URS

Memorandum

Date:	June 18, 2002
To:	**P. Donnachie, B. Brosey, GPU**
From:	K. K. Nielson, V. C. Rogers, URS
Subject:	Subsurface DCGL Technical Approach For SNEC Site

DRAFT TECHNICAL APPROACH

This memorandum documents the technical approach proposed by URS Corp to estimate Derived Concentration Guideline Limits (DCGLs) for the Subsurface materials at the Saxton Nuclear Energy Corporation (SNEC) Site. Three areas of concern have been identified at SNEC: the Spray Ponds, the Steam Generating Station (SSGS), and the Reactor area around the Containment Vessel (CV) excavations. Subsurface materials for the Spray Pond and Reactor areas (excluding the CV excavations) are very similar, consisting of approximately two meters of overburden and a greater thickness of underlying bedrock. The subsurface material in the SSGS consists of crushed, homogenized site debris that is covered with one meter of clean fill. Because of these differences, DCGLs will be estimated for only one material (homogenized debris) in the SSGS and for two materials (overburden and bedrock) in the Spray Pond and Reactor areas.

A Resident Farmer Scenario has been selected to most reasonably represent exposures to members of the critical population group. In the scenario, it is assumed that the resident moves onto the Spray Pond, Steam Plant, or Reactor areas, grades the surface, digs a basement, builds a house, develops a bedrock-depth well for drinking water and irrigation, and plants a garden. During these activities, the resident is exposed to residual radioactivity in several ways that include (a) consuming drinking water from the bedrock well, (b) consuming fruits and vegetables grown onsite with irrigation water from the bedrock well, (c) consuming beef and milk from cattle raised onsite using the same irrigation water, (d) consuming fish caught from the adjacent stream into which contaminated runoff and groundwater flows, (e) inhalation of contaminated dust suspended as a result of wind or other activities near the residence, and (f) directly from the material that has been brought to the surface during home construction and yard leveling. The effects of exposure to all pathways will be analyzed and the peak doses compared to the 25 mrem/year criterion to develop DCGLs for each nuclide, soil layer and SNEC area of concern. In addition to these DCGLs, the drinking water pathway will also be analyzed in comparison to the 4 mrem/year drinking water standard to estimate separate drinking water DCGLs for each nuclide, soil layer and SNEC area of concern. To promote consistency with the surface DCGLs, documentation and files for the first five DCGLs for each subsoil region and SNEC area of concern will be transmitted to GPU for review and approval.

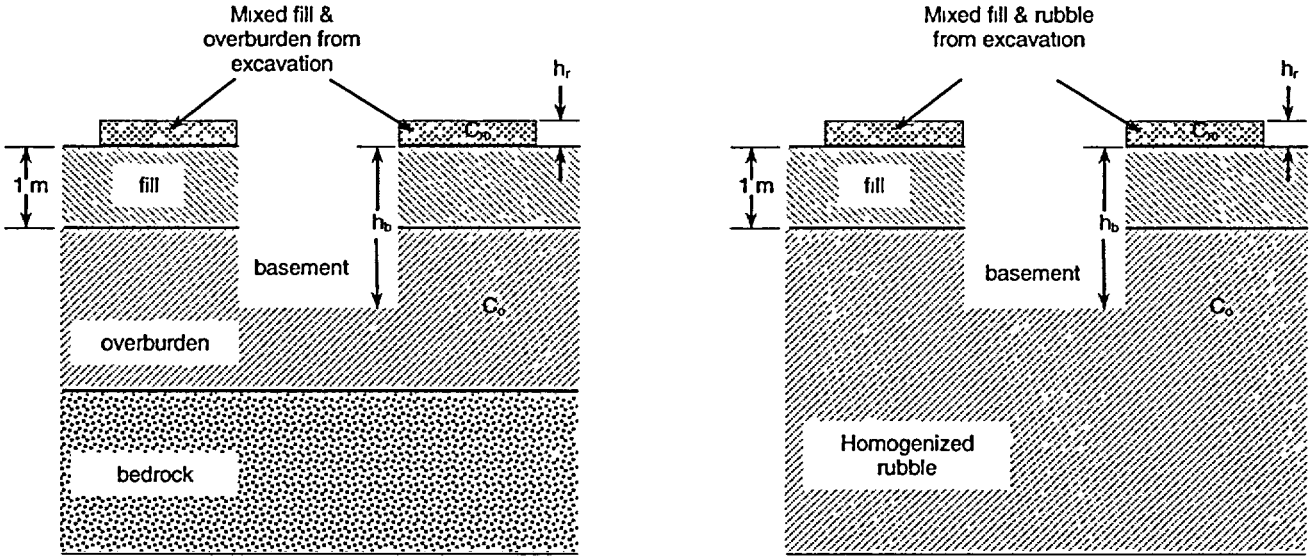
The basement of the hypothetical house built by the resident in the Spray Pond, Steam Plant, or Reactor areas penetrates the 1-m surface fill layer and the top part of the underlying material. The materials excavated for the basement are represented here in the same way as they have been in previous NRC guidance documents. The excavation is considered to penetrate sufficiently deep for construction of the basement, and the excavated material is considered to be mixed with overlying fill material and placed in the vicinity of the house.[1,2] Figure 1 illustrates the basement excavations and surface placement of the excavated materials for the different Site areas.



Spray Ponds, Reactor Area, & Most of the SNEC Site

Steam Plant Basement

FIGURE 1. HYPOTHETICAL BASEMENT EXCAVATIONS AND SURFACE MATERIAL SPREADING IN DIFFERENT AREAS OF THE SNEC SITE.

The footprint area of the hypothetical house and its basement excavation is chosen to be 200 m^2, which corresponds to the house areas used in the previous NRC analyses.[1,2]

The height of the basement, h_b, is chosen to be 2 meters based on both the previous NRC guidance and conservative assessment of the site parameters. The previous NRC guidance documents used basement depths of 3 meters for disposal cells that were covered by 2 m of clean soil or cap material.[1] This resulted in 1-meter intrusion depths into the contaminated material. For the present Site, where fill soil layers are 1 m thick, a 2-m basement excavation provides the same 1-m intrusion depth into potentially-contaminated material.

[2] NRC 1999. "Preliminary Guidelines for Evaluating Dose Assessments in Support of Decommissioning," J.W.N. Hickey, Washington D.C.: U.S. Nuclear Regulatory Commission Memorandum dated March 16, 1999.

The Spray Pond area, Reactor area (except the back-filled CV excavation), and undisturbed areas of the Site feature a 2-m layer of boulder-laden overburden between the 1-m fill soil layer and bedrock, as shown in Figure 1. The overburden discourages excavation because of its large boulders and interstitial cobbles. The hypothetical 2-m basement excavation (1-m into the boulder layer) is therefore conservatively deeper than would normally be expected. Furthermore, the water table at the Site varies between 0.7 and 2.3 m, making the hypothetical 2-m basement excavation conservatively deeper than the average estimated water table depth.

The Steam Plant basement contains homogenized rubble instead of overburden in the bottom half of the hypothetical 2-m excavation (see Figure 1). The hypothetical Steam Plant excavation therefore intrudes to the same extent (1 m) into potentially-contaminated material as in the Spray Pond area and is subject to similar water-table limitations as in other parts of the Site.

The native materials in the CV area are replaced with clean backfill to depths well beyond any realistic basement excavation depths. Therefore, any excavations in the CV area would only bring clean backfill to the surface. The surrounding materials in the Reactor area are represented by the same profile as the Spray Ponds, as illustrated in Figure 1. Because of the identical material profiles in the Spray Pond and Reactor areas, the same DCGL analyses will probably apply to both unless hydraulic gradient or water table depth differences are significant. The potential significance of any differences will be explored before any separate DCGLs are calculated for the Reactor area.

The concentrations of any contaminants in the overburden layer beneath the Spray Ponds or in the homogenized rubble in the Steam Plant are reduced to one-half of their in-situ concentrations by mixing with the top meter of fill soil during their excavation. The two-fold dilution factor results from mixing equal volumes of clean and potentially-contaminated excavation materials using the same calculation approach advocated in the NRC guidance documents.[1,2]

The mixed material from the basement excavation is considered to be spread around the hypothetical house as in the NRC models.[1] The area of this material is conservatively taken to be 2,000 m^2 based on the nominal one-half acre (2,023 m^2) and 1,000 m^2 to 2,000 m^2 area ranges estimated by NRC.[1] The average thickness of this layer of mixed material is h_r = 0.20 m [estimated as (200 m^2 basement footprint area) x (2 m depth) / (2,000 m^2 spread area)]. This thickness is conservative in giving an approximate maximum gamma radiation activity and approximating the default crop root depth of 0.15 m in the Resrad dose assessment code.[3] Additionally, the geophysical characteristics of this layer of mixed material are depth-weighted averages of those of the Fill and Overburden layers.

The technical approach and detailed steps for determining the DCGLs for the sub-surface materials at the SNEC Site are identified in Figure 2 based on discussions between URS and GPU personnel. The large gray numbers in Figure 2 correspond to the step numbers listed below.

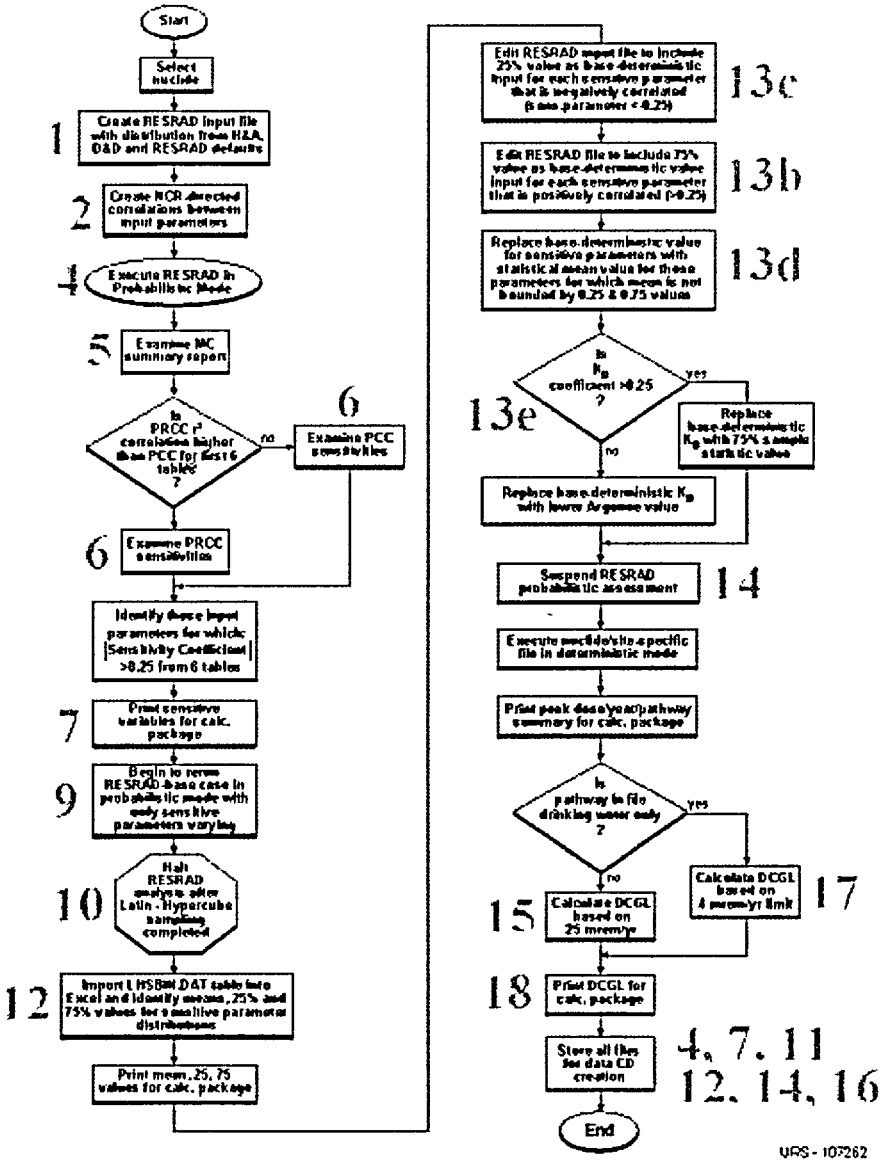

FIGURE 2. TECHNICAL APPROACH FOR SUBSURFACE DCGL CALCULATIONS.

1) Generate an appropriate RESRAD 6.1 input file containing all Haley and Aldrich (H & A) values and parameter distributions. Where available, DandD default values will be used for metabolic and behavior inputs. For parameters for which input guidance is unavailable from either DandD or H & A, default RESRAD values and distributions will be used. Uncertainty analysis will be performed by RESRAD for each parameter for which a distribution has been input. A list of these values and distributions is presented in Table 1.

2) Uncertainty correlations will be established between density and total porosity, density and effective porosity, and total porosity and effective porosity with a correlation value specified as 0.99.

3) A random seed of 1,000 will be used for the uncertainty sampling. Additionally, the Latin HyperCube Sample (LHS) method will be used to generate samples of input values for the probabilistic analysis. The analysis will be repeated three times, with between 300 and 500 points selected for each analysis.

4) The RESRAD input file will then be processed using the probabilistic analysis feature of RESRAD 6.1. All output reports will be copied and stored for inclusion in the data CD to be delivered to the NRC.

5) The first 6 correlation tables of the MCSUMMARY.REP file will then be extracted. Within these tables, the higher correlation coefficient (r^2 value) between the PRCC and PCC sensitivity methods will be highlighted.

6) Sensitive input parameters will then be identified and highlighted for those parameters whose sensitivity correlation value is greater than 0.25 or less than -0.25, using the correlation method identified in 5) with the highest r^2 value.

7) The tables with appropriate highlighted points will be printed for inclusion in the Calculation Package and the data CD.

8) A copy of the RESRAD input file generated in numbers 1 through 3 will then be made. From within this copy, the uncertainties and input distributions will be deleted for all insensitive parameters (those not highlighted in step 6).

9) The RESRAD input file will then begin started using the probabilistic analysis feature of RESRAD 6.1.

10) Once the RESRAD processing has completed the LHS step, the RESRAD analysis will be halted.

11) The LHSBIN.DAT file will then be copied from the RESRAD output and stored for permanent inclusion in the data CD.

12) The LHSBIN.DAT file will then be imported into MS Excel and the MS Excel Data Analysis package will be used to analyze the input parameter distributions to determine mean, 25th percentile, and 75th percentile for each sensitive input parameter. These values will be summarized in a printout

for inclusion in the Calculation Package and the resulting MS Excel file saved for addition to the data CD.

13) The duplicate RESRAD input file, created in step 8, will then be edited within RESRAD. Modifications will include:

a. Suppression of the uncertainty analysis.

b. The 75th percentile value will replace the base-deterministic input value for those sensitive parameters whose coefficients of sensitivity was greater than 0.25.

c. The 25th percentile value will replace the base-deterministic input value for those sensitive parameters whose coefficients of sensitivity was less than -0.25.

d. The mean value calculated in step 12 will replace the base-deterministic input value for those sensitive parameters whose mean is not bounded by the 25th and 75th percentile values.

e. Except when the coefficients of sensitivity for the distribution coefficients (K_d) are greater than 0.25, the minimum Argonne distribution coefficient (K_d) will be used.

14) The input file created in step 13 will then be analyzed using RESRAD 6.1 in a deterministic mode. The input and resulting output reports will be saved for addition to the data CD. The peak dose, year of occurrence, and pathway breakdown for the peak dose will be printed for inclusion in the Calculation Package.

15) The 25 mrem/year dose limit will then be divided by the peak dose to determine a DCGL representing exposure from all pathways. This process will be performed for each nuclide, soil region, and SNEC area of concern.

16) Steps 1 through 14 will then be repeated with all pathways turned off, except the drinking water pathway. Those files and reports designated for inclusion in the Calculation Package or data CD will be appended with "DW" to signify Drinking Water only.

17) The 4 mrem/year drinking water dose limit will then be divided by the peak dose from drinking water only to determine a DW DCGL. This process will be repeated for each nuclide, soil region, and SNEC area of concern.

18) A summary table of all cumulative and drinking water DCGLs for each nuclide, subsoil region, and SNEC area of concern and will be prepared.

NOTE ANL Kd values may be "greater than" values. The ANL Min value is the lowest reported value for this element and the ANL Max value is the highest reported value
NOTE Items in RED type face are SNEC input values.
NOTE Items in GREEN type face are URS input values.
NOTE Items with BLUE background are D & D default values, while items with a YELLOW background are RESRAD default values. Unlisted parameters are RESRAD defaults.

NOTE- ANL Kd values may be "greater than" values. The ANL Min value is the lowest reported value for this element and the ANL Max value is the highest reported value

NOTE- Items in RED type face are SNEC input values

NOTE- Items in GREEN type face are URS input values.

NOTE- Items with BLUE background are D & D default values, while items with a YELLOW background are RESRAD default values. Unlisted parameters are RESRAD defaults.

Site-Specific Parameter Summary (continued)

Menu	Parameter	User Input	Default	Used by RESRAD (If different from user input)	Parameter Name
R021	Volumetric water content of the foundation	not used	3.000E-02	---	PH2OFL
R021	Diffusion coefficient for radon gas (m/sec):				
R021	in cover material	not used	2.000E-06	---	DIFCV
R021	in foundation material	not used	3.000E-07	---	DIFFL
R021	in contaminated zone soil	not used	2.000E-06	---	DIFCZ
R021	Radon vertical dimension of mixing (m)	not used	2.000E+00	---	HMIX
R021	Average building air exchange rate (1/hr)	not used	5.000E-01	---	REXG
R021	Height of the building (room) (m)	not used	2.500E+00	---	HRM
R021	Building interior area factor	not used	0.000E+00	---	FAI
R021	Building depth below ground surface (m)	not used	-1.000E+00	---	DMFL
R021	Emanating power of Rn-222 gas	not used	2.500E-01	---	EMANA(1)
R021	Emanating power of Rn-220 gas	not used	1.500E-01	---	EMANA(2)
TITL	Number of graphical time points	32	---	---	NPTS
TITL	Maximum number of integration points for dose	1	---	---	LYMAX
TITL	Maximum number of integration points for risk	1	---	---	KYMAX

Summary of Pathway Selections

Pathway	User Selection
1 -- external gamma	active
2 -- inhalation (w/o radon)	active
3 -- plant ingestion	active
4 -- meat ingestion	active
5 -- milk ingestion	active
6 -- aquatic foods	active
7 -- drinking water	active
8 -- soil ingestion	active
9 -- radon	suppressed
Find peak pathway doses	active
