### PREPARATION OF ROAD-BED.

4. The earth road-bed on which the pavement is to rest, shall be graded to the required depth below the official grade of the street. The surface of such road-bed shall be parallel to and conform in every respect to the cross-section of the pavement when finished. The ground, after being perfectly dressed, shall be thoroughly and repeatedly rolled with a roller of not less than two hundred and fifty (250) pounds weight per inch length of the roller; such portions as are inaccessible to a roller shall be made solid by ramming; all soft or spongy places not affording a firm foundation shall be dug out, all trench fillings shall be thoroughly drenched with water and tamped; all depressions which appear shall be refilled with the same material as the road-bed, or other good earth, and shall be well rammed, and the entire road-bed shall be again rolled. In all places where any filling may be necessary to bring the road-bed to the required height, it shall be done in layers not to exceed twelve (12) inches in depth, and each layer shall be thoroughly tamped and flooded with water as may be required to insure a solid bed. The grading shall include the sidewalks to the official width, height and line, and all necessary trimming and shaping, refilling and tamping, all necessary excavations, depressions and trenches, rolling the road-bed and maintaining the same in a proper condition until paved.

### CURBING.

5. All natural stone curbs shall be of good quality, sound hard and of uniform color and texture, free from cracks, seams or spots; cut rectangular in form, not less than (16) sixteen inches in depth, six (6) inches in width, and four feet in length when dressed; the face of the curbstone shall be dressed smooth and even to a depth of twelve (12) inches below the top, and dressed not less than one (1) inch down on the back; all curbstones shall be of a uniform thickness and depth throughout, and free from seams, no wedge-shaped, warped or otherwise defective stones will be allowed; the ends shall be dressed smooth, so as to make close joints through the full thickness of the stone, for a distance of not less than twelve (12) inches down from the top; all joints shall be made close-fitting, and in good workmanlike manner, and joints shall be filled with cement grout. The curb to be set with plumb face, square a cotton top, true to line and grade; the curb shall rest on not less than four (4) inches of sand on the bottom, backed up with not less than three (3) inches in width of sand, to within four inches of the top of the curb, all back filling to be thoroughly tamped; so that there will be no displacement of the curb. The curbstones to be set on a curve on the corner; the radii of the curbs shall be ten feet.

6. Artificial stone or concrete curbs shall be eight (8) inches wide by sixteen (16) inches deep, and composed of one part best Portland cement, three (3) parts of coarse, clean, sharp sand, and six (6) parts of broken stone that will go through a two inch circular ring. The molds shall be backed up with earth as not to move with tamping. The concrete shall be filled in and thoroughly tamped to within three quarters (3/4) of an inch of grade. The final layer of mortar shall be one to one of cement and clean coarse sand, and filled in and smoothed with a trowel. After setting for twelve hours it shall then be covered with earth three (3) inches deep and kept so covered for ten days.

7. Wooden curbs shall be of sound redwood planks, three (3) by twelve (12) inches in size, free from sap, well and truly set to the official line of the gutter, and inclined one inch toward the property line at the top of the curb to the curb grade securely spiked with sixty (60) penny spikes to four by four (4x4) redwood stakes not over eight (8) feet apart, and at least three (3) feet long, securely planted not driven in hard ground.

The sides and ends of the blocks must be so dressed that they will make close-fitting joints, the end joints not more than one-half inch wide, and the side joints not more than seven-eighths (7/8) of an inch wide; the top and bottom faces parallel, and any block which has projections or knobs larger than half an inch shall be rejected; stone blocks must be hard, uniform in grain and texture, without free lamination or stratification; stone that will take smooth polish under traffic; that is soft or weather worn will not be accepted.

The stone blocks shall be set on the bed prepared for them, the end joints not to exceed one-half (1/2) of an inch; the side joints not to be less than one-fourth (1/4) nor more than seven-eighths (7/8) of an inch wide. The blocks shall be laid in uniform courses, each course as far as practical to be of uniform depth and width, and shall be so laid that in alternate courses all longitudinal joints shall be broken by a lap of at least two (2) inches; the outer edge shall be laid to form a footing of not less than four inches; the blocks shall be laid by hand firmly bedded in four (4) inches of clean sand, and afterwards rammed and the joints filled with refined melted asphaltum. The paving shall commence at the curb and shall conform with the cross-sections of the street three and one-half (3 1/2) feet wide.

Or the gutters may be paved to the same width with sound granite or porphyry blocks of irregular sizes, but to the depth of at least eight (8) inches on business streets, and at least six (6) inches on residence streets, the surface of which

shall be smooth and of an area of not more than four (4) blocks to the square foot. Said blocks shall be firmly bedded together, close to each other, in a bed of sand or gravel at least three (3) inches in depth. The blocks shall be laid by hand, and their interstices firmly chinked with spawls of rock and filled with sand or gravel; the blocks shall be rammed to grade.

9. Single crosswalks shall be constructed of granite slabs, not less than two and one-half (2 1/2) feet in length and fifteen (15) inches in width, and from six (6) to eight (8) inches thick, having the top roughly pean hammer-d, their edges squarely pointed down to parallel lines, their ends jointed. They shall be laid in a bed of sand four (4) inches deep, with their top one-fourth (1/4) of an inch above the street surface.

Double crosswalks shall be constructed of the same kind of slabs and laid in the same manner, but the two lines shall be eighteen (18) inches apart.

4. Joints to be thoroughly cemented with one to one cement, and cleaned on inside with swab or disk.

5. Pipe to be laid upon the bottom of the trench, the trench to be filled with concrete well packed and tamped under the lower quarters of the pipe, and covered with six inches thickness of concrete on both sides and top, except at the crosswalks, where the top covering shall be at least three inches thick. After the concrete is finished and has set for twelve hours, it must be covered with earth to a depth of at least six inches and remain so covered for three weeks.

6. "Y" branches with conduit pipes to be laid and concreted in same manner as culverts.

7. If the culverts be of iron, the material to be of best cast iron, coated inside and out with a double coat of paraffine paint.

And any expense in replacing said stakes, which the contractor or his subordinates may have failed to preserve, shall be borne by the contractor. The contractor shall, when required to do so by the Superintendent of Streets, remove from the work any overseer, superintendent, laborer or other person employed on the work, who shall refuse or neglect to obey the said Superintendent of Streets in anything relating to the work, or who shall perform his work in a manner contrary to these specifications, or who shall be found to be incompetent or unfaithful; all loss or damage arising from the nature of the work to be done under these specifications, or from any unforeseen obstruction or difficulty which may be encountered in the lines of the work, or from any act or commission on the part of the contractor, or any person or agent employed by him not authorized by these specifications, shall be sustained by the contractor. No work will be considered as accepted which may be defective in its construction or deficient in any of the requirements of these specifications in consequence or negligence of any officer of the city to point out said defects or deficiency during the construction, and the contractor shall be required to correct any imperfect work, whenever discovered, before the final acceptance of the work. The contractor shall give twelve (12) hours notice in writing, when he shall require the service of the City Engineer for laying out any portion of the work. Payment in full of the contract price shall not be released to the contractor until said period of five years has expired.

### Special Specification No. 1.

#### FOR PORPHYRY MACADAMIZING.

##### I. BUSINESS STREETS.

Section 2. The macadamizing shall be with hard porphyry rock, and no other material shall be used but such as will serve to cement or pack the broken stone. For this purpose fine porphyry screenings may be used, but not any sand. There shall be three courses laid to the respective depths before rolling as follows: The first layer shall be composed of roughly broken rock and four (4) inches thick; the second layer shall be three (3) inches thick, and composed of broken rock not larger than will pass through a three (3) inch circular ring; and the third layer, or street surface, shall be one inch thick, and composed of such broken rock and top-dressing as will pass through an inch circular ring. The first and second layers shall be separately rolled and the surface of the roadway shall be well watered and rolled down with a roller of at least seven (7) tons weight, and having at least two hundred and fifty (250) pounds weight to the lineal inch.

##### II. FOR RESIDENCE STREETS.

The macadamizing on residence streets shall be of the same material and with the same surface watering and rolling and weight of roller as already specified for business streets, but the material shall be laid in one course and to such depths as will be eight (8) inches at the crown of the street, and six (6) inches at the gutters before rolling, and decreasing uniformly from the crown to the gutters. The lower half of the layer may be of roughly broken rock, and the upper half shall be of such sizes as will pass through a three (3) inch circular ring, including the surface of top-dressing one inch thick.

##### III. FOR SUBURBAN STREETS.

The macadamizing on suburban streets shall be of the same material and with the same surface watering and rolling and weight of roller as already specified for business and residence streets, but the material shall be laid in one course to the uniform depth of six (6) inches before rolling, of which the lower five (5) inches may be of roughly broken rock, and of such smaller sizes as will pass through a two-and-one-half (2 1/2) inch circular ring, but the surface shall be of screenings and top-dressing, and at least one inch thick. Where the roadway exceeds twenty (20) feet in width, the macadamizing shall extend over at least twenty (20) feet of said width.

At the completion of the macadamizing on business, residence and suburban streets, the contractor shall remove all surplus material at his own expense.

Whenever the City Engineer certifies to the effect that the steep grade of a hilly street will not permit the use of a roller of seven (7) tons weight, the Street Superintendent may, if the Board of Public Works so indicate, permit the use thereon of a roller of not less than three (3) tons weight.

### Special Specifications No. 2.

#### I. FOR EIGHT INCH BROKEN STONE BASE AND BITUMINOUS ROCK SURFACE.

Section 3. A bed of hard rock, roughly broken and presenting no rounded or water-worn surface, eight (8) inches thick after being laid and rolled as hereinafter provided, shall be placed on the sub-grade in three (3) layers as follows:

The first layer shall be four (4) inches thick, and composed of rock of all sizes that will go through a four (4) inch ring.

The second layer shall be three (3) inches thick, and composed of rock of all sizes that will go through a three (3) inch circular ring.

The third layer shall be one inch thick and composed of rock of all sizes that will go through a one inch circular ring.

Each layer shall be thoroughly and separately rolled with a roller weighing not less than two and one-half (2 1/2) tons per lineal foot, and have the thickness required after being thus rolled.

Upon this substratum of broken rock there shall be spread and constructed a layer or wearing surface composed of pulverized carbonate of lime and natural bituminous rock, containing asphaltic material and sand in the following proportions, to-wit:

Pulverized carbonate of lime	9 to 13 parts
Bituminous rock—sand	79 to 74 parts
Asphaltic material	12 to 13 parts
Sand	79 to 74 parts
	100 " 100

and which shall be prepared and laid in the following manner:

The bituminous rock shall be heated to a temperature of not less than three hundred (300) nor more than (350) degrees Fahrenheit, thoroughly disintegrated and brought to the required standard; the pulverized carbonate of lime, while cold, will be mixed with the hot bituminous rock at the required temperature and in the proper proportions and in a suitable apparatus to effect a perfect mixture.

The pavement mixture prepared in the manner thus indicated shall be uniformly spread by means of hot iron rakes over the foundation and rolled whilst hot with rollers weighing not less than two hundred and fifty (250) pounds to the lineal foot, and about two and one-half (2 1/2) feet in length, until the layer thus superimposed presents a uniform surface and has a thickness of two (2) inches after being compressed at least two-fifths (2/5), said surface conforming at all points to the finished surface of the street as shown on the plan and cross-section in the office of the City Engineer and Street Superintendent; after which a small amount of hydraulic cement must be swept over it, and then rolled with a steam roller, the rolling being continued with a steam roller, weighing not less than two hundred and fifty (250) pounds to the inch run, for not less than five (5) hours for every one thousand (1000) yards of surface.

#### II. FOR SIX INCH BROKEN STONE BASE AND BITUMINOUS ROCK SURFACE.

A bed of hard rock, roughly broken and presenting no rounded or water-worn surface, six (6) inches thick, after being laid and rolled as hereinafter provided, shall be placed on the sub-grade in two layers, as follows:

The first layer shall be three (3) inches thick, and composed of rock of all sizes that will go through a three (3) inch ring.

The second layer shall be three (3) inches thick, and composed of rock of all sizes that will go through a two inch circular ring.

Each layer shall be thoroughly and separately rolled with a roller weighing not less than two and one-half (2 1/2) tons per lineal foot, and have the thickness required after being thus rolled.

Upon this substratum of rock there shall be spread and constructed a layer or wearing surface composed of pulverized carbonate of lime and natural bituminous rock, containing asphaltic material and sand in the following proportions, to-wit:

Pulverized Carbonate of Lime	9 to 13 parts
Bituminous Rock; Asphaltic material	12 to 13 parts
Sand	79 to 74 parts
	100 " 100

And which shall be prepared and laid in the following manner: The bituminous rock shall be heated to a temperature of not less than three hundred (300) nor more than three hundred and fifty (350) degrees Fahrenheit, thoroughly disintegrated and brought to the required standard; the pulverized carbonate of lime, while cold, will be mixed with the hot bituminous rock at the required temperature and in the proper proportions, and in a suitable apparatus to effect a perfect mixture.

The pavement mixture prepared in the manner thus indicated, shall be uniformly spread by means of hot iron rakes over the foundation, and rolled whilst hot with rollers weighing not less than two hundred and fifty (250) pounds to the lineal foot, and about two and one-half (2 1/2) feet in length, until the layer thus superimposed presents a uniform surface and has a thickness of two (2) inches after being compressed at least two-fifths (2/5), said surface conforming at all points to the finished surface of the street, as shown on the plan and cross-section in the office of the City Engineer and Street Superintendent; after which a small amount of hydraulic cement must be swept over it and then rolled with a steam roller; the roller being continued with a steam roller, weighing not less than two hundred and fifty (250) pounds to the inch run, for not less than five (5) hours for every one thousand (1000) yards of surface.

#### III. FOR FOUR INCH HYDRAULIC CONCRETE BASE AND BITUMINOUS ROCK SURFACE.

Upon the sub-grade or roadbed, constructed in accordance with the general specifications hereinbefore set forth for the "preparation of roadbed," there shall be laid a bed of hydraulic cement concrete four inches in thickness, to be made as follows: One measure of cement, equal to the best quality of Portland cement, and two measures of clean, sharp, washed sand free from clay, will be thoroughly mixed dry and then made into mortar with the least possible amount of water; roughly broken stone of acceptable dimension and character, thoroughly cleaned from dust and dirt, drenched with water, but containing no loose water in the heap, will be incorporated immediately with the mortar in such quantities as will give a surplus of mortar when rammed. This proportion, when ascertained, will be regulated by measure. Each batch of concrete will be thoroughly mixed, the mixing being continued on the board until each piece of stone is completely coated with mortar. It will then be spread and at once thoroughly compacted by ramming until free mortar appears upon the surface. The whole operation of mixing and laying each batch will be performed as expeditiously as possible, with the use of a sufficient number of skilled men.

No gravel will be used in the concrete, but only angular fragments of stone having rough faces obtained by fracture and measuring not more than two and one-fourth (2 1/4) inches in their largest dimension nor less than one-quarter inch in their smallest dimensions. The upper surface of the base will be made exactly parallel with the surface of the pavement to be laid, and will be suitably protected from the action of the wind and sun until set.

Upon this substratum of concrete there shall be spread and constructed a layer or wearing surface two inches in thickness, composed of natural bituminous rock, containing not less than fifteen per cent of hard, firm and elastic asphaltic material and eighty-five per cent of sand, to be prepared and superlaid in the following manner, to-wit: The bituminous rock shall be heated to a temperature of not less than 300 nor more than 350 degrees Fahrenheit and thoroughly disintegrated, and shall be uniformly spread by means of hot iron rakes, over the foundation of broken rock, and rolled whilst hot with rollers weighing not less than 250 pounds to the lineal foot, and about two and one-half (2 1/2) feet in length, until the layer thus superimposed presents a uniform surface and has a thickness of two (2) inches after being compressed at least two-fifths (2/5), said surface conforming at all points to the finished surface of the street as shown on plan and cross-section in the office of the City Engineer and Superintendent of Streets, after which a small amount of hydraulic cement must be swept over it and then rolled with a steam roller. The rolling being continued with a steam roller, weighing not less than 250 pounds to the inch run, for not less than five hours for every 1000 yards of surface. Under this specification the paving may be made from curb to curb.

### Special Specifications No. 3.

#### GRANITE PAVING.

Section 4. Granite blocks shall be of a durable and uniform quality, selected for this purpose, not less than eight (8) inches nor more than twelve (12) inches in length, and not less than four (4) inches nor more than five (5) inches in width, and not less than six (6) inches nor more than eight (8) inches in depth; all blocks to be sufficiently dressed to present rectangular faces, with straight edges on top, bottom and sides; and all blocks whose faces vary more than half an inch from a rectangular shape will be rejected. The sides and ends of the blocks must be so dressed that they will make close-fitting joints, the end joints not more than one-half (1/2) inch wide, and the side joints not more than seven-eighths (7/8) of an inch wide, the top and bottom faces parallel, and any block which has projections or knobs larger than half an inch shall be rejected. Granite blocks must be hard, uniform in grain and texture, without free lamination or stratification; granite that will take smooth polish under traffic, that is soft or weather worn will not be accepted. It is expressly understood that granite wearing roughly, and therefore affording better foothold for horses, will be considered preferable to the hardest, soft or weather-worn stone obtained from the surface of the quarry will not be accepted. There will be laid a bed of fine sharp sand, washed and dried, four (4) inches in thickness, to serve as a bed for the blocks, which will be laid directly upon and imbedded in it, with close joints. The granite blocks are to be laid at right angles with the line of the street, each course to be of blocks of a uniform width and depth, and so laid that all longitudinal joints shall be broken by a lap of at least two (2) inches, when thus laid the blocks will be immediately covered with clean, fine, hot gravel, in proper quantities, raked until all the joints become filled therewith, and the blocks will then be carefully rammed to a firm, unyielding bed, with uniform surface and with proper grade, there will then be poured into the joints, at a temperature of 300 degrees Fahrenheit, the best refined asphaltum. It will be poured into the joints of the pavement until the sand beneath and the gravel between the blocks will absorb no more, and the joints are filled flush with the upper surface of the pavement. Dry, not gravel, not larger than three-fourths (3/4) of an inch in any dimension, will be poured along the joints, and will then be consolidated by tapping with a light hammer. Not less than three (3) gallons of refined asphalt to each square yard of pavement will be truly inspected upon delivery by the Superintendent of Streets, and all blocks which do not conform to the foregoing

OVER

ing specifications in size or quality, or samples must be removed at once from the work by the contractor at his own expense. The contractor must furnish at his own expense such laborers as may be deemed necessary to assist in inspecting and culling the blocks. The contractor will be required to use throughout the work materials as good in every respect as the samples accompanying the proposals.

**I. - Special Specifications  
No. 4.**

**FOR BROKEN STONE BASE AND ASPHALTUM SURFACE.**

Sec. 5. A bed of hard broken stone eight [8] inches thick, after being laid and rolled as hereinafter provided, shall be placed on the subgrade in three layers, as follows:

The third layer to be one [1] inch thick and composed of broken stone of all sizes that will pass through a one [1] inch ring.

Each layer to be thoroughly rolled separately, with a roller weighing not less than two and a half [2½] tons per lineal foot; the bed of stone to have a thickness of eight [8] inches after being thus rolled, upon this substratum of broken rock, there shall be spread and constructed a layer of asphaltum prepared as follows: One [1] ton of the purest and heaviest asphaltum, equal to the best and highest grade of Moore's asphaltum, one-third [⅓] of a ton of heavy black oil, three [3] tons of dry river sand, and one-third [⅓] of a ton of ground limestone or shell, all of which to be mixed and heated until it melts, and becomes thoroughly disintegrated, but not enough to burn, and shall then be uniformly spread by means of hot iron rakes over the foundation of broken rock and rolled whilst warm, with rollers weighing not less than two hundred and fifty [250] pounds to the lineal foot, and about two and one half [2½] feet in length, until the layer thus superimposed presents a uniform surface, and has a thickness of two [2] inches after being compressed at least two-fifths [2-5] said surface conforming at all points to the finished surface of the street as shown on plan and cross-section in the office of the City Engineer and Superintendent of Streets, after which a small amount of hydraulic cement must be swept over the surface and then rolled with a steam roller weighing not less than two hundred and fifty [250] pounds to the inch run; the rolling being continued for not less than five [5] hours for every one thousand [1000] yards of surface.

The ground, after being perfectly dressed, shall be thoroughly and repeatedly rolled with a roller of not less than two hundred and fifty (250) pounds weight per inch length of the roller; such portions as are inaccessible to a roller shall be made solid by ramming; all soft or spongy places not affording a firm foundation shall be dug out, all trench refillings shall be thoroughly drenched with water and tamped; all depressions which appear shall be refilled with the same material as the road-bed, or other good earth, and shall be well rammed, and the entire road-bed shall be again rolled. In all places where any filling may be necessary to bring the road-bed to the required height it shall be done in layers not to exceed twelve (12) inches in depth, and each layer shall be thoroughly tamped and flooded with water as may be required to insure a solid bed. The grading shall include the sidewalks to the official width height and line, and all necessary trimming and shaping, refilling and tamping, all necessary excavations, depressions and trenches, rolling the road-bed and maintaining the same in a proper condition until paved.

No bituminous rock pavement laid on natural earth foundation shall be laid on fills over two feet and under four feet in depth, unless the same has been graded for a period of not less than six months, over four feet and under eight feet one year, over eight feet and under fifteen feet two years, over fifteen feet three years. All places where a solid foundation cannot be had (as in the case of sand or other yielding earth) the surface to be paved shall be excavated to a depth of not less than ten inches below the official grade, except in case a satisfactory foundation should be obtained at a less depth, and a coating of earth of a compact character of not less than eight inches in depth shall be deposited equally over the surface to be coated and the same to be thoroughly rolled and tamped in the same manner as in case one.

Upon this substratum of natural earth there shall be spread and constructed a layer or wearing surface composed of pulverized carbonate of lime and natural bituminous rock, containing asphaltic material and sand in the following proportions, to wit:

Pulverized carbonate of lime	9 to 13 parts
Bituminous rock—sand	79 to 74 parts
Asphaltic material	12 to 13 parts
	100 1 0

and which shall be prepared and laid in the following manner:  
 The bituminous rock shall be heated to a temperature of not less than three hundred (300) nor more than three hundred and fifty (350) degrees Fahrenheit, thoroughly disintegrated and brought to a required standard; the pulverized carbonate of lime, while cold, will be mixed with the hot bituminous rock at the required temperature and in the proper proportions and is a suitable apparatus to effect a perfect mixture.

The pavement mixture prepared in the manner thus indicated shall be uniformly spread by means of hot iron rakes over the foundation and rolled whilst hot with rollers weighing not less than two hundred and fifty (250) pounds to the lineal foot, and about two and one-half (2½) feet in length, until the layer thus superimposed presents a uniform surface and has a thickness of two (2) inches after being compressed at least two-fifths (2-5), said surface conforming at all points to the finished surface of the street as shown on the plan and cross section in the office of the city engineer and street superintendent, after which a small amount of hydraulic cement must be swept over it and then rolled with a steam roller, the rolling being continued with a steam roller weighing not less than two hundred and fifty (250) pounds to the inch, run for not less than five (5) hours for every one thousand (1,000) yards of surface.

At all places where the bituminous pavement ends and the natural surface or other pavement begins, a trench shall be dug and the bituminous rock turned over the end and continued in a vertical direction for the depth of one foot and the trench to be refilled and thoroughly tamped. All bituminous rock pavements to be laid on natural earth foundation shall be laid between the 1st day of June and the 1st of November of each year.

All soft or spongy places not affording a firm foundation shall be dug out; all trench refilling shall be thoroughly drenched with water and tamped; all depressions which appear shall be refilled with the same material as the bed or other good earth, and shall be well rammed. In all places where any filling may be necessary to bring the bed to the required height it shall be done in layers not to exceed twelve (12) inches in thickness, and each layer shall be thoroughly drenched and tamped to insure a solid bed.

The grading shall include the sidewalks to the official width, height and line, and all necessary trimming and shaping, refilling and tamping, all necessary excavations, depressions and trenches, rolling the roadbed and maintaining the same in a proper condition until paved.

No bituminous rock pavement laid on natural earth foundation shall be laid on fills over two feet and under four feet in depth, unless the same has been graded for a period of not less than six months, over four and under eight feet one year, over eight feet and under fifteen feet two years, over fifteen feet three years. All places where a solid foundation cannot be had (as in the case of sand or other yielding earth) the surface to be paved shall be excavated to a depth of not less than ten inches below the official grade, except in case a satisfactory foundation should be obtained at a less depth, and a coating of earth of a compact character of not less than eight inches in depth shall be deposited equally over the surface to be coated, and the same to be thoroughly rolled and tamped in the same manner as in case one.

Upon the substratum of natural earth there shall be spread and constructed a layer or wearing surface composed of pulverized carbonate of lime and natural bituminous rock, containing asphaltic material and sand in the following proportions, to-wit:

The pavement mixture prepared in the manner thus indicated shall be uniformly spread

by means of hot iron rakes over the foundation and rolled whilst hot with rollers weighing not less than two hundred and fifty (250) pounds to the lineal foot, and about two and one-half (2½) feet in length, until the layer thus superimposed presents a uniform surface and has a thickness of two (2) inches after being compressed at least two-fifths (2-5), said surface conforming at all points to the finished surface of the street as shown on the plan and cross-section in the office of the City Engineer and Street Superintendent, after which a small amount of hydraulic cement must be swept over it and then rolled with a roller, the rolling being continued with a roller weighing not less than two hundred and fifty (250) pounds to the inch, run for not less than five (5) hours for every one thousand (1000) yards of surface.

At all places where the bituminous pavement ends and the natural surface or rather pavement begins a trench shall be dug and the bituminous rock turned over the end and continued in a vertical direction for the depth of one foot and the trench to be refilled and thoroughly tamped. Section 1. All street grading in the city of San Diego, California, shall hereafter be performed in accordance with the following specifications: The City Engineer shall set stakes indicating the exact depth of cutting or filling required to bring the street to its official grade, and the contractor shall preserve such stakes until the work is completed, and pay the expenses of replacing those removed or disturbed.

The grading shall include such clearing, grubbing, cutting, filling, and other work as may be necessary to properly form the roadway, gutters and sidewalks.

No earth shall be removed from the street except upon the written authority and direction of the city engineer.

No rubbish or perishable material shall be used in the grading of any street, and all boulders and loose stones shall be buried at least six inches below the surface of the finished grade, and care shall be taken to mix the earth that there shall be no soft places or sand pockets.

Upon all embankments or fills there shall be placed a top dressing of earth of uniform quality, and of such character as will form a compact surface, and such percentage of allowance for settlement shall be made as may be directed by the city engineer and when a cut exceeds one foot in depth, all trees standing on the margin of the street shall be removed, unless the owner of the abutting property shall at his own expense place them to the grade when so requested by the contractor.

Before the resolution ordering the work of grading any street is passed by the Common Council, the city engineer shall make a careful estimate of the number of cubic yards of earth cut, and the number of cubic yards of earth fill, necessary to bring the street or portion of the street proposed to be graded to its official grade, and in case said estimate of cubic yards fill are in excess of the cubic yards of cut, the city engineer shall designate in the estimate so made the point or points where such earth required for fill shall be taken from, and in case the number of cubic yards of cut exceed the number of cubic yards of fill, said city engineer shall designate in said estimate the point or points where such excess of earth shall be deposited, provided that such excess earth shall not be deposited in any place other than upon the public streets of said city, unless under the direction of the Board of Public Works of said city.

The estimate of the city engineer made as above specified, shall be kept on file in his office, and shall during office hours be accessible for inspection by any person who may desire to inspect the same.

The place or places where the excess of earth is deposited, as well as the place or places from which the earth is taken for making the fills in the street to be graded, shall be by the contractor, before the work is accepted, leveled down and put in a condition satisfactory to the superintendent of streets.

The contractor shall furnish all tools, machinery and labor, and provide all temporary bridges, drains and other means required to protect the work from damage, and prosecute all work with diligence, and without unnecessary delay.

The street superintendent shall supervise all work and shall not approve or accept the same until the street throughout is finished to the form of cross section and to the elevations required by the official grade.

All bids and contracts must express the price by the cubic yard for cutting, and the price by the cubic yard for filling, and no other items or expenses shall be allowed unless they are particularly set forth in the contract.

Incidental expenses shall include the cost of all publication and posting and the labor and material incident thereto, and the compensation of the city engineer for surveys and estimates, and the cost of all labor and material furnished by him.

Ordinance No. 397.

An ordinance providing specifications for the construction of bituminous rock gutters on natural earth foundations, within the City of San Diego, California.

Be it ordained by the Common Council of the City of San Diego, as follows:

Section 1. The following specifications for constructing bituminous rock gutters within the City of San Diego, California, shall apply to such parts or portions of any street or avenue within said city that may from time to time be ordered guttered with bituminous rock.

The gutters shall be constructed of the material and in the manner herein specified.

The street or avenue or portion of any street or avenue proposed to be guttered shall first be curbed with either concrete or granite in accordance with specifications for such curbing contained in ordinance numbered 226 of the ordinances of said city approved August 15th, 1893.

All gutters shall be five feet wide and shall be constructed of bituminous rock two inches thick, laid upon the natural earth.

The earth bed upon which the bituminous gutter is to rest shall be graded to the required depth below the official grade of the street and in accordance with the stakes set by the city engineer for that purpose. The surface of the sub-grade or bed, shall be parallel to and conform in every respect to the cross section of the gutter when finished.

The sub-grade or bed, shall be thoroughly rammed with rams or tamps of not less than twenty pounds in weight—this ramming or tamping shall continue until the said sub-grade presents a firm and unyielding bed; all sand pockets or other soft or inferior spots shall be dug out and the holes filled up with good earth, such filling to be thoroughly rammed and wetted; any part or all of the sub-grade shall be thoroughly wetted and rammed, if required, in order to insure a solid bed; along a line parallel to and two feet from the curb line, there shall be neatly cut or excavated a trench one foot in depth and not less than one foot in width.

All that portion of the curb face, where the bituminous rock covering will come in contact therewith, shall be thoroughly cleaned of all dust, dirt, or other objectionable matter, either by use of said brush or by washing; fifty washings it shall be thoroughly dried, and a thick coat of asphaltum applied while hot with a brush—this coat of asphaltum shall be applied just in advance of the laying of the bituminous rock gutter and the points of contact thoroughly rammed and tamped with hot iron until an impervious joint between the curb and gutter has been obtained.

And the previously prepared sub-grade, including the above specified trench, there shall be evenly deposited a layer or covering of bituminous rock prepared in the manner as hereinafter specified; this layer or covering shall be at least two inches thick after ultimate depression and composed of natural bituminous sand rock containing not less than nine per cent nor more than eleven per cent of asphaltum, and in case the asphaltum exceeds eleven per cent, then perfectly clean river sand shall be added, and in case the asphaltum is deficient, then pure, refined asphaltum shall be added to attain the proper mixture. The whole mass shall be heated to a temperature of not less than two hundred and fifty degrees nor more than three hundred and fifty degrees Fahrenheit, thoroughly disintegrated and brought to the required standard, so that every grain of sand will be coated with a film of asphaltum, and the asphaltum uniformly diffused throughout the mass.

The pavement mixture, prepared in the manner as above specified, shall be uniformly spread over the sub-grade while hot and rolled and re-rolled with hot iron rollers, weighing not less than two hundred and fifty pounds to the lineal foot; in the places where such rollers cannot be used, then hot iron tamps and irons shall be used; such rolling and tamping shall continue until the layer thus superimposed presents a uniform surface and has a thickness of at least two inches after being compressed at least two fifths; after such rolling there shall be swept over the surface a small amount of hydraulic cement.

After thoroughly tamping the bituminous rock laid in the above specified trench, the trench shall be thoroughly rammed and tamped full of earth, wetting the earth while ramming.

All bituminous rock used shall be free from all coarse sand and pebbles and free from clay and vegetable matter, and shall be delivered upon the street where the work is proposed to be done in its natural condition as taken from the mines and without being previously disintegrated. The bituminous matter contained in the material used shall be such that none of it will vaporize below a temperature of two hundred and fifty degrees Fahrenheit.

The Board of Public Works of said city shall have the right at all times to have samples of the bituminous rock proposed to be used analyzed at the expense of the contractor.

No process for disintegrating the bituminous rock shall be used that is liable to burn the mixture.

Section 2. This ordinance shall take effect and be in force from and after its passage and approval and one publication in the city official newspaper of said city, to-wit, the San Diego Sun.
