- A CP-EP-13.0 Test Control
- B CP-EI-13.0-13 1 1/2" and 1" Richmond Insert Shear and Tension Tests

## 2.0 GENERAL

## 2.1 DEFINITIONS

Ultimate Load - The load applied to the specimen which caused a physical rupture of the specimen.

Failure Load - The load applied to the specimen beyond which, deflections increased considerably without substantial increase in the applied load.

## 2.2 PURPOSE AND SCOPE

These tests were performed to determine the characteristics of 1 1/2-Inch Type EC-6W and 1-Inch Type EC-2W Richmond Inserts when installed in concrete representative of that used in the power block structures at CPSES. The test specimens were subjected to shear, tension, and combined shear and tension loadings. The strength, deflections, and type of deformations produced by these loadings were the qualities to be determined.

TS TEST

## 2.3 RESPONSIBILITY

The tests were performed under the direction of the CP Project Civil Engineer. Witnesses to the tests were: A TUGCO site Quality Assurance representative and other site engineering personnel.

## 2.4 TEST APPARATUS

### 2.4.1 CONCRETE SLAB & EMBEDMENTS

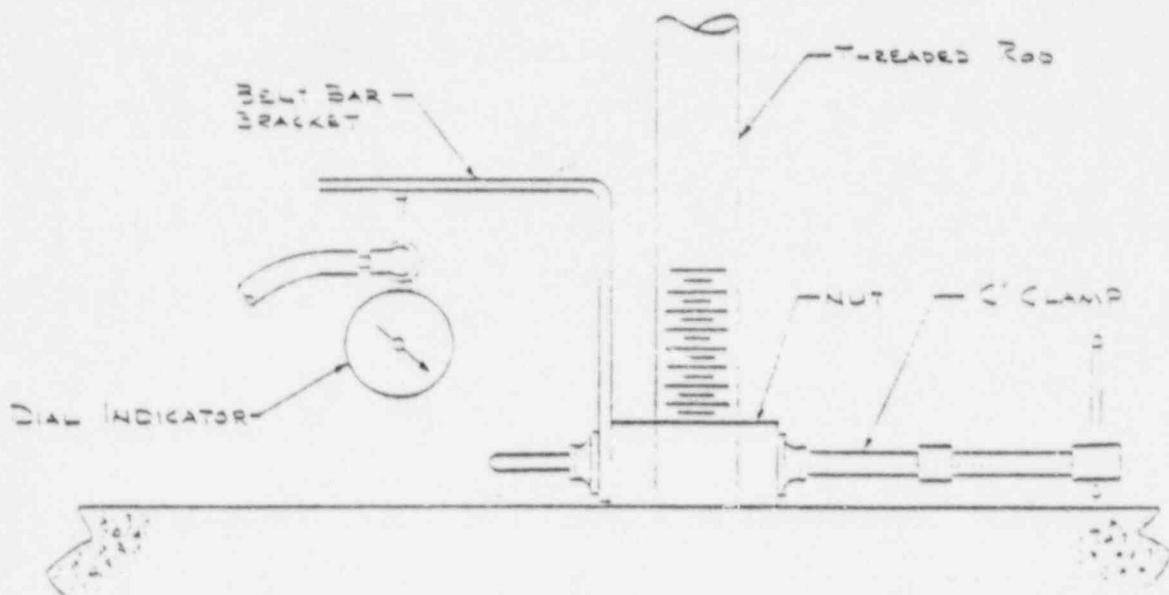

The arrangement and details of the test apparatus are shown on Drawing No. FSC-00464, Sheet 1, 2 and 3, which are included in Appendix I to this report. (Note that only MK C-14, C-15, C-16 and Assembly 'I' on Sheet 1 were used in this test.) The insert specimens tested were taken at random from the Constructor's stock on site and therefore, were representative of those installed in the plant structures. They were placed in a concrete slab cast specifically for these tests and which was composed of materials and reinforcement similar to those elements of the plant buildings. The concrete used was based on having a minimum design strength of 4000 pounds per square inch at 28 days. The laboratory test report on the concrete of which this slab is composed is included here in Appendix I.

### 2.4.2 SHEAR TEST APPARATUS

An apparatus for applying shear loads to the specimens was designed and built on site. This facility employed a 60-ton capacity, manually operated hydraulic ram whose thrust against a cross head was transmitted by tension rods to a 1 1/2-inch thick shear plate bolted to the insert specimen. The base reaction of the jack was transmitted through a structural steel "bridge" to the outer face of the concrete test slab. This arrangement, as shown in Appendix I, provided a horizontal shear load on the vertically positioned insert without producing secondary or reactive concrete stresses in the vicinity of the specimen. Ram thrust was determined by multiplying the fluid pressure (PSI), as indicated by a calibrated gauge on the pump, by a number equal to the ram piston area in square inches. Deflections were measured by a calibrated dial indicator mounted on a remotely anchored bracket and with its spring loaded probe in contact with a lug welded to the shear plate directly behind the bolt head or threaded rod.

### 2.4.3 TENSION TEST APPARATUS

An apparatus for applying tension loads to the specimens was also designed and built on site. This facility employed a 60-ton capacity, manually operated hydraulic ram which serves as an end loading on a built-up steel beam. The other end of the beam was bearing against a well-supported round bar which served as a fulcrum and provided the other end reaction of the beam when the jack was operated to load the specimen. A threaded rod protruded through the beam at mid-span, through a nut and bearing plate on the beam with the opposite end threaded into the Richmond Insert. This arrangement caused the load on the rod to be equal to twice the force applied to the jack. Location of the base plates for the reactions of the beam provided clearance from the insert of at least 4 times the overall insert height; i.e., at least 39 1/2 inches for the 1 1/2 inch inserts and 23 inches for the 1 inch inserts. Ram thrust was determined by multiplying the fluid pressure (PSI), as indicated by a calibrated gauge on the pump, by a number equal to the ram piston area in square inches. Deflections were measured by a calibrated dial indicator mounted on a remotely anchored bracket and with its spring loaded probe in contact with a bracket which was securely clamped to the nut on the threaded rod, as shown in the sketch below.

#### 2.4.4 COMBINED SHEAR AND TENSION TEST

The apparatus for the combined shear and tension test utilized the same equipment as that used on the individual shear and tension tests. For the shear portion, the equipment was set up identically to the individual shear test. For the tension portion, the equipment was arranged in a slightly different fashion. The hydraulic ram was not placed under the end of the beam, but instead, on the center of the beam on top. The ram thrust was applied directly to the threaded rod, which passed through the center of the ram, by means of a plate which was placed on top of the ram. The base reaction was resisted by the tension beam, loading which was supported by two wide flange stands at sufficient distance from the insert so as not to induce secondary or reactive concrete stresses in the vicinity of the specimen. This arrangement caused the load on the rod to be equal to the ram thrust. Both rams (one applying tension and one applying shear) were operated by a single hand pump with a calibrated pressure gauge. In this fashion, the shear and tension loads applied to the test specimen would be equal at all times.

### 3.0 TEST PROCEDURE

In performance of all of the tests, inserts were cleaned of concrete mortar and other trash that would affect bolt thread engagement. A new bolt (A-490) or threaded rod (SA-193 Grade 87) was used for each insert. The fasteners were all tightened "snug tight". The application of all loads was applied by the ram by operation of the manual hydraulic pump. As the load increased from zero (0), indications of fluid pressure (later converted to load) and simultaneous bolt head deflection were read at regular intervals. These intervals were at 400 PSI on the pressure gauge, corresponding to 5300 pounds thrust with the exception of the direct tension tests. On the direct tension test, these intervals were at 200 PSI on the pressure gauge, which also corresponded to 5300 pounds thrust on the specimen due to the configuration used. The load as indicated by these gauge pressures was maintained as constant as possible for a period of two (2) minutes. At the end of this time period, the deflection was again observed and noted. Load application on each specimen was carried out until ultimate failure of the specimen occurred (except specimen no. 1, which was tested in shear). At this point, observations were made of the condition of the specimens and the failure mode.

## 4.0 RESULTS

### 4.1 1 1/2-INCH RICHMOND INSERTS

#### 4.1.1 SHEAR TESTS

As can be seen on the test data sheets, the ultimate load applied to the specimens ranged from 90,100 lbs., to 106,000 lbs.. The failure loads ranged from 84,300 lbs. to 106,000 lbs.. All bolts sheared abruptly (except specimen #1; test was halted prior to ultimate failure), with minor spalling of the concrete on the compression side of the Richmond Insert. All five (5) specimens were utilizing A-320 bolts.

490

| <u>SPECIMEN NO.</u> | <u>ULTIMATE LOAD (lbs)</u> | <u>FAILURE LOAD (lbs)</u> |
|---------------------|----------------------------|---------------------------|
| 1                   | 90,100                     | 84,300                    |
| 2                   | 95,400                     | 90,100                    |
| 3                   | 95,400                     | 90,100                    |
| 4                   | 106,000                    | 100,700                   |
| 5                   | 106,000                    | 106,000                   |
| Average             | 98,530                     | 94,340                    |

Using the allowable insert loads given in specification 2323-SS-30 for 1 1/2-inch Richmond Inserts, the factor of safety is determined.

Allowable Shear = 27.0<sup>k</sup>

Factor of Safety (F.S.) =  $\frac{\text{Average Failure Ld.}}{\text{Design Allowable Ld.}}$

| <u>SPECIMEN NO.'s</u> | <u>AVERAGE FAILURE LOAD (k)</u> | <u>FACTOR OF SAFETY</u>     |
|-----------------------|---------------------------------|-----------------------------|
| 1 thru 5              | 94.34                           | $\frac{94.34}{27.0} = 3.49$ |

#### 4.1.2 TENSION TESTS

The ultimate load applied to the tension test specimens ranged from 87,650 lbs. to 114,150 lbs.. The failure loads ranged from 87,650 lbs. to 108,850 lbs.. The failure mode for specimens 11 and 12 was by stripping the threads between the threaded rod and the Richmond Insert. Specimen 13 failed in the Richmond Insert by a failure of the welds between the axial strut rods to the upper threaded coil. Specimens 14 and 15 failed by concrete shear cone failures. All specimens were utilizing SA-193 Grade 87 threaded material.

| <u>SPECIMEN NO.</u> | <u>ULTIMATE LOAD</u> | <u>FAILURE LOAD</u> |
|---------------------|----------------------|---------------------|
| 11                  | 106,200              | 103,650             |
| 12                  | 114,150              | 108,850             |
| 13                  | 114,150              | 108,850             |
| 14                  | 87,650               | 87,650              |
| 15                  | 100,900              | 100,900             |
| Average             | 104,610              | 101,960             |

Allowable Tension = 31.3k

Factor of Safety (F.S.) =  $\frac{\text{Average Failure Ld.}}{\text{Design Allowable Ld.}}$

| <u>SPECIMEN NO.'s</u> | <u>AVERAGE FAILURE LOAD (k)</u> | <u>FACTOR OF SAFETY</u> |
|-----------------------|---------------------------------|-------------------------|
| 11 thru 15            | 101.96                          | 101.96/31.3 = 3.25      |

#### 4.1.3 COMBINED SHEAR AND TENSION TESTS

The shear and tension loads applied to the specimens under this loading condition are equal and the ultimate loads ranged from 60,950 lbs. to 68,900 lbs.. The failure loads ranged from 58,300 lbs. to 67,575 lbs.. Specimens 6 through 9 failed by an abrupt shearing of the threaded rod. There was some deformation of the rod in bending at the shear zone (ranging for 20° to 45° bend). Upper insert washer moved from 1/2 inch to 3/4 inch with some concrete spalling on the compression side of the insert. Specimen 10 failed by stripping the threads between the threaded rod and the insert. This failure lifted the upper insert washer from the struts, but the insert remained in place.

| <u>SPECIMEN NO.</u> | <u>ULTIMATE LOAD (lbs)</u> | <u>FAILURE LOAD (lbs)</u> |
|---------------------|----------------------------|---------------------------|
| 6                   | 68,900                     | 67,575                    |
| 7                   | 67,575                     | 67,575                    |
| 8                   | 60,350                     | 58,300                    |
| 9                   | 61,613                     | 61,613                    |
| 10                  | 64,925                     | 62,275                    |
| Average             | 64,793                     | 63,468                    |

Allowable Tension = 31.3k

Allowable Shear = 27.0k

Factor of Safety (F.S.)

$$\frac{(\text{Average Failure Tension})^{4/3}}{(\text{Design Allowable Tension} \times F.S.)} + \frac{(\text{Average Failure Shear})^{4/3}}{(\text{Design Allowable Shear} \times F.S.)} = 1.0$$

|-----------------------|---|--|
| 6 thru 10             | 63.47   | $\left(\frac{63.47}{31.3 \times F.S.}\right)^{4/3} + \left(\frac{63.47}{27.0 \times F.S.}\right)^{4/3} = 1.0$<br>F.S. = 2.63 |

#### 4.2 1-INCH RICHMOND INSERTS

##### 4.2.1 SHEAR TESTS

From the test data sheets, the ultimate load applied to the specimens ranged from 39,750 lbs. to 50,350 lbs.. The failure loads ranged from 37,100 lbs. to 42,400 lbs.. Specimens 16 thru 19 failed by shear failure of the A-490 bolt. The top portion of the inserts deflected from 1/8 inch to 7/8 inch with some spalling on the compression side of the insert. Specimen 16 showed some rotation of the top of the insert. Specimen 17 and 18 showed no apparent sign of rotation. Specimen 19 failed by breaking the weld between the upper coil and the struts. The bolt then failed in bending after rotating with the upper portion of the coil. Specimen 20 failed by crushing the concrete on the compression side of the insert. The insert then rotated intact and the bolt ultimately failed in bending.

| <u>SPECIMEN NO.</u> | <u>ULTIMATE LOAD (lbs)</u> | <u>FAILURE LOAD (lbs)</u> |
|---------------------|----------------------------|---------------------------|
| 16                  | 46,375                     | 42,400                    |
| 17                  | 43,060                     | 37,100                    |
| 18                  | 50,350                     | 42,400                    |
| 19                  | 46,375                     | 42,400                    |
| 20                  | 39,750                     | 37,100                    |
| Average             | 45,182                     | 40,280                    |

Allowable Shear = 11.5<sup>k</sup>

$$\text{Factor of Safety (F.S.)} = \frac{\text{Average Failure Ld.}}{\text{Design Allowable Ld.}}$$

| <u>SPECIMEN NO's.</u> | <u>Average Failure Load (k)</u> | <u>Factor of Safety</u> |
|-----------------------|---------------------------------|-------------------------|
| 16 thru 20            | 40.28                           | 40.28/11.5 = 3.50       |

#### 4.2.2 TENSION TESTS

The ultimate load applied to the specimens ranged from 41,270 lbs. to 43,920 lbs.. The failure loads ranged from 39,950 lbs. to 43,920 lbs.. Specimens 26, 28 and 29 failed by concrete shear cone failure. Specimens 27 and 30 failed by Richmond Insert failure. The inserts failed by a failure of the welds between the struts and the lower coil. There was some surface spalling associated with these failures.

| <u>SPECIMEN NO.</u> | <u>ULTIMATE LOAD (lbs)</u> | <u>FAILURE LOAD (lbs)</u> |
|---------------------|----------------------------|---------------------------|
| 26                  | 42,600                     | 42,600                    |
| 27                  | 43,920                     | 43,920                    |
| 28                  | 42,600                     | 39,950                    |
| 29                  | 42,600                     | 39,950                    |
| 30                  | 41,270                     | 39,950                    |
| Average             | 42,598                     | 41,276                    |

Allowable Tension = 11.5k

Factor of Safety (F.S.) =  $\frac{\text{Average Failure Ld.}}{\text{Design Allowable Ld.}}$

| <u>SPECIMEN NO's.</u> | <u>AVERAGE FAILURE LOAD (k)</u> | <u>FACTOR OF SAFETY</u> |

| 26 thru 30            | 41.276                          | 41.276/11.5 = 3.59      |

#### 4.2.3 COMBINED SHEAR AND TENSION TESTS

The shear and tension loads applied to the specimens under this loading condition are equal and the ultimate loads ranged from 27,325 lbs. to 30,475 lbs.. The failure loads ranged from 27,325 to 29,150 lbs.. Specimens 21 thru 25 failed abruptly due to shear failure of the threaded rod. All inserts remained intact with only surface spalling of the concrete.

| <u>SPECIMEN NO.</u> | <u>ULTIMATE LOAD (lbs)</u> | <u>FAILURE LOAD (lbs)</u> |
|---------------------|----------------------------|---------------------------|
| 21                  | 27,325                     | 27,325                    |

|----------------------|---|--|
| 21 thru 25           | 28,355  | $\left( \frac{28.36}{11.5 \times \text{F.S.}} \right)^{4/3} + \left( \frac{28.36}{11.5 \times \text{F.S.}} \right)^{4/3} = 1.0$<br>F.S. = 4.15 |

## 5.0 CONCLUSIONS

These test results show that the performance capabilities of the 1 1/2-inch type EC-6W and the 1-inch type EC-2W Richmond Inserts in shear, tension and combined shear and tension exceed the design allowable by a ratio of more than 3 to 1. These conclusions are valid for the design allowables shown in Specification 2323-SS-30, based on a spacing of the Richmond Inserts such that a full shear cone can develop.

Based on this test, the design allowables for shear, tension and combined shear and tension are acceptable for use without further investigation or additional calculations. Richmond's recommendation of a minimum safety factor of 3 has been complied with.

CURING CONTROL TEST RESULTS  
FOR 28 DAY BREAK

## LABORATORY CURED CYLINDER(S)

## FIELD CURED CYLINDER(S)

STRENGTH (PSI) 5420 (c)  
5496 (d)  
 $(c)+(d) - (c)+(d) = 0.91$

STRENGTH (PSI) 4236 (c)  
4920 (d)  
 $2 \cdot (c)+(d) + 2 \cdot 1 = 4955$

\* NOTE: (1) ABOVE MUST BE EQUAL TO OR GREATER THAN 0.85; OR (2) ABOVE NEED NOT EXCEED THE DESIGN STRENGTH BY MORE THAN 300 PSI EVEN THOUGH THE 0.85 CRITERION IS NOT MET

Abnormal shearing of net load component  
Due to eccentric shear stresses causing micro-  
shear at some 2-hour interval.

1. Jack Thrust = Shear Load on Insert.  
1. Jack Thrust (lb.) = Gauge Pressure (PSI)  $\times$   $\frac{\pi D^2}{4}$  for Shear Load.  
2. Jack Thrust (lb.) = Gauge Pressure (PSI)  $\times$   $\frac{\pi D^2}{4}$  for Tension Load.  
Total Wt. of Tension Load Beam =  $\frac{\pi D^2}{4} \cdot 1$  lb.  
\*\*\* Back-to-back Thrust = Total Thrust minus Net Jack Thrust = 0.  
\*\*\*\* Insert Load = Net Jack Thrust = 0.

Abrupt failure of  
threads (insert and rod). Thread engagement  
was "full". Threads on both  
rod & insert were stripped. Concrete  
spalled to about 12" depth 12 x 15" over  
concrete edge. Rod not broken.

\* Jack Thrust (Lb.) = Gauge Pressure (PSI) x 13.25      By dynamometer  
M & TE # 1432  
due Apr. 17, '84  
Total Weight of Load Beam = 2450 ---  
\*\* Net Jack Thrust = Total Thrust Minus 1/2 Weight of Beam. ( $\frac{1}{2}$  wt. of bin. = 1225#)  
\*\*\* Insert Load = Net Jack Thrust x 2.

Failure occurred by failure of the insert. Weld between lower coil and vertical struts broke. Threaded, upper, coil came out and carried the two struts with concrete spalled an over area about 1.5' x 2.25' max depth 2" @ insert exposed one rebar located 3" O.C. from insert. Rebar not disturbed. Only concrete cover removed.

1. Jack Thrust = Shear load on Insert.  
 1. Jack Thrust (lb.) = Gauge Pressure (PSI) x  $\frac{12.5}{100}$  for Shear load.  
 2. Jack Thrust (lb.) = Gauge Pressure (PSI) x  $\frac{12.5}{100}$  for Tension load.  
 Total Wt. of Tension Load Beam =  $\frac{1}{12} \times$   
 Jack bond Thrust + Jack Thrust + Beam weight.  
 \*\*\* Insert load = Net Jack Thrust + 2 lb.

1. Jack Thrust = Shear load on Insert.

1. Jack Thrust (lb.) = Gauge Pressure (PSI) x  $\frac{12.5}{100}$  for Shear load.  
 2. Jack Thrust (lb.) = Gauge Pressure (PSI) x  $\frac{12.5}{100}$  for Tension load.

Total Apparatus = Jack Thrust + Beam weight + Jack bond Thrust + Beam weight.

1.- Jack Thrust = Shear load on Insert.  
 1.- Jack Thrust (lb) = Gauge Pressure (PSI) x  $\frac{2\pi}{3} \cdot \frac{D^2}{4}$  for Shear Load.  
 2.- Jack Thrust (lb) = Gauge Pressure (PSI) x  $\frac{\pi}{4} \cdot \frac{D^2}{4}$  for Tension Load.  
 Total Mt. of Tension load taken =  $\frac{D^2}{4} \cdot \frac{P}{2}$   
 2.5 - Net Jack Thrust = Total Thrust minus  $\frac{1}{2} M_t$  of eccentricity.  
 \*\*\* Insert load = Shear Jack Thrust.

Insert remained intact. Shear core type failure of concrete. Insert net located rear center between E-W & N-S axes. Core was approximately 10mm-wide by 4-5cm 2-each way. Some lifting force caused contact concrete to small 5-ft sq. size of insert. Shear cone depth = full height of insert less  $\frac{1}{4}$ " @ bottom.

\* Jack Thrust (Lb.) = Gauge Pressure (PSI) x 13.25

Total Weight of Load Beam = 2450

\*\* Net Jack Thrust = Total Thrust Minus 1/2 Weight of Beam. ( $\frac{1}{2}$  wt. = 1225/16)

\*\*\* Insert Load = Net Jack Thrust x 2.

| 17500                       | 23188                   | 21960                          | 42920                   | .146             |                 | Failure            |

Failure occurred by failure of the insert. Weld between lower coil and vertical struts broke. Threaded, upper coil came out and carried the two struts with it. Concrete spalled an oval area about 1.5' x 2.25' max depth 2" @ interior. Exposed one rebar located 3" o.c. from insert. Rebar not disturbed. Only concrete cover removed.

\* Jack Thrust (Lb.) = Gauge Pressure (PSI) x 13.25

Total Weight of Load Beam = 2450

\*\* Net Jack Thrust = Total Thrust Minus 1/2 Weight of Beam. ( $\frac{1}{2}$  wt. = 1225)

\*\*\* Insert Load = Net Jack Thrust x 2.
