REVIEW OF THE 1956 CROP SEASON

Production of principal field and fruit crops in Colorado aggregated about 4% above the low harvest of 1955, but was 12 percent below the 10-year (1945-54) average. The 1956 harvest of corn, sugar beets and potatoes—three important irrigated crops—exceeded the respective 1955 crops and compared favorably in size with average harvests for the 10-year period. In less plentiful supply was the 1956 harvest of dry beans, oats and barley all of them being far short of average. Combined 1956 production of feed grains totalled only 22.6 million bushels. Production in 1955 was 24.7 million and the 10-year average 30.1 million bushels. Hay production at slightly over 2.3 million tons was almost the same as the 1955 harvest and the 10-year average. The 1956 sorghum grain crop of 2.6 million bushels was sharply below the near 5 million bushel harvest of 1955. As was the case in 1955, livestock carrying capacity of pastures and ranges was much below normal in eastern Colorado, particularly in the east central and southeastern parts of the state. Pastures were also very short in the southwest. Winter wheat was mostly concentrated in the north and extreme northeastern counties in 1956. Harvest amounted to 16.9 million bushels, the same as the 1955 crop but less than one-half the average harvest of 40.9 million bushels. The critical drouth conditions centering in east central Colorado and extending over much of the eastern plains country also limited production of forage feeds, broomcorn, and other non-irrigated crops. Farmers and stockmen in the area faced the winter with limited feed supplies and experienced another year of severe financial loss due to extensive abandonment of 1956 crop acreages. Indicated receipts from the sale of all farm products during 1956 totalled \$422 million. This compares with \$404 million in 1955, \$443 million in 1954, and the high of \$602.5 million in 1952. Continued drouth conditions with generally comparable prices of most farm products combined to maintain farm-ranch income near the low 1955 level. Cash receipts from sale of livestock were partly maintained by a nominal reduction in breeding herds. The acreage of principal crops abandoned in 1956 was placed at 41.9 percent compared with 43.4 percent in 1955 and 19.2 percent, the 10-year (1945-54) average. The extended severe drought resulted in little production from planted acreage in east central counties near the Kansas border. Crops were dependent to a large degree on pump water in the San Luis Valley. "Ditch" water in most other areas was more plentiful than in 1955 but below normal. Crop production in the northeastern corner of the state again fared best as the growing season was near normal. Fruit harvest in the important western producing area was generally good with production average or above.

WHEAT—Production of winter wheat at 16,896,000 bushels was almost identical to the 16,862,000 bushels in 1955, but was less than one-half the 10-year (1945-54) average of 40,929,000 bushels. The 1956 crop was plagued by drouth conditions over much of the eastern plains. Loss of wheat acreage approximated one-half of the total plantings. As in other recent years, the bulk of the 1956 production came from the northeastern corner of the state. In Cheyenne and Kiowa counties, where drouth conditions were most severe, the crop was practically a total failure. Spring wheat production totalled 756,000 bushels against 850,000 bushels in 1955 and 2,055,000 bushels the average. As in 1955, most of the crop came from irrigated land generally and western non-irrigated areas.

POTATOES—The 1956 potato crop was estimated at 10,197,000 (100-lb.) sacks. This crop was 12 percent larger than the short crop of 9,120,000 sacks harvested in 1955 but was 6 percent smaller than the 10-year (1945-54) average of 10,844,000 sacks. The 1956 production was harvested from 53,000 acres with a 2,000 acre abandonment which occurred due to the continued drought. Weather was mostly favorable during harvest and a good quality crop went into storage. Recorded shipments of potatoes to December 1 of nearly 3-2/3 million sacks exceeded the shipments to that date in 1955 by 13 percent. A government assistance program for diverting potatoes to livestock feed and starch was in operation again in 1956. The 1956 yield per acre was 192 sacks against 175 in 1955 and the 1945-54 average of 176. Production of late summer potatoes at 2,650,000 compared with 2,025,000 sacks harvested in 1955 and 2,218,000 the 6-year (1949-54) average late summer harvest. Total production of fall potatoes (usually for market after October 1) reached 7,547,000 sacks in 1956 compared to the 1955 fall crop of 7,095,000 sacks and the 6-year (1949-54) average production of 8,334,000 sacks.

SUGAR BEETS—Production of sugar beets was estimated at 1,893,000 tons, about 2 percent less than average, and up 17 percent from the 1,621,000 tons harvested in 1955. The growing season was favorable with the season extending well into the fall. This gave high tonnage as well as an unusually high sugar content. The tonnage in 1956 was harvested from 120,700 acres with an average yield of 15.7 tons. In 1955, harvest from 102,000 acres averaged 15.9 tons of beets per acre.

DRY BEANS—Production of dry beans in 1956 reached 1,408,000 bags (100-lb.—clean basis). This production, mostly Pintos, compared with 1,640,000 bags produced in 1955 and the average crop of 1,887,000. The 1956 crop was the smallest since 1937. Late summer drought conditions in southwestern Colorado reduced the size of the non-irrigated crop and less than normal acreage of beans was planted in northern Colorado irrigated areas. The acreage harvested totalled 204,000 in 1956 against 200,000 acres in 1955. The 1956 yield per acre at 690 pounds was 130 pounds below 1955.

CORN—Production of all corn in 1956 was 17,340,000 bushels, the largest harvest since 1942. Production in 1955 was 17,064,000 bushels and the average crop 13,328,000 bushels. The extremely high irrigated yield in northern Colorado resulted in a record high average yield of 42.5 bushels per acre for the state. The 1955 yield was 36 bushels and the 10-year (1945-54) average yield was 25.5 bushels. Irrigated corn averaged 58.0 bushels in 1956 and 54.9 bushels in 1955. (The yield in Iowa in 1956 was only 53.0 bushels.) Corn for grain production at 8,568,000 bushels compared with 7,584,000 bushels harvested in 1955 and the average 8,326,000 bushels. Corn cut for silage was a record tonnage of 1,796,000 tons in 1956 against 1,577,000 tons in 1955.

OATS AND BARLEY—Production of oats was 3,496,000 bushels in 1956. This, with the exception of 1954, was the smallest crop since 1934 and compared to 3,906,000 bushels in 1955 and the 10-year average of 5,563,000 bushels. The non-irrigated crop was very small in 1956. Barley production totalled 7,975,000 bushels against 8,294,000 bushels in 1955 and remained far below the average of 13,368,000 bushels. As in the case of oats, very little barley was produced on non-irrigated land in eastern Colorado.

SORGHUMS—The 1956 sorghum crop was produced under generally adverse conditions. Grain harvest estimated at 2,562,000 bushels compared unfavorably with the 1955 harvest of 4,950,000 bushels, and was close to the 10-year average production of 2,816,000 bushels. Production for grain from non-irrigated land was restricted to northeastern Colorado. The crop produced on irrigated land in the Arkansas Valley was a larger percentage of the total than usual. Silage production of 120,000 and forage production of 261,000 tons was far short of respective tonnages produced in 1955. Total plantings in 1956 at 1,229,000 acres were about one-third less than those planted in 1955, and the 1956 acreage harvested for all purposes was about one-half the acreage harvested in 1955.

BROOMCORN—Production of broomcorn at 4,300 tons in 1956 was about one-half the tonnage harvested in 1955 and the smallest harvest since 1939. Production in 1955 amounted to 8,500 tons and the 10-year average was 9,010 tons. Plantings were near average in 1956, however, because of critical drought conditions only 62,000 acres reached harvest with a low average yield of 140 pounds of brush per acre.

SEED CROPS—Alfalfa seed was estimated at 2,850,000 pounds against 3,640,000 pounds in 1955 and the average of 2,696,000. Sweetclover seed in 1956 at 1,620,000 pounds compared with 1,125,000 pounds in 1955 and the average of 2,192,000. Sudangrass seed production totalled 9,200,000 pounds in 1956. Production in 1955 was 14,250,000 pounds.

HAY CROPS—Production of all hay was estimated at 2,303,000 tons against 2,322,000 tons cut in 1955 and the average of 2,245,000. Alfalfa hay production was 1,686,000 tons in 1956 compared with the 1955 harvest 1,692,000 tons and the average of 1,467,000. Alfalfa hay production in 1956 was the fourth largest since 1929, being exceeded only by the crops of 1952, 1953, and 1955. Wild hay production in 1956 at 229,000 tons was higher than the 209,000 produced in 1955, but only about one-half the average harvest of 399,000 tons. Although total hay production approached average, hay was in short supply in local mountain areas, and in eastern Colorado where drought conditions were most severe during the summer.

FRUIT CROPS

The 1956 commercial **apple** crop estimated at 1,505,000 bushels, was considerably above the 1955 harvest of 1,210,000 bushels and the average of 1,273,000. The 1956 crop was the largest since 1949, with fruit well colored and of good quality. The **peach** crop of 1,697,000 bushels was considerably below the 1955 harvest of 2,110,000 bushels, but near the average of 1,762,000. Early season frost in parts of Mesa County caused a light set of fruit in some orchards. The peak for maturity of the peach crop was about August 22, much earlier than the preceding year. The 1956 crop of **pears** totalled 225,000 bushels compared to 150,000 bushels in 1955 and the average of 194,000. Production of **sour cherries** was 1,900 tons against 1,200 tons harvested in 1955 and the average harvest of 2,350. The **sweet cherry** crop of 550 tons was about 5 percent smaller than that produced in 1955 and the average production of 578 tons.

COMMERCIAL VEGETABLES

(1956 Season)

The characteristics and influencing factors pertaining to the 1956 season were reviewed on pages five to seven of the 1955-56 edition of Colorado Agricultural Statistics published in May, 1957. Further discussions of the 1956 Commercial vegetable industry in this section would amount to unnecessary repetition. However, statistics relating to acreage, production and value of individual crops grown that year are shown as comparable data in the Review of the 1957 Season found elsewhere in this text.

REVIEW OF THE 1957 CROP SEASON

(Preliminary Estimates)

Abundant crop production and very difficult harvest conditions characterized the 1957 season in Colorado. Crop production was by far the largest volume ever produced in the state. The production of feed grains, hay, roughage, and range feeds was particularly large. It was also an excellent year for range livestock. In contrast to the abundant production, adverse weather interfered with most harvest operations beginning with winter wheat and hay harvest and extending through sugar beet, sorghum, and corn harvest. While harvest was difficult, actual loss in production as a result of adverse harvest weather was confined mainly to dry beans in western areas. With the exception of this loss of dry bean acreage and abandonment of 33 percent of the seeded winter wheat acreage, the abandonment of crops was unusually light. Quality of hay was damaged considerably and some other crops also suffered quality damage but to a lesser degree.

The record output of crops was obtained from 5,890,300 acres (excluding fruits, truck crops, and seeds), an increase of 20 percent over the previous year's harvested acreage. Yields per harvested acre of most crops were well above 1956 and average and record highs were obtained for several crops including corn for grain, silage corn, spring wheat, barley, rye, sorghum grains, dry beans, sugar beets and grain hay, with winter wheat, oats and alfalfa hay yields close to the all-time record highs. The 1957 season was promising from the start with an unusually wet April and May. There was an abundance of irrigation water and snowpack at high elevations was heavier than usual. Early indications are that receipts from sale of all farm products will total about \$476 million in 1957. This compares with 1956 receipts from sale of crops and livestock of \$422 million, the 1955 total of \$404 million and the record high of \$602 million in 1952.

WHEAT—Production of **winter wheat** amounted to 32,732,000 bushels in comparison with a 1956 crop of 16,896,000 bushels and the 10-year average (1946-55) of 39,404,000 bushels. The yield per harvested acre at 24.5 bushels was more than twice that of 1956 and was 8.1 bushels above average. The bulk of the production was in the northeast quarter of the state as plantings in east central and southeast areas lacked sufficient moisture at planting time to become established and much acreage was "soil banked". Frequent rains in July delayed harvest, which resulted in some loss of production from lodging and light test weights. The **spring wheat** crop amounted to 1,122,000 bushels. This was well above the light 1956 crop of 756,000 bushels but was only 60 percent of the 10-year average production. The larger production in 1957 resulted from the high yield per acre, as the area harvested was small.

POTATOES—The 1957 fall potato crop (for market after October 1)

totalled 8,580,000 cwt. Compared with the 1956 production of 7,547,000 cwt. and the 1949-55 average of 8,157,000 cwt. The 44,000 acres harvested was above the 42,400 in 1956 and the 7-year average of 43,800. Yield per harvested acre at 195 sacks was above the 1956 average of 178 sacks and the 7-year average of 186 sacks per acre. Irrigation water supplies were adequate to plentiful in contrast to shortages the previous year. There was some delay in harvesting although much of the acreage had been harvested prior to the October rains. The government program was again in effect for diverting potatoes to livestock feed and starch. The late summer potato crop estimate at 2,280,000 sacks was well below the 1956 production of 2,650,000 sacks with a reduction in yield from 250 to 190 sacks more than offsetting an acreage increase.

SUGAR BEETS—The largest production of sugar beets in the state since 1947 was estimated for 1957 with the average yield per acre at a record high of 17.3 tons per acre. The total tonnage at 2,361,000 tons was well above the 1956 crop of 1,893,000 tons and the 10-year average of 1,898,000 tons. General rains which started about October 10 and extended through most of November slowed harvest operations and made them very difficult. Many beet tops were pressed into the mud and had relatively little feeding value.

DRY BEANS—Dry bean production was estimated at 1,955,000 bags (100 pounds clean basis), 39 percent above the short 1956 crop of 1,408,000 bags and 3 percent above average. Irrigated beans averaged 1650 pounds per acre although restricted somewhat by blight, white mold and rust in Northern Colorado. Harvest weather was favorable in that area. The non-irrigated yield was a record high at 780 pounds primarily due to the exceptional yields secured from the acreage harvested in Southwestern Colorado. Partially offsetting the state record high all bean yield was a decline in harvested acreage to the lowest level since 1923. At 173,000 acres this area was 31,000 acres less than in 1956 and 74,000 acres less than average. The southwestern non-irrigated crop made excellent progress after a late start. A late fall allowed the entire acreage to reach maturity. These beans were cut and in the windrow or piled with about 60 percent threshed when the fall rains started in early October which resulted in very little harvesting being done after that time. Fields were snow covered through late November. The estimate of 1,955,000 bags included about 130,000 bags which cleaners in the area expected to be salvaged. The balance of the unthreshed acreage was considered to be lost and was excluded from the production estimate.

CORN—Production of all corn at 25,029,000 bushels in 1957 compared with 17,340,000 bushels in 1956 and 13,531,000 bushels average. This was the largest corn crop since 1930 and the third largest of record. Record yields were reached with irrigated corn averaging 65.0 bu. (The Iowa average in 1957 was 60.5) and non-irrigated 23.0 bu. A late October frost date in the main grain corn areas allowed late planted acreages to mature. Some corn mainly in Boulder, Larimer and Weld counties was frosted in late September but was salvaged for silage with no appreciable loss. Grain corn production at 13,550,000 bushels compared with 8,568,000 bushels in 1956 and 7,971,000 bushels the average. Silage production totalled 2,403,000 tons and was by far the largest quantity ever harvested in Colorado. The 1957 crop was one-third larger than the 1956 crop of 1,796,000 tons and 2½ times average.

OATS AND BARLEY—Production of oats amounted to 6,070,000 bushels, 74 percent above 1956, 16 percent above the 10-year average and was the largest crop since 1949. The yield per acre in 1957 at 35.5 bushels was the largest since 1912. Barley production increased sharply with 18,208,000 bushels harvested, more than double the 1956 crop of 7,975,000 bushels and more than 50 percent above average. Irrigated barley averaged 43.5 bushels per acre and non-irrigated 24.0 bushels.

SORGHUMS—A bumper crop of sorghums was produced in the state. The crop started late as rains delayed planting and necessitated considerable replanting, but growing weather through most of October allowed nearly all the acreage to mature. Grain harvest estimated at 12,711,000 bushels was about five times the 1956 production and more than four times the 10-year average. Both yield per acre and acreage harvested for grain were at record highs. Of the total 1,221,000 acres of sorghums harvested, 669,000 were for grain, 488,000 were for forage (including pasture) and 64,000 were for silage. Forage production amounted to 683,000 tons and silage production was 480,000 tons.

BROOMCORN—Broomcorn production at 11,200 tons was the largest since 1949, an increase of 160 percent or 6,900 tons over the small 1956 output and 35 percent over the 10-year average. Acreage harvested at 80,000 acres compared with 62,000 in 1956 and 74,000 average. While much of the acreage was planted late, practically all made brush prior to killing frost in late October. Harvest progressed slowly as a result of frequent rains and shortage of labor, however, practically all the acreage was cut by November 1.

SEED CROPS—Alfalfa seed estimated at 2,295,000 pounds compared with 2,850,000 pounds in 1956 and the average of 2,890,000 pounds. Sweetclover seed at 1,620,000 pounds was the same as the 1956 production but well below the 10-year average of 2,075,000 pounds. Sudangrass seed production rose sharply to an all-time record high of 43,200,000 pounds in comparison to the 1956 crop of 9,200,000 pounds. Both average yield per acre and acres of sudangrass seed harvested were a record.

HAY CROPS—Production of all hay in 1957 was 2,935,000 tons, 27 percent above the 1956 tonnage of 2,303,000 and 30 percent over the average of 2,255,000 tons. Alfalfa hay production accounted for most of the increase, totalling 2,033,000 tons in 1957 against 1,686,000 tons for 1956 and the average of 1,501,000 tons. The 1957 alfalfa hay production was the largest since 1920 when 2,176,000 tons were harvested. Wild hay production in 1957 was 344,000 tons, 50 percent greater than the 229,000 tons cut in 1956 but still 8 percent under the average of 375,000 tons. Abundant early spring moisture and the plentiful supply of irrigation water throughout the summer promoted rank growth of all hays. All yields were at relatively high levels, however, rains damaged much of the hay during harvest.

FRUIT CROPS

The 1957 peach crop was relatively large at 1,950,000 bushels, well above both 1956 when 1,697,000 bushels were harvested and the 10-year average of 1,736,000 bushels. Harvest was delayed by rain just as the fruit was ripe which resulted in some loss of quality, however, most of the crop was saved. Marketing Agreement size restrictions were in effect. Commercial apple production estimated at 1,120,000 bushels compared to 1,505,000 bushels in 1956 and the average of 1,266,000 bushels. Apple harvest was also interrupted by rain and harvest was very late in western areas. Pear production at 165,000 bushels was below the 1956 crop of 225,000 and the average of 181,000. Sour cherry production at 1,400 tons was also less than 1956 and average by 500 tons and 870 tons respectively. The sweet cherry crop totalled 420 tons against 550 tons in 1956 and the average of 598 tons.

COMMERCIAL VEGETABLES

(1957 Season)

Colorado vegetable growers continued to maintain a high level of production through another year despite a slow beginning. Early backwardness caused by a late, cold spring was mostly offset by favorable growing conditions during the latter part of the season which resulted in most crops showing above-average yields per acre. Comparisons on a National scope reveal the Colorado vegetable output to be a commendable achievement. In 1957, Colorado ranked 15th among the states in the acreage harvested for fresh market but moved up into 9th place in the total tonnage produced. A similar showing was observed in vegetables grown for processing, with the State ranking 25th in acreage and 21st in production. Such production achievements appear even more noteworthy when considered in light of the fact that Colorado vegetables are grown under widely diversified conditions at altitudes ranging from 3,500 feet to more than 8,000 feet above sea level.

The combined total of 38,040 acres of vegetables harvested for fresh market and for processing in 1957 yielded an aggregate production of 288,600 tons valued at \$14,581,000. In 1956, 37,910 acres produced 288,200 tons worth \$13,684,000. The 1955 area harvested was 34,590 acres, production was 240,000 tons and the farm value of these crops was \$12,793,000. The area harvested and total production in 1957 were about the same as a year earlier but the value of these crops was 7 percent greater, thus compensating somewhat for the set-back experienced in 1956 when production was increased 20 percent over 1955 but total value was up only 7 percent. The aggregate production in 1957 as in 1956 was the largest output since 1950, but in that year, one-third more acreage was necessary to produce 8 percent more tonnage than in 1957. Fresh market crops were responsible for holding the production level in 1957

comparable to 1956. The area harvested for fresh market in 1957 was 4 percent larger and production was 6 percent greater than in 1956. On the other hand, the acreage grown for processing was down 9 percent and production was off 19 percent in 1957. Tomatoes for processing were mostly responsible for this decline, with 24 percent less acreage and 37 percent less tomatoes.

The 1957 season was generally favorable and generous in production output despite the late spring and several damaging local weather hazards. Of the 16 fresh market and processing vegetable crops for which estimates are made, the yield per acre was higher than a year earlier for 8 and above the average of recent years for 13. Growing and maturing conditions were generally more uniform over all truck crop areas of the state than are usually experienced. The San Luis Valley suffered more extreme effect of the late spring with 2 freezes in June that damaged lettuce and green peas considerably. The most damaging hail losses occurred in Bent County which reduced the production of cantaloups and onions. Harvest of the late onion crop was made quite difficult by a prolonged rainy spell which delayed harvest and soaked the onions reducing keeping quality. The urgency to get the crop under cover before freezing caused many lots to be stored while still wet, resulting in exceptionally heavy decay loss prior to January 1. In contrast to the dry cycle of recent years, water for irrigation was ample in 1957, with excessive rainfall causing some losses from mildew.

ONIONS—The 1957 onion crop of 2,044,000 cwt. amounted to more than one-third of the total volume of all commercial vegetables grown in the state. Colorado's onion crop also holds a high rating in the Nation, ranking 4th among the 19 states in the late summer group by producing 12 percent of the Country's fall and winter onion supply. Prices dropped sharply and despite a nine-percent larger production than a year earlier, the value of the current crop dropped 21 percent. The December preliminary estimate of this year's crop was placed at \$3,475,000. In 1956, production of 1,876,000 cwt. was appraised at \$4,409,000 and the 1949-55 average was 1,804,000 cwt. worth \$3,975,000. An area of 7,300 acres was harvested in 1957 compared with 6,700 acres in 1956 and 7,770 acres the 7-year average. Compared with 1956, the 1957 area harvested was up 6 percent in Northern Colorado and 15 percent in the Arkansas Valley but was 7 percent smaller on the Western Slope. All of the increase in the Arkansas Valley came from a new area opened up in Baca County. As late as September first, the average yield per acre was not expected to equal the second highest of record obtained in 1956. The crop had been retarded by cool nights, mildew and pink root disease and bulbs were unusually small for that date. However, onions made excellent growth through the extended late-fall growing weather and high yields on late fields offset the relatively light yields obtained on early harvestings. A costly factor of the 1957 onion deal was the extremely heavy losses due to shrink, decay and lack of demand for small onions. These losses were among the heaviest of record, amounting to 30 percent of the crop prior to January 1, and were double the 15 percent losses on the 1956 crop.

LETTUCE—Lettuce moved into second place of importance in the state's vegetable industry in 1957. A harvested area of 6,000 acres yielded 720,000 cwt. valued at \$2,916,000 compared with 5,000 acres, 575,000 cwt. and \$1,179,000 in 1956 and 3,800 acres, 494,000 cwt. and \$2,050,000 in 1955. The 1949-55 average was 4,290 acres, 468,000 cwt. and \$1,208,000. Comparisons of the last two years against 1955 and earlier years reveals the sharp expansion of the lettuce deal, prompted by the revolutionary technique of shipping vacuum-cooled lettuce in cartons of two-dozen heads. Installation of another vacuum cooling chamber in the San Luis Valley increased the total number operating in that district to six. Also, one cooling chamber was placed in operation in Adams County and another in Routt county in Northern Colorado. However, much of the lettuce in the North was lost in 1957 because of weather conditions unfavorable to lettuce at critical times.

CABBAGE—This third ranking Colorado vegetable crop led the Nation's Late Summer group of 10 states in volume of production. This year's 2,600 acres yielded 650,000 cwt. valued at \$845,000 against 2,800 acres, 644,000 cwt. and \$934,000 in 1956. The 7-year average was 3,240 acres, 778,000 cwt. and \$979,000.

TOMATOES—Tomatoes grown for fresh market and for processing dropped from second to fourth place in 1957 with a combined production of 612,000 cwt. appraised at \$1,074,000. The bulk of this crop is grown for processing which in 1957 totalled 468,000 cwt. from 2,600 acres and valued at

\$548,000 compared with 742,000 cwt. from 3,400 acres and worth \$876,000 in 1956 and 488,000 cwt. from 3,300 acres worth \$591,000 the 1946-55 average. The 1957 fresh market crop amounted to 144,000 cwt. valued at \$526,000 against 153,000 cwt. and \$497,000 a year earlier and 172,000 cwt. and \$621,000 average. The sharp decline in production in 1957 was due to a substantial reduction in the acreage harvested and the failure to match the record-high yields obtained in 1956.

CUCUMBERS—Ranking in fifth place in 1957, cucumbers produced for pickles on 1,920 acres totalled 341,000 cwt. valued at \$1,030,000 compared with 2,200 acres, 348,000 cwt. and \$1,125,000 in 1956 and 2,620 acres, 268,000 cwt. and \$790,000 average.

CARROTS—The bulk of Colorado carrots are now marketed in cellophane bags. In 1957 a total of 1,800 acres produced 270,000 cwt. worth \$1,350,000 against 2,000 acres, 270,000 cwt. and \$904,000 a year earlier and 1,600 acres, 202,000 cwt. and \$592,000 average.

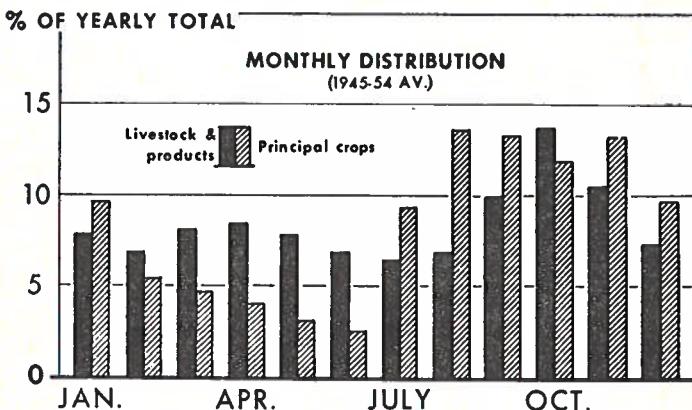

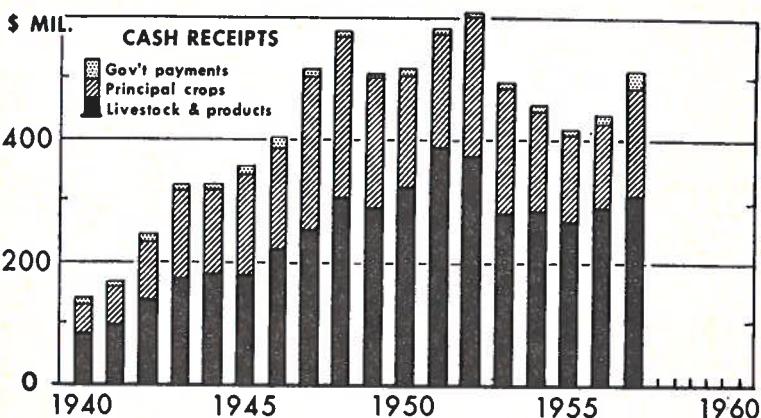

CANTALOUPS—A harvested area of 2,500 acres in 1957 yielded 212,000 cwt. with a farm value of \$456,000. In 1956, 2,500 acres produced 225,000 cwt. worth \$439,000 and the 1949-55 average was 2,140 acres, 192,000 cwt. and \$375,000.

SNAP BEANS—Production of snap beans grown for processing in 1957 amounted to 104,000 cwt. with a farm value of \$502,000 while the fresh market crop totalled 34,000 cwt. bearing a cash value of \$299,000. In 1956, the canning crop of 112,000 cwt. brought \$525,000 to growers and the fresh market output of 34,000 cwt. was worth \$282,000.

OTHER VEGETABLE CROPS—Acreage harvested and production respectively for 1957 compared with 1956 are as follows: **Cauliflower**: 900 acres and 135,000 cwt in 1957 compared with 1,000 acres and 150,000 cwt. in 1956. **Celery**: 500 acres and 150,000 cwt. against 600 acres and 186,000 cwt. **Sweet Corn** for fresh market: 2,800 acres and 179,000 cwt. compared with 2,700 acres and 162,000 cwt. **Green Peas** for fresh market: 1,600 acres and 40,000 cwt. against 1,800 acres and 45,000 cwt.; for processing: 2,000 acres and 60,000 cwt. (shelled) compared with 1,800 acres and 35,000 cwt. **Spinach**: 1,300 acres and 52,000 cwt. against 1,100 acres and 42,000 cwt.

¹Data for 1954-56 are taken from the August, 1957 issue "Survey of Current Business" published by the U. S. Dept. of Commerce, under the heading "Personal Income by States and Regions." For detailed explanation of these estimates, see text in August, 1957 issue "Survey of Current Business," pp. 11-21.

²Compiled from Mineral Yearbook of the U. S. Bureau of Mines for the years concerned. Reported values were rounded to the nearest thousand dollars for ease of presentation and comparability with other income data.

³In addition to minerals shown separately this total includes primarily molybdenum, vanadium, tungsten, natural gas together with sand and gravel and a number of other minerals of lesser importance. Individual data on some minerals are not included for security reasons.

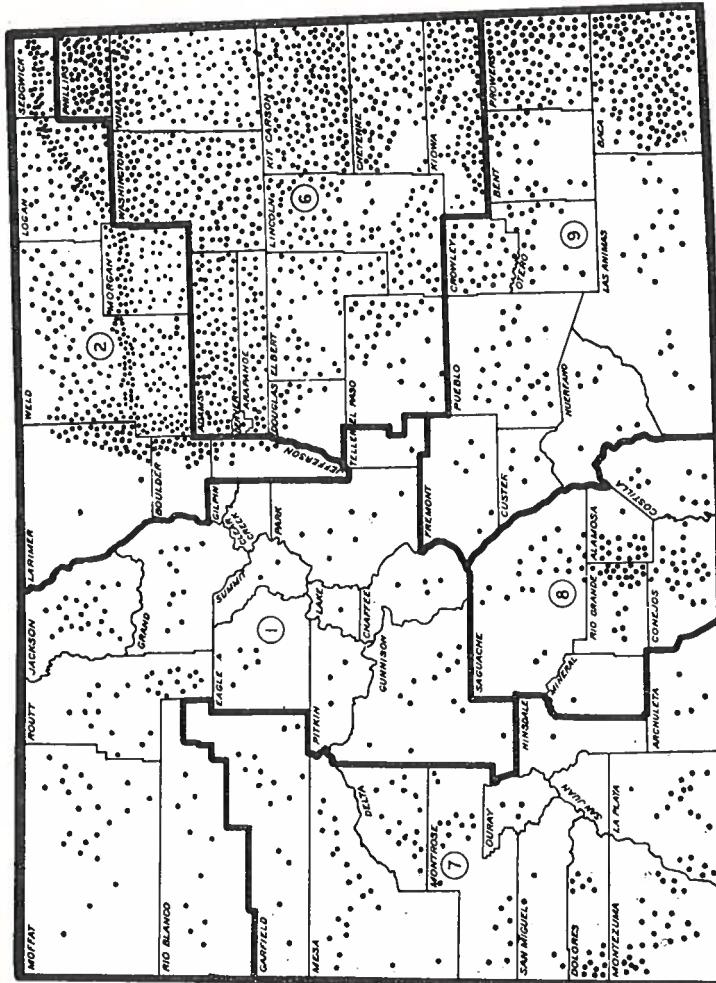

⁴Unavailable.

NOTE—For a discussion of the significance of this table, see page 4 of Colorado Agricultural Statistics, 1950.

¹Harvested acreage of oats includes acreage cut ripe and fed unthreshed prior to 1949. Beginning in 1949 estimates include only acreage threshed or combined.

²Planted for harvest in year shown. Winter wheat sown fall of preceding year.

³Only harvested acreage estimates are made for these crops.

¹In certain years, production includes some quantities not harvested because of economic conditions and excluded in computing value.²Estimates of commercial apples relate to production in 7 commercial counties (Larimer, Delta, Garfield, Mesa, Montezuma, Montrose and Fremont), which produce about 95 percent of the total apples produced in the state.

¹Includes stocks in interior mills, elevators, warehouses, commercial stocks at terminals and those owned by Commodity Credit Corporation in storage under CCC control.

²Year shown refers to year of storage. For example: The 1,738,000 bushels shown as in storage January 1, 1952, was produced in 1951 or earlier.

³Does not include stocks in merchant mills or bins owned by Commodity Credit Corporation.

⁴Unallocated—to avoid disclosing individual operations.

LIVESTOCK INVENTORY AND VALUE JANUARY 1, 1958 AND 1957

Livestock and poultry inventory numbers in Colorado were lower on January 1, 1958 than on January 1, 1957 according to reports of farm and ranch operators. Range conditions and feed supplies in 1957 were much improved over preceding drought years and demand for stocker cattle, sheep and lambs was strong in the fall of 1957. Competition for feeders, however, prevented farmers and ranchers from increasing breeding stock—particularly cattle—as much as desired. All cattle number declined 3 percent with milk cows also down 3 percent and beef cows up about $\frac{1}{2}$ percent. Hog numbers were unchanged. Stock sheep inventories increased 3 percent with a reduction in lambs on feed bringing all sheep numbers down 1 percent. All horses and mules were down 2 percent; all chickens, 9 percent; and turkeys, 10 percent. Due to above average production in 1957 there was an abundance of hay, roughage and feed grains for wintering the inventory. Open weather permitted more than average use of pasture and range feed. Values per head January 1, 1958 were higher than for the same date the year before for cattle, hogs, sheep, and horses. The aggregate value of all livestock (including cattle and sheep on feed) and poultry January 1, 1958 is calculated at \$285,573,000, 43 percent above the 1957 inventory value of \$199,570,000. For the 1947-56 period the average January 1 inventory valuation was \$283,078,000 and the record high occurred in 1952 with \$449,772,000.

ALL CATTLE AND CALVES—Cattle and calves in the state January 1, 1958 numbered 1,910,000 head (including animals in feed lots), the smallest January 1 inventory since 1951 but above all years except 1944 prior to that date. The number was 3 percent less than the 1,974,000 head on January 1, 1957 and 12 percent less than the record high reached in 1953 of 2,161,000 head. The 1947-56 average was 1,948,000. Beef cows increased from 685,000 to 688,000 head following the record number of yearling beef heifers on hand the year before. The number of such heifers 1-2 years old were down from 273,000 on January 1, 1957 to 270,000 January 1, 1958 which was still the second highest inventory of record for this class of cattle. Calves (other than milk stock) totalled 495,000 head in comparison to 507,000 the year before and the record high of 536,000 head on January 1, 1956. Beef heifers held for replacement were at near record levels while

beef cows were 14 percent below the 1954 peak of 804,000 head. There was some liquidation of mature stock during recent drought years while ranchers held their young foundation stock to re-establish herds. Numbers of steers over one year old dropped to the lowest level in 10 years with 174,000 on hand January 1, 1958 in comparison with 217,000 January 1, 1957. Average value per head for all cattle on hand January 1, 1958 at \$123.00 was 50 percent above the \$82.00 on January 1, 1957 but was still 53 percent below the all time record high of \$177.00 for January 1, 1952. Total value of cattle amounted to \$234,930,000 January 1, 1958 in comparison to \$161,868,000 a year earlier, an increase of 45 percent.

CATTLE IN FEED LOTS—An estimated 251,000 head of cattle and calves were being fattened in Colorado feed lots January 1, 1958. This feeding level was 5,000 head or 2 percent greater than January 1, 1957. Supplies of grain, hay and silage were abundant in Colorado at lower prices than the previous year. However, the relatively high prices of feeder cattle during the fall of 1957 caused reluctance among some farmers to feed cattle.

Reports from cattle feeders on January 1, 1958 on length of feeding time showed more animals on feed less than 3 months, fewer 3 to 6 months and over 6 months than the year before. The numbers on January 1, 1957 were 148,000 head on feed under 3 months, 99,000 on feed 3 to 6 months and 4,000 head on feed more than 6 months.

Cattle and calves on feed in northern Colorado and the South Platte River Valley January 1, 1958 were 208,000 against 210,000 on January 1, 1957. In the Arkansas Valley the number on feed increased to 32,000 head on January 1, 1958 from 29,000 the year before. Other sections of the state, including the lower western valleys, showed an increase—11,000 on January 1, 1958 against 7,000 on January 1, 1957.

Weight information for cattle on feed January 1, 1958 revealed 18,000 head of heavy cattle (weighing over 1100 pounds) compared with 21,000 head January 1, 1957. In the 900-1100 pound group there were also less cattle January 1, 1958—63,000 head compared with 67,000 head the year before. The number of cattle and calves weighing less than 900 pounds was up significantly—170,000 head January 1, 1958 against 158,000 head January 1, 1957.

MILK COWS AND HEIFERS—Milk cows totalled 156,000 head January 1, 1958 in comparison to 161,000 head a year earlier and the 10-year average of 186,000. Milk cow numbers have trended downward since January 1, 1934 when the peak of 300,000 head was reached. The number on January 1, 1958 was the lowest since 1913 when there were 141,000 head. Milk production per cow reached a new high of 6,140 pounds in 1957 which partially offset the decline in milk cow numbers. Heifers kept for milk cows totalled 40,000 head on January 1, 1958, no change from January 1, 1957. Total milk stock (including heifer calves) was 243,000 head January 1, 1958 compared to a 250,000 head total January 1, 1957. Average inventory value per head was placed at \$183.00 substantially above the 1957 average of \$137.00.

CALF CROP—Calves born in Colorado during 1957 totalled 744,000 head. This was 4 percent less than the 772,000 head born in 1956 and 2 percent below the 1946-55 average of 756,000 head. The state's calf crop reached a peak in 1954 with 873,000 calves. A decrease in the number of cows and heifers two years and older at the beginning of 1957 accounted for the smaller calf crop. On January 1, 1957 there were 846,000 total head of cows and heifers on Colorado farms and ranches in comparison to 908,000 a year earlier and the ten-year average of 876,000. Calves born during the year as a percentage of cows and heifers inventoried the first of the year were 88 in 1957, 85 in 1956 and averaged 86 for the 1946-55 period.

SHEEP AND LAMBS—Stock sheep were estimated at 1,252,000 head January 1, 1958, 3 percent above the January 1, 1957 number of 1,216,000

head and 1 percent below the 1947-56 average of 1,261,000. Ewe lambs which increased from 144,000 to 181,000 head accounted for the above increase over January 1, 1957. Stock sheep numbers were reduced during the preceding drought years. Feed supplies improved greatly in 1957 and encouraged re-stocking by farmers and ranchers.

Average inventory value of stock sheep was \$22.30 per head and total value was \$27,920,000 January 1, 1958. A year earlier the average was \$15.50 and the total value \$18,848,000.

Weather during late winter and through the spring was quite stormy. Precipitation during this period was well above normal and temperatures averaged lower than normal which made caring for new lambs more difficult than usual. A severe blizzard the last of March followed by intermittent snow storms in April caused some loss of lambs. Growth of grass on ranges and pastures was delayed by the cool weather. Feeding of livestock in some areas continued into May and at higher elevations into June. With good soil moisture supplies, the warm weather in late May and early June pushed growth of range feed rapidly and lambs made good progress.

Fewer sheep and lambs were in Colorado feed lots January 1, 1958 than the previous year. The number was 504,000 head compared to 550,000 head January 1, 1957 and 510,000 head on January 1, 1956 which was the smallest since January 1951. Colorado led the nation in lamb feeding for the third successive year. The decrease in 1957 was mostly in northern Colorado where 340,000 head were on feed on January 1, 1958 compared to 377,000 January 1, 1957 and 350,000 head on January 1, 1956. In the Arkansas Valley there were 140,000 head January 1, 1958 compared with 145,000 head a year earlier. Combining the number of lambs on feed in northern Colorado with those fed in the North Platte River Valley of Nebraska and Wyoming, the decrease was very significant. On January 1, 1958 there were 525,000 head in these areas compared with 624,000 head January 1, 1957, a decrease of 16 percent. On January 1, 1956 there were 540,000 head of sheep and lambs on feed in these sections.

Lambs moved into the Colorado feeding areas much later in 1957 than in 1956 and at heavier weights. This was a reflection of the very favorable feed conditions which prevailed over the Western sheep range country during 1957 compared with the drought conditions of 1956 which forced an early movement of lambs to irrigated areas to clean up crop residue before moving into dry feed lots. Difficulty was experienced during the fall of 1957 in making full use of sugar beet tops as a result of delayed harvest and the wet fields, but in general the feeding season was favorable. Feeder lambs cost more in 1957 than in 1956 but feed costs were much lower.

LAMB CROP—Colorado's lamb crop in 1957 was estimated at 966,000 head, 5 percent less than in 1956 and 5 percent less than the 1946-55 average. This was the smallest lamb crop for the state since 1950 and was 30 percent less than the 1943 record high. The small lamb crop was largely the result of the decrease in the number of ewes in breeding flocks. At 1,028,000 head on January 1, 1957, breeding ewe numbers were 5 percent below the 1946-55 average of 1,079,000 head and 1 percent below the January 1, 1956 number at 1,038,000 head. Lambing percentages were lower than both the 10-year average and the 1956 average, which also contributed to the reduction in the lamb crop. In 1957, 94 lambs were saved per 100 breeding ewes one year old and older on hand January 1, 1957. In 1956 the lambing percentage was 98, a record high, and the 1946-55 average was 95.

WOOL—Production of wool in Colorado amounted to 11,155,000 pounds in 1957, slightly below the 1956 wool clip of 11,280,000 pounds. Average production during the 10-year (1946-55) period was 11,332,000 pounds. Value of the 1957 wool clip, excluding incentive payments, totalled \$5,912,000, 22 percent above the 1956 value of \$4,850,000. The 10-year average value was \$6,057,000.

Sheep and lambs shorn in 1957 (including feed lot lambs shorn) totalled 1,243,000 head, the same as in 1956 but 4,000 head below the 10-year average. Fleece weights in 1957 averaged 9.0 pounds compared with 9.1 pounds in 1956. The average price received for shorn wool during the 10-month period, April 1957 through January 1958, was 53 cents per pound. A smaller proportion of the wool clip was sold during this period in 1957-1958 than in previous years. The seasonal average price for wool (April through March) for 1956 Colorado wool was 43 cents per pound. The above prices for 1956 and 1957 wool do not include government incentive payments on wool made direct to sheep men after the close of the marketing year.

HOGS AND PIGS—Hogs on farms January 1, 1958 at 177,000 head were the same as on January 1, 1957. The 10-year (1947-56) average was 260,000 head. The record high number of hogs was in 1944 when 774,000 hogs were on Colorado's farms.

Inventory values were up from \$20.40 in 1957 to \$27.40 in 1958. Total inventory value at the beginning of 1958 was estimated at \$4,850,000, 34 percent more than the \$3,611,000 of January 1, 1957 but 37 percent below the 1947-56 average of \$7,724,000.

The 1957 pig crop of 245,000 head compared with 249,000 head in 1956 and the 1946-55 average of 364,000 head. The 245,000 pigs saved in 1957 was the lowest on record with the exception of 1953 when 209,000 head were saved. The high point in the state's pig production came in 1943 when 961,000 head were saved. However, numbers dropped sharply the following year to 439,000 head and stayed near that level or smaller in subsequent years.

The spring pig crop was estimated at 141,000 head, 3 percent less than the 1956 spring pig crop and, with the exception of 1953, the smallest since 1935. The total was 69,000 head below the 1946-55 average of 210,000. Pigs saved per litter at 6.7 equaled the 1955 high and exceeded all other years on record. Sows farrowed during the period totalled 21,000 head in comparison to 23,000 head in 1956 and the 1946-55 average of 34,000.

Of the total 1957 pig crop, 104,000 were accounted for by the fall crop which was the same as in 1956 and 50,000 less than average. There were 15,000 fall sows farrowed, 1,000 less than a year earlier and 9,000 less than average. Pigs saved per litter averaged a record high of 6.9 in comparison with 6.5 for both 1956 and the 10-year average. Fall farrowing in 1957 reached a peak in September with distribution between months as follows: June, 11 percent; July, 15 percent; August, 20 percent; September, 27 percent; October, 19 percent; and November, 8 percent.

HORSES AND MULES—Numbers continued to decline in 1957—from 70,000 head on January 1, 1957 to 69,000 head on January 1, 1958; however, the rate of decline was less than in immediately preceding years. More than half of those on hand on January 1, 1958 were saddle horses and cow ponies. On January 1, 1919 there were 472,000 horses and mules on Colorado farms and ranches.

CHICKENS AND EGGS—A further decline in chickens on farms during 1957 brought January 1, 1958 inventory numbers to the lowest level of record (starting in 1929). The estimated number at 1,829,000 birds compared to 2,000,000 birds on hand January 1, 1957. Value of the January 1, 1958 inventory was \$1,920,000 compared to the January 1, 1957 value of \$2,100,000. A total of 2,298,000 chickens was raised on Colorado farms and ranches in 1957, a 27 percent decrease from the 3,148,000 birds raised in 1956.

Home consumption of farm flock chickens during 1957 totalled 978,000 birds, a decline of 6 percent from the 1,040,000 consumed during 1956. Value of chickens consumed on the farm was placed at \$461,000 for 1957 com-

pared with \$582,000 for 1956. Colorado farmers sold 1,051,000 chickens from their flocks for \$564,000 during 1957. In 1956 1,736,000 birds were sold with a cash return of \$1,111,000.

During 1957 the average number of eggs produced per layer was 190, almost equal to the record high of 191 for 1956. The average number of layers during 1957 was 1,629,000 compared to 1,757,000 in 1956. Annual production of eggs totalled 310,000,000 in 1957 compared with 335,000,000 in 1956. Cash received from sale of eggs totalled \$7,446,000 in 1957 against \$9,032,000 in 1956.

The number of commercial broilers produced in Colorado declined for the fourth consecutive year and in 1957 totalled only 1,240,000 birds compared with 1,459,000 one year earlier. Price per pound for broilers averaged only 20.7 cents in 1957 against 25.0 cents in 1956 and 29.0 cents in 1955. Gross income from broilers totalled \$821,000 in 1957 compared with \$1,131,000 in 1956 and \$1,749,000 in 1955.

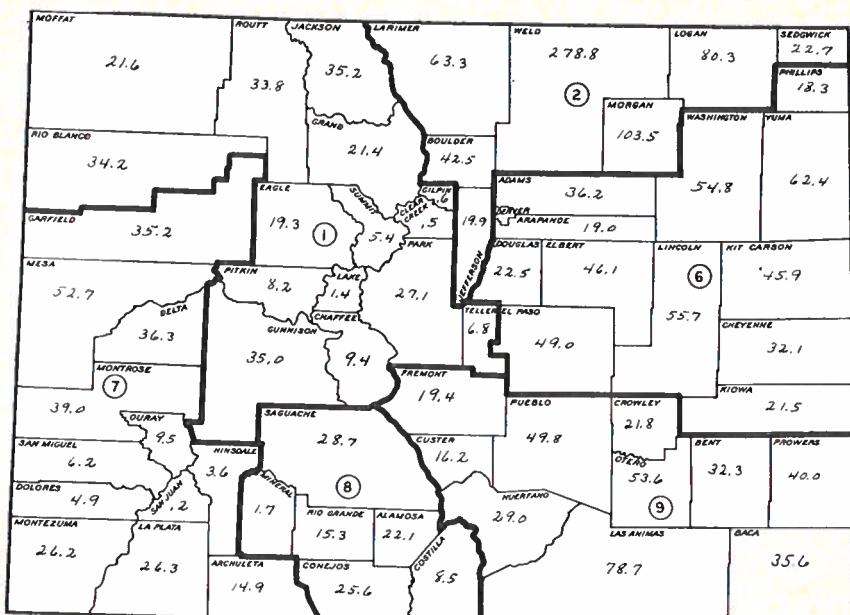

TURKEYS—A record crop of 1,184,000 turkeys was raised in Colorado in 1957, a 2 percent increase over the previous record turkey crop of 1,161,000 birds in 1956. In 1955, 860,000 turkeys were raised. The 10-year (1946-55) average number was 869,000 birds. The average price received for turkeys in 1957, a 2 percent increase over the previous record turkey crop of 1,161,000 of 26.4 cents per pound in 1956 and 28.7 cents per pound in 1955.

The increase in numbers raised failed to offset the decrease in price and cash receipts declined from \$5,859,000 in 1956 to \$5,160,000 in 1957. Gross income (cash receipts from sales plus value of turkeys consumed on farms where produced) totalled \$5,213,000 in 1957 compared to \$5,910,000 in 1956, a decrease of 12 percent. Turkeys on farms January 1, 1958 numbered 24,000 birds compared to 27,000 birds on hand January 1, 1957. Turkey breeder hens on hand January 1, 1958 numbered 8,000 birds, a decrease of 2,000 from the previous year.

¹Computed from the value of milk, cream, and farm butter sold, divided by the quantity of milk or butterfat used in the preparation of these products for market.

²Milk and milk equivalent of cream and farm butter consumed, valued at the average returns for milk utilized in dairy products sold.

³Value of combined sales plus value of products consumed in the farm household.

MILK—PRODUCTION OF MILK ON FARMS, 1948-1957

Peas, Green, for Market	8,000	36	288,000	Cwt.	9.66	2,781,000
Spinach, for Market	31,530	53	1,664,000	Cwt.	5.89	9,963,000
Tomatoes, for Mfg.	300,220	11.0	3,287,800	Ton	25.30	83,237,000
Tomatoes, for Market	220,950	89	19,651,000	Cwt.	7.64	150,202,000
Watermelons	433,350	69	30,015,000	Cwt.	1.67	50,256,000
Total Commercial Vegetables	3,721,720 ^c					1,111,291,000 ^c
Total All Principal Crops	319,062,000 ^c					17,546,892,000 ^c

^aIncludes quantities of some crops not marketed and excluded in computing values.^bPlanted for all uses.^cPounds.^dProduction, price and value on clean basis.^eof hay sold baled.^fSome crops not shown separately.

LAND CLASSIFICATION OF COLORADO

- Irrigated land
- First class dry farming
- Second class dry farming
- Third class dry farming
- Sand hills
- National forests
- National parks
- Grain crop land
- Grazing land
- Forage crop land

WHY CROP AND LIVESTOCK REPORTS

A man's judgement is no better than his facts and crop reports are the basic facts of Agriculture.

They aid farmers in planning their production and marketing.

They are essential in enacting wise legislation affecting Agriculture.

They are the basis for analysis of agricultural and other business conditions.

They enable railroads to make a better distribution of cars for moving farm products.

They give producers the same foresight to future price trends that organized dealers possess.

They are a check on fluctuation in price. Uncertainty of supply promotes undue fluctuation in price.

They are indispensable in times of war because food is as essential as ammunition and weapons of war.

They are the best basis for adjusting supply to demand which is highly essential if maximum price is to prevail.

They aid farm organizations, schools and others in planning constructive programs, and the prospective purchaser of land.

They give information on surplus and deficit areas of production making possible a more economical distribution of products.

They eliminate the ill effects of misleading reports that might be circulated for private gain, if there were no official reports.

They are a guide to farm resources and for developing new resources such as irrigation, electric power, location of food processing and other factories.

They reduce the amount of speculation in farm products. Speculation thrives on uncertainty. Unbiased official crop reports reduce uncertainty which limits speculation.

They indicate potential buying power thereby enabling the manufacturer to meet the probable demand. With economical production and distribution, the manufacturer can sell at a lower price than he could with uncertain demand.

They reduce the risk of ownership of buyers of farm products which enables them to do business on a smaller margin. Under the stimulus of competition, they pay producers higher prices than could be paid if uncertainty of production existed.

They provide an accurate, unbiased picture of Colorado's agriculture. The facts on present and prospective supplies furnish a sound basis for judgment and action by farmers, other individuals, business men, railroads, crop and livestock interests and governmental agencies.
