RF gain blocks is U109. The gain of this amplifier is +15 dB. It is an ac amplifier which requires a dc current bias be applied to its output. It is important that the dc bias network be high impedance over the operating range (1 MHz to 6 GHz) and that it not have any significant resonances. This is achieved with three series inductors, with staggered self resonant frequencies, and with parallel damping resistors. This method is used on all the gain blocks in the signal chain.

The output from the first gain block is ac coupled into the first of five digital attenuators, U107. The digital attenuators are controlled in 0.5 dB steps from 0 dB to 31.5 dB. They are powered from +5 V and are controlled by the SPI interface. The power supplies and SPI signals are filtered from stage-to-stage to reduce signal and noise feed-through.

RF Output Attenuators

(Schematic 18: SG384 Output 2, RF Stage) (Schematic 21: SG386 Output 2, RF Stage)

To achieve an amplitude dynamic range of 120 dB (from -107 dBm to +13 dBm) over 6 GHz requires extraordinary care in the design, layout and grounding of the circuit. In particular, it is important that there be no signal paths which "go around" the intended signal path. For example, if -100 dB of a signal can go around the attenuator chain via a control line or power line, then the effective attenuation range will be limited.

RF grounding is reestablished in each of the four stages shown on Sheet 2 of 3, with both the power supplies and serial control lines being filtered at each stage before being passed to the next. Physically, the circuit layout is within a series of "rooms", with good ground connections, and shielded from other parts of the circuit by the milled aluminum block.

The RF signal chain continues with the output of the attenuator on the previous page being applied to the first attenuator, U201, on the next page. The signal chain continues with an amplifier, two attenuators, another amplifier, and a final output attenuator. The final amplifier, U206, has higher gain and can provide more output power than the other gain blocks. It also requires more bias current.

BNC Output

(Schematic 19: SG384 Output 3, BNC) (Schematic 22: SG386 Output 3, BNC)

The differential outputs, $\pm BB_OUT$, are passed from the RF DDS on the motherboard to the output board via the RF synthesizer board. These differential signals can be blanked by the dual differential switches U301 & U302 by BB BLANK CTL.

 \pm BB_OUT are converted to a single-ended signal by U303, whose output is low-pass filtered (to reduce noise bandwidth and reduce high frequency spurs) by L303, C305 & C306. The signal is then attenuated by the digitally controlled attenuator, U304, which can provide 0 to 31 dB of attenuation in 1 dB steps. (Finer steps are provided by the RF DDS, whose amplitude can be set with 16-bit of resolution.) A fixed 30 dB of attenuation is provided by R302/306/307 under the control of the switch U305. The high bandwidth switches, U301, U302 and U305, are operated from \pm 3 V, and so their control lines are level shifted by U100 and U101 to \pm 3 V.

An output amplifier, U300B, buffers the attenuator output and provides a gain of $\times 3$. A final output driver, U300A, sums in an offset voltage, BB_OFFSET, and drives the output BNC via a 49.9 Ω resistor. The BNC output is sampled for measurement by the CPU via the filtered signal BB MON.

Power Supply

(Schematic 23: Power Supply)

The power supply for the unit is contained in a separate shielded enclosure. The unit accommodates universal input voltages (90-264 V_{AC} , 47-63 Hz) and provides a variety of dc voltages to the motherboard (+24, +15, +5, +3.3, -5, -15 V.) The unit will lock its dc-dc converter to a 200 kHz sync signal provided by the motherboard. The unit also has a thermostatically controlled fan whose speed increases with increasing temperature.

An OEM power supply (CUI Inc VSBU-120-24) provides up to 5 A at +24 V from the line voltage input. This power supply is "on" whenever the line voltage is present, supplying +24 V to the motherboard to power the timebase (either the standard ovenized crystal or optional rubidium oscillator.) The +24 V supplied to the motherboard is filtered by L1 & C1 to remove ripples from the OEM power supply. The OEM supply also provides +24 V for a dc-dc converter to generate the other regulated voltages used in the system. The dc-dc converter and fan are "on" only when the front panel power button is pressed "in".

The dc-dc converter is disabled when the –DISABLE (pin 8 on the motherboard interface) is held low. When –DISABLE is released the switching power supply controller, U7, generates complementary square waves at about 100 kHz to drive the MOSFETs (Q2 & Q3) into conduction during alternate half-cycles. The MOSFETs drive the primary of a transformer. The secondary voltages are rectified, filtered, and regulated to provide the +15, +5, +3.3, -5, & -15 V system voltages.

The regulated outputs have Schottky diodes on their outputs which prevent the power supplies from being pulled to the wrong polarity by loads which are connected to other supplies with opposite polarities. This is most important during start-up and to avoid SCR action in CMOS ICs in the case that one of the supplies should fail.

A thermostatic fan speed control helps to regulate the operating temperature of the entire instrument. This circuit uses an LM45 (10mV/deg C) as a temperature sensor. The output from the temperature sensor is offset, multiplied, and limited to a 0-15 V range. This voltage is drives a 12 V medium speed fan via the emitter follower, Q1.

Rear-Panel Options

There are three options that extend the performance of the instrument. All rear panel options interface to the mother board via the Option Jumper PCB (Schematic 24: Rear Panel Option Jumper).

Clock Output (Options 1)

(Schematic 25: Option #1 Clock Outputs)

These options are located on small boards attached to the rear panel and connected to the motherboard by a small vertical board which supplies power and control signals. The SPI is used to transfer serial data to a quad DAC and an octal shift register. A square wave at the RF frequency comes to the option PCB directly from the RF block via a coax cable with SMA connectors. This signal is the source for the rear panel clock and doubler outputs.

The RF square wave is terminated and fanned out by U110. One differential pair is used to drive the RF doubler and the other provides a clock to a laser diode driver, U109, which in turn drives the rear panel differential clock outputs.

The clock outputs have adjustable amplitude and offset which are controlled by two 12-bit DACs in U100. Since the power supply rails for the laser diode need to move with respect to ground as the offset is changed, the RF inputs need to be ac coupled. However, since the clocks need to work down to dc, the levels need to be dc restored after the ac coupling. The signal is ac coupled via C113 & C114 and the four transistors, Q102A&B and Q103A&B, provide the dc restoration. Gains and time constants are set so that all the parts work together as a high speed level shifter.

The laser diode driver switches a constant current source between the ±OUT. The magnitude of this current source (and so the amplitude of the clock output) is adjusted by the voltage at the MODSET input. This voltage is set by the AMPL_CTL output from the DAC, level shifted by the current mirror, U101B and Q100A&B.

The offset of the clock output is controlled by V_HIGH, which has been offset and scaled by U101A from the DAC output OFFS_CTL. The pull-up resistors for ±OUT are connected to a potential equal to 2.33×V_HIGH as sourced by the regulator U106. The regulator only works properly when sourcing current, which would be a problem for negative offsets. The transistor pair Q104A&B assure that the regulator will source current by turning "on" for negative offsets.

The ±OUT from the laser diode driver are coupled to the rear panel clock outputs via a -8.5 dB attenuator (R113-R121) which also allows for the insertion of an output offset. The layout is important to maintain high bandwidth as the transition times of the clock outputs are about 35 ps or 12 GHz. The clock outputs are sensed by R117 and R111 and offset, scaled, filtered and returned to the motherboard's CPU's ADC via the multiplexer, U105. This allows the microcontroller to do a system check on power-up as well as course offset and amplitude calibration.

RF Doubler (Option 2)

(Schematic 26: Option #2 4-8 GHz Doubler)

The rear panel Option 2 can provide RF sine wave outputs from 4.05 GHz (6.075 GHz for the SG386) to 8.10 GHz with amplitudes from +7 dBm to -20 dBm. When enabled (by asserting EN_DBL), the RF gain blocks are biased "on", enabling the RF output.

The signal path starts with the RF differential square wave, \pm RF. The +RF is low-pass filtered (to remove the square waves odd harmonics) and ac coupled into the gain block U205. The gain block increases the signal by 15 dB to drive the doubler, U209, which is a passive doubler with about 16 dB of insertion loss. The output of the doubler is ac coupled into the voltage variable attenuator (VVA), U210, whose attenuation level is controlled by the voltage applied to its V1 input.

The differential signal, ±DBL_LEVEL is converted to a single-ended signal by U213, whose output is low-pass filtered by L210 and C226, and applied to the VVA's control input. The VVA is used to set output levels with higher resolution than allowed by the digital attenuator which follows, and to level output amplitudes during sweeps.

The output of the VVA is ac coupled into the gain block U206, which provides about 12 dB of gain. The output of that amplifier is ac coupled into the digital attenuator, U211, whose attenuation can be set in 0.5 dB steps from 0 dB to 31.5 dB. The attenuator is controlled by 6 bits from a shift register (U216) which is operating between 0 V and -5 V to level shift the control bits to the proper level for the digital attenuator. Serial data, clock and register strobe are level shifted from CMOS levels to 0 V & -5 V by the triple 2:1 analog switch, U215. Serial data out of the shift register is level shifted by R229 & R230 and buffered by U214 to return the data loop to the CPU for testing purposes.

The output from the digital attenuator is ac coupled into the gain block U207, which provides about 12 dB of gain. The output from this gain block is ac coupled to the SMA output connector, J201. The RF is detected by U204, at the final gain block for power-on testing and to calibrate the differential non-linearity of the digital attenuator.

Option 2 also provides a $\pm 10~V_{DC}$ bias output on a rear panel SMA connector via a 50 Ω resistor. This output is controlled by the DAC output DC_OUT which may be set from the front panel. User loads should not exceed 20 mA on this output.

I/Q Modulator (Option 3)

(Schematic 27: Option #3 I/Q Modulator)

Option 3 provides for rear panel I/Q modulation inputs. These inputs allow the user to modulate the amplitudes of the in-phase and quadrature components of RF carriers between 400 MHz and 6.075 GHz with analog signals.

The I & Q channels use the same circuit configuration. The quadrature component, $\pm 0.5 \,\mathrm{V}$ or 1 Vpp, is applied to the rear panel BNC connector, J2. The input signal is terminated into $50 \,\Omega$ by the parallel combination of the $52.3 \,\Omega$ input termination in parallel with the $1125 \,\Omega$ input impedance to the differential amplifier U4. The differential outputs drive a differential transmission line returning to the motherboard via $49.9 \,\Omega$ resistors and J4.

Overloads are detected at the output of the differential amplifier by the fast window comparator, U2A&B. If an overload is detected at either the I or Q inputs, the differential signal ±OVLD_I/Q will be asserted and passed to the motherboard via J4 for detection by the CPU.

This option also provides rear panel I/Q modulation outputs. The modulation signals may originate from the rear panel modulation input (Option 3) or from the internal, dual, arbitrary modulation generator (to be implemented in future products). The modulation signals from the motherboard, $\pm I_OUT$ and $\pm Q_OUT$ are received by U1 and U5 and converted to single-ended signals which drive the BNC outputs via 49.9 Ω resistors. These outputs are intended to drive 50 Ω loads to ± 0.5 V or 1 V_{pp}.

Timebase Options

(Schematic 28: Timebase Adaptor Interface)

The standard timebase is an OCXO (SRS p/n SC-10-24-1-J-J-J). A rubidium frequency standard (SRS p/n PRS10) may be ordered as Option 4. Both timebases are held by the same mechanical bracket and connected to the system using the same adapter PCB.

The adapter PCB schematic is quite simple: J1 is the connector to the OCXO option, J2 is the connector to the rubidium option, and J3 is the connector to the main PCB. The op amp U1 is used to scale the 0-4.095 V_{DC} frequency calibration voltage (CAL_OPT) to 0-10 V_{DC} for the OCXO or 0-5 V_{DC} for the rubidium. The logic inverter, U2, is used to invert the logic levels for the RS-232 communication between the microcontroller on the main PCB and the PRS10 rubidium frequency standard.

Appendix A: Rational Approximation Synthesis

The SG380 Series RF synthesizers use a new approach to synthesizer design that provides low phase noise outputs with virtually infinite frequency resolution and agile modulation characteristics. The technique is called Rational Approximation Frequency Synthesis. Some details of the technique will help users to understand the performance capabilities of the instruments.

Phase Lock Loop Frequency Synthesizers

Phase lock loop (PLL) frequency synthesizers are a cornerstone technology used in every modern communication device and signal generator. The classical PLL block diagram is shown in Diagram 1.

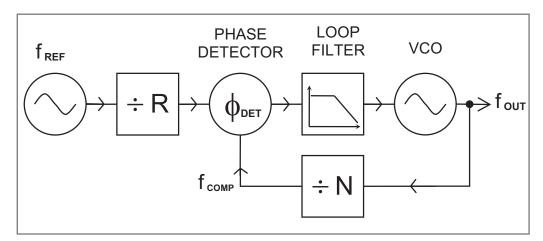

Diagram 1: Classical "Integer-N" PLL Frequency Synthesizer

The purpose of the PLL synthesizer is to generate precise output frequencies that are locked to a reference frequency. As shown in Fig 1, the reference frequency, f_{REF} , is divided by the integer R and the voltage controlled oscillator (VCO) output, f_{OUT} , is divided by the integer N. A phase detector compares the phase of the divided frequencies. The phase detector output is low-pass filtered and used to control the frequency of the VCO so that f_{OUT}/N is equal to f_{REF}/R , hence $f_{OUT}=N\times f_{REF}/R$.

A numerical example will help to illustrate the operation and design trade-offs of the PLL. Suppose $f_{REF}=10$ MHz and R=1000. If $N=10,\!000$ then the output frequency, $f_{OUT}=N\times f_{REF}$ / R=100 MHz. As N is changed from 10,000 to 10,001 to 10,002, f_{OUT} will change from 100.00 MHz to 100.01 MHz to 100.02 MHz. This PLL synthesizer has a phase comparison frequency, and a channel spacing, of f_{REF} / R=10 kHz.

Phase Noise

Diagram 2 shows a typical phase noise plot for a 100 MHz PLL synthesizer. The phase noise plot shows the noise power in a 1 Hz sideband as a function of frequency offset from the carrier. There are three dominate sources of phase noise: The reference, the phase detector, and the VCO. The frequency reference dominates the noise close to the carrier but falls off quickly at large offsets. The phase detector noise floor is relatively flat vs. frequency but decreases with increasing phase comparison frequency. In fact, the phase detector noise decreases by about 10 dB / decade, hence is about 30 dB lower for phase comparisons at 10 MHz vs. 10 kHz. Finally, the VCO phase noise will dominate at offset frequencies beyond the loop bandwidth. A high phase comparison frequency, hence low R & N divisors, is required for a low phase noise design.

In a properly designed PLL the output noise tracks the reference at low offsets, matches the phase detector noise at intermediate offsets, and is equal to the VCO noise at offsets beyond the PLL loop bandwidth. Careful attention to the loop filter design is also required to achieve the total noise characteristic shown in Diagram 2.

In addition to broadband noise there will be discrete spurious frequencies in the phase noise spectrum. A dominant spur is often seen at the phase comparison frequency. It is easier to reduce this spur in a filter when the phase comparison frequency is high.

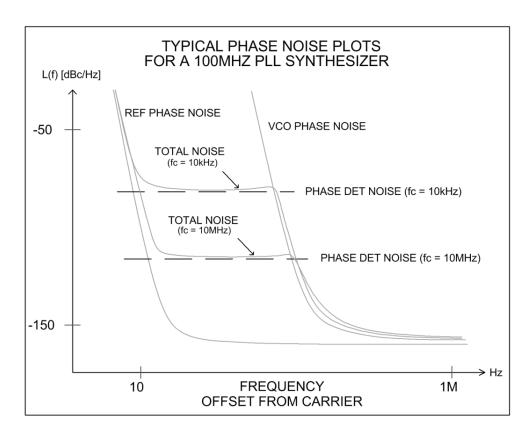

Diagram 2: Typical Phase Noise Spectrum for a 100 MHz PLL Frequency Synthesizer

Increasing Frequency Resolution

A frequency resolution of 10 kHz, or channel spacing of 10 kHz, is adequate in many communications applications but a higher resolution is desired in test and measurement applications. The simplest way to increase the frequency resolution is to increase the value of the R divider. In the above example, if R were increased from 1000 to 10,000 the frequency resolution (channel spacing) would be increased from 10 kHz to 1 kHz. However, there are several serious drawbacks to this strategy. As the R divider is increased the phase comparison frequency is decreased leading to higher phase detector noise, a reduction in the loop bandwidth, and increased settling times. *Increasing R will achieve high frequency resolution at the cost of a noisy output that takes a long time to settle.*

A Note on Fractional-N Synthesis

Another strategy to increase resolution without decreasing the phase comparison frequency is to use a Fractional-N synthesizer. In these synthesizers the value of N is modulated so that its average value can be a non-integer. If N averages to 10,000.1 then the output frequency, $f_{OUT} = N \times f_{REF} / R = 100.001$ MHz. The frequency resolution has been improved to 1 kHz. However, modulating the N value creates spurs in the VCO output. Dithering techniques are able to spread most of the spur energy into broadband noise, but the remaining noise and spurs is problematic in some applications.

About YIG Oscillators

One work-around to the trade-off between high resolution and reduced phase comparison frequency (and so higher phase noise) is to use a YIG oscillator. YIGs are extremely good VCOs due to the extremely high Q of their resonator which consists of a sub-millimeter yttrium-iron-garnet sphere tuned by a magnetic field. However, YIGs have their drawbacks including high power, slow tuning, susceptibility to environmental magnetic fields, and high cost. The SG380 Series of RF synthesizers achieve YIG performance from electrically tuned VCOs by arranging a very high phase comparison frequency.

A New Approach

A new approach to synthesizer design provides high frequency resolution, fast settling, and low phase noise. This new approach is called *Rational Approximation Frequency Synthesis*. (A rational number is a number which is equal to the ratio of two integers.) The approach has been overlooked as it relies on some surprising results of rather quirky arithmetic which abandons neat channel spacing in exchange for a much better performing PLL synthesizer.

Once again, a numerical example will be useful. Suppose we want to use our PLL synthesizer to generate 132.86 MHz. We could do that by setting R = 1000 and N = 13,286. With $f_{REF} = 10$ MHz we have $f_{OUT} = N \times f_{REF} / R = 132.86$ MHz. The phase comparison frequency is 10 kHz and so the PLL loop bandwidth, which is typically $1/20^{th}$ of the phase comparison frequency, would be only about 500Hz.

There's another way to synthesize 132.86 MHz (or at least very close to it.) Suppose we set R=7 and N=93. Then $f_{OUT}=N\times f_{REF}$ / R=132.857142 MHz, which is only 21.5 ppm below the target frequency (Hence the term "Rational Approximation". Of course, increasing the reference frequency by 21.5 ppm will produce the target frequency exactly, as will be described.) Momentarily suspending the question of the general applicability of this approach, the positive benefit is clear: The phase comparison frequency is now 10~MHz / 7=1.42~MHz which is 142 times higher than that provided by the classical PLL with a 10~kHz channel spacing. This allows a PLL bandwidth which is also 142 times wider. The higher comparison frequency of this PLL will provide faster settling, lower phase noise, and an easily removed reference spur which is 1.42 MHz away from the carrier.

Several questions arise.

- 1. Is this approach generally applicable, that is, can *small* values for R & N always be found to produce an output close to any desired frequency?
- 2. Is there a method to find the smallest values for R & N?
- 3. Can the output frequency be made exact (not just "close to") the desired frequency.

The answer to all three questions is "Yes". Details are well illustrated by a real-world example.

An Example

Diagram 3 shows a PLL synthesizer that can generate outputs anywhere in the octave between 2 GHz and 4 GHz. Lower frequencies are easily generated by binary division of this output. This example uses an Analog Devices dual-modulus PLL frequency synthesizer, the ADF4108. A dual modulus N counter is a high-speed divider which divides by a prescaler value, P, or by P+1 under the control of two registers named A & B. The dual modulus N-divider adds a bit of numerological quirkiness as there are restrictions on the allowed values for A & B as detailed in Diagram 3. The ADF4108 also requires that the phase comparison frequency be less than 104 MHz. The reference frequency input in this example is 200 MHz.

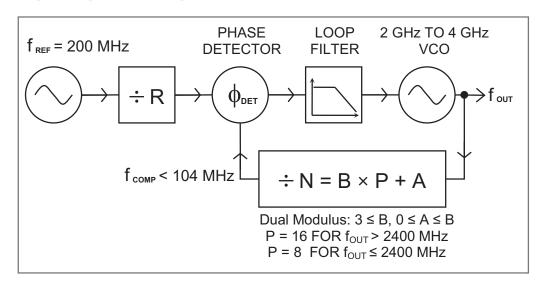

Diagram 3: A Rational Approximation Frequency Synthesizer

One curious aspect of Rational Approximation Frequency Synthesis is that it is not obvious how to choose the values for R & N. There are mathematical techniques for rational fraction approximation however brute enumeration of the possibilities may also be used. For example, R & N can be found by starting with the lowest allowed value for R and testing to see if there is an allowed value for N which gives a result, $f_{OUT} = N \times f_{REF} / R$, which is within some error band (say, ± 100 ppm) of the desired frequency. Luckily, these computational requirements are modest. The required calculations can be performed on a typical microcontroller in under a millisecond.

The largest phase comparison frequencies are achieved when there are many numeric choices available to improve the chance that a particular ratio of integers can be found which will be within the error band of the desired result. This is done three ways. First, allow a large error band. (An error band of ± 100 ppm is typical because a fundamental mode crystal oscillator, which is used to clean-up the reference source, can be tuned over ± 100 ppm.) Second, use a high frequency reference oscillator. Third, provide a second reference, detuned slightly from the first, to provide additional numeric choices.

To ascertain how well Rational Approximation Frequency Synthesis works for the example in Diagram 3, a computer program was written to compute the R & N values for 10,000 random frequencies in the octave band between 2 GHz and 4 GHz. Using a single reference source at 200 MHz, and an allowed error band of ± 100 ppm, the average phase comparison frequency was 9.79 MHz and the worst case phase comparison frequency was 400 kHz.

When a second reference frequency was available (at 201.6 MHz, as determined by trial and error while searching for the highest worst-case phase comparison frequency) the average phase comparison frequency increased to 12.94 MHz and the worse case phase comparison frequency increased to 2.35 MHz (a six-fold increase.)

Elimination of Error

Rational Approximation Frequency Synthesis provides a fast settling, low phase noise, and spur-free output, but with a troubling "error band" of typically ± 100 ppm. To eliminate this error it will be necessary to provide a low noise reference that is tunable over ± 100 ppm with very high resolution. A VCXO phase locked with narrow bandwidth to a DDS source may be used for this reference. A 48-bit DDS provides a frequency resolution of $1:2\times10^{-14}$ and the VCXO effectively removes all of the DDS spurs.

A tunable reference source is shown in Diagram 4. A 10 MHz timebase is multiplied in the DDS to 100 MHz. The DDS is programmed to generate an output within ± 100 ppm of 18.1818 MHz. The VCXO is phase locked to the DDS output with a 100Hz bandwidth. The clean 18.1818 MHz VCXO output is used as a source for an $11\times$ multiplier to produce a 200 MHz reference tunable over ± 100 ppm with a frequency resolution of $1:2\times10^{-14}$. This tunable frequency reference is used as the reference for the Rational Approximation Frequency Synthesizer, eliminating the error band inherent in the technique.

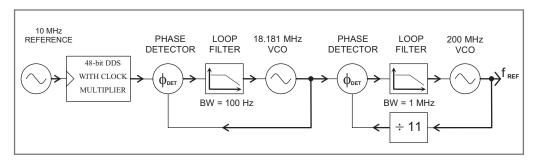

Diagram 4: Tunable (±100 ppm) 200 MHz Reference

Conclusion

A new method for the operation of classical integer-N PLL frequency synthesizers has been described. The method, Rational Approximation Frequency Synthesis, allows for operation at much higher phase comparison rates than the classical approach. The higher phase comparison rates allow wider PLL bandwidth to provide faster settling, lower phase noise, and spur-free outputs with virtually infinite frequency resolution.
