# **1-Bit Gate Pulse Modulator**

The NLHVQ011 is a 1-bit gate pulse modulator designed to translate logic voltages for TFT LCD panels for automotive applications. This part translates a low voltage logic input signal to an output voltage of 15 V to 38 V. In addition, the NLHVQ011 provides a user selectable delay and fall time on the high-to-low edge of the output signal. The delay and fall times are controlled by the magnitudes of the external and capacitor resistor, respectively.

# PIN DESCRIPTION

Pin	Pin Name	Pin Function	Comment
1	V <sub>GH</sub>	Power Supply Input	V <sub>GH</sub> = 15 to 38 V
2	V <sub>GH_M</sub>	Output	This output directly drives the power supply of Gate Driver IC
3	R <sub>E</sub>	R <sub>E</sub> pin used to set the falling edge time (t <sub>fall</sub> )	The Delay time is programmed by connecting resistor $\rm R_{E}$ to $\rm V_{GH}$ and capacitor $\rm C_{E}$ to ground.
4	C <sub>E</sub>	C <sub>E</sub> pin used to set the propagation delay time (t <sub>phl</sub> )	
5	V <sub>DD</sub>	Reference to input	The reference input pin is used to reduce flicker. The reference input voltage is as follows: $V_{DD} \le V_{GH} - 8.5 \text{ V}, V_{DD} = 0 \text{ to } 25 \text{ V}$
6	V <sub>DPM</sub>	Signal input 1	$V_{DPM}$ single input voltage is as follows: $V_{DPM} = 0 V$ to $V_{GH}$ . The $V_{DPM}$ pin is used to create a delay with the $V_{GH}$ to prevent system latch–up. $V_{DPM}$ also determines the time $V_{GH}$ is ON.
7	GND	Ground	
8	V <sub>FLK</sub>	Signal input 2	$V_{FLK}$ single input voltage is as follows: $V_{DPM}$ = 0 V to $V_{GH}.$ The $V_{FLK}$ determines the ON/OFF time of the TFT LCD and is produced from LCD timing controller module.
