10. Remarks

I: 198 pages

Attachments II through V are contained on two attachment tapes which were moved to Reference 7.6 as described in Section 8. Listings of the file content on the attachment tapes for Attachments II through V are provided in their corresponding hard-copy attachment locations.

II: 2 pages listing files on attachment tapes

III: 45 pages listing files on attachment tapes

IV: 35 pages listing files on attachment tapes

V: 2 pages listing files on attachment tapes

VI: 26 pages

Table of Contents

1. Purpose

The purpose of this calculation is to document the McGuire Unit 1 pressurized water reactor (PWR) fuel depletion calculations performed as part of the commercial reactor critical (CRC) evaluation program. The CRC evaluations support the development and validation of the neutronics models used for criticality analyses involving commercial spent nuclear fuel in a geologic repository.

2. Method

The calculational method used to perform the McGuire Unit 1 fuel depletion calculations consisted of using the SAS2H control sequence of the SCALE, Version 4.3, code system (Ref. 7.1) to deplete the necessary fuel assemblies. The various fuel assemblies were depleted through their unique operating histories such that their modified fuel compositions would be available at specific exposure times corresponding to the times (statepoints) at which detailed core reactivity calculations would be performed. The fuel assembly depletion calculations were based on detailed core follow information for each assembly. Throughout this calculation file values may be presented with excessive significant figures. The number of significant figures are an artifact of the calculations and should not be interpreted as reflecting an excessively high level of accuracy.

3. Assumptions

3.1 The inherent approximation of uniformly distributed non-fuel lattice cells in the Path B models of the SAS2H calculations as described in Section 5.4 was considered acceptable within the fidelity of these calculations. The basis for this assumption was provided in Section S2.2.3.1 of Volume 1, Rev. 5 in Reference 7.1. This assumption was used throughout all of the depletion calculations documented in Section 5.

3.2 With the utilization of one cross section update per irradiation time step in the SAS2H calculations, the maximum duration of any time step in any reactor cycle irradiation layout should have not exceeded 80 days. The basis for this assumption was that the 80 day irradiation time step limit ensured that the changing isotopic concentrations of the fuel in the system would not alter the neutron spectrum radically enough to cause a time step of the depletion calculation to be performed without the availability of cross sections which have been properly weighted with an updated neutron spectrum and spatial flux. This assumption was used throughout all of the depletion calculations documented in Section 5.

3.3 Distributing the spacer grid material uniformly in the moderator composition of the SAS2H Path A and Path B models was acceptable. The basis for this assumption was that the limited reactivity worth of the spacer grid materials would have a negligible impact on the neutron spectrum when homogeneously distributed in the moderator. This assumption was used throughout all of the depletion calculations documented in Section 5.

4. Use of Computer Software

4.1. Software Approved for QA Work

4.1.1. SAS2H

The SAS2H control module of the SCALE, Version 4.3, modular code system (Ref. 7.1) was used to perform the fuel assembly depletion calculations required for the McGuire Unit 1 CRC evaluations. The software specifications are as follow:

- Program Name: SAS2H of the SCALE Modular Code System
- Version/Revision Number: Version 4.3
- Computer Software Configuration Item (CSCI) Number: 30011 V4.3
- Computer Type: Hewlett Packard (HP) 9000 Series Workstations

The input and output files for the various SAS2H calculations were documented in the attachments to this calculation file as described in Section 5, such that an independent repetition of the software use could be performed. The SAS2H software used was: (a) appropriate for the application of commercial fuel assembly depletion, (b) used only within the range of validation as documented in References 7.1 and 7.2, (c) obtained from the Software Configuration Manager in accordance with appropriate procedures.

4.2. Software Routines

The description documentation for each of the software routines identified in this section, other than the acquired software routine Excel described in Section 4.2.1, contains the following information:

- Descriptions and equations of mathematical algorithms
- Description of software routine including execution environment
- Description of test cases
- Description of test results
- Range of input parameter values for which results were verified
- Identification of any limitations on software routine applications or validity
- Reference list of all documentation relevant to the qualification
- Directory listing of executable and data files
- Computer listing of source code
- Computer listing of test data input and output, identifying software routine name and version number.

4.2.1. Excel

- Title: Excel

- Version/Revision Number: Microsoft® Excel 97

The Excel spreadsheet program was used for simple numeric calculations as documented in Section 5 of this calculation file. The user-defined formulas, inputs, and results were documented in sufficient detail in Section 5 to allow an independent repetition of the various computations.

4.2.2. CRAFT

- Title: Commercial Reactor Assembly Follow Taskmaster (CRAFT)
- Version/Revision Number: Version 5

The CRAFT software routine produced the input and directed the execution for the various SAS2H calculations required to deplete a commercial reactor fuel assembly to support a CRC evaluation. The input and output for the various CRAFT calculations were documented in Section 5, such that an independent repetition of the software routine use could be performed. The description of the CRAFT, Version 5, software routine was provided in Attachment I of this calculation file.

4.2.3. CRC Data Tabulizer

- Title: CRC_DATA_TABULIZER
- Version/Revision Number: Version 3

The CRC Data Tabulizer software routine produced tables containing the concentration results for a set of 29 isotopes and other relevant data at each CRC statepoint for a given fuel assembly. The CRC Data Tabulizer software routine is interactive, therefore, the input was not documented. However, the output contains all necessary information to verify that the input was provided correctly. The output from the CRC Data Tabulizer usage was provided in Attachment V (this attachment was moved to Reference 7.6, see Section 8). The information provided in this output and the information provided in the description of the CRC Data Tabulizer software routine, along with the CRAFT generated "*.cut" files, were sufficient such that an independent repetition of the software routine use could be performed. The description of the CRC Data Tabulizer, Version 3, software routine was provided in Attachment VI.

4.2.4. RLAYOUT

- Title: RLAYOUT
- Version/Revision Number: Version 1

The RLAYOUT software routine automated the development of irradiation time step layout inputs for depletion calculations involving rod insertion histories in which rod movements must be followed. The RLAYOUT code is mostly interactive, therefore, some of the input was not documented. The required boron letdown inputs and rod insertion history inputs for the required assemblies were presented in Sections 5.2.7 and 5.2.9, respectively. The output contained all necessary information to verify that the entire input was provided correctly. The output from the RLAYOUT usage was presented in Section

5.5. The information provided in this output, the boron letdown input, and the rod insertion history input along with the information provided in the description of the RLAYOUT software routine, are sufficient such that an independent repetition of the software routine use could be performed. The description of the RLAYOUT, Version 1, software routine was provided in Attachment III of Reference 7.3.

5. Calculation

5.1. McGuire Unit CRC Evaluation Description

The McGuire Unit 1 CRC evaluations were performed at six statepoints: Cycle 1 [0.0 Effective Full-Power Days (EFPD)], Cycle 6 [0.0 and 62.4 EFPD], Cycle 7 [0.0, 129.0, and 282.3 EFPD]. Each statepoint represented a specific time when the reactor was brought to the critical condition (k_{eff} = 1) and the corresponding reactor core conditions were measured. The CRC evaluations of each of these critical statepoints involved the use of SAS2H to deplete the various fuel assemblies and MCNP (Ref. 7.4) to model the reactor core such that the k_{eff} value at each of the critical statepoints could be predicted to demonstrate the ability of the dual code system. Hence, the objective of each CRC statepoint evaluation was to predict the reactor core k_{eff} as close to measurement as possible (the measurement is always k_{eff} = 1). The objective of the SAS2H depletion calculations documented in this calculation file was to provide the depleted fuel and burnable poison isotopic compositions to be used in the corresponding CRC reactivity calculations.

Fuel isotopic compositions were calculated with SAS2H for each depleted fuel assembly in each of the critical statepoint configurations to facilitate MCNP modeling. The McGuire Unit 1 statepoint calculations required the depletion of fuel assemblies from eight fuel batches. Fuel assembly design characteristics may vary between each fuel batch. Section 5.2 presents the input parameters required to perform the various fuel assembly depletion calculations. Sections 5.3 through 5.7 describe how the parameters listed in Section 5.2 were utilized to perform the SAS2H depletion calculations relevant to the CRC statepoint evaluations. The CRAFT description and user information provided in Attachment I is essential for understanding the SAS2H modeling techniques employed in the calculations. The information provided in Attachment I, the input parameters provided in Section 5.2, and the CRAFT input decks contained in Attachment II (this attachment was moved to Reference 7.6, see Section 8) work together to provide a complete description of how all of SAS2H depletion calculations were performed.

5.2. Input Specifications for Depletion Calculations

The information documented in this section describes the design specifications and irradiation histories for the fuel assemblies required for the McGuire Unit 1 CRC evaluations. All of the input specifications presented in this section were obtained from Reference 7.5. The McGuire Unit 1 CRC evaluations included fuel assemblies from eleven fuel batches identified as follow: 1, 2, 3, 4, 5, 6B, 7A, 7B, 7C, 8, and 9. Depletion calculations for fuel assemblies from batches 4, 5, 6B, 7A, 7B, 7C, 8, and 9 were required to perform k_{eff} calculations at the various statepoints. Fuel assemblies from fuel batches 1, 2, and 3 were only used in the beginning-of-life (BOL) statepoint calculation. The BOL calculation included all fresh fuel (i.e., as fabricated, non-depleted).

5.2.1. Fuel Assembly Descriptions Required for Depletion Calculations

Table 5.2.1-1 contains a description of the fuel assemblies for fuel batches 1, 2, 3, 4, 5, 6B, 7A, 7B, 7C, 8, and 9 of McGuire Unit 1. All fuel assemblies within a given fuel batch have the same characteristics as presented in Table 5.2.1-1. The guide tubes are composed of two axial sections with different radial dimensions. The lower guide tube section is 59.78 cm high with its lower end positioned 6.955 cm above the bottom of the lower end-fitting (p. 21, Ref. 7.5). The upper guide tube section extends 330.59 cm above the lower guide tube section (p. 21, Ref. 7.5). The guide tube section radial dimensions are presented in Table 5.2.1-1.

5.2.2. Burnable Poison Rod Assembly (BPRA) Descriptions Required for Depletion Calculations

Two types of annular burnable poison rods (BPRs) were used in the McGuire Unit 1 reactor from cycle 1 through cycle 7. The two BPR types were delineated primarily by the type of absorber material utilized and the content of their annuli. One of the BPR types used B_2O_3-SiO_2 as the absorber material and had an empty annulus. This type is referred to as a Pyrex BPR in this calculation file. The other type of BPR used B_4C-Al_2O_3 as the absorber material and had a water filled annulus. This type is referred to as a WABA (Wet Annular Burnable Absorber) in this calculation file. Different numbers of either Pyrex or WABA BPRs were combined to form the various BPRAs utilized in the McGuire Unit 1 reactor. The number of BPRs in a given BPRA could vary from 1 to 24, depending on the number of guide tubes in which a BPR was inserted (p. 47, Ref. 7.5). The fuel assembly depletion calculations required to perform the CRC evaluations for McGuire Unit 1 utilized Pyrex BPRAs containing either 4 or 12 BPRs and WABA BPRAs containing either 4, 8, 12, or 16 BPRs. Knowing the geometric arrangement of the various BPRAs (referring to which guide tubes contain a BPR and which do not) was not required to perform the depletion calculations. Tables 5.2.2-1 and 5.2.2-2 contain descriptions of the Pyrex and WABA BPRAs, respectively, that were used in the fuel assembly depletion calculations. Tables 5.2.2-3 and 5.2.2-4 present the isotopic compositions of the Pyrex and WABA absorber materials, respectively.

Table 5.2.2-1. Pyrex BPRA Description for the McGuire Unit 1 Depletion Calculations (p. 37, Ref. 7.5)

Parameter	Value
Burnable Poison Material	B_2O_3-SiO_2
Boron Loading	12.5 wt% B_2O_3 with 0.00624 g B-10/cm
Absorber OD (cm)	0.85344
Absorber ID (cm)	0.48260
Absorber Cross-Section Area (cm^2)	0.38913
Clad Material	Type 304 Stainless Steel (SS304)
Outer Clad OD (cm)	0.96774

Table 5.2.2-1. Pyrex BPRA Description for the McGuire Unit 1 Depletion Calculations (p. 37, Ref. 7.5)

Parameter	Value

Inner Clad ID (cm)	0.42799
Number of BPRs in BPRA	4 or 12

Table 5.2.2-2. WABA BPRA Description for the McGuire Unit 1 Depletion Calculations (p. 37, Ref. 7.5)

Parameter	Value
Burnable Poison Material	B_4C-Al_2O_3
Boron Loading	14.0 wt% B_4C with 0.006165 g B-10/cm
Absorber OD (cm)	0.8077
Absorber ID (cm)	0.7061
Absorber Cross-Section Area (cm^2)	0.1208
Clad Material	Zircaloy
Outer Clad OD (cm)	0.96774
Outer Clad ID (cm)	0.83570
Inner Clad OD (cm)	0.67820
Inner Clad ID (cm)	0.57150
Number of BPRs in BPRA	4, 8, 12, or 16

Table 5.2.2-3. Pyrex Absorber Material Composition (B_2O_3-SiO_2)

Isotope/Element	Weight Percent
Boron-10	0.6976
Boron-11	3.1866
Oxygen	55.2092
Silicon	40.9067

Table 5.2.2-4. WABA Absorber Material Composition (B_4C-Al_2O_3)

Isotope/Element	Weight Percent
Boron-10	1.9684
Boron-11	8.9917
Carbon	3.0400
Oxygen	40.4789
Aluminum	45.5211

The CRAFT input required the density of the BPR absorber material to be provided in terms of grams per cubic centimeter (g/cc). The density in g/cc for both the Pyrex and WABA BPR absorber material had to be calculated using the boron loading information shown in Tables 5.2.2-1 and 5.2.2-2. The absorber material density results from these calculations were: 2.299 g/cc for the Pyrex BPR and 2.593 g/cc for the WABA BPR. Equations 5.2.2-1 through 5.2.2-7 show how the B_2O_3-SiO_2 and B_4C-Al_2O_3 densities were calculated.

Equation 5.2.2-1. Calculation of B-10 grams per O gram in B_2O_3 of Pyrex BPR

$$\left(\frac{2\,atoms\,B}{3\,atoms\,O}\right)\left(\frac{0.194\,atoms\,B^{10}}{1\,atoms\,B}\right)\left(\frac{1\,mol\,B^{10}}{Av.\#\,atoms\,B^{10}}\right)\left(\frac{10.0129\,g\,B^{10}}{1\,mol\,B^{10}}\right)\left(\frac{Av.\#\,atoms\,O}{1\,mol\,O}\right)\left(\frac{1\,mol\,O}{15.9949\,g\,O}\right)=$$

$$=0.0810\frac{g\,B^{10}}{g\,O}\;in\;B_2O_3\;where,\;Av.\#=6.022136E23$$

Equation 5.2.2-2. Calculation of B-10 grams per B gram

$$\left(\frac{0.194\,atoms\,B^{10}}{1\,atom\,B}\right)\left(\frac{1\,mol\,B^{10}}{Av.\#\,atoms\,B^{10}}\right)\left(\frac{10.0129\,g\,B^{10}}{1\,mol\,B^{10}}\right)\left(\frac{Av.\#\,atoms\,B}{1\,mol\,B}\right)\left(\frac{1\,mol\,B}{10.8160\,g\,B}\right)=0.1796\frac{g\,B^{10}}{g\,B}$$

Equation 5.2.2-3. Calculation of B_2O_3 grams per cm in Pyrex BPR

$$\left(\frac{0.00624\,g\,B^{10}}{cm}\right)\left[\left(\frac{1}{0.1796\frac{g\,B^{10}}{g\,B}}\right)+\left(\frac{1}{0.0810\frac{g\,B^{10}}{g\,O}\;in\;B_2O_3}\right)\right]=0.1118\frac{g\,B_2O_3}{cm}$$

Equation 5.2.2-4. Calculation of B_2O_3-SiO_2 grams per cubic centimeter in Pyrex BPR

$$\left(\frac{0.1118\,g\,B_2O_3}{cm}\right)\left(\frac{100}{12.5\,Wt\%\,B_2O_3\;in\;B_2O_3-SiO_2}\right)\left(\frac{1}{(\pi)(0.18209\,cm^2-0.05823\,cm^2)}\right)=$$

$$=2.2985\frac{g\,B_2O_3-SiO_2}{cm^3}$$

Equation 5.2.2-5. Calculation of B-10 grams per C gram in B_4C of WABA BPR

$$\left(\frac{4\,atoms\,B}{1\,atom\,C}\right)\left(\frac{0.194\,atoms\,B^{10}}{1\,atom\,B}\right)\left(\frac{1\,mol\,B^{10}}{Av.\#\,atoms\,B^{10}}\right)\left(\frac{10.0129\,g\,B^{10}}{1\,mol\,B^{10}}\right)\left(\frac{Av.\#\,atoms\,C}{1\,mol\,C}\right)\left(\frac{1\,mol\,C}{12.0110\,g\,C}\right)=$$

$$=0.6469\frac{g\,B^{10}}{g\,C}\;in\;B_4C$$

Equation 5.2.2-6. Calculation of B_4C grams per cm in WABA BPR

$$\left(\frac{0.006165\ g\ B^{10}}{cm}\right)\left[\left(\frac{1}{0.1796\ \frac{g\ B^{10}}{g\ B}}\right)+\left(\frac{1}{0.6469\ \frac{g\ B^{10}}{g\ C}\ in\ B_4C}\right)\right]=0.0439\ \frac{g\ B_4C}{cm}$$

Equation 5.2.2-7. Calculation of B_4C-Al_2O_3 grams per cubic centimeter in WABA BPR

$$\left(\frac{0.0439\ g\ B_4C}{cm}\right)\left(\frac{100}{14.0\ Wt\%\ B_4C\ in\ B_4C-Al_2O_3}\right)\left(\frac{1}{(\pi)(0.1631\ cm^2-0.1246\ cm^2)}\right)=$$
$$=2.5925\ \frac{g\ B_4C-Al_2O_3}{cm^3}$$

5.2.3. Rod Cluster Control Assembly (RCCA) Description Required for Depletion Calculations

The RCCA assemblies used in the McGuire Unit 1 reactor were composed of 24 control rods (CRs) arranged in a "cluster" such that each guide tube in the fuel assembly could have a CR inserted from the top of the core to a uniform height in the assembly. Table 5.2.3-1 contains the description of the RCCAs utilized during the McGuire Unit 1 reactor operation relevant to the CRC evaluations documented in this calculation file.

Table 5.2.3-1. RCCA Description for the McGuire Unit 1 Depletion Calculations (p. 37, Ref. 7.5)

Parameter	Value
Control Rod Neutron Absorbing Material	Ag-In-Cd (80 wt% Ag, 15 wt% In, 5 wt% Cd)
Ag-In-Cd Density (g/cc)	10.16
Absorber Pellet OD (cm)	0.86614
Control Rod Cladding Material	SS304
Control Rod Cladding OD (cm)	0.96774
Control Rod Cladding ID (cm)	0.87376
Number of Control Rods in RCCA	24

5.2.4. System Pressure

McGuire Unit 1 is a Westinghouse designed pressurized water reactor that operates at a constant pressure of 2250 psia (pounds per square inch absolute) (p. 7, Ref. 7.5).

5.2.5. Fuel Assembly Insertion, BPRA Type and Insertion, and RCCA Insertion Histories for the McGuire Unit 1 Depletion Calculations

The actual irradiation histories for the fuel assemblies from McGuire Unit 1 were used to perform the SAS2H depletion calculations relevant to the CRC evaluations. Table 5.2.5-1 identifies the following information:

- the cycles in which the various fuel assemblies were inserted
- the locations of the various fuel assemblies in each cycle corresponding to a one-eighth core location as shown in Figure 5.2.5-1
- the fuel batch to which each fuel assembly corresponds
- the cycles in which the various fuel assemblies contained either a BPRA or RCCA
- the types of BPRA inserted in the various fuel assemblies.

Table 5.2.5-1. Fuel Assembly Insertion Cycles, BPRA Insertion Cycles, and RCCA Insertion Cycles for the McGuire Unit 1 Depletion Calculations (p. 56 and 57, Ref. 7.5)

Assembly Identifier / Fuel Batch	Fuel Assembly, BPRA, and RCCA Insertion Locations and Cycles[1]

G28 / 9						[8] / C12

[1] No assemblies from cycle 1 are present in cycles 6 and 7 which contain the statepoints for the McGuire Unit 1 CRC evaluations.

[2] Numbers appearing in bracket like [#] indicate that a BPRA was present in the assembly in that particular cycle. The number refers to the number of BPRs in the BPRA. Cycles 1 through 4 utilized Pyrex BPRAs, and cycles 5 through 7 utilized WABA BPRAs.

[3] The alpha-numeric designations following the slash "/" identify the assembly position in the one-eighth symmetric core layout as shown in Figure 5.2.5-1.

[4] Letters appearing in brackets like {xx} indicate that an RCCA corresponding to the letter symbol was present in the assembly during operation in that particular cycle.

[5] For cycle 7, assembly E02 represents three fuel batch 7C assemblies in a full core representation (i.e., symmetric to location G09). Assembly E12 represents one fuel batch 7A assembly in location G09.

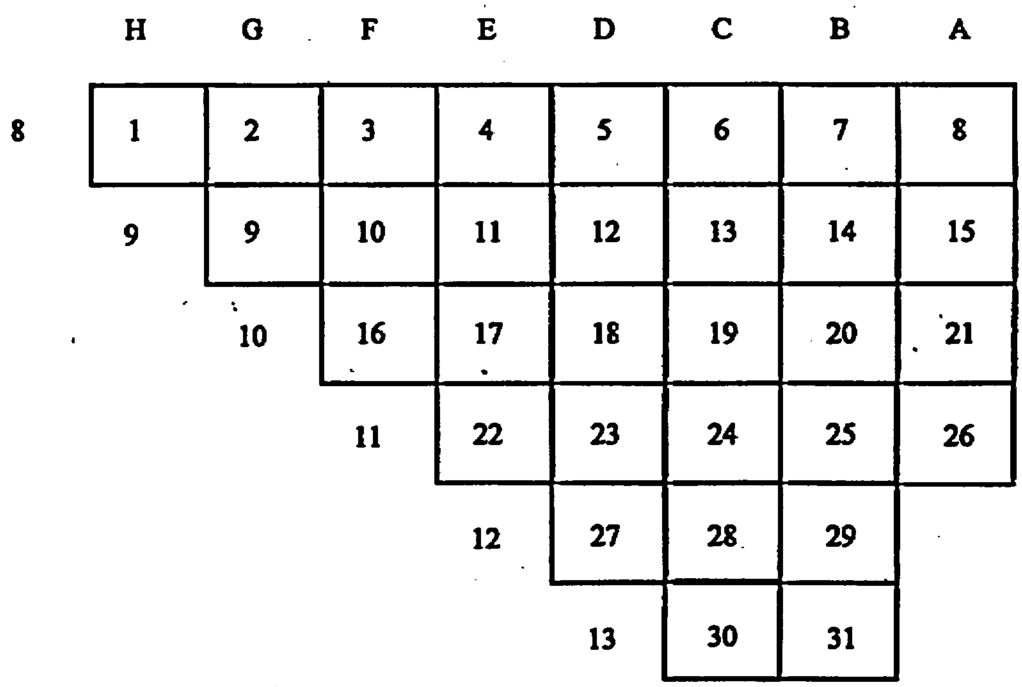

Figure 5.2.5-1. One-Eighth Symmetric Core Layout for McGuire Unit 1

5.2.6. Reactor Cycle History Specifications for McGuire Unit 1

This section contains the McGuire Unit 1 reactor cycle summary information relevant to the CRC evaluations documented in this calculation file. The calendar day duration between the various dates were determined using an Excel spreadsheet. Table 5.2.6-1 shows the cycle summary information. Table 5.2.6-2 shows the statepoint and datapoint summary information. The statepoints refer to times when the reactor was shutdown and restarted. MCNP reactivity calculations for the CRC evaluations were performed using the reactor startup conditions and appropriate depleted isotopics after each statepoint shutdown. The datapoints refer to times when the depletion calculations were halted to adjust various input parameters such as average fuel temperatures and average moderator specific volumes.

The depletion calculations were continued after each datapoint halt without modeling any reactor downtime.

Table 5.2.6-1. Cycle Summary Information for McGuire Unit 1 Depletion Calculations (p. 38 and 103, Ref. 7.5)

Cycle	Startup Date	Shutdown Date	Cycle Length (calendar days)	Cycle Length (EFPD)	Downtime at EOC[1] (days)
1	08/08/81	02/24/84	930	401.4	64
2	04/28/84	04/19/85	356	268.0	66
3	06/24/85	05/16/86	326	288.5	114
4	09/07/86	09/04/87	362	300.0	69
5	11/12/87	10/12/88	335	316.3	78
6	12/29/88	01/08/90	375	298.0	130
7	05/18/90	09/20/91	490	408.0	Not Required

[1] EOC means end-of-cycle

Table 5.2.6-2. Statepoint and Datapoint Summary Information for McGuire Unit 1 Depletion Calculations (p. 60, 64, and 103, Ref. 7.5)

Cycle	EFPD	Statepoint or Datapoint Identifier	Downtime at Statepoint or Datapoint (hours)
1	0.0	SP1 (46)[1]	0.0
2	0.0	DP1[2]	0.0
3	0.0	DP2	0.0
3	160.0	DP3	0.0
4	0.0	DP4	0.0
4	136.2	DP5	0.0
5	0.0	DP6	0.0
5	159.0	DP7	0.0
6	0.0	SP2 (47)	1872
6	62.4	SP3 (48)	1505
7	0.0	SP4 (49)	3120
7	129.0	SP5 (50)	711
7	282.3	SP6 (51)	451

[1] The letters "SP" refer to a CRC statepoint. The number immediately following the "SP" refers to the relative statepoint for the McGuire Unit 1 CRC evaluations. The number in the parenthesis following

the "SP#" refers to the statepoint number as identified in the global listing of statepoints in the CRC evaluation project.

[2] The letters "DP" refer to a CRC datapoint. The number immediately following the "DP" refers to the relative datapoint for the McGuire Unit 1 CRC evaluations.

5.2.7. Boron Letdown Data for McGuire Unit 1 Depletion Calculations

The boron letdown data for the McGuire Unit 1 reactor cycles relevant to CRC evaluations were obtained from linear regression fits of core operation data. Since no fuel assemblies from cycle 1 were present in any of the statepoint calculations in cycles 6 or 7, and no depletion calculations are required for cycle 1, boron letdown data is not provided for cycle 1. Table 5.2.7-1 contains the coefficients from the linear regression fits of the core operation data for cycles 2 through 7.

Table 5.2.7-1. Linear Regression Fit Coefficients of Boron Letdown for McGuire Unit 1 Depletion Calculations (p. 102, Ref. 7.5)

Regression Fit Description: Soluble Boron Concentration versus EFPD Regression Fit Equation: ppmb[1] = A + B * EFPD		
Cycle	A	B
2[2]	877.99	-3.57
3[3]	904.82	-3.21
4	1018.04	-3.39
5	1116.42	-3.38
6	1159.67	-3.02
7	1363.64	-3.08

[1] "ppmb" refers to parts per million by mass of natural boron in moderator (water).

[2] For cycle 2, use equation out to 243.1 EFPD and 10 ppmb from 243.1 EFPD to EOC.

[3] For cycle 3, use equation out to 287.7 EFPD and 10 ppmb from 287.7 EFPD to EOC.

5.2.8. Burnup, Fuel Temperature, and Moderator Specific Volume Data

Burnup, fuel temperature, and moderator specific volume data were required for each node of each assembly in each SAS2H depletion calculation. A set of nodal burnup data at the beginning and end of each SAS2H depletion calculation was required. A set of nodal fuel temperature and moderator specific volume data representative of full-power operation during each depletion calculation of interest (between statepoints and/or datapoints) was required. Tables 5.2.8-1 through 5.2.8-45 contain the burnup, fuel temperature, and moderator specific volume data required to perform all depletion calculations for each of the fuel assemblies present in the McGuire Unit 1 CRC evaluations. The height of each fuel assembly axial node in Tables 5.2.8-1 through 5.2.8-45 is 22.86 cm. The top of node 1 begins at the top of the active fuel region. The burnup data is presented in units of gigawatt-days per metric ton of uranium (GWd/MTU). The fuel temperature data is presented in units of degrees Fahrenheit. The moderator specific volume data is presented in units of cubic feet per pound. Each set of fuel temperature and moderator specific volume data listed in the tables was applicable to the depletion calculation performed between the statepoints and/or datapoints identified above the particular data. The data in Tables 5.2.8-1 through 5.2.8-45 is obtained from pages 60 through 99 of Reference 7.5.

5.2.9. RCCA Insertion History Data for McGuire Unit 1 Depletion Calculations

The RCCA insertion time, duration, and position were required to perform the fuel assembly depletion calculations in which an RCCA was inserted. Hardening (locally increasing the average energy of the neutron population due to less local thermalization and increased local capture of neutrons at thermal energies) the neutron spectrum in a particular axial region of an assembly at a time during its irradiation history affects the isotopic composition of the depleted fuel. The CRC depletion calculations for fuel assemblies with an RCCA insertion history required the knowledge of the RCCA insertion time in terms of the number of EFPDs inserted in each axial node for each statepoint depletion calculation. Tables 5.2.9-1 through 5.2.9-4 present the RCCA insertion time data required for the fuel assembly depletion calculations relevant to the McGuire Unit 1 CRC evaluations. The height corresponding to the axial nodes presented in Tables 5.2.9-1 through 5.2.9-4 is 22.86 cm. The top of node 1 begins at the top of the active fuel region. The data in Tables 5.2.9-1 through 5.2.9-4 is obtained from pages 100 and 101 of Reference 7.5.

5.3. Assembly Depletion Calculation Procedure

The procedure for performing the fuel assembly SAS2H depletion calculations documented in this analysis was based on the utilization of the CRAFT, Version 5, software routine. The CRAFT software routine is described generally in Sections 5.6 and 5.7. The complete detailed description of the CRAFT, Version 5, software routine is provided in Attachment I. The procedure for performing a fuel assembly depletion calculation with CRAFT, Version 5, consisted of the following steps:

- Create a CRAFT input deck for the assembly depletion calculation.
- Assure that the CRAFT executable file, the CRAFT input deck entitled "datain", and the "sedexecute" executable file are in the same directory. The "sedexecute" executable file is a script file which is used in conjunction with the CRAFT code to create the consolidated output files described in Section 5.7.
- Execute CRAFT.
- Check and analyze the CRAFT generated SAS2H input decks and the SAS2H isotopic results.

The various CRAFT generated and consolidated SAS2H output files contain unique filenames which specify the following information:

- reactor identifier
- one-eighth core symmetry assembly number in current reactor cycle

- axial node number
- reactor cycle number in which the SAS2H calculation begins
- EFPD statepoint at which the SAS2H calculation begins
- reactor cycle number in which the SAS2H calculation ends
- EFPD statepoint at which the SAS2H calculation ends.

A complete detailed description of the filename content and format is provided in Attachment I.

5.4. Path B Model Development for the McGuire Unit 1 Depletion Calculations

The SAS2H control module used ORIGEN-S to perform a point depletion calculation for the fuel assembly or section of the fuel assembly described in the SAS2H input deck. The ORIGEN-S calculational module used cell-weighted cross sections based on one-dimensional (1-D) transport calculations performed by XSDRNPM. One-dimensional transport calculations were performed on two models, Path A and Path B, to calculate energy dependent spatial neutron flux distributions necessary to perform cross section cell-weighting calculations.

The Path A model was simply a unit cell of the fuel assembly lattice containing a fuel rod. In the Path A model, the fuel pellet, gap, and clad were modeled explicitly. The only modification required to develop the Path A model was the conversion of the fuel assembly's square lattice unit cell perimeter to a radial perimeter conserving moderator volume within the unit cell (exterior to the fuel rod cladding). This modification was performed automatically by the SAS2H control module. A 1-D transport calculation was performed on the Path A model for each energy group, and the spatial flux distributions for each energy group were used to calculate cell-weighted cross sections for the fuel.

The Path B model was a larger representation of the assembly than the Path A model. The Path B model approximated spectral effects due to heterogeneity within the fuel assembly such as water gaps, burnable poison rods, control rods, or axial power shaping rods. Typically, fuel assemblies contain a number of similar non-fuel lattice cells dispersed somewhat uniformly throughout the assembly lattice. The structure of the Path B model was based on a uniform distribution of these non-fuel lattice cells. In reality, most fuel assemblies do not have uniformly distributed non-fuel lattice cells, but the approximation of uniformly distributed non-fuel lattice cells was considered acceptable within the fidelity of these calculations as documented in Section S2.2.3.1 of Volume 1, Rev. 5 in Reference 7.1.

The basic structure of the Path B model for the fuel assembly depletion calculations performed in this analysis included an inner region composed of a representation of the non-fuel assembly lattice cell. A region containing the homogenization of the Path A model surrounded the inner region in the Path B model. A final region representing the moderator in the assembly-to-assembly spacing surrounded the homogenized region in the Path B model. The size of each radial region that surrounded the inner region in the Path B model was determined by conserving both the fuel-to-moderator mass ratio and the fuel-to-absorber (either burnable poison or RCCA poison) mass ratio in the corresponding section of the fuel assembly. The cell-weighted cross sections from the Path A model were applied to the homogenized region during the Path B model transport calculations. New cell-weighted cross sections for each energy group were then developed using the unit cell spatial flux distribution results from the

Path B model transport calculations. These cell-weighted cross sections were ultimately used in point depletion calculations performed by ORIGEN-S to calculate both the depleted fuel and the depleted burnable poison (if present) isotopic compositions in the corresponding section of the fuel assembly. A detailed description of the calculations used to produce time-dependent cross sections by SAS2H is documented in Section S2.2.4 of Volume 1, Rev. 5 in Reference 7.1.

The Path B models for the various fuel assembly configurations had to be provided to the SAS2H control module. The primary concern in the development of the Path B model for PWR assemblies was the conservation of the fuel-to-moderator and the fuel-to-absorber mass ratios in the corresponding section of the assembly.

The Path B model development calculations for the McGuire Unit 1 depletion calculations are presented in Tables 5.4-1 through 5.4-22 and contain the following information:

- the fuel assembly section characteristics for which the Path B model is developed
- the required Path B model development input parameters
- the parameters calculated to determine the final Path B model dimensions
- references to equations from Table 5.4-23 that were used to calculate parameters
- the final Path B model dimension results.

Table 5.4-23 contains a listing of the equations referenced and utilized in each of the Path B model development calculations presented in Tables 5.4-1 through 5.4-22.

The insertion positions of the BPRAs in the depletion calculations had to be approximated with respect to the positions identified on pages 32 and 33 of Reference 7.5. The reason for making the approximations is that the top and bottom of the referenced burnable absorber positions do not coincide with fuel node boundaries. For Pyrex BPRAs, the absorber material extends from 3.81 cm to 364.49 cm above the bottom of the active fuel. For WABA BPRAs, the absorber material extends from 12.7 cm to 353.06 cm above the bottom of the active fuel. The sixteen fuel nodes are all 22.86 cm high. As the fuel in a fuel node region is depleted by SAS2H, the corresponding burnable poison in the node is also depleted. The CRAFT software routine requires that the burnable poison occupy the entire height of a fuel node if a BPRA is present in the fuel node. Due to the nodal boundary specification inconsistencies between the fuel and the burnable poison material, the following approximations were made in modeling the burnable poison location in the depletion calculations:

- Pyrex BPRAs: the burnable absorber material was modeled in the region defined by fuel nodes 1 through 15, where fuel node 1 is the top fuel node,
- WABA BPRAs: the burnable absorber material was modeled in the region defined by fuel nodes 1 through 15, where fuel node 1 is the top fuel node.

These burnable poison modeling approximations will have vanishingly small effects on the isotopics and subsequent reactivity in the top and bottom fuel node regions due to the limited spectral adjustment incurred in these lower flux regions. The burnable poison modeling approximations are also within the accuracy of the nodal smearing approximations.

Table 5.4-1. SAS2H Path B Model Dimension Calculations for McGuire Unit 1: OFA Assembly Type, Upper Guide Tube Section, No Insertion Assembly

Input Parameters

Number of unit cells in assembly: 289

Table 5.4-23. Equations Used in the Path B Model Development for the McGuire Unit 1 Depletion Calculations

(The equations listed below were derived. All distance dimensions are in centimeters. All area dimensions are in square centimeters. All other parameters are dimensionless.)

Equation 5.4-1. Fuel-to-Moderator Unit Volume (Area) Ratio in Fuel Assembly Section

$$\frac{F}{M}\,Ratio = \frac{(\#\,FR)\left(\frac{\pi}{4}\right)(FP\ Diameter)^2}{\left\{\begin{array}{l}(\#\,FR)\left[P^2-(FR\ Clad\ OD)^2\left(\frac{\pi}{4}\right)\right]+(\#\,Empty\ GTs)\left[P^2-(GT\ OD)^2\left(\frac{\pi}{4}\right)+(GT\ ID)^2\left(\frac{\pi}{4}\right)\right]+\\ (\#\,Rodded\ GTs)\left[\begin{array}{l}P^2-(GT\ OD)^2\left(\frac{\pi}{4}\right)+(GT\ ID)^2\left(\frac{\pi}{4}\right)-\\ (Inserted\ Rod\ Outer\ Clad\ OD)^2\left(\frac{\pi}{4}\right)+\\ (Inserted\ Rod\ Inner\ Clad\ ID)^2\left(\frac{\pi}{4}\right)\end{array}\right]+\left[P^2-(IT\ OD)^2\left(\frac{\pi}{4}\right)+(IT\ ID)^2\left(\frac{\pi}{4}\right)\right]\end{array}\right\}}$$

where: F=Fuel, M=Moderator, #=Number, FR=Fuel Rod, FP=Fuel Pellet, P=Cell Pitch, OD=Outer Diameter, GT=Guide Tube, ID=Inner Diameter, IT=Instrument Tube. Equation 5.4-1 assumes that the instrument tube is filled with water and that there is no instrument inserted. A rodded GT is any GT that contains a rod from either an RCCA or BPRA. The inserted rod refers to either an RCCA or BPRA rod inserted into the GTs of the assembly.

Equation 5.4-2. Moderator Area in Central Region of Path B Model

$$CRMA = P^2-\left(\frac{\pi}{4}\right)\left[\begin{array}{l}(GT\ OD)^2-(GT\ ID)^2+(Inserted\ Rod\ Outer\ Clad\ OD)^2-\\ (Inserted\ Rod\ Inner\ Clad\ ID)^2\end{array}\right]$$

where: CRMA=Central Region Moderator Area.

Equation 5.4-3. Fuel Pellet Cross-Sectional Area in Path A Model

$FA = (Fuel\ Pellet\ OD)^2\left(\frac{\pi}{4}\right)$ where: FA=Fuel Area

Equation 5.4-4. Moderator Cross-Sectional Area in Path A Model

$$MA = P^2 - (FR\ Clad\ OD)^2\left(\frac{\pi}{4}\right)$$ where: MA=Moderator Area

Equation 5.4-5. Relationship Between Fuel-to-Moderator Unit Volume Ratio in the Explicit Assembly Section and the Path B Model

$$\frac{F}{M}Ratio = \frac{x(FA)}{CRMA + x(MA)}$$

where: F/M Ratio is from Equation 5.4-1, FA is from Equation 5.4-3, CRMA is from Equation 5.4-2, MA is from Equation 5.4-4, and x refers to the number of assembly fuel pin lattice cells that must be represented in the Path B Model homogenized region to preserve the fuel-to-moderator unit volume ratio.

Equation 5.4-6. Number of Assembly Fuel Pin Lattice Cells Required in the Homogenized Region of the Path B Model

$$x = \frac{\left(\frac{F}{M}Ratio\right)(CRMA)}{FA - \left(\frac{F}{M}Ratio\right)(MA)}$$

Equation 5.4-7. Path B Model Homogenized Region Outer Radius

$$Homogenized\ Region\ Outer\ Radius = \sqrt{\frac{x(P)^2}{\pi} + (Homogenized\ Region\ Inner\ Radius)^2}$$

where: x is from Equation 5.4-6 and the Homogenized Region Inner Radius always refers to the outer radius of the Path B model central region which is always the explicit perimeter of an assembly unit cell that has been converted to a radial perimeter by conserving area.

Equation 5.4-8. Inter-Assembly Spacing Moderator Region Outer Radius

$$IASMR\ Outer\ Radius = \left\{\left(\frac{(x+1)}{\#\ Assembly\ Lattice\ Unit\ Cells}\right)\left[\begin{array}{l}(Assembly\ Pitch)^2 - \\ (P)^2(\#\ Assembly\ Lattice\ Unit\ Cells)\end{array}\right]\left(\frac{1}{\pi}\right) + (Homogenized\ Region\ Outer\ Radius)^2\right\}^{1/2}$$

where: IASMR=Inter-Assembly Spacing Moderator Region.

When developing the Path B model for an assembly section that has insertion rods in some or all of the guide tubes, the development should begin with an explicit representation of the insertion rod inserted in the guide tube in the central region of the Path B Model. The remaining dimensions of the Path B Model should then be determined by preserving the fuel-to-moderator unit volume ratio in the explicit assembly section. The neutron absorber unit volume or area in the Path B Model must then be adjusted to preserve the fuel-to-absorber unit volume ratio in the explicit assembly section. This adjustment is made by first determining the neutron absorber area that must exist in the Path B model to preserve the fuel-to-absorber ratio. The existing area of the neutron absorber material in the Path B Model is then adjusted by changing the outer radius dimension of the neutron absorber material. The inner radius dimension of the neutron absorber material (if applicable) is always fixed at its explicit value.

Equation 5.4-9. Fuel-to-Neutron Absorber Unit Volume Ratio (Area) in Fuel Assembly Section

$$\frac{F}{Abs}\,Ratio = \frac{(\#\,FRs)(Fuel\ Pellet\ OD)^2\left(\frac{\pi}{4}\right)}{(\#\,Insertion\ Rods)\left(\frac{\pi}{4}\right)\left[(Abs\ Pellet\ OD)^2-(Abs\ Pellet\ ID)^2\right]}$$

where: F/Abs Ratio=Fuel-to-Neutron Absorber Ratio in the explicit fuel assembly section, Abs=Neutron Absorber Material, Insertion Rods=refers to the rods of either an RCCA or BPRA that are inserted into the guide tubes in the assembly section.

Equation 5.4-10. Relationship Between Fuel-to-Neutron Absorber Unit Volume Ratio in the Explicit Assembly Section and the Path B Model

$$RAA = \frac{x(Fuel\ Pellet\ OD)^2\left(\frac{\pi}{4}\right)}{\frac{F}{Abs}\,Ratio}$$

where: RAA=Required Absorber Area for Path B Model and F/Abs Ratio is from Equation 5.4-9.

Equation 5.4-11. Adjusted Neutron Absorber Area Outer Diameter for Path B Model (adjusted to preserve the fuel-to-absorber volume ratio)

$$Adjusted\ Neutron\ Absorber\ Region\ OD = \sqrt{\left(\frac{RAA}{(\pi/4)}+(Abs\ Pellet\ ID)^2\right)}$$

where: RAA is from Equation 5.4-10.

5.5. Cycle Irradiation History Layouts for the McGuire Unit 1 Depletion Calculations

The RCCA insertion history for an assembly was modeled such that the appropriate axial nodes of the fuel assembly were depleted using the appropriate neutron flux and spectrum over the correct exposure duration. The isotopic inventory may be quite different between fuel assemblies with and without an RCCA insertion history. These isotopic inventory differences must be accounted for in the CRC depletion calculations to allow for correct prediction of core k_{eff} values in subsequent CRC reactivity calculations.

In SAS2H, the duration of a depletion calculation may be separated into a number of time steps of variable length. Typically, the length of a depletion calculation was the continuous irradiation time required to go from one CRC statepoint or datapoint to another. To follow the RCCA insertion histories, detailed intra-cycle variable irradiation time steps were required. This was due to the fact that the rods of the RCCA were only present in a given axial node of an assembly for a given period of exposure during a statepoint depletion calculation. A user specified number of cross section library updates were performed during each time step of an irradiation interval. The CRC depletion calculations always used one cross section library update per time step. The boron letdown curve of the reactor cycle may also be followed by specifying, at each irradiation step, a fraction of the soluble boron concentration defined in the base moderator material specification. This boron concentration was applied uniformly over the irradiation time step. The boron concentration fraction at the mid-point of each irradiation time step was specified in the SAS2H depletion calculations of this analysis to appropriately follow boron letdown curves. Considering the cross section update frequency, the boron letdown data, and the absorber rod assembly insertion histories, the following requirements were applied to determining an appropriate reactor cycle irradiation layout for a fuel assembly:

- The duration of each time step was specified such that a maximum of 80 days of irradiation was not exceeded between cross section updates. The SAS2H calculations in this calculation utilized one cross section update per irradiation step. Therefore, the maximum duration of any time step in any reactor cycle irradiation layout of this calculation did not exceed 80 days. The 80 day limit was an arbitrary limit based on engineering judgement. The 80 day irradiation time step limit should assure that the changes in isotopic concentrations of the system (primarily fuel) did not alter the neutron spectrum radically enough to cause a time step of the depletion calculation to be performed without the availability of cross sections which have been properly weighted with an appropriate neutron spectrum and spatial flux.

- Any radical perturbations in the boron letdown curve were followed by defining irradiation time step duration such that the average boron concentration over each time step is representative of the actual boron letdown. Usually, the 80 day time step limit imposed for cross section update frequency is adequate to properly follow a reactor cycle's boron letdown curve.

- The duration of each time step was specified such that the insertion of an RCCA in a given assembly axial node could be modeled for the correct exposure time in terms of EFPD. In SAS2H, there is an option to vary the Path B model between irradiation steps as long as the number of radial zones in the Path B models of a given SAS2H calculation remain the same. Therefore, an assembly axial node represented in a given SAS2H statepoint depletion calculation that has an RCCA insertion history for a specified period of exposure, that is less than the total exposure covered by the statepoint depletion calculation, was modeled by changing the Path B model from one representing the insertion of the RCCA to one representing the removal of the RCCA at the appropriate time step corresponding to the RCCA removal time.

The irradiation time step layout for a given statepoint depletion calculation was developed so that breakpoints existed between irradiation time steps that allowed for the appropriate removal or insertion of the RCCA to obtain the correct neutron spectrum for each axial node of the assembly. The complexity of the irradiation time step layout for a given statepoint calculation was proportional to the number of axial nodes being modeled and the frequency of RCCA movement during the assembly depletion. The time steps developed to model RCCA insertion histories were also designed to encompass the cross section update and boron letdown requirements. A software routine entitled "RLAYOUT" was written to automate the development of appropriate irradiation time step layouts for the statepoint depletion calculations of an assembly having an RCCA insertion history. The RLAYOUT software routine is described in Attachment III of Reference 7.3.

The RLAYOUT software routine was only utilized to determine the irradiation time step layouts for the CRC depletion calculations that contained an RCCA insertion history. A single assembly may have had a combination of CRC calculations that either required or did not require the RLAYOUT developed irradiation time step layouts. For the CRC depletion calculations that did not require the consideration of an RCCA insertion history, the irradiation time step layouts were developed by considering the cross section update frequency and the boron letdown data. Tables 5.5-1 through 5.5-6 contain the CRC depletion calculation time step layouts for each McGuire Unit 1 reactor cycle that was relevant to the CRC depletion calculations documented in this calculation file which did not have an RCCA insertion history. The mid-step boron concentrations presented in Tables 5.5-1 through 5.5-6 were obtained from the linear equations presented in Section 5.2.7. A description of the linear interpolation procedures employed were presented in the "UNITS_CONVERSION" subroutine description section of the CRAFT software routine description in Attachment I.

The RLAYOUT developed irradiation time step layouts for the assemblies which had an RCCA insertion history are presented in Tables 5.5-7 through 5.5-10. The boron letdown data utilized by RLAYOUT in developing these irradiation layouts were obtained from the boron letdown linear regression fits presented in Table 5.2.7. The RCCA insertion times utilized by RLAYOUT in developing these irradiation layouts were obtained from Tables 5.2.9-1 through 5.2.9-4.

Table 5.5-1. Irradiation Layout for Cycle 2 of McGuire Unit 1

Depletion: BOC[1] to EOC	Time Step Length: 67.000 days	Number of Time Steps: 4

1	154.550	887.626
2	205.650	730.238
3	256.750	572.850

[1] The irradiation layout from Cycle 7, 282.3 EFPD to Cycle 7, 408.0 EFPD (end-of-cycle) must be provided in the CRAFT input decks, but this information is never used in any of the depletion calculations. This information is arbitrarily provided to CRAFT as an irradiation step 4 in the 129.0

EFPD to 282.3 EFPD layout with a step length of 125.7 EFPD and a mid-step boron concentration on 0 ppmb.

5.6. The Commercial Reactor Assembly Follow Taskmaster (CRAFT) Software Routine and Usage

The CRAFT software routine directed the performance of the assembly depletion and decay calculations relevant to CRC evaluations. The CRAFT software routine generated input decks for the SAS2H control module of the SCALE modular code system based on user-defined input which described the fuel assembly's specifications and irradiation history. Appropriate isotopic concentrations relevant to both the CRC evaluations containing the fuel assembly and subsequent depletion and decay calculations of the fuel assembly were extracted and stored by CRAFT as it generated and executed the SAS2H cases required to simulate the complete fuel assembly irradiation history.

The CRAFT software routine was developed with a high degree of flexibility to provide for the depletion and decay of fuel assemblies that have widely varying features under flexible core operating conditions. The following listing describes some of the capabilities and usage of CRAFT.

- The CRAFT software routine generates and executes appropriate SAS2H cases required to perform a prescribed depletion and decay sequence for a fuel assembly. The depletion and decay sequence is orchestrated from the BOC statepoint calculation of the initial prescribed insertion cycle through the final statepoint calculation of the last prescribed insertion cycle. The CRAFT software routine extracts and saves fuel and burnable poison isotopics at each statepoint, including BOC statepoints, during the fuel assembly's depletion and decay sequence. A certain number of the generated isotopics in the depleted fuel composition obtained from a SAS2H calculation are not used in the initial charge composition to the next SAS2H calculation due to a lack of cross section data in the specified SAS2H master cross section library. The CRAFT software routine provides a listing of the fuel isotopics from the output of a SAS2H calculation which are not used in the initial charge to the next SAS2H calculation. The isotopics left out of the initial charge are fission products whose reactivity worth is small relative to the isotopics retained in the initial charge composition. The listing of excluded initial charge isotopics allows for a determination of the impact upon the reactivity worth of the initial fuel composition in the subsequent depletion calculation.

- Any assembly design may be analyzed within the bounds of the SAS2H control module through the use of the CRAFT software routine.

- A spacer grid modeling technique is available with the CRAFT software routine. The modeling technique homogenizes the spacer grid material throughout the moderator of the fuel assembly by utilizing a user-defined spacer material and spacer material volume fraction in the moderator. The available spacer grid materials include the following-- ZIRC-4, INCONEL, SS316, SS316S, SS304, SS304S. Any volume fraction of spacer material in the moderator may be specified (including zero).

- The fuel cladding, burnable poison rod cladding, or control rod cladding in the CRAFT calculation may be designated as any of the following materials-- ZIRC-4, INCONEL, SS316, SS316S, SS304, SS304S.

- The insertion of a BPRA during the irradiation of the fuel assembly may be modeled in the CRAFT calculation. Up to 10 unique BPRA designs may be specified for use during the depletion of a fuel assembly. Any type of BPRA design may be specified. The default burnable poison (BP) material for use in CRAFT calculation is Al_2O_3-B_4C. However, any arbitrary BP material may be specified for use in a BPRA design. A maximum of 10 unique BP materials may be specified. A maximum of 20 unique elements or isotopes may be specified in any given BP material. A BPRA may be inserted in any reactor cycle specified in the CRAFT calculation. Only one BPRA design may be specified per cycle. The position of the BPRA in the fuel assembly is specified by identifying the top and bottom axial nodes of the BP material. The BPRA remains fixed during a given reactor cycle. The depletion of the BP material is tracked during the CRAFT calculation. The appropriate depleted BP material is utilized in the statepoint calculations for a given reactor cycle. Depleted BP material isotopic concentrations are also retained for use in subsequent mid-cycle CRC statepoint reactivity calculations.

- The insertion of an RCCA during the irradiation of the fuel assembly may be modeled in the CRAFT calculation. Up to 10 unique RCCA designs may be specified for use during the depletion of a fuel assembly. Any type of RCCA design may be specified. Any arbitrary control rod (CR) absorber material may be specified for use in an RCCA design. A maximum of 10 unique CR absorber materials may be specified. A maximum of 10 unique elements or isotopes may be specified in any given CR absorber material. An RCCA may be inserted in any reactor cycle specified in the CRAFT calculation. Multiple RCCA designs may be specified per cycle. The position of the RCCA in the fuel assembly is specified by identifying the top and bottom axial nodes of sections of the fuel assembly which contain the CR absorber material. The RCCA position may be changed between each irradiation step of a SAS2H calculation generated by CRAFT. The RCCA design may also be changed between any two CRC statepoint depletion calculations in a given reactor cycle.

- A fuel assembly may be inserted in a maximum of 10 reactor cycles during a CRAFT calculation.

- A maximum of 20 statepoints or datapoints (BOC is always considered a statepoint) may be specified in any given reactor cycle in a CRAFT calculation.

- A maximum of 23 irradiation steps of variable duration may be specified in any given SAS2H depletion calculation that is generated by CRAFT.

- A maximum of 50 axial assembly nodes may be specified for use in a CRAFT calculation. Each axial node may have a unique height.

- The CRAFT software routine utilizes a user-defined input format for fuel temperature, moderator specific volume, and burnup data. The input data must be specified for each axial node in a user-defined nodal format of up to 50 nodes of arbitrary height. The total assembly active fuel height for the input data descriptions may be different than that specified for use in the CRAFT generated SAS2H depletion calculations. Depending on the user's needs, the fuel temperature, moderator specific volume, and burnup input data may be specified in a different nodal format each time a set of this input data is provided. Nominal fuel temperature input data representing full-power reactor operation must be provided in units of degrees Fahrenheit for each node in each CRC statepoint depletion calculation that will be generated by CRAFT. Nominal moderator specific volume input data representing full-power reactor operation must be provided in units of cubic feet per pound for each node in each statepoint calculation that will be generated by CRAFT. The nodal average burnup input data must be provided in units of GWd/MTU for each node at each statepoint or datapoint including all BOC statepoints. All burnup input data that is specified must be cumulative from the initial insertion of the fuel assembly in the reactor.

- A continuation CRAFT calculation for an assembly may be initiated from any statepoint in any reactor cycle if all of the nodal consolidated output files ("*.cut" files) from the statepoint calculation immediately preceding the continuation calculation exist in the CRAFT execution directory.

Additional information on the CRAFT software routine is provided in the CRAFT user information in Attachment I. Instructions on how to develop CRAFT input decks and execute CRAFT calculations are also provided in Attachment I. This attachment also discusses specific modeling procedures and details relevant to the SAS2H fuel assembly depletion calculations which were generated by CRAFT.

5.7. Input and Output Filename Descriptions for CRAFT and SAS2H

The CRAFT code generated five types of files identified as either "*.input", "*.output", "*.cut", "*.msgs", or "*.notes", where the "*" is the base file-set identifier for the statepoint depletion calculation of interest. The "*.cut" and "*.notes" files were the only files that had to be retained for CRC reactivity evaluations and documentation purposes. All files were generated in the working directory in which the CRAFT calculation was performed.

All CRAFT generated filenames utilized the following format-- "{Base File Set Identifier}.{suffix}", where the suffix corresponded to one of the five file types previously mentioned, and the base file set identifier was a 25 character name containing essential information necessary to uniquely identify each CRAFT generated SAS2H depletion calculation.

The base file set identifier for each statepoint depletion calculation contained the following information:

1. reactor identifier (three character)
2. one-eighth core symmetry assembly number in current reactor cycle (two digit)
3. axial node number (node 1 is always the top node) (two digit)
4. reactor cycle number in which the SAS2H calculation starts (two character)
5. EFPD statepoint at which the SAS2H calculation starts (three digit)
6. reactor cycle number in which the SAS2H calculation ends (two character)
7. EFPD statepoint at which the SAS2H calculation ends (three digit).

The format of the base file set identifier was as follows where the numbers identified as #{number} correspond to one of the seven items previously listed-- #1 A #2 N #3 DC #4 T #5 AC #6 T #7. The letters contained in the base file set identifier were presented explicitly as shown in the previous format. The base file set identifier did not contain any spaces.

The "*.input" files each contained a CRAFT generated SAS2H input deck. The "*.output" files each contained a complete SAS2H depletion calculation output file. The "*.cut" files each contained the corresponding SAS2H input deck followed by an output extraction from the final ORIGEN-S pass of the SAS2H depletion calculation, which contained data relevant to subsequent CRC reactivity calculations. The "*.msgs" files each contained the standard run-time messages associated with the SAS2H calculations. The "*.notes" files each contained a listing of the isotopes and associated concentrations which were left behind in generating the initial charge fuel composition for the next continuation SAS2H calculation. The "*.notes" files were only created for CRAFT generated SAS2H calculations which were continuation depletion calculations. The "*.cut" and "*.notes" files contained all of the information required to perform CRC reactivity evaluations or repeat calculations as necessary for quality assurance purposes. The remainder of the CRAFT generated files were discarded once the "*.cut" and "*.notes" files were generated and retained.

6. Results

Depletion calculations for 45 fuel assemblies from McGuire Unit 1 were documented in this analysis. The depleted fuel and depleted burnable poison isotopics for these fuel assemblies had to be calculated at a number of statepoints in cycles 6 and 7 for use in subsequent CRC reactivity calculations. Table 5.2.6-2 identifies the CRC statepoint EFPD values in each of these cycles for which isotopic compositions were required. Table 5.2.6-2 also identifies a number of datapoints at which the depletion calculations were interrupted to update input parameters. Even though the depleted isotopics available at each of the datapoints were not required for subsequent reactivity calculations, they were retained in this calculation file for completeness.

The CRAFT input decks for each assembly depletion were developed in accordance with the instructions presented in Sections 5 and 7 of Attachment I. The SAS2H modeling features incorporated in the depletion calculations are described in Attachment I. The CRAFT input decks for the assembly depletions documented in this calculation file are provided in Attachment II (this attachment was moved to Reference 7.6, see Section 8).

Attachment III (this attachment was moved to Reference 7.6, see Section 8) contains the CRAFT generated consolidated SAS2H output files for the depletion calculations documented in this analysis as identified in the attachment listing of Section 8. The consolidated output files contain the following information:

- time/date stamp for when the SAS2H depletion calculation was performed
- echo of the SAS2H input deck generated by CRAFT
- the output extraction of information pertinent to CRC evaluations from the final ORIGEN-S calculation of the SAS2H depletion calculation.

Between CRC statepoints or datapoints in the depletion sequence for a fuel assembly axial region, a new SAS2H input deck had to be created using the fuel isotopic results from the previous calculation as the initial charge. Since the 44-group master cross section library utilized in the SAS2H depletion calculations of this analysis had a reduced isotopic inventory relative to the ORIGEN-S cross section library, a number of isotopes present in the ORIGEN-S output could not be transferred to the initial fuel charge of the subsequent SAS2H depletion calculation. The isotopic inventory in the ORIGEN-S output which could not be propagated to the continuation SAS2H depletion calculation did not significantly affect the integral reactivity or the energy dependent neutron spectrum, as documented in Section 4.9.1 of Attachment I. The non-propagated isotopic inventory was written to a file entitled "{depletion case identifier}.notes" to allow for subsequent analysis of the impact of excluding these isotopics in the initial charge to the continuation SAS2H depletion calculation. The "*.notes" files are contained in Attachment IV (this attachment was moved to Reference 7.6, see Section 8).

Isotopic results for the set of 29 principal isotopes identified in Table 6-1 were tabulated for each axial node of each fuel assembly at each CRC statepoint other than beginning of life (BOC of first reactor cycle in which the assembly is inserted) statepoint. The program entitled "CRC_DATA_TABULIZER.exe" described in Attachment VI, was used to create the principal isotope result tables documented in this calculation file. Attachment V (this attachment was moved to Reference 7.6, see Section 8) contains the principal isotope tabulations for the assemblies documented in this calculation file.

8. Attachments

The attachments referenced throughout this calculation file are listed in Table 8-1. Attachments II through V have been moved to Reference 7.6. Attachment II contains the CRAFT input decks for the assembly depletion calculations. Attachment III contains the "*.cut" files for the assembly depletion calculations. Attachment IV contains the "*.notes" files for the assembly depletion calculations. Attachment V contains the principal isotope result tables for the assembly depletion calculations. Attachments II through V were written in ASCII format to an attachment tape. This attachment tape was provided with REV 00A of this calculation file. After checking of the attachment tape in REV 00A, the tape was made a reference (Ref. 7.6). Detailed listings of the content of Attachments II through V on the tape are provided in their corresponding hard-copy attachment locations in this calculation file. The listing of the content of Attachments II through V contain the following information, as appropriate, for each of the files that were written to the tape (Ref. 7.6):

- the directory and filename as taken from the HP workstation
- the corresponding filename on the attachment tape
- the date that the file was created on the HP workstation or personal computer
- the size of the file on the HP workstation or attachment tape in bytes.

The tape containing Attachments II through V (Ref. 7.6) was written using the HP Colorado Model T1000e External Parallel Port Backup System for personal computers.

Table of Contents

1. Introduction

The Commercial Reactor Assembly Follow Taskmaster (CRAFT) software routine directs the performance of assembly depletion and decay calculations relevant to Commercial Reactor Critical (CRC) evaluations. The CRAFT software routine generates input decks for the SAS2H control module of the SCALE modular code system (Ref. 1) based on user defined input which describes the fuel assembly's irradiation history. Appropriate isotopic concentrations relevant to both the CRC evaluations containing the fuel assembly and the subsequent depletion and decay calculations for the fuel assembly are extracted and stored by CRAFT as it generates and executes SAS2H cases.

2. CRAFT Applications

The CRAFT software routine directs the performance of depletion and decay calculations required to simulate the complete irradiation history of a fuel assembly. During the CRAFT orchestration of the fuel assembly depletion and decay calculations, fuel and burnable poison isotopic concentrations are retained at user-defined statepoints. The fuel and burnable poison isotopic concentrations may be used for input to subsequent CRC statepoint reactivity calculations or in other analyses concerning spent nuclear fuel from commercial power reactors.

The CRAFT software routine is developed with a high degree of flexibility that provides for the depletion and decay of fuel assemblies with widely varying features under either standard or non-standard core operating procedures. The following list describes some of the capabilities of the CRAFT software routine.

1) The CRAFT software routine generates and executes appropriate SAS2H cases required to perform a prescribed depletion and decay sequence for a fuel assembly. The depletion and decay sequence is orchestrated from the beginning of cycle (BOC) statepoint calculation of the initial prescribed insertion cycle through the final statepoint calculation of the last prescribed insertion cycle. The CRAFT software routine extracts and saves fuel and burnable poison isotopics at each statepoint, including BOC statepoints, during the fuel assembly's depletion and decay sequence. A certain portion of generated isotopics in the depleted fuel composition obtained from a SAS2H calculation are not used in the charge composition to the next SAS2H calculation due to a lack of cross section data in the specified SAS2H master cross section library. The CRAFT software routine provides a listing of the fuel isotopics from the output of a SAS2H calculation which are not used in the initial charge to the next SAS2H calculation. The isotopics left out of the initial charge are fission products whose reactivity worth is small relative to the isotopics retained in the charge composition. The listing of excluded charge isotopics allows for a determination of the impact upon the reactivity of the initial fuel composition in the subsequent calculation.

2) Any assembly design may be analyzed within the bounds of the SAS2H control module through the use of the CRAFT software routine. This includes both pressurized water reactor (PWR) and boiling water reactor (BWR) fuel assemblies.

3) An axial blanket fuel modeling option is available in the CRAFT software routine. Any UO_2 enrichment may be specified for the axial blanket fuel. The axial blanket fuel may be defined to exist in any of the CRC axial nodes which are defined for the CRAFT calculation.

4) A spacer grid modeling technique is available with the CRAFT software routine. The modeling technique homogenizes the spacer grid material throughout the moderator of the fuel assembly by utilizing a user defined spacer material and spacer material volume fraction in the moderator. The available spacer grid materials include the following-- ZIRC-4, INCONEL, SS316, SS316S, SS304, SS304S. Any volume fraction of spacer material in the moderator may be specified (including zero).

5) The fuel cladding, burnable poison rod (BPR) cladding, axial power shaping rod (APSR) cladding, or control rod (CR) cladding in the CRAFT calculation may be designated as any of the following materials-- ZIRC-4, SS316, SS316S, SS304, SS304S, or INCONEL.

6) The insertion of a BPR assembly during the irradiation of the fuel assembly may be modeled in the CRAFT calculation. Up to 10 unique BPR assembly designs may be specified for use during the depletion of a fuel assembly. Any type of BPR assembly design may be specified. The default BP material for use in CRAFT calculation is Al_2O_3-B_4C. Any arbitrary BP material may be specified for use in a BPR assembly design. A maximum of 10 unique BP materials may be specified. A maximum of 20 unique elements or isotopes may be specified in any given BP material. A BPR assembly may be inserted in any reactor cycle specified in the CRAFT calculation. Only one BPR assembly design may be specified per cycle. The position of the BPR assembly in the fuel assembly is specified by identifying the top and bottom axial nodes of the BP material. The BPR assembly remains fixed during a given reactor cycle. The depletion of the BP material is tracked during the CRAFT calculation. The appropriate depleted BP material is utilized in statepoint calculations following the BOC to statepoint 1 calculation for a given reactor cycle. Depleted BP material isotopic concentrations are also retained for use in subsequent mid-cycle statepoint reactivity calculations which may be performed as part of the CRC evaluation process.

7) The insertion of a CR assembly during the irradiation of the fuel assembly may be modeled in the CRAFT calculation. Up to 10 unique CR assembly designs may be specified for use during the depletion of a fuel assembly. Any type of CR assembly design may be specified. Any arbitrary CR absorber material may be specified for use in a CR assembly design. A maximum of 10 unique CR absorber materials may be

specified. A maximum of 10 unique elements or isotopes may be specified in any given CR absorber material. A CR assembly may be inserted in any reactor cycle specified in the CRAFT calculation. Multiple CR assembly designs may be specified per cycle. The position of the CR assembly in the fuel assembly is specified by identifying number of CR absorber regions and the top and bottom axial nodes of each region. The CR assembly position may be changed between each irradiation step of a SAS2H calculation generated by CRAFT. The CR assembly design may also be changed between any two statepoint calculations in a given reactor cycle.

8) The insertion of an APSR assembly during the irradiation of the fuel assembly may be modeled in the CRAFT calculation. Up to 10 unique APSR assembly designs may be specified for use during the depletion of a fuel assembly. Any type of APSR assembly design may be specified. Any arbitrary APSR absorber material may be specified for use in an APSR assembly design. A maximum of 10 unique APSR absorber materials may be specified. A maximum of 10 unique elements or isotopes may be specified in any given APSR absorber material. An APSR assembly may be inserted in any reactor cycle specified in the CRAFT calculation. Multiple APSR assembly designs may be specified per cycle. The position of the APSR assembly in the fuel assembly is specified by identifying the top and bottom axial nodes of the APSR absorber material. The APSR assembly position may be changed between each irradiation step of a SAS2H calculation generated by CRAFT. The APSR assembly design may also be changed between any statepoint calculations in a given reactor cycle. For any APSRA modeled, the APSR follow rods are modeled in the axial region above the poison region of the APSR's. The APSR follow rod material may be specified as a cladding material as previously described in item number five of this listing.

9) A fuel assembly may be inserted in a maximum of 10 reactor cycles during a CRAFT calculation.

10) A maximum of 20 statepoints (BOC is always considered a statepoint) may be specified in any given reactor cycle in a CRAFT calculation.

11) A maximum of 23 irradiation steps of variable duration may be specified in any given SAS2H statepoint calculation to be generated during a CRAFT calculation.

12) A maximum of 50 axial nodes may be specified in the CRC nodal format for use in a CRAFT calculation. Each axial node may have a unique height.

13) The CRAFT software routine utilizes a user-defined input format for fuel temperature, moderator specific volume, and burnup data. The input data must be specified for each axial node in a user-defined nodal format of up to 50 nodes of arbitrary height. The total assembly active fuel height for the input data descriptions may be different than that

specified in the CRC nodal format. Depending on the users needs, the fuel temperature, moderator specific volume, and burnup input data may be specified in a different nodal format each time an assembly set of this input data is provided. Nominal full-power operation nodal average fuel temperature input data must be provided in units of degrees Fahrenheit for each node in each statepoint calculation to be generated by the CRAFT calculation. Nominal full-power operation nodal average specific moderator input data must be provided in units of cubic feet per pound for each node in each statepoint calculation to be generated by the CRAFT calculation. The nodal average burnup input data must be provided in units of gigawatt-days per metric ton of uranium (GWd/MTU) for each node at each statepoint including the BOC statepoint. All burnup input data that is specified must be cumulative from the initial insertion of the fuel assembly in the reactor.

14) Up to 50 axial nodes of arbitrary height may be specified in a CRC nodal format.

15) A continuation CRAFT calculation for an assembly may be initiated from any statepoint in any reactor cycle if all of the nodal consolidated output files ("*.cut" files, see Section 8) from the statepoint calculation immediately preceding the continuation calculation exist in the CRAFT execution directory.

3. CRAFT Methodology

The objective of the CRAFT methodology was to develop a mechanism by which fuel assembly depletion and decay calculations required to support CRC evaluations could be performed most efficiently with minimal required user interface. The result was the CRAFT software routine which automates the process of performing numerous complex SAS2H depletion and decay calculations while extracting and archiving results pertinent to CRC analyses. The information provided in this section describes the general flow of a CRAFT calculation. Figure 3-1 presents a general calculational flow diagram for the CRAFT software routine. The identifiers for the CRAFT subroutines where the various processes and calculations take place are identified in this section. Detailed information on the calculations performed by CRAFT may be found in Section 4, "CRAFT Subroutine Descriptions".

The CRAFT calculation begins by reading a well-defined yet flexible user input which describes the fuel assembly depletion and decay calculation to be performed. The input contains all data necessary to describe the fuel assembly and any insertion assemblies such as burnable poison rod assemblies (BPRA's), axial power shaping rod assemblies (APSRA's), or control rod assemblies (CRA's). Fuel temperature and moderator specific volume data (which may be obtained from reactor design core-follow codes) is also utilized to provide input to the depletion calculations which are to be generated by the CRAFT software routine. The use of nominal full-power fuel temperatures and moderator specific volumes from core-follow codes provide an additional level of detail in the calculation due to the fact that feedback and flux redistribution effects are incorporated into the development of this input parameter data. The "DATA_AQUISITION" subroutine performs the input data acquisition functions in the CRAFT software routine. A detailed description of the CRAFT input deck format is provided in the CRAFT input description in Sections 5 and 7.

After data acquisition, the next procedure is to standardize all fuel assembly heights corresponding to the input data specification to a prescribed CRC fuel assembly height. The fuel assembly depletion and decay calculations must be performed on an assembly which has the same total active fuel height as that prescribed for the CRC calculation. The fuel assembly nodal formats used for providing various input to the CRAFT software routine are allowed to have an arbitrary active fuel height which may differ from that required for the CRC calculation. The assembly height standardization procedure performed by the "STD_HEIGHT" subroutine puts all of the input data specification active fuel heights on a common basis with the CRC active fuel height.

After active fuel height standardization, the next procedure is to convert all of the axial node formats for the fuel temperature, moderator specific volume, and burnup input data to the prescribed CRC axial node format. There must be a one-to-one correspondence between the various axial node input data and the CRC axial nodes. The input data nodal format conversions are performed by the "FUELTEMP_FORMAT", "MODSPECVOL_FORMAT", and "BURNUP_FORMAT" subroutines for the fuel temperature data, moderator specific volume data, and burnup data, respectively.

After the input data nodal formats are converted, the next procedure is to calculate the power to be specified in each SAS2H statepoint calculation that will be generated by the CRAFT software routine. The power is calculated in units of megawatts for each axial node of the fuel assembly based upon the nodal burnup during the statepoint calculation, the initial mass of uranium in the node (fresh fuel), and the duration of the statepoint calculation irradiation period in days. The nodal power calculations are performed by the "POWER_CALCS" subroutine.

After the nodal powers are calculated, the next procedure is to convert units and calculate moderator densities and temperatures. At this point in the CRAFT calculation, there is a nominal full-power fuel temperature and moderator specific volume value for each axial node of the assembly in each statepoint calculation. The fuel temperatures, initially input in units of degrees Fahrenheit, are converted to units of degrees Kelvin. The moderator specific volume, initially input in units of cubic feet per pound, are converted to densities in units of grams per cubic centimeter. The system pressure and moderator density are used to determine the moderator temperature in units of degrees Kelvin. The units conversions and moderator density and temperature calculations are performed by the "UNITS_CONVERSION" subroutine.

After the "UNITS_CONVERSION" subroutine is finished, the next procedure is to initiate the "EXECUTION_CONTROL" subroutine. The "EXECUTION_CONTROL" subroutine directs the development and execution of SAS2H cases required to appropriately deplete and decay the fuel assembly. The subroutine also directs the extraction of results pertinent to CRC evaluations. The development of a unique SAS2H case is required for each CRC axial node in each statepoint calculation. The CRAFT software routine directs the development and execution of SAS2H cases beginning with the top assembly node (always identified as node number one) working sequentially through the assembly to the bottom node. The complete irradiation history of the assembly as defined in the CRAFT input deck is performed for each axial node before initiating the development and execution of SAS2H cases for the next axial node. Three subroutines are called by the "EXECUTION_CONTROL" subroutine--

1) the "STANDARD_WRITER" subroutine
2) the "CONTINUATION_WRITER" subroutine
3) the "CUTTER" subroutine.

Two of these called subroutines create SAS2H input decks, and one extracts isotopic results for use in subsequent CRC analyses. The "EXECUTION_CONTROL" subroutine then calls either "STANDARD_WRITER" or "CONTINUATION_WRITER" to create the next SAS2H input deck. "EXECUTION_CONTROL" then executes the generated SAS2H calculation. Upon completion of the SAS2H calculation, "EXECUTION_CONTROL" calls the "CUTTER" subroutine to extract and archive the fuel and burnable poison isotopic compositions calculated by SAS2H. The next SAS2H input deck is then generated as appropriate. This cycle continues until the prescribed fuel assembly depletion and decay history is completed.

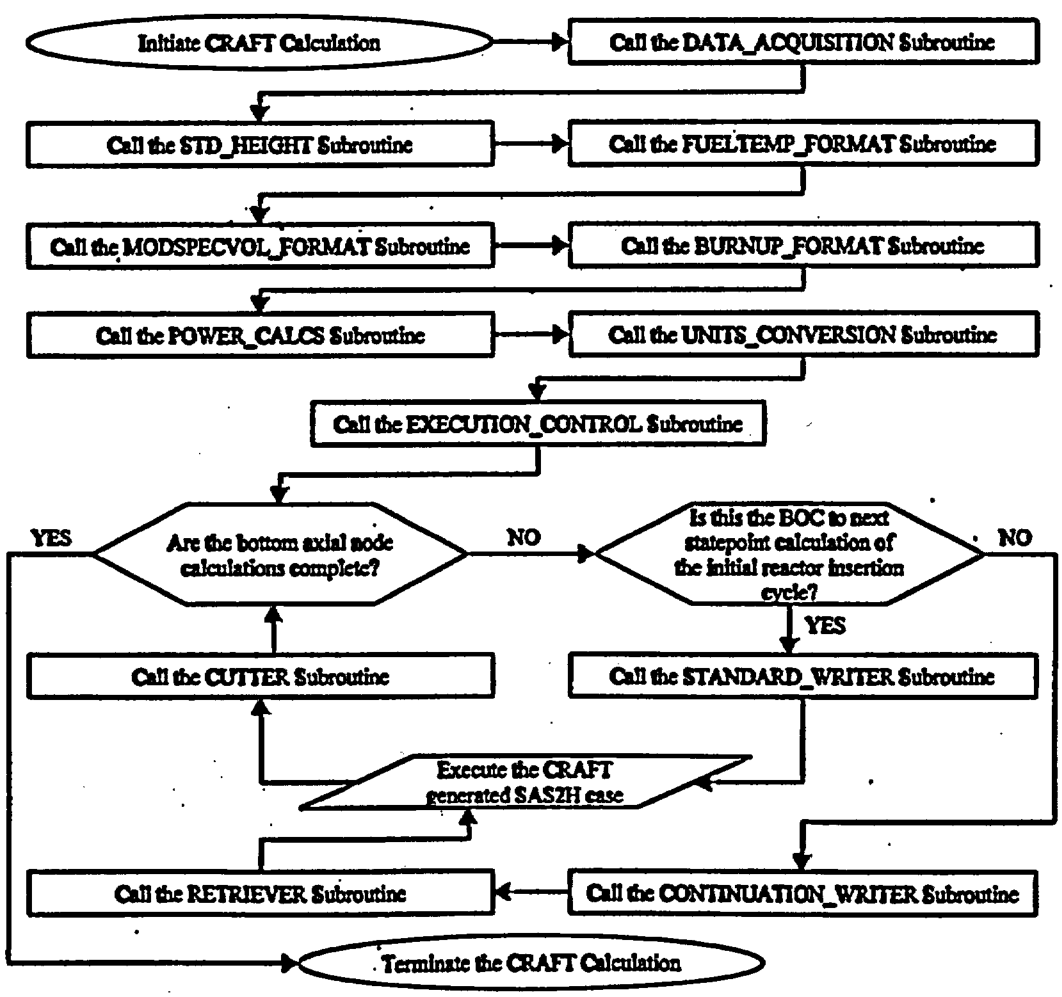
The subroutine called "STANDARD_WRITER", as previously mentioned in relation to the "EXECUTION_CONTROL" subroutine, creates an appropriate SAS2H input deck for the initial statepoint calculation in the initial insertion reactor cycle for a fuel assembly axial node. The fuel and burnable poison compositions in the SAS2H cases generated by the "STANDARD_WRITER" subroutine are always fresh. The sole source of input data for the SAS2H cases generated by the "STANDARD_WRITER" subroutine is the CRAFT input deck.

The subroutine called "CONTINUATION_WRITER", as previously mentioned in relation to the "EXECUTION_CONTROL" subroutine, writes SAS2H input decks for all statepoint calculations other than the initial statepoint calculation in the initial insertion reactor cycle. The "CONTINUATION_WRITER" subroutine calls a subroutine "RETRIEVER" to access and retrieve the fuel and burnable poison, if applicable, initial charge compositions for the statepoint calculation. The "CONTINUATION_WRITER" subroutine generates SAS2H input decks utilizing the appropriate depleted compositions such that the fuel assembly depletion and decay history continues uninterrupted.

The subroutine "CUTTER", as previously mentioned in relation to the "EXECUTION_CONTROL" subroutine, creates a CRC depletion output file for each statepoint. The file created by "CUTTER" contains the time/date stamp printed in the SAS2H output, the echoed SAS2H input deck for the statepoint calculation printed in the SAS2H output, and the pertinent section of the final ORIGEN output from the SAS2H output containing the desired depleted and decayed fuel and burnable poison isotopic concentrations. The CRC depletion output files created by "CUTTER" are identified by the same base filename identifier as the SAS2H statepoint calculation to which they apply followed by a ".cut" suffix. The CRAFT generated filenames are described in detail in Section 8.

The subroutine "RETRIEVER" reads through the appropriate "*.cut" file to obtain the fuel and burnable poison initial charge compositions for the next SAS2H calculation as previously mentioned in relation to the "CONTINUATION_WRITER" subroutine. Additionally, the "RETRIEVER" subroutine writes a file which contains a listing of all isotopes and their concentrations which were present in the ORIGEN output of the SAS2H calculation, but not utilized in the initial charge composition of the next SAS2H calculation. This file is identified by the base filename identifier corresponding to the SAS2H case which is being generated followed by a "*.notes" suffix. The CRAFT generated filenames are described in detail in Section 8.

Figure 3-1. Calculation Flow Diagram for CRAFT, Version 5



4. CRAFT Subroutine Descriptions

The CRAFT software routine is organized into 14 subroutines. Each of the subroutines has a specific responsibility in performing a CRAFT calculation. The following sections provide descriptions of the structure and task of each subroutine. The subroutines comprising the CRAFT software routine include the following:

1) Main program block--
"PROGRAM CRAFT"
2) Reactor and problem data acquisition subroutine--
"DATA_AQUISITION"
3) Assembly height standardization subroutine--
"STD_HEIGHT"
4) Fuel temperature input nodal format conversion subroutine--
"FUELTEMP_FORMAT"
5) Moderator specific volume input nodal format conversion subroutine--
"MODSPECVOL_FORMAT"
6) Burnup input nodal format conversion subroutine--
"BURNUP_FORMAT"
7) Nodal power calculation subroutine--
"POWER_CALCS"
8) Units conversion subroutine--
"UNITS_CONVERSION"
9) SAS2H input deck creation and execution control subroutine--
"EXECUTION_CONTROL"
10) Standard beginning of assembly life SAS2H input deck writing subroutine--
"STANDARD_WRITER"
11) Continuation SAS2H input deck writing subroutine--
"CONTINUATION_WRITER"
12) CRC statepoint depletion/decay output file generator subroutine--
"CUTTER"
13) Fuel and burnable poison composition retrieval subroutine--
"RETRIEVER"
14) Two digit integer conversion utility subroutine.--
"ZEROS"

4.1. Program CRAFT

The main program block is the orchestrator of the CRAFT calculation. The purpose of the main program block is to define fixed data sets and initiate the sequential execution of appropriate subroutines to perform the CRAFT calculation. The subroutines initiated by the main program block of the CRAFT software routine include the following, in order of initiation-- DATA_AQUISITION, STD_HEIGHT, FUELTEMP_FORMAT, MODSPECVOL_FORMAT, BURNUP_FORMAT, POWER_CALCS, UNITS_CONVERSION, and EXECUTION_CONTROL.

4.2. DATA_AQUISITION Subroutine

A sufficient description of the DATA_AQUISITION subroutine is provided in Section 3. A detailed description of the CRAFT input deck format is provided in Sections 5 and 7.

4.3. STD_HEIGHT Subroutine

This subroutine standardizes all assembly total active fuel heights as specified in the user-defined input to the standard assembly active fuel height being utilized in the CRC evaluation. The active fuel height standardization calculation performed on the various input data requires the adjustment of input data nodal heights. The input data nodal height adjustment is performed by multiplying each input data node height by a factor equal to the ratio of the CRC assembly total active fuel height to the input data assembly total active fuel height. This calculation is summarized in the following equation--

$$\textit{Standardized Input Node Height} = \textit{Original Input Node Height} * \left(\frac{\textit{CRC Assembly Total Active Fuel Height}}{\textit{Input Data Assembly Total Active Fuel Height}}\right)$$

All nodal input data which is a constituent of a complete set of assembly input data is adjusted using the equation above such that all sets of assembly input data have the same total active fuel height corresponding to the prescribed CRC total active fuel height.

4.4. FUELTEMP_FORMAT, MODSPECVOL_FORMAT, and BURNUP_FORMAT Subroutines

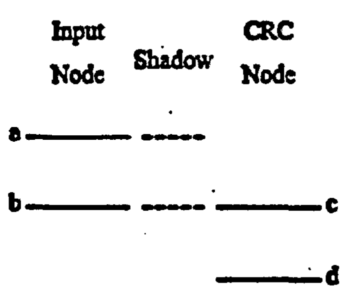
These subroutines standardizes all nodal input data such that there exists a one-to-one correspondence between input data values and CRC axial nodes. This basically means that the assembly axial node formats in which the input data is provided are adjusted such that they identically match the prescribed CRC axial node format. Appropriate averaging of the nodal input data values must be performed to adjust the input parameter nodal formats to the CRC nodal format. A nodal shadowing technique is used to calculate appropriate nodal average input values corresponding to the specified CRC nodal format using the data as provided in the arbitrary input nodal formats. The shadowing technique consists of determining which input data axial nodes shadow a particular CRC axial node. The relative shadowing contributions from the input data nodes upon the CRC axial node are used to determine the appropriate average input value for the CRC axial node. Average input data values for fuel temperature, moderator specific volume, and burnup are determined for each CRC axial node using each set of assembly input data provided in the CRAFT input deck.

The method for implementing the nodal shadowing technique consists of determining all of the possible combinations of input axial node to CRC axial node shadows that may exists. Three classes of input axial node to CRC axial node shadows are defined:

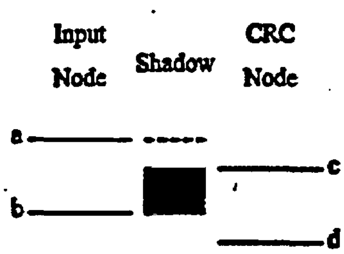
1) shadows created by input axial nodes which are the same height as the CRC axial nodes
2) shadows created by input axial nodes which are smaller than the CRC axial nodes
3) shadows created by input axial nodes which are larger than the CRC axial nodes.

Determining the average input parameter for a given CRC axial node requires that the input data values in the nodes which contribute to the average input data value for the CRC axial node be averaged appropriately. This averaging requires the determination of the relative weight which should be attributed to each of the contributing input data values. The shadowing technique determines the relative contribution of each input data axial node to the average input data value for the CRC axial node by weighting the input data values by their relative shadow contributions. The nodal shadowing descriptions below demonstrate how the contribution from each input data node to a CRC axial node is calculated. The CRAFT software routine calculates an average input data value for each CRC axial node by summing the contributions from all input data nodes which shadow the CRC axial node. This averaging process is performed for all fuel temperature input data, moderator specific volume input data, and burnup input data.

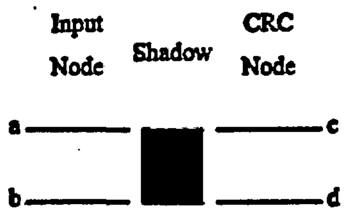
Shadows created by input axial nodes which are the same height as the CRC axial nodes--



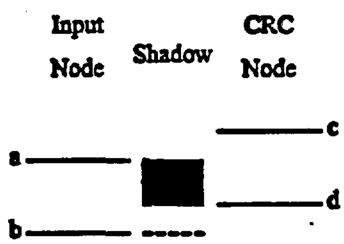
No Contribution from the Input Node to the CRC Node



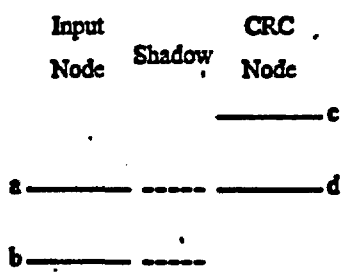
Input Node Contribution to CRC Node $= \left(\frac{b-c}{d-c}\right) * (\text{Input Data Value})$



Input Node Contribution to CRC Node $= (\textit{Input Data Value})$

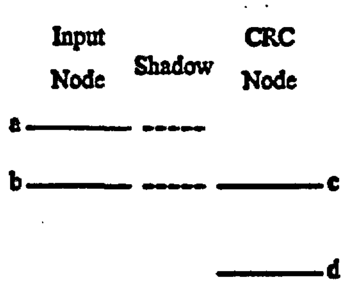


Input Node Contribution to CRC Node $= \left(\frac{d-a}{d-c}\right) * (\textit{Input Data Value})$

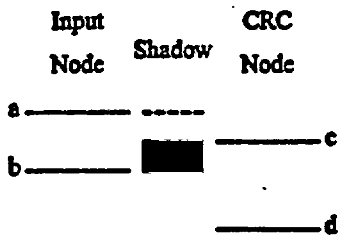


No Contribution from the Input Node to the CRC Node

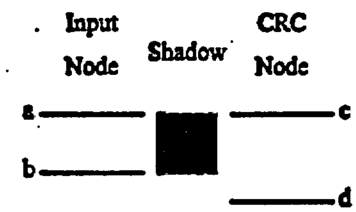
Shadows created by input axial nodes which are smaller than the CRC axial nodes--



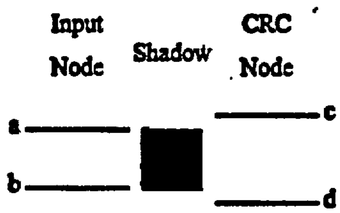
No Contribution from the Input Node to the CRC Node



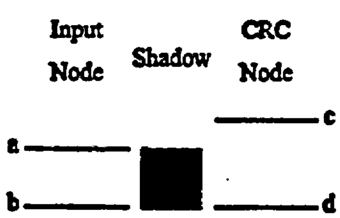
$$\text{Input Node Contribution to CRC Node} = \left(\frac{b-c}{d-c}\right) * (\text{Input Data Value})$$



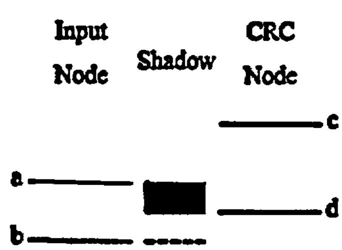
$$\text{Input Node Contribution to CRC Node} = \left(\frac{b-a}{d-c}\right) * (\text{Input Data Value})$$



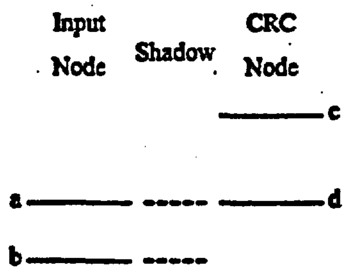
$$\text{Input Node Contribution to CRC Node} = \left(\frac{b-a}{d-c}\right) * (\text{Input Data Value})$$



$$\text{Input Node Contribution to CRC Node} = \left(\frac{b-a}{d-c}\right) * (\text{Input Data Value})$$

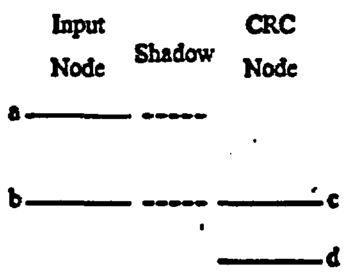


$$\text{Input Node Contribution to CRC Node} = \left(\frac{d-a}{d-c}\right) * (\text{Input Data Value})$$

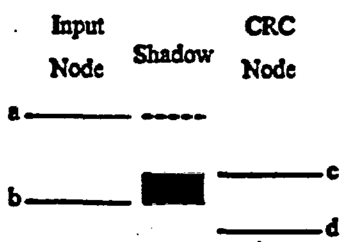


No Contribution from the Input Node to the CRC Node

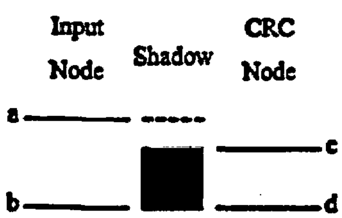
Shadows created by input axial nodes which are larger than the CRC axial nodes--



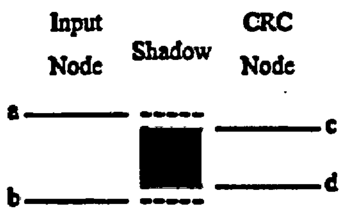
No Contribution from the Input Node to the CRC Node



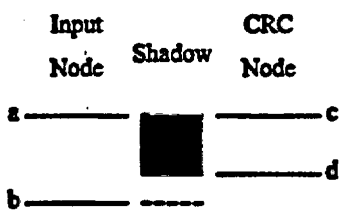
Input Node Contribution to CRC Node $=\left(\frac{b-c}{d-c}\right)*$ *(Input Data Value)*



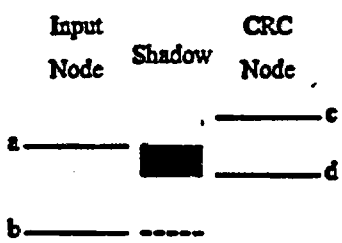
Input Node Contribution to CRC Node = (Input Data Value)



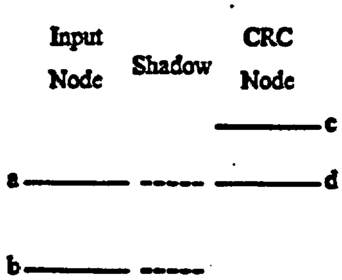
Input Node Contribution to CRC Node = (*Input Data Value*)



Input Node Contribution to CRC Node = (*Input Data Value*)



$$\textit{Input Node Contribution to CRC Node} = \left(\frac{d-a}{d-c}\right) * (\textit{Input Data Value})$$



No Contribution from the Input Node to the CRC Node

4.5. POWER_CALCS Subroutine

This subroutine calculates the average nodal power to be applied to each CRC axial node in the CRAFT generated statepoint calculations. The average nodal powers are calculated in megawatts using the average nodal burnup during the entire statepoint calculation, the initial uranium mass in the node, and the duration which the statepoint calculation covers in EFPD. The following equation shows how an average nodal power is calculated for a given statepoint calculation.

$$\text{Average Nodal Power (MW)} = \begin{array}{c}\text{(Average Nodal Burnup} \\ \text{During Statepoint Calculation in GWd/MTU)} * \\ \text{(Initial Uranium Mass in Node in Grams)} * \\ \left(\frac{1}{\text{Duration of Calculation in EFPD}}\right) * \\ \left(\frac{1}{1000}\right)\end{array}$$

where,

$$\text{Initial Uranium Mass in Node} = \begin{array}{c}\text{(Initial Uranium Mass in Assembly)} * \\ \left(\frac{\text{CRC Node Height}}{\text{CRC Total Active Fuel Height}}\right)\end{array}$$

An average nodal power in units of megawatts is calculated for each node of the assembly for each statepoint calculation. The average nodal power is constant for a given node during a given statepoint calculation. The average nodal powers are not adjusted between the irradiation steps of a given SAS2H calculation. The use of the average nodal burnup in the determination of the average nodal power results in a final total burnup for the node which is equivalent to the node's total average burnup.

4.6. UNITS_CONVERSION Subroutine

This subroutine converts all of the CRC formatted fuel temperature input data from units of degrees Fahrenheit to units of degrees Kelvin. The following equation is used to make this units conversion.

$$\text{Temperature (K)} = \left[(\text{Temperature (F)} - 32.0) * \left(\frac{5}{9}\right)\right] + 273.15$$

This subroutine also converts the CRC formatted moderator specific volume input data from units of cubic feet per pound to density input data in units of grams per cubic centimeter. The following equation is used to make this conversion. The (1/62.42691) conversion factor appearing in the following equation is obtained from conversion data in reference 3.

$$\text{Density } (g/cm^3) = \frac{1}{(\text{Specific Volume } (ft^3/lb)) * (62.42691)}$$

This subroutine also calculates the CRC formatted moderator temperature input data in units of degrees Fahrenheit using linear interpolation in the following density versus temperature versus pressure table for subcooled water shown in Table 4.6-1. Table 4.6-1 is obtained from the SCALE-4.3 user documentation (Ref. 1, p. S2.5.12).

Table 4.6-1
Density (g/cm³) of Subcooled Water at Various Temperatures and Pressures

	Pressure, psia

680	0.5559								

Once the moderator temperature is determined in degrees Fahrenheit, the same units conversion equation previously described for use with the fuel temperature data is used to convert the moderator temperature to degrees Kelvin.

The CRAFT software routine utilizes a standard linear interpolation scheme to determine the moderator temperature values once the pressure and density are known. Linear interpolation is performed using the following equation:

$$\frac{\textit{Target Value} - x_1}{\textit{Reference Value} - y_1} = \frac{x_2 - x_1}{y_2 - y_1}$$

where,

Target Value = the value for which the interpolation is being performed to obtain;
Reference Value = the known value which has a one - to - one correspondence to the Target Value;
x_1 = the target parameter value displayed in the table which corresponds to y_1;
x_2 = the target parameter value displayed in the table which corresponds to y_2;
y_1 = the reference parameter value displayed in the table which is the largest value less than the Reference Value;
y_2 = the reference parameter value displayed in the table which is the smallest value greater than the Reference Value.

The UNITS_CONVERSION subroutine utilizes the following procedure to perform the linear interpolation:

1) Determine which two adjacent columns of densities in the table correspond to pressures which bound the user-defined system pressure.
2) Linear interpolate between each of the columns defined in step 1 for each row of the table to create a new density column which corresponds to the system pressure.
3) Determine which two adjacent rows in the new density column created in step 2 correspond to densities which bound the calculated moderator density.
4) Linear interpolate between the two bounding density rows to determine the moderator temperature which corresponds to the system pressure and moderator density.

Once the moderator temperatures are calculated in degrees Kelvin for each of the CRC nodes in each statepoint calculation, the UNITS_CONVERSION subroutine's duties are complete.

4.7. EXECUTION_CONTROL Subroutine

A description of the EXECUTION_CONTROL subroutine is provided in Section 3.

4.8. STANDARD_WRITER Subroutine

This subroutine generates all SAS2H input decks which correspond to BOC to statepoint 2 depletion cases for the initial insertion cycle of the fuel assembly in the reactor. The SAS2H input decks created by the STANDARD_WRITER subroutine contain all fresh fuel. A detailed explanation of how to develop a SAS2H input deck to perform a fuel assembly depletion and decay calculation is provided in reference 1. The purpose of this discussion is not to explain how to develop a SAS2H input deck, but to explain the general format of the CRAFT generated SAS2H input decks.

The SAS2H input decks generated by the CRAFT software routine incorporate a general format consisting of the following five sections:

1) identification and Global Comment Section;
2) material Specification Section;
3) base Fuel Assembly Lattice Specification Section;
4) SAS2H Control Specifications and Unit Cell Models Section;
5) irradiation History Specification Section.

4.8.1. Identification and Global Comment Section

The first line of every SAS2H input deck relevant to CRC evaluations contains the SAS2H control module identifier and the "skipshipdata" parameter which tells the SAS2H control module not to perform an optional shielding analysis for a shipping container. The second line of every SAS2H input deck relevant to CRC evaluations is a case identification card. This card identifies the reactor in which the assembly is inserted, the relative one-eighth core symmetry assembly number, the CRC axial node to which the case pertains, the reactor cycle and statepoint at which the case begins, and the reactor cycle and statepoint at which the case ends. The third line identifies the cross section library which is utilized in the SAS2H calculation. The ENDF/B-V based 44-group cross section library is currently the suggested library for use in all CRAFT calculations relevant to CRC analyses. The remainder of the Identification and Global Comment Section contains general comments related to the SAS2H calculation.

4.8.2. Material Specification Section

The material specification section defines the fuel composition, the burnable poison composition, the control rod absorber material composition, the axial power shaping rod absorber material composition, the moderator composition, the fill gas composition, the fuel cladding composition, and other cladding compositions for use in either BPRA's, CRA's, or APSRA's. Only the material compositions necessary for use in a given CRAFT generated SAS2H calculation are specified in the SAS2H input deck. Each material composition specification has a unique material mixture identifier. The fuel composition's material mixture number is always 1. The fuel cladding's material mixture number is always 2. The moderator's material mixture is always 3. The Al_2O_3-B_4C burnable poison's material mixture number is always 4. The helium fill gas' material mixture number is always 5. Other compositions such as control rod or axial power shaping rod absorber materials, cladding materials other than the fuel cladding material, or burnable absorber materials other than Al_2O_3-B_4C must be given unique material mixture identifier numbers greater than 5. These additional material mixture number specifications are provided by the user in the CRAFT input deck.

The material specification section defines the UO_2 fresh fuel composition for the axial node to which the CRAFT generated SAS2H calculation pertains. The UO_2 fresh fuel composition is characterized by the fuel density, fuel temperature, and weight percentages of U-234, U-235, U-236, and U-238. For fresh fuel SAS2H cases, a number of additional isotopes are specified in trace amounts in the fuel composition to assure that their buildup and decay is tracked during the depletion calculation. Table 4.8.2-1 contains a listing of the trace isotopes which are always specified as each having a concentration of 1E-21 atoms/b-cm in the fresh fuel composition.

Table 4.8.2-1
Trace Isotopes Specified in Fresh Fuel Compositions

Several of the additional material composition specifications that must be provided in the SAS2H input decks include cladding materials for either fuel rods, control rod assemblies, axial power shaping rod assemblies, or burnable poison rod assemblies. The cladding materials available for specification include ZIRC-4, INCONEL, SS316, SS316S, SS304, and SS304S. The SS316/SS316S and SS304/SS304S materials are delineated by the use of two special weighting functions. The special weighting functions affect the generation of multigroup cross-sections for iron, nickel, and chromium. One of the special weighting functions corresponds to $1/E\ \sigma_t(E)$, where $\sigma_t(E)$ is the total cross-section of the stainless steel material. In the other special weighting function, $\sigma_t(E)$ is the total cross-section for the referenced nuclide. The stainless steel material identifiers ending in "S" use the weighting function where $\sigma_t(E)$ is the total cross-section for the referenced nuclide. The compositions and SCALE nuclide identifiers for the various cladding material compositions are shown in Table 4.8.2-2.

Table 4.8.2-2
Cladding Material Compositions Available in the CRAFT Software Routine

* These SCALE nuclide identifiers refer to the special 1/E $\sigma_t(E)$ weighted multigroup cross sections.

Once the fuel material specification is complete, the fuel cladding material specification is defined. The fuel cladding material may be either ZIRC-4, INCONEL, SS316, SS316S, SS304, or SS404S. The compositions of these materials are hard-wired in the CRAFT software routine. The user is required to define an average fuel cladding temperature that will be applied to all fuel cladding material specifications.

The moderator material specification may contain homogenized spacer grid materials and/or soluble boron. The appropriate CRAFT calculated moderator density and temperature values are utilized in the moderator material composition description. The soluble boron concentration corresponding to the first irradiation step of the SAS2H case is used to define the base soluble boron content in the moderator composition. The soluble boron concentrations in each of the irradiation steps of the SAS2H calculation are defined by specifying a fraction of the initial boron concentration specified in the base moderator material composition description. The material and volume fraction of spacer grids displacing moderator in the fuel assembly are specified by the user in the CRAFT input deck. The spacer grid materials available for specification include ZIRC-4, INCONEL, SS316, SS316S, SS404, and SS404S. The spacer grids are homogenized in the moderator composition based on the volume fraction of spacer grids in the moderator that is specified in the CRAFT input deck. The sum of the volume fractions of spacer grid material and moderator material (light-water) should equal unity.

If the fuel assembly contains a BPRA during the CRAFT generated SAS2H calculation, the material specifications for the BPR cladding and burnable poison material are specified. The BPR cladding may be designated as either ZIRC-4, INCONEL, SS316, SS316S, SS304, and SS304S. The default burnable poison material is Al_2O_3-B_4C, but any arbitrary burnable poison material may be specified. The BPR cladding and burnable poison material compositions are given the same temperature as the moderator.

If the fuel assembly contains a CRA or APSRA during the CRAFT generated SAS2H calculation, the material specifications for the CR or APSR cladding and absorber material are specified. The CR or APSR cladding may be designated as either ZIRC-4, INCONEL, SS316, SS316S, SS304, and SS304S. The CR or APSR cladding and absorber material compositions are given the same temperature as the moderator.

The fuel rod fill gas material is always specified as helium. The helium material temperature is allowed to default to 293 degrees Kelvin.

4.8.3. Base Fuel Assembly Lattice Specification Section

The base fuel assembly lattice specification section describes the fuel assembly configuration and specifies special control parameters that are to be utilized in performing the XSDRNPM calculations associated with the CRAFT generated SAS2H calculation. The fuel assembly lattice specification includes a "squarepitch" designator which tells SAS2H that the fuel assembly is a square array of unit cells with a constant pitch. The fuel rod pitch, fuel pellet outer diameter, fuel rod cladding inner diameter, and fuel rod cladding outer diameter are specified. The number of fuel rods per fuel assembly and active fuel length are also specified. The active fuel length represents the fuel stack height for the CRC node that the CRAFT generated SAS2H calculation represents. The special parameters that allow more control over the XSDRNPM calculation are described in Section 7. One special control parameter is always specified in the CRAFT generated SAS2H calculations. This parameter is designated "szf", and represents the spatial mesh factor for use in defining the XSDRNPM one-dimensional transport calculations.

4.8.4. SAS2H Control Specifications and Unit Cell Models Section

The SAS2H control specifications and unit cell models are provided in this section of the SAS2H input deck. The control specifications for SAS2H include the number of irradiation steps in the calculation, the number of cross-section libraries to be specified per irradiation step, and the SAS2H output print level. The unit cell model specification includes the following:

1) the unit cell model input level;
2) the number of radial zones to be specified in all unit cells of the SAS2H calculation;
3) the moderator material mixture number in the unit cell models;
4) the XSDRNPM spatial mesh factor;
5) the signal to specify if a single unit cell model description will be provided for all irradiation steps or if multiple unit cell model descriptions will be provided to accommodate each irradiation step.

4.8.5. Irradiation History Specification Section

The irradiation history specification section includes the following data for each irradiation step:

1) the assembly (node) power in megawatts;
2) the irradiation step burn duration in calendar days;
3) the down time following the irradiation step in calendar days;
4) the fraction of the soluble boron concentration specified in the base moderator material composition that corresponds to the average soluble boron concentration in the moderator over the duration of the irradiation step.

The irradiation history specification section is always the final section in CRAFT generated SAS2H input decks.

4.8.6. Calculations Performed by the STANDARD_WRITER Subroutine

- The density of UO_2 in the fresh fuel composition is calculated by the STANDARD_WRITER subroutine based on the initial mass loading of uranium in the assembly. The initial mass loading of uranium in an axial node is calculated using the following equation.

$$\textit{Initial Uranium Mass in Node} = (\textit{Initial Uranium Mass in Assembly}) * \left(\frac{\textit{CRC Node Height}}{\textit{CRC Total Active Fuel Height}}\right)$$

The mass of oxygen in the UO_2 of the node must be calculated after the initial uranium mass in the node is determined. The following equation is used to calculate the mass of oxygen in the fuel. The weight percentages of the uranium isotopes (U-234, U-235, U-236, and U-238) are calculated using the equations presented in the next bulleted calculation.

$$Oxygen\ Mass\ in\ UO_2 = \frac{[(Mass\ of\ Uranium\ in\ UO_2)*(2)*(15.994915)*(100)]}{[(wt\%\ U^{235})*(235.043915)+(wt\%\ U^{234})*(234.040904)+(wt\%\ U^{236})*(236.045637)+(wt\%\ U^{238})*(238.05077)]}$$

The mass of UO_2 in the axial node is then calculated by summing the mass of the uranium in the axial node and the mass of oxygen in the axial node.

The fuel volume in the axial node must be calculated prior to calculating the fuel density. The fuel volume is calculated using the following equation.

$$\begin{matrix}Fuel\ Volume \\ in\ Axial\ Node\end{matrix} = (\frac{\pi}{4})*(Fuel\ Outer\ Diameter)^2*(Node\ Height)*(Number\ of\ Fuel\ Rods\ in\ Assembly)$$

The fuel density in the axial node is then calculated by dividing the UO_2 mass in the node by the fuel volume in the node.

- The weight percentages of the various isotopes in the uranium of the fresh UO_2 fuel composition are calculated using the following equations (Ref. 2).

$$U^{234}\ wt\% = (0.007731)*(U^{235}\ wt\%)^{1.0837}$$

$$U^{236}\ wt\% = (0.0046)*(U^{235}\ wt\%)$$

$$U^{238}\ wt\% = 100 - U^{234}\ wt\% - U^{235}\ wt\% - U^{236}\ wt\%$$

- The volume fraction of H_2O in the homogenized moderator composition must be calculated by the STANDARD_WRITER subroutine to define the moderator material composition. The following equation is used to calculate the appropriate volume fraction of H_2O.

$$\begin{matrix}Volume\ Fraction\ of\ H_2O \\ in\ Homogenized\ Moderator\ Composition\end{matrix} = 1.0 - \begin{matrix}Volume\ Fraction\ of\ Spacer\ Material \\ in\ Homogenized\ Moderator\ Composition\end{matrix}$$

- The volume fraction of soluble boron in the H_2O of the homogenized moderator composition must be calculated by the STANDARD_WRITER subroutine to define the moderator material composition. The following equation is used to calculate the appropriate volume fraction of soluble boron.

$$\begin{matrix}\textit{Volume Fraction of Soluble Boron} \\ \textit{in Homogenized Moderator Composition}\end{matrix} = \frac{\begin{pmatrix}\textit{Boron} \\ \textit{Concentration} \\ \textit{ppm}\end{pmatrix} * (1.0E-6) *}{\begin{pmatrix}\textit{Volume Fraction of } H_2O \textit{ in} \\ \textit{Homogenized Moderator Composition}\end{pmatrix}}$$

- The density of the homogenized moderator composition must be calculated by the STANDARD_WRITER subroutine to define the moderator material composition. The following equation is used to calculate the appropriately averaged homogenized moderator density in grams per cubic centimeter.

$$\begin{matrix}\textit{Density of Homogenized} \\ \textit{Moderator Composition}\end{matrix} = \begin{matrix}\left[\begin{pmatrix}\textit{Actual} \\ \textit{Moderator} \\ \textit{Density}\end{pmatrix} * \begin{pmatrix}\textit{Volume Fraction} \\ \textit{of } H_2O \textit{ in the} \\ \textit{Moderator Composition}\end{pmatrix}\right] + \\ \left[\begin{pmatrix}\textit{Actual Density} \\ \textit{of} \\ \textit{Spacer Material}\end{pmatrix} * \begin{pmatrix}\textit{Volume Fraction} \\ \textit{of Spacer Material in the} \\ \textit{Moderator Composition}\end{pmatrix}\right]\end{matrix}$$

- If the fuel assembly contains a BPRA with Al_2O_3-B_4C burnable absorber material during the irradiation history covered in a SAS2H calculation, the aluminum and oxygen weight fractions must be calculated to define the fresh burnable absorber material composition. The following equation are used to calculate the aluminum and oxygen weight fractions in Al_2O_3-B_4C.

$$\begin{matrix}\textit{Aluminum Weight} \\ \textit{Fraction in } Al_2O_3-B_4C\end{matrix} = \frac{\left(\frac{100-B_4C \textit{ wt\% in } Al_2O_3-B_4C}{100}\right) * (\textit{Density of } Al_2O_3-B_4C)^{?} *}{(2) * (26.981539) * \left(\frac{1}{101.9631}\right)}$$

$$\begin{matrix}\textit{Oxygen Weight} \\ \textit{Fraction in } Al_2O_3-B_4C\end{matrix} = 1 - \left(\frac{B_4C \textit{ wt\% in } Al_2O_3-B_4C}{100}\right) - \begin{pmatrix}\textit{Aluminum Weight} \\ \textit{Fraction in } Al_2O_3-B_4C\end{pmatrix}$$

- The soluble boron fraction must be calculated by the STANDARD_WRITER subroutine for all irradiation steps. The soluble boron fraction for a given irradiation step is calculated using the following equation.

$$\textit{Soluble Boron Fraction in Irradiation Step} = \frac{\textit{Soluble Boron ppm in Irradiation Step}}{\textit{Soluble Boron ppm in Base Moderator Composition of the SAS2H Input Deck}}$$

4.9. CONTINUATION_WRITER Subroutine

This subroutine generates all SAS2H input decks which correspond to continuation cases in which the fuel and burnable poison isotopic initial charge compositions are obtained from the output of a previous CRAFT generated SAS2H calculation. A detailed explanation of how to develop a SAS2H input deck to perform a fuel assembly depletion and decay calculation is provided in reference 1. The purpose of this discussion is not to explain how to develop a SAS2H input deck, but to explain the general format and calculations utilized by CRAFT in generating SAS2H input decks for calculations which initially contain spent fuel and burnable poison material compositions.

The format of the CRAFT generated SAS2H input decks for the continuation of a fuel assembly depletion and decay calculation relevant to CRC analyses is the same as that previously described for the standard beginning-of-life SAS2H input decks. The material specification section of the SAS2H input deck is the only input section where the continuation case differs from the standard case.

The CRAFT software routine tracks the depletion and decay of the fuel and burnable absorber materials during the fuel assembly depletion and decay calculation. The CONTINUATION_WRITER subroutine is designed to locate the appropriate fuel and burnable poison isotopic concentrations, and utilize them in developing the correct fuel and burnable poison initial charge compositions to allow for continuation of the fuel assembly depletion calculation. All calculations performed by the STANDARD_WRITER subroutine other than those related to the fuel and burnable poison material composition specifications are performed identically by the CONTINUATION_WRITER subroutine.

4.9.1. Initial Charge Fuel and Burnable Poison Material Composition Specifications

The initial charge fuel material composition specification for a continuation SAS2H calculation utilizes all available isotopic concentrations from the appropriate previous SAS2H depletion and decay calculation's output for which cross-section data is available in the SCALE 44-group library (Vol. 3, p. M4.2.19, Ref. 1) (recommended CRC cross-section library). Table 4.9.1-1 contains a listing of all the isotopes for which data is available in the 44-group cross section library.

The fuel composition is composed of the initial oxygen mass in the fresh UO_2 and the mass of each of the actinides and fission products of the depleted fuel composition which are available in the 44-group library. There are some isotopes listed in the ORIGEN output of the spent fuel composition which are not available in the 44-group library. These isotopes are excluded from the initial charge composition for the continuation of the fuel assembly depletion. A listing of all excluded isotopes and their abundance in grams per node is retained in the CRAFT generated "*.notes" file corresponding to the SAS2H calculation for which the initial charge composition is obtained. The total mass of all isotopes (including oxygen) in the fuel composition is calculated to assist in determining the weight percentages of each isotope in the composition and the density of the composition. The fuel composition is then defined as an arbitrary material specification in the SAS2H input deck with the appropriate nodal fuel temperature applied.

Excluding the isotopic concentrations (from the ORIGEN-S output), that are not available in the 44-group library, from the fuel charge composition of a subsequent depletion calculation has a negligible effect on the neutron spectrum. The neutron spectrum must be predicted correctly during the SAS2H depletion calculations to obtain the proper cell-weighting of the cross sections. For an absorber isotope to have a significant effect on the neutron spectrum, the absorber isotope must be present in a significant quantity and have a significant absorption cross-section. Three simple calculations were performed to demonstrate that the isotopes excluded from the continuation SAS2H depletion calculations (as identified in the "*.notes" files) do not effect the neutron spectrum significantly enough to result in a change in the final depleted composition. The first two of the three calculations represent a simple fuel depletion calculation that was split into parts and continued via CRAFT. The third of these calculations is a continuous calculation equivalent to the simple depletion represented by the first two calculations. The final depleted isotopic results at the end of the second calculation (the second part of the total depletion composed of the first two calculations) are identical to the final depleted isotopic results obtained from the third calculation. The SAS2H input decks for these three calculations are presented in Figure 4.9.1-1 through Figure 4.9.1-3.

The burnable poison initial charge composition for continuing a fuel assembly depletion calculation is developed using the depleted abundance of B-10 and B-11 in the burnable poison material. These depleted abundances of B-10 and B-11 are obtained from the appropriate previous SAS2H depletion and decay calculation's output. The depletion of other isotopes in the burnable poison composition are not tracked in the CRAFT calculation. The isotopes in the burnable poison material other than B-10 and B-11 are respecified in the burnable poison composition of the continuing depletion calculation with their initial abundance. The total mass of all isotopes in the burnable poison composition is calculated to assist in determining the weight percentages of each isotope in the composition and the density of the composition. The burnable poison composition is then defined as an arbitrary material specification in the SAS2H input deck with the nodal moderator temperature applied.

4.9.2. Calculations Performed by the CONTINUATION_WRITER Subroutine

- The density of the fuel composition in the CRAFT generated continuing depletion SAS2H input deck must be calculated by the CONTINUATION_WRITER subroutine. This calculation is performed by simply dividing the total mass of the charge fuel composition (including oxygen) in the node by the total fuel volume in the node. The charge fuel composition (excluding oxygen) is obtained from the appropriate previous SAS2H calculation's output. The oxygen contribution and fuel volume of the node are calculated in the same manner as previously described in the STANDARD_WRITER subroutine description.

- The weight percentages of each isotope in the depleted initial charge compositions for the fuel and burnable poison are calculated by using the following equation.

$$\begin{array}{c}\textit{Weight Percent}\\ \textit{of Constituent in Material}\end{array} = \frac{\textit{Mass of Constituent}}{\textit{Total Material Mass}} * 100$$

- The default burnable poison material is Al_2O_3-B_4C. If this burnable poison material is specified for use in the BPRA of a continuing depletion calculation, the initial mass abundance of the aluminum, oxygen, and carbon in the fresh material must be calculated for use is defining the depleted burnable material composition for the continuation case. The first step in calculating the mass abundance of these elements is to use the following equation to calculate the mass of B_4C in the Al_2O_3-B_4C material in the node.

$$\text{B}_4\text{C Mass in Node} = \left(\frac{\text{B}_4\text{C wt\% in Al}_2\text{O}_3 - \text{B}_4\text{C}}{100}\right) * \left(\text{Density of Al}_2\text{O}_3 - \text{B}_4\text{C}\right) * \left(\text{Burnable Poison Volume in Node}\right)$$

The carbon mass in the Al_2O_3-B_4C material of the node may then be calculated using the following equation.

$$\text{Carbon Mass in Al}_2\text{O}_3 - \text{B}_4 = (\text{B}_4\text{C Mass in Node}) * (0.217374)$$

The aluminum mass in the Al_2O_3-B_4C of the node is calculated using the following equation.

$$\text{Aluminum Mass in Al}_2\text{O}_3 - \text{B}_4\text{C} = \left(\frac{100 - \text{B}_4\text{C wt\%}}{100}\right) * \left(\text{Density of Al}_2\text{O}_3 - \text{B}_4\text{C}\right) * \left(\text{Burnable Poison Volume in Node}\right) * \left(\frac{2 * 26.981539}{101.961278}\right)$$

The oxygen mass in the Al_2O_3-B_4C of the node is calculated using the following equation.

$$\text{Oxygen Mass in Al}_2\text{O}_3 - \text{B}_4\text{C} = \left[\left(\frac{100 - \text{B}_4\text{C wt\%}}{100}\right) * \left(\text{Density of Al}_2\text{O}_3 - \text{B}_4\text{C}\right) * \left(\text{Burnable Poison Volume in Node}\right)\right] - \left(\text{Aluminum Mass in Al}_2\text{O}_3 - \text{B}_4\text{C}\right)$$

The total mass of the Al_2O_3-B_4C material in the node for the continuation case is the sum of the aluminum, oxygen, and carbon masses calculated from the fresh burnable poison description, plus the depleted B-10 and B-11 masses in the burnable poison of the node obtained from the appropriate previous SAS2H depletion and decay calculation's output. The volume of the burnable poison material in the node must be calculated using the following equation for use in calculating the density of the depleted burnable poison material.

$$\text{Volume of Burnable Poison in Node} = \left(\text{Burnable Poison Cross Sectional Area in a BPR}\right) * \left(\text{Number of BPRs in Assembly}\right) * (\text{Node Height})$$

where the burnable poison cross sectional area is defined in the CRAFT input deck

The density of the depleted burnable poison for the continuing depletion SAS2H case is calculated by dividing the total mass of the depleted burnable poison material in the node by the burnable poison volume in the node. The weight percentages of the constituents of the Al_2O_3-B_4C material are calculated and used by CRAFT in generating the SAS2H input deck.

- The CRAFT software routine has the ability to model burnable poison materials other than Al_2O_3-B_4C. If a burnable poison material other than Al_2O_3-B_4C is specified, the CONTINUATION_WRITER subroutine must calculate the appropriate depleted composition for the continuing depletion SAS2H case. The first step in determining the depleted burnable poison material composition is to calculate the total mass of the depleted burnable poison in the node using the following equation.

$$\begin{matrix}\text{Depleted Burnable}\\ \text{Poison Total Mass}\\ \text{in Node}\end{matrix} = \sum_{\substack{\text{All Isotopes}\\ \text{Other Than}\\ \text{B-10 and B-11}}} [(\frac{\text{Isotope wt\%}}{100})*(\begin{matrix}\text{Original Burnable}\\ \text{Poison Density}\end{matrix})] + \begin{matrix}\text{B-10 and B-11 Mass}\\ \text{in Node from Previous}\\ \text{Depletion Calculation}\end{matrix}$$

The density of the depleted burnable poison composition is then calculated by dividing the total depleted burnable poison mass in the node by the total burnable poison material volume in the node.

The weight percents of the constituents of the burnable poison composition other than B-10 and B-11 are calculated using the following equation.

$$\begin{matrix}\text{Weight Percent of}\\ \text{Constituent in}\\ \text{Burnable Poison other}\\ \text{than B-10 and B-11}\end{matrix} = \frac{(\frac{\text{Original wt\% of Constituent}}{100})*(\begin{matrix}\text{Original Burnable}\\ \text{Poison Density}\end{matrix})*(\begin{matrix}\text{Burnable Poison}\\ \text{Volume in Node}\end{matrix})}{\text{Total Mass of Depleted Burnable Poison in Node}}*100$$

The weight percentages of the constituents of the burnable poison material are calculated and used by CRAFT in generating the SAS2H input deck.

4.10. CUTTER Subroutine

The cutter subroutine creates a consolidated output file for each CRAFT generated SAS2H calculation. This output file contains the time/date stamp from the SAS2H calculation output file, the echo of the SAS2H input deck from the SAS2H output file, and the portion of the final ORIGEN calculation's output produced as part of the SAS2H calculation which contains the light element, actinide, and fission product material compositions relevant to CRC evaluations. The output files generated by the CUTTER subroutine contain the statepoint calculation's base filename followed by the "*.cut" suffix. Section 8 contains a detailed description of the CRAFT generated filenames.

4.11. RETRIEVER Subroutine

The RETRIEVER subroutine reads through the appropriate "*.cut" file to obtain the fuel and burnable poison initial charge compositions for the next SAS2H calculation. Additionally, the RETRIEVER subroutine writes a file which contains a listing of all isotopes and their concentrations which were present in the ORIGEN output of the SAS2H calculation, but not utilized in the initial charge composition of the next SAS2H calculation. This file is identified by the initial filename identifier corresponding to the SAS2H case which is being generated followed by a "*.notes" suffix. The RETRIEVER subroutine calculates the total mass of the depleted fuel composition in the node which will be used as the initial charge for the next SAS2H calculation. The total oxygen mass in the node, which is calculated in the CONTINUATION_WRITER subroutine, is included in the total fuel mass calculated by RETRIEVER. The weight percentages of each isotope in the fuel composition are then calculated by RETRIEVER to be transferred through an array designation to the CONTINUATION_WRITER subroutine where they will be implemented into the appropriate SAS2H input deck.

4.12. ZEROS Subroutine

The ZEROS subroutine is a utility for converting integer values less than 100 to a two character string representation with leading zeros if necessary.

5. CRAFT Input Summary

The following table summarizes the input card formats and parameters required to perform a CRAFT calculation. The CRAFT input deck filename must be "datain".

Card Number	Special Notes	Card Format	Card Description
1		1 Character, 1 Character	Pick Up Case Flag [Y = pick up from a previous statepoint, any other character = start from the beginning of the case], Input Deck Check Flag [Y=check, any other character = execute]
1A	★	Integer	Relative cycle number at which to begin the calculation {If Input Card (IC) 1 = "Y"}
1B	★	Integer	Relative statepoint number within the startup cycle at which to begin the calculation {If IC 1 = "Y"}
2		21 Characters	Problem identifier (i.e., Crystal River, Unit 3)
3		3 Characters	Problem prefix to be used as an identifier in all filenames
3A		3 Characters	Reactor Type ("PWR" or "BWR")
4		15 Characters	SCALE cross-section library to be utilized by SAS2H
5		Real	wt% U-235 enrichment in UO_2
6		Real	Mass of U per assembly (g)
7		Real	Number of fuel rods in assembly
8		Real	Rod pitch in assembly (cm)
9		Real	Fuel pellet diameter (cm)
10		Real	Fuel rod cladding inner diameter (cm)
11		Real	Fuel rod cladding outer diameter (cm)
12		Real	Active fuel length (cm)

Card Number	Special Notes	Card Format	Card Description
13		1 Character	[Y] to indicate that the assembly contains axial blanket fuel, any other character equals alternative
13A	★	Real	wt% U-235 enrichment in UO_2 for axial blanket fuel {If IC 13 = "Y"}
13B	★	Integer	Number of CRC axial nodes containing axial blanket fuel {If IC 13 = "Y"}
13C	★, ℜ	Integer	CRC axial node number(s) (1=top node) containing axial blanket fuel {If IC 13 = "Y"}
14		7 Characters	Spacer grid material identification (ZIRC-4, INCONEL, SS304, SS304S, SS316, SS316S)
14A		Real	Volume fraction of spacer grids in the moderator of the fuel assembly
15		10 Characters	Fuel cladding material identification (ZIRC-4 or ZIRCALLOY4, SS304, SS304S, SS316, SS316S)
15A		Real	Average fuel cladding temperature (K)
16		1 Character	[Y] to indicate if a cladding specification other than Zirc-4 is required by any CR, BPR, or APSR
16A	★	Integer	Total number of special cladding material compositions to be specified other than Zirc-4 {If IC 16 = "Y"}
16B	★, ℜ	Integer	Material mixture number to be used in SAS2H calculations for special cladding composition {If IC 16 = "Y"}
16C	★, ℜ	6 Characters	Special cladding material identification (INCONEL, SS304, SS304S, SS316, SS316S) {If IC 16 = "Y"}
17		Real	System pressure (psia) {Input this card only for PWR}
17A		Real	Reference moderator density (g/cc) {Input this card only for BWR}

Card Number	Special Notes	Card Format	Card Description
17B		Real	Reference moderator temperature (K) {Input this card only for BWR}
17C		Integer	Number of guide tube axial sections
17D		Integer, Integer	Guide tube axial section top node number, Guide tube axial section bottom node number (Must be input from top to bottom.)
18		1 Character	[Y] to indicate if the assembly ever contains a BPRA, any other character equals alternative
18A	★	Integer	Number of reactor cycles in which the assembly contains a BPRA {If IC 18 = "Y"}
18B	★	Integer, Integer	Number of different BPRA designs inserted in assembly throughout its irradiation history, Number of BP material used other than Al_2O_3-B_4C {If IC 18 = "Y"}
18C	★, ℜ	Real, Real, Real, Integer, Integer, Integer	Density of burnable poison (g/cc), B_4C wt% in burnable poison, Cross-sectional area of burnable poison in BPR (cm^2), Number of BPR's in BPRA, SAS2H material mixture number for BPR cladding, SAS2H material mixture number for BP material {If IC 18 = "Y"}
18D	★, ℜ	Integer	Number of radial zones in BPRA Path B model {If IC 18 = "Y"}
18E	★, ℜ	Integer, Real	Material mixture number for zone of BPRA Path B model, Outer radii (cm) for zone of BPRA Path B model (This combination must be specified from inner zone to outer zone.) {If IC 18 = "Y"}
18F	★, ℜ	Integer, Real	Material mixture number for zone of Path B model with removed BPRA, Outer radii (cm) for zone of Path B model with removed BPRA (This combination must be specified from inner zone to outer zone.) {If IC 18 = "Y"}

Card Number	Special Notes	Card Format	Card Description
18G	★, ℜ	Integer, Real	Material mixture number for zone of Path B model for BPRA region above the BP absorber region, Outer radii (cm) for zone of Path B model for BPRA region above the BP absorber region (This combination must be specified from inner zone to outer zone.) {If IC 18 = "Y"}
18H	★, ℜ	5 Characters, Integer	Material in BPR above the BP absorber material (i.e., "AL2O3"), Corresponding SAS2H material mixture number {If IC 18 = "Y"}
18I	★, ℜ	Integer	Number of isotopes in material composition above the BP absorber material in the BPR {If IC 18 = "Y"} & {Value #1 of IC 18H ≠ "AL2O3"}
18J	★, ℜ	Integer, Real	SCALE nuclide identifier in material composition above the BP absorber material in the BPR, Corresponding wt% of nuclide in material composition {If IC 18 = "Y"} & {Value #1 of IC 18H ≠ "AL2O3"}
18K	★	Integer	SAS2H material mixture number to be used for the BP material specified in 18L and 18M {If IC 18 = "Y"} & {Value #2 of IC 18B > 0}
18L	★	Integer	Number of isotopes in the BP absorber material mixture {If IC 18 = "Y"} & {Value #2 of IC 18B > 0}
18M	★, ℜ	Integer, Real	SCALE nuclide identifier in BP absorber material mixture, wt% for nuclide in mixture {If IC 18 = "Y"} & {Value #2 of IC 18B > 0}
18N	★, ℜ	Integer, Integer, Integer, Integer	Relative cycle number containing BPRA, Relative BPRA design number, Top axial node containing BPRA, Bottom axial node containing BPRA {If IC 18 = "Y"}
19		Integer	Number of radial zones in standard Path B model

Card Number	Special Notes	Card Format	Card Description
20	ℜ	Integer, Real	Material mixture number for zone of standard Path B model, Outer radii (cm) for zone of standard Path B model (This combination must be specified from inner zone to outer zone.) (This card must be repeated for each guide tube axial section.)
21		Integer	Number of cross-section libraries to be created per irradiation step
22		Integer	SAS2H print level
23		Real	Zone mesh factor for use by XSDRNPM
24		7 Character	[SPECIAL] to indicate the input of 7 XSDRNPM calculational control parameters to follow, any other character string indicates no XSDRNPM calculational control parameter input
24A	★	Real	XSDRNPM calculational control parameter: Spatial Mesh Factor (SZF < 1 for finer, SZF > 1 for coarser), Default = 1 {If IC 24 = "SPECIAL"}
24B	★	Integer	XSDRNPM calculational control parameter: Order of Angular Quadrature, Default = 8 {If IC 24 = "SPECIAL"}
24C	★	Integer	XSDRNPM calculational control parameter: Maximum Number of Inner Iterations, Default = 20 {If IC 24 = "SPECIAL"}
24D	★	Integer	XSDRNPM calculational control parameter: Maximum Number of Outer Iterations, Default = 25 {If IC 24 = "SPECIAL"}
24E	★	Real	XSDRNPM calculational control parameter: Overall Convergence Criteria, Default = 0.0001 {If IC 24 = "SPECIAL"}
24F	★	Real	XSDRNPM calculational control parameter: Scalar Flux Point Convergence, Default = 0.0001 {If IC 24 = "SPECIAL"}

Card Number	Special Notes	Card Format	Card Description
24G	★	Integer	XSDRNPM calculational control parameter: IUS = 1 for upscatter scaling to speed convergence, IUS = 0 for no scaling, Default = 0 {If IC 24 = "SPECIAL"}
25		Integer	Number of reactor cycles in which the assembly is inserted
26	ℜ	2 Characters	Reactor cycle identifier in which assembly is inserted
27	ℜ	Integer	Number of CRC statepoints in reactor cycle in which the assembly is inserted (BOC is always considered statepoint 1 in a cycle)
28	ℜ	Real	Statepoint EFPD
29	ℜ	Real	Length to statepoint in calendar days
30	ℜ	Real	Downtime at statepoint
31	ℜ	Real	Days of downtime at EOC
32	ℜ	Real	Total cycle length in EFPD
33	ℜ	Real	Total cycle length in calendar days
34	ℜ	Integer	Integer position of assembly in cycle
35		1 Character	Flag to signal if constant or variable irradiation step histories will be specified [Y=variable, N=constant]
36	★, ℜ	Integer	Relative cycle number to which the following boron letdown {PWR} or moderator density {BWR} data applies {If IC 35 = "N"}
37	★, ℜ	Integer	Relative statepoint number in the relative cycle to which the following boron letdown {PWR} or moderator density {BWR} data applies (BOC statepoint equals 1) {If IC 35 = "N"}
38	★, ℜ	Real	Irradiation step length in EFPD {If IC 35 = "N"}
39	★, ℜ	Real	Number of irradiation steps to next statepoint {If IC 35 = "N"}

Card Number	Special Notes	Card Format	Card Description
40	★, ℜ	Real	Mid-point ppmb concentration {PWR} or moderator density (g/cc) {BWR} for irradiation step {If IC 35 = "N"}
41	★, ℜ	Integer	Relative cycle number to which the following boron letdown {PWR} or moderator density {BWR} data applies {If IC 35 = "Y"}
42	★, ℜ	Integer	Relative statepoint number in the relative cycle to which the following boron letdown {PWR} or moderator density {BWR} data applies (BOC statepoint equals 1) {If IC 35 = "Y"}
43	★, ℜ	Real	Number of irradiation steps to next statepoint {If IC 35 = "Y"}
44	★, ℜ	Real, Real	Irradiation step length in EFPD, Mid-point ppmb concentration {PWR} or moderator density (g/cc) {BWR} for irradiation step {If IC 35 = "Y"}
45		Integer	Number of axial nodes for CRC calculation
46	ℜ	Real, Real	Node number, Node height (cm)
47		6 Characters	'RODDED' if any control rod assembly data is to be provided, any other character string equals alternative
47A	★	Integer	Number of previously defined irradiation steps in which the assembly contains a CRA {If IC 47 = "RODDED"}
47A.1	★, ℜ	Integer	Number of delimited axial assembly sections containing the CRA during the irradiation step of interest {If IC 47 = "RODDED"}

Card Number	Special Notes	Card Format	Card Description
47B	★, ℜ	Integer, Integer, Integer, Integer, Integer, Integer, Integer	Relative cycle number containing the CRA, Relative statepoint in cycle (BOC=stpt 1), Relative irradiation step number, Top axial node number containing CRA, Bottom axial node number containing CRA, CRA absorber material mixture, CRA design description number {If IC 47 = "RODDED"}
47C	★	Integer	Number of different CRA absorber material mixtures that will be specified for use in this fuel assembly {If IC 47 = "RODDED"}
47D	★, ℜ	Integer, Real {BWR ONLY}	SAS2H material mixture identifier for CRA absorber material mixture, Density of CRA absorber material mixture {BWR ONLY} {If IC 47 = "RODDED"}
47E	★, ℜ	Integer	Number of isotopes in CRA absorber material mixture {If IC 47 = "RODDED"}
47F	★, ℜ	Integer, Real	SCALE nuclide identifier in CRA absorber material mixture, wt% for nuclide in mixture {If IC 47 = "RODDED"}
47G	★	Integer	Number of different CRA designs that will be specified for use with this fuel assembly {If IC 47 = "RODDED"}
47H	★, ℜ	Real, Integer	CRA absorber material density for design, SAS2H material mixture number for CR cladding in CRA design {If IC 47 = "RODDED"}
47I	★, ℜ	Integer	Number of radial zones in the Path B unit cell model for the assembly containing CRA design {If IC 47 = "RODDED"}
47J	★, ℜ	Integer, Real	Zone mixture identifier for use in CRA design Path B unit cell model, Corresponding zone outer radii (cm) {If IC 47 = "RODDED"}

Card Number	Special Notes	Card Format	Card Description
47K	★, ℜ	Integer, Real	Zone mixture identifier for use in Path B unit cell model after the CRA is removed, Corresponding zone outer radii (cm) {If IC 47 = "RODDED"}
48		6 Characters	'RODDED' if any axial power shaping rod assembly data is to be provided, any other character string equals alternative
48A	★	Integer	Number of previously defined irradiation steps in which the assembly contains an APSR assembly {If IC 48 = "RODDED"}
48B	★, ℜ	Integer, Integer, Integer, Integer, Integer, Integer, Integer, Integer	Relative cycle number containing the APSR, Relative statepoint in cycle (BOC=stpt 1), Relative irradiation step number in cycle, Top axial node number containing APSR, Bottom axial node number containing APSR, APSR absorber material mixture number, APSR assembly design description number, APSR follow rod material mixture number {If IC 48 = "RODDED"}
48C	★	Integer	Number of different APSR assembly absorber material mixtures that will be specified for use with this fuel assembly {If IC 48 = "RODDED"}
48D	★, ℜ	Integer	SAS2H material mixture identifier for APSR assembly absorber material mixture {If IC 48 = "RODDED"}
48E	★, ℜ	Integer	Number of isotopes in APSR assembly absorber material mixture {If IC 48 = "RODDED"}
48F	★, ℜ	Integer, Real	SCALE nuclide identifier in APSR absorber material mixture, wt% for nuclide in mixture {If IC 48 = "RODDED"}
48G	★	Integer	Number of different APSR assembly designs that will be specified for use with this fuel assembly {If IC 48 = "RODDED"}

Card Number	Special Notes	Card Format	Card Description
48H	★, ℜ	Real, Integer	APSR absorber material density for APSR assembly design, SAS2H material mixture number for APSR cladding in APSRA design {If IC 48 = "RODDED"}
48I	★, ℜ	Integer	Number of radial zones in the Path B unit cell model for the assembly containing APSR assembly design {If IC 48 = "RODDED"}
48J	★, ℜ	Integer, Real	Zone mixture identifier for use in APSR assembly design Path B unit cell model, Corresponding zone outer radii (cm) {If IC 48 = "RODDED"}
48K	★, ℜ	Integer, Real	Zone mixture identifier for use in Path B unit cell model after the APSR assembly is removed, Corresponding zone outer radii (cm) {If IC 48 = "RODDED"}
48L	★, ℜ	Integer, Real	Zone mixture identifier for use in Path B unit cell model for the follow rod section of the APSR assembly, Corresponding zone outer radii (cm) {If IC 48 = "RODDED"}
49	ℜ	Integer	Number of axial nodes for fuel temperature input
50	ℜ	Real, Real	Axial node number for fuel temperature input, Corresponding axial node height (cm)
51	ℜ	Real	Axial node fuel temperature input data (F)
52	ℜ	Integer	Number of axial nodes for moderator specific volume input {PWR ONLY}
53	ℜ	Real, Real	Axial node number for moderator specific volume input, Corresponding axial node height (cm) {PWR ONLY}
54	ℜ	Real	Axial node moderator specific volume input data (ft^3/lb) {PWR ONLY}
55	ℜ	Integer	Number of axial nodes for burnup input data

Card Number	Special Notes		Card Format	Card Description
56	▓	ℜ	Real, Real	Axial node number for burnup input, Corresponding axial node height (cm)
57	▓	ℜ	Real	Axial node burnup input data (GWd/MTU)

★: The existence of these input cards is dependent on certain previous input card values. The detailed descriptions for these input cards in Section 7 explain the various dependencies.

ℜ: These are recursive input cards that must be entered multiple times in a specific grouping format. The detailed descriptions for the recursive input cards in Section 7 explain the specific grouping formats and number of required input iterations.

▓ : The continuous shaded boxes in the special notes column indicate groupings of recursive input cards. The format and content of these recursive groupings are explained in the detailed input descriptions in Section 7.

6. CRAFT Software Routine Limits and Execution Instructions

The following listing describes the CRAFT software routine limitations.

1) The maximum number of irradiation steps allowed in a given CRAFT generated SAS2H input deck is 23.
2) The maximum number of isotopes allowed in a CR or APSR absorber material specification is 10.
3) The maximum number of concentric zones allowed in a SAS2H Path B model is 15.
4) The maximum number of axial nodes allowed in any axial format is 50.
5) The maximum number of reactor cycles in which an assembly may be inserted is 10.
6) The maximum number of CRC statepoints allowed in a single reactor cycle (BOC counts as one statepoint) is 20.
7) The maximum number of BPRA design description specifications allowed is 10.
8) The maximum number of different CR absorber material mixtures allowed is 25.
9) The maximum number of CRA design description specifications allowed is 10.
10) The maximum number of axial power shaping rod (APSR) absorber material mixtures allowed is 25.
11) The maximum number of APSRA design description specifications allowed is 10.

The procedure for performing a fuel assembly depletion calculation with CRAFT, Version 5, consists of the following four steps:

1) Create a CRAFT input deck for the assembly depletion calculation.
2) Assure that the CRAFT executable file, the CRAFT input deck entitled "datain", the "batch43" executable file, and the "sedexecute" executable file are in the same directory. The "batch43" executable file is a script file which is used by CRAFT to execute the SCALE code system. An ASCII listing of the "batch43" script is shown in Table 6-1. The "sedexecute" executable file is a script file which is used in conjunction with the CRAFT software routine to create the consolidated output files described in Section 8. An ASCII listing of the "sedexecute" script is shown in Table 6-2.
3) Assure that the "sed" line editor is loaded onto the computer system and is in the command path (i.e., executable from the command line through the issuance of the "sed" command).
4) Execute CRAFT.

Table 6-1 Listing of the "batch43" Script Required for the Execution of CRAFT

```
#!/bin/csh
if ( ! ( $?SCALE ) )    setenv SCALE /opt/neut/Scale4.3
setenv CMDS $SCALE/cmds
set pid=`$CMDS/ppid`
#  Set the TMPDIR to a scratch directory for SAS2H
setenv TMPDIR /home/wright/scale4.3/tmp
if ( -e $1 ) then
  set input=$1
  set output=$1:r.output
  set msgs=$1:r.msgs
else if ( -e $1.inp ) then
  set input=$1.inp
  set output=$1.out
  set msgs=$1.msg
else if ( -e $1.input ) then
  set input=$1.input
  set output=$1.output
  set msgs=$1.msgs
else
  echo ++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++
  echo          "the input file you specified does not exist"
  echo ++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++
  exit
endif
$CMDS/scale43 $input $output >& $msgs
rm -r $TMPDIR
```

The stucture of the "batch43" script shown in Table 6-1 is only understandable if examined in the context in which it is used in the CRAFT software routine.

Table 6-2 Listing of the "sedexecute" Script Required for the Execution of CRAFT

```
print '****************************************************************************'
> $1.cut
```

```
print '*    Date and Time Validation Stamp for the Execution of the SAS2H Case     *'
>> $1.cut
print '*************************************************************************'

The structure of the "sedexecute" script shown in Table 6-1 is only understandable if examined in the context in which it is used in the "CUTTER" subroutine of the CRAFT software routine. The "sed" command issued in the "sedexecute" script initiates the execution of the sed line editor.

7. Detailed Descriptions of CRAFT Input Cards

Input Card Number		Detailed Description
1	:	The CRAFT software routine is capable of continuing an assembly depletion/decay calculation from a statepoint other than the BOC statepoint of relative cycle number one. The requirements for continuing a CRAFT calculation from an arbitrary statepoint include the following--

1) all CRAFT input for the statepoints prior to the continuation statepoint must be specified in the

Input Card Number		Detailed Description
		CRAFT input deck for the continuation calculation; 2) all "*.cut" files from the last statepoint calculation prior to the continuation statepoint, for each node, must be present in the CRAFT execution directory. If the CRAFT calculation is a continuation calculation, an uppercase letter "Y" should be placed in column 1 of this card. Otherwise, any character other than "Y" will signal that the CRAFT calculation is to begin from BOC of relative cycle number one as defined in the CRAFT input deck. The second entry is a flag to instruct CRAFT to either do an input structure check or to execute the input deck. A "Y" for the second entry should be placed in column three if an input structure check is requested. Any other character in column three instructs CRAFT to execute the input deck.
1A	:	This card should only be specified if the value of card number 1 is "Y". This card should contain an integer value representing the relative cycle number as specified in the CRAFT input deck from which the calculation should commence. The relative cycle number refers to the sequential cycle number in which the assembly is inserted. The relative cycle number is not the cycle identifier. For example, if a CRAFT calculation is to be performed for an assembly inserted in the actual reactor cycles 1 and 4, input data for the assembly would be provided to CRAFT for cycles 1 and 4, in that order. Cycle 1 would be considered relative cycle number 1, and cycle 4 would be considered relative cycle number 2.
1B	:	This card should only be specified if the value of card number 1 is "Y". This card should contain an integer value representing the relative statepoint, within the continuation relative cycle number provided on card 1A, from which the calculation should commence.
2	:	This card should contain a 21 character problem identifier which will be placed on all SAS2H input decks and echoed throughout the SAS2H output. The problem identifier must be placed in

Input Card Number		Detailed Description
		columns 1 through 21 of this card. An example of a problem identifier would be "Crystal River, Unit 3".
3	:	This card should contain a 3 character prefix which will be used as the initial 3 characters of each file generated in the CRAFT calculation. The prefix must be placed in columns 1 through 3 of this card. An example of a prefix meaningful for use with the problem identifier example previously provided would be "CR3".
3A	:	This card should contain 3 characters starting in column 1. These characters should either be "PWR" or "BWR" to identify the type of assembly.
4	:	This card should contain the identifier for the SCALE cross section library which is to be used in all of the SAS2H calculations generated by the CRAFT calculation. Available SCALE cross section libraries include the following-- 1) 44GROUPNDF5 or 44group; 2) 27BURNUPLIB; 3) 27GROUPNDF4; 4) 238GROUPNDF5; 5) HANSEN-ROACH. The 44group cross-section library is recommended for use in all CRAFT calculations relevant to Commercial Reactor Critical evaluations.
5	:	This card should contain the weight percent of U-235 in the UO_2 fuel of the assembly. This value should not be adjusted to compensate for axial blanket fuel. Axial blanket fuel descriptions provided later in the CRAFT input deck will override the enrichment specified on this card as appropriate.
6	:	This card should contain the total mass of uranium metal in the fuel assembly in units of grams per assembly.
7	:	This card should contain the number of fuel rods in the assembly.
8	:	This card should contain the rod pitch in the assembly in units of

Input Card Number		Detailed Description
		cm.
9	:	This card should contain the nominal fuel pellet diameter in the assembly in units of cm.
10	:	This card should contain the nominal fuel rod cladding inner diameter in the assembly in units of cm.
11	:	This card should contain the nominal fuel rod cladding outer diameter in the assembly in units of cm.
12	:	This card should contain the nominal active fuel length in the assembly in units of cm.
13	:	The CRAFT software routine is capable of modeling fuel assemblies which utilize axial blanket fuel designs. If the assembly utilizes an axial blanket fuel design, an uppercase letter "Y" should be placed in column 1 of this card. If the assembly does not utilize an axial blanket fuel design, any character other than "Y" should be specified.
13A	:	This card should only be specified if the value of card number 13 is "Y". This card should contain the weight percent of U-235 in the UO_2 fuel of the axial blanket region of the assembly.
13B	:	This card should only be specified if the value of card number 13 is "Y". This card should contain an integer number representing the number of CRC axial nodes that will contain the axial blanket fuel.
13C	:	This card should only be specified if the value of card number 13 is "Y". This card should contain a single integer value which identifies a CRC axial node containing axial blanket fuel. This input card must be repeated a number of times equal to the value specified on input card 13B.
14	:	This card should contain a 7 character name, beginning in column 1, which specifies the spacer grid material. The currently available spacer grid material specifications include--

1) ZIRC-4
2) INCONEL

Input Card Number		Detailed Description
		3) SS304 4) SS304S 5) SS316 6) SS316S.
14A	:	This card should contain a value representing the volume fraction of the moderated region of the fuel assembly which is displaced by spacer grid material. The sum of the moderator volume fraction and the spacer grid volume fraction should equal one. The moderator and spacer grid volumes present in the assembly-to-assembly spacing region may also be included in calculation of the spacer grid volume fraction to be input on this card.
15	:	This card should contain the identification of the fuel cladding material. The identification must be specified in columns 1 through 10. The currently available cladding material specifications include-- 1) ZIRC-4 or ZIRCALLOY4 2) INCONEL 3) SS304 4) SS304S 5) SS316 6) SS316S.
15A	:	This card should contain an average fuel rod cladding temperature value in units of degrees Kelvin that will be used consistently throughout the CRAFT generated SAS2H calculations.
16	:	The CRAFT software routine is capable of modeling CRA's, APSRA's, and BPRA's with cladding material compositions other than the default Zirc-4. If any cladding material must be specified other than the default Zirc-4, an uppercase letter "Y" should be placed in column 1 of this card. If Zirc-4 is the only cladding material utilized in the CRAFT calculation, any character other than "Y" should be specified.
16A	:	This card should only be specified if the value of card number 16 is "Y". This card should contain an integer value specifying

Input Card Number		Detailed Description
		the number of additional cladding materials to be specified other than the default cladding material Zirc-4.

Input cards 16B and 16C represent an input grouping that must be specified recursively for each cladding material as denoted on input card 16A. This means that input cards 16B and 16C would be input for the first cladding material, and then input again for the second cladding material, etc., until all of the cladding materials other than Zirc-4 which are utilized in the CRAFT calculation, as specified on input card 16A, have been described.

16B	:	This card should only be specified if the value of card number 16 is "Y". This card should contain an integer value representing the material mixture number which corresponds to a cladding material specification that may be specified in the SAS2H input decks generated by the CRAFT calculation.
16C	:	This card should only be specified if the value of card number 16 is "Y". This card should contain either a 5 or 6 character identifier corresponding to the cladding material. The cladding material identifiers currently available in CRAFT include the following– 1) SS304 2) SS304S 3) SS316 4) SS316S 5) INCONEL.
17	:	This card should contain the system pressure in units of pounds per square inch absolute (psia). This card should only be input for PWR assemblies.
17A	:	This card should contain the reference moderator density in g/cc to which all other relative density fractions will refer. This reference moderator density will be applied in the material specification of the moderator in all SAS2H calculations generated by CRAFT for the assembly. This card should only be input for BWR assemblies.
17B	:	This card should contain the reference moderator temperature in degrees Kelvin. This reference moderator temperature will be

Input Card Number		Detailed Description
		applied in the material specification of the moderator in all SAS2H calculations generated by CRAFT for the assembly. This card should only be input for BWR assemblies.
17C	:	This card should contain an integer representing the number of axial guide tube sections which have dimensions that do not correspond to adjacent guide tube axial sections. If the guide tubes have uniform dimensions along their axial length, then a 1 should be placed on this card. If the guide tubes have two sections each having different dimensions, then a 2 should be placed on this card. An so on ...
17D	:	This card should contain 2 integer values. The first value on this card should be the number of the top node representing the top of a guide axial section. The second value on this card should be the number of the bottom node representing the bottom of a guide tube axial section. Pairs of node numbers should be provided for all guide tube axial sections from the top of the guide tube to the bottom of the guide tube. This card should be input once for each guide tube axial section. This card input should be repeated the number of times identified by card 17c.
18	:	The CRAFT software routine is capable of modeling an assembly that contains a BPRA. Usually, fuel assemblies may contain a BPRA in one cycle but not in subsequent cycles. If the fuel assembly for which the CRAFT calculation is to be performed contains a BPRA in any of its specified reactor cycles, an uppercase letter "Y" should be placed in column 1 of this card. Any other character signifies that the assembly never contains a BPRA.
18A	:	This card should only be specified if the value of card number 18 is "Y". This card should contain an integer value representing the number of reactor cycles in which the fuel assembly contains a BPRA.
18B	:	This card should only be specified if the value of card number 18 is "Y". This card should contain two integer values delimited by spaces. The first value represents the number of different BPRA designs inserted in the fuel assembly during its irradiation history. The second value represents the number of

Input Card Number		Detailed Description
		BP absorber materials other than the default, Al_2O_3-B_4C, which are utilized during the irradiation of the assembly as specified in the CRAFT calculation.

Input cards 18C through 18J represent an input grouping that must be specified recursively for each BPRA design as denoted on input card 18B. This means that input cards 18C through 18J would be input for BPRA design 1, and then input again for BPRA design 2, etc., until all of the number of BPRA designs specified on input card 18B have been described.

18C	:	This card should only be specified if the value of card number 18 is "Y". This card should contain 6 values delimited by spaces. The first value should be the density of the Al_2O_3-B_4C burnable absorber material. The second value should be the weight percent of the B_4C in the Al_2O_3-B_4C absorber material. The third value should be the cross-sectional area of the burnable poison material in a single BPR. The fourth value should be the number of BPR's in the BPRA. The fifth value should be the BPR cladding material mixture number to be utilized in the CRAFT generated SAS2H calculations. The sixth value should be the BP absorber material mixture number to be utilized in the CRAFT generated SAS2H calculations.
18D	:	This card should only be specified if the value of card number 18 is "Y". This card should contain the integer number of radial zones that will be used to describe the SAS2H Path B model for the assembly node containing the BPRA.

Input cards 18E through 18G represent an input grouping that must be specified recursively for each guide tube axial section as denoted on input card 17c. This means that input cards 18E through 18G would be input for guide tube axial section 1 (the top guide tube axial section), and then input again for guide tube axial section 2, etc., until all of the guide tube axial sections specified on input card 17c have been described. Note that input cards 18E through 18G require repetitive input themselves.

18E	:	This card should only be specified if the value of card number 18 is "Y". This card contains the description of a single radial zone in the SAS2H Path B model for the assembly containing the BPRA. This card should contain two values delimited by spaces. The first of which should be an integer value

Input Card Number		Detailed Description
		representing the SAS2H material mixture number for the Path B model radial zone which this card represents. The second value should be the outer radius (cm) of the Path B model radial zone which this card represents. This input card must be repeated a number of times equal to that specified on input card 18D.
18F	:	This card should only be specified if the value of card number 18 is "Y". If an assembly contains a BPRA in one cycle but not in another, an alternative SAS2H Path B model must be provided that describes the assembly after removal of the BPRA. This alternative Path B model must contain the same number of radial zones as the Path B model with the BPRA inserted. This card contains the description of a single radial zone in the SAS2H Path B model for the assembly node with the BPRA removed. This card should contain two values delimited by spaces. The first of which should be an integer value representing the SAS2H material mixture number for the Path B model radial zone which this card represents. The second value should be the outer radius (cm) of the Path B model radial zone which this card represents. This input card must be repeated a number of times equal to that specified on input card 18D.
18G	:	This card should only be specified if the value of card number 18 is "Y". Some BPR designs incorporate a non-absorbing region above the poison region in the BPR. To accommodate this type of BPR design an alternative SAS2H Path B model must be provided that describes the BPR assembly above the poison region of the BPR. This alternative Path B model must contain the same number of radial zones as the Path B model with the BPRA inserted. This card contains the description of a single radial zone in the SAS2H Path B model for the assembly node containing the BPRA region above the poison region of the BPR. This card should contain two values delimited by spaces. The first of which should be an integer value representing the SAS2H material mixture number for the Path B model radial zone which this card represents. The second value should be the outer radius (cm) of the Path B model radial zone which this card represents. This input card must be repeated a number of times equal to that specified on input card 18D.

Input Card Number		Detailed Description
18H	:	This card should only be specified if the value of card number 18 is "Y". This card contains a five character entry followed by an integer entry. This card should contain the 5 character string "AL2O3" if the material in the non-absorbing region of the BPR (above the poison region of the BPR) is composed of Al_2O_3. Any other character string indicates that a material other than Al_2O_3 is present in the BPR above the poison region. The integer entry of this card should be the SAS2H material mixture number for the material within the BPR above the BP absorbing region.
18I	:	This card should only be specified if the value of card number 18 is "Y", and the character string specified on input card 18H is not "AL2O3". This card should contain an integer value indicating the number of isotopes in the composition of the material contained within the BPR above the poison region.
18J	:	This card should only be specified if the value of card number 18 is "Y", and the character string specified on input card 18H is not "AL2O3". This card should contain an integer value and a floating-point value. The first value specified on this card should be an integer representing the SCALE nuclide identifier for a constituent of the material composition within the BPR above the poison region. The second value should be a floating-point value representing the corresponding wt% of this nuclide in the material composition. This input card should be repeated a number of times equal to that specified on input card 18I.
18K	:	This card should only be specified if the last value of card number 18B is greater than zero. This card should contain an integer value representing the SAS2H material mixture number for the BP absorber material being specified on cards 18L and 18M.
18L	:	This card should only be specified if the last value of card number 18B is greater than zero. This card should contain an integer value specifying the number of isotopes in the BP absorber material mixture specified on input card 18K.
18M	:	This card should only be specified if the last value of card number 18B is greater than zero. This card should contain two

Input Card Number		Detailed Description
		values delimited by spaces. The first value should be the SCALE nuclide identifier corresponding to a constituent of the BP absorber material mixture specified on input card 18K. The second value should be the weight percent of the nuclide, identified by the first value, in the BP absorber material mixture specified on input card 18K. If the BP absorber material contains boron, the SCALE nuclide identifiers for B-10 and B-11 must be specified explicitly. This input card must be repeated a number of times equal to that specified on input card 18L such that data for all nuclides in the BP absorber material mixture are provided, and the sum of the weight percents of the nuclides in the mixture equals 100.
18N	:	This card should only be specified if the value of card number 18 is "Y". This input card contains four integer values delimited by spaces. The first value is the relative cycle number containing a BPRA. The second value is the relative BPRA design number corresponding to the order in which information was provided in the groupings of input cards 18C through 18F. The third value is the upper CRC axial node number containing the BPRA (the topmost CRC node number is always considered 1). The fourth value is the lower CRC axial node number containing the BPRA. This input card must be repeated a number of times equal to the value specified on input card 18A.
19	:	This card should contain an integer value representing the number of radial zones in the SAS2H Path B model for the fuel assembly as it would be if the assembly never contained a BPRA, a CRA, or an APSR assembly during its irradiation history. This is called the standard Path B model.

Input card 20 must be specified recursively for each guide tube axial section as denoted on input card 17c. This means that input card 20 would be input for guide tube axial section 1 (the top guide tube axial section), and then input again for guide tube axial section 2, etc., until all of the guide tube axial sections specified on input card 17c have been described. Note that input card 20 requires repetitive input itself.

20	:	This card contains the description of a single radial zone in the standard Path B model for the fuel assembly. This card should contain two values delimited by spaces. The first of which should be an integer value representing the SAS2H material

Input Card Number		Detailed Description
		mixture number for the Path B model radial zone which this card represents. The second value should be the outer radius (cm) of the Path B model radial zone which this card represents. This input card must be repeated a number of times equal to that specified on input card 19.
21	:	This card should contain an integer value representing the number of cross-section libraries that are to be produced for each irradiation step in the SAS2H calculations generated by CRAFT. The number of cross-section libraries per irradiation step for CRC evaluations should be set to 1.
22	:	This card should contain an integer value representing the SAS2H print level desired for the output of SAS2H calculations generated by CRAFT. The minimum print level allowed for CRC evaluations is 5. A complete listing and description of the available print levels is provided on page S2.5.18 of reference 1.
23	:	This card should contain the zone mesh factor that should be utilized by XSDRNPM in the SAS2H calculations generated by CRAFT. A description of the zone mesh factor is provided on page S2.5.5 of reference 1.
24	:	The CRAFT calculation allows the specification of special XSDRNPM control parameters that will be utilized in SAS2H calculations generated by CRAFT. If any of the special control parameters described in cards 24A through 24G are to be specified, the character string "SPECIAL" must be provided in columns 1 through 7 of this card. Any other character string specification indicates that the default XSDRNPM control parameters are to be utilized.
24A	:	This card should only be specified if the value of card number 24 is "SPECIAL". This card contains the XSDRNPM calculational control parameter SZF. The size of the largest spatial mesh interval can be adjusted by entering a value for SZF. SZF less than 1 indicates a finer mesh spacing. SZF greater than one indicates a coarser mesh spacing. SZF equal to 1 is the default.
24B	:	This card should only be specified if the value of card number

Input Card Number		Detailed Description
		24 is "SPECIAL". This card contains the XSDRNPM calculational control parameter ISN. The ISN value specifies the order of angular quadrature for XSDRNPM. Quadrature sets are geometry-dependent quantities that are defaulted to a value of 8.
24C	:	This card should only be specified if the value of card number 24 is "SPECIAL". This card contains the XSDRNPM calculational control parameter IIM. The IIM value specifies the maximum number of inner iterations to be used by XSDRNPM. The default value is 20.
24D	:	This card should only be specified if the value of card number 24 is "SPECIAL". This card contains the XSDRNPM calculational control parameter ICM. The ICM value specifies the maximum number of outer iterations to be used by XSDRNPM. The default value is 25.
24E	:	This card should only be specified if the value of card number 24 is "SPECIAL". This card contains the XSDRNPM calculational control parameter EPS. The EPS value specifies the overall convergence criteria. This value is used by XSDRNPM after each outer iteration to determine if the problem has converged. The default value of EPS is 0.0001. A smaller value tightens the convergence criteria, and a larger value loosens the convergence criteria.
24F	:	This card should only be specified if the value of card number 24 is "SPECIAL". This card contains the XSDRNPM calculational control parameter PTC. The PTC value specifies the point flux convergence criteria used by XSDRNPM to determine if convergence has been achieved after an inner iteration. The default value of PTC is 0.0001. A smaller value tightens the convergence criteria, and a larger value loosens the convergence criteria.
24G	:	This card should only be specified if the value of card number 24 is "SPECIAL". This card contains the XSDRNPM calculational control parameter IUS. The IUS value is a flag to direct XSDRNPM to use an upscatter scaling technique to accelerate the solution or force convergence. The default value

Input Card Number		Detailed Description
		is 0, which indicates that upscatter scaling is not used. An IUS value of 1 directs XSDRNPM to use the upscatter scaling technique. The default value is 0.
25	:	This card should specify an integer number of reactor cycles in which the fuel assembly is inserted in the CRAFT calculation.

Input cards 26 through 34 represent an input grouping that must be specified recursively for each reactor cycle in which the fuel assembly is inserted in the CRAFT calculation as denoted on input card 25. This means that input cards 26 through 34 would be input for the first reactor cycle, and then input again for the second reactor cycle, etc., until all of the number of reactor cycles specified on input card 25 have been described.

26	:	This card should contain a 2 character reactor cycle identifier that will be used to identify the cycle on appropriate SAS2H input decks generated by the CRAFT calculation. For example, if the first reactor cycle were identified as "Cycle-1A", the value of this input card should be "1A". If a reactor cycle were identified as "Cycle-1", the value of this input card should be "01", etc...
27	:	This card should contain an integer value specifying the number of CRC statepoints in the reactor cycle specified on input card number 25. The BOC is always considered statepoint 1 in a CRC evaluation. For example, if the reactor cycle specified on card 25 contained one mid-cycle CRC statepoint, the value specified on this card would be 2.

Input cards 28 through 30 represent an input grouping that must be specified recursively for each CRC statepoint in the reactor cycle as denoted on input card 27. This means that input cards 28 through 30 would be input for the first statepoint (BOC), and then input again for the second statepoint, etc., until all of the number of CRC statepoints in the reactor cycle as specified on input card 27 have been described.

28	:	This card should contain a value specifying the EFPD for the statepoint. If the first statepoint in a reactor cycle (BOC) is being described, the value of this card should be 0.
29	:	This card should contain a value specifying the length in calendar days from the BOC to the CRC statepoint. If the first statepoint in a reactor cycle (BOC) is being described, the value of this card should be 0.

Input Card Number		Detailed Description
30	:	This card should contain a value specifying the downtime in calendar days for the reactor shutdown at the CRC statepoint. If the first statepoint in a reactor cycle (BOC) is being described, the value of this card should be 0.
31	:	This card should contain a value specifying the downtime in calendar days at the EOC reactor shutdown.
32	:	This card should contain a value specifying the total EFPD for the reactor cycle from the BOC startup to the EOC shutdown.
33	:	This card should contain a value specifying the total cycle length in calendar days from the BOC startup to the EOC shutdown.
34	:	This card should contain an integer value less than 100 that specifies the position of the fuel assembly in the symmetrical representation of the reactor core. Typically, a CRC evaluation is performed using core symmetry to reduce the overall calculation time required to perform the evaluation. When core symmetry is used, the input parameters utilized in the CRAFT calculation for each node of an assembly are the average of the parameters from each symmetric core location corresponding to the assembly node. Usually, one-eighth core symmetry is utilized in performing CRC evaluations.
35	:	This card should contain a single character to signal to CRAFT whether variable or constant irradiation step description data will be provided. The variable irradiation step description input allows the specification of unique irradiation step duration for each irradiation step in a statepoint calculation. This option may be useful when modeling rodded cycles. The constant irradiation step duration applies the same irradiation step length to a specified number of irradiation steps in a given statepoint calculation. The character "Y" placed in column one of the input card specifies variable irradiation step duration input. The character "N" placed in column one of the input card specifies constant irradiation step duration input.

Input cards 36 through 40 should be specified only if the value of input card 35 is "N". Input cards 36 through 40 represent an input grouping that must be specified recursively for each reactor cycle in which the fuel assembly is inserted in the CRAFT calculation as

Input Card Number		Detailed Description

denoted on input card 25. This means that input cards 36 through 40 would be input for the first reactor cycle, and then input again for the second reactor cycle, etc., until all of the number of reactor cycles specified on input card 25 have been described.

36	:	This card should only be specified if the value of card number 35 is "N". This card should contain an integer value specifying the relative cycle number to which the input data provided in the current grouping of input cards 36 through 40 apply. For example, if the CRAFT calculation involved two reactor cycles labeled Cycle-1 and Cycle-5, the relative cycle number corresponding to Cycle-5 would be specified as 2.

Input cards 37 through 40 represent an input grouping that must be specified recursively for the SAS2H calculations commencing from each statepoint in the relative reactor cycle specified on input card 36. This means that input cards 37 through 40 would be input for the first statepoint calculation (BOC to statepoint 2) in the reactor cycle, and then input again for the second statepoint calculation (perhaps statepoint 2 to statepoint 3) in the reactor cycle, etc., until all of the statepoint calculations in the reactor cycle, as specified on input card 27 corresponding to the appropriate reactor cycle, have been described. The last iteration of input cards 37 through 40 for a given reactor cycle should correspond to the last mid-cycle statepoint to EOC SAS2H calculation.

37	:	This card should only be specified if the value of card number 35 is "N". This card should contain an integer value corresponding to the relative statepoint calculation number in the reactor cycle for which input data is being provided. The BOC to mid-cycle statepoint 2 calculation is always considered relative statepoint calculation 1. The last mid-cycle statepoint to EOC calculation is always considered the last relative statepoint calculation in a given reactor cycle.
38	:	This card should only be specified if the value of card number 35 is "N". This card should contain a value specifying the irradiation step length in EFPD for the SAS2H statepoint calculation for which input data is being provided. If the value on input card 35 is "N", the CRAFT software routine only allows the use of a fixed irradiation step length in each generated SAS2H calculation. However, different irradiation step lengths may be specified for different CRAFT generated SAS2H calculations.

Input Card Number		Detailed Description
39	:	This card should only be specified if the value of card number 35 is "N". This card should contain an integer value specifying the number of irradiation steps to be utilized in the CRAFT generated SAS2H calculation corresponding to the statepoint calculation for which input data is being provided.
40	:	This card should only be specified if the value of card number 35 is "N". For PWR assemblies, this card should contain the soluble boron concentration in units of ppmb at the mid-point of a given irradiation step in the current statepoint calculation for which input data is being provided. For BWR assemblies, this card should contain the moderator density in units of g/cc at the mid-point of a given irradiation step in the current statepoint calculation for which input data is being provided. This input card must be repeated a number of times equal to that specified on input card 39. The order of repetition of this input card should be such that the initial ppmb concentration or moderator density corresponds to the first irradiation step, and the final ppmb concentration or moderator density corresponds to the last irradiation step in the statepoint calculation of interest.

Input cards 41 through 44 should be specified only if the value of input card 35 is "Y". Input cards 41 through 44 represent an input grouping that must be specified recursively for each reactor cycle in which the fuel assembly is inserted in the CRAFT calculation as denoted on input card 25. This means that input cards 41 through 44 would be input for the first reactor cycle, and then input again for the second reactor cycle, etc., until all of the number of reactor cycles specified on input card 25 have been described.

41	:	This card should only be specified if the value of card number 35 is "Y". This card should contain an integer value specifying the relative cycle number to which the input data provided in the current grouping of input cards 41 through 44 apply. For example, if the CRAFT calculation involved two reactor cycles labeled Cycle-1 and Cycle-5, the relative cycle number corresponding to Cycle-5 would be specified as 2.

Input cards 42 through 44 represent an input grouping that must be specified recursively for the SAS2H calculations commencing from each statepoint in the relative reactor cycle specified on input card 41. This means that input cards 42 through 44 would be input for the first statepoint calculation (BOC to statepoint 2) in the reactor cycle, and then

Input Card Number		Detailed Description

input again for the second statepoint calculation (perhaps statepoint 2 to statepoint 3) in the reactor cycle, etc., until all of the statepoint calculations in the reactor cycle, as specified on input card 27 corresponding to the appropriate reactor cycle, have been described. The last iteration of input cards 42 through 44 for a given reactor cycle should correspond to the last mid-cycle statepoint to EOC SAS2H calculation.

42 : This card should only be specified if the value of card number 35 is "Y". This card should contain an integer value corresponding to the relative statepoint calculation number in the reactor cycle for which input data is being provided. The BOC to mid-cycle statepoint 2 calculation is always considered relative statepoint calculation 1. The last mid-cycle statepoint to EOC calculation is always considered the last relative statepoint calculation in a given reactor cycle.

43 : This card should only be specified if the value of card number 35 is "Y". This card should contain an integer value specifying the number of irradiation steps to be utilized in the CRAFT generated SAS2H calculation corresponding to the statepoint calculation for which input data is being provided.

44 : This card should only be specified if the value of card number 35 is "Y". This card should contain two real values delimited by spaces. The first value on this card should specify the irradiation step length in EFPD for the SAS2H statepoint calculation for which input data is being provided. For PWR assemblies, the second value on this card should specify the soluble boron concentration in units of ppmb at the mid-point of a given irradiation step in the current statepoint calculation for which input data is being provided. For BWR assemblies, this card should contain the moderator density in units of g/cc at the mid-point of a given irradiation step in the current statepoint calculation for which input data is being provided. This input card must be repeated a number of times equal to that specified on input card 43. The order of repetition of this input card should be such that the initial ppmb concentration or moderator density corresponds to the first irradiation step, and the final ppmb concentration or moderator density corresponds to the last irradiation step in the statepoint calculation of interest.

45 : This card should contain an integer value corresponding to the

Input Card Number		Detailed Description
		number of axial nodes utilized in the CRC evaluation.
46	:	This card contains two integer values delimited by spaces. The first value specifies an axial node number in the CRC axial format. The second value specifies the corresponding node height in units of cm. This card must be repeated a number of times equal to that specified on input card 45. The repetition of this card should be performed such that the CRC axial node data is provided in sequential order (i.e., node 1 through node N, where N is the final node). Node 1 should always be specified as the top node of the fuel assembly.
47	:	The CRAFT software routine is capable of modeling an assembly that contains a CRA. If the fuel assembly for which the CRAFT calculation is to be performed contains a CRA in any of its specified reactor cycles, the character string "RODDED" should be placed in columns 1 through 6 of this card. Any other character string signifies that the assembly never contains a CRA.
47A	:	This card should only be specified if the value of card number 47 is "RODDED". This card should contain an integer value specifying the number of previously defined irradiation steps in the CRAFT calculation in which the fuel assembly contains a CRA.
47A.1	:	This card should only be specified if the value of card number 47 is "RODDED". This card should contain an integer value specifying the number of axial section of the fuel assembly which contain a CRA during the irradiation step for which data is being provided. This card should be repeated the number of times specified in card number 47A.
47B	:	This card should only be specified if the value of card number 47 is "RODDED". This card must be repeated a number of times equal to that specified on input card 47A.1. This card should contain 8 integer values delimited by spaces. The first integer value specifies the relative cycle number in the CRAFT calculation in which a CRA is inserted. The second integer value specifies the relative statepoint calculation number in which a CRA is inserted in the cycle identified by the first value

Input Card Number		Detailed Description
		of this card. The BOC to statepoint 1 is always considered statepoint calculation 1. The third value specifies the relative irradiation step number in the statepoint calculation identified by the second value of this card in which the CRA is inserted. The fourth value specifies the upper CRC axial node of the axial assembly section containing the CRA in the relative irradiation step specified by the third value of this card. The top node in the CRC axial format is always node 1. The fifth value specifies the lower CRC axial node of the axial assembly section containing the CRA in the relative irradiation step specified by the third value of this card. The CRAFT software routine is capable of modeling numerous CRA absorber material mixtures and CRA designs for insertion in an assembly throughout its irradiation history. The sixth value specifies the CRA absorber material mixture number for SAS2H corresponding to the CRA described on this card. The CRA absorber material specifications and mixture numbers are specified on input cards 47C through 47F. The seventh value specifies the CRA design description number corresponding to the CRA described on this card. The CRA design inputs are specified on input cards 47G through 47K. The CRA design description number corresponds to the relative position in which the relevant CRA design description input is provided in the CRAFT input deck.
47C	:	This card should only be specified if the value of card number 47 is "RODDED". This card should contain an integer value specifying the number of different CRA absorber material mixtures which must be specified for use in the various CRA designs which are inserted in the fuel assembly during its irradiation history relevant to the CRAFT calculation.

Input cards 47D through 47F represent an input grouping that must be specified recursively for each CRA absorber material mixture used in the CRAFT calculation as denoted on input card 47C. This means that input cards 47D through 47F would be input for the first CRA absorber material mixture, and then input again for the second CRA absorber material mixture, etc., until all of the CRA absorber material mixtures specified on input card 47C have been described.

47D	:	This card should only be specified if the value of card number 47 is "RODDED". For PWR assemblies, this card should only

Input Card Number		Detailed Description
		contain an integer value denoting the material mixture number that should be utilized in the CRAFT generated SAS2H calculations to identify the CRA absorber material mixture for which input is being provided. For BWR assemblies, this card should contain the previous value required for PWR assemblies followed by a real value for the density of the corresponding CRA absorber material mixture.
47E	:	This card should only be specified if the value of card number 47 is "RODDED". This card should contain an integer value specifying the number of isotopes in the CRA absorber material mixture specified on input card 47D.
47F	:	This card should only be specified if the value of card number 47 is "RODDED". This card should contain two values delimited by spaces. The first value should be the SCALE nuclide identifier corresponding to a constituent of the CRA absorber material mixture specified on input card 47D. The second value should be the weight percent of the nuclide, identified by the first value, in the CRA absorber material mixture specified on input card 47D. This input card must be repeated a number of times equal to that specified on input card 47E such that data for all nuclides in the CRA absorber material mixture are provided, and the sum of the weight percents of the nuclides in the mixture equals 100.
47G	:	This card should only be specified if the value of card number 47 is "RODDED". This card should contain an integer value specifying the number of different CRA design descriptions that will be specified for use in the CRAFT calculation.

Input cards 47H through 47K represent an input grouping that must be specified recursively for each CRA design used in the CRAFT calculation as denoted on input card 47G. This means that input cards 47H through 47K would be input for the first CRA design description, and then input again for the second CRA design description, etc., until all of the CRA design descriptions specified on input card 47G have been described. The order in which the CRA design descriptions are provided determines the relative CRA design number which corresponds to the description.

47H	:	This card should only be specified if the value of card number 47 is "RODDED". This card contains two values delimited by

Input Card Number		Detailed Description
		spaces. The first value should specify the absorber material density in units of g/cc for the CRA design for which input is being provided. The second value should be an integer specifying the SAS2H material mixture number for the CR cladding in the CRA design for which input is being provided.
47I	:	This card should only be specified if the value of card number 47 is "RODDED". This card should contain an integer value specifying the number of radial zones utilized in the SAS2H Path B model for the fuel assembly containing the CRA design for which input is being provided.

Input cards 47J and 47K represent an input grouping that must be specified recursively for each guide tube axial section as denoted on input card 17c. This means that input cards 47J and 47K would be input for guide tube axial section 1 (the top guide tube axial section), and then input again for guide tube axial section 2, etc., until all of the guide tube axial sections specified on input card 17c have been described. Note that input cards 47J and 47K require repetitive input themselves.

47J	:	This card should only be specified if the value of card number 47 is "RODDED". This card contains the description of a single radial zone in the SAS2H Path B model for the fuel assembly containing the CRA design for which input is being provided. This card should contain two values delimited by spaces. The first of which should be an integer value representing the SAS2H material mixture number for the Path B model radial zone which this card represents. The second value should be the outer radius of the Path B model radial zone which this card represents. This input card must be repeated a number of times equal to that specified on input card 47I.
47K	:	This card should only be specified if the value of card number 47 is "RODDED". If an assembly contains a CRA in one cycle but not in another, an alternative SAS2H Path B model must be provided that describes the assembly after removal of the CRA. This alternative Path B model must contain the same number of radial zones as the Path B model with the CRA inserted. This card contains the description of a single radial zone in the SAS2H Path B model for the assembly after the removal of the CRA design for which input is being provided. This card should contain two values delimited by spaces. The first of which

Input Card Number		Detailed Description
		should be an integer value representing the SAS2H material mixture number for the Path B model radial zone which this card represents. The second value should be the outer radius of the Path B model radial zone which this card represents. This input card must be repeated a number of times equal to that specified on input card 47I.
48	:	The CRAFT software routine is capable of modeling a fuel assembly that contains a APSRA. If the fuel assembly for which the CRAFT calculation is to be performed contains an APSRA in any of its specified reactor cycles, the character string "RODDED" should be placed in columns 1 through 6 of this card. Any other character string signifies that the assembly never contains an APSRA.
48A	:	This card should only be specified if the value of card number 48 is "RODDED". This card should contain an integer value specifying the number of previously defined irradiation steps in the CRAFT calculation in which the fuel assembly contains an APSRA.
48B	:	This card should only be specified if the value of card number 48 is "RODDED". This card must be repeated a number of times equal to that specified on input card 48A. This card should contain 7 integer values delimited by spaces. The first integer value specifies the relative cycle number in the CRAFT calculation in which a APSRA is inserted. The second integer value specifies the relative statepoint calculation number in which a APSRA is inserted in the cycle identified by the first value of this card. The BOC to statepoint 1 is always considered statepoint calculation 1. The third value specifies the relative irradiation step number in the statepoint calculation identified by the second value of this card in which the APSRA is inserted. The fourth value specifies the upper CRC axial node of the axial assembly section containing the APSRA in the relative irradiation step specified by the third value of this card. The top node in the CRC axial format is always node 1. The fifth value specifies the lower CRC axial node of the axial assembly section containing the APSRA in the relative irradiation step specified by the third value of this card. The CRAFT software routine is

Input Card Number		Detailed Description
		capable of modeling numerous APSRA absorber material mixtures and APSRA designs for insertion in an assembly throughout its irradiation history. The sixth value specifies the APSRA absorber material mixture number for SAS2H corresponding to the APSRA described on this card. The APSRA absorber material specifications and mixture numbers are specified on input cards 48C through 48F. The seventh value specifies the APSRA design description number corresponding to the APSRA described on this card. The APSRA design inputs are specified on input cards 48G through 48K. The APSRA design description number corresponds to the relative position in which the relevant APSRA design description input is provided in the CRAFT input deck. The eighth value is the SAS2H material mixture number corresponding to the APSR follow rod material.
48C	:	This card should only be specified if the value of card number 48 is "RODDED". This card should contain an integer value specifying the number of different APSRA absorber material mixtures which must be specified for use in the various APSRA designs which are inserted in the fuel assembly during its irradiation history relevant to the CRAFT calculation.

Input cards 48D through 48F represent an input grouping that must be specified recursively for each APSRA absorber material mixture used in the CRAFT calculation as denoted on input card 48C. This means that input cards 48D through 48F would be input for the first APSRA absorber material mixture, and then input again for the second APSRA absorber material mixture, etc., until all of the APSRA absorber material mixtures specified on input card 48C have been described.

48D	:	This card should only be specified if the value of card number 48 is "RODDED". This card should contain an integer value denoting the material mixture number that should be utilized in the CRAFT generated SAS2H calculations to identify the APSRA absorber material mixture for which input is being provided.
48E	:	This card should only be specified if the value of card number 48 is "RODDED". This card should contain an integer value specifying the number of isotopes in the APSRA absorber material mixture specified on input card 48D.

Input Card Number		Detailed Description
48F	:	This card should only be specified if the value of card number 48 is "RODDED". This card should contain two values delimited by spaces. The first value should be the SCALE nuclide identifier corresponding to a constituent of the APSRA absorber material mixture specified on input card 48D. The second value should be the weight percent of the nuclide, identified by the first value, in the APSRA absorber material mixture specified on input card 48D. This input card must be repeated a number of times equal to that specified on input card 48E such that data for all nuclides in the APSRA absorber material mixture are provided, and the sum of the weight percents of the nuclides in the mixture equals 100.
48G	:	This card should only be specified if the value of card number 48 is "RODDED". This card should contain an integer value specifying the number of different APSRA design descriptions that will be specified for use in the CRAFT calculation.

Input cards 48H through 48L represent an input grouping that must be specified recursively for each APSRA design used in the CRAFT calculation as denoted on input card 48G. This means that input cards 48H through 48L would be input for the first APSRA design description, and then input again for the second APSRA design description, etc., until all of the APSRA design descriptions specified on input card 48G have been described. The order in which the APSRA design descriptions are provided determines the relative APSRA design number which corresponds to the description.

48H	:	This card should only be specified if the value of card number 48 is "RODDED". This card should contain two values delimited by spaces. The first value should specify the absorber material density in units of g/cc for the APSRA design for which input is being provided. The second value should be an integer specifying the SAS2H material mixture for the APSR cladding in the APSRA for which input is being provided.
48I	:	This card should only be specified if the value of card number 48 is "RODDED". This card should contain an integer value specifying the number of radial zones utilized in the SAS2H Path B model for the fuel assembly containing the APSRA design for which input is being provided.

Input Card Number		Detailed Description

Input cards 48J through 48L represent an input grouping that must be specified recursively for each guide tube axial section as denoted on input card 17c. This means that input cards 48J through 48L would be input for guide tube axial section 1 (the top guide tube axial section), and then input again for guide tube axial section 2, etc., until all of the guide tube axial sections specified on input card 17c have been described. Note that input cards 48J through 48L require repetitive input themselves.

48J	:	This card should only be specified if the value of card number 48 is "RODDED". This card contains the description of a single radial zone in the SAS2H Path B model for the fuel assembly containing the APSRA design for which input is being provided. This card should contain two values delimited by spaces. The first of which should be an integer value representing the SAS2H material mixture number for the Path B model radial zone which this card represents. The second value should be the outer radius of the Path B model radial zone which this card represents. This input card must be repeated a number of times equal to that specified on input card 48I.
48K	:	This card should only be specified if the value of card number 48 is "RODDED". If an assembly contains a APSRA in one cycle but not in another, an alternative SAS2H Path B model must be provided that describes the assembly after removal of the APSRA. This alternative Path B model must contain the same number of radial zones as the Path B model with the APSRA inserted. This card contains the description of a single radial zone in the SAS2H Path B model for the assembly after the removal of the APSRA design for which input is being provided. This card should contain two values delimited by spaces. The first of which should be an integer value representing the SAS2H material mixture number for the Path B model radial zone which this card represents. The second value should be the outer radius of the Path B model radial zone which this card represents. This input card must be repeated a number of times equal to that specified on input card 48I.
48L	:	This card should only be specified if the value of card number 48 is "RODDED". APSRA designs typically utilize follow rods which are not of the same material composition as the APSR

Input Card Number		Detailed Description
		cladding. To facilitate modeling of the APSR follow rod region, an alternative SAS2H Path B model must be provided that describes the follow rod region of the APR's above the poison region in the APSRA. This alternative Path B model must contain the same number of radial zones as the Path B model with the APSRA inserted. This card contains the description of a single radial zone in the SAS2H Path B model for the follow rod region of the APSRA design for which input is being provided. This card should contain two values delimited by spaces. The first of which should be an integer value representing the SAS2H material mixture number for the Path B model radial zone which this card represents. The second value should be the outer radius of the Path B model radial zone which this card represents. This input card must be repeated a number of times equal to that specified on input card 48I.

Input cards 49 through 51 represent an input grouping that must be specified recursively for each statepoint calculation to be generated by the CRAFT calculation. This means that input cards 49 through 51 would be input for the first statepoint calculation (BOC to statepoint 2 of relative cycle number 1), and then input again for the second statepoint calculation, etc., until all of the statepoint calculations to be generated by CRAFT have been addressed (the final statepoint calculation would be that ending at the final statepoint in the last relative cycle).

49	:	This card should contain an integer value specifying the number of axial nodes in the axial format in which the current fuel temperature input data is being provided.
50	:	This card should contain two values delimited by spaces. The first value should be the appropriate node number in the fuel temperature axial format for the statepoint calculation for which input is being provided. The second value should be the node height corresponding to the axial node number identified by the first value. This input card specification should be repeated the number of times identified on input card 49. The nodal format input specified with this card should be ordered sequentially such that node 1 represents the top node of the fuel assembly.
51	:	This card should contain an exposure weighted average fuel temperature value in units of degrees Fahrenheit for the appropriate node in the fuel temperature input axial format

Input Card Number		Detailed Description
		corresponding to the statepoint calculation for which input data is being provided. This input card specification should be repeated the number of times identified on input card 49. The data provided in the sequential repetition of this input card should be ordered to correspond to the nodal input format described by the previous repetition of input card 50.

Input cards 52 through 54 represent an input grouping that must be specified recursively for each statepoint calculation to be generated by the CRAFT calculation. This means that input cards 52 through 54 would be input for the first statepoint calculation (BOC to statepoint 2 of relative cycle number 1), and then input again for the second statepoint calculation, etc., until all of the statepoint calculations to be generated by CRAFT have been addressed (the final statepoint calculation would be that ending at the final statepoint in the last relative cycle).

52	:	This card should be input for PWR assemblies only. This card should contain an integer value specifying the number of axial nodes in the axial format in which the current moderator specific volume input data is being provided.
53	:	This card should be input for PWR assemblies only. This card should contain two values delimited by spaces. The first value should be the appropriate node number in the moderator specific volume axial format for the statepoint calculation for which input is being provided. The second value should be the node height corresponding to the axial node number identified by the first value. This input card specification should be repeated the number of times identified on input card 52. The nodal format input specified with this card should be ordered sequentially such that node 1 represents the top node of the fuel assembly.
54	:	This card should be input for PWR assemblies only. This card should contain an exposure weighted average moderator specific volume value in units of ft^3/lb for the appropriate node in the moderator specific volume input axial format corresponding to the statepoint calculation for which input data is being provided. This input card specification should be repeated the number of times identified on input card 52. The data provided in the sequential repetition of this input card should be ordered to correspond to the nodal input format described by the previous repetition of input card 53.

Input Card Number		Detailed Description

Input cards 55 through 57 represent an input grouping that must be specified recursively for each statepoint calculation to be generated by the CRAFT calculation. This means that input cards 55 through 57 would be input for the first statepoint calculation (BOC to statepoint 2 of relative cycle number 1), and then input again for the second statepoint calculation, etc., until all of the statepoint calculations to be generated by CRAFT have been addressed (the final statepoint calculation would be that ending at the final statepoint in the last relative cycle).

55	:	This card should contain an integer value specifying the number of axial nodes in the axial format in which the current burnup input data is being provided.
56	:	This card should contain two values delimited by spaces. The first value should be the appropriate node number in the burnup axial format for the statepoint calculation for which input is being provided. The second value should be the node height corresponding to the axial node number identified by the first value. This input card specification should be repeated the number of times identified on input card 55. The nodal format input specified with this card should be ordered sequentially such that node 1 represents the top node of the fuel assembly.
57	:	This card should contain an exposure weighted average burnup value in units of GWd/MTU corresponding to the total burnup of the node at the beginning of the statepoint calculation for which input data is being provided. This input card specification should be repeated the number of times identified on input card 55. The data provided in the sequential repetition of this input card should be ordered to correspond to the nodal input format described by the previous repetition of input card 56.

8. CRAFT Output Description

The CRAFT software routine generates five types of files identified as either "*.input", "*.output", "*.cut", "*.msgs", or "*.notes", where the "*" is the base file set identifier for the statepoint calculation of interest. The "*.cut" and "*.notes" files are the only files that must be retained for CRC evaluation and documentation purposes. All files are generated in the working directory in which the CRAFT calculation is performed.

All CRAFT generated filenames utilize the following format: "{Base File Set Identifier}.{suffix}".

Where the suffix corresponds to one of the five file types previously mentioned, and the base file set identifier is a 25 character name containing essential information necessary to delineate one CRAFT generated SAS2H calculation from another.

The base file set identifier for a statepoint calculation contains the following information:

1) reactor identifier (three character);
2) one-eighth core symmetry assembly number in current reactor cycle (two digit);
3) axial node number (node 1 is always the top node) (two digit);
4) reactor cycle number in which the SAS2H calculation starts (two character);
5) EFPD statepoint at which the SAS2H calculation starts (truncated to three digits);
6) reactor cycle number in which the SAS2H calculation ends (two character);
7) EFPD statepoint at which the SAS2H calculation ends (truncated to three digits).

The format of the base file set identifier is as follows where the numbers identified as #{number} correspond to one of the seven items previously listed-- #1 A #2 N #3 DC #4 T #5 AC #6 T #7. The base file set identifier does not contain any spaces.

The "*.input" files contain a CRAFT generated SAS2H input deck. The "*.output" files contain a complete SAS2H calculation output file. The "*.cut" files contain the corresponding SAS2H input deck followed by an output extraction, from the final ORIGEN pass of the SAS2H calculation, which contains data relevant to CRC evaluations. The "*.msgs" files contain the standard run-time messages associated with the SAS2H calculation. The "*.notes" files contain a listing of the isotopes and their concentration which were left behind in generating the initial charge fuel composition for a continuation SAS2H calculation. The "*.notes" files are only generated for CRAFT generated SAS2H calculations which are continuing depletion and decay calculations. The "*.cut" and "*.notes" files contain all of the information which is required to perform CRC evaluations or repeat calculations as necessary for quality assurance purposes. The remainder of the CRAFT generated files may be discarded once the "*.cut" and "*.notes" files have been produced correctly.

9. Modifications Made Between CRAFT Version 3 and Version 5

Modifications between the CRAFT, Version 3, and CRAFT, Version 5, software routines are described in this section. CRAFT, Version 4, was created strictly to incorporate features for BWR fuel assembly depletion calculations. CRAFT, Version 4, provides no features beyond those present in CRAFT, Version 3, that relate to PWR fuel assembly depletion calculations. Therefore, for PWR assembly depletion purposes, feature differences between CRAFT, Versions 3 and 5, are the only differences of concern. However, for completeness, the additional features incorporated to produce CRAFT, Version 4, from CRAFT, Version 3, are also mentioned in this section.

Three major modifications were made to the CRAFT Version 3 source code to create CRAFT Version 5. The CRAFT Version 3 software routine is documented in Attachment I of reference 4. The modifications do not affect the validity of any of the previous results obtained using either the CRAFT Version 1, 2, or 3 software routines.

Modification 1:

The purpose of this modification is to allow the CRAFT software routine to process the input for a calculation without executing the calculation. This allows the user to do a cursory check of the CRAFT input.

Modification 2:

The purpose of this modification was to allow CRAFT to be used for a BWR assembly depletion calculation. The features incorporated with this modification included the following:

- the ability to follow moderator density changes as a function of each irradiation time step in each CRAFT generated SAS2H calculation
- the ability to provide different densities for each of the control rod absorber materials that are specified
- the elimination of certain input requirements that are required only for PWR assembly depletion calculations.

This modification constitutes the features incorporated between CRAFT Versions 3 and 4. This modification has no effect on PWR assembly depletion calculations performed with CRAFT.

Modification 3:

The purpose of this modification was to allow CRAFT to model guide tubes that have multiple axial sections with different dimensions.

The source code changes that were made between CRAFT Versions 3 and 5 to incorporate the modifications listed above are presented in Table 9-1. Table 9-1 shows the lines of code that would need to be altered to make CRAFT Versions 3 and 5 identical. The information in Table 9-1 was obtained using the "diff" command that is available on the Hewlett Packard 700 series workstations. The lines with "<" in column one represent CRAFT Version 5 source code. The lines with ">" represent CRAFT Version 3 source code. The corresponding source code line numbers are provided above each set of lines initiated by either "<" or ">".

Twenty-three test cases were developed and executed with Version 1 of CRAFT. These test cases are documented in Attachment I of Reference 5. These test cases demonstrated the computational accuracy of the CRAFT software routine. Modifications made between Version 1 and Version 5 did not affect any of the computations originally present in Version 1. The accuracy of all modifications made since Version 1 can be verified by visual inspection. Each CRAFT calculation can be inspected visually to show that CRAFT, Version 5, is operating correctly.

11. CRAFT Version 5 Fortran Source Code Listing

```
      PROGRAM CRAFT
*****************************************************************
*     Commercial Reactor Assembly Follow Taskmaster             *
*****************************************************************
*     This code writes the SAS2H input decks necessary to       *
*     perform depletion and decay calculations on an assembly   *
*     required in subsequent Commercial Reactor Critical        *
```

```
*     evaluations.  The code controls the SAS2H input deck      *
*     creation such that a new SAS2H input deck is developed    *
*     to perform depletion and decay calculations between CRC   *
*     statepoints in a given sequence.  The depletion and       *
*     decay of the fuel assembly through all CRC statepoints    *
*     is simulated as a continuous process by using feed fuel   *
*     isotopics from the previous calculation in the sequence.  *

This attachment contains the CRAFT input decks for the depletion calculations for McGuire Unit 1. The input decks are contained on an attachment tape of this calculation file (the attachment tape has been moved to Reference 7.6). The information contained in this hard-copy representation of Attachment II is a listing of the various CRAFT input deck files and their attributes. The file sizes listed in the following table are the file sizes as contained on the attachment tape (Ref. 7.6). The tape containing Attachment II was written using the HP Colorado Model T1000e External Parallel Port Backup System for personal computers.

This attachment contains the consolidated SAS2H output files that were generated by CRAFT during the depletion calculations for McGuire Unit 1. These files are referred to as "*.cut" files due to their ".cut" extension. The "*.cut" files are contained on an attachment tape of this calculation file (the attachment tape has been moved to Reference 7.6). The information contained in this hard-copy representation of Attachment III is a listing of the various "*.cut" files and their attributes. The file sizes listed in the following tables are the file sizes as they appear on the Hewlett Packard (HP) Series 9000 workstation. The HP files sizes differ from the file sizes on the attachment tapes due to the difference in the block sizes between the HP and the personal computer. The tape containing Attachment III was written using the HP Colorado Model T1000e External Parallel Port Backup System for personal computers.

This attachment contains the "*.notes" files that were generated by CRAFT during the depletion calculations for McGuire Unit 1. These files are referred to as "*.notes" files due to their ".notes" extension. The "*.notes" files are contained on an attachment tape of this calculation file (the attachment tape has been moved to Reference 7.6). The information contained in this hard-copy representation of Attachment IV is a listing of the various "*.notes" files and their attributes. The file sizes listed in the following tables are the file sizes as they appear on the Hewlett Packard (HP) Series 9000 workstation. The HP files sizes differ from the file sizes on the attachment tapes due to the difference in the block sizes between the HP and the personal computer. The tape containing Attachment IV was written using the HP Colorado Model T1000e External Parallel Port Backup System for personal computers.

This attachment contains the results for the principle isotope concentrations in the depleted fuel of the McGuire Unit 1 fuel assemblies. The principle isotope concentration result tables are contained on an attachment tape of this calculation file (the attachment tape has been moved to Reference 7.6). The information contained in this hard-copy representation of Attachment V is a listing of the various files containing the principle isotope concentration result tables that are contained on the attachment tape. Each file contains the results for a given fuel assembly. The filenames identify the fuel assmebly to which they correspond. The file sizes listed in the following table are the file sizes as contained on the attachment tape (Ref. 7.6). The tape containing Attachment V was written using the HP Colorado Model T1000e External Parallel Port Backup System for personal computers.

CRC_DATA_TABULIZER, Version 3

Commercial Reactor Critical Isotopic Results Tabulization Program

Developed by Kenneth D. Wright
Framatome Cogema Fuels
High-Level Waste Division

under contract with the

Management and Operating Contractor for the
Yucca Mountain High-Level Radioactive Waste Repository Project

Table of Contents

1. Purpose

The CRC_DATA_TABULIZER program was written to support Commercial Reactor Critical (CRC) evaluations. The CRC evaluations are performed as part of the disposal criticality methodology development for the proposed Yucca Mountain High-Level Radioactive Waste Repository.

2. Objective

The objective of the CRC_DATA_TABULIZER program is to retrieve and tabulate isotopic results and fuel assembly characterization parameter data that is generated and utilized in fuel assembly SAS2H depletion calculations generated by the CRAFT software routine which are relevant to CRC evaluations. The program is intended to be used without supporting documentation through the implementation of run-time user defined input prompts.

3. Methodology

The methodology employed by the CRC_DATA_TABULIZER program is to prompt the user for a minimum set of required assembly characterization data, and search through a database of CRC results to retrieve and tabulate relevant information. The structure of the CRC results database is pre-defined and must be implemented correctly for the CRC_DATA_TABULIZER program to function properly. If the CRC results database is established properly, the Tabulization program is capable of using the user defined assembly characterization input data to search through the database and retrieve relevant data. The relevant data that is retrieved includes the following for each of the principal isotopes listed in Table 3-1, for each CRC statepoint calculation to which the assembly pertains:

1) the fuel assembly axial node dimensions in units of cm
2) the SAS2H calculated spent fuel isotopic concentrations for each axial node in units of grams per node
3) the nodal burnup in units of GWd/MTU
4) the nodal fuel temperature input data used in the SAS2H calculations in units of degrees Kelvin
5) the nodal moderator density input data used in the SAS2H calculations in units of grams per cubic centimeter.

Table 3-1. Principal Isotope Set

Mo-95	Tc-99	Ru-101	Rh-103	Ag-109
Nd-143	Nd-145	Sm-147	Sm-149	Sm-150
Sm-151	Sm-152	Eu-151	Eu-153	Gd-155
U-233	U-234	U-235	U-236	U-238
Np-237	Pu-238	Pu-239	Pu-240	Pu-241
Pu-242	Am-241	Am-242m	Am-243	

The tabulization program performs simple calculations to convert the retrieved data into a form required for presentation in the generated data tables. The calculations performed by the Tabulization program include the following:

1) the calculation of the fuel assembly axial node center heights
2) the generation of a normalized profile for the isotopic results
3) the calculation of burnup-weighted nodal fuel temperature values
4) the calculation of burnup-weighted nodal moderator density values.

The tables generated by the Tabulization program for each of the principal isotopes of each CRC statepoint calculation containing spent fuel (to which the assembly pertains) contain the following information:

1) the CRAFT calculation identifier which contains the CRC assembly identifier followed by the "i.dat" suffix
2) the isotope for which the results are being tabulated
3) the reactor cycle identifier and CRC statepoint effective full-power day value for which the isotopic results are being tabulated
4) the initial enrichment of the fuel assembly
5) an integer value referring to the number of the axial node (node number 1 represents the top axial node of the fuel assembly)
6) the axial node height in unit of centimeters
7) the height at the center of the axial node in units of centimeters
8) the SAS2H isotopic results for the axial node in units of grams per node
9) the SAS2H isotopic results for the axial node normalized to the assembly average isotopic results
10) the nodal burnup in units of GWd/MTU
11) the nodal fuel temperature input values utilized in the SAS2H calculation weighted by the nodal burnup up to the statepoint calculation for which the Tabulization is being performed
12) the nodal moderator density input values utilized in the SAS2H calculation weighted by
