U. S. NUCLEAR PEOPLATICA PRICEION OFFICE OF INVESTIGATION DALLAS FIELD OFFICE

REPORT OF INCUIRY

lugus: 2, 1980

SUBJECT: INVESTIGATION OF ALLEGED B&R TERMINATION IN VIOLATION OF SECTION ZIG, ENERGY REORGANIZATION ACT, AT CPSES (Investigation No. Q4-82-

- 1. On June 25, 1982, telephonically advised the reporting investigator that a Brown & Root, Inc. (B&R) Quality Control Inspector at CPSES was terminated for attempting to submit an NCR regarding improper Hilti bolt installation.
- 2. On July 6, 1982, Mr. Robert J. Fortman, Assistant Area Director, U. S. Department of Labor, Fort Worth, Texas, advised that complaint with DOL under the provisions of the Energy Reorganization Act. A copy of the DOL letter acknowledging this complaint is attached as Attachment 1
- 3. On July 9, 1982 was telephonically contacted by the reserting investigator regarding his complaint. Istated he worked as a OE inspects on the night shift at CPSES. He stated his supervisor, Mr. Edd'e Holland, had refused to allow him to submit an NCR on June 17, 1982. Stated that an argument with Holland had ensued, subsequent to which he was terminated. Is stated Holland wanted to informally apprise the craft supervisor of the defect in order that corrective action could be taken.

 Tagreed to come to the NRC Region IV office for further interview. The week of July 12, 1982, he cancelled two appointments and failed to arrive for another. No further contact was made with
- 4. On July 21, 1982, the reporting investigator accompanied Mr. Robert J. Fortman to CPSES to investigate circumstances relating to companied Mr. The following persons were interviewed by Mr. Fortman, OOL, with the recorting investigator present:

Randall Smith, non-ASME Mechanical QC Lead, B&R
Don Mantz, Pipe Hanger General Foreman, B&R
Edward Holland, Night Shift non-ASME QC Superintendent, B&R
James Ragan, Right Shift ASME QC Supervisor, B&R
Cecelia Payne, Right Shift non-ASME QC Inspector, B&R

Interviews of the aforementioned personnel disclosed that nad been reassigned to the night shift non-ASME QC starr in about early the 1982. Smith, Holland, Ragan, and Payne stated nad not wanted to work on the night shift. Holland, Ragan, and Payne state. We wanted to work on the night shift. Holland, Ragan, and Payne state.

8607100285 860630 PDR F0IA GARDES5-59 PDR FOIA-85-59

persons working that shift. With regard to the situation that allegedly resulted in termination, Mantz, Holland, Ragan, and Payne states the problem was not one which required an NCR and that agreed has agreed with the corrective action taken at that time. Holland and Ragan related that the termination of resulted from another matter which occurred on June 17, 1982, subsequent to which Holland had discussed with this performance. During this discussion, made the statement "fire me now or /ire me later.'

(Investigator's note: During the 7/9/82 telephonic interview of Stinson, he commented that he made this statement to Holland.)

Holland stated this comment was the reason he terminated stated this statement was interpreted as a display of disrespect and his failure to understand that his performance should improve.

5. On July 29, 1982, Mr. Robert Fortman advised the reporting investigator that his determination, relating to complaint, was that evidence did not verify that discrimination was a factor in the actions which resulted in his termination. A copy of the DOL letter to concerning this decision is attached as Attachment 2.

D. D. Driskill, Investigator

FOIA-85-59 DD/3

SUMMARY

Investigation of alleged electrical deficiencies that occured from August, 1979 to January, 1980 in the construction phase of the Comanche Peak Nuclear Power Plant at Glen Rose, Texas, included an interview of the contractor's electrical Superintendent, the review of numerous electrical records, and the inspection by NRC personnel of identified alleged electrical "deficiencies." Investigation disclosed that three of the four basic alleged "deficiencies" were in the areas of non-safety wiring. During August and September, 1982 all alleged deficiencies were examined and no irregularities were found. Review of nonconformance report records did identify similar deficiencies discovered in the December 1979 through January/February 1980 time frame; however, these deficiencies were properly addressed in 1980.

DETAILS

Purpose of Investigation

The purpose of this investigation was to investigate allegations of electrical "deficiencies" during the 1979/1980 construction phase of the Comanche Peak Steam Electric Station, Glen Rose, Texas.

Background

On August 4, 1982, Mrs. Juanita Ellis, President, Citizens Association for Sound Energy (CASE), met with NRC Investigator R. K. Herr at the NRC offices in Arlington, Texas. Mrs. Ellis provided reporting investigator a copy of a statement executed on Juna 14, 1982 by

Mrs. Ellis remarked that Chandler alleges "electrical raults of construction" at the Comanche Peak site located in Glen Rose, Texas.

Interview of CHARLES BRETT

On August 31, 1982, Charles Brett, Superintendent of the Electrical Department, Brown and Root, contractors for Comanche Peak construction, was interviewed by NRC Investigator R. K. Herr at the construction site located in Glen Rose, Texas. Brett explained that he was present during the 1979 time frame, and in December 1979, the electrical department created a "termination crew." Brett stated that this crew would check out all electrical (safety and non-safety) wiring to ensure that work had been accomplished and that the work was done satisfactorily. Brett remarked that the men assigned to the work crews would submit handwritten reports to show what work was done, where the work was done, and the status of the work. Brett emphasized that this crew checked the electrical wiring before the Quality Control Inspectors were advised that the electrical wiring was ready for inspection. Brett explained that the termination crew conducted a preinspection review of all electrical work. Brett also pointed out that, if a deficiency was noticed and reported, the deficiency would be addressed before the Quality Control Inspector would conduct his inspection. Brett explained that this extra "check out" by the electrical personnel was used as a management tool to show the electrician where problems arose and to point out various potential deficiencies. Brett stated that the Quality Control Inspector could still find various deficiencies, and that the practice of utilizing "termination crews" to check the electrical wiring is no longer being used. Brett remarked that "termination crews" were not a requirement in the Brown and Root procedure or instructions, but were merely an extra check for the electrical department itself, and therefore, none of the handwritten reports or status sheets were kept.

Interview of

- (1) Motor control center located in the circulation water system: use of 1000 MCM cable, using 750 MCM lug that was drilled to accept larger cable.
- (2) Auxiliary Building, Reactor No. 1: lug designed for an approximate screw size of 3/8 inch was used on a terminal block designed for #10 screws.
- (3) Switch Gear Room, Reactor No. 1, black cable: lug designed for % inch screws were used on terminal blocks designed for #10 screws.
- (4) Annunciator logic panels, Control Room, Reactor No. 1, black cable: improper cable splicing and wiring to the wrong side of lugs.

other general allegations of deficiencies identified in his previous statement of June 14, 1982, were addressed in the following manner.

expressed concern with the improper installation and check-out of Cannon type plugs.

was provided NRC Inspection Report 50-445/80-13, dated
May 21, 1980.

Istated that after reading the NRC Inspection Report, the report answered all his concerns in this area.

had also expressed concern regarding the patching/repairing of damaged cable, faulty grounding, and wiring not protected from abrasions.

was provided eight nonconformance reports covering the above general allegations that were issued from December 20, 1979 to March 18, 1980 and subsequently corrected.

after reviewing the nonconformance reports, stated that the deficiencies identified in the nonconformance reports and subsequent corrections appeared to address the concerns that he identified in his previous statement of June 14, 1982.

explained he was not in a position to determine if his concerns were addressed properly, pointing out that he did not have access to the nonconformance reports or NRC inspection reports. Further, remarked that most of his work was with non-safety cable. However, he stated that between January 2 and January 11, 1980 he was assigned to the Electrical Department "termination check-out crew" that went around to ensure that all work was done properly, and that some of the items he checked could have been safety related.

stated that he was unaware of QA/QC activities or procedures that took place subsequent to the check-out crew activities on all safey-related activities.

also expressed concern that when cad-welding was done, welders only protected an area of about 3 feet; however, had not inspected any of these to determine if any cables had been damaged and could not identify any specific areas for follow-up by NRC.

Inspection of Alleged Deficiencies

On August 31, 1982, Dennis L. Kelley, NRC Senior Resident Reactor Inspector (SRI), assigned to Comanche Peak, Glen Rose, Texas, met with NRC Investigator R. K. Herr to review the allegations set forth by

Allegation Number 1: Kelley was able to physically locate the motor control center (MCC) located in the circulating water system, as described in the allegation concerning the use of 1000 MCM cable with a 750 MCM lug. Kelley stated that he inspected the area in question and found no 1000 MCM cable in the motor control center. Kelley reported that he did find one 750 MCM cable in MCC XB3-2 that is matched up to the proper lugs. He also found that the MCC 1B3-2 contained paired 350 MCM cables properly terminated. Kelley remarked that as of August 31, 1982, no improper wiring was evident in the MCC's of the circulating water system.

Allegation Number 2, Auxiliary Building, Reactor No. 1, improper screw size for lugs: Kelley stated that he physically located this area utilizing Map No. 1, and found that there were no washer/screws in panel 5 or 6. However, he did discover a number of screws with attached washers. Kelley explained that upon close examination he found that the washer attached to the screws is an intricate part of the screw (manufactured together) and it not an add-on as it may appear at first glance. Kelley stated that some screws contained brass plate and some contained chrome plate. Kelley remarked that the chrome plate gives the appearance of a steel washer and could easily be mistaken for steel. Kelley concluded that as of September 1982, there was no improper wiring in this area.

Allegation Number 3, Swith Gear Room, Reactor No. 1, improper screw size for lugs: Kelley stated he physically located this area utilizing Map No. 2 and found that the same conditions existed as per Allegation No. 2, above. Kelley added that as of September 1982, when he inspected Switch Gear Room, Reactor No. 1, no improper wiring was observed.

Allegation Number 4, Control Room, Reactor No. 1, splicing and cable termination to wrong side of fuse block with some shaving of the lugs: Kelley stated he physically located this area, using Map No. 3, and found no evidence of shaving or erroneous termination of cable. Kelley further stated that he checked the section in question as well two other sections in the control panel and found that there was no evidence of lugs being shaved and added that blocks were of such a nature that it makes no difference which side accepts power Lads. Kelley remarked that there were three blocks located in this area at the time of his examination. He did not find any improper wiring. Kelley confirmed Chandler's statement that the wiring in this area is black cable wiring, and is non-safety.

Kelley stated that during his inspection effort, he also examined safety and non-safety cable in the location of concern, utilizing Map No. 4, to determine if any cables were pulled too tight. Kelley explained that the cables are tied off with tie wraps and anchored with adhesive clips to hold wires down and stated he found adequate slack in these cables. Kelley pointed out that these conditions are in existence at the present time. However, he could not comment on the conditions as they existed in January 1980.

Status of Investigation

The status of this investigation is CLOSED.

STATUMENT OF

My name is

was surking at the Comanche Poak

maclear power plant construction with

The fary fact

I can personally attest to and will be supported by documented records of several faults in the electrical phase of construction at Comanche Pack as of January 11, 1980. Having been employed as a journeyman electrician by Brown & Root, Inc. during the latter part of Comanche Pack, I worked in the electrical "termination crew" doing the actual phyrical termination of the wiring and later on the "checkout crew". This latter crew shocks the wiring done by the termination crew as to ascuracy and proper termination technique. I was required to turn in a written and signed report on each cable checked by me. Some, if not all of these faults can be verified and located through these reports. These faults inclosed improper lug siming and actual physical alteration of lugs, splicing of cable, patching of damaged cables, improper pin setting on "canon" type plugs, faulty grounding, wiring not properly protected from abrasion, wire tension too high, and improper protection of cables during thermal welding.

Luga are a wiring device that attach to the ends of wires or cables as an aid to termination and come in a variety of styles and sizes. The sring type" used at Comanche Peak has a hole in its tongue to accept screws from terminal blocks. These holes can be of varying size dependent upon what dismeter or stud size screw the terminal block is engineered for. A stud size six is smaller in diameter in both the threaded portion and the bead of the screw than a stud size 8 or 10. The luse for these, in order to fit the different terminal blocks and screw size and at the same time maintain the amperage capacity they are rated for, are manufactured with a different adapted tongua. For example, #12 copper wire has an emperage rating of 20 maps, and a lug designed to accept the wire must have the same or larger ampacity. The rating of the wire is determined by the diameter of the copper conductor. The rating of a lug is determined by the size and shape of the tongue. It must have a specific area of its surface in contact with the terminal block or its ampacity will be lessened. A lug with its touque designed for a glo screw has a hole in its tongue that is larger than the hole in one designed for a \$6 or #8 sorew. The tongue is also wider and thinner. If a lug designed for a #10 serew is used on a terminal block designed in use with #8 screws, its ampacity is lessened because a #b screw having a smaller hear size only applies pressure to the inner ring of the lu; tongue causin; a "balling" effect. It sames the outer edges of the teague to curl outward, also less area under the serse head is in contact with the terminal work because of its larger hole. There are many instances where this has happened at Comanche Peak. Some of these are:

l. Asciliary Duilding Reactor β 1---Lag designed for an approximate screw size of $3/8^{\circ}$ was used on a terminal block designed for β 10 screws. This was done with the aid of a steel washer without the use of contact aid to prevent also-trolysis between the two dissimilar metals.

2. Switchgeer Room. Several lugs designed for 1/4" screws were used on terminal blooks designed for #18 screws.

These two instances stand out in my mind but there are many more in particular concerning the circulating water system and fire control; however without reference materials I cannot be more specific. However, there is at least one instance I can recall-in fact for which I am at least partially responsible. This is the termination of a 1000 MCM cable with the use of a 750 MCM lug that was drilled to accept the larger cable size. It was done after protest by both myself and Denmis Neaves, another jearneymen working as my partner on the termination crew. Drilling the lag affected its ampacity in two manners: one, it reduced the amount of metal to conduct electricity and it was a bolt type mechanical lug, meaning that the lug was secured to the cable by means of a bolt or set screw in its body. Drilling the lng body had the effect of lessening the number of threads to not more then three or four for the set screw to be screwed into. This was in a Motor Control Center in the Circulating Water system. Any failure in the circulating water system which provides coolant water for the reactor could possibly cause very serious problems.

At least one cable in the Ammenciator Logic Panels in the control for Reacter #1 was spliced in the annunciator panel itself and covered over with other wires to hide it from sight. The cable was too large (it was assumed) to terminate on the fuse block to which it was designated. Upon examination of the fase block I found the cable terminated to the wrong side of it. Had it been terminated on the correct size the original sable would have fit. The splice was made on the orders of Frank Platt, the General Foreman over termination. Also in the Annunciator panels there were several "Canon" type plugs in which the pins were not seated properly. This can cause the connector pins to be pushed back into the body of the plug causing the pin or pins to have poor contact. The Annunciator Logic Panels give the alarm if any part of the system malfunctions. Any malfunction in the annunciator system can cause no alarm to be given in any emergency to

which the plant may be subject.

Portions of the grounding system for the cable trays in the Spreader Room were damaged either by an employee collecting copper or deliberate vendelism. Strands were cut from the cables in several places. The conductors were never cut entirely in two but the removal of a strand of no matter what

length reduces the capacity of the conductor.

In the Control Center for Reactor #1 literally hundreds and possibly thousands of wires were brought out of their metal raceway and pulled sharply over their sharp, unprotected edges, making them particularly vulnerable to abrasion and vibration. Every portion of every system in the plant could be adversely affected by this faulty procedure.

At least one cable in the Switchgear Room was damaged while being pulled. Its insulation was nicked in several places and patched with heat

shrink tabing instead of being replaced.

In at least two instances wires or caules were too short by only a matter of inches for proper termination. These were pulled very tightly and terminated. They were pulled tight enough that there is the possibility of their being pulled from their luss. One of these is in the Spreader Room; emother is in a Motor Control Center in the Circulating mater System.

"Cad welding" or thermal wel in, of the grounding conjuctors on the cable trays was done after many cables had already been pulled through them. I could not inspect for damage, but the only protection used on the cables was an aspector blanket that protected only the cables in the immediate vicinity of the weld.

I am necessarily vague on which particular calinet or panel or even system to which I refer due to time elepted and the large number of systems on which I worked. With reference materials the location of these faultr could be much sore closely identified as could others not mentioned specifically herein.

Signed this 1477 day or June 1982 at

, hereby make the 'd' owing voluntary statement to Mr. R. K. Herr, who has identified nimself to me as an investigator with the U. S. Nuclear Regulatory Commission. I make this statement freely with no threats or tromisment having been made to me.

I worked at the Comanche Peak Construction site for Brown & Root as an electrician from August 21, 1979 to January 11, 1980. I worked about 3 months on the termination crews and from January 2, 1980 to January 11, 1980 I worked on the termination check out crew.

On June 14, 1982, I prepared a statement covering areas of concern that I had with various practices that the electrical department was doing. I prepared my statement upon the request of a friend of mine, Lawrence Pope, who ask me if I had any problems or concerns with the electrical department and told me that these concerns would be made known through the upcoming hearings on the Glen Rose Comanche Peak Nuclear Power site at Ft. Worth, Tex.

Mr. Herr and Mr. L. Martin of the NRC have gone over with me the concerns that I mentioned in my statement.

I would like to point out that most of my concerns deal with Black Cable that is non-safety.

In my June 14, 1982, statement I mentioned signed reports that could identify faults. These reports that I refer to are cable termination cards and cable pull cards. These cards have sign off blocks for the craft, their supervisor and Q. C., also & there is an area for comments. Any comment that I may have made on these cards would have to be addressed by Q. C. and/or corrected before Q. C. sign off, however, I was not present to observe all of the corrective action. To the best of my knowledge I documented all of my concerns on the above cards. However, most of my work was in non-safety related areas.

I have drawn a map of the Auxiliary Building Reactor #1 and located the are of my concern. This area or control panel has both safety and non-safety wiring. Mr. Herr stated he would contact me later and report the results o the NRC inspection in this area.

I have also draw, a map of the Switchroom area and have located my concern in Reactor Building #1, Grould Level, just left to the door entrance. I worked with black cable and I recall that Black Cable is non-safety related

I have also drawn a map of the Annunciator Logic Panels, in the control room, Reactor #1 and have located my area of concern. I worked with Black Cable and I understand that this area is also non-safety related.

Mr. Herr and Mr. Martin discussed my area of concern in the Manzzhotor Control Center in the Circulating Water System. In my statement I said that 1000MCM cable was present in the Motor Control Center, however, upon re-thir could have been 750 mcm. I am not sure. Mr. Kerr told me as of August 30, 1982, this area was inspected by the NRC and the lugs and wire were found to be correct. Apparently my concerns were identified and axxxxx corrected after I left in January 1980.

My concerns with improper installation and checkout of cannon type plugs was

subsequent: maified by the NA Abcumented in NRC inspection report 50-445/80-13 ... t I have read today (September 2, 1982) and addressed to my satisfactions.

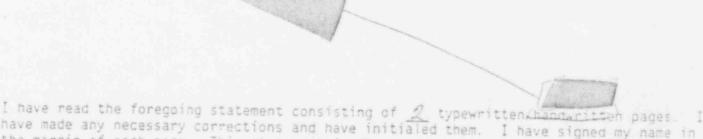

As to the rest of my concerns regarding damage, cable by sharp edges, and/c other means, Mr. Herr has shown me a number of Non-Conformance Reports (NCF that address these concerns. Most of these NCR were discovered and correct after I left the site.

My concern about the repair/patch of cable damage have been addressed by a procedure that was published in October 1980, that outlines the repair procedure requirement. I did not know about this procedure because it was pubilished after I left, however I have raead the procedure (EE1-13 Rev. 2) and have no further concerns.

I cannot locate the exact area where cables were too sourt and were pulled tight for termination however I realize that on safety-related cable, Quality Control checks and pre-requisite testing would have identified and corrected my concerns. In the MCC Rm, BLK Cable, CCW(1 cable too tight). In the Spreader Rm, either BLK or orange as per the map I gave to Mr. Herr. I would like to clarify as statement I made on cadwelds. I said that I could not check for damage but what I meant to say is that I did not check for damage. My concern is that the asbestos covering was only for an area of three feet and believed it would have becovered an area of six feet.

I now realize that subsequent megger tests and Q. C. Survelliance would brave identified damaged cable.

Mr. Herr has asked me if I have any other concern or area of concern that I wish to convey and I have no other concerns except as identified on my Dune 14, 1980, statement and in this statement.

have made any necessary corrections and have initialed them. I have signed my name in the margin of each page. This statement is the truth to the best of my knowledge and belief. I declare under penalty of perjury that the foregoing is true and correct.

Executed on 3EPT 2,1452 at 1205 fm.

OFFICE OF ENVESTIGATIONS ASSISTANCE TO INSPECTION REPORT

SUBJECT:

COMANCHE PEAK

ALLEGED IMPROPER CONSTRUCTION PRACTICES

REPORT NUMBER: A4-83-005

- On February 3, 1983, Robert L. MESSERLY provided an affidavit to the Citizens Association for Sound Energy (CASE), an intervenor that included three allegations regarding improper construction practices by Brown & Root personnel a the Comanche Peak Steam Electric Station. MESSERLY alleged the following:
 - a. That Brown & Root employees drilled undocumented unauthorized holes through rebar, and such cutting of rebar was done at the direction of supervisors
 - b. That the main steam line pipe in Unit I was moved using the polar crane, thereby placing the pipe under unsafe tension.
 - c. That a Brown & Root employee used a cutting torch on hanger material in violation of procedure.
- On April 6, 1983, MESSERLY was contacted by the reporting investigator, and a meeting was arranged with MESSERLY for the following day. MESSERLY contacted reporting investigator on April 7, 1983, and requested the meeting be changed to April 8, 1983.
- On April 8, 1983, NRC OIFO Director R.K. HERR and the reporting investigator met MESSERLY at a restaurant in Fort Worth, Texas. MESSERLY was accompanied by Ms. Juanita ELLIS, a CASE representative, and Ms. ELLIS husband. Ms. ELLIS wished to record the meeting; however, OIFO:RIV was not previously informed of her intended presence nor of her desire to record the interview. OIFO did not have a recorder, and in accordance with OI's policy, the neeting was rescheduled. On April 10, 1983, arrangements were made to use a room at the U. S. Attorney's office, Fort Worth, Texas, and for a court reporter to transcribe the interview of MESSERLY.
- On April 14, 1983, MESSERLY was interviewed at the U.S. Attorney's office with Ms. ELLIS present. MESSERLY's testimony was taken under cath, Attachment (1). and Ms. ELLIS made her owr personal recording of the interview. In his testimony, MESSERLT expanded in detail on his original allegations. MISSERLY named Brown & Root employees responsible for the alleged improprieties and those who could substantiate his aliegations. MESSERLY also identified numerous employees by title, and agreed to later provide the corresponding names when he was able to refresh his memory with his personal records located at his residence. MESSERLY also provided the NRC with a copy of a log. MESSERLY explained that he maintained this log to document the cutting of rebar at Comanche Peak. (Note: MESSERLY did not allege that all the entries in the log documented unauthorized cuts through rebar, but rather that some of the entries in the log may have been for holes drilled through rebar that may not have had the appropriate accompanying authorizations.) During this interview, MESSERLY made a fourth allegation regarding instances of

-9310180223 FOIA-85-59 3 pp. DD/4

A4-83-005 Page Two

Brown & Root welders failing to purge stainless steel pipes during welding.

- 5. On April 21, 1983, a copy of the recorded testimony was mailed to MESSERLY at his residence. On April 27, 1983, MESSERLY was contacted by HERR, and acknowledged receipt of the transcript, but postponed giving the names of the Brown & Root employees he had identified by title in the transcript. MESSERLY stated he had not as yet had an opportunity to read his entire testimony. On April 29, 1983, MESSERLY was again contacted by HERR, but he again postponed providing the names, explaining he was very busy. On May 1, 1983, the reporting investigator telephoned MESSERLY at his residence, and MESSERLY provided twelve, additional names of Brown & Root employees at Comanche Peak he alleged had knowledge of unauthorized cuts through rebar.
- 6. On May 3, 1983, interviews were initiated at the Comanche Peak site addressing the four allegations. MESSERLY identified 38 individuals allegedly responsible for, or having knowledge of, the allegations. Review of employment records determined that eighteen individuals were no longer employed at Comanche Peak.
- 7. Between May 3, 1983 and May 10, 1983, 19 Brown & Root employees and 1 Dravo Constructors Inc. employee (formerly employed by Gibbs & Hill) named by MESSERLY were interviewed, and signed, sworn statements were taken from 19 of them. One Brown and Root employee interviewed left on vacation before a signed, sworn statement was obtained from him, and his testimony was recorded in the form of a Results of Interview. One Piping Design Serfivces Inc. engineer was identified by the reporting investigator as responsible for the movement of the main steam line. This engineer was interviewed, and executed a signed, sworn statement.
- 8. Nine individuals alleged to have knowledge of improper, unauthorized cutting of rebar were interviewed and provided sworn statements. These individuals denied having knowledge of rebar that was cut without proper authorization. A 10th individual responsible for issuing the Component Modification Cards (CMC), authorizing cuts through rebar, was interviewed and provided a signed, sworn statement denying knowledge of any procedural violations. Testimony itertified instances where rebar was accidentally cut, but this testimony also established that in these instances, CMC's were obtained after the cuts were reported to the enigneers. There was no testimony received indicating that holes were drilled or rebar was cut without proper documentation, and no evidence was found to contradict the testimony of these individuals.
- 9. Three Brown & Root employees alleged to have knowledge concerning the use of the polar crane to move a portion of the main steam line in Unit I were interviewed and provided signed, sworn statements. A Piping Design Services Inc. engineer responsible for relocating the steam line, provided testimony of his evaluation and direction of the relocation of the line. The testimony taken from these four witnesses indicated that the relocation of the main steam line was done under the direction of engineers, and was accomplished to remove stress on the line and to return it to its designed location. No testimony was recieved to indicate that the line was "cold sprung" or installed under stress.

- 10. Eight Brown & Root employees alleged to have knowledge concerning the improper use of cutting torches on hanger material were interviewed. Two witnesses stated they remembered an instance during the redesign of a hanger in which a piece of tube steel was discovered to have had the bolt holes enlarged using a torch, which was a procedural violation. The testimony of the two witnesses indicated that this hanger was scrapped because of the procedural violation. and was replaced with new material. The other six had no knowledge of impropeuse of cutting torches or hangers.
- 11. Two Brown & Root employees were interviewed concerning their alleged knowledge of lugs improperly welded onto stainless steel pipe without purging the pipe. Both executed signed, sworn statements, and indicated that they did not know or any instances where welding was done on stainless steel pipe which required purging by procedure unless a "purge deletion" was received from the engineers.
- 12. All of the employees mentioned by MESSERLY in his affidavit who were still employed or available for interview denied the allegations made by MESSERLY. No evidence was uncovered during these inquiries which indicated deception on the part of the witnesses. The witnesses ranged from pipe fitter helpers to Brown & Root superintendents. A Piping Design Services Inc. engineer and the Dravo Constructors Inc. project manager also provided testimony which contradicted the allegations.
- 13. The signed, sworn statements are maintained in OIFO:RIV. No further inquiries are anticipated unless staff inspections identify additional pertinent information that would tend to substantiate the allegations or discredit the interviewees.

PRESENT AT THE TAKING OF STATEMENT: MR. ROBERT MESSERLY, Witness;

MR. B. BROOKS GRIFFIN;

MR. RICHARD K. BERR, Interrogators;

MS. JUANITA ELLIS

MR. DAVID COGBURN, Court Reporter,

SWORN ORAL STATEMENT IN QUESTION AND ANSWER FORM of ROBERT MESSERLY, taken before David Coob a Court Reporter in and for the State of Texas a the United States Pederal Courthouse in the City of Fort Worth, County of Tarrant on the 14th day of April, 1983 at 2:00 p.m., at which time the following proceedings were had:

B410310125

ATTACHMENT

ε

PROCEEDINGS

MS. ELLIS: For the record, we show indicate that we have handed the NRC official an April 13th letter from CASE addressed to Edward Markey regarding this matter, and also copy of an affidavit of J.R. Dillingham, D-i-l-i-n-g-h-a-m. And I believe Mr. Messerly has a copy of some documentation who he will be providing also to the NRC.

MR. GRIFFIN: Anything else, Ms.

Ellis?

EXAMINATION

BY MR. GRIFFIN:

taken pursuant to the rules of the Nuclear
Regulatory Commission and we are at the U.S. Feder
Courthouse, a part of the U.S. Attorney's Office,
Room 524 in Port Worth, Texas. This is Thursday,
April the 14th, 1983 and we're commencing this, it
looks like, at 2:01 p.m. Present for the NRC is
Richard K. Herr, the director of office of
investigations and myself, E. Brooks Griffin.

I understand, Mr. Messerly, that you are former employee of Brown & Root and were employed . Comanche Peak Steam Electric Station in Glen Rose,

Texas. Is that correct? Yes I was, uh-huh (affirmative). 2 And present with you is Ms. Juanita 3 Ellis. A MR. GRIFPIN: Ms. Ellis, if I migh 5 ask you, what is your role in relation to Mr 6 Messerly? 7 8 MS. ELLIS: All right. Mr. Messer is one of the individuals which we had plann 9 to call in hearings which have been postpone 10 11 for the time being, at least, in the Comanch 12 Peak operating license proceedings. MR. GRIFFIN: All right. And you 13 14 here in his behalf? 15 MS. ELLIS: Well, yes. He asked t 16 I come and join him so that he would have 17 someone here that he felt comfortable with. felt that he would feel a little more 18 comfortable with someone else here. 19 20 MR. GRIFFIN: Do you represent him 21 any way our other than just an associate o in the manner you have already described? 22 23 AS. ELLIS: In the hearings -- I'm 24 not an attorney first of all. In the hearing 25 though I am CASE's primary representative an as such do what an attorney, I should say, would do for CASE. And so to that extent I guess sort of a quasi representative status.

All right. Our purpose here today is ask Mr. Messerly questions concerning an earlier statement that I believe he made to you in which identified a number of issues that are of concern the NRC, and we would like to find out more specidetails about these issues. So my questions will directed to you, Mr. Messerly.

A Okay.

2.1

1.7

The first issue I would like to go into is the use of a rebar drill or a drill at Comanche Peak that I believe you have indicated was used, that you used in your job and was also used to drithrough cement and rebar; is that correct?

A That's correct.

Q Would you mind telling me in more deta;
what this drill is?

A Well, it's like it says. They call it rebar eater, it's made by Drilco manufacturer who out of Miami, Florida and it's a -- well, they hav a diamond tip on them or they have a real hard ste tip on them that cuts through other steel, concret anything else that gets in its way. And they are

operated by anywhere from a half to a three-quar 1 2 horse electric motor. Okay. And did you use this machine i 3 your capacity as an employee of Brown & Root? Well, I was foreman over the crew tha 5 6 used this machine. All right. Did the use of this machi 8 require documentation from --9 A It did. 10 -- from engineers? 11 A It did. 12 And these were Brown & Root engineers? 13 Right. Not Brown & Root, they were G: and Bill. 14 They are the ones that first started : when they first come on the job. 15 16 0 All right. 17 A guy named Dean Fellinger is the one you want his name. 18 19 He was the one that issued --20 Be was the one that started out with m on the rebar drilling, and later it changed into 21 fourteen different people if you want to know the 22 23 truth about it. 24 What was his last name?

Fellinger. He is still with Gibbs and

Q Bow many instances did this occur? A I wouldn't I mean, just to give you number, I couldn't do it. Many times. Q Okay

not there. The drill -- I was ordered to loan to drill out at times. I was ordered to loan a guy drill bit that he would go get a motor, a drill motor out of the tool room and I'd never see thes three, four, five, six bits again. Now, how many holes were drilled with it there's no telling how much rebar was cut.

A man comes up and says, I want you to give so and so six drills, he's gct a pipe hanger that has to go down or a cable tray that has to g down - a cable tray support - and we have got thr holes in it and we need the fourth one bad. And went to my general foreman at that time who was P Mason, and I told Pete, I said Pete, Mike keeps giving me these orders to get this drill out, loa it out to drill holes that are not authorized. I haven't got the paperwork from Dean Fellinger. I said, what can I do? Be said, man, he's my boss, what do you want me to do?

Do you know for sure that the people to you loaned this drill to did not acquire the documentation that they needed to stay within procedure and use this drill?

A I'm positive they did not get the procedure, because any time the procedure paperwork

Fellinger and I handed it to my men and seen that the job was done. Because there were areas out there that there was -- strictly was illegal at a to drill any kind of rebar or cut any kind of rebar and any kind of rebar and contains any kind of rebar and the strict of them. No rebar of any kind was allowed to be cut in that building anywhere.

- Q Is this the containment building?
- A Containment building, Reactor One.
- What the NRC would like to know in this instance is the specific locations where holes wer drilled without proper documentation. Is there are way that this information or these locations can be determined, reconstructed or anyplace we can go, anybody we can go talk to to find out specific locations?

A Let's see, Danny Brown borrowed it several times to drill holes. He's still working out there. Other than getting ahold of Mike Sanders, Danny Brown is the only one I can think o And as far as sitting here and telling you locations, evidently you haven't been out to that plant.

- Q I have, yez.
- A Well, I had access to every building on

that place. I have been in every building. I have cut rebar in every building but containment one, except the dam. Now, does that tell you anything Now, to go tell you to go to a certain wall and s if the rebar is cut is impossible.

You understand what we're trying to do with the information. We're trying to find cut specific locations --

A Right.

saying. Let me ask you, in your statement that y made to Ms. Ellis, you identified a diary that you have kept and in this diary -- it's my understand in this diary you logged in instances or times whethis rebar eater was used to drill holes when you did not have the proper documentation; is that correct?

A No. This is --

Q Was this just a work --

A This goes from 9-7-78 to 10-17-79. This was the period in which I was in charge of the reteater. And this documentation, there's some of the most of them have documentation. It also has the CMC number, and like at the beginning it was a DCD or something. I got it wrote on there someplace.

DCDDA is what they started drilling rebar with. Then they find out this was not the right 2 documentation. Then they changed it to a CMC, bu 3 when they first got it they were doing it on 5 three-part memos. 6 But --And this is every hole that I drilled, 7 legal and illegal, and except for the ones where : equipment -- I was ordered to loan my equipment o: 9 10 All right. 0 -1.1 MS. ELLIS: Just for the record, we probably should mention that Mr. Messerly is 12 13 referring to a -- looks like a twenty-four pa 14 listing which he had prepared of these 15 different items and he will be giving that to 16 you. 17 Is this a complete rendering of this 18 diary --19 A Oh-huh (affirmative). 20 So --21 It is in complete form. 22 MR. HERR: Is it marked? You said 23 legal and illegal. Bave you got the illegal 24 stuff marked on it? 25 THE WITNESS: No, I really haven't

but if it doesn't -- it's going to have to a interpreted by me, which I'll try to explain you or I can tear off a page and y'all can at a page --

MR. HERR: Perhaps take a blue per a red pen and we'll mark the illegal stuff.

THE WITNESS: No, I won't do that. can't do that because I didn't keep that muc of it. I mean, you can take a look and flip through it to see what it's talking about. didn't do that -- as far as that, if I had k that kind of a record, it would have been a separate record or something like that.

Would any of these entries in this document lead us to the locations of where holes were drilled without authorization?

A It's very possible. It is very possib

MS. ELLIS If I can call your

attention to this third column here, it says

"rebar cut" -- it's upside down. But in this

column, this is where specific rebar was cut

apparently and --

THE WITNESS: Yeah, what I did was, marked down -- this was my own deal and my ow idea, because there were certain areas that y

best on Hearts Biss 915 1000

were supposed to take out a percentage of th 1 rebar. If you cut a hole in the rebar it 3 should have been reported and thus and so forth. Q In those instances, did you report it? Yes, I'm legal. So is this thing. A 6 Okay. A But it gives the direction of the reba 8 9 which way it was running, north, south, east, wes It gives the depth that I cut the rebar and it al. 10 11 gives the percentage of rebar, just me looking at piece of rebar and saying I cut fifty percent, te: 12 percent or if I just nicked it, just whatever afte 13 14 the hole was drilled. 15 Q But on each of those entries, does it tell the location on the site out there? 16 17

A It tells you the location, what buildir what print number it was taken off of or the hange number itself. So all you got to do is look up to hanger number and it will give you the area and exact location of this particular hanger.

Q All right. So any -- which column show the authorization?

A Tris one here.

3 8

19

20

21

22

23

24

25

O Okay. So if that column is left blank,

then that would be an example? 1 2 Not necessarily blank. I don't know i in the hell to put that without sounding silly. 3 We are going to need to identify -- we not interested in the ones that were done properly 5 We're only -- we want to look at the ones that we 6 done without documentation as required by procedu 7 [MS. ELLIS: We're referring to the 8 9 fifth column now on the far right. 10 No, there's really not no way of telli 11 not without looking up the hanger number and find out what was done on the hanger. You will just h 12 to go over each individual hanger and check the C 13 and see what was legal to cut and what was not le 14 15 to cut. (MS. ELLIS): You might mention, too 16 17 in this column the ones on the front page al 18 seem to have items by them, but on several o 19 them throughout the listing there were none. 20 So it's not -- each one of these items, in 21 other words, doesn't have rebar cut 22 necessarily. It's just as indicated on ther 23 At this point I was just trying to lim it to holes drilled without proper authorization, 24

regardless of whether rebar was cut or just

25

concrete. If the drill was used improperly, we'r trying to identify those instances.

Can you think of any way with this document or any other documents you may know exist that would lead NRC inspectors to specific location where holes were drilled without proper authorization? Do you see what we're trying to continuous control of the second seems of

You're trying to make your job real easy and ther no easy way way to do it. I'm serious as hell there's just no easy way to go to it because you have so many things out there that's been like th and for me to pinpoint and give you an exact area this or any other means — I might be able to wal out there and show you things if I walk with you say, this was done here and this was done here. you're asking me to remember back three, four yea too, and if you have ever been in that area, if y go in there a week later it's all different.

I understand what you're saying. Can think of any way that I can transmit this information to an inspector or to a group of inspectors where we might be able to identify the You're right, we are trying to make it easier in that we can't reinspect all the holes drilled at

call you, but he might testify. And if you could
get shold of a Richard Montjar (phonetic), he was
man -
MS. BLLIST Do you know how to spe
that?

A M-o-n-t, something like that. It's
pronounced Montjar, but he's in Germany now, I'll

Q Now?

tell you that much.

A Yes. Well, he married a girl in the service is the only reason -- well, he was a year ago. He might be back over here, now but he's married to a girl in the service.

Q Okay.

A But he worked and drilled a lot of hold illegally.

Now, these illegal holes that you are referring to that he drilled, this was when the rebar was, or the rebar eater was on loan?

A No, he worked for me. But he was also around and could be a character witness to what I stating as to when I was ordered to do this. And you could pin that Danny Grisso (phonetic) down, Danny Grisso used to work for me, too. And if you put him on a stand and square him in, he will eith

perjure himself or tell you about holes he drille when he was working for me and now he is in charg of that operation.

If you could pin him down, but that company has got him sewed down tight. Be's a puppet.

Pirst of all, let me tell you, I'm not engineer. I have an engineering or technical background, but let me see if I can phrase this.

In the holes that were drilled by your crew members without proper documentation, can yo remember any instances or did you witness any instances where damage was done to containment or any of these other areas where the drill was used that would constitute a safety or health hazard o possible weakening of the structure?

A Well --

Q I know that's detailed.

I'm not an engineer either. I have been in steel, I have been out there working. And when an engineer designs something, he designs it for that particular thing for that particular strength. All right. If somebody comes in there and cuts part of that out without documentation, there's your answer. But I

1 not an engineer.

O So you're saying, if I understand you correctly, you're saying that if it's done, then knows what the effect will be?

A Well, the engineer knows, the engineer that designed it. If he puts in fourteen rebars there and you cut out seven of them, then you hav weakened half of them, what he designed it to hol And I have went down walls in that particular tun that I was talking about and we were putting up thold thirty-two inche lines down there. I wasn't this guy was if I could think of his name. And whad to cut a bunch of rebar down in there.

This was, I'm -- well, quote me if you want to, I think, I'm not sure, but I think this an area that wasn't supposed to have any rebar cu out of it.

Decause you have accused me of looking for the eaway. I would like to be able to walk out of this room today and go find examples or instances of holes drilled down there without proper authorization. I hope there's some way we can figure out how that can be done because we would like to follow up on this.

A If I could just think of one exact hole that I could remember. I know of three on the turbine deck, but I'll be damned if I can remember what area. There's another deal where I would have to go out and it's completely changed over now, a it would be a spot check between three or four hangers.

Q All right.

A In fact, out of the three or four, I think you will find a Hilti-bolt welded on the bac side because they couldn't get a hole in the grour

What would it take to refresh your memoras to a possible location?

get is -- now, this would be Turbine One area whice would cut it down quite a bit. It's around them tanks that they covered with the aluminum siding a insulation. I don't know what tanks, what they are called, them big long tanks up on the turbine deck and it was right alongside one of them tanks there that three holes rebar was cut in without documentation.

Q Was there anybody else present that mig be able to further identify, help us identify this location?

A There was Richard Montjar. I should h

would like to ask. Did you see any of these people using the drill improperly? I know y said you loaned them the drill out, but did ever see them use it?

THE WITNESS: Oh, yeah.

MR. HERR: And that was during the time frame --

THE WITNESS: That was during this time frame that this covers.

MR. HERR: Okay. That's the only question I have.

Will that document that you are provid: us, will examination of this document, say, by an engineer, would it lead to any locations where such cles were drilled? Seems this fifth columns seem to be filled in.

A What I would do if I was you, I would ç pull these CMC's and DCDDA all through it with an engineer, bump it against the number of the hanger and see what was authorized to cut and what was no authorized to cut, and then come back and bump it against this, like a hundre percent cut out and i that was really legal in that area to cut out a hundred percent.

O Do you think, then, a random sampling

correctly that this unauthorized use of this rebar

eater, is it true you were threatened with termination if you failed to loan it out --

A If I failed to do anything that this m said as far as that rebar eater loan-out or drill bits or the whole operation or failed to drill something myself and my crew, I was told that I would be terminated if I didn't do it.

Q Tell me what his name is again.

A Mike Sanders. You have to understand there exactly what the deal was. At that time Ha. Goodson was the superintendent. Mike Sanders was guess, twenty-six, twenty-seven years old and had never done any kind of work like that in his life and he was right underneath Hal Goodson as a three-stripe general foreman. And Hal Goodson had one thing out of his mouth, and that was productic He didn't come out and say it, but he didn't give damn how you got it --

Q Okay.

A -- as long as it showed up on paper. It wanted production, he wanted pipe hangers up, he wanted cable tray supports up and he wanted them completed and bought off. He didn't give a damn how they were put up, and this is what Mike Sanders did. And in doing so, if they ran in

a problem, you've got to to figure some holes wer drilled, a hundred and something holes for one hanger to try and find a decent spot to hang it without hitting rebar. This brings on frustratio on the men, they go to their foreman, the foreman goes to Mike Sanders, Mike Sanders says go down a see Messerly and drill the damn thing and put it:

Q I understand. Let's move on. You start in your affidavit to CASE that you observed or witnessed the use of the polar (phonetic) crane to pull up a piece of thirty-two inch pipe; is that correct?

A That is absolutely correct.

Q I'm not an engineer; I don't understand the significance of this. Could you explain it to me, please?

A All right. What it amounts to is the main steam pipe has a condensation joint like for expansion joint is what it's called. It's a huge horseshoe type shape, and this thing is coming out of the turbine building. All right. This thirty-two inch lain steam pipe, it's coming out - it's anchored in concrete all the way around it, it's a fixed object, you can't move it, right? It comes into this expansion joint, makes huge

horseshoe shape and it goes down into each one of the steam generators, which there's four of them, : the containment building.

It was attached through the wall and it was also attached to the steam generator in the compartment inside the containment building.

Somebody come along after these pipes had been in there, because somebody else was hollering, production, production, production, and found out that the main steam line was six inches off of location on the vertical way and four inches on the horizontal way off of location. There is a guy --

THE WITNESS: What was that guy's name? Have I got his name down there?

(MS. ELLIS!) I don't think you have got a name in here.

what this gold hat did was ordered his people to raise it up with the polar crane. I can't remember the exact tonnage that was put on this because they had a big gauge on it that showed tonnage when you pull on it. A big round gauge looks like big clock and whatever tonnage — seemed like to me it was eighty-five tons, it was ungodly because everybody scattered when they seen that needle going up as the

crane was pulling on it. The reason I know this f a fact is because I was pipe hanger foreman at tha time between 860 and 905 elevation in the containment building. I had all of main steam and all of fourteen-inch feedwater lines that run all through that area.

Q Supports for them?

A I had all the pipe supports. And I had to undo my pipe supports, let him pull this up, Respect, which is a guy about -- I don't know, if you seen him you would think he's eight foot tall, but he's only about seven feet tall and four foot wide, I'm serious. Look him up out there, you will -- he's got a head on him that big around.

He was on three tons come-alongs pulling the horizontal way. And they put it into position and once they got into position, I had to go back and change my pipe support dimensions and hold that thing in position. When they cut the temporary hookup that they had welded to the steam generator loose, it flopped like fourteen inches and echoed through that whole containment building.

- So you're saying they put this complete pipe under tension in this movement?
 - A (Nods head affirmatively).

ì

	1	C	And i	t was	s secure	ed into the	e wall on one
	2	end and te	mporar	ily u	unsecure	ed to the a	steam
	3	generators	?				
	4	A	It wa	s ten	poraril	y secured,	welded to t
	5	steam gene	rators	with	tempor	ary pipe.	It's a
	6	thirty-two	inch	line	that go	es into th	e steam
	7	generators					
	8	Q	So the	e pip	e was a	ttached at	both ends a
	9	the center	porti	on or	some p	ortion in	between the
	10	two ends -					
	11	٨	The e	xpans	ion cha	mbers is w	here they
	12	moved the	pipe at	t.			
	13	Q	And th	ney w	ere	this is a	complete uni
	14	so it was	put un	der t	ension;	is that w	hat you're
	15	saying?					
	16	A	Yeah.				
	17	Q	And th	nen y	ou put	in the sup	ports to hold
	18	it in that					
į	19	A	The st	ppor	ts were	already t	here. In
	20	fact, seve					be used no
	21						pipe because
	22						e hangers to
	23						wo inch main
	24	steam pipe					
	25						several of

pipe hangers had to be completely removed and started over again and redesigned to move over to the center of the pipe. They moved it six inches horizontally or six inches -- damn it -- six inche up vertically and four inches horizontally.

- Q And yet the ends remained in the same place?
 - A (Nods head affirmatively).
- Today would that same -- would it be in the same condition as far as you knew it was when was -- when your supports were put back in place, reconnected or --
 - A What do you mean, the same position?
- 2 In other words, is it still under tension?

A I would say yeah. Because I know they did -- well, they moved from where it was welded to the steam generator with the temporary pipe. I would imagine now that they have the thirty-two inc pipe going down after they got it on its last location, that they have got permanent pipe in ther now, which would still put where it comes through the wall in the same bind that it was originally when they done it.

Q When did this occur? Do you remember

of moving this thing, the gold hat?

THE WITNESS: Yeah.

MR. HERR: Is there any documentation on that?

THE WITNESS: To my knowledge, no. knew the foreman real well. Don't ask me his name. All of a sudden names escape me. I got his name at home, too.

Q You may not know the answer to this question, but just for my information, is it possible for all these people to be involved in what sounded like a major operation and management all through the company not know that this event was taking place, including the engineers that would have -- might have an opinion on any kind of movement of such a large piece of material? I'm just asking your opinion.

A I want to give my opinion, but I want to try and explain something to you. It's very possible, because you got no communication out ther between the crafts. You have a pipe engineer -- sayou're a pipe engineer and I am a cable tray engineer and so forth and so on down, just name any branch in there. We're sitting across from each other in the same office, but we don't tell each

other a damn thing. We don't talk to each other about coffee and yes, it was possible because your management out there, your upper management controthe place. If they want to do it, all they have t do is say, do it. Well, we haven't got the correct paper works. I don't give a damn, I said do it.

Now, what choice have you got? You're o there trying to make a buck and feed a family. Yo ain't got no choice and most of your upper supervision out there at that particular time, the were all a clique that came up from North Carolina and all buddy-buddies, and most of the upper supervision — how in the hell I ever got to be a supervisor out there I don't know because I don't know anybody and I ain't got no kin out there, but that's what all your upper supervision was, and ninety percent of your foremen out there are the same way.

- I noticed that at one place in your affidavit here -- moving on to a different subject now -- you talk about the fact that you reinstalled hangers on the feedwater system?
 - A Oh-huh (affirmative).
- O This was, I quess, what, a major rework project?

a cutting torch on hangers. I don't personally 1 2 know, is it improper to use a cutting torch to tear 3 down or alter a hanger? Not to tear down and alter, but it's illegal to use it in the containment building where 5 6 I was the entire supervision, when I was hanging 7 pipe supports. You drill everything and everything 8 has to go on the wall according to the drill size. 9 I took down a hanger -- took down several hangers that was put up by this general foreman out there 10 11 that I tried to fire. 12

- Q Which one is this?
- 13 A Oh, boy.

18

19

20

21

22

23

24

- 14 Q Was it your general foreman?
- 15 No, he wasn't my general foreman. 16 worked for me. I tried to fire him while he was 17 working for me.
 - You were a foreman?
 - Yeah. They call them supervisors out there. You got a supervisor, a general supervisor, a three-stripe general supervisor and then a superintendent.
 - I see. Is a foreman higher than a general foreman?
 - No. The general foreman's got two

6	you know where they were located at the site?
17	A Are you talking about the Richman
. 8	inserts?
9	Q Yes.
0.0	A Well, narrow it down between 860 and 905
11	I had that whole elevation and all of your
2	compartment rooms.
3	Q Well, do you know specific ones that wer
4	A The only way I could give you a specific
5	would have my record of my hangers that I done

1	and be able to say, well, this hanger or that han	g
2	was done that way.	
3	Q Would you have recorded the traveler f	0
4	the hanger if one of these bolts or these inserts	
5	A No.	
6	Q were improperly installed?	
7	A No, because we drilled holes this way,	
8	drilled holes up, we drilled holes down due to the	е
9	installation of the insert.	
10	Q If you found an insert that was	
11	improperly installed or not at the correct angle,	
12	did you drill these holes to repair it?	
13	A No. You don't drills holes in concrete	4
14	Not in the insert.	
15	MS. ELLIS: I misunderstood, so	
16	explain how that works with these deals. How	ì
17	do they get into the wall to start with?	
18	THE WITNESS: They tie in the rebar	
19	when they pour the concrete, and they got a	
20	piece of foam in them to plug the hole, and a	
21	you do is dig the foam out and stick your	
22	threaded rod in there.	
23	MS. ELLIS So rather than drilling	
24	hole to put them in to begin with, they have	
25	some kind of a form or something and they are	

poured -- initially when they pour the concrethey are in there to start with?

THE WITNESS: Criginally their plan were to put in so many inserts in a wall area or ceiling or whatever. They just put in a bunch of inserts; ever so many feet they put an insert. And hopefully what they were hopi was they could come back and put a pipe support, a cable support or electrical suppor whatever, a conduit and use these inserts tha were put in there -- which turned out they didn't use half of them -- and they had to be grouted over the ones that weren't used or had to have a hole drilled in there by a Hilti drill in which they changed the entire operation on unit two and went to a solid stee wall imbedded in the concrete with stude welde right to the steel wall and the concrete poure around them.

- Q Are you saying that they put this steel in the wall and started welding to that steel?
- A Started welding direct in unit two. It takes in safeguard two, auxiliary two, containment two.
 - Q Are you saying that the problem then tha

hangers they put a tapered washer on it to allow f the angle that the threaded rod came out.

Q And then you say they grouted over the other hole?

A Unused ones had to be grouted. You had dimension from one hole to another that you could drill. There was a dimension in your nine point s documentation out there how close you could drill a Richman insert, how close you could drill to another Hilti-bolt or how close you could drill to another attachment or steel plate or whatever. There's all kinds in your nine point six.

Are you saying that these redrillings of these angled drillings into these inserts constituted a procedural violation on unauthorized drilling?

A Well, there again, you can go back to being that neither one of us are engineers. These inserts are tied to rebar with wire, all right? To be at a hundred percent, they have to be surrounded by concrete a hundred percent, and they have to be ninety degrees off the wall. When you stick something in it, it should be ninety degrees off the wall. If you have got this thing in there at, say, at a ten-degree angle, you've not got the same

pulling capacity or coming out of the wall as you have if it's straight.

Q Let me ask you this, then. How many instances do you know of in which there were -- many?

A Bow about ten that were right and the rest wrong.

Q Is that right?

A Now, that's the percentage.

Q What did QC said?

A QC never seen them. QC didn't see nothing but the finished product.

O So the finished product they saw was a bolt sticking out that was attached to a hanger and it looked to be proper?

A (Nods head affirmatively). QC don't get in behind the hanger. You had a one-inch plate that goes in behind, say -- for instance, we used a six-inch tube vertical on the wall and say we had two of these inserts. All right, we drilled completely through the tube, used a one-inch washer in the back of the tube, a one-inch washer in front of the tube, and this one inch or inch and a half threaded rod went through the washer, the tube, the washer and into the wall.

Now, if it was at an angle, QC never see 1 this because there's a nut on top of that. 2 3 Were the engineers aware of this manner of altering these inserts when they were at an 5 improper angle? 6 Man, I tell you what, I have been aroun 7 a lot of places in my life but I have never seen anything out there -- if they call themselves 8 engineers -- I don't know what you'd call me, a 9 nigger aviator, I guess. But I'm telling you, the 10 don't communicate, they don't go out in the field. 11 How in the hell can you solve any problem if you s: 12 in this office and you don't go out into the plant? 13 14 That was their problem. 15 Would you mind telling me the original instance of this manner of correcting these, the 16 17 angle of these inserts? 18 Only way to correct it is not use it and drill around it and drill a straight hole. You 19 20 don't put a Richman anchor in after the concrete is 21 poured. 22 Who was directing that they do it, 0 23 though? 24 The Richman --25 These redrillings. 0

1	A Your building department.
2	Who specifically? Somebody had to decid
3	that it was going to be done this way. Do you know
4	who?
5	A No. I imagine that comes from your
6	original Gibbs and Hill drawings or something.
7	Q I'm talking about the variation, this
8	changing the angle without to make it improper,
9	where the angle is wrong.
10	A I'm losing you someplace. I don't know
11	what you're saying.
12	Q You're saying it's supposed to be at
13	ninety degrees angles to the wall?
14	A Yeah.
15	Q And you-all were changing the angles so
16	it would fit
17	A We weren't touching the Richman now.
18	Only thing we did was take the threaded rod, and
19	whatever angle it is, we would drill it at that
20	angle so that it would come through the tube and
21	when it come out the other side of the tube, it com
22	out as close to center as we could get it.
23	Q When you talk about tube, are you talkin
24	about tube steel?
25	A Uh-huh (affirmative).

1	On the hanger?
2	A On the hanger. There was no way of
3	changing the insert.
4	Q So the insert remained the same and the
5	angle on the tube steel was changed?
6	A Wel, the holes through the tube steel w
7	changed.
8	Q Okay. So does that mean that the tube
9	steel had at least two holes in it, one of which w
10	used and the other unused?
11	A No. No. I don't know how to describe
12	that to you. Say that's the insert. All right, y
13	know me and my drawing. You got a piece of tube
14	steel here. We're going to run this one
15	horizontally. All right, looking at it, here is to
16	hole in the front like so. All right, this back
17	hole, we'll say that this angle runs this way to o
18	left. The back hole, if you know anything about a
19	print at all, might be drilled like that.
20	Understand what I'm saying, looking straight through
21	the tube?
22	Q I think so.
23	A Then this one here might be drilled like
24	thus. But when it come out the front it was
25	straight, so that means that this tube, if I was

sticking it in the wall here, would be at this angle or -- no, this angle, in order to get out, and this here be at this angle and get out. But when you tighten on an inch-and-a-half screw, whatever gives I don't know, but it's flat on the front. And see, you got a big one-inch washer that goes here, the size of the tube and also on the back side of it to space it away from the wall.

Q Okay.

A So we don't change the insert.

And you are saying because it's not at the proper angle that it is less than whatever the load factor of its ability to support whatever weight it is supporting?

A Well, again, I'm not an engineer but if something is designed to go in a certain way and it's not there, it's not in that way, then it's not designed right. And it is a weaker point.

Q Okay.

MR. HERR: Did you bring this to anybody else's attention.

THE WITNESS: Yeah. It don't do no good.

MR. BERR: Do you know who you brought it to?

THE WITNESS: Oh, you could just 1 about mention anybody else's name of my 2 3 superiors from Hal Goodson to Mike Sanders to Mike Robinson to Ed Dean to Jim Starkey. 4 5 There's a jewel you ought to hang. 6 MR. HERR: What did they say when yo 7 brought it to their attention? 8 THE WITNESS: Do you want a quote? 9 "Bang the damn thing". What do you do? And 10 that is all my upper supervisors. You don't 11 know how glad I am to be away from that place. 12 I ain't got no job, but I'm still glad to be 13 away from it. I've never seen anything in my 14 forty-three years on earth run like that place 15 Can you think of any way that we can 16 identify specifics again of hangers that were, where 17 these holes were improperly --18 I tell you what. I just about bet you, Mr. Griffin, I'm telling you what I bet you. 19 20 go out there and pull any damn studded rod out of 21 there, pull three of them and two of them is 22 crooked. 23 And these were never addressed by QC from 24 that inspection? 25 There's no way of checking it. No way of knowing what angle that thing is in there unless y pull the hanger off and screw a straight rod in there and look at it. But I would say, I would just damn near bet you that out of three rods you get to of them that's crooked.

MS. ELLIS: Just to be sure I understand, when you look at this straight on like QC would come and look at it, everything looks all right from the front and all of the part that you are talking about that's at an angle is, in effect, hidden?

THE WITNESS: It's inside the concrete. Nobody knows it. It's inside of solid concrete.

Q Can you think of any way that we can identify particular areas where this was done? Is this all the areas that don't have steel plate against the wall?

A No. Most of the places that had the threaded rod would be in the compartments, compartments one, two, three and four, and then you have a lot of your other buildings, safeguard and auxiliary, they all got the threaded rod imbedded inserts.

Q Okay.

A But in the containment itself, you would probably find them in the compartments would probably be the major part of them.

Q All right. Let's go back to this, the use of the cutting torch. Is that --

That's what I'm saying. This hanger in these compartments, if they didn't have enough intelligence to find out what kind of angle it is and how to drill the hole from the back and make it come cut center from the front, what this foreman done out there or general foreman on nights, what h done was take a torch and cut about a three-inch hole. And you can see, if I cut — if I got this angle here and say we have another one here and the back was at another angle, we just cut that sucker out like that so we can move that thing any way we want to to get it started.

A They don't fill it in; it's covered with a washer. The only reason I found it out, the hanger that was particularly put up by this guy was designed wrong. I had to go down there and tear it down. And I went to my superior Ed Dean and I said what are you going to do about this? I mean, I got my butt tore up yesterday because I put something in

wrong or because one of my men had forgot to grout behind a plate. I got called up to the front office about a plate I put up three or four years ago. And it wasn't grouted, the holes wasn't grouted behind the plate. And I was called in and told if they found one more hanger like that that I was going outhe gate. I said, Raymond, what the hell are you talking about? I can't stand there and watch fifteen men every five minutes put up every plate, and you're going to fire me for something that happened four years ago, fire me.

And then I go down there and I report something like this to my general foreman. He reports to Raymond Hebert -- well, this same guy is the one that built the little sun deck or whatever you want to call it at Raymond Hebert's house.

MR. HERR: What's his name? THE WITNESS: Raymond Bebert.

MR. HERR: No, the guy that did the

building.

THE WITNESS: That's the name I can'

remember.

MR. HERR: The night foreman?

THE WITNESS: He was the general foreman. I sold him a car. Hell, he used to

be a good friend of mine. I don't have nothin 1 2 against the guy except he don't know nothing. Can you think of anybody else that we ca 3 go talk to that can identify some hangers where the specifically remember that this was done, these cut 5 were made in the tube steel? 6 7 Let me go home and I can give you a call 8 and I can give some names. If they are going to talk I don't know. If they are still out there, 9 10 ninety-nine out of a hundred of them are in the 11 clique and they ain't going to talk unless they are 12 utterly threatened, because their jobs are on the 13 line. Hell, they are making thirty-five, forty 14 thousand dollars a year for doing nothing and they 15 ain't going to come over here and take a chance on 16 losing their job. Several of them are still there. 17 I think about seventy-five percent of my crew is 18 there. But if they would talk, I don't know. 19 0 Okay. 20 MR. GRIFFIN: Off the record. 21 (Discussion off the record.) 22 Now, you say the fellow that was drilling 23 the holes with the drill, is that this guy --

24

25

foreman in that area. I was drilling holes for him.

The one I was drilling for. He was

1	Q And his name is Nathan?
2	A Nathan Bammers or something like that,
3	Bammers.
4	Q And Hammers might know specific holes
5	drilled
6	A True.
7	Q with the rebar eater?
8	A Yeah. If you could corner him, I think
9	he would go.
10	Q All right. Now, the use of the cutting
11	torch on this tube steel, you say this was at the
12	direction of the general foreman?
13	A No. He wasn't a general foreman at that
14	time.
15	Q He became
16	A He became general foreman later. He was
17	boy, I tell you what, if you could get in my print
18	shack out there and get my log that I kept on every
19	damn hanger I got in there, I could tell you who
20	worked on it, the name of the person that worked on
21	it and when he done it. I kept a daily log, but I
22	turned that over to the new foreman. When they
23	busted me back, I give him that so he would have a
24	record of all the hangers put up. In that log is

all the feedwater hangers that were reworked and why

and who the person that worked on them, because if anything ever fell back I went to each of them men and said, why was it done this way. Because when you got two or three guys here and two or three quy here and two or three guys here and so forth and so on, you can't be at every place at one time. But if you could get ahold of that log that was in my print shack, I can narrow them hangers down real close for you. How many would there be?

A Every hanger between 860 and 905 that I put up. Every CT line, every main steam line, feedwater line. It should still be in my print shack.

MR. HERR: Who did you give the log to?

THE WITNESS: Here we go again. I'm not very good on names as you found out. I car give you his name, too, because I got it in my time book. He was my lead man for me for about six months. He was an ex-foreman down there; his foreman lasted about a month before they busted him back.

MR. HERR: When did you give it to

him?

THE WITNESS: When I got fired -- no 1 no, in June of '82 when they busted me back is 2 when I gave him everything in that print shack 3 except that document you got there, which was none of his business that I took with me. 5 MR. HERR: And you weren't fired 6 until when? 7 THE WITNESS: December 7th. 8 MR. HERR: Of '827 9 THE WITNESS: '82. 10 MR. HERR: He had it six months? 11 THE WITNESS: He had it six months, 12 and everybody liked the way I kept that log 13 14 because they could go right to that book and 15 open it up and it would tell what percentage o that hanger was done, who worked on it and the 16 17 rework and CMC's and so forth on it. MR. HERR: Was it a black or green 18 book? 19 20 THE WITNESS: No, it was a notebook with paper in it, a regular black notebook. 21 22 MR. HERR: Three ring? 23 THE WITNESS: Yeah. And in there is everything I have done in four years out there 24 MR. HERR: Was there any printing on 25

it?

THE WITNESS: No. Yeah, it would just have -- let's see, I forget what I had c the front of it. I had this whiteout that youse on typing paper. I had something printed on that, main steam or containment one hanger or something like that. I don't remember what it was. You can't miss my shack.

MR. HERR: Where was your shack located?

Dut now it's outside of the entrance to containment one. It's a bright red shack out there. I painted it bright red because I got in trouble for putting a Christmas tree on it one year. And it's got my name all over it, Bob Messerly, 8895.

MR. GRIPFIN: Do you have any more questions?

MR. BERR: Is there anything else outside of your affidavit that you wish to go into or describe to us at this time?

THE WITNESS: No. Well, I don't really know. If you are going to get into something besides what I have discussed

already, I know it's been brought up before, but if you can get ahold of a guy named Red I gave you his name the other day. I ain't it with me. I wish I had his address. He was weld tech out there and he can tell you ab a lot of that welding. That's another name I'll have to get for you. I have got it on of my affidavits or something. And there's Joe Gray that was a welding foreman out ther that done a lot of welding illegally without documentation, such as lugs on pipes without purge, and —

MR. HERR: Did he tell you this?
THE WITNESS: I seen him do it.
MR. HERR: Can you give me the

location?

5

THE WITNESS: It was down on the 8: elevation. Roy Estes was foreman at the time and you might get ahold of a guy named Gary Hill who was foreman down on 808 elevation which had some bad lugs welded on by Joe Gray illegally. Ed Dean was general foreman and they done it on the sly, Raymond Hebert knew about it.

MR. HERR: Who gave the order?

1	THE WITNESS: Raymond Hebert.
2	MR. HERR: He gave it to Dean, and
3	Dean passed it
4	THE WITNESS: Dean then passed it
5	Joe Gray because he was the foreman. He wou
6	go down there and do it and didn't want any
7	the welders to know about it.
8	MS. ELLIS: Was there anybody else
9	maybe on the crew that you know of
10	THE WITNESS: Joe Gray's crew or m
11	crew?
12	MS. ELLIS: that would have know
13	about this particular thing that you are
14	talking about?
15	THE WITNESS: Other than Joe Gray
16	there's another name I need to find out. I
17	give you a bunch of names on stuff that was
18	done wrong down there that was seen by them
19	stuff like that. The only thing you can do :
20	if they are still working down there I hea
21	Joe Gray got fired, too.
22	Q Okay. Why don't we wrap this thing up?
23	We discussed three issues outside of jus
24	those notices posted, and we have asked you or you
25	have mentioned names or knowledge of names of

people, although you cannot recall the names righ 1 2 at the moment regarding the use of this rebar eat the polar crane, that incident and the use of the 3 torches to cut hangers. And do you agree that yo 5 will call me and let me know --I do. 6 -- fill in these names with these 7 situations as you have described them --8 9 Yes. 10 -- so we can put a complete package 11 together? 12 I can give you every name that was in 13 rebar crew from the time I had it. I have my tim 14 books at home. I kept my own time books. 15 We are looking for people that know ab 0 16 these instances of illegal or improper or work do 17 out of procedure. 18 These are all the people that were doi 19 it. My entire crew was. 20 MR. HERR: They were doing that at 21 your direction --22 THE WITNESS: At my direction, but

several of them were there when Mike Sanders

came down and ordered me to do so. And when

your superiors tell you to do something and

23

24

your job is on the line, that's what you did

MR. HERR: These improper weldings

Gray and some of these, did they tell you the
they had actually done it improperly?

THE WITNESS: I have seen them do : Any time you weld a stainless steel lug on, have to purge a line after a certain size. you don't purge it, it causes a sugar coating on the inside and sucks that pipe into the piece of steel that you are welding. So what you have is you have a void area inside of a slick steel piece of pipe, just a sunk-in are The stainless -- on stainless it just sucks i right into that lug you're welding. talking about a little lug like half an inch long and maybe three-eighths of an inch high. What it is, it's a lug that keeps the pipe fr doing this motion. You weld like four lugs o this side, four lugs on this side around a pipe, and you put a clamp in between it and struts back to a fixed object on the wall and it stops that pipe from going in this pation up and down, whichever way the pipe is locate

MS. ELLIS: And the purpose of it i to keep the pipe from moving?

	3	A It should.
	4	Q And aren't such things radiographed
	5	before they are finally accepted by QC?
	6	A No. On a stainless you get a hell,
	7	they run that dye test on it.
	8	MR. HERR: Penetrant test?
	9	THE WITNESS: Yeah, penetrant.
	10	That's the only thing, as long as the weld i
	11	pretty and all that, it will pass penetrant.
	12	But that's all on the inside.
7.	13	MR. BERR: Do you know one way or
	14	other whether these are involving
	15	safety-related or nonsafety-related, or do yo
	16	know offhand
	17	THE WITNESS: No, I'm not a nuclear
	18	power plant it's all put in there for
	19	something. Now, what particular thing this
	20	did, I don't know I couldn't be honest wit
	21	you and tell what you it did without
	22	remembering the line.
	23	MR. HERR: The exact location.
7	24	THE WITNESS: The exact location ar
)	25	line number. If you had the line number I'd
	7	

THE WITNESS: Right.

Q Wouldn't that show up on a radiograph?

1

1 tell you what it did. MS. ELLIS: Was it like in the 2 3 containment? THE WITNESS: Everything I done wa. 4 in the containment. Everything I have 5 mentioned here, except for the rebar eater, 6 concerns the containment building in Reactor 7 One, which the reactor is inside containment 8 one. But everything I have mentioned in here 9 10 has happened in here that I have personally 11 seen done. 12 MR. HERR: Do you have anything els 13 you wish to add? 14 THE WITNESS: No. I'll give you a 15 list of names. 16 MR. HERR: Thank you very much, Mr. 17 Messerly. 18 (End of statement). 19 20 21 22 23 24

STATE OF TEXAS COUNTY OF DALLAS This is to certify that I, David Cogburn, reported in shorthand the proceedings had at the time and place set forth in the caption hereof, a that the above and foregoing 62 pages contain a full, true and correct transcript of said proceed ings. Given under my hand and seal of office on th the _____, 1983. David Cogburn, Notary Public in and for the State of Texas County of Dallas My Commission Expires on December 30, 1985.
