E. Motor (REPLACED): The existing motor will be replaced with a motor that is of the same power characteristics and starting configuration as presently exists.

F. Power Unit (NEW): The existing power unit will be replaced with a new power unit. The new power unit consists of a pump, motor, integral control valve, oil tank and muffler. The pump and motor are submerged and are mounted to the tank with rubber isolators to reduce vibration and noise. The pump and motor are externally mounted and are belt driven. A muffler is provided to dissipate pulsations and noise from the flow of hydraulic fluid. The valve consists of up, up leveling, down and down leveling controls along with manual lowering and a pressure relief valve.

G. Valve (NEW): A new integral control valve will be installed to replace the existing valve. The valve consists of up, up leveling, down and down leveling controls along with manual lowering and a pressure relief valve.

2.05 DOOR EQUIPMENT

A. Closed Loop Door Operator (NEW) Install a new closed loop door operator. Car and hoist way doors shall be power operated by means of a closed loop door operator mounted on top of the car designed to give consistent door performance with changes in temperature, wind or minor obstruction in the door track. The system continually monitors door speed and position and adjusts it accordingly to match the pre-determined profile.

B. Door-Protection Device (NEW): Install a new solid state, infrared passenger protection device on the car door. Elevator doors shall be provided with a reopening device that will stop and reopen the car door(s) and hoistway door(s) automatically should the door(s) become obstructed by an object or person. Door protection shall consist of a two dimensional, multi-beam array projecting across the car door opening.

C. Interlocks (NEW) New interlocks will be installed. The interlocks shall prevent operation of the elevator unless all doors for that elevator are closed and shall maintain the doors in their closed position while the elevator is away from the landing. Emergency access to the hoistway as required by governing codes shall be provided.

D. Car Door Hanger (RETAINED): Existing car door hanger will be retained and inspected for proper alignment. Adjust as required.

2.06 HOISTWAY EQUIPMENT

A. Hoistway Operating Devices (NEW): Normal terminal stopping devices shall be provided to slow down and stop the car automatically at the terminal landings and to automatically cut off the power and apply the brake, should the car travel beyond the terminal landings.

B. Car Guides (RETAINED): The existing car guides shall be retained. They shall be thoroughly inspected. Any worn parts will be replaced by the original manufacture parts or equal.

C. Car Frame (RETAINED): The existing car frame shall be retained.

D. Platform (RETAINED): The current platform will be retained.

E. Hoistway Entrances (RETAINED): The present hoistway entrances will be retained.

F. Pit Switch (NEW): An emergency stop switch shall be located in the pit accessible from the pit access door.

G. Spring Buffers (NEW): Spring buffers shall be installed in the pit as means for stopping the car at the bottom limits of travel, consistent with code requirements.

H. Exterior Door Frame & Door Skins (RETAINED): Existing to be retained and polished to like new condition.

I. Hoistway Door Hanger (NEW) The present hoistway door hanger will be replaced with a new hoistway door hanger.

2.07 PISTON AND CYLINDER REPLACEMENT (NEW, UNLESS NOTED OTHERWISE)

A. Cylinder: The cylinder shall be of a double bottom design constructed of steel pipe of sufficient thickness and suitable for the operating pressure as prescribed by the latest revision of the ASME A17.1 or CAN3-B44 codes. The top of the cylinder shall be equipped with a new cylinder head with a drip ring to collect any oil seepage as well as an internal guide ring and self-adjusting packing. The cylinder exterior shall be covered with a protective coating. Sealed PVC Protection helps protect the cylinder from corrosion, permits monitoring and evacuation of liquids to make sure the cylinder does not come in contact with water, and helps contain oil should the cylinder leak. The sealed PVC Protection can help protect your property against possible environmental contamination and clean-up.

B. Plunger: The plunger shall be constructed of selected steel tubing or pipe of proper diameter machined true and smooth with a fine polished finish. The plunger shall be provided with a stop ring electrically welded to it to prevent the plunger from leaving the cylinder.

C. Cylinder Head Support: Remove the existing cylinder-head support for cylinder replacement. After installation of the cylinder and sealed PVC Protection System is complete, provide a new cylinder-head support. Remove the existing cylinder from the original well hole.

D. Hole-less Pit: Existing pit locations which contain a well hole are to be converted to “hole-less.”

2.08 FIXTURES AND AESTHETICS

A. Car Operating Panel (NEW): Provide a new applied (or integral) car operating panel containing all push buttons, key switches, and message indicators for elevator operation. The car operating panel shall have a satin stainless steel finish. It shall contain a bank of round satin stainless steel, LED illuminated mechanical buttons. Flush mounted to the panel and marked to correspond to the landings served. All buttons to have raised numerals and Braille markings. The car operating panel shall be equipped with the following features:

1. Raised markings and Braille to the left hand side of each push-button.
2. Car Position Indicator at the top of and integral to the car operating panel.
3. Door open and door close buttons.
4. Inspection key switch.
5. Help Button/Hands-Free phone: The help button shall initiate two-way communication between the car and a location inside the building, switching over to another location if the call is unanswered, where personnel are available who can take the appropriate action. Visual indicators are provided for call initiation and call acknowledgement.
6. Landing Passing Signal: A chime bell shall sound in the car to signal that the car is either stopping at or passing a floor served by the elevator.

B. Hall Buttons (NEW): Provide new stainless steel/ bronze hall buttons or key switches and faceplates at each landing, with an up button and a down button at each intermediate landing and a single button at each terminal landing. Faceplates shall be surface mounted to wall.

1. A call shall be registered by momentary pressure of a landing button. The button shall become illuminated and remain illuminated until the call is answered. All buttons, when applicable, to be long life LED illumination.

C. In-Car Lantern and Chime (NEW): Install in the car entrance, a new car lantern with chime indicating directional lantern visible from the corridor. When the car stops and the doors are opening, the lantern shall indicate the direction in which the car is to travel and a chime will sound.

D. Cab Interiors (NEW): Cab interiors renovation shall include the following:

1. New cab interior panels: The existing elevators shall have the (existing panels removed, interior walls prepared) to accommodate the Interiors Package. This shall include a modular horizontal panel system that spans the full width of the wall sections. Plastic Laminate reveals shall be installed in the corners and against the return and strike jamb portions of the interior. Panels shall be finished in plastic laminate as selected from our standard laminate selections. The base shall be finished in plastic laminate. (We shall furnish a one-eighth inch satin stainless steel inlay in the horizontal reveals between each panel.)
2. Handrail: New satin stainless steel handrails shall be mounted to the new interior panels on the (rear wall in accordance with ADA requirements and local governing codes.
3. Ceiling: Provide a new ceiling assembly. The existing lighting shall be modified and new incandescent down lights shall be installed. The ceiling shall be panel construction finished in metal look-alike laminate.
4. Emergency Car Lighting: An emergency power unit employing a 12-volt sealed rechargeable battery and a totally static circuit shall be provided. The power unit shall illuminate the elevator car and provide current to the alarm bell in the event of normal power failure. The equipment shall comply with the requirements of the latest revision of the ASME/ANSI A17.1 Code.

E. Car Enclosure (RETAINED): The present car enclosure shall be retained.

2.09 ADDITIONAL REQUIREMENTS

A. Work is expected to be delivered turn-key ready. The following items shall be included by Contractor;

1. Air Conditioning - Provide suitable ventilation and cooling equipment, if required, to maintain the machine-room temperature between 45oF and 95o.
2. Building Power - Provide electrical power for light, tools, hoists, etc. during installation as well as electric current for starting, testing and adjusting the elevator. Power of permanent characteristics to be provided to properly operate all of the elevators concurrently scheduled to be modernized. Power must be a 3-phase 4 wire system with ground and bonded disconnects. Grounded leg delta systems are not acceptable.
3. Smoke & Heat System - Provide a smoke and heat detector system, located as required with wiring from the sensing devices to each elevator controller.
4. Sprinklers - Provide code compliant sprinkler system, as required, in the hoist way, pit and machine room.
5. Cutting & Patching - Do any cutting, (including cutouts to accommodate hall signal fixtures, entrances and/or machine room access) patching and painting of walls, floors or partition.
6. Main Disconnect - Provide a fused lockable disconnect switch or circuit breaker for each elevator per the National Electrical Code with feeder or branch wiring to the transformer. Size to suit elevator contractor. Provide a SHUNT TRIP disconnect, as required, if sprinklers are being provided. Provide suitable connections from the main disconnect to the elevator control equipment.
7. Ground Wire - Provide a properly sized ground wire from the elevator controller(s) to the primary building ground.
8. Car Light Power Supply & Disconnect - Provide a 120 volt AC, 15 amp, single-phase power supply with fused SPST disconnect switch for each elevator, with feeder wiring to each controller for car lights.
9. Lighting - Any modification or installation of lights and/or GFI electrical outlets in the machine room, secondary level and/or pit to be performed by others. Provide sufficient lighting in the buildings

common areas to facilitate a safe working environment.

10. Machine Room Access - Provide a self-locking and self-closing door for the elevator machine room. Access door to be adequately sized to accept our equipment. Modify machine room access, as required, to comply with code and facilitate safe egress of all equipment.
11. Fire Extinguisher - Provide fire extinguisher in elevator machine room.
12. Non-Elevator Material in Hoistway - Remove or encapsulate, as required, any non-elevator related pipes or wiring located in the elevator machine room or hoist way.
13. Hoistway Ventilation - Provide code compliant hoist way ventilation. Code requires a means to prevent the accumulation of hot air and gasses at the top of the hoist way. Pressurizing the hoist ways, or providing vents from the top of the hoist way to the outside of the building usually accomplishes this. Vents shall not be less than 3 1/2% of the area of the hoist way or less than 3 sq. ft. for each elevator car, whichever is greater. You may not vent the hoist way to the machine room. If the hoist way vents must run through the machine room, they must be enclosed in a fire rated structure and not violate clearances around our equipment.
14. Hoistway Ledges - Provide a 75-degree angle constructed of a non-combustible material on all ledges that are 2” are greater in the hoist way, excluding multi-hatch divider beams.
15. Side Counterweight Guarding - Provide and install guarding of counterweights in a multiple elevator hoist way as required, when a counterweight is located between elevators, the counterweight runway shall be guarded on the side next to the adjacent elevator. The guarding must meet or exceed the requirements of ASME A17.1 – 2007, section 2.3.2.3.
16. Pit Ladders - Provide a pit ladder, as required, in each pit that does not have walk in access doors. Ladder shall extend 48” above first landing access door.

2.10 GENERAL REQUIREMENTS

A. Wiring: All wiring and electrical interconnections shall comply with governing codes. Insulated wiring shall have flame retardant and moisture-proof outer covering and shall be run in conduit, tubing or electrical wire ways. Traveling cables shall be flexible and suitably suspended to relieve strain on individual conductors.

B. Superseded Material: All material, removed or unused, not required in the modification will become the property of the contractor and we reserve the right to remove and retain it. PGCPS holds first right to claim existing items and equipment being replaced.

C. Permits and Inspections: Contractor shall furnish all licenses and permits and shall arrange for and make all required inspections and tests including third party.

D. Code: The elevator equipment shall be furnished and installed in accordance with the applicable version of the ASME/ANSI A17.1/ CS-B44 Safety Code for Elevators and Escalators, An American National Standard, including the latest Supplement, and the Americans with Disabilities Act.

PART 3 - EXECUTION

3.01 PREPARATION

A. Verification of Conditions: Examine areas to receive Work and conditions under which Work would be performed. Remedy conditions detrimental to the proper and timely completion of the Work Do not proceed until unsatisfactory conditions have been corrected.

B. Verification of Conditions: Examine areas to receive Work and conditions under which Work would be performed. Remedy conditions detrimental to the proper and timely completion of the Work. Do not proceed until unsatisfactory conditions have been corrected.

C. Field Measurements: Existing equipment data included in these specifications is provided for Contractor's convenience only. Contractor is responsible to field verify equipment type, capacity, speed, floors served, arrangement, features, dimensions, conditions and other relevant characteristics before proceeding with Work, and to obtain field measurements and data for related building systems associated with elevators required for proper completion of this work.

3.02 INSTALLATION

A. Installation: By manufacturer, per requirements of governing agencies.

B. Housekeeping: Contractor is to maintain neat working conditions at all times and to promptly dean up any dust, or debris due to Elevator Contractor's work. Contractor to provide necessary tarps, plastic or paper to protect floors and walls from soiling, staining or damage.

C. Removal of Existing Equipment and Retaining Spare Parts: Owner will direct Contractor which replaced existing components are to be retained as spare parts for use on Owner's other projects. Other removed parts become the property of Contractor, and are to be disposed of by Contractor, including dumpster costs as needed.

D. Environmental Requirements and Disposal of Material: Elevator Contractor to comply -with all applicable environmental and safety regulatory requirements. Contractor to properly dispose of removed equipment and any hazardous material according to applicable regulatory requirements and environmentally sound practices.

3.03 WORKMANSHIP

A. General: Finished work strong, rigid, neat in appearance and free from defects. Make plain surfaces smooth and free from warps and buckles; apply molded members straight and true; make connections between various members right to eliminate possible vibrations.

3.04 FIELD QUALITY CONTROL

A. Operations: Demonstrate to Owner that all automatic and special operations comply with Contract Documents.

B. Correction: Replace or remedy defects and discrepancies are no cost to Owner.

C. Instruction: Instruct Owner's personnel in proper use and operation of the elevator systems provide manuals, instructions and definitions for systems provided.

END OF SECTION

PART 1 - GENERAL

1.01 SUMMARY

A. A vertical platform (wheelchair) lifting device, designed to provide access to or within a building for mobility impaired persons. Lift consists of machine tower and lifting platform selected and dimensioned to provide adequate lifting height to suit building access requirements indoors and out.

1.02 REFERENCES

A. Lift shall be designed, manufactured and installed in accordance with the following standards:

1. American National Standards Institute (ANSI).
2. American Society of Mechanical Engineers (ASME).
3. ADA Accessibility Guidelines (ADAAG).
4. Underwriters Laboratories (UL).
5. International Building Code (IBC).
6. National Electrical Code (NEC).
7. American Society for Testing Materials (ASTM).
8. American Welding Society (AWS).

1.03 SYSTEM DESCRIPTION

A. Drive:

1. AC powered ballscrew drive; 1/2 hp, 120 V, 60Hz, instant reversing motor.

B. Number of Stops: 2 stops.

C. Platform Configurations: straight-thru and enter/exit same side.

D. Maximum Travel: Varies for each unit, refer to drawings.

E. Rated Load: 750 lbs. with minimum safety factor of 5X.

F. Rated Speed: 9-12 fpm (ballscrew drive) with rated load.

G. Platform Size: 36"x60"with 42" high guard panels.

H. Main Power Supply Wiring: Electrical contractor shall provide 115VAC, single phase, 20 amp, 60 Hz power circuit.

I. Operating Features:

1. Platform Controls: Directional paddle switch, on/off key switch, emergency stop switch with alarm and illuminated alarm button.
2. Landing Controls: Directional paddle switch and on/off key switch, emergency stop switch with alarm, mounted inside gate/door frames.
3. Constant pressure operation.
4. Grounded electrical system with upper, lower and final limit switches and 24 V operating controls.
5. Platform underpanel equipped with obstruction sensors.
6. Ramp with incline of 1:12.
7. Non-slip surface on platform floor and ramp.

8. Grab rail on platform.
9. Manual lowering device.
10. Integral ballscrew safety device and electromechanical brake (ballscrew drive).
11. Pit switch.
12. Upper Landing Gate/Door:
    a. 42" high, self-closing gate with VDR™ mechanical interlock and steel sheet insert panel.
    b. 6'-8" self closing, flush mount, 1-1/2 hour fire rated door with VDR™ mechanical interlock and 3"x26" glass vision panel.
13. Lower/Middle Landing Door:
    a. 6'-8" self closing, flush mount, 1-1/2 hour fire rated door with VDR™ mechanical interlock and 3"x26" glass vision panel.

1.04 QUALITY ASSURANCE

A. Manufacturer: Provide wheelchair lift manufactured by a firm with a minimum of 25 years experience in fabrication of wheelchair lifts equivalent to those specified.

B. All designs, clearances, workmanship and material, unless specifically excepted, shall be in accordance with all codes having legal jurisdiction.

C. All load ratings and safety factors shall meet or exceed those specified by all governing agencies with jurisdiction and shall be certified by a professional engineer.

D. Lift shall be subject to applicable state, local and city approval prior to installation and subject to inspection after installation. Determination of and adherence to these regulations is the responsibility of the lift contractor.

E. Welders certified in accordance with requirements of AWS D1.1 shall perform all welding of all parts.

1.05 WARRANTY

A. Manufacturer shall warrant the vertical platform lift’s drive system for a period of two years after installation and all other components for one year after installation.

B. Extended Warranty: Manufacturer shall warrant the vertical platform lift for a period of 5 years after installation with the purchase of a preventative maintenance program from lift contractor for an equal number of years.

1.06 MAINTENANCE

A. The vertical platform lift must be maintained in accordance with manufacturer’s instructions.

PART 2 - PRODUCT

2.01 MANUFACTURER

A. Basis-of-Design: Inclinator vertical platform lift Model VL manufactured by Inclinator Comany of America.

B. Other Acceptable Manufacurers:
    1. Garaventa.
    2. Symmetry Elevating Solutions.

2.02 MATERIAL

A. Machine Tower: 14 ga. steel sheet.

B. Guide Rail: 3" x 2" x 1/8" ASTM A500 grade B steel tubing.

C. Base Frame: 2" x 2" x 1/4" structural steel tubing and angle.

D. Lift Weldment: 3/8" hot rolled steel plate and 2" x 2" x 1/4" wall structural steel tubing.

E. Side Guard Panels: 18 ga. galvanealed steel sheet in 1" x 2" x 14 ga. steel tubing frame.

F. Front Access Panel: 20 ga. galvanealed steel sheet.

G. Platform: 11 ga. steel plate.

H. Access Ramp: 11 ga. steel plate.

2.03 FINISHES

A. Components shall be prepared with 1)alkaline detergent wash, 2) clear water rinse, 3)iron phosphate coating, 4)clear water rinse and finished with electrostatically applied and baked thermostatic powder coat finish for indoor or outdoor use.

B. Color: As selected from manufacturers standard colors.

2.04 ELECTRICAL SYSTEMS

A. The electrical contractors shall provide a 115V, single phase, 20 amp, 60 Hz electrical power source connection.

B. Electrical piping and wiring supplied by others.

C. Final electrical connections performed by lift contractor.

PART 3 EXECUTION

3.01 ACCEPTABLE INSTALLERS

A. Installers shall be experienced in performing work of this section who have specialized in work comparable to that required for this project.

B. Installers shall be certified and trained by the manufacturer.

3.02 EXAMINATION

A. Use field dimensions and approved manufacturer’s shop drawings to examine substrates, supports and other conditions under which this work is to be performed. Do not proceed with work until unsatisfactory conditions are corrected.

3.03 INSTALLATION

A. Vertical platform lift shall be installed in accordance with manufacturer’s instructions and as specified and approved by architect.

B. Landing gates and doors shall be installed by others. Electrical piping and wiring by others. Final electrical connections and lift adjustments by lift contractor.

3.04 DEMONSTRATION

A. The lift contractor shall make a final check of the lift’s operation with the Owner or Owner’s representative present prior to turning the lift over for use. The lift contractor shall determine that operating and safety devices are functioning properly.

END OF SECTION

Part 1 - General

I. General

A. The Bidding and Contract Requirements, Division 1 -General Requirements, Section 230100 - General Provisions, and Section 230500 - Basic Materials and Methods shall apply to this section.

II. Scope

A. An automatic sprinkler system shall be designed, installed, tested and approved for the entire building in accordance with Fairfax County School standards, NFPA standards, state codes, local jurisdiction's requirements and contract documents.

B. In all renovation and addition projects the contractor shall provide temporary protection for all branch mains and bulk mains run through corridors where the ceiling has been removed. The contractor shall provide upright sprinklers (within 12" of the deck above) along the path of all water charged sprinkler branch mains and bulk mains in the corridor. When the ceilings are replaced the upright sprinklers shall be removed and the outlets they were connected to shall be capped.

III. Quality Assurance

A. The automatic sprinkler system shall be tested in accordance with NFPA No. 13, FM 1637, UL 2443 and be approved by the local jurisdiction.

B. The sprinkler contractor shall be licensed by the local jurisdiction to install the sprinkler system as required.

C. All grooved joint couplings, fittings, valves, and specialties shall be the products of a single manufacturer. Grooving tools shall be of the same manufacturer as the grooved components.

1. All castings used for coupling housings, fittings, and valve bodies shall be date stamped for quality assurance and traceability.

IV. Submittals

A. This contractor shall prepare eight sets of shop drawings for the Architect to review. The local jurisdiction, the Architect and the Owner shall approve the shop drawings. The shop drawings shall include detailed working drawings at a scale no smaller than 1/8" per foot and shall also include lighting fixtures, ductwork, ceiling diffusers, grilles, HVAC and plumbing piping and any other possible obstructions. An overall plan showing the sprinkler zones shall be included on the working drawings (See paragraph 2.05). Calculations, sprinkler heads, alarm check valve, flow switches and other equipment shall

also be included on the shop drawings. No sprinkler piping shall be installed until shop drawings have been reviewed.

Part 2 - Products

I. Design

A. The entire building shall receive a sprinkler system, hydraulically designed and zoned. Zones shall not exceed fifty thousand square feet (50,000 sq. ft.). The sprinkler design shall be a wet-pipe system for the interior of the building. Attic spaces, crawlspaces and areas subject to freezing shall receive dry system. Loading docks, Walk-in freezer and unheated outdoor storage shall have dry heads. The sprinkler contractor shall obtain current hydrant flow test information from the local water authority prior to starting any design work.

II. Sprinkler Heads

A. Sprinklers shall be glass bulb type, with hex-shaped wrench boss integrally cast into the sprinkler body to reduce the risk of damage during installation. Wrenches shall be provided by the sprinkler manufacturer that directly engage the wrench boss. Sprinklers with rubber O-Rings are not acceptable. Acceptable manufacturers include:

1. Victaulic
2. Viking
3. Reliable Automatic Sprinkler Corporation of America
4. Tyco

B. Sprinkler heads, where there are ceilings, shall be recessed mounted with a polished chrome finish and escutcheon and shall be quick response type. Heads shall be as manufactured by Victaulic model "V2708". Exception: Sprinkler heads in locker rooms and shower rooms shall have a corrosion resistant coating.

C. Sprinkler heads, upright or pendent, exposed, shall be factory brass and shall be quick response as manufactured by Victaulic model "V2704 (upright) and V2708 (pendant)".

D. Sprinkler heads, dry sidewall, shall be glass bulb, quick response with white epoxy coating and escutcheon as manufactured by Victaulic model "V3610".

E. Sprinkler heads, sidewall, shall be wall mounted with polished chrome finish and escutcheon and shall be extended coverage quick response as manufactured by Victaulic model "V3416".

F. Sprinkler heads, dry pendant, shall be extended type glass bulb, quick response with corrosion resistant coating and escutcheon as manufactured by Victaulic model "V3606".

Provide and install dry sprinkler boot as manufactured by Victaulic to eliminate the air gap at the wall or ceiling.

G. Sprinkler heads in unoccupied spaces may be rough brass.

H. Sprinkler heads, concealed, shall have factory finished white painted cover plate and shall be quick response as manufactured by Victaulic model "V3904". For ceilings painted black, custom black painted cover plate shall be provided.

I. Provide sprinkler guards on all heads in the physical education rooms, gymnasiums, gym storage, walk-in coolers, loading docks, all storage rooms, gang toilets, locker rooms, boiler rooms and in mechanical rooms. Guards in occupied spaces shall be chrome plated. See 3.01.R for gang toilet and locker room exception.

J. Escutcheons and guards shall be listed, supplied, and approved for use with the sprinkler by the sprinkler manufacturer.

K. Sprinkler heads shall be of the same manufacturer for each type used.

L. Escutcheon finishes shall match that of the sprinkler head they serve.

M. Chrome plating is not an acceptable corrosion resistant coating.

III. Flow Switches

A. The flow switches shall be vane type. The flow switches shall be equipped with two sets of form 'C' contacts. Flow switches as manufactured by Potter Electric or Viking shall be acceptable.

IV. Chrome Fire Department Connection (siamese)

A. Two-way projecting Siamese with cast brass, straight Y pattern, double inlet body, furnished with plugs and chains, and brass escutcheon plate lettered 'AUTO. SPKR.' Finish - polished brass chrome plated and shall be manufactured by Potter Roemer, No. 5750 with automatic ball drip. Provide low point drain for service. Siamese connections fully equal to the item specified, manufactured by ELKHART, GUARDIAN FIRE EQUIPMENT< FIRE END< CROKER CORPORATION or POWHATTAN shall be acceptable. Siamese connections with a rough brass finish are not allowed. Provide a minimum 24" x 24" keyed lockable, access door, key shall be compatible to the owners HL302 key, to service check valve, ball drip and low point drain. Provide one key for each location and store in sprinkler cabinet.

B. At the low point near each fire department connection, install a 90-degree elbow with drain connection to allow for system drainage to prevent freezing. Basis of Design: Victaulic #10-DR.

V. Sprinkler Zone Graphic

A. Provide two sets of small scale floor plans showing the sprinkler zone diagram graphic. The graphic shall show the outline of the entire school, all rooms and corridors with multiple floors shown separately. The sprinkler zones, as shown on the drawings shall be delineated with each zone shown in a different color. The number of each zone shall be shown in its respective area and the graphic shall be titled "Sprinkler Control Zones". The graphic shall show the Siamese connection, the locations of all control, zone, test and drain valves, all low point drains, bulk drains, fire department connection drain, hose valves and shall identify the zone the valve serves and its function. The graphic shall have minimum dimensions of 11”x17” for elementary,middle, high and secondary schools. Larger drawings shall be provided if the minimum dimensions are too small to convey the required information legibly. The graphic shall be laminated. The graphic shall be professionally produced; hand shading will not be accepted. Provide shop drawings on this graphic with sprinkler shop drawings.

B. One zone diagram shall be wall mounted next to the sprinkler service entrance and shall be framed and covered by 1/8" clear plastic. The second zone diagram shall be turned over to the owner for sprinkler shop records.

VI. Valves

A. Sprinkler system valves shall be as manufactured by STOCKHAM, MILWAUKEE, NIBCO, MUELLER, UNITED, VICTAULIC, KENNEDY or any manufacturers listed in section 2.02. Butterfly valves as manufactured by Central are not acceptable. The minimum working pressure for system components shall be 250 psi. All valves controlling the flow of water to sprinklers shall be listed indicating valves. The main system control valve shall be an O.S. & Y, equal to VICTAULIC SERIES 771H. type; other control valves may be with grooved ends or wafer type (butterfly), equal to VICTAULIC SERIES 705. Butterfly valves shall include a pressure responsive seat, and the stem shall be offset from the disc centerline to provide complete 360-degree circumferential seating. Auxiliary control valves, (elevator shaft, pit and machine room), shall be slow close ball valves, equal to VICTAULIC SERIES 728 (MILWAUKEE series BB-SCS). All control valves shall be provided with tamper switches. All valve actuators shall be weatherproof. Fire department connection check valves shall incorporate upstream and downstream pressure taps. The inspectors test/drain valve shall be as manufactured by G/J Innovations, Inc. Model Sure-Test, combination test and drain valve with integral sight glass and test orifice. Test and drain valves manufactured by VICTAULIC TestMaster II Style 720, UNITED BRASS or AGF shall also be acceptable.

B. Backflow prevention valve shall be a U.L., listed double check valve assembly including ball type test cocks to protect the potable water supply against backflow from the automatic sprinkler system. Shutoff valves shall be U.L./FM listed, OS&Y type with tamper switches. The assembly shall comply with ASSE 1015 or AWWA C510. The double check valve assembly shall be manufactured by CONBRACO INDUSTRIES, INC., APOLLO VALVES 4SG series. Backflow prevention valves equal to the item specified as manufactured by WATTS, AMES, FEBCO orWILKINS shall be acceptable.

C. Service device valves shall be UL listed and FM approved, with a grooved end ductile iron body. The valves shall be rated for service of 225-psi (minimum). The valves shall be externally resettable, and all internal components shall be replaceable without removing the valve from the installed position. Basis of Design: VICTAULIC Series 751 (alarm valve), Series 769-NXT (preaction / deluge valve), and Series 768-NXT (dry valve, with required air pressure of 13-psi. Approved equal by VIKING will be acceptable.

VII. Piping

A. All main and branch piping shall be schedule 40 or schedule 10 steel pipe. Schedule 10 piping shall only be allowed for piping larger than two inches. No piping less than schedule 10 shall be acceptable. Grooved end fittings shall be ductile iron, short-pattern, with flow equal to standard pattern fittings. Basis of Design: VICTAULIC FireLock, or approved equal.

B. Grooved joint couplings shall consist of two ductile iron housing segments to ASTM A536, pressure responsive gasket to ASTM D2000, and zinc electroplated steel bolts and nuts to ASTM A449. Couplings shall comply with ASTM F1476 Standard Specification for the Performance of Gasketed Mechanical Couplings for Use In Piping Applications.

1. Rigid Type: Coupling housings shall be cast with offsetting, angle-pattern bolt pads to provide joint rigidity and support and hanging in accordance with NFPA-13. Couplings shall be fully installed at visual pad-to-pad offset contact. Tongue-and-recess type couplings, or any coupling that requires exact gapping of bolt pads at required torque ratings, shall be installed in strict accordance with the manufacturer's published instructions.
    a) Basis of Design: Victaulic Style 009-EZ and 107H, Installation-Ready, for direct stab installation without field disassembly, or standard rigid couplings Victaulic Style 005 "FireLock" and Style 07 "Zero-Flex".

2. Flexible Type: For use in locations where vibration attenuation and stress relief are required, and for the elimination of flexible connectors. Basis of Design: Victaulic Installation-Ready Style 177 or Style 77.

C. Spaces with suspended acoustical ceilings shall receive flexible sprinkler drops manufactured by FLEXHEAD INDUSTRIES or VICTAULIC. Union joints shall be provided for all flexible sprinkler drops. Areas without suspended acoustical ceilings shall be hard piped using return bends. Dry pipe systems shall have galvanized piping.

D. FlexHead industries- flexible sprinkler drops, hose assembly shall be stainless steel fully welded non-mechanical fittings, braided, leak tested with minimum one (1) inch true-bore internal corrugated hose diameter. The ceiling brackets shall be galvanized steel attachment type with integrated snap-on clip ends attached to the ceiling using tamper-resistant screws. The flexible hose attachment shall be removable hub type with set screw.

E. Victaulic- flexible sprinkler drops, the sprinkler drops shall be stainless steel, braided with union joints factory tested to 400 psi. No O-rings will be allowed. The flexible drop shall be attached to the ceiling grid using a one-piece open gate stainless steel bracket. The sprinkler heads installed in acoustical ceiling and concealed ceiling shall be factory pre-assembled to the flexible sprinkler drops. The drops shall include all required supports and bracing.

Part 3 - Execution

I. Installation

A. The sprinkler system shall be installed and tested in accordance with NFPA NO. 13 and shall be approved by the local jurisdiction. Two copies of the test results approved by the jurisdiction shall be sent to the Architect.

B. The sprinkler piping shall be installed concealed above the ceiling and be coordinated not to interfere with the ductwork, air devices, lighting fixtures HVAC piping, plumbing piping and other items. All mains shall run below the ductwork and all branches shall be as high as possible. Branch piping that is not installed as high as possible shall be removed and re-installed at the proper height at no additional cost to the owner. Piping shall be arranged to allow for the easy removal of acoustical ceiling tiles, piping shall be a minimum of 6” above ceiling grid.

C. The sprinkler heads in ceilings shall be installed in the center (both longitudinally and laterally) of the ceiling tile in lobbies, corridors and large rooms such as cafeterias, media

centers, libraries, lecture rooms, etc. Sprinkler heads installed in corridor ceilings shall be installed in the center of the corridor. The intent is that when the corridor width allows for a single row of sprinklers, the heads shall align witht the centerline of the corridor. Sprinkler heads in tiles in other spaces shall be installed in the center of tiles in at least the lateral dimension (width).Flexible sprinkler drops shall be installed in the top or side of main or branch piping (see drawing detail) inverted attachment is not acceptable.

D. All sprinkler heads installed within the same room or space, shall be set at a uniform elevation.

E. Test or drain lines shall discharge to the exterior of the building and shall be kept away from any entrances and off of loading docks and sidewalks.

F. Maintain a minimum clearance of 6" between sprinkler heads and any other obstruction such as lighting fixtures, clocks, etc.

G. The fire service main shall be lined piping outside of the building and inside up to the OS & Y valve. If a spool piece is used between the fire line stub and the OS & Y valve then the spool piece shall be galvanized. If the OS & Y valve is rated by the American Water Works Association (AWWA) as suitable for a connection to a potable water system, then no galvanized pipe is required and the OS & Y valve may be attached directly to the fire line stub.

H. The sprinkler system shall be zoned as shown on the sprinkler zone diagram on the drawings. Each zone shall have an inspector’s test and drain valve located off the remote area of the zone.

I. Provide high temperature sprinkler head(s) in the kitchen heat removal hood, Kiln room, near unit heaters and above gas water heaters. Heads installed within ten feet of gas clothes dryers shall be rated at 200º deg F. Heads located in the kitchen heat removal hood shall be located in the corner of the hood opposite the combi-steamer unit and rated at 360°F. Heads located in kiln hoods shall be rated at 286* deg F. Sprinklers in the heat removal hood and in the kiln room shall be white epoxy coated or stainless steel. Provide intermediate temperature, standard response sprinkler head (200°F), at the bottom of the elevator shaft and in the elevator machine room. Provide intermediate temperature, standard response sprinkler head (200°F), in the walk-in freezer.

J. All zone valves, control valves, test valves, hose valves and drain valves shall have laminated plastic labels attached to the valve to identify the zone the valve serves and the function of the valve (i.e. - "Control Valve - Zone 1", "Inspector's Test - Zone 1", “Drain valve – Zone 1”, etc.). Laminated plastic shall be one eighth inch thick, red with white

center core. Labels shall be a minimum of two inch by six inches with a minimum one quarter inch high block lettering. Peel off labels or permanent markers are not acceptable. Pre-manufactured labels with engraved information are acceptable. Where valves are located above ceilings, labels shall be screwed or riveted to the ceiling grid. In addition to the above, where valves are located in spaces which have doors, label with dimensions of 2" x10" shall be installed above the door on the occupied side of the door. Label shall read "Sprinkler control valve zone _ _ _" etc. Labels attached directly to valves shall be attached by a non-ferrous metal chain.

K. Piping shall be substantially supported from the building structure; the support shall be attached to the upper chord of the structure. Attachments shall be made either by welding or using top beam clamps. The supporting of piping from the supports of other disciplines is not acceptable.

L. As phases of construction are completed, the sprinkler system shall be activated for any additions to the building that are turned over to the owner for occupancy. Active sprinkler mains that run through portions of the building without sprinkler protection shall be protected as required by the Fire Marshall or the Authority Having Jurisdiction. Sprinkler valve signs shall be installed in these areas. Sprinkler systems shall remain activated throughout normal school hours and any subsequent connections into active systems shall be made outside of these hours.

M. All dry type sprinklers shall be of the same manufacturer and shall be insulated and sealed around the pipe penetration and shall have a corrosion resistant coating. Walk-in coolers/freezers shall have sprinklers located on opposite side of refrigeration equipment. All dry type sprinklers shall be 12" long unless special conditions require longer lengths.

N. Sprinkler main and branch piping shall be flushed prior to installing any sprinkler heads. Flushing connections shall be provided on mains and shall be 2 1/2". Flushing connections shall consist of threaded nipples with hose valves and caps. Flushing connections shall remain after the flushing and testing has been completed for use as future drain valves. Two flushing connections shall be provided for each zone and shall be located within 50' of operable windows or exterior doors. Flushing connections shall be located on opposite ends of each zone. The flushing of each zone shall be witnessed and verified by the owner's representative.

O. Check valves shall not be mounted higher than five feet above the finished floor.

P. Fire department check valve upstream and downstream pressure taps shall have valves and be provided with capped hose end connections for future maintenance/inspection purposes.

Q. All control and zone valves located in the sprinkler room shall not be mounted higher than five feet above the finished floor.

R. All inspectors' test/drain valves shall be located in chases with keyed alike, lockable access doors, minimum size is 10"x10".. Key shall be compatible with owner's HL302 key. Provide one key for each location and store in sprinkler cabinet.

S. Coordinate the spacing of heads with curtains and folding partitions.

T. Backflow valves shall be tested by an approved testing agency after installation.

U. Provide concealed type sprinkler heads in all group toilets, locker rooms and shower rooms, for all middle, high and secondary schools. Provide concealed type sprinkler heads in bulkheads, and spaces where the ceiling height is 7 foot 6 inches or less. Provide concealed type sprinkler heads at folding partitions as to not interfere with the operation of the folding partition.

V. Piping in exposed areas shall not be painted prior to the Fire Marshall approval of hydrostatic testing.

W. The use of piping bushings is not acceptable.

X. The shortest suitable length flexible braided sprinkler drop shall be used, however, avoid excessively shard bends or stress at the takeoff from the branch line or main.

Y. The sprinkler bulb protector must remain in place until the sprinkler is completely installed and before the system is placed in service. Remove bulb protectors carefully by hand after installation. Do not use any tools to remove bulb protectors.

Z. Do not install sprinklers that have been dropped, damaged, or show a visible loss of fluid. Never install sprinklers with cracked bulbs.

AA. Grooved joints shall be installed in accordance with the manufacturer's written recommendations. Grooved ends shall be clean and free from indentations, projections, or roll marks. The gasket shall be molded and produced by the coupling manufacturer of an elastomer suitable for the intended service.

II. Spare Parts

A. Provide and install cabinet adjacent to sprinkler service with spare heads, escutcheons, and wrenches for each type of sprinkler used including, but not limited to, all dry type and concealed heads, in accordance with the following schedule:

TOTAL NUMBER OF SPRINKLERS	NUMBER OF SPARE SPRINKLERS REQUIRED
1-10	1
11-299	6
OVER 299	12

B. All dry sprinklers shall be provided by the same manufacturer. Spare sprinklers shall be the same as those used on the project (temperature, color, length, etc.)

C. Provide a spare sprinkler wrench for each type of sprinkler and provide PVC sleeves with screwed caps to house dry type sprinklers. Hang sleeves on wall adjacent to sprinkler cabinet(s). Provide allen keys for flow/tamper covers.

D. Provide two spare flexible sprinkler drops for each length used. Provide bracket and hardware for each flexible sprinkler drop.

E. Provide one set of Backflow Preventer repair kit.

F. Spare wrench for recessed heads shall be socket type.

III. Special Conditions

A. The kitchen, all storage, mechanical, science rooms and science prep rooms shall be designed for Ordinary Hazard, Group One.

B. Sprinkler heads needed for sprinkler system design but not specifically referenced under paragraph 2.02 will be considered on a case by case basis.

C. Systems utilizing bulk mains, as shown on contract drawings, shall have zone valve assemblies located as shown on these drawings. The zone valve assembly shall consist of a control valve with tamper switch, a check valve and a flow switch.

D. Inspector test valves for attic dry pipe systems shall be installed in the space below, with drum drip and keyed, access door.

E. Pool areas shall use galvanized piping and sprinkler heads with corrosion resistant coatings.

END OF SECTION

Part 1 - General

I. General
   A. The Bidding and Contract Requirements, Division 1 - General Requirements, Section 230100 - General Provisions, and Section 230500 - Basic Materials and Methods shall apply to this section.

II. Scope
   A. A complete fire pump system shall be installed.

III. Quality Assurance
   A. A fire pumping system shall be installed and tested to meet the requirements of NFPA 20 Centrifugal Fire Pumps, state codes and the local jurisdiction.

IV. Submittals
   A. Provide shop drawings on the complete fire pump system as described in Section 230100 - 1.04.

Part 2 - Products

I. Fire Pump
   A. Furnish and install as indicated on the drawings an electric horizontal motor driven fire pump complete with control panel, valves, check valves, bypass, pump test header, relief valve, strainers, jockey pump, and jockey pump control panel.
      1. Fire pump shall be a packaged system mounted on a common base of fabricated steel and shall be U. L. and F. M. approved for fire protection equipment. Acceptable manufacturers include:
         a) Peerless
         b) Syncroflow
         c) Tigerflow.
      2. Fire pump shall be a (select) G. P. M. at a design head of (select) PSI,(select) HP(select) volt, 3 phase, 60 hertz, rate at 3525 RPM, motor shall be provided by the pump manufacturer, in accordance with NFPA 20 with all accessories for automatic operation.
   B. The fire pump controller shall be as manufactured by Firetrol Inc. The fire pump controller shall be automatic stop with timer and shall be identified "Fire Pump Controller". Fire pump controllers fully equal to the item specified, approved by the engineer, shall be acceptable.

C. The fire pump controller shall be U.L. listed and factory mutual approved for fire pump service and horsepower rating of the fire pump motor.

D. The fire pump controller shall have a service rated disconnect and shall be a solid state limited service with across-the-line starting type for fire pumps under 30HP and full service with across-the-line starting type for fire pumps 30HP and greater.

E. The fire pump controller shall have an interrupting capacity of at least 65,000 AIC.

F. Provide one set of dry contacts within the fire pump controller for connection to the owners security intrusion system, contacts shall make on pump run, (wiring to security system by others).

II. Jockey Pump

A. Furnish and install a jockey pump as indicated on the drawings to maintain pressure in the fire protection system complete with specialties as listed in 2.03 and controller.

1. The jockey pump shall be a (select) H.P., turbine type, (select)____ volts, 3 phase, 60 hertz, at 3450 R.P.M. as manufactured by Burks Pump. Jockey pumps fully equal to the item specified, approved by the Engineer, shall be acceptable.

2. The jockey pump controller shall be U.L. listed and factory mutual approved for fire service. The jockey pump controller shall incorporate a full voltage magnetic starter, fusible disconnect switch that is service rated, hand-off-auto selector switch, pressure switch and red pilot light. The jockey pump controller shall be as manufactured by Firetrol, Inc. The jockey pump controller fully equal to the item specified approved by the Engineer shall be acceptable.

III. Specialties

A. Specialties shall be provided to meet the requirements of NFPA 20 including but not limited to pipe, fittings, valves, check valves, eccentric reducers, concentric increasers, strainers, relief valves, pressure gauges, pressure switch including wiring and air vents. A ceiling lifting lug shall be provided directly over the fire pump motor. The lifting lug shall be sized to lift no less than 400 Lbs.

IV. Test Manifold

A. The test manifold for fire pump test connection shall be as shown on the drawings. The flush type wall hydrant shall be cast brass, double inlet body with male NPT inlet(s) and furnished with caps and chains, and cast brass escutcheon plate marked "Pump Test Connection". Finish shall be polished chrome plated, size 6" x 2-1/2" x 2-1/2", as manufactured by Potter-Roemer, Model 5862-7, complete with male snoots, caps and chains and removable swivel hose valves. Provide automatic ball drip. After the tests are

complete and approved, the valves shall be removed and stored in lockable wall cabinet, 20" x 20" x 9", with solid door, as manufactured by Potter-Roemer, Model 1815. Locate cabinet in pump room. Pump test manifolds fully equal to the item specified, manufactured by Allenco, Seco, or Elkhart, and shall be acceptable.

Part 3 - Execution

I. Installation
   A. The fire pump system shall be installed and tested as shown on the drawings and specified herein and in accordance with NFPA 20, state and local codes. Two copies of the test report approved by the local jurisdiction shall be submitted to the Owner.
   B. The fire pump supplier shall provide the services of a factory qualified technician to align pump coupling and check all items prior to fire pump test. Provide the owner with a copy of this report.
   C. Relief valves that discharge into floor drains shall not cause splashing of water in the pump room.
   D. Unless prohibited by code, drains shall discharge to the exterior of the building.
   E. Install unions to facilitate the replacement of relief valves on the fire pump and jockey pump.
   F. All piping shall be properly supported with hangers or clamps.
   G. All drain lines for drip cups and relief valves shall be PVC, CPVC or copper pipe.

II. Tests
   A. The automatic fire pump shall be tested for capacity and flow in accordance with NFPA 20.
   B. All labor, tools, materials and the services of an electrician shall be provided by the Fire Protection Contractor for all required automatic fire pump tests.

END OF SECTION

Part 1 - General

I. Summary
   A. This Section includes hangers and supports for mechanical system piping and equipment.

II. Performance Requirements
   A. Design channel support systems for piping to support multiple pipes capable of supporting combined weight of supported systems, system contents, and test water.
   B. Design heavy-duty steel trapezes for piping to support multiple pipes capable of supporting combined weight of supported systems, system contents, and test water.
   C. Design and obtain approval from authorities having jurisdiction for seismic-restraint hangers and supports for piping and equipment.

III. Submittals
   A. Product Data: For each type of pipe hanger, channel support system component, and thermal-hanger shield insert indicated.
   B. Shop Drawings: Signed and sealed by a qualified professional engineer for multiple piping supports and trapeze hangers. Include design calculations and indicate size and characteristics of components and fabrication details. This requirement may be modified in writing, for specific applications.
   C. Welding certificates.

IV. Quality Assurance
   A. Welding: Qualify procedures and personnel according to AWS D1.1, "Structural Welding Code--Steel."

Part 2 - Products

I. Manufacturers
   A. In other Part 2 articles where subparagraph titles below introduce lists, the following requirements apply for product selection:
      1. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the manufacturers specified.

II. Manufactured Units
   A. Pipe Hangers, Supports, and Components: MSS SP-58, factory-fabricated components.
   B. Approved manufacturers:

1. AAA Technology and Specialties Co., Inc.
2. B-Line Systems, Inc.
3. Carpenter & Patterson, Inc.
4. Empire Tool & Manufacturing Co., Inc.
5. Globe Pipe Hanger Products, Inc.
6. Grinnell Corp.
7. GS Metals Corp.
8. Michigan Hanger Co., Inc.
9. National Pipe Hanger Corp.
10. PHD Manufacturing, Inc.
11. PHS Industries, Inc.
12. Piping Technology & Products, Inc.
13. Approved Equal.

C. Galvanized, Metallic Coatings: For piping and equipment that will not have field-applied finish.

D. Nonmetallic Coatings: On attachments for electrolytic protection where attachments are in direct contact with copper tubing.

III. Channel Support Systems: MFMA-2, factory-fabricated components for field assembly.

A. Manufacturers:

1. B-Line Systems, Inc.
2. Grinnell Corp.
3. GS Metals Corp.
4. Michigan Hanger Co., Inc.
5. National Pipe Hanger Corp.
6. Thomas & Betts Corp.
7. Unistrut Corp.
8. Wesanco, Inc.
9. Approved Equal.

B. Coatings: Manufacturer's standard finish, unless bare metal surfaces are indicated.

C. Nonmetallic Coatings: On attachments for electrolytic protection where attachments are in direct contact with copper tubing.

IV. Thermal-Hanger Shield Inserts: 100-psi minimum compressive-strength insulation, encased in sheet metal shield.

A. Manufacturers:

1. Carpenter & Patterson, Inc.
2. Michigan Hanger Co., Inc.
3. PHS Industries, Inc.
4. Pipe Shields, Inc.
5. Rilco Manufacturing Co., Inc.
6. Value Engineered Products, Inc.
7. Approved Equal

B. Material for Cold Piping: ASTM C 552, Type I cellular glass or water-repellent-treated, ASTM C 533, Type I calcium silicate with vapor barrier.

C. Material for Hot Piping: ASTM C 552, Type I cellular glass or water-repellent-treated, ASTM C 533, Type I calcium silicate.

D. For Trapeze or Clamped System: Insert and shield cover entire circumference of pipe.

E. For Clevis or Band Hanger: Insert and shield cover lower 180 deg rees of pipe.

F. Insert Length: Extend 2 inches beyond sheet metal shield for piping operating below ambient air temperature.

V. Miscellaneous Materials

A. Powder-Actuated Drive-Pin Fasteners: Powder-actuated-type, drive-pin attachments with pull-out and shear capacities appropriate for supported loads and building materials where used.

B. Mechanical-Anchor Fasteners: Insert-type attachments with pull-out and shear capacities appropriate for supported loads and building materials where used.

C. Structural Steel: ASTM A 36/A 36M, steel plates, shapes, and bars, black and galvanized.

D. Grout: ASTM C 1107, Grade B, factory-mixed and -packaged, non-shrink and nonmetallic, dry, hydraulic-cement grout.

1. Characteristics: Post hardening and volume adjusting; recommended for both interior and exterior applications.
2. Properties: Non-staining, non-corrosive, and non-gaseous.
3. Design Mix: 5000-psi, 28-day compressive strength.

Part 3 - Execution

I. Applications

A. Specific hanger requirements are specified in Sections specifying equipment and systems.

B. Comply with MSS SP-69 for pipe hanger selections and applications that are not specified in piping system Specification Sections.

C. Horizontal-Piping Hangers and Supports: Unless otherwise indicated and except as specified in piping system Specification Sections, install the following types:

1. Adjustable Steel Clevis Hangers (MSS Type 1): For suspension of noninsulated or insulated stationary pipes, ½" to 30" NPS.
2. Yoke-Type Pipe Clamps (MSS Type 2): For suspension of 120 to 450 deg F pipes, 4" to 16" NPS, requiring up to 4 inches of insulation.
3. Carbon- or Alloy-Steel, Double-Bolt Pipe Clamps (MSS Type 3): For suspension of pipes, ¾" to 24", requiring clamp flexibility and up to 4 inches of insulation.
4. Adjustable Steel Band Hangers (MSS Type 7): For suspension of noninsulated stationary pipes, ½" to 8" NPS.
5. U-Bolts (MSS Type 24): For support of heavy pipe, ½" to 30" NPS.
6. Pipe Saddle Supports (MSS Type 36): For support of pipes, 4" to 36" NPS, with steel pipe base stanchion support and cast-iron floor flange.
7. Single Pipe Rolls (MSS Type 41): For suspension of pipes, 1" to 30" NPS, from 2 rods if longitudinal movement caused by expansion and contraction might occur.
8. Complete Pipe Rolls (MSS Type 44): For support of pipes, 2" to 42" NPS, if longitudinal movement caused by expansion and contraction might occur but vertical adjustment is not necessary.

D. Vertical-Piping Clamps: Unless otherwise indicated and except as specified in piping system Specification Sections, install the following types:

1. Extension Pipe or Riser Clamps (MSS Type 8): For support of pipe risers, ¾" to 20" NPS.
2. Carbon- or Alloy-Steel Riser Clamps (MSS Type 42): For support of pipe risers, ¾" to 20" NPS, if longer ends are required for riser clamps.

E. Hanger-Rod Attachments: Unless otherwise indicated and except as specified in piping system Specification Sections, install the following types:

1. Steel Turnbuckles (MSS Type 13): For adjustment up to 6 inches for heavy loads.
2. Steel Clevises (MSS Type 14): For 120 to 450 deg F piping installations.

F. Building Attachments: Unless otherwise indicated and except as specified in piping system Specification Sections, install the following types:

1. Steel or Malleable Concrete Inserts (MSS Type 18): For upper attachment to suspend pipe hangers from concrete ceiling.

2. Top-Beam C-Clamps (MSS Type 19): For use under roof installations with bar-joist construction to attach to top flange of structural shape.
3. Side-Beam or Channel Clamps (MSS Type 20): For attaching to bottom flange of beams, channels, or angles.
4. Center-Beam Clamps (MSS Type 21): For attaching to center of bottom flange of beams.
5. Welded Beam Attachments (MSS Type 22): For attaching to bottom of beams if loads are considerable and rod sizes are large.
6. C-Clamps (MSS Type 23): For structural shapes.
7. Welded-Steel Brackets: For support of pipes from below or for suspending from above by using clip and rod. Use one of the following for indicated loads:
   a) Light (MSS Type 31): 750 lb.
   b) Medium (MSS Type 32): 1500 lb.
   c) Heavy (MSS Type 33): 3000 lb.
8. Side-Beam Brackets (MSS Type 34): For sides of steel or wooden beams.
9. Plate Lugs (MSS Type 57): For attaching to steel beams if flexibility at beam is required.

G. Saddles and Shields: Unless otherwise indicated and except as specified in piping system Specification Sections, install the following types:
   1. Steel Pipe-Covering Protection Saddles (MSS Type 39): To fill interior voids with insulation that matches adjoining insulation.
   2. Protection Shields (MSS Type 40): Of length recommended by manufacturer to prevent crushing insulation.
   3. Thermal-Hanger Shield Inserts: For supporting insulated pipe, 360-degree insert of high-density, 100-psi minimum compressive-strength, water-repellent-treated calcium silicate or cellular-glass pipe insulation, same thickness as adjoining insulation with vapor barrier and encased in 360-degree sheet metal shield.

H. Spring Hangers and Supports: Unless otherwise indicated and except as specified in piping system Specification Sections, install the following types:
   1. Spring Cushions (MSS Type 48): For light loads if vertical movement does not exceed 1-1/4 inches.
   2. Spring-Cushion Roll Hangers (MSS Type 49): For equipping Type 41 roll hanger with springs.

3. Variable-Spring Base Supports (MSS Type 52): Preset to indicated load and limit variability factor to 25 percent to absorb expansion and contraction of piping system from base support.

II. Installation

A. Pipe Hanger and Support Installation: Comply with MSS SP-69 and MSS SP-89. Install hangers, supports, clamps, and attachments as required to properly support piping from building structure.

B. Channel Support System Installation: Arrange for grouping of parallel runs of piping and support together on field-assembled channel systems. Field assemble and install according to manufacturer's written instructions.

C. Heavy-Duty Steel Trapeze Installation: Arrange for grouping of parallel runs of horizontal piping and support together on field-fabricated, heavy-duty trapezes. Support pipes of various sizes together and space trapezes for smallest pipe size or install intermediate supports for smaller diameter pipes as specified above for individual pipe hangers. Field fabricate from ASTM A 36/A 36M, steel shapes selected for loads being supported. Weld steel according to AWS D1.1.

D. Install building attachments within concrete slabs or attach to structural steel. Space attachments within maximum piping span length indicated in MSS SP-69. Install additional attachments at concentrated loads, including valves, flanges, guides, strainers, and expansion joints, and at changes in direction of piping. Install concrete inserts before concrete is placed; fasten inserts to forms and install reinforcing bars through openings at top of inserts.

E. Install powder-actuated drive-pin fasteners in concrete after concrete is placed and completely cured. Use operators that are licensed by powder-actuated tool manufacturer. Install fasteners according to powder-actuated tool manufacturer's operating manual.

F. Install mechanical-anchor fasteners in concrete after concrete is placed and completely cured. Install fasteners according to manufacturer's written instructions.

G. Install hangers and supports complete with necessary inserts, bolts, rods, nuts, washers, and other accessories.

H. Install hangers and supports to allow controlled thermal and seismic movement of piping systems, to permit freedom of movement between pipe anchors, and to facilitate action of expansion joints, expansion loops, expansion bends, and similar units.

I. Load Distribution: Install hangers and supports so that piping live and dead loads and stresses from movement will not be transmitted to connected equipment.

J. Pipe Slopes: Install hangers and supports to provide indicated pipe slopes and so maximum pipe deflections allowed by ASME B31.9, "Building Services Piping," is not exceeded.

K. Insulated Piping: Comply with the following:

1. Attach clamps and spacers to piping.
    a) Piping Operating above Ambient Air Temperature: Clamp may project through insulation.
    b) Piping Operating below Ambient Air Temperature: Use thermal-hanger shield insert with clamp sized to match OD of insert.
    c) Do not exceed pipe stress limits according to ASME B31.9.
2. Install MSS SP-58, Type 39 protection saddles, if insulation without vapor barrier is indicated. Fill interior voids with insulation that matches adjoining insulation.
3. Install MSS SP-58, Type 40 protective shields on cold piping with vapor barrier. Shields shall span arc of 180 degrees.
4. Shield Dimensions for Pipe: Not less than the following:
    a) ¼" to 3 ½" NPS: 12 inches long and 0.048 inch thick.
    b) 4" NPS: 12 inches long and 0.06 inch thick.
    c) 5" and 6" NPS: 18 inches long and 0.06 inch thick.
    d) 8" to 14" NPS: 24 inches long and 0.075 inch thick.
    e) 16" to 24" NPS: 24 inches long and 0.105 inch thick.
5. Pipes 8" NPS and Larger: Include wood inserts.
6. Insert Material: Length at least as long as protective shield.
7. Thermal-Hanger Shields: Install with insulation same thickness as piping insulation.

III. Equipment Supports

A. Fabricate structural-steel stands to suspend equipment from structure above or to support equipment above floor. Place grout under supports for equipment and make smooth bearing surface.

IV. Metal Fabrication

A. Cut, drill, and fit miscellaneous metal fabrications for heavy-duty steel trapezes and equipment supports. Fit exposed connections together to form hairline joints. Field-weld connections that cannot be shop-welded because of shipping size limitations. Comply

with AWS D1.1 procedures for shielded metal arc welding, appearance and quality of welds, and methods used in correcting welding work, and with the following:

1. Use materials and methods that minimize distortion and develop strength and corrosion resistance of base metals.
2. Obtain fusion without undercut or overlap.
3. Remove welding flux immediately.
4. Finish welds at exposed connections so no roughness shows after finishing and contours of welded surfaces match adjacent contours.

V. Adjusting

A. Hanger Adjustment: Adjust hangers to distribute loads equally on attachments and to achieve indicated slope of pipe.

VI. Painting

A. Touching Up: Clean field welds and abraded areas of shop paint. Paint exposed areas immediately after erecting hangers and supports. Use same materials as used for shop painting. Comply with SSPC-PA 1 requirements for touching up field-painted surfaces. Apply paint by brush or spray to provide a minimum dry film thickness of 2.0 mils. See Division 9 Section "Painting" for paint materials and application requirements.

B. Galvanized Surfaces: Clean welds, bolted connections, and abraded areas and apply galvanizing-repair paint to comply with ASTM A 780.

END OF SECTION

Part 1 - General

I. General
   A. The Bidding and Contract Requirements, Division 1 -General Requirements, Section 230100 - General Provisions, and Section 230500 - Basic Materials and Methods, shall apply to this section.

II. Scope
   A. This section consists of providing the waste, vent and sanitary sewer system, domestic cold and hot water supply system and all fixtures, equipment, accessories and appurtenances.
   B. Permits, Codes & Standards:
      1. Plumbing systems shall be designed in compliance with all codes and standards as cited previously. Comply with all WSSC plumbing and gas fitting regulations.
      2. Permits will be obtained and fees paid by PGCPS. The contractor shall transfer the permits, pay only the transfer fee and comply with all WSSC regulations.
      3. Comply with Prince George's County plumbing and gas fitting regulations.

III. Quality Assurance
   A. The roof drainage system shall be tested for leaks before the insulation is applied and before the piping is covered up. The test shall be filling the system with water.

IV. Submittals
   A. Gas Service:
      1. At the Design Development phase, design engineer shall verify with the gas providing utility that sufficient gas service is available for the project.
      2. Design engineer shall submit gas service request to the providing utility. Some projects may be serviced by Baltimore Gas & Electric; the majority are served by Washington Gas Co. Service request shall be issued at the 95% complete construction document phase, copying the PGCPS Project Manager. Service request to Washington Gas shall be made on their Commercial Service Request Form, addressed to:

         Sales Rep. – Prince George's County
         6801 Industrial Road
         Springfield, VA 22151
         Room 202K

B. Plumbing Permit Drawings:
   1. At the 95% design completion submission, two (2) complete sets of plumbing drawing shall be provided to the PGCPS Project Manager, stamped and signed by the design team's plumbing professional engineer. PGCPS will submit the stamped drawings to WSSC for review and approval. WSSC review comments shall be addressed and incorporated into the 100% completed (bid) documents. PGCPS will provide the WSSC approved drawings to the plumbing contractor.
   2. Two (2) stamped and signed civil site utilities plans are also to be provided to the PGCPS Project Manager at the 95% design completion submission for the permit review submission to WSSC.

C. Leed: Require that the contractor:
   1. Submit MSDS or product data for each field-applied adhesive or sealant used, highlighting VOC and formaldehyde content.
   2. Submit certified water usage rating for each plumbing fixture. The target ratings shall be indicated on the Construction Documents under the fixture schedule.

Part 2 - Products

I. Drainage, Waste And Vent Pipe And Fittings:
   A. Above Grade:
      1. Allowable piping consists of the following: Copper tubing type DWV, schedule 40 PVC, or hubless cast iron pipe; Corresponding fittings shall be wrought copper, schedule 40 PVC, or no-hub cast iron. PVC cannot be used in plenum ceiling cavities.
      2. All exposed or semi-exposed waste piping in kitchens to be type L copper DWV
      3. Foam core piping not allowed
      4. Piping sealants, adhesives and welding cements field-applied in the interior of the building shall comply with the following VOC content limits (in grams/ liter):
         a) PVC Welding: 510
         b) ABS Welding: 400
         c) Plastic Cement Welding: 350
         d) Adhesive Primer for Plastic: 650
         e) All Other Welding & Installation Adhesive and Sealants: 250

f) Specify that “All Weather” welding cement be used on plastic piping when outdoor air temperatures are below 40°F.

B. Below Grade: Service weight cast iron, hub and spigot or Schedule 40 PVC pipe. Fittings to match piping.

II. Gas Pipe And Fittings:

A. Materials shall be schedule 40 steel pipe; threaded malleable iron fittings for piping 2” and smaller. Weld fittings shall be utilized for piping 2-1/2” and larger.

III. Domestic Water Piping, Valves, And Accessories

A. Above Grade: Copper tubing, hard drawn, type L; wrought copper fittings, solder joint

B. Below Grade:

1. Piping, 2-1/2" and smaller, type K
2. Piping, 3" and larger, ductile-iron
3. Pipe fittings: Cast bronze flared for K tubing; gasket and bolted flanges for ductile-iron

C. Dielectric connections: dielectric flanges, couplings, or nipples. Dielectric unions prohibited.

D. Valves: Ball or globe. Gate valves prohibited except for OS&Y type required for incoming water service.

IV. Acid Resistant Piping And Accessories

A. Above/Below Grade: Polypropylene tubing, connections shall be mechanical joints or electrofusion systems; CPVC Type IV Grade I compounds with a minimum cell classification of 23447, pipe and fittings shall conform to ASTM F2618 and solvent cement shall be formulated for chemical waste and confirm to ASTM F493

B. Neutralization: Means of neutralization shall be performed passively through a centralized polypropylene tank or through individual sink mounted basins. Limestone chips shall used for the neutralization/dilution process.

V. Plumbing Fixtures:

A. General: Plumbing fixtures shall be of manufacturers listed; fixtures, fittings, trim and accessories shall be same manufacturers to the extent possible.

1. Vitreous China Fixtures: American Standard, Kohler, Zurn, Crane
2. Stainless Steel Fixtures: Just, Eljer, Kohler, Elkay
3. Enameled Cast Iron: American Standard, Kohler, Zurn
4. Faucets: T&S Brass, Chicago, Symmons, Delta, American Standard, Zurn, Speakman, Moen

5. Flush Valves: Sloan, Zurn, Speakman, Moen
6. Emergency Fixtures: Bradley, Speakman, Guardian, Haws

B. Fixtures Basis of Design:

1. Water Closets: All shall be white vitreous china, floor mounted; no wall mounted water closets.
   a) Standard: Elongated bowl, siphon jet, NPS 1-1/2" (DN 40) top spud, 2-1/4" passageway, floor mounted, 1.6 gpf, heavy duty solid plastic open front seat less cover with S.S. hinge posts with combination self-sustaining and check hinge, dual-flush valve (1.6/1.1 gpf).
   b) ADA/Child: Reference above standard, mounted per Table 3.1 B
   c) Tank Type: Tank types shall not be used.
   d) Flush Valves:
      (1) Single action valves shall be 1.6 gpf.
      (2) Two-stage "dual-flush" valves shall be 1.6/1.1 gpf.
      (3) Automatic flush valves will not be accepted.
   e) Mounting: Water closets shall be secured with two bolts attaching to the floor flanges and the base shall be sealed to the floor using a clear silicone caulk. Secure with bolt caps.
2. Urinals:
   a) Wall hung, white vitreous china, 1.0 gpf, top spud, rear outlet; washdown action, flush valve.
   b) Waterless urinals are not acceptable at this time.
   c) Carriers: Wall-mounted carrier shall have top and bottom support plates, anchored to floor with foot supports.
3. Lavatories: White vitreous china, wall hung.
   a) Standard: Rectangular (20 x 18), front overflow, 4" centerset 0.5 gallon-per-minute faucet, grid strainer, wall mounted. Theft protected aerators in middle and high schools
   b) Kindergarten: Rectangular (21.25 x 18), front overflow,(grid strainer, 4" centerset 0.5 gallon-per-minute faucet, wall mounted.
   c) Supplies shall be 1/2" copper to faucet, loose key stops, 1-1/2" x 1-1/4" cast brass P-trap with clean-out and threaded outlet.
   d) All public lavatories shall receive a tempering valve conforming to latest ASSE 1070 requirements. Automatic faucets are not acceptable.

4. Sinks:
    a) Classroom Countertop: Stainless steel, single compartment, with seamless radius-coved corners, 3-hole ledge for faucet, 8" faucet centers, 5-1/2" deep, limited swing gooseneck faucet, wrist blade handles, duo strainer. Offset drain to comply with ADA requirements as necessary.
        (1) Supplies and trap per lavatories above.
        (2) Drinking bubblers shall be provided on all handicapped sinks and on all elementary school sinks.
        (3) Art room sinks shall have plaster traps (1.5 x 1.5) IPS outlet, cast-brass, ground joint, swivel type, with cleanout, complete with NPS 1.5 cast-brass nipple and cast setscrew escutcheon.
    b) Mop: Pre-cast terrazzo basin (24 x 3), 18-gage; wall mounted faucet with 3/4" hose thread, vacuum breaker, integral stops, wall brace, pail hook, hose and hose bracket, strainer (1453-BB); stainless steel edge curbs and wall guards.
    c) Service: Enameled cast iron with rim guard and wall hanger. Heritage 8341.075 faucet, trap standard. Provide a double sink in concession stands.
5. Showers:
    a) Group: Concealed metering shower valve with 30 second cycle or better (Leonard LV- 477B), H-06 shower head; Leonard Group Shower Control (TM-186 series) thermostatic mixing valve in locking recessed stainless steel cabinet.
    b) Group, Barrier Free: Concealed metering shower valve with 30 second cycle or better (Leonard LV-477B); 501P(G) hand held shower, 69" chrome hose and rail; Leonard Group Shower Control (TM-186 series) thermostatic mixing valve in locking recessed stainless steel cabinet.
    c) Staff, Barrier Free: Floor and enclosure by General Contractor. Leonard 4500-S-501P(G) temp/pressure balancing valve, fixed shower head and hand held shower, 69" chrome hose and rail.
    d) Free stand-in showers will not be allowed.
6. Water Coolers: Dual, two level; Elkay, Ebco, Haws, Halsey-Taylor, Oasis; HFC-134a refrigerant; barrier free, certified lead free, manual control. Support framing shall be made of heavy gauge galvanized steel with pre-punched mounting holes and mounted to the floor. Provide necessary filters as required.

7. Emergency Fixtures: Combination shower and eye/face wash unit shall be installed for each science classroom. Shower shall operate utilizing a pull rod and eye/face wash shall utilize highly visible push handle. Comply with ANSI Standard Z358.1 by providing uninterruptible supply of flushing fluid at a minimum of 30 PSI flowing pressure. Per ANSI Standards and Code requirements water temperature provided to emergency equipment shall be tepid. Provide floor drain at the base of each shower fixture.

VI. Specialties:

A. Traps: All traps for lavatories, electric water coolers, classroom sinks, etc. shall be cast brass, with cleanout and threaded outlet.

B. Thermostatic Mixing Valves: Lawler, Leonard model to match flow requirement.

C. Wall Hydrants: Freezeless, male hose thread, vacuum breaker, backflow preventer, loose key stop, chrome. Josam Series 71050; Jay R. Smith, Zurn.

D. Hose Bibbs:

1. Cold Water: Male hose thread, vacuum breaker, backflow preventer, loose key stop, chrome.
2. Hot and Cold Water: Two handle mixing faucet with lever handles, male hose thread, vacuum breaker, backflow preventer, loose key stop, chrome.

E. Open Site Drains: Floor drain with funnel. Josam Series #30000-E2, J.R. Smith, Zurn.

F. Floor Sinks: Josam Series #49000, J.R. Smith, Zurn. Install 1” AFF.

G. Roof Drains: Josam Series #21000-T with threaded outlet and drain receiver, J.R. Smith, Zurn.

H. Clean Outs: Josam, J.R. Smith , Zurn

1. Floor: Satin Nikolay Finish
2. Wall: Stainless steel access cover . Distance between wall cover and cleanout shall not exceed 4”.
3. Exterior: Satin Nikolay Finish

I. Backflow Preventers: Comply with WSSC

J. Trench Drains: Install trench drains in each trash room as indicated on Architectural documents. Cast-iron rectangular sectional body with 6” wide cast-iron grate meeting ADA requirements. Josam Series 76000. Install 1/8” screen over drain outlet.

K. Shock Absorbers (water hammer arresters): stainless-steel bellows type, certified in accordance with PDI WH 201, Water Hammer Arresters, equal to Zurn “Shoktrol” Z-1700.

VII. Insulation:

A. Fiberglass with all service jacket. Flexible elastomeric insulation may be used for piping drops within partitions. All joints to be properly sealed and inspected.

VIII. Identification:

A. Valves Tags: Brass circular tag with chain to identify system and valve number.

B. Where valves, equipment, pumps, etc. are concealed above ceilings provide plastic labels on grid below. Labels shall be black with white letters and should be the size of the grid tee. Label shall be provided with adhesive backing for attachment. Label shall indicate the tagging information and system.

C. Valve tag chart shall be provided and mounted in the boiler or mechanical room. Chart shall be laminated and framed.

Part 3 - Execution

I. Fixture Requirements:

A. Number of plumbing fixtures required: Reference International Plumbing Code for all code requirements related to plumbing fixture type and quantities. Student occupancy load shall be based on project specific educational specifications. Elementary classrooms with individual restrooms shall deduct 25 students per classroom from the overall occupancy load. Use the following list as a guide for minimum requirements:

	Fixture	Gender Use	Multiplier	# Fixture
(1) Students*	Water closet	M	.5	1 per 20
	Water closet	F	.75	1 per 20
	Secondary - Shower	M	.5	1 per 25
	Secondary - Shower	F	.5	1 per 25
	Lavatories	Both	-	50% of WC count
	Drinking Fountain	Both	-	1 per 100
(2) Staff*	Water closet	M	.5	1 per 25
	Water closet	F	.5	1 per 25

	Lavatories	Both	-	1 per 25
(3) Assembly Area*	Water closet	M	.5	1 per 50
	Water closet	F	.75	1 per 50
	Lavatories	Both	-	.5X # of Water closet
	Drinking Fountain	Both	-	1 per 500
*NOTES:	1. At least one of each fixture per bathroom shall be for handicapped use. 2. Urinal fixture count shall be included in water closets but not to exceed 50%. 3. Drinking fountain count based on total census 4. Provide at minimum (1) service sink per floor 5. Restrooms for public use shall be clearly identified. 6. Provide 1 shower per 0.5% of full-time staff to satisfy LEED requirements for Site Credit 4.2. – PE Staff Showers can be used to comply with this credit if easy access is provided and school has policy that allows all staff to use the PE showers.			

B. Fixture mounting heights: Standard primary and secondary school height of fixtures:*

Fixture	K	1 thru 3	4 thru 5	Middle School	High School	Adult
Lavatories	24"	28"	28"	31"	31"	31"
Water Closet	15"	15"	15"	15"	15"	15"
Urinals	16"	16"	16"	24"	24”	24”
Lavatories (Handicap)	24"	28"	28"	34"	34"	34"
Water Closet (Handicap)	15"	15"	15"	15"	16.5 - 17"	16.5 - 17"
Urinals (Handicap)	16"	16"	16"	16"	16"	16"
Electric Water Cooler (EWC)	25"	31"	31"	31"	31"	31"
E.W.C. (Handicap)	28"	34"	34"	34"	34"	34"

NOTES:
1. Heights are to rim for water closets and to lip for lavatories AFF
2. Pre-K Water Closets shall be 10” in height.

II. Drainage:

A. Provide lead flashing for vent lines. Extend minimum of 12" above roof. Do not locate vent lines within 25 feet of ventilation air intakes as required by International Mechanical Code and comply with Ventilation Rate Procedures of ASHRAE Standard 62.1. If discrepancy exists follow whichever is more stringent.

B. Roof drains must have secondary overflow drainage; water dam shall extend 3” above roof. Downspout nozzles for overflow piping to have stainless steel screens.

C. Use cast iron square boots down spouts

D. Require pipe hanger at piping connect to roof drains. Hanger shall be located directly adjacent to 90 degree bend.

E. Provide a oil monitoring sump pump in all elevator pits. Pump controller shall be mounted in nearest mechanical or building service space. Unit shall be Stancor SE-50 or equal.

F. Specify that “All Weather” welding cement be used on plastic piping when outdoor air temperatures are below 40°F.

G. Existing:

1. All existing to remain underground utilities are the general contractor’s responsibility to minimize disruption and maintain designed functionality.
2. In general, all existing sewer and storm drain lines should be replaced in full modernization projects. If PGCPS directs the A/E to maintain existing drain line in some modernization and addition projects, the following paragraph shall be placed on the plumbing drawings:

   Prior to starting any work; the contractor shall test and accept all roof drains, sewer and storm drains as free flowing and in working condition. Testing shall be performed in the presence of PGCPS maintenance personnel and PGCPS Plumbing Inspector.

H. The contractor shall take full responsibility for protecting all drains during the construction and returning them free flowing and in working condition. Contractor shall guarantee all drains for at least 90 days after occupation of the building.

I. Floor Drains, Cleanouts:
   1. Floor drains and cleanouts are to be installed prior to concrete floor pours.
   2. Trap primers:
      a) Provided from flush valves where possible
      b) Provided with time clock control when not from flush valve. Assure coordination with electrical (Div 16) regarding power to trap primers.
      c) Trap priming piping to be reinforced copper tubing; no PVC

J. Waste Disposals: Waste disposals are prohibited.

III. Domestic Water:

A. Sterilization: Domestic water to be disinfected by a certified water-treatment company. A letter of certificate must be submitted to the owner, before building is occupied.

B. If outdoor play-fields are provided with sprinkler system, require a registered submeter to exempt the water usage from sewage charges.

C. Provide a pressure regulator in the incoming water after the backflow preventer on incoming water service when pressure may exceed 60 psig at fixtures.

D. Domestic circulation temperature shall be a minimum of 120 degrees unless otherwise approved. Mop basins and specified kitchen fixtures shall receive 120 degree hot water.

E. Fixture Supplies:
   1. Locate rough-in for ADA water closets so that the handle is on the wide side of the stall.
   2. Urinals with 1.0 gpf flush valves shall be provided with 3/4” cold water supplies.

F. Science Lab Classrooms: Provide central water shut-off valves in teacher’s workstation casework to permit teacher control of water to all student sinks in the classroom.

G. Group shower mixing valve and shut off valves shall be installed in recessed locking wall cabinet.

IV. Insulation:

A. Storm: 1” thickness
   1. Drain basket
   2. Horizontal piping and first 2 feet in the vertical direction
   3. Ground floor level: five feet AFF

B. Domestic Water:
   1. Cold Water: 1” thickness.
   2. Hot Water: 1” and smaller piping: 1” thickness. 1-1/4” piping and larger: 1” thickness.
   3. Recirculating Hot Water: 1/2” thickness.

4. Insulation shall be continuous over all plumbing valves. Provide valve handle extensions for all insulated valves.
5. Fittings shall be covered with same thickness as piping with molded PVC jacket.
6. Insulation for piping outdoors shall have aluminum jackets; seams at bottom of piping.

C. Handicapped Lavatories: Pre-molded trap and valve insulation shall be applied to supplies and drains below fixture.

V. Gas:

A. Provide dual gas pressure system. Medium press (2 lbs) for boilers, generators, and long runs to HVAC equipment and science applications; pressure regulators located at equipment; low press (7" WC) for hot water heater, science, and kitchen use.

B. Provide cocks, regulators, unions and test port at equipment connections.

C. All gas regulators shall be vented to outdoors; vent piping shall be shown on contract drawings.

D. Science Lab Classrooms: Provide key switch in teacher's workstation casework to permit teacher control of gas to all outlets in the classroom. Provide mushroom style push button at classroom exit for emergency gas shut down. Provide solenoid valve on gas service to classroom to shut off gas in response to emergency gas shut down; teacher's switch opens valve.

VI. Coordination With Other Disciplines/trades:

A. Plumbing engineer shall ensure that other disciplines are cognizant of these PGCPS standards for fixtures and fittings being specified by them; i.e. laboratory fixtures and trim specified by the Architect, food service sinks specified by the Food Service Consultant, etc.

B. Coordinate with the other disciplines and clearly delineate the responsibilities of the plumbing contractor; i.e. rough-in for and make final connections to fixtures and fittings furnished and installed by others; rough-in for and install fittings furnished for fixtures provided by others; rough-in for and install fixtures and fittings furnished by others; etc.

C. Coordinate services with civil discipline; sizes, locations, and inverts are to be fixed no later than the 65% design review submission.

VII. Radon Venting:

A. Radon vent system shall be provided for every 5,000 sq.ft. of building slab. Individual vents shall be shown on contract drawing floor plans; installation per detail and to include mini magnehelic.

VIII. Leed Requirements:

A. Recycle waste piping materials in accordance with Division 1 Construction Waste Management Requirements.

B. Provide a separate meter on any rainwater harvesting system.

IX. Installing Roof Drains

A. The first fitting below the roof drain shall be a T without cleanout plug, except over food preparation and serving areas.

B. Set roof drains so flashing clamp ring is depressed below normal roof membrane level. Flashing of the roof drains shall be as specified in Division 7.

C. Sheet lead gaskets shall extend 12 inches (305 mm) beyond outer edge of roof drains and shall be secured with the flashing clamp.

D. Flashing clamp ring shall be embedded into the roofing and made watertight.

E. Ascertain that weep holes into drainage pans are open.

X. Installing Water Hammer Arresters (shock Absorbers)

A. Install water hammer arresters in each branch domestic water pipe (hot and cold) which feeds either a battery of fixtures or a single fixtures with self closing faucet valves or flush valves.

B. Size and locate in the piping as shown on drawings and as recommended by the Plumbing and Drainage Institute.

XI. Installing Sleeves

A. Install sleeves for piping, or piping with insulation continuous through sleeve, passing through walls, partitions, beams, or slabs. Sleeves through concrete floors shall be set prior to concrete pour.

1. Exception: Where steel pipe penetrates a steel beam that is not part of a fire-or smoke rated assembly, no sleeve is required.

B. Do not cut, drill, or burn structural steel for installation of piping without specific instructions from the Architect.

C. Locations in non fire-rated construction:

1. Install sleeves for penetrations of steel, iron, and insulated piping.
2. Install copper sleeves for penetrations of uninsulated copper tubing and piping.
3. Install plastic sleeves for penetrations of plastic piping. Plastic piping and sleeves are not permitted in ceiling spaces used as HVAC system plenums, nor in shafts used for building HVAC air distribution.

D. Locations in floors and fire-rated construction: Sleeves used in piping penetrations through fire rated construction shall be an acceptable component of the through-penetration firestop assembly as specified in Section 15079 Firestopping for Mechanical Work.
   1. Where firestop assembly is UL listed, sleeve material shall be as directed in the listing.
   2. Where other specified approval and acceptance is required, sleeve shall be as described in the approved assembly.

E. Install Sleeves through walls and partitions flush with finished surfaces.

F. Sleeves through floors shall extend 0.375 inch (10 mm) above top of finished floor and be finished neat and level. Sleeves through mechanical or equipment room floors shall extend 2 inches above finished floor. Provide projecting sleeves with anchor clips to prevent them from being loosened and knocked down in the floor construction.

G. Sleeves for penetrations in kitchen and food service areas shall finish 0.375 inch (10 mm) above floor or flush with wall surfaces and be neatly pointed up to fit snuggly against floor or wall materials. Seal space between pipe and sleeve with waterproof sealant or fire barrier as required, and finish even with wall or floor with a light pouring of molten lead.

H. Sleeves for insulated piping with vapor barrier shall be large enough to pass piping and insulation.

I. Seal spaces between sleeves and pipe, or pipe insulation, in nonrated walls, with mineral wool. In rated walls or floors install required fire-rated caulk.

J. Penetrations in exterior masonry or concrete walls and foundations:
   1. Sleeves: cast iron, or in cast concrete may be core drilled.
   2. Above grade: Oakum and lead, or mechanical penetration seal, at outside face of wall.
   3. Below grade: Mechanical penetration seals at outside and inside faces of wall. Link-seal or equal.

XII. Schedules

SYSTEM	TEST PRESSURE PSIG (kPa)	ALLOWABLE DROP	MEDIUM
Domestic water, cold & hot, and recirculated	125 (860)	None	Water

Heating water	125 (860)	None	Water
Chilled and chilled/heating water	125 (860)	None	Water
Sprinkler water and fire line	200 (1370)	None	Water
Air conditioning condensate drain	4.3 (30)	None	Water
Pumped storm	125 (860)	None	Water
Storm	4.3 (30)	None	Water
Fuel gas	100 (690)	None	*Nitrogen or air

END OF SECTION

Part 1 - General

I. Summary
   A. This Section includes domestic water piping from locations indicated to fixtures and equipment inside the building.
   B. See Division 23 Section "Meters and Gages" for thermometers, pressure gages, and fittings.

II. Submittals
   A. Water Samples: Specified in "Cleaning" Article in Part 3.
   B. Field quality-control test reports.

III. Quality Assurance
   A. Piping materials shall bear label, stamp, or other markings of specified testing agency.
   B. Comply with NSF 61, "Drinking Water System Components-Health Effects; Sections 1 through 9," for potable domestic water piping and components.

Part 2 - Products

I. Piping Materials
   A. Transition Couplings: Coupling or other manufactured fitting the same size as, with pressure rating at least equal to and ends compatible with, piping to be joined.
   B. Soft Copper Tube: ASTM B 88, Types K and L water tube, annealed temper.
      1. Copper Pressure Fittings: ASME B16.18, cast-copper-alloy or ASME B16.22, wrought-copper, solder-joint fittings. Furnish wrought-copper fittings if indicated.
      2. Bronze Flanges: ASME B16.24, Class 150, with solder-joint end. Furnish Class 300 flanges if required to match piping.
      3. Copper Unions: MSS SP-123, cast-copper-alloy, hexagonal-stock body, with ball-and-socket, metal-to-metal seating surfaces and solder-joint or threaded ends.
   C. Hard Copper Tube: ASTM B 88, Type L water tube, drawn temper.
      1. Copper Pressure Fittings: ASME B16.18, cast-copper-alloy or ASME B16.22, wrought- copper, solder-joint fittings. Furnish wrought-copper fittings if indicated.
      2. Bronze Flanges: ASME B16.24, Class 150, with solder-joint end. Furnish Class 300 flanges if required to match piping.
      3. Copper Unions: MSS SP-123, cast-copper-alloy, hexagonal-stock body, with ball-and-socket, metal-to-metal seating surfaces and solder-joint or threaded ends.

II. Valves

A. Refer to Division 15 Section "Valves" for bronze and cast-iron, general-duty valves.

B. Refer to Division 15 Section "Plumbing Specialties" for balancing and drain valves.

Part 3 - Execution

I. Piping Applications

A. Transition and special fittings with pressure ratings at least equal to piping rating may be used in applications below, unless otherwise indicated.

B. Flanges may be used on aboveground piping, unless otherwise indicated.

C. Domestic Water Piping: Use the following piping materials for each size range. Use copper unless plastic, PVC is specifically called for on the drawings:

1. 1-1/2" and Smaller: Hard copper tube, Type L; copper pressure fittings; and soldered joints.
2. 2": Hard copper tube, Type L; copper pressure fittings; and soldered joints.
3. 2-1/2" to 3-1/2": Hard copper tube, Type L; copper pressure fittings; and soldered joints.
4. 4" to 6": Hard copper tube, Type L; copper pressure fittings; and soldered joints.

D. Nonpotable-Water Piping: Use the same piping materials as for Potable water:

II. Valve Applications

A. Drawings indicate valve types to be used. Where specific valve types are not indicated, the following requirements apply:

1. Shutoff Duty: Use bronze ball or gate valves for piping 2" and smaller. Use cast-iron butterfly or gate valves with flanged ends for piping 2-1/2" and larger.
2. Throttling Duty: Use bronze ball or globe valves for piping 2" and smaller. Use cast-iron butterfly valves with flanged ends for piping 2-1/2" and larger.
3. Hot-Water-Piping, Balancing Duty: Memory-stop balancing valves.
4. Drain Duty: Hose-end drain valves.

III. Piping Installation

A. Refer to Division 15 Section "Basic Mechanical Materials and Methods" for basic piping installation.

B. Extend domestic water service piping to exterior water distribution piping in sizes and locations indicated.

C. Install domestic water piping level and plumb unless indicated otherwise on the drawings for winter drainage.

D. Fill water piping. Check components to determine that they are not air bound and that piping is full of water.

E. Perform the following steps before operation:

1. Close drain valves, hydrants, and hose bibbs.
2. Open shutoff valves to fully open position.
3. Open throttling valves to proper setting.
4. Remove plugs used during testing of piping and plugs used for temporary sealing of piping during installation.
5. Remove and clean strainer screens. Close drain valves and replace drain plugs.
6. Remove filter cartridges from housings, and verify that cartridges are as specified for application where used and that cartridges are clean and ready for use.

F. Check plumbing equipment and verify proper settings, adjustments, and operation. Do not operate water heaters before filling with water.

G. Check plumbing specialties and verify proper settings, adjustments, and operation.

1. Water-Pressure Regulators: Set outlet pressure at 80 psig maximum, unless otherwise indicated.

H. Energize pumps and verify proper operation.

IV. Joint Construction

A. Refer to Division 15 Section "Basic Mechanical Materials and Methods" for basic piping joint construction.

B. Soldered Joints: Use ASTM B 813, water-flushable, lead-free flux; ASTM B 32, lead-free-alloy solder; and ASTM B 828 procedure, unless otherwise indicated.

V. Valve Installation

A. Install sectional valve close to water main on each branch and riser serving plumbing fixtures or equipment. Use ball or gate valves for piping 2” and smaller. Use butterfly or gate valves for piping 2-1/2” and larger.

B. Install shutoff valve on each water supply to equipment and on each water supply to plumbing fixtures without supply stops. Use ball or gate valves for piping 2” and smaller. Use butterfly or gate valves for piping 2-1/2” and larger.

C. Install drain valves for equipment, at base of each water riser, at low points in horizontal piping, and where required to drain water piping.

1. Install hose-end drain valves at low points in water mains, risers, and branches.
2. Install stop-and-waste drain valves where indicated.

D. Install balancing valve in each hot-water circulation return branch and discharge side of each pump and circulator. Set balancing valves partly open to restrict but not stop flow. Use ball valves for piping 2” and smaller and butterfly valves for piping 2-1/2” and larger. Refer to Division 15 Section "Plumbing Specialties" for balancing valves.

E. Where specified on the drawings, install calibrated balancing valves in each hot-water circulation return branch and discharge side of each pump and circulator. Set calibrated balancing valves partly open to restrict but not stop flow. Refer to Division 15 Section "Plumbing Specialties" for calibrated balancing valves.

VI. Hanger And Support Installation

A. Refer to Division 15 Section "Hangers and Supports" for pipe hanger and support devices. Install the following:

1. Vertical Piping: MSS Type 8 or Type 42 clamps.
2. Individual, Straight, Horizontal Piping Runs: According to the following:
   a) 100 Feet and Less: MSS Type 1, adjustable, steel clevis hangers.
   b) Longer than 100 Feet MSS Type 43, adjustable roller hangers.
   c) Longer than 100 Feet if indicated: MSS Type 49, spring cushion rolls.
3. Multiple, Straight, Horizontal Piping Runs 100 Feet or Longer: MSS Type 44, pipe rolls. Support pipe rolls on trapeze.
4. Base of Vertical Piping: MSS Type 52, spring hangers.

B. Install supports according to Division 15 Section "Hangers and Supports."

C. Rod diameter may be reduced 1 size for double-rod hangers, to a minimum of 3/8 inch.

D. Install hangers for steel piping with the following maximum horizontal spacing and minimum rod diameters:

1. 1-1/4” NPS and Smaller: 84 inches with 3/8-inch rod.
2. 1-1/2” NPS: 108 inches with 3/8-inchrod.
3. 2” NPS: 10 feet with 3/8-inch rod.
4. 2-1/2”NPS: 11 feet with 1/2-inch rod.
5. 3” NPS and 3-1/2” NPS: 12 feet with 1/2-inch rod.
6. 4” NPS and 5” NPS: 12 feet with 5/8-inch rod.
7. 6”NPS: 12 feet with 3/4-inch rod.
8. 8” NPS to 12” NPS: 12 feet with 7/8-inch rod.

E. Install supports for vertical steel piping every 15 feet.

F. Install hangers for copper tubing with the following maximum horizontal spacing and minimum rod diameters:

1. ¾” and Smaller: 60 inches with 3/8-inch rod.
2. 1” and 1-1/4”: 72 inches with 3/8-inch rod.
3. 1-1/2” and 2”: 96 inches with 3/8-inch rod.
4. 2-1/2” : 108 inches with 1/2-inch rod.
5. 3” to 5”: 10 feet with 1/2-inch rod.
6. 6” : 10 feet with 5/8-inch rod.
7. 8” : 10 feet with 3/4-inch rod.

G. Install supports for vertical copper tubing every 10 feet.

H. Support piping and tubing not listed above according to MSS SP-69 and manufacturer's written instructions.

VII. Connections

A. Drawings indicate general arrangement of piping, fittings, and specialties.

B. Install piping adjacent to equipment and machines to allow service and maintenance.

C. Connect domestic water piping to exterior water service piping. Use transition fitting to join dissimilar piping materials.

D. Connect domestic water piping to service piping with shutoff valve, and extend and connect to the following:

1. Booster Systems: Cold-water suction and discharge piping.
2. Water Heaters: Cold-water supply and hot-water outlet piping in sizes indicated, but not smaller than sizes of water heater connections.
3. Plumbing Fixtures: Cold- and hot-water supply piping in sizes indicated, but not smaller than required by plumbing code.
4. Equipment: Cold- and hot-water supply piping as indicated, but not smaller than equipment connections. Provide shutoff valve and union for each connection. Use flanges instead of unions for 2-1/2” NPS and larger.

VIII. Field Quality Control

A. Inspect domestic water piping as follows:

1. Do not enclose, cover, or put piping into operation until it is inspected and approved by authorities having jurisdiction.
2. During installation, notify authorities having jurisdiction at least 24 hours before inspection must be made. Perform tests specified below in presence of authorities having jurisdiction:

a) Roughing-in Inspection: Arrange for inspection of piping before concealing or closing-in after roughing-in and before setting fixtures.

b) Final Inspection: Arrange for final inspection by authorities having jurisdiction to observe tests specified below and to ensure compliance with requirements.

3. Reinspection: If authorities having jurisdiction find that piping will not pass test or inspection, make required corrections and arrange for reinspection.
4. Reports: Prepare inspection reports and have them signed by authorities having jurisdiction.

B. Test domestic water piping as follows:

1. Test for leaks and defects in new piping and parts of existing piping that have been altered, extended, or repaired. If testing is performed in segments, submit separate report for each test, complete with diagram of portion of piping tested.
2. Leave uncovered and unconcealed new, altered, extended, or replaced domestic water piping until it has been tested and approved. Expose work that was covered or concealed before it was tested.
3. Cap and subject piping to static water pressure of 50 psig above operating pressure, without exceeding pressure rating of piping system materials. Isolate test source and allow to stand for four hours. Leaks and loss in test pressure constitute defects that must be repaired.
4. Repair leaks and defects with new materials and retest piping or portion thereof until satisfactory results are obtained.
5. Prepare reports for tests and required corrective action.

IX. Cleaning

A. Clean and disinfect potable and clean non-potable domestic water piping as follows:

1. Purge new piping and parts of existing domestic water piping that have been altered, extended, or repaired before using.
2. Use purging and disinfecting procedures prescribed by authorities having jurisdiction or, if methods are not prescribed, procedures described in either AWWA C651 or AWWA C652 or as described below:
   a) Flush piping system with clean, potable water until dirty water does not appear at outlets.
   b) Fill and isolate system according to either of the following:
   c) Fill potable system or part thereof with water/chlorine solution with at least 50 ppm of chlorine. Isolate with valves and allow to stand for 24 hours.
   d) Fill potable system or part thereof with water/chlorine solution with at least 200 ppm of chlorine. Isolate and allow to stand for three hours.

e) Flush system with clean, potable water until no chlorine is in water coming from system after the standing time.

f) Submit water samples in sterile bottles to authorities having jurisdiction. Repeat procedures if biological examination shows contamination.

B. Prepare and submit reports of purging and disinfecting activities.

C. Clean interior of domestic water piping system. Remove dirt and debris as work progresses.

END OF SECTION

Part 1 - General

I. Related Documents
   A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

II. Summary
   A. This Section includes the following plumbing specialties:
      1. Backflow preventers.
      2. Water regulators.
      3. Balancing valves.
      4. Water tempering valves.
      5. Strainers.
      6. Drain valves.
      7. Miscellaneous piping specialties.
      8. Sleeve penetration systems.
      9. Flashing materials.
   B. Related Sections include the following:
      1. Division 15 Section "Meters and Gages" for water meters, thermometers, and pressure gages.

III. Definitions
   A. The following are industry abbreviations for plastic piping materials:
      1. ABS: Acrylonitrile-butadiene-styrene plastic.
      2. PE: Polyethylene plastic.
      3. PUR: Polyurethane plastic.
      4. PVC: Polyvinyl chloride plastic.

IV. Performance Requirements
   A. Provide components and installation capable of producing piping systems with following minimum working-pressure ratings, unless otherwise indicated:
      1. Domestic Water Piping: 125 psig.

V. Submittals
   A. Product Data: Include rated capacities and shipping, installed, and operating weights. Indicate materials, finishes, dimensions, required clearances, and methods of assembly of components; and piping and wiring connections for the following:

1. Backflow preventers and water regulators.
2. Balancing valves, water filters, and strainers.
3. Thermostatic water mixing valves and water tempering valves.
4. Drain valves, hose bibbs, hydrants, and hose stations.

B. Shop Drawings: Diagram power, signal, and control wiring.

C. Field test reports.

D. Maintenance Data: For plumbing specialties to include in maintenance manuals. Include the following:

1. Backflow preventers and water regulators.
2. Thermostatic water mixing valves and water tempering valves.

VI. Quality Assurance

A. Product Options: Drawings indicate size, profiles, and dimensional requirements of plumbing specialties and are based on the specific system indicated. Refer to Division 1 Section "Product Requirements."

B. Plumbing specialties shall bear label, stamp, or other markings of specified testing agency.

C. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.

D. ASME Compliance: Comply with ASME B31.9, "Building Services Piping," for piping materials and installation.

E. NSF Compliance:

1. Comply with NSF 14, "Plastics Piping Components and Related Materials," for plastic domestic water piping components. Include marking "NSF-pw" on plastic potable-water piping and "NSF-dwv" on plastic drain, waste, and vent piping.
2. Comply with NSF 61, "Drinking Water System Components--Health Effects, Sections 1 through 9," for potable domestic water plumbing specialties.

Part 2 - Products

I. Manufacturers

A. In other Part 2 articles where subparagraph titles below introduce lists, the following requirements apply for product selection:

1. Available Products: Subject to compliance with requirements, products that may be incorporated into the Work include, but are not limited to, the products specified.
2. Products: Subject to compliance with requirements, provide one of the products specified.
3. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the manufacturers specified.
4. Manufacturers: Subject to compliance with requirements, provide products by the manufacturers specified.

II. Backflow Preventers

A. Approved Manufacturers:

1. Ames Co., Inc.
2. B & K Industries, Inc.
3. Cla-Val Co.
4. CMB Industries, Inc.; Febco Backflow Preventers.
5. Conbraco Industries, Inc.
6. FLOMATIC Corp.
7. IMI Cash Valve.
8. Mueller Co.; Hersey Meters Div.
9. Sparco, Inc.
10. Watts Industries, Inc.; Water Products Div.
11. Zurn Industries, Inc.; Wilkins Div.

B. General: ASSE standard, backflow preventers.

1. 2” NPS and Smaller: Bronze body with threaded ends.
2. 2-1/2” NPS and Larger: Bronze, cast-iron, steel, or stainless-steel body with flanged ends.
   a) Interior Lining: AWWA C550 or FDA-approved, epoxy coating for backflow preventers having cast-iron or steel body.
3. Interior Components: Corrosion-resistant materials.
4. Exterior Finish: Polished chrome plate if used in chrome-plated piping system.
5. Strainer: On inlet, if indicated.

C. Pipe-Applied, Atmospheric-Type Vacuum Breakers: ASSE 1001, with floating disc and atmospheric vent.

D. Hose-Connection Vacuum Breakers: ASSE 1011, nickel plated, with nonremovable and manual drain features, and ASME B1.20.7, garden-hose threads on outlet. Units attached to rough-bronze-finish hose connections may be rough bronze.

E. Intermediate Atmospheric-Vent Backflow Preventers: ASSE 1012, suitable for continuous pressure application. Include inlet screen and two independent check valves with intermediate atmospheric vent.

F. Reduced-Pressure-Principle Backflow Preventers: ASSE 1013, suitable for continuous pressure application. Include outside screw and yoke gate valves on inlet and outlet, and strainer on inlet; test cocks; and pressure-differential relief valve with ASME A112.1.2 air-gap fitting located between two positive-seating check valves.

1. Pressure Loss: 12 psig maximum, through middle 1/3 of flow range.

G. Double-Check Backflow Prevention Assemblies: ASSE 1015, suitable for continuous pressure application. Include shutoff valves on inlet and outlet, and strainer on inlet; test cocks; and two positive-seating check valves.

1. Pressure Loss: 5 psig maximum, through middle 1/3 of flow range.

H. Antisiphon-Pressure-Type Vacuum Breakers: ASSE 1020, suitable for continuous pressure application. Include shutoff valves, spring-loaded check valve, spring-loaded floating disc, test cocks, and atmospheric vent.

1. Pressure Loss: 5 psig maximum, through middle 1/3 of flow range.

I. Dual-Check-Valve-Type Backflow Preventers: ASSE 1024, suitable for continuous pressure application. Include union inlet and two independent check valves.

J. Dual-Check-Valve-Type Backflow Preventers: ASSE 1032, suitable for continuous pressure application for carbonated beverage dispensers. Include stainless-steel body; primary and secondary checks; ball check; intermediate atmospheric-vent port for relieving carbon dioxide; and threaded ends, 3/8” NPS.

K. Reduced-Pressure Detector Assembly Backflow Preventers: ASSE 1047, FM approved or UL listed, and suitable for continuous pressure application. Include outside screw and yoke gate valves on inlet and outlet, and strainer on inlet. Include test cocks; pressure-differential relief valve with ASME A112.1.2 air-gap fitting located between two positive-seating check valves; and bypass with displacement-type water meter, valves, and reduced-pressure backflow preventer.

1. Pressure Loss: 12 psig maximum, through middle 1/3 of flow range.

L. Double-Check Detector Assembly Backflow Preventers: ASSE 1048, FM approved or UL listed, and suitable for continuous pressure application. Include outside screw and yoke

gate valves on inlet and outlet, and strainer on inlet. Include test cocks; two positive-seating check valves; and bypass with displacement-type water meter, valves, and double-check backflow preventer.

1. Pressure Loss: 5 psig maximum, through middle 1/3 of flow range.

M. Back-Siphonage Backflow Vacuum Breakers: ASSE 1056, suitable for continuous pressure and backflow applications. Include shutoff valves, check valve, test cocks, and vacuum vent.

III. Water Regulators

A. Approved Manufacturers:

1. Armstrong-Yoshitake, Inc.
2. BERMAD.
3. Cashco, Inc.
4. Cla-Val Co.
5. Conbraco Industries, Inc.
6. FLOMATIC Corp.
7. G A Industries, Inc.
8. Honeywell Braukmann.
9. IMI Cash Valve.
10. Watts Industries, Inc.; Water Products Div.
11. Zurn Industries, Inc.; Wilkins Div.

B. General: ASSE 1003, water regulators, rated for initial working pressure of 150 psig minimum. Include integral factory-installed or separate field-installed, Y-pattern strainer.

1. 2” NPS and Smaller: Bronze body with threaded ends.
   a) General-Duty Service: Single-seated, direct operated, unless otherwise indicated.
   b) Booster Heater Water Supply: Single-seated, direct operated with integral bypass.
2. 2-1/2” NPS and Larger: Bronze or cast-iron body with flanged ends. Include AWWA C550 or FDA-approved, interior epoxy coating for regulators with cast-iron body.
   a) Type: Single-seated, direct operated.
   b) Type: Pilot-operated, single- or double-seated, cast-iron-body main valve, with bronze-body pilot valve.
3. Interior Components: Corrosion-resistant materials.

4. Exterior Finish: Polished chrome plate if used in chrome-plated piping system.

IV. Water Tempering Valves

A. Approved Manufacturers:

1. Heat-Timer Corporation.
2. Holby Valve Co., Inc.
3. Sparco, Inc.
4. Watts Industries, Inc.; Water Products Div.
5. Approved Equal.

B. General: Manually adjustable, thermostatically controlled water tempering valve; bronze body; and adjustable temperature setting.

C. System Water Tempering Valves: Piston or discs controlling both hot- and cold-water flow, capable of limited antiscald protection. Include threaded inlets and outlet.

1. Finish: Rough bronze.

D. Limited-Volume, Water Tempering Valves: Solder-joint inlets and ¾"NPS maximum outlet.

V. Strainers

A. Strainers: Y-pattern, unless otherwise indicated, and full size of connecting piping. Include ASTM A 666, Type 304, stainless-steel screens with 3/64-inch round perforations, unless otherwise indicated.

1. Pressure Rating: 125-psig minimum steam working pressure, unless otherwise indicated.
2. 2" NPS and Smaller: Bronze body, with female threaded ends.
3. 2-1/2" NPS and Larger: Cast-iron body, with interior AWWA C550 or FDA-approved, epoxy coating and flanged ends.
4. Y-Pattern Strainers: Screwed screen retainer with centered blowdown.
   a) Drain**:** Pipe plug.
5. T-Pattern Strainers: Malleable-iron or ductile-iron body with grooved ends; access end cap with drain plug and access coupling with rubber gasket.
6. Basket Strainers: Bolted flange or clamp cover, and basket with lift-out handle.
   a) Type: Duplex with bronze or stainless-steel diverter valve and two baskets.
   b) Drain: Factory- or field-installed, hose-end drain valve.

VI. Drain Valves

A. Hose-End Drain Valves: MSS SP-110, ¾"NPS ball valve, rated for 400-psig minimum CWP. Include two-piece, copper-alloy body with standard port, chrome-plated brass ball, replaceable seats and seals, blowout-proof stem, and vinyl-covered steel handle.
   1. Inlet: Threaded or solder joint.
   2. Outlet: Short-threaded nipple with ASME B1.20.7, garden-hose threads and cap.

B. Stop-and-Waste Drain Valves: MSS SP-110, ball valve, rated for 200-psig minimum CWP or MSS SP-80, Class 125, gate valve; ASTM B 62 bronze body, with 1/8" side drain outlet and cap.

VII. Miscellaneous Piping Specialties

A. Hose Bibbs: Bronze body with replaceable seat disc complying with ASME A112.18.1M for compression-type faucets. Include ½" or ¾" threaded or solder-joint inlet, of design suitable for pressure of at least 125 psig; integral or field-installed, nonremovable, drainable hose-connection vacuum breaker; and garden-hose threads complying with ASME B1.20.7 on outlet.
   1. Finish for Equipment Rooms: Rough bronze, or chrome or nickel plated.
   2. Operation for Equipment Rooms: Wheel handle or operating key.
   3. Operation for Service Areas: Wheel handle.

B. Air Vents: Float type for automatic air venting.
   1. Bolted Construction: Bronze body with replaceable, corrosion-resistant metal float and stainless-steel mechanism and seat; threaded 3/8" NPS minimum inlet; 125-psig minimum pressure rating at 140 deg F; and threaded vent outlet.

C. Roof Flashing Assemblies: Manufactured assembly made of minimum 4-lb/sq. ft., 0.0625-inch- thick, lead flashing collar and skirt extending at least 8 inches from pipe with galvanized steel boot reinforcement, and counterflashing fitting.
   1. Approved Manufacturers:
      a) Acorn Engineering Company; Elmdor/Stoneman Div.
      b) Approved Equal.
   2. Open-Top Vent Cap: Without cap.
   3. Low-Silhouette Vent Cap: With vandal-proof vent cap.
   4. Extended Vent Cap: With field-installed, vandal-proof vent cap.

D. Fixed Air-Gap Fittings: Manufactured cast-iron or bronze drainage fitting with semiopen top with threads or device to secure drainage inlet piping in top and bottom spigot or threaded outlet larger than top inlet. Include design complying with ASME A112.1.2 that will provide fixed air gap between installed inlet and outlet piping.

Part 3 - Execution

I. Installation

A. Refer to Division 15 Section "Basic Mechanical Materials and Methods" for piping joining materials, joint construction, and basic installation requirements.

B. Install backflow preventers in each water supply to mechanical equipment and systems and to other equipment and water systems that may be sources of contamination. Comply with authorities having jurisdiction.

1. Locate backflow preventers in same room as connected equipment or system.
2. Install drain for backflow preventers with atmospheric-vent drain connection with air-gap fitting, fixed air-gap fitting, or equivalent positive pipe separation of at least two pipe diameters in drain piping and pipe to floor drain. Locate air-gap device attached to or under backflow preventer. Simple air breaks are not acceptable for this application.
3. Do not install bypass piping around backflow preventers.

C. Install pressure regulators with inlet and outlet shutoff valves and balance valve bypass. Install pressure gages on inlet and outlet.

D. Install strainers on supply side of each control valve, pressure regulator, and solenoid valve.

E. Fasten wall-hanging plumbing specialties securely to supports attached to building substrate if supports are specified and to building wall construction if no support is indicated.

F. Fasten recessed-type plumbing specialties to reinforcement built into walls.

G. Install individual shutoff valve in each water supply to plumbing specialties. Use ball, gate, or globe valve if specific valve is not indicated. Install shutoff valves in accessible locations. Refer to Division 15 Section "Valves" for general-duty ball, butterfly, check, gate, and globe valves.

H. Install air vents at piping high points. Include ball, gate, or globe valve in inlet.

I. Install traps on plumbing specialty drain outlets. Omit traps on indirect wastes unless trap is indicated.

II. Connections

A. Piping installation requirements are specified in other Division 15 Sections. Drawings indicate general arrangement of piping, fittings, and specialties.

B. Install piping adjacent to equipment to allow service and maintenance.

C. Connect plumbing specialties to piping specified in other Division 15 Sections.

D. Ground equipment.

E. Tighten electrical connectors and terminals according to manufacturer's published torque-tightening values. If manufacturer's torque values are not indicated, use those specified in UL 486A and UL 486B.

F. Connect plumbing specialties and devices that require power according to Division 16 Sections.

III. Labeling And Identifying

A. Equipment Nameplates and Signs: Install engraved plastic-laminate equipment nameplate or sign on or near each backflow preventer and water tempering valve.

1. Text: Distinguish among multiple units, inform operator of operational requirements, indicate safety and emergency precautions, and warn of hazards and improper operations, in addition to identifying unit.
2. Refer to Division 15 Section "Mechanical Identification" for nameplates and signs.

IV. Field Quality Control

A. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect field-assembled trap seal primer systems and their installation, including piping and electrical connections. Report results in writing.

1. Leak Test: After installation, charge system and test for leaks. Repair leaks and retest until no leaks exist.
2. Operational Test: After electrical circuitry has been energized, start units to confirm proper motor rotation and unit operation. Remove malfunctioning units, replace with new units, and retest.
3. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.

V. Protection

A. Protect drains during remainder of construction period to avoid clogging with dirt and debris and to prevent damage from traffic and construction work.

B. Place plugs in ends of uncompleted piping at end of each day or when work stops.

VI. Demonstration

A. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain trap seal primer systems and interceptors.

END OF SECTION

Part 1 - General

I. General
   A. The Bidding and Contract Requirements, Division 1 - General Requirements, Section 230100 - General Provisions, and Section 230500 - Basic Materials and Methods, shall apply to this section.

II. Scope
   A. Provide and install the domestic recirculating pump as shown on the drawings and specified herein.

III. Quality Assurance
   A. Pump must be selected from published test curves showing actual brake horsepower. The selection point shall be confined to the left of center of the efficiency curve for the impeller being furnished.
   B. All pump motors shall meet NEMA Standards and shall be U/L listed.
   C. All pumps shall be factory tested prior to shipment to the job site.

IV. Submittals
   A. Provide shop drawings on this equipment as described in Section 230100 - 1.04.

Part 2 - Products

I. Domestic Recirculating Pump
   A. The domestic recirculating pump shall be of the centrifugal inline mounted type and of the size, capacity and voltage shown on the drawings. Acceptable manufacturers shall include:
      1. Bell & Gossett
      2. Armstrong
      3. Weinmann
      4. Patterson.
   B. Pump - Shall be quiet operating, horizontal, oil lubricated, inline, single stage, vertical split case design, and shall be all-bronze construction for domestic water applications. The pump internals shall be capable of being serviced without disturbing piping connections. The pump shall have a dynamically balanced impeller keyed and locknutted to a ground and polished steel shaft with hardened integral thrust collar. Shaft shall be supported by

oil lubricated bronze sleeve bearings. Water tight mechanical seal faces shall be carbon on cast iron or ceramic.

C. Coupling - Shall be self aligning, flexible type connecting the pump and motor.

D. Motor - Shall be open drip proof, journal bearing, resilient mounted, 1750 rpm, and shall be especially selected for quiet operation. The electrical characteristics of the motor shall be as shown on the drawings. The horsepower of the motor shall be of such a size as to insure non-overloading of the motor throughout the capacity range of the pump. The motor shall have sealed bearings.

E. Testing - The pump shall be factory tested, thoroughly cleaned, and painted with one (1) coat of machinery enamel prior to shipment. A set of installation instructions shall be included with the pump at the time of shipment.

F. Starter - Provide a manual starter for single phase units and magnetic across-the-line starter for three phase units. The starter shall have HAND-OFF-AUTOMATIC switch and red running light. See Section 15050 paragraph 2.07.

II. Specialties

A. Specialties shall be provided for all pumps, which shall include, but not be limited to, isolation valves, unions, thermometers, and check valves.

Part 3 - Execution

I. Installation

A. The pump shall be installed and serviced in accordance with the manufacturer's recommendations and as shown on the drawings.

B. Coupling guards shall be installed per ANSI and OSHA standards.

END OF SECTION

Part 1 - General

I. General
   A. The Bidding and Contract Requirements, Division 1 -General Requirements, Section 230100 - General Provisions, and Section 230500 - Basic Materials and Methods, shall apply to this section.

II. Scope
   A. Provide and install the inline pump as shown on the drawings and specified herein.

III. Quality Assurance
   A. Pump must be selected from published test curves showing actual brake horsepower. The selection point shall be confined to the left of center of the efficiency curve for the impeller being furnished.
   B. All pump motors shall meet NEMA Standards and shall be UL listed.
   C. All pumps shall be factory tested prior to shipment to the job site.

IV. Submittals
   A. Provide shop drawings on this equipment as described in Section 230100 - 1.04.

Part 2 - Products

I. Inline Pump
   A. The inline pump shall be of the centrifugal inline mounted type and of the size, capacity and voltage shown on the drawings. Acceptable manufacturers include:
      1. Bell & Gossett
      2. Armstrong
      3. Weinmann
      4. Patterson.
   B. Pump - Shall be quiet operating, horizontal, oil lubricated, inline, single stage, vertical split case design, in cast iron bronze fitted construction for heating or cooling applications and shall be all bronze construction for domestic water applications. The pump internals shall be capable of being serviced without disturbing piping connections. The pump shall have a dynamically balanced impeller keyed and locknutted to a ground and polished steel shaft with hardened integral thrust collar. Shaft shall be supported by oil lubricated bronze sleeve bearings. Watertight mechanical seal faces shall be carbon on cast iron or ceramic.

C. Coupling - Shall be self-aligning, flexible type connecting the pump and motor.

D. Motor - Shall be open drip proof, journal bearing, resilient mounted, 1750 rpm, and shall be especially selected for quiet operation. The electrical characteristics of the motor shall be as shown on the drawings. The horsepower of the motor shall be of such a size as to insure non-overloading of the motor throughout the capacity range of the pump. The motor shall have sealed bearings.

E. Testing - The pump shall be factory tested, thoroughly cleaned, and painted with one (1) coat of machinery enamel prior to shipment. A set of installation instructions shall be included with the pump at the time of shipment.

F. Starter - Provide a manual starter for single-phase units and magnetic across-the-line starter for three phase units. The starter shall have HAND-OFF-AUTOMATIC switch and red running light. See Section 230500 paragraph 2.07.

II. Specialties

A. Specialties shall be provided for all inline pumps, which shall include, but not be limited to, isolation valves, unions, strainers, thermometers and check valves.

Part 3 - Execution

I. Installation

A. The pumps shall be installed and serviced in accordance with the manufacturer's recommendations and as shown on the drawings.

B. Coupling guards shall be installed per ANSI and OSHA standards.

END OF SECTION

Part 1 - General

I. General
   A. The Bidding and Contract Requirements, Division 1 -General Requirements, Section 230100 - General Provisions, and Section 230500 - Basic Materials and Methods, shall apply to this section.

II. Scope
   A. The work covered under this section shall include a complete soil, waste and vent system.

III. Quality Assurance
   A. The entire system shall be tested and approved as required by the plumbing code and local requirements before the system is covered up.

IV. Submittals
   A. Provide shop drawings on all piping and fittings as described in Section 230100 - 1.04.

Part 2 - Products

I. Pipe And Fittings
   A. Soil and Waste Pipe and Fittings Below Grade: Shall be service weight cast iron bell-and-spigot pipe and fittings or schedule 40 PVC plastic pipe and PVC-DWV fittings. PVC flanges with metal rings below grade are not acceptable.
   B. Soil, Waste and Vent Pipe and Fittings Above Grade: Shall be service weight cast iron bell-and-spigot pipe and fittings, schedule 40 galvanized steel pipe with screwed cast iron drainage pattern fittings, cast iron no-hub piping and fitting or schedule 40 PVC plastic pipe and PVC-DWV fittings except as noted in paragraph 'C'. PVC plastic piping shall not be used in plenum spaces. DWV copper tubing and copper drainage pattern fittings shall be used for piping at the 3-compartment sink. All piping between the science prep room sinks and the acid neutralization basin shall be acid resistant polypropylene pipe and fittings.
   C. Soil, Waste and Vent Stacks - shall be cast iron bell and spigot pipe and fittings or cast iron no-hub.

II. Vent Flashings

A. Vent flashings shall be 3 lb. per square foot lead flashings or 2 1/2 lb. per square foot for prefabricated flashings, except on roofs where the manufacturer of the roof requires a special flashing to tie in his roofing system.

Part 3 - Execution

I. Pipe And Fittings

A. All soil and waste piping shall be run at a minimum grade of 1/4" per foot unless otherwise noted on the drawings. The contractor shall field check all proposed soil and waste piping to verify that the piping system can be installed at the required grade before any soil and waste piping is installed.

B. When the Building Sewer piping is installed using non-metallic piping, an insulated tracer wire, 18 AWG minimum in size and suitable for direct burial shall be installed in the same trench as the sewer within 12 inches of the pipe, this tracer wire shall terminate at the cleanout access cover.

C. All openings in the piping system during construction shall be securely capped to prevent foreign matter from entering the piping system.

D. Piping to cleanouts shall be as shown on the drawings and as required by the local plumbing code.

E. The minimum depth of the building sewer shall be no less than two feet below finished grade.

F. Double sanitary tee fittings shall not be allowed for piping receiving the discharge from fixtures or appliances.

G. PVC flanges shall not be allowed for water closets or urinals.

H. Copper pipe and fittings shall not be used on waste piping for urinals.

II. Vents And Vent Flashings

A. Vent pipes shall extend 12" above the roof unless otherwise required. The minimum size vent through roof shall be 2".

B. The lead vent flashings shall be turned down on the inside of the vent. On roofing systems where the roofing manufacturer requires a special flashing, the contractor shall install flashing as required.

C. Vent piping shall not terminate within ten feet of outside air intake. Coordinate with International Mechanical Code.

END OF SECTION

Part 1 - General

I. General
   A. The Bidding and Contract Requirements, Division 1 - General Requirements, Section 230100 - General Provisions, and Section 230500 - Basic Materials and Methods, shall apply to this section.

II. Scope
   A. The work covered under this section shall include a complete roof drainage system.

III. Quality Assurance
   A. The roof drainage system shall be tested for leaks before the insulation is applied and before the piping is covered up. The test shall be filling the system with water.

IV. Submittals
   A. Provide shop drawings on all piping and fittings as described in Section 230100 - 1.04.

Part 2 - Products

I. Pipe And Fittings
   A. Storm Water Piping Below Grade: Shall be service weight cast iron bell-and-spigot pipe and fittings or schedule 40 PVC plastic pipe and PVC-DWV fittings.
   B. Storm Water Piping Above Grade: Shall be service weight cast iron bell-and-spigot pipe and fittings, cast iron no-hub piping and fittings, schedule 40 galvanized steel pipe with screwed cast iron drainage pattern fittings, or schedule 40 PVC plastic pipe and PVC fittings. PVC plastic piping shall not be used in plenum spaces.
   C. Storm water piping below grade from 5 feet outside of the building to the storm water structure may be reinforced concrete bell-and-spigot pipe with precast matching fittings.

II. Roof Drains And Cleanouts
   A. Roof drains and cleanouts shall be as listed under section 15430.

Part 3 - Execution

I. Pipe And Fittings
   A. All piping shall be run at a minimum grade of 1/4" per foot unless otherwise noted on the drawings. The contractor shall field check all proposed storm water piping to verify that the piping system can be installed at the required grade before any piping is installed.

B. All openings in the piping system during construction shall be securely capped to prevent foreign matter from entering the piping system.

C. Piping to cleanouts shall be as shown on the drawings and as required by the local plumbing code.

D. The piping to the roof drains shall have a minimum of 5 feet offset between the vertical rain leader and the riser to the drain for expansion unless otherwise noted.

E. The minimum depth of the building storm sewer shall be no less than two feet below finished grade.

II. Pipe Insulation

A. The horizontal section of the rain leaders, riser to and including the interior part of the roof drain, shall be insulated to prevent condensation. Pipe insulation shall be as listed under section 15250.

III. Roof Drains

A. The roof drains and accessories shall be installed to meet the requirements of the roofing system. The roof drains shall be flashed with a 4-foot square sheet of 4-lb. lead. On roofing systems where the roofing manufacturing requires a special flashing, the contractor shall install the flashing as required.

END OF SECTION

Part 1 - General

I. General
   A. The Bidding and Contract Requirements, Division 1 -General Requirements, Section 230100 - General Provisions, and Section 230500 - Basic Materials and Methods, shall apply to this section.

II. Scope
   A. The extent of compressed air piping work and auxiliary equipment is indicated by drawings and schedules and by requirements of this section, and is hereby defined to include (but not necessarily be limited to) air compressor, receiver, air dryer, belt guard, all required air piping, needle valves, automatic tank drain and outlets as indicated and as specified. Provide blow-off valves at low points and intake filter silencer on exterior of building, piped to compressor.

III. Quality Assurance
   A. ANSI Code Compliance - Comply with applicable provisions of ANSI B 31.1, “Power Piping.”
   B. ASME Code Symbol Stamps - Provide compressed air receivers and safety (pressure relief) valves complying with applicable ASME codes, and stamped with appropriate code symbols.
   C. CGA Standards - Materials shall comply with Compressed Gas Association standards.
   D. UL Labels - Provide electrical components which have been listed and labeled by Underwriters Laboratories.

IV. Submittals
   A. Provide shop drawings on all equipment as described in Section 230100 - 1.04.

Part 2 - Products

I. Compressed Air Piping
   A. Piping shall be galvanized schedule 40 steel pipe with galvanized screwed, 150 pound type fittings.
   B. Air Pressure Reducing Valve - Bronze body, sized for capacity of system and set for 125 psi outlet pressure.
   C. Pressure Gauges – 2” minimum dial with safety blowout brass gauge cock.

D. Couplings - Provide Hansen quick connect-disconnect couplings. Type shall be suitable for use with Owner's equipment.

E. Valves - Safety relief valve shall be 2 piece, full-port, chrome plated ball valve rated for 125 psi operating pressure.

II. Air Compressor

A. General - Furnish and install a self-contained compressor unit, consisting of a compressor, motor, V-belt drive, and pressure regulator, all mounted on a vertical ASME receiver. Suitable interconnecting piping between the compressor, receiver and pressure regulator shall be included.

B. Performance - The compressor shall deliver not less than the scheduled cubic feet of free air per minute at inlet conditions compressed to the indicated pressure. Inlet conditions of 14.7 psia and ambient temperature of 90°F. Provide the Owner with a copy of the test/start-up record.

C. The Tech Lab air compressor shall deliver 10.9 ACFM free air delivered at 125 PSIG, 80 gallon ASME receiver, 3 HP V(select) PH(select) 60HZ. Options shall include; ASME pressure relief valve, automatic tank drain, stop-start control, belt guard, low oil control, starting unloader, and intake filter silencer. Provide phase protector as required in section 15050.

D. Receiver shall be built in accordance with ASME "Unfired Pressure Vessel Code" for a working pressure of 150 PSI, and shall be stamped with official ASME symbol, name of manufacturer, maximum allowable working pressure, year built, and National Board Number. Provide an ASME approved safety valve set to relieve at a pressure not in excess of working pressure of receiver. Valve shall be installed directly in receiver. Receiver shall be provided with a pressure gauge having not less than 2" dial graduated to not less than 1½ times maximum operating pressure. Gauge shall be installed on, or connected directly to receiver.

E. Compressor and receiver shall be installed on a concrete foundation not less than 4" high, having vibration isolation pads.

F. Automatic Condensate Trap - Automatic condensate trap shall be provided to remove accumulated moisture from the discharge receiver and aftercooler.

Part 3 - Execution

I. Installation

A. General - Comply with requirements of section 230100 for installation of basic piping materials. Install compressed air piping products and equipment in accordance with manufacturer's written instructions, applicable requirements of ANSI B 31.1, and in accordance with recognized industry practices.

B. The manufacturer shall provide the services of a qualified representative to review the installation of the compressors and all components, test and start the compressors, and instruct the Owner's operating personnel in the operation and maintenance of the systems.

C. Extend compressed air lines from receiver to rooms and outlets indicated on the drawing and connect to all equipment requiring compressed air.

D. Pitch piping in direction of flow and provide drip pockets and nipples at low points. Provide stopcocks and unions to permit disconnection at equipment.

II. Pipe Test

A. Compressed Air Piping Leak Test - Prior to initial operation of piping system, purge lines with oil-free air, and perform a 24-hour standing pressure time-test. Charge line with compressed air to 150 psi; maintain test pressure for 24 hours with a pressure loss no greater than 5 psi. During pressure test, test joints and fittings for leaks with soap bubble solution.

END OF SECTION

Part 1 - General

I. General
   A. The Bidding and Contract Requirements, Division 1 -General Requirements, Section 230100 - General Provisions, and Section 230500 - Basic Materials and Methods shall apply to this section.

II. Scope
   A. The work covered under this section shall include providing and installing complete electric water heaters.

III. Quality Assurance
   A. The water heater shall meet the requirements of the current ASHRAE Standard 90.1, for energy conservation.
   B. The electric water heater shall be factory wired in accordance with the National Electrical Code, and the heater shall bear the UL label.
   C. The water heater shall be tested at a pressure of 300 psi and shall have a water working pressure of 150 psi.
   D. The water heater shall be installed as recommended by the manufacturer and local codes.
   E. The water heater installation shall include the start-up and check out procedures as recommended by the manufacturer. Provide the owner with a copy of the start-up record.

IV. Submittals
   A. Provide shop drawings on this equipment, including an installation diagram, as described in Section 230100, 1.04.

Part 2 - Products

I. Electric Water Heaters
   A. The size, type and capacity of the water heaters are shown on the drawings along with the specified manufacturer. Water heaters shall be fully equal to the water heater specified on the drawings. Acceptable manufacturers include:
      1. Ruud/Rheem
      2. A. O. Smith
      3. State
      4. Lochinvar

B. Tank - The steel tank shall be glass lined with magnesium anode to resist corrosion, unless otherwise noted on the drawings. The tank shall be insulated to meet the current ASHRAE 90.1 requirements and shall be covered with baked enamel paint.

C. Heating Element - The heating element shall be the low watt density and screw-in design. The voltage shall be as shown on the drawings and shall be stamped on the water heater.

D. Controls

1. The water heater shall have an adjustable thermostat for operating control. The adjustable thermostat shall maintain the correct water temperature as stated on the drawings or required by Code.
2. The water heater shall have a high limit or over temperature control to cut off the power in excess temperature situations.

II. Pressure And Temperature Relief Valve

A. The combination pressure and temperature relief valve for water heater(s) shall be rated equal to or greater than the maximum hourly heat input rate of the water heater. Each relief valve shall be ASME listed, rated and stamped. Pressure relief setting shall be 150 psi or less and temperature relief of 210 degrees F, all bronze body with stainless steel spring, test level and mounted to monitor the temperature within 6" of the tank.

III. Expansion Tank

A. Shall be ASME labeled and size listed on the drawings. Provide the tank with the required tappings and a prime coat of paint. Acceptable manufacturers include:

1. Bell & Gossett
2. Taco
3. John Wood
4. Wessels
5. Armstrong.

Part 3 - Execution

I. Installation

A. The water heater shall be installed as shown on the drawings in an accessible location. Gate valves shall be installed on both the cold water supply pipe and the hot water pipe. A vacuum relief shall be installed on the cold water pipe between the gate valve and tank, and shall be located above the top of the tank. A thermometer shall be installed in the hot

water pipe above the top of the heater. All valves shall be mounted so as to be accessible while standing on the floor.

B. Where water heaters are mounted above the floor, provide and install a shelf to carry the water heater. The shelf shall have the capability of carrying the water heater filled with water.

C. A drip pan, where shown on the drawings or required by Code, shall be provided and installed. The drip pan shall be of a size to accommodate the water heater. The drip pan shall be fabricated with a minimum of 22 gauge galvanized steel. The drip pan shall be piped full size to a receptor.

D. The relief valve shall be piped full size to a receptor.

E. The thermostats in the water heater shall be adjusted to produce the water temperature called for on the drawings.

F. The water heater instruction booklet shall be secured to the water heater.

G. Provide a spare fuse for the water heater.

H. Provide ASME rated expansion tank. Install as recommended by manufacturer.

END OF SECTION

Part 1 - General

I. General
   A. The Bidding and Contract Requirements, Division 1 -General Requirements, Section 230100 - General Provisions, and Section 230500 - Basic Materials and Methods, shall apply to this section.

II. Scope
   A. The work covered under this section shall include providing and installing complete the forced draft gas water heater as shown on the drawings.

III. Quality Assurance
   A. The gas water heater shall conform with NFPA 54 - Natural Fuel Gas Code Requirements.
   B. The gas water heater shall conform with the current International Fuel Gas Code.
   C. The water heater shall meet the requirements of the current ASHRAE Standard 90.1, for energy conservation.
   D. The gas water heater shall bear the AGA label.
   E. The water heater shall be tested at a pressure of 300 psi and shall have a water working pressure of 150 psi.
   F. Water heaters with an AGA rating of 200,000 BTU/hr input or greater shall be ASME constructed and bear the UL label.
   G. Water heaters with an AGA rating of 300,000 BTU/HR input or greater shall have the manufacturers IRI rated gas train assembly installed.
   H. The water heater shall be installed as recommended by the manufacturer and local codes.
   I. The water heater installation shall include the start-up and check out procedures as recommended by the manufacturer. Provide the owner with a copy of the start-up record.

IV. Submittals
   A. Provide shop drawings on this equipment, including an installation diagram, as described in section 230100, 1.04.

Part 2 - Products

I. Gas Water Heater

A. The rating, type and capacity of the water heater are shown on the drawings along with the specified manufacturer. Water heaters shall be fully equal to the water heater specified on the drawings. Acceptable manufacturers include:
   1. Rheem/Ruud
   2. A. O. Smith
   3. PVI
   4. RBI
   5. State
   6. Lochinvar.

B. Tank - the steel tank shall be glass lined with magnesium anode to resist corrosion unless otherwise noted on the drawings. The tank shall be insulated to meet the current ASHRAE Standard 90.1 requirements and shall be covered with a baked enamel jacket.

C. The contractor shall totally regulate the gas supply to main and pilot burners. The heater shall also be equipped with an automatic gas shut off device to shut off entire gas supply in the event of excessive temperature in tank and pilot safety shut off. The gas controls shall have an adjustable temperature setting to deliver hot water at the temperature called for on the drawings.

II. Pressure And Temperature Relief Valve

A. The combination pressure and temperature relief valve for the water heater(s) shall be rated equal to or greater than the maximum hourly heat input rate of the water heater. Each relief valve shall be ASME listed, rated and stamped. Pressure relief setting shall be 150 psi or less and temperature relief of 210 degrees F, all bronze body with stainless steel spring, test level and mounted to monitor the temperature within 6" of the tank. A thermometer shall be installed in the hot water pipe above the top of the tank.

III. Expansion Tank shall be ASME labeled and size listed on the drawings. Provide the tank with the required tappings and a prime coat of paint. Acceptable manufacturers include:

A. Bell & Gossett
B. Taco
C. John Wood
D. Wessels
E. Armstrong
F. RBI.

Part 3 - Execution

I. Installation

A. Gas Water Heater - The water heater shall be installed as shown on the drawings in an accessible location. Gate valves shall be installed on both the cold water supply pipe and the hot water pipe. A vacuum relief shall be installed on the cold water pipe between the gate valve and tank, and shall be located above the top of the tank. A thermometer shall be installed in the hot water pipe above the top of the tank. All valves shall be mounted so as to be accessible while standing on the floor.

B. Piping - The relief valve shall be piped full size to a receptor or to the floor.

C. Thermostats - The thermostats in the water heater shall be adjusted to produce the water temperature called for on the drawings.

D. Instructions - The water heater instruction booklet shall be secured to the water heater.

E. Provide a spare fuse for the water heater.

F. Provide ASME rated expansion tank. Install as recommended by manufacturer.

END OF SECTION

Part 1 - General

I. General
   A. The Bidding and Contract Requirements, Division 1 -General Requirements, Section 230100 - General Provisions, and Section 230500 - Basic Materials and Methods shall apply to this section.

II. Scope
   A. The work covered under this section shall include providing and installing complete the forced draft gas water heater as shown on the drawings.

III. Quality Assurance
   A. The gas water heater shall conform with NFPA 54 - Natural Fuel Gas Code Requirements.
   B. The gas water heater shall conform with the current International Fuel Gas Code
   C. The water heater shall meet the requirements of the current ASHRAE Standard 90.1, for energy conservation.
   D. The gas water heater shall bear the AGA or CSA label.
   E. The water heater shall be tested at a pressure of 225 psi and shall have a water working pressure of 150 psi.
   F. Water heaters with an AGA rating of 200,000 BTU/hr input or greater shall be ASME constructed and bear the UL label.
   G. Water heaters with an AGA rating of 300,000 BTU/HR input or greater shall have the manufacturer's GE-GAP (IRI) /CSD-1 rated gas train assembly installed.
   H. The water heater shall be installed as recommended by the manufacturer and local codes.
   I. The water heater installation shall include factory start-up. Start up on the unit shall be performed by factory trained and authorized personnel. Provide the Owner with a copy of the start-up record.

IV. Submittals
   A. Provide shop drawings on this equipment, including an installation diagram, as described in Section 230100, 1.04.

Part 2 - Products

I. Condensing Gas Water Heater

A. The rating, type and capacity of the water heater are shown on the drawings along with the specified manufacturer. Water heaters shall be fully equal to the water heater specified on the drawings. Acceptable manufacturers include:
   1. Bock
   2. A. O. Smith
   3. State
   4. Lochinvar.

B. Tank - The steel tank shall be glass lined or an unlined pressure vessel constructed from phase-balanced austenitic and ferritic duplex stainless steel. The storage tank, heating surfaces and combustion chamber shall have a full 5 year warranty covering manufacturing or material defects, leaks and/or the production of rusty water. The tank shall be insulated to meet the current ASHRAE Standard 90.1 requirements.

C. Water heaters with full rated input below 600,000 BTU will operate at a minimum 96% thermal efficiency at full firing rate when tested to the ANSI Z21.10.3 thermal efficiency test protocol (DOE 10 CFR 431). Water heaters with full rated input above 600,000 BTU will operate at a minimum 94% thermal efficiency at full firing rate when tested to the ANSI Z21.10.3 thermal efficiency test protocol (DOE 10 CFR 431). The water heater shall be ETL listed as a complete unit. The heater shall satisfy current Federal Energy Policy Act standards for both thermal efficiency and stand-by heat losses as established for gas fired water heaters.

D. The water heater shall be a vertical fire tube, design that is constructed and stamped in accordance with Section IV, Part HLW of the ASME code. Water heater will be National Board Registered for a working pressure of 150 psi and will be pressure tested at 1-1/2 times working pressure. Materials shall meet ASME Section II material requirements and be accepted by NSF 61 for municipal potable water systems. All tank connections/fittings shall be nonferrous or stainless steel. The water heater shall employ an electronic operating control with digital temperature readout. Operator shall be capable of connecting to a building automation system through serial connection using Modbus RTU protocol. At a minimum, the water heater shall be equipped with the following:
   1. Electronic flame monitoring.
   2. An immersion operating control.
   3. An immersion UL listed temperature limiting device.

E. The Contractor shall totally regulate the gas supply to main and pilot burners. The heater shall also be equipped with an automatic gas shut off device to shut off the entire gas

supply in the event of excessive temperature in tank and pilot safety shut off. The gas controls shall have an adjustable temperature setting to deliver hot water at the temperature called for on the drawings.

II. Pressure And Temperature Relief Valve

A. The combination pressure and temperature relief valve for the water heater(s) shall be rated equal to or greater than the maximum hourly heat input rate of the water heater. Each relief valve shall be ASME listed, rated and stamped. Pressure relief setting shall be 150 psi or less and temperature relief of 210 degrees F, all bronze body with stainless steel spring, test level and mounted to monitor the temperature within 6" of the tank. A thermometer shall be installed in the hot water pipe above the top of the tank.

III. Expansion Tank

A. Shall be ASME labeled and the size listed on the drawings. Provide the tank with the * required tappings and a prime coat of paint. Acceptable manufacturers include:

1. Bell & Gossett
2. Taco
3. John Wood
4. Wessels
5. Armstrong.

Part 3 - Execution

I. Installation

A. Condensing Gas Water Heater - The water heater shall be installed as shown on the drawings in an accessible location. Gate valves shall be installed on both the cold water supply pipe and the hot water pipe. A vacuum relief shall be installed on the cold water pipe between the gate valve and tank, and shall be located above the top of the tank. A thermometer shall be installed in the hot water pipe above the top of the tank. All valves shall be mounted so as to be accessible while standing on the floor. Start up on the water heater shall be performed by factory trained and authorized personnel. A copy of the start up report shall be provided to the Owner.

B. Piping - The relief valve shall be piped full size to a receptor or to the floor.

C. Thermostats - The thermostats in the water heater shall be adjusted to produce the water temperature called for on the drawings.

D. Instructions - The water heater instruction booklet shall be secured to the water heater.

E. Provide a spare fuse for the water heater.

F. Provide an ASME rated expansion tank. Install as recommended by manufacturer.

END OF SECTION

SECTION 23 0100
MECHANICAL GENERAL REQUIREMENTS

PART 1 GENERAL

1.01 GENERAL

A. The Bidding and Contract Requirements and Division 1 - General Requirements for the Construction of this project shall apply to this division and all sections herein. Section Includes: General requirements for mechanical items and systems.

B. Where items under the Bidding and Contract Requirements, and Division 1 - General Requirements are repeated in this section, it is intended to call particular attention to or qualify the items. It is not intended that any other parts under the Bidding and Contract Requirements of Division 1 - General Requirements shall be assumed to be omitted if not repeated herein.

1.02 RELATED WORK SPECIFIED ELSEWHERE (NON-INCLUSIVE)

A. The work included under this Division shall include a complete mechanical system as shown on the drawings and as specified herein. Any apparatus, appliance, material or work not shown on the drawings but mentioned in the specifications, or vice versa, or any incidental accessories necessary to make the work complete in all respects and ready for operation, even if not particularly specified, shall be furnished, delivered and installed by the contractor without additional expense to PGCPS.

B. The contractor shall note that all items of equipment are specified in the singular; however, the contractor shall provide and install the number of items of equipment as indicated on the drawings and as required for a complete system.

C. It is the intention of the specifications and drawings to call for finished work, tested, and ready for operation. Wherever the word "provide" is used, it shall mean, "provide and install complete and ready for use."

D. Minor details not usually shown or specified but necessary for proper installation and operations shall be included in the contractor's estimate, the same as if herein specified or shown.

1.03 APPLICABLE SPECIFICATIONS, CODES, STANDARDS AND PERMITS

A. All equipment, materials and installation shall conform to the requirements of national, state and local codes, laws, ordinances, rules and regulations. All utility connections shall conform to the requirements of the local utilities.

B. Unless otherwise specified herein or shown on the contract drawings, the work and materials shall conform to the applicable requirements of the following codes, standards and regulations:

1. BOCA Building Officials & Code Administrators International, Inc.
2. ICC International Code Council
3. AMCA Air Movement and Control Association International, Inc
4. AHRI Air Conditioning & Refrigeration Institute
5. ASHRAE American Society of Heating, Refrigerating and Air Conditioning Engineers
6. ASME American Society of Mechanical Engineers
7. ASTM American Society of Testing Materials
8. NEC National Electrical Code
9. NFPA National Fire Protection Association
10. OSHA Occupational Safety and Health Association

11. SMACNA Sheet Metal and Air Conditioning Contractors National Association
12. UL Underwriters Laboratories, Inc.
13. ANSI American National Standards Institute
14. AWS American Welding Society
15. NEMA National Electrical Manufacturer's Association
16. CISPI Cast Iron Soil Pipe Institute
17. IRI Industrial Risk Insurers
18. CAA Clean Air Act Amendment of 1990 (Title VI, Section 608)
19. CTI Cooling Tower Institute

C. Contractor shall give all necessary notices, obtain all permits and pay all Government taxes, fees and other costs, including costs for water, sewer, and gas connections or extensions including meters, in connection with his work, file all necessary plans, prepare all documents and obtain required certificates of inspection for work and deliver same to Owner before request for acceptance and final payment for work.

D. The contractor shall be responsible for purchasing equipment and appliances that bear the label of an agency, as approved by the Department of Public Works and Transportation (DPW&T), Prince George's County. It shall be the responsibility of the contractor to pay for any label testing of equipment or appliances that are installed without the label of a DPW&T approved agency.

1.04 SHOP DRAWINGS

A. The contractor shall submit eight (8) copies of the shop drawings to the Architect for review with ample time for checking prior to delivery of any of this equipment or material to the job site. The project's and the contractor's names shall be on each submittal.

B. Shop drawings shall be submitted on all major pieces of equipment and material. Each item of equipment proposed shall be a standard catalog product of an established manufacturer. The shop drawing shall give complete information on the proposed equipment such as: capacity, size, construction, material, dimensions, arrangement, operating clearances, performance characteristics, weight and rating authority. Each item of the shop drawing shall be properly labeled, indicating the intended service of the material.

C. The contractor shall, before submitting the shop drawings of the equipment to the Architect, check each item of the shop drawings to verify the proper equipment. Items to check shall include but not be limited to:

1. Will equipment physically fit into space;
2. Proper equipment for the job; electrical characteristics;
3. Voltage matches that of electric service; proper arrangements for connections;
4. Meets code requirements.

D. The shop drawings shall be neatly bound and submitted to the Architect with a letter of transmittal, which shall list each item, submitted with the manufacturer's name.

E. Review of the shop drawings shall not be considered as a guarantee of measurements or building conditions. Where drawings have been reviewed, said review does not mean that drawings have been checked in detail; said review does not in any way relieve the contractor from his responsibility or the necessity of furnishing material or performing work as required by the contract drawings.

1.05 EQUIPMENT DEVIATIONS

A. Where the contractor proposes to use an item of equipment other than the prototype equipment (a specified manufacturer's equipment used as the basis of design) or that detailed on the drawings which requires any redesign of the structure, partitions, foundations, piping, wiring or any other part of the mechanical, electrical or architectural layout, all such redesign and all new drawings and detailing required therefore shall be prepared by the contractor at his own expense and be approved by PGCPS Building Services.

B. Where such deviation from the prototype equipment requires a different quantity and arrangement of materials and equipment, the contractor shall furnish and install any such ductwork, piping, structural supports, insulation, controllers, motors, starters, electrical wiring and conduit and any other additional equipment required by the system at no additional cost to PGCPS.

1.06 QUALIFICATIONS FOR BIDDERS

A. The contractor shall examine drawings and specifications relating to work of all trades and become fully informed as to the extent and character of work required and its relation to all other work in the project prior to submission of bid or prior to start of any construction covered by these specifications and drawings.

B. Before submitting bid the contractor shall visit the site and examine all adjoining existing building, equipment and space conditions on which his work is in any way dependent, for the best workmanship and operation according to the intent of the specifications and drawings. Contractor shall verify dimensions and fully inform himself as to the nature and scope of the proposed work and also the conditions under which it is to be conducted. He shall report to PGCPS any conditions that in his estimation might preclude him from installing his equipment and work in the manner intended and noted on the drawings and in this specification. Failure to take the above precaution will in no way relieve the contractor from his obligations to provide the material and work as indicated and as specified without additional cost to PGCPS or extension of completion time.

1.07 SUBMITTALS

A. This contractor shall be responsible for participation and Submittals

B. Submit per the requirements of Division 1.

C. Product Data: Material Safety Data Sheets (MSDS).

D. Certifications: Lead-Free Plumbing Certification.

E. Sustainability Submittals: Provide the following in accordance with Sustainability Requirements: Division 1.

1. Materials Sustainability Documentation Form.

2. Product data for adhesives and sealants, paints and coatings indicating VOC content.

F. If applicable, contractor shall submit to PGCPS any required applications for utility rebates and/or incentives for each eligible piece of equipment in project. Contractor is responsible for furnishing all engineering submittals, drawings, calculations, HVAC load modeling as required for rebate and incentive programs. Contractor shall work in conjunction with PGCPS Management Analyst under the Department of Building Services during the design phase of the project to complete and submit necessary forms. This shall be coordinated prior to purchase of any eligible equipment provided under Division 23.

1.08 DRAWINGS

A. The drawings are diagrammatic, indicating general arrangement of work, and should not be scaled to establish location of work. The drawings show the size of piping and ductwork branches, risers and equipment, and must be followed. Where a change of location or method of running becomes necessary due to obstructions or other construction difficulties, such changes shall be made after securing approval

of PGCPS in writing and at no increase in amount of contract.

B. Hand drawn or scanned architectural backgrounds on construction documents will not be accepted.

C. Provide required accessories, appurtenances, hardware, fittings and devices whether separate or integral, and whether or not expressly indicated, to achieve intended component, device and system operation.

D. If pipe or duct size indicated does not match connection size of equipment to which it is connected, provide required transition piece to match equipment size.

E. Contract Documents related to Fire Protection Systems are schematic and do not include all details required for design and construction of fire protection systems in compliance with requirements of NFPA standards, insurance underwriter guidelines and governing building and fire codes.

F. Do not furnish, install or disturb materials or products containing asbestos.

G. Do not furnish, install or disturb materials or products containing asbestos.

H. Decisions regarding any and all substitutions and options permitted by the specifications shall be submitted for approval to PGCPS. Approval will only be recognized when in writing.

I. In finished spaces all piping and ductwork shall be concealed or run behind furring unless shown otherwise. Where concealing is not possible, piping and ductwork may be exposed after obtaining written approval from PGCPS.

J. All horizontal piping and ductwork not run below slab on grade shall be run as close as possible to underside of floor and parallel to building lines. Maintain maximum headroom in all areas.

K. All vertical piping and ductwork shall be run as close to walls and partitions as possible.

L. Coordination of all other trades prior to erecting any piping or ductwork is required to avoid conflict between various components of the building.

1.09 FOUNDATIONS AND SUPPORTS

A. Contractor shall provide all necessary foundations, supports, pads and bases required for mechanical equipment and any other equipment furnished under this contract, unless covered under the architectural or structural work.

B. For buried concrete or cast iron sewer piping installed in filled cuts over four (4) feet in depth the contractor shall provide brick or approved equal supports or piers under piping and fittings with piers or supports extending to a depth to provide sufficient firm and adequate support to overcome the possibility of any deflection in the piping system.

C. For pumps, compressors and other rotating machinery and all equipment where foundations are indicated, furnish and install concrete pads 4" in height (unless otherwise noted) extending not less than 4" beyond equipment base in all directions. Equipment installed in areas other than slab on grade shall be installed with the appropriate vibration assembly.

D. Construction of foundations, supports, pads, bases and piers where mounted on the floor, shall be of the same materials and same quality of finish as the adjacent and surrounding flooring material.

1.10 SCAFFOLDING, RIGGING AND HOISTING

A. Unless otherwise specified, contractor shall furnish all scaffolding, rigging, hoisting, shoring and services necessary for erection and delivery into the premises for any equipment and apparatus furnished and shall remove same from premises when no longer required.

1.11 EXCAVATION AND BACKFILL

A. The contractor shall be responsible for excavation, backfill, tamping, shoring, bracing, pumping, street cuts, repairing of finished surface and all protection for safety of persons and property as required for installing a complete mechanical/plumbing system. All excavation and backfill shall conform to the architectural section of the specifications.

B. It shall be the responsibility of the contractor to check the indicated elevations of utilities entering and leaving the building. If such elevations require excavations lower than the footing levels, PGCPS shall be notified of such conditions in writing and redesign shall be made before excavations are commenced. It is also the responsibility of the contractor to make the excavations at the minimum required depths in order not to undercut the footings.

C. Trenching shall be excavated below the installation level of the bottom of the pipe. The trench shall be filled with sand or fine gravel so entire length of barrel of piping rests on solid bed of sand or fine gravel. The backfill shall be filled in layers of 6” max depth and such layers shall be compacted after each placement.

D. Excavation shall be made in a manner to provide a uniform bearing for pipes. The pipe elevation shall be determined by the contractor to meet the plumbing codes. Where rock is encountered, excavate 3" below pipe grade and back fill with sand to the installation level of the pipe. The pipe, including the joints, shall not rest on rock at any point.

E. After required test and inspections, backfill the ditch and tamp. The first foot above the pipe shall be hand backfilled with rock free clean earth. The backfill in the ditches on the exterior and interior of the building shall be tamped to 95% of the standard Proctor maximum dry density (ASTM D-698). The contractor shall be responsible for any of his ditch walls that cave in.

1.12 ELECTRICAL WORK

A. Provide work required for electrical service, field wiring and connections for mechanical equipment in accordance with Electrical: Division 16.

B. Power wiring to terminals of motors specified under Divisions 13 and 15, including disconnects at motors, when required, are provided under Electrical: Division 16. Interlock and control wiring are provided under Instrumentation and Control Equipment: Division 13, except as otherwise indicated.

C. Electrical components of mechanical equipment, including control panels, shall be UL listed and bear label of Underwriters Laboratories, Inc. (UL). Motors, starters and control panels shall be in accordance with Motors, Starters and Control Panels: Section 15190.

D. Furnish equipment manufacturer electrical wiring diagrams and information.

E. Refer to Electrical: Division 16 for Electrical Requirements of Packaged Mechanical Equipment.

1.13 PAINTING AND COATING

A. Comply with Finishes: Division 9.

B. Touch up welds of galvanized surfaces with galvanizing primer in accordance with Metals: Division 5.

C. Prime and paint bare supplemental steel, supports and hangers required for installation of Division 15 Work, in accordance with Finishes: Division 9.

1.14 ACCESSIBILITY

A. The contractor shall locate equipment, which must be serviced, operated or maintained in fully accessible position. Equipment shall include but not be limited to: valves, traps, or low limit devices, damper operators, motors, controllers, drain points, fusible links of fire dampers, fire dampers, filters, etc. If required for better accessibility, furnish access doors for this purpose. Minor deviations from drawings may be made to allow for better accessibility, and any change shall be approved. Motor starters shall be installed not more than 6'-0" above finished floor unless otherwise approved by PGCPS.

B. All filters furnished with air handling equipment shall be readily removable from sides or bottom of cabinet as required by equipment location. Contractor shall verify location of all equipment and proper location of access to filters for removal before submitting shop drawings, placing order for equipment and setting and connecting of equipment. Any filters deemed by PGCPS to be inaccessible after installation will be made accessible by the contractor at no additional cost to PGCPS.

1.15 RECORD DRAWINGS

A. The contractor shall keep daily updated accurate records of all deviations in work as actually installed from work indicated on the contract drawings. The record drawings shall be kept at the job site, available to PGCPS at all times and labeled as "Project Record Information - Job Set". When work is completed, one complete set of marked-up prints shall be delivered to PGCPS.

1.16 MATERIAL SAFETY DATA SHEETS

A. Submit Material Safety Data Sheets (MSDS) of chemicals, hydraulic fluids, seal oils, lubricating oils, glycols and other hazardous materials used in construction, storage, startup and commissioning of equipment, in accordance with U.S. Department of Labor, Occupational Safety and Health Administration (OSHA) hazard communication and right-to-know requirements stipulated in 29 CFR 1910.1200 (g).

1.17 METRIC SYSTEM

A. Pressure and vacuum values presented in kPa, Pa or other metric system units represent absolute pressure values unless indicated otherwise. Barometric pressure, unless otherwise indicated, is to be taken as 101.325 kPa.

1.18 FIRESTOPPING

A. Firestopping: Division 7.

1.19 PATENT RIGHTS

A. Provide trade-named material where indicated. Do not build facsimile of patented equipment which might infringe upon patent rights.

1.20 PERSONNEL INSTRUCTION AND OPERATING INSTRUCTIONS

A. The contractor shall submit for approval three (3) copies of all of the manufacturer's installation, operating and maintenance manuals for all new mechanical equipment listed in the equipment schedule, all necessary components of mechanical equipment, testing and balancing reports, equipment start-up records, equipment capacity (input and output) and a list of filter sizes and belt sizes for all mechanical equipment that requires filters and belts (this includes, but is not limited to, fan coils, unit ventilators, rooftop units, cabinet heaters, exhaust fans and air handlers). Submit four (4) copies of the operating and maintenance manuals for the automatic temperature control system components and diagrams for approval. A complete written narrative of how each system is intended to operate shall be included. Manuals shall be assembled in black vinyl hardback loose-leaf binders, labeled with job name, address and date. Information on each piece of equipment of system shall be in a separate tab labeled section. Provide a complete index of the contents. After approval by the Engineer the binders shall be forwarded to PGCPS.

B. After all tests are conducted and approved as specified below, furnish a competent operating engineer for a period of three working days to instruct and demonstrate to PGCPS or his authorized representative the operation of the system. The mechanical systems demonstration shall not coincide with the electrical demonstration. Notify PGCPS in writing of the person to whom this instruction was given and the date it was given.

C. On phased construction projects the aforementioned equipment start-up records shall be completed and made available to PGCPS for review prior to the occupancy of the completed phase.

D. Tests:

1. The contractor shall, at his expense, conduct capacity and general operating tests on each system. The test shall demonstrate the specified capacities of the various pieces of equipment and shall be conducted in the presence of PGCPS or his authorized representative. The general operating tests shall demonstrate that the entire equipment is functioning in accordance with the contract documents. Furnish all instructions and test equipment.
2. After all systems are completely tested, submit three copies of the test results to PGCPS for approval before final acceptance of project.

1.21 SYSTEM SELECTION

A. Preferred System Choices:

1. Buildings 60,000 GSF and Larger:
    a. 4-pipe central station Air Handling Units (AHU) with Variable Frequency Drives (VFD) and Variable Air Volume (VAV) air distribution system using standard or low temperature supply air, variable flow piping, and central heating/cooling plant.
    b. 4-pipe Fan Coil Unit (FCU)/Energy Recovery Unit (ERU) system with central heating/cooling plant
    c. Packaged heating/cooling systems
    d. Geothermal heat pump systems
    e. Other alternatives as approved by PGCPS

B. Buildings 59,999 GSF and Smaller:

1. 4-pipe central station Air Handling Units (AHU) with Variable Frequency Drives (VFD) and Variable Air Volume (VAV) air distribution system using standard or low temperature supply air, variable flow piping, and central heating/cooling plant.
2. 2-pipe or 4-pipe Fan Coil Unit (FCU)/Energy Recovery Unit (ERU) system with central heating/cooling plant
3. Packaged heating/cooling
4. Geothermal/condenser water heat pump systems
5. Other alternatives as approved by PGCPS

C. Unapproved System Choices:

1. Variable Refrigerant Flow
2. 2-pipe systems in buildings above 59,999 GSF with exception of geothermal type systems
3. Chilled beam systems

1.22 DESIGN CONDITIONS

A. Zoning

1. Unless deemed unfeasible, each classroom shall be a separate thermostatic zone.
2. Areas that require powered exhaust by code shall not be grouped with other areas.

B. Interior Space Temperature and Humidity

1. Occupied spaces shall be designed to meet the following requirements:
    a. Summer: 72° DB, 50% RH (Occupied setpoint: 76° DB; no higher than 78° DB)

b. Winter: 72°F DB, 40% RH (Occupied setpoint: 70° DB; no lower than 68° DB)

2. Data centers shall be designed to meet the following requirements year round:

a. 72° DB, 45% RH

b. Stand alone cooling shall be designed and installed for n+1 redundancy in case of unit failure. Units shall be able to maintain operation independent of main building system.

C. Winter outside air design temperature shall be 11° DB, with low ambient conditions being designed to 0° DB.

D. Ventilation shall be designed to meet requirements as outlined in the International Mechanical Code or ASHRAE standards, whichever is more stringent. Natural ventilation shall not be acceptable.

E. Hydronic Systems Operating Temperatures

1. Unless otherwise noted, chilled water supply and return temperatures in all systems shall be designed to 45°F entering and 55°F leaving.

2. Unless otherwise noted, boiler heating water supply temperatures shall not exceed 160°F.

3. Unless otherwise noted, geothermal heating water supply temperatures shall not descend below 100°F.

F. Target noise criteria levels in design spaces exclusive of noise generated by the occupants or equipment within the space are as follows:

1. Classrooms: NC 35

2. Conference Rooms: NC 30

3. Gymnasium: NC 45

4. Multi-Purpose Room: NC 35

5. Nurse/Health Rooms: NC 30

6. Open Offices: NC 35

7. Private offices: NC 30

8. Server Rooms/Printing Areas: NC 50

1.23 COORDINATION OF WORK

A. The contractor shall give full cooperation to other trades and shall furnish in writing, with copies to PGCPS, any information necessary to permit the work of all trades to be installed satisfactorily with the least possible interference or delay.

B. Coordinate demolition and installation of mechanical work with work of other trades, building conditions and sitework.

C. Do not deviate from Work indicated without written approval by PGCPS.

D. Where interferences occur and mechanical work must be relocated to allow for completed Work in accordance with Contract Documents, provide relocation at no additional cost. Contractor shall prepare composite working drawings of affected areas at a scale not less than 1/4" = 1'-0" clearly showing how his work is to be installed in relation to the work of the other trades. If the contractor installs work before coordinating with other trades or as to cause any interference with work of other trades, necessary changes shall be made to correct the condition without additional cost to PGCPS.

E. Coordinate with work of Division 9 to determine location of required access panels for mechanical work. Locate access panels as required to service mechanical equipment.

F. Coordinate with Work of Division 13 to determine quantity, size and location of pipe-mounted, duct-mounted and mechanical-equipment-mounted instrumentation devices installed under Division 15.

G. Coordinate location of floor drains, plumbing fixtures, equipment and specialties with work indicated on Architectural Drawings.

H. Structural support elements as shown on the drawings must be in place prior to the installation of piping or the setting of rooftop equipment. The contractor shall not install any piping or rooftop equipment until such elements are in place.

1.24 CONNECTIONS AND SHUTDOWNS TO EXISTING WORK

A. Coordinate with PGCPS to schedule Work requiring interruption of services during unoccupied periods to avoid interruption of services during normal working hours, in accordance with Division 1. Do not interrupt or connect to working systems without prior written approval by PGCPS.

B. Scheduling of Work: Work shall be performed in the sequence, locations and time periods agreed to by the Owner prior to commencement of work.

C. The contractor shall submit written requests to disconnect any existing utility services and to obtain equipment downtime. Only after receiving PGCPS approval of these requests shall work be allowed to proceed. This contractor shall be responsible for restoring the existing utilities. If contractor fails to provide domestic hot/cold water, gas, sewers, air conditioning and/or heating systems as specified herein it is understood and agreed that there will be liquidated damages deducted in the amount as stated in Division 01010, per school per consecutive calendar day.

D. Dust Control: The amount of dust resulting from connecting existing utilities shall be controlled to avoid creation of a nuisance in the surrounding area. Masks shall be worn for protection against dust inhalation by all persons in the vicinity of work involving removal of masonry.

E. Protection of Existing Work:

1. Existing work and furnishings to remain shall be protected from damage. Work damaged by the Contractor shall be repaired to match existing work without any additional cost to the PGCPS.
2. Cover equipment as necessary, to protect it from dust.
3. Floors shall be protected from damage.
4. At the end of each workday and during inclement weather, close exterior openings with weatherproof cover.
5. Provide temporary filter media on any portions of existing ductwork which communicate with corridors and construction areas. This media shall be checked frequently and changed as necessary.

F. Environmental Protection: Contractor shall comply with all Federal and local regulations pertaining to Environmental Protection.

G. Removal of Existing Equipment and Materials: Existing equipment and materials shall be dismantled and/or cut-up so as to be removable through existing building's access passages. No alterations to the building shall be made for the purpose of removing existing equipment and material.

H. Clean-up:

1. Debris and Rubbish: Remove debris and rubbish from the site daily. Do not allow to accumulate in building or on site.
2. Debris Control: Remove and transport debris in a manner so as to prevent spillage on site or adjacent areas.
3. Regulations: Local regulations regarding hauling and disposal shall apply.

1.25 IDENTIFICATION

A. Refer to Identification of Mechanical Equipment and Piping Systems: Section 15075.

1.26 EQUIPMENT BY OWNER

A. Refer to other Sections for equipment furnished by PGCPS.

B. Coordinate to assure clearance for moving PGCPS-furnished equipment to its final location.

C. Comply with Division 1 for setting in place and protection of Owner-furnished equipment.

D. Obtain pertinent data for equipment-required mechanical services.

E. Provide roughing-in for PGCPS-furnished equipment.

F. Provide coordination of foundations and structural support for PGCPS-furnished equipment, and identify revisions required to Contract Documents.

G. Provide mechanical services, including piping and ductwork, and make final connections to PGCPS-furnished equipment.

H. Provide painting and identification for PGCPS-furnished equipment.

I. Provide accessories, fastenings and fittings as required for installation and proper equipment operation.

J. Furnish testing and balancing services for PGCPS-furnished equipment.

1.27 PASSAGE OF EQUIPMENT

A. Comply with Division 1.

B. Verify that equipment, including equipment furnished by PGCPS, will pass through final available openings. When equipment or sections of equipment are larger than available openings, install this equipment prior to construction of walls, floors or roofs. Use planking or cribbing as required to protect adjoining construction from damage. Protect equipment from damage until construction is completed.

C. When equipment or sections of equipment are larger than available openings through existing structures, contractor shall construct a means of passage and repair any structure as required at no additional cost to PGCPS.

1.28 PROVISIONS FOR CHASES, OPENINGS AND INSERTS

A. Comply with Division 1.

1.29 CUTTING AND PATCHING

A. Comply with Division 1.

B. Coordinate and show locations and sizes on Coordination Drawings for penetrations of mechanical Work, including ductwork and piping through walls, floors, partitions, roofs, and for core-drilled openings.

1.30 MANUFACTURER'S SERVICES

A. Division 15 Sections indicate which manufacturer services including supervision, startup, factory and field testing, and Owner personnel training are required for various systems and equipment.

B. Division 15 Sections indicate details, scheduled dates and durations of each service, as required.

1.31 SERVICE AND MAINTENANCE

A. Division 15 Sections indicate which equipment and systems require contracted service and maintenance after Date of Owner Acceptance.

B. Division 15 Sections indicate requirements for service/maintenance organizations to offer renewal of Service and Maintenance Contracts to Owner at conclusion of Contract Work.

1.32 COMPLIANCE WITH CODES, REGULATIONS AND STANDARDS

A. Comply with Division 1.

1.33 PRODUCT SUBSTITUTIONS

A. Unless substitutions are prohibited, submit substitutions of material and equipment in accordance with requirements of Division 1.

B. If requested by Owner's Representative, submit independent test results for substituted products that establish compliance with indicated criteria. If independent test results are not available, furnish independent testing at no additional cost.

PART 2 PRODUCTS

2.01 GENERAL

A. Use adhesives and sealants that comply with the VOC limits specified in Sustainability Requirements: Division 1.

B. Any paints and coatings applied in the field must comply with the VOC limits specified in Sustainability Requirements, Division 1.

PART 3 EXECUTION

3.01 INSTALLATION, STARTUP AND TESTING

A. This contractor is responsible for the checkout and start-up of all equipment and systems. Equipment start-up shall be in accordance with the manufacturer's requirements and recommendations and shall be performed by personnel who are knowledgeable with the equipment and its requirements. When required by the equipment manufacturer or as noted in the specifications, equipment checkout and start-up shall be performed by personnel certified by the manufacturer. Evidence of proper certification of startup personnel shall be provided to PGCPS.

B. All close out and start-up activities are the responsibility of this contractor.

C. This contractor shall notify PGCPS two weeks prior to equipment checkout and start-up.

D. Systems and equipment shall be operated at both full and part load conditions to ensure specified requirements can be achieved.

E. Where manufacturer's services are indicated, manufacturer's representative shall inspect installation prior to, and be present during system startup and testing.

F. Do not operate systems unless all system components have been properly installed and tested and system monitoring and controls have been properly commissioned and are deemed duly connected, functional and safe.

G. The equipment manufacturer's checkout and start-up logs shall be completed in their entirety; should a reference be non-applicable it shall be marked as such. Copies of completed logs shall be submitted to PGCPS personnel the day of checkout and start-up activities, as well as included in the Operation and Maintenance manual.

END OF SECTION

Part 1 - General

I. Summary (Non-inclusive)

A. Section Includes: Demolition, removal, relocation, rerouting and reconnection of existing mechanical facilities, as required, indicated and specified herein, to accomplish alteration, restoration and to accommodate new construction and as follows:

1. Work includes draining, disconnecting, relocating, removing and dismantling, in a neat and good workmanlike manner, the items and their accessories as indicated on Drawings.
2. Do not enter Project Site or begin Work of this Section until asbestos abatement and removal Work, as specified in Article, Insulation Removal, has been completed an Asbestos Abatement Contractor approved by PGCPS.
3. PGCPS will certify in writing to Contractor that certain areas at the Project Site, where asbestos materials are present, are non-hazardous and able to be entered by Contractor's workers.

II. Related Work Specified Elsewhere (Non-Inclusive)

A. Applicable Sections: Division 1.

B. Building Demolition: Division 2.

C. Electrical Demolition, Relocation and Alteration: Division 26.

III. Submittals

A. Submit per the requirements of Division 1.

B. Quality Control Procedures:

1. Demolition Schedule and Procedures: Division 1.
2. Fire Watch Procedures: As specified in Article, Special Precautions.
3. Inspection Report of Underground Piping Systems: As specified in Article, General.
4. Welding/Burning Permit: Obtain a welding/burning permit from local Fire Official prior to start of any welding or burning in accordance with local Fire Code.

C. Certifications:

1. Refrigerant Technician EPA Certification: In accordance with Article, Refrigerant Removal.

IV. Quality Assurance

A. Referenced Codes and Standards: Comply with the following in accordance with Division 1.

1. International Building Code
2. NFPA Fire Code
3. International Plumbing and Fuel Gas Code
4. National Electric Code

5. WSSC Utility Company requirements for gas piping
6. Owner's Fire Insurance Carrier's Requirements
7. American National Standards Institute (ANSI)
   a) A10.6 - Safety Requirements for Demolition Operations
8. National Demolition Association (NDA)
   (a) Demolition Safety Manual
9. National Fire Protection Association (NFPA)
   a) 51B - Standard for Fire Protection During Welding, Cutting and Other Hot Work
   b) 70 - National Electrical Code
   c) 241 - Safeguarding Construction, Alteration and Demolition Operations
10. U.S. Department of Labor, Occupational Safety and Health Administration (OSHA)
    a) 29 CFR 1910 - Occupational Safety and Health Standards
11. U.S. Environmental Protection Agency (EPA)
    (a) Clean Air Act Amendments of 1990

V. Special Precautions

A. Torch cutting of ductwork is not acceptable.

B. Torch cutting mechanical equipment is permitted only with specific written approval of PGCPS.

C. Draining operations must not damage building components.

Part 2 - Products

I. General

A. Materials used for this Work shall be in accordance with applicable Sections in Mechanical: Division 15.

Part 3 - Execution

I. General

A. Provide alteration and demolition of mechanical facilities as required by Drawings and Specifications. Drawings are diagrammatic and do not indicate exact location of all existing mechanical work.

B. Do not begin Work until time schedules and manner of operations have been approved by PGCPS. Include interruptions of existing services in schedules as approved by PGCPS. Prior to starting Work, visit Project Site and become familiar with area. Obtain written permission from PGCPS prior to commencing Work.

C. Inspect and verify location of existing mechanical equipment, piping, fittings, valves, ductwork, insulation, controls, and other mechanical facilities. Provide for removal, relocation, rerouting

and reconnection of this Work and related Work required by demolition methods or sequences. Comply with installation procedures, materials, and support equipment specified in applicable Division 15 Sections.

D. Where existing equipment is to remain in service during construction, provide rerouting and reconnection of mechanical services as required to maintain continuous service.

E. Where existing systems shall remain in service during construction, maintain system continuity and operation of piping and ductwork circuits, whether modified, spliced, extended, relocated or newly constructed.

F. Review removed equipment with PGCPS prior to disposal. Completely remove existing ductwork, piping, conduit and similar items to be abandoned that are not embedded in walls or floor slabs unless otherwise indicated. Cap open ends at walls and flush with floors. Dispose of existing materials and equipment, not intended for reuse in Work, in a location directed by PGCPS. Where pipes or ducts penetrating a roof are documented to remain, cap pipe or duct on outside of penetration.

G. Store and protect, at locations designated by PGCPS on Project Site, existing material and equipment indicated to be retained for future use by Owner.

H. Temporarily cap ends of ductwork, sanitary piping and sanitary vent piping to remain.

I. If unsure as to disposition of any portion of demolition, request clarification from PGCPS prior to removal. If material and equipment not intended for removal are removed, replace that material and equipment in manner acceptable to Owner' Representative at no additional cost.

J. Where existing louvers or ductwork penetrations are to remain, blank-off louver on inside with galvanized sheet metal on both sides of 2 inch thick, 6 pcf density rigid fiberglass board insulation. Paint side attached to louver with flat black paint.

K. Prior to commencing with Work, inspect underground piping to which new construction will be connected, or existing systems currently feed from or discharge to, and prepare written report for each underground piping system defining existing conditions as listed below. Submit report to PGCPS Project Manager for review and comment. Do not proceed with Work until receiving a written "NOTICE TO PROCEED" from PGCPS Project Manager after submitting report.

L. Pipe system service.

1. Pipe size and invert elevation.
2. Materials of construction.
3. Nature and type of containment.
4. Nature and type of corrosion protection.
5. Status (active or inactive).

6. Condition (suitability for continued used in respective service).
7. Intended method of performing the Work, including shutdown schedule.
8. Deviations from Contract Documents.

II. Piping Removal

A. Cut off welded piping square at locations indicated. Do not cut where demolition ends at flanged valve or equipment. Close off openings of remaining valves, piping or fittings with weld caps or blind flanges to prevent debris from entering existing systems.

B. Disconnect threaded piping at locations indicated. Close off openings of remaining valves, piping, fittings and equipment with pipe plugs or pipe caps as indicated.

C. Remove pipe hangers, supports, miscellaneous steel and anchors with piping.

III. Protection From Freezing

A. It is intended that building remain protected from damage due to freezing temperatures. To that end, existing equipment and systems used for heating shall remain in place and in operation until scheduling and weather permit shutdown.

B. Where, for example, removal of equipment will leave an area unprotected from freezing, notify PGCPS 72 hours prior to removal. Provide temporary heating equipment sufficient to prevent freezing.

IV. Disconnection And Interruption Of Mechanical Services

A. When portions of existing piping system including, but not limited to, domestic water piping, sprinkler piping, natural gas piping, drainage piping, steam piping, chilled water piping, hot water heating piping, condensate piping, refrigerant piping and control air piping or ductwork system are removed, and this removal causes loss of operation to another piece of equipment due to open disconnected piping or ductwork, then cap piping or ductwork or provide temporary piping or ductwork system to retain operation of the affected systems.

B. Fire protection systems and appliances, including fire alarm and detection systems, shall be maintained and capable of proper operation at all times. Notify local Fire Official before disconnection and interruption of any fire protection system, and before tests, repairs, alterations or additions are started, and upon its completion.

V. Mechanical Equipment Removal

A. Remove mechanical equipment indicated to be removed on plans, including (but not limited to) equipment's supply and return piping, refrigerant piping, condensate piping, domestic water piping, drainage piping, valves, insulation, ductwork, hangers, supports, controls, associated components, and all line- and low-voltage wiring, unless otherwise indicated. Remove all

electrical Work, including wiring between equipment, and wiring to power source or point of origin.

B. Remove equipment steel or structure supports.

VI. Refrigerant Removal

A. Recover and dispose of all existing refrigerant charges in accordance with EPA regulations. Release of chlorofluorocarbon refrigerants to atmosphere is prohibited in accordance with Clean Air Act Amendments of 1990.

B. Technicians involved in refrigerant related Work shall possess appropriate EPA certification.

VII. Ductwork Removal

A. Disconnect ductwork to be removed at closest joint and resupport remaining ductwork.

B. Prepare remaining ductwork joints at point of disconnection to receive new ducts or blank-off panels.

C. Remove ductwork supports and miscellaneous steel with ductwork to be demolished.

VIII. Insulation Removal

A. Remove non-asbestos insulation, together with piping, fittings, valves and equipment designated for demolition.

B. Existing exposed asbestos insulation and gasketing materials should not be encountered in this Work. If there is doubt as to whether asbestos materials may be present on existing piping or dismantled equipment, stop removal Work affecting suspected asbestos immediately and advise PGCPS of this action.

C. If existing exposed asbestos insulation and gasketing materials will be encountered in this Work as stated in certain areas as marked and color-coded by PGCPS, do not perform removal Work affecting asbestos.

D. Detection, abatement, replacement, removal and disposal of asbestos materials can only be performed under supervision and control of a qualified specialist retained by PGCPS.

IX. Control Wiring Removal

A. Disconnect and remove control wiring and tubing, including conduit, associated with equipment to be removed. Where it is not possible to remove conduit, remove wiring and tubing and cap or seal conduit in place.

X. Providing Temporary Domestic/Fire Protection Water

A. Building's domestic/fire protection water supply must remain operational during all phases of demolition. During periods when water supply is not operational, provide fire watches in accordance with PGCPS's fire insurance carrier's requirements and Prince George’s County

Fire Marshal. Ensure that staging of water service for building is carefully planned so that there will be an uninterruptible supply of water to building at all times.

END OF SECTION

Part 1 - General

I. Summary
   A. This section includes the following:
      1. Piping materials and installation instructions common to most piping systems.
      2. Mechanical sleeve seals.
      3. Sleeves.
      4. Grout.
      5. Mechanical demolition.
      6. Equipment installation requirements common to equipment sections.
      7. Concrete bases.
      8. Supports and anchorages.

II. Definitions
   A. Finished spaces: Spaces other than mechanical and electrical equipment rooms, furred spaces, pipe and duct shafts, unheated spaces immediately below roof, spaces above ceilings, unexcavated spaces, crawlspaces, and tunnels.
   B. Exposed, interior installations: Exposed to view indoors. Examples include finished occupied spaces and mechanical equipment rooms.
   C. Exposed, exterior installations: Exposed to view outdoors or subject to outdoor ambient temperatures and weather conditions. Examples include rooftop locations.
   D. Concealed, interior installations: Concealed from view and protected from physical contact by building occupants. Examples include above ceilings and in duct shafts.
   E. Concealed, exterior installations: Concealed from view and protected from weather conditions and physical contact by building occupants but subject to outdoor ambient temperatures. Examples include installations within unheated shelters.

III. Submittals
   A. Welding certificates.

IV. Quality assurance
   A. Steel support welding: qualify processes and operators according to AWS D1.1, "Structural welding code--steel."
   B. Steel pipe welding: qualify processes and operators according to ASME Boiler and Pressure Vessel Code: Section IX, "welding and brazing qualifications."
      1. Comply with provisions in asme B31 series, "code for pressure piping."
      2. Certify that each welder has passed AWS qualification tests for welding processes involved and that certification is current.

C. Electrical Characteristics for Mechanical Equipment: Equipment of higher electrical characteristics may be furnished provided such proposed equipment is approved in writing and connecting electrical services, circuit breakers, and conduit sizes are appropriately modified. If minimum energy ratings or efficiencies are specified, equipment shall comply with requirements.

Part 2 - Products

I. Pipe, Tube, and Fittings
   A. Refer to individual Division 15 piping sections for pipe, tube, and fitting materials and joining methods.
   B. Pipe threads: ASME B1.20.1 For factory-threaded pipe and pipe fittings.

II. Joining Materials
   A. Refer to individual division 15 piping sections for special joining materials not listed below.
   B. Pipe-flange Gasket Materials: ASME B16.21, Non-metallic, flat, asbestos-free, 1/8-inch maximum thickness unless thickness or specific material is indicated.
   C. Solder Filler Metals: ASTM B 32, lead-free alloys. Include water-flushable flux according to ASTM B 813.
   D. Brazing Filler Metals: AWS A5.8, BCuP series or BAg1, unless otherwise indicated.
   E. Welding Filler Metals: comply with AWS D10.12.

III. Dielectric Fittings
   A. Description: Combination fitting of copper alloy and ferrous materials with threaded, solder-joint, plain, or weld-neck end connections that match piping system materials.
   B. Insulating Material: Suitable for system fluid, pressure, and temperature.
   C. Dielectric Nipples: Electroplated steel nipple with inert and non-corrosive, thermoplastic lining; plain, threaded, or grooved ends; and 300-psig minimum working pressure at 225 deg f.

IV. Mechanical Sleeve Seals
   A. Description: Modular sealing element unit, designed for field assembly, to fill annular space between pipe and sleeve.
   B. Sealing Elements: EPDM interlocking links shaped to fit surface of pipe. Include type and number required for pipe material and size of pipe.
   C. Pressure Plates: Carbon steel. Include two for each sealing element.

D. Connecting Bolts and Nuts: Carbon steel with corrosion-resistant coating of length required to secure pressure plates to sealing elements. Include one for each sealing element.

V. Sleeves

A. Galvanized-steel sheet: 0.0239-Inch minimum thickness; round tube closed with welded longitudinal joint.

B. Steel pipe: astm a 53, type e, grade b, schedule 40, galvanized, plain ends.

C. Cast iron: cast or fabricated "wall pipe" equivalent to ductile-iron pressure pipe, with plain ends and integral waterstop, unless otherwise indicated.

D. Stack sleeve fittings: manufactured, cast-iron sleeve with integral clamping flange. Include clamping ring and bolts and nuts for membrane flashing.

1. Underdeck clamp: clamping ring with set screws.

VI. Grout

A. Description: ASTM C 1107, Grade B, non-shrink and nonmetallic, dry hydraulic-cement grout.

1. Characteristics: post-hardening, volume-adjusting, non-staining, non-corrosive, non-gaseous, and recommended for interior and exterior applications.
2. Design Mix: 5000-psi, 28-day compressive strength.
3. Packaging: Premixed and factory packaged.

Part 3 - Execution

I. Mechanical demolition

A. Refer to Division 1 Sections "Cutting and Patching" for general demolition requirements and procedures.

B. Disconnect, demolish, and remove mechanical systems, equipment, and components indicated to be removed.

1. Piping to be removed: Remove portion of piping indicated to be removed and cap or plug remaining piping with same or compatible piping material.
2. Piping to be abandoned in place: Drain piping and cap or plug piping with same or compatible piping material.
3. Equipment to be removed: Disconnect and cap services and remove equipment.
4. Equipment to be removed and reinstalled: Disconnect and cap services and remove, clean, and store equipment; when appropriate, reinstall, reconnect, and make equipment operational.

5. Equipment to be removed and salvaged: Disconnect and cap services and remove equipment and deliver to owner.

C. If pipe, insulation, or equipment to remain is damaged in appearance or is unserviceable, remove damaged or unserviceable portions and replace with new products of equal capacity and quality.

II. Piping systems - common requirements

A. Install piping according to the following requirements and Division 15 sections specifying piping systems.

B. Drawing plans, schematics, and diagrams indicate general location and arrangement of piping systems. Indicated locations and arrangements were used to size pipe and calculate friction loss, expansion, pump sizing, and other design considerations. Install piping as indicated unless deviations to layout are approved on coordination drawings.

C. Install piping in concealed locations, unless otherwise indicated and except in equipment rooms and service areas.

D. Install piping indicated to be exposed and piping in equipment rooms and service areas at right angles or parallel to building walls. Diagonal runs are prohibited unless specifically indicated otherwise.

E. Install piping above accessible ceilings to allow sufficient space for ceiling panel removal.

F. Install piping to permit valve servicing.

G. Install piping at indicated slopes.

H. Install piping free of sags and bends.

I. Install fittings for changes in direction and branch connections.

J. Install piping to allow application of insulation.

K. Select system components with pressure rating equal to or greater than system operating pressure.

L. Install sleeves for pipes passing through concrete and masonry walls, gypsum-board partitions, and concrete floor and roof slabs.

M. Aboveground, exterior-wall pipe penetrations: Seal penetrations using sleeves and mechanical sleeve seals. Select sleeve size to allow for 1-inch annular clear space between pipe and sleeve for installing mechanical sleeve seals.

1. Install steel pipe for sleeves smaller than 6 inches in diameter.
2. Install cast-iron "wall pipes" for sleeves 6 inches and larger in diameter.
3. Mechanical sleeve seal installation: select type and number of sealing elements required for pipe material and size. Position pipe in center of sleeve. Assemble mechanical sleeve seals and install in annular space between pipe and sleeve.

Tighten bolts against pressure plates that cause sealing elements to expand and make watertight seal.

N. Underground, exterior-wall pipe penetrations: Install cast-iron "wall pipes" for sleeves. Seal pipe penetrations using mechanical sleeve seals. Select sleeve size to allow for 1-inch annular clear space between pipe and sleeve for installing mechanical sleeve seals.

1. Mechanical sleeve seal installation: select type and number of sealing elements required for pipe material and size. Position pipe in center of sleeve. Assemble mechanical sleeve seals and install in annular space between pipe and sleeve. Tighten bolts against pressure plates that cause sealing elements to expand and make watertight seal.

O. Fire-barrier penetrations: Maintain indicated fire rating of walls, partitions, ceilings, and floors at pipe penetrations. Seal pipe penetrations with firestop materials. Refer to division 7 section "through-penetration firestop systems" for materials.

P. Verify final equipment locations for roughing-in.

Q. Refer to equipment specifications in other sections of these specifications for roughing-in requirements.

III. Piping Joint Construction

A. Join pipe and fittings according to the following requirements and Division 15 sections specifying piping systems.

B. Ream ends of pipes and tubes and remove burrs. Bevel plain ends of steel pipe.

C. Remove scale, slag, dirt, and debris from inside and outside of pipe and fittings before assembly.

D. Soldered joints: apply ASTM B 813, water-flushable flux, unless otherwise indicated, to tube end. Construct joints according to ASTM B 828 or CDA's "Copper Tube Handbook," using lead-free solder alloy complying with ASTM B 32.

E. Brazed joints: construct joints according to aws's "brazing handbook," "pipe and tube" chapter, using copper-phosphorus brazing filler metal complying with aws a5.8.

F. Threaded joints: Thread pipe with tapered pipe threads according to ASME B1.20.1. Cut threads full and clean using sharp dies. Ream threaded pipe ends to remove burrs and restore full id. Join pipe fittings and valves as follows:

1. Apply appropriate tape or thread compound to external pipe threads unless dry seal threading is specified.

2. Damaged threads: do not use pipe or pipe fittings with threads that are corroded or damaged. Do not use pipe sections that have cracked or open welds.

G. Welded joints: Construct joints according to AWS D10.12, Using qualified processes and welding operators according to Part 1 "Quality Assurance" article.

H. Flanged joints: Select appropriate gasket material, size, type, and thickness for service application. Install gasket concentrically positioned. Use suitable lubricants on bolt threads.

IV. Piping connections

A. Make connections according to the following, unless otherwise indicated:

1. Install unions, in piping NPS 2” and smaller, adjacent to each valve and at final connection to each piece of equipment.
2. Install flanges, in piping NPS 2-½” and larger, adjacent to flanged valves and at final connection to each piece of equipment.
3. Wet piping systems: Install dielectric coupling and nipple fittings to connect piping materials of dissimilar metals.

V. Equipment installation - common requirements

A. Install equipment to allow maximum possible headroom unless specific mounting heights are not indicated.

B. Install equipment level and plumb, parallel and perpendicular to other building systems and components in exposed interior spaces, unless otherwise indicated.

C. Install mechanical equipment to facilitate service, maintenance, and repair or replacement of components. Connect equipment for ease of disconnecting, with minimum interference to other installations. Extend grease fittings to accessible locations.

D. Install equipment to allow right of way for piping installed at required slope.

VI. Concrete bases

A. Concrete bases: Anchor equipment to concrete base according to equipment manufacturer's written instructions and according to seismic codes at project.

1. Construct concrete bases of dimensions indicated, but not less than 4 inches larger in both directions than supported unit.
2. Install dowel rods to connect concrete base to concrete floor. Unless otherwise indicated, install dowel rods on 18-inch centers around the full perimeter of the base.
3. Install epoxy-coated anchor bolts for supported equipment that extend through concrete base, and anchor into structural concrete floor.
4. Place and secure anchorage devices. Use supported equipment manufacturer's setting drawings, templates, diagrams, instructions, and directions furnished with items to be embedded.

5. Install anchor bolts to elevations required for proper attachment to supported equipment.
6. Install anchor bolts according to anchor-bolt manufacturer's written instructions.
7. Use 3000-psi , 28-day compressive-strength concrete and reinforcement.

VII. Erection of metal supports and anchorages

A. Cut, fit, and place miscellaneous metal supports accurately in location, alignment, and elevation to support and anchor mechanical materials and equipment.

B. Field welding: comply with aws d1.1.

VIII. Grouting

A. Mix and install grout for mechanical equipment base bearing surfaces, pump and other equipment base plates, and anchors.

B. Clean surfaces that will come into contact with grout.

C. Provide forms as required for placement of grout.

D. Avoid air entrapment during placement of grout.

E. Place grout, completely filling equipment bases.

F. Place grout on concrete bases and provide smooth bearing surface for equipment.

G. Place grout around anchors.

H. Cure placed grout.

End of Section

Part 1 - General

I. Summary
   A. This Section includes basic requirements for motors.
   B. See individual Sections for application of motors and reference to specific motor requirements for motor-driven equipment.

II. Definitions
   A. Factory-Installed Motor: A motor installed by motorized-equipment manufacturer as a component of equipment.
   B. Field-Installed Motor: A motor installed at Project site and not factory installed as an integral component of motorized equipment.

III. Submittals
   A. Product Data for Field-Installed Motors: For each type and size of motor indicated, provide nameplate data and ratings; mounting arrangements; size, type, and location of winding terminations; conduit entry and ground lug locations; and information on coatings or finishes.
   B. Shop Drawings for Field-Installed Motors: Dimensioned plans, elevations, sections, and details, including required clearances and service space around equipment. Include the following:
      1. Each installed unit's type and details.
      2. Nameplate legends.
      3. Diagrams of power and control wiring. Provide schematic wiring diagram for each type of motor and for each control scheme.
   C. Qualification Data: For testing agency.
   D. Field quality-control test reports.
   E. Operation and maintenance data.

IV. Quality Assurance
   A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.
   B. Comply with NFPA 70.

V. Coordination
   A. Coordinate features of motors, installed units, and accessory devices. Provide motors that are:

1. Designed and labeled for use with variable frequency controllers, and suitable for use throughout speed range without overheating.
2. Matched to torque and horsepower requirements of the load.
3. Matched to ratings and characteristics of supply circuit and required control sequence.

B. Coordinate motor support with requirements for driven load; access for maintenance and motor replacement; installation of accessories, belts, belt guards; and adjustment of sliding rails for belt tensioning.

Part 2 - Products

I. Motor Requirements

A. Motor requirements apply to factory-installed and field-installed motors, except as follows:

1. Different ratings, performance, or characteristics for a motor are specified in another Section.
2. Manufacturer for a factory-installed motor requires ratings, performance, or characteristics, other than those specified in this Section, to meet performance specified.

II. Motor Characteristics

A. Frequency Rating: 60 Hz.

B. Voltage Rating: NEMA standard voltage selected to operate on nominal circuit voltage to which motor is connected.

C. Service Factor: 1.15 for open drip proof motors; 1.0 for totally enclosed motors.

D. Duty: Continuous duty at ambient temperature of 105 deg F and at altitude of 3300 ft above sea level.

E. Capacity and Torque Characteristics: Sufficient to start, accelerate, and operate connected loads at designated speeds, at installed altitude and environment, with indicated operating sequence, and without exceeding nameplate ratings or considering service factor.

F. Enclosure: Open dripproof.

III. Polyphase Motors

A. Description: NEMA MG 1, Design B, medium induction motor.

B. Efficiency: Premium efficiency.

C. Stator: Copper windings, unless otherwise indicated.

D. Rotor: Squirrel cage, unless otherwise indicated.

E. Bearings: Double-shielded, prelubricated ball bearings suitable for radial and thrust loading.

F. Temperature Rise: Match insulation rating, unless otherwise indicated.

G. Insulation: Class F, unless otherwise indicated.

H. Code Letter Designation:

1. Motors 15 hp and Larger: NEMA starting Code F or G.
2. Motors Smaller Than 15 hp: Manufacturer's standard starting characteristic.

I. Enclosure: Cast iron for motors 7.5 hp and larger; rolled steel for motors smaller than 7.5 hp.

1. Finish: Gray enamel.

IV. Polyphase Motors With Additional Requirements

A. Motors Used with Reduced-Inrush Controllers: Match wiring connection requirements for controller with required motor leads. Provide terminals in motor terminal box, suited to control method.

B. Motors Used with Variable Frequency Controllers: Ratings, characteristics, and features coordinated with and approved by controller manufacturer.

1. Designed with critical vibration frequencies outside operating range of controller output.
2. Temperature Rise: Matched to rating for Class B insulation.
3. Insulation: Class H.
4. Thermal Protection: Comply with NEMA MG 1 requirements for thermally protected motors.

C. Source Quality Control: Perform the following tests on each motor according to NEMA MG 1:

1. Measure winding resistance.
2. Read no-load current and speed at rated voltage and frequency.
3. Measure locked rotor current at rated frequency.
4. Perform high-potential test.

V. Single-phase Motors

A. Type: One of the following, to suit starting torque and requirements of specific motor application:

1. Permanent-split capacitor.
2. Split-phase start, capacitor run.
3. Capacitor start, capacitor run.

B. Shaded-Pole Motors: For motors 1/20 hp and smaller only.

C. Thermal Protection: Internal protection to automatically open power supply circuit to motor when winding temperature exceeds a safe value calibrated to temperature rating of motor insulation. Thermal-protection device shall automatically reset when motor temperature returns to normal range.

D. Bearings: Ball type for belt-connected motors and other motors with high radial forces on motor shaft; sealed, pre-lubricated sleeve type for other single-phase motors.

E. Source Quality Control: Perform the following tests on each motor according to NEMA MG 1:

1. Measure winding resistance.
2. Read no-load current and speed at rated voltage and frequency.
3. Measure locked rotor current at rated frequency.
4. Perform high-potential test.

Part 3 - Execution

I. Motor Installation

A. Anchor each motor assembly to base, adjustable rails, or other support, arranged and sized according to manufacturer's written instructions. Attach by bolting. Level and align with load transfer link.

B. Install motors on concrete bases complying with Division 3.

II. Field Quality Control

A. Prepare for acceptance tests as follows:

1. Run each motor with its controller. Demonstrate correct rotation, alignment, and speed at motor design load.
2. Test interlocks and control features for proper operation.
3. Verify that current in each phase is within nameplate rating.
4. Correct malfunctioning units on-site, where possible, and retest to demonstrate compliance; otherwise, replace with new units and retest.

III. Adjusting

A. Align motors, bases, shafts, pulleys and belts. Tension belts according to manufacturer's written instructions.

END OF SECTION

Part 1 - General

I. Related Documents

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

II. Summary

A. This Section includes the following general-duty valves:

1. Copper-alloy ball valves.
2. Ferrous-alloy ball valves.
3. Ferrous-alloy butterfly valves.
4. Spring-loaded, lift-disc check valves.
5. Bronze gate valves.
6. Cast-iron gate valves.
7. Chainwheel actuators.

B. Related Sections include the following:

1. Division 22 piping Sections for general-duty and specialty valves for site construction piping.
2. Division 21 fire-suppression piping and fire pump Sections for fire-protection valves.
3. Division 23 Section "Mechanical Identification" for valve tags and charts.
4. Division 23 Section "HVAC Instrumentation and Controls" for control valves and actuators.
5. Division 15 piping Sections for specialty valves applicable to those Sections only.

III. Definitions

A. The following are standard abbreviations for valves:

1. CWP: Cold working pressure.
2. EPDM: Ethylene-propylene-diene terpolymer rubber.
3. NBR: Acrylonitrile-butadiene rubber.
4. PTFE: Polytetrafluoroethylene plastic.
5. SWP: Steam working pressure.
6. TFE: Tetrafluoroethylene plastic.

IV. Submittals

A. Product Data: For each type of valve indicated. Include body, seating, and trim materials; valve design; pressure and temperature classifications; end connections; arrangement; dimensions; and required clearances. Include list indicating valve and its application. Include

rated capacities; shipping, installed, and operating weights; furnished specialties; and accessories.

V. Quality Assurance

A. ASME Compliance: ASME B31.9 for building services piping valves.

1. Exceptions: Domestic hot- and cold-water piping valves unless referenced.

B. ASME Compliance for Ferrous Valves: ASME B16.10 and ASME B16.34 for dimension and design criteria.

C. NSF Compliance: NSF 61 for valve materials for potable-water service.

VI. Delivery, Storage, And Handling

A. Prepare valves for shipping as follows:

1. Protect internal parts against rust and corrosion.
2. Protect threads, flange faces, grooves, and weld ends.
3. Set angle, gate, and globe valves closed to prevent rattling.
4. Set ball and plug valves open to minimize exposure of functional surfaces.
5. Set butterfly valves closed or slightly open.
6. Block check valves in either closed or open position.

B. Use the following precautions during storage:

1. Maintain valve end protection.
2. Store valves indoors and maintain at higher than ambient dew-point temperature. If outdoor storage is necessary, store valves off the ground in watertight enclosures.

C. Use sling to handle large valves; rig sling to avoid damage to exposed parts. Do not use handwheels or stems as lifting or rigging points.

Part 2 - Products

I. Manufacturers

A. In other Part 2 articles where subparagraph titles below introduce lists, the following requirements apply for product selection:

1. Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the manufacturers specified.
2. Manufacturers: Subject to compliance with requirements, provide products by the manufacturers specified.

II. Valves, General

A. Refer to Part 3 "Valve Applications" Article for applications of valves.

B. Bronze Valves: NPS 2 and smaller with threaded ends, unless otherwise indicated.

C. Ferrous Valves: NPS 2-1/2 and larger with flanged ends, unless otherwise indicated.

D. Valve Pressure and Temperature Ratings: Not less than indicated and as required for system pressures and temperatures.

E. Valve Sizes: Same as upstream pipe, unless otherwise indicated.

F. Valve Actuators:

1. Chainwheel: For attachment to valves, of size and mounting height, as indicated in the "Valve Installation" Article in Part 3.
2. Gear Drive: For quarter-turn valves NPS 8 and larger.
3. Handwheel: For valves other than quarter-turn types.
4. Lever Handle: For quarter-turn valves NPS 6 and smaller, except plug valves.
5. Wrench: For plug valves with square heads. Furnish Owner with 1 wrench for every 10 plug valves, for each size square plug head.

G. Extended Valve Stems: On insulated valves.

H. Valve Flanges: ASME B16.1 for cast-iron valves, ASME B16.5 for steel valves, and ASME B16.24 for bronze valves.

I. Valve Grooved Ends: AWWA C606.

J. Solder Joint: With sockets according to ASME B16.18.

1. Caution: Use solder with melting point below 840 deg F for angle, check, gate, and globe valves; below 421 deg F for ball valves.

K. Threaded: With threads according to ASME B1.20.1.

L. Valve Bypass and Drain Connections: MSS SP-45.

III. Copper-alloy Ball Valves

A. Manufacturers:

1. Three-Piece, Copper-Alloy Ball Valves:
   a) Conbraco Industries, Inc.; Apollo Div.
   b) DynaQuip Controls.
   c) Grinnell Corporation.
   d) Hammond Valve.
   e) Jamesbury, Inc.
   f) Kitz Corporation of America.
   g) NIBCO INC.
   h) PBM, Inc.
   i) Red-White Valve Corp.

j) Worcester Controls.

B. Copper-Alloy Ball Valves, General: MSS SP-110.

C. Three-Piece, Copper-Alloy Ball Valves: Brass or bronze body with full-port, chrome-plated bronze ball; PTFE or TFE seats; and 600-psig minimum CWP rating and blowout-proof stem.

IV. Ferrous-alloy Ball Valves

A. Manufacturers:

1. American Valve, Inc.
2. Conbraco Industries, Inc.; Apollo Div.
3. Cooper Cameron Corp.; Cooper Cameron Valves Div.
4. Crane Co.; Crane Valve Group; Stockham Div.
5. Flow-Tek, Inc.
6. Foster Valve Co.
7. Hammond Valve.
8. Jamesbury, Inc.
9. Jomar International, LTD.
10. Kitz Corporation of America.
11. KTM Products, Inc.
12. McCANNA, Incorporated.
13. Milwaukee Valve Company.
14. NIBCO INC.
15. PBM, Inc.
16. Richards Industries; Marwin Ball Valves.
17. Worcester Controls.

B. Ferrous-Alloy Ball Valves, General: MSS SP-72, with flanged ends.

C. Ferrous-Alloy Ball Valves: Class 150, full port.

V. Ferrous-alloy Butterfly Valves

A. Manufacturers:

1. Flanged, Ferrous-Alloy Butterfly Valves:

a) Bray International, Inc.

b) Cooper Cameron Corp.; Cooper Cameron Valves Div.

c) Grinnell Corporation.

d) Mueller Steam Specialty.

e) Tyco International, Ltd.; Tyco Valves & Controls.

B. Ferrous-Alloy Butterfly Valves, General: MSS SP-67, Type I, for tight shutoff, with disc and lining suitable for potable water, unless otherwise indicated.

C. Flanged, 150-psig CWP Rating, Ferrous-Alloy Butterfly Valves: Flanged-end type with one- or two-piece stem.

VI. Spring-loaded, Lift-disc Check Valves

A. Manufacturers:

B. Type II, Compact-Wafer, Lift-Disc Check Valves:

1. Durabla Fluid Technology, Inc.
2. Flomatic Valves.
3. GA Industries, Inc.
4. Grinnell Corporation.
5. Hammond Valve.
6. Metraflex Co.
7. Milwaukee Valve Company.
8. Mueller Steam Specialty.
9. Multiplex Manufacturing Co.
10. NIBCO INC.
11. SSI Equipment, Inc.
12. Val-Matic Valve & Mfg. Corp.
13. Valve and Primer Corp.

C. Lift-Disc Check Valves, General: FCI 74-1, with spring-loaded bronze or alloy disc and bronze or alloy seat.

D. Type II, Class 125, Compact-Wafer, Lift-Disc Check Valves: Compact-wafer style with cast-iron shell with diameter made to fit within bolt circle.

VII. Bronze Gate Valves

A. Manufacturers:

1. Type 1, Bronze, Nonrising-Stem Gate Valves:

a) American Valve, Inc.
b) Cincinnati Valve Co.
c) Crane Co.; Crane Valve Group; Crane Valves.
d) Crane Co.; Crane Valve Group; Jenkins Valves.
e) Crane Co.; Crane Valve Group; Stockham Div.
f) Grinnell Corporation.
g) Hammond Valve.

h) Kitz Corporation of America.
i) Legend Valve & Fitting, Inc.
j) Milwaukee Valve Company.
k) NIBCO INC.
l) Powell, Wm. Co.
m) Red-White Valve Corp.
n) Walworth Co.
o) Watts Industries, Inc.; Water Products Div.

B. Bronze Gate Valves, General: MSS SP-80, with ferrous-alloy handwheel.

C. Type 1, Class 125, Bronze Gate Valves: Bronze body with non-rising stem and bronze solid wedge and union-ring bonnet.

VIII. Cast-iron Gate Valves

A. Manufacturers:

1. Type I, Cast-Iron, Nonrising-Stem Gate Valves:

a) Cincinnati Valve Co.
b) Crane Co.; Crane Valve Group; Crane Valves.
c) Crane Co.; Crane Valve Group; Jenkins Valves.
d) Crane Co.; Crane Valve Group; Stockham Div.
e) Grinnell Corporation.
f) Hammond Valve.
g) Kitz Corporation of America.
h) Legend Valve & Fitting, Inc.
i) Milwaukee Valve Company.
j) NIBCO INC.
k) Powell, Wm. Co.
l) Red-White Valve Corp.
m) Walworth Co.
n) Watts Industries, Inc.; Water Products Div.

B. Cast-Iron Gate Valves, General: MSS SP-70, Type I.

C. Class 125, NRS, All-Iron, Cast-Iron Gate Valves: Cast-iron body with cast-iron trim, non-rising stem, and solid-wedge disc.

IX. Outside Stem and Yoke Valves

A. Manufacturers:

1. John Crane
2. Stockham
3. Powell, Nibco
4. Milwaukee.

B. Cast-Iron Gate Valves, General: MSS SP-70, Type I.

C. Class 125, NRS, All-Iron, Cast-Iron Gate Valves: Cast-iron body with cast-iron trim, non-rising stem, and solid-wedge disc.

X. Chainwheel Actuators

A. Manufacturers:

1. Babbitt Steam Specialty Co.
2. Roto Hammer Industries, Inc.

B. Description: Valve actuation assembly with sprocket rim, brackets, and chain.

C. Sprocket Rim with Chain Guides: Ductile iron, of type and size required for valve.Include zinc coating.

1. Brackets: Type, number, size, and fasteners required to mount actuator on valve.

D. Chain: Hot-dip, galvanized steel, of size required to fit sprocket rim.

Part 3 - Execution

I. Examination

A. Examine piping system for compliance with requirements for installation tolerances and other conditions affecting performance.

1. Proceed with installation only after unsatisfactory conditions have been corrected.

B. Examine valve interior for cleanliness, freedom from foreign matter, and corrosion. Remove special packing materials, such as blocks, used to prevent disc movement during shipping and handling.

C. Operate valves in positions from fully open to fully closed. Examine guides and seats made accessible by such operations.

D. Examine threads on valve and mating pipe for form and cleanliness.

E. Examine mating flange faces for conditions that might cause leakage. Check bolting for proper size, length, and material. Verify that gasket is of proper size, that its material composition is suitable for service, and that it is free from defects and damage.

F. Do not attempt to repair defective valves; replace with new valves.

II. Valve Applications

A. Refer to piping Sections for specific valve applications. If valve applications are not indicated, use the following:

1. Shutoff Service: Ball, butterfly, or gate , gate, or plug valves.
2. Throttling Service: Angle, ball, butterfly, or globe valves.
3. Pump Discharge: Spring-loaded, lift-disc check valves.

B. If valves with specified SWP classes or CWP ratings are not available, the same types of valves with higher SWP class or CWP ratings may be substituted.

C. Chilled-Water Piping: Use the following types of valves:

1. Ball Valves, NPS 2 and Smaller: Three-piece, 400-psig CWP rating, copper alloy.
2. Butterfly Valves, NPS 2-1/2 and Larger: Flanged, 150-psig CWP rating, ferrous alloy, with EPDM liner.

D. Spring-Loaded, Lift-Disc Check Valves, NPS 2-1/2 and Larger: Type II, Class 125, cast iron.

E. Condenser Water Piping: Use the following types of valves:

1. Ball Valves, NPS 2 and Smaller: Three-piece, 400-psig CWP rating, copper alloy.
2. Butterfly Valves, NPS 2-1/2 and Larger: Flanged, 150-psig CWP rating, ferrous alloy, with EPDM liner.

F. Spring-Loaded, Lift-Disc Check Valves, NPS 2-1/2 and Larger: Type II, Class 125, cast iron.

G. Domestic Water Piping: Use the following types of valves:

1. Ball Valves, NPS 2 and Smaller: Three-piece, 400-psig CWP rating, copper alloy.
2. Gate Valves, NPS 2-1/2 and Larger: Type 1, Class 125, NRS, bronze-mounted cast iron.

H. Heating Water Piping: Use the following types of valves:

1. Ball Valves, NPS 2 and Smaller: Three-piece, 400-psig CWP rating, copper alloy.
2. Butterfly Valves, NPS 2-1/2 and Larger: Flanged, 150-psig CWP rating, ferrous alloy, with EPDM liner.
3. Spring-Loaded, Lift-Disc Check Valves, NPS 2-1/2 and Larger: Type II, Class 125, cast iron.

I. Low-Pressure Steam Piping: Use the following types of valves:

1. Gate Valves, NPS 2 and Smaller: Type 1, Class 125, bronze.
2. Gate Valves, NPS 2-1/2 and Larger: Type I, Class 125, NRS, cast iron.

J. Steam Condensate Piping: Use the following types of valves:

1. Gate Valves, NPS 2 and Smaller: Type 1, Class 125, bronze.
2. Gate Valves, NPS 2-1/2 and Larger: Type I, Class 125, NRS, cast iron.

K. Select valves, except wafer and flangeless types, with the following end connections:
   1. For Copper Tubing, NPS 2 and Smaller: Solder-joint or threaded ends, except provide valves with threaded ends for heating hot water, steam, and steam condensate services.
   2. For Copper Tubing, NPS 2-1/2 to NPS 4: Flanged or threaded ends.
   3. For Steel Piping, NPS 2 and Smaller: Threaded ends.
   4. For Steel Piping, NPS 2-1/2 to NPS 4: Flanged or threaded ends.
   5. For Steel Piping, NPS 5 and Larger: Flanged ends.

III. Valve Installation

A. Piping installation requirements are specified in other Division 15 Sections. Drawings indicate general arrangement of piping, fittings, and specialties.

B. Install valves with unions or flanges at each piece of equipment arranged to allow service, maintenance, and equipment removal without system shutdown.

C. Locate valves for easy access and provide separate support where necessary.

D. Install valves in horizontal piping with stem at or above center of pipe.

E. Install valves in position to allow full stem movement.

F. Install chainwheel operators on valves NPS 4 and larger and more than 96 inches above floor. Extend chains to 60 inches above finished floor elevation.

G. Install check valves for proper direction of flow and as follows:

H. Swing Check Valves: In horizontal position with hinge pin level.
   1. Dual-Plate Check Valves: In horizontal or vertical position, between flanges.
   2. Lift Check Valves: With stem upright and plumb.

IV. Joint Construction

A. Refer to Division 15 Section "Basic Mechanical Materials and Methods" for basic piping joint construction.

B. Soldered Joints: Use ASTM B 813, water-flushable, lead-free flux; ASTM B 32, lead-free-alloy solder; and ASTM B 828 procedure, unless otherwise indicated.

V. Adjusting

A. Adjust or replace valve packing after piping systems have been tested and put into service but before final adjusting and balancing. Replace valves if persistent leaking occurs.

END OF SECTION

Part 1 - General

I. Summary (Non-inclusive)

A. Section Includes: Identification of mechanical equipment and piping systems.

II. Related Work Specified Elsewhere (Non-inclusive)

A. Applicable Sections: Division 1.

B. High-Performance Coatings: Division 9.

C. Painting: Division 9.

D. Pipe, Valves and Fittings for Mechanical Systems: Section 230500.

E. Pipe Insulation: Section 230700.

F. Mechanical Equipment Insulation: Section 230700.

III. Submittals

A. Submit per the requirements of Division 1.

B. Shop Drawings: Include compact disk and hard copy, as indicated, showing:

1. Identification Scheme, Identification Codes.

2. Valve Schedules: Listing proposed valve numbers, their location and function.

3. Equipment Schedules: Listing proposed equipment numbers, their location and function.

4. Steam Trap Schedules: Steam Trap Schedules listing proposed steam trap number, location, type, size and service.

C. Samples: Tags, attachments, stencils and markers, labeled and identified.

IV. Quality Assurance

A. Referenced Codes and Standards: Comply with the following in accordance with Division

1. American National Standards Institute (ANSI)

A13.1 Scheme for the Identification of Piping Systems

Z535.1 Safety Color

B. National Fire Protection Association (NFPA)

13 Installation of Sprinkler Systems

99 Health Care Facilities

C. U.S. Department of Labor, Occupational Safety and Health Administration (OSHA)

29 CFR 1910	Subpart J, General Environmental Controls, including:
Paragraph 1910.144:	Safety Color Code for Marking Physical Hazards
Paragraph 1910.145:	Specifications for Accident Prevention Signs and Tags

Part 2 - Products

I. Approved Manufacturers

A. Products of indicated manufacturers are acceptable. No substitutions.

1. Seton Identification Products.
2. Brady Corporation.
3. Marking Services, Inc.
4. Brimar Industries, Inc.

II. Valve Tags

A. Construct or stamp from not less than No. 14 gage brass or aluminum and not less than 1 1/2 inches diameter.

B. Provide No. 10 gage brass "S" hook and brass chain to securely fasten valve tag to valve.

C. Permanently stamp and mark with service designation, normal valve position, and unique identifying number as large as possible. Assign unique number coordinated with service designations to each valve as indicated [and consistent with Owner's existing valve numbering system]. Coordinate with Owner’s Representative and Design Professional before finalizing the valve tag numbering system.

III. Steam Trap Tags

A. Construct or stamp from not less than No. 14 gage brass or aluminum and not less than 1 1/2 inches diameter. Approved Model: Brady B-907.

B. Provide No. 10 gage brass "S" hook and brass chain to securely fasten tag to steam trap.

C. Permanently stamp and mark with service designation and unique identifying number as large as possible.

IV. Piping System Markers

A. Identify accessible piping installed indoors with pressure-sensitive piping system markers with wraparound seals. Accessible piping shall include exposed piping, and piping located above lay-in ceilings, in crawl spaces, and in shafts. Markers shall include full system name, flow arrow, color code and pipe diameter. Abbreviated system names are not acceptable. Approved Model: Seton Opti-Code.

B. Identify piping installed outdoors with pressure-sensitive pipe marker applied to plastic base. Print marker with weather-resistant ink. Mount plastic base onto piping with color-coded plastic-coated wire. Approved Models: Pipe marker: Brady B-946.

C. Where pipes are too small or not readily accessible for application of pipe markers, securely fasten brass identification tag at least 1 1/2 inches in diameter, with depressed 1/2 inch high black letters and numerals, at locations specified for pipe markers.

V. Mechanical Equipment Markers

A. For each item of mechanical equipment, provide lettered and numbered nameplate, identifying equipment number and service. Stenciled equipment data is not acceptable. Nameplates: Aluminum with permanent 1 1/2 inch high white letters on black background, mechanically affixed and installed in readily visible location on equipment. Coordinate final equipment

designations with PGCPS. Coordinate nameplates to match PGCPS' existing equipment nameplates.

B. For each item of mechanical equipment, provide manufacturer's identification plate showing equipment name, manufacturer name and address, date of purchase, model number and performance data.

VI. Fire Protection Systems

A. Refer to [ ] Fire [Protection][Extinguishing] System: Section [ ].

VII. Color Continuity

A. Coordinate legends and colors to match those on existing systems as directed by PGCPS.

B. If no color coding system exists, comply with identification schedules indicated.

VIII. Identification Schedules

A. Legends, designations and colors for piping and equipment identification as indicated in Schedule of Identifying Legends and Colors. Print legends in uppercase letters, size as indicated in Schedule of Legend Letter Sizes.

SCHEDULE OF IDENTIFYING LEGENDS AND COLORS

Under 1 1/2	8	1/2
1 1/2 to 2	8	3/4
2 1/2 to 6	12	1 1/4
8 to 10	24	2 1/2
Over 10	32	3 1/2

Part 3 - Execution

I. Installation

A. Apply piping system markers and valve tags at following locations:

1. Adjacent to each valve and fitting.
2. At each branch location and riser take-off.
3. At each side of pipe passage through floors, walls, ceilings and partitions.
4. At each pipe passage to and from underground areas.
5. Every 20 feet of run.

B. Provide arrow markers indicating direction of flow adjacent to each piping system marker. Use double-headed arrows if flow is in both directions.

C. Apply piping system markers where view is unobstructed. Markers and legends shall be clearly visible from operating positions.

D. Apply tags and piping system markers in accordance with manufacturer's written instructions. Do not attach tags to valve handle such that valve operation is hindered.

E. Submit compact disk containing valve, equipment, and steam trap schedules, logically grouped and identified by tag numbers. Spreadsheet software to be used for the schedules shall be Microsoft Excel. Submit six (6) hard copies with compact disk.

END OF SECTION

Part 1 - General

I. Summary (Non-inclusive)

A. Section Includes: Work of Mechanical Installer to prepare mechanical systems for Testing and Balancing Agency.

B. Construction Manager will engage independent Testing and Balancing (TAB) Agency for testing and balancing of mechanical systems. TAB work is described in Testing and Balancing of Mechanical Systems: Division 1.

II. Related Work Specified Elsewhere (Non-Inclusive)

A. Applicable Sections: Division 1.

B. Inspection and Testing Services: Division 1, refer to for contractual requirements to retain Agency.

C. Testing and Balancing of Mechanical Systems: Section 230593.

D. Instrumentation and Control Equipment: Section 230923.

E. Direct Digital Control (DDC) System: Section 230923.

F. DDC System Sequences of Operation: Section 230923.

G. Water Treatment: Section 232500.

III. Submittals

A. Submit per the requirements of Division 1.

B. Quality Control Procedures: Submit reports indicating compliance with indicated criteria:

1. Data Register: As indicated.
2. Testing and Balancing Schedule: As indicated.
3. Certifications: Work Completion.

Part 2 - Products

Not used.

Part 3 - Execution

I. General

A. Review Contract Documents and submittals to verify that piping, instruments, thermowells, valves, ductwork, dampers, measurement and control devices, and access openings have been provided in correct quantity and at correct locations to permit testing and balancing of air, steam and/or hydronic systems under various operating conditions.

B. Provide inlet vanes, V-belt drives, variable-frequency drives, initial fixed pitch sheaves or variable pitch sheaves for fans as indicated. Provide variable frequency drives as Work of Division 16. Replace variable pitch sheaves or initial fixed pitch sheaves with appropriate fixed pitch sheaves when

correct speed (rpm) has been determined by Testing and Balancing Agency. Deliver variable-pitch sheaves and initial fixed pitch sheaves to Owner's Representative. Notify TAB Agency upon completion of sheave replacement.

C. Inform TAB Agency regarding major deviations from Contract Documents made to systems during construction and furnish one (1) complete set of Record Drawings, showing presence and location of balancing elements, volume dampers, air extractors and instrument ports, prior to start of TAB work.

D. Provide indicated Work and submit certification that each operation indicated is complete and in accordance with Contract Documents. Accomplish this Work before TAB work can start. Within 30 days of notification by Owner of award of Testing and Balancing Contract, submit schedule to complete following Work:

1. Complete physical installation.
2. Pressure test air, steam and hydronic systems as required.
3. Clean, flush, fill and chemically treat steam and hydronic systems as required. Provide temporary startup strainers and replace with clean strainers after system cleaning as indicated.
4. Provide each air system with medium-efficiency disposable start-up filters. Replace filters one (1) time during construction. Replace with new specified filters upon acceptance of each system by Owner's Representative. Install HEPA filters, where indicated, upon acceptance of each system by PGCPS.
5. Test and operate prime movers, including fans, pumps, chillers and boilers, at full design load to verify adequate power, proper rotation, completed controls, operational auxiliaries, and complete overall installation.
6. Balance rotating equipment statically and dynamically.
7. Secure linkages.
8. Properly evacuate air from liquid systems. Install air vents at coils and at high points in systems whether or not expressly indicated, and verify that they operate properly. Verify that expansion tanks are filled and in proper working order.
9. Verify that automatic control valves are in proper working order and location, that they are marked and installed with correct "NORMAL" positions as required, and that hand valves and balancing valves are positioned for full flow through equipment.
10. Verify that automatic control dampers are in proper working order and location, that they are marked and installed with correct "NORMAL" positions as required. Verify that balancing and shut-off dampers are positioned for full flow. Verify that equipment, terminal devices and distribution systems are completely and properly connected.

E. For each item of mechanical equipment, submit typed Data Register in non-yellowing, clear plastic binder, and securely attach it to associated equipment. Show operating temperature, pressure, flow rate, amperage, voltage, phase, frequency (Hz), rpm and brake horsepower, as appropriate.

F. Deliver to TAB Agency, for use until TAB work is complete, flow-indicating devices intended for use with permanently installed primary flow measuring devices. Calibrate permanently-installed flow measuring devices and associated display instruments, thermometers, sensors and pressure gauges. Deliver documentation to TAB Agency to verify calibrations.

G. Submit schedule stating when each system is ready for TAB work to begin. Separate schedule by building, building area, building floor and mechanical system, as required. Submit schedule within 30 days of Contract Award. Update schedule at least two (2) months in advance of scheduled start of TAB work.

H. Attend coordination meetings between TAB Agency, and PGCPS, conducted under guidance of Construction Manager. First meeting is approximately two (2) weeks before scheduled start of TAB work, as scheduled by Mechanical Installer and approved by PGCPS.

I. Provide labor, material, tools and equipment to operate mechanical equipment and systems during TAB work, and for required adjustments, calibrations and repairs of automatic control devices or their components. Provide these services on each working day and without undue delay, as required by TAB Agency. Protect and operate equipment and systems during TAB work.

J. When requested by TAB Agency, contractor shall furnish services of personnel to accompany TAB Agency when TAB work is being performed.

K. Make modifications at no additional cost and to satisfaction of PGCPS to rectify discrepancies reported by TAB Agency indicating non-compliance with Contract Documents.

END OF SECTION

Part 1 - General

I. General
   A. The Bidding and Contract requirements, Division 1 - General Requirements, Section 230100 - General Provisions and Section 230500 - Basic Materials and Methods, shall apply to this section.

II. Scope
   A. The testing, adjusting and balancing of the air distribution systems, hot water heating systems chilled water cooling systems and condenser water systems, are specified under the Division 1 General Requirements.
   B. The installers shall give notice when the systems are ready for testing, adjusting and balancing, and give assistance in adjusting and correcting deficiencies.

III. Quality Assurance
   A. Tab Firm Qualifications:
      1. The TAB Firm shall be Certified in Testing, Adjusting and Balancing of Air and Hydronic Systems by one of the following:
         a) AABC
         b) NEBB
      2. Provide documentation confirming qualifications, successful experience. TAB contractor shall have a minimum of 5 (five) years experience.
   B. TAB Firm shall submit 2 copies of the firm's AABC/NEBB TAB Certification.
   C. When requested, the TAB Firm shall furnish a Certificate of Conformance Certification.
   D. TAB Report Forms: Prepare report forms in accordance with the requirements from PGCPS building services.
   E. Instrumentation Calibration: Calibration of instruments shall be in accordance with the current edition of the AABC/NEBB Procedural Standards for Testing, Adjusting, and Balancing of Environmental Systems.

IV. Submittals
   A. Qualification Data: When requested, submit 2 copies of evidence that TAB firm and this Project's TAB team members meet the qualifications specified in Sub-section 1.3 TAB Firm Qualifications.
   B. TAB Agenda: When requested, submit 2 copies of the TAB Agenda. Include a complete set of report forms intended for use on this Project.

C. Certified TAB Reports: Submit a final TAB report in accordance with the current edition of the NEBB Procedural Standards for Testing, Adjusting, and Balancing of Environmental Systems.

Part 2 - Products

I. SHEAVES AND BELTS

A. The installer shall be responsible for providing and installing new fan or motor sheaves and belts when required to obtain the designed airflow.

II. AIR FILTERS

A. The installer shall be responsible for providing and installing new, clean, air filters. Filters shall be installed before final inspection and before giving notice for the testing, adjusting and balancing.

Part 3 - Execution

I. Giving Notice To Proceed

A. It shall be the responsibility of the installers to properly install, inspect and assure proper operation of each individual component of the system before giving notice to proceed with the testing, adjusting and balancing. The testing, adjusting and balancing shall not be performed until all mechanical equipment is properly installed and is 100 percent operational, all temperature controls are installed and calibrated and all systems are cleaned and clean filters installed.

B. The mechanical contractor shall set all outside air dampers to the approximate minimum position during equipment installation and prior to start-up of equipment.

C. The Balancing Contractor shall be responsible for properly plugging test holes which were made for testing purposes. Plugs shall be made of rubber and shall be sized to fit testing holes.

II. Correction Of Deficiencies And Assistance

A. The installers shall assist in the testing, adjusting and balancing the systems, shall adjust the system and make corrections of any deficiencies found such as: motor starters and horsepower; improper sheave and belt sizes; missing, improperly installed or malfunctioning volume control dampers, air extractors, air terminals, air monitors, variable or constant volume boxes, power wiring, controls and any other items that prevent the completion of the testing, adjusting and balancing of the systems.

B. Airflow values shall not exceed +/-10% of scheduled values on contract documents. Installer shall be fully responsible for addressing any deficiencies outside of this tolerance range. TAB contractor shall provide two (2) copies of final reports verifying that tolerance range has been met on all balanced equipment.

III. Additional Material

A. Any additional items or material required to be installed in the ductwork system to implement the testing, adjusting and balancing shall be furnished under Division 1 - General Requirements along with the location. The installers shall install these items or materials.

IV. Commissioning Responsibilities

A. This contractor shall be responsible for participation and coordination with the commissioning process.

END OF SECTION

Part 1 - General

I. General

A. The Bidding and Contract Requirements, Division I - General Requirements, Section 230100 - General Provisions and Section 230500 - Basic Materials and Methods, shall apply to this section.

II. Scope

A. The work covered under this section shall include providing and installing the insulation on the items listed in this section or as shown on the drawings.

III. Quality Assurance

A. All insulation shall have a composite fire hazard rating as tested by ASTM E-84, NFPA 25 or UL 723 not to exceed 25 flame spread, 50 smoke developed, and 50 fuel contributed.

IV. Submittals

A. Provide shop drawings on proposed insulation as described in section.

Part 2 - Products

I. General

A. The manufacturer of the products specified in this section shall be one of the following:

1. Mineral Fiber (Fiberglass and Rock Wool)

a) Johns Manville

b) CertainTeed

c) Knauf

d) Owens-Corning

2. Cellular Glass

a) Pittsburgh-Corning.

3. Calcium Silicate

a) Industrial Insulation Group

4. Ceramic Fiber

a) The Carborundum Company

b) C-E Refractories

c) 3M

d) Thermal Ceramics

e) Premier Refractories and Chemicals

f) Nelson Firestop Products.

5. Elastomer

a) Armacell

b) Nomaco

6. Fire Wrap

a) Unifrax

7. Metal Jackets

a) Childers

8. Mineral Fireproofing

a) USG Acoustical Products Company

9. Mineral Wool Felt

a) Fiberex

b) US Gypsum

c) Roxul

10. Thermal Insulating Wool

a) Owens-Corning

11. Jackets, Adhesives, Mastics, Sealing Tapes and Accessories

a) Armacell

b) Foster

c) Childers

d) Compac

e) Epolux

f) Kinetics/Peabody Noise Control

g) Hamfab

h) Industrial Insulation Group

i) Johns Manville

j) Owens-Corning

k) Pittsburgh-Corning

l) U.S. Gypsum

m) Ceel-Co

n) General Aluminum Supply Corporation

o) Pipe Shields, Inc.

p) Precision

q) Proto

r) Sound Seal/United Process

s) TCI Industries.

t) FlexClad

B. Specific manufacturer's products are cited in the following paragraphs to establish the desired quality and performance of Work. Equivalent products by the other acceptable manufacturers indicated are acceptable.

II. Piping Insulation

A. The piping shall be insulated with heavy density rigid molded fiberglass pipe insulation with factory applied all service jacket (ASJ) with a 'K' factor not to exceed .25 @ 75 deg. F mean temperature. The minimum insulation thickness for the various items shall be as follows:

1. Domestic Cold Water Piping and Cold Water Makeup Piping - 1/2". Exceptions: Exterior walls and plumbing chases shall be 1".

2. Trap Primer Supply Piping - 1/2" elastomeric, expanded closed cell, seamless pipe insulation from the drain tap to the trap primer valve or distribution unit.

3. Domestic Hot Water, Tempered Water and Hot Water Recirculating Piping -1". Exceptions: Fixture runouts in interior plumbing chases and walls may be 1/2".

4. Storm Water (includes main and overflow piping) - The horizontal section of the rain leaders, riser to and including the interior part of the roof drains shall have 1" of insulation. The drain body and sump receiver of the roof drain shall have 1” of rigid fiberglass board insulation.

Above slab piping serving open site drains shall have 1” pipe insulation from the open site drain to the rain leader.

5. Hot Water Heating Supply and Return
   a) Pipe Size 1-1/2” and Under - 1".
   b) Pipe Size 2” and larger - 2".
6. Chilled Water Supply and Return
   a) Pipe Size 3” and under – 1 ½”
   b) Pipe Size 4” and larger – 2”
7. Condenser Water Supply & Return – 1-1/2”.
8. Condensate Piping - 1".
9. Refrigerant Piping - 1" closed cell, semi-slit pipe insulation with a composite fire hazard rating as tested by ASTM E-84 not to exceed 25 flame spread and 50 smoke developed. Prototype: ARMSTRONG Armaflex AP.
10. Domestic water piping in the cells of masonry walls shall have be polyolefin pipe insulation such as “IMCOLOCK” with a ½ inch wall thickness.
11. Where chilled/hot water piping is installed within the airstream of mechanical equipment, piping shall be insulated with flexible closed cell elastomeric pipe insulation. Insulation thickness shall be 1 inch.

B. Sheet Metal Saddles - See section 15050 - 2.03.

C. Finish - Exposed Piping - Cover with 8 oz. canvas jacket.
   1. Exposed piping in the kitchen shall be insulated per the specification and covered with a PVC jacket 20 mil thick, white in color, washable and approved by the USDA and the FDA.

III. Piping, Fittings, Valves And Specialties Insulation

A. Fittings, valves and specialties for the piping systems shall be insulated by two-piece molded fiberglass fittings with an insulating value equivalent to the pipe insulation. Acceptable alternative insulation methods shall be as described in paragraph 3.02 D.

B. The following piping, fittings, valves, and specialties shall be insulated.
   1. Domestic cold water piping
   2. Domestic hot water, tempered water and hot water recirculating piping
   3. Hot water heating supply and return
   4. Chilled water supply and return
   5. Condensate piping
   6. Condenser Water Supply & Return

C. Finish - Insulation on exposed piping fittings, valves and specialties shall be covered with an 8-oz. canvas jacket.

IV. Equipment Insulation

A. Chilled Water Pump, Chilled Water Standby Pump, Cooling Tower Pump and Cooling Tower Standby Pump- Pumps shall be encased with a sectional fabricated, flanged insulated split metal housing to provide ease of maintenance without damage to the insulation. Housing shall incorporate integral latching devices. Housing shall be tight sealing to prevent air infiltration. See drawing detail. All internal surfaces shall be insulated with 6 pounds per cubic foot density fiberglass board having a “K” value of 0.22@ 75 Deg F mean temperature with a factory applied all service jacket (ASJ). Minimum insulation thickness shall be one inch.

B. Chiller Cooler and Chilled Water Air Separators - All cold surfaces shall be insulated with one inch thick fiberglass insulation. 'K' factor shall not exceed 0.27 @ 75°F mean temperature with a density of 6.5 pounds per cubic foot. Chilled and hot water expansion tanks are not required to be insulated.

C. Finish - All insulation on chiller cooler and chilled water air separator shall be covered with an 8-oz. canvas jacket.

V. Ductwork Insulation

A. Concealed Rectangular and Round Supply/Return, including flexible connections (horizontal FCU’s) And Outside Air Ductwork - Unless noted otherwise on the drawings shall be insulated with fiberglass duct wrap insulation at 1 pound per cubic foot density, having a facing of laminated composite aluminum foil and kraft paper reinforced with a glass reinforcing, with a perm rating not exceeding .05. The 'K' value shall not exceed .29 @ 75 degrees F mean temperature. The duct wrap insulation shall have a minimum thickness of 2 inches. Insulate flexible connections on horizontal fan coil units.

B. Exposed Rectangular Supply/Return and Outside Air Ductwork - Unless noted otherwise on the drawings shall be insulated with 6 pounds per cubic foot density fiberglass insulating board having a facing of laminated composite aluminum foil and kraft paper reinforced with a glass reinforcing with a perm rating not exceeding .05. The 'K' value shall not exceed .23 @ 75°F mean temperature. The duct board shall have a minimum thickness of 1-1/2 inches. Exposed ductwork shall include but is not limited to, ductwork in accessible attics, equipment mezzanines, boiler rooms and equipment rooms. The exposed rectangular supply/return and outside air ductwork shall also be covered with a canvas cover and prepared for painting.

C. See Section 15810 for description of any additional ductwork that shall be lined.

Part 3 - Execution

I. General

A. All insulating material shall be installed in accordance with the manufacturer's recommendations by personnel regularly employed in the pipe, duct and equipment insulating trade.

B. The insulation shall not be applied until all surfaces are clean and dry and until inspected and released for insulation application.

C. A complete moisture and vapor seal shall be provided on cold surfaces where vapor barrier jackets or coatings are required. Anchors, hangers, and other projections shall be insulated and vapor sealed to prevent condensation.

D. Pipe or duct insulation shall be continuous through walls and floor openings except where walls or floors are required to be fire stopped or required to have a fire resistance rating.

II. Pipe Insulation Application

A. Pipe insulation shall be installed in accordance with the manufacturer's instructions.

B. Piping (except refrigeration piping) - Butt all joints firmly together. Ends of pipe insulation shall be sealed off with a vapor barrier coating at all fittings and valves. The insulation laps and butt strips shall be sealed by one of the following methods:

1. Insulation without self-seal laps shall have lap adhesive manually applied to all laps and butt strips. Stapling is not acceptable.
2. Insulation with self-seal laps shall have lap adhesive manually applied to the outside of all laps and butt strips after installation. Stapling is not acceptable.

C. Refrigeration Piping and domestic water piping using closed cell insulation – Butt joints and seams shall be joined together with contact adhesive Prototype-Armstrong 520 or manufacturer’s recommended adhesive. Both surfaces to be joined shall be coated with the adhesive.

D. Fittings and Valves - Shall be insulated with molded fiberglass fittings, segments of pipe covering, or with firmly compressed foil faced fiberglass blanket. Mitered joints are not acceptable. Secure in place with 20 gauge corrosion resistant wire and apply a smoothing coat of insulating cement. Vapor seal by applying a layer of open weave glass cloth fabric embedded between flood coats of vapor barrier mastic. Lap glass fabric 2 inches onto adjacent pipe. PVC covers are acceptable only if the item covered is fully insulated first. Insulation shall be installed so the cover cannot be deformed. Contractor shall request an inspection by the Owner of the insulated items prior to cover installation.

E. Finish - All exposed piping, and piping fittings, valves and specialties insulation shall receive an 8 oz. canvas jacket smoothly pasted in place with lagging adhesive and sized with one brush coat of lagging adhesive. The finished surface shall be suitable for painting. Exposed piping includes piping in accessible attics, equipment mezzanines, boiler rooms and equipment rooms.

F. Outdoor Piping - Weatherproofing Finishes for All Outdoor Insulation.
   1. Piping - Apply aluminum metal jacket 0.016" with moisture barrier around pipe and slip edge into preformed Z lock positioned to shed water. Butt next jacket section leaving approximately 3/8" gap. Place preformed 2" butt aluminum band and wing seal.
   2. Fittings - Apply prefabricated metal fittings in composition to pipe jacketing.

G. Sheet Metal Saddles shall be provided and installed on all pipe hangers as stated under section 15050, 2.03.

H. Pipe Insulation Support - All insulated piping shall be supported at hanger and sleeve locations by either using a high density pipe insulation or wooden blocking, installed inside the vapor barrier for all pipe sizes one inch and larger. High-density pipe insulation shall be of the type as recommended by the manufacturer and shall be substituted for no less than the bottom half section of the fiberglass pipe insulation. The lengths of the high-density insulation shall be at least two inches longer (each end) than the length of the saddle. The lengths of wooden blocking shall be eight inches. Wooden blocking shall be the same thickness as the pipe insulation, the same width as the pipe, shall be tapered within the insulation and shall be centered at the hanger. Remove portions of the fiberglass pipe insulation by peeling back the factory applied all service jackets from the insulation and cut out and replace the required sections for either method of insulation support. Re-wrap the vapor barrier to completely enclose the installation. Manually apply lap adhesive to the outside lap and apply butt strips. The installations shall also meet any additional requirements recommended by the insulation manufacturer.

I. Underground Pipe Insulation

1. Insulation- insulation shall be cellular glass insulation manufactured in accordance with ASTM C 552. The insulation shall be fabricated in half sections wherever possible. For large diameter piping where half sections are not practical, curved sidewall segments are permitted.
2. Jacketing- a 50 mil (1.3mm) thick self-sealing, modified bituminous membrane reinforced with a glass fabric, and a 1mil (0.3mm) aluminum top film on the outer surface.
3. Mastic- shall be asphalt cutback mastic.
4. Reinforcing Fabric- shall be open mesh polyester fabric with 6x5.5 mesh/inch configuration.
5. Sealant- shall be a non-setting butyl sealant.
6. Banding- shall be ½ inch aluminum or fiberglass reinforced nylon for insulated lines with OD's of 48 inches or less.

III. Equipment Insulation Application

A. Chiller Cooler and Chilled Water Air Separators - Shall be insulated with fiberglass insulation cut to a smooth uniform fit with butting edges. Complete installation shall not have wrinkles, bulges or overlapping edges. Secure insulation to all surfaces with adhesive designed for that purpose.

B. Finish - All insulation on chilled water chiller cooler and chilled water air separator shall be covered with an 8-oz. canvas jacket installed as described in paragraph 3.02 D.

IV. Ductwork Insulation Application

A. Fiberglass Duct Wrap Insulation - The duct wrap insulation shall be secured to the ductwork with fire retardant adhesive in sufficient quantities to prevent sagging. Ducts with a width of over 30" shall be further secured on the underside with mechanical fasteners on 18" maximum centers. Insulation shall be butted with facing overlapping all joints at least 2" and sealed with fire retardant vapor barrier adhesive. Seal all breaks and punctures with vapor barrier tape and same type of fire retardant adhesive. Stapling is not acceptable.

B. Fiberglass Insulating Board Application

1. The insulating board shall be secured to the ductwork with mechanical fasteners. The fasteners shall be spaced 12" to 18" on center with a minimum of two rows per side of duct. Secure insulation in place with washers firmly embedded in insulation. Seal all joints, breaks and punctures with fire retardant vapor adhesive reinforced with a 3" wide strip similar to that of facing.
2. Finish - A glass cloth shall be applied over the facing into a wet coat of fire retardant adhesive, overlapping seams at least 2". Apply finish coat of same fire retardant adhesive.

END OF SECTION

Part 1 - General

I. General

A. The Bidding and Contract Requirements, Division 1 - General Requirements, Section 230100 - General Provisions, and Section 230500 - Basic Materials and Methods, shall apply to this section.

B. The objective of commissioning is to provide documented confirmation that each facility fulfills the functional and performance requirements of Prince George's County Public Schools. To reach this goal, it is necessary for the commissioning process to establish and document the following:

1. Owner's Project Requirements (OPR), which are a criteria for system function, performance, and maintainability (design intent);
2. Compliance with OPR throughout design, construction, start-up, and the initial period of operation.

II. Scope

A. The Commissioning Agent (CxA) will serve as an objective advocate of the owner, oversee and coordinate the commissioning process, and present final recommendations to the owner regarding the performance of the commissioned building systems.

B. The primary tasks of the CxA during the overall Design Stage is to review the design to ensure it meets OPR and develop detailed commissioning specifications.

C. During construction, the CxA coordinates the execution of a testing plan, which includes observing and documenting all systems' performance to ensure that the systems are functioning in accordance with the OPR and the contract documents.

D. The CxA is not responsible for design or general construction scheduling, cost estimating, or construction management, but may assist with problem-solving or resolving non-conformance issues or deficiencies.

III. Quality Assurance

A. The roof drainage system shall be tested for leaks before the insulation is applied and before the piping is covered up. The test shall be filling the system with water.

B. LEED Requirements:

1. The CxA shall be involved throughout the project from design development through the warranty phase.
2. The CxA will provide commissioning services required by LEED for Schools - 2007 (or current version).

3. The CxA works in conjunction with the project design team through the design process, prepares a commissioning plan, and a Final Commissioning Record to meet the requirements of the LEED Energy & Atmosphere commissioning credits.

IV. Submittals

A. Provide full commissioning reports to PGCPS upon completion for all required equipment and/or systems..

Part 2 - Products (None)

Part 3 - Execution

I. Design Stage: The CxA shall perform the following duties during the design stage of the project:

A. Assemble initial commissioning team, hold a scoping meeting and identify responsibilities.

B. Review the Preliminary Commissioning Plan developed by PGCPS during the Planning Phase and fill in additional detail including team member responsibilities & directory, communication structure, specific systems & equipment to be commissioned and commissioning process schedule.

C. Schedule and lead commissioning meetings as needed with the Commissioning Team

D. Coordinate the commissioning work during design.

E. Review Owner's Project Requirements & Basis of Design documentation for clarity and completeness.

F. Perform focused reviews of the design, drawings and specifications at each stage of development (Pre-DD, 35%, 65%, & 99% review meetings).

G. Assist and review the development and updating of the PGCPS' Project Requirements and Basis of Design by design team members after each design review submission.

H. Update the Commissioning Plan in preparation for Construction Stage.

I. Develop full commissioning specifications for all commissioned equipment. Coordinate this with the architect and engineers and integrate the commissioning specifications into the overall project specification package, normally Sections 01910 and 15995; with Section 16995 open if required.

1. The commissioning specification will include general commissioning requirements common to all systems and assemblies and a detailed description of the responsibilities of all parties, details of the commissioning process; reporting and documentation requirements, including formats; alerts to coordination issues,

deficiency resolution; construction checklist and start-up requirements; the functional testing process; specific functional test requirements, including testing conditions and acceptance criteria for each piece of equipment being commissioned.

2. The specifications will clearly indicate who is witnessing and documenting start-up of each commissioned system. The specifications will be clear as to who is writing, directing, conducting and documenting functional tests and regulatory-required tests. This may vary between systems, especially between electrical and mechanical. Provide language to enhance current project specifications to ensure comprehensive controls submittals, full control contractor accountability for documented point-to-point checkout and commissioning participation, comprehensive test, adjusting and balancing, full contractor documentation of start-up and superior training and O&M manual documentation.

J. Coordinate a controls integration meeting where the electrical engineers, mechanical engineers, PGCPS representatives, and the CxA discuss integration issues between equipment, systems and disciplines to ensure that integration issues and responsibilities are clearly described in the specifications.

K. Review the recommendations from the constructability review for commissioning and O&M issues.

L. Write step-by-step functional test procedures and documentation formats for all commissioned equipment and assemblies. Test procedures will include manual functional testing, energy management control system trending and may include stand-alone data-logger monitoring.

II. Construction Stage: The CxA shall perform the following duties during the construction stage of the project:

A. Coordinate and direct the commissioning activities in a logical, sequential and efficient manner using consistent protocols and forms, centralized documentation, clear and regular communications and consultations with all necessary parties, frequently updated timelines and schedules and technical expertise.

B. Plan and conduct commissioning meetings as needed and distribute minutes. Once project has successfully been bid and awarded conduct a commissioning kick-off meeting to provide an overview of the commissioning process, establish lines of communications, and review timelines and schedules.

C. Coordinate the commissioning work with the design team, PGCPS Mechanical Division, and construction manager, to ensure that commissioning activities are being incorporated into the master schedule.

D. Revise, as necessary, the construction phase commissioning plan developed during design, including scope and schedule.

E. Request and review additional information required to perform commissioning tasks, including O&M materials, contractor start-up and checkout procedures. Before start-up, gather and review the current control sequences and interlocks and work with contractors and design engineers until sufficient clarity has been obtained, in writing, to be able to write detailed testing procedures.

F. Review submittals applicable to systems being commissioned for compliance with commissioning needs, concurrent with the design team and Construction Manager reviews.

G. Write and distribute construction checklists for commissioned equipment.

H. Develop an enhanced start-up and initial systems checkout plan with contractor input for selected equipment.

I. Perform site visits, as necessary, to observe component and system installations. Attend selected planning and job-site meetings to obtain information on construction progress. Review construction meeting minutes for revisions/substitutions relating to the commissioning process.

J. Witness HVAC piping pressure test and flushing, sufficient to be confident that proper procedures were followed. Include testing documentation in the Commissioning Record.

K. Witness any ductwork testing and cleaning sufficient to be confident that proper procedures were followed. Include documentation in the Commissioning Record.

L. Document construction checklist completion by reviewing completed construction checklists and by selected site observation.

M. Document systems start-up by reviewing start-up reports and by selected site observation.

N. Approve air and water systems balancing by spot testing and by reviewing completed reports and by selected site observation.

O. Coordinate functional testing for all commissioned systems and assemblies. Witness and document manual functional performance tests performed by the Construction Contractor for all commissioned systems and assemblies, except:

1. Some smaller equipment may be tested and documented by the Construction Contractor at the Commissioning Agent's discretion,
2. Electrical equipment testing and regulated testing may be directed and documented by the Construction Contractor with only spot witnessing and report review by the Commissioning Agent.

P. The functional testing shall include operating the system and components through each of the written sequences of operation, and other significant modes and sequences, including start-up, shutdown, unoccupied mode, manual mode, staging, miscellaneous alarms, power failure, security alarm when impacted and interlocks with other systems or equipment. Sensors and actuators shall be calibrated during construction check listing by the installing contractors, and spot checked by the commissioning authority during functional testing. Analyze functional performance trend logs and monitoring data to verify performance. Coordinate retesting as necessary until satisfactory performance is achieved.

Q. Functional testing shall be done using conventional manual methods, control system trend logs, and readouts or standalone dataloggers, to provide a high level of confidence in proper system function, as deemed appropriate by the Commissioning Agent and PGCPS.

R. After manual testing and initial trouble shooting is complete, monitor system operation and performance for selected data points for up to two weeks by requesting trend logs from the Construction Contractor from the building automation system. For needed system points not able to be trended by the building automation system, furnish and install temporary portable data loggers that will monitor up to 20 points. Analyze monitored data to verify operation and performance and issue a written report. This time frame and monitoring points may be modified to accurately commission the building.

S. Verify the following specific EMS operations and/or programming functions
   1. Building has been zoned according to design and includes associated equipment
   2. Operational schedules are set; prove modifications can be performed
   3. Overrides are functional for Zones (via touch-screen), Individual Equipment, and Outdoor Air Dampers
   4. Warm-up/cool-down and night set-back routines are accurately programmed and functional
   5. Alarms are proven for incoming power failures (EMS & Security) and critical mechanical operations.

T. Review and verify the delivery and accuracy of the following EMS items:
   1. Control As-Built documents are complete (electronic and paper form)
   2. EMS program and database installed on CD/DVD and PGCPS Energy Management laptop
   3. Graphics are complete and floor plans are color coded per zone
   4. Software manuals are delivered and EMS training is performed for PGCPS Energy Management and Building Services personnel

U. Maintain a master issues log and a separate record of functional testing. Report all issues through the Construction Manager and PGCPS Mechanical Division as they occur. Provide through the Construction Manager written progress reports and test results with recommended actions.

V. Review the O&M manuals for commissioned equipment.

W. Compile a Commissioning Record, which shall include:
   1. A brief summary report that includes a list of participants and roles, brief building description, overview of commissioning and testing scope, and a general description of testing and verification methods.
   2. All outstanding non-compliance items shall be specifically listed. Recommendations for improvement to equipment or operations, future actions, commissioning process changes, etc. shall also be listed. Each noncompliance issue shall be referenced to the specific functional test, inspection, trend log, etc. where the deficiency is documented.
   3. Also included in the Commissioning Record shall be the commissioning plan, PGCPS' Project Requirements, Basis of Design, commissioning specifications, design review, submittal review, issues log, construction checklists, CxA site visit and Commissioning Team meeting minutes, O&M review, test procedures and test data reports.
   4. Submit 3 bound text copies of the Commissioning Records with 3 CD copies including all information listed above.

END OF SECTION

Part 1 – General

I. General
   A. The Bidding and Contract Requirements, Division l - General Requirements, Section 230100 - General Provisions and Section 230500 - Basic Materials and Methods, shall apply to this section.

II. Scope: The work covered under this section of the specifications shall include:
   A. Design Considerations
   B. Technical Considerations
   C. General Requirements
   D. Zones
   E. Temperatures and Set Point
   F. Schedules
   G. Sequences
   H. Graphics
   I. Direct Digital Building System Components
      1. Wiring, Conduits, and Panels
      2. Control Dampers
      3. Control Valves
      4. Variable Frequency Drives (VFD)
      5. Instrumentation and Control Devices
   J. Training

III. Quality Control and Technical Considerations
   A. LEED, IECC Compliance items planned for the project shall be approved by PGCPS before specifications are completed.
   B. See “GENERAL REQUIREMENTS” in PART 2 of this section for addition design and technical considerations before developing the automatic temperature control system (ATC) for each project.
   C. ATC contractor is required to have at least 50 employees within construction and service. Employees must work for the controls division.
   D. ATC contractor at a minimum must have 4 employees with Niagara 4 certification. All technicians working on the PGCPS server must be Niagara 4 certified. ATC contractor shall submit certifications to PGCPS.
   E. ATC contractor must be approved by PGCPS controls division prior to contract award.

F. ATC contractor must self-perform all ATC work including but not limited to electrical installation.

G. ATC contractor must have a service department with 24/7 response.

Part 2 - Products

I. General Requirements

A. The ATC system shall be a Direct Digital Control (DDC) system.

1. The controls system shall utilize a single software platform (Use of a secondary system for controller configuration shall be unacceptable.
2. Tridium Niagara 4 Framework Titan 8000 (open-protocol and open NIC ONLY) specific controllers only. This shall include supervisory and unitary controllers.
3. All controllers, both supervisory and unitary (unit controllers) must be programmable. No configurable controllers will be accepted by PGCPS.
4. All Controllers are to be BTL (BACnet Testing Laboratories) Certified.

B. The complete system shall be warranted for a period of two (2) years from the date of substantial completion. A comprehensive test, evaluation, training and follow-up program shall be specified by the engineer to ensure that the system operates as designed over the life of the system during warranty period and beyond. Minimum training and follow-up program is specified in PART 3 of this section.

C. All software updates available for the ATC system during the warranty period shall be installed and tested to ensure proper operation at no extra cost to PGCPS.

D. Contractor shall not proceed with work involving interfacing with an existing controls system prior to written direction and approval by PGCPS Energy Management Department.

E. The ATC system in all schools shall be open protocol BACNET connecting back to the existing Tridium front end at the PGCPS Facilities Command Center, on Brown Station Road.

1. NOTE: Sole sourced DDC Controllers with proprietary software and programming requirements will not be approved by PGCPS for installation. Specify that the ATC contractor shall not order any controllers prior to approval from PGCPS and design engineer.

F. Programming for all devices (supervisory and unitary) shall use Niagara software only; “wizards” and plug-ins are NOT acceptable. All programming language and graphics

shall be the same software package shall be considered non responsive and will not be accepted.

G. All software and hardware shall be licensed directly to PGCPS.

H. All software, hardware, and training must be able to be purchased from several vendors. Branch only purchases will not be accepted.

I. PGCPS shall have the ability to be self-sufficient with regards to installation and programming of all software and hardware.

J. Each DDC controller shall communicate over a BACNET communications bus installed between the controllers by the ATC subcontractor. A communications master control panel shall be provided by the ATC subcontractor. This panel shall:

1. Provide PGCPS personnel with a convenient location to obtain system information using a laptop or a hand-held terminal. The hand-held terminal shall be available from more than one manufacturer as a standard product. School staff shall have (for read only) access to the system.
2. Collect ATC information and transmit it to the main ATC panel.
3. Receive energy management directions from the main ATC panel.
4. Have a lockable box installed inside the ATC panel with all site backups on a flash drive inside.

K. Within 10 working days of contract award, a meeting shall be scheduled with PGCPS, the Design Engineer, the General Contractor, the Controls Contractor, the Equipment Manufacturer, and the Commissioning Agent where applicable. The purpose of the meeting will be to review the sequences shown on the contract drawings, points list's, and interfaces necessary to reduce the number of issues and operational concerns. At completion of job a backup copy of the whole station; i.e. program is to be made. At completion of project, provide a copy of complete program on CD to be sent to PGCPS.

L. Two-pipe systems will require a Heating/Cooling switchover software point for equipment reference. Piping switchover will occur with manual hand valves. Automatic control valves for heating/Cooling piping switchover will not be accepted.

M. In the event an existing ATC system is being removed, the Contractor shall remove all wiring and other equipment and all old input/output (I/O) points associated with that system from all associated servers. PGCPS shall have first salvage rights for all equipment being removed.

N. All controllers, sensors, and switches shall be hard-wired. All connections between the main ATC panel and sub-panels/controllers shall be hard-wired. All electrical conduit

and wire installation as it pertains to the ATC system shall be performed by the ATC contractors' employees. Subcontractors will not be accepted. All Wiring that pertains to the DDC system shall be the sole responsibility of the ATC Contractor. Wiring shall be installed in accordance with Building and Electrical codes as well as any other applicable codes.

O. All cable splices when allowed are to be under terminal stripe.

P. All equipment shall have a Relay-In-Box (RIB) switch relay override for service and troubleshooting.

Q. Flat plate type sensors, not thermostats, shall be used to read temperature in spaces and shall have a range of 40° F to 100° F.

R. All equipment (with the exception of Boilers and Chillers) shall be capable of stand-alone DDC Function in the event of a network failure. These controllers shall be provided, and field installed by the ATC contractor. Factory controllers will not be acceptable.

S. The data transmitted from the ATC system to the Command Center shall include the following, as a minimum:

1. Equipment Information:
    a) Start/Stop signals for all equipment
    b) Summer/Winter single point switch-over capability
    c) Adjustable reset schedules
2. General Information:
    a) HWS Temperature
    b) HWR Temperature
    c) CWS Temperature
    d) CWR Temperature
    e) Glycol Temperature
    f) Geothermal Water Temperatures
    g) Outside Air Temperature
    h) Status and Flow for all Pumps
    i) Cooling Tower Status
    j) Alarm Data
3. Zone Information:
    a) All true Fan status (On/Off/Speed):
        (1) Read differential pressure for water

(2) Read status and safeties for air

b) Zone Temperature as measured by Zone Sensor

c) Override Status

d) Alarm Data (i.e. readings outside of normal system parameters)

(1) Temperature ± 10° from set point for ½ hour

e) CO_2 Level of Zones (See Section II, Paragraph E)

f) Return Air Temperature for Zones with constant volume and variable volume Air Handling Units.

g) Discharge Air Sensors on all equipment

h) Equipment Status (Default/Open/On/Off)

II. Zones

A. Buildings shall be divided into zones based on space utilization (i.e. media center, gym, etc.) and load requirements (i.e. classroom wing on North side). Consult with the PGCPS Mechanical Systems Department at the Design Development stage for final determination of zones.

B. Should adjoining zones be connected by a movable partition, particular care shall be taken to preclude short cycling when the partition is open.

C. The four basic schemes of zone control shall be:

1. Occupied Heating
2. Occupied Cooling
3. Unoccupied Heating
4. Unoccupied Cooling

D. Push button override switches shall be provided in the Administration zone to initiate an adjustable occupied mode when the zone is in an unoccupied mode. This mechanism shall be capable of extending the occupied mode in one hour increments up to three total hours. The push button switch shall be located in a controlled space and a local annunciator light shall be provided to indicate the override status. Override for all other zones shall be scheduled through the PGCPS Energy Management Department.

E. Large zones with constant volume HVAC systems and variable occupancy shall incorporate return air CO_2 sensors which shall, during the occupied mode, modulate the outside air damper(s) to maintain air quality in accordance with the latest version of ASHRAE Standard 62. These sensors shall be self-testing; i.e. upon failure of a sensor, the outside air damper(s) shall move to the position which provides the required outside air without reference to the CO_2 content of the ventilated space. The DDC system shall

have the capability to override this sensor and to provide the required outside air inside without reference to CO_2 contents of the ventilated space.

III. Temperatures and Set Points

A. All set points shall be fully adjustable and meet the following guidelines:

1. Occupied Heating: Set point 70° F, to maintain space temperatures no lower than 68° F
2. Occupied Cooling: Set point 76° F, to maintain space temperatures no higher than 78° F
3. Unoccupied Heating: Set point 55° F
4. Unoccupied Cooling: Set point 85° F

B. Cooling supply air temperature shall be maintained at design temperatures allotted on contract drawings and shall not exceed 62° F in administrative and instructional spaces with reheat capabilities.

IV. Schedules

A. Provide separate area scheduling capabilities for:

1. Administrative Offices
2. Media Center
3. Auxiliary
4. Gym (with locker rooms where applicable)
5. Cafeteria or Multi-Purpose Room
6. Auditorium
7. Classrooms: Zones shall be determined by PGCPS
8. Computer Lab
9. Daycare/Aftercare Room
10. Master Schedule for Building

V. Sequences

A. Located at the end of this section are several basic ATC sequences that should be used as the Basis of equipment sequences used by the design engineer on their project. These sequences are minimal and the design engineer will need to add the items that are unique to their project. Some items include valve types (2-way, 3-way, etc.), and auxiliary equipment interfacing with main equipment sequence (exhaust fans, sensors, dampers, etc.) that are specific to the project being designed.

B. The design engineer is to develop a point schedule for all appropriate equipment. The point schedules will then need to be reviewed and coordinated with PGCPS BAS

Department before drawings are submitted for final review. Points should be kept to a minimum and points that will be best utilized by PGCPS.

VI. Graphics

A. All proposed graphics shall be provided to PGCPS as submittals for review and approval prior to installation.

B. The home screen for each school shall include links to the Mechanical and Controls drawings, Balancing Reports, warranty certificate, Communications Layout and ATC as-builts.

VII. Direct Digital Building System Components

A. All components to be operable with a Tridium Niagara 4 framework with open protocol.

B. Wiring, conduits, and panels.

1. Wiring to serve device operating above 50 volts shall be equal to that specified in Division 26 for wires and cables. Wiring to serve devices operating below 50 volts is to be fully color coded, copper 600V type THW or THHN, minimum no. 22 or as specified in Division 26 electrical.
2. Conduit and fitting type and grade shall match that used by the Division 26 electric in various areas of the school. Types should match the following:
   a) Rigid, heavy-wall galvanized steel conduit conforming to UL6 and ANSI C80.0.
   b) Intermediate steel conduit (IMC) galvanized steel conduit conforming to UL 1242 and ANSI C80.03.
   c) Electrical metallic tubing (EMT) thin wall galvanized conforming to UL797 and ANSI C80.03.
   d) Surface metal raceway – equal to wire mold NO. 700 minimum size.
3. Control panels to be 16 gage galvanized steel cabinets with piano hinges and lockable latches. Provide only one panel per mechanical equipment room. Bolt panel to walls or building structure. Do not mount on equipment.

C. Control Dampers:

1. Supply air and return air control dampers shall be equal to Ruskin model CD35, multi-blade, 16 gage galvanized steel or aluminum blades, finished in black enamel frames, and have sound air-stops which prevent air leakage.
2. Outdoor air, exhaust air and pressure relief control dampers to be equal to Ruskin CD50 (min) or CD60 low Leakage dampers. Leakage to be no more than 4 CFM per square foot at 1-inch wg. when tested.

3. Two position control dampers can be parallel-blade type, modulating control dampers to be opposed-blade type.

D. Control Valves:
   1. Control valves to be sized based on a maximum pressure drop across water valve of 4.0 psi. Heating system valves are normally open to full flow in power loss and cooling system valves normally closed to stop flow to coil in the event there is power loss.
   2. Valves 2-inches and smaller to be single seated cast brass globe type valve capable of handling 280 degree F water at maximum of 150 Psig. Valves 2.5-inches and larger to be cast iron single seated valves capable of handling 250 degrees F water at maximum of 150 Psig. All butterfly valves used are to be high performance cast iron type with stainless steel or bronze disk capable of handling 225 degrees F water at maximum of 150 Psig.

E. Variable Frequency Drive (VFD):
   1. Acceptable manufacturers shall include:
      a) ABB
      b) Honeywell Smart VFD
   2. Variable frequency drives (VFD) are to be provided and installed by the control contractor for the project. VFD's are not to be supplied by the mechanical or electrical contractor unless the drive is used to operate the refrigeration part of the HVAC system, such as a chiller or compressor equipment. Drives normally supplied with package equipment may be supplied by control contractor. The control equipment supplier to be responsible for provide the correct VFD to accomplish the control sequence and fit physically in the space allotted.
   3. VFD's are not to be mounted in the air stream of air handling units or within 10 feet of a boiler. Each piece of equipment requiring a VFD is to be dedicated to that piece of equipment only. No motor sharing of VFD's. Provide a laminated list of fault codes attached to each VFD, inside door of the drive.
   4. VFD construction, accessories, and function shall meet the following requirements:
      a) VFD to be in a UL type 1 or 4x enclosure.
      b) VFD must have a minimum efficiency of 95 percent or better at half speed and 97 percent or better at rated full speed.
      c) VFD to be microprocessor based control with digital display and key pad operator station.

d) VFD to include a mechanical and electrical interlocked bypass.
e) VFD shall include real time clock (RTC) with automatic daylight savings time and calendar, able to provide three time channels.
f) VFD shall have built in 2 stand-alone PID control loops.
g) VFD shall include built-in dual 5 percent DC choke to minimize harmonic from the device.
h) Operational functionality required for each VFD.
(1) Motor switch ride-through
(2) Ramp time optimizer
(3) Over temperature ride-through
(4) Power ride-through
(5) Configurable automatic reset
(6) Flux optimization
(7) Flying start
(8) Automatic torque boost
(9) Resonance reduction using prohibited frequency ranges
(10) Motor pre-heat
(11) Sleep mode
(12) Temperature-controlled cooling fans

5. VFD manufacturer is to provide 16 hours of training and set-up time for the drives on the project. The control contractor is to have a representative from their firm present during this training and set-up period.
6. Drives are to be closed, free of debris dust before turnover

F. Instrumentation and Control Devices:
1. Room sensors to be accurate to plus or minus 1 degree, operating range of 35 to 115 degrees F., and set point adjustment range of 45 to 95 degrees F.
2. Humidity sensors to have a operating range of 10 to 90 percent relative humidity (RH) with a plus or minus 2 percent RH accuracy.
3. Carbon dioxide sensors to be equal to Vaisala gmd20 with a 0-2000 ppm range with a accuracy of plus or minus 30 ppm between 60 and 90 degrees F.
4. Differential pressure sensors to have a accuracy of plus or minus 0.5 percent of full scale and a operating temperature range of minus 40 to plus 200 degrees F.
5. Freeze stats to have a sensing element up to 20 feet that will properly cover the coil face and have adjustable set point.

6. Flow switches are to be paddle type equipped with SPDT contracts to establish proof of flow.
7. Actuators are to be powered with 24VAC or 24VDC with a proportional signal of 0-10VDC or 2-10VDC from the ATC Controller. Actuators will be full closed at 0/2VDC signal and display a value of 0% of the graphics. Actuators will be full open at 10VDC signal and display a value of 100% on the graphics. Floating Actuators will not be acceptable.

PART 3 – EXECUTION

I. GENERAL REQUIREMENTS
   A. Installation of ATC equipment or wiring cannot begin until submittals have been approved by design engineer and PGCPS.
   B. Control system and devices are to be installed in accordance with manufacturer's instructions, complete and operating as shown and specified.
   C. All ATC equipment and devices to be located in readily accessible locations. Locations to be approved by owner.
   D. A qualified, direct factory tech person shall operate, test, calibrate, and adjust each control system until it operates as specified in the control sequences.
   E. In the event an existing electronic control system is being replaced in an existing school project, the ATC contractor for the new system will be required to remove the existing school software from the energy management server at the Brown Station Road Facilities Complex.
   F. Cabling – No splices, no mixing of cable type, exception to splice - must be identified in location. No exceptions will be made for network communication wiring. This includes BACnet I/P, MS/TP, and I/P network wiring.

II. Sequences
   A. ATC contractor is to verify, based on the final approved manufacturers equipment, that the sequences on the contract drawings can remain as shown and do not need to be modified. In the event a modification to the sequences on the drawings is required, the change is to be discussed with design engineer and PGCPS Mechanical Systems Dept. before shop drawings are submitted.

III. Training
   A. The Controls Contractor shall provide the following training services:
      1. Two days of on-site training, 4 hours each day

a) One four (4) hour training course for the designated PGCPS personnel to be performed on job site.
b) One four (4) hour training course for the designated PGCPS personnel to be performed at the Brown Station Road Office. Time for this training will be adjusted to train PGCPS night time personnel.
c) The class shall be taught by a certified agent who is fully knowledgeable of the specific installation details of the project.
d) Agenda: The course agenda shall be provided by the contractor and shall include instruction on the specific systems and instructions for the operating the installed system. Topics covered should include as a minimum (however not limited to):
   (1) HVAC System Overview
   (2) Operation of Control System
   (3) Function of each Component
   (4) System Operating Procedures
   (5) Maintenance Procedures
   (6) Scheduling
   (7) Alarm Management
   (8) Trending

2. Off-Site Advanced Training:
   a) Two weeks of Advanced Training shall be provided at any time prior to the completion of the warranty period at the controls manufacturer's off-site training facility. **C**ontractor shall pay training registration, materials and miscellaneous fees. Contractor shall also pay for all expenses for travel (travel transportation, meals, lodging, etc.).
      (1) Advance training shall include the standard, advanced training offering on all control programming applications for the system installed.
      (2) Advance training shall include the standard, advanced training on installation, configuration, maintenance, network administrator and programming.

GI-1

General Notes for ATC System

1. Note to mechanical contractor that valve piping configurations for equipment are to be shown on control drawings so that the valves “fail safe” to the proper position. The mechanical contractor is advised to pipe the ATC valves as shown on the control drawings, which may not be the same as the mechanical contract drawings.
2. All EMS control and monitoring set points and schedules are to be adjustable through the system software.
3. Space temperature set points shall be as follows:
   a. Occupied – heating = 70 degrees F
   b. Occupied – cooling = 76 degrees F
   c. Unoccupied – heating = 55 degrees F
   d. Unoccupied – cooling = off (unless otherwise needed)
4. All low voltage ATC wiring to be run in plenum rated cable where concealed and accessible, and in rigid conduit in the boiler room. Any wiring in exposed areas other than boiler room should be installed in conduit of the same grade used by electrical contractor in that area.
5. Emergency fan disconnect switch control, smoke detectors, smoke dampers, and freeze detectors shall be hard wired and shall not require operation of DDC system software to operate or to de-energize system fans.
6. The control contractor shall be responsible for installing and wiring all control equipment supplied with the HVAC equipment and for providing power circuits for these and all other equipment in the entire control system. Control contractor shall also provide any ancillary components including but not limited to switches, relays, wiring, and conduit to accomplish intended control functions and/or control sequences that may be noted in the specifications.
7. Function of controls shall be restored to normal operation when safeties are reset or when power is restored after an outage. Freezestat tripping shall reset at the unit. Emergency fan disconnect tripping shall be reset when the disconnect switch is reset. Smoke detector tripping shall be reset when the alarm is no longer present in the fire alarm system.
8. Where smoke detector point is indicated, hard wiring of shut down is required. Additionally, a software input is required monitoring the smoke detector status so that a system user would be able to diagnose the cause of the shutdown.

9. Full Hvac Replacement Projects: For General systemic projects where all HVAC equipment is being replaced, even existing equipment that may not be replaced should have its ATC controls replaced. This includes items such as refrigerator/freezer alarms, combustible gas detecting, ATC lighting control, etc. Design engineer can acquire a list of all controls from PGCPS BAS department.
10. Partial Hvac Replacement Projects: For General systemic projects where only part of the HVAC equipment is being replaced, the extent of control system replacement should be reviewed with PGCPS Construction and HVAC department representatives. This includes partial HVAC equipment replacement jobs or additions to schools, etc.

GI-2

Auto – Occupied – Unoccupied Controls

A. **General**

a. The design engineer for the project is to provide an auto-occupied-unoccupied zone schedule for all the areas served in the building by HVAC equipment. Schedule to include zone numbers, area served, and equipment being controlled in each zone. Schedule to be on contract drawings and the ATC shop drawings.

B. **Operation**

a. Each zone as indicated on the schedule noted above shall have an auto-occupied-unoccupied time clock function.

b. When a zone is indexed to “auto” the equipment in that zone will function either on the “occupied” cycle or “unoccupied” cycle as determined by EMS.

c. When indexed to “occupied” the equipment in that zone will function on the “occupied” cycle. When indexed to “unoccupied” the equipment in that zone will function on the “unoccupied” cycle.

CPE-1

Heating Water Plant Sequence

(Boiler and Pumps Serving Heating Water Loop)

A. **Boiler Plant**

a. When the outside air temperature drops below 65° F (ADJ) the heating water plant shall be enabled. The lead heating water pump and lead boiler shall energize. The corresponding boiler circulator pump and all combustion air dampers shall be energized when boiler is enabled. Boiler shall modulate through internal controls to maintain the heating supply water temperature according to the reset schedule (developed by the design engineer).

b. When enabled, systems with two boilers shall be operated in a lead-lag configuration and alternate to maintain equal run time. Should the lead boiler fail to fire, the lag boiler shall be energized and an alarm shall be sent to the BAS.

B. **Heating Water Pumps**

a. The heating water pumps shall be controlled by the BAS. The heating water pumps shall be operated in a lead-lag configuration and alternate to maintain equal run time. When the heating water plant is enabled, the lead pump shall run continuously. The pumps shall modulate as needed based on the differential pressure sensor in the heating water loop. Upon failure of the lead pump as sensed by pump status, the lag pump shall be enabled and a lead pump failure alarm shall be generated. A flow switch shall be used to determine status/proof of pump.

C. **Safeties/Alarms**

a. The lead heating water pump shall be energized and proof of flow verified by the flow switch prior to a boiler firing. The combustion air dampers shall open and be proven open by the end switch prior to the boiler firing, based on local interlock. A CO monitor in the space shall provide an audible alarm and the boilers with their associated circulator and combustion air dampers shall be de-energized upon detection of CO and an alarm shall be sent to the BAS. If both hot water pumps fail OR the hot water loop temperature falls below 110 degrees (adj), an alarm shall be sent to the BAS and an email shall be sent to pre-determined personnel.

CPE-2

Chilled Water Plant Sequence- Air Cooled Chiller

(Air Cooled Chiller, Pumps, Heat Exchanger, Etc. Serving Chilled Water Loop)

A. **General**

a. The chilled water plant includes an air-cooled chiller, primary and secondary chilled water pumps, VFD's, glycol feeder, and glycol-to-water exchanger. The variable flow chiller plant shall be enabled by the BAS when outside air temperature is above the set point of 65°F (ADJ) and or as scheduled on contract drawings.

B. **Air-Cooled Chiller**

a. Upon the chiller plant being enabled, the lead primary chilled water pump, lead secondary chilled water pump, and chiller shall energize. The chiller shall modulate through internal controls to maintain the primary chilled water loop supply temperature set point indicated by design engineer. Should the primary chilled water loop temperature rise and remain continuously above for a 10 minute period (ADJ.) the chiller shall de-energize. The chiller plant shall be disabled when the outside air temperature is below 60°F (ADJ.)

C. **Primary Chilled Water Pumps**

a. The primary chilled water pumps shall be controlled by the BAS. This primary chilled water loop pumps water containing a glycol solution between air cooled chiller and plate heat exchanger. The primary chilled water pumps shall be operated in a lead-lag configuration and alternate to maintain equal run time. When the air cooled chiller is enabled, the lead pump shall run continuously. Upon failure of the lead pump as sensed by pump status, the lag pump shall be enabled and a lead pump failure alarm shall be generated. A flow switch shall be used to determine status of pump.

D. **Secondary Chilled Water Pumps**

a. The secondary chilled water pumps shall be controlled by the BAS. This secondary chilled water loop pumps water between the buildings cooling equipment and the plate heat exchanger. The chilled water pumps shall be operated in a lead-lag configuration and alternate to maintain equal run time. When the air cooled chiller is enabled, the lead pump shall run continuously. The pumps shall modulate as needed based on the differential pressure sensor in the building chilled water loop. Upon failure of the lead

pump as sensed by pump status, the lag pump shall be enabled and a lead pump alarm shall be generated. A flow switch shall be used to determine status of pump.

E. **Safeties**

a. The lead primary and secondary chilled water pumps shall be energized and proof of flow verified by the flow switches prior to air-cooled chiller being energized.

b. If both chilled water pumps fail OR condensing water pumps fail OR water temperature rises above 65 degrees (adj), an alarm shall be sent to the BAS and an email shall be sent to pre-determined personnel.

CPE-3

Chilled Water Plant Sequence – Water Cooled Chillers

A. **General**

a. Chiller, Primary and secondary chilled water pumps, condenser water pumps are to be controlled by the chilled water plant controller (provided by the chiller manufacturer)

b. Energizing the chilled water system shall be accomplished from a signal from the DDC computer provide an editable schedule for chiller plant operation and provide an adjustable temperature above which the chiller plant will operate when scheduled to be available.

c. Current sensing relays shall determine if the active primary, secondary, and condenser water pumps are operating properly. Pump failure will initiate an alarm at the DDC alarm printer.

d. Chiller plant controller shall include but not limited to:

i. Staging or sequencing of chiller and associated chilled and condenser water pumps based in part on part load performances and energy utilization.

ii. Monitor and control time utilization of each chiller.

iii. Switch operation of the lead chiller on a regularly scheduled basis.

iv. In case of a pump or chiller failure automatically switch operation to the other chiller.

B. **Chiller Plant Controller and Primary Chilled Water Pump**

a. The chiller manufacturer shall coordinate the control interface with the ATC contractor. The chiller manufacturer shall provide shop drawings showing point-to-point wiring diagrams of the interface between the DDC system and the chiller plant control system as well as between the components within the chiller plant control system. The chiller manufacture shall provide point-to-point diagrams and schematics with component inputs and outputs along with cut sheets and performance information of the input/output sensors and devices. The DDC control submittal shall include this information.

b. The ATC contractor shall be responsible for installing and wiring all control equipment supplied with the chiller and chiller plant controller including switches and relays or devices to accomplish the sequence of operation established by the design engineer. Provide control interface between chiller plant controller and the chiller control panel

and all associated components providing input to or receiving output from the chiller plant control system in accordance with the chiller manufacturer's wiring diagrams and recommendations. Provide all necessary wiring and devices to make the system operate according to the chiller control package requirements.

c. The chiller plant controller will receive a signal from the secondary chilled water pumps that they have been in operation for 5 minutes satisfactory. Then the chiller plant controller will start going through its control sequence. The controller will activate and assure the primary chilled water pump is operating satisfactory through its differential pressure control and check all system safeties before starting the chiller to produce chilled water.

C. **Secondary Chilled Water Pumps**

a. When the chilled water system is activated by PGCPS DDC computer, the secondary (building) chilled water pumps shall operate in sequence to maintain the differential pressure setpoint.

b. The lead pump shall be proven to be running via its current sensing relay for five minutes prior to the DDC system giving a signal to the chiller plant controller to energize the chiller plant and begin producing chilled water.

c. Lead pump's VFD shall modulate its pump motor speed to maintain the differential pressure setpoint.

d. Upon a loss of flow through the load pump for more than 10 seconds (adj.) as sensed by its current sensing relay, the lag pump shall be energized and controlled by sequence. An alarm message shall be sent to the DDC system.

e. Upon an invalid signal from a differential pressure sensor, the lead pump shall operate at maximum preset speed. Reset shall be automatic upon correction of failure.

f. Alternate lead and lag pump every 30 days.

g. When the chilled water system is de-activated, the secondary pumps shall be de-energized. When secondary pumps are off, operation of the chiller plant by the chiller plant controller shall be locked out.

h. Setpoints of differential pressure sensors shall be established during balancing.

D. **Condenser Water System**

a. The condenser water system shall be controlled by the chiller plant controller.

b. Condenser water supply temperature setpoint shall be determined by the chiller plant control system's energy management optimization program.

c. When a chiller's controls require condenser water operation, the tower inlet control valve shall open, if valve is required, and a condenser water pump shall be energized and run continuously.

d. Condenser water ATC cooling tower bypass valve shall modulate in opposition when required to ensure condenser water supply temperature does not fall below a minimum temperature setpoint, as sensed by associated insertion temperature sensor. Chiller manufacturer shall determine minimum temperature setpoint.

E. **Heat Tracing Control**

a. Provide electrical power to heat tracing when outside air temperature falls below 40 degrees F and disable electrical power when outside air temperature rises above 45 degrees F. Provide an alarm if current is not sensed in circuit when outside air temperature drops below 35 degrees F (adjustable).

CPE-4

Chiller Room Ventilation and Refrigerant Control

A. **General**
   a. Install refrigerant monitor and remote refrigerant sensors in accordance with manufacturer's' recommendations. Provide control interface with refrigerant monitor, exhaust fan and outside air damper through DDC panel.

B. **Ventilation Mode**
   a. When the set point of the room sensor is exceeded by 5 degrees F or when the timer switch is indexed to on, the outside air damper shall open and exhaust fan shall be energized.
   b. When the room sensor setpoint is satisfied or timer switch is indexed to off, the reverse shall occur. Provide a 5 degree F dead band on room sensor.

C. **Emergency Refrigerant Mode**
   a. When refrigerant is detected, as sensed by the refrigerant monitor, alarm locally and thru the DDC system to alert service personnel.
   b. Outside air damper shall open, exhaust fan, shall be energized, and chiller plant shall be de-energize. Operation shall be hard wired and shall not require operation of the DDC system in order to function.

TPS-1

Fan Coil Unit – 2 Pipe Chilled/Heating Water

A. **Occupied Cycle**
   a. The unit supply fan motor shall be energized and run continuously.
   b. With the system indexed in the heating mode; the control valve shall modulate water flow to the coil to maintain the heating setpoint of the room sensor.
   c. With the system indexed in the cooling mode, whenever the space temperature is more than 2 degrees F above the cooling setpoint of the room sensor, the control valve shall be positioned to provide full flow thru the coil. On a fall in space temperature to more than 2 degrees F below the cooling setpoint of the room sensor. The control valve shall be positioned to full bypass to the coil.

B. **Unoccupied Cycle**
   a. With the system indexed in the heating mode, unit supply fan motor and control valve shall be placed under control of the night setpoint of the room sensor, which shall cycle the fan motor and open the control valve to provide full flow across the coil to maintain temperature.

C. **Safety Control**
   a. Upon sensing excess water in secondary drain pan, condensate sensor shall de-energize fan coil unit and send alarm signal to PGCPS Mechanical Systems at Brown Station Facilities.

TPS-2

Unit Ventilator – 2 Pipe Chilled/Heating Water

A. **Occupied**

a. The supply fan motor will be energized and run continuously.

b. With the system indexed in the heating mode, the by-pass control dampers shall modulate air flow across coil to maintain the heating setpoint of the room sensor. Water flow through the coil to remain constant.

c. With the system indexed in the cooling mode, whenever the space temperature is more than 2 degrees above the cooling setpoint of the room sensor, the by-pass control dampers shall modulate air flow across coil to maintain the cooling setpoint. On a fall in space temperature to more than 2 degrees below the cooling setpoint of the room sensor, the bypass damper position for full air bypassing the coil.

d. With the unit ventilator in the economizer mode, with outdoor temperature below 62 degrees (adj.) the outside air damper will modulate open to maintain the space cooling temperature setpoint with the return air damper modulating accordingly.

e. Supply air low limit sensor will override the coil bypass damper to fully open, place outside air damper to minimum position with return air damper position accordingly, when the unit is in economizer to assure supply air temperature does not fall below 62 degrees (adj.)

f. When the economizer mode cannot satisfy the space room sensor setpoint of 76 degrees (adj.) and chilled water is available, the outside air damper to reposition to minimum setpoint and return air damper adjusting accordingly, and the bypass control dampers shall modulate air flow across coil to maintain the cooling setpoint.

g. If at any time the outside air temperature drops below 10 degrees (adj.), the outside air damper will be closed and the return air damper will open.

B. **Unoccupied**

a. The outside air damper will be closed and return air damper open. When the building system is indexed to the cooling mode the bypass damper shall be closed to the coil and the supply fan is to remain off until unit is placed in occupied mode. When the building system is indexed to the heating mode the room sensor will be indexed to the unoccupied heating temperature setpoint and the bypass damper shall be full open to coil. When the space temperature falls below the unoccupied setpoint, the unit supply

fan will cycle on. When the space temperature rises above the unoccupied heating setpoint, the unit supply fan will be disabled.

C. **Safety and Emergency Control**

a. Whenever the limitations of the freeze detector is exceeded, the supply fan will be de-energized. The outside air damper will close and return air damper will open. The coil bypass control damper is to be full open to coil. An alarm will be sent to the BAS. The low limit sensor will need to be manually reset before normal conditions are allowed to resume.

TPS-3

Two Pipe System Isolation Valves

A. **General**

a. Where heating only equipment is being served by the 2-pipe system loop, a set of isolation control valves are to be installed on the supply and return branch pipes serving the heating only unit. These control valves are not to be used for temperature control of the unit.

B. **Operation**

a. When the main heating-cooling change over switch is placed in the heating position the set of isolation control valves are to be open, and if the switch is placed in the cooling position the set of isolation control valves are to be closed.

FPS-1

Fan Coil Unit – 4 Pipe Heating Water and Chilled Water

A. **Occupied**
   a. The minimum outside air damper will be open and the supply fan motor will be energized and run continuously.
   b. The room sensor will modulate the heating control valve to maintain its space heating temperature setpoint.
   c. On a further rise in room temperature, after the heating control valve is fully closed to the coil, the cooling valve will open and close as needed to maintain the space cooling setpoint 76 degrees (adj.).
   d. A supply air low limit sensor will override the heating valve control when the outside air temperature is below 55 degrees to assure the supply air temperature does not fall below 62 degrees.
   e. If at any time the outside air temperature drops below 10 degrees (adj.), the outside air damper will be closed, and return air damper full open.

B. **Unoccupied**
   a. The outside air damper will be closed and the return air damper open. The heating valve will be open. The room sensor will be indexed to the unoccupied heating temperature setpoint. When the space temperature falls below the unoccupied setpoint, the unit supply air fan will cycle on. When the space temperature rises above the unoccupied heating setpoint, the fan coil unit will be disabled. The cooling mode on the unit will be disabled during the unoccupied, with the cooling control valve closed and the supply fan off.

C. **Safety and Emergency Control**
   a. Whenever the limitations of the freeze detector are exceeded, the supply fan motor will be de-energized. The outside air damper will close and return air damper will open. An alarm will be sent to The BAS. The low limit sensor will need to be manually reset before normal conditions are allowed to resume.

FPS-2

Unit Ventilator – 4 Pipe Heating Water and Chilled Water

A. **Occupied**
   a. The supply fan motor will be energized and run continuously.
   b. When first enabled, if the return temperature is below the warm-up setpoint of 68 degrees (adj.) the outside air damper will be closed and return air damper will be open. Heating control valve will be open for full flow to the coil. The cooling control valve is to remain in a closed position. When the return air rises above the warm-up temperature setpoint, outside air damper will open to its minimum position, with the return air damper position accordingly. Room sensor will modulate the heating control valve to maintain its space heating temperature setpoint.
   c. Economizer: on a further rise in-room temperature, after the control valve is fully closed to the coil, with outdoor temperature below 62 degrees (adj.), the outside air damper will modulate open to maintain the space cooling temperature setpoint with the return air damper modulating accordingly.
   d. Supply air low limit sensor will override the heating valve control when the unit is in economizer to assure supply air temperature does not fall below 62 degrees (adj.).
   e. If at any time the outside air temperature drops below 10 degrees (adj.), the outside air damper will be closed and the return air damper will open.
   f. When the economizer mode cannot satisfy the space room sensor setpoint of 76 degrees (adj.) and chilled water is available, the outside air damper to reposition to minimum setpoint and return air damper adjusting accordingly, and the cooling control valve shall open and close as required to maintain the space cooling setpoint of 76 degrees (adj.).

B. **Unoccupied**
   a. The outside air damper will be closed and return air damper open. The cooling valve will be closed and the heating valve will be open. The room sensor will be indexed to the unoccupied heating temperature setpoint. When the space temperature falls below the unoccupied setpoint, he unit supply fan will cycle on. When the space temperature rises above the unoccupied heating setpoint, the unit supply fan will be disabled.

C. **Safety and Emergency Control**

a. Whenever the limitations of the freeze detector is exceeded, the supply fan will be de-energized. The outside air damper will close and return air damper will open. Heating control valve to remain open. An alarm will be sent to the BAS. The low limit sensor will need to be manually reset before normal conditions are allowed to resume.

AHU-1

Air Handling Unit – Single Zone VAV with SF, Heating Water Coil and Chilled Water Coil

A. **General**

a. The single zone VAV air handling unit (AHU) with supply fan (SF) and any associated exhaust fans (EF) shall be started and stopped by a signal from the BAS as programmed (adj.). The AHU is equipped with a variable frequency drive on the SF, outside air damper, return air damper, and exhaust air damper. Supply air temperature is controlled by the modulating control valves for heating and cooling coils. The AHU shall receive an occupied/unoccupied status from the BAS as scheduled and shall apply to both the heating and cooling season.

B. **Optimized Start**

a. The AHU shall utilize an optimum start sequence prior to entering occupied mode. The unit shall use an algorithm accounting for the zone space temperature sensor and outside air temperature to calculate the minimum time required to change the space temperature to the occupied operation temperature. During optimized start operation, the outside air damper and exhaust air damper shall be closed. The return air damper shall be open. The SF shall be enabled. The unit shall modulate the control valve on the cooling coil or heating coil to supply air at the supply air temperature setpoint as determined by the BAS controller.

C. **Occupied**

a. During occupied mode, the AHU and EF's shall be energized. The AHU shall modulate the heating and cooling control valves to maintain zone temperatures of 70 degrees (adj.) in heating and 76 degrees (adj.) in cooling. Return air CO_2 shall be monitored and the outside air volume shall be modulated to maintain CO_2 at 1200 PPM (adj.). At no time shall less than the scheduled minimum operating outside air be provided. When the shared outside air temperature is below the switchover setpoint of 60 degrees (adj.) the dry bulb economizer shall be enabled.

D. **Unoccupied**

a. During unoccupied mode the SF and CF's shall be de-energized. The SF and EF's shall be programmed to maintain the unoccupied heating setpoint of 55 degrees (adj.) as sensed by the room temperature sensor. The outside air damper shall be closed. During unoccupied cooling mode the AHU and all associated coils, control valves, etc.

shall remain off. The outside air and exhaust air dampers shall be closed and return air damper open.

E. **SF Control**

a. The SF variable frequency drive shall maintain the minimum possible CO_2 level set by sensor. The return air and exhaust air dampers shall adjust, in proportion, with the outside air damper setpoint base on sensor setpoint.

F. **Safeties**

a. Upon a trip of the freeze state and/or the smoke detector, the SF and EF's shall stop, outside air and exhaust air dampers shall close. A local alarm and an alarm to the BAS. The freeze stat will require manual reset at site before unit can be energized.

AHU-2

Air Handling Unit – VAV with SF, RF, Heating Water Coil and Chilled Water Coil

A. **General**

a. The variable air volume (VAV) air handling unit (AHU) with supply fan (SF), return air (RF) and any associated exhaust fans (EF) shall be started and stopped by a signal from the BAS as programmed (adj.) the AHU is equipped with a variable frequency drive SF and RF, outside air damper, return air damper, and exhaust air damper. Supply air temperature is controlled by the modulating control valves for heating and cooling coils. The AHU shall receive an occupied/unoccupied status from the BAS as scheduled and shall apply to both the heating and cooling season.

B. **Optimized Start**

a. The AHU shall utilize an optimum start sequence prior to entering occupied mode. The unit shall use an algorithm accounting for the zone space temperature sensor and outside air temperature to calculate the minimum time required to change the space temperature to the occupied operation temperature. During optimized start operation, the outside air damper and exhaust air damper shall be closed. The return air damper shall be open. The SF and RF shall both be enabled. The unit shall modulate the control valve on the cooling coil or heating coil to supply air at the supply air temperature setpoint as determined by the BAS controller.

C. **Occupied**

a. During occupied mode, the SF, RF, and EF's shall be energized. The AHU shall modulate the heating and cooling control valves to maintain zone temperatures of 70 degrees (adj.) in heating and 76 degrees (adj.) in cooling. Return air CO_2 shall be monitored and the outside air volume shall be modulated to maintain CO_2 at 1200 PPM (adj.). At no time shall less than the scheduled minimum operating outside air be provided. When the shared outside air temperature is below the switchover setpoint of 60 degrees (adj.) the dry bulb economizer shall be enabled.

D. **Unoccupied**

a. During unoccupied mode the SF, RF, and EF's shall be energized. The SF, RF, and EF's shall be programmed to maintain the unoccupied heating setpoint of 55 degrees (adj.) as sensed by the associated VAV terminals. The outside air damper shall be closed. During unoccupied cooling mode the AHU and all associated coils, control

valves, etc. shall remain off. The outside air and exhaust air dampers shall be closed and return air damper open.

E. **SF and RF Control**

a. The SF variable frequency drive shall maintain the minimum possible to maintain a low limit supply air static pressure setpoint (adj.). A supply static pressure sensor shall slowly increase the SF speed to maintain supply static setpoint.

b. The associated RF shall modulate in conjunction with the SF utilizing the variable frequency drive on the RF. The RF shall lag the SF by a 10 percent differential (adj.).

F. **Safeties**

a. Upon a trip of the freeze stat and/or the smoke detector, the SF, RF, and EF's shall stop, outside air and exhaust air dampers shall close. A local alarm and an alarm to the BAS. The freeze stat will require manual reset at site before unit can be energized.

AHU-3

Rooftop Energy Recovery Unit – 2 Pipe Chilled/Heating Water and DX Cooling Coils

A. **General**
   a. The constant volume air handling unit (AHU), supply fan (SF), and exhaust fan (EF) shall be started and stopped by a signal from the BAS as programmed. The AHU is equipped with a constant speed SF and EF, outside air and exhaust air dampers, and fixed plate heat exchangers.

B. **Operation**
   a. Whenever the building system is indexed to heating, the control valve shall be open and modulating as require to maintain discharge temperatures. Whenever the building system is indexed to Cooling, the control valve shall be open and modulating as required to maintain discharge temperatures. Whenever Chilled water is unavailable and there is a call for cooling the DX shall be enabled to maintain discharge temperatures. The DX shall be locked out when outside air falls below 55 degrees (adj)

C. **Occupied**
   a. The AHU shall be energized by the occupied cycle programmed in the DDC clock and operate under its packaged controls.

D. **Unoccupied**
   a. When signal by the ATC system to energized the exhaust fan on the unit per owners direction. Otherwise the AHU, SF, and EF shall operate under its packaged controls.

E. **Safety and Emergency Controls**
   a. Whenever the limitations of the freezestat and/or smoke detector are exceeded, the SF and EF motors shall be de-energized, the outside air and exhaust air dampers shall close tight. The air cooled condensing unit shall be locked out during this cycle.

AHU-4

Energy Recovery Unit – 4 Pipe Heating Water and Chilled Water

A. **General**
   a. The constant volume air handling unit (AHU), supply fan (SF) and exhaust fan (EF) shall be started and stopped by a signal from the BAS as programmed. The AHU is equipped with a constant speed SF and EF, outside air and exhaust air dampers, and fixed plate heat exchanger. Supply air temperature is controlled by the modulating control valves on the heating and cooling coils. The AHU shall receive an occupied/unoccupied status from the BAS as scheduled and shall apply to both the heating and cooling season.

B. **Occupied**
   a. During occupied mode, the AHU, SF and EF shall be energized the AHU shall modulate the heating and cooling control valves to maintain a zone temperature of 70 degrees (adj.) in heating and 75 degrees (adj.) in cooling.

C. **Unoccupied**
   a. During unoccupied mode the AHU, SF, and EF shall normally be de-energized. The AHU, SF, and EF shall be called to run as needed to maintain the unoccupied heating setpoint of 55 degrees (adj.) The outside air and exhaust air dampers shall be normally closed.

D. **Safeties**
   a. Upon a trip of the freezestat and/or the smoke detector, the SF and EF shall stop, outside air and exhaust air dampers shall close. A local alarm and an alarm to the BAS. The freeze stat will require manual reset at site before unit can be energized.

AHU-5

Kitchen Hood Exhaust System with Make-Up

A. **General**
   a. Kitchen hood control panel shall be furnished by the kitchen exhaust hood manufacturer and complete with activation button, relays, local alarm, and controls to regulate the variable frequency drives provided by ATC contractor for supply fan (SF) and exhaust fan (EF). Control panel shall determine EF airflow, along with SF, and on/off output signals for the DDC monitoring control functions. Operation of the kitchen hood exhaust system shall be independent of occupied/unoccupied time scheduling.
   b. The ATC contractor shall be responsible for installing and wiring all control equipment supplied with kitchen hood exhaust system, providing interface and wiring between kitchen hood control panel and DDC control panel, and providing interface and wiring between variable frequency drives, supplied by contractor, for EF and make-up air unit fan motors.

B. **Operation**
   a. Whenever the system is energized through the kitchen hood control panel, EF and make-up air fan motors shall be energized through their corresponding variable frequency drives.
   b. Operating EF and make-up air unit fan motor speeds shall be controlled through kitchen hood control panel sequence. Make-up air unit motor speed shall track EF motor speed such that both fans are operating at an equal percentage of their respective design airflow value.
   c. When energized, make-up air unit shall operate under its packaged sequence for temperature control to maintain a discharge supply air setpoint of 70 degrees (adj.).
   d. Whenever the system is de-energized through the kitchen hood control panel, EF and make-up air unit supply fan motors shall be de-energized.

C. **Safety and Emergency Controls**
   a. Whenever the emergency fan disconnect switch is thrown or the limitations are exceeded by the current sensing relay, the EF and make-up air unit shall be de-energized.
   b. If a kitchen hood exhaust system continuously operates for a 24 hour (adj.) time period, provide an alarm through the DDC panel indicating such.

c. Whenever the limitations are exceeded by any duct smoke detector while the system is energized, the make-up air unit shall be de-energized and the EF shall remain energized.

GEO-1

Geothermal Heat Pump Loop Pumping System – Basic

A. **Operation**

a. Lead geothermal pump shall be energized and run continuously.

b. Upon loss of flow through the lead pump for more than ten seconds, the lag pump shall be energized and remote alarm shall sound.

c. Pumps and variable frequency drives (VFD) shall be placed under control of DDC panel pump control program for variable flow operation.

d. Pressure sensor shall send a signal through pressure transducer to the pump DDC controller program, indicating pressure differential conditions. The program shall compare each signal to preset setpoint.

e. When all pressure differential setpoint are satisfied, the pump speed shall remain constant.

f. As any sensor deviates from setpoint, the program shall send the appropriate signal to the pump VFD to increase or decrease the pump motor speed.

g. The program shall continuously scan and compare each pressure differential variable to its individual setpoint and control of the least satisfied sensor.

h. In the event of a system differential pressure failure due to a pump or VFD fault, the program shall automatically start the lag pump and continue variable speed operation.

i. In the event of failure to receive pressure variable signals, the pump shall maintain 100 percent speed required to satisfy schedule pump performance and the heat pump two-way control valves shall open. Reset shall be automatic upon correction of the failure.

j. System fault shall be continuously displaced until the fault has been corrected.

GEO-2

Geothermal Heat Pump Loop Pumping System – with Closed Circuit Fluid Cooler Assistance

A. **General**
   a. Generally the geothermal heat pump borehole field sizing is based on the building's normally larger cooling system heat rejection demand compared to the heating absorption demand from the borehole field.
   b. Due to lack of land to install a geothermal borehole field to satisfy the entire cooling system demand and/or to reduce construction cost, a closed circuit fluid cooler can be installed in the loop system to handle the differential in system demand between cooling season and heating season or more, if design demands.

B. **Operation**
   a. The geothermal pumping system would remain the same as specified under "Geothermal Heat Pump Loop Pumping System-Basic" control sequence. Additional program items are as follows:
      i. Cooling Mode
         1. DDC system shall place geothermal loop system in cooling mode when outside air temperature is above 65 degrees (adj.).
         2. The ATC diverting control valve shall be positioned to flow calculated GPM through closed circuit fluid cooler and remainder to geothermal borehole field.
         3. Water treatment system shall be energized.
         4. Whenever cooler entering water temperature is below 80 degrees the fan motor and spray pump shall be de-energized.
         5. Whenever cooler entering water temperature is between 80 to 90 degrees, the fan motor shall be de-energized and the spray pump shall be energized.
         6. Whenever cooler entering water temperature is above 90 degrees, the fan motor and spray pump shall be energized.
      ii. Heating Mode
         1. DDC system shall place system in heating mode when outside air temperature is below 60 degrees setpoint.
         2. The ATC diverting control valve shall be closed to the closed circuit fluid cooler and generally all flow to the geothermal borehole field. A small heating

bypass control valve shall be installed to allow for a small flow through the closed circuit fluid cooler to protect the cooler from freezing.

iii. Safety Controls

1. A vibration switch shall de-energize the closed circuit fluid cooler fan and spray pump upon a high vibration level. All devices shall return to fail positions.

GEO-3

Heat Pump Unit Connected to Geothermal Heat Pump Loop Piping

A. **Occupied**
   a. The unit supply fan motor shall be energized and run continuously.
   b. On a fall in space temperature the room sensor shall place heat pump unit reversing valve in the heating position and open the two-way unit isolation control.
   c. Valve on the heat pump return pipe. After the control valve is proven open the compressor shall energize and maintain room sensor heating setpoint. When compressor is de-energized the control valve shall close.
   d. On a rise in space temperature the room sensor shall place heat pump unit reversing valve in the heating position and open the two-way unit isolation control valve on the heat pump return pipe. After the control valve is proven open the compressor shall energize and maintain room sensor cooling setpoint. When compressor is de-energized the control valve shall close.

B. **Unoccupied**
   a. The heat pump unit supply fan shall be placed under control of the night setpoint of the room sensor which shall cycle the supply fan, two-way isolation control valve and unit compressor to maintain the sensor unoccupied heating setpoint.
   b. Heat pump unit shall be de-energized and control valve shall be closed when system is indexed to the unoccupied cooling mode.

EF-1

Exhaust Fan with Occupied/Unoccupied Control

A. **Operation - Occupied**
   a. Whenever the system is in occupied mode, and outside air damper on air handling unit is open, exhaust fan(s) shall run continuously.

B. **Operation - Unoccupied**
   a. Whenever the system is in unoccupied mode, and outside air damper on air handling unit is closed, exhaust fan(s) shall be de-energized.

EF-2

Exhaust Fan with Room Sensor Control

A. **Operation**

a. On a rise in temperature above the room sensor set point, the exhaust fan shall be energized. On a fall in temperature below the room sensor set point, the exhaust fan shall be de-energized.

EF-3

Exhaust Fan with Continuous Operation

(Fans for Science Chemical Storage, Storage of possible Hazardous Material, Etc.)

A. **Operation**

a. Exhaust fan shall be energized through the DDC system and operate continuously. A current sensing relay on the exhaust fan motor shall send an alarm signal to central control center if motor fails and stops.

EF-4

Exhaust Fan and Outside Air Damper with Room Temperature Sensor Control

A. **Operation**

a. On a rise in temperature of 5 degrees F above room temperature sensor set point (80 degrees F) the fan shall be energized and run continuously and damper shall open.

b. When room temperature sensor is satisfied the fan shall be de-energized and damper shall close.

EF-5

Kiln Exhaust Fan Control

A. **General**

a. Kiln exhaust system can be supplied with the kiln, but based on kiln room location, package controls supplied may not work. This sequence would be used when control is supplied by ATC.

B. **Operation**

a. Whenever kiln is manually energized through local switch (by electrical) exhaust fan shall be energized.

b. Whenever kiln is de-energized exhaust fan shall continue to run through delay shutdown (by ATC system) for adjustable time period. Initial time period shall be set to delay for 8 hours. Exhaust fan shall be de-energized at the end of delay period.

MISC-1

Single Duct VAV Terminal with Heating Water Coil

A. **General**

a. The VAV terminal shall be equipped with a heating coil, reheat valve for each VAV terminal heating coil and discharge air sensor for monitoring purposes. If some space temperature sensor need to be equipped with an occupied override button, indicate room location on plans.

B. **Occupied Mode**

a. When the temperature is between the occupied heating and cooling set points 70-76 degrees F (ADJ.), the primary air damper shall be at minimum CFM position with the reheat valve in the bypass position. On a rise in temperature above the cooling set point, the primary air damper shall increase the supply CFM. On a drop in the space temperature below the heating set point, the primary air damper shall maintain minimum CFM and the reheat valve shall modulate heating water to the heating coil as needed to maintain the space temperature set point.

C. **Unoccupied Mode**

a. During unoccupied mode the primary air damper will normally be at the minimum CFM position with the reheat valve closed and unoccupied heating and cooling set points 55-85 degrees F (ADJ.) shall be in effect. Upon a call for heating or cooling, the associated air handling unit shall be called to run and the terminal shall operate as in occupied mode, except with unoccupied set points, until space is again at set point. The occupied override button shall put the VAV terminal and associated air handling unit into occupied mode for up to 3 hours, in one hour increments.

MISC-2

Cabinet or Propeller Unit Heaters

A. **Operation**

a. On a fall in temperature below the room sensor set point (70 degrees F) the control valve shall open. On a rise in temperature 5 degrees F above the room sensor set point, the control valve shall close.

b. On a rise in pipe temperature, as sensed by the surface mounted pipe sensor on the return pipe (100 degrees F) and when the valve is open, the unit heater fan motor shall be energized.

c. On a fall in pipe temperature, below the set point of the surface mounted pipe sensor or when the valve is closed, the unit heater fan motor shall be de-energized.

MISC-3

Finned Tube Radiation and Convector

A. **General**

a. The temperature sensor for the finned tube radiation is to be unit mounted. The temperature sensor for the convector can be unit mounted or wall mounted, based on where the convector is located and if the sensor is subject to abuse.

B. **Operation**

a. On a fall in temperature below the sensor setpoint, the control valve shall modulate open.

b. On a rise in temperature above the sensor setpoint, the control valve shall close.

MISC-4

Emergency Fan Disconnect Switch

A. **Operation**

a. Provide a manual push button switch with local alarm cover near the main entrance to the school. Exact location to be coordinated with local Fire Marshal. This emergency push button switch will shut down all air handling equipment that is handling 2000 CFM or more. This switch is only to be used by the Fire Department in case of an emergency as determined by their personnel.

MISC-5

Boiler Room Carbon Monoxide Sensor System

A. **Operation**

a. If carbon monoxide is detected by sensors in boiler room, an alarm signal shall be energized at the DDC system and a local alarm shall sound.

MISC-6

Combustion Gas Detector System

A. **General**

a. If gas (natural or bottled LP gas) is used as the main fuel on heating equipment, such as boilers, water heaters, etc., in the boiler/mechanical room, this control sequence is to be supplied.

B. **Operation**

a. If gas is detected by sensors in boiler/mechanical room, the gas monitor panel shall send and alarm signal to the DDC system and sound a local alarm in the room and in the hallway outside of the boiler/mechanical room. Activation of this alarm will override all other signals and notify the DDC operator immediately of this emergency.

MISC-7

High Temperature Refrigerator/Freezer Alarm

A. **General**

a. This control sequence shall be used when there is a walk-in type refrigerator and/or freezer on the project.

B. **Operation**

a. Whenever the set point of the high temperature sensor in the walk-in refrigerator or the freezer is exceeded, the alarm reporting device of the DDC system shall be activated. Set points shall be determined in cooperation with school personnel. Local alarm shall also sound in the room where the refrigerator and/or freezer is located.

b. Latching alarm is to be supplied which requires manual reset at the freezer or refrigerator via a push button.

c. Alarm reporting device shall notify school personnel of condition.

MISC-8

Domestic Hot Water Circulator

A. **Operation – Occupied**
   a. On a fall in water temperature below the immersion sensor “on” setpoint, the circulator shall be energized.
   b. On a rise in water temperature above the immersion sensor “off” setpoint the circulator shall be de-energized.

B. **Operation-Unoccupied**
   a. The circulator shall be de-energized.

MISC-9

Freeze Protection Circulating Pump Control on Heating Coils

A. **Operation**

a. Whenever the outside air temperature is below 50 degrees (adj.) and heating water is available as indicated by DDC system, the heating coil circulator shall be energized. Whenever the outside air temperature is above 55 degrees (adj.) the circulator shall be de-energized. Upon loss of flow for more than 10 seconds (when control requires pump operation) as sensed by flow sensor, an alarm shall be energized through the DDC panel.

Part 1 - General

I. Summary
   A. This Section includes fuel oil and diesel fuel piping, specialties, and accessories within the building.

II. Performance Requirements
   A. Minimum Working-Pressure Rating: Unless otherwise indicated, minimum pressure requirement for fuel oil piping is 150 psig.

III. Submittals
   A. Product Data: For the following:
      1. Specialty valves.
      2. Fuel oil transfer pumps. Include rated capacities; shipping, installed, and operating weights; furnished specialties; and accessories.
   B. Shop Drawings: Fuel oil piping and equipment. Include plans and attachments to other Work.
      1. Wiring Diagrams: Power, signal, and control wiring. Differentiate between manufacturer-installed and field-installed wiring.
   C. Field Test Reports: Indicate and interpret test results for compliance with performance requirements.
   D. Maintenance Data: For fuel oil transfer pumps to include in maintenance manuals specified in Division 1.

IV. Quality Assurance
   A. Product Options: Drawings indicate size, profiles, and dimensional requirements of oil transfer pumps and are based on the specific model indicated. Other manufacturers' products complying with requirements may be considered. Refer to Division 1 Section "Substitutions."
   B. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.
   C. Comply with ASME B31.9, "Building Services Piping," for fuel oil piping materials, installation, inspection, and testing.
   D. Comply with NFPA 30, "Flammable and Combustible Liquids Code," and NFPA 31, "Installation of Oil Burning Equipment," for fuel oil piping materials, components, installations, inspection, and testing.

E. Comply with NFPA 70 "National Electrical Code" for electrical connections between wiring and electrically operated control devices.

F. Provide listing/approval stamp, label, or other marking on equipment made to specified standards.

G. Listing and Labeling: Provide equipment and accessories that are listed and labeled.

1. Terms "Listed" and "Labeled": As defined in the "National Electrical Code," Article 100.
2. Listing and Labeling Agency Qualifications: A "Nationally Recognized Testing Laboratory" (NRTL) as defined in OSHA Regulation 1910.7.

Part 2 - Products

I. Manufacturers

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

1. Oil Shutoff Valves:
   a) Conbraco Industries, Inc.; Apollo Div.
   b) Jomar International, Ltd.
   c) Kitz Corp. of America.
   d) McCanna, Inc.
   e) Nibco, Inc.
   f) Watts Industries, Inc.; Water Products Div.
2. Pressure-Reducing Valves:
   a) Anderson, Greenwood & Co.; Kunkle Valve Div.
   b) Fulflo Specialties Co.
   c) IMI Cash Valve, Inc.
   d) Webster Heating.
3. Oil Safety Valves:
   a) Suntec Industries, Inc.
   b) Webster Heating.
4. Fuel Oil Transfer Pumps:
   a) Baker Manufacturing Co.; Haight Pump Div.
   b) Desmi, Inc.
   c) Suntec Industries, Inc.
   d) Tuthill Corp.; Tuthill Pump Div.

e) Viking Pump, Inc.

f) Webster Heating.

5. UL-Listed, Fuel Oil Transfer Pumps:

a) Tuthill Corp.; Tuthill Pump Div.

b) Viking Pump, Inc.

c) Webster Heating.

6. Duplex, Fuel Oil Transfer Pump Sets:

a) Alyan Pump Co.

b) APT, Inc.

c) Hydronic Modules Corp.

d) Preferred Utilities Manufacturing Corp.

e) Smith-Koch, Inc.

f) Webster Heating.

II. Piping Materials

A. Steel Pipe: ASTM A 53, Type E or S, Grade B, Schedule 40, black.

1. Malleable-Iron Threaded Fittings: ASME B16.3, Class 150, standard pattern, with threaded ends according to ASME B1.20.1.
2. Unions: ASME B16.39, Class 150, malleable iron with brass-to-iron seat, ground joint, and threaded ends according to ASME B1.20.1.
3. Steel Welding Fittings: ASME B16.9, wrought steel or ASME B16.11, forged steel.
4. Steel Threaded Fittings: ASME B16.11, forged steel with threaded ends according to ASME B1.20.1.

B. Transition Fittings: Type, material, and end connections to match piping being joined.

C. Pipe Connectors: UL 567, swivel or compression type for connection to equipment.

D. Common Joining Materials: Refer to Division 15 Section "Basic Mechanical Materials and Methods" for joining materials not in this Section.

III. Specialty Valves

A. Oil Shutoff Valves: UL 842; metal-body ball valve with threaded ends according to ASME B1.20.1 for pipe threads.

B. Pressure-Reducing Valves: UL listed for fuel oil service. Include bronze body with 150-psig minimum pressure rating.

C. Oil Safety Valves: UL listed for fuel oil service. Include metal body; broken-line, oil shutoff feature; and 40-psig minimum pressure rating.

IV. Fuel Oil Transfer Pumps

A. Fuel Oil Transfer Pump: Comply with UL 343 and HI 3.1-3.5, single- or two-stage, internal-gear, positive-displacement, rotary type. Include steel base; foot-mounted, cast-iron housing; steel gears; bronze bearings; steel shaft; mechanical seals; and built-in pressure relief bypass.
   1. Drive: direct close coupled.
   2. Motor: Comply with Division 15 Section 15055 "Motors."

B. Fuel Oil Transfer Pump Sets: Factory-fabricated and -wired, packaged unit; for fuel oil service, listed and labeled by a nationally recognized testing laboratory acceptable to authorities having jurisdiction; with base, strainer, two fuel oil pumps, and controls.
   1. Base: Steel with pumps, accessories, and controls factory mounted.
   2. Pumps: Comply with HI 3.1-3.5, single- or two-stage, internal-gear with crescent, positive-displacement, rotary type. Include foot-mounted, cast-iron housing; steel gears; bronze bearings; steel shaft; mechanical seals; and built-in pressure relief bypass.
   3. Drives: direct close coupled.
   4. Motors: Comply with Division 15 Section "Motors."
   5. Piping: Steel with ferrous fittings and threaded or welded joints.
   6. Strainer: Duplex, basket type with corrosion-resistant-metal-screen baskets.
   7. Controls: Automatic operation with pump alternator and broken-line, oil shutoff feature.

Part 3 - Execution

I. Service Entrance Piping
   A. Extend fuel oil piping and connect to fuel oil distribution for service entrance into building.

II. Piping Applications
   A. General: Flanges, unions, transition, and special fittings with pressure ratings same as or higher than system pressure rating may be used in applications below, unless otherwise indicated.
   B. Piping: Steel pipe, malleable-iron fittings, and threaded joints.

III. Valve Applications
   A. Shutoff Valves:
      1. Install ball valves at each branch connection to supply mains and elsewhere as indicated for piping 2 inches and smaller.
      2. Use gate valves for piping 2-1/2 inches and larger.

B. Gate and Check Valves, 2” NPS and Smaller: Use general-duty valves that comply with MSS SP-80, Class 125, bronze body, suitable for fuel oil service, with "WOG" indicated on body. Refer to Division 15 Section "Valves" for selection. Install swing check valves as required to control flow direction.
   1. Gate Valves: With solid wedge.
   2. Swing Check Valves: With bronze disc.
   3. Lift Check Valves: Vertical pattern; two-piece construction with bronze disc.

C. Drain Valves: Use hose-end drain valves that comply with MSS SP-110, bronze ball valve with outlet connection according to ASME B1.20.7 for garden-hose thread with cap. Install drain valves at low points in mains, risers, branch lines, and elsewhere as required for system drainage. Refer to Division 15 Section "Plumbing Specialties" for selection.

IV. Piping Installation

A. Refer to Division 15 Section "Basic Mechanical Materials and Methods" for basic piping installation requirements.

B. Use eccentric reducer fittings to make reductions in pipe sizes. Install fittings with level side down.

C. Install strainers on the supply side of each control valve, pressure regulating valve, oil burner connection, and elsewhere as indicated. Install 3/4inch pipe nipple and ball valve in blowdown connection of strainers 2-1/2 inches and larger. Use same size nipple and valve as blowdown connection of strainer on strainers 2 inches and smaller.

D. Install sediment traps at points where sediment or condensate may collect. Locate where readily accessible to permit cleaning and emptying. Do not install where condensate would be subject to freezing.
   1. Construct sediment traps using tee fitting with bottom outlet plugged or capped. Use minimum-length nipple of 3 pipe diameters, but not less than 3 inches long, and same size as connected pipe. Install with space between bottom of drip and floor for removal of plug or cap.

E. Install pressure gages on suction and discharge piping of each fuel oil pump set.

V. Joint Construction

A. Refer to Division 15 Section "Basic Mechanical Materials and Methods" for basic piping joint construction.

VI. Valve Installation

A. Install valves in accessible locations, protected from possible damage.

B. Install valves at branch connections to supply mains and at equipment.

C. Install drain valves at piping low points.

D. Refer to Division 15 Section 15110 "Valves" for general installation requirements.

VII. Hanger And Support Installation

A. Refer to Division 15 Section "Hangers and Supports" for pipe hanger and support devices.

B. Install hangers for horizontal steel piping with the following maximum spacing and minimum rod sizes:

1. 1/2” NPS and Smaller: Maximum span, 60 inches; minimum rod size, 3/8 inch.
2. 3/4" NPS to 1-1/4” NPS: Maximum span, 84 inches; minimum rod size, 3/8 inch.
3. 1-1/2” NPS: Maximum span, 108 inches; minimum rod size, 3/8 inch.
4. 2” NPS: Maximum span, 10 feet; minimum rod size, 3/8 inch.

C. Support vertical steel pipe at each floor and at spacing not greater than 15 feet.

D. Install hangers for horizontal drawn-temper copper tubing with the following maximum spacing and minimum rod sizes:

1. 1/2” and Smaller: Maximum span, 48 inches; minimum rod size, 3/8 inch.
2. 3/4” : Maximum span, 60 inches; minimum rod size, 3/8 inch.
3. 1” and 1-1/4” : Maximum span, 72 inches; minimum rod size, 3/8 inch.
4. 1-1/2” and 2” : Maximum span, 96 inches; minimum rod size, 3/8 inch.

E. Support vertical copper tube at each floor and at spacing not greater than 10 feet.

VIII. Connections

A. Install piping adjacent to equipment to allow service and maintenance.

B. Connect piping to equipment with oil shutoff valve and union. Install union between valve and equipment.

C. Ground equipment.

1. Tighten electrical connectors and terminals according to manufacturer's published torque-tightening values. If manufacturer's torque values are not indicated, use those specified in UL 486A and UL 486B.

D. Electrical Connections: Wiring is specified in Division 16 Sections.

IX. Field Quality Control

A. Inspect and test fuel oil piping according to NFPA 30, "Testing" Paragraph and NFPA 31, "Tests of Piping" Paragraph; and according to requirements of authorities having jurisdiction.

B. Repair leaks and defects with new materials and retest system until satisfactory results are obtained.

C. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.

D. Report test results promptly and in writing to Engineer.

X. Demonstration

A. Train Owner's maintenance personnel on procedures and schedules for starting and stopping, troubleshooting, servicing, and maintaining fuel oil pump sets.

B. Review data in maintenance manuals. Refer to Division 1 Section "Contract Closeout."

C. Review data in maintenance manuals. Refer to Division 1 Section "Operation and Maintenance Data."

D. Schedule training with Owner, through Engineer, with at least seven days' advance notice.

XI. Commissioning

A. Before activating system perform these steps:

1. Open valves to full open position and close bypass valves.
2. Remove and clean strainer screens.
3. Check pump for proper direction of rotation.
4. Fill oil storage tank with proper fuel type.
5. Check operating controls of fuel burner units.
6. Check operation at automatic bypass valves.
7. Check and set operating temperature controls on oil heaters.
8. Check corrosion monitoring systems for proper operation.

END OF SECTION

Part 1 - General

I. Related Documents
   A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

II. Summary
   A. This Section includes fuel gas piping, specialties, and accessories within the building.
   B. Related Sections include the following:
      1. Division 23 Section "Meters and Gages" for pressure gages.

III. Project Conditions
   A. Gas System Pressure: As shown on the drawings.
   B. Design values of fuel gas supplied for these systems unless shown differently on the drawings, are as follows:
      1. Nominal Heating Value: 1000 Btu/cu. ft.
      2. Nominal Specific Gravity: 0.6.

IV. Submittals
   A. Product Data: For the following:
      1. Corrugated, stainless-steel tubing systems. Include associated components.
      2. Specialty valves. Include pressure rating, capacity, settings, and electrical connection data of selected models.
      3. Service-meter bars. Include service-meter size of selected models.
      4. Service meters. Include pressure rating and capacity of selected models.
      5. Service-meter bypass fittings.
      6. Pressure regulators. Include pressure rating, capacity, and settings of selected models.
   B. Shop Drawings: For fuel gas piping. Include plans and attachments to other Work. Show different pressure zones and indicate pressure for each zone.
      1. Wiring Diagrams: Power, signal, and control wiring. Differentiate between manufacturer-installed and field-installed wiring.
   C. Field Test Reports: Indicate and interpret test results for compliance with performance requirements.
   D. Maintenance Data: For natural gas specialties and accessories to include in maintenance manuals specified in Division 1.

V. Quality Assurance

A. Electrical Components and Devices: Listed and labeled as defined in NFPA 70, Article 100, by testing agency acceptable to authorities having jurisdiction, and marked for intended use.

B. ANSI Standard: Comply with ANSI Z223.1, "National Fuel Gas Code."

C. FM Standard: Provide components listed in FM's "Fire Protection Approval Guide" if specified to be FM approved.

D. IAS Standard: Provide components listed in IAS's "Directory of A. G. A. and C. G. A Certified Appliances and Accessories" if specified to be IAS listed.

E. UL Standard: Provide components listed in UL's "Gas and Oil Equipment Directory" if specified to be UL listed.

VI. Delivery, Storage, And Handling

A. Handling Flammable Liquids: Remove and legally dispose of liquids from drips in existing gas piping. Handle cautiously to avoid spillage and ignition. Notify fuel gas supplier. Handle flammable liquids used by Installer with proper precautions and do not leave on premises from end of one day to beginning of next day.

VII. Coordination

A. Existing Utilities: Do not interrupt utilities serving facilities occupied by Owner or others unless permitted under the following conditions and then only after arranging to provide temporary utility services according to requirements indicated:

1. Notify Engineer not less than two days in advance of proposed utility interruptions.
2. Do not proceed with utility interruptions without Engineer's written permission.

Part 2 - Products

I. Manufacturers

A. Manufacturers: Subject to compliance with requirements, provide products by one of the listed approved manufacturers. War-flex piping systems are not acceptable. Approved manufacturers include:

1. Corrugated, Stainless-Steel Tubing Systems:
   a) Omega Flex, Inc.
   b) Titeflex Corp.
   c) Tru-Flex Metal Hose Corp.
   d) Ward Manufacturing, Inc.
   e) Approved Equal.

2. Appliance Connector Valves:
    a) American Valve.
    b) B&K Industries, Inc.
    c) Brass Craft Manufacturing Co.
    d) Cimberio Valves, S. p. A.
    e) Conbraco Industries, Inc.; Apollo Div.
    f) E. M. Plastic and Electric Products, Ltd.; Neo Valve Div.
    g) Frey: John M. Frey Co.
    h) Jomar International, Ltd.
    i) Key Gas Components, Inc.
    j) Legend Valve and Fitting, Inc.
    k) McDonald: A. Y. McDonald Mfg. Co.
    l) Mueller Co.; Mueller Gas Products Div.
    m) Newman Hattersley, Ltd.; Specialty Valve Div.
    n) Robert Manufacturing Co.
    o) State Metals, Inc.
    p) Watts Industries, Inc.; Water Products Div.
    q) Approved Equal.
3. Gas Valves, 2" NPS and Smaller:
    a) BMI Canada, Inc.
    b) Crane Valves.
    c) Dungs: Karl Dungs, Inc.
    d) Flow Control Equipment, Inc.
    e) Grinnell Corp.
    f) Honeywell, Inc.
    g) Jomar International, Ltd.
    h) Kitz Corp. of America.
    i) Legend Valve and Fitting, Inc.
    j) Lyall: R. W. Lyall & Co., Inc.
    k) McDonald: A. Y. McDonald Mfg. Co.
    l) Milwaukee Valve Co., Inc.
    m) Mueller Co.; Mueller Gas Products Div.
    n) Nibco, Inc.
    o) Red-White Valve Corp.

p) Velan Valve Corp.

q) Watts Industries, Inc.; Water Products Div.

r) Approved Equal.

4. Plug Valves, 2-1/2" NPS and Larger:

a) Flow Control Equipment, Inc.

b) Milliken Valve Co., Inc.

c) Nordstrom Valves, Inc.

d) Olson Technologies, Inc.; Homestead Valve Div.

e) Walworth Co.

f) Approved Equal.

5. Automatic Gas Valves:

a) ASCO General Controls.

b) ASCOLECTRIC, Ltd.

c) Automatic Switch Co.

d) Dungs: Karl Dungs, Inc.

e) Eaton Corp.; Controls Div.

f) Eclipse Combustion, Inc.

g) GPS Gas Protection Systems, Inc.

h) Honeywell, Inc.

i) Johnson Controls, Inc.

j) Approved Equal.

6. Electrically Operated Gas Valves:

a) ASCO General Controls.

b) Atkomatic Valve Co., Inc.

c) Automatic Switch Co.

d) Dungs: Karl Dungs, Inc.

e) Eclipse Combustion Inc.

f) Goyen Valve Corp.

g) Magnatrol Valve Corp.

h) Parker Hannifin Corp.; Climate & Industrial Controls Group; Skinner Valve Div.

i) Approved Equal.

7. Line Pressure Regulators:

a) American Meter Co.

b) Donkin: Bryan Donkin RMG Canada, Ltd.

c) Eclipse Combustion, Inc.
d) Equimeter, Inc.

f) Approved Equal.

II. Piping Materials

A. Refer to Part 3 "Piping Applications" Article for applications of pipe, tube, fitting, and joining materials.

III. Corrugated, Stainless-steel Tubing Systems

A. Description: Comply with AGA LC 1 and include the following:
1. Tubing: Corrugated stainless steel with plastic jacket or coating.
2. Fittings: Copper alloy with ends made to fit corrugated tubing. Include ends with threads according to ASME B1.20.1 if connection to threaded pipe or fittings is required.
3. Striker Plates: Steel, designed to protect tubing from penetrations.
4. Manifolds: Malleable iron or steel with protective coating. Include threaded connections according to ASME B1.20.1 for pipe inlet and corrugated tubing outlets.

IV. Pipes, Tubes, Fittings, And Joining Materials

A. Steel Pipe: ASTM A 53; Type E or S; Grade B; Schedule 40; black.
1. Malleable-Iron Threaded Fittings: ASME B16.3, Class 150, standard pattern, with threaded ends according to ASME B1.20.1.
2. Unions: ASME B16.39, Class 150, malleable iron with brass-to-iron seat, ground joint, and threaded ends according to ASME B1.20.1.
3. Cast-Iron Flanges and Flanged Fittings: ASME B16.1, Class 125.

4. Steel Welding Fittings: ASME B16.9, wrought steel or ASME B16.11, forged steel.
5. Steel Threaded Fittings: ASME B16.11, forged steel with threaded ends according to ASME B1.20.1.
6. Joint Compound and Tape: Suitable for natural gas.
7. Steel Flanges and Flanged Fittings: ASME B16.5.
8. Gasket Material: Thickness, material, and type suitable for natural gas.

B. Hard Copper Tube: ASTM B 88, Type L, water tube, drawn temper.
1. Copper Fittings: ASME B16.22, wrought copper, streamlined pattern.
2. Brazing Filler Metals: AWS A5.8, Silver Classification BAg-1. Filler metal containing phosphorus is prohibited.
3. Bronze Flanges and Flanged Fittings: ASME B16.24, Class 150.
4. Gasket Material: Thickness, material, and type suitable for natural gas.

C. Soft Copper Tube: ASTM B 88, Type L, water tube, annealed temper.
1. Copper Fittings: ASME B16.22, wrought copper, streamlined pattern.
2. Brazing Filler Metals: AWS A5.8, Silver Classification BAg-1. Filler metal containing phosphorus is prohibited.

D. Tin-Lined Copper Tube: ASTM B 280, seamless, annealed, with interior tin-plated lining.
1. Copper Fittings: ASME B16.22, wrought copper, streamlined pattern.
2. Brazing Filler Metals: AWS A5.8, Silver Classification BAg-1. Filler metal containing phosphorus is prohibited.

E. Transition Fittings: Type, material, and end connections to match piping being joined.

F. Common Joining Materials: Refer to Division 15 Section "Basic Mechanical Materials and Methods" for joining materials not in this Section.

V. Piping Specialties

A. Flexible Connectors: ANSI Z21.24, copper alloy.

B. Quick-Disconnect Devices: ANSI Z21.41, convenience outlets and matching plug connector.

VI. Specialty Valves

A. Valves, 2” NPS and Smaller: Threaded ends according to ASME B1.20.1 for pipe threads.

B. Valves, 2-1/2” NPS and Larger: Flanged ends according to ASME B16.5 for steel flanges and according to ASME B16.24 for copper and copper-alloy flanges.

C. Appliance Connector Valves: ANSI Z21.15 and IAS listed.

D. Gas Stops: Bronze body with AGA stamp, plug type with bronze plug and flat or square head, ball type with chrome-plated brass ball and lever handle, or butterfly valve with stainless-steel disc and fluorocarbon elastomer seal and lever handle; 2-psig minimum pressure rating.

E. Gas Valves, 2" NPS and Smaller: ASME B16.33 and IAS-listed bronze body and 125-psig pressure rating.

1. Tamperproof Feature: Include design for locking.

F. Plug Valves, 2-1/2" NPS and Larger: ASME B16.38 and MSS SP-78 cast-iron, lubricated plug valves, with 125-psig pressure rating.

1. Tamperproof Feature: Include design for locking.

G. General-Duty Valves, 2-1/2" NPS and Larger: ASME B16.38, cast-iron body, suitable for fuel gas service, with "WOG" indicated on valve body, and 125-psig pressure rating.

1. Gate Valves: MSS SP-70, OS&Y type with solid wedge.
2. Butterfly Valves: MSS SP-67, lug type with lever handle.

H. Automatic Gas Valves: ANSI Z21.21, with electrical or mechanical operator for actuation by appliance automatic shutoff device.

I. Electrically Operated Gas Valves: UL 429, bronze, aluminum, or cast-iron body solenoid valve; 120-V ac, 60 Hz, Class B, continuous-duty molded coil. Include NEMA ISC 6, Type 4, coil enclosure and electrically opened and closed dual coils. Valve position shall normally be closed.

VII. Pressure Regulators

A. Description: Single stage and suitable for fuel gas service. Include steel jacket and corrosion-resistant components, elevation compensator, and atmospheric vent.

1. 2" NPS and Smaller: Threaded ends according to ASME B1.20.1 for pipe threads.
2. 2-1/2" NPS and Larger: Flanged ends according to ASME B16.5 for steel flanges and according to ASME B16.24 for copper and copper-alloy flanges.
3. Service Pressure Regulators: ANSI Z21.80. Include 100-psig- minimum inlet pressure rating.
4. Line Pressure Regulators: ANSI Z21.80 with inlet pressure rating shown on drawings.
5. Appliance Pressure Regulators: ANSI Z21.18. Regulator may include vent limiting device, instead of vent connection, if approved by authorities having jurisdiction.

B. Pressure Regulator Vents: Factory- or field-installed, corrosion-resistant screen in opening if not connected to vent piping.

Part 3 - Execution

I. Preparation
   A. Close equipment shutoff valves before turning off fuel gas to premises or section of piping. Perform leakage test as specified in "Field Quality Control" Article to determine that all equipment is turned off in affected piping section.
   B. Comply with ANSI Z223.1, "Prevention of Accidental Ignition" Paragraph.

II. Piping Applications
   A. Flanges, unions, transition, and special fittings with pressure ratings same as or higher than system pressure rating may be used in applications below, unless otherwise indicated.
   B. Fuel Gas Piping, 2 psig or less: Use the following:
      1. Steel pipe, steel welding fittings, and welded joints.

III. Valve Applications
   A. Appliance Shutoff Valves for Pressure 0.5 psig or Less: Appliance connector valve or gas stop.
   B. Appliance Shutoff Valves for Pressure 0.5 to 2 psig: Gas stop or gas valve.
   C. Appliance Shutoff Valves for Pressure 2 to 5 psig: Gas valve.
   D. Piping Line Valves, 2” NPS and Smaller: Gas valve.
   E. Piping Line Valves, 2-1/2” NPS and Larger: Plug valve or general-duty valve.

IV. Piping Installation
   A. Refer to Division 15 Section "Basic Mechanical Materials and Methods" for basic piping installation requirements.
   B. Drips and Sediment Traps: Install drips at points where condensate may collect. Include outlets of service meters. Locate where readily accessible for cleaning and emptying.
      1. Construct drips and sediment traps using tee fitting with bottom outlet plugged or capped. Use minimum-length nipple of 3 pipe diameters, but not less than 3 inches long, and same size as connected pipe. Install with space between bottom of drip and floor for removal of plug or cap.
   C. Install fuel gas piping at uniform grade of 0.1 percent slope upward toward risers.
   D. Use eccentric reducer fittings to make reductions in pipe sizes. Install fittings with level side down.
   E. Connect branch piping from top or side of horizontal piping.

F. Install unions in pipes 2” NPS and smaller, adjacent to each valve, at final connection to each piece of equipment, and elsewhere as indicated. Unions are not required on flanged devices.

G. Install corrugated, stainless-steel tubing system according to manufacturer's written instructions. Include striker plates to protect tubing from puncture where tubing is restrained and cannot move.

H. Install strainer on inlet of each line pressure regulator and automatic and electrically operated valve.

I. Install pressure gage upstream and downstream from each line pressure regulator.

J. Install flanges on valves, specialties, and equipment having 2-1/2” NPS and larger connections.

K. Install vent piping for gas pressure regulators and gas trains, extend outside building, and vent to atmosphere. Terminate vents with turned-down, reducing-elbow fittings with corrosion-resistant insect screens in large end.

V. Joint Construction

A. Refer to Division 15 Section "Basic Mechanical Materials and Methods" for basic piping joint construction.

B. Use materials suitable for fuel gas.

1. Brazed Joints: Make with brazing alloy with melting point greater than 1000 deg F. Brazing alloys containing phosphorus are prohibited.

VI. Hanger And Support Installation

A. Refer to Division 15 Section "Hangers and Supports" for pipe hanger and support devices.

B. Install hangers for horizontal steel piping with the following maximum spacing and minimum rod sizes:

1. 1” NPS and Smaller: Maximum span, 96 inches; minimum rod size, 3/8 inch.
2. 1-1/4” NPS: Maximum span, 108 inches; minimum rod size, 3/8 inch.
3. 1-1/2” NPS and 2” NPS: Maximum span, 108 inches; minimum rod size, 3/8 inch.
4. 2-1/2” NPS to 3-1/2” NPS: Maximum span, 10 feet; minimum rod size, 1/2 inch.
5. 4” NPS and Larger: Maximum span, 10 feet; minimum rod size, 5/8 inch.

C. Install hangers for horizontal hard copper tubing with the following maximum spacing and minimum rod sizes:

1. 3/8” NPS: Maximum span, 48 inches; minimum rod size, 3/8 inch.
2. ½” NPS and 5/8” NPS: Maximum span, 72 inches; minimum rod size, 3/8 inch.

3. ¾” NPS and 7/8” NPS: Maximum span, 84 inches; minimum rod size, 3/8 inch.
4. 1” NPS: Maximum span, 96 inches; minimum rod size, 3/8 inch.

VII. Connections

A. Drawings indicate general arrangement of fuel gas piping, fittings, and specialties.
B. Install piping adjacent to appliances to allow service and maintenance.
C. Connect piping to appliances using gas with shutoff valves and unions. Install valve upstream from and within 72 inches of each appliance. Install union downstream from valve.
D. Sediment Traps: Install tee fitting with capped nipple in bottom to form drip, as close as practical to inlet of each appliance using gas.
E. Ground equipment.
   1. Tighten electrical connectors and terminals according to manufacturer's published torque-tightening values. If manufacturer's torque values are not indicated, use those specified in UL 486A and UL 486B.
   2. Do not use gas pipe as grounding electrode.

VIII. Labeling And Identifying

A. Equipment Nameplates and Signs: Install engraved plastic-laminate equipment nameplate or sign on or near each service meter, pressure regulator, and specialty valve.
   1. Text: In addition to name of identified unit, distinguish between multiple units, inform operator of operational requirements, indicate safety and emergency precautions, and warn of hazards and improper operations.
   2. Refer to Division 15 Section "Mechanical Identification" for nameplates and signs.

IX. Painting

A. Use materials and procedures in Division 9 Section "Painting," "Exterior Paint Schedule" Article, "Ferrous Metal" Paragraph, "Full-Gloss, Alkyd-Enamel Finish" Subparagraph.
B. Paint exterior piping, service meters, pressure regulators, and specialty valves and supports.
   1. Color: Grey.
C. Paint interior piping.
   1. Color: Yellow.

X. Field Quality Control

A. Inspect, test, and purge piping according to ANSI Z223.1, Part 4 "Inspection, Testing, and Purging," and requirements of authorities having jurisdiction.

B. Repair leaks and defects with new materials and retest system until satisfactory results are obtained.
C. Report test results promptly and in writing to Engineer and authorities having jurisdiction.
D. Verify capacities and pressure ratings of service meters, pressure regulators, valves, and specialties.
E. Verify correct pressure settings for pressure regulators.
F. Verify that specified piping tests are complete.

XI. Adjusting

A. Adjust controls and safety devices. Replace damaged and malfunctioning controls and safety devices.

END OF SECTION

Part 1 - General

I. General
   A. The Bidding and Contract Requirements, Division 1 -General Requirements, Section 230100 - General Provisions, and Section 230500 - Basic Materials and Methods, shall apply to this section.

II. Scope
   A. The work covered under this section shall include a complete fuel oil transfer pumping system.

III. Quality Assurance
   A. The pumping system shall meet the requirements of NFPA 31 - Oil Burning Equipment, state and local codes.
   B. The transfer pump shall be U/L listed for fuel oil use.

IV. Submittals
   A. Provide shop drawings on this equipment as described in Section 230100 - 1.04.

Part 2 - Products

I. Fuel Oil Transfer Pumps
   A. Provide and install a duplex fuel oil pump package as shown on the drawings. Acceptable manufacturers include:
      1. Viking
      2. Tuthill
      3. Webster
      4. Sundstrand.
   B. Type - The pump shall be positive displacement internal gear rotary type in standard cast iron construction. Provide cast iron mounting foot.
   C. Capacity shall be as shown in equipment schedule on drawings.
   D. Rotor - Iron heads shall be hydraulically balanced to assure instant priming and constant flow. Rotor, shaft and idler shall be steel.
   E. Seal - The pump shall employ a mechanical face-type seal, with carbon graphite casing bushing.
   F. Bearings - the bearing shall be Teflon impregnated outboard type.

G. Motor - Pump shall be mounted on formed steel base direct connected through flexible coupling with guard to 1200-rpm open drip-proof motor.

H. Starter - Provide a manual starter for single-phase units and magnetic across-the-line starter for three phase units. The starter shall have ON-OFF switch and red running light. See section 230500, article 2.07.

Part 3 - Execution

I. Installation

A. The fuel oil transfer pumps shall be installed as shown on the drawing and as recommended by the manufacturer.

END OF SECTION

Part 1 - General

I. General

A. The Bidding and Contract Requirements, Division 1 -General Requirements, Section 230100 - General Provisions, and Section 230500 - Basic Materials and Methods, shall apply to this section.

II. Scope

A. The work covered under this section shall include a complete installation of a double wall fiberglass underground fuel oil storage tank with an electronic fuel oil gauge, overfill and spill prevention system, hydrostatic tank monitoring system, and all other measures required by local, state, and national governing bodies having jurisdiction over the installation and as shown on the drawings and in the specifications.

III. Quality Assurance

A. The system shall meet the requirements of NFPA 30, “Flammable and Combustible Liquids Code”, and NFPA 31, “Standards for Installation of Fuel Burning Equipment”, Maryland Department of Energy Regulations, and the Prince George’s County building code.

B. The storage tank shall bear a UL label.

C. The complete tank and piping system shall be tested as follows:

1. Primary and secondary tank shall be leak tested by the manufacturer prior to shipment.
2. Leak test primary and secondary tanks before installing in ground. Pressure test primary tank to 5 psig for thirty (30) minutes using gauge pressure to check for leaks. Connect primary and secondary tanks together, pressure test to 5 psig for one hour using gauge pressure to check for leaks. Soap entire tank during this period to check for leaks.
3. After installing the tank in the ground repeat the above tests using gauge pressure to check for leaks.
4. After installation is completed, perform precision test of entire tank and piping system. Test method shall be able to detect leaks of .05 gallons per hour in accordance with Maryland Department of Energy Regulations and NFPA 329.
5. Perform operation test of hydrostatic tank monitoring system by temporarily raising and lowering fluid in annular space.

6. Within 6 months of installation tank must be inspected by a MDE certified inspector.

IV. Submittals

A. Provide shop drawings for tank, piping, and all ancillaries as described in Section 230100, 1.04.

V. Warranty

A. The installed tank specified in this section shall warranted not to fail or leak due to internal or external corrosion or structural damage under normal use and services. If within 30 years from the date of acceptance by the Architect the tank should fail, the manufacturer shall repair or replace it. Installation costs after the first year are not a part of this warranty.

Part 2 - Products

I. Fiberglass-reinforced Polyester Underground Storage Tank

A. Provide and install double-wall storage tank as shown on the drawings. The storage tank shall have corrosion resistant construction of glass fiber reinforcement and isophthalic resin. Capacity and dimensions of the tank shall be as shown on the drawings. The tank shall be manufactured by FLUID CONTAINMENT or XERXES. Tank shall be double wall fiberglass reinforced plastic (FRP) underground storage tank with a primary (internal) tank and a secondary (external) tank.

B. Loading Conditions – Tank shall meet the following design criteria:

1. Internal Load: Primary and secondary tanks shall withstand 5 psi air pressure test with 5 to 1 safety factor.
2. Vacuum Test: Tank shall be vacuum tested by the tank manufacturer to assure structural integrity. Primary tank shall be tested to 11.5 inches mercury and secondary tank tested to 9.5 inches mercury vacuum.
3. Surface Loads: Tank shall withstand surface H-20 axle loads when properly installed according to current manufacturer’s installation instructions.
4. External hydrostatic pressure: Buried in ground with 7’ of overburden over the top of the tank, the hole flooded and a safety factor of 5:1 against general buckling.
5. Tank shall be designed to support accessory equipment such as drop tubes when installed according to manufacturer’s recommendations and limitations.

C. Product Storage Requirements

1. Tanks shall be capable of storing petroleum with specific gravity up to 1.1, shall be chemically inert to petroleum products, and shall be capable of storing fuel oil at temperatures not to exceed 150 degrees F.
2. The primary tank shall be vented to atmospheric pressure. The tank is not designed as a pressure vessel.

D. Materials – Tanks (primary and secondary) shall be manufactured with 100% isophthalic polyester resin and glass fiber reinforcement with no sand fillers.

E. Brine Filled Annular Space – Tank shall have a space between the primary and secondary shell walls to allow for the free flow and containment of all leaked product from the primary tank.

II. Tank Accessories

A. Anchor straps – Provide FRP anchor straps as manufactured by tank manufacturer. Number and location of straps shall be specified in current literature of tank manufacturer. Each strap shall be capable of withstanding the buoyancy load for tank diameter as follows:
1. 4’-4,200 lbs. 8’-25,000 lbs. 12’-26,000 lbs.
2. 6’-18,000 lbs. 10’-32,000 lbs.

B. Tank Flanged Manway shall be 22” I.D. flanged complete with U.L. listed gaskets, bolts and covers.

C. Gauge Plates shall be installed by the manufacturer under each fitting and manway to prevent damage from dipstick abuse and ladders.

D. Annular Space
1. Tank shall have a space between the primary and secondary shell walls to allow for the free flow and containment of all leaked product from the primary tank.
2. Tank shall have one 4” NPT fitting located at each end of the tank for monitoring access to the space between the primary and secondary shell walls. Tank shall also include one 4” NPT fitting in the reservoir on the top of the tank.

E. NPT Threaded Fittings
1. All threaded fittings shall be a material of construction consistent with the requirements of the U.L. label. Fittings shall withstand a minimum of 150 foot pounds of torque and 1000 foot pounds of bending both with 2:1 factor of safety.
2. All standard thread fittings shall be half couplings and shall be 4” in diameter. Reducers are to be used for smaller sizes where shown and provided by contractor.

3. Suction Line – Shall be installed by contractor on site. Pipes shall terminate a minimum of 4” from bottom of tank.
4. Return line shall be installed by contractor and shall terminate at the top of the tank.

F. Hydrostatic Monitor Reservoir – An integrally mounted reservoir installed by the manufacturer shall be installed on the top of the tank. Reservoir shall be constructed of fiberglass reinforced plastic and shall have a 4” NPT monitoring fitting on top.

G. Deadman Anchors – Deadman shall be a concrete beam with a total length 12” greater than the length of the tank. Deadman for 6’ and 8’ diameter tanks shall be 12” X 12” and deadman for 10’ diameter tanks shall be 24” X 18”.

H. Certification Plate – Underwriter Laboratory label shall be permanently affixed to tank.

I. Lifting Lugs – Provide lifting lugs on tank. Lugs shall be capable of withstanding weight of tank with a safety factor of 3 to 1.

J. On 4,000 gallon tanks only, the Contractor shall install a foot valve in the supply line inside of the oil tank. The valve shall be single poppet style with an 8-mesh protective screen. Prototype: OPW model 91.

III. Fuel Oil Gauge System

A. The fuel oil gauge system shall consist of a liquid level transducer in the tank with an electronic indicator mounted in the boiler room complete with all necessary wiring. The tank gauging system shall be Hersey Model VR-2 transducer and model 5000 indicator or equal by Pneumercator or Petrometer, providing all aspects of the following are met:

1. The liquid level transducer shall extend to the bottom of the tank with the connection section mounted on the top outer tank shell. The transducer shall convert the position of a floating magnet to a variable resistive signal output to the indicator. The transducer shall be enclosed in a stainless steel housing, have a resolution of 1/8”, include zener barriers for intrinsically safe operation, and be Factory Mutual approved for fuel oil tanks.
2. The electronic indicator shall be compatible with level transducer and have a calibrated 250°F 10-1/2 inch diameter dial, an accuracy of 1.5% full scale, a standard proportional 4-20 mA output, an integral terminal connection block, and four alarm contacts. Power supply to the unit shall be 115 volt and low voltage power supply shall be internal to the unit. The indicator shall in a NEMA 3R housing and surface mounted in the boiler room. Wiring between the transmitter and the indicator and from the 115 volt power source to the indicator shall be under this section of the specifications.

3. Buried conduit for fuel oil gauge and reservoir sensor conductors shall be ¾" non-metallic. Conduit exposed in manhole shall be rigid metallic. Conduit within the boiler room shall be rigid metallic or IMC. Junction boxes shall be in manholes and shall be NEMA type 6, submersible watertight. Minimum conductor size shall be AWG #18 type THHN.

IV. Overfill And Spill Prevention System

A. The overfill and spill prevention system shall consist of an automatic overfill prevention valve, a spill containment basin, product fill tube, and manhole with lid and lockable fill cap. Overfill and spill prevention shall be the product of a single manufacturer. System shall be Emco/Wheaton model A1000 or equal provided all aspects of this specification are met. Components shall meet the following:

1. Overfill Prevention Valve – Valve shall be mounted within the spill containment basin for access. Valve shall shut off flow when the tank is 95% full, have a two-stage reset, a test button, and a spill basin drain assembly. Valve shall be cast aluminum with teflon floats protected with a shroud, with buna seals and 4" NPT fittings on each end. Prototype: OPW 61-60 overfill valve with drop tube, fill adapter and lockable cap.
2. Spill Prevention Basin – Basin shall have a 5 gallon capacity and shall contain an expandable inner shield within a rigid outer housing. The overfill prevention valve shall be mounted in the inner shield of the basin. Basin shall be constructed of fuel resistant plastic. Prototype: EMCO/WHEATON Model A1003.
3. Fill Tube – Tube shall be supplied with the overfill prevention valve, shall be aluminum, and shall extend to 4" from the bottom of the tank.
4. Manhole Cover – Manhole shall be cast iron or aluminum and be capable of a 7-1/2 ton bearing load. Paint the cover green.
5. Fill Tube Cap – Cap shall be water tight and lockable.
6. Sound Line Cap – Cap shall be watertight and oil wrench operated. Provide one oil wrench for the Owners use. Mount the wrench on the wall next to the fuel oil gauge or monitoring system.

V. Hydrostatic Tank Monitoring

A. The hydrostatic tank monitoring system shall be supplied by the tank manufacturer and shall consist of a brine solution in the annular space between tanks, a level sensor in the monitoring reservoir, an alarm panel, and all necessary wiring. The monitoring system shall be capable of detecting a leak in the primary and/or secondary tank as small as .05

gallons per hour regardless of the oil level in the tank or ground water conditions. Components shall be as follows:

1. Brine Solution - The annular space between tanks shall be filled with environmentally safe, non-toxic brine solution able to provide freeze protection to minus 40 degrees F and UL listed for compatibility with the tank.
2. Level Sensor - The sensor shall be mounted in the monitoring reservoir on the tank and shall complete a circuit to generate alarm signals for normal, high, and low brine levels.
3. Alarm Panel - The alarm panel shall have a 120 volt power source. The panel shall have a normal operation lamp, an alarm indicator lamp, a bell alarm, a test button, a silencing switch, terminal contacts for external monitoring, two spare light bulbs, NEMA 2 enclosure, and a hasp for a padlock. Each lamp or switch shall be permanently labeled. A wiring diagram for the monitoring system shall be provided.

VI. Vent Cap

A. The fuel oil tank vent line shall be extended to at least ten (10) feet above grade. Provide a rain roof cap on vent opening.

VII. Manhole Cover

A. Manholes shall be 30" diameter, round with cast iron lid and steel rim. Manholes shall be set in 8" thick concrete extending at least 18" in all directions. Concrete shall slope away from hole to ensure drainage.

VIII. Manway Risers

A. Riser shall be fiberglass, 48" diameter. Bottom of riser shall be within 6" of top of the tank.

IX. Tank Nameplate

A. Provide an engraved aluminum or brass nameplate (minimum 10” x 8”) permanently mounted in the concrete at the tank fill valve or on the building adjacent to the trench. Nameplate shall state the following: “TANK CAPACITY IN GALLONS”, DIAMETER OF TANK”, “TANK MANUFACTURER”, “TANK U/L #”, “DATE OF INSTALLATION”, “TYPE OF FUEL”, “TANK #” (if more than one tank). Engraved letters shall be one inch high.

Part 3 - Execution

I. Fuel Oil Tank

A. Tank shall be installed according to current installation instructions provided by the manufacturer. Tank system shall be tested according to manufacturer's instruction and part 1.03 of this section.

B. A 12 inch deep layer of pea gravel (1/8" to 3/4" diameter) or fine stone crushings (1/8" to 1/2" diameter) (ASTM D-448 & C-33-9.1) shall be spread evenly under the entire tank as a bed to separate the tank from the earth.

C. Before placing the tank in the excavation, all dirt clods and similar foreign matter shall be cleaned from the tank and areas of coating damages shall be repaired with a compatible coating.

D. Equipment to lift the tank shall be of adequate size to lift and lower the tank without dragging or dropping to ensure do damage to the tank. Tanks shall be carefully lifted and lowered by use of cables of adequate length attached where recommended by the manufacturer. Under no circumstances will chains or slings around the tank shell be used.

E. Special care should be exercised when installing hold down straps to ensure that the straps are separated from the tanks by separating pad made of an inert insulating material. The separating pad should be at least 2 inches wider than hold down straps width and must be carefully placed anywhere on the tank where hold down straps would come into direct contact with the tank shell.

F. Backfill consisting of pea fine gravel or #8 crushed stone shall be placed along bottom sides of tank by shoveling and tamping to ensure the tank is fully and evenly supported around bottom quadrant. The backfill shall be deposited carefully around tank and to a depth over tank shown on the drawings.

G. The plugs at unused tank openings, shall be removed; a pipe compound shall be added, and the plugs shall be reinstalled in the unused openings. The plugs in tank openings which are to be used should not be over tightened as this may cause the bushing thread or damage the non-metallic bushings when replacing plugs or installing required tank piping.

H. Anchoring - Concrete pad or Deadman as shown on plans shall be located and installed as recommended by the tank manufacturer.

I. The tank shall be filled to 100% of capacity with new number 2 fuel oil.

II. Ancillary Equipment

A. All ancillary equipment including the fuel oil gauge system, overfill and spill prevention system, hydrostatic tank monitoring system, vent caps manholes, etc. shall be installed in accordance with the manufacturer's instructions.

III. Installation Contractor

A. The storage tank system shall be installed by experienced mechanics regularly employed by a specialty contractor that is in the full time business of designing and installing petroleum storage tank and fuel dispensing systems. Contractor shall be an MDE certified UST technician. The contractor shall have a minimum of five (5) years successful history in the design, installation, and maintenance of petroleum storage systems. Submit a written description of the firm's experience and a listing of at least three (3) of its installations of a comparable size and complexity.

IV. Tank Installation Documentation

A. Contractor shall provide the Owner with the following information for each tank installed within thirty days after installation.

1. Facility address.
2. Fire Marshall or other installation inspection reports.
3. Manufacturers installation instruction sheet with UL# and procedures checked.
4. MSDS sheets on materials supplied.
5. Precision test results.
6. Copy of approved drawings and permit from local building authority.

END OF SECTION

Fuel Oil Underground Storage Tank Removal
Section 231315

Part 1 - General

I. General
   A. The Bidding and Contract Requirements, Division 1 -General Requirements, Section 230100 - General Provisions shall apply to this section.

II. Scope
   A. The work covered under this section shall include the removal of the existing underground fuel oil storage tank and associated piping, and all other measures required by local, state, and national governing bodies having jurisdiction over the existing installation and as shown on the drawings and in the specifications.
   B. The oil tank area shall be restored to grade and re-paved.

III. Quality Assurance
   A. The demolition/removal shall meet the requirements of the Maryland Department of Energy Regulations for underground storage tanks; Prince George's County building code, and Fire Marshal Regulations.

Part 2 - Products

I. Backfill
   A. Backfill shall be installed in accordance with Division 31.

II. Pavement And Subbase
   A. Pavement and Subbase shall be installed in accordance with Division 32.

Part 3 - Execution

I. Fuel Oil Tank And Pipe Removal:
   A. Contractor shall remove and dispose of the existing fuel oil tank, concrete pad, and soil in a manner as required and approved by all federal, state, and local agencies. The contractor shall be responsible for the removal of ten inches (10") or less of oil/water in the tank. Additional liquid will be disposed of at an additional cost to PGCPS. A Certificate of Compliance with these requirements shall be submitted to the Owner.
   B. Contractor shall remove and dispose of the existing oil piping in the boiler room, and any piping within the tank excavation area. Remaining underground oil piping shall be drained and abandoned in place.

C. If evidence of contamination exists (as determined by the Fire Marshal Official, or by soil tests submitted to the state) the Contractor shall immediately notify the Owner and take necessary steps to limit any future contamination of surroundings. The state and local governing authorities will dictate corrective action to be taken subject to guidelines established by The Environmental Protection Agency. Corrective actions will be done by change order to the contract.

D. Any additional or backfill soil shall be free of all debris and shall be compacted to 95 percent density. Contractor shall be responsible for providing all backfill soil. See Division 31.

E. All tank cleaning and disposal costs shall be included in contract price.

F. Prior to removal of existing underground fuel oil tank, the Contractor shall notify the office of the Fire Marshal and obtain all necessary permits.

G. An official from the office of the Fire Marshal will witness the tank removal and, subject to his determination, backfilling of excavation shall be permitted or denied.

H. Excavated soil shall be piled in multiple piles by soil condition at an Owner approved location either on site within property or at a site provided by Contractor. Costs for loading, hauling, and dumping shall be included in the bid. Pile(s) shall be on plastic sheets with seams taped and surrounded by hay bales.

II. Existing Utilities

A. The Contractor shall contact “Miss Utility” to determine the location of any conflicting utilities in the oil tank excavation area. Provide adequate means of protection during earthwork operations of any utilities.

B. Should uncharted or incorrectly charted piping or other utilities be encountered during excavation, the Contractor shall notify the Owner’s Representative immediately.

C. The Contractor shall not move or interrupt existing utilities without first coordinating with the Owner’s Representative.

III. Excavation, Sheeting, Shoring, And Bracing

A. Existing asphalt and concrete surface shall be cut neatly and cleanly.

B. Stability of Sides: Slope sides of excavations over 4' deep to angle of response of material excavated; otherwise, shore and brace where sloping is not possible either because of space restrictions, stability of material excavated or nearby utilities.

1. Maintain sides and slopes of excavations in a safe condition until completion of backfilling by scaling, benching, shelving or bracing.

2. Take precautions to prevent slides or cave-ins when excavations are made in locations adjacent to backfilled excavations, and when sides of excavations are subjected to vibrations from vehicular traffic or the operation of machinery, or any other source.

C. Shoring and Bracing shall be installed in accordance with Division 31.

IV. Backfill

A. Backfill shall be installed in accordance with section Division 31.

V. Pavement And Subbase

A. Pavement and Subbase shall be installed in accordance with Division 32.

VI. Barricades, Warning Signs And Lights

A. Comply with recognized standards and code requirements for the erection of substantial, structurally adequate barricades where needed to prevent accidents and losses. Paint with appropriate colors, graphics and warning signs to inform personnel at the site and the public, of the hazard being protected against. Provide lighting where appropriate and needed, including flashing red lights where appropriate.

VII. Enclosure Fence

A. When excavation or other substantial elements of the work begin, install a general enclosure fence with suitable lockable entrance gates. Enclose substantially the entire site or portion thereof determined to be sufficient to accommodate the entire construction operation. Install fence in a manner that will prevent persons, dogs and similar animals from easily entering the site. Fence shall be a minimum height of 6 feet.

END OF SECTION

Part 1 - General

I. Related Documents
   A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

II. Summary
   A. This Section includes piping, special-duty valves, and hydronic specialties for hot-water heating, chilled-water cooling, and condenser water systems; makeup water for these systems; blowdown drain lines; and condensate drain piping.
   B. Related Sections include the following:
      1. Division 23 Section "Basic Mechanical Materials and Methods" for general piping materials and installation requirements.
      2. Division 23 Section "Hangers and Supports" for pipe supports, product descriptions, and installation requirements. Hanger and support spacing is specified in this Section.
      3. Division 23 Section "Valves" for general-duty gate, globe, ball, butterfly, and check valves.
      4. Division 23 Section "Meters and Gages" for thermometers, flow meters, and pressure gages.
      5. Division 23 Section "Mechanical Identification" for labeling and identifying hydronic piping.
      6. Division 23 Section "Hydronic Pumps" for pumps, motors, and accessories for hydronic piping.
      7. Division 23 Section "HVAC Instrumentation and Controls" for temperature-control valves and sensors.

III. Definitions
   A. PVC: Chlorinated polyvinyl chloride.
   B. PVC: Polyvinyl chloride.

IV. Submittals
   A. Product Data: For each type of special-duty valve indicated. Include flow and pressure drop curves based on manufacturer's testing for diverting fittings, calibrated balancing valves, and automatic flow-control valves.

B. Shop Drawings: Detail fabrication of pipe anchors, hangers, special pipe support assemblies, alignment guides, expansion joints and loops, and their attachment to the building structure. Detail location of anchors, alignment guides, and expansion joints and loops.

C. Welding Certificates: Copies of certificates for welding procedures and personnel.

D. Field Test Reports: Written reports of tests specified in Part 3 of this Section. Include the following:

1. Test procedures used.
2. Test results that comply with requirements.
3. Failed test results and corrective action taken to achieve requirements.

E. Maintenance Data: For hydronic specialties and special-duty valves to include in maintenance manuals specified in Division 1.

F. Water Analysis: Submit a copy of the water analysis to illustrate water quality available at Project site.

V. Quality Assurance

A. Welding: Qualify processes and operators according to the ASME Boiler and Pressure Vessel Code: Section IX, "Welding and Brazing Qualifications."

B. ASME Compliance: Comply with ASME B31.9, "Building Services Piping," for materials, products, and installation. Safety valves and pressure vessels shall bear the appropriate ASME label. Fabricate and stamp air separators and expansion tanks to comply with the ASME Boiler and Pressure Vessel Code, Section VIII, Division 1.

VI. Coordination

A. Coordinate layout and installation of hydronic piping and suspension system components with other construction, including light fixtures, HVAC equipment, fire-suppression-system components, and partition assemblies.

B. Coordinate pipe sleeve installations for foundation wall penetrations.

C. Coordinate piping installation with roof curbs, equipment supports, and roof penetrations. Roof specialties are specified in Division 7 Sections.

D. Coordinate pipe fitting pressure classes with products specified in related Sections.

E. Coordinate size and location of concrete bases. Cast anchor-bolt inserts into base.

F. Coordinate installation of pipe sleeves for penetrations through exterior walls and floor assemblies.

VII. Extra Materials

A. Water Treatment Chemicals: Furnish sufficient chemicals for initial system startup and for preventive maintenance for one year from date of Substantial Completion.

Part 2 - Products

I. Manufacturers

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

1. Calibrated Balancing Valves:
   a) Armstrong Pumps, Inc.
   b) Flow Design, Inc.
   c) ITT Bell & Gossett; ITT Fluid Technology Corp.
   d) Taco, Inc.
2. Pressure-Reducing Valves:
   a) Amtrol, Inc.
   b) Armstrong Pumps, Inc.
   c) Conbraco Industries, Inc.
   d) ITT Bell & Gossett; ITT Fluid Technology Corp.
   e) Spence Engineering Company, Inc.
   f) Watts Industries, Inc.; Watts Regulators.
3. Safety Valves:
   a) Amtrol, Inc.
   b) Armstrong Pumps, Inc.
   c) Conbraco Industries, Inc.
   d) ITT McDonnell & Miller Div.; ITT Fluid Technology Corp.
   e) Kunkle Valve Division.
   f) Spence Engineering Company, Inc.
4. Expansion Tanks:
   a) Amtrol, Inc.
   b) Armstrong Pumps, Inc.
   c) ITT Bell & Gossett; ITT Fluid Technology Corp.
   d) Taco, Inc.
   e) Wessels
5. Air Separators and Air Purgers:
   a) Amtrol, Inc.
   b) Armstrong Pumps, Inc.

c) ITT Bell & Gossett; ITT Fluid Technology Corp.

d) Taco, Inc.

e) Wessels

II. Piping Materials

A. General: Refer to Part 3 "Piping Applications" Article for applications of pipe and fitting materials.

III. Copper Tube And Fittings

A. Drawn-Temper Copper Tubing: ASTM B 88, Type L.

B. Annealed-Temper Copper Tubing: ASTM B 88, Type K.

C. DWV Copper Tubing: ASTM B 306, Type DWV.

D. Wrought-Copper Fittings: ASME B16.22.

E. Wrought-Copper Unions: ASME B16.22.

F. Solder Filler Metals: ASTM B 32, 95-5 tin antimony or 100% lead free.

G. Brazing Filler Metals: AWS A5.8, Classification BAg-1 (silver).

IV. Steel Pipe And Fittings

A. Steel Pipe, NPS 2 and Smaller: ASTM A 53, Type S (seamless) or Type F (furnace-butt welded), Grade B, Schedule 40, black steel, plain ends.

B. Steel Pipe, NPS 2-1/2 through NPS 12: ASTM A 53, Type E (electric-resistance welded), Grade B, Schedule 40, black steel, plain ends.

1. Steel Pipe Nipples: ASTM A 733, made of ASTM A 53, Schedule 40, black steel; seamless for NPS 2 and smaller and electric-resistance welded for NPS 2-1/2 and larger.

C. Black Cast-Iron Threaded Fittings: ASME B16.4; Classes 125 and 250.

D. Malleable-Iron Threaded Fittings: ASME B16.3, Classes 150 and 300.

E. Malleable-Iron Unions: ASME B16.39; Classes 150, 250, and 300.

F. Cast-Iron Pipe Flanges and Flanged Fittings: ASME B16.1, Classes 25, 125, and 250; raised ground face, and bolt holes spot faced.

G. Wrought-Steel Fittings: ASTM A 234/A 234M, wall thickness to match adjoining pipe.

H. Wrought Cast- and Forged-Steel Flanges and Flanged Fittings: ASME B16.5, including bolts, nuts, and gaskets of the following material group, end connections, and facings:

1. Material Group: 1.1.

2. End Connections: Butt welding.

3. Facings: Raised face.

I. Flexible Connectors: Stainless-steel bellows with woven, flexible, bronze, wire-reinforcing protective jacket; 150-psig minimum working pressure and 250 deg F maximum operating

temperature. Connectors shall have flanged or threaded-end connections to match equipment connected and shall be capable of 3/4-inch misalignment.

J. Welding Materials: Comply with Section II, Part C, of the ASME Boiler and Pressure Vessel Code for welding materials appropriate for wall thickness and for chemical analysis of pipe being welded.

K. Gasket Material: Thickness, material, and type suitable for fluid to be handled; and design temperatures and pressures.

V. Plastic Pipe And Fittings

A. PVC Plastic Pipe: ASTM D 1785, Schedules 40 and 80, plain ends.

B. PVC Plastic Pipe Fittings: Socket-type pipe fittings, ASTM D 2466 for Schedule 40 pipe; ASTM D 2467 for Schedule 80 pipe.

1. PVC Solvent Cement: ASTM D 2564.

VI. Valves

A. Gate, globe, check, ball, butterfly, and outside stem and yoke valves are specified in Division 15 Section "Valves."

B. Refer to Part 3 "Valve Applications" Article for applications of each valve.

C. Calibrated Balancing Valves, NPS 2” and Smaller: Bronze body, ball type, 125-psig working pressure, 250 deg F maximum operating temperature, and having threaded ends. Valves shall have calibrated orifice or venturi, connections for portable differential pressure meter with integral seals, and be equipped with a memory stop to retain set position.

D. Calibrated Balancing Valves, NPS 2-½” and Larger: Cast-iron or steel body, ball type, 125-psig working pressure, 250 deg F maximum operating temperature, and having flanged connections. Valves shall have calibrated orifice or venturi, connections for portable differential pressure meter with integral seals, and be equipped with a memory stop to retain set position.

E. Pressure-Reducing Valves: Diaphragm-operated, bronze or brass body with low inlet pressure check valve, inlet strainer removable without system shutdown, and non-corrosive valve seat and stem. Select valve size, capacity, and operating pressure to suit system. Valve shall be factory set at operating pressure and have capability for field adjustment.

F. Safety Valves: Diaphragm-operated, bronze or brass body with brass and rubber, wetted, internal working parts; shall suit system pressure and heat capacity and shall comply with the ASME Boiler and Pressure Vessel Code, Section IV.

VII. Hydronic Specialties

A. Manual Air Vent: Bronze body and nonferrous internal parts; 150-psig working pressure; 225 deg F operating temperature; manually operated with screwdriver or thumbscrew; with NPS 1/8 discharge connection and NPS 1/2 inlet connection.

B. Automatic Air Vent: Designed to vent automatically with float principle; bronze body and nonferrous internal parts; 150-psig working pressure; 240 deg F operating temperature; with NPS 1/4 discharge connection and NPS 1/2 inlet connection.

C. Expansion Tanks: Welded carbon steel, rated for 125-psig working pressure and 375 deg F1 deg C) maximum operating temperature, with taps in bottom of tank for tank fitting and taps in end of tank for gage glass. Tanks shall be factory tested with taps fabricated and labeled according to the ASME Boiler and Pressure Vessel Code, Section VIII, Division 1. Include the following fittings and accessories:

1. Air-Control Tank Fitting: Cast-iron body, copper-plated tube, brass vent tube plug, and stainless-steel ball check, 100-gal. unit only; sized for compression-tank diameter. Design tank fittings for 125-psig working pressure and 250 deg F maximum operating temperature.
2. Tank Drain Fitting: Brass body, nonferrous internal parts; 125-psig working pressure and 240 deg F maximum operating temperature; designed to admit air to compression tank, drain water, and close off system.
3. Gage Glass: Full height with dual manual shutoff valves, 3/4-inch- diameter gage glass, and slotted-metal glass guard.

D. Tangential-Type Air Separators: Welded black steel; ASME constructed and labeled for 125-psig minimum working pressure and 375 deg F maximum operating temperature; perforated stainless-steel air collector tube designed to direct released air into expansion tank; tangential inlet and outlet connections; threaded connections for NPS 2” and smaller; flanged connections for NPS 2-½” and larger; threaded blowdown connection. Provide units in sizes for full-system flow capacity.

E. In-Line Air Separators: One-piece cast iron with an integral weir designed to decelerate system flow to maximize air separation at a working pressure up to 175 psig and liquid temperature up to 300 deg F.

F. Air Purgers: Cast-iron body with internal baffles that slow the water velocity to separate the air from solution and divert it to the vent for quick removal. Maximum working pressure of 150 psig and temperature of 250 deg F.

G. Bypass Chemical Feeder: Welded steel construction; 125-psig working pressure; 5-gal. capacity; with fill funnel and inlet, outlet, and drain valves.
   1. Chemicals: Specially formulated, based on analysis of makeup water, to prevent accumulation of scale and corrosion in piping and connected equipment.

H. Y-Pattern Strainers: 125-psig working pressure; cast-iron body (ASTM A 126, Class B), flanged ends for NPS 2-½" and larger, threaded connections for NPS 2" and smaller, bolted cover, perforated stainless-steel basket, and bottom drain connection.

I. Flexible Connectors: Stainless-steel bellows with woven, flexible, bronze, wire-reinforcing protective jacket; 150-psig minimum working pressure and 250 deg F maximum operating temperature. Connectors shall have flanged- or threaded-end connections to match equipment connected and shall be capable of 3/4-inch misalignment.

Part 3 - Execution

I. Piping Applications
   A. Hot and Chilled Water, NPS 2" and Smaller: Above ground, use Type L drawn-temper copper tubing with soldered joints or Schedule 40 steel pipe with threaded joints.
   B. Hot and Chilled Water, NPS 2-½" and Larger: Schedule 40 steel pipe with welded and flanged joints.
   C. Condenser Water: Schedule 80 PVC pipe with solvent-welded joints.

II. Valve Applications
   A. General-Duty Valve Applications: Unless otherwise indicated, use the following valve types:
      1. Shutoff Duty: Gate, ball, and butterfly valves.
      2. Throttling Duty: Globe, ball, and butterfly valves.
   B. Concealed valve location identifiers on site shall be metal tag type attached to drop ceiling structure or identified by permanent tag on wall under hard ceilings directly under valve.
   C. Install shutoff duty valves at each branch connection to supply mains, at supply connection to each piece of equipment, unless only one piece of equipment is connected in the branch line. Install throttling duty valves at each branch connection to return mains, at return connections to each piece of equipment, and elsewhere as indicated.
   D. Install calibrated balancing valves in the return water line of each heating or cooling element and elsewhere as required to facilitate system balancing.
   E. Install check valves at each pump discharge and elsewhere as required to control flow direction.

F. Install safety valves on hot-water generators and elsewhere as required by the ASME Boiler and Pressure Vessel Code. Install safety-valve discharge piping, without valves, to floor. Comply with the ASME Boiler and Pressure Vessel Code, Section VIII, Division 1, for installation requirements.

G. Install pressure-reducing valves on hot-water generators and elsewhere as required to regulate system pressure.

III. Piping Installations

A. Refer to Division 15 Section "Basic Mechanical Materials and Methods" for basic piping installation requirements.

B. Install groups of pipes parallel to each other, spaced to permit applying insulation and servicing of valves.

C. Install drains, consisting of a tee fitting, NPS 3/4” ball valve, and short NPS 3/4” threaded nipple with cap, at low points in piping system mains and elsewhere as required for system drainage.

D. Install piping at a uniform grade of 0.2 percent upward in direction of flow.

E. Reduce pipe sizes using eccentric reducer fitting installed with level side up.

F. Unless otherwise indicated, install branch connections to mains using tee fittings in main pipe, with the takeoff coming out the bottom of the main pipe. For up-feed risers, install the takeoff coming out the top of the main pipe.

G. Install strainers on supply side of each control valve, pressure-reducing valve, solenoid valve, in-line pump, and elsewhere as indicated. Install NPS 3/4” nipple and ball valve in blowdown connection of strainers NPS 2” and larger. Match size of strainer blowoff connection for strainers smaller than NPS 2”.

H. Anchor piping for proper direction of expansion and contraction.

IV. Hangers And Supports

A. Hanger, support, and anchor devices are specified in Division 15 Section "Hangers and Supports." Comply with requirements below for maximum spacing of supports.

B. Install the following pipe attachments:

1. Adjustable steel clevis hangers for individual horizontal piping less than 20 feet long.
2. Adjustable roller hangers and spring hangers for individual horizontal piping 20 feet or longer.
3. Pipe Roller: MSS SP-58, Type 44 for multiple horizontal piping 20 feet or longer, supported on a trapeze.
4. Spring hangers to support vertical runs.

5. On plastic pipe, install pads or cushions on bearing surfaces to prevent hanger from scratching pipe.

C. Install hangers for steel piping with the following maximum spacing and minimum rod sizes:
   1. NPS 3/4": Maximum span, 7 feet; minimum rod size, 1/4 inch.
   2. NPS 1": Maximum span, 7 feet; minimum rod size, 1/4 inch.
   3. NPS 1-½": Maximum span, 9 feet; minimum rod size, 3/8 inch.
   4. NPS 2": Maximum span, 10 feet; minimum rod size, 3/8 inch.
   5. NPS 2-½": Maximum span, 11 feet; minimum rod size, 3/8 inch.
   6. NPS 3": Maximum span, 12 feet; minimum rod size, 3/8 inch.
   7. NPS 4": Maximum span, 14 feet; minimum rod size, 1/2 inch.
   8. NPS 6": Maximum span, 17 feet; minimum rod size, 1/2 inch.
   9. NPS 8": Maximum span, 19 feet; minimum rod size, 5/8 inch.
   10. NPS 10": Maximum span, 20 feet; minimum rod size, 3/4 inch.
   11. NPS 12": Maximum span, 23 feet; minimum rod size, 7/8 inch22 mm).
   12. NPS 14": Maximum span, 25 feet; minimum rod size, 1 inch.
   13. NPS 16": Maximum span, 27 feet; minimum rod size, 1 inch.
   14. NPS 18": Maximum span, 28 feet; minimum rod size, 1-1/4 inches2 mm).
   15. NPS 20": Maximum span, 30 feet; minimum rod size, 1-1/4 inches.

D. Install hangers for drawn-temper copper piping with the following maximum spacing and minimum rod sizes:
   1. NPS 3/4": Maximum span, 5 feet; minimum rod size, 1/4 inch.
   2. NPS 1": Maximum span, 6 feet; minimum rod size, 1/4 inch.
   3. NPS 1-½": Maximum span, 8 feet; minimum rod size, 3/8 inch.
   4. NPS 2": Maximum span, 8 feet; minimum rod size, 3/8 inch.
   5. NPS 2-½": Maximum span, 9 feet; minimum rod size, 3/8 inch.
   6. NPS 3": Maximum span, 10 feet; minimum rod size, 3/8 inch.

E. Plastic Piping Hanger Spacing: Space hangers according to pipe manufacturer's written instructions for service conditions. Avoid point loading. Space and install hangers with the fewest practical rigid anchor points.

F. Support vertical runs at roof, at each floor, and at 10-foot intervals between floors.

V. Pipe Joint Construction

A. Refer to Division 15 Section "Basic Mechanical Materials and Methods" for joint construction requirements for soldered and brazed joints in copper tubing; threaded, welded, and flanged joints in steel piping; and solvent-welded joints for PVC piping.

VI. Hydronic Specialties Installation

A. Install manual air vents at high points in piping, at heat-transfer coils, and elsewhere as required for system air venting.

B. Install automatic air vents in mechanical equipment rooms only at high points of system piping, at heat-transfer coils, and elsewhere as required for system air venting.

C. Install dip-tube fittings in boiler outlet. Install piping to expansion tank with a 2 percent upward slope toward tank. Connect boiler-outlet piping.

D. Install in-line air separators in pump suction lines. Install piping to compression tank with a 2 percent upward slope toward tank. Install drain valve on units NPS 2" and larger.

E. Install combination air separator and strainer in pump suction lines. Install piping to compression tank with a 2 percent upward slope toward tank. Install blowdown piping with gate valve; extend to nearest drain.

F. Install bypass chemical feeders in each hydronic system where indicated, in upright position with top of funnel not more than 48 inches above floor. Install feeder in bypass line, off main, using globe valves on each side of feeder and in the main between bypass connections. Pipe drain, with ball valve, to nearest equipment drain.

G. Install expansion tanks above air separator. Install gage glass and cocks on end of tank. Install tank fitting in tank bottom and charge tank. Use manual vent for initial fill to establish proper water level in tank.

1. Support tank from floor or structure above with sufficient strength to carry weight of tank, piping connections, and fittings, plus weight of a full tank of water. Do not overload building components and structural members.

VII. Terminal Equipment Connections

A. Size for supply and return piping connections shall be same as for equipment connections.

B. Install control valves in accessible locations close to connected equipment.

C. Install bypass piping with globe valve around control valve. If multiple, parallel control valves are installed, only one bypass is required.

D. Install ports for pressure and temperature gages at coil inlet connections.

VIII. Field Quality Control

A. Prepare hydronic piping according to ASME B31.9 and as follows:

1. Leave joints, including welds, uninsulated and exposed for examination during test.

2. Provide temporary restraints for expansion joints that cannot sustain reactions due to test pressure. If temporary restraints are impractical, isolate expansion joints from testing.

3. Flush system with clean water. Clean strainers.

4. Isolate equipment from piping. If a valve is used to isolate equipment, its closure shall be capable of sealing against test pressure without damage to valve. Install blinds in flanged joints to isolate equipment.
5. Install safety valve, set at a pressure no more than one-third higher than test pressure, to protect against damage by expanding liquid or other source of overpressure during test.

B. Perform the following tests on hydronic piping:
1. Use ambient temperature water as a testing medium unless there is risk of damage due to freezing. Another liquid that is safe for workers and compatible with piping may be used.
2. While filling system, use vents installed at high points of system to release trapped air. Use drains installed at low points for complete draining of liquid.
3. Check expansion tanks to determine that they are not air bound and that system is full of water.
4. Subject piping system to hydrostatic test pressure that is not less than 1.5 times the design pressure. Test pressure shall not exceed maximum pressure for any vessel, pump, valve, or other component in system under test. Verify that stress due to pressure at bottom of vertical runs does not exceed either 90 percent of specified minimum yield strength or 1.7 times "SE" value in Appendix A of ASME B31.9, "Building Services Piping."
5. After hydrostatic test pressure has been applied for at least 10 minutes, examine piping, joints, and connections for leakage. Eliminate leaks by tightening, repairing, or replacing components, and repeat hydrostatic test until there are no leaks.
6. Prepare written report of testing.

IX. Adjusting

A. Mark calibrated nameplates of pump discharge valves after hydronic system balancing has been completed, to permanently indicate final balanced position.

B. Perform these adjustments before operating the system:
1. Open valves to fully open position. Close coil bypass valves.
2. Check pump for proper direction of rotation.
3. Set automatic fill valves for required system pressure.
4. Check air vents at high points of system and determine if all are installed and operating freely (automatic type), or bleed air completely (manual type).
5. Set temperature controls so all coils are calling for full flow.
6. Check operation of automatic bypass valves.

7. Check and set operating temperatures of boilers and chillers to design requirements.
8. Lubricate motors and bearings.

X. Cleaning

A. Flush hydronic piping systems with clean water. Remove and clean or replace strainer screens. After cleaning and flushing hydronic piping systems, but before balancing, remove disposable fine-mesh strainers in pump suction diffusers.

END OF SECTION

Part 1 - General

I. Related Documents
   A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

II. Summary
   A. This Section includes the following categories of hydronic pumps for hydronic systems:
      1. In-line circulators.
      2. Vertical in-line pumps.
      3. End-suction pumps.
      4. Double-suction pumps.
      5. Automatic condensate pump units.
   B. Related Sections include the following:
      1. Division 15 Section "Motors" for general motor requirements.

III. Submittals
   A. Product Data: Include certified performance curves and rated capacities; shipping, installed, and operating weights; furnished specialties; final impeller dimensions; and accessories for each type of product indicated. Indicate pump's operating point on curves.
   B. Shop Drawings: Show pump layout and connections. Include Setting Drawings with templates for installing foundation and anchor bolts and other anchorages.
      1. Wiring Diagrams: Detail wiring for power, signal, and control systems and differentiate between manufacturer-installed and field-installed wiring.
   C. Maintenance Data: For pumps to include in maintenance manuals specified in Division 1.

IV. Quality Assurance
   A. UL Compliance: Fabricate and label pumps to comply with UL 778, "Motor-Operated Water Pumps," for construction requirements.
   B. Product Options: Drawings indicate size, profiles, connections, and dimensional requirements of pumps and are based on the specific types and models indicated. Other manufacturers' pumps with equal performance characteristics may be considered. Refer to Division 1 Section "Substitutions."
   C. Regulatory Requirements: Fabricate and test steam condensate pumps to comply with HI 1.1-1.5, "Centrifugal Pumps for Nomenclature, Definitions, Application and Operation," and HI 1.6, "Centrifugal Pump Tests."

D. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction.

V. Delivery, Storage, And Handling

A. Manufacturer's Preparation for Shipping: Clean flanges and exposed machined metal surfaces and treat with anticorrosion compound after assembly and testing. Protect flanges, pipe openings, and nozzles with wooden flange covers or with screwed-in plugs.

B. Store pumps in dry location.

C. Retain protective covers for flanges and protective coatings during storage.

D. Protect bearings and couplings against damage from sand, grit, and other foreign matter.

E. Comply with pump manufacturer's written rigging instructions.

VI. Coordination

A. Coordinate size and location of concrete bases.

VII. Extra Materials

A. Furnish extra materials described below that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.

1. Mechanical Seals: One mechanical seal for each pump.

Part 2 - Products

I. Manufacturers

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

1. In-Line Circulators:
   a) Armstrong Pumps, Inc.
   b) Bell & Gossett ITT; Div. of ITT Fluid Technology Corp.
   c) Taco; Fabricated Products Div.
2. Compact In-Line Circulators:
   a) Armstrong Pumps, Inc.
   b) Bell & Gossett ITT; Div. of ITT Fluid Technology Corp.
   c) Taco; Fabricated Products Div.
3. Vertical In-Line Pumps:
   a) Armstrong Pumps, Inc.
   b) Bell & Gossett ITT; Div. of ITT Fluid Technology Corp.
   c) Taco; Fabricated Products Div.

4. Supported-Volute, Flexible-Coupled, End-Suction Pumps:
    a) Armstrong Pumps, Inc.
    b) Bell & Gossett ITT; Div. of ITT Fluid Technology Corp.
    c) Taco; Fabricated Products Div.

II. General Pump Requirements

A. Pump Units: Factory assembled and tested.

B. Motors: Include built-in, thermal-overload protection and grease-lubricated ball bearings. Select each motor to be non-overloading over full range of pump performance curve.

C. Motors Indicated to Be Energy Efficient: Minimum efficiency as indicated according to IEEE 112, Test Method B. Include motors with higher efficiency than "average standard industry motors" according to IEEE 112, Test Method B, if efficiency is not indicated.

D. Warranty: Provide pumps with five year warranty for manufacturer or installation defects.

III. In-line Circulators

A. Description: Horizontal, in-line, centrifugal, single-stage, bronze-fitted, radially split case design; rated for 125-psig minimum working pressure and a continuous water temperature of 225 deg F.

1. Casing: Cast iron, with threaded companion flanges for piping connections, and threaded gage tappings at inlet and outlet connections.
    a) Connection Option: Unions at connections for casings that are not available with threaded companion flanges.
2. Impeller: ASTM B 584, cast bronze, statically and dynamically balanced, closed, overhung, single suction, and keyed to shaft.
3. Shaft and Sleeve: Steel shaft with oil-lubricated copper sleeve.
4. Seals: Mechanical type. Include carbon-steel rotating ring, stainless-steel spring, ceramic seat, and flexible bellows and gasket.
5. Pump Bearings: Oil-lubricated, bronze journal and thrust type.
6. Motor Bearings: Oil-lubricated, sleeve type.
7. Coupling: Flexible, capable of absorbing torsional vibration and shaft misalignment.
8. Motor: Resiliently mounted to pump casing.

IV. Compact In-line Circulators

A. Description: Water cooled, horizontal, in-line, compact design, seal-less, centrifugal, and single stage. Include pump and motor assembled on a common shaft in hermetically sealed unit, without stuffing boxes or mechanical seals. Include lubrication of sleeve bearing and cooling of motor by circulating pumped liquid through motor section, and

isolation of motor section from motor-stator windings by corrosion-resistant, nonmagnetic, alloy liner. Include design rated for 125-psig minimum working pressure and a continuous water temperature of 225 deg F.

B. Description: Cartridge type, horizontal, in-line, compact, seal-less, centrifugal, and single stage. Include pump and motor assembled on a common shaft in cartridge-type, hermetically sealed unit, without stuffing boxes or mechanical seals. Include isolation of motor section from motor-stator windings by corrosion-resistant, nonmagnetic, alloy liner. Include design rated for 125-psig minimum working pressure and a continuous water temperature of 225 deg F.

1. Casing: Cast bronze or cast iron, with stainless-steel liner, static O-ring seal to separate motor section from motor stator, and flanged piping connections.
2. Impeller: Overhung, single suction, closed or open, nonmetallic.
3. Shaft and Sleeve: Stainless-steel shaft with carbon-steel sleeve.
4. Motor: Single speed.
5. Motor: Multispeed.

V. Vertical In-line Pumps

A. Description: Vertical, in-line, centrifugal, flexible-coupled, single-stage, radially split case design. Include vertical-mounting, bronze-fitted design and mechanical seals rated for 125-psig minimum working pressure and a continuous water temperature of 225 deg F.

1. Casing: Cast iron, with threaded companion flanges for piping connections smaller than 3” NPS, drain plug at low point of volute, and threaded gage tappings at inlet and outlet connections.
2. Impeller: ASTM B 584, cast bronze, statically and dynamically balanced, closed, overhung, single suction, and keyed to shaft.
3. Wear Rings: Replaceable, bronze casing ring.
4. Shaft and Sleeve: Ground and polished stainless-steel shaft with bronze sleeve.
5. Shaft: Ground and polished stainless-steel shaft with axially split spacer coupling.
6. Seals: Mechanical, with carbon-steel rotating ring, stainless-steel spring, ceramic seat, and flexible bellows and gasket.
7. Motor: Directly mounted to pump casing and with lifting and supporting lugs in top of motor enclosure.

VI. Flexible-coupled, End-suction Pumps

A. Description: Base-mounted, centrifugal, flexible-coupled, end-suction, single-stage, bronze-fitted, back-pull-out, radially split case design; rated for 175-psig minimum working pressure and a continuous water temperature of 225 deg F.

1. Casing: Cast iron, with flanged piping connections, drain plug at low point of volute, threaded gage tappings at inlet and outlet connections, and integral feet or other means on volute to support weight of casing and attached piping. Casing shall allow removal and replacement of impeller without disconnecting piping.
2. Impeller: ASTM B 584, cast bronze, statically and dynamically balanced, closed, overhung, single suction, keyed to shaft, and secured by locking cap screw.
3. Wear Rings: Replaceable, bronze casing ring.
4. Shaft and Sleeve: Steel shaft with bronze sleeve.
5. Seals: Mechanical, with carbon-steel rotating ring, stainless-steel spring, ceramic seat, and flexible bellows and gasket.
6. Coupling: Flexible-spacer type, capable of absorbing torsional vibration and shaft misalignment; with flange and sleeve section that can be disassembled and removed without removing pump or motor.
7. Coupling Guard: Steel, removable, and attached to mounting frame.
8. Mounting Frame: Welded-steel frame and cross members, factory fabricated from ASTM A 36/A 36M channels and angles. Fabricate for mounting pump casing, coupling guard, and motor. Field-drill motor-mounting holes for field-installed motors.
   a) Option: Cast-iron frames are acceptable.
9. Motor: Secured to mounting frame, with adjustable alignment.

VII. Pump Specialty Fittings

A. Suction Diffuser: Angle or straight pattern, 175-psig or as required for system, pressure rating, cast-iron body and end cap, pump-inlet fitting; with bronze startup and bronze or stainless-steel permanent strainers; bronze or stainless-steel straightening vanes; drain plug; and factory- or field-fabricated support.

Part 3 - Execution

I. Examination

A. Examine equipment foundations and anchor-bolt locations for compliance with requirements for installation.

1. Examine roughing-in for piping systems to verify actual locations of piping connections before pump installation.

2. Examine foundations and inertia bases for suitable conditions where pumps are to be installed.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

II. Pump Installation

A. Install pumps according to manufacturer's written instructions.

1. Install pumps according to HI 1.1-1.5, "Centrifugal Pumps for Nomenclature, Definitions, Application and Operation."

B. Install pumps to provide access for periodic maintenance, including removing motors, impellers, couplings, and accessories.

C. Support pumps and piping separately so piping is not supported by pumps.

D. Suspend in-line pumps using continuous-thread hanger rod and vibration-isolation hangers. Install seismic bracing as required by authorities having jurisdiction.

E. Set base-mounted pumps on concrete foundation. Disconnect coupling halves before setting. Do not reconnect couplings until alignment operations have been completed.

1. Support pump baseplate on rectangular metal blocks and shims, or on metal wedges with small taper, at points near foundation bolts to provide a gap of 3/4 to 1-1/2 inches between pump base and foundation for grouting.

2. Adjust metal supports or wedges until pump and driver shafts are level. Check coupling faces and suction and discharge flanges of pump to verify that they are level and plumb.

III. Alignment

A. Align pump and motor shafts and piping connections after setting them on foundations, after grout has been set and foundation bolts have been tightened, and after piping connections have been made.

B. Comply with pump and coupling manufacturers' written instructions.

C. Adjust pump and motor shafts for angular and offset alignment by methods specified in HI 1.1-1.5, "Centrifugal Pumps for Nomenclature, Definitions, Application and Operation."

D. After alignment is correct, tighten foundation bolts evenly but not too firmly. Completely fill baseplate with non-shrink, nonmetallic grout while metal blocks and shims or wedges are in place. After grout has cured, fully tighten foundation bolts.

IV. Connections

A. Piping installation requirements are specified in other Division 15 Sections. Drawings indicate general arrangement of piping, fittings, and specialties.

B. Install piping adjacent to machine to allow service and maintenance.

C. Connect piping to pumps. Install valves that are the same size as piping connected to pumps.

D. Install suction and discharge pipe sizes equal to or greater than diameter of pump nozzles.

E. Install check valve and throttling valve on discharge side of in-line circulators.

F. Install non-slam check valve and globe valve on discharge side of vertical in-line pumps.

G. Install suction diffuser and shutoff valve on suction side of vertical in-line pumps.

H. Install suction diffuser and shutoff valve on suction side of base-mounted pumps.

I. Install flexible connectors on suction and discharge sides of base-mounted pumps between pump casing and valves.

J. Install pressure gages on pump suction and discharge. Install at integral pressure-gage tappings where provided.

K. Install temperature and pressure-gage connector plugs in suction and discharge piping around each pump.

L. Install electrical connections for power, controls, and devices.

M. Electrical power and control wiring and connections are specified in Division 16 Sections.

N. Ground equipment.

1. Tighten electrical connectors and terminals according to manufacturer's published torque-tightening values. If manufacturer's torque values are not indicated, use those specified in UL 486A and UL 486B.

V. Commissioning

A. Verify that pumps are installed and connected according to the Contract Documents.

B. Verify that electrical wiring installation complies with manufacturer's written instructions and the Contract Documents.

C. Perform the following preventive maintenance operations and checks before starting:

1. Lubricate bearings.
2. Remove grease-lubricated bearing covers, flush bearings with kerosene, and clean thoroughly. Fill with new lubricant according to manufacturer's written instructions.
3. Disconnect coupling and check motor for proper rotation that matches direction marked on pump casing.
4. Verify that pumps are free to rotate by hand and that pumps for handling hot liquids are free to rotate with pumps hot and cold. Do not operate pumps if they are bound or drag, until cause of trouble is determined and corrected.
5. Check suction piping connections for tightness to avoid drawing air into pumps.

6. Clean strainers.
7. Verify that pump controls are correct for required application.

D. Starting procedure for pumps with shutoff power not exceeding safe motor power is as follows:
   1. Prime pumps by opening suction valves and closing drains, and prepare pumps for operation.
   2. Open cooling water-supply valves in cooling water supply to bearings, where applicable.
   3. Open cooling water-supply valves if stuffing boxes are water cooled.
   4. Open sealing liquid-supply valves if pumps are so fitted.
   5. Open warm-up valves of pumps handling hot liquids if pumps are not normally kept at operating temperature.
   6. Open circulating line valves if pumps should not be operated against dead shutoff.
   7. Start motors.
   8. Open discharge valves slowly.
   9. Observe leakage from stuffing boxes and adjust sealing liquid valve for proper flow to ensure lubrication of packing. Let packing "run in" before reducing leakage through stuffing boxes; then tighten glands.
   10. Check general mechanical operation of pumps and motors.
   11. Close circulating line valves once there is sufficient flow through pumps to prevent overheating.

E. When pumps are to be started against closed check valves with discharge shutoff valves open, steps are the same, except open discharge valves before starting motors.

F. Refer to Division 15 Section "Testing, Adjusting, and Balancing" for detailed requirements for testing, adjusting, and balancing hydronic systems.

END OF SECTION

Part 1 - General

I. Related Documents
   A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

II. Summary

III. This Section includes steam and condensate piping and specialties for systems up to 125 psig, inside the building.

IV. Related Sections include the following:
   A. Division 23 Section "Basic Mechanical Materials and Methods" for general piping materials and installation requirements.
   B. Division 23 Section "Hangers and Supports" for pipe supports, product descriptions, and installation requirements. Hanger and support spacing is specified in this Section.
   C. Division 23 Section "Valves" for general-duty gate, globe, ball, butterfly, and check valves.
   D. Division 23 Section "Meters and Gages" for thermometers, flow meters, and pressure and vacuum gages.
   E. Division 23 Section "Mechanical Identification" for labeling and identifying steam and condensate piping.
   F. Division 23 Section "Feedwater Equipment."
   G. Division 23 Section "HVAC Instrumentation and Controls" for temperature-control valves and sensors.

V. Definitions
   A. HP Systems: High-pressure systems operating at 15 psig or more.
   B. LP Systems: Low-pressure systems operating at less than 15 psig.

VI. System Description
   A. Steam and condensate piping for this Project is a two-pipe, mechanical flow, upfeed system.

VII. Submittals
   A. Product Data: For each type of special-duty valve and steam trap indicated, including rated capacities and accessories.
   B. Welding Certificates: Copies of certificates for welding procedures and personnel.
   C. Field Test Reports: Written reports of tests specified in Part 3 of this Section. Include the following:

1. Test procedures used.
2. Test results that comply with requirements.
3. Failed test results and corrective action taken to achieve requirements.

D. Maintenance Data: For steam traps, vacuum breakers, and meters to include in maintenance manuals specified in Division 1.

VIII. Quality Assurance

A. Welding: Qualify processes and operators according to the ASME Boiler and Pressure Vessel Code: Section IX, "Welding and Brazing Qualifications."

B. ASME Compliance: Comply with ASME B31.9, "Building Services Piping," for materials, products, and installation. Safety valves and pressure vessels shall bear the appropriate ASME label. Fabricate and stamp flash tanks to comply with the ASME Boiler and Pressure Vessel Code, Section VIII, Division 1.

IX. Coordination

A. Coordinate layout and installation of steam and condensate piping and suspension system components with other construction, including light fixtures, hydronic piping, fire-suppression-system components, and partition assemblies.

B. Coordinate piping installation with roof curbs, equipment supports, and roof penetrations.

C. Coordinate pipe fitting pressure classes with products specified in related Sections.

Part 2 - Products

I. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

A. Safety Valves:

1. Armstrong International, Inc.
2. Kunkle Inds. Inc.; Kunkle Valve Division.
3. Spirax Sarco, Inc.
4. Watts Industries, Inc.; Watts Regulators.

B. Pressure-Reducing Valves:

1. Armstrong International, Inc.
2. ITT Hoffman; ITT Fluid Technology Corp.
3. Leslie Controls, Inc.
4. Spence Engineering Company, Inc.
5. Spirax Sarco, Inc.

C. Steam Traps:

1. Armstrong International, Inc.
2. Dunham-Bush, Inc.
3. ITT Hoffman; ITT Fluid Technology Corp.
4. Spirax Sarco, Inc.
5. Sterling, Inc.

D. Air Vents and Vacuum Breakers:
1. Armstrong International, Inc.
2. ITT Hoffman; ITT Fluid Technology Corp.
3. Johnson Corp. (The).
4. Spirax Sarco, Inc.

E. Steam Meters:
1. EMCO Flowmeters.
2. ISTEC Corp.
3. Preso Meters Corp.
4. Spirax Sarco, Inc.

F. Condensate Meters:
1. Hersey Measurement Company.
2. ISTEC Corp.

II. Piping Materials

A. General: Refer to Part 3 piping application articles for applications of pipe and fitting materials.

III. Steel Pipe And Fittings

A. Steel Pipe, 2” NPS and Smaller: ASTM A 53, Type S (seamless), Grade A, Schedules 40 and 80, black steel, plain ends.

B. Steel Pipe, 2-1/2” NPS through 12” NPS: ASTM A 53, Type E (electric-resistance welded), Grade A, Schedules 40 and 80, black steel, plain ends.

C. Cast-Iron Threaded Fittings: ASME B16.4; Classes 125, 150, and 300.

D. Malleable-Iron Threaded Fittings: ASME B16.3; Classes 150 and 300.

E. Malleable-Iron Unions: ASME B16.39; Classes 150, 250, and 300.

F. Cast-Iron Threaded Flanges and Flanged Fittings: ASME B16.1, Classes 125 and 250; raised ground face, and bolt holes spot faced.

G. Wrought-Steel Fittings: ASTM A 234/A 234M, wall thickness to match adjoining pipe.

H. Wrought-Steel Flanges and Flanged Fittings: ASME B16.5, including bolts, nuts, and gaskets of the following material group, end connections, and facings:
1. Material Group: 1.1.

2. End Connections: Butt welding.
3. Facings: Raised face.

I. Flexible Connectors: Stainless-steel bellows with woven, flexible, bronze, wire-reinforcing protective jacket; 150-psig minimum working pressure and 250 deg F maximum operating temperature. Connectors shall have flanged or threaded-end connections to match equipment connected and shall be capable of 3/4-inch misalignment.

J. Welding Materials: Comply with Section II, Part C, of the ASME Boiler and Pressure Vessel Code for welding materials appropriate for wall thickness and for chemical analysis of pipe being welded.

K. Gasket Material: Thickness, material, and type suitable for fluid to be handled; and design temperatures and pressures.

IV. Valves

A. Gate, globe, check, ball, butterfly, outside stem and yoke valves are specified in Division 15 Section "Valves."

B. Refer to Part 3 "Valve Applications" Article for applications of each valve.

V. Safety Valves

A. Size and Capacity: As required for equipment according to the ASME Boiler and Pressure Vessel Code.

B. Brass or Bronze Safety Valves: Class 250, with threaded inlet and outlet; forged copper-alloy disc; fully enclosed steel spring with adjustable pressure range and positive shutoff; factory set and sealed.

1. Drip-Pan Elbow: Cast iron and having threaded inlet and outlet with threads complying with ASME B1.20.1.

C. Cast-Iron Safety Valves: Class 250; forged copper-alloy disc with bronze nozzle; fully enclosed, cadmium-plated steel spring with adjustable pressure range and positive shutoff; raised-face flanged inlet and threaded outlet connections; factory set and sealed.

1. Drip-Pan Elbow: Cast iron and having threaded inlet and outlet with threads complying with ASME B1.20.1.

D. Stop-Check Valves: Class 250, malleable-iron body and bonnet, cylindrical disc, removable liner and machined seat, brass-alloy stem, outside screw and yoke, polytetrafluoroethylene-impregnated packing with 2-piece packing gland assembly, flanged end connections, and cast-iron handwheel.

VI. Steam Traps

A. Float and Thermostatic Traps: ASTM A 126, cast-iron body and bolted cap; renewable, stainless-steel float mechanism with renewable, hardened stainless-steel head and seat; maximum operating pressure of 125 psig; balanced-pressure, stainless-steel or monel thermostatic bellow element.

1. Thermostatic air vent capable of withstanding 45 deg F of superheat and resisting water hammer without sustaining damage.

VII. Thermostatic Air Vents

A. Quick Vents: Cast-iron or brass body, with balanced-pressure, stainless-steel or monel thermostatic bellows and stainless-steel heads and seats.

B. Float Vents: Cast-iron or brass body, seamless brass float, balanced-pressure thermostatic bellows, and replaceable stainless-steel seat, float, and head.

VIII. Vacuum Breakers

A. Vacuum Breakers: 150-psig steam working pressure, 365 deg F maximum operating temperature, brass or stainless-steel body, and stainless-steel retainer, spring, and ball; with plain or threaded outlet.

IX. Strainers

A. Y-Pattern Strainers: 250-psig working steam pressure; ASTM A 126, Class B cast-iron body; stainless-steel screen, No. 20 mesh for 2” NPS and smaller and manufacturer's recommended perforations for 2-1/2” NPS and larger; tapped blowoff plug. Threaded connections for strainers 2” NPS and smaller and flanged connections for strainers 2-1/2” NPS and larger.

B. Basket Strainers: 250-psig working steam pressure; ASTM A 126, Class B cast-iron body; stainless-steel screen; bolted cover; threaded connections for strainers 2” NPS and smaller and flanged connections for strainers 2-1/2” NPS and larger.

Part 3 - Execution

I. Low Pressure Steam Piping Applications

A. Steam Piping, 2” NPS and Smaller: Schedule 40 steel pipe, with threaded joints using Class 125 cast-iron fittings.

B. Steam Piping, 2-1/2” NPS through 12” NPS: Schedule 40 steel pipe, with welded joints using Schedule 40 wrought-steel welding fittings and Class 150 wrought-steel flanges.

C. Condensate Piping, 2” NPS and Smaller: Schedule 80 steel pipe, with threaded joints using Class 125 malleable-iron fittings.

D. Condensate Piping, 2-1/2” NPS through 12” NPS: Schedule 80 steel pipe, with welded joints using Schedule 80 wrought-steel welding fittings and Class 150 wrought-steel flanges.

II. Low Pressure Steam-trap Applications

A. Float and Thermostatic Traps: Steam main and riser drip legs, laundry equipment, kitchen equipment, heat exchangers, and heating coils.

III. Piping Installations

A. Refer to Division 15 Section "Basic Mechanical Materials and Methods" for basic piping installation requirements.

B. Install groups of pipes parallel to each other, spaced to permit applying insulation and servicing of valves.

C. Install drains, consisting of a tee fitting, ¾” NPS ball valve, and short ¾” NPS threaded nipple with cap, at low points in piping system mains and elsewhere as required for system drainage.

D. Install steam supply piping at a uniform grade of 0.2 percent downward in direction of steam flow.

E. Install condensate return piping at a uniform grade of 0.4 percent downward in direction of condensate flow.

F. Reduce pipe sizes using eccentric reducer fitting installed with level side down.

G. Unless otherwise indicated, install branch connections to steam mains using 45-degree fittings in main pipe, with the takeoff coming out the top of the main pipe. Use of 90-degree tee fittings is permissible if 45-degree fittings are impractical. If length of branch takeoff is less than 10 feet, pitch branch line down toward mains at a 0.4 percent grade.

H. Install unions in piping 2” NPS and smaller adjacent to each valve, at final connections of each piece of equipment, and elsewhere as indicated.

I. Install flanges in piping 2-1/2” NPS and larger at final connections of each piece of equipment and elsewhere as indicated.

J. Install strainers on supply side of each control valve, pressure-reducing valve, solenoid valve, traps, and elsewhere as indicated. Install ¾” NPS nipple and ball valve in blowdown connection of strainers 2” NPS and larger. Match size of strainer blowoff connection for strainers smaller than 2” NPS.

K. Anchor piping for proper direction of expansion and contraction.

L. Install drip legs at low points and natural drainage points such as ends of mains, bottoms of risers, and ahead of pressure regulators, control valves, isolation valves, pipe bends, and expansion joints.

1. On straight runs with no natural drainage points, install drip legs at intervals not exceeding 300 feet where pipe is pitched down in direction of steam flow and a maximum of 150 feet where pipe is pitched up in direction of steam flow.
2. Size drip legs at vertical risers same size as pipe and extend beyond rise. Size drip legs at other locations same diameter as main. In steam mains 6" NPS and larger, dirt leg size can be reduced, but to no less than 4" NPS.
3. Install gate valve at drip legs, dirt pockets, and strainer blowdowns to allow removal of dirt and scale.
4. Install steam traps close to drip legs.

M. Pitch condensate piping down toward flash tank. If more than one condensate pipe discharges into flash tank, install a swing check valve in each line. Install thermostatic air vent at top of tank. Install inverted bucket or float and thermostatic trap at low-pressure condensate outlet, sized for three times the condensate load. Install safety valve at tank top. Install pressure gage, gate valve, and swing check valve on low-pressure (flash) steam outlet.

IV. Steam-trap Installation

A. Install steam traps in accessible locations as close as possible to connected equipment, but not more than 48 inches from connected equipment.
   1. Unless otherwise indicated, install gate valve, strainer, and union upstream from trap; install union, check valve, and gate valve downstream from trap.

V. Safety Valve Installations

A. Install safety valves according to ASME B31.1. Pipe safety valve discharge without valves to atmosphere outside building. Install drip-pan elbow fitting adjacent to safety valve and pipe drain connection to nearest floor drain.

VI. Hangers And Supports

A. Hanger, support, and anchor devices are specified in Division 15 Section "Hangers and Supports."

B. Install the following pipe attachments:
   1. Adjustable steel clevis hangers for individual horizontal piping less than 20 feet long.
   2. Adjustable roller hangers and spring hangers for individual horizontal piping 20 feet or longer.
   3. Pipe Roller: MSS SP-58, Type 44 for multiple horizontal piping 20 feet or longer, supported on a trapeze.
   4. Spring hangers to support vertical runs.

C. Install hangers with the following maximum spacing and minimum rod sizes:

1. 3/4” NPS: Maximum span, 9 feet; minimum rod size, 1/4 inch.
2. 1” NPS: Maximum span, 9 feet; minimum rod size, 1/4 inch.
3. 1-1/2” NPS: Maximum span, 12 feet; minimum rod size, 3/8 inch.
4. 2” NPS: Maximum span, 13 feet; minimum rod size, 3/8 inch.
5. 2-1/2” NPS: Maximum span, 14 feet; minimum rod size, 3/8 inch.
6. 3” NPS: Maximum span, 15 feet; minimum rod size, 3/8 inch.
7. 4” NPS: Maximum span, 17 feet; minimum rod size, 1/2 inch.
8. 6” NPS: Maximum span, 21 feet; minimum rod size, 1/2 inch.
9. 8” NPS: Maximum span, 24 feet; minimum rod size, 5/8 inch.
10. 10” NPS: Maximum span, 26 feet; minimum rod size, 3/4 inch.

D. Support vertical runs at roof, at each floor, and at 10-foot intervals between floors.

VII. Pipe Joint Construction

A. Refer to Division 23 Section "Basic Mechanical Materials and Methods" for joint construction requirements for threaded, welded, and flanged joints.

VIII. Terminal Equipment Connections

A. Size for supply and return piping connections shall be same as for equipment connections.

B. Install traps and control valves in accessible locations close to connected equipment.

C. Install bypass piping with globe valve around control valve. If multiple, parallel control valves are installed, only one bypass is required.

D. Install vacuum breaker downstream from control valve and bypass and close to coil inlet connection.

E. Install ports for pressure and temperature gages at coil inlet connections.

F. Install a drip leg at coil outlet.

IX. Field Quality Control

A. Prepare steam and condensate piping according to ASME B31.9 and as follows:

1. Leave joints, including welds, uninsulated and exposed for examination during test.
2. Flush system with clean water. Clean strainers.
3. Isolate equipment from piping. If a valve is used to isolate equipment, its closure shall be capable of sealing against test pressure without damage to valve. Install blinds in flanged joints to isolate equipment.
4. Install safety valve, set at a pressure no more than one-third higher than test pressure, to protect against damage by expanding liquid or other source of overpressure during test.

B. Perform the following tests on steam and condensate piping:

1. Use ambient temperature water as a testing medium unless there is risk of damage due to freezing. Another liquid that is safe for workers and compatible with piping may be used.
2. While filling system, use vents installed at high points of system to release trapped air. Use drip legs installed at low points for complete draining of liquid.
3. Subject piping system to hydrostatic test pressure that is not less than 1.5 times the design pressure. Test pressure shall not exceed maximum pressure for any vessel, pump, valve, or other component in system under test. Verify that stress due to pressure at bottom of vertical runs does not exceed either 90 percent of specified minimum yield strength or 1.7 times "SE" value in Appendix A of ASME B31.9, "Building Services Piping."
4. After hydrostatic test pressure has been applied for at least 30 minutes, examine piping, joints, and connections for leakage. Eliminate leaks by tightening, repairing, or replacing components, and repeat hydrostatic test until there are no leaks.
5. Prepare written report of testing.

X. Adjusting

A. Mark calibrated nameplates of pump discharge valves after steam and condensate system balancing has been completed, to permanently indicate final balanced position.

B. Perform these adjustments before operating the system:

1. Open valves to fully open position. Close coil bypass valves.
2. Set temperature controls so all coils are calling for full flow.
3. Check operation of automatic bypass valves.

XI. Cleaning

A. Flush steam and condensate piping with clean water. Remove and clean or replace strainer screens.

END OF SECTION

Part 1 - General

I. General
   A. The Bidding and Contract Requirements, Division 1 -General Requirements, Section 230100 - General Provisions, and Section 230500 - Basic Materials and Methods, shall apply to this section.

II. Scope
   A. This section includes refrigerant liquid, hot gas and suction piping system, including pipe, fittings, valves, specialty items and refrigerant.
   B. The refrigeration piping system shall be provided, installed, tested, evacuated and charged.

III. Quality Assurance
   A. The refrigeration piping system shall be provided, installed, tested, evacuated and charged in accordance with the manufacturer's recommendations, ANSI, ASHRAE, and ARI's Safety Code for Mechanical Refrigeration, state and local codes.
   B. Charging reports and field test reports shall be provided to PGCPS at the conclusion of installation.
   C. Referenced Codes and Standards: Comply with the following in accordance with Division 1.
      1. American National Standards Institute/American Society of Heating, Refrigerating and Air-Conditioning Engineers (ANSI/ASHRAE)
         a) ASHRAE Standard 15 - Safety Standards for Refrigeration Systems
         b) ASHRAE Standard 34 - Designation and Safety Classification of Refrigerants
      2. American National Standards Institute/American Society of Mechanical Engineers (ANSI/ASME)
         a) ASME B31.5 - Refrigeration Piping and Heat Transfer Components
      3. Air-Conditioning, Heating and Refrigeration Institute (AHRI)
         a) AHRI Standard 700 - Specifications for Fluorocarbons and Other Refrigerants
      4. U.S. Department of Labor, Occupational Safety and Health Administration (OSHA)
         a) OSHA Standard 1910 - Occupational Safety and Health Standards
      5. U.S. Environmental Protection Agency (EPA)
         a) Clean Air Act Ammendments of 1990

IV. Submittals
   A. Provide shop drawings on the proposed system as described in Section 230100.

Part 2 - Products

I. General

A. The refrigerant piping system shall be provided complete and installed in accordance with the manufacturer's recommendations and as specified herein. The size of the refrigerant pipes shall be obtained from the equipment manufacturer unless otherwise shown on the drawings.

B. Pipe, Fittings and Accessories - The pipe shall be type ACR 'L' copper refrigerant tubing with hard wrought copper fittings. Pipe sized ½ inch and larger shall be hard drawn. Pipe size 3/8 inch and smaller can either be hard or soft drawn. All of the joints shall be brazed with a filler material that complies with AWS classification BCuP-5. A sight glass with moisture indicator shall be provided if not provided with equipment (not required on VRF systems). A removable type SPORLAN cartridge type drier-strainer shall be installed in the liquid line with a three-way valve by-pass if it is not provided on the equipment (not required on VRF systems). Use type 'L' copper tubing to pipe the relief valve discharge to the outside.

C. Condensate Drain Piping - Shall be type 'L' or type ‘M’ copper tubing.

D. Pipe Hangers and Supports - Shall be as required in section 230500.

E. The piping shall be insulated as shown in section 230700.

F. Specialties

1. Filter Dryers: Replaceable core, low pressure drop, capable of removing acids, corrosion-resistant steel shell, wrought copper fittings, UL listed. Series V-8000 as manufactured by Henry Technologies or equivalent by Sporlan or Ranco.
2. Liquid Indicators: By color change, factory assembled, with polished optical glass, triple sealed, removable cap, flared or soldered connections, soldered connections with extended ends, UL listed. Dri-Vue as manufactured by Henry Technologies or equivalent by Sporlan or Alco.
3. Strainers: With replaceable No. 10 mesh brass screen cartridge held in place by spring tension, UL listed. Type 866 or 895 as manufactured by Henry Technologies or equivalent by Sporlan or Mueller Brass.

Part 3 - Execution

I. General

A. The Refrigeration Piping System shall be installed in accordance with the manufacturer's recommendations and requirements of referenced ANSI, AHRI, ASHRAE and OSHA codes and standards as specified herein.

B. Installation - During brazing, dry nitrogen shall be continuously passed through the system at a rate sufficient to maintain an oxygen free environment to prevent the formation of copper oxide scale. After piping has been completed, the refrigerant piping system shall be pressure tested at a pressure of 300 psi on the high side and 150 psi on the low side. The pressure shall be maintained on the system for a minimum of 24 hours. The system shall be evacuated when the surrounding ambient air is not less than 60°F. If the temperature is less, auxiliary heat must be provided to insure proper evacuating conditions. A minimum vacuum of 500 Microns of Hg. shall be pulled on the system and maintained for 24 hours. The vacuum pump displacement shall be not less than 2 cfm for up to 15 tons.

C. The system shall be charged as recommended by the equipment manufacturer.

D. Insulation

1. Insulate hot gas piping if the piping surface temperature exceeds 120 degrees F.
2. Insulate suction piping from DX coil to condensing unit to prevent dripping.
3. Insulate piping in accordance with Section 230700.

END OF SECTION

Refrigerant Monitoring and Safety Equipment
Section 232316

Part 1 - General

I. Summary
   A. This Section includes refrigerant monitors, alarms, and breathing apparatus.

II. Definitions
   A. CMOS: Ceramic metal-oxide semiconductor.
   B. HFC: Hydrofluorocarbon.
   C. HCFC: Hydrochlorofluorocarbon.
   D. IR: Infrared.
   E. SCBA: Self-contained breathing apparatus.

III. Submittals
   A. Product Data: For SCBA; include mounting details and service requirements and compliance with authorized Federal agency.
   B. Shop Drawings: For each type of refrigerant monitor; include refrigerant ppm range, temperature range, alarm outputs, readout range, furnished specialities, installation requirements, and power consumption.
      1. Wiring Diagrams: Power, signal, and control wiring.
   C. Operation and maintenance data.

IV. Quality Assurance
   A. ASHRAE: Monitoring system shall comply with ASHRAE 15.
   B. CFR: SCBA shall comply with requirements in 42 CFR 84.

Part 2 - Products

I. Manufacturers
   A. In other Part 2 articles where subparagraph titles below introduce lists, the following requirements apply for product selection:
      1. Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the manufacturers specified.

II. Functional Description Of Refrigerant Monitoring System
   A. On leak detection by refrigerant sensor(s), the system shall perform the following:
      1. Activate machinery room ventilation.
      2. Activate audio and visual alarm inside and outside machinery room.

3. Shut down combustion process where combustion equipment is employed.
4. Notify Building Automation System of alarm condition.

III. Refrigerant Monitor

A. Approved Manufacturers:
1. Davis Instruments Manufacturing Co., Inc.
2. Foxboro Company (The).
3. General Analysis Corp.
4. Genesis International Inc.
5. Thermal Gas Systems, Inc.; Haloguard Monitors.
6. Trane Co. (The).
7. Approved Equal.

B. Description: CMOS or IR sensor shall continuously measure and display the specific gas concentration and shall be capable of indicating, alarming, and shutting down equipment, and automatically activating ventilation system.

C. Performance Requirements:
1. Refrigerant(s) to be Monitored: Selected refrigerant(s) for chiller(s).
2. Refrigerant Concentration: Per ASHRAE 15 requirement for specific refrigerant.
3. Accuracy: 0 to 100 ppm; 1 ppm; 100 to 1000 ppm; plus or minus 10 percent of reading.
4. Linearity: 0 to 100 ppm; linear; 100 to 1000 ppm; plus or minus 2 percent of full scale.
5. Sensitivity: 1 ppm.
6. Resolution: 1 ppm.
7. Operating Temperature: 41 to 104 deg F.
8. Response Time: 90 percent of a step change in 4 minutes.
9. Relatively Humidity: 20 to 95 percent, non-condensing over the operating temperature range.

D. Operating Requirements:
1. Maximum Power Input: 120-V ac; 60 Hz, 30 W.
2. Alarm Relays: 3 relays at 5- to 8-A resistive load.
3. Alarm Set Points: Displayed on front of meter.
4. Audible Output: Sonic alert at 75 to 80 dB at 60 inches (1525 mm).
5. Analog Output: 0- to 10-V dc or 4- to 20-mA current sourcing.
6. Serial Output Type: RS 232.

E. Sensor Configuration: CMOS sensor.
1. Single-sensing channel.

2. Expandable to four or greater as scheduled on the drawings channels.

F. Display: 10-character, alphanumeric, vacuum-fluorescent indicating lights for each alarm set point; standard alarm; acknowledge switch and test switch mounted on front panel; and alarm status LEDs and service fault LEDs.

1. Enclosure: NEMA 250, type as required for ambient condition.

G. Alarm Output: Indicating light flashes and horn sounds.

1. Unit-mounting device with single-light beacon.
2. Remote unit for mounting outside machinery room and having light beacon with quantities of lights shown on the drawings.
3. Field-adjustable alarm set points.

H. Calibration: Factory calibrated.

I. SCBA

J. Manufacturers:

1. AFC International, Inc.
2. Clarey's Safety Equipment, Inc.
3. Genesis International Inc.
4. MSA, Instrument Division.
5. Thermal Gas Systems, Inc.; Haloguard Monitors.

K. Description: Open-circuit, pressure-demand, compressed-air SCBA includes completely assembled, portable, self-contained devices designed for hazardous breathing environment application.

L. Face Piece: EPDM construction material, one-size-fits-all with double-sealing edge, stainless-steel speaking diaphragm and lens retainer, five adjustable straps to hold face piece to head (two straps on each side and one on top), exhalation valve in mask, close-fitting nose piece to ensure no CO_2 build-up, and perspiration drain to avoid skin irritation and to prevent eyepiece, spectacle, and lens fogging.

M. Backplate: Orthopedically designed of high-strength chemical and impact-resistant glass-fiber composite or lightweight aluminum.

N. Harness and Carrier Assembly: Large triangular back pad, backplate, and adjustable waist and shoulders straps. Modular in design, detachable components, and easy to clean and maintain. Shoulder straps are padded with flame-resistant material and reinforced with stainless-steel cable and attached with T-nuts, washers, and screws; rivets are not permitted.

O. Air Cylinder: 30-minute, low-pressure, air-supply-loaded fiberglass cylinders fitted with quick-fill assembly for refilling and air transfer.

P. Wall-Mounted Case: Leakproof, corrosion-resistant, tough, plastic case.

IV. Control Cable

A. Electronic and fiber-optic cable for control wiring shall be as specified in Division 16.

V. Source Quality Control

A. SCBA: Tested and certified by the National Institute for Occupational Safety and Health and the Mine Safety and Health Administration according to 42 CFR 84, Subpart H.

B. Refrigerant Monitor: Factory tested and certified.

Part 3 - Execution

I. Installation

A. Install labels and nameplates to identify monitoring devices and SCBA components according to Division 15 Section Basic Mechanical Materials and Methods or Mechanical Identification.

B. Install building wire and cable according to Division 16 Section "Conductors and Cables".

C. Install signal and communication cable according to Division 16 Section “Voice and Data Communication Cabling."

II. Field Quality Control

A. Manufacturer's Field Service: Engage a factory-authorized service representative to perform the following:

1. Inspect field-assembled components, equipment installation, and electrical connections for compliance with requirements.
2. Test and adjust controls and safeties.
3. Test Reports: Prepare a written report to record the following:
   a) Test procedures used.
   b) Test results that comply with requirements.
   c) Test results that do not comply with requirements and corrective action taken to achieve compliance with requirements.

B. Repair or replace malfunctioning units. Retest as specified above after repairs or replacements are made.

III. Adjusting

A. Adjust alarm set points.

B. Set field-adjustable switches and circuit-breaker trip ranges as indicated.

END OF SECTION

Part 1 - General

I. Related Documents
   A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

II. Summary
   A. This Section includes water-treatment systems for the following:
      1. Heating, hot-water piping (closed-loop system).
      2. Chilled-water piping (closed-loop system).
      3. Heating, steam and condensate piping.
      4. Steam and condensate piping for humidifiers and cooking appliances (open systems).
      5. Condenser water piping (open system).

III. Chemical Feed System Description
   A. Closed-Loop System: One bypass feeder on each system with isolating and drain valves downstream from circulating pumps, unless otherwise indicated.
      1. Introduce chemical treatment through bypass feeder when required or indicated by test.
   B. Closed-Loop, Heating Steam and Condensate Piping: Lead-lag switch controls the sequence of boilers and introduces the chemical to the boiler through a bypass feeder.
   C. Chemical feed pump introduces sequestering agent and base from solution tank into condensate tank or return water line close to each boiler as required, with minimum of one pump per boiler. Use agitator as required.
   D. Pump oxygen scavenger feed from solution tank into feedwater line as far as possible from boiler. Use agitator as required.
   E. Feed carbon dioxide, neutralizing amine from solution tank directly into condensate tank. Use agitator as required.
   F. Activate chemical solution pump when feedwater pumps are running.
      1. Activate chemical solution pump from meter on makeup water line only when one boiler is used.
      2. Continuously run pump for feeding chemical when multiple boilers are used.
      3. Liquid-level switch, in each solution tank, deactivates chemical solution pump and signals alarm.
      4. Conductivity controller samples boiler water on timed cycle and operates solenoid blowdown valve.

G. Open-Loop Systems for Humidifiers, Air Washers, Evaporative Condensers, and Cooling Towers: PVC tubing with hole to feed chemical.
   1. Conductivity controller samples sump water when activated by pump and operates solenoid bleed-off valve in line to drain.

H. Open-Loop, Condenser Water Piping: Pump sequestering agent and corrosion inhibitor from solution tank into condenser water supply to tower. Use agitator as required.
   1. Intermittently feed biocide to condenser water to achieve a toxic level of the chemical to kill the organism present.
   2. Change biocides periodically to avoid chemical immunity.
   3. Activate chemical solution pump from water meter in makeup water line to cooling tower when condenser water pumps are running.
   4. Automatically feed chemical with electronic solid-state controllers.
   5. Deactivate solution pump and signal alarm by a liquid-level switch in each solution tank on low chemicals.

IV. Performance Requirements

A. Maintain water quality for HVAC systems that controls corrosion and build-up of scale and biological growth for maximum efficiency of installed equipment without posing a hazard to operating personnel or the environment.

B. Base chemical treatment performance requirements on quality of water available at Project site, HVAC system equipment material characteristics and functional performance characteristics, operating personnel capabilities, and requirements and guidelines of authorities having jurisdiction.

V. Submittals

A. Product Data: Include rated capacities; water-pressure drops; shipping, installed, and operating weights; and furnished products listed below:

B. Pumps.
   1. Chemical solution tanks.
   2. Agitators.
   3. Control equipment and devices.
   4. Test equipment.
   5. Chemicals.
   6. Filters.
   7. Chemical feeders.

C. Shop Drawings: Detail equipment assemblies indicating dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.
   1. Wiring Diagrams: Detail power and control wiring and differentiate between manufacturer-installed and field-installed wiring.

D. Water Analysis: Submit a copy of the water analysis to illustrate water quality available at Project site.

E. Field Test Reports: Indicate and interpret test results for compliance with performance requirements.

F. Maintenance Data: For pumps, agitators, filters, system controls, and accessories to include in maintenance manuals specified in Division 1.

VI. Quality Assurance

A. Installer Qualifications: An experienced installer who is an authorized representative of the chemical treatment manufacturer for both installation and maintenance of chemical treatment equipment required for this Project.

B. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.

VII. Maintenance

A. Scope of Service: Provide chemicals and service program for maintaining optimum conditions in the circulating water for inhibiting corrosion, scale, and organic growths in the applicable piping systems and equipment. Services and chemicals shall be provided for a period of one year from date of Substantial Completion, including the following:
   1. Initial water analysis and recommendations.
   2. Startup assistance.
   3. Periodic field service and consultation.
   4. Customer report charts and log sheets.
   5. Laboratory technical assistance.
   6. Analyses and reports of all chemical items concerning safety and compliance with government regulations.

VIII. Extra Materials

A. Furnish extra materials described below that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.

Part 2 - Products

I. Manufacturers
   A. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
   B. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
      1. HVAC Water-Treatment Products:
         a) Aqua-Chem, Inc.; Cleaver-Brooks Div.
         b) Calgon Corp., ECC International.
         c) Trane Boland Services; Water Treatment.

II. Chemical Feeding Equipment
   A. Bypass Feeders: Cast iron or steel, for introducing chemicals into system; with funnel shutoff valve on top, air-release valve on top, drain valve on bottom, and recirculating shutoff valves on sides.
      1. Capacity: 2 quarts (low capacity systems) or 5 gal. (high capacity systems).
      2. Working Pressure: 125 psig.
   B. Drip Feeders: Plastic reservoir with capillary tubing probe, weight, charging syringe, and clip.
   C. Positive-Displacement Diaphragm Pump: Simplex, self-priming, rated for intended chemical with 25 percent safety factor for design pressure and temperature.
      1. Adjustable flow rate.
      2. Thermoplastic construction.
      3. Fully enclosed, continuous-duty, 120-V, 60-Hz, single-phase motor. Comply with requirements in Division 15 Section "Motors."
      4. Built-in relief valve.
   D. Positive-Displacement Piston Pump: Metal and thermoplastic construction.
      1. Fully enclosed, continuous-duty, 120-V, 60-Hz, single-phase motor. Comply with requirements in Division 15 Section "Motors."
      2. Built-in relief valve.
   E. Chemical Solution Tanks: Chemical-resistant reservoirs fabricated from high-density opaque polyethylene with graduated markings.
      1. Molded fiberglass cover with recess for mounting pump, agitator, and liquid-level switch.
      2. Capacity: 30 gal. (low capacity systems) or 50 gal. (high capacity systems.

F. Agitator: Direct drive, 1750 rpm, mounted on tank with angle adjustment.
   1. Fully enclosed, continuous-duty, 120-V, 60-Hz, single-phase motor. Comply with requirements in Division 15 Section "Motors."
   2. Stainless-steel clamp and motor mount, with stainless-steel shaft and propeller.

G. Liquid-Level Switch: Polypropylene housing, integrally mounted PVC air trap, receptacles for connection to metering pump, and low-level alarm.

H. Packaged Conductivity Controller: Solid-state circuitry, 5 percent accuracy, linear dial adjustment, built-in calibration switch, on-off switch and light, control-function light, output to control circuit, and recorder.

I. Cold-Water Meter: Positive-displacement type with sealed, tamperproof magnetic drive; impulse contact register; single-pole, double-throw, dry-contact switch.
   1. Rotating-disc or Turbine type with bronze or cast-iron body rated for 125 psig.
   2. Magnetic-drive or mechanical-impulse contactor matched to signal receiver.
   3. At least six-digit totalizers.
   4. 120-V ac.

J. Solenoid Valves: Forged-brass body, globe pattern, and general-purpose solenoid enclosure with 120-V, continuous-duty coil.

K. Electronic Timers: 150-second and 5-minute ranges, with infinite adjustment over full range, and mounted in cabinet with hand-off-auto switches and status lights.

L. Chemical Tubing: Schedule 40, PVC with solvent-cement joints; or polypropylene tubing with heat fusion.

M. Plastic Ball Valves: Rigid PVC or CPVC body, integral union ends, and polytetrafluoroethylene seats and seals.

N. Plastic-Body Strainer: Rigid PVC or CPVC with cleanable stainless-steel strainer element.

O. Condenser Water-Treatment Control Panel: Incorporate solid-state integrated circuits and digital LED displays, in NEMA 250, Type 12 enclosure with gasketed and lockable door.
   1. Control dissolved solids, based on conductivity, and include the following:
      a) Digital readout display.
      b) Temperature-compensated sensor probe adaptable to sample stream manifold.
      c) High, low, and normal conductance indicator lights.
      d) High or low conductance alarm light, trip points field adjustable; with silence switch.
      e) Hand-off-auto switch for solenoid bleed-off valve.
      f) Bleed-off light to indicate valve operation.
      g) Internal adjustable hysteresis or dead band.

2. Control inhibitor feeding, based on makeup volume, and include the following:
   a) Solid-state reset counter (accumulator), with selections from 1 to 15.
   b) Solid-state timer, adjustable from 15 to 300 seconds.
   c) Test switch.
   d) Hand-off-auto switch for chemical pump.
   e) Illuminated legend to indicate feed when pump is activated.
   f) Solid-state lockout timer, adjustable from 15 to 180 minutes, with indicator light. Lockout timer to deactivate the pump and activate alarm circuits.
   g) Electromechanical-type, panel-mounted makeup totalizer to measure amount of makeup water.
3. Control biocide with an adjustable time programmer and include the following:
   a) 24-hour timer with 14-day skip feature to permit activation any hour of day.
   b) Precision, solid-state, bleed-off lockout timer (zero to nine hours) and clock-controlled biocide pump timer (zero to two and one-half hours). Prebleed and bleed lockout.
   c) Solid-state alternator to enable the use of two different formulations.
   d) 24-hour digital display of time of day.
   e) 14-day LED display of day of week.
   f) Fast and slow internal clock set controls.
   g) Battery backup so clock is not disturbed by power outages.
   h) Quartz timekeeping accuracy.
   i) Hand-off-auto switches for biocide pumps.
   j) Biocide A and Biocide B illuminated legends to indicate pump is running.

III. Chemical Treatment Test Equipment

A. Test Kit: Manufacturer recommended equipment and chemicals, in a carrying case, for testing pH, total dissolved solids, dissolved oxygen, biocount, chloride, and total alkalinity and for calcium hardness field tests.

B. Corrosion Test Coupon Assembly: Constructed of corrosion material, complete with piping, valves, and mild steel and copper coupons. Locate copper coupon downstream from mild steel coupon in the test coupon assembly.

IV. Chemicals

A. Furnish chemicals recommended by water-treatment system manufacturer that are compatible with piping system components and connected equipment.

B. System Cleaner: Liquid alkaline compound with emulsifying agents and detergents to remove grease and petroleum products.

C. Biocide: Chlorine release agents or microbiocides.

D. Closed-Loop, Water Piping Chemicals: Sequestering agent to reduce deposits and adjust pH, corrosion inhibitors, and conductivity enhancers.

E. Heating Steam and Condensate Piping Chemicals: Sequestering agent to reduce hardness and prevent feedline congestion and to provide alkalinity, oxygen scavenger, carbon-dioxide neutralizer, and filming amines.

F. Open-Loop, Condenser Water Piping Chemicals: Sequestering agent to inhibit scaling, acid to reduce alkalinity and pH, corrosion inhibitor, and biocide.

G. Open-Loop Piping Chemicals Serving Humidifiers, Air Washers, Evaporative Condensers, Small Cooling Towers, and Liquid Coolers: Sequestering agent to inhibit scaling, corrosion inhibitor, and biocide nonoxidizing.

V. Condenser Water Filtration Unit

A. Description: Filtration unit, including sand filter, filter pump, strainer, and controls; factory assembled, piped, and wired; mounted to steel skid.

B. Sand Filter: Glass-fiber-reinforced polyester tank, internal distribution piping, differential gage panel, manual and automatic pressure relief valves, backwash valve, and backwash sight tube; graded silica sand installed according to manufacturer's written instructions.

C. Pump: All-bronze, centrifugal filter pump with totally enclosed, fan-cooled motor; strainer mounted on pump suction; and manually reset, motor-overload switch with pilot light.

1. Comply with requirements in Division 15 Section "Motors."

D. Backwash Control: Automatic, with time clocks and differential pressure switches; mounted in NEMA 250, Type 4 control panel; factory wired for single, external electrical connection.

VI. Hot-water/chilled-water Filtration Unit

A. Filtration Unit: Stainless-steel housing and polypropylene filter with polypropylene core.

B. Replaceable Filter Media: Compatible with antifreeze and water-treatment chemicals.

C. Filter Media for Sediment Removal Service: Rated at 98 percent efficiency for 20-micrometer particulate.

D. Pressure Drop through the Filter Cartridge: Not to exceed manufacturer’s specified rating at design-flow rate when clean or when filter is dirty.

Part 3 - Execution

I. Water Analysis
   A. Perform an analysis of supply water to determine the type and quantities of chemical treatment needed to maintain the water quality as specified in "Performance Requirements" Article.

II. Installation
   A. Install treatment equipment level and plumb.
   B. Add cleaning chemicals as recommended by manufacturer.

III. Connections
   A. Piping installation requirements are specified in other Division 15 Sections. Drawings indicate general arrangement of piping, fittings, and specialties.
   B. Install piping adjacent to equipment to allow service and maintenance.
   C. Confirm applicable electrical requirements in Division 16 Sections for connecting electrical equipment.
   D. Ground equipment.
      1. Tighten electrical connectors and terminals according to manufacturer's published torque-tightening values. If manufacturer's torque values are not indicated, use those specified in UL 486A and UL 486B.

IV. Field Quality Control
   A. Engage a factory-authorized service representative to perform startup service.
      1. Inspect field-assembled components and equipment installation, including piping and electrical connections. Report results in writing.
      2. Inspect piping and equipment to determine that systems and equipment have been cleaned, flushed, and filled with water, and are fully operational before introducing chemicals for water-treatment system.
      3. Place HVAC water-treatment system into operation and calibrate controls during the preliminary phase of HVAC systems' startup procedures.
   B. Test chemical feed piping as follows:
      1. Do not enclose, cover, or put piping into operation until it is tested and satisfactory test results are achieved.
      2. Test for leaks and defects. If testing is performed in segments, submit separate report for each test, complete with diagram of portion of piping tested.

3. Leave uncovered and unconcealed new, altered, extended, and replaced water piping until it has been tested and approved. Expose work that has been covered or concealed before it has been tested and approved.
4. Cap and subject piping to static water pressure of 50 psig above operating pressure, without exceeding pressure rating of piping system materials. Isolate test source and allow test pressure to stand for four hours. Leaks and loss in test pressure constitute defects.
5. Repair leaks and defects with new materials and retest piping until satisfactory results are obtained.
6. Prepare test reports, including required corrective action.

V. Adjusting

A. Sample boiler water at one-week intervals after boiler startup for a period of five weeks, and prepare certified test report for each required water performance characteristic. Where applicable, comply with ASTM D 3370 and the following standards:
   1. Silica: ASTM D 859.
   2. Steam System: ASTM D 1066.
   3. Acidity and Alkalinity: ASTM D 1067.
   4. Iron: ASTM D 1068.
   5. Water Hardness: ASTM D 1126.

B. Occupancy Adjustments: Within 12 months of Substantial Completion, perform two separate water analyses to prove that automatic chemical feed systems are maintaining water quality within performance requirements specified in this Section. Perform analyses at least 60 days apart. Submit written reports of water analysis to PGCPS Building Services.

VI. Demonstration

A. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain HVAC water-treatment systems and equipment.
   1. Train Owner's maintenance personnel on procedures and schedules for starting and stopping, troubleshooting, servicing, and maintaining equipment and schedules.

B. Review manufacturer's safety data sheets for handling of chemicals.

C. Review data in maintenance manuals, especially data on recommended parts inventory and supply sources and on availability of parts and service. Refer to Division 1 Section "Contract Closeout."

D. Review data in maintenance manuals, especially data on recommended parts inventory and supply sources and on availability of parts and service. Refer to Division 1 Section "Operation and Maintenance Data."

E. Schedule at least three days of training with PGCPS Building Services, through Architect, with at least seven days' advance notice.

END OF SECTION

Part 1 - General

I. General
   A. The Bidding and Contract Requirements, Division 1 -General Requirements, Section 230100 - General Provisions and Section 230500 - Basic Materials and Methods shall apply to this section.

II. Scope
   A. The work covered under this section of the specifications shall include furnishing and installing the ductwork, accessories, associated items and all necessary connections to outlets, inlets and equipment required for a complete system as shown on the drawings and hereinafter specified.

III. Quality Assurance
   A. Galvanized sheet metal shall meet the requirements of ASTM A653 and A924 standards.
   B. Ductwork and duct accessories shall meet the requirements and recommendations of SMACNA standards, SMACNA Duct Cleanliness for New Construction (Advanced Level), UL-181 standard and ASHRAE recommendations.
   C. The installation of ductwork and duct accessories shall comply with NFPA standard 90A and state and local codes.

IV. Submittals
   A. Provide shop drawings on ductwork materials and accessories as described in Section 230100 - 1.04. Shop drawings are not required for duct layouts.

Part 2 - Products

I. Ductwork System Classification
   A. For determination of ductwork construction criteria, all ductwork systems shall be classified as either low or medium pressure according to the following velocities or pressures. In all cases the higher of the two values shall be used to determine the system classification unless other overriding considerations are established on the drawings or in the specifications. A ductwork system is defined as, the complete run of a supply, return, exhaust, or intake air system, each classified individually.
   B. Ductwork systems with any portion having an average cross-sectional velocity up to and including 2000 FPM and not exceeding 2" w.g. maximum static pressure at any point in the system shall be classified as low pressure. New low pressure ductwork shall be sized

at 0.08 friction loss per 100 linear feet of ductwork. Existing ductwork that will not meet this standard shall not exceed 0.10 friction loss per 100 linear feet of ductwork.

C. Ductwork systems with any portion having an average cross-sectional velocity exceeding 2000 FPM or exceeding 2" w.g. maximum static pressure at any point in the system shall be classified as medium pressure. New low pressure ductwork shall be sized at 0.25 friction loss per 100 linear feet of ductwork. Existing ductwork that will not meet this standard shall not exceed 0.30 friction loss per 100 linear feet of ductwork.

D. All Variable Air Volume (VAV) supply air duct systems and all air duct systems outside exposed to weather regardless of velocity and pressure conditions are classified as medium pressure and shall be constructed in compliance with SMACNA's three (3) inch pressure classification, formerly 'High Pressure Duct Construction Standard.' Joints and seams shall be sealed as described in this specification.

II. Duct Materials

A. All ductwork, housings, dampers, access doors and all other duct related accessories shall be formed from galvanized steel sheets unless otherwise noted.

B. All angles used for reinforcement, support, hanging and other construction uses shall be galvanized steel and shall be equal to that used for ductwork. Galvanized angle iron shall be used where required by SMACNA standards.

III. Ductwork Construction

A. The low pressure ductwork as defined in Article 2.01 shall be constructed in accordance with the one (1) inch pressure classification, as described in SMACNA’s “HVAC Duct Construction Standards – Metal and Flexible”.

B. Ductwork classified as other than low pressure shall be constructed in accordance with the three (3) inch pressure classification, as described in SMACNA’s “HVAC Duct Construction Standards – Metal and Flexible”.

C. Duct sizes are shown on the drawings in inches. The dimensions given establish the free or unobstructed area required on the inside of the duct. In case a duct size is not shown the dimensions shall be requested from the Architect.

D. The ductwork shall be fabricated from field measurements to avoid conflict with beams, columns, pipes and other obstructions. Where necessary to avoid obstructions, the ductwork shall be transformed, divided or moved to one side as long as the free area is not reduced and such changes meet the approval of the Architect.

E. The minimum thickness of the sheet metal shall be either as described in SMACNA’s “HVAC Duct Construction Standards – Metal and Flexible” or as shown in the following table:

DUCT CONSTRUCTION MINIMUM SHEET METAL GAUGES
RECTANGULAR DUCTS

Maximum side (inches)	Steel (Minimum Galvanized Sheet Gauge)	Aluminum (Minimum B & S Gauge)
Thru 12"	26 (0.022 inches)	24 (0.020 inches)
13" - 30"	24 (0.028 inches)	22 (0.025 inches)
31" - 54"	22 (0.034 inches)	20 (0.032 inches)
55" - 84"	20 (0.040 inches)	18 (0.040 inches)
Over 84"	18 (0.052 inches)	16 (0.051 inches)

ROUND DUCTS

Diameter (inches)	SPIRAL SEAM DUCT Steel (Minimum Galvanized Sheet Gauge)	LONGITUDINAL SEAM DUCT Steel (Minimum Galvanized Sheet Gauge)	FITTINGS Steel (Minimum Galvanized Sheet Gauge)
Thru 12"	28 (0.019 in.)	26 (0.022 in.)	26 (0.022 in.)
13" - 18"	26 (0.022 in.)	24 (0.028 in.)	24 (0.028 in.)
19" - 28"	24 (0.028 in.)	22 (0.034 in.)	22 (0.034 in.)
29" - 36"	22 (0.034 in.)	20 (0.040 in.)	20 (0.040 in.)
37" - 52"	20 (0.040 in.)	18 (0.052 in.)	18 (0.052 in.)

F. When required, heavier ductwork shall be installed to meet the requirements of the UL Fire Resistance Index.

G. Where indicated on the drawings or where insufficient space is available for round ductwork, flat oval ductwork may be used. The conversion from round duct sizes to flat oval should be made on an equivalent pressure loss basis, not on an equal cross-sectional area. The flat oval ducts shall be constructed in accordance with current SMACNA standards.

H. Rectangular Duct Section Connections - Shall be as described in the SMACNA Standards. Contractor may use zero leakage four corner bolted companion angle transverse joint as manufactured by DUCTMATE INDUSTRIES, INC. or LOCKFORMER. Joint shall be constructed of galvanized steel with bolting corner pieces, roll formed double wall mating angles, gasketing, mastic sealer and snap-on flange cover cleats.

IV. Flexible Ductwork

A. Where shown on the drawings provide flexible ductwork between branch ducts and terminals or air outlets. It shall be of a low or medium pressure to match duct system served.

B. Ductwork

1. Insulated flexible ductwork shall be factory pre-insulated duct composed of a corrosion-resistant reinforcing wire or band helix permanently bonded and enclosed in polyester film, covered with 1 1/2", 3/4 pound density fiberglass insulation blanket sheathed in a vapor barrier of aluminum polyester film laminated to glass mesh, elastomer back coated. The flexible duct shall be rated for a minimum working velocity of 2000 fpm, shall be listed by Underwriters Laboratories under their UL-181 standards as a Class 1 air duct material and shall comply with NFPA standard No. 90A.

2. Taps for flexible ductwork shall be high efficiency gasketed air-tite type with manual damper

C. The maximum length of flexible duct connection shall be ten feet.

D. Flexible ductwork shall not be used for return air or exhaust air ductwork.

V. Duct Access Doors

A. Duct Access Doors shall be provided in both the low and medium pressure duct systems as shown on the contract drawings and as specified.

B. Access doors shall be constructed as shown in SMACNA standards for the appropriate pressure classification. Door shall be the same gauge and material as the duct. All access doors shall be hinged, except where a removable type is required.

C. The minimum size of all access doors shall be 20" x 14" except where the duct is less than 16", in which case one dimension shall be 20" and the other 2" less than the duct width.

D. Access doors shall be provided in the following locations: At the linkage side of automatic dampers; at the manual volume control dampers; at smoke detection heads; fire dampers; and any other service, balance or control device requiring periodic maintenance.

VI. Flexible Connections At Fan

A. Flexible connections shall be provided at the inlet and outlet connection for each fan, between ductwork and inlet and outlet collars.

B. Each flexible connection shall be designed to allow one inch of free movement and shall be completely air tight and shall have sewed and cemented seams.

C. Flexible connections for low-pressure ductwork shall be in accordance with SMACNA standards. Material shall be neoprene coated glass fabric, 30 oz. per square yard.

D. Flexible connections for medium pressure ductwork shall be the same as for low pressure except additional reinforcing shall be provided as required by the operating pressure of the system.

E. Flexible connections to any roof mounted equipment shall not be exposed to the elements. Flexible connections shall be located inside the building just below the roofline. For side discharge units the flexible connection shall be located inside the building just inside the wall.

VII. Turning Vanes

A. Any square elbow ductwork 18 inches or over in width shall require turning vanes of galvanized steel.

B. Vanes for Low and Medium Pressure Systems: Shall be as shown in SMACNA standards for appropriate pressure classification.

C. Vane lengths shall not exceed 36" for low-pressure systems or 48" for medium pressure systems. Where greater lengths are required, separate banked sections shall be provided.

VIII. Fire, Smoke And Ceiling Dampers.

A. Fire dampers, also known as flame retarding or primary dampers, may be of the individual folded blade type, the continuous folded stainless steel one piece curtain type, the pivoted single blade type or the pivoted multi-blade type, providing they bear a UL label for the complete assembly. Dampers shall be sized so that folded or open blades do not restrict the duct free area given by the duct dimensions. Dampers shall have a positive lock in the closed position. Fusible links shall be UL listed and marked 160oF.

B. Ceiling dampers, also known as radiation shielding or secondary dampers, may be of the single blade spring loaded guillotine type, the continuous folded stainless steel one piece curtain type or the folded approved fire retardant fabric type provided they bear a UL label for the complete assembly. Single protected pivoted blade type ceiling damper constructed in accordance with the requirements of specific UL ceiling assemblies and SMACNA standards and subject to field acceptance may be used where permitted by the conditions of the specific UL ceiling assembly used. Dampers shall be sized so that folded or open blades do not restrict the duct free area given by the duct dimensions. Dampers shall have a positive lock in the closed position. Fusible links shall be UL listed and marked 160oF.

C. Smoke dampers shall meet the requirements of NFPA 90A & 92A and UL5555. Smoke dampers shall be UL Class I smoke damper, normally open and automatically operated by a 120 volt, electric actuator. Provide airfoil style blades. Elevated temperature rating shall be 350°F. Smoke damper shall operate upon activation of smoke detector and re-settable by a locally mounted momentary contact switch.

D. All dampers shall be installed in sleeves a minimum of two gauges heavier than the connecting ductwork unless noted otherwise. Sleeves shall be mounted within and secured to wall, floor, ceiling or other structural penetration. Dampers shall be positioned only as permitted in the UL listing. Connecting ductwork shall be joined to the sleeve so that in the event of damage to the duct system it will break away leaving the fire damper and sleeve intact in the structural penetration. When necessary to avoid obstructions and after acceptance by the Architect, damper dimensions may be different from the connecting ductwork providing the required free area is maintained and 15o maximum transitions are used.

E. Provide UL listed, photoelectric, 120 volt smoke detector for use with smoke damper and 120 volt, reset switch, (normally on, momentary off) mounted within sight of the damper and detector. This switch shall reset the damper and the detector. Smoke detectors shall be rated for air velocities of 500 to 4000 fpm and have integral, auxiliary contacts for “ALARM” and “TROUBLE” annunciation to the fire alarm system.

IX. Manual Volume Control Dampers

A. Manual Volume Control Dampers in ducts not exceeding 12" on the longest side shall be as shown in SMACNA Duct Standards. For ducts over 12", dampers of the opposed multiblade type shall be used. Dampers shall be galvanized steel, swivel end bearings at one end of the blade, and quadrant with level and lock-screw at the opposite end. Multi-blade dampers shall have steel washers at ends of damper rods with self-aligning blade interconnecting hardware.

X. Coated Duct Liner

A. Duct Liner: Low-Pressure Ductwork

1. All plenums and transfer ducts shall receive duct liner. Supply air ductwork shall receive duct liner from the fan discharge to 20 feet downstream from the fan discharge or as otherwise shown. Return air ductwork shall receive duct liner from the fan suction to 20 feet upstream from the fan suction or as otherwise shown. All supply air discharge ductwork from fan coil units shall receive duct liner.
2. Duct liner shall be designed for use as an acoustical and thermal insulation for sheet metal heating and cooling ducts and plenums. The duct liner shall have a density of

1.5 pounds per cubic foot a "K" factor not to exceed .24 @ 50oF mean temperature and a minimum NRC rating of .75. The minimum duct liner thickness shall be 1 inch.

3. Duct liner shall be designed for use as an acoustical and thermal insulation for sheet metal heating and cooling ducts and plenums. The duct liner shall have a density of 1.5 pounds per cubic foot a "K" factor not to exceed .24 @ 50oF mean temperature and a minimum NRC rating of .75. The minimum duct liner thickness shall be 1 inch.
4. Duct liner air stream surface shall be coated with an immobilized, EPA-registered antimicrobial agent so it will not support microbial growth. Duct liner shall be Johns Manville Linacoustic RC. Duct liners with similar characteristics will be considered as long as all aspects of the specifications are met.
5. All duct liner systems will be covered with a perforated-heavy gauge metal liner with a minimum open area of 25%.

B. Duct Liner: Medium Velocity

1. All rectangular supply/return air duct and all air duct outside exposed to weather shall receive duct liner. Rectangular supply air duct shall receive duct liner from the fan discharge to 20 feet downstream from the discharge or as otherwise shown. Return air duct work shall receive duct liner from the fan suction to 20 feet upstream from the fan suction or as otherwise shown.
2. Duct liner shall be designed for use as an acoustical and thermal insulation for sheet metal heating and cooling ducts. The duct liner shall have a density of 1.5 lbs./cu. ft., a 'K' factor not to exceed .24 @ 50 degrees F mean temperature and a minimum NRC rating of .95. The minimum duct liner thickness shall be 2 inches.
3. Duct liner air stream surface shall be coated with an immobilized, EPA-registered antimicrobial agent so it will not support microbial growth. Duct liner shall be Johns Manville Linacoustic RC. Duct liners with similar characteristics will be considered
4. as long as all aspects of the specifications are met.
5. All duct liner systems will be covered with a perforated-heavy gauge metal liner with a minimum open area of 25%.

Part 3 - Execution

I. Duct Installation

A. The ductwork, fittings, access doors, flexible connections, turning vanes, hangers and supports, fire dampers, volume dampers and other accessories shall be installed as recommended by SMACNA Duct Construction Standards. Ductwork shall not be

supported from bottom chords of bar joists, bridging between bar joists or from metal decks. Ductwork shall be supported from the top chords of bar joists.

B. All necessary allowances and provisions shall be made by this contractor for beams, columns or other obstructions of the building or the work of other contractors, whether or not same is indicated. Where necessary to avoid obstructions, the ducts shall be transformed, divided or moved to one side with the required free area being maintained, all as approved or directed by the Architect.

C. Flexible ducts shall be secured to the metal ductwork, terminal units and supply diffusers by use of a 3/4" minimum width stainless steel drawband pulled tight with an adjusting worm drive type screw. Flexible duct insulation shall be properly sealed at connections to maintain vapor seal/barrier.

D. All duct dimensions shown on the drawings are inside clear dimensions. The duct sizes of ducts with duct liner shall be increased accordingly.

II. Duct Liner

A. Duct Liner Application: Coated duct liner shall be cut to assure overlapped and compressed longitudinal corner joints. Apply liner with coated surface facing the air stream and adhere with 100% coverage of fire retardant adhesive. Coat all exposed leading edges and all transverse joints with fire retardant adhesive. The liner shall be additionally secured with mechanical fasteners which shall compress the duct liner sufficiently to hold it firmly in place as follows:

B. Low Velocity to 2000 FPM: Fasteners shall start within 3" of the upstream transverse edge of liner and 3" from the longitudinal joints and shall be spaced at a maximum of 12" o.c. around the perimeter of the duct, except that they may be a maximum of 12" from a corner break. Elsewhere they shall be a maximum of 18" o.c. except that they shall not be more than 6" from a longitudinal joint of liner nor 12" from a corner break. Coat all exposed joints with a fire retardant adhesive.

C. Medium Velocity from 2000 FPM to 4000 FPM - Fasteners shall start within 3" of the upstream transverse edges of the liner and 3" from the longitudinal joints shall be spaced at a maximum of 6" o.c. around the perimeter of the duct, except that they may be a maximum of 6" from a corner break. Elsewhere they shall be a maximum of 16" o.c. except that they shall not be more than 6" from a longitudinal joint of liner nor 12" from a corner break.

D. In addition to adhesive edge coating of transverse joints, any longitudinal joints shall be similarly coated with adhesive.

III. Waterproofing Ductwork Above Roof

A. Exposed ductwork shall be waterproofed with a prefabricated self-adhering, sheet-type waterproofing membrane as manufactured by Venture Tape and offered as VentureClad-1579CW series. Additional manufacturers will be considered providing all aspects of the specifications are met.

B. Materials:

1. Prefabricated, Self-Adhering, Sheet-Type Waterproofing Membrane.

a) Description:

(1) Top Layer: Stucco-embossed, UV-resistant aluminum weathering surface.

(2) Middle Layer: Double layer of high-density polyethylene reinforcement.

(3) Bottom Layer: Uniform layer of rubberized asphalt adhesive, protected by disposable silicone release paper.

(4) Heat Aging, ASTM D 794: No visible blistering or deterioration.

(5) Tear Resistance, ASTM D 1424, Average: 660 grams.

(6) Elongation, ASTM D 412, Minimum: 450 percent.

(7) Low Temperature Flexibility, 1,000,000 Cycles at -10 Degrees F, 1,200 Cycles at 20 Degrees F: No cracking.

(8) Water Vapor Transmission, ASTM E 96: 0.009 perms.

(9) Flame Spread Index, ASTM E 84.0.

(10) Smoke Density Index, ASTM E 84.5.

(11) Wind-Driven Rain, SFBC TAS-110-95, 100 mph: No leakage or failure.

(12) UV Stability: Excellent.

C. Surface Preparation And Application.

1. Prepare surfaces in accordance with manufacturer's instructions.
2. Ensure tops of ducts have sufficient slope to eliminate ponding water.
3. Remove dirt, dust, oil, grease, hand oils, processing lubricants, moisture, frost, and other contaminants that could adversely affect adhesion of waterproofing membrane.
4. Ensure surfaces are clean and dry.
5. Apply membrane to clean, dry, primed metal ductwork and foil-faced rigid insulation boards. Do not apply over wet or nonrigid insulation.
6. Apply membrane in accordance with manufacturer's air, material, and surface temperature requirements.
7. Apply firm, uniform pressure with hand roller to entire membrane to ensure proper adhesion. Concentrate pressure at seams and on underside of ductwork.
8. Apply membrane to ducts in accordance with manufacturer's instructions.
9. Apply membrane shingle fashion to shed water over, not against laps.

10. Do not terminate membrane on bottom of duct.
11. Apply minimum 3-inch side laps and minimum 6-inch end laps for ductwork applications.

IV. Duct Sealing For Variable Air Volume Systems

A. All supply/return air metal and flexible duct joints shall be sealed with water based brush on duct sealant such as FLEX-GRIP 550 as manufactured by Hardcast, Inc.or UNI-FLEX as manufactured by McGill AirSeal LLC and applied in accordance with the manufacturer's directions.

B. Where zero leakage transverse joints as manufactured by DUCTMATE INDUSTRIES or LOCKFORMER are used to join rectangular duct sections additional sealing is not required at those joints unless leakage is revealed during pressure tests.

V. Leakage

A. All low pressure supply, return and outside air ductwork shall be tested and made substantially airtight at static pressure indicated for the system before covering with insulation or concealing in masonry. Substantially airtight shall be construed to mean that no air leakage is noticeable through the senses of feeling or hearing at all duct joints. Supply, return and outside air transverse duct joints shall be sealed a water based brush on duct sealant such as FLEX-GRIP550 as manufactured by HARDCAST or UNI-FLEX as manufactured by McGill LLC.

B. The entire medium pressure ductwork system, including duct runouts to the variable air volume control units, shall be pressure tested for leakage at three (3) inches ductwork static pressure. Perform leakage tests in accordance with the SMACNA HVAC Duct Leakage Test Manual, using test forms equivalent to those outlined in manual. Tests shall be observed by the Architect, Engineer and owner's representative. A test log shall be maintained by the contractor which will contain the results of systems tested and approval from test observer. Copies of the test log will be included in the operation and maintenance manuals.

VI. Cleaning/storage

A. Every effort should be made to ensure the components of the ductwork systems are kept clean and free of dust and debris. Stocked ductwork shall be stored in areas which are away from dust producing operations. Lined ductwork shall be stored in areas which are substantially weather-tight. Should any portion of lined ductwork become water saturated during storage or installation identified sections will be removed and replaced at no additional cost to the owner. As ductwork is being installed any open ductwork shall be temporarily sealed to prevent the ductwork from being contaminated with construction

debris or dust. Temporary filter media shall be installed on the return systems of any equipment which is required to be run as a temporary control during the construction period. Temporary filters shall be monitored and changed frequently to ensure the cleanliness of the ducted systems.

B. After completing installation of ductwork, entire system shall be cleaned of rubbish, plaster, dirt and any other debris. After installation of equipment and connections are made on fan, and before any grilles are installed, entire system shall be blown out with dampers and outlets wide open.

VII. Duct Smoke Detectors

A. Duct smoke detectors shall be furnished under and interconnected between the auxiliary contacts and the fire alarm system by the Division 16 contractor and installed under this section. The duct smoke detectors shall be installed in accordance with the manufacturer's recommendations, NFPA requirements and local fire marshal requirements. Duct smoke detectors shall be mounted to allow full access for service.

VIII. Fire, Smoke And Ceiling Dampers

A. Provide fire dampers where ducts pass through fire-rated components and where required by the local authority. Install in accordance with local codes, NFPA, SMACNA-FSR and manufacturers requirements.

B. Demonstrate the re-setting of the smoke damper and smoke detector to the Fire Marshal and the owner’s representative.

C. All interlock wiring between the 120 volt power supply and devices listed in this section shall be installed under this section. All wiring shall conform to the requirements of Division 16.

END OF SECTION

Part 1 - General

I. General
   A. The Bidding and Contract Requirements, Division 1 -General Requirements, Section 230100 - General Provisions, and Section 230500 - Basic Materials and Methods, shall apply to this section.

II. Scope
   A. Provide and install the Cabinet and Ceiling Exhaust Fans as shown on the drawings and specified herein.

III. Quality Assurance
   A. Exhaust fan shall have Certified Rating Seal by AMCA and shall be UL listed.

IV. Submittals
   A. Provide shop drawings on this equipment as described in Section 15010 - 1.04.

Part 2 - Products

I. Cabinet And Ceiling Exhaust Fans
   A. The exhaust fan shall consist of a centrifugal type fan with a direct drive motor. Fan shall be of the low sound level type. Motor speed shall not exceed 1100 rpm. Acceptable manufacturers include:
      1. Penn Ventilator Company
      2. Greenheck
      3. Carnes
      4. Loren Cook.

II. Housing
   A. Shall be acoustically insulated and shall be provided with a backdraft damper, motor vibration isolation and electrical connections. Factory air inlet grille shall be provided on ceiling exhaust fans. Cabinet fans shall be arranged for inline duct mounting.

Part 3 - Execution

I. Installation
   A. The exhaust fans shall be installed as recommended by the manufacturer and as shown on the drawings.
   B. Fans shall be controlled as outlined in the Automatic Temperature Control section.

C. Provide three (3) sets of spare fan belts for each unit as required.

D. Provide a typed list of all the different units, their fan belt sizes to be included in the O&M manuals. The list shall include the unit designation, belt size and the number of belts required for each unit. In addition to this, submit to the Owner two additional copies of the list, distributed to the PGCPS project manager of record and PGCPS Building Services.

END OF SECTION

Part 1 - General

I. General
   A. The Bidding and Contract Requirements, Division 1 -General Requirements, Section 230100 - General Provisions, and Section 230500 - Basic Materials and Methods, shall apply to this section.

II. Scope
   A. Provide and install the Power Roof Ventilator as shown on the drawings and specified herein.

III. Quality Assurance
   A. Power roof ventilators shall have Certified Rating Seal by AMCA or published data by an acceptable manufacturer and shall be UL listed.

IV. Submittals
   A. Provide shop drawings on this equipment as described in Section 230100 - 1.04.

Part 2 - Products

I. Power Roof Ventilator
   A. The power roof ventilator shall be the type, capacity and drive (belt drive or direct drive), and be located as shown on the drawings. Acceptable manufacturers include:
      1. Penn Ventilator Company
      2. Greenheck
      3. Loren Cook
      4. Carnes.
   B. Fan - Shall be provided with a backward inclined centrifugal wheel that has been statically and dynamically balanced. The bearings shall be heavy duty, self-aligning, sealed ball bearings. The motor and fan assembly shall be isolated from the base with rubber-in-shear vibration isolators.
   C. Belt drive ventilators shall have variable speed sheave pulley to adjust the speed of the ventilator.
   D. Motor - Shall be installed in a totally enclosed weatherproof housing outside of the air stream. The motor shall have internal thermal protection and sealed ball bearings.
   E. Disconnect Switch - A factory wired non-fused toggle type disconnect switch shall be located under the housing of the unit.

F. Starter - Provide a magnetic across-the-line starter for three phase units. See Section 15050 - 2.07.

G. Pre-fabricated aluminum or galvanized steel curbs 12" high shall be provided to match the power roof ventilator. The curb shall be flashed to match the roofing system. Provide wood nailer. The power roof ventilator and curb shall be provided by the same manufacturer. Backdraft dampers shall be mounted in the curb and shall be full size of the opening.

H. Accessories shall be provided as shown on the drawings. Such accessories shall be of the same manufacturer as the ventilators. All ventilators shall have gravity type backdraft dampers.

I. Unit shall be controlled as described in the Automatic Temperature Control section of the specifications.

Part 3 - Execution

I. Installation

A. The power roof ventilator shall be installed as recommended by the manufacturer and as shown on the drawings. Backdraft damper shall be mounted on rails inside the curb and within the manufacturers recommended minimum distance from the fan. The power roof ventilator shall be secured to the roof curb using like fasteners, fasteners shall be self tapping stainless steel with a 5/16 hex head, 2 inches in length. The number of fasteners used shall be per the manufacturers' recommendations.

B. Variable Sheave Pulley

1. If the belt drive power roof ventilators do not have a variable speed sheave pulley, the contractor shall provide and install pulley and belts to meet the air flow requirements as shown on the drawings.

C. Provide three (3) sets of spare fan belts for each unit as required.

D. Provide a typed list of all the different units, their fan belt sizes to be included in the O&M manuals. The list shall include the unit designation, belt size and the number of belts required for each unit. In addition to this, submit to the Owner two additional copies of the list, distributed to the PGCPS project manager of record and PGCPS Building Services.

END OF SECTION

Part 1 - General

I. General
   A. The Bidding and Contract Requirements, Division 1 -General Requirements, Section 230100 - General Provisions, and Section 230500 - Basic Materials and Methods, shall apply to this section.

II. Scope
   A. Provide and install the fly fans as shown on the drawings and specified herein.

III. Quality Assurance
   A. The fly fan shall have Certified Rating Seal by AMCA or published data by an acceptable manufacturer and shall be UL listed.

IV. Submittals
   A. Provide shop drawings on this equipment as described in Section 230100 - 1.04.

Part 2 - Products

I. Fly Fans
   A. The fly fans shall be of the type, capacity and voltage shown on the drawings. Acceptable manufacturers include:
      1. Mars
      2. Fantech
      3. Powered Aire
      4. Berner Miniveil.
   B. Cabinet - Shall be suitable for exposed indoor wall mounting and manufactured of polycarbonate or satin anodized aluminum painted with color selected by Architect. The air shall enter the fan through a horizontal louvered inlet grille. Air shall be diffused through a nozzle that extends the entire width of the unit and is equipped with air directional control vanes. Velocity control shall be through two speed motor control or adjustable intake louver damper control.
   C. Fan and Motor - Shall be direct drive, forward curved, centrifugal, continuous duty type with permanently lubricated sealed ball bearings and automatic thermal overload protection. The fans shall be selected for quiet operation with motor speed not exceeding 1750 rpm.

Part 3 - Execution

I. Installation

A. The fly fans shall be installed as recommended by the manufacturer and as shown on the drawings.

B. Fans shall be controlled through a remote mounted wall switch.

END OF SECTION

Part 1 - General

I. General
   A. The Bidding and Contract Requirements, Division 1 - General Requirements, Section 230100 - General Provisions, and Section 230500 - Basic Materials and Methods, shall apply to this section.

II. Scope
   A. Provide and install the air terminal units as shown on the drawings and specified herein.

III. Quality Assurance
   A. Air terminal units shall be rated by a recognized testing agency such as the Air Diffusion Council, ASHRAE Standard 36-72, Air Movement and Control Association International, Inc., or an acceptable manufacturer's test laboratory.

IV. Submittals
   A. Provide shop drawings on this equipment as described in Section 230100 - 1.04. Shop drawings shall include proposed uses of all items.

Part 2 - Products

I. Fan Powered Variable Air Volume and Constant Volume Terminal Units
   A. Provide and install fan powered terminals with electrically driven fan and automatically controlled modulating damper. Unit shall supply a constant volume of air to the space by mixing of the primary conditioned variable air with ceiling plenum return air as described herein and shown on the drawings. Capacities shall be as shown in the equipment schedule. Acceptable manufacturers include:
      1. Environmental Technologies
      2. Carrier
      3. Titus
      4. Trane
   B. Air Controlling Assembly - Shall consist of volume regulator, air flow throttling control device, device operator, and adjustment points, Regulator shall compensate for static pressure fluctuations by repositioning damper operator and shall act as reversing relay. Provide normally closed actuators for units with integral heating coils.
   C. Cabinet shall be galvanized steel wrap around one-piece structural frame with all exposed edges flanged and interior of discharge section insulated. Mixing section shall

have single blade gasketed minimum leakage damper. Fans shall be centrifugal forward curved double width mounted on double-shafted three-speed permanent split capacitor motor. Fan wheels and housing shall be constructed of non-corrosive material.

D. Coils - Shall be constructed of aluminum fins mechanically bonded to seamless copper tubes, with continuous fin collars and sleeved coil and supports. Coils shall be factory leak tested at a minimum 300 psi.

E. Unit Supports - Control units and slot type diffusers shall be located as shown on drawings and shall be independently supported with mounted channel and SMACNA approved hanger strap.

F. Filters – Shall be throwaway type.

G. The Sound Power Levels (10 - 12 watts) generated when producing the specified cfm shall not exceed the following figures in any octave band.

Octave Band	2	3	4	5	6	7	8
Center Frequency	125	250	500	1000	2000	4000	8000
Sound Power Level	73	69	66	59	54	53	56

H. Fan and damper controls shall be furnished and installed under the Automatic Temperature Control section of the specification. The division 15900 contractor shall furnish and ship direct digital controllers to the terminal equipment manufacturer for factory installation. The division 15900 contractor shall provide the equipment manufacturer with the necessary wiring diagrams and mounting instructions. The terminal equipment manufacturer shall furnish transformers, relays, airflow sensors and enclosures.

II. Shut-Off Type Variable Air Volume (VAV) Equipment Terminal Units

A. Provide shut-off type air terminal components of an automatically controlled variable air volume system as described herein and shown on the drawings. The system shall consist of air modulating control units serving remote diffusers. Capacities shall be as shown in the equipment schedule. Acceptable manufacturers include:

1. Environmental Technologies
2. Carrier
3. Titus

4. Trane

B. VAV box manufacturer shall provide all necessary transformers, relays, airflow rings and enclosures. The division 15900 contractor shall furnish and ship the direct digital controllers and actuators to the equipment manufacturer for installation. The division 15900 contractor shall provide the equipment manufacturer with the necessary wiring diagrams and mounting instructions.

C. Air Control Units - Shall regulate the air volume delivered to diffusers either mounted on the unit or remotely connected by ductwork. Units shall be constructed of heavy gauge galvanized steel. All interior surfaces shall be acoustically and thermally insulated with glass fiber material, surface treated to prevent erosion. Insulation shall be U/L listed and meet NFPA requirements. Provide hanger holes at all four corners. Minimum box setting shall be factory adjusted to minimum airflow shown in the equipment schedule.

D. Automatic Temperature Control System - Damper operator shall be controlled by a remote sensor as described in the temperature control section of the specifications.

E. Air Controlling Assembly - Shall consist of volume regulator, airflow throttling control device, device operator, and adjustment points. Regulator shall compensate for static pressure fluctuations by repositioning damper operator and shall act as a reversing relay. Provide normally open direct acting actuator or provide the necessary reversing relay to meet this requirement.

F. Hot Water Coils - Shall be constructed of aluminum fins mechanically bonded to seamless copper tubes, with continuous fin collars and sleeved coil and supports. Coil shall be factory leak tested at minimum 300 psi.

III. Motorized Dampers

A. Motorized dampers shall be low leakage opposed blade galvanized steel type with 16 gauge frame and 16 gauge blades. Maximum blade width 8". Provide neoprene seals at all blade edge and side meeting surfaces so that air leakage shall be no more than 1% at 4" static pressure. Provide Teflon or oil impregnated bronze shaft bearings and standard finish. Acceptable manufacturers include:

1. Ruskin
2. Penn Ventilator
3. Carnes.

Part 3 - Execution

I. Installation

A. Shall be installed in accordance with the manufacturers' recommendations. For the Variable Air Volume Terminal Units, the first unit installed will be considered the typical mock up and shall require notification, inspection and approval by designated owner representative and/or architect and engineer before any additional installations will be allowed.

B. Filters - Shall be changed at the end of the construction period and before the final inspection. Provide a typed list of all the different units and their filter sizes to be included in the O&M manuals. The list shall include the unit designation, filter size and the number of filters required for each unit. Provide three (3) sets of filters as required at closeout. In addition to this, submit to the Owner two additional copies of the list, distributed to the PGCPS project manager of record and PGCPS Building Services.

END OF SECTION

Part 1 - General

I. General
   A. The Bidding and Contract Requirements, Division 1 -General Requirements, Section 230100 - General Provisions, and Section 230500 - Basic Materials and Methods, shall apply to this section.

II. Scope
   A. Provide and install the diffusers, registers and grilles as shown on the drawings and specified herein.

III. Quality Assurance
   A. Air outlets and inlets shall be rated by a recognized testing agency such as the Air Diffusion Council, ASHRAE Standard 36-72, Air Movement and Control Association International, Inc., or an acceptable manufacturer's test laboratory.

IV. Submittals
   A. Provide shop drawings on this equipment as described in Section 230100 - 1.04. Shop drawings shall include proposed uses of all items.

Part 2 - Products

I. Diffusers, Registers, and Grilles
   A. The grilles, registers and ceiling diffusers shall be provided as shown on the drawings along with accessories as required. Acceptable manufacturers include:
      1. Titus
      2. Nailor
      3. Price
      4. Metalaire.
   B. Supply Air Diffuser, Ceiling, Square: lay-in type, steel, stamped type, fixed pattern, square louvered face, opposed blade volume damper, equalizing grid, (combination damper/grid are not acceptable) white powder coat finish. Price model SCD.
   C. Supply Air Louver, Exposed Duct Mounting, Drum Louver: Aluminum, adjustable pattern, aluminum finish with volume damper. Price model HCD1.
   D. Supply Air Registers: Steel adjustable vanes, double deflection, vertical front vanes, opposed blade dampers, Aluminum finish. Price model 520D.
   E. Air Extractor: Pivoted adjusting curved blades with adjusting strap. Price model AE1.

F. Return Air Grille, Ceiling: Steel individual fixed horizontal face bars, 0° deflection, white finish, size shall be minimum 12” x 24”. Price model 510HZ.

G. Return Air Grille, Wall: Steel, individual fixed horizontal face bars, 40° deflection, heavy duty type, aluminum finish. Price model 91.

H. Return Air Register, Ceiling: Steel, individual fixed horizontal face bars, 0° deflection, volume damper, white enamel finish. Price model 510ZD. Exhaust air register shall be the same except aluminum, Price model 610ZD.

I. Linear Slot Diffuser: Aluminum, adjustable blades, 1” slot with 1” frame, standard frame finish white, mounting hardware, 1” end caps at both ends, blank sections as required. Remove blades when used as a return. Coordinate with drawings for frame type, number of slots and length. Price model SDS100 Frame 2.

Part 3 - Execution

I. Installation

A. The grilles, registers and ceiling diffusers shall be installed in accordance with the manufacturer's recommendations. Dampers shall be installed where shown and where required to balance the air system.

B. Before locating grilles and ceiling diffusers, check the Architectural and Electrical drawings to make sure that there is no conflict with floor moldings, electrical outlets, lighting fixtures or any other obstruction. Low sidewall grilles and registers shall be mounted with the bottom edge eight inches above the floor with the vanes turned down. High sidewall grilles and registers shall be mounted six inches below the ceiling or as shown on architectural drawings.

C. Air extractors shall be provided and installed as shown on the drawings. Provisions shall be made to adjust air extractor from the exterior of the ductwork. When air extractor is installed, no damper for the register is required.

END OF SECTION

Part 1 - General

I. Related Documents
   A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

II. Summary
   A. This Section includes the following:
      1. Listed chimney liners.
      2. Listed double-wall vents.
      3. Field-fabricated metal breechings and chimneys.

III. Submittals
   A. Product Data: For the following:
      1. Chimney liners.
      2. Type B and BW vents.
      3. Type L vents.
      4. Special gas vents.
      5. Building-heating-appliance chimneys.
      6. Grease ducts.
      7. Refractory-lined metal breechings and chimneys.
      8. Guy wires and connectors.
   B. Shop Drawings: For vents, breechings, chimneys, and stacks. Include plans, elevations, sections, details, and attachments to other work.
      1. Detail equipment assemblies and indicate dimensions, weights, loads, required clearances, methods of field assembly, components, hangers and seismic restraints, and location and size of each field connection.
      2. For installed products indicated to comply with design loads, include calculations required for selecting seismic restraints and structural analysis data signed and sealed by the qualified professional engineer responsible for their preparation.
   C. Welding certificates.
   D. Warranties: Special warranties specified in this Section.

IV. Quality Assurance
   A. Source Limitations: Obtain listed system components through one source from a single manufacturer.

B. Welding: Qualify processes and operators according to AWS D1.1, "Structural Welding Code--Steel," for hangers and supports and AWS D9.1, "Sheet Metal Welding Code," for shop and field welding of joints and seams in vents, breechings, and stacks.

C. Certified Sizing Calculations: Manufacturer shall certify venting system sizing calculations.

V. Coordination

A. Coordinate installation of roof curbs, equipment supports, and roof penetrations. These items are specified in Division 7 Section "Roof Accessories."

VI. Warranty

A. Special Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace components of venting system that fail in materials or workmanship within specified warranty period. Failures include, but are not limited to, structural failures caused by expansion and contraction.

B. Warranty Period: 10 years from date of Substantial Completion.

Part 2 - Products

I. Manufacturers

A. In other Part 2 articles where titles below introduce lists, the following requirements apply to product selection:

1. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the manufacturers specified.
2. Manufacturers: Subject to compliance with requirements, provide products by one of the manufacturers specified.

II. Listed Chimney Liners

A. Manufacturers:

1. American Metal Products; MASCO Corporation.
2. Deflect-O Corp.
3. Heat-Fab Inc.
4. Industrial Chimney Company.
5. Metal-Fab, Inc.
6. Pringle Power-Vac, Inc.
7. ProTech Systems Inc.
8. Selkirk Inc.; Selkirk Metalbestos and Air Mate.

9. Shook Manufactured Products, Inc.
10. Simpson Dura-Vent Co., Inc.; Subsidiary of Simpson Manufacturing Co.
11. Tru-Flex Metal Hose Corp.
12. Approved Equal.

B. Description: Straight, single-wall chimney liner tested according to UL 1777 and rated for 1000 deg F continuously, or 2100 deg F for 10 minutes; with negative or positive flue pressure complying with NFPA 211 and suitable for general usage.

C. Straight Liner Materials: ASTM A 666, Type 304 stainless steel.

D. Corrugated Liner Materials: ASTM A 240/A 240M, Type 321.

E. Accessories:

1. Fittings: Tees, elbows, increasers, draft-hood connectors, metal caps with bird barriers, adjustable roof flashings, storm collars, support assemblies, thimbles, firestop spacers, and fasteners; fabricated from similar or compatible materials and designs.
2. Sealant: Manufacturer's standard high-temperature sealant.
3. Insulating Fill: Manufacturer's standard high-temperature insulation fill material in annular space surrounding chimney liner including high-temperature, ceramic-fiber insulation required to seal chimney at top and bottom.

III. Listed Type b And Bw Vents

A. Manufacturers:

1. American Metal Products; MASCO Corporation.
2. FAMCO.
3. Hart & Cooley, Inc.
4. Heat-Fab Inc.
5. Industrial Chimney Company.
6. LSP Products Group, Inc.
7. Metal-Fab, Inc.
8. ProTech Systems Inc.
9. Schebler Co. (The).
10. Selkirk Inc.; Selkirk Metalbestos and Air Mate.
11. Simpson Dura-Vent Co., Inc.; Subsidiary of Simpson Manufacturing Co.
12. Tru-Flex Metal Hose Corp.
13. Van-Packer Co.
14. Approved Equal.

B. Description: Double-wall metal vents tested according to UL 441 and rated for 480 deg F continuously for Type B, or 550 deg F continuously for Type BW; with neutral or negative flue pressure complying with NFPA 211 and suitable for certified gas-fired appliances.

C. Construction: Inner shell and outer jacket separated by at least a 1/4-inch airspace.

D. Inner Shell: ASTM B 209, Type 1100 aluminum.

E. Outer Jacket: Galvanized steel.

F. Accessories: Tees, elbows, increasers, draft-hood connectors, terminations, adjustable roof flashings, storm collars, support assemblies, thimbles, firestop spacers, and fasteners; fabricated from similar materials and designs as vent-pipe straight sections; all listed for same assembly.

1. Termination: Stack cap designed to exclude 90 percent of rainfall.

IV. Listed Type I Vent

A. Manufacturers:

1. American Metal Products; MASCO Corporation.
2. FAMCO.
3. Heat-Fab Inc.
4. Industrial Chimney Company.
5. LSP Products Group, Inc.
6. Metal-Fab, Inc.
7. ProTech Systems Inc.
8. Schebler Co. (The).
9. Selkirk Inc.; Selkirk Metalbestos and Air Mate.
10. Simpson Dura-Vent Co., Inc.; Subsidiary of Simpson Manufacturing Co.
11. Tru-Flex Metal Hose Corp.
12. Van-Packer Co.
13. Approved Equal.

B. Description: Double-wall metal vents tested according to UL 641 and rated for 570 deg F continuously, or 1700 deg F for 10 minutes; with neutral or negative flue pressure complying with NFPA 211 and suitable for low-heat appliances.

C. Construction: Inner shell and outer jacket separated by at least a 1-inch airspace filled with high-temperature, ceramic-fiber insulation.

D. Inner Shell: ASTM A 666, Type 304 stainless steel.

E. Outer Jacket: Galvanized steel.

F. Accessories: Tees, elbows, increasers, draft-hood connectors, terminations, adjustable roof flashings, storm collars, support assemblies, thimbles, firestop spacers, and fasteners; fabricated from similar materials and designs as vent-pipe straight sections; all listed for same assembly.

1. Termination: Stack cap designed to exclude 90 percent of rainfall.

V. Listed Special Gas Vent

A. Manufacturers:

1. Heat-Fab Inc.
2. Metal-Fab, Inc.
3. ProTech Systems Inc.
4. Z-FLEX.
5. Approved Equal.

B. Description: Double-wall metal vents tested according to UL 1738 and rated for 480 deg F continuously, with positive or negative flue pressure complying with NFPA 211 and suitable for condensing-gas appliances.

C. Construction: Inner shell and outer jacket separated by at least a 1/2-inch airspace.

D. Inner Shell: ASTM A 959, Type 29-4C stainless steel.

E. Outer Jacket: Stainless steel.

F. Accessories: Tees, elbows, increasers, draft-hood connectors, terminations, adjustable roof flashings, storm collars, support assemblies, thimbles, firestop spacers, and fasteners; fabricated from similar materials and designs as vent-pipe straight sections; all listed for same assembly.

1. Termination: Stack cap designed to exclude 90 percent of rainfall.

VI. Listed Building-heating-appliance Chimneys

A. Manufacturers:

1. American Metal Products; MASCO Corporation.
2. FAMCO.
3. Hart & Cooley, Inc.
4. Heat-Fab Inc.
5. Industrial Chimney Company.
6. LSP Products Group, Inc.
7. Metal-Fab, Inc.
8. ProTech Systems Inc.
9. Schebler Co. (The).

10. Selkirk Inc.; Selkirk Metalbestos and Air Mate.
11. Simpson Dura-Vent Co., Inc.; Subsidiary of Simpson Manufacturing Co.
12. Tru-Flex Metal Hose Corp.
13. Van-Packer Co.
14. Approved Equal.

B. Description: Double-wall metal vents tested according to UL 103 and 959 and rated for 1400 deg F continuously, or 1800 deg F for 10 minutes; with positive or negative flue pressure complying with NFPA 211 and suitable for dual-fuel boilers, oven vents, water heaters, or exhaust for engines.

C. Construction: Inner shell and outer jacket separated by at least a 2-inch annular space filled with high-temperature, ceramic-fiber insulation.

D. Inner Shell: ASTM A 666, Type 304 stainless steel.

E. Outer Jacket: Stainless steel.

F. Accessories: Tees, elbows, increasers, draft-hood connectors, terminations, adjustable roof flashings, storm collars, support assemblies, thimbles, firestop spacers, and fasteners; fabricated from similar materials and designs as vent-pipe straight sections; all listed for same assembly.

1. Termination: Round chimney top designed to exclude 98 percent of rainfall.

VII. Listed, Refractory-lined Metal Breechings And Chimneys

A. Manufacturers:

1. Van-Packer Co.
2. Warren Environment, Inc.
3. Approved Equal.

B. Comply with ASME STS-1-1992.

C. Design Wind Loads: 150 mph.

D. Design for seismic conditions at Project site.

E. Chimney Outer Jacket: Aluminized steel with riveted or welded seams.

F. Refractory Lining: Tested according to UL 959 for temperature and acid resistance, and bearing the testing laboratory label.

1. Temperature Rating: 1800 deg F continuously, and 2000 deg F intermittently.
2. Acid Extraction: Maximum of 0.2 percent.
3. Cold Crushing Strength: Minimum of 3200 psig.
4. Thickness: Minimum of 2 inches.

G. Finish: Factory-applied, high-heat-resistant paint; color as selected by Owner.

H. Base Section: Acid-resistant-coated, cast-iron anchor lugs for securing stack to foundation with anchorage designed by manufacturer.

I. Reinforced Cleanout Section: Smoke-tight connection, with gasketed and bolt-tightened inspection plate; neck shall be welded to stack section.

J. T- or Y- Sections: Smoke-tight connection, with welded joints and refractory lining; finished with smooth transition and with no exposed metal on inside.

K. Spark Screen: ASTM A 666, Type 316 stainless steel, 0.0625 inch thick, maximum 1/2-by-1/2-inch mesh, with ASTM A 666, Type 304 stainless-steel rolled angle and drawband.

L. Guy Bands: 8-inch- wide bands of same material as jacket, with bolted fasteners.

M. Roof Penetration: Factory-fabricated thimbles, flashings, and counterflashings.

N. Fabricate sections, fittings, and accessories as individual pieces or in combination lengths for field handling.

O. Fabricate components with centrifugally cast refractory lining in lengths suitable for connection with drawbands.

P. Bond refractory to steel jacket with calcium aluminate cement to prevent separation in finished product during shipping, handling, and installation.

Q. Fabricate stacks with anchor lugs; cleanout; T-sections; flashings and counterflashings; and provisions for support, expansion, and contraction.

Part 3 - Execution

I. Examination

A. Examine areas and conditions for compliance with requirements for installation tolerances and other conditions affecting performance of work.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

II. Installation Of Listed Vents And Chimneys

A. Locate to comply with minimum clearances from combustibles and minimum termination heights according to product listing or NFPA 211, whichever is most stringent.

B. Seal between sections of positive-pressure vents according to manufacturer's written installation instructions, using sealants recommended by manufacturer.

C. Support vents at intervals recommended by manufacturer to support weight of vents and all accessories, without exceeding appliance loading.

D. Slope breechings down in direction of appliance, with condensate drain connection at lowest point piped to nearest drain.

E. Connect base section to foundation using anchor lugs of size and number recommended by manufacturer.

F. Join sections with acid-resistant joint cement to provide continuous joint and smooth interior finish.

G. Erect stacks plumb to finished tolerance of no more than 1 inch out of plumb from top to bottom.

III. Cleaning

A. After completing system installation, including outlet fittings and devices, inspect exposed finish. Remove burrs, dirt, and construction debris and repair damaged finishes.

B. Clean breechings internally, during and after installation, to remove dust and debris. Clean external surfaces to remove welding slag and mill film. Grind welds smooth and apply touchup finish to match factory or shop finish.

C. Provide temporary closures at ends of breechings, chimneys, and stacks that are not completed or connected to equipment.

END OF SECTION

Part 1 - General

I. General
   A. The Bidding and Contract Requirements, Division 1 -General Requirements, Section 230100 - General Provisions, and Section 230500 - Basic Materials and Methods, shall apply to this section.

II. Scope
   A. Provide and install a complete factory-built vent system as called for on the drawings.

III. Quality Assurance
   A. The vents shall meet the requirements of NFPA standards and The International Fuel Gas Code, be UL listed, and satisfy all state and local codes.

IV. Submittals
   A. Provide shop drawings on this equipment as described in section 230100.

Part 2 - Products

I. Gas Fired Boiler Vents
   A. Provide and install the boiler vents complete as shown on the drawings and specified herein. The vents shall be UL listed for this application and meet the requirements of NFPA standard No. 211. The boiler vent shall be double walled using AL29-4C stainless steel. Acceptable manufacturers include:
      1. Selkirk model SAF-T Vent CI Plus
      2. Metal-Fab
      3. Schebler.

II. Gas Fired Water Heater Vent
   A. Provide and install the water heater vent complete as shown on the drawings and specified herein. The vents shall be UL listed for this application and meet the requirements of NFPA standard No. 54 and/or No. 211. The water heater vent for atmospheric type heaters shall be model RV for 3” to 8” and model QC for 10” vents. The water heater vent for power burner type heaters shall be model PS. High efficient condensing water heater vent shall be double walled using AL29-4C stainless steel. Acceptable manufacturers include:
      1. Selkrik model SAF-T Vent CI
      2. Metal-Fab
      3. Schebler.

Part 3 - Execution

I. Gas Fired Boiler Vents

A. The boiler vents shall be installed in accordance with the manufacturer's recommendations and to meet the requirements of NFPA No. 211, state and local codes. Provide barometric dampers when recommended by boiler manufacturer.

II. Water Heater Vent

A. The water heater vent shall be installed in accordance with the manufacturer's recommendations and to meet the requirements of NFPA No. 54 and/or No. 211, state and local codes. Provide barometric dampers when recommended by water heater manufacturer.

III. Connections To Chimneys

A. Vent connections to chimneys shall be made with thimbles. The thimble shall be permanently cemented in place, utilizing heat-resistant cement. The metal vent shall be flush with the inside wall of the chimney.

END OF SECTION

Part 1 - General

I. General
   A. The Bidding and Contract Requirements, Division 1 - General Requirements, Section 15010 - General Provisions, and Section 15050 - Basic Materials and Methods, shall apply to this section.

II. Scope
   A. The work covered under this section shall include Electric heating boilers as specified in this section.

III. Quality Assurance
   A. Referenced codes and standards include:
      1. American Boiler Manufacturers Association (ABMA)
      2. American National Standards Institute/American Society of Mechanical Engineers (ANSI/ASME)
         a) CSD-1: Controls and Safety Devices for Automatically-Fired Boilers; Boiler and Pressure Vessel Code, Section IV: Heating Boilers
      3. National Board of Boiler and Pressure Vessel Inspectors (NBBPVI)
      4. National Fire Protection Association (NFPA)
         a) 70: National Electric Code (NEC)
      5. Underwriters Laboratories, Inc. (UL)
         a) 834: Electric Heating, Water Supply and Power Boilers Labeling and Listing Requirements
      6. Prince George's County Building Codes
      7. International Mechanical Code
      8. State of Maryland Regulations Governing Boilers and Unfired Pressure Vessels

IV. Submittals
   A. Provide shop drawings including predicted performance data, design, fabrication and installation details. Include piping and wiring diagrams, and shipping and operating weights.
   B. Provide minimum 1-year warranty, required product certifications and operating permits for all equipment.

Part 2 - Products

I. Electric Boilers

A. Provide electric immersion element packaged [hot water] [steam] boiler.. Acceptable manufacturers include:

1. Lochinvar
2. Fulton
3. Smith.

B. Boiler burner package, including accessories, controls and boiler trim, all factory mounted and wired, shall be approved as a unit by Underwriters Laboratories, Inc., and furnished with a guarantee that it will meet all required regulations.

C. Entire boiler and components shall be factory-assembled, wired and tested, and shall require only external field piping and wiring connections.

D. Boiler shall be UL listed and bear the UL label.

II. Vessel

A. Boiler vessel shall be vertically constructed in compliance with ANSI/ASME Boiler and Pressure Vessel Code, Section IV, and shall be National Board inspected and bear "H" stamp for pressure as required or scheduled steam operating pressure.

B. Vessel liner shall be equal to “Pre-Krete” Formula G-8. Liner shall be an aluminum silicate cement lining designed for a boiler system operating at maximum of 1000 degrees F. Lining shall be non-toxic.

C. Pressure relief valve shall be ASME, NB rated, and set at pressure rating as scheduled.

D. For boilers 400 hp and smaller, insulate vessel with 2 inch thick, 1.5 pcf density fiberglass insulation.

E. For boilers larger than 400 hp, insulate vessel with 4 inch thick, 1.5 pcf density fiberglass insulation.

III. Heating Elements

A. Heating elements shall be capacity and voltage as required, Incoloy sheathed immersion elements, mechanically mounted and field replaceable without welding or brazing.

B. Heating element watt density shall not exceed 75 Watts per square inch.

IV. Boiler Trim

A. The boiler trim for each boiler shall include the following:

1. First on/first off progressive sequencing control with recycle relay.
2. Operating aquastat.
3. High-limit aquastat.

4. Safety high-limit aquastat with manual reset.
5. Integral contactors.
6. Supplemental internal circuit protection fuses, current-limiting, rated at required amperage interrupting capacity.
7. Main lugs for supply circuits.
8. 120 volt, fused control circuit, including control transformer.
9. Integral high temperature/high pressure limit control.
10. Low water-level cutoff (with manual reset and push-to-test feature).
11. External interlock terminals.
12. On/off control switch.
13. Step-indicating lights (one (1) per step).
14. ASME-rated pressure relief valve.
15. Pressure/temperature gage.
16. Drain valve.
17. Power panel electric door interlock.
18. Alarm bell with silence switch.
19. Flow switch.
20. Common alarm contacts for remote alarm indication. Dry contacts for start/stop and status indication.
21. Fused disconnect switch.
22. Molded case circuit breaker with ground fault protection.

V. Temperature Control System

A. Modulating control shall be a 20-step control design featuring solid-state circuitry with modulating control to proportion power input to system demand. Control shall provide an adjustable time delay between steps and shall include a recycle feature to cause boiler to always start at unloaded condition on startup or after a power outage of more than a few seconds.

B. Modulating control shall maintain one of the following as required:
   1. Leaving Water Temperature (LWT) as scheduled at full or part load, within plus or minus 5 degrees F of specified temperature
   2. Leaving Steam Pressure (LSP) as scheduled at full or part load, within plus or minus 2 psi of specified pressure.

C. Step control shall be a progressive sequencing type and shall equalize number of cycles of operation of components controlled by step control. At each increase in load, heating

elements that have been off the longest shall be next to be energized. At each decrease in load, elements that have been on the longest shall be next to be deenergized.

D. Provide manually-adjustable kW demand limiting control.

E. Provide adjustable (weekly/monthly) surface blowdown control with adjustable (0 to 60 second) duration.

F. External to this boiler package, a multiple boiler sequencer for lead/lag control with other boilers will be provided by Others under Division 13. Under such control, this boiler may then, at option of the operator, be operated as a summer boiler, or as a supplemental boiler in a boiler sequence, for optimum plant efficiency.

VI. Lead-Lag Controller

A. Provide a lead-lag sequence controller to control the operation of boilers with modulating combustion control.

B. Lead-lag controller shall include lead-lag selector switch relays, status indicating lights, and fused power switch. Controller shall be factory wired and tested.

C. Controller shall be shipped loose for field mounting within 20 feet of the boilers.

D. Lead-lag controller shall be Cleveland Controls, Inc. Master Sequence Programmer Series "C" or approved equal.

VII. Enclosure

A. Mount boiler on a structural steel base, full size for boiler enclosure.

B. Electrical control panel shall be No. 14 gage steel. Vessel enclosure shall be No. 18 gage steel.

C. Finish entire enclosure in baked enamel.

Part 3 - Execution

I. Installation

A. Mount boiler(s) on concrete foundation and/or mounting structure as required by manufacturer.

B. Install the work in accordance with manufacturer's written instructions, approved submittals, and in compliance with all referenced codes and ordinances.

C. Connect all piping to boiler(s) in accordance with the Specification Sections referenced under Article, Related Work Specified Elsewhere (Non-inclusive), and as indicated on the Drawings.

D. Provide field control wiring of boiler, boiler control panel, boiler annunciator, multiple boiler control panel, automatic damper blade end switches, and their associated sensors in accordance with the requirements of Division 16.

E. Equipment dimensions shall be such that it will adequately fit into the mechanical space and shall, when installed, fit within the allocated space indicated on Drawings.

F. All boiler, burner and auxiliary components shall be delivered, unloaded and stored in an area adjacent to the erection location as directed by Owner.

G. Lead-lag controller and other auxiliaries that are shipped loose shall be installed and wired in accordance with the Contract Documents after the Mechanical Installer has completed all of the piping and power wiring work.

H. Installation of boiler, burner and controls shall be coordinated with PGCPS and the Mechanical Installer.

I. Startup and one-year service shall be included for each boiler.

J. Provide an engraved nameplate permanently affixed to the front of the control cabinet (inside of cabinet for outdoor locations) with the following information:

UNIT #	*(unit number)*
INSTALLED BY:	*(contracting company's name)*
WARRANTY EXPIRES:	*(month/day/year)*
COMPRESSOR WARRANTY EXPIRES:	*(month/day/year)*

II. Manufacturer's Services

A. After the boiler, piping and electrical systems have been completed by the Mechanical Installer, each boiler shall be operated by the boiler manufacturer under actual operating conditions to demonstrate to PGCPS and the Design Professional that they meet the design requirements.

B. Operation and test shall be no less than twenty four (24) hours for each boiler.

END OF SECTION

Part 1 - General

I. General

A. The Bidding and Contract Requirements, Division 1 - General Requirements, Section 230100 - General Provisions, and Section 230500 - Basic Materials and Methods, shall apply to this section.

II. Scope

A. The work covered under this section shall include packaged, factory-fabricated and -assembled, gas-fired condensing boilers, trim, and accessories for generating hot water.

III. Quality Assurance

A. Manufacturer's Qualifications: Firms regularly engaged in the manufacture of condensing hydronic boilers with welded steel pressure vessels, whose products have been in satisfactory use in service for not less than twenty-five (25) years. The manufacturer must be privately owned and located in North America. The boilers must be manufactured in North America and be able to participate in projects that require a level of content for boiler materials. The specifying engineer, contractor and end customer must have the option to visit the factory during the manufacture of the boilers and be able to witness test fire and other relevant procedures.

B. Referenced codes and standards include:

1. American Boiler Manufacturers Association (ABMA)
2. American National Standards Institute/American Society of Mechanical Engineers (ANSI/ASME)
    a) CSD-1: Controls and Safety Devices for Automatically-Fired Boilers; Boiler and Pressure Vessel Code, Section IV: Heating Boilers
3. ASTM International (ASTM)
    a) D 396: Specification for Fuel Oils (if required)
4. Factory Mutual Global System (FMG) Approval Guide
5. Hydronics Institute (HI)
    a) S-B-R Steel Boiler Ratings
6. General Electric Global Asset Protection (GE GAP) Approval Guide
7. National Fire Protection Association (NFPA)
    a) 85: Boiler and Combustion Hazards Code
8. Underwriters Laboratories, Inc. (UL)

9. Prince George's County Building Codes
10. International Mechanical Code

IV. Submittals

A. Provide shop drawings including predicted performance data, design, fabrication and installation details. Include piping and wiring diagrams, and shipping and operating weights.

B. Warranty

1. The boiler manufacturer will repair or replace any part that is found to be defective in workmanship or material within eighteen (18) months of shipment from the factory or twelve (12) months from start-up, whichever comes first.
2. Special Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace components of boilers that fail in materials or workmanship within specified warranty period.
   a) Warranty Period for Pulse-Combustion Boilers:
      (1) Heat Exchanger Damaged by Thermal Shock: Ten (10) years from date of Substantial Completion.
      (2) Heat-Exchanger Corrosion: Nonprorated for five (5) years from date of Substantial Completion.
      (3) Flue Gas Corrosion and/or defective material or workmanship: five (5) years from the date of shipment from the factory. The manufacturer will repair, replace, exchange or credit at the option of PGCPS.
   b) Warranty Period for Fire-Tube Condensing Boilers:
      (1) Leakage and Materials: Ten (10) years from date of Substantial Completion.
      (2) Heat Exchanger Damaged by Thermal Stress and Corrosion: Nonprorated for five (5) years from date of Substantial Completion.
      (3) Flue Gas Corrosion and/or defective material or workmanship: Five (5) years from the date of shipment from the factory. The manufacturer will repair, replace, exchange or credit at the option of PGCPS.
   c) Warranty Period for Water-Tube Condensing Boilers: Twenty (20) years from date of Substantial Completion.
   d) Warranty Period for Water-Jacketed Condensing Boilers:
      (1) Leakage and Materials: Eight (8) years from date of Substantial Completion.

(2) Heat Exchanger Damaged by Thermal Stress and Corrosion: Nonprorated for five (5) years from date of Substantial Completion.

(3) Flue Gas Corrosion and/or defective material or workmanship: Five (5) years from the date of shipment from the factory. The manufacturer will repair, replace, exchange or credit at the option of PGCPS.

Part 2 - Products

I. Condensing Boilers

A. Factory-fabricated, -assembled, and -tested, condensing boiler with heat exchanger sealed pressure tight, built on a steel base; including insulated jacket; flue-gas vent; combustion-air intake connections; water supply, return, and condensate drain connections; and controls. Water heating service only. Acceptable manufacturers include:

1. Cleaver-Brooks
2. Fulton
3. Hydrotherm/KN
4. Weil-McLain.

B. Boiler burner package, including accessories, controls and boiler trim, all factory mounted and wired, shall be approved as a unit by Underwriters Laboratories, Inc., and furnished with a guarantee that it will meet all state and EPA air pollution control regulations. Boiler shall develop full IBR gross output capacity at 100 percent firing rate.

C. Complete boiler assembly shall be hydrostatically pressure tested after erection in accordance with Section IV of the ANSI/ASME Boiler and Pressure Vessel Code.

D. Combustion Chamber: Stainless steel, sealed.

E. Blower: Centrifugal fan to operate during each burner firing sequence and to prepurge and post-purge the combustion chamber.

1. Motors: Comply with requirements specified in Division 23 Section "Common Motor Requirements for HVAC Equipment."
   a) Motor Sizes: Minimum size as indicated. If not indicated, large enough so driven load will not require motor to operate in service factor range above 1.0.

F. Gas Train: Combination gas valve with manual shutoff and pressure regulator.

G. Ignition: Silicone carbide hot-surface ignition that includes flame safety supervision and 100 percent main-valve shutoff.

H. Integral Circulator: Cast-iron body and stainless-steel impeller sized for minimum flow required in heat exchanger.

II. Boiler Shell and Insulation

A. The boiler shell shall be constructed in accordance with ANSI/ASME Boiler and Pressure Vessel Code and inspected prior to shipment. Submit ASME Boiler Inspection Report for approval.

B. Casing

1. Jacket: Sheet metal, with snap-in or interlocking closures.
2. Control Compartment Enclosures: NEMA 250, Type 1A.
3. Finish: Powder-coated protective finish.
4. Insulation: Minimum 4-inch (100-mm-) thick, mineral-fiber insulation surrounding the heat exchanger.
5. Combustion-Air Connections: Inlet and vent duct collars.
6. Mounting base to secure boiler.
7. Seismic Fabrication Requirements: Fabricate mounting base and attachment to boiler pressure vessel, accessories, and components with reinforcement strong enough to withstand seismic forces when mounting base is anchored to building structure.

III. Boiler Trim

A. The boiler trim for each boiler shall include the following:

1. Include devices sized to comply with ANSI B31.1, "Power Piping.
2. Combination high-limit and low-limit water temperature cut-off control.
3. Pressure and Temperature Gage: Minimum 3-1/2-inch- (89-mm-) diameter, combination water-pressure and -temperature gage. Gages shall have operating-pressure and -temperature ranges so normal operating range is about 50 percent of full range.
4. Water relief valve (ASME-rated), set at pressure as needed by code.
5. Approved low water cut-off switch.
6. 1 inch taps for water treatment and water sampling lines.
7. Safety Relief Valve: ASME rated.
8. Boiler Air Vent: Automatic.
9. Drain valve with hose connection.

10. All conduit and wiring of boiler controls. (Refer to Section 15900 for controls details)
11. Control circuit shall interconnect with the combustion safeguard and limit control circuits governing burner operation. To provide fixed damper opening during purge, constant outlet pressure during firing, and closed damper after boiler shutdown, a selector switch shall provide a means of manually positioning the damper for test purposes. However, the burner shall shut down when the switch is moved from automatic.
    a) Actuator shall be self-locking on power failure and shall be equipped with integral brake for close position controls. The mechanisms shall be totally enclosed in a dust-tight cabinet.
    b) Limit and purge position signal switches shall be an integral part of the damper operator. All necessary linkages, including adjustable clevises, pipe adaptors and damper lever arms, shall be designed for the particular use of the equipment.
    c) Combination Burner

B. Provide a flame-retention forced-draft type combination gas and/or oil burner that shall not exceed manufacturer's recommended distance from the front of the boiler to the end of the burner.
C. Oil and gas fuel trains shall include all safety devices required for Factory Mutual Global (FMG) approval with auxiliary dry contacts as indicated.
D. Provide a factory-wired burner control panel integral with the burner assembly. Panel shall include switches, indicating lights, step-down control transformer with fuse, and devices to effectively operate the boiler/burner system in combination with a lead-lag controller.
E. Provide one (1) set of normally-open auxiliary contacts for remote alarm indication.
F. Provide contacts for emergency boiler cut-off switch.
G. Control panel shall include an electronic combustion safeguard burner primary control, with pre-purge and post-purge programming, and ultra-violet-sensitive electronic flame detector and motor starter relay.
H. Control panel shall also include a manual fuel transfer switch permitting manual fuel changeover.
I. Provide a circuit breaker to deenergize all power to the boiler and control circuits.
J. Graphic Burner Display:

1. Provide, as part of the control cabinet, a multi-color graphic display with integral annunciator status lights.
2. System shall allow the operator a view of the operational status on a lighted graphic display of burner operation.
3. Graphic display shall be mounted on an easy access panel door with quick disconnect device to enable the operator to disconnect system or remove access door while maintaining annunciator in full operation.
4. The following points shall be annunciated on the graphic display:
   a) Power On: Green.
   b) Limits Closed: Green.
   c) Flame Failure: Red.
   d) Main Gas: Blue.
   e) Main Oil: Amber.
   f) High Fire Oil Control: Amber.
   g) High Fire Air Control: Amber.

IV. Lead-Lag Controller

A. Provide a lead-lag sequence controller to control the operation of boilers with modulating combustion control.

B. Lead-lag controller shall be Cleveland Controls, Inc. Master Sequence Programmer Series "C" or approved equal.

Part 3 - Execution

I. Field Quality Control

A. Perform tests and inspections and prepare test reports.

1. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect components, assemblies, and equipment installations, including connections, and to assist in testing.

B. Tests and Inspections:

1. Perform installation and startup checks according to manufacturer's written instructions.
2. Leak Test: Hydrostatic test. Repair leaks and retest until no leaks exist.
3. Operational Test: Start units to confirm proper motor rotation and unit operation. Adjust air-fuel ratio and combustion.

4. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.
    a) Check and adjust initial operating set points and high- and low-limit safety set points of fuel supply, water level, and water temperature.
    b) Set field-adjustable switches and circuit-breaker trip ranges as indicated.

C. Remove and replace malfunctioning units and retest as specified above.

D. Occupancy Adjustments: When requested within 12 months of date of Substantial Completion, provide on-site assistance in adjusting system to suit actual occupied conditions. Provide up to two visits to Project during other than normal occupancy hours for this purpose.

E. Engage a factory-authorized service representative to train PGCPS maintenance personnel to adjust, operate, and maintain boilers.

II. Installation

A. Mount boiler(s) level on concrete foundations as required by manufacturer and/or structural engineer, if required.

B. Vibration Isolation: Elastomeric mounts with a minimum static deflection of 0.25 inch (6.35 mm) or as approved by PGCPS.

C. Install the work in accordance with manufacturer's written instructions, approved submittals, and in compliance with all referenced codes and ordinances.

D. Connect all piping to boiler(s) in accordance with the Specification Sections referenced under Article, Related Work Specified Elsewhere (Non-inclusive), and as indicated on the Drawings.

E. Provide field control wiring of boiler, boiler control panel, boiler annunciator, multiple boiler control panel, automatic damper blade end switches, and their associated sensors in accordance with the requirements of Division 16.

F. Equipment dimensions shall be such that it will adequately fit into the mechanical space and shall, when installed, fit within the allocated space indicated on Drawings.

G. All boiler, burner and auxiliary components shall be delivered, unloaded and stored in an area adjacent to the erection location as directed by Owner.

H. Boiler/burner components shall be assembled by mechanics experienced with boiler erection. The hydrostatic test of the pressure parts of the boiler shall be performed before the insulation and casing are installed. The test shall be witnessed by the Owner's Representative, the Design Professional and the delegated boiler inspector.

I. After the insulation and casing have been installed, the burner shall be mounted to the boiler, and all wiring and controls shall be wired and tested.

J. Lead-lag controller and other auxiliaries that are shipped loose shall be installed and wired in accordance with the Contract Documents after the Mechanical Installer has completed all of the piping and power wiring work.

K. Erection of boiler, burner and controls shall be coordinated with PGCPS and the Mechanical Installer.

L. Startup and one-year service shall be included for each boiler.

M. Provide an engraved nameplate permanently affixed to the front of the control cabinet (inside of cabinet for outdoor locations) with the following information:

UNIT #	*(unit number)*
INSTALLED BY:	*(contracting company's name)*
WARRANTY EXPIRES:	*(month/day/year)*
COMPRESSOR WARRANTY EXPIRES:	*(month/day/year)*

III. Manufacturer's Services

A. After the boiler, piping and electrical systems have been completed by the Mechanical Installer, each boiler shall be operated by the boiler manufacturer under actual operating conditions to demonstrate to PGCPS and the Design Professional that they meet the design requirements.

B. Operation and test shall be no less than twenty four (24) hours for each boiler.

END OF SECTION

Part 1 - General

I. General

A. The Bidding and Contract Requirements, Division 1 - General Requirements, Section 230100 - General Provisions, and Section 230500 - Basic Materials and Methods, shall apply to this section.

II. Scope

A. The work covered under this section shall include Factory-packaged sectional cast iron hot water boiler(s), including boiler casing and insulation, boiler trim, combination oil and gas burner, oil and gas fuel trains, burner and flame failure control system, draft control damper, lead-lag controller for boilers and control panel as specified herein and scheduled in this Section.

III. Quality Assurance

A. Referenced codes and standards include:

1. American Boiler Manufacturers Association (ABMA)
2. American National Standards Institute/American Society of Mechanical Engineers (ANSI/ASME)
    a) CSD-1: Controls and Safety Devices for Automatically-Fired Boilers; Boiler and Pressure Vessel Code, Section IV: Heating Boilers
3. ASTM International (ASTM)
    a) D 396: Specification for Fuel Oils
4. Factory Mutual Global System (FMG) Approval Guide
5. Hydronics Institute (HI)
    a) I-B-R Cast Iron Boiler Ratings
    b) S-B-R Steel Boiler Ratings
6. General Electric Global Asset Protection (GE GAP) Approval Guide
7. National Fire Protection Association (NFPA)
    a) 85: Boiler and Combustion Hazards Code
8. Underwriters Laboratories, Inc. (UL)
9. Prince George's County Building Codes
10. International Mechanical Code

IV. Submittals

A. Provide shop drawings including predicted performance data, design, fabrication and installation details. Include piping and wiring diagrams, and shipping and operating weights.

B. Provide minimum 1-year warranty, required product certifications and operating permits for all equipment.

Part 2 - Products

I. Cast Iron Boilers

A. Hot water boiler shall be constructed of cast iron sections with draw rods, packaged and designed for a flame-retention type combination high-pressure No. 2 oil burner and power gas burner, and factory-painted casings. Acceptable manufacturers include:

1. Burnham
2. Hurst
3. Smith.

B. Boiler burner package, including accessories, controls and boiler trim, all factory mounted and wired, shall be approved as a unit by Underwriters Laboratories, Inc., and furnished with a guarantee that it will meet all state and EPA air pollution control regulations. Boiler shall develop full IBR gross output capacity at 100 percent firing rate.

C. Complete boiler assembly shall be hydrostatically pressure tested after erection in accordance with Section IV of the ANSI/ASME Boiler and Pressure Vessel Code.

D. Combustion box shall be surrounded with water that is constantly circulated.

II. Boiler Shell and Insulation

A. The boiler shell shall be constructed in accordance with ANSI/ASME Boiler and Pressure Vessel Code and inspected prior to shipment. Submit ASME Boiler Inspection Report for approval.

B. Boiler casing shall be completely insulated with 2 inch thick, 1.6 pcf fiberglass blanket under sectional performed sheet metal lagging that can be readily removed and easily reinstalled. Casing shall have a baked enamel finish.

III. Boiler Trim

A. The boiler trim for each boiler shall include the following:

1. Combination high-limit and low-limit water temperature cut-off control.
2. Pressure gage, 6 inch minimum diameter.
3. Temperature gage, 5 inch minimum diameter.
4. Temperature control (for regulation of burner operation).

5. Water relief valve (ASME-rated), set at pressure as needed by code.
6. Approved low water cut-off switch.
7. 1 inch taps for water treatment and water sampling lines.
8. Built-in air eliminator.
9. Drain valve with hose connection.
10. All conduit and wiring of boiler controls.
11. Control circuit shall interconnect with the combustion safeguard and limit control circuits governing burner operation. To provide fixed damper opening during purge, constant outlet pressure during firing, and closed damper after boiler shutdown, a selector switch shall provide a means of manually positioning the damper for test purposes. However, the burner shall shut down when the switch is moved from automatic.
    a) Actuator shall be self-locking on power failure and shall be equipped with integral brake for close position controls. The mechanisms shall be totally enclosed in a dust-tight cabinet.
    b) Limit and purge position signal switches shall be an integral part of the damper operator. All necessary linkages, including adjustable clevises, pipe adaptors and damper lever arms, shall be designed for the particular use of the equipment.
    c) Combination Burner

B. Provide a flame-retention forced-draft type combination oil/gas burner [that shall not exceed manufacturer's recommended distance from the front of the boiler to the end of the burner.
C. Burner shall be capable of firing either No. 2 fuel oil or natural gas Combination oil/gas burner shall be arranged for full modulation with pre-purge, low fire start, high fire run and post-purge.
D. Oil and gas fuel trains shall include all safety devices required for Factory Mutual Global (FMG) approval with auxiliary dry contacts as indicated.
E. Provide a factory-wired burner control panel integral with the burner assembly. Panel shall include switches, indicating lights, step-down control transformer with fuse, and devices to effectively operate the boiler/burner system in combination with a lead-lag controller.
F. Provide one (1) set of normally-open auxiliary contacts for remote alarm indication.
G. Provide contacts for emergency boiler cut-off switch.

H. Control panel shall include an electronic combustion safeguard burner primary control, with pre-purge and post-purge programming, and ultra-violet-sensitive electronic flame detector and motor starter relay.

I. Control panel shall also include a manual fuel transfer switch permitting manual fuel changeover.

J. Provide a circuit breaker to deenergize all power to the boiler and control circuits.

K. Graphic Burner Display:

1. Provide, as part of the control cabinet, a multi-color graphic display with integral annunciator status lights.
2. System shall allow the operator a view of the operational status on a lighted graphic display of burner operation.
3. Graphic display shall be mounted on an easy access panel door with quick disconnect device to enable the operator to disconnect system or remove access door while maintaining annunciator in full operation.
4. The following points shall be annunciated on the graphic display:
   a) Power On: Green.
   b) Limits Closed: Green.
   c) Flame Failure: Red.
   d) Main Gas: Blue.
   e) Main Oil: Amber.
   f) High Fire Oil Control: Amber.
   g) High Fire Air Control: Amber.

IV. Lead-Lag Controller

A. Provide a lead-lag sequence controller to control the operation of boilers with modulating combustion control.

B. Lead-lag controller shall be Cleveland Controls, Inc. Master Sequence Programmer Series "C" or approved equal.

Part 3 - Execution

I. Installation

A. Mount boiler(s) on concrete foundations as required by manufacturer and/or structural engineer.

B. Install the work in accordance with manufacturer's written instructions, approved submittals, and in compliance with all referenced codes and ordinances.

C. Connect all piping to boiler(s) in accordance with the Specification Sections referenced under Article, Related Work Specified Elsewhere (Non-inclusive), and as indicated on the Drawings.

D. Provide field control wiring of boiler, boiler control panel, boiler annunciator, multiple boiler control panel, automatic damper blade end switches, and their associated sensors in accordance with the requirements of Division 16.

E. Equipment dimensions shall be such that it will adequately fit into the mechanical space and shall, when installed, fit within the allocated space indicated on Drawings.

F. All boiler, burner and auxiliary components shall be delivered, unloaded and stored in an area adjacent to the erection location as directed by Owner.

G. Boiler/burner components shall be assembled by mechanics experienced with boiler erection. The hydrostatic test of the pressure parts of the boiler shall be performed before the insulation and casing are installed. The test shall be witnessed by the Owner's Representative, the Design Professional and the delegated boiler inspector.

H. After the insulation and casing have been installed, the burner shall be mounted to the boiler, and all wiring and controls shall be wired and tested.

I. Lead-lag controller and other auxiliaries that are shipped loose shall be installed and wired in accordance with the Contract Documents after the Mechanical Installer has completed all of the piping and power wiring work.

J. Erection of boiler, burner and controls shall be coordinated with PGCPS and the Mechanical Installer.

K. Startup and one-year service shall be included for each boiler.

L. Provide an engraved nameplate permanently affixed to the front of the control cabinet (inside of cabinet for outdoor locations) with the following information:

UNIT #	*(unit number)*

INSTALLED BY:	*(contracting company's name)*
WARRANTY EXPIRES:	*(month/day/year)*
COMPRESSOR WARRANTY EXPIRES:	*(month/day/year)*

II. Manufacturer's Services

A. After the boiler, piping and electrical systems have been completed by the Mechanical Installer, each boiler shall be operated by the boiler manufacturer under actual operating conditions to demonstrate to PGCPS and the Design Professional that they meet the design requirements.

B. Operation and test shall be no less than twenty four (24) hours for each boiler.

END OF SECTION

Part 1 - General

I. General

A. The Bidding and Contract Requirements, Division 1 - General Requirements, Section 230100 - General Provisions, and Section 230500 - Basic Materials and Methods, shall apply to this section.

II. Scope

A. The work covered under this section shall include Factory-packaged fire tube hot water boilers, including boiler shell and insulation, tubes, tube sheets, combination oil and gas burner, intermittent gas pilot, boiler trim, oil, gas and gas pilot fuel trains, combustion control burner and flame failure control system, control panel, boiler draft and outlet damper control, and lead/lag controller for control of boilers as specified herein.

III. Quality Assurance

A. Referenced codes and standards include:

1. American Boiler Manufacturers Association (ABMA)
2. American National Standards Institute/American Society of Mechanical Engineers (ANSI/ASME)
    a) CSD-1: Controls and Safety Devices for Automatically-Fired Boilers; Boiler and Pressure Vessel Code, Section IV: Heating Boilers
3. ASTM International (ASTM)
    a) D 396: Specification for Fuel Oils
4. Factory Mutual Global System (FMG) Approval Guide
5. Hydronics Institute (HI)
    a) I-B-R Cast Iron Boiler Ratings
    b) S-B-R Steel Boiler Ratings
6. General Electric Global Asset Protection (GE GAP) Approval Guide
7. National Fire Protection Association (NFPA)
    a) 85: Boiler and Combustion Hazards Code
8. Underwriters Laboratories, Inc. (UL)
9. Prince George's County Building Codes
10. International Mechanical Code

IV. Submittals

A. Provide shop drawings including predicted performance data, design, fabrication and installation details. Include piping and wiring diagrams, and shipping and operating weights.

B. Provide warranty, required product certifications and operating permits for all equipment.

Part 2 - Products

I. Fire Tube Hot Water Boilers

A. The hot water boiler shall be a factory-packaged 3-pass horizontal fire tube, forced-draft, combination oil and gas fired unit mounted on a structural steel frame, factory wired and tested, and factory painted. The complete package, including accessories, boiler trim and intermittent gas pilot, shall be approved as a unit by Underwriters Laboratories, Inc. and furnished with a guarantee that it will meet all state, OSHA and EPA air pollution control requirements. Acceptable manufacturers include:

1. Burnham
2. Hurst
3. Smith.

B. Unit shall have voltage as required, 3 phase/60 Hz, single-source power supply with fused disconnect switch. Provide any necessary stepdown transformers with package.

C. The boiler shall have a minimum fireside heating surface ratio of 5 square feet per rated boiler horsepower.

D. The boiler tubes shall have an outside diameter of no less than 2 1/2 inches.

E. The boiler shall have a factory-mounted forced-draft burner and burner controls, including a completely factory wired and tested boiler control panel. The burner shall be a flame-retention type combination oil/gas burner, low NOx type with the required equipment to lower NOx emissions to 60 ppm at 3 percent oxygen in the flue gas when firing on natural gas.

F. The burner system shall be integrated with the front head of the boiler, and shall have a combination forced air type burner for oil firing. and an annular port flame retention type burner for gas firing. The burner shall be approved for operation burning either Commercial No. 2 fuel oil meeting ASTM D 396, or natural, manufactured or mixed gas. The oil pumps shall have psi as needed.

G. The gas system shall include a primary motor-operated gas shut-off valve with spring return. The gas train, controls and regulator shall meet Factory Mutual Global (FMG) Standards.

H. The burner shall have an integral forced-draft fan with inlet louvered dampers connected via a jackshaft and linkage to a cam-operated oil metering valve, so that air and oil supply will synchronize through the modulating firing range.

I. The burner shall have an intermittent fully automatic gas-electric ignition, including gas regulator and gas solenoid valve.

J. The front and rear tube sheets, and all flues shall be fully accessible for inspection and cleaning, including front and rear observation ports for inspection of flame conditions.

K. The boilers shall be factory tested under full-load firing conditions with the specified fuel and a copy of the actual performance test shall be submitted to the Owner.

II. Boiler Shell and Insulation

A. The boiler shell shall be constructed in accordance with ANSI/ASME Boiler and Pressure Vessel Code and inspected prior to shipment.

B. The boiler insulation shall consist of a 2 inch thick insulation blanket under sectional, preformed sheet metal lagging that can be easily removed and reinstalled.

III. Boiler Trim

A. The boiler trim for each boiler shall include the following:

1. Low water-level cut-off wired into the burner control circuit with a manual reset device.
2. Water pressure gage (8 inches).
3. Water thermometers (6 inch) industrial-rated dial type) on inlet (0 to 400 degrees F) and outlet (0 to 400 degrees F).
4. Excess oxygen analyzer (optional). Provide one (1) portable unit per boiler room.
5. Excess oxygen controller (optional).
6. Relief valves selected in accordance with ASME code requirements, set pressure at as needed.
7. 1 inch taps for water treatment, chemical injection and water sampling lines.
8. Bottom drain valves.
9. Automatic air eliminator valves on boiler shell.
10. Stack thermometer (6 inch) industrial-rated mounted in boiler combustion gas outlet.
11. Check valve and shut-off valve for boiler fill.

IV. Oil Burner and Flame Failure Control System

A. The program relay shall control ignition, starting and stopping of the burner.

B. The control system shall shut down the burner in the event of ignition, pilot, or flame failure.

C. The burner shall always return to low-fire position for ignition.

D. Provide the control system with both a pre-combustion purge and a post-combustion purge.

V. Gas Burner and Flame Failure Control System

A. The gas piping system motor-operated shut-off valve shall control the stopping and starting of the gas burner.

B. Provide the control system with both a pre-combustion purge and a post-combustion purge.

C. The gas shut-off valve shall automatically fail closed in the event of power failure, flame failure, or a low water-level condition.

D. Provide lubricated plug-type valves ahead of the motorized valve for manual shut-off, and the gas pilot, separately.

E. The gas pilot shall be equipped with automatic electric ignition (with detector controlling gas valve opening only when pilot flame has been established).

VI. Burner Blower Controls

A. The burner blower shall be interlocked to prevent burner operation without required mechanical draft.

B. The burner blower shall have an automatic burner timer delay to allow the fan to purge boiler passes of combustion gases after flame failure or other burner malfunction.

C. The control panel shall be completely factory-wired. Controls shall includeThe control panel shall contain burner controls, including:

1. Burner relay.
2. Blower motor starter.
3. Control switches.
4. Status indicating lights for:
    a) Power On.
    b) Purge Complete.
    c) Flame Failure.
    d) Low Water Level.
    e) Fuel Valve On.
    f) Load Demand.
    g) Remote Start/Stop.

D. Provide a three-pole breaker as required by code to deenergize all power to boiler power and control circuits.

E. Provide a modulating controller to permit automatic or manual continuous firing at any rate between low fire and maximum burner rating.

F. Provide a fuel selector switch and interlocks to prevent simultaneous firing of different fuels.

VII. Boiler Annunciator

VIII. Power Flame Burner will supply as need.

A. Alarm:

a) Low Water Level.

b) High Water Pressure.

c) High Water Temperature.

d) .

e) Low Oil Pressure.

f) Low Gas Pressure.

g)

2. Status and Alarm:

a) Power Off.

b) Pilot Flame Off.

c) Main Flame Off.

d) Fan Off.

e) Air Compressor Off.

f) Spare.

g) Spare.

B. The annunciator shall be factory wired with UL label. Annunciator shall be powered from the boiler control panel.

C. Provide one common alarm contact for remote alarm to the DDC System. Conduit and wiring between the annunciator and the remote DDC System panel will be provided by others under Division 16.

D. Provide automatic resets for alarms due to power failures.

E. Provide manual "acknowledge" reset for all audible alarm points.

F. Provide one (1) set of dry contacts for remote indication of boiler status.

G. Approved Manufacturers: The following annunciator manufacturers and products are acceptable. No substitutions.

1. Fireye Model E110/EP160/ED510.

IX. Multiple Boiler Control Panel

A. Provide a central control panel common to all boilers.
B. Provide a multiple boiler control package using a sequence controller for the cycling and firing rate for boilers, as a function of water temperature in the common boiler outlet header.
C. Provide a packaged NEMA control cabinet, factory wired, piped and tested. Wiring to and from panel will be provided by others under Division 16.
D. Provide a sequence controller to permit automatic sequencing of the multiple boilers. The sequence shall be modified from the panel by the operator.
E. The master sequence controller shall start boilers in sequence, one at a time, in response to the hot water outlet header temperature. The control sensing range shall be 180 to 250 degrees F.
F. Approved Manufacturers: The following sequence controller Power Flame.The sequence controller shall permit on-off or modulating operation, and out-of-service status.
G. The sequence controller shall turn off boilers in the opposite sequence to that of starting.
    1. Leaving water temperature.

Part 3 - Execution

I. Installation
A. Mount boiler(s) on concrete foundations as required by manufacturer and/or structural engineer.
B. Install the work in accordance with manufacturer's written instructions, approved submittals, and in compliance with all referenced codes and ordinances.
C. Connect all piping to boiler(s) in accordance with the Specification Sections referenced under Article, Related Work Specified Elsewhere (Non-inclusive), and as indicated on the Drawings.
D. Provide field control wiring of boiler, boiler control panel, boiler annunciator, multiple boiler control panel, automatic damper blade end switches, and their associated sensors in accordance with the requirements of Division 16.
E. Provide an engraved nameplate permanently affixed to the front of the control cabinet (inside of cabinet for outdoor locations) with the following information:

UNIT #	*(unit number)*
INSTALLED BY:	*(contracting company's name)*
WARRANTY EXPIRES:	*(month/day/year)*
COMPRESSOR WARRANTY EXPIRES:	*(month/day/year)*

II. Manufacturer's Services

A. Provide manufacturer's startup service, field testing, and instruction to PGCPS Building Services on operation and maintenance of boiler(s) for a minimum of for 2 years each boiler.

B. Operation and test shall be no less than twenty four (24) hours for each boiler.

END OF SECTION

Part 1 - General

I. General

A. The Bidding and Contract Requirements, Division 1 - General Requirements, Section 230100 - General Provisions, and Section 230500 - Basic Materials and Methods, shall apply to this section.

II. Scope

A. The work covered under this section shall include packaged, factory-fabricated and -assembled, combination gas- and oil-fired, fire tube boilers, trim, and accessories for generating steam.

III. Quality Assurance

A. Product Options: Drawings indicate size, profiles, and dimensional requirements of fire-tube boilers and are based on the specific system indicated. Refer to Division 1 Section "Product Requirements."

B. Ancillary electrical components shall be Underwriters Laboratories (UL) listed and labeled and in accordance with national Fire Protection Association (NFPA) code 70 "National Electrical Code".

C. ASME Compliance: Fabricate and label fire-tube boilers to comply with ASME Boiler and Pressure Vessel Code: Section VIII, Division 1.

D. ASHRAE/IESNA 90.1 Compliance: Fire-tube boilers shall have minimum efficiency according to Table 10-8.

E. UL Compliance: Test fire-tube boilers to comply with UL 726, "Oil-Fired Boiler Assemblies."

F. UL Compliance: Test fire-tube boilers to comply with UL 795, "Commercial-Industrial Gas Heating Equipment."

G. Comply with Federal, State, and Local Codes and regulations.

H. Control devices and control sequences: in accordance with requirements of ASME, CSD-1, Industrial Risk Insurers (IRI) and factory Mutual Insurance (FM).

I. Installation standards: Oil-fired burners shall be in accordance with National Fire Protection Association (NFPA) Standard 31 "Standard for the Installation of Oil Burning Equipment".

J. Installation standards: Gas-fired burners shall be in accordance with National Fire Protection Association (FNPA) Code 54 “National Fuel Gas Code”.

IV. Submittals

A. Provide shop drawings on all boilers as described in Section 15010 - 1.04.

B. Product Data: Include performance data, operating characteristics, furnished specialties, and accessories.

C. Shop Drawings: For boilers, boiler trim, and accessories. Include plans, elevations, sections, details, and attachments to other Work. Shop Drawings shall be signed and sealed by a qualified professional engineer.

1. For installed products indicated to comply with design loads, include structural analysis data signed and sealed by the qualified professional engineer responsible for their preparation.
2. Design Calculations: Calculate requirements for selecting vibration isolators and seismic restraints and for designing vibration isolation bases.
3. Wiring Diagrams: Detail power, signal, and control wiring.

D. Source quality-control test reports.

E. ASME Stamp Certification and Report: Submit "H2" stamp certificate of authorization, as required by authorities having jurisdiction, and document hydrostatic testing of piping external to boiler.

F. Startup service reports.

G. Operation and Maintenance Data: For fire-tube boilers to include in emergency, operation, and maintenance manuals.

H. Warranties: Special warranties specified in this Section.

V. Coordination

A. Coordinate size and location of concrete bases. Cast anchor-bolt inserts into bases. Concrete, reinforcement, and formwork requirements are specified in Division 3.

VI. Warranty

A. Special Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace front and rear door refractories and heat exchangers of fire-tube boilers that fail in materials or workmanship within specified warranty period.

1. Fire Tube Boilers: Refractory in front and rear doors, 10 years from date of startup by factory-authorized personnel.

Part 2 - Products

I. Manufacturers

A. In other Part 2 articles where titles below introduce lists, the following requirements apply for product selection:
   1. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the manufacturers specified.
   2. Manufacturers: Subject to compliance with requirements, provide products by the manufacturers specified.

II. Fire Tube Boilers

A. Manufacturers:
   1. Superior Boilers
   2. Burnham
   3. Hurst

B. Description: Factory-fabricated, -assembled, and -tested fire-tube boilers with heat exchanger sealed pressure-tight, built on a steel base; including insulated jacket, flue-gas vent, water supply and return connections, and controls.

C. Fabricate base and attachment to pressure vessel with reinforcement strong enough to resist boiler movement during a seismic event when boiler base is anchored to building structure.

D. Pressure Vessel Design: Straight steel tubes welded into steel headers. Three passes with wet-back design. The ratings shall be based on no less than five square feet of heating surface (waterside) per boiler horsepower. Include the following features and accessories:
   1. Tube Size and Thickness: Minimum NPS 2, minimum 0.105 inch thick.
   2. Brass washout plugs.
   3. Steel turbulators.
   4. Lifting lugs on top of boiler.
   5. Minimum NPS 1 hose-end drain valves at shell low point.
   6. Accessible drain and blowdown tappings, both high and low, for surface and mud removal.
   7. Tappings for steam supply, makeup, level controls, and chemical treatment.
   8. Tappings or flanges for supply- and return-water piping.
   9. Built-in air separator.

E. Combustion Chamber: Welded steel, waterwall and -floor design or water-leg design with refractory insulation poured in the floor. Flame observation port.

F. Casing:
   1. Insulation: Minimum 2-inch- thick mineral-fiber insulation surrounding the boiler shell.
   2. Insulated removable smoke boxes and reversing chamber cover.
   3. Jacket: Sheet metal, with screw-fastened closures and baked-enamel or powder-coated protective finish.
   4. Control Compartment Enclosure: NEMA 250, Type 1A.

G. Barometric Damper: Galvanized-steel assembly with flue-gas thermometer having a minimum 3-1/2-inch- diameter dial.

III. Combination Gas And Oil Burners

A. Burner: Welded construction with multivane, stainless-steel, flame-retention diffuser for fuel oil and natural gas. Mount burner on hinged access door to permit access to combustion chamber.

B. Blower: Forward-curved, centrifugal fan integral to burner, directly driven by motor; with adjustable, dual-blade damper assembly and locking quadrant to set air-fuel ratio.
   1. Refer to Division 15 Section "Motors" for general requirements.
   2. RPM: 3450.

C. Oil Supply: Control devices and low-high-lo control sequence shall comply with requirements in FMG, ASME CSD-1, and UL.
   1. Two-stage, gear-type oil pump shall be capable of producing 300-psig discharge pressure and 15-in. Hg vacuum. Include suction-line, manual, gate-type shutoff valve; removable-mesh-type oil strainer; 0- to 30-in. Hg vacuum; 0- to 30-psig vacuum-pressure gage; 0- to 300-psig oil-nozzle pressure gage; and nozzle-line, solenoid-safety-shutoff oil valve.

D. Gas Train: Control devices and low-high-low control sequence shall comply with requirements in ASME CSD-1 and UL.

E. Gas Pilot: electric-spark pilot ignition with 100 percent main-valve and pilot-safety shutoff with electronic supervision of burner flame.

F. Oil Pilot: electric-spark pilot ignition with 100 percent main-valve and pilot-safety shutoff solenoid with cadmium sulfide or ultraviolet scanner flame-safety control.

IV. Steam Boiler Trim

A. Include devices sized to comply with ANSI B31.1, "Power Piping, ANSI B31.9, "Building Services Piping."

B. Pressure Controllers: Manual reset high limit pressure limit, operating pressure control, modulating pressure control when applicable.

C. McDonnell Miller combination pump controls/water columns with low water cut off, tri-cocks and sight glasses. Water columns above six feet high shall have chain-operated tri-cocks.

D. McDonnell Miller # 51 automatic water feeder with secondary low water cutoff.

E. Safety Relief Valve:

1. Size and Capacity: As required for equipment according to ASME Boiler and Pressure Vessel Code: Section VIII, Division 1.
   a) Pressure Setting: 15 psig.
2. Bronze Safety Valves: Class 250, forged copper-alloy disc; fully enclosed steel spring with adjustable pressure range and positive shutoff; factory set and sealed.
   a) Drip-Pan Elbow: Cast iron and having threaded inlet and outlet with threads complying with ASME B1.20.1.

F. Pressure Gage: Minimum 3-1/2-inch diameter, 0- to 30-psig range.

G. Water Column: Minimum 12-inch glass gage with shutoff cocks.

H. Drain Valves: Minimum NPS 3/4 or nozzle size with hose-end connection.

I. Boiler mud legs will have blow down valves on the front and rear (4) at each corner. The valves will be full size of the boiler tapping and piped to floor drain. The sides of each mud leg corner (4) will have installed nipples and caps for ease in cleaning and inspections. Blowdown valves shall be combination of slow and quick acting as required by ANSI B31.1.

J. Stop Valves: Boiler inlets and outlets, except safety relief valves or preheater inlet and outlet, shall be equipped with stop valve in an accessible location as near as practical to boiler nozzle and same size or larger than nozzle. Valves larger than NPS 2 shall have rising stem.

K. Stop-Check Valves: Furnish stop-check valve and stop valve for field installation at boiler outlet with free-blow drain valve for field installation between the two valves and visible when operating stop-check valve.

L. 5" stack thermometers located at the rear of the boiler.

M. 6" diameter steam pressure gauge.

N. A rear flue access plug shall be included with the boilers to allow access to the boiler fire box, for inspection and cleaning, without removing the burner.

O. Factory installed brass screw piping is to be used on all water columns and water feeders. These will be equipped with cross tees to permit visual inspection of the piping interior.

P. Two lifting loops on top of boiler.

Q. On low-high or modulating boilers, a low fire hold will be installed to provide automatic warming of cold boiler when it is put on line.

R. Remote pump mounted at burner to permit change over from gas to oil without having to install a coupling or make mechanical adjustments.

S. A cross will be installed above the normal water line with a steam trap. This will be piped to the boiler feed tank to maintain water level in lag boiler, preventing flooding.

V. Burner Controls

A. Burner Control Panel

1. The burner control panel (NEMA 12) will be equipped with annunciator lamps to indicate the status of the following burner circuits:
   a) Power on
   b) Call for heat
   c) Pilot on
   d) Main fuel valve
   e) Low water
   f) Alarm
2. The alarm lights will be located on the top, or front, of the cabinet.
3. The panel shall contain an alarm horn, with silencing switch, which will sound when the boiler goes into flame failure or a low water condition.
4. The control panel will also include a burner on/off switch, a manual/automatic switch, and a manual firing rate potentiometer.

B. A secondary alarm relay will be installed in each control panel. This relay will be wired in series so that both boilers must be in safety before an alarm relay signal is generated to the Board's security office.

C. A night setback switch will be installed in the control panel and wired to an aquastat in the boiler to maintain 180 degrees F in the boiler when switched to the night position. When switched to the day position the pressure control will operate at the set pressure. The switch will be clearly labeled "Day/Night."

D. A relay will be provided to bypass the lead/lag system, based on an input from an indoor temperature sensor, should the indoor temperature drop below set point.

E. All of the above lights, alarms, and switches will be factory wired and appear on the wiring diagram submitted prior to ordering the equipment, with the same drawing laminated and install on the inside of the burner panel.

F. All control components shall be mounted within integral control panels, one for each burner. The panel shall allow full access to the internal components.

VI. Flame Safeguard Control

A. The flame safeguard control shall be installed by the contractor and be a Fireye Flame-Monitor Model E-110, microprocessor based flame safety control to consisting of the following:

1. EB 700 chassis (one per boiler)
2. ED 510 display module (one per boiler)
3. EC 600 dust cover (one per boiler)
4. EIRI Infrared amplifier (one per boiler)

B. Items above must be installed and wired at the factory and tested by the boiler manufacturer.

C. All devices, wiring diagrams, switches and controls, including those within control cabinets, shall be UL listed and clearly labeled.

D. Ultraviolet flame detection will not be acceptable.

E. Emergency Shutoff Switches

1. The contractor will install at least 2 emergency shut off switch(s) as required by code authorities. All electrical devices and equipment required to enable the operation of the switch(s) shall be provided and installed by the contractor. The switch shall shut down all power to the burners, oil pumps and gas valves. It shall be of design that does not require manual resetting in the event of a power failure. The locations of the switches shall be approved by the Owner and the applicable regulatory agencies. A vandalism resistant pre-alarm cover acceptable to the Board shall protect such switches. Affix proper signage to identify said switches.

F. Description: To maintain safe operating conditions, burner safety controls limit the operation of burner. Microprocessor-based control system integrates safety and operating controls.

1. High Cutoff: Manual reset stops burner if operating conditions rise above maximum boiler design pressure.
2. Low-Water Cutoff Switch: Electronic probe shall prevent burner operation on low water. Cutoff switch shall be manual-reset type.

G. Alarm Bell: Factory mounted on control panel with silence switch; shall sound alarm for above conditions.

VII. Source Quality Control

A. Test and inspect factory-assembled boilers, before shipping, according to ASME Boiler and Pressure Vessel Code: Section I, for high-pressure boilers and Section IV, for low-pressure boilers.

B. Burner and Hydrostatic Test: Factory adjust burner to eliminate excess oxygen, carbon dioxide, oxides of nitrogen, and carbon monoxide in flue gas and to achieve combustion efficiency; perform hydrostatic test.

C. Allow Owner access to source quality-control testing of fire-tube boilers. Notify Engineer 14 days in advance of testing.

Part 3 - Execution

I. Examination

A. Before boiler installation, examine roughing-in for concrete equipment bases, anchor-bolt sizes and locations, and piping and electrical connections to verify actual locations, sizes, and other conditions affecting boiler performance, maintenance, and operations.

1. Final boiler locations indicated on Drawings are approximate. Determine exact locations before roughing-in for piping and electrical connections.

B. Examine mechanical spaces for suitable conditions where boilers will be installed. Proceed with installation only after unsatisfactory conditions have been corrected.

II. Boiler Installation

A. Install boilers level on concrete base. Concrete base is specified in Division 15 Section "Basic Mechanical Materials and Methods," and concrete materials and installation requirements are specified in Division 3.

B. Concrete Bases: Anchor boilers to concrete base.

1. Install dowel rods to connect concrete base to concrete floor. Unless otherwise indicated, install dowel rods on 18-inch centers around full perimeter of base.
2. For supported equipment, install epoxy-coated anchor bolts that extend through concrete base and anchor into structural concrete floor.
3. Place and secure anchorage devices. Use setting drawings, templates, diagrams, instructions, and directions furnished with items to be embedded.
4. Install anchor bolts to elevations required for proper attachment to supported equipment.
5. Cast-in-place concrete materials and placement requirements are specified in Division 3.

C. Install gas-fired boilers according to NFPA 54.

D. Install oil-fired boilers according to NFPA 31.

E. Assemble and install boiler trim.

F. Install electrical devices furnished with boiler but not specified to be factory mounted.

III. Connections

A. Piping installation requirements are specified in other Division 15 Sections. Drawings indicate general arrangement of piping, fittings, and specialties.

B. Connect gas piping full size to boiler gas-train inlet with union.

C. Connect oil piping full size to burner inlet with shutoff valve and union.

D. Connect hot-water piping to supply- and return-boiler tappings with shutoff valve and union or flange at each connection.

E. Connect steam and condensate piping to supply-, return-, and blowdown-boiler tappings with shutoff valve and union or flange at each connection.

F. Install piping from safety relief valves to nearest floor drain.

G. Install piping from safety valves to drip-pan elbow and to nearest floor drain.

H. Connect breeching full size to boiler outlet. Refer to Division 15 Section "Breechings, Chimneys, and Stacks" for venting materials.

I. Install flue-gas recirculation duct from vent to burner. Refer to Division 15 Section "Breechings, Chimneys, and Stacks" for recirculation duct materials.

J. Install piping adjacent to boiler to allow service and maintenance.

K. Ground equipment according to Division 16 Section "Grounding and Bonding."

L. Connect wiring according to Division 16 Section "Conductors and Cables."

M. Tighten electrical connectors and terminals according to manufacturer's published torque-tightening values. If manufacturer's torque values are not indicated, use those specified in UL 486A and UL 486B.

IV. Startup Service

A. Engage a factory-authorized service representative to test, inspect, and adjust boiler components and equipment installation and to perform startup service.

B. Perform installation and startup checks according to manufacturer's written instructions.

C. Leak Test: Hydrostatic test. Repair leaks and retest until no leaks exist.

D. Operational Test: Start units to confirm proper motor rotation and unit operation. Adjust air-fuel ratio and combustion.

E. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.

F. Adjust initial temperature set points.

G. Set field-adjustable switches and circuit-breaker trip ranges as indicated.

H. Occupancy Adjustments: When requested within 12 months of date of Substantial Completion, provide on-site assistance in adjusting system to suit actual occupied conditions. Provide up to two visits to site outside normal occupancy hours for this purpose, without additional cost.

I. Prepare written report that documents testing procedures and results.

J. Provide an engraved nameplate permanently affixed to the front of the control cabinet (inside of cabinet for outdoor locations) with the following information:

UNIT #	*(unit number)*
INSTALLED BY:	*(contracting company's name)*
WARRANTY EXPIRES:	*(month/day/year)*
COMPRESSOR WARRANTY EXPIRES:	*(month/day/year)*

K. Manufacturer's Services

1. Provide manufacturer's startup service, field testing, and instruction to PGCPS Building Services on operation and maintenance of boiler(s) for a minimum of for 2 years each boiler.
2. Operation and test shall be no less than twenty four (24) hours for each boiler.

V. Demonstration

A. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain fire-tube boilers. Refer to Division 1 Section "Closeout Procedures and Demonstration and Training."

END OF SECTION

Part 1 - General

I. Related Documents
   A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

II. Summary
   A. This Section includes the following:
      1. Feedwater pumps and receivers.

III. Submittals
   A. Product Data: For each type of product indicated. Include manufacturer's technical Product Data; rated capacity of selected model; temperature and net-positive suction head required characteristics; pump performance curve with selection points clearly indicated; shipping, installed, and operating weights; furnished specialties; and accessories.
   B. Shop Drawings: Detail fabrication and installation and indicate dimensions, weights, loadings, required clearances, method of field assembly, and components.
      1. Wiring Diagrams: Power, signal, and control wiring. Differentiate between manufacturer-installed and field-installed wiring.
   C. Maintenance Data: For feedwater units to include in maintenance manuals specified in Division 1.

IV. Quality Assurance
   A. Product Options: Drawings indicate size, profiles, and dimensional requirements of feedwater units and are based on the specific types and models indicated. Other manufacturers' products complying with requirements may be considered. Refer to Division 1 Section "Substitutions."
   B. Regulatory Requirements: Fabricate and test unit according to ASME PTC 12.1, "Closed Feedwater Heaters."
   C. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.
   D. ASME Compliance: ASME B31.9, "Building Services Piping," for low-pressure systems equal to or less than 15 psig. Safety valves and pressure vessels shall bear the appropriate ASME label.

V. Delivery, Storage, And Handling

A. Preparation for Shipping: Clean flanges and exposed-metal surfaces and treat with anti-corrosion compound after assembly and testing. Protect flanges, pipe openings, and nozzles with wooden flange covers or with screwed-in plugs.
B. Store units in dry location.
C. Retain protective flange covers and machined-surface protective coatings during storage.
D. Protect bearings and couplings against damage from sand, grit, and other foreign matter.
E. Comply with manufacturer's written rigging instructions.

Part 2 - Products

I. Manufacturers
A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
1. Feedwater Units:
a) Alyan Pump.
b) Aurora/Pentair Pump Group.
c) BFS Industry Incorporated.
d) Bryan Boilers; Bryan Steam Corp.
e) Cleaver-Brooks; Div. of Aqua-Chem, Inc.
f) Dixon Boiler Works.
g) Donlee Technologies, Inc.; Boiler Div.
h) Flotronics, Inc.
i) Gerow Equipment Co.; Pump & Hydraulic Division.
j) Hurst Boiler & Welding Co., Inc.
k) ITT Fluid Handling; ITT Fluid Technology Corp.
l) Kewanee Boiler Manufacturing Co.
m) Lattner Boiler Manufacturing Co.
n) PVI Industries Inc.
o) Roth Pump Co.; a subsidiary of Roy E. Roth Co.
p) Sellers Engineering Co.
q) Shippensburg Pump Co., Inc.
r) Skidmore.
s) Smith-Koch, Inc.
t) Superior Boiler Works, Inc.
u) U.S. Deaerator Co.

II. Feedwater Units

A. Description: Factory-assembled and -tested unit consisting of a condensate receiver, feedwater pumps, controls, and the following features and accessories:

1. Liquid-filled thermometer graduated in both Fahrenheit and Celsius.
2. Gage glass with stops at top and bottom.
3. Inlet strainer.
4. Lifting eyes.
5. Companion flanges.
6. Pump-discharge check valve.
7. Pump-discharge pressure gauge.
8. Pump-suction isolation valve.
9. Pump-discharge isolation valve.

B. Makeup-Water Assembly: Float-operated, makeup-water valve; inlet strainer; and three-valve bypass.

C. Factory-Furnished Pipe, 2-1/2" NPS and Smaller: ASTM A 53, Type S (seamless), Grade A, Schedule 80, with threaded joints and malleable-iron fittings of class to match pressure rating of pipe.

D. Factory-Furnished Pipe, 3" NPS and Larger: ASTM A 53, Type E (electric-resistance welded), Grade A, Schedule 80, with welded joints and malleable-iron fittings of class to match pressure rating of pipe.

E. Receiver Material: Close-grain cast iron.

1. Finish: Painted exterior.
2. Arrangement: Floor mounted.

F. Mounting Frame: Structural-steel stand to support receiver and pumps. Fabricate stand with bracing adequate for seismic forces according to authorities having jurisdiction and to allow anchoring mounting frame to floor.

G. Vertical Feedwater Pump: Flange-mounted, closed-coupled, multistage, radially split case design centrifugal pump; rated for 175-psig minimum working pressure and a continuous water temperature of 225 deg F; with the following features:

1. Impeller: Bronze or Stainless steel.
2. Seals: Mechanical.
3. Motor: Open dripproof.

H. Horizontal Feedwater Pump: Base-mounted, single-stage, radially split case design centrifugal pump; rated for 175-psig minimum working pressure and a continuous water temperature of 225 deg F; with the following features:
   1. Impeller: Bronze.
   2. Coupling: Flexible.
   3. Seals: Mechanical.
   4. Motor: Totally enclosed fan cooled.

I. Feedwater Pump Control Panel: Unit mounted, factory wired, and including the following:
   1. NEMA 250, Type 2 enclosure.
   2. Combination magnetic starters for each pump, with three overload relays, fused disconnect switch, and cover interlock.
   3. Numbered terminal block.
   4. Removable control mounting plate.
   5. Electric alternator for duplex units.
   6. Pilot lights for pump running and alarm.
   7. Alarm bell and silence switch.
   8. Elapsed-time run meter, graduated in hours.
   9. Fusible, control-circuit transformer where motor voltage exceeds 130 V.

J. Feedwater Pump Control Sequence: Boiler water-level controller starts lead pump; alternator switches lead and lag pumps after each cycle. Low-level receiver float switch opens makeup-water solenoid valve.

Part 3 - Execution

I. Examination
   A. Examine equipment foundation and anchor-bolt locations for compliance with requirements for installation and other conditions affecting performance.
   B. Examine roughing-in for condensate return piping systems to verify actual locations of piping connections before equipment installation.
   C. Proceed with installation only after unsatisfactory conditions have been corrected.

II. Installation
   A. Install unit level and plumb and to permit access for maintenance.
   B. Support piping independent of pumps.
   C. Install base-mounted pumps on concrete bases with grouted base frames.
   D. Install parts and accessories shipped loose.

III. Connections

A. Piping installation requirements are specified in other Division 15 Sections. Drawings indicate general arrangement of piping, fittings, and specialties.

B. Install piping adjacent to machine to allow service and maintenance.

C. Connect makeup-water piping and cooling-water piping with reduced-pressure backflow preventers.

D. Install overflow drain piping to nearest floor drain.

E. Install vents and extend to outdoors; terminate with elbow turned down and an insect screen.

F. Ground equipment.

1. Tighten electrical connectors and terminals according to manufacturer's published torque-tightening values. If manufacturer's torque values are not indicated, use those specified in UL 486A and UL 486B.

IV. Field Quality Control

A. Testing: Perform the following field quality-control testing:

1. After installing unit and after electrical circuitry has been energized, test for compliance with requirements.

B. Repair or replace malfunctioning units. Retest as specified above after repairs or replacements are made.

C. Manufacturer's Field Service: Engage a factory-authorized service representative to perform the following:

1. Inspect field-assembled components, equipment installation, and piping and electrical connections for compliance with manufacturer's written instructions.
2. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.
3. Check bearing lubrication.
4. Verify proper motor rotation.
5. Start up service.
6. Report results in writing.

V. Adjusting

A. Adjust boiler water-level controls to properly stage unit.

B. Set field-adjustable makeup-water and cooling-water controls.

VI. Cleaning

A. Clean equipment internally; remove coatings applied for protection during shipping and storage, foreign material, and oily residue according to manufacturer's written instructions.

B. Clean strainers.

VII. Demonstration

A. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain units.

1. Train Owner's maintenance personnel on procedures and schedules for starting and stopping, troubleshooting, servicing, and maintaining equipment and schedules.
2. Review data in maintenance manuals. Refer to Division 1 Section "Contract Closeout."
3. Review data in maintenance manuals. Refer to Division 1 Section "Operation and Maintenance Data."
4. Schedule training with Owner, through Engineer, with at least seven days' advance notice.

END OF SECTION

Part 1 - General

I. General
   A. The Bidding and Contract Requirements, Division 1 -General Requirements, Section 230100 - General Provisions, and Section 230500 - Basic Materials and Methods shall apply to this section.

II. Scope
   A. Provide and install unit heater as shown on the drawings and specified herein.
   B. Items included in this specification include (but are not limited to):
      1. Cabinet Unit Heaters
      2. Hot Water Unit Heaters

III. Quality Assurance
   A. The unit heater shall have published ratings and be UL listed and bear the UL label.
   B. Equipment installer shall attend a controls coordination meeting with the Section 230923 contractor as described in 230923, 1.03.

IV. Submittals
   A. Provide shop drawings on this equipment as described in Section 230100 - 1.04. The controls coordination meeting described in 15900 shall be held before the shop drawings are submitted.

Part 2 - Products

I. The unit heaters shall be of type and capacity shown on the drawings. Acceptable manufacturers include:
   A. Indeeco
   B. Trane
   C. Reznor
   D. Sterling

II. Motor Requirements
   A. Motor requirements apply to factory-installed and field-installed motors, except as follows:
      1. Different ratings, performance, or characteristics for a motor are specified in Section 230513.

2. Manufacturer for a factory-installed motor requires ratings, performance, or characteristics, other than those specified in this Section, to meet performance specified.

III. Motor Characteristics

A. Frequency Rating: 60 Hz.

B. Voltage Rating: NEMA standard voltage selected to operate on nominal circuit voltage to which motor is connected.

C. Service Factor: 1.15 for open dripproof motors; 1.0 for totally enclosed motors.

D. Duty: Continuous duty at ambient temperature of 105 deg F and at altitude of 3300 ft above sea level.

E. Capacity and Torque Characteristics: Sufficient to start, accelerate, and operate connected loads at designated speeds, at installed altitude and environment, with indicated operating sequence, and without exceeding nameplate ratings or considering service factor.

F. Enclosure: Open dripproof.

IV. Polyphase Motors

A. Description: NEMA MG 1, Design B, medium induction motor.

B. Efficiency: Premium efficiency.

C. Stator: Copper windings, unless otherwise indicated.

D. Rotor: Squirrel cage, unless otherwise indicated.

E. Bearings: Double-shielded, prelubricated ball bearings suitable for radial and thrust loading.

F. Temperature Rise: Match insulation rating, unless otherwise indicated.

G. Insulation: Class F, unless otherwise indicated.

H. Code Letter Designation:

1. Motors 15 hp and Larger: NEMA starting Code F or G.
2. Motors Smaller Than 15 hp: Manufacturer's standard starting characteristic.

I. Enclosure: Cast iron for motors 7.5 hp and larger; rolled steel for motors smaller than 7.5 hp.

1. Finish: Gray enamel.

V. Polyphase Motors With Additional Requirements

A. Motors Used with Reduced-Inrush Controllers: Match wiring connection requirements for controller with required motor leads. Provide terminals in motor terminal box, suited to control method.

B. Motors Used with Variable Frequency Controllers: Ratings, characteristics, and features coordinated with and approved by controller manufacturer.
   1. Designed with critical vibration frequencies outside operating range of controller output.
   2. Temperature Rise: Matched to rating for Class B insulation.
   3. Insulation: Class H.
   4. Thermal Protection: Comply with NEMA MG 1 requirements for thermally protected motors.

C. Source Quality Control: Perform the following tests on each motor according to NEMA MG 1:
   1. Measure winding resistance.
   2. Read no-load current and speed at rated voltage and frequency.
   3. Measure locked rotor current at rated frequency.
   4. Perform high-potential test.

VI. Single-phase Motors

A. Type: One of the following, to suit starting torque and requirements of specific motor application:
   1. Permanent-split capacitor.
   2. Split-phase start, capacitor run.
   3. Capacitor start, capacitor run.

B. Shaded-Pole Motors: For motors 1/20 hp and smaller only.

C. Thermal Protection: Internal protection to automatically open power supply circuit to motor when winding temperature exceeds a safe value calibrated to temperature rating of motor insulation. Thermal-protection device shall automatically reset when motor temperature returns to normal range.

D. Bearings: Ball type for belt-connected motors and other motors with high radial forces on motor shaft; sealed, prelubricated-sleeve type for other single-phase motors.

E. Source Quality Control: Perform the following tests on each motor according to NEMA MG 1:
   1. Measure winding resistance.
   2. Read no-load current and speed at rated voltage and frequency.
   3. Measure locked rotor current at rated frequency.
   4. Perform high-potential test.

Part 3 - Execution

I. Motor Installation
   A. Anchor each motor assembly to base, adjustable rails, or other support, arranged and sized according to manufacturer's written instructions. Attach by bolting. Level and align with load transfer link.
   B. Install motors on concrete bases complying with Division 3, as required.

II. Field Quality Control
   A. Prepare for acceptance tests as follows:
      1. Run each motor with its controller. Demonstrate correct rotation, alignment, and speed at motor design load.
      2. Test interlocks and control features for proper operation.
      3. Verify that current in each phase is within nameplate rating.
      4. Correct malfunctioning units on-site, where possible, and retest to demonstrate compliance; otherwise, replace with new units and retest.

III. Adjusting
   A. Align motors, bases, shafts, pulleys and belts. Tension belts according to manufacturer's written instructions.

END OF SECTION

Part 1 - General

I. Related Documents
   A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

II. Summary
   A. This Section includes shell-and-tube heat exchangers.

III. Submittals
   A. Product Data: Include rated capacities, operating characteristics, furnished specialties, and accessories.
   B. Shop Drawings: Signed and sealed by a qualified professional engineer. Detail equipment assemblies and indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.
      1. Design Calculations: Calculate requirements for selecting seismic restraints and for designing bases.
      2. Base Details: Detail fabrication including anchorages and attachments to structure and to supported equipment.
   C. Coordination Drawings: Equipment room, drawn to scale, on which the following items are shown and coordinated with each other, based on input from installers of the items involved:
      1. Tube-removal space.
      2. Structural members to which heat exchangers will be attached.
   D. Manufacturer Seismic Qualification Certification: Submit certification that heat exchanger, accessories, and components will withstand seismic forces defined in Division 15 Section "Mechanical Vibration and Seismic Controls." Include the following:
      1. Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculation.
         a) The term "withstand" means "the unit will remain in place without separation of any parts from the device when subjected to the seismic forces specified."
         b) The term "withstand" means "the unit will remain in place without separation of any parts from the device when subjected to the seismic forces specified and the unit will be fully operational after the seismic event."
      2. Dimensioned Outline Drawings of Equipment Unit: Identify center of gravity and locate and describe mounting and anchorage provisions.

3. Detailed description of equipment anchorage devices on which the certification is based and their installation requirements.

E. Operation and Maintenance Data: For heat exchangers to include in emergency, operation, and maintenance manuals.

IV. Quality Assurance

A. Product Options: Drawings indicate size, profiles, performance, and dimensional requirements of heat exchangers and are based on the specific equipment indicated. Refer to Division 1 Section "Product Requirements."

B. ASME Compliance: Fabricate and label heat exchangers to comply with ASME Boiler and Pressure Vessel Code: Section VIII, "Pressure Vessels," Division 1.

C. Registration: Fabricate and label shell-and-tube heat exchangers to comply with the Tubular Exchanger Manufacturers Association's standards.

Part 2 - Products

I. Manufacturers

A. In other Part 2 articles where titles below introduce lists, the following requirements apply to product selection:

B. Approved Manufacturers:

1. Armstrong Pumps, Inc.
2. ITT Industries; Bell & Gossett.
3. Taco, Inc.

C. Configuration: U-tube with removable bundle.

D. Shell Materials: Steel.

E. Head:

1. Materials: Cast iron.
2. Flanged and bolted to shell.

F. Tube:

1. Seamless copper tubes.
2. Tube diameter is determined by manufacturer based on service.

G. Tubesheet Materials: Steel tubesheets.

H. Piping Connections:

1. Shell: Flanged inlet and threaded outlet fluid connections, threaded drain, and vent connections.

2. Head: Threaded inlet and outlet fluid connections.

I. Support Saddles:

1. Fabricated of material similar to shell.
2. Foot mount with provision for anchoring to support.
3. Fabricate attachment of saddle supports to pressure vessel with reinforcement strong enough to resist heat-exchanger movement during a seismic event when heat-exchanger saddles are anchored to building structure.

Part 3 - Execution

I. Examination

A. Examine areas for compliance with requirements for installation tolerances and for structural rigidity, strength, anchors, and other conditions affecting performance of heat exchangers.

1. Proceed with installation only after unsatisfactory conditions have been corrected.

II. Heat-exchanger Installation

A. Install shell-and-tube heat exchangers on saddle supports.

B. Install shell-and-tube heat exchangers on concrete base. Concrete base is specified in Division 15 Section "Basic Mechanical Materials and Methods," and concrete materials and installation requirements are specified in Division 3.

C. Concrete Bases: Anchor heat exchanger to concrete base.

1. Install dowel rods to connect concrete base to concrete floor. Unless otherwise indicated, install dowel rods on 18-inch centers around full perimeter of base.
2. For supported equipment, install epoxy-coated anchor bolts that extend through concrete base and anchor into structural concrete floor.
3. Place and secure anchorage devices. Use setting drawings, templates, diagrams, instructions, and directions furnished with items to be embedded.
4. Install anchor bolts to elevations required for proper attachment to supported equipment.
5. Cast-in-place concrete materials and placement requirements are specified in Division 3.

III. Connections

A. Piping installation requirements are specified in other Division 15 Sections. Drawings indicate general arrangement of piping, fittings, and specialties.

B. Maintain manufacturer's recommended clearances for service and maintenance. Install piping connections to allow service and maintenance of heat exchangers.

C. Install shutoff valves at heat-exchanger inlet and outlet connections.

D. Install relief valves on heat-exchanger heated-fluid connection and install pipe relief valves, full size of valve connection, to floor drain.

E. Install vacuum breaker at heat-exchanger steam inlet connection.

F. Install hose end valve to drain shell.

IV. Field Quality Control

A. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.

V. Cleaning

A. After completing system installation, including outlet fitting and devices, inspect exposed finish. Remove burrs, dirt, and construction debris and repair damaged finishes.

END OF SECTION

Part 1 - General

I. General
   A. The Bidding and Contract Requirements, Division 1 -General Requirements, Section 230100 - General Provisions, and Section 230100 - Basic Materials and Methods, shall apply to this section.

II. Scope
   A. A complete factory assembled packaged water-cooled hermetic centrifugal water chiller shall be installed.

III. Quality Assurance
   A. Unit shall be run tested at the factory and start-up and checkout shall be done by a factory certified technician. Pressurized components shall comply with the ASME code for unfired pressure vessels.
   B. Manufacturer shall provide a certification that the equipment has been performance tested at the factory. Certification shall record the unit capacity in BTU/hour and kilowatts.
   C. Chiller performance shall be rated in accordance with Air Conditioning and Refrigeration Institute (ARI) Standard 550, latest edition.
   D. Equipment and installation shall be in compliance with Safety Code for Mechanical Refrigeration, ANSI/ASHRAE 15-2004.
   E. Factory start-up- The manufacturer shall supply complete factory start-up by a factory approved start-up agent.
   F. Equipment installer shall attend a controls coordination

IV. Submittals
   A. Provide shop drawings on this equipment as described in section 230100, 1.04. The controls coordination meeting described in 230923, 1.03 shall be held before the shop drawings are submitted.

Part 2 - Products

I. Chiller
   A. The chiller shall be of the type and capacity shown on the equipment schedule on the drawings. Absorption type chillers are not acceptable. Acceptable manufacturers include:

1. Trane
2. Carrier
3. Daikin/McQuay
4. York

B. Unit Description - The chiller shall be a factory assembled, piped, wired and tested unit consisting of an evaporator, condenser, compressor, control panel, refrigerant piping and purge system all assembled on one base with accessories as required in this specification or as shown on the drawings. A matching motor starter shall be located as shown on the drawings.

C. Refrigerant – The chiller shall use refrigerant R-134a or R-410a.

D. Evaporator and Condenser - Shall be of shell and tube type. Test pressures shall be 45 psig minimum for the refrigerant side and 225 psig for the water side of the shells. Provide refrigerant circuit safety rupture disc. Condensing circuit marine type water box with taps for vents and drains shall be hydrostatically tested at 1.5 times working pressure. Provide fixed orifice return liquid refrigerant flow control.

E. Compressor - Shall be direct drive, single or multiple stage design with high strength aluminum alloy, proof tested statically and dynamically balanced impellers keyed directly to motor shaft. Hermetic compressor motor shall be liquid refrigerant cooled with inherent low voltage protection, each phase motor winding temperature sensing for stopping by any phase sensing excessive temperature. Inherent single-phase protection shall operate in the same manner. Capacity control shall be variable inlet guide vanes capable of modulating performance from 100 to 10 percent of rated unit capacity at design conditions. Provide submerged oil pump for lubrication.

F. Compressors

1. Semi-Hermetic Compressors:
    a) Compressor shall be semi-hermetic with a suction gas cooled motor, vibration isolators, thermal overloads, oil sight glass, manual reset high-pressure switch, pump-down low-pressure switch, suction line strainer, and reversible oil pumps for forced-feed lubrication and a maximum operating speed of 1,750 rpm.
    b) Provide thermostatically-controlled crankcase heater to evaporate refrigerant returning to crankcase during shutdown. Energize heater when compressor is not operating.
2. Rotary Screw Compressors:

a) Compressor shall be made of cast iron and precision machined to provide minimal clearance for the rotors.
b) Provide a bursting disc to meet the requirements of the ANSI/ASHRAE 15: Safety Standard for Refrigeration Systems. Rotors shall be manufactured from forged steel and shall use asymmetrical profiles.
c) Compressor shall incorporate a complete anti-friction bearing design for reduced power and increased reliability. Provide four (4) separate cylindrical roller bearings to handle radial loads. Provide two (2) 4-point angular contact ball bearings to handle axial loads. Together, they shall maintain accurate rotor positioning at all pressure ratios, minimizing blowby and maintaining efficiency.

3. Hermetic Scroll Compressors
   a) Provide hermetic direct-drive scroll compressors, with fixed compression, and integral centrifugal oil pump, and check valve on the scroll discharge port.
   b) Statically and dynamically balance rotating parts.
   c) Provide reversible oil-pump lubrication system arranged to ensure adequate lubrication during starting, stopping, and normal operation.
   d) Provide compressor with automatic capacity-reduction equipment consisting of suction-valve unloaders. Use lifting mechanism operated by solenoid valve. Provide unloaded compressor start.
   e) Provide constant speed, compressor motor, suction-gas cooled, with overheating protection (coordinate with PGCPS building services). Supply complete with starter.
   f) Provide thermostatically-controlled crankcase heater to evaporate refrigerant returning to crankcase during shutdown. Energize heater when compressor is not operating.
   g) Provide a hot-gas muffler in the discharge of each compressor.

G. Refrigerant Isolation Valves - Factory-installed condenser inlet and outlet refrigerant valves shall allow isolation of the full refrigerant charge in the condenser while servicing the chiller.
H. Control Panel - Shall be electronic with microprocessor, current limiter, temperature control system with dead band range, indicator lights and gauges, low refrigerant temperature override, unloaded start, anti-recycle timer to limit starts to two per hour,

oil pump operation, purge system operation, safety controls, and integral fused control circuits. Provide Expanded Service Panel located in the chiller control panel for reset of chilled water temperature based on return water temperature. Purge System - Shall be provided to remove non-condensable gasses and return refrigerant to the machine. Provide a communication interface between the chiller and the building energy management system. Provide all necessary protocol documentation and gateway hardware and software (if required) such that the section 15900 system supplier may successfully create a communication interface between the control system furnished in this section of the specification and the 15900 control system. Provide an adequate level of technical support to guide the section 15900 personal towards completion of subject communication interface. Protocol must support reading/writing status and analog and digital point information from this section of the specification.. All documentation, gateway hardware and software, and required technical support are understood to be included in the bid. The points listed in section 15900 input/output summaries as well as those below shall be the minimum acceptable.

1. Chilled water pump request.
2. Chilled water setpoint.
3. Chiller enable/disable.
4. Chiller current draw.
5. Entering water temperature.
6. Leaving water temperature.
7. Compressor starts.
8. Compressor run time.
9. Alarm.
10. Present operating mode

I. Integral Compressor Motor Starter - Shall be closed transition Wye-Delta type enclosed in a NEMA-1 enclosure with hinged door. Wires, busbars, and fittings shall be copper. Anti-recycling timer shall be included. Provide lugs for connection of specified conductors.

II. Refrigerant Leakage Sensor

A. A sensor mounted within the chiller room shall monitor refrigerant levels in the room. The sensor shall measure and indicate refrigerant levels ranging from 0-1000 parts per million. The sensor shall have an alarm setting of 1000 PPM which will activate audible and visual alarms located in the chiller room, outdoors at the chiller room entrance, and

in the building outside of the chiller room. Exceeding the alarm setting of the sensor shall also activate the chiller room emergency exhaust fan (and de-energize the boilers and water heaters if located in the chiller room). Interlock wiring to be provided by the mechanical contractor.

III. Signage

A. Provide signage outdoors on the exterior door to the chiller room, and indoors on the outside of the chiller room door, which states "DO NOT ENTER WHEN ALARM IS ACTIVE. CALL THE PGCPS MAINTENANCE DEPARTMENT. " 301-952-7815.

B. Provide hazard signage outdoors on the exterior door to the chiller room, and indoors on the outside of the chiller room door, to comply with the NFPA 704 requirements for use of refrigerants R-134a R-410a. Signs shall be a minimum of 6" x6" and shall display the hazard ratings.

Part 3 - Execution

I. Installation

A. Factory start-up- The manufacturer shall supply a complete factory start-up by a factory approved start-up agent.

B. Insulation - Insulate the evaporator shell, exposed refrigerant circuit piping and auxiliary water piping as required. Insulation shall comply with the requirements of Section 15250.

C. Installation - The chiller shall be installed in accordance with the manufacturer's recommendations. Provide auxiliary water supply to purge unit and oil cooler.

D. Isolation - The chiller shall be mounted on spring vibration isolators.

E. Pipe Connections - The chiller shall have a marine water box on the condenser water piping connections to the machine and either a marine water box or flanged pipe connections on the chilled water piping connections to the machine to allow removal of headers for inspection, cleaning, or removal of tubes. Two 1/2" valved connections shall be provided in tower water lines at machine inside the condenser shut off valves for future chemical cleaning.

F. Refrigerant Leakage Sensor Installation - Sensor and alarms shall be installed in accordance with manufacturer's recommendations.

G. Refrigerant Vent - Provide vent piping from rupture disc to outside of building. Piping shall be sized as recommended by ARI.

H. Provide an engraved nameplate permanently affixed to the front of the control cabinet with the following information:

UNIT #	*(unit number)*
INSTALLED BY:	*(contracting company's name)*
WARRANTY EXPIRES:	*(month/day/year)*
COMPRESSOR WARRANTY EXPIRES:	*(month/day/year)*

END OF SECTION

Part 1 - General

I. General
   A. The Bidding and Contract Requirements, Division 1 -General Requirements, Section 15010 - General Provisions, and Section 15050 - Basic Materials and Methods, shall apply to this section.

II. Scope
   A. A complete factory assembled package air-cooled water chiller shall be installed.

III. Quality Assurance
   A. Unit shall be run tested at the factory and start-up and check out shall be done by a factory certified technician. Pressurized components shall comply with the ASME code for unfired pressure vessels. Rating and construction shall be in accordance with ARI Standard 59086, ANSI B9.1 safety code and the National Electrical Code.
   B. Manufacturer shall provide a certification that the equipment has been performance tested at the factory. Certification shall record the unit capacity in BTU/hour and kilowatts.
   C. Factory start-up- The manufacturer shall supply complete factory start-up by a factory approved start-up agent.
   D. Equipment installer shall attend a controls coordination meeting with the section 15900 contractor as described in 230923, 1.03.

IV. Submittals
   A. Provide shop drawings on this equipment as described in section 230100, 1.04. The controls coordination meeting described in 230923, 1.03 shall be held before the shop drawings are submitted.

Part 2 - Products

I. Air Cooled Chiller
   A. The air-cooled chiller shall be of the type and capacity shown in the equipment schedule on the drawings. Absorption type chillers are not acceptable. Acceptable manufacturers include:
      1. Trane
      2. Carrier
      3. Daikin/McQuay

4. York

B. Unit Description - The Air Cooled chiller shall be a factory assembled, piped, wired and tested unit consisting of a corrosion protected steel casing, an evaporator, condensers, multiple scroll or screw compressors, control panel, refrigerant piping and dual refrigeration system all assembled on one base with accessories as required in this specification or as shown on the drawings. Motor starters shall be unit mounted. The refrigerant used shall have an ozone depletion potential of less than .05 and a global warming potential of less than 0.37, (R-134A, R-410A).

C. Unit Casing - Unit shall be enclosed in a galvanized steel casing, zinc phosphatized, with an electrostatically applied baked enamel finish, capable of withstanding Federal Test Method Standard No. 141, Method 6061, 500 hour salt spray test.

D. Evaporator/Cooler - Shall be shell and tube type with removable heads and shall have two independent direct-expansion refrigerant circuits. Cooler shall be tested and stamped in accordance with ASME code for refrigerant side working pressure of 235 psig and a minimum waterside working pressure of 150 psig. Copper tubes shall be rolled into the tube sheets. Shell shall be covered with 3/4" layer of closed-cell foam plastic, vapor insulated.

E. Condenser
   1. Air cooled condenser coils shall have aluminum fins mechanically bonded to seamless copper tubes, cleaned, dehydrated, sealed, leak tested at 150 psig and pressure tested at 450 psig.
   2. Condenser fans shall be propeller type with PVC coated steel wire safety guards, balanced statically and dynamically, and shall discharge vertically.
   3. Condenser fan motors shall have inherent overcurrent protection.
   4. Provide metal hail guards to protect the condenser coil from damage.

F. Compressors - Shall be scroll hermetic type with a maximum speed of 3500 rpm (up to 200 tons), or rotary screw (200 Tons and above), serviceable and shall have an automatically reversible oil pump and operating oil charge. Compressors shall be equipped with suction and discharge shutoff valves and shall be mounted on individual spring vibration isolators. Each compressor motor shall be cooled by suction gas passing around the motor windings and shall be thermally protected with manual restart after thermal or pressure overload stoppage. Each compressor shall be equipped with an insert type crankcase heater to control oil dilution during shutdown.

G. Refrigeration Circuit - Each refrigeration circuit shall include: hot gas muffler, combination moisture indicator and sight glass, replaceable core refrigerant filter drier, liquid line solenoid valve, expansion valve, suction and discharge pressure gauges with manual shutoff valves, high side pressure relief device, and charging valve.

H. Controls

1. Unit controls, including microprocessor, shall be factory mounted and wired in a weatherproof enclosure with hinged access doors for easy access. The controls shall include automatic lead-lag except where noted, pumpdown at beginning and end of every circuit cycle, loss-of-charge protection, inherent low water flow protection, low chilled water temperature safety, low- and high-suction superheat protection, low oil pressure protection for each circuit, ground current protection for each compressor, low control voltage to unit, current limit, field power and control circuit terminal blocks, compressor and fan motor circuit breakers, ON/OFF switch, replaceable relay board, individual solid-state compressor protection board, leaving chilled water set point board, diagnostic digital display module, a microprocessor board and a temperature reset board. The chiller shall be capable of sending a chill water pump run request to the building automation system.
2. Unit control capacity is based upon leaving water temperature and will be compensated by return water temperature.
3. Minimum number of capacity control steps shall be as shown in the equipment schedule.
4. Provide a definite purpose magnetic contactor for each compressor.
5. Calibrated circuit breakers shall be factory installed for each compressor, shall be manual reset and ambient insensitive, and shall open all three phases should an overload occur on any phase.
6. Unit primary electrical power supply shall be connected to a single point with lugs sized for specified conductors.
7. Control voltage shall be provided by a factory installed integral control transformer.
8. Heat tracing for exterior piping shall be provided by a separate 120 volt, single phase power supply.
9. Provide a barrel freeze alarm output for connection to the BAS.

I. Chiller shall be capable of operating at ambient air temperatures down to 0 deg F without the use of glycol or any other type of antifreeze. Chillers that do not meet this requirement are not acceptable.

J. Flow switches- switches for flow conformation shall be provided. Switches shall be paddle type with stainless steel bellows and paddle. Switches shall be suitable for outdoor installation.

Part 3 - Execution

I. Installation

A. Factory Start-up: The manufacturer shall supply complete factory start-up by a factory approved start-up agent.

B. Installation: The chiller shall be installed in accordance with the manufacturer's recommendations.

C. Install isolation valves on evaporator water inlet and outlet at chiller.

D. Install thermometers on evaporator water inlet and outlet at chiller.

E. Isolation: Provide spring isolators as recommended by chiller manufacturer.

F. Pipe Connections: The machine shall have water boxes or the contractor shall provide flanged pipe connections in the piping adjacent to the machine to allow removal of headers for inspection, cleaning or removal of tubes.

G. Provide an engraved nameplate permanently affixed to the front of the control cabinet (inside of cabinet for outdoor locations) with the following information:

UNIT #	*(unit number)*
INSTALLED BY:	*(contracting company's name)*
WARRANTY EXPIRES:	*(month/day/year)*
COMPRESSOR WARRANTY EXPIRES:	*(month/day/year)*

END OF SECTION

Part 1 - General

I. General
   A. The Bidding and Contract Requirements, Division 1 - General Requirements, Section 230100 - General Provisions, and Section 230500 - Basic Materials and Methods, shall apply to this section.

II. Scope
   A. The work covered under this section shall include a complete factory-assembled closed circuit cooling tower of induced draft design with vertical air discharge shall be installed.

III. Quality Assurance
   A. Capacity shall be in accordance with published ratings, wet deck ASTM standard E-84 flame spread rated and finish corrosion protection tested per ASTM B117-64. Towers thermal performance shall be in accordance with CTI standard 201.
   B. Equipment installer shall attend a controls coordination meeting with the Section 230923 contractor as described in 230923, 1.03.

IV. Submittals
   A. Provide shop drawings on this equipment as described in Section 230100 - 1.04. The controls coordination meeting described in 230500 shall be held before the shop drawings are submitted.

Part 2 - Products

I. Cooling Tower
   A. The cooling tower shall be of the type and capacity shown on the drawings. Acceptable manufacturers include:
      1. Baltimore Aircoil
      2. Evapco
      3. Trane
   B. Unit Description - The cooling tower shall be a factory assembled, piped, wired and tested unit consisting of a stainless steel housing, distribution basins, wet deck, drift eliminator, propeller fan and fan motor and drive, recirculating spray water pump and piping, positive closure damper hood and actuator, all assembled on one base with accessories using series 300 stainless steel nuts and bolts, as required in this specification or as shown on the drawings.

C. Casing and Basins - Shall be constructed of heavy gauge, stainless steel including all angles or channels. All casing exterior panels shall be stainless steel panels. Piping connections shall be flanged.

D. Stainless Steel Coil - Coil shall be constructed of Type 304 stainless steel serpentine tube. Tubes shall be sloped for free drainage and coil assembly shall be pneumatically tested at 375 psig (2,685 kPa). Coil shall be ASME B31.5 compliant.

E. Hot Water Distribution Basins - Shall be type 304 stainless steel and open gravity type with distribution weirs and plastic metering orifices. Basin shall include integral balancing valves and removable basin covers. Each cell shall have a single water inlet with pre-strainer assembly, or external factory mounted strainer. PVC distribution system with plastic or brass nozzles are acceptable.

F. Cold Water Basin - Shall be type 304 stainless steel and include circular access doors; large area strainers type 304 stainless steel with perforated openings sized smaller than water distribution metering orifices; and an integral anti-vortexing hood to prevent air entrainment.

G. Wet Deck and Drift Eliminator - Shall be manufactured and performance tested by the manufacturer and shall be 15 mils thick polyvinyl chloride. It shall have a flame spread rate of 5 per ASTM E84-77a.

H. Air Inlet Louvers - Shall be wave form, fiberglass reinforced polyester or stainless steel, spaced to minimize air resistance and prevent splash-out.

I. Positive Closure Damper Hood - Provide coil air intake hoods with factory mounted positive closure dampers with stainless steel linkages and damper actuators. The hood shall be factory insulated.

J. Fan - Shall be fixed pitch cast aluminum propeller type mounted on a solid steel fan shaft supported by heavy duty, self-aligning relubricatible 40,000 hour life bearings with cast iron housings. Extended lube lines shall be provided for ease of maintenance. Provide galvanized steel fan guard. To maintain the quality of the local environment, the closed circuit cooling tower shall be furnished with a low sound fan.

K. Fan Motor and Drive

1. Motor - Shall be drip-proof ball-bearing type with 1.15 service factor. High efficiency motor shall be rated for VFD duty and suitable for outdoor service and operation on indicated electrical service. Motor shall be mounted on easily adjusted heavy duty motor base located so that drive and motor are in a protected position.

2. The V-belt fan drive shall be designed for not less than 150% of motor nameplate horsepower. Drive and all moving parts shall be completely enclosed by removable stainless steel screens.
3. Install VFD Variable Frequency Drive per specification Section 262923.
4. Provide a vibration cutout switch to de-energize fan motors in case of excessive vibration.

L. Recirculating Spray Water Pump
1. Pump shall be close coupled, bronze fitted centrifugal pump.
2. Motor shall be totally enclosed fan cooled (TEFC) motor.
3. Provide bleed line with metering valve from pump discharge to overflow.

M. Water Level Control Package: Manufacturer's standard mechanical make up water valve (rated at 80 psig) and a plastic or bronze float with adjustable linkage.

N. Basin Sump Heater Package - Provide heaters, contactors for each heater element, control transformer, basin thermostat, and low water cut out. Provide and wire one heater package for each tower cell. Provide a 1" threaded outlet in each cells sump for the purposes of temperature monitoring via the ATC. Sump shall be stainless steel type; no exceptions.

O. Internal/External Working/Service Platforms- provide complete internal/external working/service platforms and ladder systems for the maintenance and service of all drive components and motor assemblies, at access doors for plenum sections and at the louver face. Towers which require service/maintenance from the top (fan deck) shall be provided with a perimeter handrail system with a ladder from grade to the fan deck. Ladders for external platforms shall extend to grade.

Part 3 - Execution

I. Installation

A. The cooling tower shall be installed as shown on the drawings and in accordance with the manufacturer's recommendations. Coordinate required elevation with supporting structure. Provide vibration isolation as shown on drawings.
1. Install OSHA approved ladders to all internal and external working/service platforms.
2. Install manufacturer's handrail system around the perimeter of the top of the unit.

II. Adjusting And Demonstration

A. Have manufacturer's representative inspect tower after installation is complete and submit report prior to start-up, verifying that installation is in accordance with specifications and manufacturer's instructions.

B. Have manufacturer's representative supervise rigging, hoisting, and installation of the cooling tower.

C. Provide manufacturer's representative for two consecutive 8-hour days working per tower for start-up of cooling tower and instruction of PGCPS' operating personnel.

III. Warranty

A. See Section 230100 for warranty information.

END OF SECTION

Part 1 - General

I. General
   A. Related Sections:
      1. Division 1 - General Requirements
      2. Division 1 - Special Procedures
      3. Section 230100 - General Provisions
      4. Section 230500 - Basic Materials and Methods

II. Section includes:
   A. Cooling tower
   B. Controls
   C. Ladder and handrails

III. Quality Assurance
   A. Capacity shall be in accordance with published ratings; wet deck ASTM standard E-84 flame spread rated and finish corrosion protection tested per ASTM B117-64. Towers thermal performance shall be in accordance with CTI standard 201.
   B. ASHRAE/IESNA 90.1-2004 Compliance: Applicable requirements in ASHRAE/IESNA 90.1-2004, Section 6 - "Heating, Ventilating, and Air-Conditioning."
   C. Equipment installer shall attend a controls coordination meeting with the Section 230923 contractor as described in 230923, 1.03.

IV. Submittals
   A. Provide shop drawings on this equipment as described in Section 230100 - 1.04. The controls coordination meeting described in 15900 shall be held before the shop drawings are submitted.
      1. Submit suggested structural-steel support including dimensions, sizes, and locations for mounting bolt holes. Include weight-distribution drawings, showing point loadings.
      2. Submit schematic showing capacity controls.
      3. Submit manufacturer's installation, operation, and maintenance instructions.

V. Delivery, Storage, And Handling
   A. Factory-assemble entire unit. For shipping, disassemble into as large as practical subassemblies so that minimum amount of field work is required for reassembly.

Part 2 - Products

I. Propeller Fan Cooling Tower

A. The propeller fan-cooling tower shall be of the type and capacity shown on the drawings.

B. Approved manufacturers:
   1. Baltimore Aircoil
   2. Trane
   3. Evapco

C. Cooling Tower
   1. Unit Description - The cooling tower shall be a factory assembled, piped, wired and tested unit consisting of a stainless steel housing, distribution basins, wet deck, drift eliminator, propeller fan and fan motor and drive, all assembled on one base with accessories using series 300 stainless steel nuts and bolts, as required in this specification or as shown on the drawings.
   2. Provide electric heaters in tower sump suitable to maintain temperature of water in sump at 42 deg F when outside temperature is 0 deg F. Control heaters from sump-mounted thermostat and interlock with float control so heaters operate only when there is water in sump.
   3. Provide capacity control suitable for stable operation down to 10 percent of rated cooling.

D. Fabrication
   1. Type: Suitable for outdoor use, section, counterflow, draw-thru type, complete with sump, fan, surface sections, drift eliminators, and motor.
   2. Casing: Galvanized steel (conforming to ASTM A 525) with Coating Designation G-235, or with Designation G-210 and a polymer coating.
      a) All joints sealed watertight.
      b) Fasteners: Corrosion resistance equal to or better than the materials being fastened.
      c) Rigging supports for handling cooling towers at job site.
   3. Fan: Shall be fixed pitch cast aluminum propeller type mounted on a solid steel fan shaft supported by heavy duty, self-aligning relubricatible 40,000-hour life bearings with cast iron housings. Extended lube lines shall be provided for ease of maintenance. Provide galvanized steel fan guard.
   4. Fan Motor and Drive
      a) Motor - Shall be drip-proof ball-bearing type with 1.15 service factor. High efficiency motor shall be rated for VFD duty and suitable for outdoor service and operation on indicated electrical service. Motor shall be mounted on easily adjusted heavy-duty motor base located so that drive and motor are in a protected position (coordinate with PGCPS building services).

b) The V-belt fan drive shall be designed for not less than 150% of motor nameplate horsepower. Drive and all moving parts shall be completely enclosed by removable stainless steel screens.

c) Install VFD Variable Frequency Drive per specification section 262923.

d) Provide a vibration cutout switch to de-energize fan motors in case of excessive vibration.

5. Fan Cylinder: One-piece, welded, hot-dip galvanized steel assembly with full-height inlet cylinder welded to fan deck.
6. Fan Guard: Welded, one-piece guard, rod and wire, hot-dip galvanized after fabrication.
7. Access: Large doors to air plenum, safety railings, and ladder from grade/roof to fan deck.
8. Distribution: Open basin gravity-type with plastic diffusing-type orifices.
9. Filling: Vertical sheets of polyvinyl chloride plastic or impregnated neoprene.
10. Control: Fan motor cycling.
11. Provide safety cage on ladder where fan deck is 20 feet (6 m) or more above tower base.
12. Wet Deck and Drift Eliminator: Shall be manufactured and performance tested by the manufacturer and shall be 15 mils thick polyvinyl chloride. It shall have a flame spread rating of 5 per ASTM E84-77a.
13. Air Inlet Louvers - Shall be waveform, fiberglass-reinforced polyester or stainless steel, spaced to minimize air resistance and prevent splash out.
14. Water Level Control Package: Manufacturer's standard mechanical make up water valve (rated at 80 psig) and a plastic or bronze float with adjustable linkage.
15. Starter - Shall be manufacturer specified. Coordinate with installation of VFD.
16. Basin Sump Heater Package: Provide heaters, contactors for each heater element, control transformer, basin thermostat, and low water cut out. Provide and wire one heater package for each tower cell. Provide a 1" threaded outlet in each cell's sump for the purposes of temperature monitoring via the ATC. Sump shall be stainless steel type; no exceptions.
17. Internal/External Working/Service Platforms: provide complete internal/external working/service platforms and ladder systems for the maintenance and service of all drive components and motor assemblies, at access doors for plenum sections and at the louver face. Towers which require service/maintenance from the top (fan deck) shall be provided with a perimeter handrail system with a ladder from grade to the fan deck. Ladders for external platforms shall extend to grade.

18. Casing and Basins - Shall be constructed of heavy gauge, stainless steel including all angles or channels. All casing exterior panels shall be stainless steel panels. Piping connections shall be flanged.
    a) Hot water Distribution Basins - Shall be type 304 stainless steel and open gravity type with distribution weirs and plastic metering orifices. Basin shall include integral balancing valves and removable basin covers. Each cell shall have a single water inlet with pre-strainer assembly, or external factory mounted strainer. PVC distribution system with plastic or brass nozzles are acceptable.
    b) Cold Water Basin - Shall be type 304 stainless steel and include circular access doors; large area strainers type 304 stainless steel with perforated openings sized smaller than water distribution metering orifices; and an integral anti-vortexing hood to prevent air entrainment.

Part 3 - Execution

I. Installation
   A. The cooling tower shall be installed as shown on the drawings and in accordance with the manufacturer's recommendations. Coordinate required elevation with supporting structure. Provide vibration isolation as shown on drawings.
      1. Install OSHA approved ladders to all internal and external working/service platforms.
      2. Install manufacturer’s handrail system around the perimeter of the top of the unit.

II. Adjusting And Demonstration
   A. Have manufacturer’s representative inspect tower after installation is complete and submit report prior to start-up, verifying that installation is in accordance with specifications and manufacturer’s instructions.
   B. Have manufacturer’s representative supervise rigging, hoisting, and installation of the cooling tower.
   C. Provide manufacturer’s representative for two consecutive 8-hour days working per tower for start-up of cooling tower and instruction of PGCPS’ operating personnel.

III. Warranty
   A. See Section 230100 for warranty information.

END OF SECTION

Part 1 - General

I. General
   A. The Bidding and Contract Requirements, Division 1 -General Requirements, Section 230100 - General Provisions, and Section 230500 - Basic Materials and Methods, shall apply to this section.

II. Scope
   A. The work covered under this section shall include energy recovery units.

III. Quality Assurance
   A. The system shall deliver the specified air volume at the static pressure scheduled.
   B. The unit shall be constructed to provide smooth interior surfaces and to limit the casing leakage at less than 1% of the specified air volume at operating static.
   C. Unit shall be constructed in accordance with CSA C22.2 and UL 1812 and shall carry the ETL label of approval.
   D. Unit shall be constructed in accordance with industrial design practices.
   E. Insulation shall comply with NFPA 90A requirements for flame spread and smoke generation.
   F. Airflow data shall comply with AMCA 210 method of testing.
   G. Cabinet and exterior components shall be tested and certified weatherproof.
   H. All units shall be 100% factory tested.
   I. All effectiveness data of heat and energy recovery components shall be certified by the ARI 1060 certification program directory.
   J. Factory Start-Up – The manufacturer shall supply complete factory start-up by a factory approved start-up agent.
   K. Equipment installer shall attend a controls coordination meeting with the division 230923 contractor as described in 230923, 1.03.

IV. Submittals
   A. Provide shop drawings on this equipment as described in Section 230100, 1.04. The controls coordination meeting described in 230923, 1,.03 shall be held before the shop drawings are submitted.

Part 2 - Products

I. Manufacturers

A. Energy recovery unit(s) shall be supplied by:
   1. Innovent Air Handling Equipment
   2. Seasons Four
   3. Greenheck
   4. AAON.

II. Equipment

A. General: Factory assembled, consisting of fan and motor assemblies (supply and exhaust), Flat Plate Heat Exchanger, Heat Recovery Wheel, all necessary dampers, hoods, plenums, filters, drain pans, wiring and controls. Unit shall be stand-alone controlled with all control devices provided by the unit manufacturer or control contractor. Unit shall have single point power connection.

B. Unit Cabinet:
   1. The energy recovery unit is to be installed outdoors by the mechanical contractor. Indoor units weatherized for outdoor use are not acceptable.
   2. All unit panels are fixed with zinc plated hexagonal head type screws complete with a washer and rubber gasket for a weatherproof assembly. Self-drilling, self-tapping screws are used and therefore no tools are required from the unit interior for panel removal. These panels allow for fast service to all major components.
   3. All panel joints must be caulked with a weatherproof silicone. The silicone used must be clear to match any color surfaces. After application, the silicone must react with atmospheric moisture to produce a formed-in-place silicone rubber glazing and curtain wall seal.
   4. The unit base frame shall be constructed from a bolted, structural formed G90 galvanized steel with internal structural cross members properly sized to allow rigging and handling of the unit. All major components shall be supported by the base without sagging or pulsating. Lifting lugs shall be provided and strategically located to allow equilibrium during lifting.
   5. Unit construction consists of an insulated 14 gauge galvanized structural frame complete with die cast aluminum corners. The rigid frame provides stable construction allowing for panel removal without affecting the unit integrity. Panels shall be double wall construction using 2" thick mineral wool insulation 1.5 lbs/ft3 density, 18 gauge galvanized steel exterior panels (satin coat finish) and 26 gauge G90 galvanized steel inner liner. The unit shall be designed to resist any snow, ice and wind loads, as well as seismic loads in compliance with the National Building

Code. Single wall construction with coated insulation will not be acceptable. Exposed insulation edges in the air stream will not be acceptable.

Insulating Value

	Thickness
Type of Insulation	2”
Mineral Wool (3.5 pcf)	R8.6
Urethane	R14.8

6. Internal partition wall shall be insulated and constructed the same as the unit cabinet.
7. Full size access door(s) to allow for periodic maintenance and inspections must be provided for all serviceable components Serviceable components include but are not limited to Coils, Heat Exchanger, Damper sections,Motor sections and piping enclosures. Doors shall be double wall construction made of 18 gauge galvanized steel on both outer and inner liner for maximum rigidity. Door insulation is the same as the unit panels. Provide doors with heavy duty corrosion resistant aluminum hinges that allow the door to open at 180°. Compression type handles are operable from both sides of the unit access door(s) and neoprene resilient bubble gaskets for an enclosure that is sealed tight shall also be provided. Plastic latches and hinges are not acceptable.
8. Outdoor constructed units shall have a pitched roof to dissipate water accumulation. Rain gutters must be provided above access doors. All roof joint seams are "T" shape construction, minimum height of 1.5", sealed and encapsulated by a metal strip.
9. All weather hoods for outdoor constructed units are provided with birdscreen and rain gutters. Hoods may ship loose for field assembly.
10. Recessed, double-sloped drain pans shall be made of formed sections of steel. Drain pans are sloped with a threaded drain pipe connection of 1 1/2" in diameter ending outside through the structural base channel. All drain pan corners shall be welded.
11. Paint:
    a) Outdoor constructed units shall have one coat of primer and two coats of enamel paint.

b) All galvanized steel surfaces that require paint shall be made of satin coat-finished galvanized steel of the specified gauge(s).

c) All galvanized steel surfaces without any paint shall be made of G90 galvanized steel of the specified gauges.

d) All unit surfaces that require paint must be cleaned and free from all oil, dirt and other contaminants before painting.

C. Energy Recovery Heat Wheel

1. Heat Wheels shall comply with UL standards.
2. Heat Wheel - Provide aluminum or polymer transfer media, flame spread rating of not more than 25 and smoke developed rating of not more than 50 and shall be independently tested in accordance with ASTM standard E-84. Rotor media shall be independently tested in accordance with ASHRAE Standards. It shall allow laminar flow (but not radial) at usual velocities and prevent leakage, bypassing and cross contamination by cross flow within wheel. Size the transfer media to allow passage of 300 micron particles without fouling or clogging. Treat media with non-degrading desiccant that is bacteriostatic, non-corroding and non-toxic. No asbestos material will be allowed. Wheel shall not condense water directly or require a condensate drain for summer or winter operation. Performance rating shall be in accordance with ARI Standard 1060.
3. Provide casing seals on periphery of rotor as well as on duct divider and purge section. Seals are to be adjustable, of extended life materials and effective in limiting air leakage.
4. Wheel shall be supported by ball or roller bearings and belt driven by a fractional horsepower, totally enclosed, NEMA Standard motor through a close coupled positively lubricated speed reducer, or gear/chain speed reduction.
5. Unit shall be constructed of heavy gage steel to insure rigidity and stability. Casing side panels shall be removable to insure easy access to internal parts. Provide integral flanges for flanged duct connection and provide lifting holes or lugs.

D. Defrost Strategies (As Required)

1. The traversing defrost system is DDC controlled. Independent traversing dampers with actuators and bypass damper (if free-cooling is required). This defrost strategy allows for the recovery of energy while the unit is in defrost.
2. Recirculation defrost including outside air, exhaust air and recirculation dampers with actuators and the appropriate controls.

3. Exhaust only defrost including outside air and exhaust air dampers with actuators and the appropriate controls.
4. Face and bypass defrost including face and bypass dampers with actuators and the appropriate controls. Bypass may also be used for free-cooling in summer operation (if required).

E. Fans:

1. Fan performance ratings for flow rate, pressure, power, air density, speed or rotation and efficiency shall be factory tested and shall comply with the requirements of AMCA 210.
2. All fans shall be statically and dynamically balanced and designed for continuous operation at the maximum rated fan speed and motor horsepower in accordance with AMCA 300.
3. Fans shall be of centrifugal type, rigidly braced and reinforced to help prevent vibration or pulsation. Wheel diameters and outlet areas shall be in accordance with the standard sizes adopted by AMCA.
4. Fan and motors shall be mounted inside the unit casing with 1" (minimum 90% efficiency) deflection spring vibration isolators and supplied with neoprene flexible connections.
5. Fans shall be selected for a stable operation, at least 20% under the fans first critical speed.
6. Units shall be equipped with non-overloading, airfoil, SWSI plenum fan, Arrangement 3 (AMCA labeled) supply and exhaust fans to provide scheduled airflows against static pressures indicated.
7. Fan shaft shall be solid steel, turned, ground, polished and completed with a corrosion resistant coating. Fan wheels shall be keyed to the shaft.
8. Bearings shall be heavy duty, grease-lubricated, self-aligning ball or pillow block type. Bearing shall be selected for a basic rating fatigue life (L-50) in excess of 200,000 hours at maximum operating speed in accordance with AFBMA 9 regulations.
9. Fan drives shall be designed for a 1.4 service factor. Drives are factory mounted with final alignment and belt adjustment made before unit start-up.
10. Belt drives with motor pulley shall be adjustable pitch for use with motors up to and including 10 HP. Fan pulleys shall be fixed pitch.

F. Motors:

1. All motors are internal to the unit casing and are mounted on an adjustable base allowing for belt alignment and tensioning.
2. Fan motors shall be heavy duty, 1800 rpm, high efficiency (E-pact Series), open drip proof (ODP), NEMA Design B with Class F insulation and 1.15 service factor. Motors shall be constant speed operable at field voltage: 460 Volts, 60 Hz, 3 phase.
3. Torque characteristics shall be sufficient to accelerate the drive loads satisfactorily.
4. Motor sizes shall be minimum size indicated in the equipment schedule. If not indicated, large enough so that the drive load will not require the motor to operate in the service factor range.
5. Temperature rating shall be 122°F (50°C) maximum temperature rise at 104°F (40°C) ambient for continuous duty at full load (Class B Insulation).
6. Motor construction shall be NEMA Standard MG 1, general purpose, continuous duty, Design B.
    a) Bases shall be adjustable.
    b) Bearings shall be:
        (1) Ball or roller bearing with inner and outer shaft seals.
        (2) Grease lubricated.
        (3) Designed to resist thrust loading where belt drives or other drives produce lateral or axial thrust in motors.
        (4) Fully serviceable prelubricated 200,000 hour life ball bearings with externally mounted grease fittings shall be included on all units so bearings can be serviced without dismantling the unit. Provide internal grease tubings for servicing where applicable.
    c) Energy efficient motors shall have a minimum efficiency as scheduled in accordance with IEEE Standard 112-B. If efficiency is not specified, motors shall give a higher efficiency than "average standard industry motors" in accordance with IEEE Standard 112-B.

G. Filters:
1. Filters shall be UL 900 Class II.
2. Outside and return air inlet shall be equipped with galvanized steel racks that permit slide out removal of filters (side access) for units equal or smaller than 78”, and universal holding frames with upstream access for units taller than 78”.
3. Unit shall include 2" disposable type air filters, 25-30% DSE efficiency, consisting of viscous coated fibers with filtering media encased in fiberboard cell sides having

perforated metal grids on each face to provide media support. Airflow resistance with clean media shall not exceed 0.28 inch w.g. at a face velocity of 500 fpm and filter arrestance efficiency of 90% based on ASHRAE Test Standard 52. Metal filters may be accepted pending approval by PGCPS building services.

H. Dampers:
   1. Air leakage through a 48" x 48" damper shall not exceed 10.3 cfm/sq.ft. against 4 in. wg. differential static pressure at standard air. Standard air leakage data to be certified under AMCA certified rating program.
   2. Dampers are designed for operation in temperatures ranging between -40°F and 212°F.
   3. Unit shall be equipped with all necessary dampers. Dampers for outside air intake, exhaust air and all other dampers required for the system, including the dampers for defrost (if required).
   4. Intake outside air dampers are opposed blade type and exhaust air dampers are parallel blade type. For other dampers, see manufacturer's recommendations.
   5. Outside air dampers shall be motorized. Provide damper actuators with 24 VAC drive voltage. 0-10 VDC modulation.
   6. Exhaust air dampers shall be gravity backdraft type. Provide damper actuators with 24 VAC drive voltage. 0-10 VDC modulation.
   7. Dampers construction shall be as followed:
      a) Damper frame shall be extruded aluminum.
      b) Blades shall be extruded aluminum.
      c) Dampers shall be opposed blade type or parallel blades where indicated
      d) Neoprene flexible edge seals complete with bottom and top blade wiper seals.
      e) Frame and blades shall be non-insulated.

I. Coils – General Information:
   1. Acceptable coils shall have ARI Standard 410 certification and bear the ARI symbol. Coil manufacturer must be ISO 9002 certified.
   2. Coils shall be submerged in water and tested with a minimum of 315 psi air pressure for standard copper tube coils. Coils must display a tag with the inspector's identification as proof of testing.
   3. Tubes shall have a nominal thickness of 0.020" unless otherwise specified.
   4. Fins shall be made of 0.0075" thick aluminum unless otherwise specified.

5. Tubing, return bends and headers shall be constructed from UNS 12200 seamless copper conforming to ASTM B75 and ASTM B251 for standard pressure applications. Coil return headers shall be equipped with factory installed 1.2" fpt air vent connection placed at the highest point available on the face of the header (except for evaporator coils).
6. Casings and endplates shall be made of 16 gauge galvanized steel, meeting ASTM A527 unless otherwise noted. Double flanged casings on the top and bottom of finned height are to be provided to allow for stacking of the coils. On applications where cooling coils are stacked, use an intermediate drain pan to dissipate water accumulation. All drain lines shall be field trapped as per manufacturer's recommendations. A water level sensing device shall be provided in the unit condensate pan which will shut down the unit in the event this devices level is exceeded.
7. Piping, control valve and valve operator shall be supplied and installed by others.
    a) Hot Water Coils:
        (1) Coils shall be designed to withstand 250 psi maximum operating pressure and a maximum steam temperature of 300°F (149°C) for standard duty copper tube coils.
        (2) Coil tube size and wall thickness is 5/8" x 0.020" [16 x 0.5mm] standard for copper.
        (3) Standard construction fluid connections are male pipe thread (MPT) and constructed from red brass conforming to ASTM B43 or Schedule 40 steel pipe as a minimum.
    b) Chilled Water Coils:
        (1) Coils shall be designed to withstand 250 psi maximum operating pressure and a maximum fluid temperature of 300°F for standard duty copper tube coils.
        (2) Coil tube size and wall thickness is 5/8" x 0.020" standard for copper.
        (3) Standard construction fluid connections are male pipe thread (MPT) and constructed from red brass conforming to ASTM B43 or Schedule 40 steel pipe as a minimum.

J. Roofcurb: Roofcurb shall be supplied by the unit manufacturer for field assembly. Curb shall be one piece; two piece curbs will not be accepted. Curb shall consist of formed 18 gauge galvanized steel sections. Manufacturer’s curb is standard double wall, 18" in

height, 2" thick fiberglass insulation. Unit base design is made for recessed curb installation. Stiffeners will be provided for field assembly when required. Pitch roofcurb to match building roof. Provide wood nailer.

K. Sound Ratings:
   1. Energy recovery unit sound ratings shall be based on tests in a sound laboratory reverberant room strictly conforming to ASHRAE Standard 36-62, in accordance with AMCA 300 procedures. Sound data must be accurate to within + 5 db @ 63 Hz, + 4 db @ 125 Hz, + 2 db from 250-2000 Hz, + 3 db @ 4000 Hz and above.
   2. Where the manufacturer's sound power data is not published, an officer of the company must certify that sound data conforms to the above requirements. If the manufacturer does not have acoustical facilities in accordance with the above requirements, the contractor must submit certified data that the specified operating conditions, to determine sound power levels by octave band

L. Temperature Controls shall be accomplished by either of the following methods:
   1. Factory built-in controls shall be provided to interface with the ATC to accomplish control sequence as outlined in Automatic Temperature Control section of specifications.
   2. Field installed controls provided by the section 15900 contractor is acceptable provided the control sequence as outlined in Automatic Temperature Control section of specifications is met.
   3. The control contractor must have the ability to interface with and control the factory supplied outside airflow monitoring assembly.

M. A water level sensing device shall be provided in the unit condensate pan which will shut down the unit in the event this devices level is exceeded. Condensate float shall be located in a readily accessible location.

N. Electrical Components
   1. All electrical controls shall be ETL listed and the entire unit shall be factory wired in accordance with the National Electrical Code Standard.
   2. The outdoor constructed units shall be supplied with a weatherproof non-fused main power disconnect switch. A single point power connection shall be provided for all units.
   3. Unit shall be equipped with all necessary high voltage components as follows:
      a) Motor starters on all high voltage motors for constant speed applications.
      b) Thermal protection on all high voltage motors.

c) Fuses and fuse holders.

d) All necessary control transformers.

4. Unit shall be completed with all necessary relays, time delay, damper actuators with auxiliary switches (as required).
5. The automatic unit start-up is provided as standard via an external dry contact provided by others (ex: Building management system, DDC controller, time clock, etc.).
6. Terminal board shall be provided for low voltage control wiring. Low voltage is 24V.
7. Fan access doors are equipped with a momentary interrupt switch that shuts off the unit when a protected door is opened. These switches can be removed if belt guards are installed on the fan assembly.
8. An integral control panel shall be provided having a hinged access door and an approved locking device.
9. All control devices, except those not mounted directly to the unit, shall be factory mounted and wired. Control panel shall have a labeled strip to land all wires for field installed control components.
10. All components are fully wired and 100% tested prior to shipping.

Part 3 - Execution

I. Installation

A. Factory Start-up- The manufacturer shall supply complete factory start-up by a factory approved start-up agent.

B. The energy recovery units shall be installed complete with all accessories in accordance with the manufacturer's recommendations, as listed in the specifications and as shown on the drawings.

C. Three (3) sets of spare filters shall be provided in addition to the set used during construction with each unit. The filters shall be changed after the construction dust has been eliminated and before final inspection. The other set of filters shall be stored in the respective mechanical rooms or spaces.

D. Provide a typed list of all the different units and their filter sizes to be included in the O&M manuals. The list shall include the unit designation, filter size and the number of filters required for each unit. In addition to this, submit to the Owner three additional copies of the list, distributed to the building supervisor, PGCPS project manager of record and PGCPS building services.

E. Provide two (2) sets of spare fuses for each energy recovery unit.

F. Provide three (3) sets of spare belts per unit.

G. Warranty Tag - The Contractor shall attach an engraved weatherproof Guarantee or Warranty tag to the exterior of each unit. Identification tag shall be black with engraved 1/2 " white letters which reads:

UNIT #	*(unit number)*
INSTALLED BY:	*(contracting company's name)*
WARRANTY EXPIRES:	*(month/day/year)*
COMPRESSOR WARRANTY EXPIRES:	*(month/day/year)*

END OF SECTION

Part 1 - General

I. General
   A. The Bidding and Contract Requirements, Division 1 -General Requirements, Section 230100 - General Provisions, and Section 230500 - Basic Materials and Methods, shall apply to this section.

II. Scope
   A. The work covered under this section shall include providing and installing complete the rooftop air handling unit as shown on the drawings and specified herein.

III. Quality Assurance
   A. The air handling unit shall have ARI certified ratings and shall be labeled as acceptable by an approved safety testing or inspection agency such as Underwriters Laboratories.
   B. The motors shall be manufactured under NEMA standards.
   C. All wiring shall conform to the National Electric Code (NEC).
   D. The coils shall have ARI certified ratings.
   E. Factory Start-up – The manufacture shall supply complete factory start-up by a factory approved start-up agent.
   F. Equipment installer shall attend a controls coordination meeting with the section 230923 contractor as described in 15900, 1.03.

IV. Submittals
   A. Provide shop drawings on this equipment as described in section 230100, 1.04. The controls coordination meeting described in 230923, 1.03 shall be held before the shop drawings are submitted.

Part 2 - Products

I. Rooftop Air Handling Unit
   A. The air handling unit shall be provided and installed complete with the type, arrangement, capacities and accessories as shown on the drawings and specified herein. Acceptable manufacturers include:
      1. Trane
      2. Carrier
      3. Daikin
      4. York

B. Casing - The housing shall be constructed of heavy sheet mill galvanized steel adequately reinforced with structural members and provided with sufficient access panels for proper lubrication and maintenance. Unit shall be of the arrangement shown on the drawings. Units shall be fully gasketed for weather protection. Piping to the roof mounted units shall be totally within the unit curb. Unit shall include one-piece, cellular insulation extending under coil and fan sections with drain connections on both sides. The double wall panels shall be two inches thick with 18 gauge mill galvanized steel outer wall and 22 gauge mill galvanized inner wall. Panels shall be individually removable for access and maintenance. The insulation shall be two inches thick fiberglass with 1.5 PCF density. Hinged, gasketed, double wall, insulated access doors shall be provided for access to all fan, filter, coil, energy recovery wheel sections and piping enclosures. Unit casing may be chemically cleaned, spray painted, baked and coated with an additional exterior coat of enamel after final assembly in lieu of mill galvanizing.

C. Fans - Shall be airfoil type. All fans shall be statically and dynamically balanced and tested after being installed in factory-assembled fan sections. Fully serviceable prelubricated 200,000 hour life ball bearings with externally mounted grease fittings shall be included on all units so bearings can be serviced without dismantling the unit. Provide internal grease tubings for servicing where applicable.

D. Motor and Drive

1. Provide belt drive with guard and adjustable motor sheave. Motor nameplate horsepower shall exceed brake horsepower by a minimum of 5% with airfoil. Provide oil resistant type belts. Provide motor especially designed for quiet operation.
2. Motor speed (for VAV units) shall be controlled by variable frequency drives. All variable frequency drives shall be factory installed by the manufacturer. See section 262923 for acceptable manufacturers.

E. Chilled Water Coil - Shall be pitched within the casing for proper drainage. It shall be the continuous aluminum plate fin and copper tube type, with drawn and belled collars mechanically expanded to seamless copper tubes. The completely drainable coil shall be tested under water at 250 psig. Provide one piece sloped, non-corrosive, cleanable stainless steel or plastic IAQ type insulated drain pan. A water level sensing device shall be provided in the unit condensate pan which will shut down the unit in the event this devices level is exceeded.

F. Hot Water Heating Coil - Shall be pitched within the casing for proper drainage. Coil shall be furnished with metering orifices in the supply header to insure equal distribution of hot

water to each tube. The coil shall be tested at 250 psig under water. The hot water coil shall be placed in a pre-heat position on chilled water systems and downstream on a DX system.

G. Energy Recovery Heat Wheel (If so equipped):
   1. Heat Wheels shall comply with UL standards.
   2. Heat Wheel - Provide aluminum or polymer transfer media, flame spread rating of not more than 25 and smoke developed rating of not more than 50 and shall be independently tested in accordance with ASTM standard E-84. Rotor media shall be independently tested in accordance with ASHRAE Standards. It shall allow laminar flow (but not radial) at usual velocities and prevent leakage, bypassing and cross contamination by cross flow within wheel. Size the transfer media to allow passage of 300 micron particles without fouling or clogging. Treat media with non-degrading desiccant that is bacteriostatic, non-corroding and non-toxic. No asbestos material will be allowed. Wheel shall not condense water directly or require a condensate drain for summer or winter operation. Performance rating shall be in accordance with ARI Standard 1060.
   3. Provide casing seals on periphery of rotor as well as on duct divider and purge section. Seals are to be adjustable, of extended life materials and effective in limiting air leakage.
   4. Wheel shall be supported by ball or roller bearings and belt driven by a fractional horsepower, totally enclosed, NEMA Standard motor through a close coupled positively lubricated speed reducer, or gear/chain speed reduction.
   5. Unit shall be constructed of heavy gage steel to insure rigidity and stability. Casing side panels shall be removable to insure easy access to internal parts. Provide integral flanges for flanged duct connection and provide lifting holes or lugs.

H. Air Dampers shall be aluminum, non-corrosive opposed blade type.

I. Outside Air Damper (for VAV units) - Provide factory installed damper/airflow monitoring assembly for maintaining a constant quantity of outside air. Assembly shall consist of factory mounted dampers that both modulate and measure airflow.

J. Filter Section - Low velocity medium capacity filter section shall be a matching part of the unit with access through hinged doors on both sides. Filters shall be 2" FARR 30/30 medium efficiency, pleated, disposable type. Each filter shall consist of a non-woven cotton fabric media, media support grid and enclosing frame. The filter media shall have an average efficiency of 30-35% on ASHRAE Test Standard 52-76. It shall have an

average arrestance of not less than 92% in accordance with that test standard. The filter shall be listed by Underwriters Laboratories as Class 2. Two complete sets of spare filters shall be supplied in addition to the set used during construction. Metal filters may be accepted pending review by PGCPS building services.

K. Vibration Isolators - Provide factory installed internal spring isolators or field installed external housed type spring isolators for all air handling units. Install external isolators in accordance with manufacturer's recommendations. Acceptable external isolator manufacturers:
   1. Mason Industries
   2. Peabody Noise Control
   3. Vibration Eliminator Company
   4. Vibration Mountings And Controls.

L. Roof Curb - Provide pre-fabricated aluminum or galvanized steel 14" high curbs to match the unit. Provide wood nailer. The curb shall be flashed to match the roofing system. The unit and curb shall be provided by the same manufacturer. Roof curbs shall be one piece; two piece curbs will not be accepted.

M. Starter - Provide magnetic line voltage starter with HAND-OFF-AUTO switch, red running light, and auxiliary contacts for all motors. See Electric Motor Starters, Section 15050. All starters shall be factory installed by the manufacturer.

N. Wiring - All units shall have single point power connections with convenience outlet. The units shall be completely pre-wired at the factory, including all motors, starters, variable frequency drives, internal transformers, actuators, and controls.

O. A water level sensing device shall be provided in the unit condensate pan which will shut down the unit in the event this devices level is exceeded. Condensate float shall be located in a readily accessible location.

P. Unit shall be provided with hail guards.

Q. Temperature Controls
   1. Shall be provided to accomplish control sequence as outlined in the automatic temperature control section of specifications. All temperature controls shall be factory installed, wired and programmed by the manufacturer or see item 3 below.
   2. Manufacturer shall provide an interface which will allow the Owner's energy management system to access the control points shown on the points list. This interface shall be in complete compliance with ANSI/ASHRAE Standard #135-2000. Provide any coordination as required to facilitate this interface into the Owner's EMS.

Provide all necessary protocol documentation and gateway hardware and software (if required) such that the section 230923 system suppliers may successfully create a communication interface between the control system furnished in this section of the specification and the 230923 control system. Provide an adequate level of technical support to guide the section 15900 personal towards completion of subject communication interface. Protocol must support reading / writing status and analog and digital point information from this section of the specification. All documentation, gateway hardware and software, and required technical support are understood to be included in the bid.

3. Unit shall be provided with freeze protection as required by Section 15900. No automatic reset freezestats will be accepted.
4. Temperature Controls shall be accomplished by either of the following methods:
   a) Factory built-in controls shall be provided to interface with the ATC to accomplish control sequence as outlined in Automatic Temperature Control section of specifications.
   b) Field installed controls provided by the division 230923 contractor is acceptable provided the control sequence as outlined in Automatic Temperature Control section of specifications is met.

      The control contractor must have the ability to interface with and control the factory supplied outside airflow monitoring assembly.

Part 3 - Execution

I. Installation

A. The air handling units shall be installed as shown on the drawings and as recommended by the manufacturer.

B. Factory Start-up – The manufacturer shall supply complete factory start-up by a factory approved start-up agent.

C. The air handling unit fan speed shall be adjusted to deliver the amount of air as stated on the drawings by adjusting the motor sheave or variable frequency drive. If the proper amount of air cannot be obtained by this adjustment, the contractor shall provide and install new motor sheave and belts to obtain the proper amount of air.

D. Provide three (3) sets of spare belts for each air handling unit.

E. Three (3) sets of spare filters shall be provided in addition to the set used during construction with each air handling unit. The filters shall be changed after the construction dust has been eliminated and before final inspection. The other set of filters shall be stored in the respective mechanical rooms or spaces.

F. Provide grease fittings extensions where necessary to have the grease fitting accessible.

G. Provide a typed list of all the different air handling units their filter sizes and their belt sizes to be included in the O&M manuals. The list shall include the unit designation, filter size and belt size the number of filters and belts required for each unit in addition to this submit to the Owner three copies of the list distributed to the PGCPS project manager of record, building supervisor, and PGCPS Building Services.

H. Warranty Tag - The Contractor shall attach an engraved weatherproof Guarantee or Warranty tag to the exterior of each unit. Identification tag shall be black with engraved 1/2 " white letters which reads:

UNIT #	*(unit number)*
INSTALLED BY:	*(contracting company's name)*
WARRANTY EXPIRES:	*(month/day/year)*
COMPRESSOR WARRANTY EXPIRES:	*(month/day/year)*

END OF SECTION

Part 1 - General

I. General
   A. The Bidding and Contract Requirements, Division 1 -General Requirements, Section 230100 - General Provisions, and Section 230500 - Basic Materials and Methods, shall apply to this section.

II. Scope
   A. The work covered under this section shall include providing and installing, complete, the air handling unit as shown on the drawings and specified herein.

III. Quality Assurance
   A. The air-handling unit shall have ARI certified ratings and shall be labeled as acceptable by an approved safety testing or inspection agency such as Underwriters Laboratories.
   B. The motor shall be manufactured under NEMA standards.
   C. The coils shall have ARI certified ratings.
   D. Equipment installer shall attend a controls coordination meeting with the section 230923 contractor as described in 230923, 1.03.

IV. Submittals
   A. Provide shop drawings on this equipment as described in section 230100, 1.04. The controls coordination meeting described in 230923, 1.03 shall be held before the shop drawings are submitted.

Part 2 - Products

I. Air Handling Unit
   A. The air-handling unit shall be provided and installed complete with the type, arrangement, capacities and accessories as shown on the drawings and specified herein. Acceptable manufacturers include:
      1. Trane
      2. Carrier
      3. Daikin
      4. York.
   B. Casing - The housing shall be constructed of heavy sheet mill galvanized steel adequately reinforced with structural members and provided with sufficient access panels for proper lubrication and maintenance. Unit shall be of the arrangement shown on the

drawings. Unit shall include one piece drain pan with 1/2" foamed-in-place, cellular insulation extending under coil and fan sections with drain connections on both sides. Hinged panels in fan, coil, filter and mixing box sections shall provide access to all internal parts. All unit panels shall be insulated with 1" foil faced glass fiberboard. Unit casing may be chemically cleaned, spray painted, baked and coated with an additional exterior coat of enamel after final assembly in lieu of mill galvanizing.

C. Fans - Shall be airfoil type. All fans shall be statically and dynamically balanced and tested after being installed in factory-assembled fan sections. Fully serviceable prelubricated 200,000 hour life ball bearings with externally mounted grease fittings shall be included on all units so bearings can be serviced without dismantling the unit. Provide internal grease tubings for servicing where applicable.

D. Motor and Drive:

1. Shall be belt drive with guard and adjustable motor sheave. Motor nameplate horsepower shall exceed brake horsepower by a minimum of 5% with airfoil. Belts shall be of the oil resistant type. Motor shall be especially designed for quiet operation. Provide and install VFD Variable Frequency Drive.
2. Motor speed for VAV units shall be controlled by a variable frequency drive. All VFD's shall be factory installed by the manufacturer.

E. Chilled Water Coil - Shall be pitched within the casing for proper drainage. It shall be the continuous aluminum plate fin and copper tube type, with drawn and belled collars mechanically expanded to seamless copper tubes. The completely drainable coil shall be tested under water at 250 psig. Provide an IAQ type sloped cleanable non-corrosive one piece insulated drain pan.

F. Hot Water Heating Coil - Shall be pitched within the casing for proper drainage. Coil shall be furnished with metering orifices in the supply header to insure equal distribution of hot water to each tube. The coil shall be tested at 250 psig under water. The hot water coil shall be placed in a pre-heat position on all chilled water systems and downstream on a DX system, except for VAV type unit.

G. Mixing Box - Low Leak Dampers - The mixing box shall be a product of the air handling unit manufacturer with the arrangement as shown on the drawings. The return air and outside air dampers shall be sized for 100% air, shall be interconnected, and shall be as follows:

1. Return Air Damper - The parallel blades shall be brake formed and secured to a minimum of 5/8" diameter steel-rods rotating in nylon bushings and mounted in rigid

steel damper frames. The frame shall be constructed of a minimum 13-gauge sheet steel and the blades of a minimum double 22 gauge sheet steel.

2. Outside Air Damper - Opposed Blade - The outside air damper supplied by the air handling unit manufacturer shall not be used.

H. Filter Section - Low velocity medium capacity filter section shall be a matching part of the unit with access through hinged doors on both sides. Combination mixing box/filter sections are not acceptable. Filters shall be 2" FARR 30/30 medium efficiency, pleated, disposable type. Each filter shall consist of a non-woven cotton fabric media, media support grid and enclosing frame. The filter media shall have an average efficiency of 30-35% on ASHRAE Test Standard 52-76. It shall have an average arrestance of not less than 92% in accordance with that test standard. The filter shall be listed by Underwriters Laboratories as Class 2. Two complete sets of spare filters shall be supplied in addition to the set used during construction. Metal filters may be accepted pending review by PGCPS building services.

I. Filter Gauge - Shall be a manometer type with an operating range of 0 - 3" w.c. Furnish one for each air-handling unit.

J. Vibration Isolation - Provide factory installed internal spring isolators or field installed external housed type spring isolators for all air handling units. Install external isolators in accordance with manufacturer's recommendations. Acceptable external isolator manufacturers:

1. Mason Industries
2. Peabody Noise Control
3. Vibration Eliminator Company
4. Vibration Mountings And Controls.

K. Starter - Provide magnetic line voltage starter with HAND-OFF-AUTO switch and red running light. See Electric Motor Starters, section 230513.

L. Sound Ratings

1. The sound power rating (re: 10-12 watts) leaving the air handling unit shall meet current AHRI standards.
2. Air handling unit sound ratings shall be based on tests in a sound laboratory reverberant room strictly conforming to ASHRAE Standard 36-62, in accordance with AMCA 300 procedures. Sound data must be accurate to within + 5 db @ 63 Hz, + 4 db @ 125 Hz, + 2 db from 250-2000 Hz, + 3 db @ 4000 Hz and above.

3. Where the manufacturer's sound power data is not published, an officer of the company must certify that sound data conforms to the above requirements. If the manufacturer does not have acoustical facilities in accordance with the above requirements, the contractor must submit certified data that the specified units have been tested in an approved independent acoustics lab, capable of testing equipment at specified operating conditions, to determine sound power levels by octave band.

M. Temperature Controls:
   1. All controls shall be provided by the BAS contractor under section 15900.

N. A water level sensing device shall be provided in the unit condensate pan which will shut down the unit in the event this devices level is exceeded. Condensate float shall be located in a readily accessible location.

Part 3 - Execution

I. Installation

A. The air handling units shall be installed as shown on the drawings and as recommended by the manufacturer.

B. The air handling unit fan speed shall be adjusted to deliver the amount of air as stated on the drawings by adjusting the motor sheave. If the proper amount of air cannot be obtained by this adjustment, the contractor shall provide and install new motor sheave and belts to obtain the proper amount of air.

C. Three (3) sets of spare filters shall be provided with each unit. The filters shall be changed after the construction dust has been eliminated and before final inspection. The other set of filters shall be stored in the respective mechanical rooms or spaces.

D. Provide three (3) sets of spare belts for each air handling unit.

E. Provide grease fitting extensions where necessary to have the grease fitting accessible.

F. The mixing box dampers shall be checked by startup agent after the damper motors have been installed and before the final inspection to make sure that the dampers are closing properly.

G. Provide a typed list of all the different air handling units their filter sizes and their belt sizes to be included in the O&M manuals. The list shall include the unit designation, filter size and belt size the number of filters and belts required for each unit in addition to this submit to the Owner three copies of the list distributed to the PGCPS project manager of record, building supervisor, and PGCPS Building Services.

H. Warranty Tag - The Contractor shall attach an engraved weatherproof Guarantee or Warranty tag to the exterior of each unit. Identification tag shall be black with engraved 1/2 " white letters which reads:

UNIT #	*(unit number)*
INSTALLED BY:	*(contracting company's name)*
WARRANTY EXPIRES:	*(month/day/year)*
COMPRESSOR WARRANTY EXPIRES:	*(month/day/year)*

END OF SECTION

Part 1 - General

I. General
   A. The Bidding and Contract Requirements, Division 1 -General Requirements, Section 230100 - General Provisions, and Section 230500 - Basic Materials and Methods, shall apply to this section.

II. Scope
   A. The work covered under this section shall include packaged rooftop heating and cooling units and packaged electric cooling/heating rooftop heat pump units.

III. Quality Assurance
   A. The packaged units shall have published ratings and shall be UL listed, conforms to the current International Energy Conservation Code and current ASHRAE standards.
   B. Construct gas fired heating sections in accordance with AGA safety standards and provide AGA label.
   C. Factory start-up-The manufacturer shall supply complete factory start-up by a factory approved start-up agent.
   D. Equipment installer shall attend a controls coordination meeting with the section 230923 contractor as described in 230923, 1.03.

IV. Submittals
   A. Provide shop drawings on this equipment as described in Section 230100, 1.04. The controls coordination meeting described in 230923, 1.03 shall be held before the shop drawings are submitted.

Part 2 - Products

I. Packaged Rooftop Heating And Cooling Unit
   A. The rooftop unit shall be of the type and capacity shown the drawings. Acceptable manufacturers include:
      1. Trane
      2. Carrier
      3. Daikin.
   B. Packaged Assembly: Unit shall consist of a completely assembled, piped, wired and tested unit composed of a weatherproof enclosure that is insulated with foil faced insulation having a thickness of 1” and a density of 1 pound with all edges sealed and

hinged gasketed locking access doors and, non-corrosive, sloped, cleanable insulated IAQ type condensate drain pan centrifugal blower with belt drive air handling section, low velocity throwaway filter section complete direct expansion air cooled cooling system section, single point power connection and gas fired or hot water heating section all mounted on one base with additional roof adapting components and accessories as required in this specification or as shown on the plans.

C. Enclosure: Shall be heavy gauge zinc-coated steel with baked enamel finish and shall be completely weatherized for outdoor installation.

D. Air Handling Section: Fans shall be airfoil type. All fans shall be statically and dynamically balanced and tested after being installed in factory-assembled fan sections. Fully serviceable prelubricated 200,000 hour life ball bearings with externally mounted grease fittings shall be included on all units so bearings can be serviced without dismantling the unit. Provide internal grease tubings for servicing where applicable. The motor shall have thermal overload protection.

E. Filter Section: Shall fit into integral racks inside casing. Maximum velocity through filter 350 fpm. Filters shall be throwaway, 2" thick pleated with 35% efficiency, and a MERV rating of 8. Two complete sets of spare filters shall be supplied in addition to the set used during construction.

F. Cooling Section: Shall have vibration isolated hermetic/scroll compressor(s), copper tube aluminum fin air cooled condensing coil and propeller type condenser fans direct-connected to inherently protected motors. Provide metal hail / vandal guards to protect the condenser coil fins. Complete system shall be factory de-hydrated, tested and charged. Refrigeration cycle shall include condenser and evaporator fan compressor cutouts, 24-volt transformers, and low and high pressure cutouts. Provide liquid line solenoid valves for system pump-down and compressor protection cutout with reset as required. Units rated 10 tons and above shall have 50% capacity reduction capability. Units with a cooling capacity of 54 MBH and greater shall be equipped with an economizer cycle and shall include industry standard acceptable low leakage outside air damper.

G. Hot Water and Steam Heating Coils (if required): Shall be ARI certified non-freeze type pitched within the ductwork for proper drainage. Headers shall be heavy-gauge galvanized steel. Maximum work pressure limit of coil shall be 175 psig at 400 degrees F. Coils shall be within unit or remote in ductwork as shown on plans. When in unit, piping to coils shall be within unit.

H. Heat Exchangers: Provide manufacturer's standard construction for gas-fired heat exchangers and burners, designed for minimum of 2-stage operation. Provide single gas connection.

I. Gas Controls: Provide the following controls:
   1. Redundant gas valves
   2. Intermittent pilot ignition
   3. Electronic spark ignition system
   4. High limit cutout
   5. Flame rollout switch

J. Economizer Control: Provide economizer control consisting of return and outside air dampers, outside air filter, fully modulating electric control system with enthalpy control, and adjustable mixed-air thermostat. Design system for 100% outside air capability. Provide automatic changeover through adjustable enthalpy control device. Units without economizer cycle shall have 25% motorized outside air damper. Units which are scheduled for demand ventilation shall be configured to accept a control signal from the Automatic Temperature Control system for control of the outside air damper to accomplish the demand ventilation sequence as described in division 15900.

K. Factory built-in controls shall be provided for control of the refrigeration cycle, refrigeration safeties, heating cycle, heating safeties and economizer (if applicable). The Automatic Temperature Control contractor shall furnish controls for temperature control and energy management routines. The unit manufacturer shall provide a terminal strip for control wiring terminations.

L. Accessories: Units shall include the following accessories:
   1. All units 15 tons and larger shall have vibration isolation roof curb assembly. All other units shall have vibration isolation roof curb assembly, when shown on drawings. Pre-fabricated aluminum or galvanized steel curbs 14" high shall be provided to match the rooftop unit. The curb shall be flashed to match the roofing system. Provide wood nailer. The rooftop unit and curb shall be provided by the same manufacturer. Roof curbs shall be one piece; two piece curbs will not be accepted.
   2. Units with a cooling capacity less than 54 MBH shall have two-position, motorized outside air dampers (25% minimum) and low ambient control to 0*F. Accessories shall be of the same manufacturer as the rooftop unit.
   3. Units with cooling capacities of 54 MBH or greater shall have economizer cycle and 100% barometric relief.

4. All damper actuators shall be spring return type (for loss of power). Units using means other than true spring return are not acceptable.
5. Conventional thermostat interface for connection to the automatic temperature control system.
6. Accessories shall be of the same manufacturer as the rooftop unit.
7. A water level sensing device shall be provided in the unit condensate pan which will shut down the unit in the event this devices level is exceeded. Condensate float shall be located in a readily accessible location.
8. Units with Hot Gas Reheat, provide factory mounted sensor between evaporator coil and hot gas reheat coil for connection to the ATC system. Signal to be coordinated with the Division 15900 contractor.
9. Units with Demand Control Ventilation capabilities shall be furnished with an outdoor airflow monitoring device. This device shall be compatible with the Building Automation System (BAS) such that the outdoor airflow volume shall be set in Cubic Feet per Minute (CFM) and displayed on the BAS graphics.

II. Packaged Rooftop Heat Pump Unit

A. The rooftop heat pump unit shall be of the type and capacity shown on the drawings. Acceptable manufacturers include:
   1. Trane
   2. Carrier
   3. Daikin.

B. Packaged Assembly: Conditioner shall consist of a completely assembled, piped, wired and tested unit composed of weatherproof enclosure with resealable hinged access panels, centrifugal blower with belt drive air handling section, low velocity throwaway filter section, complete direct expansion air to air reverse cycle heat pump system section completely pre-wired and interlocked and all mounted on one base with additional roof adapting components and accessories as required in this specification or as shown on plans. Roof curb shall be by the same manufacturer.

C. Enclosure: Shall be heavy gauge zinc-coated steel with baked enamel finish and shall be completely weatherized for outdoor installation.

D. Air Handling Section: Fans shall be airfoil type. All fans shall be statically and dynamically balanced and tested after being installed in factory-assembled fan sections. Fully serviceable prelubricated 200,000 hour life ball bearings with externally mounted grease fittings shall be included on all units so bearings can be serviced without dismantling the

unit. Provide internal grease tubings for servicing where applicable. The motor shall have thermal overload protection.

E. Filter Section: Shall fit into integral racks inside casing. Maximum velocity through filter 350 FPM. Filters to be throwaway type, pleated, 2" thick, 35% efficient, and a MERV rating of 8. Provide unit with 25% motorized outside air damper.

F. Heating/Cooling Section: Shall have vibration isolated hermetic compressor(s), copper type aluminum fin air cooled condenser/evaporator coil and propeller type outdoor fans direct connected to inherently protected motors. Provide metal hail / vandal guards to protect coil fins. Complete system shall be factory dehydrated, tested and charged. Refrigeration cycle control shall include condenser and evaporator fan and compressor contactors, 24-volt transformers, low and high pressure cutouts, refrigerant and charging valves, reversing valve, automatic defrost control, low ambient control, suction line accumulator, and compressor protection cutout with reset. Provide an IAQ type sloped cleanable non-corrosive insulated condensate drain pan.

G. Supplementary Electric Heating Coil: Shall be enclosed nickel-chromium wire heating element. Heating section shall contain built-in contactors, thermal cutouts, interlock relays and box, and line voltage terminal blocks with lugs. Heaters shall be UL listed.

H. Factory built-in controls shall be provided for control of the refrigeration cycle, refrigeration safeties, heating cycle, heating safeties and economizer (if applicable). The Automatic Temperature Control contractor shall furnish controls for temperature control and energy management routines. The unit manufacturer shall provide a terminal strip for control wiring terminations.

I. Pre-fabricated aluminum or galvanized steel curbs 14" high shall be provided to match the heat pump unit. The curb shall be flashed to match the roofing system. The heat pump unit and curb shall be provided by the same manufacturer. Provide wood nailer. All units shall set on curbs unless indicated differently on drawings. Roof curbs shall be one piece; two piece curbs will not be accepted.

J. A water level sensing device shall be provided in the unit condensate pan which will shut down the unit in the event this devices level is exceeded. Condensate float shall be located in a readily accessible location.

K. Units with Hot Gas Reheat, provide factory mounted sensor between evaporator coil and hot gas reheat coil for connection to the ATC system.

L. Units with Demand Control Ventilation capabilities shall be furnished with an outdoor airflow monitoring device. This device shall be compatible with the Building Automation

System (BAS) such that the outdoor airflow volume shall be set in Cubic Feet per Minute (CFM) and displayed on the BAS graphics.

III. Packaged Vav Rooftop Heating And Cooling Unit

A. The rooftop unit shall be of the type and capacity shown the drawings. Acceptable manufacturers include:

1. Trane
2. Carrier
3. Daikin.

B. Packaged Assembly: Unit shall consist of a completely assembled, piped, wired and tested unit composed of; a weatherproof enclosure with hinged gasketed locking access doors and a non-corrosive, sloped, cleanable, insulated, IAQ type condensate drain pan, centrifugal blower with belt drive air handling section, low velocity throwaway filter section, complete direct expansion air cooled cooling system section, single point power connection, and gas fired or hot water heating section all mounted on one base with additional roof adapting components and accessories as required in this specification or as shown on the plans.

C. Enclosure: Shall be heavy gauge zinc-coated steel with baked enamel finish and shall be completely weatherized for outdoor installation. The unit roof shall be cross broken and/or sloped to assure drainage. Access to compressors, controls, blower section, heating section and other items needing periodic checking or maintenance shall be through hinged access doors. All access doors shall have gaskets and provide a weather tight seal. The air handling section of the unit shall have ½ minimum non-eroding fiberglass insulation.

D. Fan Section: Fan shall have forward curved blades, belt driven with adjustable motor sheaves. Fully serviceable prelubricated 200,000 hour life ball bearings with externally mounted grease fittings shall be included on all units so bearings can be serviced without dismantling the unit. Provide internal grease tubings for servicing where applicable. The motor shall have thermal overload protection. Supply air flow modulation shall be by a factory installed variable frequency drive. (see section 15905 for acceptable drive manufacturer).

E. Filter Section: Shall fit into integral racks inside casing. Maximum velocity through filter 350 fpm. Filters shall be pleated, 2" thick rigid extended surface, 35% efficient and a MERV rating of 8 throwaway type. Two complete sets of spare filters shall be supplied in addition to the set used during construction.

F. Cooling Section: Shall have vibration isolated scroll or hermetic compressor(s), copper tube aluminum fin air cooled condensing coil and propeller type condenser fans direct-connected to inherently protected motors. Provide metal hail/vandal guards to protect the condenser coil fins. Complete system shall be factory de-hydrated, tested and charged. Refrigeration cycle shall include condenser and evaporator fan compressor cutouts, 24-volt transformers, low and high pressure cutouts, crankcase heaters, liquid line solenoid valves for system pump-down and compressor protection cutout with reset. Refrigerant shall be 410A. Units rated 10 tons and above shall have 50% capacity reduction capability. Units with a cooling capacity of 54 MBH and greater shall be equipped with an economizer cycle and shall include low leakage outside air damper.

G. Hot Water Heating Coils: Shall be ARI certified non-freeze type pitched within the ductwork for proper drainage. Headers shall be heavy-gauge galvanized steel. Maximum work pressure limit of coil shall be 175 psig at 400 degrees F. Coils shall be within unit or remote in ductwork as shown on plans. When in unit, piping to coils shall be within unit.

H. Unit shall be provided with freeze protection. Automatic reset will not be accepted.

I. Gas Fired Furnace: Provide manufacturer's standard construction for gas-fired heat exchangers and burners, designed for fully modulating operation to maintain discharge temperature. Provide single gas connection.

1. Provide gas burner with the following controls:
    a) Redundant gas valves
    b) Intermittent pilot ignition
    c) Electronic spark ignition system
    d) High limit cutout
    e) Flame rollout switch

J. Hot Gas Reheat for Dehumidification - Hot gas reheat coils, piping and fully modulating controls shall be factory installed for humidity control.

K. Economizer Control: Provide economizer control consisting of return and outside air dampers, outside air filter, fully modulating electronic control system with reference enthalpy control and adjustable mixed-air thermostat. Design system for 100% outside air capability. Provide automatic changeover through adjustable enthalpy control device. Units without economizer cycle shall have 25% motorized outside air damper.

L. Temperature Controls: Factory built-in controls shall be provided to interface with the ATC to accomplish control sequence as outlined in Automatic Temperature Control section of specifications.

1. Manufacturer shall provide a interface device which will allow the Owner's energy management system to access the control points required by the specification section 230923. Provide any coordination as required to facilitate this interface with the Owners energy management system. Provide all necessary protocol documentation and gateway hardware and software (if required) such that the section 230923 system supplier may successfully create a communication interface between the control system furnished in this section of the specification and the 230923 control system. Provide an adequate level of technical support to guide the section 230923 personnel towards completion of subject communication interface. Protocol must support reading status and analog and digital point information from this section of the specification. All documentation, gateway hardware and software, and required technical support are understood to be included in the bid.
2. Unit shall be equipped an electronic supply air discharge temperature controller with zone, return and outdoor air reset capabilities.

M. Accessories: Units shall include the following accessories:

1. All units 15 tons and larger shall have vibration isolation roof curb assembly. All other units shall have vibration isolation roof curb assembly, when shown on drawings. Pre-fabricated aluminum or galvanized steel curbs 14" high shall be provided to match the rooftop unit. The curb shall be flashed to match the roofing system. Provide wood nailer. The rooftop unit and curb shall be provided by the same manufacturer.
2. Units with a cooling capacity less than 54 MBH shall have two-position, motorized outside air dampers (25% minimum) and low ambient control to 0 deg F. Accessories shall be of the same manufacturer as the rooftop unit.
3. Units with cooling capacities of 54 MBH or greater shall have economizer cycle and 100% barometric relief. Units that incorporate a modulating power exhaust based on building static or economizer damper position are acceptable.
4. All damper actuators shall be spring return type (for loss of power). Actuators using means other than true spring return are not acceptable.
5. Provide a factory installed outside airflow monitoring device to ensure minimum outside airflow requirements are met. This device shall compensate the outside air flow in relation to supply air percentage as it increases and decreases.
6. Provide extended grease lines for all fan bearings.
7. Accessories shall be of the same manufacturer as the rooftop unit.

8. A water level sensing device shall be provided in the unit condensate pan which will shut down the unit in the event this devices level is exceeded. Condensate float shall be located in a readily accessible location.
9. Roof curbs shall be one piece; two piece curbs will not be accepted.
10. Provide factory mounted sensor between evaporator coil and hot gas reheat coil for connection to the ATC system.

Part 3 - Execution

I. Installation

A. Factory Start-up – The manufacturer shall supply complete factory start-up by a factory approved start-up agent.

B. The packaged rooftop unit shall be installed complete with all accessories in accordance with the manufacturer's recommendations, as indicated in the specifications and as shown on the drawings.

C. Three (3) sets of spare filters shall be provided with each unit. The filters shall be changed after the construction dust has been eliminated and before final inspection. The other set of filters shall be stored in the respective mechanical rooms or spaces.

D. Provide three (3) sets of spare belts for each air handling unit.

E. Provide a typed list of all the different air handling units their filter sizes and their belt sizes to be included in the O&M manuals. The list shall include the unit designation, filter size and belt size the number of filters and belts required for each unit in addition to this submit to the Owner three copies of the list distributed to the PGCPS project manager of record, building supervisor, and PGCPS Building Services.

F. Supply and return air ductwork connecting to package rooftop units setting on steel framing shall have flexible connections in the ductwork located inside the building, just below the roofline or inside of wall for horizontal discharge units. Package rooftop units setting on roof curbs which discharge horizontally shall have the flexible connection located within the building.

G. Provide two (2) sets of spare fuses for each packaged rooftop unit.

H. Warranty Tag - The Contractor shall attach an engraved weatherproof Guarantee or Warranty tag to the exterior of each unit. Identification tag shall be black with engraved 1/2" white letters which read:

UNIT #	*(unit number)*
INSTALLED BY:	*(contracting company's name)*
WARRANTY EXPIRES:	*(month/day/year)*
COMPRESSOR WARRANTY EXPIRES:	*(month/day/year)*

END OF SECTION

Part 1 - General

I. General
   A. The Bidding and Contract Requirements, Division 1 -General Requirements, Section 230100 - General Provisions, and Section 230500 - Basic Materials and Methods, shall apply to this section.

II. Scope
   A. The work covered under this section shall include providing and installing complete the roof mounted makeup air unit as shown on the drawing and specified herein.

III. Quality Assurance
   A. The unit fan shall have ARI certified ratings and be UL listed.
   B. The motor shall be manufactured under NEMA standards.
   C. The coils shall have ARI certified ratings.
   D. Equipment installer shall attend a controls coordination meeting with the section 15900 contractor as described in 230923, 1.03.

IV. Submittals
   A. Provide shop drawings on this equipment as described in Section 230100 - 1.04. The controls coordination meeting described in 230923, 1.03 shall be held before the shop drawings are submitted.

Part 2 - Products

I. Roof Mounted Makeup Air Unit
   A. The roof mounted makeup air unit shall be provided and installed complete with the type, arrangement, capacities and accessories as shown on the drawings and specified therein. Direct fire type units are not acceptable. Acceptable manufacturers include:
      1. Innovent
      2. Daikin
      3. CaptiveAire.
   B. Casing – The housing shall be constructed of heavy sheet mill galvanized steel adequately reinforced with structural members and provided with sufficient access panels for proper weatherproofing, lubrication and maintenance. Unit shall be of the arrangement shown on the drawings. Provide internal piping pocket within casing to coils. Piping to the units shall be totally within the unit curb. External pipe chases, including those mounted

on the units, are not acceptable. Unit shall include one-piece, cellular insulation extending under coil and fan sections with drain connections on both sides. The double wall panels shall be two inches thick with 18 gauge mill galvanized steel outer wall and 22 gauge mill galvanized inner wall. Panels shall be individually removable for access and maintenance. The insulation shall be two inches thick fiberglass with 1.5 PCF density. Hinged, gasketed, double wall, insulated access doors shall be provided for access to fan, filter, coil, damper, and heat exchanger sections. Unit casing may be chemically cleaned, spray painted, baked and coated with an additional exterior coat of enamel after final assembly in lieu of mill galvanizing.

C. Fans - Shall be airfoil type. All fans shall be statically and dynamically balanced and tested after being installed in factory-assembled fan sections. Fully serviceable prelubricated 200,000 hour life ball bearings with externally mounted grease fittings shall be included on all units so bearings can be serviced without dismantling the unit. Provide internal grease tubings for servicing where applicable.

D. Motor and Drive - Shall be belt drive with guard and adjustable motor sheave. Motor nameplate horsepower shall exceed brake horsepower by a minimum of 5% with airfoil. Belts shall be of the oil resistant type. Motor shall be especially designed for quiet operation.

E. Isolation – Fans and motors shall be mounted on spring isolated unitary bases, flexibly connected to the unit casing.

F. Chilled Water Coil – Shall be pitched within the casing for proper drainage. It shall be the continuous aluminum plate fin and copper tube type, with drawn and belled collars mechanically expanded to seamless copper tubes. The completely drainable coil shall be tested under water at 250 psig. Provide one piece IAQ type insulated drain pan. Drain pan shall be sloped toward the condensate drain connection drain pan shall be non-corrosive and cleanable. All piping and isolation valves to coils shall be inside unit casing. Chilled water pipes exposed to the air stream shall be insulated with ¾" armaflex or equal.

G. Hot Water Heating Coil – Shall be pitched within the casing for proper drainage. It shall be the continuous aluminum plate fin and copper tube type, with drawn and belled collars mechanically expanded to seamless copper tubes. The completely drainable coil shall be tested under water at 250 psig. The hot water coil shall be placed in a pre-heat position on chilled water systems and downstream on a DX system. All piping and isolation valves

to coils shall be inside unit casing. Hot water pipes exposed to the airstream shall be insulated with ¾" armaflex or equal.

H. Heat Exchanger shall be stainless steel type.

I. Outside Air Damper – Shall be low leakage opposed blade type with 16-gauge frame and 16 gauge blades. Maximum blade width 8". Provide neoprene seals at all blade edge and side meeting surfaces so that air leakage shall be no more than 1% at 4" static pressure. Provide teflon or oil impregnated bronze shaft bearings and standard finish. Approved manufacturers include:

J. Filter Section – Low velocity medium capacity filter section shall be a matching part of the unit with access through hinged doors on both sides. Filters shall be 2" FARR 30/30, medium efficiency, pleated, disposable type. Each filter shall consist of a non-woven cotton fabric media, media support grid, and enclosing frame. The filter media shall have an average efficiency of 30-35% of ASHRAE Test Standard 52-76. It shall have an average arrestance of not less than 92% in accordance with that test standard. The filter shall be listed by Underwriter's Laboratories as Class 2. Two complete sets of spare filters shall be supplied.

K. Starter – Provide magnetic line voltage starter with HAND-OFF-AUTO switch and red running light and auxiliary contacts. See Electric Motor Starters, Section 230513.

L. Temperature Controls shall be accomplished by either of the following methods:

1. Factory built-in controls shall be provided to interface with the ATC to accomplish control sequence as outlined in Automatic Temperature Control section of specifications.
2. Field installed controls provided by the section 230923 contractor are acceptable provided the control sequence as outlined in Automatic Temperature Control section of specifications is met.

M. The control contractor must have the ability to interface with and control the factory supplied outside airflow monitoring assembly. Make up air unit shall be interlocked with kitchen exhaust hood.

N. Pre-fabricated aluminum or galvanized steel curbs 14" high shall be provided to match the roof mounted makeup air unit. The curb shall be flashed to match the roofing system. The unit and curb shall be provided by the same manufacturer. Roof curbs shall be one piece; two piece curbs will not be accepted.

O. Provide inlet hood with moisture eliminator.

P. Unit shall be provided with hail guards.

Part 3 - Execution

I. Installation

A. The roof mounted makeup air unit shall be installed as shown on the drawings and as recommended by the manufacturer.

B. The unit fan speed shall be adjusted to deliver the amount of air as stated on the drawings by adjusting the motor sheave or frequency drive. If the proper amount of air cannot be obtained by this adjustment, the contractor shall provide and install new motor sheave and belts to obtain the proper amount of air.

C. Three (3) sets of spare filters shall be provided with each unit. The filters shall be changed after the construction dust has been eliminated and before final inspection. The other set of filters shall be stored in the respective mechanical rooms or spaces.

D. Provide three (3) sets of spare belts for each air handling unit.

E. Provide grease-fitting extensions where necessary to have the grease fitting accessible.

F. Provide one set of spare fuses for each roof mounted makeup air unit.

G. Provide a typed list of all the different air handling units their filter sizes and their belt sizes to be included in the O&M manuals. The list shall include the unit designation, filter size and belt size the number of filters and belts required for each unit in addition to this submit to the Owner three copies of the list distributed to the PGCPS project manager of record, building supervisor, and PGCPS Building Services.

H. All rooftop mechanical equipment must be curb or steel frame mounted. Any equipment previously mounted on loose wooden supports laying directly on the roof's surface will be re-installed on new curb style equipment supports as shown in plans on the drawing sheet labeled Typical Details. See the State of MD DGS Chapter VII standards for New Roofing Construction, Re-Roofing Construction and Roof System Guarantee Requirements. All mechanical equipment shall be mechanically attached to equipment curbs mechanically attached to the roof structure. New equipment curbs shall be properly flashed, counter flashed and capped. All piping and electrical conduit must be firmly supported. All equipment installations must match general roofing uplift requirements. Re-installing equipment on loose lumber supports (in-kind) is not acceptable.

I. Warranty Tag - The Contractor shall attach an engraved weatherproof Guarantee or Warranty tag to the exterior of each unit. Identification tag shall be black with engraved 1/2 " white letters which reads:

UNIT #	*(unit number)*
INSTALLED BY:	*(contracting company's name)*
WARRANTY EXPIRES:	*(month/day/year)*
COMPRESSOR WARRANTY EXPIRES:	*(month/day/year)*

END OF SECTION

Part 1 - General

I. General
   A. The Bidding and Contract Requirements, Division 1 - General Requirements, Section 230100 - Mechanical General Requirements, and Section 230500 - Basic Materials and Methods shall apply to this Section.

II. Scope
   A. Install a complete factory assembled kitchen makeup air unit with an indirect gas fired preheater.

III. Quality Assurance
   A. Conform to AMCA Bulletins regarding construction and testing. Fans shall bear AMCA certified rating seal.
   B. Provide fans with U/L label. Provide furnaces design-certified by the American Gas Association (AGA) and bear the AGA label.

IV. Submittals
   A. Provide shop drawings on this equipment as described in Section 230100 - 1.04.

Part 2 - Products

I. Kitchen Make-Up Air Units
   A. Acceptable manufacturers include:
      1. CaptiveAire
      2. Greenheck
      3. RenewAire
      4. Reznor
   B. Supply Air
      1. Filtered makeup air units shall have belt driven double width/double inlet, forward curved centrifugal type supply fans. The entire fan and motor assembly shall be mounted on vibration isolators to prevent noise transmission. Motors shall be permanently lubricated, heavy duty, ball bearing type, carefully matched to the fan load and furnished at the specified voltage, phase and enclosure. The fan shaft shall be ground and polished steel mounted in heavy duty, sealed ball bearings. Bearings shall be selected for a minimum average life in excess of 200,000 hours of maximum cataloged operating speeds. Pulleys shall be of the fully machined, cast iron type, keyed and securely attached to the wheel and motor shafts. Motor

sheaves shall be adjustable for final system balancing. Drives shall be sized for a minimum of 150% of driven horsepower.

2. Fan wheels shall be of the forward curved type, constructed of heavy gauge steel and statically and dynamically balanced to ensure smooth, vibration free operation.
3. Housing construction shall be heavy gauge galvanized steel with removable panels for access to fan and tempering unit components, filters and controls.
4. Filter Section - Low velocity medium capacity filter section shall be a matching part of the unit with access through hinged doors on both sides. Filters shall be 2" FARR 30/30, medium efficiency, pleated, disposable type. Each filter shall consist of a non-woven cotton fabric media, media support grid and enclosing frame. The filter media shall have an average efficiency of 30-35% of ASHRAE Test Standard 52-76. It shall have an average arrestance of not less than 92% in accordance with that test standard. The filter shall be listed by Underwriter's Laboratories as Class 2. Two complete sets of spare filters shall be supplied.
5. The prewired control center shall include, but not be limited to, an integral master disconnect switch with fuse blocks for main power connection, magnetic motor starters with thermal overloads and manual reset, fused 115 volt control transformer, and distribution terminal control strip for control wiring connection. All electrical components shall be U/L listed, Approved or Classified where applicable and wired in compliance with the National Electrical Code. Wiring shall be complete, requiring only one-point field connection for power service and one-point field connection for low voltage.

C. Exhaust:

1. Roof exhaust fans shall be of the belt drive, upblast, vertical discharge type. Housings shall be constructed of heavy gauge aluminum. The windband shall have a rolled bead and additional structural members for added strength. The fan wheel shall be of the backward inclined, centrifugal type, constructed of aluminum and statically and dynamically balanced for smooth, vibration free operation.
2. Motors and drives shall be isolated from the airstream. Motors shall be permanently lubricated, heavy duty, ball bearing type, carefully matched to the fan load and furnished at the specified voltage, phase and enclosure. Motors shall be cooled by air drawn from outside the exhaust airstream.

3. The fan shaft shall be ground and polished steel mounted on heavy duty ball bearings. Bearings shall be selected for a minimum average life in excess of 200,000 hours at maximum cataloged operating speeds.
4. Pulleys shall be of the fully machined cast iron type, keyed and securely attached to the wheel and motor shafts. Motor sheaves shall be adjustable for final system balancing. Drives shall be sized for a minimum of 150% of driven horsepower. The entire fan and motor assembly shall be mounted on vibration isolators to prevent noise transmission.
5. The roof exhaust fans shall bear the AMCA certified ratings seals for air and sound performance.

D. Heater:
1. Provide an indirect gas fired preheater. The preheater shall be supplied as an integral part of the makeup air unit.
2. The heater shall include, but not be limited to, a cast iron and stainless steel burner, gas valve with sensor, main and pilot electric gas valves and pressure regulators, main and pilot manual shutoff valves, an air flow switch, high limit control, flame safeguard control, flame rod, and electronic ignition pilot.

E. Roof Curb: Provide prefabricated 12" roof curb lined with fiberglass insulation. Provide heavy gauge galvanized steel equipment supports.

Part 3 - Execution

I. Installation
A. Supply and install sheaves as necessary for final air balancing.
B. Set roof mounted fans on curbs. Provide acoustic insulation on duct to below roof line and on fan inlet plenum, and drip pan for collecting condensation.
C. Provide a spare fan belt for each makeup air unit.
D. Provide a typed list of all the different makeup air units and their filter and fan belt sizes and submit to the Owner two copies of the list distributed to the PGCPS project manager of record and PGCPS building services. Include list in the Operation and Maintenance manuals.

END OF SECTION

Part 1 - General

I. General
   A. The Bidding and Contract Requirements, Division 1 -General Requirements, Section 230100 - General Provisions, and Section 230500 - Basic Materials and Methods, shall apply to this section.

II. Scope
   A. Furnish permanently installed electric cooling/hot water packaged terminal air conditioner of size and capacity shown on drawing. Conditioner shall consist of a room cabinet-wall sleeve, Heating/Cooling chassis, control module, and outside air louver.

III. Quality Assurance
   A. The packaged units shall have published ratings and be listed by Underwriters Laboratories.

IV. Submittals
   A. Provide shop drawings on this equipment as described in Section 230100 - 1.04.

Part 2 - Products

I. Packaged Terminal Unit
   A. The thru-wall unit shall be of the type and capacity shown on the drawings. Acceptable manufacturers include:
      1. Amana
      2. Trane
      3. Daikin
      4. Carrier.
   B. Outside Air Louver - Shall be anodized extruded aluminum with finish selected by Architect. Louver shall be easily installed from inside of building.
   C. Room Cabinet-Wall Sleeve - Shall be entirely constructed of zinc-coated, phosphatized steel. Top and sides shall be 18 gauge with baked epoxy corrosion resistant finish. Base pan shall be 16 gauge dipped in thermo-setting plastic, epichlorhydrin bisphenol, and baked to form a continuous film of corrosion protection. Discharge grilles shall be four-position stamped aluminum. Front panel shall be capable of being opened and/or removed without the use of tools.

D. Heating-Cooling Chassis - Shall be a slide-in, plug-in chassis with self-contained refrigerant cycle consisting of compressor, condenser fan and coil, evaporator fan and coil, hot water coil, refrigerant tubing and controls, electrical and operating controls, pressure ventilation system and condensate removal system.
   1. Compressor shall be welded hermetic, internally and externally vibration isolated. Refrigeration control shall provide full cooling capacity at ambient temperatures down to 35 degrees F without evaporator coil freeze-up, compressor short-cycling or slugging. Refrigerant shall be 410A.
   2. Evaporator and condenser fans shall be driven by one two-speed, permanent split capacitor, permanently lubricated fan motor located in conditioned air stream.
   3. Heating coil shall be serpentine hot water type. The coil shall be constructed of aluminum fins mechanically bonded to seamless copper tubes with continuous fin collars and sleeved coil and supports. Coils shall be factory tested at 300 psi. Provide supply and return gate valves, automatic air vents and drain plugs. Provide hailguard at coils.

E. Operating Controls - Shall be provided in a separable, plug-in module as part of the cooling chassis. Control module shall consist of self-contained adjustable thermostat, with OFF-HEAT-COOL-HIGH-LOW selector switches.

Part 3 - Execution

I. Installation
   A. The packaged unit shall be installed complete with all accessories in accordance with the manufacturer's recommendations and as shown on the drawings.
   B. New filters shall be installed after construction is over and before the final inspection.
   C. Provide a typed list of all the different units and their filter sizes to be included in the O&M manuals. In addition to this, submit to the Owner two additional copies of the list, distributed to the PGCPS project manager of record and PGCPS building services.

END OF SECTION

Part 1 - General

I. General
   A. The Bidding and Contract Requirements, Division 1 - General Requirements, Section 230100 - General Provisions, and Section 230500 - Basic Materials and Methods, shall apply to this section.

II. Scope
   A. Provide and install complete the Remote Air Cooled Condensing Units as shown on the drawing and specified herein.

III. Quality Assurance
   A. The combined systems shall comply with ARI Standard 210.
   B. Both the air handling unit and the air cooled condensing unit shall be Underwriters Laboratories listed and bear the UL label.
   C. Equipment installer shall attend a controls coordination meeting with the Section 15900 contractor as described in 15900.

IV. Submittals
   A. Provide shop drawings on all piping and fittings as described in Section 230100 - 1.04.

Part 2 - Products

I. Air Cooled Condensing Unit
   A. The air cooled condensing unit shall be provided and installed of the type and capacities as shown on the drawings and specified herein. The matching systems shall be manufactured by the manufacturer shown on the drawings. Acceptable manufacturers include:
      1. Trane
      2. Carrier
      3. Daikin
      4. York.

II. Condenser
   A. Air cooled condenser coils shall have aluminum fins mechanically bonded to seamless copper tubes, cleaned, dehydrated, sealed, leak tested at 150 psig and pressure tested at 450 psig.

B. Condenser fans shall be propeller type with PVC coated steel wire safety guards, balanced statically and dynamically, and shall discharge vertically.

C. Condenser fan motors shall have inherent overcurrent protection.

D. Provide metal hail guards to protect the condenser coil from damage.

E. Compressors - Shall be scroll hermetic type with a maximum speed of 3500 rpm, or rotary screw, serviceable and shall have an automatically reversible oil pump and operating oil charge. Compressors shall be equipped with suction and discharge shutoff valves and shall be mounted on individual spring vibration isolators. Each compressor motor shall be cooled by suction gas passing around the motor windings and shall be thermally protected with manual restart after thermal or pressure overload stoppage. Each compressor shall be equipped with an insert type crankcase heater to control oil dilution during shutdown. Cycles per hour per compressor shall not exceed six.

F. Refrigeration Circuit - Each refrigeration circuit shall include: hot gas muffler, combination moisture indicator and sight glass, replaceable core refrigerant filter drier, liquid line solenoid valve, expansion valve, suction and discharge pressure gauges with manual shutoff valves, high side pressure relief device, and charging valve.

G. Controls

1. Unit controls, including microprocessor, shall be factory mounted and wired in a weatherproof enclosure with hinged access doors for easy access. The controls shall include automatic lead-lag except where noted, pumpdown at beginning and end of every circuit cycle, loss-of-charge protection, inherent low water flow protection, low chilled water temperature safety, low- and high-suction superheat protection, low oil pressure protection for each circuit, ground current protection for each compressor, low control voltage to unit, current limit, field power and control circuit terminal blocks, compressor and fan motor circuit breakers, ON/OFF switch, replaceable relay board, individual solid-state compressor protection board, leaving chilled water set point board, diagnostic digital display module, a microprocessor board and a temperature reset board. The chiller shall be capable of sending a chill water pump run request to the building automation system.
2. Unit control capacity is based upon leaving water temperature and will be compensated by return water temperature.
3. Minimum number of capacity control steps shall be as shown in the equipment schedule.
4. Provide a definite purpose magnetic contactor for each compressor.

5. Calibrated circuit breakers shall be factory installed for each compressor, shall be manual reset and ambient insensitive, and shall open all three phases should an overload occur on any phase.
6. Unit primary electrical power supply shall be connected to a single point with lugs sized for specified conductors.
7. Control voltage shall be provided by a factory installed integral control transformer.
8. Heat tracing for exterior piping shall be provided by a separate 120 volt, single phase power supply.
9. Provide a barrel freeze alarm output for connection to the BAS.

H. Condenser shall be capable of operating at ambient air temperatures down to 0 deg F without the use of glycol or any other type of antifreeze. Condensers that do not meet this requirement are not acceptable.

I. Flow switches- switches for flow conformation shall be provided. Switches shall be paddle type with stainless steel bellows and paddle. Switches shall be suitable for outdoor installation.

Part 3 - Execution

I. Factory Start-up- The manufacturer shall supply complete factory start-up by a factory approved start-up agent.

II. Installation - The chiller shall be installed in accordance with the manufacturer's recommendations.

III. Install isolation valves on evaporator water inlet and outlet at chiller.

IV. Install thermometers on evaporator water inlet and outlet at chiller.

V. Isolation - Provide spring isolators as recommended by chiller manufacturer.

VI. Pipe Connections - The machine shall have water boxes or the contractor shall provide flanged pipe connections in the piping adjacent to the machine to allow removal of headers for inspection, cleaning or removal of tubes.

VII. Provide an engraved nameplate permanently affixed to the front of the control cabinet (inside of cabinet for outdoor locations) with the following information.

UNIT #	*(unit number)*

INSTALLED BY:	*(contracting company's name)*
WARRANTY EXPIRES:	*(month/day/year)*
COMPRESSOR WARRANTY EXPIRES:	*(month/day/year)*

END OF SECTION

Part 1 - General

I. General

A. The Bidding and Contract Requirements, Division 1 -General Requirements, Section 230100 - General Provisions, and Section 230500 - Basic Materials and Methods, shall apply to this section.

II. Scope

A. The work covered under this section shall include the following:

1. Complete mini-split system including equipment, piping, and controls. System shall be a mini-split air conditioning system or heat pump sytem. The system will utilize an air cooled condensing/heat pump type unit supplying a maximum of four indoor fan coil units with combinations of outdoor units 1 - 15 ton capacity at one time for 208-230V/ 3 Phase service.
2. The mini-split system shall be a cooling only air conditioning system or cooling and heating heat pump system. The mini-split system shall consist of an outdoor unit, high efficiency unit designed for minimum piping and maximum design flexibility, indoor units, and controls by the equipment manufacturer. Indoor units shall be capable of operating in either heating or cooling only depending on the cycle setting of the outdoor unit.
3. The mini-split system piping system shall be designed by a manufacturer's certified designer. If Basis-of-Design system is not used, contractor shall submit fully revised piping layout to engineer, complete with revised locations and quantities of units. Revised piping layout shall be submitted with equipment submittal for review and approval by engineer. Revised piping layout shall not affect performance of indoor or outdoor units. The contractor is responsible for all costs associated with additional review required by engineer.
4. The mini-split system piping system shall be installed by a manufacturer's certified contractor with a minimum of 10 years of successful system installations. Installer shall be approved by PGCPS prior to construction.
5. The installing contractor shall be trained and certified at the manufacturer's training facility prior to installation, start-up, and commissioning. Submit for review the installation contractor's certification from the manufacturer. This certification shall include the company certification as well as certifications for each individual contractor which will be working on this project.

6. The refrigeration piping system shall be provided, installed, tested, evacuated, and charged.

III. Quality Assurance

A. Manufacturers Field Service - Engage a factory-authorized service representative to inspect field assembled components and equipment installation, including connections, and to assist in field testing.

B. The units shall be listed by Electrical Laboratories (ETL) and bear the ETL label. All wiring shall be in accordance with the National Electrical Code (NEC). The units shall be manufactured in a facility registered to ISO 9001 and ISO14001.

C. The refrigeration piping system shall be provided, installed, tested, evacuated and charged in accordance with the manufacturer's recommendations, ANSI, ASHRAE, and ARI's Safety Code for Mechanical Refrigeration, state and local codes.

D. Perform the following field tests and inspections and prepare test reports:

1. Leak Test - After installation, charge system and test for leaks. Repair leaks and retest until no leaks exist.
2. Operational Test - After electrical circuitry has been energized, start units to confirm proper motor rotation and unit operation.
3. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.

E. Remove and replace malfunctioning units and retest as specified above.

F. Equipment installer shall attend a controls coordination meeting with the Section 230923 contractor.

IV. Submittals

A. Provide shop drawings on this equipment as described in Section 15010, 1.04. The controls coordination meeting described in 230923 shall be held before the shop drawings are submitted.

Part 2 - Products

I. Manufacturers

A. Manufacturers - Provide products by one of the following:

1. Daikin
2. Mitsubishi
3. Samsung
4. Carrier

B. Coordinate any changes from the basis of design with all associated trades. Any additional costs associated with the alternate equipment shall be covered by the equipment manufacturer. No additional costs shall be incurred by the Owner.

II. Refrigerant Components

A. The equipment specified in this section shall operate with refrigerant R410A - no exceptions or substitutions.

B. The system shall utilize fully modulating electronic expansion valves.

C. Refrigerant Piping

1. The refrigerant piping system shall be provided complete and installed in accordance with the manufacturer's recommendations and as specified herein and the requirement of 232300. The size of the refrigerant pipes shall be obtained from the equipment manufacturer unless otherwise shown on the drawings.
2. Pipe, Fittings, and Accessories - The pipe shall be type ACR 'L' copper refrigerant tubing with hard wrought copper fittings. Pipe sized ½ inch and larger shall be hard drawn. Pipe sized 3/8 inch and smaller can either be hard or soft drawn. All of the joints shall be brazed with a filler material that complies with AWS classification BCuP-5. Use type 'L' copper tubing to pipe the relief valve discharge to the outside.
3. Condensate Drain Piping - Shall be type 'L' copper tubing.
4. Pipe Hangers and Supports - Shall be as required in Section 230500.
5. All refrigerant lines shall be insulated from the outdoor unit to the indoor terminal units as shown in Section 230700.
6. The system shall be capable of operating with refrigerant piping lengths as specified by equipment manufacturer, without any oil traps or additional equipment. The vertical difference shall not exceed a maximum of 100 feet where the outdoor unit is located below the indoor unit.

III. Heat Pump/Condensing Unit

A. The outdoor unit will have air cooled heat exchange coils constructed from copper tubing with aluminum fins. The coils will be set in a vertical formation with air being drawn in through three sides of the unit and discharged out of the top of the unit. The systems will have fan(s) mounted adjacent to the coils.

B. The outdoor unit will have one inverter controlled hermetic compressor. The system shall use a control sequence to ensure that indoor loads are matched to compressor capacity control.

C. The refrigeration process of the outdoor unit will be maintained by pressure and temperature sensors controlling solenoid valves check valves and bypass valves. The heating or cooling mode of the outdoor unit will be controlled using a combination of two- and three-way valves which will reverse the cycle of the refrigerant to change the mode of the outdoor unit.

D. The mini-split heat pump/air conditioning system shall consist of 1-4 evaporators using PID control and inverter driven outdoor unit. The unit shall consist of direct expansion (DX), air-cooled heat pump air conditioning system, variable speed driven compressor single zone split system. The outdoor unit may connect an indoor evaporator capacity of 50-130% to that of the outdoor condensing unit capacity. Each indoor unit shall be capable of operating separately with individual temperature control.

E. The outdoor unit shall be interconnected to indoor unit types specified in this section. The indoor units shall be connected to the outdoor units utilizing the specialized piping joints and headers provided by the equipment manufacturer.

F. General - The outdoor unit is designed specifically for use with manufacturers components:

1. Refrigerant: R410A.
2. The outdoor unit shall be factory assembled and pre-wired with all necessary electronic and refrigerant controls. The refrigeration circuit of the condensing unit shall consist of a compressor, motors, fans, condenser coil, electronic expansion valve, solenoid valves, four-way valve, distribution headers, capillaries, filters, shut off valves, oil separators, service ports, liquid receivers and accumulators.
3. Both liquid and suction lines shall be individually insulated between the outdoor and indoor units.
4. The outdoor unit shall be wired and piped with outdoor unit access from left, right, rear, or bottom.
5. The connection ratio of indoor units to outdoor unit shall be 50% to 130%.
6. The outdoor unit shall have a sound rating no higher than 63 dB(A).
7. The system shall automatically restart operation after a power failure and shall not cause any settings to be lost, thus eliminating the need for re-programming.
8. The outdoor unit shall be modular in design and should allow for side-by-side installation with minimal spacing.
9. The following safety devices shall be included on the condensing unit: high pressure switch, crankcase heaters, high pressure switch, overload relay, inverter

overload protector, thermal protectors for compressor and fan motors, and over current protection for the inverter. To ensure the liquid refrigerant does not flash when supplying to the various fan coil units, the circuit shall be provided with a sub-cooling feature. Oil recovery cycle shall be automatic, occurring one hour after system start up, every six hours of system operation or as required to maintain oil levels at the system condensing unit.

10. Heat pump type outdoor units shall operate in heating mode to -4F dry bulb ambient temperature without additional ambient controls.

G. Unit Cabinet - The outdoor unit model shall be completely weatherproof and corrosion resistant. The outdoor unit will be constructed from steel plate and treated with acrylic paint, or galvanized steel, bonderized and finished with a powder coated baked enamel. Provide outdoor unit with hail guards for exposed fins (HailStop Hail Guard Netting, or equal as approved by PGCPS).

H. Fan

1. The condensing unit shall consist of a propeller type, direct-drive fan motor that has multiple speed operation via a DC inverter.
2. The fan motors shall have inherent protection and permanently lubricated bearings and be mounted.
3. The fan motors shall be provided with a fan guard to prevent contact with moving parts.

I. Condenser Coil - The condenser coil shall be manufactured from copper tubes expanded into aluminum fins to form a mechanical bond.

J. Compressor

1. The compressor shall be variable speed control capable of changing the speed to follow the variations in total cooling load as determined by the suction gas pressure as measured in the condensing unit.
2. The inverter driven compressor in each condensing unit shall be a high efficiency DC, hermetically sealed compressor.
3. The capacity control range shall be a minimum of 20% to 100% of total capacity.
4. Each compressor shall be equipped with a crankcase heater, high pressure safety switch, and internal thermal overload protector.
5. Oil separators shall be standard with the equipment together with an oil balancing circuit.
6. The compressor shall be mounted to avoid the transmission of vibration.

K. Electrical

1. The power supply to the outdoor unit shall be 208/230 volts, 3 phase, 60 hertz with a voltage range of 187 volts to 253 volts.
2. The control wiring shall be a two-wire multiplex transmission system, making it possible to connect multiple indoor units to one outdoor unit with one 2-cable shielded communications wire.

IV. Indoor Air Handling Units

A. It shall be possible for the total connected capacity of the indoor units to be between 50 and 130% of the capacity of the outdoor unit.

B. Each indoor unit will have a heat exchanger which shall be constructed from copper tubing with aluminum fins. The flow of refrigerant through the heat exchanger will be controlled by an electronic proportional expansion valve. This valve will be controlled by two pipe thermistors, a return air and discharge air thermistor and shall be capable of controlling the variable capacity of the indoor unit between 25% and 100%.

C. Each indoor unit shall have an operating voltage of 208-230V/1 phase/60Hz. The indoor unit shall supply demand capacity information to the outdoor unit via its control algorithm.

D. Indoor units shall not be the primary source of dehumidification in a large capacity designed space (classrooms, etc.), nor should indoor units be the primary source of ventilation. A DOAS or outside air processing unit shall be installed in conjunction with a variable refrigerant flow system.

E. Unconditioned outside air shall not be directly introduced to indoor units. Indoor units providing ventilation shall be supplied from a DOAS or outside air processing unit.

F. Four (4) Way Ceiling Cassette Indoor Unit

1. The indoor unit shall be a ceiling cassette fan coil unit for installation into the ceiling cavity equipped with an air panel grille to be connected to indoor unit as scheduled and specified in this section. The indoor unit shall have a four-way air distribution type, impact resistant and washable decoration panel. The supply air shall be distributed via motorized louvers which can be horizontally and vertically adjusted from 0 degree to 90 degree angle.
2. Construction
   a) The indoor unit shall be completely factory assembled and tested. The unit shall include factory wiring, piping, electronic proportional expansion valve, control circuit board, fan motor thermal protector, condensate drain pan,

self-diagnostics, auto-restart function, 3-minute fused time delay, and test run switch.

b) The 4-way supply airflow shall be field modifiable to 3-way and 2-way airflow to accommodate various installation configurations including corner installations.

c) Return air shall be through the concentric panel, which shall include a filter.

d) The indoor unit shall be equipped with a condensate pan.

e) The indoor unit shall be equipped with a return air thermistor.

f) The indoor unit shall be separately powered with 208-230V/1 phase/60Hz.

g) The voltage range shall be 253 volts maximum and 187 volts minimum.

h) The indoor unit shall be equipped with a condensate pump capable of providing at least 19" of lift.

3. Unit Cabinet

a) The cabinet shall be space saving and shall be located into the ceiling.

b) The airflow of the unit shall have the ability to shut down one or two sides allowing for simpler corner installation.

c) Provide fresh air intake kit where used and indicated on the drawings. A branch duct knockout shall exist for branch ducting supply air.

4. Fan

a) The fan shall be direct-drive turbo fan type with statically and

b) dynamically balanced impeller with high and low fan speeds available.

c) The indoor unit shall operate with a power supply of 208/230 volts, 1 phase, 60 hertz. The allowable voltage range shall be 187 to 253 volts.

d) The airflow rate shall be adjustable and have high, medium and low fan settings.

e) The fan motor shall be thermally protected.

5. Filter - The return air shall be filtered by means of a long-life filter.

6. Coil

a) Coils shall be of the direct expansion type constructed from copper tubes expanded into aluminum fins to form a mechanical bond.

b) A condensate pan shall be located under the coil. The condensate pan shall have a built in high level safety alarm to shut down the unit.

c) A thermistor shall be located on the liquid and gas line.

G. One (1) Way Ceiling Cassette Indoor Unit

1. The indoor unit shall be a ceiling cassette fan coil unit for installation into the ceiling cavity equipped with an air panel grille to be connected to indoor unit as scheduled and specified in this section. The indoor unit shall have a one-way air distribution type, impact resistant and washable decoration panel. The supply air shall be distributed via motorized louvers which can be horizontally and vertically adjusted from 0 degree to 90 degree angle.
2. Construction
   a) The indoor unit shall be completely factory assembled and tested. The unit shall include factory wiring, piping, electronic proportional expansion valve, control circuit board, fan motor thermal protector, condensate drain pan, self-diagnostics, auto-restart function, 3-minute fused time delay, and test run switch.
   b) Return air shall be through the concentric panel, which shall include a filter.
   c) The indoor units shall be equipped with a condensate pan.
   d) The indoor units shall be equipped with a return air thermistor.
   e) The indoor unit shall be separately powered with 208-230V/1 phase/60Hz.
   f) The voltage range shall be 253 volts maximum and 187 volts minimum.
   g) The indoor unit shall be equipped with a condensate pump capable of providing at least 23" of lift.
3. Unit Cabinet
   a) The cabinet shall be space saving and shall be located into the ceiling.
   b) Provide fresh air intake kit where used and indicated on the drawings. A branch duct knockout shall exist for branch ducting supply air.
4. Fan
   a) The fan shall be direct-drive fan type with statically and dynamically balanced impeller with high and low fan speeds available.
   b) The indoor unit shall operate with a power supply of 208/230 volts, 1 phase, 60 hertz. The allowable voltage range shall be 187 to 253 volts.
   c) The airflow rate shall be adjustable and have high, medium and low fan settings.
   d) The fan motor shall be thermally protected.
5. Filter - The return air shall be filtered by means of a long-life filter.
6. Coil

a) Coils shall be of the direct expansion type constructed from copper tubes expanded into aluminum fins to form a mechanical bond.
b) A condensate pan shall be located under the coil. The coil in the condensate pan shall have a built in high level safety alarm to shut down the unit.
c) A thermistor shall be located on the liquid and gas line.

V. Controls
A. The units shall have controls provided with the unit by the manufacturer to perform input functions necessary to operate the system.
B. Computerized PID control shall be used to maintain room temperature within 1F of setpoint.

VI. Controllers
A. Physical Characteristics - The control system shall be a neutral color plastic material with a Liquid Crystal Display (LCD).
B. Electrical Characteristics
1. General - From each circuit board to the controls, the electrical voltage shall be 16 - 24 volts DC.
2. Wiring: Control wiring shall be installed in a daisy chain configuration from indoor unit to indoor unit then to the outdoor unit. Control wiring shall run from the indoor unit terminal block to the specific controller for that unit.
3. Wiring Size: The wire shall be a shielded, size AWG16-2 or AWG 18-2.
C. Individual Zone Controller
1. The simplified wired remote controller shall be able to control 1 group (maximum of 16 fan coil units).
2. The simplified wired remote controller shall have the following features:
a) Operation - Start/Stop, Operation Mode, Temperature Setting, 60F - 90F Set Point Range, Fan Speed, Airflow Direction.
b) Monitoring - Status, malfunction flashing, malfunction content, filter sign, operation mode, temperature setting, permit/prohibit selection, fan speed, airflow direction.
c) Scheduling - ON/OFF Timer.
d) Control Management - Field Setting Mode, Group Setting, Auto Restart.
D. Centralized Controller
1. The Centralized Controller shall be capable of controlling a maximum of 8 indoor units across one outdoor unit. Centralized controller shall have a color LCD

touch-screen. The Centralized Controller shall support system configuration, daily/weekly scheduling, monitoring of operation status, night setback settings, free contact interlock configuration and malfunction monitoring. The Centralized Controller shall have five basic operation controls which can be applied to an individual indoor unit, a group of all associated indoor units (collective batch operation). This basic set of operation controls for the Centralized controller shall include on/off, operation mode selection (cool, heat, auto, dry, and fan), temperature setting, fan speed setting, and airflow direction setting. The Centralized Controller shall allow the user to define both daily and weekly schedules with operations consisting of ON/OFF, mode selection, temperature setting, air flow (vane) direction, fan speed, and permit/prohibit of remote controllers.

E. BACnet Interface to Building Automation System

1. The cooling and heating BACnet7 interface shall be compliant with BACnet7 Protocol (ANSI/ASHRAE 135-2004) and be Certified by the (BTL) BACnet7 Testing Laboratories. The BACnet7 interface shall support BACnet Broadcast Management (BBMD). The BACnet7 interface shall support a maximum of 8 indoor units. Operation and monitoring points include, but are not limited to, space temperature, space temperature setpoint, on/off, operation mode, fan speed, prohibit remote controller, filter sign reset, alarm state, error code and error address.

F. Control Panel

1. This contractor shall deliver the components of the centralized controllers and the BACnet interface devices to the Division 238923 contractor. It is the responsibility of the Division 238923 contractor to construct the control panel, housing these components in compliance with 238923 specification 2.02F.

G. Indoor Unit Sequence of Operations

1. On/Off Control - the indoor units shall be commanded ON/OFF by the BAS. If all indoor units are off, the outdoor unit shall turn off. With the Night Setback Function/Mode, the system shall cycle on during unoccupied periods as needed to maintain unoccupied temperature setpoint of 55°F (adjustable).
2. Space Temperature Control - the indoor unit shall modulate its internal linear expansion valve (LEV) to maintain the temperature setpoint via the indoor unit's internal controls.
    a) The setpoint is provided and adjustable through the BAS interface.

b) The temperature setpoint provided through the BAS interface shall additionally be adjustable to a maximum of ±2°F from that setpoint using the room controller.

3. Mode Control
   a) Auto Mode
      (1) The indoor unit shall determine whether it should be in auto-heat mode or auto-cool mode based on space temperature relative to temperature setpoint. If the indoor unit is in auto-heat mode, the indoor unit control board shall follow the heat mode sequence. If the indoor unit is in auto-cool mode, the indoor unit control board shall follow the cool mode sequence.
      (2) The indoor unit shall switch from auto-heat to auto-cool when the space temperature rises above and remains above the temperature setpoint plus the dead band for 3 minutes.
      (3) The indoor unit will switch from auto-cool to auto-heat when the space temperature drops below and remains below the temperature setpoint minus the dead band for 3 minutes.
   b) Heating Mode - the indoor unit shall modulate its linear expansion valve (LEV) to maintain temperature setpoint of 71°F (adjustable).
   c) Cooling Mode - the indoor unit shall modulate its linear expansion valve (LEV) to maintain temperature setpoint of 74°F (adjustable).

Part 3 - Execution

I. Installation
   A. Install all piping, fittings, and insulation to meet manufacturers requirements. Install units level and plumb. Condenser fan components shall be installed using manufacturer's standard mounting devices securely fastened to building structure (Thybar TEMS or approved equal). Install and connect refrigerant tubing and fittings. Pipe penetrations through the roof shall be installed with a pipe curb assembly (Thybar TCC or approved equal).
   B. Installer shall supply isolation ball valves for zoned refrigerant isolation. Installer shall supply Isolation ball valves with Schrader connection for isolating refrigerant charge and evacuation at each connected air handling unit and condensing unit. Isolation ball valves, with Schrader connection, are required for instances of air handling unit isolation for troubleshooting, repair, or replacement without affecting the remainder of

the system. Isolation ball valves with Schrader connection are also required at condensing unit connection to isolate unit for troubleshooting, repair or replacement and as required to provide partial capacity Heating/Cooling in the instance of a failure of one of the multiple outdoor unit (condensing unit) compressors.

C. During brazing an inert gas (such as nitrogen) shall be continuously passed through the system at a rate sufficient to maintain an oxygen free environment to prevent the formation of copper oxide scale. After piping has been completed, the refrigerant piping system shall be pressure tested at a pressure of 300 psi on the high side and 150 psi on the low side. The pressure shall be maintained on the system for a minimum of 24 hours. The system shall be evacuated when the surrounding ambient air is not less than 60 F. If the temperature is less, auxiliary heat must be provided to insure proper evacuating conditions. A minimum vacuum of 300 Microns of Hg. shall be pulled on the system and maintained for 24 hours. The vacuum pump displacement shall be not less than 2 cfm for up to 15 tons. The system shall be charged as recommended by the equipment manufacturer.

D. Electrical wiring required by this section, both high and low voltage, shall comply with the Division 16 requirements.

E. Start Up - Engage manufacturer or factory-authorized service representative to perform startup service. Manufacturer shall provide on-site startup and commissioning assistance through job completion. Complete installation and startup checks according to manufacturers written instructions. This shall include a factory startup for factory provided control devices as well as configuring control points for other DO devices. Service representative shall completely configure all control devices and establish remote internet connectivity with the owner's energy management department web server.

F. Demonstration - Engage manufacturer or factory-authorized service representative to demonstrate and instruct the owner's maintenance personnel of the operation and functionality of the system.

G. Training - Engage manufacturer or factory authorized service representative to train owner's maintenance personnel for a period of 2 days, to adjust, operate and maintain individual units and complete system. This shall also include training of the owner's energy management department representatives as to establish control system programming, scheduling routines, alarm reporting, system topography, communication

protocols and password level assignments. This training shall take place on-site and at the owner's maintenance facility.

H. The indoor air handling and outside condensing units shall be installed in accordance with the manufacturer's recommendations and as shown on the drawings. The first unit installed will be considered the typical mock up and shall require notification, inspection and approval by the designated owner representative and/or architect and engineer before any additional installations will be allowed.

I. Provide laminated as built drawings and manufacturer's refrigeration piping layout showing typical layout of the system. This shall include the actual room numbers, not from construction documents, and addressing scheme. Laminate shall have minimum thickness of 10 mil. Drawing size shall be 11"x17". Provide multiple drawings should zones not fit into one page.

J. Refrigerant distribution (BC) controllers shall include a label affixed to the controllers which identifies the room or rooms served for each line set on the controller. Use the actual room numbers and not from construction documents.

K. Provide a typed list of all the different units, their filter sizes, and belt sizes to be included in the O&M manuals. The list shall include the unit designation, filter size, belt size, and the number of filters and belts required for each unit. In addition to this, submit to the Owner two additional copies of the list, distributed to the PGCPS project manager of record and PGCPS Building Services.

L. Warranty Tag - The Contractor shall attach an engraved weatherproof Guarantee or Warranty tag to the exterior of each condensing unit. Tag is to be screwed or riveted to unit. Identification tag shall be black with engraved 3" white letters which reads:

UNIT #	*(unit number)*
INSTALLED BY:	*(contracting company's name)*
WARRANTY EXPIRES:	*(month/day/year)*
COMPRESSOR WARRANTY EXPIRES:	*(month/day/year)*

END OF SECTION

Part 1 - General

I. General

A. The Bidding and Contract Requirements, Division 1 -General Requirements, Section 230100 - General Provisions, and Section 230500 - Basic Materials and Methods, shall apply to this section.

II. Scope

A. The work covered under this section shall include the following:

1. Complete variable refrigerant flow system including equipment, piping, and controls. System shall be a VRF (variable refrigerant flow) multi split air conditioning system. The system will utilize an air cooled condensing unit supplying a maximum of forty indoor fan coil units with combinations of outdoor units 3 - 25 ton capacity with a maximum of 2 outdoor units connected at one time for 208-230V/ 3 Phase service.
2. The VRF (Variable Refrigerant Flow) system shall be a simultaneous cooling and heating heat pump system. The VRF system shall consist of an outdoor unit, high efficiency heat recovery units designed for minimum piping and maximum design flexibility, indoor units, and controls by the equipment manufacturer. Each indoor unit shall be independently capable of operating in either heating or cooling mode regardless of the mode of other indoor units.
3. The variable refrigerant flow system piping system shall be designed by a manufacturer's certified designer. If Basis-of-Design system is not used, contractor shall submit fully revised piping layout to engineer, complete with revised locations and quantities of heat recovery units. Revised piping layout shall be submitted with equipment submittal for review and approval by engineer. Revised piping layout shall not affect performance of indoor or outdoor units. The contractor is responsible for all costs associated with additional review required by engineer.
4. The variable refrigerant flow system piping system shall be installed by a manufacturer's certified contractor with a minimum of 10 years of successful system installations. Installer shall be approved by PGCPS prior to construction.
5. The installing contractor shall be trained and certified at the manufacturer's training facility prior to installation, start-up, and commissioning. Submit for review the installation contractor's certification from the manufacturer. This certification shall

include the company certification as well as certifications for each individual contractor which will be working on this project.

6. The refrigeration piping system shall be provided, installed, tested, evacuated, and charged.

III. Quality Assurance

A. Manufacturers Field Service - Engage a factory-authorized service representative to inspect field assembled components and equipment installation, including connections, and to assist in field testing.

B. The units shall be listed by Electrical Laboratories (ETL) and bear the ETL label. All wiring shall be in accordance with the National Electrical Code (NEC). The units shall be manufactured in a facility registered to ISO 9001 and ISO14001.

C. The refrigeration piping system shall be provided, installed, tested, evacuated and charged in accordance with the manufacturer's recommendations, ANSI, ASHRAE, and ARI's Safety Code for Mechanical Refrigeration, state and local codes.

D. Perform the following field tests and inspections and prepare test reports:

1. Leak Test - After installation, charge system and test for leaks. Repair leaks and retest until no leaks exist.
2. Operational Test - After electrical circuitry has been energized, start units to confirm proper motor rotation and unit operation.
3. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.

E. Remove and replace malfunctioning units and retest as specified above.

F. Equipment installer shall attend a controls coordination meeting with the Section 15900 contractor as described in 15900, 1.03.

IV. Submittals

A. Provide shop drawings on this equipment as described in Section 15010, 1.04. The controls coordination meeting described in 15900 shall be held before the shop drawings are submitted.

Part 2 - Products

I. Manufacturers

A. Manufacturers - Provide products by one of the following:

1. Daikin
2. Mitsubishi

3. Samsung
4. Carrier

B. Coordinate any changes from the basis of design with all associated trades. Any additional costs associated with the alternate equipment shall be covered by the equipment manufacturer. No additional costs shall be incurred by the Owner.

II. Refrigerant Components

A. The equipment specified in this section shall operate with refrigerant R410A - no exceptions or substitutions.

B. The system shall utilize fully modulating electronic expansion valves.

C. Refrigerant Piping

1. The refrigerant piping system shall be provided complete and installed in accordance with the manufacturer's recommendations and as specified herein and the requirement of 232300. The size of the refrigerant pipes shall be obtained from the equipment manufacturer unless otherwise shown on the drawings.
2. Pipe, Fittings, and Accessories - The pipe shall be type ACR 'L' copper refrigerant tubing with hard wrought copper fittings. Pipe sized ½ inch and larger shall be hard drawn. Pipe sized 3/8 inch and smaller can either be hard or soft drawn. All of the joints shall be brazed with a filler material that complies with AWS classification BCuP-5. Use type 'L' copper tubing to pipe the relief valve discharge to the outside.
3. Condensate Drain Piping - Shall be type 'L' copper tubing.
4. Pipe Hangers and Supports - Shall be as required in Section 230500.
5. All refrigerant lines shall be insulated from the outdoor unit to the indoor terminal units as shown in Section 230700.
6. The system shall be capable of operating with refrigerant piping up to 492 equivalent feet, a total combined length of 984 feet of piping between the condensing and fan coil units with 164 feet maximum vertical difference, without any oil traps or additional equipment. The vertical difference shall not exceed a maximum of 131 feet where the outdoor unit is located below the indoor unit.

III. Heat Pump Condensing Unit

A. The outdoor unit will have air cooled heat exchange coils constructed from copper tubing with aluminum fins. The coils will be set in a vertical formation with air being drawn in through three sides of the unit and discharged out of the top of the unit. The systems will have a single fan mounted on top of the coils.

B. The outdoor unit will have one inverter controlled hermetic compressor. Partial capacity cooling/heating capability must be available. The system shall use a control sequence to ensure that indoor loads are matched to compressor capacity control.

C. The refrigeration process of the outdoor unit will be maintained by pressure and temperature sensors controlling solenoid valves check valves and bypass valves. The heating or cooling mode of the outdoor unit will be controlled using a combination of two- and three-way valves which will reverse the cycle of the refrigerant to change the mode of the outdoor unit.

D. The variable capacity, heat pump air conditioning system shall be variable refrigerant flow split system. The system shall consist of multiple evaporators using PID control and inverter driven outdoor unit. The unit shall consist of direct expansion (DX), air-cooled heat pump air conditioning system, variable speed driven compressor multi zone split system. The outdoor unit may connect an indoor evaporator capacity of 50-130% to that of the outdoor condensing unit capacity. Each indoor unit shall be capable of operating separately with individual temperature control.

E. The outdoor unit shall be interconnected to indoor unit types specified in this section. The indoor units shall be connected to the outdoor units utilizing the specialized piping joints and headers provided by the equipment manufacturer.

F. General - The outdoor unit is designed specifically for use with manufacturers components:

1. Refrigerant: R410A.
2. The outdoor unit shall be factory assembled and pre-wired with all necessary electronic and refrigerant controls. The refrigeration circuit of the condensing unit shall consist of a compressor, motors, fans, condenser coil, electronic expansion valve, solenoid valves, four-way valve, distribution headers, capillaries, filters, shut off valves, oil separators, service ports, liquid receivers and accumulators.
3. Both liquid and suction lines shall be individually insulated between the outdoor and indoor units.
4. The outdoor unit shall be wired and piped with outdoor unit access from left, right, rear, or bottom.
5. The connection ratio of indoor units to outdoor unit shall be 50% to 130%.
6. The outdoor unit shall have a sound rating no higher than 63 dB(A).
7. The system shall automatically restart operation after a power failure and shall not cause any settings to be lost, thus eliminating the need for re-programming.

8. The outdoor unit shall be modular in design and should allow for side-by-side installation with minimal spacing.
9. The following safety devices shall be included on the condensing unit: high pressure switch, crankcase heaters, high pressure switch, overload relay, inverter overload protector, thermal protectors for compressor and fan motors, and over current protection for the inverter. To ensure the liquid refrigerant does not flash when supplying to the various fan coil units, the circuit shall be provided with a sub-cooling feature. Oil recovery cycle shall be automatic, occurring one hour after system start up, every six hours of system operation or as required to maintain oil levels at the system condensing unit.
10. The outdoor unit shall operate in heating mode to -4F dry bulb ambient temperature without additional ambient controls.

G. Unit Cabinet - The outdoor unit model shall be completely weatherproof and corrosion resistant. The outdoor unit will be constructed from steel plate and treated with acrylic paint, or galvanized steel, bonderized and finished with a powder coated baked enamel.

H. Fan
1. The condensing unit shall consist of a propeller type, direct-drive fan motor that has multiple speed operation via a DC inverter.
2. The fan motors shall have inherent protection and permanently lubricated bearings and be mounted.
3. The fan motors shall be provided with a fan guard to prevent contact with moving parts.

I. Condenser Coil - The condenser coil shall be manufactured from copper tubes expanded into aluminum fins to form a mechanical bond.

J. Compressor
1. The compressor shall be variable speed control capable of changing the speed to follow the variations in total cooling load as determined by the suction gas pressure as measured in the condensing unit.
2. The inverter driven compressor in each condensing unit shall be a high efficiency DC, hermetically sealed compressor.
3. The capacity control range shall be a minimum of 20% to 100% of total capacity.
4. Each compressor shall be equipped with a crankcase heater, high pressure safety switch, and internal thermal overload protector.

5. Oil separators shall be standard with the equipment together with an oil balancing circuit.
6. The compressor shall be mounted to avoid the transmission of vibration.

K. Electrical
1. The power supply to the outdoor unit shall be 208/230 volts, 3 phase, 60 hertz with a voltage range of 187 volts to 253 volts.
2. The control wiring shall be a two-wire multiplex transmission system, making it possible to connect multiple indoor units to one outdoor unit with one 2-cable shielded communications wire.

IV. Heat Recovery Units For Simultaneous Heating And Cooling Systems

A. General - The Heat Recovery Unit shall be designed for use with VRF equipment of the same manufacturer. These units shall be equipped with a circuit board that interfaces to the controls system and shall perform all functions necessary for operation. The unit shall have a galvanized steel finish. The heat recovery unit shall be completely factory assembled, piped, and wired. Each unit shall be run tested at the factory. This unit shall be mounted indoors. The sum of connected capacity of all indoor air handlers shall range from 50% to 150% of rated capacity.

B. Unit Cabinet
1. The casing shall be fabricated of galvanized steel.
2. Each cabinet shall house a liquid-gas separator and multiple refrigeration control valves.
3. The unit shall house tube-in-tube heat exchangers.

C. Refrigerant - R410A refrigerant shall be required for Heat Recovery units in conjunction with outdoor unit systems.

D. Refrigerant Valves
1. The unit shall be furnished with multiple branch circuits which can individually accommodate up to 54,000 BTUH and/or three indoor units. Branches may be twinned to allow more than 54,000 BTUH.
2. Each branch shall have multiple two-position valves to control refrigerant flow for optimum efficiency.
3. Service shut-off valves shall be installed for each branch to allow service to any indoor unit without field interruption to overall system operation. Shut-off valves shall be full-port ball valves, rated at 700 PSIG, with a Schrader port.

4. Linear electronic expansion valves shall be used to control the variable refrigerant flow.

E. Integral Drain Pan - A integral condensate pan and drain, if required, shall be provided.

F. Electrical

1. The unit electrical power shall be 208/230 volts, 1 phase, 60 hertz.
2. The unit shall be capable of satisfactory operation within voltage limits of 187-228 volts (208V/60Hz) or 207-253V (230V/60Hz).
3. The Heat Recovery unit shall be controlled by integral microprocessors.
4. The control circuit between the indoor units and the outdoor unit shall be 24VDC completed using a 2-conductor, twisted pair shielded cable to provide total integration of the system.

V. Indoor Air Handling Units

A. It shall be possible for the total connected capacity of the indoor units to be between 50 and 130% of the capacity of the outdoor unit.

B. Each indoor unit will have a heat exchanger which shall be constructed from copper tubing with aluminum fins. The flow of refrigerant through the heat exchanger will be controlled by an electronic proportional expansion valve. This valve will be controlled by two pipe thermistors, a return air and discharge air thermistor and shall be capable of controlling the variable capacity of the indoor unit between 25% and 100%.

C. Each indoor unit shall have an operating voltage of 208-230V/1 phase/60Hz. The indoor unit shall supply demand capacity information to the outdoor unit via its control algorithm.

D. Indoor units shall not be the primary source of dehumidification in a large capacity designed space (classrooms, etc.), nor should indoor units be the primary source of ventilation. A DOAS or outside air processing unit shall be installed in conjunction with a variable refrigerant flow system.

E. Unconditioned outside air shall not be directly introduced to indoor units. Indoor units providing ventilation shall be supplied from a DOAS or outside air processing unit.

F. Four (4) Way Ceiling Cassette Indoor Unit

1. The indoor unit shall be a ceiling cassette fan coil unit for installation into the ceiling cavity equipped with an air panel grille to be connected to indoor unit as scheduled and specified in this section. The indoor unit shall have a four-way air distribution type, impact resistant and washable decoration panel. The supply air shall be

distributed via motorized louvers which can be horizontally and vertically adjusted from 0 degree to 90 degree angle.

2. Construction
   a) The indoor unit shall be completely factory assembled and tested. The unit shall include factory wiring, piping, electronic proportional expansion valve, control circuit board, fan motor thermal protector, condensate drain pan, self-diagnostics, auto-restart function, 3-minute fused time delay, and test run switch.
   b) The 4-way supply airflow shall be field modifiable to 3-way and 2-way airflow to accommodate various installation configurations including corner installations.
   c) Return air shall be through the concentric panel, which shall include a filter.
   d) The indoor unit shall be equipped with a condensate pan.
   e) The indoor unit shall be equipped with a return air thermistor.
   f) The indoor unit shall be separately powered with 208-230V/1 phase/60Hz.
   g) The voltage range shall be 253 volts maximum and 187 volts minimum.
   h) The indoor unit shall be equipped with a condensate pump capable of providing at least 19" of lift.
3. Unit Cabinet
   a) The cabinet shall be space saving and shall be located into the ceiling.
   b) The airflow of the unit shall have the ability to shut down one or two sides allowing for simpler corner installation.
   c) Provide fresh air intake kit where used and indicated on the drawings. A branch duct knockout shall exist for branch ducting supply air.
4. 4. Fan
   a) The fan shall be direct-drive turbo fan type with statically and
   b) dynamically balanced impeller with high and low fan speeds available.
   c) The indoor unit shall operate with a power supply of 208/230 volts, 1 phase, 60 hertz. The allowable voltage range shall be 187 to 253 volts.
   d) The airflow rate shall be adjustable and have high, medium and low fan settings.
   e) The fan motor shall be thermally protected.
5. Filter - The return air shall be filtered by means of a long-life filter.
6. Coil

a) Coils shall be of the direct expansion type constructed from copper tubes expanded into aluminum fins to form a mechanical bond.
b) A condensate pan shall be located under the coil. The condensate pan shall have a built in high level safety alarm to shut down the unit.
c) A thermistor shall be located on the liquid and gas line.

G. One (1) Way Ceiling Cassette Indoor Unit
1. The indoor unit shall be a ceiling cassette fan coil unit for installation into the ceiling cavity equipped with an air panel grille to be connected to indoor unit as scheduled and specified in this section. The indoor unit shall have a one-way air distribution type, impact resistant and washable decoration panel. The supply air shall be distributed via motorized louvers which can be horizontally and vertically adjusted from 0 degree to 90 degree angle.
2. Construction
a) The indoor unit shall be completely factory assembled and tested. The unit shall include factory wiring, piping, electronic proportional expansion valve, control circuit board, fan motor thermal protector, condensate drain pan, self-diagnostics, auto-restart function, 3-minute fused time delay, and test run switch.
b) Return air shall be through the concentric panel, which shall include a filter.
c) The indoor units shall be equipped with a condensate pan.
d) The indoor units shall be equipped with a return air thermistor.
e) The indoor unit shall be separately powered with 208-230V/1 phase/60Hz.
f) The voltage range shall be 253 volts maximum and 187 volts minimum.
g) The indoor unit shall be equipped with a condensate pump capable of providing at least 23" of lift.
3. Unit Cabinet
a) The cabinet shall be space saving and shall be located into the ceiling.
b) Provide fresh air intake kit where used and indicated on the drawings. A branch duct knockout shall exist for branch ducting supply air.
4. 4. Fan
a) The fan shall be direct-drive fan type with statically and dynamically balanced impeller with high and low fan speeds available.
b) The indoor unit shall operate with a power supply of 208/230 volts, 1 phase, 60 hertz. The allowable voltage range shall be 187 to 253 volts.

c) The airflow rate shall be adjustable and have high, medium and low fan settings.

d) The fan motor shall be thermally protected.

5. Filter - The return air shall be filtered by means of a long-life filter.

6. Coil

a) Coils shall be of the direct expansion type constructed from copper tubes expanded into aluminum fins to form a mechanical bond.

b) A condensate pan shall be located under the coil. The coil in the condensate pan shall have a built in high level safety alarm to shut down the unit.

c) A thermistor shall be located on the liquid and gas line.

VI. Controls

A. The units shall have controls provided with the unit by the manufacturer to perform input functions necessary to operate the system.

B. Computerized PID control shall be used to maintain room temperature within 1F of setpoint.

VII. Controllers

A. Physical Characteristics - The control system shall be a neutral color plastic material with a Liquid Crystal Display (LCD).

B. Electrical Characteristics

1. General - From each circuit board to the controls, the electrical voltage shall be 16 - 24 volts DC.

2. Wiring: Control wiring shall be installed in a daisy chain configuration from indoor unit to indoor unit then to the outdoor unit. Control wiring shall run from the indoor unit terminal block to the specific controller for that unit.

3. Wiring Size: The wire shall be a shielded, size AWG16-2 or AWG 18-2.

C. Individual Zone Controller

1. The simplified wired remote controller shall be able to control 1 group (maximum of 16 fan coil units).

2. The simplified wired remote controller shall have the following features:

a) Operation - Start/Stop, Operation Mode, Temperature Setting, 60F - 90F Set Point Range, Fan Speed, Airflow Direction.

b) Monitoring - Status, malfunction flashing, malfunction content, filter sign, operation mode, temperature setting, permit/prohibit selection, fan speed, airflow direction.

c) Scheduling - ON/OFF Timer.

d) Control Management - Field Setting Mode, Group Setting, Auto Restart.

D. Centralized Controller

1. The Centralized Controller shall be capable of controlling a maximum of 50 indoor units across multiple outdoor units. Centralized controller shall have a color LCD touch-screen. The Centralized Controller shall support system configuration, daily/weekly scheduling, monitoring of operation status, night setback settings, free contact interlock configuration and malfunction monitoring. The Centralized Controller shall have five basic operation controls which can be applied to an individual indoor unit, a group of indoor units (up to 50 indoor units), or all indoor units (collective batch operation). This basic set of operation controls for the Centralized controller shall include on/off, operation mode selection (cool, heat, auto, dry, and fan), temperature setting, fan speed setting, and airflow direction setting. The Centralized Controller shall allow the user to define both daily and weekly schedules with operations consisting of ON/OFF, mode selection, temperature setting, air flow (vane) direction, fan speed, and permit/prohibit of remote controllers.

E. BACnet Interface to Building Automation System

1. The cooling and heating BACnet7 interface shall be compliant with BACnet7 Protocol (ANSI/ASHRAE 135-2004) and be Certified by the (BTL) BACnet7 Testing Laboratories. The BACnet7 interface shall support BACnet Broadcast Management (BBMD). The BACnet7 interface shall support a maximum of 50 indoor units. Operation and monitoring points include, but are not limited to, space temperature, space temperature setpoint, on/off, operation mode, fan speed, prohibit remote controller, filter sign reset, alarm state, error code and error address.

F. Control Panel

1. This contractor shall deliver the components of the centralized controllers and the BACnet interface devices to the Division 15900 contractor. It is the responsibility of the Division 15900 contractor to construct the control panel, housing these components in compliance with 15900 specification 2.02F.

G. Indoor Unit Sequence of Operations

1. On/Off Control - the indoor units shall be commanded ON/OFF by the BAS. If all indoor units are off, the outdoor unit shall turn off. With the Night Setback

Function/Mode, the system shall cycle on during unoccupied periods as needed to maintain unoccupied temperature setpoint of 55°F (adjustable).

2. Space Temperature Control - the indoor unit shall modulate its internal linear expansion valve (LEV) to maintain the temperature setpoint via the indoor unit's internal controls.
   a) The setpoint is provided and adjustable through the BAS interface.
   b) The temperature setpoint provided through the BAS interface shall additionally be adjustable to a maximum of ±2°F from that setpoint using the room controller.
3. Mode Control
   a) Auto Mode
      (1) The indoor unit shall determine whether it should be in auto-heat mode or auto-cool mode based on space temperature relative to temperature setpoint. If the indoor unit is in auto-heat mode, the indoor unit control board shall follow the heat mode sequence. If the indoor unit is in auto-cool mode, the indoor unit control board shall follow the cool mode sequence.
      (2) The indoor unit shall switch from auto-heat to auto-cool when the space temperature rises above and remains above the temperature setpoint plus the dead band for 3 minutes.
      (3) The indoor unit will switch from auto-cool to auto-heat when the space temperature drops below and remains below the temperature setpoint minus the dead band for 3 minutes.
   b) Heating Mode - the indoor unit shall modulate its linear expansion valve (LEV) to maintain temperature setpoint of 71°F (adjustable).
   c) Cooling Mode - the indoor unit shall modulate its linear expansion valve (LEV) to maintain temperature setpoint of 74°F (adjustable).

Part 3 - Execution

I. Installation

A. Install all piping, fittings, and insulation to meet manufacturers requirements. Install units level and plumb. Condenser fan components shall be installed using manufacturer's standard mounting devices securely fastened to building structure (Thybar TEMS or approved equal). Install and connect refrigerant tubing and fittings.

Pipe penetrations through the roof shall be installed with a pipe curb assembly (Thybar TCC or approved equal).

B. Installer shall supply isolation ball valves for zoned refrigerant isolation. Installer shall supply Isolation ball valves with Schrader connection for isolating refrigerant charge and evacuation at each connected air handling unit and condensing unit. Isolation ball valves, with Schrader connection, are required for instances of air handling unit isolation for troubleshooting, repair, or replacement without affecting the remainder of the system. Isolation ball valves with Schrader connection are also required at condensing unit connection to isolate unit for troubleshooting, repair or replacement and as required to provide partial capacity Heating/Cooling in the instance of a failure of one of the multiple outdoor unit (condensing unit) compressors.

C. During brazing an inert gas (such as nitrogen) shall be continuously passed through the system at a rate sufficient to maintain an oxygen free environment to prevent the formation of copper oxide scale. After piping has been completed, the refrigerant piping system shall be pressure tested at a pressure of 300 psi on the high side and 150 psi on the low side. The pressure shall be maintained on the system for a minimum of 24 hours. The system shall be evacuated when the surrounding ambient air is not less than 60 F. If the temperature is less, auxiliary heat must be provided to insure proper evacuating conditions. A minimum vacuum of 300 Microns of Hg. shall be pulled on the system and maintained for 24 hours. The vacuum pump displacement shall be not less than 2 cfm for up to 15 tons. The system shall be charged as recommended by the equipment manufacturer.

D. Electrical wiring required by this section, both high and low voltage, shall comply with the Division 16 requirements.

E. Start Up - Engage manufacturer or factory-authorized service representative to perform startup service. Manufacturer shall provide on-site startup and commissioning assistance through job completion. Complete installation and startup checks according to manufacturers written instructions. This shall include a factory startup for factory provided control devices as well as configuring control points for other DO devices. Service representative shall completely configure all control devices and establish remote internet connectivity with the owner’s energy management department web server.

F. Demonstration - Engage manufacturer or factory-authorized service representative to demonstrate and instruct the owner's maintenance personnel of the operation and functionality of the system.

G. Training - Engage manufacturer or factory authorized service representative to train owner's maintenance personnel for a period of 2 days, to adjust, operate and maintain individual units and complete system. This shall also include training of the owner's energy management department representatives as to establish control system programming, scheduling routines, alarm reporting, system topography, communication protocols and password level assignments. This training shall take place on-site and at the owner's maintenance facility.

H. The indoor air handling and outside condensing units shall be installed in accordance with the manufacturer's recommendations and as shown on the drawings. The first unit installed will be considered the typical mock up and shall require notification, inspection and approval by the designated owner representative and/or architect and engineer before any additional installations will be allowed.

I. Provide laminated as built drawings and manufacturer's refrigeration piping layout showing typical layout of the system. This shall include the actual room numbers, not from construction documents, and addressing scheme. Laminate shall have minimum thickness of 10 mil. Drawing size shall be 11"x17". Provide multiple drawings should zones not fit into one page.

J. Refrigerant distribution (BC) controllers shall include a label affixed to the controllers which identifies the room or rooms served for each line set on the controller. Use the actual room numbers and not from construction documents.

K. Provide a typed list of all the different units, their filter sizes, and belt sizes to be included in the O&M manuals. The list shall include the unit designation, filter size, belt size, and the number of filters and belts required for each unit. In addition to this, submit to the Owner two additional copies of the list, distributed to the PGCPS project manager of record and PGCPS Building Services.

L. Warranty Tag - The Contractor shall attach an engraved weatherproof Guarantee or Warranty tag to the exterior of each condensing unit. Tag is to be screwed or riveted to unit. Identification tag shall be black with engraved 3" white letters which reads:

UNIT # *(unit number)*

INSTALLED BY:	*(contracting company's name)*
WARRANTY EXPIRES:	*(month/day/year)*
COMPRESSOR WARRANTY EXPIRES:	*(month/day/year)*

END OF SECTION

Part 1 - General

I. General
   A. The Bidding and Contract Requirements, Division 1 - General Requirements, Section 230100 - General Provisions, and Section 230500 - Basic Materials and Methods, shall apply to this section.

II. Scope
   A. Provide and install electric duct heater as shown on the drawings and as specified herein.

III. Quality Assurance
   A. The electric duct heater shall have published ratings and be listed by Underwriters Laboratories.
   B. Equipment installer shall attend a controls coordination meeting with the Section 230923 contractor as described in 230923, 1.03.

IV. Submittals
   A. Provide shop drawings on this equipment as described in Section 230100, 1.04. The controls coordination meeting described in 230923 shall be held before the shop drawings are submitted.

Part 2 - Products

I. Electric Duct Heater
   A. The electric duct heater shall be of the type, capacity and voltage shown on the drawings. Acceptable manufacturers include:
      1. Indeeco
      2. Carnes
      3. Environmental Technologies
   B. Type – Shall be of the open type using wire constructed of 80% nickel and 20% chromium supported in ceramic bushings. The heating wire for each step shall be strung across the entire face of the coil to prevent stratification when operating at less than full capacity. Maximum watts density shall not exceed 35 watts per 1 sq. in. of wire surface.
   C. Trim – All terminals and nuts shall be constructed of stainless steel, and terminal insulators and bracket bushings shall be constructed of ceramic and securely positioned.
   D. Test – Heating coils shall be tested for twice the rated voltage plus 1000 volts, or 2000 volts whichever is greater. After the heater is built, the manufacturer’s quality control

inspection shall test the heater for the following: Ohm reading to verify capacity, voltage, phase, control voltage and tightness of terminals.

E. Casing – shall be constructed of not less than 16 or 18 gauge galvanized steel with vertical galvanized steel supports 4” on center gusseted and spot welded. A solid cover shall be provided on the terminal box to minimize dust in the terminal box. The terminal box shall be recessed when installed in air handling units. Mounting provisions shall be flanged or slip-type as shown in the equipment schedule.

F. Safety Features – Shall include an automatic reset thermal cutout wired in series with the control circuit and heat timers (fusible links) wired in series with the power legs. All of the safety devices shall be serviceable through the terminal box without removing the heater from the duct.

G. Built-in Features – Shall include contactors, transformers, interlock relay, fusing to meet NEC requirements and lugs sized to receive specified conductors. All built-in components shall be factory wired and mounted on the heating coil in an integral terminal box. The unit shall be complete with terminal strip for electrical connections.

H. The duct heater shall be controlled as shown on the drawings or in the Automatic Temperature Control Section.

Part 3 - Execution

I. Installation

A. The electric duct heater shall be installed in accordance with the manufacturer's recommendations and as shown on the drawings.

END OF SECTION

Part 1 - General

I. General
   A. The Bidding and Contract Requirements, Division 1 -General Requirements, Section 230100 - General Provisions, and Section 230500 - Basic Materials and Methods, shall apply to this section.

II. Scope
   A. Provide and install complete the fan coil units as shown on the drawings and specified herein.

III. Quality Assurance
   A. The fan coil units shall be Underwriters Laboratories listed and be rated in accordance with ARI Standards 440-81.
   B. Equipment installer shall attend a controls coordination meeting with the Section 230923 contractor as described in 230923, 1.03.

IV. Submittals
   A. Provide shop drawings on this equipment as described in Section 230100, 1.04. The controls coordination meeting described in 230923, 1.03 shall be held before the shop drawings are submitted.

Part 2 - Products

I. Fan Coil Units
   A. Provide and install fan coil units of the type and capacity as shown on the drawings and specified herein. Acceptable manufacturers include:
      1. Trane
      2. Carrier
      3. Daikin.
   B. Assembly Description - The unit shall consist of a finished room cabinet with configuration as shown, access openings, discharge and intake grilles, toe space base, connection pockets, noted coils, drain pan, fan and motor assembly, filter and control box. Non-metallic blower wheels will not be accpeted.
   C. Cabinet
      1. The cabinet shall be constructed of galvanized steel panels, acoustically and thermally insulated with glass fiber blanket material. The cabinet shall be constructed of a minimum of 18-gauge steel on top and sides with 16 gauge front panels. The

interior chassis shall be constructed of not less than 16 gauge galvanized steel and shall be coated with rust inhibiting paint. Cabinet shall have baked enamel finish with color selected from manufacturer's selection chart by the Architect.

2. The discharge grille shall be integral stamped metal unless noted otherwise. Discharge shall be slanted top unless otherwise approved in writing by PGCPS.

D. Coils - Shall be constructed of aluminum fins mechanically bonded to seamless copper tubes, with continuous fin collars and sleeved coil and supports. Coils shall be factory tested at 300 psi. Coil connections shall be at opposite ends. Hot water coils shall be placed in a pre-heat position in all units.

E. Drain pan shall be an IAQ type non-corrosive, positively sloped, insulated and cleanable drain pan. It shall fit under the coil and control valves and be sized to collect the water from all component chilled surfaces. Pan insulation shall be selected to prevent condensation on pan surfaces.

F. Motor and Fan - Shall be direct driven, forward curved, centrifugal, double width type, quiet operating design. The motor shall be multi-speed, permanent split capacitor, continuous duty, high efficiency type. Motor shall have built-in thermal overload protection. The electric inputs shall not exceed those listed on drawings.

G. Filters shall be concealed and accessible without removing front panel. They shall be the throwaway type and 1” thick.

H. Controls - The fan shall be controlled with a multi-speed fan switch with auxiliary taps located in an accessible lockable end compartment. The temperature controls shall be as shown in Section 230923 - Automatic Temperature Controls.

I. All floor mounted fan coil units shall be provided with a sub-base.

J. All horizontal, semi-recessed fan coil units shall be provided with a telescoping ceiling panel with hinged access and intake grille.

Part 3 - Execution

I. Installation

A. The fan coil units shall be installed in accordance with the manufacturer's recommendations and as shown on the drawings. Install sub-bases on all floor-mounted units. The first unit installed will be considered the typical mock up and shall require notification, inspection and approval by the designated owner representative and/or architect and engineer before any additional installations will be allowed.

B. Piping - Shall be as described in Section 232113, 232300 and/or 232213. Provide supply and return ball valves, manual air vents and drain plugs.

C. Filters - Shall be changed at the end of the construction period and before the final inspection.

D. Provide a minimum 18” long section of removable horizontal pipe enclosure, for floor mounted units that can not be piped from opposite ends, to locate valves in. Provide end caps.

E. Two sets of spare filters shall be provided in addition to the set used during construction with each unit. The filters shall be changed after the construction dust has been eliminated and before the final inspection. The other set of filters shall be stored in the respective mechanical rooms or spaces.

F. Provide a typed list of all the different fan coil units and their filter sizes to be included in the O&M manuals. In addition to this, submit to the Owner two additional copies of the list, distributed to the PGCPS project manager of record and PGCPS Building Services.

END OF SECTION

Part 1 - General

I. General
   A. The Bidding and Contract Requirements, Division 1 - General Requirements, Section 230100 - General Provisions, and Section 230500 - Basic Materials and Methods shall apply to this section.

II. Scope
   A. Provide and install, complete, the unit ventilator as shown on the drawings and specified herein.

III. Quality Assurance
   A. The unit ventilator shall be Underwriters Laboratories listed or be tested by an accepted independent testing agency.
   B. Equipment installer shall attend a controls coordination meeting with the Section 230923 contractor as described in 230923, 1.03.

IV. Submittals
   A. Provide shop drawings on this equipment as described in Section 230100 - 1.04. The controls coordination meeting described in 230923, 1.03 shall be held before the shop drawings are submitted.

Part 2 - Products

I. Unit Ventilators
   A. Provide and install unit ventilator(s) of the type and capacity as shown on the drawings and specified herein. Acceptable manufacturers include:
      1. Trane
      2. MagicAire
      3. McQuay
      4. Carrier.
   B. Assembly Description - The unit shall consist of a finished room cabinet with configuration as shown, access openings, discharge and intake grilles, toe space base, connection pockets, noted coils, drain pan, fan and motor assembly, damper assembly, outside air inlet, filter and control box and factory supplied extension cabinet for housing shutoff and control valves. Units with plastic blower wheels are not acceptable.
   C. Cabinet

1. The cabinet shall be constructed of 14 gauge steel panels, acoustically and thermally insulated with glass fiber blanket material. All exposed edges shall be rounded. The interior chassis shall be constructed of not less than 16 gauge galvanized steel and shall be coated with rust inhibiting paint. Cabinet shall have baked enamel finish with color selected from manufacturer's selection chart by the Architect.
2. Front panels shall be removable in sections. They shall be secured by allen wrench operated quick open fasteners. The cabinet shall have a separate space for piping and wiring crossover. Provide access opening for adjustment and service access.
3. Return air intake grille shall be bottom front face located or recessed in toe space slotted kick plate type.
4. Discharge air grille shall be top mounted, continuous; round edged steel bars with 10 degrees vertical deflection.

D. The coils shall be constructed of aluminum fins mechanically bonded to seamless copper tubes, with continuous fin collars and sleeved coil and supports. Coils shall be factory tested at 300 psi. Coils connections shall be at opposite ends. Hot water coils shall be placed in a pre-heat position in all units. Chilled water coil connections shall be on the opposite end from the electrical connections. 2-pipe systems shall have coil connections on the opposite end from the electrical connections.

E. The drain pan shall be an IAQ type non-corrosive positively sloped and cleanable drain pan. It shall fit under the coil and control valves and be sized to collect the water from all future component chilled surfaces. Pan insulation shall be selected to prevent condensation on pan surfaces.

F. Motor and Fan - Shall be direct driven, forward curved, centrifugal, double width type, quiet operating design. The motor shall be multi-speed, permanent split capacitor, continuous duty, high efficiency type. Motor shall have built-in thermal overload protection. The electric inputs shall not exceed those listed on drawings. Thermoplastic materials on steam type units are not acceptable.

G. The filters shall be concealed and accessible without removing front panel. They shall be the throwaway type and 1” thick.

H. Controls - The fan shall be controlled with a multi-speed fan switch with auxiliary taps located in an accessible lockable end compartment. The temperature controls shall be as shown in Section 230923 - Automatic Temperature Controls.

I. Provide factory installed float control safety switch in condensate drain pans. Float shall stop unit upon activation.

Part 3 - Execution

I. Installation

A. The unit ventilator shall be installed in accordance with the manufacturer's recommendations and as shown on the drawings.

B. Piping - Shall be as described in Section 232113, 232213 or 232300. Provide supply and return gate valves, manual air vents and drain plugs.

C. Filters - Shall be changed at the end of the construction period and before the final inspection.

D. Provide spare fuses for unit ventilators for each size of fuse used in accordance with the following schedule:

Number of Ventilators	Spares Required
1-10	2
11-20	4
21-30	6
31-40	8
Over 40	10

E. Provide a typed list of all the different unit ventilators and their filter sizes to be included in the O&M manuals. In addition to this, submit to the Owner two additional copies of the list, distributed to PGCPS project manager of record.

F. The unit ventilators shall be installed in accordance with the manufacturer's recommendations and as shown on the drawings. The first unit installed will be considered the typical mock-up and shall require notification, inspection and approval by the designated owner representative and/or architect and engineer before any additional installations will be allowed.

END OF SECTION

Part 1 - General

I. General
   A. The Bidding and Contract Requirements, Division 1 -General Requirements, Section 230100 - General Provisions, and Section 230500 - Basic Materials and Methods, shall apply to this section.

II. Scope
   A. Provide and install convectors as shown on the drawings and specified herein.

III. Quality Assurance
   A. Convectors shall have published AHRI ratings.

IV. Submittals
   A. Provide shop drawings on this equipment as described in Section 15010 - 1.04.

Part 2 - Products

I. Hot Water Convectors
   A. The hot water convectors shall be of type and capacity shown on the drawings. Acceptable manufacturers include:
      1. Sterling
      2. Vulcan
      3. Trane
      4. Zehnder-Rittling.
   B. Enclosure - Cabinet front and top panels shall be 14-gauge steel. End panels shall be reinforced 18 gauge. Front panel shall have horizontal stiffening channel. Cabinet backs shall be phosphatized, galvanized; front, top and sides shall be phosphatized and painted inside and out with one coat of gray primer. Provide baked enamel finish with color selection by architect. Fronts shall be secured in place by quick opening slide bolts or camlock fasteners. Convector styling shall match fin-tube enclosure styling. All cabinets shall have recessed framed air outlets. Provide damper blade with a vandal resistant, allen head external operator.
   C. Heating Element - Shall be constructed of aluminum fins, ribbed steel side plates, fin tube supports and copper tubes expanded and rolled into cast iron headers. Fins shall have integral fin collars, which space the fins and provide fin-to-tube surface firmly bonded to the tube by mechanical expansion of the tube. All elements shall withstand 150-lb. air pressure factory tested under water.

II. Steam Convectors

A. The hot water convectors shall be of type and capacity shown on the drawings. Acceptable manufacturers include:

1. Sterling
2. Vulcan
3. Trane
4. Zehnder-Rittling.

B. Enclosure - Cabinet front and top panels shall be 14-gauge steel. End panels shall be reinforced 18 gauge. Front panel shall have horizontal stiffening channel. Cabinet backs shall be phosphatized, galvanized; front, top and sides shall be phosphatized and painted inside and out with one coat of gray primer. Provide baked enamel finish with color selection by architect. Fronts shall be secured in place by quick opening slide bolts or camlock fasteners. Convector styling shall match fin-tube enclosure styling. All cabinets shall have recessed framed air outlets. Provide damper blade with a vandal resistant, allen head external operator.

C. Heating Element - Shall be constructed of extended surface 0.010 inch thick aluminum fins mechanically bonded to 5/8 inch O.D. seamless copper tubing. Braze tubes to Schedule 40 steel headers, and factory test at 500 psig hydrostatic pressure and 200 psig steam pressure. Submit test results to the Owner.

Part 3 - Execution

I. Installation

A. Convectors shall be installed as shown on the drawings and in accordance with the manufacturer's recommendations.

B. Furnish integral thermostat on the unit or wall-mounted thermostat as scheduled.

END OF SECTION

Part 1 - General

I. General
   A. The Bidding and Contract Requirements, Division 1 -General Requirements, Section 230100 - General Provisions, and Section 230500 - Basic Materials and Methods, shall apply to this section.

II. Scope
   A. Provide and install complete with all accessories the hot water finned tube radiation and steam radiation as shown on the drawings and as specified herein.

III. Quality Assurance
   A. The hot water finned tube radiation shall have published ratings and be certified by IBR.
   B. Equipment installer shall attend a controls coordination meeting with the Section 15900 contractor as described in 230923, 1.03.

IV. Submittals
   A. Provide shop drawings on this equipment as described in Section 23010, 1.04. The controls coordination meeting described in 230923 shall be held before the shop drawings are submitted.

Part 2 - Products

I. Hot Water Finned Tube Radiation
   A. The hot water finned tube radiator shall be of the type and capacity shown on the drawings. Acceptable manufacturers include:
      1. Sterling.
      2. Vulcan
      3. Zehnder-Rittling.
   B. Enclosure - shall be constructed of 14 gauge steel and shall mount into a continuous roll-formed captive channel mounting strip which permits hinge type mounting and access at the top and invisible fastening onto a rigid, 14 gauge steel enclosure brackets at the bottom. Enclosure brackets shall be spaced at not more than 4-foot intervals. Front panels shall be individually removable to facilitate cleaning, servicing or replacement. All accessories shall fasten to the enclosure assembly in a manner, which prevents contact with the back wall during installation. Cabinet air outlets of sheet metal

shall be recessed and framed. Enclosure shall have baked enamel finish with color selection by Architect.

C. Heating Element - Copper tube aluminum fin element types, as indicated on plans, shall have integral fin collars which space the fins and provide fin-to-tube surface firmly bonded by mechanical expansion of the tube. Elements shall be positively positioned front-to-back, with provisions for silent horizontal expansion and contraction.

II. Steam Finned Tube Radiation

A. The steam finned tube radiator shall be of the type and capacity shown on the drawings. Acceptable manufacturers include:

1. Sterling.
2. Vulcan
3. Zehnder-Rittling.

B. Enclosure - shall be constructed of 14 gauge steel and shall mount into a continuous roll-formed captive channel mounting strip which permits hinge type mounting and access at the top and invisible fastening onto a rigid, 14 gauge steel enclosure brackets at the bottom. Enclosure brackets shall be spaced at not more than 4-foot intervals. Front panels shall be individually removable to facilitate cleaning, servicing or replacement. All accessories shall fasten to the enclosure assembly in a manner, which prevents contact with the back wall during installation. Cabinet air outlets of sheet metal shall be recessed and framed. Enclosure shall have baked enamel finish with color selection by Architect.

C. Heating Element - Single-width flat horizontal steam tubes with header in rear. Tubes shall be 2 3/4 inches high and 1/4 inch deep. Headers shall have all necessary inlet, outlet, venting and draining connections, and baffles to ensure even heating output. All units shall have 3/4 inch NPT connections. All radiator components shall be carbon steel. Element shall have corrugated steel fins welded to tube with finish to match tubes. Elements shall be single or multi-tiered as scheduled. Mounting brackets shall be No. 12 gauge steel. End caps shall be provided with tight-fitting access doors to all valves without visible hinges.

Part 3 - Execution

I. Installation

A. The finned tube radiation shall be installed complete with all accessories in accordance with the manufacturer's recommendations and as shown on the drawings.

B. Set radiators as indicated on the Drawings with tops level, and fronts and ends plumb. Radiators shall be rigidly attached to adjoining building construction.
C. Joints between radiators and adjoining building material surfaces shall be tight and neatly fitted.
D. Conceal all fasteners.
E. Locate isolation valves above floor slab, and provide access doors at valve locations.

END OF SECTION

Part 1 - General

I. Summary (Non-inclusive)

A. It is the intent of this Specification that this Contractor furnish and install all material, labor, equipment, apparatus, tools, transportation, and other incidentals required to provide the following: electrical service(s); power distribution (both normal and stand-by emergency power); branch circuit wiring; low voltage wiring; wiring devices; grounding; lighting (both interior and exterior); lighting control systems; fire detection and alarm system; security intrusion system; door video access entry system; wireless master clock and program system; sound and intercommunications system and program system; classroom amplification systems; auxiliary sound reinforcement systems; auditorium sound reinforcement system; Black Box Theater sound reinforcement system; gymnasium sound reinforcement systems; band, choral, and orchestra sound reinforcement systems; athletic fields sound reinforcement systems; dance and gymnastics sound reinforcement systems; telecommunications system; cable television/broadband distribution system; and multi-media systems as shown on Drawings and as described in these Specifications.

II. Requirements

A. The general provisions of the Contract, including General and Supplementary Conditions and General Requirements, apply to the work specified in this Section.

B. Provisions of this Section apply to each and every Section of this Division.
Applicable Sections: Division 1.

III. Scope

A. It is the intention of these Specifications and the Contract Drawings to call for finished work, tested and ready for operation.

B. Any apparatus, appliances, materials, or work not indicated but mentioned in these Specifications, or vice versa, or any incidental accessories necessary to make the work complete and perfect in all respects and ready for operation, even if not particularly specified, shall be furnished, delivered, and installed by this Contractor at no additional expense to the Owner.

C. Minor details not usually shown or specified, but necessary for the proper installation and operation shall be included the same as if herein specified or shown on the Drawings.

D. With submission of bid, this Contractor shall give written notice to the Architect/Engineer of any materials or apparatus believed: inadequate or unsuitable; in violation of federal, state, and local laws, codes, and ordinances, including Prince George's County's electrical inspection rules or regulations; and any necessary items of the work which have been omitted. In the absence of such written notice, it shall be mutually agreed that the Contractor has included the cost of all required items in the proposal and that the Contractor shall be responsible for the approved satisfactory functioning of the entire electrical system and low voltage electrical systems at no additional expense to the Owner.

IV. Applicable Specifications, Codes, Standards, And Permits

A. Materials, equipment, and installation shall be in accordance with the requirements of the latest adopted editions of the National Electrical Code (NEC), and these Specifications.

B. Unless otherwise specified herein the work and material shall conform to the applicable requirements of the (latest editions or currently adopted) following codes, standards, and regulations:

1. American National Standards Institute (ANSI).
2. Americans with Disabilities Act Code of Federal Regulation (ADA).
3. Canadian Standards Association (CSA).
4. Electronic Industries Association/Telecommunications Industry Association (EIA/TIA)
5. Prince George's County Fire Marshal's Office.
6. Illuminating Engineering Society (IES).
7. International Building Code (IBC)
8. International Code Council (ICC)
9. National Electrical Code (NEC).
10. National Electrical Contractors Association (NECA).
11. National Electrical Manufacturer's Association (NEMA).
12. National Fire Protection Association (NFPA).
13. Occupational Safety and Health Association (OSHA).
14. Underwriters Laboratories, Inc. (UL).

C. All electrical materials and equipment shall be new, listed by UL, and bear the UL label. This applies to all equipment for which UL standards have been established and label service is regularly furnished.

D. Equipment not UL labeled and equipment assembled in the field using UL components and not UL labeled as an "assembly", for which standards have not been promulgated, shall be accepted upon certification by MET ELECTRICAL TESTING, LLC, 4390 Parliament Place, Suite Q, Lanham, MD 20706 telephone: 240-487-1900 or ELECTRICAL TESTING CORPORATION, 1701 Edmondson Avenue, #201, Baltimore, Maryland, 21228, telephone 410-526-4700. Cost of such certification shall be included in the base bid and in each quoted cost for alternates and proposed change orders. Electrical equipment that requires certification shall be tested by this Contractor at no additional cost to the Owner.

E. Workmanship shall conform to the "Standard of Installation" published by the NECA. This Contractor shall provide a minimum of one (1) licensed journeyman electrician for each three (3) electrical workers assigned to this project. Such certification shall be provided to the Architect/Engineer upon request.

F. This Contractor shall: give all necessary notices; obtain all permits (including a low voltage wiring permit); pay all government taxes, fees, and other costs including, but not limited to the Prince George's County Fire Marshal's Office shop drawing review fees; file all necessary plans; prepare all documents; and obtain required certificates of inspection for work and deliver same to the Architect/Engineer before any request for acceptance and final payment for the work.

G. This Contractor shall be responsible for purchasing equipment and appliances that bear the label of an agency as approved by the Prince George's Department of the Environment (DoE). It shall be the responsibility of the Contractor to pay for any label testing of equipment or appliances that are installed without the label of a DPWES approved agency.

V. Reviews And Shop Drawings

A. The materials, workmanship, design, and arrangement of all work installed under this contract shall be subject to the review of the Architect/Engineer and Owner.

B. Where any specified materials, process, or method of construction or manufactured article is specified by name, or by reference to the catalog number of a manufacturer, the specifications are to be used as a guide and are not intended to take precedence over the basic duty and performance specified or noted on the Drawings.

C. In all cases, the Contractor shall verify the duty and available electric characteristics with the specific characteristics of the equipment offered for review.

D. All component parts of each item of equipment or device shall bear the manufacturer's name plate giving name of manufacturer, description, size, type, serial or model number, electrical characteristics, etc., in order to facilitate maintenance or replacement. The nameplate of a Contractor will not be acceptable.

E. If materials or equipment are installed before they have been reviewed by the Architect/Engineer, the Contractor shall be liable for their removal and replacement at no additional expense to the Owner, if in the opinion of the Architect/ Engineer, material or equipment does not meet the intent of the Drawings and Specifications.

F. This Contractor shall call to the attention of the Architect/Engineer by letter or on shop drawing submittals, any instance in which the shop drawings differ from the requirements of the Drawings and Specifications.

G. Data and shop drawings shall be coordinated and included in a single submission in a bound format. Multiple submissions are not acceptable except where prior approval has been obtained from the Architect/Engineer. In such cases, a list of data to be submitted later shall be included with the first submission. No delays in construction occasioned by the Contractor's failure to submit material in accordance with the approval schedule will be excused.

H. Catalogs, pamphlets, or other documents submitted to describe items on which review is being requested shall be specific and identifications in catalog, pamphlets, etc., of items submitted shall be clearly made in a contrasting ink. Data of a general nature shall not be acceptable.

I. Submitted samples, drawings, specifications, catalogs, and the like shall be properly labeled and shall indicate: specified service for which the material or equipment is to be used; Section and Article number of Specifications governing; contractor's name; and name of the job.

J. If applicable, contractor shall submit to PGCPS any required applications for utility rebates and/or incentives for each eligible piece of equipment in project. Contractor is responsible for furnishing all engineering submittals, drawings, calculations, load modeling as required for rebate and incentive programs. Contractor shall work in conjunction with PGCPS Management Analyst under the Department of Building Services during the design phase of the project to complete and submit necessary forms. This shall be coordinated prior to purchase of any eligible equipment provided under Division 26.

K. Data and shop drawings shall be identified in accordance with SECTION 01340. In addition, shop drawings shall be identified by the name of the item and system and the applicable Specification paragraph number. This Contractor shall submit the following components/systems described herein and as specified in other Sections of this Specification.

1. Athletic fields sound reinforcement systems.
2. Auditorium lighting controls and performance lighting.
3. Auditorium sound reinforcement system.
4. Auxiliary sound reinforcement systems.
5. Band, Orchestra, and Choral rooms sound reinforcement systems.
6. Black Box Theater performance lighting controls and lighting.
7. Black Box Theater sound reinforcement system.
8. Boxes including device, junction, outlet, and pull types.
9. Cable hook (J-hook) support systems.
10. Cable television/broadband distribution system.
11. Cable tray systems.
12. Classroom Amplification Systems.
13. Conduit and associated fittings.
14. Dance and gymnastics sound reinforcement systems.
15. Disconnect /safety switches.
16. Distribution switchboard(s).
17. Door Access Video Entry System.
18. Dry type transformers.
19. Emergency/standby engine generator set, remote annunciator panel, and automatic transfer switch(es).

20. Enclosed circuit breakers.
21. Feeder type busway.
22. Fire detection and alarm system.
23. Fuses and spare fuse cabinet.
24. Generator quick connect switchboard.
25. Grounding system, including rods, connectors, and welds.
26. Gymnasium sound reinforcement system.
27. Lighting control systems.
28. Lighting fixtures including lamps, ballasts, and poles.
29. Lighting occupancy sensors.
30. Master clock system.
31. Middle School stage performance lighting controls and lighting.
32. Multi-media systems.
33. Motor control centers.
34. Panelboards, including distribution and branch circuit.
35. Rooftop conduit support system.
36. School zone warning signals.
37. Security intrusion system.
38. Sound and intercommunications and program system.
39. Sports field lighting systems.
40. Surface metal raceways and fittings.
41. Surge protective devices.
42. Telecommunications system including outlets, equipment racks, and cables.
43. Television studio performance lighting controls and lighting.
44. Track Busway System
45. Wireless master clock system.
46. Wires, cables, and connectors.
47. Wiring devices.

L. No item or system listed in the schedule above shall be delivered to the site or installed until successful completion of the review. After review of the proposed materials has been successfully completed, no substitution shall be permitted except where approved by the Architect/Engineer in writing. Should the Contractor fail to comply with the requirements of this paragraph, the Owner reserves the right to select any and all items and systems required

by this Specification. Materials so selected shall be used in the work at no additional expense to the Owner.

M. The successful review rendered on shop drawings shall not be considered as a guarantee of building conditions. Where shop drawings have been successfully reviewed, said review does not mean that the drawings have been checked in detail and does not in any way relieve the Contractor from the responsibility, nor the necessity of furnishing the material or performing the work as required by the Drawings and Specifications.

N. Failure to submit shop drawings that meet the requirements of the Drawings and Specifications in ample time for review shall not entitle the Contractor to an extension of contract time, and no claim for extension by reason of such default shall be allowed.

O. All equipment and materials to be furnished under this Division of these Specifications shall be as manufactured by the manufacturer(s) listed on the Drawings or herein specified. All requests by any bidder to provide equipment and/or material manufactured by a manufacturer not listed on the Drawings or specified herein, including equipment identified as “OR EQUAL” to a listed manufacturer, must be submitted to the Architect/Engineer not less than ten (10) calendar days prior to the bid date. Any and all replies to said requests will be made in the form of an addendum which shall be made available to all bidders. Any equipment and/or materials installed by this Contractor not manufactured by a specified manufacturer or covered under an addendum shall be removed by this Contractor and the proper equipment or materials installed at no additional expense or delay to the Owner.

P. This contractor shall furnish to the Owner, after approval of shop drawings, three (3) wiring sample boards. Each sample board shall be made of minimum space ½” thick plywood and sized as required to accommodate all wiring samples. Each board shall be painted white and shall have samples of fire alarm, all sound reinforcement systems (divided by system), multi-media, security, CATV, door access video entry, and telecommunications wiring. Each wiring sample shall be a minimum of 6 inches long with the manufacturer and model number clearly visible. Each wiring sample shall be properly labeled for its intended purpose using a labeling machine.

VI. Equipment Deviations

A. Where this Contractor proposes to use, and/or uses, an item of equipment other than that specified or detailed on the Drawings, which requires any redesign of any other part of the electrical, mechanical, or architectural layout, all such redesign and all new drawings and detailing required shall be prepared by this Contractor at no additional expense to the Owner and shall be reviewed by the Architect/Engineer.

B. Where such approved deviation requires a different quantity and arrangement of duct work, piping, wiring, conduit, and equipment, this Contractor shall furnish and install any such duct work, piping, structural supports, insulation, controllers, motors, starters, electrical wiring and conduit, and any other additional equipment required by the system at no additional expense to the Owner.

VII. Qualifications For Bidders

A. This Contractor shall examine drawings and Specifications relating to the work of all trades and become fully informed as to the extent and character of work required and its relation to all other work in the project prior to submission of bid or prior to the start of any construction.

B. Before submitting bid, this Contractor is encouraged to visit the site and examine all adjoining existing buildings, equipment, and space conditions including areas above accessible ceilings on which his work is in any way dependent, for the best workmanship and operation according to the intent of the Specifications and Drawings. This Contractor shall verify dimensions and become fully informed as to the nature and scope of the proposed work and also the conditions under which it is to be conducted. This Contractor shall report to the Architect/Engineer any conditions which, in their estimation, might preclude them from installing the equipment and work in the manner as intended and noted on the Drawings and in this Specification. Failure to take the above precaution shall in no way relieve this Contractor from his obligation to provide the material and work as indicated and as specified at no additional expense to the Owner within the stipulated completion time period.

C. No consideration or allowance shall be granted for failure to visit the site, or for any alleged misunderstanding of materials to be furnished, or work to be done, it being agreed that tender of proposal carried with it agreement to items and conditions referred to herein or indicated in the Drawings.

VIII. Temporary Facilities:

A. Temporary facilities shall be as specified under SECTION 01510 TEMPORARY UTILITIES. Requirements therein are hereby made a part of this Section as if fully specified herein.

B. Contractor shall coordinate with the construction phasing of the building in order for this contractor to provide power and systems cabling and devices for the temporary relocation of the existing administrative offices, media center and other essential school operational areas as directed by the Owner.

IX. Drawings

A. The Drawings are diagrammatic and indicate the general arrangement of systems and work included in the Contract. Do not scale the drawings. Consult the Drawings for the exact location of fixtures and equipment. Where same are not definitely located, this Contractor shall obtain this information from the Architect/Engineer.

B. This Contractor shall follow the Drawings in laying out work and check the Drawings of other trades to verify spaces in which work is to be installed. This Contractor shall maintain maximum headroom and space conditions at all points. Where headroom or space conditions appear inadequate, this Contractor shall notify the Architect/Engineer before proceeding.

C. This Contractor shall call to the attention of the Architect/Engineer of any conflicting information in the Contract Drawings and/or Specifications, by letter or Request for Information (RFI) process. Contractor shall not proceed in error. Conflicts must be resolved.

D. If directed by the Architect/Engineer, this Contractor shall, at no additional expense to the Owner, make reasonable modifications in the layout as needed to prevent conflict with other trades for proper execution.

E. When failure by this Contractor to comply with the work set forth in the above paragraphs results in a conflict, the work shall be modified by this Contractor as directed by the Architect/Engineer at no additional expense to the Owner.

X. Contractor's Warranty

A. This Contractor shall warrant the workmanship, materials, and equipment against defects and/or non-operation as described in SECTION 01740 WARRANTIES AND BONDS.

XI. Cooperation With Other Trades

A. This Contractor shall give full cooperation to other trades and shall furnish in writing to the Architect/Engineer any information necessary to permit the work of all trades to be installed satisfactorily with the least possible interference or delay.

B. Where the work of this Contractor will be installed in close proximity to work of other trades, or where there is evidence that work shall interfere with the work of other trades, this Contractor shall assist in working out space conditions to make a satisfactory adjustment. This Contractor shall prepare composite working drawings at a scale not less than 1/4 inch equals 1'-0", clearly showing how the work is to be installed in relation to the work of the other trades. If this Contractor installs the work before coordinating with other trades or as to cause any interference with work of other trades, this Contractor shall make necessary changes to the work to correct the condition at no additional expense to the Owner.

C. This Contractor shall furnish to other trades, all necessary templates, patterns, setting plans, and shop details for the proper installation of the work and for the purpose of coordinating adjacent work.

Part 2 - Products

I. Standard Products

A. Unless otherwise shown on the Drawings or herein specified, each item of equipment furnished by this Contractor shall be essentially the standard product of the manufacturer. Where two (2) or more equipment items of the same kind or class or equipment are required, they shall be the product of a single manufacturer.

B. For equipment consisting of an assembly of multiple components, such multiple components do not have to be the products of a single manufacturer.

II. Performance Data

A. All performance data specified herein shall be considered actual performance of equipment as installed. If installation details are such that actual operating conditions unfavorably affect performance as compared to conditions under which the equipment was rated, suitable allowance shall be made by this Contractor.

III. Quiet Operation

A. All equipment, including the emergency engine generator set, shall operate under all conditions of load without transmission of sound and/or vibration which is found to be objectionable in the opinion of the Architect/Engineer. In case of sound or vibration noticeable outside of the room or space in which it is installed, or annoyingly noticeable inside its' own room or space, it shall be considered objectionable. Sound or vibration eliminators as recommended to eliminate any objectionable sound or vibration shall be furnished and

installed by this Contractor if deemed necessary by the Architect/Engineer.

IV. Electrical Work
   A. All electrical motors for plumbing and mechanical equipment shall be furnished and installed under Division 23.
   B. All starters and phase failure relays required for equipment shall be furnished under Division 15, and shall be installed and wired under this Division of these Specifications.
   C. All other electrical devices such as variable frequency drives (VFD), pushbutton stations, selector switches, flow switches, pilot lights, thermostats, etc., for the control or operation of mechanical and plumbing equipment shall be furnished and installed under Division 15. These items shall comply with all Sections of this Division of these Specifications.

Part 3 - Execution

I. Installation Of Work
   A. This Contractor shall examine the site and all Drawings before proceeding with the layout and installation of this work.
   B. This Contractor shall arrange the work essentially as shown on the Drawings, exact layout shall be made on the job to suit actual conditions. This Contractor shall confer and cooperate with other trades on the job so all work shall be installed in proper relationship. Precise location of parts to coordinate with other work shall be the responsibility of this Contractor.
   C. This Contractor shall arrange for required sleeves and openings. This Contractor shall be liable for cutting or patching made necessary by failure to make proper arrangements in this respect.
   D. This Contractor shall provide a full-time Job Foreman who shall oversee and coordinate the work with other trades and make proper layout of the work to suit the job conditions and to satisfy the general requirements of the Contract.

II. Delivery And Storage
   A. All materials and equipment shall be delivered in the manufacturer's original packages with seals unbroken and with manufacturer's name and contents legibly marked thereon. This Contractor shall store all materials off the ground, under cover, and protected from the weather and construction.

III. Scaffolding, Rigging, And Hoisting
   A. Unless otherwise specified, this Contractor shall furnish all scaffolding, rigging, hoisting, shoring, and services necessary for the erection and delivery into the premises of any equipment and apparatus furnished and removal of same from premises when no longer required.

IV. Excavating And Backfilling
   A. Mass excavation to approximate building level shall be carried out under DIVISION 1 of these Specifications. This Contractor shall do all trench and pit excavation and backfilling required for the electrical work inside and outside the building, including: repairing of finished surfaces; all required shoring, bracing, pumping; re-stripping; and all protection of safety of persons and property. The method of backfilling shall conform to the requirements of Prince George’s County. In addition, it shall be the responsibility of this Contractor to check the indicated elevations of utilities entering and leaving the building. If such elevations require excavations lower than the footing levels, the Architect/Engineer shall be notified of such conditions and redesign shall be made before excavations are commenced. It shall also be the responsibility of this Contractor to make the excavations at the minimum required depths in order not to

undercut the footings.

B. Conduits installed below the ground floor level shall have the bottom of the trench excavated to grade so that the conduit shall rest on a solid bed of undisturbed earth. If rock is encountered, the trench shall be excavated to not less than three (3) inches below required grade and filled to required grade with sand so as to provide a solid bed under the entire length of conduit.
C. Where the trench is excavated below the required depth, the trench shall be filled with sand and fine gravel so that the entire length of conduit rests on solid bed of sand.
D. Backfilling to one (1) foot above the top of the conduit pipe shall be done by hand, using clean dirt free of rocks or other debris. All backfill shall be properly compacted in accordance with DIVISION 2 of this Specification. Utility tracing tape shall be placed by this Contractor above underground electrical work approximately one (1) foot below finished grade for the entire length of the installation.

V. Accessibility
A. This Contractor shall be responsible for the sufficiency of the size of shafts and chases, the adequate thickness of partitions, and the adequate clearance in double partitions and hung ceilings for the proper installation of the work. This Contractor shall cooperate with all other trades whose work is in the same space, and shall advise each trade of their requirements. Such spaces and clearances shall, however, be kept to the minimum size required.
B. This Contractor shall locate all equipment that must be serviced, operated, or maintained in fully accessible positions. This equipment shall include, but not be limited to, disconnect switches, panelboards, transformers, controllers, switchgear, motor control centers, generators, junction boxes and pillboxes, and the like. If required for better accessibility, this Contractor shall furnish access doors or panels for this purpose. Minor deviations from the Drawings may be made to allow for better accessibility, and all changes shall be approved by the Architect/Engineer.
C. This Contractor shall furnish and install access panels as required for access to junction boxes, etc. The panels shall be twelve (12) inches square, unless otherwise required to be larger, with hinged metal door and metal frames. Door and frame shall be not lighter than sixteen (16) gauge sheet steel. Access panels shall be the flush type with screwdriver latching device. The frame shall be constructed so that it can be secured to the building material. Access panels and their locations shall meet with the approval of the Architect/Engineer.

VI. Demolition
A. This Contractor shall perform all demolition work as shown on the Drawings and specified herein.
B. The procedures used for the accomplishment of demolition work shall provide for safe conduct of the work, careful removal and disposition of material specified to be salvaged, protection of property which is to remain undisturbed, coordination with other work in progress, and timely disconnection of utility services.
C. Work shall be performed in sequence, locations, and time periods as agreed to by the Owner prior to commencement of work.
D. The amount of dust resulting from demolition shall be controlled to avoid creation of a nuisance in the surrounding area. Masks shall be worn for protection against dust inhalation by all persons in the vicinity of work involving removal of masonry.
E. Protection of existing work:

1. Existing work and finishes to remain shall be protected from damage. Work damaged by this Contractor shall be repaired to match existing work at no additional expense to the Owner.
2. This Contractor shall cover equipment as necessary to protect it from dust.
3. Floors shall be protected by this Contractor from damage.
4. At the end of each workday and during inclement weather, this Contractor shall close exterior openings with weatherproof covers.
5. At the end of each workday this Contractor shall broom clean the entire project.

F. This Contractor shall comply with all Federal and local regulations pertaining to environmental protection.

G. Existing equipment and materials shall be dismantled and/or cut-up so as to be removable through existing access passages. No alterations to the building shall be made for the purpose of removing existing equipment and material.

H. All equipment removed shall remain in the property of the Owner and shall be stored or disposed of as directed.

I. Clean-up:
1. This Contractor shall remove debris and rubbish from the site. Do not allow to accumulate in building or on site.
2. This Contractor shall remove and transport debris in a manner so as to prevent spillage on site or adjacent areas.
3. Local regulations regarding hauling and disposal shall apply.

J. Modifications to Existing Electrical Systems:
1. This Contractor shall ensure that all demolition and modifications to existing electrical systems and associated equipment shall be by a qualified electrician.
2. This Contractor shall remove such existing work as called for on the Drawings and/or as required to clear the areas for new construction. Remove each item of equipment, devices including low voltage devices, luminaires (lighting fixtures), etc. and it's associated circuitry back to the source of power (switchboard, panelboard, controller, control panel, equipment rack, etc.). Associated circuitry includes conduit, conductors, boxes, wiring devices, cover plates, lamps, ballasts, wireways, switches, starters, etc. which are associated with the item being removed.
3. Except as otherwise noted on the Drawings, all existing electrical work which will not be rendered obsolete and which may be disturbed due to any changes required under this Contract shall be restored to its original operating condition. Contractor shall make all necessary provisions to maintain ALL electrical systems, including communications and other low voltage systems, by extending wiring, conduit, relocating equipment, installing new temporary equipment and/or wiring, etc.
4. Electrical work or material rendered obsolete shall be abandoned where concealed in walls and floor slabs and removed where exposed, and/or where made exposed by the removal of walls and/or ceilings. Where a concealed conduit is abandoned and the terminated end is exposed above an accessible ceiling the end shall be capped or sealed in an approved manner. Where a concealed abandoned conduit is terminated in a finished space the conduit shall be removed to below the finished surface (minimum three inches for concrete floor slabs) and the void filled with non-shrinking grout and finished to match the surrounding surfaces.
5. Unused flush device outlet boxes or junction boxes shall be provided with blank cover

plates.

6. Where equipment is identified, or required to be relocated its associated circuitry shall also be removed, as herein before described, along with its associated devices, etc. Provide all electrical connections to the relocated equipment to new or extended circuitry as indicated on the Drawings and/or required to make the equipment fully functional.
7. Power, communications and other low voltage systems that will be reconnected or extended permanently or temporarily shall be identified and marked above the ceiling during the demolition and phased construction periods.
8. Where existing electrical work interferes with new work, and where such installations are to remain in use, the installation shall be disconnected and/or reconnected to coordinate with the work indicated on the Drawings and as herein specified.
9. Except as otherwise indicated, panelboard cabinets shall not be used for other purposes than circuit protection and distribution points and shall not be used as junction or pullboxes.

VII. Cutting And Patching

A. All cutting and patching of existing construction required for work under this DIVISION of these Specifications shall be performed by this Contractor in accordance with SECTION 01045 CUTTING AND PATCHING.

VIII. Personnel Instruction And Operating Instructions

A. This Contractor shall furnish to the Architect/Engineer for delivery to the Owner, four (4) bound and indexed copies of an approved operations and maintenance instruction booklet along with a copy of the submittal data for each item of equipment installed under this Contract. The submittal data shall include all low voltage “special systems” drawings and floor plans, updated to include any deviations to the system(s) and/or the building layout to properly reflect “as built” conditions.
B. After all tests are conducted and approved as specified below, this Contractor shall furnish a competent operations engineer for a period of two (2) days to instruct and demonstrate to the Owner, or his authorized representative, the operation of each system. This Contractor shall notify the Architect/Engineer in writing of the person to whom this instruction was given and the date given. This Contractor shall provide at least one (1) weeks’ notice to the Owner when conducting tests or demonstrations of equipment.
C. This Contractor shall furnish to the Owner as part of the Owner's operating and personnel instruction package, one (1) bound set of marked up drawings indicating any changes made during construction to the original contract drawings. The set shall be clearly labeled, "As Built Plans."
D. This Contractor shall furnish complete Technical Service Manuals with component schematics and parts lists as indicated in appropriate section for each system.

IX. Equipment Suppliers Inspection

A. The following equipment and systems shall not be placed in operation until a competent installation and service representative of the manufacturer has made an on the job inspection of the installation, has certified that the equipment is properly installed and lubricated, that preliminary operating instructions have been given, and that equipment is ready for operation.
   1. Athletic fields sound reinforcement systems.
   2. Auditorium lighting controls and performance lighting systems.
   3. Auditorium sound reinforcement system.
   4. Auxiliary sound and reinforcement systems.

5. Band, Orchestra, and Choral rooms sound reinforcement systems.
6. Black Box Theater lighting controls and performance lighting systems.
7. Black Box Theater sound reinforcement system.
8. Cable television/broadband distribution system (CATV).
9. Classroom amplification systems.
10. Dance and gymnastics sound reinforcement systems.
11. Door access video entry system.
12. Emergency engine generator set and automatic transfer switch(es).
13. Fire detection and alarm system.
14. Gymnasium sound reinforcement system.
15. Lighting control systems.
16. Master clock system.
17. Middle School stage performance lighting controls and lighting.
18. Multi-media systems.
19. School zone warning signals.
20. Security intrusion system.
21. Sound, intercommunications and program systems.
22. Sports fields lighting systems, including fixture aiming.
23. Telecommunications system including networking equipment.
24. Television studio lighting controls and performance lighting systems.
25. Wireless master clock system.

X. Tests

A. This Contractor shall, at his expense, conduct a capacity and general operating test on each system. The test shall demonstrate the specified capacities of the various pieces of equipment, and shall be conducted in the presence of the Architect/Engineer and the Owner. The general operating tests shall demonstrate that the entire equipment system is functioning in accordance with the Drawings and Specifications. This Contractor shall furnish all instructions, test equipment, and utilities.

B. After all systems are completely tested, this Contractor shall submit four (4) copies of the test results to the Architect/Engineer for review. Final inspection shall not be made until test results have been reviewed by the Architect/Engineer.

XI. Cleaning

A. This Contractor shall thoroughly clean all electrical equipment installed under this DIVISION of these Specifications after the system has been completed or used for temporary service, but in any case, prior to final inspection by the Owner's representatives.

B. Cleaning shall include, but not be limited to, luminaires (lighting fixtures), wiring devices, cover plates, distribution equipment, and the like.

XII. Guarantee

A. This Contractor shall guarantee by acceptance of the contract that all work installed shall be free from any and all defects in workmanship and/or materials, and that all apparatus shall develop capacities and characteristics specified, and that if during the phased construction and warranty period such defects in workmanship, materials, or performance appear, this Contractor shall with no additional expense to the Owner, remedy such defects within a reasonable time. In default thereof, Owner may have such work done and charge the cost to this Contractor.

XIII. Identification

A. This Contractor shall furnish an "As-Built" power systems riser diagram indicating service entrance switchboard, panelboards, emergency engine generator set, automatic transfer switch, dimming systems, and safety switches. Diagram shall indicate size of feeders and conduit, breakers, circuit, and fuses. The diagram shall be neatly drawn, using mechanical drafting methods, at least 24 inches x 36 inches, laminated, and hung from the wall adjacent to service entrance switchboard as directed by the Owner.

B. This Contractor shall refer to the appropriate sections of these Specifications for identification requirements for junction boxes, branch and feeder conductors, underground wiring, low voltage special systems wiring and the like.

XIV. Lock-out/tag-out Procedures

A. This Contractor shall have an established lock-out/tag-out procedure which meets the requirements of VOSH Standard 29 CFR Part 1910, Subpart J, Subsection 147, entitled "Control of Hazardous Energy Sources". This Contractor shall coordinate with the Owner's representative to insure conformance with the Owner's lock-out/tag-out program requirements.

END OF SECTION

Part 1 - General

I. REQUIREMENTS

A. The general provisions of the Contract, including General and Supplementary Conditions and General Requirements, apply to the work specified in this Section.

II. SCOPE

A. The work under this Section shall consist of furnishing and installing grounding systems as shown on the Drawings and herein specified.

III. SUBMITTALS

A. Product Data: Provide manufacturer's standard catalog pages and data sheets for grounding and bonding system components.

B. Shop Drawings:

1. Indicate proposed arrangement for signal reference grids. Include locations of items to be bonded and methods of connection.

2. Manufacturer's Instructions: Indicate application conditions and limitations of use stipulated by product testing agency. Include instructions for storage, handling, protection, examination, preparation, and installation of product.

3. Field quality control test reports.

4. Project Record Documents: Record actual locations of grounding electrode system components and connections.

IV. QUALITY ASSURANCE

A. All equipment, materials, and their installation shall conform to the requirements of the National Electrical Code (NEC), local code requirements, and these Specifications.

B. All equipment and material shall be listed by Underwriter's Laboratories, Inc. (UL) for their intended use and shall bear the UL label.

C. Equipment shall be constructed in accordance with National Electrical Manufacturer's Association (NEMA) standards.

D. Maintain at the project site a copy of each referenced document that prescribes execution requirements.

E. Manufacturer Qualifications: Company specializing in manufacturing the products specified in this section with minimum three years documented experience.

V.

A. Installer Qualifications for Signal Reference Grids: Company with minimum five years documented experience with high frequency grounding systems.

B. Product Listing Organization Qualifications: An organization recognized by OSHA as a Nationally Recognized Testing Laboratory (NRTL) and acceptable to authorities having jurisdiction.

VI. DESCRIPTION

A. The equipment grounding system shall be designed so all building steel, metallic structures, raceways, enclosures, cabinets, machine frames, junction boxes, outlet boxes, portable equipment, and all other conductive items in close proximity with electrical circuits operate continuously at ground potential providing a low impedance path for possible ground fault currents.

VII. DELIVERY, STORAGE, AND HANDLING

A. Receive, inspect, handle, and store products in accordance with manufacturer's instructions.

Part 2 - Products

I. MATERIALS AND COMPONENTS

A. MAIN GROUNDING SYSTEM:

1. The ground bus in the main distribution switchboard shall be connected to at least three (3) copper-clad ground rods, not less than 3/4 inches in diameter, ten (10) feet long, and driven full length into the ground outside in unpaved earth. Where location is not indicated, locate electrode(s) at least 5 feet outside building perimeter foundation as near as possible to electrical service entrance; where possible, locate in softscape (uncovered) area. Where required to meet the requirements of herein specified tests, extra rods shall be installed at no additional cost to the Owner. Provide ground access well for each electrode. The rods shall be located a minimum of ten (10) feet from each other, or any other electrode, and shall be loop interconnected with each other by a minimum No. 4/0 AWG bare copper conductor thermal welded, using the proper style mold, to each rod below grade.

2. Provide a minimum No. 4/0 AWG green insulated copper ground conductor from the main distribution switchboard ground bus to the main metallic water service entrance (before the first pipe joint inside the building) and connect to same by means of adequate ground clamps. Where a dielectric main water fitting is installed, this ground conductor shall be connected to the street side of the dielectric water fitting. The conduit shall be bonded to the ground conductor at each end. Furnish and install with ground clamps, a minimum No. 4/0 AWG

jumper around the water meter.

3. Provide a secondary building ground bar to serve as part of the building grounding electrode system in each electric room and other utilitarian areas of the building where dry-type transformers will be located, and in each communication room and/or where telecommunications main distribution frames (MDF) and sub-distribution frames (SDF) will be located. A ground bar(s) shall also be located at the telephone and CATV service entrance demarcation point(s). The ground bar(s) shall be electro-tin plated copper, minimum size of ¼" x 6" x 12" or larger sizes as shown on the Drawings or required, with 3/8" plastic standoff insulators bolted to the wall. Ground Bar Mounting Height: 18 inches above finished floor unless otherwise indicated. These ground bars shall be connected with a continuous No. 4/0 AWG bare copper ground conductor using high compression two (2) hole lugs. The No. 4/0 AWG ground conductor shall originate at the main switchboard ground bus and route through the building corridor ceilings unspliced to each of the ground bars. Provide "low smoke" type exothermic welds in an accessible ceiling using the proper style mold. Where impractical to use an exothermic weld due to space constraints, the Contractor may use an irreversible compression type connection listed for the purpose but only at locations approved by the Owner.

4. Steel framed buildings:

    a) Provide a secondary building ground bar to serve as part of the building grounding electrode system in each electric room and other utilitarian areas of the building where dry- type transformers will be located, and in each communication room and/or where telecommunications main distribution frames (MDF) and sub-distribution frames (SDF) will be located. A ground bar(s) shall also be located at the telephone and CATV service entrance demarcation point(s). The ground bar(s) shall be electro-tin plated copper, minimum size of ¼" x 6" x 12" or larger sizes as shown on the Drawings or required, with 3/8" plastic standoff insulators bolted to the wall. These ground bars shall be connected with a continuous No. 4/0 AWG bare copper ground conductor using high compression two (2) hole lugs. The No. 4/0 AWG ground conductor shall originate at the nearest accessible building steel beam or column using a "low smoke" type exothermic weld with the proper style mold. Remove the building steel paint completely prior to making grounding connections and repaint with proper galvanized paint when complete.

    b) Bond the building steel at each building expansion joint with No. 4/0 AWG bare copper using a "low smoke" type exothermic weld using the proper style mold at accessible locations. Remove the building steel paint completely prior to making grounding/bonding connections and repaint with proper galvanized paint when complete.

5. New Buildings, Building Additions and Exterior Electrical Equipment Enclosures:

a) Buildings with new concrete foundations and/or footings shall be provided with a minimum No. 4 AWG bare copper ground conductor from the main distribution switchboard ground bus to the foundations and/or footings concrete-encased electrode rebar meeting the requirements of NEC 250.52(A)(3). The conductor shall be thermal welded to the concrete-encased electrode (rebar), using the proper style mold. Refer to the detail on the Drawings. (ENGINEER EDIT OUT THIS PORTION IF NOT USING) Building additions foundations and/or footings not within a reasonable distance from the switchboard may have the concrete- encased electrode bonded to the buildings secondary building electrode system ground bar.

b) Exterior electrical equipment enclosures with new concrete foundations and/or footings shall be provided with a bare copper ground conductor from the ground rods (if provided) and/or from the ground bus of the main panel within the enclosure to the concrete-encased electrode, meeting the requirements of NEC 250.52(A)(3), as shown on the Drawings. The conductor shall be thermal welded to the concrete-encased electrode (rebar), using the proper style mold. The enclosure, if metal, shall be bonded to the grounded electrode.

c) STEEL FRAMED BUILDING: Steel frame buildings shall also have the steel columns anchor bolt connected to the concrete-encased electrode (rebar) with a No. 4/0 AWG bare copper ground conductor having an exothermic weld at both ends, using the proper style molds. Coordinate the installation of the anchor bolts to the base plate to scrape away paint/rust prior to the installation of the washer and nut to the steel columns anchor bolts. Refer to the detail on the Drawings.

B. Secondary services shall be grounded on the "line" side in accordance with the NEC. The neutral disconnecting link, or links, shall be located so that the main distribution switchboard neutral bus with all interior secondary neutrals can be isolated from the common ground bus and the service entrance conductors.

C. The equipment grounding conductors and straps shall be sized in compliance with the NEC. All equipment grounding conductors shall be provided with green insulation equivalent to the insulation on the associated phase conductors. The related feeder and branch circuit grounding conductors shall be connected to the ground bus with pressure connectors. A feeder serving several panelboards shall have a continuous grounding conductor which shall be connected to each related cabinet ground bus.

D. This Contractor shall furnish and install a separate green insulated equipment grounding conductor for each single or three-phase feeder and each branch circuit with a two-pole or three-pole protective device. The required grounding conductor shall be installed in the same raceway with the related phase and/or neutral conductors. Where there are parallel feeders installed in more than one raceway, each raceway shall have a green insulated equipment ground conductor. Single-phase branch circuits required for 120

and 277-volt lighting, receptacles, and motors shall consist of phase and neutral conductors installed in a common metallic raceway, which shall serve as the grounding conductor. Flexible metallic conduit equipment connections utilized in conjunction with the above single-phase branch circuits shall be provided with suitable green insulated grounding conductors connected to grounding terminals at each end of the flexible conduit.

E. This Contractor shall furnish and install in the same raceway with the associated phase and/or neutral conductors, a green colored equipment ground conductor having the same type insulation and connected as described below:

1. Where electrical devices, such as heaters, are installed in air ducts, provide a green insulated equipment ground conductor sized in accordance with the NEC based on the rating of the overcurrent device supplying the unit. This conductor shall be bonded to the ground bus in the associated panelboard.

2. From the equipment ground bus in panelboards through raceways and flexible metallic conduit to ground terminal in a connection box mounted on three-phase motors, furnish and install a ground conductor sized as herein specified. Where the motor has a separate starter and disconnecting device, the ground conductor shall originate at the ground bus in the panelboard. Motors shall be bonded to each starter and disconnecting device enclosure.

II. GROUNDING AND BONDING COMPONENTS

A. General Requirements:

1. Provide products listed, classified, and labeled as suitable for the purpose intended. Provide products listed and labeled as complying with UL 467 where applicable.

B. Conductors for Grounding and Bonding,

1. Use insulated copper conductors unless otherwise indicated.

2. Exceptions:

a) Use bare copper conductors where installed underground in direct contact with earth.

b) Use bare copper conductors where directly encased in concrete (not in raceway).

3. Factory Pre-fabricated Bonding Jumpers: Furnished with factory-installed ferrules; size braided cables to provide equivalent gage of specified conductors.

C. Connectors for Grounding and Bonding:

1. Description: Connectors appropriate for the application and suitable for the conductors and items to be connected; listed and labeled as complying with UL 467.

2. Unless otherwise indicated, use exothermic welded connections for underground, concealed and other inaccessible connections.

3. Exceptions:

    a) Use mechanical connectors for connections to electrodes at ground access wells.

    b) Unless otherwise indicated, use mechanical connectors, compression connectors, or exothermic welded connections for accessible connections.

    c) Use exothermic welded connections for connections to metal building frame.

D. Mechanical and Compression Connectors:
    1. Manufacturers

        a) Advanced Lightning Technology (ALT): www.altfab.com.

        b) Burndy LLC: www.burndy.com.

        c) Harger Lightning & Grounding: www.harger.com.

        d) Thomas & Betts Corporation: www.tnb.com.

        e) Substitutions: See Section 16010 – Electrical General Provisions

E. Exothermic Welded Connections:
    1. Manufacturers

        a) Burndy LLC: www.burndy.com.

        b) Cadweld, a brand of Erico International Corporation: www.erico.com.

        c) thermOweld, subsidiary of Continental Industries; division of Burndy LLC: www.thermoweld.com.

F. Ground Bars:

    1. Description: Copper rectangular ground bars with mounting brackets and insulators.

    2. Size: As indicated.

3. Holes for Connections: As indicated or as required for connections to be made.

4. Manufacturers:

    a) Advanced Lightning Technology (ALT): www.altfab.com.

    b) Erico International Corporation: www.erico.com.

    c) Harger Lightning & Grounding: www.harger.com.

    d) thermOweld, subsidiary of Continental Industries; division of Burndy LLC: www.thermoweld.com.

    e) Substitutions: See Section 16010 – Electrical General Provisions

G. Ground Rod Electrodes:

1. Comply with NEMA GR 1.

2. Material: Copper-bonded (copper-clad) steel.

3. Size: 3/4 inch diameter by 10 feet length, unless otherwise indicated.

4. Where rod lengths of greater than 10 feet are indicated or otherwise required, sectionalized ground rods may be used.

5. Manufacturers:

    a) Advanced Lightning Technology (ALT): www.altfab.com.

    b) Erico International Corporation: www.erico.com.

    c) Galvan Industries, Inc: www.galvanelectrical.com.

    d) Harger Lightning & Grounding: www.harger.com.

    e) Substitutions: See Section 16010 – Electrical General Provisions

H. Ground Plate Electrodes:

1. Material: Copper.

2. Size: 24 by 24 by 1/4 inches, unless otherwise indicated.

3. Manufacturers:

    a) Advanced Lightning Technology (ALT): www.altfab.com.

b) Erico International Corporation: www.erico.com.

c) Harger Lightning & Grounding: www.harger.com.

d) thermOweld, subsidiary of Continental Industries; division of Burndy LLC: www.thermoweld.com.

e) Substitutions: See Section 16010 – Electrical General Provisions

Part 3 - Execution

I. POWER SYSTEM GROUNDING

A. This Contractor shall furnish and install green insulated ground conductor(s) in a raceway to the main ground and domestic metallic water main with ground clamps designed specifically for that purpose.

B. Main distribution system: From the ground electrodes, this Contractor shall furnish and install an insulated ground conductor to the ground bus within the switchgear, to the neutral of the switchgear, and to all non-current carrying parts.

C. Secondary building grounding: Furnish and install secondary building ground bars where indicated and as detailed on the drawings. Connect the ground bars with No. 4/0 AWG bare copper ground conductors originating from the (switchgear ground bus) (building steel). Provide green tags on the ground conductors every fifty (50) feet or less. The tags shall identify the ground conductor as the building secondary grounding electrode system. Laminate tags and secure with tie wraps.

D. Branch circuit grounding: This Contractor shall furnish and install grounding bushings, ground terminal blocks, and grounding jumpers at distribution centers, pullboxes, panelboards, and the like.

E. Bonding jumpers: This Contractor shall furnish and install a green insulated bonding conductor (size shall be correlated with the over-current device protecting the conductor) attached to grounding bushings on the raceway, to lugs on boxes, and other enclosures.

F. Bonding conductors: This Contractor shall furnish and install a bonding conductor in all flexible conduits connected at each end to a grounding bushing.

G. Pole mounting luminaire (lighting fixture) grounding: This Contractor shall furnish and install a ground conductor with green insulation to the lighting standard (pole). Connect to a corrosion-resistant ground stud or ground clamp furnished as part of the standard. The ground conductor shall originate and be run with the branch circuit wiring.

H. All electrical outlets shall be connected from the device grounding terminal to the outlet

box with No. 12 AWG green insulated conductor. This Contractor shall furnish and install a green screw terminal in the outlet box and a continuous green ground conductor from the green terminal screw to the grounding systems as indicated on the Drawings.

II. EXAMINATION

1. Verify that work likely to damage grounding and bonding system components has been completed.

2. Verify that field measurements are as indicated.

3. Verify that conditions are satisfactory for installation prior to starting work.

III. COMMUNICATION GROUNDING

A. Telephone

1. This Contractor shall furnish and install one (1) No. 2 AWG green ground conductor in a ¾ inch raceway from the telephone equipment demarcation space to the main service ground or building secondary grounding electrode system.

2. This Contractor shall furnish and install one (1) No. 2 AWG type green ground loop between each raceway terminating at the telephone equipment demarcation backboard by means of a grounding bushing.

B. Fire detection and alarm systems: This Contractor shall furnish and install one (1) No. 8 AWG green ground conductor in a 3/4-inch raceway from system equipment enclosures to the main service ground or building secondary grounding electrode system.

C. Ancillary communication systems: Provide additional grounding of other building systems as described elsewhere in these specifications.

IV. TESTS

A. The completed grounding system shall be subjected to a ground resistance test with an earth test megger to ensure that the ground resistance, without chemical treatment or other artificial means, does not exceed five (5) ohms at the service entrance equipment's ground bus. The Contractor shall furnish and install additional ground rods and conductors from the exterior ground grid to achieve the required resistance to ground. Testing equipment must be calibrated to the manufacturer's requirements. Upon request, the Contractor shall provide documentation of the testing equipment's most recent calibration.

B. ALL STEEL FRAMED BUILDINGS: In addition to the above, steel framed buildings shall be subjected to a ground resistance test with an earth test megger for the adequacy of the steel framing of the building as a grounding electrode system for five (5) ohms or less. Testing shall be at all of the secondary building ground bar connection points. If

testing results do not meet the required resistance, the engineer must be notified.

END OF SECTION

Part 1 - General

I. REQUIREMENTS

A. The general provisions of the Contract, including General and Supplementary Conditions and General Requirements, apply to the work specified in this Section.

II. SCOPE

A. The work covered under this Section shall consist of furnishing and installing conduits, raceways, cable trays, and fittings for all systems as shown on the Drawings and herein specified.

III. QUALITY ASSURANCE

A. All equipment, materials, and their installation shall conform to the requirements of the National Electrical Code (NEC), local code requirements, and these Specifications

B. All equipment and materials shall be listed by Underwriters Laboratories, Inc. (UL) for their intended use and shall bear the UL label.

C. Equipment shall be constructed in accordance with National Electrical Manufacturer's Association (NEMA) standards.

D. Submittals are required in accordance with SECTION 260500 of these Specifications for conduits, raceways, fittings, wiring troughs, cable hooks, cable trays and associated support systems.

1. Cable tray submittals shall include product data and drawings of cable tray and accessories including clamps, brackets, hanger rods, splice plate connectors, expansion joint assemblies and fittings showing accurately scaled components.

2. Cable tray product data shall include, but not be limited to, types of materials, finishes, rung spacing, inside depths, and fitting radii. For side rails and rungs, submit cross sectional properties including Section Modulus (Sx) and Moment of Inertia (Ix).

Part 2 - Products

2.1 CONDUITS

A. Minimum conduit size shall be 1/2 inch. No more than six (6) No. 12 AWG conductors shall be pulled in 1/2-inch conduit. For conductors, larger than No. 12 AWG or quantities of No. 12 greater than six (6) conductors, 3/4-inch conduit shall be the minimum size. Other sizes shall be as indicated on the plans, or as required by the NEC for number and size of conductors installed. Materials shall be new and full length. Crushed and/or deformed conduits shall not be used.

B. Rigid steel conduit and intermediate metal (IMC) conduits shall be full weight threaded and galvanized steel pipe of standard pipe dimensions.

C. Electrical metallic tubing (EMT) shall be threadless thin wall conduit, galvanized or zinc metallized.

D. Flexible steel conduit shall be single-strip type, galvanized. Use for short connections where rigid type conduits are impractical, for expansion joint crossing, from outlet box to a recessed luminaire (lighting fixture) (minimum, 4 feet; maximum, 6 feet in length), for final connections to motor terminal boxes or other vibrating equipment. Use only steel connectors approved for flexible conduit. Provide an internal ground wire with proper fittings. Other uses on the project shall not be permitted.

E. Flexible weatherproof conduit shall have polyvinyl sheathing similar to AMERICAN METAL HOSE "Sealtite" type "UA" and shall be used where exposed to the weather to connect all motors; all rooftop mounted equipment, and all other wet locations, where rigid type conduits connections are impractical. Weatherproof flexible conduit installations shall have maximum lengths of + twenty-four (24) inches. Use only steel connectors approved for flexible weatherproof conduit. Provide an internal ground wire with proper fittings. Other uses on the project shall not be permitted, except where indicated hereinafter in these specifications or as shown on the drawings.

F. Plastic conduits shall be installed only underground or in a concrete slab on grade. Only heavywall (Schedule 40) plastic conduit shall be used. Where conduit turns out of a concrete slab or finished grade, inside or outside the building, provide a rigid steel conduit elbow and suitable adaptor between plastic and steel conduits. No plastic conduit shall be used inside the building or exposed outside the building, unless otherwise noted on the Drawings.

G. This contractor can use for exterior, underground, pole mounted luminaire branch circuit wiring, schedule 40 high-density polyethylene (HDPE) piping. Where conduit turns out above finished grade, provide a rigid steel conduit elbow and suitable adaptor between plastic and steel conduits. No plastic conduit shall be used exposed outside the building, unless otherwise noted on the Drawings. A HDPE pipe that meets this specification is DURA-LINE Cat. No. EPEC- 40/SCH 40 (black) or approved equal.

2.2 METAL CONDUIT AND TUBING

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

1. AFC Cable Systems, Inc
2. Alflex Inc.
3. Allied Tube & Conduit; a Tyco International Ltd. Co.
4. Anamet Electrical, Inc.; Anaconda Metal Hose.
5. Electri-Flex Co.
6. Manhattan/CDT/Cole-Flex.

7. Maverick Tube Corporation.
8. O-Z Gedney; a unit of General Signal.
9. Wheatland Tube Company.

B. Rigid Steel Conduit: ANSI C80.1.

C. IMC: ANSI C80.6.

D. EMT: ANSI C80.3.

E. FMC: Zinc-coated steel.

F. LFMC: Flexible steel conduit with PVC jacket.

G. Fittings for Conduit (Including all Types and Flexible and Liquidtight), EMT, and Cable: NEMA FB 1; listed for type and size raceway with which used, and for application and environment in which installed.

1. Conduit Fittings for Hazardous (Classified) Locations: Comply with UL 886.
2. Fittings for EMT: Set-screw or compression type.
3. Coating for Fittings for PVC-Coated Conduit: Minimum thickness, 0.040 inch, with
overlapping sleeves protecting threaded joints.

H. Joint Compound for Rigid Steel Conduit or IMC: Listed for use in cable connector assemblies, and compounded for use to lubricate and protect threaded raceway joints from corrosion and enhance their conductivity.

2.3 NONMETALLIC CONDUIT

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

1. AFC Cable Systems, Inc.
2. Anamet Electrical, Inc.; Anaconda Metal Hose.
3. Arnco Corporation.
4. CANTEX Inc.
5. CertainTeed Corp.; Pipe & Plastics Group.
6. Condux International, Inc.
7. ElecSYS, Inc.
8. Electri-Flex Co.
9. Lamson & Sessions; Carlon Electrical Products.
10. Manhattan/CDT/Cole-Flex.
11. RACO; a Hubbell Company.
12. Thomas & Betts Corporation.

B. RNC: NEMA TC 2, Type EPC-40-PVC, unless otherwise indicated.
C. Fittings for RNC: NEMA TC 3; match to conduit or tubing type and material.

2.4 FITTINGS

A. Fittings, couplings, and accessories shall be compatible with the conduit material.

B. Unions, couplings, and fittings for rigid and IMC conduits shall be of galvanized steel of conventional dimensions and shall be internally threaded at each end to fit the nontapered thread standard for the corresponding size conduit. Couplings and fittings for electrical metallic tubing shall be of steel and shall be of the compression or setscrew type. Cast pot metal and crimp types are not acceptable.

C. Conduit bodies used with conduits 1 ½ inches and larger shall be galvanized cast iron “mogul conduit bodies” complete with a domed and angled cover, neoprene gasket, stainless steel screws, and rated for “wet locations”.

2.5 BUSHINGS AND LOCKNUTS

A. Use OZ/GEDNEY type 'B' insulated or type 'BLG' bushing where necessary to bond conduit to ground connection. Bushings shall be as manufactured by OZ/GEDNEY, THOMAS & BETTS, or CROUSE-HINDS.

B. Locknuts shall be used on both sides of conduit connections to a box or a panelboard in addition to the bushing. Where a larger size opening occurs than the size of the conduit, use reducing locknuts. Do not use reducing washers.

2.6 WIRING TROUGHS

A. Wiring troughs complete with screwed covers shall be used where indicated and for mounting groups of switches and/or starters. Wiring troughs shall be the standard manufactured product of a company regularly producing wiring troughs and shall not be a local shop assembled unit. Wiring trough shall be UL listed and of sizes indicated or as required by NEC, if not indicated. The interior, including couplings shall be completely open without interference. Finish shall be ASA #49 medium light gray enamel over a rust inhibitor. Wiring troughs shall be UL listed "Suitable For Wet Locations" and so labeled where indicated "WP" on the Drawings.

B. Wiring connection taps within wiring troughs shall be made using clear self- sealing, self-insulating, multi-tap connectors with transparent flexible insulating covers. The connectors shall be securely fastened. The multi-tap connector shall be manufactured by ILSCO, Series “PCT” ClearTap or approved equal.

2.7 CABLE TRAY

A. Ladder type cable tray shall be used where indicated on the Drawings, for low voltage cabling systems. Low voltage cabling systems shall be as hereinafter specified in other

sections of these specifications. Ladder type cable trays may also be used for Type MC Cable as hereinafter specified in other sections of these specifications.

B. Cable tray systems shall be made of straight sections, fittings, and accessories as shown on the Drawings, described herein, and as defined in the latest NEMA standards publication VE-1. Cable tray shall be UL classified as an equipment-grounding conductor.

C. Ladder type cable tray shall be metal (aluminum or pre-galvanized steel) of the types, classes and sizes indicated; with splice plates bolts, nuts and washers for connecting units. Construct units with rounded edges and smooth surfaces; in compliance with applicable standards and these specifications.

D. Cable tray materials and finish shall be as follows:

1. Aluminum: Straight section and fitting side rails and rungs shall be extruded from Aluminum Association Alloy 6063. All fabricated parts shall be made from Aluminum Association Alloy 5052.

2. Pre-Galvanized Steel: Straight sections, fitting side rails, and rungs shall be made from structural quality steel meeting the minimum mechanical properties and mill galvanized in accordance with ASTM A653 SS, Grade 33, Coating Designation G90.

E. Ladder type cable tray shall consist of two (2) longitudinal members (side rails) with transverse members (rungs) welded to the side rails. Rungs shall be spaced six (6) inches on center. Rung spacing in radiused fittings shall be nine (9) inches and measured at the center of the tray's width. Rungs shall have a minimum cable bearing surface of 7/8 inches with radiused edges. No portion of the rungs shall protrude below the bottom plane of the side rails. Each rung must be capable of supporting the cable load, with a safety factor of 1.5, and a 200-lb. concentrated load when tested with NEMA VE 1, section 5.4.

F. Ladder type cable tray shall have an overall side rail height of four (4) inches with a minimum loading depth of three (3) inches. Cable tray width shall be twelve (12) inches, eighteen (18) inches, or twenty-four (24) inches as shown on the Drawings. Straight section side rails shall be of "I-beam" design with a rung retaining weld bead. All straight sections shall be supplied in standard lengths of twelve (12) feet, except where shorter lengths are permitted to facilitate tray assembly lengths as shown on the Drawings. Fittings radius shall be twenty-four (24) inches. Side rails of straight sections and fittings shall be compatible so that standard splice plates can be used to join straight sections and fittings. Fittings shall have three (3) inch tangents beyond the curved section to accommodate the standard splice plates.

G. Splice plates shall be the bolted type made as indicated below for each tray type. The resistance to fixed splice connections between an adjacent section of tray shall not exceed .00033 ohm. Splice plate construction shall be such that a splice may be located anywhere within the support span without diminishing rated loading capacity of

the cable tray.

1. Aluminum Tray: Splice plates shall be made of 6063-T6 aluminum, using four square neck bolts and serrated flange locknuts. Hardware shall be zinc plated in accordance with ASTM B633, SC1.

2. Pre-Galvanized Steel Tray: Splice plates shall be manufactured of high strength steel, meeting the minimum mechanical properties of ASTM A1011 HSLAS, Grade 50, Class 1. Each splice plate shall be attached with ribbed neck carriage bolts and serrated flange locknuts. Hardware shall be zinc plated in accordance with ASTM B633 SC1.

Splice plates shall be furnished with straight sections and fittings.

H. Cable Tray Supports

1. Supports shall be constructed from 12-gauge steel formed shape channel members 1 5/8 inch by 1 5/8 inch with necessary hardware such as trapeze support kits furnished by manufacturer of cable tray (or engineer approved equal). Cable trays installed adjacent to walls shall be supported on wall-mounted brackets furnished by manufacturer of cable tray (or engineer approved equal).

2. Trapeze hanger supports shall be supported by ½ inch (minimum) diameter rods.

3. Cable tray fitting supports shall be located such that they meet the strength requirements of straight sections. Install fitting supports per NEMA VE-2 guidelines, and in accordance with manufacturer's instructions.

I. Accessories shall be furnished as required to protect, support, and install a cable tray system. Accessories shall consist of but not be limited to: section splice plates, expansion plates, blind-end plates, specially designed ladder dropouts, etc.

J. Cable tray shall be capable of carrying a uniformly distributed load of 126 lbs./ft. for aluminum on a 12-ft. support span or 103 lbs./ft for pre-galvanized steel on a 12-ft. support span (NEMA Class 12C) with a safety factor of 1.5 when supported as a simple span and tested per NEMA VE 1, section 5.2. In addition to the uniformly distributed load, the cable tray shall support 200 lbs. concentrated load at mid-point of span. Load and safety factors specified are applicable to both the side rails and rung capacities. Cable tray shall be made to manufacturing tolerances as specified by NEMA.

K. Cable tray manufacturers shall be B-LINE SYSTEMS, INC. Series 24A for aluminum and 248 for pre-galvanized steel or equal as manufactured by WIREMOLD CABLOFIL, CHALFANT CABLE TRAY, COPE CABLE TRAY, SQUARE D, or THOMAS & BETTS CORPORATION.

2.8 CABLE HOOK SUPPORT SYSTEMS

A. Cable hooks (also known as “J” hooks) shall be provided for low voltage cable systems as hereinafter specified in other sections of these specifications.

B. Cable hooks shall provide a flat bottom bearing surface of sufficient width to comply with required bend radii of high-performance cables.

C. Cable hooks shall have flare edges to prevent damage while installing cables.

D. Cable hooks shall be designed so the mounting hardware is recessed to prevent cable damage.

E. Cable hooks sized 1 5/16 inches and larger shall have a stainless-steel cable latch retainer to provide containment of cables within the hook. The retainer shall be removable and reusable and be suitable for use in air handling spaces.

F. Cable hooks shall be factory assembled for direct attachment to walls, hanger rods, beam flanges, purlins, strut, floor posts, etc. to meet job conditions.

G. Multi-tiered cable hook assemblies shall be used where required to provide separate cabling compartments, or where additional capacity is needed. Assemblies may be factory assembled or assembled from pre-packaged kits. Assemblies shall consist of a steel angled hanger bracket holding up to six (6) cable hooks.

H. Cable hooks for non-corrosive areas shall be pre-galvanized steel, ASTM A653. Where additional strength is required, cable hooks shall be spring steel with a zinc-plated finish, ASTM B633, SC3. Cable hooks for corrosive areas shall be stainless steel, AISI Type 304.

I. Cable hooks shall be capable of supporting a minimum of 30 pounds with a safety factor of 3. Spring steel cable hooks shall be capable of supporting a minimum of 100 pounds with a safety factor of 3 where extra strength is required.

J. Cable hook manufacturer shall be B-LINE SYSTEMS, INC. Series BCH21, BCH32, BCH64, or equal as manufactured by ERICO CADDY.

2.9 PULL-LINES (CORDAGE)

A. Pull-lines (rope and cordage) types and strengths must be selected and calculated by the Contractor. The selection must be based on the intended use and expected pulling load applications. Design Factor (DF) selections and Working Load Limits (WLL) must be calculated with consideration of exposures to risk and actual conditions of use for each application. Pull-lines shall be in compliance with the latest Cordage Institute Standards and Guidelines.

B. The minimum pull-line tensile strength for insertion into conduits shall be 500 pounds and of the low-friction type.

C. Each utility service entrance conduit (raceway) for power company, telephone company and/or cable television (CATV) company shall have a MULETAPE® pulling tape with numerical values having sequential footage (feet and inches) markings, without splices. The MULETAPE® shall have a minimum tensile strength of 2500 pounds and shall be of the low-friction type with prelubrication, high abrasion resistant yarns.

D. Where minimum pull-line strengths are given, they do not negate the Contractor's responsibility for proper selections and calculations for higher strength pull-lines to suit the application.

2.10 ROOFTOP CONDUIT SUPPORT STRUT SYSTEM

A. Provide rooftop conduit support strut systems that will absorb thermal expansion and contraction of conduits, thus preventing damage to the roof membrane. This Contractor must select the support strut system's load capacity necessary to carry the weights and sizes of conduits.

B. The conduit support base shall have gently rounded edges to prevent damage to the roof and shall be UV resistant polycarbonate resin or 100% recycled rubber and polyurethane prepolymer, and all other metal parts made of hot-dip galvanized or stainless steel.

C. Conduits shall rest on the strut system made of hot-dip galvanized or stainless steel. Provide fasteners sized for the conduit.

D. Rooftop conduit support system manufacturers shall be MIRO INDUSTRIES, INC. or equal as manufactured by CABLOFIL (CABLO-PORT), COOPER B-LINE (DURA-BLOK™) or approved equal.

Part 3 - Execution

I. CONDUITS

A. Panelboard feeders shall be run in electrical metallic tubing (EMT), galvanized rigid steel conduit, intermediate grade metal conduit, or plastic conduit as described herein.

B. Branch circuit raceways for motors twenty (20) horsepower (or tons) and larger, or a combination of motors totaling twenty (20) horsepower and larger requiring a single point connection shall be EMT, galvanized rigid steel conduit, intermediate grade metal conduit, or plastic conduit as described herein.

C. Branch circuit raceways for motors served by variable frequency drives (VFD) shall be electrical metallic tubing (EMT), galvanized rigid steel conduit, or intermediate grade metal conduit from the load side of the VFD to the line side of the motor. Do not use plastic conduit.

D. Feeders, branch circuits, fire alarm system wiring, and other low voltage systems wiring (required to be in conduit) installed indoors in dry locations shall be run in electrical

metallic tubing (EMT), galvanized rigid steel conduit, or intermediate grade metal conduit above hung ceilings (accessible and non-accessible), in hollow block walls, in furred spaces, in vertical and horizontal pipe chases, and in exposed dry locations as describe herein and other sections of these specifications.

E. Feeders, branch circuits, fire alarm system wiring, and other low voltage systems wiring installed underground, under slab on grade, in concrete, in crawl spaces, or in wet locations shall be run in galvanized rigid steel conduit, intermediate grade metal conduit, or plastic conduit as described herein.

F. Low voltage systems plenum rated wiring or cables run indoors in dry locations shall be in electrical metallic tubing (EMT), galvanized rigid steel conduit, or intermediate grade metal conduit when run above non-accessible ceilings, in hollow block walls, and in exposed dry locations other than communications rooms or in a cable tray. Refer to the respective low voltage systems sections of the specifications for other conduit requirements.

G. Conduits run exposed in boiler rooms, elevator machine rooms, mechanical rooms, pump rooms, fire sprinkler service room, and all other similar spaces, located between the floor and a height of 10’-0” above the finished floor, shall be galvanized rigid steel conduit, or intermediate grade metal conduit as described herein. Conduits above 10’-0” may be EMT, unless otherwise indicated on the Drawings, or required by codes.

II. RACEWAY SYSTEM

A. Raceways shall be continuous from outlet to outlet; from outlet to cabinets, junction boxes, or pullboxes; and secured to all boxes so that each system is electrically continuous from service to outlets. Provide termination of raceways with double lock nuts and bushings.

B. Raceways shall be securely and rigidly supported to the building structure in a neat and workmanlike manner, and wherever possible, parallel runs or horizontal conduit shall be grouped together on adjustable trapeze hangers. Support shall be provided at appropriate intervals not exceeding ten (10) feet with straps, hangers, and brackets specifically designed for the application. Channels shall be 1 inch for 24-inch wide trapeze and 1-1/2 inch for larger than 24 inch. Perforated steel straphangers or tie-wire supports are not acceptable. Conduits installed along wall surfaces shall be supported with galvanized steel brackets specifically designed for conduits and sized for the conduit used. Conduit brackets shall be fastened to the wall using appropriate anchors and screws, the use of drive pins and/or other methods using compressed air or gases are not acceptable. Raceways and supports shall not terminate or be fastened directly to the roof decking. Raceways under roof decking shall not be less than 1½ inches from the nearest surface of the roof decking. Supports attached to structural steel joists shall only be attached within 3” of the joist panel points, top or bottom. Supports attached beyond 3” of the joist panel points must be approved, in writing, by the Structural Engineer of record and the Owner before attaching.

C. Run exposed raceways parallel with or at right angles to walls. In mechanical rooms and similar utilitarian spaces where exposed conduits are used, provide "condulets",

and similar fittings in lieu of junction boxes. Exposed outlet boxes of adequate size, however, shall be used to contain wire junctions.

D. No raceway shall be installed within three (3) inches of hot water pipes, or appliances, except at crossings where raceway shall be at least one (1) inch from pipe cover.

E. Install raceway to prevent collection of trapped condensation and be devoid of traps. Slope underground raceways away from the building or provide weep holes when sloping away from the building is not possible.

F. Do not terminate in, or fasten raceways to, motor foundations.

G. Raceways installed outside underground shall have a minimum of twenty-four (24) inches top cover. Separate electric raceways from telephone (and other low voltage systems) raceways with a minimum of twelve (12) inches of well-tamped earth, or six (6) inches of concrete.

H. Joints in raceways in concrete or underground shall be watertight. Steel conduits shall have ends cut square. Ream smooth and paint male threads with graphite- base pipe compound and draw up tight with conduit couplings. Do not paint female threads; where required, use Erickson, or equal, conduit fittings. Running threads shall not be permitted. Place caps in ends of conduits as soon as located to prevent entry of foreign material. Screwed on caps shall be used for threaded conduits. Unused (abandoned) conduits shall be capped. The use of tape, paper or rag wads in not acceptable for conduit caps.

I. After conduit installation, clean and paint marred surfaces affecting galvanizing with asphaltum, galvanized-iron primer.

J. Run conduit above suspended ceilings for outlets in suspended ceilings. Keep clear of planned ductwork where turning down from slab into suspended ceiling.

K. Horizontal or cross runs in solid partitions and walls shall not be permitted.

L. Conduits designated on the Drawings as empty conduits (EC) shall have a properly sized pull-line.

M. Flexible metal conduit used for connection of luminaires (lighting fixtures), receptacles outlets, telepower poles, and as otherwise shown on the Drawings, shall be supported and bonded in accordance with NEC Article 348.

N. Conduit runs in concrete slabs shall be installed only where shown on the Drawings and shall be limited to 3/4-inch conduit.

O. Where embedded conduits cross building expansion joints, the Contractor shall furnish and install an offset expansion joint or a sliding expansion joint. Sliding expansion joints shall be provided with bonding strap and clamp. Where conduits are exposed, provide expansion fittings or flexible conduit as required.

P. In all wet and damp locations, boiler rooms, elevator machine rooms, kitchens, mechanical rooms, pump rooms, fire sprinkler service room, and all other similar spaces, all final electrical connections to any and all equipment, regardless of the type, shall consist of conductors run in polyvinyl sheathed flexible metal conduit ("Sealtite") with maximum lengths as hereinbefore specified.

Q. Conduits/raceways shall not be permitted to be run exposed on top of finished floors or grade, unless specifically shown on the drawings or approved by the Owner in advance.

R. Raceways or sleeves known to be subjected to different temperatures and where condensation is known to be a problem, as in cold storage areas of (or in) the building or where passing from the interior to the exterior of the building, the raceway or sleeve shall be filled with an approved material to prevent the circulation of warm air to a cold section of the raceway or sleeve, per NEC 300.7.

III. CABLE TRAY

A. Installation shall be in accordance with equipment manufacturer's instructions and with recognized industry practices (NEMA VE 2), to ensure that cable tray equipment complies with requirements of the NEC and applicable portions of NFPA 70B.

B. Cable tray shall be supported from the building structure. Supports attached to structural steel joists shall only be attached within 3" of the joist panel points, top or bottom. Supports attached beyond 3" of the joist panel points must be approved, in writing, by the Structural Engineer of record and the Owner before attaching.

C. Coordinate cable tray with other electrical work and other trades' work as necessary to properly integrate installation of cable tray work with other work.

D. Provide sufficient space encompassing cable trays to permit access for installing and maintaining cables.

E. Test cable trays to ensure electrical continuity of bonding and grounding connections and to demonstrate compliance with specified minimum grounding resistance. Refer to NFPA 70B, Chapter 18, for testing requirements and test methods.

IV. CABLE HOOK SUPPORT SYSTEM

A. Installation and configurations shall conform to the requirements of the current revision levels of ANSI/EIA/TIA Standards 568 & 569, NEC, the manufacturer's installation instructions and other sections of these project specifications.

B. Cable hook assemblies shall be supported from the building structure. Where fastened to walls use appropriate anchors and screws, the use of drive pins and/or other methods using compressed air or gases are not acceptable. Supports shall not terminate or be fastened directly to the roof decking Cables installed under roof decking shall not be less than 1½ inches from the nearest surface of the roof. Cable hook supports attached to structural steel joists shall only be attached within 3" of the joist

panel points, top or bottom. Supports attached beyond 3” of the joist panel points must be approved, in writing, by the Structural Engineer of record and the Owner before attaching.

C. Install cables using techniques, practices, and methods that are consistent with Category 5 cables or higher requirements and that support Category 5 or higher performance of completed and linked signal paths, end to end.

D. Install cables without damaging conductors, shield, or jacket.

E. Do not bend cables, in handling or in installing, to smaller radii than minimums recommended by cable manufacturers.

F. Do not exceed load ratings and allowable fill capacity specified by the cable hook manufacturer.

G. Install cable hooks to maintain a minimum three (3) inch clear or higher vertical space above the accessible ceiling tiles for the horizontal cabling and pathway.

V. CUTTING AND HOLES

A. Locate holes in advance where they are proposed in structural sections such as ribs or beams. Prior to drilling through any structural section or member, obtain the written approval of the Architect/Structural Engineer of Record and the Owner.

B. Cut holes through concrete and masonry structures with a diamond core drill or concrete saw. Pneumatic hammer, impact electric, hand or manual hammer type drills are not allowed, except where permitted in advance by the Architect/Engineer and Owner, due to limited working space.

C. Openings in floor slabs or fire-rated walls or partitions for raceways and other electrical equipment shall, after installation of the raceway, be fire stopped using a product similar to THOMAS & BETTS "Flame-Safe" fire retardant.

VI. ROOFTOP CONDUIT SUPPORT STRUT SYSTEM

A. Rooftop conduit support struts shall be installed in accordance with manufacturer’s instructions and recommendations.

B. Determine that the structure, roof insulation, and roof membrane are structurally adequate to support weight of conduits (with conductors), supports and hangers.

C. Install supports at maximum spacing of 10 feet, unless closer spacing is required due to weight of conduits or as shown on the Drawings. Do not exceed manufacturer’s recommended load limits.

D. Support pads: Remove rock or gravel from area to be covered by pad, apply on clean area, and center bases on top of support pads.

E. Set conduit in support without dropping or causing undue impact. Install properly sized clamps to suit conduit sizes.

F. Always consult roofing manufacturer for roof membrane compression capacities. If necessary, a compatible sheet of roofing material (rubber pad) may be installed under rooftop support to disperse concentrated loads and add further membrane protection.

G. Contractor shall adjust conductor sizes in raceways in accordance with the National Electrical Code section 310.15(B)(2)(c) based on an average ambient temperature of 84°F.

END OF SECTION

Part 1 - General

I. REQUIREMENTS

A. The general provisions of the Contract, including General and Supplementary Conditions and General Requirements, apply to the work specified in this Section.

II. SCOPE

A. The work covered under this Section shall include furnishing and installing surface mounted metal raceways complete for all electrical systems as shown on the Drawings and herein specified. Surface raceway systems shall consist of raceway bases, covers, appropriate fittings, dividers, and device mounting plates necessary for a complete installation.

III. QUALITY ASSURANCE

A. All equipment, materials, and their installation shall conform to the requirements of the National Electrical Code (NEC), local code requirements, and these Specifications.

B. All equipment and materials shall be listed by Underwriters Laboratories, Inc. (UL) for their intended use and shall bear the UL label.

C. Equipment shall be constructed in accordance with National Electrical Manufacturer's Association (NEMA) standards.

D. Submittals are required in accordance with SECTION 16010 of these Specifications.

IV. USES PERMITTED

A. Surface mounted metal raceway shall be used primarily where new wiring is required on existing walls and on new walls as noted on the Drawings.

B. Over floor metal raceways shall be used in dry locations where wiring is required over floors to provide electrical services under desks and similar spaces as shown on the Drawings.

V. DELIVERY, STORAGE AND HANDLING

A. Deliver raceway systems in factory labeled packages.

B. Store and handle in strict compliance with manufacturer’s written instructions and recommendations.

C. Protect from damage due to weather, excessive temperature, and construction operations.

Part 2 - Products

2.1 MANUFACTURERS

A. Surface metal raceways shall be as manufactured by THE WIREMOLD COMPANY or equal product as manufactured by HUBBELL INCORPORATED, as described herein as the basis of design.

B. Surface Nonmetallic Raceways: Two-piece construction, manufactured of rigid PVC with
texture and color selected by Architect from manufacturer's standard colors.

C. Surface Nonmetallic raceways shall be as manufactured by THE WIREMOLD COMPANY, Panduit Corp., or equal product as manufactured by HUBBELL INCORPORATED, as described herein as the basis of design.

D. All components and fittings shall be of the same manufacturer, or UL listed as an assembly.

2.2 MATERIALS AND COMPONENTS

A. All surface metal raceways shall be galvanized steel, with snap on covers unless otherwise indicated. Finish shall be ivory in color (unless otherwise indicated) having a scratch- resistant surface (a polyester topcoat over ivory base) and shall be suitable for field repainting to match surroundings.

B. A full complement of fittings must be available including but not limited to mounting clips and straps, couplings, flat, internal and external elbows, cover clips, tees, entrance fittings, wire clips, support clips, c-hangers, end caps, conduit connectors, bushings, and take-off fittings to adapt to flush wall boxes. The covers shall be painted with an enamel finish, ivory in color to match the raceway. They shall overlap the raceway to hide uneven cuts. All fittings shall be supplied with a base where applicable to eliminate mitering. Transition fittings shall be available to adapt to other raceways manufactured by The Wiremold Company. This Contractor shall provide all fittings, etc. for a complete installation.

C. Device Boxes shall be suitable for the type of raceways provided and for mounting standard devices and faceplates. Devices boxes shall be provided in single- and multiple-gang configurations, up to six-gang. Single-gang boxes shall allow for snap-on and fastener applications. They shall range in depth from 0.94” to 2.75”. Extension boxes shall be provided to adapt to existing standard flush switch and receptacle boxes.

D. The raceway manufacturer shall provide a complete line of connectivity outlets and modular inserts for UTP/STP, Fiber Optic, Coaxial and other cabling types with face

plates and bezels to facilitate mounting. A complete line of preprinted station and port

identification labels, snap-in icon buttons as well as write-on station identification labels shall be available. Provide as needed for a complete installation.

E. Raceways used for communications cabling shall have a complete line of full capacity corner elbows and tee fittings, and used where required or shown on the Drawings, to maintain a controlled 2” cable bend radius which meets the specifications for Fiber Optic and UTP/STP cabling and exceeds the TIA 569 requirements for communications pathways.

2.3 SURFACE METAL RACEWAYS

A. WIREMOLD Series V500 or V700 raceway shall be one-piece design with a base and cover factory assembled. The total width shall be 3/4” x 17/32” high with a capacity of 1.19 square inches for V500 or 3/4" x 21/32” with a capacity of 0.26 square inches for V700. The raceway base and cover shall be a minimum thickness of 0.040”. The raceway shall be available in five (5) foot and ten (10) foot lengths.

B. WIREMOLD Series V2400 raceway shall be a single-channel two-piece design with a metal base and snap-on metal cover. The assembled base and cover shall be 1 7/8” wide x 7/8” high with a capacity of 1.39 square inches. The raceway base and cover shall be a minimum thickness of 0.040”. The raceway base shall be available in ten (10) foot lengths and the cover shall be available in five (5) foot lengths.

C. WIREMOLD Series V3000 raceway shall be a single-channel two-piece design with a metal base and snap-on metal cover. The assembled base and cover shall be 2 3/4” wide x 1 17/32” high with a capacity of 3.70 square inches. The raceway base and cover shall be a minimum thickness of 0.040”. The raceway base shall be available in ten (10) foot lengths and the cover shall be available in five (5) foot lengths.

1. Device brackets shall be provided for mounting standard single or two- gang devices within the raceway.

D. WIREMOLD Series V4000 raceway shall be a single-or dual-channel two-piece design with a metal base and snap-on metal cover. Base shall be dividable by means of a removable barrier section into two equal compartments. The assembled base and cover shall be 4 3/4" wide x 1 3/4" high with a capacity of 7.20 square inches for undivided raceway and a capacity of 3.10 square inches for each compartment of the divided raceway. The raceway base shall be a minimum thickness of 0.050 inches and the cover with a minimum thickness of 0.040”. The raceway base shall be available in ten (10) foot lengths and the cover shall be available in five (5) foot lengths.

1. Plastic device mounting bracket and trim plates shall be provided to install devices horizontally within the raceway. Trim plate shall overlap the cover-eliminating seam. Faceplates shall accept a variety of power and data/communication devices. Plastic must be compatible with UL 94 for Plastic Materials. Device brackets and trim plates shall be colored to match the raceway.

E. WIREMOLD Series S4000 raceway shall be a dual-channel two-piece design with a Type 302 stainless steel base and snap-on cover having a Number 4 brushed finish. Base shall be dividable by means of a removable barrier section into two equal compartments. The assembled base and cover shall be 4 ¾" wide x 1 ¾" high with a capacity of 7.20 square inches for each compartment of the divided raceway. The raceway base shall be a minimum thickness of 0.050 inches and the cover with a minimum thickness of 0.040". The raceway base shall be available in ten (10) foot lengths and the cover shall be available in five (5) foot lengths.

1. Plastic device mounting bracket and trim plates shall be provided to install devices horizontally within the raceway. Trim plate shall overlap the cover-eliminating seam. Faceplates shall accept a variety of power and data/communication devices. Plastic must be compatible with UL 94 for Plastic Materials. Device brackets and trim plates shall be colored to match the raceway.

F. WIREMOLD Series V6000 raceway shall be a single-or dual-channel two-piece design with a metal base and snap-on metal cover. Base shall be dividable by means of a removable barrier section into two equal compartments. The assembled base and cover shall be 4 3/4" wide x 3 9/16" high with a capacity of 16.00 square inches for undivided raceway and a capacity of 7.20 square inches for each compartment of the divided raceway. The raceway base shall be a minimum thickness of 0.050 inches and the cover with a minimum thickness of 0.040". The raceway base shall be available in ten (10) foot lengths and the cover shall be available in five (5) foot lengths.

1. Plastic device mounting bracket and trim plates shall be provided to install devices horizontally within the raceway. Trim plate shall overlap the cover-eliminating seam. Faceplates shall be available to accept a variety of power and data/communication devices. Plastic must be compatible with UL 94 for Plastic Materials. Device brackets and trim plates shall be colored to match the raceway.

G. WIREMOLD Series OFR (OVERFLOOR RACEWAY). Over floor raceway shall be low profile ADA compliant, multi-piece design with aluminum base and screw- on steel covers. The assembled base and cover shall be 7" wide x 1/2" high. Height of assembled base and cover increases from 0" at edge to 1/2" with a slope of no less than 1:2. Base shall have four (4) wiring channels, separated by three (3) integral dividers. The raceway base shall be aluminum with a minimum thickness of 0.080 inches and the cover shall be steel with a minimum thickness of 0.040 inches. Bases for raceway and device boxes shall be suitable for mounting directly to bare concrete or floor coverings. The raceway base and covers shall be available in eight (8) foot lengths.

1. Covers, fittings, device boxes, etc. for the OFR shall have a durable black powder coat finish.

2. Over floor raceway 2-or 4-gang divided device boxes shall allow for multiple

services (power, communications, A/V) at a single point-of-use with side facing device mounting. The assembled device box shall be 7” wide x 2 1/4” high x 13” long (2-gang) or 18” long (4-gang). This low-profile device box shall allow space for large cable bend radius and accept OFR Series device plates. Removable divider can be aligned with any of the raceway channels.

3. Provide all fittings, crossovers, clips, raceway transitions to other vertical raceway types, device plates, etc. necessary for a complete OFR system.

Part 3 - Execution

I. EXAMINATION

A. Examine conditions under which surface raceways, boxes, distribution systems, accessories, and fittings are to be installed and substrate that will support raceways. Notify the Architect/Engineer and Owner of conditions detrimental to proper completion of the work. Do not proceed with work until unsatisfactory conditions have been corrected.

II. INSTALLATION

A. Surface raceways shall be installed in strict compliance with the manufacturer’s installation instructions and recommendations and approved shop drawings. Coordinate installation with adjacent work to ensure proper clearances and to prevent electrical hazards.

B. Surface raceways shall be installed parallel with or at right angles to building structure and at the mounting heights noted on Drawings.

C. Surface raceway systems shall be mechanically continuous and connected to all electrical outlets, boxes, device mounting brackets, and cabinets, in accordance with manufacturer’s installation sheets.

D. Metal raceways shall be electrically continuous and bonded in accordance with the National Electrical Code for proper grounding.

E. Surface raceway shall be supported at intervals not exceeding five (5) feet or in accordance with manufacturer’s installation sheets using appropriate anchors and screws. The use of drive pins and/or other methods using compressed air or gases are not acceptable.

1. V500 and V700 shall be supported using two (2) hole straps specifically designed for the application secured with plastic anchors and No. 6 screws.

F. Provide accessories as required for a complete installation, including insulated bushings and inserts where required by the manufacturer.

G. Close all unused raceway openings using manufacturer’s recommended accessories.

H. All surface raceway connections to outlet and/or junction boxes shall be made using

adjustable offset connectors or combination connectors as detailed on the Drawings. The connectors shall be furnished by the manufacturer of the surface raceway.

I. Field cutting of surface raceways base and covers shall be accomplished by the use of the manufacturer's raceway cutters specifically designed for this purpose.

III. CLEANING AND PROTECTION

A. Clean exposed surfaces using non-abrasive materials and methods recommended by manufacturer.

B. Protect raceways and boxes until final acceptance by the Owner.

C. Repaint marred and scratched surfaces with touch-up paint to match original finish.

END OF SECTION

Part 1 - General

I. REQUIREMENTS

A. The general provisions of the Contract, including General and Supplementary Conditions and General Requirements, apply to the work specified in this Section.

II. SCOPE

A. The work covered under this Section shall include furnishing and installing Cabinets, enclosures and junction and pull boxes larger than 100 cubic inches complete for all electrical systems as shown on the Drawings and herein specified,

III. QUALITY ASSURANCE

A. All equipment, material, and their installation shall conform to the requirements of the National Electrical Code (NEC), local code requirements, and these Specifications.

B. All equipment and materials shall be listed by Underwriters Laboratories, Inc. (UL) for their intended use and shall bear the UL label.

C. Equipment shall be constructed in accordance with National Electrical Manufacturer's Association (NEMA) standards.

D. Maintain at the project site a copy of each referenced document that prescribes execution requirements.

E. Product Listing Organization Qualifications: An organization recognized by OSHA as a Nationally Recognized Testing Laboratory (NRTL) and acceptable to authorities having jurisdiction.

F. Submittals are required in accordance with SECTION 16010 of these specifications.

IV. DELIVERY, STORAGE, AND HANDLING

A. Receive, inspect, handle, and store products in accordance with manufacturer instructions.

Part 2 - Products

II. BOXES ENCLOSURES, AND CABINETS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

1. Cooper Crouse-Hinds; Div. of Cooper Industries, Inc.

2. EGS/Appleton Electric.
3. Erickson Electrical Equipment Company.
4. Hoffman.
5. Hubbell Incorporated; Killark Electric Manufacturing Co. Division.
6. O-Z/Gedney; a unit of General Signal.
7. RACO; a Hubbell Company.
8. Robroy Industries, Inc.; Enclosure Division.
9. Scott Fetzer Co.; Adalet Division.
10. Spring City Electrical Manufacturing Company
11. Thomas & Betts Corporation.
12. Wiremold Wire & Cable Management ; Legrand
13. Woodhead, Daniel Company; Woodhead Industries, Inc. Subsidiary.

B. Sheet Metal Outlet and Device Boxes: NEMA OS 1.

C. Cast-Metal Outlet and Device Boxes: NEMA FB 1, aluminum, Type FD, with gasketed cover.

D. Metal Floor Boxes: Cast metal, fully adjustable, rectangular.

E. Small Sheet Metal Pull and Junction Boxes: NEMA OS 1.

F. Cast-Metal Access, Pull, and Junction Boxes: NEMA FB 1, galvanized, cast iron with gasketed cover.

G. Hinged-Cover Enclosures: NEMA 250, Type 1, with continuous-hinge cover with flush latch, unless otherwise indicated.

1. Metal Enclosures: Steel, finished inside and out with manufacturer's standard enamel.
2. Nonmetallic Enclosures: Plastic.

H. Cabinets:

1. NEMA 250, Type 1, galvanized-steel box with removable interior panel and removable front, finished inside and out with manufacturer's standard enamel.
2. Hinged door in front cover with flush latch and concealed hinge.

3. Key latch to match panelboards.

4. Metal barriers to separate wiring of different systems and voltage.

5. Accessory feet where required for freestanding equipment.

III. MATERIALS AND COMPONENTS

A. Junction and pull boxes shall be provided where indicated and required and shall be of the type and size for the installation of the electrical system. Junction or pull boxes not over one hundred (100) cubic inches in volume shall be constructed in accordance with the requirements of NEC. All junction boxes shall have removable screwed covers and be accessible after completion of the building. Removable covers shall not exceed three (3) feet in size in any direction and split covers shall be used for boxes larger than three (3) feet in any direction. Where several feeders pass through a common pull box, the feeders shall be tagged to indicate clearly their electrical characteristics and branch circuit numbers and panelboard designation. This same information shall be stenciled in paint on the cover of each box.

1. Pull and junction boxes shall be made of code gauge galvanized sheet steel with removable screw covers. Minimum size shall be 4 inch x 4 inch x 2-1/8 inches deep.

2. Cast metal pull boxes shall be provided in damp or wet locations, with a gasketed screwed cover, and drilled and tapped holes as required. Screws shall be brass or bronze.

3. Pull boxes shall be provided in any conduit run which exceeds one hundred (100) feet in length, or any run having more than two hundred seventy (270) total degrees of bend.

IV. UNDERGROUND BOXES AND ENCLOSURES

A. Underground boxes, enclosures and covers shall conform to all test provisions of the most current ANSI/SCTE 77 “Specifications for Underground Enclosure Integrity” for Tier 15 applications. When multiple tiers are specified the boxes must physically accommodate and structurally support compatible covers while possessing the highest Tier rating. In no assembly can the cover design load exceed the design load of the box. All components in an assembly (box and cover) shall be manufactured using matched surface tooling. All covers are required to have a minimum coefficient of friction of 0.05 in accordance with ASTM C1028 and the corresponding Tier level embossed on the top surface. Assemblies not U.L. Listed shall have independent third party verification or test reports stamped by a registered Professional Engineer certifying that all test provisions of this specification have been met are required with each submittal.

1. Color of Frame and Cover: Gray.

2. Configuration: Units shall be designed for flush burial and have open bottom, unless otherwise indicated.

3. Cover: Weatherproof, secured by tamper-resistant locking devices and having

structural load rating consistent with enclosure.

4. Cover Finish: Nonskid finish shall have a minimum coefficient of friction of 0.50.

5. Cover Legend: Molded lettering, "ELECTRIC." And “EMERGENCY”

6. Conduit Entrance Provisions: Conduit-terminating fittings shall mate with entering ducts for secure, fixed installation in enclosure wall.

B. Underground boxes, enclosures and covers shall be as manufactured by QUAZITE or approved equal.

1. Telephone Service inground enclosure box and cover shall be QUAZITE Cat. No. PG3048BA36 box with Cat. No. PG3048HS0043 cover.

2. CATV Service inground enclosure box and cover shall be QUAZITE Cat. No. PG3048BA36 box with Cat. No. PG3048HS0010 cover.

3. Sports Field Lighting Pole ground rod hand hole enclosure box and cover shall be QUAZITE Cat. No. PG1118BA18 box with Cat. No. PG1118CA0024 cover.

4. Other applications requiring the use of exterior underground boxes or enclosures shall use QUATIZE “PG” Series enclosure boxes appropriately sized complete with the proper cover with logo designating the use of the box or enclosure.

C. Fiberglass Handholes and Boxes with Polymer-Concrete Frame and Cover: Sheet-molded, fiberglass-reinforced, polyester-resin enclosure joined to polymer-concrete top ring or frame.

1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

a) Armorcast Products Company.

b) Carson Industries LLC.

c) Christy Concrete Products.

d) Synertech Moulded Products, Inc.; a division of Oldcastle Precast.

Part 3 - Execution

I. EXAMINATION

A. Verify that field measurements are as indicated.

B. Verify that mounting surfaces are ready to receive boxes.

C. Verify that conditions are satisfactory for installation prior to starting work.

II. INSTALLATION

A. Install products in accordance with manufacturer's instructions.

1. Install boxes in accordance with NECA 1 (general workmanship) and, where applicable, NECA 130, including mounting heights specified in those standards where mounting heights are not indicated.

2. Arrange equipment to provide minimum clearances in accordance with manufacturer's instructions and NFPA 70.

3. Provide separate boxes for emergency power and normal power systems.

4. Unless otherwise indicated, provide separate boxes for line voltage and low voltage systems.

a) Pull and junction boxes shall be installed where indicated on the Drawings or as herein specified. Boxes shall be located so as to be inaccessible to the general public.

b) All boxes and conductors therein shall be marked as hereinbefore specified to indicate the voltage and circuit numbers.

c) Boxes shall not be fastened in place with drive pins and/or other methods using compressed air or gases.

d) Boxes located under roof decking shall not be less than 1½ inches from the nearest surface of the roof decking.

e) Pull and junction boxes shall be concealed except in electrical and mechanical equipment rooms, spaces architecturally designed to have an open structure without ceilings or as otherwise indicated on the Drawings.

f) All system pull and junction box covers shall be painted as follows:

(1) 120/208 Volt - Black

(2) 277/480 Volt - Orange

(3) Clocks and Program Clocks - Green

(4) Emergency - White

(5) Fire Alarm - Red

(6) Security System - Gray

(7) Sound - Blue

(8) Telecommunications - Yellow

(9) Cable Television/Broadband - Tan

(10) Verizon Communications I-NET (fiber) - Purple

III. UNDERGROUND BOXES AND ENCLOSURES

A. Exterior underground boxes and enclosures shall be installed per manufacturer's recommendations and the following minimum requirements:

1. Install handholes and boxes level and plumb and with orientation and depth coordinated with connecting conduits to minimize bends and deflections required for proper entrances.

2. Unless otherwise indicated, support units on a level bed of crushed stone or gravel, graded from 1/2-inch sieve to No. 4 sieve and compacted to same density as adjacent undisturbed earth.

3. Elevation: In paved areas, set so cover surface will be flush with finished grade. Set covers of other enclosures 1 inch above finished grade.

4. Install handholes and boxes with bottom below the frost line, 36" below grade.

5. After the proper location of the underground enclosure has been established and the conduits, underground cables or ground rods, etc. are installed or located, the hole for the enclosure shall be excavated and shall be at least six (6) to eight (8) inches deeper that the depth of the enclosure and shall have a minimum of six (6) inches of gravel in the bottom of the hole or as shown on the Drawings. The gravel base shall extend past the side walls of the enclosure by at least four (4) to six (6) inches. Once the enclosure is positioned on top of the gravel base and the elevation check, the enclosure shall be back-filled.

6. Back-filling shall have 95% compaction or greater.

7. Provide internal bracing during back-filling to ensure minimal box sidewall deflections. Bracing supports shall be 2x4's or similar material sized to hold the box at mid-depth.

8. Top of the box and cover shall be flush with the finished grade.

IV. CONDUCTORS

A. All conductors entering junction and pull boxes shall be of the same voltage. Do not mix voltages regardless of the conductors' voltage rating, unless specifically shown on the Drawings.

B. Branch circuit conductors and feeder conductors shall not occupy the same junction or

pull box. Maintain separate boxes for branch circuits and separate boxes for feeders, unless specifically shown otherwise on the drawings.

V. ARC-PROOFING

A. All feeders entering a pull box containing more than one (1) feeder, or more than one (1) parallel feeder, shall be arc-proofed as follows. Conductors of the same feeder, including each set of a parallel feeder, shall be tightly grouped together and held in place with random wrapped 3M No. 33 Tape. Grouped cables shall be arc proofed using spirally wound one half-lapped layer of 3M No. 77 Fire and Arc-Proofed Tape which shall be held in place with random wrapped 3M No. 69 Glass Cloth Electrical Tape.

END OF SECTION

Part 1 - General

I. REQUIREMENTS

A. The general provisions of the Contract, including General and Supplementary Conditions and General Requirements, apply to the work specified in this Section.

II. SCOPE

A. The work covered under this Section shall include
1. Furnishing and installing device and outlet boxes,

2. Flush floor outlets (boxes), Floor box service fittings. Poke-through assemblies. and Science Room multiplex service fittings complete for all electrical systems as shown on the Drawings and herein specified.

3.2 QUALITY ASSURANCE

A. All equipment, materials, and their installation shall conform to the requirements of the National Electrical Code (NEC), local code requirements, and these Specifications.

B. All equipment and materials shall be listed by Underwriters Laboratories, Inc. (UL) for their intended use and shall bear the UL label.

C. Equipment shall be constructed in accordance with National Electrical Manufacturer's Association (NEMA) standards.

D. Flush floor outlet boxes and/or poke-thru devices shall have been tested to meet UL514A and/or UL514C and bear the UL Listing Mark. Floor boxes/devices shall be classified for use in 2-hour rated unprotected reinforced concrete floors and concrete toppings (D900 Series Designs) or above grade concrete floors with suspended ceilings (fire resistive designs with suspended ceilings shall have provisions for accessibility in the ceiling below the floor boxes/devices). Floor boxes/devices shall also conform to the standards set in Section 300.21 of the National Electrical Code. Floor Boxes/devices shall meet UL scrub water requirements, but are not suitable for wet or damp locations, or other areas subject to saturation with water or other liquids such as commercial kitchens. Floor boxes/devices shall also have been evaluated by UL to meet the applicable
U.S. safety standards for scrub water exclusion when used on tile, bare concrete, terrazzo, wood, and carpet covered floors. Above grade floor boxes/devices shall be suitable for use in air handling spacers in accordance with Section 300.22 (C) of the National Electrical Code.

E. Submittals are required in accordance with SECTION 16010 of these specifications.

Part 2 - Products

I. MATERIALS AND COMPONENTS

A. Boxes shall be steel, hot-dipped galvanized after fabrication, of the type and size for the intended use, and shall have only the holes necessary to accommodate the conduits at point of installation. Multi-gang boxes shall be used for multiple device locations utilizing a single multi-gang cover plate. Sectionalized boxes are not permitted. Boxes shall have barrier separations for conductors using different voltages within the same box.

B. Outlet boxes for lighting switches and receptacles in finished walls shall be of a suitable size for the device to be mounted in the partitions in which they are installed. The boxes shall have covers with rectangular openings of appropriate size and shape. Provide covers with raised openings on all outlets in masonry walls with plaster or tile finishes. Wall switch outlets shall be located within eight (8) inches of the trim on the latch side of the door. Outlets shall be set flush with the wall.

C. Single gang outlet boxes installed in concrete, masonry or gypsum wall board shall be a minimum four (4) inches square, 1-1/2 inches deep with appropriate tile ring, set flush with wall surface and provided with a single gang cover plate.

D. Outlet boxes for exposed lighting switches and receptacles shall be of the cast "FS" type or “FD” type (when required for code required box volume).

E. Outlet boxes for devices shown on the Drawings to be flush mounted in existing gypsum wallboard partitions shall be minimum three (3) inches by two (2) inches by 2-3/4 inches deep gangable switch box type complete with ears and conduit knockouts.

II. MANUFACTURERS

A. Manufacturers' Names: Shortened versions (shown in parentheses) of the following manufacturers' names are used in other Part 2 articles:

1. Legrand North America, LLC (Wiremold)

III. FLUSH FLOOR OUTLETS

A. Flush floor outlets designated on the Drawings as “Type A” shall consist of a WIREMOLD Model No. EFB6S-OG floor box or approved equal manufactured from stamp steel approved for use with on-grade concrete floor applications. Boxes shall have the ability to accept a component (EFB610-CTR) that will allow the box to be installed flush in polished concrete or terrazzo floors. Boxes shall be painted with a fusion-bonded epoxy designed for use on metal reinforcement bar and related accessories before encapsulation in concrete, and be approved for use on-grade and above grade floors. Boxes shall be 15-3/16” L x 13-7/8” W x 4- 3/16” H [385mm x 351mm x 107mm]. Provide boxes with six (6) independent wiring compartments that allow for up to six (6) duplex receptacles, communication and/or audio/video services. Boxes shall have removable and relocatable dividers to permit custom configuration of compartments as well as permit feed to

adjacent compartments. Boxes shall permit feed to compartments on the opposite side of the box through a tunnel. Each of the four (4) outer compartments shall have a minimum wiring capacity of 32-in^3 [524ml]. Each of the two (2) center compartments shall have a minimum wiring capacity of 38.5- in^3 [630ml]. Each of the six (6) compartments shall have a minimum depth of 3- 7/8" [98mm] behind the plate. Provide boxes with removable compartments to facilitate installation. The compartments shall be removable from the top of the floor box. Provide boxes with two (2) cable guides to organize and maintain the cables egress out of the box. The box shall contain the following number of knockouts: 10 1" trade size, six (6) 1-1/4" trade size, and six (6) 3/4" trade size. Boxes shall be fully adjustable, accommodating a maximum 2-inch [51mm] pre- concrete pour and a maximum 1/2" [12.7mm] post-concrete pour adjustment. The box shall be able to accept 2-3/4" x 4-1/2" standard size wall plates. Include mounting brackets with the boxes that will accommodate 15 amp, 20-amp straight blade, 20 amp turn loc, 30-amp straight blade and 30 amp turn loc receptacles, Ortronics® workstation connectivity and modular adapters, a variety of audio/video devices from most manufacturers, and other open system devices.

1. This floor box shall contain three (3) two pole, three wire, 20 amp, 125 volt, NEMA 5-20R duplex receptacles as hereinbefore specified complete with cover plates; one (1) two (2) port modular jack kit complete with one RJ-45 (568A) voice port and one (1) RJ-45 (568A) data port; and two blank single gang cover plates.

2. Floor boxes shall be complete with die-cast aluminum Activation Covers. Activation covers shall be available in surface mount and flush versions. Provide covers with two (2) gaskets (one (1) for carpet and one (1) for tile) to go under the trim flange to maintain scrub water tightness. Covers shall be 16-15/16" x 12-1/2" x 3/16" [430mm x 318mm x 4mm]. Covers shall be provided with a carpet recess area in carpeted and tiled areas or a solid lid in non-carpeted/tiled areas. Secure the cover to the flange and enable cover to rotate greater than 180 degrees to reduce trip hazards and provide maximum amount of working space. Provide covers with spring-loaded self-closing slide egress doors to reduce egress opening when cables are exiting and reduce trip hazards. Each of the two (2) egress openings shall have a minimum of 4-in^2 [102mm^2], or a minimum of 8-in^2 [203mm^2] per cover assembly. Covers shall have a powder coat finish with one of the following colors to be selected by the architect.

B. Flush floor outlets designated on the Drawings as "Type B" shall consist of a WIREMOLD Model No. EFB6S-OG floor box or approved equal manufactured from stamp steel approved for use with on-grade concrete floor applications. Boxes shall have the ability to accept a component (EFB610-CTR) that will allow the box to be installed flush in polished concrete or terrazzo floors. Boxes shall be painted with a fusion-bonded epoxy designed for use on metal reinforcement bar and related accessories before encapsulation in concrete, and be approved for use on-grade and above grade floors. Boxes shall be 15-3/16" L x 13-7/8" W x 4- 3/16" H [385mm x 351mm x 107mm]. Provide boxes with six (6) independent wiring compartments that allow for up to six (6) duplex receptacles, communication and/or audio/video services. Boxes shall have removable and relocatable dividers to permit custom configuration of compartments as well as permit feed to

adjacent compartments. Boxes shall permit feed to compartments on the opposite side of the box through a tunnel. Each of the four (4) outer compartments shall have a minimum wiring capacity of 32-in^3 [524ml]. Each of the two (2) center compartments shall have a minimum wiring capacity of 38.5- in^3 [630ml]. Each of the six (6) compartments shall have a minimum depth of 3- 7/8" [98mm] behind the plate. Provide boxes with removable compartments to facilitate installation. The compartments shall be removable from the top of the floor box. Provide boxes with two (2) cable guides to organize and maintain the cables egress out of the box. The box shall contain the following number of knockouts: 10 1" trade size, six (6) 1-1/4" trade size, and six (6) 3/4" trade size. Boxes shall be fully adjustable, accommodating a maximum 2-inch [51mm] pre- concrete pour and a maximum 1/2" [12.7mm] post-concrete pour adjustment. The box shall be able to accept 2-3/4" x 4-1/2" standard size wall plates. Include mounting brackets with the boxes that will accommodate 15 amp, 20-amp straight blade, 20 amp turn loc, 30-amp straight blade and 30 amp turn loc receptacles, Ortronics® workstation connectivity and modular adapters, a variety of audio/video devices from most manufacturers, and other open system devices.

1. This floor box shall contain three (3) two pole, three wire, 20 amp, 125 volt, NEMA 5-20R duplex receptacles as hereinbefore specified complete with cover plates; and four (4) two port modular jack kits complete with two (2) RJ-45 (568A) ports in each, for a total of eight (8) ports.

2. Floor boxes shall be complete with die-cast aluminum Activation Covers. Activation covers shall be available in surface mount and flush versions. Provide covers with two (2) gaskets (one (1) for carpet and one (1) for tile) to go under the trim flange to maintain scrub water tightness. Covers shall be 16-15/16" x 12-1/2" x 3/16" [430mm x 318mm x 4mm]. Covers shall be provided with a carpet recess area in carpeted and tiled areas or a solid lid in non-carpeted/tiled areas. Secure the cover to the flange and enable cover to rotate greater than 180 degrees to reduce trip hazards and provide maximum amount of working space. Provide covers with spring-loaded self-closing slide egress doors to reduce egress opening when cables are exiting and reduce trip hazards. Each of the two (2) egress openings shall have a minimum of 4-in^2 [102mm^2], or a minimum of 8-in^2 [203mm^2] per cover assembly. Covers shall have a powder coat finish with one of the following colors to be selected by the architect.

C. Flush floor outlets designated on the Drawings as "Type C" shall consist of a WIREMOLD Model No. EFB6S-OG floor box or approved equal manufactured from stamp steel approved for use with on-grade concrete floor applications. Boxes shall have the ability to accept a component (EFB610-CTR) that will allow the box to be installed in polished concrete or terrazzo floors. Boxes shall be painted with a fusion-bonded epoxy designed for use on metal reinforcement bar and related accessories before encapsulation in concrete, and be approved for use on-grade and above grade floors. Boxes shall be 15-3/16" L x 13-7/8" W x 4-3/16" H [385mm x 351mm x 107mm]. Provide boxes with six (6) independent wiring compartments that allow for up to six (6) duplex receptacles, communication and/or audio/video services. Boxes shall have removable and relocatable dividers to permit custom configuration of compartments as well as permit feed to adjacent compartments. Boxes shall permit feed to compartments on the opposite side of

the box through a tunnel. Each of the four (4) outer compartments shall have a minimum wiring capacity of 32-in^3 [524ml]. Each of the two (2) center compartments shall have a minimum wiring capacity of 38.5- in^3 [630ml]. Each of the six (6) compartments shall have a minimum depth of 3- 7/8" [98mm] behind the plate. Provide boxes with removable compartments to facilitate installation. The compartments shall be removable from the top of the floor box. Provide boxes with two (2) cable guides to organize and maintain the cables egress out of the box. The box shall contain the following number of knockouts: 10 1" trade size, six (6) 1-1/4" trade size, and six (6) 3/4" trade size. Boxes shall be fully adjustable, accommodating a maximum 2-inch [51mm] pre- concrete pour and a maximum 1/2" [12.7mm] post-concrete pour adjustment. The box shall be able to accept 2-3/4" x 4-1/2" standard size wall plates. Include mounting brackets with the boxes that will accommodate 15 amp, 20-amp straight blade, 20 amp turn loc, 30-amp straight blade and 30 amp turn loc receptacles, Ortronics® workstation connectivity and modular adapters, a variety of audio/video devices from most manufacturers, and other open system devices.

1. This floor box shall contain with three (3) two pole, three wire, 20 amp,125 volt, NEMA 5-20R duplex receptacles as hereinbefore specified complete with cover plates; one (1) three port modular jack kit complete with two (2) RJ-45 (568A) ports and one (1) F-Connector; and one (1) RAPIDRUN Part No. 2212-42320-001 cover plate multi-media system outlet consisting of a double brushed aluminum faceplate with female HD15, 3.5mm audio, and RCA composite video and audio connectors; and one (1) blank single gang cover plate.

2. Floor boxes shall be complete with die-cast aluminum Activation Covers. Activation covers shall be available in surface mount and flush versions. Provide covers with two (2) gaskets (one (1) for carpet and one (1) for tile) to go under the trim flange to maintain scrub watertightness. Covers shall be 16-15/16" x 12-1/2" x 3/16" [430mm x 318mm x 4mm]. Covers shall be provided with a carpet recess area in carpeted and tiled areas or a solid lid in non-carpeted/tiled areas. Secure the cover to the flange and enable cover to rotate greater than 180 degrees to reduce trip hazards and provide maximum amount of working space. Provide covers with spring-loaded self-closing slide egress doors to reduce egress opening when cables are exiting and reduce trip hazards. Each of the two (2) egress openings shall have a minimum of 4-in^2 [102mm^2], or a minimum of 8-in^2 [203mm^2] per cover assembly. Covers shall have a powder coat finish with one of the following colors to be selected by the architect.

D. Flush floor outlets designated on the Drawings as Type "D" shall be THOMAS & BETTS (STEEL CITY) Cat. No. 643, 3-gang case iron floor box complete with three (3) separate wiring compartments; cast iron watertight body, one (1) P64DS duplex brass mop tight cover plate, two (2) P64-GFCI brass mop tight cover plates, one (1) OPODEC-XLRF-WH rectangular microphone jack adaptor, one (1) OPODEC1-WH device plate with keystone port with one (1) ORTRONICS Cat. No. OR-KS35STST 3.5mm keystone adaptor. The body shall be divided having one (1) NEMA 5-20R duplex receptacle as previously specified, one (1) microphone jack and one (1) 3.5mm jack for MP3. The trim, shall be completely flush with the finished floor.

E. Flush floor outlets designated on the Drawings as “Type E” shall be THOMAS & BETTS (STEEL CITY) Cat. No. 642, 2-gang cast iron floor box complete two (2) P64DS duplex brass mop tight cover plates, two (2) NEMA 5-20R duplex receptacles as previously specified. The trim, shall be completely flush with the finished floor. Each floor outlet shall be complete with carpet flange assembly in carpeted areas; and non-skid top in non-carpeted areas.

F. Flush floor outlets designated on the Drawings as “Type F” shall be WIREMOLD Cat. No. 6ATCP fire-rated Poke-Thru Assembly Unit, for use in existing concrete floors, or approved equal. This assembly consists of an insert and an activation cover. Overall poke-thru assembly length shall be 16 3/4”. The insert body shall recess the devices a minimum of 2 3/4” and have a polyester based backing enamel finished interior (ivory). There shall be necessary channels to provide complete separation of power and communication services. There shall be three (3) compartments that allow for up to three (3) duplex receptacles and/or twelve (12) communications ports and/or ten (10) of Extron® Electronics MAAP™ and/or two (2) AAP™ devices. The body shall consist of an intumescent fire stop material to maintain the fire rating of the floor slab. The intumescent material will be held securely in place in the insert body and shall not have to be adjusted to maintain fire rating of the unit and the floor slab. The insert shall have retaining feature that will hold the poke-thru device in the floor slab without additional fasteners. The poke-thru insert shall also consist of a 3/4” trade size conduit stub that is connected to the insert body and a 24.5 cubic inch stamped steel junction box for wire splices and connections. The stamped steel junction box shall also contain the necessary means to electrically ground the poke-thru device to the system ground. Communication Modules Mounting Accessories: The poke-thru manufacturer shall have available open modular inserts to facilitate mounting UTP (including Category 5, 5e, 6), STP, fiber optic, coaxial, and data/communications devices. The activation shall have three (3) locations to mount communication connectors. Connectors shall be mounted using a mounting bracket. Where indicated, provide connectivity outlets and modular inserts by Ortronics or approved equal.

1. This floor box shall contain two (2) proprietary two pole, three wire, 20 amp, 125 volt, NEMA 5-20R duplex receptacles with mounting plates; one (1) ‘6TRAC’ device mounting plate for use in the center compartment only, complete with one (1) RJ-45 (568A) TracJack voice device and one RJ-45 (568A) TracJack data device; and four (4) blank TracJack inserts.

2. Flush Floor Poke-Thru shall be complete with die-cast aluminum Activation Covers. Two gaskets (one for carpet and one for tile) shall be provided to go under the trim flange to maintain scrub water tightness. The activation cover shall be 7 1/4” in diameter. The activation covers shall be available in carpet and tile versions. The carpet covers shall be surface mounted and the tile covers shall be flush with the finished floor coverings. The cover shall have spring loaded slides to allow cables to egress out of the unit and maintain as small an egress opening as possible. Covers shall have a powder coat finish with one of the following colors to be selected by the architect.

G. Flush floor outlets designated on the Drawings as “Type G” shall be WIREMOLD Cat. No. 8ATC fire-rated Poke-Thru Assembly Unit, for use in existing concrete floors, or approved equal. This assembly consists of an insert and an activation cover. Overall poke-thru

assembly length shall be 16 3/4". The INSERT body shall recess the devices a minimum of 2 3/4" and have a polyester based backing enamel finished interior (ivory). There shall be necessary channels to provide complete separation of power and communication services. There shall be five (5) compartments that allow for up to five (5) duplex receptacles and/or twenty-two (22) communications ports and/or sixteen (16) of Extron® Electronics MAAP™ and/or four (4) AAP™ devices. The body shall consist of an intumescent fire stop material to maintain the fire rating of the floor slab. The intumescent material will be held securely in place in the insert body and shall not have to be adjusted to maintain fire rating of the unit and the floor slab. The insert shall have retaining feature that will hold the poke-thru device in the floor slab without additional fasteners. The poke-thru insert shall also consist of a 3/4" trade size conduit stub that is connected to the insert body and a 24.5 cubic inch stamped steel junction box for wire splices and connections. The stamped steel junction box shall also contain the necessary means to electrically ground the poke-thru device to the system ground. Communication Modules Mounting Accessories: The poke-thru manufacturer shall have available open modular inserts to facilitate mounting UTP (including Category 5, 5e, 6), STP, fiber optic, coaxial, and data/communications devices. Where indicated, provide connectivity outlets and modular inserts by Ortronics or approved equal.

1. This floor box shall contain two (2) proprietary two pole, three wire, 20 amp, 125 volt, NEMA 5-20R duplex receptacles with mounting plates; one (1) duplex mounting plate (8DP) with one (1) two pole, three wire, 20 amp, 125 volt, NEMA 5-20R duplex receptacle to be used in the center compartment; one '8TRAC' device mounting plate for use in the center compartment only, complete with eight (8) RJ-45 (568A) TracJack devices; and one (1) blank (8B) device mounting plate to blank off one of the three gangs in the center compartment.

2. Flush Floor Poke-Thru shall be complete with die-cast aluminum Activation Covers. Two gaskets (one for carpet and one for tile) shall be provided to go under the trim flange to maintain scrub water tightness. The activation cover shall be 7 1/4" in diameter. The activation covers shall be available in carpet and tile versions. The carpet covers shall be surface mounted and the tile covers shall be flush with the finished floor coverings. The cover shall have spring loaded slides to allow cables to egress out of the unit and maintain as small an egress opening as possible. Covers shall have a powder coat finish with one of the following colors to be selected by the architect.

H. Flush floor outlets designated on the Drawings as "Type H" shall consist of a WIREMOLD Model EFB6S Floor Box or approved equal suitable for use in above grade applications in newly poured concrete floors or raised floors. The floor box shall be manufactured from stamped steel. Boxes shall have the ability to accept a component (EFB610-CTR) that will allow the box to be installed in polished concrete or terrazzo floors. Boxes shall have a polyester based backed enamel finished interior (white). Boxes shall be 15-3/16" L x 13-7/8" W x 4-3/16" H [385mm x 351mm x 107mm]. Provide boxes with provisions that enable installation into concrete floors, raised floors or wood floors without having to purchase additional components or accessories. Provide boxes with six (6) independent wiring compartments that allow for up to six (6) receptacles, communication and/or audio/video services. Boxes shall permit feed to adjacent compartments. Boxes shall have removable and relocatable dividers to permit custom configuration of compartments as well as permit feed to adjacent compartments. Boxes shall permit feed to compartments on the opposite side of the box through a tunnel. Each of the four (4) outer

compartments shall have a minimum wiring capacity of 32-in^3 [524ml]. Each of the two (2) center compartments shall have a minimum wiring capacity of 38.5-in^3 [630ml]. Each of the six (6) compartments shall have a minimum depth of 3-7/8" [98mm] behind the plate. Provide boxes with removable compartments to facilitate installation and moves, additions, and changes. The compartments shall be removable from the top and back of the floor box. Provide boxes with two (2) cable guides to organize and maintain the cables egress out of the box. Provide boxes with removable knockout plates to allow for the maximum cable pass-through area. The cable pass-through shall be a minimum of 6-16/16 in^2 [176mm^2]. The box shall contain the following number of knockouts: ten (10) 1" trade six, six (6) 1-1/4" trade size, six (6) 3/4" trade size, and two (2) 2" trade size. Boxes shall be fully adjustable, accommodating a maximum 2-inch [51mm] pre-concrete pour and a maximum 1/2" [12.7mm] post-concrete pour adjustment. The box shall be able to accept 2-3/4" x 4-1/2" standard size wall plates. Include mounting brackets with the boxes that will accommodate 15 amp, 20-amp straight blade, 20 amp turn loc, 30-amp straight blade and 30 amp turn loc receptacles, Ortronics® workstation connectivity and modular adapters, a variety of audio/video devices from most manufacturers, and other open system devices.

1. This floor box shall contain three (3) two pole, three wire, 20 amp, 125 volt, NEMA 5-20R duplex receptacles as hereinbefore specified complete with cover plates; one (1) two port modular jack kit complete with one (1) RJ-45 (568A) voice device and one (1) RJ-45 (568A) TracJack data device; and two (2) blank single gang cover plates.

2. Floor boxes shall be complete with die-cast aluminum Activation Covers. Activation covers shall be available in surface mount and flush versions. Provide covers with two (2) gaskets (one (1) for carpet and one (1) for tile) to go under the trim flange to maintain scrub water tightness. Covers shall be 16-15/16" x 12-1/2" x 3/16" [430mm x 318mm x 4mm]. Covers shall be provided with a carpet recess area in carpeted and tiled areas or a solid lid in non-carpeted/tiled areas. Secure the cover to the flange and enable cover to rotate greater than 180 degrees to reduce trip hazards and provide maximum amount of working space. Provide covers with spring-loaded self-closing slide egress doors to reduce egress opening when cables are exiting and reduce trip hazards. Each of the two (2) egress openings shall have a minimum of 4-in^2 [102mm^2], or a minimum of 8-in^2 [203mm^2] per cover assembly. Covers shall have a powder coat finish with one of the following colors to be selected by the architect.

I. Flush floor outlets designated on the Drawings as "Type J" shall consist of a WIREMOLD Model EFB6S Floor Box suitable for use in above grade applications in newly poured concrete floors or raised floors. The floor box shall be manufactured from stamped steel. Boxes shall have the ability to accept a component (EFB610-CTR) that will allow the box to be installed in polished concrete or terrazzo floors. Boxes shall have a polyester based backed enamel finished interior (white). Boxes shall be 15-3/16" L x 13-7/8" W x 4-3/16" H [385mm x 351mm x 107mm]. Provide boxes with provisions that enable installation into concrete floors, raised floors or wood floors without having to purchase additional components or accessories. Provide boxes with six (6) independent wiring compartments that allow for up to six (6) receptacles, communication and/or audio/video

services. Boxes shall permit feed to adjacent compartments. Boxes shall have removable and relocatable dividers to permit custom configuration of compartments as well as permit feed to adjacent compartments. Boxes shall permit feed to compartments on the opposite side of the box through a tunnel. Each of the four (4) outer compartments shall have a minimum wiring capacity of 32-in^3 [524ml]. Each of the two (2) center compartments shall have a minimum wiring capacity of 38.5-in^3 [630ml]. Each of the six (6) compartments shall have a minimum depth of 3-7/8" [98mm] behind the plate. Provide boxes with removable compartments to facilitate installation and moves, additions, and changes. The compartments shall be removable from the top and back of the floor box. Provide boxes with two (2) cable guides to organize and maintain the cables egress out of the box. Provide boxes with removable knockout plates to allow for the maximum cable pass-through area. The cable pass-through shall be a minimum of 6-16/16 in^2 [176mm^2]. The box shall contain the following number of knockouts: ten (10) 1" trade six, six (6) 1-1/4" trade size, six (6) 3/4" trade size, and two (2) 2" trade size. Boxes shall be fully adjustable, accommodating a maximum 2-inch [51mm] pre-concrete pour and a maximum 1/2" [12.7mm] post-concrete pour adjustment. The box shall be able to accept 2-3/4" x 4-1/2" standard size wall plates. Include mounting brackets with the boxes that will accommodate 15 amp, 20 amp straight blade, 20 amp turn loc, 30 amp straight blade and 30 amp turn loc receptacles, Ortronics® workstation connectivity and modular adapters, a variety of audio/video devices from most manufacturers, and other open system devices.

1. This floor box shall contain three (3) two pole, three wire, 20 amp, 125 volt, NEMA 5-20R duplex receptacles as hereinbefore specified complete with cover plates; four (4) two port modular jack kits complete with two (2) RJ-45 (568A) ports in each, for a total of eight (8) ports.

2. Floor boxes shall be complete with die-cast aluminum Activation Covers. Activation covers shall be available in surface mount and flush versions. Provide covers with two (2) gaskets (one (1) for carpet and one (1) for tile) to go under the trim flange to maintain scrub watertightness. Covers shall be 16-15/16" x 12-1/2" x 3/16" [430mm x 318mm x 4mm]. Covers shall be provided with a carpet recess area in carpeted and tiled areas or a solid lid in non-carpeted/tiled areas. Secure the cover to the flange and enable cover to rotate greater than 180 degrees to reduce trip hazards and provide maximum amount of working space. Provide covers with spring-loaded self-closing slide egress doors to reduce egress opening when cables are exiting and reduce trip hazards. Each of the two (2) egress openings shall have a minimum of 4-in^2 [102mm^2], or a minimum of 8-in^2 [203mm^2] per cover assembly. Covers shall have a powder coat finish with one of the following colors to be selected by the architect.

J. Flush floor outlets designated on the Drawings as "Type K" shall consist of a WIREMOLD Model EFB6S Floor Box or approved equal suitable for use in above grade applications in newly poured concrete floors or raised floors. The floor box shall be manufactured from stamped steel. Boxes shall have the ability to accept a component (EFB610-CTR) that will allow the box to be installed in polished concrete or terrazzo floors. Boxes shall have a polyester based backed enamel finished interior (white). Boxes shall be 15-3/16" L x 13-7/8" W x 4-3/16" H [385mm x 351mm x 107mm]. Provide boxes with provisions that

enable installation into concrete floors, raised floors or wood floors without having to purchase additional components or accessories. Provide boxes with six (6) independent wiring compartments that allow for up to six (6) receptacles, communication and/or audio/video services. Boxes shall permit feed to adjacent compartments. Boxes shall have removable and relocatable dividers to permit custom configuration of compartments as well as permit feed to adjacent compartments. Boxes shall permit feed to compartments on the opposite side of the box through a tunnel. Each of the four (4) outer compartments shall have a minimum wiring capacity of 32-in^3 [524ml]. Each of the two (2) center compartments shall have a minimum wiring capacity of 38.5-in^3 [630ml]. Each of the six (6) compartments shall have a minimum depth of 3-7/8" [98mm] behind the plate. Provide boxes with removable compartments to facilitate installation and moves, additions, and changes. The compartments shall be removable from the top and back of the floor box. Provide boxes with two (2) cable guides to organize and maintain the cables egress out of the box. Provide boxes with removable knockout plates to allow for the maximum cable pass-through area. The cable pass-through shall be a minimum of 6-16/16 in^2 [176mm^2]. The box shall contain the following number of knockouts: ten (10) 1" trade six, six (6) 1- 1/4" trade size, six (6) 3/4" trade size, and two (2) 2" trade size. Boxes shall be fully adjustable, accommodating a maximum 2-inch [51mm] pre-concrete pour and a maximum 1/2" [12.7mm] post-concrete pour adjustment. The box shall be able to accept 2-3/4" x 4-1/2" standard size wall plates. Include mounting brackets with the boxes that will accommodate 15 amp, 20 amp straight blade, 20 amp turn loc, 30 amp straight blade and 30 amp turn loc receptacles, Ortronics® workstation connectivity and modular adapters, a variety of audio/video devices from most manufacturers, and other open system devices.

1. This floor box shall contain three (3) two pole, three wire, 20 amp, 125 volt, NEMA 5-20R duplex receptacles as hereinbefore specified complete with cover plates; one (1) three port modular jack kit complete with two (2) RJ-45 (568A) ports and one (1) F-Connector; and one (1) RAPIDRUN Part No. 2212-43036317-001 cover plate multi-media system outlet consisting of a double brushed aluminum faceplate with female HD15, 3.5mm audio, HDMI connector, and USB connector; and one (1) blank single gang cover plate.

2. Floor boxes shall be complete with die-cast aluminum Activation Covers. Activation covers shall be available in surface mount and flush versions. Provide covers with two (2) gaskets (one (1) for carpet and one (1) for tile) to go under the trim flange to maintain scrub watertightness. Covers shall be 16-15/16" x 12-1/2" x 3/16" [430mm x 318mm x 4mm]. Covers shall be provided with a carpet recess area in carpeted and tiled areas or a solid lid in non-carpeted/tiled areas. Secure the cover to the flange and enable cover to rotate greater than 180 degrees to reduce trip hazards and provide maximum amount of working space. Provide covers with spring-loaded self-closing slide egress doors to reduce egress opening when cables are exiting and reduce trip hazards. Each of the two (2) egress openings shall have a minimum of 4-in^2 [102mm^2], or a minimum of 8-in^2 [203mm^2] per cover assembly. Covers shall have a powder coat finish with one of the following colors to be selected by the architect.

K. Flush floor outlets designated on the Drawings as “Type L” shall be WIREMOLD Cat. No. 8ATC fire-rated Poke-Thru Assembly Unit, for use in existing concrete floors, or approved equal. This assembly consists of an insert and an activation cover. Overall poke-thru assembly length shall be 16 3/4”. The INSERT body shall recess the devices a minimum of 2 3/4” and have a polyester based backing enamel finished interior (ivory). There shall be necessary channels to provide complete separation of power and communication services. There shall be five (5) compartments that allow for up to five (5) duplex receptacles and/or twenty-two (22) communications ports and/or sixteen (16) of Extron® Electronics MAAP™ and/or four (4) AAP™ devices. The body shall consist of an intumescent fire stop material to maintain the fire rating of the floor slab. The intumescent material will be held securely in place in the insert body and shall not have to be adjusted to maintain fire rating of the unit and the floor slab. The insert shall have retaining feature that will hold the poke-thru device in the floor slab without additional fasteners. The poke-thru insert shall also consist of a 3/4” trade size conduit stub that is connected to the insert body and a 24.5 cubic inch stamped steel junction box for wire splices and connections. The stamped steel junction box shall also contain the necessary means to electrically ground the poke-thru device to the system ground. Communication Modules Mounting Accessories: The poke-thru manufacturer shall have available open modular inserts to facilitate mounting UTP (including Category 5, 5e, 6), STP, fiber optic, coaxial, and data/communications devices. Where indicated, provide connectivity outlets and modular inserts by Ortronics or approved equal.

1. This floor box shall contain two (2) proprietary two pole, three wire, 20 amp, 125 volt, NEMA 5-20R duplex receptacles with mounting plates; one (1) duplex mounting plate (8DP) with one (1) two pole, three wire, 20 amp, 125 volt, NEMA 5-20R duplex receptacle to be used in the center compartment; one ‘8TRAC’ device mounting plate for use in the center compartment only, complete with two (2) RJ-45 (568A)TracJack devices, one (1) “F” Connector TracJack device, and three (3) blank TracJack devices; and one (1) ‘8DEC’ device mounting plate for use in the center compartment only, complete with one (1) RAPIDRUN Part No. 2212- 42335-001 multi-media system ‘decorator style’ outlet consisting of a female HD-15, 3.5mm audio and RCA composite video and audio connectors.

2. Flush Floor Poke-Thru shall be complete with die-cast aluminum Activation Covers. Two gaskets (one for carpet and one for tile) shall be provided to go under the trim flange to maintain scrub water tightness. The activation cover shall be 7 1/4” in diameter. The activation covers shall be available in carpet and tile versions. The carpet covers shall be surface mounted and the tile covers shall be flush with the finished floor coverings. The cover shall have spring loaded slides to allow cables to egress out of the unit and maintain as small an egress opening as possible. Covers shall have a powder coat finish with one of the following colors to be selected by the architect.

IV. MULTIPLEX SERVICE FITTINGS

A. Multiplex service fittings designated on the Drawings as Type “1” shall consist of the following field assembled by this Contractor as detailed on the Drawings: one (1) WIREMOLD Cat. No. MP8 dual service fitting or approved equal including housing, base, mounting frames, integral divider, and mounting hardware; one (1) WIREMOLD Cat. No. M-2DR dual duplex opening faceplate; two (2) NEMA 5-20R duplex receptacles as previously specified; one (1) WIREMOLD Cat. No. LTF48-ACT communications face

plate; one (1) WIREMOLD Cat. No. 2A245-C5E dual-port, RJ-45 (568A) workstation insert; two (2) WIREMOLD Cat. No. 2A-BL blank inserts; and two (2) WIREMOLD Cat. No. LTF48-B blank face plates.

B. Multiplex service fittings designated on the Drawings as Type “2” shall consist of the following field assembled by this Contractor as detailed on the Drawings: one (1) WIREMOLD Cat. No. MP4 single service fitting including housing, base, mounting frames, integral divider, and mounting hardware; one (1) WIREMOLD Cat. No. M-2DR dual duplex opening face plate; two (2) NEMA 5-20R duplex receptacles as previously specified; and one (1) WIREMOLD Cat. No. LTF48-B blank face plate.

Part 3 - Execution

I. DEVICE INSTALLATION

A. Before locating outlet boxes, check all of the Drawings for the type of construction and to make sure that there is no conflict with other equipment. The outlet boxes' location shall not interfere with other work or equipment and shall be accessible after completion.

B. Outlet boxes shown on the Drawings to be flush mounted in existing gypsum wallboard partitions shall be installed using metal switch box supports similar to STEEL CITY Cat. No. 820-D.

C. Outlet boxes for devices shown on the Drawings to be installed on opposite sides of the same wall shall be separated horizontally by not less than six (6) inches and if connected with each other, the ends of the raceway shall be filled with sound insulating material after wiring has been installed to fill the voids around the wire. For fire, rated walls provide minimum 24” separation or use approved fire assembly.

D. Provide only the conduit openings necessary to accommodate the conduits at the individual location. Plug any unused openings.

E. Thoroughly coordinate casework and backsplash heights with mounting heights of boxes.

F. Device and outlet boxes shall not be fastened in place with drive pins and/or other methods using compressed air or gases.

G. Device and outlet boxes located under roof decking shall not be less than 1½ inches from the nearest surface of the roof decking.

II. FLUSH FLOOR OUTLET BOXES INSTALLATION

A. Examine conditions under which boxes and fittings are to be installed. Notify the Architect/Engineer in writing of conditions detrimental to proper completion of work. Do not proceed with work until unsatisfactory conditions have been corrected.

B. Strictly comply with manufacturer’s installation instructions and recommendations.

Coordinate installation with adjacent work to ensure proper clearances and to prevent electrical hazards.

C. Floor boxes shall permit all wiring to be completed at floor level. The “FC” models, when used, shall be used as defined by the UL Fire Resistance Directory at a minimum spacing of 24 inches (610 mm) on center.

III. FLUSH FLOOR POKE-THRU ASSEMBLY UNITS

A. Examine conditions under which boxes and fittings are to be installed. Notify the Architect/Engineer in writing of conditions detrimental to proper completion of work. Do not proceed with work until unsatisfactory conditions have been corrected. Flush floor poke-thru assemblies require the floor to be core drilled. Coordinate exact locations with the building structure and other trades before core drilling and obtain written approval from the Structural Engineer and Architect before core drilling.

B. Strictly comply with manufacturer’s installation instructions and recommendations. Coordinate installation with adjacent work to ensure proper clearances and to prevent electrical hazards.

C. Units shall permit all wiring to be completed at floor level. Use is defined by the UL Fire Resistance Directory as a minimum spacing of “2 ft. on center and not more than one device per each 65-sq. ft. of floor area in each span.”

D. Poke-thru assemblies installation shall be completed by pushing unit down into the cored hole. The unit shall contain a retainer for securing the device in the slab, as well as the necessary intumescent material to seal the cored hole under fire conditions.

END OF SECTION

Part 1 - General

I. REQUIREMENTS

A. The general provisions of the Contract, including General and Supplementary Conditions and General Requirements, apply to the work specified in this Section.

II. SCOPE

A. The work covered under this Section shall include furnishing and installing wire, metal-clad cable, two-hour fire rated conduit cable, and connectors for all power wiring systems as shown on the Drawings and herein specified.

B. Wiring for data, communication, electronic, fire alarm, or other low voltage and special systems shall be provided as specified in the appropriate specialty Section of these Specifications.

III. QUALITY ASSURANCE

A. All equipment, materials, and their installation shall conform to the requirements of the National Electrical Code (NEC), local code requirements, and these Specifications.

B. All equipment and materials shall be listed by Underwriters Laboratories, Inc. (UL) for their intended use and shall bear the UL label.

C. Equipment shall be constructed in accordance with National Electrical Manufacturer's Association (NEMA) standards.

D. Submittals are required in accordance with SECTION 260500 of these Specifications.

1. Submittals shall include a preliminary schedule to perform the infrared scans described in Part 3 of this specification. The schedule shall be based on the contractual substantial completion date for this project.

Part 2 - Products

I. MATERIALS AND COMPONENTS

A. All conductors shall be new soft drawn high conductivity copper not less than 98% conductivity and shall be delivered to the site in their original unbroken packages plainly marked as follows:

1. UL Label.

2. Size, type and insulation rating of the wire marked every four (4) feet along the length.

3. Name of the manufacturing company and the trade name of the wire.

B. All conductors shall have 600-volt insulation, unless specified otherwise. The minimum operating temperature of the conductor's insulation shall be 75° C.

C. Where conductors are installed in a raceway, in dry and damp locations, conductor insulation shall be rated 75° C. Type THWN or dual rated THWN/THHN.

D. Where conductors are installed in a raceway, exposed to excessive temperatures, conductor insulation shall be rated 90° C. Type THHN, THWN/THHN (dual rated), XHHW or XHHW-2.

E. Where conductors are installed in a raceway, in wet locations, conductor insulation shall be rated 75° C. Type XHHW (wet locations), or XHHW-2 rated 90° C. (dry and wet locations) as appropriate.

F. Conductors on the secondary side of variable frequency drives (VFD) shall be Type XHHW or XHHW-2 as appropriate.

G. The minimum conductor size shall be No. 12 AWG, except for control wiring (minimum size shall be No. 14 AWG), and as stated in other Sections of these Specifications, or as shown on the Drawings. Conductors for 120/277-volt control signals shall not be considered as control wiring.

H. Branch circuits for emergency lighting, including illuminated exit signs, shall be a minimum of No. 10 AWG.

I. Conductors smaller than No. 8 shall be solid; No. 8 and larger shall be stranded.

J. All conductors throughout the project shall be color coded to identify phases, neutral, and ground. Color-coding shall be as follows:

	SYSTEM VOLTAGE	
CONDUCTORS	120/208	277/480
Phase A	Black	Brown
Phase B	Red	Orange
Phase C	Blue	Yellow
Neutral	White	Gray
Ground	Green	Green

K. Insulated conductors size No. 6 A.W.G. and smaller shall have the insulation color-code identification factory applied for the entire length of the conductor. On larger sizes, provide color-coded phasing tape at each box and connection. White or gray colored insulation shall only be used for grounded (neutral) conductors. For multiple

neutrals run in the same conduit, provide separate neutral conductors with a continuous, factory applied tracer stripe matching the color of the respective phase conductor. Green colored insulation shall only be used for equipment grounding conductors.

L. Where conductor size is not indicated, its current carrying capacity shall be equal to or greater than the rating of its overcurrent protective device.

M. Where conductor sizes are increased for voltage drop or other reasons the equipment grounding conductor (when provided) shall be increased in size proportionately.

N. Where conductor sizes are increased for voltage drop they may be reduced in size within ten feet of the termination in order to fit under the lugs available on the overcurrent protective device but not less than the ampacity of the frame size of the overcurrent protective device.

2.2 METAL-CLAD CABLE

A. The Contractor shall furnish and install where shown on the Drawings or specified herein, metal-clad cable, type “MC”, of the size and number of conductors noted on the Drawings. The metal-clad cable shall be a factory assembly of one or more conductors, including a green insulated ground wire enclosed in a galvanized steel interlocked metallic sheath. Metal-clad cable with an aluminum sheath will not be acceptable.

B. Conductors shall be copper with a minimum size of No. 18 A.W.G., solid (through No. 10 A.W.G.) or stranded (No. 8 and larger), Type THHN/THWN (90^{o} C.), and 600 volt. Color-coding of conductors shall be as hereinbefore described.

C. Fittings for metal-clad cable shall be all steel, approved for use with metal-clad cable. Cast pot metal types are not acceptable.

D. Metal-clad cable shall be UL listed and marked in accordance with NEC Article 310.11. Manufacturer’s standard color-coding on the exterior sheath may be used. Metal-clad cable shall be as manufactured by AFC CABLE SYSTEMS or CM & ELKINS (CME) WIRE AND CABLE or SOUTHWIRE COMPANY.

Part 3 - Execution

I. IDENTIFICATION OF CONDUCTORS

A. All branch circuits, including grounded (neutral) conductors, shall be tagged in the panelboards, in all gutters, and in all junction boxes where circuits terminate for the purpose of identifying the various circuits.

B. Feeders and mains shall be tagged in the distribution switchboards, panelboards, and within junction and pull boxes.

C. The method of tagging shall be with an adhesive type of marker. Tagging shall clearly distinguish between 120/208 volt and 277/480 volt conductors.

D. Tags shall be applied after wire is installed in conduit.

E. Where it is impractical to use printed markers on certain wires or cables, use blank type with identification marked thereon in indelible pencil.

II. INSTALLATION

A. Conduit/raceway system shall be complete prior to pulling in wires.

B. Any run of conduit/raceway which does not permit conductors to be pulled in readily shall be condemned and replaced to the satisfaction of the Architect/Engineer and Owner.

C. Conductors shall be continuous between outlets or junction boxes and no splices shall be made except in outlet boxes, junction boxes, and handholes.

D. Do not combine systems of various voltages or circuits from separate sources in the same raceway or conduit system, regardless of the voltage rating of the conductors, unless otherwise shown on the Drawings.

E. All joints, splices and taps for conductor sizes No. 10 and smaller (including luminaire pigtails) shall be connected with approved type crimp connectors, or spring type screw-on connectors (wire-nuts) with insulating skirts; No. 8 and larger shall be connected with solderless THOMAS & BETTS high pressure connectors with heat shrink insulation that possess equivalent or better mechanical strength and insulation ratings than that of the unspliced conductor. Refer to Specification Section 16110 for splices and taps within wiring troughs. The use of pressure connectors is **not** acceptable.

F. Oil, grease or silicon, which could damage the insulation of the conductors or cables, shall not be used when pulling conductors. Use only UL approved cable lubricants approved for the purpose.

G. Train conductors neatly in panelboards, cabinets, and other electrical equipment. Installed conductors shall allow for a minimum of one (1) future re-termination.

III. Tighten pressure type lugs on switchboards, panelboards, motors and other equipment to the manufacturer's published torque-tightening values. If manufacturer's torque values are not indicated, use those specified in UL 486A and 486B.

A. Conductors in vertical conduit runs shall be supported with split-wedge type fittings that clamp each conductor and tighten under the weight of the conductors at intervals required by the NEC.

B. All wiring within the building structure, crawlspaces, and slabs shall be installed in conduit unless indicated or specified otherwise.

C. Homeruns longer than seventy-five (75) feet from a 120/208-volt panelboard or one hundred seventy-five (175) feet from a 277/480-volt panelboard shall be not less than No. 10 AWG, copper.

D. No more than three (3) current carrying phase conductors shall be installed in any one conduit, unless explicitly shown on the drawings.

E. Connect circuits and feeders as shown on the Drawings. Drawings are diagrammatic and do not show every detail required in the wiring system.

F. Install wiring so conductors are not in tension in completed systems.

G. All conductors making up parallel feeders shall be the same size, same type, same insulation and all cut the same length. Bond each group of conductors making up a phase or neutral at both ends in an approved manner. Parallel conductors shall not be run in the same raceway.

H. Provide a separate neutral and grounding conductor (or conduit ground) for all GFI circuits or GFI devices to ensure an adequate ground-fault path.

I. Branch circuits requiring a neutral conductor shall have one neutral conductor per phase conductor when installed in a common raceway, unless specifically shown otherwise on the Drawings.

J. Conductors or cables installed in conduit or tubing exposed to direct sunlight on rooftops require temperature adjustment factors in accordance with the values in NEC 2008 Table 310.15(B)(2)(c).

IV. METAL-CLAD CABLE

A. Metal-clad cable may be used in dry locations for connections in casework, for “fished” applications in existing partitions or walls, above accessible ceilings in classrooms, offices and similar locations and within newly installed drywall partitions. Metal-clad cable may also be used as a “whip” connection from an outlet box (secured to the building structure) to a recessed luminaire (lighting fixture) (minimum, 4 feet; maximum, 6 feet in length) above accessible ceilings in lieu of flexible metal conduit as stated in Section 16110.

B. Metal-clad cable may <u>not</u> be used for feeders, homeruns or within corridors, except for recessed luminaire (lighting fixture) connections as described above. Metal-clad cable shall not be used in areas without a ceiling, in areas without an accessible ceiling or from corridors into adjacent rooms.

C. Metal-clad cable shall be installed and supported in accordance with NEC Article 330.30 and these specifications. Supports shall be zinc-coated or equivalent corrosion protection. Individual hangers, straps or similar fittings shall be used and installed at intervals so as not to damage the cable. Where fastened to walls use appropriate

anchors and screws, the use of drive pins and/or other methods using compressed air or gases are not acceptable. Supports shall **not** terminate or be fastened directly to the roof decking. MC Cable under roof decking shall not be less than 1½ inches from the nearest surface of the roof decking. Supports attached to structural steel joists shall only be attached within 3" of the joist panel points, top or bottom. Supports attached beyond 3" of the joist panel points must be approved, in writing, by the Structural Engineer of record and the Owner before attaching. Staples are not permitted to be used for supports.

D. Bending radius for the metal-clad cable shall be in accordance with NEC Article 330.24.

E. Fittings used for connecting the metal-clad cable to boxes, cabinets, or other equipment shall be all steel UL listed and identified for such use.

F. Metal-clad cable shall be installed parallel or perpendicular to walls. No diagonal runs shall be permitted.

G. Metal-clad cable shall not be installed within three (3) inches of hot water pipes, or appliances, except at crossings where metal-clad cable shall be a least one (1) inch from pipe cover.

H. Metal-clad cable shall not interfere with accessible ceiling tiles. Access to electrical or other equipment shall not be denied by runs of MC cable that prevents removal of panels, including suspended ceiling panels.

I. Flattened, dented, deformed, or open armor is not permitted. If damaged during installation, damaged cables shall be replaced with new undamaged material.

J. Horizontal or cross runs in solid masonry partitions or walls shall not be permitted.

K. All horizontal penetrations through new or existing walls shall be sleeved. No other type of wiring systems shall occupy the same penetration sleeve with the MC cable. Sleeve penetrations through fire-rated walls, after installation of MC cables, shall be fire stopped using a product similar to THOMAS & BETTS "Flame-Safe" fire retardant.

V. FIELD QUALITY CONTROL

A. After installing conductors and cables and before electrical circuitry has been energized, perform the following visual and mechanical inspections:

1. Verify cables and conductors comply with the contract documents.

2. Verify cables and conductors are braced for short circuit stresses where specified.

3. Verify cables and conductors are correctly identified at each termination, splice and tap where applicable.

4. Verify correct phase rotation is maintained throughout project.

5. Verify color coding and identification complies with specifications and the National Electrical Code.

6. Inspect all exposed sections of cables and conductors for physical damage and correct connection.

7. Inspect all bolted and compression connections.

B. Verify phase identification is A, B, C, left to right, front to back and top to bottom. If corrections are required change feeder and branch circuit identification at each end of circuit so that correct phase identification is maintained throughout the project. If incorrect identification is noted on existing systems notify the Architect/Engineer and Owner for action to be taken.

C. Infrared Scanning: After Substantial Completion, but not more than sixty (60) days after Final Acceptance, perform an infrared scan of each splice in cables and conductors No. 3 AWG and larger and a complete infrared scan of each panel board, switchboard, and lug terminations of each chiller and motor terminations 20 HP and larger. Remove box and equipment covers so splices and lugs are accessible to portable scanner.

1. Perform a follow-up infrared scan for all splices and terminations previously described approximately eleven (11) months after date of Substantial Completion, but must be during normal school (business) operating hours.

2. Contractor shall submit to the Architect/Engineer and Owner, at time of final inspection, a schedule to perform the infrared scans during normal school (business) operating hours while the building is in full operation, under load. Re-terminations requiring any power shut-downs must be coordinated with the Owner and performed during non-school (business) hours.

3. Instrument: Use an infrared scanning device designed to measure temperature or to detect significant deviations from normal values. Provide calibration record for device.

4. Record of Infrared Scanning: Prepare a certified report that identifies equipment and splices checked and that describes scanning results. Include notation of deficiencies detected, remedial action taken and observations after remedial action.

D. Remove and replace malfunctioning units then verify, inspect and retest as specified above.

END OF SECTION

Underground Electrical Service Section 260543

Part 1 - General

I. REQUIREMENTS

A. The general provisions of the Contract, including General and Supplementary Conditions and General Requirements, apply to the work specified in this Section.

II. SCOPE

A. The work covered under this Section shall include furnishing and installing an underground electrical service complete as shown on Drawings and herein specified.

B. The existing underground and/or overhead electrical service(s) shall remain in operation and shall continue to serve the building during the construction period until the new service has been installed and tested, ready for operation. After the new service has assumed the building's entire power load, the existing service(s) shall be removed as shown on the Drawings.

III. QUALITY ASSURANCE

A. All equipment, materials and their installation shall conform to the requirements of the National Electrical Code (NEC), local code requirements, and these Specifications.

B. All equipment and material shall be listed by Underwriter's Laboratories, Inc. (UL) for their intended use and shall bear the UL label.

C. Equipment shall be constructed in accordance with National Electrical Manufacturer's Association (NEMA) standards.

D. All electrical work specified under this Section of these Specifications shall conform to the requirements of the electric utility company.

E. The grounding systems shall comply with the National Electrical Code (NEC) and as hereinafter specified.

Part 2 - Products

I. ELECTRICAL SERVICE

A. Primary service shall be three phase with pad or pole mounted transformer(s) as shown on the Drawings and shall be furnished by Potomac Electric Power Company in most instances and Baltimore Gas and Electric in selected instances.

B. This Contractor shall furnish and install primary underground service conduits, electric utility company manhole(s) as shown on the Drawings. Electric utility company shall

install all primary service conductors.

C. This Contractor shall furnish and install secondary underground service conduits from the electrical utility company's transformer(s) into the building and extend the service to the metering equipment as shown on the Drawings. Secondary voltage, phase, and number of conduits shall be as shown on the Drawings. Electric utility company shall furnish and install all secondary service conductors, unless otherwise shown on the Drawings to be furnished and installed by this Contractor.

D. All necessary devices, such as meter sockets, meter connection boxes, meter enclosures, current and/or potential transformers, manhole enclosure lid(s), and instrument transformer hangers shall be furnished to this Contractor by the electric utility company.

E. This Contractor shall furnish and install the concrete transformer pad(s), unless other arrangements are made with the electric utility company to have the pads provided by the electric utility company. Contractor provided pads must meet all of the requirements of the electric utility company.

F. This Contractor shall provide pull-lines in all primary and secondary service conduits, including spare raceways. Refer to Specification Section 16110.

II. MATERIALS AND COMPONENTS

A. Primary and secondary electrical service entrance conduits shall be heavy wall (Schedule 40) polyvinyl chloride (PVC) plastic as hereinbefore specified. Secondary electrical service entrance conduits shall be encased in concrete as detailed on the Drawings and specified herein.

B. Concrete for the secondary electrical service entrance ductbank(s) shall be 3,000 psi, air entrained with 3/4-inch maximum aggregate size.

C. Duct spacers shall be fabricated plastic, UL listed.

D. Electrical service entrance conductors, where shown on the Drawings, shall be as hereinbefore specified.

E. Cable lugs for termination of electrical service entrance conductors shall be suitable for the application and as approved by the electrical utility company.

F. Electric utility company manhole enclosures shall be installed, by this contractor, and sized per the electric utility company requirements. Coordinate with the electric utility company.

Part 3 - Execution

I. INSTALLATION

A. This Contractor shall furnish and install a metering system as shown on the Drawings and as required by the electric utility company serving the project.

B. Conduits for the primary and secondary electrical service shall be installed a minimum thirty-six (36) inches below grade, or as required by the electrical utility company.

C. This Contractor shall make all necessary final arrangements with the electric utility company for the installation of the permanent underground electrical service.

D. This Contractor shall coordinate all scheduling of the installation with the electric utility company.

E. Slope installation of electrical service to drain away from the building.

F. Terminate primary and secondary service entrance raceways at transformer location(s) as directed by the electric utility company.

G. This Contractor shall make all necessary final arrangements with the electric utility company for the phased removal of the existing electrical service(s) and associated equipment.

II. DUCTBANK

A. Place concrete so that all voids around ducts are filled.

B. Furnish and install a three (3) inch minimum concrete envelope around ducts with two (2) inch minimum concrete thickness between ducts.

C. Adjust final slopes on site to coordinate with existing and new utilities.

D. Install on undisturbed soil.

E. After installation, clean and swab ducts.

F. Cap spare ducts.

G. Install a minimum thirty-six (36) inches below grade to top of ductbank or as indicated on the Drawing.

III. SERVICE INSTALLATION

A. Furnish and install ductbank and/or conduits as indicated on Drawings complete from service location in building to transformer location(s). Seal raceways watertight at inside face of outside wall or where raceways pierce slab.

END OF SECTION

Part 1 - General

I. REQUIREMENTS

A. The general provisions of the Contract, including General and Supplementary Conditions and General Requirements, apply to the work specified in this Section.

II. SCOPE

A. The work covered under this Section shall include furnishing and installing an underground electrical service complete as shown on Drawings and herein specified.

B. The existing underground and/or overhead electrical service(s) shall remain in operation and shall continue to serve the building during the construction period until the new service has been installed and tested, ready for operation. After the new service has assumed the building's entire power load, the existing service(s) shall be removed as shown on the Drawings.

III. QUALITY ASSURANCE

A. All equipment, materials and their installation shall conform to the requirements of the National Electrical Code (NEC), local code requirements, and these Specifications.

B. All equipment and material shall be listed by Underwriter's Laboratories, Inc. (UL) for their intended use and shall bear the UL label.

C. Equipment shall be constructed in accordance with National Electrical Manufacturer's Association (NEMA) standards.

D. All electrical work specified under this Section of these Specifications shall conform to the requirements of the electric utility company.

E. The grounding systems shall comply with the National Electrical Code (NEC) and as hereinafter specified.

Part 2 - Products

I. ELECTRICAL SERVICE

A. Primary service shall be three phase with pad or pole mounted transformer(s) as shown on the Drawings and shall be furnished by Potomac Electric Power Company in most instances and Baltimore Gas and Electric in selected instances.

B. This Contractor shall furnish and install primary underground service conduits, electric utility company manhole(s) as shown on the Drawings. Electric utility company shall

install all primary service conductors.

C. This Contractor shall furnish and install secondary underground service conduits from the electrical utility company's transformer(s) into the building and extend the service to the metering equipment as shown on the Drawings. Secondary voltage, phase, and number of conduits shall be as shown on the Drawings. Electric utility company shall furnish and install all secondary service conductors, unless otherwise shown on the Drawings to be furnished and installed by this Contractor.

D. All necessary devices, such as meter sockets, meter connection boxes, meter enclosures, current and/or potential transformers, manhole enclosure lid(s), and instrument transformer hangers shall be furnished to this Contractor by the electric utility company.

E. This Contractor shall furnish and install the concrete transformer pad(s), unless other arrangements are made with the electric utility company to have the pads provided by the electric utility company. Contractor provided pads must meet all of the requirements of the electric utility company.

F. This Contractor shall provide pull-lines in all primary and secondary service conduits, including spare raceways. Refer to Specification Section 16110.

II. MATERIALS AND COMPONENTS

A. Primary and secondary electrical service entrance conduits shall be heavy wall (Schedule 40) polyvinyl chloride (PVC) plastic as hereinbefore specified. Secondary electrical service entrance conduits shall be encased in concrete as detailed on the Drawings and specified herein.

B. Concrete for the secondary electrical service entrance ductbank(s) shall be 3,000 psi, air entrained with 3/4-inch maximum aggregate size.

C. Duct spacers shall be fabricated plastic, UL listed.

D. Electrical service entrance conductors, where shown on the Drawings, shall be as hereinbefore specified.

E. Cable lugs for termination of electrical service entrance conductors shall be suitable for the application and as approved by the electrical utility company.

F. Electric utility company manhole enclosures shall be installed, by this contractor, and sized per the electric utility company requirements. Coordinate with the electric utility company.

Part 3 - Execution

I. INSTALLATION

A. This Contractor shall furnish and install a metering system as shown on the Drawings and as required by the electric utility company serving the project.

B. Conduits for the primary and secondary electrical service shall be installed a minimum thirty-six (36) inches below grade, or as required by the electrical utility company.

C. This Contractor shall make all necessary final arrangements with the electric utility company for the installation of the permanent underground electrical service.

D. This Contractor shall coordinate all scheduling of the installation with the electric utility company.

E. Slope installation of electrical service to drain away from the building.

F. Terminate primary and secondary service entrance raceways at transformer location(s) as directed by the electric utility company.

G. This Contractor shall make all necessary final arrangements with the electric utility company for the phased removal of the existing electrical service(s) and associated equipment.

II. DUCTBANK

A. Place concrete so that all voids around ducts are filled.

B. Furnish and install a three (3) inch minimum concrete envelope around ducts with two (2) inch minimum concrete thickness between ducts.

C. Adjust final slopes on site to coordinate with existing and new utilities.

D. Install on undisturbed soil.

E. After installation, clean and swab ducts.

F. Cap spare ducts.

G. Install a minimum thirty-six (36) inches below grade to top of ductbank or as indicated on the Drawing.

III. SERVICE INSTALLATION

A. Furnish and install ductbank and/or conduits as indicated on Drawings complete from service location in building to transformer location(s). Seal raceways watertight at inside face of outside wall or where raceways pierce slab.

END OF SECTION

Part 1 - General

I. REQUIREMENTS

A. The general provisions of the Contract, including General and Supplementary Conditions and General Requirements, apply to the work specified in this Section.

II. SCOPE

A. The work covered under this Section shall include furnishing and installing power pole systems using Tele-Power Poles and/or Vertical Chase Power Communications Delivery Systems (multi-outlet systems) in steel and aluminum, used to provide branch circuit wiring, convenience power outlets, multi-media and other low voltage communications wiring and outlets as shown on the Drawings and herein specified.

1. Tele-Power Poles shall consist of the Tele-Power Pole Multi-Outlet Assembly, appropriate fittings and accessories to complete the installation.

2. Vertical Chase Power Communications Delivery Systems (multi-outlet systems) assemble shall consist of modular vertical channels, and appropriate fittings. The system shall consist of a pre-punched support, aluminum end covers and a metallic center panel, which can be adorned with laminate products. Options may include furniture feeds or wired receptacle harnesses, and appropriate fittings to complete the installation.

III. QUALITY ASSURANCE

A. All equipment, materials, and their installation shall conform to the requirements of the National Electrical Code (NEC), local code requirements, and these Specifications.

B. All equipment and materials shall be listed by Underwriters Laboratories, Inc. (UL) for their intended use and shall bear the UL label.

C. Equipment shall be constructed in accordance with National Electrical Manufacturer's Association (NEMA) standards.

D. Submittals are required in accordance with SECTION 260500 of these Specifications.

IV. DELIVERY, STORAGE AND HANDLING

A. Deliver power pole systems in factory labeled packages.

B. Store and handle in strict compliance with manufacturer's written instructions and recommendations.

C. Protect from damage due to weather, excessive temperature, and construction operations.

Part 2 - Products

2.1 MANUFACTURERS

A. Power Pole Systems shall be as manufactured by THE WIREMOLD COMPANY, as described herein as the basis of design, or equal product as manufactured by HUBBELL INCORPORATED.

B. All components and fittings shall be of the same manufacturer, or UL listed as an assembly.

2.2 TELE-POWER POLES

A. The Tele-Power Pole shall be WIREMOLD Cat. No. 30TP-4V.

1. The Tele-Power Pole channel shall be steel, ivory baked enamel finish with a cross section of 3" x 2.75" with two (2) separate compartments. One compartment is to be factory wired with two (2) duplex 2 pole, 3 wire, 20A, 125V NEMA 5-20R receptacles (Pass & Seymour Cat. No. 5362AI), ivory colored to match the pole finish. The harness is to be single circuit (2 conductor plus ground) with #12 AWG solid type THHN conductors, factory assembled to the receptacles, unless otherwise shown on the Drawings. Minimum 6" conductor leads shall be furnished for termination to the overhead wiring system.

2. The second compartment shall be for field installation of low voltage communications cabling. A 12" removable cover section in this compartment must be provided to assemble and mount communications connectors. This section must be removable without dismantling or removing the Tele-Power Pole after installation. The cover section is to have four (4) knockouts for modular voice-data, video, multi-media outlets or ports and a 1.375" x 2.7" rectangular knockout for a modular furniture outlet. A "mouse hole" knockout with furnished grommet shall be included for straight through communication cable access.

3. The Tele-Power Pole shall be 10'-5" or 12'-5" long to suit the location installed.

B. Fittings: A full complement of fittings for the Tele-Power Pole shall include, but not limited to, entrance end fitting for top of the electrical channel, ceiling trim plate, pole-mounted bracket, Velco™ carpet gripper pad and adhesive pad. Provide all fittings necessary for a complete installation.

1. If for air handling spaces, an entrance end fitting must be furnished for the low voltage communications channel.

C. Add-On Device Covers:

1. The Tele-Power Pole must be UL Listed for field modification, changes and additions of receptacles, devices and circuits. Field installed device plates shall be available to add duplex, single 1.40” and 1.59” diameter, and rectangular type receptacles. These plates must be ivory in color to match the pole.

2. Add-on communications covers must be available to mount workstation device faceplates, inserts, and specialty mounting bezels. The power pole manufacturer shall provide a complete line of connectivity outlets and multi-media modular inserts for UTP, fiber optic, coaxial, and other cabling types to suit the project requirements.

3. UTP inserts shall feature a unique recessed area for port labeling and shall be able to accommodate designation icon buttons or icon labels. Custom label capabilities shall be available using templates that can be downloaded from the Internet.

2.3 VERTICAL CHASE POWER & COMMUNICATIONS DELIVERY ASSEMBLIES

A. The Vertical Power & Communications Deliver Assemblies shall be the WIREMOLD VISTA ARCHITECTURAL COLUMN SYSTEM SERIES. [Engineer, provide a complete catalog number here or on the drawings if more than one type is needed for the project]

B. Frames shall be mill finished 6063-T6 aluminum with snap on steel and/or aluminum covers and satin anodized aluminum end caps. Covers and access panels may also be painted over and are suitable for field painting.

1. The frame shall be a four (4) piece design with two center supports and snap-on covers and end caps, yielding a total of three (3) useable wire and cable channels. The product shall be available in two (2) sizes – small and large, as shown on the Drawings or indicated herein. The total small width shall be 8.9” x 3.8” deep. The large size shall be 13.4” wide x 3.8” deep. The aluminum extrusions shall be a minimum thickness of 0.06”, and steel covers 0.040”. The system shall be available in 10’-6” height. The system shall be provided with an extension kit that includes aluminum tubes to allow for varying ceiling heights up to 15’-0” where needed. Access panels and covers

up to a height of 30” above finished floor shall provide access to wiring and devices.

2. The frame supports shall include factory pre-punched hole cuts for communication receptacles and trade knockouts for electrical termination.

C. The panels finish and colors shall be as selected by the Architect/Engineer or as shown on the Drawings. The finishes and panels availability shall be as follows:

1. The center panels shall be constructed of painted steel, aluminum or stainless steel in 96”, 30”, 24”, and 6” heights. The center panel finishes available from the manufacturer shall include wood laminate, metal laminate, nonmetallic laminate, fabric, and a painted surface. Perforated metal in painted steel and glass panels shall be available for the upper sections. An open center option shall also be offered. This option consists of a metallic panel from the floor to 30” high. The remainder of the center section is open to the ceiling. [Engineer to coordinate with the Architect and edit as needed. If necessary develop types to be used if they are more than one type. A schedule on the drawings may need to be developed with catalog numbers if not done above.]

D. A full complement of fittings shall include, but not limited to, internal braces with knockouts, snap-in dividers and wire clips, ceiling and carpet trim pieces. The fittings shall be manufactured of extruded aluminum, galvanized steel, and/or plastic.

E. Multi-outlet wiring harnesses shall consist of 2 pole, 3 wire, 20A, 125V NEMA 5- 20R receptacles (Pass & Seymour Cat. No. 5362AI). The harness shall be a single circuit (2 conductor plus ground) or two circuit (4 conductor plus ground) wiring configurations as indicated on the Drawings. The wires shall be #12 AWG solid type THHN conductors, factory assembled to the receptacles.

F. A plate with openings and knockouts shall be provided for a furniture feed option, when shown on the Drawings, to feed a modular furniture system.

Part 3 - Execution

I. EXAMINATION

A. Examine conditions under which power pole systems, accessories, and fittings are to be installed and substrate that will support systems. Notify the Architect/Engineer and Owner of conditions detrimental to proper completion of the work. Do not proceed with work until unsatisfactory conditions have been corrected.

II. INSTALLATION

A. Prior to and during installation, refer to the system layout drawing containing all elements of the system. Contractor shall comply with detailed manufacturer’s instruction sheets, which shall accompany system components as well as complete system instruction sheets, using whichever is applicable. Coordinate installation with adjacent

work to ensure proper clearances and to prevent electrical hazards.

B. System poles shall be plumb and securely supported at the ceiling and the floor in accordance with manufacturer's installation sheets.

C. All systems shall be mechanically continuous and connected to all electrical outlets, boxes, device mounting brackets, and cabinets, in accordance with manufacturer's installation sheets.

D. The system shall be electrically continuous and bonded in accordance with the National Electrical Code for proper grounding.

E. Provide accessories as required for a complete installation, including insulated bushings and inserts where required by the manufacturer.

F. Close all unused openings where wire is exposed using manufacturer's recommended accessories.

III. CLEANING AND PROTECTION

A. Clean surfaces using non-abrasive materials and methods recommended by manufacturer.

B. Protect power poles until final acceptance by the Owner.

C. Repaint marred and scratched surfaces with touch-up paint to match original finish.

END OF SECTION

Part 1 - General

I. REQUIREMENTS

A. The general provisions of the Contract, including General and Supplementary Conditions and General Requirements, apply to the work specified in this Section.

II. SCOPE

A. The work covered under this Section shall include furnishing and installing wiring devices, for all electrical systems as shown on the Drawings and herein specified. This Section includes the following:

1. Lighting Switches
2. Motor Switches
3. Wall Dimmer Switches
4. Receptacles, receptacles with integral GFCI, and associated device plates Twist-locking receptacles.
5. Cover Plates
6. Wall Plates
7. Cord and plug sets.

III. QUALITY ASSURANCE

A. All equipment, materials, and their installation shall conform to the requirements of the National Electrical Code (NEC), local code requirements and these Specifications.

B. All equipment and materials shall be listed by Underwriters Laboratories, Inc. (UL) for their intended use and shall bear the UL Label.

C. All 125 volt and 250 volt, 15 amp and 20 amp receptacles (NEMA 5-15R, 5-20R, 6-15R, 6-20R, L5-15R, and L5-20R) shall be FSUL WC-596-G compliant and bear the FSUL label.

D. All non-locking 125 volt and 250 volt, 15 amp and 20 amp receptacles (NEMA 5- 15R, 5-20R, 6-15R and 6-20R) located in damp or wet locations shall be UL Listed as “weather resistant”.

E. All lighting switches shall be FSUL WS-896 compliant and bear the FSUL label.

F. Equipment shall be constructed in accordance with National Electrical Manufacturer's Association (NEMA) standards.

G. Source Limitations: Obtain each type of wiring device and associated wall plate through one source from a single manufacturer. Insofar as they are available, obtain all wiring devices and associated wall plates from a single manufacturer and one source.

H. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use. Comply with NFPA 7.

IV. DEFINITIONS

A. EMI: Electromagnetic interference.
B. GFCI: Ground-fault circuit interrupter.
C. Pigtail: Short lead used to connect a device to a branch-circuit conductor.
D. RFI: Radio-frequency interference.

V. SUBMITTALS

A. Product Data: For each type of product indicated.

B. Shop Drawings: List of legends and description of materials and process used for premarking wall plates.

C. Submittals are required in accordance with SECTION 16010 of these Specifications.

1. Certain wiring devices and other equipment listed hereinafter may not be part of this project. This Contractor shall select from the listed devices the equipment necessary to be compliant with the Contract Documents and include in the submittals only the devices and equipment specific for this project.

2. Field quality-control test reports.

3. Operation and Maintenance Data: For wiring devices to include in all manufacturers' packing label warnings and instruction manuals that include labeling conditions.

Part 2 - Products

I. LIGHTING SWITCHES

A. Lighting switches shall be manufactured by PASS & SEYMOUR (P&S) as listed below or the equivalent as manufactured by COOPER (ARROW HART), HUBBELL, or LEVITON.

B. Lighting switches shall be totally enclosed, 20 amp, 120-277 volt with screw-type wire terminals to accept No. 14 through No. 10 AWG solid copper conductors, ivory thermoplastic toggle, and grounding terminal, or Plug Tail Type. All locking type switches

shall be keyed alike. Lighting switches shall be as follows:

1. Single pole P&S Cat. No. PS20AC1I
2. Single Pole (PlugTail Type) PT20AC1I
3. Single pole, locking type P&S Cat. No. PS20AC1IL
4. Single pole, double throw- P&S Cat. No. 1221I Two circuit, center off
5. Three –way P&S Cat. No. PS20AC3I
6. Three-way (PlugTail Type) PT20AC3I
7. Three-way, locking type P&S Cat. No. PS20AC3IL
8. Four-way P&S Cat. No. PS20AC4I
9. Four-way, locking type P&S Cat. No. PS20AC4IL
10. Momentary contact P&S Cat. No. 1251I
11. Momentary contact, P&S Cat. No. 1251L locking type

C. All PlugTail lighting switches shall come complete minimum six (6) inch solid THHN Connector. Stranded connectors shall not be acceptable.

D. Pilot lighting switches shall be totally enclosed, 20 amp, 120 volt and 277 volt with screw type wire terminals to accept No. 14 through No. 10 AWG solid copper conductors, red “lighted when ON” lighted toggle, and grounding terminal. Pilot lighted switches shall be as follows:

1. Single pole (120V) P&S Cat. No. PS20AC1RPL
2. Single pole (277V) P&S Cat. No. PS20AC1RPL7
3. Three-way (120V) P&S Cat. No. PS20AC3RPL
4. Three-way (277V) P&S Cat. No. PS20AC3RPL7

E. Digital lighting control switches required under Specification SECTION 16505 shall be part of the lighting control system.

F. Wall switch occupancy sensors are specified under Specification SECTION 16506.

II. MOTOR SWITCHES

A. Motor switches shall be totally enclosed, 30 amp, 600 volt with screw-type wire terminals to accept solid copper conductors and a grounding terminal. Motor switches shall be as follows:

1. Single phase, Double pole P&S Cat. No. 7802MD

2. Three phase, Three pole P&S Cat. No. 7803MD

B. Motor switches shall include a red pilot light with the switch or on a separate mounting strap in a two-gang outlet box and suitable cover plate. Pilot light shall glow red when switch is ON. Pilot lights shall be suitable for the voltage supplied to the motor switch. Pilot light on a separate mounting strap shall be P&S Cat. No. 2151RED or approved equal.

C. Mechanical door limit switches shall be Mars Corporation Part No. 99-014 – 250 volt, 1 phase, 20 amp, 1 HP max or approved equal.

III. WALL DIMMER SWITCHES

A. Wall dimmer switches shall be LUTRON “Nova” Type with gray faceplate incandescent, fluorescent or L.E.D. of the wattage (incandescent) or number of lamps (fluorescent) as noted on the Drawings or approved equal by PASS & SEYMOUR.

IV. RECEPTACLES

A. Receptacles shall be manufactured by PASS & SEYMOUR (P&S) as listed below or the equivalent as manufactured by COOPER (ARROW HART), HUBBELL, or LEVITON.

B. All straight blade 15A and 20A receptacles in elementary schools only, shall be tamper-resistant type, except clock outlet receptacles.

C. Receptacles shall be of the types listed below, complete with an impact resistant nylon face, screw type wire terminals to accept copper conductors, high strength thermoplastic back body, and grounding terminal, or Plug Tail Type.

1. Duplex 2P, 3W, 20A, 125V, NEMA 5-20R: P&S Cat. No. 5362-AI

2. Duplex (PlugTail Type), 2P, 3W, 20A, 125V, NEMA 5-20R: P&S Cat. No. PT5362-AI

3. Controlled Receptacle, Duplex 2P, 3W, 20A, 125V, NEMA 5-20R: P&S Cat. No. 5362-AGRY

4. Controlled Receptacle (PlugTail Type), Duplex 2P, 3W, 20A, 125V, NEMA 5-20R: P&S Cat. No. PT5362-AGRY

5. Duplex 2P, 3W, 20A,125V, NEMA 5-20R Tamper-Resistant (safety) type with two USB Charging Ports: P&S Cat. No. TR5362USBI

6. Duplex 2P, 3W, 20A, 125V, NEMA 5-20R Weather-Resistant: P&S Cat. No. WR5362I

7. Duplex 2P, 3W, 20A, 125V, NEMA 5-20R Ground Fault Circuit Interrupter type with Safe Lock: P&S Cat. No. 2095I

8. Duplex (Plugtail Type) 2P, 3W, 20A, 125V, NEMA 5-20R Ground Fault Circuit Interrupter type with Safe Lock: P&S Cat. No. PT2095I

9. Duplex 2P, 3W, 20A, 125V, NEMA 5-20R Connected to an emergency circuit: P&S Cat. No. 5362-ARED

10. Duplex (Plugtail Type) 2P, 3W, 20A, 125V, NEMA 5-20R Connected to an emergency circuit: P&S Cat. No. PT5362-ARED

11. Duplex 2P, 3W, 20A, 125V, NEMA 5-20R Tamper-Resistant (safety) type: P&S Cat. No. TR63I

12. Duplex (PlugTail Type), 2P, 3W, 20A, 125V, NEMA 5-20R Tamper-Resistant (safety) type: P&S Cat. No. PTTR63I

13. Controlled Receptacle, Duplex 2P, 3W, 20A, 125V, NEMA 5-20R Tamper-Resistant (safety) type: P&S Cat. No. TR63GRY

14. Controlled Receptacle Duplex (PlugTail Type), 2P, 3W, 20A, 125V, NEMA 5-20R, Tamper-Resistant (safety) type: P&S Cat. No. PTTR63I

15. Duplex 2P, 3W, 20A, 125V, NEMA 5-20R Tamper-Resistant (safety), Ground Fault Circuit Interrupter type with Safe Lock: P&S Cat. No. 2095TRI

16. Duplex 2P, 3W, 20A, 125V, NEMA 5-20R Tamper-Resistant (safety), Ground Fault Circuit Interrupter type with Safe Lock: P&S Cat. No. PT2095TRI

17. Duplex 2P, 3W, 20A, 125V, NEMA 5-20R Weather-Resistant and Tamper-Resistant, Ground FaultCircuit Interrupter type with Safe Lock: P&S Cat. No. 2095TRWRI

18. Single 2P, 3W, 20A, 125V, NEMA 5-20R connector: P&S Cat. No. 5369-X

19. Single 2P, 3W, 15A, 125V, NEMA L5-15R: P&S Cat. No. 4710

20. Single 2P, 3W, 20A, 125V, NEMA L5-20R: P&S Cat. No. L520R

21. Single 2P, 3W, 20A, 125V, NEMA L5-20R connector: P&S Cat. No. L520C

22. Single 2P, 3W, 30A, 125V, NEMA 5-30R: P&S Cat. No. 3802

23. Single 2P, 3W, 30A, 125V, NEMA L5-30R: P&S Cat. No. L530R

24. Single 2P, 3W, 15A, 250V, NEMA 6-15R: P&S Cat. No. 5662AI

25. Single 2P, 3W, 20A, 250V, NEMA 6-20R: P&S Cat. No. 5862AI

26. Single 2P, 3W, 30A, 250V, NEMA 6-30R: P&S Cat. No. 3801

27. Single 2P, 3W, 50A, 250V, NEMA 6-50R: P&S Cat. No. 3804

28. Single 3P, 4W, 20A, 125/250V, NEMA 14-20R: P&S Cat. No. 3820
29. Single 3P, 4W, 30A, 125/250V, NEMA 14-30R: P&S Cat. No. 3864
30. Single 3P, 4W, 50A, 125/250V, NEMA 14-50R: P&S Cat. No. 3894
31. Single 3P, 4W, 60A, 125/250V, NEMA 14-60R: P&S Cat. No. 3871
32. Single 3P, 4W, 20A, 250V, NEMA 15-20R: P&S Cat. No. 3821
33. Single 3P, 4W, 30A, 250V, NEMA 15-30R: P&S Cat. No. 5740
34. Single 3P, 4W, 50A, 250V, NEMA 15-50R: P&S Cat. No. 5750
35. Single 3P, 4W, 60A, 250V, NEMA 15-60R: P&S Cat. No. 5760
36. Single 3P, 4W, 50A, 125/250V P&S Cat. No. CS6369.
37. Single 2P, 3W, 15A, 125V, NEMA 5-15R Wireless Clock Outlet with stainless steel cover plate: P&S Cat. No. S3733-SS

D. Wiring devices mounted in WIREMOLD V4000 surface metal raceways shall be ivory or light almond in color to match the raceway in lieu of the colors indicated above, except red wiring devices shall not change.

E. All PlugTail receptacles shall come complete minimum six (6) inch solid THHN Connector. Stranded connectors shall not be acceptable.

V. COVER PLATES

A. Single and combination types to match corresponding wiring devices.

B. Plate-Securing Screws: Metal with head color to match plate finish.

C. A cover plate shall be furnished and installed over each wiring device Plates shall be PASS & SEYMOUR Type 302 (non-magnetic) stainless steel with satin finish, 0.032" nominal thickness or the equivalent as manufactured by COOPER (ARROW HART), HUBBELL, LEVITON or MULBERRY. All cover plates shall be UL listed.

1. Wall switch occupancy sensors shall have stainless steel cover plates, not the plastic cover plates that may be included in the switch packaging.

D. Cover plates shall be of a configuration to match the type of wiring device to be covered. Where more than one flush outlet (switch, receptacle, etc.) is indicated in the same location and at the same mounting height, all (except dimmer switches) shall be ganged in a single multi-gang outlet box under a common cover plate.

E. Wiring devices located in wet or damp locations, or noted "WP" on the Drawings shall be complete with a die-cast weatherproof metallic cover plate. Receptacles in damp locations only, may use this type of weatherproof cover plate. All weatherproof cover plates shall be UL listed. All 15 amp and 20 amp receptacle type wiring devices located in

wet locations, or noted “WP” on the Drawings, shall have hinged weatherproof “while-in-use” covers, Wet-Location, Weatherproof Cover Plates: NEMA 250, complying with type 3R weather.

F. Other receptacle type wiring devices located in wet and damp locations where equipment is intended to be plugged into it and not attended while in use shall also have hinged weatherproof “while-in-use” covers, Wet-Location, Weatherproof Cover Plates: NEMA 250, complying with type 3R weather. Provide these types of weatherproof covers at other locations identified on the Drawings. Covers, body and plates shall be gray die-cast aluminum, fully gasketed and suitable for mounting horizontally and vertically. Mounting screws shall be 302 stainless steel. Cover assembly shall be UL listed.

G. All receptacles on an emergency circuit shall have a cover plate, PASS & SEYMOUR Type 302 (non-magnetic), labeled with 1/8” high engraved and filled lettering “EMERGENCY”.

H. Cover plates for receptacles shall be labeled with the circuit number including panelboard designations. Labeling shall be done with a BROTHER® Model No. PT-1400 (P-touch) professional label maker, or approved equal, using a laminated type extra strength adhesive tape, Letters/numerals shall be black with a white background, minimum 3/16” high. Locations/rooms requiring labels shall be as follows:

1. Elementary schools:

   a) All classrooms and instructional spaces.

   b) Media Centers/Libraries, excluding offices, conference rooms and other ancillary spaces associated with the Media Center.

2. Middle and High Schools:

   a) Lecture Halls.

   b) Media Centers/Libraries, excluding offices, conference rooms and other ancillary spaces associated with the Media Center.

   c) Multi-Purpose Classrooms.

I. Cover plates for lighting control digital switches shall be labeled with the lighting control panel designation and room number designation or as shown on the Drawings. Labeling shall be done with a BROTHER® Model No. PT-1400 (P- touch) professional label maker, or approved equal, using a laminated type extra strength adhesive tape, Letters/numerals shall be black with a white background, minimum 3/16” high.

1. Cooper Wiring Devices; a division of Cooper Industries, Inc. (Cooper)

2. Hubbell Incorporated; Wiring Device-Kellems (Hubbell)

3. Leviton Mfg. Company Inc. (Leviton).

4. Pass & Seymour/Legrand; Wiring Devices & Accessories (Pass & Seymour)

VI. POWER OUTLET PANELS

A. Power Outlet Panels shall have one duplex 2P, 3W, 20A, 125V, NEMA 5-20R weather-resistant and tamper-resistant, Ground Fault Circuit Interrupter (GFCI) type receptacle; P&S Cat. No. 2095TRWR or equal.

B. Enclosure shall be rainproof NEMA 3R and fabricated from G90 galvanized steel with welded flange construction and a gray powder coat finish. The door cover shall swing up and able to be held in the open position and closed with plugs and cords inserted into the receptacle while maintaining the NEMA 3R rating. The door shall have rolled edges to protect cords from damage and with padlock provisions. The deadfront cover shall be angled with the receptacle to facilitate easier plug and cord attachments and shall be removable without interfering with factory wiring.

C. All components shall be factory wired and have field termination lugs, including ground lug.

D. Power Outlet Panels shall be MIDWEST ELECTRIC PRODUCTS, INC. Catalog No. U010SEP or approved equal.

VII. CORD REELS

A. Cord reels designated on the Drawings as ‘CR’ shall be WOODHEAD Cat. No. 990-3000, having an open housing, a minimum 18-inch primary power cord and a NEMA 5-15P plug cap, a shock-absorbing ball stop, adjustable tension, built in ratchet locks, a swivel/pivot base (Cat. No, 9507), and a forty-five (45) foot secondary power cord (rated 11 amps, minimum) with an attached non- conductive rubber and plastic power outlet box having two (2) 2P, 3W, 15A duplex receptacles (NEMA 5-15R). The power cords shall be SJTOW’ type with three (3) conductor, No. 14 AWG.

1. This Contractor shall furnish and install a NEMA 5-15R single receptacle in/on the ceiling as shown on the Drawings for plugging in the cord reels primary cord.

2. Contractor shall activate ratchet if not set by the factory.

B. Cord reels designated on the Drawings, as ‘CRL’ shall be WOODHEAD Cat. No. 980A-83, having an open housing with an automatic ‘on/off’ power switch located inside the reel, a minimum 18-inch primary power cord and a NEMA 5-15P plug cap, a shock-absorbing ball stop, adjustable tension, built in ratchet locks, a swivel/pivot base (Cat. No, 9507), and a fifty (50) foot secondary power cord with an attached 13-watt fluorescent hand lamp having vinyl coated guard and rubber handle without a receptacle in the handle suitable for use in minor repair garages classified as a non-hazardous location per NEC Article 511.3(D)(1). The power cords shall be ‘SJTOW’’ type with three (3) conductor, No. 16 AWG.

1. This Contractor shall furnish and install a NEMA 5-15R single receptacle in/on the ceiling as shown on the Drawings for plugging in the cord reels primary cord.

2. Contractor shall activate ratchet if not set by the factory.

VIII. DOORBELL SYSTEM

A. This Contractor shall furnish and install where shown on the Drawings, a complete doorbell signaling system as specified herein:

1. Bell: Edwards Signaling Cat. No. 340-6G5 Adaptable. Bell shall be six (6) inches in diameter, 24 volts AC, having a sound level of 92 dB measured at 10 feet.

2. Class 2 Signaling Transformer: Edwards Signaling Cat. No. 592. Transformer shall have primary voltage of 120 volts AC and secondary voltage of 24 volts AC and 20 VA.

3. Pushbutton Station: Edward Signaling Cat. No. 1786C-B. Pushbutton shall be weatherproof, surface mount, and solid brass construction. The pushbutton shall have normally open momentary contacts, rated at 24 volts, 4 amps AC, 2 amps DC, a neoprene diaphragm to protect the internal phosphor bronze contact springs, and a bakelite back plate threaded for ½ inch conduit.

IX. FIRE EVACUATION STAGING AREA (FESA) VISUAL NOTIFICATION SYSTEM

A. This Contractor shall furnish and install where shown on the Drawings, a complete FESA visual notification system as specified herein:

1. Signal Beacon: Federal Signal Corporation Model No. FB2PST-120R exterior red strobe light rated at 120VAC, 0.25 amps, flash rate/minute of 90, candela ratings of 1,000,000 (peak) and 300 ECP (effective candela) suitable for mounting on ½" NPT pipe.

2. Wall Mounting Bracket Kit: Federal Signal Corporation Model No. LWMB2 wall mounting bracket for mounting the FESA exterior strobe light signal beacon. The wall bracket shall be wall mounted on a suitable outlet box and shall allow wiring to be run concealed within the wall bracket to the strobe light.

3. Activation Station (on/off): STI Model No. SS-2231 with custom two (2) line label to read "FESA" (line 1), "SIGNAL BEACON" (line 2) and a STI Model No. SUB-102722 Spacer (color to match shell). Mount over flush outlet box or surface mounted on Wiremold V5744S outlet box where indicated on the Drawings or required to be surface mounted.

4. Transformer: Provide a transformer, when required to step down the voltage from 277 volts to 120 volts. Transformer shall be equal to ACME ELECTRIC Catalog No. TB81301 rated at 50 VA, 277 volts primary to 120 volts secondary complete with a primary fuse block, Part No, PL112700 and 0.6-amp time delay class CC fuses. Mount transformer and fuse block in a metal NEMA 1 vented enclosure with a latching hinged cover, HOFFMAN Catalog No. A8N66/A8N6P with HOFFMAN Catalog No. AVK23 louver vents field installed on two (2) side walls of enclosure. Mount enclosure above the ceiling or as shown on the Drawings.

X. S.O.L TESTING PORTABLE POWER DISTRIBUTION BOX (middle and high schools only)

A. S.O.L. testing portable power distribution boxes shall contain a minimum of six (6) NEMA

5-20R duplex receptacles, one (1) NEMA L5-30R single receptacle, one (1) 50A 125/250V locking inlet (CS6375) and one (1) 50A 125/250V locking outlet (CS6369). A circuit breaker panel box with a hinged door cover shall be provided. Each NEMA 5-20R duplex receptacle shall be protected by one (1) single pole, 20A circuit breaker and each NEMA L5-30R single receptacle shall be protected by one (1) 2 pole, 30A circuit breaker. The power distribution box shall have individual GFCI modules to protect the duplex receptacles against ground faults with manual GFCI reset configuration.

B. The power distribution box shall be suitable for indoor or outdoor environments. Box shall have a reinforced steel housing and support legs and finished with a powder coat paint inside and out to prevent corrosion.

C. Each portable power distribution box shall have one (1) factory assembled 50A, 125/250V, 50 ft. min. length cordset for connecting the unit from a CS6369 wall receptacle to the inlet (CS6375) of the power distribution box.

D. An S.O.L. testing portable power distribution box that meets this specification is a COOPER (ARROW HART) Cat. No. RB300M with PC50A cordset or as equal by ERICSON, or HUBBELL. This contractor shall furnish one (1) unit for each S.O.L. 50A receptacle shown on the Drawings.

Part 3 - Execution

I. WIRING DEVICES

A. This Contractor shall furnish and install all wiring devices, material, and hardware as indicated on the Drawings, as specified, or as required for a complete installation.

B. Before installation, the exact type of wiring devices shall be coordinated with all associated trades.

C. This Contractor shall check all wiring devices for damages during construction and replace where necessary. All devices shall be cleaned and left in a complete operable condition.

D. This Contractor shall verify all door swings before installing lighting switches.

E. Receptacles shall be installed only on clear wall spaces, not in tackboards, chalkboards, pipe chases, mechanical equipment, or built-in type furniture and cabinets. If receptacles are shown on the Drawings to be installed therein, this Contractor shall call it to the attention of the Architect/Engineer and obtain a new location.

F. Dimmer switches shall not be ganged together with other types of lighting switches. Multiple dimmer switches shall be ganged together using the number of outlet boxes and/or outlet box gangs in accordance with the manufacturer's instructions.

II. DEVICE INSTALLATION

A. Replace all devices that have been in temporary use during construction or that show signs that they were installed before building finishing operations were complete.

B. Keep each wiring device in its package or otherwise protected until it is time to connect conductors.

C. Do not remove surface protection, such as plastic film and smudge covers, until the last possible moment.

D. Connect devices to branch circuits using pigtails that are not less than 6 inches in length.

E. When there is a choice, use side wiring with binding-head screw terminals. Wrap solid conductor tightly clockwise, 2/3 to 3/4 of the way around terminal screw.

F. Use a torque screwdriver when a torque is recommended or required by the manufacturer.

G. When conductors larger than No. 12 AWG are installed on 15- or 20-A circuits, splice No. 12 AWG pigtails for device connections.

H. Tighten unused terminal screws on the device.

I. When mounting into metal boxes, remove the fiber or plastic washers used to hold device mounting screws in yokes, allowing metal-to-metal contact.

III. RECEPTACLE ORIENTATION

A. Install ground pin of vertically mounted receptacles down, and on horizontally mounted receptacles to the left.

B. Device Plates: Do not use oversized or extra-deep plates. Repair wall finishes and remount outlet boxes when standard device plates do not fit flush or do not cover rough wall opening.

C. Arrangement of Devices: Unless otherwise indicated, mount flush, with long dimension vertical and with grounding terminal of receptacles on top. Group adjacent switches under single, multigang wall plates.

D. Adjust locations of floor service outlets and service poles to suit arrangement of partitions and furnishings.

IV. POWER OUTLET PANELS

A. This Contractor shall furnish and install power outlet panels, material, and hardware as indicated on the Drawings, as specified, and as required for a complete installation. Power outlet panels generally will be mounted on the roof with the free-standing safety switch assembly as detailed on the Drawings or other locations shown on the Drawings.

B. All mounting openings not used must be permanently sealed to keep rain, moisture, insects, etc. from entering the box housing. The use of stainless steel screws/nuts with

rubber washers and silicone sealant may be used, or another approved method for a completely sealed box housing.

V. S.O.L 50A POWER RECEPTACLES

A. S.O.L. 50A receptacles shown on the Drawings as TYPE ‘A’ shall be complete with a spring loaded self-closing die-cast flip cover. Label each receptacle cover to read “S.O.L. TESTING”.

B. S.O.L. 50A receptacles shown on the Drawings as TYPE ‘B’ and associated outlet box shall be installed within a flush recessed HOFFMAN box with a hinged cover. Label each HOFFMAN box to read “S.O.L. TESTING” on the exterior of the box.

VI. CONNECTIONS

A. Ground equipment according to Specification Section 16460 “Grounding” and the National Electrical Code.

B. Connect wiring according to Specification Section 16120 “Wire, Cables and Connectors”.

C. Tighten electrical connections and terminals according to manufacturer’s published torque-tightening values. If manufacturer’s torque values are not indicated, use those specified in UL 486A/B.

VII. FIELD QUALITY CONTROL

A. Perform the following field tests and inspections, and prepare test reports :

1. After installing wiring devices and after electrical circuitry has been energized, test for proper polarity, ground continuity, and compliance with requirements.

2. Test GFCI operation with both local and remote fault simulations according to manufacturer’s written instructions.

3. Test Instruments: Use instruments that comply with UL 1436.

4. Test Instrument for Convenience Receptacles: Digital wiring analyzer with digital readout or illuminated LED indicators of measurement.

B. Tests for Convenience Receptacles:

1. Line Voltage: Acceptable range is 105 to 132 V.

2. Percent Voltage Drop under 15-A Load: A value of 6 percent or higher is not acceptable.

3. Ground Impedance: Values of up to 2 ohms are acceptable.

4. GFCI Trip: Test for tripping values specified in UL 1436 and UL 943.

5. Using the test plug, verify that the device and its outlet box are securely mounted.
6. The tests shall be diagnostic, indicating damaged conductors, high resistance at the circuit breaker, poor connections, inadequate fault current path, defective devices, or similar problems. Correct circuit conditions, remove malfunctioning units and replace with new ones, and retest as specified above.

C. Remove malfunctioning units, replace with new units, and retest as hereinbefore specified.

END OF SECTION

Part 1 - General

I. SUMMARY

A. Related Documents:

1. Drawings and general provisions of the Subcontract apply to this Section.

2. Review these documents for coordination with additional requirements and information that apply to work under this Section.

B. Section Includes:

1. This section specifies the unique responsibilities that are a part of, or are related to the commissioning process for the electrical systems. Electrical systems include those listed in Division 01 Section "General Commissioning Requirements" as being commissioned. All statements are the responsibility of the Subcontractor, unless specifically stated otherwise.

2. Electrical testing specified for systems not listed as formally commissioned are not under the commissioning umbrella and are not governed by this section.

3. Electrical Systems Commissioning consists of static checks of component and system installations and actual testing of equipment conditions and functions.

4. The Commissioning Authority or University will review and approve, prior to use, all test procedures and forms used and will witness a varying fraction of the initial checks and testing performed by the Subcontractor. The Commissioning Authority will review the completed check and test documentation of the Subcontractor of all checks and tests.

5. Electrical testing requirements are found in various sections in Division 01 and in Division 26 (Division 01 Section "General Commissioning Requirements" and this section). It is not the intent of the commissioning process or these specifications to duplicate efforts or to require the Subcontractor to perform any check or test twice. Checks and testing by the Subcontractor are expected to occur once in the normal sequence of installation and checkout, if appropriate coordination has occurred allowing the University and the Commissioning Authority to witness installations and initial testing. Identical electrical checks and testing requirements in both Division 01 and Division 26 are referring to the same event.

6. The test requirements listed in this section do not release the Subcontractor from the obligation to perform all other appropriate, industry standard, manufacturer-recommended or code-required checks and tests.

7. Testing Participants. The work of this section shall be performed by parties identified in the Check and Testing Responsibility Table--a supplement to Division 01 Section "General Commissioning Requirements". Static checks and testing shall be fully documented according to provisions in Division 01 Section "General Commissioning Requirements".

C. Related Sections:

1. Division 01 Section "General Requirements."

2. Division 01 Section "Special Procedures."

3. Division 01 Section "General Commissioning Requirements".

II. SUBMITTALS

A. Submit under provisions of Divisions 01 Section "General Requirements" and "Special Procedures."

III. QUALITY ASSURANCE

A. Qualifications:

1. The CTC (Certified Testing Company) performing the work of this section shall be qualified to test electrical equipment and is a NETA (National Electrical Testing Association)-certified testing agency. The CTC shall not be associated with the manufacturer of equipment or systems under test.

B. Test Equipment:

1. The Subcontractor shall provide all test equipment necessary to fulfill the checks and testing requirements. Test equipment shall have been calibrated within one (1) year of its use on the project.

C. Refer to Division 01 Section "General Commissioning Requirements" for additional requirements.

Part 2 - Products -- NOT USED

Part 3 - Execution

I. SUBMITTALS

A. Sixty (60) days before any testing is conducted, submit an overall testing plan and schedule for electrical systems that lists the equipment, modes to be tested, dates of

testing and parties conducting the tests. Put these tests into the master construction schedule. Keep this plan and schedule updated.

B. Additional submittal requirements relative to commissioning are found in this Section and in Division 01 Section "General Commissioning Requirements" and Division 01 Section "General Requirements."

II. COMMON RESPONSIBILITIES

A. The following are responsibilities applicable to all electrical systems being commissioned.

B. The general commissioning requirements and coordination are detailed in Division 01 Section "General Commissioning Requirements" and apply to electrical systems. The Subcontractor shall be familiar with all parts of Division 01 Section "General Commissioning Requirements" and the commissioning plan issued by the Commissioning Authority and shall execute all commissioning responsibilities assigned to them in the Contract Documents.

C. The work of this Section shall be performed by a CTC (Certified Testing Company, Electrical), by the EC (Electrical Subcontractor), or the MSR (Manufacturer's Service Representative). The Commissioning Authority has some testing responsibilities for some equipment. The specified checks and static tests are conducted by any of the above listed parties, but the tests requiring measurements or special tools or skills are generally conducted only by the CTC. The Check and Testing Responsibility Table, included as a supplement to Division 01 Section "General Commissioning Requirements" provides specific allocation of checklist oversight and testing responsibilities. The CTC, EC, and MSR shall document all checks and testing on check and test procedure forms submitted to and approved by the Commissioning Authority prior to testing.

D. The Subcontractor shall notify PGCPS ahead of time when commissioning activities not yet performed or not yet scheduled will delay construction. The Subcontractor shall be proactive in seeing that commissioning processes are executed and that the CA has the scheduling information needed to efficiently execute the commissioning process.

E. The Subcontractor shall respond to notices of issues identified during the commissioning process, making required corrections or clarifications and returning prompt notification to the Commissioning Authority according to the process given in Division 01 Section "General Commissioning Requirements".

F. When completion of a task or other issue has been identified as holding up any commissioning process, particularly functional testing, the Subcontractor shall, within two (2) days of notification of the issue, notify the Commissioning Authority in writing providing an expected date of completion. The Subcontractor shall notify the Commissioning Authority in writing within one day of completion. It is not the responsibility of the Commissioning Authority to obtain this status information through meeting attendance, asking questions or field observation

G. Construction Checklists. The Commissioning Authority or Subcontractor shall develop checklists as noted in the list of commissioned systems in Division 01 Section "General Commissioning Requirements", following the process described in Division 01 Section "General Commissioning Requirements" and in this Section. At a minimum, for a given piece of equipment, checks from the inspection checklists in NETA Acceptance Testing Specifications for Electric Power Distribution Equipment and Systems shall be included in the electrical checklists. The Subcontractor shall execute and document all checks.

H. Check and testing procedure and startup plan development and execution responsibilities are described in the Check and Testing Responsibility Table in the supplements to Division 01 Section "General Commissioning Requirements".

I. The Subcontractor shall review design documents, shop drawings and O&M manuals and manufacturer recommended installation and testing procedures of each system installation.

J. The Subcontractor shall monitor installation to ensure the equipment, configuration and quality of construction meets the design requirements, approved submittals and shop drawings.

K. The Subcontractor shall develop test procedures and forms and execute and document testing according to the requirements of this Section, Division 01 Section "General Commissioning Requirements" and other specification sections containing testing requirements.

L. Tests of energized equipment shall be conducted when the equipment is operating at its normal capacity. This may require some tests to be conducted after occupancy.

M. Training and Orientation. The Subcontractor shall follow the facility staff orientation and training requirements as described in Division 01 Section "Demonstration and Training" and other applicable technical sections.

N. Operation And Maintenance (O&M) Manuals. Refer to Division 01 Section "General Commissioning Requirements" and Division 01 Section "General Requirements" for requirements for O&M manuals.

Part 4 - Equipment Specific Verification and Testing Requirements

III. SUMMARY

A. This Part specifies the check and testing requirements for electrical components and systems. From these requirements, the Commissioning Authority or Subcontractor will develop detailed procedures and forms. The general testing process, requirements and test method definitions are described in Division 01 Section "General Commissioning Requirements".

IV. CHECKS AND TESTS

A. Checks are intended to begin upon completion of a component or equipment installation. Testing generally occurs later when systems are energized or nearing that point. Beginning system testing before full completion, does not relieve the Subcontractor from fully completing the system as soon as possible, including all construction checklists and may require retesting portions of the system once all components are fully functioning.

B. Refer to Division 01 Section "General Commissioning Requirements" for specific details on non-conformance issues relating to construction checklists and tests. Refer to Division 01 Section "General Commissioning Requirements", for common requirements of deferred testing and to articles in this Section.

C. The check and test procedures and record forms shall contain the following:

1. The Subcontractors executing the checks or tests.

2. A list of the integral components being inspected and tested, equipment tag numbers, manufacturer, model number, pertinent performance information / rating data.

3. Test equipment used.

4. Construction checklists associated with the components, if any.

5. Any special required conditions of the check or test for each procedure.

6. Items, conditions or functions to be inspected, verified or tested, the checks and testing method given and a place provided with results recorded.

7. Acceptance criteria (or reference by specific table where the acceptance criteria is found).

8. For each procedure, list the technician performing check or test and company, witnesses of the tests and dates of tests.

9. Sampling strategies used.

D. The test procedures for dynamic equipment like lighting controls, emergency generator or fire alarm shall contain more step-by-step procedures with expected responses similar to the sample test provided as a supplement to Division 01 Section "General Commissioning Requirements". The test procedures and forms for more static components like panel boards, switchgear, circuit breakers, transformers, etc., can be more checklist-like in format. For each piece of equipment, checks and test procedures and their documentation record forms may be different documents or combined in the

same document, but checks and tests should be grouped.

E. At the Commissioning Authority's discretion, if large numbers or repeated deficiencies are encountered, the Subcontractor shall test and troubleshoot all remaining systems at issue on their own before commissioning with the Commissioning Authority will resume.

F. Sampling for Identical Units. When there are a number of identical units, at the Commissioning Authority's discretion, some or all procedures of a test for a piece of equipment or assembly may be omitted when these same tests on other pieces of identical equipment or assemblies were conducted without deficiency.

V. EQUIPMENT-SPECIFIC TESTING REQUIREMENTS

A. The following paragraphs define the testing requirements for each type of system or feature that is a part of the project. The Commissioning Authority shall use this information to develop specific testing procedures for each of the systems to be commissioned. The Subcontractor shall be responsible for support, execution and coordination of these tests as described in the project specifications including intersystem tests and interlocks with systems in Divisions other than Division 26.

B. The Commissioning Authority and Subcontractor shall coordinate with the project LEED coordinator to verify that LEED requirements for testing electrical systems are included in the tests.

C. Common Testing Requirements

1. The following requirements apply to all electrical systems and features that are to be commissioned when referenced below. Tests shall:

a) Verify functionality and compliance with the design intent for each individual sequence module in the sequences of operation. Verify proper operation of all control strategies, energy efficiency and self-diagnostics features by stepping through each sequence and documenting equipment and system performance. Test every step in every written sequence and other significant modes, sequences and operational features not mentioned in written sequences; including startup, normal operation, shutdown, scheduled on and off, unoccupied and manual modes, safeties, alarms, over-rides, lockouts and power failure.

b) Verify all alarm and high and low limit functions and messages generated on all points with alarm settings.

c) Verify integrated performance of all components and control system components, including all interlocks and interactions with other equipment and systems.

d) Verify shut down and restart capabilities both for scheduled and unscheduled events (e.g. power failure recovery and normal scheduled start/stop).

e) When applicable, demonstrate a full cycle from off to on and no load to full load and then to no load and off.

f) Verify time of day schedules and setpoints.

g) Verify all energy saving control strategies.

h) Verify that monitoring system graphics are representative of the systems and that all points and control elements are in the same location on the graphic as they are in the field.

i) Provide complete and accurate equipment labeling for the operations and maintenance staff. The equipment labels listed on the drawings and sequences of operation should match the field labels and should be verified as a part of the commissioning process.

j) Verify operator control of all commandable control system points including proper security level access.

k) When testing procedures for commissioned equipment are listed in NETA Acceptance Testing Specifications for Electric Power Distribution Equipment and Systems the NETA test procedures shall be part of the testing requirements of this specification. Additional testing procedures may be listed in this specification.

l) Common Acceptance Criteria

2. The following common acceptance criteria apply to all mechanical equipment, assemblies and features:

a) For the conditions, sequences and modes tested, the equipment, integral components and related equipment shall respond to varying loads and changing conditions and parameters appropriately as expected, according to the sequences of operation, as specified, according to acceptable operating practice and the manufacturer's performance specifications. Verify that equipment operates within tolerances specified in: governing codes, acceptance criteria contained in the construction documents, manufacturer's literature and according to good operating practice.

b) Systems shall accomplish their intended function and performance.

c) All safety trips shall require a manual reset to allow a system restart.

d) Resetting a manual safety shall result in a stable, safe, and predictable return to normal operation by the system.

e) Safety circuits and permissive control circuits shall function in all possible combinations of selector switch positions (hand, auto, inverter, bypass, etc.).

f) Other acceptance criteria is given in the equipment testing requirements articles or referenced standards.

g) Additional acceptance criteria will be developed by the Commissioning Authority when detailed test procedures are developed.

h) When testing procedures for commissioned equipment are listed in NETA Acceptance Testing Specifications for Electric Power Distribution Equipment and Systems the NETA performance criteria shall apply.

D. Equipment-Specific Testing Requirements:

1. Scheduled Lighting Controls.

a) Apply the applicable common testing requirements and acceptance criteria.

b) Test Methods. Utilize active testing, and trending when available. If able to trend, trend all zones over a week period and follow the trending guidelines in Division 15 Section "Commissioning of HVAC".

c) Sampling Strategy. Manually test 20 percent of the zones or at least four. If more than 10 percent or two zones fail, test another 10 percent sample. If the second sample fails the Subcontractor shall document retesting on all zones on their own using a Commissioning Authority approved form.

2. Occupancy Sensor Lighting Controls.

a) Apply applicable common testing requirements and acceptance criteria. Test all units functions, including sensor sensitivity and time-to-OFF functions and ensure that sensor location is proper and won't be tripped inadvertently by other occupants and movements outdoors, etc...

b) Ensure that the sensor is correctly placed and oriented per the specifications and/or construction drawings. If unanticipated obstructions are present, it may be necessary to adjust the sensor location and

orientation.

c) Adjust the sensitivity and time delay of the occupancy sensor, and test to ensure it provides appropriate response. For optimal user acceptance, energy savings and lamp life, set the time delay initially for a minimum of 15 minutes (NEMA recommendation).

d) Daylight Harvesting - All furnishings and interior finishes and materials should be installed before calibrating the sensors. Adjust the photosensor to determine the threshold for switching based on detected light level. It may be helpful to calibrate under normal daylight conditions and dusk conditions (it may be possible to close window blinds to approximate dusk). Record the calibration adjustments, if possible, and replicate in similar spac

e) Test Methods. Utilize active test methods.

3. *Time Delay:* The time delay setting indicates how much time it will take to shut off the lights after detecting that the space is unoccupied.

4. Motion Sensitivity: The occupancy sensor's motion sensitivity level indicates how much movement causes the lights to turn on.

5. *Entry Test:* If the sensor is used to automatically turn on the lighting, then it should do so within two seconds after the person gets three feet into the space.

6. *Perimeter Test:* Walk and wave your hand in different places around the room to try to find spots where the sensor is least effective in detecting major and minor motion.

a) Sampling Strategy. Test 10 percent of the sensors or six, whichever is greater. If more than 10 percent or two sensors fail, test another 10 percent sample. If the second sample fails the Subcontractor shall document retesting on all units on their own using a Commissioning Authority approved form.

b) Additional Acceptance Criteria. Reasonable sensitivity, no inadvertent trips, lights go off within 15 seconds of design.

7. Emergency Generator System

a) Apply applicable common testing requirements and acceptance criteria.

b) Simulate a utility power outage to verify the essential power system restores power to essential loads.

8. Power to the loads connected to the life safety system within 10 seconds of a utility outage.

    a) Test according to NETA 7.22.1 and NFPA 110 5.13 and per Division 01 Section "Special Procedures."

    b) Record all data and results.

    c) Include the following tests:

        (1) When in enclosed spaces, verify combustion and ventilation air damper functions and pressure drop of exhaust.

        (2) Verify fuel oil system, diesel fuel storage tank, and level and low fuel indication alarms.

        (3) Verify all alarms, meters, and auxiliaries and interlocks to the BAS.

    d) Building Test. Under a cold generator condition, provide full utility power interruption under load and cause emergency power service operation. Include all UPS in this test. Load bank the UPS if necessary during test.

    e) Verify all generator functions

    f) Test auto-transfer switch operation under actual voltage drop, per specification Division 26 Section "Automatic Transfer Switch with Bypass-Isolation Feature".

    g) Using a power line disturbance monitor, measure the following times: power failure to engine start command, engine start command to engine start (cranking time), engine start to point where generator is at proper volts and frequency and total time from power failure until ATS switches.

    h) Verify system reporting & control monitoring point-to-point

    i) Verify that each circuit and equipment served by emergency power, does power up. Verify all functions of the Emergency Power Response Matrix.

    j) Verify appropriate mechanical system and control system restart functions of all equipment served by the generator.

    k) Neutral Bonding - If a 4 pole ATS is used, the neutral should be bonded at the generator or paralleling switchgear. If a 3 pole ATS is used, the neutral should not be bonded at the generator or paralleling switchgear. In both cases the neutral is bonded at the service entrance.

l) Testing of Incoming power and distribution equipment should occur prior to energization of this equipment.

m) The commissioning professional shall request the settings for ATS's and other equipment well in advance of functional performance testing. Verify that the settings are correctly applied in the field.

n) Provide complete and accurate equipment labeling for the operations and maintenance staff. The equipment labels listed on the drawings and sequences of operation should match the field labels and should be verified as a part of the commissioning process.

9. Step Load Tests.

a) Test at 0 percent, 25 percent, 50 percent and 100 percent of full load. Measure voltage and frequency and record all gaged engine conditions. The test shall consist of running the the engine-generator while connected to the resistive load bank for one hour, and then shutting down for 30 minutes.

b) Test for multiple generator starts.

c) Verify all operational data and start-up minimum time interval.

d) Verify 2-hour full load run full load bank (building load can serve as part of the load).

e) Verify all generator-running characteristics.

f) Verify battery-charging system.

10. Uninterruptible Power Supply.

a) Apply applicable common testing requirements and acceptance criteria.

b) Test according to NETA 7.22.2 and NFPA 111-2001 5.6.

c) Test the UPS during the Integrated Building Test in the Emergency Generator System test requirements article in this Section.

11. Fire Alarm.

a) Apply applicable common testing requirements and acceptance criteria.

12. NFPA 3: Recommended Practice for Commissioning of Fire Protection and Life

Safety Systems and NFPA 4: Standard for Integrated Fire Protection and Life Safety System Testing.

13. Hire a company or person who has qualifications of both fire alarm commissioning and integrated testing to confirm that the Fire alarm system interacts properly with other systems.

    a) Test the fire alarm and High Sensitivity Smoke Detection systems according to NFPA 110-1999 7-1 through 7-2, and specification Division 28 Sections "High Sensitivity Air Sampling Smoke Detection System" and "MXL Fire Detection & Alarm System".

    b) Document all test procedures and results. A fire alarms system printout of the test annunciation record is not sufficient documentation.

    c) Verify all fire alarm panel functions, alarms and troubles.

    d) Verify all functions in the Fire Alarm Response Matrix, including remote communications.

    e) Verify resetting of all equipment affected by an alarm.

    f) Sampling Strategy. Verify device functions and annunciations per using the approved sampling rate of the authority having jurisdiction and per LBNL.

END OF SECTION

Part 1 - General

I. REQUIREMENTS

A. The general provisions of the Contract, including General and Supplementary Conditions and General Requirements, apply to the work specified in this Section.

II. SCOPE

A. The work covered in this section shall include furnishing and installing complete lighting control systems for the control of selected interior and exterior lighting and other equipment as indicated on the Drawings, detailed in the manufacturer submittal and as further defined herein. Contractor is solely responsible to verify quantity, installation locations and wiring requirements for this project. Specific manufacturers' catalog numbers, when listed in this section are for reference only. It is the responsibility of this Contractor to verify with the lighting control manufacturer all catalog information and specific product acceptability.

B. The systems shall include but not be limited by the following: Pre-wired, microprocessor controlled relay panels with electrically held, electronically latched relay panels controlled via communication based equipment including digital switches, digital photocells, Digital Time Clock (DTC), other various digital devices, interface cards, occupancy sensors and other devices as shown on the Drawings. The type of lighting control equipment and wiring specified in this section is covered by the description: Microprocessor Controlled Digital Relay Lighting Control system with RS485 Bus communications.

C. Requirements are indicated elsewhere in these specifications for work including, but not limited to, raceways and electrical boxes and fittings required for installation of control equipment and wiring.

D. It is the intent of this specification that the entire lighting control system, as specified herein, be available to all bidders and not "Packaged or Bundled" with any other lighting systems or equipment. Therefore, the lighting control system shall be provided as a separate price, to all bidders, at bid time.

III. DEFINITIONS

A. BACnet: A networking communication protocol that complies with ASHRAE 135.

B. BAS: Building automation system

C. Low Voltage: As defined in NFPA 70 for circuits and equipment operating at less than 50 V or for remote-control, signaling and power-limited circuits.

D. Monitoring: Acquisition, processing, communication, and display of equipment status data, metered electrical parameter values, power quality evaluation data, event and alarm signals, tabulated reports, and event logs.

E. RS-485: A serial network protocol, similar to RS-232, complying with TIA/EIA-485-A

IV. 1.2 SUBMITTALS

A. Product Data: For control modules, power distribution components, manual switches and plates, and conductors and cables.

B. Shop Drawings: Detail assemblies of standard components, custom assembled for specific application on this Project.

1. Outline Drawings: Indicate dimensions, weights, arrangement of components, and clearance and access requirements.

2. Block Diagram: Show interconnections between components specified in this Section and devices furnished with power distribution system components. Indicate data communication paths and identify networks, data buses, data gateways, concentrators, and other devices to be used. Describe characteristics of network and other data communication lines.

3. Wiring Diagrams: Power, signal, and control wiring. Coordinate nomenclature and presentation with a block diagram.

C. Coordination Drawings: Submit evidence that lighting controls are compatible with connected monitoring and control devices and systems specified in other Sections.

1. Show interconnecting signal and control wiring and interfacing devices that prove compatibility of inputs and outputs.

2. Field quality-control test reports.

D. Operation and Maintenance Data: For lighting controls to include in emergency, operation, and maintenance manuals.

V. QUALITY ASSURANCE

A. Source Limitations: Obtain lighting control module and power distribution components through one source from a single manufacturer.

B. The lighting control systems shall meet the requirements of the National Electrical Code (NEC), state and local codes, and these Specifications.

C. Lighting Control Panels (LCP) shall be UL 916 Listed. LCPs controlling emergency operation by a relay panel shall fully comply with NEC 700.9(B). This Contractor is responsible for verifying compliance.

D. Control wiring shall be in accordance with the NEC requirements for Class 2 remote control systems, Article 725 and manufacturer’s specification and requirements.

E. Comply with protocol described in IEC 60929, Annex E, for DALI lighting control

devices, wiring, and computer hardware and software.

VI. SUBMITTALS

A. This Contractor shall furnish submittals for all components of the lighting control systems in accordance with SECTION 260500 of these Specifications. Submittals shall include the following for review. Submittals not containing all of the information listed below will be rejected.

1. Shop Drawings: Submit dimensioned drawings of complete lighting control systems and accessories including, but not necessarily limited to, relay panels, switches, DTC, photocells and other interfaces. Shop drawings shall indicate exact location of each device. Plans shall be diagrammatical. “Cut Sheet” submittals not acceptable. This contractor shall furnish to the lighting control system manufacturer a copy of the project construction phasing plan for design of the bus system.

2. Product Data: Submit for approval manufacturer’s data on the specific lighting control systems and components. Submittal shall be in both electronic and hard copy formats. To prevent departures from approved system operation, electronic file submitted shall be able to be directly downloaded to the specified system at the manufacturer’s facility. Submit a complete bill of materials with part numbers, description and voltage specifications.

3. One Line Diagram: Submit a one-line diagram of the system configuration indicating the type, size and number of conductors between each component, and each communication buss provided for the project. Submittals that show typical riser diagrams are not acceptable.

4. Programming Forms: Submit programming forms with complete information describing the operation of the lighting control system and all other information necessary to show proper operation of the system.

VII. COORDINATION

A. Coordinate lighting control components to form an integrated interconnection of compatible components.

1. Match components and interconnections for optimum performance of lighting control functions.

B. Coordinate lighting control components specified in this Section with components specified in Section 16435 "Branch Circuit Panelboards.

VIII. SPARE PARTS

A. Provide 10% spare relays per Lighting Control Panel, up to the maximum capacity of the LCP. If the LCP is fully populated with active relays provide a minimum of two spare relays, per relay panel.

B. Provide a ten (10) spare classroom lighting control switches plus one (1) spare digital switch for each additional type of digital switch shown.

C. Provide CD version of manufacturer's operating software to include graphical interface software. Software shall be the latest version.

D. Provide 2 extra sets of as-built and operating manuals.

E. Provide 10 spare keys for each key operated switch.

IX. SYSTEM DESCRIPTION

A. The lighting control system shall be a networked system that communicates via RS485. The systems must be able to communicate with fully digital centralized relay panels, micro relay panels, digital switches, photocells, various interfaces and shall include all operational software. Relay panels shall control selected interior and exterior lighting and site lighting. Lighting control system shall include all hardware and software. Software shall be resident within the Digital Time Clock (DTC). System shall provide local access to all programming functions via Ethernet connection.

B. System software shall provide real time status of each relay, each zone and each group.

C. Lighting control systems shall be able to be monitored by and take commands from a remote PC. At any time, should the remote PC go off-line all system programming uploaded to the lighting control system shall continue to operate as intended. Systems requiring an on-line PC or server for normal operation are not acceptable.

D. All devices shall be pre-addressed at the factory. Field addressing is not acceptable.

E. All programs, schedules, time of day, etc., shall be held in non-volatile memory for a minimum of 10 years at power failure. At restoration of power, lighting control system shall implement programs required by current time and date.

F. System shall be capable of flashing lights Off/On any relay or any zone prior to the lights being turned Off. The warning interval time between the flash and the final lights off signal shall be definable for each zone. Occupant shall be able to override any scheduled Off sweep using local wall switches within the occupied space. Occupant override time shall be locally and remotely programmable and not exceed 2-hours.

G. System shall be capable of implementing on commands, Off commands, Raise (dimming) commands, Lower (dimming) commands for any relay, group or zone by means of digital wall switches, specification grade line voltage type wall switches, photocell, web based software or other devices connected to programmable inputs in a lighting control panel.

H. The lighting control system shall provide the ability to control each relay and each relay group per this specifications requirement. All programming and scheduling shall be able to be done locally at the Master LCP and remotely Text Deleted via the internet. Remote connection to the lighting control system shall provide real time control and real

time feedback.

I. System may consist of centralized relay panels, micro relay panels, digital switches, photocells, various digital devices and various digital interfaces. Centralized relay panels and digital switches shall communicate as one network via RS485.

J. Micro relay panels shall be capable of taking inputs from standard, line voltage type switches and outputting up to eight (8) independent 0v to10v dimming signals. All micro relay panels and devices connected to the relay panels (switches, photocells, occupancy sensors, etc.) shall be wired per lighting control manufacturer's instructions.

K. 4 thru 16 relay panels shall be available that contain field configurable relays. Panels shall include (4) inputs for photosensors, (4) inputs for occupancy sensors and (4) dry contact inputs. One 0-10V dimming output shall be available per relay.

X. SYSTEM TEST AND ACCEPTANCE

A. Prior to the Architect/Engineer's final site visitation, and acceptance of each construction phase, this Contractor shall conduct a complete operating test of each system including each device. The systems shall test free from grounds, shorts, and other faults. All connections shall be thoroughly checked for mechanical and electrical connection. All equipment shall be demonstrated to operate in accordance with the requirements set forth in these Specifications and as shown on the Drawings.

B. This Contractor shall perform all tests in the presence of the Owner. This Contractor shall furnish all personnel for use in the tests.

C. When the work on the system has been completed and is ready for final review, a visit shall be made by the Owner at which time the Contractor shall demonstrate that the requirements of the Contract as it applies to this system have been carried out and that the system has been adjusted and operated in accordance herewith.

XI. DOCUMENTATION

A. This Contractor shall furnish to the Owner point-to-point "As Built" wiring diagrams for the lighting control systems. Diagrams must indicate exact mounting location of each system and their devices. This accurate "as built" shall indicate the loads controlled by each relay and the identification number for that relay, placement of switches and location of photocell. Original shall be given to Owner, copies placed inside the door of each LCP.

B. This Contractor shall furnish to the Owner, four (4) sets of factory operation and maintenance manuals. These manuals shall include factory service manuals with complete parts lists, wiring and component schematics including circuit diagrams, programming forms with complete information and all other information necessary for the proper operation, service, and maintenance of the Lighting Control Systems.

XII. TRAINING

A. This Contractor shall furnish four (4) hours of technical service training to the Owner's

technical staff using the factory operation manuals previously specified.

B. This Contractor shall furnish four (4) hours of operating and programming training to the Owner's operating staff to be scheduled at the Owner's convenience during the warranty period.

C. All training specified herein shall be performed by a factory certified technician.

XIII. WARRANTY

A. This Contractor shall deliver the work in first-class operating condition in every respect. This Contractor shall also warrant that the material, equipment, and workmanship furnished shall be entirely free from defects. Any materials, equipment, or workmanship in which defects may develop before or during the warranty period shall be repaired or replaced at the Contractors own expense. Refer to SECTION 01740 for the start of the warranty period. This contractor shall further warrant that all material, equipment, and workmanship used in the installation, but not specifically mentioned in the Drawings and Specifications, is the best of their respective kinds and that the construction and installation was performed in accordance with the best accepted standard practices in all details.

Part 2 - Products

I. MANUFACTURER

A. Lighting Control Systems products shall be manufactured by Lighting Control & Design (LC&D), Los Angeles, CA, 800.345.4448 or as listed herein by Eaton Cooper (Elementary Schools Only) Controls. Such firms shall be regularly engaged in the manufacture of lighting control equipment and ancillary equipment, of types and capacities required, whose products have been in satisfactory use in similar service for not less than 5 years. Any product or manufacturer other than those listed in this specification must be pre-approved in accordance with these specifications as hereinbefore described in SECTION 16010. Engineer to Edit.

II. SYSTEM REQUIREMENTS

A. Expandability: System shall be capable of increasing the number of control functions in the future by 25 percent of current capacity; to include equipment ratings, housing capacities, spare relays, terminals, number of conductors in control cables, and control software.

B. Performance Requirements: Manual switch operation sends a signal to programmable-system control module that processes the signal according to its programming and routes an open or close command to one or more relays in the power-supply circuits to groups of lighting fixtures or other loads.

III. MATERIAL AND COMPONENTS

A. Relay panels shall be LC&D GR1400 LTD series (Blue Box LTD), GR2400 series Relay

Panel, GR2400i series MicroPanel or GR2400 MicroPanel-8. Relay panels shall have the quantities of single pole and two pole relays and spares, devices and accessories required to perform the lighting control functions described herein and shown on the Drawings.

1. The enclosure(s) shall be NEMA 1 rated with a hinged door cover with a keyed lock, except MicroPanels may have a screwed cover. A 16-gauge steel barrier shall separate the high voltage and low voltage compartments of the panel and separate 120 volts and 277 volts.

2. LCP input power shall be capable of accepting 120 volt or 277 volt without rewiring.

3. Control electronics in the low voltage section shall be capable of driving two (2) to forty-eight (48), 30 ampere, 18,000 SCCR rated latching relays, control any individual or group of relays, provide individual relay overrides, provide a master override for each panel, store all programming in non-volatile memory, after power is restored return system to current state, provide programmable blink warn timers for each relay and every zone, and be able to control relays that default to Open, Normally Open Latching (NOL) or relays that default to Closed, Normally Closed Latching (NCL).

4. Lighting control systems shall be digital and may consist of a Master LCP, Slave LCPs, Micro LCPs, digital switches, photocells and digital interface cards of the quantities necessary to perform the functions shown on the Drawings. All system components shall connect and be controlled via a single Category 5e, 4 twisted pair cable with RJ45 connectors, providing real time two-way communication with each system component. All Micro LCPs shall provide multiple quick connect inputs for photocells and occupancy sensors. Analog systems are not acceptable.

B. Micro Relay Panels

1. Micro relay panels shall have 8, 30a, 18,000 SCCR rated lighting relays and shall control all lighting in the designated area indicated on the plans and be part of the lighting control network. Each micro relay panel shall provide minimum 300ma at 24vdc for powering occupancy sensors. Micro relay panels that require a separate occupancy sensor power pack are not acceptable.

2. Micro relay panel shall provide a minimum 4-programmable photocell inputs, a minimum 4-programmable occupancy sensor inputs and matrixed contact closure inputs. This requirement is to insure integration of entire lighting system into one networked, lighting control system.

3. Micro relay panels shall be capable of outputting minimum 4 and up to 8 independent 0v to 10v dimming signals, one independent dimming signal at each of 8 relays. In order to maximize daylight harvesting and minimize disruption to occupants, each dimming output shall provide adjustment for baseline, start point, mid-point, end point, trim, fade up rate, fade down rate, time delay and enable/disable masking. Any 2 individual relays shall be able to

be “bound” to dim as one continuous load. (Relay 1 dims from 100% to 0%, then relay 2 starts dimming from 100% to 0%) All photocell setting must be remotely accessible. Systems providing On, Off with Time Delay only, and system that do not provide remote access are not acceptable.

C. BlueBox LTD Panels

1. BlueBox LTD panels shall contain 4, 8 or 16 field configurable relays as indicated on the plans and be part of the lighting control network. Each BlueBox LTD panel shall provide 300mA at 24VDC for powering occupancy sensors.

2. BlueBox LTC panels shall provide 4-programmable photocell inputs, 4-programmable occupancy sensors inputs and 4-programmable contact closure inputs. All inputs shall be able to be matrixed to any relay in the panel.

3. BlueBox LTD panels shall be capable of outputting a quantity of 0-10V dimming signals equivalent to the number of relays in the panel. In order to maximize daylight harvesting and minimize disruption to occupants, each dimming output shall provide adjustment for baseline, start point, mid-point, end point, trim, fade up rate, fade down rate, time delay and enable/disable masking. Any 2 individual relays shall be able to be “bound” to dim as one continuous load. (Relay 1 dims from 100% to 0%, then relay 2 starts dimming from 100% to 0%) All photocell setting must be remotely accessible. Systems providing On, Off with Time Delay only, and system that do not provide remote access are not acceptable.

D. Standard Output Relays

1. UL listed 30 Amp, Latching, 18,000 SCCR, 277VAC Ballast and HID and 20 Amp Tungsten at 120 VAC.

2. Relays shall be individually replaceable. Relay terminal blocks shall be capable of accepting two (2) #8 AWG wires on both the line and the load side. Systems that do not allow for individual relay replacement or additions are not acceptable.

3. Relays shall be rated for 250,000 operations minimum at a full 30 ampere lighting load, default to closed at normal power loss, Normally Closed Latching (NCL).

4. Other relay types may include: Normally Open Latching (NOL) relay rated for 250,000 operations; a 600 volt 2-pole NO and NC; and a Single Pole, Double Throw (SPDT) relay, as appropriate for the application of this project.

5. Each relay shall have an identification label indicating the originating branch circuit number and panelboard name as indicated on the Drawings. This identification may be in the form of a schedule or directory affixed on the inside door of the panel. Each line side branch circuit conductor shall have an identification tag indicating the branch circuit number.

6. Relays shall be manufactured to default to closed (simulated NC) upon loss of power, unless otherwise noted.

E. Field Configurable Relays (BlueBox LTD only)

1. UL Listed 40A, Latching, 65,000A SCCR (maximum), controlling 120VAC to 480VAC (in multi-pole configuration).

2. Relays shall be individually replaceable. Relay terminals shall be capable of accepting two (2) #8 AWG wires on both the line and the load side.

3. Relays shall have a manual override switch that allows the opening and closing of the relays when the system is not energized.

4. Relays shall be field-configurable into single-, double- and triple-pole configurations through the use of a handle-tie.

5. Relays shall be rated for 250,000 operations minimum at full load and default to normally-closed at the loss of normal power.

6. Each relay shall have an identification label indicating the originating branch circuit number and panelboard name as indicated on the Drawings. This identification may be in the form of a schedule or directory affixed on the inside door of the panel. Each line side branch circuit conductor shall have an identification tag indicating the branch circuit number.

F. Low Voltage Switches

1. All switches shall be digital and communicate via RS485. Contact closure style switches, except as specified for connection to the micro relay panel matrixed contact closure inputs, shall not be acceptable. The programming for a digital switch will reside in the switch itself, via double EPROM memory. Any digital switch button function shall be able to be changed locally (at DTC or a PC) or remotely, via Internet or Ethernet.

2. Digital low voltage switch shall be a device that sits on the lighting control system bus. Digital switch shall connect to the system bus using the same cable and connection method required for relay panels. System shall provide capability to locally and remotely program each individual switch button, monitor and change function of each button locally and remotely. Each button shall be capable of being programmed for On only, Off only, On/Off (toggle), Raise (Dim up) and Lower (Dim down). Switches requiring low voltage control wires to be moved from one input terminal to another to accomplish these functions are not acceptable.

3. Digital low voltage switch buttons shall have custom factory engraving (and filled) as shown on the Drawings. Engraving shall be up to two (2) lines and up to eight (8) characters per line, minimum. Buttons colors shall be white or ivory unless other colors are shown on the Drawings.

4. Keyed switches shall be programmable and connect to the lighting controls system bus.

5. Where indicated on the Drawings, digital switches shall be high abuse vandal resistant, contain no moving parts, and be touch sensitive and available with up to three buttons in a single gang. Multi gang versions shall also be available. Touch pads shall be Stainless Steel and capable of handling both high abuse and wash down locations. High abuse switches shall connect to the lighting control system digital bus. Each high abuse switch touch button shall be able to control any relay or any group in any panel or panels that is part of the lighting control system. Each touch button shall be able to be programmed for On, Off, Toggle or Maintain operation. All programming shall be done locally or remotely Text Deleted or web interface as described in other paragraphs of this section. High abuse switches shall be able to be enabled or disabled digitally. Each touch pad is to be identified as to function by an engraved and filled label. Switches must be capable of handling electrostatic discharges of at least 30,000 volts (1cmspark) without any interruption or failure in operation.

G. DTC – Digital Electronic Time Clock

1. A Digital Time Clock (DTC) shall control and program the lighting control system and supply all time functions and accept interface inputs.

2. DTC shall be capable of up to 32 schedules. Each schedule shall consist of one set of On and Off times per day for each day of the week and for each of two holiday lists. The schedules shall apply to any individual relay or group of relays.

3. The DTC shall be capable of controlling up to 126 digital devices on a single bus and capable of interfacing digitally with other individual busses using manufacturer supplied interface cards.

4. The DTC shall accept control locally using built in button prompts and use of an 8 line 21-letter display or from a computer. All commands shall be in plain English. Help pages shall display on the DTC screen.

5. The DTC shall be run from non-volatile memory so that all system programming and real time clock functions are maintained for a minimum of 15 years with loss of power.

6. DTC shall provide system wide timed overrides. Any relay, group or zone that is overridden On, before or after hours, shall automatically be swept Off by the DTC a maximum of 2 hours later.

H. Remote Programming Connection

1. System shall be remotely programmable via an Ethernet connection that allows factory technicians to connect to the system. Provide all necessary software for local or remote control via Ethernet connection.

2. For single BUS systems, the system shall be provided with a Link-2- Ethernet connection. Link-2-Ethernet panel shall be provided with an Ethernet port for connection to the school's IT network.

3. For multiple BUS systems, the system shall be provided with an Uplink (one per BUS) and a MetaServer panel. MetaServer panel shall be provided with an Ethernet port for connection to the school's IT network.

I. Photocells: Photocells shall be mounted at locations indicated on the plans. Photocells used for exterior lights shall provide multiple trip points from 1 roof mounted or wall unit and shall be aimed north. All trip points shall be able to be changed remotely via internet or text deleted. Photocells requiring manual trip point adjustment are not acceptable. Photocell used for interior lighting control shall have multiple settings such as start-point, mid-point, off-point, fade-up, fade-down, etc. All settings shall be remotely accessible and adjustable. Systems providing local adjustment only are not acceptable. Photocells shall be certified to comply with the current energy code covering this project at time of submittal of plans for permit.

J. Interfaces: For expansion capability, the system shall have available all of the following interfaces. Verify and install only those interfaces indicated on the Drawings and/or necessary for the operation of the lighting control systems.

1. A dry contact input interface card that provides 14 programmable dry contact closure inputs. Use manufacturer's recommended cable to connect input devices to interface card.

2. Interface card providing digital communication from one system bus to another system bus, allowing up to 12,000 devices to communicate.

3. Direct digital interface to DMX 512 based systems. DMX interface shall provide 14 global commands, each of which can be modified locally or remotely using lighting controls manufacturer supplied software. DMX interface shall be integral to the system bus and shall connect and be controlled via a single Category 5, 4 twisted pair cable, providing real time response from the lighting control system to DMX commands.

4. Direct digital interface to building automation systems using DDC protocols such as BACnet, Metasys (N2) and ModBus that accept on/off commands, time schedules and report status of all relays in all panels in real time. Interface cards shall "self-populate" each individual relay and each group to the BAS. All BAS system programming required shall be the responsibility of the BAS system provider.

K. Graphical Interface: System shall have application specific graphical control software that allows the user to graphically locate and control any zone of lighting, indicating real time status. Following are required features:

1. Graphical interface shall have the capability of controlling 20 individual sites with up to 12 graphic screens per site and 1250 control points per graphic.

2. Software shall allow dwg, dwf, dxf, bmp, jpg and wmf files to be imported.

3. Each graphic screen shall be vector based and able to infinitely pan and zoom without any loss of graphic quality and allow for easy creation/editing of each control region.

4. Graphical software shall allow control of multiple buses over a single IP address via Server/Uplink backbone bus. Connection to PC via RS-232, or Ethernet.

5. Graphical software shall have embedded color pallet allowing individual color choices for all layers and control points.

6. Graphical software shall be password protected and allow direct access to DTC controller.

7. Software shall provide real time status (On/Off) for each relay and real time dimming output level.

L. Low Voltage Cable:

1. This Contractor shall furnish and install the required low voltage cable with RJ45 connectors between all switches and panels. The cable shall be UL listed, plenum rated, unshielded, four (4) twisted pairs, No. 24 AWG, Category 5e, extended distance, high speed data type with a flame retardant polyvinyl chloride jacket and a temperature range for dry locations of minus ten (10) degrees C to sixty (60) degrees C. A Category 5e cable, which meets this specification, is BERK-TEK Cat. No. 10033814 (Pink) or equal as manufactured by AMP, AT&T, BELDEN, THE CABLE COMPANY, GENISIS, HITACHI, MOHAWK, NORTHERN TELECOM, OPTICAL CABLE CORP., or PAIGE, or SUPERIOR.

2. Refer to Specification Section 16506 for low voltage three (3) conductor, No. 18 AWG, plenum rated wiring between Lighting Control Panels and occupancy sensors.

3. Low voltage wiring for connections to photocells and contact closure switches to Micro relay panels shall be three (3) conductors, No. 18 AWG, plenum rated with a temperature range for dry locations of minus ten (-10) degrees C to sixty (60) degrees C. A cable that will meet this specification is WEST PENN Cat. No. 25234B or equal by CONSULATED WIRE, GENERAL CABLE, PAIGE or TAPPAN.

Part 3 - Execution

I. EQUIPMENT INSTALLATION

A. Lighting Control Panels:

1. Before installing the lighting control panels relay control cabinets check all of the

Drawings for possible conflict of space and adjust the location of the relay control cabinet to prevent such conflict with other items. Relay control cabinet locations in electrical rooms and other spaces shall closely follow the layouts shown on the Drawings, leaving sufficient space on walls for future installations of panelboards and/or other electrical equipment.

2. Relay control cabinet shall be securely mounted to steel framing channels, by at least four (4) points, at locations shown on the Drawings. Construction shall be such that additional conduits can be added for future requirements.

3. The cabinets and enclosures shall be mounted and grounded in accordance with the NEC. This Contractor shall furnish all materials necessary for mounting the cabinets.

4. Relay control cabinets will generally be located adjacent to respective lighting panelboards unless otherwise shown on the Drawings. During the construction process, protect all interior components of each relay panel and each digital switch from dust and debris. Any damage done to electronic components due to non-protection shall be the sole responsibility of this Contractor.

5. Micro relay panels shown on the Drawings mounted in classrooms or similar spaces will generally be located above the ceiling either wall mounted or mounted to the building structure.

B. Switches: Provide outlet boxes, single or multi-gang, as shown on the Drawings for the low voltage digital switches. Provide Type 302 (non-magnetic) cover plates for all switches, refer to specification section 16130. Provide labeling as shown on the Drawings.

C. Wiring:

1. All vertical wiring for the lighting control systems shall be installed by this Contractor in conduit and/or surface metal raceway as shown on the drawings.

2. All horizontal wiring for the lighting control systems to be installed in areas without a ceiling or in areas without an accessible ceiling shall be installed by this Contractor in conduit sized for maximum 40% fill, but not less than ½" trade size.

3. All horizontal wiring for the lighting control systems to be installed in areas with accessible ceilings shall be installed by this Contractor and run exposed above the ceiling. Cables shall be supported by "J" hooks to be dedicated to the wiring specified in this specification section.

4. All horizontal wiring for the lighting control systems shall be run at right angles to the building structure.

5. All horizontal wiring for the lighting control systems shall be installed below the roof/floor structural supports (joists, beams, birders, etc.). Wiring installed between the structural supports mentioned above and the roof or floor deck will

not be acceptable.

6. All horizontal wiring penetrations for the lighting control systems through new and/or existing walls shall be sleeved. Minimum sleeve size shall be ¾ inch. All sleeves shall be bushed both sides.

7. All wiring for the lighting control systems in millwork or casework only shall be installed in flexible metal conduit, complete with an additional 200-pound pull string.

8. All wiring for the lighting control systems shall be furnished and installed by this Contractor as hereinbefore specified and as shown on the Drawings. All junction box covers shall be stenciled for distinct identification.

9. All low voltage RJ45 wiring connections shall be made by this Contractor as detailed on the Drawings using the 568A data only configuration. Lighting control system buss cables shall be continuous from the equipment enclosures to all other lighting control devices. The use of spices, “T” taps, or terminators in the buss wiring between devices is not acceptable.

10. All wiring shall be checked and tested by this Contractor to insure the system is free from grounds, opens, and shorts.

11. Do not mix low voltage and high voltage conductors in the same conduit.

12. Ensure low voltage conductors, conduits or control wires do not run within four (4) inches parallel to current carrying conduits or cables.

13. Place manufacturer supplied “terminators” at each end of the system bus per manufacturer’s instructions.

14. Neatly lace and rack wiring in cabinets.

15. Plug in Category 5e cable at the indicated RJ45 port provided at each lighting control device, per manufacturer’s instructions.

16. Do not exceed 4000 ft-wire length for each system bus.

17. All items on the bus shall be connected in sequence (daisy chained). Star and spur topologies are not acceptable.

18. Each construction phase of this project shall have its own separate communication bus.

II. INSTALLATION AND SET-UP

A. Verify that conduit for line voltage wires enters the panel in line voltage areas and conduit for low voltage control wires enters the panel on low-voltage areas. Refer to manufacturer’s plans and approved shop drawings for location of line and low-voltage areas. It is the responsibility of this Contractor to verify with the lighting control

manufacturer all catalog information and specific product acceptability.

B. For approved line voltage type Micro relay panel switches connected to matrixed inputs of the Micro relay panel, furnish #18 AWG conductors. For all other digital switches provide wiring required by the system manufacturer.

C. Contractor shall test all low voltage cable for integrity and proper operation.

D. Unused openings in the cabinets shall be effectively closed.

E. Lugs shall be suitable and listed for installation with the conductor being connected.

F. Neatly lace and rack wiring in cabinets. Conductor lengths shall be maintained to a minimum within the wiring gutter space. Conductors shall be long enough to reach the terminal location in a manner that avoids strain on the connecting lugs and maintain the required bending radius of conductors inside cabinets.

G. Follow the manufacturer's torque values to tighten lugs.

H. Before energizing the panel, the following steps shall be taken:

1. Retighten connections to the manufacturer's torque specifications. Verify that required connections have been furnished.

2. Remove shipping blocks from component devices and the panel interior.

3. Remove debris from panel interior.

I. Follow manufacturer's instructions for installation and for all low voltage wiring.

J. This contractor shall tag the cable at either end at the connection point. Label with the lighting control panel designation and room number designation. Labeling shall be done with a BROTHER® Model No. PT-1400 (P-touch) professional label maker, or approved equal, using a laminated type extra strength adhesive tape, Letters/numerals shall be black with a white background.

III. SERVICE, SUPPORT AND COMMISSONING

A. Start Up: This Contractor shall contact the system manufacturer at least 7 days before activation of the system. This Contractor shall connect the Link-2- Ethernet (for one BUS systems) or MetaServer (for multiple BUS systems) to the school's Intranet network switch. This Contractor shall contact PGCPS IT 14 days prior to startup for a dedicated IP address that will be assigned to the Link-2- Ethernet or MetaServer. Dedicated IP address shall be provided to factory technician, by this Contractor, upon request.

B. Ethernet factory support shall be available at no additional cost to the Contractor or Owner both during and after the warranty period. Factory to pre-program the lighting control system per plans and approved submittal, to the extent data is available. Text deleted. Upon request, manufacturer to provide remote Ethernet software at no added

cost to the system owner. No exceptions.

C. Upon completion of the installation of the entire lighting control system, and prior to the substantial completion of the project, this contractor shall have the system commissioned by an authorized system manufacturer's representative. This contractor shall be responsible for participation and coordination within the Commissioning process including but not limited to:

1. Verify proper installation and performance of the lighting control system.

2. Provide a factory trained lighting control system technician/programmer for use during system verification and functional performance testing.

3. Manipulate the lighting control systems to facilitate verification and performance testing.

4. Perform and clearly document all completed startup and system operational checkout procedures, providing a copy to the Owner.

5. Address current A/E punchlist items before functional testing.

6. Correct deficiencies (differences between specified and observed performance) as interpreted by the CA, Owner and A/E and retest the equipment.

7. On multi-phased projects, each phase shall have a separate startup by a factory trained lighting control system technician. Contractor to contact factory a minimum of 7 business days prior to technician being required to be onsite.

IV. CLEANING

A. Remove debris from the Lighting Control Panels, wipe dust and dirt from all components, and repaint marred surfaces with touch-up paint to match the original finish.

B. Clean photocell lens as recommended by manufacturer.

C. Clean all switch faceplates.

V. ON-SITE AS-BUILT DRAWINGS

A. The Contractor shall provide one (1) set of the as-built lighting floor plans (including site lighting plans associated with this lighting control system) and one (1) set of the lighting control system supplier's point-to-point as-built wiring diagrams and supporting drawings as hereinbefore described for permanent use on-site. The Contractor shall: laminate each page of these drawings; provide a rigid means for mounting such as 1/4-inch-thick x two (2) inch wide x width of the drawings through-bolted wood along the left edge of the drawings; furnish and install hanging hooks on the back of the Main Electric Room door; and hang the bound set of drawings. An additional PDF copy shall be furnished to PGCPS Master Electrician.

END OF SECTION

Part 1 - General

I. REQUIREMENTS

A. The general provisions of the Contract, including General and Supplementary Conditions and General Requirements, apply to the work specified in this Section.

II. SCOPE

A. The work covered under this Section shall include furnishing and installing a complete operational occupancy sensor based lighting control system as shown on the Drawings, detailed in the manufacturer's submittal and as herein specified.

B. Work described in this section shall be coordinated with all applicable plans and specifications, including by not limited to interfacing with microprocessor based Lighting Control Systems, wiring, raceways, boxes and fittings, luminaires, and HAVC systems.

III. QUALITY ASSURANCE

A. Occupancy sensors shall conform to the requirements of the National Electrical Code (NEC), state and local codes, and these Specifications.

B. All components shall be listed by Underwriter's Laboratories, Inc. (UL) for their intended use and shall bear the UL label.

C. Products supplied shall be from a single manufacturer that has been continuously involved in manufacturing of occupancy sensors for a minimum of five (5) years. Mixing of manufacturers shall not be allowed.

D. Products shall be manufactured by an ISO 9002 certified manufacturing facility and shall have a defect rating of less than 1/3 of 1%.

E. Wall switch products must be capable of withstanding the effects of inrush current. Submittals shall clearly indicate the method used.

IV. COORDINATION

A. Coordinate layout and installation of ceiling-mounted devices with other construction that penetrates ceilings or is supported by them, including light fixtures, HVAC equipment, smoke detectors, fire-suppression system, and partition assemblies.

V. SUBMITTALS

A. Submittals are required in accordance with SECTION 260500 of these specifications. Submittals shall include, but not be limited to the following for review. Submittals not containing all of the information listed below will be rejected.

1. Manufacturers shall substantiate conformance to this specification by providing the necessary documents, performance data and wiring diagrams. Any deviations to the specifications must be clearly stated by letter and submitted.

2. Submit a scaled building lighting plan (minimum size of 1/16" = 1'-0") clearly marked by the manufacturer showing proper product, location and orientation of each sensor and power pack (switch pack). Plans shall show detection coverage patterns. If necessary for clarity, provide a 1/8" = 1'-0" scaled plan or one plan with coverage areas shown and another plan with the other information shown. Illegible drawings will be rejected.

3. Submit interconnections diagrams per major subsystem and interfacing with Lighting Control Panels (LCP) (Refer to SECTION 16505), showing proper wiring.

4. Submit standard catalog literature which includes performance specifications indicating compliance to the specification.

5. Catalog sheets must clearly state any load restrictions when used with electronic ballasts.

6. Field quality-control test reports.

7. Operation and Maintenance Data: For each type of product to include in emergency, operation, and maintenance manuals.

VI. SYSTEM DESCRIPTION

A. The objective of this specification section is to ensure the proper installation of the occupancy sensor based lighting control system so that lighting is turned off automatically after reasonable time delay when a room or area is vacated by the last person to occupy said room or area.

B. The occupancy sensor based lighting control shall accommodate all conditions of space utilization and irregular work hours and habits.

VII. SYSTEM TEST AND ACCEPTANCE

A. Prior to the Architect/Engineer's final site visitation, and acceptance of each construction phase, this Contractor shall conduct a complete operation test of each system including each device. The systems shall test free from grounds, shorts, and other faults. All connections shall be thoroughly checked for mechanical and electrical connection. All equipment shall be demonstrated to operate in accordance with the requirements set forth in these Specifications and as shown on the Drawings.

B. This Contractor shall perform all tests in the presence of PGCPS Master Electrician. This Contractor shall furnish all personnel for use in the tests.

C. When the work on the system has been completed and is ready for final review, a visit shall be made by PGCPS Master Electrician at which time the Contractor shall demonstrate that the requirements of the Contract as it applies to this system have been carried out and that the system has been adjusted and operated in accordance herewith.

VIII. Training

A. Upon completion of the project, the Contractor and manufacturer's factory authorized representative shall provide a minimum of four (4) hours of training to familiarize the Owner with the operation, use, adjustment, and problem solving diagnosis of the occupancy sensing devices and systems.

IX. WARRANTY

A. This[1] Contractor shall warrant all equipment furnished in accordance with this specification to be undamaged, free of defects in materials and workmanship, and in conformance with these specifications. The warranty shall include repair or replacement, and testing without charge to the Owner on all or any parts of equipment which are found to be damaged, defective or non-conforming. There shall be no deductibles applied to such warranty. Satisfactory warranty documents shall be furnished. Refer to SECTION 01740 WARRANTIES AND BONDS.

Part 2 - Products

I. MANUFACTURERS

A. The lighting occupancy sensors shall be manufactured by SENSORSWITCH, as listed or equal by GREENGATE (COOPER CONTROLS), HUBBELL, or WATTSTOPPER.

B. The listing of any manufacturer as "equal" does not imply automatic approval. This Contractor shall ensure submittals made are for sensors and associated equipment which meets or exceeds the specifications included herein.

II. LIGHTING OCCUPANCY SENSORS

A. Occupancy sensors shall consist of, but not be limited to the following:

1. Sensing technology shall be passive infrared (PIR), MicroPhonics (or ultrasonic), dual technology having both PIR and MicroPhonics (or ultrasonic).

2. Passive infrared sensors shall provide high immunity to false triggering from RFI (hand-held radios) and EMI (electrical noise in the line). The PIR sensors shall have a multiple segmented Fresnel lens, in multi-tier configuration, with grooves-in to eliminate dust and residue build-up.

3. MicroPhonics shall be used in conjunction with PIR (passive infrared) sensing technology to enable a sensor to provide dual-technology sensing that is

completely passive. MicroPhonics shall detect an occupant by detecting leading edge noises typical of human activity while filtering out building noises. The MicroPhonic sensing circuitry shall have automatic gain control to dynamically adapt to the sensor to its environment allowing it to filter out background noise.

4. Ultrasonic sensors shall be able to adjust the detection threshold dynamically to compensate for constantly changing levels of activity and air flow throughout controlled spaces. Ultrasonic operating frequency shall be crystal controlled at 32 kHz within ± 0.002% tolerance, or 40 kHz within ± 0.002% tolerance to assure reliable performance and eliminate sensor cross-talk. Sensors using multiple frequencies are not acceptable.

5. Dual technology sensors shall consist of PIR and MicroPhonics (or ultrasonic) technologies for occupancy detection.

6. All sensors shall be capable of operating normally with electronic ballasts, PL lamp systems and rated motor loads.

7. Coverage of sensors shall remain constant after sensitivity control has been set. No automatic reduction shall occur in coverage due to the cycling of air conditioner or heating fans.

8. All sensors shall have readily accessible, user adjustable settings for time delay and sensitivity for turning lights off, adjustable over a minimum range of 1 to 30 minutes. Settings shall be located on the sensor (not the control unit) and shall be recessed and concealed behind hinged door.to limit tampering.

9. In the event of failure, a bypass manual override shall be provided on each sensor. When bypass is utilized, lighting shall remain on constantly or control shall divert to a wall switch or lighting control panel until the sensor is replaced. This control shall be recessed to prevent tampering.

10. All sensors shall provide an LED as a visual means of indication at all times to verify that motion is being detected during both testing and normal operation.

B. Ceiling mounted room occupancy sensors shall be low voltage dual technology type consisting of passive infrared (PIR) and MicroPhonic (or ultrasonic) technologies with 360° coverage for large classrooms, open office spaces or areas up to 1600 square feet; SENSORSWITCH Model CM PDT 10. Sensors shall operate on 12 to 24 VAC or VDC and NEC Class 2 wiring. Each sensor shall be complete with one (1) power pack or two (2) power packs for rooms requiring two (2) lighting branch circuits. Rooms requiring multiple sensors may only require one (1) power pack for multiple sensors, where shown on the Drawings. Sensors shall also be equipped with an additional isolated relay.

1. Occupancy sensors shown on the Drawings to be powered from a Lighting Control Panel generally will not require a power pack.

C. Ceiling mounted (or wall mounted where shown on the Drawings) room occupancy sensors shall be low voltage dual technology type consisting of passive infrared (PIR) and MicroPhonics (or ultrasonic) technologies for directional one-way coverage for classrooms, offices or areas up to 1000 square feet when mounted on a 96-inch- high ceiling; SENSORSWITCH Model WV PDT 16. Sensors shall operate on 12 to 24 VAC or VDC and NEC Class 2 wiring. Each sensor shall be complete with one (1) power pack or two (2) power packs for rooms requiring two (2) lighting branch circuits. Rooms requiring multiple sensors may only require one (1) power pack for multiple sensors, where shown on the Drawings. Sensors shall also be equipped with an additional isolated relay for HVAC control.

1. Occupancy sensors shown on the Drawings to be powered from a Lighting Control Panel generally will not require a power pack.

2. Sensitivity Adjustment: Separate for each sensing technology.

3. Detector Sensitivity: Detect occurrences of 6-inch- minimum movement of any portion of a human body that presents a target of not less than 36 sq. in., and detect a person of average size and weight moving not less than 12 inches in either a horizontal or a vertical manner at an approximate speed of 12 inches/s.

4. Detection Coverage (Standard Room): Detect occupancy anywhere within a circular area of 1000 sq. ft. when mounted on a 96-inch- high ceiling.

5. Extra contact for HVAC control.

D. Corridor and corridor lobby ceiling mounted occupancy sensors shall be low voltage dual-technology passive infrared (PIR) and MicroPhonics (or ultrasonic) technology type with coverage of approximately 50 linear feet; SENSORSWITCH Model CM PDT 10. Sensors shall operate on 12 to 24 VAC or VDC and NEC Class 2 wiring. Sensors shall be powered from a lighting control panel or power pack and/or as shown on the Drawings. Sensors shall also be equipped with an additional isolated relay.

1. Detection Coverage (Corridors): Detect occupancy anywhere shown on the drawings with 90 linear feet coverage, 45 feet at each side

E. Wall switch occupancy sensors shall be line voltage dual-technology passive infrared (PIR) and MicroPhonic (or ultrasonic) technology type with coverage of approximately 30 to 40 square feet for use in small utility/storage rooms, small toilet rooms, etc. as shown on the Drawings; SENSORSWITCH Model WSX PDT-IV. Sensors shall operate on 120 or 277 volts. Load rating shall be 0 to 800 watts ballast or tungsten at 120 volts and 0 to 1200 watts ballast at 277 volts. Sensor shall use zero-cross circuitry to detect when the sine wave crosses at the “zero-point” so as to minimize wear on the switching contact.

1. Sensitivity Adjustment: Separate for each sensing technology.

2. Detector Sensitivity: Detect occurrences of 6-inch- minimum movement of any

portion of a human body that presents a target of not less than 36 sq. in., and detect a person of average size and weight moving not less than 12 inches in either a horizontal or a vertical manner at an approximate speed of 12 inches/s.

3. Detection Coverage (Standard Room): Detect occupancy anywhere within a circular area of 400 sq. ft. when mounted on a 48-inch on the wall.

4. Provide single or double buttons as shown on the drawings.

5. Contractor shall supply stainless steel cover plates, not the plastic cover plates that may be included in the switch packaging. See Specification Section 16130 for type.

F. Wall switch occupancy sensors, with dual ON/OFF button switches and dual relays for controlling two lighting loads or circuits, shall be line voltage dual-technology passive infrared (PIR) and MicroPhonic (or ultrasonic) technology type with coverage of approximately 30 to 40 square feet for use in small utility/storage rooms, small toilet rooms, etc. as shown on the Drawings; SENSORSWITCH Model WSX PDT 2P-IV. Sensors shall operate on 120 or 277 volts. Load rating shall be 0 to 800 watts ballast or tungsten at 120 volts and 0 to 1200 watts ballast at 277 volts.

1. Contractor shall supply stainless steel cover plates, not the plastic cover plates that may be included in the switch packaging. See Specification Section 16130 for type.

III. POWER PACKS AND AUXILIARY RELAY PACKS CONTROL UNITS

A. Power packs shall accept 120 or 277 volts, be plenum rated, and provide Class 2 power to a minimum of two (2) occupancy sensors. Power packs shall be able to externally mount through a 1/2” knock-out on a standard electrical enclosure (junction box) and be an integrated, self-contained unit consisting internally of an isolated load switching control relay (load rated 20 amperes at 120 or 277 volts) and a transformer to provide low voltage power; SENSORSWITCH Model PP 20 Power pack shall provide a minimum of 150mA at 15 VDC to drive occupancy sensors and auxiliary relay packs.

B. Power packs shall use zero-cross circuitry to detect when the sine wave crosses at the “zero-point” so as to minimize wear on the switching contact.

C. Auxiliary relay packs shall be the same self-contained type unit as the power pack hereinbefore described, except shall not include a transformer; SENSORSWITCH Model SP 20. The auxiliary relay pack shall be used to control another lighting load with a different line voltage than the power pack. Auxiliary relay packs shall be powered from a power pack with 15 VDC.

IV. ISOLATED RELAY

A. Sensors hereinbefore described to include an isolated relay shall have the relay be internal with Normally Open, Normally Closed and Common outputs for use with

Lighting Control Panels (LCP), HVAC control, and other control options as shown on the Drawings. Sensors utilizing separate components or specially modified units to achieve this function shall not be acceptable.

B. Corridor and other location occupancy sensors indicated on the Drawings to interface with a Lighting Control Panel (LCP) shall have the isolated relay send a contact closure signal to the Lighting Control System. These sensors shall be powered from the LCP and not by a power pack. Operation of sensors in corridors and other areas where sensors are interfaced with the lighting control system shall operate in a manner such the lighting in the controlled areas is “held-on” during normal school operating hours. After normal school hours, these controlled areas shall respond to the occupancy sensors for lighting control. See the Drawings and details for the sequence of operations via the LCP.

V. WIRING

A. Low voltage wiring between occupancy sensors and power packs shall be three (3) conductor, No. 18 AWG, unshielded, plenum rated with a temperature range for dry locations of minus ten (10) degrees C to sixty (60) degrees C. A cable that will meet this specification is WEST PENN Cat. No. 25234B.

B. Low voltage wiring between occupancy sensors and Lighting Control Panels (LCP) shall be three (3) conductor, No. 18 AWG, unshielded, plenum rated with a temperature range for dry locations of minus ten (10) degrees C to sixty (60) degrees C. A cable that will meet this specification is WEST PENN Cat. No. 25234B.

Part 3 - Execution

I. INSTALLATION

A. It shall be the Contractor’s responsibility to provide the quantity of occupancy sensors required for complete and proper volumetric coverage to completely cover the controlled areas. Rooms shall have ninety (90) to one hundred (100) percent volumetric coverage to completely cover the controlled areas to accommodate all occupancy habits of single or multiple occupants at any location within the rooms. Proper judgment must be exercised in executing the work so as to ensure the best possible installation in the available space and to overcome local difficulties due to space limitations, interference of structural components, or furnishings in the rooms or spaces. The locations and quantities of sensors shown on the Drawings are based on coverage patterns of SENSORSWITCH sensors. Sensors of other approved manufacturers may require different quantities of sensors for full coverage of spaces being controlled. The sensors shown on the drawings are diagrammatic and do not necessarily show the exact locations of the sensors. This contractor shall confirm with the occupancy sensors manufacturer the exact quantities of sensors and power packs at time of bid. This Contractor shall provide additional sensors if required to properly and completely cover the respective rooms at no additional cost to the Owner.

B. Line voltage wall switch type occupancy sensors shall be installed in a suitable wall outlet box in a method recommended by the equipment manufacturer similar to a standard line voltage light switch.

C. Low voltage occupancy sensors shall be securely mounted to a ceiling or wall mounted junction box in a method recommended by the sensor manufacturer. Ceiling mounted junction boxes shall be supported from the building structure with no less than one (1) ¼" threaded rod. Sensors shall be wired as detailed on the Drawings and as recommended by the equipment manufacturer.

D. Power packs shall be located in accessible ceiling spaces and securely mounted to a standard electrical enclosure (junction box) through a standard 1/2" chase nipple. Plastic clips into the junction box shall not be acceptable. Junction box shall be supported from the building structure with no less than one (1) ¼" threaded rod. All Class 1 wiring shall pass through the chase nipple into the junction box without any exposure of wire leads. Low voltage Class 2 wiring to the sensors shall not be exposed in finished spaces. Power packs shall be wired as detailed on the Drawings and as recommended by the equipment manufacturer.

E. Supports shall not terminate or be fastened directly to the roof decking except where specifically approved by the Owner.

F. Wiring:

1. Wiring Method: Comply with Division 16 Section "Conductors and Cables." All low voltage field wiring in finished and unfinished spaces shall be installed by this Contractor in 1/2-inch conduit and/or surface metal raceway as shown on the Drawings or hereinbefore specified elsewhere. Conduit fill shall not exceed the conduit space capacity.

2. All low voltage field wiring to be installed in areas without a ceiling or in areas without an accessible ceiling shall be installed by this Contractor in 1/2-inch conduit.

3. All low voltage field wiring to be installed in areas with accessible ceilings shall be installed by this Contractor bundled together and run exposed above the ceilings. Bundles shall be supported by "J" hooks mounted not more than four (4) feet on center. "J" hooks shall be dedicated to the wiring specified in this specification section.

4. All low voltage field wiring shall be run at right angles to the building structure.

5. All low voltage field wiring shall be installed below the roof/floor structural supports (joists, beams, girders, etc.). Wiring installed between the structural supports mentioned above and the roof or floor deck will not be acceptable.

6. All low voltage field wiring penetrations through new and/or existing walls shall

be sleeved. Minimum sleeve size shall be one (1) inch. All sleeves shall be bushed both sides.

7. All low voltage field wiring for the occupancy sensor systems shall be furnished and installed by this Contractor. All junction box covers shall be stenciled for distinct identification.

8. All wiring connections shall be made by this Contractor as shown on the Drawings and as recommended by the equipment manufacturer. Splices shall be made only in junction boxes.

9. All occupancy sensor system wiring shall be checked and tested by this Contractor to insure the system is free from grounds, opens, and shorts.

10. Contractor shall test all low voltage cable for integrity and proper operation of the system.

G. The Contractor shall arrange a pre-installation meeting with the occupancy sensors manufacturer's factory authorized representative, at the project facility to verify proper placement of sensors and installation criteria.

II. TESTING

A. Sensor Testing and Adjustment:

1. At the time of installation, the Contractor shall be responsible for testing and adjusting each sensor for proper detection of motion appropriate to room usage. The Contractor shall follow the testing and adjustment procedures as written in the installation instructions for each sensor model. Note: Due to room conditions, it may be necessary for the Contractor to make adjustments, change the location or type of sensor to obtain proper operation and coverage of the system in each room and should therefore make labor and material allowances for such changes and adjustments.

III. DEMONSTRATION

A. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain lighting control devices

END OF SECTION

Part 1 - General

I. REQUIREMENTS

A. The general provisions of the Contract, including General and Supplementary Conditions and General Requirements, apply to the work specified in this Section.

II. SCOPE

A. The work under this Section shall include furnishing and installing TP-1 dry-type energy efficient transformers complete as shown on the Drawings and herein specified. Provide all lugs, accessories and mounting hardware necessary for proper installation and operation.

III. SUBMITTALS

A. Product Data: Include rated nameplate data, capacities, weights, dimensions, minimum clearances, installed devices and features, and performance for each type and size of transformer indicated.

IV.

A. Shop Drawings: Detail equipment assemblies and indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.

1. Wiring Diagrams: Power, signal, and control wiring.

2. Source quality-control test reports.

3. Field quality-control test reports.

4. Operation and Maintenance Data: For transformers to include in emergency, operation, and maintenance manuals.

V. QUALITY ASSURANCE

A. Source Limitations: Obtain each transformer type through one source from a single manufacturer.

B. All equipment, materials and their installation shall conform to the requirements of the National Electrical Code (NEC), local code requirements, and these Specifications.

C. Transformers shall meet the requirements of Federal Law 10 CFR Part 431 “Energy Efficiency Program for Certain Commercial and Industrial Equipment” and bear the Energy Star® label.

D. The transformer manufacturer shall be ISO 9001 or 9002 certified.

E. All equipment and material shall be listed by Underwriter's Laboratories, Inc. (UL) for their intended use and shall bear the UL label.

F. Equipment shall be constructed and tested in accordance with National Electrical Manufacturer's Association (NEMA) standards including TP-1, TP-2 and TP-3.

G. Submittals are required in accordance with SECTION 16010 of these Specifications. The following minimum information shall be submitted:

1. Outline dimensions and weights.

2. Technical certification sheet.

3. Transformer ratings including:

a) kVA

b) Primary and secondary voltage.

c) Taps.

d) Design impedance.

e) Insulation class and temperature rise.

f) Sound level.

4. Product data sheets.

VI. DELIVERY, STORAGE AND HANDLING

A. Handle transformers in accordance with manufacturer’s recommendations. Utilize factory provisions for all lifting, rigging, or hoisting.

B. Store transformers prior to installation in a temperature and humidity controlled space. If such a space is not available, apply temporary heat in accordance with the manufacturer’s instructions within each ventilated type transformer case to exclude moisture and condensation.

VII. COORDINATION

A. Coordinate size and location of concrete bases with actual transformer provided. Cast anchorbolt inserts into bases. Concrete, reinforcement, and formwork requirements are specified in Section 033000.

B. Coordinate installation of wall-mounting and structure-hanging supports with actual transformer provided.

Part 2 - Products

I. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

1. ACME Electric Corporation; Power Distribution Products Division.
2. Eaton Electrical Inc.; Cutler-Hammer Products.
3. Magnetek Power Electronics Group.
4. Schneider Electric; Square D
5. Siemens Energy & Automation, Inc.

II. MATERIALS AND COMPONENTS

A. Dry-type energy efficient transformers shall be indoor, dry, ventilated, quiet type and shall be constructed and tested in accordance with the latest applicable standards of ANSI, NEMA and UL.

B. Ratings:

1. KVA and voltage ratings shall be as shown on the drawings.
2. Transformers shall be designed for continuous operation at rated kVA, for 24 hours a day, 365 days a year operation, with normal life expectancy as defined in ANSI C57.96.
3. Transformer sound levels shall not exceed the following ANSI and NEMA levels for self-cooled ratings:

0	to	9 kVA	40 dB
10	to	50 kVA	45 dB
51	to	150 kVA	50 dB
151	to	300 kVA	55 dB
301	to	500 kVA	60 dB

4. Transformers shall be low loss type with minimum efficiencies as listed in NEMA TP-1 when operated at 35% of full load capacity. Efficiency shall be tested in accordance with NEMA TP-2.

C. Insulation Systems:

1. Transformer insulation system shall be 220 degrees C insulation system with 150-degree C rise, ventilated design.

2. Required performance shall be obtained without exceeding the above indicated temperature rise in a 40 degrees C maximum ambient, and a 24-hour average ambient of 30 degrees C.

3. All insulation materials shall be flame-retardant and shall not support combustion as defined in ASTM Standard Test Method D635.

D. Core and Coil Assemblies:

1. Transformer core shall be constructed with high-grade, nonaging, silicon steel with high magnetic permeability, and low hysteresis and eddy current losses. Maximum magnetic flux densities shall be substantially below the saturation point. The transformer core volume shall allow efficient transformer operation at 10% above the nominal tap voltage. The core laminations shall be tightly clamped and compressed. Coils shall be wound of high quality electrical grade aluminum with continuous wound construction.

2. On three-phase units rated 15 kVA and above the core and coil assembly shall be impregnated with non-hydroscopic, thermosetting varnish and cured to reduce hot spots and provide a flame retardant seal and seal out moisture. The assembly shall be installed on vibration-absorbing pads. There shall not be any metal-to-metal contact between the core and coil assembly and the enclosure except for a flexible safety ground strap.

E. Three-phase transformers rated 15 through 500 kVA shall be provided with six 2- 1/2% taps, two above and four below rated primary voltage.

F. Enclosure:

1. The enclosure shall be made of heavy-gauge steel. All transformers shall be equipped with a wiring compartment suitable for conduit entry and large enough to allow convenient wiring. The maximum temperature of the enclosure shall not exceed 90 degrees C. The core of the transformer shall be visibly grounded to the enclosure by means of a flexible grounding conductor sized in accordance with applicable UL and NEC standards.

2. On three-phase transformers rated 15 kVA and above the enclosure construction shall be ventilated, NEMA 2, drip-proof, with lifting holes. All ventilation openings shall be protected against falling dirt. Enclosures shall be finished with ANSI gray color, weather-resistant enamel.

3. On ventilated outdoor units provide suitable weathershields over ventilation opening, conforming to the requirements of NEMA 250, Type 3R. Suitable screens shall be provided to prevent insertion of foreign debris and animals in the ventilation openings.

G. Dry-type transformers shall be as manufactured by EATON/CUTLER-HAMMER, GENERAL ELECTRIC, SIEMENS, or SORGEL (SQUARE D).

III. NAMEPLATE

A. Transformers shall have nameplates of 1/16-inch-thick laminated plastic with 3/16-inch-high white letters on a black background. Nameplates shall identify the transformer and shall be mounted on the top front edge of the enclosure. Nameplates shall be screw fastened using stainless steel corrosion resistant screws. Nameplates for transformers on emergency power shall have a red background.

Part 3 - Execution

I. FACTORY TESTING

A. The following standard factory tests shall be performed on the equipment provided under this section. All tests shall be in accordance with latest version of ANSI and NEMA standards.

1. Ratio tests at the rated voltage connection and at all tap connections.

2. Polarity and phase relation tests on the rated voltage connection.

3. Applied voltage tests.

4. Induced potential test.

5. No-load and excitation current at rated voltage on the rated voltage connection.

II. EXAMINATION

A. Examine conditions for compliance with enclosure- and ambient-temperature requirements for each transformer.

B. Verify that field measurements are as needed to maintain working clearances required by NFPA 70 and manufacturer's written instructions.

C. Examine walls, floors, roofs, and concrete bases for suitable mounting conditions where transformers will be installed.

D. Verify that ground connections are in place and requirements in Section 260526 "Grounding and Bonding" have been met. Maximum ground resistance shall be 5 ohms at location of transformer.

E. Proceed with installation only after unsatisfactory conditions have been corrected.

III. INSTALLATION

A. Transformers, shown on the Drawings to be floor mounted shall have a four (4) inch high by four (4) inch greater all sides concrete base. Connections shall be made with flexible metal conduit.

B. Transformer manufacturer's nameplates, marked in accordance with NEMA Specifications, shall be permanently attached to the transformer in a readily accessible position.

C. Transformer secondary neutral shall be grounded as per NEC requirements, and/or hereinafter specified.

D. This Contractor shall install the transformer to ensure that the minimum clearances required by the transformer manufacturer are provided. These clearances shall be clearly labeled on the transformer by the manufacturer.

E. Install units plumb, level and rigid without distortion.

IV. ADJUSTMENTS AND CLEANING

A. On completion of installation, inspect components. Remove paint splatters and other spots, dirt and debris. Repair scratches and mars on finish to match original finish. Clean components internally using methods and materials recommended by the manufacturer.

B. Adjust transformer taps to provide optimum voltage conditions at utilization equipment throughout normal operating cycle of the facility. Measure and record primary and secondary voltages and tap settings and submit with test results. Test results shall be displayed on site adjacent to transformer.

V. FIELD TESTING

A. Include the following minimum inspections and tests according to manufacturer’s written instructions. Comply with IEEE C57.12.91 for test methods and data correction factors.

B. Inspect accessible components for cleanliness, mechanical and electrical integrity and damage or deterioration. Verify that temporary shipping bracing has been removed. Include internal inspection through access panels and covers.

C. Inspect bolted electrical connections for tightness according to manufacturer’s published torque values or, if not available, those specified in UL 486A and UL 468B.

D. Tests and Inspections:

1. Perform each visual and mechanical inspection and electrical test stated in NETA Acceptance Testing Specification. Certify compliance with test parameters.

E. Remove and replace units that do not pass tests or inspections and retest as specified

above.

F. Infrared Scanning: Two months after Substantial Completion, perform an infrared scan of transformer connections.

1. Use an infrared-scanning device designed to measure temperature or detect significant deviations from normal values. Provide documentation of device calibration.

2. Perform one follow-up infrared scans of transformers at 11 months after Substantial Completion.

3. Prepare a certified report identifying transformer checked and describing results of scanning. Include notation of deficiencies detected, remedial action taken, and scanning observations after remedial action.

G. Test Labeling: On completion of satisfactory testing of each unit, attach a dated and signed "Satisfactory Test" label to tested component.

END OF SECTION

Fuses Section 262413

Part 1 - General

I. REQUIREMENTS

A. The general provisions of the Contract, including General and Supplementary Conditions and General Requirements, apply to the work specified in this Section.

II. SCOPE

A. The work under this Section shall include furnishing and installing a complete distribution switchboard(s) as shown on the Drawings and herein specified.

A. Section Includes:

1. Service and distribution switchboards rated 600 V and less.

III. QUALITY ASSURANCE

A. All equipment, materials, and their installation shall conform to the requirements of the National Electrical Code (NEC), local code requirements, and these Specifications.

B. All equipment and material shall be listed by Underwriter's Laboratories, Inc. (UL) for their intended use and shall bear the UL label. Comply with UL 891.

C. Equipment shall be constructed in accordance with National Electrical Manufacturer's Association (NEMA) standards.

D. Installer Qualifications: An employer of workers qualified as defined in NEMA PB 2.1 and trained in electrical safety as required by NFPA 70E.

E. Source Limitations: Obtain switchboards, overcurrent protective devices, components, and accessories from single source from single manufacturer.

F. Submittals are required in accordance with SECTION 16010 of these Specifications. The manufacturer shall furnish printed product data and also provide drawings to include components, materials, finishes, detailed plan and elevation views, required conduit rough-in openings, anchors, accessories, and wiring diagrams. Submittals shall also include, but not be limited to the following:

1. Include dimensioned plans, elevations, sections, and details, including required clearances and service space around equipment. Show tabulations of installed devices, equipment features, and ratings.

2. Detail enclosure types for types other than NEMA 250, Type 1.

3. Detail bus configuration, current, and voltage ratings

1. Lug sizes.

2. Bus arrangements with all ampere ratings noted.

3. Type and spacing of bus supports.

4. Maximum short-circuit bracing.

5. Fusible switch units size, interrupting rating, and fuse rating.

6. Circuit breaker trip ratings and frame sizes.

7. Circuit breaker and fusible switch units arrangements.

8. Detail utility company's metering provisions with indication of approval by utility company.

9. Detail features, characteristics, ratings, and factory settings of individual overcurrent protective devices and auxiliary components.

10. Include time-current coordination curves for each type and rating of overcurrent protective device included in switchboards.

11. Include schematic and wiring diagrams for power, signal, and control wiring.

12. The results of coordination and short circuit study shall apply for all switchboards prior to submission.

13. Overall dimensions.

14. Provisions for future.

15. Metering.

16. Wiring diagrams for the single-phase protection, blown fuse protection, and ground fault protection systems.

17. Surge protective devices when SPDs are integral with the switchboard. Provide submittals as described in Section 16418.

B. The distribution switchboard's utility metering provisions shall be constructed to comply with all of the electric utility company's requirements.

C. The distribution switchboard(s) shall be factory engineered and shall be a completely assembled unit, complete as shown on the Drawings and/or herein specified with provisions for electric utility company's metering equipment where required.

1.2 DELIVERY, STORAGE AND HANDLING

A. Deliver material and products in factory labeled packages. Store and handle in strict compliance with manufacturer’s instructions and recommendations.

B. Each switchboard section shall be delivered in individual shipping splits and

individually wrapped for protection and mounted on shipping skids.

C. Store in a clean, dry space. Maintain factory protection and /or provide an additional heavy canvas or heavy plastic cover to protect structure from dirt, water, construction debris, and traffic. Where applicable, provide adequate heating within enclosures to prevent condensation.

D. Handle in accordance with NEMA PB2.1 and manufacturer’s written instructions. Lift only by lifting means provided for this express purpose. Handle carefully to avoid damage to switchboard internal components, enclosure and finish.

1.3 PROJECT CONDITIONS

A. Environmental Limitations:

1. Do not deliver or install switchboards until spaces are enclosed and weathertight, wet work in spaces is complete and dry, work above switchboards is complete, and temporary HVAC system is operating and maintaining ambient temperature and humidity conditions at occupancy levels during the remainder of the construction period.

2. Rate equipment for continuous operation under the following conditions unless otherwise indicated:

a. Ambient Temperature: Not exceeding 104 deg F b.
Altitude: Not exceeding 6600 feet

B. Service Conditions: NEMA PB 2, usual service conditions, as follows:

1. Ambient temperatures within limits specified. 2. Altitude
not exceeding 6600 feet

Part 2 - Products

I. MANUFACTURERS

A. The distribution switchboard(s) shall be as manufactured by CUTLER-HAMMER, GENERAL ELECTRIC, SIEMENS, or SQUARE D.

B. The manufacturer of this equipment shall have produced similar electrical equipment for a minimum of ten (10) years.

II. MATERIALS AND COMPONENTS

A. Enclosure Construction:

1. The switchboard shall be of the modular type construction, constructed in accordance with the latest NEMA PB-2 and UL 891 standards with the required number of vertical sections bolted together to form one metal enclosed rigid switchboard. Enclosure construction shall be NEMA 1 indoor. Service entrance switchboards shall be suitable for use as service equipment and be labeled in accordance with UL requirements.

2. The switchboard framework shall be fabricated on a dieformed steel base or base assembly consisting of formed steel channel welded or bolted together to rigidly support the entire shipping unit for moving on rollers and floor mounting. The framework shall be formed code gauge steel, rigidly welded and bolted together to support all cover plates, bussing, and component devices during shipment and installations.

3. Each switchboard section shall have an open bottom and individual removable top plate for installation and termination of conduits. The sides, top and rear shall be covered with removable screw-on code gauge steel plates. All edges of front covers or hinged front panels shall be formed. Provide adequate ventilation within the enclosure.

4. The switchboard shall include all protective devices, provision only spaces for future protective devices, and equipment as listed on the Drawings and specified herein with necessary interconnections, instrumentation and control wiring.

5. Top and bottom conduit area(s) shall be clearly shown and dimensioned on

the shop drawings. The wireway front covers shall be hinged to permit access to the branch overcurrent protective device load side terminals without removing the covers.

6. All sections of the switchboard shall be rear aligned as shown on the Drawings. All protective devices shall be group mounted. Protective devices shall be front removable and load connections front accessible enabling the switchboard to be mounted against a wall. All sections of the switchboard shall also be front aligned unless specifically shown otherwise on the drawings.

7. The switchboard shall have fully equipped provision spaces for future protective devices as shown on the Drawing. Remaining space not identified on the Drawings shall be fully bussed and pre-drilled for future protective devices that do not have established frame sizes. This is in addition to the scheduled space or spare branches specified or shown on the Drawings.

B. Bus Requirements:

1. Switchboard bussing shall be rigid bus bars of silver-plated copper having ninety-eight (98) percent conductivity and shall be rated for a minimum of one

(1) square inch per one thousand (1,000) ampere capacity with a maximum average temperature rise sized for UL at sixty-five (65) degrees C.

2. The bus bars shall be rigidly braced to comply with the integrated equipment rating of the switchboard. The neutral bus shall be full capacity and sized as shown on the Drawings. The main horizontal bus bars between sections shall be full size, non-tapered for the complete length of the switchboard and located to permit a maximum of available conduit area. The through bus on the end section shall be extended and pre- drilled to allow the addition of future sections. The bus bar supports, connections, and joints are to be bolted with Grade five (5) carriage bolts and conical spring-type (Belleville) washers. All hardware used on conductors shall be high-tensile strength and zinc-plated.

3. A ground bus and lug shall be furnished firmly secured to each vertical section structure and shall extend the entire length of the switchboard. Provisions for the addition of future switchboard sections shall be provided. The manufacturer shall furnish a bus bond between the neutral and ground bus bars.

4. Ground Bus: 1/4-by-2-inch-hard-drawn copper of 98 percent conductivity, equipped with compression connectors for feeder and branch-circuit ground conductors.

5. The manufacturer shall furnish a 1/16-inch-thick plastic mimic bus of a contrasting color. Tape will not be acceptable.

6. Neutral Buses: 100 percent of the ampacity of phase buses unless otherwise indicated, equipped with compression connectors for outgoing circuit neutral cables.

C. Wiring/Terminations:

1. Small wiring, necessary fuse blocks and terminal blocks within the switchboard shall be furnished as required. Control components mounted within the assembly, such as fuse blocks, relays, pushbuttons, switches, etc., shall be suitably marked for identification corresponding to appropriate designations on manufacturer's wiring diagrams.

2. Mechanical-type terminals shall be provided for all line and load terminations suitable for copper or aluminum cable rated for 75 degrees C of the size as indicated on the Drawings.

3. Lugs shall be provided in the incoming line section for connections of the main grounding conductor. Additional lugs for connection of other grounding conductors shall be provided as indicated on the Drawings.

4. All control wiring shall be type SIS, bundled and secured with nylon ties. Insulated locking spade terminals shall be provided for all control connections, except where saddle type terminals are provided integral to a device. All current transformer secondary leads shall first be connected to conveniently

accessible short-circuit terminal blocks before connecting to any other device. All groups of control wires leaving the switchboard shall be provided with terminal blocks with suitable numbering strips. Provide wire markers at each end of all control wiring.

D. Ratings: The switchboard's system voltage and amperage shall be as indicated on the Drawings. The switchboard, as a complete unit, shall be given a single integrated equipment rating by the manufacturer of 65,000 amperes minimum or as determined by the Short-Circuit Coordination Study whichever is higher and shall be so labeled. Such rating shall be established by actual tests by the manufacturer on similar equipment available and shall be furnished with the submittal.

E. Incoming Service:

1. The utility metering compartment (C/T cabinet) shall also serve as the incoming service entrance compartment. Suitable compression lugs in the quantity and size required to terminate incoming utility service entrance cables shall be provided in accordance with the Contract Drawings and the requirements of the local electric utility company. Bus work shall include provisions for mounting utility company current transformers and potential transformers or potential taps as required by the utility company. Provide service entrance label and provide necessary applicable service entrance features per NEC and local code

requirements.

2. The C/T cabinet shall be an integral part of the switchboard, complete with a barrier to separate the utility metering compartment from the rest of the switchboard. It shall be of the height necessary, and meet all other requirements of the electric utility company. The entire cabinet shall have a double hinged door with sealable hasp and knurled captive screws.

3. A separate incoming cable pull section shall not be required.

F. Fire Pump Tap: A fire pump tap section shall be provided as integral part of the switchboard. It shall be on the line side of the main disconnecting devices of the switchboard and contain only through bus and tap lugs to feed the fire pump.

G. Bolted Pressure Switches:

1. All main switches indicated on the Drawings 800 amperes and larger shall be true bolted contact load-break type with provisions for NEMA Class L fuses (fuses shall be furnished and installed by this Contractor). The stored energy deadfront operating mechanism shall include disk springs, compressed and released by the operating handle, to provide quick-positive switching action independent of the speed with which it is operated. The mechanism shall be designed so that the switch can be closed only after the opening spring has been charged, ready for electrical opening by solenoid or manual opening by mechanical pushbutton.

2. The operating handle shall be mechanically interlocked with the fuse access door and have provisions for padlocking in the OPEN position. An external mechanical flag shall be provided to identify whether the switch is either open

or closed.

3. Switches, with Class L fuses installed, shall be rated for use on systems capable of withstanding and closing into circuits having available fault currents of 200,000 RMS symmetrical amperes at 600 VAC maximum. Switches shall have an interrupting rating of twelve (12) times the continuous rating at 240, 480, and 600 VAC and capable of carrying 100% of rated current and shall have been tested in accordance with UL Subject 977. Switches shall have power terminals to accommodate either cable or bolted bus connections. Cable lugs, when used, shall be rated for use with 90 degrees C wire insulation (sized according to the 75-degree C temperature rating in the NEC). High-pressure contact switches do not meet the intent of these specifications.

4. The switch shall be complete with single phase protection to open the main device upon loss of any single phase but not upon simultaneous loss of all three (3) phases.

5. The switch shall be complete with separate blown fuse protection to open the main bolted pressure switch if one (1) or more of the Class L fuses operate.

6. The switch shall have two (2) sets of auxiliary contacts (2 normally open and 2 normally closed) for switch position monitoring.

7. Switch(es) shall be PRINGLE type CBC or approved equal.

H. Ground Fault Protection:

1. A zero-sequence type ground fault protection system shall be included for each main bolted pressure service switch as shown on the Drawings or as required by NEC. It shall consist of a current sensor enclosing all phase and neutral conductors of the circuit to be monitored, and appropriate relaying equipment to provide the desired ground fault current sensitivity and time-current response characteristics. The main switch shall be equipped to function in conjunction with the other elements of the ground fault protection system. Installation of the equipment shall be in all respects in accordance with the manufacturer's recommendations.

2. A current sensor shall be provided of the size necessary to encircle the phase conductors and the neutral conductor of the circuit to be monitored. Current sensor output shall be coordinated with the required input to the relay. A test winding shall be included to simulate the flow of ground fault current through the current sensor in order to test the operation of the ground fault protection system including sensor pick-up relay, and circuit protective device operation. The frame of the current sensor shall be so constructed that one leg can be opened to allow removal of installation around cable or bus without disturbing the cable or requiring drop-links in the bus.

3. The ground fault relay shall be of solid state construction, except that a coil operated output relay shall be provided to control 120-volt power to operate the associated fusible bolted pressure switch ground fault trip mechanism. The relay shall require 120-volt power to operate the associated main device.

Adjustable pickup current sensitivity for ground currents from 200 amperes to 1200 amperes shall be provided. A calibrated dial shall be provided for setting the current pickup point in the field. Settings for individual relays shall be 1200 amperes or as determined by the Short-Circuit Coordination Study whichever is lower. Time delay provided by the relay circuitry shall be nominally 0.2 seconds or as determined by the Short-Circuit Coordination Study and shall be permanently calibrated. A self-contained test circuit utilizing the test coil provided in the current sensor shall be incorporated in the system. The test circuit shall be part of the monitor panel that shall be mounted on the front cover of the switchboard.

I. Fusible Switches: Main switches 600 amperes and smaller and feeder protective devices shall consist of fusible switch units as indicated on the Drawings. The fusible switch units shall be quick-make, quick-break type. The units shall be listed by UL for service entrance use. The fusible switch units shall be group mounted in panel-type construction. Each unit shall be enclosed in a separate steel enclosure. The enclosure shall employ a hinged cover for access to the fuses which shall be interlocked with the operating handle to prevent opening the cover when the switch is in the ON position. This interlock shall be constructed so that it can be released with a standard electrician's tool for testing fuses without interrupting service. The units shall have padlocking provisions in the OFF position and the operating handle position shall give switch position indication, i.e., horizontal OFF, diagonal ON. This Contractor shall furnish and install BUSSMANN "LIMITRON", or approved equal, dual element fuses of the ratings noted on the Drawings.

J. Molded Case Circuit Breakers:

1. Feeder protective devices shall consist of molded case circuit breakers as indicated on the Drawings, equipped with individually insulated, braced, and protected connectors. The front faces of all circuit breakers shall be flush with each other.

2. The circuit breakers shall be operated by a toggle type handle and shall have a quick-make, quick-break over-center switching mechanism that shall be mechanically trip free from the handle so that the contacts cannot be held closed against short circuits and abnormal currents. Tripping due to overload or short circuit shall be clearly indicated by the handle automatically assuming a position midway between the manual "ON" and "OFF" positions. All latch surfaces shall be ground and polished. All poles of a multi-pole breaker shall be so constructed that they open, close, and trip simultaneously.

3. The circuit breakers shall be completely enclosed in a molded case. Non-interchangeable trip breakers shall have their covers sealed; interchangeable trip breakers shall have the trip unit sealed to prevent tampering. Ampere ratings shall be clearly visible. Contacts shall be non-welding silver alloy. Arc extinction shall be accomplished by means of arc chutes consisting of metal grids mounted in an insulating support. Breakers shall be of the bolt-on or I-Line type; plug-in, plug-on, and clamp-on circuit breakers shall not be acceptable.

4. Circuit breakers shall be 80% rated unless indicated on the Drawings to be 100% rated.

5. Circuit breakers shall have a minimum symmetrical interrupting capacity as indicated on the Drawings. The interrupting ratings of the circuit breakers shall be at least equal to, or greater than, the available short circuit at the line terminals and not less than those values shown on the Drawings and specified in this specification section or as determined by the Short-Circuit Coordination Study

whichever is higher.

6. Circuit breakers shall be listed with UL, conform to the applicable requirements of the latest issue of NEMA Standards Publication No. AB1.

7. Circuit breaker frames 250 ampere and below shall have thermal- magnetic trip units, with inverse time-current characteristics, unless otherwise indicated on the Drawings.

   a) Automatic operation of all circuit breakers shall be obtained by means of thermal-magnetic tripping devices located in each pole providing inverse time delay and instantaneous circuit protection.

   b) Circuit breaker frames shall be ambient compensating in that, as the ambient temperature increases over 40 C, the circuit breaker automatically derates itself to better protect its associated conductor.

   c) Thermal-magnetic circuit breakers 250A and above shall have thermal magnetic interchangeable trip units, unless otherwise indicated on the Drawings.

8. Circuit breaker frames 400 ampere and above shall have microprocessor-based RMS sensing trip units, unless otherwise indicated on the Drawings.

   a) Solid State sensing shall measure true RMS current with capability to measure through to the 21st harmonic. Automatic operation of all circuit breakers shall be obtained by means of solid state tripping elements providing inverse time delay and instantaneous and short-time circuit protection. Continuous current rating shall be adjustable from 20% to 100% of trip unit rating. Long-time delay and instantaneous trip ratings shall also be adjustable. The short time pick-up trip shall have adjustable pick-up settings at definite times and with I2t delay.

   b) Longtime current adjustment shall be possible without the need for a rating plug.

   c) Feeder circuit breakers shall be provided with integral ground fault protection. Ground fault pick-up shall be adjustable from 20% to 70% of the breakers maximum continuous current rating, but in no case, be greater than 1200A. Ground fault time delay shall be adjustable with three (3) I2t delay settings.

d) Solid State circuit breakers shall have built-in test ports for testing the long-time delay, instantaneous, and ground fault functions of the breaker by means of a test set.

e) Provide a test set capable of testing all circuit breakers with a built-in test port.

9. Circuit breaker accessories: Provide shunt trips, bell alarms and auxiliary switches, etc. as may be shown on the drawings. All accessories shall be UL Listed for field installation.

10. Circuit breakers shall be manufactured by the same manufacturer as the switchboard and factory installed.

11. Where indicated, circuit breakers shall be UL listed for series application.

12. Large permanent individual circuit numbers shall be affixed to each breaker in a uniform position.

K. Nameplates:

1. Each device installed in the switchboard (including the C/T cabinet) shall be identified with a suitable nameplate, engraved as indicated on the Drawings. Nameplates shall be white phenolic with engraved black letters not less than 3/8" block style. The emergency service nameplates shall be red with white letters. Nameplates shall be screw fastened.

2. Furnish master nameplate giving switchboard designation, voltage and ampere rating, short-circuit rating, manufacturer's name, general order number, and item number.

L. All exterior and interior steel surfaces of the switchboard shall be properly cleaned and provided with a rust-inhibiting phosphatized coating. Color and finish of the switchboard shall be ANSI 61 gray.

III. METERING

A. A separate digital meter shall be panel mounted in the front face of the switchboard. The information and capabilities provided by the meter shall include, but not be limited to the following:

1. Current (amperes) per phase.

2. Voltage, phase-to-phase and phase-neutral.

3. Real Power (kW), per phase and three phase total.

4. Reactive Power (kVAR), per phase and three phase total.

5. Apparent Power (kVA), per phase and three phase total.

6. Power Factor (true), per phase and three phase total.

7. Frequency readings.

8. Real Energy (kWh), three phase total.

9. Reactive Energy (kVARh), three phase total.

10. Apparent Energy (kVAh), three phase total.

11. Energy Accumulation modes, signed, absolute, energy in, energy out.

12. Neutral current measurements.

13. Demand Current, per phase and neutral, present and peak.

14. Real Power Demand (kWd) readings, three phase total, present and peak.

15. Reactive Power Demand (kVARd) readings, three phase total, present and peak.

16. Apparent Power Demand (kVAd) readings, three phase total, present and peak.

17. Total Harmonic Distortion (THD) readings, voltage and current, per phase, provided as individual harmonic magnitudes up to the 31st harmonic, and as total odd, total even and total overall harmonic distortion; all readings given as a percentage of fundamental.

18. Date and Time Stamping, peak demands, power up/restart and resets.

19. Onboard Alarms for over/under voltages (per phase L-L, L-N), and voltage unbalance.

20. Minimum and Maximum readings.

B. The meter shall be accurate to 0.25% of readings plus 0.05% of full scale for voltage and current sensing, and 0.5% of reading plus 0.05% of full scale for power and energy, accurate through the 31st harmonic.

1. These accuracies shall be maintained for both light and full loads.

2. No annual re-calibration by users shall be required to maintain these accuracies.

3. Voltage and current for all phases shall be sampled simultaneously to assure high accuracy.

C. The meter shall be provided with a Modbus RTU serial or Modbus-TCP Ethernet communications port for open protocol integration of the electrical data into the BAS.

The Meter manufacturer shall provide all register data and support to the BAS Integrator onsite to provide a seamless integration of the data into the BAS.

D. The meter data communications shall be optically isolated to provide reliable operation.

E. The meter shall be equipped with backlit, two-line or greater LCD display.

F. All meter setup information and reset commands shall be password protected.

G. The meter shall have a KYZ pulse initiator for communication of kWh, kVARh, or kVAh information to third party energy management systems shall be provided.

H. Metering transformers shall be provided to support the requirements of the meters specified herein, UL listed or recognized.

IV. SURGE PROTECTIVE DEVICE (SPD)

A. Provide surge protective devices (SPD) as specified in Specification Section 16418.

Part 3 - Execution

I. EXAMINATION

A. Receive, inspect, handle, and store switchboards according to NEMA PB 2.1.

B. Examine switchboards before installation. Reject switchboards that are moisture damaged or physically damaged.

C. Examine elements and surfaces to receive switchboards for compliance with installation tolerances and other conditions affecting performance of the Work.

D. Proceed with installation only after unsatisfactory conditions have been corrected.

II. INSTALLATION

A. The switchboard shall be installed in accordance with the manufacturer's recommendations, as shown on the Drawings, and as required by the electric utility company serving this project.

B. Equipment Mounting: The Contractor shall furnish and install a four (4) inch high by six (6) inch greater all sides (except rear when the switchboard is mounted against a wall) concrete housekeeping pad for the switchboard. Ensure that the concrete pad is level and free of irregularities.

1. Install dowel rods to connect concrete base to concrete floor. Unless otherwise indicated, install dowel rods on 18-inch centers around the full perimeter of concrete base.

2. For supported equipment, install epoxy-coated anchor bolts that extend through concrete base and anchor into structural concrete floor.

3. Place and secure anchorage devices. Use setting drawings, templates, diagrams, instructions, and directions furnished with items to be embedded.

4. Install anchor bolts to elevations required for proper attachment to switchboards

C. The assembly shall be provided with adequate lifting means and shall be capable of being moved into installation position and bolted directly to Contractor-supplied floor sills to be set level in concrete per manufacturer's recommendations. All necessary hardware to secure the assembly in place shall be provided by the Contractor.

D. Install units' plumb, level and rigid without distortion to the switchboard cubicles.

E. Switchboard wiring for factory mounted devices shall be installed complete at the factory and adequately bundled and protected. All conductors across hinges, and all conductors for interconnections between shipping units, shall be flexible.

F. Contractor shall install required safety labels.

III. START-UP SERVICE AND PERFORMANCE TEST

A. The manufacturer shall provide factory personnel to completely inspect and test the switchboard(s) for proper installation and operation of all equipment, at the time of system start-up. Testing shall include, but not be limited to, performance testing of the bolted pressure switch(es), circuit breakers, SPDs, metering, single phase protection, blown fuse protection, and ground fault protection systems and equipment.

B. All testing and start-up services shall be in the presence of the Engineer and the Contract Owners Technical Representative (COTR). The tests shall be as stated in the manufacturer's literature. One (1) copy of the tests results shall be submitted to the

Engineer and Owner for review.

C. The completed equipment grounding system shall be subjected to a metered test at the switchboard ground bar to ensure that the ground resistance, without chemical treatment or other artificial means, does not exceed five (5) ohms. One copy of the test results shall be submitted to the Engineer and Owner for review.

D. Check tightness of all accessible mechanical and electrical connections to assure they are torqued to the minimum acceptable manufacturer's recommendations.

E. Check the switchboard for proper grounding, fastening and alignment.

IV. FIELD ADJUSTMENTS

A. This Contractor shall perform field adjustments of the protective devices as required to place the equipment in final operating condition. Necessary field settings of devices and adjustments and minor modifications to equipment shall be carried out by this Contractor at no additional cost to the Owner.

B. The settings shall be in accordance with the approved protective device coordination study or as directed by the Engineer.

V. TRAINING

A. This Contractor shall provide eight (8) hours of technical service training to the Owner's technical and maintenance staff.

B. The training session shall be conducted by a manufacturer's qualified representative. The training program shall consist of instruction on operation of the assembly, circuit breakers, fused switches, metering, and major components within the assembly.

VI. CLEANING

A. Remove debris from switchboard and wipe dust and dirt from all components.

B. Repaint marred and scratched surfaces with touch-up paint to match original finish.

VII. RISER DIAGRAM

A. This Contractor shall furnish one (1) set of the complete as-built power riser diagram showing all switchboards, panelboards, emergency electrical power system equipment, and their interconnections. The riser diagram shall be laminated and mounted by this Contractor as directed by the Owner at the location of the main distribution switchboard.

END OF SECTION

Part 1 - General

I. REQUIREMENTS

A. The general provisions of the Contract, including General and Supplementary Conditions and General Requirements, apply to the work specified in this Section.

II. SCOPE

A. The work under this Section shall include furnishing and installing a complete distribution switchboard(s) as shown on the Drawings and herein specified.

A. Section Includes:

1. Service and distribution switchboards rated 600 V and less.

III. QUALITY ASSURANCE

A. All equipment, materials, and their installation shall conform to the requirements of the National Electrical Code (NEC), local code requirements, and these Specifications.

B. All equipment and material shall be listed by Underwriter's Laboratories, Inc. (UL) for their intended use and shall bear the UL label. Comply with UL 891.

C. Equipment shall be constructed in accordance with National Electrical Manufacturer's Association (NEMA) standards.

D. Installer Qualifications: An employer of workers qualified as defined in NEMA PB 2.1 and trained in electrical safety as required by NFPA 70E.

E. Source Limitations: Obtain switchboards, overcurrent protective devices, components, and accessories from single source from single manufacturer.

F. Submittals are required in accordance with SECTION 16010 of these Specifications. The manufacturer shall furnish printed product data and also provide drawings to include components, materials, finishes, detailed plan and elevation views, required conduit rough-in openings, anchors, accessories, and wiring diagrams. Submittals shall also include, but not be limited to the following:

1. Include dimensioned plans, elevations, sections, and details, including required clearances and service space around equipment. Show tabulations of installed devices, equipment features, and ratings.

2. Detail enclosure types for types other than NEMA 250, Type 1.

3. Detail bus configuration, current, and voltage ratings

1. Lug sizes.

2. Bus arrangements with all ampere ratings noted.

3. Type and spacing of bus supports.

4. Maximum short-circuit bracing.

5. Fusible switch units size, interrupting rating, and fuse rating.

6. Circuit breaker trip ratings and frame sizes.

7. Circuit breaker and fusible switch units arrangements.

8. Detail utility company's metering provisions with indication of approval by utility company.

9. Detail features, characteristics, ratings, and factory settings of individual overcurrent protective devices and auxiliary components.

10. Include time-current coordination curves for each type and rating of overcurrent protective device included in switchboards.

11. Include schematic and wiring diagrams for power, signal, and control wiring.

12. The results of coordination and short circuit study shall apply for all switchboards prior to submission.

13. Overall dimensions.

14. Provisions for future.

15. Metering.

16. Wiring diagrams for the single-phase protection, blown fuse protection, and ground fault protection systems.

17. Surge protective devices when SPDs are integral with the switchboard. Provide submittals as described in Section 16418.

B. The distribution switchboard's utility metering provisions shall be constructed to comply with all of the electric utility company's requirements.

C. The distribution switchboard(s) shall be factory engineered and shall be a completely assembled unit, complete as shown on the Drawings and/or herein specified with provisions for electric utility company's metering equipment where required.

1.2 DELIVERY, STORAGE AND HANDLING

A. Deliver material and products in factory labeled packages. Store and handle in strict compliance with manufacturer’s instructions and recommendations.

B. Each switchboard section shall be delivered in individual shipping splits and

individually wrapped for protection and mounted on shipping skids.

C. Store in a clean, dry space. Maintain factory protection and /or provide an additional heavy canvas or heavy plastic cover to protect structure from dirt, water, construction debris, and traffic. Where applicable, provide adequate heating within enclosures to prevent condensation.

D. Handle in accordance with NEMA PB2.1 and manufacturer's written instructions. Lift only by lifting means provided for this express purpose. Handle carefully to avoid damage to switchboard internal components, enclosure and finish.

1.3 PROJECT CONDITIONS

A. Environmental Limitations:

1. Do not deliver or install switchboards until spaces are enclosed and weathertight, wet work in spaces is complete and dry, work above switchboards is complete, and temporary HVAC system is operating and maintaining ambient temperature and humidity conditions at occupancy levels during the remainder of the construction period.

2. Rate equipment for continuous operation under the following conditions unless otherwise indicated:

a. Ambient Temperature: Not exceeding 104 deg F
b. Altitude: Not exceeding 6600 feet

B. Service Conditions: NEMA PB 2, usual service conditions, as follows:

1. Ambient temperatures within limits specified.
2. Altitude not exceeding 6600 feet

Part 2 - Products

I. MANUFACTURERS

A. The distribution switchboard(s) shall be as manufactured by CUTLER-HAMMER, GENERAL ELECTRIC, SIEMENS, or SQUARE D.

B. The manufacturer of this equipment shall have produced similar electrical equipment for a minimum of ten (10) years.

II. MATERIALS AND COMPONENTS

A. Enclosure Construction:

1. The switchboard shall be of the modular type construction, constructed in accordance with the latest NEMA PB-2 and UL 891 standards with the required number of vertical sections bolted together to form one metal enclosed rigid switchboard. Enclosure construction shall be NEMA 1 indoor. Service entrance switchboards shall be suitable for use as service equipment and be labeled in accordance with UL requirements.

2. The switchboard framework shall be fabricated on a dieformed steel base or base assembly consisting of formed steel channel welded or bolted together to rigidly support the entire shipping unit for moving on rollers and floor mounting. The framework shall be formed code gauge steel, rigidly welded and bolted together to support all cover plates, bussing, and component devices during shipment and installations.

3. Each switchboard section shall have an open bottom and individual removable top plate for installation and termination of conduits. The sides, top and rear shall be covered with removable screw-on code gauge steel plates. All edges of front covers or hinged front panels shall be formed. Provide adequate ventilation within the enclosure.

4. The switchboard shall include all protective devices, provision only spaces for future protective devices, and equipment as listed on the Drawings and specified herein with necessary interconnections, instrumentation and control wiring.

5. Top and bottom conduit area(s) shall be clearly shown and dimensioned on the shop drawings. The wireway front covers shall be hinged to permit access to the branch overcurrent protective device load side terminals without removing the covers.

6. All sections of the switchboard shall be rear aligned as shown on the Drawings. All protective devices shall be group mounted. Protective devices shall be front removable and load connections front accessible enabling the switchboard to be mounted against a wall. All sections of the switchboard shall also be front aligned unless specifically shown otherwise on the drawings.

7. The switchboard shall have fully equipped provision spaces for future protective devices as shown on the Drawing. Remaining space not identified on the Drawings shall be fully bussed and pre-drilled for future protective devices that do not have established frame sizes. This is in addition to the scheduled space or spare branches specified or shown on the Drawings.

B. Bus Requirements:

1. Switchboard bussing shall be rigid bus bars of silver-plated copper having ninety-eight (98) percent conductivity and shall be rated for a minimum of one

(1) square inch per one thousand (1,000) ampere capacity with a maximum average temperature rise sized for UL at sixty-five (65) degrees C.

2. The bus bars shall be rigidly braced to comply with the integrated equipment rating of the switchboard. The neutral bus shall be full capacity and sized as shown on the Drawings. The main horizontal bus bars between sections shall be full size, non-tapered for the complete length of the switchboard and located to permit a maximum of available conduit area. The through bus on the end section shall be extended and pre- drilled to allow the addition of future sections. The bus bar supports, connections, and joints are to be bolted with Grade five (5) carriage bolts and conical spring-type (Belleville) washers. All hardware used on conductors shall be high-tensile strength and zinc-plated.

3. A ground bus and lug shall be furnished firmly secured to each vertical section structure and shall extend the entire length of the switchboard. Provisions for the addition of future switchboard sections shall be provided. The manufacturer shall furnish a bus bond between the neutral and ground bus bars.

4. Ground Bus: 1/4-by-2-inch-hard-drawn copper of 98 percent conductivity, equipped with compression connectors for feeder and branch-circuit ground conductors.

5. The manufacturer shall furnish a 1/16-inch-thick plastic mimic bus of a contrasting color. Tape will not be acceptable.

6. Neutral Buses: 100 percent of the ampacity of phase buses unless otherwise indicated, equipped with compression connectors for outgoing circuit neutral cables.

C. Wiring/Terminations:

1. Small wiring, necessary fuse blocks and terminal blocks within the switchboard shall be furnished as required. Control components mounted within the assembly, such as fuse blocks, relays, pushbuttons, switches, etc., shall be suitably marked for identification corresponding to appropriate designations on manufacturer’s wiring diagrams.

2. Mechanical-type terminals shall be provided for all line and load terminations suitable for copper or aluminum cable rated for 75 degrees C of the size as indicated on the Drawings.

3. Lugs shall be provided in the incoming line section for connections of the main grounding conductor. Additional lugs for connection of other grounding conductors shall be provided as indicated on the Drawings.

4. All control wiring shall be type SIS, bundled and secured with nylon ties. Insulated locking spade terminals shall be provided for all control connections, except where saddle type terminals are provided integral to a device. All current transformer secondary leads shall first be connected to conveniently

accessible short-circuit terminal blocks before connecting to any other device. All groups of control wires leaving the switchboard shall be provided with terminal blocks with suitable numbering strips. Provide wire markers at each end of all control wiring.

D. Ratings: The switchboard's system voltage and amperage shall be as indicated on the Drawings. The switchboard, as a complete unit, shall be given a single integrated equipment rating by the manufacturer of 65,000 amperes minimum or as determined by the Short-Circuit Coordination Study whichever is higher and shall be so labeled. Such rating shall be established by actual tests by the manufacturer on similar equipment available and shall be furnished with the submittal.

E. Incoming Service:

1. The utility metering compartment (C/T cabinet) shall also serve as the incoming service entrance compartment. Suitable compression lugs in the quantity and size required to terminate incoming utility service entrance cables shall be provided in accordance with the Contract Drawings and the requirements of the local electric utility company. Bus work shall include provisions for mounting utility company current transformers and potential transformers or potential taps as required by the utility company. Provide service entrance label and provide necessary applicable service entrance features per NEC and local code requirements.

2. The C/T cabinet shall be an integral part of the switchboard, complete with a barrier to separate the utility metering compartment from the rest of the switchboard. It shall be of the height necessary, and meet all other requirements of the electric utility company. The entire cabinet shall have a double hinged door with sealable hasp and knurled captive screws.

3. A separate incoming cable pull section shall not be required.

F. Fire Pump Tap: A fire pump tap section shall be provided as integral part of the switchboard. It shall be on the line side of the main disconnecting devices of the switchboard and contain only through bus and tap lugs to feed the fire pump.

G. Bolted Pressure Switches:

1. All main switches indicated on the Drawings 800 amperes and larger shall be true bolted contact load-break type with provisions for NEMA Class L fuses (fuses shall be furnished and installed by this Contractor). The stored energy deadfront operating mechanism shall include disk springs, compressed and released by the operating handle, to provide quick-positive switching action independent of the speed with which it is operated. The mechanism shall be designed so that the switch can be closed only after the opening spring has been charged, ready for electrical opening by solenoid or manual opening by mechanical pushbutton.

2. The operating handle shall be mechanically interlocked with the fuse access door and have provisions for padlocking in the OPEN position. An external mechanical flag shall be provided to identify whether the switch is either open

or closed.

3. Switches, with Class L fuses installed, shall be rated for use on systems capable of withstanding and closing into circuits having available fault currents of 200,000 RMS symmetrical amperes at 600 VAC maximum. Switches shall have an interrupting rating of twelve (12) times the continuous rating at 240, 480, and 600 VAC and capable of carrying 100% of rated current and shall have been tested in accordance with UL Subject 977. Switches shall have power terminals to accommodate either cable or bolted bus connections. Cable lugs, when used, shall be rated for use with 90 degrees C wire insulation (sized according to the 75-degree C temperature rating in the NEC). High-pressure contact switches do not meet the intent of these specifications.

4. The switch shall be complete with single phase protection to open the main device upon loss of any single phase but not upon simultaneous loss of all three (3) phases.

5. The switch shall be complete with separate blown fuse protection to open the main bolted pressure switch if one (1) or more of the Class L fuses operate.

6. The switch shall have two (2) sets of auxiliary contacts (2 normally open and 2 normally closed) for switch position monitoring.

7. Switch(es) shall be PRINGLE type CBC or approved equal.

H. Ground Fault Protection:

1. A zero-sequence type ground fault protection system shall be included for each main bolted pressure service switch as shown on the Drawings or as required by NEC. It shall consist of a current sensor enclosing all phase and neutral conductors of the circuit to be monitored, and appropriate relaying equipment to provide the desired ground fault current sensitivity and time-current response characteristics. The main switch shall be equipped to function in conjunction with the other elements of the ground fault protection system. Installation of the equipment shall be in all respects in accordance with the manufacturer's recommendations.

2. A current sensor shall be provided of the size necessary to encircle the phase conductors and the neutral conductor of the circuit to be monitored. Current sensor output shall be coordinated with the required input to the relay. A test winding shall be included to simulate the flow of ground fault current through the current sensor in order to test the operation of the ground fault protection system including sensor pick-up relay, and circuit protective device operation. The frame of the current sensor shall be so constructed that one leg can be opened to allow removal of installation around cable or bus without disturbing the cable or requiring drop-links in the bus.

3. The ground fault relay shall be of solid state construction, except that a coil operated output relay shall be provided to control 120-volt power to operate the associated fusible bolted pressure switch ground fault trip mechanism. The relay shall require 120-volt power to operate the associated main device.

Adjustable pickup current sensitivity for ground currents from 200 amperes to 1200 amperes shall be provided. A calibrated dial shall be provided for setting the current pickup point in the field. Settings for individual relays shall be 1200 amperes or as determined by the Short-Circuit Coordination Study whichever is lower. Time delay provided by the relay circuitry shall be nominally 0.2 seconds or as determined by the Short-Circuit Coordination Study and shall be permanently calibrated. A self-contained test circuit utilizing the test coil provided in the current sensor shall be incorporated in the system. The test circuit shall be part of the monitor panel that shall be mounted on the front cover of the switchboard.

I. Fusible Switches: Main switches 600 amperes and smaller and feeder protective devices shall consist of fusible switch units as indicated on the Drawings. The fusible switch units shall be quick-make, quick-break type. The units shall be listed by UL for service entrance use. The fusible switch units shall be group mounted in panel-type construction. Each unit shall be enclosed in a separate steel enclosure. The enclosure shall employ a hinged cover for access to the fuses which shall be interlocked with the operating handle to prevent opening the cover when the switch is in the ON position. This interlock shall be constructed so that it can be released with a standard electrician's tool for testing fuses without interrupting service. The units shall have padlocking provisions in the OFF position and the operating handle position shall give switch position indication, i.e., horizontal OFF, diagonal ON. This Contractor shall furnish and install BUSSMANN "LIMITRON", or approved equal, dual element fuses of the ratings noted on the Drawings.

J. Molded Case Circuit Breakers:

1. Feeder protective devices shall consist of molded case circuit breakers as indicated on the Drawings, equipped with individually insulated, braced, and protected connectors. The front faces of all circuit breakers shall be flush with each other.

2. The circuit breakers shall be operated by a toggle type handle and shall have a quick-make, quick-break over-center switching mechanism that shall be mechanically trip free from the handle so that the contacts cannot be held closed against short circuits and abnormal currents. Tripping due to overload or short circuit shall be clearly indicated by the handle automatically assuming a position midway between the manual "ON" and "OFF" positions. All latch surfaces shall be ground and polished. All poles of a multi-pole breaker shall be so constructed that they open, close, and trip simultaneously.

3. The circuit breakers shall be completely enclosed in a molded case. Non-interchangeable trip breakers shall have their covers sealed; interchangeable trip breakers shall have the trip unit sealed to prevent tampering. Ampere ratings shall be clearly visible. Contacts shall be non-welding silver alloy. Arc extinction shall be accomplished by means of arc chutes consisting of metal grids mounted in an insulating support. Breakers shall be of the bolt-on or I-Line type; plug-in, plug-on, and clamp-on circuit breakers shall not be acceptable.

4. Circuit breakers shall be 80% rated unless indicated on the Drawings to be 100% rated.

5. Circuit breakers shall have a minimum symmetrical interrupting capacity as indicated on the Drawings. The interrupting ratings of the circuit breakers shall be at least equal to, or greater than, the available short circuit at the line terminals and not less than those values shown on the Drawings and specified in this specification section or as determined by the Short-Circuit Coordination Study whichever is higher.

6. Circuit breakers shall be listed with UL, conform to the applicable requirements of the latest issue of NEMA Standards Publication No. AB1.

7. Circuit breaker frames 250 ampere and below shall have thermal- magnetic trip units, with inverse time-current characteristics, unless otherwise indicated on the Drawings.

    a) Automatic operation of all circuit breakers shall be obtained by means of thermal-magnetic tripping devices located in each pole providing inverse time delay and instantaneous circuit protection.

    b) Circuit breaker frames shall be ambient compensating in that, as the ambient temperature increases over 40 C, the circuit breaker automatically derates itself to better protect its associated conductor.

    c) Thermal-magnetic circuit breakers 250A and above shall have thermal magnetic interchangeable trip units, unless otherwise indicated on the Drawings.

8. Circuit breaker frames 400 ampere and above shall have microprocessor-based RMS sensing trip units, unless otherwise indicated on the Drawings.

    a) Solid State sensing shall measure true RMS current with capability to measure through to the 21st harmonic. Automatic operation of all circuit breakers shall be obtained by means of
        solid state tripping elements providing inverse time delay and instantaneous and short-time circuit protection. Continuous current rating shall be adjustable from 20% to 100% of trip unit rating. Long-time delay and instantaneous trip ratings shall also be adjustable. The short time pick-up trip shall have adjustable pick-up settings at definite times and with I2t delay.

    b) Longtime current adjustment shall be possible without the need for a rating plug.

    c) Feeder circuit breakers shall be provided with integral ground fault protection. Ground fault pick-up shall be adjustable from 20% to 70% of the breakers maximum continuous current rating, but in no case, be greater than 1200A. Ground fault time delay shall be adjustable with three (3) I2t delay settings.

d) Solid State circuit breakers shall have built-in test ports for testing the long-time delay, instantaneous, and ground fault functions of the breaker by means of a test set.

e) Provide a test set capable of testing all circuit breakers with a built-in test port.

9. Circuit breaker accessories: Provide shunt trips, bell alarms and auxiliary switches, etc. as may be shown on the drawings. All accessories shall be UL Listed for field installation.

10. Circuit breakers shall be manufactured by the same manufacturer as the switchboard and factory installed.

11. Where indicated, circuit breakers shall be UL listed for series application.

12. Large permanent individual circuit numbers shall be affixed to each breaker in a uniform position.

K. Nameplates:

1. Each device installed in the switchboard (including the C/T cabinet) shall be identified with a suitable nameplate, engraved as indicated on the Drawings. Nameplates shall be white phenolic with engraved black letters not less than 3/8" block style. The emergency service nameplates shall be red with white letters. Nameplates shall be screw fastened.

2. Furnish master nameplate giving switchboard designation, voltage and ampere rating, short-circuit rating, manufacturer's name, general order number, and item number.

L. All exterior and interior steel surfaces of the switchboard shall be properly cleaned and provided with a rust-inhibiting phosphatized coating. Color and finish of the switchboard shall be ANSI 61 gray.

III. METERING

A. A separate digital meter shall be panel mounted in the front face of the switchboard. The information and capabilities provided by the meter shall include, but not be limited to the following:

1. Current (amperes) per phase.

2. Voltage, phase-to-phase and phase-neutral.

3. Real Power (kW), per phase and three phase total.

4. Reactive Power (kVAR), per phase and three phase total.

5. Apparent Power (kVA), per phase and three phase total.

6. Power Factor (true), per phase and three phase total.

7. Frequency readings.

8. Real Energy (kWh), three phase total.

9. Reactive Energy (kVARh), three phase total.

10. Apparent Energy (kVAh), three phase total.

11. Energy Accumulation modes, signed, absolute, energy in, energy out.

12. Neutral current measurements.

13. Demand Current, per phase and neutral, present and peak.

14. Real Power Demand (kWd) readings, three phase total, present and peak.

15. Reactive Power Demand (kVARd) readings, three phase total, present and peak.

16. Apparent Power Demand (kVAd) readings, three phase total, present and peak.

17. Total Harmonic Distortion (THD) readings, voltage and current, per phase, provided as individual harmonic magnitudes up to the 31st harmonic, and as total odd, total even and total overall harmonic distortion; all readings given as a percentage of fundamental.

18. Date and Time Stamping, peak demands, power up/restart and resets.

19. Onboard Alarms for over/under voltages (per phase L-L, L-N), and voltage unbalance.

20. Minimum and Maximum readings.

B. The meter shall be accurate to 0.25% of readings plus 0.05% of full scale for voltage and current sensing, and 0.5% of reading plus 0.05% of full scale for power and energy, accurate through the 31st harmonic.

1. These accuracies shall be maintained for both light and full loads.

2. No annual re-calibration by users shall be required to maintain these accuracies.

3. Voltage and current for all phases shall be sampled simultaneously to assure high accuracy.

C. The meter shall be provided with a Modbus RTU serial or Modbus-TCP Ethernet communications port for open protocol integration of the electrical data into the BAS.

The Meter manufacturer shall provide all register data and support to the BAS Integrator onsite to provide a seamless integration of the data into the BAS.

D. The meter data communications shall be optically isolated to provide reliable operation.

E. The meter shall be equipped with backlit, two-line or greater LCD display.

F. All meter setup information and reset commands shall be password protected.

G. The meter shall have a KYZ pulse initiator for communication of kWh, kVARh, or kVAh information to third party energy management systems shall be provided.

H. Metering transformers shall be provided to support the requirements of the meters specified herein, UL listed or recognized.

IV. SURGE PROTECTIVE DEVICE (SPD)

A. Provide surge protective devices (SPD) as specified in Specification Section 16418.

Part 3 - Execution

I. EXAMINATION

A. Receive, inspect, handle, and store switchboards according to NEMA PB 2.1.

B. Examine switchboards before installation. Reject switchboards that are moisture damaged or physically damaged.

C. Examine elements and surfaces to receive switchboards for compliance with installation tolerances and other conditions affecting performance of the Work.

D. Proceed with installation only after unsatisfactory conditions have been corrected.

II. INSTALLATION

A. The switchboard shall be installed in accordance with the manufacturer's recommendations, as shown on the Drawings, and as required by the electric utility company serving this project.

B. Equipment Mounting: The Contractor shall furnish and install a four (4) inch high by six (6) inch greater all sides (except rear when the switchboard is mounted against a wall) concrete housekeeping pad for the switchboard. Ensure that the concrete pad is level and free of irregularities.

1. Install dowel rods to connect concrete base to concrete floor. Unless otherwise indicated, install dowel rods on 18-inch centers around the full perimeter of concrete base.

2. For supported equipment, install epoxy-coated anchor bolts that extend through concrete base and anchor into structural concrete floor.

3. Place and secure anchorage devices. Use setting drawings, templates, diagrams, instructions, and directions furnished with items to be embedded.

4. Install anchor bolts to elevations required for proper attachment to switchboards

C. The assembly shall be provided with adequate lifting means and shall be capable of being moved into installation position and bolted directly to Contractor-supplied floor sills to be set level in concrete per manufacturer's recommendations. All necessary hardware to secure the assembly in place shall be provided by the Contractor.

D. Install units' plumb, level and rigid without distortion to the switchboard cubicles.

E. Switchboard wiring for factory mounted devices shall be installed complete at the factory and adequately bundled and protected. All conductors across hinges, and all conductors for interconnections between shipping units, shall be flexible.

F. Contractor shall install required safety labels.

III. START-UP SERVICE AND PERFORMANCE TEST

A. The manufacturer shall provide factory personnel to completely inspect and test the switchboard(s) for proper installation and operation of all equipment, at the time of system start-up. Testing shall include, but not be limited to, performance testing of the bolted pressure switch(es), circuit breakers, SPDs, metering, single phase protection, blown fuse protection, and ground fault protection systems and equipment.

B. All testing and start-up services shall be in the presence of the Engineer and the Contract Owners Technical Representative (COTR). The tests shall be as stated in the manufacturer's literature. One (1) copy of the tests results shall be submitted to the Engineer and Owner for review.

C. The completed equipment grounding system shall be subjected to a metered test at the switchboard ground bar to ensure that the ground resistance, without chemical treatment or other artificial means, does not exceed five (5) ohms. One copy of the test results shall be submitted to the Engineer and Owner for review.

D. Check tightness of all accessible mechanical and electrical connections to assure they are torqued to the minimum acceptable manufacturer's recommendations.

E. Check the switchboard for proper grounding, fastening and alignment.

IV. FIELD ADJUSTMENTS

A. This Contractor shall perform field adjustments of the protective devices as required to place the equipment in final operating condition. Necessary field settings of devices and adjustments and minor modifications to equipment shall be carried out by this Contractor at no additional cost to the Owner.

B. The settings shall be in accordance with the approved protective device coordination study or as directed by the Engineer.

V. TRAINING

A. This Contractor shall provide eight (8) hours of technical service training to the Owner's technical and maintenance staff.

B. The training session shall be conducted by a manufacturer's qualified representative. The training program shall consist of instruction on operation of the assembly, circuit breakers, fused switches, metering, and major components within the assembly.

VI. CLEANING

A. Remove debris from switchboard and wipe dust and dirt from all components.

B. Repaint marred and scratched surfaces with touch-up paint to match original finish.

VII. RISER DIAGRAM

A. This Contractor shall furnish one (1) set of the complete as-built power riser diagram showing all switchboards, panelboards, emergency electrical power system equipment, and their interconnections. The riser diagram shall be laminated and mounted by this Contractor as directed by the Owner at the location of the main distribution switchboard.

END OF SECTION

Part 1 - General

I. REQUIREMENTS

A. The general provisions of the Contract, including General and Supplementary Conditions and General Requirements, apply to the work specified in this Section.

II. SCOPE

A. The work under this Section shall include furnishing and installing a complete generator quick connection switchboard(s), utilizing a main circuit protective device, generator lug and receptacle connections as shown on the Drawings and herein specified.

III. QUALITY ASSURANCE

A. All equipment, materials, and their installation shall conform to the requirements of the National Electrical Code (NEC), local code requirements, and these Specifications.

B. All equipment and material shall be listed by Underwriter's Laboratories, Inc. (UL) for their intended use and shall bear the UL label.

C. Equipment shall be constructed in accordance with National Electrical Manufacturer's Association (NEMA) standards.

D. Submittals are required in accordance with Division 1 of these Specifications. The manufacturer shall furnish printed product data and also provide drawings to include components, materials, finishes, detailed plan and elevation views, required conduit rough-in openings, anchors, pad accessories, wiring diagrams, key interlock scheme drawings and sequence of operations. Submittals shall also include, but not be limited to the following:

1. Lug sizes.
2. Bus arrangements with all ampere ratings noted.
3. Type and spacing of bus supports.
4. Maximum short-circuit bracing.
5. Circuit breaker trip ratings and frame sizes.
6. Circuit breaker arrangements.
7. Overall dimensions.
8. Metering.

9. Surge protective devices when SPDs are integral with the switchboard. Provide submittals as described in Section 16418.

10. Wiring diagrams for the single-phase protection and ground fault protection systems.

E. The generator quick connection switchboard(s) shall be factory engineered and shall be a completely assembled unit, complete as shown on the Drawings and/or herein specified.

F. The manufacturer of the assembly shall be the manufacturer of the major components within the assembly.

G. The manufacturer shall be ISO 9001 or 9002 certified for the equipment specified herein.

IV. DELIVERY, STORAGE AND HANDLING

A. Deliver material and products in factory labeled packages. Store and handle in strict compliance with manufacturer's instructions and recommendations.

B. Each switchboard section shall be delivered in individual shipping splits and individually wrapped for protection and mounted on shipping skids.

C. Store in a clean, dry space. Maintain factory protection and /or provide an additional heavy canvas or heavy plastic cover to protect structure from dirt, water, construction debris, and traffic. Where applicable, provide adequate heating within enclosures to prevent condensation.

D. Handle in accordance with NEMA PB2.1 and manufacturer's written instructions. Lift only by lifting means provided for this express purpose. Handle carefully to avoid damage to switchboard internal components, enclosure and finish.

Part 2 - Products

I. MANUFACTURERS

A. The generator quick connection switchboard(s) shall be as manufactured by CUTLER-HAMMER, GENERAL ELECTRIC, SIEMENS, or SQUARE D.

B. The listing of specific manufacturers does not imply acceptance of their products that do not meet the specified ratings, features and functions. Manufacturers listed are not relieved from meeting these specifications in their entirety.

C. The manufacturer of this equipment shall have produced similar electrical equipment for a minimum of ten (10) years.

II. MATERIALS AND COMPONENT

A. Construction:

1. The generator quick connection switchboard shall be of the modular type construction, constructed in accordance with the latest NEMA PB-2 and UL 891 standards with the required number of vertical sections bolted together to form one metal enclosed rigid switchboard. The sides and rear shall be covered with removable bolt-on covers. All edges of front covers and hinged front panels shall be formed. Provide adequate ventilation within the enclosure.

2. All sections of the switchboard shall be front and rear aligned as shown on the Drawings with depth as required by the manufacturer with all code required clearances maintained. All protective devices shall be grouped mounted. Devices shall be front removable and load connections front accessible enabling switchboard to be mounted against a wall.

3. The switchboard shall be provided with load connection options to cross bus or mechanical outgoing cable terminations, which shall be suitable for copper or aluminum conductors.

4. The assembly shall be provided with adequate lifting means.

5. The switchboard framework shall be fabricated on a dieformed steel base or base assembly consisting of formed steel channel welded or bolted together to rigidly support the entire shipping unit for moving on rollers and floor mounting. The framework shall be formed code gauge steel, rigidly welded and bolted together to support all cover plates, bussing, and component devices during shipment and installations.

6. Top and bottom conduit area(s) shall be clearly shown and dimensioned on the shop drawings.

B. Enclosure construction shall be NEMA Type 1 indoor.

C. Enclosure construction shall be NEMA Type 3R outdoor.

1. Outdoor enclosure shall be non-walk-in and meet applicable NEMA 3R UL requirements.

2. Enclosure shall have a flat roof.

3. Provide hinged cable entry trap door to allow cable access to generator connection receptacles and lugs while maintaining Type 3R Enclosure integrity.

4. The enclosure shall be provided with bolt-on rear covers for each

section.

5. Doors shall have provisions for pad locking.

6. Ventilating openings shall be provided.

7. The outdoor enclosure shall be provided with a space heater having adequate wattage to prevent the accumulation of moisture and shall be thermostatically controlled. Power for the space heater shall be obtained from a source as indicated on the Drawings. Supply voltage shall be 120 volts AC.

D. Bus Requirements:

1. Switchboard bussing shall be rigid bus bars of silver-plated copper having ninety-eight (98) percent conductivity and shall be rated for a minimum of one (1) square inch per one thousand (1,000) ampere capacity with a maximum average temperature rise sized for UL at sixty-five (65) degrees C; Over a forty (40) degrees C ambient (outside the enclosure).

2. The bus bars shall be rigidly braced to comply with the integrated equipment rating of the switchboard. The neutral bus shall be full capacity and sized as shown on the Drawings. The bus bar supports, connections, and joints are to be bolted with grade five (5) carriage bolts and Belleville washers.

3. A ground bus and lug shall be furnished firmly secured to each vertical section structure and shall extend the entire length of the switchboard.

E. Wiring/terminations:

1. The switchboard shall be provided with both mechanical lugs and cam- type receptacle assembly for connection of generator power phases (A, B, C), neutral and grounding conductors. All connections for phases, neutral, ground, etc., shall be clearly marked via labeling.

2. Each single pole cam-type receptacle shall be rated for no less than 400 amps at 90 degrees C. Multiple receptacles per phase, neutral and ground shall be utilized when amperages over 400 are requested. Contact material of the receptacle shall be composed of brass.

3. Cam-type receptacles shall be male type, unless otherwise directed by the Owner, and must be suitable for use in outdoor environments.

4. Single pole Cam-type receptacles shall be UL 498 listed for Attachment Plugs and Receptacles and UL 1691.

5. Small wiring, necessary fuse blocks and terminal blocks within the

switchboard shall be furnished as required. Control components mounted within the assembly, such as fuse blocks, relays pushbuttons, switches, etc., shall be suitably marked for identification corresponding to appropriate designations on manufacturer's wiring diagrams.

6. Where applicable all control wire shall be type SIS, bundled and secured with nylon ties. Insulated locking spade terminals shall be provided integral to a device. All current transformer secondary leads shall first be connected to conveniently accessible short-circuit terminal blocks before connection to any other device. All groups of control wires leaving the switchboard shall be provided with terminal blocks with suitable numbering strips. Provide wire markers at each end of all control wiring.

F. Ratings: The switchboard's system voltage and amperage shall be as indicated on the Drawings. The switchboard, as a complete unit, shall be given a single integrated equipment rating by the manufacturer of 65,000 amperes minimum or as determined by the Short-Circuit Coordination Study whichever is higher and shall be so labeled. Such rating shall be established by actual tests by the manufacturer on similar equipment available and shall be furnished with the submittal.

G. Main Protective Device:

1. Main protective device shall consist of a molded case circuit breaker as indicated on the Drawings, equipped with individually insulated, braced, and protected connectors, and single phase protection.

2. The circuit breaker shall be operated by a toggle type handle and shall have a quick-make, quick-break over-center switching mechanism that shall be mechanically trip free from the handle so that the contacts cannot be held closed against short circuits and abnormal currents. Tripping due to overload or short circuit shall be clearly indicated by the handle automatically assuming a position midway between the manual "ON" and "OFF" positions. All latch surfaces shall be ground and polished. All poles of a multi-pole breaker shall be so constructed that they open, close, and trip simultaneously.

3. The circuit breaker shall be completely enclosed in a molded case. Non- interchangeable trip breaker shall have the cover sealed; interchangeable trip breaker shall have the trip unit sealed to prevent tampering. Ampere ratings shall be clearly visible. Contacts shall be non-welding silver alloy. Arc extinction shall be accomplished by means of arc chutes consisting of metal grids mounted in an insulating support. Breaker shall be of the bolt-on type; plug-in, plug-on, blow-on, and clamp-on circuit breakers shall not be acceptable.

4. Circuit breakers shall be 80% rated unless indicated on the Drawings to be 100% rated.

5. Circuit breaker shall have a minimum symmetrical interrupting capacity of 65,000 amperes. The interrupting ratings of the circuit breaker shall be at least equal to, or greater than, the available short circuit at the line terminals and not less than those values shown on the Drawings and specified in this specification section or as determined by the Short-Circuit Coordination Study whichever is higher.

6. Circuit breaker shall be listed with UL, conform to the applicable requirements of the latest issue of NEMA Standards Publication No. AB1.

7. Circuit breaker frames 250 ampere and below shall have thermal-magnetic trip units, with inverse time-current characteristics, unless otherwise indicated on the Drawings.

   a) Automatic operation of all circuit breakers shall be obtained by means of thermal-magnetic tripping devices located in each pole providing inverse time delay and instantaneous circuit protection.

   b) Circuit breaker frames shall be ambient compensating in that, as the ambient temperature increases over 40 C, the circuit breaker automatically derates itself to better protect its associated conductor.

   c) Thermal-magnetic circuit breakers 250A and above shall have thermal magnetic interchangeable trip units, unless otherwise indicated on the Drawings.

8. Circuit breaker frames 400 ampere and above shall have microprocessor-based RMS sensing trip units, unless otherwise indicated on the Drawings.

   a) Solid State sensing shall measure true RMS current with capability to measure through to the 21st harmonic. Automatic operation of all circuit breakers shall be obtained by means of solid state tripping elements providing inverse time delay and instantaneous and short-time circuit protection. Continuous current rating shall be adjustable from 20% to 100% of trip unit rating. Long-time delay and instantaneous trip ratings shall also be adjustable. The short time pick-up trip shall have adjustable pick-up settings at definite times and with I2t delay.

   b) Longtime current adjustment shall be possible without the need for a rating plug.

c) Feeder circuit breakers shall be provided with integral ground fault protection. Ground fault pick-up shall be adjustable from 20% to 70% of the breakers maximum continuous current rating, but in no case, be greater than 1200A. Ground fault time delay shall be adjustable with three (3) I2t delay settings.

d) Solid State circuit breakers shall have built-in test ports for testing the long-time delay, instantaneous, and ground fault functions of the breaker by means of a test set.

e) Provide a test set capable of testing all circuit breakers with a built-in test port.

9. Circuit breaker accessories: In addition to single-phase protection, provide shunt trips, bell alarms and auxiliary switches, etc. as may be shown on the Drawings. All accessories shall be UL Listed for field installation.

10. Circuit breaker shall be manufactured by the same manufacturer as the switchboard and factory installed.

11. Where indicated, circuit breakers shall be UL listed for series application.

H. Provide Key interlocks between Generator Switchboard Main and Normal source breaker to prevent inadvertent interconnections and utility back feed or paralleling of unsynchronized sources. Key interlocks shall be as manufactured by KIRK KEY INTERLOCK COMPANY.

I. All exterior and interior steel surfaces of the switchboard shall be properly cleaned and provided with a rust-inhibiting phosphatized coating. Color and finish of the switchboard shall be ANSI 61 gray.

III. NAMEPLATES

A. Provide a switchboard designation engraved nameplate on the face of the switchboard. Each device installed in the switchboard shall be identified with a suitable nameplate, engraved as indicated on the Drawings. Engraved nameplates shall be white phenolic with engraved black letters not less than 3/8" block style. Each wiring termination assembly section shall also be identified with an engraved nameplate i.e.: QUICK CONNECT RECEPTACLES, GENERATOR INCOMING LUGS, GENERATOR BREAKER, etc.

B. Furnish a master nameplate giving switchboard designation, voltage ampere rating, short-circuit rating, manufacturer’s name, general order number, item number and other manufacturer’s required information.

C. Provide a set of permanent operating instructions affixed to the switchboard having simple instructions for operation. Through the inclusion of these instructions, any qualified generator technician can operate the mechanisms include in the assembly.

IV. SURGE PROTECTION DEVICE

A. Provide surge protective devices (SPD) as specified in Section 16418.

Part 3 - Execution

I. INSTALLATION

A. The switchboard shall be installed in accordance with the manufacturer's recommendations and as shown on the Drawings.

B. The Contractor shall furnish and install a four (4) inch high by six (6) inch greater all sides (except rear when the switchboard is mounted against a wall) concrete housekeeping pad for the switchboard.

C. The assembly shall be provided with adequate lifting means and shall be capable of being moved into installation position and bolted directly to Contractor-supplied floor sills to be set level in concrete per manufacturer's recommendations. All necessary hardware to secure the assembly in place shall be provided by the Contractor.

D. Install units' plumb, level and rigid without distortion to the switchboard cubicles.

E. Switchboard wiring for factory mounted devices shall be installed complete at the factory and adequately bundled and protected. All conductors across hinges, and all conductors for interconnections between shipping units, shall be flexible.

F. Contractor shall install required safety labels.

II. KEY INTERLOCKS

A. Key interlocks shall be factory installed in the Generator Quick Connect Switchboard. Key interlocks shall be factory or field installed in the "normal source" main protective devices and shall not void the UL Listing of the "normal source" protective device. If required, this Contractor shall have the "normal source" device manufacturer's authorized factory engineer or service technician install the Contractor provided key interlock switch.

B. The sequence of operation shall be such that there will be only one key for the interlock sequence. To insert or withdraw the key the protective device must be in the OPEN position with the interlock bolt engaged. To close the protective device the key must be inserted and turned within the lock to withdraw the interlock bolt allowing the protective device to CLOSE. When the protective device is in the CLOSED position the key cannot be removed until the protective device is once again in the OPEN position with the key turned to insert the interlock bolt, locking the device OPEN.

III. START-UP SERVICE AND PERFORMANCE TEST

A. The manufacturer shall provide factory personnel to completely inspect and test the

switchboard(s) for proper installation and operation of all equipment, at the time of system start-up. Testing shall include, but not be limited to, performance testing of the circuit breakers, TVSS, metering, single-phase protection, and ground fault protection systems and equipment.

B. All testing and start-up services shall be in the presence of the Engineer and the Contract Owners Technical Representative (COTR). The tests shall be as stated in the manufacturer's literature. One (1) copy of the tests results shall be submitted to the Engineer and Owner for review.

C. The completed equipment grounding system shall be subjected to a metered test at the switchboard ground bar to ensure that the ground resistance, without chemical treatment or other artificial means, does not exceed five (5) ohms. One (1) copy of the test results shall be submitted to the Engineer and Owner for review.

D. Check tightness of all accessible mechanical and electrical connections to assure they are torqued to the minimum acceptable manufacturer's recommendations.

E. Check the switchboard for proper grounding, fastening and alignment.

IV. FIELD ADMUSTMENTS

A. This Contractor shall perform field adjustments of the protective devices as required to place the equipment in final operating condition. Necessary field settings of devices and adjustments and minor modifications to equipment shall be carried out by this Contractor at no additional cost to the Owner.

B. The settings shall be in accordance with the approved protective device coordination study or as directed by the Engineer.

V. TRAINING

A. This Contractor shall provide eight (8) hours of technical service training to the Owner's technical and maintenance staff.

B. The training session shall be conducted by a manufacturer's qualified representative. The training program shall consist of instruction on operation of the assembly, circuit breakers, metering, and major components within the assembly.

VI. CLEANING

A. Remove debris from switchboard and wipe dust and dirt from all components.

B. Repaint marred and scratched surfaces with touch-up paint to match original finish.

VII. RISER DIAGRAM

A. This Contractor shall furnish one (1) set of the complete as-built power riser diagram showing all switchboards, panelboards, emergency electrical power system equipment,

and their interconnections. The riser diagram shall be laminated and mounted by this Contractor as directed by the Owner at the location of the main distribution switchboard or the generator quick connect switchboard.

END OF SECTION

Distribution Panelboards Section 262416

Part 1 - General

I. REQUIREMENTS

A. The general provisions of the Contract, including General and Supplementary Conditions and General Requirements, apply to the work specified in this Section.

II. SCOPE

A. The work covered under this Section shall include furnishing and installing distribution panelboards complete for all systems as shown on the Drawings and herein specified.

III. SUBMITTALS

A. Product Data: For each type of panelboard, switching and overcurrent protective device, transient voltage suppression device, accessory, and component indicated. Include dimensions and manufacturers' technical data on features, performance, electrical characteristics, ratings, and finishes.

B. Shop Drawings: For each panelboard and related equipment.

1. Include dimensioned plans, elevations, sections, and details. Show tabulations of installed devices, equipment features, and ratings.

2. Detail enclosure types and details for types other than NEMA 250, Type 1.

3. Detail bus configuration, current, and voltage ratings.

4. Short-circuit current rating of panelboards and overcurrent protective devices.

5. Include evidence of NRTL listing for series rating of installed devices.

6. Detail features, characteristics, ratings, and factory settings of individual overcurrent protective devices and auxiliary components.

7. Include wiring diagrams for power, signal, and control wiring.

8. Include time-current coordination curves for each type and rating of overcurrent protective device included in panelboards. Submit on translucent log-log graft paper; include selectable ranges for each type of overcurrent protective device.

9. The results of coordination and short circuit study shall be submitted along with

the submission.

C. Field Quality-Control Reports:

1. Test procedures used.

2. Test results that comply with requirements.

3. Results of failed tests and corrective action taken to achieve test results that comply with requirements.

D. Panelboard Schedules: For installation in panelboards. Submit final versions after load balancing.

E. Operation and Maintenance Data: For panelboards and components to include in emergency, operation, and maintenance manuals. In addition to items specified in Section 017823 "Operation and Maintenance Data," include the following:

1. Manufacturer's written instructions for testing and adjusting overcurrent protective devices.

2. Time-current curves, including selectable ranges for each type of overcurrent protective device that allows adjustments.

IV. QUALITY ASSURANCE

A. Source Limitations: Obtain panelboards, overcurrent protective devices, components, and accessories from single source from single manufacturer.

B. All equipment, materials, and their installation shall conform to the requirements of the National Electrical Code (NEC), local code requirements, and these Specifications.

C. All equipment and materials shall be listed by Underwriter's Laboratories, Inc. (UL) for their intended use and shall bear the UL label.

D. Equipment shall be constructed in accordance with National Electrical Manufacturer's Association (NEMA) standards.

E. Submittals are required in accordance with SECTION 16010 of these Specifications. The manufacturer shall furnish, but not be limited to the following:

1. Circuit breaker and/or fusible switch layout with dimensions and nameplate designation.

2. Circuit breaker trip ratings and frame sizes.

3. Fusible switch units' size, interrupting rating, and fuse rating.

4. Component list.

5. Conduit entry/exit locations.

6. Assembly ratings, including short-circuit rating, voltage, and continuous current

rating.

7. Bus material, including ground bar.

8. Cable terminal sizes.

9. Product data for each type of panelboard.

V. DELIVERY, STORAGE AND HANDLING

A. Deliver material and products in factory labeled packages. Store and handle in strict compliance with manufacturer's instructions and recommendations.

B. Each distribution panelboard section shall be delivered in individual shipping splits and individually wrapped for protection and mounted on shipping skids.

C. Store in a clean, dry space. Maintain factory protection and /or provide an additional heavy canvas or heavy plastic cover to protect structure from dirt, water, construction debris, and traffic. Where applicable, provide adequate heating within enclosures to prevent condensation.

D. Handle in accordance with NEMA PB1.1 and manufacturer's written instructions. Handle carefully to avoid damage to panelboard internal components, enclosure and finish.

VI. PROJECT CONDITIONS

A. Environmental Limitations:

1. Do not deliver or install panelboards until spaces are enclosed and

weathertight, wet work in spaces is complete and dry, work above panelboards is complete, and temporary HVAC system is operating and maintaining ambient temperature and humidity conditions at occupancy levels during the remainder of the construction period.

2. Rate equipment for continuous operation under the following conditions unless otherwise indicated:

a) Ambient Temperature: Not exceeding 23 deg Fto plus 104 deg F.

b) Altitude: Not exceeding 6600 feet.

3. Service Conditions: NEMA PB 1, usual service conditions, as follows:

a) Ambient temperatures within limits specified.

b) Altitude not exceeding 6600 feet.

Part 2 - Products

I. GENERAL REQUIREMENTS FOR PANELBOARDS

A. Enclosures: Flush- and surface-mounted cabinets.

1. Rated for environmental conditions at installed location.

a) Indoor Dry and Clean Locations: NEMA 250, Type 1.

b) Outdoor Locations: NEMA 250, Type 3R.

c) Kitchen or Wash-Down Areas: NEMA 250, Type 4X.

d) Other Wet or Damp Indoor Locations: NEMA 250, Type 4.

e) Indoor Locations Subject to Dust, Falling Dirt, and Dripping Noncorrosive

f) Liquids: NEMA 250, Type 12.

2. Front: Secured to box with concealed trim clamps. For surface-mounted fronts, match box dimensions; for flush-mounted fronts, overlap box. 3. Finishes:

a) Panels and Trim: galvanized steel, factory finished immediately after cleaning and pretreating with manufacturer's standard two-coat, baked-on finish consisting

of prime coat and thermosetting topcoat.

4. Back Boxes: Galvanized steel.

5. Directory Card: Inside panelboard door, mounted in metal frame with transparent protective cover.

B. Incoming Mains Location: Top and/or bottom as determined by the contractor.

C. Phase, Neutral, and Ground Buses:

1. Material: Hard-drawn copper, 98 percent conductivity.

2. Equipment Ground Bus: Adequate for feeder and branch-circuit equipment grounding conductors; bonded to box.

D. Conductor Connectors: Suitable for use with conductor material and sizes.

1. Material: Hard-drawn copper, 98 percent conductivity.

2. Main and Neutral Lugs: Compression type.

3. Ground Lugs and Bus-Configured Terminators: Compression type.

4. Feed-Through Lugs: Compression type, suitable for use with conductor material. Locate at opposite end of bus from incoming lugs or main device.

5. Subfeed (Double) Lugs: Compression type suitable for use with conductor material.

6. Locate at same end of bus as incoming lugs or main device.

E. Service Equipment Label: NRTL labeled for use as service equipment for panelboards or load centers with one or more main service disconnecting and overcurrent protective devices.

F. Future Devices: Mounting brackets, bus connections, filler plates, and necessary appurtenances required for future installation of devices.

G. Panelboard Short-Circuit Current Rating: Fully rated to interrupt symmetrical short-circuit current available at terminals.

II. MANUFACTURERS

A. The distribution switchboard(s) shall be as manufactured by CUTLER-HAMMER,

GENERAL ELECTRIC, SIEMENS, or SQUARE D.

III. PANELBOARDS

A. This Contractor shall furnish and install where indicated on the Drawings, deadfront distribution panelboards incorporating switching and branch circuit protective devices of the number, ratings, and type noted herein or as shown on the Drawings. Panelboards shall have NEMA 1 general purpose enclosures and shall be surface mounted. All distribution panelboards shall be rated for the intended voltage and shall be in accordance with UL's "Standard for Panelboards" and "Standard for Cabinets and Boxes" and shall be so labeled. Distribution panelboards shall also comply with NEMA "Standard PB1 For Panelboards" and the NEC. (Circuit breakers) (Switch and fuse units) shall conform to the paragraph, which follows in these Specifications.

B. Ratings:

1. Distribution panelboards rated 240 Vac or less shall have short-circuit ratings as shown on the Drawings or as determined by the Short- Circuit Coordination Study whichever is higher, but not less than 10,000-amperes RMS symmetrical.

2. Distribution panelboards rated 480 Vac shall have short-circuit ratings as shown on the Drawings or as determined by the Short-Circuit Coordination Study whichever is higher, but not less than 14,000- amperes RMS symmetrical.

3. Distribution panelboards used for service entrance shall have short-circuit ratings as shown on the Drawings or as determined by the Short- Circuit Coordination Study whichever is higher, but not less than 65,000 amperes RMS symmetrical at system voltage and be labeled as service entrance equipment in accordance with UL requirements.

4. Distribution panelboards shall have fully rated or series connected short-circuit rated interrupting ratings as indicated on the drawings and shall be labeled with a

UL short-circuit rating. When series connected ratings are applied with integral or remote upstream devices, a label shall be provided. It shall state the conditions of the UL series connected ratings including:

a) Size and type of upstream device.

b) Branch devices that can be used.

c) UL series short-circuit rating.

C. Interiors:

1. All interiors shall be completely factory assembled with switching and protective devices, wire connectors, etc. All conductor connectors, except screw terminals, shall be of the anti-turn solderless type and all shall be suitable for copper conductors of the sizes indicated

on the Drawings.

2. Interiors shall be designed so that switching and protective devices can be replaced without disturbing adjacent units and without removing the main bus connectors and shall be so designed that circuits may be changed without matching, drilling, or tapping.

D. All distribution panelboards shall be surface mounted on twelve (12) gauge formed steel channel having a cross section dimension at least 1-1/2 inches x 1- 1/2 inches. The channel and fittings shall have a hot dipped galvanized finish to resist rust formation. Channels shall be installed vertically and as detailed on the Drawings.

E. Bus Bars:

1. Bus bars for the mains shall be of copper sized in accordance with UL 67 Standards for temperature rise to limit temperature rise on any current carrying part to a maximum of 65 degrees C above an ambient of 40 degrees C maximum. The bus bars shall be standard density rated for 1000 amperes per square inch copper. Bus bar taps for distribution panelboards with single pole branches shall be arranged for sequence phasing of the branch circuit devices. Busing shall be braced throughout to conform to industry standard practice governing short circuit stresses in panelboards. Phase busing shall be full height without reduction. Cross connectors shall be copper.

2. Phase busing shall be manufactured to accept bolt-on circuit protective devices only.

3. The distribution panelboard shall have fully equipped provision spaces for future protective devices as shown on the Drawings. Remaining space not identified on the Drawings shall be fully bused and pre-drilled for future protective devices that do not have established frame sizes. This is in addition to the scheduled space or spare branches specified or shown on the Drawings.

4. A non-insulated copper ground bus shall be provided for each distribution panelboard.

5. Full size (100% rated) insulated neutral busing shall be included for panelboards shown with a neutral. Neutral busing shall have a suitable lug for each outgoing feeder or branch circuit requiring a neutral connection.

6. Lugs shall be rated for 75 degrees C terminations and shall bolt in place.

F. Backboxes:

1. Backboxes shall be made from unpainted galvanized code gauge steel having no knockouts.

2. Boxes shall have gutter and wiring space sized as required per NEC but not less than four (4) inches on all sides.

3. Backboxes shall also have sufficient space to safely attach clamp-on or split-core current transformers to the feeders for future portable or permanent check metering.

4. Backboxes for multiple (two or more) sections shall be of the same dimensions.

5. Each backbox shall include at least four (4) interior mounting studs.

6. The distribution panelboard identification number shall be on the backbox.

G. Trim: 1. Distribution panelboards having individual switch and fuse units shall have hinged door trims which cover all live parts. Switching device handles shall be accessible. The use of door in a hinged cover type panelboard is prohibited.

2. Doors in distribution panelboard trims shall conform to the following:

a) In making device handles accessible, inboard doors shall not uncover any live parts. Outboard doors shall allow hinged access to the interior panel wiring without removal of the panel door assembly.

b) Doors shall have a semi-flush type cylinder lock and catch. Door hinges shall be concealed. Two (2) keys shall be furnished for each distribution panelboard door and all locks shall be keyed as requested by the Owner to match current standard. The outer door shall be keyed separately. Directory frame and card, having a transparent cover, shall be furnished on the inside of each door.

c) Directory cards shall be neatly typewritten indicating each branch circuit number and assignment. The assignment designation shall include the final room number(s) assigned by the Owner. Do not use the architectural room numbers shown on the Drawings. The directory cards shall also include the source (switchboard, panelboard, etc., with circuit number) feeding the panel.

3. The trims shall be fabricated from code gauge sheet steel.

4. All of the distribution panelboard's steel surfaces, exterior and interior shall be properly cleaned and finished with the manufacturer's standard paint over a rust-inhibiting phosphatized coating. The finish paint shall be of a type to which field applied paint will adhere.

5. Trims shall be mountable by a screwdriver without the need for special tools.

IV. CIRCUIT BREAKERS

A. Electrical circuits shall be protected by molded case circuit breakers as indicated on the Drawings.

B. The circuit breakers shall be operated by a toggle type handle and shall have a quick-make, quick-break over-center switching mechanism that shall be mechanically trip free from the handle so that the contacts cannot be held closed against short circuits and abnormal currents. Tripping due to overload or short circuit shall be clearly indicated by the handle automatically assuming a position midway between the manual "ON" and "OFF" positions. All latch surfaces shall be ground and polished. All poles of a multi-pole breaker shall be so constructed that they open, close, and trip simultaneously.

C. The circuit breakers shall be completely enclosed in a molded case. Non- interchangeable trip breakers shall have their covers sealed; interchangeable trip breakers shall have the trip unit sealed to prevent tampering. Ampere ratings shall be clearly visible. Contacts shall be non-welding silver alloy. Arc extinction shall be accomplished by means of arc chutes consisting of metal grids mounted in an insulating support. Breakers shall be of the bolt-on type; plug-in, plug-on, blow-on, and clamp-on circuit breakers shall not be acceptable.

D. Circuit breakers shall be 80% rated unless indicated on the Drawings to be 100% rated.

E. Circuit breakers shall have a minimum symmetrical interrupting capacity as indicated on the Drawings. The interrupting ratings of the circuit breakers shall be at least equal to, or greater than, the available short circuit at the line terminals and not less than those values shown on the Drawings and specified in this specification section or as determined by the Short-Circuit Coordination Study whichever is higher.

F. Circuit breakers shall be listed with UL, conform to the applicable requirements of the latest issue of NEMA Standards Publication No. AB1.

G. Circuit breakers shall have thermal-magnetic trip units, with inverse time-current characteristics, unless otherwise noted on the Drawings and/or specified herein.

1. Automatic operation of all circuit breakers shall be obtained by means of thermal-magnetic tripping devices located in each pole providing inverse time delay and instantaneous circuit protection. Instantaneous pick-up settings for each phase shall be adjustable on all frames 250A and above.

2. Circuit breakers shall be ambient compensating in that, as the ambient temperature increases over 40 C, the circuit breaker automatically derates itself to better protect its associated conductor.

3. Circuit breakers 250A and above shall have thermal adjustable magnetic interchangeable trip units.

H. Circuit breaker frames 400 ampere and above shall have microprocessor-based RMS sensing

trip units on 480 volt systems and on 208 volt systems where indicated on the Drawings.

1. Solid State sensing shall measure true RMS current with capability to measure through to the 21st harmonic. Automatic operation of all circuit breakers shall be obtained by means of solid state tripping elements providing inverse time delay and instantaneous and short-time circuit protection. Continuous current rating shall be adjustable from 20% to 100% of trip unit rating. Long-time delay and instantaneous trip ratings shall also be adjustable. The short time pick-up trip shall have adjustable pick-up settings at definite times and with I2t delay.

2. Long time current adjustment shall be possible without the need for a rating plug.

3. Main and feeder circuit breakers shall be provided with integral ground fault protection in 480-volt distribution panels. Ground fault pick-up shall be adjustable from 20% to 70% of the breakers maximum continuous current rating, but in no case, be greater than 1200A. Ground fault time delay shall be adjustable with three (3) I2t delay settings.

4. Solid State circuit breakers shall have built-in test ports for testing the long-time delay, instantaneous, and ground fault functions (if equipped) of the breaker by means of a test set.

5. Provide one (1) test set capable of testing all circuit breakers with a built- in test port.

I. Service entrance panelboards shall utilize a molded case main circuit breaker (MCB) equipped with individual insulated, braced and protected connectors, and single phase protection. The circuit breaker shall use a solid-state trip furnished with a plug-in or panel mounted metering device. This device shall simultaneously display all three phase currents, as well as average current, ground current, and phase unbalance. In addition, it shall display date, time and type (overload, short circuit or ground fault) of trip for the most recent five (5) events.

J. Circuit breaker accessories: Provide shunt trips, bell alarms and auxiliary switches, etc. as may be shown on the Drawings. All accessories shall be UL Listed for field installation.

K. Circuit breakers shall be manufactured by the same manufacturer as the panelboard and factory installed.

L. Where indicated, circuit breakers shall be UL listed for series application.

V. SWITCH AND FUSE UNITS

A. The switch and fuse units shall be quick-make, quick-break type. The units shall be listed by UL for service entrance use where applicable. Each unit shall be enclosed in a

separate steel enclosure. The enclosure shall employ a hinged cover for access to the fuses which shall be interlocked with the operating handle to prevent opening the cover when the

switch is in the ON position. This interlock shall be constructed so that it can be released with a standard electrician's tool for testing fuses without interrupting service. The units shall have padlocking provisions in the OFF position and the operating handle position shall give switch position indication, i.e., horizontal OFF, diagonal ON. Units 30 ampere through 600 ampere shall be rated not less than 100 kAIC with rejection type clips for Class R type fuses. Fuses shall be furnished and installed by this Contractor.

B. Switch and fuse units shall be manufactured by the same manufacturer as the panelboard and factory installed.

VI. MULTIPLE SECTION PANELBOARDS

A. Panelboards with two (2) or more sections shall have sub-feed lugs or thru-feed lugs in all but one (1) section of the panelboard, unless otherwise shown on the Drawings. Lugs shall have same capacity as incoming mains. Cable interconnections shall be field installed.

VII. NAMEPLATES

A. Panelboards shall have nameplates of 1/16-inch thick laminated plastic with 3/16-inch-high white letters on a black background. Nameplates shall identify the panelboard and shall be mounted on the front top of the enclosure.

B. Circuit protective devices shall each have nameplates of 1/16-inch-thick laminated plastic with 1/8-inch-high white letters on a black background. Nameplates shall be mounted in a manner to that above.

VIII. SURGE PROTECTIVE DEVICE (SPD)

A. Provide surge protective devices (SPD) as specified in Section 16418.

Part 3 - Execution

III. EXAMINATION

A. Receive, inspect, handle, and store panelboards according to NEMA PB 1.1.

B. Examine panelboards before installation. Reject panelboards that are damaged or rusted or have been subjected to water saturation.

C. Examine elements and surfaces to receive panelboards for compliance with installation tolerances and other conditions affecting performance of the Work.

D. Proceed with installation only after unsatisfactory conditions have been corrected.

IV. INSTALLATION

A. Before installing panelboards, check all of the Drawings for possible conflict of space and adjust the location of the panelboard to prevent such conflict with other items. Panelboard

locations in electrical rooms and other spaces shall closely follow the layouts shown on the Drawings, leaving sufficient space on walls for future installations of panelboards and/or other electrical equipment.

B. Panelboards shall be securely mounted to steel framing channel at locations shown on Drawings. Construction shall be such that additional conduits can be added for future requirements.

C. The cabinets and enclosures shall be mounted in accordance with the NEC. This Contractor shall furnish all materials necessary for mounting the panelboards.

D. Install units plumb, level and rigid without distortion to the distribution panelboard.

E. Panelboard interiors shall be factory assembled with circuit breakers, wire connectors, etc. Circuit breakers shall be sequence numbered to correspond with the panelboard directory.

F. Connect the SPD to the appropriate circuit breaker.

G. Contractor shall install required safety labels.

V. START-UP SERVICE AND PERFORMANCE TEST FOR SERVICE ENTRANCE DISTRIBUTION PANELBOARDS

A. The manufacturer shall provide factory personnel to completely inspect and test the service entrance panelboard(s) for proper installation and operation of all equipment, at the time of system start-up. Testing shall include, but not be limited to, performance testing of the circuit breakers, fused switches (if equipped), SPDs, metering, single phase protection, and ground fault protection systems and equipment.

B. All testing and start-up services shall be in the presence of the Engineer and the Contract Owners Technical Representative (COTR). The tests shall be as stated in the manufacturer's literature. One (1) copy of the tests results shall be submitted to the Engineer and Owner for review.

C. The completed equipment grounding system shall be subjected to a metered test at the service entrance panelboard ground bar to ensure that the ground resistance, without chemical treatment or other artificial means, does not exceed five (5) ohms. One (1) copy of the test results shall be submitted to the Engineer and Owner for review.

VI. FIELD TESTS

A. Check tightness of all accessible mechanical and electrical connections to assure they are torqued to the minimum acceptable manufacturer's recommendations.

B. Check all panelboards for proper grounding, fastening and alignment.

VII. FIELD ADJUSTMENTS

A. This Contractor shall perform field adjustments of the protective devices as required to place

the equipment in final operating condition. Necessary field settings of devices and

adjustments and minor modifications to equipment shall be carried out by this Contractor at no additional cost to the Owner.

B. The settings shall be in accordance with the approved protective device coordination study or as directed by the Engineer.

VIII. TRAINING

A. This Contractor shall provide eight (8) hours of technical service training to the Owner's technical and maintenance staff.

B. The training session shall be conducted by a manufacturer's qualified representative. The training program shall consist of instruction on operation of the assembly, circuit breakers, fused switches (if equipped), metering, and major components within the assembly.

IX. CLEANING

A. Remove debris from panelboards and wipe dust and dirt from all components.

B. Repaint marred and scratched surfaces with touch-up paint to match original finish.

X. EXISTING DISTRIBUTION PANELBOARDS

A. This Contractor shall clean, adjust, and tighten all feeder and branch circuit connections (new and existing) and provide new typewritten directories (as described above) in all existing distribution panelboards that is associated with work on this project. Distribution panelboards not associated with work on this project are not subject to the requirement.

END OF SECTION

Part 1 - General

I. REQUIREMENTS

A. The general provisions of the Contract, including General and Supplementary Conditions and General Requirements, apply to the work specified in this Section.

II. SCOPE

A. The work covered under this Section shall include furnishing and installing distribution panelboards complete for all systems as shown on the Drawings and herein specified.

III. SUBMITTALS

A. Product Data: For each type of panelboard, switching and overcurrent protective device, transient voltage suppression device, accessory, and component indicated. Include dimensions and manufacturers' technical data on features, performance, electrical characteristics, ratings, and finishes.

B. Shop Drawings: For each panelboard and related equipment.

1. Include dimensioned plans, elevations, sections, and details. Show tabulations of installed devices, equipment features, and ratings.

2. Detail enclosure types and details for types other than NEMA 250, Type 1.

3. Detail bus configuration, current, and voltage ratings.

4. Short-circuit current rating of panelboards and overcurrent protective devices.

5. Include evidence of NRTL listing for series rating of installed devices.

6. Detail features, characteristics, ratings, and factory settings of individual overcurrent protective devices and auxiliary components.

7. Include wiring diagrams for power, signal, and control wiring.

8. Include time-current coordination curves for each type and rating of overcurrent protective device included in panelboards. Submit on translucent log-log graft paper; include selectable ranges for each type of overcurrent protective device.

9. The results of coordination and short circuit study shall be submitted along with the submission.

C. Field Quality-Control Reports:

1. Test procedures used.

2. Test results that comply with requirements.

3. Results of failed tests and corrective action taken to achieve test results that comply with requirements.

D. Panelboard Schedules: For installation in panelboards. Submit final versions after load balancing.

E. Operation and Maintenance Data: For panelboards and components to include in emergency, operation, and maintenance manuals. In addition to items specified in Section 017823 "Operation and Maintenance Data," include the following:

1. Manufacturer's written instructions for testing and adjusting overcurrent protective devices.

2. Time-current curves, including selectable ranges for each type of overcurrent protective device that allows adjustments.

IV. QUALITY ASSURANCE

A. Source Limitations: Obtain panelboards, overcurrent protective devices, components, and accessories from single source from single manufacturer.

B. All equipment, materials, and their installation shall conform to the requirements of the National Electrical Code (NEC), local code requirements, and these Specifications.

C. All equipment and materials shall be listed by Underwriter's Laboratories, Inc. (UL) for their intended use and shall bear the UL label.

D. Equipment shall be constructed in accordance with National Electrical Manufacturer's Association (NEMA) standards.

E. Submittals are required in accordance with SECTION 16010 of these Specifications. The manufacturer shall furnish, but not be limited to the following:

1. Circuit breaker and/or fusible switch layout with dimensions and nameplate designation.

2. Circuit breaker trip ratings and frame sizes.

3. Fusible switch units’ size, interrupting rating, and fuse rating.

4. Component list.

5. Conduit entry/exit locations.

6. Assembly ratings, including short-circuit rating, voltage, and continuous current

rating.

7. Bus material, including ground bar.

8. Cable terminal sizes.

9. Product data for each type of panelboard.

V. DELIVERY, STORAGE AND HANDLING

A. Deliver material and products in factory labeled packages. Store and handle in strict compliance with manufacturer's instructions and recommendations.

B. Each distribution panelboard section shall be delivered in individual shipping splits and individually wrapped for protection and mounted on shipping skids.

C. Store in a clean, dry space. Maintain factory protection and /or provide an additional heavy canvas or heavy plastic cover to protect structure from dirt, water, construction debris, and traffic. Where applicable, provide adequate heating within enclosures to prevent condensation.

D. Handle in accordance with NEMA PB1.1 and manufacturer's written instructions. Handle carefully to avoid damage to panelboard internal components, enclosure and finish.

VI. PROJECT CONDITIONS

A. Environmental Limitations:

1. Do not deliver or install panelboards until spaces are enclosed and weathertight, wet work in spaces is complete and dry, work above panelboards is complete, and temporary HVAC system is operating and maintaining ambient temperature and humidity conditions at occupancy levels during the remainder of the construction period.

2. Rate equipment for continuous operation under the following conditions unless otherwise indicated:

a) Ambient Temperature: Not exceeding 23 deg Fto plus 104 deg F.

b) Altitude: Not exceeding 6600 feet.

3. Service Conditions: NEMA PB 1, usual service conditions, as follows:

a) Ambient temperatures within limits specified.

b) Altitude not exceeding 6600 feet.

Part 2 - Products

I. GENERAL REQUIREMENTS FOR PANELBOARDS

A. Enclosures: Flush- and surface-mounted cabinets.

1. Rated for environmental conditions at installed location.

a) Indoor Dry and Clean Locations: NEMA 250, Type 1.

b) Outdoor Locations: NEMA 250, Type 3R.

c) Kitchen or Wash-Down Areas: NEMA 250, Type 4X.

d) Other Wet or Damp Indoor Locations: NEMA 250, Type 4.

e) Indoor Locations Subject to Dust, Falling Dirt, and Dripping Noncorrosive

f) Liquids: NEMA 250, Type 12.

2. Front: Secured to box with concealed trim clamps. For surface-mounted fronts, match box dimensions; for flush-mounted fronts, overlap box.
3. Finishes:

a) Panels and Trim: galvanized steel, factory finished immediately after cleaning and pretreating with manufacturer's standard two-coat, baked-on finish consisting of prime coat and thermosetting topcoat.

4. Back Boxes: Galvanized steel.

5. Directory Card: Inside panelboard door, mounted in metal frame with transparent protective cover.

B. Incoming Mains Location: Top and/or bottom as determined by the contractor.

C. Phase, Neutral, and Ground Buses:

1. Material: Hard-drawn copper, 98 percent conductivity.

2. Equipment Ground Bus: Adequate for feeder and branch-circuit equipment grounding conductors; bonded to box.

D. Conductor Connectors: Suitable for use with conductor material and sizes.

1. Material: Hard-drawn copper, 98 percent conductivity.

2. Main and Neutral Lugs: Compression type.

3. Ground Lugs and Bus-Configured Terminators: Compression type.

4. Feed-Through Lugs: Compression type, suitable for use with conductor material. Locate at opposite end of bus from incoming lugs or main device.

5. Subfeed (Double) Lugs: Compression type suitable for use with conductor material.

6. Locate at same end of bus as incoming lugs or main device.

E. Service Equipment Label: NRTL labeled for use as service equipment for panelboards or load centers with one or more main service disconnecting and overcurrent protective devices.

F. Future Devices: Mounting brackets, bus connections, filler plates, and necessary appurtenances required for future installation of devices.

G. Panelboard Short-Circuit Current Rating: Fully rated to interrupt symmetrical short-circuit current available at terminals.

II. MANUFACTURERS

A. The distribution switchboard(s) shall be as manufactured by CUTLER-HAMMER, GENERAL ELECTRIC, SIEMENS, or SQUARE D.

III. PANELBOARDS

A. This Contractor shall furnish and install where indicated on the Drawings, deadfront distribution panelboards incorporating switching and branch circuit protective devices of the number, ratings, and type noted herein or as shown on the Drawings. Panelboards shall have NEMA 1 general purpose enclosures and shall be surface mounted. All distribution panelboards shall be rated for the intended voltage and shall be in accordance with UL's "Standard for Panelboards" and "Standard for Cabinets and Boxes" and shall be so labeled. Distribution panelboards shall also comply with NEMA "Standard PB1 For Panelboards" and the NEC. (Circuit breakers) (Switch and fuse units) shall conform to the paragraph, which follows in these Specifications.

B. Ratings:

1. Distribution panelboards rated 240 Vac or less shall have short-circuit ratings as shown on the Drawings or as determined by the Short- Circuit Coordination Study whichever is higher, but not less than 10,000-amperes RMS symmetrical.

2. Distribution panelboards rated 480 Vac shall have short-circuit ratings as shown on the Drawings or as determined by the Short-Circuit Coordination Study whichever is higher, but not less than 14,000- amperes RMS symmetrical.

3. Distribution panelboards used for service entrance shall have short-circuit ratings as shown on the Drawings or as determined by the Short- Circuit Coordination Study whichever is higher, but not less than 65,000 amperes RMS symmetrical at system voltage and be labeled as service entrance equipment in accordance with UL requirements.

4. Distribution panelboards shall have fully rated or series connected short-circuit rated interrupting ratings as indicated on the drawings and shall be labeled with a

UL short-circuit rating. When series connected ratings are applied with integral or remote upstream devices, a label shall be provided. It shall state the conditions of the UL series connected ratings including:

a) Size and type of upstream device.

b) Branch devices that can be used.

c) UL series short-circuit rating.

C. Interiors:

1. All interiors shall be completely factory assembled with switching and protective devices, wire connectors, etc. All conductor connectors, except screw terminals, shall be of the anti-turn solderless type and all shall be suitable for copper conductors of the sizes indicated on the Drawings.

2. Interiors shall be designed so that switching and protective devices can be replaced without disturbing adjacent units and without removing the main bus connectors and shall be so designed that circuits may be changed without matching, drilling, or tapping.

D. All distribution panelboards shall be surface mounted on twelve (12) gauge formed steel channel having a cross section dimension at least 1-1/2 inches x 1- 1/2 inches. The channel and fittings shall have a hot dipped galvanized finish to resist rust formation. Channels shall be installed vertically and as detailed on the Drawings.

E. Bus Bars:

1. Bus bars for the mains shall be of copper sized in accordance with UL 67 Standards for temperature rise to limit temperature rise on any current carrying part to a maximum of 65 degrees C above an ambient of 40 degrees C maximum. The bus bars shall be standard density rated for 1000 amperes per square inch copper. Bus bar taps for distribution panelboards with single pole branches shall be arranged for sequence phasing of the branch circuit devices. Busing shall be braced throughout to conform to industry standard practice governing short circuit stresses in panelboards. Phase busing shall be full height without reduction. Cross connectors shall be copper.

2. Phase busing shall be manufactured to accept bolt-on circuit protective devices only.

3. The distribution panelboard shall have fully equipped provision spaces for future protective devices as shown on the Drawings. Remaining space not identified on the Drawings shall be fully bused and pre-drilled for future protective devices that do not have established frame sizes. This is in addition to the scheduled space or spare branches specified or shown on the Drawings.

4. A non-insulated copper ground bus shall be provided for each distribution panelboard.

5. Full size (100% rated) insulated neutral busing shall be included for panelboards shown with a neutral. Neutral busing shall have a suitable lug for each outgoing feeder or branch circuit requiring a neutral connection.

6. Lugs shall be rated for 75 degrees C terminations and shall bolt in place.

F. Backboxes:

1. Backboxes shall be made from unpainted galvanized code gauge steel having no knockouts.

2. Boxes shall have gutter and wiring space sized as required per NEC but not less than four (4) inches on all sides.

3. Backboxes shall also have sufficient space to safely attach clamp-on or split-core current transformers to the feeders for future portable or permanent check metering.

4. Backboxes for multiple (two or more) sections shall be of the same dimensions.

5. Each backbox shall include at least four (4) interior mounting studs.

6. The distribution panelboard identification number shall be on the backbox.

G. Trim:

1. Distribution panelboards having individual switch and fuse units shall have hinged door trims which cover all live parts. Switching device handles shall be accessible. The use of door in a hinged cover type panelboard is prohibited.

2. Doors in distribution panelboard trims shall conform to the following:

a) In making device handles accessible, inboard doors shall not uncover any live parts. Outboard doors shall allow hinged access to the interior panel wiring without removal of the panel door assembly.

b) Doors shall have a semi-flush type cylinder lock and catch. Door hinges shall be concealed. Two (2) keys shall be furnished for each distribution panelboard door and all locks shall be keyed as requested by the Owner to match current standard. The outer door shall be keyed separately. Directory frame and card, having a transparent cover, shall be furnished on the inside of each door.

c) Directory cards shall be neatly typewritten indicating each branch circuit number and assignment. The assignment designation shall include the final room number(s) assigned by the Owner. Do not use the architectural room numbers shown on the Drawings. The directory cards shall also include the source (switchboard, panelboard, etc., with circuit number) feeding the panel.

3. The trims shall be fabricated from code gauge sheet steel.

4. All of the distribution panelboard's steel surfaces, exterior and interior shall be properly cleaned and finished with the manufacturer's standard paint over a rust-inhibiting phosphatized coating. The finish paint shall be of a type to which field applied paint will adhere.

5. Trims shall be mountable by a screwdriver without the need for special tools.

IV. CIRCUIT BREAKERS

A. Electrical circuits shall be protected by molded case circuit breakers as indicated on the Drawings.

B. The circuit breakers shall be operated by a toggle type handle and shall have a quick-make, quick-break over-center switching mechanism that shall be mechanically trip free from the handle so that the contacts cannot be held closed against short circuits and abnormal currents. Tripping due to overload or short circuit shall be clearly indicated by the handle automatically assuming a position midway between the manual "ON" and "OFF" positions. All latch surfaces shall be ground and polished. All poles of a multi-pole breaker shall be so constructed that they open, close, and trip simultaneously.

C. The circuit breakers shall be completely enclosed in a molded case. Non-interchangeable trip breakers shall have their covers sealed; interchangeable trip breakers shall have the trip unit sealed to prevent tampering. Ampere ratings shall be clearly visible. Contacts shall be non-welding silver alloy. Arc extinction shall be accomplished by means of arc chutes consisting of metal grids mounted in an insulating support. Breakers shall be of the bolt-on type; plug-in, plug-on, blow-on, and clamp-on circuit breakers shall not be acceptable.

D. Circuit breakers shall be 80% rated unless indicated on the Drawings to be 100% rated.

E. Circuit breakers shall have a minimum symmetrical interrupting capacity as indicated on the Drawings. The interrupting ratings of the circuit breakers shall be at least equal to, or greater than, the available short circuit at the line terminals and not less than those values shown on the Drawings and specified in this specification section or as determined by the Short-Circuit Coordination Study whichever is higher.

F. Circuit breakers shall be listed with UL, conform to the applicable requirements of the latest issue of NEMA Standards Publication No. AB1.

G. Circuit breakers shall have thermal-magnetic trip units, with inverse time-current characteristics, unless otherwise noted on the Drawings and/or specified herein.

1. Automatic operation of all circuit breakers shall be obtained by means of thermal-magnetic tripping devices located in each pole providing inverse time delay and instantaneous circuit protection. Instantaneous pick-up settings for each phase shall be adjustable on all frames 250A and above.

2. Circuit breakers shall be ambient compensating in that, as the ambient temperature increases over 40 C, the circuit breaker automatically derates itself to better protect its associated conductor.

3. Circuit breakers 250A and above shall have thermal adjustable magnetic interchangeable trip units.

H. Circuit breaker frames 400 ampere and above shall have microprocessor-based RMS sensing trip units on 480 volt systems and on 208 volt systems where indicated on the Drawings.

1. Solid State sensing shall measure true RMS current with capability to measure through to the 21st harmonic. Automatic operation of all circuit breakers shall be obtained by means of solid state tripping elements providing inverse time delay and instantaneous and short-time circuit protection. Continuous current rating shall be adjustable from 20% to 100% of trip unit rating. Long-time delay and instantaneous trip ratings shall also be adjustable. The short time pick-up trip shall have adjustable pick-up settings at definite times and with I2t delay.

2. Long time current adjustment shall be possible without the need for a rating plug.

3. Main and feeder circuit breakers shall be provided with integral ground fault protection in 480-volt distribution panels. Ground fault pick-up shall be adjustable from 20% to 70% of the breakers maximum continuous current rating, but in no case, be greater than 1200A. Ground fault time delay shall be adjustable with three (3) I2t delay settings.

4. Solid State circuit breakers shall have built-in test ports for testing the long-time delay, instantaneous, and ground fault functions (if equipped) of the breaker by means of a test set.

5. Provide one (1) test set capable of testing all circuit breakers with a built- in test port.

I. Service entrance panelboards shall utilize a molded case main circuit breaker (MCB) equipped with individual insulated, braced and protected connectors, and single phase protection. The circuit breaker shall use a solid-state trip furnished with a plug-in or panel mounted metering device. This device shall simultaneously display all three phase currents, as well as average current, ground current, and phase unbalance. In addition, it shall display date, time and type (overload, short circuit or ground fault) of trip for the most recent five (5) events.

J. Circuit breaker accessories: Provide shunt trips, bell alarms and auxiliary switches, etc. as may be shown on the Drawings. All accessories shall be UL Listed for field installation.

K. Circuit breakers shall be manufactured by the same manufacturer as the panelboard and factory installed.

L. Where indicated, circuit breakers shall be UL listed for series application.

V. SWITCH AND FUSE UNITS

A. The switch and fuse units shall be quick-make, quick-break type. The units shall be listed by UL for service entrance use where applicable. Each unit shall be enclosed in a

separate steel enclosure. The enclosure shall employ a hinged cover for access to the fuses which shall be interlocked with the operating handle to prevent opening the cover when the switch is in the ON position. This interlock shall be constructed so that it can be released with a standard electrician's tool for testing fuses without interrupting service. The units shall have padlocking provisions in the OFF position and the operating handle position shall give switch position indication, i.e., horizontal OFF, diagonal ON. Units 30 ampere through 600 ampere shall be rated not less than 100 kAIC with rejection type clips for Class R type fuses. Fuses shall be furnished and installed by this Contractor.

B. Switch and fuse units shall be manufactured by the same manufacturer as the panelboard and factory installed.

VI. MULTIPLE SECTION PANELBOARDS

A. Panelboards with two (2) or more sections shall have sub-feed lugs or thru-feed lugs in all but one (1) section of the panelboard, unless otherwise shown on the Drawings. Lugs shall have same capacity as incoming mains. Cable interconnections shall be field installed.

VII. NAMEPLATES

A. Panelboards shall have nameplates of 1/16-inch thick laminated plastic with 3/16-inch-high white letters on a black background. Nameplates shall identify the panelboard and shall be mounted on the front top of the enclosure.

B. Circuit protective devices shall each have nameplates of 1/16-inch-thick laminated plastic with 1/8-inch-high white letters on a black background. Nameplates shall be mounted in a manner to that above.

VIII. SURGE PROTECTIVE DEVICE (SPD)

A. Provide surge protective devices (SPD) as specified in Section 16418.

Part 3 - Execution

III. EXAMINATION

A. Receive, inspect, handle, and store panelboards according to NEMA PB 1.1.

B. Examine panelboards before installation. Reject panelboards that are damaged or rusted or have been subjected to water saturation.

C. Examine elements and surfaces to receive panelboards for compliance with installation tolerances and other conditions affecting performance of the Work.

D. Proceed with installation only after unsatisfactory conditions have been corrected.

IV. INSTALLATION

A. Before installing panelboards, check all of the Drawings for possible conflict of space and adjust the location of the panelboard to prevent such conflict with other items. Panelboard

locations in electrical rooms and other spaces shall closely follow the layouts shown on the Drawings, leaving sufficient space on walls for future installations of panelboards and/or other electrical equipment.

B. Panelboards shall be securely mounted to steel framing channel at locations shown on Drawings. Construction shall be such that additional conduits can be added for future requirements.

C. The cabinets and enclosures shall be mounted in accordance with the NEC. This Contractor shall furnish all materials necessary for mounting the panelboards.

D. Install units plumb, level and rigid without distortion to the distribution panelboard.

E. Panelboard interiors shall be factory assembled with circuit breakers, wire connectors, etc. Circuit breakers shall be sequence numbered to correspond with the panelboard directory.

F. Connect the SPD to the appropriate circuit breaker.

G. Contractor shall install required safety labels.

V. START-UP SERVICE AND PERFORMANCE TEST FOR SERVICE ENTRANCE DISTRIBUTION PANELBOARDS

A. The manufacturer shall provide factory personnel to completely inspect and test the service entrance panelboard(s) for proper installation and operation of all equipment, at the time of system start-up. Testing shall include, but not be limited to, performance testing of the circuit breakers, fused switches (if equipped), SPDs, metering, single phase protection, and ground fault protection systems and equipment.

B. All testing and start-up services shall be in the presence of the Engineer and the Contract Owners Technical Representative (COTR). The tests shall be as stated in the manufacturer's literature. One (1) copy of the tests results shall be submitted to the Engineer and Owner for review.

C. The completed equipment grounding system shall be subjected to a metered test at the service entrance panelboard ground bar to ensure that the ground resistance, without chemical treatment or other artificial means, does not exceed five (5) ohms. One (1) copy of the test results shall be submitted to the Engineer and Owner for review.

VI. FIELD TESTS

A. Check tightness of all accessible mechanical and electrical connections to assure they are torqued to the minimum acceptable manufacturer's recommendations.

B. Check all panelboards for proper grounding, fastening and alignment.

VII. FIELD ADJUSTMENTS

A. This Contractor shall perform field adjustments of the protective devices as required to place the equipment in final operating condition. Necessary field settings of devices and

adjustments and minor modifications to equipment shall be carried out by this Contractor at no additional cost to the Owner.

B. The settings shall be in accordance with the approved protective device coordination study or as directed by the Engineer.

VIII. TRAINING

A. This Contractor shall provide eight (8) hours of technical service training to the Owner's technical and maintenance staff.

B. The training session shall be conducted by a manufacturer's qualified representative. The training program shall consist of instruction on operation of the assembly, circuit breakers, fused switches (if equipped), metering, and major components within the assembly.

IX. CLEANING

A. Remove debris from panelboards and wipe dust and dirt from all components.

B. Repaint marred and scratched surfaces with touch-up paint to match original finish.

X. EXISTING DISTRIBUTION PANELBOARDS

A. This Contractor shall clean, adjust, and tighten all feeder and branch circuit connections (new and existing) and provide new typewritten directories (as described above) in all existing distribution panelboards that is associated with work on this project. Distribution panelboards not associated with work on this project are not subject to the requirement.

END OF SECTION

Part 1 - General

I. REQUIREMENTS

A. The general provisions of the Contract, including General and Supplementary Conditions and General Requirements, apply to the work specified in this Section.

II. SCOPE

A. The work covered under this Section shall include furnishing and installing circuit breaker type branch circuit panelboards complete for all systems as shown on the Drawings and herein specified.

III. SUBMITTALS

A. Product Data: For each type of panelboard, switching and overcurrent protective device, transient voltage suppression device, accessory, and component indicated. Include dimensions and manufacturers' technical data on features, performance, electrical characteristics, ratings, and finishes.

B. Shop Drawings: For each panelboard and related equipment.

1. Include dimensioned plans, elevations, sections, and details. Show tabulations of installed devices, equipment features, and ratings.

2. Detail enclosure types and details for types other than NEMA 250, Type 1.

3. Detail bus configuration, current, and voltage ratings.

4. Short-circuit current rating of panelboards and overcurrent protective devices.

5. Include evidence of NRTL listing for series rating of installed devices.

6. Detail features, characteristics, ratings, and factory settings of individual overcurrent protective devices and auxiliary components.

7. Include wiring diagrams for power, signal, and control wiring.

8. Include time-current coordination curves for each type and rating of overcurrent protective device included in panelboards. Submit on translucent log-log graft paper; include selectable ranges for each type of overcurrent protective device.

9. The results of coordination and short circuit study shall be submitted along with the submission.

C. Field Quality-Control Reports:

1. Test procedures used.

2. Test results that comply with requirements.

3. Results of failed tests and corrective action taken to achieve test results that comply with requirements.

D. Panelboard Schedules: For installation in panelboards. Submit final versions after load balancing.

E. Operation and Maintenance Data: For panelboards and components to include in emergency, operation, and maintenance manuals. In addition to items specified in Section 017823 "Operation and Maintenance Data," include the following:

1. Manufacturer's written instructions for testing and adjusting overcurrent protective devices.

2. Time-current curves, including selectable ranges for each type of overcurrent protective device that allows adjustments.

IV. QUALITY ASSURANCE

A. General Requirements

1. Source Limitations: Obtain panelboards, overcurrent protective devices, components, and accessories from single source from single manufacturer.

2. Product Selection for Restricted Space: Drawings indicate maximum dimensions for panelboards including clearances between panelboards and adjacent surfaces and other items. Comply with indicated maximum dimensions.

3. All equipment, materials, and their installation shall conform to the requirements of the National Electrical Code (NEC), local code requirements, and these Specifications.

4. All equipment and materials shall be listed by Underwriter's Laboratories, Inc. (UL) for their intended use and shall bear the UL label.

5. Equipment shall be constructed in accordance with National Electrical Manufacturer's Association (NEMA) PB1 standards.

B. Submittals are required in accordance with SECTION 16010 of these Specifications. The manufacturer shall furnish, but not be limited to the following:

1. Circuit breaker layout with dimensions and nameplate designation.

2. Circuit breaker trip ratings and frame sizes.

3. Component list.

4. Conduit entry/exit locations.

5. Assembly ratings, including short-circuit rating, voltage, and continuous current rating.

6. Bus material, including ground bar.

7. Cable terminal sizes.

8. Product data for each type of panelboard.

V. DELIVERY, STORAGE AND HANDLING

A. Deliver material and products in factory labeled packages. Store and handle in strict compliance with manufacturer's instructions and recommendations.

B. Each panelboard section shall be delivered in individual shipping cases and individually wrapped for protection.

C. Store in a clean, dry space. Maintain factory protection and /or provide an additional heavy canvas or heavy plastic cover to protect panelboards from dirt, water, construction debris, and traffic. Where applicable, provide adequate heating within enclosures to prevent condensation.

D. Handle in accordance with NEMA PB1.1 and manufacturer's written instructions. Handle carefully to avoid damage to panelboards internal components, enclosure and finish.

VI. PROJECT CONDITIONS

A. Environmental Limitations:

1. Do not deliver or install panelboards until spaces are enclosed and weathertight, wet work in spaces is complete and dry, work above panelboards is complete, and temporary HVAC system is operating and maintaining ambient temperature and humidity conditions at occupancy levels during the remainder of the construction period.

2. Rate equipment for continuous operation under the following conditions unless otherwise indicated:

a) Ambient Temperature: Not exceeding 23 deg F to plus 104 deg F.

b) Altitude: Not exceeding 6600 feet.

B. Service Conditions: NEMA PB 1, usual service conditions, as follows:

1. Ambient temperatures within limits specified.

2. Altitude not exceeding 6600 feet.

VII. COORDINATION

A. Coordinate layout and installation of panelboards and components with other construction that penetrates walls or is supported by them, including electrical and other types of equipment, raceways, piping, encumbrances to workspace clearance requirements, and adjacent surfaces. Maintain required workspace clearances and required clearances for equipment access doors and panels.

Part 2 - Products

I. MANUFACTURERS

A. The branch circuit panelboards shall be as manufactured by CUTLER-HAMMER, GENERAL ELECTRIC, SIEMENS, or SQUARE D.

II. PANELBOARDS

A. This Contractor shall furnish and install where indicated on the Drawings, deadfront branch circuit panelboards incorporating switching and branch circuit protective devices of the number, ratings, and type noted herein or as shown on the Drawings. Branch circuit panelboards shall have NEMA 1 general purpose enclosures and shall be surface or flush mounted as noted. All branch circuit panelboards shall be rated for the intended voltage and shall be in accordance with UL's "Standard for Panelboards" and "Standard for Cabinets and Boxes" and shall be so labeled. Branch circuit panelboards shall also comply with NEMA "Standard PB1 for Panelboards" and the NEC.

B. Ratings: [ENGINEER, EDIT OUT SHORT-CKT STUDY IF NOT IN PROJECT]

1. Panelboards rated 240 Vac or less shall have short-circuit ratings as shown on the drawings or as determined by the Short-Circuit Coordination Study whichever is higher, but not less than 10,000- amperes RMS symmetrical.

2. Panelboards rated 480 Vac shall have short-circuit ratings as shown on the drawings or as determined by the Short-Circuit Coordination Study whichever is higher, but not less than 14,000-amperes RMS symmetrical.

3. If required, panelboards shall have a fully rated or series connected short-circuit rated interrupting ratings as indicated on the drawings and shall be labeled with a UL short-circuit rating. When series connected, ratings are applied with integral or remote upstream devices, a label shall be provided. It shall state the conditions of the UL series connected ratings including:

a) Size and type of upstream device.

b) Branch devices that can be used.

c) UL series short-circuit rating.

C. Enclosures: Flush- and surface-mounted cabinets.

1. Rated for environmental conditions at installed location.

a) Indoor Dry and Clean Locations: NEMA 250, Type 1.

b) Outdoor Locations: NEMA 250, Type 3R.

c) Kitchen or Wash-Down Areas: NEMA 250, Type 4X.

d) Other Wet or Damp Indoor Locations: NEMA 250, Type 4.

e) Indoor Locations Subject to Dust, Falling Dirt, and Dripping Noncorrosive

III. Liquids: NEMA 250, Type 12.

A. Interiors:

1. All interiors shall be completely factory assembled with switching and protective devices, wire connectors, etc. All conductor connectors, except screw terminals, shall be of the anti-turn solderless type and all shall be suitable for copper conductors of the sizes indicated on the Drawings.

2. Interiors shall be designed so that switching and protective devices can be replaced without disturbing adjacent units and without removing the main bus connectors and shall be so designed that circuits may be changed without matching, drilling, or tapping.

B. Branch circuits shall be arranged using double row construction except where a narrow column width panelboard is required or noted on the Drawings. Branch circuits shall be numbered by the manufacturer.

C. Furnish and install three (3), 3/4 inch and two (2), one inch empty conduits up through the wall and turned out above the ceiling; and three (3), 3/4 inch and two (2), one inch empty conduits down into the ceiling space below the floor for all flush mounted branch circuits panelboards. Where floor slab is on grade, provide only empty conduits to the ceiling.

D. All surface mounted branch circuit panelboards shall be mounted on twelve (12) gauge formed steel channel having a cross section dimension at least 1-1/2 inches x 1-1/2 inches on walls. The channel and fittings shall have a hot dipped galvanized finish to resist rust formation. Channels shall be installed vertically and as detailed on the Drawings.

E. Bus Bars:

1. Bus bars for the mains shall be of copper, Hard-drawn copper, 98 percent

conductivity sized in accordance with UL 67 Standards for temperature rise to limit temperature rise on any current carrying part to a maximum of 65 degrees C above an ambient of 40 degrees C maximum. The bus bars shall be standard density rated for 1000 amperes per square inch copper. Bus bar taps for branch circuit panelboards with single pole branches shall be arranged for sequence phasing of the branch circuit devices. Busing shall be braced throughout to conform to industry standard practice governing short circuit stresses in panelboards. Phase busing shall be full height without reduction. Cross connectors shall be copper. A non-insulated copper ground bus shall be provided for each panelboard.

2. Phase busing shall be manufactured to accept bolt-on circuit breakers only.

3. Spaces for the addition of future switching and protective devices in branch circuit panelboards shall be bussed for the maximum number of devices possible complete with pre-drilled mounting holes and knockouts in the front cover.

4. A non-insulated copper ground bus shall be provided for each branch circuit panelboard.

    a) Equipment Ground Bus: Adequate for feeder and branch-circuit equipment grounding conductors; bonded to box.

5. Full size (100% rated) insulated neutral busing shall be included for panelboards shown with a neutral. Neutral busing shall have a suitable lug for each outgoing feeder or branch circuit requiring a neutral connection.

6. Lugs shall be rated for 75 degrees C terminations and shall bolt in place.

F. Backboxes:

1. Backboxes shall be made from unpainted galvanized code gauge steel having no knockouts.

2. Boxes shall have gutter and wiring space sized as required per NEC but not less than four (4) inches on all sides. Where feeder cables supplying the mains of a panelboard are carried through the box to supply other electrical equipment, the box shall be so sized as to include this wiring space. This wiring space shall be in addition to the minimum gutter space specified above and the limiting width may be increased accordingly.

3. Backboxes shall also have sufficient space to safely attach clamp-on or split-core current transformers to the feeders for future portable or permanent check metering.

4. Backboxes for multiple (two or more) sections shall be of the same dimensions.

5. Each backbox shall include at least four (4) interior mounting studs.

6. The branch circuit panelboard identification number shall be on the backbox.

7. Branch circuit panelboard backboxes shall be of one (1) piece construction.

G. Trim:

1. Hinged doors shall be the door-in-door type covering all switching device handles and all live parts and shall be included in all branch circuit panelboard trims. The use of door in a hinged cover type panelboard is prohibited.

2. Doors in branch circuit panelboard trims shall conform to the following:

a) In making device handles accessible, inboard doors shall not uncover any live parts. Outboard doors shall allow hinged access to the interior panel wiring without removal of the panel door assembly.

b) Doors shall have a semi-flush type cylinder lock and catch. Door hinges shall be concealed. Two (2) keys shall be furnished for each panelboard door and all locks shall be keyed as requested by the Owner to match current standard. The outer door shall be keyed separately. Directory frame and card, having a transparent cover, shall be furnished on the inside of each door.

c) Directory cards shall be neatly typewritten indicating each branch circuit number and assignment. The assignment designation shall include the final room number(s) assigned by the Owner. Do not use the architectural room numbers shown on the Drawings. The director cards shall also include the source (switchboard, panelboard, etc. with circuit number) feeding the panel.

3. The trims shall be fabricated from code gauge sheet steel.

4. All of the panelboard's steel surfaces, exterior and interior shall be properly cleaned and finished with the manufacturer's standard paint over a rust-inhibiting phosphatized coating. The finish paint shall be of a type to which field applied paint will adhere.

5. Trims for flush mounted branch circuit panelboards shall overlap the box by at least 3/4 inches on all sides. Surface trims shall be mountable by a screwdriver without the need for special tools.

H. Conduit skirts shall be provided on surface mounted branch circuit panelboards, where shown on the drawings. Skirts shall be the same width and depth as the panelboard backbox. Screw on skirt covers shall be the same code gauge sheet steel as the panelboard trim and painted with the same finish and color as the panelboard. Skirts shall be from the top of the panelboard to the underside of the finished ceiling and/or

from the bottom of the panelboard to the finished floor concealing all conduits.

IV. CIRCUIT BREAKERS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

1. Eaton Electrical Inc.; Cutler-Hammer Business Unit.

2. General Electric Company; GE Consumer & Industrial - Electrical Distribution.

3. Siemens Energy & Automation, Inc.

4. Square D; a brand of Schneider Electric.

B. Electrical circuits shall be protected by molded case circuit breakers as indicated on the Drawings.
1. Comply with UL 489, with full interrupting capacity to meet available fault currents.

C. The circuit breakers shall be operated by a toggle type handle and shall have a quick-make, quick-break over-center switching mechanism that shall be mechanically trip free from the handle so that the contacts cannot be held closed against short circuits and abnormal currents. Tripping due to overload or short circuit shall be clearly indicated by the handle automatically assuming a position midway between the manual "ON" and "OFF" positions. All latch surfaces shall be ground and polished. All poles of a multi-pole breaker shall be so constructed that they open, close, and trip simultaneously.

D. The circuit breakers shall be completely enclosed in a molded case. Non-interchangeable trip breakers shall have their covers sealed; interchangeable trip breakers shall have the trip unit sealed to prevent tampering. Ampere ratings shall be clearly visible. Contacts shall be non-welding silver alloy. Arc extinction shall be accomplished by means of arc chutes consisting of metal grids mounted in an insulating support. Breakers shall be of the bolt-on type; plug-in, plug-on, blow-on, and clamp-on circuit breakers shall not be acceptable.

E. Circuit breakers shall be 80% rated unless indicated on the Drawings to be 100% rated.

F. Circuit breakers shall have a minimum symmetrical interrupting capacity as indicated on the Drawings. The interrupting ratings of the circuit breakers shall be at least equal to, or greater than, the available short circuit at the line terminals and not less than those values shown on the Drawings and specified in this specification section or as determined by the Short-Circuit Coordination Study whichever is higher.

V. Short Circuit Study (Use as Needed)

A. Circuit breakers shall be listed with UL, conform to the applicable requirements of the

latest issue of NEMA Standards Publication No. AB1.

B. Circuit breakers shall have thermal-magnetic trip units, with inverse time-current characteristics, unless otherwise noted on the Drawings and/or specified herein.

1. Automatic operation of all circuit breakers shall be obtained by means of thermal-magnetic tripping devices located in each pole providing inverse time delay and instantaneous circuit protection. Instantaneous pick-up settings for each phase shall be adjustable on all frames 250A and above.

2. Circuit breakers shall be ambient compensating in that, as the ambient temperature increases over 40 C, the circuit breaker automatically derates itself to better protect its associated conductor.

3. Circuit breakers 250A and above shall have thermal magnetic interchangeable trip units.

4. Ground-Fault Equipment Protection (GFEP) Circuit Breakers: Class B ground-fault protection (30-mA trip).

5. Molded-Case Circuit-Breaker (MCCB) Features and Accessories:

a) Standard frame sizes, trip ratings, and number of poles.

b) Lugs: Compression style, suitable for number, size, trip ratings, and conductor materials.

c) Application Listing: Appropriate for application; Type SWD for switching fluorescent lighting loads; Type HID for feeding fluorescent and high-intensity discharge (HID) lighting circuits.

d) Ground-Fault Protection: Integrally mounted relay and trip unit with adjustable pickup and time-delay settings, push-to-test feature, and ground-fault indicator.

e) Shunt Trip: 120-V trip coil energized from separate circuit, set to trip at 75 percent of rated voltage.

f) Multipole units enclosed in a single housing or factory assembled to operate as a single unit.

g) Handle Padlocking Device: Fixed attachment, for locking circuit-breaker handle in on or off position.

h) Handle Clamp: Loose attachment, for holding circuit-breaker handle in on position.

C. Circuit breaker frames 400 amperes and above shall have microprocessor-based RMS

sensing trip units on 480 volt systems and on 208 volt systems where indicated on the Drawings.

1. Solid State sensing shall measure true RMS current with capability to measure through to the 21st harmonic. Automatic operation of all circuit breakers shall be obtained by means of solid state tripping elements providing inverse time delay and instantaneous and short-time circuit protection. Continuous current rating shall be adjustable from 20% to 100% of trip unit rating. Long-time delay and instantaneous trip ratings shall also be adjustable. The short time pick-up trip shall have adjustable pick-up settings at definite times and with I2t delay.

2. Long time current adjustment shall be possible without the need for a rating plug.

3. Main and feeder circuit breakers shall be provided with integral ground fault protection in 480 volt panels. Ground fault pick-up shall be adjustable from 20% to 70% of the breakers maximum continuous current rating, but in no case, be greater than 1200A. Ground fault time delay shall be adjustable with three (3) I2t delay settings.

4. Solid State circuit breakers shall have built-in test ports for testing the long-time delay, instantaneous, and ground fault functions (if equipped) of the breaker by means of a test set.

5. Provide one test set capable of testing all circuit breakers with a built-in test port, unless previously provided under another section of these specifications.

D. Circuit breaker accessories: Provide shunt trips, bell alarms and auxiliary switches, etc. as may be shown on the drawings. All accessories shall be UL Listed for field installation.

E. Circuit breakers shall be manufactured by the same manufacturer as the panelboard and factory installed.

F. Where indicated, circuit breakers shall be UL listed for series application. (ENGINEER TO EDIT OUT THIS PARAGRAPH IF NOT USING SERIES CONNECTED BREAKERS.)

VI. MULTIPLE SECTION PANELBOARDS

A. Panelboards with two (2) or more panelboard sections, sub-feed lugs or thru- feed lugs shall be used in all but one (1) section of each panelboard, unless otherwise shown on the Drawings. Lugs shall have same capacity as incoming mains. Cable interconnections shall be field installed.

VII. NAMEPLATES

A. Branch circuit panelboards shall have nameplates of 1/16-inch-thick laminated plastic

with 3/16-inch-high white letters on a black background. Nameplates shall identify the branch circuit panelboard and shall be mounted on the front top of the enclosure.

VIII. SURGE PROTECTIVE DEVICE (SPD)

A. Provide surge protective devices (SPD) as specified in Section 16418.

Part 3 - Execution

I. INSTALLATION

A. Install panelboards and accessories according to NEMA PB 1.1.

B. Before installing branch circuit panelboards, this Contractor shall check all of the Drawings for possible conflict of space and adjust the location of the branch circuit panelboard to prevent such conflict with other items. Panelboard locations in electrical rooms and other spaces shall closely follow the layouts shown on the Drawings, leaving sufficient space on walls for future installations of panelboards and/or other electrical equipment.

C. Surface mounted branch circuit panelboards shall be securely mounted to steel framing channel at locations shown on Drawings. Construction shall be such that additional conduits can be added for future requirements. Retain a minimum of 20% space/spare capacity.

D. Mount top of trim 90 inches above finished floor unless otherwise indicated in order to keep the highest breaker at 79” above finished floor.

E. Mount panelboard cabinet plumb and rigid without distortion of box. Mount recessed panelboards with fronts uniformly flush with wall finish and mating with back box.

F. The cabinets and enclosures shall be mounted in accordance with the NEC. This Contractor shall furnish all materials necessary for mounting the branch circuit panelboards.

G. Install units plumb, level and rigid without distortion to the branch circuit panelboard.

H. Branch circuit panelboard interiors shall be factory assembled with circuit breakers, wire connectors, etc. Circuit breakers shall be sequence numbered to correspond with the panelboard directory.

I. Arrange conductors in gutters into groups and bundle and wrap with wire ties after completing load balancing.

J. Comply with NECA 1.

K. Connect the SPD to the appropriate circuit breaker.

L. Contractor shall install required safety labels.

M. The mounting of junction boxes, wire troughs, and auxiliary gutters to the top, bottom or sides of a branch circuit panelboard is prohibited unless approved by the PGCPS technical inspection staff on a case by case basis.

II. FIELD TESTS

A. Check tightness of all accessible mechanical and electrical connections to assure they are torqued to the minimum acceptable manufacturer's recommendations.

B. Check all panelboards for proper grounding, fastening and alignment.

III. FIELD ADJUSTMENTS

A. This Contractor shall perform field adjustments of the protective devices as required to place the equipment in final operating condition. Necessary field settings of devices and adjustments and minor modifications to equipment shall be carried out by this Contractor at no additional cost to the Owner.

B. The settings shall be in accordance with the approved protective device coordination study or as directed by the Engineer.

IV. CLEANING

A. Remove debris from panelboards and wipe dust and dirt from all components.

B. Repaint marred and scratched surfaces with touch-up paint to match original finish.

V. EXISTING BRANCH CIRCUIT PANELBOARDS

A. This Contractor shall clean, adjust, and tighten all feeder and branch circuit connections (new and existing) and provide new dated typewritten directories (as described above) in all existing branch circuit panelboards that are associated with work on this project. Panelboard's not associated with work on this project are not subject to this requirement.

END OF SECTION

Part 1 - General

I. REQUIREMENTS

A. The general provisions of the Contract, including General and Supplementary Conditions and General Requirements, apply to the work specified in this Section.

II. SCOPE

A. The work covered under this Section shall consist of furnishing and installing (a) motor control center(s) as shown on the Drawings and herein specified.

III. SUBMITTALS

A. Product Data: Provide manufacturer's standard catalog pages and data sheets for motor control centers, enclosures, units, overcurrent protective devices, and other installed components and accessories.

1. Include characteristic trip curves for each type and rating of overcurrent protective device upon request.

2. Arc-Resistant Motor Control Centers: Indicate IEEE C37.20.7 accessibility type, and maximum fault current and arc duration.

B. Shop Drawings: Indicate dimensions, voltage, bus ampacities, unit arrangement and sizes, short circuit current ratings, conduit entry locations, conductor terminal information, and installed features and accessories.

1. Include dimensioned plan and elevation views of motor control centers and adjacent equipment with all required clearances indicated.

2. Include wiring diagrams showing all factory and field connections.

3. Clearly indicate whether proposed short circuit current ratings are fully rated or, where acceptable, series rated systems.

4. Include documentation of listed series ratings upon request.

5. Include documentation demonstrating selective coordination upon request.

6. Arc-Resistant Motor Control Centers: Include proposed plenum arrangement, where applicable.

C. Manufacturer's Installation Instructions: Indicate application conditions and limitations of use stipulated by product testing agency. Include instructions for storage, handling, protection, examination, preparation, and installation of product.

D. Field Quality Control Test Reports.

E. Project Record Documents: Record actual installed locations of motor control centers and final equipment settings.

1. Include nameplate data of actual installed motors and associated overload relay selections and settings.

2. Motor Circuit Protectors: Include magnetic instantaneous trip settings.

F. Maintenance Materials: Furnish the following for Owner's use in maintenance of project.

1. See Division 1 - Product Requirements, for additional provisions.

2. Enclosure Keys: Two of each different key

3. Indicating Lights: Two of each different type. Electronic Trip Circuit Breakers: Provide one portable test set.

IV. QUALITY ASSURANCE

A. All equipment, materials, and installation shall conform to the requirements of the National Electrical Code (NEC), state and local codes, and these Specifications.

B. All equipment and material shall be listed by Underwriter's Laboratories, Inc. (UL) for their intended use and shall bear the UL label.

C. Equipment shall be constructed in accordance with National Electrical Manufacturer's Association (NEMA) standards.

D. Submittals are required in accordance with Division 1 of these Specifications.

V. DELIVERY, STORAGE, AND HANDLING

A. Receive, inspect, handle, and store motor control centers in accordance with manufacturer's instructions, NECA 402, and NEMA ICS 2.3.

B. Store in a clean, dry space having a uniform temperature to prevent condensation. Where necessary, provide temporary enclosure space heaters or temporary power for permanent factory-installed space heaters.

C. Maintain factory wrapping or provide an additional heavy canvas or heavy plastic cover to protect units from dirt, water, construction debris, and traffic.

D. Handle carefully to avoid damage to internal components, enclosure, and finish.

Part 2 - Products

I. MANUFACTURER

A. Source Limitations: Furnish motor control centers and associated components produced

by a single manufacturer and obtained from a single supplier.

B. The motor control center shall be as manufactured by CUTLER-HAMMER, GENERAL ELECTRIC, SIEMENS, or SQUARE D.

II. MATERIALS AND COMPONENTS

A. The motor control center shall be designed in accordance with NEMA Standards and shall be NEMA Class IS, Type B-T and shall consist of independent vertical sections, free standing on four (4) inch channel iron sills with sections bolted together to make up the center.

B. The motor control center supply voltage shall be as indicated and/or noted on the Drawings. Adequate ventilation shall be furnished to prevent abnormal starter tripping by the normally rated heater units in each control compartment. The size shall be a maximum of ninety (90) inches overall in height, including the mounting sill. The width of each section shall be a maximum twenty (20) inch structure and shall be arranged for front mounting only and shall not exceed twenty-two (22) inches in depth. Each section shall be dead front and rear access shall not be required for connections. Removable rear plates shall be employed on the rear of the structure. Pan type doors shall be used for all units and future spaces. Doors shall be hinged to the structure with a concealed hinge, and fastened with pressure type fasteners. All door openings shall be gasketed. The top of each section shall have a removable plate for access to the horizontal feeder bus and for conduit entry. Manufacturer's standard gauge steel shall be used throughout the structure including all doors and plates. All painted steelwork shall be treated with a primer coat and finish coat, or bonderized and finished with the manufacturer's standard baked enamel.

C. Each section shall contain three (3) feeder tin-plated copper bus bars, which shall run continuously through the center from section to section. Provisions shall be made for easy addition and connection to adjacent sections. The horizontal bus shall be sized as noted on the Drawings, but with a minimum rating of 600 amps, and 1/4 inch x 2-inch bus bars. The horizontal bus shall be extended with this same capacity the entire length of the center. The horizontal bus shall be braced to withstand minimum 65,000 amps RMS asymmetrical fault current, or as indicated on the Drawings. Each motor control center section shall be furnished with an uninsulated non-current carrying 1/4 inch x 2-inch tin-plated copper bus bar which shall be suitably bolted to related bus bar supports in adjacent sections in order to furnish a separate ground bus. The bus supports shall be formed of high dielectric strength, low moisture-absorbing, high-impact material with ample creepage distance between bus bars. Each section shall contain three (3) vertical tin-plated bus bars running the full working height of the section and connected to the horizontal feeder bus bars. The vertical bus bars shall have a minimum rating of 300 amps and be braced for withstanding 65,000 amps RMS asymmetrical fault current, or as indicated on the Drawings.

D. Each section shall have a top horizontal wiring trough in front of the main horizontal bus and the same wiring trough in back of the horizontal bus in minimum twenty (20) inch depth structures. This wiring trough shall be protected from the horizontal bus bars by means of a steel barrier plate. The wiring trough shall be equipped with cable supports and the structure shall have a cutout in the end for continuous cable runs through the

motor control center. A vertical wiring through shall run the full working height of each section and shall be equipped with cable tie clamps. This vertical wiring trough shall be designed to allow installation of wiring to units with the unit doors open, but with units in place. A minimum of three (3) inches of access between the unit terminal blocks and the side of the structure shall be furnished for the wiring trough.

E. Motor starter units shall be of the combination switch and fuse type and/or instantaneous magnetic trip only circuit breakers for motor short circuit protection of the rating and type as indicated on the Drawings. Units shall be connected to the vertical bus bar in each section with a stab-on power plug connector on the back of the unit. These stab-on connectors shall be free floating silver plated clips, self-aligning and backed up with a steel spring pressure clip. Each unit shall have an engraved identifying nameplate (black letters on a white background) showing the circuit it controls. The unit shall be capable of being withdrawn from the structure with a minimum of difficulty and shall have provisions for being locked in a test position. Control circuit connections shall be made through a pull-apart terminal block. The male portion of the terminal block shall be removable. All spring clips and stabs shall be recessed into the molding for safety and to protect them from being damaged. The male portions of the terminal block shall be entirely separable from the structure and unit, so that it can be wired outside of the structure. The rating of the pull-apart block shall be not less than 30 amps. Motor power lead connections above 30 amps shall be wired into fixed terminal blocks on the unit panels.

III.

A. Indicating lights, pushbuttons, and selector switches shall be furnished as indicated on the Drawings and shall be mounted with the motor starter units on a hinged plate in the unit itself and withdrawn from the unit without the removal of any wiring or elements. Pilot lights shall be the press-to-test type and it shall be possible to test the lamp regardless of whether the overload relay is tripped or in the reset position. Unit support brackets shall be furnished in the structure to properly align the units. Cam latch fasteners shall be employed on each unit to latch the unit in either an engaged or test position in the structure as follows: in the engaged position the stabs shall be connected to the vertical power bus; or in the test position with units withdrawn from the vertical power bus but still supported by the structure. In the test position, the pull-apart terminal block shall be still capable of being engaged for electrical testing purposes. In either engaged or test positions, the cam latching mechanism on the unit shall be capable of being padlocked to prevent unauthorized movement of the unit. Units shall have complete steel top and bottom plates to provide maximum isolation between units. Handles shall be provided on units for ease of withdrawal. Units shall be of modular dimensions so that it is possible to readily interchange units of the same size without modifications to the structure. Operating handles shall be mounted on the unit door. They shall have defeatable door interlocks that prevent the doors from opening with the switch in the ON position. The operating handle shall be arranged for padlocking in the OFF position with up to three (3) padlocks.

IV. MOTOR STARTERS

A. Combination starter units shall be full-voltage non-reversing, unless otherwise shown on the drawings. Starters shall be sized in accordance with NEMA Standards for Industrial Control, except that no smaller than NEMA Size 0 starters shall be employed in any unit. Combination starter units shall utilize motor circuit protector (MCP) circuit breakers

or switch and fuse units as shown on the Drawings and shall conform to the following:

1. Motor Circuit Protectors Description: Instantaneous-trip circuit breakers furnished with magnetic instantaneous tripping elements for short circuit protection, but not with thermal inverse time tripping elements for overload protection; UL 489 recognized only for use as part of a listed combination motor controller with overload protection; ratings, configurations, and features as indicated on the drawings.
2. Each combination unit utilizing motor circuit protectors shall be rated 65,000 AIC symmetrical at rated voltage. The MCP shall provide adjustable magnetic protection, which has an adjustment range that can be set to 1700% motor nameplate full load current to comply with NEC requirements. The magnetic trips shall be adjustable from the front of the MCP. All MCP combination units shall have a “tripped” position on the unit disconnect and a push-to-test button on the MCP. The MCP shall include transient override feature for motor inrush current. The MCP shall be used to provide short circuit coordination to 65,000 amperes.
3. Switch and Fuse Units: Fusible switches shall be quick-make, quick- break and shall accept class R fuses and the combination shall safely interrupt 100,000 amperes. Fusible combination starters shall provide short circuit coordination to 100,000 amperes.

V. OVERCURRENT DEVICES

A. Individual feeder circuit breakers shall be thermal magnetic type and shall have a minimum interrupting capacity of 65,000 AIC at rated voltage or as scheduled on the Drawings.

B. Individual feeder fusible switches shall be quick-make, quick-break gang- operated type using Class “R” fuse clips. The fused switch shall be rated 100,000 AIC at rated voltage. The fusible switch shall have a defeatable door interlocked to prevent the door from opening with the switch in the ON position. The operating handle shall be arranged for padlocking in the OFF position with up to three (3) padlocks.

C. Overcurrent devices shall be dual mounted where possible.

VI. PHASE LOSS PROTECTION

A. The motor control center shall be provided with a full height and width blank section having hinged latching doors for the installation of phase loss monitoring relays. Section shall be provided with all necessary mounting hardware, rails, etc. to accept the phase loss monitoring relays. The phase loss monitoring relays shall be furnished and installed by the Division 15 Contractor. This Contractor shall coordinate the installation and wiring of the phase loss monitor relays.

VII. BRANCH CIRCUIT PANELBOARDS

A. Where shown on the Drawings, provide a branch circuit panelboard within the motor

control center. Panelboard shall be fully rated or UL series-connected rated for 65,000 AIC. Refer to Specification Section 16435 Branch Circuit Panelboards.

VIII. DRY-TYPE TRANSFORMERS

A. Where shown on the Drawings, provide a three-phase dry-type transformer within the motor control center. The transformer shall be located in the bottom unit space of the section due to weight. Transformer rating shall be as shown on the Drawings, but not larger than 45 kVA. The transformers shall include primary and secondary circuit breakers housed behind a single door. The transformer and circuit breaker assembly shall be rated for 65,000 AIC. Refer to Specification Section 16450 Dry-Type Transformers.

IX. 2.8 SURGE PROTECTIVE DEVICE (SPD)

A. Provide surge protective devices (SPD) as specified in Section 16418.

X. NAMEPLATES

A. Motor Control Centers shall have nameplates of 1/16-inch-thick laminated plastic with 3/16-inch-high white letters on a black background. Nameplates shall identify the motor control center and shall be mounted on the front top of the enclosure. Nameplates shall be screw fastened. Adhesive backed, embossed lettering tape is not acceptable.

B. Each device installed in the motor control center shall be identified with a suitable nameplate with 1/8-inch-high white letters on a black background. Nameplates shall be mounted in a manner to that above.

XI. MOTOR CONTROL ACCESSORIES

A. Auxiliary Contacts:

1. Comply with NEMA ICS 5; heavy-duty type.

2. Nominal Size: 30 mm

3. Pushbuttons: Unless otherwise indicated, provide momentary, non-illuminated type with flush button operator; normally open or normally closed as indicated or as required.

4. Selector Switches: Unless otherwise indicated, provide maintained, non-illuminated type with knob operator; number of switch positions as indicated or as required.

5. Indicating Lights: Push-to-test type unless otherwise indicated.

6. Provide LED lamp source for indicating lights and illuminated devices.

B. Control and Timing Relays:

1. Comply with NEMA ICS 5

2. Provide number and type of relays indicated or required to perform necessary functions.

3. Timing Relays: Electronic or pneumatic as indicated.

4. Adjustable Timing Range: As indicated on drawings.

5. Multi-Speed Motor Starters: Employ accelerating relays, decelerating relays, and compelling relays where indicated.

6. Accelerating Relays: Starts motor at low speed and then accelerates automatically through definite time intervals for each successive speed until selected speed is attained.

7. Decelerating Relays: Allows motor to decelerate automatically through definite time intervals for each successive speed until selected speed is attained.

XII. C. Control Power Transformers:

1. Size to accommodate burden of contactor coil(s) and all connected auxiliary devices, plus[1] VA spare capacity as provided by engineer.

2. Include primary and secondary fuses.

B. Control Terminal Blocks: Include 25 percent spare terminals.

Part 3 - Execution

I. INSTALLATION

A. The motor control center shall be installed in accordance with the manufacturer's recommendations and as shown on the Drawings.

B. The Contractor shall furnish and install a four (4) inch high by four (4) inch greater all sides (except rear when the motor control center is mounted against a wall) concrete housekeeping pad for the motor control center.

C. Motor control center wiring for factory mounted devices shall be installed complete at the factory and adequately bundled and protected. All conductors across hinges, and all conductors for interconnections between shipping units, shall be flexible.

D. Rig the motor control center assembly into final location and install on level surface.

E. This Contractor shall provide clearance around equipment in accordance with latest National Electrical Code.

II. FIELD QUALITY CONTROL

A. Check all removable cells and starter units for easy removal and insertion.

B. Perform insulation tests on each phase and verify low-resistance ground connections on ground bus.

C. Connect all wiring and verify basic operation of each starter from the control power source.

D. Torque all bolted connections made in the field and verify all factory bolted connections.

E. Overload relay heater ratings must be properly sized and coordinated for each motor starter unit.

END OF SECTION

Feeder Busway Section 262500

Part 1 - General

I. REQUIREMENTS

A. The general provisions of the Contract, including General and Supplementary Conditions and General Requirements, apply to the work specified in this Section.

II. SCOPE

A. The work under this Section shall include furnishing and installing prefabricated feeder busway distribution system(s) including all necessary fittings, hangers, and accessories as shown on the Drawings and herein specified.

III. ADMINISTRATIVE REQUIREMENTS

A. Coordination:

1. Coordinate the arrangement of busway with structural members, ductwork, piping, equipment and other potential conflicts installed under other sections or by others. Coordinate the work with other trades to avoid installation of obstructions within busway required clearances.

2. Coordinate arrangement of busway with the dimensions and clearance requirements of the actual equipment to be installed.

3. Coordinate the work with placement of supports, anchors, etc. required for mounting.

4. Verify with manufacturer that conductor terminations are suitable for use with the conductors to be installed.

5. Notify Architect of any conflicts with or deviations from the contract documents. Obtain direction before proceeding with work.

6. Preinstallation Meeting: Convene one week prior to performing field measurements for busway fabrication drawings; require attendance of all affected installers. Review proposed routing, sequence of installation, and protection requirements for installed busway.

7. Sequencing: Perform field measurements prior to busway fabrication.

IV. SUBMITTALS

A. Product Data: Provide manufacturer's standard catalog pages and data sheets for

busway system components and accessories. Include dimensions, weight, materials, fabrication details, finishes, and service condition requirements. Indicate voltage and current ratings, short circuit current ratings, configurations, and installed features and accessories.

1. Include busway resistance, reactance, and impedance data and voltage drop ratings.

2. Include characteristic trip curves for each type and rating of circuit breaker plug-in device upon request.

3. Clearly indicate whether proposed short circuit current ratings are fully rated or, where acceptable, series rated systems.

4. Include documentation of listed series ratings upon request.

B. Field Quality Control Test Reports.

1. Manufacturer's Installation Instructions: Indicate application conditions and limitations of use stipulated by product testing agency. Include instructions for storage, handling, protection, examination, preparation, and installation of product.

2. Project Record Documents: Record actual routing of busway. Include actual installed locations of plug-in units.

3. Maintenance Data: Include information on replacement parts and recommended maintenance procedures and intervals.

a) Maintenance Materials: Furnish the following for Owner's use in maintenance of project.

b) See Division 1 - Product Requirements, for additional provisions.

c) Hook Stick(s) for Plug-In Units With Hook Stick Operable Handles: One, with length as required for suitable operation of plug-in unit handle from floor or working platform

V. QUALITY ASSURANCE

A. All equipment, materials, and their installation shall conform to the requirements of the National Electrical Code (NEC), local code requirements, and these Specifications.

B. All equipment and materials shall be listed by Underwriter's Laboratories, Inc. (UL) for their intended use and shall bear the UL label.

C. Equipment shall be constructed in accordance with National Electrical Manufacturer's Association (NEMA) standards.

D. All of the busway components shall be of the same manufacturer and be of the same manufacturer as the switchboard, see SECTION 262413.

E. Manufacturer Qualifications: Company specializing in manufacturing the products specified in this section with minimum five years documented experience.

F. Installer Qualifications: Company specializing in performing the work of this section with minimum five years documented experience with busway systems of similar size, type, and complexity.

G. For the equipment specified herein, the manufacturer shall be ISO 9001 or 9002 certified.

H. Submittals are required in accordance with Division 1 of these Specifications. Submittals shall include, but not be limited to the following:

1. Product data to include all dimensions, weights, electrical ratings, wiring diagrams, required clearances, fittings, hangers and accessories.

2. A dimensioned isometric drawing, prepared by the manufacturer, for each feeder busway system showing the layout for and identification of all required components, including hanger spacing.

3. Cable terminal sizes and ratings.

VI. DELIVERY, STORAGE, AND HANDLING

A. Receive, inspect, handle, and store busway in accordance with manufacturer's instructions, NECA 408, and NEMA BU1.1.

B. Store products indoors in a clean, dry space having a uniform temperature to prevent condensation. Maintain factory wrapping or provide an additional heavy canvas or heavy plastic cover to protect units from dirt, water, construction debris, and traffic.

C. Handle products carefully to avoid damage to internal components, enclosure, and finish.

VII. FIELD CONDITIONS

A. Maintain field conditions within required service conditions during and after installation.

Part 2 - Products

I. MATERIALS AND COMPONENTS

A. This Contractor shall furnish and install prefabricated feeder busway distribution system(s) as shown on the Drawings and as specified herein including all necessary fittings, hangers, and accessories. The feeder busway distribution system(s) shall consist of standard ten (10) foot sections with special sections and fittings provided to suit the installation. Horizontal runs shall be suitable for hanging on ten (10) foot maximum support centers. On vertical runs, one (1) adjustable vertical hanger per floor shall be furnished and installed. The feeder busway shall meet the latest applicable standards of NEMA, ANSI, and UL 857.

B. Busway shall be 277/480 volt, three phase, four wire with 100% neutral and 50% capacity integral (housing) and/or internal ground bus as manufactured by CUTLER-HAMMER, GENERAL ELECTRIC, SIEMENS, or SQUARE D. Feeder busway

ampere rating shall be as noted on the Drawings.

C. The busway shall be of the low impedance type, totally enclosed and non- ventilated for protection against mechanical damage and dust accumulation. The housing shall meet NEC requirements and shall be a 2-piece design fabricated from extruded aluminum. The 2-piece housing shall be bolted together along with bottom flange using grade 5, 1⁄4 x 20 zinc-plated fasteners on 3-inch centers for maximum mechanical strength. The busway enclosure finish shall be ANSI 61 gray baked epoxy powder paint applied by an electrostatic process.

D. Each busway section shall be furnished complete with joint hardware and covers. The joints shall be a single-bolt, non-rotating, removable bridge design. All bridge joints shall be furnished with torque-indicating double head joint bolts and Belleville washers. The bridge joint shall ensure proper installation without the use of a torque wrench. Each joint shall allow for a minimum length adjustment of +\- 0.5 inches. De-energization of busway shall not be required for safe testing of joint tightness. Access to only one side of the busway shall be required for tightening or inspection of the joint. Joint covers shall be provided with captive hardware. It shall be possible to remove any joint connection assembly to allow electrical isolation or physical removal of a busway length without disturbing adjacent busway lengths.

E. Bus bars shall be fabricated from high strength 98% conductivity copper and suitably plated at all electrical contact surfaces. Bus bars shall be insulated over their entire length, except at joints and contact surfaces, with an UL listed insulating material consisting of epoxy applied by fluidized bed process or electrostatically applied Class B (130-degree C. certified) epoxy insulation. Busway shall be of sandwich construction meaning no air gap

shall exist between bus bars except at the joints. Bus bars shall be tin plated at all contact surfaces.

F. Busway[1] shall be braced to withstand engineer recommended maximum RMS symmetrical amperes. The short circuit rating must be based upon actual tests at the rated short-circuit current for six (6) cycles. The busway shall be so designed and tested that at rating no part shall exceed a fifty-five (55) degree C. rise based on a forty (40) degree C. maximum ambient temperature.

G. Three-phase line-to-line voltage drop shall not exceed 3.0 volts per hundred feet at 70% power factor concentrated load, which condition may exist during motor starting. The voltage drop (input voltage minus output voltage) specified shall be based on the busway operating at full rated current and at stabilized operating temperature in 35-degree C. ambient temperature.

H. The busway shall be UL listed to meet two-hour fire ratings for gypsum wallboard construction and three-hour fire rating for poured concrete or concrete block construction.

Part 3 - Execution

I. EXAMINATION

A. Verify that field measurements are as shown on drawings.

B. Verify that the ratings of busway system components are consistent with the indicated requirements.

C. Verify that mounting surfaces are ready to receive busway and associated supports.

D. Verify that conditions are satisfactory for installation prior to starting work.

II. INSTALLATION

A. The feeder busway shall be installed in accordance with the manufacturer's recommendations/instructions, NEMA publication BU1.1 (which shall be shipped with the busway) and the NEC.

B. Busway shall be run as tight as possible to the underside of the building structure and shall be carefully coordinated with all piping, ductwork, other trades and the building structure. Install busway expansion fittings at each location where busway crosses a building expansion joint. Extra care shall be taken to ensure that all components of each busway system remain dry and free from foreign matter during the construction period. Final field measurements shall be made by this Contractor prior to release of the busway for

fabrication.

C. Busway supports shall not terminate or be fastened directly to the roof decking except where specifically approved by the Owner. Busway shall not be supported from the bottom cord of joists unless specifically approved, in writing, by the Structural Engineer of record.

III. TESTING

A. Standard factory tests shall be performed on the equipment provided under this specification section. All tests shall be in accordance with the latest version of ANSI and NEMA standards. The manufacturer shall provide three (3) copies of factory test reports.

B. After completion of each busway system, and prior to energizing, the entire system shall be tested by an independent testing laboratory to ensure that phasing is correct and that there are no electrical faults present. This Contractor shall notify the Architect/Engineer and the Owner two (2) weeks prior to the date the test will performed. Costs associated with this test shall be the responsibility of this Contractor.

END OF SECTION

Part 1 - General

I. REQUIREMENTS

A. The general provisions of the Contract, including General and Supplementary Conditions and General Requirements, apply to the work specified in this Section.

II. SCOPE

A. The work under this Section shall include furnishing and installing prefabricated feeder busway distribution system(s) including all necessary fittings, hangers, and accessories as shown on the Drawings and herein specified.

III. ADMINISTRATIVE REQUIREMENTS

A. Coordination:

1. Coordinate the arrangement of busway with structural members, ductwork, piping, equipment and other potential conflicts installed under other sections or by others. Coordinate the work with other trades to avoid installation of obstructions within busway required clearances.

2. Coordinate arrangement of busway with the dimensions and clearance requirements of the actual equipment to be installed.

3. Coordinate the work with placement of supports, anchors, etc. required for mounting.

4. Verify with manufacturer that conductor terminations are suitable for use with the conductors to be installed.

5. Notify Architect of any conflicts with or deviations from the contract documents. Obtain direction before proceeding with work.

6. Preinstallation Meeting: Convene one week prior to performing field measurements for busway fabrication drawings; require attendance of all affected installers. Review proposed routing, sequence of installation, and protection requirements for installed busway.

7. Sequencing: Perform field measurements prior to busway fabrication.

IV. SUBMITTALS

A. Product Data: Provide manufacturer's standard catalog pages and data sheets for busway system components and accessories. Include dimensions, weight, materials, fabrication details, finishes, and service condition requirements. Indicate voltage and current ratings, short circuit current ratings, configurations, and installed features and accessories.

1. Include busway resistance, reactance, and impedance data and voltage drop ratings.

2. Include characteristic trip curves for each type and rating of circuit breaker plug-in device upon request.

3. Clearly indicate whether proposed short circuit current ratings are fully rated or, where acceptable, series rated systems.

4. Include documentation of listed series ratings upon request.

B. Field Quality Control Test Reports.

1. Manufacturer's Installation Instructions: Indicate application conditions and limitations of use stipulated by product testing agency. Include instructions for storage, handling, protection, examination, preparation, and installation of product.

2. Project Record Documents: Record actual routing of busway. Include actual installed locations of plug-in units.

3. Maintenance Data: Include information on replacement parts and recommended maintenance procedures and intervals.

a) Maintenance Materials: Furnish the following for Owner's use in maintenance of project.

b) See Division 1 - Product Requirements, for additional provisions.

c) Hook Stick(s) for Plug-In Units With Hook Stick Operable Handles: One, with length as required for suitable operation of plug-in unit handle from floor or working platform

V. QUALITY ASSURANCE

A. All equipment, materials, and their installation shall conform to the requirements of the National Electrical Code (NEC), local code requirements, and these Specifications.

B. All equipment and materials shall be listed by Underwriter's Laboratories, Inc. (UL) for their intended use and shall bear the UL label.

C. Equipment shall be constructed in accordance with National Electrical Manufacturer's Association (NEMA) standards.

D. All of the busway components shall be of the same manufacturer and be of the same manufacturer as the switchboard, see SECTION 262413.

E. Manufacturer Qualifications: Company specializing in manufacturing the products specified in this section with minimum five years documented experience.

F. Installer Qualifications: Company specializing in performing the work of this section with minimum five years documented experience with busway systems of similar size, type, and complexity.

G. For the equipment specified herein, the manufacturer shall be ISO 9001 or 9002 certified.

H. Submittals are required in accordance with Division 1 of these Specifications. Submittals shall include, but not be limited to the following:

1. Product data to include all dimensions, weights, electrical ratings, wiring diagrams, required clearances, fittings, hangers and accessories.

2. A dimensioned isometric drawing, prepared by the manufacturer, for each feeder busway system showing the layout for and identification of all required components, including hanger spacing.

3. Cable terminal sizes and ratings.

VI. DELIVERY, STORAGE, AND HANDLING

A. Receive, inspect, handle, and store busway in accordance with manufacturer's instructions, NECA 408, and NEMA BU1.1.

B. Store products indoors in a clean, dry space having a uniform temperature to prevent condensation. Maintain factory wrapping or provide an additional heavy canvas or heavy plastic cover to protect units from dirt, water, construction debris, and traffic.

C. Handle products carefully to avoid damage to internal components, enclosure, and finish.

VII. FIELD CONDITIONS

A. Maintain field conditions within required service conditions during and after installation.

Part 2 - Products

I. MATERIALS AND COMPONENTS

A. This Contractor shall furnish and install prefabricated feeder busway distribution system(s) as shown on the Drawings and as specified herein including all necessary fittings, hangers, and accessories. The feeder busway distribution system(s) shall consist of standard ten (10) foot sections with special sections and fittings provided to suit the installation. Horizontal runs shall be suitable for hanging on ten (10) foot maximum support centers. On vertical runs, one (1) adjustable vertical hanger per floor shall be furnished and installed. The feeder busway shall meet the latest applicable standards of NEMA, ANSI, and UL 857.

B. Busway shall be 277/480 volt, three phase, four wire with 100% neutral and 50% capacity integral (housing) and/or internal ground bus as manufactured by CUTLER-HAMMER, GENERAL ELECTRIC, SIEMENS, or SQUARE D. Feeder busway

ampere rating shall be as noted on the Drawings.

C. The busway shall be of the low impedance type, totally enclosed and non- ventilated for protection against mechanical damage and dust accumulation. The housing shall meet NEC requirements and shall be a 2-piece design fabricated from extruded aluminum. The 2-piece housing shall be bolted together along with bottom flange using grade 5, ¼ x 20 zinc-plated fasteners on 3-inch centers for maximum mechanical strength. The busway enclosure finish shall be ANSI 61 gray baked epoxy powder paint applied by an electrostatic process.

D. Each busway section shall be furnished complete with joint hardware and covers. The joints shall be a single-bolt, non-rotating, removable bridge design. All bridge joints shall be furnished with torque-indicating double head joint bolts and Belleville washers. The bridge joint shall ensure proper installation without the use of a torque wrench. Each joint shall allow for a minimum length adjustment of +\- 0.5 inches. De-energization of busway shall not be required for safe testing of joint tightness. Access to only one side of the busway shall be required for tightening or inspection of the joint. Joint covers shall be provided with captive hardware. It shall be possible to remove any joint connection assembly to allow electrical isolation or physical removal of a busway length without disturbing adjacent busway lengths.

E. Bus bars shall be fabricated from high strength 98% conductivity copper and suitably plated at all electrical contact surfaces. Bus bars shall be insulated over their entire length, except at joints and contact surfaces, with an UL listed insulating material consisting of epoxy applied by fluidized bed process or electrostatically applied Class B (130-degree C. certified) epoxy insulation. Busway shall be of sandwich construction meaning no air gap shall exist between bus bars except at the joints. Bus bars shall be tin plated at all contact surfaces.

F. Busway[1] shall be braced to withstand engineer recommended maximum RMS symmetrical amperes. The short circuit rating must be based upon actual tests at the rated short-circuit current for six (6) cycles. The busway shall be so designed and tested that at rating no part shall exceed a fifty-five (55) degree C. rise based on a forty (40) degree C. maximum ambient temperature.

G. Three-phase line-to-line voltage drop shall not exceed 3.0 volts per hundred feet at 70% power factor concentrated load, which condition may exist during motor starting. The voltage drop (input voltage minus output voltage) specified shall be based on the busway operating at full rated current and at stabilized operating temperature in 35-degree C. ambient temperature.

H. The busway shall be UL listed to meet two-hour fire ratings for gypsum wallboard construction and three-hour fire rating for poured concrete or concrete block construction.

Part 3 - Execution

I. EXAMINATION

A. Verify that field measurements are as shown on drawings.

B. Verify that the ratings of busway system components are consistent with the indicated requirements.

C. Verify that mounting surfaces are ready to receive busway and associated supports.

D. Verify that conditions are satisfactory for installation prior to starting work.

II. INSTALLATION

A. The feeder busway shall be installed in accordance with the manufacturer's recommendations/instructions, NEMA publication BU1.1 (which shall be shipped with the busway) and the NEC.

B. Busway shall be run as tight as possible to the underside of the building structure and shall be carefully coordinated with all piping, ductwork, other trades and the building structure. Install busway expansion fittings at each location where busway crosses a building expansion joint. Extra care shall be taken to ensure that all components of each busway system remain dry and free from foreign matter during the construction period. Final field measurements shall be made by this Contractor prior to release of the busway for fabrication.

C. Busway supports shall not terminate or be fastened directly to the roof decking except where specifically approved by the Owner. Busway shall not be supported from the bottom cord of joists unless specifically approved, in writing, by the Structural Engineer of record.

III. TESTING

A. Standard factory tests shall be performed on the equipment provided under this specification section. All tests shall be in accordance with the latest version of ANSI and NEMA standards. The manufacturer shall provide three (3) copies of factory test reports.

B. After completion of each busway system, and prior to energizing, the entire system shall be tested by an independent testing laboratory to ensure that phasing is correct and that there are no electrical faults present. This Contractor shall notify the Architect/Engineer and the Owner two (2) weeks prior to the date the test will performed. Costs associated with this test shall be the responsibility of this Contractor.

END OF SECTION

Part 1 - General

I. REQUIREMENTS

A. The general provisions of the Contract, including General and Supplementary Conditions and General Requirements, apply to the work specified in this Section.

II. SCOPE

A. The work under this Section shall include furnishing and installing prefabricated track busway distribution system(s) including all necessary fittings, hangers, and accessories as shown on the Drawings and herein specified.

B. The system is primarily for overhead distribution of electrical power to support designated work areas and equipment. Once installed, the busway will provide a simple, versatile, fast and economic means of distributing power. Loads fed from a variety of plug-in units can be easily added or removed without shutting power down to the busway.

III. ADMINISTRATIVE REQUIREMENTS

A. Coordination:

1. Coordinate the arrangement of busway with structural members, ductwork, piping, equipment and other potential conflicts installed under other sections or by others. Coordinate the work with other trades to avoid installation of obstructions within busway required clearances.

2. Coordinate arrangement of busway with the dimensions and clearance requirements of the actual equipment to be installed.

3. Coordinate the work with placement of supports, anchors, etc. required for mounting.

B. Verify with manufacturer that conductor terminations are suitable for use with the conductors to be installed.

C. Notify Architect of any conflicts with or deviations from the contract documents. Obtain direction before proceeding with work.

D. Preinstallation Meeting: Convene one week prior to performing field measurements for busway fabrication drawings; require attendance of all affected installers. Review proposed routing, sequence of installation, and protection requirements for installed busway.

E. Sequencing: Perform field measurements prior to busway fabrication.

IV. SUBMITTALS

A. Product Data: Provide manufacturer's standard catalog pages and data sheets for busway system components and accessories. Include dimensions, weight, materials, fabrication details, finishes, and service condition requirements. Indicate voltage and current ratings, short circuit current ratings, configurations, and installed features and accessories.

1. Include busway resistance, reactance, and impedance data and voltage drop ratings.

2. Include characteristic trip curves for each type and rating of circuit breaker plug-in device upon request.

3. Clearly indicate whether proposed short circuit current ratings are fully rated or, where acceptable, series rated systems.

4. Include documentation of listed series ratings upon request.

B. Field Quality Control Test Reports.

1. Manufacturer's Installation Instructions: Indicate application conditions and limitations of use stipulated by product testing agency. Include instructions for storage, handling, protection, examination, preparation, and installation of product.

2. Project Record Documents: Record actual routing of busway. Include actual installed locations of plug-in units.

3. Maintenance Data: Include information on replacement parts and recommended maintenance procedures and intervals.

4. Maintenance Materials: Furnish the following for Owner's use in maintenance of project.

a) See Division 1 - Product Requirements, for additional provisions.

b) Hook Stick(s) for Plug-In Units With Hook Stick Operable Handles: One, with length as required for suitable operation of plug-in unit handle from floor or working platform

c) Extra Plug-In Unit(s)

V. QUALITY ASSURANCE

A. All equipment, materials, and their installation shall conform to the requirements of the National Electrical Code (NEC), local code requirements, and these Specifications.

B. All equipment and materials shall be listed by Underwriter's Laboratories, Inc. (UL) for their intended use and shall bear the UL label.

C. Equipment shall be constructed in accordance with National Electrical Manufacturer's

Association (NEMA) standards.

D. All of the busway components shall be of the same manufacturer and be of the same manufacturer as the switchboard, see SECTION 262416.

E. Manufacturer Qualifications: Company specializing in manufacturing the products specified in this section with minimum five years documented experience.

F. Installer Qualifications: Company specializing in performing the work of this section with minimum five years documented experience with busway systems of similar size, type, and complexity.

G. For the equipment specified herein, the manufacturer shall be ISO 9001 or 9002 certified.

H. Submittals are required in accordance with Division 1 of these Specifications. Submittals shall include, but not be limited to the following:

1. Product data to include all dimensions, weights, electrical ratings, wiring diagrams, required clearances, fittings, hangers and accessories.

2. A dimensioned isometric drawing, prepared by the manufacturer, for each feeder busway system showing the layout for and identification of all required components, including hanger spacing.

3. Cable terminal sizes and ratings.

VI. DELIVERY, STORAGE, AND HANDLING

A. Receive, inspect, handle, and store busway in accordance with manufacturer's instructions, NECA 408, and NEMA BU1.1.

B. Store products indoors in a clean, dry space having a uniform temperature to prevent condensation. Maintain factory wrapping or provide an additional heavy canvas or heavy plastic cover to protect units from dirt, water, construction debris, and traffic.

C. Handle products carefully to avoid damage to internal components, enclosure, and finish.

VII. QUALITY ASSURANCE

A. All equipment, materials, and their installation shall conform to the requirements of the National Electrical Code (NEC), local code requirements, and these Specifications.

B. All equipment and materials shall be listed by Underwriter's Laboratories, Inc. (UL) for their intended use and shall bear the UL label.

C. Equipment shall be constructed in accordance with National Electrical Manufacturer's Association (NEMA) standards.

D. The manufacturer of the assembly shall be the manufacturer of the major components

within the assembly.

E. Submittals are required in accordance with SECTION 16010 of these Specifications. Submittals shall include, but not be limited to the following:

1. Product data to include all dimensions, weights, electrical ratings (to include short-circuit rating, voltage and continuous current), wiring diagrams, power details, required clearances, fittings, hangers and accessories.

2. Circuit breaker and cable schedule include cable lengths, plug-in unit schedules with type and quantity of devices (if applicable).

3. A dimensioned drawing, prepared by the manufacturer, for each track busway system showing the layout for and identification of all required components, including hanger spacing.

4. Cable terminal sizes and ratings.

5. Component list.

VIII. DELIVERY, STORAGE AND HANDLING

A. Refer to NEMA Publication BU1.1, which is a guide for proper installation, operation and maintenance of busway products.

B. Equipment shall be handled and stored in accordance with manufacturer's instructions. One (1) copy of these instructions shall be included with the equipment at time of shipment.

C. Utilize factor provisions for all lifting, rigging, or hoisting.

D. Prior to installation, busway and busway equipment shall be stored in a temperature and humidity controlled dry environment.

IX. WARRANTY

A. This Contractor shall deliver the work in first-class operating condition in every respect. This Contractor shall also warrant that the material, equipment, and workmanship furnished shall be entirely free from defects. Any materials, equipment, or workmanship in which defects may develop before or during the warranty period shall be repaired or replaced at the Contractors own expense. Refer to SECTION 01740 for the start of the warranty period. This Contractor shall further warrant that all material, equipment, and workmanship used in the installation, but not specifically mentioned in the Drawings and Specifications, is the best of their respective kinds and that the construction and installation was performed in accordance with the best accepted standard practices in all details.

Part 2 - Products

I. MANUFACTURERS

A. The track busway shall be STARLINE Track Busway manufactured by Universal Electric Corp. or approved equal. Such firms shall be regularly engaged in the manufacture of track busway system equipment and ancillary equipment, of types and capacities required, whose products have been in satisfactory use in similar service for not less than 5 years. Any product other than those listed in this specification must be pre-approved in accordance with these specifications as hereinbefore described in SECTION 16010.

II. RATINGS

A. The track busway shall be rated for 120/208 volt, three phase, four wire with 100% neutral and 100% capacity integral (housing) ground.

B. The track busway shall have a minimum of 3-cycle short-circuit rating of 22 kA RMS symmetrical rating.

C. Three-phase line-to-line voltage drop shall not exceed 1.0 volt per forty-seven (47) feet at 80% power factor for a distributed load at 225 amperes.

III. MATERIALS AND COMPONENTS

A. This Contractor shall furnish and install prefabricated track busway distribution system(s) as shown on the Drawings and as specified herein including all necessary plug-in units, cables, fittings, hangers, accessories, etc.

B. The track busway sections shall have an extruded aluminum housing containing solid copper busbars. Aluminum busbars are not permitted. The housing shall act as a 100% ground and shall provide a polarizing feature to avoid incorrect installation of plug-in units. Busbars shall be enclosed in a continuous insulator, with openings sufficient for the plug-in units to make contact. Busbars shall be sized to handle 100% of its rating continuously with ambient temperatures below 40° C / 104° F.

C. Track busway housing sections shall be five (5), ten (10), or twenty (20) feet standard lengths. The housing shall be extruded with slots to receive rod mount hangers to hang from the building structure. The housing shall a continuous access slot opening on the bottom to accept plug-in units anywhere along its length. This opening shall pass the UL hypothetical finger probe test.

D. The ampere ratings, approximate footage, fittings, plug-in units, etc. shall be as shown on the Drawings.

E. Busbar connections shall be provided, consisting of copper stabs protruding from one end of each busway section. The stabs shall insert into the opposite end of the next section, and use a tool provided by the manufacturer to make a compression fit into the busbar channel for a reliable connection.

F. Housing couplers shall be provided with adequate mechanical strength so that busway and couplers will support up to 100 pounds per 10-foot interval, with 10-foot hanger spacing. Housing couplers shall be secured in place with bolts provided by the manufacturer.

G. End caps shall be provided and installed at the ends of each track busway run.

H. Closure strips shall be provided, cut and fitted to cover the continuous access slot bottom opening of the track busway housing to prevent dust and debris from gathering in the track busway.

I. Power feed connections with junction boxes, end caps, ells, tees and special fittings shall be provided as necessary and as shown on the Drawings to complete the system

J. Plug-in units shall be of the types and electrical ratings indicated in the Drawings, with UL listing where applicable. Units shall consist of a plug head assembly design to fit into the access slot of the busway sections, and rotate 90 degrees to make the electrical connection. Units shall be polarized, to avoid incorrect installation. Each plug stab shall have wire color coding indicated on the unit. A grounded junction box shall be provided on the plug-in unit. Direct wire connections, fusing, circuit breakers or other circuit protection devices, shall be provided as required. The units shall have locking clips or bolt-on tabs to secure units to the busway. Circuit breakers and fuses in plug-in units shall have a minimum interrupting rating of 22 kA.

K. Cord grips and fittings, drop cord assemblies, and other electrical devices shall be furnished as indicated on the Drawings and specified herein. Plug-in units that include drop cords shall be manufactured with cord grips and receptacles.

L. Busway whole run metering:

1. An electronic power meter equivalent to STARLINE Model No. CPM6 Critical Power Monitor shall be mounted in busway end power feed units to monitor power utilization for each busway run, where shown on the Drawings.

2. Electronic power meter shall have a digital display showing real-time information about critical power parameters for each phase. Each phase shall be visible on the display simultaneously.

3. The electronic power meter shall comply with ANSI C12.20 for power utilization and quality with an accuracy of 0.5 percent.

4. The electronic power meter shall be capable of monitoring the following parameters: Input Voltages (L-L/L-N); current per phase (max/min); voltage per phase (max/min); neutral current; power factor; frequency; active (real), reactive and apparent power; demand (kWh); current demand; and current peak demand.

5. The electronic power meter shall communicate in RS-485 or Ethernet or wireless mesh network or web interface, Modbus RTU or SNMP. Provide all necessary

communication hubs, modules, software, etc. for complete remote monitoring capabilities.

Part 3 - Execution

I. INSTALLATION

A. The track busway and accessories shall be installed in accordance with the manufacturer's recommendations/instructions, NEMA publication BU1.1 and the National Electrical Code.

B. Track Busway shall be hung using manufacturer’s hangers and Contractor furnished all thread rods secured to the building structure. The rod mount hangers shall connect the track busway to the all thread. The maximum spacing is ten (10) feet on center for the hangers. The height of the track busway shall be as shown on the Drawings. The busway runs shall be routed as shown on the Drawings and carefully coordinated with all piping, ductwork, other trades and the building structure. Final field measurements and coordination shall be made by this Contractor prior to release of the busway for fabrication.

C. Busway supports shall not terminate or be fastened directly to roof decking. Busway shall not be supported from the bottom cord of joists unless specifically approved, in writing, by the Structural Engineer of record.

D. Extra care shall be taken to ensure that all components of each busway system remain dry and free from foreign matter during the construction period.

II. ADJUSTMENTS AND CLEANING

A. Set field-adjustable trip devices per coordination study.

B. Clean exposed surfaces using manufacturer recommended materials and methods. Touch-up damaged coating and finishes using non-abrasive material and methods recommended by the manufacturer. Eliminate all visible evidence of repair.

III. TESTING

A. Perform testing on all busway runs per NEMA publication BU1.1 and manufacturer’s recommendations prior to energizing.

IV. STARTUP SERVICES

A. A factory authorized service representative shall perform all startup services.

V. TRAINING

A. This Contractor shall provide four (4) hours of technical service training to the Owner’s technical and maintenance staff.

B. This Contractor shall provide six (6) hours of operating, programming and software

training to the Owner's operating staff. Training shall be scheduled at the Owner's convenience during the warranty period.

C. All training specified herein shall be performed by a factory certified technician.

END OF SECTION

Part 1 - General

I. REQUIREMENTS

A. The general provisions of the Contract, including General and Supplementary Conditions and General Requirements, apply to the work specified in this Section.

II. SCOPE

A. The work covered under this Section shall include furnishing and installing Cartridge fuses rated 600-V ac and less complete for all electrical systems and a spare fuse cabinet as shown on the Drawings and herein specified.

III. SUBMITTALS

A. Product Data: For each type of product indicated. Include construction details, material dimensions, descriptions of individual components. Include the following for each fuse type indicated:

1. Ambient Temperature Adjustment Information: If ratings of fuses have been adjusted to accommodate ambient temperatures, provide list of fuses with adjusted ratings.

    a) For each fuse having adjusted ratings, include location of fuse, original fuse rating, local ambient temperature, and adjusted fuse rating.

    b) Provide manufacturer's technical data on which ambient temperature adjustment calculations are based.

2. Dimensions and manufacturer's technical data on features, performance, electrical characteristics, and ratings.

3. Current-limitation curves for fuses with current-limiting characteristics.

4. Time-current coordination curves (average melt) and current-limitation curves (instantaneous peak let-through current) for each type and rating of fuse. Coordination charts and tables and related data.

5. Fuse sizes for elevator feeders and elevator disconnect switches.

B. Operation and Maintenance Data: For fuses to include in emergency, operation, and maintenance manuals. In addition to items specified in Section 017823 "Operation and Maintenance Data," include the following:

1. Ambient temperature adjustment information.

2. Current-limitation curves for fuses with current-limiting characteristics.

3. Time-current coordination curves (average melt) and current-limitation curves (instantaneous peak let-through current) for each type and rating of fuse.

4. Coordination charts and tables and related data.

IV. QUALITY ASSURANCE

A. Source Limitations: Obtain fuses, for use within a specific product or circuit, from single source from single manufacturer. Comply with UL 248-1.

B. All equipment, materials, and their installation shall conform to the requirements of the National Electrical Code (NEC), local code requirements, and these Specifications.

1. All equipment and materials shall be listed by Underwriters Laboratories, Inc. (UL) for their intended use and shall bear the UL label. Comply with UL 248-11 for plug fuses.

2. Equipment shall be constructed in accordance with National Electrical Manufacturer's Association (NEMA) standards. Comply with NEMA FU 1 for cartridge fuses

3. Submittals are required in accordance with SECTION 16010 of these Specifications.

V. COORDINATION

A. Coordinate fuse ratings with utilization equipment nameplate limitations of maximum fuse size and with system short-circuit current levels.

Part 2 - Products

I. MATERIALS AND COMPONENTS

A. Fuses shall be listed and meet UL and/or NEMA Standards for Class K5, J, L, and RK1 fuses, or as indicated on the Drawings.

B. Dual element cartridge fuses shall be Class K5, or as indicated on the Drawings, high interrupting capacity with current limiting effect, 200,000 ampere RMS symmetrical at rated voltage minimum, and a minimum time delay of ten (10) seconds at five hundred

percent (500%) load. Unless otherwise indicated on Drawings, Class K-5 fuses shall be used for individual motor circuit protection, for motor control centers, and motor starter panelboard protection.

C. Class J and L fuses shall be provided as indicated on the Drawings for protection of non-motor loads.

D. Fuse voltage rating shall be 250 volts for 120/208-volt system and 480 or 600 volts for 277/480-volt system.

E. Fuses shall be as manufactured by COOPER BUSSMANN, GENERAL ELECTRIC, LITTLEFUSE or MERSEN (FERRAZ SHAWMUT), or EDISON FUSE, Inc..

F. Fuses over 600 amps up to 6,000 amps shall be UL Class 'L' time-delay fuses equal to BUSSMANN "HI-CAP" KRP-C. The fuses shall hold five hundred percent (500%) of rated current for a minimum of four (4) seconds and clear twenty (20) times rated current in .01 seconds or less.

G. Fuses up to 600 amps used for service entrance equipment shall be UL Class RK1 dual-element fuses equal to BUSSMANN "LOW-PEAK" LPN-RK for 250 volts or LPS-RK for 600 volts. The fuses shall hold five hundred percent (500%) of rated current for a minimum of ten (10) seconds.

H. Fuses protecting other than service entrance equipment rated over 100 amps up to 600 amps shall be UL Class K5 dual-element fuses equal to BUSSMANN "FUSETRON" FRN-R for 250 volts or FRS-R for 600 volts unless otherwise noted on the Drawings.

I. Fuses 100 amps and under shall be UL Class K5 dual-element fuses equal to BUSSMAN "FUSETRON" FRN-R for 250 volts or FRS-R for 600 volts unless otherwise noted on the Drawings.

II. PLUG FUSES

A. Characteristics: UL 248-11, nonrenewable plug fuses; 125-V ac.

B. PLUG-FUSE ADAPTERS

1. Characteristics: Adapters for using Type S, rejection-base plug fuses in Edison-base fuseholders or sockets; ampere ratings matching fuse ratings; irremovable once installed.

III. SPARE FUSE CABINET

A. All spare fuses shall be stored in their original cartons in the existing spare fuse cabinet furnished and installed by this Contractor. The cabinet shall be steel, surface mounted,

with a hinged door and flush lock, finished with gray baked enamel, and sized as required to house all spare fuses. A directory listing type and location of each fuse shall be mounted on the inside of the door. Spare fuse cabinet shall be similar to BUSSMANN Cat. No. SFC.

Part 3 - Execution

I. INSTALLATION

A. This Contractor shall furnish and install all fuses required for the electrical equipment furnished under this Division of these Specifications including all fusible safety switches, switchboards, distribution panels, motor control centers, etc.

B. Fuses shall be of the proper size, type and ampere rating required by the device accepting the fuses. The use of fuse reducers will not be allowed.

C. Examine fuses before installation. Reject fuses that are moisture damaged or physically damaged.

D. Examine holders to receive fuses for compliance with installation tolerances and other conditions affecting performance, such as rejection features.

E. Examine utilization equipment nameplates and installation instructions. Install fuses of sizes and with characteristics appropriate for each piece of equipment.

F. Evaluate ambient temperatures to determine if fuse rating adjustment factors must be applied to fuse ratings.

G. Proceed with installation only after unsatisfactory conditions have been corrected.

II. FUSE APPLICATIONS

A. Plug Fuses:
1. Motor Branch Circuits: Type S, dual-element time delay.

III. SPARE FUSES

A. This Contractor shall provide one set of spare fuses for every set installed and shall be stored in the original boxes in the spare fuse cabinet.

END OF SECTION

Part 1 - General

I. REQUIREMENTS

A. The general provisions of the Contract, including General and Supplementary Conditions and General Requirements, apply to the work specified in this Section.

II. SCOPE

A. The work under this Section shall include furnishing and installing enclosed circuit breakers and/or molded case switches as shown on the Drawings and herein specified.

III. QUALITY ASSURANCE

A. All equipment, materials, and their installation shall conform to the requirements of the National Electrical Code (NEC), local code requirements, and these Specifications.

B. Source Limitations: Obtain enclosed switches and circuit breakers, overcurrent protective devices, components, and accessories, within same product category, from single source from single manufacturer.

C. All equipment and materials shall be listed by Underwriter's Laboratories, Inc. (UL) for their intended use and shall bear the UL label.

D. Equipment shall be constructed in accordance with National Electrical Manufacturer's Association (NEMA) standards.

E. Submittals are required in accordance with Division 1 of these Specifications. The manufacturer shall furnish, but not be limited to the following:

1. Circuit breaker enclosure with dimensions and nameplate designation.

2. Circuit breaker trip ratings and frame sizes.

3. Conduit entry/exit locations.

4. Assembly ratings, including short-circuit rating, voltage, and continuous current rating.

5. Cable terminal sizes.

6. Product data.

IV. DELIVERY, STORAGE AND HANDLING

A. Deliver material and products in factory labeled packages. Store and handle in strict compliance with manufacturer’s instructions and recommendations.

B. Each unit shall be delivered in individual shipping cases and individually wrapped for protection.

C. Store in a clean, dry space. Maintain factory protection and /or provide an additional heavy canvas or heavy plastic cover to protect equipment from dirt, water, construction debris, and traffic. Where applicable, provide adequate heating within enclosures to prevent condensation.

D. Handle carefully to avoid damage to panelboards internal components, enclosure and finish.

Part 2 - Products

I. MANUFACTURERS

A. The enclosed circuit breaker(s) shall be as manufactured by CUTLER-HAMMER, GENERAL ELECTRIC, SIEMENS, or SQUARE D.

II. MATERIALS AND COMPONENTS

A. Enclosed circuit breakers shall be furnished and installed by this Contractor as shown on the Drawings. Enclosed circuit breakers shall be UL listed.

B. Enclosed circuit breakers required and/or noted on the Drawings to be "four wire" shall be furnished by the manufacturer complete with a solid neutral assembly.

C. Enclosed circuit breaker enclosures shall generally be NEMA 1 or NEMA 3R (rainproof) for exterior locations, or where noted "WP" on the Drawings.

III. CIRCUIT BREAKERS

A. Electrical circuits shall be protected by molded case circuit breakers as indicated on the Drawings.

B. The circuit breakers shall be operated by a toggle type handle and shall have a quick-make, quick-break over-center switching mechanism that shall be mechanically trip free from the handle so that the contacts cannot be held closed against short circuits and abnormal currents. Tripping due to overload or short circuit shall be clearly indicated by the handle automatically assuming a position midway between the manual "ON" and "OFF" positions. All latch surfaces shall be ground and polished. All poles of a multi-pole breaker shall be so constructed that they open, close, and trip simultaneously.

C. The circuit breakers shall be completely enclosed in a molded case. Non-interchangeable trip breakers shall have their covers sealed; interchangeable trip breakers shall have the trip unit sealed to prevent tampering. Ampere ratings shall be clearly visible. Contacts shall be non-welding silver alloy. Arc extinction shall be

accomplished by means of arc chutes consisting of metal grids mounted in an insulating support. Breakers shall be of the bolt-on type; plug-in, plug-on, blow-on, and clamp-on circuit breakers shall not be acceptable.

D. Circuit breakers shall be 80% rated unless indicated on the Drawings to be 100% rated.

E. For short circuit studies in projects, circuit breakers shall have a minimum symmetrical interrupting capacity as indicated on the Drawings. The interrupting ratings of the circuit breakers shall be at least equal to, or greater than, the available short circuit at the line terminals and not less than those values shown on the Drawings and specified in this specification section or as determined by the Short-Circuit Coordination Study whichever is higher.

F. Circuit breakers shall be listed with UL, conform to the applicable requirements of the latest issue of NEMA Standards Publication No. AB1.

G. Circuit breakers shall have thermal-magnetic trip units, with inverse time-current characteristics, unless otherwise noted on the Drawings.

1. Automatic operation of all circuit breakers shall be obtained by means of thermal-magnetic tripping devices located in each pole providing inverse time delay and instantaneous circuit protection. Instantaneous pick-up settings for each phase shall be adjustable on all frames 250A and above.

2. Circuit breakers shall be ambient compensating in that, as the ambient temperature increases over 40 C, the circuit breaker automatically derates itself to better protect its associated conductor.

3. Circuit breakers 250A and above shall have thermal magnetic interchangeable trip units.

H. Circuit breaker frames 400 ampere and above shall have microprocessor-based RMS sensing trip units on 480 volt systems and on 208 volt systems where indicated on the Drawings.

1. Solid State sensing shall measure true RMS current with capability to measure through to the 21st harmonic. Automatic operation of all circuit breakers shall be obtained by means of solid state tripping elements providing inverse time delay and instantaneous and short-time circuit protection. Continuous current rating shall be adjustable from 20% to 100% of trip unit rating. Long-time delay and instantaneous trip ratings shall also be adjustable. The short time pick-up trip shall have adjustable pick-up settings at definite times and with I2t delay.

2. Long time current adjustment shall be possible without the need for a rating plug.

3. Where specifically indicated on the Drawings, enclosed circuit breakers shall be provided with integral ground fault protection. Ground fault pick- up shall be

adjustable from 20% to 70% of the breakers maximum continuous current rating, but in no case be greater than 1200A. Ground fault time delay shall be adjustable with three (3) I2t delay settings.

4. Solid State circuit breakers shall have built-in test ports for testing the long-time delay, instantaneous, and ground fault functions (if equipped) of the breaker by means of a test set.

5. Provide one test set capable of testing all circuit breakers with a built-in test port, unless previously provided under another section of these specifications.

I. Circuit breaker accessories:

1. Provide shunt-trips, bell alarms and auxiliary switches, etc. as may be shown on the drawings. All accessories shall be UL Listed for field installation.

2. Coils for the shunt-trip circuit breakers associated with the elevator shut- down system, activated by the Fire Alarm and Detection System shall be coordinated with the Fire Alarm and Detection System for the proper coil voltage of the shunt-trip device.

J. Circuit breakers shall be manufactured by the same manufacturer as the panelboards and the circuit breaker enclosure and be factory installed.

K. Lugs shall be rated for 75 degrees C terminations and shall bolt in place.

L. As required, circuit breakers shall be UL listed for series application where indicated.

IV. MOLDED CASE SWITCHES

A. Where indicated on the Drawings provide enclosed molded case switches. Molded case switches shall employ the same operating mechanism as the thermal magnetic and magnetic only circuit breaker units described above. The molded case switch shall have a factory preset instantaneous function to allow the switch to trip and protect itself at a high fault current, without thermal overload protection.

V. NAMEPLATES

A. Enclosed circuit breakers and or molded case switches, including exterior locations, shall have nameplates of 1/16-inch-thick laminated plastic with 3/16-inch-high white letters on a black background. Nameplates shall identify each piece of equipment and shall be mounted on the front top of the enclosure. Nameplates shall be screw fastened using stainless steel screws.

Part 3 - Execution

I. INSTALLATION

A. The enclosed circuit breakers shall be securely mounted in accordance with the NEC, approximately forty-eight (48) inches but no less than twelve (12) inches above the finished floor to the bottom unless otherwise noted.

B. Mounting brackets and hardware exposed to weather shall be galvanized or otherwise suitably protected from corrosion.

C. Install units plumb, level and rigid without distortion to the units.

D. Contractor shall install required safety labels.

II. FIELD TESTS

A. Check tightness of all accessible mechanical and electrical connections to assure they are torqued to the minimum acceptable manufacturer's recommendations.

B. Check all enclosed circuit breakers and enclosures for proper grounding, fastening and alignment.

III. FIELD ADJUSTMENTS

A. This Contractor shall perform field adjustments of the protective devices as required to place the equipment in final operating condition. Necessary field settings of devices and adjustments and minor modifications to equipment shall be carried out by this Contractor at no additional cost to the Owner.

B. As required, The settings shall be in accordance with the approved protective device coordination study or as directed by the Engineer.

IV. CLEANING

A. Remove debris from enclosed circuit breaker enclosures and wipe dust and dirt from all components.

B. Repaint marred and scratched surfaces with touch-up paint to match original finish.

END OF SECTION

Disconnect Switches Section 262818

Part 1 - General

I. REQUIREMENTS

A. The general provisions of the Contract, including General and Supplementary Conditions and General Requirements, apply to the work specified in this Section.

II. SCOPE

A. The work under this Section shall include furnishing and installing safety switches and/or bolted pressure switches as shown on the Drawings and herein specified.

III. SUBMITTALS

A. Product Data: For each type of disconnect switch, enclosed switch, circuit breaker, accessory, and component indicated. Include dimensioned elevations, sections, weights, and manufacturers' technical data on features, performance, electrical characteristics, ratings, accessories, and finishes.

1. Enclosure types and details for types other than NEMA 250, Type 1.

2. Current and voltage ratings.

3. Short-circuit current ratings (interrupting and withstand, as appropriate).

4. Include evidence of NRTL listing for series rating of installed devices.

5. Detail features, characteristics, ratings, and factory settings of individual overcurrent protective devices, accessories, and auxiliary components.

6. Include time-current coordination curves (average melt) for each type and rating of overcurrent protective device; include selectable ranges for each type of overcurrent protective device.

7. Submit the results of coordination and short circuit study along with this submission.

B. Shop Drawings: For disconnect switches, enclosed switches and circuit breakers. Include plans, elevations, sections, details, and attachments to other work.

IV. QUALITY ASSURANCE

A. All equipment, materials, and their installation shall conform to the requirements of the National Electrical Code (NEC), local code requirements, and these Specifications.

B. Source Limitations: Obtain disconnect switches and circuit breakers, overcurrent protective devices, components, and accessories, within same product category, from single source from single manufacturer.

C. All equipment and materials shall be listed by Underwriter's Laboratories, Inc. (UL) for

their intended use and shall bear the UL label.

D. Equipment shall be constructed in accordance with National Electrical Manufacturer's Association (NEMA) standards.

E. Submittals are required in accordance with SECTION 16010 of these Specifications.

F. Product Selection for Restricted Space: Drawings indicate maximum dimensions for disconnect switches, enclosed switches and circuit breakers, including clearances between enclosures, and adjacent surfaces and other items. Comply with indicated maximum dimensions.

Part 2 - Products

I. SAFETY SWITCHES

A. This Contractor shall furnish and install where shown on the Drawings, heavy- duty type safety switches. Safety switches shall be NEMA heavy-duty type HD only and shall be UL listed. The heavy-duty safety switches shall be manufactured by CUTLER-HAMMER, GENERAL ELECTRIC, SIEMENS, or SQUARE D.

B. Type HD, Heavy Duty, Single Throw, 240, or 600-V ac, 1200 A and Smaller: UL 98 and NEMA KS 1, horsepower rated, with clips or bolt pads to accommodate specified fuses, lockable handle with capability to accept three padlocks, and interlocked with cover in closed position.

C. Type HD, Heavy Duty, Double Throw, 240 or 600-V ac, 1200 A and Smaller: UL 98 and NEMA KS 1, horsepower rated, lockable handle with capability to accept three padlocks, and interlocked with cover in closed position.

D. Switches shall have a quick-make and quick-break operating handle and mechanism that shall be an integral part of the enclosure. Switches shall be horsepower rated 250 volt for 120/208 volt systems or 600 volt for 277/480-volt system. The lugs shall be UL listed for copper conductors and be front removable. Ampere ratings shall be as indicated on the Drawings.

E. Safety switches required and/or noted on the Drawings to be "four wire" shall be furnished by the manufacturer complete with a solid neutral assembly.

F. Safety switches shall have defectable door interlocks that prevent the door from opening when the handle is in the “ON” position. Defeater mechanism shall be front accessible.

G. Enclosures for the switches shall generally be NEMA 1 or NEMA 3R (rainproof) for exterior locations, or where noted "WP" on the Drawings.

II. BOLTED PRESSURE SWITCHES

A. This Contractor shall furnish and install where shown on the Drawings, true bolted contact load-break type switches with provisions for NEMA Class L fuses (fuses shall be furnished and installed by this Contractor). The stored energy deadfront operating

mechanism shall include disk springs, compressed and released by the operating handle, to provide quick-positive switching action independent of the speed with which it is operated. The mechanism shall be designed so that the switch can be closed only after the opening spring has been charged, ready for manual opening by mechanical pushbutton.

B. The switch operating handle shall be mechanically interlocked with the fuse access door and have provisions for padlocking in OPEN position.

C. The switch shall have an interrupting rating of twelve (12) times the continuous rating and capable of carrying 100% of rated current and shall have been tested in accordance with UL Subject 977. The switch shall be suitable for use on circuits having available fault currents of 65,000 RMS symmetrical amperes rated (250) (600) VAC and of the ampacity shown on the Drawings. High- pressure contact switches do not meet the intent of these specifications.

D. The switch shall be complete with single phase protection to open the main device upon loss of any single phase but not upon simultaneous loss of all three (3) phases.

E. The switch shall be complete with separate blown fuse protection to open the bolted pressure switch if one or more of the Class L fuses operate. Indicating lights mounted on the front of the switch shall be included as a means of showing that the fuses have operated. Operating lights shall operate only when a fuse has blown.

F. The switch shall have two (2) sets of auxiliary contacts (2 normally open and 2 normally closed) for switch position monitoring.

G. A ground fault protection system shall be included for the bolted pressure switch as shown on the Drawings or as required by NEC.

1. The system shall consist of a current sensor enclosing all phase and neutral conductors of the circuit to be monitored, and appropriate relaying equipment to

provide the desired ground fault current sensitivity and time- current response characteristics. The switch shall be equipped to function in conjunction with the other elements of the ground fault protection system. Installation of the equipment shall be in all respects in accordance with the manufacturer's recommendations.

2. A current sensor shall be provided of the size necessary to encircle the phase conductors and the neutral conductor of the circuit to be monitored. Current sensor output shall be coordinated with the required input to the relay. A test winding shall be included to simulate the flow of ground fault current through the current sensor in order to test the operation of the ground fault protection system including sensor pick-up relay, and circuit protective device operation. The frame of the current sensor shall be so constructed that one leg can be opened to allow removal of installation around cable or bus without disturbing the cable or requiring drop-links in the bus.

3. The ground fault relay shall be of solid state construction, except that a coil operated output relay shall be provided to control 120-volt power to operate the associated fusible bolted pressure switch ground fault trip mechanism. The

relay shall require 120-volt power to operate the associated main device. Adjustable pickup current sensitivity for ground currents from 200 amperes to 1200 amperes shall be provided. A calibrated dial shall be provided for setting the current pickup point in the field. Settings for individual relays shall be 1200 amperes or as determined by the Short-Circuit Coordination Study whichever is lower. Time delay provided by the relay circuitry shall be nominally 0.2 seconds or as determined by the Short-Circuit Coordination Study and shall be permanently calibrated. A self-contained test circuit utilizing the test coil provided in the current sensor shall be incorporated in the system. The test circuit shall be part of the monitor panel that shall be mounted on the front cover of the switch.

H. The switch enclosure shall be NEMA 1, floor or wall mounted as shown on the Drawings.

I. The switch shall be manufactured by PRINGLE[1] and shall be type CBC or approved equal.

III. ENCLOSURES

A. Disconnect Switches and Circuit Breakers: NEMA AB 1, NEMA KS 1, NEMA 250, and UL 50, to comply with environmental conditions at installed location.

1. Indoor, Dry and Clean Locations: NEMA 250, Type 1.

2. Outdoor Locations: NEMA 250, Type 3R.

3. Kitchen or Wash-Down Areas: NEMA 250, Type 4X.

4. Other Wet or Damp, Indoor Locations: NEMA 250, Type 4.

5. Indoor Locations Subject to Dust, Falling Dirt, and Dripping Noncorrosive Liquids: NEMA 250, Type 12.

6. Hazardous Areas Indicated on Drawings: NEMA 250, Type 9.

IV. NAMEPLATE

A. Disconnect switches, including exterior locations, shall have nameplates of 1/16-inch-thick laminated plastic with 3/16-inch-high white letters on a black background. Nameplates shall identify each piece of equipment and shall be mounted on the front top of the enclosure. Nameplates shall be screw fastened using stainless steel screws.

B. Disconnect switches for elevator equipment shall also provide nameplates and signage to identify the location of the supply side overcurrent protective device, including circuit numbers, per NEC Article 620. Nameplates and signage shall be laminated plastic as hereinbefore described.

Part 3 - Execution

I. EXAMINATION

A. Examine elements and surfaces to receive enclosed switches and circuit breakers for compliance with installation tolerances and other conditions affecting performance of the Work.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

II. INSTALLATION

A. The disconnect switches shall be securely mounted in accordance with the NEC, approximately forty-eight (48) inches but no less than twelve (12) inches above the finished floor to the bottom unless otherwise noted.

B. Mounting brackets and hardware exposed to weather shall be galvanized or otherwise suitably protected from corrosion.

1. All NEMA 3R disconnect safety switches mounting openings not used must be permanently sealed to keep rain, moisture, insects, etc. from entering the switch

housing. The use of stainless steel screws/nuts with rubber washers and silicone sealant may be used, or another approved method for a completely sealed switch housing.

C. The fuses (type and size as noted on the Drawings) as specified shall be installed in disconnect switches requiring fuses. Rejection fuse clips shall be installed where called for on the Drawings or in these Specifications. Contractor shall provide Owner attic stock of two (2) fuses per phase.

D. Contractor shall install required safety labels.

E. Comply with NECA 1.

END OF SECTION

Part 1 - General

I. REQUIREMENTS

A. The general provisions of the Contract, including General and Supplementary Conditions and General Requirements, apply to the work specified in this Section.

II. SCOPE

A. The work under this Section shall include furnishing and installing safety switches and/or bolted pressure switches as shown on the Drawings and herein specified.

III. SUBMITTALS

A. Product Data: For each type of disconnect switch, enclosed switch, circuit breaker, accessory, and component indicated. Include dimensioned elevations, sections, weights, and manufacturers' technical data on features, performance, electrical characteristics, ratings, accessories, and finishes.

1. Enclosure types and details for types other than NEMA 250, Type 1.

2. Current and voltage ratings.

3. Short-circuit current ratings (interrupting and withstand, as appropriate).

4. Include evidence of NRTL listing for series rating of installed devices.

5. Detail features, characteristics, ratings, and factory settings of individual overcurrent protective devices, accessories, and auxiliary components.

6. Include time-current coordination curves (average melt) for each type and rating of overcurrent protective device; include selectable ranges for each type of overcurrent protective device.

7. Submit the results of coordination and short circuit study along with this submission.

B. Shop Drawings: For disconnect switches, enclosed switches and circuit breakers. Include plans, elevations, sections, details, and attachments to other work.

IV. QUALITY ASSURANCE

A. All equipment, materials, and their installation shall conform to the requirements of the National Electrical Code (NEC), local code requirements, and these Specifications.

B. Source Limitations: Obtain disconnect switches and circuit breakers, overcurrent protective devices, components, and accessories, within same product category, from single source from single manufacturer.

C. All equipment and materials shall be listed by Underwriter's Laboratories, Inc. (UL) for

their intended use and shall bear the UL label.

D. Equipment shall be constructed in accordance with National Electrical Manufacturer's Association (NEMA) standards.

E. Submittals are required in accordance with SECTION 16010 of these Specifications.

F. Product Selection for Restricted Space: Drawings indicate maximum dimensions for disconnect switches, enclosed switches and circuit breakers, including clearances between enclosures, and adjacent surfaces and other items. Comply with indicated maximum dimensions.

Part 2 - Products

I. SAFETY SWITCHES

A. This Contractor shall furnish and install where shown on the Drawings, heavy- duty type safety switches. Safety switches shall be NEMA heavy-duty type HD only and shall be UL listed. The heavy-duty safety switches shall be manufactured by CUTLER-HAMMER, GENERAL ELECTRIC, SIEMENS, or SQUARE D.

B. Type HD, Heavy Duty, Single Throw, 240, or 600-V ac, 1200 A and Smaller: UL 98 and NEMA KS 1, horsepower rated, with clips or bolt pads to accommodate specified fuses, lockable handle with capability to accept three padlocks, and interlocked with cover in closed position.

C. Type HD, Heavy Duty, Double Throw, 240 or 600-V ac, 1200 A and Smaller: UL 98 and NEMA KS 1, horsepower rated, lockable handle with capability to accept three padlocks, and interlocked with cover in closed position.

D. Switches shall have a quick-make and quick-break operating handle and mechanism that shall be an integral part of the enclosure. Switches shall be horsepower rated 250 volt for 120/208 volt systems or 600 volt for 277/480-volt system. The lugs shall be UL listed for copper conductors and be front removable. Ampere ratings shall be as indicated on the Drawings.

E. Safety switches required and/or noted on the Drawings to be "four wire" shall be furnished by the manufacturer complete with a solid neutral assembly.

F. Safety switches shall have defectable door interlocks that prevent the door from opening when the handle is in the “ON” position. Defeater mechanism shall be front accessible.

G. Enclosures for the switches shall generally be NEMA 1 or NEMA 3R (rainproof) for exterior locations, or where noted "WP" on the Drawings.

II. BOLTED PRESSURE SWITCHES

A. This Contractor shall furnish and install where shown on the Drawings, true bolted contact load-break type switches with provisions for NEMA Class L fuses (fuses shall be furnished and installed by this Contractor). The stored energy deadfront operating

mechanism shall include disk springs, compressed and released by the operating handle, to provide quick-positive switching action independent of the speed with which it is operated. The mechanism shall be designed so that the switch can be closed only after the opening spring has been charged, ready for manual opening by mechanical pushbutton.

B. The switch operating handle shall be mechanically interlocked with the fuse access door and have provisions for padlocking in OPEN position.

C. The switch shall have an interrupting rating of twelve (12) times the continuous rating and capable of carrying 100% of rated current and shall have been tested in accordance with UL Subject 977. The switch shall be suitable for use on circuits having available fault currents of 65,000 RMS symmetrical amperes rated (250) (600) VAC and of the ampacity shown on the Drawings. High- pressure contact switches do not meet the intent of these specifications.

D. The switch shall be complete with single phase protection to open the main device upon loss of any single phase but not upon simultaneous loss of all three (3) phases.

E. The switch shall be complete with separate blown fuse protection to open the bolted pressure switch if one or more of the Class L fuses operate. Indicating lights mounted on the front of the switch shall be included as a means of showing that the fuses have operated. Operating lights shall operate only when a fuse has blown.

F. The switch shall have two (2) sets of auxiliary contacts (2 normally open and 2 normally closed) for switch position monitoring.

G. A ground fault protection system shall be included for the bolted pressure switch as shown on the Drawings or as required by NEC.

1. The system shall consist of a current sensor enclosing all phase and neutral conductors of the circuit to be monitored, and appropriate relaying equipment to provide the desired ground fault current sensitivity and time- current response characteristics. The switch shall be equipped to function in conjunction with the other elements of the ground fault protection system. Installation of the equipment shall be in all respects in accordance with the manufacturer's recommendations.

2. A current sensor shall be provided of the size necessary to encircle the phase conductors and the neutral conductor of the circuit to be monitored. Current sensor output shall be coordinated with the required input to the relay. A test winding shall be included to simulate the flow of ground fault current through the current sensor in order to test the operation of the ground fault protection system including sensor pick-up relay, and circuit protective device operation. The frame of the current sensor shall be so constructed that one leg can be opened to allow removal of installation around cable or bus without disturbing the cable or requiring drop-links in the bus.

3. The ground fault relay shall be of solid state construction, except that a coil operated output relay shall be provided to control 120-volt power to operate the associated fusible bolted pressure switch ground fault trip mechanism. The

relay shall require 120-volt power to operate the associated main device. Adjustable pickup current sensitivity for ground currents from 200 amperes to 1200 amperes shall be provided. A calibrated dial shall be provided for setting the current pickup point in the field. Settings for individual relays shall be 1200 amperes or as determined by the Short-Circuit Coordination Study whichever is lower. Time delay provided by the relay circuitry shall be nominally 0.2 seconds or as determined by the Short-Circuit Coordination Study and shall be permanently calibrated. A self-contained test circuit utilizing the test coil provided in the current sensor shall be incorporated in the system. The test circuit shall be part of the monitor panel that shall be mounted on the front cover of the switch.

H. The switch enclosure shall be NEMA 1, floor or wall mounted as shown on the Drawings.

I. The switch shall be manufactured by PRINGLE[1] and shall be type CBC or approved equal.

III. ENCLOSURES

A. Disconnect Switches and Circuit Breakers: NEMA AB 1, NEMA KS 1, NEMA 250, and UL 50, to comply with environmental conditions at installed location.

1. Indoor, Dry and Clean Locations: NEMA 250, Type 1.

2. Outdoor Locations: NEMA 250, Type 3R.

3. Kitchen or Wash-Down Areas: NEMA 250, Type 4X.

4. Other Wet or Damp, Indoor Locations: NEMA 250, Type 4.

5. Indoor Locations Subject to Dust, Falling Dirt, and Dripping Noncorrosive Liquids: NEMA 250, Type 12.

6. Hazardous Areas Indicated on Drawings: NEMA 250, Type 9.

IV. NAMEPLATE

A. Disconnect switches, including exterior locations, shall have nameplates of 1/16-inch-thick laminated plastic with 3/16-inch-high white letters on a black background. Nameplates shall identify each piece of equipment and shall be mounted on the front top of the enclosure. Nameplates shall be screw fastened using stainless steel screws.

B. Disconnect switches for elevator equipment shall also provide nameplates and signage to identify the location of the supply side overcurrent protective device, including circuit numbers, per NEC Article 620. Nameplates and signage shall be laminated plastic as hereinbefore described.

Part 3 - Execution

I. EXAMINATION

A. Examine elements and surfaces to receive enclosed switches and circuit breakers for compliance with installation tolerances and other conditions affecting performance of the Work.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

II. INSTALLATION

A. The disconnect switches shall be securely mounted in accordance with the NEC, approximately forty-eight (48) inches but no less than twelve (12) inches above the finished floor to the bottom unless otherwise noted.

B. Mounting brackets and hardware exposed to weather shall be galvanized or otherwise suitably protected from corrosion.

1. All NEMA 3R disconnect safety switches mounting openings not used must be permanently sealed to keep rain, moisture, insects, etc. from entering the switch housing. The use of stainless steel screws/nuts with rubber washers and silicone sealant may be used, or another approved method for a completely sealed switch housing.

C. The fuses (type and size as noted on the Drawings) as specified shall be installed in disconnect switches requiring fuses. Rejection fuse clips shall be installed where called for on the Drawings or in these Specifications. Contractor shall provide Owner attic stock of two (2) fuses per phase.

D. Contractor shall install required safety labels.

E. Comply with NECA 1.

END OF SECTION

Part 1 - General

I. REQUIREMENTS

A. The general provisions of the Contract, including General and Supplementary Conditions and General Requirements, apply to the work specified in this Section.

II. SCOPE OF WORK

A. The work covered under this Section shall apply to the design and supply of pad mounted, weatherproof, electric equipment enclosures that are used to house electric equipment in outdoor environments.

B. The electric equipment enclosures shall be as noted on the Contract Drawings.

III. QUALITY ASSURANCE

A. All equipment, materials, and their installation shall conform to the requirements of the National Electrical Code (NEC), local code requirements, and these Specifications.

B. All equipment and materials shall be listed by Underwriters Laboratories, Inc. (UL) for their intended use and shall bear the UL label.

C. Equipment shall be constructed in accordance with National Electrical Manufacturer's Association (NEMA) standards.

D. The supplier shall design and produce the electric equipment enclosures to meet the criteria noted in these specifications and as shown on the Drawings. The supplier shall be capable of producing a premium grade product, which meets the quality, fit and finish noted herein.

E. The cabinet shall be designed to meet the approval of the local electrical utility (if applicable) and shall be designed for ease of maintenance.

F. Submittals are required in accordance with Division 1 of these specifications. Submittals shall include but not be limited to the following:

1. Detailed cabinet and door shop drawings showing all fabrication and the layout of all internal components and equipment.

2. List of all components (by manufacturer and model number) and product sheets for each item.

Part 2 - Products

I. MANUFACTURERS

A. Acceptable Manufacturers of Electric Equipment Enclosures are: HOFFMAN ENCLOSURES, INC., NJ SULLIVAN CO. or approved equal.

B. The listing of the above manufacturers does not constitute automatic approval or final acceptance. It is the Contractor's responsibility to verify and document that any product selected from the above list does meet the requirements of the Contract Documents.

II. GENERAL MATERIAL REQUIREMENTS

A. All materials shall be new.

B. Unless otherwise noted, the cabinet shall be fabricated from 12 gauge galvanized post-fabrication, electrostatically primed and painted steel; or unpainted 12-gauge Type 304 or 316L stainless steel.

C. All materials shall be corrosion resistant for extended life.

D. Enclosures shall be rated NEMA 3R or 4X.

III. FABRICATION PROCESS

A. The cabinet and doors shall be fabricated to plus or minus 10-thousandths of an inch tolerance for proper fit.

B. All bending shall be done using a suitable break press.

IV. CONNECTING HARDWARE

A. All screws, bolts, washers, nuts, etc. shall be stainless steel.

B. All screws shall be stainless steel pan-head machine screw type.

C. No sheet metal or self-tapping screws shall be used.

V. WELDING

A. All exterior seams shall be of continuously welded construction. All welds shall be free of slag and spatter. All exterior welds shall be ground smooth.

B. The supplier shall have suitable credentials to weld steel and shall adhere to all applicable ANSI standards.

C. The supplier shall use a suitable welding process and materials.

VI. DOORS AND HINGES

A. Doors shall be designed for maximum strength and snug fit. It is the supplier's responsibility to design and fabricate the doors to the fit and finish required in this

specification.

B. Doors shall be fabricated out of a single sheet of steel and have wrap-around return for strength and fit.

C. Doors shall have a one-piece gasket to provide a tight seal against contaminants entering the cabinet.

D. Door handles shall be 3-point contact steel construction. The lever handles shall latch to the cabinet with 16-gauge stainless steel rails and rollers which shall be fabricated to provide a secure and well-sealed attachment to the cabinet. Door handles shall be designed to accept a padlock. Bolted door closures or dogs are not allowed.

E. The exterior of the doors shall have continuous welds.

F. All exterior corners shall be rounded to a minimum radius of 1/8 of an inch. All sharp edges shall be de-burred to a minimum radius of 1/64 inch in order to reduce hazards to service personnel.

G. Hinges shall be both corrosion resistant and vandal proof.

VII. CABINET

A. The cabinet and door shall be constructed to meet NEMA 3R or 4X standards. The cabinet shall be made up of the main body, roof section and inner wall. These components shall be welded together. The cabinet shall be designed for maximum strength and proper fit to the door.

B. It is the supplier's responsibility to design and fabricate the cabinet to the fit and finish required in this specification.

C. The cabinet shall be designed to attach to a concrete pad via suitable drop-in anchors, which shall be supplied with the cabinet.

D. The exterior of the cabinet shall have continuous welds.

E. The cabinet main body shall have a wrap-around return to accept the door.

F. The cabinet shall have 120V weather-resistant ground fault duplex receptacle.

G. The cabinet shall be equipped with lifting brackets, which shall be removable after installation.

H. All exterior corners shall be rounded to a minimum radius of 1/8 of an inch. All sharp edges shall be de-burred to a minimum radius of 1/64 inch in order to reduce hazards to service personnel.

VIII. EQUIPMENT MOUNTING INNER WALL

A. Equipment shall be mounted on the interior using mounts and fittings supplied with the enclosure. No penetrations of the outer enclosure shall be used to mount equipment.

B. Equipment mounting panels shall be constructed from minimum 12-gauge sheet steel with a conductive, corrosion-resistant coating. Panels shall have edge flanges on two or four sides and lifting holes.

IX. FINISH

A. Upon completion of fabrication the cabinet, door and inner wall shall be finished as follows:

1. Surfaces shall be thoroughly cleaned and degreased.

2. Painted surfaces shall receive a prime coat electrostatically applied. After the prime coat has set, the top coat shall be electrostatically applied. Color shall be ANSI Dark Green or as shown on the Drawings.

3. Stainless steel surfaces are unpainted. Front, sides, top and back shall have a smooth #4 brushed finish.

4. The final product shall be free of dents, scratches, weld burns and abrasions harmful to its strength and general appearance.

X. GENERAL ELECTRICAL

A. All equipment shall be mounted on stand-off back panels.

B. All equipment shall be labeled using Lamicoid or vinyl adhesive labels with ½-inch high black characters on a white background.

XI. METERING (WHEN REQUIRED)

A. Metering location shall meet the approval of the local utility company. The metering shall be located for easy reading by the local utility.

B. CT’s and metering cabinets shall be sized and laid out to meet the local utility company’s standards.

XII. GROUNDING

A. The grounding system shall be designed to meet all NEC standards and any codes and local utility standards.

B. The grounding system shall be designed as part of the power distribution system.

XIII. EXTERNAL LIGHTING CONTROLS – SPORTS FIELDS

A. A weatherproof NEMA 3R pad-lockable box shall be provided and located as shown on the Drawings, for an On/Off pushbutton control station furnished as part of the Sports Field Lighting Control System. This control station switch will allow users to turn the lights on or off whenever the system is enabled by the remote system, on-site digital key pad, or time clock, see Specification Section 16545. The control station enclosure box shall be suitably located on the exterior of the Electrical Equipment Enclosure.

XIV. LABELING

A. All products shall be labeled (inside) with the supplier's company name, model number, panel rating and the date of manufacture.

B. The Contractor or supplier shall also provide adhesive Lamicoid or vinyl labels on the inside of each cabinet for each component. Each incoming feeder and output circuit shall also be labeled per the electrical design Drawings.

C. All ID labels shall have ¼" to ½" high black characters on a white background.

XV. PACKAGING

A. Any product damaged in shipping shall be repaired or replaced at no cost to the Owner.

Part 3 - Execution

I. FOUNDATIONS

A. The Contractor shall provide and install concrete pads for electrical equipment enclosures and utility transformers (if applicable) as shown on the Drawings.

1. Concrete foundations for electrical equipment enclosures shall be as follows:

a) Minimum compressive strength at 28 days – 3500PSI

b) Maximum nominal aggregate size – 1 inch

c) Maximum W/C ratio by mass - 0.45

d) Air content - 5 ± 1%
e) Slump - 2" ± 0.75"

2. Top of concrete bases shall be trowel finished smooth and level with beveled edges. Top surface shall not vary by more than 1/8 inch in depth as measured across the widest surface.

3. All concrete shall be fully vibrated.

4. Reinforcing Steel – Reinforcing to meet ASTM requirements. Spacing of bars shall be adjusted to suit conduit spacing.

B. Excavated material may be used as backfill. All excess excavated material shall be disposed of off-site.

II. GROUNDING

A. Install all grounding and bonding in accordance with NEC and the Contract Documents.

III. FIELD QUALITY CONTROL

A. Inspect each installed unit for damage. Replace damaged components.

B. Any paint damage shall be repaired by spray applied or other application that matches the factory finish to the maximum extent possible. Brush or roller applied repair painting is not allowed.

END OF SECTION

Part 1 - General

I. REQUIREMENTS

A. The general provisions of the Contract, including General and Supplementary Conditions and General Requirements, apply to the work specified in this Section.

II. SCOPE

A. The work covered under this Section shall include furnishing and installing the standby electrical power system consisting of an emergency engine generator set and automatic transfer switch as shown on the Drawings and herein specified.

B. The existing standby electrical power system shall remain in operation and shall continue to serve the building's emergency power during the construction period until the new system has been installed and tested, ready for operation. After the new system has assumed the building's entire emergency power load, the existing system shall be removed as shown on the Drawings.

C. Related Sections include the following:

1. Division 16 Section "Transfer Switches" for transfer switches including sensors and relays to initiate automatic-starting and -stopping signals for engine-generator sets

III. SUBMITTALS

A. Product Data: For each type of packaged engine generator indicated. Include rated capacities, operating characteristics, and furnished specialties and accessories. In addition, include the following:

1. Thermal damage curve for generator.

2. Time-current characteristic curves for generator protective device.

B. Shop Drawings: Detail equipment assemblies and indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.

1. Dimensioned outline plan and elevation drawings of engine-generator set and other components specified.

2. Wiring Diagrams: Power, signal, and control wiring.

C. Qualification Data: Manufacturer shall demonstrate they manufacture either the alternator or the generator. Manufacturers that assemble, and do not manufacture the alternator or the generator shall not be permitted.

D. Source quality-control test reports.

1. Certified summary of prototype-unit test report.

2. Certified Test Reports: For components and accessories that are equivalent, but not identical, to those tested on prototype unit.

3. Certified Summary of Performance Tests: Certify compliance with specified requirement to meet performance criteria for sensitive loads.

4. Report of factory test on units to be shipped for this Project, showing evidence of compliance with specified requirements.

5. Report of sound generation.

6. Report of exhaust emissions showing compliance with applicable regulations.

7. Certified Torsional Vibration Compatibility: Comply with NFPA 110.

E. Field quality-control test reports.

F. Operation and Maintenance Data: For packaged engine generators to include in emergency, operation, and maintenance manuals.

G. Warranty: Special warranty specified in this Section.

IV. QUALITY ASSURANCE

A. All applicable parts of the standby electrical power system shall meet National Electrical Manufacturer's Association (NEMA) and National Fire Protection Association (NFPA) standards, and be Underwriter's Laboratories, Inc. (UL) listed to UL 2200 and bear the UL label. The system shall be installed to meet the requirements of the National Electric Code (NEC) and all applicable state and local codes, and these Specifications.

B. This system shall be completely built, tested, and shipped by a manufacturer who has been regularly engaged in the production of such equipment for the past ten (10) years and who has had parts and service facilities available locally (within a 50-mile radius of the job site) for the past five (5) years.

C. The supplier of the standby electrical power system shall have and shall be able to

demonstrate fully stocked service vehicles. The supplier shall also have factory trained and factory certified maintenance technicians on staff.

D. The performance of the standby electrical power system shall be certified by an independent testing laboratory as to the unit's full power rating, voltage, and frequency regulation.

E. The standby electrical power system shall provide standby for the emergency white and exit lights and other such auxiliary power as indicated on the Drawings so as to operate automatically in the event of a utility power failure of the "normal" power system.

F. Submittals are required in accordance with SECTION 16010 of the Specifications. The manufacturer shall furnish printed literature and brochures describing the standard series specified (not a one of a kind fabrication). The manufacturer shall furnish schematic and wiring diagrams for the engine generator set and automatic load transfer switch; and an interconnecting diagram showing connections to individual components which constitute the standby electrical power system.

G. The performance tests of the generating set series shall be in accordance with procedures certified by an independent testing laboratory. The manufacturer shall have successfully tested a prototype of the generating set series offered which shall include: maximum power level; maximum motor starting capacity; structural soundness; torsigraph analysis; fuel consumption; engine-alternator cooling air flow; transient response and steady state governing; alternator temperature rise per NEMA MG1-22.40; single step load pickup per NFPA 76A- 822; harmonic analysis and voltage waveform deviation; and three-phase short circuit test for mechanical and electrical strength.

H. Manufacturer Qualifications: The manufacturer of the gen set shall be either a manufacturer of the engine or the alternator. Maintain, within 200 miles of Project site, a service center capable of providing training, parts, and emergency maintenance repairs.

I. The generator set manufacturer shall be certified to ISO 9001 International Quality Standard and shall have third party certification verifying quality assurance in design/development, production, installation, and service, in accordance with ISO 9001.

J. The manufacturer shall maintain model and serial number records for each engine generator set and automatic load transfer switch provided for at least 20 years.

K. Source Limitations: Obtain packaged generator set, automatic transfer switches and auxiliary components through one source from a single manufacturer.

V. COORDINATION

A. Coordinate size and location of concrete bases for package engine generators. Cast anchor-bolt inserts into bases. Concrete, reinforcement, and formwork requirements are specified in Division 3.

VI. MAINTENANCE SERVICE

A. Initial Maintenance Service: Beginning at Substantial Completion, provide 12 months' full maintenance by skilled employees of manufacturer's designated service organization.

B. Include quarterly exercising to check for proper starting, load transfer, and running under load. Include routine preventive maintenance as recommended by manufacturer and adjusting as required for proper operation. Provide parts and supplies same as those used in the manufacture and installation of original equipment.

Part 2 - Products

I. DESCRIPTION

A. The standby electrical power system shall be furnished and installed by this Contractor as shown on the Drawings and as herein specified. The system shall be manufactured by CUMMINS POWER GENERATION as listed herein or equal as manufactured by CATERPILLAR (OLYMPIAN), GENERAC POWER SYSTEMS, or KOHLER POWER SYSTEMS.

B. The standby electrical power system shall be an electric plant rated for continuous standby service at 35 KW, 0.8 power factor, 277/480 volts, three phase, four wire, 60 Hertz. A standby electrical power system that will meet this specification is CUMMINS POWER GENERATION Model Number 35 GGPA. The system shall be a package of new and current equipment consisting of:

1. A natural gas fueled engine generator set, as indicated on the Drawings, to provide standby electrical power.

2. An automatic transfer switch to provide automatic starting and stopping of the engine generator set and switching of the load.

3. Mounted accessories as herein specified.

4. Three pole, 70 amp output main circuit breaker. Provide auxiliary contacts to indicate circuit breaker status.

5. Engine mounted start-stop control system.

6. Spring type vibration isolators.

II. ENGINE GENERATOR SET

A. Engine

1. The engine shall be natural gas fueled, four (4) cycle, water cooled, with natural aspiration, mounted radiator, fan, and water pump. It shall have six (6) cylinders with a minimum displacement of 305 cubic inches, with a minimum rating of 77.3-brake horsepower at operating speed of 1800 RPM. Free-turn overhead valves shall be alloy steel with hard chrome-cobalt alloy. Full pressure lubrication shall be supplied by a gear oil pump. The engine shall have a replaceable, full-flow oil filter and gaseous fuel pressure regulation and solenoid valve. Engine speed shall be governed by an electronic governor for isochronous frequency regulation. The engine shall have a twelve (12) volt, DC, battery charging alternator (70A) automatically controlled by a solid-state voltage regulator. Starting shall be by a twelve (12) volt electric starter.

2. The complete engine shall be furnished with a start control that operates on contact closing and a stop control that operates on contact opening. A cranking limiter shall be provided to open the starting circuit in approximately forty-five (45) seconds if the plant is not started within that time.

B. The alternator shall be a four (4) pole revolving field type with static exciter and torque matched voltage regulator. No commutator or commutator brushes shall be allowed. The starter shall be directly connected to the engine flywheel housing, and the rotor shall be driven through a rigid coupling to insure permanent alignment. Voltage regulation shall be within plus or minus two percent (2%) of rated voltage, from no-load to full-load. The instantaneous voltage dip shall be less than twelve percent (12%) of rated voltage when full- load and rated power factor is applied to the alternator. Recovery to stable operation shall occur within two (2) seconds. Stable or steady-state operation is defined as operation with terminal voltage remaining constant within plus or minus one (1%) percent of rated voltage. Temperature rise shall not be more than one hundred twenty-five (125) degrees F over forty (40) degrees ambient at rated load. A permanent magnet generator shall provide excitation power to the automatic voltage regulator for immunity from voltage distortion caused by non- linear SCR controlled loads on the unit. The permanent magnet generator shall sustain short circuit current for selective operation and coordination of overcurrent devices.

C. The engine generator set control panel shall be wired, tested, and shock mounted on the generator set by the manufacturer of the alternator. It shall contain: panel lighting; RUN-STOP-REMOTE selector switch; coolant temperature gauge; field circuit breaker; DC voltmeter; running time meter; lamp test switch; oil pressure gauge; fault reset switch; cycle cranking; and low coolant level shutdown. The panel shall contain a twelve (12) light monitor panel with the following: green RUN light; yellow PREWARNING FOR

LOW OIL PRESSURE light; yellow PREWARNING FOR HIGH COOLANT TEMPERATURE light; red LOW OIL PRESSURE SHUTDOWN light; red HIGH COOLANT TEMPERATURE SHUTDOWN light; red OVERCRANK SHUTDOWN light; red OVERSPEED SHUTDOWN light; flashing red SWITCH OFF light; yellow LOW COOLANT TEMPERATURE light; yellow

D. The engine generating set shall be mounted on a welded steel base which shall provide for suitable mounting by this Contractor to any level surface. This Contractor shall furnish and install vibration isolators of the number and size required for the total weight of the unit between the steel base and mounting pad.

E. Accessories required for the proper operation of the engine generator set shall be furnished by the manufacturer. These shall include, but not be limited to, the following:

1. Flexible exhaust connectors.
2. Twelve (12) volt lead acid type starting batteries.
3. Battery rack and cables.
4. Additional solenoid valve (shipped loose).
5. This Contractor shall install the additional DC voltage solenoid valve supplied, prior to the flexible fuel line and wire as directed by the engine generator manufacturer to the control circuit to open with the engine operation.
6. Flexible gas lines.
7. Gaseous fuel pressure regulator (to be supplied by the Division 15 Contractor).
8. Single phase, 1.5 kW, 120 volt crank case heater, direct connected. Plug and cord connected type will not be acceptable.
9. Fifty percent (50%) ethylene glycol antifreeze solution to fill engine cooling system.
10. Two (2) 12-volt Form C dry contacts for connection to the fire alarm system graphic annunciator panel for “Generator Run” and “Generator Fault” indications.
11. Two (2) 12-volt Form C dry contacts for connection to the security intrusion system panel for “Generator Run” and “Generator Fault” indications.

F. The engine generator set shall be enclosed with a weather protective housing. The housing shall be rated for sound attenuation of sixty-three (63) dB(A) average at seven

(7) meters when using an eight (8) position measurement system using tests conducted per ANSI S1.13-1971. Acoustical materials shall be oil and water-resistant. A critical silencer muffler shall be mounted inside the housing with raincap and rainshield. The housing shall be attached to the skid base of the generator set and constructed of minimum 14-gauge metal using non-marring fasteners. The access doors shall have both key-lockable door handles and provisions for padlocking and mounted using stainless steel hinges. Paint protection shall be epoxy primer and dual coat electrodeposition method for all sides and all metal surfaces. Overspray of hoses, clamps, wiring and harnesses, and other serviceable items shall not be acceptable.

III. AUTOMATIC TRANSFER SWITCH

A. The complete automatic transfer switch shall be suitable for utility power (source 1) to engine generator set (source 2) application, be completely factory assembled with digital electronic controls designed for surge voltage isolation, and including voltage sensors on all phases of both sources, linear operator, permanently attached manual handles, positive mechanical and electrical interlocking, and mechanically held contacts.

B. The automatic transfer switch shall conform to the requirements of the following codes and standards (latest editions):

C. UL1008. The transfer switch shall be UL listed and labeled.

1. CSA C22.2, No. 14 – M91 Industrial Control Equipment.

2. CSA 282, Emergency Electrical Power Supply for Buildings.

3. NFPA110 – Emergency and Standby Power Systems. The transfer switch shall meet all requirements for level 1 systems.

4. IEEE446 – Recommended Practice for Emergency and Standby Power Systems for Commercial and Industrial Applications.

5. NEMA ICS10 – AC Automatic Transfer Switches.

D. The transfer switch manufacturer shall be certified to ISO 9001 International Quality Standard and shall have third party certification verifying quality assurance in design/development, production, installation, and service, in accordance with ISO 9001.

E. Transfer switch equipment specifications for this project are based on microprocessor-based transfer switches. The transfer switch shall be CUMMINS POWER GENERATION Model OTPC or an equal as manufactured by AUTOMATIC SWITCH COMPANY (ASCO) Model 7000 Series.

F. Ratings

1. The transfer switch shall be three pole, four wire, 277/480 volt, 60 hertz, 150 amp.

2. Main contacts shall be rated for 600 Volts AC minimum.

3. Transfer switch(es) shall be rated to carry 100 percent of rated current continuously in the enclosure supplied, in ambient temperatures of - 40 to + 60 degrees C, relative humidity up to 95% (non-condensing), and altitudes up to 10,000 feet (3000M).

4. Transfer switch equipment shall have a minimum withstand and closing ratings (WCR) in RMS symmetrical amperes of 30,000. The transfer switch and its upstream protection shall be third party listed and labeled for use with the specific protective device(s) installed in the application.

G. Construction

1. Transfer switch(es) shall be double-throw, electrically and mechanically interlocked, and mechanically held in the source 1 and source 2 positions. The transfer switch shall be specifically designed to transfer to the best available source if it inadvertently stops in a neutral position.

2. Transfer switches shall be equipped with permanently attached manual operating handles and quick-break, quick-make over-center contact mechanisms.

3. Main switch contacts shall be high-pressure silver alloy. Contact assemblies shall have arc chutes for positive arc extinguishing. Arc chutes shall have insulating covers to prevent inter-phase flashover.

4. Transfer switch internal wiring shall be composed of pre-manufactured harnesses that are permanently marked for source and destination. Harnesses shall be connected to the control system by means of locking disconnect plug(s), to allow the control system to be easily disconnected and serviced without disconnecting power from the transfer switch mechanism.

5. Transfer switch shall be provided with flame retardant transparent covers to allow viewing of switch contact operation but prevent direct contact with line voltage components.

6. Transfer switches shall be provided with a neutral bus and lugs. The neutral bus shall be sized to carry 100% of the current designed on the switch rating.

H. Connections

1. Field control connections shall be made on a common terminal block that is clearly and permanently labeled.

2. Transfer switch shall be provided with AL/CU mechanical lugs sized to accept the full output rating of the generator set.

I. Transfer Switch Control

1. Operator Panel. Each transfer switch shall be provided with a control panel to allow the operator to view the status and control operation of the transfer switch. The operator panel shall be a sealed membrane panel rated NEMA 3R/IP53 or better (regardless of enclosure rating) that is permanently labeled for switch and control functions. The operator panel shall be provided with the following features and capabilities.

a) High intensity LED lamps to indicate the source that the load is connected to (source 1 or source 2); and which source(s) are available. Source available LED indicators shall operate from the control microprocessor to indicate the true condition of the sources as sensed by the control.

b) High intensity LED lamps to indicate that the transfer switch is “not in auto” (due to control being disabled or due to bypass switch enabled or in operation) and “Test/Exercise Active” to indicate that the control system is testing or exercising the generator set.

c) “OVERRIDE” pushbutton to cause the transfer switch to bypass any active time delays for start, transfer, and retransfer and immediately proceed with its next logical operation.

d) “TEST” pushbutton to initiate a preprogrammed test sequence for the generator set and transfer switch. The transfer switch shall be programmable for test with load or test without load.

e) “RESET/LAMP TEST” pushbutton that will clear any faults present in the control, or simultaneously test all lamps on the panel by lighting them.

f) The control system shall continuously log information on the number of hours each source has been connected to the load, the number of times transferred, and the total number of times each source has failed. This information shall be available via the service tool or an operator

display panel.

g) Vacuum fluorescent alphanumeric display panel with push-button navigation switches. The display shall be clearly visible in both bright (sunlight) and no light conditions. It shall be visible over an angle of at least 120 degrees. The Alphanumeric display panel shall be capable of providing the following functions and capabilities.

(1) Display source condition information, including AC voltage for each phase of normal and emergency source, frequency of each source. Voltage for all three phases shall be displayed on a single screen for easy viewing of voltage balance.

(2) Display source status, to indicate source is connected or not connected.

(3) Display load data, including 3-phase AC voltage, 3-phase AC current, frequency, KW, KVA, and power factor. Voltage and current data for all phases shall be displayed on a single screen.

(4) The display panel shall allow the operator to view and make the following adjustments in the control system, after entering an access code:

(a) Set nominal voltage and frequency for the transfer switch.

(b) Adjust voltage and frequency sensor operation set points.

(c) Set up time clock functions.

(d) Set up load sequence functions.

(e) Enable or disable control functions in the transfer switch, including program transition.

(f) Set up exercise and load test operation conditions, as well as normal system time delays for transfer time, time delay start, stop, transfer, and retransfer.

(5) Display Real Time Clock data, including date, and time in hours, minutes, and seconds. The real-time clock shall

incorporate provisions for automatic daylight savings time and leap year adjustments. The control shall also log total operating hours for the control system.

(6) Display service history for the transfer switch. Display source connected hours, to indicate the total number of hours connected to each source. Display number of times transferred, and total number of times each source has failed.

(7) Display fault history on the transfer switch, including condition, and date and time of fault. Faults to include controller checksum error, low controller DC Voltage, ATS fail to close on transfer, ATS fail to close on retransfer, battery charger malfunction, network battery voltage low, network communications error.

(8) Display information for other transfer switches in the system, including transfer switch name, real time load in KW on the transfer switch, current source condition, and current operating mode.

J. Internal Controls

1. The transfer switch control system shall be configurable in the field for any operating voltage level up to 600VAC. Provide RMS voltage sensing and metering that is accurate to within plus or minus 1% of nominal voltage level. Frequency sensing shall be accurate to within plus or minus 0.2%. Voltage sensing shall be monitored based on the normal voltage at the site. Systems that utilize voltage monitoring based on standard voltage conditions are not acceptable.

2. Transfer switch voltage sensors shall be close differential type, providing source availability information to the control system based on the following functions:

a) Monitoring all phases of the normal service (source 1) for under voltage conditions (adjustable for pickup in a range of 85 to 98% of the normal voltage level and dropout in a range of 75 to 98% of normal voltage level).

b) Monitoring all phases of the emergency service (source 2) for under voltage conditions (adjustable for pickup in a range of 85 to 98% of the normal voltage level and dropout in a range of 75 to 98% of pickup voltage level).

c) Monitoring all phases of the normal service (source 1) and emergency service (source 2) for voltage imbalance.

d) Monitoring all phases of the normal service (source 1) and emergency service (source 2) for loss of a single phase.

e) Monitoring all phases of the normal service (source 1) and emergency service (source 2) for phase rotation.

f) Monitoring all phases of the normal service (source 1) and emergency service (source 2) for over voltage conditions (adjustable for dropout over a range of 105 to 135% of normal voltage, and pickup at 95-99% of dropout voltage level).

g) Monitoring all phases of the normal service (source 1) and emergency service (source 2) for over or under frequency conditions.

h) Monitoring the neutral current flow in the load side of the transfer switch. The control shall initiate an alarm when the neutral current exceeds a preset adjustable value in the range of 100-150% of rated phase current for more than an adjustable time period of 10 to 60 seconds.

3. All transfer switch sensing shall be configurable from a Windows XP or NT PC-based service tool, to allow setting of levels, and enabling or disabling of features and functions. Selected functions including voltage sensing levels and time delays shall be configurable using the operator panel. The transfer control shall incorporate a series of diagnostic LED lamps.

4. The transfer switch shall be configurable to control the operation time from source to source (program transition operation). The control system shall be capable of enabling or disabling this feature, and adjusting the time period to a specific value. A phase band monitor or similar device is not an acceptable alternate for this feature.

5. The transfer switch shall incorporate adjustable time delays for generator set start (adjustable in a range from 0-15 seconds); transfer (adjustable in a range from 0-120 seconds); retransfer (adjustable in a range from 0- 30 minutes); and generator stop (cooldown) (adjustable in a range of 0- 30 minutes).

6. The control system shall be designed and prototype tested for operation in ambient temperatures from – 20°C to + 60°C.

7. The control shall have optically isolated logic inputs, high isolation transformers

for AC inputs, and relays on all outputs, to provide optimum protection from line voltage surges, RFI and EMI.

8. The transfer switch shall be provided with a battery charger for the generator set starting batteries. The battery charger shall be a float type charger rated 10 amps. The battery charger shall include an ammeter for display of charging current and shall have fused AC inputs and DC outputs. The charger shall also include fault indications for high and low DC voltage and supply power failed, and dry contacts for external indication of these fault conditions. Supply power failed indication shall be displayed on the ATS control panel.

K. Control Interface

1. The transfer switch will provide an isolated relay contact for starting of a generator set. The relay shall be normally held open, and close to start the generator set. Output contacts shall be form C, for compatibility with any generator set.

2. Provide one set of Form C auxiliary contacts on both sides, operated by transfer switch position, rated 10 amps 250 VAC.

L. Enclosure

1. Enclosures shall be UL listed, NEMA Type 1. The enclosure shall provide NEC wire bend space. The cabinet door shall be key-locking.

M. Operation

1. Transfer switch normally connects an energized utility power source (source1) to loads and a generator set (source 2) to the loads when normal source fails. The normal position of the transfer switch is source 1 (connected to the utility), and no start signal is supplied to the genset.

2. Generator Set Exercise (Test) With Load Mode. The control system shall be configurable to test the generator set under load. In this mode, the transfer switch shall control the generator set in the following sequence:

a) Transfer switch shall initiate the exercise sequence at a time indicated in the exercise timer program, or when manually initiated by the operator.

b) When the control systems senses the generator set at rated voltage and frequency, it shall operate to connect the loads to the generator set by opening the normal source contacts, and closing the alternate

source contacts a predetermined time period later. The timing sequence for the contact operation shall be programmable in the controller.

c) The generator set shall operate connected to the load for the duration of the exercise period. If the generator set fails during this period, the transfer switch shall automatically reconnect the generator set to the normal service.

d) On completion of the exercise period, the transfer switch shall operate to connect the loads to the normal source by opening the alternate source contacts, and closing the normal source contacts a predetermined time period later. The timing sequence for the contact operation shall be programmable in the controller.

e) The transfer switch shall operate the generator set unloaded for a cooldown period, and then remove the start signal from the generator set. If the normal power fails at any time when the generator set is running, the transfer switch shall immediately connect the system loads to the generator set.

3. Generator Set Exercise (Test) Without Load Mode. The control system shall be configurable to test the generator set without transfer switch load connected. In this mode, the transfer switch shall control the generator set in the following sequence:

a) Transfer switch shall initiate the exercise sequence at a time indicated in the exercise timer program, or when manually initiated by the operator.

b) When the control systems senses the generator set at rated voltage and frequency, it shall operate the generator set unloaded for the duration of the exercise period.

c) At the completion of the exercise period, the transfer switch shall remove the start signal from the generator set. If the normal power fails at any time when the generator set is running, the transfer switch shall immediately connect the system loads to the generator set.

Part 3 - Execution

I. INSTALLATION

A. This Contractor shall furnish and install complete the standby electrical power system including the engine generator set, automatic transfer switch, batteries, exhaust system, vibration isolation, cooling system, electrical system, concrete pad, and accessories in

accordance with the system manufacturer's recommendations.

B. The Contractor shall furnish and install a six (6) inch high by six (6) inch greater all sides concrete base foundation for the engine generator set.

1. Concrete foundation shall be as follows:

a) Minimum compressive strength at 28 days – 3500 PSI
b) Maximum nominal aggregate size – 1 inch
c) Maximum W/C ratio by mass – 0.45
d) Air content – 5 ± 1%
e) Slump – 2" ± 0.75"

2. Top of concrete bases shall be trowel finished smooth and level with beveled edges. Top surface shall not vary by more than 1/8" in depth as measured across the widest surface.

3. All concrete shall be fully vibrated.

4. Reinforcing Steel – Reinforcing to meet ASTM requirements. Spacing of bars shall be adjusted to suit conduit spacing.

C. This Contractor shall ground the generator set as per the NEC, as shown on the Drawings, and as herein specified.

D. All equipment shall be physically inspected for damage. Scratches and other installation damage shall be repaired. Equipment shall be thoroughly cleaned to remove all dirt and debris.

II. START-UP SERVICE AND ACCEPTANCE TEST

A. Start-up Service: The standby electrical power system's equipment shall be initially started, operated and tested by the manufacturer's representative prior to the "on-site acceptance test".

B. On-Site Acceptance Test: The manufacturer shall furnish service personnel and all testing equipment and temporary cable connections to completely service and field test, in the presence of the Owner, the standby electrical power system. The test shall include, but not be limited to, a "cold start" test, a minimum period of four (4) hours with a load bank at one hundred percent (100%) of the nameplate rating of the engine generator set and a one-step rated load pick-up test in accordance with NFPA 110. The manufacturer shall make any adjustments to the system to assure proper operation. The manufacturer shall then instruct the Owner's personnel as to proper maintenance and operation and furnish three (3) sets of operating, technical, factory service manuals

and maintenance instructions, including descriptive literature of equipment, parts list, and the names and telephone numbers of manufacturer's representatives.

III. WARRANTY

A. The warranty for the complete standby electric power system shall be unconditional for a period of one (1) year with unlimited operating hours from the date of the successful acceptance test. The warranty shall be furnished by the system manufacturer. Said coverage shall be for all equipment provided under this specification section whether or not it is manufactured by the Standby Electrical System Manufacturer and shall include parts, labor, travel expenses, and labor to remove/reinstall said equipment per the manufacturer's standard published warranty. There shall be no deductibles applied to said warranty. Multiple warranties for individual components, engine alternator, controls, etc. will not be acceptable. Satisfactory warranty documents shall be furnished. Refer to SECTION 01740 WARRANTIES AND BONDS.

B. Contractor shall provide Warranty Coverage Labels mounted conspicuously on the engine generator control section and on the door of the automatic load transfer switch. The labels shall identify the one source supplier/manufacturer's address and telephone number, coverage description, coverage type, start-up date, model number, serial number, system registration number and other information deemed pertinent by the supplier/manufacturer. It is the intent of this warranty specification to have a single source contact for the Owner to call for warranty service for all standby electrical power system equipment.

C. The manufacturer shall be prepared to offer a service contract for the maintenance of the standby electric power system after the warranty period and/or an extended warranty.

END OF SECTION

Part 1 - General

I. REQUIREMENTS

A. The general provisions of the Contract, including General and Supplementary Conditions and General Requirements, apply to the work specified in this Section.

II. SCOPE

A. The work covered under this Section shall include furnishing and installing the standby electrical power system consisting of an emergency engine generator set and automatic transfer switch as shown on the Drawings and herein specified.

B. The existing standby electrical power system shall remain in operation and shall continue to serve the building's emergency power during the construction period until the new system has been installed and tested, ready for operation. After the new system has assumed the building's entire emergency power load, the existing system shall be removed as shown on the Drawings.

III. SUBMITTALS

A. Product Data: For each type of packaged engine generator indicated. Include rated capacities, operating characteristics, and furnished specialties and accessories. In addition, include the following:

1. Thermal damage curve for generator.

2. Time-current characteristic curves for generator protective device.

B. Shop Drawings: Detail equipment assemblies and indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.

1. Dimensioned outline plan and elevation drawings of engine-generator set and other components specified.

2. Wiring Diagrams: Power, signal, and control wiring.

C. Qualification Data: Manufacturer shall demonstrate they manufacture either the alternator or the generator. Manufacturers that assemble, and do not manufacture the alternator or the generator shall not be permitted.

D. Source quality-control test reports.

1. Certified summary of prototype-unit test report.

2. Certified Test Reports: For components and accessories that are equivalent, but not identical, to those tested on prototype unit.

3. Certified Summary of Performance Tests: Certify compliance with specified requirement to meet performance criteria for sensitive loads.

4. Report of factory test on units to be shipped for this Project, showing evidence of compliance with specified requirements.

5. Report of sound generation.

6. Report of exhaust emissions showing compliance with applicable regulations.

7. Certified Torsional Vibration Compatibility: Comply with NFPA 110.

E. Field quality-control test reports.

F. Operation and Maintenance Data: For packaged engine generators to include in emergency, operation, and maintenance manuals.

G. Warranty: Special warranty specified in this Section.

IV. QUALITY ASSURANCE

A. All applicable parts of the standby electrical power system shall meet National Electrical Manufacturer's Association (NEMA) and National Fire Protection Association (NFPA) standards, and be Underwriter's Laboratories, Inc. (UL) listed to UL 2200. The system shall be installed to meet the requirements of the National Electric Code (NEC) and all applicable state and local codes, and these Specifications.

B. This system shall be completely built, tested, and shipped by a manufacturer who has been regularly engaged in the production of such equipment for the past ten (10) years and who has had parts and service facilities available locally (within a 50-mile radius of the job site) for the past five (5) years.

C. The supplier of the standby electrical power system shall have and shall be able to demonstrate fully stocked service vehicles. The supplier shall also have factory trained and factory certified maintenance technicians on staff.

D. The performance of the standby electrical power system shall be certified by an independent testing laboratory as to the unit's full power rating, voltage, and frequency regulation.

E. The standby electrical power system shall provide standby for the emergency white and exit lights and other such auxiliary power as indicated on the Drawings so as to operate automatically in the event of an utility power failure of the "normal" power system.

F. Submittals are required in accordance with SECTION 16010 of the Specifications. The manufacturer shall furnish printed literature and brochures describing the standard

series specified (not a one of a kind fabrication). The manufacturer shall furnish schematic and wiring diagrams for the engine generator set and automatic load transfer switch; and an interconnecting diagram showing connections to individual components which constitute the standby electrical power system.

G. The performance tests of the generating set series shall be in accordance with procedures certified by an independent testing laboratory. The manufacturer shall have successfully tested a prototype of the generating set series offered which shall include: maximum power level; maximum motor starting capacity; structural soundness; torsigraph analysis; fuel consumption; engine-alternator cooling air flow; transient response and steady state governing; alternator temperature rise per NEMA MG1-22.40; single step load pickup per NFPA 76A- 822; harmonic analysis and voltage waveform deviation; and three-phase short circuit test for mechanical and electrical strength.

H. The generator set manufacturer shall be certified to ISO 9001 International Quality Standard and shall have third party certification verifying quality assurance in design/development, production, installation, and service, in accordance with ISO 9001.

I. The manufacturer shall maintain model and serial number records for each engine generator set and automatic load transfer switch provided for at least 20 years.

J. Manufacturer Qualifications: The manufacturer of the gen set shall be either a manufacturer of the engine or the alternator. Maintain, within 200 miles of Project site, a service center capable of providing training, parts, and emergency maintenance repairs.

K. The generator set manufacturer shall be certified to ISO 9001 International Quality Standard and shall have third party certification verifying quality assurance in design/development, production, installation, and service, in accordance with ISO 9001.

L. The manufacturer shall maintain model and serial number records for each engine generator set and automatic load transfer switch provided for at least 20 years.

M. Source Limitations: Obtain packaged generator set, automatic transfer switches and auxiliary components through one source from a single manufacturer.

V. COORDINATION

A. Coordinate size and location of concrete bases for package engine generators. Cast anchor-bolt inserts into bases. Concrete, reinforcement, and formwork requirements are specified in Division 3.

VI. MAINTENANCE SERVICE

A. Initial Maintenance Service: Beginning at Substantial Completion, provide 12 months' full maintenance by skilled employees of manufacturer's designated service organization.

B. Include quarterly exercising to check for proper starting, load transfer, and running under load. Include routine preventive maintenance as recommended by manufacturer and adjusting as required for proper operation. Provide parts and supplies same as those used in the manufacture and installation of original equipment.

Part 2 - Products

I. DESCRIPTION

A. The standby electrical power system shall be furnished and installed by this Contractor as shown on the Drawings and as herein specified. The system shall be manufactured by CUMMINS POWER GENERATION as listed herein or equal as manufactured by CATERPILLAR (OLYMPIAN) GENERAC POWER SYSTEMS, or KOHLER POWER SYSTEMS.

B. The standby electrical power system shall be an electric plant rated for continuous standby service at 45 KW, 0.8 power factor, 277/480 volts, three phase, four wire, 60 Hertz. A standby electrical power system that will meet this specification is CUMMINS POWER GENERATION Model Number 45 GGPC. The system shall be a package of new and current equipment consisting of:

1. A natural gas fueled engine generator set, as indicated on the Drawings, to provide standby electrical power.
2. An automatic transfer switch to provide automatic starting and stopping of the engine generator set and switching of the load.
3. Mounted accessories as herein specified.
4. Three pole, 90 amp output main circuit breaker. Provide auxiliary contacts to indicate circuit breaker status.
5. Engine mounted start-stop control system.
6. Spring type vibration isolators.
7. Remote annunciator panel.

II. ENGINE GENERATOR SET

A. Engine

1. The engine shall be natural gas fueled, four (4) cycle, water cooled, with natural aspiration, mounted radiator, fan, and water pump. It shall have six (6) cylinders with a minimum displacement of 305 cubic inches, with a minimum rating of 77.3-brake horsepower at operating speed of 1800 RPM. Free-turn overhead valves shall be alloy steel with hard chrome-cobalt alloy. Full pressure lubrication shall be supplied by a gear oil pump. The engine shall have a replaceable, full-flow oil filter and gaseous fuel pressure regulation and solenoid valve. Engine speed shall be governed by an electronic governor for isochronous frequency regulation. The engine shall have a twelve (12) volt, DC, battery charging alternator (70A) automatically controlled by a solid-state voltage regulator. Starting shall be by a twelve (12) volt electric starter.

2. The complete engine shall be furnished with a start control that operates on contact closing and a stop control that operates on contact opening. A cranking limiter shall be provided to open the starting circuit in approximately forty-five (45) seconds if the plant is not started within that time.

B. The alternator shall be a four (4) pole revolving field type with static exciter and torque matched voltage regulator. No commutator or commutator brushes shall be allowed. The starter shall be directly connected to the engine flywheel housing, and the rotor shall be driven through a rigid coupling to insure permanent alignment. Voltage regulation shall be within plus or minus two percent (2%) of rated voltage, from no-load to full-load. The instantaneous voltage dip shall be less than twelve percent (12%) of rated voltage when full- load and rated power factor is applied to the alternator. Recovery to stable operation shall occur within two (2) seconds. Stable or steady-state operation is defined as operation with terminal voltage remaining constant within plus or minus one (1%) percent of rated voltage. Temperature rise shall not be more than one hundred twenty-five (125) degrees F over forty (40) degrees ambient at rated load. A permanent magnet generator shall provide excitation power to the automatic voltage regulator for immunity from voltage distortion caused by non- linear SCR controlled loads on the unit. The permanent magnet generator shall sustain short circuit current for selective operation and coordination of overcurrent devices.

C. The engine generator set control panel shall be wired, tested, and shock mounted on the generator set by the manufacturer of the alternator. It shall contain: panel lighting; RUN-STOP-REMOTE selector switch; coolant temperature gauge; field circuit breaker; DC voltmeter; running time meter; lamp test switch; oil pressure gauge; fault reset switch; cycle cranking; and low coolant level shutdown. The panel shall contain a twelve (12) light monitor panel with the following: green RUN light; yellow PREWARNING FOR LOW OIL PRESSURE light; yellow PREWARNING FOR HIGH COOLANT TEMPERATURE light; red LOW OIL PRESSURE SHUTDOWN light; red HIGH COOLANT TEMPERATURE SHUTDOWN light; red OVERCRANK SHUTDOWN light; red OVERSPEED SHUTDOWN light; flashing red SWITCH OFF light; yellow LOW COOLANT TEMPERATURE light; yellow.

D. The engine generating set shall be mounted on a welded steel base which shall provide for suitable mounting by this Contractor to any level surface. This Contractor shall furnish and install vibration isolators of the number and size required for the total weight of the unit between the steel base and mounting pad.

E. Accessories required for the proper operation of the engine generator set shall be furnished by the manufacturer. These shall include, but not be limited to, the following:

1. Flexible exhaust connectors.

2. Twelve (12) volt lead acid type starting batteries.

3. Battery rack and cables.

4. Additional solenoid valve (shipped loose).

5. This Contractor shall install the additional DC voltage solenoid valve supplied, prior to the flexible fuel line and wire as directed by the engine generator

manufacturer to the control circuit to open with the engine operation.

6. Flexible gas lines.

7. Gaseous fuel pressure regulator (to be supplied by the Division 15 Contractor).

8. Single phase, 1.5 kW, 120 volt crank case heater, direct connected. Plug and cord connected type will not be acceptable.

9. Fifty percent (50%) ethylene glycol antifreeze solution to fill engine cooling system.

10. Two (2) 12-volt Form C dry contacts for connection to the fire alarm system graphic annunciator panel for “Generator Run” and “Generator Fault” indications.

11. Two (2) 12-volt Form C dry contacts for connection to the security intrusion system panel for “Generator Run” and “Generator Fault” indications.

F. The engine generator set shall be enclosed with a weather protective housing. The housing shall be rated for sound attenuation of sixty-three (63) dB(A) average at seven (7) meters when using an eight (8) position measurement system using tests conducted per ANSI S1.13-1971. Acoustical materials shall be oil and water-resistant. A critical silencer muffler shall be mounted inside the housing with raincap and rainshield. The housing shall be attached to the skid base of the generator set and constructed of minimum 14-gauge metal using non-marring fasteners. The access doors shall have both key-lockable door handles and provisions for padlocking and mounted using stainless steel hinges. Paint protection shall be epoxy primer and dual coat electrodeposition method for all sides and all metal surfaces. Overspray of hoses, clamps, wiring and harnesses, and other serviceable items shall not be acceptable.

III. AUTOMATIC TRANSFER SWITCH

A. The complete automatic transfer switch shall be suitable for utility power (source 1) to engine generator set (source 2) application, be completely factory assembled with digital electronic controls designed for surge voltage isolation, and including voltage sensors on all phases of both sources, linear operator, permanently attached manual handles, positive mechanical and electrical interlocking, and mechanically held contacts.

B. The automatic transfer switch shall conform to the requirements of the following codes and standards (latest editions):

1. UL1008. The transfer switch shall be UL listed and labeled.

2. CSA C22.2, No. 14 – M91 Industrial Control Equipment.

3. CSA 282, Emergency Electrical Power Supply for Buildings.

4. NFPA110 – Emergency and Standby Power Systems. The transfer switch shall

meet all requirements for level 1 systems.

5. IEEE446 – Recommended Practice for Emergency and Standby Power Systems for Commercial and Industrial Applications.

6. NEMA ICS10 – AC Automatic Transfer Switches.

C. The transfer switch manufacturer shall be certified to ISO 9001 International Quality Standard and shall have third party certification verifying quality assurance in design/development, production, installation, and service, in accordance with ISO 9001.

D. Transfer switch equipment specifications for this project are based on microprocessor-based transfer switches. The transfer switch shall be CUMMINS POWER GENERATION Model OTPC or equal as manufactured by AUTOMATIC SWITCH COMPANY (ASCO) Model 7000 Series.

E. Ratings

1. The transfer switch shall be three pole, four wire, 277/480 volt, 60 hertz, 150 amp.

2. Main contacts shall be rated for 600 Volts AC minimum.

3. Transfer switch(es) shall be rated to carry 100 percent of rated current continuously in the enclosure supplied, in ambient temperatures of - 40 to + 60 degrees C, relative humidity up to 95% (non-condensing), and altitudes up to 10,000 feet (3000M).

4. Transfer switch equipment shall have a minimum withstand and closing ratings (WCR) in RMS symmetrical amperes of 30,000. The transfer switch and its upstream protection shall be third party listed and labeled for use with the specific protective device(s) installed in the application.

F. Construction

1. Transfer switch(es) shall be double-throw, electrically and mechanically interlocked, and mechanically held in the source 1 and source 2 positions. The transfer switch shall be specifically designed to transfer to the best available source if it inadvertently stops in a neutral position.

2. Transfer switches shall be equipped with permanently attached manual operating handles and quick-break, quick-make over-center contact mechanisms.

3. Main switch contacts shall be high-pressure silver alloy. Contact assemblies shall have arc chutes for positive arc extinguishing. Arc chutes shall have insulating covers to prevent inter-phase flashover.

4. Transfer switch internal wiring shall be composed of pre-manufactured

harnesses that are permanently marked for source and destination. Harnesses shall be connected to the control system by means of locking disconnect plug(s), to allow the control system to be easily disconnected and serviced without disconnecting power from the transfer switch mechanism.

5. Transfer switch shall be provided with flame retardant transparent covers to allow viewing of switch contact operation but prevent direct contact with line voltage components.

6. Transfer switches shall be provided with a neutral bus and lugs. The neutral bus shall be sized to carry 100% of the current designed on the switch rating.

G. Connections

1. Field control connections shall be made on a common terminal block that is clearly and permanently labeled.

2. Transfer switch shall be provided with AL/CU mechanical lugs sized to accept the full output rating of the generator set.

H. Transfer Switch Control

1. Operator Panel. Each transfer switch shall be provided with a control panel to allow the operator to view the status and control operation of the transfer switch. The operator panel shall be a sealed membrane panel rated NEMA 3R/IP53 or better (regardless of enclosure rating) that is permanently labeled for switch and control functions. The operator panel shall be provided with the following features and capabilities.

a) High intensity LED lamps to indicate the source that the load is connected to (source 1 or source 2); and which source(s) are available. Source available LED indicators shall operate from the control microprocessor to indicate the true condition of the sources as sensed by the control.

b) High intensity LED lamps to indicate that the transfer switch is “not in auto” (due to control being disabled or due to bypass switch enabled or in operation) and “Test/Exercise Active” to indicate that the control system is testing or exercising the generator set.

c) “OVERRIDE” pushbutton to cause the transfer switch to bypass any active time delays for start, transfer, and retransfer and immediately proceed with its next logical operation.

d) “TEST” pushbutton to initiate a preprogrammed test sequence for the generator set and transfer switch. The transfer switch shall be programmable for test with load or test without load.

e) “RESET/LAMP TEST” pushbutton that will clear any faults present in the control, or simultaneously test all lamps on the panel by lighting

them.

f) The control system shall continuously log information on the number of hours each source has been connected to the load, the number of times transferred, and the total number of times each source has failed. This information shall be available via the service tool or an operator display panel.

g) Vacuum fluorescent alphanumeric display panel with push-button navigation switches. The display shall be clearly visible in both bright (sunlight) and no light conditions. It shall be visible over an angle of at least 120 degrees. The Alphanumeric display panel shall be capable of providing the following functions and capabilities.

(1) Display source condition information, including AC voltage for each phase of normal and emergency source, frequency of each source. Voltage for all three phases shall be displayed on a single screen for easy viewing of voltage balance.

(2) Display source status, to indicate source is connected or not connected.

(3) Display load data, including 3-phase AC voltage, 3-phase AC current, frequency, KW, KVA, and power factor. Voltage and current data for all phases shall be displayed on a single screen.

(4) The display panel shall allow the operator to view and make the following adjustments in the control system, after entering an access code:

(a) Set nominal voltage and frequency for the transfer switch.

(b) Adjust voltage and frequency sensor operation set points.

(c) Set up time clock functions.

(d) Set up load sequence functions.

(e) Enable or disable control functions in the transfer switch, including program transition.

(f) Set up exercise and load test operation conditions, as well as normal system time delays for transfer time, time delay start, stop, transfer, and retransfer.

(5) Display Real Time Clock data, including date, and time in hours, minutes, and seconds. The real-time clock shall

incorporate provisions for automatic daylight savings time and leap year adjustments. The control shall also log total operating hours for the control system.

(6) Display service history for the transfer switch. Display source connected hours, to indicate the total number of hours connected to each source. Display number of times transferred, and total number of times each source has failed.

(7) Display fault history on the transfer switch, including condition, and date and time of fault. Faults to include controller checksum error, low controller DC Voltage, ATS fail to close on transfer, ATS fail to close on retransfer, battery charger malfunction, network battery voltage low, network communications error.

(8) Display information for other transfer switches in the system, including transfer switch name, real time load in KW on the transfer switch, current source condition, and current operating mode.

I. Internal Controls

1. The transfer switch control system shall be configurable in the field for any operating voltage level up to 600VAC. Provide RMS voltage sensing and metering that is accurate to within plus or minus 1% of nominal voltage level. Frequency sensing shall be accurate to within plus or minus 0.2%. Voltage sensing shall be monitored based on the normal voltage at the site. Systems that utilize voltage monitoring based on standard voltage conditions are not acceptable.

2. Transfer switch voltage sensors shall be close differential type, providing source availability information to the control system based on the following functions:

a) Monitoring all phases of the normal service (source 1) for under voltage conditions (adjustable for pickup in a range of 85 to 98% of the normal voltage level and dropout in a range of 75 to 98% of normal voltage level).

b) Monitoring all phases of the emergency service (source 2) for under voltage conditions (adjustable for pickup in a range of 85 to 98% of the normal voltage level and dropout in a range of 75 to 98% of pickup voltage level).

c) Monitoring all phases of the normal service (source 1) and emergency service (source 2) for voltage imbalance.

d) Monitoring all phases of the normal service (source 1) and emergency service (source 2) for loss of a single phase.

e) Monitoring all phases of the normal service (source 1) and emergency service (source 2) for phase rotation.

f) Monitoring all phases of the normal service (source 1) and emergency service (source 2) for over voltage conditions (adjustable for dropout over a range of 105 to 135% of normal voltage, and pickup at 95-99% of dropout voltage level).

g) Monitoring all phases of the normal service (source 1) and emergency service (source 2) for over or under frequency conditions.

h) Monitoring the neutral current flow in the load side of the transfer switch. The control shall initiate an alarm when the neutral current exceeds a preset adjustable value in the range of 100-150% of rated phase current for more than an adjustable time period of 10 to 60 seconds.

3. All transfer switch sensing shall be configurable from a Windows XP or NT PC-based service tool, to allow setting of levels, and enabling or disabling of features and functions. Selected functions including voltage sensing levels and time delays shall be configurable using the operator panel. The transfer control shall incorporate a series of diagnostic LED lamps.

4. The transfer switch shall be configurable to control the operation time from source to source (program transition operation). The control system shall be capable of enabling or disabling this feature, and adjusting the time period to a specific value. A phase band monitor or similar device is not an acceptable alternate for this feature.

5. The transfer switch shall incorporate adjustable time delays for generator set start (adjustable in a range from 0-15 seconds); transfer (adjustable in a range from 0-120 seconds); retransfer (adjustable in a range from 0-30 minutes); and generator stop (cooldown) (adjustable in a range of 0-30 minutes).

6. The control system shall be designed and prototype tested for operation in ambient temperatures from – 20°C to + 60°C.

7. The control shall have optically isolated logic inputs, high isolation transformers for AC inputs, and relays on all outputs, to provide optimum protection from line voltage surges, RFI and EMI.

8. The transfer switch shall be provided with a battery charger for the generator set starting batteries. The battery charger shall be a float type charger rated 10 amps. The battery charger shall include an ammeter for display of charging current and shall have fused AC inputs and DC outputs. The charger shall also include fault indications for high and low DC voltage and supply power failed, and dry contacts for external indication of these fault conditions. Supply power failed indication shall be displayed on the ATS control panel.

J. Control Interface

1. The transfer switch will provide an isolated relay contact for starting of a generator set. The relay shall be normally held open, and close to start the generator set. Output contacts shall be form C, for compatibility with any generator set.

2. Provide one set of Form C auxiliary contacts on both sides, operated by transfer switch position, rated 10 amps 250 VAC.

K. Enclosure

1. Enclosures shall be UL listed, NEMA Type 1. The enclosure shall provide NEC wire bend space. The cabinet door shall be key-locking.

L. Operation

1. Transfer switch normally connects an energized utility power source (source1) to loads and a generator set (source 2) to the loads when normal source fails. The normal position of the transfer switch is source 1 (connected to the utility), and no start signal is supplied to the genset.

2. Generator Set Exercise (Test) With Load Mode. The control system shall be configurable to test the generator set under load. In this mode, the transfer switch shall control the generator set in the following sequence:

a) Transfer switch shall initiate the exercise sequence at a time indicated in the exercise timer program, or when manually initiated by the operator.

b) When the control systems senses the generator set at rated voltage and frequency, it shall operate to connect the loads to the generator set by opening the normal source contacts, and closing the alternate source contacts a predetermined time period later. The timing sequence for the contact operation shall be programmable in the controller.

c) The generator set shall operate connected to the load for the duration of the exercise period. If the generator set fails during this period, the transfer switch shall automatically reconnect the generator set to the normal service.

d) On completion of the exercise period, the transfer switch shall operate to connect the loads to the normal source by opening the alternate source contacts, and closing the normal source contacts a predetermined time period later. The timing sequence for the contact operation shall be programmable in the controller.

e) The transfer switch shall operate the generator set unloaded for a cool down period, and then remove the start signal from the generator set. If the normal power fails at any time when the generator set is running,

the transfer switch shall immediately connect the system loads to the generator set.

3. Generator Set Exercise (Test) Without Load Mode. The control system shall be configurable to test the generator set without transfer switch load connected. In this mode, the transfer switch shall control the generator set in the following sequence:

   a) Transfer switch shall initiate the exercise sequence at a time indicated in the exercise timer program, or when manually initiated by the operator.

   b) When the control systems senses the generator set at rated voltage and frequency, it shall operate the generator set unloaded for the duration of the exercise period.

   c) At the completion of the exercise period, the transfer switch shall remove the start signal from the generator set. If the normal power fails at any time when the generator set is running, the transfer switch shall immediately connect the system loads to the generator set.

IV. REMOTE ALARM ANNUNCIATOR PANEL

A. Provide and install a 20-light LED type remote alarm annunciator with horn, located as shown on the drawings in the building engineer's office. The remote annunciator shall provide all the audible and visual alarms called for by NFPA Standard 110 for level 1 systems for the local generator control panel. Spare lamps shall be provided to allow future addition of other alarm and status functions to the annunciator. Provisions for labeling of the annunciator in a fashion consistent with the specified functions shall be provided. Alarm silence and lamp test switch(es) shall be provided. LED lamps shall be replaceable, and indicating lamp color shall be capable of changes needed for specific application requirements. Alarm horn shall be switchable for all annunciation points. Alarm horn (when switched on) shall sound for first fault, and all subsequent faults, regardless of whether first fault has been cleared, in compliance with NFPA110 3-5.6.2. The interconnecting wiring between the annunciator and other system components shall be monitored and failure of the interconnection between components shall be displayed on the annunciator panel.

B. The annunciator shall include the following alarm labels, audible annunciation features, and lamp colors:

Condition	Lamp Color	Audible Alarm
Normal Power (to Loads)	Green	No
Genset Supplying Load	Amber	No
Genset Running	Green	No
Not in Auto	Red (Flashing)	Yes
High Battery Voltage	Red	Yes
Low Battery Voltage	Red	Yes
Charger AC Failure	Red	Yes
Fail to Start	Red	Yes

Low Engine Temperature	Amber	Yes
Pre-High Engine Temperature	Amber	Yes
High Engine Temperature	Red	Yes
Pre-Low Oil Pressure	Amber	Yes
Low Oil Pressure	Red	Yes
Overspeed	Red	Yes
Low Coolant Level	Amber	Yes
Low Fuel Pressure	Amber	Yes
Network OK	Green	Yes
(3) Spares	Configurable	Configurable

Low battery voltage lamp shall also be lighted for low cranking voltage or weak battery alarm.

Part 3 - Execution

I. INSTALLATION

A. This Contractor shall furnish and install complete the standby electrical power system including the engine generator set, automatic transfer switch, batteries, exhaust system, vibration isolation, cooling system, electrical system, concrete pad, and accessories in accordance with the system manufacturer's recommendations.

B. The Contractor shall furnish and install a six (6) inch high by six (6) inch greater all sides concrete base foundation for the engine generator set.

1. Concrete foundation shall be as follows:

a) Minimum compressive strength at 28 days – 3500 PSI
b) Maximum nominal aggregate size – 1 inch
c) Maximum W/C ratio by mass – 0.45
d) Air content – 5 ± 1%
e. Slump – 2” ± 0.75”

2. Top of concrete bases shall be trowel finished smooth and level with beveled edges. Top surface shall not vary by more than 1/8” in depth as measured across the widest surface.

3. All concrete shall be fully vibrated.

4. Reinforcing Steel – Reinforcing to meet ASTM requirements. Spacing of bars shall be adjusted to suit conduit spacing.

C. This Contractor shall ground the generator set as per the NEC, as shown on the Drawings, and as herein specified.

D. All equipment shall be physically inspected for damage. Scratches and other installation

damage shall be repaired. Equipment shall be thoroughly cleaned to remove all dirt and debris.

II. START-UP SERVICE AND ACCEPTANCE TEST

A. Start-up Service: The standby electrical power system's equipment shall be initially started, operated and tested by the manufacturer's representative prior to the "on-site acceptance test".

B. On-Site Acceptance Test: The manufacturer shall furnish service personnel and all testing equipment and temporary cable connections to completely service and field test, in the presence of the Owner, the standby electrical power system. The test shall include, but not be limited to, a "cold start" test, a minimum period of four (4) hours with a load bank test at one hundred percent (100%) of the nameplate rating of the engine generator set and a one-step rated load pickup test in accordance with NFPA 110. The manufacturer shall make any adjustments to the system to assure proper operation. The manufacturer shall then instruct the Owner's personnel as to proper maintenance and operation and furnish three (3) sets of operating, technical, factory service manuals and maintenance instructions, including descriptive literature of equipment, parts list, and the names and telephone numbers of manufacturer's representatives.

III. WARRANTY

A. The warranty for the complete standby electric power system shall be unconditional for a period of one (1) year with unlimited operating hours from the date of the successful acceptance test. The warranty shall be furnished by the system manufacturer. Said coverage shall be for all equipment provided under this specification section whether or not it is manufactured by the Standby Electrical System Manufacturer and shall include parts, labor, travel expenses, and labor to remove/reinstall said equipment per the manufacturer's standard published warranty. There shall be no deductibles applied to said warranty. Multiple warranties for individual components, engine alternator, controls, etc. will not be acceptable. Satisfactory warranty documents shall be furnished. Refer to SECTION 01740 WARRANTIES AND BONDS.

B. Contractor shall provide Warranty Coverage Labels mounted conspicuously on the engine generator control section and on the door of the automatic load transfer switch. The labels shall identify the one source supplier/manufacturer's address and telephone number, coverage description, coverage type, start-up date, model number, serial number, system registration number and other information deemed pertinent by the supplier/manufacturer. It is the intent of this warranty specification to have a single source contact for the Owner to call for warranty service for all standby electrical power system equipment.

C. The manufacturer shall be prepared to offer a service contract for the maintenance of the standby electric power system after the warranty period and/or an extended warranty.

END OF SECTION

Part 1 - General

I. REQUIREMENTS

A. The general provisions of the Contract, including General and Supplementary Conditions and General Requirements, apply to the work specified in this Section.

II. SCOPE

A. The work covered under this Section shall include furnishing and installing the standby electrical power system consisting of an emergency engine generator set and automatic transfer switch as shown on the Drawings and herein specified.

B. The existing standby electrical power system shall remain in operation and shall continue to serve the building's emergency power during the construction period until the new system has been installed and tested, ready for operation. After the new system has assumed the building's entire emergency power load, the existing system shall be removed as shown on the Drawings.

III. SUBMITTALS

A. Product Data: For each type of packaged engine generator indicated. Include rated capacities, operating characteristics, and furnished specialties and accessories. In addition, include the following:

1. Thermal damage curve for generator.

2. Time-current characteristic curves for generator protective device.

B. Shop Drawings: Detail equipment assemblies and indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.

1. Dimensioned outline plan and elevation drawings of engine-generator set and other components specified.

2. Wiring Diagrams: Power, signal, and control wiring.

C. Qualification Data: Manufacturer shall demonstrate they manufacture either the alternator or the generator. Manufacturers that assemble, and do not manufacture the alternator or the generator shall not be permitted.

D. Source quality-control test reports.

1. Certified summary of prototype-unit test report.

2. Certified Test Reports: For components and accessories that are equivalent, but not identical, to those tested on prototype unit.

    a) Certified Summary of Performance Tests: Certify compliance with specified requirement to meet performance criteria for sensitive loads.

    b) Report of factory test on units to be shipped for this Project, showing evidence of compliance with specified requirements.

    c) Report of sound generation.

    d) Report of exhaust emissions showing compliance with applicable regulations.

    e) Certified Torsional Vibration Compatibility: Comply with NFPA 110.

E. Field quality-control test reports.

F. Operation and Maintenance Data: For packaged engine generators to include in emergency, operation, and maintenance manuals.

G. Warranty: Special warranty specified in this Section.

IV. QUALITY ASSURANCE

A. All applicable parts of the standby electrical power system shall meet National Electrical Manufacturer's Association (NEMA) and National Fire Protection Association (NFPA) standards, and be Underwriter's Laboratories, Inc. (UL) listed to UL 2200 and bear the UL label. The system shall be installed to meet the requirements of the National Electric Code (NEC) and all applicable state and local codes, and these Specifications.

B. This system shall be completely built, tested, and shipped by a manufacturer who has been regularly engaged in the production of such equipment for the past ten (10) years and who has had parts and service facilities available locally (within a 50-mile radius of the job site) for the past five (5) years.

C. The supplier of the standby electrical power system shall have and shall be able to demonstrate fully stocked service vehicles. The supplier shall also have factory trained and factory certified maintenance technicians on staff.

D. The performance of the standby electrical power system shall be certified by an independent testing laboratory as to the unit's full power rating, voltage, and frequency regulation.

E. The standby electrical power system shall provide standby for the emergency white and exit lights and other such auxiliary power as indicated on the Drawings so as to operate automatically in the event of a utility power failure of the "normal" power system.

F. Submittals are required in accordance with SECTION 16010 of the Specifications. The

manufacturer shall furnish printed literature and brochures describing the standard series specified (not a one of a kind fabrication). The manufacturer shall furnish schematic and wiring diagrams for the engine generator set and automatic load transfer switch; and an interconnecting diagram showing connections to individual components which constitute the standby electrical power system.

G. The performance tests of the generating set series shall be in accordance with procedures certified by an independent testing laboratory. The manufacturer shall have successfully tested a prototype of the generating set series offered which shall include: maximum power level; maximum motor starting capacity; structural soundness; torsigraph analysis; fuel consumption; engine-alternator cooling air flow; transient response and steady state governing; alternator temperature rise per NEMA MG1-22.40; single step load pickup per NFPA 76A- 822; harmonic analysis and voltage waveform deviation; and three-phase short circuit test for mechanical and electrical strength.

H. The generator set manufacturer shall be certified to ISO 9001 International Quality Standard and shall have third party certification verifying quality assurance in design/development, production, installation, and service, in accordance with ISO 9001.

I. The manufacturer shall maintain model and serial number records for each engine generator set and automatic load transfer switch provided for at least 20 years.

J. Manufacturer Qualifications: The manufacturer of the gen set shall be either a manufacturer of the engine or the alternator. Maintain, within 200 miles of Project site, a service center capable of providing training, parts, and emergency maintenance repairs.

K. The generator set manufacturer shall be certified to ISO 9001 International Quality Standard and shall have third party certification verifying quality assurance in design/development, production, installation, and service, in accordance with ISO 9001.

L. The manufacturer shall maintain model and serial number records for each engine generator set and automatic load transfer switch provided for at least 20 years.

M. Source Limitations: Obtain packaged generator set, automatic transfer switches and auxiliary components through one source from a single manufacturer.

V. COORDINATION

A. Coordinate size and location of concrete bases for package engine generators. Cast anchor-bolt inserts into bases. Concrete, reinforcement, and formwork requirements are specified in Division 3.

VI. MAINTENANCE SERVICE

A. Initial Maintenance Service: Beginning at Substantial Completion, provide 12 months' full maintenance by skilled employees of manufacturer's designated service organization.

B. Include quarterly exercising to check for proper starting, load transfer, and running under load. Include routine preventive maintenance as recommended by manufacturer and

adjusting as required for proper operation. Provide parts and supplies same as those used in the manufacture and installation of original equipment.

Part 2 - Products

I. DESCRIPTION

A. The standby electrical power system shall be furnished and installed by this Contractor as shown on the Drawings and as herein specified. The system shall be manufactured by CUMMINS POWER GENERATION as listed herein or equal as manufactured by CATERPILLAR (OLYMPIAN), GENERAC POWER SYSTEMS, or KOHLER POWER SYSTEMS.

B. The standby electrical power system shall be an electric plant rated for continuous standby service at 100 KW, 0.8 power factor, 277/480 volts, three phase, four wire, 60 Hertz. A standby electrical power system that will meet this specification is CUMMINS POWER GENERATION Model Number 100 GGHH. The system shall be a package of new and current equipment consisting of:

1. A natural gas fueled engine generator set, as indicated on the Drawings, to provide standby electrical power.

2. An automatic transfer switch to provide automatic starting and stopping of the engine generator set and switching of the load.

3. Mounted accessories as herein specified.

4. Three pole, 200 amp output main circuit breaker. Provide auxiliary contacts to indicate circuit breaker status.

5. Engine mounted start-stop control system.

6. Spring type vibration isolators.

7. Remote annunciator panel.

II. ENGINE GENERATOR SET

A. Engine

1. The engine shall be natural gas fueled, four (4) cycle, water cooled, turbo charged with mounted radiator, fan, and water pump. It shall have eight (8) cylinders with a minimum displacement of 412.5 cubic inches, with a minimum rating of 176.0-brake horsepower at operating speed of 1800 RPM. Free-turn overhead valves shall be alloy steel with hard chrome-cobalt alloy. Full pressure lubrication shall be supplied by a gear oil pump. The engine shall have a replaceable, full-flow oil filter and gaseous fuel pressure regulation and solenoid

valve. Engine speed shall be governed by an electronic governor for isochronous frequency regulation. The engine shall have a twelve (12) volt, DC, battery charging alternator (65A) automatically controlled by a solid-state voltage regulator. Starting shall be by a twelve (12) volt electric starter.

2. The complete engine shall be furnished with a start control that operates on contact closing and a stop control that operates on contact opening. A cranking limiter shall be provided to open the starting circuit in approximately forty-five (45) seconds if the plant is not started within that time.

B. The alternator shall be a four (4) pole revolving field type with permanent magnet exciter and torque matched voltage regulator. No commutator or commutator brushes shall be allowed. The starter shall be directly connected to the engine flywheel housing, and the rotor shall be driven through a rigid coupling to insure permanent alignment. Voltage regulation shall be within plus or minus two percent (2%) of rated voltage, from no-load to full-load. The instantaneous voltage dip shall be less than twelve percent (12%) of rated voltage when full- load and rated power factor is applied to the alternator. Recovery to stable operation shall occur within two (2) seconds. Stable or steady-state operation is defined as operation with terminal voltage remaining constant within plus or minus one (1%) percent of rated voltage. Temperature rise shall not be more than one hundred twenty-five (125) degrees F over forty (40) degrees ambient at rated load. A permanent magnet generator shall provide excitation power to the automatic voltage regulator for immunity from voltage distortion caused by non- linear SCR controlled loads on the unit. The permanent magnet generator shall sustain short circuit current for selective operation and coordination of overcurrent devices.

C. The engine generator set control panel shall be wired, tested, and shock mounted on the generator set by the manufacturer of the alternator. It shall contain: panel lighting; RUN-STOP-REMOTE selector switch; coolant temperature gauge; field circuit breaker; DC voltmeter; running time meter; lamp test switch; oil pressure gauge; fault reset switch; cycle cranking; and low coolant level shutdown. The panel shall contain a twelve (12) light monitor panel with the following: green RUN light; yellow PREWARNING FOR LOW OIL PRESSURE light; yellow PREWARNING FOR HIGH COOLANT TEMPERATURE light; red LOW OIL PRESSURE SHUTDOWN light; red HIGH COOLANT TEMPERATURE SHUTDOWN light; red OVERCRANK SHUTDOWN light; red OVERSPEED SHUTDOWN light; flashing red SWITCH OFF light; yellow LOW COOLANT TEMPERATURE light; yellow

D. The engine generating set shall be mounted on a welded steel base which shall provide for suitable mounting by this Contractor to any level surface. This Contractor shall furnish and install vibration isolators of the number and size required for the total weight of the unit between the steel base and mounting pad.

E. Accessories required for the proper operation of the engine generator set shall be furnished by the manufacturer. These shall include, but not be limited to, the following:

1. Flexible exhaust connectors.

2. Twelve (12) volt lead acid type starting batteries.

3. Battery rack and cables.

4. Additional solenoid valve (shipped loose).

5. This Contractor shall install the additional DC voltage solenoid valve supplied, prior to the flexible fuel line and wire as directed by the engine generator manufacturer to the control circuit to open with the engine operation.

6. Flexible gas lines.

7. Gaseous fuel pressure regulator (to be supplied by the Division 15 Contractor).

8. Single phase, 1.5 kw, 120 volt crank case heater, direct connected. Plug and cord connected type will not be acceptable.

9. Fifty percent (50%) ethylene glycol antifreeze solution to fill engine cooling system.

10. Two (2) 12-volt Form C dry contacts for connection to the fire alarm system graphic annunciator panel for “Generator Run” and “Generator Fault” indications.

11. Two (2) 12-volt Form C dry contacts for connection to the security intrusion system panel for “Generator Run” and “Generator Fault” indications.

F. The engine generator set shall be enclosed with a weather protective housing. The housing shall be rated for sound attenuation to seventy (70) dB(A) average at seven (7) meters when using an eight (8) position measurement system using tests conducted per ANSI S1.13-1971. Acoustical materials shall be oil and water-resistant. A critical silencer muffler shall be mounted inside the housing with raincap and rainshield. The housing shall be attached to the skid base of the generator set and constructed of minimum 14-gauge metal using non-marring fasteners. The access doors shall have both key-lockable door handles and provisions for padlocking and mounted using stainless steel hinges. Paint protection shall be epoxy primer and dual coat electrodeposition method for all sides and all metal surfaces. Overspray of hoses, clamps, wiring and harnesses, and other serviceable items shall not be acceptable.

III. AUTOMATIC TRANSFER SWITCH

A. The complete automatic transfer switch shall be suitable for utility power (source 1) to engine generator set (source 2) application, be completely factory assembled with digital electronic controls designed for surge voltage isolation, and including voltage sensors on all phases of both sources, linear operator, permanently attached manual handles, positive mechanical and electrical interlocking, and mechanically held contacts.

B. The automatic transfer switch shall conform to the requirements of the following codes and standards (latest editions):

1. UL1008. The transfer switch shall be UL listed and labeled.

2. CSA C22.2, No. 14 – M91 Industrial Control Equipment.

3. CSA 282, Emergency Electrical Power Supply for Buildings.

4. NFPA110 – Emergency and Standby Power Systems. The transfer switch shall meet all requirements for level 1 systems.

5. IEEE446 – Recommended Practice for Emergency and Standby Power Systems for Commercial and Industrial Applications.

6. NEMA ICS10 – AC Automatic Transfer Switches.

C. The transfer switch manufacturer shall be certified to ISO 9001 International Quality Standard and shall have third party certification verifying quality assurance in design/development, production, installation, and service, in accordance with ISO 9001.

D. Transfer switch equipment specifications for this project are based on microprocessor-based transfer switches. The transfer switch shall be CUMMINS POWER GENERATION Model OTPC or equal as manufactured by AUTOMATIC SWITCH COMPANY (ASCO) Model 7000 Series.

E. Ratings

1. The transfer switch shall be three pole, four wire, 277/480 volt, 60 hertz, 225 amps.

2. Main contacts shall be rated for 600 Volts AC minimum.

3. Transfer switch(es) shall be rated to carry 100 percent of rated current continuously in the enclosure supplied, in ambient temperatures of - 40 to + 60 degrees C, relative humidity up to 95% (non-condensing), and altitudes up to 10,000 feet (3000M).

4. Transfer switch equipment shall have a minimum withstand and closing ratings (WCR) in RMS symmetrical amperes of 30,000. The transfer switch and its upstream protection shall be third party listed and labeled for use with the specific protective device(s) installed in the application.

F. Construction

1. Transfer switch(es) shall be double-throw, electrically and mechanically interlocked, and mechanically held in the source 1 and source 2 positions. The transfer switch shall be specifically designed to transfer to the best available source if it inadvertently stops in a neutral position.
2. Transfer switches shall be equipped with permanently attached manual operating handles and quick-break, quick-make over-center contact mechanisms.

3. Main switch contacts shall be high-pressure silver alloy. Contact assemblies shall have arc chutes for positive arc extinguishing. Arc chutes shall have insulating covers to prevent inter-phase flashover.

4. Transfer switch internal wiring shall be composed of pre-manufactured harnesses that are permanently marked for source and destination. Harnesses shall be connected to the control system by means of locking disconnect plug(s), to allow the control system to be easily disconnected and serviced without disconnecting power from the transfer switch mechanism.

5. Transfer switch shall be provided with flame retardant transparent covers to allow viewing of switch contact operation but prevent direct contact with line voltage components.

6. Transfer switches shall be provided with a neutral bus and lugs. The neutral bus shall be sized to carry 100% of the current designed on the switch rating.

G. Connections

1. Field control connections shall be made on a common terminal block that is clearly and permanently labeled.

2. Transfer switch shall be provided with AL/CU mechanical lugs sized to accept the full output rating of the generator set.

H. Transfer Switch Control

1. Operator Panel. Each transfer switch shall be provided with a control panel to allow the operator to view the status and control operation of the transfer switch. The operator panel shall be a sealed membrane panel rated NEMA 3R/IP53 or better (regardless of enclosure rating) that is permanently labeled for switch and control functions. The operator panel shall be provided with the following features and capabilities.

a) High intensity LED lamps to indicate the source that the load is connected to (source 1 or source 2); and which source(s) are available. Source available LED indicators shall operate from the control microprocessor to indicate the true condition of the sources as sensed by the control.

b) High intensity LED lamps to indicate that the transfer switch is “not in auto” (due to control being disabled or due to bypass switch enabled or in operation) and “Test/Exercise Active” to indicate that the control system is testing or exercising the generator set.

c) “OVERRIDE” pushbutton to cause the transfer switch to bypass any active time delays for start, transfer, and retransfer and immediately proceed with its next logical operation.

d) “TEST” pushbutton to initiate a preprogrammed test sequence for the

generator set and transfer switch. The transfer switch shall be programmable for test with load or test without load.

e) "RESET/LAMP TEST" pushbutton that will clear any faults present in the control, or simultaneously test all lamps on the panel by lighting them.

f) The control system shall continuously log information on the number of hours each source has been connected to the load, the number of times transferred, and the total number of times each source has failed. This information shall be available via the service tool or an operator display panel.

g) Vacuum fluorescent alphanumeric display panel with push-button navigation switches. The display shall be clearly visible in both bright (sunlight) and no light conditions. It shall be visible over an angle of at least 120 degrees. The Alphanumeric display panel shall be capable of providing the following functions and capabilities.

(1) Display source condition information, including AC voltage for each phase of normal and emergency source, frequency of each source. Voltage for all three phases shall be displayed on a single screen for easy viewing of voltage balance.

(2) Display source status, to indicate source is connected or not connected.

(3) Display load data, including 3-phase AC voltage, 3-phase AC current, frequency, KW, KVA, and power factor. Voltage and current data for all phases shall be displayed on a single screen.

(4) The display panel shall allow the operator to view and make the following adjustments in the control system, after entering an access code:

(a) Set nominal voltage and frequency for the transfer switch.
(b) Adjust voltage and frequency sensor operation set points.
(c) Set up time clock functions.
(d) Set up load sequence functions.
(e) Enable or disable control functions in the transfer switch, including program transition.
(f) Set up exercise and load test operation conditions, as well as normal system time delays for transfer time, time delay start, stop, transfer, and retransfer.

(5) Display Real Time Clock data, including date, and time in hours, minutes, and seconds. The real-time clock shall incorporate provisions for automatic daylight savings time and leap year adjustments. The control shall also log total operating hours for the control system.

(6) Display service history for the transfer switch. Display source connected hours, to indicate the total number of hours connected to each source. Display number of times transferred, and total number of times each source has failed.

(7) Display fault history on the transfer switch, including condition, and date and time of fault. Faults to include controller checksum error, low controller DC Voltage, ATS fail to close on transfer, ATS fail to close on retransfer, battery charger malfunction, network battery voltage low, network communications error.

(8) Display information for other transfer switches in the system, including transfer switch name, real time load in KW on the transfer switch, current source condition, and current operating mode.

I. Internal Controls

1. The transfer switch control system shall be configurable in the field for any operating voltage level up to 600VAC. Provide RMS voltage sensing and metering that is accurate to within plus or minus 1% of nominal voltage level. Frequency sensing shall be accurate to within plus or minus 0.2%. Voltage sensing shall be monitored based on the normal voltage at the site. Systems that utilize voltage monitoring based on standard voltage conditions are not acceptable.

2. Transfer switch voltage sensors shall be close differential type, providing source availability information to the control system based on the following functions:

a) Monitoring all phases of the normal service (source 1) for under voltage conditions (adjustable for pickup in a range of 85 to 98% of the normal voltage level and dropout in a range of 75 to 98% of normal voltage level).

b) Monitoring all phases of the emergency service (source 2) for under voltage conditions (adjustable for pickup in a range of 85 to 98% of the normal voltage level and dropout in a range of 75 to 98% of pickup voltage level).

c) Monitoring all phases of the normal service (source 1) and emergency service (source 2) for voltage imbalance.

d) Monitoring all phases of the normal service (source 1) and emergency service (source 2) for loss of a single phase.

e) Monitoring all phases of the normal service (source 1) and emergency service (source 2) for phase rotation.

f) Monitoring all phases of the normal service (source 1) and emergency service (source 2) for over voltage conditions (adjustable for dropout over a range of 105 to 135% of normal voltage, and pickup at 95-99% of dropout voltage level).

g) Monitoring all phases of the normal service (source 1) and emergency service (source 2) for over or under frequency conditions.

h) Monitoring the neutral current flow in the load side of the transfer switch. The control shall initiate an alarm when the neutral current exceeds a preset adjustable value in the range of 100-150% of rated phase current for more than an adjustable time period of 10 to 60 seconds.

3. All transfer switch sensing shall be configurable from a Windows XP or NT PC-based service tool, to allow setting of levels, and enabling or disabling of features and functions. Selected functions including voltage sensing levels and time delays shall be configurable using the operator panel. The transfer control shall incorporate a series of diagnostic LED lamps.

4. The transfer switch shall be configurable to control the operation time from source to source (program transition operation). The control system shall be capable of enabling or disabling this feature, and adjusting the time period to a specific value. A phase band monitor or similar device is not an acceptable alternate for this feature.

5. The transfer switch shall incorporate adjustable time delays for generator set start (adjustable in a range from 0-15 seconds); transfer (adjustable in a range from 0-120 seconds); retransfer (adjustable in a range from 0-30 minutes); and generator stop (cool down) (adjustable in a range of 0-30 minutes).

6. The control system shall be designed and prototype tested for operation in ambient temperatures from – 20°C to + 60°C.

7. The control shall have optically isolated logic inputs, high isolation transformers for AC inputs, and relays on all outputs, to provide optimum protection from line voltage surges, RFI and EMI.

8. The transfer switch shall be provided with a battery charger for the generator set starting batteries. The battery charger shall be a float type charger rated 10 amps. The battery charger shall include an ammeter for display of charging current and shall have fused AC inputs and DC outputs. The charger shall also include fault indications for high and low DC voltage and supply power failed, and dry contacts for external indication of these fault conditions. Supply power

failed indication shall be displayed on the ATS control panel.

J. Control Interface

1. The transfer switch will provide an isolated relay contact for starting of a generator set. The relay shall be normally held open, and close to start the generator set. Output contacts shall be form C, for compatibility with any generator set.

2. Provide one set of Form C auxiliary contacts on both sides, operated by transfer switch position, rated 10 amps 250 VAC.

K. Enclosure

1. Enclosures shall be UL listed, NEMA Type 1. The enclosure shall provide NEC wire bend space. The cabinet door shall be key-locking.

L. Operation

1. Transfer switch normally connects an energized utility power source (source1) to loads and a generator set (source 2) to the loads when normal source fails. The normal position of the transfer switch is source 1 (connected to the utility), and no start signal is supplied to the genset.

2. Generator Set Exercise (Test) With Load Mode. The control system shall be configurable to test the generator set under load. In this mode, the transfer switch shall control the generator set in the following sequence:

a) Transfer switch shall initiate the exercise sequence at a time indicated in the exercise timer program, or when manually initiated by the operator.

b) When the control systems senses the generator set at rated voltage and frequency, it shall operate to connect the loads to the generator set by opening the normal source contacts, and closing the alternate source contacts a predetermined time period later. The timing sequence for the contact operation shall be programmable in the controller.

c) The generator set shall operate connected to the load for the duration of the exercise period. If the generator set fails during this period, the transfer switch shall automatically reconnect the generator set to the normal service.

d) On completion of the exercise period, the transfer switch shall operate to connect the loads to the normal source by opening the alternate source contacts, and closing the normal source contacts a predetermined time period later. The timing sequence for the contact operation shall be programmable in the controller.

e) The transfer switch shall operate the generator set unloaded for a cool

down period, and then remove the start signal from the generator set. If the normal power fails at any time when the generator set is running, the transfer switch shall immediately connect the system loads to the generator set.

3. Generator Set Exercise (Test) Without Load Mode. The control system shall be configurable to test the generator set without transfer switch load connected. In this mode, the transfer switch shall control the generator set in the following sequence:

   a) Transfer switch shall initiate the exercise sequence at a time indicated in the exercise timer program, or when manually initiated by the operator.

   b) When the control systems senses the generator set at rated voltage and frequency, it shall operate the generator set unloaded for the duration of the exercise period.

   c) At the completion of the exercise period, the transfer switch shall remove the start signal from the generator set. If the normal power fails at any time when the generator set is running, the transfer switch shall immediately connect the system loads to the generator set.

IV. REMOTE ALARM ANNUNCIATOR PANEL

A. Provide and install a 20-light LED type remote alarm annunciator with horn, located as shown on the drawings in the building engineer's office. The remote annunciator shall provide all the audible and visual alarms called for by NFPA Standard 110 for level 1 systems for the local generator control panel. Spare lamps shall be provided to allow future addition of other alarm and status functions to the annunciator. Provisions for labeling of the annunciator in a fashion consistent with the specified functions shall be provided. Alarm silence and lamp test switch(es) shall be provided. LED lamps shall be replaceable, and indicating lamp color shall be capable of changes needed for specific application requirements. Alarm horn shall be switchable for all annunciation points. Alarm horn (when switched on) shall sound for first fault, and all subsequent faults, regardless of whether first fault has been cleared, in compliance with NFPA110 3-5.6.2. The interconnecting wiring between the annunciator and other system components shall be monitored and failure of the interconnection between components shall be displayed on the annunciator panel.

B. The annunciator shall include the following alarm labels, audible annunciation features, and lamp colors:

Condition	Lamp Color	Audible Alarm
Normal Power (to Loads)	Green	No
Genset Supplying Load	Amber	No
Genset Running	Green	No
Not in Auto	Red (Flashing)	Yes

High Battery Voltage	Red	Yes
Low Battery Voltage	Red	Yes
Charger AC Failure	Red	Yes
Fail to Start	Red	Yes
Low Engine Temperature	Amber	Yes
Pre-High Engine Temperature	Amber	Yes
High Engine Temperature	Red	Yes
Pre-Low Oil Pressure	Amber	Yes
Low Oil Pressure	Red	Yes
Overspeed	Red	Yes
Low Coolant Level	Amber	Yes
Low Fuel Pressure	Amber	Yes
Network OK	Green	Yes
(3) Spares	Configurable	Configurable

Low battery voltage lamp shall also be lighted for low cranking voltage or weak battery alarm.

Part 3 - Execution

I. INSTALLATION

A. This Contractor shall furnish and install complete the standby electrical power system including the engine generator set, automatic transfer switch, batteries, exhaust system, vibration isolation, cooling system, electrical system, concrete pad, and accessories in accordance with the system manufacturer's recommendations.

B. The Contractor shall furnish and install a six (6) inch high by six (6) inch greater all sides concrete base foundation for the engine generator set.

1. Concrete foundation shall be as follows:

a) Minimum compressive strength at 28 days – 3500 PSI
b) Maximum nominal aggregate size – 1 inch
c) Maximum W/C ratio by mass – 0.45
d) Air content – 5 + 1%
e. Slump – 2” + 0.75”

2. Top of concrete bases shall be trowel finished smooth and level with beveled edges. Top surface shall not vary by more than 1/8” in depth as measured across the widest surface.

3. All concrete shall be fully vibrated.

4. Reinforcing Steel – Reinforcing to meet ASTM requirements. Spacing of bars shall be adjusted to suit conduit spacing.

C. This Contractor shall ground the generator set as per the NEC, as shown on the

Drawings, and as herein specified.

D. All equipment shall be physically inspected for damage. Scratches and other installation damage shall be repaired. Equipment shall be thoroughly cleaned to remove all dirt and debris.

II. START-UP SERVICE AND ACCEPTANCE TEST

A. Start-up Service: The standby electrical power system's equipment shall be initially started, operated and tested by the manufacturer's representative prior to the "on-site acceptance test".

B. On-Site Acceptance Test: The manufacturer shall furnish service personnel and all testing equipment and temporary cable connections to completely service and field test, in the presence of the Owner, the standby electrical power system. The test shall include, but not be limited to, a "cold start" test, a minimum period of four (4) hours with a load bank test at one hundred percent (100%) of the nameplate rating of the engine generator set and a one-step rated load pickup test in accordance with NFPA 110. The manufacturer shall make any adjustments to the system to assure proper operation. The manufacturer shall then instruct the Owner's personnel as to proper maintenance and operation and furnish three (3) sets of operating, technical, factory service manuals and maintenance instructions, including descriptive literature of equipment, parts list, and the names and telephone numbers of manufacturer's representatives.

III. WARRANTY

A. The warranty for the complete standby electric power system shall be unconditional for a period of one (1) year with unlimited operating hours from the date of the successful acceptance test. The warranty shall be furnished by the system manufacturer. Said coverage shall be for all equipment provided under this specification section whether or not it is manufactured by the Standby Electrical System Manufacturer and shall include parts, labor, travel expenses, and labor to remove/reinstall said equipment per the manufacturer's standard published warranty. There shall be no deductibles applied to said warranty. Multiple warranties for individual components, engine alternator, controls, etc. will not be acceptable. Satisfactory warranty documents shall be furnished. Refer to SECTION 01740 WARRANTIES AND BONDS.

B. Contractor shall provide Warranty Coverage Labels mounted conspicuously on the engine generator control section and on the door of the automatic load transfer switch. The labels shall identify the one source supplier/manufacturer's address and telephone number, coverage description, coverage type, start-up date, model number, serial number, system registration number and other information deemed pertinent by the supplier/manufacturer. It is the intent of this warranty specification to have a single source contact for the Owner to call for warranty service for all standby electrical power system equipment.

C. The manufacturer shall be prepared to offer a service contract for the maintenance of the standby electric power system after the warranty period and/or an extended warranty.

END OF SECTION

Part 1 - General

I. REQUIREMENTS

A. The general provisions of the Contract, including General and Supplementary Conditions and General Requirements, apply to the work specified in this Section.

II. SCOPE

A. The work covered under this Section shall include furnishing and installing a standby electrical power system as shown on the drawings and specified herein.

1. Provide complete factory assembled generator set equipment with digital (microprocessor-based) electronic generator set controls, digital governor, digital voltage regulator, and remote annunciator panel.

2. Provide complete factory assembled power transfer equipment with field programmable digital electronic controls designed for fully automatic operation and including: surge voltage isolation, voltage sensors on all phases of both sources, linear operator, permanently attached manual handles, positive mechanical and electrical interlocking, and mechanically held contacts for both sources.

3. Provide generator-base fuel oil tank (UL 2085).

4. Provide a complete fuel oil transfer pumping system.

5. Provide factory test, startup by a supplier authorized by the equipment manufacturer(s), and on-site testing of the system.

6. The generator set manufacturer shall warrant all equipment provided under this section, whether or not it is manufactured by the generator set manufacturer, so that there is one source for warranty and product service. Technicians specifically trained and certified by the manufacturer to support the product and employed by the generator set supplier shall service the generator sets.

B. The existing standby electrical power system shall remain in operation and shall continue to serve the building's emergency power during the construction period until the new system has been installed and tested, ready for operation. After the new system has assumed the building's entire emergency power load, the existing system shall be removed as shown on the Drawings.

C. The standby “emergency” electrical power system for life safety is a separate system and not a part of this standby electrical power system.

III. SUBMITTALS

A. Submittals are required in accordance with SECTION 16010 of the Specifications, which shall include the following minimum information for review:

1. Manufacturer's product literature and performance data, sufficient to verify compliance to specification requirements.

2. Manufacturer's certification of prototype testing.

3. Manufacturer's published warranty documents.

4. Shop drawings showing plan and elevation views with certified overall dimensions, as well as wiring interconnection details.

5. Interconnection wiring diagrams showing all external connections required; with field wiring terminals marked in a consistent point-to-point manner.

6. Manufacturer's installation instructions.

B. Product Data: For each type of packaged engine generator indicated. Include rated capacities, operating characteristics, and furnished specialties and accessories. In addition, include the following:

1. Thermal damage curve for generator.

2. Time-current characteristic curves for generator protective device.

C. Shop Drawings: Detail equipment assemblies and indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.

1. Dimensioned outline plan and elevation drawings of engine-generator set and other components specified.
2. Wiring Diagrams: Power, signal, and control wiring.

D. Qualification Data: Manufacturer shall demonstrate they manufacture either the alternator or the generator. Manufacturers that assemble, and do not manufacture the alternator or the generator shall not be permitted.

E. Source quality-control test reports.

1. Certified summary of prototype-unit test report.

2. Certified Test Reports: For components and accessories that are equivalent, but not identical, to those tested on prototype unit.

3. Certified Summary of Performance Tests: Certify compliance with specified requirement to meet performance criteria for sensitive loads.

4. Report of factory test on units to be shipped for this Project, showing evidence of compliance with specified requirements.

5. Report of sound generation.

6. Report of exhaust emissions showing compliance with applicable regulations.

7. Certified Torsional Vibration Compatibility: Comply with NFPA 110.

F. Field quality-control test reports.

G. Operation and Maintenance Data: For packaged engine generators to include in emergency, operation, and maintenance manuals.

H. Warranty: Special warranty specified in this Section.

IV. QUALITY ASSURANCE

A. The manufacturer of the generator set shall maintain service parts inventory at a central location which is accessible to the service location 24 hours per day, 365 days per year.

B. The manufacturer shall maintain model and serial number records of each generator set provided for at least 20 years.

C. The generator set shall be serviced by a local service organization that is trained and factory certified in generator set service. The supplier shall maintain an inventory of critical replacement parts at the local service organization, and in service vehicles. The service organization shall be on call 24 hours per day, 365 days per year, who has had parts and service facilities available locally (within a 50-mile radius of the job site) for the last five (5) years.

D. Factory Testing:

1. The generator set manufacturer shall perform a complete operational test on the generator set prior to shipping from the factory. A certified test report shall be provided. Equipment supplied shall be fully tested at the factory for function and performance.

2. Generator set factory tests on the equipment shall be performed at rated load and rated power factor. Generator sets that have not been factory tested at rated power factor will not be acceptable. Tests shall include: run at full load, maximum power, voltage regulation, transient and steady- state governing, single step load pickup, and function of safety shutdowns.

3. The automatic transfer switch manufacturer shall perform a complete operational test on the transfer switch prior to shipping from the factory. A certified test report shall be available on request. Test process shall include calibration of voltage sensors.

4. Installer Qualifications: Manufacturer's authorized representative who is trained and approved for installation of units required for this Project.

E. Maintenance Proximity: Not more than four hours' normal travel time from Installer's

place of business to Project site.

F. Engineering Responsibility: Preparation of data for vibration isolators of engine skid mounts, including Shop Drawings, based on testing and engineering analysis of manufacturer's standard units in assemblies similar to those indicated for this Project.

1. Manufacturer Qualifications: The manufacturer of the gen set shall be either a manufacturer of the engine or the alternator. Maintain, within 200 miles of Project site, a service center capable of providing training, parts, and emergency maintenance repairs.

2. Source Limitations: Obtain packaged generator set, automatic transfer switches and auxiliary components through one source from a single manufacturer.

3. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.

A. Comply with ASME B15.1.

B. Comply with NFPA 37.

C. Comply with NFPA 70.

D. Comply with NFPA 99.

E. Comply with NFPA 110 requirements for Level 1 emergency power supply system.

F. Comply with UL 2200.

G. Engine Exhaust Emissions: Comply with applicable state and local government requirements.

H. Noise Emission: Comply with applicable state and local government requirements 55db for
maximum noise level at adjacent property boundaries due to sound emitted by generator set including engine, engine exhaust, engine cooling-air intake and discharge, and other components of installation.

G. CODES AND STANDARDS

H. The generator set installation and on-site testing shall conform to the requirements of the following codes and standards, as applicable. The generator set shall include necessary features to meet the requirements of these standards:

1. CSA 282, 1989 Emergency Electrical Power Supply for Buildings

2. IEEE446-Recommended Practice for Emergency and Standby Power Systems for Commercial and Industrial Applications.

3. NFPA 37

4. NFPA 70 – National Electrical Code. Equipment shall be suitable for use in systems in compliance to Article 700, 701 and 702.

5. NFPA 99 – Essential Electrical Systems for Health Care Facilities

6. NFPA 110 – Emergency and Standby Power Systems. The generator set shall

   meet all requirements for Level 1 systems. Level 1 prototype tests required by this standard shall have been performed on a complete and functional unit, component level type tests will not substitute for this requirement.

I. The generator set and supplied accessories shall meet the requirements of the following standards, as applicable:

1. NEMA MG1. Alternator shall comply with the requirements of the current version this standard as they apply to AC alternators.

2. UL142 – Sub base tanks.

3. UL2085 – Sub-base tanks.

4. UL1236 – Battery Chargers.

5. UL 2200 Standard for Stationary Engine Generator Assemblies

J. The control system for the generator set shall comply with the following requirements, as applicable:

1. CSA C22.2, No. 14 – M91 Industrial Control Equipment.

2. EN50082-2, Electromagnetic Compatibility – Generic Immunity Requirements, Part 2: Industrial.

3. EN55011, Limits and Methods of Measurement of Radio Interference Characteristics of Industrial, Scientific and Medical Equipment.

4. FCC Part 15, Subpart B.

5. IEC8528 part 4. Control Systems for Generator Sets.

6. IEC STD 801.2, 801.3, and 801.5 for susceptibility, conducted, and radiated electromagnetic emissions.

7. UL508. The entire control system of the generator set shall be UL508 listed and labeled.

8. UL1236. Battery chargers.

K. The automatic transfer switch(es) installation and application shall conform to the

requirements of the following codes and standards:

1. CSA 282, Emergency Electrical Power Supply for Buildings
2. NFPA70 – National Electrical Code. Equipment shall be suitable for use in systems in compliance to Article 700, 701, and 702.
3. NFPA99 – Essential Electrical Systems for Health Care Facilities
4. NFPA110 – Emergency and Standby Power Systems. The transfer switch shall meet all requirements for Level 1 systems.
5. IEEE446 – Recommended Practice for Emergency and Standby Power Systems for Commercial and Industrial Applications.
6. NEMA ICS10-1993 – AC Automatic Transfer Switches.

L. The transfer switch assembly shall comply with the following standards:

1. CSA C22.2, No. 14 – M91 Industrial Control Equipment.
2. EN55011, Class B Radiated Emissions
3. EN55011, Class B Conducted Emissions
4. IEC 1000-4-5 (EN 61000-4-5); AC Surge Immunity.
5. IEC 1000-4-4 (EN 61000-4-4) Fast Transients Immunity
6. IEC 1000-4-2 (EN 61000-4-2) Electrostatic Discharge Immunity
7. IEC 1000-4-3 (EN 61000-4-3) Radiated Field Immunity
8. IEC 1000-4-6 Conducted Field Immunity
9. IEC 1000-4-11 Voltage Dip Immunity.
10. IEEE 62.41, AC Voltage Surge Immunity.
11. IEEE 62.45, AC Voltage Surge.
12. UL1008 – Transfer Switches. Transfer switches shall be UL1008 listed. UL1008 transfer switches may be supplied in UL891 enclosures if necessary to meet the physical requirements of the project.

M. The generator set manufacturer and the automatic transfer switch manufacturer shall be certified to ISO 9001 International Quality Standard and shall have third party certification verifying quality assurance in design/development, production, installation, and service, in accordance with ISO 9001.

V. ACCEPTABLE MANUFACTURERS

A. Generator set equipment specifications for this project are based on microprocessor-based generator sets manufactured by CUMMINS POWER GENERATION. Equipment by CATERPILLAR, GENERAC POWER SYSTEMS, or KOHLER POWER SYSTEMS that meets the requirements of this specification shall be acceptable.

B. Automatic transfer switch equipment specifications for this project are based on

microprocessor-based transfer switches manufactured by CUMMINS POWER GENERATION Model OTPC or equal as manufactured by AUTOMATIC SWITCH COMPANY (ASCO) Model 7000 Series.

C. The Cummins Power Generation transfer switches shall be provided with the Cummins Power Generation generator set and the ASCO transfer switches shall be provided with the Caterpillar generator set, to ensure there is one source for warranty and product service.

Part 2 - Products

II. GENERATOR SET

A. Ratings

1. The generator set shall operate at 1800 rpm and at a voltage of: 277/480 Volts AC, Three phase, Four wire, 60 hertz.

2. The generator set rating shall be based on emergency/standby service.

B. Performance

1. Voltage regulation shall be plus or minus 0.5 percent for any constant load between no load and rated load for both parallel and non-parallel applications. Random voltage variation with any steady load from no load to full load shall not exceed plus or minus 0.5 percent.

2. Frequency regulation shall be isochronous from steady state no load to steady state rated load. Random frequency variation with any steady load from no load to full load shall not exceed plus or minus 0.5%.

3. Steady-State Frequency Stability: When system is operating at any constant load within the rated load, there shall be no random speed variations outside the steady-state operational band and no hunting or surging of speed.

4. The diesel engine-generator set shall be capable of single step load pick up of 100% nameplate kW and power factor, less applicable derating factors, with the engine-generator set at operating temperature.

5. Sustained Short-Circuit Current: For a 3-phase, bolted short circuit at system output terminals, system shall supply a minimum of 250 percent of rated full-load current for not less than 10 seconds and then clear the fault automatically, without damage to generator system components.

6. Motor starting capability shall be a minimum of kVA. The generator set shall be capable of recovering to a minimum of 90% of rated no load voltage with the application of the specified kVA load at near zero power factor applied to the generator set. Maximum voltage dip on application of this load, considering both alternator performance and engine speed changes shall not exceed 25%.

7. The alternator shall produce a clean AC voltage waveform, with not more than 5% total harmonic distortion at full linear load, when measured from line to neutral, and with not more than 3% in any single harmonic, and no 3rd order harmonics or their multiples. Telephone influence factor shall be less than 40.

    a) The generator set shall be certified by the engine manufacturer to be suitable for use at the installed location and rating, and shall meet all applicable exhaust emission requirements at the time of commissioning.

C. Construction:

1. The engine-generator set shall be mounted on a heavy-duty steel base to maintain alignment between components. The base shall incorporate a battery tray with hold-down clamps within the rails.

2. All switches, lamps, and meters in the control system shall be oil-tight and dust-tight. There shall be no exposed points in the control (with the door open) that operate in excess of 50 volts.

D. Connections.

1. The generator set load connections shall be composed of silver or tin plated copper bus bars, drilled to accept mechanical or compression terminations of the number and type as shown on the Drawings.

2. Sufficient lug space shall be provided for use with cables of the number and size as shown on the Drawings.

3. Power connections to auxiliary devices shall be made at the devices, with required protection located at a wall-mounted common distribution panel.

4. Generator set control interfaces to other system components shall be made on a common, permanently labeled terminal block assembly. Labels describing point functions shall be provided.

III. ENGINE AND ENGINE EQUIPMENT

A. The engine shall be diesel, 4 cycle, radiator and fan cooled. Engine shall be EPA, Tier-? Certified. Minimum displacement shall be cubic inches, with cylinders. The horsepower rating of the engine at its minimum tolerance level shall be sufficient to drive the alternator and all connected accessories. Two cycle engines are not acceptable. Engine accessories and features shall include:

1. An electronic governor system shall provide automatic isochronous frequency regulation. The governing system dynamic capabilities shall be controlled as a function of engine coolant temperature to provide fast, stable operation at varying engine operating temperature conditions. The control system shall actively control the fuel rate and excitation as appropriate to the state of the generator set. Fuel rate shall be regulated as a function of starting,

accelerating to start disconnect speed and accelerating to rated speed. The governing system shall include a programmable warm up at idle and cool down at idle function. While operating in idle state, the control system shall disable the alternator excitation system.

2. Skid-mounted radiator and cooling system rated for full load operation in 122 degrees F (50 degrees C) ambient as measured at the generator air inlet. Radiator fan shall be suitable for use in a system with 0.5 in H2O restriction. Radiator shall be sized based on a core temperature which is 20˚F higher than the rated operation temperature, or prototype tested to verify cooling performance of the engine/radiator/fan operation in a controlled environment. Radiator shall be provided with a duct adapter flange. The cooling system shall be filled with a 50/50-ethylene glycol/water mixture prior to shipping by the equipment manufacturer. Rotating parts shall be guarded against accidental contact.
3. Size of Radiator: Adequate to contain expansion of total system coolant from cold start to 100 percent load condition.
4. Electric starter(s) capable of three complete cranking cycles without overheating.
5. Positive displacement, mechanical, full pressure, lubrication oil pump.
6. Full flow lubrication oil filters with replaceable spin-on canister elements and dipstick oil level indicator.
7. An engine driven, mechanical, positive displacement fuel pump. Fuel filter with replaceable spin-on canister element. Fuel cooler, suitable for operation of the generator set at full rated load in the ambient temperature specified shall be provided if required for operation due to the design of the engine and the installation.
8. Replaceable dry element air cleaner with restriction indicator.

    a) Flexible supply and return fuel lines.

    b) Engine mounted battery charging alternator, 40-ampere minimum, and solid-state voltage regulator.

    c) Coolant heater.

        (1) Engine mounted, thermostatically controlled, coolant heater(s) for each engine. Heater voltage shall be as shown on the project drawings. The coolant heater shall be UL499 listed and labeled.

        (2) The coolant heater shall be installed on the engine with high temperature silicone hose connections. Steel tubing shall be used for connections into the engine coolant system wherever the length of pipe run exceeds 12 inches. The coolant heater installation shall be specifically designed to provide proper

venting of the system. The coolant heaters shall be installed using quick disconnect couplers with provisions to isolate the heater for replacement of the heater element. The quick disconnect/automatic sealing couplers shall allow the heater element to be replaced without draining the engine cooling system or significant coolant loss.

(3) The coolant heater shall be provided with a DC thermostat, installed at the engine thermostat housing. An AC power connection box shall be provided for a single AC power connection to the coolant heater system.

(4) The coolant heater(s) shall be sized as recommended by the engine manufacturer to warm the engine to a minimum of 104˚F (40˚C) in a 40˚F (4˚C) ambient, in compliance with NFPA110 requirements, or the temperature required for starting and load pickup requirements of this specification.

(5) Provide vibration isolators, spring/pad type, quantity as recommended by the generator set manufacturer. Isolators shall include seismic restraints if required by site location.

(6) Starting and Control Batteries shall be calcium/lead antimony type, 24-volt DC, sized as recommended by the engine manufacturer, complete with battery cables and connectors. The batteries shall be capable of a minimum of three (3) complete 15-second cranking cycles at 40˚F ambient temperature when fully charged.

B. Provide exhaust silencer(s) for each engine of size and type as recommended by the generator set manufacturer and approved by the engine manufacturer. The exhaust silencer (muffler) shall be critical grade. Exhaust system shall be installed inside the generator set enclosure.

C. Provide a minimum 12-amp battery charger for each generator set battery bank. Generator sets incorporating two battery banks shall be provided with two charger sets connected together and operated in parallel, with alarm outputs connected in parallel. The chargers shall include the following capabilities:

1. Chargers shall be UL 1236-BBHH listed and CSA or CUL certified for use in emergency applications.

2. The charger shall be compliant with UL 991 requirements for vibration resistance.

3. The charger shall comply with the requirements of EN61000-4-5 for voltage surge resistance; EN50082-2 for immunity; EN61000-4-2 for ESD; EN-61000-4-3 for radiated immunity; ANSI/IEEE C62.41 category B and IN61000-4-4 for electrically fast transient; EN61000-4-6 for conducted emissions; and FCC Part 15 Class A for radiated emissions.

4. The charger shall be capable of charging a fully discharged battery without damage to the charger. It shall be capable of returning a fully discharged battery to fully charged condition within 24 hours. The charger shall be UL-labeled with the maximum battery amp-hour rating that can be recharged within 24 hours. The label shall indicate that the charger is suitable for charging of 220AH batteries per NFPA requirements.

5. The charger shall incorporate a 4-state charging algorithm, to provide trickle charge rate to restore fully discharged batteries, a bulk charge rate to provide fastest possible recharge after normal discharge, an absorption state to return the battery to 100 percent of charge, and a float stage to maintain a fully charged battery and supply battery loads when the generator set is not operating. In addition, the charger shall include an equalization timer. Charge rates shall be temperature compensated based on the temperature directly sensed at the battery.

6. The DC output voltage regulation shall be within plus or minus 1%. The DC output ripple current shall not exceed 1 amp at rated output current level.

7. Operation: Equalizing-charging rate of 10 A shall be initiated automatically after battery has lost charge until an adjustable equalizing voltage is achieved at battery terminals. Unit shall then be automatically switched to a lower float-charging mode and shall continue to operate in that mode until battery is discharged again.

8. Automatic Temperature Compensation: Adjust float and equalize voltages for variations in ambient temperature from minus 40 deg C to plus 60 deg C to prevent overcharging at high temperatures and undercharging at low temperatures.

9. Automatic Voltage Regulation: Maintain constant output voltage regardless of input voltage variations up to plus or minus 10 percent.

10. Ammeter and Voltmeter: Provide integral DC output ammeter and voltmeter Flush mounted in door with five percent accuracy. Meters shall indicate charging rates.

11. Safety Functions: Sense abnormally low battery voltage and close contacts providing low battery voltage indication on control and monitoring panel. Sense high battery voltage and loss of ac input or dc output of battery charger. Either condition shall close contacts that provide a battery-charger malfunction indication at system control and monitoring panel. Enclosure and Mounting: NEMA 250, Type 3R, mounted on the generator.

12. The charger shall include the following features:

    a) Two-line alphanumeric display with programming keys to allow display of DC output ammeter and voltmeters (5% accuracy or better), display alarm messages, and perform programming;

    b) LED indicating lamp(s) to indicate normal charging condition (green),

equalize charge state (amber), and fault condition (red);

(1) AC input overcurrent, over voltage, and under voltage protection;

(2) DC output overcurrent protection;

(3) Alarm output relay;

(4) Corrosion resistant aluminum enclosure.

13. Battery Heater: Provide thermostatically controlled battery heater to improve starting under cold ambient conditions.

IV. GENERATOR – BASE FUEL TANK

A. ENGINEER, DETERMINE CAPACITY OF FUEL TANK TO OPERATE THE GENSET FOR APPROXIMENTLY 24 HOURS, BUT NOT LARGER THAN 2000 GALLONS. Provide a dual wall sub-base fuel storage tank with gallons capacity. The tank shall be constructed of corrosion resistant steel and shall be UL listed and labeled as complying with UL 142.. The equipment, as installed, shall meet all local and regional requirements for above ground tanks.

B. Certifications

1. Underwriters Laboratories (UL) 2085 Special-Purpose Flammable-Liquid Protected Secondary-Containment Generator-Base Tank Listing

2. The tank must have been tested by UL for:

a) Fire – Not to exceed 260˚ in UL Full-Scale Fire Test

b) Projectile Resistant – UL Section 21

c) Vehicle Impact Resistant – UL Section 20

3. The internal and external tank shall be constructed in accordance with UL 142.

4. The tank shall have an identifying UL Nameplate attached with the following:

a) “Special Purpose Flammable Liquid Tank Protected Secondary Containment Generator Base Tank UL 2085”

b) Tank serial number

c) “This tank is Intended for Installation In Accordance With NFPA 30, NFPA 30A or NFPA 31, NFPA 37, NFPA 110”

d) Manufacturer’s name, location and telephone number

e) Date of manufacture

f) Model number of tank

g) Primary Tank Capacity in Gallons

h) Containment Percentage

i) “Tank Requires Emergency Relief Venting, Capacity Not Less Than Cubic Feet Per Hour, PRIMARY TANK and Cubic Feet Per Hour ANNULAR SPACE”.

j) “Maximum Generator Weight” ”.

k) “Tank Is Intended for Stationary Installation Only. Tank shall be inspected to determine suitability after fire exposure”.

l) “For Diesel Fuel Only”

m) “Pressurize Primary Tank When Pressure Testing Annular Space. Follow Installation Instructions”.

C. Insulation

1. The internal steel tank shall be encased in 6” of LIGHTWEIGHT INSULATING CONCRETE; which is capable of preventing the internal tank temperature from rising not more than 260˚.

2. The insulation shall not contain any aggregates that may act as heat sinks.

3. The insulation shall be a monolithic (seamless) pour and contain no cold joints or multiple concrete sections.

D. Painting

1. Sand blast tank to commercial sandblast standard.

2. Prime coat with Industrial Primer.

3. The entire exterior finish coating shall be petroleum-resistant two-part white.

4. Bottom of tank to be coated with coal-tar epoxy.

E. Construction

1. The internal tank shall be rectangular in shape, listed and constructed in accordance with UL 142 Standard for Generator-Base Tanks.

2. The inner and outer steel tank shall be constructed of minimum 3/16” thick, A-36 Hot Rolled Steel.

3. The tank shall meet seismic zone standards and provide the capability to be anchored as required by local codes for earthquake and/or flood.

4. The internal tank shall be pressure tested and pass a test of 5 psi at the factory.

5. The tank shall be designed with over-spill containment and shall have a 2" interstitial test monitoring pipe.

6. The tank shall include atmospheric and emergency venting nozzles sized to UL requirements.

7. The tank shall have signs to include: Labels to meet applicable codes, product content, and tank capacity. Each nozzle on Flammable, No Smoking, the tank shall be identified for its intended use.

8. The tank shall be designed to meet weight loads of the engine generator set.

9. The tank shall be designed with earthquake, hurricane, and flood tie- down points.

10. Leak detection provisions shall be provided and wired to the generator set control for local and remote alarm indicators.

11. Tank shall be equipped with multiple float switches for high and low fuel levels alarms, activation of fuel oil transfer pumps and for any other requirements of the engine generator set manufacturer and as shown on the drawings. Switches shall be wired to the generator control for local and remote indications. ENGINEER TO EDIT THIS PARAGRAPH, IF NECESSARY.

12. The fuel fill opening shall be recessed in the enclosure wall with a lockable door near the high fuel alarm box.

13. Conduit stub-up sleeves shall be provided for generator set load and control wiring and cabling. Spare couplings shall be provided in tank and rupture basin for customer use. External to the base main rail beams shall be two grounding bosses, one each end opposite corners, for customer grounding requirements.

F. Tank Capacity: Size for minimum of 24 hours of continuous engine generator operation at 100 percent rated load, but not larger than permissible by applicable codes.

1. Features:

a) Direct reading fuel level gage.
b) Normal atmospheric vent.
c) Emergency pressure relief vent.
d) Fuel fill opening with Vandal-resistant lockable cap.
e) Dedicated electrical conduit stub-up area.
f) Low fuel level switch.
g) Leak detection switch; located within secondary containment interstitial space for detection of primary tank fuel leak.

2. Tank supplier shall also provide suitable steps and a man-way platform to provide complete maintenance access to the generator set and enclosure. The platform and stairs shall be constructed of galvanized steel. The platform and stairs shall be minimum 3'-0" in width.

V. AC GENERATOR

A. The AC generator shall be; synchronous, four pole, 2/3 pitch, revolving field, drip- proof construction, single prelubricated sealed bearing, air cooled by a direct drive centrifugal blower fan, and directly connected to the engine with flexible drive disc. All insulation system components shall meet NEMA MG1 temperature limits for Class H insulation system and shall be UL1446 listed. Actual temperature rise measured by resistance method at full load shall not exceed 105 degrees Centigrade.

B. The generator shall be capable of delivering rated output (kVA) at rated frequency and power factor, at any voltage not more than 5 percent above or below rated voltage.

C. A permanent magnet generator (PMG) shall be included to provide a reliable source of excitation power for optimum motor starting and short circuit performance. The PMG and controls shall be capable of sustaining and regulating current supplied to a single phase or three phase fault at approximately 300% of rated current for not more than 10 seconds.

D. The sub transient reactance of the alternator shall not exceed 15 percent, based on the standby rating of the generator set.

VI. GENERATOR SET CONTROL

A. The generator set shall be provided with a microprocessor-based control system that is designed to provide automatic starting, monitoring, and control functions for the generator set. The control system shall also be designed to allow local monitoring and control of the generator set, and remote monitoring and control as described in this specification.

B. The control shall be mounted on the generator set. The control shall be vibration isolated and prototype tested to verify the durability of all components in the system under the vibration conditions encountered.

C. The generator set mounted control shall include the following features and functions:

1. Control Switches

a) Mode Select Switch. The mode select switch shall initiate the following control modes. When in the RUN or Manual position, the generator set shall start, and accelerate to rated speed and voltage as directed by the operator. A separate push-button to initiate starting is acceptable. In the OFF position the generator set shall immediately stop, bypassing all time delays. In the AUTO position, the generator set shall be ready to accept a signal from a remote device to start and accelerate to rated speed and voltage.

b) EMERGENCY STOP switch. Switch shall be Red “mushroom- head” push-button. Depressing the emergency stop switch shall cause the generator set to immediately shut down, and be locked out from automatic restarting. Switch shall have a cover to prevent accidental activation.

c) RESET switch. The RESET switch shall be used to clear a fault and allow restarting the generator set after it has shut down for any fault condition.

d) PANEL LAMP switch. Depressing the panel lamp switch shall cause the entire panel to be lighted with DC control power. The panel lamps shall automatically be switched off 10 minutes after the switch is depressed, or after the switch is depressed a second time.

2. Generator Set AC Output Metering. The generator set shall be provided with a metering set including the following features and functions:

a) Analog voltmeter, ammeter, frequency meter, and kilowatt (KW) meter. Voltmeter and ammeter shall display all three phases. Meter scales shall be color coded in the following fashion: green shall indicate normal operating condition, amber shall indicate operation in ranges that indicate potential failure, and red shall indicate failure impending. Metering accuracy shall be within 1% at rated output.

b) Digital metering set, 1% accuracy, to indicate generator RMS voltage and current, frequency, output current, output KW, KW- hours, and power factor. Generator output voltage shall be available in line-to-line and line-to-neutral voltages, and shall display all three phase voltages (line to neutral or line to line) simultaneously.

c) Both analog and digital metering are required. The analog and digital metering equipment shall be driven by a single microprocessor, to provide consistent readings and performance.

d) The control system shall monitor the total load on the generator set, and maintain data logs of total operating hours at specific load levels ranging from 0 to 110% of rated load, in 10% increments. The control shall display hours of operation at less than 30% load and total hours of operation at more than 90% of rated load.

e) The control system shall log total number of operating hours, total kWH, and total control on hours, as well as total values since reset.

3. Configuration: Operating and safety indications, protective devices, basic system controls, and engine gages shall be grouped in a common control and monitoring panel mounted on the generator set. Mounting method shall isolate the control panel from generator-set vibration

4. Generator Set Alarm and Status Display

a) The generator set shall include LED alarm and status indication lamps. The lamps shall be high-intensity LED type. The lamp condition shall be clearly apparent under bright lighting conditions. Functions indicated by the lamps shall include:

(1) The control shall include five (5) configurable alarm- indicating lamps. The lamps shall be field adjustable for any status, warning, or shutdown function monitored by the generator set. They shall also be configurable for color, and control action (status, warning, or shutdown).

(2) The control shall include green lamps to indicate that the generator set is running at rated frequency and voltage, and that a remote start signal has been received at the generator set. The running signal shall be based on actual sensed voltage and frequency on the output terminals of the generator set.

(3) The control shall include a flashing red lamp to indicate that the control is not in automatic state, and red common shutdown lamp.

(4) The control shall include an amber common warning indication lamp.

b) The generator set control shall indicate the existence of the warning and shutdown conditions on the control panel. All conditions indicated below for warning shall be field-configurable for shutdown. Conditions required to be annunciated shall include:

(1) Low oil pressure (warning)

(2) Low oil pressure (shutdown)

(3) Oil pressure sender failure (warning)

(4) Low coolant temperature (warning)

(5) High coolant temperature (warning)

(6) High coolant temperature (shutdown)

(7) High oil temperature (warning)

(8) Engine temperature sender failure (warning)

(9) Low coolant level (warning)

(10) Fail to crank (shutdown)

(11) Fail to start/overcrank (shutdown)

(12)Overspeed (shutdown)

(13)Low DC voltage (warning)

(14)High DC voltage (warning)

(15)Weak battery (warning)

(16)Low fuel-base tank (warning)

(17)High AC voltage (shutdown)

(18)Low AC voltage (shutdown)

(19)Under frequency (shutdown)

(20)Over current (warning)

(21)Over current (shutdown)

(22)Short circuit (shutdown)

(23) Ground fault (warning) (optional – when required by code or specified)

(24)Over load (warning)

(25)Emergency stop (shutdown)

(26)(4) configurable conditions

(27) Provisions shall be made for indication of four customer-specified alarm or shutdown conditions. Labeling of the customer-specified alarm or shutdown conditions shall be of the same type and quality as the above specified conditions. The non-automatic indicating lamp shall be red, and shall flash to indicate that the generator set is not able to automatically respond to a command to start from a remote location.

5. Engine Status Monitoring.

   a) The following information shall be available from a digital status panel on the generator set control:

      (1) Engine oil pressure (psi)

      (2) Engine coolant temperature (degrees F)

      (3) Engine oil temperature (degrees F)

(4) Engine speed (rpm)

(5) Number of hours of operation (hours)

(6) Number of start attempts

(7) Battery voltage (DC volts)

b) The control system shall also incorporate a data logging and display provision to allow logging of the last 10 warning or shutdown indications on the generator set, as well as total time of operation at various loads, as a percent of the standby rating of the generator set.

6. Engine Control Functions

a) The control system provided shall include a cycle cranking system, which allows for user selected crank time, rest time, and # of cycles. Initial settings shall be for 3 cranking periods of 15 seconds each, with 15-second rest period between cranking periods.

b) The control system shall include an idle mode control, which allows the engine to run in the idle mode in the RUN position only. In this mode, the alternator excitation system shall be disabled.

c) The control system shall include an engine governor control, which functions to provide steady state frequency regulation as noted elsewhere in this specification. The governor control shall include adjustments for gain, damping, and a ramping function to control engine speed and limit exhaust smoke while the unit is starting.

d) The control system shall include time delay start (adjustable 0-300 seconds) and time delay stop (adjustable 0-600 seconds) functions.

e) The control system shall include sender failure monitoring logic for speed sensing, oil pressure and engine temperature which is capable of discriminating between failed sender or wiring components, and an actual failure conditions.

7. Alternator Control Functions:

a) The generator set shall include a full wave rectified automatic digital voltage regulation system that is matched and prototype tested by the engine manufacturer with the governing system provided. It shall be immune from misoperation due to load- induced voltage waveform distortion and provide a pulse width modulated output to the alternator exciter. The voltage regulation system shall be equipped with three-phase line to neutral RMS sensing and shall control buildup of AC generator voltage to provide a linear rise and limit overshoot. The system shall include a torque-matching characteristic, which shall reduce output voltage in proportion to frequency below an adjustable frequency threshold. Torque matching characteristic shall be adjustable

for roll-off frequency and rate, and be capable of being curve- matched to the engine torque curve with adjustments in the field. The voltage regulator shall include adjustments for gain, damping, and frequency roll-off. Adjustments shall be broad range, and made via digital raise-lower switches, with an alphanumeric LED readout to indicate setting level. Rotary potentiometers for system adjustments are not acceptable.

b) A microprocessor-based protection device shall be provided to individually monitor all phases of the output current of the generator set and initiate an alarm (over current warning) when load current exceeds 110% of the rated current of the generator set on any phase for more than 60 seconds. The controls shall shut down and lock out the generator set when output current level approaches the thermal damage point of the alternator (over current shutdown). The protective functions provided shall be in compliance to the requirements of NFPA 70 article 445.

c) A microprocessor-based protection device shall be provided to individually monitor all phases of the output current for short circuit conditions. The control/protection system shall monitor the current level and voltage. The controls shall shut down and lock out the generator set when output current level approaches the thermal damage point of the alternator (short circuit shutdown). The protective functions provided shall be in compliance to the requirements of NFPA 70 article 445.

d) Controls shall be provided to monitor the KW load on the generator set, and initiate an alarm condition (over load) when total load on the generator set exceeds the generator set rating for in excess of 5 seconds. Controls shall include a load shed control, to operate a set of dry contacts (for use in shedding customer load devices) when the generator set is overloaded.

e) A microprocessor-based protection device AC over/under voltage monitoring system that responds only to true RMS voltage conditions shall be provided. The system shall initiate shutdown of the generator set when alternator output voltage exceeds 110% of the operator-set voltage level for more than 10 seconds, or with no intentional delay when voltage exceeds 130%. Under voltage shutdown shall occur when the output voltage of the alternator is less than 85% for more than 10 seconds. The system shall monitor individual phases and be connected line to neutral on three-phase, four-wire generator sets, and for systems that are solidly grounded.

f) When required by the National Electrical Code or indicated on the Drawings. The Control System shall include a ground fault monitoring relay. The relay shall be adjustable from 3.8-1200 amps, and include adjustable time delay of 0-10.0 seconds. The relay shall be for indication only, and not trip or shut down the generator set. Note bonding and grounding requirements for the generator set, and provide relay that will function correctly in system as installed.

g) The generator set control shall include a 120 VAC-control heater.

8. Other Control Functions:

a) The generator set shall be provided with a network communication module to allow LonMark compliant communication with the generator set control by remote devices. The control shall communicate all engine and alternator data, and allow starting and stopping of the generator set via the network in both test and emergency modes.

b) A battery monitoring system shall be provided which initiates alarms when the DC control and starting voltage is less than 25VDC or more than 32VDC. During engine cranking (starter engaged), the low voltage limit shall be disabled, and if DC voltage drops to less than 14.4 volts for more than two seconds a “weak battery” alarm shall be initiated.

9. Control Interfaces for Remote Monitoring:

a) All control and interconnection points from the generator set to remote components shall be brought to a separate connection box. No field connections shall be made in the control enclosure or in the AC power output enclosure.

b) The control system shall provide four (4) programmable output relays. These relay outputs shall be configurable for any alarm, shutdown, or status condition monitored by the control. The relays shall be configured to indicate: 1) generator set operating at rated voltage and frequency; 2) common warning; 3) common shutdown; load shed command.

c) A fused 10 amp switched 24VDC power supply circuit shall be provided for customer use. DC power shall be available from this circuit whenever the generator set is running.

d) A fused 10 amp 24VDC power supply circuit shall be provided for customer use. DC power shall be available from this circuit at all times from the engine starting/control batteries.

e) Provide two (2) Form C dry contacts for connection to the fire alarm system graphic annunciator panel for “Generator Run“ and “Generator Fault” indications.

f) Provide two (2) Form C dry contacts for connection to the Security Intrusion System panel for “Generator Run” and “Generator Fault” indications.

g) The control shall be provided with a direct serial communication link for the LonWorks communication network interface as described elsewhere in this specification and shown on the Drawings.

VII. MAIN LINE CIRCUIT BREAKER

A. The generator set shall be provided with a mounted main line 100% rated circuit breaker, sized to carry the rated output current of the generator set. The circuit breaker shall incorporate an electronic trip unit that operates to protect the alternator under all overcurrent conditions, or a thermal-magnetic trip with other overcurrent protection devices that positively protect the alternator under overcurrent conditions. The supplier shall submit time overcurrent characteristic curves and thermal damage curve for the alternator, demonstrating the effectiveness of the protection provided.

VIII. REMOTE ALARM ANNUNCIATOR PANEL

A. Provide and install a 20-light LED type remote alarm annunciator with horn, located as shown on the drawings in the building engineer's office or in a location directed by the Owner. The remote annunciator shall provide all the audible and visual alarms called for by NFPA Standard 110 for level 1 systems for the local generator control panel. Spare lamps shall be provided to allow future addition of other alarm and status functions to the annunciator. Provisions for labeling of the annunciator in a fashion consistent with the specified functions shall be provided. Alarm silence and lamp test switch(es) shall be provided. LED lamps shall be replaceable, and indicating lamp color shall be capable of changes needed for specific application requirements. Alarm horn shall be switchable for all annunciation points. Alarm horn (when switched on) shall sound for first fault, and all subsequent faults, regardless of whether first fault has been cleared, in compliance with NFPA110 3-5.6.2. The interconnecting wiring between the annunciator and other system components shall be monitored and failure of the interconnection between components shall be displayed on the annunciator panel.

B. The annunciator shall include the following alarm labels, audible annunciation features, and lamp colors:

Condition	Lamp Color	Audible Alarm
Normal Power (to Loads)	Green	No
Genset Supplying Load	Amber	No
Genset Running	Green	No
Not in Auto	Red (Flashing)	Yes
High Battery Voltage	Red	Yes
Low Battery Voltage	Red	Yes
Charger AC Failure	Red	Yes
Fail to Start	Red	Yes
Low Engine Temperature	Amber	Yes
Pre-High Engine Temperature	Amber	Yes
High Engine Temperature	Red	Yes
Pre-Low Oil Pressure	Amber	Yes
Low Oil Pressure	Red	Yes
Overspeed	Red	Yes
Low Coolant Level	Amber	Yes
Low Fuel Pressure	Amber	Yes
Network OK Fuel Tank	Green	Yes

Leak	Amber	Yes
(2) Spares	Configurable	Configurable

Low battery voltage lamp shall also be lighted for low cranking voltage or weak battery alarm.

IX. OUTDOOR WEATHER-PROTECTIVE SOUND ATTENUATING HOUSING

A. The generator set shall be provided with a sound-attenuating housing which allows the generator set to operate at full rated load in the ambient conditions previously specified. The enclosure shall reduce the sound level of the generator set while operating at full rated load to a maximum of (Engineer to edit) 76 dBA at any location 7 meters from the generator set in a free field environment. Housing configuration and materials used may be of any suitable design which meets application needs, except that acoustical materials used shall be non- hydroscopic and oil resistant. No foam materials shall be used unless they can be demonstrated to have the same durability and life as fiberglass.

B. Radiator discharge outlet shall be deflected upward, ducted through built-in hood in an approved manner to allow recommended air flow for engine cooling, and to allow minimum clearance in front of the radiator and also help to reduce the sound level of the generator set.

C. The enclosure shall be constructed of minimum 12-gauge steel for framework and 14-gauge steel for panels. All hardware and hinges shall be stainless steel.

D. The enclosure shall include hinged access doors to maintain easy access for all operating and service functions. Key-locking and padlockable door latches shall be provided for all doors, and include retainers to hold the door open during service. Door hinges shall be stainless steel.

E. Enclosure roof shall be cambered to prevent rainwater accumulation. The roof shall be designed for evenly distributed loading of 50 lbs./square foot. The roof shall also be designed to support the largest commercially available silencer in addition to two 250-lb men during normal maintenance procedures. Additional support added for project specific requirements shall be incorporated where required.

F. Provide motorized louvers and dampers to minimize air flow through the enclosure when the generator set is not operating. Louvers shall include provisions to prevent accumulation of ice or snow that might prevent operation.

G. Inlet ducts shall include rain hoods.

H. The enclosure shall be provided with a factory mounted and wired electrical distribution panel to serve the generator set and enclosure. The provisions shall include:

1. 120/208 VAC, 3-phase, 4-wire, 100-amp panelboard connected to the buildings utility service by this Contractor

2. Two GFCI duplex receptacles, one inside the enclosure and one receptacle outside the enclosure with an “in-use” weatherproof cover.

3. Two three-way switches controlling three AC lamps mounted in vapor tight and gasketed fixtures.

4. Factory-wired normal AC service from the panelboard to the engine coolant heaters, alternator heaters, battery charger, etc.

I. The enclosure shall be provided with an exhaust silencer which is mounted inside of the enclosure, and allows the generator set package to meet specified sound level requirements. The exhaust shall exit the enclosure through a rain collar and terminate with a rain cap. Exhaust connections to the generator set shall be through seamless flexible connections.

J. All sheet metal shall be primed for corrosion protection and finish painted in a color selected by the Architect. All surfaces of all metal parts shall be primed and painted.

K. Painting of hoses, clamps, wiring harnesses and other non-metallic service parts shall not be acceptable. Fasteners used shall be corrosion resistant, and designed to minimize marring of the painted surface when removed for normal installation or service work.

L. The enclosure shall include the following maintenance provisions:

1. Flexible coolant and lubricating oil drains lines, which extend to the exterior of the enclosure, with internal drain valves.

2. External radiator fill provision.

M. The enclosure shall have sufficient guards and screens to prevent entrance by small animals.

X. VIBRATION ISOLATION DEVICES

A. Restrained Spring Isolators: Freestanding, steel, open-spring isolators with seismic restraint.

1. Housing: Steel with resilient vertical-limit stops to prevent spring extension due to wind loads or if weight is removed; factory-drilled baseplate bonded to 1/4-inch- thick, elastomeric isolator pad attached to baseplate underside; and adjustable equipment mounting and leveling bolt that acts as blocking during installation.

2. Outside Spring Diameter: Not less than 80 percent of compressed height of the spring at rated load.

3. Minimum Additional Travel: 50 percent of required deflection at rated load.

4. Lateral Stiffness: More than 80 percent of rated vertical stiffness.

5. Overload Capacity: Support 200 percent of rated load, fully compressed, without deformation or failure.

6. Minimum Deflection: 1”.

XI. SEQUENCE OF OPERATION -- GENERATOR SET

A. Generator set shall start on receipt of a start signal from remote equipment. The start signal shall be hardwired connection to the generator set control and a redundant signal over the required network connection.

B. The generator set shall complete a time delay start period as programmed into the control.

C. The generator set control shall initiate the starting sequence for the generator set. The starting sequence shall include the following functions:

1. The control system shall verify that the engine is rotating when the starter is signaled to operate. If the engine does not rotate after two attempts, the control system shall shut down and lock out the generator set, and indicate “fail to crank” shutdown.

2. The engine shall fire and accelerate as quickly as practical to start disconnect speed. If the engine does not start, it shall complete a cycle cranking process as described elsewhere in this specification. If the engine has not started by the completion of the cycle cranking sequence, it shall be shut down and locked out, and the control system shall indicate “fail to start”.

3. The engine shall accelerate to rated speed and the alternator to rated voltage. Excitation shall be disabled until the engine has exceeded programmed idle speed, and regulated to prevent over voltage conditions and oscillation as the engine accelerates and the alternator builds to rated voltage.

D. On reaching rated speed and voltage, the generator set shall operate as dictated by the control system in isochronous state.

E. When all start signals have been removed from the generator set, it shall complete a time delay stop sequence. The duration of the time delay stop period shall be adjustable by the operator.

F. On completion of the time delay stop period, the generator set control shall switch off the excitation system and shall shut down.

G. Any start signal received after the time stop sequence has begun shall immediately terminate the stopping sequence and return the generator set to isochronous operation.

XII. FUEL OIL TRANSFER PUMPS

A. Type: The pump shall be positive displacement internal gear rotary type in standard

cast iron construction. Provide cast iron mounting foot.

B. Capacity shall be: suitable for #2 fuel oil and rated for 120 GPH @ 100 PSIG, Motor ¼ horsepower; 120v, single phase.

C. Rotor iron heads shall be hydraulically balanced to assure instant priming and constant flow. Rotor, shaft and idler shall be steel.

D. Seal – The pump shall employ a mechanical face-type seal, with carbon graphite casing bushing.

E. Bearings – the bearing shall be Teflon impregnated outboard type.

F. Motor – Pump shall be mounted on formed steel base direct connected through flexible coupling with guard to 1200-rpm open drip-proof motor.

G. Starter – Provide a manual starter for single-phase units and magnetic across- the-line starter for three phase units. The starter shall have ON-OFF switch and red running light.

H. Provide electric alternator and control panel, control shall include fuel level sensors for pump on-off and high-low level alarms.

I. Package pump set shall be mounted in a NEMA 3R enclosure with hinged access doors or generator enclosure.

XIII. SOURCE QUALITY CONTROL

A. Prototype Testing: Factory test engine-generator set using same engine model, constructed of identical or equivalent components and equipped with identical or equivalent accessories.

1. Tests: Comply with NFPA 110, Level 1 Energy Converters and with IEEE 115.

B. Project-Specific Equipment Tests: Before shipment, factory test engine-generator set and other system components and accessories manufactured specifically for this Project. Perform tests at rated load and power factor. Include the following tests:

a) Test components and accessories furnished with installed unit that are not identical to those on tested prototype to demonstrate compatibility and reliability.

b) Full load run.

c) Maximum power.

d) Voltage regulation.

e) Transient and steady-state governing.

f) Single-step load pickup.

g) Safety shutdown.

h) Provide 14 days' advance notice of tests and opportunity for observation of tests by Owner's representative.

i) Report factory test results within 10 days of completion of test.

XIV. AUTOMATIC TRANSFER SWITCH (ATS)

A. The complete automatic transfer switch(es) shall be suitable for utility power (source 1) to engine generator set (source 2) application, be completely factory assembled with field programmable digital electronic controls designed for fully automatic operation and including: surge voltage isolation, and including voltage sensors on all phases of both sources, linear operator, permanently attached manual handles, positive mechanical and electrical interlocking, and mechanically held contacts for both sources.

B. Ratings

1. Refer to Drawings for sizes and types of transfer equipment, voltage and ampere ratings, enclosure type, and accessories. Transfer switch(es) rated up to 125 amperes shall be three (3) pole, with solid neutral. Transfer switch(es) rated 150 amperes and above shall be four (4) pole.

2. Main contacts shall be rated for 600 Volts AC minimum.

3. Transfer switch(es) shall be rated to carry 100 percent of rated current continuously in the enclosure supplied, in ambient temperatures of - 40 to + 60 degrees C, relative humidity up to 95% (non-condensing), and altitudes up to 10,000 feet (3000M).

4. Transfer switch equipment shall have withstood and closing ratings (WCR) in RMS symmetrical amperes greater than the available fault currents, but not less than 30,000 for an ATS up to 260 amperes and 65,000 for an ATS larger than 260 amperes, at the specified voltage. The transfer switch shall be third party listed and labeled for use with the specified protective device(s) installed in the application.

C. Construction

1. Transfer switch(es) shall be double-throw, electrically and mechanically interlocked, and mechanically held in the source 1 and source 2 positions. The transfer switch shall be specifically designed to transfer to the best available source if it inadvertently stops in a neutral position.

2. Transfer switches rated through 1000 amperes shall be equipped with permanently attached manual operating handles and quick-make over- center contact mechanisms. Transfer switches over 1000 amperes shall be equipped with manual operators for service use only under de- energized conditions.

3. Main switch contacts shall be high-pressure silver alloy. Contact assemblies

shall have arc chutes for positive arc extinguishing. Arc chutes shall have insulating covers to prevent inter-phase flashover.

4. Transfer switch internal wiring shall be composed of pre-manufactured harnesses that are permanently marked for source and destination. Harnesses shall be connected to the control system by means of locking disconnect plug(s), to allow the control system to be easily disconnected and serviced without disconnecting power from the transfer switch mechanism.

5. Transfer switch shall be provided with flame retardant transparent covers to allow viewing of switch contact operation but prevent direct contact with line voltage components.

6. Four (4) pole transfer switches shall be provided with a switched neutral pole. The neutral pole shall be of the same construction and have the same ratings as the phase poles. All poles shall be switched simultaneously using a common crossbar. Equipment using overlapping neutral contacts is not acceptable.

7. Three (3) pole transfer switches shall be provided with a neutral bus and lugs. The neutral bus shall be sized to carry 100% of the current designated on the switch rating.

D. Connections

1. Field control connections shall be made on a common terminal block that is clearly and permanently labeled.

2. Transfer switch shall be provided with AL/CU mechanical lugs sized to accept the full output rating of the generator set. Lugs shall be suitable for the number and size of conductors shown on the drawings.

E. Transfer Switch Control

1. Operator Panel. Each transfer switch shall be provided with a control panel to allow the operator to view the status and control operation of the transfer switch. The operator panel shall be a sealed membrane panel rated NEMA 3R/IP53 or better (regardless of enclosure rating) that is permanently labeled for switch and control functions. The operator panel shall be provided with the following features and capabilities.

a) High intensity LED lamps to indicate the source that the load is connected to (source 1 or source 2); and which source(s) are available. Source available LED indicators shall operate from the control microprocessor to indicate the true condition of the sources as sensed by the control.

b) High intensity LED lamps to indicate that the transfer switch is “not in auto” (due to control being disabled or due to bypass switch enabled or in operation) and “Test/Exercise Active” to indicate that the control system is testing or exercising the generator set.

c) "OVERRIDE" pushbutton to cause the transfer switch to bypass any active time delays for start, transfer, and retransfer and immediately proceed with its next logical operation.

d) "TEST" pushbutton to initiate a preprogrammed test sequence for the generator set and transfer switch. The transfer switch shall be programmable for test with load or test without load.

e) "RESET/LAMP TEST" pushbutton that will clear any faults present in the control, or simultaneously test all lamps on the panel by lighting them.

f) The control system shall continuously log information on the number of hours each source has been connected to the load, the number of times transferred, and the total number of times each source has failed. This information shall be available via a PC- based service tool and an operator display panel.

g) Vacuum fluorescent alphanumeric display panel with push-button navigation switches. The display shall be clearly visible in both bright (sunlight) and no light conditions. It shall be visible over an angle of at least 120 degrees. The Alphanumeric display panel shall be capable of providing the following functions and capabilities.

(1) Display source condition information, including AC voltage for each phase of normal and emergency source, frequency of each source. Voltage for all three phases shall be displayed on a single screen for easy viewing of voltage balance. Line to neutral voltages shall be displayed for 4-wire systems.

(2) Display source status, to indicate source is connected or not connected.

(3) Display load data, including 3-phase AC voltage, 3-phase AC current, frequency, KW, KVA, and power factor. Voltage and current data for all phases shall be displayed on a single screen.

(4) The display panel shall allow the operator to view and make the following adjustments in the control system, after entering an access code:

(a) Set nominal voltage and frequency for the transfer switch.

(b) Adjust voltage and frequency sensor operation set points.

(c) Set up time clock functions.

(d) Set up load sequence functions.

(e) Enable or disable control functions in the transfer switch, including program transition.

(f) Set up exercise and load test operation conditions, as well as normal system time delays for transfer time, time delay start, stop, transfer, and retransfer.

(5) Display Real Time Clock data, including date, and time in hours, minutes, and seconds. The real-time clock shall incorporate provisions for automatic daylight savings time and leap year adjustments. The control shall also log total operating hours for the control system.

(6) Display service history for the transfer switch. Display source connected hours, to indicate the total number of hours connected to each source. Display number of times transferred, and total number of times each source has failed.

(7) Display fault history on the transfer switch, including condition, and date and time of fault. Faults to include controller checksum error, low controller DC Voltage, ATS fail to close on transfer, ATS fail to close on retransfer, battery charger malfunction, network battery voltage low, network communications error.

(8) Display information for other transfer switches in the system, including transfer switch name, real time load in KW on the transfer switch, current source condition, and current operating mode.

F. Internal Controls

1. The transfer switch control system shall be configurable in the field for any operating voltage level up to 600VAC. Provide RMS voltage sensing and metering that is accurate to within plus or minus 1% of nominal voltage level. Frequency sensing shall be accurate to within plus or minus 0.2%. Voltage sensing shall be monitored based on the normal voltage at the site. Systems that utilize voltage monitoring based on standard voltage conditions are not acceptable.

2. Transfer switch voltage sensors shall be close differential type, providing source availability information to the control system based on the following functions:

a) Monitoring all phases of the normal service (source 1) for under voltage conditions (adjustable for pickup in a range of 85 to 98% of the normal voltage level and dropout in a range of 75 to 98% of normal voltage level).

b) Monitoring all phases of the emergency service (source 2) for under voltage conditions (adjustable for pickup in a range of 85 to 98% of the

normal voltage level and dropout in a range of 75 to 98% of pickup voltage level).

c) Monitoring all phases of the normal service (source 1) and emergency service (source 2) for voltage imbalance.

d) Monitoring all phases of the normal service (source 1) and emergency service (source 2) for loss of a single phase.

e) Monitoring all phases of the normal service (source 1) and emergency service (source 2) for phase rotation.

f) Monitoring all phases of the normal service (source 1) and emergency service (source 2) for over voltage conditions (adjustable for dropout over a range of 105 to 135% of normal voltage, and pickup at 95-99% of dropout voltage level).

g) Monitoring all phases of the normal service (source 1) and emergency service (source 2) for over or under frequency conditions.

h) Monitoring the neutral current flow in the load side of the transfer switch. The control shall initiate an alarm when the neutral current exceeds a preset adjustable value in the range of 100-150% of rated phase current for more than an adjustable time period of 10 to 60 seconds.

3. All transfer switch sensing shall be configurable from a Windows XP or NT PC-based service tool, to allow setting of levels, and enabling or disabling of features and functions. Selected functions including voltage sensing levels and time delays shall be configurable using the operator panel. The transfer control shall incorporate a series of diagnostic LED lamps.

4. The transfer switch shall be configurable to control the operation time from source to source (program transition operation). The control system shall be capable of enabling or disabling this feature, and adjusting the time period to a specific value. A phase band monitor or similar device is not an acceptable alternate for this feature.

5. The transfer switch shall incorporate adjustable time delays for generator set start (adjustable in a range from 0-15 seconds); transfer (adjustable in a range from 0-120 seconds); retransfer (adjustable in a range from 0-30 minutes); and generator stop (cool down) (adjustable in a range of 0-30 minutes).

6. The transfer switch shall be configurable to accept a relay contact signal and a network signal from an external device for load shedding purposes. On receipt of this signal, the transfer switch shall switch to a neutral position when connected to source 2. If source 1 is available when the load-shed signal is received, the transfer switch shall connect to source 1.

7. The transfer switch shall be configurable to accept a relay contact signal and a network signal from an external device to prevent transfer to the generator

service.

8. The transfer switch shall provide a relay contact signal prior to transfer or retransfer. The time period before and after transfer shall be adjustable in a range of 0-50 seconds.

9. The control system shall be designed and prototype tested for operation in ambient temperatures from -40C to +70C. It shall be designed and tested to comply with the requirements of the noted voltage and RFI/EMI standards.

10. The control shall have optically isolated logic inputs, high isolation transformers for AC inputs, and relays on all outputs, to provide optimum protection from line voltage surges, RFI and EMI.

11. The transfer switch network monitoring equipment, when supplied, shall be provided with a battery based auxiliary power supply to allow monitoring of the transfer switch when both AC power sources are non- operational. The battery power supply shall be monitored for proper condition, and the transfer switch shall include an alarm condition to indicate low battery condition.

G. Control Interface

1. The transfer switch will provide an isolated relay contact for starting of a generator set. The relay shall be normally held open, and close to start the generator set. Output contacts shall be form C, for compatibility with any generator set.

2. Provide one set of Form C auxiliary contacts on both sides, operated by transfer switch position, rated 10 amps 250 VAC.

3. The transfer switch shall provide relay contacts to indicate the following conditions: source 1 available, load connected to source 1, source 2 available, source 2 connected to load.

4. The transfer switch shall be provided with a network communication card, and configured to allow LonMark compliant communication with the transfer switch and other network system components. The network shall provide a redundant start signal to the generator set(s) in the system.

H. Enclosure

1. Enclosures shall be UL listed, NEMA Type 1 or better or as shown on the Drawings. The cabinet shall provide code-required wire bend space. Manual operating handles and all control switches (other than key-operated switches) shall be accessible to authorized personnel only by opening the key-locking cabinet door. Transfer switches with manual operating handles and/or non-key- operated control switches located on outside of cabinet do not meet this specification and are not acceptable.

XV. SEQUENCE OF OPERATION – AUTOMATIC TRANSFER SWITCH(ES)

A. Transfer switch normally connects an energized utility power source (source1) to loads and a generator set (source 2) to loads when normal source fails. The normal position of the transfer switch is source 1 (connected to the utility), and no start signal is supplied to the generator set.

B. Standby electrical power systems for Prince George's County Shelters shall have a remote manual override switch(es) of the type and locations shown on the Drawings. The override switch shall have two settings, NORMAL MODE and SHELTER MODE. NORMAL MODE switch position shall not allow the transfer switch to send a start signal to the generator set to operate upon loss of utility power. SHELTER MODE switch position shall allow the generator set to operate upon loss of utility power and the transfer switch to transfer the loads to the generator set.

C. Generator Set Exercise (Test) With Load Mode. The control system shall be configurable to test the generator set under load. In this mode, the transfer switch shall control the generator set in the following sequence:

1. Transfer switch shall initiate the exercise sequence at a time indicated in the exercise timer program, or when manually initiated by the operator.

2. When the control systems sense the generator set at rated voltage and frequency, it shall operate to connect the loads to the generator set by opening the normal source contacts, and closing the alternate source contacts a predetermined time period later. The timing sequence for the contact operation shall be programmable in the controller.

3. The generator set shall operate connected to the load for the duration of the exercise period. If the generator set fails during this period, the transfer switch shall automatically reconnect the generator set to the normal service.

4. On completion of the exercise period, the transfer switch shall operate to connect the loads to the normal source by opening the alternate source contacts, and closing the normal source contacts a predetermined time period later. The timing sequence for the contact operation shall be programmable in the controller.

5. The transfer switch shall operate the generator set unloaded for a cool down period, and then remove the start signal from the generator set. If the normal power fails at any time when the generator set is running, the transfer switch shall immediately connect the system loads to the generator set only when the remote manual override switch is set to "SHELTER MODE", otherwise the generator set shall continue with the normal exercise sequence.

D. Generator Set Exercise (Test) Without Load Mode. The control system shall be configurable to test the generator set without transfer switch load connected. In this mode, the transfer switch shall control the generator set in the following sequence:

1. Transfer switch shall initiate the exercise sequence at a time indicated in the exercise timer program, or when manually initiated by the operator.

2. When the control systems senses the generator set at rated voltage and

frequency, it shall operate the generator set unloaded for the duration of the exercise period.

3. At the completion of the exercise period, the transfer switch shall remove the start signal from the generator set. If the normal power fails at any time when the generator set is running, the transfer switch shall immediately connect the system loads to the generator set only when the remote manual override switch is set to “SHELTER MODE”, otherwise the generator set shall continue with the normal exercise sequence.

Part 3 - Execution

III. EXAMINATION

A. Examine areas, equipment bases, and conditions, with Installer present, for compliance with requirements for installation and other conditions affecting packaged engine-generator performance.

B. Examine roughing-in of piping systems and electrical connections. Verify actual locations of connections before packaged engine-generator installation.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

IV. INSTALLATION

A. Comply with packaged engine-generator manufacturers' written installation and alignment instructions and with NFPA 110.

B. Install packaged engine generator to provide access, without removing connections or accessories, for periodic maintenance.

C. Install packaged engine generator with 1.5” restrained spring isolators having a minimum deflection of on 4-inch- high concrete base. Secure sets to anchor bolts installed in concrete bases.

D. This Contractor shall furnish and install complete the standby electrical power system including the engine generator set, automatic transfer switch(es), batteries and charging system, exhaust system, vibration isolation, cooling system, electrical system, concrete pad, generator-base fuel tank, man-way platforms, enclosure, and accessories in accordance with the system manufacturer's recommendations.

E. Equipment shall be installed by this Contractor in accordance with final submittals and contract documents. Installation shall comply with applicable state and local codes as required by the authority having jurisdiction. Install equipment in accordance with manufacturer’s instructions and instructions included in the listing or labeling of UL listed products.

F. Installation of equipment shall include furnishing and installing all interconnecting wiring between all major equipment provided for the on-site power system. The contractor shall also perform interconnecting wiring between equipment sections (when required), under the supervision of the equipment supplier.

G. The Contractor shall furnish and install a concrete base for the engine generator set and generator base fuel tank, as shown on the drawings. Equipment shall be permanently fastened to the concrete pad in accordance with the manufacturer's instructions.

1. Concrete foundation shall be as follows:

a) Minimum compressive strength at 28 days – 3500 PSI

b) Maximum nominal aggregate size – 1 inch

c) Maximum W/C ratio by mass – 0.45

d) Air content – 5 + 1%

e) Slump – 2" + 0.75"

2. Top of concrete bases shall be trowel finished smooth and level with beveled edges. Top surface shall not vary by more than 1/8" in depth as measured across the widest surface.

3. All concrete shall be fully vibrated.

4. Reinforcing Steel – Reinforcing to meet ASTM requirements. Spacing of bars shall be adjusted to suit conduit spacing.

H. This Contractor shall ground the generator set as per the NEC, as shown on the Drawings, and as herein specified.

I. All equipment shall be physically inspected for damage. Scratches and other installation damage shall be repaired. Equipment shall be thoroughly cleaned to remove all dirt and debris prior to initial operation and final testing of the system.

J. All fuel tanks shall be field testing in accordance with the requirements of the authority having jurisdiction (AHJ). All fuel tanks shall be filled to full capacity by this Contractor after final testing and Owner acceptance.

V. START-UP SERVICE AND ACCEPTANCE TEST

A. Start-up Service: The standby electrical power system's equipment shall be initially started, operated and tested by the manufacturer's representative prior to the "on-site acceptance test". The Owner shall be notified in advance before any testing in order to coordinate any possible disruption or downtime with the school or facility.

B. On-Site Acceptance Test:

1. The manufacturer shall furnish service personnel and all testing equipment and temporary cable connections to completely service and field test, in the presence of the Owner, the standby electrical power system.

2. The test shall include, but not be limited to, a “cold start” test, a minimum period of four (4) hours with a load bank test at one hundred percent (100%) of the nameplate rating of the engine generator set and a one-step rated load pickup test in accordance with NFPA 110. The manufacturer shall make any adjustments to the system to assure proper operation.

3. The manufacturer shall instruct the Owner's personnel as to proper maintenance and operation and furnish three (3) sets of operating, technical, factory service manuals and maintenance instructions, including descriptive literature of equipment, parts list, and the names and telephone numbers of manufacturer's representatives.

4. Battery Tests: Equalize charging of battery cells according to manufacturer's written instructions. Record individual cell voltages.

   a) Measure charging voltage and voltages between available battery terminals for full-charging and float-charging conditions. Check electrolyte level and specific gravity under both conditions.3

   b) Test for contact integrity of all connectors. Perform an integrity load test and capacity load test for the battery.

   c) Verify acceptance of charge for each element of the battery after discharge.

   d) Verify that measurements are within manufacturer's specifications.

5. Battery-Charger Tests: Verify specified rates of charge for both equalizing and float charging conditions.

6. System Integrity Tests: Methodically verify proper installation, connection, and integrity of each element of engine-generator system before and during system operation. Check for air, exhaust, and fluid leaks.

7. Exhaust-System Back-Pressure Test: Use a manometer with a scale exceeding 40-inch. Connect to exhaust line close to engine exhaust manifold. Verify that back pressure at full-rated load is within manufacturer's written allowable limits for the engine.

8. Voltage and Frequency Transient Stability Tests: Use recording oscilloscope to measure voltage and frequency transients for 50 and 100 percent step-load increases and decreases, and verify that performance is as specified.

9. Harmonic-Content Tests: Measure harmonic content of output voltage under 25 percent and at 100 percent of rated linear load. Verify that harmonic content is within specified limits.

C. Coordinate tests with tests for transfer switches and run them concurrently.

D. Test instruments shall have been calibrated within the last 12 months, traceable to

standards of NIST, and adequate for making positive observation of test results. Make calibration records available for examination on request.

VI. SOFTWARE AND TRAINING

A. The manufacturer shall supply to the Owner a complete set of service and maintenance software for use in properly supporting the product. The software shall be provided at a training class attended by the Owner's personnel, to qualify them in proper use of the software. The software shall have the following features and capabilities:

1. The software shall be 32 bit and shall be Windows '95, Windows '98, XP, and NT compatible.

2. The software shall use the Windows "Explorer" format, for ease of use and commonality with other software in use at the facility.

3. The software shall allow adjustment of all functions described herein via the tool; adjustment of operating levels of all protective functions; and programming of all optional functions in the controller. Adjustments shall be possible over modem from a facility that is remote from the generator set.

4. The software shall allow simulation of fault conditions, to verify operation of all protective devices.

5. The software shall include the ability to store and display data for any function monitored by the generator set control. This data shall be available in common file formats, and on graphical "strip chart" displays.

6. The software shall automatically record all control operations and adjustments performed by any operator or software user, for tracking of changes to the control.

7. The software shall display all warning, shutdown, and status changes programmed into transfer switch controller. For each event, the control shall provide information on the nature of the event, when it last occurred, and how many times it has occurred.

8. The software shall include detailed operation and service information on the specific generator set supplied, so that no other documentation (other than schematic and wiring diagram drawings) is necessary for service of the product.

9. The software shall have been developed under strict quality control guidelines, and comply with the requirements of ISO 9001 and Mil Standard 498 for software development.

B. After generator set installation and successful acceptance test, the generator set supplier shall conduct a complete operation, basic maintenance, and emergency service seminary for up to 10 persons employed by the Owner. The seminary shall include instruction on operation of the transfer equipment, normal testing and exercise,

adjustments to the control system, use of the PC based service and maintenance tools provided under this contract, and emergency operation procedures. The class duration shall be at least 8 hours in length, and include practical operation with the installed equipment.

VII. WARRANTY

A. The warranty for the complete standby electric power system shall be unconditional for a period of one (1) year with unlimited operating hours from the date of the successful acceptance test. The warranty shall be furnished by the system manufacturer. Said coverage shall be for all equipment provided under this specification section whether or not it is manufactured by the Standby Electrical System Manufacturer and shall include parts, labor, travel expenses, and labor to remove/reinstall said equipment per the manufacturer's standard published warranty. There shall be no deductibles applied to said warranty. Multiple warranties for individual components, engine alternator, controls, etc. will not be acceptable. Satisfactory warranty documents shall be furnished. Refer to SECTION 01740 WARRANTIES AND BONDS.

B. Contractor shall provide Warranty Coverage Labels mounted conspicuously on the engine generator control section and on the door of the automatic load transfer switch. The labels shall identify the one source supplier/manufacturer's address and telephone number, coverage description, coverage type, start-up date, model number, serial number, system registration number and other information deemed pertinent by the supplier/manufacturer. It is the intent of this warranty specification to have a single source contact for the Owner to call for warranty service for all standby electrical power system equipment.

C. The manufacturer shall be prepared to offer a service contract for the maintenance of the standby electric power system after the warranty period and/or an extended warranty.

END OF SECTION

Part 1 - General

I. REQUIREMENTS

A. The general provisions of the Contract, including General and Supplementary Conditions and General Requirements, apply to the work specified in this Section.

II. SCOPE

A. The work under this Section shall include furnishing and installing Surge Protective Devices (SPDs), formerly TVSS, for the protection of AC electrical circuits as shown on the Drawings and herein specified.

III. QUALITY ASSURANCE

A. All equipment, materials, and their installation shall conform to the requirements of the National Electrical Code (NEC), local code requirements, and these Specifications.

B. SPD units and all components shall be designed, manufactured and tested in accordance with the most recent editions of ANSI/UL 1449 and UL 1283.

C. Equipment shall be constructed in accordance with National Electrical Manufacturer's Association (NEMA) standards (NEMA LS-1).

D. Submittals are required in accordance with SECTION 16010 of these Specifications. The submittals shall contain, at a minimum, the following:

1. Provide verification that the SPD complies with the required ANSI/UL 1449 3rd Edition listing by Underwriters Laboratories (UL) or other Nationally Recognized Testing Laboratory (NRTL) acceptable to Prince George's Department of the Environment (DoE). Compliance may be in the form of a file number that can be verified on UL's website or on any other NRTL's website, as long as the website contains the following information at a minimum: model number, SPD Type, system voltage, phases, modes of protection, Short Circuit Current Rating (SCCR), Voltage Protection Ratings (VPRs) for all modes, Maximum Continuous Operating Voltage rating (MCOV) and Nominal Discharge Current (In). UL data and visual inspection takes precedence over manufacturer's published documentation.

2. For SPD, external mounting applications include electrical/mechanical drawings showing unit dimensions, weights, installation instruction details, and wiring configuration.

3. Where applicable the following additional information shall be included in the submittals:

a) Descriptive bulletins.

b) Product sheets.

Part 2 - Products

I. MANUFACTURERS

A. Subject to compliance, the following SPD manufacturers are acceptable: ADVANCED PROTECTION TECHNOLOGIES (APT) as listed herein or TOTAL PROTECTION SOLUTIONS (TPS) or SURGE SUPPRESSION INC, EATON ELECTRICAL INC., SIEMENS ENERGY & AUTOMATION, SQUARE D; a brand of SCHNEIDER ELECTRIC or the switchboard manufacturers SPD's for internal or external mounting in or on switchboards shall also be acceptable. Panelboard manufacturers SPD's for external mounting only shall also be acceptable.

B. The listing of specific manufacturers above does not imply acceptance of their products that do not meet the specified ratings, features, and functions. Manufacturers listed above are not relieved from meeting these specifications in their entirety.

II. VOLTAGE SURGE SUPPRESSION – GENERAL

A. Electrical Requirements:

1. Refer to Drawings for operating voltages and unit configurations.

2. SPD's shall be UL labeled with 200kA Short Circuit Current Rating (SCCR). Fuse ratings shall not be considered in lieu of demonstrated withstand testing SPDs.

3. Maximum Continuous Operating Voltage (MCOV):

System Voltage	Allowable System Voltage Fluctuation (%)	MCOV
208Y/120	25%	150V
480Y/277	15%	320V

4. The suppression system shall incorporate thermally protected metal- oxide varistors (MOVs) as the core surge suppression component for the service entrance and all other distribution levels. The system shall not utilize silicon avalanche diodes, selenium cells, air gaps, or other components that may crowbar the system voltage leading to system upset or create any environmental hazards.

5. The SPD shall provide surge current path for all modes of protection: L-N, L-G,

and N-G for Wye systems; L-L, L-G in Delta and impedance grounded Wye systems.

6. All SPD's applied to the distribution system shall have a 20kA Nominal Discharge Current (In) rating regardless of their SPD Type (includes Types 1 and 2) or operating voltage. SPDs having an In less than 20kA shall not be acceptable.

7. ANSI/UL 1449 Listed Voltage Protection Ratings (VPRs) shall not exceed the following:

System Voltage	L-N	L-G	L-L	N-G
208Y/120	800V	800V	1200V	800V
480Y/277	1200V	1200V	2000V	1200V

(Numerically lower is allowed/preferred; old-style Suppressed Voltage Ratings (SVRs) shall not be submitted, nor evaluated due to outdated less-strenuous testing).

B. SPD Design:

1. SPD shall be UL listed Type 1 or Type 2, intended for use without need for external or supplemental overcurrent controls. Every suppression component of every mode, including N-G, shall be protected by internal overcurrent and thermal over temperature controls. SPD's relaying upon external or supplementary installed safety disconnects do not meet the intent of this specification.

2. The SPD shall be maintenance free and shall not require any user intervention throughout its life. SPDs containing items such as replaceable modules, replaceable fuses, or replaceable batteries shall not be accepted. SPDs requiring any maintenance of any sort such as periodic tightening of connections shall not be accepted. SPDs requiring user intervention to test the unit via a diagnostic test kit or similar device shall not be accepted.

3. The surge current shall be equally distributed to all MOV components to ensure equal stressing and maximum performance. The surge suppression platform must provide equal impedance paths to each matched MOV. Designs incorporating replaceable SPD modules shall not be accepted.

4. SPD shall have UL 1283 EMI/RFI filtering with minimum attenuation of 50dB at 100kHz.

5. SPD shall include visual LED diagnostics including a minimum of one green LED indicator per phase, and one red service LED. SPD shall include an audible alarm with on/off silence function and diagnostic test function. SPDs for branch circuit panels not employing an on/off silence function will be acceptable.

6. The SPD must include Form C dry contacts (one NO and one NC) for remote monitoring of its status. Both the NO and NC contacts shall change state under any fault condition or if power is removed from the SPD. Service entrance locations shall have two sets of NO and NC contacts for building power monitoring.

7. SPDs at service entrance locations shall be provided with a surge event counter with a reset button allowing the surge counter to be zeroed. The surge event count shall have a lithium battery backup or be stored in non- volatile memory and displayed after power is restored.

8. Internally mounted SPDs in switchboards shall be designed to interface with the electrical assembly via factory installed conductors only and not mounted directly to bus bars.

9. Sidemount SPDs shall be factory sealed in order to prevent access to the inside of the unit. Sidemount SPDs shall have factory installed phase, neutral, ground and remote status contact conductors factory installed and shall have a pigtail of conductors protruding outside of the enclosure for field installation. Top mount SPDs for switchboards where sidemount is not feasible due to space constrictions or space allowed for future expansion.

C. SPDs shall have NEMA 1 general purpose enclosures, unless otherwise noted or required for the environment. SPDs located in kitchens or other areas subject to possible water exposure shall be NEMA 4X.

III. SYSTEM APPLICATION

A. The SPD applications covered under this section include switchboard assemblies, motor control centers (if present), distribution and branch circuit panelboards. All SPDs shall be tested and demonstrate suitability for application within ANSI/IEEE C62.41 Category C, B, and A environments.

B. The minimum current capability (single pulse rated) per phase shall be:

Service Entrance or Automatic Transfer Switch: 50kA

Distribution Panelboards & MCC: 150kA

Branch Circuit Panelboards: 100kA

C. SPDs installed on the load side of the service entrance disconnect shall be Type

1. Other SPD locations beyond the service entrance shall be Type 1 or Type 2.

IV. SERVICE ENTRANCE SWITCHBOARD/PANELBOARD LOCATIONS

A. The SPD application covered under this section is for service entrance switchboard(s). Service entrance located SPDs shall be tested and demonstrated suitability for application within ANSI/IEEE C62.41 Category C environments.

B. The SPD shall be from the same manufacturer as the switchboard. The SPD shall be internal and panel mounted in the front face of the switchboard at the assembly point by the original equipment manufacturer. Alternatively, the SPD from the same or different manufacturer may be mounted external to the switchboard.

C. The SPD for service entrance distribution panelboards shall be mounted external and adjacent to the panelboard.

D. Locate the SPD (Type 1) on the load side of the main disconnect device, as close as possible to the phase conductors and the ground neutral bar.

E. The SPD shall be connected through a three pole, 60A circuit breaker to serve as the disconnecting means for the SPD. This disconnect shall be located in immediate proximity to the SPD. Connections shall be made via conductors originating in the SPD and shall be kept as short as possible.

1. As an option, internal mounted SPD's in switchboards may be provided with an integral disconnect switch in lieu of using a 60A circuit breaker to serve as the SPD disconnecting means. Connections shall be made via conductors originating in the SPD and connected to the bus bars with suitably sized tap lugs, factor installed. Conductors shall be kept as short as possible.

F. All monitoring and diagnostic features shall be visible from the front of the equipment.

G. The service entrance distribution panelboard external SPD shall be ADVANCED PROTECTION TECHNOLOGIES (APT) Model No.:

1. TE02XAS25E1X for 120/208V SE distribution panelboards

2. TE04XAS25E1X for 277/480V SE distribution panelboards

V. POWER DISTRIBUTION AND BRANCH CIRCUIT PANELBOARD LOCATIONS

A. The SPD application covered under this section includes distribution and branch circuit panelboards. The SPD units shall be tested and demonstrate suitability for application within ANSI/IEEE C62.41 Category B environments.

B. The SPD shall be mounted externally and adjacent to the panelboard. The SPD shall be connected through a three pole, 30A circuit breaker to serve as the disconnecting means for the SPD. Connections shall be made via conductors originating in the SPD and shall be kept as short as possible.

C. SPDs shall be flush mounted adjacent flush mounted panelboards and surface mounted adjacent to or attached to surface mounted panelboards.

D. The external SPD shall be ADVANCED PROTECTION TECHNOLOGIES (APT) Model No.:

1. TE02XDS154XA for 120/208V distribution panelboards

2. TE04XDS154XA for 277/480V distribution panelboards

3. TE02XDS104XA for 120/208V branch circuit panelboards

4. TE04XDS104XA for 277/480V branch circuit panelboards

E. SPDs for motor control centers (MCC) shall be from the same manufacturer as the MCC. The SPD shall be internal and panel mounted in the front face of the MCC at the assembly point by the original equipment manufacturer. Alternatively, the SPD from the same or different manufacturer may be mounted external to the MCC. All monitoring and diagnostic features shall be visible from the front of the equipment.

Part 3 - Execution

I. INSTALLATION

A. SPD shall be installed per manufacturer's installation instructions with lead lengths as short (less than 24") and straight as possible. Gently twist conductors together.

B. This Contractor may reasonably rearrange the circuit breaker locations to ensure the shortest and straightest possible leads for the SPD connections.

C. Before energizing, this Contractor shall verify service and separately derived system neutral to ground bonding jumpers per the National Electrical Code.

D. Repaint marred and scratched surfaces with touch-up paint to match original finish.

II. TRAINING

A. This Contractor shall provide four (4) hours of technical service training to the Owner's technical and maintenance staff.

B. The training session shall be conducted by a manufacturer's qualified representative. The training program shall consist of instruction on operation of the assembly.

III. WARRANTY

A. SPDs and supporting components and accessories shall be guaranteed by the manufacturer to be free of defects in material and workmanship for a period of ten (10) years from the date of substantial completion of service and activation of the system to which the suppressor is attached. Additionally, during the applicable warranty period, and SPD which fails due to any electrical anomaly, including lightning, shall be replaced by the manufacturer without charge. Special or optional warranties in excess of the warranty period for purposes of this bid are not acceptable. Standard unit warranties in excess of the warranty period stated herein are acceptable. Refer to SECTION 01740 for the start of the warranty period.

B. Since "Acts of Nature" or similar statements typically include the threat of lightning to which the SPDs shall be exposed, any such clause limiting warranty responsibility in the

general conditions of this specification shall not apply to this particular section. The warranty must specifically provide for unlimited free replacements of the SPD in the event of failure caused by the effects of lightning and all other electrical anomalies. The warranty shall cover the entire device, not just various components, such as modules only.

END OF SECTION

Part 1 - General

I. REQUIREMENTS

A. The general provisions of the Contract, including General and Supplementary Conditions and General Requirements, apply to the work specified in this Section.

II. SCOPE

A. The work covered under this Section shall include furnishing and installing light- emitting diode (L.E.D.) luminaires (lighting fixtures) complete as shown on the Drawings, as described in the “Luminaire (Lighting Fixture) Schedule", and as herein specified.

III. QUALITY ASSURANCE

A. This contractor shall provide luminaires that are of a manufacturer engaged in the production of luminaires that are equal in material, design and workmanship. The manufacturer’s luminaire shall have been in satisfactory commercial or industrial use for a minimum of three (3) years. The manufacturer’s luminaire shall have been available on the commercial market during the three (3) year period.

B. L.E.D. luminaires shall conform to the requirements of the National Electrical Code (NEC), state and local codes, and these Specifications.

C. The luminaires shall be listed by Underwriters Laboratories, Inc. (UL) or listed by a nationally recognized testing laboratory acceptable to Prince George’s County DoE.

D. Submittals are required in accordance with SECTION 260500 of these Specifications.

IV. DESCRIPTION

A. This Contractor shall furnish, assemble, and install L.E.D. luminaires complete with sockets, louvers, lenses, internal wiring, leads, trims, rings, frames, hangers, straps, reflectors, light engine, and power supply unit (driver) as applicable and required for a complete installation.

B. Luminaires that require remote mounting of any components needed for its operation, such as drivers, or light engine electronics are not permitted. All components needed to make the luminaire operational shall be integral to the luminaire housing.

V. WARRANTY

A. This Contractor shall deliver the work described herein in first class operating condition in every respect. This Contractor shall also warrant that the material and workmanship shall be entirely free from defects. Any materials, equipment, or workmanship in which defects may develop before or during the warranty period shall be repaired or replaced at the Contractors own expense. Refer to SECTION 01740 for the start of the warranty period. The contractor shall further warrant that all material, equipment, and

workmanship used in the installation, but not specifically mentioned in the Drawings and Specifications, is the best of their respective kinds and that the construction and installation was performed in accordance with the best accepted standard practices in all details.

Part 2 - Products

I. MATERIALS AND COMPONENTS

A. The L.E.D. luminaires supplied shall have the proper trim, frames, mounting devices, configuration, and accessories necessary to be properly installed in the building construction. Catalog numbers of luminaires in the “Luminaire Schedule” or "Lighting Fixture Schedule" on the Drawings are to establish a type of luminaire and not to determine a method of mounting.

1. Catalog numbers scheduled on the Drawings may indicate luminaire compatibility with certain types of ceiling construction. The Contractor shall determine exact type of ceilings actually to be furnished in each area and shall obtain luminaires to suit, deviating from specified catalog numbers or descriptions only where necessary, and only to the extent necessary to insure luminaire-ceiling compatibility. The Contractor shall notify the Architect/Engineer and Owner in writing where such changes are to be made.

B. Where L.E.D. luminaires are specified on the Drawings to be complete with a flat diffusing lens, the lens shall be virgin acrylic Type 19 pattern with a minimum thickness of 0.156 inches unless otherwise shown on the Drawings.

C. When L.E.D. luminaires are specified on the Drawings to be complete with a curved or rounded lens refractor/diffuser, the lens shall be impact resistant 100% virgin acrylic type with diffusing optical film.

D. Double lock nuts shall be used at the load bearing ends of threaded pipe used as part of a stem mounting assembly.

E. Approved[1] lay-in type fixture manufacturers include:

II. POWER SUPPLY UNIT (DRIVERS)

A. Luminaires shall be equipped with an L.E.D. driver(s) that accepts the voltage as indicated on the "Luminaire (Lighting Fixture) Schedule". Individual driver(s) shall be replaceable.

B. Driver(s) shall be UL8750 class 2 compliant for their intended purpose.

C. Total harmonic distortion (THD) for current: ≤ 20%

D. Driver(s) shall be rated to operate between -30ºC to 50ºC minimum.

E. Individual driver(s) shall be equipped with surge protection (6kV minimum) in accordance with IEEE/ANSI C62.4.1. Driver shall be protected against damage due to either an open circuit or short circuit fault condition on the driver output.

F. Driver(s) shall have a minimum efficiency of 85%.

G. Drivers shall deliver full-range dimming from 0-10V control signal.

H. Electronic Drivers: Inrush currents not exceeding peak currents specified in NEMA 410.

III. L.E.D. LIGHT SOURCE (LIGHT ENGINE)

A. Individual light engine(s) shall be replaceable.

B. L.E.D. light engine(s) shall have a minimum lifetime of 50,000+ hours at 40º C and shall have a minimum efficiency of 80 lumens per watt.

C. L.E.D. dies shall be tested in accordance with I.E.S.N.A. LM-80-08 standards.

D. Thermal management shall be passive by design and shall consist of heat sinks with no fans, pumps, or liquids.

IV. SPARE PARTS

A. The Contractor shall furnish to the Owner at the completion of the project, a minimum of 5% spare L.E.D. driver assemblies. LED drivers shall be turned over to the Owner representative in their manufacturer's protective packaging. LED drivers not in their protective packaging will not be acceptable.

B. The Contractor shall furnish to the Owner at the completion of the project, a minimum of 5% spare L.E.D. light engine assemblies. LED light engines shall be turned over to the Owner representative in their manufacturer's protective packaging. L.E.D. light engines not in their protective packaging will not be acceptable.

V. EXIT LIGHTS

A. Exit lights (signs) shall be universal mount and complete with factory installed light-emitting diodes (L.E.D.'s) mounted behind a red diffusing panel and with direction arrows as shown on the Drawings.

1. Housing: Thermoplastic.

2. Finish: White.

3. Mounting Type: Universal.

4. Number of Faces: Single, with extra faceplate and color panel for field conversion to double-faced.

5. Letter Color: Red

6. Emergency Operation: Self-powered.

7. Battery: Nickel cadmium.

8. Voltage: Dual 120/277 V.

B. Exit lights shall have wire guards where shown on the Drawings.

Part 3 - Execution

I. INSTALLATION

A. L.E.D. luminaires (lighting fixtures) shall be installed as shown on the Drawings and in accordance with the manufacturer's recommendations.

B. Recessed lay-in type linear L.E.D. luminaires shall be supported from the building structure independently of the ceiling grids with a minimum of four (4) steel tie wires per luminaire or as detailed on the Drawings.

C. Recessed lay-in type linear L.E.D. luminaires installed in lay-in type ceiling tile shall be securely fastened from the building structure and be installed in the lay- in type ceiling in such a manner that the louver/lens housing may be easily opened and so that the luminaires may be removed and relocated without forcing the luminaires or changing the grid system tie wires. This Contractor shall coordinate with the ceiling installer before the ceiling grid is installed to assure a mutually satisfactory installation of ceiling and luminaires.

D. Recessed L.E.D. luminaires installed in “hard” ceiling systems (i.e. drywall, metal pan, etc.) shall be securely fastened from the building structure and be installed in such a manner that the louver/lens housing may be easily opened and so that the luminaires may be removed and relocated without forcing the luminaires or changing the ceiling support system. This Contractor shall coordinate with the ceiling installer before the ceiling is installed to assure a mutually satisfactory installation of ceiling and luminaires.

E. Surface mounted linear L.E.D. luminaires shall be supported from the building structure with a minimum of two (2) 1/4 inch threaded rods per each one (1) foot wide by four (4) foot long and a minimum of four (4) 1/4 inch threaded rods per each two (2) foot wide by four (4) foot long luminaire as detailed on the Drawings.

F. Pendant/suspended luminaires shall be supported from the building structure with 1/4 inch threaded rods at each of the luminaires suspension points. Hardware connections to the threaded rods shall be listed components from the luminaire manufacturer and be specifically designed for the type of suspension called for on the Drawings. Installation shall be in accordance with the manufacturer’s instructions.

G. Recessed non-linear L.E.D. luminaires (i.e. downlights) located in lay-in type ceiling tile

shall be mounted in the center of the tile or as shown on the Drawings and shall be supported by means of bar hangers extended across the main ceiling support members and also supported from the building structure with no less than one (1) 1/4-inch threaded rod per luminaire. Where luminaires are installed in slopped ceilings the luminaires shall be complete with appropriate slopped ceiling adapters.

H. Surface mounted non-linear L.E.D. luminaires and exit lights shall be supported from the building structure with a minimum of two (2) 1/4 inch threaded rods per luminaire or exit light.

I. 1-1/2 inch x 1-1/2-inch steel framing channel shall be used where required to span bar joists and otherwise facilitate structural support for luminaires and exit lights.

J. Ceiling grid layouts when indicated on the electrical Drawings are for convenience only. This Contractor shall coordinate the luminaires layout with the Architect/Engineer and all other trades before the ceiling grid, air outlets, and luminaires are installed.

K. L.E.D. luminaires installed in mechanical room and other similar equipment rooms shall be located in the field to clear all obstructions such as ducts, piping, bracing, and supports. Where the location of luminaires shown on the Drawings must be radically changed, approval from the Architect/Engineer shall be obtained before the luminaire is placed.

L. Pendant mounted luminaires and exit lights shall be located to avoid mechanical systems, ductwork, piping, structural members, and the like.

M. Supports shall not terminate or be fastened directly to the roof decking.

II. GENERAL CONFORMANCE

A. Surface mounted luminaires shall not have gaps between the luminaire and attaching surface, except where required by code regulations or manufacturer’s instructions.

B. Recessed luminaires shall not have gaps between the luminaire trim and the adjacent surface. Where light leaks occur, suitable gaskets shall be furnished and installed.

C. Install luminaires level, plumb and true. Align rows accurately in three (3) dimensions.

D. Where luminaires are to be installed in areas without ceilings, this Contractor shall furnish supports consisting of threaded rods and steel channels as required to have a finished mounting height of 8’-0” to bottom of the luminaire (or other mounting height as shown on the Drawings), unless pendant or chain mounting is indicated on the Drawings or Luminaire Schedule.

E. Recessed luminaires shall be connected with flexible metal conduit or MC Cable (maximum 6’-0” length) from outlet boxes mounted above or alongside of luminaire. Luminaires shall be wired in such a way that removal of one shall not disrupt the continuity of power to the others.

F. All luminaires designated for wet locations shall have sealed conduit entries. Any luminaire leaking water before or during the warranty period shall be repaired or replaced by this Contractor at no additional expense to the Owner.

G. Prior to final inspection, this Contractor shall check all L.E.D. luminaires for damages during construction and replace the damaged luminaires where necessary at no additional expense to the Owner. All luminaires shall be cleaned at the time of final acceptance of the building.

END OF SECTION

Part 1 - General

I. REQUIREMENTS

A. The general provisions of the Contract, including General and Supplementary Conditions and General Requirements, apply to the work specified in this Section.

II. SCOPE

A. The work covered under this Section shall include the materials and equipment necessary for this Contractor to furnish and install, a minimum of two (2), solar powered school zone warning signals, including a concrete base, where shown on the Drawings or where directed by the Owner, usually off site.

B. This Contractor shall furnish and install all necessary equipment and components as hereinafter detailed for a complete and functional signal.

III. QUALITY ASSURANCE

A. This Contractor shall furnish submittals for all components of the school zone warning signals in accordance with SECTION 260500 of these Specifications. The submittals should include, but not be limited to the following.

1. Manufacturer's catalog data for all equipment and components which shall include all technical data to demonstrate conformance with these Specifications.

2. Complete physical drawings of all items of equipment showing dimensions, metal gauges, etc.

3. Complete internal and interconnection wiring diagrams showing number, size, and types of conductors between components.

B. The school zone warning signals specified herein shall be the sole responsibility of a single supplier.

C. All work shall be in accordance with good engineering practices. All equipment for this system shall be listed by Underwriter's Laboratories, Inc. (UL), bear the UL label, and shall be installed in accordance with all requirements of the National Electrical Code (NEC), state and local codes, and these Specifications.

Part 2 - Products

I. SOLAR PANEL

A. Each school zone warning signal shall be furnished complete with solar panels as detailed on the Drawings. The solar panels shall consist of vandal resistant, ultra-violet stabilized, sixty (60) watt, silicon solar modules and glass laminated face with an aluminum backplate and an anodized aluminum frame. The solar modules shall have a peak output voltage of 16.5 volts DC under standard test conditions of 1000W/m2 at 25C.

B. Integral bypass diodes shall be included in each cell to allow the modules to produce power when partially shaded.

C. Minimum recovery time shall be three (3) hours in optimum sun conditions based upon five (5) hours of run time.

D. The solar panel shall have a minimum twenty (20) year output warranty.

E. The solar panel shall be complete with a weatherproof junction box providing wire termination for #14 AWG conductors.

II. BATTERY BANK

A. Each school zone warning signal shall be furnished complete with a battery bank. The battery bank shall consist of two (2) to four (4) Group 29 sealed maintenance free, deep cycle, gel lead acid type, 12VDC batteries (INTERSTATE Cat. No. SG29).

B. The batteries shall provide for a minimum of twelve (12) days of no sun operation based upon five (5) hours of operation at 78 degrees ambient cell temperature.

C. The batteries shall be housed in a separate pole mounted weatherproof NEMA 3R ventilated aluminum enclosure .125 inches thick complete with a gasketed door and a standard traffic/police type lock and continuous piano hinge. The enclosure shall be mounted to the pole as detailed on the Drawings.

III. CONTROLS

A. Each school zone warning signal shall be furnished complete with the following control electronics. All control electronics shall be mounted on a removable sub- assembly. The control electronics sub-assembly shall be fused for short circuit protection.

The sub-assembly shall include an eight-position labeled terminal strip accommodating spade-type connectors for the solar panel, battery, and beacon conductors.

B. The control sub-assembly shall include a programmable, solid state, seven (7) day time switch suitable for use on a solar school zone flasher with the following features:

1. Interface to the 12 VDC battery and to the school flasher shall be provided by means of an 8 pin octal base capable of terminating wire sizes up to #10

AWG.

2. The time switch shall operate on a nominal 12 VDC power source, and shall operate satisfactorily from -30 to +74 C.

3. The timing of the programmer shall be maintained by the 12 VDC battery and a back-up power source. Crystal accuracy of the programmer shall be +/- .005% throughout its full temperature range. No time shall be gained or lost during the replacement of the system battery.

4. Programming of the time switch shall be accomplished via a battery powered programmer designed for this function, or a laptop or desktop PC type computer. Upon completion of the program transfer from a programmer or PC computer to the time switch, an electronic check shall be activated to insure an accurate transfer of data. In the event an invalid transfer occurs, an error message shall be displayed on the programmer or the PC alerting the operator. The transfer cable connection shall be accessible from the front of the time switch, the programmer, and the PC.

5. Changeover from standard time to daylight savings time or vice versa shall be accomplished automatically. Leap year compensation shall be automatic.

6. The time switch shall be capable of initiating a minimum of 16 program steps. A program step is defined as the time of day and the day or days of the week at which the output relay shall be turned on or off.

7. The time switch shall have the capability of a pulsed output adjustable from 1 to 9 seconds in one second increments.

8. The time switch shall be capable of executing ten (10) separate skip plans programmable to any year in advance. Programming for the skip plans shall be accomplished through the use of the time switch programmer. Each plan shall be programmed by entering the beginning date (month/date/year) and the ending date for which the output of the time switch will not be activated. The time switch shall be capable of skipping as short a duration as one (1) day or as long as six (6) months. It shall be possible to begin a skip plan in one calendar year and end that same plan in the next consecutive year. It shall not be necessary to enter the skip plan program in chronological order.

9. A means shall be provided to maintain timekeeping and the program when the system power source (12 VDC battery) is not available. This back-up system shall maintain time keeping and all programmed steps intact for not less then 48 hours at 25C when fully charged, and shall go on line automatically upon removal of the 12 VDC battery. Upon reinstallation of the battery, the time switch shall automatically resume normal operation and begin recharging the back-up system. Should the program of the time switch be erased, the unit shall display an indication of the program loss. The display shall be a color coded LED. The device used for the back-up system shall be a rechargeable

capacitor. When the time switch is operating on the back-up system, the displays shall be blanked and the output disabled to conserve back-up power.

10. Integral with the time switch shall be three (3) LED indicators. A green LED shall flash when 12VDC power is supplied. This display will fast flash while the unit is receiving a program from a time switch programmer. An amber LED shall illuminate steady when the output relay is energized. A red LED shall illuminate when the back-up capacitor of the unit has discharged and the unit requires reprogramming.

11. The time switch shall have a single-pole, double-throw relay output with a contact rating of at least 10 amps at 120 VAC resistive load.

12. Field wiring shall be accommodated by an 8 pin octal base capable of terminating wire sizes up to #10 AWG. A separate terminal point on the octal base shall be provided for each pole of the relay, battery + and battery.

13. The time switch shall be RTC MANUFACTURING, INC. Cat. No. APT21TRDC only.

C. The control sub-assembly shall also include a solid state flasher/charge controller/regulator/low voltage disconnect module suitable for use in solar powered school zone warning signals with the following features.

1. The dual circuit flasher circuit shall provide fifty (50) to sixty (60) flashes per minute, fifty percent (50%) duty cycle.

2. The module shall regulate top end battery voltage with variances in temperature.

3. The module shall include low voltage disconnect deep discharge protection (11.2 VDC under load), automatic reconnect at 12.1 VDC, and shall include a "Low Battery" LED indicator.

4. The module shall include an automatic lamp intensity regulator to hold the lamp outlet constant with varying battery voltage.

5. The module shall include reverse current and on-board short circuit protection.

6. The module shall include a red charge rate LED.

7. The flasher unit shall be RTC MANUFACTURING, INC., Cat. No. DCF2 or approved equal.

D. The control electronics shall be housed in a separate pole mounted weatherproof NEMA 3R aluminum enclosure .125 inches thick complete with a gasketed door and a standard traffic/police type lock and continuous piano hinge. The enclosure shall be

mounted to the pole above the battery enclosure as detailed on the Drawings.

IV. SIGNAL BEACONS

A. The school zone warning signal shall be furnished complete with two (2) eight (8) inch diameter LED type signal beacons as detailed on the Drawings. Each signal beacon shall have: a one-piece aluminum body; one-piece aluminum cutaway visor attached at four (4) points to a one-piece aluminum door; terminal block, UL Type 1015, 600 volt, color coded wiring; and solid state LED amber lamp elements suitable for operation on 12 VDC as described below. The door shall have stainless steel hinge pins and thread lock hex-head screws. The signal beacons shall be the Maryland Department of Transportation (MDOT) Type VR-6 only.

B. The LED lamp elements shall be high efficiency, solid state amber LED lamps with a size of eight (8) inches. The lamp shall have optically matched LED elements for uniform color output of 590 nanometers. The amber elements shall contain LED elements constructed from TSAIInGaP. Lamps shall incorporate multiple main circuits comprised of four (4) LED's per string and shall be self- regulating with input voltages of 10.5 – 18.0 VDC. The lamp lens shall be either a clear or tinted UV stabilized acrylic which shall be easily removed and replaced. The lens of the lamps shall be designed to have up to 300 collector lenses for each LED with up to 450 exit facets to direct the light to meet a 17.5 degree vertical by 55 degree horizontal beam pattern.

V. SIGN FACE

A. Each school zone warning signal shall be furnished complete with one (1) sign face as detailed on the Drawings. The sign face shall be fabricated from .125 inch thick aluminum alloy conforming to ASTM B209, Alloy 5052-H38, 5154-H38, or 6061-T6. The background field shall be reflectorized. The message and borders shall be black. The sign face shall be pole mounted as detailed on the Drawings.

B. Sign faces are available free of charge from the Maryland Department of Transportation.

VI. POLE AND BASE

A. Each school zone warning signal shall be furnished complete with one (1) fifteen (15) foot high, 4-1/2" diameter, spun aluminum or .250 inch thick steel, schedule 40 pole as detailed on the Drawings. The pole shall be complete with a hot dipped galvanized finish.

B. The pole shall be complete with an eight-inch square, 3/4-inch thick base plate as detailed on the Drawings. The base plate shall be welded to the pole and shall be complete with four (4) 1-1/4 inch diameter anchor bolt holes meeting ASTM a- 36.

C. The pole shall be furnished complete with four (4) one (1) inch diameter by thirty- six (36) inch long hot dipped galvanized anchor bolts as detailed on the Drawings. The

anchor bolts shall have a minimum yield strength of 55,000 psi.

D. The pole shall be complete with a three (3) inch by five (5) inch hand hole with cover as detailed on the Drawings.

E. The pole shall be complete with four (4) breakaway support couplings as detailed on the Drawings. The couplings shall comply with AASHTO standards and shall be equal to ALCOA Model 100-1. A sheet metal skirt shall be installed around the couplings.

F. This Contractor shall provide a quick disconnect for each conductor passing through the pole base. The connector shall be the weatherproof "Y" type installed at the base.

Part 3 - Execution

I. INSTALLATION

A. This Contractor shall install the school zone warning signals in accordance with the Manual on Permits, Maryland Department of Transportation.

B. This Contractor shall assembly all components of the school zone warning signal in accordance with the manufacturer's/supplier's instructions.

C. The school zone warning signal shall be installed on a concrete base as detailed on the Drawings.

D. This Contractor shall be responsible for all damages to existing facilities, roadway, grass areas, sidewalks, etc. damaged during the installation of the school zone warning signals.

E. This Contractor shall furnish the Owner's officially designated representative with a minimum of eight (8) hours of on-the-job instructions in the operation, maintenance, and diagnostic testing of the system. This Contractor shall also furnish the Architect/Engineer four (4) bound copies of complete operating and maintenance instructions of the lighting control system including circuit diagrams and all other information necessary for proper operation and service maintenance.

II. SYSTEM TEST

A. This Contractor shall conduct an operating test of the completed school zone warning signal. Each signal shall test free from grounds, shorts, and other faults. All connections shall be thoroughly checked for mechanical and electrical connections. All control electronics shall be demonstrated to operate in accordance with the requirements set forth in these Specifications and as shown on the Drawings.

B. This Contractor shall perform all tests in the presence of the Architect/Engineer. This Contractor shall furnish all personnel and test instruments for use in the test.

III. WARRANTY

A. This Contractor shall deliver the work in a first-class operating condition in every respect.

B. This Contractor shall warrant that the material, equipment, and workmanship furnished shall be entirely free from defects, and shall repair or replace at this Contractor's own expense any material, equipment, or workmanship in which defects may develop before or during the warranty period. Refer to SECTION 01740 for the start of the warranty period. This Contractor shall further warrant that all material, equipment, and workmanship used in the installation, but not specifically mentioned in the Drawings and Specifications, shall be the best of their respective kinds and that the construction and installation shall be in accordance with the best accepted standard practices in all details.

C. All materials used shall be new and of good quality conforming to these Specifications. Any material not specified or reviewed by the Architect/Engineer that is incorporated in the work used or delivered to the site, shall be immediately removed upon the order of the Architect/Engineer and replaced to the satisfaction of the Architect/Engineer at this Contractor's expense.

D. If any work has not been installed in accordance with the Drawings, Specifications, or the manufacturer's instructions, or becomes damaged during the progress of the work, such materials or work shall, at the sole expense of this Contractor, be removed and replaced to the satisfaction of the Architect/Engineer together with any work disarranged by such alterations.

END OF SECTION

Part 1 - General

I. REQUIREMENT

A. The general provisions of the Contract, including General and Supplementary Conditions and General Requirements, apply to the work specified in this Section.

II. SCOPE

A. The work covered under this Section shall include the materials and equipment necessary for this Contractor to furnish and install the house and stage lighting control system, emergency lighting transfer system, stage theatrical lighting instruments, and stage lighting equipment herein specified. It shall also include the services of qualified field engineer/technicians regularly employed by the manufacturer of the system who shall review the installation to ensure its proper operation and provide Owner training.

B. The Auditorium Lighting Controls and Performance Lighting Systems shall be furnished by a factory authorized Theatrical Contractor/Distributor certified to design, program and service the systems. The Theatrical Contractor shall be responsible for coordination between the electrical installation and other trades installing theatrical equipment and for control terminations, system startup, system training, and warranty repair. A Theatrical Contractor is defined as a dealer who regularly engages in the sale and installation of theatrical supplies and equipment. The Theatrical Contractor/Distributor must show evidence of successfully furnishing theatrical systems specified for at least five (5) years.

C. This Contractor shall furnish and install all necessary equipment as hereinafter detailed for a complete and functional house and stage lighting control system including the stage theatrical lighting instruments. Although not every component is called out in every detail, it shall be the responsibility of the manufacturer providing the system to assure that the intended function is furnished.

D. The system specified herein shall consist of a dimmer-per-circuit high density dimming system equipment rack, performance lighting control console, E1.31 ANSI based network signal distribution system, distribution equipment, stage theatrical lighting instruments, and all required interconnecting wiring.

E. This Contractor shall furnish and install in accordance with the lighting control manufacturer's instructions, all conduits, wiring, and outlet boxes required for the erection and operation of the complete system(s) as herein specified and as shown on the Drawings.

F. The house and stage lighting control system shall be supplied as a single integral unit with all dimmer modules, control circuits, circuit breakers, and the like factory wired. Field wiring shall consist of connecting input feeders, dimmer circuits, and remote control wiring to the distribution devices and control console.

G. It is the intention of this specification section that the entire house and stage lighting control system be available to all bidders and not “Packaged or Bundled” with any other lighting systems or equipment.

III. QUALITY ASSURANCE

A. This Contractor shall furnish submittals for all components of the house and stage lighting and lighting control system in accordance with SECTION 16010 of these Specifications. The submittals should include, but not be limited to the following:

1. Manufacturer's catalog data for all lighting instruments, equipment, and components that shall include all technical data to demonstrate conformance with these Specifications.

2. Complete physical drawings of all items of equipment showing dimensions, metal gauges, etc.

3. Complete load schedules which shall clearly indicate actual connected loads and control channel assignment (where applicable), cross- reference of internal equipment identifications to circuit numbers shown on the Drawings, and all other scheduled information which shall relate the equipment to the project requirements. The schedules shall also clearly identify those circuits that are on the emergency lighting transfer system.

4. Complete internal and interconnection wiring diagrams showing number, size, and types of conductors between equipment and from equipment to loads, and feeder quantity and sizes.

B. All materials used shall be new and of good quality conforming to these specifications and the successfully reviewed submittals. Any material not successfully reviewed by the Architect/Engineer that is incorporated in the work, used or delivered to the site, shall be immediately removed upon the order of the Owner or Architect/Engineer and replaced to the satisfaction of the Owner and Architect/Engineer at this Contractor's expense.

1. It shall be this Contractor’s responsibility to include costs incurred in other trades for any work disarranged by such replacements described above. This will include replacement of work and damaged equipment during the progress of construction.

C. The lighting control system equipment specified herein shall be the sole responsibility of a single manufacturer. The manufacturer shall have been producing theatrical lighting and SCR type lighting control systems for at least fifteen (15) years.

D. All work shall be in accordance with good engineering practices. All equipment for this system shall be listed by Underwriter's Laboratories, Inc. (UL), bear the UL label, and shall be installed in accordance with all requirements of the National Electrical Code (NEC), state and local codes, and these Specifications.

E. The entire house and stage lighting control system shall be completely factory assembled and tested under load conditions prior to shipment of the system.

F. Existing Systems Only: Prior to any work being performed on the existing system, the entire house and stage lighting control systems shall be completely tested under load conditions. The test shall include each device on the existing system. The Contractor

shall certify the operating condition and report any abnormal conditions to the Owner.

IV. QUALIFICATIONS

A. The Contractor and the Theatrical Contractor/Distributor shall be required to furnish satisfactory proof of their competence as evidenced by successfully completed previous contracts where control equipment of this nature has been specified.

B. The Contractor is encouraged to visit the site, become familiar with the Drawings outlining this work, and shall become completely familiar with the various items of equipment being furnished under other Divisions of these Specifications related to this work. This Contractor shall make all necessary investigations relative to the conditions that may be encountered on this project.

V. SPARE PARTS

A. This Contractor shall furnish to the Owner spare parts as follows. Spare parts shall be furnished prior to the installation of the system.

1. Two (2) dual 2.4 kW dimmer modules.

2. One (1) spare dimmer rack processor. (Control Modules)

3. One (1) Spare Architectural Processor

B. This Contractor shall furnish to the Owner, at the completion of the project, 20% (minimum of two) spare lamps for each type and wattage of lamps used in the theatrical lighting instruments and the dimmable house luminaires.

Part 2 - Products

I. MANUFACTURERS

A. The house and stage lighting control system as shown on the Drawings and herein specified shall be as manufactured by ELECTRONIC THEATRE CONTROLS, INC. (ETC) [Sensor3™ System] as listed or the equivalent as manufactured by STRAND LIGHTING, INC. [C21 System] which must meet all of the requirements of these Specifications. The system shall utilize the manufacturer's standard products and components with modifications as required meeting the construction and performance requirements of this section.

B. The theatrical lighting instruments as shown on the drawings and herein specified shall be as manufactured by ELECTRONIC THEATER CONTROLS INC. (ETC), and STRONG ENTERTAINMENT LIGHTING (followspots) as listed or the equivalents as manufactured by STRAND LIGHTING, INC., ALTMAN or LYCIAN (followspots) which must meet all of the construction and performance requirements of these specifications.

II. DIMMING SYSTEM EQUIPMENT RACK

A. This Contractor shall furnish and install where shown on the Drawings, a house and stage lighting dimming system equipment rack(s). The racks shall be the ETC Sensor3

SR3-48 (48 module) Advanced Features dimmer rack.

B. Dimmer Rack Electrical:

1. The dimming system equipment rack shall be suitable for operation at 120/208 volt, three phase, four wire, + ground, sixty hertz, 800 amp, and have busing rated for 100% continuous duty, and suitable lugs for a single point connection. Sensor racks shall automatically compensate for frequency variations during operation. Standard SCCR fault current protection shall be 100,000A. The rack shall have a bus kit provided by the manufacturer to allow adjacent racks to be powered by a single feed. Racks shall be UL listed with appropriate factory applied labels.

2. Load and neutral terminals shall be sized to accept up to three (3) sets of 500 kcmil conductors or other sizes and/or quantities as shown on the Drawings.

3. Load terminals shall be located at the front of the wiring cavity. Front access racks having terminals located at the back of the rack or on the side near the back of the rack such that adjacent load cabling may block terminal access shall not be acceptable.

C. Dimmer Rack Electronics:

1. Power control electronics (CEM3) shall be contained in a single module that must be plug-in capable without use of tools.

2. All data and power input for CEM3 control electronics shall be located on a separately removable/pluggable termination connector on the backplane such that backplane can be replaced without removal and discrete secondary conductor terminations. Dimming systems that require discrete termination of DMX, Ethernet, power input, and dimmer control output directly on terminals on the control module or pluggable backplane shall not be permitted.

3. The power controller shall directly support the following network protocols:

a) Net3 protocol suite including ANSI E1.31 Streaming ACN (sACN)

b) ANSI E1.17 Architecture for Control Networks (ACN)

4. Systems must support the above listed industry standard ACN protocols for Ethernet setup, control and feedback integrated directly between the power system and control system.

5. The power controller shall directly support 2 ports of control input using ANSI E1.11 USITT DMX512-A.

6. Dimming control signals must be sent between control module and dimmer/power modules using flat ribbon cables.

7. System must provide an optional low voltage connection to maintain power of control electronics through brown out, instantaneous, and sustained power

outages.

8. Control electronics shall be housed in a formed steel body with cast- aluminum face panel.

D. Physical:

1. The Sensor3 dimmer rack shall be a free-standing, dead-front switchboard, substantially framed and enclosed with 16 gauge, formed steel panels. All rack components shall be properly treated, primed and finished. Exterior surfaces shall be finished in fine-texture, scratch- resistant, gray epoxy paint. Removable top and bottom panels shall facilitate conduit termination on the rack.

2. Rack components shall be designed for easy removal and installation so that the dimming system equipment rack is completely open and empty during field wiring. Rear access to the rack for installation or servicing shall not be required. Racks shall be designed for front access to allow back-to-back, back-to-wall or side-by-side installation.

3. Racks shall be designed to allow easy insertion and removal of all modules without the use of tools. Supports shall be provided for precise alignment of dimmer modules into power and signal connector blocks. With modules removed, racks must provide clear front access to all load, neutral and control terminations.

4. Module spaces shall be mechanically keyed to accept only the 3kW or below, 5kW, or 10kW module specified for that space. The rack shall be configurable to accept mixed dimmer types and sizes throughout the rack.

5. Each rack shall provide a lockable full-height door containing an integral electrostatic air filter that shall be removable for easy cleaning. A single low-noise fan shall be located at the top of each rack. Design of the rack and dimmer modules shall draw all cool air intake air through the integral electrostatic air filter at the front of the rack, discretely through each module housing and directly out the top of the rack such that exhausted hot air from adjacent modules does not heat the module(s) above, below, or to the side of each other.

6. The fan shall maintain the temperature of all components at proper operating levels with dimmers under full load, provided the ambient temperature of the dimmer room does not exceed 40°C/104°F. Dimmer racks that do not employ both locking doors and electrostatic air filters shall not be acceptable.

7. The fan shall turn on whenever any dimmer in the system is activated. In the event of an over-temperature condition, only the affected dimmer module(s) shall shut down and a message shall appear on the control module LCD. The fan shall remain on during thermal shutdown of individual dimmer modules. Systems must include over-temperature sensing and preventative thermal shutdown.

8. A fan sensor shall be provided. In the event of momentary fan failure, error

message will be displayed and sent remotely over Ethernet to optional logging systems. Systems must provide optional system event logging.

9. If the ambient room temperature drops below 0°C/32°F or rises above 40°C/104°F, a warning shall appear on the dimmer rack LCD. If the temperature rises above 46°C/115°F, the rack shall shut down until the condition is corrected.

10. A 3 x 0.5-inch LED status indicator (beacon) shall be mounted in the rack door. The beacon shall be visible throughout a wide viewing angle. In normal operating conditions, this LED is illuminated. If the rack's control module senses an error condition, the beacon shall flash until the error is corrected. An optional indicator shall be available for remote locations. Racks must have external means of visually showing that an error is present.

E. Provide two (2) SR3AF 48 Advanced Features Dimmer racks (7141A1005) with all applicable cross bussing hardware. [Engineer; edit for quantity of racks]

F. Provide an engraved nameplate on the front face of the dimmer rack in a suitable location. The nameplate shall be lettered HOUSE AND STAGE LIGHTING THEATRICAL DIMMING SYSTEM EQUIPMENT RACK.

III. POWER CONTROL ELECTRONICS

A. The dimmer rack electronics shall be contained in one plug-in CEM3 Power Controller. Each power controller shall plug into the dimming cabinet with no need for tools or discrete wire connections. A simple user interface shall be provided for group configuration, testing and diagnostics. Power control shall be UL/cUL Listed and CE Marked. Removal of Power and Dimming Control electronics must be a tool free process.

1. The control electronics shall be contained in one plug-in module, housed in a formed steel body with cast-aluminum face panel, and self-retaining ejection handles to ease removal from the rack.

2. The power control shall automatically compensate for frequency variations during operation.

B. Power Control Interface:

1. A backlit eight-line by 20-character graphical LCD shall be provided for system configuration, live control, and status display.

2. The following functional features shall be available in power control to reduce setup and tech times:

a) Full number pad shall be provided for quick access to dimmers. Power Control must provide 0-9 number pad and logic keys for AND, THRU, and AT for fast access, selection, and control of circuit/dimmer number.

b) Power control shall provide NEXT and LAST buttons to progress

through circuits/dimmers during dimmer check operations such that only a single circuit is brought on to a level at a time during pre-show lighting checks for lamp burnouts.

c) Shortcut buttons for Setup, About, and live control shall be provided for separation of functionality such that a user intending to check status or settings does not accidentally render their system unusable. These buttons shall also serve to reduce maximum time to access any feature or setting on a single dimmer, range of dimmers, or entire rack.

3. The front panel shall have five status LED indicators: power, network activity, DMX A, DMX B, and panic state.

4. Power control must include the above buttons and features.

C. Control Signal and Communications:

1. The power control shall be provided with an Ethernet control signal input. This input shall be fully configurable with a range of patching and priority programming capabilities. The Ethernet signal shall supply seamless integration between the dimmer racks and both the entertainment and architectural lighting control systems. The Ethernet signal shall also enable remote configuration, playback, file storage and monitoring features on a personal computer on the network. Dimming systems that require Ethernet to DMX translation devices for control of critical show lighting introduce a potential failure point and shall not be acceptable.

2. All data and power input for CEM3 control electronics shall be located on a separately removable/pluggable termination connector on the backplane such that the backplane can be replaced without removal and discrete secondary conductor terminations. Systems must support tool- less and not require removal of wires connected directly to the control electronics.

3. DMX connections shall be available with option for pluggable screw or punch-down type terminal. Systems must allow this option to support both DMX over CAT5 and multi-strand conductors.

4. Ethernet connection shall be available via standard Cat5 RJ45 connection. System requiring punch down direct to rack or controller cannot be Cat5 system certified and shall not be acceptable.

5. Dimming systems that require discrete termination of DMX, Ethernet, power input, and dimmer control output directly on terminals on the power control or pluggable backplane shall not be acceptable.

6. The following options shall be provided to backup all controller setup UL924 Panic configuration, and recorded presets:

a) Automatic backup in non-volatile backplane memory.

b) Automatic backup in non-volatile Controller memory.

c) USB storage device pluggable on the controller face panel.

d) Data shall also be transferable to and from library storage on a personal computer on a per-rack basis.

7. The power controller shall directly support the following network protocols:

a) Net3 protocol suite including ANSI E1.31 Streaming ACN (sACN).

b) ANSI E1.17 Architecture for Control Networks (ACN).

8. The power control shall directly support two (2) optically isolated ports of ANSI E1.11 USITT DMX512-A for control input. Minimum 2,500V of optical isolation shall be provided between the DMX512 inputs and the electronics. Systems having optical isolation on a prewired factory plug-in device shall not be acceptable.

9. Systems must support the above listed industry standard ACN protocols for Ethernet setup, control, and feedback integrated directly between the power system and control system.

D. Power Control Features

1. Power Control shall have a dimmer update rate better than 16ms (60HZ) or 20 MS (50 Hz) average. Dimmer outputs shall exhibit no oscillating or hunting for levels. Dimmers with the same choke type set to the same level shall output within ±1V of each other, regardless of phase or input voltage.

2. Power control shall maintain proper dimming performance for all line feed frequencies from 47-53Hz and 57-63Hz without flicker or misfire. Shifts in frequencies up to 3 Hz shall not result in flicker or loss of dimming timing. Systems must perform to these frequency tolerances and shifts.

3. Dimmer output levels shall be regulated for incoming line voltages. The regulation shall adjust for both RMS voltage changes and deformations in the incoming AC waveform. The power control shall monitor and adjust each dimmer's output to maintain a constant power to the load. Regulation shall maintain the desired output voltage ±1V for the entire operating range (91-139V and 181-259 VACS) with the exception that the maximum output will be no greater than the line voltage minus dimmer insulation loss. The regulation shall compensate for dips and anomalies in the AC waveform on a dimmer by dimmer basis. There shall be no interaction between dimmers in the system or any other equipment. The output shall be nominally regulated to 115V/230V appropriate for the market, but shall be field adjustable on a dimmer by dimmer basis to allow for varying cable length. Systems must maintain performance to the above stated voltage regulation.

4. Power control shall support a rack filled with different types and sizes of dimmer modules. The properties of each dimmer shall be configurable, including dimmer name, output curve, dimmer firing mode, and scale voltage values.

a) The output curve selections shall include IES Modified Square, Square, Linear, Modified Linear and a Sensor v2.0 output curve. The power control shall also have the capability of storing up to three custom curves as well as an adjustable preheat level, assignable on a per-dimmer basis.

b) The dimmer firing modes shall include: Normal (Dimmed), Dimmer Doubled, Switched (unregulated on/off with adjustable on-at level), Fluorescent with adjustable threshold, and Off.

c) Dimmers set as Dimmer Doubled shall allow a single dimmer to set two different levels on one dimmer circuit by splitting the AC power into positive and negative half cycles with no resultant DC line current.

d) Power Control must support all above listed adjustments to dimmers on a per circuit basis.

5. Controller shall support two (2) methods of automatic configuration during controller replacement in a rack.

   a) Use backplane configuration- The backplane shall retain full setup and preset data in. In this recovery mode, when a new power control is inserted, the controller shall automatically come on-line fully functional without any manual intervention.

   b) Use controller configuration- Override backplane configuration such that replacement modules automatically use the configuration resident in nonvolatile memory of the power control.

6. Controller shall be capable of changing rack setup for multiple shows for an entire system with a single update command from a remote PC. Show setup shall be saved in XML format and capable of being saved/uploaded from both USB and remote PC.

7. In the event of data loss each rack shall maintain the last level for a user programmable time of zero to five minutes or indefinitely, or may be programmed to fade out or to play a specific preset. Systems must offer this feature.

8. The power control shall contain diagnostic routines to allow the user to test and troubleshoot the system. The power control shall also contain a Test/Bypass switch to turn all dimmers on to full for testing. This switch shall bypass all electronics and shall force the fan on. Systems must include local control, “all on” control bypass, and diagnostic routines.

9. The power control shall be able to record up to 64 presets in a rack. Presets shall be user programmable by recording a snapshot of current dimmer levels (as set by the all control sources), by entering dimmer levels on the power control directly, or a combination of both methods. The system shall have the ability to program and activate group wide presets from the power control,

remote station, console, networked computer, or handheld device. Presets shall be activated in the default fade time of 2 seconds, but shall be have a user-programmable fade time between 0 and 60 minutes.

10. A system wide panic (emergency UL924) activation circuit shall be provided. Any dimmer in any rack may be assigned to the panic circuit. The panic shall be set to a maintained closure. Upon activation the system shall:

    a) Force all circuits selected to be included in panic to a master level between 80-100%

    b) Optionally force all non-panic dimmers to zero

    c) Provide configurable fade time to and from “emergency” state

    d) Provide configurable delay to and from “emergency” state

11. DMX A and B as well as the Ethernet DMX (EDMX) data may be patched using a rack start address - assigned sequentially from a starting control channel or patched individually on a per-dimmer basis. Priority may be set per universe for the DMX inputs, and set per universe by the control source for Ethernet input. Each dimmer may have up to six network control inputs with either a highest takes precedence or priority patch. Each dimmer may also then be assigned to one of 16 spaces for additional specific preset control. Each preset shall have a separate priority for maximum flexibility of prioritization. Systems that must support prioritization of multiple Ethernet sources beyond HTP shall not be deemed acceptable. Systems must support the above listed flexibility in control source prioritization shall not be deemed acceptable.

12. Power control shall provide the ability to set a single circuit, all circuits or a range of circuits to a level at the control interface in the rack. Systems that cannot locally control dimmers through local control override shall not be acceptable.

13. The power control shall be capable of monitoring and displaying incoming line voltage for all three phases on the LCD. With installed current sensors, the same display shall show amperage on each phase.

14. The power control shall support security protected access. The user shall to able to program passwords that restrict access, preventing unauthorized use of higher-level functions by unauthorized personnel. Systems that do not provide security protected access to features that can render the system unusable shall not be acceptable.

E. Standard Feedback:

    1. System and Rack messages shall include, but not be limited to, the following:

        a) DMX port A or B has an error or has failed

        b) Network has an error or has failed

c) Phase A, B or C is below 90 volts

d) Phase A, B or C is above 140 volts

e) Phase A, B or C did not start because it was below 90V or above 140V at power up

f) Phase A, B or C voltage headroom warning

g) Frequency is not 50 or 60 Hz

h) Rack shutting down due to air flow loss

i) Ambient temperature is below 0°C/32°F

j) Ambient temperature is above 40°C/104°F

k) Rack shutting down - ambient temperature exceeds 46°C/115°F

l) Configuration memory error

2. About display shall allow monitoring of system, rack or dimmer status.

a) About System shall provide information about Panic circuits, Preset looks, and System name.

b) About Network shall provide IP address, gateway and net mask.

c) About Rack shall provide information about rack name, ambient temperature, air filters and rack type.

d) About Rack Power shall provide information about power type, rack voltages, current per phase (only with current transformers), under voltage warnings.

e) About Rack Data shall provide status for DMXA, DMXB, EDMX and Network activity.

f) About Dimmer shall provide information about dimmer type, location, output level, control source, scale voltage, mode and curve.

F. Advanced Feedback:

1. Sensor's Advanced Features (AF) shall provide an additional sensor in the individual dimmer modules. This must allow monitoring of current and output voltage on a dimmer by dimmer basis and provide information on lamp burnouts, dimmer status, and input voltages.

2. Power control shall allow the user to record the loads of all AF dimmers in the system. The power control shall, during operation, test each AF dimmer,

determine its load, and compare it to the recorded load. Any change from recorded loads of configured tolerance shall display an error on the power control and any monitoring device on the network. If a dimmer is driven on with no load, an optional message shall be available to notify the console operator and electrician that there is no load.

3. Dimmer Specific messages shall include, but not be limited to, the following:

    a) Load has dropped below recorded value

    b) Load has raised above recorded value

    c) DC detected on dimmer output

    d) One SCR has failed on/off

    e) Dimmer has failed off or circuit breaker has tripped

    f) Dimmer has been removed

    g) Dimmer load has failed

    h) Dimmer has shut down due to over temperature

    i) About Dimmer display shall provide additional information regarding the dimmer's recorded load and current or actual load

4. System shall offer a reporting feature of power load and consumption per individual load

G. Network Interface:

1. The Ethernet network shall provide an integral link to connect all racks in the system for rack-to-console and rack-to-network device communication.

2. The network interface to the power controller shall provide a number of user-programmable control schemes between control sources, including architectural control.

3. Hardware settings for rack type, available module types, availability of AF features, and operating voltage shall be configurable at the factory or in the field, and shall not require secondary setup after system commissioning even in the event to power controller replacement.

4. User programmable parameters shall support onsite setup, via the local interface in the rack. These parameters shall include, but not be limited to, defining module type, scale voltage for each dimmer, firing mode, curve, dimmer numbering and DMX512 or network port assignments. Systems requiring factory programming shall not be acceptable.

H. Provide one (1) CEM3 control module (7140A1001) per dimmer rack with one (1) additional CEM3 module (spare) for the system.

IV. CONTROL ENCLOSURES

A. The Control Enclosure shall be the Unison ERn Series Control Enclosure as manufactured by Electronic Theatre Controls, Inc., or equal.

B. Mechanical:

1. The ERn Control Enclosure shall be a surface mounted panel, suitable for rack mounting, constructed of 18 gauge formed steel panels with a hinged, lockable full-height door containing an integral electrostatic air filter.

    a) The Enclosure door shall have an opening to allow limited access to the control module face panel.

    b) Enclosures shall be convection cooled without the use of fans.

    c) Enclosure shall be have rack mounting brackets.

2. Control Enclosures shall be sized to accept one or two Control Processors and one or two Station Power Modules, as needed for a complete system, including various options and accessories.

    a) The two-space Control Enclosure (ERn2) shall support a single Station Power Supply module.

    b) The four-space Control Enclosure (ERn4) shall support two Control Processors, and two Station Power Supply modules, or, one Control Processor, one Station Power Supply Module and one Station Bus Repeaters module, or one control processor and one dual Station Bus Dual Repeater module.

3. All Enclosure components shall be properly treated and finished.

    a) Exterior surfaces shall be finished in fine textured, scratch resistant, powder based epoxy paint.

4. Enclosure(s) shall be the 19” rack mounted (RM) version.

    a) Rack-mounted version shall have an independent Enclosure suspension kit, with a full height, locking door/cover attached to the kit.

    b) Rack-mounted version shall have an opening to access the control module face panel, and openings to view indicators on option modules.

    c) Rack-mounted version enclosure dimensions and weights (without modules) shall not exceed ERn2-RM - 19" W 11"H 10" D, 20 lb.

5. Top, bottom, and side knockouts shall facilitate conduit entry.

6. Enclosures shall be designed to allow easy insertion and removal of all control and option modules without the use of tools.

    a) Supports shall be provided for precise alignment of modules into power and signal connector blocks.

    b) With modules removed, Enclosures shall provide clear front access to all power and control wire terminations.

C. Electrical:

1. Control Enclosures shall have 120 volt, single-phase configurations.

2. Control Enclosures shall be completely pre-wired by the manufacturer. This contractor shall provide input and control wiring.

3. Control Enclosures shall be designed to support the following wire terminations:

    a) AC (single phase)

    b) Echelon link power (Belden 8471 or equivalent)

    c) 24Vdc (2- 16AWG Wire)

    d) DMX512A Port A (In or Out) (Belden 9729 or equivalent)

    e) DMX512A Port B (In or Out) (Belden 9729 or equivalent)

    f) RS232 Serial In/Out (Belden 9729 or equivalent)

    g) Unshielded Twisted Pair (UTP) Category 5 Ethernet

    h) Contact Closure In (14AWG to 26AWG Wire)

    i) Contact Closure Out (14AWG to 26AWG Wire)

        (1) Contact Closure Out shall provide 1A @ 30vDC

4. Station Power Modules

    a) Station power supply modules shall provide LinkPower for at 32 stations and 1.5A@24VDC of Auxiliary (AUX) power.

    b) Station power module shall support over-current/short protection for LinkPower and Aux. LinkPower shall support fault detection on each leg of the balanced data bus.

5. All control wire connections shall be terminated via factory provided connectors.

D. Thermal

1. Ambient room temperature: 0-40°C / 32-104°F

2. Ambient humidity: 30-90% non-condensing

E. Provide one (1) Unison ERn Series Control Enclosure

V. CONTROL PROCESSOR MODULES

A. The Architectural Control Processor shall be the Unison Paradigm P-ACP Series Control Processor as manufactured by Electronic Theatre Controls, Inc., or equal.

B. The Architectural Control Processor (ACP) assembly shall be designed for use in DRd Series Dimming Enclosures and ERn Series Control Enclosures.

C. The processor shall utilize microprocessor based, solid state technology to provide multi-scene lighting and building control.

1. ACP shall support functions such as station programming, macro sequencing, electronic lockout, room combine and astronomical time clock events. ACP station processor shall allow configuration of the control system via the menus.

2. When used in a dimming enclosure, the ACP shall allow access to dimming control menus including the status screen, dimming configuration screen, backup menu, test menu and configuration menu.

D. One ACP shall be rated to drive 1024 channels of control, 1024 zones, 64 rooms, 512 presets, 62 button or button/fader stations and 6 Touchscreen Stations.

E. ACP module electronics shall be convection cooled.

F. The ACP shall provide front-panel RJ45 jack, Secure Digital (SD) card slot, and Universal Serial Bus (USB) Port for configuration and data exchange.

G. Architectural Lighting System configuration and program information shall be stored in flash memory, which does not require battery backup.

H. The ACP shall be contained in a plug-in assembly and require no discrete wiring connections; all wiring shall be terminated into Dimming or Control Enclosure.

1. The ACP shall support the following communications:

a) Echelon LinkPower

b) 10/100BaseTX, auto MDI/MDIX, 802.3af compliant Ethernet networking with TCP/IP, ESTA BSR E1.17 Advanced Control Networks (ACN) and ESTA BSR E1.31 (sACN) Protocols

c) EIA-232 serial protocol

d) ESTA DMX512A, configurable as input or output ports

e) Dry contact closure inputs

f) Dry contact closure outputs, rated at 1A@30VDC

I. Provide one (1) Paradigm Architectural Control Processor (7180A1001) and one (1) spare P-ACP

VI. DIMMER MODULES

A. The dimmer modules shall be the Sensor Advanced Features modules as manufactured by Electronic Theatre Controls, Inc., or equal. Sensor Modules shall be designed for complete flexibility of choice for dimmed, non-dim, or hot power on each 20A branch circuit. A single module shall provide one of the following:

1. Two dimmed outputs with choice of 500 or 350us rise times, controlled by DMX.

2. Two air gap relay switched outputs controlled by DMX.

3. Two manual bypass constant power circuits, controlled manually.

a) The module may be configured to operate as two dimmers, two relays, or any combination of relay and dimmer from the CEM3 Power Control Module or from an ETC control console connected to a CEM3 system. Any single circuit may be set to bypass the dimmer using a switch on the front of the module.

4. The power control system shall report circuit specific errors via the rack control electronics and/or via a lighting control console.

5. Modules shall provide the following status reporting functions:

a) Load dropped below recorded value

b) Load increased over recorded value

c) DC on dimmer output

d) SCR failed on/off

e) Circuit breaker tripped

f) Dimmer error

g) Module removed

h) Load absent

B. Electrical:

1. Each dimmer module shall contain two single-pole circuit breakers, a solid-state switching or dimming module, associated toroidal filters, power and control connectors, a 120VAC remotely controllable mechanically latching air gap relay, a low voltage dc manual bypass override switch, and one fuse per branch circuit for sufficient short circuit rating.

2. Modules shall not have any protruding pins subject to physical damage when the module is not installed.

3. Modules shall be keyed so that dimmer modules of different capacity shall not be interchangeable.

4. Each dimmer shall be protected by a fully magnetic single pole, 20 amp, or as shown on the Drawings, one hundred percent (100%) rated circuit breaker listed at 10,000 amps or greater interruptible current mounted on the face plate of the dimmer. The breaker shall be used as a dimmer disconnect and shall be rated for 100% switching duty. Circuit breakers shall be rated for tungsten loads having an inrush rating of no less than 20 times normal current. Under overload conditions, the circuit breaker shall disconnect power to the dimmer module before damage can be done to the power devices. The trip current shall not be affected by ambient temperature within the operational specifications of the system. Dimmers must operate continuously at 100% load.

5. Modules that use Triac dimming shall not be acceptable. Modules which utilize an SCR or Triac solid state switch as a dimmer bypass may void warranty of products they are powering and shall not be an acceptable means of bypass.

C. SCR Assembly:

1. Each dimmer shall be rated 2.4kW.

2. Each dimmer module shall use a solid-state module (SSM) consisting of two silicon-controlled rectifiers (SCRs) in an inverse parallel configuration, and all required gating circuitry on the high voltage side of an integral, opto-coupled control voltage isolator. Rectifiers, copper leads and a ceramic substrate shall be reflow soldered to an integral heat sink for maximum heat dissipation. The SSM shall also contain a control LED, a thermistor for temperature sensing, and silver-plated control and load contacts. The SSM shall include an integral output LED, output voltage sensors and current sensors for feedback to the control module. The SSM shall provide a parallel output connection which completely bypasses all SCR dimming including toroid filters and shall intercept the output prior to connection of the load sensing circuit such that the advanced features are still active during bypass. The entire SSM shall be sealed in a plastic housing requiring only a screwdriver to replace. Dimmers must employ triac power devices, pulse transformers, or other isolating devices providing at least 2,500V RMS isolation. Dimmer modules requiring disassembly, heat sink grease or additional tools for repair shall not be acceptable.

3. All electronic components (current/voltage sensors and indicators) shall be contained in a single, field-replaceable housing. Modules requiring discrete wiring of electronic components shall not be acceptable.

4. SCR power switching devices shall have the following minimum ratings:

Module Size:	20A
Single cycle: Peak surge current	625A
Half cycle: 12T	1,620
Transient over voltage	600V
Die size (in)	.257

D. Filtering:

1. Dimmer modules shall include toroidal filters to reduce the rate of current rise time resulting from switching the SCRs. The filter shall limit objectionable harmonics, reduce lamp filament sing and limit radio frequency interference on line and load conductors. Modules shall offer 350 or 500 uS, filter rise times. Rise time shall be measured at the worst case slew rate (about 50 percent) from 10 to 90 percent of the output wave form with the dimmer operating at full load.

2. All dimmers shall maintain their published rise time and/or fall time regardless of duty cycle or rack temperatures. Dimmers that de-rate due to increased dimmer temperature caused by full load operation or high phase angles shall not be acceptable.

E. Power efficiency for standard dimmers shall be at least 97 percent at full load with a no-load loss of 3V RMS. The dimmer shall accept hot patching of a cold incandescent load up to the full rated capacity of the dimmer.

F. Dimmer modules shall be fully plug-in and factory wired. Dimmer modules shall consist of a heavy duty, die-cast aluminum chassis with integral face panel. No tools shall be required for module removal and insertion. All parts shall be properly treated, primed and finished in fine-texture, scratch resistant, gray epoxy powder coat. With the exception of the circuit breaker, the module shall contain no moving parts. Each module shall be labeled with the manufacturer's name, catalog number and rating. Modules constructed of molded plastic for structural support are not equivalent and are not acceptable. Modules shall be UL Recognized.

G. Provide seventy-three (73) D20AFTR Advanced Features Thru Power Dimmer Modules (7083A1022) and twenty-three (23) AFM Air Flow Modules.

H. If manufacturer is unable to provide a Thru Power Module, manufacturer shall provide ten (10) spare relay modules (in addition to the dimmer modules) and five (5) spare Constant Circuit Modules.

VII. GENERAL NETWORK

A. The Electronic Theatre Controls (ETC) Net3 network shall provide data distribution over TCP/IP Ethernet networks. Data shall be layer 3 routable. Systems using proprietary formats or formats other than 10/100/100Mbit wired Ethernet or non-layer 3 routable networks shall not be accepted.

1. Connections shall be made between consoles, face panels, architectural processors, dimmers, Net3 Gateways, and computers over standard Ethernet distribution systems using 100BaseT, 100BaseFL, or greater wiring. All installations shall conform to established Ethernet wiring practice, and installation shall be performed by contractors qualified to do this type of work. All wiring shall be tested at Category 5e or higher for full bandwidth operation to the appropriate IEEE standard.

2. The Lighting Control system must be supplied by a single manufacturer and must have seamless integration over Ethernet between the Performance and Architectural lighting control.

3. Network data, DMX associated equipment, and theatrical control devices shall be housed in a separate wall mounted equipment rack.

B. Capacities:

1. The network shall support DMX routing, patching, and prioritization for up to 63,399 universes (32,767,488 DMX addresses). Each address may be input or output from any port on any DMX gateway in the system. DMX input, routing and output shall be specifically supported on the system from multiple sources and locations up to the maximum number of gateways supported by the Ethernet topology.

2. The network shall support multiple network hosts including consoles, gateways, dimming racks, computers, file servers, printers, and architectural control processors with discrete command lines and control. The lighting network shall support multiple venues within a system and discrete systems on the same network.

C. System Configuration and Monitoring:

1. Network device configuration shall be via Net3 Gateway Configuration Editor (GCE) software and/or ANSI E1.17 Architecture for Control Networks (ACN).

2. Patch addresses shall support viewing and manipulation via ANSI E1.17 ACN.

a) The system shall permit complete user flexibility allowing the system operator to patch each DMX input address to any ANSI E1.31 streaming ACN address, and DMX output to span streaming ACN universes.

b) The lighting system shall support assignment of DMX offsets, truncation of DMX universes, and provide choice of DMX port prioritization.

c) The lighting system shall support the DD start code extension to ANSI E1.31 which provides priority per address such that multiple control sources can share universes with discrete control per address.

d) Lighting systems that must support the above-mentioned address patching capabilities

3. The system shall allow assignable labels for all network devices to allow easy identification by system users.

4. Each network device shall have a discrete and unique IP address provided automatically by the software. The user may edit this IP address. Systems that must support automated IP allocation with IP collision avoidance, and systems that do not allow complete reconfiguration of the above-mentioned features over ANSI E1.17 ACN shall not be acceptable.

5. All configuration data for each network device shall be held at the device and system operation shall not require continuous on-line operation of the network configuration software.

6. Lighting console operators shall be able to back up the network configurations in the lighting control console. In the event of a network device failure, the operator shall be able to apply the configuration of the failed device to a replacement device of the same type without manually reentering settings. Systems that must support configuration backup as described above.

7. Architectural and Entertainment systems connected to the same network shall be capable of arbitrating control over E1.31 Streaming ACN (sACN) level data. The system shall be capable of alternating control of individual address data between architectural and entertainment systems without intervention by the user. The user shall dictate the conditions under which system shall automatically take control. The network shall allow user override of the selected defaults. Systems which require direct user intervention to allocate control of dimmers between architectural and entertainment lighting systems shall not be accepted.

8. The Net3 network shall allow multiple DMX input sources to be prioritized on the same universe as network native sources using E1.31 Streaming ACN prioritization. Multiple DMX inputs may be assigned to the same streaming ACN address (this provides multi-source control for a particular address). Likewise, the system shall support E1.31 prioritization of multiple simultaneous network sources. Systems that cannot prioritize multiple DMX inputs and multiple native network sources on a network shall not be deemed suitable.

9. The lighting network shall allow each DMX input address to be assigned a priority on the network allowing each DMX control level coming into the system to participate in full arbitration. Addresses with the highest priority shall have control, with lower priority addresses being ignored. Addresses assigned the same numeric priority, between 1 and 200, shall respond in highest level takes precedence (HTP) manor. The network shall require a valid DMX signal present at the input to initiate prioritization. Systems that do not allow for prioritized HTP

for DMX inputs to the network shall not be allowed.

VIII. Operational Features:

1. Each DMX gateway shall control up to 512 DMX addresses per port, within the confines of up to 63,999 DMX universes (32,747,488 address). The specific DMX data input or output by the gateway shall be configurable by the user.

2. Duplicate outputs of DMX data (DMX splitter) and discrete outputs shall be fully supported.

3. Merging of multiple DMX input sources on a single gateway without gateway with DMX output on the same gateway shall be supported without connection to the network. The gateway shall support assignment of priority to each input source independently.

4. File transmission, synchronization and access to software shall be supported.

B. Provide one (1) General Network.

IX. NETWORK/DMX EQUIPMENT RACK

A. A wall mounted Network/DMX Equipment Rack shall be provided to house Network data, DMX associated equipment, theatrical control devices and spare theatrical and house luminaire lamps in a fully functional, EIA compliant 19” panel mount assembly. The rack shall be MIDDLE ATLANTIC PRODUCTS (MAP) Model No. DWR Series or equal with an overall width of 24.4”, depth of 26.3” and height as needed to house all the equipment required and recommended by the theatrical system manufacturer. The rack’s center section and back panel shall be 16-gauge steel, phosphate pre-treated and finished in a black textured powder coat. Rack rails shall be constructed of 11-gauge steel with tapped 10-32 mounting holes in universal EIA spacing with black e-coat finish and marked rack spaces. Rack shall be constructed to swing open for component cabling access, center section shall pivot for either left or right opening. Rack shall be provided with suitable cable management modules.

B. The rack shall contain all of the rack mounted equipment set forth in these specifications, as shown on the Drawings and required by the system manufacturer. The rack shall also contain, but not be limited to the following:

1. Lockable sliding shelf to allow a 15.6” laptop computer to fit. (laptop provided by others)

2. Blank brushed panels for equipment mounting not designed for rack mounting but necessary for the operation of the system.

3. Blank brushed panels for future applications and to enclose all unused spaces.

4. One (1) rack mounted UPS unit rated 120 volt, 1000VA, MAP Model No. 1000R (Part No. PJPS1012) or equal with a nine (9) foot power cord with a NEMA 5-15P plug.

5. One (1) UH 5 Button Station.

6. One (1) Theatrical system wireless access point (Airport).

7. One (1) 24 port POE Switch and one (1) spare POE Switch.

8. One (1) 24 port Patch Panel.

9. Two (2) locking drawers, one (1) or more for spare lamps, labeled as “Spare Lamps”

10. Four (4) rack spaces with four (4) individual blank panels for future devices or equipment.

C. Spare Lamps:

1. All spare lamps for the Theatrical Lighting Instruments and House Lighting Luminaires shall be stored in their original cartons in a locking drawer in the NETWORK/DMX EQUIPMENT RACK. The drawer shall be sized as required to house all of the spare lamps. Provide additional locking drawers as needed. A directory listing of the type and location of each lamp shall be inside each drawer. Provide an engraved nameplate lettered SPARE LAMPS on the front face of the spare lamp drawer(s) for identification.

D. Provide one (1) Network/DMX rack. The rack shall have an engraved nameplate on the front face of the Network/DMX rack in a suitable location. The nameplate shall be lettered THEATRICAL LIGHTING SYSTEM NETWORK/DMX EQUIPMENT RACK.

X. DMX GATWAY – FOUR PORT

A. The lighting control gateway shall be a microprocessor-based unit specifically designed to provide DMX-512 control of lighting systems and transport of RDM configuration and status messages. The gateway shall permit DMX-512 data to be encoded, routed over an Ethernet network and decoded back to DMX-512. The unit(s) shall be a Net3 DMX 4-port Gateway as manufactured by ETC, Inc. or approved equal.

1. Gateway shall communicate over Ethernet directly with at least ETC, Inc.’s entertainment and architectural lighting control products and other Ethernet interfaces.

2. Connections shall be made between gateways, consoles, architectural systems, and PCs over standard Ethernet distribution systems using 10/100BaseT.

3. The gateway shall support multiple protocols including:

a) ANSI E1.17 Architecture for Control Networks (ACN).

b) ANSI E1.11 USITT DMX512-A.

c) ANSI E1.20 Remote Device Management (RDM).

d) Net3 protocol suite including ANSI E1.31 Streaming ACN (sACN).

4. The gateway shall be tested to UL standards and labeled ETL Listed.

5. The gateway shall be RoHS Compliant (lead-free).

6. The gateway shall be CE compliant.

7. The gateway shall have a backlit graphic LCD display for identification (soft-labeling) and status reporting. Labeling shall be user configurable using ANSI E1.17 Architecture for Control Network (ACN), Gateway Configuration Editor (GCE) software. The LCD display shall show DMX port configuration indication as well as indicate the presence of valid signal. Gateways that do not indicate port configuration (input/output) and valid data shall not be acceptable.

8. Each gateway shall have power and network activity LEDs on both the front and rear of the gateway.

B. DMX Ports:

1. DMX Ports shall comply with the requirements of ANSI E1.11 USITT DMX512-A standards.

2. Each DMX port shall be software-configurable for either input or output functionality.

3. Hardware configuration override setting shall be provided on the gateway.

4. DMX input shall be optically-isolated from the gateway electronics.

5. DMX output shall be earth-ground referenced.

6. DMX Port shall be capable of withstanding fault voltages of up to 250VAC without damage.

7. Each port shall incorporate one DMX512-A Connection.

a) Each DMX port shall be modular and hot swappable.

b) Each DMX port location shall support a single 5-pin male XLR, 5- pin female XLR or terminal strip module for DMX wiring.

8. Network gateways that do not indicate input/output port configuration or presence of valid data shall not be accepted.

C. Processor:

1. Each gateway shall have sufficient processing power to manage up to 63,999 universes (32,767,488 addresses).

2. Maximum delay time from input to output shall not be greater than one packet

time (approximately 22 mSec.).

3. A minimum DMX update rate of 40Hz shall be sustained under all conditions unless specifically configured for a slower rate for the sake of compatibility with 3rd party DMX devices.

D. Mechanical:

1. The gateway shall be fabricated of 16-gauge steel, finished in fine- texture, scratch-resistant, black powder coat.

2. Dimensions shall be 8.5” (22 cm) wide x 8.0” (20 cm) deep x 1.75” (5 cm) high.

3. The weight of the gateway shall be 3.5 lbs (1.6 kg) with four modules. An individual module shall weight no more than .25 lbs (.1 kg).

4. Mounting holes shall be provided for installation of a pipe mount accessory kit.

E. Power:

1. Power for the gateway shall be provided either over the Category 5e (or better) cable, utilizing IEEE 802.3af compliant Power over Ethernet distribution equipment, or via conventional switches together with isolated in-line power supplies capable of an operating range of 8-28vDC provided by the gateway manufacturer. Power consumption shall not be greater than 5 watts.

2. The gateway electronics shall be electrically isolated from the power supplied over the Category 5e (or better) cable.

3. Power may be provided from any IEEE 802.3af compliant power-over Ethernet distribution equipment, or by using conventional switches together with isolated in-line power supplies as provided by gateway manufacturer.

F. Configuration:

1. Each gateway on the network shall be individually configurable using:

a) Any devices utilizing ANSI E1.17 ACN communications.

b) Gateway Configuration Editor (GCE), running on a network connected PC. The PC shall only be required for configuration, labeling and signal routing, and shall not be required for normal operation of the system.

2. Each DMX gateway shall control up to 512 DMX addresses, within the confines of 63,999 universes. The specific DMX data input or output by the gateway shall be freely configurable by the user. Duplicate outputs of DMX lines (DMX splitter) and discrete outputs shall be fully supported.

3. Any number of DMX universes may be configured with any length up to 512 addresses. Any range of DMX input addresses shall support selection and routing to the specified sACN output.

4. Multiple sources may be combined and a priority may be assigned to each source. Each DMX port may have its own universe and start address.

5. All relevant routing information shall be stored in non-volatile memory at each gateway. The system shall recover from a power outage without requiring the PC to be online. Gateways that do not support non-volatile storage of data routing shall not be accepted.

G. Network:

1. Communications physical layer shall comply with IEEE 802.3i for 10BASE-T, 802.3u for 100BASE-TX and 802.3af for Power over Ethernet specifications.

2. All network cabling shall be Category 5e (or better), conforming to TIA- 568A/B, and shall be installed by a qualified network installer.

3. Data transport shall utilize the TCP/IP suite of protocols to transfer the DMX data.

4. ANSI E1.17 Architecture for Control Networks (ACN) and streaming ACN (sACN) shall be supported. Gateways that do not support ANSI E1.17 shall not be acceptable.

5. Switches shall comply with power-over-Ethernet IEEE802.3af, unless a separate in-line power supply is provided.

6. Multiple DMX signal routing patches and multiple facilities shall be supported and limited only by the file storage capacity of the computer with ETC Gateway Configuration Editor (GCE) Software installed.

7. Each DMX gateway shall control up to 512 DMX addresses, per DMX port within the confines of up to 64,399 universes (32,767,488 addresses) using Streaming ACN (sACN).

    a) Any range of DMX addresses may be selected for each universe.

    b) Multiple sources shall be supported by prioritized Highest Takes Precedence (HTP with priority). Each source shall support assignment of priority to allow override of default HTP behavior.

    c) Each DMX port shall support its own universe and start address.

8. Gateways shall have built in DMX merger capability on a universe or channel-by-channel basis.

9. Gateways shall support and have built-in priority on a per-universe or channel-by-channel basis. Gateways that do not support prioritized merging of multiple network sources at independent priorities shall not be accepted.

H. DMX Connector Modules:

1. Each gateway shall support up to four connector modules containing a single connector and its associated electronics.

2. Connector module options shall include:

    a) 5-pin Male DMX connector for DMX Input.

    b) 5-pin female DMX connector for DMX output.

3. Eight position terminal connector for DMX input or output supporting screw terminals or Insulation displacement (IDC) wire terminations.

4. Each connector module shall be optically-isolated from the gateway electronics and from each other.

5. DMX connector modules shall be capable of withstanding fault voltages of up to 250vAC without damage.

I. Environmental:

1. The ambient operating temperature shall be 0° to 40°C (32° to 104°F).

2. The storage temperature shall be -40° to 70°C (-40° to 158°F).

3. The operating humidity shall be 5% - 95% non-condensing.

J. Accessories shall be provided:

1. Hanging bracket kit shall allow unit to be mounted in three orientations.

    a) U-Bolt or C-Clamp mounting hardware shall be available.

2. One E.I.A. rack space mounting bracket kit shall support either one or two complete units and allow for up to eight ports of DMX.

3. Front Access Panel kit shall allow the connectors on the rear of the gateway to be accessed from the front of an equipment rack.

4. A Universal Power Supply with plug-sets shall be provided. Multiple power supplies shall be able to fit in a vertically stacked power strip.

5. ETC Gateway Configuration Editor Software (GCE).

K. System Requirements:

1. Provide the quantity and type of ETC gateways required for a complete installation.

2. Provide the quantities of Ethernet switches and power supplies required for a complete installation.

3. Provide a current generation PC with Windows XP operating system equipped with a 10/100 Ethernet card.

4. Systems that do not provide the above capabilities shall not be acceptable.

L. Provide one (1) Net3 DMX 4-port Gateway.

XI. DMX/RDM REPEATER (OPTO-SPLITTER)

A. The DMX/RDM Installation Repeater shall permit star-wiring of DMX512 signals and shall isolate DMX transmitters and DMX receivers from common mode voltages, ground loop currents and other electrical faults.

1. The DMX/RDM Installation Repeater shall have bi-directional ports to allow Remote Device Management (RDM) data packets to be sent and received between control systems and responding devices.

2. Each DMX/RDM Installation Repeater shall have one input port and eight output ports. No in-line processing of the input signal is permitted to ensure the highest reliability.

3. DMX signal splitting shall be provided using 4-output DIN-rail mounted modules for easy expansion and/or servicing.

4. The system shall be capable of repeating simplex protocols other than DMX512, provided they meet the electrical requirements of EIA-RS422 or RS485.

B. Physical:

1. Enclosures shall be constructed of formed or cast aluminum and steel.

2. The DMX Repeater shall be designed to mount in a single rack unit of height and shall include all necessary mounting hardware for this purpose.

3. The housing shall be provided in stain black textured power-coat finish. The front and rear panels will clearly identify ports and connectors with black print on a white background for legibility.

C. Electrical:

1. The power supply shall be a field-replaceable, wide-range input (115/240VAC, 50/60 Hz), UL-listed switching power supply. There shall be no power switch to reduce the chance of accidental shut-off.

2. There shall be 2500-volt electrical isolation between all input and output sections, and between adjacent output sections.

3. The input and each output shall be capable of withstanding the continuous application of up to 250V without damage to internal components. Input and

output protection shall be of the self-resetting type, rated for 250V. Replaceable fuses are not acceptable.

D. Field Connections:

1. All internal field wiring connections shall be clearly labeled according to their function.

2. Connections for all data input, output and pass-thru ports, and DC power shall be two-part, Phoenix-type screw terminal strips, capable of accepting #26 to #14 gauge solid or stranded wire.

3. An active, isolated data pass-thru connection port shall be provided to allow daisy-chaining of additional modules or Installation Repeaters.

4. The power supply connections shall be capable of accepting up to #12 gauge solid or stranded wire. A suitable terminal shall be provided for ground wire connection.

E. Features:

1. Each repeater module shall incorporate LED indicators for DC power input, isolated DC power, DMX input and processor status.

2. Each module shall have two LEDs per output port to indicate active DMX output and RDM activity for that port.

3. Each module shall be individually discoverable via RDM. No remote configuration options shall be available to the user.

4. Each DMX/RDM port shall incorporate an active data line terminator.

F. Compliance:

1. The DMX/RDM Installation Repeater shall be compliant with ANSI E1.11 DMX512-A (2004), USITT DMX512 (1990) and ANSI E1.20 Remote Device Management (2006).

2. The DMX/RDM Installation Repeater shall be ETL-listed.

3. The DMX/RDM Installation Repeater shall be compliant with the RoHS 2002/95/EC directive.

G. Acceptable Product:

1. Supply Pathway DMX/RDM Installation Repeaters only.

H. Provide one (1) rack mounted Pathway 8-way DMX/RDM Installation Repeater, or approved equal.

XII. TOUCHSCREEN CONTROL STATIONS (MASTER HOUSE LIGHT)

A. The Master House Light Control Stations shall be the Unison Paradigm Touchscreen P-LCD Series Control Stations as manufactured by Electronic Theatre Controls, Inc., or equal.

1. Touchscreen stations shall support default and fully graphical control pages.

2. The Touchscreen station shall operate using graphic buttons, faders and other images on at least 30 separate programmable control pages.

3. Touchscreen stations shall also allow programming of page pass-code, lock out and visibility levels.

B. Mechanical:

1. Touchscreen stations shall consist of a seven inch, backlit liquid crystal display (LCD) with a minimum resolution of 800 by 400 pixels and 12-bit color depth with a touch interface.

2. Touchscreen bezels shall be constructed of aluminum and shall have no visible means of attachment.

a) The bezel shall install and remove without the use of tools.

b) The bezel shall provide two working positions for the Touchscreen: service and operating.

3. The Touchscreen shall have a protective overlay over the display.

a) The overlay shall reduce wear.

b) The overlay shall reduce glare.

4. The manufacturer shall provide backboxes for all LCD stations.

a) Flush back box dimensions shall be 7.94” wide x 5.33” high x 3.25” deep.

b) Surface back box dimensions shall be 8.3” wide x 5.6” high x 2.55” deep.

C. Electrical:

1. Touchscreens shall be powered entirely by the System network.

2. Touchscreens shall connect to the System using an Ethernet network with Power over Ethernet (PoE) or the Unison control station Echelon® Link power network.

a) Ethernet Network

(1) Ethernet network shall be 10/100BaseTX, auto MDI/MDIX, 802.3af compliant.

(2) Network shall utilize Unshielded Twisted Pair (UTP) Category 5e wiring.

b) Echelon® Link power network

(1) Link power shall utilize low-voltage Class II unshielded twisted pair, type Belden 8471 or equivalent, and one #14 ESD drain wire (when not installed in grounded metal conduit).

(2) Touchscreen stations shall also require (2) #16 AWG stranded wires for 24Vdc operating power. 24Vdc wiring shall be topology free.

(3) Network wiring may be bus, loop, home run, star or any combination of these.

(4) Network insulation displacement connectors shall be provided with all stations.

D. Functional:

1. System

a) The Touchscreen shall support configuration firmware upload from a Paradigm Processor as proxy.

b) The Touchscreen shall support configuration or firmware upload from local removable media.

2. Setup Mode

a) There shall be a setup display that is separate from any user- defined configuration.

b) It shall be possible to view and modify connectivity settings.

c) It shall be possible to view status information.

d) It shall be possible to view and modify LCD screen settings.

e) It shall be possible to perform Touchscreen calibration.

f) It shall be possible to view and modify audio settings.

g) The appearance of the setup display shall be standard and not editable.

h) The setup display may be invoked from within the user-defined

configuration and/or physical button on the Touchscreen.

i) There shall be a default protected method to invoke the setup display.

3. Configurations

a) It shall be possible to have multiple configurations stored within an LCD Station.

b) Only one configuration may be active on the LCD Station.

c) It shall be possible for Touchscreen Stations connected via the Echelon® Link power network to select a configuration automatically based on the configuration of the physical connection.

d) Where multiple configurations are stored there shall be a boot menu to allow selection of a configuration.

e) Each configuration shall be identified as a different Station within the System.

4. Operation

a) The Unison Paradigm Control System shall be designed to allow control of lighting and associated systems via Touchscreen controls. System shall allow the control of presets, sequences, macros and time clock events.

(1) System presets shall be programmable via Button, Button/Fader, Touchscreen, or LightDesigner software.

(a) Presets shall have a discrete fade time, programmable from zero to 84,600 seconds with a resolution of one hundred milliseconds.

(b) Presets shall be selectable via Touchscreen stations.

(2) System macros and sequences shall be programmable via LightDesigner system software.

(a) Macro and sequence steps shall provide user selectable steps, and allow the application of conditional logic.

(b) Macro and sequences shall be activated by button, time clock event or LightDesigner software.

(3) System clock events shall be programmable via the Touchscreen, LightDesigner system software, the processor user interface, or the internal web server.

(a) Time clock events shall be assigned to system day types. Standard day types include: anyway, weekday, weekend, Sunday, Monday, Tuesday, Wednesday, Thursday, Friday and Saturday. System shall support programming of additional custom or special day types.

(b) Time clock events shall be activated based on sunrise, sunset, time of day or periodic event. System shall automatically compensate for regions using a fully configurable daylight saving time.

(4) A Color picker, supporting Hue, Saturation and Brightness (HSB) color selection shall be available for color selection of color changing fixtures and provide visual feedback of the current color produced by the associated fixture.

(a) The color picker shall be provided with a default layout that requires no user configuration.

(b) The Color Picker shall provide RGB faders in addition to the default HSB color wheel for color selection.

(c) Color picker values shall allow for numerical value input in addition to color wheel and fader control.

(d) The color picker shall be compatible with color mixing systems that use up to seven discrete color control channels.

b) Touchscreen stations shall be designed to operate standard default or custom system functions. Components shall operate default functions unless re-assigned via LightDesigner, the Windows-based configuration program.

(1) Optional button functions include: preset selection, manual mode activation, record mode activation, station lockout, raise, lower, macro activation, and cue light, or room join/separate.

(2) Optional fader functions include master control, individual channel control, fade rate control or preset master control.

c) Touchscreen stations shall allow programming of station and component electronic lockout levels via LightDesigner.

d) It shall be possible to adjust LCD contrast and brightness.

e) It shall be possible to program the station to dim during periods of inactivity.

E. Provide two (2) Paradigm LCD touchscreen station.

XIII. CONTROL STATIONS

A. Button Stations

1. The Lighting Control Stations shall be the Unison Heritage UH Series Control Stations as manufactured by Electronic Theatre Controls, Inc., or equal.

2. Mechanical:

a) The button stations shall operate using up to ten programmable buttons.

b) All button stations shall be available with white, cream, ivory, gray or black faceplates, and buttons.

(1) Manufacturer's standard colors shall conform to the RAL CLASSIC Standard.

c) Stations shall have indicators lights at each button.

(1) Indicators shall be comprised of red, green and blue LED's.

(2) Indicator color and state (steady On, Blink, Off) shall be configured in software, and shall operate relative to the button it is associated with.

d) All faceplates shall be designed for flush or surface mounting.

e) Station faceplates shall be constructed of ABS plastic and shall use no visible means of attachment.

f) Station faceplates shall be indelibly marked for each button or fader function.

g) The manufacturer shall supply back boxes for flush mounted half gang stations and for all surface mounted stations.

h) All Button stations shall be designed to accept the infrared signal from a remote hand held IR transmitter.

(1) The stations shall have a 60° reception angle and shall operate reliably within a 45-foot distance.

3. Electrical:

a) Unison control station wiring shall be an Echelon® Link power network.

(1) Link power shall utilize low-voltage Class II unshielded twisted pair, type Belden 8471 or equivalent, and one #14 ESD drain wire (when not installed in grounded metal conduit).

(2) Touchscreen and Interface stations shall also require (2) #16 AWG stranded wires for 24Vdc operating power. 24Vdc wiring shall be topology free.

(3) Network wiring may be bus, loop, home run, star or any combination of these.

(4) Network insulation displacement connectors shall be provided with all stations.

4. Functional:

a) The Unison Paradigm Control System shall be designed to allow control of lighting and associated systems via Button, Interface or Astronomical time clock controls. System shall allow the programming of presets, sequences, macros and time clock events.

(1) System presets shall be programmable via Button, Touchscreen, or LightDesigner software.

(a) Presets shall have a discrete fade time, programmable from zero to 1,000 hours with a resolution of one millisecond.

(b) Presets shall be selectable via button, IR transmitter, time clock event, macro activation or switch interface stations.

(2) System macros and sequences shall be programmable via LightDesigner system software.

(a) Macro and sequence steps shall provide user selectable steps, and allow the application of conditional logic.

(b) Macro and sequences shall be activated by button, time clock event or LightDesigner software.

(3) System time clock events shall be programmable via LightDesigner system software, the processor user interface, or the internal web server.

(a) Time clock events shall be assigned to system day types. Standard day types include: anyway, weekday, weekend, Sunday, Monday, Tuesday, Wednesday, Thursday, Friday and Saturday. System shall support programming of additional custom or special day types.

(b) Time clock events shall be activated based on sunrise, sunset, time of day or periodic event. System shall automatically compensate for regions using a fully

configurable daylight saving time.

b) Station Button, and Interface control components shall be designed to operate standard default or custom system functions. Components shall operate default functions unless re-assigned via LightDesigner, the Windows-based configuration program.

(1) Button functions shall allow preset selection, manual mode activation, record mode activation, station lockout, raise, lower, macro activation, cue light, or room join/separate.

c) Button Stations shall allow programming of station and component electronic lockout levels via LightDesigner.

B. Connector Stations

1. The Lighting Control Stations shall be the Unison Heritage UH Series Control Stations as manufactured by Electronic Theatre Controls, Inc., or equal.

2. Mechanical:

a) Unison connector stations shall provide an interface to portable Unison stations.

b) All connector stations shall be available with white, cream, ivory, gray or black faceplates, fader knobs, and buttons.

(1) Manufacturer's standard colors shall conform to the RAL CLASSIC Standard.

c) All faceplates shall be designed for flush or surface mounting.

d) Station faceplates shall be constructed of ABS plastic and shall use no visible means of attachment.

e) Station faceplates shall be indelibly marked for each function.

f) The manufacturer shall supply back boxes for flush mounted half gang stations and for all surface mounted stations.

3. Electrical:

a) Unison control station wiring shall be an Echelon® Link power network.

(1) Link power shall utilize low-voltage Class II unshielded twisted pair, type Belden 8471 or equivalent, and one #14 ESD drain wire (when not installed in grounded metal conduit).

(2) Touchscreen and Interface stations shall also require (2) #16 AWG stranded wires for 24Vdc operating power. 24Vdc wiring shall be topology free.

(3) Network wiring may be bus, loop, home run, star or any combination of these.

(4) Network insulation displacement connectors shall be provided with all stations.

4. Functional:

a) The Unison Paradigm Control System shall be designed to allow control of lighting and associated systems via Button, Button/Fader, and Interface or Astronomical time clock controls. System shall allow the programming of presets, sequences, macros and time clock events.

(1) System presets shall be programmable via Button, Button/Fader, Touchscreen, or LightDesigner software.

(a) Presets shall have a discrete fade time, programmable from zero to 1,000 hours with a resolution of one millisecond.

(b) Presets shall be selectable via button, fader, IR transmitter, time clock event, macro activation or switch interface stations.

(2) System macros and sequences shall be programmable via LightDesigner system software.

(a) Macro and sequence steps shall provide user selectable steps, and allow the application of conditional logic.

(b) Macro and sequences shall be activated by button, time clock event or LightDesigner software.

(3) System time clock events shall be programmable via LightDesigner system software, the processor user interface, or the internal web server.

(a) Time clock events shall be assigned to system day types. Standard day types include: anyway, weekday, weekend, Sunday, Monday, Tuesday, Wednesday, Thursday, Friday and Saturday. System shall support programming of additional custom or special day types.

(b) Time clock events shall be activated based on sunrise, sunset, time of day or periodic event. System shall automatically compensate for regions using a fully configurable daylight saving time.

(c) .5A@120V

C. Provide four (4) Unison Heritage Push Button Station (UH10007-1F).

XIV. DATA PLUG-IN STATIONS

A. Data Plug-in Stations shall consist of the appropriate connectors required for the functional intent of the system. These stations shall be available with DMX input or output, Remote Focus Unit, Network, or architectural control connectors as shown on the Drawings or as required.

B. Connector Options:

1. The following standard components shall be available for Plug-in Stations:

a) 5-Pin male XLR connectors for DMX input

b) 5-Pin female XLR connectors for DMX output

c) RJ45 connectors for Network connections - Twisted Pair

C. Physical:

1. Station faceplates shall be .80” aluminum, finished in fine texture, scratch-resistant black powder coat. Silk-screened graphics shall be white.

2. The station panel shall mount into an industry standard back box, depending on size and quantity of connectors. A terminal block shall be supplied for contractor terminations.

D. Provide Data Plug-In Stations of the types and quantities as follows:

1. Two (2) ECPB DMX OUT/NET

2. One (1) ECPB DMX/NET

3. One (1) ECPB NET

XV. EMERGENCY LIGHTING TRANSFER SYSTEM

A. Provide an Emergency Lighting Transfer System (ELTS2) to provide automatic transfer of branch circuits from normal to emergency power when normal power fails. Each system shall consist of power transfer switches and a control circuitry interconnected to provide complete, automatic protection.

1. The ELTS shall transfer designated lighting load branch circuits from dimmers or secondary control outputs to a second power source in the event of a loss of power to the dimmer rack, a normal system failure, or activation of fire alarm.

2. The system shall comply with ANSI / UL1008 Transfer Switch Equipment, ANSI / NFPA 110 Standard for Emergency and Standby Power Systems, and ANSI /

NFPA 70 National Electrical Code (NEC). Emergency transfer systems that do not comply with the below stated NEC articles and sections shall not be permitted:

a) Article 700 – Emergency Systems

b) Article 701 – Legally Required Standby Systems

c) Article 702 – Optional Standby Systems

d) Section 518.3(C) – Assembly Occupancies

e) Section 520.8 – Theatres and Similar Locations

f) Section 540.11(C) – Motion Picture Projection Rooms

3. The ELTS shall be a self-contained system for up to 24 circuits at 20 amps each and available for single or three phase power (120/208V). The unit shall be available with either discrete emergency branch circuit feeds from an external circuit breaker panel (by others) or emergency main feed with built-in branch circuit distribution and over current protection, as shown on the Drawings.

B. Transfer Switch

1. The switch shall be a UL 1008 LISTED, electrically operated and mechanically held (maintained) transfer switch.

2. The switch shall be positively locked and unaffected by voltage variations or momentary outages so constant contact pressure is maintained and temperature rise at the contacts is minimized.

3. The switch shall be mechanically interlocked to ensure only one of the two possible positions, either Normal or Emergency.

4. Each switch shall be configured as guaranteed break-before-make.

5. Built-in fuses shall provide up to 65,000A Short Circuit Current Rating (SCCR) on connected emergency circuits.

6. Built-in fuses class G shall be provided on each output for compliance with NEC Section 700.27 Coordination – larger upstream breakers cannot be tripped by downstream branch circuit faults.

7. Switch contacts shall withstand transfer without welding, with 180º phase displacement between Normal and Emergency power sources, both sources energized and with 80% load.

8. Transfer switch contacts shall be rated for mixed loads, including electric discharge lamps and tungsten filament lamps.

9. Transfer switches shall be rated for 6000 cycles at full tungsten load.

C. Control Circuit

1. The control circuitry shall direct the operation of the transfer switch.

2. User configurable timing delays shall be provided for power transfer between:

   a) Loss of normal power and the transfer to emergency up to 10 seconds.

   b) Restoration of normal power and the transfer from emergency back to normal power up to 60 seconds.

3. A normally closed dry contact closure fire alarm input shall be provided.

4. Transfer switch shall support connections for up to 5 Remote Stations which can manually switch between normal and emergency power.

D. Operation

1. Transfer to alternate supply will occur when normal supply voltage drops below 80V when used at 120V, or 185V for the A phase and 80V for the B and C phase when used at 277V.

2. A self-supervising isolated signal input shall be provided for connection to the facility fire alarm. The ELTS2 shall automatically transfer the loads to the Emergency power source when the facility fire alarm is activated as part of a normally-closed loop.

3. A key-operated switch shall be provided to manually control the ELTS2. All automatic functions shall override this control. Two indicator lights shall be provided to show the position of the transfer switch.

4. All automatic functions shall override remote control functions. Any combination of open or shorted wiring to remote stations shall not affect automatic functions, or disable the local switch.

E. Enclosure

1. The ELTS2 shall be mounted in a NEMA 1 interior or NEMA 4 watertight type enclosure finished in textured epoxy paint. It shall be equipped with a hinged locking door. Material shall be no less than 14-gauge steel.

2. An enclosure containing no more than 12 (twelve) 20A circuits shall be 36”H x 24” W x 8.5” D.

3. An enclosure containing up to 24 (twenty-four) 20A circuits shall be 48”H x 30” W x 8.5” D.

4. The enclosure shall provide power distribution and branch circuit protection for all emergency power circuits. Systems requiring external emergency power circuit protection shall not be acceptable.

5. The enclosure shall be separate and independent of all other equipment. In no instance shall the ELTS2 be enclosed in a dimmer rack or in an enclosure containing other equipment.

6. The system shall be provided with an approved overlay mounted on the front of the enclosure, stating, “EMERGENCY LIGHTING TRANSFER SYSTEM”.

7. The enclosure shall be provided with an approved label indicating that the system is UL1008 LISTED.

F. The manufacturer of the ELTS shall be the same manufacturer as the dimming system equipment rack manufacturer, or approved equal.

G. Provide one (1) Emergency Lighting Transfer System (ELTS2).

XVI. LIGHTING CONSOLE AND ACCESSORIES

A. The lighting control console shall be a microprocessor-based system specifically designed to provide complete control of stage, studio, and entertainment lighting systems. The console shall be the “Ion” as manufactured by Electronic Theatre Controls, Inc., or equal.

1. The control system shall be Net3 and Net 2 native, with both protocols output simultaneously over the network. The system shall also be able to control third party ANSI e1.31 sACN/ACN devices directly. Artnet and Avab UDP protocols shall also be available. The system shall provide control of 1024 outputs on a maximum of 10,000 control channels.

2. A maximum of 10,000 cues, 999 cue lists, 1000 groups, 1000 presets, 4 x 1000 palettes (Intensity, Focus, Color and Beam), 1000 effects, 1000 macros and 100 curves may be contained in non-volatile electronic memory and stored to an onboard hard disk or to any USB storage device.

3. Recorded cue lists may be played back simultaneously on a maximum of 200 faders. Channels shall respond to cue information by last instruction with discrete rate control provided for all cues. The console may be placed in Tracking or Cue Only mode by the user as a system default and overridden on individual record actions as required. HTP/LTP intensity flags, assert, proportional, intensity master or manual master fade control and independent status may be placed on each cue list. It shall also be possible for a cue list to contribute to playback background states or to withhold such contributions.

4. A Master Playback fader pair and dedicated Grand Master/Blackout shall be provided.

5. Up to six USB fader wings may be connected to the console, for a maximum of 300 submasters and/or 200 playback faders. USB fader wings may be rigidly connected to the main console to provide a "single connected unit" with no external cables required. The wings also may be connected via USB cables and used "on the side." Virtual fader control is also provided.

6. A high-resolution level wheel shall be provided to control intensity for selected channels and scrolling within selected displays. Four page-able high-resolution encoders shall be provided for control of other non- intensity parameters. Non-intensity parameters shall be controllable via the encoders or keypad controls, without need of an external pointing device. A high-resolution rate wheel shall also be provided.

7. Rotary encoders for non-intensity parameters must be labeled by means of an integral LCD display mounted below the encoders on the main console. The display shall show the currently loaded functions of the encoders based on the current selections.

8. Control and programming features for automated fixtures shall also include: a standard library of fixture profiles, the ability to copy and edit existing profiles and create new profiles, patch displays including channel and output addressing, 16-bit fade resolution, color characterization allowing color mixing and storing in Hue and Saturation or native device values.

9. System information, including playback status, live output and blind values for all record targets shall be displayed on a maximum of two external high resolution DVI monitors, or one SVGA monitor, which may also be touch-screen(s). Only one display shall be required for operation.

10. A context sensitive on-line Help feature shall explain and provide an example of the operation of each feature of the system.

11. An optional, fully-functioning, detachable alphanumeric keyboard shall be provided. The keyboard shall allow labeling of channels, cues, presets, groups, palettes, effects, macros, curves and the show. An integral electronic keyboard shall be provided.

12. A row of softkeys shall be provided, which change function based on the selection and context of the console. These softkeys must be labeled via an adjacent LCD display that shows their current functions at all times.

13. Console software upgrades shall be made by the user via a USB port; changing internal components shall not be required. It shall be possible to install software updates in all consoles, processor units and remotes from one device over the network.

14. The console operating software shall be loaded into program execution memory from the internal hard drive when the console is powered. In the event of an uncontrolled shutdown, the console shall return to its last output state when power is restored.

15. Integrated dimmer monitoring features shall be provided to allow indication of dimming system status, error states and dimmer load monitoring. Adjustment of dimmer configuration shall also be supported. Communications with the dimming system shall utilize ANSI E1.17 2006 - Entertainment Technology - Architecture for Control Networks.

16. Integrated RDM device features shall be provided. The console shall discover and patch RDM device. The console shall monitor RDM devices to allow indication of RDM device online/offline status error states. The console shall be capable of changing settings of RDM devices such as changing the DMX start address. Communications with the RDM devices shall utilize ANSI E1.20 2006 – Remote Device Management.

17. Show data may be created and modified on a personal computer, using either Windows XP or Windows 7 operating systems, using a free offline editing application. The offline editor may also run natively on Macintosh platforms using OS X.

18. A computer, using either Windows XP or Windows 7, or a Macintosh (Intel only) running OS X using the offline software application shall be able to connect to a control system via the network and view or modify current show data in an independent display environment using an Eos Client Dongle. When connected without the dongle, the computer shall operate in Mirror Mode, with the device to be mirrored selectable by the user.

19. Synchronized backup shall be provided via another full console on the network or by use of a remote processor unit. The backup unit (either full console or rack mounted Remote Processor Unit (RPU) shall maintain synchronized playback with the master and shall take over control of the lighting system upon loss of communication with the master. Use of two RPUs to service and backup system output is also supported. Systems must offer this kind of instant backup from multiple sources.

20. A maximum of four users may access and interact with show data simultaneously. Each user shall have an individual workspace and channel partitioning shall be supported.

21. Mirror mode shall allow the console displays and operating modes to be mimicked on another connected device. Alternatively, the console may mirror another device.

22. The system must allow remote control from external devices as follows: Client software running on a PC connected to the network, a remote video interface with keyboard, a purpose-built wireless remote focus unit (Radio Focus Remote). Universal fader wings may be attached to any of these devices for local fader control.

23. The system shall support a Telephone remote control that allows basic functions to be controlled from a standard wireless phone producing touch-tone signals. This allows the use of a standard telephone for a low cost remote control. Systems must allow this function.

24. Network management tools shall be provided from the desk itself.

25. The system shall support up to 32 individual Time Code Event lists.

B. Controls and Playback

1. Manual Control and Programming Section

a) The console keyboard shall be grouped by function. Major groupings shall be record target functions, numeric keys, level assignment functions, display navigation functions and controls.

b) Non-intensity parameters may be set numerically or via the encoders. This control shall be fully interactive. In either case the current parameter value must be displayed on the console monitor and simultaneously on the console LCD display.

c) Only those parameters available for control in the active lighting system shall be displayed for control.

d) Lamp controls provide direct access to luminaire functions such as striking and dousing arc lamps and calibrating entire fixtures or individual mechanisms of fixtures, as provided by the luminaire manufacturer. User access to these features is normalized across all manufacturers for ease of use. Use of a “control channel” for accessing these functions shall not be required and systems requiring use of a control channel shall not be acceptable. Lamp control commands maybe staged, and channels which have been sent lamp ON commands shall be indicated in LIVE.

e) Fan functions shall be provided both via command line operation and through encoder controls.

f) Highlight shall be supported, with user definable highlight values. Lowlight conditions may be defined for selected, but not specified channels. Rem Dim command, at specific levels by channel, may be optionally and automatically called with the highlight command.

g) Fixtures with CMY or RBG color mixing may be set with direct CMY or RBG controls, as well as the Hue and Saturation encoders and/or color picker. Color may also be set directly to a gel match, via a graphic selection tool or from the command line.

h) The Virtual Media Server function shall allow the user to create layouts of devices, identified as pixel maps. Media content (images, movies, text and procedurally generated effects) may then be applied, manipulated and stored. Stock content is provided and the user may import his own imagery and animations. 40 Pixel maps, each with 12 layers, may be created.

i) Macros may be set to run as default. Default macros called manually shall post to the command line, but executed via cue lists shall run in the background. The user may override this behavior by defining the macro to always execute in the foreground or the background, regardless of the recall method.

2. Playback Section

    a) The master fader shall consist of a 60mm Master Fader pair with associated Load, Go and Stop/Back buttons. Additional playback faders may be configured via the virtual fader module or on the Universal Fader Wings.

    b) It shall be possible to instantaneously halt an active cue, back to the previous cue, manually override the intensity fade or manually override the entire fade.

    c) It shall be possible for a cue list to contribute to the background state or for the contents of each cue list to be withheld from such.

    d) The playback faders shall have the following associate controls:

        (1) Freeze, which halides the output of the fader

        (2) Step Effect, which stops the action of an effect.

        (3) Filter, to assign filter states to a fader

        (4) Go to Cue 0, to reset a cue list.

3. Fader Wings

    a) Submaster and fader support shall be provided via a 2X10 fader wing. Up to six of these wings may be connected to the desk via internal or external USB. Via paging, access is provided to all 300 faders, regardless of the number of physical wings attached.

    b) The 2x10 fader wing must include a full-length LCD for labeling and identification functions. Each fader must have two associated hard buttons for various operations.

    c) Up to 300 proportional, fully overlapping additive, effect or inhibitive submasters may be defined. Submasters shall have colored LEDs to indicate submaster status. Each submaster may have fade up, dwell and down fade times. Each has a bump and assert/channel select button. Submasters may be set to independent, exclusive, shielded and proportional/intensity master control.

    d) The submaster blind buffer shall be linked directly to live playback allowing live editing of live submaster content via the command line.

    e) It shall be possible to set submaster values directly from the command line.

    f) Up to 200 cue lists may be active concurrently.

4. Grand Master

    a) A dedicated grand master and blackout button are provided.

    b) The grand master shall proportionally fade intensity values to zero. Blackout shall send all intensity outputs to zero. Non- intensity outputs shall not be affected. No additional configuration shall be required to withhold non-intensity values from Grand Master and Blackout control.

C. Display Controls

1. Format shall change the view of selected displays.

2. It shall be possible for the user to choose which parameter categories or parameters (s)he wishes to display.

3. Flexichannel shall change which channels are viewed in selected displays, based on a variety of different criteria, including all, patched channels, show channels, active/moved channels, selected channels, manual channels, channels with discrete timing and user selectable channel views.

4. Expand shall extend the selected view sequentially across connected displays.

5. Time shall display discrete timing data.

6. Data shall display absolute values of referenced data.

D. Operating Modes

1. Live Modes

    a) Channel lists may be constructed using the +, - and Thru keys as well as the direct selects. Channel selection and deselection is fully interactive, regardless of the method used.

    b) Levels may be set with the keypad, level wheel and non-intensity encoders. “Selected” channels shall be those last addressed and under keypad control.

    c) Sneak shall be used to restore specified channels to background states, default values, or to send them to specified values, in user specified or default times.

    d) Selected channels may be set at a level or held to current values while all other channels are set to zero using Rem Dim. Toggling Rem Dim shall restore all unselected channels to original levels. The Rem Dim level shall be user definable via the command line or with a default setup value.

    e) Channels may be recorded into groups for fast recall of commonly used channels. 1000 groups shall be available. Groups shall store selection

order. The Offset function supports rapid creation of ordered groups, including reverse and random order.

f) Parameter settings may be stored to Intensity, Focus, Color and Beam Palettes and to Presets. All referenced data may be stored to whole numbers or to up to 99 decimal places between each whole number. It shall be possible to store 1000 presets and 1000 of each palette type.

g) Any collection of channel data, as determined by the use of “Record”, “Record Only, selective store commands and/or parameter filters may be stored to palettes (as appropriate to the type) and presets.

h) The following conditions may be placed on a channel or channel parameter to be included with a cue record action.

(1) Discrete fade time and/or delay

(2) Block flag

(3) Assert flag

(4) IFCB Filters, which may be set at a parameter level.

i) 999 cue lists may be stored. Cues may be recorded in any order. Up to 99 decimal cues may be inserted between any two whole number cues. Each cue may contain a maximum of twenty parts. Parameters may be automatically assigned to specific parts or assigned when the part is created.

j) It shall be possible to record cues and cue parts with the following information:

(1) Any collection of channel data, as determined by the use of “Record”, “Record Only” or selective store commands, combined with parameter filters.

(2) Cue Level timing and delays for Intensity Up, Intensity Down, Focus, Color and Beam.

(3) Follow or hang time

(4) Link instruction

(5) Loop value

(6) Block, Assert, Allfade, preheat and/or Mark Flag

(7) Curve

(8) Label and note

(9) Execute list to trigger other activity

k) Non-intensity channel parameters may be marked (preset), in two ways. Automark presets any parameters transitions in the cue just prior to intensity becoming active. Automark may be disabled on a cue or cue part basis, enabling a “live” move. Alternatively, non-intensity parameters may be marked to a specific cue with a single command instruction. It shall not be necessary to store these parameters directly into the cue in which the movement is to occur.

l) Any channel parameter may be stored with an effect instruction. These effects may contain relative offsets from current value, or absolute instructions. Effects may be progressive action or on/off states. Entry and exit behaviors shall modify the channel parameters activity when beginning and ending the effect.

m) Update may be used to selectively add modified parameter data quickly to that parameter’s current source. It shall be possible to update inactive record targets. It shall also be possible to update back to the current source of the move instruction without specifying that cue via Trace

n) Recall From quickly pulls specified data from record targets or other channels into the current view.

o) Copy To quickly copies selected data to specified channels or other record targets.

p) Address and channel check functions shall be provided.

q) Channel parameters may be “parked” at levels. Output addresses may also be parted directly. Parked levels shall not be added to any live record operations, nor may they be changed until the parked element is “unparked”. Address Park shall also be provided.

r) About shall provide detailed status of selected channels or specified record targets, including utilization information. About shall also access lamp control functions to calibrate devices, strike and douse arc sources. Use of a luminaire control channel for these functions shall not be acceptable.

s) 1000 snapshots may be stored which instantly recall specified front panel and display configurations.

t) Live data may be displayed in a summary view or detailed table orientation.

u) Undo shall be used to sequentially step back through manual operations, record, update and delete actions. Redo functions shall be provided. Multiple undo commands may be executed at once.

v) Home shall set selected channels non-intensity parameters to their default values. User definable home, on a per channel basis, shall be provided.

w) Move shall allow all show data to be moved from one record target to another.

2. Blind

a) The Blind display allows viewing and modification of all record targets without affecting stage levels.

b) Record target data may be displayed in a summary view, a detailed table orientation or a spreadsheet view, which allows quick data comparisons, move and replace with functions.

c) Changes made in blind displays shall be automatically stored.

d) Blind editing shall be possible for all record targets.

e) Selection of what parameter data to view for blind editing shall be user configurable.

3. Patch Display

a) Patch shall be used to display and modify the system control channels with their associated library data.

b) Each channel may be provided with a proportional patch level, preheat, curve, label, swap and invert functions.

c) Offset functions in patch shall allow selection of channel ranges and shall allow the user to establish a “custom” footprint for any device output.

d) Custom color wheels, color scrolls and gobo wheels shall be defined in patch. These devices shall be created with a simple table and graphical user interface supported by images of major manufacturers.

e) Copy to and Move functions shall be supported in patch.

f) RDM discovery and device monitoring shall be supported.

4. Setup/Browser

a) Setup shall access system, show and desk configurations.

b) The browser shall access show data storage, import, export, print to .pdf and clear functions, as well as show data utilities.

E. Interface Options

1. The console shall support a variety of local interfaces.

    a) AC input.

    b) USB (five ports for connecting devices such as an Alphanumeric keyboard, mouse, touch screens, USB Flash drive, fader wings, etc.) The desk shall provide four ports on the rear of the console and one on the control service itself.

    c) Ethernet (one port) 802.3af compliant

    d) Two DVI video output connectors, supporting a maximum of two DVI monitors at 1280x1024 resolution minimum.

    e) One VGA output connector.

    f) Up to six fader wings may be attached to the main console via internal or external USB connections. Systems must allow the addition of fader wings.

F. Accessories Required

1. iPFR and iRFR Preview (application for iPhone, iPod Touch and iPad units)

2. aRFR (application for Android devices)

3. 2x10 Universal Fader Wing

4. Ion Client Software Kit

5. One (1) 50’ Net Cable

6. One (1) 10’ Net Cable

7. Two (2) 19” ELO1928L LCD Touchscreen Monitors with DVI cable

G. Physical

1. All operator controls and console electronics for a standard system shall be housed in a single desktop console, not to exceed 19” wide, 19” deep, 5.5” high, weighing 20 pounds. Consoles must fit in a 19" rack.

2. Console power shall be 95 – 240V AC at 50 or 60Hz, supplied via a detachable power cord.

H. Provide One (1) ION 1000 or current equivalent.

XVII. ELECTRICAL DISTRIBUTION EQUIPMENT

A. All distribution equipment shall be furnished by the manufacturer of the dimming

equipment. Hanging and supporting hardware shall be furnished and installed under SECTION 11064 "THEATRE AND STAGE EQUIPMENT - RIGGING SYSTEMS".

B. Connector Strips shall be furnished and installed for the stage and catwalk where shown on the Drawings.

1. Each connector strip shall be complete with three-pole, 20A grounded stage pin connector type female receptacles.

2. Internal wiring shall be sized to circuit ampacity and shall be rated at 125°C.

3. Terminations shall be at one end using feed-through terminals individually labeled with corresponding circuit numbers.

a) 20 amp circuits shall use screwless tension clamp terminals listed for 20 – 8-gauge wire.

b) Terminals that place a screw directly on the wire are not acceptable.

4. Connector strips shall be supplied with appropriate brackets and hardware for mounting as shown on the Drawings.

a) Connector strips shall have junction brackets on 5’ centers.

b) Brackets shall be 1 ½” x .188” ASTM A 36 steel.

c) Hardware shall be ASTM A307 grade 5.

5. A low voltage distribution system shall be available to incorporate DMX, Ethernet or other protocols as specified in the connector strip. Connector strips shall utilize a voltage barrier to accommodate these systems. Low Voltage signals shall enter the connector strip via a strain relief or connector mounted in a separate low voltage terminal box at the specified end of the connector strip. Up to four low voltage cables shall be supported for each connector strip.

a) Connector strips with multiple DMX outputs from the same source shall use DMX pass through assemblies consisting of a 6” panel with the one DMX output connector, one DMX input (Pass Through) connector, one DMX pass through (Bypass) switch, and a label detailing the use of the pass-through assembly.

b) The bypass switch shall be used when no DMX devices are present at that location. When activated, the DMX pass through switch shall pass DMX directly through to the next DMX panel on the strip. The pass-through switch shall have a mechanical indicator to show the operator that it has or has not been engaged

6. Physical:

a) Connector strips shall be 6.25” H x 3.3” D and fabricated from 18-gauge galvanized steel and finished in black fine-texture powder coat

paint.

b) Covers shall be fabricated from 16-gauge galvanized steel.

c) Connector strips shall be available in any length specified in increments of 6” and shipped fully wired with all splicing hardware.

d) Connector outlets shall be spaced on 18” centers, or as otherwise specified or shown on the Drawings.

e) Outlets shall be mounted on individual 3” panels.

f) No external terminal boxes shall be required for connector strips with 28 or fewer circuits unless otherwise specified.

g) Circuits shall be labeled on the connector strip with 2” high lettering. Circuit labeling shall be located on the front side of the connector strip with white lettering on black background.

7. Connector strips shall support and include optional LED indicators to indicate the presence of power at each local circuit. The LED indicator shall be red in color and mounted in the connector strip directly below the outlet panel.

8. Connector Strips shall be Underwriter Laboratories (UL) LISTED. The connector strips shall be the Electronic Theatre Controls, Inc. 99 series or equal.

C. Plug-in Outlet Boxes shall be furnished and installed where shown on the Drawings.

1. Plug-in outlet boxes shall be complete with three-pole, 20A grounded stage pin connector type female receptacles attached to twenty-four (24) inch pigtails.

2. Pigtails shall be three-wire type “SOW” rubber jacketed cable sized for the maximum circuit ampacity.

3. Pigtails with 20-amp stage pin connectors shall be terminated using 12 gauge 4-way indent crimp (with inspection window) type where the wire is inserted and crimped directly in the socket.

4. Terminations for pigtail connectors shall utilize feed-through terminals individually labeled with corresponding circuit numbers. 20 amp circuits shall use screwless tension clamp terminals listed for 20 – 8-gauge wire. Terminals that place a screw directly on the wire are not acceptable.

5. Pigtail outlet boxes shall be supplied with appropriate brackets and hardware for mounting as shown on the Drawings.

a) Standard mounting options shall include pipe or wall mounting.

b) Brackets shall be made from ASTM A 36 steel.

c) Hardware shall be ASTM A307 grade 5.

6. A low voltage distribution system shall be available to incorporate DMX, Ethernet or other protocols as specified in the plug-in outlet box where shown on the Drawings.

    a) A voltage barrier shall be used to separate the low voltage wiring for the electrical circuits.

7. Physical:

    a) Plug-in outlet boxes shall be 6.25” H x 3.3” D and fabricated from 18-gauge galvanized steel and finished in black fine-texture powder coat paint.

    b) Covers shall be fabricated from 16-gauge galvanized steel.

    c) Plug-in outlet boxes shall be available in any length specified in increments of 3-inches with a maximum length of up to 3-feet.

    d) Pigtails and outlets shall be spaced on 4” centers, or as otherwise specified.

    e) Pigtail outlets shall be mounted on individual 3” panels.

    f) Circuits shall be labeled with 1.25” lettering. Circuit labeling shall be located on the front side of the plug-in outbox with white lettering on black background.

    g) Pigtail boxes shall support and include optional LED indicators to indicate the presence of power at each local circuit. The LED indicator shall be red in color and mounted in the cover plate directly below the circuit label for pigtail circuits.

8. Plug-in outlet boxes power distribution equipment shall be Underwriter Laboratories (UL) LISTED. Plug-in pigtail outlet boxes shall be the Electronic Theatre Controls, Inc. 9300 Series or equal (for surface or pipe mounting).

D. CONNECTOR STRIP—DISTRO shall be furnished and installed where shown on drawings

    1. Circuit wiring shall be supplied to the trough via an ETC Pantograph cable management system.

    2. Cable management shall utilize an ETC Prodigy pantograph that allows up to sixteen line-voltage circuits or a combination of line–voltage and up to two emergency circuits. Knockouts located 6” on-center are built into the raceway. The knockouts permit installation of houselights with canopy or stem mounts to attach directly to the raceway. Up to 50 pounds may be suspended between raceway supports.

    3. Pantograph cable management and houselight distribution is UL LISTED for

use with flat cable circuit distribution and fixture mounting as described above.

4. The load circuits and data wiring shall be fed to the distribution trough by one or more UL Listed Pantograph cable management systems that are specifically designed to interface with traditional stage distribution raceways. The pantograph shall allow the cable trays, feeder cable and data wiring to fold and store along the top of the connector strip without imposing a direct physical load on the connector strip.

5. The pantograph shall consist of a series of 18 ga. ventilated steel trays hinged to each other to allow the entire distance of travel required by the batten, up to 50'. The hinges and hinge attachment points shall be stiffened to prevent distortion of the pantograph.

6. The trays shall be connected to a moving trolley at the compression tube that allows relief as the system moves slightly from side to side during ascent/descent of the batten. At the bottom, the pantograph shall be attached to a hinge point above the houselight or distribution trough in a manner that imposes no additional physical load on those assemblies. The flat cable in the trays shall exit the pantograph and enter a termination box on the distro strip where all electrical connections shall be made.

7. The flat cable shall be UL LISTED.

8. The pantograph shall support a double-high/double wide stack of flat cable and shall allow the flat cable to bend at each joint within required NEC bending radii.

9. The trays shall hinge open/closed as the batten is lowered/raised and shall not impede the movement of the line set

10. The trays shall be sufficiently stiff to support themselves and the flat cable they carry. At no time shall the trays bow, warp, sag or twist whether or not under load of the flat cable.

11. Flat cable in the pantograph tray shall never heat in excess of the rated temperature maximum of the flat cable when all circuits within the tray are loaded at maximum electrical capacity.

12. It shall be possible to provide power for up to sixteen 20 amp circuits plus ground and data via each pantograph.

13. These cable management systems shall interface with the circuit distribution trough with standard mechanical and electrical hardware purpose designed for this assembly.

14. Hoisting systems utilizing cable management systems from third-party vendors shall be fully integrated into the hoisting system without additional custom hardware, changes to any part of the pantograph or changes to the QuickTouch controller.

15. Hoisting systems that do not fully integrate cable management in the hoisting system and controller shall not be acceptable for this installation

XVIII. THEATRICAL LIGHTING INSTRUMENT PACKAGE

A. Theatrical lighting instruments manufactured by Electronic Theatre Controls, Inc. are specified herein to provide a basis of quality. Other acceptable manufacturers are ALTMAN and STRAND LIGHTING, INC.

1. Followspot lighting instruments shall be manufactured by STRONG ENTERTAINMENT LIGHTING or LYCIAN.

B. Theatrical lighting instruments shall be capable of performing with tungsten halogen lamps or light emitting diodes (LED) as indicated herein with proper heat sink cooling. Phenolic materials shall be employed on the fixtures in order to protect the operator from potential burns.

C. Each theatrical lighting instrument shall be supplied with a malleable iron clamp to grip up to a two (2) inch ID pipe, a fixture yoke with locking clutch handle, and three (3) foot long SF2 leads in a fiberglass sleeve.

D. Minimum performance criterion for all theatrical lighting instruments shall be as herein specified. Each instrument shall be furnished with a three pole, grounded stage-pin male connector and safety cable. UL listing shall be required on all theatrical lighting instruments.

E. Ellipsoidal Reflector Spotlights (ERS):

1. The unit shall be constructed of rugged, die cast aluminum, free of burrs and pits, finished in black, high temperature epoxy paint. Tools shall not be required for either lamp alignment or cleaning the reflector or lens.

2. The ellipsoidal spotlights shall include:

a) Integral cable clamp for power leads.

b) Positive locking of lamp focus and independent lamp alignment controls.

c) High impact, thermally insulated knobs and shutter handles.

d) Reflector secured with shock mounts.

e) Lens secured with silicone shock mounts.

f) Shutter assembly shall allow for +/-25° rotation.

g) 20-gauge stainless steel shutters.

h) Insulated rear handle.

i) Interchangeable lens tubes for different field angles with Teflon guides for smooth tube movement.

j) Sturdy integral die cast gel frame holders with two accessory slots, and a top mounted, quick release gel frame retainer.

k) Rugged 3/16” x 1-1/4” steel yoke with two mounting positions allowing 300°+ rotation of the fixture within the yoke.

l) Positive locking, hand operated yoke clutch.

m) Slot with sliding cover for motorized pattern devices or optional iris.

3. The optical train shall combine a compact filament lamp with a precision molded borosilicate, ellipsoidal reflector and aspheric lens to produce an optimum cosine field. The unit shall provide, but not be limited to:

a) Molded borosilicate reflector with multiple dichroic layers.

b) 95% of visible light shall be reflected while 90% of infrared light as heat shall be transmitted through the reflector.

c) Low gate and beam temperature.

d) Sharp imaging through a three-plane shutter design.

e) Projector-quality, high contrast aspheric lens, with an anti- reflective coating to increase transmission.

4. The unit shall be precision engineered to use an HPL lamp to deliver an even, intense field with cosine distribution. The unit shall provide, but not be limited to:

a) 5, 10, 14, 19, 26, 36, 50, 70 and 90-degree field angles.

b) High-quality pattern imaging.

c) Sharp shutter cuts without halation.

d) Shutter warping and burnout in normal use shall be unacceptable.

e) Adjustable hard and soft beam edges.

f) The unit shall be capable of utilizing ETC Dimmer Doubling technology.

g) The unit shall be UL and cUL listed and so labeled.

h) 19, 26, 36, and 50 degree units shall have optional lens tubes available for precision, high-contrast imaging.

5. The high efficiency lamp shall be an HPL lamp, which shall consist of a compact tungsten filament contained in a krypton-filled quartz envelope. The lamp shall

mount axially within the reflector. The lamp base shall have an integral die cast aluminum heat sink that reduces seal temperature and ensures proper lamp alignment. The lamp socket shall be ATP 220 nickel gold plated.

6. The Theatrical Lighting Instruments shall be ETC Source 4 ELLIPSOIDAL.

7. This Contractor shall furnish the following types and quantities of ERS instruments with lamp, gel holder, C-clamp, and safety chain:

    a) Fourteen (14) 14-degree fixed focus ERS's, ETC 414.

    b) Twenty-two (22) 19-degree fixed focus ERS's, ETC 419.

    c) Thirty-eight (38) 26-degree fixed focus ERS's, ETC 426.

F. Fresnel Spotlights:

1. The unit shall be constructed of rugged, die cast aluminum, free of burrs and pits, finished in black, high temperature paint.

2. The unit shall be nominally 12.5" long x 9.5" wide and weigh 13.25 lbs. without the "C" clamp.

3. The fresnel spotlights shall include:

    a) 36" power lead with bare-ends.

    b) Integral cable clamp for power leads.

    c) Sealed housing with no light leaks.

    d) Zoom adjustment by means of a large, side-mounted knob with integral locking lever.

    e) Bottom-access lamp removal.

    f) Lamp socket access door shall use a tool-free ¼-turn closure device.

    g) Two accessory slots and a top mounted locking door for gel frames and beam control accessories.

        (1) Accessory slots shall be completely surrounded by a rugged metal housing for elimination of light leaks around gel frames and other beam control accessories.

        (2) Accessory slots shall be compatible with 7.5" beam control accessories, i.e. barn doors, gel frames, top hats, etc., such as used by Source Four PAR luminaires and other similarly-sized fixtures.

    h) Rugged steel yoke.

i) Adjustable yoke mounting position for variable fixture balance point.

j) Positive locking, hand operated yoke clutch.

k) Large, rugged handle on rear of fixture.

l) Integrated safety cable mounting ring.

m) Color frame.

4. Optical:

a) Units shall use a Fresnel lens and provide soft-edged, but well- defined beam shaping with a barn door attachment.

b) Luminaire shall provide a field angle zoom range of 20 degrees to 65 degrees.

c) The optical train shall utilize a compact filament lamp with a modified spherical reflector.

d) The luminaire shall output no less than 10,000 field lumens in full flood setting when fitted with 750W, 115V high out-put HPL lamp.

e) Luminaires producing less than 10,000 field lumens in full flood setting with a 750W lamp shall not be acceptable.

f) Reflector shall be molded borosilicate glass with multiple dichroic layers.

g) Reflector efficiency shall be a minimum of 93%.

h) Reflectors of pressed aluminum or other sheet metal construction shall not be acceptable.

5. The unit shall utilize only the HPL lamp, which shall consist of a compact tungsten filament contained in a krypton-filled quartz envelope. The lamp base shall have an integral die cast aluminum heat sink that reduces seal temperature and ensures proper lamp alignment. The lamp socket shall be ATP 220 nickel gold plated.

a) The lamp shall be pre-focused in relation to the reflector.

b) The lamp shall be removable from the bottom of the fixture for re-lamping.

6. The Theatrical Lighting Instruments shall be ETC Source 4 Fresnel units (7064A1001-0X).

7. This Contractor shall furnish the following types and quantities of FRESNEL

instruments with lamp, gel holder, C-clamp, and safety chain:

a) Twenty (20) ETC Source 4 Fresnel instruments.

G. Color Mixing Light Emitting Diode (LED) Wash Fixtures:

1. The lighting instruments (fixture) shall be a color-mixing high-intensity LED illuminator with DMX control of intensity and color. The fixtures shall be Desire D40 and D40 Studio as manufactured by Electronics Theatre Controls, Inc. or approved equal.

2. The LED lighting instrument shall be UL 1573 listed for stage and studio use and shall comply with USITT DMX-512 A standard.

3. The LED lighting instrument shall be contained in a rugged all-metal die- cast housing, free of burrs and pits and shall have a black powder coat finish. Power supply, cooling and electronics shall be integral to each unit.

4. The LED lighting instrument shall have two (2) easy-access slots for secondary lenses and other accessories. The slots shall be equipped with locking retaining clips.

5. The LED lighting instrument shall include, but not be limited to:

a) Theatrical –style hanging yoke.

b) 25 deg. secondary lens.

c) Five (5) foot power lead with grounded stage-pin connector.

d) Yoke with floor stand conversion feature.

e) PowerCon to PowerCon cables for fixture power wiring.

f) Multiple secondary lens options to include multiple angles in the following patterns:

(1) Linear

(2) Round

(3) Oblong

6. Light output shall be via a round aperture. Aperture and accessory slots shall accommodate standard 7.5” accessories such as used in other similar-sized fixtures. Accessories available as options shall include but not be limited to:

a) Gel/diffusion frames

b) Top hats

c) Barndoors

d) Egg crate louvers

e) Concentric ring louvers

f) Multiple secondary lensing options

7. Thermal:

a) The fixture shall be totally convection cooled, requiring no cooling fan. Fixtures which require an on-board cooling fan shall not be acceptable unless pre-approved.

b) The fixture shall utilize advanced thermal management systems to maintain LED life to an average of 70% intensity after 50,000 hours of use.

8. Thermal management shall include multiple temperature sensors within the housing to include:

a) LED array circuit board temperatures.

b) Temperature sensors placed on each individual LED color circuit.

c) Fixture ambient.

d) CPU.

9. Fixture user shall permit monitoring of temperature sensors via a legible LCD multi-line backlit display.

10. Fixtures that do not provide active thermal monitoring of LED circuits and other temperature readings shall not be acceptable.

a) The fixture shall operate in an ambient temperature range of - 20°C (-4°F) minimum, to 40° C (104°F) maximum ambient temperature.

11. Electrical:

a) The fixture shall be equipped with 100V to 240V 50/60 Hz internal power supply.

b) The fixture shall support power in and thru operation.

(1) Power in shall be via Neutrik® PowerCon™ input connector.

(2) Power thru shall be via Neutrik ® PowerCon ™ output connector.

(3) Fixture power wiring and accessory power cables shall be rated

to support linking of multiple fixtures up to the capacity of a 15A breaker.

c) The fixture requires power from non-dim source.

d) Power supply outputs shall have self-resetting current limiting protection.

e) Power supply shall have power factor correction.

12. LED Emitters:

a) The fixture shall contain a minimum of 5 different LED colors to provide color characteristics as hereinafter described.

b) All LEDs used in the fixture shall be high brightness and proven quality from established and reputable LED manufacturers.

(1) Fixture shall utilize Luxeon® Rebel™ LED emitters.

c) Manufacturer of LED emitters shall utilize an advanced production LED binning process to maintain color consistency.

d) LED emitters should be rated for nominal 50,000 hour LED life to 70% intensity.

e) All LED fixtures (100% of each lot) shall undergo a minimum eight-hour burn-in test during manufacturing.

13. Calibration – Fixtures shall be calibrated at factory the for achieve consistent color and intensity output between fixtures built at different times and/or from different LED lots or bins.

a) Calibration data shall be stored on the LED array as a permanent part of on-board operating system.

b) All arrays, including replacement arrays shall be calibrated to the same standard to insure consistency.

c) Fixtures not offering LED calibration shall not be acceptable.

14. Color – The fixture shall utilize a minimum of 40 LED emitters. The fixture shall be available in specialized LED arrays as outlined below:

a) DESIRE D40

(1) Red, Amber, Green, Cyan, Blue, Indigo and White LEDs in an array designed for broad spectrum color, light tints, and variable whites. This array shall be the Lustr+ array as manufactured by Electronic Theatre Controls, or approved equal.

b) Measured brightness of the Lustr+ array shall be greater than 2900 field lumens

(1) Red, Orange, Amber, Green, Cyan, Blue and Indigo LEDs in an array designed for broad spectrum deep colors. This array shall be the Vivid array as manufactured by Electronic Theatre Controls, or approved equal.

c) Measured brightness of the Vivid array shall be greater than 2500 field lumens.

(1) Red, Orange, Amber, Green and Indigo LEDs in an array designed for extra-high brightness output in red/warm end of the spectrum. This shall be the Fire array as manufactured by Electronic Theatre Controls, or approved equal.

d) Measured brightness of the Fire array shall be greater than 2500 field lumens.

(1) Red, Orange, Green, Cyan, Blue and Indigo LEDs in an array designed for extra-high brightness output in the blue/cool end of the spectrum. This shall be the Ice array as manufactured by Electronic Theatre Controls, or approved equal.

e) Measured brightness of the Ice array shall be greater than 1800 field lumens.

15. Dimming:

a) The LED system shall use 15-bit nonlinear scaling techniques for high-resolution dimming. At least four different dimming curve options shall be accessible at the fixture's User Interface.

(1) Incandescent

(2) Standard

(3) Linear

(4) Quick

b) Dimming curves shall be optimized for smooth dimming over longer timed fades.

c) The LED system shall be digitally driven using high-speed pulse width modulation (PWM).

d) LED control shall be compatible with broadcast equipment in the following ways:

(1) PWM control of LED levels shall be imperceptible to video cameras and related equipment.

(2) PWM rates shall be adjustable by the user at the fixture if necessary to avoid any visible interference to video cameras and related equipment.

16. Control and User Interface:

a) The fixture shall be USITT DMX 512A-compatible via In and Thru 5-pin XLR connectors.

b) The fixture shall be compatible with the ANSI RDM E1.20 standard.

(1) All fixture functions shall accessible via RDM protocol for modification from suitably equipped control console.

(2) Temperature sensors within the luminaire shall be viewable in real time via RDM.

(3) Fixtures not offering RDM compatibility, feature set access or temperature monitoring via RDM shall not be compatible.

c) The fixture shall be equipped with multi-line LCD display for easy-to-read status reports and configuration changes.

d) The fixture shall be equipped with a six-button user-interface.

e) The fixture shall offer multiple DMX input profile options to include:

(1) RGB – control of all individual LED colors via a three- channel profile.

f) Red, Green, Blue.

(1) HIS – control of all individual LED colors via a three- channel profile.

g) Hue, Saturation, and Intensity.

(1) HSIC – control of all LED colors via a four-channel profile.

h) Hue, Saturation, Intensity and Color Point.

i) Color point provides variable color temperature settings.

(1) Direct – control of each individual color channel via an independent channel.

(2) A variable-rate strobe channel shall be provided.

j) The fixture shall offer three output setting:

(1) Boost mode - powers LEDs at maximum intensity and provides no compensation against LED ‘droop’ or intensity loss.

(2) Regulated mode – slightly restricts maximum LED intensity levels to compensate against LED droop.

(3) Protected mode – further restricts maximum LED intensity levels to compensate against LED droop and offer color consistency at highest permissible ambient temperatures (40C).

(4) Fixtures that do not provide regulated and protected operation modes are not acceptable.

k) The fixture shall offer additional user-definable options to including but not limited to:

(1) Display time out options.

(2) Loss of data behavior options.

(3) White point settings.

(4) Red-shift option for tungsten dimming emulation.

l) The fixture shall offer five Quick Set-Ups to allow user to rapidly select different combinations of the numerous user options based on the desired usage situation, to include:

(1) General – for most situations.

(2) Stage – when emulating incandescent fixtures is desired.

(3) High Impact – when maximum output and effect is desired.

(4) XT Arch – when color consistency and architectural characteristics are desired.

(5) Studio - when DMX or stand-alone of white light output is required with intensity, color temperature and color tint control parameters.

m) The fixture shall offer stand-alone functionality eliminating the need for a console.

(1) Fixture shall ship with 24 preset colors accessible as a stand-alone feature.

(2) Fixture shall ship with 12 Sequences accessible as a stand-alone feature.

(3) Each color and sequence can be modified by the end user.

(4) Fixtures can be linked together with standard DMX cables and controlled from designated master fixture.

n) Up to 32 fixtures may be linked.

(1) Fixtures in a stand-alone state shall restore to the settings present prior to power cycling, eliminating the need for reprogramming.

(2) Fixtures without stand-alone operation features described in a, b, c, d, and e shall not be acceptable.

17. The Theatrical Lighting Instruments shall be ETC D40 LED lighting instruments. This Contractor shall furnish the following types and quantities of LED lighting instruments with C-clamp, safety chain, full lens sets, 5' DMX cables, and 10' PowerCon Jumper Cables:

a) Twenty-four (24) Desire D40™.

H. 2.5 Watt Color Mixing LED Fixtures (Cyc Lights):

1. The LED lighting instruments (fixture) shall be a color-mixing LED fixture with DMX control of intensity as well as color changing. The fixture shall be a Vivid as manufactured by Electronics Theatre Controls, Inc. or approved equal.

2. The LED lighting instrument shall be ETL listed to UL 1573 and shall comply with USITT DMX-512 A standard.

3. The LED lighting instrument shall be contained in a rugged all-metal die- cast housing, free of burrs and pits and shall have a black powder coat finish. Power supply, cooling and electronics shall be integral to each unit.

4. The LED lighting instrument shall utilize advanced thermal management systems for long LED life and shall be designed to transfer heat from the LED board to the outside environment.

5. The LED lighting instrument shall have easy-access slots for secondary lenses and varied beam spreads. The slots shall be equipped with locking retaining clips.

6. The LED lighting instrument shall be provided with:

a) 1/2" Mounting bolts on each end.

b) Five (5) foot power lead with grounded stage-pin connector.

c) Yoke, c-clamp, and 25’ DMX cable

d) Lens set of 2 lenses

7. The unit shall be:

a) 21.5 inches (547mm) long by 7.1 inches (180mm) high by 6.5 inches (165mm) deep with a weight of 20 lbs (9.1 kg) not including mounting hardware.

8. Electrical:

a) The fixture shall be equipped with 100V to 240V 50/60 Hz internal power supply.

b) The fixture shall receive power via Neutrik® PowerCon™ input connector.

c) The fixture requires power from non-dim source.

d) Power/data supply outputs shall have current limiting protection.

e) Power/data supply shall provide miswiring protection.

f) Power/data supply shall have power factor correction.

g) Power/data supply shall be UL listed for Class 1 or Class 2 wiring.

9. LED Emitters:

a) The fixture shall utilize red, red-orange, amber, green, cyan, blue, and indigo emitters for maximum spectral output.

b) All LEDs used in the LED fixture shall be high brightness and proven quality from established and reputable LED manufacturers.

c) Manufacturer of LED systems shall utilize an advanced production LED binning process to maintain color consistency.

d) LED emitters should be rated for nominal 50,000 hour LED life.

e) Fixture shall utilize the ETC’s Vivid-R 2.5W Rebel LED emitters.

f) All LED fixtures (100% of each lot) shall undergo a minimum eight-hour burn-in test during manufacturing.

10. Color:

a) Each 11” cell shall contain 40 LEDs with seven (7) different colors of LED emitters for a spectral output using the ETC x7 Color System™ 7-color array.

b) The fixture shall be optimized for excellent pastel and saturated colors.

c) The LED system shall be capable of at least 15-bit control of each color level in each cell for greater than 1 billion possible color combinations.

d) The fixture shall interact seamlessly with conventional sources.

e) The fixture shall render light tints and skin tones similar to tungsten-sourced fixtures.

11. Control:

a) Each 11” cell of every fixture shall have the capability to be set to a unique and individual address.

12. 21” fixture provides 2 independently controlled cells.

a) The fixture shall be DMX 512 compatible via In and Thru 5-pin XLR connectors.

b) The LED system shall be digitally driven using high-speed pulse width modulation (PWM).

c) LED control shall be compatible to broadcast equipment.

(1) PWM control of LED levels shall be imperceptible to video cameras and related equipment.

d) Each 11” cell of every fixture shall provide 8 channel control (7 color plus intensity).

(1) An intensity channel shall be utilized for each cell to minimize color shift during dimming.

e) The LED system shall use 15-bit nonlinear scaling techniques for high-resolution dimming.

f) Dimming curves shall be optimized for smooth dimming at low intensities and over longer timed fades.

13. The Theatrical Lighting Instruments shall be ETC Selador Vivid-R LED lighting instruments. This Contractor shall furnish the following types and quantities of LED lighting instruments with hanging hardware, safety chains, and 25’ DMX cables:

a) Eighteen (18) 21” Selador Vivid-R LED lighting instruments.

I. Followspots:

1. The followspot unit frame and enclosure shall be constructed of formed cold

rolled steel and sturdy aluminum extrusions, free of burrs and protected by a black powder coat finish.

a) Handles shall be provided to facilitate smooth operation and to lift the unit.

b) The unit shall be mounted on a stable, folding three-point floor stand.

c) Mounting shall incorporate the following design features:

(1) Unobstructed access;

(2) Easy height adjustments;

(3) Horizontal Pan and Vertical Tilt Control Levers.

d) The Power Supply shall be separate from the followspot in order to maintain quiet and efficient cooling and to facilitate maintenance, repair or replacement of the Power Supply. Follwspots containing internal power supplies shall not be acceptable.

e) A sliding panel shall provide access to lenses without the use of tools.

f) Weight of Head unit shall not exceed 37 pounds.

g) Length of head unit with color changing boomerang shall not exceed 41”.

2. Controls:

a) The lamp housing shall, as a minimum incorporate the following:

(1) Quiet forced-air cooling by internally wired blower.

(2) Remote ON/OFF fan control.

(3) Drop-down single ended lamp holder to permit bulb replacement without the use of hand tools.

(4) Bulb positioning controls.

b) The body of the unit shall, as minimum incorporate the following:

(1) Optical dimmer iris mechanism for smooth manual dimming.

(2) Four shutters mounted on two planes, for both vertical and horizontal masking

(3) Drop-in nichrome steel Iris and Gobo holder.

(4) Zoom focus controls with calibrations silk screened on

followspot body.

c) With the iris fully open the followspot shall be capable of producing a continuous range of field angles from 8.0 degrees in spot to 22 degrees in flood.

d) At any field angle the beam shall be adjustable between soft and sharp edges.

e) The front of the unit shall house a five (5) color, self-canceling boomerang with color filters.

3. Optical:

a) The unit's optical train shall consist of:

(1) Socket mounted 700 watt single-ended metal halide lamp.

(2) Fixed optical quality glass reflector and double condenser lens.

(3) Variable focus lens system utilizing Optical-quality glass.

(4) Iris/Gobo holder, and shutters for beam shaping control.

(5) Five color boomerang.

b) The zoom focus shall increase light intensity as it decreases the spot diameter.

c) The light Color Temperature shall be 6,000 ° K with Philips MSD 700 (3,300-hour lamp)

4. Electrical:

a) Metal halide lamp system input shall be 110-120V.AC, 50/60 Hertz, single phase.

b) Power Supply shall be separate from spotlight unit and easily interchanged.

c) A double microswitch interlock shall be provided for safe lamp replacement.

5. Performance:

a) Adjusted for flat field (approximately 70%) the unit shall produce a continuous range of illumination from 270,000 beam candlepower in Flood focus to 1,123,000 beam candlepower in Spot focus.

b) The Field diameter at a 60-foot throw shall be continuously adjustable from 15.8 feet in Flood focus to 6.3 feet in Spot focus. With full iris the

Field diameter in spot focus shall be 15”.

6. This Contractor shall furnish the following followspot lighting instruments complete with Lamp, Iris, Gobo Holder, Color Changer, Stand and all necessary accessories.

    a) Two (2) STRONG LIGHTING Canto 700 followspots (10707080).

Part 3 - Execution

I. INSTALLATION

A. All wiring for the house and stage lighting control system shall be run in conduit and flexible multi-conductor cables as hereinbefore specified. All junction box covers shall be identified as hereinbefore specified. All conduit, device mounting boxes, junction boxes, and enclosures shall be securely fastened with appropriate fittings to ensure positive ground throughout the entire system.

B. This Contractor shall furnish and install all wiring and make all final connections as indicated in the system manufacturer’s shop drawings and standard installation documents. Splices for dimming circuits shall be made only in junction boxes.

C. All wiring shall be checked and tested by this Contractor to ensure the system is free from grounds, opens, and shorts.

D. It shall be the responsibility of the Contractor performing the work in this section to coordinate with the stage rigging system Contractor for the proper installation and operation of the stage lighting, wiring devices, cables, supports, etc.

E. All work shall be under the supervision of a field engineering technician, accredited by the system manufacturer. It shall be the responsibility of this technician to check and inspect the installation to the Owner's and Architect/Engineer's satisfaction. This technician shall perform the initial programming of the system with direction and coordination with the Owner.

II. SYSTEMS INTERFACE AND PROGRAMMING MODIFICATIONS

A. A Fire Alarm Interface module shall be furnished and installed by this Contractor. Upon activation of the buildings Fire Alarm and Detection System the auditorium house lights, including emergency lights controlled by the dimmer system, shall be programmed to automatically be restored to full brightness. Refer to Specifications Section 16610, Fire Alarm and Detection System.

B. The Auditorium House Lights shall be programmed so that the dimmable house lighting loads will not exceed 90% of their full dimmable output during normal operations. A time clock function shall bring all dimmable tungsten halogen and incandescent house lighting loads to full 100% output for one hour during each one week cycle. The cycle shall occur on Wednesdays at 3:00 A.M., unless otherwise directed by the Owner. This cycle will help to extend the life of the tungsten halogen and incandescent lamps and burn off any carbon buildup on the tungsten halogen lamp envelope.

III. PERSONNEL TRAINING

A. A field engineering technician, accredited by the system manufacturer shall provide a minimum of eight (8) hours of training for the Owner's operating personnel on the proper operation and troubleshooting of the lighting control system equipment.

IV. OPERATING AND MAINTENANCE INSTRUCTIONS

A. At the completion of the installation, the manufacturer shall furnish four (4) final sets of "as-built" drawings as well as manuals of instruction as to the proper operation and maintenance of the lighting control system. Formal turn-on and instruction shall be provided to the Owner's officially designated representative within fourteen (14) days of a written request by the Owner.

B. This Contractor shall furnish the Owner's officially designated representative(s) with a minimum of eight (8) hours of on-the-job instructions in the operation, maintenance, and diagnostic testing of the system. (This shall not be part of the system turn-on specified above.) This Contractor shall also furnish the Architect/Engineer four (4) bound copies of complete operating and maintenance instruction manuals of the lighting control system including circuit diagrams and all other information necessary for proper operation and service maintenance.

V. SYSTEM TEST

A. This Contractor shall conduct an operating test of the complete system. The system shall test free from grounds, shorts, and other faults. All connections shall be thoroughly checked for mechanical and electrical connections. All lighting control system equipment shall be demonstrated to operate in accordance with the requirements set forth in these Specifications and as shown on the Drawings.

B. This Contractor shall perform all tests in the presence of the Architect/Engineer. This Contractor shall furnish all personnel and test instruments for use in the tests.

VI. WARRANTY

A. This Contractor shall deliver the work in a first-class operating condition in every respect.

B. This Contractor shall warrant that the material, equipment, and workmanship furnished shall be entirely free from defects. Any material, equipment, or workmanship in which defects may develop before or during the warranty period shall be repaired or replaced at the Contractor's own expense. Refer to SECTION 01740 for the start of the warranty period. The Contractor shall further warrant that all material, equipment, and workmanship used in the installation, but not specifically mentioned in the Drawings and Specifications, is the best of their respective kinds and that the construction and installation was performed in accordance with the best accepted standard practices in all details.

C. The lighting control system manufacturer shall be prepared to offer a service contract for the maintenance of the system after the warranty period.

END OF SECTION

Part 1 - General

I. REQUIREMENTS

A. The general provisions of the Contract, including General and Supplementary Conditions and General Requirements, apply to the work specified in this Section.

II. SCOPE

A. The work covered under this Section shall include the materials and equipment necessary for this Contractor to furnish and install a performance lighting control system(s), wiring devices and performance lighting instruments herein specified for the middle school stage. It shall also include the services of qualified field engineer/technicians regularly employed by the manufacturer of the system(s) who shall review the installation(s) to ensure its proper operation and provide Owner training.

B. The Middle School Stage Performance Lighting Systems and Controls shall be furnished by a factory authorized Theatrical Contractor certified to design, program and service the systems. The Theatrical Contractor shall be responsible for coordination between the electrical installation and other trades installing theatrical equipment and for control terminations, system startup, system training, and warranty repair. A Theatrical Contractor is defined as a dealer who regularly engages in the sale and installation of theatrical supplies and equipment. The Theatrical Contractor must show evidence of successfully furnishing theatrical systems specified for at least five (5) years.

C. This Contractor shall furnish and install all necessary equipment as hereinafter detailed for a complete and functional performance lighting control system(s) including the theatrical lighting instruments. Although not every component is called out in every detail, it shall be the responsibility of the manufacturer providing the system to assure that the intended function is furnished.

D. The system specified herein shall consist of a dimmer-per-circuit high density dimming system equipment panel, performance lighting control console, network based signal distribution system, distribution equipment, performance lighting instruments, and all required interconnecting wiring.

E. This Contractor shall furnish and install in accordance with the lighting control manufacturer's instructions, all conduits, wiring, and outlet boxes required for the erection and operation of the complete system(s) as herein specified and as shown on the Drawings.

F. The performance lighting control system shall be supplied as a single integral unit with all dimmer modules, control circuits, circuit breakers, and the like factory wired. Field wiring shall consist of connecting input feeders, dimmer circuits, and remote control wiring to the distribution devices and control console.

G. It is the intention of this specification section that the entire Middle School Stage performance lighting control system be available to all bidders and not “Packaged or Bundled” with any other lighting systems or equipment.

III. QUALITY ASSURANCE

A. The contractor shall furnish submittals for all components of the performance lighting and lighting control system(s) in accordance with SECTION 16010 of these Specifications. The submittals should include the manufacturers working drawings and shall include, but not be limited to the following:

1. Manufacturer's catalog data for all lighting instruments, equipment, and components that shall include all technical data to demonstrate conformance with these Specifications.

2. Complete physical drawings of all items of equipment showing dimensions, metal gauges, etc.

3. Complete load schedules which shall clearly indicate actual connected loads and control channel assignment (where applicable), cross- reference of internal equipment identifications to circuit numbers shown on the Drawings, and all other scheduled information which shall relate the equipment to the project requirements.

4. Complete internal and interconnection wiring diagrams showing number, size, and types of conductors between equipment and from equipment to loads, and feeder quantity and sizes.

B. The lighting control system equipment specified herein shall be the sole responsibility of a single manufacturer. The manufacturer shall have been producing theatrical lighting and SCR type lighting control systems for at least fifteen (15) years.

C. All work shall be in accordance with good engineering practices. All equipment for this system shall be listed by Underwriter's Laboratories, Inc. (UL), bear the UL label, and shall be installed in accordance with all requirements of the National Electrical Code (NEC), state and local codes, and these Specifications.

D. The entire performance lighting control system shall be completely factory assembled and tested under load conditions prior to shipment of the system.

IV. QUALIFICATIONS

A. The Contractor and the Theatrical Contractor/Distributor shall be required to furnish satisfactory proof of their competence as evidenced by successfully completed previous contracts where control equipment of this nature has been specified.

B. The Contractor is encouraged to visit the site, shall become familiar with the Drawings outlining this work, and shall become completely familiar with the various items of

equipment being furnished under other Divisions of these Specifications related to this work. The Contractor shall make all necessary investigations relative to the conditions that may be encountered on this project.

V. SPARE PARTS

A. This Contractor shall furnish to the Owner spare parts as follows. Spare parts shall be furnished prior to the installation of the system.

1. One (1) D20AFTR dimmer module.

2. One (1) spare dimmer rack processor. (Control Modules) with Smartlink Processor

B. This Contractor shall furnish to the Owner, at the completion of the project, 20% (minimum of two) spare lamps for each type and wattage of lamps used in the theatrical lighting instruments.

Part 2 - Products

I. MANUFACTURERS

A. The house and stage lighting control system as shown on the Drawings and herein specified shall be as manufactured by ELECTRONIC THEATRE CONTROLS, INC. (ETC) [Sensor3™ System] as listed or the equivalent as manufactured by STRAND LIGHTING, INC. [C21 System] which must meet all of the requirements of these Specifications. The system shall utilize the manufacturer's standard products and components with modifications as required meeting the construction and performance requirements of this section.

B. The theatrical lighting instruments as shown on the drawings and herein specified shall be as manufactured by ELECTRONIC THEATER CONTROLS INC. (ETC), and STRONG ENTERTAINMENT LIGHTING (followspots) as listed or the equivalents as manufactured by STRAND LIGHTING, INC., ALTMAN Canto, or LYCIAN which must meet all of the construction and performance requirements of these specifications.

II. DIMMING SYSTEM EQUIPMENT RACK

A. This Contractor shall furnish and install where shown on the Drawings, a house and stage lighting dimming system equipment rack(s). The racks shall be the ETC Sensor3 SR3-24 (24 module) Advanced Features dimmer rack.

B. Dimmer Rack Electrical:

1. The dimming system equipment rack shall be suitable for operation at 120/208 volt, three phase, four wire, + ground, sixty hertz, 400 amp, and have busing rated for 100% continuous duty, and suitable lugs for a single point connection. Sensor racks shall automatically compensate for frequency variations during operation. Standard SCCR fault current protection shall be 100,000A. The rack

shall have a bus kit provided by the manufacturer to allow adjacent racks to be powered by a single feed. Racks shall be UL listed with appropriate factory applied labels.

2. Load and neutral terminals shall be sized to accept up to three (3) sets of 500 kcmil conductors or other sizes and/or quantities as shown on the Drawings.

3. Load terminals shall be located at the front of the wiring cavity. Front access racks having terminals located at the back of the rack or on the side near the back of the rack such that adjacent load cabling may block terminal access shall not be acceptable.

C. Dimmer Rack Electronics:

1. Power control electronics (CEM3) shall be contained in a single module that must be plug-in capable without use of tools.

2. All data and power input for CEM3 control electronics shall be located on a separately removable/pluggable termination connector on the backplane such that backplane can be replaced without removal and discrete secondary conductor terminations. Dimming systems that require discrete termination of DMX, Ethernet, power input, and dimmer control output directly on terminals on the control module or pluggable backplane shall not be permitted.

3. The power controller shall directly support the following network protocols:

   a) Net3 protocol suite including ANSI E1.31 Streaming ACN (sACN)

   b) b. ANSI E1.17 Architecture for Control Networks (ACN)

4. Systems must support the above listed industry standard ACN protocols for Ethernet setup, control and feedback integrated directly between the power system and control system.

5. The power controller shall directly support 2 ports of control input using ANSI E1.11 USITT DMX512-A.

6. Dimming control signals must be sent between control module and dimmer/power modules using flat ribbon cables.

7. System must provide an optional low voltage connection to maintain power of control electronics through brown out, instantaneous, and sustained power outages.

8. Control electronics shall be housed in a formed steel body with cast- aluminum face panel.

D. Physical:

1. The Sensor3 dimmer rack shall be a free-standing, dead-front switchboard, substantially framed and enclosed with 16 gauge, formed steel panels. All rack components shall be properly treated, primed and finished. Exterior surfaces shall be finished in fine-texture, scratch- resistant, gray epoxy paint. Removable top and bottom panels shall facilitate conduit termination on the rack.

2. Rack components shall be designed for easy removal and installation so that the dimming system equipment rack is completely open and empty during field wiring. Rear access to the rack for installation or servicing shall not be required. Racks shall be designed for front access to allow back-to-back, back-to-wall or side-by-side installation.

3. Racks shall be designed to allow easy insertion and removal of all modules without the use of tools. Supports shall be provided for precise alignment of dimmer modules into power and signal connector blocks. With modules removed, racks must provide clear front access to all load, neutral and control terminations.

4. Module spaces shall be mechanically keyed to accept only the 3kW or below, 5kW, or 10kW module specified for that space. The rack shall be configurable to accept mixed dimmer types and sizes throughout the rack.

5. Each rack shall provide a lockable full-height door containing an integral electrostatic air filter that shall be removable for easy cleaning. A single low-noise fan shall be located at the top of each rack. Design of the rack and dimmer modules shall draw all cool air intake air through the integral electrostatic air filter at the front of the rack, discretely through each module housing and directly out the top of the rack such that exhausted hot air from adjacent modules does not heat the module(s) above, below, or to the side of each other.

6. The fan shall maintain the temperature of all components at proper operating levels with dimmers under full load, provided the ambient temperature of the dimmer room does not exceed 40°C/104°F. Dimmer racks that do not employ both locking doors and electrostatic air filters shall not be acceptable.

7. The fan shall turn on whenever any dimmer in the system is activated. In the event of an over-temperature condition, only the affected dimmer module(s) shall shut down and a message shall appear on the control module LCD. The fan shall remain on during thermal shutdown of individual dimmer modules. Systems must include over-temperature sensing and preventative thermal shutdown.

8. A fan sensor shall be provided. In the event of momentary fan failure, error message will be displayed and sent remotely over Ethernet to optional logging systems. Systems must provide optional system event logging.

9. If the ambient room temperature drops below 0°C/32°F or rises above 40°C/104°F, a warning shall appear on the dimmer rack LCD. If the temperature rises above 46°C/115°F, the rack shall shut down until the condition is corrected.

10. A 3 x 0.5-inch LED status indicator (beacon) shall be mounted in the rack door. The beacon shall be visible throughout a wide viewing angle. In normal operating conditions, this LED is illuminated. If the rack's control module senses an error condition, the beacon shall flash until the error is corrected. An optional indicator shall be available for remote locations. Racks must have external means of visually showing that an error is present.

E. Provide one (1) SR3AF 24 Advanced Features Dimmer racks.

1. Provide an engraved nameplate on the front face of the dimmer rack in a suitable location. The nameplate shall be lettered HOUSE AND STAGE LIGHTING THEATRICAL DIMMING RACK

III. POWER CONTROL ELECTRONICS

A. The dimmer rack electronics shall be contained in one plug-in CEM3 Power Controller. Each power controller shall plug into the dimming cabinet with no need for tools or discrete wire connections. A simple user interface shall be provided for group configuration, testing and diagnostics. Power control shall be UL/cUL Listed and CE Marked. Removal of Power and Dimming Control electronics must be a tool free process.

1. The control electronics shall be contained in one plug-in module, housed in a formed steel body with cast-aluminum face panel, and self-retaining ejection handles to ease removal from the rack.

2. The power control shall automatically compensate for frequency variations during operation.

B. Power Control Interface:

1. A backlit eight-line by 20-character graphical LCD shall be provided for system configuration, live control, and status display.

2. The following functional features shall be available in power control to reduce setup and tech times:

a) Full number pad shall be provided for quick access to dimmers. Power Control must provide 0-9 number pad and logic keys for AND, THRU, and AT for fast access, selection, and control of circuit/dimmer number.

b) Power control shall provide NEXT and LAST buttons to progress through circuits/dimmers during dimmer check operations such that

only a single circuit is brought on to a level at a time during pre-show lighting checks for lamp burnouts.

c) Shortcut buttons for Setup, About, and live control shall be provided for separation of functionality such that a user intending to check status or settings does not accidentally render their system unusable. These buttons shall also serve to reduce maximum time to access any feature or setting on a single dimmer, range of dimmers, or entire rack.

3. The front panel shall have five status LED indicators: power, network activity, DMX A, DMX B, and panic state.

4. Power control must include the above buttons and features.

C. Control Signal and Communications:

1. The power control shall be provided with an Ethernet control signal input. This input shall be fully configurable with a range of patching and priority programming capabilities. The Ethernet signal shall supply seamless integration between the dimmer racks and both the entertainment and architectural lighting control systems. The Ethernet signal shall also enable remote configuration, playback, file storage and monitoring features on a personal computer on the network. Dimming systems that require Ethernet to DMX translation devices for control of critical show lighting introduce a potential failure point and shall not be acceptable.

2. All data and power input for CEM3 control electronics shall be located on a separately removable/pluggable termination connector on the backplane such that the backplane can be replaced without removal and discrete secondary conductor terminations. Systems must support tool- less and not require removal of wires connected directly to the control electronics.

3. DMX connections shall be available with option for pluggable screw or punch-down type terminal. Systems must allow this option to support both DMX over CAT5 and multi-strand conductors.

4. Ethernet connection shall be available via standard Cat5 RJ45 connection. System requiring punch down direct to rack or controller cannot be Cat5 system certified and shall not be acceptable.

5. Dimming systems that require discrete termination of DMX, Ethernet, power input, and dimmer control output directly on terminals on the power control or pluggable backplane shall not be acceptable.

6. The following options shall be provided to backup all controller setup UL924 Panic configuration, and recorded presets:

a) Automatic backup in non-volatile backplane memory.

b) Automatic backup in non-volatile Controller memory.

c) USB storage device pluggable on the controller face panel.

d) Data shall also be transferable to and from library storage on a personal computer on a per-rack basis.

7. The power controller shall directly support the following network protocols:

a) Net3 protocol suite including ANSI E1.31 Streaming ACN (sACN).

b) ANSI E1.17 Architecture for Control Networks (ACN).

8. The power control shall directly support two (2) optically isolated ports of ANSI E1.11 USITT DMX512-A for control input. Minimum 2,500V of optical isolation shall be provided between the DMX512 inputs and the electronics. Systems having optical isolation on a prewired factory plug-in device shall not be acceptable.

9. Systems must support the above listed industry standard ACN protocols for Ethernet setup, control, and feedback integrated directly between the power system and control system.

D. Power Control Features

1. Power Control shall have a dimmer update rate better than 16ms (60HZ) or 20 ms (50 Hz) average. Dimmer outputs shall exhibit no oscillating or hunting for levels. Dimmers with the same choke type set to the same level shall output within ±1V of each other, regardless of phase or input voltage. Power control shall maintain proper dimming performance for all line feed frequencies from 47-53Hz and 57-63Hz without flicker or misfire. Shifts in frequencies up to 3 Hz shall not result in flicker or loss of dimming timing. Systems must perform to these frequency tolerances and shifts. Dimmer output levels shall be regulated for incoming line voltages. The regulation shall adjust for both RMS voltage changes and deformations in the incoming AC waveform. The power control shall monitor and adjust each dimmer's output to maintain a constant power to the load. Regulation shall maintain the desired output voltage ±1V for the entire operating range (91-139V and 181-259 VACS) with the exception that the maximum output will be no greater than the line voltage minus dimmer insulation loss. The regulation shall compensate for dips and anomalies in the AC waveform on a dimmer by dimmer basis. There shall be no interaction between dimmers in the system or any other equipment. The output shall be nominally regulated to 115V/230V appropriate for the market, but shall be field adjustable on a dimmer by dimmer basis to allow for varying cable length. Systems must maintain performance to the above stated voltage regulation. Power control shall support a rack filled with different types and sizes of dimmer modules. The properties of each dimmer shall be configurable, including

dimmer name, output curve, dimmer firing mode, and scale voltage values.

a) The output curve selections shall include IES Modified Square, Square, Linear, Modified Linear and a Sensor v2.0 output curve. The power control shall also have the capability of storing up to three custom curves as well as an adjustable preheat level, assignable on a per-dimmer basis.

b) The dimmer firing modes shall include: Normal (Dimmed), Dimmer Doubled, Switched (unregulated on/off with adjustable on-at level), Fluorescent with adjustable threshold, and Off.

c) Dimmers set as Dimmer Doubled shall allow a single dimmer to set two different levels on one dimmer circuit by splitting the AC power into positive and negative half cycles with no resultant DC line current.

d) Power Control must support all above listed adjustments to dimmers on a per circuit basis.

2. Controller shall support two (2) methods of automatic configuration during controller replacement in a rack.

a) Use backplane configuration- The backplane shall retain full setup and preset data in. In this recovery mode, when a new power control is inserted, the controller shall automatically come on-line fully functional without any manual intervention.

b) Use controller configuration- Override backplane configuration such that replacement modules automatically use the configuration resident in nonvolatile memory of the power control.

3. Controller shall be capable of changing rack setup for multiple shows for an entire system with a single update command from a remote PC. Show setup shall be saved in XML format and capable of being saved/uploaded from both USB and remote PC.

4. In the event of data loss each rack shall maintain the last level for a user programmable time of zero to five minutes or indefinitely, or may be programmed to fade out or to play a specific preset. Systems must offer this feature.

5. The power control shall contain diagnostic routines to allow the user to test and troubleshoot the system. The power control shall also contain a Test/Bypass switch to turn all dimmers on to full for testing. This switch shall bypass all electronics and shall force the fan on. Systems must include local control, “all on” control bypass, and diagnostic routines.

6. The power control shall be able to record up to 64 presets in a rack. Presets

shall be user programmable by recording a snapshot of current dimmer levels (as set by the all control sources), by entering dimmer levels on the power control directly, or a combination of both methods. The system shall have the ability to program and activate group wide presets from the power control, remote station, console, networked computer, or handheld device. Presets shall be activated in the default fade time of 2 seconds, but shall be have a user-programmable fade time between 0 and 60 minutes.

7. A system wide panic (emergency UL924) activation circuit shall be provided. Any dimmer in any rack may be assigned to the panic circuit. The panic shall be set to a maintained closure. Upon activation, the system shall:

    a) Force all circuits selected to be included in panic to a master level between 80-100%

    b) Optionally force all non-panic dimmers to zero

    c) Provide configurable fade time to and from “emergency” state

    d) Provide configurable delay to and from “emergency” state

8. DMX A and B as well as the Ethernet DMX (EDMX) data may be patched using a rack start address - assigned sequentially from a starting control channel or patched individually on a per-dimmer basis. Priority may be set per universe for the DMX inputs, and set per universe by the control source for Ethernet input. Each dimmer may have up to six network control inputs with either a highest takes precedence or priority patch. Each dimmer may also then be assigned to one of 16 spaces for additional specific preset control. Each preset shall have a separate priority for maximum flexibility of prioritization. Systems that must support prioritization of multiple Ethernet sources beyond HTP shall not be deemed acceptable. Systems must support the above listed flexibility in control source prioritization shall not be deemed acceptable.

9. Power control shall provide the ability to set a single circuit, all circuits or a range of circuits to a level at the control interface in the rack. Systems that cannot locally control dimmers through local control override shall not be acceptable.

10. The power control shall be capable of monitoring and displaying incoming line voltage for all three phases on the LCD. With installed current sensors, the same display shall show amperage on each phase.

11. The power control shall support security protected access. The user shall to able to program passwords that restrict access, preventing unauthorized use of higher-level functions by unauthorized personnel. Systems that do not provide security protected access to features that can render the system unusable shall not be acceptable.

E. Standard Feedback:

1. System and Rack messages shall include, but not be limited to, the following:

a) DMX port A or B has an error or has failed

b) Network has an error or has failed

c) Phase A, B or C is below 90 volts

d) Phase A, B or C is above 140 volts

e) Phase A, B or C did not start because it was below 90V or above 140V at power up

f) Phase A, B or C voltage headroom warning

g) Frequency is not 50 or 60 Hz

h) Rack shutting down due to air flow loss

i) Ambient temperature is below 0°C/32°F

j) Ambient temperature is above 40°C/104°F

k) Rack shutting down - ambient temperature exceeds 46°C/115°F

(1) Configuration memory error

(2) About display shall allow monitoring of system, rack or dimmer status.

(a) About System shall provide information about Panic circuits, Preset looks, and System name.

(b) About Network shall provide IP address, gateway and net mask.

(c) About Rack shall provide information about rack name, ambient temperature, air filters and rack type.

(d) About Rack Power shall provide information about power type, rack voltages, current per phase (only with current transformers), under voltage warnings.

(e) About Rack Data shall provide status for DMXA, DMXB, EDMX and Network activity.

(f) About Dimmer shall provide information about dimmer type, location, output level, control source, scale voltage, mode and curve.

F. Advanced Feedback:

1. Sensor's Advanced Features (AF) option shall add an additional sensor in the individual dimmer modules. This option shall allow monitoring of current and output voltage on a dimmer by dimmer basis and provide information on lamp burnouts, dimmer status, and input voltages.

2. Power control shall allow the user to record the loads of all AF dimmers in the system. The power control shall, during operation, test each AF dimmer, determine its load, and compare it to the recorded load. Any change from recorded loads of configured tolerance shall display an error on the power control and any monitoring device on the network. If a dimmer is driven on with no load, an optional message shall be available to notify the console operator and electrician that there is no load.

3. Dimmer Specific messages shall include, but not be limited to, the following:

a) Load has dropped below recorded value

b) Load has raised above recorded value

c) DC detected on dimmer output

d) One SCR has failed on/off

e) Dimmer has failed off or circuit breaker has tripped

f) Dimmer has been removed

g) Dimmer load has failed

h) Dimmer has shut down due to over temperature

i) About Dimmer display shall provide additional information regarding the dimmer's recorded load and current or actual load

G. Network Interface:

1. The Ethernet network shall provide an integral link to connect all racks in the system for rack-to-console and rack-to-network device communication.

2. The network interface to the power controller shall provide a number of user-programmable control schemes between control sources, including architectural control.

3. Hardware settings for rack type, available module types, availability of AF features, and operating voltage shall be configurable at the factory or in the field, and shall not require secondary setup after system commissioning even in the event to power controller replacement.

4. User programmable parameters shall support onsite setup, via the local interface in the rack. These parameters shall include, but not be limited to, defining module type, scale voltage for each dimmer, firing mode, curve, dimmer numbering and DMX512 or network port assignments. Systems requiring factory programming shall not be acceptable.

H. Provide one (1) CEM3 control module.

IV. CONTROL PROCESSOR MODULES

A. The Architectural Control Processor shall be the Unison SmartLink S-ACP Series Control Processor as manufactured by Electronic Theatre Controls, Inc., or equal.

B. Mechanical:

1. The Architectural Control Processor (ACP) assembly shall be designed for use in DRd Series Rack Enclosures.

2. The processor shall utilize microprocessor based, solid state technology to provide multi-scene lighting and building control.

3. ACP module electronics shall be contained in a plug-in assembly.

a) The module shall be housed in a formed steel body and contain no discrete wire connections.

(1) No tools shall be required for module removal or insertion.

4. The ACP shall be convection cooled.

5. User Interface

a) The ACP shall utilize a backlit liquid crystal display capable of graphics and eight lines of text.

(1) The backlight shall have a user selectable time out, including no time out.

b) The ACP shall provide a numeric keypad for data entry and navigation.

c) The ACP shall provide a touch-sensitive control wheel for navigation.

d) The ACP shall provide shortcut buttons to assist in navigation, selection, and data entry.

6. The ACP shall provide a Secure Digital (SD) Removable Media slot on the front panel for saving and loading of configuration data.

a) The SD slot shall be secured behind the locking door.

C. Electrical:

1. The ACP shall require no discrete wiring connections; all wiring shall be terminated into the dimming enclosure.

2. The ACP shall require low-voltage power supplied by the dimming enclosure.

3. The ACP shall be hot-swap capable.

4. The ACP shall support Echelon LinkPower communications with remote devices, including button stations and timeclock stations.

a) The LinkPower network shall utilize polarity-independent, low- voltage Class II twisted pair wiring, type Belden 8471 (unshielded) or Belden 8719 (shielded) or equivalent. One # 14 AWG drain wire will be required for system not using grounded metal conduit.

b) The LinkPower network shall be topology free. Network wiring may be bus, loop, home run, star or any combination of these.

c) Link power wiring shall permit a total wire run of 1640 ft. (500m).

d) Link power wiring between stations shall not exceed 1313 ft. (400m).

5. The ACP shall support one ESTA DMX512A port, for DMX input.

a) DMX input support of 8 or 16 bit DMX.

b) Shall support DMX through of incoming DMX control signal.

D. Functional:

1. Capacity

a) Shall support 48 channels of control.

b) The ACP shall support 1 physical DMX port for DMX input.

c) The ACP shall support 64 presets using any combination of 48 channels.

2. System

    a) System shall support local firmware upload from removable media (SD media)

3. Configuration Data

    a) Configuration data shall be locally stored in non-volatile memory

    b) Configuration Data may be loaded to and from removable media. access provided on front panel (SD media).

4. Local User Interface

    a) Shall provide access to Processor status

    b) Shall provide access to Dimming enclosure setup and status

    c) Shall provide control functionality for Control Channels, Presets, and Sequence within the current configuration.

    d) Shall allow for display of local DMX information

    e) Shall allow to perform firmware upgrades for connected Dimming enclosures

    f) Shall allow for transfer of configuration to and from Dimming enclosures using removable media (SD media)

5. Access Controls

    a) There shall be 2 user accounts - Administrator, and User with separate password protection

    b) Account and password settings shall be local to each Processor

6. Stations

    a) Stations shall be connected to a SmartLink Processor via LinkPower network

7. Operation

    a) The ACP shall support control channel patch functions individually or for each of its 48 channels to any of 512 channels

    b) Configurable control signal-loss behavior including hold last look, wait

and change to present or wait and change to off

c) Support of 64 channel presents with DMX snapshot

d) User programmable up, down and hold times as well as configurable sequence

(1) Times shall be configurable from 0 to 60min, 59sec

(2) Sequence shall include at least 1, up to 64 presets and use the timing of each independent preset.

e) The ACP shall be capable of standalone operation and support host preset activation to and from other SmartLink products

f) Shall support the following dimmer modes; normal, dimmer doubled, switched, 2/3 wire fluorescent, 4 wire fluorescents, DALI, Constant On, Off and Reverse Phase

g) The ACP shall support multiple dimmer outputs including IES modified square law, linear, switched, fluorescent with adjustable cut-off, and adjustable pre-heat tandard rack feedback indications shall include

(1) Dimmer over-temperature

(2) Rack power status including under and over voltage

(3) DMX input status

h) Upon power cycle, the ACP shall return to its previous output state

i) The ACP shall boot in less than 5 seconds

j) DMX output refresh rate shall be configurable

k) There shall be support for 16-bit DMX Attributes

l) On Preset Record, the values of Attributes within the Preset shall be updated to reflect the current output

m) Each Preset shall have a status that can be Activated or Deactivated

E. Provide one (1) SmartLink Architectural Processor.

V. DIMMER MODULES

A. The dimmer modules shall be the Sensor Advanced Features modules as manufactured by Electronic Theatre Controls, Inc., or equal. Sensor Modules shall be designed for

complete flexibility of choice for dimmed, non-dim, or hot power on each 20A branch circuit. A single module shall provide one of the following:

1. Two dimmed outputs with choice of 500 or 350us rise times, controlled by DMX.

2. Two air gap relay switched outputs controlled by DMX.

3. Two manual bypass constant power circuits, controlled manually.

    a) The module may be configured to operate as two dimmers, two relays, or any combination of relay and dimmer from the CEM3 Power Control Module or from an ETC control console connected to a CEM3 system. Any single circuit may be set to bypass the dimmer using a switch on the front of the module.

4. The power control system shall report circuit specific errors via the rack control electronics and/or via a lighting control console.

5. Modules shall provide the following status reporting functions:

    a) Load dropped below recorded value

    b) Load increased over recorded value

    c) DC on dimmer output

    d) SCR failed on/off

    e) Circuit breaker tripped

    f) Dimmer error

    g) Module removed

    h) Load absent

B. Electrical:

1. Each dimmer module shall contain two single-pole circuit breakers, a solid-state switching or dimming module, associated toroidal filters, power and control connectors, a 120VAC remotely controllable mechanically latching air gap relay, a low voltage dc manual bypass override switch, and one fuse per branch circuit for sufficient short circuit rating.

2. Modules shall not have any protruding pins subject to physical damage when the module is not installed.

3. Modules shall be keyed so that dimmer modules of different capacity shall not

be interchangeable.

4. Each dimmer shall be protected by a fully magnetic single pole, 20 amp, or as shown on the Drawings, one hundred percent (100%) rated circuit breaker listed at 10,000 amps or greater interruptible current mounted on the face plate of the dimmer. The breaker shall be used as a dimmer disconnect and shall be rated for 100% switching duty. Circuit breakers shall be rated for tungsten loads having an inrush rating of no less than 20 times normal current. Under overload conditions, the circuit breaker shall disconnect power to the dimmer module before damage can be done to the power devices. The trip current shall not be affected by ambient temperature within the operational specifications of the system. Dimmers must operate continuously at 100% load.

5. Modules that use Triac dimming shall not be acceptable. Modules which utilize an SCR or Triac solid state switch as a dimmer bypass may void warranty of products they are powering and shall not be an acceptable means of bypass.

C. SCR Assembly:

1. Each dimmer shall be rated 2.4kW.

2. Each dimmer module shall use a solid-state module (SSM) consisting of two silicon-controlled rectifiers (SCRs) in an inverse parallel configuration, and all required gating circuitry on the high voltage side of an integral, opto-coupled control voltage isolator. Rectifiers, copper leads and a ceramic substrate shall be reflow soldered to an integral heat sink for maximum heat dissipation. The SSM shall also contain a control LED, a thermistor for temperature sensing, and silver-plated control and load contacts. The SSM shall include an integral output LED, output voltage sensors and current sensors for feedback to the control module. The SSM shall provide a parallel output connection which completely bypasses all SCR dimming including toroid filters and shall intercept the output prior to connection of the load sensing circuit such that the advanced features are still active during bypass. The entire SSM shall be sealed in a plastic housing requiring only a screwdriver to replace. Dimmers must employ triac power devices, pulse transformers, or other isolating devices providing at least 2,500V RMS isolation. Dimmer modules requiring disassembly, heat sink grease or additional tools for repair shall not be acceptable.

3. All electronic components (current/voltage sensors and indicators) shall be contained in a single, field-replaceable housing. Modules requiring discrete wiring of electronic components shall not be acceptable.

4. SCR power switching devices shall have the following minimum ratings:

Module Size:	20A
Single cycle: Peak surge current	625A

Half cycle: 12T	1,620
Transient over voltage	600V
Die size (in)	.257

D. Filtering:

1. Dimmer modules shall include toroidal filters to reduce the rate of current rise time resulting from switching the SCRs. The filter shall limit objectionable harmonics, reduce lamp filament sing and limit radio frequency interference on line and load conductors. Modules shall offer 350 or 500 uS, filter rise times. Rise time shall be measured at the worst case slew rate (about 50 percent) from 10 to 90 percent of the output wave form with the dimmer operating at full load.

E. All dimmers shall maintain their published rise time and/or fall time regardless of duty cycle or rack temperatures. Dimmers that de-rate due to increased dimmer temperature caused by full load operation or high phase angles shall not be acceptable.

F. Power efficiency for standard dimmers shall be at least 97 percent at full load with a no-load loss of 3V RMS. The dimmer shall accept hot patching of a cold incandescent load up to the full rated capacity of the dimmer.

G. Dimmer modules shall be fully plug-in and factory wired. Dimmer modules shall consist of a heavy duty, die-cast aluminum chassis with integral face panel. No tools shall be required for module removal and insertion. All parts shall be properly treated, primed and finished in fine-texture, scratch resistant, gray epoxy powder coat. With the exception of the circuit breaker, the module shall contain no moving parts. Each module shall be labeled with the manufacturer's name, catalog number and rating. Modules constructed of molded plastic for structural support are not equivalent and are not acceptable. Modules shall be UL Recognized.

H. Provide twelve (12) D20AFTR Advanced Features Thru Power Dimmer Modules (7083A1022).

I. If manufacturer is unable to provide a Thru Power Module, manufacturer shall provide an additional 20% of spare relay modules in addition to the dimmer modules.

VI. PRESET STATIONS

A. The Button station shall be the SmartLink Button Station as manufactured by Electronic Theatre Controls, Inc., or equal. It shall be a remote station on an Echelon LinkPower network that can play presets stored in a host product such as a SmartPack dimmer pack, SmartSwitch Relay panel or in the Control Electronics Module (CEM+) of a Sensor+ dimmer rack. The station shall consist of a dual function (program/play) push-button with an integral LED for each corresponding look.

1. Standard stations shall control 5 or 10 backup looks.

2. The system shall support up to four stations without an additional power supply.

B. Electrical:

1. Button station wiring shall be an Echelon® Link power network. Link power shall utilize low-voltage Class II unshielded twisted pair, type Belden 8471 or equivalent, and one #14 ESD drain wire (when not installed in grounded metal conduit).

2. The station shall operate on ± 21 VDC provided by the CEM+ via the Link power network (for more than 4 stations, an additional power supply shall be required). The number of stations shall be limited by the available power.

3. Station wiring must be topology free. It may be point-to-point, bus, loop, home run or any combination of these.

4. Network insulation displacement connectors shall be provided with all stations

C. Station Addressing

1. Preset addressing for stations shall be via a 7- position dipswitch, and will be set by installers or factory personnel. Stations shall address only consecutive presets. Multiple stations of the same type and address are permissible. Multiple stations with different button quantities may have “overlapping” preset addresses.

2. Stations shall not address presets in different rooms.

D. Play Presets

1. Pressing a button shall play the corresponding preset. The station will send the command to play the look to all host products. If the look is a recorded look, the button's LED will stay lit. If the look is unrecorded, the LED will go off.

2. The station shall monitor (at 30-second intervals) the status of presets. If any looks are active in the range of the station's numbered push-buttons, the station shall light the corresponding LED regardless of which device (console, host product, network PC or Button station) activated the look.

3. If the button with the active look (LED lit) is pressed, the station shall send the command to return to normal operation, deactivate the preset and turn off the LED.

4. Only one preset may be active at a time. Pressing a second button shall play the corresponding preset and fade out any preset previously active.

E. Physical

1. Control station electronics shall mount directly behind the faceplate. A terminal block shall be supplied for contractor terminations. The entire assembly shall mount into a single gang back box. Back boxes for the flush mounted stations shall be industry standard back boxes. The manufacturer shall supply back boxes for surface mounted stations.

2. Station faceplates shall be constructed of ABS plastic and shall use no visible means of attachment. All Button stations shall be available with white, signal white, ivory, gray or black faceplates and buttons.

F. Provide SmartLink preset button stations SH 10005 (five button) and SH 10010 (ten button) station in the quantities shown on the Drawings.

VII. DATA PLUG-IN STATIONS

A. Data Plug-in Stations shall consist of the appropriate connectors required for the functional intent of the system. These stations shall be available with DMX input or output, Remote Focus Unit, Network, or architectural control connectors as shown on the Drawings or as required.

B. Connector Options:

1. The following standard components shall be available for Plug-in Stations:

a) 5-Pin male XLR connectors for DMX input

b) 5-Pin female XLR connectors for DMX output

c) RJ45 connectors for Network connections - Twisted Pair

C. Physical:

1. Station faceplates shall be .80” aluminum, finished in fine texture, scratch-resistant black powder coat. Silk-screened graphics shall be white.

2. The station panel shall mount into an industry standard back box, depending on size and quantity of connectors. A terminal block shall be supplied for contractor terminations.

D. Provide Data Plug-In Stations of the types and quantities shown on the Drawings.

VIII. LIGHTING CONSOLE AND ACCESSORIES

A. General:

1. The lighting control console shall be a microprocessor-based system specifically designed to provide complete control of stage, studio, and entertainment lighting systems. The console shall be the Element as manufactured by Electronic Theatre Controls, Inc., or equal.

2. The control system shall be Net3 and Net2 native, with both protocols output simultaneously over the network. The system shall also be able to control third party ACN devices directly. The system shall provide control of 1024 outputs on 250 or 500 channels.

3. A maximum of 10,000 cues, 1000 groups, 1000 Intensity Palettes, 1000 Color Palettes, 1000 Focus Palettes, 1000 Beam Palettes, 1000 effects, 1000 macros and 100 curves may be contained in non-volatile electronic memory and stored to an onboard hard disk or to any USB storage device.

4. The console may be placed in Tracking or Cue Only mode by the user as a system default and overridden on individual record actions as required.

5. A Master Playback fader pair and dedicated Grand Master/Blackout shall be provided.

6. The console shall provide 40 or 60 pageable faders and bump keys that may be operated in either LTP channel or HTP/LTP submaster mode. The console shall support a total of 300 submasters.

7. A high-resolution level wheel shall be provided to control intensity for selected channels and scrolling within selected displays. On demand moving light controls shall be provided for control of other non-intensity parameters. Non-intensity parameters shall be controllable via the on demand or keypad controls.

   On demand moving light controls shall provide mouse-based tools for non-intensity parameters. The tools shall display the current value for each parameter and shall provide controls for adjusting each parameter.

8. Control and programming features for automated fixtures shall also include: a standard library of fixture profiles, the ability to copy and edit existing profiles and create new profiles, patch displays including channel and output addressing, 16-bit fade resolution, color characterization allowing color mixing and storing in Hue and Saturation or native device values.

9. System information, including playback status, live output and blind values for all record targets shall be displayed on a maximum of two external high resolution DVI monitors, or one SVGA monitor, which may also be touch-screen(s). Only one display shall be required for operation.

10. The system shall direct user input through on-screen dynamic prompts and integral LEDs on console keys indicating current operating mode. A context

sensitive on-line Help feature shall explain and provide an example of the operation of each feature of the system.

11. An optional, fully-functioning, detachable alphanumeric keyboard shall be supported. The keyboard shall allow labeling of channels, cues, presets, groups, palettes, effects, macros, curves and the show. An integral electronic keyboard shall be provided.

12. A row of softkeys shall be provided, which change function based on the selection and context of the console. These softkeys shall be labeled on the connected external display.

13. Console software upgrades shall be made by the user via a USB port; changing internal components shall not be required.

14. The console operating software shall be loaded into program execution memory from the internal hard drive when the console is powered. In the event of an uncontrolled shutdown, the console shall return to its last output state when power is restored.

15. Show data may be created and modified on a personal computer, using either Windows XP or Windows 7 operating systems, using a free offline editing application. The offline editor may also run natively on Macintosh platforms using OS X.

16. A PC, using Windows XP, Windows 7, or a Macintosh computer running OS X, running a client software application shall be able to connect to a control system via the network and view current show data in a mirrored display environment.

17. The system shall allow remote control from a purpose-built wireless remote focus unit (Radio Focus Remote). Systems without these remote-control devices shall not be acceptable.

18. The system shall support a Telephone remote control that allows basic functions to be controlled from a standard wireless phone producing touch-tone signals. This allows the use of a standard telephone for a low cost remote control. Systems that do not allow this function shall not be acceptable.

19. Network management tools shall be provided from the desk itself.

20. The system shall support up to 32 individual Time Code Event lists.

B. Controls and Playback:

1. Manual Control and Programming Section

a) The console keyboard shall be grouped by function. Major groupings shall be record target functions, numeric keys, level assignment

functions, display navigation functions and controls. Non-intensity parameters may be set numerically or via the on demand moving light controls. This control shall be fully interactive. In either case the current parameter value shall be displayed on the console monitor. Only those parameters available for control in the active lighting system shall be displayed for control. Lamp controls provide direct access to luminaire functions such as striking and dousing arc lamps and calibrating entire fixtures or individual mechanisms of fixtures, as provided by the luminaire manufacturer. User access to these features is normalized across all manufacturers for ease of use. Use of a “control channel” for accessing these functions shall not be required and systems requiring use of a control channel shall not be acceptable. Fixtures with CMY or RBG color mixing may be set with direct CMY or RBG controls, as well as the Hue and Saturation controls and/or color picker. Color may also be set directly to a gel match, normalized to 3200K.

2. Playback Section:

    a) The master fader shall consist of a 60mm Master Fader pair with associated Load, Go and Stop/Back buttons.

    b) It shall be possible to instantaneously halt an active cue, go back to the previous cue, manually override the intensity fade or manually override the entire fade.

3. Integral Channel/Submaster Faders:

    a) Submaster and fader support shall be provided via 40 or 60 integral 45mm faders with bump leys. These faders shall be pageable and shall operate in LTP channel and LTP/HTP submaster modes.

    b) LTP channel mode shall allow the user access to intensity of the first 120 channels and shall operate with LTP logic. Faders that are not currently set to the same level as the corresponding channel shall have to be matched to that level before affecting said channel.

    c) Up to 240 proportional, fully overlapping additive or inhibitive submasters may be defined. Submasters shall have colored LEDs to indicate submaster status. Each submaster may have fade up, dwell and down fade times. Each has a bump and assert/channel select button. Submasters may be set to independent, exclusive and proportional/intensity master control.

    d) The submaster blind buffer shall be linked directly to live playback allowing live editing of live submaster content via the command line.

    e) It shall be possible to set submaster values directly from the command line.

4. Grand Master:

    a) A dedicated 60mm grand master and blackout button are provided.

    b) The grand master shall proportionally fade intensity values to zero. Blackout shall send all intensity outputs to zero. Non- intensity outputs shall not be affected. No additional configuration shall be required to withhold non-intensity values from Grand Master and Blackout control.

C. Display Controls:

1. Format shall change the view of selected displays.

2. Channel views may be displayed either in a expanded table view combining conventional channel symbols with table views for multi- parameter devices, or in a channel summary view.

3. Flexi channel shall change which channels are viewed in selected displays, based on a variety of different criteria, including all channels, patched channels, active/move channels, manual channels, selected channels and user-specified channel lists.

4. Expand shall extend the selected view sequentially across connected displays.

5. Data shall display absolute values of referenced data.

D. Operating Modes:

1. Live Mode:

    a) Channel lists may be constructed using the +, - and Thru keys.

    b) Levels may be set with the keypad, level wheel and on demand moving light controls. “Selected” channels shall be those last addressed and under keypad control.

    c) Sneak shall be used to restore specified channels to background states, default values, or to send them to specified values, in user specified or default times.

    d) Selected channels may be set at a level or held to current values while all other channels are set to zero using Rem Dim. Toggling Rem Dim shall restore all unselected channels to original levels. The Rem Dim level shall be user definable.

    e) Channels may be recorded into groups for fast recall of commonly used channels. 1000 groups shall be available. Groups shall store selection

order. The Offset function supports rapid creation of ordered groups, including reverse and random order.

f) Parameter settings may be stored to Focus and Color Palettes. All referenced data may be stored to whole numbers or to up to 99 decimal places between each whole number. It shall be possible to store 1000 of each palette type.

g) Any collection of channel data, as determined by the use of “Record” or selective store commands may be stored to palettes (as appropriate to the type).

h) The following conditions may be placed on a channel or channel parameter to be included with a cue record action.

(1) Block flag

(2) Note

i) Cues may be recorded in any order. Up to 99 decimal cues may be inserted between any two whole number cues. Each cue may contain a maximum of twenty parts. Parameters may be automatically assigned to specific parts or assigned when the part is created.

j) It shall be possible to record cues and cue parts with the following information:

(1) Any collection of channel data, as determined by the use of “Record” or selective store commands.

(2) Cue Level timing and delays for Intensity Up and Intensity Down, Parameter moves shall follow the Intensity Up time.

(3) Follow or hang time

(4) Link instruction

(5) Loop value

(6) Block and/or preheat

(7) Curve

(8) Label and note

(9) Execute list to trigger other activity

k) Non-intensity channel parameters may be marked (preset using

Automark. Automark presets any parameter transitions in the cue just prior to intensity becoming active. Automark may be disabled on a cue or cue part basis, enabling a “live” move.

l) Any channel parameter may be stored with an effect instruction. These effects may contain relative offsets from current value, or absolute instructions. Effects may be progressive action or on/off states. Entry and exit behaviors shall modify the channel parameters activity when beginning and ending the effect.

m) Update may be used to selectively add modified parameter data quickly to that parameter’s current source. It shall be possible to update inactive record targets. It shall also be possible to update back to the current source of the move instruction without specifying that cue via Trace.

n) Recall From quickly pulls specified data from record targets into the current view.

o) Copy To quickly copies selected data to specified record targets.

p) Address and channel check functions shall be provided.

q) Channel parameters may be “parked” at levels. Output addresses may also be parted directly. Parked levels shall not be added to any live record operations, nor may they be changed until the parked element is “unparked”. Address park shall also be provided.

r) About shall provide detailed status of selected channels or specified record targets, including utilization information. About shall also access lamp control functions to calibrate devices, strike and douse arc sources. Use of a luminaire control channel for these functions shall not be acceptable.

s) Live data may be displayed in an expanded table view containing conventional symbols and table views for multi-parameter devices or in a summary view.

t) Undo shall be used to sequentially step back through manual operations, record, update and delete actions. Redo functions shall be provided. Multiple undo commands may be executed at once.

u) Home shall set selected channels non-intensity parameters to their default values.

v) Move shall allow all show data to be moved from one record target to another.

2. Blind:

    a) The Blind display allows viewing and modification of all record targets without affecting stage levels.

    b) Record target data may be displayed in an expanded table view containing conventional symbols and table views for multi- parameter devices, in a summary view or a spreadsheet view, which allows quick data comparisons, move and replace with functions.

    c) Changes made in blind displays shall be stored automatically.

    d) Blind editing shall be possible for all record targets.

    e) It shall be possible to show or hide parameter data in spreadsheet views for simplicity in viewing/editing.

3. Patch Display:

    a) Patch shall be used to display and modify the system control channels with their associated library data.

    b) Each channel may be provided with a proportional patch level, preheat, curve, label, swap and invert functions.

    c) Offset functions in patch shall allow selection of channel ranges and shall allow the user to establish a “custom” footprint for any device output.

    d) Custom color wheels, color scrolls and gobo wheels shall be defined in patch. These devices shall be created with a simple table and graphical user interface supported by images of major manufacturers.

    e) Copy to and Move functions shall be supported in patch.

4. Setup/Browser:

    a) Setup shall access system, show and desk configurations.

    b) The browser shall access show data storage, import, export, print to .pdf and clear functions, as well as show data utilities.

E. Interface Options:

1. The console shall support a variety of local interfaces.

    a) AC input.

b) USB (a minimum of five ports shall be provided for connecting devices such as a Alphanumeric keyboard, mouse, touch screens, USB Flash drive, etc.) The desk shall provide at least four ports on the rear of the console and one on the control surface itself.

c) Ethernet (one port) 802.3af compliant

d) Two (2) DVI video output connectors, supporting a maximum of two DVI monitors at 1280x1024 resolution minimum.

e) One (1) VGA output connector.

F. Accessories Required:

1. iRFR an iRFR Preview (applications for iPhone, IPod Touch and iPad)

2. aRFR (application for Android devices)

3. Element Client Software Kit

4. Two (2) 19” ELO LCD Touchscreen monitors with DVI

G. Physical:

1. All operator controls and console electronics for a standard system shall be housed in a single desktop console, not to exceed 32.9” wide, 17.9” deep, 5.1” high, weighing 30 pounds.

2. Console power shall be 95 – 240V AC at 50 or 60Hz, supplied via a detachable power cord.

H. Provide:

1. One (1) Element 60 with 250 control channels.

IX. DMX/RDM REPEATER (OPTO-SPLITTER)

A. The DMX/RDM Installation Repeater shall permit star-wiring of DMX512 signals and shall isolate DMX transmitters and DMX receivers from common mode voltages, ground loop currents and other electrical faults.

1. The DMX/RDM Installation Repeater shall have bi-directional ports to allow Remote Device Management (RDM) data packets to be sent and received between control systems and responding devices.

2. Each DMX/RDM Installation Repeater shall have one input port and eight output ports. No in-line processing of the input signal is permitted to ensure the highest reliability.

3. DMX signal splitting shall be provided using 4-output DIN-rail mounted modules for easy expansion and/or servicing.

4. The system shall be capable of repeating simplex protocols other than DMX512, provided they meet the electrical requirements of EIA-RS422 or RS485.

B. Physical:

1. Enclosures shall be surface-mount NEMA 1 enclosure types, and shall be constructed from 18 gauge steel, finished in satin black powder epoxy, with a non-louvered, surface cover.

2. Dimensions shall be 10.25” x 23.25” x 4.5” (260mm x 510mm x 120mm) for the eight output units.

3. Enclosures shall be provided with ½” and ¾”conduit knockouts, appropriate internal voltage barriers, and shall be clearly labeled as “Pathway eDIN System”.

C. Electrical:

1. The power supply shall be a field-replaceable, wide-range input (115/240VAC, 50/60 Hz), UL-listed switching power supply. There shall be no power switch to reduce the chance of accidental shut-off.

2. There shall be 2500-volt electrical isolation between all input and output sections, and between adjacent output sections.

3. The input and each output shall be capable of withstanding the continuous application of up to 250V without damage to internal components. Input and output protection shall be of the self-resetting type, rated for 250V. Replaceable fuses are not acceptable.

D. Field Connections:

1. All internal field wiring connections shall be clearly labeled according to their function.

2. Connections for all data input, output and pass-thru ports, and DC power shall be two-part, Phoenix-type screw terminal strips, capable of accepting #26 to #14 gauge solid or stranded wire.

3. An active, isolated data pass-thru connection port shall be provided to allow daisy-chaining of additional modules or Installation Repeaters.

4. The power supply connections shall be capable of accepting up to #12 gauge

solid or stranded wire. A suitable terminal shall be provided for ground wire connection.

E. Features:

1. Each repeater module shall incorporate LED indicators for DC power input, isolated DC power, DMX input and processor status.

2. Each module shall have two LEDs per output port to indicate active DMX output and RDM activity for that port.

3. Each module shall be individually discoverable via RDM. No remote configuration options shall be available to the user.

4. Each DMX/RDM port shall incorporate an active data line terminator.

F. Compliance:

1. The DMX/RDM Installation Repeater shall be compliant with ANSI E1.11 DMX512-A (2004), USITT DMX512 (1990) and ANSI E1.20 Remote Device Management (2006).

2. The DMX/RDM Installation Repeater shall be ETL-listed.

3. The DMX/RDM Installation Repeater shall be compliant with the RoHS 2002/95/EC directive.

G. Acceptable Product:

1. Supply Pathway DMX/RDM Installation Repeaters only.

2. This specification applies to Pathway Model #4814 only.

H. Provide one (1) Pathway 8-way eDIN DMX/RDM Installation Repeater, Model No. 4814 or approved equal.

X. ELECTRICAL DISTRIBUTION EQUIPMENT

A. All distribution equipment shall be furnished by the manufacturer of the dimming equipment. Hanging and supporting hardware shall be furnished and installed under SECTION 11064 "THEATRE AND STAGE EQUIPMENT - RIGGING SYSTEMS".

B. Connector Strips shall be furnished and installed where shown on the Drawings. Use only when providing connector strips, usually only used in front of stage when not in a gym. Can be used on stage if sufficient ceiling height. Consult with PGCPS.

1. Each connector strip shall be complete with three-pole, 20A grounded stage pin connector type female receptacles.

2. Internal wiring shall be sized to circuit ampacity and shall be rated at 125°C.

3. Terminations shall be at one end using feed-through terminals individually labeled with corresponding circuit numbers.

    a) 20 amp circuits shall use screwless tension clamp terminals listed for 20 – 8 gauge wire.

    b) Terminals that place a screw directly on the wire are not acceptable.

4. Connector strips shall be supplied with appropriate brackets and hardware for mounting as shown on the Drawings.

    a) Connector strips shall have junction brackets on 5’ centers.

    b) Brackets shall be 1 ½” x .188” ASTM A 36 steel.

    c) Hardware shall be ASTM A307 grade 5.

5. A low voltage distribution system shall be available to incorporate DMX, Ethernet or other protocols as specified in the connector strip. Connector strips shall utilize a voltage barrier to accommodate these systems. Low Voltage signals shall enter the connector strip via a strain relief or connector mounted in a separate low voltage terminal box at the specified end of the connector strip. Up to four low voltage cables shall be supported for each connector strip.

    a) Connector strips with multiple DMX outputs from the same source shall use DMX pass through assemblies consisting of a 6” panel with the one DMX output connector, one DMX input (Pass Through) connector, one DMX pass through (Bypass) switch, and a label detailing the use of the pass through assembly.

    b) The bypass switch shall be used when no DMX devices are present at that location. When activated, the DMX pass through switch shall pass DMX directly through to the next DMX panel on the strip. The pass through switch shall have a mechanical indicator to show the operator that it has or has not been engaged

6. Physical:

    a) Connector strips shall be 6.25” H x 3.3” D and fabricated from 18-gauge galvanized steel and finished in black fine-texture powder coat paint.

    b) Covers shall be fabricated from 16-gauge galvanized steel.

    c) Connector strips shall be available in any length specified in increments

of 6” and shipped fully wired with all splicing hardware.

d) Connector outlets shall be spaced on 18” centers, or as otherwise specified or shown on the Drawings.

e) Outlets shall be mounted on individual 3” panels.

f) No external terminal boxes shall be required for connector strips with 28 or fewer circuits unless otherwise specified.

g) Circuits shall be labeled on the connector strip with 2” high lettering. Circuit labeling shall be located on the front side of the connector strip with white lettering on black background.

7. Connector strips shall support and include optional LED indicators to indicate the presence of power at each local circuit. The LED indicator shall be red in color and mounted in the connector strip directly below the outlet panel.

8. Connector Strips shall be Underwriter Laboratories (UL) LISTED. The connector strips shall be the Electronic Theatre Controls, Inc. 99 series or equal.

C. Gridiron Junction Boxes shall be furnished and installed where shown on the Drawings or required. (Use this only when providing connector strips)

1. Gridiron junction boxes shall be available to accommodate SO or SOW cable wiring into connector strips mounted to non-fixed locations.

2. Junction Boxes shall be fabricated from 16-gauge cold rolled steel with 14 gauge end panels. They shall be finished with fine-textured, scratch- resistant, black powder coat paint. Cover(s) shall be 16-gauge cold rolled steel and hinged to allow mounting in any direction. Cover(s) shall be attached with machine screws and Tinnerman retainer nuts.

a) Boxes for 30 circuits or less shall be 14”H x 14”W x 4”D.

b) Boxes for 31 to 60 circuits shall be 14”H x 28”W x 4”D.

3. Junction boxes shall include mounting brackets and hardware.

4. Wiring terminations shall be made using feed through terminals individually labeled with corresponding circuit numbers.

a) 20 amp circuits shall use screwless tension clamp terminals listed for 20 – 8 gauge wire.

b) Terminals that place a screw directly on the wire are not acceptable.

5. A low voltage distribution system shall be available to incorporate DMX,

Ethernet or other protocols as specified with the gridiron junction box.

a) Low voltage junction boxes shall attach to gridiron junction boxes to simplify wiring to a discrete device.

b) Low voltage signals shall enter the junction box via a strain relief or connector mounted in a separate low voltage terminal box on the top or bottom of the gridiron junction box.

c) Up to four low voltage cables shall be supported for each junction box location.

6. Gridiron junction boxes shall be Underwriter Laboratories (UL) LISTED. The gridiron junction boxes shall be the Electronic Theatre Controls, Inc. GB Series or equal.

D. Plug-in Outlet Boxes shall be furnished and installed where shown on the Drawings.

1. Plug-in outlet boxes shall be complete with three-pole, 20A grounded stage pin connector type female receptacles attached to twenty four (24) inch pigtails.

2. Pigtails shall be three-wire type “SOW” rubber jacketed cable sized for the maximum circuit ampacity.

3. Pigtails with 20 amp stage pin connectors shall be terminated using 12 gauge 4 way indent crimp (with inspection window) type where the wire is inserted and crimped directly in the socket.

4. Terminations for pigtail connectors shall utilize feed-through terminals individually labeled with corresponding circuit numbers. 20 amp circuits shall use screwless tension clamp terminals listed for 20 – 8 gauge wire. Terminals that place a screw directly on the wire are not acceptable.

5. Pigtail outlet boxes shall be supplied with appropriate brackets and hardware for mounting as shown on the Drawings.

a) Standard mounting options shall include pipe or wall mounting.

b) Brackets shall be made from ASTM A 36 steel.

c) Hardware shall be ASTM A307 grade 5.

6. A low voltage distribution system shall be available to incorporate DMX, Ethernet or other protocols as specified in the plug-in outlet box where shown on the Drawings.

a) A voltage barrier shall be used to separate the low voltage wiring for the electrical circuits.

7. Physical:

    a) Plug-in outlet boxes shall be 6.25” H x 3.3” D and fabricated from 18 gauge galvanized steel and finished in black fine-texture powder coat paint.

    b) Covers shall be fabricated from 16-gauge galvanized steel.

    c) Plug-in outlet boxes shall be available in any length specified in increments of 3-inches with a maximum length of up to 3-feet.

    d) Pigtails and outlets shall be spaced on 4” centers, or as otherwise specified.

    e) Pigtail outlets shall be mounted on individual 3” panels.

    f) Circuits shall be labeled with 1.25” lettering. Circuit labeling shall be located on the front side of the plug-in outbox with white lettering on black background.

    g) Pigtail boxes shall support and include optional LED indicators to indicate the presence of power at each local circuit. The LED indicator shall be red in color and mounted in the cover plate directly below the circuit label for pigtail circuits.

8. Plug-in outlet boxes power distribution equipment shall be Underwriter Laboratories (UL) LISTED. Plug-in pigtail outlet boxes shall be the Electronic Theatre Controls, Inc. 9300 Series or equal (for surface or pipe mounting) or 9400 Series or equal (for flush wall mounting).

E. Pipe Batten

1. The pipe batten shall be 1½” schedule 40 grade A, seamless pipe fabricated in the largest possible lengths without splices. Battens of greater length shall be spliced by means of .120 x 1 9/16 dia. DOM tube 18” long with 9” of tube inserted into each half of the splice. The tight fitting splice tube shall be held in place by a pair of 3/8 x 2 ½” grade 5 hex bolts on each side of the joint. The bolts shall pass through the pipe at an angle of 90° to each other. There shall be two bolts on each side of the joint spaced 1” and 8” from the joint. Alternatively, one pair of bolts on one side of the joint may be replaced with either plug welds or tight fitting steel rivets. Pipes shall be straight and painted flat black.

2. A safety-yellow batten cap shall be installed at each end of each pipe batten.

3. The manufacturer shall provide four self-adhesive labels for each batten on which the rated batten load shall be written by the installer.

4. Chain used for dead hung suspension shall be zinc plated NACM, Grade 30 proof coil chain with ¼" shackle and 1 ½" Grad 5 safety bolt. Top and bottom attachment shall be made via a wrap and a half of chain with shackle and safety bolt. Hardware shall be US made and be stamped with safe working load.

5. Bottom attachment with rated Crosby shackle to the connector strip hangar bracket will be acceptable for all electrics with connector strips.

XI. PORTABLE ELECTRICAL DISTRIBUTION EQUIPMENT (STAGES OFF OF GYMNASIUMS)

A. A self-contained connector strip/dimmer bar unit shall be provided for mounting on a free standing tripod lighting tree support stand.

1. The dimmer bar shall be the SmartBar 2 as manufactured by Electronic Theatre Controls, Inc. (ETC), or equal. SmartBars shall be portable linear forward-phase (SCR) dimmer bars that allow Theatrical Lighting Instruments to be mounted on them.

2. The SmartBars shall be available with current ratings of maximum 10 Amps per output circuit for a maximum of 20 Amps per incoming phase of power.

3. Installation requires attachment for suspension points, safety cables, local main power via a flexible cable, and DMX signal input.

B. Mechanical:

1. The dimmer bar shall be a self-contained unit, suitable for portable or permanent installation. It shall be constructed of aircraft quality powder coated aluminum.

2. All dimmer bars shall be convection cooled and shall operate without cooling fans or filters.

3. The bar shall have integrated suspension points for fixtures and for mounting hardware(c-clamps or stand adapters). It shall be supplied with five 4-1/2" long, ½" bolts and appropriate hardware.

4. Integrated suspension points shall provide captive nylon bushings for ease of swivel focus of fixtures after mounting bolts have been tightened.

5. The 2 circuit dimmer bar shall measure 3.0 x 2.0 x 40 inches and weigh no more than 14 lbs. The 4 circuit dimmer bar shall measure 3.0 x 2.0 x 60 inches and weigh no more than 18 lbs. The 6 circuit dimmer bar shall measure 3.0 x 2.0 x 88 inches and weigh no more than 28 lbs.

C. Electrical:

1. Power wiring to each module shall be connected by use of a 12’ flexible SO Top or bottom fed cord and connector. Use of flexible feed cords and connectors facilitates the reconfiguration of both permanent and portable dimming equipment installations. Each bar shall be powered by a power feed service according to its current rating.

    a) Four (4) circuit, single phase 2-wire plus ground, 20A feed.

2. Fully magnetic circuit breakers shall be used for load protection.

3. Output connectors shall be Grounded Stage Pin connectors.

4. A single duplex outlet shall be provided as a convenience power outlet.

D. Control:

1. The front panel shall contain DMX512 Input and Thru connectors. The module shall support up to 32 Power Modules on one DMX line.

2. The Bar shall support ANSI E1.20 Remote Device management (RDM).

3. Dimmer control electronics shall be contained within the dimmer bar. The electronics shall include the following indicators and controls:

    a) Two status LED indicators: Power and Valid DMX.

    b) 2-line by 20-character backlit LCD for system configuration, status display and error indication.

    c) 6-button keypad with arrow array which includes Enter button

4. The electronics shall provide flexible programming of individual dimmer characteristics:

    a) Local control or live manual control

    b) 20 pre-programmed chase sequences

    c) Selection of standard Dimmer Curves

    d) RDM programmable DMX patch

    e) RDM Identification

    f) Minimum levels

    g) Non-dim operation

E. Thermal:

1. All units shall be convection cooled and shall operate without cooling fans or filters. The pack shall operate safely in an environment having an ambient temperature between 32ºF (0ºC) and 104ºFC)(,40 and humidity between 10 - 90% (non-condensing).

2. Optimum cooling shall be when the units are mounted horizontally with the control panel vertical (or upright).

XII.

A. Provide four (4) SmartBar® 2 Linear Dimmer Bars, Model No. SB4-10-B.

XIII. PORTABLE LIGHTING SUPPORT STANDS (STAGES OFF OF GYMNASIUMS

A. Portable tripod lighting support stands shall be provided for mounting self- contained connector strip/dimmer bar units.

1. The support stand shall be the SmartStand™ as manufactured by Electronic Theatre Controls, Inc. (ETC), or equal.

2. The crank-up stand may be loaded with a dimmer bar and theatrical lighting instruments to provide lighting for temporary setups.

3. The heavy duty stand shall rise to a maximum height of 12’ (380cm) and shall raise and lower up to a maximum of 68 pounds (31 kg).

B. Mechanical:

1. The unit shall be manufactured of black anodized steel with a geared column. Three tubular sections, with diameters of 2.2” (55mm), 1.8” (45mm), and 1.5” (38mm) respectively, shall allow the stand to extend at an elevation of 1.7” (44mm) per handle turn. A fold-away hand crank shall be used for gradual height adjustment.

2. The geared column shall use a dual cable control process for safety. The dual cable control shall ensure simultaneous retrieval of all sections as height is adjusted.

3. The unit shall have three legs with stabilizers, each 1.2” (30mm) diameter. One leg shall be an articulating leg to level the stand when placed on uneven surfaces. The full stand base diameter shall be 65” (166cm).

4. A sturdy adjustable foot step shall be included on the base section of the stand.

5. An industry standard senior stud adapter shall be included (1-1/8” diameter stud with ½”–13 thread) for mounting accessories to the stand. The top head of the stand shall also have a 1-1/8” receiver and 5/8” retractable baby stud (standard television head).

6. The total folded length of the unit shall be 6’0” (182cm).

7. The weight of the stand shall be 49.5 lbs. (22.4 kg), and with casters, 58.5lbs. (26.5 kg).

C. Required:

1. The following options for the stand shall be provided:

a) An additional stand adapter (stud).

b) A set of three (3) locking casters – 3.9” (100mm) diameter casters with brakes.

D. Provide four (4) SmartStand Light Stands with Bar.

E. Each portable lighting support stand shall have three (3) black heavy duty nylon construction bags containing 25 pounds of sand for anchoring the tripod support stand.

F. Loose cables shall be provided as follows:

1. Four (4) 12/3 SO extension cables, 50 feet long, with a NEMA 5-15P plug on one end and a 20 amp female grounded stage pin connector on the other end.

2. Two (2) 12/3 SO extension cables, 25 feet long, with a NEMA 5-15P plug on one end and a 20 amp female grounded stage pin connector on the other end.

3. Four (4) DMX data cables, 50 feet long, with 5-pin XLR data line, male to female connectors. Type as recommended by the system manufacturer.

4. Four (4) DMX data cables, 10 feet long, with 5-pin XLR data line, male to female connectors. Type as recommended by the system manufacturer.

XIV. THEATRICAL LIGHTING INSTRUMENT PACKAGE

A. Theatrical lighting instruments manufactured by ELECTRONICS DIVERSIFIED, INC. (ETC), and ALTMAN are specified herein to provide a basis of quality. Other acceptable manufacturers are STRAND LIGHTING, INC.

1. Followspot lighting instruments shall be manufactured by STRONG ENTERTAINMENT LIGHTING.

B. Theatrical lighting instruments shall be capable of performing with tungsten halogen lamps and light emitting diodes (LED) as indicated herein with proper heat sink cooling. Phenolic materials shall be employed on the fixtures in order to protect the operator from potential burns.

C. Each theatrical lighting instrument shall be supplied with a malleable iron clamp to grip up to a two (2) inch ID pipe, a fixture yoke with locking clutch handle, and three (3) foot long SF2 leads in a fiberglass sleeve.

D. Minimum performance criterion for all theatrical lighting instruments shall be as herein specified. Each instrument shall be furnished with a three pole, grounded stage-pin (GSP) connector and safety cable. UL listing is required on all theatrical lighting instruments.

E. COLOR MIXING OR WHITE-LIGHT LIGHT EMITTING DIODE PROFILE FIXTURE

1. The fixture shall be a color-mixing high-intensity LED illuminator with DMX control of intensity and color. The fixture shall be a Source Four LED as manufactured by Electronics Theatre Controls, Inc. or approved equal.

2. All LED fixtures shall be provided by a single manufacturer to ensure compatibility.

3. The fixture shall be UL 1573 listed for stage and studio use.

4. The fixture shall comply with the USITT DMX-512A standard.

5. Physical

a) The unit shall be constructed of rugged, die cast aluminum, free of burrs and pits, finished in black.

b) The following shall be provided:

(1) Lens secured with silicone shock mounts
(2) Shutter assembly shall allow for +/-25 rota tion

(3) 20 gauge stainless steel shutters

(4) Interchangeable lens tubes for different field angles with Teflon guides for smooth tube movement

(5) Sturdy integral die cast gel frame holders with two accessory slots, and a top-mounted, quick release gel frame retainer

(6) Rugged steel yoke with two mounting positions allowing 300+ rota tion of the fixture within the yoke

(7) Positive locking, hand operated yoke clutch

(8) Slot with sliding cover for motorized pattern devices or optional iris

c) The housing shall have a rugged black powder coat finish

(1) White or silver/gray powder coat finishes shall be available as color options

(2) Other powder coat color options shall be available on request

d) Power supply, cooling and electronics shall be integral to each unit.

e) The unit shall ship with:

(1) Theatrical-style hanging yoke as standard

(2) 5’ Neutrik PowerCon™ to Edison power cable as standard

(3) Gate diffuser

(4) A-size pattern holder

f) Available options shall include but not be limited to:

(1) Bare-end, Stage-Pin or Twist-lock type-equipped power leads

(2) PowerCon to PowerCon cables for fixture power linking

(3) Smooth Wash Diffuser for overlapping beams of light from multiple fixtures

6. Optical

a) The light beam should have a 2-to-1 center-to-edge drop-off ratio

b) The unit shall provide, but not be limited to:

(1) Low gate and beam temperature

(2) Sharp imaging through a three-plane shutter design

c) The unit shall provide, but not be limited to:

(1) 5, 10, 14, 19, 26, 36, 50, 70 and 90 degree field angles

(2) High-quality pattern imaging

(3) Sharp shutter cuts without halation

(4) Shutter warping and burnout in normal use shall be unacceptable

(5) Adjustable hard and soft beam edges

d) 19, 26, 36, and 50 degree units shall have optional lens tubes available for precision, high-contrast imaging.

7. Environmental and Agency Compliance

a) The fixture shall be ETL and cETL LISTED and/or CE rated, and shall be so labeled when delivered to the job site.

b) The fixture shall be UL LISTED to the UL1573 standard for stage and studio use

c) The fixture shall be rated for IP-20 dry location use.

8. Thermal

a) Fixture shall be equipped with a cooling fan.

(1) Fan speed control via a DMX channel shall be possible

(2) Fan speed software shall permit the fixture to override DMX fan speed setting to prevent heat damage to the fixture

b) The fixture shall utilize advanced thermal management systems to maintain LED life to an average of 70% intensity after 50,000 hours of use

(1) Thermal management shall include multiple temperature sensors within the housing to include:

c) LED array circuit board temperatures

d) Temperature sensors placed on each individual LED color circuit

e) Fixture ambient

f) CPU

(1) Fixture user shall permit monitoring of temperature sensors via a legible LCD multi-line backlit display

(2) Fixtures that do not provide active thermal monitoring of LED circuits and other temperature readings shall not be acceptable

g) The fixture shall operate in an ambient temperature range of - 20°C (-4°F) minimum, to 40° C (104°F) maximum ambient temperature.

9. Electrical

    a) The fixture shall be equipped with a 100V to 240V 50/60Hz internal power supply

    b) The fixture shall support power in and thru operation

        (1) Power in shall be via Neutrik® PowerCon™ input connector

        (2) Power thru shall be via Neutrik ® PowerCon ™ output connector

        (3) Fixture power wiring and accessory power cables shall be rated to support linking of multiple fixtures up to the capacity of a 15A breaker

    c) The fixture requires power from a non-dim source

    d) Power supply outputs shall have self-resetting current-limiting protection

    e) Power supply shall have power factor correction

10. LED Emitters

    a) The fixture shall contain a minimum of five different LED colors to provide color characteristics as described in the Color Section below.

    b) All LEDs used in the fixture shall be high brightness and proven quality from established and reputable LED manufacturers.

        (1) Fixture shall utilize Luxeon® Rebel™ LED emitters

    c) Manufacturer of LED emitters shall utilize an advanced production LED binning process to maintain color consistency.

    d) LED emitters should be rated for nominal 50,000-hour LED life to 70% intensity

    e) All LED fixtures (100% of each lot) shall undergo a minimum eight-hour burn-in test during manufacturing.

    f) LED system shall comply with all relevant patents

11. Calibration

    a) Fixture shall be calibrated at factory for achieve consistent color and

intensity output between fixtures built at different times and/or from different LED lots or bins

(1) Calibration data shall be stored on the LED array as a permanent part of on-board operating system

(2) All arrays, including replacement arrays shall be calibrated to the same standard to insure consistency

(3) Fixtures not offering LED calibration shall not be acceptable

12. Color

a) The fixture shall utilize a minimum of 60 LED emitters

b) Source Four LED Lustr+

(1) Red, Amber, Green, Cyan, Blue, Indigo and White LEDs in an array designed for broad spectrum color, light tints, and variable whites. This array shall be the Lustr+ array as manufactured by Electronic Theatre Controls, or approved equal

c) Measured brightness of the Lustr+ array shall be greater than 4,000 field lumens

13. Dimming

a) The LED system shall use 15-bit nonlinear scaling techniques for high-resolution dimming.

b) At least four different dimming curve options shall be accessible at the fixture's User Interface

(1) Incandescent

(2) Standard

(3) Linear

(4) Quick

c) Dimming curves shall be optimized for smooth dimming over longer timed fades.

d) The LED system shall be digitally driven using high-speed pulse width modulation (PWM)

e) LED control shall be compatible with broadcast equipment in the following ways:

(1) PWM control of LED levels shall be imperceptible to video cameras and related equipment

(2) PWM rates shall be adjustable by the user at the fixture if necessary to avoid any visible interference to video cameras and related equipment

14. Control and User interface

a) The fixture shall be USITT DMX 512A-compatible via In and Thru 5-pin XLR connectors

b) The fixture shall be compatible with the ANSI RDM E1.20 standard

(1) All fixture functions shall accessible via RDM protocol for modification from suitably equipped control console

(2) Temperature sensors within the luminaire shall be viewable in real time via RDM

(3) Fixtures not offering RDM compatibility, feature set access or temperature monitoring via RDM shall not be compatible

c) The fixture shall be equipped with multi-line LCD display for easy-to-read status reports and configuration changes

d) The fixture shall be equipped with a six-button user-interface

e) The fixture shall offer multiple DMX input profile options to include:

(1) RGB - control of all individual LED colors via a three- channel profile

(a) Red, Green, Blue

(2) HSI – control of all individual LED colors via a three- channel profile

(a) Hue, Saturation, Intensity

(3) HSIC – control of all LED colors via a four-channel profile

f) Hue, Saturation, Intensity and Color Point

(a) Color point provides variable color temperature settings

(2) Direct – control of each individual color channel via an independent channel

(3) Studio – Control of the fixture in a white-light 3 channel profile

g) Intensity, Color Temperature, +/- Green (Tint)

(a) Without DMX the fixture can master other Source Four LEDs and Desire fixtures that are connected via 5 pin XLR DMX cables

(2) A variable-rate strobe channel shall be provided

h) The fixture shall offer three output settings

(1) Boost mode - powers LEDs at maximum intensity and provides no compensation against LED 'droop' or intensity loss

(2) Regulated mode – slightly restricts maximum LED intensity levels to compensate against LED droop

(3) Protected mode – further restricts maximum LED intensity levels to compensate against LED droop and offer color consistency at highest permissible ambient temperatures (40C)

(4) Fixtures that do not provide regulated and protected operation modes are not acceptable

i) The fixture shall offer additional user-definable options to including but not limited to:

(1) Display time out options

(2) Loss of data behavior options

(3) White point settings

(4) Red-shift option for tungsten dimming emulation

j) The fixture shall offer five Quick Set-Ups to allow user to rapidly select different combinations of the numerous user options based on the desired usage situation, to include:

(1) General – for most situations

(2) Stage – when emulating incandescent fixtures is desired

(3) High Impact – when maximum output and effect is desired

(4) XT Arch – when color consistency and architectural characteristics are desired.

(5) Studio - when DMX or stand-alone of white light output is required with intensity, color temperature and color tint control parameters

k) The fixture shall offer stand-alone functionality eliminating the need for a console

(1) Fixture shall ship with 24 preset colors accessible as a stand-alone feature

(2) Fixture shall ship with 12 sequences accessible as a stand-alone feature

(3) Each color and sequence can be modified by the end user

(4) Fixtures can be linked together with standard DMX cables and controlled from designated master fixture

l) Up to 32 fixtures may be linked

(1) Fixtures in a stand-alone state shall restore to the settings present prior to power cycling, eliminating the need for reprogramming

(2) Fixtures without stand-alone operation features described above shall not be acceptable.

m) The fixture shall be capable of copying all performance settings to other fixtures of the same type via a 5 pin XLR DMX cable

n) Provide sixteen (16) LED Ellipsoidal Lustr+ with 26° Enhance Definition Lens Tube

F. 2.5 WATT COLOR MIXING LIGHT EMITTING DIODE FIXTURE:

1. The fixture shall be a broad-spectrum color-mixing LED illuminator with DMX control of intensity as well as color changing. The fixture shall be a Vivid-R as manufactured by Electronics Theatre Controls, Inc. or approved equal.

2. All LED fixtures shall be provided by a single manufacturer to ensure compatibility.

3. The fixture shall comply with USITT DMX-512 A.

4. Physical

    a) The unit shall be black in color and contained in a rugged all-metal extruded and formed-metal housing, free of burrs and pits.
    b) Power supply, cooling and electronics shall be integral to each unit.

    c) The unit shall provide, but not be limited to:

        (1) 1/2” Mounting bolts on each end

        (2) 5’ power lead with Edison connector

        (3) Easy-access slots for secondary lenses for varied beam spreads

        (4) Optional yoke (11” and 21” only), trunnion, and hanging bracket mounting kits.

        (5) Bare-end, Stage-Pin or Twist-Loc power leads shall be available

    d) The unit shall be 21.5in (547mm) long by 7.1in (180mm) high by 7.1in (180mm) deep with a weight of 20 lbs (9.1 kg) not including mounting hardware

5. Environmental and Agency Compliance

    a) The fixture shall operate in an ambient temperature range of 0°C minimum, to 40° C (104°F) maximum ambient temperature. The fixture shall be rated for IP-20 dry location use.

    b) The fixture shall utilize advanced thermal management systems for long LED life

    c) The fixture shall provide on-board fan speed control

    d) LED fixture housing shall be designed to transfer heat from the LED board to the outside environment.

    e) The fixture shall be ETL and cETL LISTED, and shall be so labeled when delivered to the job site. The fixture shall be ETL LISTED to UL1573.

6. ELECTRICAL

    a) The fixture shall be equipped with 100V to 240V 50/60 Hz internal power supply

b) The fixture shall receive power via Neutrik® PowerCon™ input connector

c) The fixture requires power from non-dim source

d) Power/data supply outputs shall have current limiting protection.

e) Power/data supply shall provide miswiring protection.

f) Power/data supply shall have power factor correction.

g) Power/data supply shall be UL listed for Class 1 or Class 2 wiring

h) Power/data supply shall come with a housing that meets a minimum IP20 rating for dry location installation

7. LED Emitters

a) The fixture shall utilize red, red-orange, amber, green, cyan, blue, and indigo emitters for maximum spectral output.

b) All LEDs used in the LED fixture shall be high brightness and proven quality from established and reputable LED manufacturers.

c) Manufacturer of LED systems shall utilize an advanced production LED binning process to maintain color consistency.

d) LED emitters should be rated for nominal 50,000 hour LED life

e) The fixture shall utilize Luxeon® Rebel™ 2.5W LED emitters

f) All LED fixtures (100% of each lot) shall undergo a minimum eight-hour burn-in test during manufacturing.

g) LED system shall comply with all relevant patents.

8. COLOR

a) The fixture shall utilize the exclusive x7 Color System™ 7-color LED array

(1) Each 11” cell shall contain 40 LEDs

(2) Each 11” cell shall contain seven different colors of LED emitters for maximum spectral output

b) The fixture shall optimized for excellent pastel and saturated colors

c) The LED system shall be capable of at least 15-bit control of each color level in each cell for greater than 1 billion possible color combinations.

d) The fixture shall interact seamlessly with conventional sources

e) The fixture shall render light tints and skin tones similar to tungsten-sourced fixtures.

9. CONTROL

a) Each 11” cell of every fixture shall have the capability to be set to a unique and individual address.

(1) 21” fixture provides 2 independently controlled cells

b) The fixture shall be DMX 512 compatible via In and Thru 5-pin XLR connectors

c) The LED system shall be digitally driven using high-speed pulse width modulation (PWM).

d) LED control shall be compatible to broadcast equipment

(1) PWM control of LED levels shall be imperceptible to video cameras and related equipment

e) Each 11” cell of every fixture shall provide 8 channel control (7 color plus intensity)

(1) An intensity channel shall be utilized for each cell to minimize color shift during dimming.

f) The LED system shall use 15-bit nonlinear scaling techniques for high-resolution dimming.

g) Dimming curves shall be optimized for smooth dimming at low intensities and over longer timed fades.

10. Provide eight (8) Vivid 21” LED fixtures with lens set.

G. Color Mixing Light Emitting Diode (LED) Wash Fixtures:

1. The lighting instruments (fixture) shall be a color-mixing high-intensity LED illuminator with DMX control of intensity and color. The fixtures shall be Desire D40 as manufactured by Electronics Theatre Controls, Inc. or approved equal.

2. The LED lighting instrument shall be UL 1573 listed for stage and studio use and shall comply with USITT DMX-512 A standard.

3. The LED lighting instrument shall be contained in a rugged all-metal die- cast housing, free of burrs and pits and shall have a black powder coat finish. Power supply, cooling and electronics shall be integral to each unit.

4. The LED lighting instrument shall have two (2) easy-access slots for secondary lenses and other accessories. The slots shall be equipped with locking retaining clips.

5. The LED lighting instrument shall include, but not be limited to:

    a) Theatrical –style hanging yoke.

    b) 25 deg. secondary lens.

    c) Five (5) foot power lead with grounded stage-pin connector.

    d) Yoke with floor stand conversion feature.

    e) PowerCon to PowerCon cables for fixture power linking.

    f) Multiple secondary lens options to include multiple angles in the following patterns:

        (1) Linear

        (2) Round

        (3) Oblong

6. Light output shall be via a round aperture. Aperture and accessory slots shall accommodate standard 7.5” accessories such as used in other similar-sized fixtures. Accessories available as options shall include but not be limited to:

    a) Gel/diffusion frames

    b) Top hats

    c) Barndoors

    d) Egg crate louvers

    e) Concentric ring louvers

    f) Multiple secondary lensing options

7. Thermal:

a) The fixture shall be totally convection cooled, requiring no cooling fan. Fixtures which require an on-board cooling fan shall not be acceptable unless pre-approved.

b) The fixture shall utilize advanced thermal management systems to maintain LED life to an average of 70% intensity after 50,000 hours of use.

(1) Thermal management shall include multiple temperature sensors within the housing to include:

(a) LED array circuit board temperatures.

(b) Temperature sensors placed on each individual LED color circuit.

(c) Fixture ambient.

(d) CPU.

(2) Fixture user shall permit monitoring of temperature sensors via a legible LCD multi-line backlit display.

(3) Fixtures that do not provide active thermal monitoring of LED circuits and other temperature readings shall not be acceptable.

(a) The fixture shall operate in an ambient temperature range of -20°C (-4°F) minimum, to 40° C (104°F) maximum ambient temperature.

8. Electrical:

a) The fixture shall be equipped with 100V to 240V 50/60 Hz internal power supply.

b) The fixture shall support power in and thru operation.

(1) Power in shall be via Neutrik® PowerCon™ input connector.

(2) Power thru shall be via Neutrik ® PowerCon ™ output connector.

(3) Fixture power wiring and accessory power cables shall be rated to support linking of multiple fixtures up to the capacity of a 15A breaker.

c) The fixture requires power from non-dim source.

d) Power supply outputs shall have self-resetting current limiting protection.

e) Power supply shall have power factor correction.

9. LED Emitters:

a) The fixture shall contain a minimum of 5 different LED colors to provide color characteristics as hereinafter described.

b) All LEDs used in the fixture shall be high brightness and proven quality from established and reputable LED manufacturers.

(1) Fixture shall utilize Luxeon® Rebel™ LED emitters.

c) Manufacturer of LED emitters shall utilize an advanced production LED binning process to maintain color consistency.

d) LED emitters should be rated for nominal 50,000 hour LED life to 70% intensity.

e) All LED fixtures (100% of each lot) shall undergo a minimum eight-hour burn-in test during manufacturing.

10. Calibration – Fixtures shall be calibrated at factory the for achieve consistent color and intensity output between fixtures built at different times and/or from different LED lots or bins.

a) Calibration data shall be stored on the LED array as a permanent part of on-board operating system.

b) All arrays, including replacement arrays shall be calibrated to the same standard to insure consistency.

c) Fixtures not offering LED calibration shall not be acceptable.

11. Color – The fixture shall utilize a minimum of 40 LED emitters.
a) DESIRE D40

(1) Red, Amber, Green, Cyan, Blue, Indigo and White LEDs in an array designed for broad spectrum color, light tints, and variable whites. This array shall be the Lustr+ array as manufactured by Electronic Theatre Controls, or approved equal.

b) Measured brightness of the Lustr+ array shall be greater than 2900 field lumens

12. Dimming:

    a) The LED system shall use 15-bit nonlinear scaling techniques for high-resolution dimming. At least four different dimming curve options shall be accessible at the fixture's User Interface.

        (1) Incandescent

        (2) Standard

        (3) Linear

        (4) Quick

    b) Dimming curves shall be optimized for smooth dimming over longer timed fades.

    c) The LED system shall be digitally driven using high-speed pulse width modulation (PWM).

    d) LED control shall be compatible with broadcast equipment in the following ways:

        (1) PWM control of LED levels shall be imperceptible to video cameras and related equipment.

        (2) PWM rates shall be adjustable by the user at the fixture if necessary to avoid any visible interference to video cameras and related equipment.

13. Control and User Interface:

    a) The fixture shall be USITT DMX 512A-compatible via In and Thru 5-pin XLR connectors.

    b) The fixture shall be compatible with the ANSI RDM E1.20 standard.

        (1) All fixture functions shall accessible via RDM protocol for modification from suitably equipped control console.

        (2) Temperature sensors within the luminaire shall be viewable in real time via RDM.

    c) Fixtures not offering RDM compatibility, feature set access or temperature monitoring via RDM shall not be compatible.

    d) The fixture shall be equipped with multi-line LCD display for easy-to-read status reports and configuration changes.

e) The fixture shall be equipped with a six-button user-interface.

f) The fixture shall offer multiple DMX input profile options to include:

(1) RGB – control of all individual LED colors via a three- channel profile.

(a) Red, Green, Blue.

(2) HIS – control of all individual LED colors via a three- channel profile.

(a) Hue, Saturation, and Intensity.

(3) HSIC – control of all LED colors via a four-channel profile.

(a) Hue, Saturation, Intensity and Color Point.

g) Color point provides variable color temperature settings.

(1) Direct – control of each individual color channel via an independent channel.

(2) A variable-rate strobe channel shall be provided.

h) The fixture shall offer three output setting:

(1) Boost mode - powers LEDs at maximum intensity and provides no compensation against LED ‘droop’ or intensity loss.

(2) Regulated mode – slightly restricts maximum LED intensity levels to compensate against LED droop.

(3) Protected mode – further restricts maximum LED intensity levels to compensate against LED droop and offer color consistency at highest permissible ambient temperatures (40C).

(4) Fixtures that do not provide regulated and protected operation modes are not acceptable.

i) The fixture shall offer additional user-definable options to including but not limited to:

(1) Display time out options.

(2) Loss of data behavior options.

(3) White point settings.

(4) Red-shift option for tungsten dimming emulation.

j) The fixture shall offer five Quick Set-Ups to allow user to rapidly select different combinations of the numerous user options based on the desired usage situation, to include:

(1) General – for most situations.

(2) Stage – when emulating incandescent fixtures is desired.

(3) High Impact – when maximum output and effect is desired.

(4) XT Arch – when color consistency and architectural characteristics are desired.

(5) Studio - when DMX or stand-alone of white light output is required with intensity, color temperature and color tint control parameters.

k) The fixture shall offer stand-alone functionality eliminating the need for a console.

(1) Fixture shall ship with 24 preset colors accessible as a stand-alone feature.

(2) Fixture shall ship with 12 Sequences accessible as a stand-alone feature.

(3) Each color and sequence can be modified by the end user.

(4) Fixtures can be linked together with standard DMX cables and controlled from designated master fixture.

(5) Up to 32 fixtures may be linked.

(6) Fixtures in a stand-alone state shall restore to the settings present prior to power cycling, eliminating the need for reprogramming.

(7) Fixtures without stand-alone operation features hereinbefore described shall not be acceptable.

14. The Theatrical Lighting Instruments shall be ETC D40 LED lighting instruments. This Contractor shall furnish the following types and quantities of LED lighting

instruments with C-clamp, safety chain and full lens sets:

a) Provide fourteen (14) Desire D40™ Lustr+

H. Followspots:

1. The basis of this design shall be the Canto 250HR follow spotlight, as marketed by Strong Entertainment Lighting of Omaha, Nebraska.

2. The unit frame and enclosure shall be constructed of formed cold rolled steel and sturdy aluminum extrusions, free of burrs and protected by a black powder coat finish.

3. Handles shall be provided to facilitate smooth operation and to lift the unit.

4. The unit shall be mounted on a stable, folding three-point floor stand, with:

   a) Easy height adjustments,

   b) Horizontal Swing Control Lever and

   c) Vertical Tilt Control Lever

5. The Power Supply shall be integral to the followspot.

6. Weight of Head, including power supply, shall not exceed 34 pounds.

7. Length of head unit with color changing boomerang shall not exceed 41”.

8. A sliding panel shall provide access to lenses without the use of tools.

9. Controls

   a) The Lamphouse shall as a minimum incorporate the following:

10. Silent Fan Free air cooling system;

11. Drop-down single ended lamp holder to permit bulb replacement without the use of hand tools;

12. Bulb positioning controls.

    a) The body of the unit shall, as minimum incorporate the following:

13. Optical dimmer iris mechanism for smooth manual dimming;

14. Four shutters mounted on two planes, for both vertical and horizontal masking

15. Drop-in Nichrome steel iris

16. Drop-in Gobo Holder

17. Zoom focus controls with calibrations silk screened on followspot body.

    a) With the iris fully open this followspot shall be capable of producing a continuous range of field angles from 10.6 degrees in spot to 19.2 degrees in flood.

    b) At any field angle the beam shall be adjustable between soft and sharp edges.The front of the unit shall house a five color, self-canceling boomerang with color filters

18. Optical

    a) The unit's optical train shall consist of

        (1) Socket mounted 250 watt single-ended ceramic lamp, with the following features:

    b) 3,200°K color temperature;

    c) CRI greater than 90;

    d) Hot restrike;

        (1) 4,000 hour average life.

        (2) Fixed Optical Quality glass reflector and double condenser lens.

        (3) Variable focus lens system utilizing Optical-quality glass;

        (4) Iris/Gobo Holder, Shutters for beam shaping control;

        (5) Optical dimmer Iris;

        (6) Five color boomerang.

    e) The zoom focus shall increase light intensity as it decreases the spot diameter.

19. Electrical

    a) Lamp system input shall be 90-265 V.AC, 50/60 Hertz, single phase.

    b) Lamp shall be ST 250HR as manufactured by Philips, or approved

equal.

c) A double microswitch interlock shall be provided for safe lamp replacement.

20. Performance

a) Adjusted for flat field (approximately 70%) the unit shall produce a continuous range of illumination from 136,800 beam candlepower in Flood focus to 277,200 beam candlepower in Spot focus.

b) The Field diameter at a 60 foot throw shall be continuously adjustable from 20.3 feet in Flood focus to 11.2 feet in Spot focus. With full iris the Field diameter in spot focus shall be less than 15”.

c) Furnish two (2) #10857070 Canto 250 HR followspots, complete with Lamp, Iris, Gobo Holder, Color Changer, Stand and all necessary accessories.

Part 3 - Execution

XV. INSTALLATION

A. All wiring for lighting and control system shall be run in minimum ¾” conduit as hereinbefore specified. All junction box covers shall be identified as hereinbefore specified. All conduits, device mounting boxes, junction boxes, and enclosures shall be securely fastened with appropriate fittings to insure positive ground throughout the entire system.

B. This Contractor shall furnish and install all wiring and make all final connections as indicated in the system manufacturer’s shop drawings and standard installation documents. Splices for dimming circuits shall be made only in junction boxes.

C. All wiring shall be checked and tested by this Contractor to ensure the system is free from grounds, opens, and shorts.

D. All work shall be under the supervision of a field engineering technician, accredited by the system manufacturer. It shall be the responsibility of this technician to check and inspect the installation to the Owner's and Architect/Engineer's satisfaction. This technician shall also provide a minimum of four (4) hours of training for the Owner's operating personnel on the proper operation and maintenance of the lighting control system equipment.

XVI. OPERATING AND MAINTENANCE INSTRUCTIONS

A. At the completion of the installation, the manufacturer shall furnish four (4) final sets of "as-built" drawings as well as manuals of instruction as to the proper operation and maintenance of the lighting control system. “As built” drawings shall include all field

modifications. Formal turn-on and instruction shall be provided to the Owner's officially designated representative within fourteen (14) days of a written request by the Owner.

B. This Contractor shall furnish the Owner's officially designated representative(s) with a minimum of three (3) hours of on-the-job instructions in the operation, maintenance, and diagnostic testing of the system. (This shall not be part of the system turn-on specified above.) This Contractor shall also furnish the Architect/Engineer four (4) bound copies of complete operating and maintenance instruction manuals of the lighting control system including circuit diagrams and all other information necessary for proper operation and service maintenance.

XVII. SYSTEM TEST

A. This Contractor shall conduct an operating test of the complete system. The system shall test free from grounds, shorts, and other faults. All connections shall be thoroughly checked for mechanical and electrical connections. All lighting control system equipment shall be demonstrated to operate in accordance with the requirements set forth in these Specifications and as shown on the Drawings.

B. This Contractor shall perform all tests in the presence of the Architect/Engineer. This Contractor shall furnish all personnel and test instruments for use in the test.

XVIII. WARRANTY

A. This Contractor shall deliver the work in a first-class operating condition in every respect.

B. This Contractor shall warrant that the material, equipment, and workmanship furnished shall be entirely free from defects. Any material, equipment, or workmanship in which defects may develop before or during the warranty period shall be repaired or replaced at the Contractor's own expense. Refer to SECTION 01740 for the start of the warranty period. The Contractor shall further warrant that all material, equipment, and workmanship used in the installation, but not specifically mentioned in the Drawings and Specifications, is the best of their respective kinds and that the construction and installation was performed in accordance with the best accepted standard practices in all details.

C. All materials used shall be new and of good quality conforming to these specifications and the successfully reviewed submittals. Any material not successfully reviewed by the Architect/Engineer that is incorporated in the work, used or delivered to the site, shall be immediately removed upon the order of the Owner or Architect/Engineer and replaced to the satisfaction of the Architect/Engineer at this Contractor's expense.

D. It shall be this Contractor’s responsibility to include costs incurred in other trades for any work disarranged by such replacements described above. This will include replacement of work and damaged equipment during the progress of construction.

E. The lighting control system manufacturer shall be prepared to offer a service contract

for the maintenance of the system after the warranty period.

END OF SECTION

Part 1 - General

I. REQUIREMENTS

A. The general provisions of the Contract, including General and Supplementary Conditions and General Requirements, apply to the work specified in this Section.

II. SCOPE

A. The work covered under this Section shall include the materials and equipment necessary for this Contractor to furnish and install a performance lighting control system(s), wiring devices and performance lighting instruments herein specified for the black box theater. It shall also include the services of qualified field engineer/technicians regularly employed by the manufacturer of the system(s) who shall review the installation(s) to ensure its proper operation and provide Owner training.

B. The Black Box Theater Performance Lighting Systems and Controls shall be furnished by a factory authorized Theatrical Contractor/Distributor certified to design, program and service the systems. The Theatrical Contractor shall be responsible for coordination between the electrical installation and other trades installing theatrical equipment and for control terminations, system startup, system training, and warranty repair. A Theatrical Contractor is defined as a dealer who regularly engages in the sale and installation of theatrical supplies and equipment. The Theatrical Contractor/Distributor must show evidence of successfully furnishing theatrical systems specified for at least five (5) years.

C. This Contractor shall furnish and install all necessary equipment as hereinafter detailed for a complete and functional performance lighting control system(s) including the theatrical lighting instruments. Although not every component is called out in every detail, it shall be the responsibility of the manufacturer providing the system to assure that the intended function is furnished.

D. The system specified herein shall consist of a dimmer-per-circuit high density dimming system equipment panel, performance lighting control console, network based signal distribution system, distribution equipment, performance lighting instruments, and all required interconnecting wiring.

E. This Contractor shall furnish and install in accordance with the lighting control manufacturer's instructions, all conduits, wiring, and outlet boxes required for the erection and operation of the complete system(s) as herein specified and as shown on the Drawings.

F. The Black Box Theater performance lighting control system shall be supplied as a single integral unit with all dimmer modules, control circuits, circuit breakers, and the like factory wired. Field wiring shall consist of connecting input feeders, dimmer circuits, and remote control wiring to the distribution devices and control console.

G. It is the intention of this specification section that the entire Black Box Theater performance lighting control system be available to all bidders and not “Packaged or Bundled” with any other lighting systems or equipment.

III. DEFINITIONS

A. The term “furnish” means to supply and deliver to the job site, ready for unloading, unpacking, assembly, installation, and similar operations.

B. The term “install” is used to describe operations at the job site including the actual anchoring, applying, assembling, cleaning, curing, cutting, erection, finishing, patching, placing, protecting, pulling, terminating, unloading, unpacking, working to dimension, and similar operations that will render the systems complete and ready for the intended use.

C. DMX: Digital Multiplexing

IV. SUBMITTALS

A. Provide three (3) submittals in accordance with General and Special Conditions. Submit submittals in a timely manner, allowing sufficient time for adequate review and possible resubmittal without jeopardizing the project schedule.

1. Submittals shall include: full system riser diagrams, a full set of printed technical data sheets, and any additional information as required by the owner to verify compliance with specifications.

B. Manuals:

1. Operations and Maintenance Manuals shall include:

a) Contact information for pertinent manufacturers

b) Safety and Operational Instructions

V. QUALITY ASSURANCE

A. The contractor shall furnish submittals for all components of the performance lighting and lighting control system(s) in accordance with SECTION 16010 of these Specifications. The submittals should include the manufacturers working drawings and shall include, but not be limited to the following:

1. Manufacturer's catalog data for all lighting instruments, equipment, and components that shall include all technical data to demonstrate conformance with these Specifications.

2. Complete physical drawings of all items of equipment showing dimensions, metal gauges, etc.

3. Complete load schedules which shall clearly indicate actual connected loads and control channel assignment (where applicable), cross- reference of internal equipment identifications to circuit numbers shown on the Drawings, and all other scheduled information which shall relate the equipment to the project requirements.

4. Complete internal and interconnection wiring diagrams showing number, size, and types of conductors between equipment and from equipment to loads, and feeder quantity and sizes.

B. All materials used shall be new and of good quality conforming to these specifications and the successfully reviewed submittals. Any material not successfully reviewed by the Architect/Engineer that is incorporated in the work, used or delivered to the site, shall be immediately removed upon the order of the Owner or Architect/Engineer and replaced to the satisfaction of the Owner and Architect/Engineer at this Contractor's expense.

1. It shall be this Contractor’s responsibility to include costs incurred in other trades for any work disarranged by such replacements described above. This will include replacement of work and damaged equipment during the progress of construction.

C. The lighting control system equipment specified herein shall be the sole responsibility of a single manufacturer. The manufacturer shall have been producing theatrical lighting and SCR type lighting control systems for at least fifteen (15) years.

D. All work shall be in accordance with good engineering practices. All equipment for this system shall be listed by Underwriter's Laboratories, Inc. (UL), bear the UL label, and shall be installed in accordance with all requirements of the National Electrical Code (NEC), state and local codes, and these Specifications.

E. The entire performance lighting control system shall be completely factory assembled and tested under load conditions prior to shipment of the system.

F. Existing system modifications only: Prior to any work being performed on the existing system, the entire performance lighting control system shall be completely tested under load conditions. The test shall include each device on the existing system. The Contractor shall certify the operating condition and report any abnormal conditions to the Owner.

VI. QUALIFICATIONS

A. Qualifications

1. Manufacturer: A firm who has been continuously engaged in the production of theatrical lighting and control equipment for at least fifteen (15) years and in the manufacture of theatrical dimming systems and dimmers for a minimum of ten (10) years.

2. Provider: Skilled technicians who are thoroughly trained and experienced in the necessary crafts and who are completely familiar with the specified requirements and best industry practices for the proper installation of the work.

B. The Contractor and the Theatrical Contractor/Distributor shall be required to furnish satisfactory proof of their competence as evidenced by successfully completed previous contracts where control equipment of this nature has been specified.

C. The Contractor is encouraged to visit the site, shall become familiar with the Drawings outlining this work, and shall become completely familiar with the various items of equipment being furnished under other Divisions of these Specifications related to this work. The Contractor shall make all necessary investigations relative to the conditions that may be encountered on this project.

VII. DELIVERY, STORAGE AND HANDLING

A. Deliver equipment and controls securely wrapped in factory fabricated wooden or fiberboard containers.

B. Handle equipment and controls carefully to prevent breakage, denting and scoring finish. Do not install damaged equipment and controls; replace and return damaged units to equipment manufacturer.

C. Acceptance at Site: Provider shall accept and inventory all equipment upon delivery and provide copies of the inventory to the owner.

D. Storage and Protection: Store equipment in a secure, environmentally controlled location. Place no equipment until that location is substantially complete, free from construction dust, and “broom clean”. Store in original cartons and protect from dirt, physical damage, weather, and construction traffic.

VIII. SPARE PARTS

A. This Contractor shall furnish to the Owner spare parts as follows. Spare parts shall be furnished prior to the installation of the system.

1. One (1) dual 2.4 kW dimmer module.

2. One (1) spare dimmer rack processor (Control Module).

B. This Contractor shall furnish to the Owner, at the completion of the project, 20% (minimum of two) spare lamps for each type and wattage of lamps used in the theatrical lighting instruments.

Part 2 - Products

I. MANUFACTURERS

A. The Black Box Theater lighting control system as shown on the Drawings and herein specified shall be as manufactured by ELECTRONIC THEATRE CONTROLS, INC. (ETC) [Sensor3™ System] as listed or the equivalent as manufactured by STRAND LIGHTING, INC. [A21 System] which must meet all of the requirements of these Specifications. The system shall utilize the manufacturer’s standard products and components with modifications as required meeting the construction and performance requirements of this section.

B. The theatrical lighting instruments as shown on the drawings and herein specified shall be as manufactured by ELECTRONIC THEATER CONTROLS INC. (ETC), as listed or the equivalents as manufactured by STRAND LIGHTING, INC., or DESISTI LIGHTING

which must meet all of the construction and performance requirements of these specifications.

II. DIMMING SYSTEM EQUIPMENT RACK

A. This Contractor shall furnish and install where shown on the Drawings, a Black Box Theater performance lighting dimming system equipment rack. The rack shall be ETC Sensor3 SR3-12 (12 module) Advanced Features wall mounted dimmer rack or equal.

B. Dimmer Rack Electrical:

1. The dimming system equipment rack shall be suitable for operation at 120/208 volt, three phase, four wire, + ground, sixty hertz, 200 amp, and have busing rated for 100% continuous duty, and suitable lugs for a single point connection. Sensor racks shall automatically compensate for frequency variations during operation. Standard SCCR fault current protection shall be 50,000A. Racks shall be UL listed with appropriate factory applied labels.

2. Load and neutral terminals shall be sized to accept up to two (2) sets of 250 kcmil conductors or other sizes and/or quantities of conductors as shown on the Drawings.

3. Load terminals shall be located at the front of the wiring cavity. Front access racks having terminals located at the back of the rack or on the side near the back of the rack such that adjacent load cabling may block terminal access shall not be acceptable.

C. Dimmer Rack Electronics:

1. Power control electronics (CEM3) shall be contained in a single module that must be plug-in capable without use of tools.

2. All data and power input for CEM3 control electronics shall be located on a separately removable/pluggable termination connector on the backplane such that backplane can be replaced without removal and discrete secondary conductor terminations. Dimming systems that require discrete termination of DMX, Ethernet, power input, and dimmer control output directly on terminals on the control module or pluggable backplane shall not be permitted.

3. The power controller shall directly support the following network protocols:

a) Net3 protocol suite including ANSI E1.31 Streaming ACN (sACN)

b) ANSI E1.17 Architecture for Control Networks (ACN)

4. Systems must support the above listed industry standard ACN protocols for Ethernet setup, control and feedback integrated directly between the power system and control system.

5. The power controller shall directly support 2 ports of control input using ANSI E1.11 USITT DMX512-A.

6. Dimming control signals must be sent between control module and dimmer/power modules using flat ribbon cables.

7. System must provide an optional low voltage connection to maintain power of control electronics through brown out, instantaneous, and sustained power outages.

8. Control electronics shall be housed in a formed steel body with cast- aluminum face panel.

D. Physical:

1. The Sensor3 dimmer rack shall be a wall mounted, dead-front switchboard, substantially framed and enclosed with 16 gauge, formed steel panels. All rack components shall be properly treated, primed and finished. Exterior surfaces shall be finished in fine-texture, scratch- resistant, gray epoxy paint. Knockouts in the top and bottom panels shall facilitate conduit termination on the rack.

2. Rack components shall be designed for easy removal and installation so that the dimming system equipment rack is completely open and empty during field wiring. Rear access to the rack for installation or servicing shall not be required. Racks shall be designed for front access to allow back-to-back, back-to-wall or side-by-side installation.

3. Racks shall be designed to allow easy insertion and removal of all modules without the use of tools. Supports shall be provided for precise alignment of dimmer modules into power and signal connector blocks. With modules removed, racks must provide clear front access to all load, neutral and control terminations.

4. An optional bus bar kit shall be available from the factory to allow adjacent racks to be powered by a single line feed. No hard, rack-to-rack wiring shall be required. Racks that require discrete cabling to connect adjacent racks shall not be acceptable.

5. Module spaces shall be mechanically keyed to accept only the 3kW or below, 5kW, or 10kW module specified for that space. The rack shall be configurable to accept mixed dimmer types and sizes throughout the rack.

6. Each rack shall provide a lockable full-height door containing an integral electrostatic air filter that shall be removable for easy cleaning. A single low-noise fan shall be located at the top of each rack. Design of the rack and dimmer modules shall draw all cool air intake air through the integral electrostatic air filter at the front of the rack, discretely through each module housing and directly out the top of the rack such that exhausted hot air from adjacent modules does not heat the module(s) above, below, or to the side of each other.

7. The fan shall maintain the temperature of all components at proper operating levels with dimmers under full load, provided the ambient temperature of the

dimmer room does not exceed 40°C/104°F. Dimmer racks that do not employ both locking doors and electrostatic air filters shall not be acceptable.

8. The fan shall turn on whenever any dimmer in the system is activated. In the event of an over-temperature condition, only the affected dimmer module(s) shall shut down and a message shall appear on the control module LCD. The fan shall remain on during thermal shutdown of individual dimmer modules. Systems must include over-temperature sensing and preventative thermal shutdown.

9. A fan sensor shall be provided. In the event of momentary fan failure, error message will be displayed and sent remotely over Ethernet to optional logging systems. Systems must provide optional system event logging.

10. If the ambient room temperature drops below 0°C/32°F or rises above 40°C/104°F, a warning shall appear on the dimmer rack LCD. If the temperature rises above 46°C/115°F, the rack shall shut down until the condition is corrected.

11. A 3 x 0.5-inch LED status indicator (beacon) shall be mounted in the rack door. The beacon shall be visible throughout a wide viewing angle. In normal operating conditions, this LED is illuminated. If the rack's control module senses an error condition, the beacon shall flash until the error is corrected. An optional indicator shall be available for remote locations. Racks must have external means of visually showing that an error is present.

E. Provide one (1) SR3 12AF Advanced Features Dimmer rack.

F. Provide an engraved nameplate on the front face of the dimmer rack in a suitable location. The nameplate shall be lettered BLACK BOX THEATER LIGHTING SYSTEM RACK.

III. POWER CONTROL ELECTRONICS

A. The dimmer rack electronics shall be contained in one (1) plug-in CEM3 Power Controller. Each power controller shall plug into the dimming cabinet with no need for tools or discrete wire connections. A simple user interface shall be provided for group configuration, testing and diagnostics. Power control shall be UL/cUL Listed and CE Marked. Removal of Power and Dimming Control electronics must be a tool free process.

1. The control electronics shall be contained in one plug-in module, housed in a formed steel body with cast-aluminum face panel, and self-retaining ejection handles to ease removal from the rack.

2. The power control shall automatically compensate for frequency variations during operation.

B. Power Control Interface:

1. A backlit eight-line by 20-character graphical LCD shall be provided for system

configuration, live control, and status display.

2. The following functional features shall be available in power control to reduce setup and tech times:

    a) Full number pad shall be provided for quick access to dimmers. Power Control must provide 0-9 number pad and logic keys for AND, THRU, and AT for fast access, selection, and control of circuit/dimmer number.

    b) Power control shall provide NEXT and LAST buttons to progress through circuits/dimmers during dimmer check operations such that only a single circuit is brought on to a level at a time during pre-show lighting checks for lamp burnouts.

    c) Shortcut buttons for Setup, About, and live control shall be provided for separation of functionality such that a user intending to check status or settings does not accidentally render their system unusable. These buttons shall also serve to reduce maximum time to access any feature or setting on a single dimmer, range of dimmers, or entire rack.

3. The front panel shall have five status LED indicators: power, network activity, DMX A, DMX B, and panic state.

4. Power control that does not include the above buttons and features shall not be acceptable.

C. Control Signal and Communications:

1. The power control shall be provided with an Ethernet control signal input. This input shall be fully configurable with a range of patching and priority programming capabilities. The Ethernet signal shall supply seamless integration between the dimmer racks and both the entertainment and architectural lighting control systems. The Ethernet signal shall also enable remote configuration, playback, file storage and monitoring features on a personal computer on the network. Dimming systems that require Ethernet to DMX translation devices for control of critical show lighting introduce a potential failure point and shall not be acceptable.

2. All data and power input for CEM3 control electronics shall be located on a separately removable/pluggable termination connector on the backplane such that the backplane can be replaced without removal and discrete secondary conductor terminations. Systems must support tool- less and not require removal of wires connected directly to the control electronics.

3. DMX connections shall be available with option for pluggable screw or punch-down type terminal. Systems must allow this option to support both DMX over CAT5 and multi-strand conductors.

4. Ethernet connection shall be available via standard Cat5 RJ45 connection. System requiring punch down direct to rack or controller cannot be Cat5 system certified and shall not be acceptable.

5. Dimming systems that require discrete termination of DMX, Ethernet, power input, and dimmer control output directly on terminals on the power control or pluggable backplane shall not be acceptable.

6. The following options shall be provided to backup all controller setup UL924 Panic configuration, and recorded presets:

    a) Automatic backup in non-volatile backplane memory.

    b) Automatic backup in non-volatile Controller memory.

    c) USB storage device pluggable on the controller face panel.

    d) Data shall also be transferable to and from library storage on a personal computer on a per-rack basis.

7. The power controller shall directly support the following network protocols:

    a) Net3 protocol suite including ANSI E1.31 Streaming ACN (sACN).

    b) ANSI E1.17 Architecture for Control Networks (ACN).

8. The power control shall directly support two (2) optically isolated ports of ANSI E1.11 USITT DMX512-A for control input. Minimum 2,500V of optical isolation shall be provided between the DMX512 inputs and the electronics. Systems having optical isolation on a prewired factory plug-in device shall not be acceptable.

9. Systems must support the above listed industry standard ACN protocols for Ethernet setup, control, and feedback integrated directly between the power system and control system.

D. Power Control Features:

1. Power Control shall have a dimmer update rate better than 16ms (60HZ) or 20 ms (50 Hz) average. Dimmer outputs shall exhibit no oscillating or hunting for levels. Dimmers with the same choke type set to the same level shall output within ±1V of each other, regardless of phase or input voltage.

2. Power control shall maintain proper dimming performance for all line feed frequencies from 47-53Hz and 57-63Hz without flicker or misfire. Shifts in frequencies up to 3 Hz shall not result in flicker or loss of dimming timing. Systems must perform to these frequency tolerances and shifts.

3. Dimmer output levels shall be regulated for incoming line voltages. The regulation shall adjust for both RMS voltage changes and deformations in the incoming AC waveform. The power control shall monitor and adjust each dimmer's output to maintain a constant power to the load. Regulation shall maintain the desired output voltage ±1V for the entire operating range (91-139V and 181-259 VACS) with the exception that the maximum output will be no

greater than the line voltage minus dimmer insulation loss. The regulation shall compensate for dips and anomalies in the AC waveform on a dimmer by dimmer basis. There shall be no interaction between dimmers in the system or any other equipment. The output shall be nominally regulated to 115V/230V appropriate for the market, but shall be field adjustable on a dimmer by dimmer basis to allow for varying cable length. Systems must maintain performance to the above stated voltage regulation.

4. Power control shall support a rack filled with different types and sizes of dimmer modules. The properties of each dimmer shall be configurable, including dimmer name, output curve, dimmer firing mode, and scale voltage values.

    a) The output curve selections shall include IES Modified Square, Square, Linear, Modified Linear and a Sensor v2.0 output curve. The power control shall also have the capability of storing up to three custom curves as well as an adjustable preheat level, assignable on a per-dimmer basis.

    b) The dimmer firing modes shall include: Normal (Dimmed), Dimmer Doubled, Switched (unregulated on/off with adjustable on-at level), Fluorescent with adjustable threshold, and Off.

    c) Dimmers set as Dimmer Doubled shall allow a single dimmer to set two different levels on one dimmer circuit by splitting the AC power into positive and negative half cycles with no resultant DC line current.

    d) Power Control must support all above listed adjustments to dimmers on a per circuit basis.

5. Controller shall support two (2) methods of automatic configuration during controller replacement in a rack.

    a) Use backplane configuration- The backplane shall retain full setup and preset data in. In this recovery mode, when a new power control is inserted, the controller shall automatically come on-line fully functional without any manual intervention.

    b) Use controller configuration- Override backplane configuration such that replacement modules automatically use the configuration resident in nonvolatile memory of the power control.

6. Controller shall be capable of changing rack setup for multiple shows for an entire system with a single update command from a remote PC. Show setup shall be saved in XML format and capable of being saved/uploaded from both USB and remote PC.

7. In the event of data loss each rack shall maintain the last level for a user programmable time of zero to five minutes or indefinitely, or may be programmed to fade out or to play a specific preset. Systems must offer this feature.

8. The power control shall contain diagnostic routines to allow the user to test and troubleshoot the system. The power control shall also contain a Test/Bypass switch to turn all dimmers on to full for testing. This switch shall bypass all electronics and shall force the fan on. Systems must include local control, “all on” control bypass, and diagnostic routines.

9. The power control shall be able to record up to 64 presets in a rack. Presets shall be user programmable by recording a snapshot of current dimmer levels (as set by the all control sources), by entering dimmer levels on the power control directly, or a combination of both methods. The system shall have the ability to program and activate group wide presets from the power control, remote station, console, networked computer, or handheld device. Presets shall be activated in the default fade time of 2 seconds, but shall be have a user-programmable fade time between 0 and 60 minutes.

10. DMX A and B as well as the Ethernet DMX (EDMX) data may be patched using a rack start address - assigned sequentially from a starting control channel or patched individually on a per-dimmer basis. Priority may be set per universe for the DMX inputs, and set per universe by the control source for Ethernet input. Each dimmer may have up to six network control inputs with either a highest takes precedence or priority patch. Each dimmer may also then be assigned to one of 16 spaces for additional specific preset control. Each preset shall have a separate priority for maximum flexibility of prioritization. Systems that must support prioritization of multiple Ethernet sources beyond HTP shall not be deemed acceptable. Systems must support the above listed flexibility in control source prioritization shall not be deemed acceptable.

11. Power control shall provide the ability to set a single circuit, all circuits or a range of circuits to a level at the control interface in the rack. Systems that cannot locally control dimmers through local control override shall not be acceptable.

12. The power control shall be capable of monitoring and displaying incoming line voltage for all three phases on the LCD. With installed current sensors, the same display shall show amperage on each phase.

13. The power control shall support security protected access. The user shall to able to program passwords that restrict access, preventing unauthorized use of higher-level functions by unauthorized personnel. Systems that do not provide security protected access to features that can render the system unusable shall not be acceptable.

E. Standard Feedback:

1. System and Rack messages shall include, but not be limited to, the following:

    a) DMX port A or B has an error or has failed

    b) Network has an error or has failed

c) Phase A, B or C is below 90 volts

d) Phase A, B or C is above 140 volts

e) Phase A, B or C did not start because it was below 90V or above 140V at power up

f) Phase A, B or C voltage headroom warning

g) Frequency is not 50 or 60 Hz

h) Rack shutting down due to air flow loss

i) Ambient temperature is below 0°C/32°F

j) Ambient temperature is above 40°C/104°F

k) Rack shutting down - ambient temperature exceeds 46°C/115°F

l) Configuration memory error

2. About display shall allow monitoring of system, rack or dimmer status.

a) About System shall provide information about Panic circuits, Preset looks, and System name.

b) About Network shall provide IP address, gateway and net mask.

c) About Rack shall provide information about rack name, ambient temperature, air filters and rack type.

d) About Rack Power shall provide information about power type, rack voltages, current per phase (only with current transformers), under voltage warnings.

e) About Rack Data shall provide status for DMXA, DMXB, EDMX and Network activity.

f) About Dimmer shall provide information about dimmer type, location, output level, control source, scale voltage, mode and curve.

F. Advanced Feedback:

1. Sensor's Advanced Features (AF) option shall add an additional sensor in the individual dimmer modules. This option shall allow monitoring of current and output voltage on a dimmer by dimmer basis and provide information on lamp burnouts, dimmer status, and input voltages.

2. Power control shall allow the user to record the loads of all AF dimmers in the system. The power control shall, during operation, test each AF dimmer, determine its load, and compare it to the recorded load. Any change from

recorded loads of configured tolerance shall display an error on the power control and any monitoring device on the network. If a dimmer is driven on with no load, an optional message shall be available to notify the console operator and electrician that there is no load.

3. Dimmer Specific messages shall include, but not be limited to, the following:

    a) Load has dropped below recorded value

    b) Load has raised above recorded value

    c) DC detected on dimmer output

    d) One SCR has failed on/off

    e) Dimmer has failed off or circuit breaker has tripped

    f) Dimmer has been removed

    g) Dimmer load has failed

    h) Dimmer has shut down due to over temperature

4. About Dimmer display shall provide additional information regarding the dimmer's recorded load and current or actual load.

G. Network Interface:

1. The Ethernet network shall provide an integral link to connect all racks in the system for rack-to-console and rack-to-network device communication.

2. The network interface to the power controller shall provide a number of user-programmable control schemes between control sources, including architectural control.

3. Hardware settings for rack type, available module types, availability of AF features, and operating voltage shall be configurable at the factory or in the field, and shall not require secondary setup after system commissioning even in the event to power controller replacement.

4. User programmable parameters shall support onsite setup, via the local interface in the rack. These parameters shall include, but not be limited to, defining module type, scale voltage for each dimmer, firing mode, curve, dimmer numbering and DMX512 or network port assignments. Systems requiring factory programming shall not be acceptable.

H. Provide one (1) CEM3 control module (7140A1001) with Smartlink and one (1) spare CEM3 control module.

IV. CONTROL PROCESSOR MODULES

A. The Architectural Control Processor shall be the Unison Smartlink S-ACP Series Control Processor as manufactured by Electronic Theatre Controls, Inc., or equal.

B. The Architectural Control Processor (ACP) assembly shall be designed for use in DRd Series Dimming Enclosures.

C. The processor shall utilize microprocessor based, solid state technology to provide multi-scene lighting control.

1. ACP shall support functions such as system programming. ACP station shall allow configuration of the control system via the menus.

2. When used in a dimming enclosure, the ACP shall allow access to dimming control menus including the status screen, dimming configuration screen, backup menu, test menu and configuration menu.

D. One ACP shall be rated to drive up to 48 channels of control, 64 presets, and 16 button stations.

E. ACP module electronics shall be convection cooled.

F. The ACP shall provide front-panel Secure Digital (SD) card slot for configuration and data exchange.

G. Architectural Lighting System configuration and program information shall be stored in flash memory, which does not require battery backup.

H. The ACP shall be contained in a plug-in assembly and require no discrete wiring connections; all wiring shall be terminated into the Rack Enclosure.

1. The ACP shall support the following communications:

a) Echelon LinkPower

b) ESTA DMX512A

I. Provide one (1) Smartlink Architectural Control Processor and one (1) spare S- ACP

V. DIMMER MODULES

A. The dimmer modules shall be the Sensor dimmer modules as manufactured by Electronic Theatre Controls, Inc., or equal. Sensor modules shall be designed for complete flexibility of choice for dimmed, non-dim, or hot power on each 20A branch circuit. A single module shall provide one of the following:

1. Two dimmed outputs with choice of 500 or 350us rise times, controlled by DMX.

2. Two air gap relay switched outputs controlled by DMX.

3. Two manual bypass constant power circuits, controlled manually.

a) The module may be configured to operate as two dimmers, two relays, or any combination of relay and dimmer from the CEM3 Power Control module or from an ETC control console connected to a CEM3 system. Any single circuit may be set to bypass the dimmer using a switch on the front of the module.

4. The power control system shall report circuit specific errors via the rack control electronics and/or via a lighting control console.

5. Modules shall provide the following status reporting functions:

a) Load dropped below recorded value

b) Load increased over recorded value

c) DC on dimmer output

d) SCR failed on/off

e) Circuit breaker tripped

f) Dimmer error

g) Module removed

h) Load absent

B. Electrical:

1. Each dimmer module shall contain two single-pole circuit breakers, a solid-state switching module, associated toroidal filters, and power and control connectors, a 120VAC remotely controllable mechanically latching air gap relay, a low voltage dc manual bypass override switch, and one fuse per branch circuit for sufficient short circuit rating.

2. Modules shall not have any protruding pins subject to physical damage when the module is not installed.

3. Modules shall be keyed so that dimmer modules of different capacity shall not be interchangeable.

4. Each dimmer shall be protected by a fully magnetic single pole, 20 amp, or as shown on the Drawings, one hundred percent (100%) rated circuit breaker listed at 10,000 amps or greater interruptible current mounted on the face plate of the dimmer. The breaker shall be used as a dimmer disconnect and shall be rated for 100% switching duty. Circuit breakers shall be rated for tungsten loads having an inrush rating of no less than 20 times normal current. Under overload conditions, the circuit breaker shall disconnect power to the dimmer module before damage can be done to the power devices. The trip current shall not be affected by ambient temperature within the operational specifications of the system. Dimmers must operate continuously at 100% load.

5. Modules that use Triac dimming shall not be acceptable. Modules which utilize an SCR or Triac solid state switch as a dimmer bypass may void warranty of products they are powering and shall not be an acceptable means of bypass.

C. SCR Assembly:

1. Each dimmer shall be rated 2.4kW.

2. Each dimmer module shall use a solid-state module (SSM) consisting of two silicon-controlled rectifiers (SCRs) in an inverse parallel configuration, and all required gating circuitry on the high voltage side of an integral, opto-coupled control voltage isolator. Rectifiers, copper leads and a ceramic substrate shall be reflow soldered to an integral heat sink for maximum heat dissipation. The SSM shall also contain a control LED, a thermistor for temperature sensing, and silver-plated control and load contacts. The entire SSM shall be sealed in a plastic housing requiring only a screwdriver to replace. Dimmers must employ triac power devices, pulse transformers, or other isolating devices providing at least 2,500V RMS isolation. Dimmer modules requiring disassembly, heat sink grease or additional tools for repair shall not be acceptable.

3. All electronic components (current/voltage sensors and indicators) shall be contained in a single, field-replaceable housing. Modules requiring discrete wiring of electronic components shall not be acceptable.

4. SCR power switching devices shall have the following minimum ratings:

Module Size:	20A
Single cycle: Peak surge current	625A
Half cycle: 12T	1,620
Transient over voltage	600V
Die size (in.)	.257

D. Filtering:

1. Dimmer modules shall include toroidal filters to reduce the rate of current rise time resulting from switching the SCRs. The filter shall limit objectionable harmonics, reduce lamp filament sing and limit radio frequency interference on line and load conductors. Modules shall offer 350 or 500 uS, filter rise times. Rise time shall be measured at the worst case slew rate (about 50 percent) from 10 to 90 percent of the output wave form with the dimmer operating at full load.

2. All dimmers shall maintain their published rise time and/or fall time regardless of duty cycle or rack temperatures. Dimmers that derate due to increased dimmer

temperature caused by full load operation or high phase angles shall not be acceptable.

E. Power efficiency for standard dimmers shall be at least 97 percent at full load with a no-load loss of 3V RMS. The dimmer shall accept hot patching of a cold incandescent load up to the full rated capacity of the dimmer.

F. Dimmer modules shall be fully plug-in and factory wired. Dimmer modules shall consist of a heavy duty, die-cast aluminum chassis with integral face panel. No tools shall be required for module removal and insertion. All parts shall be properly treated, primed and finished in fine-texture, scratch resistant, gray epoxy powder coat. With the exception of the circuit breaker, the module shall contain no moving parts. Each module shall be labeled with the manufacturer's name, catalog number and rating. Modules constructed of molded plastic for structural support are not equivalent and are not acceptable. Dimmer modules shall be UL Recognized.

G. Provide twelve (12) D20AFTR Advanced Features Thru Power Dimmer Modules. Manufacturers that do not have a Thru Power Module will provide twelve (12) 500MS Rise Time Dimmer Modules and twelve (12) Relay Modules.

VI. DMX/RDM REPEATER (OPTO SPLITTER)

A. The DMX/RDM Installation Repeater shall permit star-wiring of DMX512 signals and shall isolate DMX transmitters and DMX receivers from common mode voltages, ground loop currents and other electrical faults.

1. The DMX/RDM Installation Repeater shall have bi-directional ports to allow Remote Device Management (RDM) data packets to be sent and received between control systems and responding devices.

2. Each DMX/RDM Installation Repeater shall have one input port and eight output ports. No in-line processing of the input signal is permitted to ensure the highest reliability.

3. DMX signal splitting shall be provided using 4-output DIN-rail mounted modules for easy expansion and/or servicing.

4. The system shall be capable of repeating simplex protocols other than DMX512, provided they meet the electrical requirements of EIA-RS422 or RS485.

B. Physical:

1. Enclosures shall be surface-mount NEMA 1 enclosure types, and shall be constructed from 18-gauge steel, finished in satin black powder epoxy, with a non-louvered, surface cover.

2. Dimensions shall be 10.25” x 23.25” x 4.5” (260mm x 510mm x 120mm) for the eight output units.

3. Enclosures shall be provided with ½” and ¾” conduit knockouts, appropriate

internal voltage barriers, and shall be clearly labeled as “Pathway eDIN System”.

C. Electrical:

1. The power supply shall be a field-replaceable, wide-range input (115/240VAC, 50/60 Hz), UL-listed switching power supply. There shall be no power switch to reduce the chance of accidental shut-off.

2. There shall be 2500-volt electrical isolation between all input and output sections, and between adjacent output sections.

3. The input and each output shall be capable of withstanding the continuous application of up to 250V without damage to internal components. Input and output protection shall be of the self-resetting type, rated for 250V. Replaceable fuses are not acceptable.

D. Field Connections:

1. All internal field wiring connections shall be clearly labeled according to their function.

2. Connections for all data input, output and pass-thru ports, and DC power shall be two-part, Phoenix-type screw terminal strips, capable of accepting #26 to #14 gauge solid or stranded wire.

3. An active, isolated data pass-thru connection port shall be provided to allow daisy-chaining of additional modules or Installation Repeaters.

4. The power supply connections shall be capable of accepting up to #12 gauge solid or stranded wire. A suitable terminal shall be provided for ground wire connection.

E. Features:

1. Each repeater module shall incorporate LED indicators for DC power input, isolated DC power, DMX input and processor status.

2. Each module shall have two LEDs per output port to indicate active DMX output and RDM activity for that port.

3. Each module shall be individually discoverable via RDM. No remote configuration options shall be available to the user.

4. Each DMX/RDM port shall incorporate an active data line terminator.

F. Compliance:

1. The DMX/RDM Installation Repeater shall be compliant with ANSI E1.11 DMX512-A (2004), USITT DMX512 (1990) and ANSI E1.20 Remote Device Management (2006).

2. The DMX/RDM Installation Repeater shall be ETL-listed.

3. The DMX/RDM Installation Repeater shall be compliant with the RoHS 2002/95/EC directive.

G. Provide a wall mounted Pathway 8-way DMX/RDM Installation Repeater, or approved equal.

VII. DATA PLUG-IN STATIONS

A. Data Plug-in Stations shall consist of the appropriate connectors required for the functional intent of the system. These stations shall be available with DMX input or output, Remote Focus Unit, Network, or architectural control connectors as shown on the Drawings or as required.

B. Connector Options:

1. The following standard components shall be available for Plug-in Stations:

a) 5-Pin male XLR connectors for DMX input

b) 5-Pin female XLR connectors for DMX output

c) RJ45 connectors for Network connections - Twisted Pair

C. Physical:

1. Station faceplates shall be .80” aluminum, finished in fine texture, scratch-resistant black powder coat. Silk-screened graphics shall be white.

2. The station panel shall mount into an industry standard back box, depending on size and quantity of connectors. A terminal block shall be supplied for contractor terminations.

D. Provide the following Data Plug-In Stations:

1. One (1) ECPB NET

2. One (1) ECPB DMX

VIII. PRESET STATIONS

A. The Button Station shall be the Smart Link Button Station as manufactured by Electronic Theatre Controls, Inc., or equal. It shall be a remote station on an Echelon LinkPower network that can play presets stored in a host product such as a SmartPack dimmer pack, SmartSwitch Relay panel or in the Control Electronics Module (CEM+) of a Sensor+ dimmer rack. The station shall consist of a dual function (program/play) push-button with an integral LED for each corresponding look.

1. Standard stations shall control five (5) backup looks.

2. The system shall support up to four stations without an additional power supply.

B. Electrical

1. Button station wiring shall be an Echelon® Link power network. Link power shall utilize low-voltage Class II unshielded twisted pair, type Belden 8471 or equivalent, and one #14 ESD drain wire (when not installed in grounded metal conduit).

2. The station shall operate on ± 21 VDC provided by the CEM+ via the Link power network (for more than 4 stations, an additional power supply shall be required). The number of stations shall be limited by the available power.

3. Station wiring must be topology free. It may be point-to-point, bus, loop, home run or any combination of these.

4. Network insulation displacement connectors shall be provided with all stations.

C. Station Addressing

1. Preset addressing for stations shall be via a 7- position dipswitch, and will be set by installers or factory personnel. Stations shall address only consecutive presets. Multiple stations of the same type and address are permissible. Multiple stations with different button quantities may have “overlapping” preset addresses.

2. Stations shall not address presets in different rooms

D. Play Presets

1. Pressing a button shall play the corresponding preset. The station will send the command to play the look to all host products. If the look is a recorded look, the button's LED will stay lit. If the look is unrecorded, the LED will go off.

2. The station shall monitor (at 30-second intervals) the status of presets. If any looks are active in the range of the station's numbered push-buttons, the station shall light the corresponding LED regardless of which device (console, host product, network PC or Button station) activated the look.

3. If the button with the active look (LED lit) is pressed, the station shall send the command to return to normal operation, deactivate the preset and turn off the LED.

4. Only one preset may be active at a time. Pressing a second button shall play the corresponding preset and fade out any preset previously active.

E. Physical

1. Control station electronics shall mount directly behind the faceplate. A terminal block shall be supplied for contractor terminations. The entire assembly shall

mount into a single gang back box. Back boxes for the flush mounted stations shall be industry standard back boxes. The manufacturer shall supply back boxes for surface mounted stations.

2. Station faceplates shall be constructed of ABS plastic and shall use no visible means of attachment. All Button stations shall be available with white, signal white, ivory, gray or black faceplates and buttons.

F. Provide one (1) SH 10005 SmartLink button station.

IX. LIGHTING CONSOLE AND ACCESSORIES

A. The lighting control console shall be a microprocessor-based system specifically designed to provide complete control of stage, studio, and entertainment lighting systems. The console shall be the “Element” as manufactured by Electronic Theatre Controls, Inc., or equal.

1. The control system shall be Net3 and Net2 native, with both protocols output simultaneously over the network. The system shall also be able to control third party ACN devices directly. The system shall provide control of 1024 outputs on 250 channels.

2. A maximum of 10,000 cues, 1000 groups, 1000 Intensity Palettes, 1000 Color Palettes, 1000 Focus Palettes, 1000 Beam Palettes, 1000 effects, 1000 macros and 100 curves may be contained in non-volatile electronic memory and stored to an onboard hard disk or to any USB storage device.

3. The console may be placed in Tracking or Cue Only mode by the user as a system default and overridden on individual record actions as required.

4. A Master Playback fader pair and dedicated Grand Master/Blackout shall be provided.

5. The console shall provide 40 pageable faders and bump keys that may be operated in either LTP channel or HTP/LTP submaster mode. The console shall support a total of 300 submasters.

6. A high-resolution level wheel shall be provided to control intensity for selected channels and scrolling within selected displays. On demand moving light controls shall be provided for control of other non-intensity parameters. Non-intensity parameters shall be controllable via the on demand or keypad controls.

7. On demand moving light controls shall provide mouse-based tools for non-intensity parameters. The tools shall display the current value for each parameter and shall provide controls for adjusting each parameter.

8. Control and programming features for automated fixtures shall also include: a standard library of fixture profiles, the ability to copy and edit existing profiles and create new profiles, patch displays including channel and output addressing, 16-bit fade resolution, color characterization allowing color mixing

and storing in Hue and Saturation or native device values.

9. System information, including playback status, live output and blind values for all record targets shall be displayed on a maximum of two external high resolution DVI monitors, or one SVGA monitor, which may also be touch-screen(s). Only one display shall be required for operation.

10. The system shall direct user input through on-screen dynamic prompts and integral LEDs on console keys indicating current operating mode. A context sensitive on-line Help feature shall explain and provide an example of the operation of each feature of the system.

11. An optional, fully-functioning, detachable alphanumeric keyboard shall be supported. The keyboard shall allow labeling of channels, cues, presets, groups, palettes, effects, macros, curves and the show. An integral electronic keyboard shall be provided.

12. A row of softkeys shall be provided, which change function based on the selection and context of the console. These softkeys shall be labeled on the connected external display.

13. Console software upgrades shall be made by the user via a USB port; changing internal components shall not be required.

14. The console operating software shall be loaded into program execution memory from the internal hard drive when the console is powered. In the event of an uncontrolled shutdown, the console shall return to its last output state when power is restored.

15. Show data may be created and modified on a personal computer, using either Windows XP or Windows 7 operating systems, using a free offline editing application. The offline editor may also run natively on Macintosh platforms using OS X.

16. A PC, using Windows XP, Windows 7, or a Macintosh computer running OS X, running a client software application shall be able to connect to a control system via the network and view current show data in a mirrored display environment.

17. The system shall allow remote control from a purpose-built wireless remote focus unit (Radio Focus Remote). Systems without these remote-control devices shall not be acceptable.

18. The system shall support a Telephone remote control that allows basic functions to be controlled from a standard wireless phone producing touch-tone signals. This allows the use of a standard telephone for a low cost remote control. Systems that do not allow this function shall not be acceptable.

19. Network management tools shall be provided from the desk itself.

20. The system shall support up to 32 individual Time Code Event lists.

B. Controls and PlaybackManual Control and Programming Section

1. General

a) The console keyboard shall be grouped by function. Major groupings shall be record target functions, numeric keys, level assignment functions, display navigation functions and controls.

b) Non-intensity parameters may be set numerically or via the on demand moving light controls. This control shall be fully interactive. In either case the current parameter value shall be displayed on the console monitor.

c) Only those parameters available for control in the active lighting system shall be displayed for control.

d) Lamp controls provide direct access to luminaire functions such as striking and dousing arc lamps and calibrating entire fixtures or individual mechanisms of fixtures, as provided by the luminaire manufacturer. User access to these features is normalized across all manufacturers for ease of use. Use of a “control channel” for accessing these functions shall not be required and systems requiring use of a control channel shall not be acceptable.

e) Fixtures with CMY or RBG color mixing may be set with direct CMY or RBG controls, as well as the Hue and Saturation controls and/or color picker. Color may also be set directly to a gel match, normalized to 3200K.

2. Playback Section

a) The master fader shall consist of a 60mm Master Fader pair with associated Load, Go and Stop/Back buttons.

b) It shall be possible to instantaneously halt an active cue, go back to the previous cue, manually override the intensity fade or manually override the entire fade.

3. Integral Channel/Submaster Faders

a) Submaster and fader support shall be provided via 40 or 60 integral 45mm faders with bump leys. These faders shall be pageable and shall operate in LTP channel and LTP/HTP submaster modes.

b) LTP channel mode shall allow the user access to intensity of the first 120 channels and shall operate with LTP logic. Faders that are not currently set to the same level as the corresponding channel shall have to be matched to that level before affecting said channel.

c) Up to 240 proportional, fully overlapping additive or inhibitive

submasters may be defined. Submasters shall have colored LEDs to indicate submaster status. Each submaster may have fade up, dwell and down fade times. Each has a bump and assert/channel select button. Submasters may be set to independent, exclusive and proportional/intensity master control.

d) The submaster blind buffer shall be linked directly to live playback allowing live editing of live submaster content via the command line.

e) It shall be possible to set submaster values directly from the command line.

4. Grand Master

a) A dedicated 60mm grand master and blackout button are provided.

b) The grand master shall proportionally fade intensity values to zero. Blackout shall send all intensity outputs to zero. Non- intensity outputs shall not be affected. No additional configuration shall be required to withhold non-intensity values from Grand Master and Blackout control.

C. Display ControlsFormat shall change the view of selected displays.

1. Channel views may be displayed either in an expanded table view combining conventional channel symbols with table views for multi- parameter devices, or in a channel summary view.

2. Flexi channel shall change which channels are viewed in selected displays, based on a variety of different criteria, including all channels, patched channels, active/move channels, manual channels, selected channels and user-specified channel lists.

3. Expand shall extend the selected view sequentially across connected displays.

D. Data shall display absolute values of referenced data.

1. Operating ModesLive Mode

a) Channel lists may be constructed using the +, - and Thru keys.

b) Levels may be set with the keypad, level wheel and on demand moving light controls. “Selected” channels shall be those last addressed and under keypad control.

c) Sneak shall be used to restore specified channels to background states, default values, or to send them to specified values, in user specified or default times.

d) Selected channels may be set at a level or held to current values while all other channels are set to zero using Rem Dim. Toggling Rem Dim shall restore all unselected channels to original levels. The Rem Dim

level shall be user definable.

e) Channels may be recorded into groups for fast recall of commonly used channels. 1000 groups shall be available. Groups shall store selection order. The Offset function supports rapid creation of ordered groups, including reverse and random order.

f) Parameter settings may be stored to Focus and Color Palettes. All referenced data may be stored to whole numbers or to up to 99 decimal places between each whole number. It shall be possible to store 1000 of each palette type.

g) Any collection of channel data, as determined by the use of “Record” or selective store commands may be stored to palettes (as appropriate to the type).

h) The following conditions may be placed on a channel or channel parameter to be included with a cue record action.

    (1) Block flag

    (2) Note

i) Cues may be recorded in any order. Up to 99 decimal cues may be inserted between any two whole number cues. Each cue may contain a maximum of twenty parts. Parameters may be automatically assigned to specific parts or assigned when the part is created.

j) It shall be possible to record cues and cue parts with the following information:

    (1) Any collection of channel data, as determined by the use of “Record” or selective store commands.

    (2) Cue Level timing and delays for Intensity Up and Intensity Down, Parameter moves shall follow the Intensity Up time.

    (3) Follow or hang time

    (4) Link instruction

    (5) Loop value

    (6) Block and/or preheat

    (7) Curve

    (8) Label and note

    (9) Execute list to trigger other activity

k) Non-intensity channel parameters may be marked (preset using Automark. Automark presets any parameter transitions in the cue just prior to intensity becoming active. Automark may be disabled on a cue or cue part basis, enabling a “live” move.

l) Any channel parameter may be stored with an effect instruction. These effects may contain relative offsets from current value, or absolute instructions. Effects may be progressive action or on/off states. Entry and exit behaviors shall modify the channel parameters activity when beginning and ending the effect.

m) Update may be used to selectively add modified parameter data quickly to that parameter’s current source. It shall be possible to update inactive record targets. It shall also be possible to update back to the current source of the move instruction without specifying that cue via Trace.

n) Recall From quickly pulls specified data from record targets into the current view.

o) Copy To quickly copies selected data to specified record targets.

p) Address and channel check functions shall be provided.

q) Channel parameters may be “parked” at levels. Output addresses may also be parted directly. Parked levels shall not be added to any live record operations, nor may they be changed until the parked element is “unparked”. Address park shall also be provided.

r) About shall provide detailed status of selected channels or specified record targets, including utilization information. About shall also access lamp control functions to calibrate devices, strike and douse arc sources. Use of a luminaire control channel for these functions shall not be acceptable.

s) Live data may be displayed in an expanded table view containing conventional symbols and table views for multi-parameter devices or in a summary view.

t) Undo shall be used to sequentially step back through manual operations, record, update and delete actions. Redo functions shall be provided. Multiple undo commands may be executed at once.

u) Home shall set selected channels non-intensity parameters to their default values.

v) Move shall allow all show data to be moved from one record target to another.

2. Blind

a) The Blind display allows viewing and modification of all record targets without affecting stage levels.

b) Record target data may be displayed in an expanded table view containing conventional symbols and table views for multi- parameter devices, in a summary view or a spreadsheet view, which allows quick data comparisons, move and replace with functions.

c) Changes made in blind displays shall be stored automatically.

d) Blind editing shall be possible for all record targets.

e) It shall be possible to show or hide parameter data in spreadsheet views for simplicity in viewing/editing.

3. Patch Display

a) Patch shall be used to display and modify the system control channels with their associated library data.

b) Each channel may be provided with a proportional patch level, preheat, curve, label, swap and invert functions.

c) Offset functions in patch shall allow selection of channel ranges and shall allow the user to establish a “custom” footprint for any device output.

d) Custom color wheels, color scrolls and gobo wheels shall be defined in patch. These devices shall be created with a simple table and graphical user interface supported by images of major manufacturers.

e) Copy to and Move functions shall be supported in patch.

4. Setup/Browser

a) Setup shall access system, show and desk configurations.

b) The browser shall access show data storage, import, export, print to .pdf and clear functions, as well as show data utilities.

E. Interface Options: The console shall support a variety of local interfaces.

a) AC input.

b) USB (a minimum of five ports shall be provided for connecting devices such as an Alphanumeric keyboard, mouse, touch screens, USB Flash drive, etc.) The desk shall provide at least four ports on the rear of the console and one on the control surface itself.

c) Ethernet (one port) 802.3af compliant.

d) Two DVI video output connectors, supporting a maximum of two DVI monitors at 1280x1024 resolution minimum.

e) One VGA output connector.

F. Accessories Required

1. iRFR an iRFR Preview (applications for iPhone, iPod Touch and iPad)

2. aRFR (application for Android devices)

3. Element Client Software Kit

4. One (1) 19” ELO LCD Touchscreen Monitor

G. Physical

1. All operator controls and console electronics for a standard system shall be housed in a single desktop console, not to exceed 32.9” wide, 17.9” deep, 5.1” high, weighing 30 pounds.

2. Console power shall be 95 – 240V AC at 50 or 60Hz, supplied via a detachable power cord.

H. Provide One (1) Element 40, 250 control channels (4330A1030).

X. ELECTRICAL DISTRIBUTION EQUIPMENT

A. All distribution equipment shall be furnished by the manufacturer of the dimming equipment. Hanging and supporting hardware shall be furnished and installed under Division 11 or Division 5 Contractor.

B. Plug-in Outlet Boxes shall be furnished and installed where shown on the Drawings.

1. Plug-in outlet boxes shall be complete with three-pole, 20A grounded stage pin connector type female receptacles attached to twenty four (24) inch pigtails.

2. Pigtails shall be three-wire type “SOW” rubber jacketed cable sized for the maximum circuit ampacity.

3. Pigtails with 20-amp stage pin connectors shall be terminated using 12 gauge 4-way indent crimp (with inspection window) type where the wire is inserted and crimped directly in the socket.

4. Terminations for pigtail connectors shall utilize feed-through terminals individually labeled with corresponding circuit numbers. 20 amp circuits shall use screwless tension clamp terminals listed for 20 – 8-gauge wire. Terminals that place a screw directly on the wire are not acceptable.

5. Pigtail outlet boxes shall be supplied with appropriate brackets and hardware for mounting as shown on the Drawings.

a) Standard mounting options shall include pipe or wall mounting.

b) Brackets shall be made from ASTM A 36 steel.

c) Hardware shall be ASTM A307 grade 5.

6. A low voltage distribution system shall be available to incorporate DMX, Ethernet or other protocols as specified in the plug-in outlet box where shown on the Drawings.

a) A voltage barrier shall be used to separate the low voltage wiring for the electrical circuits.

7. Physical:

a) Plug-in outlet boxes shall be 6.25” H x 3.3” D and fabricated from 18-gauge galvanized steel and finished in black fine-texture powder coat paint.

b) Covers shall be fabricated from 16-gauge galvanized steel.

c) Plug-in outlet boxes shall be available in any length specified in increments of 3-inches with a maximum length of up to 3-feet.

d) Pigtails and outlets shall be spaced on 4” centers, or as otherwise specified.

e) Pigtail outlets shall be mounted on individual 3” panels.

f) Circuits shall be labeled with 1.25” lettering. Circuit labeling shall be located on the front side of the plug-in outbox with white lettering on black background.

g) Pigtail boxes shall support and include optional LED indicators to indicate the presence of power at each local circuit. The LED indicator shall be red in color and mounted in the cover plate directly below the circuit label for pigtail circuits.

8. Plug-in outlet boxes power distribution equipment shall be Underwriter Laboratories (UL) LISTED. Plug-in pigtail outlet boxes shall be the Electronic Theatre Controls, Inc. 9300 Series or equal (for surface or pipe mounting).

C. Pipe Batten

1. The pipe batten shall be 1½” schedule 40 grade A, seamless pipe fabricated in the largest possible lengths without splices. Battens of greater length shall be spliced by means of .120 x 1 9/16 dia. DOM tube 18” long with 9” of tube inserted into each half of the splice. The tight-fitting splice tube shall be held in place by a pair of 3/8 x 2 ½” grade 5 hex bolts on each side of the joint. The bolts shall pass through the pipe at an angle of 90° to each other. There shall

be two bolts on each side of the joint spaced 1" and 8" from the joint. Alternatively, one pair of bolts on one side of the joint may be replaced with either plug welds or tight fitting steel rivets. Pipes shall be straight and painted flat black.

2. Grids shall be installed as indicated on the drawings with pipes intersecting on four foot by four foot centers.

3. Intersecting pipes shall be joined with SSRC # 1202-15 Grid Connector or by an approved equal.

4. The grid shall be nominally rated for 30 pounds per linear foot of pipe.

5. A safety-yellow batten cap shall be installed at each end of each pipe batten.

6. The manufacturer shall provide four self-adhesive labels for each batten on which the rated batten load shall be written by the installer.

7. Chain used for dead hung suspension shall be zinc plated NACM, Grade 30 proof coil chain with ¼" shackle and 1 ½" Grad 5 safety bolt. Top and bottom attachment shall be made via a wrap and a half of chain with shackle and safety bolt. Hardware shall be US made and be stamped with safe working load.

8. Bottom attachment with rated Crosby shackle to the connector strip hangar bracket will be acceptable for all electrics with connector strips.

XI. THEATRICAL LIGHTING INSTRUMENT PACKAGE

A. Theatrical lighting instruments manufactured by Electronic Theatre Controls, Inc. (ETC) are specified herein to provide a basis of quality. Other acceptable manufacturers are DESISTI and STRAND LIGHTING, INC.

B. Theatrical lighting instruments shall be capable of performing with tungsten halogen lamps and light emitting diodes (LED) as indicated herein with proper heat sink cooling. Phenolic materials shall be employed on the fixtures in order to protect the operator from potential burns.

C. Each theatrical lighting instrument shall be supplied with a malleable iron clamp to grip up to a two (2) inch ID pipe, a fixture yoke with locking clutch handle, and three (3) foot long SF2 leads in a fiberglass sleeve.

D. Minimum performance criterion for all theatrical lighting instruments shall be as herein specified. Each instrument shall be furnished with a three pole, grounded stage-pin male connector and safety cable. UL listing shall be required on all theatrical lighting instruments.

E. Ellipsoidal Reflector Spotlights (ERS):

1. The unit shall be constructed of rugged, die cast aluminum, free of burrs and pits, finished in black, high temperature epoxy paint. Tools shall not be required for either lamp alignment or cleaning the reflector or lens.

2. The ellipsoidal spotlights shall include:

    a) Integral cable clamp for power leads.

    b) Positive locking of lamp focus and independent lamp alignment controls.

    c) High impact, thermally insulated knobs and shutter handles.

    d) Reflector secured with shock mounts.

    e) Lens secured with silicone shock mounts.

    f) 20-gauge stainless steel shutters.

    g) Insulated rear handle.

    h) Sturdy integral die cast gel frame holders with two accessory slots, and a top mounted, quick release gel frame retainer.

    i) Rugged 3/16” x 1-1/4” steel yoke with two mounting positions allowing 300°+ rotation of the fixture within the yoke.

    j) Positive locking, hand operated yoke clutch

    k) Slot with sliding cover for motorized pattern devices or optional iris.

3. The optical train shall combine a compact filament lamp with a precision molded borosilicate, ellipsoidal reflector and aspheric lens to produce an optimum cosine field. The unit shall provide, but not be limited to:

    a) Molded borosilicate reflector with multiple dichroic layers.

    b) 95% of visible light shall be reflected while 90% of infrared light as heat shall be transmitted through the reflector.

    c) Low gate and beam temperature.

    d) Sharp imaging through a three-plane shutter design.

    e) Projector-quality, high contrast aspheric lens, with an anti- reflective coating to increase transmission.

4. The unit shall be precision engineered to use an HPL lamp to deliver an even, intense field with cosine distribution. The unit shall provide, but not be limited to:

    a) 5, 10, 14, 19, 26, 36, 50, 70 and 90 degree field angles

    b) 25 – 50 degree Zoom range

c) High-quality pattern imaging.

d) Sharp shutter cuts without halation.

e) Shutter warping and burnout in normal use shall be unacceptable.

f) Adjustable hard and soft beam edges.

5. The unit shall be capable of utilizing ETC Dimmer Doubling technology.

6. The unit shall be UL and cUL listed and so labeled.

7. The high efficiency lamp shall be an HPL lamp, which shall consist of a compact tungsten filament contained in a krypton-filled quartz envelope. The lamp shall mount axially within the reflector. The lamp base shall have an integral die cast aluminum heat sink that reduces seal temperature and ensures proper lamp alignment. The lamp socket shall be ATP 220 nickel gold plated.

8. The Theatrical Lighting Instruments shall be ETC Source 4 Jr. Zoom ELLIPSOIDAL. This Contractor shall furnish the following types and quantities of ERS instruments with lamp, gel holder, C-clamp, and safety chain:

a) Eight (8) 25 – 50 degree zoom focus ERS's, ETC 42550J

F. Color Mixing Light Emitting Diode (LED) Wash Fixtures:

1. The lighting instruments (fixture) shall be a color-mixing high-intensity LED illuminator with DMX control of intensity and color. The fixtures shall be Desire D40 as manufactured by Electronics Theatre Controls, Inc. or approved equal.

2. The LED lighting instrument shall be UL 1573 listed for stage and studio use and shall comply with USITT DMX-512 A standard.

3. The LED lighting instrument shall be contained in a rugged all-metal die- cast housing, free of burrs and pits and shall have a black powder coat finish. Power supply, cooling and electronics shall be integral to each unit.

4. The LED lighting instrument shall have two (2) easy-access slots for secondary lenses and other accessories. The slots shall be equipped with locking retaining clips.

5. The LED lighting instrument shall include, but not be limited to:

a) Theatrical –style hanging yoke.

b) 25 deg. secondary lens.

c) Five (5) foot power lead with grounded stage-pin connector.

d) Yoke with floor stand conversion feature.

e) PowerCon to PowerCon cables for fixture power wiring.

f) Multiple secondary lens options to include multiple angles in the following patterns:

(1) Linear

(2) Round

(3) Oblong

6. Light output shall be via a round aperture. Aperture and accessory slots shall accommodate standard 7.5” accessories such as used in other similar-sized fixtures. Accessories available as options shall include but not be limited to:

a) Gel/diffusion frames

b) Top hats

c) Barndoors

d) Egg crate louvers

e) Concentric ring louvers

f) Multiple secondary lensing options

7. Thermal:

a) The fixture shall be totally convection cooled, requiring no cooling fan. Fixtures which require an on-board cooling fan shall not be acceptable unless pre-approved.

b) The fixture shall utilize advanced thermal management systems to maintain LED life to an average of 70% intensity after 50,000 hours of use.
