

Automated Volume Scan Evaluation and Termination (AVSET)

Joe N Chrisman
Engineering Branch
Radar Operations Center (ROC)

AVSET Overview

- The basic premise of the Automated Volume Scan Evaluation and Termination (AVSET) function is to terminate the current volume scan after the radar has scanned all the elevations with important return.
- Once the data collection elevation overshoots the available radar return the volume scan is terminated (because there is no benefit realized by continuing the execution of the current volume scan) and a new volume scan is begun.

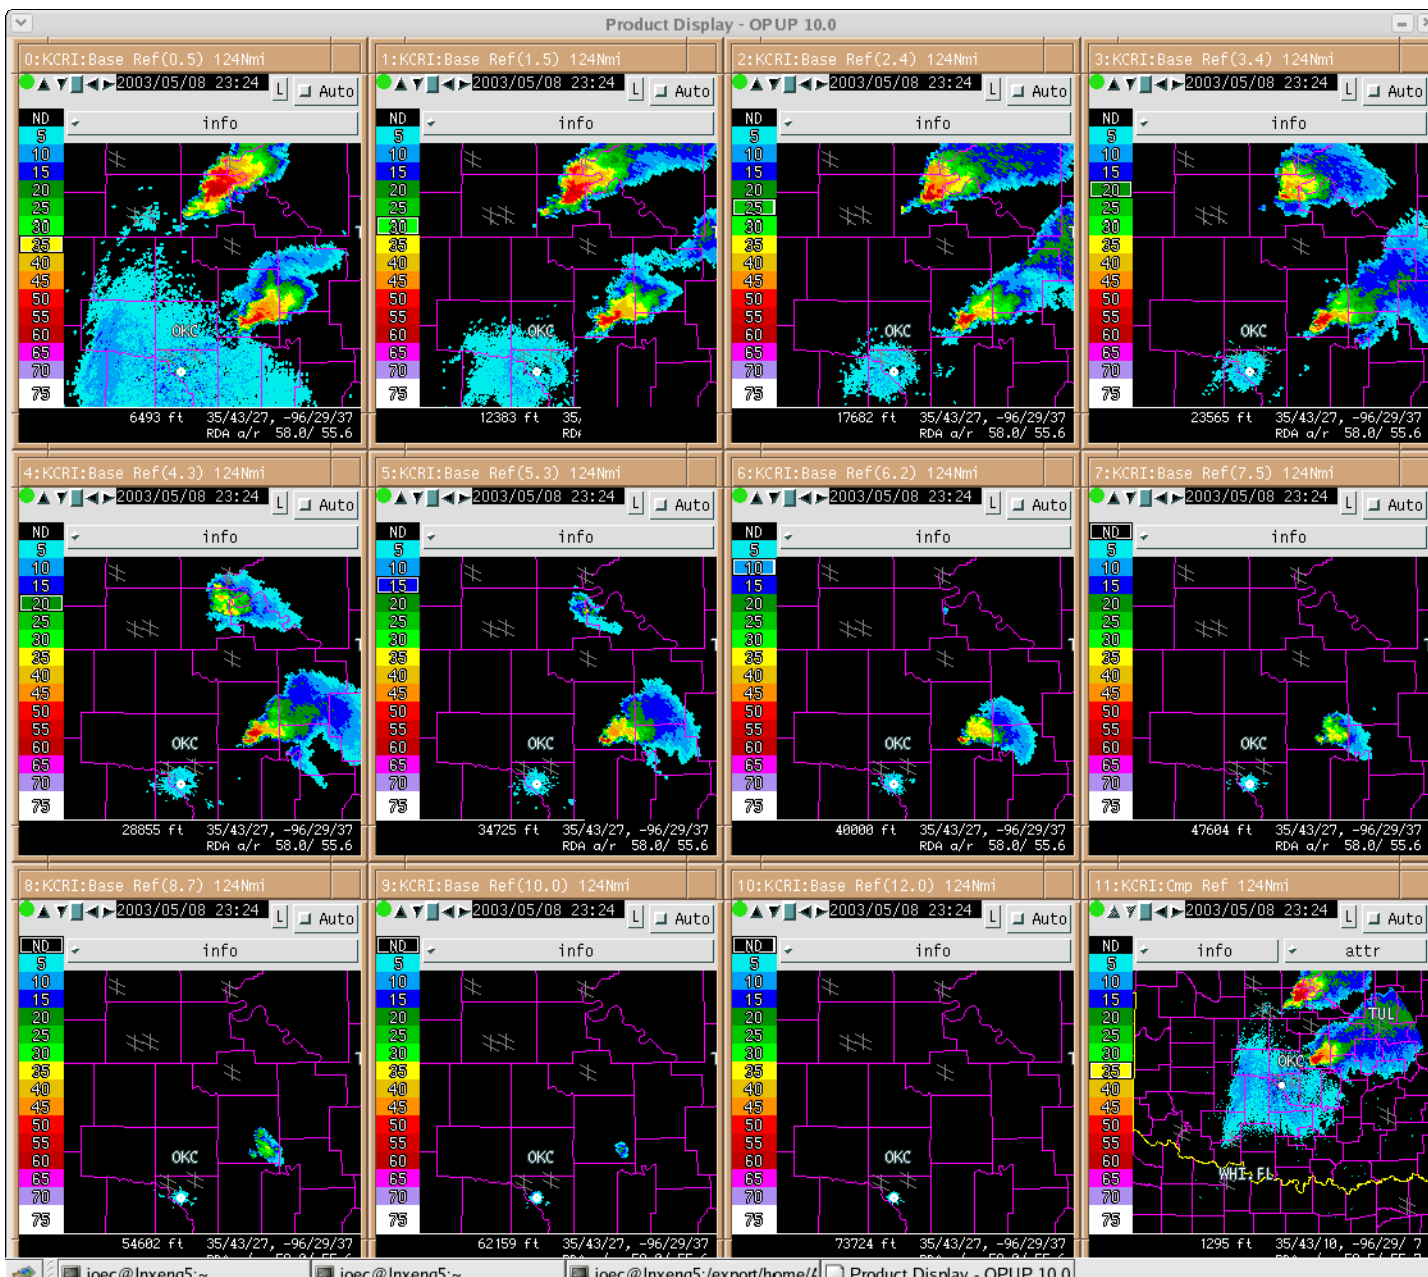

AVSET Overview (cont)

- To ensure adequate vertical coverage to support precipitation accumulation processing, the AVSET process will only run on elevations higher than 5.0°.
- Two conditions must be met before the AVSET process will terminate a volume scan:
 - The areal coverage of reflectivity above 30 dBZ must be less than 30 km² and
 - The areal coverage of reflectivity above 18 dBZ must be less than 80 km².

NOTE: These parameters would be adaptable and would be modified if warranted by test results

- The AVSET-commanded volume scan termination would emulate the normal “end of volume scan” processing as opposed to the restart volume scan process.

AVSET VCP 11

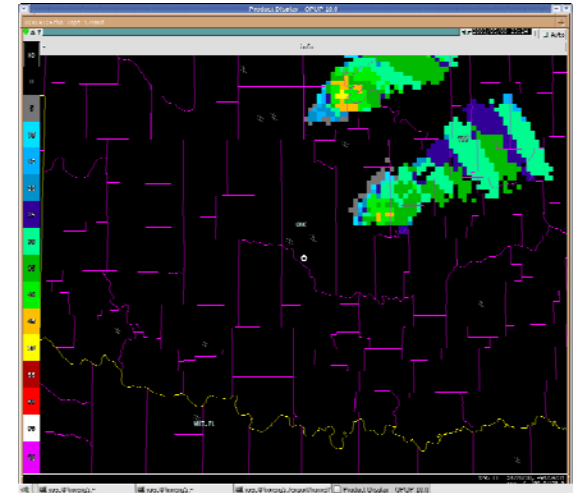

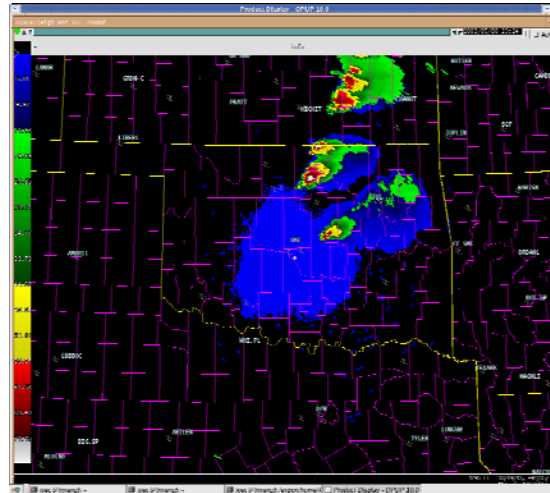

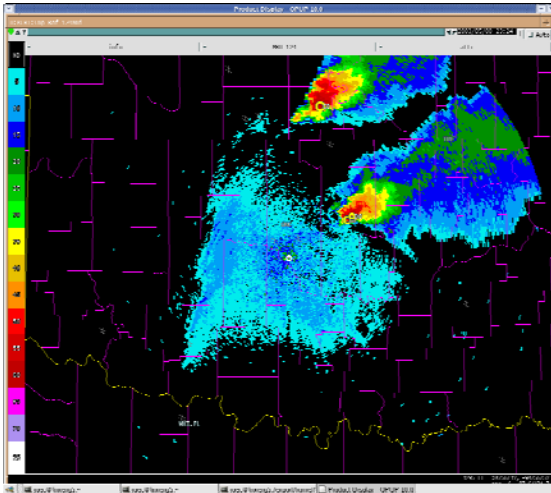

Example Volume Scan Times

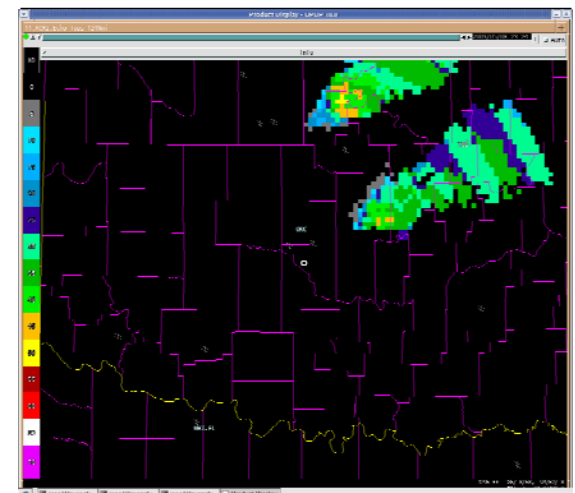

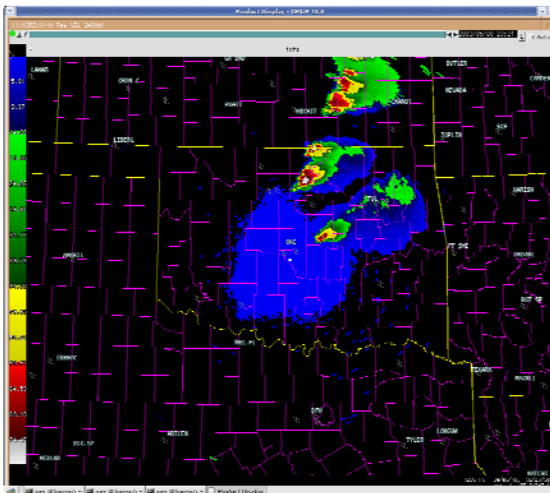

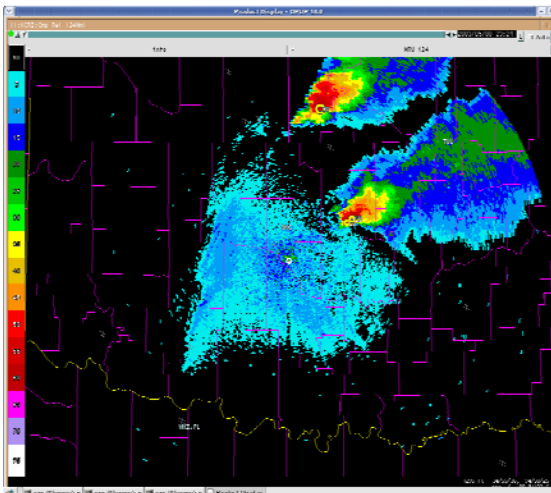

AVSET-Controlled Shortest VCP 11		AVSET-Controlled Shortest VCP 12		AVSET-Controlled Shortest VCP 212		AVSET-Controlled Shortest VCP 21	
Elevations	Time (sec)	Elevations	Time (sec)	Elevations	Time (sec)	Elevations	Time (sec)
0.5	19	0.5	17	0.5	17	0.5	32
0.5	19	0.5	14	0.5	21	0.5	32
1.5	18	0.9	17	0.9	17	1.5	32
1.5	19	0.9	14	0.9	21	1.5	32
2.4	22	1.3	17	1.3	17	2.4	32
3.4	20	1.3	14	1.3	21	3.4	32
4.3	20	1.8	15	1.8	15	4.3	32

Total Time	192		190		210		296

Standard VCP 11 vs: AVSET

VCP 11

AVSET VCP 11

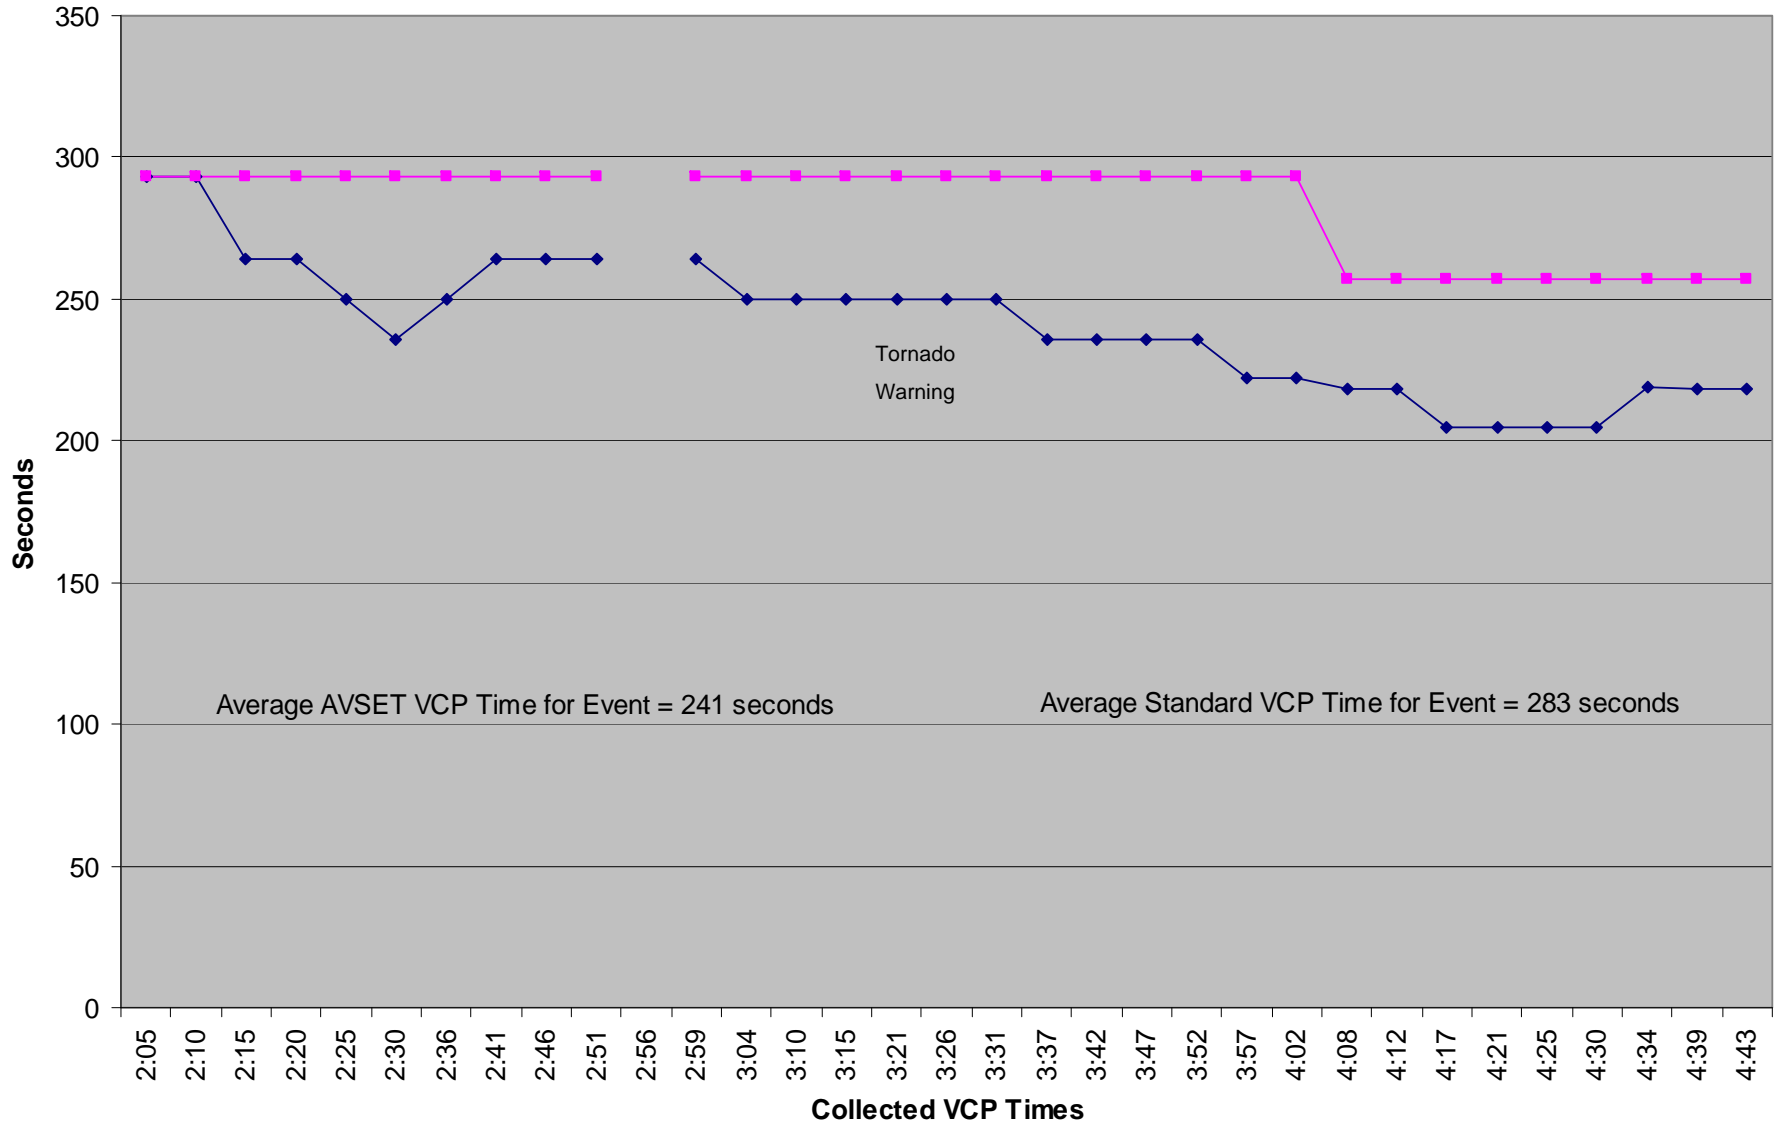

Desktop Testing

- Desktop testing of the AVSET function using RPG tool that emulates AVSET processing.
- Processes Level II data and “terminates” processing when data coverage falls below AVSET thresholds
- Emulates data collection/termination but cannot change VCP update times.

Preliminary Summary

The AVSET-controlled VCP times averaged 241 seconds for the 2 ½ hour test case compared with the standard VCP average execution time of 283 seconds.

- Automated comparison of the 968 volume products resulted in a 92% exact (byte-byte) match.

Preliminary Summary

- Visual comparison of the “mis-matched” products revealed very small differences (a single to a few gates) between the “original” and “mis-matched” products
- The differences were confined to within 10nm from the radar.
- In the context of their contribution to the interpretation of the weather event, the “mis-matched” gates correspond to operationally insignificant differences in the products.

Real World Testing

- AVSET (“non-operational” Build 11) installed on ROC Testbed (KCRI).
- KTLX (Build 9) located approximately 10nm NE of KCRI.
- Level II data collected from both sites.

KTLX 22:44

Interim Summary

- For the entire 4-hour time period, the AVSET-controlled VCP times averaged 200 seconds.
- Focusing on the 3-hour period prior to, and including, the tornado, the AVSET-controlled VCP 12 times averaged 190 seconds.
- AVSET enabled KCRI to produce 73 volume scans during the 4-hour period; conversely, only 57 volumes scans executing VCP 12, or 50 volume scans executing VCP 11, would have been possible with AVSET inactive.

Interim Summary

- A visual inspection of the products from KTLX (standard VCP 11 and VCP 12) and KCRI (AVSET-controlled VCP 12) showed only operationally insignificant differences that did not impact the identification and interpretation of the unfolding weather events.

AVSET - Operational Concerns

- Missed return due to the Cone-of-Silence
- Communications Load with shorter volume scan durations

Cone-of-Silence

- In Clear-Air Mode, the field has always accepted the risk of the possibility that a “new” updraft (return) would develop above 4.5 degrees (close to the radar).
- AVSETs always samples about 2 degrees higher than the Clear-Air VCPs which results in a significantly smaller “cone-of-silence” than we currently accept.
- The “cone-of-silence” for AVSET is approximately 10kft ARL at a range of 20nm (5kft ARL at a range of 10nm).
- It unlikely that important return would be completely confined to this small “cone of silence”, where it would not be detected, for more than a few minutes.
- In the case where there AVSET terminates the volume scan at 6.4 degrees, the VCP update time is approx 190 seconds.

Communications Impact Questions

- What impact will AVSET have on the Narrowband Communications - Specifically Central Data Collection?
- Are there any Techniques available to mitigate the increased bandwidth requirements?

Comms Load Testing

- Performed AVSET communications load test using the 3/2/08 severe convective data set.
- A 1-hour period (22-23Z), which included the tornado touchdown time (22:46Z), was processed to generate the products included on Multicast Product List (acquired from AWIPS).
- The size of each product was recorded using an automated RPG tool. The maximum size and the 1-hour average product size for each individual product type were used in the analysis.

Comms Load with Product Compression

- The same test was performed with RPG product compression applied to the Base Reflectivity, Base Velocity, Base Spectrum Width and Storm Relative Mean Radial Velocity, Composite Reflectivity and Layered Composite Reflectivity products.
- This test was performed to estimate the potential bandwidth savings obtainable by applying product compression.

Standard Product vs. Compressed Product Comm Load Comparison

Comms Load Test Summary

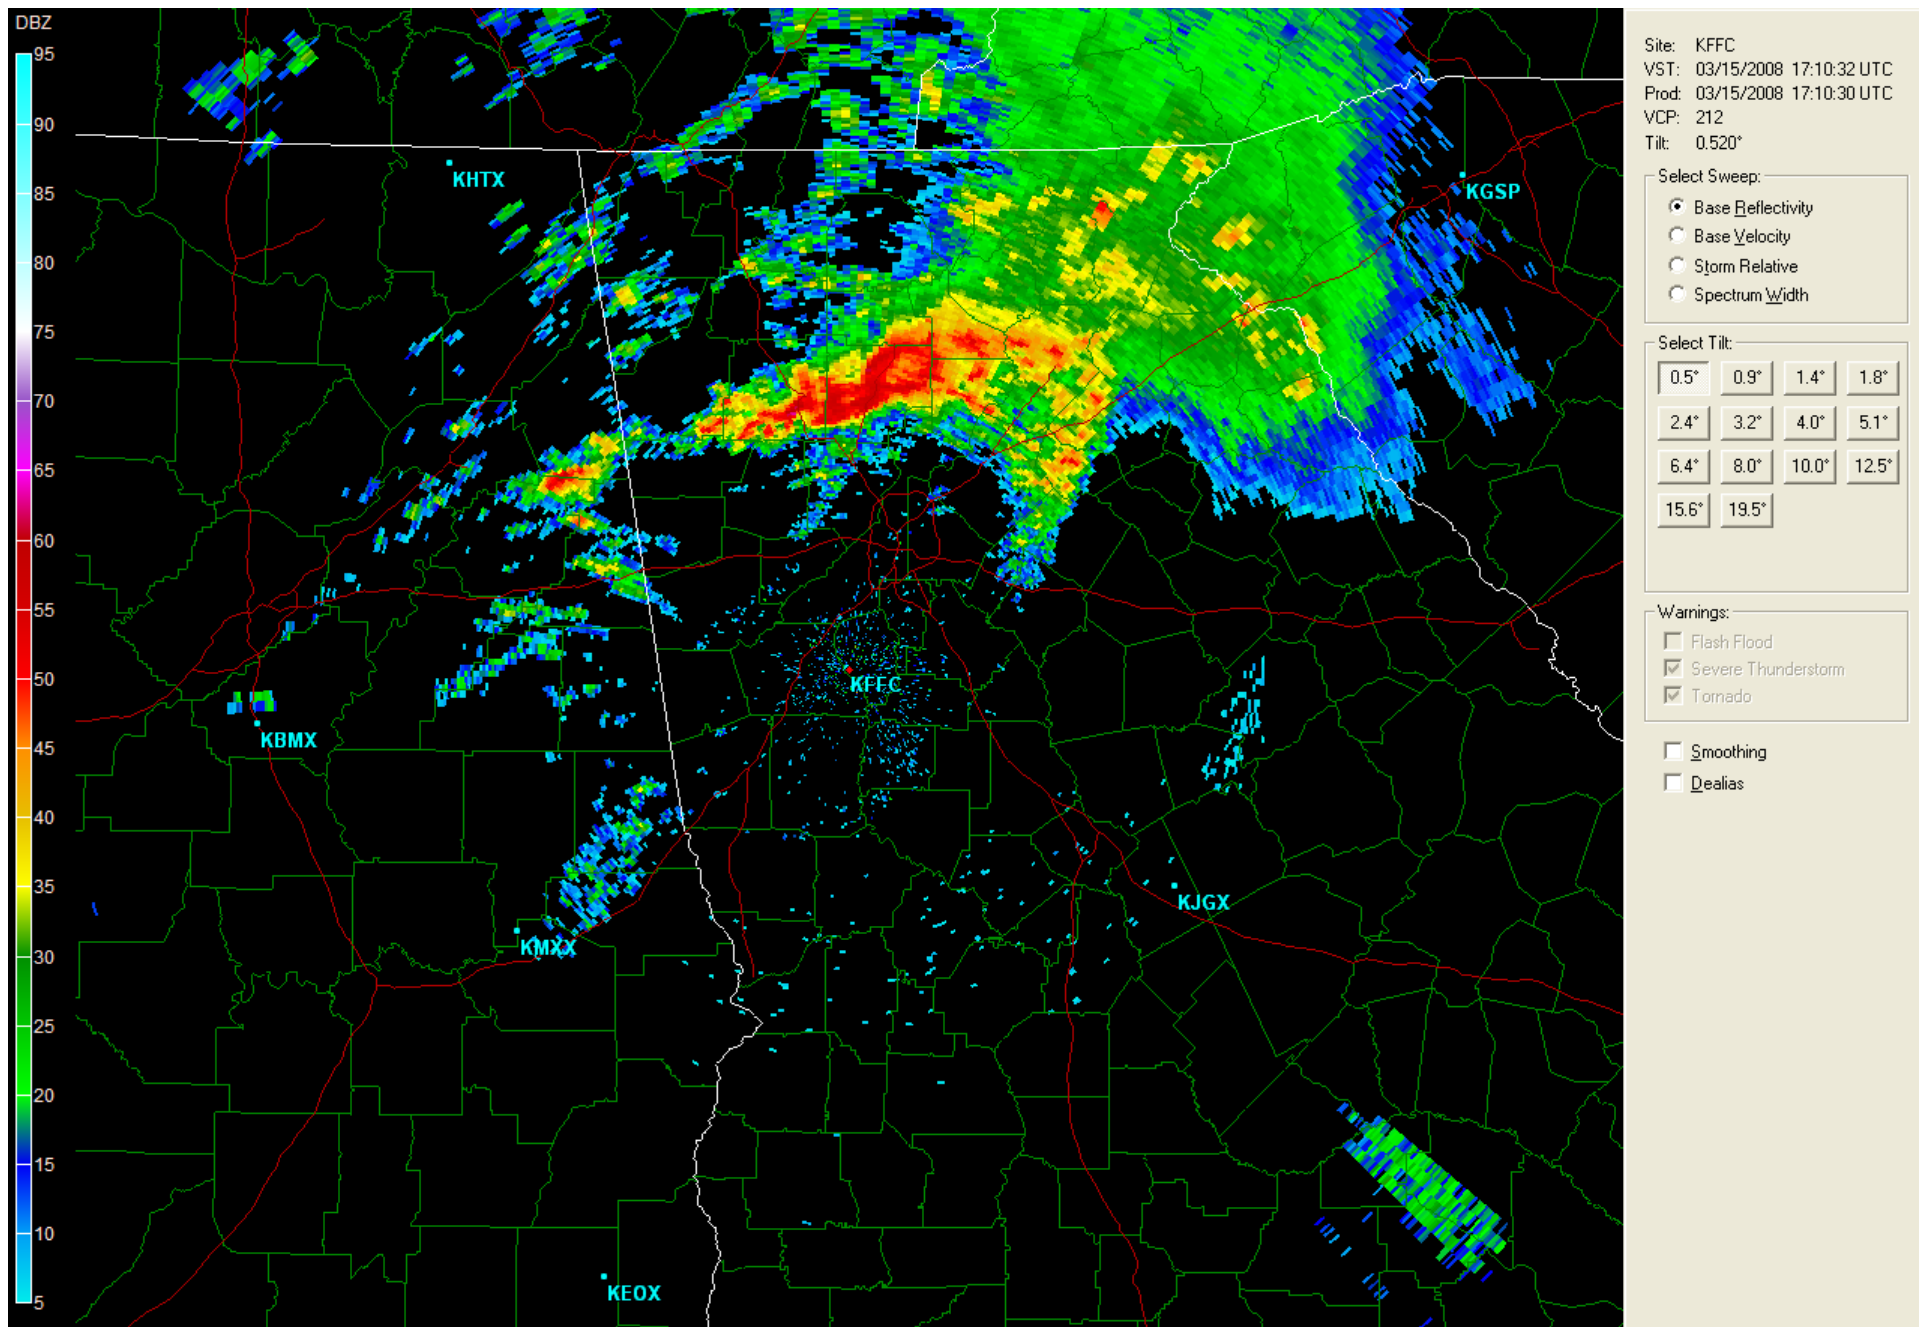

- For this test case, AVSET operation increased the Multicast List communications load by approximately 26% to 24kbps.
- However, when applying product compression to only the listed six product types, the bandwidth required to support the fastest AVSET update was reduced to levels below the current VCP 12 baseline.
- A CCR has been submitted to enable product compression.

Summary

- WSR-88D VCPs were designed to automatically and continuously scan predefined elevation angles.
- This scheme results in each VCP having a particular periodic update cycle that does not change, regardless of the current meteorological conditions.
- The only way to change the update period is to invoke another VCP and accept its elevation scans and periodic update rate.

Summary (cont)

- The AVSET function evaluates the return on each elevation above 5° and terminates the current volume scan after the radar has scanned all elevations with important return.
- AVSET shortens the elapse time between data collection on low elevation angles (and generating volume-based products) during periods when no significant data are available on the higher tilts.
- The AVSET function results in faster volume scan update times without impacting the quality and accuracy of the base data estimates.
- AVSET works with all Precipitation Mode VCPs

Future Plans

- Test and analysis are on-going at ROC
- AVSET is currently under OSIP (Stage 2)
- WSR-88D CCR in review (Disapproved by NWS due to communication impact concerns and desire for more testing)
- SREC briefing seeking CCR approval scheduled for Jun 08.
