OUTSIDE-BARK FORM CLASS VOLUME TABLES FOR
SOME SOUTHERN APPALACHIAN SPECIES^{1/}

By

Jesse H. Buell, Associate Silviculturist

INTRODUCTION

Board foot volume tables applicable to restricted localities are in continual demand. Public foresters need local tables for use on lands under their supervision or for helping farmers and other owners of small woodlands to prepare forest management plans. Private foresters need tables which will give dependable results in a wide variety of stands. Regional volume tables based on height and d.b.h. (diameter breast high) are often used locally with the hope that they are not too far off. Accumulated experience has shown that such regional tables vary in dependability. In some localities of the region, accurate estimates result from their use; in others, estimates have been found to be in considerable error. Aside from mistakes in application, including neglect to obtain accurate local cull figures, two factors are primarily responsible for the failure of carefully made regional tables to provide consistently accurate results. Possibly the less important of these factors are differences between limits of utilization as practiced, and those assumed in the table. Stump heights and top utilization not only differ within a region, but vary with economic conditions, and may thus depart from the utilization standards used in the table. The more important factor is the variation within a region of the form, or bole taper, of a given species. Application of a regional volume table, which gives volumes of trees of average taper for the region in each diameter-height class, will not give reliable results for a tract wherein relation of tree taper to diameter and height differs from that of the regional average. Even

1/To answer the many requests for these volume tables, they are being issued in this temporary form to serve until after the present emergency when they may be printed.

though the additional accuracy of local volume tables is urgently desired, the construction of local volume tables by means of stem measurements remains a task for which many practicing foresters do not feel that time is available.

One solution of this problem, a partial one at least, is the preparation of regional tables which give tree volumes for various combinations of d.b.h., merchantable height and form class. Such tables serve as reference bases from which volume tables for local use can be made through simple arithmetical procedures when once a knowledge of tree form in a particular locality is accumulated.

Tables are here presented for 16 important species of the Appalachian and mid-Atlantic states. Each table gives tree volumes by various combinations of d.b.h. and merchantable height for a fixed "outside-bark" form class, but provision is made for converting the volumes, by a simple multiplication, to volumes for any other form class that may be encountered.

The fact must be emphasized that, unless these basic tables are modified and corrected for the form classes prevailing in the stands to be cruised, they may prove to be less accurate for a given locality than a well prepared set of regional tables based on diameter and height only. Directions for this modification are presented in the section entitled, "Use of Basic Tables in Making Local Tables."

DEFINITIONS OF FORM CLASS

It is essential that the reader attain a thorough understanding of the distinction between inside-bark form class and the outside-bark form class used to express tree taper in the tables presented. Outside-bark form class is defined as the percent which the diameter outside bark at the top of the first 16.3-foot log is of the diameter outside bark at breast height (4.5 feet above the ground). Inside-bark form class is defined as the percent which the diameter inside bark at the top of the first 16.3-foot log is of the diameter outside bark at breast height. Both types of form class are ratios of diameter at the top of the first 16.3-foot log to diameter at breast height; the difference is, for outside bark form class the upper diameter is measured or estimated outside bark, but for the inside-bark form class this upper diameter is measured or estimated inside bark.

A major advantage of the outside-bark form class is that the necessary measurement at the top of the first 16-foot log of a standing tree can be taken directly without determination of bark thickness. Thus a dendrometer, an instrument for measuring upper diameters of standing trees by sighting through a telescope, which can obviously read only outside-bark diameters, can be used in measuring outside-bark form classes; and if trees are to be climbed to measure the upper diameter, outside-bark

form classes can be obtained without measuring bark thickness. It is also believed that the man lacking special skill can more readily become proficient in reliable ocular estimates of outside-bark form class because considerations of bark thickness are not necessary.

DISTRIBUTION OF FORM CLASS IN FOREST STANDS

The ways in which both inside- and outside-bark form class are correlated with diameter class or merchantable length in forest stands are not yet well understood. Preliminary studies have indicated that such correlations show considerable variability. In some localities the form class for a given species increased as d.b.h. increased. In others a decrease in form class was associated with increasing d.b.h. It was found that no correlation whatever between form class and either d.b.h. or merchantable height existed in many localities, and an average for a given species, irrespective of tree size, was a satisfactory expression of form class.

Because no general rules can yet be presented on the distribution of form classes over the range of tree sizes for the 16 species for which volume tables are presented, it is essential that the nature of such distributions be determined locally if the accuracy of a volume table made up from local data is desired.

METHOD USED IN MAKING BASIC TABLES

The basic tables were prepared from equations derived by multiple regression, the logarithm of board-foot volume being expressed in terms of three independent variables: (1) logarithm of d.b.h. in inches, (2) logarithm of merchantable height in feet, and (3) outside-bark form class. Measurements from individual trees were used, without grouping. The full effect of o.b. form class measured separately for each tree is thus shown in the equations, and consequently they may be used to obtain unusually accurate estimates of the volumes of trees for each of which the o.b. form class is known in addition to the d.b.h. and merchantable height.

To save space, each table was made up only for the average o.b. form class of the trees basic to the table. Multipliers for converting the tabular volumes to volumes of trees of any other o.b. form class are given at the bottom of the table, along with an example showing how to make the conversion.

UTILIZATION LIMITS, SCALING METHODS AND LOG SCALES USED IN BASIC DATA

The tables give volumes to a variable top diameter, as actually utilized. A discussion of the relation of utilized top diameter to d.b.h. has already been given by Barrett,^{2/} much of the data basic to the present tables having been previously used by him. Field measurements for each tree were plotted on cross-section paper and smooth curves drawn through the plotted points. The trees were then rescaled, using small-end diameters of logs read from the curves. Log lengths as actually cut were used as often as possible, but all log lengths were made an even multiple of 2 feet plus a trimming allowance of 0.3 feet, and all cull sections were included as though they were sound. Log volumes for International, Scribner, and Doyle-Scribner rules were read from tables made up from formulas to read to the nearest 2 feet of log length and to the nearest 0.1 inch of diameter. Following custom, Scribner Decimal C volumes are shown in the tables to the nearest 10 board feet; for the other log rules, volumes are shown to the nearest board foot. The Doyle-Scribner tables give volumes by the Doyle formula for all logs up to 24.9 inches in diameter, and by Scribner formula for larger logs. The Doyle formula was applied strictly, even to the small logs. In other words, logs 8 inches or less in diameter were not given a board-foot value equal to their length in feet as is the custom in parts of the Southeast.

TABLES FOR SPECIES GROUPS

Grouped-species tables are supplied for use of those who, for the sake of the convenience of having a smaller number of tables to handle, are willing to sacrifice something in accuracy. A pair of species was considered suitable for grouping if a comparison of the individual-species volume tables showed that for small, medium, and large trees, the volumes did not vary more than 6 percent from the mean of the two tables. The groups used are those that seemed most logical among the possible ones. The equation for any group was derived by adding the equations for the species in the group and dividing by the number of species. Each species is thus given equal weight regardless of the number of sample trees in the species.

USE OF BASIC TABLES IN MAKING LOCAL TABLES

The chief usefulness of the volume tables presented here depends on the fact that the average form of trees, or the relation of tree form to

^{2/}Barrett, L. I. Recent volume tables for some southern Appalachian species. Appalachian Forest Exp. Sta. Tech. Note 19. Feb. 1936.

d.b.h. or height, or both, may differ from locality to locality. Because of this, the tables may be used as a base from which local volume tables can be derived. Such derived tables will usually not be quite as accurate as tables based on d.b.h. and height made from a generous amount of representative local data, but the labor involved is much less and the results are more accurate than could be obtained from an ordinary regional volume table wherever the relation of form to d.b.h. and height differs locally from the average regional relation of form to d.b.h. and height.

In the locality where one of the tables is to be used, the d.b.h., merchantable height, and o.b. form class of a sufficient number of trees of the species concerned should be measured to determine whether o.b. form class is correlated with d.b.h. or with merchantable height (or with both). For such correlations, o.b. form classes should be taken on 30 to 50 trees well distributed throughout the diameter range present. O.b. form class can be determined by measuring o.b. diameters at the top of the first 16.3-foot log on felled trees. On standing trees it can be measured by climbing, or with a dendrometer, or it can be estimated. Estimates, checked as frequently as possible by measurements, may be accurate enough when made by a practiced individual. O.b. diameters at the top of the first log are divided by d.b.h.o.b. and multiplied by 100 to get o.b. form classes. Plot o.b. form class over d.b.h. and then over merchantable height to see where the greater correlation lies. (If greater refinement is desired, more data can be collected and the plotting of o.b. form class made over d.b.h. by merchantable height classes.) Fit a free-hand curve to the plotting showing the closer correlation, and from it read the average o.b. form class by d.b.h. classes, or height classes (or both if separate plottings are made over d.b.h. by height classes). For each average o.b. form class thus obtained, read the corresponding multiplier from the tabulation appended to the volume table and apply it to the proper part of the basic table.

If there is no correlation between o.b. form class and d.b.h., or merchantable height, then the multiplier corresponding to the mean o.b. form class can be applied to the whole basic table.

An example will make the procedure clearer.

EXAMPLE: CONSTRUCTION OF LOCAL TABLE

On the Bent Creek Experimental Forest where local Scribner board-foot volume tables were needed, d.b.h., merchantable height, and outside-bark form factor were measured on 59 black oak trees. Plotting showed that form class was correlated with d.b.h., but not with height. The relation of form class to d.b.h. for the 59 black oaks appeared to be linear, and a straight line was fitted to the data. The average form class for each 2-inch d.b.h. class as read from the plotted line is given

in the second column of the tabulation below. In the third column are entered the multipliers corresponding to these o.b. form classes, read from the table of multipliers appended to the black oak Scribner table (Table 31). The volumes in the tabulation were then computed by multiplying the values in a horizontal line of Table 31 by the multiplier entered for the particular d.b.h. class. Using the 20-inch d.b.h. class as an example, the 9, 15, 21, 26, 30, and 35 board-foot volumes read opposite 20 inches in Table 31, when multiplied by 1.10 give the 10, 16, 23, 29, 33 and 38 board-foot volumes shown opposite 20 inches in the local volume table.

Local Volume Table

Black Oak (Scribner Decimal C) - Bent Creek Experimental Forest

26	90	1.16		32	44	55	65	74
28	91	1.19		39	54	67	79	90
30	92	1.22		48	65	81	94	109
32	93	1.25		55	74	93	110	126

This local volume table used for the black oak trees on 20.8 acres of cruise plots in the oak type on the Bent Creek Forest gave a total of 15,140 board feet of that species. The regional volume table made up from the data basic to the form class volume tables presented here, but based on d.b.h. and merchantable height alone, gave a total of 13,800 board feet for the same black oak trees. The difference amounts to nearly 10 percent of the volume obtained from the regional table.

Local tables made up from form class tables through the use of local data on the relation of form class to d.b.h. and height will be an improvement over regional tables whenever the relation of form class to d.b.h. and height differs locally from the average relation between these variables in the data basic to the regional table. In some instances a regional table may serve as a local table with little or no modification, but where accuracy is sought it would be unsafe to use the regional table without first testing it. Local tables will often differ more widely from regional tables than does the black oak table in this example.

CHANGING O.B. FORM CLASS TABLES TO I.B. FORM CLASS TABLES

Because individuals already accustomed to the use of inside-bark form classes may find that the volume tables presented here require an inconvenient departure from their usual procedures, a method of translating them to i.b. form class tables has been worked out. By use of multipliers calculated from the tabulation given below, the o.b. form class volume tables can be changed to i.b. form class tables. The translation is from a table of a certain o.b. form class to a table of a numerically equivalent i.b. form class--from o.b. form class 84, for instance, to i.b. form class 84.

The values of b and a in the tabulation depend on (1) the regression of bark thickness at the top of the first 16.3-foot log on d.b.h.o.b. and (2) the partial regression of logarithm of volume on o.b. form class as given in the equation accompanying each volume table. Item (2) changes with the log rule used. Consequently there are separate values of b and a for International, Scribner and Doyle-Scribner log rules.

Constants for the calculation of multipliers by which to transform o.b. form class volume tables to i.b. form class volume tables.

$$\text{logarithm } M = b + a (1/D)$$

where $D = \text{d.b.h.o.b.}$

and $M = \text{multiplier by which to transform o.b. form class volume table to i.b. form class volume table.}$

If $D = \text{d.b.h.o.b.}$,

F = numerical value of a form class, either o.b. or i.b., and
 M = factor by which to multiply volume of a tree of o.b. form
class F to get volume of a tree of the same d.b.h. and mer-
chantable length with i.b. form class F ,

then M may be calculated from the equation:

$$\log M = b + a (1/D).$$

For scarlet oak, for example, the tabulation shows that for the Scribner rule, $b = .0478$ and $a = .4432$. The equation for scarlet oak, Scribner rule is then:

$$\log M = .0478 + .4432 (1/D)$$

making it evident that the multiplier will change with diameter. Below are given the values of the multiplier for scarlet oak, Scribner rule, by 2-inch diameter classes as worked out from the equation. Note that above about 18 inches the multipliers change very little, and 1.16 might be used with only slight error for all diameters 20 inches and larger. For some species and log rules the multiplier may change so little with diameter that one value could be used for all diameters.

Multipliers for scarlet oak, Scribner rule

$$b = .0478 \quad a = .4432 \quad \log M = b + a (1/D)$$

D.B.H.	1/D	$\log M$	M
10	.1000	.0921	1.24

30	.0333	.0626	1.16
32	.0312	.0616	1.15
34	.0294	.0608	1.15
36	.0278	.0601	1.15

$D = \text{d.b.h.o.b.}$

M = factor by which to multiply volume of a tree
of o.b. form class F to get volume of a tree
of i.b. form class F .

Table 30 of the o.b. form class volume tables gives Scribner Decimal C volumes for scarlet oaks of o.b. form class 87. If the values for

10-inch trees are multiplied by 1.24, those for 12-inch trees by 1.22, etc. (see multipliers for scarlet oak, above), there will result a table by 2-inch diameter classes for scarlet oaks of i.b. form class 87, Scribner Decimal C volume. Following is part of such a table from which volumes for 1/2-log length are omitted.

SCARLET OAK
I.B. FORM CLASS VOLUME TABLE
BOARD FEET-SCRIBNER DECIMAL C LOG RULE
I.B. FORM CLASS 87

12	6	10	15	17	
14	8	14	20	25	
:	:	:	:	:	
:	:	:	:	:	
:	:	:	:	:	
36		135	183	228	269

If a table for some other i.b. form class, say 70, is wanted, the above table can be converted to it by using the multiplier for form class 70 given in the tabulation at the end of Table 30. This multiplier is .67. The Scribner Decimal C volume of 36-inch trees 2, 3, 4, and 5 logs, i.b. form class 70 are therefore, respectively, $.67 \times 135$, $.67 \times 183$, $.67 \times 228$, and $.67 \times 269$, or 90, 123, 153, and 180 tens of board feet.

The work of converting volumes (1) from o.b. form class to i.b. form class of the same numerical value, and then (2) to i.b. form class of some other numerical value can be combined into one job by using the product of the two multipliers concerned. In the example above, the multiplier for converting volumes of 36-inch trees from o.b. form class 87 to i.b. form class 87 is 1.15, and for converting form class 87 to form class 70 is .67. The multiplier for doing the two jobs at once is therefore $1.15 \times .67$ or .77. The results of converting volumes of 36-inch trees 2, 3, 4, and 5 logs, o.b. form class 87, directly to volumes of trees of the same d.b.h. and merchantable heights but of i.b. form class 70 are (see Form Class Volume Table 30): $.77 \times 117$, $.77 \times 159$, $.77 \times 198$, and $.77 \times 234$, or 90, 122, 152, and 180, the same results as before except for differences due to rounding off.

Volume as utilized, to a variable top diameter.

O.B.-FORM CLASS: Diameter outside bark at top of first 16.3-foot log divided by diameter outside bark at breast height, the result being multiplied by 100.

Block indicates extent of basic data for all O.B.-Form Classes.

Table above is for the average O.B.-Form Class of the 210 sample trees used. Factors in table below are to be used to get volumes for other O.B.-Form Classes.

MULTIPLIERS FOR OTHER O.B.-FORM CLASSES

Factors by which to multiply volumes in the above average table to obtain volumes for other O.B.-Form Classes

O.B.-Form Class (Tens)	(Units) Factors									
	0	1	2	3	4	5	6	7	8	9
5										
6										
7	.73	.75	.77	.79	.81	.84	.88	.90	.92

9	1.23	1.26	1.29	1.33	1.36					

Example: Volume of 16", 2-log tree of O.B.-Form Class 92 = 160 x 1.29 = 206 bd. ft.
Basic data: 210 trees from Cherokee, Pisgah and Nantahala National Forests.

Table constructed from the equation:

Logarithm International 1/4" bd. ft. vol. = 2.097153 (logarithm d.b.h. inches) + .696569 (logarithm merch. ht. ft.) + .011186 (O.B.-Form Class) - 2.291899.

Average deviation of individual tree volumes from values estimated by the equation ±5.6 percent.

Aggregate difference: estimated values 0.92 percent low.

Volume as utilized, to a variable top diameter.

O.B.-FORM CLASS: Diameter outside bark at top of first 16.3-foot log divided by diameter outside bark at breast height, the result being multiplied by 100.

Block indicates extent of basic data for all O.B.-Form Classes.

Table above is for the average O.B.-Form Class of the 112 sample trees used. Factors in table below are to be used to get volumes for other O.B.-Form Classes.

MULTIPLIERS FOR OTHER O.B.-FORM CLASSES

Factors by which to multiply volumes in the above average table to obtain volumes for other O.B.-Form Classes:

O.B.-Form Class (Tens)	(Units) Factors									
	0	1	2	3	4	5	6	7	8	9
5										
6										
7										
8	.89	.91	.93	.95	.98	1.00	1.03	1.05	1.08	1.10
9	1.13	1.16	1.19	1.22	1.25	1.28	1.31	1.34	1.37	1.41

Example: Volume of 16", 2-log tree of O.B.-Form Class 92 = 168 x 1.19 = 200 bd. ft.

Basic data: 112 trees from Cherokee, Pisgah and Nantahala National Forests; and

Bland County, Virginia.

Table constructed from the equation:

Logarithm International 1/4" bd. ft. vol. = 2.259927 (logarithm d.b.h. inches) + .646370 (logarithm merch. ht. ft.) + .010605 (O.B.-Form Class) - 2.375710.

Average deviation of individual tree volumes from values estimated by the equation: ±6.9 percent.

Aggregate difference: estimated values 0.27 percent low.

9					1.13	1.15	1.18	1.20	1.22	1.25	1.27	1.30	1.33	1.35

Example: Volume of 16", 2-log tree of O.B.-Form Class 92 = 168 x 1.02 = 171 bd. ft.

Basic data: 54 trees from Pisgah and Nantahala National Forests; and Eland County, Virginia.

Table constructed from the equation:

Logarithm International 1/4" bd. ft. vol. = 2.239227 (logarithm d.b.h. inches) + .762725 (logarithm merch. ht. ft.) + .008761 (O.B.-Form Class) - 2.359875.

Average deviation of individual tree volumes from values estimated by the equation: ±6.3 percent.

Aggregate difference: estimated values 0.35 percent low.

9	1.13	1.16	1.18	1.21	1.24	1.27	1.30	1.33	1.36	1.40

Example: Volume of 16", 2-log tree of O.B.-Form Class 92 = 167 x 1.18 = 197 bd. ft.

Basic data: 280 trees from Cherokee, Pisgah, and Nantahala National Forests:

Jackson County, Ohio; Garrett County, Md; Tucker County, W. Va; and Bland County, Va.

Table constructed from the equation:

Logarithm International 1/4" bd. ft. vol. = 2.274411 (logarithm d.b.h. inches) + .745902 (logarithm merch. ht. ft.) + .010369 (O.B.-Form Class) - 2.526032.

Average deviation of individual tree volumes from values estimated by the equation:
16.6 percent.

Aggregate difference: estimated values 0.12 percent high.

8	.90	.93	.95	.98	1.00	1.03	1.05	1.08	1.11	1.14
9	1.17	1.20	1.23	1.26	1.29	1.32	1.36	1.40	1.43	1.47

Example: Volume of 16", 2-log tree of O.B.-Form Class 92 = 162 x 1.23 = 199 bd. ft.

Basic data: 150 trees from Cherokee, Nantahala and Chattahoochee National Forests; Jackson County, Ohio; and Bland County, Virginia.

Table constructed from the equation:

Logarithm International 1/4" bd. ft. vol. = 2.270779 (logarithm d.b.h. inches) + .753428 (logarithm merch. ht. ft.) + .011131 (O.B.-Form Class) - 2.599530.

Average deviation of individual tree volumes from values estimated by the equation: ±6.1 percent.

Aggregate difference: estimated values 0.23 percent low.

Volume as utilized, to a variable top diameter.

O.B.-FORM CLASS: Diameter outside bark at top of first 16.3-foot log divided by diameter outside bark at breast height, the result being multiplied by 100.

Block indicates extent of basic data for all O.B.-Form Classes.

Table above is for the average O.B.-Form Class of the 688 sample trees used. Factors in table below are to be used to get volumes for other O.B.-Form Classes.

MULTIPLIERS FOR OTHER O.B.-FORM CLASSES

Factors by which to multiply volumes in the above average table to obtain volumes for other O.B.-Form Classes

O.B.-Form Class (Tens)	(Units) Factors									
	0	1	2	3	4	5	6	7	8	9
5	.45	.46	.48	.49	.50	.51	.52	.54	.55	.56

9	1.15	1.18	1.20	1.23	1.26	1.29	1.32	1.35	1.38	1.42

Example: Volume of 16", 2-log tree of O.B.-Form Class 92 = 170 x 1.20 = 204 bd. ft.

Basic data: 688 trees from Cherokee, Pisgah, Nantahala, and Chattahoochee National

Forests; Jackson County, Ohio; Garrett County, Maryland; Hardy County, W. Va.; Bland County, Virginia; and Chatham County, North Carolina.

Table constructed from the equation:

Logarithm International 1/4" bd. ft. vol. = 2.361718 (logarithm d.b.h. inches) + .689234 (logarithm merch. ht. ft.) + .010075 (O.B.-Form Class) - 2.502791.

Average deviation of individual tree volumes from values estimated by the equation: ±6.2 percent.

Aggregate difference: estimated values 0.40 percent high.

Volume as utilized, to a variable top diameter.

O.B.-FORM CLASS: Diameter outside bark at top of first 16.3-foot log divided by diameter outside bark at breast height, the result being multiplied by 100.

Block indicates extent of basic data for all O.B.-Form Classes.

Table above is for the average O.B.-Form Class of the 105 sample trees used. Factors in table below are to be used to get volumes for other O.B.-Form Classes.

MULTIPLIERS FOR OTHER O.B.-FORM CLASSES

Factors by which to multiply volumes in the above average table to obtain volumes for other O.B.-Form Classes

O.B.-Form Class (Tens)	(Units) Factors									
	0	1	2	3	4	5	6	7	8	9
5										
6										
7	.71	.73	.74	.76	.78	.80	.82	.84	.86	.89
8	.91	.93	.95	.98	1.00	1.03	1.05	1.08	1.10	1.13
9	1.16	1.19	1.22	1.25	1.28	1.31	1.34	1.38	1.41	1.44

Example: Volume of 16", 2-log tree of O.B.-Form Class 92 = 161 x 1.22 = 196 bd. ft.

Basic data: 105 trees from Pisgah and Nantahala National Forests.

Table constructed from the equation:

Logarithm International 1/4" bd. ft. vol. = 2.252352 (logarithm d.b.h. inches) + .689232 (logarithm merch. ht. ft.) + .010682 (O.B.-Form Class) - 2.446606.

Average deviation of individual tree volumes from values estimated by the equation:

±7.6 percent.

Aggregate difference: estimated values 0.20 percent low.

Volume as utilized, to a variable top diameter.

O.B.-FORM CLASS: Diameter outside bark at top of first 16.3-foot log divided by diameter outside bark at breast height, the result being multiplied by 100. Table above is for the average O.B.-Form Class of the 322 sample trees used. Factors in table below are to be used to get volumes for other O.B.-Form Classes.

MULTIPLIERS FOR OTHER O.B.-FORM CLASSES

Factors by which to multiply volumes in the above average table to obtain volumes for other O.B.-Form Classes:

O.B.-Form Class (Tens)	(Units) Factors									
	0	1	2	3	4	5	6	7	8	9
5										
6										
7	.72	.74	.76	.78	.80	.82	.84	.86	.88	.90
8	.93	.95	.98	1.00	1.02	1.05	1.08	1.10	1.13	1.16
9	1.19	1.22	1.25	1.28	1.32	1.35	1.38	1.42	1.46	1.49

Example: Volume of 16", 2-log tree of O.B.-Form Class 92 = 162 x 1.25 = 203 bd. ft.
Basic data: 322 trees from Cherokee, Pisgah and Nantahala National Forests; and

Bland County, Virginia.

Table constructed from the equation:

Logarithm International 1/4" bd. ft. vol. = 2.178540 (logarithm d.b.h. inches) + .671470 (logarithm merch. ht. ft.) + .010895 (O.B.-Form Class) - 2.333807.

Average deviation of individual tree volumes from values estimated by the equation:

White pine ±6.2 percent; Hemlock ±6.9 percent.

Aggregate difference: estimated values - White pine 0.60 percent low;
Hemlock 1.64 percent low.

Volume as utilized, to a variable top diameter.

O.B.-FORM CLASS: Diameter outside bark at top of first 16.3-foot log divided by diameter outside bark at breast height, the result being multiplied by 100.

Table above is for the average O.B.-Form Class of the 712 sample trees used. Factors in table below are to be used to get volumes for other O.B.-Form Classes.

MULTIPLIERS FOR OTHER O.B.-FORM CLASSES

Factors by which to multiply volumes in the above average table to obtain volumes for other O.B.-Form Classes

O.B.-Form Class (Tens)	(Units) Factors									
	0	1	2	3	4	5	6	7	8	9
5							.56	.58	.59	.61
6										
7	.62	.64	.66	.68	.70	.72	.74	.76	.78	.80
8	.82	.85	.87	.90	.92	.95	.97	1.00	1.03	1.05
9	1.08	1.11	1.15	1.18	1.21	1.24	1.28	1.32	1.35	1.39

Example: Volume of 16", 2-log tree of O.B.-Form Class 92 = 173 x 1.15 = 194 bd. ft.

Basic data: 712 trees - Yellowpoplar from: Geo. Washington, Cherokee, Pisgah and Nantahala National Forests; Jackson County, Ohio; Tucker County, W. Va.; Bland County, Virginia and Chatham County, N. C. - Loblolly pine from: Piedmont and northern coastal plain counties of South Carolina.

Table constructed from the equation:

Logarithm International 1/4" bd. ft. vol. = 2.336667 (logarithm d.b.h. inches) + .696762 (logarithm merch. ht. ft.) + .011959 (O.B.-Form Class) - 2.668960.

Average deviation of individual tree volumes from values estimated by the equation:
Loblolly pine ±5.9 percent; Yellowpoplar ±7.0 percent.Aggregate difference: estimated values - Loblolly pine 1.03 percent low;
Yellowpoplar 2.04 percent high.

Volume as utilized, to a variable top diameter.

O.B.-FORM CLASS: Diameter outside bark at top of first 16.3-foot log divided by diameter outside bark at breast height, the result being multiplied by 100.

Table above is for the average O.B.-Form Class of the 247 sample trees used. Factors in table below are to be used to get volumes for other O.B.-Form Classes.

MULTIPLIERS FOR OTHER O.B.-FORM CLASSES

Factors by which to multiply volumes in the above average table to obtain volumes for other O.B.-Form Classes

O.B.-Form Class (Tens)	(Units) Factors									
	0	1	2	3	4	5	6	7	8	9
5					.62	.63	.64	.66	.67	.69
6					.73	.75	.77	.78	.80	.82
7					.92	.94	.96	.98	1.00	1.02
8					1.14	1.17	1.19	1.22	1.24	1.27
9					1.14	1.17	1.19	1.22	1.24	1.27

Example: Volume of 16", 2-log tree of O.B.-Form Class 92 = 168 x 1.19 = 190 bd. ft.

Basic data: 247 trees from Pisgah and Nantahala National Forests; Tucker County, W. Va.; and Bland County, Virginia.

Table constructed from the equation:

Logarithm International 1/4" bd. ft. vol. = 2.263548 (logarithm d.b.h. inches) + .716287 (logarithm merch. ht. ft.) + .009572 (O.B.-Form Class) - 2.388677.

Average deviation of individual tree volumes from values estimated by the equation:

Sugar maple ±8.3 percent; Red maple ±8.4 percent; Sweet birch ±6.3 percent.

Aggregate difference: estimated values - Sugar maple 5.59 percent high;

Red maple 5.51 percent low; Sweet birch 1.31 percent high.

9	1.12	1.15	1.18	1.20	1.23	1.26	1.29	1.32	1.35	1.38

Example: Volume of 16", 2-log tree of O.B.-Form Class 92 = 169 x 1.18 = 199 bd. ft.

Basic data: 1802 trees from Cherokee, Pisgah, Nantahala and Chattahoochee National Forests; Jackson County, Ohio; Garrett County, Maryland; Hardy and Tucker Counties, W. Va.; Bland County, Virginia; and Chatham County, North Carolina.

Table constructed from the equation:

Logarithm International 1/4" bd. ft. vol. = 2.305965 (logarithm d.b.h. inches) + .729780 (logarithm merch. ht. ft.) + .010116 (O.B.-Form Class) - 2.514001.

Average deviation of individual tree volumes from values estimated by the equation:
White oak \pm 7.9 percent; Chestnut oak \pm 6.8 percent; Eastern red oak \pm 6.6 percent;
Black oak \pm 6.3 percent; and Scarlet oak \pm 6.5 percent.

Aggregate difference: estimated value - White oak 4.51 percent low; Chestnut oak 3.97 percent high; Eastern red oak 2.02 percent high; Black oak 1.90 percent high; and Scarlet oak 4.33 percent low.

9	1.09	1.12	1.15	1.19	1.22	1.26	1.29	1.33	1.37	1.41

Example: Volume of 16", 2-log tree of O.B.-Form Class 92 = 182 x 1.15 = 209 bd. ft.
Basic data: 192 trees from Pisgah and Nantahala National Forests and Tucker County,

W. Va.

Table constructed from the equation:

Logarithm International 1/4" bd. ft. vol. = 2.397562 (logarithm d.b.h. inches) + .737772 (logarithm merch. ht. ft.) + .012495 (O.B.-Form Class) - 2.831076.

Average deviation of individual tree volumes from values estimated by the equation:

White ash \pm 6.4 percent; Basswood \pm 8.1 percent.

Aggregate difference: estimated values - White ash 1.32 percent high;
Basswood 1.83 percent low.

Volume as utilized, to a variable top diameter.
O.B.-FORM CLASS: Diameter outside bark at top of first 16.3-foot log divided by diameter outside bark at breast height, the result being multiplied by 100. Block indicates extent of basic data for all O.B.-Form Classes. Table above is for the average O.B.-Form Class of the 378 sample trees used. Factors in table below are to be used to get volumes for other O.B.-Form Classes.

MULTIPLIERS FOR OTHER O.B.-FORM CLASSES

Factors by which to multiply volumes in the above average table to obtain volumes for other O.B.-Form Classes.

O.B.-Form Class (Tens)	(Units) Factors									
	0	1	2	3	4	5	6	7	8	9
5										
6										
7	.62	.64	.66	.68	.70	.72	.74	.76	.78	.81
8	.83	.86	.88	.91	.94	.97	1.00	1.03	1.06	1.09
9	1.13	1.16	1.20	1.23	1.27	1.31	1.35	1.39	1.44	1.48

Example: Volume of 16", 2-log tree of O.B.-Form Class 92 = 15 x 1.20 = 18. Basic data: 378 trees from Piedmont and northern coastal plain counties of South Carolina.

Table constructed from the equation:

$$\text{Logarithm Scribner bd. ft. vol.} = 2.656781 (\text{logarithm d.b.h. inches}) + .668339 (\text{logarithm merch. ht. ft.}) + .013130 (\text{O.B.-Form Class}) - 3.174013.$$

Average deviation of individual tree volumes from values estimated by the equation: ±6.3 percent.

Aggregate difference: estimated values 0.40 percent high.

Volume as utilized, to a variable top diameter.

O.B.-FORM CLASS: Diameter outside bark at top of first 16.3-foot log divided by diameter outside bark at breast height, the result being multiplied by 100.

Block indicates extent of basic data for all O.B.-Form Classes.

Table above is for the average O.B.-Form Class of the 280 sample trees used. Factors in table below are to be used to get volumes for other O.B.-Form Classes.

MULTIPLIERS FOR OTHER O.B.-FORM CLASSES

Factors by which to multiply volumes in the above average table to obtain volumes for other O.B.-Form Classes

O.B.-Form Class (Tens)	(Units) Factors									
	0	1	2	3	4	5	6	7	8	9
5										
6										
7	.70	.71	.73	.75	.77	.79	.80	.82	.84	.86
8	.89	.91	.93	.95	.98	1.00	1.02	1.05	1.07	1.10
9	1.12	1.15	1.18	1.21	1.24	1.27	1.30	1.33	1.36	1.40

Example: Volume of 16", 2-log tree of O.B.-Form Class 92 = 15 x 1.18 = 18.

Basic data: 280 trees from Cherokee, Pisgah and Nantahala National Forests; Jackson County, Ohio; Garrett County, Md.; Tucker County, W. Va.; and Bland County, Va.

Table constructed from the equation:

Logarithm Scribner bd. ft. vol. = 2.358786 (logarithm d.b.h. inches) + .724375 (logarithm merch. ht. ft.) + .010388 (O.B.-Form Class) - 2.634671.

Average deviation of individual tree volumes from values estimated by the equation:
±7.3 percent.

Aggregate difference: estimated values 0.23 percent high.

9	1.08	1.10	1.13	1.15	1.18	1.20	1.22	1.25	1.27	1.30

Example: Volume of 16", 2-log tree of O.B.-Form Class 92 = 15 x 1.13 = 17.

Basic data: 471 trees from Cherokee, Pisgah and Nantahala National Forests; Jackson County, Ohio; and Bland County, Virginia.

Table constructed from the equation:

Logarithm Scribner bd. ft. vol. = 2.440861 (logarithm d.b.h. inches) + .699519 (logarithm merch. ht. ft.) + .008751 (O.B.-Form Class) - 2.578469.

Average deviation of individual tree volumes from values estimated by the equation: ±6.7 percent.

Aggregate difference: estimated values 0.47 percent low.

Volume as utilised, to a variable top diameter.

O.B.-FORM CLASS: Diameter outside bark at top of first 16.3-foot log divided by diameter outside bark at breast height, the result being multiplied by 100.

Block indicates extent of basic data for all O.B.-Form Classes.

Table above is for the average O.B.-Form Class of the 52 sample trees used. Factors in table below are to be used to get volumes for other O.B.-Form Classes.

MULTIPLIERS FOR OTHER O.B.-FORM CLASSES

Factors by which to multiply volumes in the above average table to obtain volumes for other O.B.-Form Classes

O.B.-Form Class (Tens)	(Units) Factors								
	0	1	2	3	4	5	6	7	8
5									
6									
7	.58	.60	.62	.64	.66	.68	.70	.73	.75
8	.80	.82	.85	.88	.91	.94	.97	1.00	1.03
9	1.10	1.14	1.18	1.21	1.25	1.29	1.33	1.38	1.42

Example: Volume of 16", 2-log tree of O.B.-Form Class 92 = 17 x 1.18 = 20.

Basic data: 52 trees from Pisgah and Nantahala National Forests and Tucker County, W. Virginia.

Table constructed from the equation:

$$\text{Logarithm Scribner bd. ft. vol.} = 2.404893 (\text{logarithm d.b.h. inches}) +$$

$$.753712 (\text{logarithm merch. ht. ft.}) + .013933 (\text{O.B.-Form Class}) - 3.024582.$$

Average deviation of individual tree volumes from values estimated by the equation: 26.7 percent.

Aggregate difference: estimated values 0.43 percent high.

9	1.20	1.23	1.26	1.29	1.32	1.36	1.40	1.43	1.47	1.51

Example: Volume of 16", 2-log tree of O.B.-Form Class 92 = 15 x 1.26 = 19.

Basic data: 322 trees from Cherokee, Pisgah, and Nantahala National Forests, and Bland County, Virginia.

Table constructed from the equation:

$$\text{Logarithm Scribner bd. ft. vol.} = 2.272700 \text{ (logarithm d.b.h. inches)} + .654938 \text{ (logarithm merch. ht. ft.)} + .011158 \text{ (O.B.-Form Class)} - 2.482938.$$

Average deviation of individual tree volumes from values estimated by the equation:
White pine ± 6.5 percent; Hemlock ± 7.1 percent.

Aggregate difference: estimated values - White pine 0.83 percent low;
Hemlock 1.07 percent low.

9	1.09	1.12	1.16	1.19	1.23	1.27	1.30	1.34	1.38	1.43

Example: Volume of 16", 2-log tree of O.B.-Form Class 92 = 15 x 1.16 = 17.

Basic data: 712 trees - Yellowpoplar from: Geo. Washington, Cherokee, Pisgah and Nantahala National Forests; Jackson County, Ohio; Tucker County, W. Va.; Bland County, Virginia; and Chatham County, North Carolina. Loblolly pine from: Piedmont and northern coastal plain counties of South Carolina.

Table constructed from the equation:

$$\text{Logarithm Scribner bd. ft. vol.} = 2.524953 (\text{logarithm d.b.h. inches}) + .663803 (\text{logarithm merch. ht. ft.}) + .012322 (\text{O.B.-Form Class}) - 2.971420.$$

Average deviation of individual tree volumes from values estimated by the equation:

Loblolly pine ± 7.1 percent; Yellowpoplar ± 7.6 percent.

Aggregate difference: estimated values - Loblolly pine 0.09 percent high; Yellowpoplar 3.28 percent high.

Volume as utilized, to a variable top diameter.

O.B.-FORM CLASS: Diameter outside bark at top of first 16.3-foot log divided by

diameter outside bark at breast height, the result being multiplied by 100.

Table above is for the average O.B.-Form Class of the 247 sample trees used. Factors in table below are to be used to get volumes for other O.B.-Form Classes.

MULTIPLIERS FOR OTHER O.B.-FORM CLASSES

Factors by which to multiply volumes in the above average table to obtain volumes for other O.B.-Form Classes

O.B.-Form Class (Tens)	(Units) Factors										
	0	1	2	3	4	5	6	7	8	9	
5											
6				.61	.62	.64	.65	.67	.68	.70	.71
7		.73	.75	.76	.78	.80	.82	.84	.86	.87	.89
8		.91	.94	.96	.98	1.00	1.02	1.05	1.07	1.09	1.12
9		1.14	1.17	1.20	1.22	1.25	1.28	1.31	1.34	1.37	1.40

Example: Volume of 16", 2-log tree of O.B.-Form Class 92 = 15 x 1.20 = 18.

Basic data: 247 trees from Pisgah and Nantahala National Forests; Tucker County, W. Va.; and Bland County, Virginia.

Table constructed from the equation:

$$\text{Logarithm Scribner bd. ft. vol.} = 2.355638 (\text{logarithm d.b.h. inches}) + .714891 (\text{logarithm merch. ht. ft.}) + .009757 (\text{O.B.-Form Class}) - 2.551868.$$

Average deviation of individual tree volumes from values estimated by the equation:

Sugar maple ± 8.7 percent; Red maple ± 8.3 percent; Sweet birch ± 6.5 percent.

Aggregate difference: estimated values - Sugar maple 6.17 percent high;

Red maple 4.11 percent low; Sweet birch 1.56 percent high.

Volume as utilized, to a variable top diameter.

O.B.-FORM CLASS: Diameter outside bark at top of first 16.3-foot log divided by diameter outside bark at breast height, the result being multiplied by 100.

Table above is for the average O.B.-Form Class of the 1802 sample trees used. Factors in table below are to be used to get volumes for other O.B.-Form Classes.

MULTIPLIERS FOR OTHER O.B.-FORM CLASSES

Factors by which to multiply volumes in the above average table to obtain volumes for other O.B.-Form Classes

O.B.-Form Class (Tens)	(Units) Factors									
	0	1	2	3	4	5	6	7	8	9
5	.44	.45	.46	.48	.49	.50	.51	.52	.53	.55
6	.56	.57	.59	.60	.61	.63	.64	.66	.67	.69
7	.70	.72	.74	.76	.77	.79	.81	.83	.85	.87
8	.89	.91	.93	.96	.98	1.00	1.02	1.05	1.07	1.10
9	1.12	1.15	1.18	1.20	1.23	1.26	1.29	1.32	1.35	1.39

Example: Volume of 16", 2-log tree of O.B.-Form Class 92 = 16 x 1.18 = 19.

Basic data: 1802 trees from Cherokee, Pisgah, Nantahala and Chattahoochee National Forests; Jackson County, Ohio; Garrett County, Md.; Hardy and Tucker Counties, W. Va.; Bland County, Virginia; and Chatham County, North Carolina.

Table constructed from the equation:

$$\text{Logarithm Scribner bd. ft. vol.} = 2.383987 (\text{logarithm d.b.h. inches}) + .724431 (\text{logarithm merch. ht. ft.}) + .010107 (\text{O. B.-Form Class}) - 2.634971.$$

Average deviation of individual tree volumes from values estimated by the equation:
 White oak ± 8.2 percent; Chestnut oak ± 7.1 percent; Eastern red oak ± 7.3 percent;
 Black oak ± 5.6 percent; Scarlet oak ± 6.3 percent.

Aggregate difference: estimated values - White oak 4.25 percent low; Chestnut oak 4.07 percent high; Eastern red oak 2.66 percent high; Black oak 0.56 percent high; Scarlet oak 3.69 percent low.

Volume as utilized, to a variable top diameter.

O.B.-FORM CLASS: Diameter outside bark at top of first 16.3-foot log divided by diameter outside bark at breast height, the result being multiplied by 100.

Block indicates extent of basic data for all O.B.-Form Classes.

Table above is for the average O.B.-Form Class of the 378 sample trees used. Factors in table below are to be used to get volumes for other O.B.-Form Classes?

MULTIPLIERS FOR OTHER O.B.-FORM CLASSES

Factors by which to multiply volumes in the above average table to obtain volumes for other O.B.-Form Classes

O.B.-Form Class (Tens)	(Units) Factors									
	0	1	2	3	4	5	6	7	8	9
5										
6										
7	.53	.55	.58	.60	.62	.65	.67	.70	.73	.76
8	.79	.82	.85	.89	.92	.96	1.00	1.04	1.08	1.13
9	1.17	1.22	1.27	1.32	1.37	1.43	1.49	1.54	1.61	1.67

Example: Volume of 16", 2-log tree of O.B.-Form Class 92 = 101 x 1.27 = 128 bd. ft.

Basic data: 378 trees from Piedmont and northern coastal plain counties of South Carolina.

Table constructed from the equation:

Logarithm Doyle-Scribner bd. ft. vol. = 3.415548 (logarithm d.b.h. inches) + .627998 (logarithm merch. ht. ft.) + .017182 (O.B.-Form Class) - 4.534534.

Average deviation of individual tree volumes from values estimated by the equation: ±8.8 percent.

Aggregate difference: estimated values 2.74 percent high.

Volume as utilized, to a variable top diameter.

O.B.-FORM CLASS: Diameter outside bark at top of first 16.3-foot log divided by diameter outside bark at breast height, the result being multiplied by 100.

Block indicates extent of basic data for all O.B.-Form Classes.

Table above is for the average O.B.-Form Class of the 54 sample trees used. Factors in table below are to be used to get volumes for other O.B.-Form Classes.

MULTIPLIERS FOR OTHER O.B.-FORM CLASSES

Factors by which to multiply volumes in the above average table to obtain volumes for other O.B.-Form Classes

O.B.-Form Class (Tens)	(Units) Factors									
	0	1	2	3	4	5	6	7	8	9
5										
6					.59	.60	.62	.63	.65	.66
7		.71	.73	.75	.76	.78	.80	.82	.84	.86
8		.91	.93	.95	.98	1.00	1.02	1.05	1.07	1.10
9		1.15	1.18	1.21	1.24	1.27	1.30	1.33	1.37	1.40

Example: Volume of 16", 2-log tree of O.B.-Form Class 92 = 111 x 1.21 = 134 bd. ft.

Basic data: 54 trees from Pisgah and Nantahala National Forests and Bland County, Va.

Table constructed from the equation:

$$\text{Logarithm Doyle-Scribner bd. ft. vol.} = 2.922970 \text{ (logarithm d.b.h. inches)} + .725017 \text{ (logarithm merch. ht. ft.)} + .010465 \text{ (O.B.-Form Class)} - 3.450154.$$

Average deviation of individual tree volumes from values estimated by the equation:
±7.9 percent.

Aggregate difference: estimated values 0.02 percent high.

8	.86	.89	.92	.94	.97	1.00	1.03	1.06	1.09	1.12
9	1.16	1.19	1.23	1.27	1.31	1.34	1.38	1.43	1.47	1.51

Example: Volume of 16", 2-log tree of O.B.-Form Class 92 = 110 x 1.23 = 135 bd. ft.

Basic data: 280 trees from Cherokee, Pisgah, and Nantahala National Forests; Jackson County, Ohio; Garrett County, Md.; Tucker County, W. Va.; and Bland County, Va.

Table constructed from the equation:

Logarithm Doyle-Scribner bd. ft. vol. = 2.865214 (logarithm d.b.h. inches) + .677057 (logarithm merch. ht. ft.) + .012839 (O.B.-Form Class) - 3.524248.

Average deviation of individual tree volumes from values estimated by the equation:
±9.7 percent.

Aggregate difference: estimated values 1.93 percent high.

Volume as utilized, to a variable top diameter.
O.B.-FORM CLASS: Diameter outside bark at top of first 16.3-foot log divided by diameter outside bark at breast height, the result being multiplied by 100.

Block indicates extent of basic data for all O.B.-Form Classes.

Table above is for the average O.B.-Form Class of the 688 sample trees used. Factors in table below are to be used to get volumes for other O.B.-Form Classes.

MULTIPLIERS FOR OTHER O.B.-FORM CLASSES

Factors by which to multiply volumes in the above average table to obtain volumes for other O.B.-Form Classes

O.B.-Form Class (Tens)	(Units) Factors									
	0	1	2	3	4	5	6	7	8	9
5	.38	.39	.40	.41	.42	.43	.45	.46	.47	.49
6	.50	.52	.53	.55	.56	.58	.59	.61	.63	.65
7	.67	.69	.71	.73	.75	.77	.79	.82	.84	.86
8	.89	.92	.94	.97	1.00	1.03	1.06	1.09	1.12	1.15
9	1.19	1.22	1.26	1.30	1.33	1.37	1.41	1.46	1.50	1.54

Example: Volume of 16", 2-log tree of O.B.-Form Class 92 = 113 x 1.26 = 142 bd. ft.

Basic data: 688 trees from Cherokee, Pisgah, Nantahala and Chattahoochee National Forests; Jackson County, Ohio; Garrett County, Md.; Hardy County, W. Va.; Bland County, Virginia and Chatham County, North Carolina.

Table constructed from the equation:

$$\text{Logarithm Doyle-Scribner bd. ft. vol.} = 2.960694 (\text{logarithm d.b.h. inches}) + .625508 (\text{logarithm merch. ht. ft.}) + .012540 (\text{O.B.-Form Class}) - 3.512881.$$

Average deviation of individual tree volumes from values estimated by the equation:
±0.4 percent.

Aggregate difference: estimated values 2.32 percent high.

9	1.10	1.13	1.15	1.18	1.21	1.24	1.27	1.30	1.33	1.37

Example: Volume of 16", 2-log tree of O.B.-Form Class 92 = 109 x 1.15 = 125 bd. ft.
Basic data: 471 trees from Cherokee, Pisgah and Nantahala National Forests; Jackson

County, Ohio; and Bland County, Virginia.

Table constructed from the equation:

Logarithm Doyle-Scribner bd. ft. vol. = 2.913098 (logarithm d.b.h. inches) + .644365 (logarithm merch. ht. ft.) + .010489 (O.B.-Form Class) - 3.347888.

Average deviation of individual tree volumes from values estimated by the equation:

±8.4 percent.

Aggregate difference: estimated values 0.15 percent high.

Volume as utilized, to a variable top diameter.

O.B.-FORM CLASS: Diameter outside bark at top of first 16.3-foot log divided by diameter outside bark at breast height, the result being multiplied by 100.

Block indicates extent of basic data for all O.B.-Form Classes.

Table above is for the average O.B.-Form Class of the 334 sample trees used. Factors in table below are to be used to get volumes for other O.B.-Form Classes.

MULTIPLIERS FOR OTHER O.B.-FORM CLASSES

Factors by which to multiply volumes in the above average table to obtain volumes for other O.B.-Form Classes

O.B.-Form Class (Tens)	(Units) Factors									
	0	1	2	3	4	5	6	7	8	9
5										
6										
7	.53	.55	.57	.59	.61	.64	.66	.68	.71	.73
8	.76	.78	.81	.84	.87	.90	.93	.97	1.00	1.04
9	1.07	1.11	1.15	1.19	1.23	1.28	1.32	1.37	1.42	1.47

Example: Volume of 16", 2-log tree of O.B.-Form Class 92 = 119 x 1.15 = 137 bd. ft.

Basic data: 334 trees from Geo. Washington, Cherokee, Pisgah and Nantahala National Forests; Jackson County, Ohio; Tucker County W. Va.; Bland County, Virginia; and Chatham County, North Carolina.

Table constructed from the equation:

Logarithm Doyle-Scribner bd. ft. vol. = 2.909762 (logarithm d.b.h. inches) + .587714 (logarithm march ht. ft.) + .015130 (O.B.-Form Class) - 3.648002.

Average deviation of individual tree volumes from values estimated by the equation: ±8.7 percent.

Aggregate difference: estimated values 0.84 percent high.

Volume as utilized, to a variable top diameter.

O.B.-FORM CLASS: Diameter outside bark at top of first 16.3-foot log divided by diameter outside bark at breast height, the result being multiplied by 100.

Block indicates extent of basic data for all O.B.-Form Classes.

Table above is for the average O.B.-Form Class of the 105 sample trees used. Factors in table below are to be used to get volumes for other O.B.-Form Classes.

MULTIPLIERS FOR OTHER O.B.-FORM CLASSES

Factors by which to multiply volumes in the above average table to obtain volumes for other O.B.-Form Classes

O.B.-Form Class (Tens)	(Units)									
	0	1	2	3	4	5	6	7	8	9
5							.56	.58	.60	.62
6							.77	.80	.82	.85
7	.64	.66	.68	.70	.72	.75				
8	.88	.91	.94	.97	1.00	1.03	1.07	1.10	1.14	1.18
9	1.21	1.25	1.30	1.34	1.38	1.43	1.48	1.52	1.57	1.63

Example: Volume of 16", 2-log tree of O.B.-Form Class 92 = 106 x 1.30 = 138 bd. ft.

Basic data: 105 trees from Pisgah and Nantahala National Forests.

Table constructed from the equation:

Logarithm Doyle-Scribner bd. ft. vol. = 2.819509 (logarithm d.b.h. inches) + .641480 (logarithm merch. ht. ft.) + .014070 (O.B.-Form Class) - 3.520644.

Average deviation of individual tree volumes from values estimated by the equation: ±9.5 percent.

Aggregate difference: estimated values 1.10 percent high.

Volume as utilized, to a variable top diameter.

O.B.-FORM CLASS: Diameter outside bark at top of first 16.3-foot log divided by diameter outside bark at breast height, the result being multiplied by 100.

Block indicates extent of basic data for all O.B.-Form Classes.

Table above is for the average O.B.-Form Class of the 88 sample trees used. Factors in table below are to be used to get volumes for other O.B.-Form Classes.

MULTIPLIERS FOR OTHER O.B.-FORM CLASSES

Factors by which to multiply volumes in the above average table to obtain volumes for other O.B.-Form Classes

O.B.-Form Class (Tens)	(Units) Factors									
	0	1	2	3	4	5	6	7	8	9
5										
6										
7	.69	.71	.73	.75	.77	.79	.81	.83	.85	.88
8	.90	.92	.95	.97	1.00	1.03	1.05	1.08	1.11	1.14
9	1.17	1.20	1.23	1.26	1.30	1.33	1.37	1.40	1.44	1.48

Example: Volume of 16", 2-log tree of O.B.-Form Class 92 = 117 x 1.23 = 144 bd. ft.

Basic data: 88 trees from Pisgah and Nantahala National Forests; Tucker County, W. Va.; and Bland County, Virginia.

Table constructed from the equation:

Logarithm Doyle-Scribner bd. ft. vol. = 2.889611 (logarithm d.b.h. inches) + .635702 (logarithm merch. ht. ft.) + .011347 (O.B.-Form Class) - 3.325889.

Average deviation of individual tree volumes from values estimated by the equation:
±8.6 percent.

Aggregate difference: estimated values 0.37 percent low.

9	1.24	1.28	1.32	1.36	1.40	1.45	1.49	1.54	1.59	1.64

Example: Volume of 16", 2-log tree of O.B.-Form Class 92 = 108 x 1.32 = 142 bd. ft.

Basic data: 322 trees from Cherokee, Pisgah and Nantahala National Forests; and Bland County, Virginia.

Table constructed from the equation:

Logarithm Doyle-Scribner bd. ft. vol. = 2.747583 (logarithm d.b.h. inches) + .606102 (logarithm merch. ht. ft.) + .013381 (O.B.-Form Class) - 3.305406.

Average deviation of individual tree volumes from values estimated by the equation:

White pine ± 7.6 percent; Hemlock ± 8.4 percent.

Aggregate difference: estimated values - White pine 0.45 percent low; Hemlock 0.98 percent high.

Volume as utilized, to a variable top diameter.

O.B.-FORM CLASS: Diameter outside bark at top of first 16.3-foot log divided by diameter outside bark at breast height, the result being multiplied by 100. Table above is for the average O.B.-Form Class of the 712 sample trees used. Factors in table below are to be used to get volumes for other O.B.-Form Classes.

MULTIPLIERS FOR OTHER O.B.-FORM CLASSES

Factors by which to multiply volumes in the above average table to obtain volumes for other O.B.-Form Classes

O.B.-Form Class (Tens)	(Units) Factors									
	0	1	2	3	4	5	6	7	8	9
5										
6										
7	.53	.55	.57	.59	.62	.64	.66	.69	.72	.74
8	.77	.80	.83	.86	.90	.93	.96	1.00	1.04	1.08
9	1.12	1.16	1.20	1.25	1.30	1.35	1.40	1.45	1.51	1.56

Example: Volume of 16", 2-log tree of O.B.-Form Class 92 = 110 x 1.20 = 132 bd. ft.

Basic data: 712 trees - Yellowpoplar from Geo. Washington, Cherokee, Pisgah and Nantahala National Forests; Jackson County, Ohio; Tucker County, W. Va.; Bland County, Virginia; and Chatham County, N. C. Loblolly pine from Piedmont and northern coastal plain counties of South Carolina.

Table constructed from the equation:

Logarithm Doyle-Scribner bd. ft. vol. = 3.162655 (logarithm d.b.h. inches) + .607856 (logarithm marsh. ht. ft.) + .016156 (O.B.-Form Class) - 4.091264.

Average deviation of individual tree volumes from values estimated by the equation:

Loblolly pine 19.9 percent; Yellowpoplar 110.1 percent.

Aggregate difference: estimated values - Loblolly pine 0.22 percent high;

Yellowpoplar 10.51 percent high.

9	1.11	1.15	1.19	1.23	1.27	1.32	1.36	1.41	1.46	1.51

Example: Volume of 16", 2-log tree of O.B.-Form Class 92 = 148 x 1.19 = 176 bd. ft. Basic data: 503 trees from Cherokee and Nantahala National Forests and northeastern South Carolina.

Table constructed from the equation:

Logarithm Doyle-Scribner bd. ft. vol. = 3.221276 (logarithm d.b.h. inches) + .633376 (logarithm merch. ht. ft.) + .014844 (O.B.-Form Class) - 3.959952.

Average deviation of individual tree volumes from values estimated by the equation:

Shortleaf pine ±8.5 percent; Virginia pine ±8.8 percent.

Aggregate difference: estimated values - Shortleaf pine 4.75 percent high; Virginia pine 4.60 percent low.

Volume as utilized, to a variable top diameter.

O.B.-FORM CLASS: Diameter outside bark at top of first 16.3-foot log divided by diameter outside bark at breast height, the result being multiplied by 100.

Table above is for the average O.B.-Form Class of the 247 sample trees used. Factors in table below are to be used to get volumes for other O.B.-Form Classes.

MULTIPLIERS FOR OTHER O.B.-FORM CLASSES

Factors by which to multiply volumes in the above average table to obtain volumes for other O.B.-Form Classes

O.B.-Form Class (Tens)	(Units) Factors									
	0	1	2	3	4	5	6	7	8	9
5										
6				.55	.56	.58	.59	.61	.63	.64
7		.68	.70	.72	.74	.76	.78	.80	.82	.85
8		.90	.92	.95	.97	1.00	1.03	1.06	1.09	1.12
9		1.18	1.21	1.25	1.28	1.32	1.36	1.39	1.43	1.51

Example: Volume of 16", 2-log tree of O.B.-Form Class 92 = 111 x 1.25 = 139 bd. ft.
Basic data: 247 trees from Pisgah and Nantahala National Forests; Tucker County,

W. Va.; and Bland County, Virginia.

Table constructed from the equation:

$$\text{Logarithm Doyle-Scribner bd. ft. vol.} = 2.877373 \text{ (logarithm d.b.h. inches)} + .667400 \text{ (logarithm merch. ht. ft.)} + .011960 \text{ (O.B.-Form Class)} - 3.432235$$

Average deviation of individual tree volumes from values estimated by the equation:

Sugar maple \pm 10.8 percent; Red maple \pm 10.5 percent; Sweet birch \pm 8.3 percent.

Aggregate difference: estimated values - Sugar maple 9.94 percent high;

Red maple 5.85 percent low; Sweet birch 1.96 percent high.

Volume as utilized, to a variable top diameter.

O.B.-FORM CLASS: Diameter outside bark at top of first 16.3-foot log divided by diameter outside bark at breast height, the result being multiplied by 100.
Table above is for the average O.B.-Form Class of the 1802 sample trees used. Factors in table below are to be used to get volumes for other O.B.-Form Classes.

MULTIPLIERS FOR OTHER O.B.-FORM CLASSES

Factors by which to multiply volumes in the above average table to obtain volumes for other O.B.-Form Classes

O.B.-Form Class (Tens)	(Units) Factors									
	0	1	2	3	4	5	6	7	8	9
5	.37	.38	.39	.40	.41	.42	.44	.45	.46	.48
6	.49	.50	.52	.53	.55	.56	.58	.60	.62	.63
7	.65	.67	.69	.71	.73	.75	.77	.80	.82	.84
8	.87	.89	.92	.94	.97	1.00	1.03	1.06	1.09	1.12
9	1.15	1.19	1.22	1.26	1.29	1.33	1.37	1.41	1.45	1.49

Example: Volume of 16", 2-log tree of O.B.-Form Class 92 = 113 x 1.22 = 138 bd. ft.
Basic data: 1802 trees from Cherokee, Pisgah, Nantahala, and Chattahoochee National Forests; Jackson County, Ohio; Garrett County, Maryland; Hardy and Tucker Counties, W. Va.; Bland County, Virginia and Chatham County, North Carolina.

Table constructed from the equation:

Logarithm Doyle-Scribner bd. ft. vol. = 2.892515 (logarithm d.b.h. inches) + .673880 (logarithm merch. ht. ft.) + .012399 (O.B.-Form Class) - 3.503653.

Average deviation of individual tree volumes from values estimated by the equation:
White oak \pm 10.9 percent; Chestnut oak \pm 8.6 percent; Eastern red oak \pm 9.7 percent;
Black oak \pm 7.1 percent; Scarlet oak \pm 8.1 percent.

Aggregate difference: estimated values - White oak 3.21 percent low; Chestnut oak 6.11 percent high; Eastern red oak 5.67 percent high; Black oak 2.06 percent high; Scarlet oak 4.47 percent low.

Volume as utilized, to a variable top diameter.
O.B.-FORM CLASS: Diameter outside bark at top of first 16.3-foot log divided by diameter outside bark at breast height, the result being multiplied by 100.
Table above is for the average O.B.-Form Class of the 192 sample trees used. Factors in table below are to be used to get volumes for other O.B.-Form Classes.

MULTIPLIERS FOR OTHER O.B.-FORM CLASSES

Factors by which to multiply volumes in the above average table to obtain volumes for other O.B.-Form Classes

O.B.-Form Class (Tens)	(Units) Factors									
	0	1	2	3	4	5	6	7	8	9
5										
6										
7	.54	.56	.58	.60	.62	.64	.67	.69	.72	.74
8	.77	.80	.83	.86	.90	.93	.96	1.00	1.04	1.08
9	1.12	1.16	1.20	1.25	1.29	1.34	1.39	1.44	1.50	1.55

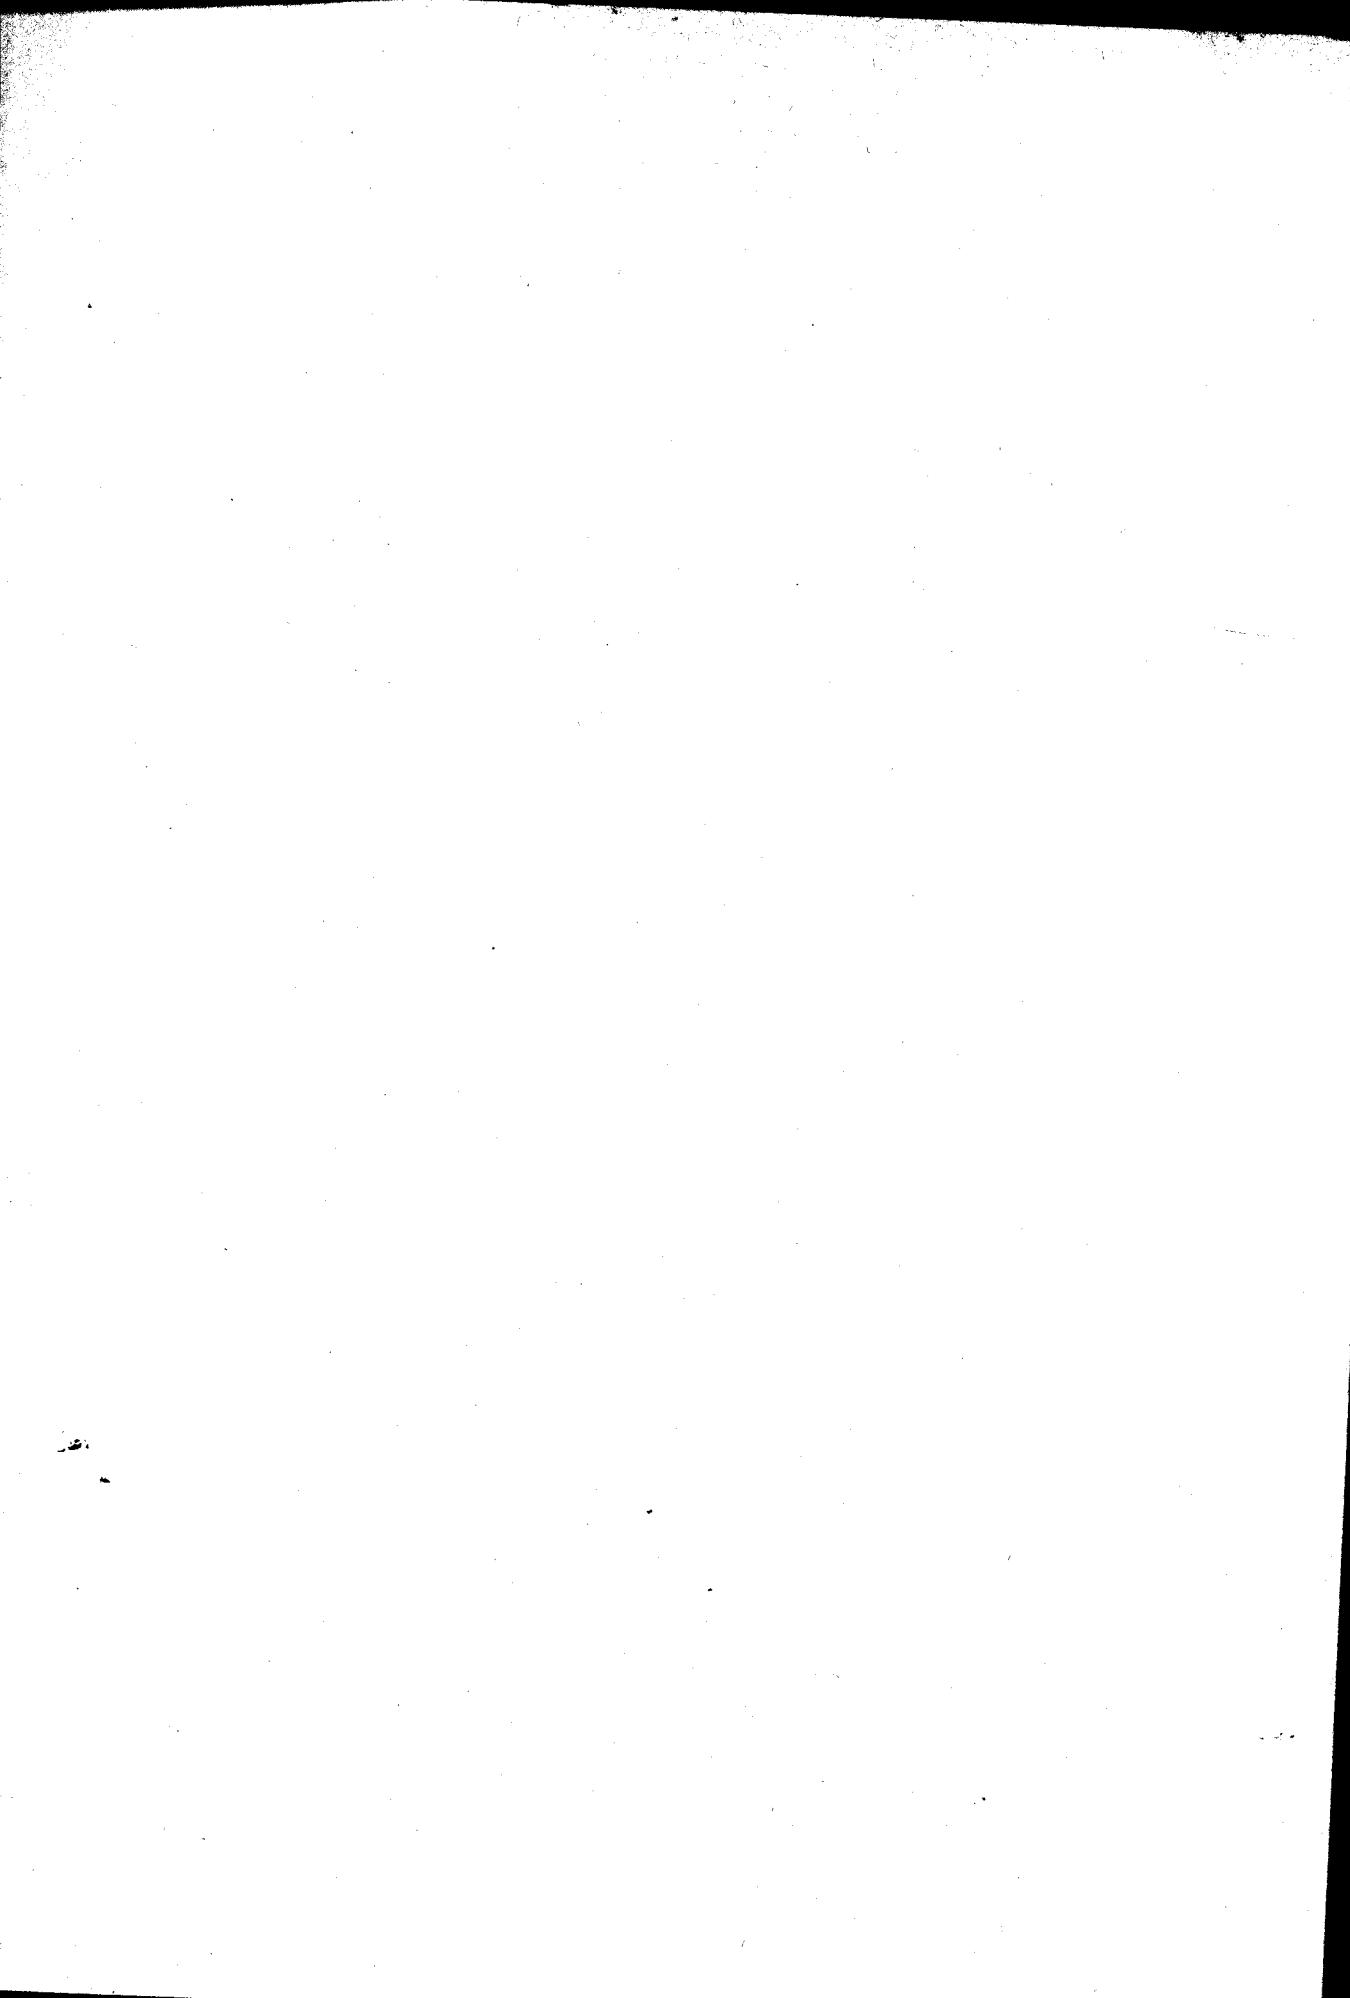

Example: Volume of 16", 2-log tree of O.B.-Form Class 92 = 124 x 1.20 = 149 bd. ft.
Basic data: 192 trees from Pisgah and Nantahala National Forests and Tucker County,
W. Virginia.

Table constructed from the equation:

$$\text{Logarithm Doyle-Scribner bd. ft. vol.} = 3.013698 \text{ (logarithm d.b.h. inches)} + .690124 \text{ (logarithm march. ht. ft.)} + .015940 \text{ (O.B.-Form Class)} - 3.968214$$

Average deviation of individual tree volumes from values estimated by the equation:
White ash ± 9.0 percent; Basswood ± 10.8 percent.

Aggregate difference: estimated values - White ash 3.01 percent high;
Basswood 1.19 percent low.
