   1. As used in this Specification Section, "semi-exposed" portions of woodwork include those members behind opaque doors, such as shelves, divisions, interior faces of ends, case backs, drawer sides, backs and bottoms, and back face of doors. Tops of cases 6'-6" or more above finish floor shall be considered semi-exposed. Bottoms of woodwork less than 4 feet above finish floor are considered semi-exposed. Semi-exposed portions of woodwork shall be of same species, finish and color as the "exposed" portions.

1.3 SYSTEM DESCRIPTION

A. Design Requirements:
   1. Manufacturer is responsible for:
      a. Designing, engineering, fabricating, and installing system
      b. Anchorage to structure
      c. Modifications to meet specified requirements and maintain visual design concepts
   2. Drawings are diagrammatic and are intended to establish basic dimension of units, sight lines, and unit profiles.
   3. Provide concealed fastening wherever possible.
   4. Attachment considerations: Account for site peculiarities, expansion and contraction movements, so there is no loosening, weakening, and fracturing, of connections between units and substrate.
   5. Comply with UL 544 for electrically powered equipment.

B. Interface With Adjacent Systems:
   1. Coordinate with mechanical service lines and ductwork.
   2. Coordinate with electrical service lines.

1.4 SCOPE

A. Furnish and install all cabinets and casework, including tops, ledges, supporting structures, fume hoods, laboratory sinks, cup sinks, and miscellaneous items of equipment as listed in these specifications, including delivery to the building, setting in place, leveling, scribing to walls and floors as required. Furnishing and installing all filler panels, knee space panels and scribes as shown on drawings.

B. Furnish and deliver all utility service outlet accessory fittings, as listed in these specifications or as shown on drawings as mounted on the laboratory furniture. The above defined items shall be furnished unassembled with supply tank nipples and lock nuts, not attached, loose in boxes and properly marked for delivery to the mechanical contractor. All plumbing fittings shall be packaged separately and properly marked for delivery to the appropriate contractor.

C. Furnish and deliver, packed in boxes for installation by the mechanical contractor, all drain troughs and sink outlets with integral tailpieces, which occur above the floor, and where these items are part of the equipment or listed in the specifications, or shown on the drawings. Integral tailpieces when required shall be in accordance with the manufacturer's standards. All tailpieces shall be furnished less the couplings required to connect them to the drain piping system.

D. Furnish service strip supports where specified, and setting in place service tunnels, service turrets, supporting structures and reagent racks of the type shown on the details.

1.5 SUBMITTALS

A. Product Data:
   1. Submit manufacturer's descriptive literature and product specifications for each product.
   2. Include data to indicate cabinet construction.
   3. Include information for factory finishes, chemical resistance ratings, hardware, glass, sealants, accessories, and other required components.

B. Shop Drawings:
   1. Indicate typical casework and countertop layout including dimensioned floor plans, sections and elevations, and service fixture holes locations.
   2. Indicate enclosures, cabinets, hardware, service fixtures complete with numbers and item names, and details including construction kinds of cabinets, countertops, process tables, and other components.
   3. Submit detail drawings of special accessory components not included in manufacturer's product data.
   4. Indicate joints in countertop material.

C. Samples:
   1. Work Surface Samples:
      a. One sample of all top materials shown or called for, of sufficient size to perform finish requirement tests
      b. Two pieces sealed and joined. Full depth of counter and 6 inches from each side of joint
   2. Wood Finish Sample –
      a. Include samples. Maple veneer
      b. Size: 3" x 5"
   3. Metal Casework Color Samples:
      a. Include manufacturer's full range of colors for Architect's selection.
      b. Architect will select casework components' color with no change in contract sum.
      c. Provide sample of colors, as selected by Architect, on same metal from which casework will be fabricated

d. Size: 6” x 6”

4. Sample of all mechanical service fittings, locks, door pulls, hinges, and interior hardware.

D. Certification: Submit certifications specified in Quality Assurance article.

E. Qualification Data:
1. Submit manufacturer's and installer's qualifications verifying years of experience.
2. Include list of completed projects having similar scope of Work identified by name, location, date, reference names, and phone numbers.

F. Manufacturer's Instructions: Submit manufacturer's printed installation instructions.

G. Warranty:
1. Submit specified warranty in accordance with Division 01.
2. Warrant installed casework to be free from defects in material and workmanship for 1 year from date of substantial completion.
3. Warrant casework and components to be corrosion free for 3 years from date of substantial completion.
4. Include coverage against defects which may arise during the warranty period except those which are caused by misuse.

1.6 QUALITY ASSURANCE

A. General Performance:
1. Provide certification that furniture shall meet the performance requirements described in SEFA 8.

B. Wood Casework Performance Standards:
1. Architectural Woodwork Quality Standards Illustrated. Eighth Edition, Version 1.0. Virginia: 2003. Architectural Woodwork Institute.
2. ANSI/Hardwood Plywood Veneer Association Manual Version ANSI/HPVA HP-1-2009

C. Single Source Responsibility:
1. Furnish units from one manufacturer for entire Project, unless otherwise acceptable to Architect.
2. Provide casework modules as complete units, including countertop hardware, glazing, service fixtures and accessory items necessary for proper function.
3. Provide each fume hood as a complete unit, including service fixtures specified in Section 123090 and accessory items necessary for operation.

D. Manufacturer Qualifications: Company specializing in manufacturing Products specified in this Section with minimum 5 years documented experience.

E. Installer Qualifications: Acceptable to fabricator with documented experience on at least 5 projects of similar nature in past 5 years.

F. Regulatory Requirements: Ensure flammable components comply with applicable portions of local, state, and federal codes, laws, and ordinances for flame spread and smoke developed indices.

1.7 PERFORMANCE REQUIREMENTS:

A. Base cabinets shall be constructed to support at least a uniformly distributed load of 200 lbs.

per square foot of cabinet top area, including working surface without objectionable distortion of interference with door and drawer operation.

B. Base cabinet corner gussets with leveling bolts shall support 500 lbs. per corner, at 1-1/2" projection of the leveling bolt below the gusset.

C. Each adjustable and fixed shelf 4 ft. or shorter in length shall support an evenly distributed load of 40 lbs. per square ft. up to a maximum of 200 lbs., with nominal temporary deflection, but without permanent set. These requirements apply to all shelves including, but not limited to wall mounted shelves, shelves at island benches, and shelves inside cabinets.

D. Drawer construction and performance shall allow 13-5/8" clear when in an extended position and suspension system shall prevent friction contact with any other drawer or door during opening or closing. All drawers shall operate smoothly, a minimum of 10,000 cycles with an evenly distributed load of 150 lbs.

E. Swinging doors on floor mounted casework shall support 200 lbs. suspended at a point 12" from hinged side. Weight load test shall allow only a temporary deflection, without permanent distortion or twist. Door shall operate freely after test and assume a flat plane in a closed position.

F. Utility Tables (4 legged) shall support 300 lbs. per square foot

1.8 MOCK-UP

A. General: Comply with provisions of Division 01.

B. The laboratory furniture manufacturer shall erect a laboratory furniture mock-up, in the location indicated by the Architect. All components utilized shall meet the requirements of the Drawings and Specifications.

C. The manufacturer shall make adjustments necessary to meet minimum performance requirements and testing criteria specified, and obtain acceptance from Owner's Representative. Modifications to the mock-up shall be incorporated into the overall design of the project without change in contract sum. Do not proceed with shop fabrication or project installation until mock-up has been accepted by Architect.

D. Accepted mock-up establishes minimum performance standards and quality for workmanship and materials for the Project. Mock-up shall remain in designated location until all furniture is installed and approved by the Owner's Representative. Approved mock-up will be incorporated into the project.

E. Mock-up scope shall include one lab, prep room, or portion of a lab, and shall incorporate the basic elements of a lab including, but not limited to, a sink and associated counter area, base cabinets with drawers and doors, knee space, wall mounted cabinet, wall mounted shelf, flammable and acid cabinets, fume hood, and ADA service panel with all necessary surface fixtures and service connection components to make the lab function. Mock-up shall be of the same color finish selected and approved via sample process.

F. Mock-up location shall be either in a conditioned trailer remaining on site throughout the project (provided by the contractor), or in a conditioned room within the new facility agreed upon by the Owner, Architect, Contractor, and Lab Casework & Equipment Provider / Installer. Mock-up shall remain in place the duration of the project and if all components are acceptable, the mock-up is permitted to become a part of the completed work. If the mock-up is located within a trailer, the components, if approved, may be relocated in the new facility

at a time approved by the Architect.

1.9 TESTING

A. The laboratory furniture manufacturer shall be required to submit with their bid certified test reports on the laboratory casework finish, all work top materials to be furnished, and hoods. These test reports shall be performed by an independent nationally recognized testing laboratory and shall certify that the materials to be supplied will conform to the requirements of these specifications as well as testing procedures. Failure to include these test reports with the bid might be cause for rejection of the bidder and of the bid proposal.

1.10 FIELD MEASUREMENTS

A. It is the laboratory furniture manufacturer's responsibility to verify all field measurements and that all equipment will fit through entry ways, corridors and door openings enabling a smooth flow of equipment to its proper location in the building.

B. Drawings show arrangement and location of casework. If it is necessary to vary from arrangement shown, because of structural, mechanical, electrical or other considerations make such variations only after approval of Architect and at no additional expense to Owner.

C. Measure all recesses and openings at buildings and provide all trim pieces, fillers, and closures, in sizes required.

1.11 PRE-INSTALLATION CONFERENCE

A. Conduct pre-installation conference in accordance with Division 01.

B. Convene pre-installation conference one week prior to commencing work of this Section.

C. Attendance Required: Owner, Architect, Contractor, Manufacturer's Representative, and Installer.

D. Agenda: Discuss and agree upon acceptable substrate and support conditions, preparatory work, interface with mechanical and electrical services, and methods of installation and testing.

1.12 PROJECT CONDITIONS

A. Environmental Requirements: Comply with manufacturer's written requirements for installing sealants.

B. Do not deliver or install casework until the following conditions have been met:
   1. Windows and doors are installed and the building is secure and weather-tight.
   2. Ceiling, overhead ductwork and lighting are installed.
   3. All painting is completed and floor tile is installed.
   4. Do not deliver or install wood product until Interior building temperature is maintained between 65 and 80 degree F, and ambient relative humidity maintained between 25% and 55% prior to delivery, and during and after installation. Frequent and/or excessive changes in temperature and/or humidity levels during casework installation, or once casework is installed, must be avoided to prevent damage to materials.

1.13 SEQUENCING

A. Sequence work under provisions of Division 01.

B. Coordinate with plumbing rough-in requirements specified in Division 22.

C. Coordinate with mechanical requirements specified in Division 23.

D. Coordinate with electrical rough-in requirements specified in Division 26.

PART 2 PRODUCTS

2.1 MANUFACTURERS

A. The specific requirements shown and specified are indicated to establish a standard of design and quality for materials, construction, size and workmanship.

B. Acceptable Manufacturers. As noted for individual sections and as follows:
   1. Epoxy Resin Countertops, Sinks, Cup Sinks and Peg Boards:
      a. The Durcon Company, Canton, MI
      b. Kewaunee Scientific, Statesville, NC
      c. Thermo Scientific ALC, Austin, TX
   2. Stainless Steel Countertops and Sinks:
      a. Kewaunee Scientific, Statesville, NC
      b. Thermo Scientific ALC, Austin, TX
      c. Jamestown Metal Products Inc., Jamestown, NY
   3. Gas Cylinder Supports:
      a. Lab Safety Supply, Janesville, WI
         Wall mounted bracket: Model # 8446
         Bench mounted bracket: Model # 9417
      b. Kewaunee Scientific, Statesville, NC
      c. Thermo Scientific Hamilton, Two Rivers, WI

C. The Naming of manufacturer(s) and designation of product (s) is for the purpose of identifying and describing required product and not to limit competition. Other manufacturers capable of producing the same appearance and having the same quality, durability, and performance may be proposed for use on this project subject to Architect's approval.

D. Other approved manufacturers are responsible for all adjustments required to fit their products to the work at no additional cost.

2.2 MATERIALS

A. Solid Wood:
   1. Exposed solid wood: Select White Maple Lumber, clean and free of defect.
   2. Interior solid wood: Sound hardwood of selected species suitable for intended purpose.
   3. All lumber kiln dried to uniform moisture content of six percent.

B. Exterior Plywood:
   1. Maple and Hardwood (Maple faced poplar) Plywood: Balanced construction of cross and face-plies glued with water resistant resin glue.
   2. Maple Veneer: Quarter sliced maple veneer on all exposed faces. Vertically matched.
   3. MDF / Particle Board is not acceptable.

C. Interior Plywood:
   1. All interior plywood used in cabinets and cases, unexposed, shall be clear hardwood Grade A veneer face, Grade 2 back. All interior plywood shall have high grade, clear veneers and assembled with poly-vinyl emulsion glue. All interior unexposed shelves shall be 7-ply hardwood plywood, maple banded.

D. Cold Rolled Steel:
   1. Cold rolled sheet steel shall be prime grade U.S. Standard; roller leveled, and shall be treated at the mill to be free of scale, ragged edges, deep scratches or other injurious effects.
   2. No less than 25% of the steel by weight shall be recycled material.

E. Galvanized Steel:
   1. Galvanized steel shall be hot dipped, extra smooth, G90, and shall be free of scale, ragged edges, deep scratches or other injurious effects.

F. Glue: Type 2 or Type 3 water resistant glue.

G. Edgebanding: 1/8" hardwood on all edges of doors and drawers; fronts of shelves, base, wall, upper and tall cases.

H. Epoxy Resin:
   1. Modified epoxy resin compounded and cured for optimum physical and chemical resistant properties.
   2. Uniform mixture throughout full thickness.
   3. Non-glaring sheen.
   4. Color: Black.
   5. Countertop and back splash thickness: 1 inch
   6. Slab flatness: No gap exceeding 0.09 inches in 96 inch span, measured in an unrestrained condition.

I. Glass:
   1. Type: Laminated safety glass.
   2. Color: Clear.
   3. Thickness: 1/4 inch nominal
      a. Outer light: 1/8 inch
      b. Plastic innerlayer: 0.030 inch polyvinylbutyral, clear
      c. Inner light: 1/8 inch
   4. Glass used for unframed sliding doors shall be ¼" float glass.

J. Epoxy Resin Cement:
   1. Suitable for use in joining sections of epoxy resin countertop, backsplashes, and sinks.
   2. Sufficient adhesion properties at temperatures 40 degrees to 100 degrees Fahrenheit for permanently anchoring epoxy resin countertops to base cabinets.
   3. Chemical resistance equal to that specified for epoxy resin countertops and sinks.
   4. Loss of hardness and adhesion properties at temperatures in excess of approximately 140 degrees Fahrenheit.
   5. Color to match epoxy resin countertops and sinks.

K. Silicone Sealant: Comply with requirements for Silicone Sanitary Sealant specified in Division 07.

L. Galvanizing Touch-up Paint: SSPC Paint 20.

M. Stainless Steel Sheet Panels:

1. ASTM A167
2. UNS Number S30200 or S30400 and S31603 (316L)
3. Location:
    a. Countertops win integral sinks and back splashes (S31603)
    b. Base and Wall Cabinets (S30200 or S30400)

N. Stainless Steel Tubing:
1. ASTM A554
2. UNS Number S30200 or S30400

O. Stainless Steel Bars and Shapes:
1. ASTM A276
2. UNS Number S30200 or S30400

P. Sound Deadening: Heavy bodied resinous coating, with resilient filler material, compounded for permanent, non-flaking adhesion to metal in 1/8 inch thick coating.

2.3 FABRICATION

A. General Requirements:
1. Prior to fabrication, field measure actual existing conditions to ensure proper fit.
2. Material shall be selected so that the finished installation shall provide an attractive and harmonious appearance. All exterior casework surfaces exposed to view after installation, and cabinet interior surfaces exposed to view when doors and drawers are in the open position, shall be select white maple. Solid woods and veneers exposed to view after completion of installation shall be of color and graining in conformance with the normally accepted standards required of the scientific laboratory equipment industry. All plywood shall be hardwood plywood certified by the manufacturer to be produced with No Added Formaldehyde (NAF). All woods shall be obtained from forests certified by an FSC accredited certification body to comply with FSC STD-01-001, "FSC Principles and Criteria for Forest Stewardship." Chain-of-custody documentation shall be provided in accordance with FSC's standards. Manufacturer shall provide certification and include statement indicating cost for each certified wood product. Softwoods such as Fir or Pine are not permitted.
3. Veneers exposed to view after completion of installation shall be of color and graining in conformance with the normally accepted standards required of the Scientific Laboratory Equipment Industry.

2.4 COMPONENTS

A. Epoxy Sinks:
1. Material: Epoxy Resin.
2. Construction: Taper side of sink. Inside corners radiused. Pitch bottom of sink to drain.
3. Size: See drawings.
4. Epoxy Sink Supports: Steel channels attached to sink cabinet ends and screw type adjustable rods to insure tight fit to underside of table with a water-proof compound.
5. Support Struts: Support struts shall consist of two 16 gauge channel uprights fastened top and bottom by two adjustable "U" shaped spreaders, each 12 gauge, 1-1/2" x length required. Struts shall be furnished to support drain troughs, and to support work top at plumbing space under fume hood superstructures or other heavy loads. They shall be fabricated so as to accept industry standard, pipe and conduit hangers.
6. Seal around drain with silicone sealant as recommended by epoxy sink manufacturer, and as specified in Division 07. Plumbers putty is not acceptable.

B. Cup Sinks:

a. Material: Black Epoxy Resin.
b. Size: 9 by 3 inches nominal.

C. Stainless Steel Sinks:
1. Sinks integral with stainless steel countertops: Weld-in with seams ground smooth and polished to match countertop finish.
a. Fabricate stock-sized sinks from deep drawn single sheets
b. Fabricate non-stock sized sinks having joints continuous heliarc welded, ground and polished smooth joints
c. Use stainless steel to fabricate integral sink of same type as adjacent stainless steel countertop
d. Interior coved corners with bottom pitched toward drain
2. Size: See drawings.
3. Free-standing Stainless Steel Sinks: See Division 22.
4. Sinks in non-laboratory areas: See Division 22.

D. Sink Strainer and Tailpieces:
1. Sink strainer and tailpieces:
a. Epoxy Sinks: Polypropylene. Coordinate tailpiece termination with service line connection requirements.
b. Stainless Steel Sink: See Division 22.

E. Epoxy Resin Countertops and Back Splashes:
1. Fabricate from epoxy resin unless otherwise noted in drawings.
2. Provide back splashes at rear of countertop and on end returns where indicated; notched as required.
3. Fabricate to install without field cutting or drilling. Drill holes in counter for laboratory service fixtures as scheduled in Section 123090.
4. Seal gap between back splash and wall with acrylic latex sealant specified in Division 07.
5. Joint between segments of tops and back splashes:
a. Smooth, even, and level with no raised edges
b. Width: 1/8 inch maximum
c. Seal watertight with modified epoxy resin cement
6. Epoxy Resin countertops:
a. Cut to size of cabinet or knee space below, where indicated on drawing. Where no indication is made, countertops lengths shall be at Contractor's option with termination points at base cabinet or knee space edges.
b. Do not cut to be smaller than 24 inches wide.
c. Fabricate with drip grooves on underside of exposed edges.
d. Fabricate exposed edges of base sections of countertops with a 1/4 inch chamfer on front top edge, square bottom edge, and vertical corners; fabricate other countertop edges with square tops and bottoms.
e. Bond back splash to surface of countertop to form square joint.
f. Back splash to be 4 inches (high, unless otherwise noted on Drawings.

F. Stainless Steel Countertops:
1. Construct countertops with raised front rim, marine edge construction to match existing adjacent fabrications.
2. Integrally and slightly radius joint where rear curb meets horizontal surface with radius dimension to match existing adjacent fabrication.
3. Weld carbon steel channels to underside in at least three locations along length to prevent twisting, oil canning, and buckling of surface.
4. Apply one coat of sound deadening material to underside but not to visually exposed surfaces.
5. Fabricate tops as single units; longest lengths as practical.

6. Provide field joints to join existing tops and work of this Section with welded channels and angles with bolting arrangements to pull tops together forming hair-line seam. Weld, grind smooth, and polish seams and joints to match adjoining surfaces.
7. Develop maximum strength and rigidity in construction and design of each fabrication.
8. Fabricate each sectional unit ready for placement in casework and equipment assembly.
    a. Fabricate as complete integral rigid unit in itself.
    b. Screw fasteners: Do not use in fabrication of units.
    c. Reinforce with galvanized steel hat sections with cross braces spaced no greater than 30 inches apart.
    d. Turn splash up, height to match existing adjacent fabrication.
    e. Turn splash back, dimension to match existing adjacent fabrication.
    f. Weld turned-up and turned-back portions together.

G. Peg Boards:
1. Constructed of modified epoxy resin.
2. Thickness: 1 inch
3. Color: To match adjacent counter tops.
4. Polish front surface, back surface, and edges.
5. Fabricate with:
    a. 30 inch high removable round-tip polypropylene peg section. Omit bottom row as required to avoid conflict with faucets
    b. Stainless steel drip trough with 1/4 inch diameter outlet below peg area
    c. Flexible clear tubing between drip trough outlet and sink (cut as required)
6. Mechanically fasten drip trough to pegboard and continuously seal with sanitary silicone specified in Division 07 at top edge.
7. Provide stainless steel peg boards where indicated on the drawings.

H. Hardware and Trim:
1. Drawer and Door Pulls:
   Drawer and door pulls shall be satin finish stainless steel wire pulls, and shall be securely fastened to doors and drawers with vandal-proof screws. Two pulls shall be required on all drawers over 24 inches long. Drawer pulls shall be mounted horizontally. Door pulls shall be mounted vertically.
2. Drawer Suspension:
   Provide full-extension, heavy duty drawers suspension.
   Loading capacity of 150 lbs. minimum.
3. Drawer Stops:
   Provide on drawers to prevent inadvertent removal.
4. Hinges:
   Hinges shall be the five (5) knuckle institutional. Hinges shall be 2-1/2" long, one (1) pair for doors under 4 ft in height and 1-1/2 pair on doors over 4 ft in height. Hinges shall be mounted with flathead screws, so applied to door and cabinet to withstand a weight load of 150 lbs. minimum. All hinges shall be satin finish stainless steel.
5. Locks:
    a. Locks shall be a National Lock, pin tumbler with heavy duty interchangeable cylinder. Exposed lock noses shall be dull nickel (satin) plated and stamped with identifying numbers. Locks shall have capacity of at least 1000 primary key changes.
    b. Provide locks where noted on lab plans.
    c. Keying:
       Key locks individually; two keys per lock.
       Master key locks by lab suite; two keys per suite.
       Provide two grand master keys for locks
6. Roller Catches:

Roller catches shall be used on swinging doors. Catches shall have a spring-loaded polyethylene roller and provided with a steel strike plate. Double-doors, without looks shall have a catch on each door. Full height cases shall have latching devices located on the structurally fixed center shelf. The left hand door shall have a positive catch and the right hand door shall have the roller type catch.

7. Elbow Catches:
   Elbow catches and strike plates shall be used on left hand doors of double door cases and are to be cast aluminum with bronze finish.
8. Leg Shoes:
   Leg shoes shall be provided on all table legs, unless otherwise specified, to conceal leveling device. Shoes shall be 2-1/2" high and a pliable, black vinyl material. Use of a leg shoe which does not conceal leveling device will not be acceptable.
9. Base Molding:
   Refer to Division 9.
10. Shelf Support Clips:
    Shelf support clips for wood casework shall be pin type for mounting on interior of cabinet work. Clips shall be corrosion resistant and shall retain shelves from accidental removal. Shelves shall be adjustable on 1-1/4" centers. Surface mounted metal support strips and clips subject to corrosion are not acceptable.
11. Fasteners and Anchors:
    Size and type to securely fasten and anchor items to substrates and supporting structure.
12. Dowels:
    Dowels used to join frames and panels shall be fluted hardwood not less than 3/8” in diameter.
13. Label Holders:
    Label holders, where shown or called for, shall be aluminum brad-attached type with satin finish and designed for 2-1/2” x 1-1/8” cards, unless otherwise specified.
14. Number Plates:
    Number plates, where shown or called for, shall be aluminum brad-attached type with satin finish and indented black lettering.

I. Accessories:
   1. Gas Cylinder Supports :
      Aluminum cylinder supports to hold 4-1/2" to 14" diameter cylinders upright and ready to use, with safety strap and chain. Provide with safety reminder on both sides of buckle, and spring catch buckle. Attach to wall or bench, as indicated on drawings.

2.5 FINISH AND PERFORMANCE REQUIREMENTS

A. Environmental Standards:
   1. The finish must be low VOC and reclaimable with enclosed spray and/or roll coat application; thus providing an environmentally responsible product.

B. Wood Finish and Performance Requirements:
   1. Wood Surface Preparation:
      Prior to application of wood finish, all cabinet component surfaces shall be sanded smooth to remove loose fibers, scratch marks, and abrasions, with all dust thoroughly removed.
   2. Wood Finish Application:
      Cabinet components shall be finished using a state of the art flat-line system. The finish shall be applied under controlled conditions prior to casework assembly and attachment of hardware. This will provide maximum coverage and protection to the assembled product. The finish shall be fully UV cured to ensure proper performance.
   3. Exterior and Interior Wood Casework Finish: Interior and exterior surfaces shall receive two applications of chemical resistant, UV cured, epoxy top coat. The

finishing process described in this section shall result in a highly chemical resistant finish that is equally suitable for an AWI premium finish application. The first application shall be cured, sanded, and cleaned. The final top coat shall then be applied and fully cured. All cabinets shall be stained and additionally sealed with two applications of chemical-resistant epoxy top coat. The fully reclaimable low VOC water-borne stain shall be uniformly applied by a series of automated spray applicators. The stained components shall then travel through a series of heated chambers to incrementally achieve a temperature of 140 degrees F to dry the stain material. The first of two low VOC epoxy top coats shall be applied, cured, sanded, and cleaned. The final top coat will then be applied and UV cured, providing a semi-gloss sheen. The completed product shall meet the performance test requirements specified under PERFORMANCE TEST RESULTS and SEFA

C. Steel Finish:

1. After cold rolled steel component parts have been completely fabricated and before finishing, they shall be given a pre-paint treatment to provide excellent adhesion of the finish system to the steel and to aid in the prevention of corrosion. Physical and chemical cleaning of the steel shall be accomplished by washing with an alkaline cleaner, followed by a spray treatment with a complex metallic phosphate solution to provide a uniform fine grained crystalline phosphate surface that shall provide both an excellent bond for the finish and enhance the protection provided by the finish against humidity and corrosive chemicals.
2. After the phosphate treatment, the steel shall be dried and all steel surfaces shall be coated with a chemical and corrosion-resistant, environmentally friendly, electrostatically applied powder coat finish. All components shall be individually painted, insuring that no area be vulnerable to corrosion due to lack of paint coverage. The coating shall then be cured by baking at elevated temperatures to provide maximum properties of corrosion and wear resistance.
3. The completed finish system in standard colors shall meet the performance test requirements specified under PERFORMANCE TEST RESULTS and SEFA.

D. Performance Test Results (Chemical Spot Tests):

1. Testing Procedure:
   Chemical spot tests for non-volatile chemicals shall be made by applying 5 drops of each reagent to the surface to be tested and covering with a 1-1/4" dia. watch glass, convex side down to confine the reagent. Spot tests of volatile chemicals shall be tested by placing a cotton ball saturated with reagent on the surface to be tested and covering with an inverted 2-ounce wide mouth bottle to retard evaporation. All spot tests shall be conducted in such a manner that the test surface is kept wet throughout the entire test period, and at a temperature of 77° ±3° F. For both methods, leave the reagents on the panel for a period of one hour. At the end of the test period, the reagents shall be flushed from the surface with water, and the surface scrubbed with a soft bristle brush under running water, rinsed and dried. Volatile solvent test areas shall be cleaned with a cotton swab soaked in the solvent used on the test area. Immediately prior to evaluation, 16 to 24 hours after the reagents are removed, the test surface shall be scrubbed with a damp paper towel and dried with paper towels.
2. Test Evaluation:
   Evaluation shall be based on the following rating system.
   Level 0 - No detectable change.
   Level 1 - Slight change in color or gloss.
   Level 2 - Slight surface etching or severe staining.
   Level 3 - Pitting, cratering, swelling, or erosion of coating. Obvious and significant deterioration.
   After testing, panel shall show no more than three (3) Level 3 conditions.
3. Test Reagents :

Evaluation shall be based on the following rating system.

Test No.	Chemical Reagent	Test Method
1.	Acetate, Amyl	Cotton ball & bottle
2.	Acetate, Ethyl	Cotton ball & bottle
3.	Acetic Acid, 98%	Watch glass
4.	Acetone	Cotton ball & bottle
5.	Acid Dichromate, 5%	Watch glass
6.	Alcohol, Butyl	Cotton ball & bottle
7.	Alcohol, Ethyl	Cotton ball & bottle
8.	Alcohol, Methyl	Cotton ball & bottle
9.	Ammonium Hydroxide, 28%	Watch glass
10.	Benzene	Cotton ball & bottle
11.	Carbon Tetrachloride	Cotton ball & bottle
12.	Chloroform	Cotton ball & bottle
13.	Chromic Acid, 60%	Watch glass
14.	Cresol	Cotton ball & bottle
15.	Dichlor Acetic Acid	Cotton ball & bottle
16.	Dimethylformanide	Cotton ball & bottle
17.	Dioxane	Cotton ball & bottle
18.	Ethyl Ether	Cotton ball & bottle
19.	Formaldehyde, 37%	Cotton ball & bottle
20.	Formic Acid, 90%	Watch glass
21.	Furfural	Cotton ball & bottle
22.	Gasoline	Cotton ball & bottle
23.	Hydrochloric Acid, 37%	Watch glass
24.	Hydrofluoric Acid, 48%	Watch glass
25.	Hydrogen Peroxide, 3%	Watch glass
26.	Iodine, Tincture of	Watch glass
27.	Methyl Ethyl Ketone	Cotton ball & bottle
28.	Methylene Cloride	Cotton ball & bottle
29.	Mono Chlorobenzene	Cotton ball & bottle
30.	Naphthalene	Cotton ball & bottle
31.	Nitric Acid, 20%	Watch glass
32.	Nitric Acid, 30%	Watch glass
33.	Nitric Acid, 70%	Watch glass
34.	Phenol, 90%	Cotton ball & bottle
35.	Phosphoric Acid, 85%	Watch glass
36.	Silver Nitrate, Saturated	Watch glass
37.	Sodium Hydroxide, 10%	Watch glass
38.	Sodium Hydroxide, 20%	Watch glass
39.	Sodium Hydroxide, 40%	Watch glass
40.	Sodium Hydroxide, Flake	Watch glass
41.	Sodium Sulfide, Saturated	Watch glass
42.	Sulfuric Acid, 33%	Watch glass
43.	Sulfuric Acid, 77%	Watch glass
44.	Sulfuric Acid, 96%	Watch glass
45.	Sulfuric Acid, 77% and Nitric Acid, 70%, equal parts	Watch glass
46.	Toluene	Cotton ball & bottle
47.	Trichloroethylene	Cotton ball & bottle
48.	Xylene	Cotton ball & bottle
49.	Zinc Chloride, Saturated	Watch glass

* Where concentrations are indicated, percentages are by weight.

E. Performance Test Results (Heat Resistance):

1. Hot water (190° F - 205° F) shall be allowed to trickle (with a steady stream at a rate

not less than 6 ounces per minute) on the finished surface, which shall be set at an angle of 45° from horizontal, for a period of five minutes. After cooling and wiping dry, the finish shall show no visible effect from the hot water treatment.

F. Performance Test Results (Impact Resistance):
1. A one-pound ball (approximately 2" diameter) shall be dropped from a distance of 12 inches onto the finished surface of a 3/4" thick plywood panel supported underneath by a solid surface and onto the finished surface of steel panel supported underneath by a solid surface.. There shall be no evidence of cracks or checks in the finish due to impact upon close eye-ball examination.

G. Performance Test Results (Moisture Resistance) (Plywood only):
1. A cellulose sponge (2" x 3" x 1") shall be soaked with water and placed on the finished surface for a period of 100 hours. The sponge shall be maintained in a wet condition throughout the entire test period. At the end of the test period, the surface shall be dried and no visible effect shall be shown on the finish.

H. Performance Test Results (Bending Test) (Steel only):
1. An 18 gauge steel strip, finished as specified, when bent 180^{o} over a 1/2" diameter mandrel, shall show no peeling or flaking off of the finish.

I. Performance Test Results (Adhesion) (Steel only):
1. Ninety or more squares of the test sample shall remain coated after the scratch adhesion test. Two sets of eleven parallel lines 1/16" apart shall be cut with a razor blade to intersect at right angle thus forming a grid of 100 squares. The cuts shall be made just deep enough to go through the coating, but not into the substrate. They shall then be brushed lightly with a soft brush. Examine under 100 foot-candles of illumination. Note: This test is based on ASTM D2197-68, "Standard Method of Test for Adhesion of Organic Coatings".

J. Performance Test Results (Hardness) (Steel only):
1. The test sample shall have a hardness of 4-H using the pencil hardness test. Pencils, regardless of their brand are valued in this way: 8-H is the hardest, and next in order of diminishing hardness are 7-H, 6-H, 5-H, 4-H, 3-H, 2-H, F, HB, B (soft), 2-B, 3-B, 4-B, 5-B (which is the softest).
2. The pencils shall be sharpened on emery paper to a wide sharp edge. Pencils of increasing hardness shall be pushed across the paint film in a chisel-like manner until one is found that will cut or scratch the film. The pencil used before that one-that is, the hardest pencil that will not rupture the film-is then used to express or designate the hardness.

PART 3 EXECUTION

3.1 EXAMINATION

A. Examine conditions and proceed with work in accordance with specifications.

3.2 INSTALLATION

A. Coordinate the work of the Section with the schedule and other requirements of other work being performed in the area at the same time both with regard to mechanical and electrical connections to and in the fume hoods and the general construction work.

B. Install in accordance with manufacturer's printed instructions and approved shop drawings.

C. Install items plumb, level, square, and free from warp and twist and securely anchor to building structure. Shim as required using concealed shims.

D. Screw continuous cabinets together with joints flush, tight and uniform, and with alignment of adjacent units within 1/16" tolerance.

E. Abut top edge surfaces in one true plane. Provide flush joints not to exceed 1/8" between top units.

F. Maintain dimensional tolerances and alignment with surrounding construction and adjacent surfaces.

G. Install miscellaneous filler panels and scribes for a continuous tight-fitting assembly without gaps and spaces between cabinets, counters, service chase, and adjoining surfaces.

H. Seal backsplashes at wall surfaces.

I. Interface With Other Work. Install items in a sequence to not delay:
   1. Adjoining construction
   2. Connections of casework and hoods to mechanical and electrical services.

3.3 ADJUSTING

A. Adjust parts for smooth, uniform operation.

B. Repair or remove and replace defective work, as directed by owner and/or his representative upon completion of installation

3.4 CLEANING

A. Comply with manufacturer cleaning instructions.

B. Clean shop finished casework; touch up as required.

C. Clean worksurfaces and leave them free of all grease and streaks.

D. Do not use materials and methods which may damage finish and surrounding construction.

3.5 PROTECTION

A. Protect finished work.

B. Advise contractor of procedures and precautions for protection of material, installed laboratory casework and fixtures from damage by other trades.

C. Post casework completion notices to alert other trades to the potential damage to completed work as required.

END OF SECTION 123400

SECTION 123450 – METAL LABORATORY CASEWORK AND FUME HOODS

PART 1 GENERAL

1.1 SUMMARY

A. Related Documents: Conditions of the Contract, Division 01 - General Requirements, Specification Section 123400 - Laboratory Casework-General Requirements, and Drawings apply to work of this Section.

B. This Section includes, but is not limited to, all materials, labor and equipment, complete with all anchors and related accessory, necessary to furnish, deliver and install:
   1. Restricted bypass design chemical fume hoods, complete with fixtures, supports, lighting fixtures, cup sinks, etc.
   2. Restricted bypass design, ADA compliant chemical fume hoods, complete with fixtures, supports, lighting fixtures, cup sinks, etc.
   3. Restricted bypass design, walk-in, chemical fume hoods, complete with fixtures, supports, lighting fixtures, cup sinks, etc.
   4. Biosafety Cabinets
   5. Local Exhaust (Snorkels)
   6. Special Purpose Cabinets for Use under Fume Hoods
   7. Full Height Flammable and Acid Storage Cabinets
   8. Ceiling Service Panels
   9. Stainless Casework including:
      a. Floor Mounted Metal Base Cabinets
      b. Wall Mounted Metal Shelves
      c. Miscellaneous fillers and panels required for a finished installation

C. Although such work is not specifically shown or specified, furnish and install all supplementary or miscellaneous items, appurtenances and devices incidental to or necessary for a sound, secure and complete installation.

D. For general requirements, applicable to this and all other Casework Specification Sections including, but not limited to definitions, system description, submittals, quality assurance, mock-up, testing, field measurements, pre-installation conference, delivery, storage and handling, project conditions, and sequencing requirements, refer to Specification Section 123400 - Laboratory Casework-General Requirements.

E. Products Installed But Not Specified Under This Section:
   1. Section 123090 - Laboratory Service Fixtures: Supply of service fixtures for fume hoods for placement under this Section

F. Fume Hood Test Mock-Up
   1. General: Comply with provisions of Division 01.
   2. Fume Hood Test Mock-Up:
   3. Construct an operating prototype of the type of hood to be supplied for Project and demonstrate its ability to comply with fume hood performance requirements.
   4. Test Method: ANSI/ASHRAE Test 110-1995.
   5. Perform test under controlled conditions in manufacturer's test facility.
   6. Perform engineering and physical modifications on prototype to comply with performance requirements.
   7. Manufacturer retains ownership of prototype.
   8. Manufacturer bears costs of test mock-up and modifications to achieve performance

criteria.

9. Performance requirement: Meet or exceed the recommendations of the American Conference of Governmental Industrial Hygienists as defined in the most recent edition of "Industrial Ventilation. A Manual of Recommended Practice."
10. The fume hood, with vertical rising sash, shall provide adequate containment (meet ASHRAE standard) when combined with a VAV system set point of 80 fpm at full open and 100 fpm when the sash is set at 18" (normal operating height).

G. Acceptance:
1. Make adjustments necessary to meet minimum performance testing criteria and obtain acceptance from Architect. Do not proceed with shop fabrication or Project installation until mock-up has been tested, and accepted by Architect.
2. Accepted mock-up establishes minimum performance standards and quality for workmanship and materials for Project.

1.2 OPERATION AND MAINTENANCE DATA

A. Submit manufacturer's printed, operation and maintenance data.

B. Prior to final acceptance, affix one copy of each manual described in Demonstration Article to an unobscured exterior side panel of each hood.

C. Prior to final acceptance, submit certification that hazardous material cabinets have been electrically grounded as specified.

PART 2 PRODUCTS

2.1 GENERAL

A. For general requirements, applicable to this and all other Casework Specification Sections including, but not limited to, manufacturers, materials, components, and finish and performance requirements, refer to Specification Section 123400 - Laboratory Casework-General Requirements.

2.2 MANUFACTURERS

A. Acceptable Manufacturers:
1. Metal casework, chemical fume hoods, ADA compliant chemical fume hoods, walk-in chemical fume hoods, and miscellaneous fillers and panels required for a finished installation:
a. Kewaunee Scientific Corporation, Statesville, NC
b. ALC-Collegedale, Austin, TX
c. Jamestown Metal Products, Inc., Jamestown, NY

2.3 COMPONENTS

A. Services for Hoods:
Hoods shall be pre-piped and pre-wired at the factory. Plumbing and electrical services shall be as follows:
1. Plumbing services shall consist of front loaded remote control valves as selected located within the end panels, controlled by extension rods projecting through the control panels of the hood, with color coded handles. Interior fitting for gases and water shall be as specified in section 123090. All plumbing fittings shall be factory installed and piped between the valve and the outlet. If fittings are mounted in both

ends, there shall be two connection points. Piping shall be routed to the top of the hood. Location of plumbing services at ADA hoods shall comply with ADAAG requirements.

2. Pre-Wired hoods shall be wired using flexible metallic conduit to a single junction box located at the top of the hood for a single point connection at the job site. Electrical services shall consist of two duplex receptacles and a light switch. The duplex receptacles shall be 20 Amp, 125 volt AC, and 3-wire polarized grounded. The receptacles shall be of specification grade, ground fault interrupter type, side wired only, to insure a positive connection. The light switch shall be 20 Amp, 125 volt AC, and 3-wire polarized grounded. Location of electrical services at ADA hoods shall comply with ADAAG requirements.

2.4 RESTRICTED BYPASS CHEMICAL FUME HOODS

A. Standard for Quality and Design:
   1. Restricted Bypass Chemical Fume Hood - General Purpose Bench Type (Supreme Air by Kewaunee)

B. Description:
   1. Fume hoods shall be of complete airfoil design to insure maximum operating efficiency. Foil sections at the front fasciae of the hood shall minimize eddying of air currents at the hood face and the rear baffle system shall minimize turbulence in the upper portion of the hood interior.
   2. Restricted bypass fume hoods shall be designed for operation on variable air volume (VAV) exhaust systems when used with a fume hood face velocity controller. The air bypass shall be sized to provide an appropriate minimum exhaust volume so that when the sash is closed there will be sufficient exhaust air through the hood to dilute and prevent the escape of contaminants.
   3. Frame: A free-standing rigid frame structure of steel angle shall be provided to support exterior panels and interior liner and baffle panels. To allow for maintenance and replacements, the interior liner panels shall be removable without disassembly of the frame structure and outer steel panels. Likewise, the exterior steel panels shall be removable without disassembly of the frame structure and inner liner panels.
   4. Walls:
      a. Double wall ends, not more than 5" wide, shall be provided to maximize interior working area. The area between the double wall ends shall be closed to house the remote control valves. The front vertical fascia section shall have a full 135° 1" radius at the front leading edge to provide a streamlined section and insure smooth even flow of air into the hood. The vertical fascias shall contain the required service controls, electrical switches and receptacles. Side posts cannot exceed 4 inches in width. The hood interior end panels and sash track shall be flush with the fascia to prevent eddy currents and back flow of air.
      b. The hood exteriors shall be fabricated of cold rolled steel, phosphate coated with a baked chemical resistant, synthetic resin finish. Rear panel if rear side of hood is exposed to view; shall be finished to match material and color of remainder of hood's outer wall shell.
      c. Interior liner panels shall be 1/4" thick fiberglass reinforced polyester sheet. Interior liner panels shall be fastened using stainless steel screws with plastic covered heads.
      d. Access panels on both inside and outside of hood wall shall be provided. The interior end liner panels shall be furnished with an opening that provides access to the service piping and valves to facilitate installation and maintenance. The openings shall be covered with a removable panel with rounded corners. Panels which require tools to remove are not acceptable. The panel shall provide an overlapping seal on all edges.

5. Airfoil: A streamlined airfoil shall be installed at the bottom of the hood opening on bench hoods. This foil shall provide a nominal 1" open space between the foil and the top front edge of the worksurface to direct an air stream across the work surface to prevent back flow of air. The airfoil shall extend back under the sash, so that the sash does not close the 1" opening. The foil shall be removable to allow large equipment to be moved into the hood. The foil shall be of 12-gauge steel to resist denting and flexing.
6. Countertop: Construct countertops of 1 inch thick epoxy resin, with dished design to contain spillage with a 6 inch wide safety ledge across the front edge. Where countertops are penetrated by vent piping from fume hood base cabinet, piping shall be located behind the adjustable baffle and sealed tight all around at countertop with waterproof chemical-resistant sealant. A cup drain flush with the recessed worksurface shall be provided. The worksurface and cup sink shall be black. Continuous corrosion-resistant air-tight seam between hood lining and countertop shall be provided.
7. Fume Hood Cup Sinks
    a. Material: Stainless Steel
    b. Size: 3 by 6 inches nominal
8. Lighting
    a. Two tube T8 fluorescent light fixtures to generate 1075 lx (100 foot candles) of illumination inside hood.
    b. The light fixtures shall be isolated from the hood interior by a 1/4" thick tempered glass panel sealed from the hood cavity.
    c. Fixture shall be UL labeled.
    d. Re-lamping shall be performed from outside of hood front and shall not require removal of hood top-to-ceiling closure panel.
9. Baffles
    a. A baffle with three fixed horizontal slots shall be provided to aid in distributing the flow of air into and through the hood. The baffle shall be spaced out 2-1/4" from the back liner. The baffle shall be removable for cleaning.
    b. Externally adjustable baffle slots, top, and bottom shall be provided. A single point baffle adjustment shall be provided that will allow adjustment of the upper and lower slots. This single baffle adjustment shall allow the operator to make adjustments without placing their hand further than six inches into the hood.
10. Duct Collar
    a. 4 inches high and straight
    b. Outside Diameter: 10 to 12 inches
    c. Fabricated from UNS S31603 stainless steel
    d. Provide stainless steel transition if standard exhaust collar does not meet this requirement
11. Vertical Rising Sash: A vertical rising sash of 1/4" laminated safety float glass shall be provided. The sash shall have a neutral colored polyvinyl chloride horizontal member at the top and a full length metal handle at the bottom. The sash shall be counterbalanced with a single weight to prevent tilting and binding during operation. The sash track shall be a neutral colored polyvinyl chloride set flush with the interior liner panels to minimize turbulence. Bench hoods shall have one sash in a single slotted sash track.
12. Sash height limiting hardware
    a. Provide each fume hood with integral sash height hardware which prevents raising vertical sash above a set point
    b. Set points to be at full closure and 18 inches
13. Overall depth of hood: 36 inches.
14. Fan Operation Control: Shall be provided under Division 23 Mechanical.
15. Safety Monitor/Alarm System: See Division 23.

16. Closure panels:
    a. Provide fume hood closure panels from top of each fume hood to the underside of the finished ceiling.
    b. Match closure panels to fume hood's exterior color and finish.

2.5 RESTRICTED BYPASS CHEMICAL FUME HOODS - ADA

A. Standard for Quality and Design:
    1. Restricted Bypass Chemical Fume Hood - ADA compliant - General Purpose Bench Type (Supreme Air by Kewaunee)

B. Description:
    1. General construction for the ADA compliant Restricted Bypass Chemical Fume Hoods shall be the same as for the Restricted Bypass Chemical Fume Hoods, except as follows:
        a. ADA compliant restricted bypass fume hoods shall be designed to meet guidelines of the Americans with Disabilities Act (ADA).
        b. It shall be complete with Sash Stop, mounted at 21" above the lower deflector to keep the sash from rising above the operators reach.
        c. Fixtures and service fittings shall be moved down to within reach of wheelchair bound operator.
        d. It shall be provided with radiused corner posts and airfoils for smooth air movement to assure high level of comfort, safety and efficiency.
        e. ADA guidelines require a space of 30" wide by 30" high by 25" deep for a wheelchair to roll beneath a fume hood.

2.6 RESTRICTED BYPASS WALK-IN CHEMICAL FUME HOODS:

A. Standard for Quality and Design:
    1. Restricted Bypass Walk-In Chemical Fume Hood (Supreme Air by Kewaunee)

B. Description:
    1. General construction for Walk-in Hoods shall be the same as for restricted by-pass general purpose bench type chemical fume hoods except walk-in hoods shall be floor mounted design to handle large laboratory equipment with roll-in accessibility.

2.7 FUME HOOD FINISH:

A. After the component parts have been completely welded together and before finishing, they shall be given a pre-paint treatment to provide excellent adhesion of the finish system to the steel and to aid in the prevention of corrosion. Physical and chemical cleaning of the steel shall be accomplished by washing with an alkaline cleaner, followed by a spray treatment with a complex metallic phosphate solution to provide a uniform fine grained crystalline phosphate surface that shall provide both an excellent bond for the finish and enhance the protection provided by the finish against humidity and corrosive chemicals.

B. After the phosphate treatment, the steel shall be dried and all steel surfaces shall be coated with a chemical and corrosion-resistant, environmentally friendly, electrostatically applied powder coat finish. All components shall be individually painted, insuring that no area be vulnerable to corrosion due to lack of paint coverage. The coating shall then be cured by baking at elevated temperatures to provide maximum properties of corrosion and wear resistance.

C. The completed finish in standard colors shall meet the performance test requirements specified under Steel Paint Finish Performance Test Results.

2.8 BIOSAFETY CABINETS

A. Acceptable Manufacturers:
   1. NuAire, Plymouth, MN (Model LabGard NU-440)
   2. The Baker Company, Sanford, Maine
   3. Labconco Corporation, Kansas City, MO

B. Biosafety Cabinets Tests
   1. Each unit, before shipping, shall have a complete physical test to assure cabinet meets Class II requirements.
   2. Manufacturer shall provide a certified copy of the personnel, product and cross-contamination (biological) tests, equivalent to or more demanding than as specified in NSF International Standard #49, performed on the unit selected, one unit from each production run from of cabinets for this project. Tests may be witnessed by a representative of the purchaser

C. Description:
   1. Four-foot or six foot, Class II Type A2, Biological Safety Cabinet, non-ducted, 100 percent recirculated, designed for biological work of low to moderate risk biological agents.
   2. The unit shall comply with NSF/ANSI classification #49, 2002, Class II Type A2.
   3. Interior Dimensions Inches:
      a. Width (W) 46-3/8 IN (Nominal 4 FT BSC) , or (W) 70-3/8 IN (Nominal 6 FT BSC)
      b. Depth (D) 23-1/2 IN
      c. Height (H) 28-1/2 IN
   4. The cabinet shall provide airflows & biological safety performance as specified:
      a. The cabinet shall provide biological containment protection for both operator and product proven by an actual test.
      b. The cabinet shall be constructed from 16GA, Type 304 stainless steel forming an all welded, monolithic, sealed structure.
      c. The cabinet shall be easily fumigated employing an established procedure such as that recommended by NSF.
      d. Supply HEPA filter shall be of full cabinet workzone width and depth; work zone below supply HEPA shall be of fixed cross-sectional area (sloping back wall or viewing window is unacceptable).
      e. Supply HEPA filter shall be protected by a perforated metal diffuser covering the entire top of the work zone.
      f. Air Velocity from the supply filter shall average 65 to 75 FPM (.32 to .38 m/s) with no single point outside the 20 percent of average range measured in a horizontal plane defined by bottom edge of window.
      g. Work access opening shall be 10 IN high. Average inflow velocity shall nominally be 105 LFPM (.53 m/s).
   5. The cabinet shall be ergonomically designed for maximum user comfort and adjustability to meet the requirements of the American Disabilities Act (ADA). Cabinet shall be provided with an adjustable, motorized, base stand which shall allow for the work surface to be at 30 to 36 inches above the finished floor.
   6. The cabinet shall have all positive pressure plenums surrounded by a vacuum relative to the room.
   7. Electrical power shall be supplied with a 12-foot, 3-wire cord with molded plug. Electrical supply shall be 115 VAC, 60 Hz.
   8. The cabinet shall have two internal electrical circuits; one for blower/lights and one for the duplex outlets.
   9. The cabinet shall be listed by Underwriters Laboratories.
   10. The cabinet shall contain a control system which is a self contained electronic module that will perform the following functions:

a. Control blower motor via solid state triac.
b. Monitor, display and control downflow via dual thermister airflow probe.
c. Disable audible alarm switch with ring back function.
d. Clock display (24 hours) and timer function.
e. Control lights via solid state switch.
f. Control outlets via solid state switch.
g. Complete diagnostic functions.
h. Monitor and display exhaust flow (inflow via dual thermister airflow probe.
i. Alarm setpoints high/low for error conditions (downflow and exhaust flow).

11. Balancing of cabinet workzone downflow (recycling flow) to exhaust flow shall be accomplished with an internal exhaust flow damper, externally adjustable. Damper access plug shall be under a vacuum relative to the room.
12. The cabinet shall be easily transportable through a standard 36 IN wide door without disassembly.
13. Sound level shall be no more than 67 dbA measured 15 IN above the work tray and 12 IN in front of viewing window.
14. Fluorescent lighting shall be externally mounted and provide 90 to 120 foot-candles on work surface. The ballast to be electronic containing thermal protection with automatic reset.
15. Cabinet shall be provided with two GFI duplex outlets with drip proof covers on back wall. See drawings for other required services.
16. Cabinet shall be a freestanding console model.
17. Cabinet workzone shall be all 16 GA. stainless steel and reinforced with stainless steel U channels to minimize vibration.
18. A 3/8 IN ball valve shall be provided in the drain trough beneath the work tray.
19. Cabinet shall have the capability of incorporating a permanent positive pressure plenum with quick release supply filter removal.
20. Motor/blower shall be positioned so as to create an even filter loading, thereby prolonging the life of the supply HEPA filter, and shall deliver over 80 percent the initial HEPA filter static pressure with no more than a 10 percent decrease of CFM.
21. Cabinet shall be capable of front filter removal without disassembly of the control panel and sliding window tracks/hardware.
22. The following equipment shall also be provided:
    a. Ultraviolet Light.
    b. Ground Fault Interrupter for Electrical System.
    c. Alarm Systems.
    d. Metal Framed HEPA Filters.
    e. HEPA Filters 99.999% @ 0.3 Micron.
    f. Stainless Steel Armrest.

2.9 LOCAL EXHAUST (SNORKELS)

A. Acceptable Manufacturers:
1. Nederman, Inc., Wetland, MI (Model #FX75 with metal hood)
2. Classic Modular Systems, Inc., Houston, TX
3. Movex, Inc., Bath, PA

B. Description:
1. Ceiling Mounted Local Exhaust (Snorkels) shall be designed for use with movable equipment.
2. The arms shall consist of three pipes with a 3 inch diameter, manufactured from Anodized Aluminum.
3. Maximum reach: 5 ft.
4. The arms shall be flexible in all directions and stay in position when adjusted. Vertically and horizontally jointed, the arms shall be able to rotate 360º by its swivel function.

5. The arms shall be resistant to different solvents and certain chemicals, and it shall be easy to dismantle for internal cleaning.
6. They shall be provided with a metallic hood.

2.10 SPECIAL PURPOSE CABINETS FOR USE UNDER FUME HOODS:

A. Acid Storage Cabinets:
Where indicated acid storage cabinets shall use the same gauges of steel and construction features as other base cabinets. In addition, they shall have a one-piece liner insert made of linear low-density polyethylene. The liner insert shall form a one-inch pan at the bottom to retain spillage. Each door will have a set of louvers at the top and bottom. The door shall be lined with a polyethylene sheet. Each cabinet shall be vented into the fume hood with a 1-1/2" vent pipe, providing a positive airflow directly into the fume hood exhaust system.

B. Solvent Storage Cabinets:
Solvent storage cabinets shall be UL labeled and specifically designed for the storage for the storage of flammable and combustible liquids. Construction shall be based upon the requirements listed by UL, UFC, OSHA, and NFPA No. 30 - 2003. The bottoms, top, sides and doors shall be fabricated of 18 gauge steel and shall be all double panel construction with a 1-1/2" air space between panels. All joints shall be welded, or screwed, to provide a rigid enclosure. The doors shall swing on full-length stainless steel piano hinges and shall be fully insulated. The right hand door shall be equipped with a three point latching device and the left-hand door shall have a full height astragal. The doors shall be self-closing and synchronized so that both doors will always fully close. The right hand door shall be equipped with a three-point latching system that automatically engages when the doors close. Each door shall be equipped with a fusible-link hold-open feature that will ensure the door closes should the temperature outside the cabinet exceed 165 degrees Fahrenheit. Units 24" long shall have only one door, self-closing, and equipped with a three-point latching system and hold-open feature. A 2" deep liquid tight pan that covers the entire bottom of the cabinet shall be furnished to contain liquid leaks and spills. A full-depth adjustable shelf shall also be provided. Two diametrically opposed vents with spark screens shall be provided in the back of the cabinet as well as a grounding screw. The cabinet shall have an interior finish the same as the exterior and shall be labeled: "FLAMMABLE - KEEP FIRE AWAY".

2.11 FULL HEIGHT FLAMMABLE AND ACID STORAGE CABINETS:

A. Acceptable Manufacturers:
1. Justrite, Des Plaines, IL
2. Secureall Safety Storage Equipment, Laporte, IN
3. SciMatCo, Scientific Materials Company, Batavia, IL

B. Solvent Storage Cabinets:
1. Solvent storage cabinets shall be UL labeled and specifically designed for the storage for the storage of flammable and combustible liquids. Construction shall be based upon the requirements listed by UL, UFC, OSHA, and NFPA No. 30 - 2003.
2. The bottoms, top, sides and doors shall be fabricated of 18 gauge steel and shall be all double panel construction with a 1-1/2" air space between panels. All joints shall be welded, or screwed, to provide a rigid enclosure. The doors shall swing on full-length stainless steel piano hinges and shall be fully insulated. The right hand door shall be equipped with a three point latching device and the left-hand door shall have a full height astragal. The doors shall be self-closing and synchronized so that both doors will always fully close. The right hand door shall be equipped with a three-point latching system that automatically engages when the doors close. Each door shall be equipped with a fusible-link hold-open feature that will ensure the door closes should the temperature outside the cabinet exceed 165 degrees Fahrenheit. Units 24" long shall have only one door, self-closing, and equipped with a three-point locking system

and hold-open feature.

3. A 2" deep liquid tight pan that covers the entire bottom of the cabinet shall be furnished to contain liquid leaks and spills.
4. A full-depth adjustable shelf shall also be provided. The shelves shall have built-in troughs to catch incidental drips and easy adjust on 2 ¼" centers for versatile storage. Heavy-gauge galvanized steel shelves, ribbed for extra strength to support 350 lb., weight capacity shall be provided.
5. Two diametrically opposed vents with spark screens shall be provided in the back of the cabinet as well as a grounding screw.
6. The cabinet shall have an interior finish the same as the exterior and shall be labeled: "FLAMMABLE - KEEP FIRE AWAY".

C. Acid Storage Cabinets:

1. Acid storage cabinets shall have the same quality features specified for flammable cabinets, including double wall, 18-fauge, welded steel construction, adjustable selves, three-point self latching doors and level feet.
2. A one-piece liner insert made of linear low-density polyethylene shall be provided. The liner insert shall form a two-inch pan at the bottom to retain spillage. The door shall be lined with a polyethylene sheet. Two diametrically opposed vents with spark screens shall be provided in the back of the cabinet as well as a grounding screw.

D. Combination Corrosive and Flammable Storage Cabinets:

1. Combination cabinets shall be constructed of 1" thick multi-ply, exterior grade plywood with chemical-resistant paint.
2. All cabinets shall be constructed to meet and exceed all applicable NFPA and OSHA standards.
3. Individual cabinets shall be designed for stacking.
4. Cabinets shall be easily identified by cabinet color and 10" hazard label.
5. All cabinets shall have a liquid-tight, 2" trough to contain accidental spills.
6. Flammables cabinets shall be provided with self-closing doors.

2.12 CEILING SERVICE PANELS

A. Ceiling service panels shall be designed to integrate into common ceiling grids providing a method of delivering plumbing, electrical and data service to the lab benches.

B. The panels shall fit in standard 2' x 2' and 2' x 4' ceiling grids.

C. Power components shall be UL listed and shall be pre-wired.

D. The panels shall accommodate the lab services indicated on the lab plans. They shall accept quick-connect valves, fittings and hoses as indicated as well as communication and data outlets and electrical service outlets.

E. Finish:

1. Powder coat finish.
2. Performance of painted surfaces shall meet the requirements specified in Section 123400 – Laboratory Casework-General Requirements.
3. Color to be selected by Architect from manufacturer standard colors.

2.13 STAINLESS STEEL CASEWORK

A. Construction:

1. All units shall be flush front construction with intersection of vertical and horizontal case members, such as end panels, top rails, bottoms and vertical posts in same plane

without overlap. Exterior corners shall be spot welded with heavy back up reinforcement at exterior corners. All face joints shall be welded and ground smooth to provide a continuous flat plane.

2. All units shall have a cleanable smooth interior. Bottom shall be the pan type with both sides and back formed up for easy cleaning. Bottoms with pans turned down must be caulked around inside perimeter. Fabricate concealed surfaces of inner and outer pans from same finish as exposed surfaces.
3. Unless otherwise indicated all casework units shall be fabricated of stainless steel.
4. Toe space member:
   a. Size: 4 inches high by 3 inches deep, unless otherwise noted on Drawings.
   b. Fabricate with channel-shaped flanges at bottoms, and flange at top for engagement with bottom rails forming interlocking joints.
5. Corner gusset plates:
   a. Provide in each corner of sectional units.
   b. Floor mounted casework shall be equipped with leveling devices easily adjustable from within units, to compensate for unevenness in floor.
   c. Fabricate leveling socket as integral part of gusset plate.
   d. Provide slot in each 1/2 inch leveling bolt for easy adjustment using screwdriver from above.
   e. Provide access to leveling bolt through holes in cabinet bottoms directly above leveling bolts.
   f. Provide access holes in cabinet bottoms with removable snap-on covers.
6. Doors:
   a. Fabricate of double wall sound deadened construction. Place sound-deadening mineral filler between inner and outer pans for quiet operation.
   b. Fabricate for fit with minimum clearance.
   c. Fabricate inner door pans to be held securely in place by concealed fasteners that are easily removable for cleaning in case of spillage.
   d. Where swinging doors are specified or shown, fabricate of double wall construction, glazed where specified.
7. Adjustable shelves in cabinets:
   a. Fabricate with adjustable supports at 1/2 inch centers.
   b. Support shelves on adjustable shelf clips, made of cadmium plated steel, engaging in slotted members so dust cannot accumulate at bottoms. Clips shall retain shelves to prevent accidental removal.
   c. Provide 2 inch high lip at back of rear portion of shelf to prevent shelf contents from falling.

B. Base Cabinets:
1. Construct base cabinets to achieve industry standard height of 31 inches or 37 inches with a 1 inch countertop without raising cabinet off floor beyond height required for normal leveling conditions (1 inch nominal).
2. Removable access panel:
   a. At cupboards and knee spaces.

C. Accessories:
1. Fasteners and Anchors: Size and type to securely fasten and anchor items to substrates and supporting structure.
2. Provide miscellaneous fillers and panels required for a finished installation.

PART 3 EXECUTION

3.1 GENERAL REQUIREMENTS

A. For General Installation Requirements, applicable to this and all other Casework Specification Sections including, but not limited to, examination, installation, adjusting,

cleaning, and protection general requirements, refer to Specification Section 123400 - Laboratory Casework-General Requirements.

3.2 ADDITIONAL INSTALLATION REQUIREMENTS

A. Fasten together assemblies to meet Performance Requirements specified above.

B. Floor Mounted Cabinets:
   1. Locate at designated positions.
   2. Level by means of adjustment device located in cabinet's bottom corners.

C. Countertops: Anchor to base cabinets.

D. Field Joints:
   1. Reinforce and weld in manner equivalent to shop welds and joints.

E. Wall Joints:
   1. Joints between equipment and walls up to 3/8 inches wide:
      a. Fill with sealant backing bond breaker rod and silicone sealant.
      b. Comply with requirements of Division 07.
      c. Apply sealant in one continuous pass, compressing surface slightly concave and forcing contact with both sides of joints.
   2. Joints between casework and walls larger than 3/8 inches wide:
      a. Seal with stainless steel closure or filler strip.
      b. Fit tightly and fasten securely with concealed clips.

F. Site Tolerances: Install wall-to-wall countertops with a maximum 1/4 inch gap.

END OF SECTION 123450

SECTION 123460 - WOOD LABORATORY CASEWORK

PART 1 GENERAL

1.1 SUMMARY

A. Related Documents: Conditions of the Contract, Division 01 - General Requirements, Specification Section 123400 – Laboratory Casework-General Requirements, and Drawings apply to work of this Section.

B. This Section includes, but is not limited to, all materials, labor and equipment, complete with all anchors and related accessories, necessary to furnish, deliver and install:
   1. Wood Laboratory Casework:
      Open-leg Tables
      Wood Aprons
      Floor Mounted Base Cabinets
      Wall Hung Cabinets
      Full Height Cabinets
      Island Bench Structural Modules
      Adjustable Shelves
      Wall Mounted Shelving Systems
      ADA Workstations
      Mobile Instructor Workstations
      Miscellaneous fillers and panels required for a finished installation

C. Although such work is not specifically shown or specified, furnish and install all supplementary or miscellaneous items, appurtenances and devices incidental to or necessary for a sound, secure and complete installation.

D. For general requirements applicable to this and all other Casework Specification Sections including, but not limited to definitions, system description, submittals, quality assurance, mock-up, testing, field measurements, pre-installation conference, delivery, storage and handling, project conditions, and sequencing requirements, refer to Specification Section 123400 for Laboratory Casework - General Requirements.

E. Products Installed But Not Specified Under This Section:
   1. Section 123090 - Laboratory Service Fixtures: Supply of service fixtures for placement under this Section.

PART 2 PRODUCTS

2.1 GENERAL

A. For general requirements, applicable to this and all other Casework Specification Sections including, but not limited to, manufacturers, materials, components, and finish and performance requirements, refer to Specification Section 123400 - Laboratory Casework-General Requirements.

2.2 MANUFACTURERS

A. Casework Acceptable Manufacturers:
   1. Thermo Scientific ALC, Austin, TX (ALC GOLD Series)
   2. Kewaunee Scientific, Statesville, NC
   3. Mott Manufacturing, Maxwelton, WV

2.3 FABRICATION

A. General Requirements:
   1. Prior to fabrication, field measure actual existing conditions to ensure proper fit.
   2. Material shall be selected so that the finished installation shall provide an attractive and harmonious appearance. All exterior casework surfaces exposed to view after installation, and cabinet interior surfaces exposed to view when doors and drawers are in the open position, shall be select white maple. Solid woods and veneers exposed to view after completion of installation shall be of color and graining in conformance with the normally accepted standards required of the scientific laboratory equipment industry. All plywood shall be hardwood plywood certified by the manufacturer to be produced with No Added Formaldehyde (NAF). All woods shall be obtained from forests certified by an FSC accredited certification body to comply with FSC STD-01-001, "FSC Principles and Criteria for Forest Stewardship." Chain-of-custody documentation shall be provided in accordance with FSC's standards. Manufacturer shall provide certification and include statement indicating cost for each certified wood product. Softwoods such as Fir or Pine are not permitted.
   3. Veneers exposed to view after completion of installation shall be of color and graining in conformance with the normally accepted standards required of the Scientific Laboratory Equipment Industry.
   4. The cabinets shall be full overlay construction with 3/4" thick door and drawer fronts. The exposed face of doors and drawer heads shall be vertical matching grain, with all doors and drawer heads for each cabinet cut from a single sheet of select white maple veneer core plywood. The door and drawer heads shall occupy a plane extending 3/4" past the plane of the front of the cabinet body, shall be square edged, and shall overlay the face of the cabinet leaving minimal reveals. All cabinet end panels shall be finished for the purpose of future relocation.

B. Open-leg Tables:
   Legs shall be maple hardwood construction, 2-1/2" square with all corners radiused 1/4". Legs shall be secured to the apron frame by a heavy duty corner bolt and a 14-gauge metal corner brace. Corner braces shall be locked into apron rails by accurately located grooves and shall be securely fastened with screws. This construction shall guarantee equal tension on all wood and metal parts. Top edge shall be grooved for securing top fasteners. Leg stretchers, where required, shall be 1-5/16" x 2-1/2", utilizing a mortise and tenon joint with legs and secured with a 4" long through bolt.

C. Wood Aprons:
   All apron rails shall be 3/4" thick 5-ply maple veneer lumber core plywood.

D. Floor Mounted Base Cabinets:
   1. Panels and Rails:
      a. All cabinet end panels shall be 3/4" thick select white maple veneer core plywood with 1/8" thick select white maple facing on exposed vertical edges and bottom horizontal edge.
      b. Bottom panels and toe space rails shall be 3/4" thick select white maple veneer core plywood with 1/8" thick select white maple facing on exposed edges.
      c. Top panels shall be 1" thick select white maple veneer core plywood with 1/8" thick select white maple facing on exposed edge.
      d. End panels shall be multiple doweled, glued, and screwed to top panel, bottom panel and toe space rail.
      e. Cupboard base cabinet shelves shall be full-width adjustable, 3/4" thick select white maple veneer core plywood with 1/8" thick select white maple facing on exposed edge. Shelves shall be adjustable on 32mm centers utilizing shelf support clips.
      f. Sink cabinets shall be made without a top panel.
   2. Backs:

Cabinet backs shall be 1/4" thick hardboard, dadoed into end panels and securely fastened to cabinet bottom and top panels. Backs that are attached to end panels with cleats shall be unacceptable. Removable backs shall be provided at all cupboard base cabinets. Base Cabinets with drawers shall have full backs.

3. Intermediate Rails:
   Intermediate rails shall be 3-1/4" x 3/4" veneer core plywood with 1/8" thick select white maple facing on exposed edge. Rails shall be screwed to end panels. Intermediate rails shall be mounted at the front between the drawers and between all drawers and doors.
4. Drawers Bodies:
   Drawer bodies shall be 20 gauge, painted, cold rolled steel, made in a one-piece construction including the bottom, two sides, back and front. They shall be fully coved at interior bottom on all four sides for easy cleaning.
5. Drawer Heads:
   Drawer heads shall 3/4", select white maple plywood with 1/8" select white maple edging and shall be mounted to the front of the steel drawer bodies. Each drawer head under 30" wide shall have one pull mounted horizontally, drawer heads 30" and over shall have two pulls.
6. Doors:
   Doors shall be 3/4", select white maple, plywood with 1/8" select white maple edging, mounted on cabinet with 1 pair of offset hinges and shall be latched with a roller catch. Double doors shall have a roller catch on each door. Each door shall have one pull mounted vertically. Locks, when required on double doors, shall be mounted on the right-hand door and the left-hand door shall have a select white maple astragal.

E. Wall Hung Cabinets:
   1. All cabinet end panels shall be 3/4" thick select white maple veneer core plywood with 1/8" select white maple facing on front edges. Tops and bottoms shall be 1" thick select white maple veneer core plywood with 1/8" select white maple facing on exposed edges, multiple doweled into end panels, and secured with glue and countersunk screws. Shelves shall be full-width adjustable, 3/4" thick select white maple veneer core plywood with 1/8" thick select white maple facing on exposed edge. Shelves shall be adjustable on 32mm centers utilizing shelf support clips. The backs shall be 3/8" select white maple veneer core plywood.
   2. Doors:
      a. Sliding Plate Glass Doors:
         Solid glass doors shall be 1/4" thick float glass with polished edges. Doors shall be set in an aluminum bottom frame containing roller bearings and held in position with an aluminum guide at the top of the case.
      b. Swinging Doors:
         Cabinets shall be designed and integrally constructed for full enclosure to assure dust proofing of the cabinet interior.
         Doors shall either be solid hardwood core panel or glass framed, as indicated. Solid hardwood core doors shall be 3/4", select white maple plywood with 1/8" select white maple edging. Glass doors shall be 1/4" thick float glass with polished edges.
         Doors shall be hung on 1 pair of offset hinges and shall latch with a roller catch. Double doors without locks shall have a roller catch on each door. Double doors with locks shall have an elbow catch and select white maple astragal mounted to the left-hand door and the lock and a roller catch mounted on the right-hand door. Glass shall be set indo door solid maple frame and secured with a plastic retainer.

F. Full Height Cabinets:
   1. Cabinet:

a. Cabinets shall be designed and integrally constructed for full enclosure to assure dust proofing of the case interior.
b. All cabinet end panels shall be 3/4" thick select white maple plywood with 1/8" select white maple facing on exposed vertical edges and bottom horizontal edge. Tops shall be 1" thick select white maple plywood with 1/8" select white maple facing on exposed edge, multiple doweled into end panels, secured with glue and countersunk screws.
c. Shelves shall be full-width adjustable, 3/4" thick select white maple plywood with 1/8" thick select white maple facing on exposed edge. Adjustable shelves shall be adjustable on 32mm centers utilizing shelf support clips. To assure a completely rigid case, a fixed center shelf of 1" thick select white maple veneer core plywood with 1/8" select white maple facing on exposed edge, shall be multiple doweled into end panels, secured with glue and countersunk screws.
d. Cabinet bottoms shall be 3/4" thick select white maple plywood, multiple doweled and glued securely to end panels. All cabinets 22" in depth shall have a 3/4" x 3-3/4" select white maple plywood toe space rail to form a 4" high toe space. Cabinets 16" deep shall use a 1" x 4-1/2" select white maple plywood base rail mounted flush with the face of the cabinet. The backs in full height cabinets shall be 3/8" select white maple veneer core plywood. Cabinet interior shall be flush.

2. Doors:
a. Doors shall either be solid hardwood core panel, glass framed, screen framed or with marker board, as indicated.
b. Doors shall be 3/4", select white maple plywood with 1/8" select white maple edging. Each door shall have one pull mounted vertically, shall be hung on 1-1/2 pair of offset hinges, and shall latch with a roller catch. Double doors without locks shall have a roller catch on each door. Double doors with locks shall have an elbow catch and select white maple astragal mounted to the left-hand door and the lock and a roller catch mounted on the right-hand door.
c. Glass framed doors shall be 3/4" thick with 1" thick by 3-3/16" wide solid maple framing, mortised, tenoned, and glued. Glass shall be set into door frame and secured with a plastic retainer.
d. Screen framed doors shall be black aluminum wire mesh with protective finish to prevent corrosion.
e. Marker board doors shall be 3/4", select white maple plywood with 1/8" select white maple edging. A dry-erase magnetic white board shall be applied to the wood door.

G. Island Bench Structural Modules:
1. Island Structural Modules shall be made from cold-rolled steel with a corrosion and chemical resistant finish as specified in 123400.
2. Structure Modules shall provide support structure.
3. The structural modules shall be capable of supporting adjustable shelving on each side.
4. Single or double-slotted uprights shall have holes on 1 inch centers for adjustable shelves.

H. Adjustable Shelves:
1. Adjustable module shelving shall attach to the structural module upright, or to the wall mounted rails, with height adjustability on 1 inch increments.
2. Adjustable module shelves shall be supported by 11 gauge brackets, which shall mount to the single or double-slotted support module upright. Shelf brackets shall be mounted above or below the shelves as shown on drawings.
3. Outer and Inner shelves shall be 1" thick hardwood plywood with maple veneer on all exposed surfaces.

4. Top outer shelves shall fit flush with top ledge of panel or core. Top surface of pane or core shall act as inner shelf.
5. End lips shall be provided.
6. Inner shelves shall be added to back of outer shelves to fill the space between island uprights.

I. Wall Mounted Shelving System:
1. Wall Mounted Shelving Systems shall consist of Wood Shelves, with Heavy Duty Vertical Wall Standards, and Heavy Duty Adjustable Shelf Brackets. Fasten standards to concrete masonry walls or properly blocked steel studded walls with appropriate flat head screws.
2. Vertical Wall Standards shall allow adjustable bracket to be positioned along its full length for maximum use of space. A pair of vertical supports shall hold the shelves and their support brackets.
3. Adjustable shelf bracket shall have up-turned lip to prevent shelves from being pulled off bracket. It shall be formed from high-strength, cold-rolled steel. It shall include mounting hardware to secure bracket to vertical wall standards.

2.4 MOBILE ADA WORKSTATION

A. Kewaunee (Model #T05H3760-0 ADA Workstation)
1. Handicapped accessible, with four inch swivel casters, two of them equipped with brakes.
2. It shall be built of maple and plywood.
3. Complete with Epoxy Resin Countertop.
4. Size: 30” Deep by 60” Long by 30”-37” adjustable height on 1” increments.
5. Cabinet: Two drawer cabinet (Kewaunee Model # D81H1918-0)
6. Sink: 9” Diameter – Stainless Steel
7. 1 ½” I.P.S. Stainless Steel Sink Outlet
8. 6ft. Long 1” dia. Stainless Steel Braided Drainline Hose with Quick-Disconnect hose fittings.
9. Electric Fixtures: 120 VAC GFI Duplex Pedestal (Kewaunee Model # 0656-02)
10. 8 ft long extension cord
11. Fittings:
    a. Cold and Hot Water w/4” Wrist Blade Handles (Kewaunee Model # W-0340-0V).
    b. 4ft. long ½” dia Reinforced PVC Cold and Hot Water Service Hoses with Quick-Disconnect. Color coded per services.
    c. Single Outlet Service Fitting (Kewaunee Model # W-0260-00).
    d. 4ft. long 3/8” dia Reinforced PVC Gas/Air/Vac Service Hose with Quick-Disconnect Hose Fittings. Color coded per services.

2.5 MOBILE INSTRUCTOR WORKSTATION

A. Kewaunee (Model #T57W323060-XX Mobile Instructor Workstation)
1. Handicapped accessible, with four inch swivel casters, two of them equipped with brakes.
2. It shall be built of maple and plywood.
3. Complete with Epoxy Resin Countertop.
4. Size: 30” Deep by 60” Long by 34” High.
5. Storage Cabinets: As shown on lab drawings
6. Sink: 6” Diameter – Stainless Steel
7. Totally self-contained with its own services. It shall be furnished complete with cold water pump gooseneck, and one gallon carboys for water supply and waste.
8. Electric Fixtures: 120 VAC GFI Duplex Pedestal (Kewaunee Model # 0581-02)
9. 8 ft long extension cord and plug.

10. Provide complete with Rod Sockets, ½" dia. upright rods, 18" long and upright rod assembly.

2.6 ACCESSORIES

A. Fasteners and Anchors: Size and type to securely fasten and anchor items to substrates and supporting structure.

B. Provide miscellaneous fillers and panels required for a finished installation.

PART 3 EXECUTION

3.1 GENERAL REQUIREMENTS

A. For General Installation Requirements, applicable to this and all other Casework Specification Sections including, but not limited to, examination, installation, adjusting, cleaning, and protection requirements, refer to Specification Section 123400 for Laboratory Casework - General Requirements.

3.2 ADDITIONAL INSTALLATION REQUIREMENTS

A. Floor Mounted Base Cabinets:
   1. Locate at designated positions
   2. Level by means of adjustment device located in cabinet's bottom corners

B. Countertops: Anchor to base cabinets, unless noted otherwise.

C. Fasten together assemblies listed below with devices of adequate strength to support cabinet and shelves loaded 40 pound per square foot per shelf for enclosed wall cabinets or open adjustable shelves not inclusive of cabinet, shelf, and bracket weight.
   1. Wall cabinet to wall
   2. Wall mounted shelves to wall

D. Site Tolerances: Install wall-to-wall countertops with a maximum 1/4 inch gap.

END OF SECTION 123460

SECTION 123470 - POLYPROPYLENE LABORATORY CASEWORK

PART 1 GENERAL

1.1 SUMMARY

A. Related Documents: Conditions of the Contract, Division 01 - General Requirements, Specification Section 123400 – Laboratory Casework-General Requirements, and Drawings apply to work of this Section.

B. This Section includes, but is not limited to, all materials, labor and equipment, complete with all anchors and related accessories, necessary to furnish, deliver and install:
   1. Polypropylene Laboratory Casework:
      Floor Mounted Base Cabinets (Swinging doors, drawers and open shelves)
      Wall Hung Cabinets
      Adjustable Shelves
      Miscellaneous fillers and panels required for a finished installation

C. Although such work is not specifically shown or specified, furnish and install all supplementary or miscellaneous items, appurtenances and devices incidental to or necessary for a sound, secure and complete installation.

D. For general requirements applicable to this and all other Casework Specification Sections including, but not limited to definitions, system description, submittals, quality assurance, mock-up, testing, field measurements, pre-installation conference, delivery, storage and handling, project conditions, and sequencing requirements, refer to Specification Section 123400 for Laboratory Casework - General Requirements.

E. Products Installed But Not Specified Under This Section:
   1. Section 123090 - Laboratory Service Fixtures: Supply of service fixtures for placement under this Section.

PART 2 PRODUCTS

2.1 GENERAL

A. For general requirements, applicable to this and all other Casework Specification Sections including, but not limited to, manufacturers, materials, components, and finish and performance requirements, refer to Specification Section 123400 - Laboratory Casework-General Requirements.

2.2 MANUFACTURERS

A. Acceptable Manufacturers:
   1. Polypropylene casework and miscellaneous fillers and panels required for a finished installation, by NuAire, Plymouth, MN or approved equal.

2.3 CASEWORK FABRICATION

A. Prior to fabrication, field measure actual existing conditions to ensure proper fit.

B. Casework shall be of sealed and solid seamed welded polypropylene construction, including casework, countertops and accessories.

C. Polypropylene shall be a high corrosion resistant material that has high temperature and tensile strength. It shall possess excellent chemical resistance to organic solvents and degreasing agents as well as electrolytic attack. The properties of polypropylene shall be enhanced with anti-oxidizing agents and UV stabilizers to increase strength and improve thermal characteristics. Polypropylene shall be light weight, stain resistant and have a low moisture absorption rate.

D. All polypropylene casework shall be manufactured from ¼", 3/8" and ½" stress relieved, refrigerator white standard polypropylene.

E. Each casework unit shall be machined from a full length sheet of polypropylene, designed to be folded into an unbroken surface and seamless exterior (except one rear corner). All interior surfaces shall be completely seam welded and reinforced, where necessary, forming a completely rigid and self-supporting cabinet that can be used interchangeably in a group of casework or can be used as a stand-alone cabinet. When properly installed, the casework shall provide an easily cleaned, smooth and flush interior and a dust resistant installation.

F. All drawer and door pulls shall be constructed from polypropylene, which offer a comfortable hand grip, through-bolt attachment to the upper middle of drawer/door fronts, with polypropylene fasteners from the back face. Two pulls shall be provided on drawers wider than 24 inches.

G. All doors shall be solid one-piece construction and of overlapping design. Hinges shall be molded from refrigerator white polypropylene, with a minimum of three-knuckles rounded edge barrel. A minimum of two hinges shall be provided for doors under 36 inches. Each hinge shall be attached to the door and frame with two polypropylene screws on each side. Door catches shall consist of 20-mil polyethylene coated magnets that are imbedded into the door/frame at the top and bottom of each door. The catches shall provide a minimum pull of seven pounds. Where adjustable shelves are required in base cabinets or cupboards, the precision PVC adjustment clips shall allow you to adjust shelf positions on 1- ½" increments. Shelves that are placed over 5 feet above finished floor (AFF) shall have a ½ inch seismic restraining lip.

H. Drawer guides (on each side) shall provide quiet, smooth and precise operation with little or no side-to-side motion when withdrawing the drawer. The drawers shall be constructed from ½ inch polypropylene, through out, in the same "V" groove, fold-up fashion as the base cabinets, providing a seamless exterior. The drawer fronts shall be a separately welded piece. All drawers shall have integral draw stops to prevent inadvertent drawer removal and contact with the back of the cabinet, yet allow easy removal without the use of tools.

I. The standard method of leveling the base cabinets to the floor, shall utilize polypropylene shims. It should be recognized that ALL POPYPROPYLENE CONSTRUCTED PRODUCTS because of their flexible nature do not lend themselves to field adjustment procedures that permit door/drawer adjustments. Field adjustability is minimal, therefore proper leveling of casework at the time of installation is critical. Leveling devices in base cabinets shall be provided in each corner of the base cabinet. The leveling one inch thick threaded polypropylene rods shall be adjusted from within the cabinet's interior and provide for a one inch adjustment. The levelers shall be protected by a ½ inch lip with cover around the leveler to control spill leakage under the cabinet.

J. All base cabinets with doors shall be configured with a removable access panel in the rear for access to a plumbing utility chase. Panels shall be ¼ inch thick polypropylene mounted flush within the rear wall's ½ inch thick polypropylene. Polypropylene screws shall fasten the panel to the rear wall. All base cabinets with drawers shall be configured with a closed back panel to prevent items from falling into the chase behind. All base cabinets shall have a 4 inch high by 3 inch deep toe kick.

K. All base cabinets shall have a full length 3 inch gusset on both the front and rear top for fastening the countertop. Each base cabinet shall also have a ½ inch spill lip at the front floor to contain liquids.

L. Base cabinet (type B14) with pull-out shelf and full extension, heavy duty shelf suspension system loading capacity of 200 lbs. minimum.

M. All non-plastic internal surfaces and/or components shall be corrosion, flame, and moisture resistant. They shall not deteriorate when exposed to liquid or vapor phase decontaminants, such as formaldehyde, alcohol, iodophors, peracetic acid, halogenated phenols, and hypochorite solutions.

N. Fasteners and Anchors: Size and type to securely fasten and anchor items to substrates and supporting structure.

O. Provide miscellaneous fillers and panels required for a finished installation.

PART 3 EXECUTION

3.1 GENERAL REQUIREMENTS

A. For General Installation Requirements, applicable to this and all other Casework Specification Sections including, but not limited to, examination, installation, adjusting, cleaning, and protection requirements, refer to Specification Section 123400 for Laboratory Casework - General Requirements.

3.2 ADDITIONAL INSTALLATION REQUIREMENTS

A. Floor Mounted Base Cabinets:
   1. Locate at designated positions
   2. Level by means of adjustment device located in cabinet's bottom corners

B. Countertops: Anchor to base cabinets, unless noted otherwise.

C. Fasten together assemblies listed below with devices of adequate strength to support cabinet and shelves loaded 40 pound per square foot per shelf for enclosed wall cabinets or open adjustable shelves not inclusive of cabinet, shelf, and bracket weight.
   1. Wall cabinet to wall
   2. Wall mounted shelves to wall

D. Site Tolerances: Install wall-to-wall countertops with a maximum 1/4 inch gap.

END OF SECTION 123470

SECTION 123661 – SOLID SURFACE COUNTERTOPS AND WALL PANELS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:

1. Solid-surface-material countertops and backsplashes.
2. Solid-surface-material convenience shelf.
3. Quartz-surface wall panels.

B. Related Sections:

1. Division 06 Section “Interior Architectural Woodwork” for solid surface countertops mounted to plastic laminate cabinets.
2. Division 22 Section "Plumbing Fixtures" for under-counter mounted sinks and plumbing fittings.

1.3 ACTION SUBMITTALS

A. Product Data: For countertop and wall panel solid-surface materials.

B. LEED Submittals:

1. Product Data for Credit MR 4: For products having recycled content, documentation indicating percentages by weight of postconsumer and preconsumer recycled content. Include statement indicating cost for each product having recycled content.
2. Certificates for Credit MR 7: Chain-of-custody certificates indicating that wood products comply with forest certification requirements. Include documentation that manufacturer is certified for chain of custody by an FSC-accredited certification body. Include statement indicating cost for each certified wood product.
3. Product Data for Credit IEQ 4.4: For adhesives and composite wood products, documentation indicating that product contains no urea formaldehyde.
4. Laboratory Test Reports for Credit IEQ 4: For adhesives, documentation indicating that products comply with the testing and product requirements of the California Department of Health Services' "Standard Practice for the Testing of Volatile Organic Emissions from Various Sources Using Small-Scale Environmental Chambers."

C. Shop Drawings: For countertops. Show materials, finishes, edge and backsplash profiles, methods of joining, and cutouts for plumbing fixtures.

D. Samples for Initial Selection: For each type of material exposed to view.

E. Samples for Verification: For the following products:

1. Countertop material, 6 inches square.
2. Wall panel material, 6 inches square.

1.4 PROJECT CONDITIONS

A. Field Measurements: Verify dimensions of countertops by field measurements before countertop fabrication is complete.

1.5 COORDINATION

A. Coordinate locations of utilities that will penetrate countertops or backsplashes.

PART 2 - PRODUCTS

2.1 SOLID-SURFACE-MATERIAL COUNTERTOPS

A. Configuration: Provide countertops with the following front and backsplash style:

1. Front: Beveled.
2. Backsplash: Beveled.
3. Endsplash: Matching backsplash.

B. Countertops: 1/2-inch- thick, solid surface material with apron and built up front edge of same material.

C. Backsplashes: 1/2-inch- thick, solid surface material.

D. Fabrication: Fabricate tops in one piece with shop-applied edges, aprons and coved backsplashes unless otherwise indicated. Comply with solid-surface-material manufacturer's written instructions for adhesives, sealers, fabrication, and finishing.

1. Fabricate with loose end splashes for field assembly.

2.2 COUNTERTOP MATERIALS

A. Certified Wood Materials: Fabricate countertop support frames with wood and wood-based products produced from wood obtained from forests certified by an FSC-accredited certification body to comply with FSC STD-01-001, "FSC Principles and Criteria for Forest Stewardship."

B. Adhesives: Adhesives shall not contain urea formaldehyde.

C. Solid Surface Material: Homogeneous solid sheets of filled plastic resin complying with ANSI SS1.

D. Basis-of-Design Product: Subject to compliance with requirements, provide Corian product by E. I. du Pont de Nemours and Company or comparable products by one of the following:

1. Avonite Surfaces.

2. Formica Corporation.
3. Wilsonart International; Div. of Premark International, Inc.

E. Support Brackets: Fabricated stainless steel countertop bracket angle with welded gusset.

1. Minimum load capacity 200 pounds per bracket.
2. Size: 20 inches by 20 inches at lavatory countertops; 10inches by 10 inches at convenience shelf.
3. Manufacturer: Subject to compliance with requirements, provide the following or an equal product.

a. Short Run Pro, LLC; Federal Brace division

1) Model: Brunswick

2.3 QUARTZ-SURFACE WALL PANELS

A. Adhesives: Adhesives shall not contain urea formaldehyde.

B. Quartz Surface Material: Homogeneous mixture containing 93% pure quartz with additions of high performance polymer resins and pigments that are compacted under intense vibration, vacuum, and pressure into dense, non-porous slabs.

C. Basis-of-Design Product: Subject to compliance with requirements, provide Zodiaq product by E. I. du Pont de Nemours and Company or comparable products by one of the following:

1. Caesarstone
2. Cambria.
3. Silestone.

D. Thickness: ¾ inch.

2.4 FINISHES

1. Solid-surface-material countertops: DuPont Corian Illumination Series – Arctic white.
2. Quartz-surface wall panels: DuPont Zodiaq – Calm Spring.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine substrates and conditions, with fabricator present for compliance with requirements for installation tolerances, and other conditions affecting performance of work.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. Countertops:

1. Install support brackets plumb and level. Provide blocking in wall adequate to support the imposed loads. Provide shims as required to prevent crushing of the wall finish.
2. Construct support frame with continuous members over each bracket and at all perimeter edges.
3. Install countertops plumb, level and rigid, scribed to adjacent finishes, in accordance with approved shop drawings and product data.

    a. Provide product in the largest pieces available.
    b. Form field joints using manufacturer's recommended adhesive, with joints inconspicuous in finished work.
    c. Exposed joints/seams shall not be allowed.
    d. Reinforce field joints with solid surface strips extending a minimum of 1 inch on either side of the seam with the strip being the same thickness as the top.
    e. Cut and finish component edges with clean, sharp returns.
    f. Rout cutouts to template.
    g. Anchor securely to bracket supports.
    h. Align adjacent countertops and form seams to comply with manufacturer's written recommendations using adhesive in color to match countertop.
    i. Carefully dress joints smooth, remove surface scratches and clean entire surface.
    j. Install countertops with no more than 1/8-inch sag, bow or other variation from a straight line.

4. Endsplashes:

    a. Install applied endplashes using manufacturer's standard color-matched silicone sealant.

B. Convenience Shelf:

1. Install support brackets plumb and level. Provide blocking in wall adequate to support the imposed loads. Provide shims as required to prevent crushing of the wall finish.
2. Install plywood sublayer.
3. Install countertops plumb, level and rigid, scribed to adjacent finishes, in accordance with approved shop drawings and product data.

    a. Provide product in the largest pieces available.
    b. Form field joints using manufacturer's recommended adhesive, with joints inconspicuous in finished work.
    c. Exposed joints/seams shall not be allowed.
    d. Cut and finish component edges with clean, sharp returns.
    e. Carefully dress joints smooth, remove surface scratches and clean entire surface.
    f. Install shelf with no more than 1/8-inch sag, bow or other variation from a straight line.

C. Wall Panels:

1. Install components plumb, level and rigid, scribed to adjacent finishes, in accordance with approved shop drawings and product data, using compatible adhesive sealants per the manufacturer's written recommendations

    a. Provide product in the largest pieces available.

b. Form vertical seams where necessary using manufacturer's recommended adhesive, with joints inconspicuous in finished work. No horizontal seams shall be allowed.
c. Fabricate reveal field joints as indicated with built up solid surface edges and batten strips.
d. Cut and finish component edges with clean, sharp returns.
e. Carefully dress joints smooth, remove surface scratches and clean entire surface.

3.3 REPAIR

A. Repair or replace damaged work, which cannot be repaired to architect's satisfaction.

3.4 CLEANING AND PROTECTION

A. Keep components clean during installation.

B. Remove adhesives, sealants and other stains.

END OF SECTION 123661

SECTION 124816 - ENTRANCE FLOOR GRILLES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. This Section includes recessed foot grilles and frames.

B. Related Sections include the following:

1. Division 03 Section "Cast-in-Place Concrete" for slab depression grouting and filling for recessed foot grilles and frames.

1.3 PERFORMANCE REQUIREMENTS

A. Structural Performance: Provide foot grilles and frames capable of withstanding the following loads and stresses:

1. Uniform floor load of 300 lbf/sq. ft..
2. Wheel load of 350 lb per wheel.

1.4 ACTION SUBMITTALS

A. Product Data: Include construction details, material descriptions, dimensions of individual components and profiles, and finishes for foot grilles and frames.

B. Shop Drawings: Show the following:

1. Items penetrating foot grilles and frames, including the following:

a. Door control devices.

2. Divisions between grille sections.
3. Perimeter floor moldings.

C. Samples for Initial Selection: For each type of product involving color selection.

D. Samples for Verification: For each type of product indicated.

1. Foot Grille: 12-inch- square assembled sections.
2. Frame Members: 12-inch- long Sample of each type and color.

1.5 CLOSEOUT SUBMITTALS

A. Maintenance Data: For foot grilles and frames to include in maintenance manuals.

1.6 QUALITY ASSURANCE

A. Source Limitations: Obtain foot grilles and frames through one source from a single manufacturer.

B. Accessibility Requirements: Provide installed foot grilles that comply with Section 4.5 in the U.S. Architectural & Transportation Barriers Compliance Board's "Americans with Disabilities Act (ADA), Accessibility Guidelines for Buildings and Facilities (ADAAG)."

1.7 PROJECT CONDITIONS

A. Field Measurements: Indicate measurements on Shop Drawings.

1.8 COORDINATION

A. Coordinate size and location of recesses in concrete to receive foot grilles and frames.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

1. ARDEN Architectural Specialties, Inc.
2. Balco, Inc.
3. C/S Group.

2.2 MATERIALS

A. Aluminum Sheet: ASTM B 209, alloy and temper recommended by aluminum producer and finisher for type of use and finish indicated, and with not less than strength and durability properties of Alloy 5005-H15.

B. Extruded Aluminum: ASTM B 221, Alloy 6061-T6 or Alloy 6063-T5, T6, or T52 as standard with manufacturer. Coat surface of frame in contact with cementitious materials with manufacturer's standard protective coating.

2.3 FOOT GRILLES

A. General: Provide manufacturer's standard foot-grille assemblies consisting of treads of type and profile indicated, interlocked or joined together by cross members, and with support legs (if any) and other components needed to produce a complete installation.

B. Aluminum Foot Grilles: Provide manufacturer's standard foot grilles with extruded members, top-surfaced tread rails, and as follows:

1. Tread Rails: Extruded-aluminum tread rails with extruded-aluminum frame.
2. Tread Rail Spacing: 1-1/2 inches o.c. with 1/8- to 3/16-inch- wide openings between treads.
3. Top Surface: Fusion-bonded, level-cut-pile nylon carpet insert; 1/4 inch high, 28 oz./sq. yd..

    a. Colors: As selected by Architect from manufacturer's full range.

4. Grille Size: As indicated.

C. Lockdown: Manufacturer's standard.

2.4 FRAMES

A. Provide manufacturer's standard frames of size and style for grille type, for permanent recessed installation in subfloor, complete with installation anchorages and accessories. Unless otherwise indicated, fabricate frame of same material and finish as grilles.

2.5 SUPPORT SYSTEM

A. Level Bed Applications: Provide manufacturer's standard, vinyl cushion support system.

2.6 FABRICATION

A. Shop fabricate foot grilles to greatest extent possible in sizes as indicated. Unless otherwise indicated, provide each grille as a single unit; do not exceed manufacturer's recommended maximum sizes for units that are removed for maintenance and cleaning. Where joints in grilles are necessary, space symmetrically and away from normal traffic lanes.

B. Fabricate frame members in single lengths or, where frame dimensions exceed maximum available lengths, provide minimum number of pieces possible, with hairline joints equally spaced and pieces spliced together by straight connecting pins.

2.7 FINISHES, GENERAL

A. Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" for recommendations for applying and designating finishes.

B. Protect mechanical finishes on exposed surfaces from damage by applying a strippable, temporary protective covering before shipping.

2.8 ALUMINUM FINISHES

A. Finish designations prefixed by AA comply with the system established by the Aluminum Association for designating aluminum finishes.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine substrates and floor conditions for compliance with requirements for location, size, minimum recess depth, and other conditions affecting installation of foot grilles and frames.

B. Examine roughing-in for drainage piping systems to verify actual locations of piping connections before foot grille and frame and drain pan installation.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. Install recessed foot grilles and framesto comply with manufacturer's written instructions at locations indicated and with top of foot grilles and frames in relationship to one another and to adjoining finished flooring as recommended by manufacturer. Set foot-grille tops at height for most effective cleaning action. Coordinate top of foot-grille surfaces with doors that swing across grilles to provide clearance under door.

3.3 PROTECTION

A. After completing frame installations, provide temporary filler of plywood or fiberboard in foot-grille recesses and cover frames with plywood protective flooring. Maintain protection until construction traffic has ended and Project is near Substantial Completion.

END OF SECTION 124816

SECTION 129300 – SITE FURNISHINGS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

1.2 SUMMARY

A. This Section includes the following:

1. Bicycle racks
2. Benches
3. Tables and chairs
4. Trash Receptacles
5. Recycling Containers
6. Planters

B. Related Sections include the following:

1. Earthwork for excavation for installation of concrete footings.
2. Cast-in-Place Concrete.

C. Products furnished, but not installed under this Section, include pipe sleeves and anchor bolts to be cast in concrete footings and installed in paving.

1.3 SUBMITTALS

A. Product Data: For each type of product indicated.

B. Samples for Verification: For each type of exposed finish required, prepared in Samples of size indicated below.

1. Size: Not less than 6-inch- long linear components and 4-inch- square sheet components.

1.4 QUALITY ASSURANCE

A. Source Limitations: Obtain each type of site furnishing(s) through one source from a single manufacturer.

PART 2 - PRODUCTS

2.1 BICYCLE RACKS

A. Provide single loop bike rack as manufactured by Landscape Forms, Inc.

1. Model: Ring Bike Rack.

B. Finish: Stainless Steel.

C. Mounting: As shown on plans.

2.2 BENCHES

A. Provide bench as manufactured by Landscape Forms, Inc.

1. Model: Plexus II.

B. Frame Color: Titanium.

C. Mounting: As shown on plans.

D. Length: 6 feet.

E. Seat Type: Wire grid.

2.3 TABLES AND CHAIRS

A. Provide table as manufactured by Landscape Forms, Inc.

1. Model: Plexus II

B. Frame Color: Titanium.

C. Mounting: Surface mount.

D. Seat Type: Wire grid.

E. Table Top: Perforated Steelhead.

2.4 TRASH RECEPTACLES

A. Provide receptacle as manufactured by Landscape Forms, Inc.

1. Model: Plexus II.

B. Color: Titanium.

C. Mounting: Surface mount.

D. Lid: Spun top with side opening and ash tray.

2.5 RECYCLING CONTAINERS

A. Provide receptacle as manufactured by Landscape Forms, Inc.

1. Model: Plexus II.

B. Color: Ocean.

C. Mounting: Surface mount.

D. Lid: Spun top with side opening without ash tray.

E. Decal: Provide white recycling logo.

2.6 PLANTERS

A. Provide planters as manufactured by Greenform (310.663.3995).

1. Model: Delta 60 - Round

B. Color: Anthracite.

C. Size: 30” diam x 24” height.

2.7 PLANTER IRRIGATION SYSTEMS

A. Provide one reservoir irrigation unit per planter manufactured by Tournesol (www. Tournesolsiteworks.com)

B. Contractor to coordinate selected planter make and model with Tournesol. Tournesol to provide cut sheet of proposed reservoir unit to landscape architect for approval.

2.8 FABRICATION

A. Metal Components: Form to required shapes and sizes with true, consistent curves, lines, and angles. Separate metals from dissimilar materials to prevent electrolytic action.

B. Welded Connections: Weld connections continuously. Weld solid members with full-length, full-penetration welds and hollow members with full-circumference welds. At exposed connections, finish surfaces smooth and blended so no roughness or unevenness shows after finishing and welded surface matches contours of adjoining surfaces.

C. Pipes and Tubes: Form simple and compound curves by bending members in jigs to produce uniform curvature for each repetitive configuration required; maintain cylindrical cross section of member throughout entire bend without buckling, twisting, cracking, or otherwise deforming exposed surfaces of handrail and railing components.

D. Exposed Surfaces: Polished, sanded, or otherwise finished; all surfaces smooth, free of burrs, barbs, splinters, and sharpness; all edges and ends rolled, rounded, or capped.

E. Factory Assembly: Assemble components in the factory to greatest extent possible to minimize field assembly. Clearly mark units for assembly in the field.

2.9 FINISHES, GENERAL

A. Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" for recommendations for applying and designating finishes.

B. Appearance of Finished Work: Variations in appearance of abutting or adjacent pieces are acceptable if they are within one-half of the range of approved Samples. Noticeable variations in the same piece are not acceptable. Variations in appearance of other components are acceptable if they are within the range of approved Samples and are assembled or installed to minimize contrast.

2.10 ALUMINUM FINISHES

A. Baked-Enamel, Powder-Coat Finish: Manufacturer's standard, baked, polyester, powder-coat finish complying with finish manufacturer's written instructions for surface preparation, including pretreatment, application, baking, and minimum dry film thickness.

2.11 STEEL AND GALVANIZED STEEL FINISHES

A. Baked-Enamel, Powder-Coat Finish: Manufacturer's standard, baked, polyester, powder-coat finish complying with finish manufacturer's written instructions for surface preparation, including pretreatment, application, baking, and minimum dry film thickness.

B. PVC Finish: Manufacturer's standard, UV-light stabilized, mold-resistant, slip-resistant, matte-textured, dipped or sprayed-on, PVC-plastisol finish, with flame retardant added; complying with coating manufacturer's written instructions for pretreatment, application, and minimum dry film thickness.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine areas and conditions, with Installer present, for compliance with requirements for correct and level finished grade, mounting surfaces, installation tolerances, and other conditions affecting performance.

1. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION, GENERAL

A. Comply with manufacturer's written installation instructions unless more stringent requirements are indicated. Complete field assembly of site furnishings where required.

B. Unless otherwise indicated, install site furnishings after landscaping and paving have been completed.

C. Install site furnishings level, plumb, true, and securely anchored at locations indicated on Drawings.

D. Post Setting: Set cast-in support posts in concrete footing with smooth top, shaped to shed water. Protect portion of posts above footing from concrete splatter. Verify that posts are set plumb or at correct angle and are aligned and at correct height and spacing. Hold posts in position during placement and finishing operations until concrete is sufficiently cured.

E. Pipe Sleeves: Use steel pipe sleeves preset and anchored into concrete for installing posts. After posts have been inserted into sleeves, fill annular space between post and sleeve with non-shrink, nonmetallic grout, mixed and placed to comply with anchoring material manufacturer's written instructions, with top smoothed and shaped to shed water.

3.3 CLEANING

A. After completing site furnishing installation, inspect components. Remove spots, dirt, and debris. Repair damaged finishes to match original finish or replace component.

END OF SECTION 129300

SECTION 130390 - CONTROLLED ENVIRONMENT ROOMS

PART 1 GENERAL

1.1 SUMMARY

A. Related Documents: Conditions of the Contract, Division 01 - General Requirements, and Drawings apply to work of this Section.

B. This Section includes, but is not limited to, all materials, labor and equipment, complete with all anchors and related accessory, necessary to furnish, deliver and install:
   1. +4°C Cold Room

C. Related Sections:
   1. Divisions 22 & 23 - Mechanical: Fire protection and plumbing piping.
   2. Division 26 - Electrical: Conduit and wiring to points of connection in junction box on exterior of controlled environment rooms.

1.2 SYSTEM DESCRIPTION

A. Design Requirements:
   1. Manufacturer is responsible for engineering cooling system, including but not limited to selecting the controls and sizing the equipment, to meet the performance requirements.
   2. Door-opening temperature recovery period: Following a 15 second door opening, the room temperature shall recover within 3 minutes.
   3. Manufacturer is responsible for designing units, including refrigeration system, anchorage to structural system and necessary modifications to meet specified requirements, and shall maintain visual design concepts.
   4. Drawings are diagrammatic and are intended to establish basic dimension of units, sight lines, and profiles of units.
   5. The walk-in room contractor is responsible for physically measuring the area to assure that their equipment will fit in the designated location. Any dimensional corrections will be accomplished at no change in contract sum.
   6. Provide concealed fastening whenever possible.
   7. Attachment considerations: Account for site peculiarities and expansion and contraction movements so there is no possibility of loosening, weakening and fracturing connection between piping and units.
   8. Modular constructed room incorporating wall, roof-ceiling, and floor panels.
   9. Panels consisting of interior and exterior metal skins with an insulation core.
   10. Incorporate integral mechanical method of fastening and sealing joints between panels to provide vapor-tight seal.
   11. Allow for disassembly for possible relocation or expansion at a later date.
   12. Prefabricated, metal clad, sectionally constructed and designed for easy and accurate field assembly and interchanging.
   13. Provide unit complete with electrical devices such as receptacles, boxes, conduit, wiring, light fixtures, switches, surface mounted wiremold with duplex 120 Volts, 20 Amp receptacles, Tel/data outlets, power and control wiring, and power and control mechanisms, terminated at a single point on exterior of controlled environment rooms, for each voltage for connection to power supply. All materials in accordance with Division 26 – Electrical.
   14. Standards:
      a. The controlled environment room design and installation shall conform to ADA and all other applicable codes, ordinances and regulations.

b. Control panel shall be tested and certified by a Nationally Recognized Testing Laboratory to be constructed and documented in accordance with UL 508 and NFPA 79 (Electrical Standard For Industrial Machinery).

15. Refrigeration system:
    a. Size refrigeration piping integral with equipment.
    b. Size refrigerant pipe lines for distance between evaporator and condensing units.
    c. Provide interconnecting piping, including piping insulation. Provide piping and insulation materials per refrigeration equipment manufacturer's recommendations. Coordinate with other trades.
16. Electric power requirements:
    a. Condenser units shall operate at 208 volts, 3 phase
    b. Control Panel Power Source shall be 208 Volts, 3 phase, 4 wire, 30 Amp circuit to power auxiliaries such as, lights, heaters, controls, etc.
    c. Provide wiring between evaporator and condenser unit as required for unit controls.
    d. Provide fused disconnect switches for the compressors and a main disconnect switch for the control panel.
    e. All electrical materials shall be in accordance with Division 26 – Electrical.
17. Performance Requirements:
    a. Refrigeration system:
        1) Provide continuous operation at the setpoint conditions and within the specified tolerances with the following heat loads present in any combination:
            a) 10 watts/sq.ft. from receptacles
            b) Lighting on
            c) Personnel present in room and door openings as indicated
            d) Make-up air as scheduled
            e) Ambient conditions +24°C / 50% RH
            f) Compressor located in + 40°C ambient
        2) Provide equipment and controls for evaporator defrost cycle as required.
        3) Achieve and maintain individual room operating temperature requirements and performance.
18. Fire Resistance Requirements:
    a. Panel insulation flame spread: ASTM E84; 25 or less.
    b. Panels to have Class I rating when tested in accordance with FM 4880.
19. Structural Requirements:
    a. Design and fabricate wall panels to support roof-ceiling panels.
    b. Design and fabricate roof-ceiling panels to support roof and ceiling mounted equipment, and service technician.
20. Thermal Requirements:
    a. Refer to Schedule Article for initial temperature setting.
    b. Maximum temperature variation from setting: 0.5°C at any point in the room.

B. Interface with Adjacent Systems. The following items are incidental to this Section and provided by other Specification Sections:
1. Division 22:
    a. Sprinkler piping.
    b. Condenser water supply & return.
2. Division 26:
    a. Power rough-in and final connection of all power circuits to the controlled environment rooms junction boxes on top of the units.
    b. Remote alarm monitoring wiring and conduit, as directed by the Owner.

1.3 SUBMITTALS

A. General: Submit in accordance with Division 01.

B. Product Data:
   1. Submit product data for insulation materials, panel facing materials, refrigeration equipment, lighting, audio-visual alarm, and recording instrumentation.
   2. Include information for factory finishes, hardware, glass, sealants, accessories, and other required components.
   3. Include name of refrigerant/condenser manufacturer.

C. Shop Drawings:
   1. Indicate layout including sections and elevations with dimensions.
   2. Submit detail drawings of materials, construction, anchorage devices, and finishes.

D. Samples:
   1. Finished exterior panel metal skin:
      a. Two pieces 6” x 6”
   2. Finished Floor Samples:
      a. Color samples of not less than ten (10) standard manufacturer’s colors
      b. Architect will select color from manufacturers’ standard colors. Multiple colors may be selected at no change in contract sum.

E. Submit following Informational Submittals:
   1. Test Reports: Submit written results of testing specified as part of Source and Field
   2. Quality Control articles.
   3. Qualification Data: Manufacturer's and installer's qualification data.
   4. Manufacturer's instructions.

F. Closeout Submittals:
   1. Submit under provisions of Division 01.
   2. Project record documents: Record actual locations of mechanical and electrical components, piping, ducts and writing.
   3. Special Documentation Requirements:
      a. Labeling of Conductors: Ungrounded current carrying conductors shall be labeled as follows:
         1) Field installed conductors shall be numbered at both ends with the same number. Conductors within the control panel shall be numbered in the same fashion.
         2) Numbered conductors shall have discrete number labels which are not found on any other conductor on the controlled environment room.
         3) The number labels on each numbered conductor shall correspond to labels on the control panel component layout and control system schematic drawings which indicate the point of connection of each labeled conductor.
   4. Control System Documentation: The following documentation is required at project completion. It shall be provided in addition to any requirements of the project general conditions. All documentation shall illustrate or describe the as-built condition of the completed work. Provide 2 complete sets of documentation for each room installed. Each set shall be delivered in a three ring binder with the project name and room identifier on the cover
      a. Drawings of the completed installation showing locations of all equipment ad fixtures.
      b. Refrigeration piping schematic.
      c. Compete parts list with all control and refrigeration system parts and the original manufacturer’s name and part numbers
      d. Control panel wiring diagram indicating the terminal connections for all ungrounded conductors. All conductor label numbers shall be indicated on the

drawings. Conform with other control system documentation requirements of this section.

e. Control panel interior component layout drawing indicating the numbered wire connections and terminal connection locations for each component. Conform with other control system documentation requirements of this section.

5. Approved copy of operating procedures manual and maintenance data.
6. Warranty: Submit specified warranty.

1.4 QUALITY ASSURANCE

A. Single Source Responsibility:
   1. Furnish rooms from one manufacturer for entire Project, unless otherwise indicated.
   2. Provide each room as complete unit, including equipment and component items necessary for proper operation.

B. Manufacturer Qualifications: Company specializing in manufacturing Products specified in this Section with minimum 5 years documented experience.

C. Installer Qualifications: Acceptable to manufacturer with documented experience on at least 5 projects of similar nature in past 5 years.

1.5 PRE-INSTALLATION CONFERENCE

A. Conduct pre-installation conference in accordance with Division 01.

1.6 DELIVERY, STORAGE, AND HANDLING

A. Comply with requirements of Division 01.

1.7 SEQUENCING

A. Sequence work under provisions of Division 01.

B. Coordinate installation of fire sprinklers, piping, refrigeration lines and condensate drain line with respective sections of division 22.

C. Coordinate installation of electric power conduit and wiring with respective sections of Division26.

1.8 WARRANTY

A. Comply with provisions of Division 01.

B. Warrant installed room to be free from defects in material and workmanship for 2 years from date of substantial completion.

C. Warrant refrigeration system to be free from defects in material and workmanship for 5 years from date of substantial completion.

D. Include coverage against defects which may arise during the warranty period except those which are caused by misuse.

1.9 MAINTENANCE

A. Service: Provide service and maintenance of room and components for 12 months from date of Substantial Completion to maintain warranty conditions.

PART 2 PRODUCTS

2.1 MANUFACTURERS

A. Acceptable Manufacturers:
   1. Thermmax Scientific Products, Colmar, PA
   2. Climate Technologies, Laytonsville, MD.
   3. Environmental Growth Chambers, Chagrin Falls, OH

2.2 MATERIALS

A. Aluminum, Extrusions:
   1. ASTM B221M (B221).
   2. Alloy: 6063-T5.

B. Galvanized Carbon Steel Sheet:
   1. ASTM A446/A446M.
   2. Coating Thickness: Z185 (G60).

C. Stainless Steel:
   1. ASTM A167.
   2. UNS Number S30200.
   3. Finish: Number 4.

D. Panel Insulation: Foamed-in-place urethane having a thermal conductivity ("K" Factor) not exceeding 0.125 BTU/Hr/Sq.Ft./degree F/inch of thickness (0.019W/(m*K)) The overall coefficient of heat transfer ("U" Factor) shall not exceed .034 (R-30.1) for 4 inch thick walls. Other thickness shall have corresponding higher or lower value. Insulation density shall be 2 lb./cu.ft. minimum.

2.3 COMPONENTS

A. Size:
   1. Length: See drawings.
   2. Depth: See drawings.
   3. Height: 9'-4" nominal exterior height.

B. Panels:
   1. Panel Thickness: 4 inches including metal skin and finish thickness.
   2. Manufacturer's standard and custom sized panels to provide layout, dimensioned on drawings, or to within 2" of adjacent building walls if no dimensions are given.
   3. Fabricate without wood components.
   4. Compose entire panel section of panel insulation except for metal skins and internal structural interlock and framing.
   5. Fabricate wall and roof-ceiling panels with integral structural support blocking capable of supporting refrigeration equipment.
   6. Fabricate edges of tongue and groove profile.
   7. Fabricate panels with foamed-in-place gaskets on each edge to assure airtight seals.
   8. Fabricate panels with manufacturer's standard joining devices and panel locks.
   9. Provide 1.57 rad (90 degree) corner panel units for each corner.
   10. The floor panels shall be clad on the interior and exterior with the specified metal skin and utilize urethane insulation. The floor panels shall allow fastening to the wall

panels, and shall be able to withstand uniformly distributed floor loads up to, and including 600 lbs/sq.ft.

11. Floor Covering: All walk-in room floors shall be covered with a crevice-free, non-absorbent, slip-resistant, abrasive vinyl (90% virgin vinyl matrix) floor covering Altro Walkway 20 or approved equal, inlaid type having temperature stability, dimensional stability and flexibility from -40°C to +60°C. Flooring shall be smooth, free of ribs or patterns. Flooring shall require no maintenance except cleaning with detergent and water. Depending upon room size, floors shall be seamless or seams shall be welded. Floor covering shall be coved up the walls 4 inches high, capped with a vinyl trim piece, and continuously silicone sealed between vinyl cap and walls. Floor covering color shall be selected by Architect.
12. Closure panels: Match sheet metal of exposed exterior panel skin.

C. Insulation:
1. Nominal 4 inches urethane foam in floors and walls and ceilings and –20°C freezer room.

D. Door:
1. One 36" x 77" minimum clear opening dimension of the doorway.
2. Door shall be provided with cylinder lock, door closer, interior safety latch, and chrome hardware.
3. Construct door same as wall panels.
4. Align door faces flush with faces of wall panels.
5. Door Vision Light: (W) 12” x (H) 18" minimum. Multi-pane assembly, designed to prevent the formation of condensation on the glass or frame under the performance criteria. The window shall be removable for replacement.

E. Hardware:
1. Material: Chrome plated steel, stainless steel, or aluminum.
2. Finish: Satin texture.

F. Hinges:
1. Swing clear configuration to not allow door thickness to obstruct door's clear opening.
2. Provide minimum of three hinges per door.

G. Latch:
1. Provide with cylinder lock.
2. Provide with interior safety release handle connected to lock mechanism to prevent people from being locked inside.
3. Mounting Height: Between 36 and 48 inches above floor surface.

H. Closer:
1. Closing time: Minimum of three seconds to move from 1.22 rad (70 degree) open position to 3 inches from latch, measured from leading edge of the door.
2. Maximum door opening force: 22 N (5 pounds) and as required by ADA guidelines.

I. Gasket:
1. Head and jambs: Thermoplastic with magnetic steel core.
2. Sill: Thermoplastic sweep.

J. Signage: Place card to remind user of hazard caused by spilled specimens and water on room's floor.

K. Condensation and frost prevention heaters:

1. Door and frame assembly shall remain free of condensation under the specified room operating conditions.

L. Lighting:
1. Furnished and install lighting fixtures in each room in an arrangement which will attain the illumination levels specified. Rooms with minimum operating temperatures below 0°C shall be provided with incandescent light fixtures. All others shall be provided with fluorescent fixtures.
2. Fixture Types:
a. Fluorescent fixtures shall have electronic ballasts rated for operation at the maximum low temperature at the location where they are installed. Fixtures shall be weatherproof type with non-metallic housing and gasketed lens. Each fixture shall accommodate two 48" size T-8 lamps. Provide 75 lx (70 foot candles) of illumination at 40 inches above the floor measured at + 25°C.

M. Furnish and install all electrical items in Controlled Environment Rooms as indicated on Electrical Drawings. All materials shall be in accordance with Division 26 – Electrical specifications.

2.4 FINISHES

A. Exterior: Factory applied baked white polyester on galvanized steel. Galvalume will not be acceptable.

B. Interior: Factory applied baked white polyester on galvanized steel. Galvalume will not be acceptable.

2.5 EQUIPMENT

A. All equipment and componentry shall be listed by a NRTL (Nationally Recognized Testing Laboratory) to be suitable for application to which it is applied on this project. Major assemblies, including condensing units and control panels shall be tested and labeled by a NRTL in accordance with a suitable applicable nationally recognized standard.

B. Pressure Relief Port:
Pressure relief ports shall be utilized for all rooms operating at a temperature of -17.8°C (0°F) or below. The relief port shall be provided to equalize the difference in exterior and interior pressure caused by sudden temperature changes. The relief port shall be heated to prevent freezing.

C. Refrigeration system:
1. All rooms shall be provided with mechanical cooling system as specified herein. The refrigeration system shall be an integral part of the control and conditioning system. Condensing unit shall be located on the exterior ceiling of each room. All piping and wiring between remote components and rooms shall be installed by the manufacturer. Coordinate final connections to building services with plumbing, mechanical and electrical contractors.
a. The compressor condensing unit shall consist of an air-cooled accessible semi-hermetic compressor. Include all components necessary to accomplish effective, efficient, serviceable installation. System shall consist of, but not limited to, accessible semi-hermetic compressor, receiver, condenser, evaporator, moisture indicating sight glass, liquid filter-drier, high and low pressure controls, crankcase pressure regulator, suction accumulator, suction line filter, expansion valve, oil level, sight glass, condenser pressure regulator, manual shut-off valves and all interconnecting piping, insulation and wiring. Unit shall be designed for continuous operation for maximum compressor life.

b. System capacity control shall be accomplished with hot gas bypass which continuously mixes liquid and gaseous refrigerant to achieve the selected performance of the system.
c. Condensing units shall be provided with automatic reset high and low pressure controls.
d. Provide 2-way or 3-way (as required by condenser water design) condenser water regulating valve.
e. Provide solenoid valves for operation with a manual pump down switch included with the main control panel.
f. Ceiling Conditioning Unit: The air in the room shall be conditioned by a ceiling mounted conditioning unit. It shall contain all interior cooling, heating, and air moving equipment within a housing fabricated of smooth white aluminum. Service to the internal components shall be via removable panels on the housing. The bottom of the housing shall serve as a condensate drain pan. The conditioning unit shall be completely pre-assembled, and tested prior to shipment, requiring only field connection to controller and condensing units. Mount condenser on base with vibration isolators.
g. Air movers shall be aluminum bladed fans with permanently lubricated motors. Evaporator coil shall be fabricated of copper tubes and aluminum fins. Suspend unit from roof-ceiling panels, and provide connection for condensate drain pipes to drip pan.
h. Condensate drain pan shall be heated on all units with operating temperature range extending below 0°C.

2.6 ACCESSORIES

A. Shelving:
Provide full height adjustable shelving as indicated on drawings and as specified in section 106710. All shelving units shall be constructed of stainless steel, with a minimum of five years corrosion resistance guarantee.

B. Penetrations for Pipe and Conduit through Panels:
1. Provide for each penetration through room's walls and roof-ceiling.
2. Seal penetrations, from both ends with silicone sealant, to prevent air infiltration into room and insulate to prevent condensation at pipes, conduit, and junction boxes.

2.7 CONTROL CONSOLE

A. Control Console
1. A control console incorporating a key locked door with a clear acrylic window shall be required for viewing and protecting the settable controls. The console shall be mounted on the controlled environment room exterior next to the door if possible. All controls, switches, pilot lights, alarms and temperature recorder shall be housed in a welded control console.
2. All ungrounded conductors in the control panel and their field wired extensions shall be uniquely numbered at each end with a suitably applied label. The labels shall be permanent and machine printed. Hand marking of conductors or application of tapes with hand written markings will not be accepted.
3. Control panel components shall be assigned a name, tag, or other identifier which shall be utilized throughout the system documentation to describe or refer to that component.
4. Complete control panel assembly shall be tested and certified by a NRTL to be in accordance with NFPA 70 and NFPA 79. A certifying label from the testing agency shall be applied to the exterior of each control panel.

B. Temperature Controller:

1. Temperature control shall be through a solid state microprocessor based digital control with RTD sensing. The control components shall control capacity of the refrigeration/conditioning system and be designed to meet the performance criteria of the room. Setpoint shall be through the digital control and readout shall be in degrees Centigrade. The controller shall simultaneously display the actual condition and setpoint.

C. High/Low Temperature Safety Alarms:
1. Separately adjustable high and low limit control circuits shall be provided in the control panel. Limit controllers shall be electronic, with digital setpoint and display of current room temperature. Hydraulic actuated devices, or those with reference dials shall not be permitted. Limit control shall have its own sensor, independent from all others. Provide functions and devices as follows;
   a. High Limit: In the event of a high temperature limit condition, the limit control will de-energize all heat producing devices loaded on the control panel power circuits, illuminate a red pilot light and sound an audio alarm. Additionally, the control circuit shall have a normally open contact wired in series with the compressor contactor control signal to provide immediate and direct shutdown of the compressor. When temperature returns to the normal range the system shall reset by one of the methods below. Reset methods shall be operator selectable with a front panel mounted switch. Provide a normally open and normally closed relay contact for connection to building alarm system.
   b. Low Limit: In the event of a low temperature limit condition, the safety control will directly open the compressor contactor, activate a red pilot light and sound an audio alarm. Limit control circuit shall have a normally open contact wired in series with the compressor contactor control signal. Systems which rely on low pressure switch action to shutdown compressor will not be accepted,. When temperature returns to the normal range the system shall reset by one of the methods below. Reset method shall be operator selectable with a front panel mounted switch. Provide a normally open and normally closed relay contact for connections to building alarm system.
   c. Reset methods for high and low limit:
      1) Manual reset shall prevent restart of the equipment until the operator has pressed a reset button on the control panel face.
      2) Automatic reset will cause the equipment to restart when the room temperature returns to the normal range.
   d. Auxiliary High Limit Safety: On all rooms provided with electric air heating, provide a separate, independent solid state limit control which is UL listed (UL991) as a temperature limit device. This limit control shall monitor air temperature in the conditioning unit, opening the heater power contactor and enabling the audio alarm and a red pilot light if temperature exceeds a preset limit. The preset, non-adjustable limit setpoint shall not exceed +65°C, but shall be high enough to prevent false alarming under normal system operation. The tripped limit control shall require manual reset by operation of a panel mounted push button.

D. Defrost Control:
1. Defrost controls shall be installed on all rooms with specified operating temperature extending below +6°C. Cycle shall consist of controlled heating and then cooling of the evaporator coil, removing any accumulated frost while minimizing the impact on room performance. All rooms shall be defrosted with compressor discharge gas. Defrost cycle control shall be considered an essential element of room operation. Defrost controls shall perform the following functions:
   a. Defrost cycle initiation will automatically be skipped if room temperature is above a preset limit. Limit shall be adjustable on the front of the control panel.

Fans shall be off during the heating phase of the cycle. Initiation of the heating portion shall be accomplished in two ways:

1) Operator can manually initiate a defrost cycle with a switch on the control panel face. Cycle shall start immediately upon operation of the switch.
2) An electronic timing device shall automatically initiate defrost cycles at predetermined adjustable intervals

b. Four methods of terminating the heating portion of the cycle shall be provided:

1) Termination shall occur when evaporator temperature or suction pressure reaches a preset adjustable level.
2) An increase in room air temperature by a predetermined amount shall cause the heating portion of the cycle to terminate. This maximum room temperature rise limit shall be adjustable on the control panel face.
3) The expiration of a preset time period allowed for coil heating shall cause the heating cycle to terminate. This function shall be considered to be a secondary method. Defrost cycles shall normally terminate by the detection of a rise in evaporator temperature or suction pressure.
4) The heating cycle can be manually terminated by the operator. A switch on the control panel face shall be provided for this function. Operation of the switch shall immediately terminate an active defrost cycle.

c. After the heating cycle is terminated, the evaporator shall be cooled to an adjustable fan cut-in temperature and the fan shall begin operation. This function shall be automatically disabled when the room is operating above temperatures where defrost is required.

d. Coordination of the defrost cycle and operation of other heat producing equipment shall be accomplished to minimize the effect on room temperature rise during the defrost cycle.

E. Recorder:

1. Provide a solid state temperature recorder with a seven day or twenty-four hour chart movement which is switch selectable. The recorder shall utilize a 10 inch circular chart. On controlled environment rooms with humidity control, provide a second pen for recording of RH levels with the room. The same sensor shall be utilized for control and to record RH levels with the room. The thermometer shall be calibrated below and above the operating range of the room and the hygrometer shall be calibrated over the range of 10% to 98%. Recorder accuracy shall be 1% full scale.

F. Humidity Control:

1. If desiccant dehumidification of controlled environment rooms is required to achieve specified environmental control parameters, the following control system shall be capable of maintaining selected relative humidity within specified limits. The system shall control humidity through a microprocessor based digital controller with readout in percentage RH. The RH sensor shall be a variable capacitance sensor or hygroscopic plastic foil sensor, temperature compensated and calibrated over the entire range of the room Sensor shall be located within the room air flow to provide maximum sensitivity and fast response to changes within the room. Wet bulb/dry bulb, lithium chloride, gold grid, bulk resistance or similar sensors shall not be accepted.

2.8 MECHANICAL DESIGN

A. Fresh Air Exchange:

Controlled environment rooms shall be provided with inlet and outlet connections for fresh air supply and exhaust from the building HVAC system. Air flow rate shall be as scheduled,

and shall be continuous. Provide an insulated enclosure on the exterior ceiling of the room containing auxiliary heating/cooling coil with the necessary controls as part of the controlled environment conditioning system. The auxiliary coil shall automatically heat or cool the fresh air supply to the current room setpoint before the air enters the room. Provide condensate removal system, temperature controls, and all necessary materials and labor for a complete installation.

B. Humidification:
Controlled environment rooms shall utilize independent steam generators. Electrically heated generators shall have an automatic safety device to shut down system in case of water cut off. Steam shall enter the room air stream through a stainless or copper plenum mounted steam head.

C. Dehumidification:
Controlled environment rooms utilizing an automatic regenerative desiccant drier for lowering of humidity from ambient to the minimum humidity level specified shall automatically modulate the amount of dry air needed from the regenerative drier to prolong equipment life and lower operating costs. Dryer shall be furnished complete with ductwork and dampers.

2.9 SPECIAL REQUIREMENTS

A. +4°C Walk-In Cold Room
1. Use: Storage
2. Temperature Range: +4°C
3. Relative Humidity: Maximum 65%
4. Number of people working in room at one time: 2
5. Door openings: Personnel entering and leaving the room at a rate of 6 openings per hour
6. Special Requirements:
   a. Stainless Steel Shelving as shown on drawings.
7. Electrical Devices Within Room:
   a. See Electrical Drawings.

PART 3 EXECUTION

3.1 EXAMINATION

A. Examine conditions and proceed with work in accordance with Division 01.

B. Verify mechanical and electrical services to room are roughed-in and ready for connection to room equipment, plumbing, and wiring.

3.2 INSTALLATION

A. Install in accordance with Division 26, and approved shop drawings.

B. Install units plumb, level, square, and free from warp and twist while maintaining dimensional tolerances and alignment with surrounding construction.

C. Fabricate panels with manufacturer's standard joining devices.

D. Join panel edges to each other using steel straps set in panel insulation.

E. Field wire electrical devices to a single point for each voltage for connection to outside power supply and monitoring devices.

F. Closure Panels: Provide closure panels, to match sheet metal of exposed exterior panel skin, where space exists between room's walls and roof and building's walls, columns, and ceiling.

G. Interface With Other Work:
1. Coordinate with Divisions 22 & 23:
   a. Sizing and location of condenser-to-evaporator or piping
2. Coordinate with Division 26:
   a. Location of power connection to outside power supply.
   b. Remote monitoring devices.
3. Penetrations for Pipe and Conduit through Panels:
   a. Coordinate with respective trades.
   b. Seal penetrations to prevent air infiltration and condensation.

3.3 FIELD QUALITY CONTROL

A. Site Tests:
1. Comply with requirements of Division 01.
2. Operational Function Testing:
   a. Simulate and verify all alarm and limit functions
   b. Operate and verify all defrost functions and their coordination with other room functions.
   c. Verify operation of all specified functions and switches.
   d. Prepare a detailed written report indicating the step by step procedure used to perform tests. Indicate the specific results of each step.
3. Performance Testing:
   a. All rooms shall be tested for compliance with the specified thermal requirements. Test and measure each room for compliance with specified Thermal Requirements using digital data logger and at least 6 sensors widely spaced throughout the room. Test duration shall be minimum 24 hours per room. Sampling interval shall be less than 3 minutes. Turn over raw data, plotted data and analysis to Architect for approval. Additionally, test for door opening recovery time and defrost temperature rise.
   b. Rooms with relative humidity control shall be tested for humidity control performance and recovery.
   c. Test instrumentation shall have documented accuracy sufficient to effectively test the rooms. Submit calibration report as evidence of accuracy. Resolution shall be 0.1°C or better for temperature, 1% for relative humidity.
   d. Test setpoints for temperature:
      1) Rooms with a temperature span (difference between highest and lowest operating temperatures) of 10 degrees or less shall be tested at the midpoint of the temperature range or the indicated operating temperature.
      2) Rooms with a temperature span greater than 10 degrees, but less than 21 degrees, shall be tested at the highest and lowest setpoints in the range.
      3) All other rooms shall be tested at the highest, lowest and midpoint operating temperature setpoints.
   e. Test conditions for relative humidity:
      1) Rooms with a single operating point shall be tested at that point.
      2) All other rooms shall be tested at the highest and lowest temperature and relative humidity combinations scheduled. This requires testing at 4 possible combinations of high and low temperature and humidity conditions.
4. Refrigeration system testing:

a. Clean, pressure test, dehydrate, and separately vacuum test unit.
b. Test Duration: 5 Hours.
c. Perform the following number of times: One.
d. Pressure test minimum of 690 kPa (100 pounds per square inch) above operating pressure.
e. Vacuum test at 96.5 kPa (28.5 inches of mercury) or less.
f. Charge system with required amount of refrigerant and oil then retest system.

5. Deficiencies in performance or operation evidenced by the tests shall be remedied by the manufacturer and the room shall be re-tested.

3.4 ADJUSTING

A. Adjust parts for smooth, uniform operation.

3.5 CLEANING

A. Clean as required by manufacturer. Do not use materials and methods which may damage finish and surrounding construction.

3.6 DEMONSTRATION

A. Provide system demonstration at mutually agreed upon time to Owner.

B. Demonstrate refrigeration system maintenance control and alarm operations.

3.7 PROTECTION

A. Protect finished work in accordance with Division 01.

END OF SECTION 130390

SECTION 140800 ELEVATOR SYSTEM COMMISSIONING

PART 1 - GENERAL

1.1 WORK INCLUDED

A. Systems and equipment Start-Up and Functional Performance Testing.

B. Validation of proper and thorough installation of Division 14 - elevator systems and equipment.

C. Generic Start-Up Documentation for electrical systems and equipment.

D. Development of final Start-Up Documentation for electrical systems and equipment.

E. System Start-Up and Turn-Over procedures.

F. Coordination and execution of Training Events.

1.2 GENERAL DESCRIPTION

A. Commissioning (Commissioning) is the process of ensuring that all building systems are installed and perform interactively according to the design intent; that systems are efficient and cost effective and meet the Owner's operational needs; that the installation is adequately documented; and that the Operators are adequately trained. It serves as a tool to minimize post-occupancy operational problems. It establishes testing and communication protocols in an effort to advance the building systems from installation to full dynamic operation and optimization.

B. Commissioning Authority (CA) shall work with the Contractor and the design engineers to direct and oversee the Cx process and perform Functional Performance Testing.

C. The Commissioning Plan outlines the Cx process beyond the Construction Contract, including design phase activities and design team/owner responsibilities. The specification Sections dictate all requirements of the commissioning process relative to the construction contract. The Cx Plan is not part of the construction contract, although it is available for reference at the request of the Contractor.

D. This Section outlines the Cx procedures specific to the Division 14 Contractors. Requirements common to all Sections are specified in Sections 019113 and 019114. This Section and other sections of the specification details the Contractor's responsibilities relative to the Cx process.

1.3 SCOPE

A. The following elevator system features/functions are included in the Scope of Commissioning for this project:

1. Security Card Reader
2. Battery-powered Lowering
3. Emergency Communication System
4. Firefighters' Two-Way Telephone Communication System
5. Smoke/Heat Detector Initiated Emergency Recall System

1.4 RELATED WORK AND DOCUMENTS

A. Drawings and general provisions of Contract, including General and Supplementary Conditions and Division-1 Specification sections, apply to work of this section.

B. The Cx process references many related Sections, particularly Section 019113 - General Commissioning. It is important for all Contractors subject to the Cx process to be familiar with Section 019113.

C. Refer to Section 019113 for a complete list of Sections on Related Work.

1.5 DEFINITIONS AND ABBREVIATIONS

A. Refer to Section 019113 for a complete list of Definitions and Abbreviations.

1.6 REFERENCE STANDARDS

A. National Electric Code (NEC)

B. American Society for Testing and Materials (ASTM)

C. Electronics Industry Association/Telecommunications Industry Association (EIA/TIA)

D. Institute of Electrical and Electronics Engineers (IEEE)

E. International Electrical Testing Association (NETA)

F. National Electrical Manufacturers Associates (NEMA)

G. National Fire Protection Association (NFPA)

H. Underwriters Laboratory, Inc. (UL)

I. Refer to Section 019113 for additional Reference Standards.

1.7 DOCUMENTATION

A. Documentation shall be as required in Section n 019113. In addition, Contractor shall also provide to the CA the following per the procedures specified herein, in the Cx Plan, and in other Sections of the specification:

a. AHJ Approval Certificate and Inspection Reports

1.8 CONTRACTOR RESPONSIBILITIES

A. Refer to Section 019113: Detailed Contractor responsibilities common to all Divisions are specified in Section 019113. The following are additional responsibilities or notable responsibilities specific to Division 14.

B. Construction Phase

1. Coordinate the checkout of the elevator systems and interfaces and the approval of the regulatory authorities with the Cx process.

C. Acceptance Phase

1. Assist CA in Functional Performance Testing.

1.9 START-UP DOCUMENTATION

A. Refer to Section 019113.

1.10 FUNCTIONAL PERFORMANCE TESTING

A. For applicable systems and equipment, Contractor shall participate in all Cx tests.

1.11 TRAINING

A. Contractors, subcontractor, vendors, and other applicable Parties shall prepare and conduct training sessions on the installed systems and equipment they are responsible for per the requirements of Section 019113 and the individual Specifications.

1.12 O&M DOCUMENTATION CONTENT - PREPARATION AND LOGISTICS

A. Refer to Section 019113 the individual Specifications

PART 2 - PRODUCTS

2.1 WEB-BASED COMMISSIONING PORTAL

A. All general and major subcontractors participating in the Cx process shall use the web-based Cx Portal ('Portal') to document the Cx procedures. The Portal is a Web-based Internet hub used to electronically collaborate and coordinate activities and deliverables throughout the Cx process. The Portal is hosted by the CA and shall be accessible to all Parties participating in the Cx program. The Portal provides a common location to store Start-Up Documentation, Functional Performance Tests and results, project documents and deliverables. It also serves as a collaborative email hub to facilitate, automate, and track communications between Parties relating to the Cx process.

B. Refer to Section 019113 the individual Specifications for additional information and requirements for using the Portal.

PART 3 - EXECUTION

3.1 GENERIC START-UP DOCUMENTATION - GENERAL

A. Part III of this Section outlines 'generic' or minimally acceptable Start-Up Documentation (which are defined to include both 'Start-Up Checks' and 'Start-Up Tests') and individual systems training requirements for systems and equipment. These procedures are the direct responsibility of the Contractor as a basic element of validating that the installation is correct per normal quality control practices. These items shall provide a minimally acceptable guideline for required Contractor development of Start-Up Documentation. Contractor shall synthesize these minimum requirements along with their own internal quality control practices, those of the manufacturer, and any applicable codes and standards to develop specific and itemized final Start-Up Documentation specific to the equipment and systems installed on this project.

B. Section 019113 defines the systems and equipment Start-Up process in detail and provides definitions for Start-Up Documentation, including the generic Start-Up Documentation provided below.

3.2 START-UP CHECKS COMMON TO ALL SYSTEMS

A. The following Start-Up verifications and procedures shall be considered common to all systems:

1. Checkout shall proceed from lower level devices to larger components to the entire system operation.
2. Verify labeling is affixed per specification and visible.
3. Verify prerequisite procedures are done.
4. Inspect for damage and ensure none is present.
5. Verify system is installed per the manufacturer's recommendations.
6. Verify system has undergone Start-Up per the manufacturer's recommendations.
7. Verify that access is provided for inspection, operation and repair.
8. Verify that access is provided for eventual replacement of the equipment.
9. Verify that record drawings, submittal data and O&M documentation accurately reflect the installed systems.
10. Verify that the installation ensures safe operation and maintenance.
11. Verify all rotating and moving parts are properly lubricated.
12. Verify all monitoring and ensure all alarms are active and set per Owner's requirements.

3.3 SECURITY CARD READER

A. Include all applicable 'Start-Up Checks Common to All Systems". Additional Start-Up Checks and Tests are as follows.

B. General: Refer to the quality control requirements listed in applicable sections of Division 14 for additional checks and tests. These shall be included in the Start-Up Checks and Tests used for this project.

C. Start-Up Tests: During start-up, perform procedures specified in manufacturer's instructions.

1. Demonstrate proper operation of the Security System Card Reader installed in elevator cabs.

3.4 BATTERY-POWERED LOWERING

A. Include all applicable 'Start-Up Checks Common to All Systems". Additional Start-Up Checks and Tests are as follows.

B. General: Refer to the quality control requirements listed in applicable sections of Division 14 for additional checks and tests. These shall be included in the Start-Up Checks and Tests used for this project.

C. Start-Up Tests: During start-up, perform procedures specified in manufacturer's instructions.

1. Demonstrate proper operation of the Battery-powered Lowering System.

D. Training: Train Owner's maintenance personnel on procedures and schedules related to troubleshooting, servicing, and preventative maintenance.

3.5 EMERGENCY COMMUNICATION SYSTEM

A. Include all applicable 'Start-Up Checks Common to All Systems". Additional Start-Up Checks and Tests are as follows.

B. General: Refer to the quality control requirements listed in applicable sections of Division 14 for additional checks and tests. These shall be included in the Start-Up Checks and Tests used for this project.

C. Start-Up Tests: During start-up, perform procedures specified in manufacturer's instructions.

1. Demonstrate proper operation of the Emergency Communication System.

D. Training: Train Owner's maintenance personnel on procedures and schedules related to troubleshooting, servicing, and preventative maintenance.

3.6 FIREFIGHTERS' TWO-WAY TELEPHONE COMMUNICATION SYSTEM

A. Include all applicable 'Start-Up Checks Common to All Systems". Additional Start-Up Checks and Tests are as follows.

B. General: Refer to the quality control requirements listed in applicable sections of Division 14 for additional checks and tests. These shall be included in the Start-Up Checks and Tests used for this project.

C. Start-Up Tests: During start-up, perform procedures specified in manufacturer's instructions.

1. Demonstrate proper operation of the Firefighters' Two-Way Telephone Communication System.

D. Training: Train Owner's maintenance personnel on procedures and schedules related to troubleshooting, servicing, and preventative maintenance.

3.7 SMOKE/HEAT DETECTOR INITIATED EMERGENCY RECALL SYSTEM

A. Include all applicable 'Start-Up Checks Common to All Systems". Additional Start-Up Checks and Tests are as follows.

B. General: Refer to the quality control requirements listed in applicable sections of Division 14 for additional checks and tests. These shall be included in the Start-Up Checks and Tests used for this project.

C. Start-Up Tests: During start-up, perform procedures specified in manufacturer's instructions.

1. Demonstrate proper operation of the Smoke/Heat Detector Initiated Emergency Recall System.

D. Training: Train Owner's maintenance personnel on procedures and schedules related to troubleshooting, servicing, and preventative maintenance.

END OF SECTION 140800

SECTION 142400 - HYDRAULIC ELEVATORS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section includes hydraulic passenger and service elevators.

B. Related Requirements:

1. Section 015000 "Temporary Facilities and Controls" for temporary use of elevators for construction purposes.
2. Section 051200 "Structural Steel Framing" for the following:

    a. Attachment plates, angle brackets, and other preparation of structural steel for fastening guide-rail brackets.
    b. Hoist beams.
    c. Structural-steel shapes for subsills that are part of steel frame.

3. Section 055000 "Metal Fabrications" for the following:

    a. Attachment plates and angle brackets for supporting guide-rail brackets.
    b. Hoist beams.
    c. Structural-steel shapes for subsills.
    d. Pit ladders.
    e. Cants in hoistways made from steel sheet.

4. Section 096519 “Resilient Tile Flooring” for finish flooring in elevator cars.
5. Section 221429 "Sump Pumps" for sump pumps, sumps, and sump covers in elevator pits.
6. Section 271500 "Communications Horizontal Cabling" for telephone service for elevators.
7. Section 283111 "Digital, Addressable Fire-Alarm System" for smoke detectors in elevator lobbies to initiate emergency recall operation and heat detectors in shafts and machine rooms to disconnect power from elevator equipment before sprinkler activation and for connection to elevator controllers.

1.3 DEFINITIONS

A. Definitions in ASME A17.1/CSA B44 apply to work of this Section.

B. Service Elevator: A passenger elevator that is also used to carry freight.

1.4 ACTION SUBMITTALS

A. Product Data: Include capacities, sizes, performances, operations, safety features, finishes, and similar information. Include product data for car enclosures, hoistway entrances, and operation, control, and signal systems.

B. Shop Drawings:

1. Include plans, elevations, sections, and large-scale details indicating service at each landing, machine room layout, coordination with building structure, relationships with other construction, and locations of equipment.
2. Include large-scale layout of car-control station.
3. Indicate maximum dynamic and static loads imposed on building structure at points of support, and maximum and average power demands.

C. Samples for Initial Selection: For finishes involving color selection.

D. Samples for Verification: For exposed car, hoistway door and frame, and signal equipment finishes; 3-inch- square Samples of sheet materials; and 4-inch lengths of running trim members.

1.5 INFORMATIONAL SUBMITTALS

A. Qualification Data: For Installer.

B. Manufacturer Certificates: Signed by elevator manufacturer certifying that hoistway, pit, and machine room layout and dimensions, as shown on Drawings, and electrical service, as shown and specified, are adequate for elevator system being provided.

C. Sample Warranty: For special warranty.

1.6 CLOSEOUT SUBMITTALS

A. Operation and Maintenance Data: For elevators to include in emergency, operation, and maintenance manuals.

1. In addition to items specified in Section 017823 "Operation and Maintenance Data," include diagnostic and repair information available to manufacturer's and Installer's maintenance personnel.

B. Inspection and Acceptance Certificates and Operating Permits: As required by authorities having jurisdiction for normal, unrestricted elevator use.

C. Continuing Maintenance Proposal: Submit a continuing maintenance proposal from Installer to Owner, in the form of a standard one-year maintenance agreement, starting on date initial maintenance service is concluded. State services, obligations, conditions, and terms for agreement period and for future renewal options.

1.7 QUALITY ASSURANCE

A. Installer Qualifications: Elevator manufacturer or an authorized representative who is trained and approved by manufacturer.

1.8 DELIVERY, STORAGE, AND HANDLING

A. Deliver, store, and handle materials, components and equipment in manufacturer's protective packaging. Store materials, components, and equipment off of ground, under cover, and in a dry location.

1.9 COORDINATION

A. Coordinate installation of sleeves, block outs, elevator equipment with integral anchors, and other items that are embedded in concrete or masonry for elevator equipment. Furnish templates, sleeves, elevator equipment with integral anchors, and installation instructions and deliver to Project site in time for installation.

B. Furnish well casing and coordinate delivery with related excavation work.

C. Coordinate locations and dimensions of other work relating to hydraulic elevators including pit ladders; sumps and floor drains in pits; entrance subsills; electrical service; and electrical outlets, lights, and switches in hoistways, pits, and machine rooms.

1.10 WARRANTY

A. Manufacturer's Special Warranty: Manufacturer agrees to repair, restore, or replace elevator work that fails in materials or workmanship within specified warranty period.

1. Failures include, but are not limited to, operation or control system failure, including excessive malfunctions; performances below specified ratings; excessive wear; unusual deterioration or aging of materials or finishes; unsafe conditions; need for excessive maintenance; abnormal noise or vibration; and similar unusual, unexpected, and unsatisfactory conditions.
2. Warranty Period: 12 months from date of Substantial Completion.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

1. Otis Elevator Co.
2. Schindler Elevator Corp.
3. ThyssenKrupp Elevator.

B. Source Limitations: Obtain elevators from single manufacturer.

1. Major elevator components, including pump-and-tank units, plunger-cylinder assemblies, controllers, signal fixtures, door operators, car frames, cars, and entrances, shall be manufactured by single manufacturer.

2.2 PERFORMANCE REQUIREMENTS

A. Regulatory Requirements: Comply with ASME A17.1/CSA B44.

B. Accessibility Requirements: Comply with Section 407 in the U.S. Architectural & Transportation Barriers Compliance Board's ADA-ABA Accessibility Guidelines and with ICC A117.1.

2.3 ELEVATORS

A. Elevator System, General: Manufacturer's standard elevator systems. Unless otherwise indicated, manufacturers' standard components shall be used, as included in standard elevator systems and as required for complete system.

B. Elevator Description:

1. Elevator Number(s): E1.
2. Type: Under-the-car single cylinder.
3. Rated Load: 3500 lb.
4. Rated Speed: 125 fpm.
5. Operation System: Selective-collective automatic.
6. Travel: 14'-0"
7. Landings: 2 total
8. Openings:

    a. Front: 2

9. Auxiliary Operations:

    a. Battery-powered lowering.

10. Car Enclosures:

    a. Inside Width: 80 inches from side wall to side wall.
    b. Inside Depth: 65 inches from back wall to front wall (return panels).
    c. Inside Height: 96 inches to underside of ceiling.
    d. Front Walls (Return Panels): Satin stainless steel, No. 4 finish with integral car door frames.
    e. Car Fixtures: Satin stainless steel, No. 4 finish.
    f. Side and Rear Wall Panels: Plastic laminate.
    g. Reveals: Satin stainless steel, No. 4 finish.
    h. Door Faces (Interior): Satin stainless steel, No. 4 finish.
    i. Door Sills: Nickel silver, polished.
    j. Ceiling: Satin stainless steel, No. 4 finish.
    k. Handrails: 1-1/2 inches round satin stainless steel, No. 4 finish, at sides and rear of car.
    l. Floor prepared to receive resilient flooring (specified in Section 096500 "Resilient Flooring").

11. Hoistway Entrances:

    a. Width: 42 inches.
    b. Height: 84 inches.
    c. Type: Single-speed center opening.
    d. Frames: Satin stainless steel, No. 4 finish.
    e. Doors: Satin stainless steel, No. 4 finish.
    f. Sills: Nickel silver, polished.

12. Hall Fixtures: Satin stainless steel, No. 4 finish.
13. Additional Requirements:

    a. Provide inspection certificate in each car, mounted under acrylic cover with frame made from satin stainless steel, No. 4 finish.
    b. Provide hooks for protective pads in all cars and two complete set(s) of full-height protective pads.

C. Elevator Description:

1. Service Elevator Number(s): E2.
2. Type: Under-the-car single cylinder.
3. Rated Load: 4500 lb.
4. Freight Loading Class for Service Elevators: Class A.
5. Rated Speed: 125 fpm.
6. Operation System: Selective-collective automatic.
7. Travel: 28'-0"
8. Landings: 3 total
9. Openings:

    a. Front: 3
    b. Rear: 3

10. Auxiliary Operations:

    a. Battery-powered lowering.

11. Car Enclosures:

    a. Inside Width: 68 inches from side wall to side wall.
    b. Inside Depth: 94 inches from back wall to front wall (return panels).
    c. Inside Height: 96 inches to underside of ceiling.
    d. Front Walls (Return Panels): Satin stainless steel, No. 4 finish with integral car door frames.
    e. Car Fixtures: Satin stainless steel, No. 4 finish.
    f. Side and Rear Wall Panels: Plastic laminate.
    g. Reveals: Satin stainless steel, No. 4 finish.
    h. Door Faces (Interior): Satin stainless steel, No. 4 finish.
    i. Door Sills: Nickel silver, polished.
    j. Ceiling: Satin stainless steel, No. 4 finish.
    k. Handrails: 1-1/2 inches round satin stainless steel, No. 4 finish, at sides and rear of car.
    l. Floor prepared to receive resilient flooring (specified in Section 096500 "Resilient Flooring").

12. Hoistway Entrances:

    a. Width: 48 inches.
    b. Height: 84 inches.
    c. Type: Two-speed side sliding.
    d. Frames: Satin stainless steel, No. 4 finish.
    e. Doors: Satin stainless steel, No. 4 finish.
    f. Sills: Nickel silver, polished.

13. Hall Fixtures: Satin stainless steel, No. 4 finish.

14. Additional Requirements:

    a. Provide inspection certificate in each car, mounted under acrylic cover with frame made from satin stainless steel, No. 4 finish.
    b. Provide hooks for protective pads in all cars and two complete set(s) of full-height protective pads.

D. Elevator Description:

1. Elevator Number(s): E3.
2. Type: Under-the-car single cylinder.
3. Rated Load: 3500 lb.
4. Rated Speed: 125 fpm.
5. Operation System: Selective-collective automatic.
6. Travel: 42'-0"
7. Landings: 4 total
8. Openings:

    a. Front: 4

9. Auxiliary Operations:

    a. Battery-powered lowering.

10. Security Features: Card-reader operation for access to Penthouse level.
11. Car Enclosures:

    a. Inside Width: 80 inches from side wall to side wall.
    b. Inside Depth: 65 inches from back wall to front wall (return panels).
    c. Inside Height: 96 inches to underside of ceiling.
    d. Front Walls (Return Panels): Satin stainless steel, No. 4 finish with integral car door frames.
    e. Car Fixtures: Satin stainless steel, No. 4 finish.
    f. Side and Rear Wall Panels: Plastic laminate.
    g. Reveals: Satin stainless steel, No. 4 finish.
    h. Door Faces (Interior): Satin stainless steel, No. 4 finish.
    i. Door Sills: Nickel silver, polished.
    j. Ceiling: Satin stainless steel, No. 4 finish.
    k. Handrails: 1-1/2 inches round satin stainless steel, No. 4 finish, at sides and rear of car.
    l. Floor prepared to receive resilient flooring (specified in Section 096500 "Resilient Flooring").

12. Hoistway Entrances:

    a. Width: 42 inches.
    b. Height: 84 inches.
    c. Type: Single-speed center opening.
    d. Frames: Satin stainless steel, No. 4 finish.
    e. Doors: Satin stainless steel, No. 4 finish.
    f. Sills: Nickel silver, polished.

13. Hall Fixtures: Satin stainless steel, No. 4 finish.
14. Additional Requirements:

a. Provide inspection certificate in each car, mounted under acrylic cover with frame made from satin stainless steel, No. 4 finish.
b. Provide hooks for protective pads in all cars and two complete set(s) of full-height protective pads.

2.4 SYSTEMS AND COMPONENTS

A. Pump Units: Positive-displacement type with a maximum of 10 percent variation between no load and full load and with minimum pulsations.

1. Pump shall be submersible type with submersible squirrel-cage induction motor, and shall be suspended inside oil tank from vibration isolation mounts.
2. Motor shall have variable-voltage, variable-frequency control.

B. Hydraulic Silencers: System shall have hydraulic silencer containing pulsation-absorbing material in blowout-proof housing at pump unit.

C. Piping: Size, type, and weight of piping as recommended by elevator manufacturer, with flexible connectors to minimize sound and vibration transmissions from power unit.

1. Cylinder units shall be connected with dielectric couplings.
2. Casing for Underground Piping: Schedule 40 PVC pipe complying with ASTM D 1785, joined with PVC fittings complying with ASTM D 2466 and solvent cement complying with ASTM D 2564.

D. Hydraulic Fluid: Nontoxic, biodegradable, fire-resistant fluid made from vegetable oil with antioxidant, anticorrosive, antifoaming, and metal-passivating additives and approved by elevator manufacturer for use with elevator equipment.

1. Product: Subject to compliance with requirements, provide "Hydro Safe" by Hydro Safe Oil Division, Inc.

E. Inserts: Furnish required anchorage devices for installing guide rails, machinery, and other components of elevator work. Device installation is specified in another Section.

F. Protective Cylinder Casing: PVC or HDPE pipe casing complying with ASME A17.1/CSA B44, of sufficient size to provide not less than 1-inch clearance from cylinder and extending above pit floor. Casing shall have means of monitoring effectiveness to comply with ASME A17.1/CSA B44.

G. Corrosion-Protective Filler: A nontoxic, petroleum-based gel formulated for filling the space between hydraulic cylinder and protective casing. Filler shall be electrically nonconductive, displace or absorb water, and gel or solidify at temperatures below 60 deg F.

1. Products: Subject to compliance with requirements, available products that may be incorporated into the Work include, but are not limited to, the following:

a. Hydro Safe Oil Division, Inc.; No-Ox-Id Liquid Elevator Casing Filler E-800.
b. Union-Gard, a division of Dome Services L.L.C.; Union-Gard 160.

H. Car Frame and Platform: Welded steel units.

I. Guides: Roller guides. Provide guides at top and bottom of car and counterweight frames.

2.5 OPERATION SYSTEMS

A. General: Provide manufacturer's standard microprocessor operation system as required to provide type of operation indicated.

B. Auxiliary Operations: In addition to primary operation system features, provide the following operational features for elevators where indicated:
   1. Single-Car Battery-Powered Lowering: If power fails and car is at a floor, it remains at that floor, opens its doors, and shuts down. If car is between floors, it is lowered to a preselected floor, opens its doors, and shuts down. If car is below the preselected floor, it is lowered to the next lower floor, opens its doors, and shuts down. System includes rechargeable battery and automatic recharging system.

C. Security Features: Provide the following security features, where indicated. Security features shall not affect emergency firefighters' service.

   1. Card-Reader Operation: System uses card readers at car-control stations to authorize calls. Security system determines which landings and at what times calls require authorization by card reader. Provide required conductors in traveling cable and panel in machine room for interconnecting card readers, other security access system equipment, and elevator controllers. Allow space as indicated for card reader in car.

      a. Security access system equipment is specified in Section 281300 "Access Control."

2.6 DOOR REOPENING DEVICES

A. Infrared Array: Provide door reopening device with uniform array of 36 or more microprocessor-controlled, infrared light beams projecting across car entrance. Interruption of one or more light beams shall cause doors to stop and reopen.

B. Nudging Feature: After car doors are prevented from closing for predetermined adjustable time, through activating door reopening device, a loud buzzer shall sound and doors shall begin to close at reduced kinetic energy.

2.7 CAR ENCLOSURES

A. General: Provide steel-framed car enclosures with nonremovable wall panels, with removable car roof, access doors, power door operators, and ventilation.

   1. Provide standard railings complying with ASME A17.1/CSA B44 on car tops where required by ASME A17.1/CSA B44.

B. Materials and Finishes: Manufacturer's standards, but not less than the following:

   1. Subfloor: Exterior, underlayment grade plywood, not less than 5/8-inch nominal thickness.
   2. Floor Finish: Specified in Section 096519 “Resilient Tile Flooring” -.
   3. Stainless-Steel Wall Panels: Flush, hollow-metal construction; fabricated from stainless-steel sheet.
   4. Plastic-Laminate Wall Panels: Plastic laminate adhesively applied to manufacturer's standard honeycomb core with plastic-laminate panel backing and manufacturer's standard protective edge trim. Panels have a flame-spread index of 25 or less, when

tested according to ASTM E 84. Plastic-laminate color, texture, and pattern as selected by Architect from plastic-laminate manufacturer's full range.

5. Fabricate car with recesses and cutouts for signal equipment.
6. Fabricate car door frame integrally with front wall of car.
7. Stainless-Steel Doors: Flush, hollow-metal construction; fabricated from stainless-steel sheet.
8. Sight Guards: Provide sight guards on car doors.
9. Sills: Extruded metal, with grooved surface, 1/4 inch thick.
10. Metal Ceiling: Flush panels, with fluorescent downlights in the center of each panel. Ceiling to have cove lights at left and right sides for depth of cab. Align ceiling panel joints with joints between wall panels.
11. Handrails: Manufacturer's standard handrails, of shape, metal, and finish indicated.

2.8 HOISTWAY ENTRANCES

A. Hoistway Entrance Assemblies: Manufacturer's standard horizontal-sliding, door-and-frame hoistway entrances complete with track systems, hardware, sills, and accessories. Frame size and profile shall accommodate hoistway wall construction.

1. Where gypsum board wall construction is indicated, frames shall be self-supporting with reinforced head sections.

B. Fire-Rated Hoistway Entrance Assemblies: Door and frame assemblies shall comply with NFPA 80 and be listed and labeled by a testing and inspecting agency acceptable to authorities having jurisdiction based on testing at as close-to-neutral pressure as possible according to NFPA 252 or UL 10B.

1. Fire-Protection Rating: 1-1/2 hours.

C. Materials and Fabrication: Manufacturer's standards, but not less than the following:

1. Stainless-Steel Frames: Formed from stainless-steel sheet.
2. Stainless-Steel Doors: Flush, hollow-metal construction; fabricated from stainless-steel sheet.
3. Sight Guards: Provide sight guards on doors matching door edges.
4. Sills: Extruded metal, with grooved surface, 1/4 inch thick.
5. Nonshrink, Nonmetallic Grout: Factory-packaged, nonstaining, noncorrosive, nongaseous grout complying with ASTM C 1107/C 1107M.

2.9 SIGNAL EQUIPMENT

A. General: Provide hall-call and car-call buttons that light when activated and remain lit until call has been fulfilled. Fabricate lighted elements with long-life lamps and acrylic or other permanent, non-yellowing translucent plastic diffusers.

B. Car-Control Stations: Provide manufacturer's standard recessed car-control stations. Mount in return panel adjacent to car door unless otherwise indicated.

1. Mark buttons and switches for required use or function. Use both tactile symbols and Braille.
2. Provide "No Smoking" sign matching car-control station, either integral with car-control station or mounted adjacent to it, with text and graphics as required by authorities having jurisdiction.

C. Emergency Communication System: Two-way voice communication system, with visible signal, which dials preprogrammed number of monitoring station and does not require handset use. System is contained in flush-mounted cabinet, with identification, instructions for use, and battery backup power supply.

D. Firefighters' Two-Way Telephone Communication Service: Provide flush-mounted cabinet telephone jack in each car and required conductors in traveling cable for firefighters' two-way telephone communication service specified inSection 283111 "Digital, Addressable Fire-Alarm System"

E. Car Position Indicator: Provide illuminated, digital-type car position indicator, located above car door or above car-control station. Also, provide audible signal to indicate to passengers that car is either stopping at or passing each of the floors served. Include travel direction arrows if not provided in car-control station.

F. Hall Push-Button Stations: Provide one hall push-button station at each landing.

1. Provide units with flat faceplate for mounting with body of unit recessed in wall.
2. Equip units with buttons for calling elevator and for indicating applicable direction of travel.
3. Provide telephone jack in each unit for firefighters' two-way telephone communication service specified in Section 283111 "Digital, Addressable Fire-Alarm System".

G. Hall Lanterns: Units with illuminated arrows; but provide single arrow at terminal landings. Provide the following:

1. Manufacturer's standard wall-mounted units, for mounting above entrance frames.

H. Hall Annunciator: With each hall lantern, provide audible signals indicating car arrival and direction of travel. Signals sound once for up and twice for down.

1. At manufacturer's option, audible signals may be placed on cars.

2.10 FINISH MATERIALS

A. General: Provide the following materials for exposed parts of elevator car enclosures, car doors, hoistway entrance doors and frames, and signal equipment as indicated.

B. Cold-Rolled Steel Sheet: ASTM A 1008/A 1008M, commercial steel, Type B, exposed, matte finish.

C. Hot-Rolled Steel Sheet: ASTM A 1011/A 1011M, commercial steel, Type B, pickled.

D. Stainless-Steel Sheet: ASTM A 240/A 240M, Type 304.

E. Stainless-Steel Tubing: ASTM A 554, Grade MT 304.

F. Aluminum Extrusions: ASTM B 221, Alloy 6063.

G. Nickel Silver Extrusions: ASTM B 151/B 151M, Alloy UNS No. C74500 or No. C77600.

H. Plastic Laminate: High-pressure type complying with NEMA LD 3, Type HGS for flat applications Type BKV for panel backing.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine elevator areas, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of the Work. Verify critical dimensions and examine supporting structure and other conditions under which elevator work is to be installed.

B. Prepare written report, endorsed by Installer, listing conditions detrimental to performance of the Work.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. Excavation for Cylinder: Drill well hole in each elevator pit to accommodate installation of cylinder; comply with applicable requirements in Section 312000 "Earth Moving."

B. Provide well casing as necessary to retain well-hole walls.

C. Install cylinder in protective casing within well hole. Before installing protective casing, remove water and debris from well hole and provide permanent waterproof seal at bottom of well casing.

1. Fill void space between protective casing and cylinder with corrosion-protective filler.
2. Align cylinders and fill space around protective casing with fine sand.

D. Install cylinder plumb and accurately centered for elevator car position and travel. Anchor securely in place, supported at pit floor. Seal between protective casing and pit floor with 4 inches of nonshrink, nonmetallic grout.

E. Welded Construction: Provide welded connections for installing elevator work where bolted connections are not required for subsequent removal or for normal operation, adjustment, inspection, maintenance, and replacement of worn parts. Comply with AWS workmanship and welding operator qualification standards.

F. Sound Isolation: Mount rotating and vibrating equipment on vibration-isolating mounts to minimize vibration transmission to structure and structure-borne noise due to elevator system.

G. Install piping above the floor, where possible. Install underground piping in casing.

H. Lubricate operating parts of systems as recommended by manufacturers.

I. Alignment: Coordinate installation of hoistway entrances with installation of elevator guide rails for accurate alignment of entrances with car. Where possible, delay installation of sills and frames until car is operable in shaft. Reduce clearances to minimum, safe, workable dimension at each landing.

J. Leveling Tolerance: 1/4 inch, up or down, regardless of load and travel direction.

K. Set sills flush with finished floor surface at landing. Fill space under sill solidly with nonshrink, nonmetallic grout.

L. Locate hall signal equipment for elevators as follows, unless otherwise indicated:

1. For groups of elevators, locate hall push-button stations between two elevators at center of group or at location most convenient for approaching passengers.
2. Place hall lanterns either above or beside each hoistway entrance.
3. Mount hall lanterns at a minimum of 72 inches above finished floor.

3.3 FIELD QUALITY CONTROL

A. Acceptance Testing: On completion of elevator installation and before permitting elevator use (either temporary or permanent), perform acceptance tests as required and recommended by ASME A17.1/CSA B44 and by governing regulations and agencies.

B. Advise Owner, Architect, and authorities having jurisdiction in advance of dates and times that tests are to be performed on elevators.

3.4 PROTECTION

A. Temporary Use: Limit temporary use for construction purposes to one elevator. Comply with the following requirements for elevator used for construction purposes:

1. Provide car with temporary enclosure, either within finished car or in place of finished car, to protect finishes from damage.
2. Provide strippable protective film on entrance and car doors and frames.
3. Provide padded wood bumpers on entrance door frames covering jambs and frame faces.
4. Provide other protective coverings, barriers, devices, signs, and procedures as needed to protect elevator and elevator equipment.
5. Do not load elevators beyond their rated weight capacity.
6. Engage elevator Installer to provide full maintenance service. Include preventive maintenance, repair or replacement of worn or defective components, lubrication, cleanup, and adjustment as necessary for proper elevator operation at rated speed and capacity. Provide parts and supplies same as those used in the manufacture and installation of original equipment.
7. Engage elevator Installer to restore damaged work, if any, so no evidence remains of correction. Return items that cannot be refinished in the field to the shop, make required repairs and refinish entire unit, or provide new units as required.

3.5 DEMONSTRATION

A. Engage a factory-authorized service representative to train Owner's maintenance personnel to operate, adjust, and maintain elevator(s).

B. Check operation of each elevator with Owner's personnel present before date of Substantial Completion and again not more than one month before end of warranty period. Determine that operation systems and devices are functioning properly.

3.6 MAINTENANCE

A. Initial Maintenance Service: Beginning at Substantial Completion, maintenance service shall include 12 months' full maintenance by skilled employees of elevator Installer. Include monthly preventive maintenance, repair or replacement of worn or defective components, lubrication,

cleaning, and adjusting as required for proper elevator operation. Parts and supplies shall be manufacturer's authorized replacement parts and supplies.

1. Perform maintenance during normal working hours.
2. Perform emergency callback service during normal working hours with response time of two hours or less.
3. Include 24-hour-per-day, 7-day-per-week emergency callback service with response time of two hours or less.

END OF TABLE OF CONTENTS, PART B

SECTION 200000 - COMMON MECHANICAL/ELECTRICAL REQUIREMENTS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

B. Where Paragraphs of this Section conflict with similar paragraphs of Division 01, the more stringent specification requirements shall prevail.

C. This section shall apply to the following Divisions:

1. Division 21 - Fire Suppression
2. Division 22 - Plumbing
3. Division 23 - Heating, Ventilating, and Air Conditioning (HVAC)
4. Division 26 - Electrical
5. Division 27 - Communications
6. Division 28 - Electronic Safety and Security

1.2 SUMMARY

A. Perform work and provide material and equipment as shown on the drawings, as specified and in accordance with this Section. Completely coordinate work of this Division with work of others and provide a complete and fully functional installation.

B. Drawings and Specifications form complimentary requirements. Provide work specified and not shown, work shown and not specified as though explicitly required by both. Although work is not specifically shown or specified, provide supplementary or miscellaneous items, appurtenances, devices and materials obviously necessary for a sound, secure and complete installation

C. Give notices, file plans, obtain permits and licenses, pay fees and back charges, and obtain necessary approvals from authorities that have jurisdiction. Perform work in accordance with all legal requirements and with Specifications, Drawings, Addenda and Change Orders, all of which are part of Contract Documents.

D. Examine Drawings and other Sections of Specifications for requirements that affect work of this Section.

E. Attention is directed to the following specialized requirements of this Section:

1. Paragraph GUARANTEE AND 24-HOUR SERVICE. The requirement to provide a 24 hour phone number for service during the guarantee period is incorporated; also, an extended warrantee to cover the full one year contractor's guarantee period starting on the date of beneficial occupancy, even if equipment has been previously used for temporary heat or other purpose.
2. Paragraph RECORD DRAWINGS. A requirement to incorporate photographs, taken during construction, of buried and concealed components is incorporated.

3. Paragraph SUBMITTALS. A special cover sheet for each shop drawing, to be filled out by the contractor, is required. A description of "Acceptable Manufacturers" is included. No other manufacturers will be considered for this project. The turn-around time Vanderweil requires to process shop drawings is described.

4. Paragraph COMMISSIONING OF EQUIPMENT AND SYSTEMS. Requirements for commissioning of systems and equipment, including preparation of a commissioning work plan and commissioning forms, are incorporated.

5. Paragraph COMMISSIONING OF EQUIPMENT AND SYSTEMS. Requirements for commissioning of systems and equipment shall apply to GENERAL COMMISSIONING REQUIREMENTS within Division 01.

1.3 DEFINITIONS

A. As used in all Sections, "provide" means "furnish and install." "Furnish" means "to purchase and deliver to the project site complete with every necessary appurtenance and support," and "Install" means "to unload at the delivery point at the site and perform every operation necessary to establish secure mounting and correct operation at the proper location in the project. "Architect" means the "Prime Design Consultant." If R.G. Vanderweil Engineers, LLP is not the prime design consultant, the Architect may authorize R.G. Vanderweil Engineers, LLP to act on the Architect's behalf in matters concerning the all Sections of specifications.

B. "RFI" means "Contractor's Request for Information."

C. Insofar as submittals, reviews, and approvals are concerned, the words “Architect” and “Engineer” may be used interchangeably in the mechanical and electrical divisions.

D. Refer to Division 00 for additional definitions.

1.4 CONTRACT DOCUMENTS

A. Listing of Drawings does not limit responsibility of determining full extent of work required by these Contract Documents. Refer to Architectural, Fire Protection, Plumbing, HVAC, Electrical, Communication, Electronic Safety and Security, Structural, Site Utility and all other Drawings and other Sections that indicate types of construction in which work shall be installed and work of other trades with which work of this Section must be coordinated

B. Refer to Division 00 for additional definitions.

1.5 ELECTRONIC CAD FILES

A. Electronic CAD files for Fire Protection, Plumbing, HVAC, Electrical, Communication, or Electronic Safety and Security drawings will be furnished by Engineer at contractor’s request. These files will be provided on Engineer’s FTP site in the software release used by the Engineer. If other media or software version is requested, Engineer will require advance reimbursement of processing costs.

B. Requests should be made by filling out the following form and providing an authorized signature. The requested information will not be released prior to receipt of the completed Release of Liability Form for the appropriate documents.

DATE

NAME
ADDRESS

Re: JOB# JOB NAME

Dear NAME:

Per the request of **[Owner/Client]**, we are pleased to offer you the following electronic files:

[**Drawing file name, date of file, description**].

Vanderweil Engineers agrees to provide the above-referenced electronic files to **[Addressee]**. **[Addressee]** recognizes that data, plans, specifications, reports, documents, or other information recorded on or transmitted as electronic files are subject to undetectable alteration, either intentional or unintentional, due to among other causes, transmission, conversion, media degradation, software error, or human alteration. Accordingly, the electronic files are provided to **[Addressee]** for informational purposes only and not as an end product or Contract Document. The actual stamped drawings and documents together with any Addenda or revisions are the only true and actual Contract Documents.

Vanderweil Engineers makes no warranties, either express or implied, regarding the fitness or suitability of the electronic files.

Engineer's work done in 2D or 3D CAD is diagrammatic. It is not intended to be absolutely precise; it is not intended to specify or to show every offset, fitting, and component. The purpose of the drawings is to indicate a systems concept, the main components of the systems, and the approximate geometrical relationships. Based on the systems concept, the main components, and the approximate geometrical relationships, contractor shall provide all other components and materials necessary to make the systems fully complete, coordinated with other systems and the structure and space available, and operational.

Like the actual stamped drawings and documents, the electronic files are instruments of professional service, and shall not be used, in whole or in part, for any project other than that for which they were created, without the express written consent of Vanderweil Engineers.

Accordingly, **[Addressee]** agrees to waive any and all claims against Vanderweil Engineers and **[Owner/Client]** resulting in any way from the use, unauthorized reuse or alteration, or misuse of the electronic files, and to defend, indemnify and hold Vanderweil Engineers and **[Owner/Client]** harmless from any claims, losses, damages, or costs, including attorneys fees, arising out of the use, reuse, alteration, or misuse of the electronic files.

Please acknowledge your acceptance of these terms and conditions by returning a signed original of this letter.

1.6 DISCREPANCIES IN DOCUMENTS

A. Where Drawings or Specifications conflict or are unclear, submit clarification request in writing before Award of Contract. Otherwise, College Project Manager (PM) interpretation of Contract Documents shall be final, and no additional compensation shall be permitted due to discrepancies or un-clarities thus resolved.

B. Where Drawings or Specifications do not coincide with manufacturers' recommendations or with applicable codes and standards, submit clarification request in writing before installation. Otherwise, make changes in installed work required for compliance with manufacturer instructions or codes and standards within Contract Price.

C. If the required material, installation, or work can be interpreted differently from drawing to drawing, or between drawings and specs, provide material, installation or work that is of the higher standard.

D. It is the requirement of these contract documents to require provision of systems and components that are fully complete and operational and fully suitable for the intended use. There may be situations in the documents where insufficient information exists to precisely describe a certain component or subsystem, or the routing of a component or its coordination with other building elements. In these cases, where notification required by Paragraph (A) above has not been submitted, provide the specific component or subsystem with all parts necessary for the intended use, fully complete and operational, and installed in workmanlike manner either concealed or exposed in accordance with the design intent.

E. In cases covered by Paragraph (D) above, where the contractor believes engineering guidance is needed, submit a sketch identifying proposed solution. College PM shall review, note if necessary, and approve the sketch.

F. Where discrepancies exist between the mechanical, plumbing, fire protection, and electrical drawings in regards to what trade owns equipment such as disconnects, starters, etc., the discrepancy shall be brought to the College Project Manager’s attention in accordance with paragraph (A) above. If the scope is not resolved prior to the Award of Contract, the Electrical Contractor shall provide such items.

G. Refer to Division 00 for additional requirements.

1.7 MODIFICATIONS IN LAYOUT

A. Drawings are diagrammatic. They indicate general arrangements of mechanical systems and other work. They do not show all offsets required for coordination nor do they show the exact routings and locations needed to coordinate with structure and other trades and to meet ceiling heights and other Architectural requirements.

B. In order to obtain the intended aesthetics in spaces used by building occupants, prior to installation of visible material and equipment (including access panels), review Architectural Drawings for desired locations and where not definitively indicated, request information from College PM.

C. Check Contract Drawings, as well as Shop Drawings, to verify and coordinate spaces in which work of this section will be installed.

D. Maintain maximum headroom at all locations. All piping, duct, conduit, and associated components to be as tight to underside of structure as possible.

E. Make reasonable modifications in layout and components needed to prevent conflict with work of other trades and to coordinate according to paragraphs above. Systems shall be run in a rectilinear fashion.

F. Where conflicts or potential conflicts exist and engineering guidance is desired, submit sketch of proposed resolution to College PM for review and approval. Refer to Division 00 for additional requirements.

1.8 REQUEST FOR INFORMATION (RFI'S)

A. Refer to Division 00.

1.9 RELATED WORK IN OTHER SECTIONS

A. The following work is not included and shall be performed under other Sections.

1. Excavation and backfill.
2. Concrete work, including concrete housekeeping pads and other pads and blocks for vibrating and rotating equipment, and cast in place manholes and handholes.
3. Cutting and patching of masonry, concrete, tile and other parts of structure, with the exception of drilling for hangers and providing holes and openings in metal decks.
4. Flashing of wall and roof penetrations.
5. Installation of access panels in floors, walls, furred spaces or above ceilings.
6. Painting, except as specified herein.
7. Structural supports necessary to distribute loading from equipment to roof or floor except as specified herein.
8. Temporary light, power, water, heat, gas and sanitary facilities for use during construction and testing.
9. Outdoor air intake and exhaust louvers.
10. Electric power wiring for all equipment shall be provided by Division 26, Electrical.
11. Installation of circuit breakers (furnished by ATC Contractor) and final electrical panel terminal connections for ATC control power wiring shall be provided by Division 26, Electrical.
12. Wall and ceiling enclosures and shafts for supply, return and exhaust ductwork as shown on drawings.

1.10 SITE VISIT

A. Refer to Division 00 for requirements.

1.11 EXISTING CONDITIONS AND PREPARATORY WORK

A. Refer to Division 00 for requirements.

1.12 CODES, STANDARDS, AUTHORITIES AND PERMITS

A. Perform work in accordance with rules, regulations, standards, codes, ordinances, and laws of local, state, and Federal governments, and other authorities that have legal jurisdiction over the site.

B. Prior to work commencement of work, notify State and applicable authorities and submit all of the applicable notifications for construction, operation and/or demolition.

C. Materials and equipment shall be manufactured, installed and tested as specified in latest editions of applicable publications, standards, rulings and determinations of:

1. Local and state building, plumbing, mechanical, electrical, fire and health department codes.
2. American Gas Association (AGA).
3. National Fire Protection Association (NFPA).
4. American Insurance Association (AIA) (formerly National Board of Fire Underwriters).
5. Occupational Safety and Health Act (OSHA).
6. Underwriters Laboratories (UL)
7. Factory Mutual Association (FM)
8. Owner's Insurance Underwriter.

D. Material and equipment shall be listed by Underwriters' Laboratories (UL), and approved by ASME, ANSI, ASTM, and AGA for intended service.

E. When requirements cited in this Specification conflict with each other or with Contract Documents, most stringent shall govern work. College PM may relax this requirement when relaxation does not violate ruling of authorities that have jurisdiction. Approval for relaxation shall be obtained in writing.

F. Unless indicated otherwise, the most recent editions of applicable specifications and publications of the following organizations form part of these Contract Documents.

1. American National Standards Institute (ANSI).
2. American Society of Mechanical Engineers (ASME).
3. National Electric Manufacturers Association (NEMA).
4. American Society for Testing and Materials (ASTM).
5. American Water Works Association (AWWA).
6. American Society for Heating, Refrigerating and Air Conditioning Engineers (ASHRAE).
7. Air Moving and Conditioning Association (AMCA).
8. Sheet Metal and Air Conditioning Contractors National Association (SMACNA).
9. Air Conditioning and Refrigeration Institute (ARI).
10. Thermal Insulation Manufacturers Association (TIMA).
11. Institute of Electrical and Electronics Engineers (IEEE).
12. Insulated Cable Engineers Association (ICEA).
13. Manufacturer's Standardization Society of the Valve & Fittings Industry (MSS)

G. Specific reference is made to the following NFPA standards which contain an exceptionally high quantity of mechanical, electrical, and fire protection requirements. These standards as referenced by the State Building Code shall apply in full.

1. No. 13 - Installation of Sprinkler Systems

2. No. 14 - Installation of Standpipe and Hose Systems
3. No. 20 - Installation of Centrifugal Fire Pumps
4. No. 30 - Combustible Liquids
5. No. 37 - Installation of Use of Stationary Combustion Engines and Gas Turbines
6. No. 45 - Fire Protection for Laboratories Using Chemicals
7. No. 70 - National Electric Code
8. No. 72 - National Fire Alarm Code
9. No. 101 - Life Safety Code

H. Secure and pay for all permits and inspections required by the Authorities having Jurisdiction. Secure trade permits prior to beginning work.

1.13 GUARANTEE AND 24 HOUR SERVICE

A. Guarantee the Work of this Section in writing for one year following the date of Substantial Completion. If the equipment is used for ventilation, temporary heat, or other use prior to initial beneficial occupancy by the Owner, the bid price shall include an extended period of warranty covering the one-year of beneficial occupancy by the Owner. The guarantee shall repair or replace defective materials, equipment, workmanship and installation that develop within this period, promptly and to Architect's satisfaction and correct damage caused in making necessary repairs and replacements under guarantee within Contract Price.

B. In addition to guarantee requirements of Division 01 and of Paragraph A above, obtain written equipment and material warranties offered in manufacturer's published data without exclusion or limitation, in Owner's name.

C. Replace material and equipment that require excessive service during guarantee period. Excessive service shall be defined as more than 3 service calls for the same material or equipment within a 12 month period.

D. Provide 24-hour service beginning on the date of Substantial Completion and lasting until the termination of the guarantee period. Service may be provided by a separate service organization subject to Owner approval. Submit name and a phone number that will be answered on a 24-hour basis each day of the week, for the duration of the service.

E. Submit copies of equipment and material warranties before final payment.

F. At end of guarantee period, transfer manufacturers' equipment and material warranties still in force to Owner.

G. This Paragraph shall not be interpreted to limit Owner's rights under applicable codes and laws and under this Contract.

H. Part 2 paragraphs of all specification Sections may specify warranty requirements that exceed those of this Paragraph.

I. Use of systems provided under this Section for temporary services and facilities shall NOT constitute Final Acceptance of work nor beneficial use by Owner, and shall not institute guarantee period.

J. Provide manufacturer's engineering and technical staff at site to analyze and rectify problems that develop during guarantee period immediately. If problems cannot be rectified immediately to Owner's satisfaction, advise Architect in writing, describe efforts to rectify situation, and provide analysis of cause of problem. Architect will suggest course of action.

1.14 COORDINATION DRAWINGS

A. A single set of coordination drawings shall be mutually prepared by all mechanical and electrical trades.

B. The initiation of these drawings begins with the Sheet Metal Subcontractor.

C. The Sheet Metal Subcontractor shall prepare a complete set of electronic type background drawings in approved versions of AutoCAD, REVIT, Navisworks, or approved alternative) at scale not less than 3/8" equals 1'-0" showing structure and other information as needed for coordination. Sheet metal layout including horizontal and vertical offsets and changes in direction and necessary access panels shall be shown thereon, as well as all fire walls and smoke partitions, which shall be shown in a different color than the regular partitions and the sheet metal. All trades shall electronically add their systems to the electronic formatted drawings, each trade in a different color. These electronic files will be considered the project Coordination Drawings. Drawing layers must coincide with original Vanderweil electronic format.

D. Each of the mechanical, electrical and other specialty trades shall add its work to these background drawings with appropriate offsets, elevations and grid dimensions, and showing necessary access panels. Specialty trade information is required for fan rooms and mechanical rooms, horizontal exits from duct shafts, crossovers, and for spaces in and above ceilings where congestion of work may occur (e.g. corridors). This may apply to entire floors. Drawings shall indicate horizontal and vertical dimensions, to avoid interference with structural framing, ceilings, partitions, and other services.

E. Each specialty trade shall sign and date each plotted coordination drawing. Return drawings to the Sheet Metal Subcontractor, who shall route them sequentially to all specialty trades.

F. Where conflicts occur with placement of materials of various trades, the Sheet Metal Subcontractor will be responsible to coordinate the available space to accommodate all trades. Resulting adjustments shall be initialed and dated by the specialty trade. The Sheet Metal Subcontractor shall then final date and sign each drawing. If conflict cannot be resolved, the decision of the General Contractor/Construction Manager shall be final.

G. A Subcontractor who fails to promptly review and incorporate his work on the drawings shall assume full responsibility of installation conflicts affecting his work and of schedule ramifications.

H. Sheet Metal Subcontractor shall make copies of all coordination drawings for submission. Fabrication shall not start until copies of completed coordination drawings are received by the Architect and have been reviewed.

I. Review by Engineer of coordination drawings is limited to confirming that requirements for coordination and preparation of plans have been complied with by the Construction Manager or General Contractor and shall not diminish responsibility under this Contract for final coordination of installation and maintenance clearances of all systems and equipment with Architectural, Structural, Mechanical, Electrical and other related work.

J. After Review:

1. After review of coordination drawings, the method used to resolve interferences not previously identified shall be as described in Paragraph 1.07 "MODIFICATIONS IN LAYOUT" above.

2. All changes to reviewed coordination drawings shall be in writing by the Architect prior to start of work in affected area.

K. Distribution of Reviewed Coordination Drawings:

1. The Sheet Metal Subcontractor shall provide one color coded electronic copy and one color coded hard copy of the reviewed Coordination Drawings to each of the specialty trades, the Contractor and the Owner..

L. The main paths of egress and for equipment removal, from main mechanical and electrical rooms shall be clearly shown on the coordination drawings.

M. Coordination Drawings shall include, but are not limited to:

1. Plumbing systems, piping and equipment.
2. HVAC piping, systems and equipment.
3. Control systems.
4. Electrical distribution, systems and equipment.
5. Lighting systems and fixtures.
6. Sheet metal work, components and accessories (e.g. coils, terminal boxes).
7. Fire protection and sprinkler system, piping and heads.
8. Structural.
9. Electrical Equipment Room layouts.
10. Environmental Rooms and associated refrigeration/heating systems.
11. Partition/room layout.
12. Ceiling tile and grid
13. Access panels.
14. Smoke and fire dampers.
15. Roof drain piping.
16. Major electrical conduit runs, panel boards, feeder conduit and racks of branch conduit.
17. Above ceiling miscellaneous metal.
18. Heat tracing of piping.

1.15 SHOP DRAWING SUBMITTALS

A. This Paragraph supplements Division 01.

B. Definitions:

1. Shop Drawings are information prepared to illustrate portions of the work in more detail than shown in the Contract Documents.

2. Coordination Drawings are detailed, large-scale layout Shop Drawings showing HVAC, Electrical, Plumbing and Fire Protection work superimposed in order to identify conflicts and ensure inter-coordination of Mechanical, Electrical, Plumbing, Architectural, Structural and other work.

3. Electronic Copy means copy in a searchable PDF format, and excludes scanned material and faxed material. Scanned material and faxed material shall not be submitted.

4. Shop drawings shall be submitted with a separate cover sheet completed for each product, rather than one cover sheet for multiple products, whether or not supplied by one manufacturer or vendor.

C. Submittal Procedures and Format

1. Construction Manager or General Contractor shall review submittal packages for compliance with Contract Documents and then submit for review by Architect. Review by Construction Manager or Contractor is intended to ensure that the submittals include the foregoing cover sheet, are in the correct electronic or paper format as specified below, and that the item fits into the space provided. Also, that the submittal contains adequate information to verify specification requirements as well as the performance and dimensional requirements shown on the drawings. If a shop drawing is returned with a submittal status of "REJECTED" or "REVISE AND RESUBMIT", it indicates the shop drawing was not adequately reviewed by the Contractor. Subsequent submittals shall include a written response to previous items.

2. Submittal Contents

   a. Submittals shall be comprehensive and fully self contained.

   b. Electronic submittals shall be fully self contained and shall not contain links to associated websites.

   c. Submittals shall include all catalog data and physical and performance characteristics and plans and diagrams as necessary to confirm compliance with plans and specifications.

   d. Submittals shall contain only information relevant to the particular equipment or materials to be furnished. Clearly indicate the piece of equipment or material being provided. Do not submit generic catalog cuts which describe several different items in addition to those specific items being provided, unless all irrelevant information is marked out or relevant information is clearly differentiated. Those features that are not being proposed for this project shall be crossed out so as not to imply that they are included.

3. Division 23 shop drawings and installation layout drawings for heating, pumping, process piping, and refrigeration systems prepared by the Installer shall note name(s), license number(s), and license expiration dates of the installing firm.

4. Submit the following for review with submittal cover sheet for each product:

   a. Electronic copy (see above definition of electronic copy) with cover sheet for each shop drawing, except those noted below.

   b. Electronic copy with cover sheet, plus one paper copy by overnight mail, for the following submittals:

      1) Air handling unit

      2) Chiller

      3) Cooling Tower

      4) Boiler

      5) Electrical switchgear and generator

      6) Electrical short circuit, coordination, and arc flash studies

      7) Lighting

      8) Fire protection calculations

      9) Other submittals if larger than 8-1/2x11

   c. Electronic copy with cover sheet plus one paper copy in 11x17 format with cover sheet, by overnight mail for all controls submittals.

d. Sheet Metal Shop Drawings

1) Provide electronic copy, containing sufficient plans, elevations, sections, details and schematics to describe work clearly. Plans shall be ⅜" = 1'-0" scale and shall indicate work of other Sections where physical clearances are critical and where interferences are possible. Provide larger scale details to show complete installation. Sheet metal drawings shall show elements of Architect's reflected ceiling plan, exposed ductwork, walls, partitions, diffusers, registers, grilles, fire dampers, sleeves and other aspects of construction for coordination.

5. After review, Contractor to receive electronically transmitted response report for all reviewed submittals which includes the following information:

a. Submittal status

b. List of reviewer's comments

c. Copy of returned submittal. All submittals will be returned electronically, with the exception of coordination drawings, which will have one copy returned with comments through overnight mail.

6. Shop drawings showing manufacturer's product data shall contain detailed dimensional drawings, accurate and complete description of materials of construction, manufacturer's published performance characteristics and capacity ratings (performance data, alone, is not acceptable), electrical requirements and wiring diagrams. Drawings shall clearly indicate location (terminal block or wire number), voltage and function for all field terminations, and other information necessary to demonstrate compliance with all requirements of Contract Documents.

7. Provide shop drawing submittals showing details of piping connections to ALL equipment. If connection details are not submitted and connections are installed incorrectly in the field, reinstall within the original contract price.

D. Acceptable Manufacturers: The Architect's mechanical design for each product is based on the single manufacturer listed in the schedule or shown on the drawings. In Part 2 of the specifications certain Alternate Manufacturers may be listed as being acceptable. These are acceptable only if, as a minimum, they:

1. Meet all performance criteria listed in the schedules and outlined in the specification. For example, to be acceptable, an air handling unit must deliver equal CFM against equal external static pressure using equal or less horsepower as the air handler listed in the schedules.

2. Have identical operating characteristics to those called for in the specification. For example, a reciprocating compressor will not be acceptable if a rotary model is specified.

3. Fit within the available space it was designed for, including space for maintenance and component removal, with no modification to either the space or the product. Clearances to walls, ceilings and other equipment will be at least equal to those shown on the design drawings. The fact that a manufacturer's name appears as acceptable shall not be taken to mean that the Architect has determined that the manufacturer's products will fit within the available space - this determination is solely the responsibility of the contractor.

4. For rooftop mounted equipment and for equipment mounted in areas where structural matters are a consideration, the products must have a weight no greater than the product listed in the schedules or specifications.

5. Products must adhere to all architectural considerations including, but not limited to: being of the same color as the product scheduled or specified, fitting within architectural enclosures and details, and for diffusers and plumbing fixtures - being the same size and of the same physical appearance as scheduled or specified products.

E. Required Use of Acceptable Manufacturers on this Project:

1. Substitution of products other than those of the Acceptable Manufacturers specified herein shall not be made. Only the specified items or the comparable product by one of the specified Alternate Manufacturers shall be submitted. Products by other manufacturers shall not be used on this project.

F. Deviations

1. Concerning deviations other than substitutions, proposed deviations from Contract Documents shall be requested individually in writing whether deviations result from field conditions, standard shop practice, or other cause. Submit letter with transmittal of Shop Drawings which flags the deviation to the attention of the Architect.

2. Without letters flagging the deviation to the Architect, it is possible that the Architect may not notice such deviation or may not realize its ramifications. Therefore, if such letters are not submitted to the Architect, the contractor shall hold the Architect and his consultants harmless for any and all adverse consequences resulting from the deviations being implemented. This shall apply regardless of whether the Architect has reviewed or approved shop drawings containing the deviation, and will be strictly enforced.

3. Approval of proposed deviations, if any, will be made at discretion of Architect.

G. Submittal Status: Electronic and paper submittals will be returned notated as illustrated below:

"REVIEWED"

"Reviewed and found generally acceptable. Minor deviations may be noted. No further submittal required if notations are complied with."

"REVIEWED, DEVIATIONS NOTED; REVISE AND RESUBMIT"

"Submittal contains deviations which shall be corrected and confirmed by a new submittal."

"REJECTED"
Submittal is incorrect to such an extent that material is unacceptable, or is incomplete to such an extent that a complete review cannot be made. Resubmit in accordance with requirements of the Contract Documents."

"NO ACTION"
Submittal not reviewed.

H. Responsibility

1. Intent of Architect's submittal review is to check for capacity, rating, and certain construction features. Contractor shall ensure that work meets requirements of Contract Documents regarding information that pertains to fabrication processes or means, methods, techniques, sequences and procedures of construction; and for coordination of work of this and other Sections. Work shall comply with submittals marked "REVIEWED" to extent that they agree with Contract Documents. Submittal review shall not diminish responsibility under this Contract for dimensional coordination, quantities, installation, wiring, supports and access for service, nor shop drawing errors or deviations from requirements of Contract Documents. Noting of some errors while overlooking others will not excuse proceeding in error. Contract Documents requirements are not limited, waived nor superseded by review.

2. INFORM SUBCONTRACTORS, MANUFACTURERS AND SUPPLIERS OF SCOPE AND LIMITED NATURE OF REVIEW PROCESS AND ENFORCE COMPLIANCE WITH CONTRACT DOCUMENTS.

I. Schedule: Incorporate shop drawing review period into construction schedule so that Work is not delayed. Contractor shall assume full responsibility for delays caused by not incorporating the following shop drawing review time requirements into his project schedule. Working days listed reference the time in the Engineer's office. It does not include transmittal or review time of others. Allow at least 10 working days, exclusive of transmittal time, for review each time shop drawing is submitted or resubmitted with the exception that 20 working days, exclusive of transmittal time, are required for the following:

1. HVAC temperature control submittals.
2. HVAC balancing report.
3. Coordination Drawings.
4. Fire protection fabrication drawings.
5. If more than five shop drawings of a single trade are received in one calendar week.

J. List of Proposed Equipment and Materials

1. Within four weeks after Award of Contract and before ordering materials or equipment, submit complete list of proposed materials and equipment and indicate manufacturer's names and addresses. No consideration will be given to partial lists submitted out of sequence.

1.16 RECORD DRAWINGS

A. This paragraph supplements Division 01.

B. As work progresses and for duration of Contract, maintain complete and separate set of prints of Contract Drawings at job site at all times. Record work completed and all changes from original Contract Drawings. Such changes shall include, but not be limited to, those resulting from RFI's, field conditions, and modifications and additions. Include actual location of existing utilities if they differ from design documents. Record valve tags as they are installed. In addition, take photographs of all concealed equipment in gypsum board ceilings, shafts, underground (buried) piping routes and supports and other concealed, inaccessible work. At completion of work, make copies of photographs with written explanation on back. These shall become part of Record Documents.

C. Underground and utility work shall be located by distances to landmarks, such as building foundations. Give actual dimensions of everything installed including elevations and elevations at each change in direction.

D. Drawings shall show record condition of details, sections, riser diagrams, control changes and corrections to schedules. Schedules shall show actual manufacturer and make and model numbers of final equipment installation.

E. "Record Drawings" are a complete set of drawings containing the information in (A) - (D) above.

F. The installing Contractor shall certify Record Drawings for accuracy. The Architect/Engineer will not certify the accuracy of the record drawings - this is the sole responsibility of the Contractor.

G. The installing contractor shall configure the drawing layers to be the same as those in Vanderweil Engineers' format.

H. If required by the Authority having jurisdiction, each trade shall submit a set of record drawings for approval by the Authority. Format for submission shall be acceptable to the Authority. Drawing format

and size changes, and supplemental information required for the submittal are the responsibility of the installing contractor. Provide copies of submittal to General Contractor, Owner, Architect, and Engineer.

I. At completion of work, prepare a complete set of record drawings in electronic format. Deliver these to the College PM for approval.

J. After approval, deliver the following:

1. Original (not scanned) electronic version of drawings in approved format, notated as "Record Drawings," and conformed to incorporate all changes to the original design noted above. The changes shall be clouded and appropriately identified. Deliver one copy each to the General Contractor, Owner, Architect, and Engineer.
2. Deliver to the Owner one set of blackline record drawings stamped "record" and signed by the appropriate subcontractors.
3. Electronic version of contract specifications with addenda incorporated, will be provided by Vanderweil as the Record Specifications.

K. Smart Record Drawings

1. Contractor shall import the conformed and approved final record drawings into Navisworks and establish electronic hyperlinks. The final work product shall be a self-contained compact disk containing the record drawings in Navisworks with the below-described hyperlinks to PDFs of the hyperlinked information, also contained on the disk. The disk shall also contain the full MEP specifications in secure searchable PDF format.
2. Electronic hyperlinks shall be established so that when any scheduled equipment is clicked on in plan view or sectional view, or on the schedules, the following menu of hyperlinks will appear:

<u>If Clicking on Plan or Section</u>
Hyperlink to PDF of Schedule for That Item
Hyperlink to PDF of Shop Drawing for That Item
Hyperlink to PDF of Corresponding Section of Maintenance Manual
Hyperlink to PDF of Corresponding Section of Manufacturers Catalog
Hyperlink to PDF of Specification for That Item
<u>If Clicking on Schedule</u>
Hyperlink to PDF of Shop Drawing for That Item
Hyperlink to PDF of Corresponding Section of Maintenance Manual
Hyperlink to PDF of Corresponding Section of Manufacturers Catalog
Hyperlink to PDF of Specification for That Item

3. By clicking on any menu selection, the respective electronic hyperlink shall be established.
4. If the same component is used numerous times throughout the project, each of which is described by the same shop drawing submittal, maintenance instructions, specification section, and manufacturer's catalog sheet, it is not required to link each and every installation of that component. Instead, Contractor shall hyperlink one or more prototypical installations. Examples where this approach is applicable are: VAV boxes, valves, and circuit breakers 480V or less.
5. All hyperlinked equipment and components shall be color coded in the same unique color, that stands out from other colors in use.
6. This requires importation of PDFs of the catalog information into Navisworks from the manufacturer's websites, importation of PDFs of the relevant section of the Maintenance Manual, etc.

7. Once all the necessary hyperlinks have been established and the hyperlinked material has been imported, and the Smart Drawings have been proved operational, download the completed package onto self-contained CDs and distribute to Construction Manager or General Contractor, as well as Owner, Architect, Engineer.

8. Deliver to the Owner one set of blackline record drawings stamped “record” and signed by the appropriate subcontractor.

9. Electronic version of contract specifications with addenda incorporated, will be provided by Vanderweil as the Record Specifications.

1.17 BULLETINS, MANUALS, AND OPERATING INSTRUCTIONS - ELECTRONIC FORMAT

A. This paragraph supplements Division 01.

B. “Electronic Format” means searchable PDF format. It does not include scanned items, which are considered inappropriate.

C. Obtain at time of purchase of equipment, electronically formatted versions of operation, lubrication and maintenance manuals for all items. Assemble this literature along with other information in coordinated electronic manuals with additional information describing combined operation of field assembled units, including as-built wiring diagrams. Manual shall contain names and addresses of manufacturers and local representatives who stock or furnish repair parts for items or equipment. Divide manuals into three sections or books as follows:

1. Engineering flow diagrams and controls sequences from project mechanical drawings, approved automatic temperature controls submittal, equipment startup procedures and operational instructions. Startup and operational instructions shall list valves, switches, and other devices used to start, stop and control systems. Describe procedure to be followed in case of malfunctions. Include approved valve directory showing each valve number, location of each valve, and equipment or fixture controlled by valve.

2. Detailed maintenance and troubleshooting manuals containing data furnished by manufacturer for complete maintenance. Include copy of balancing report.

3. Lubrication instructions detailing type of lubricant, amount, and intervals recommended by manufacturer for each item of equipment. Include additional instructions necessary for implementation of first class lubrication program. Include approved summary of lubrication instructions in chart form, where appropriate.

D. Submit electronic format version of manual(s) to College PM for approval. After approval, submit electronic version and one hard copy for Architect’s distribution to Owner. Deliver manuals no less than 30 days prior to acceptance of equipment to permit Owner's personnel to become familiar with equipment and operation prior to acceptance.

E. Operating instructions: Upon completion of installation, prior to Owner accepting portions of building and equipment for operational use, instruct Owner's operating personnel in operation of systems and equipment. Instruction shall be performed by equipment and controls vendors’ factory-trained personnel. Owner shall determine which systems require additional instruction. Duration of instructions for controls shall take equipment through complete cycle of operation (at least five working days). Make adjustments under operating conditions.

PART 2 - PRODUCTS (THIS PART NOT USED)

PART 3 - EXECUTION

3.1 LIFE SAFETY SYSTEMS CERTIFICATION OF COMPLETION

A. Definitions

1. Life Safety Systems - Mechanical and electrical systems including:
    a. Fire Suppression Systems
    b. Fire Notification (Alarm) and Detection Systems
    c. Smoke Exhaust and Control Systems
    d. Egress Signage and Lighting Systems
    e. Emergency Power Systems
2. Complete - For a system to be complete the following shall be true:
    a. No further work is required to satisfy the requirements specified in the drawings, specifications and applicable codes and standards.
    b. Systems are fully operational with power to components, valves open, status indicators in "normal" condition and otherwise ready "as-is" to perform required functions.
    c. Required product data and shop drawing submittals have been submitted and returned with a "Reviewed" status. See Paragraph 1.17 “Submittals” for submittal requirements.
    d. Test certificates have been submitted and returned with a "Reviewed" status. See Paragraph 1.17 “Submittals”.
    e. Project visit report observations and "punch list" items have been addressed and/or corrected.
    f. "O&M" documentation and "as-built" plans have been submitted and returned with a "Reviewed" status.

B. Notification of Completion

1. Notify the College PM in writing that the life safety systems are complete at least five (5) working days prior to requesting final certification of completion ("affidavits") from the Architect. The notification shall be in the form of a single formal document endorsed by an individual charged with management responsibility for all trades associated with the life safety systems.
2. Schedule work so life safety systems are complete in advance of other systems. This requirement is to allow the Architect to conduct a final project visit and correction of issues found without affecting issuance of a Certificate of Occupancy by the Authorities Having Jurisdiction.

3.2 SPECIAL RESPONSIBILITIES

A. Cooperate and coordinate with work of other Sections in executing work of this Section.

1. Perform work so that progress of entire project including work of other Sections shall not be interfered with or delayed.
2. Provide information as requested on items furnished under one Section which shall be installed under other Sections.

3. For equipment provided under any division or section which has connection made under the mechanical or electrical sections, obtain detailed installation and hookup information from the equipment manufacturers.

4. Obtain final roughing dimensions or other information as needed for complete installation of items furnished under other Sections or by Owner.

5. Keep fully informed as to shape, size and position of openings required for material or equipment to be provided under all Sections. Give full information so that openings required by work of this Section may be coordinated with other work and other openings and may be provided for in advance. In case of failure to provide sufficient information in proper time, provide cutting and patching or have same done, at own expense and to full satisfaction of Architect.

6. Provide information as requested as to sizes, number and locations of concrete housekeeping pads necessary for floor-mounted vibrating and rotating equipment provided under this Section.

7. Notify Architect of location and extent of existing piping, conduit, ductwork and equipment that interferes with new construction. In coordination with and with approval of Architect, relocate piping, ductwork and equipment to permit new work to be provided. Remove non-functioning and abandoned piping, ductwork and equipment. Dispose of or store items.

B. Building Expansion Joints and Firewalls

1. Ductwork, conduit, cable tray, piping, and other horizontal distribution systems shall be provided with approved expansion provisions when passing by building expansion joints. Provide copper ground jumper across expansion joints for electrical components. Systems shall be run through rated walls, partitions, and floors via approved fireproofed sleeves.

C. Installation Shall Provide Access to Systems

1. Installation shall allow clearances for easy access to systems for routine maintenance, for repairs, and for installing new cable in conduit and cable trays.

2. Access panels shall be installed in ceilings that are not composed of removable tiles. These shall be located wherever systems components exist that have moving parts, motors, or other components requiring periodic maintenance, adjustment, or replacement. Access panels shall be shown on Coordination Drawings and shall be of the type and finish as approved by the Architect.

D. Protection of Work

1. Each contractor shall be responsible for work and equipment until finally inspected, tested, and accepted. Carefully store materials and equipment that is not immediately installed after delivery to site. Close open ends of work with temporary covers or plug during construction to prevent entry of obstructing material. Cover work subject to falling debris with temporary covers.

2. Provide all materials, equipment and labor to provide adequate protection of all equipment during the course of construction. This includes protection from moisture and foreign material. At completion, all work must be turned over to Owner clean and in new condition.

3. Protect the work and material of other trades that might be damaged by work or workmen and make good all damage thus caused.

E. Installation Only Items

1. Where it is required install items that it does not purchase, coordinate the delivery and be responsible for their unloading from delivery vehicles and for safe handling and field storage up to the time of installation.

a. Necessary field assembly and internal connections, as well as mounting in place of the items, including the purchase and installation of dunnage supporting members and fastenings necessary to adapt them to architectural and structural conditions.

b. Their connection to building systems including the purchase and installation of terminating fittings necessary to adapt and connect them to the building systems.

2. Carefully examine items upon delivery. Claims that these items have been received in a condition that their installation will require procedures beyond the reasonable scope of work of this contract will be considered only if presented in writing within one week of their date of delivery. Unless claims have been submitted, fully recondition or replace damaged items.

F. Maintenance of equipment and systems: Maintain equipment and systems until Final Acceptance. Ensure adequate protection of equipment and material during delivery, storage, installation and shutdown and during delays pending final test of systems and equipment because of seasonal conditions. Protect work and equipment from damage and exposure to moisture and outdoor extreme temperature conditions until finally inspected, tested, and accepted. Carefully store materials and equipment that is not immediately installed after delivery to site. Close open ends of work including piping and ductwork with temporary covers or plugs during construction to prevent entry of obstructing material or debris.

G. Use of premises shall be restricted as follows:

1. Remove and dispose of dirt and debris, and keep premises clean. During progress of work, remove equipment and unused material. Put building and premises in neat and clean condition, and do cleaning and washing required to provide acceptable appearance and operation of equipment, to satisfaction of Architect.

2. Store materials in a manner that will maintain an orderly clean appearance. If stored on-site in open or unprotected areas, equipment and material shall be kept off the ground by means of pallets or racks, and covered with tarpaulins.

3. Do not interfere with function of existing sewers and water and gas mains, electrical, or mechanical systems and services. Extreme care shall be observed to prevent debris from entering pipe, ductwork and equipment. Confer with College PM as to disruption of services or other utilities due to testing or connection of new work to existing. Interruption of services shall be performed at time of day or night deemed by Owner to provide minimal interference with normal operation. Obtain Owner's approval of the method proposed for minimizing service interruption.

H. Surveys and Measurements:

1. Base measurements, both horizontal and vertical, on reference points established by Contractor and be responsible for correct lay out of work.

2. In event of discrepancy between actual measurements and those indicated, notify College PM in writing and do not proceed with work until written instructions have been issued.

I. Fireproofing:

1. Clips, hangers, clamps, supports and other attachments to surfaces to be fireproofed shall be installed, insofar as possible, prior to start of spray fiber work.

2. Ducts, piping and other items that would interfere with proper application of fireproofing shall be installed after completion of spray fiber work.

3. Patching and repairing of fireproofing due to cutting or damaging to fireproofing during course of work specified under this Section shall be performed by installer of fireproofing and paid for by trade responsible for damage and shall not constitute grounds for an extra to Owner.

J. Temporary Utilities:

1. Refer to Division 1 regarding requirements.

2. Coordinate work under this Section with progress of construction so that permanent heating system will be ready to provide temporary heating if permitted by College PM as soon as building is closed in.

3. Provide and direct labor required for attendance, operation and final restoration of permanent heating system if used for temporary heating purposes. Continuous direct attendance shall be provided whenever permanent system is in operation prior to acceptance of permanent heating system by Owner.

K. Airbound Systems

1. If, after plant is in operation, piping systems, coils or other apparatus are stratified or air bound (by vacuum or pressure), they shall be repiped with new approved and necessary fittings, air vents, or vacuum breakers at no extra cost. If connections are concealed in furring, floors, or ceilings, this trade shall bear all expenses of tearing up and refinishing construction and finish, leaving same in as good condition as before it was disturbed.

L. Miscellaneous

1. Unload materials and equipment delivered to site. Pay costs for rigging, hoisting, lowering and moving equipment on and around site, in building or on roof.

3.3 CONTINUITY OF SERVICES

A. Do not interrupt existing services without College PM's approval.

B. Schedule interruptions in advance, according to Owner's instructions. Submit, in writing, with request for interruption, methods proposed to minimize length of interruption.

C. Interruptions shall be scheduled at times of day and work so that they have minimal impact on Owner's operations.

D. Subcontractor shall coordinate shutdowns of existing systems as follows:

1. Give proper notice to Owner when making shutdowns; a minimum of fourteen full days are required.

2. Minimize shutdowns.

3. Provide temporary services where required and perform shutdowns and tie ins at a time convenient to Owner.

4. Subcontractor shall be responsible for completing and filing the Owner's shutdown notice questionnaire.

5. Perform required survey and inspection work required by the notice for shutdown.

E. Include premium time work associated with interruptions of services and/or shutdowns to avoid disruption to Owner's operations.

3.4 CLEANING

A. Cleaning shall be performed prior to commissioning.

B. Ductwork

1. Ducts shall be thoroughly cleaned so that no dirt or dust shall be discharged from diffusers, registers or grilles, when system is operated.

2. Provide temporary connections required for cleaning. Provide cheesecloth for openings during cleaning.

3. Replace filters prior to final inspection and testing.

C. Piping

1. Furnish pipe cleaning chemicals, chemical feed equipment, materials and labor necessary to clean piping.

2. Permanently install necessary chemical injection fittings complete with stop valves.

3. After piping systems have been pressure tested and approved for tightness, clean and flush piping as specified and in accordance with applicable codes.

4. Maintain continuous blowdown and make-up during flushing operation.

D. Equipment

1. After completion of project, clean the exterior surface of equipment, including concrete residue, dirt and paint residue.

3.5 PROJECT PUNCH LIST PROCEDURE

A. When the contract work is substantially complete, each trade contractor shall physically walk down the installation and prepare a punchlist containing an itemization of work remaining for 100% completion. The punchlist shall be submitted to the College PM as a prerequisite to the Architect's own punchlist, which will then be developed to complement that of the trade contractor.

B. If, when the Engineer arrives at the site certain areas are not complete and ready for punch out, the Engineer will not review these areas. When a second notification is issued indicating the installation is completed and the Contractor has punched and corrected these areas, the Engineer will then re-visit the site for final observations and punch list.

3.6 FUNDAMENTAL COMMISSIONING OF EQUIPMENT AND SYSTEMS

A. Refer to Division 01 for commissioning regarding additional submittal, quality assurance, and product requirements. Coordinate startup, checkout and testing procedures with the aforementioned specification. General contractor and subcontractors are responsible for reviewing, supporting and executing commissioning requirements as defined by this specification.

B. General

1. Completion of start up and commissioning shall be accomplished as a prerequisite for substantial completion.

2. Operate and maintain systems and equipment until final acceptance by the Owner.

3. All guarantees and warranties shall not begin until final acceptance of the systems and equipment by the Owner. Acceptance requires, at a minimum, completed systems commissioning.

4. The Owner maintains the right to have access to the entire project site to develop his own operational procedures.

5. The following shall be commissioned: HVAC Systems and Equipment, Plumbing Domestic Hot Water System, Laboratory Lab Gas systems, Laboratory and Water System, Electrical Lighting Controls System.

C. Commissioning Team

1. The commissioning team shall consist of: (a) the Contractor's Commissioning Project Manager ("CxPM"), plus the Project Manager for the controls vender, plus designated representatives of piping, sheetmetal, electrical, and plumbing subcontractors; (b) the Commissioning Authority ("CxA"), (c) a representative of the Owner, (d) if the HVAC engineer is not providing the CxA, then a representative of the HVAC engineer will be on the commissioning team.

2. The CxPM shall be assigned by the Construction Manager and shall be an employee of the Construction Manager, or, if there is no Construction Manager, then the CxPM shall be assigned by the General Contractor and shall be an employee of the General Contractor.

3. The CxPM shall serve as the construction team's single point of contact for the CxA. The CxPM shall be responsible for Contractor oversight and direction of the commissioning effort and for communications to all contractors' and subcontractors' representatives on the commissioning team. It shall be the CxPM's responsibility to ensure that all required parties, including technical representatives of equipment vendors, are present at commissioning related effort when required by this specification and/or when requested by the CxA. The CxPM shall witness all commissioning activities and shall initial commissioning forms to indicate satisfactory completion.

4. During the course of construction, in advance of pre-inspection and functional performance testing, the commissioning team shall meet periodically to plan the commissioning effort. Quantity and frequency of meetings shall be determined by the CxA, and will not exceed a total of four.

D. Contractor's Responsibilities

1. The Contractor shall perform the commissioning.

2. Commissioning includes all meetings, planning, scheduling, coordination, inspection testing, adjustment, re-testing, and material and labor necessary to ensure that all commissioned systems operate according to the Construction Documents.

3. The phases and overall scope of commissioning are as follows:

   a. Planning. Meeting, scheduling, and coordination to ensure that all parties, including vendors' representatives, know in advance the scope and schedule of what is required of them in the commissioning process.

   b. Commissioning Pre-Inspection (CPI). After equipment is installed, connected, and ready to operate, but before balancing and functional performance testing, the Contractor shall conduct pre-inspection to validate the installation of all equipment being commissioned. This shall be done in accordance with the pre-inspection forms (CPI forms) included in this section of the specification. The CxPM and the respective contractor's commissioning team member shall witness and shall certify the results of the pre-inspection by initialing the respective forms. The CxPM shall advise the CxA of the exact schedule for pre-inspection so that the CxA can witness parts or all of the pre-inspection. A representative of the electrical subcontractor shall be present throughout the CPI process to confirm electrical connections. A representative of the ATC subcontractor shall be present throughout the CPI process to confirm controls connections.

   c. Equipment Startup. After pre-inspection is complete, equipment shall be systematically started up according to the schedule approved by the CxPM and the commissioning team.

Representatives of equipment vendors shall be present to observe and to assist in the startup process.

d. After equipment has been successfully started up and operated, systems shall be tested and balanced. Testing shall include testing and verification of all controls sequences.

e. Functional Performance Tests (FPT). After systems are complete and equipment pre-inspection, startup, and testing and balancing have been completed, contractor shall conduct functional performance testing, in order to validate component and systems performance. This shall be done in accordance with the functional performance testing forms (FPT forms) included in this section of the specifications. The CxPM and the respective contractor's commissioning team members shall witness and shall certify the results by initialing the respective forms. The CxPM shall ensure that representatives of equipment vendors are present to observe and assist in the testing of respective equipment. The CxPM shall advise the CxA of the exact schedule for functional performance testing so that the CxA can witness parts or all of it. The functional performance tests shall be conducted over a continuous nominal one-month period in which the CxPM, and the controls project manager and controls technicians shall be constantly present and available, and the CxA shall be present periodically (on a discretionary basis). The continuous nominal one-month functional performance test period is a nominal duration only. The actual duration may be more or less than one month, but the commissioning effort shall be continuous day to day for whatever duration is required to complete it, and the CxPM, the controls project manager, and the controls technicians shall be constantly present and available.

f. Acceptance of Installation and Closeout

1) Acceptance and closeout shall be accomplished when the following has been satisfactorily completed by the contractor and certified by the CxA:

a) Pre-inspection

b) Startup, testing, and balancing

c) Functional Performance Testing

d) Systems Operating and Maintenance Manual

e) Warranties and 24 hour Service Phone Number Received

f) Other requirements of Paragraph 3.7 "Project Closeout Procedure"

3.7 COMMISSIONING OF EQUIPMENT AND SYSTEMS

A. General

1. Completion of start up and commissioning shall be accomplished as a prerequisite for substantial completion.

2. Operate and maintain systems and equipment until final acceptance by the Owner.

3. All guarantees and warranties shall not begin until final acceptance of the systems and equipment by the Owner. Acceptance requires, at a minimum, complete systems commissioning.

4. The Owner maintains the right to have access to the entire project site to develop his own operational procedures.

B. Comprehensive Work Plan & Reporting

1. Provide detailed, methodical, scheduled, start up and commissioning procedures and execution of same for every system and piece of equipment provided.

2. Attend start up and commissioning meetings on a regular basis.

3. Develop and provide a written work plan with detailed procedures for this work and submit, using shop drawing submittal procedure, within 3 months of the contract award. The work plan shall include provisions for an integrated start up plan and schedule. The plan and schedule shall identify tasks, start and completion dates, critical path items, interface requirements with other trades and major equipment start up, as minimum requirements of the plan.

4. The purpose of this work plan is to provide for smooth, quick, and efficient start up and commissioning of systems and equipment and to provide for a smooth transition to turn the complete, correctly operating building over to the Owner.

5. The Owner and Architect will have input to and be part of the approval process for the start up and commissioning plan.

6. Develop and submit for approval a specific start up, check out and sign off form for each and every system.

7. Develop and submit for approval a specific start up, check out and sign off form for every piece of major equipment.

8. Systems shall be operated under actual or simulated full load conditions. Identify the operating conditions in the work plan.

9. Work plan shall incorporate the "Demonstration of Successful Operation" described below.

10. The Architect/Owner may check the completed and commissioned installation either sequentially as different parts are completed, and/or when the entire installation is complete, at the sole option of the Architect/Owner.

11. Each trade shall arrange that an officer of the contracting company shall certify that each and every system has been tested. At the conclusion of the tests, submit a letter and enclosed commissioning forms signed by the officer stating:

    a. That he/she is an officer of the company.

    b. That he/she certifies that the specified testing of the systems has been performed by the company (give the name and dates of system testing).

    c. The results of the testing, as compared to specified performance, listing the name, title, and company affiliation of all those witnessing and performing these tests.

C. Commissioning

1. Commission equipment and systems in accordance with the approved work plan, completing the start up, check out and sign off forms for each piece of equipment and each system.

2. Provide qualified personnel, equipment, apparatus and services for start-up and testing of equipment and systems, to obtain the performance data shown in schedules, as specified or shown in commissioning forms in compliance with applicable codes, standards, regulations and authorities having jurisdiction including Municipal Inspectors, Owners and Architect.

3. Start up and testing procedures as may be outlined in the various sections of the specifications are the minimum effort required for the project. Use additional procedures required to properly start up and test the systems and equipment actually installed on the job.

4. Prove capacity and performance of equipment by field testing. Install thermowells and gauge connections and at no additional cost to Owner equipment and instruments required for testing.

5. Qualified representative of equipment manufacturer shall be present at test.

6. For each piece of equipment, copy nameplate data and include with the letter and start up, check out and sign off forms referred to above.

7. Do not cover or conceal work before testing and inspection and obtaining approval.

8. Leaks, damage and defects discovered or resulting from start up and testing shall be repaired or replaced by this contract to like-new condition with acceptable materials. Tests shall be continued until system operates without adjustments or repairs.

D. Demonstration of Successful Operation

1. After components and systems have been commissioned, provide a 2 week, 24 hour per day fully functional automatic operation period of systems simultaneously. This shall be successfully concluded before systems are accepted by Owner.

3.8 PROJECT CLOSE-OUT PROCEDURE

A. General

1. The requirements of this section are in addition to and supplement the requirements outlined in Division 01, Execution and Closeout Requirements.

2. Hand-deliver project close-out checklist items and to obtain authorized signed receipt for items requiring Owner sign-off.

B. Project Close-Out Checklist

1. Review requirements of each section of the specifications and submit for approval to Architect the sign-off forms that shall become the project close-out checklist. These, at a minimum, shall include the following information shown in attached Project Closeout Checklist Example. The Architect and/or Owner may incorporate additional specific items to the following checklist which shall become part of the project requirements.

2. Close-Out Checklist Example.

PROJECT CLOSE-OUT				
PROJECT:				
DIVISION NO.:				
CONTRACTOR:				

ITEM[1]	DATES		OWNER'S SIGN-OFF
	COMPLETED	RECEIVED BY OWNER	
Permits			
City and County Inspection			
Manufacturer's Warranties			
Contractor's Warranties			
State Fire Rating Data			
Copy of Final Shop Drawings			
List and Possession of Spare Parts			
Pressure Tests			
Equipment Tests Required by Specs			
O & M Manuals			
Record Documents			
Coordination Drawings			
Sanitization Reports			
Commissioning Reports/Letters/Forms			
On Site Training Complete			
Protective Device Settings			
Valve Tags and Charts			
Final ATC Installation Drawings			
Insurance Underwriters Approvals			
Final Punch List (Initialed by contractor that items are complete)			
Building Certificate of Occupancy (CO)			
24 Hour Phone No. for Service During Guarantee Period

[1] Provide separate line item for each specified item (do not group items)

SECTION 210500 - COMMON WORK RESULTS FOR FIRE SUPPRESSION

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. This Section includes the following:
   1. Piping materials and installation instructions common to most piping systems.
   2. Mechanical sleeve seals.
   3. Sleeves.
   4. Escutcheons.
   5. Grout.
   6. Fire-suppression equipment.
   7. Equipment installation requirements common to equipment sections.
   8. Painting and finishing.
   9. Concrete bases.

B. Refer to Section 220529 for pipe supports and hangers.

1.3 DEFINITIONS

A. Finished Spaces: Spaces other than mechanical and electrical equipment rooms, furred spaces, pipe chases, unheated spaces immediately below roof, spaces above ceilings, unexcavated spaces, crawlspaces, and tunnels.

B. Exposed, Interior Installations: Exposed to view indoors. Examples include finished occupied spaces and mechanical equipment rooms.

C. Exposed, Exterior Installations: Exposed to view outdoors or subject to outdoor ambient temperatures and weather conditions. Examples include rooftop locations.

D. Concealed, Interior Installations: Concealed from view and protected from physical contact by building occupants. Examples include above ceilings and in chases.

E. Concealed, Exterior Installations: Concealed from view and protected from weather conditions and physical contact by building occupants but subject to outdoor ambient temperatures. Examples include installations within unheated shelters.

F. The following are industry abbreviations for plastic materials:

G. The following are industry abbreviations for rubber materials:
   1. EPDM: Ethylene-propylene-diene terpolymer rubber.
   2. NBR: Acrylonitrile-butadiene rubber.

1.4 SUBMITTALS

A. Product Data: For the following:
   1. Mechanical sleeve seals.
   2. Escutcheons.

B. Welding certificates.

1.5 QUALITY ASSURANCE

A. Steel Support Welding: Qualify processes and operators according to AWS D1.1, "Structural Welding Code--Steel."

B. Steel Pipe Welding: Qualify processes and operators according to ASME Boiler and Pressure Vessel Code: Section IX, "Welding and Brazing Qualifications."
   1. Comply with provisions in ASME B31 Series, "Code for Pressure Piping."
   2. Certify that each welder has passed AWS qualification tests for welding processes involved and that certification is current.

C. Electrical Characteristics for Fire-Suppression Equipment: Equipment of higher electrical characteristics may be furnished provided such proposed equipment is approved in writing and connecting electrical services, circuit breakers, and conduit sizes are appropriately modified. If minimum energy ratings or efficiencies are specified, equipment shall comply with requirements.

1.6 DELIVERY, STORAGE, AND HANDLING

A. Deliver pipes and tubes with factory-applied end caps. Maintain end caps through shipping, storage, and handling to prevent pipe end damage and to prevent entrance of dirt, debris, and moisture.

B. Store plastic pipes protected from direct sunlight. Support to prevent sagging and bending.

1.7 COORDINATION

A. Arrange for pipe spaces, chases, slots, and openings in building structure during progress of construction, to allow for fire-suppression installations.

B. Coordinate installation of required supporting devices and set sleeves in poured-in-place concrete and other structural components as they are constructed.

C. Coordinate requirements for access panels and doors for fire-suppression items requiring access that are concealed behind finished surfaces. Access panels and doors are specified in Division 08 Section "Access Doors and Frames."

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. In other Part 2 articles where subparagraph titles below introduce lists, the following requirements apply for product selection:
   1. Manufacturers: Subject to compliance with requirements, provide products by the manufacturers specified.

2.2 PIPE, TUBE, AND FITTINGS

A. Refer to individual Division 21 piping Sections for pipe, tube, and fitting materials and joining methods.

B. Pipe Threads: ASME B1.20.1 for factory-threaded pipe and pipe fittings.

2.3 JOINING MATERIALS

A. Refer to individual Division 21 piping Sections for special joining materials not listed below.

B. Pipe-Flange Gasket Materials: Suitable for chemical and thermal conditions of piping system contents.
   1. ASME B16.21, nonmetallic, flat, asbestos-free, 1/8-inch maximum thickness unless thickness or specific material is indicated.
      a. Full-Face Type: For flat-face, Class 125, cast-iron and cast-bronze flanges.
      b. Narrow-Face Type: For raised-face, Class 250, cast-iron and steel flanges.
   2. AWWA C110, rubber, flat face, 1/8 inch thick, unless otherwise indicated; and full-face or ring type, unless otherwise indicated.

C. Flange Bolts and Nuts: ASME B18.2.1, carbon steel, unless otherwise indicated.

D. Welding Filler Metals: Comply with AWS D10.12 for welding materials appropriate for wall thickness and chemical analysis of steel pipe being welded.

2.4 MECHANICAL SLEEVE SEALS

A. Description: Modular sealing element unit, designed for field assembly, to fill annular space between pipe and sleeve.
   1. Manufacturers:
      a. Advance Products & Systems, Inc.
      b. Calpico, Inc.
      c. Metraflex Co.
      d. Pipeline Seal and Insulator, Inc.
   2. Sealing Elements: **EPDM** interlocking links shaped to fit surface of pipe. Include type and number required for pipe material and size of pipe.
   3. Pressure Plates: Stainless steel. Include two for each sealing element.
   4. Connecting Bolts and Nuts: Stainless steel of length required to secure pressure plates to sealing elements. Include one for each sealing element.

2.5 SLEEVES

A. Galvanized-Steel Sheet: 0.0239-inch minimum thickness; round tube closed with welded longitudinal joint.

B. Steel Pipe: ASTM A 53, Type E, Grade B, Schedule 40, galvanized, plain ends.

C. Cast Iron: Cast or fabricated "wall pipe" equivalent to ductile-iron pressure pipe, with plain ends and integral waterstop, unless otherwise indicated.

D. Stack Sleeve Fittings: Manufactured, cast-iron sleeve with integral clamping flange. Include clamping ring and bolts and nuts for membrane flashing.
   1. Underdeck Clamp: Clamping ring with set screws.

2.6 ESCUTCHEONS

A. Description: Manufactured wall and ceiling escutcheons and floor plates, with an ID to closely fit around pipe, tube, and insulation of insulated piping and an OD that completely covers opening.

B. One-Piece, Deep-Pattern Type: Deep-drawn, box-shaped brass with polished chrome-plated finish.

C. One-Piece, Cast-Brass Type: With set screw.
   1. Finish: Polished chrome-plated.

D. Split-Casting, Cast-Brass Type: With concealed hinge and set screw.
   1. Finish: Polished chrome-plated.

E. One-Piece, Stamped-Steel Type: With set screw or spring clips and chrome-plated finish.

F. Split-Plate, Stamped-Steel Type: With exposed-rivet hinge, set screw or spring clips, and chrome-plated finish.

G. One-Piece, Floor-Plate Type: Cast-iron floor plate.

H. Split-Casting, Floor-Plate Type: Cast brass with concealed hinge and set screw.

2.7 GROUT

A. Description: ASTM C 1107, Grade B, nonshrink and nonmetallic, dry hydraulic-cement grout.
   1. Characteristics: Post-hardening, volume-adjusting, nonstaining, noncorrosive, nongaseous, and recommended for interior and exterior applications.
   2. Design Mix: 5000-psi, 28-day compressive strength.
   3. Packaging: Premixed and factory packaged.

PART 3 - EXECUTION

3.1 PIPING SYSTEMS - COMMON REQUIREMENTS

A. Install piping according to the following requirements and Division 21 Sections specifying piping systems.

B. Drawing plans, schematics, and diagrams indicate general location and arrangement of piping systems. Indicated locations and arrangements were used to size pipe and calculate friction loss, expansion, pump sizing, and other design considerations. Install piping as indicated unless deviations to layout are approved on Coordination Drawings.

C. Install piping in concealed locations, unless otherwise indicated and except in equipment rooms and service areas.

D. Install piping indicated to be exposed and piping in equipment rooms and service areas at right angles or parallel to building walls. Diagonal runs are prohibited unless specifically indicated otherwise.

E. Install piping above accessible ceilings to allow sufficient space for ceiling panel removal.

F. Install piping to permit valve servicing.

G. Install piping at indicated slopes.

H. Install piping free of sags and bends.

I. Install fittings for changes in direction and branch connections.

J. Select system components with pressure rating equal to or greater than system operating pressure.

K. Install escutcheons for penetrations of walls, ceilings, and floors according to the following:
   1. New Piping:
      a. Piping with Fitting or Sleeve Protruding from Wall: One-piece, deep-pattern type.
      b. Chrome-Plated Piping: One-piece, cast-brass type with polished chrome-plated finish.
      c. Insulated Piping: One-piece, stamped-steel type with spring clips.
      d. Bare Piping at Wall and Floor Penetrations in Finished Spaces: One-piece, cast-brass type with polished chrome-plated finish.
      e. Bare Piping at Ceiling Penetrations in Finished Spaces: One-piece or split-casting, cast-brass type with polished chrome-plated finish.
      f. Bare Piping in Unfinished Service Spaces: One-piece, cast-brass type with polished chrome-plated finish.
      g. Bare Piping in Equipment Rooms: One-piece, cast-brass type.
      h. Bare Piping at Floor Penetrations in Equipment Rooms: One-piece, floor-plate type.

L. Sleeves are not required for core-drilled holes.

M. Install sleeves for pipes passing through concrete and masonry walls, gypsum-board partitions, and concrete floor and roof slabs.
   1. Cut sleeves to length for mounting flush with both surfaces.
      a. Exception: Extend sleeves installed in floors of mechanical equipment areas or other wet areas 2 inches above finished floor level. Extend cast-iron sleeve fittings below floor slab as required to secure clamping ring if ring is specified.

2. Install sleeves in new walls and slabs as new walls and slabs are constructed.
3. Install sleeves that are large enough to provide 1/4-inch annular clear space between sleeve and pipe or pipe insulation. Use the following sleeve materials:
    a. Steel Pipe Sleeves: For pipes smaller than NPS 6.
    b. Steel Sheet Sleeves: For pipes NPS 6 and larger, penetrating gypsum-board partitions.
    c. Stack Sleeve Fittings: For pipes penetrating floors with membrane waterproofing. Secure flashing between clamping flanges. Install section of cast-iron soil pipe to extend sleeve to 2 inches above finished floor level. Refer to Division 07 Section "Sheet Metal Flashing and Trim" for flashing.
        1) Seal space outside of sleeve fittings with grout.
4. Except for underground wall penetrations, seal annular space between sleeve and pipe or pipe insulation, using joint sealants appropriate for size, depth, and location of joint. Refer to Division 07 Section "Joint Sealants" for materials and installation.

N. Aboveground, Exterior-Wall Pipe Penetrations: Seal penetrations using sleeves and mechanical sleeve seals. Select sleeve size to allow for 1-inch annular clear space between pipe and sleeve for installing mechanical sleeve seals.
1. Install steel pipe for sleeves smaller than 6 inches in diameter.
2. Install cast-iron "wall pipes" for sleeves 6 inches and larger in diameter.
3. Mechanical Sleeve Seal Installation: Select type and number of sealing elements required for pipe material and size. Position pipe in center of sleeve. Assemble mechanical sleeve seals and install in annular space between pipe and sleeve. Tighten bolts against pressure plates that cause sealing elements to expand and make watertight seal.

O. Underground, Exterior-Wall Pipe Penetrations: Install cast-iron "wall pipes" for sleeves. Seal pipe penetrations using mechanical sleeve seals. Select sleeve size to allow for 1-inch annular clear space between pipe and sleeve for installing mechanical sleeve seals.
1. Mechanical Sleeve Seal Installation: Select type and number of sealing elements required for pipe material and size. Position pipe in center of sleeve. Assemble mechanical sleeve seals and install in annular space between pipe and sleeve. Tighten bolts against pressure plates that cause sealing elements to expand and make watertight seal.

P. Fire-Barrier Penetrations: Maintain indicated fire rating of walls, partitions, ceilings, and floors at pipe penetrations. Seal pipe penetrations with firestop materials. Refer to Division 07 Section "Penetration Firestopping" for materials.

Q. Verify final equipment locations for roughing-in.

R. Refer to equipment specifications in other Sections of these Specifications for roughing-in requirements.

3.2 PIPING JOINT CONSTRUCTION

A. Join pipe and fittings according to the following requirements and Division 21 Sections specifying piping systems.

B. Ream ends of pipes and tubes and remove burrs. Bevel plain ends of steel pipe.

C. Remove scale, slag, dirt, and debris from inside and outside of pipe and fittings before assembly.

D. Threaded Joints: Thread pipe with tapered pipe threads according to ASME B1.20.1. Cut threads full and clean using sharp dies. Ream threaded pipe ends to remove burrs and restore full ID. Join pipe fittings and valves as follows:

1. Apply appropriate tape or thread compound to external pipe threads unless dry seal threading is specified.
2. Damaged Threads: Do not use pipe or pipe fittings with threads that are corroded or damaged. Do not use pipe sections that have cracked or open welds.

E. Welded Joints: Construct joints according to AWS D10.12, using qualified processes and welding operators according to Part 1 "Quality Assurance" Article.

F. Flanged Joints: Select appropriate gasket material, size, type, and thickness for service application. Install gasket concentrically positioned. Use suitable lubricants on bolt threads.

3.3 PAINTING

A. Painting of fire-suppression systems, equipment, and components is specified in Division 09 Sections "Interior Painting" and "Exterior Painting."

B. Damage and Touchup: Repair marred and damaged factory-painted finishes with materials and procedures to match original factory finish.

3.4 ERECTION OF METAL SUPPORTS AND ANCHORAGES

A. Refer to Division 05 Section "Metal Fabrications" for structural steel.

B. Cut, fit, and place miscellaneous metal supports accurately in location, alignment, and elevation to support and anchor fire-suppression materials and equipment.

C. Field Welding: Comply with AWS D1.1.

3.5 GROUTING

A. Mix and install grout for fire-suppression equipment base bearing surfaces, pump and other equipment base plates, and anchors.

B. Clean surfaces that will come into contact with grout.

C. Provide forms as required for placement of grout.

D. Avoid air entrapment during placement of grout.

E. Place grout, completely filling equipment bases.

F. Place grout on concrete bases and provide smooth bearing surface for equipment.

G. Place grout around anchors.

H. Cure placed grout.

END OF SECTION 210500

SECTION 210800 – FIRE SUPPRESSION SYSTEM COMMISSIONING

PART 1 - GENERAL

1.1 WORK INCLUDED

A. Systems and equipment testing and start-up

B. Validation of proper and thorough installation of Division 21 systems and equipment

C. Equipment performance verification

D. Functional testing of Fire Protection systems

E. Documentation of tests, procedures, and installations

F. Coordination of training

1.2 GENERAL DESCRIPTION

A. Commissioning (Cx) is the process of ensuring that all building systems are installed and perform interactively according to the design intent; that systems are efficient and cost effective and meet the Owner's operational needs; that the installation is adequately documented; and that the Operators are adequately trained. It serves as a tool to minimize post-occupancy operational problems. It establishes testing and communication protocols in an effort to advance the building systems from installation to full dynamic operation and optimization.

B. Commissioning Authority (CA) is retained by the Owner shall work with the Contractor and the Design Engineer to direct and oversee the Cx process and perform functional performance testing.

C. This Section outlines the Cx procedures specific to the Division 21 Contractors. Requirements common to all Sections are specified in Sections 019113 and 019114 and the Cx Plan.

1.3 SCOPE

A. The following are included in the Scope of Commissioning on this project:

1. Fire Suppression Systems and Controls
2. Fire Pumps

1.4 RELATED WORK AND DOCUMENTS

A. Commissioning Plan: The Commissioning Plan outlines the commissioning process beyond the construction specification. All Contractor responsibilities are outlined in Specifications. Cx Plan is available to the Contractor to understand the context of their responsibilities but does not define any additional responsibilities of the Contractor

B. Section 019113 – General Commissioning Requirements: details the Cx requirements common across all divisions

C. Section 019114 – Functional Testing Procedures: Outlines the generic functional testing procedures required.

D. Individual Specification Sections: Individual sections stipulate installation, start-up, warranty, O&M documentation, and training requirements for the system or device specified in the Section.

E. Section 220800– Plumbing Systems Commissioning: Details the commissioning procedures specific to Plumbing Systems (Div 22) work.

F. Section 230800 – HVAC Systems Commissioning: Details the commissioning procedures specific to HVAC (Div 23) work.

G. Section 230995 – Building Automation Systems Commissioning: Details the commissioning procedures specific to the Building Automation System.

H. Section 260800 – Electrical Systems Commissioning: Details the commissioning procedures specific to Division 26 work.

I. Section 280810 – Security Systems Commissioning: Details the commissioning procedures specific to the Security System.

J. Section 280820 – Fire Alarm Systems Commissioning: Details the commissioning procedures specific to the Fire Alarm System.

1.5 DEFINITIONS AND ABBREVIATIONS

A. Refer to Section 019113

1.6 REFERENCE STANDARDS

A. Local Building Codes

B. National Fire Protection Association (NFPA)

C. National Electric Code (NEC)

D. American Society for Testing and Materials (ASTM)

E. Electronics Industry Association/Telecommunications Industry Association (EIA/TIA)

F. Illuminating Engineering Society (IES)

G. Institute of Electrical and Electronics Engineers (IEEE)

H. International Electrical Testing Association (NETA)

I. National Electrical Manufacturer Association (NEMA)

J. Underwriters Laboratory, Inc. (UL)

1.7 DOCUMENTATION

A. In addition to the documentation required in Section 019113, Contractor shall provide to the CA the following per the procedures specified herein, in the Cx Plan, and in other Sections of the specification:

1. Factory Test Reports: Contractor shall provide any factory testing documentation or certified test reports required by the specifications. These shall be provided prior to Acceptance Phase. Factory Test Reports should be provided in pdf electronic format. These may include but are not limited to:

   a. Fire pump certified curves

2. Field Testing Agency Reports: Provide all documentation of work of independent testing agencies required by the specification. These shall be provided prior to Acceptance Phase. Provide in acceptable electronic format. These may include but are not limited to:

   a. Hydraulic Test for the Fire Pump
   b. Testing of the Fire Pump Transfer Switch

3. Fire alarm system approvals and certifications

1.8 CONTRACTOR RESPONSIBILITIES

A. Refer to Section 019113: Detailed Contractor responsibilities common to all Divisions are specified in Section 019113. The following are additional responsibilities or notable responsibilities specific to Division 21.

B. Construction Phase

1. Coordinate the work of the Fire Pump Testing Agency and the Cx requirements.
2. Coordinate the checkout of the fire suppression system and the approval of the regulatory authorities with the Cx process.

1.9 INDEPENDENT FIRE PUMP TESTING AGENCY

A. An independent testing agency shall be provided under the construction specifications and therefore included with the bid. Many of the aspects of the start up and functional performance testing indicated herein will be accomplished under the respective section and witnessed by the CxT at the indicated sample rate. CxT will include applicable test results in the functional performance testing record.

1. Fire Pump Controller and Transfer switch operation testing documentation shall be included.

1.10 TRAINING

A. Contractors, Subcontractor, Vendors, and other applicable Parties shall prepare and conduct training sessions on the installed systems and equipment they are responsible for per the requirements of Section 019113 and the individual Specifications.

PART 2 - PRODUCTS

2.1 INSTRUMENTATION

A. General: All testing equipment used by any Party shall be of sufficient quality and accuracy to test and/or measure system performance with the tolerances specified.

2.2 WEB-BASED COMMISSIONING PORTAL

A. All general and major subcontractors participating in the Cx process shall use the web-based Cx Portal ('Portal') to document the Cx procedures. The Portal is a Web-based Internet hub used to electronically collaborate and coordinate activities and deliverables throughout the Cx process. The Portal is hosted by the CA and shall be accessible to all Parties participating in the Cx program. The Portal provides a common location to store Start-Up Documentation, Functional Performance Tests and results, project documents and deliverables. It also serves as a collaborative email hub to facilitate, automate, and track communications between Parties relating to the Cx process.

B. Refer to Section 019113 the individual Specifications for additional information and requirements for using the Portal.

PART 3 - EXECUTION

3.1 START-UP PROCEDURES - GENERAL

A. Part 3 of this Section outlines specific start-up, check out and training requirements for systems and equipment. These requirements along with those specified in the individual section provide a minimum or guideline for development of start-up procedures, checklists and tests. Contractor shall synthesize these minimum requirements along with their own internal quality control practices, those of the manufacturer, and any applicable codes and standards to develop specific and itemized Start-Up Procedures specific to the equipment and systems installed on this project.

B. Coordination with other contractors: Division 21 contractor shall coordinate with the mechanical contractors for testing of mechanical components, fire alarm contractor for checkout of alarming of the suppression systems and electrical contractor for testing of electrical components.

3.2 METERS AND GAGES

A. Start-Up Checks: Perform the following checks during start-up and as specified in manufacturer's instructions:

1. Adjust faces of meters and gages to proper angle for best visibility.
2. Clean windows of meters and gages and factory-finished surfaces. Replace cracked and broken windows, and repair scratched and marred surfaces with manufacturer's touch-up paint. For meters and gages requiring temporary manual connection of read-out device such as pressure taps on a flow measuring device, ensure threads are clean and that connection can be made easily.
3. Meters and gages requiring manual connection of readout device shall be installed with adequate access to allow connection of device with normal tools.

3.3 PIPING - GENERAL

A. Start-Up Checks: These Procedures apply to all installed piping systems, including underground site utilities.

1. Inspect all piping for proper installation, adequate support (with appropriate vibration isolation where applicable) and adequate isolation valves for required service.
2. Flush and clean all piping and clean all strainers. Provide documentation of all related procedures.
3. Ensure adequate drainage is provided at low points and venting is provided at high points.
4. Ensure air is thoroughly removed from the system as applicable. Ensure facilities to effectively drain and fill the system are in place.
5. Ensure all piping is adequately supported and anchored to allow expansion. Bump across-the-line pumps and inspect for excessive pipe movement.
6. Provide notification of pressure testing
7. Pressure and/or leak test all applicable systems in accordance with the requirements in the applicable sections, ASME B 31.1 and 39.1 as applicable.
8. Sterilize applicable piping systems as specified in the individual Sections and as required by regulatory authorities.
9. Submit pressure test reports that document the pressure testing results with Certification of the results.
10. Verify the operation of applicable safety relief valves, operating controls, safety controls, etc. to ensure a safe installation.
11. Set and adjust fill, pressure, or level controls to the required setting.

3.4 AC MOTORS

A. Start-Up Checks: Follow the manufacturer's written procedures and the following as a minimum:

1. Inspect terminations and grounding
2. Ensure proper access to all electrical equipment
3. Ensure proper labeling of all electrical equipment
4. Compare wiring of poles to manufacturer's instructions
5. Verify proper alignment, installation, and rotation
6. Check voltage to disconnects with disconnect open and compare to rating data.
7. In collaboration with the contractor who supplied the motor, bump it and ensure proper rotation.
8. Megger test each motor.
9. In collaboration with the contractor who supplied the motor, place the motor under load to the maximum feasible and measure

    a. Voltage and current at motor terminals on each phase and calculate balance
    b. Power factor and phasing of each motor

10. Check the overloads in comparison to FLA measured and ensure adequacy of protection and reliability.
11. Observe several start to ensure the start is reliable.
12. Measure voltage available to all phases; after motor has been placed in operation under load measure amps and RPM
13. Record all motor nameplate data

3.5 BEARINGS

A. This applies to all bearings on fans, pumps, compressors, etc.

B. Check alignment as applicable

C. Lubricate all bearings per the manufacturer’s instructions. When bearing is used for temporary conditioning, lubricate on manufacturer’s recommended frequency and document it.

3.6 FIRE PUMPS

A. General: Provide the services of a manufacturer certified specialist to supervise the installation, make adjustments, and perform tests on the Fire Pump and train Owner's maintenance personnel.

B. Start-Up Checks: Perform the following checks before start-up:

1. Check suction lines connections for tightness to avoid drawing air into the pump.
2. Clean and lubricate all bearings.
3. Refer to AC Motors in this section
4. Check motor for proper rotation. Rotation shall match direction of rotation marked on pump casing.
5. Check that pump is free to rotate by hand. If the pump is bound or even drags slightly, do not operate the pump until the cause of the trouble is determined and corrected.
6. Clean associated strainers
7. Check that the proper overloads have been installed in the starter and are the correct size
8. Verify that the integrity of the vibration isolation is maintained throughout the support and the connections
9. Align pump within manufacturers recommended tolerances
10. Ensure all associated piping has been cleaned, tested deareated.

C. Starting Procedures: Follow the manufacturer's written procedures and the following as a minimum:

1. Start the pump per the manufacturer’s instructions
2. Check the general mechanical operation of the pump and motor.
3. Verify that all gages are installed, are clean and undamaged, and are functional
4. Verify that check valve seal is appropriate
5. Check noise and vibration levels and ensure they are within the manufacturers recommended tolerances.
6. Check that the NPSH is with that allowable for the operating condition.

D. Start-Up Tests: Perform a Fire Pump Hydraulic Acceptance test per NFPA 20.

1. Schedule and notify CA and Owner representatives of the Fire Pump Hydraulic Acceptance tests.
2. Perform Flow Test
3. Perform Loaded Start test (start into peak capacity)
4. Perform Phase Reversal Test
5. Perform Controller Acceptance test

E. Training: Train Owner's maintenance personnel on procedures and schedules related to start-up and shutdown, troubleshooting, servicing, and preventative maintenance.

1. Review data in Operating and Maintenance Manuals

3.7 FIRE SUPPRESSION SYSTEMS

A. General: Provide the services of a manufacturer certified specialist to supervise the installation, make adjustments, and perform tests on the Fire Suppression Systems and train Owner's maintenance personnel.

B. Start up and Checkout sprinkler systems per NFPA 13 Chapter 10 Systems acceptance

1. Complete NFPA Material and Test Certificate forms
2. Flush water mains prior to connection of the system
3. Hydrostatically test the systems per NFPA 13
4. For dry pipe systems, pneumatically pressure test piping per NFPA
5. Schedule and notify CA and Owner representatives of the Fire Suppression systems acceptance tests
6. Test all wet pipe zones through the inspector’s test station. Ensure proper alarming and draining. Simulate one head and jockey pump operation. Then simulate multiple zones and full fire pump operation
7. For Dry Pipe Systems: Test the dry pipe valve alone and with a quick-opening device, if installed, by opening the inspector’s test connection. The test shall measure the time to trip the valve and the time for water to be discharged from the inspector’s test connection. All times shall be measured from the time the inspector’s test connection is completely opened. The results shall be recorded using the contractor’s material and test certificate for aboveground piping.
8. For Deluge or Preaction Systems: test the automatic operation of a deluge or preaction valve in accordance with the manufacturer’s instructions. The manual and remote control operation, where present, shall also be tested.
9. Open and close all hydrants with full water pressure on the hydrant
10. PRVs: Each pressure-reducing valve shall be tested upon completion of installation to ensure proper operation under flow and no-flow conditions. Testing shall verify that the device properly regulates outlet pressure at both maximum and normal inlet pressure conditions. The results of the flow test of each pressure-reducing valve shall be recorded on the contractor’s test certificate. The results shall include the static and residual inlet pressures, static and residual outlet pressures, and the flow rate.

C. Training: Train Owner in the operation, maintenance, and inspection of the Fire Suppression Systems. Provide the owner with a copy of NFPA 25

3.8 AUTOMATIC TRANSFER SWITCHES

A. General: Provide the services of a manufacturer certified specialist to supervise the installation, make adjustments, and perform tests on the automatic transfer switches and train Owner's maintenance personnel.

B. Start-up checklists: Perform the following final checks before startup

1. Visually inspect the systems.
2. Ensure the terminations are tight and all ancillary equipment completely installed.
3. Ensure all overloads are in place.
4. Measure contact resistance
5. Complete NFPA forms as applicable

C. Starting Procedures: Follow the manufacturer's written procedures and the following as a minimum:

1. Energize Switch

2. Check positive interlock between systems
3. Set/Calibrate Voltage sensing relay, transfer time delays (in both directions), and synchronization relays
4. Measure insulation resistance and resistance to ground
5. Check manual bypass operation

D. Acceptance Testing: In concert with the Fire Pump Acceptance Test, perform start tests, the power outage and endurance tests, phase reversal tests required by NFPA 20.

E. Training: Train Owner's maintenance personnel on procedures and schedules related to start-up and shutdown, troubleshooting, servicing, and preventative maintenance.

1. Review data in Operating and Maintenance Manuals.

END OF SECTION 210800

SECTION 211200 - FIRE-SUPPRESSION STANDPIPES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:
1. Pipes, fittings, and specialties.
2. Fire-protection valves.
3. Fire department hose connections.
4. Fire department cabinets.
5. Fire department connections free standing.
6. Alarm devices.
7. Manual control stations.
8. Control panels.
9. Pressure gages.

B. Related Sections:
1. Division 21 Section "Wet-Pipe Sprinkler Systems" for wet-pipe sprinkler piping.
2. Division 28 Sections for alarm devices not specified in this Section.

1.3 DEFINITIONS

A. Standard-Pressure Standpipe Piping: Fire-suppression standpipe piping designed to operate at working pressure 175 psig (1200 kPa) maximum.

1.4 SYSTEM DESCRIPTIONS

A. Automatic Wet-Type, Class I Standpipe System: NPS 2-1/2 (DN 65) hose connections with reducer caps for NPS 1-1/2 (DN 37) hose connections.

1.5 PERFORMANCE REQUIREMENTS

A. Standard-Pressure, Fire-Suppression Standpipe System Component: Listed for 175-psig (1200-kPa) minimum working pressure.

B. Delegated Design: Design fire-suppression standpipes, including comprehensive engineering analysis by a qualified NICET certified designer, using performance requirements and design criteria indicated.
1. Available fire-hydrant flow test records used as the basis of design are provided on the Drawings.

C. Fire-suppression standpipe design shall be approved by authorities having jurisdiction.

1. Minimum residual pressure at each hose-connection outlet is as follows:
   a. NPS 2-1/2 (DN 65) Hose Connections: 100 psig (690 kPa).
2. Maximum residual pressure at required flow at each hose-connection outlet is as follows unless otherwise indicated:
   a. NPS 2-1/2 (DN 65) Hose Connections: 175 psig (1200 kPa).

1.6 SUBMITTALS

A. Product Data: For each type of product indicated. Include rated capacities, operating characteristics, electrical characteristics, and furnished specialties and accessories.

B. Shop Drawings: For fire-suppression standpipes. Include plans, elevations, sections, details, and attachments to other work.
   1. Wiring Diagrams: For power, signal, and control wiring.

C. Delegated-Design Submittal: For standpipe systems indicated to comply with performance requirements and design criteria, including analysis data.

D. Coordination Drawings: Fire-suppression standpipes, drawn to scale, on which the following items are shown and coordinated with each other, using input from installers of the items involved:
   1. All MEP systems

E. Qualification Data: For qualified Installer and professional engineer.

F. Approved Standpipe Drawings: Working plans, prepared according to NFPA 14, that have been approved by authorities having jurisdiction, including hydraulic calculations.
   1. Grooved joint couplings and fittings shall be shown on drawings and product submittals and shall be specifically identified with the applicable Victaulic style or series number.

G. Welding certificates.

H. Fire-hydrant flow test report.

I. Field Test Reports and Certificates: Indicate and interpret test results for compliance with performance requirements and as described in NFPA 14. Include "Contractor's Material and Test Certificate for Aboveground Piping" and "Contractor's Material and Test Certificate for Underground Piping."

J. Field quality-control reports.

K. Operation and Maintenance Data: For fire-suppression standpipes specialties to include in emergency, operation, and maintenance manuals.

1.7 QUALITY ASSURANCE

A. Installer Qualifications:
   1. Installer's responsibilities include designing, fabricating, and installing fire-suppression standpipes and providing professional engineering services needed to assume engineering responsibility. Base calculations on results of fire-hydrant flow test.
      a. Engineering Responsibility: Preparation of working plans, calculations, and field test reports.

B. Welding Qualifications: Qualify procedures and operators according to ASME Boiler and Pressure Vessel Code.

C. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

D. NFPA Standards: Fire-suppression standpipe equipment, specialties, accessories, installation, and testing shall comply with NFPA 14, "Installation of Standpipe and Hose Systems."

E. To assure uniformity and compatibility of piping components in grooved piping systems, all grooved products utilized shall be supplied by a single manufacturer. Grooving tools shall be supplied from the same manufacturer as the grooved components.

1.8 PROJECT CONDITIONS

A. Interruption of Existing Fire-Suppression Standpipe Service: Do not interrupt fire-suppression standpipe service to facilities occupied by Owner or others unless permitted under the following conditions and then only after arranging to provide temporary fire-suppression standpipe service according to requirements indicated:
   1. Notify Owner no fewer than two days in advance of proposed interruption of fire-suppression standpipe service.
   2. Do not proceed with interruption of fire-suppression standpipe service without Owner's written permission.

PART 2 - PRODUCTS

2.1 PIPING MATERIALS

A. Comply with requirements in "Piping Schedule" Article for applications of pipe, tube, and fitting materials, and for joining methods for specific services, service locations, and pipe sizes.

2.2 STEEL PIPE AND FITTINGS

A. Standard Weight, Galvanized- and Black-Steel Pipe: ASTM A 53/A 53M, Type E, Grade B. Pipe ends may be factory or field formed to match joining method.

B. Standard-Weight, Galvanized- and Black-Steel Pipe Nipples: ASTM A 733, made of ASTM A 53/A 53M, seamless steel pipe with threaded ends.

2.3 PIPING JOINING MATERIALS

A. Pipe-Flange Gasket Materials: AWWA C110, rubber, flat face, 1/8 inch (3.2 mm) thick or ASME B16.21, nonmetallic and asbestos free.
   1. Class 125, Cast-Iron Flanges and Class 150, Bronze Flat-Face Flanges: Full-face gaskets.
   2. Class 250, Cast-Iron Flanges and Class 300, Steel Raised-Face Flanges: Ring-type gaskets.

B. Metal, Pipe-Flange Bolts and Nuts: ASME B18.2.1, carbon steel unless otherwise indicated.

C. Welding Filler Metals: Comply with AWS D10.12M/D10.12 for welding materials appropriate for wall thickness and chemical analysis of steel pipe being welded.

2.4 LISTED FIRE-PROTECTION VALVES

A. General Requirements:
1. Valves shall be UL listed or FM approved.
2. Minimum Pressure Rating for Standard-Pressure Piping: 175 psig (1200 kPa).

B. Ball Valves:
1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   a. Victaulic Company Series 728
2. Standard: UL 1091 except with ball instead of disc.
3. Valves NPS 1-1/2 (DN 40) and Smaller: Bronze body with threaded or grooved ends.
4. Valves NPS 2 (DN 50): Bronze body with threaded ends or with grooved ends.

C. Bronze Butterfly Valves:
1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   a. Fivalco Inc.
   b. Global Safety Products, Inc.
   c. Milwaukee Valve Company.
2. Standard: UL 1091.
3. Pressure Rating: 175 psig (1200 kPa).
4. Body Material: Bronze.
5. End Connections: Threaded.

D. Iron Butterfly Valves:
1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   a. Victaulic Company Series 705 and Series 765.
   b. Approved equal.
2. Standard: UL 1091.
3. Pressure Rating: [300 psig (2065 kPa)][365 psig (2517 kPa)].
4. Body Material: Ductile iron.
5. Style: Lug or wafer.
6. End Connections: Grooved.

E. Check Valves:
1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   a. American Cast Iron Pipe Company; Waterous Company Subsidiary.
   b. Clow Valve Company; a division of McWane, Inc.
   c. Crane Co.; Crane Valve Group; Crane Valves.
   d. Crane Co.; Crane Valve Group; Jenkins Valves.
   e. Crane Co.; Crane Valve Group; Stockham Division.
   f. Groeniger & Company.
   g. Kennedy Valve; a division of McWane, Inc.
   h. Milwaukee Valve Company.
   i. Mueller Co.; Water Products Division.
   j. United Brass Works, Inc.

k. Victaulic Company Series 717H or Series 717.
l. Viking Corporation.
m. Watts Water Technologies, Inc.

2. Standard: UL 312.
3. Pressure Rating: 365 psig (2517 kPa).
4. Type: Swing or spring-loaded check.
5. Body Material: Cast or ductile iron.
6. End Connections: Flanged or grooved.

F. Bronze OS&Y Gate Valves:
1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
a. Crane Co.; Crane Valve Group; Crane Valves.
b. Crane Co.; Crane Valve Group; Stockham Division.
c. Milwaukee Valve Company.
d. NIBCO INC.
e. United Brass Works, Inc.
2. Standard: UL 262.
3. Pressure Rating: 175 psig (1200 kPa).
4. Body Material: Bronze.
5. End Connections: Threaded.

G. Iron OS&Y Gate Valves:
1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
a. American Cast Iron Pipe Company; Waterous Company Subsidiary.
b. American Valve, Inc.
c. Clow Valve Company; a division of McWane, Inc.
d. Crane Co.; Crane Valve Group; Crane Valves.
e. Crane Co.; Crane Valve Group; Jenkins Valves.
f. Crane Co.; Crane Valve Group; Stockham Division.
g. Hammond Valve.
h. Milwaukee Valve Company.
i. Mueller Co.; Water Products Division.
j. United Brass Works, Inc.
k. Victaulic Company Series 771.
l. Watts Water Technologies, Inc.
2. Standard: UL 262.
3. Pressure Rating: 250 psig (1725 kPa) maximum.
4. Body Material: Cast or ductile iron.
5. End Connections: Flanged or grooved.

H. Indicating-Type Butterfly Valves:
1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
a. Kennedy Valve; a division of McWane, Inc.
b. Milwaukee Valve Company.
c. NIBCO INC.
d. Victaulic Company.
2. Standard: UL 1091.
3. Pressure Rating: 175 psig (1200 kPa) minimum.
4. Valves NPS 2 (DN 50) and Smaller:
a. Valve Type: Ball.
b. Body Material: Bronze.

c. End Connections: Threaded or grooved.

5. Valves NPS 2-1/2 (DN 65) and Larger:
   a. Valve Type: Butterfly.
   b. Body Material: Ductile iron.
   c. End Connections: Flanged, grooved, or wafer.
6. Valve Operation: Integral electrical, 115-V ac, prewired, two-circuit, supervisory switch and visual indicating device with weather-proof actuator.

I. NRS Gate Valves:
1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
2. Basis-of-Design Product: Subject to compliance with requirements, provide [product indicated on Drawings] <Insert manufacturer's name; product name or designation> or comparable product by one of the following:
   a. American Cast Iron Pipe Company; Waterous Company Subsidiary.
   b. American Valve, Inc.
   c. Clow Valve Company; a division of McWane, Inc.
   d. Crane Co.; Crane Valve Group; Stockham Division.
   e. Kennedy Valve; a division of McWane, Inc.
   f. Mueller Co.; Water Products Division.
   g. Victaulic Company Series 772.
3. Standard: UL 262.
4. Pressure Rating: 250 psig (1725 kPa) maximum.
5. Body Material: Cast or ductile iron with indicator post flange.
6. Stem: Nonrising.
7. End Connections: Flanged or grooved.

2.5 TRIM AND DRAIN VALVES

A. General Requirements:
1. Standard: UL's "Fire Protection Equipment Directory" listing or "Approval Guide," published by FM Global, listing.
2. Pressure Rating: 175 psig (1200 kPa) minimum.

B. Angle Valves:
1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   a. Fire Protection Products, Inc.
   b. United Brass Works, Inc.

C. Ball Valves:
1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   a. Affiliated Distributors.
   b. Anvil International, Inc.
   c. Barnett.
   d. Conbraco Industries, Inc.; Apollo Valves.
   e. Fire-End & Croker Corporation.
   f. Fire Protection Products, Inc.
   g. Flowserve.
   h. FNW.
   i. Jomar International, Ltd.
   j. Kennedy Valve; a division of McWane, Inc.

k. Kitz Corporation.
l. Legend Valve.
m. Metso Automation USA Inc.
n. Milwaukee Valve Company.
o. NIBCO INC.
p. Potter Roemer.
q. Red-White Valve Corporation.
r. Southern Manufacturing Group.
s. Stewart, M. A. and Sons Ltd.
t. Tyco Fire & Building Products LP.
u. Victaulic Company.
v. Watts Water Technologies, Inc.

2.6 HOSE CONNECTIONS

A. Nonadjustable-Valve Hose Connections:
1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
a. AFAC Inc.
b. Elkhart Brass Mfg. Company, Inc.
c. Fire-End & Croker Corporation.
d. Fire Protection Products, Inc.
e. GMR International Equipment Corporation.
f. Guardian Fire Equipment, Inc.
g. Kennedy Valve; a division of McWane, Inc.
h. Mueller Co.; Water Products Division.
i. NIBCO INC.
j. Potter Roemer.
k. Tyco Fire & Building Products LP.
l. Wilson & Cousins Inc.
2. Standard: UL 668 hose valve for connecting fire hose.
3. Pressure Rating: 300 psig (2070 kPa) minimum.
4. Material: Brass or bronze.
5. Size: NPS 2-1/2 (DN 65).
6. Inlet: Female pipe threads.
7. Outlet: Male hose threads with lugged cap, gasket, and chain. Include hose valve threads according to NFPA 1963 and matching local fire-department threads.
8. Pattern: Angle or gate.
9. Finish: Polished chrome plated.

B. Hose Valve Cabinets

1. Equal to Potter Roemer Model 1810 recessed valve cabinet with No. 4 finish stainless steel.

2.7 ALARM DEVICES

A. Alarm-device types shall match piping and equipment connections.

B. Water-Flow Indicators:

1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   a. ADT Security Services, Inc.
   b. McDonnell & Miller; ITT Industries.
   c. Potter Electric Signal Company.
   d. System Sensor.
   e. Viking Corporation.
   f. Watts Industries (Canada) Inc.
2. Standard: UL 346.
3. Water-Flow Detector: Electrically supervised.
4. Components: Two single-pole, double-throw circuit switches for isolated alarm and auxiliary contacts, 7 A, 125-V ac and 0.25 A, 24-V dc; complete with factory-set, field-adjustable retard element to prevent false signals and tamperproof cover that sends signal if removed.
5. Type: Paddle operated.
6. Pressure Rating: 250 psig (1725 kPa).
7. Design Installation: Horizontal or vertical.

C. Pressure Switches:
1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   a. AFAC Inc.
   b. Barksdale, Inc.
   c. Detroit Switch, Inc.
   d. Potter Electric Signal Company.
   e. System Sensor.
   f. Tyco Fire & Building Products LP.
   g. United Electric Controls Co.
   h. Viking Corporation.
2. Standard: UL 346.
3. Type: Electrically supervised water-flow switch with retard feature.
4. Components: Single-pole, double-throw switch with normally closed contacts.
5. Design Operation: Rising pressure signals water flow.

D. Valve Supervisory Switches:
1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   a. Fire-Lite Alarms, Inc.; a Honeywell company.
   b. Kennedy Valve; a division of McWane, Inc.
   c. Potter Electric Signal Company.
   d. System Sensor.
2. Standard: UL 346.
3. Type: Electrically supervised.
4. Components: Single-pole, double-throw switch with normally closed contacts.
5. Design: Signals that controlled valve is in other than fully open position.

2.8 PRESSURE GAGES

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
1. AMETEK; U.S. Gauge Division.
2. Ashcroft Inc.
3. Brecco Corporation.
4. WIKA Instrument Corporation.

B. Standard: UL 393.

C. Dial Size: 3-1/2- to 4-1/2-inch (90- to 115-mm) diameter.

D. Pressure Gage Range: 0 to 250 psig (0 to 1725 kPa) minimum.

E. Water System Piping Gage: Include "WATER" or "AIR/WATER" label on dial face.

F. Air System Piping Gage: Include retard feature and "AIR" or "AIR/WATER" label on dial face.

2.9 ESCUTCHEONS

A. General: Manufactured ceiling, floor, and wall escutcheons and floor plates.

B. One-Piece, Cast-Brass Escutcheons: Polished chrome-plated finish with set-screws.

C. One-Piece, Deep-Pattern Escutcheons: Deep-drawn, box-shaped brass with chrome-plated finish.

D. One-Piece, Stamped-Steel Escutcheons: Chrome-plated finish with set-screw or spring clips.

E. Split-Casting, Cast-Brass Escutcheons: Polished chrome-plated finish with concealed hinge and set-screw.

F. Split-Plate, Stamped-Steel Escutcheons: Chrome-plated finish with set-screw or spring clips.

G. One-Piece Floor Plates: Cast-iron flange with holes for fasteners.

H. Split-Casting Floor Plates: Cast brass with concealed hinge.

2.10 SLEEVES

A. Cast-Iron Wall-Pipe Sleeves: Cast or fabricated of cast iron and equivalent to ductile-iron pressure pipe, with plain ends and integral waterstop unless otherwise indicated.

B. Galvanized-Steel-Sheet Sleeves: 0.0239-inch (0.6-mm) minimum thickness; round tube closed with welded longitudinal joint.

C. Galvanized-Steel-Pipe Sleeves: ASTM A 53/A 53M, Type E, standard weight, zinc coated, plain ends.

D. Stack Sleeve Fittings: Manufactured, cast-iron sleeve with integral clamping flange. Include clamping ring and bolts and nuts for membrane flashing.
   1. Underdeck Clamp: Clamping ring with set-screws.

2.11 SLEEVE SEALS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   1. Advance Products & Systems, Inc.
   2. Calpico, Inc.
   3. Metraflex, Inc.
   4. Pipeline Seal and Insulator, Inc.

B. Description: Modular sealing element unit, designed for field assembly, to fill annular space between pipe and sleeve.
   1. Sealing Elements: EPDM-rubber interlocking links shaped to fit surface of pipe. Include type and number required for pipe material and size of pipe.
   2. Pressure Plates: Stainless steel.
   3. Connecting Bolts and Nuts: Stainless steel of length required to secure pressure plates to sealing elements.

2.12 GROUT

A. Standard: ASTM C 1107, Grade B, posthardening and volume adjusting, dry, hydraulic-cement grout.

B. Characteristics: Nonshrink, and recommended for interior and exterior applications.

C. Design Mix: 5000-psi (34-MPa), 28-day compressive strength.

D. Packaging: Premixed and factory packaged.

PART 3 - EXECUTION

3.1 PREPARATION

A. Perform fire-hydrant flow test according to NFPA 14 and NFPA 291. Use results for system design calculations required in "Quality Assurance" Article.

B. Report test results promptly and in writing.

3.2 EXAMINATION

A. Examine roughing-in for hose connections and stations to verify actual locations of piping connections before installation.

B. Examine walls and partitions for suitable thickness, fire- and smoke-rated construction, framing for hose-station cabinets, and other conditions where hose connections and stations are to be installed.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.3 SERVICE-ENTRANCE PIPING

A. Connect fire-suppression standpipe piping to water-service piping at service entrance into building. Comply with requirements for exterior piping in Division 21 Section "Facility Fire-Suppression Water-Service Piping."

B. Install shutoff valve, backflow preventer, pressure gage, drain, and other accessories at connection to fire-suppression water-service piping. Comply with requirements for backflow preventers in Division 21 Section "Facility Fire-Suppression Water-Service Piping."

3.4 PIPING INSTALLATION

A. Locations and Arrangements: Drawing plans, schematics, and diagrams indicate general location and arrangement of piping. Install piping as indicated, as far as practical.
   1. Deviations from approved working plans for piping require written approval from authorities having jurisdiction. File written approval with Architect before deviating from approved working plans.

B. Piping Standard: Comply with requirements in NFPA 14 for installation of fire-suppression standpipe piping.

C. Install seismic restraints on piping. Comply with requirements in NFPA 13 for seismic-restraint device materials and installation.
   1. In Victaulic grooved piping systems, seismic motion shall be accommodated by installing swing joints consisting of flexible couplings, pipe nipples and elbows that provide simultaneous movement in all directions, or other seismic movement compensation devices such as loops, offsets, or Style 155 expansion joints (when an in-line device is required), to provide flexibility to the system and help reduce pipe stresses. Refer to Victaulic design submittal #26.12.

D. Install listed fittings to make changes in direction, branch takeoffs from mains, and reductions in pipe sizes.

E. Install drain valves on standpipes. Extend drain piping to outside of building.

F. Install automatic (ball drip) drain valves to drain piping between fire-department connections and check valves. Drain to floor drain or outside building.

G. Install alarm devices in piping systems.

H. Install hangers and supports for standpipe system piping according to NFPA 14. Comply with requirements in NFPA 13 for hanger materials.
   1. Victaulic Style 009, 005, and 07 rigid couplings, with angle-pattern bolt pads may be used with IPS steel piping systems, which meet the support and hanging requirements of NFPA 13 and 14. An adequate number of Victaulic Style 177, 004, and 77 flexible couplings shall also be used to compensate for thermal expansion/contraction of the pipe.

I. Install pressure gages on riser or feed main and at top of each standpipe. Include pressure gages with connection not less than NPS 1/4 (DN 8) and with soft-metal seated globe valve, arranged for draining pipe between gage and valve. Install gages to permit removal, and install where they will not be subject to freezing.

J. Fill wet-type standpipe system piping with water.

3.5 JOINT CONSTRUCTION

A. Install couplings, flanges, flanged fittings, unions, nipples, and transition and special fittings that have finish and pressure ratings same as or higher than system's pressure rating for aboveground applications unless otherwise indicated.

B. Install flanges, flange adapters, or couplings for grooved-end piping on valves, apparatus, and equipment having NPS 2-1/2 (DN 65) and larger end connections.

C. Ream ends of pipes and tubes and remove burrs. Bevel plain ends of steel pipe.

D. Remove scale, slag, dirt, and debris from inside and outside of pipes, tubes, and fittings before assembly.

E. Flanged Joints: Select appropriate gasket material in size, type, and thickness suitable for water service. Join flanges with gasket and bolts according to ASME B31.9.

F. Threaded Joints: Thread pipe with tapered pipe threads according to ASME B1.20.1. Cut threads full and clean using sharp dies. Ream threaded pipe ends to remove burrs and restore full ID. Join pipe fittings and valves as follows:
   1. Apply appropriate tape or thread compound to external pipe threads.
   2. Damaged Threads: Do not use pipe or pipe fittings with threads that are corroded or damaged.

G. Steel-Piping, Roll-Grooved Joints: Roll rounded-edge groove in end of pipe according to AWWA C606. Assemble coupling with housing, gasket, lubricant, and bolts. Join steel pipe and grooved-end fittings according to AWWA C606 for steel-pipe grooved joints. The gasket style and elastomeric material (grade) shall be verified as suitable for the intended service as specified. Gaskets shall be molded and produced by Victaulic. Grooved end shall be clean and free from indentations, projections, and roll marks in the area from pipe end to groove for proper gasket sealing. A Victaulic factory-trained field representative shall provide on-site training for contractor's field personnel in the proper use of grooving tools and installation of grooved piping products. Factory-trained representative shall periodically review the product installation. Contractor shall remove and replace any improperly installed products.

H. Welded Joints: Construct joints according to AWS D10.12M/D10.12, using qualified processes and welding operators according to "Quality Assurance" Article.
   1. Shop weld pipe joints where welded piping is indicated. Do not use welded joints for galvanized-steel pipe.

I. Dissimilar-Material Piping Joints: Make joints using adapters compatible with materials of both piping systems.

3.6 VALVE AND SPECIALTIES INSTALLATION

A. Install listed fire-protection valves, trim and drain valves, specialty valves and trim, controls, and specialties according to NFPA 14 and authorities having jurisdiction.

B. Install listed fire-protection shutoff valves supervised-open, located to control sources of water supply except from fire-department connections. Install permanent identification signs indicating portion of system controlled by each valve.

C. Install check valve in each water-supply connection. Install backflow preventers instead of check valves in potable-water-supply sources.

3.7 HOSE-CONNECTION INSTALLATION

A. Install hose connections adjacent to standpipes.

B. Install NPS 2-1/2 (DN 65) hose connections with quick-disconnect NPS 2-1/2 by NPS 1-1/2 (DN 65 by DN 40) reducer adapter and flow-restricting device.

C. Install wall-mounted-type hose connections in cabinets. Include pipe escutcheons, with finish matching valves, inside cabinet where water-supply piping penetrates cabinet. Install valves at angle required for connection of fire hose. Comply with requirements for cabinets in Division 10 Section "Fire Extinguisher Cabinets."

3.8 ESCUTCHEON INSTALLATION

A. Install escutcheons for penetrations of walls, ceilings, and floors.

3.9 SLEEVE INSTALLATION

A. General Requirements: Install sleeves for pipes and tubes passing through penetrations in floors, partitions, roofs, and walls.

B. Sleeves are not required for core-drilled holes.

C. Permanent sleeves are not required for holes formed by removable PE sleeves.

D. Cut sleeves to length for mounting flush with both surfaces unless otherwise indicated.

E. Install sleeves in new partitions, slabs, and walls as they are built.

F. For interior wall penetrations, seal annular space between sleeve and pipe or pipe insulation using joint sealants appropriate for size, depth, and location of joint. Comply with requirements for joint sealants in Division 07 Section "Joint Sealants."

G. For exterior wall penetrations above grade, seal annular space between sleeve and pipe using joint sealants appropriate for size, depth, and location of joint. Comply with requirements for joint sealants in Division 07 Section "Joint Sealants."

H. For exterior wall penetrations below grade, seal annular space between sleeve and pipe using sleeve seals.

I. Seal space outside of sleeves in concrete slabs and walls with grout.

J. Install sleeves that are large enough to provide 1/4-inch (6.4-mm) annular clear space between sleeve and pipe or pipe insulation unless otherwise indicated.

K. Install sleeve materials according to the following applications:
   1. Sleeves for Piping Passing through Concrete Floor Slabs: Galvanized-steel pipe.
   2. Sleeves for Piping Passing through Concrete Floor Slabs of Mechanical Equipment Areas or Other Wet Areas: Galvanized-steel pipe.
      a. Extend sleeves 2 inches (50 mm) above finished floor level.
      b. For pipes penetrating floors with membrane waterproofing, extend cast-iron sleeve fittings below floor slab as required to secure clamping ring if ring is specified. Secure flashing between clamping flanges. Install section of cast-iron soil pipe to extend sleeve to 2 inches (50 mm) above finished floor level. Comply with requirements for flashing in Division 07 Section "Sheet Metal Flashing and Trim."
   3. Sleeves for Piping Passing through Gypsum-Board Partitions:
      a. Galvanized-steel-pipe sleeves for pipes smaller than NPS 6 (DN 150).
      b. Galvanized-steel-sheet sleeves for pipes NPS 6 (DN 150) and larger.

c. Exception: Sleeves are not required for water-supply tubes and waste pipes for individual plumbing fixtures if escutcheons will cover openings.

4. Sleeves for Piping Passing through Concrete Roof Slabs: Galvanized-steel pipe.
5. Sleeves for Piping Passing through Exterior Concrete Walls:
   a. Galvanized-steel-pipe sleeves for pipes smaller than NPS 6 (DN 150).
   b. Cast-iron wall pipe sleeves for pipes NPS 6 (DN 150) and larger.
   c. Install sleeves that are large enough to provide 1-inch (25-mm) annular clear space between sleeve and pipe or pipe insulation when sleeve seals are used.
6. Sleeves for Piping Passing through Interior Concrete Walls:
   a. Galvanized-steel-pipe sleeves for pipes smaller than NPS 6 (DN 150).
   b. Galvanized-steel-sheet sleeves for pipes NPS 6 (DN 150) and larger.

L. Fire-Barrier Penetrations: Maintain indicated fire rating of walls, partitions, ceilings, and floors at pipe penetrations. Seal pipe penetrations with firestop materials. Comply with requirements for firestop materials and installations in Division 07 Section "Penetration Firestopping."

3.10 SLEEVE SEAL INSTALLATION

A. Install sleeve seals in sleeves in exterior concrete walls at water-service piping entries into building.

B. Select type and number of sealing elements required for pipe material and size. Position pipe in center of sleeve. Assemble sleeve seal components and install in annular space between pipe and sleeve. Tighten bolts against pressure plates that cause sealing elements to expand and make watertight seal.

3.11 IDENTIFICATION

A. Install labeling and pipe markers on equipment and piping according to requirements in NFPA 14.

B. Identify system components, wiring, cabling, and terminals. Comply with requirements for identification specified in Division 26 Section "Identification for Electrical Systems."

3.12 FIELD QUALITY CONTROL

A. Perform tests and inspections.

B. Tests and Inspections:
1. Leak Test: After installation, charge systems and test for leaks. Repair leaks and retest until no leaks exist.
2. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.
3. Flush, test, and inspect standpipe systems according to NFPA 14, "System Acceptance" Chapter.
4. Energize circuits to electrical equipment and devices.
5. Coordinate with fire-alarm tests. Operate as required.
6. Coordinate with fire-pump tests. Operate as required.
7. Verify that equipment hose threads are same as local fire-department equipment.

C. Fire-suppression standpipe system will be considered defective if it does not pass tests and inspections.

D. Prepare test and inspection reports.

3.13 PIPING SCHEDULE

A. Piping between Fire-Department Connections and Check Valves: Galvanized, standard-weight steel pipe with grooved ends; grooved-end fittings; grooved-end-pipe couplings; and grooved joints.

B. Standard-pressure, wet-type, fire-suppression standpipe piping, NPS 4 (DN 100) and smaller , shall be one of the following:
   1. Standard-weight, black-steel pipe with threaded ends; uncoated, gray-iron threaded fittings; and threaded joints.
   2. Standard-weight, galvanized-steel pipe with threaded ends; galvanized, gray-iron threaded fittings; and threaded joints.
   3. Standard-weight, black-steel pipe with roll-grooved ends; uncoated, grooved-end fittings for steel piping; grooved-end-pipe couplings for steel piping; and grooved joints.
   4. Standard-weight, black-steel pipe with plain ends; steel welding fittings; and welded joints.

C. Standard-pressure, wet-type, fire-suppression standpipe piping, NPS 6 to NPS 8 (DN 125 to DN 200), shall be one of the following:
   1. Standard-weight, black-steel pipe with roll-grooved ends; uncoated, grooved-end fittings for steel piping; grooved-end-pipe couplings for steel piping; and grooved joints.
   2. Standard-weight, black-steel pipe with plain ends; steel welding fittings; and welded joints.
   3. Schedule 10 black-steel pipe with roll-grooved ends; uncoated, grooved-end fittings for steel piping; grooved-end-pipe couplings for steel piping; and grooved joints.

END OF SECTION 211200

N:\N0912.00\DOC\SPEC\2012_03-16_BID\211200 FL - FIRE-SUPPRESSION STANDPIPES.DOC

SECTION 211313 - WET-PIPE SPRINKLER SYSTEMS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:
   1. Pipes, fittings, and specialties.
   2. Fire-protection valves.
   3. Sprinklers.
   4. Alarm devices.
   5. Manual control stations.
   6. Control panels.
   7. Pressure gages.

B. Related Sections:
   1. Division 21 Section "Fire-Suppression Standpipes" for standpipe piping.

1.3 DEFINITIONS

A. Standard-Pressure Sprinkler Piping: Wet-pipe sprinkler system piping designed to operate at working pressure of 175 psig (1200 kPa) maximum.

1.4 SYSTEM DESCRIPTIONS

A. Wet-Pipe Sprinkler System: Automatic sprinklers are attached to piping containing water and that is connected to water supply through alarm valve. Water discharges immediately from sprinklers when they are opened. Sprinklers open when heat melts fusible link or destroys frangible device. Hose connections are included if indicated.

1.5 PERFORMANCE REQUIREMENTS

A. Standard-Pressure Piping System Component: Listed for 175-psig (1200-kPa) minimum working pressure.

B. Delegated Design: Design sprinkler system(s), including comprehensive engineering analysis by a qualified NICET certified designer using performance requirements and design criteria indicated.
   1. Available fire-hydrant flow test: Refer to Drawings.

C. Sprinkler system design shall be approved by authorities having jurisdiction.

1. Margin of Safety for Available Water Flow and Pressure: 20 percent using low hydraulic gradient from water supply test data, including losses through water-service piping, valves, and backflow preventers.
2. Sprinkler Occupancy Hazard Classifications: Refer to Drawings.
3. Minimum Density for Automatic-Sprinkler Piping Design: Refer to Drawings.
4. Maximum Protection Area per Sprinkler: Refer to Drawings.
5. Total Combined Hose-Stream Demand Requirement: According to NFPA 13 unless otherwise indicated. Refer to Drawings.

1.6 SUBMITTALS

A. Product Data: For each type of product indicated. Include rated capacities, operating characteristics, electrical characteristics, and furnished specialties and accessories.

B. Shop Drawings: For wet-pipe sprinkler systems. Include plans, elevations, sections, details, and attachments to other work.
1. Wiring Diagrams: For power, signal, and control wiring.

C. Delegated-Design Submittal: For sprinkler systems indicated to comply with performance requirements and design criteria, including analysis data. Include water supply test data.

D. Coordination Drawings: Sprinkler systems, drawn to scale, on which the following items are shown and coordinated with each other, using input from installers of the items involved:
a. All MEP systems

E. Qualification Data: For qualified Installer and professional engineer.

Approved Sprinkler Piping Drawings: Working plans, prepared according to NFPA 13, that have been approved by authorities having jurisdiction, including hydraulic calculations if applicable.
1. Grooved joint couplings and fittings shall be shown on drawings and product submittals and shall be specifically identified with the applicable Victaulic style or series number.

F. Welding certificates.

G. Fire-hydrant flow test report.

H. Field Test Reports and Certificates: Indicate and interpret test results for compliance with performance requirements and as described in NFPA 13. Include "Contractor's Material and Test Certificate for Aboveground Piping."

I. Field quality-control reports.

J. Operation and Maintenance Data: For sprinkler specialties to include in emergency, operation, and maintenance manuals.

1.7 QUALITY ASSURANCE

A. Installer Qualifications:
1. Installer's responsibilities include designing, fabricating, and installing sprinkler systems and providing professional engineering services needed to assume engineering responsibility. Base calculations on results of fire-hydrant flow test.

a. Engineering Responsibility: Preparation of working plans, calculations, and field test reports.

B. Welding Qualifications: Qualify procedures and operators according to ASME Boiler and Pressure Vessel Code.

C. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

D. NFPA Standards: Sprinkler system equipment, specialties, accessories, installation, and testing shall comply with the following:
1. NFPA 13, "Installation of Sprinkler Systems."

E. To assure uniformity and compatibility of piping components in grooved piping systems, all grooved products utilized shall be supplied by a single manufacturer. Grooving tools shall be supplied from the same manufacturer as the grooved components.

1.8 PROJECT CONDITIONS

A. Interruption of Existing Sprinkler Service: Do not interrupt sprinkler service to facilities occupied by Owner or others unless permitted under the following conditions and then only after arranging to provide temporary sprinkler service according to requirements indicated:
1. Notify Owner no fewer than two days in advance of proposed interruption of sprinkler service.
2. Do not proceed with interruption of sprinkler service without Owner's written permission.

1.9 COORDINATION

A. Coordinate layout and installation of sprinklers with other construction that penetrates ceilings, including light fixtures, signage, HVAC equipment, and partition assemblies.

1.10 EXTRA MATERIALS

A. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.
1. Sprinkler Cabinets: Finished, wall-mounted, steel cabinet with hinged cover, and with space for minimum of six spare sprinklers plus sprinkler wrench. Include number of sprinklers required by NFPA 13 and sprinkler wrench. Include separate cabinet with sprinklers and wrench for each type of sprinkler used on Project.

PART 2 - PRODUCTS

2.1 PIPING MATERIALS

A. Comply with requirements in "Piping Schedule" Article for applications of pipe, tube, and fitting materials, and for joining methods for specific services, service locations, and pipe sizes.

2.2 STEEL PIPE AND FITTINGS

A. Standard Weight, Galvanized- and Black-Steel Pipe: ASTM A 53/A 53M, Type E, Grade B. Pipe ends may be factory or field formed to match joining method.

B. Standard-Weight, Galvanized- and Black-Steel Pipe Nipples: ASTM A 733, made of ASTM A 53/A 53M, seamless steel pipe with threaded ends.

2.3 PIPING JOINING MATERIALS

A. Pipe-Flange Gasket Materials: AWWA C110, rubber, flat face, 1/8 inch (3.2 mm) thick or ASME B16.21, nonmetallic and asbestos free.
   1. Class 125, Cast-Iron Flanges and Class 150, Bronze Flat-Face Flanges: Full-face gaskets.
   2. Class 250, Cast-Iron Flanges and Class 300, Steel Raised-Face Flanges: Ring-type gaskets.

B. Metal, Pipe-Flange Bolts and Nuts: ASME B18.2.1, carbon steel unless otherwise indicated.

C. Welding Filler Metals: Comply with AWS D10.12M/D10.12 for welding materials appropriate for wall thickness and chemical analysis of steel pipe being welded.

2.4 LISTED FIRE-PROTECTION VALVES

A. General Requirements:
   1. Valves shall be UL listed or FM approved.
   2. Minimum Pressure Rating for Standard-Pressure Piping: 175 psig (1200 kPa).

B. Ball Valves:
   1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
      a. Victaulic Company Series 728.
      b. Approved equal.
   2. Standard: UL 1091 except with ball instead of disc.
   3. Valves NPS 1-1/2 (DN 40) and Smaller: Bronze body with threaded or grooved ends.
   4. Valves NPS 2 and NPS 2-1/2 (DN 50 and DN 65): Bronze body with threaded ends or grooved ends.

C. Bronze Butterfly Valves:
   1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
      a. Fivalco Inc.
      b. Global Safety Products, Inc.
      c. Milwaukee Valve Company.
   2. Standard: UL 1091.
   3. Pressure Rating: 175 psig (1200 kPa).
   4. Body Material: Bronze.
   5. End Connections: Threaded.

D. Iron Butterfly Valves:
   1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
      a. Victaulic Company.

b. Approved equal.
2. Standard: UL 1091.
3. Pressure Rating: 365 psig (2517 kPa).
4. Body Material: Ductile iron.
5. End Connections: Grooved.

E. Check Valves:
1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
a. American Cast Iron Pipe Company; Waterous Company Subsidiary.
b. Clow Valve Company; a division of McWane, Inc.
c. Crane Co.; Crane Valve Group; Crane Valves.
d. Crane Co.; Crane Valve Group; Jenkins Valves.
e. Crane Co.; Crane Valve Group; Stockham Division.
f. Groeniger & Company.
g. Kennedy Valve; a division of McWane, Inc.
h. Milwaukee Valve Company.
i. Mueller Co.; Water Products Division.
j. United Brass Works, Inc.
k. Victaulic Company.
l. Viking Corporation.
m. Watts Water Technologies, Inc.
2. Standard: UL 312.
3. Pressure Rating: 365 psig (2517 kPa) minimum.
4. Type: Swing or spring loaded check.
5. Body Material: Cast or ductile iron.
6. End Connections: Flanged or grooved.

F. Bronze OS&Y Gate Valves:
1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
a. Crane Co.; Crane Valve Group; Crane Valves.
b. Crane Co.; Crane Valve Group; Stockham Division.
c. Milwaukee Valve Company.
d. NIBCO INC.
e. United Brass Works, Inc.
2. Standard: UL 262.
3. Pressure Rating: 175 psig (1200 kPa).
4. Body Material: Bronze.
5. End Connections: Threaded.

G. Iron OS&Y Gate Valves:
1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
a. American Cast Iron Pipe Company; Waterous Company Subsidiary.
b. American Valve, Inc.
c. Clow Valve Company; a division of McWane, Inc.
d. Crane Co.; Crane Valve Group; Crane Valves.
e. Crane Co.; Crane Valve Group; Jenkins Valves.
f. Crane Co.; Crane Valve Group; Stockham Division.
g. Hammond Valve.
h. Milwaukee Valve Company.
i. Mueller Co.; Water Products Division.
j. United Brass Works, Inc.

k. Victaulic Series 771.
l. Watts Water Technologies, Inc.

2. Standard: UL 262.
3. Pressure Rating: 250 psig (1725 kPa) maximum.
4. Body Material: Cast or ductile iron.
5. End Connections: Flanged or grooved.

H. Indicating-Type Butterfly Valves:
1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
a. Kennedy Valve; a division of McWane, Inc.
b. Milwaukee Valve Company.
c. NIBCO INC.
d. Victaulic Company.
2. Standard: UL 1091.
3. Pressure Rating: 175 psig (1200 kPa) minimum.
4. Valves NPS 2 (DN 50) and Smaller:
a. Valve Type: Ball.
b. Body Material: Bronze.
c. End Connections: Threaded or grooved.
5. Valves NPS 2-1/2 (DN 65) and Larger:
a. Valve Type: Butterfly.
b. Body Material: Ductile iron.
c. End Connections: Flanged, grooved, or wafer.
6. Valve Operation: Integral electrical, 115-V ac, prewired, two-circuit, supervisory switch and visual indicating device with weather-proof actuator.

I. NRS Gate Valves:
1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
a. American Cast Iron Pipe Company; Waterous Company Subsidiary.
b. American Valve, Inc.
c. Clow Valve Company; a division of McWane, Inc.
d. Crane Co.; Crane Valve Group; Stockham Division.
e. Kennedy Valve; a division of McWane, Inc.
f. Mueller Co.; Water Products Division.
g. NIBCO INC.
h. Tyco Fire & Building Products LP.
2. Standard: UL 262.
3. Pressure Rating: 250 psig (1725 kPa) minimum.
4. Body Material: Cast iron with indicator post flange.
5. Stem: Nonrising.
6. End Connections: Flanged or grooved.

2.5 TRIM AND DRAIN VALVES

A. General Requirements:
1. Standard: UL's "Fire Protection Equipment Directory" listing or "Approval Guide," published by FM Global, listing.
2. Pressure Rating: 175 psig (1200 kPa) minimum.

B. Angle Valves:

1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
    a. Fire Protection Products, Inc.
    b. United Brass Works, Inc.

C. Ball Valves:
1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
    a. Affiliated Distributors.
    b. Anvil International, Inc.
    c. Barnett.
    d. Conbraco Industries, Inc.; Apollo Valves.
    e. Fire-End & Croker Corporation.
    f. Fire Protection Products, Inc.
    g. Flowserve.
    h. FNW.
    i. Jomar International, Ltd.
    j. Kennedy Valve; a division of McWane, Inc.
    k. Kitz Corporation.
    l. Legend Valve.
    m. Metso Automation USA Inc.
    n. Milwaukee Valve Company.
    o. NIBCO INC.
    p. Potter Roemer.
    q. Red-White Valve Corporation.
    r. Southern Manufacturing Group.
    s. Stewart, M. A. and Sons Ltd.
    t. Tyco Fire & Building Products LP.
    u. Victaulic Company.
    v. Watts Water Technologies, Inc.

D. Globe Valves:
1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
    a. Fire Protection Products, Inc.
    b. United Brass Works, Inc.

2.6 SPECIALTY VALVES

A. General Requirements:
1. Standard: UL's "Fire Protection Equipment Directory" listing or "Approval Guide," published by FM Global, listing.
2. Pressure Rating:
    a. Standard-Pressure Piping Specialty Valves: 175 psig (1200 kPa) minimum.
3. Body Material: Cast or ductile iron.
4. Size: Same as connected piping.
5. End Connections: Flanged or grooved.

B. Automatic (Ball Drip) Drain Valves:
1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
    a. AFAC Inc.
    b. Reliable Automatic Sprinkler Co., Inc.

c. Tyco Fire & Building Products LP.
2. Standard: UL 1726.
3. Pressure Rating: 175 psig (1200 kPa) minimum.
4. Type: Automatic draining, ball check.
5. Size: NPS 3/4 (DN 20).
6. End Connections: Threaded.

2.7 SPRINKLER SPECIALTY PIPE FITTINGS

A. Branch Outlet Fittings:
1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
a. Anvil International, Inc.
b. National Fittings, Inc.
c. Shurjoint Piping Products.
d. Tyco Fire & Building Products LP.
e. Victaulic Company.
2. Standard: UL 213.
3. Pressure Rating: 175 psig (1200 kPa) minimum.
4. Body Material: Ductile-iron housing with EPDM seals and bolts and nuts.
5. Type: Mechanical-T and -cross fittings.
6. Configurations: Snap-on and strapless, ductile-iron housing with branch outlets.
7. Size: Of dimension to fit onto sprinkler main and with outlet connections as required to match connected branch piping.
8. Branch Outlets: Grooved, plain-end pipe, or threaded.

B. Flow Detection and Test Assemblies:
1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
a. AGF Manufacturing Inc.
b. Reliable Automatic Sprinkler Co., Inc.
c. Tyco Fire & Building Products LP.
d. Victaulic Company.

2. Standard: UL's "Fire Protection Equipment Directory" listing or "Approval Guide," published by FM Global, listing.
3. Pressure Rating: 175 psig (1200 kPa) minimum.
4. Body Material: Cast- or ductile-iron housing with orifice, sight glass, and integral test valve.
5. Size: Same as connected piping.
6. Inlet and Outlet: Threaded.

C. Branch Line Testers:
1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
a. Elkhart Brass Mfg. Company, Inc.
b. Fire-End & Croker Corporation.
c. Potter Roemer.
2. Standard: UL 199.
3. Pressure Rating: 175 psig (1200 kPa).
4. Body Material: Brass.
5. Size: Same as connected piping.
6. Inlet: Threaded.
7. Drain Outlet: Threaded and capped.

8. Branch Outlet: Threaded, for sprinkler.

D. Sprinkler Inspector's Test Fittings:
1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   a. AGF Manufacturing Inc.
   b. Triple R Specialty.
   c. Tyco Fire & Building Products LP.
   d. Victaulic Company.
   e. Viking Corporation.
2. Standard: UL's "Fire Protection Equipment Directory" listing or "Approval Guide," published by FM Global, listing.
3. Pressure Rating: 175 psig (1200 kPa) minimum.
4. Body Material: Cast- or ductile-iron housing with sight glass.
5. Size: Same as connected piping.
6. Inlet and Outlet: Threaded.

E. Adjustable Drop Nipples:
1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   a. CECA, LLC.
   b. Corcoran Piping System Co.
   c. Merit Manufacturing; a division of Anvil International, Inc.
2. Standard: UL 1474.
3. Pressure Rating: 250 psig (1725 kPa) minimum.
4. Body Material: Steel pipe with EPDM-rubber O-ring seals.
5. Size: Same as connected piping.
6. Length: Adjustable.
7. Inlet and Outlet: Threaded.

2.8 SPRINKLERS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
1. AFAC Inc.
2. Globe Fire Sprinkler Corporation.
3. Reliable Automatic Sprinkler Co., Inc.
4. Tyco Fire & Building Products LP.
5. Venus Fire Protection Ltd.
6. Victaulic Company.
7. Viking Corporation.

B. General Requirements:
1. Standard: UL's "Fire Protection Equipment Directory" listing or "Approval Guide," published by FM Global, listing.
2. Pressure Rating for Automatic Sprinklers: 175 psig (1200 kPa) minimum.

C. Automatic Sprinklers with Heat-Responsive Element:
1. Nonresidential Applications: UL 199.
2. Characteristics: Nominal 1/2-inch (12.7-mm) orifice with Discharge Coefficient K of 5.6, and for "Ordinary" temperature classification rating unless otherwise indicated or required by application.

D. Sprinkler Finishes:
1. White cover for concealed heads.

2. Chrome plated for semi-recessed pendants and sidewalls.
3. Bronze for mechanical rooms and other unfinished areas without ceilings.

E. Sprinkler Escutcheons: Materials, types, and finishes for the following sprinkler mounting applications. Escutcheons for concealed, flush, and recessed-type sprinklers are specified with sprinklers.
1. Ceiling Mounting: Chrome-plated steel, one piece, flat.
2. Sidewall Mounting: Chrome-plated steel, one piece, flat.

F. Sprinkler Guards:
1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   a. Reliable Automatic Sprinkler Co., Inc.
   b. Tyco Fire & Building Products LP.
   c. Victaulic Company.
   d. Viking Corporation.
2. Standard: UL 199.
3. Type: Wire cage with fastening device for attaching to sprinkler.

2.9 ALARM DEVICES

A. Alarm-device types shall match piping and equipment connections.

B. Pressure Switches:
1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   a. AFAC Inc.
   b. Barksdale, Inc.
   c. Detroit Switch, Inc.
   d. Potter Electric Signal Company.
   e. System Sensor.
   f. Tyco Fire & Building Products LP.
   g. United Electric Controls Co.
   h. Viking Corporation.
2. Standard: UL 346.
3. Type: Electrically supervised water-flow switch with retard feature.
4. Components: Single-pole, double-throw switch with normally closed contacts.
5. Design Operation: Rising pressure signals water flow.

C. Valve Supervisory Switches:
1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   a. Fire-Lite Alarms, Inc.; a Honeywell company.
   b. Kennedy Valve; a division of McWane, Inc.
   c. Potter Electric Signal Company.
   d. System Sensor; a Honeywell company.
2. Standard: UL 346.
3. Type: Electrically supervised.
4. Components: Single-pole, double-throw switch with normally closed contacts.
5. Design: Signals that controlled valve is in other than fully open position.

2.10 PRESSURE GAGES

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   1. AMETEK; U.S. Gauge Division.
   2. Ashcroft, Inc.
   3. Brecco Corporation.
   4. WIKA Instrument Corporation.

B. Standard: UL 393.

C. Dial Size: 3-1/2- to 4-1/2-inch (90- to 115-mm) diameter.

D. Pressure Gage Range: 0 to 250 psig (0 to 1725 kPa) minimum.

E. Water System Piping Gage: Include "WATER" or "AIR/WATER" label on dial face.

2.11 ESCUTCHEONS

A. General: Manufactured ceiling, floor, and wall escutcheons and floor plates.

B. One-Piece, Cast-Brass Escutcheons: Polished chrome-plated finish with set-screws.

C. One-Piece, Deep-Pattern Escutcheons: Deep-drawn, box-shaped brass with chrome-plated finish.

D. One-Piece, Stamped-Steel Escutcheons: Chrome-plated finish with set-screw or spring clips.

E. Split-Casting, Cast-Brass Escutcheons: Polished chrome-plated finish with concealed hinge and set-screw.

F. Split-Plate, Stamped-Steel Escutcheons: Chrome-plated finish with concealed hinge, set-screw or spring clips.

G. One-Piece Floor Plates: Cast-iron flange with holes for fasteners.

H. Split-Casting Floor Plates: Cast brass with concealed hinge.

2.12 SLEEVES

A. Cast-Iron Wall Pipe Sleeves: Cast or fabricated of cast iron and equivalent to ductile-iron pressure pipe, with plain ends and integral waterstop unless otherwise indicated.

B. Galvanized-Steel-Sheet Sleeves: 0.0239-inch (0.6-mm) minimum thickness; round tube closed with welded longitudinal joint.

C. Galvanized-Steel-Pipe Sleeves: ASTM A 53/A 53M, Type E, standard weight, zinc coated, plain ends.

D. Stack Sleeve Fittings: Manufactured, cast-iron sleeve with integral clamping flange. Include clamping ring and bolts and nuts for membrane flashing.
   1. Underdeck Clamp: Clamping ring with set-screws.

2.13 SLEEVE SEALS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   1. Advance Products & Systems, Inc.
   2. Calpico, Inc.
   3. Metraflex, Inc.
   4. Pipeline Seal and Insulator, Inc.

B. Description: Modular sealing element unit, designed for field assembly, to fill annular space between pipe and sleeve.
   1. Sealing Elements: EPDM-rubber interlocking links shaped to fit surface of pipe. Include type and number required for pipe material and size of pipe.
   2. Pressure Plates: Stainless steel.
   3. Connecting Bolts and Nuts: Stainless steel of length required to secure pressure plates to sealing elements.

2.14 GROUT

A. Standard: ASTM C 1107, Grade B, posthardening and volume adjusting, dry, hydraulic-cement grout.

B. Characteristics: Nonshrink, and recommended for interior and exterior applications.

C. Design Mix: 5000-psi (34-MPa), 28-day compressive strength.

D. Packaging: Premixed and factory packaged.

PART 3 - EXECUTION

3.1 PREPARATION

A. Perform fire-hydrant flow test according to NFPA 13 and NFPA 291. Use results for system design calculations required in "Quality Assurance" Article.

B. Report test results promptly and in writing.

3.2 PIPING INSTALLATION

A. Locations and Arrangements: Drawing plans, schematics, and diagrams indicate general location and arrangement of piping. Install piping as indicated, as far as practical.
   1. Deviations from approved working plans for piping require written approval from authorities having jurisdiction. File written approval with Architect before deviating from approved working plans.

B. Piping Standard: Comply with requirements for installation of sprinkler piping in NFPA 13.

C. Use listed fittings to make changes in direction, branch takeoffs from mains, and reductions in pipe sizes.

D. Install unions adjacent to each valve in pipes NPS 2 (DN 50) and smaller.

E. Install flanges, flange adapters, or couplings for grooved-end piping on valves, apparatus, and equipment having NPS 2-1/2 (DN 65) and larger end connections.

F. Install "Inspector's Test Connections" in sprinkler system piping, complete with shutoff valve, and sized and located according to NFPA 13.

G. Install sprinkler piping with drains for complete system drainage.

H. Install sprinkler control valves, test assemblies, and drain risers adjacent to standpipes when sprinkler piping is connected to standpipes.

I. Install automatic (ball drip) drain valve at each check valve for fire-department connection, to drain piping between fire-department connection and check valve. Install drain piping to and spill over floor drain or to outside building.

J. Install alarm devices in piping systems.

K. Install hangers and supports for sprinkler system piping according to NFPA 13. Comply with requirements for hanger materials in NFPA 13.
   1. Victaulic Style 009, 005, and 07 rigid couplings, with angle-pattern bolt pads may be used with IPS steel piping systems, which meet the support and hanging requirements of NFPA 13 and 14. An adequate number of Victaulic Style 177, 004, and 77 flexible couplings shall also be used to compensate for thermal expansion/contraction of the pipe.

L. Install pressure gages on riser or feed main, at each sprinkler test connection, and at top of each standpipe. Include pressure gages with connection not less than NPS 1/4 (DN 8) and with soft metal seated globe valve, arranged for draining pipe between gage and valve. Install gages to permit removal, and install where they will not be subject to freezing.

M. Fill sprinkler system piping with water.

3.3 JOINT CONSTRUCTION

A. Install couplings, flanges, flanged fittings, unions, nipples, and transition and special fittings that have finish and pressure ratings same as or higher than system's pressure rating for aboveground applications unless otherwise indicated.

B. Install unions adjacent to each valve in pipes NPS 2 (DN 50) and smaller.

C. Install flanges, flange adapters, or couplings for grooved-end piping on valves, apparatus, and equipment having NPS 2-1/2 (DN 65) and larger end connections.

D. Ream ends of pipes and tubes and remove burrs. Bevel plain ends of steel pipe.

E. Remove scale, slag, dirt, and debris from inside and outside of pipes, tubes, and fittings before assembly.

F. Flanged Joints: Select appropriate gasket material in size, type, and thickness suitable for water service. Join flanges with gasket and bolts according to ASME B31.9.

G. Threaded Joints: Thread pipe with tapered pipe threads according to ASME B1.20.1. Cut threads full and clean using sharp dies. Ream threaded pipe ends to remove burrs and restore full ID. Join pipe fittings and valves as follows:

1. Apply appropriate tape or thread compound to external pipe threads.
2. Damaged Threads: Do not use pipe or pipe fittings with threads that are corroded or damaged.

H. Welded Joints: Construct joints according to AWS D10.12M/D10.12, using qualified processes and welding operators according to "Quality Assurance" Article.
1. Shop weld pipe joints where welded piping is indicated. Do not use welded joints for galvanized-steel pipe.

I. Steel-Piping, Roll-Grooved Joints: Roll rounded-edge groove in end of pipe according to AWWA C606. Assemble coupling with housing, gasket, lubricant, and bolts. Join steel pipe and grooved-end fittings according to AWWA C606 for steel-pipe grooved joints. The gasket style and elastomeric material (grade) shall be verified as suitable for the intended service as specified. Gaskets shall be molded and produced by Victaulic. Grooved end shall be clean and free from indentations, projections, and roll marks in the area from pipe end to groove for proper gasket sealing. A Victaulic factory-trained field representative shall provide on-site training for contractor's field personnel in the proper use of grooving tools and installation of grooved piping products. Factory-trained representative shall periodically review the product installation. Contractor shall remove and replace any improperly installed products.

J. Steel-Piping, Pressure-Sealed Joints: Join Schedule 5 steel pipe and steel pressure-seal fittings with tools recommended by fitting manufacturer.

K. Dissimilar-Material Piping Joints: Make joints using adapters compatible with materials of both piping systems.

3.4 VALVE AND SPECIALTIES INSTALLATION

A. Install listed fire-protection valves, trim and drain valves, specialty valves and trim, controls, and specialties according to NFPA 13 and authorities having jurisdiction.

B. Install listed fire-protection shutoff valves supervised open, located to control sources of water supply except from fire-department connections. Install permanent identification signs indicating portion of system controlled by each valve.

C. Install check valve in each water-supply connection. Install backflow preventers instead of check valves in potable-water-supply sources.

D. Specialty Valves:
1. General Requirements: Install in vertical position for proper direction of flow, in main supply to system.

3.5 SPRINKLER INSTALLATION

A. Install sprinklers in suspended ceilings in center of acoustical ceiling panels.

B. Install dry-type sprinklers with water supply from heated space. Do not install pendent or sidewall, wet-type sprinklers in areas subject to freezing.

C. Install sprinklers into flexible, sprinkler hose fittings and install hose into bracket on ceiling grid.

3.6 ESCUTCHEON INSTALLATION

A. Install escutcheons for penetrations of walls, ceilings, and floors.

3.7 SLEEVE INSTALLATION

A. General Requirements: Install sleeves for pipes and tubes passing through penetrations in floors, partitions, roofs, and walls.

B. Sleeves are not required for core-drilled holes.

C. Permanent sleeves are not required for holes formed by removable PE sleeves.

D. Cut sleeves to length for mounting flush with both surfaces unless otherwise indicated.

E. Install sleeves in new partitions, slabs, and walls as they are built.

F. For interior wall penetrations, seal annular space between sleeve and pipe or pipe insulation using joint sealants appropriate for size, depth, and location of joint. Comply with requirements for joint sealants in Division 07 Section "Joint Sealants."

G. For exterior wall penetrations above grade, seal annular space between sleeve and pipe using joint sealants appropriate for size, depth, and location of joint. Comply with requirements for joint sealants in Division 07 Section "Joint Sealants."

H. For exterior wall penetrations below grade, seal annular space between sleeve and pipe using sleeve seals.

I. Seal space outside of sleeves in concrete slabs and walls with grout.

J. Install sleeves that are large enough to provide 1/4-inch (6.4-mm) annular clear space between sleeve and pipe or pipe insulation unless otherwise indicated.

K. Install sleeve materials according to the following applications:
   1. Sleeves for Piping Passing through Concrete Floor Slabs: Galvanized-steel pipe.
   2. Sleeves for Piping Passing through Concrete Floor Slabs of Mechanical Equipment Areas or Other Wet Areas: Galvanized-steel pipe.
      a. Extend sleeves 2 inches (50 mm) above finished floor level.
      b. For pipes penetrating floors with membrane waterproofing, extend cast-iron sleeve fittings below floor slab as required to secure clamping ring if ring is specified. Secure flashing between clamping flanges. Install section of cast-iron soil pipe to extend sleeve to 2 inches (50 mm) above finished floor level. Comply with requirements for flashing in Division 07 Section "Sheet Metal Flashing and Trim."
   3. Sleeves for Piping Passing through Gypsum-Board Partitions:
      a. Galvanized-steel-pipe sleeves for pipes smaller than NPS 6 (DN 150).
      b. Galvanized-steel-sheet sleeves for pipes NPS 6 (DN 150) and larger.
      c. Exception: Sleeves are not required for water-supply tubes and waste pipes for individual plumbing fixtures if escutcheons will cover openings.
   4. Sleeves for Piping Passing through Concrete Roof Slabs: Galvanized-steel pipe.
   5. Sleeves for Piping Passing through Exterior Concrete Walls:
      a. Galvanized-steel-pipe sleeves for pipes smaller than NPS 6 (DN 150).
      b. Cast-iron wall-pipe sleeves for pipes NPS 6 (DN 150) and larger.

c. Install sleeves that are large enough to provide 1-inch (25-mm) annular clear space between sleeve and pipe or pipe insulation when sleeve seals are used.

6. Sleeves for Piping Passing through Interior Concrete Walls:
   a. Galvanized-steel-pipe sleeves for pipes smaller than NPS 6 (DN 150).
   b. Galvanized-steel-sheet sleeves for pipes NPS 6 (DN 150) and larger.

L. Fire-Barrier Penetrations: Maintain indicated fire rating of walls, partitions, ceilings, and floors at pipe penetrations. Seal pipe penetrations with firestop materials. Comply with requirements for firestop materials and installations in Division 07 Section "Penetration Firestopping."

3.8 SLEEVE SEAL INSTALLATION

A. Install sleeve seals in sleeves in exterior concrete walls at water-service piping entries into building.

B. Select type and number of sealing elements required for pipe material and size. Position pipe in center of sleeve. Assemble sleeve seal components and install in annular space between pipe and sleeve. Tighten bolts against pressure plates that cause sealing elements to expand and make watertight seal.

3.9 IDENTIFICATION

A. Install labeling and pipe markers on equipment and piping according to requirements in NFPA 13.

B. Identify system components, wiring, cabling, and terminals. Comply with requirements for identification specified in Division 26 Section "Identification for Electrical Systems."

3.10 FIELD QUALITY CONTROL

A. Perform tests and inspections.

B. Tests and Inspections:
1. Leak Test: After installation, charge systems and test for leaks. Repair leaks and retest until no leaks exist.
2. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.
3. Flush, test, and inspect sprinkler systems according to NFPA 13, "Systems Acceptance" Chapter.
4. Energize circuits to electrical equipment and devices.
5. Coordinate with fire-alarm tests. Operate as required.
6. Coordinate with fire-pump tests. Operate as required.
7. Verify that equipment hose threads are same as local fire-department equipment.

C. Sprinkler piping system will be considered defective if it does not pass tests and inspections.

D. Prepare test and inspection reports.

3.11 CLEANING

A. Clean dirt and debris from sprinklers.

B. Remove and replace sprinklers with paint other than factory finish.

3.12 PIPING SCHEDULE

A. Piping between Fire-Department Connections and Check Valves, interior above slab: Galvanized, standard-weight steel pipe with grooved ends; grooved-end fittings; grooved-end-pipe couplings; and grooved joints.

B. Sprinkler specialty fittings may be used, downstream of control vales, instead of specified fittings.

C. Standard-pressure, wet-pipe sprinkler system, NPS 2 (DN 50) and smaller, shall be one of the following:
   1. Standard-weight, black-steel pipe with threaded ends; uncoated, gray-iron threaded fittings; and threaded joints.

D. Standard-pressure, wet-pipe sprinkler system, NPS 2-1/2 to NPS 4 (DN 65 to DN 100), shall be one of the following:
   1. Standard-weight, black-steel pipe with threaded ends; uncoated, gray-iron threaded fittings; and threaded joints.

E. Standard-pressure, wet-pipe sprinkler system, NPS 6 (DN 125) and larger, shall be one of the following:
   1. Schedule 10, black-steel pipe with roll-grooved ends; uncoated, grooved-end fittings for steel piping; grooved-end-pipe couplings for steel piping; and grooved joints.

3.13 SPRINKLER SCHEDULE

A. Use sprinkler types in subparagraphs below for the following applications:
   1. Rooms without Ceilings: Upright sprinklers.
   2. Rooms with Suspended Ceilings: Concealed sprinklers.
   3. Wall Mounting: Sidewall sprinklers.
   4. Spaces Subject to Freezing: Upright, pendent, dry sprinklers; and sidewall, dry sprinklers as indicated.

B. Provide sprinkler types in subparagraphs below with finishes indicated.
   1. Concealed Sprinklers: Rough brass, with factory-painted white cover plate.
   2. Flush Sprinklers: Bright chrome, with painted white escutcheon.
   3. Recessed Sprinklers: Bright chrome, with bright chrome escutcheon.
   4. Upright, Pendent, and Sidewall Sprinklers: Chrome plated in finished spaces exposed to view; rough bronze in unfinished spaces not exposed to view.

END OF SECTION 211313

N:\N0912.00\DOC\SPEC\2012_03-16_BID\211313 FL - WET-PIPE SPRINKLER SYSTEMS.DOC

SECTION 220500 - COMMON WORK RESULTS FOR PLUMBING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. This Section includes the following:
1. Piping materials and installation instructions common to most piping systems.
2. Transition fittings.
3. Dielectric fittings.
4. Mechanical sleeve seals.
5. Sleeves.
6. Escutcheons.
7. Grout.
8. Equipment installation requirements common to equipment sections.
9. Painting and finishing.
10. Concrete bases.
11. Supports and anchorages.

1.3 DEFINITIONS

A. Finished Spaces: Spaces other than mechanical and electrical equipment rooms, furred spaces, pipe chases, unheated spaces immediately below roof, spaces above ceilings, unexcavated spaces, crawlspaces, and tunnels.

B. Exposed, Interior Installations: Exposed to view indoors. Examples include finished occupied spaces and mechanical equipment rooms.

C. Exposed, Exterior Installations: Exposed to view outdoors or subject to outdoor ambient temperatures and weather conditions. Examples include rooftop locations.

D. Concealed, Interior Installations: Concealed from view and protected from physical contact by building occupants. Examples include above ceilings and in chases.

E. Concealed, Exterior Installations: Concealed from view and protected from weather conditions and physical contact by building occupants but subject to outdoor ambient temperatures. Examples include installations within unheated shelters.

F. The following are industry abbreviations for rubber materials:
1. EPDM: Ethylene-propylene-diene terpolymer rubber.
2. NBR: Acrylonitrile-butadiene rubber.

1.4 SUBMITTALS

A. Product Data: For the following:
   1. Transition fittings.
   2. Dielectric fittings.
   3. Mechanical sleeve seals.
   4. Escutcheons.

B. Welding certificates.

1.5 QUALITY ASSURANCE

A. Steel Support Welding: Qualify processes and operators according to AWS D1.1, "Structural Welding Code--Steel."

B. Steel Pipe Welding: Qualify processes and operators according to ASME Boiler and Pressure Vessel Code: Section IX, "Welding and Brazing Qualifications."
   1. Comply with provisions in ASME B31 Series, "Code for Pressure Piping."
   2. Certify that each welder has passed AWS qualification tests for welding processes involved and that certification is current.

C. Electrical Characteristics for Plumbing Equipment: Equipment of higher electrical characteristics may be furnished provided such proposed equipment is approved in writing and connecting electrical services, circuit breakers, and conduit sizes are appropriately modified. If minimum energy ratings or efficiencies are specified, equipment shall comply with requirements.

1.6 DELIVERY, STORAGE, AND HANDLING

A. Deliver pipes and tubes with factory-applied end caps. Maintain end caps through shipping, storage, and handling to prevent pipe end damage and to prevent entrance of dirt, debris, and moisture.

B. Store plastic pipes protected from direct sunlight. Support to prevent sagging and bending.

1.7 COORDINATION

A. Arrange for pipe spaces, chases, slots, and openings in building structure during progress of construction, to allow for plumbing installations.

B. Coordinate installation of required supporting devices and set sleeves in poured-in-place concrete and other structural components as they are constructed.

C. Coordinate requirements for access panels and doors for plumbing items requiring access that are concealed behind finished surfaces. Access panels and doors are specified in Division 08 Section "Access Doors and Frames."

D. Provide coordination drawings between all trades.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. In other Part 2 articles where subparagraph titles below introduce lists, the following requirements apply for product selection:
   1. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the manufacturers specified.
   2. Manufacturers: Subject to compliance with requirements, provide products by the manufacturers specified.

2.2 PIPE, TUBE, AND FITTINGS

A. Refer to individual Division 22 piping Sections for pipe, tube, and fitting materials and joining methods.

B. Pipe Threads: ASME B1.20.1 for factory-threaded pipe and pipe fittings.

2.3 JOINING MATERIALS

A. Refer to individual Division 22 piping Sections for special joining materials not listed below.

B. Pipe-Flange Gasket Materials: Suitable for chemical and thermal conditions of piping system contents.
   1. ASME B16.21, nonmetallic, flat, asbestos-free, 1/8-inch (3.2-mm) maximum thickness unless thickness or specific material is indicated.
      a. Full-Face Type: For flat-face, Class 125, cast-iron and cast-bronze flanges.
      b. Narrow-Face Type: For raised-face, Class 250, cast-iron and steel flanges.
   2. AWWA C110, rubber, flat face, 1/8 inch (3.2 mm) thick, unless otherwise indicated; and full-face or ring type, unless otherwise indicated.

C. Flange Bolts and Nuts: ASME B18.2.1, carbon steel, unless otherwise indicated.

D. Plastic, Pipe-Flange Gasket, Bolts, and Nuts: Type and material recommended by piping system manufacturer, unless otherwise indicated.

E. Solder Filler Metals: ASTM B 32, lead-free alloys. Include water-flushable flux according to ASTM B 813.

F. Brazing Filler Metals: AWS A5.8, BCuP Series, copper-phosphorus alloys for general-duty brazing, unless otherwise indicated; and AWS A5.8, BAg1, silver alloy for refrigerant piping, unless otherwise indicated.

G. Welding Filler Metals: Comply with AWS D10.12 for welding materials appropriate for wall thickness and chemical analysis of steel pipe being welded.

2.4 TRANSITION FITTINGS

A. AWWA Transition Couplings: Same size as, and with pressure rating at least equal to and with ends compatible with, piping to be joined.

1. Manufacturers:
    a. Cascade Waterworks Mfg. Co.
    b. Dresser Industries, Inc.; DMD Div.
    c. Ford Meter Box Company, Incorporated (The); Pipe Products Div.
    d. JCM Industries.
    e. Smith-Blair, Inc.
    f. Viking Johnson.
2. Underground Piping NPS 1-1/2 (DN 40) and Smaller: Manufactured fitting or coupling.
3. Underground Piping NPS 2 (DN 50) and Larger: AWWA C219, metal sleeve-type coupling.
4. Aboveground Pressure Piping: Pipe fitting.

B. Flexible Transition Couplings for Underground Nonpressure Drainage Piping: ASTM C 1173 with elastomeric sleeve, ends same size as piping to be joined, and corrosion-resistant metal band on each end.
1. Manufacturers:
    a. Cascade Waterworks Mfg. Co.
    b. Fernco, Inc.
    c. Mission Rubber Company.
    d. Plastic Oddities, Inc.

2.5 DIELECTRIC FITTINGS

A. Description: Combination fitting of copper alloy and ferrous materials with threaded, solder-joint, plain, or weld-neck end connections that match piping system materials.

B. Insulating Material: Suitable for system fluid, pressure, and temperature.

C. Dielectric Unions: Factory-fabricated, union assembly, for 250-psig (1725-kPa) minimum working pressure at 180 deg F (82 deg C).
1. Manufacturers:
    a. Capitol Manufacturing Co.
    b. Central Plastics Company.
    c. Eclipse, Inc.
    d. Epco Sales, Inc.
    e. Hart Industries, International, Inc.
    f. Watts Industries, Inc.; Water Products Div.
    g. Zurn Industries, Inc.; Wilkins Div.

D. Dielectric Flanges: Factory-fabricated, companion-flange assembly, for 150- or 300-psig (1035- or 2070-kPa) minimum working pressure as required to suit system pressures.
1. Manufacturers:
    a. Capitol Manufacturing Co.
    b. Central Plastics Company.
    c. Epco Sales, Inc.
    d. Watts Industries, Inc.; Water Products Div.

E. Dielectric-Flange Kits: Companion-flange assembly for field assembly. Include flanges, full-face- or ring-type neoprene or phenolic gasket, phenolic or polyethylene bolt sleeves, phenolic washers, and steel backing washers.
1. Manufacturers:
    a. Advance Products & Systems, Inc.
    b. Calpico, Inc.
    c. Central Plastics Company.

d. Pipeline Seal and Insulator, Inc.

2. Separate companion flanges and steel bolts and nuts shall have 150- or 300-psig (1035- or 2070-kPa) minimum working pressure where required to suit system pressures.

F. Dielectric Couplings: Galvanized-steel coupling with inert and noncorrosive, thermoplastic lining; threaded ends; and 300-psig (2070-kPa) minimum working pressure at 225 deg F (107 deg C).

1. Manufacturers:
   a. Calpico, Inc.
   b. Lochinvar Corp.

G. Dielectric Nipples: Electroplated steel nipple with inert and noncorrosive, thermoplastic lining; plain, threaded, or grooved ends; and 300-psig (2070-kPa) minimum working pressure at 225 deg F (107 deg C).

1. Manufacturers:
   a. Perfection Corp.
   b. Precision Plumbing Products, Inc.
   c. Sioux Chief Manufacturing Co., Inc.
   d. Victaulic Co. of America.

2.6 MECHANICAL SLEEVE SEALS

A. Description: Modular sealing element unit, designed for field assembly, to fill annular space between pipe and sleeve.

1. Manufacturers:
   a. Advance Products & Systems, Inc.
   b. Calpico, Inc.
   c. Metraflex Co.
   d. Pipeline Seal and Insulator, Inc.
2. Sealing Elements: EPDM interlocking links shaped to fit surface of pipe. Include type and number required for pipe material and size of pipe.
3. Pressure Plates: Plastic. Include two for each sealing element.
4. Connecting Bolts and Nuts: Stainless steel of length required to secure pressure plates to sealing elements. Include one for each sealing element.

2.7 SLEEVES

A. Galvanized-Steel Sheet: 0.0239-inch (0.6-mm) minimum thickness; round tube closed with welded longitudinal joint.

B. Steel Pipe: ASTM A 53, Type E, Grade B, Schedule 40, galvanized, plain ends.

C. Cast Iron: Cast or fabricated "wall pipe" equivalent to ductile-iron pressure pipe, with plain ends and integral waterstop, unless otherwise indicated.

D. Stack Sleeve Fittings: Manufactured, cast-iron sleeve with integral clamping flange. Include clamping ring and bolts and nuts for membrane flashing.

1. Underdeck Clamp: Clamping ring with set screws.

2.8 ESCUTCHEONS

A. Description: Manufactured wall and ceiling escutcheons and floor plates, with an ID to closely fit around pipe, tube, and insulation of insulated piping and an OD that completely covers opening.

B. One-Piece, Deep-Pattern Type: Deep-drawn, box-shaped brass with polished chrome-plated finish.

C. One-Piece, Cast-Brass Type: With set screw.
1. Finish: Polished chrome-plated.

D. Split-Casting, Cast-Brass Type: With concealed hinge and set screw.
1. Finish: Polished chrome-plated.

E. One-Piece, Stamped-Steel Type: With set screw or spring clips and chrome-plated finish.

F. Split-Plate, Stamped-Steel Type: With exposed-rivet hinge, set screw or spring clips, and chrome-plated finish.

G. One-Piece, Floor-Plate Type: Cast-iron floor plate.

H. Split-Casting, Floor-Plate Type: Cast brass with concealed hinge and set screw.

2.9 GROUT

A. Description: ASTM C 1107, Grade B, non-shrink and nonmetallic, dry hydraulic-cement grout.
1. Characteristics: Post-hardening, volume-adjusting, non-staining, noncorrosive, nongaseous, and recommended for interior and exterior applications.
2. Design Mix: 5000-psi (34.5-MPa), 28-day compressive strength.
3. Packaging: Premixed and factory packaged.

PART 3 - EXECUTION

3.1 PIPING SYSTEMS - COMMON REQUIREMENTS

A. Install piping according to the following requirements and Division 22 Sections specifying piping systems.

B. Drawing plans, schematics, and diagrams indicate general location and arrangement of piping systems. Indicated locations and arrangements were used to size pipe and calculate friction loss, expansion, pump sizing, and other design considerations. Install piping as indicated unless deviations to layout are approved on Coordination Drawings.

C. Install piping in concealed locations, unless otherwise indicated and except in equipment rooms and service areas.

D. Install piping indicated to be exposed and piping in equipment rooms and service areas at right angles or parallel to building walls. Diagonal runs are prohibited unless specifically indicated otherwise.

E. Install piping above accessible ceilings to allow sufficient space for ceiling panel removal.

F. Install piping to permit valve servicing.

G. Install piping at indicated slopes.

H. Install piping free of sags and bends.

I. Install fittings for changes in direction and branch connections.

J. Install piping to allow application of insulation.

K. Select system components with pressure rating equal to or greater than system operating pressure.

L. Install escutcheons for penetrations of walls, ceilings, and floors according to the following:
   1. New Piping:
      a. Piping with Fitting or Sleeve Protruding from Wall: One-piece, deep-pattern type.
      b. Chrome-Plated Piping: One-piece, cast-brass type with polished chrome-plated finish.
      c. Insulated Piping: One-piece, stamped-steel type with spring clips.
      d. Bare Piping at Wall and Floor Penetrations in Finished Spaces: One-piece, cast-brass type with polished chrome-plated finish.
      e. Bare Piping at Wall and Floor Penetrations in Finished Spaces: One-piece, stamped-steel type.
      f. Bare Piping at Ceiling Penetrations in Finished Spaces: One-piece or split-casting, cast-brass type with polished chrome-plated finish.
      g. Bare Piping in Unfinished Service Spaces: One-piece, cast-brass type with polished chrome-plated finish.
      h. Bare Piping in Equipment Rooms: One-piece, cast-brass type.
      i. Bare Piping at Floor Penetrations in Equipment Rooms: One-piece, floor-plate type.

M. Sleeves are not required for core-drilled holes.

N. Install sleeves for pipes passing through concrete and masonry walls and concrete floor and roof slabs.

O. Install sleeves for pipes passing through concrete and masonry walls, gypsum-board partitions, and concrete floor and roof slabs.
   1. Cut sleeves to length for mounting flush with both surfaces.
      a. Exception: Extend sleeves installed in floors of mechanical equipment areas or other wet areas 2 inches (50 mm) above finished floor level. Extend cast-iron sleeve fittings below floor slab as required to secure clamping ring if ring is specified.
   2. Install sleeves in new walls and slabs as new walls and slabs are constructed.
   3. Install sleeves that are large enough to provide 1/4-inch (6.4-mm) annular clear space between sleeve and pipe or pipe insulation. Use the following sleeve materials:
      a. Steel Pipe Sleeves: For pipes smaller than NPS 6 (DN 150).
      b. Steel Sheet Sleeves: For pipes NPS 6 (DN 150) and larger, penetrating gypsum-board partitions.
      c. Stack Sleeve Fittings: For pipes penetrating floors with membrane waterproofing. Secure flashing between clamping flanges. Install section of cast-iron soil pipe to extend sleeve to 2 inches (50 mm) above finished floor level. Refer to Division 07 Section "Sheet Metal Flashing and Trim" for flashing.
         1) Seal space outside of sleeve fittings with grout.
   4. Except for underground wall penetrations, seal annular space between sleeve and pipe or pipe insulation, using joint sealants appropriate for size, depth, and location of joint. Refer to Division 07 Section "Joint Sealants" for materials and installation.

P. Aboveground, Exterior-Wall Pipe Penetrations: Seal penetrations using sleeves and mechanical sleeve seals. Select sleeve size to allow for 1-inch (25-mm) annular clear space between pipe and sleeve for installing mechanical sleeve seals.
   1. Install steel pipe for sleeves smaller than 6 inches (150 mm) in diameter.
   2. Install cast-iron "wall pipes" for sleeves 6 inches (150 mm) and larger in diameter.
   3. Mechanical Sleeve Seal Installation: Select type and number of sealing elements required for pipe material and size. Position pipe in center of sleeve. Assemble mechanical sleeve seals and install in annular space between pipe and sleeve. Tighten bolts against pressure plates that cause sealing elements to expand and make watertight seal.

Q. Underground, Exterior-Wall Pipe Penetrations: Install cast-iron "wall pipes" for sleeves. Seal pipe penetrations using mechanical sleeve seals. Select sleeve size to allow for 1-inch (25-mm) annular clear space between pipe and sleeve for installing mechanical sleeve seals.
   1. Mechanical Sleeve Seal Installation: Select type and number of sealing elements required for pipe material and size. Position pipe in center of sleeve. Assemble mechanical sleeve seals and install in annular space between pipe and sleeve. Tighten bolts against pressure plates that cause sealing elements to expand and make watertight seal.

R. Fire-Barrier Penetrations: Maintain indicated fire rating of walls, partitions, ceilings, and floors at pipe penetrations. Seal pipe penetrations with firestop materials. Refer to Division 07 Section "Penetration Firestopping" for materials.

S. Verify final equipment locations for roughing-in.

T. Refer to equipment specifications in other Sections of these Specifications for roughing-in requirements.

3.2 PIPING JOINT CONSTRUCTION

A. Join pipe and fittings according to the following requirements and Division 22 Sections specifying piping systems.

B. Ream ends of pipes and tubes and remove burrs. Bevel plain ends of steel pipe.

C. Remove scale, slag, dirt, and debris from inside and outside of pipe and fittings before assembly.

D. Soldered Joints: Apply ASTM B 813, water-flushable flux, unless otherwise indicated, to tube end. Construct joints according to ASTM B 828 or CDA's "Copper Tube Handbook," using lead-free solder alloy complying with ASTM B 32.

E. Brazed Joints: Construct joints according to AWS's "Brazing Handbook," "Pipe and Tube" Chapter, using copper-phosphorus brazing filler metal complying with AWS A5.8.

F. Threaded Joints: Thread pipe with tapered pipe threads according to ASME B1.20.1. Cut threads full and clean using sharp dies. Ream threaded pipe ends to remove burrs and restore full ID. Join pipe fittings and valves as follows:
   1. Apply appropriate tape or thread compound to external pipe threads unless dry seal threading is specified.
   2. Damaged Threads: Do not use pipe or pipe fittings with threads that are corroded or damaged. Do not use pipe sections that have cracked or open welds.

G. Welded Joints: Construct joints according to AWS D10.12, using qualified processes and welding operators according to Part 1 "Quality Assurance" Article.

H. Flanged Joints: Select appropriate gasket material, size, type, and thickness for service application. Install gasket concentrically positioned. Use suitable lubricants on bolt threads.

3.3 PIPING CONNECTIONS

A. Make connections according to the following, unless otherwise indicated:
   1. Install unions, in piping NPS 2 (DN 50) and smaller, adjacent to each valve and at final connection to each piece of equipment.
   2. Install flanges, in piping NPS 2-1/2 (DN 65) and larger, adjacent to flanged valves and at final connection to each piece of equipment.
   3. Dry Piping Systems: Install dielectric unions and flanges to connect piping materials of dissimilar metals.
   4. Wet Piping Systems: Install dielectric coupling and nipple fittings to connect piping materials of dissimilar metals.

3.4 EQUIPMENT INSTALLATION - COMMON REQUIREMENTS

A. Install equipment to allow maximum possible headroom unless specific mounting heights are not indicated.

B. Install equipment level and plumb, parallel and perpendicular to other building systems and components in exposed interior spaces, unless otherwise indicated.

C. Install plumbing equipment to facilitate service, maintenance, and repair or replacement of components. Connect equipment for ease of disconnecting, with minimum interference to other installations. Extend grease fittings to accessible locations.

D. Install equipment to allow right of way for piping installed at required slope.

3.5 PAINTING

A. Painting of plumbing systems, equipment, and components is specified in Division 09 Sections "Interior Painting" and "Exterior Painting."

B. Damage and Touchup: Repair marred and damaged factory-painted finishes with materials and procedures to match original factory finish.

3.6 CONCRETE BASES

A. Concrete Bases: Anchor equipment to concrete base according to equipment manufacturer's written instructions and according to seismic codes at Project.
   1. Construct concrete bases of dimensions indicated, but not less than 4 inches (100 mm) larger in both directions than supported unit.
   2. Install dowel rods to connect concrete base to concrete floor. Unless otherwise indicated, install dowel rods on 18-inch (450-mm) centers around the full perimeter of the base.
   3. Install epoxy-coated anchor bolts for supported equipment that extend through concrete base, and anchor into structural concrete floor.
   4. Place and secure anchorage devices. Use supported equipment manufacturer's setting drawings, templates, diagrams, instructions, and directions furnished with items to be embedded.

5. Install anchor bolts to elevations required for proper attachment to supported equipment.
6. Install anchor bolts according to anchor-bolt manufacturer's written instructions.
7. Use 3000-psi (20.7-MPa), 28-day compressive-strength concrete and reinforcement as specified in Division 03 Sections for cast in place concrete.

3.7 ERECTION OF METAL SUPPORTS AND ANCHORAGES

A. Refer to Division 05 Section "Metal Fabrications" for structural steel.

B. Cut, fit, and place miscellaneous metal supports accurately in location, alignment, and elevation to support and anchor plumbing materials and equipment.

C. Field Welding: Comply with AWS D1.1.

3.8 ERECTION OF WOOD SUPPORTS AND ANCHORAGES

A. Cut, fit, and place wood grounds, nailers, blocking, and anchorages to support, and anchor plumbing materials and equipment.

B. Select fastener sizes that will not penetrate members if opposite side will be exposed to view or will receive finish materials. Tighten connections between members. Install fasteners without splitting wood members.

C. Attach to substrates as required to support applied loads.

3.9 GROUTING

A. Mix and install grout for plumbing equipment base bearing surfaces, pump and other equipment base plates, and anchors.

B. Clean surfaces that will come into contact with grout.

C. Provide forms as required for placement of grout.

D. Avoid air entrapment during placement of grout.

E. Place grout, completely filling equipment bases.

F. Place grout on concrete bases and provide smooth bearing surface for equipment.

G. Place grout around anchors.

H. Cure placed grout.

END OF SECTION 220500

N:\N0912.00\DOC\SPEC\2012_03-16_BID\220500 - COMMON WORK RESULTS FOR PLUMBING.DOC

SECTION 220516 - EXPANSION FITTINGS AND LOOPS FOR PLUMBING PIPING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:
   1. Metal-bellows expansion joints.
   2. Rubber expansion joints.
   3. Flexible-hose expansion joints.
   4. Pipe bends and loops.
   5. Alignment guides and anchors.

1.3 DEFINITIONS

A. BR: Butyl rubber.

B. Buna-N: Nitrile rubber.

C. CR: Chlorosulfonated polyethylene synthetic rubber.

D. CSM: Chlorosulfonyl-polyethylene rubber.

E. EPDM: Ethylene-propylene-diene terpolymer rubber.

F. NR: Natural rubber.

1.4 PERFORMANCE REQUIREMENTS

A. Compatibility: Products shall be suitable for piping system fluids, materials, working pressures, and temperatures.

B. Capability: Products shall absorb 200 percent of maximum axial movement between anchors.

1.5 SUBMITTALS

A. Product Data: For each type of product indicated.

B. Delegated-Design Submittal: For each anchor and alignment guide indicated to comply with performance requirements and design criteria, including analysis data signed and sealed by the qualified professional engineer responsible for their preparation.

1. Design Calculations: Calculate requirements for thermal expansion of piping systems and for selecting and designing expansion joints, loops, and bends.
2. Anchor Details: Detail fabrication of each anchor indicated. Show dimensions and methods of assembly and attachment to building structure.
3. Alignment Guide Details: Detail field assembly and attachment to building structure.
4. Schedule: Indicate type, manufacturer's number, size, material, pressure rating, end connections, and location for each expansion joint.

C. Welding certificates.

D. Product Certificates: For each type of pipe expansion joint, signed by product manufacturer.

E. Maintenance Data: For pipe expansion joints to include in maintenance manuals.

1.6 QUALITY ASSURANCE

A. Welding Qualifications: Qualify procedures and personnel according to the following:
1. Steel Shapes and Plates: AWS D1.1, "Structural Welding Code - Steel."
2. Welding to Piping: ASME Boiler and Pressure Vessel Code: Section IX.

PART 2 - PRODUCTS

2.1 EXPANSION JOINTS

A. Metal-Bellows Expansion Joints: ASTM F 1120, circular-corrugated-bellows type with external tie rods.
1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
a. Adsco Manufacturing, LLC.
b. Anamet, Inc.
c. Badger Industries.
d. Expansion Joint Systems, Inc.
e. Flex-Hose Co., Inc.
f. Flexicraft Industries.
g. Flex-Pression, Ltd.
h. Flex-Weld, Inc.
i. Hyspan Precision Products, Inc.
j. Metraflex, Inc.
k. Piping Technology & Products, Inc.
l. Proco Products, Inc.
m. Senior Flexonics, Inc.; Pathway Division.
n. Tozen America Corp.
o. Unaflex Inc.
p. WahlcoMetroflex.
q.
2. Metal-Bellows Expansion Joints for Copper Piping: Single- or multiple -ply phosphor-bronze bellows, copper pipe end connections, and brass shrouds.
3. Minimum Pressure Rating: 150 psig (1035 kPa), unless otherwise indicated.
4. Configuration: Single- or double -bellows type, unless otherwise indicated.
5. End Connections: Flanged or weld.

2.2 ALIGNMENT GUIDES

A. Description: Steel, factory fabricated, with bolted two-section outer cylinder and base for alignment of piping and two-section guiding spider for bolting to pipe.
   1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
      a. Adsco Manufacturing, LLC.
      b. Advanced Thermal Systems, Inc.
      c. Flex-Hose Co., Inc.
      d. Flexicraft Industries.
      e. Flex-Weld, Inc.
      f. Hyspan Precision Products, Inc.
      g. Metraflex, Inc.
      h. Piping Technology & Products, Inc.
      i. Senior Flexonics, Inc.; Pathway Division.

2.3 MATERIALS FOR ANCHORS

A. Steel Shapes and Plates: ASTM A 36/A 36M.

B. Bolts and Nuts: ASME B18.10 or ASTM A 183, steel, hex head.

C. Washers: ASTM F 844, steel, plain, flat washers.

D. Mechanical Fasteners: Insert-wedge-type stud with expansion plug anchor for use in hardened portland cement concrete, and tension and shear capacities appropriate for application.
   1. Stud: Threaded, zinc-coated carbon steel.
   2. Expansion Plug: Zinc-coated steel.
   3. Washer and Nut: Zinc-coated steel.

E. Chemical Fasteners: Insert-type-stud bonding system anchor for use with hardened portland cement concrete, and tension and shear capacities appropriate for application.
   1. Bonding Material: ASTM C 881, Type IV, Grade 3, 2-component epoxy resin suitable for surface temperature of hardened concrete where fastener is to be installed.
   2. Stud: ASTM A 307, zinc-coated carbon steel with continuous thread on stud, unless otherwise indicated.
   3. Washer and Nut: Zinc-coated steel.

F. Concrete: Portland cement mix, 3000 psi (20.7 MPa) minimum. Comply with requirements in Division 03 Section "Cast-in-Place Concrete" for formwork, reinforcement, and concrete.

G. Grout: ASTM C 1107, factory-mixed and -packaged, dry, hydraulic-cement, nonshrink, nonmetallic grout; suitable for interior and exterior applications.
   1. Properties: Non-staining, noncorrosive, and nongaseous.
   2. Design Mix: 5000-psi (34.5-MPa), 28-day compressive strength.

PART 3 - EXECUTION

3.1 EXPANSION-JOINT INSTALLATION

A. Install manufactured, nonmetallic expansion joints according to FSA's "Technical Handbook: Non-Metallic Expansion Joints and Flexible Pipe Connectors."

B. Install expansion joints of sizes matching size of piping in which they are installed.

C. Install alignment guides to allow expansion and to avoid end-loading and torsional stress.

3.2 PIPE BEND AND LOOP INSTALLATION

A. Install pipe bends and loops cold-sprung in tension or compression as required to partly absorb tension or compression produced during anticipated change in temperature.

B. Attach pipe bends and loops to anchors.
   1. Steel Anchors: Attach by welding. Comply with ASME B31.9 and ASME Boiler and Pressure Vessel Code: Section IX, "Welding and Brazing Qualifications."
   2. Concrete Anchors: Attach by fasteners. Follow fastener manufacturer's written instructions.

3.3 ALIGNMENT-GUIDE INSTALLATION

A. Install guides on piping adjoining pipe expansion fittings and loops.

B. Attach guides to pipe and secure to building structure.

3.4 ANCHOR INSTALLATION

A. Install anchors at locations to prevent stresses from exceeding those permitted by ASME B31.9 and to prevent transfer of loading and stresses to connected equipment.

B. Fabricate and install steel anchors by welding steel shapes, plates, and bars to piping and to structure. Comply with ASME B31.9 and AWS D1.1.

C. Construct concrete anchors of poured-in-place concrete of dimensions indicated and include embedded fasteners.

D. Install pipe anchors according to expansion-joint manufacturer's written instructions if expansion joints are indicated.

E. Use grout to form flat bearing surfaces for expansion fittings, guides, and anchors installed on or in concrete.

END OF SECTION 220516

N:\N0912.00\DOC\SPEC\2012_03-16_BID\220516 - EXPANSION FITTINGS AND LOOPS FOR PLUMBING PIPING.DOC

SECTION 220519 - METERS AND GAGES FOR PLUMBING PIPING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:
   1. Thermometers.
   2. Gages.
   3. Test plugs.

B. Related Sections:
   1. Division 22 Section "Facility Water Distribution Piping" for domestic and fire-protection water service meters outside the building.
   2. Division 22 Section "Domestic Water Piping" for domestic and fire-protection water service meters inside the building.
   3. Division 22 Section "Facility Natural-Gas Piping" for gas meters.

1.3 DEFINITIONS

A. CR: Chlorosulfonated polyethylene synthetic rubber.

B. EPDM: Ethylene-propylene-diene terpolymer rubber.

1.4 SUBMITTALS

A. Product Data: For each type of product indicated; include performance curves.

B. Shop Drawings: Schedule for thermometers and gages indicating manufacturer's number, scale range, and location for each.

C. Product Certificates: For each type of thermometer and gage, signed by product manufacturer.

PART 2 - PRODUCTS

2.1 THERMOMETERS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   1. Palmer - Wahl Instruments Inc.
   2. Trerice, H. O. Co.

3. Weiss Instruments, Inc.
4. Weksler Instruments Operating Unit; Dresser Industries; Instrument Div.

B. Description: Digital, self-powered (solar) thermometer with angle adjustment.

C. Case: High impact ABS.

D. Range: -50 to 300 degrees F.

E. Display: 3/8" LCD digits.

F. Sensor: Glass passivated thermistor.

G. Accuracy: Plus or minus 1 percent of range or plus or minus 1 scale division to maximum of 1.5 percent of range.

H. Basis of Design: Weiss Model DVU35 or equal.

2.2 THERMOWELLS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
1. AMETEK, Inc.; U.S. Gauge Div.
2. Ashcroft Commercial Instrument Operations; Dresser Industries; Instrument Div.
3. Ernst Gage Co.
4. Marsh Bellofram.
5. Miljoco Corp.
6. NANMAC Corporation.
7. Noshok, Inc.
8. Palmer - Wahl Instruments Inc.
9. REO TEMP Instrument Corporation.
10. Tel-Tru Manufacturing Company.
11. Trerice, H. O. Co.
12. Weiss Instruments, Inc.
13. Weksler Instruments Operating Unit; Dresser Industries; Instrument Div.
14. WIKA Instrument Corporation.
15. Winters Instruments.

B. Manufacturers: Same as manufacturer of thermometer being used.

C. Description: Pressure-tight, socket-type metal fitting made for insertion into piping and of type, diameter, and length required to hold thermometer.

2.3 PRESSURE GAGES

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
1. AMETEK, Inc.; U.S. Gauge Div.
2. Ashcroft Commercial Instrument Operations; Dresser Industries; Instrument Div.
3. Ernst Gage Co.
4. Eugene Ernst Products Co.
5. KOBOLD Instruments, Inc.
6. Marsh Bellofram.

7. Miljoco Corp.
8. Noshok, Inc.
9. Palmer - Wahl Instruments Inc.
10. REO TEMP Instrument Corporation.
11. Trerice, H. O. Co.
12. Weiss Instruments, Inc.
13. Weksler Instruments Operating Unit; Dresser Industries; Instrument Div.
14. WIKA Instrument Corporation.
15. Winters Instruments.

B. Direct-Mounting, Dial-Type Pressure Gages: Indicating-dial type complying with ASME B40.100.
1. Case: Dry type, metal or plastic, 4-1/2-inch (114-mm) diameter.
2. Pressure-Element Assembly: Bourdon tube, unless otherwise indicated.
3. Pressure Connection: Brass, NPS 1/4 (DN 8), bottom-outlet type unless back-outlet type is indicated.
4. Movement: Mechanical, with link to pressure element and connection to pointer.
5. Dial: Satin-faced, non-reflective aluminum with permanently etched scale markings.
6. Pointer: Red or other dark-color metal.
7. Window: Glass or plastic.
8. Ring: Metal.
9. Accuracy: Grade A, plus or minus 1 percent of middle half scale.
10. Vacuum-Pressure Range: 30-in. Hg of vacuum to 15 psig of pressure (100 kPa of vacuum to 103 kPa of pressure).
11. Range for Fluids under Pressure: Two times operating pressure.

C. Pressure-Gage Fittings:
1. Valves: NPS 1/4 (DN 8) brass or stainless-steel needle type.
2. Snubbers: ASME B40.5, NPS 1/4 (DN 8) brass bushing with corrosion-resistant, porous-metal disc of material suitable for system fluid and working pressure.

2.4 TEST PLUGS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
1. Flow Design, Inc.
2. MG Piping Products Co.
3. National Meter, Inc.
4. Peterson Equipment Co., Inc.
5. Sisco Manufacturing Co.
6. Trerice, H. O. Co.
7. Watts Industries, Inc.; Water Products Div.

B. Description: Corrosion-resistant brass or stainless-steel body with core inserts and gasketed and threaded cap, with extended stem for units to be installed in insulated piping.

C. Minimum Pressure and Temperature Rating: 500 psig at 200 deg F (3450 kPa at 93 deg C).

D. Core Inserts: One or two self-sealing rubber valves.
1. Insert material for water service at 20 to 200 deg F (minus 7 to plus 93 deg C) shall be CR.
2. Insert material for water service at minus 30 to plus 275 deg F (minus 35 to plus 136 deg C) shall be EPDM.

E. Test Kit: Furnish one test kit(s) containing one pressure gage and adaptor, one thermometer, and carrying case. Pressure gage, adapter probes, and thermometer sensing elements shall be of diameter to fit test plugs and of length to project into piping.
   1. Pressure Gage: Small bourdon-tube insertion type with 2- to 3-inch- (51- to 76-mm-) diameter dial and probe. Dial range shall be 0 to 200 psig (0 to 1380 kPa).
   2. Low-Range Thermometer: Small bimetallic insertion type with 1- to 2-inch- (25- to 51-mm-) diameter dial and tapered-end sensing element. Dial ranges shall be 25 to 125 deg F (minus 4 to plus 52 deg C).
   3. High-Range Thermometer: Small bimetallic insertion type with 1- to 2-inch- (25- to 51-mm-) diameter dial and tapered-end sensing element. Dial ranges shall be 0 to 220 deg F (minus 18 to plus 104 deg C).
   4. Carrying case shall have formed instrument padding.

PART 3 - EXECUTION

3.1 THERMOMETER APPLICATIONS

A. Install thermometers in the outlet of each domestic hot-water storage tank.

B. Install thermometers at suction and discharge of each hot water circulation pump.

C. Provide the following temperature ranges for thermometers:
   1. Domestic Hot Water: 30 to 180 deg F, with 2-degree scale divisions (Minus 1 to plus 82 deg C, with 1-degree scale divisions).
   2. Domestic Cold Water: 0 to 100 deg F, with 2-degree scale divisions (Minus 18 to plus 38 deg C, with 1-degree scale divisions).

3.2 GAGE APPLICATIONS

A. Install pressure gages for each reduced pressure backflow preventer.

B. Install pressure gages at suction and discharge of each pump.

3.3 INSTALLATIONS

A. Install direct-mounting thermometers and adjust vertical and tilted positions.

B. Install thermowells with socket extending one-third of diameter of pipe and in vertical position in piping tees where thermometers are indicated.

C. Install direct-mounting pressure gages in piping tees with pressure gage located on pipe at most readable position.

D. Install needle-valve and snubber fitting in piping for each pressure gage.

E. Install test plugs in tees in piping.

F. Install permanent indicators on walls or brackets in accessible and readable positions.

G. Install connection fittings for attachment to portable indicators in accessible locations.

H. Install thermometers and gages adjacent to machines and equipment to allow service and maintenance for thermometers, gages, machines, and equipment.

I. Adjust faces of thermometers and gages to proper angle for best visibility.

END OF SECTION 220519

N:\N0912.00\DOC\SPEC\2012_03-16_BID\220519 - METERS AND GAGES FOR PLUMBING PIPING.DOC

SECTION 220523 - GENERAL-DUTY VALVES FOR PLUMBING PIPING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:
   1. Bronze angle valves.
   2. Bronze ball valves.
   3. Bronze lift check valves.
   4. Bronze swing check valves.
   5. Lubricated plug valves.

B. Related Sections:
   1. Division 22 plumbing piping Sections for specialty valves applicable to those Sections only.
   2. Division 22 Section "Identification for Plumbing Piping and Equipment" for valve tags and schedules.
   3. Division 33 water distribution piping Sections for general-duty and specialty valves for site construction piping.

1.3 DEFINITIONS

A. CWP: Cold working pressure.

B. EPDM: Ethylene propylene copolymer rubber.

C. NBR: Acrylonitrile-butadiene, Buna-N, or nitrile rubber.

D. NRS: Nonrising stem.

E. OS&Y: Outside screw and yoke.

F. RS: Rising stem.

G. SWP: Steam working pressure.

1.4 SUBMITTALS

A. Product Data: For each type of valve indicated.

1.5 QUALITY ASSURANCE

A. Source Limitations for Valves: Obtain each type of valve from single source from single manufacturer.

B. ASME Compliance:
1. ASME B16.10 and ASME B16.34 for ferrous valve dimensions and design criteria.
2. ASME B31.9 for building services piping valves.

C. NSF Compliance: NSF 61 for valve materials for potable-water service.

1.6 DELIVERY, STORAGE, AND HANDLING

A. Prepare valves for shipping as follows:
1. Protect internal parts against rust and corrosion.
2. Protect threads, flange faces, grooves, and weld ends.
3. Set angle, gate, and globe valves closed to prevent rattling.
4. Set ball and plug valves open to minimize exposure of functional surfaces.
5. Block check valves in either closed or open position.

B. Use the following precautions during storage:
1. Maintain valve end protection.
2. Store valves indoors and maintain at higher than ambient dew point temperature. If outdoor storage is necessary, store valves off the ground in watertight enclosures.

C. Use sling to handle large valves; rig sling to avoid damage to exposed parts. Do not use handwheels or stems as lifting or rigging points.

PART 2 - PRODUCTS

2.1 GENERAL REQUIREMENTS FOR VALVES

A. Refer to valve schedule articles for applications of valves.

B. Valve Pressure and Temperature Ratings: Not less than indicated and as required for system pressures and temperatures.

C. Valve Sizes: Same as upstream piping unless otherwise indicated.

D. Valves in Insulated Piping: With 2-inch (50-mm) stem extensions and the following features:
1. Ball Valves: With extended operating handle of non-thermal-conductive material, and protective sleeve that allows operation of valve without breaking the vapor seal or disturbing insulation.

E. Valve-End Connections:
1. Flanged: With flanges according to ASME B16.1 for iron valves.
2. Grooved: With grooves according to AWWA C606.
3. Solder Joint: With sockets according to ASME B16.18.
4. Threaded: With threads according to ASME B1.20.1.

F. Valve Bypass and Drain Connections: MSS SP-45.

2.2 BRONZE BALL VALVES

A. Two-Piece, Full-Port, Bronze Ball Valves with Bronze Trim:
   1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
      a. American Valve, Inc.
      b. Conbraco Industries, Inc.; Apollo Valves.
      c. Crane Co.; Crane Valve Group; Crane Valves.
      d. Hammond Valve.
      e. Lance Valves; a division of Advanced Thermal Systems, Inc.
      f. Legend Valve.
      g. Milwaukee Valve Company.
      h. NIBCO INC.
      i. Red-White Valve Corporation.
      j. Watts Regulator Co.; a division of Watts Water Technologies, Inc.
   2. Description:
      a. Standard: MSS SP-110.
      b. SWP Rating: 150 psig (1035 kPa).
      c. CWP Rating: 600 psig (4140 kPa).
      d. Body Design: Two piece.
      e. Body Material: Bronze.
      f. Ends: Threaded.
      g. Seats: PTFE or TFE.
      h. Stem: Bronze.
      i. Ball: Chrome-plated brass.
      j. Port: Full.

2.3 BRONZE SWING CHECK VALVES

A. Class 150, Bronze Swing Check Valves with Bronze Disc:
   1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
      a. American Valve, Inc.
      b. Crane Co.; Crane Valve Group; Crane Valves.
      c. Crane Co.; Crane Valve Group; Jenkins Valves.
      d. Crane Co.; Crane Valve Group; Stockham Division.
      e. Kitz Corporation.
      f. Milwaukee Valve Company.
      g. NIBCO INC.
      h. Red-White Valve Corporation.
      i. Zy-Tech Global Industries, Inc.
   2. Description:
      a. Standard: MSS SP-80, Type 3.
      b. CWP Rating: 300 psig (2070 kPa).
      c. Body Design: Horizontal flow.
      d. Body Material: ASTM B 62, bronze.
      e. Ends: Threaded.
      f. Disc: Bronze.

2.4 LUBRICATED PLUG VALVES

A. Class 125, Regular-Gland, Lubricated Plug Valves with Threaded Ends:
   1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
      a. Nordstrom Valves, Inc.
      b. Approved equal.
   2. Description:
      a. Standard: MSS SP-78, Type II.
      b. CWP Rating: 200 psig (1380 kPa).
      c. Body Material: ASTM A 48/A 48M or ASTM A 126, cast iron with lubrication-sealing system.
      d. Pattern: Regular or short.
      e. Plug: Cast iron or bronze with sealant groove.

B. Class 125, Regular-Gland, Lubricated Plug Valves with Flanged Ends:
   1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
      a. Nordstrom Valves, Inc.
      b. Approved equal.
   2. Description:
      a. Standard: MSS SP-78, Type II.
      b. CWP Rating: 200 psig (1380 kPa).
      c. Body Material: ASTM A 48/A 48M or ASTM A 126, cast iron with lubrication-sealing system.
      d. Pattern: Regular or short.
      e. Plug: Cast iron or bronze with sealant groove.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine valve interior for cleanliness, freedom from foreign matter, and corrosion. Remove special packing materials, such as blocks, used to prevent disc movement during shipping and handling.

B. Operate valves in positions from fully open to fully closed. Examine guides and seats made accessible by such operations.

C. Examine threads on valve and mating pipe for form and cleanliness.

D. Examine mating flange faces for conditions that might cause leakage. Check bolting for proper size, length, and material. Verify that gasket is of proper size, that its material composition is suitable for service, and that it is free from defects and damage.

E. Do not attempt to repair defective valves; replace with new valves.

3.2 VALVE INSTALLATION

A. Install valves with unions or flanges at each piece of equipment arranged to allow service, maintenance, and equipment removal without system shutdown.

B. Locate valves for easy access and provide separate support where necessary.

C. Install valves in horizontal piping with stem at or above center of pipe.

D. Install valves in position to allow full stem movement.

E. Install check valves for proper direction of flow and as follows:
   1. Swing Check Valves: In horizontal position with hinge pin level.
   2. Lift Check Valves: With stem upright and plumb.

3.3 ADJUSTING

A. Adjust or replace valve packing after piping systems have been tested and put into service but before final adjusting and balancing. Replace valves if persistent leaking occurs.

3.4 GENERAL REQUIREMENTS FOR VALVE APPLICATIONS

A. If valve applications are not indicated, use the following:
   1. Shutoff Service: Ball or plug valves.
   2. Throttling Service: angle or ball valves.
   3. Pump-Discharge Check Valves:
      a. NPS 2 (DN 50) and Smaller: Bronze swing check valves with bronze or nonmetallic disc.
      b. NPS 2-1/2 (DN 65) and Larger for Domestic Water: Iron swing check valves with lever and weight or with spring or iron, center-guided, metal or resilient-seat check valves.
      c. NPS 2-1/2 (DN 65) and Larger for Sanitary Waste and Storm Drainage: Iron swing check valves with lever and weight or spring.

B. If valves with specified SWP classes or CWP ratings are not available, the same types of valves with higher SWP classes or CWP ratings may be substituted.

C. Select valves, except wafer types, with the following end connections:
   1. For Copper Tubing, NPS 2 (DN 50) and Smaller: Threaded ends except where solder-joint valve-end option is indicated in valve schedules below.
   2. For Copper Tubing, NPS 2-1/2 to NPS 4 (DN 65 to DN 100): Flanged ends except where threaded valve-end option is indicated in valve schedules below.
   3. For Copper Tubing, NPS 5 (DN 125) and Larger: Flanged ends.
   4. For Steel Piping, NPS 2 (DN 50) and Smaller: Threaded ends.
   5. For Steel Piping, NPS 2-1/2 to NPS 4 (DN 65 to DN 100): Flanged ends except where threaded valve-end option is indicated in valve schedules below.
   6. For Steel Piping, NPS 5 (DN 125) and Larger: Flanged ends.
   7. For Grooved-End Copper Tubing: Valve ends may be grooved.

3.5 DOMESTIC, HOT- AND COLD-WATER VALVE SCHEDULE

A. Pipe NPS 4 (DN 100) and Smaller:
   1. Bronze Valves: May be provided with solder-joint ends instead of threaded ends.
   2. Bronze Angle Valves: Class 125, nonmetallic disc.
   3. Ball Valves: Two piece, reduced port, bronze with bronze trim.
   4. Bronze Swing Check Valves: Class 125, nonmetallic disc.

3.6 SANITARY-WASTE AND STORM-DRAINAGE VALVE SCHEDULE

A. Pipe NPS 2 (DN 50) and Smaller:

1. Bronze Valves: May be provided with solder-joint ends instead of threaded ends.
2. Bronze Angle Valves: Class 125, nonmetallic disc.
3. Ball Valves: Two piece, reduced port, bronze with stainless-steel trim.
4. Bronze Swing Check Valves: Class 125, nonmetallic disc.

END OF SECTION 220523

N:\N0912.00\DOC\SPEC\2012_03-16_BID\220523 - GENERAL-DUTY VALVES FOR PLUMBING PIPING.DOC

SECTION 220529 - HANGERS AND SUPPORTS FOR PLUMBING PIPING AND EQUIPMENT

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. This Section includes the following hangers and supports for plumbing system piping and equipment:
   1. Steel pipe hangers and supports.
   2. Trapeze pipe hangers.
   3. Metal framing systems.
   4. Fiberglass strut systems.
   5. Thermal-hanger shield inserts.
   6. Fastener systems.
   7. Pipe stands.
   8. Pipe positioning systems.
   9. Equipment supports.

B. Related Sections include the following:
   1. Division 05 Section "Metal Fabrications" for structural-steel shapes and plates for trapeze hangers for pipe and equipment supports.
   2. Division 22 Section "Expansion Fittings and Loops for Plumbing Piping" for pipe guides and anchors.
   3. Division 22 Section "Vibration and Seismic Controls for Plumbing Piping and Equipment" for vibration isolation devices.

1.3 DEFINITIONS

A. MSS: Manufacturers Standardization Society for the Valve and Fittings Industry Inc.

B. Terminology: As defined in MSS SP-90, "Guidelines on Terminology for Pipe Hangers and Supports."

1.4 PERFORMANCE REQUIREMENTS

A. Design supports for multiple pipes, including pipe stands, capable of supporting combined weight of supported systems, system contents, and test water.

B. Design equipment supports capable of supporting combined operating weight of supported equipment and connected systems and components.

C. Design seismic-restraint hangers and supports for piping and equipment and obtain approval from authorities having jurisdiction.

1.5 SUBMITTALS

A. Product Data: For the following:
   1. Steel pipe hangers and supports.
   2. Thermal-hanger shield inserts.
   3. Powder-actuated fastener systems.
   4. Pipe positioning systems.

B. Welding certificates.

1.6 QUALITY ASSURANCE

A. Welding: Qualify procedures and personnel according to AWS D1.1, "Structural Welding Code--Steel." AWS D1.4, "Structural Welding Code--Reinforcing Steel." ASME Boiler and Pressure Vessel Code: Section IX.

B. Welding: Qualify procedures and personnel according to the following:
   1. AWS D1.1, "Structural Welding Code--Steel."
   2. AWS D1.2, "Structural Welding Code--Aluminum."
   3. AWS D1.4, "Structural Welding Code--Reinforcing Steel."
   4. ASME Boiler and Pressure Vessel Code: Section IX.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. In other Part 2 articles where titles below introduce lists, the following requirements apply to product selection:
   1. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, manufacturers specified.

2.2 STEEL PIPE HANGERS AND SUPPORTS

A. Description: MSS SP-58, Types 1 through 58, factory-fabricated components. Refer to Part 3 "Hanger and Support Applications" Article for where to use specific hanger and support types.

B. Manufacturers:
   1. AAA Technology & Specialties Co., Inc.
   2. Bergen-Power Pipe Supports.
   3. B-Line Systems, Inc.; a division of Cooper Industries.
   4. Carpenter & Paterson, Inc.
   5. Empire Industries, Inc.
   6. ERICO/Michigan Hanger Co.
   7. Globe Pipe Hanger Products, Inc.
   8. Grinnell Corp.
   9. GS Metals Corp.
   10. National Pipe Hanger Corporation.
   11. PHD Manufacturing, Inc.

12. PHS Industries, Inc.
13. Piping Technology & Products, Inc.
14. Tolco Inc.

C. Galvanized, Metallic Coatings: Pregalvanized or hot dipped.

D. Nonmetallic Coatings: Plastic coating, jacket, or liner.

E. Padded Hangers: Hanger with fiberglass or other pipe insulation pad or cushion for support of bearing surface of piping.

2.3 TRAPEZE PIPE HANGERS

A. Description: MSS SP-69, Type 59, shop- or field-fabricated pipe-support assembly made from structural-steel shapes with MSS SP-58 hanger rods, nuts, saddles, and U-bolts.

2.4 METAL FRAMING SYSTEMS

A. Description: MFMA-3, shop- or field-fabricated pipe-support assembly made of steel channels and other components.

B. Manufacturers:
1. B-Line Systems, Inc.; a division of Cooper Industries.
2. ERICO/Michigan Hanger Co.; ERISTRUT Div.
3. GS Metals Corp.
4. Power-Strut Div.; Tyco International, Ltd.
5. Thomas & Betts Corporation.
6. Tolco Inc.
7. Unistrut Corp.; Tyco International, Ltd.

C. Coatings: Manufacturer's standard finish unless bare metal surfaces are indicated.

D. Nonmetallic Coatings: Plastic coating, jacket, or liner.

2.5 FIBERGLASS STRUT SYSTEMS

A. Description: Shop- or field-fabricated pipe-support assembly, similar to MFMA-3, made of fiberglass channels and other components.

B. Manufacturers:
1. B-Line Systems, Inc.; a division of Cooper Industries.
2. Champion Fiberglass, Inc.
3. Cope, T. J., Inc.; Tyco International Ltd.
4. Seasafe, Inc.

2.6 THERMAL-HANGER SHIELD INSERTS

A. Description: 100-psig- (690-kPa-) minimum, compressive-strength insulation insert encased in sheet metal shield.

B. Manufacturers:
   1. Carpenter & Paterson, Inc.
   2. ERICO/Michigan Hanger Co.
   3. PHS Industries, Inc.
   4. Pipe Shields, Inc.
   5. Rilco Manufacturing Company, Inc.
   6. Value Engineered Products, Inc.

C. Insulation-Insert Material for Cold Piping: ASTM C 552, Type II cellular glass with vapor barrier.

D. Insulation-Insert Material for Hot Piping: ASTM C 552, Type II cellular glass.

E. For Trapeze or Clamped Systems: Insert and shield shall cover entire circumference of pipe.

F. For Clevis or Band Hangers: Insert and shield shall cover lower 180 degrees of pipe.

G. Insert Length: Extend 2 inches (50 mm) beyond sheet metal shield for piping operating below ambient air temperature.

2.7 FASTENER SYSTEMS

A. Powder-Actuated Fasteners: Threaded-steel stud, for use in hardened portland cement concrete with pull-out, tension, and shear capacities appropriate for supported loads and building materials where used.
   1. Manufacturers:
      a. Hilti, Inc.
      b. ITW Ramset/Red Head.
      c. Masterset Fastening Systems, Inc.
      d. MKT Fastening, LLC.
      e. Powers Fasteners.

B. Mechanical-Expansion Anchors: Insert-wedge-type stainless steel, for use in hardened portland cement concrete with pull-out, tension, and shear capacities appropriate for supported loads and building materials where used.
   1. Manufacturers:
      a. B-Line Systems, Inc.; a division of Cooper Industries.
      b. Empire Industries, Inc.
      c. Hilti, Inc.
      d. ITW Ramset/Red Head.
      e. MKT Fastening, LLC.
      f. Powers Fasteners.

2.8 PIPE STAND FABRICATION

A. Pipe Stands, General: Shop or field-fabricated assemblies made of manufactured corrosion-resistant components to support roof-mounted piping.

B. Compact Pipe Stand: One-piece plastic unit with integral-rod-roller, pipe clamps, or V-shaped cradle to support pipe, for roof installation without membrane penetration.
   1. Manufacturers:
      a. ERICO/Michigan Hanger Co.
      b. MIRO Industries.

c. Approved equal.

C. Low-Type, Single-Pipe Stand: One-piece stainless-steel base unit with plastic roller, for roof installation without membrane penetration.
1. Manufacturers:
a. MIRO Industries.
b. Approved equal.

D. High-Type, Single-Pipe Stand: Assembly of base, vertical and horizontal members, and pipe support, for roof installation without membrane penetration.
1. Manufacturers:
a. ERICO/Michigan Hanger Co.
b. MIRO Industries.
c. Portable Pipe Hangers.
2. Base: Stainless steel.
3. Vertical Members: Two or more cadmium-plated-steel or stainless-steel, continuous-thread rods.
4. Horizontal Member: Cadmium-plated-steel or stainless-steel rod with plastic or stainless-steel, roller-type pipe support.

E. High-Type, Multiple-Pipe Stand: Assembly of bases, vertical and horizontal members, and pipe supports, for roof installation without membrane penetration.
1. Manufacturers:
a. Portable Pipe Hangers.
b. Approved equal.
2. Bases: One or more plastic.
3. Vertical Members: Two or more protective-coated-steel channels.
4. Horizontal Member: Protective-coated-steel channel.
5. Pipe Supports: Galvanized-steel, clevis-type pipe hangers.

F. Curb-Mounting-Type Pipe Stands: Shop- or field-fabricated pipe support made from structural-steel shape, continuous-thread rods, and rollers for mounting on permanent stationary roof curb.

2.9 PIPE POSITIONING SYSTEMS

A. Description: IAPMO PS 42, system of metal brackets, clips, and straps for positioning piping in pipe spaces for plumbing fixtures for commercial applications.

B. Manufacturers:
1. C & S Mfg. Corp.
2. HOLDRITE Corp.; Hubbard Enterprises.
3. Samco Stamping, Inc.

2.10 EQUIPMENT SUPPORTS

A. Description: Welded, shop- or field-fabricated equipment support made from structural-steel shapes.

2.11 MISCELLANEOUS MATERIALS

A. Structural Steel: ASTM A 36/A 36M, steel plates, shapes, and bars; black and galvanized.

B. Grout: ASTM C 1107, factory-mixed and -packaged, dry, hydraulic-cement, nonshrink and nonmetallic grout; suitable for interior and exterior applications.
   1. Properties: Nonstaining, noncorrosive, and nongaseous.
   2. Design Mix: 5000-psi (34.5-MPa), 28-day compressive strength.

PART 3 - EXECUTION

3.1 HANGER AND SUPPORT APPLICATIONS

A. Specific hanger and support requirements are specified in Sections specifying piping systems and equipment.

B. Comply with MSS SP-69 for pipe hanger selections and applications that are not specified in piping system Sections.

C. Use hangers and supports with galvanized, metallic coatings for piping and equipment that will not have field-applied finish.

D. Use nonmetallic coatings on attachments for electrolytic protection where attachments are in direct contact with copper tubing.

E. Use padded hangers for piping that is subject to scratching.

F. Horizontal-Piping Hangers and Supports: Unless otherwise indicated and except as specified in piping system Sections, install the following types:
   1. Adjustable, Steel Clevis Hangers (MSS Type 1): For suspension of noninsulated or insulated stationary pipes, NPS 1/2 to NPS 30 (DN 15 to DN 750).
   2. Yoke-Type Pipe Clamps (MSS Type 2): For suspension of 120 to 450 deg F (49 to 232 deg C) pipes, NPS 4 to NPS 16 (DN 100 to DN 400), requiring up to 4 inches (100 mm) of insulation.
   3. Carbon- or Alloy-Steel, Double-Bolt Pipe Clamps (MSS Type 3): For suspension of pipes, NPS 3/4 to NPS 24 (DN 20 to DN 600), requiring clamp flexibility and up to 4 inches (100 mm) of insulation.
   4. Steel Pipe Clamps (MSS Type 4): For suspension of cold and hot pipes, NPS 1/2 to NPS 24 (DN 15 to DN 600), if little or no insulation is required.
   5. Pipe Hangers (MSS Type 5): For suspension of pipes, NPS 1/2 to NPS 4 (DN 15 to DN 100), to allow off-center closure for hanger installation before pipe erection.
   6. Adjustable, Swivel Split- or Solid-Ring Hangers (MSS Type 6): For suspension of noninsulated stationary pipes, NPS 3/4 to NPS 8 (DN 20 to DN 200).
   7. Adjustable, Steel Band Hangers (MSS Type 7): For suspension of noninsulated stationary pipes, NPS 1/2 to NPS 8 (DN 15 to DN 200).
   8. Adjustable Band Hangers (MSS Type 9): For suspension of noninsulated stationary pipes, NPS 1/2 to NPS 8 (DN 15 to DN 200).
   9. Adjustable, Swivel-Ring Band Hangers (MSS Type 10): For suspension of noninsulated stationary pipes, NPS 1/2 to NPS 2 (DN 15 to DN 50).
   10. Split Pipe-Ring with or without Turnbuckle-Adjustment Hangers (MSS Type 11): For suspension of noninsulated stationary pipes, NPS 3/8 to NPS 8 (DN 10 to DN 200).
   11. Extension Hinged or 2-Bolt Split Pipe Clamps (MSS Type 12): For suspension of noninsulated stationary pipes, NPS 3/8 to NPS 3 (DN 10 to DN 80).
   12. U-Bolts (MSS Type 24): For support of heavy pipes, NPS 1/2 to NPS 30 (DN 15 to DN 750).
   13. Clips (MSS Type 26): For support of insulated pipes not subject to expansion or contraction.

14. Pipe Saddle Supports (MSS Type 36): For support of pipes, NPS 4 to NPS 36 (DN 100 to DN 900), with steel pipe base stanchion support and cast-iron floor flange.
15. Pipe Stanchion Saddles (MSS Type 37): For support of pipes, NPS 4 to NPS 36 (DN 100 to DN 900), with steel pipe base stanchion support and cast-iron floor flange and with U-bolt to retain pipe.
16. Adjustable, Pipe Saddle Supports (MSS Type 38): For stanchion-type support for pipes, NPS 2-1/2 to NPS 36 (DN 65 to DN 900), if vertical adjustment is required, with steel pipe base stanchion support and cast-iron floor flange.
17. Single Pipe Rolls (MSS Type 41): For suspension of pipes, NPS 1 to NPS 30 (DN 25 to DN 750), from 2 rods if longitudinal movement caused by expansion and contraction might occur.
18. Adjustable Roller Hangers (MSS Type 43): For suspension of pipes, NPS 2-1/2 to NPS 20 (DN 65 to DN 500), from single rod if horizontal movement caused by expansion and contraction might occur.
19. Complete Pipe Rolls (MSS Type 44): For support of pipes, NPS 2 to NPS 42 (DN 50 to DN 1050), if longitudinal movement caused by expansion and contraction might occur but vertical adjustment is not necessary.
20. Pipe Roll and Plate Units (MSS Type 45): For support of pipes, NPS 2 to NPS 24 (DN 50 to DN 600), if small horizontal movement caused by expansion and contraction might occur and vertical adjustment is not necessary.
21. Adjustable Pipe Roll and Base Units (MSS Type 46): For support of pipes, NPS 2 to NPS 30 (DN 50 to DN 750), if vertical and lateral adjustment during installation might be required in addition to expansion and contraction.

G. Vertical-Piping Clamps: Unless otherwise indicated and except as specified in piping system Sections, install the following types:
1. Extension Pipe or Riser Clamps (MSS Type 8): For support of pipe risers, NPS 3/4 to NPS 20 (DN 20 to DN 500).
2. Carbon- or Alloy-Steel Riser Clamps (MSS Type 42): For support of pipe risers, NPS 3/4 to NPS 20 (DN 20 to DN 500), if longer ends are required for riser clamps.

H. Hanger-Rod Attachments: Unless otherwise indicated and except as specified in piping system Sections, install the following types:
1. Steel Turnbuckles (MSS Type 13): For adjustment up to 6 inches (150 mm) for heavy loads.
2. Steel Clevises (MSS Type 14): For 120 to 450 deg F (49 to 232 deg C) piping installations.
3. Swivel Turnbuckles (MSS Type 15): For use with MSS Type 11, split pipe rings.
4. Malleable-Iron Sockets (MSS Type 16): For attaching hanger rods to various types of building attachments.
5. Steel Weldless Eye Nuts (MSS Type 17): For 120 to 450 deg F (49 to 232 deg C) piping installations.

I. Building Attachments: Unless otherwise indicated and except as specified in piping system Sections, install the following types:
1. Steel or Malleable Concrete Inserts (MSS Type 18): For upper attachment to suspend pipe hangers from concrete ceiling.
2. Top-Beam C-Clamps (MSS Type 19): For use under roof installations with bar-joist construction to attach to top flange of structural shape.
3. Side-Beam or Channel Clamps (MSS Type 20): For attaching to bottom flange of beams, channels, or angles.
4. Center-Beam Clamps (MSS Type 21): For attaching to center of bottom flange of beams.
5. Welded Beam Attachments (MSS Type 22): For attaching to bottom of beams if loads are considerable and rod sizes are large.
6. C-Clamps (MSS Type 23): For structural shapes.
7. Top-Beam Clamps (MSS Type 25): For top of beams if hanger rod is required tangent to flange edge.

8. Side-Beam Clamps (MSS Type 27): For bottom of steel I-beams.
9. Steel-Beam Clamps with Eye Nuts (MSS Type 28): For attaching to bottom of steel I-beams for heavy loads.
10. Linked-Steel Clamps with Eye Nuts (MSS Type 29): For attaching to bottom of steel I-beams for heavy loads, with link extensions.
11. Malleable Beam Clamps with Extension Pieces (MSS Type 30): For attaching to structural steel.
12. Welded-Steel Brackets: For support of pipes from below, or for suspending from above by using clip and rod. Use one of the following for indicated loads:
    a. Light (MSS Type 31): 750 lb (340 kg).
    b. Medium (MSS Type 32): 1500 lb (680 kg).
    c. Heavy (MSS Type 33): 3000 lb (1360 kg).
13. Side-Beam Brackets (MSS Type 34): For sides of steel or wooden beams.
14. Plate Lugs (MSS Type 57): For attaching to steel beams if flexibility at beam is required.
15. Horizontal Travelers (MSS Type 58): For supporting piping systems subject to linear horizontal movement where headroom is limited.

J. Saddles and Shields: Unless otherwise indicated and except as specified in piping system Sections, install the following types:
1. Steel Pipe-Covering Protection Saddles (MSS Type 39): To fill interior voids with insulation that matches adjoining insulation.
2. Protection Shields (MSS Type 40): Of length recommended in writing by manufacturer to prevent crushing insulation.
3. Thermal-Hanger Shield Inserts: For supporting insulated pipe.

K. Spring Hangers and Supports: Unless otherwise indicated and except as specified in piping system Sections, install the following types:
1. Restraint-Control Devices (MSS Type 47): Where indicated to control piping movement.
2. Spring Cushions (MSS Type 48): For light loads if vertical movement does not exceed 1-1/4 inches (32 mm).
3. Spring-Cushion Roll Hangers (MSS Type 49): For equipping Type 41 roll hanger with springs.
4. Spring Sway Braces (MSS Type 50): To retard sway, shock, vibration, or thermal expansion in piping systems.
5. Variable-Spring Hangers (MSS Type 51): Preset to indicated load and limit variability factor to 25 percent to absorb expansion and contraction of piping system from hanger.
6. Variable-Spring Base Supports (MSS Type 52): Preset to indicated load and limit variability factor to 25 percent to absorb expansion and contraction of piping system from base support.
7. Variable-Spring Trapeze Hangers (MSS Type 53): Preset to indicated load and limit variability factor to 25 percent to absorb expansion and contraction of piping system from trapeze support.
8. Constant Supports: For critical piping stress and if necessary to avoid transfer of stress from one support to another support, critical terminal, or connected equipment. Include auxiliary stops for erection, hydrostatic test, and load-adjustment capability. These supports include the following types:
    a. Horizontal (MSS Type 54): Mounted horizontally.
    b. Vertical (MSS Type 55): Mounted vertically.
    c. Trapeze (MSS Type 56): Two vertical-type supports and one trapeze member.

L. Comply with MSS SP-69 for trapeze pipe hanger selections and applications that are not specified in piping system Sections.

M. Comply with MFMA-102 for metal framing system selections and applications that are not specified in piping system Sections.

N. Use powder-actuated fasteners or mechanical-expansion anchors instead of building attachments where required in concrete construction.

O. Use pipe positioning systems in pipe spaces behind plumbing fixtures to support supply and waste piping for plumbing fixtures.

3.2 HANGER AND SUPPORT INSTALLATION

A. Steel Pipe Hanger Installation: Comply with MSS SP-69 and MSS SP-89. Install hangers, supports, clamps, and attachments as required to properly support piping from building structure.

B. Trapeze Pipe Hanger Installation: Comply with MSS SP-69 and MSS SP-89. Arrange for grouping of parallel runs of horizontal piping and support together on field-fabricated trapeze pipe hangers.
1. Pipes of Various Sizes: Support together and space trapezes for smallest pipe size or install intermediate supports for smaller diameter pipes as specified above for individual pipe hangers.
2. Field fabricate from ASTM A 36/A 36M, steel shapes selected for loads being supported. Weld steel according to AWS D1.1.

C. Metal Framing System Installation: Arrange for grouping of parallel runs of piping and support together on field-assembled metal framing systems.

D. Fiberglass Strut System Installation: Arrange for grouping of parallel runs of piping and support together on field-assembled fiberglass struts.

E. Thermal-Hanger Shield Installation: Install in pipe hanger or shield for insulated piping.

F. Fastener System Installation:
1. Install powder-actuated fasteners for use in lightweight concrete or concrete slabs less than 4 inches (100 mm) thick in concrete after concrete is placed and completely cured. Use operators that are licensed by powder-actuated tool manufacturer. Install fasteners according to powder-actuated tool manufacturer's operating manual.
2. Install mechanical-expansion anchors in concrete after concrete is placed and completely cured. Install fasteners according to manufacturer's written instructions.

G. Pipe Stand Installation:
1. Pipe Stand Types except Curb-Mounting Type: Assemble components and mount on smooth roof surface. Do not penetrate roof membrane.
2. Curb-Mounting-Type Pipe Stands: Assemble components or fabricate pipe stand and mount on permanent, stationary roof curb. Refer to Division 07 Section "Roof Accessories" for curbs.

H. Pipe Positioning System Installation: Install support devices to make rigid supply and waste piping connections to each plumbing fixture. Refer to Division 22 Section "Plumbing Fixtures" for plumbing fixtures.

I. Install hangers and supports complete with necessary inserts, bolts, rods, nuts, washers, and other accessories.

J. Equipment Support Installation: Fabricate from welded-structural-steel shapes.

K. Install hangers and supports to allow controlled thermal and seismic movement of piping systems, to permit freedom of movement between pipe anchors, and to facilitate action of expansion joints, expansion loops, expansion bends, and similar units.

L. Install lateral bracing with pipe hangers and supports to prevent swaying.

M. Install building attachments within concrete slabs or attach to structural steel. Install additional attachments at concentrated loads, including valves, flanges, and strainers, NPS 2-1/2 (DN 65) and larger and at changes in direction of piping. Install concrete inserts before concrete is placed; fasten inserts to forms and install reinforcing bars through openings at top of inserts.

N. Load Distribution: Install hangers and supports so piping live and dead loads and stresses from movement will not be transmitted to connected equipment.

O. Pipe Slopes: Install hangers and supports to provide indicated pipe slopes and so maximum pipe deflections allowed by ASME B31.9 (for building services piping) are not exceeded.

P. Insulated Piping: Comply with the following:
1. Attach clamps and spacers to piping.
   a. Piping Operating above Ambient Air Temperature: Clamp may project through insulation.
   b. Piping Operating below Ambient Air Temperature: Use thermal-hanger shield insert with clamp sized to match OD of insert.
   c. Do not exceed pipe stress limits according to ASME B31.9 for building services piping.
2. Install MSS SP-58, Type 39, protection saddles if insulation without vapor barrier is indicated. Fill interior voids with insulation that matches adjoining insulation.
   a. Option: Thermal-hanger shield inserts may be used. Include steel weight-distribution plate for pipe NPS 4 (DN 100) and larger if pipe is installed on rollers.
3. Install MSS SP-58, Type 40, protective shields on cold piping with vapor barrier. Shields shall span an arc of 180 degrees.
   a. Option: Thermal-hanger shield inserts may be used. Include steel weight-distribution plate for pipe NPS 4 (DN 100) and larger if pipe is installed on rollers.
4. Shield Dimensions for Pipe: Not less than the following:
   a. NPS 1/4 to NPS 3-1/2 (DN 8 to DN 90): 12 inches (305 mm) long and 0.048 inch (1.22 mm) thick.
   b. NPS 4 (DN 100): 12 inches (305 mm) long and 0.06 inch (1.52 mm) thick.
   c. NPS 5 and NPS 6 (DN 125 and DN 150): 18 inches (457 mm) long and 0.06 inch (1.52 mm) thick.
   d. NPS 8 to NPS 14 (DN 200 to DN 350): 24 inches (610 mm) long and 0.075 inch (1.91 mm) thick.
   e. NPS 16 to NPS 24 (DN 400 to DN 600): 24 inches (610 mm) long and 0.105 inch (2.67 mm) thick.
5. Pipes NPS 8 (DN 200) and Larger: Include wood inserts.
6. Insert Material: Length at least as long as protective shield.
7. Thermal-Hanger Shields: Install with insulation same thickness as piping insulation.

3.3 EQUIPMENT SUPPORTS

A. Fabricate structural-steel stands to suspend equipment from structure overhead or to support equipment above floor.

B. Grouting: Place grout under supports for equipment and make smooth bearing surface.

C. Provide lateral bracing, to prevent swaying, for equipment supports.

3.4 METAL FABRICATIONS

A. Cut, drill, and fit miscellaneous metal fabrications for trapeze pipe hangers and equipment supports.

B. Fit exposed connections together to form hairline joints. Field weld connections that cannot be shop welded because of shipping size limitations.

C. Field Welding: Comply with AWS D1.1 procedures for shielded metal arc welding, appearance and quality of welds, and methods used in correcting welding work, and with the following:
   1. Use materials and methods that minimize distortion and develop strength and corrosion resistance of base metals.
   2. Obtain fusion without undercut or overlap.
   3. Remove welding flux immediately.
   4. Finish welds at exposed connections so no roughness shows after finishing and contours of welded surfaces match adjacent contours.

3.5 ADJUSTING

A. Hanger Adjustments: Adjust hangers to distribute loads equally on attachments and to achieve indicated slope of pipe.

B. Trim excess length of continuous-thread hanger and support rods to 1-1/2 inches (40 mm).

3.6 PAINTING

A. Touch Up: Clean field welds and abraded areas of shop paint. Paint exposed areas immediately after erecting hangers and supports. Use same materials as used for shop painting. Comply with SSPC-PA 1 requirements for touching up field-painted surfaces.
   1. Apply paint by brush or spray to provide minimum dry film thickness of 2.0 mils (0.05 mm).

B. Touch Up: Cleaning and touchup painting of field welds, bolted connections, and abraded areas of shop paint on miscellaneous metal are specified in Division 09 painting Sections.

C. Galvanized Surfaces: Clean welds, bolted connections, and abraded areas and apply galvanizing-repair paint to comply with ASTM A 780.

END OF SECTION 220529

N:\N0912.00\DOC\SPEC\2012_03-16_BID\220529 - HANGERS AND SUPPORTS FOR PLUMBING PIPING AND EQUIPMENT.DOC

SECTION 220553 - IDENTIFICATION FOR PLUMBING PIPING AND EQUIPMENT

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:
   1. Equipment labels.
   2. Warning signs and labels.
   3. Pipe labels.
   4. Stencils.
   5. Valve tags.
   6. Warning tags.

1.3 SUBMITTALS

A. Product Data: For each type of product indicated.

B. Samples: For color, letter style, and graphic representation required for each identification material and device.

C. Equipment Label Schedule: Include a listing of all equipment to be labeled with the proposed content for each label.

D. Valve numbering scheme.

E. Valve Schedules: For each piping system to include in maintenance manuals.

1.4 COORDINATION

A. Coordinate installation of identifying devices with completion of covering and painting of surfaces where devices are to be applied.

B. Coordinate installation of identifying devices with locations of access panels and doors.

C. Install identifying devices before installing acoustical ceilings and similar concealment.

PART 2 - PRODUCTS

2.1 EQUIPMENT LABELS

A. Metal Labels for Equipment:
1. Material and Thickness: Stainless steel, 0.025-inch (0.64-mm) minimum thickness, and having predrilled or stamped holes for attachment hardware.
2. Minimum Label Size: Length and width vary for required label content, but not less than 2-1/2 by 3/4 inch (64 by 19 mm).
3. Minimum Letter Size: 1/4 inch (6.4 mm) for name of units if viewing distance is less than 24 inches (600 mm), 1/2 inch (13 mm) for viewing distances up to 72 inches (1830 mm), and proportionately larger lettering for greater viewing distances. Include secondary lettering two-thirds to three-fourths the size of principal lettering.
4. Fasteners: Stainless-steel rivets or self-tapping screws.
5. Adhesive: Contact-type permanent adhesive, compatible with label and with substrate.

B. Label Content: Include equipment's Drawing designation or unique equipment number, Drawing numbers where equipment is indicated (plans, details, and schedules), plus the Specification Section number and title where equipment is specified.

C. Equipment Label Schedule: For each item of equipment to be labeled, on 8-1/2-by-11-inch (A4) bond paper. Tabulate equipment identification number and identify Drawing numbers where equipment is indicated (plans, details, and schedules), plus the Specification Section number and title where equipment is specified. Equipment schedule shall be included in operation and maintenance data.

2.2 WARNING SIGNS AND LABELS

A. Material and Thickness: Multilayer, multicolor, plastic labels for mechanical engraving, 1/8 inch (3.2 mm) thick, and having predrilled holes for attachment hardware.

B. Letter Color: Black.

C. Background Color: Yellow.

D. Maximum Temperature: Able to withstand temperatures up to 160 deg F (71 deg C).

E. Minimum Label Size: Length and width vary for required label content, but not less than 2-1/2 by 3/4 inch (64 by 19 mm).

F. Minimum Letter Size: 1/4 inch (6.4 mm) for name of units if viewing distance is less than 24 inches (600 mm), 1/2 inch (13 mm) for viewing distances up to 72 inches (1830 mm), and proportionately larger lettering for greater viewing distances. Include secondary lettering two-thirds to three-fourths the size of principal lettering.

G. Fasteners: Stainless-steel rivets or self-tapping screws.

H. Adhesive: Contact-type permanent adhesive, compatible with label and with substrate.

I. Label Content: Include caution and warning information, plus emergency notification instructions.

2.3 PIPE LABELS

A. General Requirements for Manufactured Pipe Labels: Preprinted, color-coded, with lettering indicating service, and showing flow direction.

B. Pretensioned Pipe Labels: Precoiled, semirigid plastic formed to partially cover circumference of pipe and to attach to pipe without fasteners or adhesive.

C. Self-Adhesive Pipe Labels: Printed plastic with contact-type, permanent-adhesive backing.

D. Pipe Label Contents: Include identification of piping service using same designations or abbreviations as used on Drawings, pipe size, and an arrow indicating flow direction.
   1. Flow-Direction Arrows: Integral with piping system service lettering to accommodate both directions, or as separate unit on each pipe label to indicate flow direction.
   2. Lettering Size: At least 1-1/2 inches (38 mm) high.

2.4 VALVE TAGS

A. Valve Tags: Stamped or engraved with 1/4-inch (6.4-mm) letters for piping system abbreviation and 1/2-inch (13-mm) numbers.
   1. Tag Material: Stainless steel, 0.025-inch (0.64-mm) minimum thickness, and having predrilled or stamped holes for attachment hardware.
   2. Fasteners: Brass wire-link or beaded chain; or S-hook .

B. Valve Schedules: For each piping system, on 8-1/2-by-11-inch (A4) bond paper. Tabulate valve number, piping system, system abbreviation (as shown on valve tag), location of valve (room or space), normal-operating position (open, closed, or modulating), and variations for identification. Mark valves for emergency shutoff and similar special uses.
   1. Valve-tag schedule shall be included in operation and maintenance data.

2.5 WARNING TAGS

A. Warning Tags: Preprinted or partially preprinted, accident-prevention tags, of plasticized card stock with matte finish suitable for writing.
   1. Size: 3 by 5-1/4 inches (75 by 133 mm) minimum.
   2. Fasteners: Brass grommet and wire.
   3. Nomenclature: Large-size primary caption such as "DANGER," "CAUTION," or "DO NOT OPERATE."
   4. Color: Yellow background with black lettering.

PART 3 - EXECUTION

3.1 PREPARATION

A. Clean piping and equipment surfaces of substances that could impair bond of identification devices, including dirt, oil, grease, release agents, and incompatible primers, paints, and encapsulants.

3.2 EQUIPMENT LABEL INSTALLATION

A. Install or permanently fasten labels on each major item of mechanical equipment.

B. Locate equipment labels where accessible and visible.

3.3 PIPE LABEL INSTALLATION

A. Piping Color-Coding: Painting of piping is specified in Division 09.

B. Locate pipe labels where piping is exposed or above accessible ceilings in finished spaces; machine rooms; accessible maintenance spaces such as shafts, tunnels, and plenums; and exterior exposed locations as follows:
1. Near each valve and control device.
2. Near each branch connection, excluding short takeoffs for fixtures and terminal units. Where flow pattern is not obvious, mark each pipe at branch.
3. Near penetrations through walls, floors, ceilings, and inaccessible enclosures.
4. At access doors, manholes, and similar access points that permit view of concealed piping.
5. Near major equipment items and other points of origination and termination.
6. Spaced at maximum intervals of 50 feet (15 m) along each run. Reduce intervals to 25 feet (7.6 m) in areas of congested piping and equipment.
7. On piping above removable acoustical ceilings. Omit intermediately spaced labels.

C. Pipe Label Color Schedule:
1. Domestic & Tempered Water Piping:
   a. Background Color: Green.
   b. Letter Color: White.
2. Fuel Gas
   a. Background Color: Yellow.
   b. Letter Color: Black.
3. Sanitary Waste& Vent:
   a. Background Color: Yellow.
   b. Letter Color: Black.
4. Laboratory Waste & Vent
   a. Background Color: Yellow.
   b. Letter Color: Black.
5. Storm & Overflow Drainage Piping:
   a. Background Color: Yellow.
   b. Letter Color: Black.
6. RO Water Piping:
   a. Background Color: Blue.
   b. Letter Color: Black.
7. CO2 and Gas Piping:
   a. Background Color: Yellow.
   b. Letter Color: Black.

3.4 VALVE-TAG INSTALLATION

A. Install tags on valves and control devices in piping systems, except check valves; valves within factory-fabricated equipment units; shutoff valves; faucets; convenience and lawn-watering hose connections; and similar roughing-in connections of end-use fixtures and units. List tagged valves in a valve schedule.

B. Valve-Tag Application Schedule: Tag valves according to size, shape, and color scheme and with captions similar to those indicated in the following subparagraphs:

1. Valve-Tag Size and Shape:
   a. Cold Water: 1-1/2 inches (38 mm), round.
   b. Hot Water: 1-1/2 inches (38 mm), round.
   c. Fuel Gas: 1 ½ inches (38 mm) round.
   d. Pumped Waste: 1-1/2 inches (38 mm), round.
   e. Tempered Water: 1-1/2 inches (38 mm), round.
   f. RO Water: 1-1/2 inches (38 mm), round.
   g. CO2: 1-1/2 inches (38 mm), round.

2. Valve-Tag Color:
   a. Cold Water: Natural.
   b. Hot Water: Natural.
   c. Fuel Gas: Natural.
   d. Pumped Waste: Natural.
   e. Tempered Water: Natural.
   f. RO Water : Natural.
   g. CO2 :Natural.

3. Letter Color:
   a. Cold Water: Black.
   b. Hot Water: Black.
   c. Fuel Gas: Black.
   d. Pumped Waste: Black.
   e. Tempered Water: Black.
   f. RO Water : Black.
   g. CO2: Black.

3.5 WARNING-TAG INSTALLATION

A. Write required message on, and attach warning tags to, equipment and other items where required.

END OF SECTION 220553

N:\N0912.00\DOC\SPEC\2012_03-16_BID\220553 - IDENTIFIATION FOR PLUMBING PIPING AND EQUIPMENT.DOC

SECTION 220700 - PLUMBING INSULATION

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:
   1. Insulation Materials:
      a. Mineral fiber.
   2. Adhesives.
   3. Sealants.
   4. Factory-applied jackets.
   5. Field-applied fabric-reinforcing mesh.
   6. Field-applied jackets.
   7. Tapes.
   8. Securements.
   9. Corner angles.

B. Related Sections include the following:
   1. Division 21 Section "Fire-Suppression Systems Insulation."
   2. Division 23 Section "HVAC Insulation."

1.3 SUBMITTALS

A. Product Data: For each type of product indicated. Include thermal conductivity, thickness, and jackets (both factory and field applied, if any).

B. LEED Submittal:
   1. Product Data for Credit EQ 4.1: For adhesives and sealants, including printed statement of VOC content.

C. Shop Drawings:
   1. Detail application of protective shields, saddles, and inserts at hangers for each type of insulation and hanger.
   2. Detail insulation application at pipe expansion joints for each type of insulation.
   3. Detail insulation application at elbows, fittings, flanges, valves, and specialties for each type of insulation.
   4. Detail removable insulation at piping specialties, equipment connections, and access panels.
   5. Detail application of field-applied jackets.
   6. Detail application at linkages of control devices.
   7. Detail field application for each equipment type.

D. Qualification Data: For qualified Installer.

E. Material Test Reports: From a qualified testing agency acceptable to authorities having jurisdiction indicating, interpreting, and certifying test results for compliance of insulation materials, sealers, attachments, cements, and jackets, with requirements indicated. Include dates of tests and test methods employed.

F. Field quality-control reports.

1.4 QUALITY ASSURANCE

A. Installer Qualifications: Skilled mechanics who have successfully completed an apprenticeship program or another craft training program certified by the Department of Labor, Bureau of Apprenticeship and Training.

B. Fire-Test-Response Characteristics: Insulation and related materials shall have fire-test-response characteristics indicated, as determined by testing identical products per ASTM E 84, by a testing and inspecting agency acceptable to authorities having jurisdiction. Factory label insulation and jacket materials and adhesive, mastic, tapes, and cement material containers, with appropriate markings of applicable testing and inspecting agency.
   1. Insulation Installed Indoors: Flame-spread index of 25 or less, and smoke-developed index of 50 or less.
   2. Insulation Installed Outdoors: Flame-spread index of 75 or less, and smoke-developed index of 150 or less.

1.5 DELIVERY, STORAGE, AND HANDLING

A. Packaging: Insulation material containers shall be marked by manufacturer with appropriate ASTM standard designation, type and grade, and maximum use temperature.

1.6 COORDINATION

A. Coordinate size and location of supports, hangers, and insulation shields specified in Division 22 Section "Hangers and Supports for Plumbing Piping and Equipment."

B. Coordinate clearance requirements with piping Installer for piping insulation application and equipment Installer for equipment insulation application. Before preparing piping Shop Drawings, establish and maintain clearance requirements for installation of insulation and field-applied jackets and finishes and for space required for maintenance.

1.7 SCHEDULING

A. Schedule insulation application after pressure testing systems and, where required, after installing and testing heat tracing. Insulation application may begin on segments that have satisfactory test results.

B. Complete installation and concealment of plastic materials as rapidly as possible in each area of construction.

PART 2 - PRODUCTS

2.1 INSULATION MATERIALS

A. Comply with requirements in Part 3 schedule articles for where insulating materials shall be applied.

B. Products shall not contain asbestos, lead, mercury, or mercury compounds.

C. Insulation materials for use on austenitic stainless steel shall be qualified as acceptable according to ASTM C 795.

D. Foam insulation materials shall not use CFC or HCFC blowing agents in the manufacturing process.

E. Mineral-Fiber Blanket Insulation: Mineral or glass fibers bonded with a thermosetting resin. Comply with ASTM C 553, Type II and ASTM C 1290, Type I. Factory-applied jacket requirements are specified in "Factory-Applied Jackets" Article.
   1. Products: Subject to compliance with requirements, provide one of the following:
      a. CertainTeed Corp.; Duct Wrap.
      b. Johns Manville; Microlite.
      c. Knauf Insulation; Duct Wrap.
      d. Manson Insulation Inc.; Alley Wrap.
      e. Owens Corning; All-Service Duct Wrap.

F. High-Temperature, Mineral-Fiber Blanket Insulation: Mineral or glass fibers bonded with a thermosetting resin. Comply with ASTM C 553, Type V, without factory-applied jacket.
   1. Products: Subject to compliance with requirements, provide one of the following:
      a. Johns Manville; HTB 23 Spin-Glas.
      b. Owens Corning; High Temperature Flexible Batt Insulations.

G. Mineral-Fiber, Preformed Pipe Insulation:
   1. Products: Subject to compliance with requirements, provide one of the following:
      a. Fibrex Insulations Inc.; Coreplus 1200.
      b. Johns Manville; Micro-Lok.
      c. Knauf Insulation; 1000(Pipe Insulation.
      d. Manson Insulation Inc.; Alley-K.
      e. Owens Corning; Fiberglas Pipe Insulation.
   2. Type I, 850 deg F (454 deg C) Materials: Mineral or glass fibers bonded with a thermosetting resin. Comply with ASTM C 547, Type I, Grade A, with factory-applied ASJ-SSL. Factory-applied jacket requirements are specified in "Factory-Applied Jackets" Article.

H. Mineral-Fiber, Pipe and Tank Insulation: Mineral or glass fibers bonded with a thermosetting resin. Semirigid board material with factory-applied ASJ complying with ASTM C 1393, Type II or Type IIIA Category 2, or with properties similar to ASTM C 612, Type IB. Nominal density is 2.5 lb/cu. ft. (40 kg/cu. m) or more. Thermal conductivity (k-value) at 100 deg F (55 deg C) is 0.29 Btu x in./h x sq. ft. x deg F (0.042 W/m x K) or less. Factory-applied jacket requirements are specified in "Factory-Applied Jackets" Article.
   1. Products: Subject to compliance with requirements, provide one of the following:
      a. CertainTeed Corp.; CrimpWrap.
      b. Johns Manville; MicroFlex.
      c. Knauf Insulation; Pipe and Tank Insulation.
      d. Manson Insulation Inc.; AK Flex.
      e. Owens Corning; Fiberglas Pipe and Tank Insulation.

2.2 INSULATING CEMENTS

A. Mineral-Fiber Insulating Cement: Comply with ASTM C 195.
   1. Products: Subject to compliance with requirements, provide one of the following:
      a. Insulco, Division of MFS, Inc.; Triple I.
      b. P. K. Insulation Mfg. Co., Inc.; Super-Stik.

2.3 SEALANTS

A. FSK and Metal Jacket Flashing Sealants:
   1. Products: Subject to compliance with requirements, provide one of the following:
      a. Childers Products, Division of ITW; CP-76-8.
      b. Foster Products Corporation, H. B. Fuller Company; 95-44.
      c. Marathon Industries, Inc.; 405.
      d. Mon-Eco Industries, Inc.; 44-05.
      e. Vimasco Corporation; 750.
   2. Materials shall be compatible with insulation materials, jackets, and substrates.
   3. Fire- and water-resistant, flexible, elastomeric sealant.
   4. Service Temperature Range: Minus 40 to plus 250 deg F (Minus 40 to plus 121 deg C).
   5. Color: Aluminum.
   6. For indoor applications, use sealants that have a VOC content of 250 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).

B. ASJ Flashing Sealants, and Vinyl, PVDC, and PVC Jacket Flashing Sealants:
   1. Products: Subject to compliance with requirements, provide one of the following:
      a. Childers Products, Division of ITW; CP-76.
   2. Materials shall be compatible with insulation materials, jackets, and substrates.
   3. Fire- and water-resistant, flexible, elastomeric sealant.
   4. Service Temperature Range: Minus 40 to plus 250 deg F (Minus 40 to plus 121 deg C).
   5. Color: White.
   6. For indoor applications, use sealants that have a VOC content of 250 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).

2.4 FACTORY-APPLIED JACKETS

A. Insulation system schedules indicate factory-applied jackets on various applications. When factory-applied jackets are indicated, comply with the following:
   1. ASJ: White, kraft-paper, fiberglass-reinforced scrim with aluminum-foil backing; complying with ASTM C 1136, Type I.
   2. ASJ-SSL: ASJ with self-sealing, pressure-sensitive, acrylic-based adhesive covered by a removable protective strip; complying with ASTM C 1136, Type I.

2.5 FIELD-APPLIED JACKETS

A. Field-applied jackets shall comply with ASTM C 921, Type I, unless otherwise indicated.

B. PVC Jacket: High-impact-resistant, UV-resistant PVC complying with ASTM D 1784, Class 16354-C; thickness as scheduled; roll stock ready for shop or field cutting and forming. Thickness is indicated in field-applied jacket schedules.
   1. Products: Subject to compliance with requirements, provide one of the following:

a. Johns Manville; Zeston.
b. P.I.C. Plastics, Inc.; FG Series.
c. Proto PVC Corporation; LoSmoke.
d. Speedline Corporation; SmokeSafe.

2. Adhesive: As recommended by jacket material manufacturer.
3. Color: White.
4. Factory-fabricated fitting covers to match jacket if available; otherwise, field fabricate.
   a. Shapes: 45- and 90-degree, short- and long-radius elbows, tees, valves, flanges, unions, reducers, end caps, soil-pipe hubs, traps, mechanical joints, and P-trap and supply covers for lavatories.
5. Factory-fabricated tank heads and tank side panels.

C. Metal Jacket:
1. Products: Subject to compliance with requirements, provide one of the following:
   a. Childers Products, Division of ITW; Metal Jacketing Systems.
   b. PABCO Metals Corporation; Surefit.
   c. RPR Products, Inc.; Insul-Mate.

2.6 TAPES

A. ASJ Tape: White vapor-retarder tape matching factory-applied jacket with acrylic adhesive, complying with ASTM C 1136.
1. Products: Subject to compliance with requirements, provide one of the following:
   a. Avery Dennison Corporation, Specialty Tapes Division; Fasson 0835.
   b. Compac Corp.; 104 and 105.
   c. Ideal Tape Co., Inc., an American Biltrite Company; 428 AWF ASJ.
   d. Venture Tape; 1540 CW Plus, 1542 CW Plus, and 1542 CW Plus/SQ.
2. Width: 3 inches (75 mm).
3. Thickness: 11.5 mils (0.29 mm).
4. Adhesion: 90 ounces force/inch (1.0 N/mm) in width.
5. Elongation: 2 percent.
6. Tensile Strength: 40 lbf/inch (7.2 N/mm) in width.
7. ASJ Tape Disks and Squares: Precut disks or squares of ASJ tape.

B. FSK Tape: Foil-face, vapor-retarder tape matching factory-applied jacket with acrylic adhesive; complying with ASTM C 1136.
1. Products: Subject to compliance with requirements, provide one of the following:
   a. Avery Dennison Corporation, Specialty Tapes Division; Fasson 0827.
   b. Compac Corp.; 110 and 111.
   c. Ideal Tape Co., Inc., an American Biltrite Company; 491 AWF FSK.
   d. Venture Tape; 1525 CW, 1528 CW, and 1528 CW/SQ.
2. Width: 3 inches (75 mm).
3. Thickness: 6.5 mils (0.16 mm).
4. Adhesion: 90 ounces force/inch (1.0 N/mm) in width.
5. Elongation: 2 percent.
6. Tensile Strength: 40 lbf/inch (7.2 N/mm) in width.
7. FSK Tape Disks and Squares: Precut disks or squares of FSK tape.

C. PVC Tape: White vapor-retarder tape matching field-applied PVC jacket with acrylic adhesive. Suitable for indoor and outdoor applications.
1. Products: Subject to compliance with requirements, provide one of the following:
   a. Avery Dennison Corporation, Specialty Tapes Division; Fasson 0555.
   b. Compac Corp.; 130.

c. Ideal Tape Co., Inc., an American Biltrite Company; 370 White PVC tape.
d. Venture Tape; 1506 CW NS.

2. Width: 2 inches (50 mm).
3. Thickness: 6 mils (0.15 mm).
4. Adhesion: 64 ounces force/inch (0.7 N/mm) in width.
5. Elongation: 500 percent.
6. Tensile Strength: 18 lbf/inch (3.3 N/mm) in width.

2.7 CORNER ANGLES

A. PVC Corner Angles: 30 mils (0.8 mm) thick, minimum 1 by 1 inch (25 by 25 mm), PVC according to ASTM D 1784, Class 16354-C. White or color-coded to match adjacent surface.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine substrates and conditions for compliance with requirements for installation and other conditions affecting performance of insulation application.
1. Verify that systems and equipment to be insulated have been tested and are free of defects.
2. Verify that surfaces to be insulated are clean and dry.
3. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 PREPARATION

A. Surface Preparation: Clean and dry surfaces to receive insulation. Remove materials that will adversely affect insulation application.

B. Coordinate insulation installation with the trade installing heat tracing. Comply with requirements for heat tracing that apply to insulation.

3.3 GENERAL INSTALLATION REQUIREMENTS

A. Install insulation materials, accessories, and finishes with smooth, straight, and even surfaces; free of voids throughout the length of equipment and piping including fittings, valves, and specialties.

B. Install insulation materials, forms, vapor barriers or retarders, jackets, and thicknesses required for each item of equipment and pipe system as specified in insulation system schedules.

C. Install accessories compatible with insulation materials and suitable for the service. Install accessories that do not corrode, soften, or otherwise attack insulation or jacket in either wet or dry state.

D. Install insulation with longitudinal seams at top and bottom of horizontal runs.

E. Install multiple layers of insulation with longitudinal and end seams staggered.

F. Do not weld brackets, clips, or other attachment devices to piping, fittings, and specialties.

G. Keep insulation materials dry during application and finishing.

H. Install insulation with tight longitudinal seams and end joints. Bond seams and joints with adhesive recommended by insulation material manufacturer.

I. Install insulation with least number of joints practical.

J. Where vapor barrier is indicated, seal joints, seams, and penetrations in insulation at hangers, supports, anchors, and other projections with vapor-barrier mastic.
   1. Install insulation continuously through hangers and around anchor attachments.
   2. For insulation application where vapor barriers are indicated, extend insulation on anchor legs from point of attachment to supported item to point of attachment to structure. Taper and seal ends at attachment to structure with vapor-barrier mastic.
   3. Install insert materials and install insulation to tightly join the insert. Seal insulation to insulation inserts with adhesive or sealing compound recommended by insulation material manufacturer.
   4. Cover inserts with jacket material matching adjacent pipe insulation. Install shields over jacket, arranged to protect jacket from tear or puncture by hanger, support, and shield.

K. Apply adhesives, mastics, and sealants at manufacturer's recommended coverage rate and wet and dry film thicknesses.

L. Install insulation with factory-applied jackets as follows:
   1. Draw jacket tight and smooth.
   2. Cover circumferential joints with 3-inch- (75-mm-) wide strips, of same material as insulation jacket. Secure strips with adhesive and outward clinching staples along both edges of strip, spaced 4 inches (100 mm) o.c.
   3. Overlap jacket longitudinal seams at least 1-1/2 inches (38 mm). Install insulation with longitudinal seams at bottom of pipe. Clean and dry surface to receive self-sealing lap. Staple laps with outward clinching staples along edge at 4 inches (100 mm) o.c.
      a. For below ambient services, apply vapor-barrier mastic over staples.
   4. Cover joints and seams with tape as recommended by insulation material manufacturer to maintain vapor seal.
   5. Where vapor barriers are indicated, apply vapor-barrier mastic on seams and joints and at ends adjacent to pipe flanges and fittings.

M. Cut insulation in a manner to avoid compressing insulation more than 75 percent of its nominal thickness.

N. Finish installation with systems at operating conditions. Repair joint separations and cracking due to thermal movement.

O. Repair damaged insulation facings by applying same facing material over damaged areas. Extend patches at least 4 inches (100 mm) beyond damaged areas. Adhere, staple, and seal patches similar to butt joints.

P. For above ambient services, do not install insulation to the following:
   1. Vibration-control devices.
   2. Testing agency labels and stamps.
   3. Nameplates and data plates.
   4. Manholes.
   5. Handholes.
   6. Cleanouts.

3.4 PENETRATIONS

A. Insulation Installation at Roof Penetrations: Install insulation continuously through roof penetrations.
   1. Seal penetrations with flashing sealant.
   2. For applications requiring only indoor insulation, terminate insulation above roof surface and seal with joint sealant. For applications requiring indoor and outdoor insulation, install insulation for outdoor applications tightly joined to indoor insulation ends. Seal joint with joint sealant.
   3. Extend jacket of outdoor insulation outside roof flashing at least 2 inches (50 mm) below top of roof flashing.
   4. Seal jacket to roof flashing with flashing sealant.

B. Insulation Installation at Underground Exterior Wall Penetrations: Terminate insulation flush with sleeve seal. Seal terminations with flashing sealant.

C. Insulation Installation at Aboveground Exterior Wall Penetrations: Install insulation continuously through wall penetrations.
   1. Seal penetrations with flashing sealant.
   2. For applications requiring only indoor insulation, terminate insulation inside wall surface and seal with joint sealant. For applications requiring indoor and outdoor insulation, install insulation for outdoor applications tightly joined to indoor insulation ends. Seal joint with joint sealant.
   3. Extend jacket of outdoor insulation outside wall flashing and overlap wall flashing at least 2 inches (50 mm).
   4. Seal jacket to wall flashing with flashing sealant.

D. Insulation Installation at Interior Wall and Partition Penetrations (That Are Not Fire Rated): Install insulation continuously through walls and partitions.

E. Insulation Installation at Fire-Rated Wall and Partition Penetrations: Install insulation continuously through penetrations of fire-rated walls and partitions.
   1. Comply with requirements in Division 07 Section "Penetration Firestopping"irestopping and fire-resistive joint sealers.

F. Insulation Installation at Floor Penetrations:
   1. Pipe: Install insulation continuously through floor penetrations.
   2. Seal penetrations through fire-rated assemblies. Comply with requirements in Division 07 Section "Penetration Firestopping."

3.5 GENERAL PIPE INSULATION INSTALLATION

A. Requirements in this article generally apply to all insulation materials except where more specific requirements are specified in various pipe insulation material installation articles.

B. Insulation Installation on Fittings, Valves, Strainers, Flanges, and Unions:
   1. Install insulation over fittings, valves, strainers, flanges, unions, and other specialties with continuous thermal and vapor-retarder integrity, unless otherwise indicated.
   2. Insulate pipe elbows using preformed fitting insulation or mitered fittings made from same material and density as adjacent pipe insulation. Each piece shall be butted tightly against adjoining piece and bonded with adhesive. Fill joints, seams, voids, and irregular surfaces with insulating cement finished to a smooth, hard, and uniform contour that is uniform with adjoining pipe insulation.

3. Insulate tee fittings with preformed fitting insulation or sectional pipe insulation of same material and thickness as used for adjacent pipe. Cut sectional pipe insulation to fit. Butt each section closely to the next and hold in place with tie wire. Bond pieces with adhesive.
4. Insulate valves using preformed fitting insulation or sectional pipe insulation of same material, density, and thickness as used for adjacent pipe. Overlap adjoining pipe insulation by not less than two times the thickness of pipe insulation, or one pipe diameter, whichever is thicker. For valves, insulate up to and including the bonnets, valve stuffing-box studs, bolts, and nuts. Fill joints, seams, and irregular surfaces with insulating cement.
5. Insulate strainers using preformed fitting insulation or sectional pipe insulation of same material, density, and thickness as used for adjacent pipe. Overlap adjoining pipe insulation by not less than two times the thickness of pipe insulation, or one pipe diameter, whichever is thicker. Fill joints, seams, and irregular surfaces with insulating cement. Insulate strainers so strainer basket flange or plug can be easily removed and replaced without damaging the insulation and jacket. Provide a removable reusable insulation cover. For below ambient services, provide a design that maintains vapor barrier.
6. Insulate flanges and unions using a section of oversized preformed pipe insulation. Overlap adjoining pipe insulation by not less than two times the thickness of pipe insulation, or one pipe diameter, whichever is thicker.
7. Cover segmented insulated surfaces with a layer of finishing cement and coat with a mastic. Install vapor-barrier mastic for below ambient services and a breather mastic for above ambient services. Reinforce the mastic with fabric-reinforcing mesh. Trowel the mastic to a smooth and well-shaped contour.
8. For services not specified to receive a field-applied jacket except for flexible elastomeric and polyolefin, install fitted PVC cover over elbows, tees, strainers, valves, flanges, and unions. Terminate ends with PVC end caps. Tape PVC covers to adjoining insulation facing using PVC tape.
9. Stencil or label the outside insulation jacket of each union with the word "UNION." Match size and color of pipe labels.

C. Insulate instrument connections for thermometers, pressure gages, pressure temperature taps, test connections, flow meters, sensors, switches, and transmitters on insulated pipes, vessels, and equipment. Shape insulation at these connections by tapering it to and around the connection with insulating cement and finish with finishing cement, mastic, and flashing sealant.

D. Install removable insulation covers at locations indicated. Installation shall conform to the following:
1. Make removable flange and union insulation from sectional pipe insulation of same thickness as that on adjoining pipe. Install same insulation jacket as adjoining pipe insulation.
2. When flange and union covers are made from sectional pipe insulation, extend insulation from flanges or union long at least two times the insulation thickness over adjacent pipe insulation on each side of flange or union. Secure flange cover in place with stainless-steel or aluminum bands. Select band material compatible with insulation and jacket.
3. Construct removable valve insulation covers in same manner as for flanges except divide the two-part section on the vertical center line of valve body.
4. When covers are made from block insulation, make two halves, each consisting of mitered blocks wired to stainless-steel fabric. Secure this wire frame, with its attached insulation, to flanges with tie wire. Extend insulation at least 2 inches (50 mm) over adjacent pipe insulation on each side of valve. Fill space between flange or union cover and pipe insulation with insulating cement. Finish cover assembly with insulating cement applied in two coats. After first coat is dry, apply and trowel second coat to a smooth finish.
5. Unless a PVC jacket is indicated in field-applied jacket schedules, finish exposed surfaces with a metal jacket.

3.6 MINERAL-FIBER INSULATION INSTALLATION

A. Insulation Installation on Straight Pipes and Tubes:
   1. Secure each layer of preformed pipe insulation to pipe with wire or bands and tighten bands without deforming insulation materials.
   2. Where vapor barriers are indicated, seal longitudinal seams, end joints, and protrusions with vapor-barrier mastic and joint sealant.
   3. For insulation with factory-applied jackets on above ambient surfaces, secure laps with outward clinched staples at 6 inches (150 mm) o.c.
   4. For insulation with factory-applied jackets on below ambient surfaces, do not staple longitudinal tabs but secure tabs with additional adhesive as recommended by insulation material manufacturer and seal with vapor-barrier mastic and flashing sealant.

B. Insulation Installation on Pipe Flanges:
   1. Install preformed pipe insulation to outer diameter of pipe flange.
   2. Make width of insulation section same as overall width of flange and bolts, plus twice the thickness of pipe insulation.
   3. Fill voids between inner circumference of flange insulation and outer circumference of adjacent straight pipe segments with mineral-fiber blanket insulation.
   4. Install jacket material with manufacturer's recommended adhesive, overlap seams at least 1 inch (25 mm), and seal joints with flashing sealant.

C. Insulation Installation on Pipe Fittings and Elbows:
   1. Install preformed sections of same material as straight segments of pipe insulation when available.
   2. When preformed insulation elbows and fittings are not available, install mitered sections of pipe insulation, to a thickness equal to adjoining pipe insulation. Secure insulation materials with wire or bands.

D. Insulation Installation on Valves and Pipe Specialties:
   1. Install preformed sections of same material as straight segments of pipe insulation when available.
   2. When preformed sections are not available, install mitered sections of pipe insulation to valve body.
   3. Arrange insulation to permit access to packing and to allow valve operation without disturbing insulation.
   4. Install insulation to flanges as specified for flange insulation application.

3.7 FIELD-APPLIED JACKET INSTALLATION

A. Where FSK jackets are indicated, install as follows:
   1. Draw jacket material smooth and tight.
   2. Install lap or joint strips with same material as jacket.
   3. Secure jacket to insulation with manufacturer's recommended adhesive.
   4. Install jacket with 1-1/2-inch (38-mm) laps at longitudinal seams and 3-inch- (75-mm-) wide joint strips at end joints.
   5. Seal openings, punctures, and breaks in vapor-retarder jackets and exposed insulation with vapor-barrier mastic.

B. Where PVC jackets are indicated, install with 1-inch (25-mm) overlap at longitudinal seams and end joints; for horizontal applications, install with longitudinal seams along top and bottom of tanks and vessels. Seal with manufacturer's recommended adhesive.
   1. Apply two continuous beads of adhesive to seams and joints, one bead under lap and the finish bead along seam and joint edge.

C. Where metal jackets are indicated, install with 2-inch (50-mm) overlap at longitudinal seams and end joints. Overlap longitudinal seams arranged to shed water. Seal end joints with weatherproof sealant recommended by insulation manufacturer. Secure jacket with stainless-steel bands 12 inches (300 mm) o.c. and at end joints.

3.8 FINISHES

A. Equipment and Pipe Insulation with ASJ, Glass-Cloth, or Other Paintable Jacket Material: Paint jacket with paint system identified below and as specified in Division 09 painting Sections.
   1. Flat Acrylic Finish: Two finish coats over a primer that is compatible with jacket material and finish coat paint. Add fungicidal agent to render fabric mildew proof.
      a. Finish Coat Material: Interior, flat, latex-emulsion size.

B. Flexible Elastomeric Thermal Insulation: After adhesive has fully cured, apply two coats of insulation manufacturer's recommended protective coating.

C. Color: Final color as selected by Architect. Vary first and second coats to allow visual inspection of the completed Work.

D. Do not field paint aluminum or stainless-steel jackets.

3.9 PIPING INSULATION SCHEDULE, GENERAL

A. Acceptable preformed pipe and tubular insulation materials and thicknesses are identified for each piping system and pipe size range. If more than one material is listed for a piping system, selection from materials listed is Contractor's option.

B. Items Not Insulated: Unless otherwise indicated, do not install insulation on the following:
   1. Drainage piping located in crawl spaces.
   2. Underground piping.
   3. Chrome-plated pipes and fittings unless there is a potential for personnel injury.
   4. RO Piping
   5. Tempered Water

3.10 INDOOR PIPING INSULATION SCHEDULE

A. Domestic Cold Water:
   1. NPS 1 (DN 25) and Smaller: Insulation shall be the following:
      a. Mineral-Fiber, Preformed Pipe Insulation, Type I: 1/2 inch (13 mm) thick.
   2. NPS 1-1/4 (DN 32) and Larger: Insulation shall be the following:
      a. Mineral-Fiber, Preformed Pipe Insulation, Type I: 1 inch (25 mm) thick.

B. Domestic Hot and Recirculated Hot Water:
   1. NPS 1-1/4 (DN 32) and Smaller: Insulation shall be the following:
      a. Mineral-Fiber, Preformed Pipe Insulation, Type I: 1 inch (25 mm) thick.
   2. NPS 1-1/2 (DN 40) and Larger: Insulation shall be the following:
      a. Mineral-Fiber, Preformed Pipe Insulation, Type I: 1 1/2 inch (38 mm) thick.

C. Storm water and Overflow:
   1. All Pipe Sizes: Insulation shall be the following:

a. Mineral-Fiber, Preformed Pipe Insulation, Type I: 1 inch (25 mm) thick.

D. Roof Drain and Overflow Drain Bodies:
1. All Pipe Sizes: Insulation shall be the following:
a. Mineral-Fiber, Preformed Pipe Insulation, Type I: 1 inch (25 mm) thick.

E. Exposed Sanitary Drains, Domestic Water, Domestic Hot Water, and Stops for Plumbing Fixtures for People with Disabilities:
1. All Pipe Sizes: Insulation shall be the following:
a. Flexible Elastomeric: 1/2 inch (13 mm) thick.
b. Mineral-Fiber, Preformed Pipe Insulation, Type I: 1/2 inch (13 mm) thick.

F. Condensate and Equipment Drain Water below 60 Deg F (16 Deg C):
1. All Pipe Sizes: Insulation shall be the following:
a. Mineral-Fiber, Preformed Pipe Insulation, Type I: 1/2 inch (13 mm) thick.

G. Floor Drains, Traps, and Sanitary Drain Piping within 10 Feet (3 m) of Drain Receiving Condensate and Equipment Drain Water below 60 Deg F (16 Deg C):
1. All Pipe Sizes: Insulation shall be the following:
a. Mineral-Fiber, Preformed Pipe Insulation, Type I: 1/2 inch (13 mm) thick.

END OF SECTION 220700

N:\N0912.00\DOC\SPEC\2012_03-16_BID\220700 - PLUMBING INSULATION.DOC

SECTION 220800 – PLUMBING SYSTEM COMMISSIONOING

PART 1 - GENERAL

1.1 WORK INCLUDED

A. Systems and equipment testing and start-up

B. Validation of proper and thorough installation of Division 22 (Plumbing) systems and equipment

C. Systems balancing verification

D. Prefunctional performance testing of equipment and systems

E. Documentation of tests, procedures, and installations

F. Coordination of Training Events

G. Generic Start-Up Procedures for plumbing systems and equipment.

1.2 GENERAL DESCRIPTION

A. Commissioning (Cx) is the process of ensuring that all building systems are installed and perform interactively according to the design intent; that systems are efficient and cost effective and meet the Owner's operational needs; that the installation is adequately documented; and that the Operators are adequately trained. It serves as a tool to minimize post-occupancy operational problems. It establishes testing and communication protocols in an effort to advance the building systems from installation to full dynamic operation and optimization.

B. Commissioning Authority (CA) is retained by the Owner shall work with the Contractor and the Design Engineer to direct and oversee the Cx process and perform functional performance testing.

C. This Section outlines the Cx procedures specific to the Division 22 Contractors. Requirements common to all Sections are specified in Sections 019113 and 019114 and the Cx Plan.

1.3 SCOPE

A. The following are included in the Scope of Commissioning on this project:

B. Plumbing Systems

1. Domestic Water Systems
2. Compressed air system
3. Vacuum system
4. Pure water system
5. Specialty gas system

1.4 RELATED WORK AND DOCUMENTS

A. Commissioning Plan: The Commissioning Plan outlines the commissioning process beyond the construction specification. All Contractor responsibilities are outlined in Specifications. Cx Plan is available to the Contractor to understand the context of their responsibilities but does not define any additional responsibilities of the Contractor

B. Section 019113 – General Commissioning Requirements: details the Cx requirements common across all divisions

C. Section 019114 – Functional Testing Procedures: Outlines the generic functional testing procedures required.

D. Individual Specification Sections: Individual sections stipulate installation, start-up, warranty, O&M documentation, and training requirements for the system or device specified in the Section.

E. Section 210800– Fire Suppression Systems Commissioning: Details the commissioning procedures specific to Fire Protection Systems (Div 21) work.

F. Section 230800 – HVAC Systems Commissioning: Details the commissioning procedures specific to HVAC (Div 23) work.

G. Section 230995 – Building Automation Systems Commissioning: Details the commissioning procedures specific to the Building Automation System.

H. Section 260800 – Electrical Systems Commissioning: Details the commissioning procedures specific to Division 26 work.

1.5 DEFINITIONS AND ABBREVIATIONS

A. Refer to Section 019113

1.6 REFERENCE STANDARDS

A. ASHRAE Guideline 1-1996, "Guideline for Commissioning HVAC Systems"

B. ASHRAE Guideline 4-1993, “Preparation of operating and Maintenance Documentation for Building Systems”

C. NFPA 99, “Standard for Health Care Facilities”

1.7 DOCUMENTATION

A. In addition to the documentation required in Section 019113, Contractor shall provide to the CA the following per the procedures specified herein, in the Cx Plan, and in other Sections of the specification:

1. Factory Test Reports: Contractor shall provide any factory testing documentation or certified test reports required by the specifications. These shall be provided prior to Acceptance Phase. Factory Test Reports should be provided in pdf electronic format. These may include but are not limited to:

a. Air Compressors
b. Pump Capacity

2. Field Testing Agency Reports (other than TAB): Provide all documentation of work of independent testing agencies required by the specification. These shall be provided prior to Acceptance Phase. Field Testing Agency Reports should be provided in pdf electronic format. These may include but are not limited to:

a. Pipe Pressure Testing
b. Potable Water Disinfection
c. Pure water testing

1.8 CONTRACTOR RESPONSIBILITIES

A. Refer to Section 019113: Detailed Contractor responsibilities common to all Divisions are specified in Section 019113. The following are additional responsibilities or notable responsibilities specific to Division 22.

B. Construction Phase

1. Provide skilled technicians qualified to perform the work required.
2. Provide factory-trained and authorized technicians where required by the Contract Documents.
3. Prepare and submit required draft Start-Up Procedures and submit along with the manufacturer's application, installation and start-up information.
4. Provide assistance to the CA in preparation of the specific Functional Performance Test (FPT) procedures. Contractors, subcontractors and vendors shall review FPT procedures to ensure feasibility, safety and equipment protection and provide necessary written alarm limits to be used during the tests. Damage caused to equipment performed in accordance with the approved procedures will be the responsibility of the Contractor.
5. Thoroughly complete and inspect installation of systems and equipment as detailed throughout Contract Documents, as required by reference or industry standards, and as specifically indicated elsewhere this Section.
6. Start-up, and test/adjust/balance systems and equipment prior to functional performance testing by the CA. Start-Up Procedures shall be in accordance with Contract Documents, reference or industry standards, and specifically elsewhere in Part I of this Section.
7. Record Start-up Procedures on start-up procedure forms and certify that the systems and equipment have been started and or tested in accordance with the requirements specified above. Each task or item shall be indicated with the Party actually performing the task or procedure.

C. Acceptance Phase

1. Assist CA in functional performance testing. Assistance will generally include the following:

a. Manipulate systems and equipment to facilitate testing (as dictated in Section 019114; in some cases this will entail only an initial sample);
b. Provide any specialized instrumentation necessary for functional performance testing;

D. Warranty Phase

1. Maintain record documentation of any configurations, set ups, parameters etc, that change throughout the period.
2. Provide representative for off season testing as required by CA.

3. Respond to Warranty issues as required by Division 1 and the General Conditions.

1.9 TRAINING

A. Contractors, Subcontractor, Vendors, and other applicable Parties shall prepare and conduct training sessions on the installed systems and equipment they are responsible for per the requirements of Section 019113 and the individual Specifications.

PART 2 - PRODUCTS

2.1 INSTRUMENTATION

A. General: All testing equipment used by any Party shall be of sufficient quality and accuracy to test and/or measure system performance with the tolerances specified. If not otherwise noted, the following minimum requirements apply:

1. Temperature sensors and digital thermometers shall have a certified calibration within the past year and a resolution of + or - 0.1°F.
2. Pressure sensors shall have an accuracy of + or - 2.0% of the value range being measured (not full range of meter) and have been calibrated within the last year.
3. All equipment shall be calibrated according to the manufacturer's recommended intervals. Calibration tags shall be affixed or certificates readily available.

B. Standard Testing Instrumentation: Standard instrumentation used for testing air and water flows, temperatures, humidity, noise levels, amperage, voltage, and pressure differential in air and water systems shall be provided by CA.

C. Special Tools: Special equipment, tools and instruments (only available from vendor, specific to a piece of equipment) required for testing equipment, according to these Contract Documents shall be included in the base bid price to the Contractor and turned over to the Owner upon project completion.

2.2 WEB-BASED COMMISSIONING PORTAL

A. All general and major subcontractors participating in the Cx process shall use the web-based Cx Portal ('Portal') to document the Cx procedures. The Portal is a Web-based Internet hub used to electronically collaborate and coordinate activities and deliverables throughout the Cx process. The Portal is hosted by the CA and shall be accessible to all Parties participating in the Cx program. The Portal provides a common location to store Start-Up Documentation, Functional Performance Tests and results, project documents and deliverables. It also serves as a collaborative email hub to facilitate, automate, and track communications between Parties relating to the Cx process.

B. Refer to Section 019113 the individual Specifications for additional information and requirements for using the Portal.

2.3 TEST KITS FOR METERS AND GAGES

A. Test kits for meters and gages shall be provided to the Owner new and in good condition. Previously used kits will be unacceptable. Kits shall be submitted prior to the Acceptance Phase. Kits included shall be as a minimum:

1. Digital indication of temperature and pressure with associated sensors to work with the P/T test ports
2. Companion readout kit (with fittings) for calibrated balancing valve with ranges as required by all devices on this project

PART 3 - EXECUTION

3.1 START-UP PROCEDURES - GENERAL

A. Part 3 of this Section outlines 'generic' or minimally acceptable Start-Up Procedures (delineated as Start-Up Checks and Start-Up Tests) and individual systems Training requirements for systems and equipment. These procedures are the direct responsibility of the Contractor as a basic element of validating that the installation is correct per normal quality control practices. These items shall provide a minimum or guideline for required Contractor development of Start-Up Procedures. Contractor shall synthesize these minimum requirements along with their own internal quality control practices, those of the manufacturer, and any applicable codes and standards to develop specific and itemized Start-Up Procedures specific to the equipment and systems installed on this project.

3.2 PROCEDURES COMMON TO ALL SYSTEMS

A. The following start up verifications/procedures are common to all systems

B. Checkout shall proceed from devices to the components to the systems.

C. Verify labeling is affixed per spec and visible

D. Verify prerequisite procedures are done.

E. Inspect for damage and ensure none is present.

F. Verify system is applied per the manufacturer's recommendations

G. Verify system has been start up per the manufacturer's recommendations

H. Verify that access is provided for inspection, operation and repair

I. Verify that access is provided for replacement of the equipment

J. Verify the record drawings, submittal data and O&M documentation accurately reflect the installed systems

K. Verify all gages and test ports are provided as required by contract documents and manufacturer's recommendations

L. Verify all recorded nameplate data is accurate

M. Installation is done to ensure safe operation and maintenance.

N. Verify specified replacement material/attic stock has been provided as required by the Construction Documents

O. Verify all rotating parts are properly lubricated

P. Verify all monitoring and ensure all alarms are active and set per Owner's requirements

Q. Complete all nameplate data and confirm ratings conform with the design documents

3.3 VALVES

A. Start-Up Checks: Perform the following checks during start-up and as specified in manufacturer's instructions:

1. Operate all valves, manual and automatic, through their full stroke. Ensure smooth operation through full stroke and appropriate sealing or shutoff.
2. Verify actuators are properly installed with adequate clearance.
3. Verify all valves are labeled per the construction documents. Confirm that concealed valves are indicated on the finished building surface.
4. For automatic pneumatically-operated valves, verify spring range and adjust pilot positioners where applicable. For electronically operated valves, check the stroke and range. For all automated valves controlled by a program, ensure that the minimum and maximum stroke and ranges on the valves are coordinated with the limits entered in the program.

3.4 METERS AND GAGES

A. Start-Up Checks: Perform the following checks during start-up and as specified in manufacturer's instructions:

1. Adjust faces of meters and gages to proper angle for best visibility.
2. Clean windows of meters and gages and factory-finished surfaces. Replace cracked and broken windows, and repair scratched and marred surfaces with manufacturer's touch-up paint. For meters and gages requiring temporary manual connection of read-out device such as pressure taps on a flow measuring device, ensure threads are clean and that connection can be made easily.
3. Meters and gages requiring manual connection of readout device shall be installed with adequate access to allow connection of device with normal tools.

3.5 MECHANICAL IDENTIFICATION

A. Start-Up Checks: Perform the following checks:

1. Verify all valve tags, piping, duct, and equipment labeling corresponds with drawings and indexes and meets requirements specified. Correct any deficiencies for all piping and duct systems.
2. Adjusting: Relocate any mechanical identification device which has become visually blocked by work of this division or other divisions.
3. Cleaning: Clean face of identification devices and glass frames of valve charts

3.6 MECHANICAL INSULATION

A. Start-Up Checks: Examine all piping, systems and equipment specified to be insulated.

1. Ensure quality of insulation. Patch and repair all insulation damaged after installation.
2. Ensure the integrity of vapor barrier around all cold surfaces.

3.7 PIPING - GENERAL

A. Start-Up Checks: These Procedures apply to all installed piping systems, including underground site utilities.

1. Inspect all piping for proper installation, adequate support (with appropriate vibration isolation where applicable) and adequate isolation valves for required service.
2. Submit welding certifications as required by the applicable specification section or referenced ASME specification.
3. Submit certified welding inspection results per the applicable specification section or referenced ASME specification. ASME B31.1 requires 100% inspection based on pressure class.
4. Provide notification of pipe cleaning and flushing activities
5. Flush and clean all piping and clean all strainers. Provide documentation of all related procedures.
6. Ensure adequate drainage is provided at low points and venting is provided at high points.
7. Ensure air is thoroughly removed from the system as applicable. Ensure facilities to effectively drain and fill the system are in place.
8. Ensure all piping is adequately supported and anchored to allow expansion. Bump across-the-line pumps and inspect for excessive pipe movement.
9. Provide notification of pressure testing
10. Pressure and/or leak test all applicable systems in accordance with the requirements in the applicable sections, ASME B 31.1 and 39.1 as applicable.
11. Sterilize applicable piping systems as specified in the individual Sections and as required by regulatory authorities.
12. Submit pressure test reports that document the pressure testing results with Certification of the results.
13. Verify the operation of applicable safety relief valves, operating controls, safety controls, etc. to ensure a safe installation.
14. Set and adjust fill, pressure, or level controls to the required setting.

3.8 AC MOTORS

A. Start-Up Checks: Perform the following checks during start-up and as specified in manufacturer's instructions:

1. Verify proper alignment, installation, and rotation.
2. Verify properly sized overloads are in place

B. Start-Up Tests: Perform the following tests, measurements, or procedures during start-up and as specified in manufacturer's instructions:

1. Measure insulation resistance, phase balance, and resistance to ground
2. Measure voltage available to all phases; measure amps and RPM after motor has been placed in operation and is under load.
3. Record all motor nameplate data.

3.9 BEARINGS

A. This applies to all bearings on fans, pumps, compressors, etc.

B. Check alignment as applicable

C. Lubricate all bearings per the manufacturer's instructions. When bearing is used for temporary conditioning, lubricate on manufacturer's recommended frequency and document it.

3.10 LABORATORY AIR COMPRESSORS AND VACUUM PUMPS

A. General: Provide the services of a factory authorized representative to inspect equipment installation and start-up equipment, and train the Owner's personnel

B. Safety Controls: Operate and adjust safety controls. Replace damaged and malfunctioning controls and equipment.

C. Refer to AC Motors elsewhere in this Section.

D. Start-Up Checks: Perform the following checks before start-up:

1. Verify that specified tests of piping systems are complete.
2. Check that medical air compressor inlets are properly located for clean air supply, and that medical vacuum exhausts are properly located to prevent contamination of medical air compressor inlets and public spaces.
3. Check that medical air compressor inlet filters and piping and medical vacuum pump filters and discharge piping are clear.
4. Check for lubricating oil for lubricated-type equipment.
5. Check V-belts for proper tension.
6. Check for equipment vibration control supports and flexible pipe connectors and that equipment is properly attached to substrate.
7. Check that safety (pressure relief) valves have a setting greater than medical air compressor discharge pressure but not greater than pressure rating of system components.
8. Adjust vacuum relief valves.
9. Check for water supply to water-cooled equipment.
10. Check for water supply to liquid ring medical air compressors and vacuum pumps.
11. Drain medical air and vacuum receiver tanks.
12. Check for proper seismic restraints.
13. Check for adequate room ventilation.

E. Start-Up Tests: Follow the manufacturer's printed procedures. If no procedures are specified by the manufacturer, proceed as follows:

1. Energize circuits.
2. Start and run equipment through complete sequence of operations.
3. Check for excessive vibration and noise.
4. Check air and vacuum pressures.
5. Manually operate safety valves and vacuum relief valves.
6. Adjust operating controls including pressure and vacuum settings.

F. Training: Train Owner's maintenance personnel on procedures and schedules related to start-up and shutdown, troubleshooting, servicing, and preventative maintenance.

1. Review data in Operating and Maintenance Manuals

3.11 HIGH PURITY WATER SYSTEM

A. General: Provide the services of a factory authorized representative to inspect equipment installation and start-up equipment, and train the Owner's personnel

1. Refer to applicable elements itemized elsewhere in this section like pumps, water softeners piping, etc. as applicable.

B. Start-up Checks: Perform the following checks before start-up:

1. Ensure piping is properly installed, sterilized, and tested.
2. Fill brine tank.
3. Ensure 3 valve bypass, pressure gages, and sample valve are installed on the UV sterilizer and Pre- and Final Filters.
4. Ensure isolation valves are installed throughout the system as required by the specifications.
5. For the UV sterilizer, ensure proper power source is provided and connected. Also verify the interface with the BAS for on/off, high temp alarm, no flow alarm.
6. At the DI Columns, ensure each can be isolated for service, each column is properly secured to frame, manual isolation valve is installed on the common discharge header, resistivity monitor is installed and connected to the BAS, and sample valve is provided.
7. Verify storage tank fill and level controls are installed and functional.
8. Validate that sunlight cannot get to stored pure water

C. Start-Up Tests: Follow the manufacturer's printed procedures as a minimum:

1. Start-up and check out booster pumps in accordance with the item so labeled in this Section.
2. Run pre-treatment through all regeneration and backwash cycles.
3. Verify blending valve is operational.
4. Test the storage tank makeup and fill and associated alarming function.
5. Calibrate all sensors including resistivity meters.
6. Verify all modes of operation and ensure that the controls, alarms and safeties are functional and properly adjusted.
7. Perform bacteria and TOC test.
8. Verify record documentation represents installed conditions

D. Functional Performance Tests: The acceptance of the Pure Water System will be done in concert with the factory authorized representatives testing after start up. Manufacturer's representative will conduct all functional testing in the presence of the CxT. Coordinate Manufacturer's start up and testing with functional testing on support utilities.

1. Demonstrate Access to equipment for maintenance and repair
2. Present Record Documentation
3. CA to review start up documentation
4. Normal Operation Tests:

a. Open Pure Water Outlets to load the system to near capacity.
b. Monitor booster pumps and temperature mixing valves for proper operation.
c. Observe softener cycles and rotation of softeners as backwash cycles are initiated.
d. Confirm RO system operation and monitoring
e. Confirm proper UV sterilizer operation
f. Confirm proper recirculation flows

g. Check pressures in relation to ratings of terminal devices
h. Inspect for dead legs and ensure sunlight is not available to storage tanks.
i. Spot check balancing of the circulation system to ensure adequate flow
j. Test pumps in accordance with the procedure indicated for them elsewhere in the plan.

5. During normal operation take samples as follows:

a. TOC Tests: Samples shall be taken at 10 locations as specified by the CxA. Use a calibrated TOC analyzer with documented calibration within the last 6 months. Appropriately bleed outlet prior to taking sample.
b. Bacteria Tests: Samples shall be taken at 10 locations as specified by the CxA. Take 100 milliliter samples and culture for 72 hours.
c. TDS: Samples shall be taken at 10 locations as specified by the CxA. Measure the total dissolved solids using a calibrated meter with certification within 6 months.
d. Documentation shall contrast the measured sample with the threshold for the applicable reagent grade spec.

6. Normal Maintenance:

a. During normal operation, systematically take redundant components out of service to simulate them being serviced or repaired. Ensure system continues operation without interruption. Demonstrate replacing filters and media.

7. Emergency Operation:

a. Simulate failures of various components and sensors. Ensure proper responses to failures and proper enunciation of condition.

E. Training: Factory-authorized representative shall train Owner's maintenance personnel including:

1. Procedures and schedules related to start-up and shut down, troubleshooting, servicing, preventative maintenance, and how to obtain replacement parts.
2. Familiarization with contents of Operating and Maintenance Manuals

3.12 WATER HEATERS

A. General: Provide the services of a factory authorized service representative to test and inspect unit installation, provide start-up service, and demonstrate and train Owner's maintenance personnel as specified below.

1. Check for piping connections leaks.
2. Test and adjust operating and safety controls. Replace damaged and malfunctioning controls and equipment.
3. Set all DHW recirculation flow rates and time the delivery of hot water at the remote branches of the system.

B. Training: Train Owner's maintenance personnel on procedures and schedules related to start-up and shutdown, troubleshooting, servicing, and preventative maintenance.

1. Review data in Operating and Maintenance Manuals.

3.13 COMPRESSED AIR SYSTEMS

A. General: Provide the services of a factory authorized service representative to test and inspect unit installation, provide startup service, and to demonstrate and train Owner's maintenance personnel as specified below.

B. Refer to AC Motors in this section

C. Start-Up Checks: Perform the following final checks before startup:

1. Piping System Tests: Complete system test in accordance with the respective section
2. Inspect the installation and access/clearance for service and maintenance to ensure it meets the project and manufacturer’s requirements
3. Check for piping connection leaks.
4. Check lubricating oil for lubricated type equipment.
5. Check V-belts for proper tension.
6. Check that compressor inlet filters and piping are clear.
7. Check equipment vibration control supports and flexible pipe connectors, and that equipment is properly attached to substrate.
8. Check for proper seismic restraints.
9. Check that safety valves have correct setting; greater than compressor discharge pressure, but not greater than pressure rating of system components.
10. Test operation of equipment safety controls and devices.
11. Check water supply to water cooled equipment.
12. Check water supply to liquid ring air compressors.
13. Drain receiver tanks.
14. Check for adequate room ventilation.

D. Start-Up Tests: Follow the manufacturer's written procedures and the following as a minimum:

1. Energize circuits.
2. Check for proper rotation of 3 phase motors.
3. Start and run equipment through complete sequence of operations.
4. Check for excessive vibration and noise. Correct problems.
5. Check air pressures.
6. Manually operate safety valves.
7. Adjust operating controls including pressure settings.

E. Training: Factory-authorized representative shall train Owner's maintenance personnel including:

1. Procedures and schedules related to start-up and shut down, troubleshooting, servicing, preventative maintenance, and how to obtain replacement parts.
2. Familiarization with contents of Operating and Maintenance Manuals

3.14 PUMPS

A. Refer to AC Motors in this section

B. Refer to Bearings in this section

C. Refer to Division 23 Section "Testing, Adjusting, and Balancing" for detailed requirements for testing, adjusting, and balancing hydronic systems.

D. Start-Up Checks: Perform the following checks before start-up:

1. Check suction lines connections for tightness to avoid drawing air into the pump.
2. Clean and lubricate all bearings.
3. Check motor for proper rotation. Rotation shall match direction of rotation marked on pump casing.
4. Check that pump is free to rotate by hand. For pumps handling hot liquids, pump shall be free to rotate with the pump hot and cold. If the pump is bound or even drags slightly, do not operate the pump until the cause of the trouble is determined and corrected.
5. Clean associated strainers.
6. Check that the proper overloads have been installed in the starter and are the correct size.
7. Verify that the integrity of the vibration isolation is maintained throughout the support and the connections.
8. Align pump within manufacturers recommended tolerances.
9. Ensure all associated piping has been cleaned, tested, and vented.
10. Verify that all thermometers and gages are installed, are clean and undamaged, and are functional.

E. Start-Up Tests: Perform the following tests, measurements, or procedures during start-up:

1. Start the pump per the manufacturer's instructions.
2. Check the general mechanical operation of the pump and motor.
3. Verify that check valve seal is appropriate.
4. Check noise and vibration levels and ensure they are within the manufacturers recommended tolerances.
5. Check that the NPSH is with that allowable for the operating condition.
6. Refer to Division 23 Section "Testing, Adjusting, and Balancing" for detailed requirements for testing, adjusting, and balancing hydronic systems.

3.15 SEQUENCING ILLUSTRATION

A. Reference Section 019113

END OF SECTION 220800

SECTION 221116 - DOMESTIC WATER PIPING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:
   1. Aboveground domestic water pipes, tubes, fittings, and specialties inside the building.
   2. Escutcheons.
   3. Sleeves and sleeve seals.
   4. Wall penetration systems.

B. Related Section:
   1. Division 22 Section "Facility Water Distribution Piping" for water-service piping outside the building from source to the point where water-service piping enters the building.

1.3 SUBMITTALS

A. Product Data: For the following products:
   1. Specialty valves.
   2. Transition fittings.
   3. Dielectric fittings.
   4. Flexible connectors.
   5. Backflow preventers.
   6. Escutcheons.
   7. Sleeves and sleeve seals.
   8. Water penetration systems.

B. LEED Submittal:
   1. Product Data for Credit EQ 4.1: For solvent cements and adhesive primers, including printed statement of VOC content.

C. Water Samples: Specified in "Cleaning" Article.

D. Coordination Drawings: For piping in equipment rooms and other congested areas, drawn to 1/4” scale, on which the following items are shown and coordinated with each other, using input from Installers of the items involved:
   1. All MEP systems

E. Field quality-control reports.

1.4 QUALITY ASSURANCE

A. Piping materials shall bear label, stamp, or other markings of specified testing agency.

B. Comply with NSF 14 for plastic, potable domestic water piping and components.

C. Comply with NSF 61 for potable domestic water piping and components.

1.5 COORDINATION

A. Coordinate sizes and locations of concrete bases with actual equipment provided.

PART 2 - PRODUCTS

2.1 PIPING MATERIALS

A. Comply with requirements in "Piping Schedule" Article for applications of pipe, tube, fitting materials, and joining methods for specific services, service locations, and pipe sizes.

2.2 COPPER TUBE AND FITTINGS

A. Hard Copper Tube: ASTM B 88, Type L (ASTM B 88M, Type B) water tube, drawn temper.
   1. Cast-Copper Solder-Joint Fittings: ASME B16.18, pressure fittings.
   2. Wrought-Copper Solder-Joint Fittings: ASME B16.22, wrought-copper pressure fittings.
   3. Bronze Flanges: ASME B16.24, Class 150, with solder-joint ends.
   4. Copper Unions: MSS SP-123, cast-copper-alloy, hexagonal-stock body, with ball-and-socket, metal-to-metal seating surfaces, and solder-joint or threaded ends.
   5. Grooved-Joint Copper-Tube Appurtenances:
      a. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
         1) Anvil International.
         2) Shurjoint Piping Products.
         3) Victaulic Company.
      b. Copper Grooved-End Fittings: ASTM B 75 (ASTM B 75M) copper tube or ASTM B 584 bronze castings.
      c. Grooved-End-Tube Couplings: Copper-tube dimensions and design similar to AWWA C606. Include ferrous housing sections, EPDM-rubber gaskets suitable for hot and cold water, and bolts and nuts.

2.3 PIPING JOINING MATERIALS

A. Pipe-Flange Gasket Materials: AWWA C110, rubber, flat face, 1/8 inch (3.2 mm) thick or ASME B16.21, nonmetallic and asbestos free, unless otherwise indicated; full-face or ring type unless otherwise indicated.

B. Metal, Pipe-Flange Bolts and Nuts: ASME B18.2.1, carbon steel unless otherwise indicated.

C. Solder Filler Metals: ASTM B 32, lead-free alloys. Include water-flushable flux according to ASTM B 813.

D. Brazing Filler Metals: AWS A5.8/A5.8M, BCuP Series, copper-phosphorus alloys for general-duty brazing unless otherwise indicated.

2.4 DIELECTRIC FITTINGS

A. General Requirements: Assembly of copper alloy and ferrous materials or ferrous material body with separating nonconductive insulating material suitable for system fluid, pressure, and temperature.

B. Dielectric Unions:
1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   a. Capitol Manufacturing Company.
   b. Central Plastics Company.
   c. EPCO Sales, Inc.
   d. Hart Industries International, Inc.
   e. Watts Regulator Co.; a division of Watts Water Technologies, Inc.
   f. Zurn Plumbing Products Group; Wilkins Water Control Products.
2. Description:
   a. Pressure Rating: 150 psig (1035 kPa) at 180 deg F (82 deg C).
   b. End Connections: Solder-joint copper alloy and threaded ferrous.

C. Dielectric Flanges:
1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   a. Capitol Manufacturing Company.
   b. Central Plastics Company.
   c. EPCO Sales, Inc.
   d. Watts Regulator Co.; a division of Watts Water Technologies, Inc.
2. Description:
   a. Factory-fabricated, bolted, companion-flange assembly.
   b. Pressure Rating: 150 psig (1035 kPa).
   c. End Connections: Solder-joint copper alloy and threaded ferrous; threaded solder-joint copper alloy and threaded ferrous.

D. Dielectric-Flange Kits:
1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   a. Advance Products & Systems, Inc.
   b. Calpico, Inc.
   c. Central Plastics Company.
   d. Pipeline Seal and Insulator, Inc.
2. Description:
   a. Nonconducting materials for field assembly of companion flanges.
   b. Pressure Rating: 150 psig (1035 kPa).
   c. Gasket: Neoprene or phenolic.
   d. Bolt Sleeves: Phenolic or polyethylene.
   e. Washers: Phenolic with steel backing washers.

E. Dielectric Couplings:

1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   a. Calpico, Inc.
   b. Lochinvar Corporation.
2. Description:
   a. Galvanized-steel coupling.
   b. Pressure Rating: 300 psig (2070 kPa) at 225 deg F (107 deg C).
   c. End Connections: Female threaded.
   d. Lining: Inert and noncorrosive, thermoplastic.

F. Dielectric Nipples:
1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   a. Perfection Corporation; a subsidiary of American Meter Company.
   b. Precision Plumbing Products, Inc.
   c. Victaulic Company.
2. Description:
   a. Electroplated steel nipple complying with ASTM F 1545.
   b. Pressure Rating: 300 psig (2070 kPa) at 225 deg F (107 deg C).
   c. End Connections: Male threaded or grooved.
   d. Lining: Inert and noncorrosive, propylene.

2.5 ESCUTCHEONS

A. General: Manufactured ceiling, floor, and wall escutcheons and floor plates.

B. One Piece, Cast Brass: Polished, chrome-plated finish with setscrews.

C. One Piece, Deep Pattern: Deep-drawn, box-shaped brass with chrome-plated finish.

D. One Piece, Stamped Steel: Chrome-plated finish with setscrew or spring clips.

E. Split Casting, Cast Brass: **Polished, chrome-plated** finish with concealed hinge and setscrew.

F. Split Plate, Stamped Steel: Chrome-plated finish with **concealed** hinge, **setscrew or spring clips**.

G. One-Piece Floor Plates: Cast-iron flange **with holes for fasteners**.

H. Split-Casting Floor Plates: Cast brass with concealed hinge.

2.6 SLEEVES

A. Cast-Iron Wall Pipes: Fabricated of cast iron, and equivalent to ductile-iron pressure pipe, with plain ends and integral waterstop unless otherwise indicated.

B. Galvanized-Steel-Sheet Sleeves: 0.0239-inch (0.6-mm) minimum thickness; round tube closed with welded longitudinal joint.

C. Molded-PE Sleeves: Reusable, PE, tapered-cup shaped, and smooth outer surface with nailing flange for attaching to wooden forms.

D. Galvanized-Steel-Pipe Sleeves: ASTM A 53/A 53M, Type E, Grade B, Schedule 40, zinc-coated, with plain ends.

E. Stack Sleeve Fittings: Manufactured, cast-iron sleeve with integral clamping flange. Include clamping ring and bolts and nuts for membrane flashing.
1. Underdeck Clamp: Clamping ring with setscrews.

2.7 SLEEVE SEALS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
1. Advance Products & Systems, Inc.
2. Calpico, Inc.
3. Metraflex, Inc.
4. Pipeline Seal and Insulator, Inc.

B. Description: Modular sealing element unit, designed for field assembly, used to fill annular space between pipe and sleeve.
1. Sealing Elements: EPDM-rubber interlocking links shaped to fit surface of pipe. Include type and number required for pipe material and size of pipe.
2. Pressure Plates: Stainless steel.
3. Connecting Bolts and Nuts: Stainless steel of length required to secure pressure plates to sealing elements.

2.8 WALL PENETRATION SYSTEMS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
1. SIGMA.
2. Proset
3. Approved equal.

B. Description: Wall-sleeve assembly, consisting of housing and gland, gaskets, and pipe sleeve.
1. Carrier-Pipe Deflection: Up to 5 percent without leakage.
2. Housing: Ductile-iron casting with hub, waterstop, anchor ring, and locking devices. Include gland, bolts, and nuts.
3. Housing-to-Sleeve Gasket: EPDM rubber.
4. Housing-to-Carrier-Pipe Gasket: AWWA C111, EPDM rubber.
5. Pipe Sleeve: ASTM A 53/A 53M, Schedule 40, zinc-coated steel pipe.

2.9 GROUT

A. Standard: ASTM C 1107, Grade B, post-hardening and volume-adjusting, dry, hydraulic-cement grout.

B. Characteristics: Nonshrink; recommended for interior and exterior applications.

C. Design Mix: 5000-psi (34.5-MPa), 28-day compressive strength.

D. Packaging: Premixed and factory packaged.

PART 3 - EXECUTION

3.1 PIPING INSTALLATION

A. Drawing plans, schematics, and diagrams indicate general location and arrangement of domestic water piping. Indicated locations and arrangements are used to size pipe and calculate friction loss, expansion, and other design considerations. Install piping as indicated unless deviations to layout are approved on Coordination Drawings.

B. Install copper tubing under building slab according to CDA's "Copper Tube Handbook."

C. Install shutoff valve, hose-end drain valve, strainer, pressure gage, and test tee with valve, inside the building at each domestic water service entrance. Comply with requirements in Division 22 Section "Meters and Gages for Plumbing Piping" for pressure gages and Division 22 Section "Domestic Water Piping Specialties" for drain valves and strainers.

D. Install shutoff valve immediately upstream of each dielectric fitting.

E. Install domestic water piping level **with 0.25 percent slope downward toward drain** and plumb.

F. Install piping concealed from view and protected from physical contact by building occupants unless otherwise indicated and except in equipment rooms and service areas.

G. Install piping indicated to be exposed and piping in equipment rooms and service areas at right angles or parallel to building walls. Diagonal runs are prohibited unless specifically indicated otherwise.

H. Install piping above accessible ceilings to allow sufficient space for ceiling panel removal, and coordinate with other services occupying that space.

I. Install piping adjacent to equipment and specialties to allow service and maintenance.

J. Install piping to permit valve servicing.

K. Install nipples, unions, special fittings, and valves with pressure ratings the same as or higher than system pressure rating used in applications below unless otherwise indicated.

L. Install piping free of sags and bends.

M. Install fittings for changes in direction and branch connections.

N. Install unions in copper tubing at final connection to each piece of equipment, machine, and specialty.

O. Install pressure gages on suction and discharge piping from each plumbing pump and packaged booster pump. Comply with requirements in Division 22 Section "Meters and Gages for Plumbing Piping" for pressure gages.

P. Install thermostats in hot-water circulation piping. Comply with requirements in Division 22 Section "Domestic Water Pumps" for thermostats.

Q. Install thermometers on outlet piping from each water heater. Comply with requirements in Division 22 Section "Meters and Gages for Plumbing Piping" for thermometers.

3.2 JOINT CONSTRUCTION

A. Ream ends of pipes and tubes and remove burrs. Bevel plain ends of steel pipe.

B. Remove scale, slag, dirt, and debris from inside and outside of pipes, tubes, and fittings before assembly.

C. Threaded Joints: Thread pipe with tapered pipe threads according to ASME B1.20.1. Cut threads full and clean using sharp dies. Ream threaded pipe ends to remove burrs and restore full ID. Join pipe fittings and valves as follows:
   1. Apply appropriate tape or thread compound to external pipe threads.
   2. Damaged Threads: Do not use pipe or pipe fittings with threads that are corroded or damaged.

D. Soldered Joints: Apply ASTM B 813, water-flushable flux to end of tube. Join copper tube and fittings according to ASTM B 828 or CDA's "Copper Tube Handbook."

E. Copper-Tubing Grooved Joints: Roll groove end of tube. Assemble coupling with housing, gasket, lubricant, and bolts. Join copper tube and grooved-end fittings according to AWWA C606 for roll-grooved joints.

F. Flanged Joints: Select appropriate asbestos-free, nonmetallic gasket material in size, type, and thickness suitable for domestic water service. Join flanges with gasket and bolts according to ASME B31.9.

G. Dissimilar-Material Piping Joints: Make joints using adapters compatible with materials of both piping systems.

3.3 VALVE INSTALLATION

A. General-Duty Valves: Comply with requirements in Division 22 Section "General-Duty Valves for Plumbing Piping" for valve installations.

B. Install shutoff valve close to water main on each branch and riser serving plumbing fixtures or equipment, on each water supply to equipment, and on each water supply to plumbing fixtures that do not have supply stops. Use ball valves for piping NPS 2 (DN 50) and smaller. Use ball valves for piping NPS 2-1/2 (DN 65) and larger.

C. Install drain valves for equipment at base of each water riser, at low points in horizontal piping, and where required to drain water piping. Drain valves are specified in Division 22 Section "Domestic Water Piping Specialties."
   1. Hose-End Drain Valves: At low points in water mains, risers, and branches.
   2. Stop-and-Waste Drain Valves: Instead of hose-end drain valves where indicated.

D. Install balancing valve in each hot-water circulation return branch and discharge side of each pump and circulator. Set balancing valves partly open to restrict but not stop flow. Use ball valves for piping NPS 2 (DN 50) and smaller and butterfly valves for piping NPS 2-1/2 (DN 65) and larger. Comply with requirements in Division 22 Section "Domestic Water Piping Specialties" for balancing valves.

E. Install calibrated balancing valves in each hot-water circulation return branch and discharge side of each pump and circulator. Set calibrated balancing valves partly open to restrict but not stop flow. Comply with requirements in Division 22 Section "Domestic Water Piping Specialties" for calibrated balancing valves.

3.4 DIELECTRIC FITTING INSTALLATION

A. Install dielectric fittings in piping at connections of dissimilar metal piping and tubing.

B. Dielectric Fittings for NPS 2 (DN 50) and Smaller: Use dielectric couplings or nipples.

C. Dielectric Fittings for NPS 2-1/2 to NPS 4 (DN 65 to DN 100): Use dielectric flanges.

D. Dielectric Fittings for NPS 5 (DN 125) and Larger: Use dielectric flange kits.

3.5 HANGER AND SUPPORT INSTALLATION

A. Comply with requirements in Division 22 Section "Vibration and Seismic Controls for Plumbing Piping and Equipment" for seismic-restraint devices.

B. Comply with requirements in Division 22 Section "Hangers and Supports for Plumbing Piping and Equipment" for pipe hanger and support products and installation.
1. Vertical Piping: MSS Type 8 or 42, clamps.
2. Individual, Straight, Horizontal Piping Runs:
   a. 100 Feet (30 m) and Less: MSS Type 1, adjustable, steel clevis hangers.
   b. Longer Than 100 Feet (30 m): MSS Type 43, adjustable roller hangers.
   c. Longer Than 100 Feet (30 m) If Indicated: MSS Type 49, spring cushion rolls.
3. Multiple, Straight, Horizontal Piping Runs 100 Feet (30 m) or Longer: MSS Type 44, pipe rolls. Support pipe rolls on trapeze.
4. Base of Vertical Piping: MSS Type 52, spring hangers.

C. Support vertical piping and tubing at base and at each floor.

D. Rod diameter may be reduced one size for double-rod hangers, to a minimum of 3/8 inch (10 mm).

E. Install hangers for copper tubing with the following maximum horizontal spacing and minimum rod diameters:
1. NPS 3/4 (DN 20) and Smaller: 60 inches (1500 mm) with 3/8-inch (10-mm) rod.
2. NPS 1 and NPS 1-1/4 (DN 25 and DN 32): 72 inches (1800 mm) with 3/8-inch (10-mm) rod.
3. NPS 1-1/2 and NPS 2 (DN 40 and DN 50): 96 inches (2400 mm) with 3/8-inch (10-mm) rod.
4. NPS 2-1/2 (DN 65): 108 inches (2700 mm) with 1/2-inch (13-mm) rod.
5. NPS 3 to NPS 5 (DN 80 to DN 125): 10 feet (3 m) with 1/2-inch (13-mm) rod.
6. NPS 6 (DN 150): 10 feet (3 m) with 5/8-inch (16-mm) rod.
7. NPS 8 (DN 200): 10 feet (3 m) with 3/4-inch (19-mm) rod.

F. Install supports for vertical copper tubing every 10 feet (3 m).

G. Support piping and tubing not listed in this article according to MSS SP-69 and manufacturer's written instructions.

3.6 CONNECTIONS

A. Drawings indicate general arrangement of piping, fittings, and specialties.

B. Install piping adjacent to equipment and machines to allow service and maintenance.

C. Connect domestic water piping to exterior water-service piping. Use transition fitting to join dissimilar piping materials.

D. Connect domestic water piping to water-service piping with shutoff valve; extend and connect to the following:
   1. Domestic Water Booster Pumps: Cold-water suction and discharge piping.
   2. Water Heaters: Cold-water inlet and hot-water outlet piping in sizes indicated, but not smaller than sizes of water heater connections.
   3. Plumbing Fixtures: Cold- and hot-water supply piping in sizes indicated, but not smaller than required by plumbing code. Comply with requirements in Division 22 plumbing fixture Sections for connection sizes.
   4. Equipment: Cold- and hot-water supply piping as indicated, but not smaller than equipment connections. Provide shutoff valve and union for each connection. Use flanges instead of unions for NPS 2-1/2 (DN 65) and larger.

3.7 SLEEVE INSTALLATION

A. General Requirements: Install sleeves for pipes and tubes passing through penetrations in floors, partitions, roofs, and walls.

B. Sleeves are not required for core-drilled holes.

C. Permanent sleeves are not required for holes formed by removable PE sleeves.

D. Cut sleeves to length for mounting flush with both surfaces unless otherwise indicated.

E. Install sleeves in new partitions, slabs, and walls as they are built.

F. For interior wall penetrations, seal annular space between sleeve and pipe or pipe insulation using joint sealants appropriate for size, depth, and location of joint. Comply with requirements in Division 07 Section "Joint Sealants" for joint sealants.

G. For exterior wall penetrations above grade, seal annular space between sleeve and pipe using joint sealants appropriate for size, depth, and location of joint. Comply with requirements in Division 07 Section "Joint Sealants" for joint sealants.

H. For exterior wall penetrations below grade, seal annular space between sleeve and pipe using wall penetration systems specified in this Section.

I. Seal space outside of sleeves in concrete slabs and walls with grout.

J. Install sleeves that are large enough to provide 1/4-inch (6.4-mm) annular clear space between sleeve and pipe or pipe insulation unless otherwise indicated.

K. Install sleeve materials according to the following applications:
   1. Sleeves for Piping Passing through Concrete Floor Slabs: Steel pipe.
   2. Sleeves for Piping Passing through Concrete Floor Slabs of Mechanical Equipment Areas or Other Wet Areas: Steel pipe.
      a. Extend sleeves 2 inches (50 mm) above finished floor level.
      b. For pipes penetrating floors with membrane waterproofing, extend cast-iron sleeve fittings below floor slab as required to secure clamping ring if ring is specified. Secure flashing between clamping flanges. Install section of cast-iron soil pipe to extend sleeve to 2 inches

(50 mm) above finished floor level. Comply with requirements in Division 07 Section "Sheet Metal Flashing and Trim" for flashing.

3. Sleeves for Piping Passing through Gypsum-Board Partitions:
   a. Steel pipe sleeves for pipes smaller than NPS 6 (DN 150).
   b. Galvanized-steel sheet sleeves for pipes NPS 6 (DN 150) and larger.
   c. Exception: Sleeves are not required for water supply tubes and waste pipes for individual plumbing fixtures if escutcheons will cover openings.
4. Sleeves for Piping Passing through Concrete Roof Slabs: Steel pipe.
5. Sleeves for Piping Passing through Exterior Concrete Walls:
   a. Steel pipe sleeves for pipes smaller than NPS 6 (DN 150).
   b. Cast-iron wall pipe sleeves for pipes NPS 6 (DN 150) and larger.
   c. Install sleeves that are large enough to provide 1-inch (25-mm) annular clear space between sleeve and pipe or pipe insulation when sleeve seals are used.
   d. Do not use sleeves when wall penetration systems are used.
6. Sleeves for Piping Passing through Interior Concrete Walls:
   a. Steel pipe sleeves for pipes smaller than NPS 6 (DN 150).
   b. Galvanized-steel sheet sleeves for pipes NPS 6 (DN 150) and larger.

L. Fire-Barrier Penetrations: Maintain indicated fire rating of walls, partitions, ceilings, and floors at pipe penetrations. Seal pipe penetrations with firestop materials. Comply with requirements in Division 07 Section "Penetration Firestopping" for firestop materials and installations.

3.8 SLEEVE SEAL INSTALLATION

A. Install sleeve seals in sleeves in exterior concrete walls at water-service piping entries into building.

B. Select type and number of sealing elements required for pipe material and size. Position pipe in center of sleeve. Assemble sleeve seal components and install in annular space between pipe and sleeve. Tighten bolts against pressure plates that cause sealing elements to expand and make watertight seal.

3.9 WALL PENETRATION SYSTEM INSTALLATION

A. Install wall penetration systems in new, exterior concrete walls.

B. Assemble wall penetration system components with sleeve pipe. Install so that end of sleeve pipe and face of housing are flush with wall. Adjust locking devices to secure sleeve pipe in housing.

3.10 IDENTIFICATION

A. Identify system components. Comply with requirements in Division 22 Section "Identification for Plumbing Piping and Equipment" for identification materials and installation.

B. Label pressure piping with system operating pressure.

3.11 FIELD QUALITY CONTROL

A. Perform tests and inspections.

B. Piping Inspections:

1. Do not enclose, cover, or put piping into operation until it has been inspected and approved by authorities having jurisdiction.
2. During installation, notify authorities having jurisdiction at least one day before inspection must be made. Perform tests specified below in presence of authorities having jurisdiction:
   a. Roughing-in Inspection: Arrange for inspection of piping before concealing or closing-in after roughing-in and before setting fixtures.
   b. Final Inspection: Arrange final inspection for authorities having jurisdiction to observe tests specified below and to ensure compliance with requirements.
3. Reinspection: If authorities having jurisdiction find that piping will not pass tests or inspections, make required corrections and arrange for reinspection.
4. Reports: Prepare inspection reports and have them signed by authorities having jurisdiction.

C. Piping Tests:
1. Fill domestic water piping. Check components to determine that they are not air bound and that piping is full of water.
2. Test for leaks and defects in new piping and parts of existing piping that have been altered, extended, or repaired. If testing is performed in segments, submit a separate report for each test, complete with diagram of portion of piping tested.
3. Leave new, altered, extended, or replaced domestic water piping uncovered and unconcealed until it has been tested and approved. Expose work that was covered or concealed before it was tested.
4. Cap and subject piping to static water pressure of 50 psig (345 kPa) above operating pressure, without exceeding pressure rating of piping system materials. Isolate test source and allow to stand for four hours. Leaks and loss in test pressure constitute defects that must be repaired.
5. Repair leaks and defects with new materials and retest piping or portion thereof until satisfactory results are obtained.
6. Prepare reports for tests and for corrective action required.

D. Domestic water piping will be considered defective if it does not pass tests and inspections.

E. Prepare test and inspection reports.

3.12 ADJUSTING

A. Perform the following adjustments before operation:
1. Close drain valves, hydrants, and hose bibbs.
2. Open shutoff valves to fully open position.
3. Open throttling valves to proper setting.
4. Adjust balancing valves in hot-water-circulation return piping to provide adequate flow.
   a. Manually adjust ball-type balancing valves in hot-water-circulation return piping to provide flow of hot water in each branch.
   b. Adjust calibrated balancing valves to flows indicated.
5. Remove plugs used during testing of piping and for temporary sealing of piping during installation.
6. Remove and clean strainer screens. Close drain valves and replace drain plugs.
7. Remove filter cartridges from housings and verify that cartridges are as specified for application where used and are clean and ready for use.
8. Check plumbing specialties and verify proper settings, adjustments, and operation.

3.13 CLEANING

A. Clean and disinfect potable domestic water piping as follows:

1. Purge new piping before using.
2. Use purging and disinfecting procedures prescribed by authorities having jurisdiction; if methods are not prescribed, use procedures described in either AWWA C651 or AWWA C652 or follow procedures described below:
    a. Flush piping system with clean, potable water until dirty water does not appear at outlets.
    b. Fill and isolate system according to either of the following:
        1) Fill system or part thereof with water/chlorine solution with at least 50 ppm (50 mg/L) of chlorine. Isolate with valves and allow to stand for 24 hours.
        2) Fill system or part thereof with water/chlorine solution with at least 200 ppm (200 mg/L) of chlorine. Isolate and allow to stand for three hours.
    c. Flush system with clean, potable water until no chlorine is in water coming from system after the standing time.
    d. Submit water samples in sterile bottles to authorities having jurisdiction. Repeat procedures if biological examination shows contamination.

B. Clean non-potable domestic water piping as follows:
1. Purge new piping and parts of existing piping that have been altered, extended, or repaired before using.
2. Use purging procedures prescribed by authorities having jurisdiction or; if methods are not prescribed, follow procedures described below:
    a. Flush piping system with clean, potable water until dirty water does not appear at outlets.
    b. Submit water samples in sterile bottles to authorities having jurisdiction. Repeat procedures if biological examination shows contamination.

C. Prepare and submit reports of purging and disinfecting activities.

D. Clean interior of domestic water piping system. Remove dirt and debris as work progresses.

3.14 PIPING SCHEDULE

A. Transition and special fittings with pressure ratings at least equal to piping rating may be used in applications below unless otherwise indicated.

B. Flanges and unions may be used for aboveground piping joints unless otherwise indicated.

C. Fitting Option: Extruded-tee connections and brazed joints may be used on aboveground copper tubing.

D. Aboveground domestic water piping, NPS 2 (DN 50) and smaller, shall be the following:
1. Hard copper tube, ASTM B 88, Type L (ASTM B 88M, Type B); wrought- copper solder-joint fittings; and soldered joints.

E. Aboveground domestic water piping, NPS 2-1/2 to NPS 6 (DN 65 to DN 100), shall be the following:
1. Hard copper tube, ASTM B 88, Type L (ASTM B 88M, Type B); wrought- copper solder-joint fittings; and brazed joints.

3.15 VALVE SCHEDULE

A. Drawings indicate valve types to be used. Where specific valve types are not indicated, the following requirements apply:
1. Shutoff Duty: Use ball valves for piping NPS 2 (DN 50) and smaller. Use butterfly, ball, with flanged ends for piping NPS 2-1/2 (DN 65) and larger.

2. Hot-Water Circulation Piping, Balancing Duty: Memory-stop balancing valves.
3. Drain Duty: Hose-end drain valves.

B. Use check valves to maintain correct direction of domestic water flow to and from equipment.

END OF SECTION 221116

N:\N0912.00\DOC\SPEC\2012_03-16_BID\221116 - DOMESTIC WATER PIPING.DOC

SECTION 221119 - DOMESTIC WATER PIPING SPECIALTIES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. This Section includes the following domestic water piping specialties:
1. Vacuum breakers.
2. Backflow preventers.
3. Water pressure-reducing valves.
4. Balancing valves.
5. Temperature-actuated water mixing valves.
6. Strainers.
7. Outlet boxes.
8. Hose stations.
9. Hose bibbs.
10. Wall hydrants.
11. Ground hydrants.
12. Post hydrants.
13. Drain valves.
14. Water hammer arresters.
15. Air vents.
16. Trap-seal primer valves.
17. Trap-seal primer systems.

B. Related Sections include the following:
1. Division 22 Section "Meters and Gages for Plumbing Piping" for thermometers, pressure gages, and flow meters in domestic water piping.
2. Division 22 Section "Domestic Water Piping" for water meters.

1.3 PERFORMANCE REQUIREMENTS

A. Minimum Working Pressure for Domestic Water Piping Specialties: 125 psig (860 kPa), unless otherwise indicated.

1.4 SUBMITTALS

A. Product Data: For each type of product indicated.

B. Shop Drawings: Diagram power, signal, and control wiring.

C. Field quality-control test reports.

D. Operation and Maintenance Data: For domestic water piping specialties to include in emergency, operation, and maintenance manuals.

1.5 QUALITY ASSURANCE

A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.

B. NSF Compliance:
   1. Comply with NSF 14, "Plastics Piping Components and Related Materials," for plastic domestic water piping components.
   2. Comply with NSF 61, "Drinking Water System Components - Health Effects; Sections 1 through 9."

PART 2 - PRODUCTS

2.1 VACUUM BREAKERS

A. Pipe-Applied, Atmospheric-Type Vacuum Breakers:
   1. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
   2. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
      a. Ames Co.
      b. Cash Acme.
      c. Conbraco Industries, Inc.
      d. FEBCO; SPX Valves & Controls.
      e. Rain Bird Corporation.
      f. Toro Company (The); Irrigation Div.
      g. Watts Industries, Inc.; Water Products Div.
      h. Zurn Plumbing Products Group; Wilkins Div.
   3. Standard: ASSE 1001.
   4. Size: NPS 1/4 to NPS 3 (DN 8 to DN 80), as required to match connected piping.
   5. Body: Bronze.
   6. Inlet and Outlet Connections: Threaded.
   7. Finish: Chrome plated.

B. Pressure Vacuum Breakers:
   1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
      a. Ames Co.
      b. Conbraco Industries, Inc.
      c. FEBCO; SPX Valves & Controls.
      d. Flomatic Corporation.
      e. Toro Company (The); Irrigation Div.
      f. Watts Industries, Inc.; Water Products Div.
      g. Zurn Plumbing Products Group; Wilkins Div.
   2. Standard: ASSE 1020.
   3. Operation: Continuous-pressure applications.

4. Pressure Loss: 5 psig (35 kPa) maximum, through middle 1/3 of flow range.
5. Accessories:
   a. Valves: Ball type, on inlet and outlet.

C. Spill-Resistant Vacuum Breakers:
1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   a. Conbraco Industries, Inc.
   b. Watts Industries, Inc.; Water Products Div.
2. Standard: ASSE 1056.
3. Operation: Continuous-pressure applications.
4. Accessories:
   a. Valves: Ball type, on inlet and outlet.

2.2 BACKFLOW PREVENTERS

A. Reduced-Pressure-Principle Backflow Preventers:
1. Manufacturers: Subject to compliance with requirements and approval by the authority having jurisdiction, provide products by one of the following:
   a. Ames Co.
   b. Conbraco Industries, Inc.
   c. FEBCO; SPX Valves & Controls.
   d. Flomatic Corporation.
   e. Watts Industries, Inc.; Water Products Div.
   f. Zurn Plumbing Products Group; Wilkins Div.
2. Standard: ASSE 1013.
3. Operation: Continuous-pressure applications.
4. Pressure Loss: 12 psig (83 kPa) maximum, through middle 1/3 of flow range.
5. Body: Bronze for NPS 2 (DN 50) and smaller; for NPS 2-1/2 (DN 65) and larger.
6. End Connections: Threaded for NPS 2 (DN 50) and smaller;
7. Configuration: Designed for horizontal, straight through flow.
8. Accessories:
   a. Valves: Ball type with threaded or flanged ends on inlet and outlet of NPS 4 (DN 50) and smaller.
   b. Air-Gap Fitting: ASME A112.1.2, matching backflow-preventer connection.

B. Hose-Connection Backflow Preventers:
1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   a. Conbraco Industries, Inc.
   b. Watts Industries, Inc.; Water Products Div.
   c. Woodford Manufacturing Company.
2. Standard: ASSE 1052.
3. Operation: Up to 10-foot head of water (30-kPa) back pressure.
4. Inlet Size: NPS 1/2 or NPS 3/4 (DN 15 or DN 20).
5. Outlet Size: Garden-hose thread complying with ASME B1.20.7.
6. Capacity: At least 3-gpm (0.19-L/s) flow.

C. Backflow-Preventer Test Kits:
1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   a. Conbraco Industries, Inc.
   b. FEBCO; SPX Valves & Controls.

c. Flomatic Corporation.
d. Watts Industries, Inc.; Water Products Div.
e. Zurn Plumbing Products Group; Wilkins Div.

2. Description: Factory calibrated, with gages, fittings, hoses, and carrying case with test-procedure instructions.

2.3 BALANCING VALVES

A. Copper-Alloy Calibrated Balancing Valves:
1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
a. Armstrong International, Inc.
b. Flo Fab Inc.
c. ITT Industries; Bell & Gossett Div.
d. NIBCO INC.
e. TAC Americas.
f. Taco, Inc.
g. Watts Industries, Inc.; Water Products Div.
2. Type: Ball or Y-pattern globe valve with two readout ports and memory setting indicator.
3. Body: bronze,
4. Size: Same as connected piping, but not larger than NPS 2 (DN 50).
5. Accessories: Meter hoses, fittings, valves, differential pressure meter, and carrying case.

2.4 STRAINERS FOR DOMESTIC WATER PIPING

A. Y-Pattern Strainers:
1. Pressure Rating: 125 psig (860 kPa) minimum, unless otherwise indicated.
2. Body: Bronze for NPS 2 (DN 50) and smaller; cast iron with interior lining complying with AWWA C550 or FDA-approved, epoxy coating for NPS 2-1/2 (DN 65) and larger.
3. End Connections: Threaded for NPS 2 (DN 50) and smaller;flanged for NPS 2-1/2 (DN 65) and larger.
4. Screen: Stainless steel with round perforations, unless otherwise indicated.
5. Perforation Size:
a. StrainersNPS 2 (DN 50) and Smaller: 0.020 inch (0.51 mm).
b. Strainers NPS 2-1/2 to NPS 4 (DN 65 to DN 100): 0.045 inch (1.14 mm).
6. Drain: Factory-installed, hose-end drain valve.

2.5 HOSE BIBBS

A. Hose Bibbs (HB-1, HB-2):
1. Standard: ASME A112.18.1 for sediment faucets.
2. Body Material: Bronze.
3. Seat: Bronze, replaceable.
4. Supply Connections: NPS 1/2 or NPS 3/4 (DN 15 or DN 20) threaded or solder-joint inlet.
5. Outlet Connection: Garden-hose thread complying with ASME B1.20.7.
6. Pressure Rating: 125 psig (860 kPa).
7. Vacuum Breaker: Integral or field-installation, nonremovable, drainable, hose-connection vacuum breaker complying with ASSE 1052.
8. Finish for Equipment Rooms: Rough bronze, or chrome or nickel plated.
9. Finish for Service Areas: Chrome or nickel plated.

10. Finish for Finished Rooms: Chrome or nickel plated.
11. Operation for Equipment Rooms: Wheel handle or operating key.
12. Operation for Service Areas: Operating key.
13. Operation for Finished Rooms: Operating key.
14. Include operating key with each operating-key hose bibb.
15. Include wall flange with each chrome- or nickel-plated hose bibb.

2.6 WALL HYDRANTS

A. Wall Hydrants (WH-1):
1. Equal to Jay R. Smith No.5519-WC dual check valve wall hydrant.
2. Standard: ASSE 1052, Type A or Type B.
3. Type: Freeze-resistant, automatic draining.
4. Classification: Type A, for automatic draining with hose removed o.
5. Pressure Rating: 125 psig (860 kPa).
6. Operation: Loose key .
7. Casing and Operating Rod: Of length required to match wall thickness. Include wall clamp.
8. Inlet: NPS 3/4 (DN 20).
9. Outlet: Exposed with garden-hose thread complying with ASME B1.20.7.

2.7 POST HYDRANTS

A. Nonfreeze, Draining-Type Post Hydrants (PH-1):
1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   a. MIFAB, Inc.
   b. Prier Products, Inc.
   c. Simmons Manufacturing Co.
   d. Smith, Jay R. Mfg. Co.; Division of Smith Industries, Inc.
   e. Tyler Pipe; Wade Div.
   f. Watts Drainage Products Inc.
   g. Woodford Manufacturing Company.
   h. Zurn Plumbing Products Group; Light Commercial Operation.
   i. Zurn Plumbing Products Group; Specification Drainage Operation.
2. Standard: ASME A112.21.3M.
3. Type: Nonfreeze, exposed-outlet post hydrant.
4. Operation: Loose key.
5. Casing and Operating Rod: Of at least length required for burial of valve below frost line.
6. Casing: Bronze with casing guard.
7. Inlet: NPS 3/4 (DN 20).
8. Outlet: Garden-hose thread complying with ASME B1.20.7.
9. Drain: Designed with hole to drain into ground when shut off.
10. Vacuum Breaker: Nonremovable, drainable, hose-connection backflow preventer complying with ASSE 1052; and garden-hose thread complying with ASME B1.20.7 on outlet.
11. Operating Key(s): Two with each loose-key-operation wall hydrant.

2.8 DRAIN VALVES

A. Ball-Valve-Type, Hose-End Drain Valves:
1. Standard: MSS SP-110 for standard-port, two-piece ball valves.

2. Pressure Rating: 400-psig (2760-kPa) minimum CWP.
3. Size: NPS 3/4 (DN 20).
4. Body: Copper alloy.
5. Ball: Chrome-plated brass.
6. Seats and Seals: Replaceable.
7. Handle: Vinyl-covered steel.
8. Inlet: Threaded or solder joint.
9. Outlet: Threaded, short nipple with garden-hose thread complying with ASME B1.20.7 and cap with brass chain.

2.9 WATER HAMMER ARRESTERS

A. Water Hammer Arresters (WHA):
1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   a. AMTROL, Inc.
   b. Josam Company.
   c. MIFAB, Inc.
   d. PPP Inc.
   e. Sioux Chief Manufacturing Company, Inc.
   f. Smith, Jay R. Mfg. Co.; Division of Smith Industries, Inc.
   g. Tyler Pipe; Wade Div.
   h. Watts Drainage Products Inc.
   i. Zurn Plumbing Products Group; Specification Drainage Operation.
2. Standard: ASSE 1010 or PDI-WH 201.
3. Type: Metal bellows.
4. Size: ASSE 1010, Sizes AA and A through F or PDI-WH 201, Sizes A through F.

2.10 TRAP-SEAL PRIMER VALVES

A. Supply-Type, Trap-Seal Primer Valves (TP):
1. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
   a. MIFAB, Inc.
   b. PPP Inc.
   c. Sioux Chief Manufacturing Company, Inc.
   d. Smith, Jay R. Mfg. Co.; Division of Smith Industries, Inc.
   e. Watts Industries, Inc.; Water Products Div.
2. Standard: ASSE 1018.
3. Pressure Rating: 125 psig (860 kPa) minimum.
4. Body: Bronze.
5. Inlet and Outlet Connections: NPS 1/2 (DN 15) threaded, union, or solder joint.
6. Gravity Drain Outlet Connection: NPS 1/2 (DN 15) threaded or solder joint.
7. Finish: Chrome plated, or rough bronze for units used with pipe or tube that is not chrome finished.
8. Equal to PPP Model P2-500 floor drain trap primer with DU-U distribution unit.

B. Automatic Type, Trap Seal Primer Assembly, Mechanical Rooms (TPA)
1. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
   a. PPP Inc.

b. Approved equal.
2. Standard: ASSE 1044.
3. Pressure Rating: 125 psig (860 kPa) minimum.
4. Inlet and Outlet Connections: NPS 1/2 (DN 15) threaded, union, or solder joint.
5. Gravity Drain Outlet Connection: NPS 1/2 (DN 15) threaded or solder joint.
6. Equal to PPP Model MP-500-115V electronic trap primer.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Refer to Division 22 Section "Common Work Results for Plumbing" for piping joining materials, joint construction, and basic installation requirements.

B. Install backflow preventers in each water supply to mechanical equipment and systems and to other equipment and water systems that may be sources of contamination. Comply with authorities having jurisdiction.
1. Locate backflow preventers in same room as connected equipment or system.
2. Install drain for backflow preventers with atmospheric-vent drain connection with air-gap fitting, fixed air-gap fitting, or equivalent positive pipe separation of at least two pipe diameters in drain piping and pipe to floor drain. Locate air-gap device attached to or under backflow preventer. Simple air breaks are not acceptable for this application.
3. Do not install bypass piping around backflow preventers.

C. Install balancing valves in locations where they can easily be adjusted.

D. Install trap primers in accordance with manufacturer’s written instructions.

E. Install water hammer arresters in water piping according to PDI-WH 201.

F. Install supply-type, trap-seal primer valves with outlet piping pitched down toward drain trap a minimum of 1 percent, and connect to floor-drain body, trap, or inlet fitting. Adjust valve for proper flow.

3.2 CONNECTIONS

A. Piping installation requirements are specified in other Division 22 Sections. Drawings indicate general arrangement of piping and specialties.

B. Ground equipment according to Division 26 Section "Grounding and Bonding for Electrical Systems."

C. Connect wiring according to Division 26 Section "Low-Voltage Electrical Power Conductors and Cables."

3.3 LABELING AND IDENTIFYING

A. Equipment Nameplates and Signs: Install engraved plastic-laminate equipment nameplate or sign on or near each of the following:
1. Pressure vacuum breakers.
2. Intermediate atmospheric-vent backflow preventers.

3. Reduced-pressure-principle backflow preventers.
4. Calibrated balancing valves.
5. Hose stations.
6. Supply-type, trap-seal primer valves.

B. Distinguish among multiple units, inform operator of operational requirements, indicate safety and emergency precautions, and warn of hazards and improper operations, in addition to identifying unit. Nameplates and signs are specified in Division 22 Section "Identification for Plumbing Piping and Equipment."

3.4 FIELD QUALITY CONTROL

A. Perform the following tests and prepare test reports:
1. Test each pressure vacuum breaker, reduced-pressure-principle backflow preventer, and double-check backflow-prevention assembly, according to authorities having jurisdiction and the device's reference standard.

B. Remove and replace malfunctioning domestic water piping specialties and retest as specified above.

3.5 ADJUSTING

A. Set field-adjustable pressure set points of water pressure-reducing valves.

B. Set field-adjustable flow set points of balancing valves.

END OF SECTION 221119

N:\N0912.00\DOC\SPEC\2012_03-16_BID\221119 - DOMESTIC WATER PIPING SPECIALTIES.DOC

SECTION 221120 - DOMESTIC-WATER PACKAGED BOOSTER PUMPS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. This Section includes constant-speed, duplex, packaged booster pumps for domestic water piping systems.

1.3 SUBMITTALS

A. Product Data: For each packaged booster pump specified. Include certified performance curves with operating points plotted on curves; and rated capacities of selected models, furnished specialties, and accessories.

B. Shop Drawings: For packaged booster pumps and accessories. Include plans, elevations, sections, details, and attachments to other work.
   1. For installed products indicated to comply with design loads, include structural analysis data signed and sealed by the qualified professional engineer responsible for their preparation.
   2. Vibration Isolation Base Details: Detail fabrication including anchorages and attachments to structure and to supported equipment. Include auxiliary motor slides and rails and equipment mounting frames.
   3. Wiring Diagrams: Detail power, signal, and control wiring.

C. Operation and Maintenance Data: For each packaged booster pump to include in emergency, operation, and maintenance manuals.

1.4 QUALITY ASSURANCE

A. Product Options: Drawings indicate size, profiles, and dimensional requirements of packaged booster pumps and are based on the specific system indicated. Refer to Division 01 Section "Product Requirements."

B. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.

C. ASME Compliance: Comply with ASME B31.9 for piping.

D. Packaged booster pumps shall be listed and labeled as pumping systems by testing agency acceptable to authorities having jurisdiction.

1.5 DELIVERY, STORAGE, AND HANDLING

A. Retain shipping flange protective covers and protective coatings during storage.

B. Protect bearings and couplings against damage.

C. Comply with pump manufacturer's written rigging instructions for handling.

1.6 COORDINATION

A. Coordinate size and location of concrete bases. Cast anchor-bolt inserts into bases. Concrete, reinforcement, and formwork requirements are specified in Division 03.

PART 2 - PRODUCTS

2.1 MANUFACTURER

A. Bell & Gossett and no others.

2.2 CONSTANT-SPEED, DUPLEX BOOSTER PUMPS

A. Description: Factory-assembled and -tested, packaged booster pump with multiple pumps, piping, valves, sensors, and controls on skids or base.

B. System Working-Pressure Rating: 175 psig (1200 kPa) minimum.

C. Pump Arrangement: Duplex, with two equal-size pumps.

D. Pumps: Overhung impeller, close coupled, single stage, end suction, centrifugal. Comply with UL 778 and HI 1.1-1.2 and HI 1.3.
   1. Each Pump:
      a. Orientation: Mounted horizontally or vertically.
      b. Construction: Bronze fitted.
         1) Casing: Radially split, cast iron.
         2) Impeller: ASTM B 584, cast bronze; statically and dynamically balanced, closed, and keyed to shaft.
         3) Shaft and Shaft Sleeve: Steel shaft, with copper-alloy shaft sleeve.
         4) Seal: Mechanical.

E. Motors: Single speed, with oil-lubricated bearings, unless otherwise indicated. Select motor that will not overload through full range of pump performance curve. Comply with Division 22 Section "Common Motor Requirements for Plumbing Equipment."

F. Control Valves: Adjustable, automatic, pilot-operated pressure regulator on each pump discharge.

G. Relief Valves: Adjustable, pressure relief type on pump discharge.

H. Piping: ASME B31.9 for piping materials and installation.

1. NPS 4 (DN 100) and Smaller: ASTM B 88, Type L (ASTM B 88M, Type B), drawn copper water tube; with copper solder-joint pressure fittings, and brazed joints.
2. Header End Connections:
   a. NPS 2 (DN 50) and Smaller: Threaded.
   b. NPS 2-1/2 (DN 65) and Larger: Flanged.
3. Piping Option: Piping, including valves and other components, may have grooved ends for grooved joints.

I. Valves: Include shutoff valve at each pump suction, and shutoff valve and check valve at each pump discharge.
1. Shutoff Valves, NPS 2 (DN 50) and Smaller: MSS SP-80, Class 125, bronze rising-stem gate valve or MSS SP-110, 600-psig (4135-kPa) minimum CWP, bronze ball valve with ends matching piping.
2. Shutoff Valves, NPS 2-1/2 (DN 65) and Larger: MSS SP-70, Class 125, bronze-trim, OS&Y, cast-iron gate valve with flanged ends or MSS SP-67, Type I for tight shutoff, 175-psig (1200-kPa) CWP, single-flanged, cast-iron butterfly valve.
3. Check Valves, NPS 2 (DN 50) and Smaller: Spring- or lever-loaded, MSS SP-80, Class 125, bronze, swing check valve.
4. Check Valves, NPS 2-1/2 (DN 65) and Larger: Spring- or lever-loaded, MSS SP-71, Class 125, bronze-trim, cast-iron, swing check valve.

J. Sensors: Pressure and flow switches.

K. Dielectric Fittings: With insulating material isolating joined dissimilar metals to prevent galvanic action and to stop corrosion.
1. NPS 2 (DN 50) and Smaller: Factory-fabricated union assembly, for 250-psig (1725-kPa) minimum working pressure at 180 deg F (82 deg C).
2. NPS 2-1/2 (DN 65) and Larger: Factory-fabricated, companion-flange assembly; for 150- or 300-psig (1035- or 2070-kPa) minimum working pressure as required to suit system pressures.

L. Control Panel: Factory installed and connected as an integral part of unit complying with NEMA ICS 2 and UL 508; automatic for multiple-pump, constant-speed operation, with load control and protection functions.
1. Enclosure: NEMA 1.
2. Motor Controller: Full-voltage, combination-magnetic type with undervoltage release feature, motor-circuit-protector-type disconnect, and short-circuit protective device.
3. Motor Overload Protection: Overload relay in each phase.
4. Starting Devices: Hand-off-automatic selector switch in cover of control panel, plus pilot device for automatic control.
   a. Duplex, Automatic, Alternating Starter: Switches lead pump to lag main pump and to two-pump operation.
5. Instrumentation: Unit suction and discharge pressure gages.
6. Lights: Running light for each pump.
7. Alarm Signal Device: Sounds alarm when backup pumps are operating.
8. High-suction pressure cutout.
9. High-discharge pressure cutout.
10. Remote signal contacts.

M. Manufacturer's Preparation for Shipping: Clean flanges and exposed machined metal surfaces and treat with anticorrosion compound after assembling and testing. Protect flanges, pipe openings, and pump nozzles.

N. Capacity and Characteristics:
1. System Capacity: 150 gpm (L/s).

2. Inlet Pressure: 50 psig (kPa) min.
3. Discharge Pressure: 80 psig (kPa) max.
4. Inlet and Outlet Header Size: 3 inch.
5. Lead Pump:
   a. Capacity: 150 gpm (L/s).
   b. Total Dynamic Head: 65 feet (kPa).
   c. Speed: 1750 rpm.
   d. Control Valve: Manufacturer standard.
   e. Motor Horsepower: 3.
   f. Electrical Characteristics:
      1) Volts: 480.
      2) Phases: Three.
      3) Hertz: 60.
6. Lag Pump:
   a. Capacity: 150 gpm (L/s).
   b. Total Dynamic Head: 65 feet (kPa).
   c. Speed: 1750 rpm.
   d. Control Valve: Manufacturer standard.
   e. Motor Horsepower: 3.
   f. Electrical Characteristics:
      1) Volts: 480.
      2) Phases: Three.
      3) Hertz: 60.

2.3 FLEXIBLE CONNECTORS

A. Manufacturers:
1. Anamet, Inc.
2. Flex-Hose Co., Inc.
3. Flexicraft Industries.
4. Flex-Pression, Ltd.
5. Flex-Weld, Inc.
6. Hyspan Precision Products, Inc.
7. Mercer Rubber.
8. Metraflex, Inc.
9. Proco Products, Inc.
10. Tozen America Corporation.
11. Unaflex Inc.

B. Description: Corrugated, bronze inner tubing covered with bronze wire braid. Include copper-tube ends or bronze flanged ends, braze-welded to tubing. Include 175-psig (1200-kPa) minimum working-pressure rating and ends according to the following:
1. NPS 2 (DN 50) and Smaller: Threaded. Provide flanged ends if pump has flanged connections.
2. NPS 2-1/2 (DN 65) and Larger: Flanged.

2.4 BUILDING-AUTOMATION-SYSTEM INTERFACE

A. Provide auxiliary contacts in pump controllers for interface to building automation system. Include the following:
1. On-off status of each pump.
2. Alarm status.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine roughing-in for packaged booster pumps to verify actual locations of connections before booster pump installation.

3.2 CONCRETE BASES

A. Install concrete bases of dimensions indicated for packaged booster pumps. Refer to Division 22 Section "Common Work Results for Plumbing."
   1. Install dowel rods to connect concrete base to concrete floor. Unless otherwise indicated, install dowel rods on 18-inch (450-mm) centers around full perimeter of base.
   2. For supported equipment, install epoxy-coated anchor bolts that extend through concrete base and anchor into structural concrete floor.
   3. Place and secure anchorage devices. Use setting drawings, templates, diagrams, instructions, and directions furnished with items to be imbedded.
   4. Install anchor bolts to elevation required for proper attachment to supported equipment.

B. Cast-in-place concrete materials and placement requirements are specified in Division 03.

3.3 BOOSTER PUMP INSTALLATION

A. Install packaged booster pumps level on concrete bases with access for periodic maintenance including removal of pumps, motors, impellers, couplings, and accessories.
   1. Do not dismantle packaged booster pumps or remove individual components.

B. Vibration Isolation: Vibration isolation devices are specified in Division 22 Section "Vibration and Seismic Controls for Plumbing Piping and Equipment."

C. Support connected domestic water piping so weight of piping is not supported by packaged booster pumps.

3.4 CONNECTIONS

A. Piping installation requirements are specified in other Division 22 Sections. Drawings indicate general arrangement of piping, fittings, and specialties.

B. Connect domestic water piping to packaged booster pumps. Install suction and discharge pipe equal to or greater than size of unit suction and discharge headers.
   1. Install flexible connectors on piping connections to unit suction and discharge headers. Install flexible connectors same size as piping.
   2. Install shutoff valves on piping connections to each booster pump suction and discharge headers. Install ball, butterfly, or gate valves same size as suction and discharge headers. General-duty valves are specified in Division 22 Section "General-Duty Valves for Plumbing Piping."
   3. Install union or flanged connections on pump suction and discharge **headers** at connection to domestic water piping.
   4. Install piping adjacent to packaged booster pumps to allow service and maintenance.

C. Ground equipment according to Division 26 Section "Grounding and Bonding for Electrical Systems."

D. Connect wiring according to Division 26 Section "Low-Voltage Electrical Power Conductors and Cables."

3.5 STARTUP SERVICE

A. Engage a factory-authorized service representative to perform the following startup service:
   1. Complete installation and startup checks according to manufacturer's written instructions.
   2. Check piping connections for tightness.
   3. Clean strainers if any.
   4. Verify that pump controls are correct for required application.

B. Perform the following startup checks for each pump of packaged booster pump unit before starting:
   1. Verify bearing lubrication.
   2. Prime pumps by opening suction valves and closing discharge valves, and prepare pumps for operation.
   3. Start motors.
   4. Open discharge valves slowly.
   5. Adjust settings.

C. Occupancy Adjustments: When requested within 12 months of date of Substantial Completion, provide on-site assistance in adjusting packaged booster pumps to suit actual occupied conditions. Provide up to two visits to Project outside normal occupancy hours for this purpose.

3.6 LABELING AND IDENTIFICATION

A. Install identifying equipment markers and equipment signs on booster pumps. Labeling and identification materials are specified in Division 22 Section "Identification for Plumbing Piping and Equipment."

3.7 DEMONSTRATION

A. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain packaged booster pumps. Refer to Division 01 Section "Demonstration and Training"

END OF SECTION 221120

N:\N0912.00\DOC\SPEC\2012_03-16_BID\221120 - DOMESTIC WATER PACKAGED BOOSTER PUMPS.DOC

SECTION 221123 - FACILITY NATURAL-GAS PIPING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:
   1. Pipes, tubes, and fittings.
   2. Piping specialties.
   3. Piping and tubing joining materials.
   4. Valves.
   5. Pressure regulators.
   6. Mechanical sleeve seals.
   7. Grout.
   8. Concrete bases.

1.3 DEFINITIONS

A. Finished Spaces: Spaces other than mechanical and electrical equipment rooms, furred spaces, pipe and duct shafts, unheated spaces immediately below roof, spaces above ceilings, unexcavated spaces, crawlspaces, and tunnels.

B. Exposed, Interior Installations: Exposed to view indoors. Examples include finished occupied spaces and mechanical equipment rooms.

C. Exposed, Exterior Installations: Exposed to view outdoors or subject to outdoor ambient temperatures and weather conditions. Examples include rooftop locations.

1.4 PERFORMANCE REQUIREMENTS

A. Minimum Operating-Pressure Ratings:
   1. Piping and Valves: 100 psig minimum unless otherwise indicated.
   2. Service Regulators: 100 **psig** minimum unless otherwise indicated.

B. Natural-Gas System Pressure within Buildings: 0.5 psig or less .

1.5 SUBMITTALS

A. Product Data: For each type of the following:
   1. Piping specialties.

2. Valves. Include pressure rating, capacity, settings, and electrical connection data of selected models.
3. Pressure regulators. Indicate pressure ratings and capacities.
4. Dielectric fittings.
5. Mechanical sleeve seals.
6. Escutcheons.

B. Shop Drawings: For facility natural-gas piping layout. Include plans, piping layout and elevations, sections, and details for fabrication of pipe anchors, hangers, supports for multiple pipes, alignment guides, expansion joints and loops, and attachments of the same to building structure. Detail location of anchors, alignment guides, and expansion joints and loops.
1. Shop Drawing Scale: 1/4 inch per foot.
2. Detail mounting, supports, and valve arrangements for **service meter assembly and** pressure regulator assembly.

C. Delegated-Design Submittal: For natural-gas piping and equipment indicated to comply with performance requirements and design criteria, including analysis data signed and sealed by the qualified professional engineer responsible for their preparation.
1. Detail fabrication and assembly of seismic restraints.
2. Design Calculations: Calculate requirements for selecting seismic restraints.

D. Coordination Drawings: Plans and details, drawn to scale, on which natural-gas piping is shown and coordinated with other installations, using input from installers of the items involved.

E. Site Survey: Plans, drawn to scale, on which natural-gas piping is shown and coordinated with other services and utilities.

F. Qualification Data: For qualified professional engineer.

G. Welding certificates.

H. Field quality-control reports.

I. Operation and Maintenance Data: For pressure regulators to include in emergency, operation, and maintenance manuals.

1.6 QUALITY ASSURANCE

A. Steel Support Welding Qualifications: Qualify procedures and personnel according to AWS D1.1/D1.1M, "Structural Welding Code - Steel."

B. Pipe Welding Qualifications: Qualify procedures and operators according to ASME Boiler and Pressure Vessel Code.

C. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

1.7 DELIVERY, STORAGE, AND HANDLING

A. Deliver pipes and tubes with factory-applied end caps. Maintain end caps through shipping, storage, and handling to prevent pipe end damage and to prevent entrance of dirt, debris, and moisture.

B. Store and handle pipes and tubes having factory-applied protective coatings to avoid damaging coating, and protect from direct sunlight.

1.8 PROJECT CONDITIONS

A. Perform site survey, research public utility records, and verify existing utility locations. Contact utility-locating service for area where Project is located.

1.9 COORDINATION

A. Coordinate sizes and locations of concrete bases with actual equipment provided.

B. Coordinate requirements for access panels and doors for valves installed concealed behind finished surfaces. Comply with requirements in Division 08 Section "Access Doors and Frames."

PART 2 - PRODUCTS

2.1 PIPES, TUBES, AND FITTINGS

A. Steel Pipe: ASTM A 53/A 53M, black steel, Schedule 40, Type E or S, Grade B.
   1. Malleable-Iron Threaded Fittings: ASME B16.3, Class 150, standard pattern.
   2. Wrought-Steel Welding Fittings: ASTM A 234/A 234M for butt welding and socket welding.
   3. Unions: ASME B16.39, Class 150, malleable iron with brass-to-iron seat, ground joint, and threaded ends.
   4. Forged-Steel Flanges and Flanged Fittings: ASME B16.5, minimum Class 150, including bolts, nuts, and gaskets of the following material group, end connections, and facings:
      a. Material Group: 1.1.
      b. End Connections: Threaded or butt welding to match pipe.
      c. Lapped Face: Not permitted underground.
      d. Gasket Materials: ASME B16.20, metallic, flat, asbestos free, aluminum o-rings, and spiral-wound metal gaskets.
      e. Bolts and Nuts: ASME B18.2.1, carbon steel aboveground and stainless steel underground.
   5. Protective Coating for Underground Piping: Factory-applied, three-layer coating of epoxy, adhesive, and PE.
      a. Joint Cover Kits: Epoxy paint, adhesive, and heat-shrink PE sleeves.
   6. Mechanical Couplings:
      a. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
         1) Dresser Piping Specialties; Division of Dresser, Inc.
         2) Smith-Blair, Inc.
      b. Steel flanges and tube with epoxy finish.
      c. Buna-nitrile seals.
      d. Steel bolts, washers, and nuts.
      e. Coupling shall be capable of joining PE pipe to PE pipe, steel pipe to PE pipe, or steel pipe to steel pipe.
      f. Steel body couplings installed underground on plastic pipe shall be factory equipped with anode.

2.2 JOINING MATERIALS

A. Joint Compound and Tape: Suitable for natural gas.

B. Welding Filler Metals: Comply with AWS D10.12/D10.12M for welding materials appropriate for wall thickness and chemical analysis of steel pipe being welded.

2.3 MANUAL GAS SHUTOFF VALVES

A. General Requirements for Metallic Valves, NPS 2 and Smaller: Comply with ASME B16.33.
   1. CWP Rating: 125 psig.
   2. Threaded Ends: Comply with ASME B1.20.1.
   3. Dryseal Threads on Flare Ends: Comply with ASME B1.20.3.
   4. Tamperproof Feature: Locking feature for valves indicated in "Underground Manual Gas Shutoff Valve Schedule" and "Aboveground Manual Gas Shutoff Valve Schedule" Articles.
   5. Listing: Listed and labeled by an NRTL acceptable to authorities having jurisdiction for valves 1 inch and smaller.
   6. Service Mark: Valves 1-1/4 inches to NPS 2 shall have initials "WOG" permanently marked on valve body.

B. General Requirements for Metallic Valves, NPS 2-1/2 and Larger: Comply with ASME B16.38.
   1. CWP Rating: 125 psig.
   2. Flanged Ends: Comply with ASME B16.5 for steel flanges.
   3. Tamperproof Feature: Locking feature for valves indicated in "Underground Manual Gas Shutoff Valve Schedule" and "Aboveground Manual Gas Shutoff Valve Schedule" Articles.
   4. Service Mark: Initials "WOG" shall be permanently marked on valve body.

C. One-Piece, Bronze Ball Valve with Bronze Trim: MSS SP-110.
   1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
      a. BrassCraft Manufacturing Company; a Masco company.
      b. Conbraco Industries, Inc.; Apollo Div.
      c. Lyall, R. W. & Company, Inc.
      d. McDonald, A. Y. Mfg. Co.
      e. Perfection Corporation; a subsidiary of American Meter Company.
   2. Body: Bronze, complying with ASTM B 584.
   3. Ball: Chrome-plated brass.
   4. Stem: Bronze; blowout proof.
   5. Seats: Reinforced TFE; blowout proof.
   6. Packing: Separate packnut with adjustable-stem packing threaded ends.
   7. Ends: Threaded, flared, or socket as indicated in "Underground Manual Gas Shutoff Valve Schedule" and "Aboveground Manual Gas Shutoff Valve Schedule" Articles.
   8. CWP Rating: 600 psig.
   9. Listing: Valves NPS 1 and smaller shall be listed and labeled by an NRTL acceptable to authorities having jurisdiction.
   10. Service: Suitable for natural-gas service with "WOG" indicated on valve body.

D. Bronze Plug Valves: MSS SP-78.
   1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
      a. Lee Brass Company.
      b. McDonald, A. Y. Mfg. Co.

2. Body: Bronze, complying with ASTM B 584.
3. Plug: Bronze.
4. Ends: Threaded, socket, or flanged as indicated in "Underground Manual Gas Shutoff Valve Schedule" and "Aboveground Manual Gas Shutoff Valve Schedule" Articles.
5. Operator: Square head or lug type with tamperproof feature where indicated.
6. Pressure Class: 125 psig.
7. Listing: Valves NPS 1 and smaller shall be listed and labeled by an NRTL acceptable to authorities having jurisdiction.
8. Service: Suitable for natural-gas service with "WOG" indicated on valve body.

E. Cast-Iron, Lubricated Plug Valves: MSS SP-78.
1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   a. Flowserve.
   b. Homestead Valve; a division of Olson Technologies, Inc.
   c. McDonald, A. Y. Mfg. Co.
   d. Milliken Valve Company.
   e. Mueller Co.; Gas Products Div.
   f. R&M Energy Systems, A Unit of Robbins & Myers, Inc.
2. Body: Cast iron, complying with ASTM A 126, Class B.
3. Plug: Bronze or nickel-plated cast iron.
4. Seat: Coated with thermoplastic.
5. Stem Seal: Compatible with natural gas.
6. Ends: Threaded or flanged as indicated in "Underground Manual Gas Shutoff Valve Schedule" and "Aboveground Manual Gas Shutoff Valve Schedule" Articles.
7. Operator: Square head or lug type with tamperproof feature where indicated.
8. Pressure Class: 125 psig.
9. Listing: Valves NPS 1 and smaller shall be listed and labeled by an NRTL acceptable to authorities having jurisdiction.
10. Service: Suitable for natural-gas service with "WOG" indicated on valve body.

2.4 SLEEVES

A. Steel Pipe Sleeves: ASTM A 53/A 53M, Type E, Grade B, Schedule 40, galvanized steel, plain ends.

B. Cast-Iron Pipe Sleeves: Cast or fabricated "wall pipe," equivalent to ductile-iron pressure pipe, with plain ends and integral waterstop, unless otherwise indicated.

2.5 MECHANICAL SLEEVE SEALS

A. Description: Modular sealing element unit, designed for field assembly, to fill annular space between pipe and sleeve.
1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   a. Advance Products & Systems, Inc.
   b. Calpico Inc.
   c. Metraflex Company (The).
   d. Pipeline Seal and Insulator, Inc.
2. Sealing Elements: EPDM interlocking links shaped to fit surface of pipe. Include type and number required for pipe material and size of pipe and sleeve.
3. Pressure Plates: Carbon steel.

4. Connecting Bolts and Nuts: Stainless steel of length required to secure pressure plates to sealing elements. Include one nut and bolt for each sealing element.

2.6 GROUT

A. Description: ASTM C 1107, Grade B, nonshrink and nonmetallic, dry hydraulic-cement grout.
   1. Characteristics: Post-hardening, volume adjusting, nonstaining, noncorrosive, nongaseous, and recommended for interior and exterior applications.
   2. Design Mix: 5000-psi, 28-day compressive strength.
   3. Packaging: Premixed and factory packaged.

2.7 LABELING AND IDENTIFYING

A. Detectable Warning Tape: Acid- and alkali-resistant, PE film warning tape manufactured for marking and identifying underground utilities, a minimum of 6 inches wide and 4 mils thick, continuously inscribed with a description of utility, with metallic core encased in a protective jacket for corrosion protection, detectable by metal detector when tape is buried up to 30 inches deep; colored yellow.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine roughing-in for natural-gas piping system to verify actual locations of piping connections before equipment installation.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 PREPARATION

A. Close equipment shutoff valves before turning off natural gas to premises or piping section.

B. Inspect natural-gas piping according to **NFPA 54 and the International Fuel Gas Code** to determine that natural-gas utilization devices are turned off in piping section affected.

C. Comply with **NFPA 54 and the International Fuel Gas Code** requirements for prevention of accidental ignition.

3.3 OUTDOOR PIPING INSTALLATION

A. Comply with **NFPA 54 the International Fuel Gas Code** for installation and purging of natural-gas piping.

B. Install underground, natural-gas piping buried at least 36 inches below finished grade. Comply with requirements in Division 31 Section "Earth Moving" for excavating, trenching, and backfilling.
   1. If natural-gas piping is installed less than 36 inches below finished grade, install it in containment conduit.

C. Steel Piping with Protective Coating:
   1. Apply joint cover kits to pipe after joining to cover, seal, and protect joints.
   2. Repair damage to PE coating on pipe as recommended in writing by protective coating manufacturer.

D. Install fittings for changes in direction and branch connections.

E. Aboveground, Exterior-Wall Pipe Penetrations: Seal penetrations using sleeves and mechanical sleeve seals. Select sleeve size to allow for 1-inch annular clear space between pipe and sleeve for installing mechanical sleeve seals.
   1. Install steel pipe for sleeves smaller than 6 inches in diameter.
   2. Install cast-iron "wall pipes" for sleeves 6 inches and larger in diameter.

F. Underground, Exterior-Wall Pipe Penetrations: Install cast-iron "wall pipes" for sleeves. Seal pipe penetrations using mechanical sleeve seals. Select sleeve size to allow for 1-inch annular clear space between pipe and sleeve for installing mechanical sleeve seals.

G. Mechanical Sleeve Seal Installation: Select type and number of sealing elements required for pipe material and size. Position pipe in center of sleeve. Assemble mechanical sleeve seals and install in annular space between pipe and sleeve. Tighten bolts against pressure plates that cause sealing elements to expand and make watertight seal.

H. Install pressure gage downstream from each service regulator. Pressure gages are specified in Division 23 Section "Meters and Gages for HVAC Piping."

3.4 INDOOR PIPING INSTALLATION

A. Comply with **NFPA 54** and **the International Fuel Gas Code** for installation and purging of natural-gas piping.

B. Drawing plans, schematics, and diagrams indicate general location and arrangement of piping systems. Indicated locations and arrangements are used to size pipe and calculate friction loss, expansion, and other design considerations. Install piping as indicated unless deviations to layout are approved on Coordination Drawings.

C. Arrange for pipe spaces, chases, slots, sleeves, and openings in building structure during progress of construction, to allow for mechanical installations.

D. Install piping in concealed locations unless otherwise indicated and except in equipment rooms and service areas.

E. Install piping indicated to be exposed and piping in equipment rooms and service areas at right angles or parallel to building walls. Diagonal runs are prohibited unless specifically indicated otherwise.

F. Install piping above accessible ceilings to allow sufficient space for ceiling panel removal.

G. Locate valves for easy access.

H. Install natural-gas piping at uniform grade of 2 percent down toward drip and sediment traps.

I. Install piping free of sags and bends.

J. Install fittings for changes in direction and branch connections.

K. Install escutcheons at penetrations of interior walls, ceilings, and floors.
   1. New Piping:
      a. Piping with Fitting or Sleeve Protruding from Wall: One-piece, deep-pattern type.
      b. Piping at Wall and Floor Penetrations in Finished Spaces: One-piece, cast-brass type with polished chrome-plated finish.
      c. Piping at Ceiling Penetrations in Finished Spaces: One-piece or split-casting, cast-brass type with polished chrome-plated finish.
      d. Piping in Unfinished Service Spaces: One-piece, cast-brass type with rough-brass finish.
      e. Piping in Equipment Rooms: One-piece, cast-brass type.
      f. Piping at Floor Penetrations in Equipment Rooms: One-piece, floor-plate type.

L. Fire-Barrier Penetrations: Maintain indicated fire rating of walls, partitions, ceilings, and floors at pipe penetrations. Seal pipe penetrations with firestop materials. Comply with requirements in Division 07 Section "Penetration Firestopping."

M. Verify final equipment locations for roughing-in.

N. Comply with requirements in Sections specifying gas-fired appliances and equipment for roughing-in requirements.

O. Drips and Sediment Traps: Install drips at points where condensate may collect, including service-meter outlets. Locate where accessible to permit cleaning and emptying. Do not install where condensate is subject to freezing.
   1. Construct drips and sediment traps using tee fitting with bottom outlet plugged or capped. Use nipple a minimum length of 3 pipe diameters, but not less than 3 inches long and same size as connected pipe. Install with space below bottom of drip to remove plug or cap.

P. Extend relief vent connections for service regulators, line regulators, and overpressure protection devices to outdoors and terminate with weatherproof vent cap.

Q. Conceal pipe installations in walls, pipe spaces, utility spaces, above ceilings, below grade or floors, and in floor channels unless indicated to be exposed to view.

R. Concealed Location Installations: Except as specified below, install concealed natural-gas piping and piping installed under the building in containment conduit constructed of steel pipe with welded joints as described in Part 2. Install a vent pipe from containment conduit to outdoors and terminate with weatherproof vent cap.
   1. Above Accessible Ceilings: Natural-gas piping, fittings, valves, and regulators may be installed in accessible spaces without containment conduit.
   2. In Walls or Partitions: Protect tubing installed inside partitions or hollow walls from physical damage using steel striker barriers at rigid supports.
      a. Exception: Tubing passing through partitions or walls does not require striker barriers.
   3. Prohibited Locations:
      a. Do not install natural-gas piping in or through circulating air ducts, clothes or trash chutes, chimneys or gas vents (flues), ventilating ducts, or dumbwaiter or elevator shafts.
      b. Do not install natural-gas piping in solid walls or partitions.

S. Use eccentric reducer fittings to make reductions in pipe sizes. Install fittings with level side down.

T. Connect branch piping from top or side of horizontal piping.

U. Install unions in pipes NPS 2 and smaller, adjacent to each valve, at final connection to each piece of equipment. Unions are not required at flanged connections.

V. Do not use natural-gas piping as grounding electrode.

W. Install strainer on inlet of each line-pressure regulator and automatic or electrically operated valve.

X. Install pressure gage downstream from each line regulator. Pressure gages are specified in Division 23 Section "Meters and Gages for HVAC Piping."

3.5 VALVE INSTALLATION

A. Install manual gas shutoff valve for each gas appliance.

3.6 PIPING JOINT CONSTRUCTION

A. Ream ends of pipes and tubes and remove burrs.

B. Remove scale, slag, dirt, and debris from inside and outside of pipe and fittings before assembly.

C. Threaded Joints:
1. Thread pipe with tapered pipe threads complying with ASME B1.20.1.
2. Cut threads full and clean using sharp dies.
3. Ream threaded pipe ends to remove burrs and restore full inside diameter of pipe.
4. Apply appropriate tape or thread compound to external pipe threads unless dryseal threading is specified.
5. Damaged Threads: Do not use pipe or pipe fittings with threads that are corroded or damaged. Do not use pipe sections that have cracked or open welds.

D. Welded Joints:
1. Construct joints according to AWS D10.12/D10.12M, using qualified processes and welding operators.
2. Bevel plain ends of steel pipe.
3. Patch factory-applied protective coating as recommended by manufacturer at field welds and where damage to coating occurs during construction.

E. Flanged Joints: Install gasket material, size, type, and thickness appropriate for natural-gas service. Install gasket concentrically positioned.

3.7 HANGER AND SUPPORT INSTALLATION

A. Install seismic restraints on piping. Comply with requirements for seismic-restraint devices specified in Division 23 Section "Vibration and Seismic Controls for HVAC Piping and Equipment."

B. Comply with requirements for pipe hangers and supports specified in Division 23 Section "Hangers and Supports for HVAC Piping and Equipment."

C. Install hangers for horizontal steel piping with the following maximum spacing and minimum rod sizes:
1. NPS 1 and Smaller: Maximum span, 96 inches; minimum rod size, 3/8 inch.
2. NPS 1-1/4: Maximum span, 108 inches; minimum rod size, 3/8 inch.

3. NPS 1-1/2 and NPS 2: Maximum span, 108 inches; minimum rod size, 3/8 inch.
4. NPS 2-1/2 to NPS 3-1/2: Maximum span, 10 feet; minimum rod size, 1/2 inch.
5. NPS 4 and Larger: Maximum span, 10 feet; minimum rod size, 5/8 inch.

3.8 CONNECTIONS

A. Connect to utility's gas main according to utility's procedures and requirements.

B. Install natural-gas piping electrically continuous, and bonded to gas appliance equipment grounding conductor of the circuit powering the appliance according to NFPA 70.

C. Install piping adjacent to appliances to allow service and maintenance of appliances.

D. Connect piping to appliances using manual gas shutoff valves and unions. Install valve within 72 inches of each gas-fired appliance and equipment. Install union between valve and appliances or equipment.

E. Sediment Traps: Install tee fitting with capped nipple in bottom to form drip, as close as practical to inlet of each appliance.

3.9 LABELING AND IDENTIFYING

A. Comply with requirements in Division 22 Section for plumibng piping and valve identification.

B. Install detectable warning tape directly above gas piping, 12 inches below finished grade, except 6 inches below subgrade under pavements and slabs.

3.10 PAINTING

A. Comply with requirements in Division 09 painting Sections for painting interior and exterior natural-gas piping.

B. Paint exposed, exterior metal piping, valves, service regulators, service meters and meter bars, earthquake valves, and piping specialties, except components, with factory-applied paint or protective coating.
1. Alkyd System: MPI EXT 5.1D.
   a. Prime Coat: Alkyd anticorrosive metal primer.
   b. Intermediate Coat: Exterior alkyd enamel matching topcoat.
   c. Topcoat: Exterior alkyd enamel (semigloss).
   d. Color: Gray.

C. Paint exposed, interior metal piping, valves, service regulators, service meters and meter bars, earthquake valves, and piping specialties, except components, with factory-applied paint or protective coating.

D. Damage and Touchup: Repair marred and damaged factory-applied finishes with materials and by procedures to match original factory finish.

3.11 FIELD QUALITY CONTROL

A. Perform tests and inspections.

B. Tests and Inspections:
   1. Test, inspect, and purge natural gas according to **NFPA 54 and the International Fuel Gas Code** and authorities having jurisdiction.

C. Natural-gas piping will be considered defective if it does not pass tests and inspections.

D. Prepare test and inspection reports.

END OF SECTION 231123

N:\N0912.00\DOC\SPEC\2012_03-16_BID\221123 - FACILITY NATURAL GAS PIPING- .DOC

SECTION 221316 – STORM DRAINAGE AND SANITARY WASTE AND VENT PIPING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. This Section includes the following for soil, waste, and vent piping inside the building:
   1. Pipe, tube, and fittings.
   2. Special pipe fittings.
   3. Encasement for underground metal piping.

B. Related Sections include the following:
   1. Division 22 Section "Sanitary Sewerage Pumps."

1.3 DEFINITIONS

A. EPDM: Ethylene-propylene-diene terpolymer rubber.

B. PVC: Polyvinyl chloride plastic.

1.4 PERFORMANCE REQUIREMENTS

A. Components and installation shall be capable of withstanding the following minimum working pressure, unless otherwise indicated:
   1. Soil, Waste, and Vent Piping: 10-foot head of water.
   2. Sanitary Sewer, Force-Main Piping: 50 psig .

1.5 SUBMITTALS

A. Product Data: For pipe, tube, fittings, and couplings.

B. LEED Submittal:
   1. Product Data for Credit EQ 4.1: For solvent cements and adhesive primers, including printed statement of VOC content.

C. Shop Drawings:
   1. Design Calculations: Signed and sealed by a qualified professional engineer for selecting seismic restraints.

D. Field quality-control inspection and test reports.

1.6 QUALITY ASSURANCE

A. Piping materials shall bear label, stamp, or other markings of specified testing agency.

B. Comply with NSF 14, "Plastics Piping Systems Components and Related Materials," for plastic piping components. Include marking with "NSF-dwv" for plastic drain, waste, and vent piping; "NSF-drain" for plastic drain piping; "NSF-tubular" for plastic continuous waste piping; and "NSF-sewer" for plastic sewer piping.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. In other Part 2 articles where titles below introduce lists, the following requirements apply to product selection:
   1. Manufacturers: Subject to compliance with requirements, provide products by one of the manufacturers specified.

2.2 PIPING MATERIALS

A. Refer to Part 3 "Piping Applications" Article for applications of pipe, tube, fitting, and joining materials.

2.3 HUBLESS CAST-IRON SOIL PIPE AND FITTINGS

A. Pipe and Fittings: ASTM A 888 or CISPI 301.

B. Shielded Couplings: ASTM C 1277 assembly of metal shield or housing, corrosion-resistant fasteners, and rubber sleeve with integral, center pipe stop.
   1. Heavy-Duty, Shielded, Stainless-Steel Couplings: With stainless-steel shield, stainless-steel bands and tightening devices, and ASTM C 564, rubber sleeve.
      a. Manufacturers:
         1) ANACO.
         2) Clamp-All Corp.
         3) Ideal Div.; Stant Corp.
         4) Mission Rubber Co.
         5) Tyler Pipe; Soil Pipe Div.

2.4 COPPER TUBE AND FITTINGS

A. Copper DWV Tube: ASTM B 306, drainage tube, drawn temper.
   1. Copper Drainage Fittings: ASME B16.23, cast copper or ASME B16.29, wrought copper, solder-joint fittings.

B. Hard Copper Tube: ASTM B 88, Types L and M, water tube, drawn temper.
   1. Copper Pressure Fittings: ASME B16.18, cast-copper-alloy or ASME B16.22, wrought-copper, solder-joint fittings. Furnish wrought-copper fittings if indicated.
   2. Copper Flanges: ASME B16.24, Class 150, cast copper with solder-joint end.

3. Copper Unions: MSS SP-123, copper-alloy, hexagonal-stock body with ball-and-socket, metal-to-metal seating surfaces, and solder-joint or threaded ends.

C. Soft Copper Tube: ASTM B 88, Type L, water tube, annealed temper.
1. Copper Pressure Fittings: ASME B16.18, cast-copper-alloy or ASME B16.22, wrought-copper, solder-joint fittings. Furnish wrought-copper fittings if indicated.

2.5 PVC PIPE AND FITTINGS

A. Solid-Wall PVC Pipe: ASTM D 2665, drain, waste, and vent.
1. PVC Socket Fittings: ASTM D 2665, socket type, made to ASTM D 3311, drain, waste, and vent patterns.

B. Solvent Cement and Adhesive Primer:
1. Use PVC solvent cement that has a VOC content of 510 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).
2. Use adhesive primer that has a VOC content of 550 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).

2.6 SPECIAL PIPE FITTINGS

A. Flexible, Nonpressure Pipe Couplings: Comply with ASTM C 1173, elastomeric, sleeve-type, reducing or transition pattern. Include shear ring, ends of same sizes as piping to be joined, and corrosion-resistant-metal tension band and tightening mechanism on each end.
1. Manufacturers:
   a. Dallas Specialty & Mfg. Co.
   b. Fernco, Inc.
   c. Logan Clay Products Company (The).
   d. Mission Rubber Co.
   e. NDS, Inc.
   f. Plastic Oddities, Inc.
2. Sleeve Materials:
   a. For Cast-Iron Soil Pipes: ASTM C 564, rubber.
   b. For Plastic Pipes: ASTM F 477, elastomeric seal or ASTM D 5926, PVC.
   c. For Dissimilar Pipes: ASTM D 5926, PVC or other material compatible with pipe materials being joined.

B. Shielded Nonpressure Pipe Couplings: ASTM C 1460, elastomeric or rubber sleeve with full-length, corrosion-resistant outer shield and corrosion-resistant-metal tension band and tightening mechanism on each end.
1. Manufacturers:
   a. Cascade Waterworks Mfg. Co.
   b. Mission Rubber Co.

PART 3 - EXECUTION

3.1 EXCAVATION

A. Refer to Division 31 Section "Earth Moving" for excavating, trenching, and backfilling.

3.2 PIPING APPLICATIONS

A. Flanges and unions may be used on aboveground pressure piping, unless otherwise indicated.

B. Aboveground, soil and waste piping NPS 4 and smaller shall be the following:
   1. Hubless cast-iron soil pipe and fittings; standard, shielded, stainless-steel couplings; and hubless-coupling joints.
   2. Copper DWV tube, copper drainage fittings, and soldered joints.
   3. Dissimilar Pipe-Material Couplings: Flexible, nonpressure pipe couplings for joining dissimilar pipe materials with small difference in OD.

C. Aboveground, Storm and OverFlow piping NPS 4 and smaller shall be the following:
   1. Hubless cast-iron soil pipe and fittings; standard, shielded, stainless-steel couplings; and hubless-coupling joints.

D. Aboveground, soil and waste piping NPS 5 and larger shall be the following:
   1. Hubless cast-iron soil pipe and fittings; heavy-duty shielded, stainless-steel couplings; and hubless-coupling joints.

E. Aboveground, Storm and Over Flow NPS 5 and larger shall be the following:
   1. Hubless cast-iron soil pipe and fittings; heavy-duty shielded, stainless-steel couplings; and hubless-coupling joints.

F. Aboveground, vent piping **NPS 4 and smaller** shall be the following:
   1. Hubless cast-iron soil pipe and fittings; standard, shielded, stainless-steel couplings; and hubless-coupling joints.
   2. Copper DWV tube, copper drainage fittings, and soldered joints.
      a. Option for Vent Piping, NPS 2-1/2 and NPS 3-1/2: Hard copper tube, Type M; copper pressure fittings; and soldered joints.
   3. Dissimilar Pipe-Material Couplings: Flexible, nonpressure pipe couplings for joining dissimilar pipe materials with small difference in OD.

G. Underground, soil, waste, and vent piping NPS 12 and smaller shall be the following:
   1. Solid wall PVC pipe, PVC socket fittings, and solvent-cemented joints.
   2. Dissimilar Pipe-Material Couplings: Flexible, nonpressure pipe couplings for joining dissimilar pipe materials with small difference in OD.

H. Aboveground waste force mains NPS 1-1/2 and NPS 2 shall be the following:
   1. Hard copper tube, Type L; copper pressure fittings; and soldered joints.
   2. Steel pipe, pressure fittings, and threaded joints.

3.3 PIPING INSTALLATION

A. Basic piping installation requirements are specified in Division 22 Section "Common Work Results for Plumbing."

B. Install cleanouts at grade and extend to where building sanitary drains connect to building sanitary sewers.

C. Install cleanout fitting with closure plug inside the building in sanitary force-main piping.

D. Install cast-iron sleeve with water stop and mechanical sleeve seal at each service pipe penetration through foundation wall. Select number of interlocking rubber links required to make installation watertight. Sleeves and mechanical sleeve seals are specified in Division 22 Section "Common Work Results for Plumbing."

E. Install wall-penetration fitting at each service pipe penetration through foundation wall. Make installation watertight.

F. Install cast-iron soil piping according to CISPI's "Cast Iron Soil Pipe and Fittings Handbook," Chapter IV, "Installation of Cast Iron Soil Pipe and Fittings."

G. Make changes in direction for soil and waste drainage and vent piping using appropriate branches, bends, and long-sweep bends. Sanitary tees and short-sweep 1/4 bends may be used on vertical stacks if change in direction of flow is from horizontal to vertical. Use long-turn, double Y-branch and 1/8-bend fittings if 2 fixtures are installed back to back or side by side with common drain pipe. Straight tees, elbows, and crosses may be used on vent lines. Do not change direction of flow more than 90 degrees. Use proper size of standard increasers and reducers if pipes of different sizes are connected. Reducing size of drainage piping in direction of flow is prohibited.

H. Lay buried building drainage piping beginning at low point of each system. Install true to grades and alignment indicated, with unbroken continuity of invert. Place hub ends of piping upstream. Install required gaskets according to manufacturer's written instructions for use of lubricants, cements, and other installation requirements. Maintain swab in piping and pull past each joint as completed.

I. Install soil, storm and waste drainage and vent piping at the following minimum slopes, unless otherwise indicated:
   1. Building Sanitary and Strom Drain: 2 percent downward in direction of flow for piping NPS 3 and smaller; 1 percent downward in direction of flow for piping NPS 4 and larger.
   2. Horizontal Sanitary and Strom Drainage Piping: 2 percent downward in direction of flow.
   3. Vent Piping: 1 percent down toward vertical fixture vent or toward vent stack.

J. Sleeves are not required for cast-iron soil piping passing through concrete slabs-on-grade if slab is without membrane waterproofing.

K. Install PVC soil and waste drainage and vent piping according to ASTM D 2665.

L. Install underground PVC soil and waste drainage piping according to ASTM D 2321.

M. Do not enclose, cover, or put piping into operation until it is inspected and approved by authorities having jurisdiction.

3.4 JOINT CONSTRUCTION

A. Basic piping joint construction requirements are specified in Division 22 Section "Common Work Results for Plumbing."

B. Join hubless cast-iron soil piping according to CISPI 310 and CISPI's "Cast Iron Soil Pipe and Fittings Handbook" for hubless-coupling joints.

C. Soldered Joints: Use ASTM B 813, water-flushable, lead-free flux; ASTM B 32, lead-free-alloy solder; and ASTM B 828 procedure, unless otherwise indicated.

D. Grooved Joints: Assemble joint with keyed coupling, gasket, lubricant, and bolts according to coupling and fitting manufacturer's written instructions.

E. PVC Nonpressure Piping Joints: Join piping according to ASTM D 2665.

3.5 VALVE INSTALLATION

A. General valve installation requirements are specified in Division 22 Section "General-Duty Valves for Plumbing Piping."

B. Check Valves: Install swing check valve, between pump and shutoff valve, on each sewage pump discharge.

3.6 HANGER AND SUPPORT INSTALLATION

A. Pipe hangers and supports are specified in Division 22 Section "Hangers and Supports for Plumbing Piping and Equipment." Install the following:
   1. Vertical Piping: MSS Type 8 or Type 42, clamps.
   2. Install individual, straight, horizontal piping runs according to the following:
      a. 100 Feet and Less: MSS Type 1, adjustable, steel clevis hangers.
      b. Longer Than 100 Feet: MSS Type 43, adjustable roller hangers.
      c. Longer Than 100 Feet, if Indicated: MSS Type 49, spring cushion rolls.
   3. Multiple, Straight, Horizontal Piping Runs 100 Feet or Longer: MSS Type 44, pipe rolls. Support pipe rolls on trapeze.
   4. Base of Vertical Piping: MSS Type 52, spring hangers.

B. Install supports according to Division 22 Section "Hangers and Supports for Plumbing Piping and Equipment."

C. Support vertical piping and tubing at base and at each floor.

D. Rod diameter may be reduced 1 size for double-rod hangers, with 3/8-inch minimum rods.

E. Install hangers for cast-iron soil piping with the following maximum horizontal spacing and minimum rod diameters:
   1. NPS 1-1/2 and NPS 2: 60 inches with 3/8-inch rod.
   2. NPS 3: 60 inches with 1/2-inch rod.
   3. NPS 4 and NPS 5: 60 inches with 5/8-inch rod.
   4. NPS 6: 60 inches with 3/4-inch rod.
   5. NPS 8 to NPS 12: 60 inches with 7/8-inch rod.

F. Install supports for vertical cast-iron soil piping every 15 feet.

G. Install supports for vertical steel piping every 15 feet.

H. Install hangers for copper tubing with the following maximum horizontal spacing and minimum rod diameters:
   1. NPS 1-1/4: 72 inches with 3/8-inch rod.
   2. NPS 1-1/2 and NPS 2: 96 inches with 3/8-inch rod.
   3. NPS 2-1/2: 108 inches with 1/2-inch rod.
   4. NPS 3 to NPS 5: 10 feet with 1/2-inch rod.
   5. NPS 6: 10 feet with 5/8-inch rod.
   6. NPS 8: 10 feet with 3/4-inch rod.

I. Install supports for vertical copper tubing every 10 feet.

J. Support piping and tubing not listed above according to MSS SP-69 and manufacturer's written instructions.

3.7 CONNECTIONS

A. Drawings indicate general arrangement of piping, fittings, and specialties.

B. Connect soil and waste piping to exterior sanitary sewerage piping. Use transition fitting to join dissimilar piping materials.

C. Connect storm piping to exterior sanitary sewerage piping. Use transition fitting to join dissimilar piping materials.

D. Connect drainage and vent piping to the following:
   1. Plumbing Fixtures: Connect drainage piping in sizes indicated, but not smaller than required by plumbing code.
   2. Plumbing Fixtures and Equipment: Connect atmospheric vent piping in sizes indicated, but not smaller than required by authorities having jurisdiction.
   3. Plumbing Specialties: Connect drainage and vent piping in sizes indicated, but not smaller than required by plumbing code.
   4. Equipment: Connect drainage piping as indicated. Provide shutoff valve, if indicated, and union for each connection. Use flanges instead of unions for connections NPS 2-1/2 and larger.

3.8 FIELD QUALITY CONTROL

A. During installation, notify authorities having jurisdiction at least 24 hours before inspection must be made. Perform tests specified below in presence of authorities having jurisdiction.
   1. Roughing-in Inspection: Arrange for inspection of piping before concealing or closing-in after roughing-in and before setting fixtures.
   2. Final Inspection: Arrange for final inspection by authorities having jurisdiction to observe tests specified below and to ensure compliance with requirements.

B. Reinspection: If authorities having jurisdiction find that piping will not pass test or inspection, make required corrections and arrange for reinspection.

C. Reports: Prepare inspection reports and have them signed by authorities having jurisdiction.

D. Test sanitary and storm drainage and vent piping according to procedures of authorities having jurisdiction or, in absence of published procedures, as follows:

1. Test for leaks and defects in new piping and parts of existing piping that have been altered, extended, or repaired. If testing is performed in segments, submit separate report for each test, complete with diagram of portion of piping tested.
2. Leave uncovered and unconcealed new, altered, extended, or replaced drainage and vent piping until it has been tested and approved. Expose work that was covered or concealed before it was tested.
3. Roughing-in Plumbing Test Procedure: Test drainage and vent piping, except outside leaders, on completion of roughing-in. Close openings in piping system and fill with water to point of overflow, but not less than 10-foot head of water. From 15 minutes before inspection starts to completion of inspection, water level must not drop. Inspect joints for leaks.
4. Finished Plumbing Test Procedure: After plumbing fixtures have been set and traps filled with water, test connections and prove they are gastight and watertight. Plug vent-stack openings on roof and building drains where they leave building. Introduce air into piping system equal to pressure of 1-inch wg. Use U-tube or manometer inserted in trap of water closet to measure this pressure. Air pressure must remain constant without introducing additional air throughout period of inspection. Inspect plumbing fixture connections for gas and water leaks.
5. Repair leaks and defects with new materials and retest piping, or portion thereof, until satisfactory results are obtained.
6. Prepare reports for tests and required corrective action.

E. Test force-main piping according to procedures of authorities having jurisdiction or, in absence of published procedures, as follows:
1. Leave uncovered and unconcealed new, altered, extended, or replaced force-main piping until it has been tested and approved. Expose work that was covered or concealed before it was tested.
2. Cap and subject piping to static-water pressure of 50 psig above operating pressure, without exceeding pressure rating of piping system materials. Isolate test source and allow to stand for four hours. Leaks and loss in test pressure constitute defects that must be repaired.
3. Repair leaks and defects with new materials and retest piping, or portion thereof, until satisfactory results are obtained.
4. Prepare reports for tests and required corrective action.

3.9 CLEANING

A. Clean interior of piping. Remove dirt and debris as work progresses.

B. Protect drains during remainder of construction period to avoid clogging with dirt and debris and to prevent damage from traffic and construction work.

C. Place plugs in ends of uncompleted piping at end of day and when work stops.

END OF SECTION 221316

N:\N0912.00\DOC\SPEC\2012_03-16_BID\221316 - STORM DRAINAGE AND SANITARY WASTE AND VENT PIPING.DOC

SECTION 221319 - SANITARY WASTE AND STORM PIPING SPECIALTIES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. This Section includes the following sanitary drainage piping specialties:

B. Cleanouts.
   1. Floor drains.
   2. Roof drains
   3. Roof flashing assemblies.
   4. Through-penetration firestop assemblies.
   5. Miscellaneous sanitary drainage piping specialties.
   6. Flashing materials.

C. Related Sections include the following:
   1. Division 22 Section "Storm Drainage Piping Specialties" for trench drains for storm water, channel drainage systems for storm water, roof drains, and catch basins.

1.3 DEFINITIONS

A. PVC: Polyvinyl chloride plastic.

1.4 SUBMITTALS

A. Product Data: For each type of product indicated. Include rated capacities, operating characteristics, and accessories.

B. Shop Drawings: Show fabrication and installation details for frost-resistant vent terminals.
   1. Wiring Diagrams: Power, signal, and control wiring.

C. Field quality-control test reports.

D. Operation and Maintenance Data: For drainage piping specialties to include in emergency, operation, and maintenance manuals.

1.5 QUALITY ASSURANCE

A. Drainage piping specialties shall bear label, stamp, or other markings of specified testing agency.

B. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.

C. Comply with NSF 14, "Plastics Piping Components and Related Materials," for plastic sanitary piping specialty components.

1.6 COORDINATION

A. Coordinate size and location of concrete bases. Cast anchor-bolt inserts into bases. Concrete, reinforcement, and formwork requirements are specified in Division 03.

B. Coordinate size and location of roof penetrations.

PART 2 - PRODUCTS

2.1 CLEANOUTS

A. Exposed Metal Cleanouts:
1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   a. Josam Company; Josam Div.
   b. MIFAB, Inc.
   c. Smith, Jay R. Mfg. Co.; Division of Smith Industries, Inc.
   d. Tyler Pipe; Wade Div.
   e. Watts Drainage Products Inc.
   f. Zurn Plumbing Products Group; Specification Drainage Operation.
   g. Josam Company; Blucher-Josam Div.
2. Standard: ASME A112.36.2M for cast iron for cleanout test tee.
3. Size: Same as connected drainage piping
4. Body Material: Hubless, cast-iron soil pipe test tee as required to match connected piping.
5. Closure: Countersunk or raised-head plug.
6. Closure Plug Size: Same as or not more than one size smaller than cleanout size.

B. Cast-Iron Wall Cleanouts:
1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   a. Josam Company; Josam Div.
   b. MIFAB, Inc.
   c. Smith, Jay R. Mfg. Co.; Division of Smith Industries, Inc.
   d. Tyler Pipe; Wade Div.
   e. Watts Drainage Products Inc.
   f. Zurn Plumbing Products Group; Specification Drainage Operation.
2. Standard: ASME A112.36.2M. Include wall access.
3. Size: Same as connected drainage piping.
4. Body: Hubless, cast-iron soil pipe test tee as required to match connected piping.
5. Closure: Countersunk , drilled-and-threaded cast-iron plug.
6. Closure Plug Size: Same as or not more than one size smaller than cleanout size.
7. Wall Access: Round, flat, chrome-plated brass or stainless-steel cover plate with screw.

2.2 FLOOR DRAINS

A. Cast-Iron Floor Drains:
1. FD-1: Equal to Jay R. Smith model 2005-P050-NB. Cast iron body floor drain with primer connection and nickel bronze strainer. Above grade- NO-HUB Connection. On-grade- threaded outlet connection (-T).
2. FD-2: Equal to Jay R. Smith model 2131Y-P050. Medium duty cast iron floor drain with sediment bucket and trap primer connection.
3. FD-3: Equal to Jay R. Smith model 2242C-P050. Heavy duty deep drain with sediment bucket.

2.3 BACKWATER VALVES

A. BWV: Equal to Jay R. Smith model 7022S. Cast iron body backwater valve with threaded access cover, hub inlet and spigot outlet.

2.4 ROOF FLASHING ASSEMBLIES

A. Roof Flashing Assemblies:
1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
a. Acorn Engineering Company; Elmdor/Stoneman Div.
b. Thaler Metal Industries Ltd.

B. Description: Manufactured assembly made of 6.0-lb/sq. ft. (30-kg/sq. m), 0.0938-inch- (2.4-mm-) thick, lead flashing collar and skirt extending at least 10 inches (250 mm) from pipe, with galvanized-steel boot reinforcement and counterflashing fitting.
1. Open-Top Vent Cap: Without cap.
2. Low-Silhouette Vent Cap: With vandal-proof vent cap.
3. Extended Vent Cap: With field-installed, vandal-proof vent cap.

2.5 THROUGH-PENETRATION FIRESTOP ASSEMBLIES

A. Through-Penetration Firestop Assemblies:
1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
a. ProSet Systems Inc.
2. Standard: UL 1479 assembly of sleeve and stack fitting with firestopping plug.
3. Size: Same as connected soil, waste, or vent stack.
4. Sleeve: Molded PVC plastic, of length to match slab thickness and with integral nailing flange on one end for installation in cast-in-place concrete slabs.
5. Stack Fitting: ASTM A 48/A 48M, gray-iron, hubless-pattern, wye branch with neoprene O-ring at base and gray-iron plug in thermal-release harness. Include PVC protective cap for plug.
6. Special Coating: Corrosion resistant on interior of fittings.

2.6 MISCELLANEOUS SANITARY DRAINAGE PIPING SPECIALTIES

A. Open Drains:

1. Description: Shop or field fabricate from ASTM A 74, Service class, hub-and-spigot, cast-iron, soil-pipe fittings. Include P-trap, hub-and-spigot riser section; and where required, increaser fitting joined with ASTM C 564, rubber gaskets.
2. Size: Same as connected waste piping.

B. Floor-Drain, Trap-Seal Primer Fittings:
1. Description: Cast iron, with threaded inlet and threaded or spigot outlet, and trap-seal primer valve connection.
2. Size: Same as floor drain outlet with NPS 1/2 (DN 15) side inlet.

2.7 FLASHING MATERIALS

A. Lead Sheet: ASTM B 749, Type L51121, copper bearing, with the following minimum weights and thicknesses, unless otherwise indicated:
1. General Use: 4.0-lb/sq. ft. (20-kg/sq. m), 0.0625-inch (1.6-mm) thickness.
2. Vent Pipe Flashing: 3.0-lb/sq. ft. (15-kg/sq. m), 0.0469-inch (1.2-mm) thickness.
3. Burning: 6-lb/sq. ft. (30-kg/sq. m), 0.0938-inch (2.4-mm) thickness.

B. Copper Sheet: ASTM B 152/B 152M, of the following minimum weights and thicknesses, unless otherwise indicated:
1. General Applications: 12 oz./sq. ft. (3.7 kg/sq. m or 0.41-mm thickness).
2. Vent Pipe Flashing: 8 oz./sq. ft. (2.5 kg/sq. m or 0.27-mm thickness).

C. Zinc-Coated Steel Sheet: ASTM A 653/A 653M, with 0.20 percent copper content and 0.04-inch (1.01-mm) minimum thickness, unless otherwise indicated. Include G90 (Z275) hot-dip galvanized, mill-phosphatized finish for painting if indicated.

D. Elastic Membrane Sheet: ASTM D 4068, flexible, chlorinated polyethylene, 40-mil (1.01-mm) minimum thickness.

E. Fasteners: Metal compatible with material and substrate being fastened.

F. Metal Accessories: Sheet metal strips, clamps, anchoring devices, and similar accessory units required for installation; matching or compatible with material being installed.

G. Solder: ASTM B 32, lead-free alloy.

H. Bituminous Coating: SSPC-Paint 12, solvent-type, bituminous mastic.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Refer to Division 22 Section "Common Work Results for Plumbing" for piping joining materials, joint construction, and basic installation requirements.

B. Install cleanouts in aboveground piping and building drain piping according to the following, unless otherwise indicated:
1. Size same as drainage piping up to NPS 4 (DN 100). Use NPS 4 (DN 100) for larger drainage piping unless larger cleanout is indicated.

2. Locate at each change in direction of piping greater than 45 degrees.
3. Locate at minimum intervals of 50 feet (15 m) for piping NPS 4 (DN 100) and smaller and 100 feet (30 m) for larger piping.
4. Locate at base of each vertical soil and waste stack.

C. For floor cleanouts for piping below floors, install cleanout deck plates with top flush with finished floor.

D. For cleanouts located in concealed piping, install cleanout wall access covers, of types indicated, with frame and cover flush with finished wall.

E. Install floor drains at low points of surface areas to be drained. Set grates of drains flush with finished floor, unless otherwise indicated.
1. Position floor drains for easy access and maintenance.
2. Set floor drains below elevation of surrounding finished floor to allow floor drainage. Set with grates depressed according to the following drainage area radii:
   a. Radius, 30 Inches (750 mm) or Less: Equivalent to 1 percent slope, but not less than 1/4-inch (6.35-mm) total depression.
   b. Radius, 30 to 60 Inches (750 to 1500 mm): Equivalent to 1 percent slope.
   c. Radius, 60 Inches (1500 mm) or Larger: Equivalent to 1 percent slope, but not greater than 1-inch (25-mm) total depression.
3. Install floor-drain flashing collar or flange so no leakage occurs between drain and adjoining flooring. Maintain integrity of waterproof membranes where penetrated.
4. Install individual traps for floor drains connected to sanitary building drain, unless otherwise indicated.

F. Install roof flashing assemblies on sanitary stack vents and vent stacks that extend through roof.

G. Install flashing fittings on sanitary stack vents and vent stacks that extend through roof.

H. Install through-penetration firestop assemblies in plastic stacks at floor penetrations.

I. Install floor-drain, trap-seal primer fittings on inlet to floor drains that require trap-seal primer connection.
1. Exception: Fitting may be omitted if trap has trap-seal primer connection.
2. Size: Same as floor drain inlet.

J. Install air-gap fittings on draining-type backflow preventers and on indirect-waste piping discharge into sanitary drainage system.

K. Install sleeve flashing device with each riser and stack passing through floors with waterproof membrane.

L. Install vent caps on each vent pipe passing through roof.

M. Install expansion joints on vertical stacks and conductors. Position expansion joints for easy access and maintenance.

3.2 CONNECTIONS

A. Piping installation requirements are specified in other Division 22 Sections. Drawings indicate general arrangement of piping, fittings, and specialties.

B. Install piping adjacent to equipment to allow service and maintenance.

3.3 FLASHING INSTALLATION

A. Fabricate flashing from single piece unless large pans, sumps, or other drainage shapes are required. Join flashing according to the following if required:
   1. Lead Sheets: Burn joints of lead sheets 6.0-lb/sq. ft. (30-kg/sq. m), 0.0938-inch (2.4-mm) thickness or thicker. Solder joints of lead sheets 4.0-lb/sq. ft. (20-kg/sq. m), 0.0625-inch (1.6-mm) thickness or thinner.
   2. Copper Sheets: Solder joints of copper sheets.

B. Install sheet flashing on pipes, sleeves, and specialties passing through or embedded in floors and roofs with waterproof membrane.
   1. Pipe Flashing: Sleeve type, matching pipe size, with minimum length of 10 inches (250 mm), and skirt or flange extending at least 8 inches (200 mm) around pipe.
   2. Sleeve Flashing: Flat sheet, with skirt or flange extending at least 8 inches (200 mm) around sleeve.
   3. Embedded Specialty Flashing: Flat sheet, with skirt or flange extending at least 8 inches (200 mm) around specialty.

C. Set flashing on floors and roofs in solid coating of bituminous cement.

D. Secure flashing into sleeve and specialty clamping ring or device.

E. Install flashing for piping passing through roofs with counterflashing or commercially made flashing fittings, according to Division 07 Section "Sheet Metal Flashing and Trim."

F. Extend flashing up vent pipe passing through roofs and turn down into pipe, or secure flashing into cast-iron sleeve having calking recess.

G. Fabricate and install flashing and pans, sumps, and other drainage shapes.

3.4 FIELD QUALITY CONTROL

A. Tests and Inspections:
   1. Leak Test: After installation, charge system and test for leaks. Repair leaks and retest until no leaks exist.
   2. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.

3.5 PROTECTION

A. Protect drains during remainder of construction period to avoid clogging with dirt or debris and to prevent damage from traffic or construction work.

B. Place plugs in ends of uncompleted piping at end of each day or when work stops.

END OF SECTION 221319

N:\N0912.00\DOC\SPEC\2012_03-16_BID\221319 - SANITARY WASTE AND STORM PIPING SPECIALTIES.DOC

SECTION 221429 - SUMP PUMPS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. This Section includes the following sump pumps and accessories, inside the building, for building storm drainage systems:
   1. Submersible sump pumps.

1.3 SUBMITTALS

A. Product Data: For each type and size of sump pump specified. Include certified performance curves with operating points plotted on curves, and rated capacities of selected models, furnished specialties, and accessories.

B. Shop Drawings: Diagram power, signal, and control wiring.

C. Operation and Maintenance Data: For each sump pump to include in emergency, operation, and maintenance manuals.

1.4 QUALITY ASSURANCE

A. Product Options: Drawings indicate size, profiles, and dimensional requirements of sump pumps and are based on the specific system indicated. Refer to Division 01 Section "Product Requirements."

B. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.

1.5 DELIVERY, STORAGE, AND HANDLING

A. Retain shipping flange protective covers and protective coatings during storage.

B. Protect bearings and couplings against damage.

C. Comply with pump manufacturer's written rigging instructions for handling.

1.6 COORDINATION

A. Coordinate size and location of concrete pits. Concrete, reinforcement, and formwork requirements are specified in Division 03.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. In other Part 2 articles where titles below introduce lists, the following requirements apply to product selection:
   1. Manufacturers: Subject to compliance with requirements, provide products by one of the manufacturers specified.

2.2 SUBMERSIBLE SUMP PUMPS

A. Manufacturers:
   1. ABS Pumps, Inc.
   2. Aermotor Pumps, Inc.
   3. Barnes; Crane Pumps & Systems.
   4. Bell & Gossett Domestic Pump; ITT Industries.
   5. BJM Corporation.
   6. EBARA International Corporation; Standard Pump Division.
   7. Federal Pump Corp.
   8. Gorman-Rupp Company (The).
   9. Goulds Pumps; ITT Industries.
   10. Grundfos Pumps Corp.
   11. Liberty Pumps.
   12. Little Giant Pump Co.
   13. McDonald, A. Y. Mfg. Co.
   14. Metropolitan Industries, Inc.
   15. Myers, F. E.; Pentair Pump Group (The).
   16. Paco Pumps, Inc.
   17. Stancor, Inc.
   18. Sta-Rite Industries, Inc.
   19. Swaby Manufacturing Co.
   20. Weil Pump Company, Inc.
   21. Weinman Div.; Crane Pumps & Systems.
   22. Zoeller Company.

B. Description: Factory-assembled and -tested, simplex , single-stage, centrifugal, end-suction, submersible, direct-connected sump pumps complying with UL 778 and HI 1.1-1.2 and HI 1.3 for submersible sump pumps.

C. Casing: Stainless steel; with stainless-steel inlet strainer, legs that elevate pump to permit flow into impeller, and vertical discharge with companion flange suitable for piping connection.

D. Impeller: Stainless steel or other corrosion-resistant material.

E. Pump and Motor Shaft: Stainless steel, with factory-sealed, grease-lubricated ball bearings and double-mechanical seals.

F. Motor: Hermetically sealed, capacitor-start type, with built-in overload protection; three-conductor waterproof power cable of length required, and with grounding plug and cable-sealing assembly for connection at pump. Comply with requirements in Division 22 Section "Common Motor Requirements for Plumbing Equipment."
1. Moisture-Sensing Probe: Internal moisture sensor with moisture alarm.

G. Pump Discharge Piping: Factory or field fabricated, copper tube.

H. Controls: NEMA 250, Type 1 enclosure, pedestal-mounted float switch; with float, float rod, and rod buttons.

I. Controls: Equal to Stancor Oil Minder System with oil sensor and float switch.

J. Capacity and Characteristics:
1. Number of Pumps: One.
2. Pump:
   a. Capacity: 74 gpm.
   b. Total Dynamic Head: 25 feet.
   c. Speed: 3600 rpm.
   d. Discharge Pipe Size: 2" NPS.
   e. Motor Horsepower: 0.5.
   f. Electrical Characteristics:
      1) Volts: 120
      2) Phases: Single.
      3) Hertz: 60.
   g. Unit Electrical Characteristics:
      1) Full-Load Amperes: 5.
      2) Minimum Circuit Ampacity:
      3) Maximum Overcurrent Protection:
3. Alternator Control Required: No.
4. Equal to Stancor model SE-50.

2.3 FLEXIBLE CONNECTORS

A. Manufacturers:
1. Anamet, Inc.
2. Flex-Hose Co., Inc.
3. Flexicraft Industries.
4. Flex-Pression, Ltd.
5. Flex-Weld, Inc.
6. Hyspan Precision Products, Inc.
7. Mercer Rubber.
8. Metraflex, Inc.
9. Proco Products, Inc.
10. Tozen America Corporation.
11. Unaflex Inc.

B. Description: 125-psig (860-kPa) minimum working-pressure rating and ends matching pump connection:

1. Bronze Flexible Connectors: Corrugated, bronze inner tubing covered with bronze wire braid. Include copper-tube ends or bronze flanged ends, braze welded to tubing.
2. Stainless-Steel Flexible Connectors: Corrugated, stainless-steel inner tubing covered with stainless-steel wire braid. Include stainless-steel nipples or flanges, welded to tubing.

2.4 BUILDING AUTOMATION SYSTEM INTERFACE

A. Provide auxiliary contacts in pump controllers for interface to building automation system. Include the following:
   1. Alarm status.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine roughing-in of plumbing piping to verify actual locations of storm drainage piping connections before sump pump installation.

3.2 SUMP PUMP INSTALLATION

A. Excavating, trenching, and backfilling are specified in Division 31 Section "Earth Moving."

B. Install sump pumps according to applicable requirements in HI 1.4.

C. Install pumps and arrange to provide access for maintenance including removal of motors, impellers, couplings, and accessories.

D. Set submersible sump pumps on pit floor. Make direct connections to storm drainage piping.

E. Support piping so weight of piping is not supported by pumps.

3.3 CONNECTIONS

A. Piping installation requirements are specified in Division 22 Section "Facility Storm Drainage Piping." Drawings indicate general arrangement of piping, fittings, and specialties.

B. Install piping adjacent to sump pumps to allow service and maintenance.

C. Install discharge piping equal to or greater than size of pump discharge piping. Refer to Division 22 Section "Facility Storm Drainage Piping."
   1. Install flexible connectors adjacent to pumps in discharge piping.
   2. Install check and shutoff valves on discharge piping from each pump. Install unions on pumps having threaded pipe connections. Install valves same size as connected piping. Refer to Division 22 Section "General-Duty Valves for Plumbing Piping" for general-duty valves for drainage piping.

D. Ground equipment according to Division 26 Section "Grounding and Bonding for Electrical Systems."

E. Connect wiring according to Division 26 Section "Low-Voltage Electrical Power Conductors and Cables."

3.4 STARTUP SERVICE

A. Engage a factory-authorized service representative to perform startup service.
   1. Complete installation and startup checks according to manufacturer's written instructions.
   2. Verify bearing lubrication.
   3. Disconnect couplings and check motors for proper direction of rotation.
   4. Verify that each pump is free to rotate by hand. If pump is bound or drags, do not operate until cause of trouble is determined and corrected.
   5. Verify that pump controls are correct for required application.

B. Start pumps without exceeding safe motor power:
   1. Start motors.
   2. Open discharge valves slowly.
   3. Check general mechanical operation of pumps and motors.

C. Test and adjust controls and safeties.

D. Remove and replace damaged and malfunctioning components.
   1. Pump Controls: Set pump controls for automatic start, stop, and alarm operation as required for system application.
   2. Set field-adjustable switches and circuit-breaker trip ranges as indicated, or if not indicated, for normal operation.

E. Occupancy Adjustments: When requested within 12 months of date of Substantial Completion, provide on-site assistance in adjusting system to suit actual occupied conditions. Provide up to two visits to Project outside normal occupancy hours for this purpose.

3.5 DEMONSTRATION

A. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain controls and pumps. Refer to Division 01 Section "Demonstration and Training."

END OF SECTION 221429

N:\N0912.00\DOC\SPEC\2012_03-16_BID\221429 - SUMP PUMPS.DOC

SECTION 221513 - LABORATORY SERVICE PIPING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and General Provision of Contract, including General and Supplementary Conditions and Division 1 specifications, apply to this section.

B. Where Paragraphs of this Section conflict with similar paragraphs of the General and Supplementary Conditions and Division 1, requirements of this Section shall prevail.

1.2 SUMMARY

A. This Section describes the technical specifications and general instructions for the furnishing, installation, testing, handling and delivery of water, wastewater, and process gas piping and related components.

B. Pipe materials and components specified in this section include:
1. Pipe and tube
2. Fittings and couplings
3. Valve actuators
4. Identification markers
5. Installation requirements

C. Related sections
1. Division 11, Casework
2. 220529 Hangers and Supports for Plumbing Piping and Equipment
3. 224000 Plumbing Fixtures and Specialties
4. 220700 Plumbing Insulation

1.3 REFERENCES

A. The most current issue, revision, or affirmation of the references listed herein shall be used, including all addenda, errata and referenced documents.
1. Standards for Copper and Copper Alloy Tube, Pipe and Fitting
a. American Society for Testing and Materials (ASTM)
1) B88: Standard Specification for Seamless Copper Water Tube

1.4 DEFINITIONS

A. CPVC: Chlorinated polyvinyl chloride plastic

B. EPDM: Ethylene-propylene-diene terpolymer rubber

C. HDPE: High density polyethylene plastic

D. PE: Polyethylene plastic

E. PP: Polypropylene plastic

F. PTFE: Polytetrafluoroethylene plastic

G. PVC: Polyvinyl chloride plastic

H. PVDF: Polyvinylidene fluoride plastic

I. SS: Stainless steel

J. TFE: Tetrafluoroethylene

1.5 SUBMITTALS

A. Documentation Requirements
1. Submitted documentation shall be complete and consistent to provide a written record to prove that the pipe, tube and components conform to the specifications and intent of the design.

B. Shop Drawings
1. Refer to paragraph 1.17 of Section "General Mechanical Requirements" for procedural requirements and also to the other related documents referenced in paragraph 1.1 of this section.
2. Submittal packages shall include for all equipment (where applicable):
   a. Component drawings including sections, dimensions, exploded parts drawing, and parts identification
   b. Pipe dimensions, wall thickness, pressure ratings at temperature
   c. Pressure and temperature classification
   d. End connection details
   e. Welders' Qualifications
   f. Thermoplastic heat fusion installer certifications by manufacturer
   g. Internal finish specifications
   h. External finish specifications
   i. Control valve pressure and flow characteristics including Cv values as tested by the manufacturer
   j. Shop Drawings detailing pipe anchors, alignment guides, and expansion joints and loops

C. Installation check procedures

D. Testing and Pre-Start-up Procedures

E. Closeout Submittals
1. Revise final drawings, to incorporate all mark-ups and notes in the shop drawings to reflect the specific installation
2. Submit certificates of inspections and test reports
3. Submit weld reports.
4. Operation and Maintenance Manual
5. Equipment certificates and warranties

1.6 CERTIFICATIONS

A. Weld stamps shall be traceable back to the individual installer's training and certification records.

B. Factory-trained and certified installers shall install thermoplastic piping. Installers of heat fusion thermoplastic joints shall hold current certifications in the installation and fusion methods from the respective pipe manufacturers.

1.7 DELIVERY STORAGE AND HANDLING

A. Packing/Shipping/Handling/Unloading
1. ings and valves with end caps and in individual plastic bags, properly sealed.

B. Storage and Protection
1. ain packaging, caps and seals on all materials until ready for immediate installation. Wood or cloth plugs or any type of tape are not acceptable and shall not be used.

1.8 COORDINATION

A. Coordinate size and location of supports, hangers, and insulation shields specified in Division 15400 Section "Hangers and Supports."

B. Coordinate clearance requirements with piping installer for insulation application.

C. Coordinate installation and testing of electric heat tracing.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the work include, but are not limited to, the manufacturers specified.

B. Bronze Valves
1. Conbraco Industries, Inc.; Apollo Division
2. Crane Co.; Crane Valve Group; Crane Valves
3. Watts Industries, Inc., Water Products Division
4. Grinnell Corporation
5. Jamesbury, Inc.
6. NIBCO, Inc.
7. American Valve, Inc.
8. Process Development and Control
9. Milwaukee Valve Company
10. Tyco International Ltd.
11. Approved equal

C. Polypropylene Valves
1. George Fisher
2. Enfield
3. Orion
4. Asahi America
5. Nibco, Inc.

6. Approved equal

D. Stainless Steel Valves
1. Neles-Jamesbury
2. Worcester
3. Jordan Steriflow
4. ITT
5. Alfa Laval
6. Nupro
7. Swagelock
8. Parker
9. Approved equal

E. Piping and Fittings
1. Polypropylene, CPVC Drainage Pipe and Fitting
   a. George Fisher
   b. Enfield
   c. Chemtrol
   d. Approved equal
2. Copper Tubing and Fittings
   a. Mueller Industries
   b. Howell Metal Company
   c. Cerro Copper Tube Co.
   d. Elkhart Products
   e. Nibco Inc.
   f. Approved equal
3. Dielectric Unions and Flanges
   a. Watts Industries Co.
   b. Epco Sales Inc.
4. Gaskets
   a. Garlock Inc.
   b. Flexitallic
   c. Melrate Gasket

2.2 PIPE MATERIALS SPECIFICATION INDEX

A. The following table summarizes the pipe classes specified in this Section. Refer to the respective Pipe Class data sheets for detailed requirements.

Service	Code	Maximum Service Operating Limits		Class	Pipe Material
		(psig)	Temp (°F)		
Indirect Waste	IW	Gravity	250	A10	Copper
Hot and Cold Water	HW/CW	80	250	A10	Copper
Tempered Water	TW/EW	80	250	A10	Copper
Natural Gas	G	50	70	A11	Carbon Steel
Laboratory Compressed Air	CA	125	120	A13	Copper
Carbon Dioxide	CO2	125	120	A14	Copper
Laboratory Vacuum	VAC	29" HG	120	A15	Copper
Vacuum Exhaust	VE	50	120	A17/A10	Galvanized Steel/Copper
Lab Vent	LV	Gravity	140	D12	Polypropylene
Lab Waste	LW	Gravity	140	D12	Polypropylene
Lab Waste (Plenum Rated)	LW	Gravity		D13A	PVDF

Service	Code	Maximum Service Operating Limits		Class	Pipe Material
		(psig)	Temp (°F)		
Lab Waste (Plenum Rated)	LV	Gravity		D13A	PVDF

General Pipe Spec Notes:

1. Each valve type shall be the product of a single manufacturer. Each system shall be provided with valves as required by code and shown on the drawings. And shall be installed to facilitate operation, replacement and repair.
2. Provide access panels for concealed valves behind non-removable ceilings or walls.
3. Provide shut-off valves on supply piping to individual pieces of equipment.
4. Provide pipe dope, Teflon tape, wax rings, neoprene gaskets and other jointing compounds as required by best standard practice and only on service as recommended by manufacturer.
5. Apply putties and jointing compounds for plumbing fixtures and trim as recommended by manufacturers.
6. Valves on insulated piping systems shall be equipped with extended handles to accommodate insulation thickness.

A10: COPPER WATER TUBE

PIPE CLASS A10	½" to 3"	4" and Larger
PIPE	Seamless copper water tube, drawn temper, Type L. ASTM B-88. See Note 1.	Seamless copper water tube, drawn temper, Type L. ASTM B-88. See Notes 2 & 5.
FITTINGS	Wrought copper, solder-joint. ASME B16.22	Ductile iron coupling with copper alkyd enamel paint coating, ASTM A-536. Grade "E" EPDM elastomer gasket, ASTM D-2000. Equal to Victaulic Style 606 coupling. ASTM B-75 copper alloy fittings. ASTM B-584 grooved end cast bronze fittings for 6" pipe size.
JOINTS	ASTM B-32 solder filler material, Alloy Sb5 "95/5." ASTM B-813 liquid or paste flux. Soldering procedures shall comply with ASTM B-828.	Rolled groove prepared and assembled in accordance with manufacturer instructions.
MECHANICAL JOINTS	Cast copper alloy unions, hexagonal stock with ball-and-socket joint, solder joint ends. ASME B16.18.	ANSI Class 150 flange adapter equal to Victaulic Style 641 for connections to flanged equipment. ANSI B16.1 dimensions.
VALVES		
GATE	Use ball valve.	Use ball valve.
BALL	All bronze, 3 piece, full port, PTFE seats, solder end connections. 600 psig WOG. Apollo 82-200, Milwaukee BA-350, Watts B-6801.	Class 125, cast iron body, epoxy coated. Full port, flanged ends, stainless steel ball and stem. ANSI B16.1 flange dimensions. Watts G-4000-FDA series.
CHECK	Bronze body and clapper, solder ends, 200 WOG. Jenkins 4093, Milwaukee 1509, Stockham B-309.	Iron body, bronze mounted, flanged ends, 200 WOG. Jenkins 624-C, Milwaukee F-2974-M, Stockham G-931.
BALANCING	All bronze, 2 piece, RPTFE seats, solder end connections. 600 psig WOG. Apollo 70-100, Milwaukee BA-150, Watts B-6001. CamLock handle.	Cast iron lug body butterfly valve. Bronze disc, replaceable EPT liner, stainless steel stem, 200 psig CWP.
DRAIN	All bronze, 2 piece, RPTFE seats, thread x solder end connections. 600 psig WOG. Apollo 70-100, Milwaukee BA-150, Watts B-6001. Hose thread adapter with cap and chain.	

Notes:
1. Below grade water piping 3" and smaller shall be Type K copper with bituminous coating and copper brazed joints, BCuP filler alloy. ANSI/AWS A5.8. Procedures shall be per ANSI/AWS B2.2.
2. Below grade water piping 4" and larger shall be ductile iron cement lined Class 52 piping with push-on joints.
3. Contact between dissimilar metals shall be made with di-electric couplings or di-electric flanges. Contact between ferrous stud bolts and bronze flanges shall be electrically insulated with non-metalic washers.

A11: NATURAL GAS

PIPE CLASS A11 ITEM	2" AND SMALLER	2½" AND LARGER
Pipe	Schedule 40 Carbon Steel ASTM A53 Grade B, A106 Grade A or A120.	Schedule 40 carbon steel ASTM A53 Grade B, A106 grade A or A120.
Fittings	Screwed malleable iron 125 psi.	Butt weld carbon steel Schedule 40, A234.
Joints		
Unions	Screwed 150# Malleable Iron A105 Grade II.	Use flanges.
Flanges	Class 125 Raised face, screwed, A105.	Class 150 raised face weld neck A105 ASTM A181, Grade I. Class 150 flat face for cast iron valve.
Flange Gaskets	1/16" red rubber, wire inserted. Class 150 raised face and Class 125 flat face gasket.	
Flange Bolts		
Valves Plug/Gas Cock	Use ball valve.	Iron body, greasable and lubricated tapered plug, flanged end, 175 working pressure. Nordstrom 143, Serck Audco LSW-133-GG, Walworth.
Ball	Bottom loaded pressure stem. Valve rated at 600 psi WOG. Watts B-6000-UL, Apollo Model 70-10x-07, or equal. Nibco 585-70	
Emergency Gas Shut-Off Cabinet	Zurn Accudoor custom valve box with brushed stainless finish. Flush door, glass panel, labeled "safety gas shutoff valve," T handle locks. Furnish and install approved ball valve as specified above.	
Check	150# class, bronze swing check valve. Aluminum disc, screwed cap, and threaded ends. Approved equal to Eclipse Inc. Series 1000. Nibco	
Pressure Regulators	Fisher Regulator 113 Series or equal.	
Gas Meter	By local utility.	

NOTES:
1. Provide two wrenches for each gas cock size.
2. All welders for gas piping must be certified per the requirements of this Section.
3. Gas piping installed inside concrete walls or block partitions shall be protected for corrosion and in accordance with IFGC

A13: LABORATORY AIR

PIPE CLASS A13 ITEM	½" to 2"	2 ½" and Larger
Pipe	Seamless copper tube, drawn temper, ACR Type L. ASTM B-280. (See Note 1.)	Seamless copper tube, drawn temper, ACR Type L. ASTM B-280. (See Note 1.)
Fittings	Wrought copper, solder-joint. ASME B16.22. (See Note 1.)	Wrought copper, solder-joint. ASME B16.22. (See Note 1.)
Joints	ANSI/AWS A5.8 brazing filler material, BCuP series. No flux. (See Note 2.)	ANSI/AWS A5.8 brazing filler material, BCuP series. No flux. (See Note 2.)
Unions	Cast copper alloy unions, hexagonal stock with ball-and-socket joint, solder joint ends. ASME B16.18. (See Note 1.)	Use flanges.
Flange	Class 150 flange, ANSI B16.24. 210 psi wog, 150°F, ANSI B16.1 flange dimensions (See Note 1.) (Note: Flange and bolt insulating kits should be used when flanges are dissimilar metals)	Class 150 flange, ANSI B16.24. 210 psi wog, 150°F, ANSI B16.1 flange dimensions (See Note 1.) (Note: Flange and bolt insulating kits should be used when flanges are dissimilar metals)
Flange Gaskets	1/8" thick fiber free neoprene, full face or ring type for rigid face flanges. Garlock No. 7986, or equal.	1/8" thick fiber free neoprene, full face or ring type for rigid face flanges. Garlock No. 7986, or equal.
Flange Bolts	Studs: Continuous threaded studs, carbon steel hex, head bolts, ASTM A307, Grade B Nuts: Heavy hex, carbon steel, ASTM A563, Grade A (Note: Isolated bolts and nuts from flanges by means of insulating kits)	Studs: Continuous threaded studs, carbon steel hex, head bolts, ASTM A307, Grade B Nuts: Heavy hex, carbon steel, ASTM A563, Grade A (Note: Isolated bolts and nuts from flanges by means of insulating kits)
Valves (See Note 1.)		
Ball	All bronze, 3 piece, full port, PTFE seats, stainless steel ball and stem, solder end connections. 600 psig WOG. Apollo 82-200-10-57, Worcester valve model X4-16-TT, Nibco S-595-Y oxygen cleaned, Watts B-6801-SS-OC.	All bronze, 3 piece, full port, PTFE seats, stainless steel ball and stem, solder end connections. 600 psig WOG. Apollo 82-200-57, Worcester valve (O_2 service) model X41-6TT-151 supply ANSI flanges, Chemetron model 77 K-tube extension.
Check	Class 125, bronze body, bronze disc, solder end connections. See Note 2. Milwaukee 1509, Jenkins 4093, Stockham B-309. Nibco 413Y	Class 125, cast iron body, bronze disc, flanged end connections. ANSI B16.1 flange dimensions. (See Note 2.) Milwaukee F-2974.
Pressure Regulator (Mains)	Bronze body, bronze piston and cylinder. BUNA "N" seat elastomer disc and stack. Cash Acme B Series with wheel handle.	
Pressure Regulator (Point-Of-Use)	Bronze body, stainless steel piston and cylinder. Concoa Series 400.	
Relief Valve		

NOTES:

1. Valves, fittings, components and each length of tube shall be factory cleaned per the applicable pipe standard. They shall be permanently labeled and delivered plugged, capped, bagged or otherwise sealed. Plug caps or other seals shall remain in place until final assembly.
2. Joints and piping shall be continuously purged with a positive flow of Grade M, CGA Pamphlet G-10.1 oil free, dry nitrogen per ANSI/AWS B2.2 procedures.
3. Valves shall be by a single manufacturer.
4. Provide mechanical joint connections to all equipment such as pumps, compressors, manifolds, etc.
5. Contact between dissimilar metals shall be made with dielectric couplings or dielectric flanges. Contact between ferrous and bolts and bronze or copper flanges shall be electrically insulated with non-metallic washers.

A14: CARBON DIOXIDE

PIPE CLASS A14 ITEM	½" to 2"	2 ½" and Larger
Pipe	Seamless copper tube, medical gas, drawn temper, Type L. ASTM B-819. (See Note 1.)	Seamless copper tube, medical gas, drawn temper, Type L. ASTM B-819. (See Note 1.)
Fittings	Wrought copper, solder-joint. ASME B16.22. (See Note 1.)	Wrought copper, solder-joint. ASME B16.22. (See Note 1.)
Joints	ANSI/AWS A5.8 brazing filler material, BcuP series. No flux. (See Note 2.)	ANSI/AWS A5.8 brazing filler material, BCuP series. No flux. (See Note 2.)
Unions	Cast copper alloy unions, hexagonal stock with ball-and-socket joint, solder joint ends. ASME B16.18. (See Note 1.)	Use flanges.
Flanges	Class 150 flange, ANSI B16.24. 210 psi wog, 150°F, ANSI B16.1 flange dimensions (See Note 1.) (Note: Flange and bolt insulating kits should be used when flanges are dissimilar metals)	Class 150 flange, ANSI B16.24. 210 psi wog, 150°F, ANSI B16.1 flange dimensions (See Note 1.) (Note: Flange and bolt insulating kits should be used when flanges are dissimilar metals)
Flange Gaskets	1/8" thick fiber free neoprene, full face or ring type for rigid face flanges. Garlock No. 7986, or equal.	1/8" thick fiber free neoprene, full face or ring type for rigid face flanges. Garlock No. 7986, or equal.
Flange Bolts	Studs: Continuous threaded studs, carbon steel hex, head bolts, ASTM A307, Grade B Nuts: Heavy hex, carbon steel, ASTM A563, Grade A (Note: Isolated bolts and nuts from flanges by means of insulating kits)	Studs: Continuous threaded studs, carbon steel hex, head bolts, ASTM A307, Grade B Nuts: Heavy hex, carbon steel, ASTM A563, Grade A (Note: Isolated bolts and nuts from flanges by means of insulating kits)
Valves (See Note 1.)		
Ball	All bronze, 3 piece, full port, PTFE seats, stainless steel ball and stem, solder end connections. 600 psig WOG. Apollo 82-200-10-57, Worcester valve model X4-16-TT, Nibco S-595-Y oxygen cleaned, Watts B-6801-SS-OC.	All bronze, 3 piece, full port, PTFE seats, stainless steel ball and stem, solder end connections. 600 psig WOG. Apollo 82-200-57, Worcester valve (O_2 service) model X41-6TT-151 supply ANSI flanges, Chemetron model 77 K-tube extension.
Check	Class 125, bronze body, bronze disc, solder end connections. See Note 2. Milwaukee 1509, Jenkins 4093, Stockham B-309. Nibco 413Y	Class 125, cast iron body, bronze disc, flanged end connections. ANSI B16.1 flange dimensions. (See Note 2.) Milwaukee F-2974.
Regulators	Watersaver Faucet Model L3173-366-158WS. Refer to details.	
Relief Valves		

NOTES:

1. Valves, fittings, components and each length of tube shall be factory cleaned and suitable for medical oxygen service in accordance with CGA Pamphlet G-4.1. They shall be permanently labeled and delivered plugged, capped, bagged or otherwise sealed. Plug caps or other seals shall remain in place until final assembly.
2. Brazers shall be qualified in accordance with the requirements of NFPA 99. Joints and piping shall be continuously purged with a positive flow of Grade M, CGA Pamphlet G-10.1 oil free, dry nitrogen per ANSI/AWS B2.2 and NFPA 99 procedures.
3. Valves shall be by a single manufacturer.
4. Provide mechanical joint connections to all equipment such as pumps, compressors, manifolds, etc.
5. For all medical gas installations, provide lockable valves on all control valve installations.
6. Contact between dissimilar metals shall be made with dielectric couplings or dielectric flanges. Contact between ferrous and bolts and bronze or copper flanges shall be electrically insulated with non-metallic washers.

A15: LABORATORY VACUUM

PIPE CLASS A15 ITEM	½" to 2"	2 ½" and Larger
Pipe	Seamless copper tube, drawn temper, Type L. ASTM B-88.	Seamless copper tube, drawn temper, Type L. ASTM B-88.
Fittings	Pressure wrought copper, solder-joint, drainage pattern. ASME B16.22.	Pressure wrought copper, solder-joint, drainage pattern. ASME B16.22.
Joints	ANSI/AWS A5.8 brazing filler material, BcuP series	ANSI/AWS A5.8 brazing filler material, BCuP series.
Unions	Cast copper alloy unions, hexagonal stock with ball-and-socket joint, solder joint ends. ASME B16.18.	Use flanges.
Flanges	Class 150 flange, ANSI B16.24. 210 psi wog, 150°F, ANSI B16.1 flange dimensions. (Note: Flange and bolt insulating kits should be used when flanges are dissimilar metals)	Class 150 flange, ANSI B16.24. 210 psi wog, 150°F, ANSI B16.1 flange dimensions. (Note: Flange and bolt insulating kits should be used when flanges are dissimilar metals)
Flange Gaskets	1/8" thick fiber free neoprene, full face or ring type for rigid face flanges. Garlock No. 7986, or equal.	1/8" thick fiber free neoprene, full face or ring type for rigid face flanges. Garlock No. 7986, or equal.
Flange Bolts	Studs: Continuous threaded studs, carbon steel hex, head bolts, ASTM A307, Grade B Nuts: Heavy hex, carbon steel, ASTM A563, Grade A (Note: Isolated bolts and nuts from flanges by means of insulating kits)	Studs: Continuous threaded studs, carbon steel hex, head bolts, ASTM A307, Grade B Nuts: Heavy hex, carbon steel, ASTM A563, Grade A (Note: Isolated bolts and nuts from flanges by means of insulating kits)
Valves Ball	All bronze, 3 piece, full port, PTFE seats, stainless steel ball and stem, solder end connections. 600 psig WOG. Apollo 82-200, Chemetron Model 77 with tube extension, Worcester Model X416TT-TE, Nibco Valve Co. S-595-Y-66	To 4" Apollo 82-200, Chemetron Model 77, Worcester Valve X416TT-151 with flanges.
Check	Class 125, bronze body, bronze disc, solder end connections. Milwaukee 1509, Jenkins 4093, Stockham B-309. Nibco 413Y	Class 125, cast iron body, bronze disc, flanged end connections. ANSI B16.1 flange dimensions. Milwaukee F-2974. Nibco F408W

NOTES
1. Valves shall be by a single manufacturer.
2. Provide mechanical joint connections to all equipment such as pumps, compressors, manifolds, etc.
3. Contact between dissimilar metals shall be made with dielectric couplings or dielectric flanges. Contact between ferrous stud bolts and bronze or copper flanges shall be electrically insulated with non-metallic washers.

A17 VACUUM EXHAUST

PIPE CLASS A17 ITEM	3" AND SMALLER	4" AND LARGER
Pipe	Schedule 40 galvanized steel.. ASTM A53 Grade B, A106 Grade A or A120 plain end.	Schedule 40 galvanized steel. ASTM A53 Grade B, A106 grade A or A120 plain end.
Fittings	Screwed malleable iron Class 125 galvanized.	Grooved malleable iron 125 psi galvanized.
Unions	Screwed Class 150 malleable iron A105 Grade II, galvanized.	Use flanges.
Joints	Threaded joints, flanges at equipment and valves as required (Note 1)	Flanged at flanged equipment and valves (Note 1)
Flanges	Class 125 raised face, screwed, A105 galvanized.	Class 150 raised face galvanized uniflange, ASTM A181, Grade I. Class 150 flat face for cast iron valve, 175 WOG at 150°F.
Flange Gaskets	1/16" red rubber, wire inserted, Class 150 raised face and Class 125 flat face gasket.	1/16" red rubber, wire inserted, Class 150 raised face and Class 125 flat face gasket.
Flange Bolts	Studs: Continuous threaded studs, carbon steel hex, head bolts, ASTM A307, Grade B Nuts: Heavy hex, carbon steel, ASTM A563, Grade A (Note: Isolated bolts and nuts from flanges by means of insulating kits)	Studs: Continuous threaded studs, carbon steel hex, head bolts, ASTM A307, Grade B Nuts: Heavy hex, carbon steel, ASTM A563, Grade A (Note: Isolated bolts and nuts from flanges by means of insulating kits)
Check	Horizontal swing, composition disc, all bronze, threaded ends, 200 psi WP. Milwaukee 509, Jenkins 352c, Stockham B319. Nibco T/S 413Y	Outside lever and weight swing check, IBBM for installation at no more than 45° from horizontal, flanged end, 200 psi wp. Jenkins 477-l, Stockham G931-l&W. Nibco 918W
NOTE: 1. Apply galvanized compound in accordance with manufacturer's instructions.		

D12: LAB VENT, LAB WASTE

PIPE CLASS D12 ITEM	ABOVE GRADE	BELOW GRADE
Pipe	Schedule 40 polypropylene pipe (FRPP) flame retardant manufactured to meet Schedule 40 iron pipe size dimensional standards in accordance with ASTM D2122, Section 4 and 7.	Schedule 40 polypropylene pipe (PPNO) non flame retardant black Type I.
Fittings	DWV pattern flame retardant Schedule 40 fittings based on laying length dimensions in ANSI B16-12. Wall thickness shall conform to ASTM D2122, Section 4.	DWV pattern flame retardant Schedule 40 fittings based on laying length dimensions in ANSI B16-12. Wall thickness shall conform to ASTM D2122, Section 4.
Joints	Fusion method with fusion coils or fixed fusion fittings fabricated in accordance with the manufacturer's recommendations. Joints made between PP pipe and dissimilar materials shall be joined with proper adapters and transition fittings according to manufacturer's recommendations.	Fusion method with fusion coils or fixed fusion fittings fabricated in accordance with the manufacturer's recommendations. Joints made between PP pipe and dissimilar materials shall be joined with proper adapters and transition fittings according to manufacturer's recommendations.
Acceptable Manufacturers	Refer to Section 2.1	

NOTES:

1. Interior lab waste and vent branch piping under lab benches shall be made with FRPP pipe and mechanically joined DWV chemical waste pipe fittings.

D13A: LAB WASTE AND VENT (PLENUM RATED).

PIPE CLASS D-13A ITEM	ABOVE GRADE	BELOW GRADE
PIPE	Schedule 40 Flame Retardant Polyvinylidene Fluoride Piping, (PVDF). Pipe shall be rated for use in return air plenums per UL and FM tests for smoke and flame spread. The PVDF material shall conform to ASTM D3222. The Piping shall be manufactured to meet schedule 40 Iron Pipe Size Dimensional Standards In Accordance With ASTM D 2122, Section 4 & 7. The pipe shall be marked with UL Classification to indicate compliance with UL 723 (ASTM E84).	Schedule 40 Flame Retardant Polyvinylidene Fluoride Piping, (PVDF). The PVDF material shall conform to ASTM D3222. The Piping shall be manufactured to meet schedule 40 Iron Pipe Size Dimensional Standards In Accordance With ASTM D 2122, Section 4 & 7.
FITTINGS	DWV Pattern Flame Retardant Schedule 40 Fittings Based On Laying Length Dimensions In ANSI B16-12. Wall Thickness Shall Conform To ASTM F1673 and ASTM E84	DWV Pattern Schedule 40 Fittings Based On Laying Length Dimensions In ANSI B16-12. Wall Thickness Shall Conform To ASTM F1673 and ASTM E84
JOINTS	Fusion Method equal to Orion socket fusion system conforming to ASTM 2657. Fittings Fabricated In Accordance With The Manufacturer's Recommendations. Joints Made Between PVDF Pipe And Dissimilar Materials Shall Be Joined With Proper Adapters And Transition Fittings According To Manufacturer's Recommendations.	Same As Above Grade
Accepted Manufacturers	Refer to Section 2.1	

NOTES:

1. Installation, including support spacing, compensation for expansion and contraction, and joining shall be in compliance with manufacturer's recommendations.

PART 3 - EXECUTION

3.1 SPECIAL RESPONSIBILITIES

A. Coordinate with work of other Sections in executing work of this Section.

3.2 INSTALLERS

A. The installation of laboratory process piping systems requires high quality of workmanship, quality control and documentation. The Contractor is fully responsible for quality control documentation related to the experience, certifications, training, and field and shop procedures utilized.

B. Maintain a continuous record of field or shop-installed or fabricated elements of the system to the individual(s) performing the Work.

3.3 LABORATORY PIPING INSTALLATION

A. Material Handling and Protection in Field
   1. Confirm that the packaging of sub-assemblies or components is undamaged and that all tube ends are sealed and capped.
   2. All pipe and fittings shall be clean when installed. Each length of pipe shall be free of all grease, oil, loose mill scale or other foreign matter. All piping that is clean when received shall be kept clean. Any piping that is dirty or contaminated shall not be used.
   3. Protective plugs or caps shall not be removed until just prior to installation. Just prior to completion of the day's work, all open ends of pipe, tubing, and fittings shall again be plugged or capped. Any pipe, tubing, or fittings exposed to the weather during installation shall be capped or plugged unless fit-up work is in progress and then only that end being fit-up shall have the plug or cap removed during the fit-up period.
   4. Owner's Representative shall have the right to reject any material for installation or already installed that has been improperly stored or handled.
   5. If any job is not completed at the end of the workday all open pipe or valve ends will be capped with suitable cap capable of maintaining a 2 to 5 psig positive pressure.

3.4 JOINT CONSTRUCTION

A. Refer to Part 2 of this specification for basic piping joint construction.

B. Joints and connections shall be permanent and shall be gas- and water-tight. Jointing shall be types specified for service indicated. Joints and connections shall meet requirements of manufacturer's best recommended practice. All transitions between different piping materials shall be made using approved adapters. Adapters for transitions between two types of piping materials shall be manufactured for purpose intended.

C. Provide dielectric fittings at connections of dissimilar materials.

D. Nipples shall be same material, make and thickness as pipe with which they are used.

E. Make screw joints tight with Teflon (polytetrafluoroethylene) tape for water systems.

F. Make fusion welded joints as required by ANSI B31.1. Make changes in direction of welded pipe with welded fittings only. Bevel connections before welding, mechanically or by flame-cutting. Welding qualifications, weld records and quality control samples.

G. Connections to tanks and equipment shall be made with unions or flanges.

H. Soldered Joints: Use ASTM B813, water flushable, lead-free flux, ASTM B32, lead-free alloy solder; and ASTM B 828 procedure, unless otherwise indicated.

I. Grooved Joints: Assemble joint with keyed coupling, gasket, lubricant, and bolts according to coupling and fitting manufacturer's written instructions.

J. Brazed Joints: Use ANSI/AWS A5.8 filler material, BCUP series. No flux is permitted

3.5 PIPE IDENTIFICATION

A. Provide color-coded pipe identification markers on piping installed under this Section. Pipe markers shall be snap-on laminated plastic protected by clear acrylic coating. Pipe markers shall be applied after Architectural painting where such is required.

B. Provide arrow marker with each pipe content marker to indicate direction of flow. If flow can be in either direction, use double-headed arrow marker.

C. Mains shall be labeled at points of entrance and exit from mechanical room, adjacent to each valve, on each riser, at each tee fitting, at points of entrance and exit from building, at least once in each room, and at intervals no longer than 20'.

D. In general, 2" high legend shall be used for pipe lines 4" dia. and larger, and 3/4" high legend shall be used for pipe lines 3" dia. and smaller.

E. Markers shall be Seton, Setmark, Marking Services Inc., or approved equal.

F. Color banding shall meet ANSI latest and OSHA requirements.

G. Markers shall have legends and color coding with black letters:
1. Markers are to be applied to all piping, regardless of under jacket colors per the following schedule:

Service	Legend	Background Color
Exhaust Gas	Exhaust Gas	Yellow
Natural Gas	Natural Gas	Yellow
Emergency Tempered Water	Tempered Water	Green
Laboratory Compressed Air	Compressed Air	Blue
Laboratory Vacuum	Vacuum	Green
Carbon Dioxide	Carbon Dioxide	Yellow
Lab Waste	Lab Waste	Yellow
Lab Vent	Lab Vent	Yellow

3.6 TAGS, VALVES, EQUIPMENT AND INSTRUMENTS

A. Upon completion of work, attach engraved laminated plastic tags to all valves, and instrumentation. Equipment shall bear a stamped stainless tag. Tags shall have black characters

on white face, consecutively numbered and prefixed with letter P for general valves. Tags shall bear the number used in the P&IDs for those items so marked.

B. Embossed or engraved aluminum or brass tags may be substituted if desired. Tags shall be at least 1/8" thick.

C. Tags shall be at least 1" diameter with numerals at least 3/8" high and attached by S hooks and chains.

D. Nameplates, catalog numbers and rating identifications shall be securely attached to electrical and mechanical equipment with screws or rivets. Adhesives or cements will not be permitted.

E. Non-potable water outlets shall be identified with permanently attached yellow color code or 4" high triangle tag reading, "water unsafe."

F. Coordinate numbering system with existing piping tags as not to duplicate numbers.

3.7 LABORATORY WASTE AND VENT PIPING

A. Provide laboratory waste and vent piping as shown on Drawings. Laboratory vents shall extend through roof and shall increase to at least 4". Piping shall be assembled and installed without undue strains and stresses, and provision shall be made for expansion, contraction and structural settlement.

B. Interior horizontal laboratory waste piping shall be installed in practical alignment at uniform grade of at least 1/8" per foot but ¼" per foot where code dictates, and as shown on Drawings.

C. Vents from laboratory fixtures or line of fixtures (not including island bench), when connected to vent line serving other fixtures, shall be extended at least 6" above flood level rim of highest fixtures to prevent use of vent line as waste. No vent terminal shall be directly beneath door, window or other ventilating opening of building, nor shall any vent be within 12 feet horizontally of such opening.

D. Provide sleeves for pipes that pass through a wall.

E. Piping shall run straight and plumb and offsets shall be made at an angle of no less than 45.
   1. Cut pipe and square with axis of pipe. Use fine tooth hand saw and miter box, a power cutoff saw, or a plastic tubing cutter to make a precision cut.
   2. Remove all burrs remaining on end of pipe from both inside and outside surfaces.
   3. Wipe all dirt and foreign matter from end of pipe and fitting socket, using a clean, dry cloth.
   4. Vigorously sand the outside surface of the pipe where it enters the socket and the fitting socket. Use clean 60 grit abrasive cloth or paper. Clean sanded surfaces and coil with MEK (methyl ethyl ketone) or acetone.
   5. Do not handle the freshly cleaned surfaces before assembling the joint.

F. Set up joint and fuse joint according to manufacturer's recommended practice.

3.8 LABORATORY PROCESS GASEOUS SYSTEMS

A. Process gaseous systems shall be installed with minimum number of fittings. Changes in direction requiring turns of offsets with radii less than five times pipe or tubing outside diameter shall be

made by bending tubing. Bends shall be free from appreciable flattening, buckling or thinning of tube wall.

B. Tubing shall be cut accurately to system measurements obtained at site and installed without springing or forcing. Tubing shall be protected against mechanical injury in manner satisfactory to authorities that have jurisdiction.

C. Vacuum piping and component valves and fittings shall be capable of full vacuum. Threaded joints shall not be used.

3.9 CLEANING

A. Clean systems thoroughly before testing. Fixtures, equipment, pipe, valves and fittings shall be free of grease, metal cuttings, dirt and other foreign material. Remove protective covers. Fixtures (including lavatories, water closets and urinals) shall be cleaned and ready for use.

B. Repair stoppage, discoloration and damage to parts of building, finish and furnishings due to failure to properly clean piping system within Contract Price.

C. After completion of project, clean the exterior surface of equipment included in this section, including concrete residue.

D. After the completion of the work, all materials and equipment surfaces shall be cleaned and polished in accordance with the finish of the material. All chromed surfaces shall be highly polished.

E. Before the systems are tested and balanced, pipes and equipment shall be thoroughly cleaned so that no dirt, dust, or other foreign matter will be deposited in or carried through the systems.

F. Water systems shall be thoroughly flushed and cleansed of any and all deleterious materials at least once before system is placed in operation. At this time, these systems will be carefully checked for leaking and defects as hereinafter specified. An approved cleansing agent will be used in flushing.

G. At all times, keep the premises clear of undue accumulation of rubbish.

H. On completion of the work, remove all rubbish and debris resulting from this contract, and dispose of same. At any time should the general contractor be dissatisfied with the performance of clean-up responsibilities, he may elect, after proper notification, to undertake this operation and backcharge this Subcontractor accordingly.

I. All equipment shall be thoroughly cleaned and left in a satisfactory condition for proper operation at project completion.

3.10 TESTING: PIPING SYSTEMS

A. General

1. Piping systems shall be subjected to testing water or air as noted and shall hold tight at the pressure head stated for the time interval required without adding air or water. While any system is being tested, required head or pressure shall be maintained until joints are inspected.

2. Tests shall be witnessed by inspector having jurisdiction with 48-hour notice given these authorities.
3. Equipment, material and labor required for testing of various systems or part thereof shall be provided by Plumbing Contractor.

B. Vacuum System:
1. The lab vacuum system shall be tested to 150 psi with Owner's representative present, then perform rate of rise vacuum test as follows: Perform rate of rise test for vacuum per the requirements set forth by the American Vacuum Society. System P must be less than or equal to .1 ($P_{pumpout}$-P_{del}) over 1 hour; P must be less than or equal to .1 (P_{del}) over 24 hours.

C. Natural Gas Piping Systems
1. Upon completion of gas piping system or section thereof, as required, test by attaching an air compressor testing apparatus to any suitable opening and, after closing all other inlets or outlets, force air into the system until a uniform pressure of at least 10" mercury or 3 lb. gauge for a period of no less than 60 minutes for each 500 cubic feet of pipe volume without showing any drop in pressure. Pressure shall be measured with a mercury manometer, slope gauge, or an equivalent device calibrated to read in increments of no greater than 1/10 lbs.
2. Test all elevated pressure gas piping at **[ ] [15 psi]** for 24 hours. Pressure shall be measured with a mercury manometer, slope gauge, or an equivalent device calibrated to read in increments of no greater than 1/10 lbs.

D. Laboratory Process Gaseous Systems:
1. Compressed air, Carbon Dioxide and other lab gases piping shall be tested with nitrogen gas to 150 psi for one hour.
2. Provide a complete purity test of all laboratory gaseous piping systems. Test piping with oil-free air or nitrogen and check for cross connection. Submit testing procedures in shop drawing format for review.
    a. Retain the services for an independent testing agency to testall laboratory gases and vacuum systems.
    b. Final Purging: Introduce applicable gas for each system into respective piping system. Purge installed outlets to remove test gas. Collect samples and analyze gas at each source to identify purity level.
    c. Outflow Analysis: Collect samples and analyze gas at positive pressure outlets to confirm delivery of source gas and purity level.
    d. Particulate Sampling: Test positive pressure outlets using a 0.45-micron filter for evidence of particulate contamination. Excessive contaminants level will require additional purging.
    e. Moisture: Test positive pressure outlets for dewpoint to verify absence of moisture in piping. Do not exceed source gas dewpoint by more than 4 deg. F.
    f. The purity of the gas at six (6) random remote outlets per floor, per building shall equal the purity of the source gas.
    g. Maintain a log of systems and outlets tested. Prepare a written report including all problems and corrective action.

E. Testing Summary

System	Test Medium	Test Pressure	Test Duration
Natural Gas (low pressure)	Air	10” Mercury minimum for each 500 cubic feet of pipe volume	1 hour
Compressed Air	Oil-free Air or Nitrogen	150 psig	1 hour
Vacuum	Oil-free Air or Nitrogen	150 psig then full rate of rise vacuum test	1 hour
Special Gases	Source Gas	150 psig	1 hour
Vacuum Exhaust	Air	25 psig	1 hour

F. Defective Work: If inspection or tests show defects, such defective work or material shall be replaced and inspection and tests shall be repeated. Repairs to piping shall be made with new material. No caulking of screwed joints or holes shall be acceptable.

G. Additional Tests
1. Provide additional tests such as smoke pressure tests as required by regulations or as directed by authorities making the inspection.
2. Provide for any repeated test as directed by the Architect, to make all systems tight as required.
3. Visual inspections of joints and valves shall be made as directed by the Architect.

END OF SECTION 221513

N:\N0912.00\DOC\SPEC\2012_03-16_BID\221513 - LABORATORY SERVICE PIPING.DOC

SECTION 221600 - LABORATORY WASTE NEUTRALIZATION SYSTEM

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

1.2 SUMMARY

A. This specification section describes the technical specification and general instructions for the fabrication, furnishing, handling, delivery and installation of pH treatment equipment for wastewater.

B. Section Includes:
1. Contact basin,
2. Access way covers,
3. Neutralizing media,
4. In-line pH probes and transmitter equipment,
5. Strip-chart recorder,
6. Pour in place anti-buoyancy pads,
7. Interconnecting piping tubing and wiring.

C. Related Sections
1. Division 3 Section “Cast In Place Concrete”
2. Section 221513 Laboratory Service Piping

1.3 DEFINITIONS

A. pH – A logarithmic scale ranging from 0 to 14 indicating the level of acidity or alkalinity of a solution. Specifically, pH is determined by calculating the negative logarithm of the hydrogen ion (H+) concentration in solution expressed in moles per liter. A pH level of 7.0 at 25°C (77°F) is considered neutral. Values below 7.0 are considered acidic and values above 7.0 are alkaline (basic).

B. Neutral – Refers to the state of a solution when the concentration of hydrogen (H+) ions in solution is equal to the hydroxide ion (OH-) concentration.

C. Local Sewer Authority – The regulatory authority (local, state or otherwise) having jurisdiction regarding the discharge of industrial and other treated wastes into the public sewer system. Also referred to in regulations as the publicly owned (operated) treatment works (POTW).

D. Retention Period – The average period of time for untreated influent to travel from the inlet of the tank to the outlet of the tank and into the sewer system as treated effluent.

E. Reagent – A substance used to convert acidic or caustic constituents in solution to a neutral state by means of an acid/base neutralizing reaction.

1.4 SYSTEM DESCRIPTION

A. Continuous flow, pH adjustment system fabricated to treat laboratory waste effluent prior to discharge to the POTW. The neutralizing system shall minimize turbulence, promote settling, and prevent scouring of neutralizing media. Temporary backwater conditions will not cause neutralizing media to be suspended or scoured from the neutralizing system. The neutralizing system shall be comprised of two cells or chambers promoting efficient and maximum contact with the neutralizing media.

B. The neutralizing media shall be non toxic, non hazardous, and safe to handle and store without special storage devices, or under any special storage regulations.

C. The neutralizing system shall be for underground installation and shall be installed per the manufacturer's recommendations.

D. Performance Requirements
   1. Maintain effluent discharge between 5.5 and 12.0 pH or as required by Local Sewer Authority.
   2. The pH level shall be maintained by means of neutralization media and retention time within the basin.
   3. Discharge pipe shall be fitted with an approved sample port for direct sampling of the effluent by the local authority having jurisdiction.

1.5 SUBMITTALS

A. General – Submit product data, shop drawings and other related documentation in accordance with Contract Clauses and Division 1 Specification Sections.

B. Submit Product Data
   1. Product data submittal shall include all components including, but not limited to:
      a. Neutralizing retention tank(s)
      b. Neutralizing media
      c. In-line electronic pH probes and wiring
      d. Strip-chart recorder
      e. Interconnecting piping, tubing and wiring
   2. Include rated capacities, furnished specialties, and all accessories.

C. Submit Shop Drawings
   1. Submit scale drawings showing physical layout of equipment in plan view and elevation view. Include references for connection locations and clearances around and above.
   2. Submit complete wiring diagrams of all interconnecting power and control wiring. Diagrams shall indicate factory-installed wiring and field-installed wiring.
   3. Submit Material Safety Data Sheets (MSDS) of neutralizing media.

D. Submit Maintenance Data
   1. Submit maintenance instructions for inclusion in Operating and Maintenance Manual specified in Division 15 Section "Mechanical General Requirements."

E. Permits and Licenses
   1. Submit copies of all applicable paid and approved permits and licensing forms in connection with the installation of waste treatment equipment as required by the Local Sewer Authority.

1.6 QUALITY ASSURANCE

A. Manufactured equipment shall comply with the regulatory requirements of the Local Sewer Authority having jurisdiction.

B. Equipment vendor shall hold a current license to install, maintain and operate automatic pH adjustment equipment in jurisdictions requiring same.

C. The equipment vendor shall be capable of serving as Owner's agent in the application for and securing of all required DEP installation and waste discharge permits.

D. Neutralization system shall be assembled and tested at the factory prior to delivery to the site, with the exception of neutralization media, which shall be field installed at start-up.

E. Electrical components, devices and accessories shall be listed and labeled as defined in NFPA 70, Article 100, by an independent testing agency acceptable to the authorities having jurisdiction.

F. Assembly by Contractor shall be limited to influent and effluent connections, single power feed, signal and alarm feeds.

1.7 DELIVERY, STORAGE AND HANDLING

A. Hardware
1. All mechanical and electrical components shall be packaged for shipping as deemed appropriate by vendor. Equipment shall be stored indoors on site in accordance with vendor recommendations and away from sources of excess heat or vibration.
2. Retain shipping flange protective covers and protective coatings during storage.
3. Protect components against damage.
4. Comply with manufacturer's rigging instructions for handling.

B. Chemicals
1. Vendor shall supply complete Material Safety Data Sheet (MSDS) documentation upon chemical deliveries to the site.
2. Store and handle chemicals in accordance with vendor's recommendation and the package labeling instructions.

1.8 START-UP

A. Provide complete fill of neutralization media.

1.9 WARRANTY

A. Equipment price shall include manufacturer's standard warrantee agreement.

1.10 MAINTENANCE

A. The Contractor shall provide a twelve-month supply of strip chart recording paper.

B. The supplying vendor shall provide an option quote for an annual comprehensive service contract.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Subject to compliance with requirements and Drawings, provide products from one of the following:
   1. Green Turtle.
   2. Engineer approved equal.

2.2 MATERIALS, COMPONENTS AND FABRICATION

Laboratory Waste Neutralization System	
Equipment Tag	**LWNT-1**
Tank	Flat bottom, domed top, elliptical shaped ribbed tank with internal baffles, process connection nozzles and access ports. One tank required, suitable for direct burial up to 6 feet of overburden without reinforcement.
Tank Connections	6 inch inlet and outlet. All connections Schedule 40 PVC plain end pipe. Include 4 inch vent nozzle on basin top. (2) 24 inch access ports.
Tank Materials of Construction	Reinforced fiberglass. Bisphenol Type "A" epoxy vinyl ester resin and e-glass chemical resistant liner and isophthalic polyester resin and e-glass structural reinforcement layers. ASTM D 883-ULC third party tested. Cover and connections shall be air and water tight.
Neutralizing Media	Green Turtle PHIX Media 3000. Initial fill at start-up: 24 buckets.
Tank Capacity	750 gallons nominal volume.
Extension Collars	FRP. Provided by basin manufacturer. 24 inch diameter. Cut to length in field to suit finished grade elevation. Fiberglass Sinkaflex sealant.
Access Covers	Provided by basin manufacturer. 24 inch diameter cast iron covers and frame. H20 loading rated.
Internal Distribution Piping	SDR 35 PVC. Fabricated and installed by basin manufacturer.
Manufacturer/Model	Green Turtle PHIX Gravity Series, PHIX G750.
pH Sensor	Industrial quality pH glass membrane electrode with a measuring range of 0-14 pH. Automatic temperature compensation. Epoxy encapsulated preamplifier with polypropylene housing and 25 ft of five conductor shielded cable.
pH Recorder	Strip chart recorder with single pen and 2 5/16" chart width pH scaled paper. Recorder shall operate on 4-20 mA input from effluent pH. Strip paper length shall record for 31 days. 120 VAC power. Mount on main control front panel.
Effluent Monitoring Port	U-trap shall be constructed of Schedule 80 Fire Retardant Polypropylene (FRPP) designed to meet local regulatory requirements for effluent monitoring. Provide a sampling tap at the monitoring point. Inlet and outlet of the assembly shall be provided with flanged connections.
Assembly and Interconnecting Hardware	The neutralization system internals shall be completely fabricated, assembled and tested by the manufacturer for installation as a single unit.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine product data for connection sizes and dimensional requirements prior to installation of rough plumbing.

B. Examine rough plumbing to verify proper interface prior to installation of neutralization equipment.

C. Examine product data for requirements of concrete base dimensions. Refer to Division 3 Section "Cast-in-Place Concrete" and Division 15 Section "Mechanical General Methods."

3.2 INSTALLATION

A. Install equipment according to manufacturer's published and submitted instructions.

B. Excavate to the required depth, length and width in accordance with OSHA practices. Provide 12 inches of free clearance around the basin at the bottom.

C. Install and level a 6 inch layer of pea gravel or manufacturer approved equivalent backfill and compact to 98% Standard Proctor Density (SPD).

D. Install pour in place concrete anti-buoyancy slab as indicated on the drawing details. Ensure that anchor brackets on side of basin are covered.

E. Fill the basin with water to the level of the inlet and outlet pipes.

F. Backfill around the basin to the level of the inlet and outlet pipes will pea gravel or equivalent backfill approved by the manufacturer. Backfill in 6 to 8 inch layers and compact to 98% SPD.

G. Connect inlet and outlet piping. Complete drainage piping integrity testing to test for leaks prior to backfill.

H. Install extension collars following manufacturer's written instructions.

I. Backfill covering basin top and around extension collars in 6 to 8 inch layers and compacting to 98% SPD.

J. Pour reinforced concrete bearing slab at surface even with finished grade casting in cast iron manhole frame. Center manhole frames over extension collars. Reinforce the concrete slab for H20 loading.

K. Install electrical connections for power, controls and instrumentation. Tighten electrical connectors and terminals according to manufacturer's published torque-tightening values. If manufacturer's torque values are not indicated, use those specified in UL 486A and UL 486B.

3.3 FIELD QUALITY CONTROL

A. Manufacturer representative shall inspect final installation.

B. Manufacturer shall provide representative for field supervision of equipment installation.

3.4 ADJUSTING

A. Calibrate pH probe and indicator.

3.5 DEMONSTRATION

A. Equipment manufacturer shall provide training to Owner on the normal operation, function, and maintenance of equipment and components including response to out of limit conditions, chart recorder paper replacement, and safety procedures.

3.6 COMMISSIONING

A. Perform the following checks before starting system:
   1. Laboratory waste and vent system tests complete.
   2. Check piping connections for leaks.
   3. Test operation of safety controls and devices.
   4. Provide complete fill of neutralizing media per manufacturer recommendations.

END OF SECTION 221600

N:\N0912.00\DOC\SPEC\2012_03-16_BID\221600 - LABORATORY WASTE NEUTRALIZATION SYSTEM.DOC

SECTION 222620 - PACKAGED LABORATORY VACUUM PUMP AND RECEIVER

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:
   1. Laboratory oil-sealed vacuum pumps.
   2. Vacuum receiver.
   3. Control panel.

1.3 DEFINITIONS

A. Actual Air: Expanded air/gas delivered to vacuum pump receiver and through pumps. Flow rate is delivered measured in acfm (actual L/s).

B. Low Voltage: As defined in NFPA 70 for circuits and equipment operating at less than 50 V or for remote-control, signaling power-limited circuits.

C. Standard Air: Free air at 68 deg F (20 deg C) and 1 atmosphere (29.92 in. Hg) before expansion and measured in scfm (standard L/s).

1.4 SUBMITTALS

A. Product Data: For each type of product indicated. Include rated capacities, operating characteristics, electrical characteristics, and furnished specialties and accessories.
   1. Wiring Diagrams: For power, signal, and control wiring.

B. Operation and Maintenance Data: For compressed-air equipment to include in emergency, operation, and maintenance manuals.

1.5 QUALITY ASSURANCE

A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

B. ASME Compliance: Fabricate and label receivers to comply with ASME Boiler and Pressure Vessel Code.

1.6 COORDINATION

A. Coordinate sizes and locations of concrete bases with actual equipment provided.

1.7 EXTRA MATERIALS

A. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.

1. Oil-Filter Elements: Equal to 100 percent of amount installed.

PART 2 - PRODUCTS

2.1 GENERAL REQUIREMENTS FOR PACKAGED VACUUM PUMPS AND RECEIVERS

A. General Description: Factory-assembled, -wired, -piped, and -tested; electric-motor-driven; air-cooled; continuous-duty vacuum pumps and receiver.

B. Control Panels: Automatic control station with load control and protection functions. Comply with NEMA ICS 2 and UL 508.
1. Enclosure: NEMA ICS 6, Type 12 control panel unless otherwise indicated.
2. Motor Controllers: Full-voltage, combination magnetic type with undervoltage release feature and motor-circuit-protector-type disconnecting means and short-circuit protective device.
3. Control Voltage: 120-V ac or less, using integral control power transformer.
4. Motor Overload Protection: Overload relay in each phase.
5. Starting Devices: Hand-off-automatic selector switch in cover of control panel, plus pilot device for automatic control.
6. Automatic control switches to alternate lead-lag compressors for multi-plex pumps.
7. Instrumentation: As noted below.
8. Alarm Signal Device: For connection to building alarm system to indicate when pumps malfunction.

C. Receivers: Steel tank constructed according to ASME Boiler and Pressure Vessel Code: Section VIII, Division 1.
1. Pressure Rating: Full vacuum.
2. Interior Finish: Corrosion-resistant coating.
3. Accessories: As noted below.

D. Mounting Frame: Fabricate mounting and attachment to pressure vessel with reinforcement strong enough to resist packaged equipment movement during a seismic event when base is anchored to building structure.

2.2 OIL-SEALED, VACUUM PUMPS

A. Equipment Tags: VP-1.

B. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

1. Busch.
2. Nash
3. Becker.
4. Approved equal.

C. Data Sheet:

LABORATORY OIL SEALED VACUUM PUMPS	
Equipment Tag	VP-1 (Comprising one package unit with three pumps)
Number Required	Three (3) pumps with pipe headers and control arranged to accept one future pumps without modifications to equipment.
Performance Condition	Vacuum Level at the Pump: 25" Hg Vacuum Level at the Outlet: 24" Hg
Mounting Condition Arrangement	The system shall be expandable with a fully assembled mechanical expansion module to quadruplet.
Type	Rotary vane, oil seal, duplex skid mounted unit with duplex pumps, receiver, piping and control cabinet.
Motor	Direct driven NEMA C-face TEFC nominal speed, 1800 rpm.
Vanes	Non-metallic, non-asbestos composite vanes.
Materials of Construction	Cast iron
Receiver	200 gallon capacity, ASME rated, bypass piping and valving, drain valve and vacuum indicator.
Cooling	Air cooled package.
Lubrication	Integral recirculating oil supply with oil filter. Internal oil separation shall be 4 stages of oil and smoke eliminators consisting of bulk separation, mist elimination, smoke elimination to achieve 99.9+ separation of oil and smoke particles from the exhaust gas.
Controls	The vacuum system shall be equipped with a motor control center consisting of (2) magnetic motor starters with integral overload and short-circuit protection, with pad-lockable disconnecting means; (1) low voltage control transformer with primary and secondary fuses; (2) Manual-Purge/Stop-Auto selector switches with integral pump run lights; (1) programmable controller with data interface means for adjusting system set points; (2) hour meters; (1) power distribution block for single point power feed connection; (1) 24 VDC power supply for use with an externally mounted pressure transmitter; equipment ground bus, and IEC style terminals, all housed in a NEMA 4/12 enclosure. The control panel shall be UL (UL 508) listed. [The entire motor control center shall be configured for future expansion to an automatic alternating triplex unit.] This control center shall alternate on a demand basis when the lead pump turns off, and on a timed basis to ensure approximately equal run time for each pump. All pumps will be set to come on in a cascading sequence. The controls are programmed to minimize motor starts per hour.
Electrical	Single point 460 VAC, 3 phase, 60 Hz
Valves and Connectors	Each pump shall have a built-in antisuck back valve 10 micron inlet filter, auto ball isolation valve, back pressure gauge and vibration isolators and threaded exhaust.
Sundries	Vacuum gauge, oil drain valve, flexible connectors, autopurge assembly, vertical (or horizontal) stand.
Purge System	Each pump shall be equipped with an automatic purge system to flush any gases from the pump to prevent condensation as the pump cools. Purge system shall include isolation valve and actuator, solenoid bleed valve, and controls to operate a 15-minute shutdown purge. If the supply of air or power is discontinued, the isolation valve will go in the closed position and the purge valve will go to the open position.
Start Up and Warranty	1 year by the pump manufacturer. Provide full start up service, installation, check and instruction to maintenance personnel.

LABORATORY OIL SEALED VACUUM PUMPS	
Rated Duty	325 ACFM at 25" Hg Flow Split: 50%, 50%, 50% Pump Flow: 170 acfm, 170 acfm, 170 acfm Pump Horsepower: 10 HP, 10 HP, 10 HP Pump Speed: 1,800 rpm
Acceptable Manufacturers	Busch Model TVET-3-LAB255 vertical triplex
Other:	Mounted on concrete housekeeping pad.
Notes: 1. Supply compressed air at 80 psig for controls and purge. 2. The base shall be pre-drilled, and the manifold shall be pre-piped to accept additional pumps. 3. The entire system shall be factory assembled and tested by the vacuum pump manufacturer to insure that all performance specifications are met	

PART 3 - EXECUTION

3.1 EQUIPMENT INSTALLATION

A. Equipment Mounting: Install vacuum pump skid on concrete base using elastomeric mounts. Comply with requirements in Division 03 Section "Cast-in-Place Concrete." Comply with requirements for vibration isolation devices specified in Division 22 Section "Vibration and Seismic Controls for Plumbing Piping and Equipment."
   1. Minimum Deflection: 1/4 inch (6 mm).
   2. Install dowel rods to connect concrete base to concrete floor. Unless otherwise indicated, install dowel rods on 18-inch (450-mm) centers around the full perimeter of concrete base.
   3. For supported equipment, install epoxy-coated anchor bolts that extend through concrete base and anchor into structural concrete floor.
   4. Place and secure anchorage devices. Use setting drawings, templates, diagrams, instructions, and directions furnished with items to be embedded.
   5. Install anchor bolts to elevations required for proper attachment to supported equipment.

B. Arrange equipment so controls and devices are accessible for servicing.

C. Maintain manufacturer's recommended clearances for service and maintenance.

3.2 CONNECTIONS

A. Comply with requirements for piping specified in Division 22 Section "Laboratory Service Piping." Drawings indicate general arrangement of piping, fittings, and specialties.

B. Install piping adjacent to machine to allow service and maintenance.

3.3 IDENTIFICATION

A. Identify general-service and components. Comply with requirements for identification specified in Division 22 Section "Identification for Plumbing Piping and Equipment."

3.4 STARTUP SERVICE

A. Engage a factory-authorized service representative to perform startup service.
   1. Complete installation and startup checks according to manufacturer's written instructions.
   2. Check for lubricating oil in lubricated-type equipment.
   3. Verify that filters and piping are clear.
   4. Check for equipment vibration-control supports and flexible pipe connectors and verify that equipment is properly attached to substrate.
   5. Check safety valves for correct settings. Ensure that settings are higher than air-compressor discharge pressure but not higher than rating of system components.
   6. Check for proper seismic restraints.
   7. Drain receiver tanks.
   8. Operational Test: After electrical circuitry has been energized, start units to confirm proper motor rotation and unit operation.
   9. Test and adjust controls and safeties.

END OF SECTION 222620

N:\N0912.00\DOC\SPEC\2012_03-16_BID\222620 - PACKAGE LABORATORY PUMP AND RECEIVER.DOC

SECTION 223300 - ELECTRIC, DOMESTIC-WATER HEATERS

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes:
   1. Commercial, electric, storage, domestic-water heaters.
   2. Domestic-water heater accessories.

1.2 PERFORMANCE REQUIREMENTS

1.3 ACTION SUBMITTALS

A. Product Data: For each type and size of domestic-water heater indicated.

B. Shop Drawings:
   1. Wiring Diagrams: For power, signal, and control wiring.

1.4 INFORMATIONAL SUBMITTALS

A. Source quality-control reports.

B. Field quality-control reports.

C. Warranty: Sample of special warranty.

1.5 CLOSEOUT SUBMITTALS

A. Operation and maintenance data.

1.6 QUALITY ASSURANCE

A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

B. ASME Compliance: Where ASME-code construction is indicated, fabricate and label commercial, domestic-water heater storage tanks to comply with ASME Boiler and Pressure Vessel Code: Section VIII, Division 1.

C. NSF Compliance: Fabricate and label equipment components that will be in contact with potable water to comply with NSF 61, "Drinking Water System Components - Health Effects."

1.7 WARRANTY

A. Special Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace components of electric, domestic-water heaters that fail in materials or workmanship within specified warranty period.
   1. Warranty Periods: From date of Substantial Completion.
      a. Commercial, Electric, Storage, Domestic-Water Heaters:
         1) Storage Tank: Three years.
         2) Controls and Other Components: Three years.
      b. Compression Tanks: Five years.

PART 2 - PRODUCTS

2.1 COMMERCIAL, ELECTRIC, domestic-WATER HEATERS

A. Commercial, Electric, Storage, Domestic-Water Heaters:
   1. Basis-of-Design Product: Subject to compliance with requirements, provide product indicated on Drawings or comparable product by one of the following:
      a. American Water Heaters.
      b. Bradford White Corporation.
      c. Lochinvar Corporation.
   2. Standard: UL 1453.
   3. Storage-Tank Construction: Non-ASME-code, steel vertical arrangement.
      a. Tappings: Factory fabricated of materials compatible with tank and piping connections. Attach tappings to tank before testing.
         1) NPS 2 (DN 50) and Smaller: Threaded ends according to ASME B1.20.1.
      b. Pressure Rating: 150 psig (1035 kPa).
      c. Interior Finish: Comply with NSF 61 barrier materials for potable-water tank linings, including extending lining material into tappings.
   4. Factory-Installed Storage-Tank Appurtenances:
      a. Anode Rod: Replaceable magnesium.
      b. Drain Valve: Corrosion-resistant metal complying with ASSE 1005.
      c. Insulation: Comply with ASHRAE/IESNA 90.1.
      d. Jacket: Steel with enameled finish.
      e. Heating Elements: Electric, screw-in or bolt-on immersion type arranged in multiples of three.
      f. Temperature Control: Adjustable thermostat.
      g. Safety Controls: High-temperature-limit and low-water cutoff devices or systems.
      h. Relief Valves: ASME rated and stamped for combination temperature-and-pressure relief valves. Include one or more relief valves with total relieving capacity at least as great as heat input, and include pressure setting less than domestic-water heater working-pressure rating. Select one relief valve with sensing element that extends into storage tank.

2.2 DOMESTIC-WATER HEATER ACCESSORIES

A. Drain Pans: Corrosion-resistant metal with raised edge. Comply with ANSI/CSA LC 3. Include dimensions not less than base of domestic-water heater, and include drain outlet not less than NPS 3/4 (DN 20) with ASME B1.20.1 pipe threads or with ASME B1.20.7 garden-hose threads.

2.3 SOURCE QUALITY CONTROL

A. Hydrostatically test commercial domestic-water heaters to minimum of one and one-half times pressure rating before shipment.

B. Electric, domestic-water heaters will be considered defective if they do not pass tests and inspections. Comply with requirements in Section 014000 "Quality Requirements" for retesting and reinspecting requirements and Section 017300 "Execution" for requirements for correcting the Work.

C. Prepare test and inspection reports.

PART 3 - EXECUTION

3.1 DOMESTIC-WATER HEATER INSTALLATION

A. Commercial, Electric, Domestic-Water Heater Mounting: Install, electric, domestic-water heaters on domestic-water heater mounting bracket.
   1. Maintain manufacturer's recommended clearances.
   2. Arrange units so controls and devices that require servicing are accessible.
   3. Place and secure anchorage devices. Use setting drawings, templates, diagrams, instructions, and directions furnished with items to be embedded.
   4. Install anchor bolts to elevations required for proper attachment to supported equipment.
   5. Anchor domestic-water heaters to substrate.

B. Install electric, domestic-water heaters level and plumb, according to layout drawings, original design, and referenced standards. Maintain manufacturer's recommended clearances. Arrange units so controls and devices needing service are accessible.
   1. Install shutoff valves on domestic-water-supply piping to domestic-water heaters and on domestic-hot-water outlet piping. Comply with requirements for shutoff valves specified in Section 220523 "General-Duty Valves for Plumbing Piping."

C. Install water-heater drain piping as indirect waste to spill by positive air gap into open drains or over floor drains. Install hose-end drain valves at low points in water piping for electric, domestic-water heaters that do not have tank drains. Comply with requirements for hose-end drain valves specified in Section 221119 "Domestic Water Piping Specialties."

D. Install thermometers on outlet piping of electric, domestic-water heaters. Comply with requirements for thermometers specified in Section 220519 "Meters and Gages for Plumbing Piping."

E. Fill electric, domestic-water heaters with water.

3.2 CONNECTIONS

A. Comply with requirements for piping specified in Section 221116 "Domestic Water Piping." Drawings indicate general arrangement of piping, fittings, and specialties.

B. Where installing piping adjacent to electric, domestic-water heaters, allow space for service and maintenance of water heaters. Arrange piping for easy removal of domestic-water heaters.

3.3 IDENTIFICATION

A. Identify system components. Comply with requirements for identification specified in Section 220553 "Identification for Plumbing Piping and Equipment."

3.4 FIELD QUALITY CONTROL

A. Perform tests and inspections.
   1. Leak Test: After installation, charge system and test for leaks. Repair leaks and retest until no leaks exist.
   2. Operational Test: After electrical circuitry has been energized, start units to confirm proper operation.
   3. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.

B. Electric, domestic-water heaters will be considered defective if they do not pass tests and inspections. Comply with requirements in Section 014000 "Quality Requirements" for retesting and reinspecting requirements and Section 017300 "Execution" for requirements for correcting the Work.

C. Prepare test and inspection reports.

END OF SECTION 223300

N:\N0912.00\DOC\SPEC\2012_03-16_BID\223300 - ELECTRIC DOMESTIC WATER HEATERS.DOC

SECTION 223400 - FUEL-FIRED DOMESTIC WATER HEATERS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. This Section includes the following fuel-fired water heaters:
   1. Commercial, power-burner, storage, gas water heaters.
   2. Compression tanks.
   3. Water heater accessories.

1.3 SUBMITTALS

A. Product Data: For each type and size of water heater indicated. Include rated capacities, operating characteristics, furnished specialties, and accessories.

B. LEED Submittal:
   1. Product Data for Prerequisite EA 2: Documentation indicating that units comply with ASHRAE/IESNA 90.1-2004, Section 7 - "Service Water Heating."

C. Shop Drawings: Diagram power, signal, and control wiring.

D. Product Certificates: For each type of commercial water heater, signed by product manufacturer.

E. Source quality-control test reports.

F. Field quality-control test reports.

G. Operation and Maintenance Data: For water heaters to include in emergency, operation, and maintenance manuals.

H. Warranty: Special warranty specified in this Section.

1.4 QUALITY ASSURANCE

A. Source Limitations: Obtain same type of water heaters through one source from a single manufacturer.

B. Product Options: Drawings indicate size, profiles, and dimensional requirements of water heaters and are based on the specific system indicated. Refer to Division 01 Section "Product Requirements."

C. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.

D. ASHRAE/IESNA 90.1-2004 Compliance: Applicable requirements in ASHRAE/IESNA 90.1-2004.

E. ASME Compliance:

1. Where ASME-code construction is indicated, fabricate and label commercial water heater storage tanks to comply with ASME Boiler and Pressure Vessel Code: Section VIII, Division 1.
2. Where ASME-code construction is indicated, fabricate and label commercial, finned-tube water heaters to comply with ASME Boiler and Pressure Vessel Code: Section IV.

F. Comply with NSF 61, "Drinking Water System Components - Health Effects; Sections 1 through 9" for all components that will be in contact with potable water.

1.5 COORDINATION

A. Coordinate size and location of concrete bases with Architectural and Structural Drawings.

1.6 WARRANTY

A. Special Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace components of fuel-fired water heaters that fail in materials or workmanship within specified warranty period.
1. Failures include, but are not limited to, the following:
a. Structural failures including storage tank and supports.
b. Faulty operation of controls.
c. Deterioration of metals, metal finishes, and other materials beyond normal use.
2. Warranty Period(s): From date of Substantial Completion:
a. Commercial, Gas Water Heaters:
1) Storage Tank: Ten (10) years.
2) Burner, Controls and Other Components: One (1) year.
b. Compression Tanks: One year(s).

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. In other Part 2 articles where titles below introduce lists, the following requirements apply to product selection:
1. Manufacturers: Subject to compliance with requirements, provide products by one of the manufacturers specified.

2.2 COMMERCIAL GAS WATER HEATERS

A. Commercial, Storage, Gas Water Heaters: Comply with ANSI Z21.10.3/CSA 4.3 and meet ASHRAE/IESNA 90.1.
1. Manufacturers:
a. PVI Industries, Inc.
b. A. O. Smith
c. State
d. Lochinvar
e. Hubbell
f. Ruud
g. Approved equal.
2. Thermal Efficiency: 94% for gas burner.
3. Primary heat source: U-Tube water to water heat exchanger with control valve wired to tank mounted thermostat. Located at bottom half of storage tank. Receive circulated cooling jacket water from mechanical equipment to maintain tank temperature at 140 degrees F.
4. Storage-Tank Construction:

a. ASME-code steel with 150-psigworking-pressure rating.
b. Tappings: Factory fabricated of materials compatible with tank. Attach tappings to tank before testing.
1) NPS 2 and Smaller: Threaded ends according to ASME B1.20.1.
2) NPS 2-1/2 and Larger: Flanged ends according to ASME B16.5 for steel and stainless-steel flanges, and according to ASME B16.24 for copper and copper-alloy flanges.
c. Lining: Nickel plated complying with NSF 61 barrier materials for potable-water tank linings, including extending lining into and through tank fittings and outlets.

5. Factory-Installed, Storage-Tank Appurtenances:
a. Anode Rod: Manufacturer standard.
b. Dip Tube: Provide unless cold-water inlet is near bottom of tank.
c. Drain Valve: Corrosion-resistant metal complying with ASSE 1005.
d. Insulation: Comply with ASHRAE/IESNA 90.1. Surround entire storage tank except connections and controls.
e. Jacket: Steel with enameled finish.
f. Combination Temperature and Pressure Relief Valves: ANSI Z21.22/CSA 4.4. Include one or more relief valves with total relieving capacity at least as great as heat input, and include pressure setting less than water heater working-pressure rating. Select one relief valve with sensing element that extends into storage tank.
6. Venting: Sealed construction, direct-vent.
7. Temperature Control: Adjustable thermostat.
8. Safety Controls: Automatic, high-temperature-limit and low-water cutoff devices or systems.
9. Special Requirements: NSF 5 construction.
10. Building Automation System Interface: Normally closed dry contacts for enabling and disabling water heater.
11. Capacity and Characteristics:
a. Refer to plumbing plans for schedule.

2.3 COMPRESSION TANKS

A. Description: Steel, ASME and non-ASME pressure-rated tank constructed with welded joints and factory-installed, butyl-rubber diaphragm. Include air precharge to minimum system-operating pressure at tank.
1. Manufacturers:
a. AMTROL Inc.
b. Armstrong Pumps, Inc.
c. Flexcon Industries.
d. Smith, A. O.; Aqua-Air Div.
e. Watts Regulator Co.
2. Construction:
a. Tappings: Factory-fabricated steel, welded to tank before testing and labeling.
b. Interior Finish: Comply with NSF 61 barrier materials for potable-water tank linings, including extending finish into and through tank fittings and outlets.
c. Air-Charging Valve: Factory installed.
3. Capacity and Characteristics:
a. Refer to plumbing plans for expansion tank schedule.

2.4 WATER HEATER ACCESSORIES

A. Gas Shutoff Valves: ANSI Z21.15/CGA 9.1, manually operated. Furnish for installation in piping.

B. Gas Pressure Regulators: ANSI Z21.18, appliance type. Include pressure rating, capacity, and pressure differential required between gas supply and water heater.

C. Gas Automatic Valves: ANSI Z21.21, appliance, electrically operated, on-off automatic valve.

D. Combination Temperature and Pressure Relief Valves: Include relieving capacity at least as great as heat input, and include pressure setting less than water heater working-pressure rating. Select each relief valve with sensing element that extends into storage tank.
   1. Gas Water Heaters: ANSI Z21.22/CSA 4.4.

E. Pressure Relief Valves: Include pressure setting less than working-pressure rating of water heater.
   1. Gas Water Heaters: ANSI Z21.22/CSA 4.4.

2.5 SOURCE QUALITY CONTROL

A. Test and inspect water heater storage tanks, specified to be ASME-code construction, according to ASME Boiler and Pressure Vessel Code.

B. Hydrostatically test commercial water heater storage tanks before shipment to minimum of one and one-half times pressure rating.

C. Prepare test reports.

PART 3 - EXECUTION

3.1 WATER HEATER INSTALLATION

A. Install commercial water heaters on concrete bases.
   1. Concrete base construction requirements are specified in Division 22 Section "Common Work Results for Plumbing."

B. Install water heaters level and plumb, according to layout drawings, original design, and referenced standards. Maintain manufacturer's recommended clearances. Arrange units so controls and devices needing service are accessible.

C. Anchor to substrate.

D. Install gas water heaters according to NFPA 54.

E. Install gas shutoff valves on gas supplies to gas water heaters without shutoff valves.

F. Install gas pressure regulators on gas supplies to gas water heaters without gas pressure regulators if gas pressure regulators are required to reduce gas pressure at burner.

G. Install automatic gas valves on gas supplies to gas water heaters, if required for operation of safety control.

H. Install combination temperature and pressure relief valves in top portion of storage tanks. Use relief valves with sensing elements that extend into tanks. Extend commercial-water-heater, relief-valve outlet, with drain piping same as domestic water piping in continuous downward pitch, and discharge by positive air gap onto closest floor drain.

I. Install combination temperature and pressure relief valves in water piping for water heaters without storage. Extend commercial-water-heater relief-valve outlet, with drain piping same as domestic water piping in continuous downward pitch, and discharge by positive air gap onto closest floor drain.

J. Install water heater drain piping as indirect waste to spill by positive air gap into open drains or over floor drains. Install hose-end drain valves at low points in water piping for water heaters that do not have tank drains. Refer to Division 22 Section "Domestic Water Piping Specialties" for hose-end drain valves.

K. Install thermometer on outlet piping of water heaters. Refer to Division 22 Section "Meters and Gages for Plumbing Piping" for thermometers.

L. Assemble and install inlet and outlet piping manifold kits for multiple water heaters. Fabricate, modify, or arrange manifolds for balanced water flow through each water heater. Include shutoff valve and thermometer in each water heater inlet and outlet, and throttling valve in each water heater outlet. Refer to Division 22 Section "General-Duty Valves for Plumbing Piping" for general-duty valves and to Division 22 Section "Meters and Gages for Plumbing Piping" for thermometers.

M. Install piping-type heat traps on inlet and outlet piping of water heater storage tanks without integral or fitting-type heat traps.

N. Fill water heaters with water.

3.2 CONNECTIONS

A. Piping installation requirements are specified in other Division 22 Sections. Drawings indicate general arrangement of piping, fittings, and specialties.

B. Install piping adjacent to water heaters to allow service and maintenance. Arrange piping for easy removal of water heaters.

C. Ground equipment according to Division 26 Section "Grounding and Bonding for Electrical Systems."

D. Connect wiring according to Division 26 Section "Low-Voltage Electrical Power Conductors and Cables."

3.3 FIELD QUALITY CONTROL

A. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect, test, and adjust field-assembled components and equipment installation, including connections, and to assist in field testing. Report results in writing.

B. Perform the following field tests and inspections and prepare test reports:
1. Leak Test: After installation, test for leaks. Repair leaks and retest until no leaks exist.
2. Operational Test: After electrical circuitry has been energized, confirm proper operation.
3. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.

C. Remove and replace water heaters that do not pass tests and inspections and retest as specified above.

3.4 DEMONSTRATION

A. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain commercial water heaters. Refer to Division 01 Section "Demonstration and Training."

END OF SECTION 223400

SECTION 224000 - PLUMBING FIXTURES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. This Section includes the following conventional plumbing fixtures and related components:
   1. Faucets for lavatories, showers and sinks.
   2. Flushometers.
   3. Toilet seats.
   4. Protective shielding guards.
   5. Fixture supports.
   6. Dishwasher air-gap fittings.
   7. Disposers.
   8. Hot-water dispensers.
   9. Water closets.
   10. Urinals.
   11. Lavatories.
   12. Commercial sinks.
   13. Kitchen sinks.
   14. Service basins.

B. Related Sections include the following:
   1. Division 10 Section "Toilet, Bath, and Laundry Accessories."
   2. Division 22 Section "Domestic Water Piping Specialties" for backflow preventers, floor drains, and specialty fixtures not included in this Section.
   3. Division 22 Section "Drinking Fountains and Water Coolers."

1.3 DEFINITIONS

A. Accessible Fixture: Plumbing fixture that can be approached, entered, and used by people with disabilities.

B. Fitting: Device that controls the flow of water into or out of the plumbing fixture. Fittings specified in this Section include supplies and stops, faucets and spouts, shower heads and tub spouts, drains and tailpieces, and traps and waste pipes. Piping and general-duty valves are included where indicated.

C. PVC: Polyvinyl chloride plastic.

D. Solid Surface: Nonporous, homogeneous, cast-polymer-plastic material with heat-, impact-, scratch-, and stain-resistance qualities.

1.4 SUBMITTALS

A. Product Data: For each type of plumbing fixture indicated. Include selected fixture and trim, fittings, accessories, appliances, appurtenances, equipment, and supports. Indicate materials and finishes, dimensions, construction details, and flow-control rates.

B. LEED Submittal:
   1. Product Data for Credit WE 2, 3.1, and 3.2: Documentation indicating flow and water consumption requirements.

C. Shop Drawings: Diagram power, signal, and control wiring.

D. Operation and Maintenance Data: For plumbing fixtures to include in emergency, operation, and maintenance manuals.

E. Warranty: Special warranty specified in this Section.

1.5 QUALITY ASSURANCE

A. Source Limitations: Obtain plumbing fixtures, faucets, and other components of each category through one source from a single manufacturer.
   1. Exception: If fixtures, faucets, or other components are not available from a single manufacturer, obtain similar products from other manufacturers specified for that category.

B. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.

C. Regulatory Requirements: Comply with requirements in ICC A117.1, "Accessible and Usable Buildings and Facilities"; Public Law 90-480, "Architectural Barriers Act"; and Public Law 101-336, "Americans with Disabilities Act"; for plumbing fixtures for people with disabilities.

D. Regulatory Requirements: Comply with requirements in Public Law 102-486, "Energy Policy Act," about water flow and consumption rates for plumbing fixtures.

E. NSF Standard: Comply with NSF 61, "Drinking Water System Components--Health Effects," for fixture materials that will be in contact with potable water.

F. Select combinations of fixtures and trim, faucets, fittings, and other components that are compatible.

G. Comply with the following applicable standards and other requirements specified for plumbing fixtures:
   1. Enameled, Cast-Iron Fixtures: ASME A112.19.1M.
   2. Plastic Mop-Service Basins: ANSI Z124.6.
   3. Solid-Surface-Material Lavatories and Sinks: ANSI/ICPA SS-1.
   4. Stainless-Steel Commercial, Handwash Sinks: NSF 2 construction.
   5. Stainless-Steel Residential Sinks: ASME A112.19.3.
   6. Vitreous-China Fixtures: ASME A112.19.2M.
   7. Water-Closet, Flush Valve, Tank Trim: ASME A112.19.5.

H. Comply with the following applicable standards and other requirements specified for **lavatory and sink** faucets:
   1. Faucets: ASME A112.18.1.

2. Hose-Connection Vacuum Breakers: ASSE 1011.
3. Hose-Coupling Threads: ASME B1.20.7.
4. Integral, Atmospheric Vacuum Breakers: ASSE 1001.
5. NSF Potable-Water Materials: NSF 61.
6. Pipe Threads: ASME B1.20.1.
7. Sensor-Actuated Faucets and Electrical Devices: UL 1951.
8. Supply Fittings: ASME A112.18.1.
9. Brass Waste Fittings: ASME A112.18.2.

I. Comply with the following applicable standards and other requirements specified for miscellaneous fittings:
1. Atmospheric Vacuum Breakers: ASSE 1001.
2. Brass and Copper Supplies: ASME A112.18.1.
3. Dishwasher Air-Gap Fittings: ASSE 1021.
4. Manual-Operation Flushometers: ASSE 1037.
5. Plastic Tubular Fittings: ASTM F 409.
6. Brass Waste Fittings: ASME A112.18.2.
7. Sensor-Operation Flushometers: ASSE 1037 and UL 1951.

J. Comply with the following applicable standards and other requirements specified for miscellaneous components:
1. Disposers: ASSE 1008 and UL 430.
2. Dishwasher Air-Gap Fittings: ASSE 1021.
3. Flexible Water Connectors: ASME A112.18.6.
4. Floor Drains: ASME A112.6.3.
5. Hose-Coupling Threads: ASME B1.20.7.
6. Hot-Water Dispensers: ASSE 1023 and UL 499.
7. Off-Floor Fixture Supports: ASME A112.6.1M.
8. Pipe Threads: ASME B1.20.1.
9. Plastic Toilet Seats: ANSI Z124.5.
10. Supply and Drain Protective Shielding Guards: ICC A117.1.

1.6 WARRANTY

A. Special Warranties: Manufacturer's standard form in which manufacturer agrees to repair or replace components of whirlpools that fail in materials or workmanship within specified warranty period.
1. Failures include, but are not limited to, the following:
a. Structural failures of unit shell.
b. Faulty operation of controls, blowers, pumps, heaters, and timers.
c. Deterioration of metals, metal finishes, and other materials beyond normal use.
2. Warranty Period for Commercial Applications: **One** year from date of Substantial Completion.

1.7 EXTRA MATERIALS

A. Furnish extra materials described below that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.
1. Faucet Washers and O-Rings: Equal to **10** percent of amount of each type and size installed.
2. Faucet Cartridges and O-Rings: Equal to **5** percent of amount of each type and size installed.
3. Flushometer Valve, Repair Kits: Equal to **10** percent of amount of each type installed, but no fewer than **12** of each type.

4. Provide hinged-top wood or metal box, or individual metal boxes, with separate compartments for each type and size of extra materials listed above.
5. Flushometer Tank, Repair Kits: Equal to **5** percent of amount of each type installed, but no fewer than **2** of each type.
6. Water-Closet Tank, Repair Kits: Equal to **5**> percent of amount of each type installed.
7. Toilet Seats: Equal to **5** percent of amount of each type installed.

PART 2 - PRODUCTS

2.1 LAVATORY FAUCETS

A. Basis-of-Design Product: Subject to compliance with requirements, provide the product indicated on Drawing Fixture Schedule or approved equal as product submittal to the Architect for Owner approval.

B. Lavatory Faucets:
1. American Standard Companies, Inc.
2. Chicago Faucets.
3. Kohler Co.
4. Moen, Inc.
5. Speakman Company.
6. T & S Brass and Bronze Works, Inc.
7. TOTO.
8. Zurn Plumbing Products Group; Commercial Brass Operation.

C. Sink Faucets:
1. American Standard Companies, Inc.
2. Chicago Faucets.
3. Delta Faucet Company.
4. Elkay Manufacturing Co.
5. Just Manufacturing Company.
6. Kohler Co.
7. Moen, Inc.
8. Speakman Company.
9. T & S Brass and Bronze Works, Inc.
10. Zurn Plumbing Products Group; Commercial Brass Operation.

D. Flushometers:
1. Zurn Plumbing Products Group; Commercial Brass Operation.

E. Toilet Seats:
1. American Standard Companies, Inc.
2. Bemis Manufacturing Company.
3. Church Seats.
4. Kohler Co.

F. Protective Shielding Pipe Covers:
1. McGuire Manufacturing Co., Inc.
2. Plumberex Specialty Products Inc.
3. TRUEBRO, Inc.
4. Zurn Plumbing Products Group; Tubular Brass Plumbing Products Operation.

G. Protective Shielding Piping Enclosures:
   1. TRUEBRO, Inc.
   2. Approved equal.

H. Fixture Supports:
   1. Josam Company.
   2. MIFAB Manufacturing Inc.
   3. Smith, Jay R. Mfg. Co.
   4. Tyler Pipe; Wade Div.
   5. Watts Drainage Products Inc.; a div. of Watts Industries, Inc.
   6. Zurn Plumbing Products Group; Specification Drainage Operation.

I. Interceptors:
   1. Josam Company.
   2. MIFAB Manufacturing Inc.
   3. Smith, Jay R. Mfg. Co.
   4. Tyler Pipe; Wade Div.
   5. Watts Drainage Products Inc.; a div. of Watts Industries, Inc.
   6. Zurn Plumbing Products Group; Specification Drainage Operation.

J. Dishwasher Air-Gap Fittings:
   1. Brass Craft Mfg. Co.; a Subsidiary of Masco Corporation.
   2. JB Products; a Federal Process Corporation Company.
   3. Sioux Chief Manufacturing Company, Inc.
   4. Watts Brass & Tubular; a division of Watts Regulator Co.

K. Disposers:
   1. American Standard Companies, Inc.
   2. In-Sink-Erator; a div. of Emerson Electric Co.

L. Water Closets:
   1. American Standard Companies, Inc.
   2. Kohler Co.
   3. TOTO USA, Inc.

M. Urinals:
   1. American Standard Companies, Inc.
   2. Kohler Co.
   3. TOTO USA, Inc.

N. Lavatories:
   1. American Standard Companies, Inc.
   2. Kohler Co.

O. Kitchen Sinks:
   1. Elkay Manufacturing Co.
   2. Just Manufacturing Company.

P. Service Basins:
   1. Crane Plumbing, L.L.C./Fiat Products.
   2. Florestone Products Co., Inc.
   3. Mustee, E. L. & Sons, Inc.
   4. Zurn Plumbing Products Group; Light Commercial Operation.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine roughing-in of water supply and sanitary drainage and vent piping systems to verify actual locations of piping connections before plumbing fixture installation.

B. Examine cabinets, counters, floors, and walls for suitable conditions where fixtures will be installed.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. Assemble plumbing fixtures, trim, fittings, and other components according to manufacturers' written instructions.

B. Install off-floor supports, affixed to building substrate, for wall-mounting fixtures.
   1. Use carrier supports with waste fitting and seal for back-outlet fixtures.
   2. Use carrier supports without waste fitting for fixtures with tubular waste piping.
   3. Use chair-type carrier supports with rectangular steel uprights for accessible fixtures.

C. Install back-outlet, wall-mounting fixtures onto waste fitting seals and attach to supports.

D. Install wall-mounting fixtures with tubular waste piping attached to supports.

E. Install counter-mounting fixtures in and attached to casework.

F. Install fixtures level and plumb according to roughing-in drawings.

G. Install water-supply piping with stop on each supply to each fixture to be connected to water distribution piping. Attach supplies to supports or substrate within pipe spaces behind fixtures. Install stops in locations where they can be easily reached for operation.
   1. Exception: Use ball, gate, or globe valves if supply stops are not specified with fixture. Valves are specified in Division 22 Section "General-Duty Valves for Plumbing Piping."

H. Install trap and tubular waste piping on drain outlet of each fixture to be directly connected to sanitary drainage system.

I. Install tubular waste piping on drain outlet of each fixture to be indirectly connected to drainage system.

J. Install flushometer valves for accessible water closets and urinals with handle mounted on wide side of compartment. Install other actuators in locations that are easy for people with disabilities to reach.

K. Install toilet seats on water closets.

L. Install faucet-spout fittings with specified flow rates and patterns in faucet spouts if faucets are not available with required rates and patterns. Include adapters if required.

M. Install water-supply flow-control fittings with specified flow rates in fixture supplies at stop valves.

N. Install faucet flow-control fittings with specified flow rates and patterns in faucet spouts if faucets are not available with required rates and patterns. Include adapters if required.

O. Install traps on fixture outlets.
   1. Exception: Omit trap on fixtures with integral traps.
   2. Exception: Omit trap on indirect wastes, unless otherwise indicated.

P. Install disposer in outlet of each sink indicated to have disposer. Install switch where indicated or in wall adjacent to sink if location is not indicated.

Q. Install dishwasher air-gap fitting at each sink indicated to have air-gap fitting. Connect inlet hose to dishwasher and outlet hose to disposer.

R. Install escutcheons at piping wall ceiling penetrations in exposed, finished locations and within cabinets and millwork. Use deep-pattern escutcheons if required to conceal protruding fittings. Escutcheons are specified in Division 22 Section "Common Work Results for Plumbing."

S. Seal joints between fixtures and walls, floors, and countertops using sanitary-type, one-part, mildew-resistant silicone sealant. Match sealant color to fixture color. Sealants are specified in Division 07 Section "Joint Sealants."

3.3 CONNECTIONS

A. Piping installation requirements are specified in other Division 22 Sections. Drawings indicate general arrangement of piping, fittings, and specialties.

B. Connect fixtures with water supplies, stops, and risers, and with traps, soil, waste, and vent piping. Use size fittings required to match fixtures.

C. Ground equipment according to Division 26 Section "Grounding and Bonding for Electrical Systems."

D. Connect wiring according to Division 26 Section "Low-Voltage Electrical Power Conductors and Cables."

3.4 FIELD QUALITY CONTROL

A. Verify that installed plumbing fixtures are categories and types specified for locations where installed.

B. Check that plumbing fixtures are complete with trim, faucets, fittings, and other specified components.

C. Inspect installed plumbing fixtures for damage. Replace damaged fixtures and components.

D. Test installed fixtures after water systems are pressurized for proper operation. Replace malfunctioning fixtures and components, then retest. Repeat procedure until units operate properly.

E. Install fresh batteries in sensor-operated mechanisms.

3.5 ADJUSTING

A. Operate and adjust faucets and controls. Replace damaged and malfunctioning fixtures, fittings, and controls.

B. Adjust water pressure at faucets and flushometer valves to produce proper flow and stream.

C. Replace washers and seals of leaking and dripping faucets and stops.

D. Install fresh batteries in sensor-operated mechanisms.

3.6 CLEANING

A. Clean fixtures, faucets, and other fittings with manufacturers' recommended cleaning methods and materials. Do the following:
   1. Remove faucet spouts and strainers, remove sediment and debris, and reinstall strainers and spouts.
   2. Remove sediment and debris from drains.

B. After completing installation of exposed, factory-finished fixtures, faucets, and fittings, inspect exposed finishes and repair damaged finishes.

3.7 PROTECTION

A. Provide protective covering for installed fixtures and fittings.

B. Do not allow use of plumbing fixtures for temporary facilities unless approved in writing by Owner.

END OF SECTION 224000

N:\N0912.00\DOC\SPEC\2012_03-16_BID\224000 - PLUMBING FIXTURES.DOC

SECTION 224700 - DRINKING FOUNTAINS AND WATER COOLERS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. This Section includes the following drinking fountains and related components:
   1. Drinking fountains.
   2. Fixture supports.

1.3 DEFINITIONS

A. Accessible Drinking Fountain: Fixture that can be approached and used by people with disabilities.

B. Drinking Fountain: Fixture with nozzle for delivering stream of water for drinking.

C. Fitting: Device that controls flow of water into or out of fixture.

D. Fixture: Drinking fountain unless one is specifically indicated.

1.4 SUBMITTALS

A. Product Data: For each fixture indicated. Include rated capacities, furnished specialties, and accessories.

B. Field quality-control test reports.

C. Operation and Maintenance Data: For fixtures to include in emergency, operation, and maintenance manuals.

1.5 QUALITY ASSURANCE

A. Regulatory Requirements: Comply with requirements in ICC A117.1, "Accessible and Usable Buildings and Facilities"; Public Law 90-480, "Architectural Barriers Act"; and Public Law 101-336, "Americans with Disabilities Act"; for fixtures for people with disabilities.

B. NSF Standard: Comply with NSF 61, "Drinking Water System Components--Health Effects," for fixture materials that will be in contact with potable water.

C. ARI Standard: Comply with ARI's "Directory of Certified Drinking Water Coolers" for style classifications.

1.6 EXTRA MATERIALS

A. Furnish extra materials described below that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.
   1. Filter Cartridges: Equal to 100 percent of amount installed for each type and size indicated, but no fewer than 1 of each.

PART 2 - PRODUCTS

2.1 DRINKING FOUNTAINS

A. Drinking Fountains, (DF-1):
   1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
      a. Filtrine Manufacturing Company; Drinking Water Division.
      b. Halsey Taylor.
      c. Haws Corporation.
      d. Murdock, Inc.
      e. Oasis Corporation.
      f. Stern-Williams Co., Inc.
      g. Sunroc Corp.
   2. Description: Refer to drawing plumbing schedules.
   3. Ambient Temperature

2.2 FIXTURE SUPPORTS

A. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

B. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   1. Josam Co.
   2. MIFAB Manufacturing, Inc.
   3. Smith, Jay R. Mfg. Co.
   4. Tyler Pipe; Wade Div.
   5. Watts Drainage Products Inc.; a div. of Watts Industries, Inc.
   6. Zurn Plumbing Products Group; Specification Drainage Operation.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine roughing-in for water and waste piping systems to verify actual locations of piping connections before fixture installation. Verify that sizes and locations of piping and types of supports match those indicated.

B. Examine walls and floors for suitable conditions where fixtures are to be installed.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 APPLICATIONS

A. Use carrier off-floor supports for wall-mounting fixtures, unless otherwise indicated.

B. Use chrome-plated brass or copper tube, fittings, and valves in locations exposed to view. Plain copper tube, fittings, and valves may be used in concealed locations.

3.3 INSTALLATION

A. Install off-floor supports affixed to building substrate and attach wall-mounting fixtures, unless otherwise indicated.

B. Install fixtures level and plumb. For fixtures indicated for children, install at height required by authorities having jurisdiction.

C. Install water-supply piping with shutoff valve on supply to each fixture to be connected to water distribution piping. Install valves in locations where they can be easily reached for operation. Valves are specified in Division 22 Section "General-Duty Valves for Plumbing Piping."

D. Install trap and waste piping on drain outlet of each fixture to be connected to sanitary drainage system.

E. Install pipe escutcheons at wall penetrations in exposed, finished locations. Use deep-pattern escutcheons where required to conceal protruding pipe fittings. Escutcheons are specified in Division 22 Section "Common Work Results for Plumbing."

F. Seal joints between fixtures and walls and floors using sanitary-type, one-part, mildew-resistant, silicone sealant. Match sealant color to fixture color. Sealants are specified in Division 07 Section "Joint Sealants."

3.4 CONNECTIONS

A. Piping installation requirements are specified in other Division 22 Sections. Drawings indicate general arrangement of piping, fittings, and specialties.

B. Connect fixtures with water supplies, stops, and risers, and with traps, soil, waste, and vent piping. Use size fittings required to match fixtures.

3.5 ADJUSTING

A. Adjust fixture flow regulators for proper flow and stream height.

3.6 CLEANING

A. After completing fixture installation, inspect unit. Remove paint splatters and other spots, dirt, and debris. Repair damaged finish to match original finish.

B. Clean fixtures, on completion of installation, according to manufacturer's written instructions.

END OF SECTION 224700

N:\N0912.00\DOC\SPEC\2012_03-16_BID\224700 - DRINKING FOUNTAINS AND WATER COOLERS.DOC

SECTION 226119 - COMPRESSED AIR EQUIPMENT

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and General Provision of Contract, including General and Supplementary Conditions and Division 1 specifications, apply to this section.

B. Where Paragraphs of this Section conflict with similar paragraphs of the General and Supplementary Conditions and Division 1, requirements of this Section shall prevail.

1.2 SUMMARY

A. This Specification section describes the technical specifications and general instructions for the furnishing, factory testing, handling, delivery and installation of compressed air equipment and related accessories.

B. The Contractor is responsible for preparing the detailed engineering specifications, skid fabrication drawings and wiring diagrams necessary for fabrication, quality of materials, and quality of workmanship. This specification is intended to establish minimum acceptable standards consistent with industry practice.

C. Section Includes:
1. Air compressors.
2. Receivers with integral air dryers.
3. Filters and Housings.
4. Communication interfaces.

D. Related Sections:
1. 221513 Laboratory Service Piping

1.3 REFERENCES

A. Unless noted otherwise, the most current issue, revision, or affirmation of the references listed herein shall be used, including all addenda, errata and referenced documents.

B. American Society of Mechanical Engineers (ASME)
1. Boiler and Pressure Vessel Code, Section VIII, Division 1, “Unfired Pressure Vessels.”
2. Boiler and Pressure Vessel Code, Section IX, “Welding and Brazing Qualifications.”

H. National Electrical Manufacturers Association (NEMA) Standard 250, Enclosures for Electrical Equipment (1000 Volts Maximum).

1.4 SUBMITTALS

A. Submittal Requirements
1. Refer to paragraph 1.17 of Section 15010 "General Mechanical Requirements" for procedural requirements, and also the other related documents referenced in paragraph 1.1 of this section.
2. Submitted documentation shall be complete and consistent to provide a written record to prove that the equipment, accessories and quality assurance conform to the specifications and intent of the design.

PART 2 - PRODUCTS

2.1 COMPRESSED AIR EQUIPMENT

ROTARY AIR COMPRESSOR, OIL-FREE	
Equipment Tag	AC-01, AC-02
Description	Oil-free, single stage rotary air compressor(s) with inlet pre-filter and silencer, drive motor(s), and receiver. Factory pre-assembled, pre-wired and tested for single point field connections.
Performance Conditions	Inlet: Refer to Quality Assurance Qualifications for inlet conditions. Unit shall produce discharge pressure with zero negative tolerance at rated inlet temperature within a tolerance of +/- 4% on flow and +/- 5% on specific horsepower per ISO – 1217. Outlet: Discharge air quality shall be oil-free by design: 100 psig maximum, 100°F, saturated, oil-free air.
Operating Arrangement	Duplex system with sequencing controller and receiver for automatic lead/lag operation. Integral air dryer in each unit.
Materials of Construction	Cast iron casing, stainless steel rotors, and non-asbestos gaskets.
Controls and Instrumentation	Monitoring equipment shall be integral to each compressor unit and shall include: Discharge and oil pressure indicators; outlet temperature indicators; high air inlet vacuum indicator, low oil pressure alarm, high outlet air temperature alarms, hour meter, power on light, motor overload light, auto operation light. Automatic shut-off safety devices shall include: low oil pressure, high discharge temperature, and motor overload. Emergency stop button.
Control Sequencing	Provide manufacturer-supplied sequencing control panel. Sequence control system shall start/stop, load/unload connected compressors according to field-adjustable receiver pressure settings. Compressor lead/lag sequence shall be shifted based on either manual selection, day-based sequence, or hour-based sequence. Controller shall provide selectable manual and automatic control modes. Load/unload logics.
Control Options	Automatic power outage restart.
Driver	High efficiency TEFC electric motor. Direct drive via flexible coupling.
Valves and Connectors	Per valve spec A-13. Flexible braided stainless steel connectors.
Pre-filter/Silencer	Internal to system package with 5 micron replaceable paper cartridge filter element.
Enclosure	Steel sound insulating enclosure for 65 dBA noise level rating.
Cooling	Air-cooled package.
Lubrication	Drive gear, bearings and timing gear spray lubricated. Oil pump direct-driven by main drive shaft. Integral sump. Threaded screw oil seal between gear box and rotors. Provide factory fill of bearing lubricant.
Receiver (AT-01)	240 gallon capacity. ASME rated and stamped. 150 psi working pressure. Supply relief valve (PSV), automatic drain (KV), temperature indicator (TI), pressure indicator (PI), and pressure transmitter (PT).
Electrical	460 VAC, 3ϕ , 60 Hz, single field connection. Control voltage transformer shall be provided by the manufacturer. Wye-Delta starter. Fused disconnects shall be provided under Division 16 (one per motor).
Rated Duty	Compressor Capacity: 80 scfm, each Horsepower: 20 hp, each
Start-up & Warranty	Equipment cost shall include start-up service by factory-authorized technician and twelve (12) month minimum warranty agreement for materials and workmanship.
Other	Mount on concrete housekeeping pad.

Model Number for Equality	Atlas Copco Model ZT-15 or equal.

COMPRESSED AIR REFRIGERATED DRYER AND FILTER SYSTEM	
Equipment Tag	Integral to AC-01, AC-02
Description	Refrigerated dryer. Integral to air compressor enclosure.
Performance Conditions	Inlet: 125 psig, 100 F, saturated air maximum Outlet: 35 F to 37ºF pressure dewpoint.
Maximum Working Pressure	200 psig
Materials of Construction	Stainless steel heat exchangers.
Controls and Instrumentation	Integral to AC-01, AC-02
Condenser	Air cooled.
Prefilters	N/A

COMPRESSED AIR FILTER	
Equipment Tag	F-2A, F-2B
Description	After filter
Performance Conditions	Receive air from dryer system and remove incidental particulate contamination prior to building use. Maintain ISO 8573.1 solid contaminant Quality Class
Operating Arrangement	Duplex arrangement to allow isolation of one filter for maintenance while the other remains in service.
Materials of Construction	Manufacturer standard.
Pressure Rating	150 psig maximum.
Temperature Rating	150°F maximum.
Dry Differential Pressure	1.0 psid
Wet Differential Pressure	Not applicable.
Micron Rating	.1 micron.
Drain	Not applicable.
Rated Duty	Capacity _____ scfm, each Pressure Drop _____ psi
Other	
Acceptable Manufacturer	Wilkerson AF Series or equal

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine product data for connection sizes and dimensional requirements prior to installation of utilities and piping.

B. Examine utilities to verify proper interface prior to installation of equipment.

C. Examine product data for requirements of concrete base dimensions. Refer to Division 3 Section “Cast-in-Place Concrete” and Division 15 Section “Mechanical General Methods.”

D. Review placement of emergency shower and eyewash equipment relative to treatment chemicals and retention tanks for compliance with OSHA regulations.

3.2 INSTALLATION

A. Install skidded components and other equipment in accordance with manufacturers’ written instructions and recommendations.

B. Install equipment on concrete bases. Set and connect units and major accessories according to manufacturers' written instructions. Install units plumb, level, and firmly anchored in locations indicated. Maintain manufacturers' recommended clearances. Orient so equipment, controls, and devices needing service are accessible.

C. Support equipment using the following vibration-control devices, unless otherwise indicated. Refer to Division 15 Section "Vibration Control."
1. Install rotating equipment, 5 hp or less with spring isolators.
2. Install rotating equipment, more than 5 hp, with concrete inertia base and spring isolators.

D. Install piping and valves in accordance with the instructions included under the respective Pipe Class. Refer to Section 15400 “Plumbing Piping.”

E. Provide pipe hangers as described under Division 15.
1. Install spring isolation hangers on piping 25 feet from rotating machine.

F. Affix instrument identification numbers, date of calibration, and next date of calibration. Labels shall be clearly visible.

G. Tag all equipment, valves, and instruments with permanent stainless steel tags bearing Drawings tag number.

3.3 CONNECTIONS

A. Install piping next to equipment and accessories to allow service and maintenance.

B. Install stainless steel braided flexible connectors to rotating equipment.

C. Connect piping to equipment and accessories with flanges, unions, and couplings as shown on Drawings and as specified under the respective pipe class.

D. Install piping for condensate drains. Pipe liquid waste drains to sanitary drainage systems. Provide air gaps at indirect waste drains with not less than 3 pipe diameters between the waste discharge and the floor drain's flood rim.

E. Ground electrical equipment.

F. Tighten electrical connectors and terminals according to manufacturer's published torque-tightening values. Where manufacturer's torque values are not indicated, use those specified in UL 486A and UL 486B.

G. Arrange for electric-power connections to equipment that requires power. Electric power, wiring, and disconnect switches are specified in Division 16 Sections.

3.4 DEMONSTRATION

A. Engage a factory-authorized service representative to perform startup services and to demonstrate and train Owner's maintenance personnel as specified below.
   1. Train Owner's maintenance personnel on procedures and schedules related to start up and shutdown, troubleshooting, servicing, and preventive maintenance.
   2. Review data in the operation and maintenance manuals. Refer to Division 1 Section "Contract Closeout."
   3. Review data in the operation and maintenance manuals. Refer to Division 1 Section "Operation and Maintenance Data."
   4. Schedule training with Owner with at least 7 days' advance notice.

3.5 PROTECTION

A. The Contractor is fully responsible for providing adequate protection to piping and components during construction and start-up.

B. Comply with manufacturer's written instructions for equipment protection.

3.6 DELIVERY, STORAGE AND HANDLING

A. Packing/Handling
   1. Prior to shipment, all openings shall be adequately sealed to protect from damage.
   2. Disassemble units only to the extent to prevent damage during shipping and to facilitate field handling.
   3. Pack each unit individually and include in packaging all necessary appurtenances and parts required for field installation.
   4. Equipment shall be match-marked or tagged to identify location.

B. Shipping
   1. Ship freight on board (FOB) job site.

3.7 SYSTEM START UP

A. Perform start-up services and training of operators by a factory-trained field service engineer. Provide travel and accommodation costs of factory personnel.

B. Start-up service of the compressed air system shall include the following:
   1. Installation checks including utility connections.
   2. System operation for routine start-up and shut-down.

3. Programming of control set points.
4. "Off-spec" set-points and response.
5. Alarm condition and response.
6. After completion of start-up testing, obtain written sign-off of system from Owner. Correct design and fabrication deficiencies responsible for unsatisfactory test results at no cost to the Owner.
7. Conduct training of system operation and maintenance for Owner personnel.

3.8 MAINTENANCE

A. Equipment vendor shall have an established field service organization and guarantee less than 12-hour response time, 24 hours per day, 7 days per week.

B. Provide one spare set of filter media cartridges for all filter types.

3.9 QUALITY ASSURANCE QUALIFICATIONS

A. Source Quality Control
1. All Electrical wiring and components shall comply with NFPA 70 (NEC)
2. Factory test certify performance to ISO1217.1996, Third Edition, Annex C or CAGI/Pneurop PN2CPC2

B. Free air delivery ratings of compressors shall be in accordance with ISO1217 or CAGI/Pneurop PN2CPTC2 Test Code.

C. Compressor equipment shall be guaranteed not to exceed a noise level of 76, dBA as measured in accordance with CAGI/Pneurop S5.1 Test Code.

D. Use the following atmospheric conditions to establish output guarantees:

1.	Barometric Pressure:	14.4 psia
2.	Inlet Pressure:	14.1 psia
3.	Ambient Temperature:	95°F
4.	Relative Humidity:	60%

3.10 WARRANTY

A. Warranty all equipment to be free of defects in material and workmanship for a period as required by Law from the date of acceptance of the functional system by the Owner, as notified in writing.

END OF SECTION 226119

N:\N0912.00\DOC\SPEC\2012_03-16_BID\226119 - COMPRESSED AIR EQUIPMENT.DOC

SECTION 226700 - REAGENT GRADE WATER SYSTEM

PART 1 - GENERAL

1.1 RELATED SECTIONS

A. Drawings and General Provision of Contract, including General and Supplementary Conditions and Division 1 specifications, apply to this section.

B. Where Paragraphs of this Section conflict with similar paragraphs of the General and Supplementary Conditions and Division 1, requirements of this Section shall prevail.

1.2 SUMMARY

A. This Specification section describes the technical specifications and general instructions for the furnishing, factory testing, handling, delivery and installation of water purification equipment for general laboratory or academic research facility reagent water.

B. The Contractor is responsible for preparing the detailed engineering specifications, skid fabrication drawings and wiring diagrams necessary for fabrication, quality of materials, and quality of workmanship. This specification is intended to establish minimum acceptable standards consistent with industry practice.

C. Section Includes:
1. Cartridge particulate filters and housings.
2. Sodium based water softeners.
3. Activated granular carbon (AGC) bed
4. Skid-mounted reverse osmosis unit.
5. Service de-ionization mixed-beds.
6. Programmable logic controller.
7. Water storage tank.
8. Repressurization pumps with variable frequency drive (VFD).
9. Ultra-violet sterilizers.
10. Sub-micron final filters.
11. Related instrumentation and controls.

D. The Contractor is responsible for providing and installing a complete functioning system meeting the performance requirements specified herein. The contractor is responsible for providing and installing all interconnecting piping, wiring (both power and control voltage) and conduit.

1.4 DEFINITIONS

A. For definitions of terms used in this Section, refer to ASTM D1129, D6161 and NCCLS Document C3-A3.

1.5 SYSTEM DESCRIPTION

A. The reagent water system shall process potable water to a purity at all points of use equal to or exceeding the water quality and microbial requirements specified in:
   1. ASTM Type IV.

B. The system shall consist of packaged, modular unit treatment skids. Operation of the system shall be fully automatic.

C. Obtain a current water analysis for the water supply to be used as the system feed.

1.6 QUALITY ASSURANCE QUALIFICATIONS

A. Pure water equipment vendor shall have a minimum of five (5) years' experience in manufacturing water purification equipment and provide references for five (5) similar facilities.

1.7 SUBMITTALS

A. Submit shop drawings and submittals to Division 01.

B. Documentation Requirements
   1. Submitted documentation shall be complete and consistent to provide a written record to prove that the utilities and equipment conform to the specifications and intent of the design.

C. General
   1. Submit technical specification for all equipment including pretreatment equipment, reverse osmosis and tanks, filters, pumps, starters, heat exchangers, instrumentation and controls.
   2. Submit electrical requirements.
   3. Submit electrical data and wiring diagrams. Differentiate between factory wiring and field wiring.
   4. Submit control loop diagrams and ladder logic diagrams.
   5. Materials of construction and finishes of all product contact (wet) and non-contact parts.

D. Shop Drawings
   1. Submit shop drawings two weeks after receipt of purchase order.
   2. Submittal package shall include for all equipment (where applicable):
      a. Cover letter.
      b. Owner name and project location.
      c. Equipment name and identification number on the Drawings.
      d. Purchase order number and date.
      e. Manufacturer name and plant location.
      f. Equipment specification including utility requirements, connection sizes and types.
      g. Equipment drawings including plan and elevation, dimensions, and parts identification.

h. Equipment model, serial number, shop order number and date of fabrication.
i. Internal finish specifications.
j. External finish specifications.
k. Drawing title, number, revision number and date of issue.
l. P&ID with parts list.
m. Installation check procedures.
n. Pre-start-up check procedures.
o. Water quality test procedures.
p. Equipment weights.
q. Electrical schematics with parts list.
r. Exceptions list to specification (if applicable).
s. Exceptions list to vendor specification (if applicable).

3. Softeners: Also include the following:
   a. Overall dimensions and tolerances including access clearances.
   b. Quantity and type of softener resin including grains/gallon capacity.
   c. Material Safety Data Sheets (MSDS) for brine solution.
   d. Vessel ASME rating.
   e. Vessel interior coating.
   f. Valve specifications including solenoids, tubing and accessories.
   g. Control sequences.
   h. Regeneration flow rate and duration.
   i. Backwash flow rate and duration.
   j. NSF Certification.
4. Activated Granular Carbon (AGC) Assembly: Also include the following:
   a. Skid dimensions and tolerances.
   b. Quantity and type of activated carbon media.
   c. Vessel ASME rating.
   d. Vessel interior coating.
   e. Valve specifications including solenoids, tubing and accessories.
   f. Control sequences.
   g. Backwash flow rate and duration.
   h. Sanitization method, frequency and description.
   i. NSF Certifications.
5. Reverse Osmosis Unit: Also include the following:
   a. Membrane specifications and module assembly.
   b. Percent rejection of TDS rating.
   c. Rated permeate yield.
   d. Percent brine rejection to permeate yield.
6. Service De-ionization Mixed-Bed Units
   a. Overall dimensions.
   b. Materials of construction.
   c. Resin type and grade.
   d. Nozzle connection types, sizes and dimensioned physical locations.
7. Purified Water Tank submittals: Also include the following:
   a. Overall dimensions and tolerances for the tank and accessories.
   b. Design data including applicable codes and standards.
   c. Complete bills of materials for tank and accessories.
   d. Nozzle connection types, sizes and dimensioned physical locations.
   e. Customer nameplate.
8. Centrifugal Pumps: Also include the following:

a. Complete performance curves showing pump rate vs. discharge pressure, impeller diameter, brake horsepower, motor horsepower, hydraulic efficiency and net-positive suction head required (NPSHR).
b. Highlighted duty point of the pump on the performance curves.
c. Detailed pump and seal drawings.
d. Overall pump dimensions, including motor and frame.
e. Size, type and location of suction and discharge connections.
f. Operating weight (lbs.).
g. Passivation procedures.
h. Design and operating conditions.
i. Materials of construction.
j. Details of seal materials and design.

9. Submit Instrument Datasheets.

E. Closeout Submittals

1. General
   a. Revise final drawings and documents to incorporate all mark-ups and notes in the shop drawings to reflect the specific installation.
   b. Submit Inspection and test reports specified in "Source Quality Control" Articles in Part 2 of this Section.
2. Pre-Treatment, Primary Treatment: Provide equipment documentation as follows:
   a. User manual (3 sets): Include information to install, operate, configure, calibrate, troubleshoot and service the equipment. Include final as-built drawings, parts lists and component manufacturer literature as part of the User Manual.
   b. Manufacturing documentation (3 sets): Include safety and authorization certificates of vendor policies. Provide certificates of compliance for pressure vessel and piping materials, manufacturing, welding, surface treatment, inspection, testing and pressure vessel test report (Form U-1 for ASME) with a copy of the name plate. A certificate of compliance is defined as a description of design and manufacturing principles, practices, methods and equipment. Include boroscopic documentation.
   c. Control system validation documentation (3 sets): Include the PLC input/output listing, control valve table and a source code listing. Include change control documentation, version and media management documentation, and software development guidelines.
   d. Qualification documentation (3 sets): Include a general description of the factory acceptance test (FAT) procedures and compliance test report. General description of FAT procedures defines the objectives and describes the contents of each test and verification.
   e. Pressure vessel inspection procedure and reports.
   f. Passivation procedure and reports.
   g. Document and software review procedures.
   h. Functional software and design specification.
   i. Hardware design specification.
   j. Hardware acceptance test specification.
   k. System acceptance test specification.
3. Storage Tank: Provide equipment documentation as follows:
   a. Materials of construction.
   b. Wall thicknesses.
   c. Location of all welded joints (if applicable).
   d. Cleaning procedures and inspection report.

4. Sanitary Centrifugal Pumps: Provide equipment documentation as follows:
    a. Electropolishing procedure and inspection report.
    b. Passivation procedure and inspection report.
    c. Operating, Installation and maintenance manual.
    d. Recommended spare parts for 12 month operation.
5. Instrumentation: Provide equipment documentation as follows:
    a. Calibration certificates of all process instrumentation.

1.8 DELIVERY, STORAGE AND HANDLING

A. Packing/Handling
1. Prior to shipment, all openings shall be adequately sealed to protect from damage.
2. Disassemble units only to the extent to prevent damage during shipping and to facilitate field handling.
3. Pack each unit individually and include in packaging all necessary appurtenances and parts required for field installation.
4. Equipment shall be match-marked or tagged to identify location.

B. Shipping
1. Ship F.O.B. job site.

1.9 SYSTEM START UP

A. Perform start-up services and training of operators by a factory-trained field service engineer. Provide travel and accommodation costs of factory personnel.

B. Start-up service of the pure water system and storage tank shall include the following:
1. Installation checks including utility connections.
2. System operation for routine start-up and shut-down.
3. Programming of control set points.
4. “Off-spec” permeate dumping set-points and response.
5. Storage tank level control interfacing.
6. Alarm condition and response.
7. After system has been operating for 24 hours, collect RO water samples at hourly intervals for 8 hours. Owner analysis of samples shall meet the requirements of this specification in all respects.
8. During sampling period, check RO production rate. Production rate shall be in excess of 95% of the specified capacity.
9. After completion of start-up testing, obtain written sign-off of system from Owner. Correct design and fabrication deficiencies responsible for unsatisfactory test results at no cost to the Owner.
10. Conduct training of system operation and maintenance for Owner personnel.

C. Start-up of the purified water distribution loop shall include the following:
1. System operation for routine start-up and shut-down.
2. Programming of control set points.
3. Verification of pump rotation, speed and discharge pressure.
4. Verification of UV light intensity.
5. Collect pure water samples at use points at hourly intervals for 8 hours. Owner analysis of samples shall meet the requirements of this specification in all respects.
6. During sampling period, check flow rate and velocity through distribution loop.

7. After completion of start-up testing, obtain written sign-off of system from Owner. Correct design and fabrication deficiencies responsible for unsatisfactory test results at no cost to the Owner.
8. Conduct training of system operation and maintenance for Owner personnel.

1.10 MAINTENANCE

A. Pure water equipment vendor shall have an established field service organization and guarantee less than 12-hour response time, 24 hours per day, 7 days per week.

B. Provide one spare set of filter media cartridges for all filter types.

C. Provide as an option, the cost for a basic spare parts kit for an average 2 years operation.

D. Provide quotation for the service replacement of mixed-bed deionization units.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Subject to compliance with requirements and Drawings, provide products by one of the following:
1. Particulate Filters, Softeners, Carbon Beds, Mixed-Bed De-ionizers
   a. Siemens/U.S. Filter
   b. General Electric
   c. Hydro
   d. Ionics
2. Reverse Osmosis Units
   a. Siemens/U.S. Filter
   b. General Electric
   c. Hydro
   d. Ionics
3. Ultra-Violet Sterilizers
   a. Aquafine
   b. Siemens/U.S. Filter
   c. Approved equal.
4. Storage Tanks (Thermoplastic)
   a. American Process Technology, Inc.
   b. Teracon
   c. Nalgene
   d. Approved Equal
5. Pumps, Sanitary
   a. Tri-Clover “Tri-Flo” Series
   b. Fristam Pumps
   c. Waukesha Pumps
   d. APV Pumps
6. Sub-micron Filters and Housings
   a. Siemens/ U. S. Filter
   b. Gelman
   c. Pall
   d. Approved equal
7. Programmable Logic Controllers

a. Allen-Bradley
b. Approved vendor standard.

B. Subject to compliance with requirements and Drawings, and unless specified otherwise, instruments and controls provided with standard approved vendor-packaged units will be considered acceptable.

C. Refer to related sections and instrument lists, valve lists, and equipment lists for explicit specifications of attached instrumentation and controls. Some instruments and controls specified may be substitutes to standard vendor components within skid-mounted units.

2.2 GENERAL FABRICATION

A. Unless otherwise noted, all skids shall be fabricated of welded carbon steel with an epoxy or PVC protective finish. All welds shall be ground smooth and polished.

B. Unless otherwise noted, all electrical enclosures shall be NEMA 12 and constructed of epoxy coated carbon steel.

C. All skids shall be assembled by the vendor to allow for single field connections for power, feed, product, drain, and control air. All electrical components shall be pre-wired, neatly arranged and run in conduit. All electrical shall be wired to an electrical enclosure.

D. Provide all interconnecting wiring (power and control) between skids back to main PLC and polishing skid. Main power to PLC-1 and polishing skid shall be provided under Electrical Division.

2.3 CARTRIDGE PARTICULATE FILTER

A. Data Sheet:

CARTRIDGE PARTICULATE FILTER	
Equipment Tag	F-101
Description	Cartridge for removal of suspended solids and turbidity.
Performance Conditions	Source Water: Municipal water supply. Provide 15 micron particulate removal.
Operating Arrangement	One (1) housing with isolation valves and manual bypass for simplex operation.
Materials of Construction	Polypropylene.
Controls and Instrumentation	None. Inlet and outlet pressure gages as shown on drawings.
Filter Media	String wound polypropylene cartridge.
Valves and Connectors	Per valve spec P-10. Threaded inlet and outlet connections.
Housing	Polypropylene. 10 inch housing.
Distribution	N/A
Electrical	None.
Compressed Air	None.
Rated Duty	3.0 gpm minimum.
Basis of Design	Equal to Siemens DI GARD series with ZHCFA series polypropylene housing.

2.4 DUPLEX WATER SOFTENERS

A. Data Sheet:

DUPLEX WATER SOFTENERS	
Equipment Tag	WS-101 and WS-102
Description	Duplex sodium based, strong acid cation water softener. Automatically regenerable. Packaged and preassembled for single point field connections. Factory preassembled, pre-wired and tested for single point field connections.
Operating Arrangement	Two (2) vessels with pipe headers and controls for a duplex parallel operation with automatic regeneration.
Materials of Construction	FRP vessels. Other components manufacturer standard.
Controls and Instrumentation	Motorized five cycle control valve with regeneration initiated based on volume throughput. NEMA 3R enclosure.
Resin	Sodium form, strong acid cation resin. 30,000 grains/cu ft capacity.
Brinemaker	Polyethylene container. Sodium chloride (NaCl) saturated solution. Injected by PVC eductor, mounted on skid.
Valves and Connectors	Per pipe Class P10.
Pressure Vessels	Non-ASME rated FRP.
Distribution	NA.
Electrical	Wall outlet.
Compressed Air	None.
Rated Duty & Connection Sizes	3.0 gpm (RO feed rating).
Certification	ANSI/NSF 44 Certified Product.
Basis of Design	Equal to Siemens PTCT Series.

2.5 ACTIVATED GRANULAR CARBON SKID

A. Data Sheet:

CARBON GRANULAR CARBON (AGC) SKID ASSEMBLY	
Equipment Tag	AGC-101
Description	General purpose carbon-filter assembly. Automatically backwashable with time clock control. Factory preassembled, pre-wired and tested for single point field connections.
Performance Conditions	>99% reduction in inlet free chlorine or chloramine level prior to RO membrane contact.
Operating Arrangement	One (1) units with pipe headers and controls for simplex operation.
Materials of Construction	FRP vessels. Other components manufacturer standard. Piping as noted on the drawings.
Controls and Instrumentation	NEMA 3R control enclosure. Frequency of backwash shall be based on timeclock. Pneumatic pilot control valves.
Filter Media	Activated Granulated Carbon & Anthracite.
Valves and Connectors	Per Pipe Class P10.
Filter Tanks	Non-ASME rated FRP.
Distribution	NA.
Electrical	Wall outlet.
Compressed Air	None.
Rated Duty	3.0 gpm (RO feed rating).
Certification	ANSI/NSF 42 and 53 Certified Product.
Basis of Design	Siemens PTCC Series.

2.6 REVERSE OSMOSIS

A. Data Sheets:

REVERSE OSMOSIS UNIT			
Equipment Tag	RO-101		
Description	Pressure assisted hyperfiltration machine designed to reject dissolved solids, bacteria and endotoxins and produce purified water. Unit shall be designed and constructed for general laboratory reagent water applications. It shall be skid mounted, and factory assembled, tested and packaged. Control shall be fully automatic.		
ITEM	SPECIFICATION		
Performance Data	Design Output	1.4 gallons per minute.	
	Feed Input	Filtered, softened, de-chlorinated city water.	
	Concentrate Flow		
	Recovery	>=75%	
	Reject	MW C/O	200 Daltons and larger.
		TDS	>99%
		Endotoxin	>2-log reduction.
	Feed Temperature	60-65°F.	
Materials of Construction	Housing	Manufacturer standard.	
	Feed Water Pipe	Pipe Class P10.	
	Permeate Pipe	Pipe Class P20.	
	Pump(s)	316 Stainless Steel, mill finish internals.	
	High Pressure Pipe	316 Stainless Steel. AWWA C606 couplings, 304 Stainless Steel with neoprene gasket.	
	Membrane Housing	Manufacturer standard.	
	Skid Frame	Carbon Steel, anti-corrosion overcoat per vendor standard design.	
	Reject Piping	Refer to P&ID.	
Inlet Filter	Mounted on skid.		
Membranes	Material	Thin Film Composite (TFC). Spiral wound.	
	Arrangement	Two-Pass design. Second stage reject recycled to first stage inlet.	
	Array	Size and number as per vendor standard design based on calculated membrane profile to meet specified performance.	
	Sanitization	Chemical	
Pump(s)	Type	Multi-staged centrifugal, high pressure pump.	
	Manufacturer	Per Vendor standard package.	
	Motor	TEFC.	
	Horsepower	Manufacturer standard.	
Controller	Description	Microprocessor with I/O display and membrane keypad.	
	Enclosure	NEMA 12	
	Location	Skid mounted.	
Electrical	480 VAC, 60 Hz, 3 phase. Control voltage transformer provided in control cabinet.		

REVERSE OSMOSIS UNIT		
Equipment Tag	RO-101	
Control Air	None.	
Inlet Water Pressure	30 psig minimum. 80 psig maximum.	
Instrumentation	Instrument	Vendor Package.
	Flow Meters	Vendor Package.
	Pressure Indicators	Vendor Package.
	Pressure Transmitters	Vendor Package.
	Conductivity	Vendor Package.
Basis of Design	Siemens Vantage M41RHP Series.	

PROGRAMMABLE LOGIC CONTROLLER PANEL	
Equipment Tag	**PLC-1: Mounted on Distribution Skid**
Description	Programmable logic controller for the control of the distribution pumps and polishing equipment. Factory pre-assembled, pre-wired and tested for single point field connections.
Enclosure	NEMA 12.
Manufacturer & Model	Allen Bradley SLC-5/04.
I/O interface	Panel View Color 1400e display with single line graphics, touch screen functions and keypad.
Wiring	Discrete input and output points shall be supplied for communication throughout the system. These discrete points shall be wired to the terminal blocks in the main control panel. The unit‘s skid wiring shall be neatly arranged and protected in conduit runs.
Components	Enclosure. Power distribution block, terminal blocks, ground block. PLC processor, chassis and power supply, 24K memory capacity PLC discrete 16 point I/O modules, 120 VAC Control voltage transformer. Fuses and circuit breakers. Variable frequency drives, 480 VAC (2 pumps). Control relays. Thermal overload protection. Elapsed run time indicator. Alarm horn. System power switch. Nameplate plaques for device identification.
Monitoring Functions	Loop flow. Pump speed. Pump voltage. Pump run elapsed time. Ultraviolet intensity monitor. Loop conductivity.
Alarm Conditions	UV intensity low. Pump fault. Loop flow low. Loop conductivity high. Loop temperature high.
Unit Shutdown Conditions	Pump fault. Loop temperature high.
Electrical	480 VAC, 3 phase, 60 Hz.
Start-up & Warranty	Equipment cost shall include start-up service by factory-authorized technician and twelve (12) month minimum warranty agreement for materials and workmanship.
Other	NA.

B. RO Source Quality Control

1. Perform factory acceptance tests to guarantee that the manufacture, functionality, and performance of the system is in accordance with approved submittal documentation package.
2. Perform factory Fabrication QC and provide the following:

a. Unit identification including unit type, drawing number, serial number, etc.
b. Drawing and diagram verification with record of as-built drawing numbers of equipment drawings, Drawings and circuit diagrams.
c. Equipment verification to certify the critical dimensions of the unit and recorded serial numbers of critical components, such as control valve, pumps safety valves, etc.
d. Control system hardware acceptance tests verifying the correct hardware has been installed, system initialized correctly and inputs and outputs (I/O) of the system are functioning correctly.
e. Process instrument calibration reports of temperature, pressure, control system, recorders, gauges and displays.
f. Inspection reports of all internal pressure vessel and piping welds and primary welds.
g. Hydrostatic test reports of pressure vessels.
h. Passivation and sanitization reports.
i. Test equipment calibration to certify the conductivity meter reference instrument and resistor systems.
j. Set printers and recorders, check motor rotation and overload device settings. Adjust flow control valves, level sensors and pressure switches.

3. Perform Operational QC and provide the following:
   a. Verification of proper connection of test utilities and the tuning of valves and recorders.
   b. Alarm testing report of all alarms on the unit.
   c. Test report of safety interlocks.
4. Perform Performance QC and provide the following:
   a. Test run reports indicating capacity and utility consumption rates. Utility connections shall be similar to those at the project site.
   b. Provide test report of unit purification capability. Report percent rejection of TDS and permeate yield for RO units.

2.7 SERVICE MIXED-BED DE-IONIZATION UNITS

A. Data Sheet:

SERVICE MIXED BED DE-IONIZERS	
Equipment Tag	SDI-101, SDI-102
Description	Mixed bed polishing units utilizing ion exchange resin.
Operating Arrangement	Two vessels with piping headers and controls for a "primary/polishing" operation.
Materials of Construction	Vendor Standard
Vessels	Non-ASME rated FRP.
Distributors	Manufacturer standard.
Resin	Virgin semiconductor grade, with Type I Anion. 25 sf per vessel.
Rated Duty	1.6 gpm minimum.
Start-up & Warranty	Equipment cost shall include start-up service by factory-authorized technician and twelve (12) month minimum warranty agreement for materials and workmanship.
Other	Include post-DI resistivity cell wired to PLC. Include post-DI resin trap.
Regeneration	Mixed bed units shall be removable for exchange at the customer site. Fixed units requiring on site regeneration utilizing acid/caustic reagents shall not be permitted.

2.8 STORAGE TANKS

A. Data Sheets:

WATER STORAGE TANK ASSEMBLY	
Equipment Tag	T-101
Description	Storage tank with level transmitter, temperature transmitter, vent filter, valves and drain. Factory preassembled, pre-wired and tested for single point field connections.
Operating Arrangement	One vessel.
Materials of Construction	Polyethylene Resin. ASTM D-1998 (0.935 – 0.965 g/cm^3 density). Comply with 21 CFR 177.1520, Olefin Polymers intended for contact with food. Long term UV stable resin.
Controls and Instrumentation	The level transmitter, temperature transmitter shall be field wired to the main control panel provided with the distribution and polishing skid unit. Refer to instrumentation spec sheets for control valve and instrument specifications.
Valves and Connectors	Pipe Class P20.
Tank	Rotationally Molded Cylindrical with dished or flat top and cone bottom. Four steel/PVC coated pipe legs. Refer to P&ID for dimensions and capacity.

Sample Valve	Tank outlet sample valve shall be pure valve equal to GF Model 319 diaphragm type.
Electrical	The level transmitter and temperature transmitter shall be field wired to the main PLC.
Nozzles	Flanged or welded. Refer to P&ID's for nozzle sizes.
Supports	Epoxy or PVC coated carbon steel saddle with four tubular steel legs. Carbon steel footpads for anchoring to floor.
Spray Ball	Include spray ball.
Rated Duty & Connection Sizes	1000 gallon nominal capacity.
Start-up & Warranty	Equipment cost shall include start-up service by factory-authorized technician and twelve (12) month minimum warranty agreement for materials and workmanship.
Other	

2.9 VENT FILTERS

A. Equipment Data:

HYDROPHOBIC FILTER	
Equipment Tag	Vent Filter
Number Required	One (1)
Mounting Condition Arrangement	Mount on vent nozzle at tank top head.
Housing	Polypropylene.
Materials of Construction	Polypropylene.
Filter Media	Hydrophobic 0.2 micron vent filter.
Controls	NA
Connections	See Drawings.
Vent/Drain	
Gaskets	Teflon/Viton (FDA approved).
Interior Finish	NA
Electrical	NA
Valves and Connectors	NA
Rated Duty	See Drawings.

2.10 CIRCULATION PUMPS

A. Data Sheet:

CIRCULATION PUMPS	
Equipment Tag	P-101, P-102
Number Required	Two. Piped in parallel for duplex operation.
Mounting Condition	Mounted on skid; both pumps mounted, with UV sterilizer and final filters. Refer to notes on Drawings for piping arrangement.
Type	Sanitary centrifugal, volute casing.
Motor	TEFC NEMA, C-faced standard
Impeller M.O.C.	316 L stainless steel 20 RA Electropolished.
Casing Materials of Construction	316 L stainless steel 20 RA, Electropolished. Exterior finish to be satin.
Casing Gasket	BUNA-N Elastomer.
Controls	From skid mounted PLC at the skid. Variable speed control. Refer to Sequence of Operation, Part III this Section.
Electrical	460/3φ/60 Hz
Mechanical Seal	Clamped sanitary seal/seat. Carbon vs. silicon carbide seal seat.
Valves and Connectors	Per pipe spec P20. Hard pipe connections with vibration isolators. Tri-Clamp port connections.
Sundries	1/2" case drain, adjustable leg kit
Start Up and Warranty	Standard manufacturing package
Rated Duty	280 ft TDH @ 88 gpm.
Horsepower	25
Acceptable Manufacturers	Alfa Laval LKP-UP-25 or equal by Tri-Clover, Waukesha, G&H.

B. Pump Source Quality Control

1. Inspect pump and bench test prior to shipment. Use manufacturer's standard mechanical and electrical integrity and performance tests.

2.11 ULTRAVIOLET STERILIZER

A. Data Sheet:

UV STERILIZER	
Equipment Tag	UV-101
Number Required	One (1)
Mounting Condition	Mounted on skid with Pumps, final filters, control valves and piping.
Type	Low pressure lamps, 185 NM.
Lamps	12.
Inlet/Outlet Connections	Refer to Drawings.
Materials of Construction	316 stainless steel.
Controls	Via PLC.
Electrical	120 VAC/10/60 Hz, wired from PLC.
Valves	Isolation, see pipe class P20.
Instrumentation	S-254 optical sensor, T-120 temperature safety control, lamp out alert, high pressure design.
Cooling Media	N/A.
Rated Duty	88 gpm minimum.
Other	Thermister, intensity monitor.
Acceptable Manufacturers	Equal to Aquafine Model CSL-12R

2.12 FLOW METER

A. FIT-101: Equal to George Fischer Vortex System in-line flow meter. DN 63 port size. PVDF body.

2.13 FINAL FILTERS

A. Data Sheet:

FINAL FILTERS	
Equipment Tag	**LF-101A/B**
Number Required	Two (2)
Mounting Condition Arrangement	Part of polishing skid, pumps
Rating	0.1 micron.
Sample Valve	See pipe class P10.
Housing	Stainless Steel.
Media	
Instruments	NA.
Connections	Flange.
Code Requirements	N/A.
Rated Duty	88 gpm minimum.
Other	

PART 3 - EXECUTION

3.1 CONCRETE BASES

A. Construct concrete bases of dimensions indicated, but not less than 4 inches (100 mm) larger in both directions than supported unit and not less than 4 inches (100 mm) high.

B. Refer to Division 3 Section "Cast-in-Place Concrete" for reinforcement, framing, and concrete materials for 4000-psig (27.6-MPa), 28-day compressive strength.

C. Refer to Division 23 Section "Basic Mechanical Materials and Methods."

3.2 INSTALLATION

A. Install skidded components and other equipment in accordance with manufacturers' written instructions and recommendations.

B. Install equipment on concrete bases. Set and connect units and major accessories according to manufacturers' written instructions. Install units plumb, level, and firmly anchored in locations indicated. Maintain manufacturers' recommended clearances. Orient so equipment, controls, and devices needing service are accessible.

C. Support equipment using the following vibration-control devices, unless otherwise indicated. Refer to Division 15 Section "Vibration Control."
1. Install rotating equipment, 5 hp or less with spring isolators.
2. Install rotating equipment, more than 5 hp, with concrete inertia base and spring isolators.

D. Install piping and valves in accordance with the instructions included under the respective Pipe Class. Refer to Section 15400 "Plumbing Piping."

E. Provide pipe hangers as described under Division 22.

F. Affix instrument identification numbers, date of calibration, and next date of calibration. Labels shall be clearly visible.

G. Tag all equipment, valves, and instruments with permanent stainless steel tags bearing Drawings tag number.

3.3 CONNECTIONS

A. Install piping next to equipment and accessories to allow service and maintenance.

B. Connect piping to equipment and accessories with flanges, unions, and sanitary couplings as shown on Drawings and as specified under the respective pipe class.

C. Install piping for waste and reject streams. Pipe liquid waste drains to sanitary drainage or process waste systems. Provide air gaps at indirect waste drains with not less than 3 pipe diameters between the waste discharge and the floor drains flood rim.

D. Connect pneumatic tubing from compressed air supply to solenoids and actuators. Field wire actuator solenoids to PLCs and local controls as shown on Drawings.

E. Ground electrical equipment.

F. Tighten electrical connectors and terminals according to manufacturer's published torque-tightening values. Where manufacturer's torque values are not indicated, use those specified in UL 486A and UL 486B.

G. Arrange for electric-power connections to equipment that requires power. Electric power, wiring, and disconnect switches are specified in Division 26 Sections.

3.4 SEQUENCE OF OPERATION

A. Skidded, pre-packaged units fabricated in the factory shall undergo thorough Factory Acceptance Tests to test control sequences and calibrate instruments. Refer to Section 226700, Part 2, "Source Quality Control" for all applicable equipment.

B. Duplex Softener (WS-101, 102)
1. Control sequence for the regeneration and backwash of the softeners, a packaged skidded unit, shall be defined by the vendor. Refer to Section 226700, Part I, Submittals.
2. Initiation of softener regeneration and backwash shall be based on totalized reverse osmosis throughput.
3. The supplying vendor shall define cycle frequency, taking into account supply water hardness.

C. Activated Granular Carbon Skid (AGC-101): No control sequence.

D. Reverse Osmosis (RO-101)
1. The supplying vendor shall define all control sequences, start/stop permissives and alarm parameters. Refer to Section 226700, Part I, Submittals.
2. Control of RO-101 shall be from the control panel mounted on the reverse osmosis unit.

E. Storage Tank
1. Level
a. LIT-101 shall provide an analog signal to PLC-1 for T-101 level control.
b. LIT-101 $\geq$ 95%
1) Initiate a "T-101 Level High" alarm on PLC-1 and send a signal to RO-101 to stop.
c. LIT-101 $\geq$ 90%
1) Stop RO-101.
d. LIT-101 $\leq$ 60%
1) Start RO-101.
2. P-101/102 Safety Interlock
a. When in "automatic" mode, P-101/102 shall be operated from PLC-1 and be interlocked with T-101 level settings.
b. LIT-101 $\geq$ 30%
1) The permissive condition to start P-101/102 from PLC-1.
c. LIT-101 $\leq$ 25%
1) PLC-1 shall stop P-101/102 and initiate a "T-101 Level Low" alarm.

2) PLC-1 shall not allow automatic start of P-101/102 until the 30% level permissive is met.

F. Circulation Pumps
1. Refer to T-101 safety interlocks for details on automatic start/stop permissives from PLC-1.
2. HS-101 and HS-102 are "Local, Off, Auto" (LOA) selector switches located on the starter panel for P-101/102.
a. "Local" setting: The pumps are started and stopped from local "Start, Stop, Push" (SSP) buttons HS-101 and HS-102.
b. "Off" setting: The pumps cannot be started locally or from PLC-1.
c. "Auto" setting: The pumps are started and stopped from PLC-1 provided the T-101 level permissives are satisfied.
3. QAL-101 and QAL-102 detect line voltage to the pump motors. On low voltage, an alarm condition shall be displayed at PLC-1 and PLC-1 will shut down P-101/102.
4. Sequencing and Speed Control: In normal operating condition, both pumps shall be in "Auto" setting and shall both run (simultaneous parallel operation) at a reduced speed. PLC-1 shall monitor loop flow by means of FIT-101 mounted on the pump and polishing skid. The PLC shall adjust the speed of both pumps as if they were one pump to maintain the target loop flow of 88 gpm. If one pump were to shut down either by placing it in "Local" and stopping or due to a fault, the PLC shall adjust the speed of the remaining pump to maintain the target flow. Each pump has been selected to provide the full head anticipated to achieve the target flow rate independently. The simultaneous use is intended to (1) maintain even hours of use, (2) prevent the stagnation of water in an off-line pump casing and piping, and (3) provide uninterrupted response to loop circulation in the event of a single pump fault. The control sequence shall be capable of defaulting by user setting on the PLC to single pump operation for testing or maintenance purposes.

G. Ultra-Violet Disinfection & TOC Reduction
1. XAL-101 shall send a digital signal to PLC-1 to indicate a fault in the ultraviolet light unit.

3.5 FIELD QUALITY CONTROL

A. Sample purified water system output at user points at one-week intervals after start-up, for a period of 3 weeks. Follow ASTM D3370 procedures for sampling water. Prepare certified test reports for each required water performance characteristic. Water quality shall comply with the following standards:
1. ASTM
a. D1126
b. D859
c. D1067
d. D1068
e. D1888

3.6 CLEANING AND PASSIVATION

A. Refer to Section 226710 for Field Cleaning and Passivation Procedures.

3.7 DEMONSTRATION

A. Engage a factory-authorized service representative to perform startup services and to demonstrate and train Owner's maintenance personnel as specified below.
   1. Train Owner's maintenance personnel on procedures and schedules related to start up and shutdown, troubleshooting, servicing, and preventive maintenance.
   2. Review data in the operation and maintenance manuals. Refer to Division 1 Section "Contract Closeout."
   3. Review data in the operation and maintenance manuals. Refer to Division 1 Section "Operation and Maintenance Data."
   4. Schedule training with Owner with at least 7 days' advance notice.

3.8 PROTECTION

A. The Contractor is fully responsible for providing adequate protection to piping and components during construction and start-up.

B. Comply with manufacturer’s written instructions for equipment protection.

C. Restrict physical access to equipment room to individuals directly involved in equipment installation (including vendors and consultants).

END OF SECTION 226700
N:\N0912.00\DOC\SPEC\2012_03-16_BID\226700 - REAGENT GRADE WATER SYSTEM.DOC

SECTION 226710 - PURIFIED WATER PIPING

PART 1 - GENERAL

1.1 RELATED SECTIONS

A. Drawings and General Provision of Contract, including General and Supplementary Conditions and Division 1 specifications, apply to this section.

B. Where Paragraphs of this Section conflict with similar paragraphs of the General and Supplementary Conditions and Division 1, requirements of this Section shall prevail.

1.2 SUMMARY

A. This Specification section describes the technical specifications and general instructions for the furnishing, handling, delivery and installation of pipe, tube, fittings and valves to be used for purified water applications.

B. Pipe materials and components specified in this Section include:
1. Pipe and tube.
2. Fittings and couplings.
3. Valves.
4. Valve actuators.
5. Insulation Products

C. Related Sections
1. Section 226700 "Reagent Water System"
2. Section 220519 "Meters and Gages for Plumbing Piping"
3. Division 22 Sections for pipe insulation and pipe hangers.

1.3 REFERENCES

A. Unless noted otherwise, the most current issue, revision, or affirmation of the references listed herein shall be used, including all addenda, errata, and referenced documents:

1.4 SUBMITTALS

A. Documentation Requirements
1. Submitted documentation shall be complete and consistent to provide a written record to prove that the pipe, tube and components conform to the specifications and intent of the design.

B. Shop Drawings
1. Submit shop drawings two weeks after receipt of purchase order.
2. Submittal package shall include for all equipment (where applicable):
   a. Cover letter,
   b. Owner name and plant location,
   c. Component name and identification number on the P&ID’s,
   d. Purchase order number and date,
   e. Manufacturer name and plant location,
   f. Component drawings including sections, dimensions, exploded parts drawing, and parts identification,
   g. Quantity (units, feet, meters or number of lengths),
   h. Pipe dimensions, wall thickness, pressure ratings at temperature.
   i. Component model, serial number, shop order number and date of fabrication,
   j. Heat fusion procedures for thermoplastic pipe,
   k. Thermoplastic heat fusion installer certifications by manufacturer,
   l. Drawing title, number, revision number and date of issue,
   m. Control valve pressure and flow characteristics including Cv values as tested by the manufacturer.
   n. Shop Drawings detailing pipe anchors, special pipe support assemblies, alignment guides, and expansion joints and loops.
   o. Detailed isometric diagrams of all loop distribution systems.

C. Installation check procedures,

D. Pre-Start-up Check Procedures,

E. Exceptions list to specification (if applicable),

F. Exceptions list to vendor specification (if applicable).

G. Samples
   1. Submit sample of butt fused joint for each type of thermoplastic pipe.
   2. Submit sample of butt fused, ridge and bubble free joint for each type of thermoplastic pipe.

H. Closeout Submittals
   1. General
      a. Revise final drawings, isometrics and documents to incorporate all mark-ups and notes in the shop drawings to reflect the specific installation.
      b. Submit certificates of inspections and tests to the validation agency.
      c. Submit Inspection and test reports specified in "Source Quality Control" Articles in Part 2 of this Section.
      d. Submit mill test reports on all materials used to fabricate system components.
      e. Isometric diagrams of “As-Built” condition including weld number, date and Welder I.D. number for each Field Weld.

1.5 QUALITY ASSURANCE

A. Comply with the latest versions of the following codes and provisions, including all addendum, errata, and revisions:
   1. ASME B31.3 for materials, products, and installation. Safety valves and pressure vessels shall bear the appropriate ASME label.
   2. Fabricate and stamp tanks to comply with ASME Boiler and Pressure Vessel Code, Section VIII, Division 1.

1.6 CERTIFICATIONS

A. Only factory-trained and certified installers shall install thermoplastic piping. Installers of heat fusion thermoplastic joints shall hold current certifications in the installation and fusion methods from the respective pipe manufacturers.

1.7 DELIVERY STORAGE AND HANDLING

A. Packing/Shipping/Handling/Unloading
   1. Ship tube and pipe with capped ends. Insert stainless steel tubing in 6 mil poly protective plastic sleeves prior to packing.
   2. Bundle tube together and ship in tri-wall boxes in accordance with manufacturer’s established procedures.
   3. Ship fittings and valves with end caps and in individual plastic bags, properly sealed. Include part number, heat trace number(s), and the packing date with each valve and fitting.

B. Storage and Protection
   1. Store pipe, tube, fittings and valves on site in accordance with manufacturer recommendations.

2. Place materials indoors and on elevated platforms in a dry location away from construction activity that may cause damage or contamination.
3. Maintain packaging, caps and seals on all materials until ready for immediate installation.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Subject to compliance with requirements stated herein and with the Drawings, provide materials from one of the following manufacturers:
   1. Polyvinyl Chloride (PVC) and Chlorinated Polyvinyl Chloride (CPVC) Pipe and Fittings
      a. George Fischer
      b. Sani-Tech
      c. Enfield
   2. Polypropylene Pipe and Fittings
      a. George Fischer
      b. Sani-Tech
      c. Enfield
      d. Trent Tube
      e. G&H Products
      f. Alfa Laval
      g. Tri-Clover
   3. PVC and CPVC Valves, Actuators and Strainers
      a. George Fischer
      b. Asahi
      c. Sani-Tech
      d. Hayward Safe Block
      e. Plast-O-Matic
   4. Polypropylene Valves and Actuators
      a. George Fischer
      b. Asahi
      c. Sani-Tech
      d. Hayward Safe Block
      e. Plast-O-Matic

B. All pipe and components of a given pipe class shall originate from one source and be the product of a single manufacturer (e.g., All P10 ball valves, diaphragm valves and check valves shall be by one manufacturer).

C. When possible, all stainless steel fittings, valves and weldable parts of the same nominal diameter shall be purchased with the same heat trace number to standardize weld quality for each tubing size.

2.2 PIPE MATERIALS SPECIFICATION INDEX

A. The following table summarizes the pipe classes specified in this Section. Refer to the respective Pipe Class data sheets for detailed requirements.

Service	Drawing Tag	Maximum Service Operating Limits		Class	Pipe Material
		Pressure (psig)	Temperature (°F)		
PRE-TREATMENT WATER	NPCW	100	70	P10	PVC
ASTM/CAP REAGENT WATER	RO	100	68	P20	PIGMENTED POLYPROPYLENE

2.3 PRE-TREATMENT WATER PIPING

PIPE CLASS P10			
ITEM	SPECIFICATION		
Pipe	Material	Polyvinylchloride (PVC), Type 1 complying with ASTM D3915.	
	Manufacture	ASTM D1784.	
	Wall Thickness	Schedule 80.	
	Tensile Strength		
	Pressure Rating		
	Purity		
Fittings	Material	PVC complying with ASTM 2467.	
	End Connections	Socket for solvent weld. Flanged or threaded joints at equipment connections and where noted on P&ID's.	
Joints	Method	Solvent cementing methods per ASTM D2855 standard procedures.	
	Solvent	Use ASTM D2564 solvent.	
	Primer	Use ASTM F656 primers.	
Flange	ANSI B16.5 Class 150 pattern of same pipe material.		
Valves			
Ball	Materials	Body	PVC, Type 1, ASTM D1784
		Ball	PVC
		Seat	Polytetrafluoroethylene (PTFE)
		O-Ring	Viton
		Stem	Manufacturer Standard
	End Connections	Union or solvent cement socket.	

PIPE CLASS P10			
ITEM	SPECIFICATION		
	Pressure Rating	2" and smaller	230 psig at 68ºF.
		2.5" and larger	150 psig at 68ºF.
	Stem	Blow-out proof.	
	Model	Equal to George Fischer Type 560.	
Check	Materials	Body	PVC, Type 1, ASTM D1784.
		Ball	PVC
		Seat	Polytetrafluoroethylene (PTFE)
	End Connections	Union or solvent cement socket.	
	Pressure Rating	150 psig at 68ºF.	
	Model	Equal to George Fischer Type 360.	
Diaphragm	Materials	Body	PVC, Type 1, ASTM D1784.
		Diaphragm	Polytetrafluoroethylene (PTFE)
		Stem	Manufacturer Standard
		Bonnet	PVC
	End Connections	Flange	
	Pressure Rating	150 psig at 68ºF.	
	Position Indicator	Yes.	
	Model	Equal to George Fischer Type 317.	
Globe,	Materials	Body	PVC, Type 1, ASTM D1784.

PIPE CLASS P10			
ITEM	SPECIFICATION		
Y-Pattern		Diaphragm	Polytetrafluoroethylene (PTFE)
		Stem	Manufacturer Standard.
	End Connections	Union or solvent cement socket. Refer to P&ID's.	
	Pressure Rating	125 psig at 68ºF.	
	Actuator	Pneumatic piston with limit switches. FO or FC as noted on P&ID's.	
	Model	Equal to Aquamatic.	
Strainer	Model		
Use Point			

2.4 THERMOPLASTIC PURE WATER PIPING

PIPE CLASS P20			
ITEM	SPECIFICATION		
Pipe	Material	Polypropylene, Pigmented. Type II Copolymer.	
	Manufacture	ASTM D4101	
	Wall Thickness	SDR 11.	
	Tensile Strength	3900 psi at 73ºF. Conform to ASTM D-638.	
	Pressure Rating	150 psig at 68ºF. 50 psig at 200ºF. Conform to ASTM D-2837.	
	Purity	Adequate for contact with deionized water.	
Fittings	Material	Comply with pipe specifications.	
	End Connections	4" and smaller	Socket fusion. Flanged at equipment or where noted on the P&ID.

PIPE CLASS P20			
ITEM	SPECIFICATION		
		5” and larger	Butt fusion.
Joints	Method	Comply with ASTM D2657 procedures.	
	Equipment	Use fusion joining equipment supplied by pipe/fitting manufacturer.	
	Other	Fusion inserts and prefabricated coil fusion fittings are **prohibited.**	
Flange	ANSI B16.5 Class 150 pattern of same pipe material.		
Valves			
Ball	Materials	Body	Polypropylene, ASTM D4101.
		Ball	Polypropylene
		Seat	Polytetrafluoroethylene (PTFE)
		O-Ring	Viton
		Stem	Manufacturer Standard
	End Connections	Union or socket heat fusion.	
	Pressure Rating	2” and smaller	230 psig at 68ºF.
		2.5” and larger	150 psig at 68ºF.
	Stem	Blow-out proof.	
	Model	Equal to George Fischer Type 346.	
Check	Materials	Body	Polypropylene, ASTM D4101.
		Ball	Polypropylene
		Seat	EPDM
	End Connections	Union or socket heat fusion.	
	Pressure Rating	150 psig at 68ºF.	

PIPE CLASS P20			
ITEM	SPECIFICATION		
	Model	Equal to George Fischer Type 360.	
Diaphragm	Materials	Body	Polypropylene, ASTM D4101.
		Diaphragm	Polytetrafluoroethylene (PTFE)
		Stem	Manufacturer Standard
		Bonnet	Polypropylene
	End Connections	Flange	
	Pressure Rating	150 psig at 68ºF.	
	Position Indicator	Yes.	
	Model	Equal to George Fischer Type 317.	
Pressure Reducing	Materials	Body	Polypropylene, ASTM D4101.
		Diaphragm	Polytetrafluoroethylene (PTFE)
		Stem	Manufacturer Standard.
	End Connections	Union or spigot. Refer to P&ID's.	
	Pressure Rating	150 psig at 68ºF.	
	Manometer	Attached to valve body to display reduced pressure.	
	Model	To 1.5"	George Fischer Type V782.
		2" and Up	George Fischer Type V82.
Back Pressure Regulator	Model	Same material specifications and end connections as pressure reducing valves. Equal to George Fischer Type V86.	
Use Point		Refer to details.	

PART 3 - EXECUTION

3.1 INSTALLERS

A. The installation of process systems requires an unusually high quality of workmanship and strict quality control and documentation. The Contractor is fully responsible for quality control documentation related to the experience, certifications, training, and field and shop procedures utilized. Maintain a continuous record of field or shop-installed or fabricated elements of the system to the individual(s) performing the Work.

B. An installation specialist shall install all piping insulation.

3.2 INSTALLATION

A. General:
   1. Refer to Division 22 sections for general requirements for pipe installation and pipe supports.
   2. Refer to Division 22 sections for general requirements for application of pipe insulation.
   3. Installation, including support spacing, compensation for expansion and contraction, and joining shall be in compliance with manufacturer's recommendations.
   4. Support all thermoplastic piping with continuous support channel under all horizontal pipe runs. Support pipe and channel from the piping suspension system.

B. Solvent-Cemented, Thermoplastic Pipe and Fitting Joints:
   1. Handle cleaners, primers, and solvent cements according to ASTM F 402.
   2. Follow ASTM D2855 standard procedures for the joining of solvent-cemented joints.

C. Heat Fused Olefin and Fluoropolymer Thermoplastic Pipe and Fitting Joints:
   1. Follow ASTM D2757standard procedures for the joining of heat fusion joints.
   2. Use heat fusion equipment supplied by the pipe and fitting manufacturer. Follow manufacturer’s instructions.

3.3 FIELD QUALITY CONTROL

A. At the Owner’s option and direction, remove an installed thermoplastic fitting identified by the Owner for a spot check. Removed fitting shall be sent to pipe manufacturer for evaluation. If the joint is evaluated as satisfactory, the Owner will pay for the replacement of the fitting. If the pipe manufacturer evaluates the joint as unsatisfactory, replace the fitting with new materials at no cost to the Owner.

B. If an unsatisfactory fitting is identified, the Owner shall reserve the right to have additional fittings removed for evaluation until the level of quality of the installation is proven to the Owner’s satisfaction at no additional cost.

C. Hydrostatically test all pipe systems with deionized water at 100 psig for one hour. Document all results.

3.4 CLEANING OF THERMOPLASTICS

A. If a system is to be sterilized in place, leak check and pressure test the system with air or water, prior to sterilization.

B. Disconnect any UV lights and remove any sub-micron filter cartridges from their housings and install 5 micron filter cartridges.

C. Close valves on inlet and outlet and open bypass on any DI bottles to prevent the sterilizing solution from entering DI bottles and contacting the resin, while still allowing the solution to circulate.

D. Fill storage tank to a depth of approximately 3 ft. with DI water. Calculate the total volume of water in the storage tank AND the piping loop. Add sufficient hydrogen peroxide (H_2O_2) to the water in the storage tank to result in a solution strength of 10% H_2O_2).

E. When circulating the H_2O_2 solution, sample the water at each sink valve, as follows, to verify the presence of the H_2O_2 solution:
   1. Utilize a Nach Co., Inc. premanufacturing test kit Model no. HYP-1 (Cat. No. 2291-00) or approved equal. This kit shall be used to test H202 presence by a drop count titration) thiosulfide method.
   2. Adjust the pH of a quart of potassium permanganate ($KMNO_4$) and pH 6.5 with sulfuric acid (H_2SO_4). A quart should be adequate for testing most systems.
   3. Draw approximately one-half cup of water from each sink valve, individually, and add a small amount of the test solution ($KMNO_4$) to the sample.
   4. If H_2O_2 is present in the sample, it will turn clear or brown; if no H_2O_2 is present, it will remain purple.

F. When testing verifies the H_2O_2 solution is present at all test locations, turn off the distribution pump and open inlet and outlet valve as required to retain the solution in the loop for a minimum of 12 hours, while isolating the tank from the loop.

G. During the 12 hour retention period, the storage tank can be drained and cleaned. This is accomplished by first draining the tank to below the manhole. Enter the tank and using suitable spraying device and pressure, wash the tank walls and dome with the residual H_2O_2 in the tank. After spraying, drain the tank to a suitable drain and then thoroughly rinse the interior with DI water allowing it to go to drain also. Vacuum any residual DI water and then dry the tank, replace the manhole and close the tank drain. Fill the storage tank with DI water and revalve or install a bypass to allow the building loop return line to discharge to drain for the flushing and draining of the loop.
   1. While performing the following tank cleaning procedure, full body protective gear including breathing apparatus is required. Also, a life line must be attached to the person entering the tank and an additional person should be stationed outside within sight and sound, in case of an emergency.

H. After the 12 hour retention period, flush the H_2O_2 solution in the loop to drain, utilizing the distribution pump and the DI water in the storage tank. Flush until testing with $KMNO_4$ indicates no residual H_2O_2 in the loop.

END OF SECTION 226710

N:\N0912.00\DOC\SPEC\2012_03-16_BID\226710 - PURIFIED WATER PIPING.DOC

SECTION 230500 – COMMON WORK RESULTS FOR HVAC

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

1.2 SUMMARY

A. This Section includes the following:
1. Piping materials and installation instructions common to most piping systems.
2. Transition fittings.
3. Dielectric fittings.
4. Mechanical sleeve seals.
5. Sleeves.
6. Escutcheons.
7. Grout.
8. Equipment installation requirements common to equipment sections.
9. Painting and finishing.
10. Concrete bases.
11. Supports and anchorages.

1.3 DEFINITIONS

A. Finished Spaces: Spaces other than mechanical and electrical equipment rooms, furred spaces, pipe and duct shafts, unheated spaces immediately below roof, spaces above ceilings, unexcavated spaces, crawlspaces, and tunnels.

B. Exposed, Interior Installations: Exposed to view indoors. Examples include finished occupied spaces and mechanical equipment rooms.

C. Exposed, Exterior Installations: Exposed to view outdoors or subject to outdoor ambient temperatures and weather conditions. Examples include rooftop locations.

D. Concealed, Interior Installations: Concealed from view and protected from physical contact by building occupants. Examples include above ceilings and in duct shafts.

E. Concealed, Exterior Installations: Concealed from view and protected from weather conditions and physical contact by building occupants but subject to outdoor ambient temperatures. Examples include installations within unheated shelters.

F. The following are industry abbreviations for plastic materials:
1. ABS: Acrylonitrile-butadiene-styrene plastic.
2. CPVC: Chlorinated polyvinyl chloride plastic.
3. PE: Polyethylene plastic.
4. PVC: Polyvinyl chloride plastic.

G. The following are industry abbreviations for rubber materials:
   1. EPDM: Ethylene-propylene-diene terpolymer rubber.
   2. NBR: Acrylonitrile-butadiene rubber.

1.4 SUBMITTALS

A. Product Data: For the following:
   1. Transition fittings.
   2. Dielectric fittings.
   3. Mechanical sleeve seals.
   4. Escutcheons.

B. Welding certificates.

1.5 QUALITY ASSURANCE

A. Steel Support Welding: Qualify processes and operators according to AWS D1.1, "Structural Welding Code--Steel."

B. Steel Pipe Welding: Qualify processes and operators according to ASME Boiler and Pressure Vessel Code: Section IX, "Welding and Brazing Qualifications."
   1. Comply with provisions in ASME B31 Series, "Code for Pressure Piping."
   2. Certify that each welder has passed AWS qualification tests for welding processes involved and that certification is current.

C. Electrical Characteristics for Mechanical Equipment: Equipment of higher electrical characteristics may be furnished provided such proposed equipment is approved in writing and connecting electrical services, circuit breakers, and conduit sizes are appropriately modified. If minimum energy ratings or efficiencies are specified, equipment shall comply with requirements.

1.6 DELIVERY, STORAGE, AND HANDLING

A. Deliver pipes and tubes with factory-applied end caps. Maintain end caps through shipping, storage, and handling to prevent pipe end damage and to prevent entrance of dirt, debris, and moisture.

B. Store plastic pipes protected from direct sunlight. Support to prevent sagging and bending.

1.7 COORDINATION

A. Arrange for pipe spaces, chases, slots, and openings in building structure during progress of construction, to allow for mechanical installations.

B. Coordinate installation of required supporting devices and set sleeves in poured-in-place concrete and other structural components as they are constructed.

C. Coordinate requirements for access panels and doors for mechanical items requiring access that are concealed behind finished surfaces. Access panels and doors are specified in Division 8 Section "Access Doors and Frames."

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. In other Part 2 articles where subparagraph titles below introduce lists, the following requirements apply for product selection:
   1. Manufacturers: Subject to compliance with requirements, provide products by the manufacturers specified.

2.2 PIPE, TUBE, AND FITTINGS

A. Refer to individual Division 23 piping Sections for pipe, tube, and fitting materials and joining methods.

B. Pipe Threads: ASME B1.20.1 for factory-threaded pipe and pipe fittings.

2.3 JOINING MATERIALS

A. Pipe-Flange Gasket Materials: Suitable for chemical and thermal conditions of piping system contents.
   1. ASME B16.21, nonmetallic, flat, asbestos-free, 1/8-inch maximum thickness unless thickness or specific material is indicated.
      a. Full-Face Type: For flat-face, Class 125, cast-iron and cast-bronze flanges.
      b. Narrow-Face Type: For raised-face, Class 250, cast-iron and steel flanges.
   2. AWWA C110, rubber, flat face, 1/8 inch thick, unless otherwise indicated; and full-face or ring type, unless otherwise indicated.

B. Flange Bolts and Nuts: ASME B18.2.1, carbon steel, unless otherwise indicated.

C. Solder Filler Metals: ASTM B 32, lead-free alloys. Include water-flushable flux according to ASTM B 813.

D. Brazing Filler Metals: AWS A5.8, BCuP Series, copper-phosphorus alloys for general-duty brazing, unless otherwise indicated; and AWS A5.8, BAg1, silver alloy for refrigerant piping, unless otherwise indicated.

E. Welding Filler Metals: Comply with AWS D10.12 for welding materials appropriate for wall thickness and chemical analysis of steel pipe being welded.

2.4 TRANSITION FITTINGS

A. AWWA Transition Couplings: Same size as, and with pressure rating at least equal to and with ends compatible with, piping to be joined.
   1. Available Manufacturers:
      a. Cascade Waterworks Mfg. Co.
      b. Dresser Industries, Inc.; DMD Div.
      c. Ford Meter Box Company, Incorporated (The); Pipe Products Div.
      d. JCM Industries.
      e. Smith-Blair, Inc.
      f. Viking Johnson.
   2. Underground Piping NPS 1-1/2 and Smaller: Manufactured fitting or coupling.

3. Underground Piping NPS 2 and Larger: AWWA C219, metal sleeve-type coupling.
4. Aboveground Pressure Piping: Pipe fitting.

B. Flexible Transition Couplings for Underground Nonpressure Drainage Piping: ASTM C 1173 with elastomeric sleeve, ends same size as piping to be joined, and corrosion-resistant metal band on each end.
1. Available Manufacturers:
   a. Cascade Waterworks Mfg. Co.
   b. Fernco, Inc.
   c. Mission Rubber Company.
   d. Plastic Oddities, Inc.

2.5 DIELECTRIC FITTINGS

A. Description: Combination fitting of copper alloy and ferrous materials with threaded, solder-joint, plain, or weld-neck end connections that match piping system materials.

B. Insulating Material: Suitable for system fluid, pressure, and temperature.

C. Dielectric Unions: Factory-fabricated, union assembly, for 250-psig minimum working pressure at 180 deg F.
1. Manufacturers:
   a. Capitol Manufacturing Co.
   b. Central Plastics Company.
   c. Epco Sales, Inc.
   d. Watts Industries, Inc.; Water Products Div.
   e. Zurn Industries, Inc.; Wilkins Div.

D. Dielectric Flanges: Factory-fabricated, companion-flange assembly, for 150- or 300-psig minimum working pressure as required to suit system pressures.
1. Manufacturers:
   a. Capitol Manufacturing Co.
   b. Central Plastics Company.
   c. Epco Sales, Inc.
   d. Watts Industries, Inc.; Water Products Div.

E. Dielectric-Flange Kits: Companion-flange assembly for field assembly. Include flanges, full-face- or ring-type neoprene or phenolic gasket, phenolic or polyethylene bolt sleeves, phenolic washers, and steel backing washers.
1. Manufacturers:
   a. Calpico, Inc.
   b. Central Plastics Company.
   c. Pipeline Seal and Insulator, Inc.
2. Separate companion flanges and steel bolts and nuts shall have 150- or 300-psig minimum working pressure where required to suit system pressures.

F. Dielectric Couplings: Galvanized-steel coupling with inert and noncorrosive, thermoplastic lining; threaded ends; and 300-psig minimum working pressure at 225 deg F.
1. Manufacturers:
   a. Calpico, Inc.
   b. Lochinvar Corp.
   c. Perfection Corp.

G. Dielectric Nipples: Electroplated steel nipple with inert and noncorrosive, thermoplastic lining; plain, threaded, or grooved ends; and 300-psig minimum working pressure at 225 deg F.
   1. Manufacturers:
      a. Perfection Corp.
      b. Precision Plumbing Products, Inc.
      c. Victaulic Co. of America.

2.6 MECHANICAL SLEEVE SEALS

A. Description: Modular sealing element unit, designed for field assembly, to fill annular space between pipe and sleeve.
   1. Manufacturers:
      a. Link Seal.
      b. Metraflex Co.
      c. Pipeline Seal and Insulator, Inc.
   2. Sealing Elements: EPDM interlocking links shaped to fit surface of pipe. Include type and number required for pipe material and size of pipe.
   3. Pressure Plates: Plastic. Include two for each sealing element.
   4. Connecting Bolts and Nuts: Carbon steel with corrosion-resistant coating of length required to secure pressure plates to sealing elements. Include one for each sealing element.

2.7 SLEEVES

A. Galvanized-Steel Sheet: 0.0239-inch minimum thickness; round tube closed with welded longitudinal joint.

B. Steel Pipe: ASTM A 53, Type E, Grade B, Schedule 40, galvanized, plain ends.

C. Cast Iron: Cast or fabricated "wall pipe" equivalent to ductile-iron pressure pipe, with plain ends and integral waterstop, unless otherwise indicated.

D. Stack Sleeve Fittings: Manufactured, cast-iron sleeve with integral clamping flange. Include clamping ring and bolts and nuts for membrane flashing.
   1. Underdeck Clamp: Clamping ring with set screws.

2.8 ESCUTCHEONS

A. Description: Manufactured wall and ceiling escutcheons and floor plates, with an ID to closely fit around pipe, tube, and insulation of insulated piping and an OD that completely covers opening.

B. One-Piece, Deep-Pattern Type: Deep-drawn, box-shaped brass with polished chrome-plated finish.

C. One-Piece, Cast-Brass Type: With set screw.
   1. Finish: Polished chrome-plated and rough brass.

D. Split-Casting, Cast-Brass Type: With concealed hinge and set screw.
   1. Finish: Polished chrome-plated and rough brass.

E. Split-Plate, Stamped-Steel Type: With concealed or exposed-rivet hinge, spring clips, and chrome-plated finish.

F. One-Piece, Floor-Plate Type: Cast-iron floor plate.

G. Split-Casting, Floor-Plate Type: Cast brass with concealed hinge and set screw.

2.9 GROUT

A. Description: ASTM C 1107, Grade B, nonshrink and nonmetallic, dry hydraulic-cement grout.
   1. Characteristics: Post-hardening, volume-adjusting, nonstaining, noncorrosive, nongaseous, and recommended for interior and exterior applications.
   2. Design Mix: 5000-psi, 28-day compressive strength.
   3. Packaging: Premixed and factory packaged.

PART 3 - EXECUTION

3.1 PIPING SYSTEMS - COMMON REQUIREMENTS

A. Install piping according to the following requirements and Division 23 Sections specifying piping systems.

B. Drawing plans, schematics, and diagrams indicate general location and arrangement of piping systems. Indicated locations and arrangements were used to size pipe and calculate friction loss, expansion, pump sizing, and other design considerations. Install piping as indicated unless deviations to layout are approved on Coordination Drawings.

C. Install piping in concealed locations, unless otherwise indicated and except in equipment rooms and service areas.

D. Install piping indicated to be exposed and piping in equipment rooms and service areas at right angles or parallel to building walls. Diagonal runs are prohibited unless specifically indicated otherwise.

E. Install piping above accessible ceilings to allow sufficient space for ceiling panel removal.

F. Install piping to permit valve servicing.

G. Install piping at indicated slopes.

H. Install piping free of sags and bends.

I. Install fittings for changes in direction and branch connections.

J. Install piping to allow application of insulation.

K. Select system components with pressure rating equal to or greater than system operating pressure.

L. Install escutcheons for penetrations of walls, ceilings, and floors according to the following:
   1. New Piping:
      a. Piping with Fitting or Sleeve Protruding from Wall: One-piece, deep-pattern type.
      b. Chrome-Plated Piping: One-piece, cast-brass type with polished chrome-plated finish.
      c. Insulated Piping: One-piece, stamped-steel type with spring clips.

d. Bare Piping at Wall and Floor Penetrations in Finished Spaces: One-piece, cast-brass type with polished chrome-plated finish.
e. Bare Piping at Ceiling Penetrations in Finished Spaces: One-piece, cast-brass type with polished chrome-plated finish.
f. Bare Piping in Unfinished Service Spaces: One-piece, cast-brass type with rough-brass finish.
g. Bare Piping in Equipment Rooms: One-piece, cast-brass type.
h. Bare Piping at Floor Penetrations in Equipment Rooms: One-piece, floor-plate type.

M. Sleeves are not required for core-drilled holes.

N. Install sleeves for pipes passing through concrete and masonry walls, gypsum-board partitions, and concrete floor and roof slabs.
1. Cut sleeves to length for mounting flush with both surfaces.
a. Exception: Extend sleeves installed in floors of mechanical equipment areas or other wet areas 2 inches above finished floor level. Extend cast-iron sleeve fittings below floor slab as required to secure clamping ring if ring is specified.
2. Install sleeves in new walls and slabs as new walls and slabs are constructed.
3. Install sleeves that are large enough to provide 1/4-inch annular clear space between sleeve and pipe or pipe insulation. Use the following sleeve materials:
a. Steel Pipe Sleeves: For pipes smaller than NPS 6.
b. Steel Sheet Sleeves: For pipes NPS 6 and larger, penetrating gypsum-board partitions.
c. Stack Sleeve Fittings: For pipes penetrating floors with membrane waterproofing. Secure flashing between clamping flanges. Install section of cast-iron soil pipe to extend sleeve to 2 inches above finished floor level. Refer to Division 7 Section "Sheet Metal Flashing and Trim" for flashing.
1) Seal space outside of sleeve fittings with grout.
4. Except for underground wall penetrations, seal annular space between sleeve and pipe or pipe insulation, using joint sealants appropriate for size, depth, and location of joint. Refer to Division 7 Section "Joint Sealants" for materials and installation.

O. Aboveground, Exterior-Wall Pipe Penetrations: Seal penetrations using sleeves and mechanical sleeve seals. Select sleeve size to allow for 1-inch annular clear space between pipe and sleeve for installing mechanical sleeve seals.
1. Install steel pipe for sleeves smaller than 6 inches in diameter.
2. Install cast-iron "wall pipes" for sleeves 6 inches and larger in diameter.
3. Mechanical Sleeve Seal Installation: Select type and number of sealing elements required for pipe material and size. Position pipe in center of sleeve. Assemble mechanical sleeve seals and install in annular space between pipe and sleeve. Tighten bolts against pressure plates that cause sealing elements to expand and make watertight seal.

P. Underground, Exterior-Wall Pipe Penetrations: Install cast-iron "wall pipes" for sleeves. Seal pipe penetrations using mechanical sleeve seals. Select sleeve size to allow for 1-inch annular clear space between pipe and sleeve for installing mechanical sleeve seals.
1. Mechanical Sleeve Seal Installation: Select type and number of sealing elements required for pipe material and size. Position pipe in center of sleeve. Assemble mechanical sleeve seals and install in annular space between pipe and sleeve. Tighten bolts against pressure plates that cause sealing elements to expand and make watertight seal.

Q. Fire-Barrier Penetrations: Maintain indicated fire rating of walls, partitions, ceilings, and floors at pipe penetrations. Seal pipe penetrations with firestop materials. Refer to Division 7 Section "Through-Penetration Firestop Systems" for materials.

R. Verify final equipment locations for roughing-in.

S. Refer to equipment specifications in other Sections of these Specifications for roughing-in requirements.

3.2 PIPING JOINT CONSTRUCTION

A. Join pipe and fittings according to the following requirements and Division 15 Sections specifying piping systems.

B. Ream ends of pipes and tubes and remove burrs. Bevel plain ends of steel pipe.

C. Remove scale, slag, dirt, and debris from inside and outside of pipe and fittings before assembly.

D. Soldered Joints: Apply ASTM B 813, water-flushable flux, unless otherwise indicated, to tube end. Construct joints according to ASTM B 828 or CDA's "Copper Tube Handbook," using lead-free solder alloy complying with ASTM B 32.

E. Brazed Joints: Construct joints according to AWS's "Brazing Handbook," "Pipe and Tube" Chapter, using copper-phosphorus brazing filler metal complying with AWS A5.8.

F. Threaded Joints: Thread pipe with tapered pipe threads according to ASME B1.20.1. Cut threads full and clean using sharp dies. Ream threaded pipe ends to remove burrs and restore full ID. Join pipe fittings and valves as follows:
   1. Apply appropriate tape or thread compound to external pipe threads unless dry seal threading is specified.
   2. Damaged Threads: Do not use pipe or pipe fittings with threads that are corroded or damaged. Do not use pipe sections that have cracked or open welds.

G. Welded Joints: Construct joints according to AWS D10.12, using qualified processes and welding operators according to Part 1 "Quality Assurance" Article.

H. Flanged Joints: Select appropriate gasket material, size, type, and thickness for service application. Install gasket concentrically positioned. Use suitable lubricants on bolt threads.

3.3 PIPING CONNECTIONS

A. Make connections according to the following, unless otherwise indicated:
   1. Install unions, in piping NPS 2 and smaller, adjacent to each valve and at final connection to each piece of equipment.
   2. Install flanges, in piping NPS 2-1/2 and larger, adjacent to flanged valves and at final connection to each piece of equipment.
   3. Dry Piping Systems: Install dielectric unions and flanges to connect piping materials of dissimilar metals.
   4. Wet Piping Systems: Install dielectric coupling and nipple fittings to connect piping materials of dissimilar metals.

3.4 EQUIPMENT INSTALLATION - COMMON REQUIREMENTS

A. Install equipment to allow maximum possible headroom unless specific mounting heights are not indicated.

B. Install equipment level and plumb, parallel and perpendicular to other building systems and components in exposed interior spaces, unless otherwise indicated.

C. Install mechanical equipment to facilitate service, maintenance, and repair or replacement of components. Connect equipment for ease of disconnecting, with minimum interference to other installations. Extend grease fittings to accessible locations.

D. Install equipment to allow right of way for piping installed at required slope.

3.5 PAINTING

A. Painting of mechanical systems, equipment, and components is specified in Division 9.

B. Damage and Touchup: Repair marred and damaged factory-painted finishes with materials and procedures to match original factory finish.

3.6 CONCRETE BASES

A. Concrete Bases: Anchor equipment to concrete base according to equipment manufacturer's written instructions and according to seismic codes at Project.
   1. Construct concrete bases of dimensions indicated, but not less than 4 inches larger in both directions than supported unit.
   2. Install dowel rods to connect concrete base to concrete floor. Unless otherwise indicated, install dowel rods on 18-inch centers around the full perimeter of the base.
   3. Install epoxy-coated anchor bolts for supported equipment that extend through concrete base, and anchor into structural concrete floor.
   4. Place and secure anchorage devices. Use supported equipment manufacturer's setting drawings, templates, diagrams, instructions, and directions furnished with items to be embedded.
   5. Install anchor bolts to elevations required for proper attachment to supported equipment.
   6. Install anchor bolts according to anchor-bolt manufacturer's written instructions.
   7. Use 3000-psi, 28-day compressive-strength concrete and reinforcement as specified in Division 3.

3.7 ERECTION OF METAL SUPPORTS AND ANCHORAGES

A. Refer to Division 5 Section "Metal Fabrications" for structural steel.

B. Cut, fit, and place miscellaneous metal supports accurately in location, alignment, and elevation to support and anchor mechanical materials and equipment.

C. Field Welding: Comply with AWS D1.1.

3.8 ERECTION OF WOOD SUPPORTS AND ANCHORAGES

A. Cut, fit, and place wood grounds, nailers, blocking, and anchorages to support, and anchor mechanical materials and equipment.

B. Select fastener sizes that will not penetrate members if opposite side will be exposed to view or will receive finish materials. Tighten connections between members. Install fasteners without splitting wood members.

C. Attach to substrates as required to support applied loads.

3.9 GROUTING

A. Mix and install grout for mechanical equipment base bearing surfaces, pump and other equipment base plates, and anchors.

B. Clean surfaces that will come into contact with grout.

C. Provide forms as required for placement of grout.

D. Avoid air entrapment during placement of grout.

E. Place grout, completely filling equipment bases.

F. Place grout on concrete bases and provide smooth bearing surface for equipment.

G. Place grout around anchors.

H. Cure placed grout.

END OF SECTION 230500

N:\N0912.00\DOC\SPEC\2012_03-16_BID\230500 - COMMON WORK RESULTS FOR HVAC.DOC

SECTION 230513 – COMMON MOTORS REQUIREMENTS FOR HVAC EQUIPMENT

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

1.2 SUMMARY

A. This Section includes basic requirements for factory-installed motors.

1.3 DEFINITIONS

A. Factory-Installed Motor: A motor installed by motorized-equipment manufacturer as a component of equipment.

1.4 COORDINATION

A. Coordinate features of motors, installed units, and accessory devices and features that comply with the following:
   1. Compatible with the following:
      a. Magnetic controllers.
   2. Designed and labeled for use with variable frequency controllers, and suitable for use throughout speed range without overheating.
   3. Matched to torque and horsepower requirements of the load.
   4. Matched to ratings and characteristics of supply circuit and required control sequence.

B. Coordinate motor support with requirements for driven load; access for maintenance and motor replacement; installation of accessories, belts, belt guards; and adjustment of sliding rails for belt tensioning.

C. Coordinate size and location of concrete bases. Cast anchor-bolt inserts into bases. Concrete, reinforcement, and formwork requirements are specified in Division 3.

PART 2 - PRODUCTS

2.1 MOTOR REQUIREMENTS

A. Motor requirements apply to factory-installed motors except as follows:
   1. Different ratings, performance, or characteristics for motor are specified in another Section.
   2. Motorized-equipment manufacturer requires ratings, performance, or characteristics, other than those specified in this Section, to meet performance specified.

2.2 MOTOR CHARACTERISTICS

A. Motors 1/2 HP and Larger: Three phase.

B. Motors Smaller Than 1/2 HP: Single phase.

C. Frequency Rating: 60 Hz.

D. Voltage Rating: NEMA standard voltage selected to operate on nominal circuit voltage to which motor is connected.

E. Service Factor: 1.15 for open dripproof motors; 1.0 for totally enclosed motors.

F. Duty: Continuous duty at ambient temperature of 105 deg F and at altitude of 3300 feet above sea level.

G. Capacity and Torque Characteristics: Sufficient to start, accelerate, and operate connected loads at designated speeds, at installed altitude and environment, with indicated operating sequence, and without exceeding nameplate ratings or considering service factor.

H. Enclosure: Open dripproof.

2.3 POLYPHASE MOTORS

A. Description: NEMA MG 1, Design B, medium induction motor.

B. Efficiency: Premium, as defined in NEMA MG 1.

C. Stator: Copper windings, unless otherwise indicated.

D. Rotor: Squirrel cage, unless otherwise indicated.

E. Bearings: Double-shielded, prelubricated ball bearings suitable for radial and thrust loading.

F. Temperature Rise: Match insulation rating, unless otherwise indicated.

G. Insulation: Class F, unless otherwise indicated.

H. Code Letter Designation:
   1. Motors 15 HP and Larger: NEMA starting Code F or Code G.
   2. Motors Smaller Than 15 HP: Manufacturer's standard starting characteristic.

I. Enclosure: Cast iron for motors 7.5 hp and larger; rolled steel for motors smaller than 7.5 hp.
   1. Finish: Gray enamel.

2.4 POLYPHASE MOTORS WITH ADDITIONAL REQUIREMENTS

A. Motors Used with Variable Frequency Controllers: Ratings, characteristics, and features coordinated with and approved by controller manufacturer.
   1. Designed with critical vibration frequencies outside operating range of controller output.
   2. Temperature Rise: Matched to rating for Class B insulation.
   3. Insulation: Class H.

4. Thermal Protection: Comply with NEMA MG 1 requirements for thermally protected motors.

B. Rugged-Duty Motors: Totally enclosed, with 1.25 minimum service factor, greased bearings, integral condensate drains, and capped relief vents. Windings insulated with non-hygroscopic material.
   1. Finish: Chemical-resistant paint over corrosion-resistant primer.

C. Source Quality Control for Field-Installed Motors: Perform the following tests on each motor according to NEMA MG 1:
   1. Measure winding resistance.
   2. Read no-load current and speed at rated voltage and frequency.
   3. Measure locked rotor current at rated frequency.
   4. Perform high-potential test.

2.5 SINGLE-PHASE MOTORS

A. Type: One of the following, to suit starting torque and requirements of specific motor application:
   1. Permanent-split capacitor.
   2. Split-phase start, capacitor run.
   3. Capacitor start, capacitor run.

B. Shaded-Pole Motors: For motors 1/20 hp and smaller only.

C. Thermal Protection: Internal protection to automatically open power supply circuit to motor when winding temperature exceeds a safe value calibrated to temperature rating of motor insulation. Thermal-protection device shall automatically reset when motor temperature returns to normal range.

D. Bearings: Ball type for belt-connected motors and other motors with high radial forces on motor shaft; sealed, prelubricated-sleeve type for other single-phase motors.

E. Source Quality Control for Field-Installed Motors: Perform the following tests on each motor according to NEMA MG 1:
   1. Measure winding resistance.
   2. Read no-load current and speed at rated voltage and frequency.
   3. Measure locked rotor current at rated frequency.
   4. Perform high-potential test.

PART 3 - EXECUTION

Not Used.

END OF SECTION 230513

N:\N0912.00\DOC\SPEC\2012_03-16_BID\230513 - COMMON MOTOR REQUIREMENTS FOR HVAC EQUIPMENT.DOC

SECTION 230516 - EXPANSION FITTINGS AND LOOPS FOR HVAC PIPING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:
   1. Metal-bellows packless expansion joints.
   2. Pipe loops and swing connections.
   3. Alignment guides and anchors.

1.3 PERFORMANCE REQUIREMENTS

A. Compatibility: Products shall be suitable for piping service fluids, materials, working pressures, and temperatures.

B. Capability: Products to absorb 200 percent of maximum axial movement between anchors.

1.4 SUBMITTALS

A. Product Data: For each type of product indicated.

B. Delegated-Design Submittal: For each anchor and alignment guide indicated to comply with performance requirements and design criteria, including analysis data signed and sealed by the qualified professional engineer responsible for their preparation.
   1. Design Calculations: Calculate requirements for thermal expansion of piping systems and for selecting and designing expansion joints, loops, and swing connections.
   2. Anchor Details: Detail fabrication of each anchor indicated. Show dimensions and methods of assembly and attachment to building structure.
   3. Alignment Guide Details: Detail field assembly and attachment to building structure.
   4. Schedule: Indicate type, manufacturer's number, size, material, pressure rating, end connections, and location for each expansion joint.

C. Welding certificates.

D. Product Certificates: For each type of expansion joint, from manufacturer.

E. Maintenance Data: For expansion joints to include in maintenance manuals.

1.5 QUALITY ASSURANCE

A. Welding Qualifications: Qualify procedures and personnel according to the following:
   1. AWS D1.1/D1.1M, "Structural Welding Code - Steel."
   2. ASME Boiler and Pressure Vessel Code: Section IX.

PART 2 - PRODUCTS

2.1 PACKLESS EXPANSION JOINTS

A. Metal-Bellows Packless Expansion Joints:
   1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
      a. Expansion Joint Systems, Inc.
      b. Flex-Hose Co., Inc.
      c. Flexicraft Industries.
      d. Flex-Weld, Inc.
      e. Hyspan Precision Products, Inc.
      f. Metraflex, Inc.
      g. Universal Metal Hose; a subsidiary of Hyspan Precision Products, Inc.
   2. Standards: ASTM F 1120 and EJMA's "Standards of the Expansion Joint Manufacturers Association, Inc."
   3. Type: Circular, corrugated bellows with external tie rods.
   4. Minimum Pressure Rating: 175 psig unless otherwise indicated.
   5. Configuration: Single joint with base and double joint with base classes unless otherwise indicated.
   6. Expansion Joints for Copper Tubing: Single- or multi-ply phosphor-bronze bellows, copper pipe ends, and brass shrouds.
      a. End Connections for Copper Tubing NPS 2 and Smaller: Solder joint or threaded.
      b. End Connections for Copper Tubing NPS 2-1/2 to NPS 4: threaded.
   7. Expansion Joints for Steel Piping: Single- or multi-ply stainless-steel bellows, steel pipe ends, and carbon-steel shroud.
      a. End Connections for Steel Pipe NPS 2 and Smaller: Threaded.
      b. End Connections for Steel Pipe NPS 2-1/2 and Larger: Flanged.

2.2 ALIGNMENT GUIDES AND ANCHORS

A. Alignment Guides:
   1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
      a. Advanced Thermal Systems, Inc.
      b. Flex-Hose Co., Inc.
      c. Flexicraft Industries.
      d. Flex-Weld, Inc.
      e. Hyspan Precision Products, Inc.
      f. Metraflex, Inc.
      g. U.S. Bellows, Inc.
   2. Description: Steel, factory-fabricated alignment guide, with bolted two-section outer cylinder and base for attaching to structure; with two-section guiding spider for bolting to pipe.

B. Anchor Materials:
   1. Steel Shapes and Plates: ASTM A 36/A 36M.
   2. Bolts and Nuts: ASME B18.10 or ASTM A 183, steel hex head.
   3. Washers: ASTM F 844, steel, plain, flat washers.
   4. Mechanical Fasteners: Insert-wedge-type stud with expansion plug anchor for use in hardened portland cement concrete, with tension and shear capacities appropriate for application.
      a. Stud: Threaded, zinc-coated carbon steel.
      b. Expansion Plug: Zinc-coated steel.
      c. Washer and Nut: Zinc-coated steel.
   5. Chemical Fasteners: Insert-type-stud, bonding-system anchor for use with hardened portland cement concrete, with tension and shear capacities appropriate for application.
      a. Bonding Material: ASTM C 881/C 881M, Type IV, Grade 3, two-component epoxy resin suitable for surface temperature of hardened concrete where fastener is to be installed.
      b. Stud: ASTM A 307, zinc-coated carbon steel with continuous thread on stud unless otherwise indicated.
      c. Washer and Nut: Zinc-coated steel.

PART 3 - EXECUTION

3.1 EXPANSION-JOINT INSTALLATION

A. Install expansion joints of sizes matching sizes of piping in which they are installed.

B. Install metal-bellows expansion joints according to EJMA's "Standards of the Expansion Joint Manufacturers Association, Inc."

3.2 PIPE LOOP AND SWING CONNECTION INSTALLATION

A. Install pipe loops cold-sprung in tension or compression as required to partly absorb tension or compression produced during anticipated change in temperature.

B. Connect risers and branch connections to mains with at least five pipe fittings including tee in main.

C. Connect risers and branch connections to terminal units with at least four pipe fittings including tee in riser.

D. Connect mains and branch connections to terminal units with at least four pipe fittings including tee in main.

3.3 ALIGNMENT-GUIDE AND ANCHOR INSTALLATION

A. Install alignment guides to guide expansion and to avoid end-loading and torsional stress.

B. Install one guide on each side of pipe expansion fittings and loops. Install guides nearest to expansion joint not more than four pipe diameters from expansion joint.

C. Attach guides to pipe and secure guides to building structure.

D. Install anchors at locations to prevent stresses from exceeding those permitted by ASME B31.9 and to prevent transfer of loading and stresses to connected equipment.

E. Anchor Attachments:
   1. Anchor Attachment to Steel Pipe: Attach by welding. Comply with ASME B31.9 and ASME Boiler and Pressure Vessel Code: Section IX, "Welding and Brazing Qualifications."
   2. Anchor Attachment to Copper Tubing: Attach with pipe hangers. Use MSS SP-69, Type 24, U-bolts bolted to anchor.

F. Fabricate and install steel anchors by welding steel shapes, plates, and bars. Comply with ASME B31.9 and AWS D1.1/D1.1M.
   1. Anchor Attachment to Steel Structural Members: Attach by welding.
   2. Anchor Attachment to Concrete Structural Members: Attach by fasteners. Follow fastener manufacturer's written instructions.

G. Use grout to form flat bearing surfaces for guides and anchors attached to concrete.

END OF SECTION 230516

N:\N0912.00\DOC\SPEC\2012_03-16_BID\230516 - EXPANSION FITTINGS AND LOOPS FOR HVAC PIPING.DOC

SECTION 230519 – METERS AND GAGES FOR HVAC PIPING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

1.2 SUMMARY

A. This Section includes the following meters and gages for mechanical systems:

S**Solar** Thermometers.
2. Pressure Gages.
3. Thermowells.
4. Test plugs.
5. Turbine Flow Meters.

1.3 DEFINITIONS

A. CR: Chlorosulfonated polyethylene synthetic rubber.

B. EPDM: Ethylene-propylene-diene terpolymer rubber.

1.4 SUBMITTALS

A. Product Data: For each type of product indicated; include performance curves.

B. Shop Drawings: Schedule for thermometers gages and flowmeters indicating manufacturer's number, scale range, and location for each.

C. Product Certificates: For each type of thermometer and gage, signed by product manufacturer.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. In other Part 2 articles where titles below introduce lists, the following requirements apply to product selection:
1. Manufacturers: Subject to compliance with requirements, provide products by one of the manufacturers specified.

2.2 SOLAR THERMOMETERS

A. Manufacturers: Subject to compliance with requirements, provide product by one of the following:
   1. Trerice, H. O. Co.- Model SX9

B. Case: Die-cast aluminum, blue epoxy finish.

C. Stem: Aluminum.

D. Sensor: Glass passivated thermistor.

E. Connector: Adjustable type, 180 degrees in vertical plane, 360 degrees in horizontal plane, with locking device.

F. Display: 7/16-inch LCD Digits, 1/10 degree resolution, 10 LUX rating, 10 seconds update interval.

G. Accuracy: Plus or minus 1 percent reading or plus or minus 1 degree whichever is greater.

H. Range: 40° to 300°F.

2.3 THERMOWELLS

A. Manufacturers:
   1. Ashcroft Commercial Instrument Operations; Dresser Industries; Instrument Div.
   2. Palmer - Wahl Instruments Inc.
   3. Trerice, H. O. Co.
   4. Weiss Instruments, Inc.
   5. Weksler Instruments Operating Unit; Dresser Industries; Instrument Div.

B. Manufacturers: Same as manufacturer of thermometer being used.

C. Description: Pressure-tight, socket-type metal fitting made for insertion into piping and of type, diameter, and length required to hold thermometer.

2.4 PRESSURE GAGES

A. Available Manufacturers:
   1. Ashcroft Commercial Instrument Operations; Dresser Industries; Instrument Div.
   2. Palmer - Wahl Instruments Inc.
   3. Trerice, H. O. Co.
   4. Weiss Instruments, Inc.
   5. Weksler Instruments Operating Unit; Dresser Industries; Instrument Div.

B. Direct-Mounting, Dial-Type Pressure Gages: Indicating-dial type complying with ASME B40.100.
   1. Case: Dry or Liquid-filled type, drawn steel or cast aluminum, 4-1/2-inch diameter.
   2. Pressure-Element Assembly: Bourdon tube, unless otherwise indicated.
   3. Pressure Connection: Brass, NPS 1/4, bottom-outlet type unless back-outlet type is indicated.
   4. Movement: Mechanical, with link to pressure element and connection to pointer.
   5. Dial: Satin-faced, nonreflective aluminum with permanently etched scale markings.
   6. Pointer: Red or other dark-color metal.
   7. Window: Shatter proof glass.

8. Ring: Stainless steel.
9. Accuracy: Grade B, plus or minus 2 percent of middle half scale.
10. Vacuum-Pressure Range: 30-in. Hg of vacuum to 15 psig of pressure.
11. Range for Fluids under Pressure: Two times operating pressure.

C. Pressure-Gage Fittings:
1. Valves: NPS 1/4 brass or stainless-steel needle type.
2. Syphons: NPS 1/4 coil of brass tubing with threaded ends.
3. Snubbers: ASME B40.5, NPS 1/4 brass bushing with corrosion-resistant, porous-metal disc of material suitable for system fluid and working pressure.

2.5 TEST PLUGS

A. Available Manufacturers:
1. Flow Design, Inc.
2. MG Piping Products Co.
3. National Meter, Inc.
4. Peterson Equipment Co., Inc.
5. Sisco Manufacturing Co.
6. Trerice, H. O. Co.
7. Watts Industries, Inc.; Water Products Div.

B. Description: Corrosion-resistant brass or stainless-steel body with core inserts and gasketed and threaded cap, with extended stem for units to be installed in insulated piping.

C. Minimum Pressure and Temperature Rating: 500 psig at 200 deg F.

D. Core Inserts: One or two self-sealing rubber valves.
1. Insert material for air or water service at minus 30 to plus 275 deg F shall be EPDM.

E. Test Kit: Furnish one test kit(s) containing one pressure gage and adaptor, two thermometer(s), and carrying case. Pressure gage, adapter probes, and thermometer sensing elements shall be of diameter to fit test plugs and of length to project into piping.
1. Pressure Gage: Small bourdon-tube insertion type with 2- to 3-inch- diameter dial and probe. Dial range shall be 0 to 200 psig.
2. High-Range Thermometer: Small bimetallic insertion type with 1- to 2-inch- diameter dial and tapered-end sensing element. Dial ranges shall be 0 to 220 deg F.
3. Carrying case shall have formed instrument padding.

2.6 TURBINE FLOWMETERS

A. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include the following:
1. Badger Meter, Inc.; Industrial Div.
2. Data Industrial Corp.
3. Hoffer Flow Controls, Inc.
4. ONICON Incorporated.

B. Description: Insertion type for inserting turbine into piping and measuring flow directly in gallons per minute.

C. Construction: Stainless-steel body; with plastic turbine or impeller and integral direct-reading scale.

D. Pressure Rating: 150 psig minimum.

E. Temperature Rating: 180 deg F minimum.

F. Display: Visual instantaneous rate of flow, with register to indicate total volume in gallons.

G. Accuracy: Plus or minus 2-1/2 percent.

PART 3 - EXECUTION

3.1 THERMOMETER APPLICATIONS

A. Install thermometers in the following locations:
1. Inlet and outlet of each hydronic boiler and chiller.
2. Inlet and outlet of each hydronic coil in air-handling unit.
3. Inlet and outlet of each thermal storage tank.
4. Inlet and outlet of each heat exchanger.
5. Inlet and outlet of each cooling tower.
6. Supply ducts.
7. Where shown on plans.

B. Install thermometers at suction and discharge of each pump.

C. Provide the following temperature ranges for thermometers:
1. Domestic Hot Water: 30 to 180 deg F, with 2-degree scale divisions.
2. Domestic Cold Water: 0 to 100 deg F, with 2-degree scale divisions.
3. Heating Hot Water: 30 to 240 deg F, with 2-degree scale divisions.
4. Chilled Water: 0 to 100 deg F, with 2-degree scale divisions.
5. Glycol Water: 0 to 75 deg F, with 2-degree scale divisions.
6. Condenser Water: 30 to 140 deg F, with 2-degree scale divisions.
7. Supply Ductwork: 0 to 100 deg F, with 2-degree scale divisions.

3.2 GAGE APPLICATIONS

A. Install dry-case-type pressure gages for discharge of each pressure-reducing valve.

B. Install liquid-filled-case-type pressure gages at chilled- water inlets and outlets of each chiller and boiler.

C. Install liquid-filled-case-type pressure gages at suction and discharge of each pump.

3.3 INSTALLATIONS

A. Install direct-mounting thermometers and adjust vertical and tilted positions.

B. Install thermowells with socket extending one-third of diameter of pipe to center of pipe and in vertical position in piping tees where thermometers are indicated.

C. Install direct-mounting pressure gages in piping tees with pressure gage located on pipe at most readable position.

D. Install needle-valve and snubber fitting in piping for each pressure gage for fluids.

E. Install test plugs in tees in piping.

F. Install flow indicators, in accessible positions for easy viewing, in piping systems.

G. Install permanent indicators on walls or brackets in accessible and readable positions.

H. Install connection fittings for attachment to portable indicators in accessible locations.

I. Mount meters on wall if accessible; if not, provide brackets to support meters.

J. Assemble and install connections, tubing, and accessories between flow-measuring elements and flowmeters as prescribed by manufacturer's written instructions.

K. Install flowmeter elements in accessible positions in piping systems.

L. Install connection fittings for attachment to portable indicators in accessible locations.

M. Install flowmeters as indicated on the drawings.

3.4 CONNECTIONS

A. Install gages adjacent to machines and equipment to allow service and maintenance for meters, gages, machines, and equipment.

B. Ground equipment according to Division 16 Section "Grounding and Bonding."

C. Connect wiring according to Division 16 Section "Conductors and Cables."

D. Connect flowmeter-system elements to meters.

E. Connect flowmeter transmitters to meters.

3.5 ADJUSTING

A. Adjust faces of gages to proper angle for best visibility.

B. Calibrate meters according to manufacturer's written instructions, after installation.

C. Adjust faces of meters and gages to proper angle for best visibility.

END OF SECTION 230519

N:\N0912.00\DOC\SPEC\2012_03-16_BID\230519 - METERS AND GAUGES FOR HVAC PIPING.DOC

SECTION 230523 – GENERAL-DUTY VALVES FOR HVAC PIPING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:
1. Bronze ball valves.
2. Iron, single-flange butterfly valves.
3. Bronze lift check valves.
4. Bronze swing check valves.
5. Iron swing check valves.
6. Chainwheels.

B. Related Sections:
1. Division 26 HVAC piping Sections for specialty valves applicable to those Sections only.
2. Division 26 Section "Identification for HVAC Piping and Equipment" for valve tags and schedules.

1.3 DEFINITIONS

A. CWP: Cold working pressure.

B. EPDM: Ethylene propylene copolymer rubber.

C. NBR: Acrylonitrile-butadiene, Buna-N, or nitrile rubber.

D. NRS: Nonrising stem.

1.4 SUBMITTALS

A. Product Data: For each type of valve indicated.

1.5 QUALITY ASSURANCE

A. Source Limitations for Valves: Obtain each type of valve from single source from single manufacturer.

B. ASME Compliance:
1. ASME B16.10 and ASME B16.34 for ferrous valve dimensions and design criteria.
2. ASME B31.1 for power piping valves.
3. ASME B31.9 for building services piping valves.

1.6 DELIVERY, STORAGE, AND HANDLING

A. Prepare valves for shipping as follows:
   1. Protect internal parts against rust and corrosion.
   2. Protect threads, flange faces, grooves, and weld ends.
   3. Set ball valves open to minimize exposure of functional surfaces.
   4. Set butterfly valves closed or slightly open.
   5. Block check valves in either closed or open position.

B. Use the following precautions during storage:
   1. Maintain valve end protection.
   2. Store valves indoors and maintain at higher than ambient dew point temperature. If outdoor storage is necessary, store valves off the ground in watertight enclosures.

C. Use sling to handle large valves; rig sling to avoid damage to exposed parts. Do not use handwheels or stems as lifting or rigging points.

PART 2 - PRODUCTS

2.1 GENERAL REQUIREMENTS FOR VALVES

A. Refer to HVAC valve schedule articles for applications of valves.

B. Valve Pressure and Temperature Ratings: Not less than indicated and as required for system pressures and temperatures.

C. Valve Sizes: Same as upstream piping unless otherwise indicated.

D. Valve Actuator Types:
   1. Gear Actuator: For quarter-turn valves NPS 4 and larger.
   2. Handwheel: For valves other than quarter-turn types.
   3. Handlever: For quarter-turn valves NPS 3 and smaller except plug valves.
   4. Chainwheel: Device for attachment to valve handwheel, stem, or other actuator; of size and with chain for mounting height, as indicated in the "Valve Installation" Article.

E. Valves in Insulated Piping: With 2-inch stem extensions and the following features:
   1. Ball Valves: With extended operating handle of non-thermal-conductive material, and protective sleeve that allows operation of valve without breaking the vapor seal or disturbing insulation.
   2. Butterfly Valves: With extended neck.

F. Valve-End Connections:
   1. Flanged: With flanges according to ASME B16.1 for iron valves.
   2. Grooved: With grooves according to AWWA C606.
   3. Solder Joint: With sockets according to ASME B16.18.
   4. Threaded: With threads according to ASME B1.20.1.

G. Valve Bypass and Drain Connections: MSS SP-45.

2.2 BRONZE BALL VALVES

A. Three-Piece, Full-Port, Bronze Ball Valves with Bronze Trim:
   1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
      a. Conbraco Industries, Inc.; Apollo Valves.
      b. Milwaukee Valve Company.
   2. Description:
      a. Standard: MSS SP-110.
      b. SWP Rating: 150 psig.
      c. CWP Rating: 600 psig.
      d. Body Design: Three piece.
      e. Body Material: Bronze.
      f. Ends: Threaded.
      g. Seats: PTFE or TFE.
      h. Stem: Bronze.
      i. Ball: Chrome-plated brass or stainless steel.
      j. Port: Full.

2.3 IRON, SINGLE-FLANGE BUTTERFLY VALVES

A. 150 CWP, Iron, Single-Flange Butterfly Valves with EPDM Seat and Stainless-Steel Disc:
   1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
      a. Conbraco Industries, Inc.; Apollo Valves.
      b. Crane Co.; Crane Valve Group; Jenkins Valves.
      c. Crane Co.; Crane Valve Group; Stockham Division.
      d. DeZurik Water Controls.
      e. Milwaukee Valve Company.
      f. Mueller Steam Specialty; a division of SPX Corporation.
      g. NIBCO INC.
      h. Spence Strainers International; a division of CIRCOR International.
   2. Description:
      a. Standard: MSS SP-67, Type I.
      b. CWP Rating: 150 psig.
      c. Body Design: Lug type; suitable for bidirectional dead-end service at rated pressure without use of downstream flange.
      d. Body Material: ASTM A 126, cast iron or ASTM A 536, ductile iron.
      e. Seat: EPDM.
      f. Stem: One- or two-piece stainless steel.
      g. Disc: Stainless steel.

2.4 BRONZE LIFT CHECK VALVES

A. Class 125, Lift Check Valves with Bronze Disc:
   1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
      a. Crane Co.; Crane Valve Group; Crane Valves.
      b. Crane Co.; Crane Valve Group; Jenkins Valves.
      c. Crane Co.; Crane Valve Group; Stockham Division.
   2. Description:

a. Standard: MSS SP-80, Type 1.
b. CWP Rating: 200 psig.
c. Body Design: Vertical flow.
d. Body Material: ASTM B 61 or ASTM B 62, bronze.
e. Ends: Threaded.
f. Disc: Bronze.

2.5 BRONZE SWING CHECK VALVES

A. Class 125, Bronze Swing Check Valves with Bronze Disc:
1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
a. Crane Co.; Crane Valve Group; Crane Valves.
b. Crane Co.; Crane Valve Group; Jenkins Valves.
c. Crane Co.; Crane Valve Group; Stockham Division.
d. Milwaukee Valve Company.
2. Description:
a. Standard: MSS SP-80, Type 3.
b. CWP Rating: 200 psig.
c. Body Design: Horizontal flow.
d. Body Material: ASTM B 62, bronze.
e. Ends: Threaded.
f. Disc: Bronze.

B. Class 150, Bronze Swing Check Valves with Bronze Disc:
1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
a. Crane Co.; Crane Valve Group; Crane Valves.
b. Crane Co.; Crane Valve Group; Jenkins Valves.
c. Crane Co.; Crane Valve Group; Stockham Division.
d. Milwaukee Valve Company.
2. Description:
a. Standard: MSS SP-80, Type 3.
b. CWP Rating: 300 psig.
c. Body Design: Horizontal flow.
d. Body Material: ASTM B 62, bronze.
e. Ends: Threaded.
f. Disc: Bronze.

2.6 IRON SWING CHECK VALVES

A. Class 125, Iron Swing Check Valves with Metal Seats:
1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
a. Crane Co.; Crane Valve Group; Crane Valves.
b. Crane Co.; Crane Valve Group; Jenkins Valves.
c. Crane Co.; Crane Valve Group; Stockham Division.
d. Milwaukee Valve Company.
2. Description:
a. Standard: MSS SP-71, Type I.
b. NPS 2-1/2 to NPS 12, CWP Rating: 200 psig.

c. NPS 14 to NPS 24, CWP Rating: 150 psig.
d. Body Design: Clear or full waterway.
e. Body Material: ASTM A 126, gray iron with bolted bonnet.
f. Ends: Flanged.
g. Trim: Bronze.
h. Gasket: Asbestos free.

B. Class 250, Iron Swing Check Valves with Metal Seats:
1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
a. Crane Co.; Crane Valve Group; Crane Valves.
b. Crane Co.; Crane Valve Group; Jenkins Valves.
c. Crane Co.; Crane Valve Group; Stockham Division.
d. Milwaukee Valve Company.
2. Description:
a. Standard: MSS SP-71, Type I.
b. NPS 2-1/2 to NPS 12, CWP Rating: 500 psig.
c. NPS 14 to NPS 24, CWP Rating: 300 psig.
d. Body Design: Clear or full waterway.
e. Body Material: ASTM A 126, gray iron with bolted bonnet.
f. Ends: Flanged.
g. Trim: Bronze.
h. Gasket: Asbestos free.

C. Class 250, Iron, Globe, Center-Guided Check Valve with Metal Seat:
1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
a. DeZurik
b. Metraflex, Inc.
c. Milwaukee Valve Company.
d. Mueller Stream Specialty; a division of SPX Corporation.
2. Description:
a. Standard: MSS SP-125
b. NPS 2-1/2 to NPS 5, CWP Rating: 400 psig.
c. Body Material: ASTM A 126, gray iron.
d. Style: Globe, spring loaded.
e. Ends: Flanged.
f. Seat: Bronzed.

2.7 CHAINWHEELS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
1. Babbitt Steam Specialty Co.
2. Roto Hammer Industries.
3. Trumbull Industries.

B. Description: Valve actuation assembly with sprocket rim, brackets, and chain.
1. Brackets: Type, number, size, and fasteners required to mount actuator on valve.
2. Attachment: For connection to butterfly and plug valve stems.
3. Sprocket Rim with Chain Guides: Aluminum or Bronze, of type and size required for valve. Include zinc coating.
4. Chain: Hot-dip, galvanized steel, of size required to fit sprocket rim.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine valve interior for cleanliness, freedom from foreign matter, and corrosion. Remove special packing materials, such as blocks, used to prevent disc movement during shipping and handling.

B. Operate valves in positions from fully open to fully closed. Examine guides and seats made accessible by such operations.

C. Examine threads on valve and mating pipe for form and cleanliness.

D. Examine mating flange faces for conditions that might cause leakage. Check bolting for proper size, length, and material. Verify that gasket is of proper size, that its material composition is suitable for service, and that it is free from defects and damage.

E. Do not attempt to repair defective valves; replace with new valves.

F. Examine piping system for compliance with requirements for installation and other conditions affecting performance.
   1. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 VALVE INSTALLATION

A. Install valves with unions or flanges at each piece of equipment arranged to allow service, maintenance, and equipment removal without system shutdown.

B. Locate valves for easy access and provide separate support where necessary.

C. Install valves in horizontal piping with stem at or above center of pipe.

D. Install valves in position to allow full stem movement.

E. Install chainwheels on operators for butterfly and plug valves NPS 4 and larger and 96 inches or higher above floor. Extend chains to 60 inches above finished floor.

F. Install check valves for proper direction of flow and as follows:
   1. Swing Check Valves: In horizontal position with hinge pin level.
   2. Lift Check Valves: With stem upright and plumb.

3.3 ADJUSTING

A. Adjust or replace valve packing after piping systems have been tested and put into service but before final adjusting and balancing. Replace valves if persistent leaking occurs.

3.4 GENERAL REQUIREMENTS FOR VALVE APPLICATIONS

A. If valve applications are not indicated, use the following:
   1. Shutoff Service: Ball, butterfly, or plug valves.

2. Butterfly Valve Dead-End Service: Single-flange (lug) type.
3. Throttling Service: See Section 232113- Hydronic Piping.
4. Pump-Discharge Check Valves:
    a. NPS 2 and Smaller: Bronze swing check valves with bronze disc (horizontal) or bronze lift check valves (vertical).
    b. NPS 2-1/2 and Larger: Iron swing check valves with metal-seat (horizontal) or iron globe, center guided (vertical).

B. If valves with specified SWP classes or CWP ratings are not available, the same types of valves with higher SWP classes or CWP ratings may be substituted.

C. Select valves, except wafer types, with the following end connections:

CHILLED, GLYCOL AND CONDENSSER WATER SERVICE Maximum 150°F and 150 psig (3/4"-5")						
Specialty	Application	Type	Size	Body/Seat Body/Trim	Connection	Minimum Rating, [1,2]
Ball Valve	Isolation (with locking handle)	Full Port 3-pc.	3/4"-2"	Bronze/Teflon	Sweat[1]	400 psig WOG
	Drain and Manual vent	Full Port 2 pc.	3/4"-10"	Bronze/Teflon	Threaded	400 psig WOG
Butterfly Valve	Isolation	Class 150	2 1/2"-12"	Iron/EPDM	Flanged/ Lug	CWP 150 psig bidirectional Shutoff 150 psig dead-end service
Check Valve	Pumps	Vertical, Globe/Center Guided	2 1/2"-10"	Gray Iron	Flanged	Class 250
		Horizontal Swing				

1. These are minimum ratings for ASTM A 126, Class B and ASTM B-61 and 62. For higher pressures and temperatures, adjust values to in- Include static head plus 1.1 times pressure relief valve settings plus pump shutoff head pressure. For actual maximum allowable valve and strainer ratings, refer to "Pressure-Temperature Ratings - Non Shock" tables and Adjusted Pressure Ratings" for copper tube, soldered end valves [and strainers]
2. SWP=Steam Working Pressure CWP=Cold Water Working Pressure WSP=Working Steam Pressure WOG=Water, Oil or Gas Class=ANSI Standard

Use 1/8" dia for plate heat exchanger application.

HOT WATER SERVICE Maximum 200°F and 150 psig (3/4"-4")						
Specialty	Application	Type	Size	Body/Seat Body/Trim	Connection	Minimum Rating, [1,2]
Ball Valve	Isolation (with locking handle)	Full Port 3-pc.	3/4"-2"	Bronze/Teflon	Sweat[1]	400 psig WOG
	Drain and Manual vent	Full Port 2 pc.	3/4"-8"	Bronze/Teflon	Threaded	400 psig WOG
Butterfly Valve	Isolation	Class 150	2 1/2"-12"	Iron/EPDM	Flanged/ Lug	CWP 150 psig bidirectional Shutoff 150 psig dead-end service
Check Valve	Pumps	Vertical, Globe/Center Guided	2 1/2"-8"	Gray Iron	Flanged	Class 250
		Horizontal Swing	2 1/2"-8"	Gray Iron	Flanged	Class 250
		Vertical, Lift	3/4"-2”	Bronze	Threaded	Class 125
		Horizontal Swing	3/4"-2"	Bronze	Threaded	Class 125

1. These are minimum ratings. For higher pressures and temperatures, adjust these values to include static head plus 1.1 times pressure relief valve Settings plus pump shutoff head pressure. For actual maximum allowable valve and strainer ratings, refer to" Pressure-Temperature Ratings - Non Shock" tables.
2. SWP=Steam Working Pressure CWP=Cold Water Working Pressure WOG=Water, Oil or Gas Class = ANSI Standard.
3. Use 1/8" for dia for plate heat exchanger application

3.5 JOINT CONSTRUCTION

A. Refer to Division 23 Section “Hydronic Piping” for basic piping joint construction.

B. Grooved Joints: Assemble joints with keyed coupling housing, gasket, lubricant, and bolts according to coupling and fitting manufacturer’s written instructions.

C. Soldered Joints: Use ASTM B 813, water-flushable, lead-free flux; ASTM B 32, lead-free-alloy solder; and ASTM B 828 procedure, unless otherwise indicated.

3.6 ADJUSTING

A. Adjust or replace valve packing after piping systems have been tested and put into service but before final adjusting and balancing. Replace valves if persistent leaking occurs.

END OF SECTION 230523

SECTION 230529 – HANGERS AND SUPPORTS FOR HVAC PIPING AND EQUIPMENT

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

1.2 SUMMARY

A. This Section includes the following hangers and supports for mechanical system piping and equipment:
   1. Steel pipe hangers and supports.
   2. Trapeze pipe hangers.
   3. Metal framing systems.
   4. Thermal-hanger shield inserts.
   5. Fastener systems.
   6. Pipe stands.
   7. Pipe positioning systems.
   8. Equipment supports.

1.3 DEFINITIONS

A. MSS: Manufacturers Standardization Society for The Valve and Fittings Industry Inc.

B. Terminology: As defined in MSS SP-90, "Guidelines on Terminology for Pipe Hangers and Supports."

1.4 PERFORMANCE REQUIREMENTS

A. Design supports for multiple pipes, including pipe stands, capable of supporting combined weight of supported systems, system contents, and test water.

B. Design equipment supports capable of supporting combined operating weight of supported equipment and connected systems and components.

1.5 SUBMITTALS

A. Product Data: For the following:
   1. Steel pipe hangers and supports.
   2. Thermal-hanger shield inserts.
   3. Powder-actuated fastener systems.
   4. Pipe positioning systems.

B. Shop Drawings: Show fabrication and installation details and include calculations for the following:
   1. Trapeze pipe hangers. Include Product Data for components.

2. Metal framing systems. Include Product Data for components.
3. Pipe stands. Include Product Data for components.
4. Equipment supports.

C. Welding certificates.

1.6 QUALITY ASSURANCE

A. Welding: Qualify procedures and personnel according to AWS D1.1, "Structural Welding Code—Steel.

B. Welding: Qualify procedures and personnel according to the following:
1. AWS D1.1, "Structural Welding Code--Steel."

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. In other Part 2 articles where titles below introduce lists, the following requirements apply to product selection:
1. Manufacturers: Subject to compliance with requirements, provide products by one of the manufacturers specified.

2.2 STEEL PIPE HANGERS AND SUPPORTS

A. Description: MSS SP-58, Types 1 through 58, factory-fabricated components. Refer to Part 3 "Hanger and Support Applications" Article for where to use specific hanger and support types.

B. Manufacturers:
1. B-Line Systems, Inc.; a division of Cooper Industries.
2. Carpenter & Paterson, Inc.
3. Grinnell Corp.
4. Piping Technology & Products, Inc.

C. Galvanized, Metallic Coatings: Pregalvanized or hot dipped.

D. Nonmetallic Coatings: Plastic coating, jacket, or liner.

E. Padded Hangers: Hanger with fiberglass or other pipe insulation pad or cushion for support of bearing surface of piping.

2.3 TRAPEZE PIPE HANGERS

A. Description: MSS SP-69, Type 59, shop- or field-fabricated pipe-support assembly made from structural-steel shapes with MSS SP-58 hanger rods, nuts, saddles, and U-bolts.

2.4 METAL FRAMING SYSTEMS

A. Description: MFMA-3, shop- or field-fabricated pipe-support assembly made of steel channels and other components.

B. Manufacturers:
1. B-Line Systems, Inc.; a division of Cooper Industries.
2. Power-Strut Div.; Tyco International, Ltd.
3. Thomas & Betts Corporation.
4. Unistrut Corp.; Tyco International, Ltd.

C. Coatings: Manufacturer's standard finish, unless bare metal surfaces are indicated.

D. Nonmetallic Coatings: Plastic coating, jacket, or liner.

2.5 THERMAL-HANGER SHIELD INSERTS

A. Description: 100-psig- minimum, compressive-strength insulation insert encased in sheet metal shield.

B. Manufacturers:
1. Carpenter & Paterson, Inc.
2. Pipe Shields, Inc.
3. Value Engineered Products, Inc.

C. Insulation-Insert Material for Cold Piping: Water-repellent treated, ASTM C 533, Type I calcium silicate with vapor barrier.

D. Insulation-Insert Material for Hot Piping: Water-repellent treated, ASTM C 533, Type I calcium silicate.

E. For Trapeze or Clamped Systems: Insert and shield shall cover entire circumference of pipe.

F. For Clevis or Band Hangers: Insert and shield shall cover lower 180 degrees of pipe.

G. Insert Length: Extend 2 inches beyond sheet metal shield for piping operating below ambient air temperature.

2.6 FASTENER SYSTEMS

A. Powder-Actuated Fasteners: Threaded-steel stud, for use in hardened portland cement concrete with pull-out, tension, and shear capacities appropriate for supported loads and building materials where used.
1. Manufacturers:
a. Hilti, Inc.
b. ITW Ramset/Red Head.
c. Powers Fasteners.

B. Mechanical-Expansion Anchors: Insert-wedge-type stainless steel, for use in hardened portland cement concrete with pull-out, tension, and shear capacities appropriate for supported loads and building materials where used.
1. Manufacturers:
a. B-Line Systems, Inc.; a division of Cooper Industries.

b. Hilti, Inc.
c. ITW Ramset/Red Head.
d. Powers Fasteners.

2.7 PIPE STAND FABRICATION

A. Pipe Stands, General: Shop or field-fabricated assemblies made of manufactured corrosion-resistant components to support roof-mounted piping.

B. Curb-Mounting-Type Pipe Stands: Shop- or field-fabricated pipe support made from structural-steel shape, continuous-thread rods, and rollers for mounting on permanent stationary roof curb.

2.8 PIPE POSITIONING SYSTEMS

A. Description: IAPMO PS 42, system of metal brackets, clips, and straps for positioning piping in pipe spaces for plumbing fixtures for commercial applications.

B. Manufacturers:
1. C & S Mfg. Corp.
2. HOLDRITE Corp.; Hubbard Enterprises.
3. Samco Stamping, Inc.

2.9 EQUIPMENT SUPPORTS

A. Description: Welded, shop- or field-fabricated equipment support made from structural-steel shapes.

2.10 MISCELLANEOUS MATERIALS

A. Structural Steel: ASTM A 36/A 36M, steel plates, shapes, and bars; black and galvanized.

B. Grout: ASTM C 1107, factory-mixed and -packaged, dry, hydraulic-cement, nonshrink and nonmetallic grout; suitable for interior and exterior applications.
1. Properties: Nonstaining, noncorrosive, and nongaseous.
2. Design Mix: 5000-psi, 28-day compressive strength.

PART 3 - EXECUTION

3.1 HANGER AND SUPPORT APPLICATIONS

A. Specific hanger and support requirements are specified in Sections specifying piping systems and equipment.

B. Comply with MSS SP-69 for pipe hanger selections and applications that are not specified in piping system Sections.

C. Use hangers and supports with galvanized, metallic coatings for piping and equipment that will not have field-applied finish.

D. Use nonmetallic coatings on attachments for electrolytic protection where attachments are in direct contact with copper tubing.

E. Use padded hangers for piping that is subject to scratching.

F. Horizontal-Piping Hangers and Supports: Unless otherwise indicated and except as specified in piping system Sections, install the following types:
   1. Adjustable, Steel Clevis Hangers (MSS Type 1): For suspension of noninsulated or insulated stationary pipes, NPS 1/2 to NPS 30.
   2. Single Pipe Rolls (MSS Type 41): For suspension of pipes, NPS 1 to NPS 30, from 2 rods if longitudinal movement caused by expansion and contraction might occur.
   3. Adjustable Roller Hangers (MSS Type 43): For suspension of pipes, NPS 2-1/2 to NPS 20, from single rod if horizontal movement caused by expansion and contraction might occur.
   4. Complete Pipe Rolls (MSS Type 44): For support of pipes, NPS 2 to NPS 42, if longitudinal movement caused by expansion and contraction might occur but vertical adjustment is not necessary.
   5. Pipe Roll and Plate Units (MSS Type 45): For support of pipes, NPS 2 to NPS 24, if small horizontal movement caused by expansion and contraction might occur and vertical adjustment is not necessary.
   6. Adjustable Pipe Roll and Base Units (MSS Type 46): For support of pipes, NPS 2 to NPS 30, if vertical and lateral adjustment during installation might be required in addition to expansion and contraction.

G. Vertical-Piping Clamps: Unless otherwise indicated and except as specified in piping system Sections, install the following types:
   1. Carbon- or Alloy-Steel Riser Clamps (MSS Type 42): For support of pipe risers, NPS 3/4 to NPS 20, if longer ends are required for riser clamps.

H. Hanger-Rod Attachments: Unless otherwise indicated and except as specified in piping system Sections, install the following types:
   1. Swivel Turnbuckles (MSS Type 15): For use with MSS Type 11, split pipe rings.

I. Building Attachments: Unless otherwise indicated and except as specified in piping system Sections, install the following types:
   1. Steel or Malleable Concrete Inserts (MSS Type 18): For upper attachment to suspend pipe hangers from concrete ceiling.
   2. Center-Beam Clamps (MSS Type 21): For attaching to center of bottom flange of beams.
   3. Welded Beam Attachments (MSS Type 22): For attaching to bottom of beams if loads are considerable and rod sizes are large.
   4. Steel-Beam Clamps with Eye Nuts (MSS Type 28): For attaching to bottom of steel I-beams for heavy loads.
   5. Linked-Steel Clamps with Eye Nuts (MSS Type 29): For attaching to bottom of steel I-beams for heavy loads, with link extensions.
   6. Malleable Beam Clamps with Extension Pieces (MSS Type 30): For attaching to structural steel.
   7. Welded-Steel Brackets: For support of pipes from below, or for suspending from above by using clip and rod. Use one of the following for indicated loads:
      a. Light (MSS Type 31): 750 lb.
      b. Medium (MSS Type 32): 1500 lb.
      c. Heavy (MSS Type 33): 3000 lb.
   8. Plate Lugs (MSS Type 57): For attaching to steel beams if flexibility at beam is required.

9. Horizontal Travelers (MSS Type 58): For supporting piping systems subject to linear horizontal movement where headroom is limited.

J. Saddles and Shields: Unless otherwise indicated and except as specified in piping system Sections, install the following types:
   1. Steel Pipe-Covering Protection Saddles (MSS Type 39): To fill interior voids with insulation that matches adjoining insulation.
   2. Protection Shields (MSS Type 40): Of length recommended in writing by manufacturer to prevent crushing insulation.
   3. Thermal-Hanger Shield Inserts: For supporting insulated pipe.

K. Spring Hangers and Supports: Unless otherwise indicated and except as specified in piping system Sections, install the following types:
   1. Restraint-Control Devices (MSS Type 47): Where indicated to control piping movement.
   2. Spring Cushions (MSS Type 48): For light loads if vertical movement does not exceed 1-1/4 inches.
   3. Spring-Cushion Roll Hangers (MSS Type 49): For equipping Type 41 roll hanger with springs.
   4. Spring Sway Braces (MSS Type 50): To retard sway, shock, vibration, or thermal expansion in piping systems.
   5. Variable-Spring Hangers (MSS Type 51): Preset to indicated load and limit variability factor to 25 percent to absorb expansion and contraction of piping system from hanger.
   6. Variable-Spring Trapeze Hangers (MSS Type 53): Preset to indicated load and limit variability factor to 25 percent to absorb expansion and contraction of piping system from trapeze support.
   7. Constant Supports: For critical piping stress and if necessary to avoid transfer of stress from one support to another support, critical terminal, or connected equipment. Include auxiliary stops for erection, hydrostatic test, and load-adjustment capability. These supports include the following types:
      a. Trapeze (MSS Type 56): Two vertical-type supports and one trapeze member.

L. Comply with MSS SP-69 for trapeze pipe hanger selections and applications that are not specified in piping system Sections.

M. Comply with MFMA-102 for metal framing system selections and applications that are not specified in piping system Sections.

N. Use mechanical-expansion anchors instead of building attachments where required in concrete construction.

O. Use pipe positioning systems in pipe spaces behind plumbing fixtures to support supply and waste piping for plumbing fixtures.

3.2 HANGER AND SUPPORT INSTALLATION

A. Steel Pipe Hanger Installation: Comply with MSS SP-69 and MSS SP-89. Install hangers, supports, clamps, and attachments as required to properly support piping from building structure.

B. Trapeze Pipe Hanger Installation: Comply with MSS SP-69 and MSS SP-89. Arrange for grouping of parallel runs of horizontal piping and support together on field-fabricated trapeze pipe hangers.
   1. Pipes of Various Sizes: Support together and space trapezes for smallest pipe size or install intermediate supports for smaller diameter pipes as specified above for individual pipe hangers.

2. Field fabricate from ASTM A 36/A 36M, steel shapes selected for loads being supported. Weld steel according to AWS D1.1.

C. Metal Framing System Installation: Arrange for grouping of parallel runs of piping and support together on field-assembled metal framing systems.

D. Thermal-Hanger Shield Installation: Install in pipe hanger or shield for insulated piping.

E. Fastener System Installation:
1. Install powder-actuated fasteners for use in lightweight concrete or concrete slabs less than 4 inches thick in concrete after concrete is placed and completely cured. Use operators that are licensed by powder-actuated tool manufacturer. Install fasteners according to powder-actuated tool manufacturer's operating manual.
2. Install mechanical-expansion anchors in concrete after concrete is placed and completely cured. Install fasteners according to manufacturer's written instructions.

F. Pipe Positioning System Installation: Install support devices to make rigid supply and waste piping connections to each plumbing fixture. Refer to Division 15 Section "Plumbing Fixtures" for plumbing fixtures.

G. Install hangers and supports complete with necessary inserts, bolts, rods, nuts, washers, and other accessories.

H. Equipment Support Installation: Fabricate from welded-structural-steel shapes.

I. Install hangers and supports to allow controlled thermal movement of piping systems, to permit freedom of movement between pipe anchors, and to facilitate action of expansion joints, expansion loops, expansion bends, and similar units.

J. Install lateral bracing with pipe hangers and supports to prevent swaying.

K. Install building attachments within concrete slabs or attach to structural steel. Install additional attachments at concentrated loads, including valves, flanges, and strainers, NPS 2-1/2 and larger and at changes in direction of piping. Install concrete inserts before concrete is placed; fasten inserts to forms and install reinforcing bars through openings at top of inserts.

L. Load Distribution: Install hangers and supports so piping live and dead loads and stresses from movement will not be transmitted to connected equipment.

M. Pipe Slopes: Install hangers and supports to provide indicated pipe slopes and so maximum pipe deflections allowed by ASME B31.9 (for building services piping) are not exceeded.

N. Insulated Piping: Comply with the following:
1. Attach clamps and spacers to piping.
   a. Piping Operating above Ambient Air Temperature: Clamp may project through insulation.
   b. Piping Operating below Ambient Air Temperature: Use thermal-hanger shield insert with clamp sized to match OD of insert.
   c. Do not exceed pipe stress limits according to ASME B31.9 for building services piping.
2. Install MSS SP-58, Type 39, protection saddles if insulation without vapor barrier is indicated. Fill interior voids with insulation that matches adjoining insulation.
   a. Option: Thermal-hanger shield inserts may be used. Include steel weight-distribution plate for pipe NPS 4 and larger if pipe is installed on rollers.

3. Install MSS SP-58, Type 40, protective shields on cold piping with vapor barrier. Shields shall span an arc of 180 degrees.
    a. Option: Thermal-hanger shield inserts may be used. Include steel weight-distribution plate for pipe NPS 4 and larger if pipe is installed on rollers.
4. Shield Dimensions for Pipe: Not less than the following:
    a. NPS 1/4 to NPS 3-1/2: 12 inches long and 0.048 inch thick.
    b. NPS 4: 12 inches long and 0.06 inch thick.
    c. NPS 5 and NPS 6: 18 inches long and 0.06 inch thick.
    d. NPS 8 to NPS 14: 24 inches long and 0.075 inch thick.
5. Pipes NPS 8 and Larger: Include wood inserts.
6. Insert Material: Length at least as long as protective shield.
7. Thermal-Hanger Shields: Install with insulation same thickness as piping insulation.

3.3 EQUIPMENT SUPPORTS

A. Fabricate structural-steel stands to suspend equipment from structure overhead or to support equipment above floor.

B. Grouting: Place grout under supports for equipment and make smooth bearing surface.

C. Provide lateral bracing, to prevent swaying, for equipment supports.

3.4 METAL FABRICATIONS

A. Cut, drill, and fit miscellaneous metal fabrications for trapeze pipe hangers and equipment supports.

B. Fit exposed connections together to form hairline joints. Field weld connections that cannot be shop welded because of shipping size limitations.

C. Field Welding: Comply with AWS D1.1 procedures for shielded metal arc welding, appearance and quality of welds, and methods used in correcting welding work, and with the following:
1. Use materials and methods that minimize distortion and develop strength and corrosion resistance of base metals.
2. Obtain fusion without undercut or overlap.
3. Remove welding flux immediately.
4. Finish welds at exposed connections so no roughness shows after finishing and contours of welded surfaces match adjacent contours.

3.5 ADJUSTING

A. Hanger Adjustments: Adjust hangers to distribute loads equally on attachments and to achieve indicated slope of pipe.

B. Trim excess length of continuous-thread hanger and support rods to 1-1/2 inches.

3.6 PAINTING

A. Touch Up: Clean field welds and abraded areas of shop paint. Paint exposed areas immediately after erecting hangers and supports. Use same materials as used for shop painting. Comply with SSPC-PA 1 requirements for touching up field-painted surfaces.
   1. Apply paint by brush or spray to provide minimum dry film thickness of 2.0 mils.

B. Galvanized Surfaces: Clean welds, bolted connections, and abraded areas and apply galvanizing-repair paint to comply with ASTM A 780.

END OF SECTION 230529

N:\N0912.00\DOC\SPEC\2012_03-16_BID\230529 - HANGERS AND SUPPORTS FOR HVAC PIPING AND EQUIPMENT.DOC

SECTION 230533 - HEAT TRACING FOR HVAC PIPING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

1.2 SUMMARY

A. This Section includes heat tracing with the following electric heating cables:
   1. Self-regulating, parallel resistance.

1.3 SUBMITTALS

A. Product Data: Include rated capacities, operating characteristics, furnished specialties, and accessories for each type of product indicated.
   1. Schedule heating capacity, length of cable, spacing, and electrical power requirement for each electric heating cable required.

B. Shop Drawings: For electric heating cable. Include plans, sections, details, and attachments to other work.
   1. Wiring Diagrams: Power, signal, and control wiring.

C. Field quality-control test reports.

D. Operation and Maintenance Data: For electric heating cables to include in operation and maintenance manuals.

E. Warranty: Special warranty specified in this Section.

1.4 QUALITY ASSURANCE

A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.

1.5 WARRANTY

A. Special Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace electric heating cable that fails in materials or workmanship within specified warranty period.
   1. Warranty Period: 15 Insert number years from date of Substantial Completion.

PART 2 - PRODUCTS

2.1 SELF-REGULATING, PARALLEL-RESISTANCE HEATING CABLES

A. Basis-of-Design Product: Subject to compliance with requirements, provide Raychem; a division of Tyco Thermal Controls or a comparable product by one of the following:
   1. Chromalox, Inc.; Wiegard Industrial Division; Emerson Electric Company.
   2. Pyrotenax; a division of Tyco Thermal Controls.

B. Heating Element: Pair of parallel No. 16 AWG, nickel-coated stranded copper bus wires embedded in crosslinked conductive polymer core, which varies heat output in response to temperature along its length. Terminate with waterproof, factory-assembled nonheating leads with connectors at one end, and seal the opposite end watertight. Cable shall be capable of crossing over itself once without overheating.

C. Installation: Wrap single strip heating elements throughout entire length of piping.

D. Electrical Insulating Jacket: Flame-retardant polyolefin.

E. Cable Cover: Tinned-copper braid, and polyolefin outer jacket with UV inhibitor.

F. Maximum Operating Temperature (Power On): 150 deg F.

G. Maximum Exposure Temperature (Power Off): 185 deg F.

H. Maximum Operating Temperature: 300 deg F.

I. Capacities and Characteristics:
   1. Maximum Heat Output: 8 W/ft..
   2. Piping Diameter: 5 NPS.
   3. Number of Parallel Cables: 2
   4. Volts: 120 V.
   5. Phase: 1
   6. Hertz: 60

2.2 CONTROLS

A. Remote bulb unit with adjustable temperature range from 30 to 50 deg F.

B. Snap action; open-on-rise, single-pole switch with minimum current rating adequate for connected cable.

C. Remote bulb on capillary, resistance temperature device, or thermistor for directly sensing pipe-wall temperature.

D. Corrosion-resistant, waterproof control enclosure.

2.3 ACCESSORIES

A. Cable Installation Accessories: Fiberglass tape, heat-conductive putty, cable ties, silicone end seals and splice kits, and installation clips all furnished by manufacturer, or as recommended in writing by manufacturer.

B. Warning Labels: Refer to Division 15 Section "Mechanical Identification."

C. Warning Tape: Continuously printed "Electrical Tracing"; vinyl, at least 3 mils thick, and with pressure-sensitive, permanent, waterproof, self-adhesive back.
   1. Width for Markers on Pipes with OD, Including Insulation, Less Than 6 Inches: 3/4 inch minimum.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine surfaces and substrates to receive electric heating cables for compliance with requirements for installation tolerances and other conditions affecting performance.
   1. Ensure surfaces and pipes in contact with electric heating cables are free of burrs and sharp protrusions.
   2. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. Install electric heating cables after piping has been tested and before insulation is installed.

B. Install electric heating cables according to IEEE 515.1.

C. Install insulation over piping with electric cables according to Division 23 Section "Pipe Insulation."

D. Install warning tape on piping insulation where piping is equipped with electric heating cables.

E. Set field-adjustable switches and circuit-breaker trip ranges.

F. Protect installed heating cables, including nonheating leads, from damage.

3.3 CONNECTIONS

A. Ground equipment according to Division 26 Section "Grounding and Bonding."

B. Connect wiring according to Division 26 Section "Conductors and Cables."

3.4 FIELD QUALITY CONTROL

A. Testing: Perform tests after cable installation but before application of coverings such as insulation, wall or ceiling construction, or concrete.

1. Test cables for electrical continuity and insulation integrity before energizing.
2. Test cables to verify rating and power input. Energize and measure voltage and current simultaneously.

B. Repeat tests for continuity, insulation resistance, and input power after applying thermal insulation on pipe-mounting cables.

C. Remove and replace malfunctioning units and retest as specified above.

END OF SECTION 230533

SECTION 230548 – VIBRATION CONTROLS FOR HVAC PIPING AND EQUIPMENT

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

B. All sections of Division 23 apply to work in this Section

1.2 SUMMARY

A. Extent of vibration control work required by this section is indicated on drawings and/or specified in this and other Division 23 sections.

B. Types of vibration control products specified in this section include the following:
1. Neoprene Pads.
2. Vibration Isolation Springs.
3. All-Directions Anchors.
4. Neoprene Mountings.
5. Spring Isolators, Free-Standing.
6. Spring Isolators, Vertically-Restrained.
7. Flexible Pipe Connectors.
8. Spring supported concrete inertia bases.

C. Vibration control product furnished as integral parts of factory-fabricated equipment, are specified herein and as part of equipment assembly in other Division 15 sections.

D. Refer to other Division 23 sections for equipment foundations, hangers, sealants, gaskets, and other work related to vibration control work.

E. Refer to other Division 23 sections for requirements of electrical connections to equipment isolated on vibrations control products.

F. Refer to other Division 23 sections for requirements of duct connections to air handling equipment isolated on vibration control products.

G. Refer to other Division 23 sections for requirements of piping connections to equipment isolated on vibration control products.

1.3 QUALITY ASSURANCE

A. Manufacturer's Qualifications: Firms regularly engaged in manufacture of vibration control products, of type, size, and capacity required, whose products have been in satisfactory use in similar service for not less than 5 years.
1. Except as otherwise indicated, obtain vibration control products from single manufacturer.
2. Engage manufacturer to provide technical supervision of installation of vibration control products.

B. All vibration isolators shall have calibration markings or some method to determine adjustment and the actual deflection under the imposed load after installation and adjustment.

C. All isolators shall operate within the linear position of their load vs. deflection curves. Load vs. deflection curves shall be furnished by the manufacturer and must be linear over a deflection range of not less than 50% above the design deflection.

D. The theoretical vertical natural frequency for each support point, based upon load per isolator and isolator stiffness, shall not differ from the design objectives for the equipment as a whole by more than +10%.

E. These specifications describe spring hangers with 30 degree misalignment feature. This requirement is mandatory. The contractor shall replace any hangers without a 30 degree capability discovered on site at no additional cost to the Owner.

1.4 SUBMITTALS

A. Product Data: Submit manufacturer's technical product data and installation instructions for each type of vibration control product. Submit schedule showing size, type, deflection and location for each product furnished.

B. Shop Drawings: Submit manufacturer's assembly-type shop drawings indicating dimensions, weights, required clearances, and method of assembly of components. Detail bases, and show location of equipment anchoring points, coordinated with equipment manufacturers' shop drawings.

C. Maintenance Data: Submit maintenance data for each type of vibration control product. Include this data, product data, and shop drawings in maintenance manual; in accordance with requirements of Division 1.

PART 2 - PRODUCTS

2.1 ACCEPTABLE MANUFACTURERS

A. Products manufactured by Mason Industries, Amber/ Booth Co., Vibration Mountings and Controls or Kinetics Noise Control meeting or surpassing the specifications shall be acceptable.

2.2 VIBRATION CONTROL MATERIALS AND SUPPORTS UNITS

A. Neoprene Pads (Type A): Oil-resistant neoprene sheets, of manufacturer's standard hardness, and cross-ribbed or waffled pattern. Pads shall be minimum 1/4 inch thick and shall be comprised of multiple layers to achieve specified deflection. Provide 1/16 inch thick steel shims between multiple layers. Provide top bearing plate as necessary to uniformly load pads. Minimum 1/8 inch deflection.

B. Vibration Isolation Springs (Type B): Wound-steel compression springs, or high-strength spring alloy steel; with spring diameter not less than 0.8 of compressed height of spring at rated loads. Provide minimum additional travel to solid, equal to 50% of rated deflection. Provide spring wire with elastic limit stress exceeding at solid deflection.

C. All-Directional Anchors (Type D): Provide all-directional acoustical pipe anchor consisting of telescopic arrangement of 2 sizes of steel tubing separated by minimum 0.5 inch thickness of

heavy-duty neoprene and duck, or neoprene isolation material. Provide vertical restraints by similar material arranged to prevent vertical travel in either direction. Design for maximum 500 psig load on isolation materials, and provide for equal resistance in any direction. Equip all anchors with threaded hole on top and 2 holes in base plate for bolting down; or provide welding provisions top and bottom, where indicated.

D. Neoprene Mountings (Type E): Provide neoprene mountings consisting of a neoprene-in-shear element bonded between 2 steel plates that are neoprene-covered to prevent corrosion. Provide minimum rated deflection of 3/8 inch. Provide threaded hole in upper plate and 2 holes in base plate for securing to equipment and substrate. Type E-H shall be hanger with a Type E isolation element.

E. Spring Isolators, Free-Standing (Type F): Except as otherwise indicated, provide vibration isolation spring (Type B) between top and bottom loading plates, and with pad-type isolator (Type A) bonded to bottom of bottom loading plate. Include studs or cups to ensure centering of spring on plates. Include leveling bolt with lock nuts and washers, centered in top plate, arranged for leveling and anchoring supported equipment as required. Provide holes in bottom plate for bolting unit to substrate as required. Provide resilient bushings and washers when bolting isolator to substrate.

F. Spring Isolators, Vertically-Restrained (Type G): Provide spring isolators (Type B) in housing that includes vertical limit stops. Design housing to act as blocking during erection, and with installed height and operating height being equal. Maintain 0.5 inch minimum clearance around restraining bolts, and between housing and springs. Design so limit stops are out of contact during normal operation.

G. Isolation Hangers (Type L): Hanger units formed with brackets and including manufacturer's standard compression isolators of type indicated. Design brackets for 3 times rated loading of units. Fabricate units to accept misalignment of 30 degrees off center in any direction before contacting hanger box, and for use with either rod or strap type members, and including acoustical washers to prevent metal-to-metal contacts.
   1. Provide vibrations isolation spring (Type B) with cap in lower part of hanger and rubber hanger element in top, securely retained in unit.
   2. Provide neoprene element, with minimum deflection of 3/8 inch, securely retained in hanger box.
   3. Provide hangers, precompressed to rated load to limit deflection during installation. Design so hanger may be released after full load is applied.

H. Spring supported concrete inertia base (Type O):
   1. Concrete inertia bases shall be formed, finished and reinforced to prevent flexure, misalignment of drive and driven unit or stress transfer to equipment.
   2. Minimum thickness of inertia base shall be as follows, with base weight not less than 1.5 times equipment weight as recommended by manufacturer:

MOTOR SIZE HP	MIN. THICKNESS (inches)
5 – 15	6
15 – 50	8

   3. A minimum 1 ½ -2 inches space shall be maintained between the inertia base and building structure.
   4. Inertia bases shall be supported by Type F isolators with minimum 2 inches deflection.

I. Flexible Pipe Connectors:
   1. For non-ferrous piping, provide bronze hose covered with bronze wire braid with copper tube ends or bronze flanged ends, braze-welded to hose.
      a. Provide for pump suction and discharge piping 2 inches and less.
   2. For ferrous piping, provide stainless steel hose covered with stainless steel wire braid with NPT steel nipples or 150 psig ANSI flanges, welded to hose.
      a. Provide for pump suction and discharge piping 2½ to 4 inches.
   3. Double spherical neoprene flexible connector (Type N):
      a. Manufactured of nylon tire cord and neoprene both molded and cured with hydraulic presses.
      b. Rated 150 psig at 200 deg. F.
      c. Size 12 inches or larger and systems above 150 psig class shall have control cables or rods with end fittings isolated from anchor plates by means of 0.5 inch thick bridge bearing neoprene washer bushings.
      d. Provide for pump suction and discharge piping larger than 4-inches.

PART 3 - PART – 3 EXECUTION

3.1 INSPECTION

A. Examine areas and conditions under which vibration control units are to be installed. Do not proceed with work until unsatisfactory conditions have been corrected in manner acceptable to Installer.

3.2 PERFORMANCE OF ISOLATORS

A. General: Comply with minimum static deflections as tabulated in this section, but not less than recommended by latest edition of ASHRAE, for selection and application of vibration isolation materials and units as indicated.

B. Manufacturer's Recommendations: Except as otherwise indicated, comply with manufacturer's recommendations for selection and application of vibration isolation materials and units.

3.3 APPLICATIONS

A. General: Except as otherwise indicated, select vibration control products in accordance with latest edition of ASHRAE Applications Handbook, "Sound and Vibration Control" chapter. Where more than one type of product is offered, selection shall be the most efficient isolator.

B. Piping: For piping connected to equipment mounted on vibration control products, install isolation hangers as indicated, and for first 3 points of support for pipe sizes 4 inches and less and for first 4 points of support for pipe sizes 5 inches through 10 inches. All piping in mechanical rooms shall be mounted on Type G isolators with 2 inches deflection or suspended by Type L hangers with 2 1/4 inch deflection. Piping within 75 feet from equipment connections shall be mounted on Type G isolators with (2 inch) deflection or suspended by Type L hangers with 2 1/4 inch deflection.

3.4 INSTALLATION

A. General: Except as otherwise indicated, comply with manufacturer's instructions for installation and load application to vibration control materials and units. Adjust to ensure that units have equal deflection, do not bottom out under loading, and are not short-circuited by other contacts or

bearing points. Remove space blocks and similar devices intended for temporary support during installation.

B. Install units between substrate and equipment as required for secure operation and to prevent displacement by normal forces, and as indicated.

C. Adjust leveling devices as required to distribute loading uniformly onto isolators. Shim units as required where substrate is not level.

D. Install inertia base frames on isolator units as indicated, so that minimum of 1½- 2 inch clearance below base will result when frame is filled with concrete and supported equipment has been installed and loaded for operation. A minimum 1½- 2 inch clearance shall be maintained between all isolated bases and building structure.

E. Locate isolation hangers as near to overhead support structure as possible. All hanging points shall be from main structural elements.

F. Weld riser isolator units in place as required to prevent displacement from loading and operations.

G. Flexible Pipe Connectors: Install on equipment side of shutoff valves, horizontally and parallel to equipment shafts wherever possible.

3.5 ADJUSTING AND CLEANING

A. Upon completion of vibration control work, prepare report showing measured equipment deflections for each major item of equipment as indicated.

B. Clean each vibration control unit, and verify that each is working freely, and that there is no dirt or debris in immediate vicinity of unit that could possibly short-circuit unit isolation.

3.6 VIBRATION ISOLATION SCHEDULE

A. Provide the most efficient and effective isolation system and deflection where a conflict may exist between the following schedule, individual equipment specifications or ASHRAE recommendations. Provide ASHRAE recommended isolators for 35 feet structural spans whether or not a 35 feet span exists.

1) Static deflection shall be determined based on the deflection guide. Deflections indicated are minimums at actual load and shall be selected from manufacturer's nominal 4", 3", 2" and 1" deflection spring series. R.P.M. is defined as the slowest operating speed of the equipment.

2) Single stroke compressor may require inertia bases with thickness greater than 14" max. As described for Base B-2. Inertia as mass shall be sufficient to maintain double amplitude of 1/8".

Deflection Guide	
RPM	Deflection
Less than 300	3.50"
301 to 500	2.50"
Over 500	1.50"

3) Equipment with less than one H.P. are excluded from vibration requirements.

4) For equipment with multiple motors, H.P. classification applies to largest single motor.

5) Epoxy coated spring and housing assembly with stainless steel bolts and nuts for outdoor installation.

END SECTION 230548

SECTION 230553 – IDENTIFICATION FOR HVAC PIPING AND EQUIPMENT

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

1.2 SUMMARY

A. This Section includes the following mechanical identification materials and their installation:
1. Equipment nameplates.
2. Equipment markers.
3. Equipment signs.
4. Access panel and door markers.
5. Pipe markers.
6. Duct markers.
7. Valve tags.
8. Valve schedules.
9. Warning tags.

1.3 SUBMITTALS

A. Product Data: For each type of product indicated.

B. Samples: For color, letter style, and graphic representation required for each identification material and device.

C. Valve numbering scheme.

D. Valve Schedules: For each piping system. Furnish extra copies (in addition to mounted copies) to include in maintenance manuals.

1.4 QUALITY ASSURANCE

A. ASME Compliance: Comply with ASME A13.1, "Scheme for the Identification of Piping Systems," for letter size, length of color field, colors, and viewing angles of identification devices for piping.

1.5 COORDINATION

A. Coordinate installation of identifying devices with completion of covering and painting of surfaces where devices are to be applied.

B. Coordinate installation of identifying devices with location of access panels and doors.

C. Install identifying devices before installing acoustical ceilings and similar concealment.

PART 2 - PRODUCTS

2.1 EQUIPMENT IDENTIFICATION DEVICES

A. Equipment Nameplates: Metal, with data engraved or stamped, for permanent attachment on equipment.
   1. Data:
      a. Manufacturer, product name, model number, and serial number.
      b. Capacity, operating and power characteristics, and essential data.
      c. Labels of tested compliances.
   2. Location: Accessible and visible.
   3. Fasteners: As required to mount on equipment.

B. Equipment Markers: Engraved, color-coded laminated plastic. Include contact-type, permanent adhesive.
   1. Terminology: Match schedules as closely as possible.
   2. Data:
      a. Name and plan number.
      b. Equipment service.
      c. Design capacity.
      d. Other design parameters such as pressure drop, entering and leaving conditions, and speed.
   3. Size: 2-1/2 by 4 inches for control devices, dampers, and valves; 4-1/2 by 6 inches for equipment.

C. Equipment Signs: ASTM D 709, Type I, cellulose, paper-base, phenolic-resin-laminate engraving stock; Grade ES-2, black surface, black phenolic core, with white melamine subcore, unless otherwise indicated. Fabricate in sizes required for message. Provide holes for mechanical fastening.
   1. Data: Instructions for operation of equipment and for safety procedures.
   2. Engraving: Manufacturer's standard letter style, of sizes and with terms to match equipment identification.
   3. Thickness: 1/8 inch, unless otherwise indicated.
   4. Thickness: 1/16 inch for units up to 20 sq. in. or 8 inches in length, and 1/8 inch for larger units.
   5. Fasteners: Self-tapping, stainless-steel screws or contact-type, permanent adhesive.

D. Access Panel and Door Markers: 1/16-inch- thick, engraved laminated plastic, with abbreviated terms and numbers corresponding to identification. Provide 1/8-inch center hole for attachment.
   1. Fasteners: Self-tapping, stainless-steel screws or contact-type, permanent adhesive.

2.2 PIPING IDENTIFICATION DEVICES

A. Manufactured Pipe Markers, General: Preprinted, color-coded, with lettering indicating service, and showing direction of flow.
   1. Colors: Comply with ASME A13.1, unless otherwise indicated.
   2. Lettering: Use piping system terms indicated and abbreviate only as necessary for each application length.
   3. Pipes with OD, Including Insulation, Less Than 6 Inches: Full-band pipe markers extending 360 degrees around pipe at each location.
   4. Pipes with OD, Including Insulation, 6 Inches and Larger: Either full-band or strip-type pipe markers at least three times letter height and of length required for label.

5. Arrows: Integral with piping system service lettering to accommodate both directions; or as separate unit on each pipe marker to indicate direction of flow.

B. Pretensioned Pipe Markers: Precoiled semirigid plastic formed to cover full circumference of pipe and to attach to pipe without adhesive.

C. Shaped Pipe Markers: Preformed semirigid plastic formed to partially cover circumference of pipe and to attach to pipe with mechanical fasteners that do not penetrate insulation vapor barrier.

D. Self-Adhesive Pipe Markers: Plastic with pressure-sensitive, permanent-type, self-adhesive back.

E. Plastic Tape: Continuously printed, vinyl tape at least 3 mils thick with pressure-sensitive, permanent-type, self-adhesive back.
1. Width for Markers on Pipes with OD, Including Insulation, Less Than 6 Inches: 3/4 inch minimum.
2. Width for Markers on Pipes with OD, Including Insulation, 6 Inches or Larger: 1-1/2 inches minimum.

2.3 DUCT IDENTIFICATION DEVICES

A. Duct Markers: Engraved, color-coded laminated plastic. Include direction and quantity of airflow and duct service (such as supply, return, and exhaust). Include contact-type, permanent adhesive.

2.4 VALVE TAGS

A. Valve Tags: Stamped or engraved with 1/4-inch letters for piping system abbreviation and 1/2-inch numbers, with numbering scheme approved by Architect. Provide 5/32-inch hole for fastener.
1. Material: 0.032-inch- thick brass or aluminum.
2. Material: 0.0375-inch- thick stainless steel.
3. Material: 3/32-inch- thick laminated plastic with 2 black surfaces and white inner layer.
4. Valve-Tag Fasteners: Brass wire-link or beaded chain.

2.5 VALVE SCHEDULES

A. Valve Schedules: For each piping system, on standard-size bond paper. Tabulate valve number, piping system, system abbreviation (as shown on valve tag), location of valve (room or space), normal-operating position (open, closed, or modulating), and variations for identification. Mark valves for emergency shutoff and similar special uses.
1. Valve-Schedule Frames: Glazed display frame for removable mounting on masonry walls for each page of valve schedule. Include mounting screws.
2. Frame: Extruded aluminum.
3. Glazing: ASTM C 1036, Type I, Class 1, Glazing Quality B, 2.5-mm, single-thickness glass.

2.6 WARNING TAGS

A. Warning Tags: Preprinted or partially preprinted, accident-prevention tags; of plasticized card stock with matte finish suitable for writing.
1. Size: Approximately 4 by 7 inches.

2. Fasteners: Brass grommet and wire.
3. Nomenclature: Large-size primary caption such as DANGER, CAUTION, or DO NOT OPERATE.
4. Color: Yellow background with black lettering.

PART 3 - EXECUTION

3.1 APPLICATIONS, GENERAL

A. Products specified are for applications referenced in other Division 15 Sections. If more than single-type material, device, or label is specified for listed applications, selection is Installer's option.

3.2 EQUIPMENT IDENTIFICATION

A. Install and permanently fasten equipment nameplates on each major item of mechanical equipment that does not have nameplate or has nameplate that is damaged or located where not easily visible. Locate nameplates where accessible and visible. Include nameplates for the following general categories of equipment:
   1. Fuel-burning units, including boilers, and heaters.
   2. Pumps, compressors, chillers, condensers, and similar motor-driven units.
   3. Coils, evaporators, and similar equipment.
   4. Fans, blowers and primary balancing dampers.
   5. HVAC central-station air handling units.

B. Install equipment markers with permanent adhesive on or near each major item of mechanical equipment. Data required for markers may be included on signs, and markers may be omitted if both are indicated.
   1. Letter Size: Minimum 1/4 inch for name of units if viewing distance is less than 24 inches, 1/2 inch for viewing distances up to 72 inches, and proportionately larger lettering for greater viewing distances. Include secondary lettering two-thirds to three-fourths the size of principal lettering.
   2. Data: Distinguish among multiple units, indicate operational requirements, indicate safety and emergency precautions, warn of hazards and improper operations, and identify units.
   3. Locate markers where accessible and visible. Include markers for the following general categories of equipment:
      a. Main control and operating valves, including safety devices and hazardous units such as gas outlets.
      b. Fire department hose valves and hose stations.
      c. Meters, gages, thermometers, and similar units.
      d. Fuel-burning units, including boilers, and heaters.
      e. Pumps, compressors, chillers, condensers, and similar motor-driven units.
      f. Coils, evaporators, and similar equipment.
      g. Fans, blowers and primary balancing dampers.
      h. HVAC central-station air handling units.
      i. Tanks and pressure vessels.
      j. Strainers, filters, water-treatment systems, and similar equipment.
      k. Exhausted and ventilation fans.
      l. Cooling towers.

C. Install equipment signs with screws or permanent adhesive on or near each major item of mechanical equipment. Locate signs where accessible and visible.

1. Identify mechanical equipment with equipment markers in the following color codes:
   a. Green: For cooling equipment and components.
   b. Yellow: For heating equipment and components.
   c. Orange: For combination cooling and heating equipment and components.
2. Letter Size: Minimum 1/4 inch for name of units if viewing distance is less than 24 inches, 1/2 inch for viewing distances up to 72 inches, and proportionately larger lettering for greater viewing distances. Include secondary lettering two-thirds to three-fourths the size of principal lettering.
3. Data: Distinguish among multiple units, indicate operational requirements, indicate safety and emergency precautions, warn of hazards and improper operations, and identify units.
4. Include signs for the following general categories of equipment:
   a. Main control and operating valves, including safety devices and hazardous units such as gas outlets.
   b. Fuel-burning units, including boilers, and heaters.
   c. Pumps, compressors, chillers, condensers, and similar motor-driven units.
   d. Coils, evaporators, and similar equipment.
   e. Fans, blowers, primary balancing dampers, and mixing boxes.
   f. HVAC central-station air handling units.
   g. Tanks and pressure vessels.
   h. Strainers, filters, water-treatment systems, and similar equipment.
   i. Exhaust fans and ventilation fans.
   j. Cooling towers.

D. Install access panel markers with screws on equipment access panels.

3.3 PIPING IDENTIFICATION

A. Install manufactured pipe markers indicating service on each piping system. Install with flow indication arrows showing direction of flow.
1. Pipes with OD, Including Insulation, Less Than 6 Inches: Pretensioned pipe markers. Use size to ensure a tight fit.
2. Pipes with OD, Including Insulation, Less Than 6 Inches: Self-adhesive pipe markers. Use color-coded, self-adhesive plastic tape, 1-1/2 inches wide, lapped at least 1-1/2 inches at both ends of pipe marker, and covering full circumference of pipe.
3. Pipes with OD, Including Insulation, 6 Inches and Larger: Shaped pipe markers. Use size to match pipe and secure with fasteners.
4. Pipes with OD, Including Insulation, 6 Inches and Larger: Self-adhesive pipe markers. Use color-coded, self-adhesive plastic tape, at least 1-1/2 inches wide, lapped at least 3 inches at both ends of pipe marker, and covering full circumference of pipe.

B. Locate pipe markers and color bands where piping is exposed in finished spaces; machine rooms; accessible maintenance spaces such as shafts, tunnels, and plenums; and exterior nonconcealed locations as follows:
1. Near each valve and control device.
2. Near each branch connection, excluding short takeoffs for fixtures and terminal units. Where flow pattern is not obvious, mark each pipe at branch.
3. Near penetrations through walls, floors, ceilings, and nonaccessible enclosures.
4. At access doors, manholes, and similar access points that permit view of concealed piping.
5. Near major equipment items and other points of origination and termination.
6. Spaced at maximum intervals of 50 feet along each run. Reduce intervals to 25 feet in areas of congested piping and equipment.
7. On piping above removable acoustical ceilings. Omit intermediately spaced markers.

3.4 DUCT IDENTIFICATION

A. Install duct markers with permanent adhesive on air ducts in the following color codes:
   1. Green: For cold-air supply ducts.
   2. Yellow: For hot-air supply ducts.
   3. Blue: For exhaust-, outside-, relief-, and return-ducts.
   4. Purple: For laboratory exhaust systems.
   5. ASME A13.1 Colors and Designs: For hazardous material exhaust.
   6. Letter Size: Minimum 1/4 inch for name of units if viewing distance is less than 24 inches, 1/2 inch for viewing distances up to 72 inches, and proportionately larger lettering for greater viewing distances. Include secondary lettering two-thirds to three-fourths the size of principal lettering.

B. Locate markers near points where ducts enter into concealed spaces and at maximum intervals of 50 feet in each space where ducts are exposed or concealed by removable ceiling system.

3.5 VALVE-TAG INSTALLATION

A. Install tags on valves and control devices in piping systems, except check valves; valves within factory-fabricated equipment units; plumbing fixture supply stops; shutoff valves; faucets; convenience and lawn-watering hose connections; and HVAC terminal devices and similar roughing-in connections of end-use fixtures and units. List tagged valves in a valve schedule.

B. Valve-Tag Application Schedule: Tag valves according to size, shape, and color scheme and with captions similar to those indicated in the following:
   1. Valve-Tag Size and Shape:
      a. Cold Water: 2 inches, round.
      b. Hot Water: 2 inches, round.
      c. Fire Protection: 2 inches, round.
      d. Gas: 2 inches, round.
   2. Valve-Tag Color:
      a. Cold Water: Green.
      b. Hot Water: Yellow.
      c. Fire Protection: Red.
      d. Gas: Blue.
   3. Letter Color:
      a. Cold Water: White.
      b. Hot Water: Black.
      c. Fire Protection: White.
      d. Gas: White.

3.6 VALVE-SCHEDULE INSTALLATION

A. Mount valve schedule on wall in accessible location in each major equipment room.

3.7 WARNING-TAG INSTALLATION

A. Write required message on, and attach warning tags to, equipment and other items where required.

3.8 ADJUSTING

A. Relocate mechanical identification materials and devices that have become visually blocked by other work.

3.9 CLEANING

A. Clean faces of mechanical identification devices and glass frames of valve schedules.

END OF SECTION 230553

N:\N0912.00\DOC\SPEC\2012_03-16_BID\230553 - IDENTIFICATION FOR HVAC PIPING AND EQUIPMENT.DOC

SECTION 230593 - TESTING, ADJUSTING, AND BALANCING FOR HVAC

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:
   1. Balancing Air Systems:
      a. Constant-volume air systems.
      b. Variable-air-volume systems.
   2. Balancing Hydronic Piping Systems:
      a. Variable-flow hydronic systems.
      b. Primary-tertiary- hydronic systems.

1.3 DEFINITIONS

A. AABC: Associated Air Balance Council.

B. NEBB: National Environmental Balancing Bureau.

C. TAB: Testing, adjusting, and balancing.

D. TABB: Testing, Adjusting, and Balancing Bureau.

E. TAB Specialist: An entity engaged to perform TAB Work.

1.4 SUBMITTALS

A. LEED Submittal:
   1. Air-Balance Report for LEED Prerequisite EQ 1: Documentation of work performed for ASHRAE 62.1-2004, Section 7.2.2, "Air Balancing."

B. Qualification Data: Within 30 days of Contractor's Notice to Proceed, submit documentation that the TAB contractor and this Project's TAB team members meet the qualifications specified in "Quality Assurance" Article.

C. Contract Documents Examination Report: Within 30 days of Contractor's Notice to Proceed, submit the Contract Documents review report as specified in Part 3.

D. Strategies and Procedures Plan: Within 60 days of Contractor's Notice to Proceed, submit TAB strategies and step-by-step procedures as specified in "Preparation" Article.

E. Certified TAB reports.

F. Sample report forms.

G. Instrument calibration reports, to include the following:
   1. Instrument type and make.
   2. Serial number.
   3. Application.
   4. Dates of use.
   5. Dates of calibration.

1.5 QUALITY ASSURANCE

A. TAB Contractor Qualifications: Engage a TAB entity certified by AABC or NEBB.
   1. TAB Field Supervisor: Employee of the TAB contractor and certified by AABC or NEBB.
   2. TAB Technician: Employee of the TAB contractor and who is certified by AABC or NEBB as a TAB technician.

B. TAB Conference: Meet with Architect, Owner, Construction Manager and Commissioning Authority on approval of the TAB strategies and procedures plan to develop a mutual understanding of the details. Require the participation of the TAB field supervisor and technicians. Provide fourteen (14) days' advance notice of scheduled meeting time and location.
   1. Agenda Items:
      a. The Contract Documents examination report.
      b. The TAB plan.
      c. Coordination and cooperation of trades and subcontractors.
      d. Coordination of documentation and communication flow.

C. Certify TAB field data reports and perform the following:

   1. Review field data reports to validate accuracy of data and to prepare certified TAB reports.
   2. Certify that the TAB team complied with the approved TAB plan and the procedures specified and referenced in this Specification.

D. TAB Report Forms: Use standard TAB contractor's forms approved by Architect Construction Manager and Commissioning Authority.

E. Instrumentation Type, Quantity, Accuracy, and Calibration: As described in ASHRAE 111, Section 5, "Instrumentation."

1.6 PROJECT CONDITIONS

A. Full Owner Occupancy: Owner will occupy the site and existing building during entire TAB period. Cooperate with Owner during TAB operations to minimize conflicts with Owner's operations.

B. Partial Owner Occupancy: Owner may occupy completed areas of building before Substantial Completion. Cooperate with Owner during TAB operations to minimize conflicts with Owner's operations.

1.7 COORDINATION

A. Notice: Provide fourteen (14) days' advance notice for each test. Include scheduled test dates and times.

B. Perform TAB after leakage and pressure tests on air and water distribution systems have been satisfactorily completed.

C. Perform TAB after leakage and pressure tests on air and water distribution systems have been satisfactorily completed.

1.8 WARRANTY

A. National Project Performance Guarantee: Provide a guarantee on AABC's "National Standards for Testing and Balancing Heating, Ventilating, and Air Conditioning Systems" forms stating that AABC will assist in completing requirements of the Contract Documents if TAB firm fails to comply with the Contract Documents. Guarantee includes the following provisions:
   1. The certified TAB firm has tested and balanced systems according to the Contract Documents.
   2. Systems are balanced to optimum performance capabilities within design and installation limits.

PART 2 - PRODUCTS (Not Applicable)

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine the Contract Documents to become familiar with Project requirements and to discover conditions in systems' designs that may preclude proper TAB of systems and equipment.

B. Examine systems for installed balancing devices, such as test ports, gage cocks, thermometer wells, flow-control devices, balancing valves and fittings, and manual volume dampers. Verify that locations of these balancing devices are accessible.

C. Examine the approved submittals for HVAC systems and equipment.

D. Examine design data including HVAC system descriptions, statements of design assumptions for environmental conditions and systems' output, and statements of philosophies and assumptions about HVAC system and equipment controls.

E. Examine ceiling plenums used for return to verify that they meet the leakage class of connected ducts as specified in Division 23 Section "Metal Ducts" and are properly separated from adjacent areas. Verify that penetrations in plenum walls are sealed and fire-stopped if required.

F. Examine equipment performance data including fan and pump curves.
   1. Relate performance data to Project conditions and requirements, including system effects that can create undesired or unpredicted conditions that cause reduced capacities in all or part of a system.
   2. Calculate system-effect factors to reduce performance ratings of HVAC equipment when installed under conditions different from the conditions used to rate equipment performance. To calculate system effects for air systems, use tables and charts found in AMCA 201, "Fans and Systems," or

in SMACNA's "HVAC Systems - Duct Design." Compare results with the design data and installed conditions.

G. Examine system and equipment installations and verify that field quality-control testing, cleaning, and adjusting specified in individual Sections have been performed.

H. Examine test reports specified in individual system and equipment Sections.

I. Examine HVAC equipment and filters and verify that bearings are greased, belts are aligned and tight, and equipment with functioning controls is ready for operation.

J. Examine terminal units, such as variable-air-volume boxes, air valves, indoor fan coils, unit heaters and verify that they are accessible and their controls are connected and functioning.

K. Examine strainers. Verify that startup screens are replaced by permanent screens with indicated perforations.

L. Examine two and three-way valves for proper installation for their intended function of diverting or mixing fluid flows.

M. Examine heat-transfer coils for correct piping connections and for clean and straight fins.

N. Examine system pumps to ensure absence of entrained air in the suction piping.

O. Examine operating safety interlocks and controls on HVAC equipment.

P. Report deficiencies discovered before and during performance of TAB procedures. Observe and record system reactions to changes in conditions. Record default set points if different from indicated values.

3.2 PREPARATION

A. Prepare a TAB plan that includes strategies and step-by-step procedures.

B. Complete system-readiness checks and prepare reports. Verify the following:
1. Permanent electrical-power wiring is complete.
2. Hydronic systems are filled, clean, and free of air.
3. Automatic temperature-control systems are operational.
4. Equipment and duct access doors are securely closed.
5. Balance, smoke, and fire dampers are open.
6. Isolating and balancing valves are open and control valves are operational.
7. Ceilings are installed in critical areas where air-pattern adjustments are required and access to balancing devices is provided.
8. Windows and doors can be closed so indicated conditions for system operations can be met.

3.3 GENERAL PROCEDURES FOR TESTING AND BALANCING

A. Perform testing and balancing procedures on each system according to the procedures contained in AABC's "National Standards for Total System Balance" ASHRAE 111 NEBB's "Procedural Standards for Testing, Adjusting, and Balancing of Environmental Systems" SMACNA's "HVAC Systems - Testing, Adjusting, and Balancing" and in this Section.

1. Comply with requirements in ASHRAE 62.1-2004, Section 7.2.2, "Air Balancing."

B. Cut insulation, ducts, pipes, and equipment cabinets for installation of test probes to the minimum extent necessary for TAB procedures.
   1. After testing and balancing, patch probe holes in ducts with same material and thickness as used to construct ducts.
   2. After testing and balancing, install test ports and duct access doors that comply with requirements in Division 23 Section "Air Duct Accessories."
   3. Install and join new insulation that matches removed materials. Restore insulation, coverings, vapor barrier, and finish according to Division 23 Section "HVAC Insulation."

C. Mark equipment and balancing devices, including damper-control positions, valve position indicators, fan-speed-control levers, and similar controls and devices, with paint or other suitable, permanent identification material to show final settings.

D. Take and report testing and balancing measurements in inch-pound (IP) units.

3.4 GENERAL PROCEDURES FOR BALANCING AIR SYSTEMS

A. Prepare test reports for both fans and outlets. Obtain manufacturer's outlet factors and recommended testing procedures. Crosscheck the summation of required outlet volumes with required fan volumes.

B. Prepare schematic diagrams of systems' "as-built" duct layouts.

C. For variable-air-volume systems, develop a plan to simulate diversity.

D. Determine the best locations in main and branch ducts for accurate duct-airflow measurements.

E. Check airflow patterns from the outdoor-air louvers and dampers and the return- and exhaust-air dampers through the supply-fan discharge and mixing dampers.

F. Locate start-stop and disconnect switches, variable frequency drives, electrical interlocks, and motor starters.

G. Verify that motor starters are equipped with properly sized thermal protection.

H. Check dampers for proper position to achieve desired airflow path.

I. Check for airflow blockages.

J. Check condensate drains for proper connections and functioning.

K. Check for proper sealing of air-handling-unit components.

L. Verify that air duct system is sealed as specified in Division 23 Section "Metal Ducts."

3.5 PROCEDURES FOR CONSTANT-VOLUME AIR SYSTEMS

A. Adjust fans to deliver total indicated airflows within the maximum allowable fan speed listed by fan manufacturer.

1. Measure total airflow.
    a. Where sufficient space in ducts is unavailable for Pitot-tube traverse measurements, measure airflow at terminal outlets and inlets and calculate the total airflow.
2. Measure fan static pressures as follows to determine actual static pressure:
    a. Measure outlet static pressure as far downstream from the fan as practical and upstream from restrictions in ducts such as elbows and transitions.
    b. Measure static pressure directly at the fan outlet or through the flexible connection.
    c. Measure inlet static pressure of single-inlet fans in the inlet duct as near the fan as possible, upstream from the flexible connection, and downstream from duct restrictions.
    d. Measure inlet static pressure of double-inlet fans through the wall of the plenum that houses the fan.
3. Measure static pressure across each component that makes up an air-handling unit, rooftop unit, and other air-handling and -treating equipment.
    a. Report the cleanliness status of filters and the time static pressures are measured.
4. Measure static pressures entering and leaving other devices, such as sound traps, heat-recovery equipment, and air washers, under final balanced conditions.
5. Review Record Documents to determine variations in design static pressures versus actual static pressures. Calculate actual system-effect factors. Recommend adjustments to accommodate actual conditions.
6. Obtain approval from Architect for adjustment of fan speed higher or lower than indicated speed. Comply with requirements in Division 23 Sections for air-handling units for adjustment of fans, belts, and pulley sizes to achieve indicated air-handling-unit performance.
7. Do not make fan-speed adjustments that result in motor overload. Consult equipment manufacturers about fan-speed safety factors. Modulate dampers and measure fan-motor amperage to ensure that no overload will occur. Measure amperage in full-cooling, full-heating, economizer, and any other operating mode to determine the maximum required brake horsepower.

B. Adjust volume dampers for main duct, submain ducts, and major branch ducts to indicated airflows within specified tolerances.
1. Measure airflow of submain and branch ducts.
    a. Where sufficient space in submain and branch ducts is unavailable for Pitot-tube traverse measurements, measure airflow at terminal outlets and inlets and calculate the total airflow for that zone.
2. Measure static pressure at a point downstream from the balancing damper, and adjust volume dampers until the proper static pressure is achieved.
3. Remeasure each submain and branch duct after all have been adjusted. Continue to adjust submain and branch ducts to indicated airflows within specified tolerances.

C. Measure air outlets and inlets without making adjustments.
1. Measure terminal outlets using a direct-reading hood or outlet manufacturer's written instructions and calculating factors.

D. Adjust air outlets and inlets for each space to indicated airflows within specified tolerances of indicated values. Make adjustments using branch volume dampers rather than extractors and the dampers at air terminals.
1. Adjust each outlet in same room or space to within specified tolerances of indicated quantities without generating noise levels above the limitations prescribed by the Contract Documents.
2. Adjust patterns of adjustable outlets for proper distribution without drafts.

3.6 PROCEDURES FOR VARIABLE-AIR-VOLUME SYSTEMS

A. Compensating for Diversity: When the total airflow of all terminal units is more than the indicated airflow of the fan, place a selected number of terminal units at a minimum set-point airflow with the remainder at maximum-airflow condition until the total airflow of the terminal units equals the indicated airflow of the fan. Select the reduced-airflow terminal units so they are distributed evenly among the branch ducts.

B. Pressure-Independent, Variable-Air-Volume Systems: After the fan systems have been adjusted, adjust the variable-air-volume systems as follows:
   1. Set outdoor-air dampers at minimum, and set return- and exhaust-air dampers at a position that simulates full-cooling load.
   2. Select the terminal unit that is most critical to the supply-fan airflow and static pressure. Measure static pressure. Adjust system static pressure so the entering static pressure for the critical terminal unit is not less than the sum of the terminal-unit manufacturer's recommended minimum inlet static pressure plus the static pressure needed to overcome terminal-unit discharge system losses.
   3. Measure total system airflow. Adjust to within indicated airflow.
   4. Set terminal units at maximum airflow and adjust controller or regulator to deliver the designed maximum airflow. Use terminal-unit manufacturer's written instructions to make this adjustment. When total airflow is correct, balance the air outlets downstream from terminal units the same as described for constant-volume air systems.
   5. Set terminal units at minimum airflow and adjust controller or regulator to deliver the designed minimum airflow. Check air outlets for a proportional reduction in airflow the same as described for constant-volume air systems.
      a. If air outlets are out of balance at minimum airflow, report the condition but leave outlets balanced for maximum airflow.
   6. Remeasure the return airflow to the fan while operating at maximum return airflow and minimum outdoor airflow.
      a. Adjust the fan and balance the return-air ducts and inlets the same as described for constant-volume air systems.
   7. Measure static pressure at the most critical terminal unit and adjust the static-pressure controller at the main supply-air sensing station to ensure that adequate static pressure is maintained at the most critical unit.
   8. Record final fan-performance data.

3.7 GENERAL PROCEDURES FOR HYDRONIC SYSTEMS

A. Prepare test reports with pertinent design data, and number in sequence starting at pump to end of system. Check the sum of branch-circuit flows against the approved pump flow rate. Correct variations that exceed plus or minus 5 percent.

B. Prepare schematic diagrams of systems' "as-built" piping layouts.

C. Prepare hydronic systems for testing and balancing according to the following, in addition to the general preparation procedures specified above:
   1. Open all manual valves for maximum flow.
   2. Check liquid level in expansion tank.
   3. Check makeup water-station pressure gage for adequate pressure for highest vent.
   4. Check flow-control valves for specified sequence of operation, and set at indicated flow.

5. Set differential-pressure control valves at the specified differential pressure. Do not set at fully closed position when pump is positive-displacement type unless several terminal valves are kept open.
6. Set system controls so automatic valves are wide open to heat exchangers.
7. Check pump-motor load. If motor is overloaded, throttle main flow-balancing device so motor nameplate rating is not exceeded.
8. Check air vents for a forceful liquid flow exiting from vents when manually operated.

3.8 PROCEDURES FOR CONSTANT-FLOW HYDRONIC SYSTEMS

A. Measure water flow at pumps. Use the following procedures except for positive-displacement pumps:
   1. Verify impeller size by operating the pump with the discharge valve closed. Read pressure differential across the pump. Convert pressure to head and correct for differences in gage heights. Note the point on manufacturer's pump curve at zero flow and verify that the pump has the intended impeller size.
      a. If impeller sizes must be adjusted to achieve pump performance, obtain approval from Architect and comply with requirements in Division 23 Section "Hydronic Pumps."
   2. Check system resistance. With all valves open, read pressure differential across the pump and mark pump manufacturer's head-capacity curve. Adjust pump discharge valve until indicated water flow is achieved.
      a. Monitor motor performance during procedures and do not operate motors in overload conditions.
   3. Verify pump-motor brake horsepower. Calculate the intended brake horsepower for the system based on pump manufacturer's performance data. Compare calculated brake horsepower with nameplate data on the pump motor. Report conditions where actual amperage exceeds motor nameplate amperage.
   4. Report flow rates that are not within plus or minus 10 percent of design.

B. Measure flow at all automatic flow control valves to verify that valves are functioning as designed.

C. Measure flow at all pressure-independent characterized control valves, with valves in fully open position, to verify that valves are functioning as designed.

D. Set calibrated balancing valves, if installed, at calculated presettings.

E. Measure flow at all stations and adjust, where necessary, to obtain first balance.
   1. System components that have Cv rating or an accurately cataloged flow-pressure-drop relationship may be used as a flow-indicating device.

F. Measure flow at main balancing station and set main balancing device to achieve flow that is 5 percent greater than indicated flow.

G. Adjust balancing stations to within specified tolerances of indicated flow rate as follows:
   1. Determine the balancing station with the highest percentage over indicated flow.
   2. Adjust each station in turn, beginning with the station with the highest percentage over indicated flow and proceeding to the station with the lowest percentage over indicated flow.
   3. Record settings and mark balancing devices.

H. Measure pump flow rate and make final measurements of pump amperage, voltage, rpm, pump heads, and systems' pressures and temperatures including outdoor-air temperature.

I. Measure the differential-pressure-control-valve settings existing at the conclusion of balancing.

J. Check settings and operation of each safety valve. Record settings.

3.9 PROCEDURES FOR VARIABLE-FLOW HYDRONIC SYSTEMS

A. Balance systems with automatic two- and three-way control valves by setting systems at maximum flow through heat-exchange terminals and proceed as specified above for hydronic systems.

3.10 PROCEDURES FOR PRIMARY-TERTIARY HYDRONIC SYSTEMS

A. Balance the primary circuit flow first and then balance the tertiary circuits.

3.11 PROCEDURES FOR HEAT EXCHANGERS

A. Measure water flow through all circuits.

B. Adjust water flow to within specified tolerances.

C. Measure inlet and outlet water temperatures.

D. Measure inlet steam pressure.

E. Check settings and operation of safety and relief valves. Record settings.

3.12 PROCEDURES FOR MOTORS

A. Motors, 1/2 HP and Larger: Test at final balanced conditions and record the following data:
1. Manufacturer's name, model number, and serial number.
2. Motor horsepower rating.
3. Motor rpm.
4. Efficiency rating.
5. Nameplate and measured voltage, each phase.
6. Nameplate and measured amperage, each phase.
7. Starter thermal-protection-element rating.

B. Motors Driven by Variable-Frequency Controllers: Test for proper operation at speeds varying from minimum to maximum. Test the manual bypass of the controller to prove proper operation. Record observations including name of controller manufacturer, model number, serial number, and nameplate data.

3.13 PROCEDURES FOR CHILLERS

A. Balance water flow through each evaporator and condenser to within specified tolerances of indicated flow with all pumps operating. With only one chiller operating in a multiple chiller installation, do not exceed the flow for the maximum tube velocity recommended by the chiller manufacturer. Measure and record the following data with each chiller operating at design conditions:

1. Evaporator-water entering and leaving temperatures, pressure drop, and water flow.
2. For water-cooled chillers, condenser-water entering and leaving temperatures, pressure drop, and water flow.
3. Evaporator and condenser refrigerant temperatures and pressures, using instruments furnished by chiller manufacturer.
4. Power factor if factory-installed instrumentation is furnished for measuring kilowatts.
5. Kilowatt input if factory-installed instrumentation is furnished for measuring kilowatts.
6. Capacity: Calculate in tons of cooling.
7. Obtain additional balancing requirements for ammonia chillers from manufacturer.

3.14 PROCEDURES FOR COOLING TOWERS

A. Shut off makeup water for the duration of the test, and verify that makeup and blowdown systems are fully operational after tests and before leaving the equipment. Perform the following tests and record the results:
   1. Measure condenser-water flow to each cell of the cooling tower.
   2. Measure entering- and leaving-water temperatures.
   3. Measure wet- and dry-bulb temperatures of entering air.
   4. Measure wet- and dry-bulb temperatures of leaving air.
   5. Measure condenser-water flow rate recirculating through the cooling tower.
   6. Measure cooling-tower spray pump discharge pressure.
   7. Adjust water level and feed rate of makeup water system.
   8. Measure flow through bypass.

3.15 PROCEDURES FOR CONDENSING UNITS

A. Verify proper rotation of fans.

B. Measure entering- and leaving-air temperatures.

C. Record compressor data.

3.16 PROCEDURES FOR BOILERS

A. Hydronic Boilers: Measure and record entering- and leaving-water temperatures and water flow.

3.17 PROCEDURES FOR HEAT-TRANSFER COILS

A. Measure, adjust, and record the following data for each water coil:
   1. Entering- and leaving-water temperature.
   2. Water flow rate.
   3. Water pressure drop.
   4. Dry-bulb temperature of entering and leaving air.
   5. Wet-bulb temperature of entering and leaving air for cooling coils.
   6. Airflow.
   7. Air pressure drop.

B. Measure, adjust, and record the following data for each refrigerant coil:

1. Dry-bulb temperature of entering and leaving air.
2. Wet-bulb temperature of entering and leaving air.
3. Airflow.
4. Air pressure drop.
5. Refrigerant suction pressure and temperature.

3.18 TOLERANCES

A. Set HVAC system's air flow rates and water flow rates within the following tolerances:
   1. Supply, Return, and Exhaust Fans and Equipment with Fans: Plus or minus 5 percent.
   2. Air Outlets and Inlets: Plus or minus 10 percent.
   3. Heating-Water Flow Rate: Plus or minus 10 percent.
   4. Cooling-Water Flow Rate: Plus or minus 10 percent.

3.19 REPORTING

A. Initial Construction-Phase Report: Based on examination of the Contract Documents as specified in "Examination" Article, prepare a report on the adequacy of design for systems' balancing devices. Recommend changes and additions to systems' balancing devices to facilitate proper performance measuring and balancing. Recommend changes and additions to HVAC systems and general construction to allow access for performance measuring and balancing devices.

B. Status Reports: Prepare monthly progress reports to describe completed procedures, procedures in progress, and scheduled procedures. Include a list of deficiencies and problems found in systems being tested and balanced. Prepare a separate report for each system and each building floor for systems serving multiple floors.

3.20 FINAL REPORT

A. General: Prepare a certified written report; tabulate and divide the report into separate sections for tested systems and balanced systems.
   1. Include a certification sheet at the front of the report's binder, signed and sealed by the certified testing and balancing engineer.
   2. Include a list of instruments used for procedures, along with proof of calibration.

B. Final Report Contents: In addition to certified field-report data, include the following:
   1. Pump curves.
   2. Fan curves.
   3. Manufacturers' test data.
   4. Field test reports prepared by system and equipment installers.
   5. Other information relative to equipment performance; do not include Shop Drawings and product data.

C. General Report Data: In addition to form titles and entries, include the following data:

   1. Title page.
   2. Name and address of the TAB contractor.
   3. Project name.
   4. Project location.

5. Architect's name and address.
6. Engineer's name and address.
7. Contractor's name and address.
8. Report date.
9. Signature of TAB supervisor who certifies the report.
10. Table of Contents with the total number of pages defined for each section of the report. Number each page in the report.
11. Summary of contents including the following:
    a. Indicated versus final performance.
    b. Notable characteristics of systems.
    c. Description of system operation sequence if it varies from the Contract Documents.
12. Nomenclature sheets for each item of equipment.
13. Data for terminal units, including manufacturer's name, type, size, and fittings.
14. Notes to explain why certain final data in the body of reports vary from indicated values.
15. Test conditions for fans and pump performance forms including the following:
    a. Settings for outdoor-, return-, and exhaust-air dampers.
    b. Conditions of filters.
    c. Cooling coil, wet- and dry-bulb conditions.
    d. Face and bypass damper settings at coils.
    e. Fan drive settings including settings and percentage of maximum pitch diameter.
    f. Inlet vane settings for variable-air-volume systems.
    g. Settings for supply-air, static-pressure controller.
    h. Other system operating conditions that affect performance.

D. System Diagrams: Include schematic layouts of air and hydronic distribution systems. Present each system with single-line diagram and include the following:
1. Quantities of outdoor, supply, return, and exhaust airflows.
2. Water and steam flow rates.
3. Duct, outlet, and inlet sizes.
4. Pipe and valve sizes and locations.
5. Terminal units.
6. Balancing stations.
7. Position of balancing devices.

E. Air-Handling-Unit Test Reports: For air-handling units with coils, include the following:
1. Unit Data:
    a. Unit identification.
    b. Location.
    c. Make and type.
    d. Model number and unit size.
    e. Manufacturer's serial number.
    f. Unit arrangement and class.
    g. Discharge arrangement.
    h. Sheave make, size in inches, and bore.
    i. Center-to-center dimensions of sheave, and amount of adjustments in inches.
    j. Number, make, and size of belts.
    k. Number, type, and size of filters.
2. Motor Data:
    a. Motor make, and frame type and size.
    b. Horsepower and rpm.
    c. Volts, phase, and hertz.
    d. Full-load amperage and service factor.
    e. Sheave make, size in inches, and bore.

f. Center-to-center dimensions of sheave, and amount of adjustments in inches.

3. Test Data (Indicated and Actual Values):
   a. Total air flow rate in cfm.
   b. Total system static pressure in inches wg.
   c. Fan rpm.
   d. Discharge static pressure in inches wg.
   e. Filter static-pressure differential in inches wg.
   f. Preheat-coil static-pressure differential in inches wg.
   g. Cooling-coil static-pressure differential in inches wg.
   h. Heating-coil static-pressure differential in inches wg.
   i. Outdoor airflow in cfm.
   j. Return airflow in cfm.
   k. Outdoor-air damper position.
   l. Return-air damper position.

F. Apparatus-Coil Test Reports:
1. Coil Data:
   a. System identification.
   b. Location.
   c. Coil type.
   d. Number of rows.
   e. Fin spacing in fins per inch o.c.
   f. Make and model number.
   g. Face area in sq. ft..
   h. Tube size in NPS.
   i. Tube and fin materials.
   j. Circuiting arrangement.
2. Test Data (Indicated and Actual Values):
   a. Air flow rate in cfm.
   b. Average face velocity in fpm.
   c. Air pressure drop in inches wg.
   d. Outdoor-air, wet- and dry-bulb temperatures in deg F.
   e. Return-air, wet- and dry-bulb temperatures in deg F.
   f. Entering-air, wet- and dry-bulb temperatures in deg F.
   g. Leaving-air, wet- and dry-bulb temperatures in deg F.
   h. Water flow rate in gpm.
   i. Water pressure differential in feet of head or psig.
   j. Entering-water temperature in deg F.
   k. Leaving-water temperature in deg F.
   l. Refrigerant expansion valve and refrigerant types.
   m. Refrigerant suction pressure in psig.
   n. Refrigerant suction temperature in deg F.
   o. Inlet steam pressure in psig.

G. Gas- Fired Heat Apparatus Test Reports: In addition to manufacturer's factory startup equipment reports, include the following:
1. Unit Data:
   a. System identification.
   b. Location.
   c. Make and type.
   d. Model number and unit size.
   e. Manufacturer's serial number.
   f. Fuel type in input data.

g. Output capacity in Btu/h.
h. Ignition type.
i. Burner-control types.
j. Motor horsepower and rpm.
k. Motor volts, phase, and hertz.
l. Motor full-load amperage and service factor.
m. Sheave make, size in inches, and bore.
n. Center-to-center dimensions of sheave, and amount of adjustments in inches.

2. Test Data (Indicated and Actual Values):
a. Total air flow rate in cfm.
b. Entering-air temperature in deg F.
c. Leaving-air temperature in deg F.
d. Air temperature differential in deg F.
e. Entering-air static pressure in inches wg.
f. Leaving-air static pressure in inches wg.
g. Air static-pressure differential in inches wg.
h. Low-fire fuel input in Btu/h.
i. High-fire fuel input in Btu/h.
j. Manifold pressure in psig.
k. High-temperature-limit setting in deg F.
l. Operating set point in Btu/h.
m. Motor voltage at each connection.
n. Motor amperage for each phase.
o. Heating value of fuel in Btu/h.

H. Fan Test Reports: For supply, return, and exhaust fans, include the following:
1. Fan Data:
a. System identification.
b. Location.
c. Make and type.
d. Model number and size.
e. Manufacturer's serial number.
f. Arrangement and class.
g. Sheave make, size in inches, and bore.
h. Center-to-center dimensions of sheave, and amount of adjustments in inches.

2. Motor Data:
a. Motor make, and frame type and size.
b. Horsepower and rpm.
c. Volts, phase, and hertz.
d. Full-load amperage and service factor.
e. Sheave make, size in inches, and bore.
f. Center-to-center dimensions of sheave, and amount of adjustments in inches.
g. Number, make, and size of belts.

3. Test Data (Indicated and Actual Values):
a. Total airflow rate in cfm.
b. Total system static pressure in inches wg.
c. Fan rpm.
d. Discharge static pressure in inches wg.
e. Suction static pressure in inches wg.

I. Round, Flat-Oval, and Rectangular Duct Traverse Reports: Include a diagram with a grid representing the duct cross-section and record the following:
1. Report Data:

a. System and air-handling-unit number.
b. Location and zone.
c. Traverse air temperature in deg F.
d. Duct static pressure in inches wg.
e. Duct size in inches.
f. Duct area in sq. ft..
g. Indicated air flow rate in cfm.
h. Indicated velocity in fpm.
i. Actual air flow rate in cfm.
j. Actual average velocity in fpm.
k. Barometric pressure in psig.

J. Air-Terminal-Device Reports:
1. Unit Data:
a. System and air-handling unit identification.
b. Location and zone.
c. Apparatus used for test.
d. Area served.
e. Make.
f. Number from system diagram.
g. Type and model number.
h. Size.
i. Effective area in sq. ft..
2. Test Data (Indicated and Actual Values):
a. Air flow rate in cfm.
b. Air velocity in fpm.
c. Preliminary air flow rate as needed in cfm.
d. Preliminary velocity as needed in fpm.
e. Final air flow rate in cfm.
f. Final velocity in fpm.
g. Space temperature in deg F.

K. System-Coil Reports: For reheat coils and water coils of terminal units, include the following:
1. Unit Data:
a. System and air-handling-unit identification.
b. Location and zone.
c. Room or riser served.
d. Coil make and size.
e. Flowmeter type.
2. Test Data (Indicated and Actual Values):
a. Air flow rate in cfm.
b. Entering-water temperature in deg F.
c. Leaving-water temperature in deg F.
d. Water pressure drop in feet of head or psig.
e. Entering-air temperature in deg F.
f. Leaving-air temperature in deg F.

L. Pump Test Reports: Calculate impeller size by plotting the shutoff head on pump curves and include the following:
1. Unit Data:
a. Unit identification.
b. Location.
c. Service.

d. Make and size.
e. Model number and serial number.
f. Water flow rate in gpm.
g. Water pressure differential in feet of head or psig.
h. Required net positive suction head in feet of head or psig.
i. Pump rpm.
j. Impeller diameter in inches.
k. Motor make and frame size.
l. Motor horsepower and rpm.
m. Voltage at each connection.
n. Amperage for each phase.
o. Full-load amperage and service factor.
p. Seal type.

2. Test Data (Indicated and Actual Values):
a. Static head in feet of head or psig.
b. Pump shutoff pressure in feet of head or psig.
c. Actual impeller size in inches.
d. Full-open flow rate in gpm.
e. Full-open pressure in feet of head or psig.
f. Final discharge pressure in feet of head or psig.
g. Final suction pressure in feet of head or psig.
h. Final total pressure in feet of head or psig.
i. Final water flow rate in gpm.
j. Voltage at each connection.
k. Amperage for each phase.

M. Instrument Calibration Reports:
1. Report Data:
a. Instrument type and make.
b. Serial number.
c. Application.
d. Dates of use.
e. Dates of calibration.

3.21 INSPECTIONS

A. Initial Inspection:
1. After testing and balancing are complete, operate each system and randomly check measurements to verify that the system is operating according to the final test and balance readings documented in the final report.
2. Check the following for each system:
a. Measure airflow of at least 10 percent of air outlets.
b. Measure water flow of at least 10 percent of terminals.
c. Measure room temperature at each thermostat/temperature sensor. Compare the reading to the set point.
d. Verify that balancing devices are marked with final balance position.
e. Note deviations from the Contract Documents in the final report.

B. Final Inspection:
1. After initial inspection is complete and documentation by random checks verifies that testing and balancing are complete and accurately documented in the final report, request that a final inspection be made by Architect, Owner, Construction Manager and Commissioning Authority.

2. The TAB contractor's test and balance engineer shall conduct the inspection in the presence of Architect, Owner, Construction Manager and Commissioning Authority.
3. Architect, Owner, Construction Manager and Commissioning Authority shall randomly select measurements, documented in the final report, to be rechecked. Rechecking shall be limited to either 10 percent of the total measurements recorded or the extent of measurements that can be accomplished in a normal 8-hour business day.
4. If rechecks yield measurements that differ from the measurements documented in the final report by more than the tolerances allowed, the measurements shall be noted as "FAILED."
5. If the number of "FAILED" measurements is greater than 10 percent of the total measurements checked during the final inspection, the testing and balancing shall be considered incomplete and shall be rejected.

C. TAB Work will be considered defective if it does not pass final inspections. If TAB Work fails, proceed as follows:
1. Recheck all measurements and make adjustments. Revise the final report and balancing device settings to include all changes; resubmit the final report and request a second final inspection.
2. If the second final inspection also fails, Owner may contract the services of another TAB contractor to complete TAB Work according to the Contract Documents and deduct the cost of the services from the original TAB contractor's final payment.

D. Prepare test and inspection reports.

3.22 ADDITIONAL TESTS

A. Within 90 days of completing TAB, perform additional TAB to verify that balanced conditions are being maintained throughout and to correct unusual conditions.

B. Seasonal Periods: If initial TAB procedures were not performed during near-peak summer and winter conditions, perform additional TAB during near-peak summer and winter conditions.

END OF SECTION 230593

N:\N0912.00\DOC\SPEC\2012_03-16_BID\230593 - TESTING, ADJUSTING, AND BALANCING FOR HVAC.DOC

SECTION 230700 - HVAC INSULATION

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:
   1. Insulation Materials:
      a. Flexible elastomeric.
      b. Mineral fiber.
      c. Cellular Foam
   2. Adhesives.
   3. Mastics.
   4. Lagging adhesives.
   5. Sealants.
   6. Field-applied fabric-reinforcing mesh.
   7. Field-applied cloths.
   8. Field-applied jackets.
   9. Tapes.
   10. Securements.
   11. Corner angles.

B. Related Sections:
   1. Division 22 Section "Fire-Suppression Systems Insulation."
   2. Division 21 Section "Plumbing Insulation."

1.3 SUBMITTALS

A. Product Data: For each type of product indicated. Include thermal conductivity, thickness, and jackets (both factory and field applied, if any).

B. Shop Drawings:
   1. Detail application of protective shields, saddles, and inserts at hangers for each type of insulation and hanger.
   2. Detail insulation application at pipe expansion joints for each type of insulation.
   3. Detail insulation application at elbows, fittings, flanges, valves, and specialties for each type of insulation.
   4. Detail removable insulation at piping specialties, equipment connections, and access panels.

C. Material Test Reports: From a qualified testing agency acceptable to authorities having jurisdiction indicating, interpreting, and certifying test results for compliance of insulation materials, sealers, attachments, cements, and jackets, with requirements indicated. Include dates of tests and test methods employed.

1.4 QUALITY ASSURANCE

A. Installer Qualifications: Skilled mechanics who have successfully completed an apprenticeship program or another craft training program certified by the Department of Labor, Bureau of Apprenticeship and Training.

B. Fire-Test-Response Characteristics: Insulation and related materials shall have fire-test-response characteristics indicated, as determined by testing identical products per ASTM E 84, by a testing and inspecting agency acceptable to authorities having jurisdiction. Factory label insulation and jacket materials and adhesive, mastic, tapes, and cement material containers, with appropriate markings of applicable testing and inspecting agency.
   1. Insulation Installed Indoors: Flame-spread index of 25 or less, and smoke-developed index of 50 or less.
   2. Insulation Installed Outdoors: Flame-spread index of 75 or less, and smoke-developed index of 150 or less.

1.5 DELIVERY, STORAGE, AND HANDLING

A. Packaging: Insulation material containers shall be marked by manufacturer with appropriate ASTM standard designation, type and grade, and maximum use temperature.

1.6 COORDINATION

A. Coordinate size and location of supports, hangers, and insulation shields specified in Division 23 Section "Hangers and Supports for HVAC Piping."

B. Coordinate clearance requirements with piping Installer for piping insulation application, duct Installer for duct insulation application, and equipment Installer for equipment insulation application. Before preparing piping and ductwork Shop Drawings, establish and maintain clearance requirements for installation of insulation and field-applied jackets and finishes and for space required for maintenance.

C. Coordinate installation and testing of heat tracing.

1.7 SCHEDULING

A. Schedule insulation application after pressure testing systems. Insulation application may begin on segments that have satisfactory test results.

B. Complete installation and concealment of plastic materials as rapidly as possible in each area of construction.

PART 2 - PRODUCTS

2.1 INSULATION MATERIALS

A. Comply with requirements in Part 3 schedule articles for where insulating materials shall be applied.

B. Products shall not contain asbestos, lead, mercury, or mercury compounds.

C. Products that come in contact with stainless steel shall have a leachable chloride content of less than 50 ppm when tested according to ASTM C 871.

D. Flexible Elastomeric: Closed-cell, sponge- or expanded-rubber materials. Comply with ASTM C 534, Type I for tubular materials and Type II for sheet materials.
   1. Products: Subject to compliance with requirements, provide one of the following:
      a. Aeroflex USA Inc.; Aerocel.
      b. Armacell LLC; AP Armaflex.
      c. RBX Corporation; Insul-Sheet 1800 and Insul-Tube 180.

E. Mineral-Fiber, Preformed Pipe Insulation with factory applied all service jacket (ASJ):
   1. Products: Subject to compliance with requirements, provide one of the following:
      a. Johns Manville; Micro-Lok.
      b. Knauf Insulation; 1000 Pipe Insulation.
      c. Owens Corning; Fiberglas Pipe Insulation.

F. Mineral-Fiber Blanket Insulation: Mineral or glass fibers bonded with a thermosetting resin. Comply with ASTM C 553, Type II and ASTM C 1290, Type III with factory-applied FSK jacket. Factory-applied jacket requirements are specified in "Factory-Applied Jackets" Article.
   1. Products: Subject to compliance with requirements, provide one of the following:
      a. Johns Manville; Microlite.
      b. Knauf Insulation; Duct Wrap.
      c. Owens Corning; All-Service Duct Wrap.

G. Mineral-Fiber Board Insulation: Mineral or glass fibers bonded with a thermosetting resin. Comply with ASTM C 612, Type IA or Type IB. For duct and plenum applications, provide insulation with factory-applied ASJ. For equipment applications, provide insulation with factory-applied ASJ. Factory-applied jacket requirements are specified in "Factory-Applied Jackets" Article.
   1. Products: Subject to compliance with requirements, provide one of the following:
      a. Johns Manville; 800 Series Spin-Glas.
      b. Knauf Insulation; Insulation Board.
      c. Owens Corning; Fiberglas 700 Series.

H. High-Temperature, Mineral-Fiber Board Insulation: Mineral or glass fibers bonded with a thermosetting resin. Comply with ASTM C 612, Type III, without factory-applied jacket.
   1. Products: Subject to compliance with requirements, provide one of the following:
      a. Johns Manville; 1000 Series Spin-Glas.
      b. Owens Corning; High Temperature Industrial Board Insulations.
      c. Knauf-Elevated Temperature (ET) Board

I. Mineral-Fiber, Pipe and Tank Insulation: Mineral or glass fibers bonded with a thermosetting resin. Semirigid board material with factory-applied ASJ complying with ASTM C 1393, Type II or Type IIIA Category 2, or with properties similar to ASTM C 612, Type IB. Nominal density is 2.5 lb/cu. ft. or more. Thermal conductivity (k-value) at 100 deg F is 0.29 Btu x in./h x sq. ft. x deg F or less. Factory-applied jacket requirements are specified in "Factory-Applied Jackets" Article.
   1. Products: Subject to compliance with requirements, provide one of the following:
      a. Johns Manville; MicroFlex.
      b. Knauf Insulation; Pipe and Tank Insulation.
      c. Owens Corning; Fiberglas Pipe and Tank Insulation.

J. Cellular Glass: Inorganic, incombustible, foamed or cellulated glass with annealed, rigid, hermetically sealed cells.
   1. Products: Subject to compliance with requirements, provide the following:
      a. Pittsburgh Corning Corporation; Foamglas.

2. Special-Shaped Insulation: ASTM C 552, Type III.
3. Preformed Pipe Insulation with Factory-Applied ASJ-SSL: Comply with ASTM C 552, Type II, Class 2.
4. Factory fabricate shapes according to ASTM C 450 and ASTM C 585.

2.2 INSULATING CEMENTS

A. Mineral-Fiber Insulating Cement: Comply with ASTM C 195.
1. Products: Subject to compliance with requirements, provide one of the following:
   a. Insulco, Division of MFS, Inc.; Triple I.
   b. P. K. Insulation Mfg. Co., Inc.; Super-Stik.

B. Mineral-Fiber, Hydraulic-Setting Insulating and Finishing Cement: Comply with ASTM C 449/C 449M.
1. Products: Subject to compliance with requirements, provide one of the following:
   a. Insulco, Division of MFS, Inc.; SmoothKote.
   b. P. K. Insulation Mfg. Co., Inc.; PK No. 127, and Quik-Cote.
   c. Rock Wool Manufacturing Company; Delta One Shot.

2.3 ADHESIVES

A. Materials shall be compatible with insulation materials, jackets, and substrates and for bonding insulation to itself and to surfaces to be insulated, unless otherwise indicated.

B. Flexible Elastomeric Adhesive: Comply with MIL-A-24179A, Type II, Class I.
1. Products: Subject to compliance with requirements, provide one of the following:
   a. Aeroflex USA Inc.; Aeroseal.
   b. Armacell LCC; 520 Adhesive.
   c. Foster Products Corporation, H. B. Fuller Company; 85-75.

C. Mineral-Fiber Adhesive: Comply with MIL-A-3316C, Class 2, Grade A.
1. Products: Subject to compliance with requirements, provide one of the following:
   a. Childers Products, Division of ITW; CP-82.
   b. Foster Products Corporation, H. B. Fuller Company; 85-20.

D. ASJ Adhesive and FSK Jacket Adhesive: Comply with MIL-A-3316C, Class 2, Grade A for bonding insulation jacket lap seams and joints.
1. Products: Subject to compliance with requirements, provide one of the following:
   a. Childers Products, Division of ITW; CP-82.
   b. Foster Products Corporation, H. B. Fuller Company; 85-20.

E. PVC Jacket Adhesive: Compatible with PVC jacket.
1. Products: Subject to compliance with requirements, provide one of the following:
   a. Dow Chemical Company (The); 739, Dow Silicone.
   b. Johns-Manville; Zeston Perma-Weld, CEEL-TITE Solvent Welding Adhesive.
   c. P.I.C. Plastics, Inc.; Welding Adhesive.
   d. Speedline Corporation; Speedline Vinyl Adhesive.

2.4 MASTICS

A. Materials shall be compatible with insulation materials, jackets, and substrates; comply with MIL-C-19565C, Type II.

B. Vapor-Barrier Mastic: Solvent based; suitable for indoor use on below ambient services.
1. Products: Subject to compliance with requirements, provide one of the following:
   a. Childers Products, Division of ITW; CP-30.
   b. Foster Products Corporation, H. B. Fuller Company; 30-35.
2. Water-Vapor Permeance: ASTM F 1249, 0.05 perm at 35-mil dry film thickness.
3. Service Temperature Range: 0 to 180 deg F.
4. Solids Content: ASTM D 1644, 44 percent by volume and 62 percent by weight.
5. Color: White.

C. Vapor-Barrier Mastic: Solvent based; suitable for outdoor use on below ambient services.
1. Products: Subject to compliance with requirements, provide one of the following:
   a. Childers Products, Division of ITW; Encacel.
   b. Foster Products Corporation, H. B. Fuller Company; 60-95/60-96.
2. Water-Vapor Permeance: ASTM F 1249, 0.05 perm at 30-mil dry film thickness.
3. Service Temperature Range: Minus 50 to plus 220 deg F.
4. Solids Content: ASTM D 1644, 33 percent by volume and 46 percent by weight.
5. Color: White.

2.5 SEALANTS

A. Joint Sealants:
1. Materials shall be compatible with insulation materials, jackets, and substrates.
2. Permanently flexible, elastomeric sealant.
3. Service Temperature Range: Minus 100 to plus 300 deg F.
4. Color: White or gray.

B. FSK and Metal Jacket Flashing Sealants:
1. Products: Subject to compliance with requirements, provide one of the following:
   a. Childers Products, Division of ITW; CP-76-8.
   b. Foster Products Corporation, H. B. Fuller Company; 95-44.
2. Materials shall be compatible with insulation materials, jackets, and substrates.
3. Fire- and water-resistant, flexible, elastomeric sealant.
4. Service Temperature Range: Minus 40 to plus 250 deg F.
5. Color: Aluminum.

C. ASJ Flashing Sealants, and PVC Jacket Flashing Sealants:
1. Products: Subject to compliance with requirements, provide the following:
   a. Childers Products, Division of ITW; CP-76.
2. Materials shall be compatible with insulation materials, jackets, and substrates.
3. Fire- and water-resistant, flexible, elastomeric sealant.
4. Service Temperature Range: Minus 40 to plus 250 deg F.
5. Color: White.

2.6 FIELD-APPLIED FABRIC-REINFORCING MESH

A. Woven Polyester Fabric: Approximately 1 oz./sq. yd. with a thread count of 10 strands by 10 strands/sq. inch, in a Leno weave, for duct, equipment, and pipe.
1. Products: Subject to compliance with requirements, provide one of the following:
   a. Foster Products Corporation, H. B. Fuller Company; Mast-A-Fab.

b. Vimasco Corporation; Elastafab 894.

2.7 FIELD-APPLIED JACKETS

A. Field-applied jackets shall comply with ASTM C 921, Type I, unless otherwise indicated.

B. FSK Jacket: Aluminum-foil-face, fiberglass-reinforced scrim with kraft-paper backing.

C. PVC Jacket: High-impact-resistant, UV-resistant PVC complying with ASTM D 1784, Class 16354-C; thickness as scheduled; roll stock ready for shop or field cutting and forming. Thickness is indicated in field-applied jacket schedules.
1. Products: Subject to compliance with requirements, provide one of the following:
   a. Johns Manville; Zeston.
   b. P.I.C. Plastics, Inc.; FG Series.
   c. Proto PVC Corporation; LoSmoke.
   d. Speedline Corporation; SmokeSafe.
2. Adhesive: As recommended by jacket material manufacturer.
3. Color: White.
4. Factory-fabricated fitting covers to match jacket if available; otherwise, field fabricate.
   a. Shapes: 45- and 90-degree, short- and long-radius elbows, tees, valves, flanges, unions, reducers, end caps, soil-pipe hubs, traps, mechanical joints, and P-trap and supply covers for lavatories.
5. Factory-fabricated tank heads and tank side panels.

D. Metal Jacket:
1. Products: Subject to compliance with requirements, provide one of the following:
   a. Childers Products, Division of ITW; Metal Jacketing Systems.
   b. PABCO Metals Corporation; Surefit.
   c. RPR Products, Inc.; Insul-Mate.
2. Aluminum Jacket: Comply with ASTM B 209, Alloy 3003, 3005, 3105 or 5005, Temper H-14.
   a. Sheet and roll stock ready for shop or field sizing.
   b. Finish and thickness are indicated in field-applied jacket schedules.
   c. Moisture Barrier for Indoor Applications: 1-mil thick, heat-bonded polyethylene and kraft paper.
   d. Factory-Fabricated Fitting Covers:
      1) Same material, finish, and thickness as jacket.
      2) Preformed 2-piece or gore, 45- and 90-degree, short- and long-radius elbows.
      3) Tee covers.
      4) Flange and union covers.
      5) End caps.
      6) Beveled collars.
      7) Valve covers.
      8) Field fabricate fitting covers only if factory-fabricated fitting covers are not available.

2.8 TAPES

A. ASJ Tape: White vapor-retarder tape matching factory-applied jacket with acrylic adhesive, complying with ASTM C 1136.
1. Products: Subject to compliance with requirements, provide one of the following:
   a. Avery Dennison Corporation, Specialty Tapes Division; Fasson 0835.
   b. Compac Corp.; 104 and 105.

c. Ideal Tape Co., Inc., an American Biltrite Company; 428 AWF ASJ.
d. Venture Tape; 1540 CW Plus, 1542 CW Plus, and 1542 CW Plus/SQ.
2. Width: 3 inches.
3. Thickness: 11.5 mils.
4. Adhesion: 90 ounces force/inch in width.
5. Elongation: 2 percent.
6. Tensile Strength: 40 lbf/inch in width.
7. ASJ Tape Disks and Squares: Precut disks or squares of ASJ tape.

B. FSK Tape: Foil-face, vapor-retarder tape matching factory-applied jacket with acrylic adhesive; complying with ASTM C 1136.
1. Products: Subject to compliance with requirements, provide one of the following:
a. Avery Dennison Corporation, Specialty Tapes Division; Fasson 0827.
b. Compac Corp.; 110 and 111.
c. Ideal Tape Co., Inc., an American Biltrite Company; 491 AWF FSK.
d. Venture Tape; 1525 CW, 1528 CW, and 1528 CW/SQ.
2. Width: 3 inches.
3. Thickness: 6.5 mils.
4. Adhesion: 90 ounces force/inch in width.
5. Elongation: 2 percent.
6. Tensile Strength: 40 lbf/inch in width.
7. FSK Tape Disks and Squares: Precut disks or squares of FSK tape.

C. PVC Tape: White vapor-retarder tape matching field-applied PVC jacket with acrylic adhesive. Suitable for indoor and outdoor applications.
1. Products: Subject to compliance with requirements, provide one of the following:
a. Avery Dennison Corporation, Specialty Tapes Division; Fasson 0555.
b. Compac Corp.; 130.
c. Ideal Tape Co., Inc., an American Biltrite Company; 370 White PVC tape.
d. Venture Tape; 1506 CW NS.
2. Width: 2 inches.
3. Thickness: 6 mils.
4. Adhesion: 64 ounces force/inch in width.
5. Elongation: 500 percent.
6. Tensile Strength: 18 lbf/inch in width.

2.9 SECUREMENTS

A. Bands:
1. Products: Subject to compliance with requirements, provide one of the following:
a. Childers Products; Bands.
b. PABCO Metals Corporation; Bands.
c. RPR Products, Inc.; Bands.
2. Stainless Steel: ASTM A 167 or ASTM A 240/A 240M, Type 304 or Type 316; 0.015 inch thick, 1/2 inch wide with wing or closed seal.
3. Aluminum: ASTM B 209, Alloy 3003, 3005, 3105, or 5005; Temper H-14, 0.020 inch thick, 1/2 inch wide with wing or closed seal.

B. Insulation Pins and Hangers:
1. Capacitor-Discharge-Weld Pins: Copper- or zinc-coated steel pin, fully annealed for capacitor-discharge welding, 0.106-inch- diameter shank, length to suit depth of insulation indicated.
a. Products: Subject to compliance with requirements, provide one of the following:
1) AGM Industries, Inc.; CWP-1.

2) GEMCO; CD.
3) Midwest Fasteners, Inc.; CD.
4) Nelson Stud Welding; TPA, TPC, and TPS.

2. Cupped-Head, Capacitor-Discharge-Weld Pins: Copper- or zinc-coated steel pin, fully annealed for capacitor-discharge welding, 0.106-inch- diameter shank, length to suit depth of insulation indicated with integral 1-1/2-inch galvanized carbon-steel washer.
   a. Products: Subject to compliance with requirements, provide one of the following:
      1) AGM Industries, Inc.; CWP-1.
      2) GEMCO; Cupped Head Weld Pin.
      3) Midwest Fasteners, Inc.; Cupped Head.
      4) Nelson Stud Welding; CHP.
3. Insulation-Retaining Washers: Self-locking washers formed from 0.016-inch- thick, galvanized-steel sheet, with beveled edge sized as required to hold insulation securely in place but not less than 1-1/2 inches in diameter.
   a. Products: Subject to compliance with requirements, provide one of the following:
      1) AGM Industries, Inc.; RC-150.
      2) GEMCO; R-150.
      3) Midwest Fasteners, Inc.; WA-150.
      4) Nelson Stud Welding; Speed Clips.
   b. Protect ends with capped self-locking washers incorporating a spring steel insert to ensure permanent retention of cap in exposed locations.
4. Nonmetal Insulation-Retaining Washers: Self-locking washers formed from 0.016-inch- thick nylon sheet, with beveled edge sized as required to hold insulation securely in place but not less than 1-1/2 inches in diameter.
   a. Products: Subject to compliance with requirements, provide one of the following:
      1) GEMCO.
      2) Midwest Fasteners, Inc.

C. Staples: Outward-clinching insulation staples, nominal 3/4-inch- wide, stainless steel or Monel.

D. Wire: 0.062-inch soft-annealed, galvanized steel.
   1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
      a. C & F Wire.
      b. Childers Products.
      c. PABCO Metals Corporation.
      d. RPR Products, Inc.

2.10 CORNER ANGLES

A. PVC Corner Angles: 30 mils thick, minimum 1 by 1 inch, PVC according to ASTM D 1784, Class 16354-C. White or color-coded to match adjacent surface.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine substrates and conditions for compliance with requirements for installation and other conditions affecting performance of insulation application.
   1. Verify that systems and equipment to be insulated have been tested and are free of defects.
   2. Verify that surfaces to be insulated are clean and dry.

3. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 PREPARATION

A. Surface Preparation: Clean and dry surfaces to receive insulation. Remove materials that will adversely affect insulation application.

B. Surface Preparation: Clean and prepare surfaces to be insulated. Before insulating, apply a corrosion coating to insulated surfaces as follows:
   1. Carbon Steel: Coat carbon steel operating at a service temperature between 32 and 300 deg F with an epoxy coating. Consult coating manufacturer for appropriate coating materials and application methods for operating temperature range.

C. Coordinate insulation installation with the trade installing heat tracing. Comply with requirements for heat tracing that apply to insulation.

D. Mix insulating cements with clean potable water; if insulating cements are to be in contact with stainless-steel surfaces, use demineralized water.

3.3 GENERAL INSTALLATION REQUIREMENTS

A. Install insulation materials, accessories, and finishes with smooth, straight, and even surfaces; free of voids throughout the length of equipment, ducts and fittings, and piping including fittings, valves, and specialties.

B. Install insulation materials, forms, vapor barriers or retarders, jackets, and thicknesses required for each item of equipment, duct system, and pipe system as specified in insulation system schedules.

C. Install accessories compatible with insulation materials and suitable for the service. Install accessories that do not corrode, soften, or otherwise attack insulation or jacket in either wet or dry state.

D. Install insulation with longitudinal seams at top and bottom of horizontal runs.

E. Install multiple layers of insulation with longitudinal and end seams staggered.

F. Do not weld brackets, clips, or other attachment devices to piping, fittings, and specialties.

G. Keep insulation materials dry during application and finishing.

H. Install insulation with tight longitudinal seams and end joints. Bond seams and joints with adhesive recommended by insulation material manufacturer.

I. Install insulation with least number of joints practical.

J. Where vapor barrier is indicated, seal joints, seams, and penetrations in insulation at hangers, supports, anchors, and other projections with vapor-barrier mastic.
   1. Install insulation continuously through hangers and around anchor attachments.
   2. For insulation application where vapor barriers are indicated, extend insulation on anchor legs from point of attachment to supported item to point of attachment to structure. Taper and seal ends at attachment to structure with vapor-barrier mastic.

3. Install insert materials and install insulation to tightly join the insert. Seal insulation to insulation inserts with adhesive or sealing compound recommended by insulation material manufacturer.
4. Cover inserts with jacket material matching adjacent pipe insulation. Install shields over jacket, arranged to protect jacket from tear or puncture by hanger, support, and shield.

K. Apply adhesives, mastics, and sealants at manufacturer's recommended coverage rate and wet and dry film thicknesses.

L. Install insulation with factory-applied jackets as follows:
1. Draw jacket tight and smooth.
2. Cover circumferential joints with 3-inch- wide strips, of same material as insulation jacket. Secure strips with adhesive and outward clinching staples along both edges of strip, spaced 4 inches o.c.
3. Overlap jacket longitudinal seams at least 1-1/2 inches. Install insulation with longitudinal seams at bottom of pipe. Clean and dry surface to receive self-sealing lap. Staple laps with outward clinching staples along edge at 2 inches o.c.
   a. For below ambient services, apply vapor-barrier mastic over staples.
4. Cover joints and seams with tape as recommended by insulation material manufacturer to maintain vapor seal.
5. Where vapor barriers are indicated, apply vapor-barrier mastic on seams and joints and at ends adjacent to duct and pipe flanges and fittings.

M. Cut insulation in a manner to avoid compressing insulation more than 75 percent of its nominal thickness.

N. Finish installation with systems at operating conditions. Repair joint separations and cracking due to thermal movement.

O. Repair damaged insulation facings by applying same facing material over damaged areas. Extend patches at least 4 inches beyond damaged areas. Adhere, staple, and seal patches similar to butt joints.

P. For above ambient services, do not install insulation to the following:
1. Vibration-control devices.
2. Testing agency labels and stamps.
3. Nameplates and data plates.
4. Manholes.
5. Handholes.
6. Cleanouts.

3.4 PENETRATIONS

A. Insulation Installation at Roof Penetrations: Install insulation continuously through roof penetrations.
1. Seal penetrations with flashing sealant.
2. For applications requiring only indoor insulation, terminate insulation above roof surface and seal with joint sealant. For applications requiring indoor and outdoor insulation, install insulation for outdoor applications tightly joined to indoor insulation ends. Seal joint with joint sealant.
3. Extend jacket of outdoor insulation outside roof flashing at least 2 inches below top of roof flashing.
4. Seal jacket to roof flashing with flashing sealant.

B. Insulation Installation at Interior Wall and Partition Penetrations (That Are Not Fire Rated): Install insulation continuously through walls and partitions.

C. Insulation Installation at Fire-Rated Wall and Partition Penetrations: Install insulation continuously through penetrations of fire-rated walls and partitions. Terminate insulation at fire damper sleeves for

fire-rated wall and partition penetrations. Externally insulate damper sleeves to match adjacent insulation and overlap duct insulation at least 2 inches.

1. Comply with requirements in Division 7 Section "Through-Penetration Firestop Systems" for firestopping and fire-resistive joint sealers.

D. Insulation Installation at Floor Penetrations:
   1. Duct: Install insulation continuously through floor penetrations that are not fire rated. For penetrations through fire-rated assemblies, terminate insulation at fire damper sleeves and externally insulate damper sleeve beyond floor to match adjacent duct insulation. Overlap damper sleeve and duct insulation at least 2 inches.
   2. Pipe: Install insulation continuously through floor penetrations.
   3. Seal penetrations through fire-rated assemblies. Comply with requirements in Division 7 Section "Through-Penetration Firestop Systems."

3.5 EQUIPMENT, TANK, AND VESSEL INSULATION INSTALLATION

A. Mineral Fiber, Pipe and Tank Insulation Installation for Tanks and Vessels: Secure insulation with adhesive and anchor pins and speed washers.
   1. Apply adhesives according to manufacturer's recommended coverage rates per unit area, for 100 percent coverage of tank and vessel surfaces.
   2. Groove and score insulation materials to fit as closely as possible to equipment, including contours. Bevel insulation edges for cylindrical surfaces for tight joints. Stagger end joints.
   3. Protect exposed corners with secured corner angles.
   4. Install adhesively attached or self-sticking insulation hangers and speed washers on sides of tanks and vessels as follows:
      a. Do not weld anchor pins to ASME-labeled pressure vessels.
      b. Select insulation hangers and adhesive that are compatible with service temperature and with substrate.
      c. On tanks and vessels, maximum anchor-pin spacing is 3 inches from insulation end joints, and 16 inches o.c. in both directions.
      d. Do not overcompress insulation during installation.
      e. Cut and miter insulation segments to fit curved sides and domed heads of tanks and vessels.
      f. Impale insulation over anchor pins and attach speed washers.
      g. Cut excess portion of pins extending beyond speed washers or bend parallel with insulation surface. Cover exposed pins and washers with tape matching insulation facing.
   5. Secure each layer of insulation with stainless-steel or aluminum bands. Select band material compatible with insulation materials.
   6. Where insulation hangers on equipment and vessels are not permitted or practical and where insulation support rings are not provided, install a girdle network for securing insulation. Stretch prestressed aircraft cable around the diameter of vessel and make taut with clamps, turnbuckles, or breather springs. Place one circumferential girdle around equipment approximately 6 inches from each end. Install wire or cable between two circumferential girdles 12 inches o.c. Install a wire ring around each end and around outer periphery of center openings, and stretch prestressed aircraft cable radially from the wire ring to nearest circumferential girdle. Install additional circumferential girdles along the body of equipment or tank at a minimum spacing of 48 inches o.c. Use this network for securing insulation with tie wire or bands.
   7. Stagger joints between insulation layers at least 3 inches.
   8. Install insulation in removable segments on equipment access doors, manholes, handholes, and other elements that require frequent removal for service and inspection.
   9. Bevel and seal insulation ends around manholes, handholes, ASME stamps, and nameplates.
   10. For equipment with surface temperatures below ambient, apply mastic to open ends, joints, seams, breaks, and punctures in insulation.

3.6 GENERAL PIPE INSULATION INSTALLATION

A. Requirements in this article generally apply to all insulation materials except where more specific requirements are specified in various pipe insulation material installation articles.

B. Insulation Installation on Fittings, Valves, Strainers, Flanges, and Unions:
   1. Install insulation over fittings, valves, strainers, flanges, unions, and other specialties with continuous thermal and vapor-retarder integrity, unless otherwise indicated.
   2. Insulate pipe elbows using preformed fitting insulation or mitered fittings made from same material and density as adjacent pipe insulation. Each piece shall be butted tightly against adjoining piece and bonded with adhesive. Fill joints, seams, voids, and irregular surfaces with insulating cement finished to a smooth, hard, and uniform contour that is uniform with adjoining pipe insulation.
   3. Insulate tee fittings with preformed fitting insulation or sectional pipe insulation of same material and thickness as used for adjacent pipe. Cut sectional pipe insulation to fit. Butt each section closely to the next and hold in place with tie wire. Bond pieces with adhesive.
   4. Insulate valves using preformed fitting insulation or sectional pipe insulation of same material, density, and thickness as used for adjacent pipe. Overlap adjoining pipe insulation by not less than two times the thickness of pipe insulation, or one pipe diameter, whichever is thicker. For valves, insulate up to and including the bonnets, valve stuffing-box studs, bolts, and nuts. Fill joints, seams, and irregular surfaces with insulating cement.
   5. Insulate strainers using preformed fitting insulation or sectional pipe insulation of same material, density, and thickness as used for adjacent pipe. Overlap adjoining pipe insulation by not less than two times the thickness of pipe insulation, or one pipe diameter, whichever is thicker. Fill joints, seams, and irregular surfaces with insulating cement. Insulate strainers so strainer basket flange or plug can be easily removed and replaced without damaging the insulation and jacket. Provide a removable reusable insulation cover. For below ambient services, provide a design that maintains vapor barrier.
   6. Insulate flanges and unions using a section of oversized preformed pipe insulation. Overlap adjoining pipe insulation by not less than two times the thickness of pipe insulation, or one pipe diameter, whichever is thicker.
   7. Cover segmented insulated surfaces with a layer of finishing cement and coat with a mastic. Install vapor-barrier mastic for below ambient services and a breather mastic for above ambient services. Reinforce the mastic with fabric-reinforcing mesh. Trowel the mastic to a smooth and well-shaped contour.
   8. For services not specified to receive a field-applied jacket except for flexible, install fitted PVC cover over elbows, tees, strainers, valves, flanges, and unions. Terminate ends with PVC end caps. Tape PVC covers to adjoining insulation facing using PVC tape.
   9. Label the outside insulation jacket of each union with the word "UNION." Match size and color of pipe labels.

C. Insulate instrument connections for thermometers, pressure gages, pressure temperature taps, test connections, flow meters, sensors, switches, and transmitters on insulated pipes, vessels, and equipment. Shape insulation at these connections by tapering it to and around the connection with insulating cement and finish with finishing cement, mastic, and flashing sealant.

D. Install removable insulation covers at locations indicated. Installation shall conform to the following:
   1. Make removable flange and union insulation from sectional pipe insulation of same thickness as that on adjoining pipe. Install same insulation jacket as adjoining pipe insulation.
   2. When flange and union covers are made from sectional pipe insulation, extend insulation from flanges or union long at least two times the insulation thickness over adjacent pipe insulation on each side of flange or union. Secure flange cover in place with stainless-steel or aluminum bands. Select band material compatible with insulation and jacket.

3. Construct removable valve insulation covers in same manner as for flanges except divide the two-part section on the vertical center line of valve body.
4. Construct pump body insulation with removeable aluminum sheet metal covers and pre-formed cellular insulation.
5. When covers are made from block insulation, make two halves, each consisting of mitered blocks wired to stainless-steel fabric. Secure this wire frame, with its attached insulation, to flanges with tie wire. Extend insulation at least 2 inches over adjacent pipe insulation on each side of valve. Fill space between flange or union cover and pipe insulation with insulating cement. Finish cover assembly with insulating cement applied in two coats. After first coat is dry, apply and trowel second coat to a smooth finish.
6. Unless a PVC jacket is indicated in field-applied jacket schedules, finish exposed surfaces with a metal jacket.

3.7 FLEXIBLE ELASTOMERIC INSULATION INSTALLATION

A. Seal longitudinal seams and end joints with manufacturer's recommended adhesive to eliminate openings in insulation that allow passage of air to surface being insulated.

B. Insulation Installation on Pipe Flanges:
1. Install pipe insulation to outer diameter of pipe flange.
2. Make width of insulation section same as overall width of flange and bolts, plus twice the thickness of pipe insulation.
3. Fill voids between inner circumference of flange insulation and outer circumference of adjacent straight pipe segments with cut sections of sheet insulation of same thickness as pipe insulation.
4. Secure insulation to flanges and seal seams with manufacturer's recommended adhesive to eliminate openings in insulation that allow passage of air to surface being insulated.

C. Insulation Installation on Pipe Fittings and Elbows:
1. Install mitered sections of pipe insulation.
2. Secure insulation materials and seal seams with manufacturer's recommended adhesive to eliminate openings in insulation that allow passage of air to surface being insulated.

D. Insulation Installation on Valves and Pipe Specialties:
1. Install preformed valve covers manufactured of same material as pipe insulation when available.
2. When preformed valve covers are not available, install cut sections of pipe and sheet insulation to valve body. Arrange insulation to permit access to packing and to allow valve operation without disturbing insulation.
3. Install insulation to flanges as specified for flange insulation application.
4. Secure insulation to valves and specialties and seal seams with manufacturer's recommended adhesive to eliminate openings in insulation that allow passage of air to surface being insulated.

3.8 MINERAL-FIBER INSULATION INSTALLATION

A. Insulation Installation on Straight Pipes and Tubes:
1. Secure each layer of preformed pipe insulation to pipe with wire or bands and tighten bands without deforming insulation materials.
2. Where vapor barriers are indicated, seal longitudinal seams, end joints, and protrusions with vapor-barrier mastic and joint sealant.
3. For insulation with factory-applied jackets on above ambient surfaces, secure laps with outward clinched staples at 6 inches o.c.

4. For insulation with factory-applied jackets on below ambient surfaces, do not staple longitudinal tabs but secure tabs with additional adhesive as recommended by insulation material manufacturer and seal with vapor-barrier mastic and flashing sealant.

B. Insulation Installation on Pipe Flanges:
   1. Install preformed pipe insulation to outer diameter of pipe flange.
   2. Make width of insulation section same as overall width of flange and bolts, plus twice the thickness of pipe insulation.
   3. Fill voids between inner circumference of flange insulation and outer circumference of adjacent straight pipe segments with mineral-fiber blanket insulation.
   4. Install jacket material with manufacturer's recommended adhesive, overlap seams at least 1 inch, and seal joints with flashing sealant.

C. Insulation Installation on Pipe Fittings and Elbows:
   1. Install preformed sections of same material as straight segments of pipe insulation when available.
   2. When preformed insulation elbows and fittings are not available, install mitered sections of pipe insulation, to a thickness equal to adjoining pipe insulation. Secure insulation materials with wire or bands.

D. Insulation Installation on Valves and Pipe Specialties:
   1. Install preformed sections of same material as straight segments of pipe insulation when available.
   2. When preformed sections are not available, install mitered sections of pipe insulation to valve body.
   3. Arrange insulation to permit access to packing and to allow valve operation without disturbing insulation.
   4. Install insulation to flanges as specified for flange insulation application.

E. Blanket Insulation Installation on Ducts and Plenums: Secure with adhesive and insulation pins.
   1. Apply adhesives according to manufacturer's recommended coverage rates per unit area, for 100 percent coverage of duct and plenum surfaces.
   2. Apply adhesive to entire circumference of ducts and to all surfaces of fittings and transitions.
   3. Install either capacitor-discharge-weld pins and speed washers or cupped-head, capacitor-discharge-weld pins on sides and bottom of horizontal ducts and sides of vertical ducts as follows:
      a. On duct sides with dimensions 18 inches and smaller, place pins along longitudinal centerline of duct. Space 3 inches maximum from insulation end joints, and 16 inches o.c.
      b. On duct sides with dimensions larger than 18 inches, place pins 16 inches o.c. each way, and 3 inches maximum from insulation joints. Install additional pins to hold insulation tightly against surface at cross bracing.
      c. Pins may be omitted from top surface of horizontal, rectangular ducts and plenums.
      d. Do not overcompress insulation during installation.
      e. Impale insulation over pins and attach speed washers.
      f. Cut excess portion of pins extending beyond speed washers or bend parallel with insulation surface. Cover exposed pins and washers with tape matching insulation facing.
   4. For ducts and plenums with surface temperatures below ambient, install a continuous unbroken vapor barrier. Create a facing lap for longitudinal seams and end joints with insulation by removing 2 inches from 1 edge and 1 end of insulation segment. Secure laps to adjacent insulation section with 1/2-inch outward-clinching staples, 1-inch o.c. Install vapor barrier consisting of factory- or field-applied jacket, adhesive, vapor-barrier mastic, and sealant at joints, seams, and protrusions.
      a. Repair punctures, tears, and penetrations with tape or mastic to maintain vapor-barrier seal.
      b. Install vapor stops for ductwork and plenums operating below 50 deg F at 18-foot intervals. Vapor stops shall consist of vapor-barrier mastic applied in a Z-shaped pattern over insulation face, along butt end of insulation, and over the surface. Cover insulation face

and surface to be insulated a width equal to 2 times the insulation thickness but not less than 3 inches.

5. Overlap unfaced blankets a minimum of 2 inches on longitudinal seams and end joints. At end joints, secure with steel bands spaced a maximum of 18 inches o.c.
6. Install insulation on rectangular duct elbows and transitions with a full insulation section for each surface. Install insulation on round and flat-oval duct elbows with individually mitered gores cut to fit the elbow.
7. Insulate duct stiffeners, hangers, and flanges that protrude beyond insulation surface with 6-inch-wide strips of same material used to insulate duct. Secure on alternating sides of stiffener, hanger, and flange with pins spaced 6 inches o.c.

F. Board Insulation Installation on Ducts and Plenums: Secure with adhesive and insulation pins.

1. Apply adhesives according to manufacturer's recommended coverage rates per unit area, for 100 percent coverage of duct and plenum surfaces.
2. Apply adhesive to entire circumference of ducts and to all surfaces of fittings and transitions.
3. Install either capacitor-discharge-weld pins and speed washers or cupped-head, capacitor-discharge-weld pins on sides and bottom of horizontal ducts and sides of vertical ducts as follows:
   a. On duct sides with dimensions 18 inches and smaller, place pins along longitudinal centerline of duct. Space 3 inches maximum from insulation end joints, and 16 inches o.c.
   b. On duct sides with dimensions larger than 18 inches, space pins 16 inches o.c. each way, and 3 inches maximum from insulation joints. Install additional pins to hold insulation tightly against surface at cross bracing.
   c. Pins may be omitted from top surface of horizontal, rectangular ducts and plenums.
   d. Do not overcompress insulation during installation.
   e. Cut excess portion of pins extending beyond speed washers or bend parallel with insulation surface. Cover exposed pins and washers with tape matching insulation facing.
4. For ducts and plenums with surface temperatures below ambient, install a continuous unbroken vapor barrier. Create a facing lap for longitudinal seams and end joints with insulation by removing 2 inches from 1 edge and 1 end of insulation segment. Secure laps to adjacent insulation section with 1/2-inch outward-clinching staples, 1 inch o.c. Install vapor barrier consisting of factory- or field-applied jacket, adhesive, vapor-barrier mastic, and sealant at joints, seams, and protrusions.
   a. Repair punctures, tears, and penetrations with tape or mastic to maintain vapor-barrier seal.
   b. Install vapor stops for ductwork and plenums operating below 50 deg F at 18-foot intervals. Vapor stops shall consist of vapor-barrier mastic applied in a Z-shaped pattern over insulation face, along butt end of insulation, and over the surface. Cover insulation face and surface to be insulated a width equal to 2 times the insulation thickness but not less than 3 inches.
5. Install insulation on rectangular duct elbows and transitions with a full insulation section for each surface. Groove and score insulation to fit as closely as possible to outside and inside radius of elbows. Install insulation on round and flat-oval duct elbows with individually mitered gores cut to fit the elbow.
6. Insulate duct stiffeners, hangers, and flanges that protrude beyond insulation surface with 6-inch-wide strips of same material used to insulate duct. Secure on alternating sides of stiffener, hanger, and flange with pins spaced 6 inches o.c.

3.9 FIELD-APPLIED JACKET INSTALLATION

A. Where glass-cloth jackets are indicated, install directly over bare insulation or insulation with factory-applied jackets.

1. Draw jacket smooth and tight to surface with 2-inch overlap at seams and joints.
2. Embed glass cloth between two 0.062-inch- thick coats of lagging adhesive.
3. Completely encapsulate insulation with coating, leaving no exposed insulation.

B. Where FSK jackets are indicated, install as follows:
   1. Draw jacket material smooth and tight.
   2. Install lap or joint strips with same material as jacket.
   3. Secure jacket to insulation with manufacturer's recommended adhesive.
   4. Install jacket with 1-1/2-inch laps at longitudinal seams and 3-inch- wide joint strips at end joints.
   5. Seal openings, punctures, and breaks in vapor-retarder jackets and exposed insulation with vapor-barrier mastic.

C. Where PVC jackets are indicated, install with 1-inch overlap at longitudinal seams and end joints; for horizontal applications, install with longitudinal seams along top and bottom of tanks and vessels. Seal with manufacturer's recommended adhesive.
   1. Apply two continuous beads of adhesive to seams and joints, one bead under lap and the finish bead along seam and joint edge.

D. Where metal jackets are indicated, install with 2-inch overlap at longitudinal seams and end joints. Overlap longitudinal seams arranged to shed water. Seal end joints with weatherproof sealant recommended by insulation manufacturer. Secure jacket with stainless-steel bands 12 inches o.c. and at end joints.

3.10 FINISHES

A. Duct, Equipment, and Pipe Insulation with ASJ, Glass-Cloth, or Other Paintable Jacket Material: Paint jacket with paint system identified below and as specified in Division 9 painting Sections.
   1. Flat Acrylic Finish: Two finish coats over a primer that is compatible with jacket material and finish coat paint. Add fungicidal agent to render fabric mildew proof.
      a. Finish Coat Material: Interior, flat, latex-emulsion size.

B. Flexible Elastomeric Thermal Insulation: After adhesive has fully cured, apply two coats of insulation manufacturer's recommended protective coating.

C. Color: Final color as selected by Architect. Vary first and second coats to allow visual inspection of the completed Work.

D. Do not field paint aluminum or stainless-steel jackets.

3.11 FIELD QUALITY CONTROL

A. Perform inspections.

B. All insulation applications will be considered defective work, if sample inspection reveals noncompliance with requirements.

3.12 DUCT INSULATION SCHEDULE, GENERAL

A. Plenums and Ducts Requiring Insulation:
   1. Indoor, concealed supply and outdoor air.
   2. Indoor, exposed supply and outdoor air.
   3. Indoor, concealed return located in nonconditioned space.
   4. Indoor, exposed return located in nonconditioned space.
   5. Indoor, concealed exhaust between isolation damper and penetration of building exterior.

6. Indoor, exposed exhaust between isolation damper and penetration of building exterior.

B. Items Not Insulated:
1. Factory-insulated flexible ducts.
2. Factory-insulated plenums and casings.
3. Flexible connectors.
4. Vibration-control devices.
5. Factory-insulated access panels and doors.

3.13 INDOOR DUCT AND PLENUM INSULATION SCHEDULE

A. Concealed, rectangular, round and flat-oval, supply and return air duct insulation shall be one of the following:
1. Mineral-Fiber Blanket: 1-1/2 inches thick and 0.75-lb/cu. ft. nominal density. Thermal Conductivity (K value): Not greater than 0.27 at mean temperature of 75 degF, when installed. Operating service temperature 40 degF to 250 degF.

B. Concealed, rectangular, exhaust-air duct insulation between isolation damper and penetration of building exterior shall be one of the following:
1. Mineral-Fiber Board: 2 inches thick and 2-lb/cu. ft. nominal density. Thermal Conductivity (K value): Not greater than 0.23 at mean temperature of 75 degF maximum service temperature 450 degF.

C. Exposed, rectangular, supply, return, outside air duct and plenum insulation shall be one of the following:
1. Mineral-Fiber Board: 2 inches thick and 2-lb/cu. ft. nominal density. Thermal Conductivity (K value): Not greater than 0.23 at mean temperature of 75 degF maximum service temperature 450 degF.

D. Exposed, round and flat-oval, supply and return air duct insulation shall be one of the following:
1. Mineral-Fiber Blanket: 2 inches thick and 0.75-lb/cu. ft. nominal density. Thermal Conductivity (K value): Not greater than 0.27 at mean temperature of 75 degF, when installed. Operating service temperature 40 degF to 250 degF.

E. Exposed, rectangular, outdoor-air duct and plenum insulation shall be the following:
1. Mineral-Fiber Board: 2 inches thick and 2-lb/cu. ft. nominal density. Thermal Conductivity (K value): Not greater than 0.23 at mean temperature of 75 degF maximum service temperature 450 degF.

F. Exposed, rectangular, exhaust and relief air duct from exhaust plenum at louver (or other outside opening) back to exhaust air damper (motorized or gravity) plus 36-inches insulation shall be one of the following:
1. Mineral-Fiber Board: 1-1/2 inches thick and 2-lb/cu. ft. nominal density. Thermal Conductivity (K value): Not greater than 0.23 at mean temperature of 75 degF maximum service temperature 450 degF.

3.14 EQUIPMENT INSULATION SCHEDULE

A. Insulation materials and thicknesses are identified below. If more than one material is listed for a type of equipment, selection from materials listed is Contractor's option.

B. Insulate indoor and outdoor equipment in paragraphs below that is not factory insulated.

C. Heating-hot-water expansion/compression tank insulation shall be the following:
1. Mineral-Fiber Board: 2 inches thick and 2-lb/cu. ft. nominal density. Thermal Conductivity (K value): Not greater than 0.23 at mean temperature of 75 degF maximum service temperature 450 degF. Insulate flanges and fittings with mineral fiber cement. Reinforce end and irregular surfaces with Glass Fab embedded in two coats of Foster 30-36 adhesive.

D. Heating-hot-water air-separator insulation shall be the following:
1. Mineral-Fiber Board: 2 inches thick and 2-lb/cu. ft. nominal density. Thermal Conductivity (K value): Not greater than 0.23 at mean temperature of 75 degF maximum service temperature 450 degF. Insulate flanges and fittings with mineral fiber cement. Reinforce end and irregular surfaces with Glass Fab embedded in two coats of Foster 30-36 adhesive.

3.15 PIPING INSULATION SCHEDULE

A. Condensate and Equipment Drain Water below 60 Deg F:
1. All Pipe Sizes: Insulation shall be one of the following:
a. Flexible Elastomeric: 1 inch thick.
b. Mineral-Fiber, Preformed Pipe Insulation, Type I: 1 inch thick. Thermal Conductivity (K value): Not greater than 0.23 at mean temperature of 75 degF.

B. Chilled Water, 40 to 56 Deg F:
1. Cellular foam, preformed pipe, Type II, Thermal Conductivity (K value): Not greater than 0.23 at mean temperature of 75 degF. Insulation shall be the following:
a. 1-1/2 inches and Smaller: 1 inch thick.
b. 2inches and Larger: 1-1/2- inches thick.

C. Glycol Water, 22 to 52 Deg F:
1. Cellular foam, preformed pipe, Type II, Thermal Conductivity (K value): Not greater than 0.23 at mean temperature of 75 degF. Insulation shall be the following:
a. 1-1/2 inches and Smaller: 1-inch thick.
b. 2-inches and larger: 2-inches thick.

D. Heating-Hot-Water Supply and Return, 200 Deg F and below:
1. Mineral-Fiber, Preformed Pipe, Type I. Thermal Conductivity (K value): Not greater than 0.23 at mean temperature of 75 degF. Insulation shall be the following:
a. 2-inches and Smaller: 1 inch thick.
b. 2-1/2-inches and Larger: 1-1/2 inches thick.

E. Refrigerant Suction and Hot-Gas Piping:
1. All Pipe Sizes: Insulation shall be one of the following:
a. Flexible Elastomeric: 1 inch thick.
b. Mineral-Fiber, Preformed Pipe Insulation, Type I: 1 inch thick. Thermal Conductivity (K value): Not greater than 0.23 at mean temperature of 75 degF. Insulation shall be the following:

F. Hot Service Drains:
1. All Pipe Sizes: Insulation shall be the following:
a. Mineral-Fiber, Preformed Pipe, Type I or II: 3/4 - inches thick. Thermal Conductivity (K value): Not greater than 0.23 at mean temperature of 75 degF. Insulation shall be the following:

G. Hot Service Vents:
1. All Pipe Sizes: Insulation shall be the following:

a. Mineral-Fiber, Preformed Pipe, Type I or II: 3/4 - inches thick. Thermal Conductivity (K value): Not greater than 0.23 at mean temperature of 75 degF. Insulation shall be the following:

3.16 INDOOR, FIELD-APPLIED JACKET SCHEDULE

A. Install jacket over insulation material. For insulation with factory-applied jacket, install the field-applied jacket over the factory-applied jacket.

B. If more than one material is listed, selection from materials listed is Contractor's option.

C. Heating-hot-water expansion/compression tank, air-separator and chemical feeder:
1. Aluminum jacket, smooth, 0.016 inch thick.

D. Piping, Exposed in mechanical rooms and central plant less than 8-feet above floor :
1. PVC: 30 mils thick.

END OF SECTION 230700

N:\N0912.00\DOC\SPEC\2012_03-16_BID\230700 - HVAC INSULATION.DOC

SECTION 230800 – HVAC SYSTEM COMMISSIONING

PART 1 - GENERAL

1.1 WORK INCLUDED

A. Systems and equipment testing and start-up

B. Validation of proper and thorough installation of Division 23 (HVAC) systems and equipment

C. Systems balancing verification

D. Prefunctional performance testing of equipment and systems

E. Documentation of tests, procedures, and installations

F. Coordination of Training Events

G. Generic Start-Up Procedures for plumbing systems and equipment

1.2 GENERAL DESCRIPTION

A. Commissioning (Cx) is the process of ensuring that all building systems are installed and perform interactively according to the design intent; that systems are efficient and cost effective and meet the Owner's operational needs; that the installation is adequately documented; and that the Operators are adequately trained. It serves as a tool to minimize post-occupancy operational problems. It establishes testing and communication protocols in an effort to advance the building systems from installation to full dynamic operation and optimization.

B. Commissioning Authority (CA) is retained by the Owner shall work with the Contractor and the Design Engineer to direct and oversee the Cx process and perform functional performance testing.

C. This Section outlines the Cx procedures specific to the Division 23 Contractors. Requirements common to all Sections are specified in Sections 019113 and 019114 and the Cx Plan.

1.3 SCOPE

A. The following are included in the Scope of Commissioning on this project:

B. HVAC Systems

1. Boilers
2. Chillers
3. Cooling Towers
4. Pumps
5. CHW/HW distribution systems
6. Air Handling Units (AHU)
7. Terminal Units

8. Phoenix valves
9. Split systems
10. Misc supply and exhaust fans and terminal equipment

C. Building Automation Systems

1. Refer to Section 230995.

1.4 RELATED WORK AND DOCUMENTS

A. Section 019113 – General Commissioning Requirements: details the Cx requirements common across all divisions

B. Section 019114 – Functional Testing Procedures: Outlines the generic functional testing procedures required.

C. Individual Specification Sections: Individual sections stipulate installation, start-up, warranty, O&M documentation, and training requirements for the system or device specified in the Section.

D. Section 230995 – Building Automation Systems Commissioning: Details the commissioning procedures specific to the Building Automation System.

E. Section 260800 – Electrical Systems Commissioning: Details the commissioning procedures specific to Division 26 work.

F. Section 280820 – Fire Alarm Systems Commissioning: Details the commissioning procedures specific to Division 28 Fire Alarm work.

1.5 DEFINITIONS AND ABBREVIATIONS

A. Refer to Section 019113

1.6 REFERENCE STANDARDS

A. ASHRAE Guideline 1-1996, "Guideline for Commissioning HVAC Systems"

B. ASHRAE Guideline 4-1993, “Preparation of operating and Maintenance Documentation for Building Systems”

C. NEBB – Procedure Standards for Building Systems Commissioning

1.7 DOCUMENTATION

A. In addition to the documentation required in Section 019113, Contractor shall provide to the CA the following per the procedures specified herein, in the Cx Plan, and in other Sections of the specification:

1. Balancing Plan: The plan shall include the following:

a. Certification on all instrumentation to be used throughout the testing; this must document certification within the last 6 months.
b. Résumés and Certification of individuals who will be balancing systems
c. Detailed step by step plans for each procedure to be performed
d. Sample forms to be used for each measurement
e. Sample balancing report

2. Factory Test Reports: Contractor shall provide any factory testing documentation or certified test reports required by the specifications. These shall be provided prior to Acceptance Phase. Factory Test Reports should be provided in pdf electronic format. These may include but are not limited to:

a. Air Handling Units
b. Chillers
c. Variable Frequency Drives
d. Fans Capacity
e. Boilers
f. Pump Capacity

3. Field Testing Agency Reports (other than TAB): Provide all documentation of work of independent testing agencies required by the specification. These shall be provided prior to Acceptance Phase. Field Testing Agency Reports should be provided in pdf electronic format. These may include but are not limited to:

a. Pipe Pressure Testing
b. Duct Leakage Testing
c. Water Treatment

4. Completed Test and Balance Reports; CA will review prior to FPT.

1.8 CONTRACTOR RESPONSIBILITIES

A. Refer to Section 019113: Detailed Contractor responsibilities common to all Divisions are specified in Section 019113. The following are additional responsibilities or notable responsibilities specific to Division 23.

B. Construction Phase

1. Provide skilled technicians qualified to perform the work required.
2. Provide factory-trained and authorized technicians where required by the Contract Documents.
3. Prepare and submit required draft Start-Up Procedures and submit along with the manufacturer's application, installation and start-up information.
4. TAB: As outlined in testing and balancing specification. Specifically as it relates to Cx:

a. Attend Cx kick-off meeting and Cx progress meetings held within 3 months of and during Acceptance Phase.
b. Submit Balancing Plan as indicated above
c. Meet with Cx Team to review TAB procedures and documentation required.
d. As called by CA, participate in CxT demonstrations of balancing procedures for repetitive procedures such as zones.
e. Attend a meeting convened by the C to coordinate with the Safety certifying agency. The point of the meeting will be to coordinate protocols and measurement approaches to

ensure that devices such as Fume Hoods and Biosafety cabinets will be set up to achieve certification

f. Participate in Action List dialogue
g. Provide all documentation electronically.

5. Provide assistance to the CA in preparation of the specific Functional Performance Test (FPT) procedures. Contractors, subcontractors and vendors shall review FPT procedures to ensure feasibility, safety and equipment protection and provide necessary written alarm limits to be used during the tests. Damage caused to equipment performed in accordance with the approved procedures will be the responsibility of the Contractor.
6. Thoroughly complete and inspect installation of systems and equipment as detailed throughout Contract Documents, as required by reference or industry standards, and as specifically indicated elsewhere this Section.
7. Start-up, and test/adjust/balance systems and equipment prior to functional performance testing by the CA. Start-Up Procedures shall be in accordance with Contract Documents, reference or industry standards, and specifically elsewhere in Part I of this Section.
8. Record Start-up Procedures on start-up procedure forms and certify that the systems and equipment have been started and or tested in accordance with the requirements specified above. Each task or item shall be indicated with the Party actually performing the task or procedure.

C. Acceptance Phase

1. Assist CA in functional performance testing. Assistance will generally include the following:

a. Manipulate systems and equipment to facilitate testing (as dictated in Section 019114; in some cases this will entail only an initial sample);
b. Provide any specialized instrumentation necessary for functional performance testing;
c. Manipulate BAS and other control systems to facilitate functional performance testing (as dictated Section 019114, Section 230995, and the Cx Plan; in some cases this will entail only an initial sample).
d. Provide a TAB technician to work at the direction of CA.
e. Provide a BAS technician to work at the direction of CA.

D. Warranty Phase

1. Maintain record documentation of any configurations, set ups, parameters etc, that change throughout the period.
2. Provide representative for off season testing as required by CA.
3. Respond to Warranty issues as required by Division 1 and the General Conditions.

1.9 TRAINING

A. Contractors, Subcontractor, Vendors, and other applicable Parties shall prepare and conduct training sessions on the installed systems and equipment they are responsible for per the requirements of Section 019113 and the individual Specifications.

PART 2 - PRODUCTS

2.1 INSTRUMENTATION

A. General: All testing equipment used by any Party shall be of sufficient quality and accuracy to test and/or measure system performance with the tolerances specified. If not otherwise noted, the following minimum requirements apply:

1. Temperature sensors and digital thermometers shall have a certified calibration within the past year and a resolution of + or - 0.1°F.
2. Pressure sensors shall have an accuracy of + or - 2.0% of the value range being measured (not full range of meter) and have been calibrated within the last year.
3. All equipment shall be calibrated according to the manufacturer's recommended intervals. Calibration tags shall be affixed or certificates readily available.

B. Standard Testing Instrumentation: Standard instrumentation used for testing air and water flows, temperatures, humidity, noise levels, amperage, voltage, and pressure differential in air and water systems shall be provided by CA.

C. Special Tools: Special equipment, tools and instruments (only available from vendor, specific to a piece of equipment) required for testing equipment, according to these Contract Documents shall be included in the base bid price to the Contractor and turned over to the Owner upon project completion.

2.2 WEB-BASED COMMISSIONING PORTAL

A. All general and major subcontractors participating in the Cx process shall use the web-based Cx Portal ('Portal') to document the Cx procedures. The Portal is a Web-based Internet hub used to electronically collaborate and coordinate activities and deliverables throughout the Cx process. The Portal is hosted by the CA and shall be accessible to all Parties participating in the Cx program. The Portal provides a common location to store Start-Up Documentation, Functional Performance Tests and results, project documents and deliverables. It also serves as a collaborative email hub to facilitate, automate, and track communications between Parties relating to the Cx process.

B. Refer to Section 019113 the individual Specifications for additional information and requirements for using the Portal.

2.3 TEST KITS FOR METERS AND GAGES

A. Test kits for meters and gages shall be provided to the Owner new and in good condition. Previously used kits will be unacceptable. Kits shall be submitted prior to the Acceptance Phase. Kits included shall be as a minimum:

1. Digital indication of temperature and pressure with associated sensors to work with the P/T test ports
2. Companion readout kit (with fittings) for calibrated balancing valve with ranges as required by all devices on this project

PART 3 - EXECUTION

3.1 START-UP PROCEDURES - GENERAL

A. Part III of this Section outlines 'generic' or minimally acceptable Start-Up Procedures (delineated as Start-Up Checks and Start-Up Tests) and individual systems Training requirements for systems and equipment. These procedures are the direct responsibility of the Contractor as a basic element of validating that the installation is correct per normal quality control practices. These items shall provide a minimum or guideline for required Contractor development of Start-Up Procedures. Contractor shall synthesize these minimum requirements along with their own internal quality control practices, those of the manufacturer, and any applicable codes and standards to develop specific and itemized Start-Up Procedures specific to the equipment and systems installed on this project.

3.2 PROCEDURES COMMON TO ALL SYSTEMS

A. The following start up verifications/procedures are common to all systems

B. Checkout shall proceed from devices to the components to the systems.

C. Verify labeling is affixed per spec and visible

D. Verify prerequisite procedures are done.

E. Inspect for damage and ensure none is present.

F. Verify system is applied per the manufacturer's recommendations

G. Verify system has been start up per the manufacturer's recommendations

H. Verify that access is provided for inspection, operation and repair

I. Verify that access is provided for replacement of the equipment

J. Verify the record drawings, submittal data and O&M documentation accurately reflect the installed systems

K. Verify all gages and test ports are provided as required by contract documents and manufacturer's recommendations

L. Verify all recorded nameplate data is accurate

M. Installation is done to ensure safe operation and maintenance.

N. Verify specified replacement material/attic stock has been provided as required by the Construction Documents

O. Verify all rotating parts are properly lubricated

P. Verify all monitoring and ensure all alarms are active and set per Owner's requirements

Q. Complete all nameplate data and confirm ratings conform with the design documents

3.3 VALVES

A. Start-Up Checks: Perform the following checks during start-up and as specified in manufacturer's instructions:

1. Operate all valves, manual and automatic, through their full stroke. Ensure smooth operation through full stroke and appropriate sealing or shutoff.
2. Verify actuators are properly installed with adequate clearance.
3. Verify all valves are labeled per the construction documents. Confirm that concealed valves are indicated on the finished building surface.
4. For automatic pneumatically-operated valves, verify spring range and adjust pilot positioners where applicable. For electronically operated valves, check the stroke and range. For all automated valves controlled by a program, ensure that the minimum and maximum stroke and ranges on the valves are coordinated with the limits entered in the program.

3.4 METERS AND GAGES

A. Start-Up Checks: Perform the following checks during start-up and as specified in manufacturer's instructions:

1. Adjust faces of meters and gages to proper angle for best visibility.
2. Clean windows of meters and gages and factory-finished surfaces. Replace cracked and broken windows, and repair scratched and marred surfaces with manufacturer's touch-up paint. For meters and gages requiring temporary manual connection of read-out device such as pressure taps on a flow measuring device, ensure threads are clean and that connection can be made easily.
3. Meters and gages requiring manual connection of readout device shall be installed with adequate access to allow connection of device with normal tools.

3.5 MECHANICAL IDENTIFICATION

A. Start-Up Checks: Perform the following checks:

1. Verify all valve tags, piping, duct, and equipment labeling corresponds with drawings and indexes and meets requirements specified. Correct any deficiencies for all piping and duct systems.
2. Adjusting: Relocate any mechanical identification device which has become visually blocked by work of this division or other divisions.
3. Cleaning: Clean face of identification devices, and glass frames of valve charts

3.6 MECHANICAL INSULATION

A. Start-Up Checks: Examine all piping, systems and equipment specified to be insulated.

1. Ensure quality of insulation. Patch and repair all insulation damaged after installation.
2. Ensure the integrity of vapor barrier around all cold surfaces.

3.7 PIPING - GENERAL

A. Start-Up Checks: These Procedures apply to all installed piping systems, including underground site utilities.

1. Inspect all piping for proper installation, adequate support (with appropriate vibration isolation where applicable) and adequate isolation valves for required service.
2. Submit welding certifications as required by the applicable specification section or referenced ASME specification.
3. Submit certified welding inspection results per the applicable specification section or referenced ASME specification. ASME B31.1 requires 100% inspection based on pressure class.
4. Provide notification of pipe cleaning and flushing activities
5. Flush and clean all piping and clean all strainers. Provide documentation of all related procedures.
6. Ensure adequate drainage is provided at low points and venting is provided at high points.
7. Ensure air is thoroughly removed from the system as applicable. Ensure facilities to effectively drain and fill the system are in place.
8. Ensure all piping is adequately supported and anchored to allow expansion. Bump across-the-line pumps and inspect for excessive pipe movement.
9. Provide notification of pressure testing
10. Pressure and/or leak test all applicable systems in accordance with the requirements in the applicable sections, ASME B 31.1 and 39.1 as applicable.
11. Sterilize applicable piping systems as specified in the individual Sections and as required by regulatory authorities.
12. Submit pressure test reports that document the pressure testing results with Certification of the results.
13. Verify the operation of applicable safety relief valves, operating controls, safety controls, etc. to ensure a safe installation.
14. Set and adjust fill, pressure, or level controls to the required setting.

3.8 AC MOTORS

A. Start-Up Checks: Perform the following checks during start-up and as specified in manufacturer's instructions:

1. Verify proper alignment, installation, and rotation.
2. Verify properly sized overloads are in place

B. Start-Up Tests: Perform the following tests, measurements, or procedures during start-up and as specified in manufacturer's instructions:

1. Measure insulation resistance, phase balance, and resistance to ground
2. Measure voltage available to all phases; measure amps and RPM after motor has been placed in operation and is under load.
3. Record all motor nameplate data.

3.9 BEARINGS

A. This applies to all bearings on fans, pumps, compressors, etc.

B. Check alignment as applicable

C. Lubricate all bearings per the manufacturer’s instructions. When bearing is used for temporary conditioning, lubricate on manufacturer’s recommended frequency and document it.

3.10 VARIABLE SPEED DRIVES

A. General: Provide the services of a factory authorized service representative to test and inspect unit installation, provide startup service, and to demonstrate and train Owner's maintenance personnel as specified below.

B. Start-Up Checks: Perform the following checks before start-up and as specified in manufacturer's start-up instructions:

1. Check unit for shipping damage.
2. Perform a point-to-point continuity test for all field installed wiring interconnections. Verify terminations of field installed wiring.
3. Check for proper torque on connections.
4. Verify use of shielded cable where specified and check that shields have been terminated properly.
5. Verify grounding.
6. Check motor nameplate against drive input rating.
7. Manually rotate motor shaft to ensure free rotation.
8. Check that motor leads are not grounded.

C. Start-Up Tests: Perform the following tests, measurements, or procedures during start-up and as specified in manufacturer's instructions:

1. Ensure device and system which drive is serving is configured to withstand the device operation specified below.
2. Adjust the Minimum Voltage Adjustment to enable starting but not to draw excessive power at start.
3. Adjust the Volts/Hz adjustment to proper setting.
4. Adjust the Acceleration and Deceleration rates to the specified times.
5. Adjust Current Limiting to coordinate with the overcorrect device and protect the motor.
6. Set the Maximum and Minimum speed pots.
7. Manually ramp fan speed from minimum to maximum and check for excessive noise and vibration
8. Determine any critical speeds to avoid and set these in the drive.
9. Check for acceptable voltage and current distortion on the power system. Record the input and output voltages and currents showing the harmonic content as a percentage of the base frequency.
10. Measure and record overall efficiency at 50%, 75%, and 100%
11. Record the motor terminal voltage.

D. Training: Train Owner's maintenance personnel on procedures and schedules related to start-up and shutdown, troubleshooting, servicing, and preventative maintenance.

1. Review data in Operating and Maintenance Manuals.

3.11 NATURAL GAS SYSTEMS

A. Start-Up Tests: Perform the following tests, measurements, or procedures during start-up:

1. Piping Tests: Inspect, test, and purge natural gas systems in accordance with NFPA 54, and local utility requirements.
2. Submit draft test forms and completed test forms to document and certify test results.

3.12 HYDRONIC PIPING

A. Start-Up Checks: Perform the following checks:

1. Prepare hydronic and test piping in accordance with applicable Section and ASME B 31.9 and/or B 31.1
2. Flush system with clean water in accordance with applicable Section.
3. Clean strainers.
4. Check expansion tanks to determine that they are not air bound and that the system is completely full of water.
5. Set automatic fill valves for required system pressure.
6. Check air vents at high points of systems and determine if all are installed and operating freely (automatic type) or to bleed air completely (manual type).
7. Set and coordinate automatic fill pressure and relief valve settings

B. Start-Up Tests: Perform the following tests, measurements, or procedures during start-up:

1. Chemical Treatment: Provide a water analysis prepared by the chemical treatment supplier to determine the type and level of chemicals required for prevention of scale and corrosion. Perform initial treatment after completion of system testing.

3.13 STEAM AND CONDENSATE PIPING

A. Start-Up Checks: Perform the following checks:

1. Prepare hydronic and test piping in accordance with applicable Section and ASME B 31.9 and/or B 31.1
2. Flush system with clean water in accordance with applicable Section.
3. Clean strainers.
4. Check expansion tanks to determine that they are not air bound and that the system is completely full of water.
5. Set automatic fill valves for required system pressure.
6. Check air vents at high points of systems and determine if all are installed and operating freely (automatic type) or to bleed air completely (manual type).
7. Set and coordinate automatic fill pressure and relief valve settings

B. Start-Up Tests: Perform the following tests, measurements, or procedures during start-up:

1. Chemical Treatment: Provide a water analysis prepared by the chemical treatment supplier to determine the type and level of chemicals required for prevention of scale and corrosion. Perform initial treatment after completion of system testing.

3.14 REFRIGERANT PIPING

A. Start-Up Checks: Perform the following:

1. Examine rough-in for refrigerant piping systems to verify actual locations of piping connections prior to installation.
2. Inspect, test, and perform corrective action of refrigerant piping in accordance with ASME Code B31.5, Chapter VI.
3. Verify actual evaporator applications and operating conditions, and adjust thermostatic expansion valve to obtain proper evaporator superheat requirements.
4. Clean and inspect refrigerant piping systems in accordance with the applicable section
5. Adjust controls and safeties. Replace damaged or malfunctioning controls and equipment with new materials and products.

B. Training: Train Owner's maintenance personnel on procedures and schedules related to start-up and shut-down, troubleshooting, servicing, and preventative maintenance of refrigerant piping valves and refrigerant piping specialties.

3.15 PUMPS

A. Refer to AC Motors in this section

B. Refer to Bearings in this section

C. Refer to Section "Testing, Adjusting, and Balancing" for detailed requirements for testing, adjusting, and balancing hydronic systems.

D. Start-Up Checks: Perform the following checks before start-up:

1. Check suction lines connections for tightness to avoid drawing air into the pump.
2. Clean and lubricate all bearings.
3. Check motor for proper rotation. Rotation shall match direction of rotation marked on pump casing.
4. Check that pump is free to rotate by hand. For pumps handling hot liquids, pump shall be free to rotate with the pump hot and cold. If the pump is bound or even drags slightly, do not operate the pump until the cause of the trouble is determined and corrected.
5. Clean associated strainers.
6. Check that the proper overloads have been installed in the starter and are the correct size.
7. Verify that the integrity of the vibration isolation is maintained throughout the support and the connections.
8. Align pump within manufacturers recommended tolerances.
9. Ensure all associated piping has been cleaned, tested, and vented.
10. Verify that all thermometers and gages are installed, are clean and undamaged, and are functional.

E. Start-Up Tests: Perform the following tests, measurements, or procedures during start-up:

1. Start the pump per the manufacturer’s instructions.
2. Check the general mechanical operation of the pump and motor.
3. Verify that check valve seal is appropriate.

4. Check noise and vibration levels and ensure they are within the manufacturers recommended tolerances.
5. Check that the NPSH is with that allowable for the operating condition.
6. Refer to Section "Testing, Adjusting, and Balancing" for detailed requirements for testing, adjusting, and balancing hydronic systems.

3.16 BREECHINGS, CHIMNEYS, AND STACKS

A. Start-Up Checks: Perform the following checks:

1. Clean breechings internally during installation, to remove dust and debris. Clean external surfaces to remove welding slag and mill film. Grind welds smooth.
2. Check to ensure adequate draft throughout firing range and with all variations of multiple boilers

3.17 FEEDWATER EQUIPMENT

A. Refer to AC Motors in this section

B. Start-Up Tests: Perform the following before or during start-up:

1. Start up feedwater equipment, in accordance with manufacturer's start-up instructions. Test controls and demonstrate compliance with requirements. Replace damaged or malfunctioning controls and equipment.

3.18 AIR-COOLED CONDENSING UNITS

A. General: Provide the services of a factory authorized service representative to test and inspect unit installation, provide startup service, and to demonstrate and train Owner's maintenance personnel as specified below.

B. Refer to AC Motors in this section

C. Start-Up Checks: Perform the following inspections/checks before start-up:

1. Ensure unit is level
2. Coils are undamaged and fins are combed
3. Condenser fan rotates freely and check rotation direction

D. Start-Up Tests: Perform the following before or during start-up:

1. Start up condensing units, in accordance with manufacturer's start-up instructions.
2. Test controls and demonstrate compliance with requirements. Replace damaged or malfunctioning controls and equipment.
3. Charge systems with refrigerant and oil, and test for leaks. Repair leaks and replace lost refrigerant and oil.

E. Training: [Factory-authorized representative] [Contractor] shall train Owner's maintenance personnel including:

1. Procedures and schedules related to start-up and shut down, troubleshooting, servicing, preventative maintenance, and how to obtain replacement parts.
2. Familiarization with contents of Operating and Maintenance Manuals

3.19 CENTRIFUGAL CHILLERS - WATER COOLED

A. General: Provide the services of a factory authorized service representative to test and inspect unit installation, provide startup service, and to demonstrate and train Owner's maintenance personnel as specified below. Representative shall provide a written report documenting the start-up.

B. Refer to Bearings in this Section

C. Start-Up Checks: Perform the following inspections/checks before start-up:

1. Ensure that all associated piping is cleaned, tested, filled, and deaerated.
2. Ensure that refrigerant/oxygen monitoring and safety controls are started and functional.
3. Inspect the installation and access/clearance for service and maintenance to ensure it meets the project and manufacturer’s requirements
4. Check control interfaces for proper ranges and approve the interface

D. Start-Up Test and Service:

1. Provide the services of a factory authorized service representative to provide startup service.
2. Evacuate, dehydrate, vacuum pump and charge with specified refrigerant, and leak test in accordance with manufacturer's instructions. Test and adjust controls and safeties. Replace damaged or malfunctioning controls and equipment.
3. Optimize chiller charge and operating characteristics
4. Log machine parameters at various load, at a minimum 25%, 50%, 75%, and 100%
5. Perform lubrication service, including filling of reservoirs, and confirming that lubricant is of quantity and type recommended by manufacturer.
6. Submit factory start-up report per specifications.

E. Training: Factory-authorized representative shall train Owner's maintenance personnel including:

1. Procedures and schedules related to start-up and shut down, troubleshooting, servicing, preventative maintenance, and how to obtain replacement parts.
2. Familiarization with contents of Operating and Maintenance Manuals

3.20 FACTORY-FABRICATED COOLING TOWERS

A. Refer to Bearings in this Section

B. Start-Up Checks: Perform the following inspections/checks before start-up:

1. Cleaning: Ensure inside of cooling tower is cleaned thoroughly before filling for start-up. Clean factory-finished surfaces. Repair any marred or scratched surfaces with manufacturer's touch-up paint.
2. Inspect the installation and access/clearance for service and maintenance to ensure it meets the project and manufacturer’s requirements
3. Verify lubrication of rotating parts; lubricate as needed.

4. Verify fan rotation direction.
5. Verify that motor amperage is in accordance with manufacturer's data.

C. Start-Up Tests: Perform the following before or during start-up:

1. Comply with manufacturer's instructions for filling and start-up of operation.
2. Balance condenser water flow to each tower, and to each inlet for multiple inlet towers.
3. Adjust water level control for proper operating level.
4. Adjust temperature controls and verify operation.
5. Operation Test: Test each cooling tower to show that it will operate in accordance with indicated requirements.

3.21 TERMINAL UNITS

A. Start-Up Checks: Perform the following inspections/checks before start-up:

1. After construction is completed, including painting if applicable, clean unit exposed surfaces.
2. Vacuum-clean terminal coils and inside of cabinets.
3. Clean factory-finished surfaces. Repair any marred or scratched surfaces with manufacturer's touch-up paint.
4. Verify adequate access for maintenance.
5. Check power and control voltages.
6. Check rotation of fan where applicable.
7. Check calibration and operation of the controlling elements.
8. Check control valves for required close-off and fail position.
9. Install new filter units for terminals requiring same.

3.22 VAV TERMINAL UNITS

A. Refer to and coordinate with Section "Testing, Adjusting, and Balancing"

B. Start-Up Checks: Perform the following inspections/checks before start-up:

1. After construction is completed, including painting if applicable, clean unit exposed surfaces.
2. Clean factory-finished surfaces. Retouch any marred or scratched surfaces of factory-finished cabinets, using finish materials furnished by manufacturer.
3. Ensure unit is properly supported and that integrity of vibration isolation has been maintained where applicable.
4. Ensure that air velocity sensor is correctly installed and that inlet/outlet restrictions for accurate measurements have been met.
5. Ensure air inlet is free of obstructions. Start fans and ensure proper rotation (as applicable). Measure and record motor amperage and voltage
6. Ensure the coils are undamaged, combed, and vented.
7. Check the heating device and control to ensure functionality and proper installation. Check stroke and range on the valve and ensure it closes and seals tightly.

C. Start-Up Tests: Perform the following before or during start-up:

1. Calibrate and adjust the airflow control parameters. Set applicable min and max setpoints. Coordinate with the ATC contractor as necessary to obtain flow parameters required.

2. Install new filters where required.
3. Set all temperature and humidity setpoints to those as directed by Owner.
4. Record supply air temperature at full cooling and at full heating (compare both with current air handler temp)

3.23 FLOW TRACKING VAV TERMINAL UNITS

A. All Start-Up Procedures for 'VAV Terminal Units' shall apply.

B. Start-Up Tests: In addition, for Flow Tracking VAV terminal units:

1. Meet with CA to establish the protocol for zone set up.
2. Measure zone differential pressure in all max and min conditions (max and min cooling, max and min heating, max and min hood sash as applicable)
3. Ensure flow variations do not cause reverse pressurization in the space.

3.24 CENTRAL-STATION AIR-HANDLING UNITS

A. Provide the services of a factory authorized service representative to test and inspect unit installation, provide startup service, and to demonstrate and train Owner's maintenance personnel as specified below.

B. References: The following additional Sections shall also apply:

1. Refer to AC Motors in this Section.
2. Refer to Fans in this Section
3. Refer to Section "Testing, Adjusting, and Balancing" for procedures for air-handling-system testing, adjusting, and balancing.
4. Refer to Division 230995 Section "BAS Commissioning" for procedures for starting the controls related to the AHU.

C. Start-Up Checks: Perform the following inspections/checks before start-up:

1. Inspect the field assembly of components and installation of central-station air-handling units including piping, ductwork, and electrical connections.
2. Cleaning: Clean unit cabinet interiors to remove foreign material and construction dirt and dust. Vacuum clean fan wheel, fan cabinet, and coils entering air face. Ensure volatile irritants are contained and kept out of occupied spaces.
3. Adjust and lubricate dampers and linkages for proper damper operation.
4. For field fabricated units, ensure the sections are properly connected within acceptable tolerances.
5. Seal the all penetrations air tight and ensure access doors seat tightly.
6. Verify unit is secure on mountings and supporting devices and that connections for piping, ductwork, and electrical are complete.
7. Verify proper thermal overload protection is installed in motors, starters, and disconnects.
8. Ensure vibration isolation integrity is maintained throughout the AHU installation and its connections.
9. Tension all belts per the drive manufacturer's recommendations.
10. Disconnect fan drive from motor and verify proper motor rotation direction and verify fan wheel free rotation and smooth bearings operations. Reconnect fan drive system, align belts, and install belt guards.

11. Lubricate bearings, pulleys, belts, and other moving parts with factory-recommended lubricants.
12. Comb coil fins for parallel orientation.
13. Install clean filters.
14. Ensure condensate drains properly and that trap is adequate.
15. Stroke all valves and damper to ensure free and full travel

D. Start-Up Tests: Perform the following before or during start-up:

1. Pressure test units as required in the AHU specification

E. Training: [Factory-authorized representative] [Contractor] shall train Owner's maintenance personnel including:

1. Procedures and schedules related to start-up and shut down, troubleshooting, servicing, preventative maintenance, and how to obtain replacement parts.
2. Familiarization with contents of Operating and Maintenance Manuals

3.25 FANS

A. References: The following additional Sections shall also apply:

1. Refer to AC Motors in this Section.
2. Refer to Bearings in this Section
3. Refer to Section "Testing, Adjusting, and Balancing" for procedures for air-handling-system testing, adjusting, and balancing.
4. Refer to Division 230995 Section “BAS Commissioning” for procedures for starting the controls related to the AHU.

B. Start-Up Checks: Perform the following inspections/checks before start-up:

1. Inspect the field assembly of components and installation of central-station air-handling units including piping, ductwork, and electrical connections.
2. Clean unit cabinet interiors to remove foreign material and construction dirt and dust. Vacuum clean fan wheel, fan cabinet, and coils entering air face. Ensure volatile irritants are contained and kept out of occupied spaces.
3. Adjust and lubricate dampers and linkages for proper damper operation.
4. Verify unit is secure on mountings and supporting devices and that connections for ductwork, and electrical are complete. Verify proper thermal overload protection is installed in motors, starters, and disconnects.
5. Ensure vibration isolation integrity is maintained with the fan installation and the connections to it
6. Disconnect fan drive from motor and verify proper motor rotation direction and verify fan wheel free rotation and smooth bearings operations. Reconnect fan drive system, align belts, and install belt guards.
7. Lubricate bearings, pulleys, belts, and other moving parts with factory-recommended lubricants.
8. Stroke all dampers to ensure free and full travel

C. Training: Contractor shall train Owner's maintenance personnel including:

1. Procedures and schedules related to start-up and shut down, troubleshooting, servicing, preventative maintenance, and how to obtain replacement parts.

2. Familiarization with contents of Operating and Maintenance Manuals

3.26 METAL DUCTWORK

A. Temporary Closure: At ends of ducts which are not connected to equipment or air distribution devices at time of ductwork installation, provide temporary closure of polyethylene film or other covering which will prevent entrance of dust and debris until time connections are to be completed.

B. Start-Up Checks: Perform the following checks before start-up and as specified:

1. Clean ductwork internally, unit by unit as it is installed, of dust and debris. Clean external surfaces of foreign substances which might cause corrosive deterioration of metal or, where ductwork is to be painted, might interfere with painting or cause paint deterioration.
2. Strip protective paper from stainless ductwork surfaces if applicable, and repair finish wherever it has been damaged.

C. Start-Up Tests: In addition to specifications, perform the following as a minimum:

1. Leakage Tests: After each duct system which is constructed for duct classes over 3" is completed, test for duct leakage in accordance with SMACNA HVAC Air Duct Leakage Test Manual. Repair leaks and repeat tests until total leakage is less than 1% of system design air flow.
2. Balancing: Refer to section "Testing, Adjusting, and Balancing" for air distribution balancing of metal ductwork; not work of this section. Seal any leaks in ductwork that become apparent in balancing process.

3.27 DUCTWORK ACCESSORIES

A. Start-Up Checks: Perform the following checks before start-up and as specified:

1. Cleaning: Clean factory-finished surfaces. Repair any marred or scratched surfaces with manufacturer's touch-up paint.

B. Start-Up Tests: In addition to specifications, perform the following as a minimum:

1. Operate installed ductwork accessories to demonstrate compliance with requirements. Test for air leakage while system is operating. Repair or replace faulty accessories, as required to obtain proper operation and leak proof performance.
2. Label access doors in accordance with section "Mechanical Identification".
3. Adjusting: Adjust ductwork accessories for proper settings, install fusible links in fire dampers and adjust for proper action.
4. Final positioning of manual dampers is specified in section "Testing, Adjusting, and Balancing".
5. Fire Damper Testing: For every fire damper, remove the fusible link and verify that the damper operates freely and closes tightly. Reinstall the fusible link.

3.28 AIR TERMINALS

A. Start-Up Checks: Upon completion of installation and prior to initial operation, check that air terminals are:

1. Properly installed with the proper airflow direction
2. Properly supported with vibration isolation integrity maintained where applicable
3. Duct connections to air terminals are leak-tight.
4. Operable dampers travel free.
5. Airflow measuring devices are properly installed and connected.
6. Repair or replace air terminals and duct connections as required to eliminate leaks, and retest to demonstrate compliance.
7. Clean exposed factory-finished surfaces; repair any marred or scratched surfaces with manufacturers touch-up paint.

3.29 BUILDING AUTOMATION AND CONTROL SYSTEMS

A. Start-Up Checks: Perform the following checks before start-up and as specified:

1. Cleaning: Clean factory-finished surfaces. Repair any marred or scratched surfaces with manufacturer's touch-up paint.

B. Start-Up Tests: Refer to Section 230995 BAS Commissioning. This generally requires manufacturers authorized representative to start-up, test, adjust, and calibrate direct digital and other microprocessor-based control systems and demonstrate compliance with requirements. This will include verification of sequences, normal and emergency operations, calibration, interfaces, and interlocks, etc.

3.30 TESTING, ADJUSTING, AND BALANCING

A. Reference: Perform testing and balancing procedures on each system identified, in accordance with the detailed procedures outlined in the respective section and the referenced standards.

B. Start-Up Checks: In addition to specifications, perform the following as a minimum:

1. Cut insulation, ductwork, and piping for installation of test probes to the minimum extent necessary to allow adequate performance of procedures.
2. Patch insulation, ductwork, and housings, using materials identical to those removed.
3. Seal ducts and piping, and test for and repair leaks.
4. Seal insulation to re-establish integrity of the vapor barrier.
5. Mark equipment settings, including damper control positions, valve indicators, fan speed control levers, and similar controls and devices, to show final settings. Mark with paint or other suitable, permanent identification materials.
6. Retest, adjust, and balance systems subsequent to significant system modifications, and resubmit test results.
7. Test and adjust mechanical systems for sound and vibration in accordance with the detailed instructions of the referenced standards.

C. Training:

1. Train the Owner's maintenance personnel on troubleshooting procedures and testing, adjusting, and balancing procedures.
2. Review for the Owner’s personnel the locations of TAB reports and data.

3.31 ROOM/ZONE CHECKOUT

A. Contractor shall complete a checklist acknowledging completion of Div. 23 responsibilities for all rooms. Checklist shall include items such as the following as applicable:

B. Typical Room:

1. Diffuser, registers, and grilles installed and cleaned
2. Zone Control in place and functional
3. All terminal equipment functional, clean, and punched out
4. Occupancy schedules entered with applicable control setpoints

C. Rooms with Plumbing Fixtures

1. Plumbing fixtures clean and operational

D. Laboratories

1. Fume hoods and BSC's cleaned, adjusted, and operating in range
2. Eye Washes and emergency showers functional with all actuators in place
3. All air, gas, and vacuum turrets checked and functional with report on cross contamination
4. Air Pressurization validated. Monitors are in place per design documents.

3.32 SEQUENCING ILLUSTRATION

A. Reference Section 019113

END OF SECTION 230800

SECTION 230900 - INSTRUMENTATION AND CONTROL FOR HVAC

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. The uniform general conditions, supplementary general conditions, and Division 1 of the Specifications apply to the work specified in this Section.

1.2 INTRODUCTION

A. Overview

1. This document contains the specification for a Direct Digital Control (DDC) system, also commonly termed the Building Automation System (BAS).

B. Instructions To Bidders

1. Base Bid – Include all work as described in the specification and drawings.

C. It is the Owner's requirement that the DDC System Suppliers will bid all parts of the project. Failure to bid on any part of the project may result in bid being rejected.

D. This document lists the requirements for the procurement of a DDC system for the entire project over a period of time.

1. The DDC System Supplier will have a contract directly with the Mechanical Contractor.

E. Approved DDC System Suppliers

1. Allerton, Inc.

2. Siemens

3. Automated Logic Corporation

4. Pritchett-Reliable.

1.3 STIPULATIONS

A. Applicable requirements of the General Conditions and special requirements and Division 1 are part of this section and shall have the same force and effect as if printed here within full.

B. In case of conflict between various requirements, the most stringent requirement shall apply.

C. The complete construction documents package for the work that is included in this project's work is being provided. It is the bidder's responsibility to ensure that they have indeed received all of the documents as listed in this specification.

1.4 PURPOSE OF THIS DOCUMENT

A. The purpose of this document is to obtain a lump sum price for the project.

B. The technical requirements for the DDC System are generally included in this document. Failure by the bidder to adhere to these requirements may result in their bid being rejected.

C. It is to be understood that the Owner is generally looking for the system as listed in this document. Any deliberate attempt by the bidders to "cheapen" the system by extensive use of unitary controllers on large equipment (air handling units, heat exchangers, etc.) may render the bid as invalid.

D. The Owners and Engineers, at their discretion, may ask for further information and/or clarification from the DDC supplier. Any written communication between the DDC System Suppliers and the Owner and/or Architect/Engineer may be included as part of the final contract between the Owner and the DDC System Supplier.

E. If DDC system improvements occur between the time the of the existing installation and the time the Bid Documents are issued, and if these improvements require significant changes in the proposed system architecture, the Owner must approve such changes before the submission of the bids. Any system improvements or enhancements must be presented to the owner, whether the intent is to use the enhanced systems on this project or not.

F. It is to be understood that the Owners are not obligated to accept the bid and the Owners reserve the right to reject the bid without explanation.

G. All costs incurred by the DDC System Suppliers and their representatives for the preparation of the bid is their own responsibility. The Owner is not responsible for any of these costs.

1.5 REQUIREMENTS FOR SUBMITTING BIDS

A. The bids must provide complete details for all equipment proposed sensors, hardware, software, and other equipment as specified. The material shall be carefully organized so that an accurate evaluation can be made.

B. The schematic system layout shall show complete system architecture, including all digital control panels (DCPs) required. (It is to be noted that the installation drawings should show enough details so that an installation contractor can provide the wiring and labeling.) Show location of all DCPs, UCs, operator devices, etc. (This is to include the existing controller and workstation.)

1.6 DESCRIPTION OF PROJECT SITE

A. Refer To General Conditions

1.7 ABBREVIATIONS

A. Below is a list of abbreviations related to this project:

ACP	Apparatus Control Panel
ASHRAE	American Society of Heating, Refrigeration, and Air Conditioning Engineers
AI	Analog Input
ANSI	American National Standards Institute
AO	Analog Output
ASME	American Society of Mechanical Engineers
AWG	American Wire Gauge
BI	Binary Input
BO	Binary Output
CFM	Cubic Feet per Minute
CPU	Central Processing Unit
CRT	Cathode Ray Tube
DCP	Digital Control Panel
DDC	Direct Digital Control
DE	Data Environment
DI	Digital Input
DO	Digital Output
DP	Differential Pressure
DPDT	Double Pole Double Throw
DPST	Double Pole Single Throw
DTC	Data Terminal Cabinets
EA	Exhaust Air
EIA	Electronic Industries Association

EMT	Electrical Metallic Tubing
EMS	Energy Management System
E/P	Electric/Pneumatic Transducer
EPROM	Erasable Programmable Read Only Memory
FCC	Federal Communication Commission
FPM	Feet per Minute
FV	Face Velocity
GPM	Gallons per Minute
HVAC	Heating, Ventilation and Air Conditioning
I&C	Instrumentation and Control
I/O	Input/Output
I/P	Current to Pneumatic
IEEE	Institute of Electrical and Electronic Engineers
ISA	Instrument Society of America
kWH	Kilowatt Hours
LAN	Local Area Network
MFA	Master Fire Alarm
N.C.	Normally Closed
NIP	Network Interface Panels
N.O.	Normally Open
NEC	National Electrical Code
OA	Outdoor Air
PDL	Peak Demand Limiting
P/E	Pneumatic/Electric
PLC	Power Line Conditioner
PUP	Non-Proprietary Public Unitary Protocol
PROM	Programmable Read Only Memory
RA	Return Air
RAM	Random Access memory
RH	Relative Humidity
RTC	Real Time Clock
RTD	Resistance Temperature Detector
SA	Supply Air
SWH	Service Water Heating
SPDT	Single Pole Double Throw
SPST	Single Pole Single Throw
TBG	Time Base Generator
UCP	Unitary Control Panel (also called application specific controllers or UC Controllers)
UL	Underwriter's Laboratory
VAV	Variable Air Volume

1.8 DEFINITIONS

A. Terms

1. **(adj):** This acronym is used for the word "adjustable". It is used in conjunction with the definition of an application parameter that resides in a Building Controller, Advanced Application Controller or Application Specific Device. Example: The hot water set point shall vary as a function of the outside air temperature. When the outside air temperature is 0 F (adj), the hot water set point shall be 180 F (adj). When the outside air temperature is 60 F (adj), the hot water set point shall be 100 F (adj). In this example, four variables have been defined as adjustable. When so defined, these variables must be exposed to the field bus as BACnet objects for viewing by a BACnet OWS.

2. **Actuator:** Control device to provide motion of a valve or damper in response to a control signal.

3. **A/D Converter Resolution:** The resolution of an analog to digital converter is the voltage range of the A/D divided by 2 to the X power where X is the number of bits for the A/D converter.

4. **Advanced Application Controller:** A controller with provisions for all of the physical inputs and physical outputs associated with a single mechanical component such as a terminal unit, air-handling unit, chiller or boiler. The controller shall also have embedded in it all of the control logic that is associated with the physical inputs to the physical outputs. A process controller may or may not have data management features such as time schedules, trend data storage and alarm message generation capabilities. These features may be provided by the Building Controller.

5. **AI:** Analog Input

6. **Alarm Handling:** The process by which the existence of an alarm condition results in the dispatch of an editable message to one or more operator workstations.

7. **Algorithm Execution Sample Rate:** How often a mathematical algorithm in a controller generates a new output value.

8. **Analog:** Continuously variable state over a stated range of values.

9. **Analog Calibration Offsets:** For all analog input measured variables, there is a requirement to adjust the value measured by the hardware based analog input point to match the value reported by a certified test instrument. An analog calibration offset is a parameter that can be added or subtracted from the raw value measured by the sensor to produce a calibrated value that will be use by the control logic and reported to the operator workstations. The initial value of this parameter is set at zero and it is adjusted when the calibration process is executed. This adjustment is referred to as a single point calibration. These offset values are configuration parameters and as such shall be written to EEPROM. It shall be possible to change the value of these parameters without re-downloading the program to the controller.

10. **AO:** Analog Output

11. **Application Programming Tool (APT):** A software tool used to create control logic for use in a Building Controller or Advanced Application Controller (Process Controller or Supervisory Logic Controller). Application programming tools are unique to each vendor. Example: The Honeywell application programming tool cannot be used to create an application for downloading to a TAC programmable process controller. The use of open protocols does not impact this definition.

12. **Application Specific Controller (ASC):** A subset of application specific devices (ASD).

13. **Application Specific Device (ASD):** A sensor, controller, or end device that is pre-programmed by the vendor. It may have physical inputs and physical outputs. The control logic, while not programmable, may be configurable through the use of configuration parameters. The application may require input network variables and may send output network variables onto the network.

14. **Approve**: The term "approved," where used in conjunction with the Engineer's action on the Contractor's submittals, applications, and requests, is limited to the Engineer's duties and responsibilities as stated in the Conditions of the Contract. Such "approval" does not release the General Contractor from the responsibility to fulfill the Contract Document requirements.

15. **Approved equal**: to be defined in the specification.

16. **Archive:** Long term storage of historical data. Archived data may be on the hard drive or relocated to disk or tape.

17. **ATS:** Automatic Time Schedules. Automatic time schedule software measures time and executes start and stop commands based on operator created requirements that are based on the day of the week or the date.

18. **AWG:** American Wire Gauge – Standard trade sizes of conductors

19. **B-AAC:** BACnet Advanced Application Controller

20. **B-ASC:** BACnet Application Specific Controller

21. **B-BC:** BACnet Building Controller

22. **B-OWS:** BACnet Operators Workstation

23. **B-SA:** BACnet Smart Actuator

24. **B-SS:** BACnet Smart Sensor

25. **BACnet:** Building Automation and Control Networks

26. **BIBBS:** BACnet Interoperability Building Blocks

27. **Broadcasting:** The propagation of data from a device to the control network. Software objects that broadcast data to the network may include the following parameters:

    a. **Send on Delta:** An adjustable parameter that defines a requirement to broadcast when the data generated by the software object changes by an amount that exceeds this parameter's value. For binary data, this parameter defaults to a change of state. The broadcast of data is initiated when this criteria and the minimum send time requirement have been met. Also referred to as a "Change of Value".

    b. **Minimum Send Time:** An adjustable parameter that defines a mandatory time period during which no broadcasting of data will occur. Once this time period has been exceeded without a broadcast, the send on delta parameter or the maximum send time parameter shall determine when a broadcast is initiated.

    c. **Maximum Send Time:** An adjustable parameter that defines the maximum time period between broadcasts of a software object's data to the network. Should the value of a software object remain constant over an extended period of time, the value will be rebroadcast once every maximum time period.

28. **Building Controller:** A device that includes IP to Field Bus router, automatic time scheduling, trend logging, alarm handling, and supervisory logic control functionality. Sometimes referred to as a BACnet Building Controller or B-BC.

29. **Building Project Manager**: is the Owner's manager for the particular building project.

30. **Bus Topology:** A term used to describe the sequential connection of devices on a LON segment. The communication cable runs from device to device with no tees or stubs from the main communication cable to a device. Also referred to as daisy chain wiring.

31. **CAT:** Category 5 Cable or Category 6 Cable – is an ANSI/EIA Standard 568 that specifies categories of twisted pair cabling systems (wire, junctions, and connectors) in terms of the data rates that they can sustain.

32. **CFM:** Cubic Feet per Minutes

33. **Concurrent Personnel Training**: is to mean adding one more trainee to the number of trainees specified. This trainee will be assumed to be added to the same training class as specified.

34. **Configuration Parameter:** An input variable to a device that is written to EEPROM. Configuration parameters can be changed from the OWS periodically but are not changed routinely as a function of control logic.

35. **Control Room**: the central station for the DDC system. This room shall also mean central control station, or central control center.

36. **Coordination**: the DDC System Supplier shall meet with the Engineer and Owner during the design stages of each building to coordinate the work of the DDC System installation

37. **Data Server:** A personal computer with a Microsoft's Sequel database for the storage of historical data. The historical data is sent to the data server by the system servers.

38. **Data Storm:** A data storm is the uncontrolled transmission of data from a controller to the network. It can consume bandwidth and prevent necessary data from getting through. It is typically caused by poorly written applications that do not use event driven communication with minimum send times, send on delta (change of value), and maximum send time parameters.

39. **Data Terminal Cabinets**: this is a slave or extender panel to the DCP. This panel usually does not operate without being connected to the DCP.

40. **Dead Zone:** With respect the performance of a PID algorithm, the dead zone is the range of an input variable to the PID above and below the set point for which the output of the PID algorithm shall not be changed. Once the input variable gets within the dead zone, it is fruitless to attempt changes to get the input variable any closer to the set point. Assigning a dead zone to a PID loop improves stability and reduces wear and tear on the actuator.

41. **DDC System Installer**: the contractor who is to install all equipment, which is furnished by the specification. The DDC System Installer will provide all wiring, pneumatic tubing and conduit, which are required by the specification unless otherwise noted.

42. **DDC System Manufacturer**: this term shall mean the same as DDC System Supplier and vice versa.

43. **DDC System Project Manager**: is the main contact person who is employed by the DDC System Supplier and is responsible for all DDC matters concerning this project.

44. **DDC System Supplier**: the contractor who is to furnish all equipment required by the specification.

45. **DI:** Digital Input. Also referred to as a binary input or discrete input.

46. **Digital Control Panel**: this is the highest level of equipment that is connected directly to the high speed local area network. The DCP may or may not have I/Os connected to it. (DCP is also referred to as NIP on the Construction Documents.)

47. **Directed**: Terms such as "directed," "requested," "authorized," "selected," "required," and "permitted" mean "directed by the Engineer," "requested by the Engineer," and similar phrases. However, no implied meaning shall be interpreted to extend the Engineer's responsibility into the Contractor's area of construction supervision.

48. **Discrete:** Binary or digital state

49. **DO:** Digital Output. Also referred to as a binary output or discrete output.

50. **Drift:** When a sensor calibration is checked after a defined period of time (typically one year), the difference between the reported value and the measured value is defined as the drift. This measurement assumes that the sensor was calibrated at the beginning of the time period. If the measurement at the end of the time period is at a different value than the measurement at the beginning of the time period, an allowance for the conformity rating must be included.

51. **Dynamic Data:** Data in a field level device that periodically changes values due to the measurements from the physical environment or the execution of control logic.

52. **EEPROM:** Electrically Erasable Programmable Read-Only Memory (ROM) that can be erased and reprogrammed (written to) repeatedly through the application of higher than normal electrical voltage.

53. **Electronic Signature:** Electronic signature is a feature that supports certification under 21 CFR Part 11. When an operator that is signed onto a system takes an action such as changing a set point, the system requires the user name, password and a documented reason for the action before the action is allowed to take affect.

54. **Enforced Acknowledged Response:** When an alarm is acknowledged, the entry of the cause of the alarm, action taken to resolve the alarm state, and additional comments are required.

55. **Engineer** or **Architect:** the Project Engineer for various projects. For the DDC System project, the Engineer shall be Burt Hill. The term "Architect" shall be deemed to mean "Engineer" unless otherwise noted. The Engineer will be responsible for all work which is in design. It may be necessary for the DDC System Supplier to coordinate with the Engineer's subcontractors during design and construction.

56. **Event Driven Communication:** A term used to describe the propagation of data from a device to the network based on broadcasting rather than polling. The send on delta (change of value) parameter is used to define the event and the data propagation is further controlled by the minimum and maximum send time parameters.

57. **Existing: "**Existing" equipment or devices shall remain in service unless otherwise noted. All equipment that is not indicated as being existing shall be new.

58. **FC:** Failed close position of a control device or actuator. The device shall move to the closed position on a loss of the control signal or energy source.

59. **Firmware:** There are two types of software associated with a hardware device. The first element of software provides the underlying core functionality of the device. The second element is the application program that allows the device to execute a specific sequence of control. The first core element is typically revision sensitive and may be updated from time to time by the vendor to improve performance. This first element of software is called firmware.

60. **Floating Control:** Floating control is a control loop algorithm used for fast responding airside and waterside pressure and flow control loops. Defining a set point and a neutral zone creates a "floating" analog zone in units of the process variable. The neutral zone is split half above the set point and half below the set point. Whenever the process variable is within the "floating" zone, the actuator is left unchanged (stationary for tri-state actuators and at the current percent stroke for analog devices). The process variable is measured and the algorithm executed once for each sample rate. For tri-state devices, the sample rate is always 1 second. For analog devices, the sample rate will vary from 2 to 10 seconds (a tuning requirement). During the execution of the algorithm, if the process variable is above or below the "floating" zone, the instructions to the end device are changed. For tri-state devices they are put into motion. For analog devices, their percent stroke signal is either increased or decreased by a set amount (called the bump rate). One

sample rate later the process is repeated. If the process variable has returned to within the "floating zone," a tri-state actuator is instructed to cease motion and an analog device will hold at the new percent signal sent on the last sample. If the process variable remains outside the "floating" zone, a tri-state device will continue in motion and an analog device will receive another "bump". With pressure based control loops, it is usually required to set the position of the control device to a fixed level for a period of time when the system is started. This will preclude a pressure spike in the first few minutes of operation. This is not required for flow control loops.

61. **Flyover:** When the linking object is "transparent", information about the link is viewable only when the operator moves the pointer over the transparent linking object. This process is called a "flyover". A transparent linking object might be placed over a bitmap picture of a piece of equipment. When the operator moves the pointer over the picture of the piece of equipment the link is viewable and clicking on the link takes the operator to the graphic page for the piece of equipment.

62. **Free Topology:** A data wiring topology supported by LON that allows for loops, tees, y-connections, etc. When this topology is used, only one terminator of a specific design is required and allowable cable lengths are significantly reduced. Guidelines on the application of this concept are available from Echelon.com.

63. **Furnish**: The term "furnish" is used to mean "supply and deliver to the Project site, ready for unloading, unpacking, assembly, installation, and similar operations."

64. **Gain:** A term used with proportional control. Gain is 100 divided by the specified throttling range. See also the definition for throttling range. This term is sometimes referred to as the proportional gain.

65. **Graphic Page:** A graphic page is a visual presentation in the operator workstation that allows the operator to view a collection of data in an organized manner. The data on a single view can come from multiple field devices. The data can be organized in a table format within the view. The data can be displayed on a visual representation of a mechanical system. Both visual equipment displays and columns of data can be displayed on single view. Links to other graphical pages can be displayed. Links to IP addresses can be displayed on a graphic page. A graphic page can be static such as a site map or picture with no dynamic data only links to other graphic pages.

66. **Graphical Programming:** Graphical programming is a concept where mathematical and logical algorithms are represented by graphical objects. Control logic is laid out by placing objects on a palate and connecting the output of one object to the input of the next object. Once completed, the object oriented diagram is compiled and checked for errors, and when all errors have been eliminated, the program can be downloaded to a controller.

67. **General**: Basic Contract definitions are included in the Conditions of the Contract.

68. **High Volume Accumulator:** Given the physical difficulty in measuring the static pressure of the outside air, the static pressure sensor is installed in a fabricated device that is made of a section of PVC piping. The pipe as multiple holes drilled in it to allow the interior of the pipe section to represent the static pressure without the effects of wind pressures. The sensor is installed in one end and the holes are drilled at all angles near the opposite end of the pipe. Both ends are capped.

69. **Historical Trend Data:** Trend data is a collection of values from a specific variable in a field bus level device such as the mixed air temperature on an air-handling unit. The collection of this data may be accomplished whenever the AHU is operating and then once every five minutes. This collected data is then stored in a database on a data collection computer. Once the data is removed from the device and placed in the database, it is considered to be Historical Trend Data.

70. **HOA:** Hand-Off-Auto

71. **HVAC:** Heating, Ventilating and Air Conditioning

72. **HZ:** Hertz, a unit of frequency. It is synonymous with cycles per second.

73. **I/O:** Input and Output

74. **IEEE:** Institute of Electrical and Electronics Engineers

75. **Inch-Pound Units:** A system of units used in the United States as contrasted with the SI system of units. See the ASHRAE Handbook of Fundamentals for a complete list of engineering units under this system of units.

76. **Indicated:** The term "indicated" refers to graphic representations, notes or schedules on the Drawings, or other Paragraphs or Schedules in the Specifications, and similar requirements in the Contract Documents. Where terms such as "shown," "noted," "scheduled," and "specified" are used, it is to help the reader locate the reference; no limitation on location is intended.

77. **Inhibit Alarms:** To inhibit an alarm is to stop the transmission of the alarm message to the OWS. This may be done on chilled water plant during the winter or during major maintenance on a system when the alarms no longer have any real significance. Also referred to as disabled alarms.

78. **Initial Value (IV):** An initial setting for a parameter that can subsequently be changed by the operator without re-compiling and downloading the program.

79. **Install**: The term "install" is used to describe operations at project site including the actual "unloading, unpacking, assembly, erection, placing, anchoring, applying, working to dimension, finishing, curing, protecting, cleaning, and similar operations."

80. **Instance Number:** A unique number in the range of 0 to 4.194,302 assigned to each device in a BACnet system. A conflict in the instance number between two devices can be problematic. This is part of the BACnet addressing scheme for devices.

81. **Internetwork**: refers to the DDC control system's LAN, including all building networks, the campus network, and all associated equipment and cabling.

82. **Interstitial Space:** The space above a ceiling and below the above floor. Ductwork, piping and electrical cables are typically run in this space.

83. **ISA:** Instrumentation, System and Automation Society

84. **Key Contact**: a person designated by the Owner to closely work with the DDC System Supplier. This person may eventually administer the DDC system at the Owner's facility.

85. **Labor**: in the Bid Form, labor by the DDC System Supplier shall include all engineering, custom software programming, submittals, coordination, supervision, checkout, start-up, testing, service and maintenance, and warranty services. It will include all work, training and administrative tasks required by the specifications.

86. **Latch:** A term used in describing control logic where a state change by a binary variable causes another point in the logic to change states and remain at the new state even though the initiating variable reverts to its original state. Latching functions include a reset function that allows the latched variable to revert to its original state when the reset input is toggled.

87. **Later Personnel Training**: is to mean that one additional trainee is to be trained by special arrangement, outside of the regular schedule of training as specified.

88. **Line Programming:** Line programming based application programming tools use line code that is similar to FORTRAN, Basic or C+ programming. Master programs and subroutines are created to meet a sequence of control. The program is then compiled and downloaded to a controller.

89. **Links:** A link is a mechanism by which the system operator can change the operator workstation view from one part of the system to another part of the system or from one graphic page display to another graphic page display.

90. **Local Area Network (LAN):** means the network which connects all of the DCPs. The operator controls may also be connected to LAN. This network is usually an industry standard network such as Arcnet or Ethernet.

91. **Logic Generated Application Parameter:** An application parameter for a control process that is generated by secondary or supporting logic. Example: A proportional plus integral (PI) control loop is used to control a chilled water coil in an Air Handling Unit. The process variable is the discharge air temperature. The set point for the PI control loop is a function of the maximum terminal load from all of the terminals being supported by the AHU. The PI control loop set point is a Logic Generated Application Parameter. If in the sequence of control, a Logic Generated Application Parameter is appended with (rpt), the value of the Logic Generated Application Parameter shall be an output network variable from the control device.

92. **Lump Sum Work**: is the work that is required to be done as part of this Document. This work includes the work associated with various packages as described.

93. **Manual Control:** A concept where the operator, from the operator workstation, takes control of an end device and forces a specific position or state. From a software perspective, the value produced by the control logic is not allowed to affect the position or state of the end device. The manual mode and the desired manual position or state, are parameters that are set by the operator.

94. **Maximum Send Time Parameter:** A parameter used to ensure the periodic update of network data. If a time period equal to the value of this parameter has expired without a broadcast of the variable, are-broadcast of the current value shall be executed. See also send on delta (change of value) and minimum send time parameter definitions.

95. **Minimum Send Time Parameter:** A parameter used to control unnecessary broadcasting of data onto the network. A broadcast of an updated value shall not occur unless a time period equal to the value of this parameter has expired. The expiration of the time period does not mandate a re-broadcast. See also send on delta and maximum send time parameter definitions.

96. **Modulating:** Movement of a control device through an entire range of values proportional to an infinitely variable input value.

97. **Multiple Controller Integrated Control (MCIC):** A concept where multiple controllers with I/O are used to control a single mechanical system such as an air-handling unit. Under this concept, the mechanical system is sub-divided into a collection of processes to be controlled such as the fan start stop circuit, the fan variable speed drive, the mixed air section, the cooling coil section, etc.

98. **NC:** Normally Closed. Refers to the position of a switch or end device when the control signal is removed. Switch or device shall be closed.

99. **Network Number:** Each unique element of the system architecture is assigned a network number as part of the addressing scheme for a BACnet system. The IP layer has a network number. Each field bus has a network number.

100. **NO:** Normally Open. Refers to the position of a switch or end device when the control signal is removed. Switch or device shall be open.

101. **Owner**: Montgomery College

102. **Owner's DDC System Coordinator**: is the lead contact of the Owner for the DDC system for construction projects. This person will interface with the Owner and the DDC System Supplier.

103. **Owner's Lead Contact**: is the Owner's main contact for the DDC system project. This terminology shall be assumed to mean the same as paragraph GG (above).

104. **OWS**: Operator Workstation. With BACnet systems and operator workstation is also referred to as a BACnet OWS.

105. **P:** Proportional only control

106. **Package**: a portion of the project with specific starting and ending periods. Generally, a package will begin with a letter to the contractor (DDC System Supplier) signed by the Owner. The package will end with the Owner's beneficial occupancy of the space. Once the Owner has taken beneficial occupancy of the space, the warranty period for the work provided under that package will begin.

107. **PI:** Proportional plus integral control.

108. **PICS:** Protocol Implementation Conformance Statements.

109. **PID:** Proportional plus integral plus derivative control.

110. **Point**: defined as a hardware I/O to the DDC system. Each hardware point shall occupy a maximum of one wiring termination in a DCP, DTC, or UCP. Each UCP connection to a DCP shall be considered one hardware point.

111. **Process Control:** Process Control consists of a control loop such as PID that requires a process variable (measured by a sensor), the logic of control (PID) and an end device to be commanded. The logic of control may require numerous application parameters that may be fixed, adjustable from the OWS, or the output of secondary control logic.

112. **Process Control Sample Rate:** The time between updates of a newly calculated command to an end device.

113. **Process Variable Sample Rate:** The time between updates of measured values as measured by physical sensors.

114. **Project**: the scope of the total project includes all DDC work, which will be required for a specified period from the execution of the contract. Extensions or reductions in the project scope must be mutually agreed upon by the Owner and the appropriate contractors.

115. **Project Engineer-Future Projects**: is to mean the engineers working on future projects not included in this document.

116. **Project Site**: is the space available to the Contractor for performance of construction activities, either exclusively or in conjunction with others performing other work as part of the Project. The extent of the Project Site is shown on the Drawings and may or may not be identical with the description of the land on which the Project is to be built.

117. **Provide**: The term "provide" means "to furnish and install, complete and ready for the intended use."

118. **Real Time Trend Data:** Trend data is a collection of values from a specific variable in a field bus level device such as the mixed air temperature on an air-handling unit. An operator workstation may poll for the value from the field device and immediately present the data in a graphical format for system troubleshooting. This type of trend data collection and presentation is called Real Time Trend Data. It is a temporary form of data collection used for periodic troubleshooting of a system problem. It is not used on a continuous basis, as excessive polling from a workstation is a poor steward of network bandwidth.

119. **Regulation**: The term "Regulations" includes laws, ordinances, statutes, and lawful orders issued by authorities having jurisdiction, as well as rules, conventions, and agreements within the construction industry that control performance of the Work.

120. **Repeater:** A physical device used to connect two segments. A repeater does not filter any message traffic. A repeater does isolate physical problems such as short circuits to a single segment and is typically required to allow the use of additional devices or additional cable length.

121. **Rolling Average:** An algorithm that eliminates spikes in a variable. Parameters required for a rolling average are the specified time period and the sample rate of the algorithm. When the rolling average variable is updated, the previously calculated rolling average value is multiplied by the time period less the sample rate and then added to the current value of the process variable times the sample rate. This sum is then divided by the time period. The result is the new rolling average value.

122. **(rpt):** An acronym indicating data to be reported for viewing at the OWS.

123. **Sample Rate Support:** The term, sample rate, refers to how often an algorithm is executed. An engineer may wish that a PID algorithm controlling the mixed air damper calculate a new command to the damper once every 25 seconds. The 25 seconds is the sample rate. Sample Rate Support refers to the ability to control the sample rate for any given algorithm.

124. **Send on Delta Parameter (Change of Value):** A parameter used to control unnecessary broadcasting of data onto the network. A broadcast of an output variable shall not occur unless the output variable has changed by an amount equal to or greater than the value of this parameter and the minimum send time has expired since the last broadcast. See also minimum send time and maximum send time parameter definitions. For binary data, the send on delta parameter is assumed to be a change of state. Logic to support the send on delta concept may be imbedded in the configurable structure of an output point or programmed as part of the logic.

125. **SI Units:** A system of units based on the metric system. See the ASHRAE Handbook of Fundamentals for a complete list of engineering units in this system.

126. **Software Point**: defined as any hardware point or point created within the system using a calculation or data manipulation.

127. **SQL:** Structured Query Language. A standard interactive and programming language for getting information from and updating a database via queries.

128. **Stand-Alone Controller:** A stand-alone controller has provisions for all of the physical inputs and physical outputs associated with a single mechanical component such as a terminal unit, air handling unit, chiller or boiler. The controller shall also have embedded in it all of the control logic that associated the physical inputs to the physical outputs. A stand-alone controller will also have data management features such as time schedules, trend data storage and alarm message generation capabilities.

129. **State Descriptors:** DDC devices work in the world of binary numbers. When a binary value is displayed at the OWS, state descriptors can be appended to the data such that the operator shall see the English words rather than the binary values. Example: 0= OFF, 1= ON or 0= STOP, 1= START.

130. **Sub-LAN**: the network wiring for connecting UCPs. There could be several sub-LANs under a DCP.

131. **Supervision**: the DDC System Supplier shall work with the DDC System Installer to obtain the final product, an operating DDC system. The DDC System Supplier shall provide sufficient supervision of these installers to ensure the work is installed without delay.

132. **Supervisory Logic:** Control logic that does not directly rely on physical inputs or physical outputs as does process control. Supervisory Logic uses data from multiple process control loops, applies defined logic to the collection of data and generates instructions to process control loops. Example: Collect the damper positions from 25

VAV controllers. Determine the highest value. When the highest value is at 50%, send a static pressure set point of 1.0 inches of water (adj) to the air handling unit controller. When the highest damper position is at 90%, send a static pressure set point of 1.5 inches of water (adj) to the air handling unit controller. Supervisory Logic may be executed in Building Controllers or Advance Application Controllers.

133. **System Messages:** A message in the event log or alarm viewer that is generated within the OWS and not from a binary indicator broadcast from a controller.

134. **TCP/IP:** Transmission Control Protocol/Internet Protocol. A basic communications protocol in a private network, either an intranet or an extranet.

135. **Testing Laboratories**: A "testing laboratory" is an independent entity engaged to perform specific inspections or tests, either at the Project Site or elsewhere, and to report and interpret the results of those inspections or tests.

136. **Terminator:** An electronic component that consists of a resistive and capacitive circuit specifically designed to enhance the quality of communications on a segment.

137. **Test Instrument Certification Data:** Test instruments are used to measure analog variables in order to effect the calibration of the analog sensor. Test instruments must be periodically re-calibrated by an instrument calibration laboratory to ensure accurate measurements. Re-certification shall be every 12 months unless otherwise specified by the manufacturer of the instrument.

138. **Test Mode:** A concept where the operator from the OWS can interrupt the flow of data from a sensor to the control logic and insert a mandatory test value or test state to be used by the control logic. The test mode and the desired test value or state, are parameters that are set by the operator.

139. **Throttling Range (TR):** A term used with proportional control. It is the amount of change in the process variable that will cause the proportional loop output to change by 100%.

140. **Transmitter:** A transmitter is a device that measures a process variable such as temperature, pressure or relative humidity and generates a corresponding electrical signal such as 0 to 10 VDC or 4 to 20 milliamps for input to a controller.

141. **Trend Chart:** A trend chart is the graphical presentation of trend data. A trend chart can be associated with real time trend data or historical trend data.

142. **Trend Logs:** A trend log is a collection of samples from a specified variable that are stored within a device on the field bus. This data will be periodically sent to the data server for long term storage and reports.

143. **Trend Logging:** The process of sampling and storing periodic values from the same variable at specific time intervals. The samples are stored at the device level and periodically uploaded to the data server where they become historical trend data.

144. **Tuning Parameters, Floating Control:** For floating control, the tuning parameters shall consist of the set point, neutral zone, sample rate, bump rate, shut down value**,** start up time and start up value. The action of the floating control loop, direct or reverse shall be hard coded to meet the needs of the application.

145. **Tuning Parameters, PID Control:** For PID control, the tuning parameters shall consist of the set point, loop throttling range, sample rate, integral time constant or integral gain, and derivative time constant or derivative gain, dead zone and shut down value. The action of the PID control loop, direct or reverse shall be hard coded to meet the needs of the application.

146. **UL:** Underwriters Laboratory

147. **Unitary Control Panel" (UCP or UC):** means the application specific controllers. These panels can provide stand-alone operation. Some of these panels may be configured for use with specific equipment while others will be programmable for custom applications. Units may have universal inputs/outputs.

148. **University Points or I/O**: means that all of the points that connect to the DCP, UCP/UC, or DTC are user definable; there are no fixed inputs or outputs (digital or analog).

149. **UPS:** Uninterruptible Power Supply. A device that allows your computer to keep running for at least a short time when the primary power source is lost. A UPS contains a battery that provides power when the primary power source is lost.

150. **Validate:** A term used in concert with calibration and sequence of control performance verification. To validate is to verify that processes have been executed and the results are within defined standards.

151. **VAV:** Variable Air Volume

152. **VFD:** Variable Frequency Drive

153. **Web Server:** A software package installed on a desk top computer that provides for operation access to the Enterprise Level EMCS system from a computer on the TCP/IP network, using only a browser.

154. **Work**: all labor and equipment provided under a specific contract.

1.9 SPECIFICATION FORMAT AND CONTENT

A. Specification Format: These Specifications are organized into Divisions and Sections based on the Construction Specifications Institute's 33-Division format and MASTERFORMAT numbering system. This format does not intend any organization for trade union or subcontract purposes.

B. Specification Content: This Specification uses certain conventions in the use of language and the intended meaning of certain terms, words, and phrases when used in particular situations or circumstances. These conventions are explained as follows:

1. Abbreviated Language: Language used in the Contract Documents is the abbreviated type. Implied words and meanings shall be appropriately interpreted. Singular words will be interpreted as plural and plural words interpreted as singular where applicable and/or where the context of the Contract Documents so indicates.

2. Imperative and streamlined language is used generally in the Specifications. Requirements expressed in the imperative mood are to be performed by the Contractor. At certain locations in the text, for clarity, subjective language is used to describe responsibilities that must be fulfilled indirectly by the Contractor.

1.10 DRAWING GRAPHICS AND CONTENT

A. Graphics employed on the drawings are those recognized in the construction industry. Those used in mechanical and electrical contexts are generally those recommended by ASHRAE, ASME, ASPE, ISA and IEEE. Refer any uncertainty to the Engineer for clarification before proceeding.

B. The manner in which the drawings are organized or titled does not intend any group for trade union or subcontract purposes.

1.11 INDUSTRY STANDARDS

A. Applicability of Standards: Except where the Contract Documents include more stringent requirements, applicable construction industry standards have the same force and effect as if bound or copied directly into the Contract Documents. Such standards are made a part of the Contract Documents by reference.

B. Publication Dates: Comply with the standard as stated. If not referenced by date, comply with that in effect as of the date of the Agreement.

C. Conflicting Requirements: Where compliance with two or more standards is required and they establish different or conflicting requirements for minimum quantities or quality levels, the most stringent will be enforced. Refer requirements that are different, but apparently equal, and any other uncertainties to the Engineer for a decision before proceeding.

1. Minimum Quantity or Quality Levels: The quantity or quality level indicated shall be the minimum provided. The actual installation may comply exactly with the minimum specified, or it may exceed the minimum within reasonable limits. In complying with these requirements, indicated numeric values are either minimum or maximum, as appropriate for the context. Refer uncertainties to the Engineer for a decision before proceeding.

D. Copies of Standards: Each entity engaged in construction on the Project is required to be familiar with industry standards applicable to that entity's construction activity. Copies of applicable standards are not bound with the Contract Documents.

1. Copies of standards for the performance of a required construction activity shall be obtained directly from the publication source. These standards, along with any referenced code, are to be available at the Project Site for reference.

E. Abbreviations and Names: Trade association names and titles of general standards are frequently abbreviated. Where such acronyms or abbreviations are used in the Specifications or other Contract Documents, they mean the recognized name of the trade association, standards generating organization, authority having jurisdiction, or other entity applicable to the context of the text provision. Refer to the "Encyclopedia of Associations," published by Gale Research Co., available in most libraries.

1.12 GOVERNING REGULATIONS/AUTHORITIES

A. The Contractor should contact those authorities having jurisdiction for data and clarification regarding the Contractor's responsibilities to the Work.

B. Trade Union Jurisdictions: As related to the construction activities, maintain complete current information on jurisdictional matters, regulations, and pending issues. Assign activities in a manner that will not unduly risk disputes, delays, claims and/or losses. Discuss new developments at the Project Meetings at the earliest date.

1.13 SUBMITTALS

A. Permits, Licenses, and Certificates: Submit copies of permits, licenses, certifications, inspection reports, releases, jurisdictional settlements, notices, receipts for fee payments, judgments, and similar documents, correspondence, and records established in conjunction with compliance with standards and regulations bearing upon performance of the Work.

B. Schedule of Standards and Codes: Submit a listing of the standards and codes that will be maintained at the Project Site. Once accepted, provide a copy of this listing to each subcontractor and supplier.

1.14 GENERAL DESCRIPTION OF PROJECT WORK

A. This division of the specification covers execution of the direct digital control (DDC) system work.

B. This division of the specification is divided into six (6) parts to facilitate indexing and referencing.

C. The DDC system shall be furnished by the DDC System Supplier

D. The DDC System Supplier shall supervise the DDC system installation to ensure that the installation is completed in a workmanlike manner and to satisfy himself that all work has been installed correctly so that he can provide a complete warranty for the system.

E. In all cases where a device or equipment item is referred to in the singular, such reference shall apply to as many such items as are required to complete the installation.

F. The following paragraphs outline the work which will generally be performed by the DDC contractors under most circumstances.

G. The work covered by this specification consists of furnishing all engineering, coordination, supervision, start-up and testing services, training, necessary coordination with the owner, the contractor, equipment, accessories, and materials, and complete the installation of the DDC system in strict accordance with this specification and applicable drawings. Where the sequence of control for an equipment item or system has not been specifically addressed, the industry standard operation sequence shall be provided. If this is the case, the DDC System Supplier shall amplify or explain in detail what is being provided. The work by the DDC System Supplier generally includes the following:

1. Provide a complete DDC system as described herein. The system shall be an integrated, easy-to-operate, flexible, microprocessor-based or desktop microcomputer-based direct digital control system for control of heating, ventilating, and air conditioning, as well as space pressurization. The DDC system shall be completely factory programmed, including all color graphics and report tables, and ready for operation.

2. The proposed system shall include any software required to program the proposed controllers. This software shall reside on the PC's. connected to the network and be configured such that any remote operators console can be used to program any of this DDC systems controllers connected to the network anywhere in the system. All scheduling, alarming, trending, and graphical user interfaces shall be accomplished through the system.

3. Provide the automatic temperature control system including all sensors, actuators, end devices, display devices, stand-alone local control panels, network subsystems, all communication and application software, all power and control wiring and all computer equipment consoles required by the drawings and the specifications.

4. Provide hardware and software complete with all engineering, documentation, start-up/commissioning, calibration, testing, trouble shooting, field service, training, and warranty as described herein.

5. Provide electronic sensors for all major HVAC equipment and for other equipment as herein described.

6. Provide a complete set of submittals as described herein.

7. Provide complete start-up and testing services as herein described.

8. Provide training to the Owner as herein described.

9. Provide Owner's Manual, complete operating instructions and spare parts lists as herein described.

10. Provide a minimum two-year full service parts and labor warranty on all control components. Provide a minimum five-year full service parts and labor warranty on DCP, operator interfaces, servers, and any other interface device.

11. Provide five-year operating system upgrades.

12. Furnish the specified number and types of spare parts to maintain critical operation.

13. Provide and closely supervise the DDC system installation to ensure that the installation is completed in a workmanlike manner and to satisfy himself that all work has been installed correctly so that he can provide a complete warranty for the system.

14. Provide automatic air dampers, complete with pneumatic or electronic actuators as specified. Provide valves with valve actuators as specified.

15. Provide all unitary application-specific control panels and actuators. Coordinate with the Owner.

16. Coordinate work with the work of each and every party involved in the project.

17. Provide other work that is required for a complete and operating DDC system, which is not specifically called out.

H. Qualifications of DDC System Supplier

1. The DDC System Supplier shall have been involved with the development and the supply of similar equipment for at least five (5) years.

2. The DDC System Supplier or his representative shall have played a major role in the operation and testing of the proposed equipment type at the factory or a test facility.

3. The DDC System Supplier and his representatives shall each have a successful track record of installations using the type of equipment described herein. The proposer shall be able to submit a minimum of 10 completed projects of similar size, design, and complexity. These systems shall serve as references regarding the system and the performance of the DDC System Supplier's capability and performance.

4. The DDC System Supplier and his representative shall have in-house engineering and service personnel experienced in implementing this type of project. The engineering and service technicians assigned to the project shall have a minimum of five years of experience in systems of this type. The DDC System Supplier shall submit for approval, the resume of all personnel to be used on the project.

1.15 IMPERATIVE LANGUAGE USED GENERALLY IN THE SPECIFICATION

A. Except as otherwise indicated, the requirements expressed imperatively are to be performed by the contractor. For clarify of reading at certain locations, contracting subjective language is used to describe responsibilities, which must be fulfilled indirectly by the contractor, or when so noted, by others.

1.16 BIDDER'S INITIATIVES

A. The DDC System Suppliers must provide a bid for the system as specified. Deviations from the specification in quoting the bid prices may render the bid invalid.

B. If the DDC System Suppliers have suggestions or value engineering alternatives, the same should be listed along with the price, in the Bidder's Initiatives Supplement to the Bid Form.

1.17 DDC SYSTEM SUPPLIER'S LEAD PERSON

A. The lead person is the main Project Engineer who will be the DDC System Supplier's main contact with respect to the project. It is intended that he will not have to confer with the DDC System Supplier's branch manager on most details.

B. The lead person is expected to have several years' experience with the DDC System Supplier whom he represents.

C. The Owner will have the option to approve the lead person, whose resume shall be submitted with the proposal, or to reject him. Should the Owner reject the proposed lead person, the DDC System Supplier shall offer another lead person who meets the Owner's approval at no additional cost to the Owner.

D. During the course of the project, the Owner will have the right to request that the lead person be replaced because of failure to perform. This person will then be replaced with another lead person who meets the Owner's approval at no additional cost to the Owner.

E. "Failure to perform" would include, but not be limited to, the following:

1. Not fulfilling his lead person functions.

2. Failing to be able to act independently of the branch office on most matters.

3. Failing to respond to any and all matters on a timely basis.

4. Failing to get the DDC system operating properly.

F. Lead person primary functions shall include the following:

1. Act as primary contact person for all matters relating to project, schedule, technical matters, billing and administrative problems.

2. Attend construction meetings for the various work packages for which the DDC system supplier has a contract with the Owner.

3. Provide lead engineering for and review all technical submittals for the initial project and future work packages.

4. Prepare testing plans and procedures.

5. Prepare training agenda.

6. Attend kick-off meeting for new projects involving the DDC system.

7. Coordinate, review and approve all DDC system engineering work for conformance to specification, conformance to material standard requirements and conformance to budget requirements.

8. Prepare updated unit pricing annually and review the updated pricing with appropriate Architect/Engineer and Owner representatives, as required.

9. Coordinate work with the Architect/Engineer and Owner.

10. Review and approve all project billings.

11. Coordinate all work being performed by all Engineers and installation supervisors provided by the DDC System Supplier under this contract.

12. Coordinate new DDC system works with the existing DDC system work by coordinating with the Owner's maintenance personnel.

13. Work with the Engineer on the design of control systems for scope changes.

14. Be responsible for accurate installation of all equipment.

G. The lead person will be responsible for supervising all installation work and as such may be supported by the DDC System Supplier with additional personnel to fulfill those duties at no additional cost to the Owner.

END OF PART 1

PART 2 - GENERAL COORDINATION AND ADMINISTRATION

2.1 SCOPE OF THIS SECTION

A. This specification covers the general requirements for project coordination and administration of the DDC System project for the work related to the entire project, as well as individual packages. This part also describes the general requirements for system installation, start-up, testing, submittals, etc.

B. For various packages described in this document and all future DDC System packages, requirements for that building package shall apply. In case of two conflicting directions, the most stringent requirement shall apply.

2.2 ABBREVIATIONS AND DEFINITIONS

A. See Section 230900/Part 1, 1.7 and 1.8 for Abbreviations and Definitions respectively.

2.3 APPLICABLE STANDARDS AND PUBLICATIONS

A. The standards and publications listed hereafter form a part of this specification to the extent referenced. The publications are referred to in the text by their abbreviated designation only. Other publications, codes, and standards may also be applicable.

1. Federal Communications Commission (FCC) Rules and Regulations:

Part 15	Radio Frequency Devices (Vol. II, July 1981)
Part 68	Connection of Terminal Equipment to the Telephone Network (Vol. X, July 1977)

2. American National Standards Institute (ANSI) Publications:

C2-1987	National Electrical Safety Code
C62.41-1980	Guide to Surge Voltages in Low Voltage AC Power Circuits
C12.1-1982	Code for Electricity Metering and Correction Sheet
C57.13-1978	Instrument Transformers
ANSI/IEEE C62.45-1987	Guide on Surge Testing for Equipment Connected to Low Voltage AC Power Circuits
ANSI/IEEE C57.110-1986	Recommended Practices for Establishing Transformer Capability when Supplying Non-sinusoidal Load Currents
ANSI/ASHRAE	Standard 135-1995

3. American Society of Mechanical Engineers (ASME) Publications:

Fluid Meters, Their Theory and Application (6th Ed., 1971; Errata 1974)

4. Electronic Industries Association (EIA) Publications:

RS-232-C	Interface Between Data Terminal Equipment and Data\Communication Equipment Employing Serial Binary Data Interchange (Oct. 1969)

5. The Institute of Electrical and Electronics Engineers, Inc. (IEEE) Publications:

No. 142-1991	Recommended Practice for Grounding of Industrial and Commercial Power Systems
No. 1100-1992	Powering and Grounding Sensitive Electronic Equipment
No. 587-80	Guide for Surge Voltage in Low Voltage AC Power Circuits

6. National Electrical Manufacturers Association (NEMA) Publications:

250-1979	Enclosures for Electrical Equipment Incl. Rev. 1 (1000 Volts Maximum)

7. Underwriters Laboratories (UL):

UL 1449-1987	Transient Voltage Surge Suppressors
UL 268A	Smoke Detectors for Duct Applications

8. National Fire Protection Association (NFPA)

NFPA 70	National Electric Code
NFPA 101	Life Safety Code
NFPA 92A	Recommended Practice for Smoke Control System

9. 2012 International Codes

2.4 SUBSTITUTIONS

A. It is the Owner's intent to get all common types of equipment on this project. For instance, if the DDC System Supplier decides to use a Type A unitary controller of an AHU, the Owner does not want to see both Type A or Type B controllers installed on the project over the life on similar equipment of the project.

B. The DDC System Supplier shall furnish the sensors which he submits in his technical proposal only.

C. "Approved equal", as listed behind each supplier, means as approved by the Architect and Owner. When "approved equal" is listed, the DDC System Supplier shall provide the particular product specified or a comparable item with all the specified characteristics and accessories which is manufactured by a reputable manufacturer. No device, sensor, or equipment shall be substituted without the Owner's approval. Where the particular device does not meet the required specification, the DDC System Supplier will be required to provide an "approved" device at the same cost as listed on the bid form for all lump sum work.

D. Should a sensor or equipment device become technically obsolete or unavailable or should a sensor or equipment device provide unsatisfactory service as judged by the Owner and/or the DDC System Supplier, a substitution may be made. Once the substitution is made, all of the devices installed thereafter shall be the "substitute" device.

2.5 SUBMITTALS - GENERAL

A. The DDC System Supplier shall be prepared to submit requested data or samples on all material and equipment items to be installed on the project.

B. General

1. After award of contract, all items of computer software and technical data (including technical data which relates to computer software), which are specifically identified in the specification, shall be delivered strictly in accordance with the requirements of the specification to the Architect/Engineer. The Engineer and/or Architect will review all submittals and samples of conformance with design concept of the project and the information contained in the contract documents. The Engineer's and/or Architect's review is for the convenience of the Owner in following the work and does not relieve the vendor/supplier/manufacturer of the responsibility of deviations from the requirements stated in the specification and contract documents. The Engineer's and/or Architect's review shall not be construed as a complete or detailed check of the work submitted nor shall it relieve the vendor/supplier/manufacturer of responsibility for errors of any sort in the submittals and samples or from the necessity of furnishing any work required by the contract documents which may have been omitted from the submittals. The review of a separate item shall not indicate review of the complete assembly in which it functions. Nothing in the Engineer's and/or Architect's review of submittals and samples shall be considered as authorizing (1) a departure from contract documents or the specification, or (2) additional cost to the Owner, or (3) increased time for completion of the work.

2. The Engineer and/or Architect will review submittals with reasonable promptness and will return them to the DDC System Suppliers. The proposals will be stamped as follows to indicate the appropriate action taken:

a. Reviewed.

b. Revise and resubmit.

c. Rejected.

3. Manufacturer's data sheets for material and equipment shall include model numbers, dimension drawings, operating weights, material specifications, operation and controls, wiring diagrams, performance characteristics, and service procedures, including clearance requirements for maintenance work and conformation to specified codes.

4. No part of the work shall be started in the shop or in the field until the Engineer and/or Architect has reviewed the shop drawings and samples for that respective portion of the work. Shop drawings and samples shall be submitted for review sufficiently in advance of the scheduled start of the work in the shop or in the field to allow ample time in consideration of the number and complexity of the drawings in the submittal, for the Engineer and/or Architect to make an orderly review. No extension of time will be granted to the DDC System Supplier by reason of failure to perform in this respect.

5. Each shop drawing and sample submitted for review shall be accompanied by a letter of transmittal and shall be identified by the project title, DDC System Supplier's name, and a reference to the related point of the contract documents.

6. Shop drawings shall be 11 inch by Shop drawings shall be 11 inch by 17 inch, landscape, bound on the left edge. Organize the packages by building if applicable.

7. All text based documents and product data sheets shall be 8 ½ inch by 11 inch format bound on the left edge.

8. All shop drawings in AutoCAD and PDF format shall be included on fully labeled CDs that includes a table of contents file in PDF format that provides a description of all of the files on the CD.

9. All submittal packages shall be submitted in a “D” clip binder of adequate size to comfortably fit all material enclosed.

C. Design Review Meeting. All submittal packages shall be submitted in a “D” clip binder of adequate size to comfortably fit all material enclosed

1. The selected controls contractor is required to set up a meeting with the Architect / Engineer at their office to review the design intent and submittal requirements prior to the submission of the first submittal package.

2. The GC and Mechanical contractor may attend this meeting at their discretion.

2.6 SUBMITTALS FOR PACKAGES

A. Group I Technical Data Package: The items listed in this paragraph should be provided prior to starting the installation of the DDC system:

1. System Drawings: The submittals shall include the following:

a. Operator's console equipment installation, block diagrams, and wiring diagrams.

b. DCP/DTC installation, block diagrams, and wiring diagrams.

c. DCP/DTC physical layout and schematics.

d. DCP/DTC/UCP physical layout and schedules.

e. Sensor and control wiring and installation drawings.

f. Details of connections to power sources, including grounding.

g. Details of surge protection device installations.

h. Instrumentation and control diagrams that are to be posted.

i. All the drawings shall also be supplied on a CD disc in AutoCadd format.

j. Schematics showing communication equipment such as a phone modem, etc.

2. Equipment Data: The submittals shall include complete catalog cut data for all materials to be installed including field and system equipment. The following equipment shall be submitted for prior approval in order to expedite subsequent project submittals.

   a. Operator's equipment

   b. DCP/DTC/UCP

   c. Enclosures

   d. Power supply

   e. Relays

   f. Terminal strips

   g. Field devices.

3. System Description and Analyses: The submittal shall include system descriptions and analyses used in sizing equipment required by the specification. Descriptions shall describe how the equipment will operate as a system to meet the performance of the specification. This system description will not necessarily include proprietary information but must include sufficient information for a building control system operator to learn about the system operation; it may serve as a text for the training course. The submittals shall include, but not be limited to, the following:

   a. Operator's console requirements.

      1) Communication speed and protocol description (if standard methodologies are used, refer to such standards). The DDC System Supplier, when selected will be required to provide their system protocols to the Owner under a non-disclosure agreement.

      2) DCP memory size.

      3) DCP automatic start up operations.

      4) Database update procedure.

      5) DCP expansion capability and method of implementation.

      6) Sample copies of each type of DCPs-generated report.

      7) Database entry forms.

      8) Historical data and trending methodology.

   b. Software Data: The submittals shall consist of complete descriptions of DCP and operator's console software as specified. The software data will not necessarily include proprietary information but must include sufficient information for a building control system operator to learn how to operate the DDC system; it may serve as a text for the training course. The submittals shall be organized as follows:

      1) DCP Functions

      2) DCP Operating System

      3) DCP Start-up

      4) DCP Operations

      5) DCP Applications Software

      6) DCP Communications Software

      7) DCP Commands

8) Operator's Console Operating System

9) Operator's Console Communications Software

10) DE Definition Process

11) Reports

12) Control Sequences for all DCPs, DTCs, and UCPs.

c. Certifications:

1) FCC Certifications: All specified FCC certifications shall be provided with the first submittals.

4. Specific Shop Drawing Requirements

a. System Architecture Design Diagram

1) This is a riser diagram that shall show the IP layer and all of the field bus layers.

2) It shall show each computer, printer, router, repeater, controller, and protocol translator that is connected to either the IP layer or any of the field busses.

3) This diagram shall include the existing control system that is to be integrated into the common enterprise level system.

4) Each component that is shown shall have a name that is representative of how it will be identified in the completed database and the manufacturer's name and model number.

5) The physical relationship of one component to another component shall reflect the proposed installation. Example: If AHU1 controller is the closest controller to the Building Controller on the field bus, then this device shall be shown as the first device on the riser diagram just below the Building Controller.

b. This diagram shall not include power supplies, sensors or end devices.

1) Layout Design Drawing for each control panel:

2) The layout drawing shall be to scale with all devices shown in their proposed positions.

3) All control devices shall be identified by name.

4) All terminal strips and wire channels shall be shown.

5) All control transformers shall be shown.

6) All 120 VAC receptacles shall be shown.

7) All IP connection points shall be shown.

c. Wiring Design Diagram for each control panel.

1) The control voltage wiring diagram shall clearly designate devices powered by each control transformer. If the control devices use half wave power, the diagram shall clearly show the consistent grounding of the appropriate power connection. All wire identification numbers shall be annotated on the diagram.

2) The Field Bus wiring diagram shall clearly show the use of the daisy chain wiring concept, the order in which the devices are connected to

the Field Bus, and the location of end of segment termination devices. All wire identification numbers shall be annotated on the diagram.

3) If shielded communication wiring is used, the grounding of the shield shall be shown.

4) The terminal strip wiring diagram shall identify all connections on both sides of the terminal strip. Wiring label numbers for all wiring leaving the control panel shall be annotated on the diagram.

d. Wiring Design Diagram for individual components (controllers, protocol translators, etc.): The wiring diagram for each component shall identify all I/O, power, and communication wiring and the locations on the terminal blocks to which the wires are landed. Example: Fan Status sensor is wired from terminals 5/6 on the controller to terminals 17 and 18 on the terminal strip.

e. Installation Design Detail for each I/O device.

1) A drawing of the wiring details for each sensor and/or end device.

2) For devices with multiple quantities, a standard detail may be submitted.

f. A System Flow Design Diagram for each controlled system.

1) A two dimensional cross sectional diagram showing key components such as fans, coils, dampers, valves, pump, etc.

2) Identify the locations and names of all sensors and end devices that are associated with the control system. Label the panel name and terminal numbers where the connections are landed.

3) A legend shall be provided for all symbols used.

g. Direct Digital Control System Hardware Technical Data.

1) A complete bill of materials of equipment to be used indicating quantity, manufacturer, and model number.

2) Manufacturer's description and technical data for each unique device to include performance curves, product specification sheets, and installation instructions. When a manufacturer's data sheet refers to a series of devices rather than a specific model, the data specifically applicable to the project shall be highlighted or clearly indicated by other means.

3) This requirement applies to:

a) Controllers

b) Transducers/Transmitters

c) Sensors

d) Actuators

e) Valves

f) Relays and Switches

g) Control Panels

h) Power Supplies

i) Batteries

j) Operator Interface Equipment

h. An Instrumentation List for each controlled system.

1) The list shall be in a table format.

2) Include name, type of device, manufacturer, model number, and product data sheet number.

i. Sequence of Control: A sequence of control for each system being controlled. Include the following as a minimum.

1) Process control sequence for each end device.

2) Supervisory logic sequence of control for each system.

3) The impact of each global application program on the sequence of control (Example: Demand Control).

4) A list of all physical inputs and outputs associated with each sequence.

5) Within the sequence of control, all application parameters that are to be user adjustable from an OWS shall be annotated with (adj) after the name of the parameter. This shall include set points, reset schedule parameters, calibration offsets, timer settings, control loop parameters such as gain, integral time constant, sample rates, differentials, etc.

6) Within the sequence of control, all calculated values that are to be viewable at the OWS shall be annotated with (rpt) after the name.

7) All points that shall be subject to manual control from an operator workstation.

8) A list of all alarm points, a description of the alarm and a description of the alarm criteria.

9) A list of all variables for which historical trending will be applied, the sample rates and any criteria used to start and stop the historical trending.

10) Binding Map

11) A list of the device to device data flow. This shall not include the flow of data from devices to the presentation system.

12) Include:

a) Description of the variable.

b) Sending device.

c) Receiving device.

j. Graphic Pages: Submit a sample graphic page for each type of page described in the specification section on graphic pages

k. Setpoint List

1) Provide a list of all setpoints for the project by sequence number

2) The list shall indicate the value of all setpoints that were gleaned from the contract documents.

3) All setpoints that will be field adjusted during the commissioning and balancing processes shall be noted.

4) All setpoints that require additional information from the Architect / Engineer shall be noted.

l. Graphical Sequence Diagrams:

1) Provide a graphical sequence diagram for every sequence

2) This diagram shall match the programming used for the sequence. One should be able to determine exactly how the sequence was programmed and all of the logic contained in the sequence. All nodes shall be labeled for clarity.

3) This diagram will be used by the College to trouble shoot issues with the system after the building has been turned over to the owner. The diagram shall be modified at the end of the project to match the as built conditions.

4) If the selected control vender uses a graphical program langue, those diagrams may be used as long as they are clear and well labeled.

m. Object, Device, and Network naming convention:

1) The college has a standing naming convention for all control objects, devices, and networks. The controls contractor shall use these naming conventions when they prepare the control submittal.

2) The naming convention standard will be made available to the controls contractor for their use.

B. Group II Technical Data Package:

1. Operation Verification Testing and Endurance Testing Data: A Test Plan and Test Procedures for the Operation Verification Test and Endurance Test shall be delivered to the Architect/Engineer for approval. The Owner reserves the right to witness any and all testing and shall be notified in advance of testing. The Test Plan shall describe in general terms the applicable tests to be performed, other pertinent information such as specialized test equipment required, and duration of Operation Verification Test. The test procedures shall explain in detail, step-by-step actions and expected results to demonstrate compliance with the requirements of the specification. The "Test Plans" for the Operation Verification Test and Endurance Test shall be delivered to the Architect/Engineer. After receipt of written approval of the Test Plan, deliver the Operation Verification Test Procedures for approval. Written approval by the Architect/Engineer of the Operation Verification Test Procedures shall be one of the prerequisites for commencing the Operation Verification Test as specified. All the test and calibration equipment required for the Operation Verification Test shall be provided by the Contractor. The test equipment provided as part of the Central System package will be used for testing.

2. Operation and Maintenance Manuals: Copies of the draft operation and maintenance manuals, as specified for the Group III Technical Data Package, shall be delivered to the Architect/Engineer prior to beginning the Operation Verification Test for use during site testing.

3. Training Documentation: Lesson plans and training manuals for the training phases, including the type of training to be provided, with a list of reference material shall be delivered for approval.

4. Data Entry Forms: Deliver the completed data entry forms utilizing all data from the contract documents, field surveys, and all other pertinent information required for complete installation of the data base. Identify, and request from the Architect/Engineer any additional data needed to provide a complete and operational DDC system. The completed forms shall be delivered to the Architect/Engineer for review and approval at least 90 days prior to the DDC system's scheduled need date.

C. Group III Technical Data Package: The Group III Technical Data Package consists of the operation and maintenance manuals. Final copies of the manuals bound in hardback, loose-leaf binders shall be delivered to the Architect/Engineer within thirty (30) days after completing the

Endurance Test. The draft copy used during site testing shall be updated with any changes required prior to final delivery of manuals. Each manual's contents shall be identified on the cover. The manuals shall include the names, addresses, and telephone numbers of service representatives and of each subcontractor installing equipment and systems, and of the nearest service representatives for each item of equipment and each system. The manuals shall have a table of contents and tab sheets. The tabs on the tab sheets should be either laminated plastic or of metal construction to ensure that they do not disintegrate after repeated use. Tab sheets shall be placed at the beginning of each chapter or section and at the beginning of each appendix. The final copies delivered after completion of the Endurance Test shall include all modifications made during installation, checkout, and acceptance. Manuals provided shall include:

1. Functional Design Manual: Twelve (6) copies.
2. Hardware Manual: Twelve (6) copies.
3. Software Manual: Twelve (6) copies.
4. Maintenance and Calibration Manual: Twelve (6) copies.
5. Operator's Manual: Twelve (6) copies.

    a. Functional Design Manual: The functional design manual shall identify the operational requirements for the system and explain the theory of operation, design philosophy, specific functions and sequence of operations. A description of hardware and software functions, interfaces, and requirements shall be provided for all system operating modes.

    b. Hardware Manual: A manual describing computers, I/O equipment and sensors shall be provided, including:

        1) General description and specification.

        2) Installation and checkout procedures.

        3) Equipment electrical schematics and layout drawings. (Field and panel wiring/piping diagrams between DCP panels and sensors and between DCP panels and control devices; it does not require schematics of DCP panel internal circuit boards.)

        4) System/network overview schematic drawings and I-O wiring lists.

        5) Alignment and calibration procedures.

        6) Manufacturer's repair parts list complete with part numbers, indicating sources of supply.

    c. Software Manual: The manual shall be arranged to provide for separate sections for operator's console software including:

        1) Definitions of terms and functions.

        2) Directory of all disk files.

        3) Description of all communications protocols, including data formats, command characters, and a sample of each type of data transfer. The successful DDC System Supplier shall be required to provide the protocols to the Owner under a non-disclosure agreement.

        4) Operator Commands.

        5) System access requirements.

        6) Data entry requirements.

        7) Flow charts and source code listing for custom application programs developed for Owner.

8) Provide a mathematical description of the control algorithms.

9) Organize the manual to have separate sections for all DCP software, including: definitions of terms and functions; descriptions of algorithms for the applications programs; description of implementation of the applications programs; and description of data base structure and interface with running programs.

10) Description of all communications protocols, including data formats, command characters, and a sample of each type of data transfer.

d. Operator's Manual: The operator's manual shall provide all procedures and instructions for operation of the system, including:

1) Computers and peripherals.

2) System start-up and shutdown procedures.

3) Use of operating system, command, and applications software.

4) Recovery and restart procedures.

5) Detailed data collection procedures.

6) Reports.

e. Maintenance and Calibration Manual: The maintenance and calibration manual shall include descriptions of maintenance and, where applicable, calibration for each type of equipment or device including inspection, periodic preventative maintenance, fault diagnosis, and repair or replacement of defective components. In addition, the maintenance manual shall include the following:

1) Manufacturer's equipment parts list of all functional components of the system, control diagrams, and wiring diagrams.

2) "As-Built" interconnection wiring diagrams, or wire lists of the complete field installed system with the complete, properly identified ordering number of each system component and device.

3) Addresses and telephone numbers of suppliers of parts.

4) Emergency contact person(s) available for telephone consultation and field visit if needed.

D. Group IV Data Package

1. The DDC System Supplier shall supply all drawings, including drawing revisions after start-up, to the Owner on a CD disk in a format such as AutoCADD. These drawings shall include all manually produced drawings required in the Group I submittal.

2. Software

a. Submit a copy of all software installed on the servers and workstations.

b. Submit all licensing information for all software installed on the servers and workstations.

c. Submit a copy of all software used to execute the project even if the software was not installed on the servers and workstations.

d. Submit all licensing information for all of the software used to execute the project.

e. All software revisions shall be as installed at the time of the system acceptance.

3. Firmware Files

a. Submit a copy of all firmware files that were downloaded to or pre-installed on any devices installed as part of this project.

b. This does not apply to firmware that is permanently burned on a chip at the factory and can only be replaced by replacing the chip.

c. Submit a copy of all application files that were created during the execution of the project.

d. Submit a copy of all graphic page files created during the execution of the project.

e. Submit a copy of all secondary graphic files such as bitmaps, jpegs, etc. that were used in the creation of the graphic pages.

2.7 CHECK-OUT PROCEDURE

A. Check-out shall be accomplished by the DDC System Supplier prior to start-up and testing with each individual package. The DDC System Supplier will be responsible to initiate the checkout procedure. The Owner shall be notified prior and, at their option, shall be present to witness.

B. Two tests will be performed: A cold test and a hot test.

1. Cold Test: In this test, the DDC System Supplier shall verify all wiring terminations prior to energizing any equipment.

2. Hot Test: In this test, each control device, the DCP, DPT, and/or UCP shall be energized. Each sensor or transmitter shall be verified to be operating and connected to the proper termination address and each control device shall be operated.

C. The DDC System Supplier shall jointly conduct the "cold" and "hot" tests. This will be demonstrated through a "Sensor/Operator Check-Off Procedure". The completed "check-off sheet" shall be turned over to the Architect/Engineer or Construction Manager as applicable prior to start-up and testing.

D. The responsible DDC System Supplier shall repair any software problems, shorts, ground faults, leaks, wiring terminations, or tubing terminations as required, and shall repair or replace any defective parts.

E. This check-out procedure shall be performed on all present and future packages.

2.8 START-UP AND TESTING

A. The DDC System Supplier shall provide start-up, testing, and adjustment of the completed DDC System. The DDC System Supplier shall provide all personnel, equipment, instrumentation, and supplies necessary to perform all start-up and testing. Written notification of any planned start-up and testing shall be given to the Architect/Engineer and Owner at least 14 days in advance of such work, and in no case shall notice be given until after written approval of the test plans and procedures as specified has been received from the Architect/Engineer.

B. Startup Testing Plan: Submit a start up testing plan for each unique system.

1. The purpose of a startup test is to demonstrate the “completeness” of the physical tasks associated with installation and the physical performance of the components.

2. For each task on the startup test checklist, the plan shall require the technician to enter his or her initials and the date the test was completed along with any recorded data such as voltages, offsets, or tuning parameters. Any deviations from the submitted installation plan shall also be recorded.

3. Required elements of the startup testing include:

a. Measurement of voltage sources, primary and secondary.

b. Verification of proper controller power wiring.

c. Verification of component inventory when compared to the submittals.

d. Verification of labeling on components and wiring.

e. Verification of connection integrity and quality (loose strands and tight connections).

f. Verification of bus topology, grounding of shields and installation of termination devices.

g. Verification of point checkout.

1) Each I/O device is landed per the submittals and functions per the sequence of control.

2) Analog sensors are properly scaled and a value is reported

3) Binary sensors have the correct normal position and the state is correctly reported.

4) Analog outputs have the correct normal position and move full stroke when so commanded.

5) Binary outputs have the correct normal state and respond appropriately to energize/de-energize commands.

h. Documentation of analog sensor calibration (measured value, reported value and calculated offset).

i. Documentation of Loop tuning (sample rate, gain and integral time constant).

4. Submit at least four weeks prior to any scheduled start-up tests.

C. The DDC System shall be started in stages to facilitate the construction schedule. The portions tested shall be as large as practically possible. Portions of the systems to be tested shall be started, operated, and tested independently of previously accepted portions of the system (i.e., before Local Project Specific LAN communication connections are made to the Main Facility-Wide LAN which may exist and be in operation at the time). Testing provided by the DDC System Supplier shall be designed to minimize interference between new and operating systems prior to making the actual LAN connection. The tests on new or add-on systems should include simulations of shared data or functions from the existing LAN system operation.

D. Upon completion of the installation, the DDC System Supplier shall start up the system and perform all necessary testing and debugging operations. An acceptance test shall be performed in the presence of the Owner's representative and the Architect/Engineer. The acceptance test will be performed by the Owner's TAB Agency and/or commissioning agent and will cover sequence verification, sensor calibration, and point to point graphic verification. The University Building Engineer shall also be requested to be present to witness the start-up and testing. This test, as a minimum, shall include an operation/verification endurance test which verifies two weeks of completely automatic and stable system operation has occurred without an unexplained point failure or alarm. The system shall also provide comfort conditions in all spaces affected by the work.

E. Startup Testing Report.

1. Startup testing reports shall be submitted on a per system basis.

2. Startup testing reports shall be the documented results of the executed startup testing plans.

F. Performance Verification Testing Plan: Submit a verification plan for each system.

1. The purpose of a performance verification test is to ensure that the system performs in accordance with the sequence of control. For each end device that is controlled, there shall be a series of step by step cause and effect tests to verify each aspect of the

sequence of control. A sample sequence of control with corresponding performance verification test is included as Appendix B.

2. A performance verification test shall also be defined for the operator interaction with the system. Test elements shall be written to require the verification of all operator interaction tasks including but not limited to the following.

   a. Login and user settings.

   b. Graphics navigation.

   c. Trend data collection and presentation.

   d. Alarm handling, acknowledgement, and routing.

   e. Time schedule editing.

   f. Application parameter adjustment.

   g. Manual control.

   h. Report execution.

   i. Automatic backups.

   j. Web Client access.

3. Submit at least 4 weeks prior to the scheduled execution of the test.

G. Upon receipt of a detailed punch list from the Architect/Engineer, an installation inspection report shall be prepared by the DDC System Supplier showing, by system, each outstanding item on the punch list. After all items appearing on the installation inspection report are completed, a second written request for system approval shall be made to the Architect/Engineer. As each or all items are approved, an appropriate notation shall be entered at the time of joint inspection on the system report, with countersignature of the Architect/Engineer and date. A copy of this report shall be made for the Owner.

H. Where it is required for the DDC System Supplier to modify, alter, add or remove hardware or software programs to the system, or related accessories for the purpose of eliminating punch list items, off-line operation and testing to implement these items shall be performed as required until such time acceptable performance of the system has been established at no additional cost to the Contract.

I. Problems which occur within approved hardware, or software, shall be corrected in an appropriate fashion under warranty. Any such occurrence shall not void previous approval; however, the DDC System Supplier shall be responsible to attend to and remedy such items within the warranty period. The DDC System Supplier shall maintain appropriate logs, schedules, and reports to reflect these items and their redress.

2.9 TRAINING FOR OWNER'S PERSONNEL

A. General: Conduct training courses for designated personnel in the maintenance and operation of the DDC system as specified. The training shall be oriented to the specific system being installed under this contract. Training manuals shall be provided for each trainee with three (3) additional copies provided for archival at the project site. The manuals shall include an agenda, defined objectives for each lesson, and a detailed description of the subject matter for each lesson. The room for training will be provided by the Owner. The audio/visual equipment will be provided by this Contractor. The DDC System Supplier shall communicate his requirements for this equipment to the Owner five (5) working days before the date when the equipment is needed. The DDC System Supplier shall be responsible for all other training material and supplies. Where portions of the course material are presented by audio/visuals, copies of those audio/visuals shall be delivered to the Architect/Engineer either as a part of the printed training manuals or on the same media as that used during the training sessions, in the same quantity as specified for training manuals. A training day is defined as eight (8) hours of classroom instruction, including two

15-minute breaks and excluding lunchtime, Monday through Friday, during the normal first shift in effect at the training facility. For guidance in planning the required instruction, assume that attendees will have a high school education or equivalent, and are familiar with HVAC systems. Notification of any planned training shall be given to the Architect/Engineer at least thirty (30) days prior to the training. If off-site training is required, the Owner will take care of travel and lodging arrangements. The Owner may videotape all training sessions.

B. Operator's Training I: The first course shall be taught at the project site for a period of six (6) consecutive training weekdays during the field testing activity. The Contractor shall assume that a minimum of two (2) training sessions with five (5) people in each will be required. Upon completion of this course, each student, using appropriate documentation, should be able to perform elementary operations with guidance and describe the general hardware architecture and functionality of the system. This course shall include:

1. General system architecture.
2. Functional operation of the system.
3. Operator commands.
4. Control sequence programming.
5. Data base entry.
6. Reports and logs.
7. Diagnostics.

C. Operator's Training II: The second course shall be taught while the Endurance Test is in progress for a total of sixteen (16) hours of instruction per student, in time blocks of four (4) hours. The DDC System Supplier shall assume that six training sessions with two (2) people in each will be required. The schedule of instruction shall allow for each student to receive individual instruction for a four-hour period in the morning (or afternoon) of the same weekday for two (2) consecutive weeks. The Contractor shall schedule his activities during this period so that the specified amount of time will be available during the Endurance Test for instructing the students. The course shall consist of "hands-on" training under the constant monitoring of the instructor. The instructor shall be responsible for advising the Owner about the appropriate password to be issued to the student commensurate with each student's acquired skills at the beginning of each of these individual training sessions. Upon completion of this course, the students should be fully proficient in the operation of all system operations. The training instructor shall prepare a written report describing the skill level of each student at the end of this course and supply three (3) copies to the Architect/Engineer within seven (7) days of completion of the training.

D. Maintenance Personnel Training: The maintenance course shall be taught at the project site after completion of the Endurance Test for a period of six (6) training days. The Contractor shall assume that three (3) training sessions of eight (8) people will be required. The training shall include:

1. Physical layout of each piece of hardware.
2. Troubleshooting and diagnostics procedures.
3. Repair instructions.
4. Preventive maintenance procedures and schedules.
5. Calibration procedures.

E. Executive Training for Planners/Supervisors: This training course shall be taught after completion of the Performance Testing. The requirements of this training course are to provide necessary background to the engineering planners/supervisors about the operation of the DDC system. This training shall consist of two 4-hour classes. Before commencement of this training, at least fourteen (14) days advance notice should be given to the Architect/Engineer. The Owner will

stipulate the number of people that will attend this training course. The training shall include, but not be limited to, the following:

1. Brief description of system architecture.
2. Functional operation of the system.
3. Summary of operator commands.
4. Overview of control sequence programming.
5. Organization of the database.
6. Reports and logs that are available.
7. Overview of the system diagnostics capabilities.
8. Transport of summary level data about building operation energy use and maintenance, for use with commercial spreadsheets and word processing programs.
9. Training for the remote monitoring of the DDC system.
10. Description of the database for detailed (every minute) data collection and method for access.

F. Training/Review Session: Conduct one 8-hour training or review session at the project site, no less than thirty (30) days and no more than sixty (60) days after the acceptance test. The purpose of this session is to allow the trainees to have their questions, which they may have had after system operation, answered. Further training/review sessions may be obtained by the Owner based on unit prices listed in the bid documents.

2.10 TRAINING FOR "ADD-ON"

A. The DDC System Supplier shall provide instructions for all new add-on systems or packages as they come on-line. Each instruction session shall include one 8-hour classroom period. For guidance in planning, it is assumed that all of the students attending these classes are familiar with the existing DDC System and its capabilities and/or have attended previous training classes.

B. The purpose of the instruction is to familiarize the building operators with the new equipment being installed under this contract.

C. The DDC System Supplier shall provide a minimum of ten (10) manuals for instruction in addition to the material required for the trainees. The Owner has stipulated that the maximum number of personnel who will attend each session is six (6). The instruction session will be scheduled with the Owner. The notice for starting the training shall be given to the Architect/Engineer. This notice shall not be less than fourteen (14) days in advance of training.

D. The 8-hour classroom training period will include the following:

1. General description of new equipment installed.
2. A listing and description of each new point and its "name".
3. A general description of the sequence of operation for each new piece of equipment including normal setpoints and all normal and emergency functions. This should include a review of appropriate control drawings, etc.
4. Maintenance training for all "new types" of equipment installed in the facility as a part of the contract.

2.11 WARRANTY TO BE PROVIDED AS PART OF EVERY PACKAGE

A. All devices and components shall be warranted for a period of two (2) years following the date of acceptance of the Performance Verification Test. All system management consoles, DCP, UCPS and software shall be warranted and upgraded to the latest operating system version for a period of five (5) years following the date of acceptance of the Performance Verification Test. This

warranty shall include labor and material. Any defects arising during this warranty period shall be corrected without cost to the Owner. During the warranty period, the Contractor's service personnel shall be available to be physically present at the facility within twenty-four (24) hours for emergency repairs. The Contractor shall consider the possibility of allowing Owner's trained maintenance personnel to affect repairs of extremely critical nature, even before the service representative arrives at the site. For this purpose, a stock of necessary spare parts shall be maintained at the facility. If the Owner's stock of spare parts is used for in-warranty repair, such stock shall be replenished within ten (10) working days.

B. Programmed Preventive Maintenance. The DDC system supplier will perform programmed preventive maintenance. For this purpose, complete requirements for this activity shall be provided, prior to final payment.

C. Preventive Maintenance. The DDC system supplier will perform all required programmed preventative maintenance. Provide complete instructions and the requirements for this activity. Also provide a schedule list for this activity. Each schedule shall list the equipment name, location, and appropriate preventive maintenance functions to be performed during that inspection. The work performed includes, but is not limited to, the following:

1. Check calibration, recalibrate if needed, instrumentation sensors for air flow, liquid flow, pressure, humidity, temperature, and transmitters. Written records shall be kept indicating the performance of such calibrations along with pertinent data. The calibration and operational ranges for all sensors shall be kept with the written records.

2. Check the operation of dampers and damper actuators to assure no seizing or lock-up has occurred. Written records shall be kept indicating the performance of such calibrations along with pertinent data.

3. Check the overall system field operation by performing an all-points review (by hard copy or by documenting all point CRT inquiries). Verifying that all monitoring and command points are valid and active.

4. Check alarming capabilities and system response by initiating alarms and observing the time duration of the responses. Written records shall be kept indicating the performance of such exercises.

D. Upgrades and Maintenance: standard software upgrades shall be included in the price for a period of five (5) years. Training required for software within this period shall be free of charge. Upgrades after this would be at additional cost and at the Owner's discretion. If software is changed due to error (or bugs), such modifications to the software shall be at no cost to the Owner for a period of ten (10) years.

E. Failure by the DDC System Supplier to provide warranty work within one (1) day shall render his conduct as negligent, in which case the Owner shall be entitled to proceed with such work at his discretion and back charge the DDC System Supplier at cost plus 10 percent for expenses incurred.

F. The DDC system supplier shall maintain for the Owner a complete accounting of all systems and components that are under warranty, including a listing of all systems under extended warranty. The listings shall be submitted to the Owner on a quarterly basis.

G. During the first two years of operation, make any recommendations for system modification, in writing, to the Owner and Architect/Engineer. No system modifications, including operating parameters and control settings, shall be made without prior approval of the Architect/Engineer. Any modifications made to the system shall be incorporated into the operation and maintenance manuals, as-built drawings, and other documentation affected.

H. The DDC System Supplier shall provide all custom software updates for control sequence modifications and verify operation in the system. These updates shall be accomplished in a timely manner, shall be fully coordinated with DDC System operators, and shall be incorporated into the operation and maintenance manuals, and software documentation.

2.12 THREE (3) YEAR EXTENDED MAINTENANCE PROGRAM

A. The DDC System Supplier shall provide guaranteed prices for service contract to maintain the system as described above. This price shall be applicable for three (3) years after the warranty expires, and not during the warranty period. Prices shall be submitted for service contractor on a per year basis for the three (3) years. The acceptance of the service contract shall be at the sole discretion of the Owner.

B. This work shall include all parts and services required and equipment necessary to maintain the entire DDC System in an operational state as specified and shall be provided for a period of three years after the initial warranties expire. Impacts on facility operations shall be minimized when performing scheduled adjustments or other nonscheduled work.

C. The adjustment and repair of the DDC System includes all computer equipment, software updates, transmission equipment, DCP's, and all new sensors and control devices. Responsibility shall include all equipment furnished as a part of the DDC system. The manufacturer's required adjustments and all other work necessary shall be provided.

D. A minimum of two service personnel shall be qualified to accomplish all work promptly and satisfactorily with the DDC System Supplier's service organization. The Owner shall be advised in writing of the name of the designated service representative, and of any changes in personnel. In addition, when a change in personnel is made, the outgoing or remaining representative is expected to orient the "new" service representative to the system and to the building. The DDC System Supplier's service personnel are expected to be familiar with the facility, with the location of the DDC System Devices, and with the locations of the equipment served by these devices without being accompanied by the Owner's personnel.

E. The work shall include two minor inspections at six-month intervals or less, two major inspections (offset equally between the minor inspections to effect quarterly inspection of alternating magnitude), and all work required as specified. Preferably, major inspections shall be scheduled in June and December.

1. Minor inspections shall include:

   a. Visual checks and operational tests of all equipment.

   b. Check the overall system field operation by performing an all-points review (by hard copy or by documenting all point CRT inquiries). Verify that all monitoring and command points are valid and active.

   c. Inventory and replenish the Owner's stock of spare parts that the contractor has used in maintenance and repair of the system.

   d. Submit report to the Owner detailing exact items or tasks which were accomplished.

2. Major inspections shall include all work described under "Minor Inspections", plus the following work:

   a. Perform diagnostics on all equipment.

   b. Resolve any previous outstanding problems.

   c. Submit report to the Owner detailing exact items or tasks which were accomplished.

F. In addition to periodic inspections, the DDC System Supplier shall perform in accordance with a program of standardized preventative maintenance as applicable to the Owner's equipment. Maintenance shall be performed a minimum of four times per year and shall coincide with the major and minor inspections. During this activity, the DDC equipment functions shall continue. Each schedule shall list the equipment name, location, and appropriate preventive maintenance functions to be performed during that inspection. The work performed shall include, but not be limited to, the following:

1. Clean all system equipment including CPU, disk memory, RGB color CRT, monochrome CRT, printer, intercom, DCP units, and printed circuit boards.

G. All minor and major inspections and all preventative maintenance work shall be performed during regular working hours, Monday through Friday, excluding legal holidays and as agreed to by the Owner.

H. Performance of scheduled adjustments and repair shall verify operation of the DDC System as demonstrated by the applicable portions of the Operation Verification Test.

I. Refer to Warranty paragraph for requirements on emergency service.

J. The DDC System Supplier shall keep records and logs of each task, and shall organize cumulative records for each major component, and for the complete system chronologically. A continuous log shall be maintained for all devices. The log shall contain all initial analog span and zero calibration values and all digital points. Complete logs shall be available for inspection on site, demonstrating that planned and systematic adjustments and repairs have been accomplished for the DDC System.

K. Each maintenance service call request shall be recorded by the DDC System Supplier, as received. The record shall include the serial number identifying the component involved; its location, date, and time the call was received; nature of trouble; names of the service personnel assigned to the task; instructions describing what has to be done; the amount and nature of the materials to be used; the time and date work started; and the time and date of completion. The Owner shall receive a record of the work performed within five (5) days after work is accomplished.

L. The DDC System Supplier shall make available at no additional cost standard software upgrades which will make available corrections and improvements in software which the Owner has already purchased as a part of this contract. This shall be done for the first five (5) years of the warranty. If the Owner chooses to have a service and maintenance contract, then the DDC System Supplier shall provide and install all software upgrades at no cost, as long as the service and maintenance contract remains in effect.

M. The DDC System Supplier shall provide all replacement hardware for three years after the warranty expires. Replacement hardware shall be purchased at the agreed upon prices given in the bid form.

N. Failure by the DDC System Supplier to provide (start and complete) scheduled maintenance work within 30 days of the established service schedule dates shall render his conduct as neglect, in which case the Owner shall be entitled to proceed with such work at his discretion and back charge the DDC System Supplier at a cost plus 10 percent for expenses incurred. Expenses shall include both material and labor.

2.13 SPARE PARTS

A. The DDC System Supplier shall provide, if directed by the Owner, spare parts. The DDC system supplier will be compensated in accordance with the price identified on the Bid Form, Document 00400. These spare parts are to be used for emergency service work and for preventative maintenance work and shall be restocked within ten (10) days of use. The entire stock of parts shall be provided when the first equipment is started up and shall be available intact at the end of the warranty period.

1. Provide a recommended spare parts list to the Owner for review.

2.14 INSTALLATION FOR ALL PACKAGES

A. Installation of Equipment

1. This paragraph describes requirements for installation of equipment on this project.

2. All system components and appurtenances shall be installed in accordance with the component manufacturer's and the DDC System Supplier's instructions. All necessary interconnections, services, and adjustments required for a complete and operable system

shall be provided. All electrical work and devices shall comply with the National Electric Code and the requirements of the Montgomery County, Maryland and all other applicable codes, and shall be installed by licensed journeyman electricians. Instrumentation and communications grounding shall be installed as necessary to preclude ground loops, noise, and surges from adversely affecting system operation.

3. All equipment shall be installed as required for an operational DDC system. In addition, the following additional precautions shall be followed and equipment shall be provided as required:

   a. All room thermostats and humidistats shall be mounted 48”-54” above the finished floor except in corridors, stairways and toilet rooms where they shall be mounted at 7'-0" above the finished floor. Refer to drawings for exemptions.

   b. RTD assemblies shall be readily accessible and installed in a manner to allow easy replacement.

   c. All RTDs installed in liquids shall be installed in stainless steel thermowalls.

   d. RTDs used for space temperature sensing shall include housing suitable for wall mounting. The housing shall also shield the sensor from sources of radiation.

   e. RTDs used for OA sensing shall have an aspirated radiation shield. The installation of OA sensors shall not be within the thermal boundary layer of the building, away from all building and automobile exhausts and shall not be mounted on concrete surfaces or on the roof.

   f. OA temperature and humidity transmitter shall be provided for, as indicated on the drawings. The preferred location is on the northward facing side of a building or on a louver mullion to an air handling unit which is scheduled to operate continuously.

   g. Averaging sensors in mixed air plenums should be installed across possible stratified air paths to insure a true average temperature.

   h. Pipe temperature sensors shall be located at least ten (10) pipe diameters downstream of converging (mixing) pipe flows.

   i. Temperature switches shall be installed in a manner similar to RTDs. Temperature switches shall be adjusted to the proper setpoint and shall be verified by calibration.

   j. Relative humidity sensors shall have air guards when in-stalled in air flows of more than 50 feet per minute across the sensor element.

   k. Pressure sensors (all types) installed on liquid lines shall have drains. Pressure sensors installed on steam lines shall have drains and siphons or drains and condensate chambers. All pressure sensors shall have 3-way valve manifolds for isolation, venting, by-passing and taps for calibration. Pressure sensors shall be verified by calibration. Differential pressure sensors shall have nulling valves.

   l. Pressure switches and differential pressure switches shall be adjusted to the proper setpoint, and shall be verified by calibration. Pressure switches shall be mounted higher than the process connection.

   m. All flowmeters shall be installed in accordance with ASME "Fluid Meters, Their Theory and Application" and other applicable industry standards. Do not install obstructions, such as temperature wells, in flowmeter "flow tubes".

   n. Flow switches shall be installed in such a manner as to minimize any disturbance in the flow of fluid while maintaining reliable operation of the switch.

o. Potential and current transformers shall be installed in approved electrical enclosures.

p. Watthour and demand meters shall be installed in approved electrical enclosures, in motor starter enclosures or in electrical switchgear enclosures.

q. Position sensing potentiometers shall be selected and in- stalled with type and mounting suited for the application to provide reliable operation.

r. End (Limit) Switches shall be selected and installed with type and mounting suited for the application to provide reliable switch operation.

s. Relays and contactors shall be installed in approved electrical enclosures, apparatus control panels, DCP panels, DTC panels, or in starter enclosures.

t. Electric solenoid operated pneumatic (EP) valves shall be installed in approved electrical enclosures or in apparatus control panels.

u. Pneumatic receiver/controllers shall be installed in apparatus control panels.

v. Current to pneumatic (I/P) transducers shall be installed in apparatus control panels, DCP panels or in DTC panels.

w. All temperature, humidity, and flow sensing transmitters and switches located in ductwork shall be installed in locations where the devices can be easily removed for routine maintenance and cleaning. This is particularly important for devices located in return air, exhaust air, and unfiltered air ductwork.

x. All wind speed and wind direction sensing devices shall be installed in a location as directed by the Architect.

4. All apparatus control panels, DCP panels and DTC panels shall be installed with the bottom 4 feet above the adjacent floor surface using an adjacent wall surface or using legs for free standing applications. All free-standing outdoor enclosures using legs shall be secured rigidly to the supporting surface to minimize vibrations from winds.

5. All penetrations in apparatus control panels and DTC panels located outdoors shall be from the bottom and shall be sealed to preclude entry of water using a silicone rubber sealant.

6. The electrical portion of the DDC system shall be installed according to the following provisions:

a. Designated circuit breakers shall be provided in various electrical distribution panel boards for powering the DDC system.

b. The DDC System Installer shall provide all power wiring required for the various apparatus control panels and DDC panels (UCPs) and sensors from these circuit breakers.

c. The DDC System Installer shall provide supplemental branch circuitry and short circuit protection including panel boards as required for proper power distribution, protection and operation of his system and equipment.

d. All wiring, conduits, additionally panel boards, etc., required to provide power for the individual DDC equipment items shall comply with the National Electrical Code (NEC), the requirements of Montgomery County, Maryland, and other applicable codes.

e. All other electrical wiring shall comply with the National Electric Code, the requirements of the Montgomery County, MD, and other applicable requirements and shall be installed by licensed journeyman electricians.

f. All peer-to-peer connections to the DDC system and the peer-to-peer network wiring and conduit shall be installed in locations identified by the DDC System Supplier in conjunction with the Architect/Engineer.

g. All DCPs, DTCs, and UCs, for the steam meters, shall be powered by normal/emergency power circuits.

h. All wiring shall be properly color-coded or identified (using terminal numbers) or both at the termination point in the DCP and DTC panels so that wiring between the panel and the sensing/control device can be easily identified.

7. All control wire and power wiring shall be provided by the DDC System Supplier. All wiring shall be installed in watertight EMT conduit with compression fittings. All copper and fiber network wiring shall be installed in watertight EMT conduit.

a. AI, BI, AO and low voltage BO wires shall be routed uniformly in a singular bundle or through a single conduit.

b. Singular or multiple 120 volt BO wires shall be routed uniformly in a singular bundle or through a single conduit. High voltage (120 volt) BO wiring shall not be installed in the same bundle or conduit as AI, BI, or AO wiring unless otherwise specified.

c. Network wiring in exposed areas shall be installed in a conduit with no other wiring.

d. All conduit shall be EMT to within 3 feet of the device. Within 3 feet, flexible conduit may be employed. All conduit shall be supported from the building structure and should not lay on the ceiling.

e. All wiring and conduit shall be run either parallel or perpendicular to walls constructed in the area served. All takeoffs or junctions shall be made at 90 degree angles.

f. Pull strings shall be provided in all conduits for the future addition of wires.

g. Provide wire identification tags (using terminal numbers) in all DCP's and DTC's panels designating terminal connection points so that wiring between the panel and the sensing/control device can be easily identified. Tab 2 shows the Owner's approved scheme for panel and equipment identification.

h. All wiring in mechanical rooms shall be in conduit.

i. Low voltage and analog wiring shall be a minimum of 18 gauge twisted shielded pair.

j. 120 volt wiring shall be a minimum of 16 gauge twisted pair for relays or status wiring.

k. Communication wiring shall be a minimum of 22 gauge twisted low capacity.

8. The requirements concerning wire and conduit installation may also be found elsewhere in the specification and drawings.

9. All instrument air lines shall be run concealed in the building construction in all finished spaces. Air lines exposed in unfinished spaces shall be run in a neat and workmanlike manner in metal raceways or conduit, or shall run exposed in hard copper tubing. Provide shut-off valve for branch isolation. All pneumatic tube material shall be suitable and approved for the service in Montgomery County, Maryland.

a. All concealed accessible instrument air lines shall be run in approved polyethylene tubing. All tubing shall conform to the requirements of the Montgomery County, Maryland.

b. All concealed inaccessible tubing shall be run in hard or soft copper tubing or in conduit.

c. Where required, all conduit shall be rigid electromechanical tubing to within 3 feet of the device. All conduits shall be supported from the building structure and should not lie on the ceiling.

d. All pneumatic tubing run without conduit shall run in bundles which are attached together using nylon ties at 3-foot intervals. Home runs of individual pneumatic tubes when bundled are available is unacceptable. All individual and bundled pneumatic tubes shall be run tight to the building structure or wall and shall be attached to the same at 3-foot intervals. Laying tubing on the ceiling is not acceptable.

e. All pneumatic tube and conduit shall run either parallel or perpendicular to walls constructed in the areas served. All takeoffs and tees from the bundles shall be made at 90 degree angles.

f. All instrument air lines installed in hot unoccupied spaces such as electrical vaults, steam tunnels, mechanical rooms with ventilation cooling only (no mechanical refrigeration), building attics and penthouses shall be run in hard or soft copper tubing. If the system is installed with polyethylene tubing each tubing termination or joint shall be provided with a metal clamping device such as a spring clamp in addition to the standard barbed fittings.

g. All instrument air mains and lines between the various system isolation valves and the room thermostats or controlling devices shall be tested.

h. All instrument air tubing between the instrument air supply (main) and the "main" air connections to control devices or control panels shall be tested for leakage. Instrument air piping upstream of pressure reducing valves shall be tested at 150 psig. All instrument air piping downstream of pressure reducing valves shall be tested at 50 psig. For all new work on the project (for projects up to 10,000 square feet work area) the test shall be completed at one time. For projects over 10,000 square feet, the project area may be broken into 10,000 square-foot increments to facilitate the construction schedule. Generally, the test shall include plugging all main air connections to terminal devices. Attach one 5-gallon portable pneumatic tank to the system for each 2,000 square feet being tested. Each tank shall be pressurized to 10 psig greater than the system test pressure. Pressurize the system, then bleed off excess tank pressure. The system shall pass the test if the pressure does not drop more than 5 psig in 24 hours.

10. All junction boxes and pull stations in the DDC conduit system shall be identified.

B. Installation - Software

1. Load all software as specified and required for an operational DDC system, including data bases, operational parameters, and all specified programs. Upon successful completion of the Endurance Test, provide two spare copies on CD ROM of source (excluding the general purpose operating system and utility programs furnished by the computer manufacturers) and object modules for all accepted software including diagnostics. Two sets of software, on media usable with the portable tester, containing all DCP software and diagnostics shall be provided.

2.15 WIRING PRODUCTS

A. The following wiring products shall be provided as required to suit project by the Controls Contractor. Wiring types provided shall be indicated on the shop drawings.

B. Wiring products shall be the product of ALFA Wire Corporation, Beldon Wire and Cable, or approved equivalent. ALFA Product numbers are provided to establish wire type, size, and materials of construction.

C. Non-plenum cable shall have passed the UL VW-1 flame test and shall have a PVC jacket which is approved for use in Montgomery County.

1. Type "A" cable shall be 18 AWG copper minimum, shielded, with 2 conductors, 300 volt insulation, and an approved outer jacket suitable for non-plenum use, UL 2092. Type "A" cable shall be used for AI and AO functions. Type "A" cable shall be ALFA Wire Corporation Number 2422C.

2. Type "B" cable shall be 18 AWG copper minimum, unshielded, with 2 conductors, 300 volt insulation, and an approved outer jacket suitable for non-plenum use, UL 2509. Type "B" cable shall be used for low voltage BI and BO functions. Type "B" cables shall be ALFA Wire Corporation Number 1897C.

3. Type "C" cable shall be 14 AWG copper minimum with two single stranded conductors and 600 volt THHN insulation. Insulation colors shall be red and black. Type "C" cable shall be used for 120 volt BO functions. Type "B" cable shall be ALFA Wire Corporation Number 1859/19.

4. Type "D" cable shall be 18 AWG copper minimum, shielded, with 3 conductors, 300 volt insulation, and an approved outer jacket suitable for non-plenum use, UL 2093. Type "D" cable shall be used for AI and AO functions and for LAN and UCP-LAN communication functions. Type "D" cable shall be ALFA Wire Corporation Number 2423C.

5. Type "E" cable shall be 18 AWG copper minimum, shielded, with 4 conductors, 300 volt insulation, and an approved outer jacket suitable for non-plenum use, UL 2094. Type "E" cable shall be used for AO functions requiring power. Type "E" cable shall be ALFA Wire Corporation Number 2424C.

6. Type "F" cable shall be RG62A/U coaxial cable with an approved outer jacket. Type "F" cable shall be used for EAN communication functions. Type "F" cable shall be ALFA Wire Corporation Number 9062AC.

7. Type "G" cable shall be 18 AWG copper minimum, shielded, with 6 conductors, 300 volt insulation, and an approved outer jacket suitable for non-plenum use, UL2464. Type "G" cable shall be used for AI and AO functions and for communications between UCPs and UCP thermostats. Type "G" cable shall be ALFA Wire Corporation Number 6063C.

8. Type "H" cable shall be 18 AWG copper minimum, unshielded, with 4 conductors, 300 volt insulation, and an approved outer jacket suitable for non-plenum use, UL 2509. Type "H" cable shall be used for low voltage BI and BO functions. Type "H" cable shall be ALFA Wire Corporation Number 1898/4C.

D. Plenum cable shall be UL listed, Class 2 power limited circuit cable, type CL2P, for plenum applications without conduit, shall have passed the UL VW-1 flame test and the Steiner Tunnel Test for low smoke and flame generation, and shall have an FEP teflon jacket which is approved by Montgomery County.

1. Type "AP" cable shall be 16 AWG copper minimum, shielded, with 2 conductors, 300 volt insulation, and an approved outer jacket suitable for plenum use, NEC 725-2(b), UL subject 13. Type "AP" cable shall be used for AI and AO functions. Type "AP" cable shall be ALFA Wire Corporation Number 58133.

2. Type "BP" cable shall be 16 AWG copper minimum, unshielded as available, with 2 conductors, 300 volt insulation, and an approved outer jacket suitable for plenum use, NEC 725-2(b), UL subject 13. Type "BP" cable shall be used for low voltage BI and BO functions. Type "BP" cable shall be ALFA Wire Corporation Number 58131.

3. Type "CP" cable is not permitted. All 120 volt BO functions must use Type "C" cable and conduit.

4. Type "DP" cable shall be 16 AWG copper minimum, shielded, with 3 conductors, 300 volt insulation, and an approved outer jacket suitable for plenum use, NEC 725-2(b), UL subject 13. Type "DP" cable shall be used for AI and AO functions and for UCP-LAN communication functions. Type "DP" cable shall be ALFA Wire Corporation Number 58133. Use of Type "DP" cable for LAN communication functions shall not be permitted; use Type "D" cable and conduit.

5. Type "EP" cable shall be 16 AWG copper minimum ,shielded, with 4 conductors, 300 volt insulation, and an approved outer jacket suitable for plenum use, NEC 725-2(b), UL Subject 13. Type "EP" cable shall be used for AO functions requiring power. Type "EP" cable shall be ALFA Wire Corporation Number 58134.

6. Type "FP" cable is not permitted. EAN communication functions must use Type "F" cable and conduit.

7. Type "GP" cable shall be 16 AWG copper minimum ,shielded, with 6 conductors, 300 volt insulation, and an approved outer jacket suitable for plenum use, NEC 725-2(b), UL Subject 13. Type "GP" cable shall be used for AI and AO functions and for communications between UCPs and UCP thermostats. Type "GP" cable shall be ALFA Wire Corporation Number 58136.

8. Type "HP" cable shall be 16 AWG copper minimum, unshielded as available, with 4 conductors, 300 volt insulation, and an approved outer jacket suitable for plenum use, NEC 725-2(b), UL Subject 13. Type "HP" cable shall be used for low voltage BI and BO functions. Type "HP" cable shall be ALFA Wire Corporation Number 58134.

E. When multiple runs of single conductor cables are employed the wiring shall be color coded in accordance with the Control Contractor's Standard for this facility.

F. Wiring shall be UL listed and labeled for specific use. The approved outer jackets shall meet the approval of Montgomery County for the specific application.

G. Wiring for photoelectric and ionization type smoke detectors shall be provided in flexible metallic tubing to facilitate removal and cleaning of the detectors.

H. Wiring for vibrating equipment including but not limited to fans, pumps, chillers, and boilers shall be provided in flexible metallic tubing.

2.16 PNEUMATIC TUBING PRODUCTS

A. The following pneumatic tubing products shall be provided by the Controls Contractor.

B. Non-metallic instrument air lines shall be an approved polyethylene tubing conforming to ASTM Specification D-1248, Type I, Class A, Category 4, Grade E5. The tubing shall be suitable for a working pressure of 150 psig at 73°F ambient. Tubing shall be 1/4 inch O.D. and 0.170 inch I.D.; minimum bend radius shall be 1 inch. Tubing shall be Parker Series E43, Dekoron F.R., or approved equal. Tubing shall conform to the requirements of the Montgomery County.

C. Main instrument air lines shall be Type "L" hard or soft copper conforming to ASTM B-88 with soldered 50-50 tin lead solder using non-acid, non-corrosive flux. Fittings shall be cast brass or wrought copper sweat type conforming to ASTM B-75. Instrument air mains on individual floors shall be minimum 1/2" O.D. Instrument air risers shall be minimum 7/8" O.D. Connections to risers shall be provided with ball valves for isolation.

2.17 CONDUIT PRODUCTS

A. The following conduit products shall be provided by the Controls Contractor.

B. Conduits shall be light wall electrical metallic conduits selected for 40 percent fill unless otherwise noted.

C. The conduit system shall be provided complete with connectors, adapters, pull stations and radius elbows as required.

D. EAN wiring shall be installed in conduits employing long radius elbows; 90° bends shall not be permitted.

E. Refer to Division 26 for requirements concerning conduit products.

2.18 OWNERSHIP OF PROPRIETARY MATERIAL

A. The Owner shall retain all rights to software for this project.

B. The Owner shall sign a copy of the manufacturer's standard software and firmware licensing agreement as a condition off this contractor. Such license shall grant use of all programs and application software to the Owner as defined by the manufacturer's license agreement, but shall protect the manufacturer's rights to disclosure of Trade Secrets contained within such software.

C. The licensing agreement shall not preclude the use of the software by individuals under contract to the owner for commissioning, servicing, or altering the system in the future. Use of the software by individuals under contract to the owner shall be restricted to use on the owner's computers and only for the purpose of commissioning, servicing, or altering the installed system.

D. All project developed software, files and documentation shall become the property of the Owner. These include but are not limited to:

1. Server and Workstation software
2. Application Programming Tools
3. Configuration Tools
4. Addressing Tools
5. Application Files
6. Configuration Files
7. Graphic Files
8. Report Files
9. Graphic Symbol Libraries
10. All Documentation.

END OF PART 2

PART 3 - SYSTEM HARDWARE REQUIREMENTS

3.1 GENERAL

A. This document defines the minimum hardware and performance requirements for a computer-based DDC system.

B. System Requirements

1. Provide all equipment, accessories, wiring and instrument piping required for a complete and functioning DDC system.

a. All materials and equipment used shall be standard components, regularly manufactured for this system and not custom designed especially for this project. All systems and components shall have been thoroughly tested and proven in actual use.

b. All embedded conduit shall be rigid conduit.

c. The DDC system shall be of a fully modular architecture permitting expansion by adding computer memory, application software, operator peripherals and field hardware.

2. Application Requirements

a. The DDC system shall meet the performance requirements of the following applications:

1) Heating, Ventilating and Air Conditioning Control

2) Air Handling Units

3) Terminal Units

4) Primary Equipment

5) Energy Management Plan

6) Historical Data Collection

7) Monitoring of critical events

8) Mass Flow Totalization

9) Record all Information required to achieve the LEED Measurement and Verification credit.

3.2 SYSTEM DESCRIPTION

A. Proposed system shall be UL listed and approved.

B. General: The Contractor shall configure the DDC system as described herein. All computing devices, as defined in FCC Rules and Regulations, Part 15, shall be certified to comply with the requirements for Class A computing devices and labeled as set forth in FCC Rules and Regulations, Part 15.

C. The system shall provide operator interaction and dynamic process manipulation, including overall system supervision, coordination, and control. Sensed data shall be obtained by DCPs which are located near the source of the data to be collected. DCPs shall manage all control functions within their Data Environment (DE) as specified.

D. The operator's console shall have the capability to communicate with the DCPs located in remote facilities through a dial-up switched telephone network and with DCPs in the same facility by Local Area Network (LAN) on a scheduled basis and as directed by a system operator. Every connected analog output (AO), analog input (AI), digital output (DO), pulse input (PI), and digital input (DI) represents a "point" when referred to in the specification.

E. Unitary controllers (UCPs) which are self-contained, stand-alone controllers, could be networked on a sub-network. These unitary controllers (also called application specific controllers) shall be considered "one point" (regardless of the fact that each of these may have several inputs and outputs).

F. Systems that utilize sub-panels in a sub-network, in addition to UCPs, to DCPs shall indicate such panels by the designation DTC (data terminal cabinet). The DTCs are generally considered to denote panels for extending the I/O capacity of the DCP. The DTCs may or may not have their own processor.

G. In general, any control panel connected to the highest level peer-to-peer network shall be called DCP. All panels in a sub-network to the DCPs shall be called DTCs. The application specific controllers (UCPs) may be on a sub-network to DCPs or to DTCs.

H. All equivalency in proposers' hardware shall be clearly identified as such.

I. System Accuracy and Display: All information shall be displayed and printed directly in engineering units with a format consistent with the range selected and matched to the full accuracy

of the sensor, i.e., a static pressure sensor with a range of 0 to 0.25 inch water gauge (w.g.) with an accuracy of 0 to 0.25 percent, will be displayed in a + x.xxxx format.

1. An analog value input to the system's equipment via an AI shall have a maximum error of +0.10 percent of range, not including the sensor or transmitter error. This accuracy is required over the specified environmental conditions.

J. Symbols, Definitions, and Abbreviations: All symbols, definitions, and engineering unit abbreviations utilized in information displays and printouts shall conform to the IEEE Standard Dictionary of Electrical and Electronic Terms and the ASHRAE Handbook of Fundamentals, where applicable.

K. Environmental Conditions:

1. The DCP, Data Terminal Cabinets (DTC) and all other field equipment shall be rated for continuous operation under ambient environmental conditions of 35˚F to 120˚F dry bulb and 5 to 95 percent relative humidity, noncondensing. Equipment installed in a more severe environment shall withstand conditions as specified. If equipment is required to operate in such severe environments, appropriate environmental-type housings shall be furnished in accordance with the specification. Instrumentation and control elements shall be rated for continuous operation under the ambient environmental temperature, pressure, humidity, and vibration conditions specified or normally encountered for the installed location.

2. Operator's console shall be designated for continuous operation under ambient environmental conditions of 60˚ to 85˚F and a relative humidity of 20 to 80 percent, noncondensing.

L. Power Line Surge Protection: All equipment connected to AC circuits shall be protected from power line surges. Equipment protection shall meet the requirements of ANSI/IEEE C62.45-1987 and tested to UL 1449-1987. Fuses shall not be used for surge protection. The inputs and outputs shall be tested in both normal mode and common mode using the following two waveforms.

1. Test 1, Category A: 100 kHz ringwave of 6 kV at 200 amps

2. Test 2, Category B: 100 kHz ringwave of 6 kV at 500 amps

3. Test 1, Category B: 1.2 x 50 at 6 kV biwave; 8 x 20 at 3,000 amps

4. Test 2, Category C: 1.2 x 50 at 6 kV biwave; 8 x 20 at 10,000 amps

M. Sensor and Control Wiring Surge Protection: All digital and analog inputs and outputs shall be protected against surges induced on control and sensor wiring installed outdoors. The inputs and outputs shall be tested in both normal mode and common mode using the following two waveforms.

1. A 10 microsecond by 1000 microsecond waveform with a peak voltage of 1500 volts and a peak current of 60 amperes.

2. An 8 microsecond by 20 microsecond waveform with a peak voltage of 1000 volts and a peak current of 500 amperes.

N. Communication Link Surge Protection: All communication equipment shall be protected against surges induced on any communications link. All cables and conductors, except fiber optics, which serve as communication links from the operator's console to field equipment and between field equipment shall have surge protection installed at each end. Protection shall be furnished at equipment and additional protectors rated for the application on each wireline circuit shall be installed within three (3) feet of the building cable entrance.

O. Power Line Conditioners (PLC): PLCs shall be furnished for all operator's consoles equipment and each DCP. The PLCs shall provide both voltage regulation and noise rejection (both at low frequency and radio frequency). The PLCs shall be of the ferroresonant design, with no moving parts and no tap switching, while electrically isolating the secondary from the power line side.

The PLCs shall be sized for 125 percent of the actual connected KVA load. Characteristics of the PLC shall be as follows:

1. At 85 percent load, the output voltage shall not deviate by more than +1 percent of nominal when the input voltage fluctuates between -25 percent to +15 percent of nominal.

2. During load changes of zero to full load, the output voltage shall not deviate by more than +3 percent of nominal. Full correction of load switching disturbances shall be accomplished within 3 Hertz, and 95 percent correction shall be accomplished within 2 Hertz of the onset of the disturbance.

3. Total harmonic distortion shall not exceed 3-1/2 percent at full load.

4. Minimum electromagnetic interference and radio frequency interference noise rejection shall be:

   a. 20 KHz - 100 MHz - 60 dB normal mode

   b. 20 KHz - 100 MHz - 40 dB common mode

5. All field equipment, including DCPs, DTCs, UCPs, ACPs (if applicable) shall have power line surge protection installed. As a minimum, Hubbell surge suppression receptacles shall be used.

P. The DDC system shall be capable of automatically calling a minimum of nine (9) telephone numbers or alphanumeric pagers. If a called number is busy, repeated attempts shall be made after a user-defined interval until one of the following occurs:

1. The call is answered.

2. The calling process is terminated by the system operator.

3. The alarm condition ceases to exist.

4. The proposers are encouraged to provide various arrangements for achieving this function. It is also a requirement that the system report troubles by calling various alphanumeric pagers. The Owner will supply the details of these pagers.

3.3 DIRECT DIGITAL CONTROL PANELS (DCPS) – ALSO REFERRED TO AS NIP'S

A. Direct Digital Control Panels are the highest level of controller that are connected to the local area network.

1. The DCPs shall be networked together to form a truly distributed control system. Any failure of a single controller (DCP) in the network shall not cause any other controller to fail. The DCPs shall communicate via a peer-to-peer, token passing or Ethernet protocol. Any DCP shall be capable of sharing information with any other DCP, without the need for a network master computer. It shall be possible to share information across the network in real time to be used for control purposes. The amount of time for control information to reach any DCP in the system shall be less than five seconds, regardless of network loading and the number of panels on-line. The network shall be capable of supporting a minimum of 255 DCPs on-line simultaneously. All data shall be displayable and changeable from any DCP in the system. The refresh rate of remote data (data at another DCP) being displayed shall be less than five seconds.

2. DCP shall be microcomputer-based with a minimum word size of 32 bits. (It is suggested that the proposers take exception to this item if necessary.) Output relays associated with digital signals shall be considered part of the Input-Output (I-O) function, whether physically mounted in the enclosure or separately mounted.

3. The DCP shall include:

   a. Main power switch.

b. Pneumatic filter regulator as needed

c. Locks on all cabinets. Locks shall be shall be keyed alike.

4. Sufficient memory shall be provided to perform all specified and indicated DCP functions and operations. Memory shall be a minimum of 640 Kilobytes, expandable to 2 megabytes or larger.

5. The DCP shall contain RAM/EPROM memory expandable to 64 Mbytes.

6. The DCP shall calculate in floating point arithmetic. Fixed point arithmetic units will not be accepted.

7. Each DCP shall have its own real time clock (RTC) with long-life battery back-up. The DCP shall systematically synchronize clock with the master clock in the system.

8. A watchdog timer shall be provided in the system to supply a contact closure if the system fails to scan for any two-second interval.

9. Internal back-up battery shall be provided on each DCP if the program is not contained in non-volatile memory. This back-up shall be for minimum of 72 hours.

10. The analog inputs to the DCP or DTC shall be as follows:

    a. Minimum analog to digital (A/D) conversion shall be 12 bits.

    b. Input range shall be 4-20 ma current loop or industry standard 0-5 volts or 0-10 volts or 1000 ohm RTD.

    c. Operating temperature shall be 32˚F to 130˚F, relative humidity 5 percent to 90 percent noncondensing.

11. The analog output shall have minimum of 10 bits resolution for digital to analog (D to A) conversion. The output signal shall be 4-20 ma or industry standard 0-10 volts.

12. The binary inputs/output (BI, BO) shall be selectable universal inputs or outputs and have the following minimum requirements.

    a. Binary inputs shall be close contact, 24 volts to 240 volts AC or DC.

    b. Binary output shall be 24 volts to 240 volts AC, switching to 3.0 amps.

    c. Operating temperature shall be 32˚F to 130˚F, operating humidity shall be 10 percent to 90 percent non-condensing.

13. DCP Communications Equipment.

    a. Certification: MODEMS shall be certified to meet the requirements of FCC Rules and Regulations, Part 68, and other applicable regulations.

    b. Automatic Answer MODEMS: MODEMS shall be suitable for connection to the dial-up telephone network and shall provide for transmission speeds of at least 2400, 9600 baud and 56k baud with auto baud rate selection. MODEMS shall provide for automatic answer of all incoming calls.

14. A dedicated 120 volt AC, 15 amp, 60 Hz duplex outlet shall be furnished either inside or within 6 feet of the DCP enclosure.

15. DCPs shall be housed in locking type mounting cabinets, with common keying and door switch. The DCP doors shall be alarmed and shall be monitored continuously and reported at the operator's console.

16. Data Control Panel (DCP):

    a. Each DCP shall have 20 percent spare capacity for I/O expansion after all the equipment has been connected to it, with 20 percent spare capacity for the building.

b. The DCP shall be provided with double-sided screw type terminal strips. One side of the terminal strip shall be used for termination of field wiring from instrumentation and controls. Terminal strip shall accept 12AWG stranded wire. The other side shall be used for connection to the DCP. All DCP and DTC circuit boards shall be plug-in type. Terminal strips shall have individual terminal identification numbers.

c. The DCPs shall have at least one spare RS-232 serial port in order to accommodate a remote operator's CRT either by direct hardwire or via auto answer phone modem.

17. DCP Portable User Interface Device: Portable user interface devices for connection to any DCP shall be provided. Each DCP shall have the ability to accept connection of the portable user interface device to it. This interface device shall be ANSI X3.64 compatible and shall include a keyboard and display. The Owner shall supply this equipment. Coordinate the requirements with the Owner. The interface available at each DCP, shall include the following features:

a. Initiate DCP Diagnostics

b. Display any digital and analog input, output or calculated point in the entire networked system at a summary and detailed level. Any dynamic information on any display, such as point value and status, shall be refreshed. The refresh rate shall be less than five seconds for all data.

1) The operator interface shall be menu driven, allowing the operator to be directed in English language. System using codes or hexadecimal addresses shall not be acceptable.

2) The data shall be obtained in multi-level hierarchical displays, such that data regarding a selected (highlighted) item on Level 1 can be displayed in full screen detail on Level 2.

3) Displays referring to points, strategies, and equipment shall be user definable by the use of path names and wild carding.

4) The summary level point display shall include, as a minimum, the point identifier, value, and status for a group of points. It should be possible for a group of points to span different DCPs.

5) The detailed level point display information shall include, as a minimum, all user defined attributes of the point, such as point limits, alarm priority, etc. These attributes are in addition to the point value and status, which appear at the point summary level.

a) Modify any digital and analog input, output, or calculated point in the entire networked system at both the summary and detailed level.

6) All information which the user can display as described above the user may change while it is being displayed. The user should be able to modify, as a minimum, all point values and statuses at the summary level. The user should be able to modify pertinent point attributes which may be displayed at the detailed level, including alarm limits, alarm priority, and hardware channel address as a minimum.

7) Any input value, whether on this DCP or another DCP, which is modified by the user, shall automatically go to an off-line status to allow the user to quickly override any input in the system.

8) Any output or calculated value, whether on this DCP or another DCP, which is modified by the user, shall automatically go to a control

override state. This will allow the user to quickly and immediately override any output or calculated point in the system.

a) It shall be possible to set all of the local real time clocks in all DCPs and modify the program in any or all DCPs (using appropriate passwords).

9) DTCs: the subpanels under the DCPs used to extend the data environment (DE) shall generally follow the same specifications for various types of I/O as the DCP.

10) The DCPs, DTCs, and UCPs shall not use fixed-point arithmetic. Any system using fixed-point arithmetic shall not be considered to meet the specification. There shall be no exceptions to this requirement.

11) I/O Functions:

a) Analog Inputs (AI): The AI function shall monitor each analog input, perform A-to-D conversion, and hold the digital value in a buffer for interrogation. Signal conditioning shall be provided for each analog input as necessary. Individually calibrate all analog inputs for zero and span, in hardware or in software. Input ranges shall be in the range of 4-20 mA DC. AI shall be a minimum of 12 bit resolution.

b) Analog Outputs (AO): The AO function shall accept digital data, perform D-to-A conversion, and output a signal in the range of 4-20 mA DC. Individually calibrate all analog outputs for zero and span. Short circuit protection on voltage outputs and open circuit protection on current outputs shall be provided. AO shall be minimum of 12 bit resolution and be a sourcing type signal.

c) Digital Inputs (DI): The DI function shall accept DE on-off, open-close, or other change of state (two state data) indications. Isolation and protection against an applied steady-state voltage up to 350 volt AC peak shall be provided. Fuses shall not be used for this purpose.

d) Digital Outputs (DO): The DO function shall provide contact closures for momentary and maintained operation of output devices. Closures shall remain closed for not less than 0.1 second. Electromagnetic interference suppression shall be furnished on all output lines to limit transients to non-damaging levels. Digital outputs shall be provided with solid state opto isolation with zero crossover for 3A. The digital outputs shall be fused for circuit protection.

e) Pulse Accumulator: The pulse accumulator function shall have the same characteristics as the DI, except that, in addition, a buffer shall be provided to totalize pulses and allow for interrogation by the DCP. The pulse accumulator shall accept rates up to 30 pulses per second. Contact debouncing circuits, if required, shall be furnished by the DDC System Supplier.

f) Signal Conditioning: Signal conditioning for sensors shall be provided as specified.

12) Provide completed details on the types of application specific panels (UCPs) that are available. In general, UCPs shall only be used on various types of terminal equipment.

3.4 DATA TERMINAL CABINETS

A. The data terminal cabinets, also known as DTCs, are essentially extender panels to increase the point capacity of the DCP.

B. The DTC may be an integral part of the DCP or may be separate from the DCP.

C. The DTC shall be sized to accommodate the number of I/O functions required for each DCP. Each DCP as installed shall be provided with the capability for 25 percent expansion capability without a change in the DCP computer memory. This expansion may be provided by future addition of DTCs.

D. The DTC shall be divided into analog and digital groupings, each with separate sensor and control signal wiring raceways.

E. The DTCs shall be provided with screw type terminal strips. The terminal strip shall be used for termination of field wiring from instrumentation and controls. All DTC terminal strip connections to the DCP or data buss shall be plug-in type. Terminal strips shall have individual terminal identification numbers.

F. All DC power supplies, interposing relays, and current to pressure transducers shall be located in the DTCs or in other ACPs.

G. All DTCs shall be housed in locking type mounting cabinets with common keying and with door switch. Door switch shall alarm the DDC system monitoring station that the door is open. Refer to paragraph on apparatus control panels and other enclosures in this part of the specification for further requirements.

H. All data cabinets shall be painted to match mounting wall color. Coordinate with Architect for finish colors.

3.5 UNITARY "APPLICATION-SPECIFIC" CONTROL PANELS (UCPS)

A. Where specified, the DDC System Supplier shall furnish UCPs. UCPs are panels with built-in microprocessors used to control terminal equipment such as VAV terminal boxes, VAV terminal boxes with reheat, and fan coil units.

B. UCPs shall be stand-alone microprocessor based control devices with networkable input and output capability. The device shall have sufficient memory to provide all specified operational functions. Refer to control sequences for requirements.

C. All UCPs shall be networked to the higher level DCPs via a sub-network for monitoring and control from the central or remote operator's console level using non-proprietary public unitary protocol (PUP).

D. It shall be possible to use UCPs from the same manufacturer on the same sub-network under a DCP if UCPs don't use PUP. The proposed system shall be able to use unitary controllers from all manufacturers that have open protocol.

E. All UCPs shall have a jack receptacle provided at the thermostat for field operator communication to other UCPs on the network.

F. Each UCP shall have sufficient I/O termination capacity for the specific application and spare capacity as specified in the General requirements..

G. Enclosures for UCP circuit boards and terminal strips shall be plug-in type.

H. Enclosures for UCPs will be NEMA 1 type or better.

I. The low voltage power supply transformers, the transformer surge protection receptacle, and circuit protection for UCPs shall be furnished by the DDC System Supplier as required. No UCP shall be installed without providing minimal surge suppression in the power line, such as Hubbell surge suppression receptacles.

3.6 [NOT USED]

3.7 OPERATORS CONSOLES - CENTRAL STATION

A. The DDC System Supplier shall provide computer equipment specified for this application.

B. This section lists the minimum requirements generally appropriate for an operator console located in the central station for the site.

C. For the estimation of installation, the DDC System Supplier shall assume that the location of this equipment is within 300 feet of an area where access to the LAN is available. For distances beyond this, a per-foot cost shall be negotiated.

D. The central station operator console shall include the following items. (See subsequent sections for details of equipment.)

1. Computer and Accessories

   a. ProLiant DL380 G3 Intel Xeon Processor 3.06 GHz – Rack Model (Part #310587-001)

   b. Intel Xeon Processor 3.06 GHz / 512KB Processor Option Kit (Part #257916-B21)

   c. 72.8-GB 10,000 rpm U320 Universal Hard Drive (Part #286714-B22)

   d. DL380 G3 Redundant Fan Option Kit (Part#293048-B21)

   e. HP NC7771 PCI-X Gigabit Server Adapter (Part#290563-B21)

   f. ProLiant Essentials Integrated Lights-Out Advanced Pack (Part#263825-B21)

   g. Compaq Hot Plug AC Redundant Power Supply Module (Part#313054-001)

   h. Operating system shall include Windows 2000 Server with SP3 Web Server and Microsoft Internet Information Server 5.0 or higher

   i. Web Browser shall be Internet Explorer 6.0 or later

   j. Microsoft SQL Server 2000 Database software

2. Read/Write CD ROM/DVD drive

3. High Resolution (minimum 1280 x 1024), 17 flat panel display

4. Keyboard

5. Optical mouse

E. The DDC System Supplier shall provide the network cards and all interfaces for fiber optic cables as required.

3.8 PERIPHERAL EQUIPMENT FOR OPERATOR CONSOLES

A. Provide all peripheral equipment for the operator console and central station, such as keyboard, mouse, colored monitor, various types of printers, disk storage systems, , phone modems, etc.

B. A full function keyboard shall be furnished with the operator's console. The keyboard shall include a 96-character standard ASCII character set numeric keypad and 12 programmable function keys. The keyboard shall provide a means for the operator to interact with all command and applications software.

C. Provide a three-button, multi-function mouse and mouse pad for graphic interaction with the computer system.

3.9 AUDIBLE ALARMS

A. An audible alarm shall be provided at the central station operator's console and at various auxiliary operators’ consoles as specified. The alarm shall incorporate the following features:

1. Adjustable volume control.

2. Disable switch to disable the alarm and relay when not in use.

3. Relay to set off alarm and hold alarm "on" upon a momentary alarm contact.

4. Reset switch to acknowledge and turn "off" alarm after each alarm and to reset relay. The acknowledgement for the alarm shall be documented by the DDC System Supplier.

3.10 COMPUTER PRINTER – FUNCTIONALITY SHALL BE PROVIDED TO TRANSMIT ALARMS TO ALPHA NUMERIC PAGERS VIA SMTP COMPUTER PRINTER

A. This printer shall be a network printer HP Laserjet 2300N or equal and must be TCP/IP compatible used at all other operator consoles other than the Central Station.

B. Provide the following equipment at the locations shown:

1. Printers for operator console. Provide the following printers for the main operator console.

a. Laser printer. Provide high quality laser printer with two paper trays with 500 page capacity each. Provide printer cable and 2 spare toner cartridges. Provide a minimum of four built-in fonts with capability to add font cartridges. The equipment shall be HP Lazerjet 2300N or equal and must be TCP/IP compatible.

b. Alarm printer. Provide 24 pin dot matrix printer for logging alarms from the system. This printer shall accept fan-fold paper with micro-perf edges. The paper size shall be 8-1/2 inches wide. Provide printer cable. The printer shall come on with "on line" status by default. The operator shall not have to put the printer on-line after turning on power. The printer shall be 75 percent duty. The print resolution shall be adjustable at the front and through software. The acceptable manufacturers are Epson, Panasonic, and Okidata.

3.11 [NOT USED]

3.12 DCP PORTABLE USER INTERFACE DEVICE – LAPTOP

A. Computer Platform 3 GHz Pentium with 1 GB of RAM

B. 40 GB free hard disk space available

C. CD-RW

D. Operating System Microsoft Windows 2000 Professional with SP3 or Microsoft Windows XP Professional with SP1

E. Web Browser Microsoft Internet Explorer Version 6.0 or later. See Table 2 for more details.

F. Communication Ethernet network interface card 10/100 Mbs (100 Mbs recommended) internal modem

G. Minimum 3 USB Ports

H. Internet Explorer 6.0 or later

I. Microsoft Office Professional Edition, latest edition.

J. DDC System Operator Workstation Application(s), latest revision.

K. Any other software required to deliver the specified performance.

3.13 INSTRUMENTATION - SENSORS, TRANSMITTERS, ACTUATORS, ETC.

A. The DDC System Supplier shall be advised strict adherence to performance criteria and accuracy of instrumentation will be a requirement. In general, standard commercial grade components will not meet some of the criteria. The sequences of control shall specify the grade of instrumentation

to use for various applications. The I/O summaries for control sequences shall provide this information. The transmitters for both Grades A and B instruments are the same. Grade C instrumentation may or may not require a 4-20 ma transmitter. The definition of instrumentation is as follows:

1. Grade A Instrumentation: This type of instrumentation is of the highest quality and shall be used in all laboratory spaces.

2. Grade B Instrumentation: This type of instrumentation is of high quality industrial and semi-industrial instrumentation, with accuracies typically in the rage of 0.5 percent to 1.0 percent. This type of instrumentation shall be used for applications requiring accurate control of main air handling units, chillers, and controls for spaces such as class rooms, conference rooms, offices, and atriums.

3. Grade C Instrumentation: This type of instrumentation shall be used for unit heaters, cabinet heaters, and similar equipment serving mechanical equipment rooms, stairwells, etc.

B. Transmitters Instrumentation

1. Transmitters: the term "transmitter" is defined as the electronic circuitry that accepts the signal from the sensor and after conditioning (if needed) transforms it into a 4-20 ma, or 0-10 VDC, signal. The term transmitter does not include the sensor which is also termed as transducer. It is also assumed in the specification that the transmitters on most industrial type sensors are to be located next to the sensor (transducer). Where indicated, the transmitters with field adjustable rangeability shall be provided. It shall be noted that all transmitters for Grade A and B instrumentation shall provide 4-20 ma or 0-10 VDC output Specialized sensors with other types of outputs may be allowed with prior approval only on a case-by-case basis.

   a. All sensors, except the binary sensors, and temperature sensors shall be provided with a 4-20 ma DC or 1-10 volt DC output type transmitters, or RTD's suitable for the sensor being used. The accuracy of the transmitter shall be $\pm$0.5 percent of the span. The stability shall be $\pm$0.012 percent of span/degree centigrade change in ambient temperature. The linearity shall be $\pm$0.05 percent of span. The transmitter shall be protected against damage caused by reverse polarity and supply voltage transients. The span required shall depend on the particular sensor and the application. A span and zero adjustment shall be provided at each transmitter to allow for recalibration when necessary. The transmitter circuitry shall be housed in an enclosure appropriate for the application and in conformance with NEC and Montgomery County, MD, requirements. The operating temperature limits for ambient conditions shall be 32˚F to 122˚F or otherwise if stated for special applications.

2. The requirements listed above for transmitters serves to indicate the performance for this electronic component. The accuracy listed for sensors is assumed to include the requirements for the transmitters.

3. Transmitters for Grade A and Grade B shall have switch-selectable ranges on the transmitter (e.g., 35˚F to 60˚F may be represented by 4-20 ma instead of -40˚F to 150˚F, etc.). Software range changes shall be acceptable.

4. Where platinum RTD temperature sensors are specified in this section, 10 k-ohm thermistors are acceptable. Thermistors less than 10 k-ohm are acceptable only when a transmitter is required.

C. [not used]

D. Sensors for Grade A Instrumentation. These sensors are for use in laboratory areas.

1. Space Temperature Transducers shall be 10k ohm thermister transducer. The sensor shall meet the following specifications:

a. Accuracy: +0.2 percent of span

b. Stability: +0.2 percent of span for six months

c. Linearity: +0.05 percent of span

d. Span: 50˚F minimum

e. Temperature Limits Ambient: -40˚F to 160˚F

f. Temperature Range: as required by application

2. Duct and Liquid Temperature Transducer. The sensor shall meet the following specifications. Transmittors used in liquid service shall be supplied with three (3) inch lagging extension stainless wells.

a. Accuracy: +0.2 percent of span

b. Stability: +0.2 percent of span/degree C

c. Linearity: +0.05 percent of span for six months

d. Span: 50˚F minimum

e. Temperature Limits Ambient: -40˚F to 160˚F

f. Temperature Range: as required by application

3. Differential Temperature Transmitters shall be factory calibrated, field calibration or adjustment is not permitted. The transmitter shall be protected against damage from reverse polarity and line transients. The transmitter shall meet the following specifications:

a. Accuracy: +0.5 percent of span

b. Stability: +0.01 percent of span for six months

c. Linearity: +0.05 percent of span

d. Span: 25˚F maximum

e. Temperature Limits Ambient: 32˚F to 122˚F

4. Static Pressure Transducer: The range shall be selected to operate at approximately 75% of the range of the sensor.

a. Accuracy: +0.25 percent

b. Long-Term Stability: +1 percent of span per year

c. Span: 0.25 inch wc minimum to 10 inch wc maximum span

d. Ambient Temperature: 50˚F to 100˚F

e. Overpressure: 25 inch ws without damage

f. Power Supply: 24 to 40 volts DC at 30 ma

g. Output: 1 to 5 volts DC or 4-20 ma

h. Reliability: MTBF = 20,000 hours

i. Noise: 2 mV RMS

j. Power Supply Variation: +0.03 of span

5. Differential Pressure Transducer: The range shall be selected to operate at approximately 75% of the range of the sensor.

a. Accuracy: +0.25 percent of span

b. Long-Term Stability: +1 percent of span per year

c. Span: 0.25 inch wc minimum to 10 inch wc maximum span

d. Overpressure: 25 inch ws without damage to 10 inch wc maximum span

e. Output: 1 to 5 volts DC or 4-20 ma, 0-10 VDC

f. Ambient Temperature: 50˚F to 100˚F

g. Reliability: MTBF = 20,000 hours

6. Gauge Pressure: The pressure transmitter shall incorporate direct electronic sensing with a completely sealed pressure cell. The unit shall use a differential capacitance sensing element that eliminates mechanical force transfer and the associated problems with vibration, shock and temperature.

a. Functional

1) Overpressure: 2000 psig without damage

2) Temperature: -20˚F to +200˚F

3) Output: 4-20 ma DC, 0-10 VDC

4) Span: 5 inch wc minimum to 6000 psig maximum span

b. Performance

1) Accuracy: +0.25 percent of span

2) Linearity: +0.10 percent of span

3) Hysteresis: +0.05 percent of span

4) Repeatability: +0.05 percent of span

5) Long-Term Stability: +0.25 percent of span per six months

7. Differential Pressure: The pressure transmitter shall incorporate direct electronic sensing with a completely sealed pressure cell. The unit shall use a differential capacitance sensing element that eliminates mechanical force transfer and the associated problems with vibration, shock and temperature.

a. Functional

1) Overpressure: 2000 psig without damage

2) Temperature: -20˚F to +200˚F

3) Power Supply: 24 to 40 volts DC at 30 ma

4) Output: 4-20 ma DC

5) Span: 5 inch wc minimum to 750 inch wc maximum span

b. Performance

1) Accuracy: +0.20 percent of span

2) Linearity: +0.10 percent of span

3) Hysteresis: +0.05 percent of span

4) Repeatability: +0.05 percent of span

5) Long-Term Stability: +0.20 percent of span per six months

8. Liquid Flow Meter: Flow transmitters shall be of a two-wire 4-20 ma type, operating on a vortex shedding principle and provide a current signal linear with flow. Transmitters shall be factory wet calibrated, field calibration or adjustment is not permitted. The

transmitter shall be protected against damage from reverse polarity and line transients. The transmitter shall meet the following specifications:

a. Accuracy: +0.5 percent of rate

b. Repeatability: 0.5 percent of span

c. Rangeability: 20:1

d. Temperature Limits: -40˚C to +750˚C

e. Ambient: -40˚C to 140˚C

f. Response Time: 1.0 sec

g. Pressure Drop: 0.0025

h. Linearity Range: 20,000 to 3,000,000 Reynold's Number

9. Electronic Air Flow Transducers: Transducers are electronic monitors of air mass flow in ducts. They measure mass flow directly, monitor low flows down to 0-100 SFPM, and do not need pneumatic hook-ups, square-root extractors or temperature and pressure corrections.

a. Accuracy: 3 percent FS over 32˚F to 122˚F

b. Repeatability: 1 percent FS

c. Response Time: 300 ms (to 63 percent of final flow)

d. Range: 0 to 200 FPM - 0 to 2000 FPM

e. Temperature: -4˚F to 212˚F

f. Output Signal: 100 to 300 ma

g. Input Power: 24 volts DC

10. Current to Pressure Transducer (I/P) shall be of industrial quality and capacity. Motor driven PRVs, switching solenoid valves, or position sensitive devices are not acceptable. The current to pressure transducer shall meet the following specifications:

a. Supply Pressure: 25 psig +2 psig

b. Linearity: +0.5 percent of span

c. Span: 3-15 psig

d. Flow Rate: 4.5 SCFM @ 25 psig supply pressure

e. Air Consumption: 0.25 SCFM

11. Reheat Valve:

a. Valves up to and including 1-1/4 inches shall have union connections. Valves 1-1/2 inches shall have screwed ends. All valves 2 inches and less in size shall be of high grade bronze. All valves 2-1/2 inches and larger shall have flanged ends, cast iron bodies and positive positioners.

b. All 2-way reheat control valves shall be PICCV characteristic ball valves by Belimo with corresponding actuator.

c. All 3--way reheat control valves shall be CCV characteristic ball valves by Belimo with corresponding actuator.

12. Dampers

a. Provide Ruskin CD60

b. Provide airflow opposed blade dampers and control dampers of the size indicated with a pressure class of not less than 150 percent of the system at shut-off pressures capable of being developed by the related fan system.

c. Dampers shall be selected to provide correct flow control characteristics as required for each individual application.

d. Single blade height control dampers and room dampers shall be single blade dampers.

e. The operating range shall be -50˚F to 200˚F.

f. All control dampers, including outdoor, return, relief and mixing box dampers, will be furnished by the DDC System Supplier. Control dampers shall be substantially built, steel frames fabricated from 2-inch channel or equal. Frames shall be substantially built, steel frames fabricated from 2 inch channel or equal. Frames shall be equipped with brass trunions and bearings and blade end stops. All damper blades shall be galvanized steel. The maximum blade width shall be 10 inches. Provide corner braces for all damper frames exceeding a 4 square foot area. Maximum width of any section shall be 48 inches and the maximum section height shall be 96 inches. Provide horizontal stiffening for any section exceeding 48 inches in height. Dampers for outdoor air, relief air and exhaust air applications shall be provided with neoprene seals on blade edges and end stops. All dampers shall be provided with appropriate seals along the blade edges and at blade ends to provide tight closure with minimum leakage. Air leakage in the damper closed position shall not exceed 15 CFM per square foot of damper or 5 percent of the flow, at 6 inches water gauge differential.

g. All low leakage dampers shall be provided with a substantial damper actuator and linkage capable of delivering the required force of torque needed for obtaining rated performance of the damper.

h. Single widths of dampers up to 4.0 square feet shall be provided with extended damper shafts, adjustable lever arm, damper motor, and motor mounting bracket.

i. Single widths of dampers in excess of 4.0 square feet shall be provided with a direct drive system consisting of an eye bracket mounted directly onto a damper blade or onto the damper linkage, damper motor and a motor mounting bracket. A duct access door shall be provided for periodic inspection, maintenance and adjustment.

j. Multiple widths of dampers in excess of 48 inches wide shall be provided with multiple damper motor or with a jack shaft system; use of jumper brackets is prohibited. The jack shaft system shall consist of the following: a 1-inch diameter shaft running the full width of the duct and extended to one side for attachment of the damper motor, bushing type pillow blocks mounted maximum 5 feet on center along the jack shaft, lever arms (one for each damper section and one for the damper motor)eye brackets mounted directly onto a damper blade in each damper section, adjustable linkages between the jack shaft lever arms and the damper blade eye brackets, a damper motor, and a motor mounting bracket. Provide access doors at each lever arm location for periodic inspection, adjustment, and maintenance. Following final adjustment, tack weld each lever arm to the jack shaft.

k. Additionally, the damper shall have the following characteristics:

1) Type: Low leakage

2) Frame: 5 inches by 16 gauge hat-shaped steel

3) Blades: Air foil double skin 14 gauge

4) Seals: Blade edge-extruded vinyl; jam-aluminum flexible compression type

5) Linkage bearing: concealed in frame

6) Axles: molded synthetic 1/2 inch plated steel hex mill galvanized

7) Maximum Temperature: 250˚F

13. [not used]

14. Damper Actuators

a. Actuators shall be electric (electronic).

b. All actuators shall be normally open (NO), normally closed (NC) or fail-in-last-position (FILP) as shown. Normally open and normally closed actuators shall be of mechanical spring return type.

c. Electric actuators shall have an electronic cut off or other means to provide burnout protection if stalled. Actuators shall have a visible position indicator.

d. Electric actuators shall provide position feedback to the controller as shown. Actuators shall smoothly open or close the devices to which they are applied.

e. Electric actuators shall have a full stroke response time in both directions of 60 seconds or less at rated load. Electric actuators shall be the direct-coupled type.

f. Where multiple electric actuators operate from a common signal, the actuators shall provide an output signal identical to its input signal to the additional devices.

g. Valve Actuators: Valve actuators shall provide shut-off pressures and torques for the corresponding flow rates and system pressures.

h. Damper Actuators: Damper actuators shall provide the torque necessary per damper manufacturer's instructions to modulate the dampers smoothly over its full range of operation and torque shall be at least 6 inch-pounds per 1 square foot of damper area for opposed blade dampers and 9 inch-pounds per 1 square foot of damper area for parallel blade dampers.

i. Positive Positioning Devices: Positive positioning devices shall be a pneumatic relay with a mechanical position feedback mechanism and an adjustable operating range and starting point.

15. [not used]

16. Straightening vanes shall be manufactured in accordance with recommendations of ASME, shall be a minimum of two (2) "diameters" in length, and shall be suitable for mounting in the pipe line without flanges. Straightening vanes shall be equal to Daniel Carbon Steel Straightening Vanes.

17. Isolation valves and tubing shall be in accordance with Section 15050 requirements for the project.

18. Provide retractable insertion type target flow meters complete with isolation valve and mechanical insertion mechanism. All valves, piping, seals and the insertion mechanism shall be rated for the line pressures stated in Division 23 of the specification. Target flow meter shall be equal to Hershey Ramapo Mark V strain gauge target flow meter.

a. Fluid service: Chilled water; hot water; glycol water

b. Pressure: 500 psig minimum for sensing element

c. Temperature: 0˚F to 350˚F

d. Range: 10:1 (30:1 on application; 20:1 more likely)

e. Accuracy: 0.5 percent of full scale

f. Repeatability: 0.15 percent of rate

19. Watthour Transducers: watt or watthour transducers shall meet the following specifications:

a. Accuracy: ±0.2 percent of full reading (full lead to full lag power factor)

b. Potential Input: Either direct connect or potential transformers as required

c. Current Input: Must use current transformers

d. Auxiliary Power: As required

e. Frequency Response: Flat from 0 Hz to 5 kHz

f. The potential and current transformers shall be of split core design.

20. High-pressure transmitters shall be solid-state devices with no moving parts and with 4-20 ma output when used in conjunction with an external power supply.

a. Pressure transmitters shall meet the following specification:

1) Range: Factory calibrated to 125 percent of required maximum pressure for specified service and location

2) Accuracy: ±0.25 percent of range

3) Repeatability: ±0.05 percent of range

4) Damping: 0.2 to 1.67 seconds (continuously adjustable)

5) Operating Temperature: -20˚F to 200˚F

6) Pressure Limits without Damage: 0-500 psig for chilled water. 0-200 psig for hot water and steam

b. The following accessories shall be provided with each transmitter:

1) Side vent/drain.

2) Isolation valve at transmitter connection.

3) Transmitter mounting bracket.

c. Pressure transmitter shall be Rosemount 5131 Series.

d. On submittal data, specify transmitter tag, proposed device's standard service range and proposed calibrated range for each device furnished.

21. Humidity Sensor: Humidity transmitter shall be two-wire, 4-20 ma output sensing device using bulk polymer resistance sensor technology.

a. Transmitters shall meet the following specifications:

1) Accuracy: ±1 percent RH

2) Span: 15 percent to 95 percent RH

3) Operating Temperature Range: 30˚F to 120˚F minimum

4) Temperature Affect: ±0.06 percent per degree centigrade change in ambient temperature

5) Manufacturer: Veris HT Series

b. Where temperature and humidity are being measured in the same room, the temperature and humidity transmitter shall be mounted on a common mounting bracket and covered with a common cover.

c. The humidity transmitter shall not be damaged when moisture condenses on the sensor itself.

22. Occupancy sensors: Occupancy sensors: Sensors are provided by the electrical contractor.

23. Air Flow stations for laboratory spaces with fumes hoods shall either comply with Part 6 of this specification or be Ebtron Gold series air flow stations. Refer to the drawings for type.

E. Sensors for Grade B instrumentation. These are for use in large Air Handling Units, Central Pants components and non-laboratory spaces.

1. Space Temperature Transducers shall be factory calibrated. The sensor shall meet the following specifications:

a. Accuracy: $\pm$1.0 percent of span

b. Stability: $\pm$0.01 percent of span/degree C

c. Linearity: $\pm$0.05 percent of span

d. Span: 50˚F minimum

e. Temperature Limits Ambient: 32˚F to 122˚F

2. Duct and Liquid Temperature: Transducers Sensors used in liquid service shall be supplied with three (3) inch lagging extension stainless wells.

a. Accuracy: $\pm$0.5 percent of span

b. Stability: $\pm$0.01 percent of span/degree C

c. Linearity: $\pm$0.05 percent of span

d. Span: 50˚F minimum

e. Temperature Limits Ambient: 32˚F to 122˚F

3. Differential Temperature Transmitters shall be factory calibrated, field calibration or adjustment is not permitted. Transmitters shall be protected against damage from reverse polarity and line transients. The transmitter shall meet the following specifications:

a. Accuracy: $\pm$1.0 percent of span

b. Stability: $\pm$0.01 percent of span/degree C

c. Linearity: $\pm$0.05 percent of span

d. Span: 25˚F maximum

e. Temperature Limits Ambient: 32˚F to 122˚F

4. Static Pressure Transducer: The operating range shall be selected to operate at approximately 75% of the range of the sensor.

a. Accuracy: $\pm$0.5 percent of span

b. Long-Term Stability: $\pm$1 percent of span per year

c. Span: 0.25 inch wc minimum to 10 inch wc maximum span

d. Overpressure: 25 inch ws without damage

e. Power Supply: 24 to 40 volts DC at 30 ma

f. Output: 1 to 5 volts DC, 0-10 VDC, 4-20 MA

5. Differential Pressure Transducer:

a. Accuracy: ±0.5 percent of span

b. Long-Term Stability: ±1 percent of span per year

c. Span: 0.25 inch wc minimum to 10 inch wc maximum span

d. Overpressure: 25 inch ws without damage

e. Power Supply: 24 to 40 volts DC at 30 ma

f. Output: 1 to 5 volts DC, 0-10 VDC, 4-20 MA

6. Gauge Pressure: The pressure transmitter shall incorporate direct electronic sensing with a completely sealed pressure cell. The unit shall use a differential capacitance sensing element that eliminates mechanical force transfer and the associated problems with vibration, shock and temperature.

a. Functional

1) Overpressure: 2000 psig without damage

2) Temperature: -20˚F to +200˚F

3) Power Supply: 24 to 40 volts DC at 30 ma

4) Output: 4-20 ma DC

5) Span: 5 inch wc minimum to 6000 psig maximum span

b. Performance

1) Accuracy: ±0.25 percent of span

2) Linearity: ±0.10 percent of span

3) Hysteresis: ±0.05 percent of span

4) Repeatability: ±0.05 percent of span

5) Long-Term Stability: ±0.25 percent of span per six months

c. Physical

1) Diaphragms: 316ss

2) Process Flanges: Carbon steel

3) Process Connections: 1/4 NPT

7. Differential Pressure: The pressure transmitter shall incorporate direct electronic sensing with a completely sealed pressure cell. The unit shall use a differential capacitance sensing element that eliminates mechanical force transfer and the associated problems with vibration, shock and temperature.

a. Functional

1) Overpressure: 2000 psig without damage

2) Temperature: -20˚F to +200˚F

3) Power Supply: 24 to 40 volts DC at 30 ma

4) Output: 4-20 ma DC

5) Span: 5 inch wc minimum to 750 inch wc maximum span

b. Performance

1) Accuracy: ±0.20 percent of span

2) Linearity: ±0.10 percent of span

3) Hysteresis: ±0.05 percent of span

4) Repeatability: ±0.05 percent of span

5) Long-Term Stability: ±0.20 percent of span per six months

c. Physical

1) Diaphragms: 316ss

2) Process Flanges: Carbon steel

3) Process Connections: 1/4 NPT

8. Liquid Flow Meter: Flow transmitters shall be of a two-wire 4-20 ma type, operating on a vortex shedding principle or a retractable insertion target meter and provide a current signal linear with flow. Transmitters shall be factory wet calibrated, field calibration or adjustment is not permitted. The transmitter shall be protected against damage from reverse polarity and line transients. The transmitter shall meet the following specifications:

a. Accuracy: ±1.0 percent of rate

b. Repeatability: 0.2 percent of span

c. Rangeability: 20:1

d. Temperature Limits: -40˚C to +215˚C

e. Ambient: -40˚C to +65˚C

9. Space Static Pressure Probe shall allow accurate space static measurement in the presence of radial air velocity sources. The probe shall be specifically designed for ceiling mounting.

a. Accuracy: 1 percent of reading @ 1000 FPM Radial

b. Weight: Velocity

c. Finish: 8 oz. Brushed Anodized Aluminum

10. Air Flow Measurement Stations shall be complete with flow straightening section, multiple self-averaging velocity and static measurement probes, housed in a flanged duct section.

a. Accuracy: ±5 percent

b. Repeatability: ±0.2 percent

c. Temperature: -200˚F to 420˚F

11. Electronic Air Flow Transducers: Transducers are electronic monitors of air mass flow in ducts. They measure mass flow directly, monitor low flows down to 0-100 SFPM, and do not need pneumatic hook-ups, square-root extractors or temperature and pressure corrections.

a. Accuracy: 3 percent FS over 32˚F to 122˚F

b. Repeatability: 1 percent FS

c. Response Time: 300 ms (to 63 percent of final flow)

d. Range: 0 to 200 FPM - 0 to 2000 FPM

e. Temperature: -4˚F to 212˚F

f. Output Signal: 100 to 300 ma

g. Input Power: 24 volts DC

12. Current to Pressure Transducer (I/P) shall be of industrial quality and capacity. Motor driven PRVs, switching solenoid valves, or position sensitive devices are not acceptable. The current to pressure transducer shall meet the following specifications:

a. Supply Pressure: 25 psig $\pm$2 psig

b. Linearity: $\pm$1.0 percent of span

c. Span: 3-15 psig

d. Flow Rate: 4.5 SCFM @ 25 psig supply pressure

e. Air Consumption: 0.25 SCFM

13. Reheat Valve:

a. Valves up to and including 1-1/4 inch shall have union connections. Valves 1-1/2 inch shall have screwed ends. All valves 2 inches and less in size shall be of high grade bronze.

b. All 2-way reheat control valves shall be PICCV characteristic ball valves by Belimo with corresponding actuator.

c. All 3--way reheat control valves shall be CCV characteristic ball valves by Belimo with corresponding actuator.

14. Dampers: Provide control dampers of the size indicated with a pressure class of not less than 150 percent of the system pressure at shut-off pressures capable of being developed by the related fan system. Dampers shall be selected to provide correct flow control characteristics as required for each individual application. Single blade height control dampers and room dampers shall be single blade dampers. The operating range shall be -50˚F to 200˚F.

a. Provide Ruskin CD60

b. Type: Low leakage

c. Frame: 5 inch by 16 gauge hat-shaped steel

d. Blades: Air foil double skin 14 gauge

e. Seals: Blade edge-extruded vinyl; jam-aluminum flexible compression type

f. Linkage bearing: concealed in frame

g. Axles: molded synthetic 1/2 inch plated steel hex mill galvanized

h. Maximum Temperature: 250˚F

15. Damper Actuators

a. Actuators shall be electric (electronic).

b. All actuators shall be normally open (NO), normally closed (NC) or fail-in-last-position (FILP) as shown. Normally open and normally closed actuators shall be of mechanical spring return type.

c. Electric actuators shall have an electronic cut off or other means to provide burnout protection if stalled. Actuators shall have a visible position indicator.

d. Electric actuators shall provide position feedback to the controller as shown. Actuators shall smoothly open or close the devices to which they are applied.

e. Electric actuators shall have a full stroke response time in both directions of 60 seconds or less at rated load. Electric actuators shall be the direct-coupled type.

f. Where multiple electric actuators operate from a common signal, the actuators shall provide an output signal identical to its input signal to the additional devices.

g. Valve Actuators: Valve actuators shall provide shut-off pressures and torques for the corresponding flow rates and system pressures.

h. Damper Actuators: Damper actuators shall provide the torque necessary per damper manufacturer's instructions to modulate the dampers smoothly over its full range of operation and torque shall be at least 6 inch-pounds per 1 square foot of damper area for opposed blade dampers and 9 inch-pounds per 1 square foot of damper area for parallel blade dampers.

i. Positive Positioning Devices: Positive positioning devices shall be a pneumatic relay with a mechanical position feedback mechanism and an adjustable operating range and starting point.

16. Humidity transmitter shall be two-wire, 4-20 ma output sensing device using bulk polymer resistance sensor technology.

a. Transmitters shall meet the following specifications:

1) Accuracy: $\pm$2 percent RH ($\pm$2 percent RH is available)

2) Span: 15 percent to 95 percent RH

3) Operating Temperature Range: 30˚F to 120˚F minimum

4) Temperature Affect: $\pm$0.06 percent per degree centigrade change in ambient temperature

5) Manufacturer: Veris HT Series

b. Where temperature and humidity are being measured in the same room, the temperature and humidity transmitter shall be mounted on a common mounting bracket and covered with a common cover. Transmitter shall be Veris HT Series.

c. The humidity transmitter shall not be damaged when moisture condenser on the sensor itself.

17. Accelerometer: this sensor shall be piezoelectric type and shall be used for measuring vibration on equipment. The vibration shall be measured as analog quantity. Pre-set vibration switches shall not be acceptable.

18. Occupancy sensors: Sensors are provided by the electrical contractor.

19. DDC natural gas meter

a. Provide a separate insertion type gas meter in the gas main that goes to the gas fired hot water heaters.

b. Provide all components required to allow the BAS to monitor and record the quantity of natural gas used by the domestic and HVAC hot water boilers.

c. Meter shall be Kurz series 454FTB insertion meter.

20. BTU Meter

a. Provide a microprocessor based instrument designed to provide full energy, flow and temperature data.

b. The corresponding flow meter, temperature sensors, and other relative components shall be provided by the same company that provides the BTU meter for a complete package.

c. The BTU unit shall have a serial connection with the BAS using the BACnet protocol. All points from the meter shall be accessible through the BAS.

d. Meter shall be custom calibrated and matched to an accuracy better than ±0.15°F from 32-200°F.

e. Meter shall be Onicon System 10 series or equivalent.

F. Grade C Instrumentation. This is of the high quality commercial instrumentation with accuracies typically in the 1.0 percent to 5.0 percent range. This Grade C Instrumentation shall be used for unit heaters, cabinet heaters, and similar equipment serving mechanical equipment rooms, stairwells, etc.

1. Space Temperature Transducers shall be factory calibrated, field calibration or adjustment is not permitted**.** The transducers shall be protected against damage from reverse polarity and line transients sensors. The sensors shall meet the following specifications:

   a. Accuracy: ±2.0 percent of span

   b. Stability: ±0.01 percent of span/degree C

   c. Linearity: ±0.05 percent of span

   d. Span: 50˚F minimum

   e. Temperature Limits Ambient: 32˚F to 122˚F

2. Duct and Liquid Temperature Transducers shall be factory calibrated, field calibration or adjustment is not permitted. The transmitter tranducers shall be protected against damage from reverse polarity and line transients. The sensor shall meet the following specifications. Transducers used in liquid service shall be supplied with three (3) inch lagging extension stainless wells.

   a. Accuracy: ±1.0 percent of span

   b. Stability: ±0.01 percent of span/degree C

   c. Linearity: ±0.05 percent of span

   d. Span: 50˚F minimum

   e. Temperature Limits Ambient: 32˚F to 122˚F

3. Differential Temperature Transmitters shall be factory calibrated, field calibration or adjustment is not permitted. The transmitter shall be protected against damage from reverse polarity and line transients. The transmitter shall meet the following specifications:

   a. Accuracy: ±2.0 percent of span

   b. Stability: ±0.01 percent of span/degree C

   c. Linearity: ±0.05 percent of span

   d. Span: 25˚F maximum

   e. Temperature Limits Ambient: 32˚F to 122˚F

4. Static Pressure Transducer: The sensor is constructed on a single printed circuit card. The input ranges are switch-selectable, offering both unidirectional and bi-directional pressure sensing settings.

a. Accuracy: ±2.0 percent of span

b. Long-Term Stability: ±1 percent of span per year

c. Span: 0.25 inch wc minimum to 10 inch wc maximum span

d. Overpressure: 25 inch ws without damage

e. Power Supply: 24 to 40 volts DC at 30 ma

f. Output: 1 to 5 volts DC, 0-10 VDC, 4-20 MA

5. Differential Pressure Transducer: the sensor is constructed on a single printed circuit card. The input ranges are switch-selectable, offering both unidirectional and bi-directional pressure sensing settings.

a. Accuracy: ±2.0 percent of span

b. Long-Term Stability: ±1 percent of span per year

c. Span: 0.25 inch wc minimum to 10 inch wc maximum span

d. Overpressure: 25 inch ws without damage

e. Power Supply: 24 to 40 volts DC at 30 ma

f. Output: 1 to 5 volts DC, 0-10 VDC, 4-20 MA

6. Liquid Flow Meter: Flow transmitters shall be of a two-wire 4-20 ma type, operating on a vortex shedding principle and provide a current signal linear with flow. Transmitters shall be factory wet calibrated, field calibration or adjustment is not permitted. The transmitter shall be protected against damage from reverse polarity and line transients. The transmitter shall meet the following specifications:

a. Accuracy: ±5.0 percent of rate

b. Repeatability: 0.2 percent of span

c. Rangeability: 20:1

d. Temperature Limits: -40˚C to +215˚C

e. Ambient: -40˚C to +65˚C

7. Space Static Pressure Probe shall allow accurate space static measurement in the presence of radial air velocity sources. The probe shall be specifically designed for ceiling mounting.

a. Accuracy: 1 percent of reading @ 1000 FPM Radial

b. Weight: Velocity

c. Finish: 8 oz. Brushed Anodized Aluminum

8. Air Flow Measurement Stations shall be complete with flow straightening section, multiple self-averaging velocity and static measurement probes, housed in a flanged duct section.

a. Accuracy: ±2 percent

b. Repeatability: ±0.2 percent

c. Temperature: -200˚F to 420˚F

9. Electronic Air Flow Transducers: Transducers are electronic monitors of air mass flow in ducts. They measure mass flow directly, monitor low flows down to 0-100 SFPM, and do not need pneumatic hook-ups, square-root extractors or temperature and pressure corrections.

a. Accuracy: 3 percent FS over 32˚F to 122˚F

b. Repeatability: 1 percent FS

c. Response Time: 300 ms (to 63 percent of final flow)

d. Range: 0 to 200 FPM - 0 to 2000 FPM

e. Temperature: -4˚F to 212˚F

f. Output Signal: 100 to 300 ma

g. Input Power: 24 volts DC

10. Current to Pressure Transducer (I/P) shall be of industrial quality and capacity. Motor driven PRVs, switching solenoid valves, or position sensitive devices are not acceptable. The current to pressure transducer shall meet the following specifications:

a. Supply Pressure: 25 psig $\pm$2 psig

b. Linearity: $\pm$2.0 percent of span

c. Span: 3-15 psig

d. Flow Rate: 4.5 SCFM @ 25 psig supply pressure

e. Air Consumption: 0.25 SCFM

11. Reheat Valve:

a. Valves up to and including 1-1/4 inch shall have union connections. Valves 1-1/2 inch shall have screwed ends. All valves 2 inches and less in size shall be of high grade bronze. All valves 2-1/2 inches and larger shall have flanged ends, cast iron bodies and positive positioners.

b. All 2-way reheat control valves shall be PICCV characteristic ball valves by Belimo with corresponding actuator.

c. All 3--way reheat control valves shall be CCV characteristic ball valves by Belimo with corresponding actuator.

12. Humidity transmitter shall be two-wire, 4-20 ma output sensing device using bulk polymer resistance sensor technology.

a. Transmitters shall meet the following specifications:

1) Accuracy: $\pm$2 percent RH

2) Span: 15 percent to 95 percent RH

3) Operating Temperature Range: 30˚F to 120˚F minimum

4) Temperature Affect: $\pm$0.06 percent per degree centigrade change in ambient temperature

b. Where temperature and humidity are being measured in the same room, the temperature and humidity transmitter shall be mounted on a common mounting bracket and covered with a common cover. Transmitter shall be as manufactured by Veris or approved equal.

c. The humidity transmitter shall not be damaged when moisture condenser on the sensor itself.

G. Binary Sensing Devices for Air Systems and Electric Control

1. General

a. Output signals from binary devices shall be SPST (N.O.) SPST (N.C.), SPDT, DPST (N.O.), DPST (N.C.) or DPDT signals as required by the application. All

contacts shall be rated for a minimum of 7.4 amps at 120 volts AC inductive and 3.7 amps at 240 volts AC inductive or greater if required by the application.

b. All contact ratings and duties shall be rated in accordance with NEMA ICS1.

2. Temperature Switches

a. Temperature switches for duct application shall be remote bulb thermostats with an adjustable setpoint range of 20˚F to 120˚F. The changeover differential shall be adjustable between 6˚F and 45˚F.

b. Temperature switches for room temperature control shall include line voltage room thermostats. These devices shall be SPST or SPDT devices with a range of 40˚F to 90˚F and a changeover differential of 1.8˚F to 3.5˚F. These devices shall be suitable for heating or cooling duty for such applications as operating unit heaters or ventilation exhaust fans.

c. Low-voltage room thermostats shall be two-position temperature regulating instruments with anticipator circuits designed for close control of heating and/or cooling systems. These devices shall be suitable for 10 amps at 120 volts AC inductive. These devices shall have range of 45˚F to 90˚F and a changeover differential of 0.5˚F for heating and 1.5˚F for cooling. Room thermostats shall have an on-off-automatic switch to control the fan and heating-off-cooling switch to control functions. The thermostats shall have automatic changeover from heating to cooling and vice versa.

3. Freeze protection thermostats shall be snap-acting manual reset electrical devices which will contain a DPST switch. Freeze protection thermostats shall have a 20 foot capillary element, any portion of which, sensing a low temperature, shall activate the control to stop the supply fan. Sufficient freeze protection thermostats will be furnished to adequately protect the entire cooling coil. Thermostat range shall be adjustable 30˚F to 55˚F minimum.

a. Provide one freezestat for each 80 square feet of coil surface area.

b. The main set of contacts shall be wired to the fan starter; the auxiliary set shall be wired to the DDC system.

4. Pressure switches and differential pressure switches shall be diaphragm operated SPDT snap switches. Motion of the diaphragm shall be restrained by a calibrated spring that can be adjusted to set the exact pressure at which the electric switch will be actuated. Switches shall be suitable for a minimum of 25 inches w.g. pressure or differential pressure without damage.

a. Switch ranges shall be selected to fall within the switch scale based on 80 percent of the "measured" devices rated pressure or differential pressure.

b. Switches shall be Dwyer Series 1910, Cleveland AFS 460 or approved equal.

5. No sail switches shall be used.

6. Vibration switches shall be acceleration sensitive devices that measure the total peak vibratory shock. The device shall provide electric switch contact closure for shutdown of fans, pumps, or compressors. The device shall be DPDT for direct wiring to the equipment and to the DDC system. The setpoint shall be field adjustable between 0 and 4.5 Gs in a frequency range of 0 to 50 Hz. The device shall be manual reset.

a. The main set of contacts shall be wired directly to the fan, pump, or compressor starter; the auxiliary set shall be wired to the DDC system.

b. Devices shall be Vibra-Alert Model 5173 or 5175 vibration switches or approved equal.

7. Damper End Switches

a. Damper end switches for new smoke dampers and for new combination fire/smoke dampers shall be furnished with each new damper provided by the HVAC Contractor.

b. Damper end switches for existing smoke dampers and for existing fire and smoke dampers shall be provided by the DDC System Supplier and shall be the same switches which would be furnished as the standard offering of the "existing" damper manufacturer.

c. Damper end switches used for outdoor air, return air, and relief air dampers in engineered smoke control systems shall be provided by the DDC System Supplier.

d. Damper end switches, unless otherwise specified, shall be low operating torque spring return NEMA 13 oil tight limit switches with "cat whisker" operating lever. End switch shall be provided complete with rigid mounting bracket for attaching switch to a "fixed" surface and a rigid for attachment to the movable portion of the damper as required. Damper end switch shall be Allen Bradley Catalog #302T-CW or approved equal.

8. Jumbo pushbutton for labs shall be NEMA 13 oil tight mushroom head momentary contact spring return pushbutton units complete with legend plate and flush wall plate and guard. Pushbutton shall have one N.O. and one N.C. set of contacts.

a. Legend plate shall read, "Emergency."

b. Pushbuttons shall be Allen Bradley Catalog #800H-DGB (red) with #800T-N151 guard or approved equal.

9. Other control devices such as manually operated selector switches and pushbuttons shall be industrial quality switches, selected for the specific application. Switches shall be a minimum of NEMA 13 oil tight.

a. All switches shall be the standard products of Allen Bradley, Cutler Hammer, Westinghouse, or approved equal.

H. Binary Sensing Devices for Water Systems

1. General

a. Output signals from binary devices shall be SPST (N.O.), SPST (N.C.), SPDT, DPST (N.O.), DPST (N.C.), or DPDT signals as required by the application. All contacts shall be rated for a minimum of 7.4 amps at 120 volt AC inductive and 3.7 amps at 240 volts AC inductive or greater if required by the application.

b. All contact ratings and duties shall be rated in accordance with NEMA ICS1.

2. Temperature Switches

a. Temperature switches (aquastats) shall be surface mounted electric thermostats designed for mounting directly onto pipes. These devices shall be SPDT devices with a range of 50˚F to 150□F and a changeover differential of approximately 10˚F. These devices shall be suitable for such applications as operating unit heaters.

b. Remote bulb temperature switches shall be electric thermostats used where remote or immersion sensing is required. These devices shall be SPDT devices with ranges of 20˚F to 120˚F or 100˚F to 240˚F and an adjustable changeover differential of between 6˚F and 45˚F.

c. Immersion sensing elements shall be provided complete with thermometer wells.

3. Pressure switches shall be SPST (N.O.) type operated by a stainless steel bourdon tube actuating a mercury switch. Switch shall be rated for a minimum of 300 (150) psig operating pressure with a minimum adjustable operating setpoint of 10 psig. Deadband shall be adjustable up to 100 percent of the switch range. Switch shall have a visible calibrated dial and two visible pointers indicating setpoint and reset point and shall have visible on/off indication.

   a. Pressure switches shall be Mercoid Series DA-41 or approved equal.

   b. Pressure switches shall be provided complete with snubber.

4. Differential pressure switches shall be SPST (N.O.) type operated by two opposing double bellows actuating a mechanical linkage. Switch shall be rated for a minimum of 300 (150) psig operating pressure with a minimum adjustable operating differential setpoint range of 0 to 30 (20) psig; deadband shall be adjustable 6 to 30 (20) psig. Switch shall have a visible calibrated dial and two visible pointers indicating setpoint and reset points.

   a. Differential switches shall be Mercoid Series DP-7043-153 or approved equal.

   b. Each pressure sensor leg shall be provided complete with snubber.

5. Paddle type flow switches shall be SPDT or DPDT switches as required by the application and shall be constructed with stainless steel parts being in contact with the water. The switch shall be suitable for installation in a female NPT pipe opening. The switch shall be rated for a minimum of 300 (150) psig operating pressure. The operating flow rate (flow - no flow) shall be adjustable.

   a. Flow switch shall be McDonnell Miller Series FS7-4 (FS4-35) or approved equal.

   b. Time delay relays shall be provided for switches which operate directly with the pump starter.

6. Level Switches

   a. Float operated level switches shall be float actuated level switches for turning pumps on and off and opening and closing valves to maintain level. The device shall also alarm and cut-out on low level. The device shall be rated for minimum 150 psig operating pressure and shall be complete with sight glass. Float switch shall be McDonnell Miller No. 157 Pump Controller/Low Water Cut-Off or approved equal.

   b. Float operated level switches for tank level detection and control shall be vertical displacer type with up to four (4) displacers and three (3) SPST switches. The number of displacers and switches shall be determined by the application. Displacers shall be porcelain or stainless steel. Displacer housing shall be supported on a cast iron flange. Switch shall be provided with a vented stilling chamber. Switch shall be McDonnell Miller Model DFC with mercury switches or approved equal.

   c. Probe actuated level switches shall be single or multiple conductance actuated controls which utilize electrodes and the conductivity of the fluid to sense liquid level. The number of probes (up to four) and switches shall be determined by the application. The control housing shall be suitable for inserting in vessels with pressures up to 250 psig. Probe shall be suitable for 120 volt pilot voltage. The switch shall be provided with a vented stilling chamber. Switch shall be McDonnell Miller Model PCH-G-A or approved equal.

7. Current switches for pumps shall be designed to mount in the starter enclosure on a power lead of the device to be monitored and energize a solid-state switch when the current level rises above the trip point. The trip point shall be easily knob adjusted from

the front of the switch and the trip point shall have a differential of ±5 percent of full range. The switch shall be powered from the starter control transformer and shall have overcurrent protection to 200 percent of the upper range limit. The output shall be a SPST (N.O.) switch, rated at 120 volts AC.

a. Current switches shall be Cymatics Model 850 or approved equal.

8. Reed relays shall be used for conversion of a single pulsed input to a multiple pulse input. This would happen where a single meter with a single pulse output used in a pre-packaged control process would be monitored by the DDC system; i.e., to determine cooling tower water consumption from the chemical feed system water meter. The purpose is to convert one "long duration pulse" into several "short duration pulses."

a. Outputs from relays shall be multiple SPST (N.O.) signals as required by the sequence of operation. All contacts shall be rated for low-energy switching at a maximum 150 volts AC, 500 ma, 25 VA maximum.

b. All contacts ratings shall be rated in accordance with ICS1.

c. Relay holding coils shall be rated for available input current and voltage and for continuous duty if necessary. Relays shall be equipped with coil transient suppression devices to limit transients to 150 percent of rated coil voltage.

I. Other Output Devices

1. Control Relays: All control relays interfacing to AC circuits shall be solid state with zero crossing, capable of handling 240V AC at 3A.

2. Electric Solenoid Operated Pneumatic (EP) Valve: EP valves shall have three port operation: common, normally open, and normally closed. EP valves shall have an outer cast aluminum body with internal parts constructed of brass, bronze, or stainless steel. The air connection shall be a 3/8 inch NPT threaded connections. EP valves shall be rated for 50 psig when used in control system operation at 25 psig or less, or rated at 150 psig when used in control system operation from 25 to 100 psig. EP coils shall be equipped with transient suppression to limit transients to 150 percent of rated voltage. EP valve operation shall be rated for a minimum of 220˚F.

3. Single Input Control Point Adjustment (CPA) Controller: Single input CPA controllers shall permit changing of control points remotely by varying the CPA port value. CPA shall be plus or minus 10 percent of primary sensor span. Controllers shall operate from electronic or pneumatic sensors as shown. Controllers shall be complete with adjustable setpoint, adjustable gain (proportional band) and shall be field selectable for direct or reverse action. Pneumatic units provided shall be constructed to withstand a maximum pressure of 25 psig. All controller inputs and outputs shall be provided with internal or external gauges for calibration on input and output signals.

4. Dual Input Controller: Dual input controllers shall permit changing of control points remotely by varying the second port input value. Controllers shall operate from electronic or pneumatic sensors as shown. Controllers shall be complete with adjustable setpoint, adjustable gain (proportional band), adjustable authority, and shall be field selectable for direct or reverse action. Authority effect of secondary sensor on setpoint shall be adjustable from 33 to 100 percent of primary sensor span. Pneumatic units shall be constructed to withstand a maximum pressure of 25 psig. All controller inputs and outputs shall be provided with internal or external gauges for calibration of input and output signals.

5. Position Sensors

a. End (Limit) Switch: Limit switches shall be of the enclosed or sealed type as required for the application. Contacts shall be snap-action Form C rated for the application.

b. Potentiometers: Potentiometers may be either rotary or linear, depending on the application of each position indicator. Position potentiometers shall have a linearity of plus or minus 5 percent and shall indicate position on a percent open basis.

J. Analog Output Devices

1. General

a. The analog outputs from the DCPs shall generally be a 4-20 ma or 0-10 volt signal which will be used either to control the setpoint of "external" devices as 4-20 ma input (i.e., a variable frequency drive) or to control a pneumatic output device (i.e., a valve or damper).

b. All control signals to "external" devices shall be protected from surges induced on the control wiring on each end. These "inputs" and outputs shall be tested in both normal mode and common mode using the following waveforms:

1) A 10 microsecond by 1000 microsecond waveform with a peak voltage of 1500 volts and a peak current of 60 amperes.

2) An 8 microsecond by 20 microsecond waveform with a peak voltage of 1000 volts and a peak current of 500 amperes.

c. All control signals to pneumatic control devices shall have the signal converted from (4-20 ma or 0-10 VDC to pneumatic via a current to pneumatic (I/P) or voltage to pneumatic (E/P) transducer.

2. Pneumatic (I/P, E/P) Transducers

a. Transducers shall meet the following specifications:

1) Supply pressure: 25 psig $\pm$ 2 psig

2) Signal: 4-20 ma or 0-10 v

3) Output pressure: 3-15 psig

4) Linearity: $\pm$1.0 percent of span at 25 psig supply

5) Flow Rate, Midrange: 4.5 SCFM at 25 psig

6) Air Consumption, Midrange: 0.1 SCFM

7) Supply Pressure sensitivity, Midrange: $\pm$1 percent of span per psig

8) Minimum Overpressurization without Damage: 30 psig

b. Each transducer output signal shall be provided with a minimum 1 inch diameter pressure gauge or LCD display.

c. Outputs from transducers shall be used to control valves, control dampers, or to reset pneumatic control setpoints.

K. Electrically Actuated Dampers and Valves

1. When called for or allowed in the specification, electronically actuated valves and dampers shall be provided in lieu of pneumatically actuated devices.

2. These actuators shall be provided in adequate size and quantity to properly position each automatic control device.

3. Refer to pneumatically actuated dampers and valves in the specification for further requirements pertaining to valve and dampers.

4. Electronic Actuators - General

a. Electronic actuators shall be selected for valves and dampers based on the torque and thrust requirements of the device to be controlled.

b. Actuators for valves and dampers shall be designed to operate in environments between 35˚F and 140˚F. Actuators for outdoor air dampers shall be designed to operate in environments between -4˚F and 122˚F.

c. Actuators shall have a minimum five-year replacement warranty.

d. All valve and terminal box actuators shall be shipped to the valve and terminal box manufacturer for mounting. Mounting costs shall be borne by the DDC System Supplier.

e. Electronic actuators shall be permitted for all applications except where noted.

5. Electronic Damper Actuators

a. Electronic damper actuators for smoke dampers shall be standard electronic actuator. These actuators shall meet the following requirements:

1) Full close to full open stroke time shall be five minutes maximum.

2) Modulating dampers shall modulate or position itself using an electronic motor and, in conjunction with damper arm as required, shall create a minimum of 133 inch-pounds of torque. Multiple actuators shall be used where higher torque requirements are required.

3) Modulating damper positioning shall be controlled using a controlled output signal or the damper actuator shall be provided with positive positioning feedback.

4) Open close damper positioning shall be controlled using an on/off closure and shall be provided with end switches.

5) Upon power loss, the damper actuator shall "spring return" to a normally open or normally closed position as specified in the control sequences.

6) Damper actuator shall be provided with a visual damper position indication on the actuator body.

6. Electronic VAV Box damper and Reheat coil valve actuators:

a. Actuators

1) Electronic dampers actuators for equipment shall be electronic actuator. These actuators shall meet the following requirements.

2) Full open close stroke time shall be120 seconds or less

3) Actuators shall be Underwriters Laboratories approved under standard 873

4) Actuators used near outdoor air streams shall have NEMA type 2 housing for water and moisture

5) Actuators shall be direct couples to the valve

6) Actuators shall be applied as per manufacturer’s specifications

7) The valve Actuators shall be capable of providing the minimum torque required for proper valve close-off pressure for the required application.

8) Actuators shall have current limiting circuitry or overload protection

9) Applications that require fail safe operation of the valve assembly shall use actuators with mechanical springs.

10) Interior valve shall fail to last position.

11) All proportional valves shall be positive positioning and respond to a 2-10 VDC or 4-20 ma signal. Positioning shall be within 0.5 percent of stroke. The actuator shall provide positive positioning feedback. Floating point actuators shall not be allowed.

12) Actuators shall operate on 24 volts AC power.

13) Manufacturer shall provide a 5 year unconditional warranty.

b. Valves

1) Valves 1/2" through 2" shall be forged brass body with nickel plating, NPT screw type. The operating temperature range shall be 0 Deg. to 212 Deg. F.

2) The valves shall have an ISO 4 bolt flange for mounting actuators in any orientation. A non-metallic thermal isolation adaptor shall separate the flange from the actuator with high temperature material rated for continual use at greater than the application temperature. Valves assemblies without thermal isolation shall not be acceptable.

3) Valves up to and including 1-1/4 inch shall have union connections. Valves 1-1/2 inch shall have screwed ends.

4) The isolation adaptors shall provide stable direct coupled mechanical connection between the valve body and actuator and prevent lateral or rotational forces from affecting the stem and its packing O-rings.

5) All control ball valves shall be furnished with a stainless steel ball and stem and fiberglass reinforced Teflon seats and seals. The valves shall have a blow out proof stem design. Each valve shall be tested by the valve manufacturer.

6) Flow type for modulating two way and three way valves shall be equal percentage. All control valves shall have a flow characterizing disc in the inlet of the valve to provide the equal percentage control port. They shall have a modified linear bypass port which will yield 70% of the flow of the A port.

7) Manufacturers shall provide a two year unconditional warranty from the date of acceptance.

8) 2-way valves shall be Belimo PICCV valves with a Belimo electric actuator rated for the application.

9) 3-way valves shall be Belimo CCV valves with a Belimo electric actuator rated for the application.

7. Isolation and Modulating Water Control Valves:

a. AHU Chilled Water Coil Control Valves

1) Prove Belimo electronic actuator sized and rated for the application.

2) Valves shall be Delta P valves by Flow Control Industries (FCI).

b. Other Control Valves over 2-1/2"

1) Valves shall be high-performance Butterfly valves by Belimo.

2) Valves shall meet the performance requirements in Specification Section 230523 - GENERAL-DUTY VALVES FOR HVAC PIPING

3) Prove Belimo electronic actuator sized and rated for the application. The only exception is as noted on drawing M801 which shall be pneumatic actuated valves.

c. Other Modulating Control Valves 2-1/2" or smaller

1) Valves shall be as specified above in section 3.13.J.6.b

2) Prove Belimo electronic actuator sized and rated for the application.

d. Other Two Position Control Valves 2-1/2" or smaller

1) Valves shall ball valves by Belimo that meet the performance requirements in Specification Section 230523 - GENERAL-DUTY VALVES FOR HVAC PIPING

2) Prove Belimo electronic actuator sized and rated for the application.

L. Miscellaneous Electrical Equipment

1. Relays

a. Socket Mounted Relays - 5 Amp Contacts: Relays shall be three pole double throw socket mounted devices with an octal pin type or blade type mounting arrangement. Contacts shall be rated for 5 amps at 120 volts AC. Coil voltage shall be as specified on the drawings or equipment lists and shall draw no more than 2.5 VA. Relays shall be provided with mounting sockets with screw type terminals and shall be suitable for mounting on a standard DIN EN 50022 mounting rail. Relays shall be provided with a manual test button for check-out and troubleshooting purposes. Acceptable devices and manufacturers are as follows:

MANUFACTURER	MODEL	COMMENTS
Potter & Brumfield	KUP14A25 relay	
Idec	RR3PA-UC relay	
	RR3B-UC relay	
Omniron	MJ3PI-UA relay	

b. Multi-Function Programmable Time Delay Relay: Time delay relay shall be capable of performing as a delay on make, delay on break, or interval timer depending on DIP switch programming or terminal jumpering. Relay time delay range shall be from 0.5 seconds minimum to 2 hours or more. Relay output shall be at least 1 set of single pole double throw contacts rated for at least 5 amps at 120 volts AC. Mounting shall be in a screw terminal type socket provided with the relay. The socket shall be suitable for mounting on a standard DIN EN 50022 mounting rail. Relay power supply voltage shall be as specified on the drawings or parts list or required for proper operation. Acceptable manufacturers and models are as follows:

MANUFACTURER	MODEL	COMMENTS
Automatic Timing & Controls Co.	328A200 relay	
Barber Colman	P-186-8-2 relay	
Guardian	PET 1481 relay	
Syrelec	LR2 Series	

c. Cube Type On-Delay Relay: Relays shall be series wired on delay relays with the voltage and time delay ratings indicated on the drawings and parts lists.

Relays shall be arranged to be wired in series with the load they serve. Adjustable time delay range, where specified, shall be provide with potentiometer wired to auxiliary terminals at the relay or programmed by DIP switches mounted at the relay. Terminals shall be screw type or quick connect spade type. Where adjustable delay ranges are specified, the relay shall be provided with all necessary accessories required to provide the adjustable range. Relays shall be capable of switching loads up to 1 amp at the input voltage specified. Acceptable manufacturers and models are as indicated below:

MANUFACTURER	MODEL	COMMENTS
National Controls Corporation	Q1 series	
Artisan	438U or 438USA or 438UP or 438 or 438AP	
Idec	RTS-MN	
Syracuse	SMPA or SMPB	

d. Cube Type Off-Delay Relay: Relays shall be off delay relays with the voltage and time delay ratings indicated on the drawings and parts lists. Timing shall be initiated by the opening of an isolated external contact. Adjustable time delay range, where specified, shall be provided with a potentiometer wired to auxiliary terminals at the relay or programmed by DIP switches mounted at the relay. Terminals shall be screw type or quick connect spade type. Where adjustable delay ranges are specified, the relay shall be provided with all necessary accessories required to provide the adjustable range. Relays shall be capable of switching loads up to 1 amp at the input voltage specified.

1) Acceptable manufacturers and models are as indicated below:

MANUFACTURER	MODEL	COMMENTS
National Controls Corporation	Q3 series	
Artisan	4710	
Syracuse	SBPA	

2. Switches, Potentiometers, and Lights

a. Multi-Pole, Multi-Step Rotary Switch: Switches shall be panel cover mounted switches with operator and numbered legend panels. Poles and steps shall be as required by the application or as indicated on the drawings. Contacts shall be rated for 10 amps at 120 volts AC. Provide a placard for each switch to be mounted with the switch indicating the function of each position. Acceptable manufacturers and models are as follows:

MANUFACTURER	MODEL	COMMENTS
Entrelec	VY10 Family	

b. Push to Test Pilot Lights: Pilot lights shall be suitable for cover mounting in control panels and shall be rated for the voltage associated with the application. Lens colors shall be as specified or as required by the application. Lamps and holders shall be the push-to-test type with the words "Push To Test" or "Press To Test" clearly engraved or cast into the lens cap. Lamps shall be provided with legend plates indicating the function associated with illumination of the lamp.

c. Momentary Contact Push-Buttons: Switches to be panel mounted single pole single throw normally off momentary on rated for a minimum of 3 amps at 120 volts AC. Buttons shall be color coded as indicated on the drawings or parts list. Switches to be supplied with all accessories required for panel mounting.

Switches to have screw type terminals. The following devices and manufacturers are acceptable:

MANUFACTURER	MODEL	COMMENTS
Idec	TWTD Series	
	TW Series	
Allen Bradley	800MS Series	
	800MR Series	
Rafix	22/30 Series	

d. Toggle Switches - Single Pole Single Throw: Switches to be panel mounted single pole single throw two-position switches with both positions maintained. Contacts to be rated for a minimum of 15 amps at 120 volts AC. Switches to be supplied with all accessories required for panel mounting. Switches to have screw type terminals. The following devices and manufacturers are acceptable:

MANUFACTURER	MODEL	COMMENTS
Idec	TWTD Series	
	TW Series	
Allen Bradley	800MS Series	
	800MR Series	
Rafix	22/30 Series	

e. Toggle Switches - Single Pole Double Throw: Switches to be panel mounted single pole double throw three position (center off) switches with all positions at 120 volts AC. Switches to be supplied with all accessories required for panel mounting. Switches to have screw type terminals. The following devices and manufacturers are acceptable:

MANUFACTURER	MODEL	COMMENTS
Idec	TWTD Series	
	TW Series	
Allen Bradley	800MS Series	
	800MR Series	
Rafix	22/30 Series	

f. Panel Cover Mounted 10 Turn Clock Face Potentiometers: Potentiometers shall be panel cover mounted devices with 10 turn clock face dials and shall be rated for the voltage and current of the circuit they are serving. Acceptable devices and manufacturers are as follows:

MANUFACTURER	MODEL	COMMENTS
Bourns	3600S-1	
Bourns	3640S-1	

g. Trimmer Potentiometer: Trimmer potentiometers shall be internally mounted at terminal strips in control panels and shall have values as required by the application. Pots shall have a screwdriver type multi-turn adjustment accessible with the device in its normal mounted position. Mounting terminals shall be of the sliding link type to allow the device to be isolated from the circuit it serves for set up. Devices shall be rated for the voltage and current of the circuit they are installed in. Acceptable manufacturers and models are as follows:

MANUFACTURER	MODEL	COMMENTS
Bourns	20	
	3006	
	3009	
	3099P	

3. Temperature and Pressure Control Switches

a. Two-Position Electric Thermostat: Thermostats shall be snap-acting type thermostats with SPDT contacts rated for a minimum of 1.5 amps inductive at 120 volts AC. Cover arrangements shall be as specified or as directed by the Engineer at the time of shop drawing review. Minimum setpoint range shall be 55˚ to 85˚. Acceptable manufacturers and models are as follows:

MANUFACTURER	MODEL	COMMENTS
Landis & Gyr Powers	ET-134 Series	
Honeywell	T651A	
White Rodgers	1A16-51	

b. Remote Bulb Thermostat - Single Pole Double Throw: Thermostats shall be thermally actuated single pole double throw switches with a field adjustable setpoint and differential. Differential range of adjustment shall be a minimum of 6 to 12˚F. Minimum setpoint range of adjustment shall be as indicated below. Switch contacts shall be rated for a minimum of 6 amps inductive load at 120 volts AC, 3 amps inductive load at 240 volts AC. Capillary length shall be a minimum of 6 feet. Where indicated, thermostats shall be supplied with two wells (one for calibration and one for bulb installation). Acceptable devices and manufacturers are as follows:

RANGE OF ADJUSTMENT DEGREES F	LANDIS & GYR
20 to 100	141-0520
100 to 240	141-0521

4. Current Operated Switches

a. General: Current operated switches shall be provided with additional relays as required to perform the indicated functions in the sequences of operation. In addition, contact resistance associated with solid state relays shall be taken into consideration and accounted for in the design of the circuits using solid state relays to prevent problems associated with voltage drops through closed switches and leakage currents through open switches.

b. Current Operated Switch - Low Range: Devices shall be capable of changing the state of an isolated dry contact or switch when a flow of current is sensed in the wire they are monitoring. The isolated output must be capable of switching up to 1 amp at 120 volts AC or DC minimum as required by the application. Trip points shall be adjustable from a minimum of 2 amps to a maximum of 15 amps. Devices shall be provided with all necessary mounting hardware. Acceptable manufacturers and models are as follows:

MANUFACTURER	MODEL	COMMENTS
Potter and Brumfield	SDAS-01 Series	With mounting socket
Neilsen – Kuljian	D-100AC	

c. Current Operated Switch - High Range: Devices shall be capable of changing the state of an isolated dry contact or switch when a flow of current is sensed in the wiring they are monitoring. The isolated output must be capable of switching up to 1 amp at 120 volts AC or DC minimum as required by the application. Trip points shall be adjustable from minimum of 15 amps to a maximum of 300 amps. Devices shall be provided with all necessary mounting hardware. Acceptable manufacturers and models are as follows:

MANUFACTURER	MODEL	COMMENTS
Neilsen - Kuljian	D-100AC	

5. Pressure Switches

a. Differential Pressure Switches - Pump Proof of Operation: Switches shall be arranged to actuate a single pole double throw switch based on the difference between two pressures. Switches shall be bellows actuated. Switches shall be suitable for the working pressure of the system on which they are installed and shall have a minimum working pressure rating of 30 inches Hg vacuum to 100 psig. The setpoint shall be adjustable between 0 and 20 psig and the sensitivity shall be adjustable with a minimum setting of 1 psig. Switches shall be rated for a minimum of 5 amps at 120 volts AC. Enclosures shall be rated NEMA 1 and shall be provided with termination points for conduit and piping connections. Switches shall be Mercoid series DPA or approved equal by United Electric or Penn.

M. Miscellaneous Auxiliary Equipment

1. 24 Volt AC Control Power Transformers: Transformers shall be NEC Class 2 general purpose transformers with primary windings as required by the application and 24 volt AC secondary windings rated for 40 VA at 100 percent power factor. Transformers shall be installed in a suitable enclosure to prevent contact with the primary and/or secondary terminals when the cover is on the enclosure. Where transformers are provided for installation by others, the transformers shall be provided mounted in the enclosure. The mounting arrangement shall be such that the terminals are accessible for connection without removing the transformer from the enclosure.

a. Transformers shall be Honeywell AT72D series with suitable NEMA 1 enclosure or approved equal.

b. Similar transformers with higher VA ratings may be supplied but must be designed and installed to meet all requirements of NEC article 725 when used to serve Class 1, Class 2, or Class 3 low voltage circuits. Transformers shall be UL labeled.

c. Disconnecting Terminal Blocks: Terminal block shall be arranged to allow the entering conductor to be disconnected from the leaving conductor without lifting the conductor from its termination point. Disconnection shall be by screwdriver actuated sliding link, knife link, or plug switch. Terminals shall be rated for the voltage and current of the circuit they are contained in at a minimum. Termination points shall be arranged with test jacks to allow a meter to be connected without interfering with the operation of the disconnecting means. Terminals shall be suitable for and mounted on a standard DIN EN 50022 mounting rail. Acceptable models and manufacturers are as follows:

MANUFACTURER	MODEL	COMMENTS
Weidmuller	SAKC10	
Weidmuller	SAKT1	
Weidmuller	SAKT2	
Entrelec	4/6.SNT	
Entrelec	M6/8.ST2	
Phoenix	URTK/SP	
Phoenix	MTK-P/P	
Phoenix	UK4-T	

1) All of the above are with accessories as required for a complete assembly.

d. Fuse Holder Terminal Blocks: Terminal block shall be arranged to allow a fuse to be installed in the terminal strip between the entering and leaving wires of the termination point. Terminals shall be provided with LED, Neon, or mechanical fuse status indicators. Terminals shall be rated for the voltage and current of the

circuit they are contained in at a minimum. Terminals shall be suitable for and mounted on a standard DIN EN 50022 mounting rail. Acceptable models and manufacturers are as follows:

MANUFACTURER	MODEL	COMMENTS
Weidmuller	SAKS Series	
Entrelec	MB10/12 Series	
Phoenix	UK5 Series	

1) All of the above are with accessories as required for a complete assembly.

e. Component Holder Terminal: Terminals shall be arranged for mounting on standard DIN mounting rail and shall be set up to allow a discrete electronic component such as a load resistor or a trimmer pot to be mounted between the entering and leaving connection points. Jumpering shall be provided as required to interconnect to sliding link terminals if required by the application. Acceptable manufacturers and models are as follows:

MANUFACTURER	MODEL	COMMENTS
Curtis	CS Series	

1) With accessories as required for a complete assembly. Use for components with 14 and 16 pin DIP configurations.

Phoenix	UK4-TG/ST-BE	

2) With accessories as required for a complete assembly. Use for 2 and 4 lead components.

f. Feed Through Terminal Blocks: Feed through terminal blocks shall be compatible with the special purpose DIN rail system. Terminals shall be clamp type terminals suitable for solid or stranded wire from #18 AWG to #12 AWG (minimum range). Terminals shall be rated for the voltage and current at which they are applied and shall be provided with all necessary end caps, separators, etc., required for a complete installation.

g. Grounding Type Terminal: Terminals shall be color coded green and yellow and shall be compatible with the other specialty terminals specified above and shall mount on the same DIN rail system. Units shall be arranged so that the wiring connected to them is grounded to the enclosure via the mounting rail. Terminals shall be Phoenix USLKG, MSLKG, or equivalent as manufactured by Weidmuller or Entrelec. These terminals shall be provided for grounding cable shields at the points where the cables enter a control panel and terminate on the control panel terminal strip.

h. Resistor Style Terminal Block: Terminals shall be arranged for mounting on a standard DIN mounting rail and shall be provided with the appropriate resistor value and tolerance either factory or field installed. Terminals shall consist of a two level block with the upper terminals bussed together and the lower terminals bussed together. A resistor of the appropriate value and tolerance as require by the application and/or as indicated on the drawings shall be installed between the upper and lower busses. The terminals shall be applied where it is desired to pass a current loop through a series load resistor to generate a voltage drop for use by a control system or an indicator. Terminals shall be Allen Bradley 1492-UW5R, 1492-H2RA, B, or C, Phoenix UDK4-DUR, or equivalent models by Weidmuller or Entrelec.

3.14 ENCLOSURES - GENERAL

A. Enclosures shall conform to the requirements of NEMA for the type specified. Finish color shall be the manufacturer's standard, unless otherwise indicated. Damaged surfaces shall be repaired and refinished using original type finish. Enclosures installed indoors shall be NEMA 1 or as specified for special applications. All enclosures shall be lockable.

3.15 NAMEPLATES

A. Laminated plastic nameplates shall be provided for all I/O devices furnished. Each nameplate shall identify the function, such as "mixed air controller" or supply air temperature sensor." Laminated plastic shall be 0.125 inch thick, white with black center core. Nameplates shall be a minimum of 1 inch by 3 inches, with a minimum 0.25 inch high engraved block lettering. Nameplates for devices smaller than 1 inch by 3 inches shall be attached by a nonferrous metal chain. All other nameplates shall be attached to the device. The name of the I/O device, as referenced in software, shall be placed on the nameplate.

B. Brass tags shall be minimum of 18 gauge polished brass, 1-1/2 inch diameter. Each tag shall include 0.25 inch high stamped black filled letters. Seton Type 250 BL or approved equal.

3.16 APPARATUS CONTROL PANELS

A. All electrical, electronic or pneumatic equipment including DCPs, DTCs and UCPs shall be installed in suitable panels or enclosures to protect the equipment from environment, dirt, rain, vandalism, and accidental damage.

B. Prewired apparatus control panels (ACPs) shall be provided for each HVAC unit and each system by the DDC System Supplier. ACPs shall include all electronic control chassis, relays, switches, transformers, time clocks, interval timers, pilot lights, setpoint adjustments, and temperature indication meters. All controls requiring adjustment shall be located in ACPs. The remote setting of the mixed air temperature and discharge temperature, regardless of whether by natural or mechanical cooling and the outdoor changeover shall be adjustable through a gradual switch at the face of the ACP.

C. Each ACP shall be provided with an isolation valve to disconnect the ACP from its main instrument air supply and a disconnect switch to isolate the line side of all electric circuits within the ACP.

D. The ACPs shall be fully enclosed cabinets, all-steel construction and shall meet the NEMA requirements for the location installed. All ACPs shall have hinged doors with a locking latch. ACP enclosures shall be NEMA 1 for indoor application. ACP enclosure for outdoor application shall be NEMA 4 or NEMA 3. ACP enclosures for the parking garage, dishwash room, and loading dock (indoor applications) shall be NEMA 4x (stainless steel or fiberglass).

E. All ACP locks shall be keyed alike. A means of storing control system instructions and drawings shall be provided inside cabinet for future reference. Cabinet and door shall be finished with two (2) coats of paint.

F. Instrumentation and control (I&C) diagrams for ACPs other than DCPs, DTCs and UCPs shall be provided. Drawings shall show complete I&C diagrams for all equipment furnished and shall be posted in the control panel. Drawings shall be furnished in permanently sealed laminated plastic. Condensed operating instructions explaining preventative maintenance procedures, methods of checking the system for normal safe operation, and procedures for safely starting and stopping the system manually shall be prepared in typed form, laminated as specified for the I&C diagrams and posted beside the diagrams. Proposed diagrams, instructions, and other sheets shall be submitted and approved by the Architect/Engineer prior to posting. The instructions shall be posted before operation verification of the systems begins. Provide a mylar reproducible of each I&C diagram in addition to the posted laminated copy.

G. In DCPs and DTCs, a nameplate shall be provided inside the enclosure indicating the DDC System Supplier's name, project number, year built, panel number, serial number (if applicable) and all applicable field wiring and connection drawing numbers.

H. All ACPs shall be provided with laminated nameplates located on the exterior of the panel.

END OF PART 3

PART 4 - SYSTEM SOFTWARE

4.1 GENERAL SYSTEM SOFTWARE REQUIREMENTS

A. This part of the specification defines the minimum software requirements for the computer-based Direct Digital Control (DDC) System.

B. The general system software is for DCPs and for Operator's Consoles.

C. The software covered under this part of the specification includes DCP general software, Operator's Console software, general HVAC calculation software programs, general HVAC application programs and graphics.

D. Custom software is covered in Part 5 of these specifications under HVAC Control Sequences. Control Sequences for specific packages are covered in other parts for individual packages.

E. Communication Software for interfacing between the BAS System and The Laboratory system shall be fully BACnet compatible at the time of installation per Conformance Class 5 (as defined by the ANSI/ASHREA Standard 135-1995). Communication shall be capable via the Building TCP/IP Network.

F. Interoperability Requirements for interfacing into all third party systems both existing and new.

1. Third Party systems included but are not limited to:

a. Fire Alarm System via a serial BACnet interface to perform necessary sequences on drawings and within specifications. Coordinate with Division 28.

b. Electrical Metering (shall be part of contract except for providing the power monitor)

c. Variable Speed Drives (shall be part of this contract)

d. All other systems shown on drawings requiring serial interfaces.

2. The interface will be a seamless integration of all system points from the ATC to the campus EMS.

3. The interface will allow monitoring, reporting, alarming, and control of all system points.

4. Graphical user interface screens must be developed using these points.

5. The ATC vendor must provide any and all information, labor, programming and testing(i.e., points list, addresses, etc.) required to integrate the existing campus system.

6. The ATC vendor must provide all software and/or equipment required to connect into their system.

7. The University will provide the IP addresses and the range of the “BACnet Instance Numbers” for all systems.

8. All data shall be viewable from work consoles provided as well as other campus locations.

9. All data will be viewed in same format and function across all existing and new facilities.

10. Communication

a. All control products provided for this project shall comprise a BACnet internetwork. Communication involving control components (i.e., all types of controllers and operator interfaces) shall conform to ASHRAE Standard 135-1995 or latest addition, BACnet, Conformance Class 5 as a minimum.

b. Communication services over the internetwork shall result in operator interface and value passing that is transparent to the internetwork architecture as follows:

1) Connection of an operator interface device to any supervisory controller on the internetwork will allow the operator to interface with all other controllers as if that interface were directly connected to the campus network. Data, status information, etc. for all controllers shall be available for viewing and editing from any one supervisory controller on the internetwork.

2) All database values (e.g., objects, software variables, custom program variables) of any one controller shall be readable by any other controller on the internetwork. This value passing shall be automatically performed by a controller when a reference to an object name not located in that controller is entered into the controller's database. An operator/installer shall not be required to set up any communication services to perform internetwork value passing.

G. System Functions For Interoperability

1. Regardless of the method selected to achieve interoperability, the DDC system should be expected to perform five basic tasks. These are:

a. **Data Exchange**: The exchange of data between two devices (e.g., PC workstations, building controllers, custom application controllers, or application specific controllers) is the most basic of interoperable functions. This function allows for the viewing (or reading) of data as well as making changes (or writing) of the data. For example:

1) A building controller has a temperature sensor that measures the outdoor air temperature. This is modeled as an analog input object. If we wanted to view the outdoor air temperature we could use a PC workstation and ask for (or read) the present value of the analog input named "outdoor air temperature.

2) In the same manner, we can change setpoints (write) to the values of analog and binary output objects and value objects. These basic functions can be used to share setpoints between controllers, provide data for graphics on a PC workstation, command the lights to come on, or sample data in a trend.

b. **Alarms and Events:** This function provides the operator with notification of non-normal conditions. A controller that has determined that an event has occurred is able to send an alarm message to a predetermined location. For Example:

1) A program that periodically compares the space temperature to a user-entered alarm limit in the building controller detects that the space temperature is too high. When the temperature exceeds that limit, the building controller generates an alarm and sends it to the PC workstation. At that workstation, an operator reads the alarm and acknowledges it.

c. **Schedules:** This set of functions allows for the editing and creation of schedules on a PC workstation that will be executed in a controller. For example:

1) The operator wants to change the stop time of the fan in the auditorium from 6:00 P.M. to 9:00 P.M. Using the scheduling function, the operator is able to load the schedule from the controller, change the stop time, and have the modified schedule at the controller.

d. **Trends:** The ability to sample, store and read trends is a valuable function. Trending is a tool for collecting data on system performance and energy usage. While trends are typically stored for archival purposes on a PC workstation, there are a number of reasons to sample them in a controller. This will reduce network traffic and also will allow for sampling of data if a PC is not continually connected to the controller.

e. **Network Management:** This final interoperability function provides the ability to manage the devices on the network. It includes tasks such as monitoring for a loss of communication and coordinating the time-settings of the clocks in each controller.

H. As a minimum the DDC contractor will be required to provide the following points in BACnet Conformance Class 5 format with all associated Bacnet services to the Ethernet LAN connection.

1. Analog Inputs
2. Analog Outputs
3. Analog Values
   a. Setpoints
   b. Limits
   c. Alarm Limits
   d. PID Tuning Constants
   e. Runtimes
   f. Time Delays
4. Binary Inputs
5. Binary Outputs
6. Binary Values
   a. Alarm States
   b. Enable / Disable
   c. Start / Stop
   d. Schedule Status
   e. Manual Commands

4.2 TYPICAL BIBB REQUIREMENTS FOR THIRD PARTY SYSTEMS

BIBB TYPE	BIBB TYPE	BACnet Service	Initiate	Execute
(Acronym)	(Verbose Description)			
NOTE: BACnet Interoperability Building Blocks (BIBBs) are collections of one or more BACnet services. The services are prescribed in terms of an 'A' and a 'B' device. Both of these devices are nodes on a BACnet inter-network. In most cases 'A' will act as the user of data (like a BAS Server) and the 'B' device will be the provider of this data (like a field control module or router).

4.3 DCP GENERAL SOFTWARE

A. DCP Functions

1. The DDC System Supplier shall provide the necessary software to accomplish the following functions, fully implemented and operational, as a part of the DCP.

   a. Scanning of inputs.

   b. Control of outputs.

   c. Respond to all Operator's commands, whether at the local DCP or at a remotely located DCP.

   d. Maintain real time communication with all DCPs in the system.

   e. DCP diagnostics.

   f. Run all applications software and control sequences.

   g. Perform all mathematical functions and operations necessary for DDC system operation as specified.

   h. Commonly used functions and operations shall be assigned to function keys in order to facilitate system operator interface.

   i. Access to other system nodes shall be transparent to the user.

   j. The operator shall be able to perform the following functions:

      1) Automatically control the status of equipment, devices and systems and/or the value of their operating parameters.

      2) Display the status of equipment, devices, and systems and/or the value of their operating parameters.

3) Modify operating parameters and status.

4) Automatically trigger audible and visual indications of alarm(s).

5) Investigate and acknowledge alarm conditions.

6) Provide means to change, on-line, the control strategies or operational sequences.

2. Operating System: The DCP shall contain an operating system that controls and schedules DCP activities in real time. The DCP shall maintain a current point status of all points connected to that DCP. The execution of DCP application programs shall utilize the current status. The operating system shall include a real time clock function that maintains the seconds, minutes, hours, date and month, including day of the week. The operating system shall provide communication to allow the loading of software and data files between the DCP and all management consoles in the system.

3. Monitoring and Control: Each command shall be executed by the DCP only after all constraint checks have been passed. As a minimum, each point shall have unique read and write access levels associated with them. Each logical point grouping shall be associated with a particular security zone used to allow or disallow access to logical point groupings. Each individual point shall be capable of being selectively overridden. Each analog point shall have high and low limits which constrain operator entry of values.

4. DCP Self-Test Diagnostics: Each DCP shall have self-test diagnostic routines implemented in firmware. The tests shall include routines that exercise memory.

5. DCP Performance Specifications: All Proportional Integral Derivative (PID) loops on the DCP shall execute periodically at a period not greater than 1.5 seconds. All PID constants shall be adjusted according to actual run time. The DCP shall provide user adjustable scan and control times in increments of not greater than 0.5 seconds. Each partition of the control algorithm on a DCP shall have its own pre-defined period of execution. This execution rate shall be user-modifiable on-line. Free running control algorithms are not acceptable.

6. DCP Start-up: The DCP shall have start-up software that causes automatic commencement of operation without human intervention. The start-up software shall initiate operation of self-test diagnostic routines. If the data base and applications software are not resident, the DCP shall attempt to communicate with any of the management consoles in the system to rectify the situation. If the real time cannot be read, the DCP shall attempt to communicate with other panels in the networked system to obtain the current real time.

7. DCP Operational Mode: The DCP shall perform all specified functions and application programs using data obtained from the DE and based upon the DCP real time clock function. All information required for operation, as specified for each day of the week and for a holiday schedule, shall be stored in the DCP data base and shall include inputs for operating for each mechanical system controlled by each DCP. The DCP shall answer requests for data communications from all other DCPs in the network and from all management consoles in the network, including the following:

   a. Execution of local (on this DCP) and remote (on any other DCP) operator initiated commands.

   b. Modification of control algorithm parameters which reside on the local DCP or any remote DCP.

   c. Downloading of a database from any management console in the system.

   d. Uploading of a DCP resident database to any management console in the system.

   e. Updating of the real time clock from any other DCP in the system.

f. Updating of the user definition tables from any other DCP in the system.

g. Capability to process alarms, both local alarms and alarms which are generated from any grouping of other DCPs which are on-line.

h. The DDC control software shall be based upon pre-defined software function blocks. These software function blocks shall be similar to process control hardware components.

i. The system shall provide overlay capabilities for bumpless multi-mode of alternate algorithm operations.

j. All setpoints, constants, and control response shall be completely field adjustable through the entire design ranges.

k. Programming shall permit manual input valves to be entered at any level necessary for operational field testing purposes.

l. An operator security system shall be provided that is identical in function to that of the system management console to prevent unauthorized access.

m. All control loops shall contain proportional, integral, and derivative modes of actions as defined by SAMA Standard PMC 20-1, 1973. The modes of control shall be completely field adjustable.

n. The control panel shall be capable of performing the following control algorithms of combinations thereof: PID control with bumpless transfer; high/low signal selection; comparison of one or more signals against a standard or each other; square foot; polynomial equations; analog signal delay; totalization of two or more signals; track and hold. All algorithms shall have an end-to-end minimum accuracy, regardless of the number of functions use, of 0.25 percent as defined by SAMA Standard PMC 20-1, 1973.

o. All analog input and output points shall be adjustable for high limit, low limit, high alarm, and low alarm.

p. An adjustable input response filter shall be provided for all analog input points to eliminate incoming process, sensor and/or transmission noise.

q. Separately adjustable on and off delay times shall be provided for all binary input and output points.

r. The system, upon restoration of power following a power failure, shall be capable of selectively initializing the database before resuming its normal program. The shall insure that restored critical points are in a safe position before continuing operating without disturbing previous operator parameters.

s. All outputs, through an internal segmented equation or polynomial curve generator, shall linearize all final control devices, e.g., valves, dampers, etc., to provide an output liner with process characteristics. This will make system sensitivity independent of device position. The device characteristics data necessary shall be obtained through published manufacturer's test data or actual field measurement. This data, along with the polynomial coefficients being used, shall be submitted to the Architect for his approval.

t. All binary outputs shall be provided with a hardware power-up initialization to take place before software initialization which shall insure that all of the binary contacts are in the open position upon power application. This will prevent these outputs from initializing in a random state.

u. The DCP shall be expandable to 60 PID loops with a scan rate not greater than 1 second.

v. Each DCP shall be capable of handling up to 200 points.

w. System scan rates shall be variable down to 0.5 seconds for added flexibility.

x. System I/O scanning shall be high speed with update times not to exceed 400 milli-seconds.

8. DCP Failure Mode: Upon detection of a self-diagnosed error, the DCP shall attempt to restart operations if possible. If this is not possible, the DCP shall cease operations. The I/O subsystem, upon recognizing loss of communications with the DCP, shall go to a preselected failure mode.

9. DCP Commands: The DCP shall accept English language commands for defining and selecting points, parameters, and all other functions associated with operation of the DCP.

10. Command Input: DCP commands shall be full English language words and acronyms selected to allow operators to use the system without extensive training or data processing backgrounds. The DCP shall prompt the operator in full English words and acronyms for all required information identifying acceptable command formats. The operator's response shall be an English word, phrase, or acronym including parameters where required.

11. Command Input Errors: The DCP shall supervise operator inputs to ensure they are correct for proper execution. Operator input assistance shall be provided whenever a command cannot be executed because of operator input errors.

a. Conditions for which operator error assist messages shall be generated include, but are not limited to:

1) The command used is incorrect or incomplete.

2) The operator is restricted from using that command.

3) The command addresses a point which is disabled or out of service.

4) The command addresses a point which does not exist.

5) The command would violate constraints.

6) A log of all operator commands and log-ons, successful or otherwise, shall be maintained at the operator's console database.

12. Operator's Commands: Operator's commands shall be provided as part of the DCP software for performing the following tasks:

a. Display any digital or analog point or grouping of points connected to any DCP in the entire networked system.

b. Start-up and shutdown selected systems or devices.

c. Modify point attributes on the local or any remote DCP.

d. Modify point values on the local or any remote DCP.

e. Modify time and event scheduling on the local or any remote DCP.

f. Adjust setpoints on the local or any remote DCP.

g. Select manual or automatic control modes on the local or any remote DCP.

h. Provide alarm indication and processing for the local DCP and any grouping of remote DCPs.

i. Allow time of day modification from any DCP in the networked system.

j. Provide time of day synchronization between the local and all other DCPs in the networked system.

k. Allow modification of user access tables from any DCP in the networked system.

l. Provide user access table consistency among all DCPs in the networked system.

m. Display a menu of operator's commands and a description of each command in response to operator entered help requests.

n. Status of alarms and other information from remote sites.

13. Unique addressing for identification shall be provided for each point in the entire networked system. The unique name for the point should include the DCP the point is located on, the device the point is located on, and a name which is related to the individual sensor or the control device's name. A minimum of six alphanumeric characters shall be allowed for each portion of the point address for a total minimum of eighteen alphanumeric characters to uniquely describe any point in the networked system.

14. System Access Control: Access to data within the system shall be limited by three items; read level, write level, and security zone. There shall be a minimum of 127 read and write levels in the system and a minimum of 20 security zones definable in the system. Each user shall have a read level, write level, and list of security zones they may access when they enter the system. Any data access performed in the system must be verified against these security control items. This security must be maintained across the entire networked system, on both the local and all remote DCPs. The definition of security levels shall be arbitrarily assignable over the entire range of read and write levels. The definition of security areas shall be arbitrary across groupings of points and partitions of the control algorithm.

15. Calculated Point: This value shall be created by calculating it from any combination of digital and analog points, or other data. The result of the calculation will be an analog or digital point having all the properties of real points, including alarms, without the associated hardware. The calculated analog point shall have point identification in the same format as any other analog point. The calculated point shall be used in any program where the real value is not obtainable directly. Constants used in calculations shall be changeable on-line by the operator.

16. Analog Monitoring: The system shall measure and transmit, as specified, all analog values including calculated analog points. An analog change in value is defined as a change exceeding a preset differential value as specified. The record transmitted for each analog value shall include a readily identifiable flag which indicates the abnormal status of the value when it deviates from operator selectable upper and lower analog limits. All analog values shall be expressed in proper engineering unit with sign. An appropriate vocabulary of engineering units shall be provided to provide meaningful translation of binary states to descriptive terms (e.g., ON/OFF, TRUE/FALSE, etc.) and to meaningfully describe analog values (e.g., CFM, FPM, percent, etc.). Scaling Factors shall be provided to scale raw analog input and output counts into meaningful floating point values. The scale factor shall be a polynomial of not less than the 4th degree which can be used to determine range and span of the analog value as well as linearize non-linear end devices.

17. Analog Totalization: Any analog value point shall be totalizable. There shall be no limit on the number of analog values totalized. Each analog value totalized shall have its own totalization time period. At the end of the time period, the total shall be stored. Totalization shall then restart from zero for the next time period. The operator shall be able to set or reset each totalized value individually. The time period shall be modifiable on-line. The program shall keep track of the peak, minimum, and total value measured during the current period and for the previous period.

18. Energy Totalization: The system shall calculate the heat energy in Btu's (ton-hours or KWH), for each energy source consumed the mechanical systems specified, totalize the

calculated Btu's, the instantaneous rate in Btu's per hour, and store totals in millions of Btu's (BTU E06).The Btu's calculated shall be totalized for an adjustable time period. The time period shall be defined uniquely for each Btu totalization. The time periods shall be able to be defined, modified, or deleted on-line.

19. Trending: Any analog and binary input, output, or calculated point may be trended. Each point trended shall have its own sample rate, with a minimum sample rate of not greater than one second to trend real-time data. The maximum sample period must be no less than 24 hours. The number of points in the trend shall be user-definable, and shall at least encompass the range from 64 points to 3,600 points (i.e., 60 minutes of trending sampling once a second) to allow for precise monitoring of selected analog points.

20. Summer-Winter Operation Monitoring: The system shall provide software to change the operating parameters, monitoring of alarm limits, and start-stop schedules for each mechanical system from summer to winter and vice versa. The software shall provide appropriate commands to applications programs to coordinate proper summer or winter operation.

21. DCP Data: Each DCP shall supervise the following alarm and event conditions and manage the communication of alarms and events to other DCPs and management consoles.

    a. The system shall record the time and date of each occurrence of an analog point exceeding its high or low limits or of a binary point entering its abnormal state. The system shall record the time and date that the point returns to normal.

    b. Any communication failure within the system and its subsequent restoration shall be recorded.

    c. Any user changes made to points, parameters, etc. shall be recorded.

    d. Any user changes made to the system clock which resides at each DCP shall be recorded.

    e. Any valid or invalid operator sign-on and all operator sign-offs shall be recorded.

    f. Record alarm conditions as communicated by the DDC system, monitoring system for electric switchgear and monitoring system from remote sites.

22. Report Formatting: All point values and alarm data may be shared across the network by any or all DCPs and management consoles. In addition, all trends in the system may be defined or retrieved by any or all management consoles in the system.

23. DCP Communications Software: Provide all communications software which allows each DCP to transparently access all point, alarm, and control data at all other DCPs in the system. The user at any DCP shall be able to access point and control data at all other DCPs in the system transparently. The communications software at the DCP shall also be capable of communicating with all management consoles in the system. The management consoles shall be capable of making requests to the DCPs including, but not limited to downloading of programs, uploading of programs, downloading of trend definitions, and uploading of trend data. The communications software used shall incorporate error detection, message retry, and packet sequencing in its software or hardware protocols.

24. Function Blocks Programming Modules: all standard operating software necessary to support the control functions described in the specification shall be provided. The DDC System Supplier shall provide as a minimum all software modules specified under this section. The system shall provide stand-alone operation. Interaction between the operators and the control system shall be through the use of a CRT English Language display. Computer programming knowledge shall not be required.

a. PID Control Module: This module shall take a measured variable and shall compare its value to its setpoint. The difference of these values is multiplied by a constant to produce a proportional term. An integral term is calculated and multiplied by the integral gain constant. The difference between the current measured value and the last measured value is multiplied by the derivative gain constant. These terms are used in an equation to produce an output control signal. (Example of application: this module can be used to operate a fan to maintain a constant static pressure.)

b. Dual PID Control Module: this module shall operate as the PID control module, except it shall input two measured variables and a setpoint for each. Two control signal values shall be calculated and the higher of these two signals shall be selected as the output control signal. (Example of application: this module can be used to control a fan from both CFM and static pressure.)

c. Logic Module: the logic function shall be defined by a Truth Table that lists all possible combination of states (on or off) of the four inputs. To specify the gate function, the desired output state shall be selected for each of the 16 input conditions. (Example of application: this module can be used to determine if there are any fans running.)

d. Square Root Extraction Module: this module shall calculate the square root of its analog input and multiply this result by a constant. (Example of application: this module can be used to convert velocity pressure readings into CFM values.)

e. Multiplier Module: this module shall input two analog values and output their products. (Example of application: this module can be used to calculate a percentage of a value.)

f. Signal Comparator Module: this module shall output a binary signal dependent on the difference between two analog values. (Example of application: this module can be used to turn compressors on and off based on outdoor air temperature.)

g. Signal Switching Module: this module shall output either of its two analog inputs based on its binary input. (Example of application: this module can be used to switch between setpoints for different modes of system operation.)

h. Low Selector Module: this module shall output the lowest of its three input values. (Example of application: this module can be used to input the static pressure in a number of ducts and output the lowest one to a controller.)

i. High Selector Module: this module shall output the highest of its three input values. (Example of application: this module can be used to input the static pressure in a number of ducts and output the highest one to a controller.)

j. Binary Connect Module: this module shall connect one binary value to another point. (Example of application: this module can be used to output one binary value to a number of binary points.)

k. Sum Module: this module shall multiply each of its inputs (3 max) by a unique gain constant and output the sum of these terms. (Example of application: this module can be used to calculate the average of three values.)

l. Sum N Module: this module shall output the sum of its inputs. (Example of application: this module can be used to add CFM values to produce a total system CFM value.)

m. Track and Hold Module: this module shall output its input value while its binary input is in the "on" state. The output retains the value once the binary input switches to "off" and will not change until the binary input goes to "on"

again. (Example of application: this module can be used to allow many analog inputs to be transmitted to one data line.)

n. Analog Connected Module: this module shall connect one analog value to another analog point. (Example of application: this module can be used to output one analog value to many analog points.)

o. Timer Module: this module shall switch a binary output to match its binary input after an adjustable on or off time delay. (Example of application: this module can be used to provide time delays in the starting and stopping of chillers.)

p. Ramp Module: this module shall ramp its output up or down from its initial value, depending on its binary input. The ramping function shall occur at adjustable up and down rates. (Example of application: this module can be used to slowly add the capacity of a second fan to a system.)

4.4 OPERATOR'S CONSOLE SOFTWARE

A. The Operator's Console software shall support all specified functions. The standard system software supplied by the computer system manufacturer shall not be modified in any way that would preclude the purchase of a standard maintenance and service contract from the computer manufacturer.

B. Each Operator's Console shall be provided with the following general software:

1. Bootstrap Program: The software shall include a bootstrap program sufficient to initiate operation of the Operator's Console using only procedures specified by the computer manufacturer.

2. Disk Operating System: A publicly available and supported disk operating system equal to the latest version of Microsoft Disk Operating System (MS-DOS) and Windows operating system shall be utilized, featuring:

a. Program control functions including program loading, execution, and termination.

b. Error detection and recovery.

c. Keyboard and display I-O control.

d. Serial and parallel I-O control.

e. File management including creation and deletion of files, searching, sequential and random file access, and maintenance of file directories and subdirectories.

f. Disk/tape management including drive selection, partitioning, space allocation and recovery, write verification, and a copy routine to transfer information between any two devices.

g. Editor software to accomplish input, modification, display, listing, and storage onto the disk files of the source languages.

h. Diagnostic programs to check the status of the Operator's Console on its screen.

a. Maintenance of current date and time.

3. Operator's Console Commands: The operator's console commands shall provide a means for entry of control and monitoring commands, and for retrieval of DDC System information. The operator's commands shall perform tasks including:

a. Request and terminate dial-up communications with any DCP.

b. Perform all tasks provided by the DCP and specified under "DCP Operator's Commands". A single command entered by the operator shall be issued by the

DCP to the device within ten seconds, provided communication with the DCP has been established prior to command issuance.

c. Update any DCP time base from the Operator's Console time base.

d. Request CRT display or printed reports, including a complete status listing for any point or all points in any DCP, all specified trend data, and the intrusion alarm log for any DCP. Point data and reports as specified shall be arranged logically for CRT display.

4. Printer Output: Formats for printed data shall be similar to and consistent with those used in CRT alphanumeric data displays. English language descriptions printed shall be identical to those presented on the operator's console LCD Screen.

C. Operator's Console and DCP Data Exchange Requirements

1. Data exchange shall be provided between the Operator's Console and the DCP's including:

a. Transmission from the Operator's Console to the DCP/RAM resident software, operating parameters and constraints, and operator commands.

b. Transmission from the DCP to the Operator's Console of all data, including parameters of the DE, constraints, and RAM resident software.

2. DCP programs and parameters shall be capable of being transmitted from the Operator's Console to the DCP, including all changes to DCP parameters. DCP parameter changes shall be capable of being performed with the DCP on-line.

4.5 GENERAL HVAC CALCULATION SOFTWARE

A. General: The following paragraphs describe general calculation software which will result in "calculated points". Calculated points shall be provided as called for on the I-O Summary Tables.

B. [Not Used]

C. [Not used]

D. Run Time Calculation: This calculation shall create software points for run time based on actual run time and speed as necessary. The run time shall be measured in increments of 1,000 hours (hrs E03). Scaling factors may be applied for systems with variable speed drives or two-speed drives. Refer to maintenance alarm in Paragraph 4.6, Subparagraph Q for further requirements.

E. Flow Calculation: This calculation shall create software points for flow (CFM, #/hr., GPM, etc.) based on differential pressure, pressure, and temperature as necessary. This calculation shall include a method of inputting a characteristic equation for the specific flow measuring device such as a pitot tube or orifice meter.

F. Energy Flow Calculation: This calculation shall create software points for energy flow (MBTUH or tons) based on fluid or gas flow (CFM, #/hr., GPM) and differential temperature (_F). It shall also create software points for energy flow (KW) based on a pulsed input.

G. Utility Consumption Calculation: This calculation shall create software points for total energy consumed (Btu E09, ton-hours E06, KWH E03) through integration of the energy flow data. It shall also totalize other utility usages (natural gas - CuFt E06, Steam - pounds E06, water - gallons E09, medical gases - CuFt E06). In addition, the calculation shall calculate heating and cooling consumption weather data, i.e., heating-degree days based on outdoor dry bulb temperature and 65°F, cooling-degree days based on outdoor wet bulb temperature and 62°F w.b. Utility usages shall be stored on a monthly and an annualized basis. Available data shall include month-to-date, year-to-date, previous 24 months, previous 10 years. Each monthly utility consumption data collection system shall be field programmable to start and end on the same dates as the utility company starts and ends its billing period. The calculation shall also have an input for up to four

unit costs and usage levels. These unit costs shall be manually input and shall produce a monthly billing.

H. Utility Demand Calculation: This calculation shall create software points for all maximum, minimum, and average utility demands. Based on flow data, energy consumption data, or utility consumption data (CFM, KBTUH, tons, pounds per hour, CFH, GPM, KW, etc.). The data shall be collected on a monthly basis which coincides with the utilities' normal billing period. The peak and minimum utilities shall be recorded based on the highest average usage over a 15-minute period. The average demand shall be calculated using the total monthly consumption divided by the time in the monthly billing period. Available data shall include month-to-date, year-to-date, previous 24 months. Each data point shall be accompanied by a time of occurrence (end time), date, outdoor dry bulb temperature, and outdoor wet bulb temperature (as applicable). The calculation shall also have an input for up to four unit costs and usage levels. These unit costs shall be manually input and shall produce a monthly billing.

I. Efficiency Calculation: This calculation shall create software points for efficiency based on an equipment device's total output and its major controlling input. For example, for electric chillers the calculation would measure KW/ton; for absorption chillers the calculation would measure pounds of steam/ton-hour, for boilers the calculation would measure gross Btu's input/net Btu's output.

4.6 DCP APPLICATIONS SOFTWARE

A. General: Provide the following applications programs, associated constraints, and interlocks as specified and as required by the I-O Summary Tables, resident and executing in the DCP. The system shall perform all functions specified in the I-O summary tables by use of the appropriate application programs. All applications programs shall be coordinated, one with the other, to insure that no conflicts or contentions remain unresolved. Refer to control drains H8.## for sequences.

B. Program Inputs: Select the appropriate program inputs listed for each application program to calculate the required program outputs. Where the specific program inputs are not available, such as no status indication called for on the I-O Summary Table, provide a "default" value to replace the missing input, thus allowing the application program to be tested. All analog inputs to application programs shall have an operator adjustable deadband to preclude short cycling or hunting.

C. Scheduled Start-Stop Program: This program shall start and stop equipment based on the time of the day and day of the week, including holidays. To eliminate power surges, an operator adjustable time delay shall be provided between consecutive start commands. The program must execute entirely on the DCPs.

1. Program Inputs

   a. Day of week/holiday.

   b. Time of day.

   c. Summer and winter high-low limits.

   d. Summer and winter start-stop schedules.

   e. Summer or winter operation.

   f. Equipment status.

   g. Equipment constraints.

2. Program Outputs:

   a. Start signal (momentary or maintained as specified).

   b. Stop signal (momentary or maintained as specified).

D. Optimum Start-Stop Program:

1. Refer to control drawings.

E. Duty Cycling Program:

1. Refer to control drawings.

F. Day-Night Setback Program.

1. Refer to control drawings.Inputs

G. Dry Bulb Economizer Program:

1. Refer to control drawings.

H. Enthalpy Economizer Program: DDC system shall include a software program to perform enthalpy optimization of air handling units. The program shall calculate the enthalpies of both the outside air and the return air, and shall control the mixture of the outside air and return air to minimize energy consumption. The program shall compute enthalpy from the dry bulb temperature and relative humidity of the outside and return air and shall use all necessary tables and equations to calculate the proper enthalpies. The program shall control the mixture of outside air to return air, based on the desired supply air temperature and the relative outside and return air conditions. Select whether each air handler is to be controlled by the enthalpy program or the mixed air local loop controller. Request a display showing the outside and return air temperatures, humidities, enthalpies and control mode for each air handler under the enthalpy program control. Adjust the minimum interval at which the enthalpy program computes enthalpies and optimizes the operation of the air handlers. The program must execute entirely on the DCPs.

1. Program Inputs

a. Changeover enthalpy value

b. OA dry bulb temperature

c. Return air dry bulb temperature

d. OA relative humidity

e. Return air relative humidity

f. OA intake damper position

g. Return air damper position

h. Relief air damper position

i. Equipment constraints

2. Program Output: Automatic (modulating) or minimum OA damper control signal.

I. Ventilation-Recirculation Program:

1. Refer to control drawings.

J. Reheat Coil Reset Program: The software shall select the zone with the least amount of heat required. The program shall reset the cold deck discharge temperature upward until it satisfies the zone with the lowest demand, or until the zone humidity control requirements cannot be met. The program must execute entirely on the DCPs.

1. Program Inputs

a. Zone relative humidity high limit.

b. Zone temperature (where shown).

c. Zone relative humidity (where shown).

d. Supply air temperature.

e. Reheat coil valve positions or proportional signals from primary elements.

f. Minimum space temperature during occupied periods.

g. Maximum space temperature during occupied periods.

h. Equipment constraints.

2. Program Outputs: Cold deck temperature setpoint.

K. Chilled Water Reset Program: DDC system shall include a software program to perform chilled water reset. The program shall optimize the use of chilled water in one of two ways. This chilled water supply reset shall be based on either maintaining a constant return temperature or supplying sufficient cooling to satisfy zone requirements. The system operator shall be able to define, modify, and delete the loops to be enabled/disabled, high and low reset limits, incremental adjustment magnitude, and sampled time interval. A log shall be provided detailing each parameter associated with a chilled water test loop. The program must execute entirely on the DCPs.

1. Program Inputs

a. Reset schedule

b. Chilled water temperature

c. Maximum chilled water temperature

d. Minimum chilled water temperature

e. Zone temperatures

f. Maximum zone temperature during occupied periods.

g. Minimum zone temperature during occupied periods.

h. Equipment constraints

2. Program Outputs: Chilled water temperature setpoint

L. Hot Water OA Reset Program: The software shall reset the hot water temperature supplied by the boiler or converter in accordance with the OA temperature. The hot water supply temperature shall be reset downward or upward from a specified temperature proportionally as a function of OA temperature. The program must execute entirely on the DCPs.

1. Program Inputs

a. Reset schedule.

b. OA dry bulb temperature.

c. Maximum hot water (HW) supply temperature.

d. Equipment constraints.

2. Program Outputs: HW temperature setpoint.

M. Peak Demand Limiting Program: DDC system shall include a software program to perform Peak Demand Limiting (PDL) on a system-wide basis. The PDL program shall monitor the rate of electrical power consumption and forecast the total demand. The PDL program shall automatically shed loads throughout the system to reduce demand. The PDL program shall be able to accommodate a minimum of 64 demand meters. It shall be possible to define a minimum of 64 separate service areas, each of which may have different power company demand interval pulse times. It shall be possible for the operator to set load schedules and demand limits in each service area separately. Each service area shall perform demand prediction and subsequent load shedding and restoring independently. Loads shall be divided into user-defined shed schedules that include a minimum of four priority levels. All loads in the lowest priority level must be shed in a rotational manner before any load in the next priority level is shed. Each load shall be defined

as to its rated power consumption in KW or HP and its maximum off time, minimum off time and minimum on time. These time parameters shall ensure load is not shed or restored too frequently to cause damage to a load. The PDL program shall be designed to accept sliding window metering systems as well as time of day metering. The demand shall be predicted each minute, and loads shed as needed. If all sheddable loads are shed by the PDL program and it is forecast that the user-defined demand limit will be exceeded, an alarm message shall be printed. Due to the nature of this program, and the amount of data sharing involved, it is acceptable to allow this program to run either on the DCPs, on a management console, or a combination of the two.

1. Program Inputs
    a. Load shed schedules
    b. Meter KW demand
    c. Day of week/holiday
    d. Time of day
    e. Maximum monthly KW demand
2. Program Outputs
    a. Stop signals to individual loads in accordance with prioritized load shed schedule.
    b. Start signals to individual loads in accordance with prioritized load shed schedule.
3. The automation system operator shall be able to request the following reports:
    a. In the event of CPU or communication failure, each remote unit shall be able to continue controlling demand in its own area.
    b. Meter area load table detailing assigned load parameters, such as load name KW rating, minimum on time, minimum off time, etc.
    c. Meter report for a meter area detailing name of meter, scaling factor, default failure rating.
4. The system shall provide the following automatic reports:
    a. 24-Hour Energy Summary. This summary will list the demand versus time for each shed setpoint in the last 24 hours.
    b. Monthly Summary Report. This summary lists the peak demand occurrences for each meter area for a one-month period.
    c. Printed Plot of Actual Demand Versus Time. For the previous 24 hours the system shall print a plot for each meter area detailing time, KWH used and setpoint.
    d. Any other reports as specified.
5. Emergency Electrical Power Consumption Program Inputs
    a. Load shed schedules.
    b. Metered KW demand at the generators.
    c. Metered KW demand from various users.
    d. Available KW capacity.
    e. Position of emergency transfer switches.
6. Emergency Electrical Power Consumption Program Outputs

a. Start-stop signals to essential HVAC systems.

b. Low speed operation start-stop signals to essential HVAC systems with 2-speed starter.

c. Limited speed operation start-stop and maximum speed signals to essential HVAC Systems with VF drives.

d. Indication to the operator that the "load" is in "PDL" override upon request.

7. Chilled Water Demand Limit Program Inputs

a. Load shed schedules.

b. Individual chiller water bridge demand - tons.

c. Individual chiller water bridge demand - GPM.

d. Individual chiller water bridge demand - CWS temperature.

e. Individual chiller water bridge demand - CWR temperature.

f. Maximum tons available - plant.

g. Maximum GPM available - plant.

h. Time of day.

i. Maximum monthly tons demand (historical).

j. Maximum monthly tons demand to date.

k. Maximum CWS temperature to individual chilled water bridge from reset program.

l. Temperatures and humidities for critical users.

8. Chilled Water Demand Limit Program Outputs.

a. Increase supply air discharge temperatures at individualized air handling units in accordance with prioritized load shed schedules.

b. Increase chilled water supply discharge temperatures at individual chilled water bridges or at the chillers themselves in accordance with a prioritized load shed schedule.

c. Start and stop pumps serving chilled water bridges if use is not required.

d. Indicate to the operator that the "load" is in PDL override upon request.

9. The DDC System operator shall be able to request the following reports:

a. In the event of an Operator's Console or DCP communication failure, each DCP shall be able to continue controlling demand in its own area.

b. Meter area load table detailing assigned load parameters, such as load name KW rating, minimum "on" time, minimum "off" time, etc.

c. Meter report for a meter area detailing name of meter, scaling factor, default failure rating.

10. The system shall provide the following automatic reports:

a. 24-Hour Energy Summary: This summary will list the demand versus time for each shed setpoint in the last 24 hours.

b. Monthly Summary Report: This summary lists the peak demand occurrences for each meter area for a one-month period.

c. Printed Plot of Actual Demand Versus Time: For the previous 24 hours, the system shall print a plot for each meter area detailing time, KWH used and setpoint.

11. Each fan or pump connected to emergency power shall be programmed in software to be associated with a particular transfer switch such that when the switch is transferred between two power sources, the loads associated with the switch can be turned off prior to transfer. Refer to "Electrical Transfer Switches" for further requirements.

N. Control Sequences: All control sequences shall be modifiable by the operator. It shall be possible to perform parameter value changes while the system is on-line and running. To provide for minimum impact in the system caused by changing a sequence while it is running, substantial changes to the control sequences may only be made at a the main operator's console. These changes may then be downloaded to any DCP for execution. Each DCP shall be supplied with a minimum of 15 percent free CPU capacity. The event that meeting this criteria would cause the splitting of critical control sequences, the next nearest DCP may contain the additional spare capacity for its neighbor.

O. [not used]

P. [not used]

Q. Alarms

1. Alarms will be programmed in three levels minimum. These will differentiate between critical, abnormal, and maintenance.

a. Critical alarms would include equipment failures, freezestats, smoke, etc. and would demand immediate attention by the highest level of the maintenance staff. These alarms would be printed immediately and would sound audible alarms as provided.

b. For critical alarms, the following capability shall be provided. If a critical alarm is not acknowledged in a predetermined Supplier and the DDC System Installer. Refer to H8.03 Exhibit halls sequence varies.

c. Exhaust fans in Engineered Fire Control Systems will normally not be affected by evidence of fire. They will continue to run or (operator adjustable) time, then the Operator's Console shall automatically call a user defined phone number for PUH paging and send an alarm on the operator's pager. This is necessary to ensure that the operator does not miss a critical alarm when he is away for short periods of time. Additionally, the alarm information may be displayed at the Security Station, other Operator Consoles, or communicated to the supervisor over the phone.

d. Abnormal alarm would include high and low temperature readings, acknowledged critical alarms, standby pump in operation, equipment being out of service for maintenance. These alarms would demand immediate attention by the next normal day-shift maintenance staff. These alarms would be displayed immediately at their assigned alarm point designation.

e. Maintenance alarms would include any other alarm such as dirty filters, run-time alarms for preprogrammed maintenance, etc. Run time alarms shall be set up on each device shown in the I/O summary tables. These alarms shall be disk filed in ASCII format with respect to date, time, system, point name and chronological event number. In addition, the date and time of the subsequent service work shall also be disk filed. These alarms would be printed only when requested.

f. All alarms shall be user-programmable to any level and to any alarm point destination (Operator Consoles). Alarm point destinations may be programmed

to change automatically by the time of day, day of week, etc. All alarm point attributes high and low levels shall also be user-programmable.

g. In case of alarms not being acknowledged, the DDC System shall call up to three user-designed alpha pagers via STMP.and relay an appropriate alarm message This message shall be repeated a user-defined number of times.

4.7 GRAPHICS SOFTWARE

~~A.~~ Operational Color Graphics

1. The operator shall be able to perform the following operations by using a mouse-driven user interface to "point and click."

   a. Examine process variables and operating conditions.

   b. Adjust setpoints and other process parameters.

   c. Collect, report and plot trended data.

   d. Define and augment control strategies.

   e. Upload and download control data and algorithms.

2. Building/Creating Color Graphics

   a. The operator shall be able to create and modify graphic schematics, building floor plans and other facilities oriented displays. Color Graphics displays shall be created by using the operator's keyboard or mouse or any combination thereof. The minimum capabilities shall include:

      1) Create and save symbols.

      2) Create and save pages.

      3) Group and ungroup symbols.

      4) Modify an existing symbol.

      5) Modify an existing graphic page.

      6) Rotate and mirror a symbol.

      7) Place a symbol on a page.

      8) Place analog dynamic data in decimal format on a page.

      9) Place binary dynamic data using state descriptors on a page.

      10) Create motion through the use off gif, jpeg or bmp files

      11) Place test mode indication on a page.

      12) Place manual mode indication on a page.

      13) Place links using a fixed symbol or flyover on a page.

         a) Links to other graphics.

         b) Links to web sites.

         c) Links to notes.

         d) Links to time schedules.

      14) Assign a background color.

      15) Assign a foreground color.

      16) Place alarm indicators on a page.

17) Change a symbol color as a function of an analog variable.

18) Change a symbol color as a function of a binary state.

19) Change symbols as a function of a binary state.

20) All symbols used by the contractor in the creation of graphic pages shall be saved to a library file for use by the owner.

b. The graphics package shall contain a standard symbol reference where an operator can select already created objects such as air handlers, fans, pumps, etc., and place them in desired locations while creating graphic diagrams.

c. It shall be possible to place live updating field point data and calculated data anywhere as desired in the diagram.

d. Color graphics shall be user friendly and shall include a menu which includes standard symbols for constructing "new" color graphics or for modifying existing color graphics. All symbols shall include required data fields which can be "snapped" to for control by the mouse. These symbols shall be readily able to be enlarged or reduced to fit the final graphics. All symbols shall be user programmable for color based on its operation status. Refer to the control drawings for all points/components/systems to be on the graphics.

3. The graphics package shall also include a menu for creating graphics from "scratch." This portion of the graphics package would be created similar to an AutoCadd drawing and the final drawing would include all attributes for mouse control as required previously in this paragraph.

4. The color graphics shall use AutoCadd type floor plans for the facility.

5. Graphic points shall be bound on line without having to assign any logical point types.

4.8 WEB SERVER SOFTWARE

A. This software shall enable operators to access the system from remote computers using only browser software. The software shall allow for a minimum of five (5) concurrent users. Once connected to the system the operators shall be able to execute the following tasks:

1. View dynamic data in a real time environment in both point list format and in a graphical page format.

2. View and acknowledge alarms.

3. Adjust time schedule parameters.

4. View historical trend data in table and graph formats.

5. View dynamic real time trends in graph format.

6. Run established reports.

7. Manually adjust application parameters.

8. Manually override physical inputs (sensor values) and force a specific value as an input to control logic.

9. Manually override physical outputs (end devices) and force a specific value regardless of the command from the control logic.

B. The Web Delivery System shall have the capability to expand to 25 concurrent web-client users looking at the same hardware environment subject to the purchase of additional software licenses.

END OF DDC PART 4

PART 5 - GENERAL SEQUENCES OF CONTROL

5.1 SCOPE

A. This Section covers "General Sequences of Control" which are to be followed throughout the length of this contract.

B. The control strategies on the control drawings (F-H800 through F-H 808) shall be used in conjunction with the matrices for controller drawings herein for engineering the control systems and preparing the required control drawings.

C. The control matrices and the sequence have been made to compliment each other. In addition, due to the nature of some controls, more or less hardware points may be necessary to accomplish the intent. The DDC System Supplier shall include all such hardware necessary to accomplish this task at no additional cost to the "unit costs". The DDC System Suppliers shall also treat the sequences and the matrices such that if a device is called for in one and not the other, it will be treated as if called for in both.

D. Control of all HVAC equipment shall be through the DDC system unless each individual sequence specifies otherwise. If a particular sequence specifies pneumatic controls for certain HVAC equipment, pneumatic controls shall be provided for the HVAC equipment identified under that sequence only.

E. In preparing the unit cost for the work, refer to Part 1 of this specification. Refer to paragraph 1.16 for other unit pricing requirements. The unit prices for these sequences are to include all valves, dampers, sensors, DCPs, DTCs, UCPs and other hardware required.

F. When executing this work on this project, all Division 15 requirements for the project shall apply. In case of a discrepancy between the requirements of the project and this document, the most stringent requirement shall apply. If this happens, the matter shall at once be brought to the attention of the Architect/Engineer, the C.M., and the Owner.

G. If significant changes are made to a control sequence for a future project, the control sequence nearest to the one desired shall be utilized. If significant changes in hardware are required, the same could be done for various control components from unit prices.

H. The unit prices for the control sequences shall include the labor cost for the DDC System Supplier to interface with future project engineering and to provide detailed installation drawings that can be included in the future bid packages for obtaining installation prices.

I. The control sequences given in this section will be used to price the additional work.

J. The following Generic DDC Control Sequences are found at the end of this section

END OF PART 5

PART 6 - LABORATORY AIRFLOW CONTROL SYSTEM

6.1 DESCRIPTION

A. A laboratory airflow control system shall be furnished and installed to control the airflow into and out of laboratory rooms and other spaces within the facility. The exhaust volume of each laboratory fume hood shall be precisely controlled by an Adaptive Face Velocity controller to maintain a constant average face velocity into the fume hood at either a standard/in-use or standby level based on actual hood usage. The laboratory control unit shall vary the amount of air into the room and hot water to the reheat coil in order to maintain temperature control, minimum ventilation, airflow balance, and laboratory pressurization in relation to adjacent spaces (positive or negative). All spaces within the lab facility shall be precisely controlled to maintain the required pressure characteristics and to maintain minimum ventilation and airflow balance in relation to adjacent spaces. Approval to bid does not relieve the Laboratory Controls Contractor from complying with the intent and requirements of these specifications.

6.2 ACCEPTABLE MANUFACTURERS

A. The plans and specifications for the laboratory airflow control system and the sizing of the air delivery systems, heating and cooling capacities, and diversity have been based on systems and equipment as manufactured by Phoenix Controls. The specified systems and equipment shall be a digital, network-able system which will interface with the specified Building Automation DDC system over BACNetTM industry standard communication protocol level 5. Manufacturers must meet factory calibration. Manufacturer is to pay for field calibration if required.

B. Experience – The Laboratory Controls Contractor shall provide a list of at least three laboratory projects of like size and scope installed within a 100 mile radius of the project site

6.3 CONCORDANCE

A. The manufacturer shall provide a separate concordance schedule, which shall include the section, paragraph, and subparagraph of these specifications and direct statement to indicate compliance or non-compliance with the requirements. For all areas of non-compliance the manufacturer shall describe what specific and alternative approach has been taken and document the impact this will have on the sizing of the air delivery systems, the required cooling and heating capacities, energy costs, and diversity of the building.

6.4 WARRANTY

A. Warranty shall commence upon the date of system acceptance and extend for a period of thirty-six (36) months for parts and five (5) years for software calibration, labor for all sensors, air flow devices and equipment to keep and maintain proper balance and containment during which time any defects in materials or system performance shall be repaired by the manufacturer at no cost to the owner. In addition any releases in software shall be installed in the system during the warranty period at no additional cost to the Owner.

6.5 PREVENTIVE MAINTENANCE

A. The laboratory airflow control system supplier shall provide a unit price for an extended maintenance program during and after the warranty period, the unit price will be based on a one (1) year duration and shall remain valid for up to a five (5) year duration. This preventative maintenance shall cover all airflow sensors (e.g., pilot tube, flow cross, orifice ring, air bar, hot wire, vortex shedder, side wall sensors, etc.) and flow transducers provided under this section. Airflow sensors shall be removed, inspected, and cleaned annually during this extended maintenance period to prevent inaccuracies due to long term buildup of corrosion, lab tissues, wet or sticky particles, or other materials that foul the sensor. If impracticable to remove the airflow sensors, the laboratory airflow system supplier shall include in his proposal the cost of supplying and installing duct access doors, one for each sensor. The transducer shall be checked and recalibrated annually to insure long-term accuracy. Note that auto-zero recalibration of transducers is not acceptable as a substitute for annual recalibration.

6.6 LABORATORY AIRFLOW CONTROL SYSTEM

A. The laboratory airflow control system shall be a fully stand-alone digital system for each individual laboratory. The system shall not use or rely on information from controllers in other laboratory areas to control the functions within its laboratory. Some non-laboratory spaces shall be controlled the same as or similar to laboratory spaces in order to assure overall air flow balance.

B. The laboratory airflow control system shall employ individual Face Velocity controllers which directly measure the area of each fume hood sash opening and proportionally control the hood's exhaust airflow in a variable volume mode to maintain a constant face velocity over a minimum range of 20 to 100% at full sash opening. Safety and energy savings shall be insured through a corresponding minimum change in hood exhaust flow of 5 to 1. The value of the hood's face velocity shall also be automatically switched to in-use level based on operator usage of the hood, anytime the laboratory is in the unoccupied mode. Response time shall be less than one second with no more than a 5% overshoot or undershoot. The system shall achieve 90% of its commanded

volume within one second of the sash reaching 90% of its final value with a full height sash movement of one second.

C. The laboratory airflow control system shall respond and maintain specific airflow (+ 5% of signal) and stability (< 5% over/undershoot) within one second of a change in duct static pressure irrespective of the magnitude of pressure and/or flow change or quantity of airflow controllers on a manifolded system.

D. The laboratory airflow control system shall also maintain intersystem stability within one second of a change in pressure and/or flow to eliminate hunting, system oscillations, and crosstalk between airflow controllers.

E. The laboratory airflow control system shall use volumetric offset control to maintain room pressurization. The system shall respond to and maintain room pressurization (negative or positive) within one second of a change in room/system conditions.

F. The laboratory airflow control system shall employ highly accurate airflow controllers (+ 5% of signal) with a minimum 15 to 1 turndown to insure accurate pressurization at low airflows and guarantee the maximum system diversity and energy efficiency without exceeding 2,000 fpm velocity through any airflow device and not lose specified accuracy through the entire range of the flow device.

G. The laboratory airflow control system shall control the supply air volume and reheat coil valve in order to maintain the temperature setpoint of the space. In laboratories with fume hoods this temperature control scheme shall include measurement of the supply discharge air temperature and calculation of the thermal load in the space. This will allow the system to respond, in an anticipatory manner, to large air volume changes caused by the opening or closing of the fume hoods without creating large temperature swings.

H. The laboratory airflow control system shall maintain the minimum required ventilation for each space regardless of the thermal or make-up air requirements at any particular time. The minimum ventilation rate shall be switched between the occupied rate and the unoccupied rate based on either time of day scheduling or room occupancy based on fume hood sash movement.

I. The laboratory airflow control system shall include a jumbo mushroom pushbutton with maintained contacts for room emergency override at the exit of each laboratory space. The activation of this emergency override will cause all flow control devices to move to a user definable controlled state of flow and remain in that condition until the button is released. Override control schemes which place the flow control devices into an uncontrolled, wide open, state during emergency or any loss of power, or compressed air condition will not be acceptable.

J. The laboratory airflow control system shall incorporate an enhanced function space temperature sensor to provide the following additional features:

1. Adjust the space temperature setpoint up or down within user definable limits.
2. Local readout of space temperature and setpoint.
3. Initiate a timed local override of the scheduled unoccupied mode.
4. A local point of system network connection for a lap-top computer.

6.7 VENTURI AIR TERMINAL UNIT

A. The airflow controller shall be of the venturi valve control type. The valve shall be manufactured and assembled in the United States, including all materials, no exceptions.

B. The valve shall be pressure independent over a 0.30" to 3.0" W.C. drop across the valve. An integral pressure independent assembly shall respond and maintain specific airflow within one second of a change in duct static pressure irrespective of the magnitude of pressure and/or flow change or quantity of airflow controllers on a manifolded system. Each venturi air valve shall be provided with a pressure sensing device, which will alarm the system if adequate pressure differential is not sensed.

C. Airflow accuracy shall be +5% of reading (not full scale) over an airflow turndown range of no less than 15 to 1 and not exceeding 2000 fpm. No minimum entrance or exit duct diameters shall be required to ensure speed of response, accuracy, or pressure independence. Systems requiring minimum duct diameters shall be required to furnish and install whatever additional ductwork is needed to meet the manufacturers published requirements. The cost of this additional ductwork, fittings, and engineering shall be included in the lab airflow control systems vendor's bid.

D. The airflow control device shall use closed loop control to linearly regulate airflow based on a digital control signal. The device shall generate a digital feedback signal that represents its airflow.

E. The airflow control device shall store its control algorithms in non-volatile, re-writable memory. The device shall be able to stand-alone or be able to network with other room level digital airflow control devices over a 78k baud network.

F. The airflow control device shall use industry standard 24 vac power.

G. The airflow control device shall have a local EIA-232 port for connection to a notebook PC commissioning tool. All software required shall be delivered to the Owner for installation on the Owner’s laptop computer. Assist and instruct the Owner as required for installation and operation on the software.

H. The airflow control device shall accommodate a universal point expansion module to address fume hood control, temperature control, and non-network sensors.

I. The airflow control device shall meet FCC Part 15 Subpart J Class A, and be UL916 listed.

J. The valve shall be constructed of one of the following two types:

1. Supply and general exhaust air assembly shall be constructed of 16 gauge aluminum. All bearing surfaces shall be made of a composite Teflon or Teflon infused (versus coated) aluminum. The assembly's shaft, pivot arm, shaft support brackets, and internal mounting hardware shall be made of 316 series stainless steel. Lesser grade stainless steel materials are unacceptable.

2. Fume hood, canopy, snorkel, and biosafety cabinet exhaust assemblies shall have two baked-on coats of a corrosion resistant phenolic coating (Heresite P403 or Phenolflex 957). The assembly's shaft shall be 316L stainless steel with two additional baked-on coats of a corrosion resistant phenolic coating. The pivot arm, shaft support brackets, and internal mounting hardware shall be made of 316L stainless steel. All bearing surfaces shall be made of a composite Teflon or Teflon infused (versus coated) aluminum. Non-coated shafts and lesser grade stainless steel materials are unacceptable. Bladder valves is this application shall be 316L stainless steel enclosed bladder.

K. A high speed electric actuator shall be factory mounted to the valve. Loss of power air shall cause exhaust valves to fail open to the maximum scheduled design flow for the project, and supply valves to fail to the minimum scheduled design flow. Fail in last position electric actuators/controllers that fail to uncontrolled flows are not acceptable.

L. Certification:

1. Each airflow control valve shall be factory calibrated to the job specific airflows as detailed on the plans and specifications using NIST traceable air stations and instrumentation having a combined accuracy of at least +1% of signal over the entire range of measurement. Electronic valves shall be further calibrated and their accuracy verified to +5% of signal at forty-eight different airflows across the full range of the valve per valve. All valve calibration shall be adjusted for the elevation of the specific location (above sea level) and verified with certified testing documentation to be submitted.

2. All airflow valves shall be individually marked with valve specific, factory calibration data. As a minimum, it should include; valve tag number, serial number, model number, eight point valve characterization information (electronic valves), and quality control

inspection numbers. All information shall be stored on computer diskette in ASCII format for future retrieval or for hard copy printout to be included with as-built documentation.

3. All venturi airflow valves and bladder valves will be configured as part of the Digital Networked System with the exception of the constant volume valves. Each VAV valve shall be either a Digital Node on the network or a virtual node connected to a digital node. Some valves may be configured as a booster valve electronically connected to a digital valve but controlled by the same signal such that both valves act as one.

6.8 EXHAUST AND SUPPLY VALVE AIRFLOW CONTROLLER

A. The controller shall use DDC based, closed loop control to regulate air volume linearly proportional to a 0 to 10 volt or 4-20ma electronic control signal. The valve shall generate a DDC based 0 to 10 or 4-20ma volt feedback signal linearly proportional to its airflow for internal volume control, or airflow tracking control.

B. Each digital valve controller shall control and communicate digitally via a high-speed (78 Kbaud) room level digital network using the RS-485 protocol) with up to fifty (50) digital fume hood, canopy, snorkel, biosafety cabinet, general exhaust, makeup, and laboratory office airflow control devices within a particular pressurization zone.

C. Any digital valve airflow controller shall have the ability to accept a point expansion module (PEM) for the purpose of providing for analog signal input and output for external devices, i.e. reheat coil valve and space temperature.

D. Point Expansion Module

E. The Expansion Module shall provide the following input / output capability:

1. Five universal inputs, jumper configurable to accept 0-10 vdc, 4-20 ma, 10K ohm thermistors, and software configurable for contact closures.

2. Two analog outputs, jumper configurable to provide 0-10 vdc or 4-20ma.

3. One digital output (Form C relay, contacts rated for 1 amp @ 24 Vac or 30 Vdc).

6.9 VENTURI AIR TERMINAL - CONSTANT VOLUME

A. The venturi air terminal shall maintain a constant, manually adjustable, volume setpoint. It shall be factory calibrated and set for desired airflow rate. It shall also be capable of field adjustment for future changes of desired airflow rate. Constant volume valves requiring feedback shall generate a 0 to 10 volt feedback signal linearly proportional to its airflow for DDC monitoring or airflow tracking control.

6.10 LABORATORY CONTROL UNIT

A. A laboratory control unit shall be supplied to control the airflow balance of the laboratory room. As a minimum, provide one complete, stand-alone laboratory control unit per laboratory or per (room) space requiring an air volume supply to exhaust air offset, or if space is served by an air terminal that is not set as a constant volume unit.

B. The control unit shall be of DDC design with analog signal inputs and outputs. The inputs shall accept signals proportional to fume hood, canopy, snorkel, biosafety cabinet exhaust, and supply flows. The controller shall also accept temperature signals corresponding to the space humidity; space temperature and if required the supply discharge temperature or humidity. Additionally the controller will accept a space pressure reading, remote emergency override contacts, and space occupancy sensor input. The output signals shall control supply valves, general exhaust/return air valves, and/or variable frequency drives with signals linearly proportional to the desired supply or exhaust volumes. The outputs shall also control the supply air reheat coil, any auxiliary heating device such as perimeter fin-tube, and or humidifier control.

C. The control unit shall maintain a constant, adjustable offset between the sum of the room's total exhaust and the make-up/supply air volumes. This offset shall be independent of the exhaust

volume magnitude and represent the volume of air that will enter (or exit) the room from the corridor or other room.

D. A Lab Control Unit (LCU) shall control the supply and/or general exhaust airflow control devices to maintain proper room pressurization polarity (positive or negative). Each individual laboratory with fume hoods shall have a dedicated LCU. Laboratories without fume hoods which contain simple airflow tracking pairs will be connected to a supervisory LCU for area level network interface, up to fifty (50) tracking pairs may be connected to a single LCU.

E. The LCU shall a be microprocessor-based digital controller. It shall control and communicate digitally (a high-speed room level digital network using the RS-485 protocol) with up to thirty one digital fume hood, canopy, snorkel, biosafety cabinet, general exhaust, makeup, and laboratory office airflow control devices within a particular pressurization zone.

F. All points shall be available through the interface to the building management system (BAS) for trending, archiving, graphics, alarm notification, and status reports. Laboratory airflow control system performance (speed, stability, and accuracy) shall be unaffected by the quantity of points being monitored, processed, or controlled and must be proven showing a total "through put" document certifying speed and lack of communication bottlenecks.

G. Refer to the BAS specification for the required input/output summary for the necessary points to be monitored and/or controlled.

H. The LCU shall have the capability for full stand alone operation; it shall also be capable of communicating digitally, using the RS-485 communication protocol, with up to 100 LCUs or Bus Interface Cards over the high-speed building wide digital laboratory control system digital network furnished by the laboratory control system supplier.

I. The LCU shall provide an RS-232 port for connecting a notebook computer, desktop computer, modem, or alarm printer. This RS-232 port shall provide access to all points on the Network.

J. The LCU shall accommodate a universal point expansion module to address temperature control and non-network sensors.

K. LCUs mounted below 10' AFF in occupiable areas shall be flush-mount panel mounted in a NEMA enclosure and shall operate on 24 vac power.

L. The LCU shall meet FCC Part 15 Subpart L Class A, and be UL916 listed.

M. An integral or wall-mounted power supply shall be included to power the complete individual space laboratory airflow control system from one dedicated 120 VAC line connection.

N. Point Expansion Module

1. A Point Expansion Module shall be available to be added to the digital electronics of the airflow control device or the LCU, for the purpose of providing for analog signal input and output.

2. The point Expansion module shall provide the following input / output capability:

3. Five universal inputs, module per configurable to accept 0-10 vdc, 4-20 ma, 10K ohm thermistors, and software configurable for contact closures.

4. Two analog outputs, jumper configurable to provide 0-10 vdc or 4-20ma.

5. One digital output (Form C relay, contacts rated for 1 amp @ 24 Vac or 30 Vdc).

O. Interface to Building Automation Systems (BAS)

P. The laboratory airflow control system network shall be required to digitally interface with the DDC Building Automation System. The required software interface drivers shall be developed and housed in an BacNet Gateway level 5, a dedicated interface device furnished by the laboratory airflow control system supplier.

6.11 INSTALLATION

A. The laboratory controls contractor (LCC) shall install the sash sensors, interface boxes, and the monitor on the fume hood. Vertical sash sensors and their stainless steel cables shall be hidden from view. Sash interface boxes with interface cards shall be mounted within an accessible location.

B. The electrical portion of the DDC system shall be installed according to the following provisions:

1. Designated circuit breakers shall be provided in various electrical distribution panel boards for powering the DDC system.

2. The DDC System Installer shall provide all power wiring required for the various apparatus control panels and DDC panels (UCPs) and sensors from these circuit breakers.

3. The DDC System Installer shall provide supplemental branch circuitry and short circuit protection including panel boards as required for proper power distribution, protection and operation of his system and equipment.

4. All wiring, conduits, additionally panel boards, etc., required to provide power for the individual DDC equipment items shall comply with the National Electrical Code (NEC), the requirements of the Montgomery County, MD, and other applicable codes.

5. All other electrical wiring shall comply with the National Electric Code, the requirements of the Montgomery County, MD, and other applicable requirements and shall be installed by licensed journeyman electricians.

6. All peer-to-peer connections to the DDC system and the peer-to-peer network wiring and conduit shall be installed in locations identified by the DDC System Supplier in conjunction with the Architect/Engineer.

7. All DCPs, DTCs, and UCs, for the steam meters, shall be powered by normal/emergency power circuits.

8. All wiring shall be properly color-coded or identified (using terminal numbers) or both at the termination point in the DCP and DTC panels so that wiring between the panel and the sensing/control device can be easily identified.

C. All control wire and power wiring shall be provided by the DDC System Supplier. All wiring, including copper and fiber network wire in exposed areas, inaccessible ceilings and mechanical rooms shall be installed in watertight EMT conduit. Wire in all other areas may use plenum rated cable.

1. AI, BI, AO and low voltage BO wires shall be routed uniformly in a singular bundle or through a single conduit.

a. Singular or multiple 120 volt BO wires shall be routed uniformly in a singular bundle or through a single conduit. High voltage (120 volt) BO wiring shall not be installed in the same bundle or conduit as AI, BI, or AO wiring unless otherwise specified.

b. Network wiring in exposed areas shall be installed in a conduit with no other wiring.

c. All conduit shall be EMT to within 3 feet of the device. Within 3 feet, flexible conduit may be employed. All conduit shall be supported from the building structure and should not lay on the ceiling.

d. All wiring and conduit shall be run either parallel or perpendicular to walls constructed in the area served. All takeoffs or junctions shall be made at 90 degree angles.

e. Pull strings shall be provided in all conduits for the future addition of wires.

f. Provide wire identification tags (using terminal numbers) in all DCP's and DTC's panels designating terminal connection points so that wiring between the panel and the sensing/control device can be easily identified. Tab 2 shows the Owner's approved scheme for panel and equipment identification.

g. All wiring in mechanical rooms shall be in conduit.

h. Low voltage and analog wiring shall be a minimum of 18 gauge twisted shielded pair.

i. 120 volt wiring shall be a minimum of 16 gauge twisted pair for relays or status wiring.

j. Communication wiring shall be Cat 5e UTP (Avaya 2061) or equal.

k. All sensors mounted in wall must have conduit stubbed to above wall.

2. The requirements concerning wire and conduit installation may also be found elsewhere in the specification and drawings.

D. The LCC contractor shall install 20 p.s.i. clean, pneumatic supply air to all airflow control valves.

E. The LCC contractor shall install, terminate and connect all cables as required. The LCC Contractor shall furnish all cable and connectors.

F. Linearized airflow control valves shall be installed in the duct-work by the mechanical contractor. All transitions and insulation shall be furnished and installed by the mechanical contractor. Airflow valves to be installed in supply air ductwork shall be furnished with closed cell foam insulation cut to fit around the valve and it's controller. It shall be the responsibility of the mechanical contractor to install the valves with the controllers positioned in an accessible location for set-up and maintenance.

G. The LCC shall provide properly sized reheat coil control valves to the mechanical contractor for installation. The Mechanical Contractor shall provide all necessary transition ductwork required for reheat coils. If the LCC requires flow meters, the LCC shall provide all necessary transition ductwork as required for installation to the sheetmetal contractor.

H. The LCC Contractor shall mount and wire all temperature controls associated with the reheat coils within the laboratory.

I. The LCC Contractor shall provide properly sized reheat coils for each supply air branch in an individual laboratory space shown on the plans. These coils shall be turned over to the Mechanical Contractor for mounting in the ductwork.

J. The BAS Contractor shall provide all interface wiring from the Lab Control system to the BAS System for monitoring and alarming.

K. System start-up shall be provided by a factory authorized representative of the laboratory airflow controls manufacturer. Said start-up shall include setting of the fume hood face velocity and electronic verification of supply, make-up, general exhaust, and return airflows. The balancing contractor shall be responsible for final verification and reporting of all airflows. It is the responsibility of the LCC to provide a factory certified start-up technician to work in conjunction with the test and balance contractor during the balancing phase of the project.

L. The laboratory airflow control system manufacturer shall furnish a minimum quantity of four (4), four(4) hour classes for ten (10) personnel at a time for a total of forty (40) personnel (sixteen (16), 4 hour classes) of owner training to provide an overview of the job specific airflow control components, calibration procedures in resetting fume hood velocities, general procedures for verifying airflows of air valves, and general troubleshooting procedures. Class shall be as scheduled by the Owner. Class dates shall not be consecutive.

6.12 LABORATORY WITH GENERAL EXHAUST TRACKING SUPPLY AIR

A. General

1. Each lab space shall be provided with a LCU for connection and control of the following:

    a. Supply Air Valve

    b. Space Temperature

    c. Supply Discharge Temperature

    d. Reheat Coil Valve

    e. General Exhaust Air Valve

    f. Room Emergency Override

    g. Network connection to the space's Digital Valves

    h. Network connection to other LCU's and the Interface Gateway

2. Each Supply Air Valve will be a Digital valve of the appropriate size configured for control through the LCU and connection to a virtual node general exhaust valve.

3. Each General Exhaust Air Valve will be a Vitrual Node valve of the appropriate size configured for connection to the Supply Digital Valve.

B. VOLUMETRIC TRACKING – The system shall measure the flow feedback of all supply air and exhaust air devices in the space. The general exhaust air valve shall be controlled to track a constant differential volume from the total space supply at all times. The volume offset shall return to within +/- 10% of setpoint within one second of any change in required flow from any of the variable volume devices in the lab space.

C. THERMAL LOAD CONTROL – The system shall measure the temperature in the space and the supply discharge duct. The system shall use these temperatures along with the supply airflow feedback to calculate the space's thermal load in BTUs/hr. The system shall use this value in an anticipatory manner to control the cooling supply air or reheat coil valve in order to maintain a stable space temperature at all times regardless of changes in room exhaust volume. The space temperature sensor shall have a user adjustable slide switch to raise or lower the space temperature setpoint within set limits. The space temperature sensor shall incorporate a local LCD readout of current temperature.

D. VENTILATION CONTROL – The supply air shall be controlled such that fresh air volume is maintained at or above the amount required to achieve the desired air change rate. The supply minimum flow shall be equal to the volume of the lab space times the number of desired (adjustable) changes per hour.

E. OCCUPIED / UNOCCUPIED CONTROL – Interface to the space occupancy sensors that shall be used to determine occupied / unoccupied for in each lab space. When the lab is unoccupied the current required air change rate to the unoccupied (adjustable) minimum value. Upon detection of personnel returning to the lab (via movement of a fume hood sash) the system lab shall immediately restore the air change rate setpoint to the occupied setpoint (adjustable). In addition the system shall allow the space temperature to float within a wider (adjustable) band before initiating a call for cooling or heating between and adjustable deadband.

F. EMERGENCY OVERRIDE – Each lab space shall be equipped with a jumbo pushbutton, maintained contact, emergency override switch at each exit of each lab. Upon sensing a depression of this switch the system shall place all variable flow devices to their programmed emergency flow setpoints. Each variable volume device's emergency flow setpoint shall be user programmable to accommodate the particular containment requirements of the space (either positive or negative).

G. CONSTANT VOLUME EXHAUST – Some spaces are equipped with Biological Safety Cabinets, Canopy Hoods, and or Spot Exhaust devices (i.e. flexible snorkels, slot exhaust, equipment exhaust). Each of these pieces of equipment shall be provided with a constant volume exhaust valve set for the appropriate flow. Each of these constant volume exhaust valves shall provide

flow feedback for connection to the laboratory controller to be used in calculating volumetric offsets and / or monitoring.

H. Laboratory with Fume Hood(s)

1. General

a. Each fume hood will be equipped with the following:

1) Fume Hood Operator Monitor.

2) Fume Hood Sash Sensor for a single vertical rising sash.

3) A Venturi or Bladder Exhaust Valve of the appropriate size configured for hood control.

b. Each Supply / Make-up Air valve will be a Venturi or Bladder valve of the appropriate size configured for control through the LCU and connection to a virtual node general exhaust valve.

c. Each General Exhaust Air Valve will be a Venturi or Bladder valve of the appropriate size configured for connection to the Supply Digital Valve.

2. Each lab space containing a fume hood shall be provided with a LCU for connection and control of the following:

a. Supply/Make-up Air Valve

b. Space Temperature

c. Supply Discharge Temperature

d. Reheat Coil Valve

e. General Exhaust Air Valve

f. Room Emergency Override

g. Network connection to the space's Digital Valves

h. Network connection to other LCU's and the BACNet™ Interface Gateway

I. Fume Hood Face Velocity Control

1. FACE VELOCITY CONTROL - The fume hood sash sensor shall be calibrated to a linear signal between minimum and maximum sash positions. The hood sash minimum shall be determined by calculating the sash area required to achieve the design face velocity at the required minimum flow volume plus three percent (3%) estimated leakage. When the sash has been lowered below this minimum area the hood shall function in a constant volume mode. When operating above this minimum position the fume hood monitor shall send a control signal to the digital hood exhaust valve proportional to the required exhaust flow to achieve the design face velocity. The fume hood monitor shall illuminate the normal operating status LED whenever the hood is operating in a normal state.

2. EMERGENCY OVERRIDE & ALARMS – A local emergency override button shall be part of the fume hood monitor, this button shall be a maintained type contact. When an operator depresses this override button the hood shall be commanded to the maximum design flow for the particular size valve in the hood exhaust duct. The monitor shall also light the emergency override red LED and sound the audible alarm. The emergency override shall be cleared by the operator depressing the emergency override button a second time. The fume hood monitor shall generate a "Caution –Flow Alarm" state whenever the hood is not achieving the required flow. This alarm will consist of lighting the "Caution –Flow Alarm" red LED on the monitor and sounding an audible alarm. The "Caution – Flow Alarm" sequence shall be initiated by any of the following conditions:

a. Flow feedback is 5% more or less than flow command.

b. System pressure falls below the required amount.

c. The hood sash is raised above the maximum design height.

d. The audible alarm shall be capable of being silenced by the operator depressing the "Mute" button on the hood monitor. Once an alarm has been muted any subsequent alarms shall re-engage the audible alarm.

3. NIGHT ENERGY WASTE – The fume hood monitor shall monitor the position of the fume hood sash and the light level in the space. Upon a condition of the lighting being below the adjustable setpoint and the sash being above the adjustable setpoint the hood monitor shall light the yellow "Energy Waste Alert" LED and sound the audible alarm.

4. Zone Presence Sensor

a. For variable air volume (VAV) systems, a sash sensor shall be provided to measure the height of each vertically moving fume hood sash. A sash sensor shall also be provided for horizontal overlapping sashes. Control systems employing sidewall-mounted velocity sensors shall be unacceptable..

b. A presence and motion sensor shall be capable of determining an operator's presence in front of the hood by detecting the presences and/or motion of an operator, and command the laboratory airflow control system from an in-use operating face velocity (e.g., 100 fpm) to a standby velocity (e.g., 60 fpm) and vice versa.

1) The sensor shall define a detection zone that extends approximately 20" (50cm) from the front of the fume hood. If the sensor does not detect the presence and/or motion in its detection zone within five seconds, it shall command the system to the user-adjustable standby face velocity. When the sensor detects the presence and/or motion of an operator within the detection zone, it shall command the system to the in-use face velocity within 1.0 second.

2) The sensor shall have a control circuit that adapts to its specific surroundings and automatically adjusts for inanimate objects placed within its detection zone. It shall map the area into memory and, after a period of five minutes, nullify the image of the inanimate object and return to a standby mode. Operators shall enter and leave the zone with the unit automatically adjusting between in-use and standby modes. If the inanimate object is moved or taken out of the zone, the unit shall automatically re-map the area.

3) Wide area motion detectors (on the hood or room level) shall be unacceptable.

c. The airflow at the fume hood shall vary in a linear manner between two adjustable minimum and maximum flow set points to maintain a constant face velocity throughout this range. A minimum volume flow shall be set to assure flow through the fume hood even with the sash totally closed..

d. A fume hood monitor shall be provided to receive the sash sensor output and presence and/or motion signal. This same monitor shall generate an exhaust airflow control signal for the appropriate airflow control device in order to provide a constant average face velocity. Audible and separate visual alarms shall be provided for both flow alarm and emergency exhaust conditions.

5. VOLUMETRIC TRACKING – The system shall measure the flow feedback of all supply/make-up air and exhaust air devices in the space. The supply/make-up air valve shall be controlled to track a constant differential volume from the total space exhaust at

all times. If the thermal load in the space calls for a greater volume of supply than would be required for make-up air the general exhaust valve shall be controlled to maintain the desired offset. The volume offset shall return to within +/- 10% of setpoint within one second of any change in required flow from any of the variable volume devices in the lab space.

6. THERMAL LOAD CONTROL – The system shall measure the temperature in the space and the supply/make-up discharge duct. The system shall use these temperatures along with the supply/make-up airflow feedback to calculate the space's thermal load in BTUs/hr. The system shall use this value in an anticipatory manner to control the cooling supply air or reheat coil valve in order to maintain a stable space temperature at all times regardless of the frequent changes in room exhaust volume associated with opening and closing of the fume hood(s). The space temperature sensor shall have a user adjustable slide switch to raise or lower the space temperature setpoint within set limits. The space temperature sensor shall incorporate a local LCD readout of current temperature.

7. VENTILATION CONTROL – The supply/make-up air shall be controlled such that fresh air volume is maintained at or above the amount required to achieve the desired air change rate. The supply minimum flow shall be equal to the volume of the lab space times the number of desired (adjustable) changes per hour.

8. OCCUPIED / UNOCCUPIED CONTROL – Two ceiling mounted room occupancy sensors shall be installed in each lab space. When the system senses that the lab is unoccupied and after an adjustable time delay the system shall reduce the current required air change rate to the unoccupied (adjustable) minimum value. Upon detection of personnel returning to the lab the system shall immediately restore the air change rate setpoint to the occupied setpoint (adjustable). The system shall also use the occupancy sensor to turn off the normal lighting in the space when the space has been unoccupied for the adjustable time period. In addition the system shall allow the space temperature to float within a wider (adjustable) band before initiating a call for cooling or heating.

9. EMERGENCY OVERRIDE – Each lab space shall be equipped with a jumbo pushbutton, maintained contact, emergency override switch at the exit of each lab. Upon sensing a depression of this switch the system shall place all variable flow devices to their programmed emergency flow setpoints. Each variable volume device's emergency flow setpoint shall be user programmable to accommodate the particular containment requirements of the space (either positive or negative).

10. CONSTANT VOLUME EXHAUST – Some spaces are equipped with Biological Safety Cabinets, Canopy Hoods, and or Spot Exhaust devices (i.e. flexible snorkels, equipment exhaust). Each of these pieces of equipment shall be provided with a constant volume exhaust valve set for the appropriate flow. Each of these constant volume exhaust valves shall provide flow feedback for connection to the laboratory controller to be used in calculating volumetric offsets and / or monitoring.

6.13 LABORATORY CONTROL SYSTEM BACNET™ INTERFACE POINTS AVAILABLE VIA THE BAS

A. The following points shall be available, as a minimum, through the BAS BACnet™ interface with the Laboratory Airflow / Temperature Control System.

B. For each Laboratory Zone:

1. Description	Point Type	Function
Space Temperature	Analog Input	BAS Read from LCS
Space Temperature Setpoint Adjust	Analog Input	BAS Read from LCS
Occupied Temperature Setpoint	Analog Output	BAS Write to LCS
Unoccupied Cooling Temperature Setpoint	Analog Output	BAS Write to LCS
Unoccupied Heating Temperature Setpoint	Analog Output	BAS Write to LCS

Supply Duct Discharge Air Temperature	Analog Input	BAS Read from LCS
Emergency Override Panic Button	Binary Input	BAS Read from LCS
Zone Offset CFM	Analog Input	BAS Read from LCS
Zone Offset CFM Setpoint	Analog Input	BAS Read from LCS
Zone Schedule Status	Binary Output	BAS Write to LCS
Supply / Make-up Air Flow	Analog Input	BAS Read from LCS
Supply / Make-up Air Flow Setpoint	Analog Input	BAS Read from LCS
Supply / Make-up Air Flow Alarm	Binary Input	BAS Read from LCS
Supply / Make-up Air Flow Occ Min Set	Analog Output	BAS Write to LCS
Supply / Make-up Air Flow Unocc Min Set	Analog Output	BAS Write to LCS
Cooling Demand %	Analog Input	BAS Read from LCS
Heating Demand %	Analog Input	BAS Read from LCS
General Exhaust Air Flow	Analog Input	BAS Read from LCS
General Exhaust Air Flow Setpoint	Analog Input	BAS Read from LCS
General Exhaust Air Flow Alarm	Binary Input	BAS Read from LCS

C. For each Fume Hood:

1. Description

	Point Type	Function
Space Temperature	Analog Input	BAS Read from LCS
Hood Face Velocity	Analog Input	BAS Read from LCS
Hood Face Velocity Setpoint	Analog Input	BAS Read from LCS
Hood Flow CFM	Analog Input	BAS Read from LCS
Hood Flow CFM Setpoint	Analog Input	BAS Read from LCS
Hood Flow Alarm	Binary Input	BAS Read from LCS
Hood Local Emergency Override Alarm	Binary Input	BAS Read from LCS
Hood Sash Opening %	Analog Input	BAS Read from LCS
Hood Sash Sensor Alarm	Binary Input	BAS Read from LCS
Hood Sash Opening Alarm Setpoint	Analog Output	BAS Write to LCS
Hood Sash Opening Alarm	Binary Input	BAS Read from LC
Hood Occupancy	Binary Input	BAS Read from LC

SECTION 230995 BUILDING AUTOMATION SYSTEM COMMISSIONING

PART 1 - GENERAL

1.1 WORK INCLUDED

A. BAS System and equipment testing and start-up

B. Validation of proper and thorough installation of BAS systems and equipment

C. Functional testing of control systems

D. Documentation of tests, procedures, and installations

E. Coordination of BAS training

F. Documentation of BAS Operation and Maintenance materials

1.2 GENERAL DESCRIPTION

A. This section defines responsibilities of the Building Automation System Contractor to Commission the BAS.

B. Commissioning (Cx) is the process of ensuring that all building systems are installed and perform interactively according to the design intent; that systems are efficient and cost effective and meet the Owner's operational needs; that the installation is adequately documented; and that the Operators are adequately trained. It serves as a tool to minimize post-occupancy operational problems. It establishes testing and communication protocols in an effort to advance the building systems from installation to full dynamic operation and optimization.

C. Commissioning Authority (CA) is retained by the Owner and shall work with the Contractor and the Design Engineer to direct and oversee the Commissioning process and perform functional performance testing.

D. This Section outlines the Commissioning procedures specific to the Building Automation System Contractors. Requirements common to all Sections are specified in Sections 019113 and 019114.

E. The scope of the Commissioning on this project shall include the entire BAS system.

1.3 RELATED SECTIONS:

A. Drawings and general provisions of Contract, including General and Supplementary Conditions and Division-1 Specification sections, apply to work of this section.

B. The Cx process references many related Sections, particularly Section 019113 - General Commissioning. It is important for all Contractors subject to the Cx process to be familiar with Section 019113.

C. Refer to Section 019113 for a complete list of Sections on Related Work.

1.4 DEFINITIONS AND ABBREVIATIONS

A. Refer to Section 019113.

1.5 REFERENCE STANDARDS

A. ASHRAE Guideline 1-1996, "Guideline for Commissioning HVAC Systems"

B. ASHRAE Guideline 4-1993, “Preparation of operating and Maintenance Documentation for Building Systems”

C. NEBB - Procedural Standards for Building Systems Commissioning

D. ASHRAE Standard 110 – Method for Testing Laboratory Fume Hoods

E. USGBC - LEED NC 3.0 Reference Package

1.6 CONTRACTOR RESPONSIBILITIES

A. General responsibilities of the Contractor are specified in Section 019113. The following responsibilities indicate specific responsibilities of the BAS contractor in addition to those responsibilities

B. Assist CA in verification and performance testing. Assistance will generally include the following:

1. Establish trend logs of system operation as specified herein
2. Manipulate systems and equipment to facilitate functional performance testing as outlined in Section 019114.
3. Provide Portable Operators Terminals or operator workstations in locations convenient to testing activities as specified below
4. Provide CA with appropriate passwords, keys, and access to control panels and workstations.
5. Where control systems do not allow a test mode or the overriding of physical input values for testing, program an interim virtual point for all inputs that can be used to represent the point and be overridden for testing

C. Provide a Control technician to work at the direction of Commissioning Authority for software optimization assistance for a minimum of 16 hours. Refer to Part 3 for a description of the software optimization.

D. Provide a form summarizing all setpoints and alarm parameters and alarming strategies for the Owner to complete. Organize a meeting with Owner and CA to discuss the desired initial setpoints and alarm parameters. Contractor shall enter the requested setpoints and alarm parameters at completion of start up and record the applicable settings in the prefunctional documentation.

E. Train Owner’s Representatives in systems operation and control equipment use, operation, maintenance and repair. Training shall be conducted as follows:

1. Control system training shall be conducted by the Control Subcontractor. Control system training shall be as specified in Part - 3 of this section.

F. Compensate the Owner for site time necessitated by incompleteness of systems or equipment at time of functional performance testing. All testing failures which require on-site time for retesting will be considered actual damages to the Owner. The contract sum shall be reduced by contract modification at a rate of $145 per man-hour of on-site time necessary to retest failures. All parties under contract with the Owner who are affected by the retesting shall be included in the contract modification. Refer to Section 019113 and 019114 for more details.

1.7 SEQUENCING:

A. Refer Section 019113.

B. The following list outlines the general sequence of events for Commissioning of the Control systems.

1. Construction Phase:

a. Collaborate on construction scheduling
b. Submit Product data and Shop Drawings, and receive approval.
c. Meet with Commissioning Team to coordinate with all trades
d. Submit Control Logic Documentation, and receive approval.
e. Begin controls installation.
f. Submit refinement of generic prefunctional checklists incorporating manufacture specific start-up procedures accompanied by manufacturers pre-printed start up procedures for all equipment provided by the BAS contractor
g. Receive BAS prefunctional checklists approval.
h. Submit Training Plan content
i. Receive approval of Training Plan content
j. Provide alarm list and receive approval
k. Provide sample graphics and receive approval
l. Complete BAS system installation
m. Place systems under BAS control.
n. Enter alarms as approved by Owner
o. Complete BAS graphics
p. Perform BAS system start up and complete prefunctional documentation.
q. Submit completed BAS prefunctional Checklists
r. Prepare and initiate Trend Log data storage and format trend graphs.
s. Train Owner on control system operation and maintenance for basic system offering.
t. Formal Hand off Meeting
u. Submit Commissioning BAS Software/Access and provide technician level (monitoring, point override/test, and setpoint adjustment) password access to Owner and CA.
v. Receive BAS prefunctional documentation approval and approval to schedule Commissioning Demonstrations.
w. Demonstrate systems to Commissioning Authority and Owner.
x. Submit trend logs in format specified
y. Receive Demonstration approval and approval to schedule Acceptance Phase.

2. Acceptance Phase

a. Receive Operational Test approval which enables start of Functional Testing.
b. CA Performs Functional Performance Testing and BAS contractor participates in initial samples.
c. Two week Operational Test
d. Receive Functional Completion approval for the BAS.
e. Substantial Completion

3. Warranty Phase

a. Provide administrator password access to Owner.
b. Train Owner on final Sequences and modes of operation.
c. Update facility manual content with any changes.
d. Revise and Re-Submit Record drawings and O&M manuals.
e. Install Framed Control Drawings

f. Final Completion
g. Opposite Season Operational Test and Functional Performance Testing
h. Receive Opposite Season Operational Test and FPT approval
i. Revise and Re-Submit Record drawings and O&M manuals and update framed control drawings if any changes result from opposite season operational test.
j. Complete owner training.
k. End of Warranty Period

1.8 TRAINING

A. Contractors, Subcontractor, Vendors, and other applicable Parties shall prepare and conduct training sessions on the installed systems and equipment they are responsible for per the requirements of Section 019113 and the individual Specifications.

PART 2 - PRODUCTS

2.1 INSTRUMENTATION

A. General: All testing equipment used by any Party shall be of sufficient quality and accuracy to test and/or measure system performance with the tolerances specified. If not otherwise noted, the following minimum requirements apply:

1. Temperature sensors and digital thermometers shall have a certified calibration within the past year and a resolution of + or - 0.1°F.
2. Pressure sensors shall have an accuracy of + or - 2.0% of the value range being measured (not full range of meter) and have been calibrated within the last year.
3. All equipment shall be calibrated according to the manufacturer's recommended intervals. Calibration tags shall be affixed or certificates readily available.

B. Standard Testing Instrumentation: Standard instrumentation used for testing air and water flows, temperatures, humidity, noise levels, amperage, voltage, and pressure differential in air and water systems related to functional testing shall be provided by CA.

C. Special Tools: Special equipment, tools and instruments (only available from vendor, specific to a piece of equipment) required for testing equipment, according to these Contract Documents shall be included in the base bid price to the Contractor and turned over to the Owner upon project completion.

2.2 WEB-BASED COMMISSIONING PORTAL

A. All general and major subcontractors participating in the Cx process shall use the web-based Cx Portal ('Portal') to document the Cx procedures. The Portal is a Web-based Internet hub used to electronically collaborate and coordinate activities and deliverables throughout the Cx process. The Portal is hosted by the CA and shall be accessible to all Parties participating in the Cx program. The Portal provides a common location to store Start-Up Documentation, Functional Performance Tests and results, project documents and deliverables. It also serves as a collaborative email hub to facilitate, automate, and track communications between Parties relating to the Cx process.

B. Refer to Section 019113 the individual Specifications for additional information and requirements for using the Portal.

2.3 TAB & COMMISSIONING PORTABLE OPERATORS TERMINAL

A. Provide the CA with all software, connection devices, licenses, passwords and the like to facilitate connection to the BAS throughout the building. Provide a license to graphic software, and all operating software necessary for testing and configuration of all control elements at all levels. License may be a temporary license that will expire after the completion of the Warranty Period. Options include:

1. Browser access to the full graphic software; CA will provide laptop however BAS contractor shall set up the laptop to successfully connect.
2. Licensed Client Software to be installed on CA Computer; BAS contractor shall install the software and ensure it is functional.

B. Access to the BAS must be provided throughout the building as more fully defined as follows:

1. Full wireless connection to the graphic server throughout the building will be adequate.
2. Network connection for full access to the graphic server within 50' of any point in the building
3. Exception to 1 and 2 above: an acceptable alternative to full building access to the graphic server relating to terminal controls shall be providing to the CA the devices and software required to connect to local terminal controllers through a connection port in the space such as connection to a jack on the temperature sensor (basically what is required by TAB specified below). This does not apply to mechanical rooms as full graphic access is required in mechanical rooms.

C. Provide software required by TAB to calibrate all flow sensors. TAB will provide computer to be used as a portable operator's terminal. Any manufacturer specific hardware such as connection cables, converters, hand held devices, etc. shall be provided by the contractor.

D. Connections shall be provided local to the device being calibrated. For instance, for VAV boxes, connection of the operator's terminal shall be either at the sensor as well as at the box. Otherwise a wireless system shall be provided to facilitate this local functionality.

PART 3 - EXECUTION

3.1 BAS START-UP TESTING, ADJUSTING, CALIBRATION

A. Work and/or systems installed shall be fully functioning prior to Demonstration and Acceptance Phase. Contractor shall start, test, adjust, and calibrate all work and/or systems under this Contract, as described below:

1. Inspect the installation of all devices. Review the manufacturer's installation instructions and validate that the device is installed in accordance with them.
2. Verify proper electrical voltages and amperages, and verify that all circuits are free from faults.
3. Verify integrity/safety of all electrical connections.
4. Coordinate with TAB subcontractor to obtain and CA to fine tune control settings that are determined from balancing procedures. Record the following control settings as obtained from TAB contractor, and note any TAB deficiencies in the BAS Start-Up Report:

a. Optimum duct static pressure setpoints for VAV air handling units
b. Minimum outside air damper settings for air handling units
c. Optimum differential pressure setpoints for variable speed pumping systems.
d. Calibration parameters for flow control devices such as VAV boxes and flow measuring stations.

1) BAS contractor shall provide hand held device as a minimum to the TAB and CA to facilitate calibration. Connection for any given device shall local to it (at the VAV box or at the thermostat). HHD or portable operators' terminal shall allow querying and editing of parameters required for proper calibration and start up.

e. Calibration parameters for fume hoods

5. Test, calibrate, and set all digital and analog sensing and actuating devices. Calibrate each instrumentation device by making a comparison between the BAS display and the reading at the device, using an instrument traceable to the National Bureau of Standards, which shall be at least twice as accurate as the device to be calibrated (e.g., if field device is +/-0.5% accurate, test equipment shall be +/-0.25% accurate over same range). Record the measured value and displayed value for each device in the BAS Start up Report.
6. Check and set zero and span adjustments for all transducers and transmitters.
7. For dampers and valves:

   a. Check for adequate installation including free travel throughout range and adequate seal.
   b. Where loops are sequenced, check for proper control without overlap

8. For actuators:

   a. Check to insure that device seals tightly when the appropriate signal is applied to the operator.
   b. Check for appropriate fail position, and that the stroke and range is as required and coordinated with the programmed ranges when it is operating under normal conditions.
   c. For pneumatic operators, adjust the operator spring compression as required to achieve close off. If positioner or volume booster is installed on the operator, calibrate per manufacturer's procedure to achieve spring range indicated. Check split range positioners to verify proper operation. Record settings for each device.
   d. Check the stroke and range under actual loading conditions and validate that they correlate with programmed values
   e. For sequenced electronic actuators, calibrate per manufacturer's instructions to required ranges.

9. Check each digital control point by making a comparison between the control command at the CU and the status of the controlled device. Check each digital input point by making a comparison of the state of the sensing device and the OI display. Record the results for each device.
10. For outputs to reset other manufacturers devices (VFDs) and feedback from them, calibrate ranges to establish proper parameters. Coordinate with representative of the respective manufacturer and obtain their approval of the installation.
11. Verify proper sequences by using the approved checklists to record results. Verify proper sequence and operation of all specified functions.
12. Verify that all safety devices trip at appropriate conditions. Adjust setpoints accordingly.
13. Tune all control loops to obtain the fastest stable response without hunting, offset or overshoot. Record tuning parameters and response test results for each control loop in the BAS Start up Report. Except from a startup, maximum allowable variance from set point for controlled variables under normal load fluctuations shall be as follows. Within 3 minutes of any upset (for which the system has the capability to respond) in the control loop, tolerances shall be maintained (exceptions noted):

    a. Duct air temperature: ±1°F.
    b. Space Temperature: ±3°F within 3 minutes and control within ±2°F

c. Chilled Water: ±1°F
d. Hot water temperature: ±2°F.
e. Duct pressure: ± 0.25" w.c.
f. Water pressure: ±1 psid
g. Duct Humidity: ±3% when adding humidity
h. Space Humidity: ±5% when adding humidity to control
i. Terminal Air flow control: ±5% of setpoint. This includes all VAV terminal control and exhausted BSCs, canopy hoods, ventilated cage racks, necropsy tables, and other scientific equipment with supply or exhaust ventilation
j. Fume Hoods: ±10% on full sash travel (from min to max in 3 seconds) within 3 seconds. ±5% when sash is positioned in the controllable range. Refer to Section 15995 for fume hood acceptance requirements
k. Space Pressurization (on active control systems): ±0.03" w.c. with no door or window movements. No high containment space shall go more than 0.15" w.c. positive, nor go positive at all for more than 20 seconds.

14. For communication interfaces and DDC control panels:

    a. Ensure devices are properly installed with adequate clearance for maintenance and with clear labels in accordance with the record drawings.
    b. Ensure that terminations are safe, secure and labeled in accordance with the record drawings.
    c. Check power supplies for proper voltage ranges and loading.
    d. Ensure that wiring and tubing are run in a neat and workman-like manner, either bound or enclosed in trough.
    e. Check for adequate signal strength and acceptable bandwidth utilization on communication networks.
    f. Check for stand alone performance of controllers by disconnecting the controller from the LAN. Verify the event is annunciated at OIs. Verify that the controlling LAN reconfigures as specified in the event of a LAN disconnection.
    g. Ensure that all outputs and devices fail to their proper positions/states.
    h. Ensure that buffered and/or volatile information is held through power outage
    i. With all system and communications operating normally and all trends functioning, sample and record update/annunciation times for critical alarms fed from the panel to the OI.
    j. Check for adequate grounding of all DDC panels and devices.
    k. Run self diagnostic routines and ensure they are functional
    l. Check the memory allocation and loading to ensure adequate and excess capacity is available and that it will not affect control functionality.

15. Coordinate desired initial alarm strategies with Owner's Operators. Set all required alarms and document the initial settings in the start up documentation
16. Coordinate all initial setpoints with Owner's Operators. Ensure those setpoints are active
17. For Operator Interfaces:

    a. Verify that all elements on the graphics are functional and are properly bound to physical devices and/or virtual points, and that hot links or page jumps are functional and logical.
    b. Output all specified BAS reports for review and approval.
    c. Verify that the alarm printing and logging is functional and per requirements.
    d. Verify that trend archiving to disk and provide a sample to the CA for review.
    e. Verify alarm enunciation functionality. Time delay from actual occurrence to the time updated or enunciated on the screen. Ensure it is per the specified requirements.
    f. Verify that real time and historical trends are accessible and viewable in graph format.
    g. Verify that paging/dial out alarm annunciation is functional.

h. Verify the functionality of remote OIs and that a robust connection can be established consistently.
i. Verify that required third party software applications required with the bid are installed and are functional.
j. Demonstrate open protocol and custom third party interfaces reliably communicate and check response time.
k. Verify response times and screen update and refresh times are per the requirements.
l. Verify that all custom programs are editable from the OI. Check upload, download, back up and restore capabilities of system configuration information as well as custom programs.
m. Verify schedules are set up and working.
n. Verify Owner stipulated security and permissions is set up and functional.
o. In concert with the Building Power Outage test, validate that critical GUI installations are properly powered by UPS and emergency outlets to keep it functional during a power outage. Validate that the space has adequate lighting to manage the building in the event of an outage.

18. Start up and check out control air compressors and air drying and filtering systems in accordance with the appropriate section and with manufacturer's instructions.

a. Validate adequate deliver and pressures
b. Validate adequate redundancy
c. Validate max run time and cycle time vs. manufacturer's recommendations
d. Validate that routing of the compressed air does not result in condensation at any point in the system when used with the specified drier
e. Check all PRVs both primary and back up to ensure adequate functionality and maintenance of downstream pressure

19. Verify proper interface with fire alarm system.
20. Verify proper interface with control panels of equipment with self contained controls that are being monitored by the BAS.

B. Submit Start-Up/prefunctional Documentation. This shall be completed, submitted, and approved prior to demonstration and Acceptance Phase.

3.2 SENSOR CHECKOUT AND CALIBRATION

A. General Checkout: Verify that all sensor locations are appropriate and are away from causes of erratic operation. Verify that sensors with shielded cable are grounded only at one end. For sensor pairs that are used to determine a temperature or pressure difference, make sure they are reading within 0.2°F of each other for temperature and within a tolerance equal to 2% of the reading of each other for pressure. Tolerances for critical applications may be tighter.

B. Calibration: Calibrate all sensors using one of the following procedures:

1. Sensors without Transmitters--Standard Application: Make a reading with a calibrated test instrument within 6 inches of the site sensor at various points across the range. Verify that the sensor reading (via the permanent thermostat, gage or EMCS) is within the tolerances specified for the sensor. If not, adjust offset and range, or replace sensor. Where sensors are subject to wide variations in the sensed variable, calibrate sensor within the highest and lowest 20% of the expected range.
2. Sensors with Transmitters--Standard Application: Disconnect sensor. Connect a signal generator in place of sensor. Connect ammeter in series between transmitter and BAS control panel. Using manufacturer's resistance-temperature data simulate minimum desired

temperature. Adjust transmitter potentiometer zero until 4 mA is read by the ammeter. Repeat for the maximum temperature matching 20 mA to the potentiometer span or maximum and verify at the OI. Record all values and recalibrate controller as necessary to conform to tolerances. Reconnect sensor. Make a reading with a calibrated test instrument within 6 inches of the site sensor. Verify that the sensor reading (via the permanent thermostat, gage or EMCS) is within the tolerances specified. If not, replace sensor and repeat. For pressure sensors, perform a similar process with a suitable signal generator.

C. Sensor Tolerance: Sensors shall be within the tolerances specified for the device.

3.3 LOOP TUNING

A. For all control loops, contractor shall tune the loops to ensure the fastest stable response without hunting, offset or overshoot with tolerances defined above. Contractor shall introduce upsets to the load when possible to affect response. Otherwise, setpoints can be changed to affect the response.

B. Generally tune loops during periods of high gain.

C. Document all parameters either by capturing text, short interval trends, or screen shots of trend graph documenting the final response.

3.4 COIL VALVE LEAK CHECK

A. Verify proper close off of the valves. Ensure the valve seats properly by simulating the maximum anticipated pressure difference across the circuit. Calibrate air temperature sensors on each side of coil to be within 0.5°F of each other. Via the OI, command the valve to close. Energize fans. After 5 minutes, observe air temperature difference across coil. If a temperature difference is indicated, and the piping surface temperature entering the coil is within 3°F of the water supply temp, leakage is probably occurring. If it appears that it is occurring, close the isolation valves to the coil to ensure the conditions change. If they do, this validates the valve is not closing. Remedy the condition by adjusting the stroke and range, increasing the actuator size/torque, replacing the seat, or replacing the valve as applicable.

3.5 VALVE STROKE SETUP AND CHECK

A. For all valve and actuator positions checked, verify the actual position against the OI readout.

B. Set pumps to normal operating mode. Command valve closed, verify that valve is closed, and adjust output zero signal as required. Command valve open, verify position is full open and adjust output signal as required. Command valve to a few intermediate positions. If actual valve position doesn't reasonably correspond, replace actuator or add pilot positioner (for pneumatics)

3.6 ALARM SETPOINT COORDINATION

A. The Contractor shall prepare a list of all conceptual point types and recommend the types and recommended alarming strategies and setpoint for review of Commissioning Agent and Owner. Owner shall use this alarm list to provide direction to Contractor for alarm strategies and setpoints. Alarm list shall be provided at least two months prior to the first functional test. Contractor shall have alarm setpoints entered prior to functional testing. Omitting an alarm setting, using the wrong strategy, or entering the wrong setpoints will be considered a failure from the perspective of the functional test.

3.7 GRAPHIC COORDINATION

A. The Contractor shall prepare all graphics (only one example graphic is required for typical systems like terminal units) with points embedded for review of Commissioning Agent and Owner. Owner shall use these graphics to provide direction to Contractor for the required final graphic. All final graphics must be complete and active before functional testing. Any deviation from the approved graphics will be considered a failure from the perspective of the functional test.

3.8 BAS DEMONSTRATION

A. Demonstrate the operation of the BAS hardware, software, and all related components and systems to the satisfaction of the Commissioning Agent and Owner. Schedule the demonstration with the Owner's representative 1 week in advance. Demonstration shall not be scheduled until all hardware and software submittals, and the Start-Up Test Report are approved. If the Work fails to be demonstrated to conform to Contract specifications, so as to require scheduling of additional site visits by the Commissioning Authority for re-demonstration, Contractor shall reimburse Owner for costs of subsequent Commissioning Authority site visits.

B. The Contractor shall supply all personnel and equipment for the demonstration, including, but not limited to, instruments, ladders, etc. Contractor supplied personnel must be competent with and knowledgeable of all project-specific hardware, software, and the HVAC systems. All training documentation and submittals shall be at the job site.

C. Demonstration shall typically involve small representative samples of systems/equipment randomly selected by the Owner and CA.

D. The system shall be demonstrated following the same procedures used in the Start-Up Test by using the approved Commissioning Checklists. Demonstration shall include, but not necessarily be limited to, the following:

1. Demonstrate that required software is installed on EMCS workstations. Demonstrate that graphic screens, alarms, trends, and reports are installed as submitted and approved.
2. Demonstrate that points specified and shown can be interrogated and/or commanded (as applicable) from all workstations, as specified.
3. Demonstrate that remote dial-up communication abilities are in accordance with these Specifications.
4. Demonstrate correct calibration of input/output devices using the same methods specified for the start-Up tests. A maximum of 10 percent of I/O points shall be selected at random by Commissioning Authority and/or Owner for demonstration. Upon failure of any device to meet the specified end-to-end accuracy, an additional 10 percent of I/O points shall be selected at random by Commissioning Authority for demonstration. This process shall be repeated until 100 percent of randomly selected I/O points have been demonstrated to meet specified end-to-end accuracy.
5. Demonstrate that all DDC and other software programs exist at respective field panels. The Direct Digital Control (DDC) programming and point database shall be as submitted and approved.
6. Demonstrate that all DDC programs accomplish the specified sequences of operation.
7. Demonstrate that the panels automatically recover from power failures, as specified.
8. Demonstrate that the stand-alone operation of panels meets the requirements of these Specifications. Demonstrate that the panels' response to LAN communication failures meets the requirements of these Specifications.
9. Identify access to equipment selected by Commissioning Authority. Demonstrate that access is sufficient to perform required maintenance.

10. Demonstrate that required trend graphs and trend logs are set up per the requirements. Provide a sample of the data archive. Indicate the file names and locations.

E. BAS Demonstration shall be completed and approved prior to functional testing.

F. Any tests successfully completed during the demonstration will be recorded as passed for the functional performance testing and will not have to be repeated.

3.9 FUNCTIONAL PERFORMANCE TESTING

A. Requirements for assistance with functional performance testing are specified in the Section 019114. Provide assistance during Functional Performance Testing per 019114 and related Specifications.

3.10 BAS ACCEPTANCE PERIOD

A. After approval of the BAS Demonstration and prior to Substantial Completion, Acceptance Phase shall commence. Acceptance Period shall not be scheduled until all HVAC systems are in operation and have been started and the startup documented, all required cleaning and lubrication has been completed (i.e., filters changed, piping flushed, strainers cleaned, etc.), and draft TAB report has been submitted. Acceptance Period and its approval MAY be performed on a system-by-system basis if mutually agreed upon by contractor and Owner.

B. Operational Test: At the end of the Acceptance Phase, the system shall operate properly for two weeks without malfunction, without alarm caused by control action or device failure, and with smooth and stable control of systems and equipment in conformance with these specifications. At the end of the two weeks, contractor shall forward the trend logs to the CA for review. CA shall determine if the system is ready for functional acceptance and document any problems requiring contractor attention.

1. If the systems are not ready for functional acceptance, Contractor shall correct problems and provide notification to the Owner's representative that all problems have been corrected. The Operational Test shall be restarted at a mutually scheduled time for an additional one week period. This process shall be repeated until Commissioning Authority issues notice that the BAS is ready for functional acceptance.

C. During the Acceptance Period, the contractor shall maintain a hard copy log of all alarms generated by the BAS. For each alarm received, contractor shall diagnose the cause of the alarm, and shall list on the log for each alarm, the diagnosed cause of the alarm, and the corrective action taken. If in the contractor's opinion, the cause of the alarm is not the responsibility of the contractor, contractor shall immediately notify the Owner's representative.

D. During the Acceptance Phase, the contractor shall maintain all controller network and workstation hardware and software in a state that will allow remote access by Commissioning Agent to Trend Logs as specified below.

3.11 TREND LOGS

A. Trends are historical archives on computer disks that document the operation of the systems and equipment. Trends can be interval recordings of system I/O parameters or Change of Value based trends that record when a system value changes by more than a specified threshold.

B. CA will analyze trend logs of the system operating parameters to evaluate normal system functionality. The requirements of the trending are specified below. Contractor shall establish these trends, ensure they are being stored properly, and forward the data in electronic format to the CA.

C. Data shall include a single row of field headings and the data thereafter shall be contiguous. Each record shall include a date and time field. Recorded parameters for a given piece of equipment or component shall be trended at the same intervals and be presented in a maximum of two separate two dimensional formats with time being the vertical axis and field name being the horizontal axis. Data shall be forwarded in one of the following formats.

1. Microsoft ACCESS Database (.mdb)
2. Microsoft EXCEL Spreadsheet (.xls)
3. Comma Separated Value (.csv or .txt) preferably with quotes delimiting text fields and # delimiting date/time fields

D. Sample times indicated as COV (±) or change of value mean that the changed parameter only needs to be recorded after the value changes by the amount listed. When output to the trending file, the latest recorded value shall be listed with any given time increment record. If the BAS does not have the capability to record based on COV, the parameter shall be recorded based on the interval common to the unit.

E. Contractor shall provide the CA with required passwords, phone numbers, etc. to allow the CA access to the trend log data and allow downloading to a remote location. Contractor shall also provide step-by-step written instructions for accessing the data.

F. Trending Requirements: All points on primary equipment and selected sampling of terminal points unless approved otherwise. This will include, but not be limited to the following. At a minimum, trend the following on 10 min. intervals for analog values and change of value for binary values.

1. Outside Air Temperature
2. Outside Air Enthalpy
3. Cooling Tons
4. All sensed Hydronic Temperatures
5. All sensed air temperatures on primary equipment
6. All damper outputs on primary equipment
7. All valve outputs on primary equipment
8. All sensed Fan Volumes on primary equipment
9. All inputs and outputs to VFDs
10. Return (or exhaust) Air Temperature on each air handler
11. All safety indications
12. Status on all primary equipment
13. All air and water pressures on primary equipment or systems
14. Space Temperatures
15. Steam Flow
16. Electricity consumption where monitored.
17. Natural Gas flows
18. Converter steam valves and hot water temperatures
19. Steam supply pressures and temperatures.
20. Basically all points on primary equipment and selected sampling of terminal points unless approved otherwise

G. Trending to document functional tests may typically be at a more frequent interval. Consult with the CA to determine the required intervals for functional testing and modify intervals as required.

3.12 TREND GRAPHS

A. Trend graphs shall generally be used during the Acceptance Phase to facilitate and document testing. Prepare controller and workstation software to display graphical format trends during the Acceptance

Period. Trend graphs shall demonstrate compliance with contract documents. Trended values and intervals shall be the same as those specified for the functional performance tests.

B. Contractor shall establish trend graphs for every PID loop under control for the main equipment and for the terminal zones, which shows the input, output and setpoint. Where applicable, multiple graphs can be used to clearly display the data. Also, multiple PIDs can share a graph when there is correlation, such as an AHU temperature and setpoint and valve outputs for both the HW and CHW valve. Coordinate with the CA regarding the set-up of the trend summaries.

C. Lines shall be labeled and shall be distinguishable from each other by using either different line types, or different line colors.

D. Indicate engineering units of the y-axis values; e.g. degrees F., inches w.c., Btu/lb, percent wide open, etc.

E. The y-axis scale shall be chosen so that all trended values are in a readable range. Do not mix trended values on one graph if their unit ranges are incompatible.

F. Trend outside air temperature, humidity, and enthalpy during each period in which any other points are trended.

G. All points trended for one HVAC subsystem (e.g. air handling unit, chilled water system, etc.) shall be trended during the same trend period.

H. Each graph shall be clearly labeled with HVAC subsystem title, date, and times.

3.13 WARRANTY PHASE BAS OPPOSITE SEASON TRENDING AND TESTING

A. Trending: throughout the Warranty Phase, trend logs shall be maintained as required for the Acceptance Period. Contractor shall forward archived trend logs to the CA for review upon CA's request. CA will review these and notify contractor of any warranty work required.

B. Opposite Season Testing: Within 6 months of completion of the Acceptance Phase, CA shall schedule and conduct Opposite Season functional performance testing. Contractor shall support this testing and remedy any deficiencies identified.

3.14 SOFTWARE OPTIMIZATION ASSISTANCE

A. The contractor shall provide the services of a controls technician as specified above at the project site to be at the disposal of the CA. The purpose of this requirement is to make changes, enhancements and additions to control unit and/or workstation software that have been identified by the CA during the construction and commissioning of the project and that are beyond the specified Contract requirements. The cost for this service shall be included with the bid. Requests for assistance shall be for contiguous or non-contiguous 8 hour days, unless otherwise mutually agreed upon by contractor, Commissioning Authority, and Owner. The Owner's representative shall notify contractor 2 days in advance of each day of requested assistance.

B. The controls technician provided shall be thoroughly trained in the programming and operation of the controller and workstation software. If the controls technician provided cannot perform every software task requested by the Commissioning Authority in a timely fashion, contractor shall provide additional qualified personnel at the project site as requested by the Commissioning Authority, to meet the total specified requirement on-site.

3.15 BAS OPERATOR TRAINING

A. Provide up to 6 complete sets of User Manuals (hard copy and one electronic copy) to be used for training.

B. Contractor shall submit a Training Plan per the requirements of Div 1 for the scope of training he is responsible. Training Plan shall be forwarded to the CM who will forward it to the AE and CA for review.

C. On Site Training: Provide training as specified and as supplemented below. All training shall include the appropriate training materials and attendance documentation required by Div1.

D. BAS Final Systems Operation Training

1. The BAS shall participate a session to present the final sequences programmed into the control system. The session will basically present:

   a. Control System Architecture
   b. Addressing and location of panels
   c. Schematic configuration of the systems
   d. Final programmed sequences. It shall present the written sequences and illustrate the programming that accomplishes those sequences. This session is typically presented on site by the primary BAS technician that managed the installation of the controls at that facility.

2. The BAS shall be use the Record Control Shop Drawings as the handout for the training. The audience for the session will be the Owner's operators and managers. The setting should be primarily classroom. Since the presentation will typically need to use a live Operator Interface, BAS shall work out the logistics of projecting the video for an effective presentation.

END OF SECTION 230995

SECTION 232113 - HYDRONIC PIPING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. This Section includes pipe and fitting materials, joining methods, special-duty valves, and specialties for the following:
   1. Hot-water heating piping.
   2. Chilled-water piping.
   3. Condenser-water piping.
   4. Glycol cooling-water piping.
   5. Makeup-water piping.
   6. Condensate-drain piping.
   7. Air-vent piping.
   8. Safety-valve-inlet and -outlet piping.

B. Related Sections include the following:
   1. Division 23 Section "Hydronic Pumps" for pumps, motors, and accessories for hydronic piping.

1.3 DEFINITIONS

A. PTFE: Polytetrafluoroethylene.

1.4 PERFORMANCE REQUIREMENTS

A. Hydronic piping components and installation shall be capable of withstanding the following minimum working pressure and temperature:
   1. Hot-Water Heating Piping: 150 psig at 200 deg F.
   2. Chilled-Water Piping: 150 psig at 200 deg F.
   3. Condenser-Water Piping: 150 psig at 150 deg F.
   4. Glycol Cooling-Water Piping: 150 psig at 150 deg F.
   5. Makeup-Water Piping: 80 psig at 150 deg F.
   6. Condensate-Drain Piping: 100 deg F.
   7. Air-Vent Piping: 100 psig at 150 deg F.
   8. Safety-Valve-Inlet and -Outlet Piping: Equal to the pressure of the piping system to which it is attached.

1.5 SUBMITTALS

A. Product Data: For each type of the following:

1. Valves. Include flow and pressure drop curves based on manufacturer's testing for calibrated-orifice balancing valves and automatic flow-control valves.
2. Air control devices.
3. Chemical treatment.
4. Hydronic specialties.

B. LEED Submittal:
1. Product Data for Credit EQ 4.1: For solvent cements and adhesive primers, including printed statement of VOC content.

C. Shop Drawings: Detail, at 1/4 scale, the piping layout, fabrication of pipe anchors, hangers, supports for multiple pipes, alignment guides, expansion joints and loops, and attachments of the same to the building structure. Detail location of anchors, alignment guides, and expansion joints and loops.

1. Refer to Section 23 0000 – "Basic HVAC Requirements" for coordination drawing requirements.

D. Welding certificates.

E. Qualification Data: For Installer.

F. Field quality-control test reports.

G. Operation and Maintenance Data: For air control devices, hydronic specialties, and special-duty valves to include in emergency, operation, and maintenance manuals.

H. Water Analysis: Submit a copy of the water analysis to illustrate water quality available at Project site.

1.6 QUALITY ASSURANCE

A. Steel Support Welding: Qualify processes and operators according to AWS D1.1/D1.1M, "Structural Welding Code - Steel."

B. Welding: Qualify processes and operators according to ASME Boiler and Pressure Vessel Code: Section IX.
1. Comply with provisions in ASME B31 Series, "Code for Pressure Piping."
2. Certify that each welder has passed AWS qualification tests for welding processes involved and that certification is current.

C. ASME Compliance: Comply with ASME B31.9, "Building Services Piping," for materials, products, and installation. Safety valves and pressure vessels shall bear the appropriate ASME label. Fabricate and stamp air separators and expansion tanks to comply with ASME Boiler and Pressure Vessel Code: Section VIII, Division 01.

1.7 EXTRA MATERIALS

A. Water-Treatment Chemicals: Furnish enough chemicals for initial system startup and for preventive maintenance for one year from date of Substantial Completion.

B. Differential Pressure Meter: For each type of balancing valve and automatic flow control valve, include flowmeter, probes, hoses, flow charts, and carrying case.

PART 2 - PRODUCTS

2.1 COPPER TUBE AND FITTINGS

A. Drawn-Temper Copper Tubing: ASTM B 88, Type L.

B. DWV Copper Tubing: ASTM B 306.

C. Wrought-Copper Fittings: ASME B16.22.
1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
a. Anvil International, Inc.
b. S. P. Fittings; a division of Star Pipe Products.

2.2 STEEL PIPE AND FITTINGS

A. Steel Pipe: ASTM A 53/A 53M, black steel with plain ends; type, grade, and wall thickness as indicated in Part 3 "Piping Applications" Article.

B. Cast-Iron Threaded Fittings: ASME B16.4; Classes 125 and 250 as indicated in Part 3 "Piping Applications" Article.

C. Malleable-Iron Threaded Fittings: ASME B16.3, Classes 150 and 300 as indicated in Part 3 "Piping Applications" Article.

D. Malleable-Iron Unions: ASME B16.39; Classes 150, 250, and 300 as indicated in Part 3 "Piping Applications" Article.

E. Cast-Iron Pipe Flanges and Flanged Fittings: ASME B16.1, Classes 25, 125, and 250; raised ground face, and bolt holes spot faced as indicated in Part 3 "Piping Applications" Article.

F. Wrought-Steel Fittings: ASTM A 234/A 234M, wall thickness to match adjoining pipe.

G. Wrought Cast- and Forged-Steel Flanges and Flanged Fittings: ASME B16.5, including bolts, nuts, and gaskets of the following material group, end connections, and facings:
1. Material Group: 1.1.
2. End Connections: Butt welding.
3. Facings: Raised face.

2.3 JOINING MATERIALS

A. Pipe-Flange Gasket Materials: Suitable for chemical and thermal conditions of piping system contents.
1. ASME B16.21, nonmetallic, flat, asbestos free, 1/8-inch maximum thickness unless thickness or specific material is indicated.
a. Full-Face Type: For flat-face, Class 125, cast-iron and cast-bronze flanges.
b. Narrow-Face Type: For raised-face, Class 250, cast-iron and steel flanges.

B. Flange Bolts and Nuts: ASME B18.2.1, carbon steel, unless otherwise indicated.

C. Solder Filler Metals: ASTM B 32, lead-free alloys. Include water-flushable flux according to ASTM B 813.

D. Brazing Filler Metals: AWS A5.8, BCuP Series, copper-phosphorus alloys for joining copper with copper; or BAg-1, silver alloy for joining copper with bronze or steel.

E. Welding Filler Metals: Comply with AWS D10.12/D10.12M for welding materials appropriate for wall thickness and chemical analysis of steel pipe being welded.

F. Gasket Material: Thickness, material, and type suitable for fluid to be handled and working temperatures and pressures.

2.4 DIELECTRIC FITTINGS

A. Description: Combination fitting of copper-alloy and ferrous materials with threaded, solder-joint, plain, or weld-neck end connections that match piping system materials.

B. Insulating Material: Suitable for system fluid, pressure, and temperature.

C. Dielectric Unions:
1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   a. Capitol Manufacturing Company.
   b. Central Plastics Company.
   c. Hart Industries International, Inc.
   d. Watts Regulator Co.; a division of Watts Water Technologies, Inc.
   e. Zurn Plumbing Products Group; AquaSpec Commercial Products Division.
2. Factory-fabricated union assembly, for 250-psig minimum working pressure at 180 deg F.

D. Dielectric Flanges:
1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   a. Capitol Manufacturing Company.
   b. Central Plastics Company.
   c. Watts Regulator Co.; a division of Watts Water Technologies, Inc.
2. Factory-fabricated companion-flange assembly, for 150- or 300-psig minimum working pressure as required to suit system pressures.

E. Dielectric-Flange Kits:
1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   a. Advance Products & Systems, Inc.
   b. Calpico, Inc.
   c. Central Plastics Company.
   d. Pipeline Seal and Insulator, Inc.
2. Companion-flange assembly for field assembly. Include flanges, full-face- or ring-type neoprene or phenolic gasket, phenolic or polyethylene bolt sleeves, phenolic washers, and steel backing washers.
3. Separate companion flanges and steel bolts and nuts shall have 150- or 300-psig minimum working pressure where required to suit system pressures.

F. Dielectric Couplings:

1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   a. Calpico, Inc.
   b. Lochinvar Corporation.
2. Galvanized-steel coupling with inert and noncorrosive thermoplastic lining; threaded ends; and 300-psig minimum working pressure at 225 deg F.

G. Dielectric Nipples:
1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   a. Perfection Corporation; a subsidiary of American Meter Company.
   b. Precision Plumbing Products, Inc.
   c. Sioux Chief Manufacturing Company, Inc.
   d. Victaulic Company of America.
2. Electroplated steel nipple with inert and noncorrosive, thermoplastic lining; plain, threaded, or grooved ends; and 300-psig minimum working pressure at 225 deg F.

2.5 VALVES

A. Check, Ball, and Butterfly Valves: Comply with requirements specified in Division 23 Section "General-Duty Valves for HVAC Piping."

B. Automatic Temperature-Control Valves, Actuators, and Sensors: Comply with requirements specified in Division 23 Section "Instrumentation and Control for HVAC."

C. Bronze, Calibrated-Orifice, Balancing Valves:
1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   a. Tour and Anderson.
2. Body: Bronze, ball or plug type with calibrated orifice or venturi.
3. Ball: Brass or stainless steel.
4. Plug: Resin.
5. Seat: PTFE.
6. End Connections: Threaded or socket.
7. Pressure Gage Connections: Integral seals for portable differential pressure meter.
8. Handle Style: Plastic dial, with memory stop to retain set position.
9. CWP Rating: Minimum 125 psig.
10. Maximum Operating Temperature: 250 deg F.

D. Cast-Iron or Steel, Calibrated-Orifice, Balancing Valves:
1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   a. Tour & Anderson; available through Victaulic Company of America.
2. Body: Cast-iron or steel body, ball, plug, or globe pattern with calibrated orifice or venturi.
3. Ball: Brass or stainless steel.
4. Stem Seals: EPDM O-rings.
5. Disc: Glass and carbon-filled PTFE.
6. Seat: PTFE.
7. End Connections: Flanged or grooved.
8. Pressure Gage Connections: Integral seals for portable differential pressure meter.
9. Handle Style: Plastic dial, with memory stop to retain set position.
10. CWP Rating: Minimum 125 psig.

11. Maximum Operating Temperature: 250 deg F.

E. Diaphragm-Operated, Pressure-Reducing Valves:
1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   a. Amtrol, Inc.
   b. Armstrong Pumps, Inc.
   c. Bell & Gossett Domestic Pump; a division of ITT Industries.
   d. Conbraco Industries, Inc.
   e. Spence Engineering Company, Inc.
   f. Watts Regulator Co.; a division of Watts Water Technologies, Inc.
2. Body: Bronze or brass.
3. Disc: Glass and carbon-filled PTFE.
4. Seat: Brass.
5. Stem Seals: EPDM O-rings.
6. Diaphragm: EPT.
7. Low inlet-pressure check valve.
8. Inlet Strainer: Stainless steel, removable without system shutdown.
9. Valve Seat and Stem: Noncorrosive.
10. Valve Size, Capacity, and Operating Pressure: Selected to suit system in which installed, with operating pressure and capacity factory set and field adjustable.

F. Diaphragm-Operated Safety Valves:
1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   a. Amtrol, Inc.
   b. Armstrong Pumps, Inc.
   c. Bell & Gossett Domestic Pump; a division of ITT Industries.
   d. Conbraco Industries, Inc.
   e. Spence Engineering Company, Inc.
   f. Watts Regulator Co.; a division of Watts Water Technologies, Inc.
2. Body: Bronze or brass.
3. Disc: Glass and carbon-filled PTFE.
4. Seat: Brass.
5. Stem Seals: EPDM O-rings.
6. Diaphragm: EPT.
7. Wetted, Internal Work Parts: Brass and rubber.
8. Inlet Strainer: Stainless steel, removable without system shutdown.
9. Valve Seat and Stem: Noncorrosive.
10. Valve Size, Capacity, and Operating Pressure: Comply with ASME Boiler and Pressure Vessel Code: Section IV, and selected to suit system in which installed, with operating pressure and capacity factory set and field adjustable.

G. Automatic Flow-Control Valves:
1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   a. Flow Design Inc.
   b. Griswold Controls.
2. Body: Brass or ferrous metal.
3. Piston and Spring Assembly: Stainless steel, tamper proof, self cleaning, and removable.
4. Combination Assemblies: Include bonze or brass-alloy ball valve.
5. Identification Tag: Marked with zone identification, valve number, and flow rate.
6. Size: Same as pipe in which installed.
7. Performance: Maintain constant flow, plus or minus 5 percent over system pressure fluctuations.

8. Minimum CWP Rating: 175 psig.
9. Maximum Operating Temperature: 200 deg F.

2.6 AIR CONTROL DEVICES

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
1. Amtrol, Inc.
2. Armstrong Pumps, Inc.
3. Bell & Gossett Domestic Pump; a division of ITT Industries.
4. Taco.
5. Spiro-Therm

B. Manual Air Vents:
1. Body: Bronze.
2. Internal Parts: Nonferrous.
3. Operator: Screwdriver or thumbscrew.
4. Inlet Connection: NPS 1/2.
5. Discharge Connection: NPS 1/8.
6. CWP Rating: 150 psig.
7. Maximum Operating Temperature: 225 deg F.

C. Automatic Air Vents:
1. Body: Bronze or cast iron.
2. Internal Parts: Nonferrous.
3. Operator: Noncorrosive metal float.
4. Inlet Connection: NPS 1/2.
5. Discharge Connection: NPS 1/4.
6. CWP Rating: 150 psig.
7. Maximum Operating Temperature: 240 deg F.

D. Bladder-Type Expansion Tanks:
1. Tank: Welded steel, rated for 125-psig working pressure and 375 deg F maximum operating temperature. Factory test with taps fabricated and supports installed and labeled according to ASME Boiler and Pressure Vessel Code: Section VIII, Division 1.
2. Bladder: Securely sealed into tank to separate air charge from system water to maintain required expansion capacity.
3. Air-Charge Fittings: Schrader valve, stainless steel with EPDM seats.

E. Tangential-Type Air Separators:
1. Tank: Welded steel; ASME constructed and labeled for 125-psig minimum working pressure and 375 deg F maximum operating temperature.
2. Air Collector Tube: Perforated stainless steel, constructed to direct released air into expansion tank.
3. Tangential Inlet and Outlet Connections: Threaded for NPS 2 and smaller; flanged connections for NPS 2-1/2 and larger.
4. Blowdown Connection: Threaded.
5. Size: Match system flow capacity.

F. Air and Dirt Separators:

1. Tank: Welded steel; ASME constructed and labeled for 150-psig (860-kPa) minimum working pressure and 375 deg F (191 deg C) maximum operating temperature.

2. Tangential Inlet and Outlet Connections: Threaded for NPS 2 (DN 50) and smaller; flanged connections for NPS 2-1/2 (DN 65) and larger.
3. Description: Coalescing type air eliminator and dirt separator, entering velocities not to exceed 4 feet per second at specified GPM, include an internal bundle filling the entire vessel to suppress turbulence and provide high efficiency, consisting of a copper core tube with continuous wound copper medium permanently affixed to the core. Separate copper medium wound completely around and permanently affixed to the internal element, separate venting chamber to prevent system contaminants from harming the float and venting valve operation, venting chamber shall be an integral full port float actuated brass venting mechanism, valved side tap to flush floating dirt or liquids and for quick bleeding of large amounts of air during system fill or refill, capable of removing 100% of the free air, 100% of the entrained air, and up to 99.6% of the dissolved air in the system fluid. Dirt separation shall be at least 80% of all particles 30 micron and larger within 100 passes.
4. Manufacturer: Spiro-Therm.

2.7 HYDRONIC PIPING SPECIALTIES

A. Y-Pattern Strainers:
1. Body: ASTM A 126, Class B, cast iron with bolted cover and bottom drain connection.
2. End Connections: Threaded ends for NPS 2 and smaller; flanged ends for NPS 2-1/2 and larger.
3. Strainer Screen: [**40**] [**60**]-mesh startup strainer, and perforated stainless-steel basket with 50 percent free area.
4. CWP Rating: 125 psig.

B. Stainless-Steel Bellow, Flexible Connectors:
1. Body: Stainless-steel bellows with woven, flexible, bronze, wire-reinforcing protective jacket.
2. End Connections: Threaded or flanged to match equipment connected.
3. Performance: Capable of 3/4-inch misalignment.
4. CWP Rating: 150 psig.
5. Maximum Operating Temperature: 250 deg F.
6. Provide for pump suction and discharge piping 4-inch or smaller.

C. Spherical, Rubber, Flexible Connectors:
1. Body: Fiber-reinforced rubber body.
2. End Connections: Steel flanges drilled to align with Classes 150 and 300 steel flanges.
3. Performance: Capable of misalignment.
4. CWP Rating: 150 psig.
5. Maximum Operating Temperature: 250 deg F.
6. Provide for pump suction and discharge piping 5-inch and larger.

D. Expansion fittings are specified in Division 23 Section "Expansion Fittings and Loops for HVAC Piping."

PART 3 - EXECUTION

3.1 PIPING APPLICATIONS

A. Hot-water heating piping, aboveground, NPS 2 and smaller, shall be the following:
1. Type L, drawn-temper copper tubing, wrought-copper fittings, and brazed joints.

B. Hot-water heating piping, aboveground, NPS 2-1/2 and larger, shall be the following:
   1. Schedule 40 steel pipe, wrought-steel fittings and wrought-cast or forged-steel flanges and flange fittings, and welded and flanged joints.

C. Chilled-water piping, aboveground, NPS 2 and smaller, shall be the following:
   1. Type L, drawn-temper copper tubing, wrought-copper fittings, and brazed joints.

D. Chilled-water piping, aboveground, NPS 2-1/2 and larger, shall be the following:
   1. Schedule 40 steel pipe, wrought-steel fittings and wrought-cast or forged-steel flanges and flange fittings, and welded and flanged joints.

E. Condenser-water piping, aboveground, NPS 2-inch and smaller, shall be the following:
   1. Type L, drawn-temper copper tubing, wrought-copper fittings, and brazed joints.

F. Condenser-water piping, aboveground, NPS 2-1/2 and larger, shall be the following:
   1. Schedule 40 steel pipe, wrought-steel fittings and wrought-cast or forged-steel flanges and flange fittings, and welded and flanged joints.

G. Makeup-water piping installed aboveground shall be the following:
   1. Type L, drawn-temper copper tubing, wrought-copper fittings, and brazed joints.

H. Condensate-Drain Piping: Type DWV, drawn-temper copper tubing, wrought-copper fittings, and soldered joints.

I. Blowdown-Drain Piping: Same materials and joining methods as for piping specified for the service in which blowdown drain is installed.

J. Air-Vent Piping:
   1. Inlet: Same as service where installed with metal-to-plastic transition fittings for plastic piping systems according to the piping manufacturer's written instructions.
   2. Outlet: Type K, annealed-temper copper tubing with soldered or flared joints.

K. Safety-Valve-Inlet and -Outlet Piping for Hot-Water Piping: Same materials and joining methods as for piping specified for the service in which safety valve is installed with metal-to-plastic transition fittings for plastic piping systems according to the piping manufacturer's written instructions.

3.2 VALVE APPLICATIONS

A. Install shutoff-duty valves at each branch connection to supply mains, and at supply connection to each piece of equipment.

B. Install calibrated-orifice, balancing valves at each branch connection to return main.

C. Install calibrated-orifice, balancing valves in the return pipe of each heating or cooling terminal.

D. Install check valves at each pump discharge and elsewhere as required to control flow direction.

E. Install safety valves at hot-water generators and elsewhere as required by ASME Boiler and Pressure Vessel Code. Install drip-pan elbow on safety-valve outlet and pipe without valves to the outdoors; and pipe drain to nearest floor drain or as indicated on Drawings. Comply with ASME Boiler and Pressure Vessel Code: Section VIII, Division 1, for installation requirements.

F. Install pressure-reducing valves at makeup-water connection to regulate system fill pressure.

3.3 PIPING INSTALLATIONS

A. Drawing plans, schematics, and diagrams indicate general location and arrangement of piping systems. Indicate piping locations and arrangements if such were used to size pipe and calculate friction loss, expansion, pump sizing, and other design considerations. Install piping as indicated unless deviations to layout are approved on Coordination Drawings.

B. Install piping in concealed locations, unless otherwise indicated and except in equipment rooms and service areas.

C. Install piping indicated to be exposed and piping in equipment rooms and service areas at right angles or parallel to building walls. Diagonal runs are prohibited unless specifically indicated otherwise.

D. Install piping above accessible ceilings to allow sufficient space for ceiling panel removal.

E. Install piping to permit valve servicing.

F. Install piping at indicated slopes.

G. Install piping free of sags and bends.

H. Install fittings for changes in direction and branch connections.

I. Install piping to allow application of insulation.

J. Select system components with pressure rating equal to or greater than system operating pressure.

K. Install groups of pipes parallel to each other, spaced to permit applying insulation and servicing of valves.

L. Install drains, consisting of a tee fitting, NPS 3/4 ball valve, and short NPS 3/4 threaded nipple with cap, at low points in piping system mains and elsewhere as required for system drainage.

M. Install piping at a uniform grade of 0.2 percent upward in direction of flow.

N. Reduce pipe sizes using eccentric reducer fitting installed with level side up.

O. Install valves according to Division 23 Section "General-Duty Valves for HVAC Piping."

P. Install unions in piping**,** NPS 2 and smaller, adjacent to valves, at final connections of equipment, and elsewhere as indicated.

Q. Install flanges in piping, NPS 2-1/2 and larger, at final connections of equipment and elsewhere as indicated.

R. Install strainers on inlet side of each control valve, pressure-reducing valve, solenoid valve, in-line pump, and elsewhere as indicated. Install NPS 3/4 nipple and ball valve in blowdown connection of strainers NPS 2 and larger. Match size of strainer blowoff connection for strainers smaller than NPS 2.

S. Install expansion loops, expansion joints, anchors, and pipe alignment guides as specified in Division 23 Section "Expansion Fittings and Loops for HVAC Piping."

T. Identify piping as specified in Division 23 Section "Identification for HVAC Piping and Equipment."

3.4 HANGERS AND SUPPORTS

A. Hanger, support, and anchor devices are specified in Division 23 Section "Hangers and Supports for HVAC Piping and Equipment." Comply with the following requirements for maximum spacing of supports.

B. Install the following pipe attachments:
1. Adjustable steel clevis hangers for individual horizontal piping less than 20 feet long.
2. Adjustable roller hangers and spring hangers for individual horizontal piping 20 feet or longer.
3. Pipe Roller: MSS SP-58, Type 44 for multiple horizontal piping 20 feet or longer, supported on a trapeze.
4. Spring hangers to support vertical runs.
5. Provide copper-clad hangers and supports for hangers and supports in direct contact with copper pipe.

C. Install hangers for steel piping with the following maximum spacing and minimum rod sizes:
1. NPS 3/4: Maximum span, 7 feet; minimum rod size, 3/8 inch.
2. NPS 1: Maximum span, 7 feet; minimum rod size, 3/8 inch.
3. NPS 1-1/4: Maximum span, 7 feet; minimum rod size, 3/8 inch.
4. NPS 1-1/2: Maximum span, 9 feet; minimum rod size, 3/8 inch.
5. NPS 2: Maximum span, 10 feet; minimum rod size, 3/8 inch.
6. NPS 2-1/2: Maximum span, 11 feet; minimum rod size, 1/2 inch.
7. NPS 3: Maximum span, 12 feet; minimum rod size, 1/2 inch.
8. NPS 3-1/2: Maximum span, 13 feet; minimum rod size, 1/2 inch.
9. NPS 4: Maximum span, 14 feet; minimum rod size, 5/8 inch.
10. NPS 5: Maximum span, 16 feet; minimum rod size, 5/8 inch.
11. NPS 6: Maximum span, 17 feet; minimum rod size, 3/4 inch.
12. NPS 8: Maximum span, 19 feet; minimum rod size, 3/4 inch.
13. NPS 10: Maximum span, 22 feet; minimum rod size, 7/8 inch.
14. NPS 12: Maximum span, 23 feet; minimum rod size, 7/8 inch.

D. Install hangers for drawn-temper copper tubing with the following maximum spacing and minimum rod sizes:
1. NPS 3/4: Maximum span, 5 feet; minimum rod size, 3/8 inch.
2. NPS 1: Maximum span, 6 feet; minimum rod size, 3/8 inch.
3. NPS 1-1/4: Maximum span, 7 feet; minimum rod size, 3/8 inch.
4. NPS 1-1/2: Maximum span, 8 feet; minimum rod size, 3/8 inch.
5. NPS 2: Maximum span, 8 feet; minimum rod size, 3/8 inch.
6. NPS 2-1/2: Maximum span, 9 feet; minimum rod size, 1/2 inch.

E. Support vertical runs at roof, at each floor, and at 10-foot intervals between floors.

3.5 PIPE JOINT CONSTRUCTION

A. Join pipe and fittings according to the following requirements and Division 23 Sections specifying piping systems.

B. Ream ends of pipes and tubes and remove burrs. Bevel plain ends of steel pipe.

C. Remove scale, slag, dirt, and debris from inside and outside of pipe and fittings before assembly.

D. Soldered Joints: Apply ASTM B 813, water-flushable flux, unless otherwise indicated, to tube end. Construct joints according to ASTM B 828 or CDA's "Copper Tube Handbook," using lead-free solder alloy complying with ASTM B 32.

E. Brazed Joints: Construct joints according to AWS's "Brazing Handbook," "Pipe and Tube" Chapter, using copper-phosphorus brazing filler metal complying with AWS A5.8.

F. Threaded Joints: Thread pipe with tapered pipe threads according to ASME B1.20.1. Cut threads full and clean using sharp dies. Ream threaded pipe ends to remove burrs and restore full ID. Join pipe fittings and valves as follows:
1. Apply appropriate tape or thread compound to external pipe threads unless dry seal threading is specified.
2. Damaged Threads: Do not use pipe or pipe fittings with threads that are corroded or damaged. Do not use pipe sections that have cracked or open welds.

G. Welded Joints: Construct joints according to AWS D10.12/D10.12M, using qualified processes and welding operators according to Part 1 "Quality Assurance" Article.

H. Flanged Joints: Select appropriate gasket material, size, type, and thickness for service application. Install gasket concentrically positioned. Use suitable lubricants on bolt threads.

3.6 HYDRONIC SPECIALTIES INSTALLATION

A. Install manual air vents at high points in piping, at heat-transfer coils, and elsewhere as required for system air venting.

B. Install automatic air vents at high points of system piping in mechanical equipment rooms only. Manual vents at heat-transfer coils and elsewhere as required for air venting.

C. Install piping from boiler air outlet, air separator to expansion tank with a 2 percent upward slope toward tank.

D. Install tangential air separator in pump suction. Install blowdown piping with butterfly or full-port ball valve; extend full size to nearest floor drain.

E. Install bypass chemical feeders in each closed hydronic systems and where indicated, in upright position with top of funnel not more than 48 inches above the floor. Install feeder in minimum NPS 3/4 bypass line, from main with full-size, full-port, ball valve in the main between bypass connections. Install NPS 3/4 pipe from chemical feeder drain, to nearest equipment drain and include a full-size, full-port, ball valve.

1. By-pass chemical feeder shall not be used for glycol charging.

F. Install expansion tanks on the floor. Vent and purge air from hydronic system, and ensure tank is properly charged with air to suit system Project requirements.

3.7 TERMINAL EQUIPMENT CONNECTIONS

A. Sizes for supply and return piping connections shall be the same as or larger than equipment connections.

B. Install control valves in accessible locations close to connected equipment.

C. Install bypass piping with globe valve around control valve. If parallel control valves are installed, only one bypass is required.

D. Install ports for pressure gages and thermometers at coil inlet and outlet connections according to Division 23 Section "Meters and Gages for HVAC Piping."

3.8 CHEMICAL TREATMENT

A. Perform an analysis of makeup water to determine type and quantities of chemical treatment needed to keep system free of scale, corrosion, and fouling, and to sustain the following water characteristics:
   1. pH: 9.0 to 10.5.
   2. "P" Alkalinity: 100 to 500 ppm.
   3. Boron: 100 to 200 ppm.
   4. Chemical Oxygen Demand: Maximum 100 ppm. Modify this value if closed system contains glycol.
   5. Corrosion Inhibitor:
      a. Sodium Nitrate: 1000 to 1500 ppm.
      b. Molybdate: 200 to 300 ppm.
      c. Chromate: 200 to 300 ppm.
      d. Sodium Nitrate Plus Molybdate: 100 to 200 ppm each.
      e. Chromate Plus Molybdate: 50 to 100 ppm each.
   6. Soluble Copper: Maximum 0.20 ppm.
   7. Tolyiriazole Copper and Yellow Metal Corrosion Inhibitor: Minimum 10 ppm.
   8. Total Suspended Solids: Maximum 10 ppm.
   9. Ammonia: Maximum 20 ppm.
   10. Free Caustic Alkalinity: Maximum 20 ppm.
   11. Microbiological Limits:
      a. Total Aerobic Plate Count: Maximum 1000 organisms/ml.
      b. Total Anaerobic Plate Count: Maximum 100 organisms/ml.
      c. Nitrate Reducers: 100 organisms/ml.
      d. Sulfate Reducers: Maximum 0 organisms/ml.
      e. Iron Bacteria: Maximum 0 organisms/ml.

B. Fill system with fresh water and add liquid alkaline compound with emulsifying agents and detergents to remove grease and petroleum products from piping. Circulate solution for a minimum of 24 hours, drain, clean strainer screens, and refill with fresh water.

C. Add initial chemical treatment and maintain water quality in ranges noted above for the first year of operation.

D. Fill systems indicated to have glycol solutions with the following concentrations:
   1. Glycol Cooling-Water Piping: Minimum 30 percent propylene glycol, see Section 236513 – “Glycol Heat Transfer Fluid”.

3.9 FIELD QUALITY CONTROL

A. Prepare hydronic piping according to ASME B31.9 and as follows:
   1. Leave joints, including welds, uninsulated and exposed for examination during test.

2. Provide temporary restraints for expansion joints that cannot sustain reactions due to test pressure. If temporary restraints are impractical, isolate expansion joints from testing.
3. Flush hydronic piping systems with clean water; then remove and clean or replace strainer screens.
4. Isolate equipment from piping. If a valve is used to isolate equipment, its closure shall be capable of sealing against test pressure without damage to valve. Install blinds in flanged joints to isolate equipment.
5. Install safety valve, set at a pressure no more than one-third higher than test pressure, to protect against damage by expanding liquid or other source of overpressure during test.

B. Perform the following tests on hydronic piping:
1. Use ambient temperature water as a testing medium unless there is risk of damage due to freezing. Another liquid that is safe for workers and compatible with piping may be used.
2. While filling system, use vents installed at high points of system to release air. Use drains installed at low points for complete draining of test liquid.
3. Isolate expansion tanks and determine that hydronic system is full of water.
4. Subject piping system to hydrostatic test pressure that is not less than 1.5 times the system's working pressure. Test pressure shall not exceed maximum pressure for any vessel, pump, valve, or other component in system under test. Verify that stress due to pressure at bottom of vertical runs does not exceed 90 percent of specified minimum yield strength or 1.7 times "SE" value in Appendix A in ASME B31.9, "Building Services Piping."
5. After hydrostatic test pressure has been applied for at least 10 minutes, examine piping, joints, and connections for leakage. Eliminate leaks by tightening, repairing, or replacing components, and repeat hydrostatic test until there are no leaks.
6. Prepare written report of testing.

C. Perform the following before operating the system:
1. Open manual valves fully.
2. Inspect pumps for proper rotation.
3. Set makeup pressure-reducing valves for required system pressure.
4. Inspect air vents at high points of system and determine if all are installed and operating freely (automatic type), or bleed air completely (manual type).
5. Set temperature controls so all coils are calling for full flow.
6. Inspect and set operating temperatures of hydronic equipment, such as boilers, chillers, cooling towers, to specified values.
7. Verify lubrication of motors and bearings.

END OF SECTION 232113

N:\N0912.00\DOC\SPEC\2012_03-16_BID\232113 - HYDRONIC PIPING.DOC

SECTION 232114 – PRE-INSULATED UNDERGROUND HVAC PIPING SYSTEMS

PART 1 - GENERAL

1.1 SUMMARY

A. This Section describes prefabricated insulated pipe/ conduit systems.

1.2 SUBMITTALS

A. Submit for review:
   1. Product data, including materials of construction of all parts and their arrangement.
   2. Provide site drawing detailing installation, showing all fittings, manholes, expansion loops, anchors, guides, concrete thrust blocks, valves, etc.
   3. Anchors, expansion loops and guide calculations and design stamped by a registered engineer.

1.3 DELIVERY, STORAGE, AND HANDLING

A. Store materials to prevent damage. End covers shall be repaired or replaced to prevent entry of water.

B. Seal ends of conduits.

PART 2 - PRODUCTS

2.1 APPROVED MANUFACTURERS

A. Thermacor

B. Rovanco

C. Permapipe

2.2 UNDERGROUND CHILLED AND HOT WATER PIPING SYSTEMS

A. Carrier Pipe:
   1. Black steel schedule 40 for underground chilled and hot water piping.

B. Insulation: Polyurethane foam with the following characteristics:
   1. Thermal conductivity "K" 0.20 btu-in/hr.-ft²-°f
   2. Density: 2 pcf.
   3. Closed Cell Content: 90-95% in conformance with ASTM C-591 completely filling the annular space between carrier pipe and jacketing.
   4. The insulation thickness shall be nominal 1-inch minimum.

C. Jacketing Material: Extruded, black, high-density polyethylene (HDPE), manufactured in accordance with ASTM D-1248 having a minimum wall thickness of 125 mils and meeting the specifications shown below:

Specific Gravity (ASTM D792)	0.941 min.
Impact Strength (ASTM D256)	Ft. Lb./in. notch, 2.0 min
Tensile Strength (ASTM D638)	3100 psi min.
Hardness, Shored (ASTM D785)	60 min.
Elongation Ultimate (ASTM D638)	400% min.
Compressive Strength (ASTM D695)	2700 psi min.
Resistance to Heat, Continuous:	
Vicat Softening Temperature (ASTM D 1525)	250°F min.

TABLE 4

NOMINAL CARRIER PIPE DIAMETER (Inches)	JACKET THICKNESS (Inches)
3/4	0.060
12	0.150

D. Carrier Pipe Joining Method: Welded joints and welded flanged fittings for steel chilled water pipes and heating hot water piping.

E. Fittings: Insulated and jacketed to match adjacent piping.

F. Insulation of Straight Joints: After welding and testing insulate and seal and all joints with factory supplied joining kits.

G. Anchors: Attach a ½" thick steel anchor plate to the carrier pipe and seal it to the pipe jacketing.

PART 3 - EXECUTION

3.1 BURIED UTILITY WARNING AND IDENTIFICATION TAPE

A. Provide as specified in Section 15075.

3.2 INSTALLATION

A. Install all pre-insulated underground piping systems in accordance with manufacturer's installation instructions and details, and under the supervision of the manufacturer's field service technician or representative.

3.3 FIELD HYDROSTATIC PRESSURE TESTING

A. All Underground Piping Systems: As specified in SECTION 15060.

B. Document all pipe testing per the forms, procedures and protocols outlined in the commissioning requirements.

3.4 BUILDING, MANHOLE OR VAULT ENTRIES

A. Seal with wall sleeves and pipe seals for water-exposed, non-flashed construction as specified in SECTION 15050.

3.5 TRENCH AND BACKFILL

A. Trench:
   1. Trench width shall be not less than 18" wider than the combined O.D. of all piping systems installed in the trench.
   2. If hard rock or shall is encountered, excavate trench 6" deeper than necessary, then fill with sand or gravel to act as a cushion.

B. Backfill: Tamped compactly in place to assure a stable surface. No rock shall be used in the first foot of backfill. 36" minimum, top of conduit to grade, of compacted fill shall meet H-20 Highway Loading.

3.6 MANUFACTURER'S FIELD SERVICE

A. A factory trained, full-time employee of the manufacturer shall be present on site for unloading of pipe, placing of pipe in trench, hydrostatic and air testing and placement of pipe anchors.

END OF SECTION 232114

N:\N0912.00\DOC\SPEC\2012_03-16_BID\232114 - PRE-INSULATED UNDERGROUND HVAC PIPING SYSTEMS.DOC

SECTION 232123 - HYDRONIC PUMPS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. This Section includes the following:
   1. Close-coupled, in-line centrifugal pumps.
   2. Separately coupled, horizontal, in-line centrifugal pumps.
   3. Separately coupled, vertical, in-line centrifugal pumps.
   4. Separately coupled, base-mounted, end-suction centrifugal pumps.
   5. Separately coupled, base-mounted, double-suction centrifugal pumps.
   6. Automatic condensate pump units.

1.3 DEFINITIONS

A. Buna-N: Nitrile rubber.

B. EPT: Ethylene propylene terpolymer.

1.4 SUBMITTALS

A. Product Data: Include certified performance curves and rated capacities, operating characteristics, furnished specialties, final impeller dimensions, and accessories for each type of product indicated. Indicate pump's operating point on curves.

B. Shop Drawings: Show pump layout and connections. Include setting drawings with templates for installing foundation and anchor bolts and other anchorages.
   1. Wiring Diagrams: Power, signal, and control wiring.

C. Operation and Maintenance Data: For pumps to include in emergency, operation, and maintenance manuals.

1.5 QUALITY ASSURANCE

A. Source Limitations: Obtain hydronic pumps through one source from a single manufacturer.

B. Product Options: Drawings indicate size, profiles, and dimensional requirements of hydronic pumps and are based on the specific system indicated. Refer to Division 01 Section "Product Requirements."

C. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.

D. UL Compliance: Comply with UL 778 for motor-operated water pumps.

1.6 DELIVERY, STORAGE, AND HANDLING

A. Manufacturer's Preparation for Shipping: Clean flanges and exposed machined metal surfaces and treat with anticorrosion compound after assembly and testing. Protect flanges, pipe openings, and nozzles with wooden flange covers or with screwed-in plugs.

B. Store pumps in dry location.

C. Retain protective covers for flanges and protective coatings during storage.

D. Protect bearings and couplings against damage from sand, grit, and other foreign matter.

E. Comply with pump manufacturer's written rigging instructions.

1.7 COORDINATION

A. Coordinate size and location of concrete bases. Cast anchor-bolt inserts into bases. Concrete, reinforcement, and formwork requirements are specified in Division 03.

1.8 EXTRA MATERIALS

A. Furnish extra materials described below that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.
1. Mechanical Seals: One mechanical seal(s) for each pump.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. In other Part 2 articles where titles below introduce lists, the following requirements apply to product selection:
1. Manufacturers: Subject to compliance with requirements, provide products by one of the manufacturers specified.

2.2 CLOSE-COUPLED, IN-LINE CENTRIFUGAL PUMPS

A. Manufacturers:
1. Bell & Gossett; Div. of ITT Industries.

B. Description: Factory-assembled and -tested, centrifugal, overhung-impeller, close-coupled, in-line pump as defined in HI 1.1-1.2 and HI 1.3; designed for installation with pump and motor shafts mounted

horizontally or vertically. Rate pump for 250-psig minimum working pressure and a continuous water temperature of 250 deg F.

C. Pump Construction:
1. Casing: Radially split, cast iron, with replaceable bronze wear rings, threaded gage tappings at inlet and outlet, and threaded companion-flange connections.
2. Impeller: ASTM B 584, cast bronze; statically and dynamically balanced, keyed to shaft, and secured with a locking cap screw. Trim impeller to match specified performance.
3. Pump Shaft: Stainless steel.
4. Mechanical Seal: Carbon rotating ring against a ceramic seat held by a stainless-steel spring, and Buna-N bellows and gasket. Include water slinger on shaft between motor and seal.
5. Packing Seal: Stuffing box, with a minimum of four rings of graphite-impregnated braided yarn with bronze lantern ring between center two graphite rings, and bronze packing gland.
6. Pump Bearings: Permanently lubricated ball bearings.

D. Motor: Single speed, with permanently lubricated ball bearings, unless otherwise indicated; and rigidly mounted to pump casing. Comply with requirements in Division 23 Section "Common Motor Requirements for HVAC Equipment."

E. Capacities and Characteristics: As scheduled on plans.

2.3 SEPARATELY COUPLED, HORIZONTAL, IN-LINE CENTRIFUGAL PUMPS

A. Manufacturers:
1. Bell & Gossett; Div. of ITT Industries.

B. Description: Factory-assembled and -tested, centrifugal, overhung-impeller, separately coupled, in-line pump as defined in HI 1.1-1.2 and HI 1.3; designed for installation with pump and motor shafts mounted horizontally. Rate pump for 175-psig minimum working pressure and a continuous water temperature of 250 deg F.

C. Pump Construction:
1. Casing: Radially split, cast iron, with threaded gage tappings at inlet and outlet, and threaded companion-flange connections.
2. Impeller: ASTM B 584, cast bronze; statically and dynamically balanced, and keyed to shaft. Trim impeller to match specified performance.
3. Pump Shaft: Stainless steel.
4. Mechanical Seal: Carbon rotating ring against a ceramic seat held by a stainless-steel spring, and Buna-N bellows and gasket. Include water slinger on shaft between motor and seal.
5. Pump Bearings: Permanently lubricated ball bearings.

D. Shaft Coupling: Molded rubber insert with interlocking spider capable of absorbing vibration.

E. Motor: Single speed, with permanently lubricated ball bearings, unless otherwise indicated; and resiliently mounted to pump casing. Comply with requirements in Division 23 Section "Common Motor Requirements for HVAC Equipment."

F. Capacities and Characteristics: As scheduled on plans.

2.4 SEPARATELY COUPLED, VERTICAL, IN-LINE CENTRIFUGAL PUMPS

A. Manufacturers:
1. Bell & Gossett; Div. of ITT Industries.

B. Description: Factory-assembled and -tested, centrifugal, overhung-impeller, separately coupled, in-line pump as defined in HI 1.1-1.2 and HI 1.3; designed for installation with pump and motor shafts mounted vertically. Rate pump for 250-psig minimum working pressure and a continuous water temperature of 250 deg F.

C. Pump Construction:
1. Casing: Radially split, cast iron, with replaceable bronze wear rings, threaded gage tappings at inlet and outlet, and threaded companion-flange connections.
2. Impeller: ASTM B 584, cast bronze; statically and dynamically balanced, keyed to shaft, and secured with a locking cap screw. Trim impeller to match specified performance.
3. Pump Shaft: Stainless steel.
4. Mechanical Seal: Carbon rotating ring against a ceramic seat held by a stainless-steel spring, and Buna-N bellows and gasket. Include water slinger on shaft between motor and seal.
5. Packing Seal: Stuffing box, with a minimum of four rings of graphite-impregnated braided yarn with bronze lantern ring between center two graphite rings, and bronze packing gland.
6. Pump Bearings: Permanently lubricated ball bearings.

D. Shaft Coupling: Axially split spacer coupling.

E. Motor: Single speed, with permanently lubricated ball bearings, unless otherwise indicated; rigidly mounted to pump casing with lifting eye and supporting lugs in motor enclosure. Comply with requirements in Division 23 Section "Common Motor Requirements for HVAC Equipment."

F. Capacities and Characteristics: As scheduled on plans.

2.5 SEPARATELY COUPLED, BASE-MOUNTED, END-SUCTION CENTRIFUGAL PUMPS

A. Manufacturers:
1. Bell & Gossett; Div. of ITT Industries.

B. Description: Factory-assembled and -tested, centrifugal, overhung-impeller, separately coupled, end-suction pump as defined in HI 1.1-1.2 and HI 1.3; designed for base mounting, with pump and motor shafts horizontal. Rate pump for 250-psig minimum working pressure and a continuous water temperature of 250 deg F.

C. Pump Construction:
1. Casing: Radially split, cast iron, with replaceable bronze wear rings, threaded gage tappings at inlet and outlet, drain plug at bottom and air vent at top of volute, and flanged connections. Provide integral mount on volute to support the casing, and attached piping to allow removal and replacement of impeller without disconnecting piping or requiring the realignment of pump and motor shaft.
2. Impeller: ASTM B 584, cast bronze; statically and dynamically balanced, keyed to shaft, and secured with a locking cap screw. Trim impeller to match specified performance.
3. Pump Shaft: Stainless steel.
4. Mechanical Seal: Carbon rotating ring against a ceramic seat held by a stainless-steel spring, and Buna-N bellows and gasket.

5. Packing Seal: Stuffing box, with a minimum of four rings of graphite-impregnated braided yarn with bronze lantern ring between center two graphite rings, and bronze packing gland.
6. Pump Bearings: Grease-lubricated ball bearings contained in cast-iron housing with grease fittings.

D. Shaft Coupling: Molded rubber insert and interlocking spider capable of absorbing vibration. EPDM coupling sleeve for variable-speed applications.

E. Coupling Guard: Dual rated; ANSI B15.1, Section 8; OSHA 1910.219 approved; steel; removable; attached to mounting frame.

F. Mounting Frame: Welded-steel frame and cross members, factory fabricated from ASTM A 36/A 36M channels and angles. Fabricate to mount pump casing, coupling guard, and motor.

G. Motor: Single speed, with permanently lubricated ball bearings, unless otherwise indicated; secured to mounting frame, with adjustable alignment. Comply with requirements in Division 23 Section "Common Motor Requirements for HVAC Equipment."

H. Capacities and Characteristics: As scheduled on plans.

2.6 AUTOMATIC CONDENSATE PUMP UNITS

A. Manufacturers:
1. Little Giant Pump Co.; Subsidiary of Tecumseh Products Co.

B. Description: Packaged units with corrosion-resistant pump, plastic tank with cover, and automatic controls. Include factory- or field-installed check valve and a 72-inch- minimum, electrical power cord with plug.

2.7 PUMP SPECIALTY FITTINGS

A. Suction Diffuser: Angle pattern, 300-psig pressure rating, ductile-iron body and end cap, pump-inlet fitting; with bronze startup and bronze or stainless-steel permanent strainers; bronze or stainless-steel straightening vanes; drain plug; and factory-fabricated support.

B. Triple-Duty Valve: Angle or straight pattern, 300-psig pressure rating, ductile-iron body, pump-discharge fitting; with drain plug and bronze-fitted shutoff, balancing, and check valve features. Brass gage ports with integral check valve, and orifice for flow measurement.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine equipment foundations and anchor-bolt locations for compliance with requirements for installation tolerances and other conditions affecting performance of work.

B. Examine roughing-in for piping systems to verify actual locations of piping connections before pump installation.

C. Examine foundations and inertia bases for suitable conditions where pumps are to be installed.

D. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 CONCRETE BASES

A. Install concrete bases of dimensions indicated for pumps and controllers. Refer to Division 23 Section "Common Work Results for HVAC."
   1. Install dowel rods to connect concrete base to concrete floor. Unless otherwise indicated, install dowel rods on 18-inch centers around full perimeter of base.
   2. For supported equipment, install epoxy-coated anchor bolts that extend through concrete base and anchor into structural concrete floor.
   3. Place and secure anchorage devices. Use setting drawings, templates, diagrams, instructions, and directions furnished with items to be embedded.
   4. Install anchor bolts to elevations required for proper attachment to supported equipment.

B. Cast-in-place concrete materials and placement requirements are specified in Division 03.

3.3 PUMP INSTALLATION

A. Comply with HI 1.4 and HI 2.4.

B. Install pumps with access for periodic maintenance including removal of motors, impellers, couplings, and accessories.

C. Independently support pumps and piping so weight of piping is not supported by pumps and weight of pumps is not supported by piping.

D. Install continuous-thread hanger rods and spring hangers with vertical-limit stop of sufficient size to support pump weight. Vibration isolation devices are specified in Division 23 Section "Vibration and Seismic Controls for HVAC Piping and Equipment." Fabricate brackets or supports as required. Hanger and support materials are specified in Division 23 Section "Hangers and Supports for HVAC Piping and Equipment."

E. Suspend vertically mounted, in-line centrifugal pumps independent of piping. Install pumps with motor and pump shafts vertical. Use continuous-thread hanger rods and spring hangers with vertical-limit stop of sufficient size to support pump weight.

F. Set base-mounted pumps on concrete foundation. Disconnect coupling before setting. Do not reconnect couplings until alignment procedure is complete.
   1. Support pump baseplate on rectangular metal blocks and shims, or on metal wedges with small taper, at points near foundation bolts to provide a gap of 3/4 to 1-1/2 inches between pump base and foundation for grouting.
   2. Adjust metal supports or wedges until pump and driver shafts are level. Check coupling faces and suction and discharge flanges of pump to verify that they are level and plumb.

G. Automatic Condensate Pump Units: Install units for collecting condensate and extend to open drain.

3.4 ALIGNMENT

A. Align pump and motor shafts and piping connections after setting on foundation, grout has been set and foundation bolts have been tightened, and piping connections have been made.

B. Comply with pump and coupling manufacturers' written instructions.

C. Adjust pump and motor shafts for angular and offset alignment by methods specified in HI 1.1-1.5, "Centrifugal Pumps for Nomenclature, Definitions, Application and Operation and HI 2.1-2.5, "Vertical Pumps for Nomenclature, Definitions, Application and Operation."

D. After alignment is correct, tighten foundation bolts evenly but not too firmly. Completely fill baseplate with nonshrink, nonmetallic grout while metal blocks and shims or wedges are in place. After grout has cured, fully tighten foundation bolts.

3.5 CONNECTIONS

A. Piping installation requirements are specified in other Division 23 Sections. Drawings indicate general arrangement of piping, fittings, and specialties.

B. Install piping adjacent to machine to allow service and maintenance.

C. Connect piping to pumps. Install valves that are same size as piping connected to pumps.

D. Install suction and discharge pipe sizes equal to or greater than diameter of pump nozzles.

E. Install triple-duty valve on discharge side of pumps.

F. Install Y-type strainer and shutoff valve on suction side of pumps.

G. Install flexible connectors on suction and discharge sides of base-mounted pumps between pump casing and valves.

H. Install pressure gages on pump suction and discharge, at integral pressure-gage tapping, or install single gage with multiple input selector valve.

I. Install check valve and gate or ball valve on each condensate pump unit discharge.

J. Install electrical connections for power, controls, and devices.

K. Ground equipment according to Division 26 Section "Grounding and Bonding for Electrical Systems."

L. Connect wiring according to Division 26 Section "Low-Voltage Electrical Power Conductors and Cables."

3.6 STARTUP SERVICE

A. Engage a factory-authorized service representative to perform startup service.
   1. Complete installation and startup checks according to manufacturer's written instructions.
   2. Check piping connections for tightness.
   3. Clean strainers on suction piping.

4. Perform the following startup checks for each pump before starting:
   a. Verify bearing lubrication.
   b. Verify that pump is free to rotate by hand and that pump for handling hot liquid is free to rotate with pump hot and cold. If pump is bound or drags, do not operate until cause of trouble is determined and corrected.
   c. Verify that pump is rotating in the correct direction.
5. Prime pump by opening suction valves and closing drains, and prepare pump for operation.
6. Start motor.
7. Open discharge valve slowly.

3.7 DEMONSTRATION

A. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain hydronic pumps. Refer to Division 01 Section "Demonstration and Training."

END OF SECTION 232123

N:\N0912.00\DOC\SPEC\2012_03-16_BID\232123 - HYDRONIC PUMPS.DOC

SECTION 232300 - REFRIGERANT PIPING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

1.2 SUMMARY

A. This Section includes refrigerant piping used for air-conditioning applications.

1.3 PERFORMANCE REQUIREMENTS

A. Line Test Pressure for Refrigerant R-134a:
   1. Suction Lines for Air-Conditioning Applications: 185 psig.
   2. Hot-Gas and Liquid Lines: 325 psig.

1.4 SUBMITTALS

A. Product Data: For each type of valve and refrigerant piping specialty indicated. Include pressure drop, based on manufacturer's test data, for the following:
   1. Thermostatic expansion valves.
   2. Solenoid valves.
   3. Filter dryers.
   4. Strainers.
   5. Pressure-regulating valves.

B. Welding certificates.

C. Field quality-control test reports.

D. Operation and Maintenance Data: For refrigerant valves and piping specialties to include in maintenance manuals.

1.5 QUALITY ASSURANCE

A. Comply with ASHRAE 15, "Safety Code for Refrigeration Systems."

B. Comply with ASME B31.5, "Refrigeration Piping and Heat Transfer Components."

1.6 PRODUCT STORAGE AND HANDLING

A. Store piping in a clean and protected area with end caps in place to ensure that piping interior and exterior are clean when installed.

1.7 COORDINATION

A. Coordinate size and location of roof curbs, equipment supports, and roof penetrations. These items are specified in Division 7 Section "Roof Accessories."

PART 2 - PRODUCTS

2.1 COPPER TUBE AND FITTINGS

A. Copper Tube: ASTM B 88, Type K or L.

B. Wrought-Copper Fittings: ASME B16.22.

C. Wrought-Copper Unions: ASME B16.22.

D. Brazing Filler Metals: AWS A5.8.

E. Flexible Connectors:
1. Body: Tin-bronze bellows with woven, flexible, tinned-bronze-wire-reinforced protective jacket.
2. End Connections: Socket ends.
3. Offset Performance: Capable of minimum 3/4-inch misalignment in minimum 7-inch- long assembly.
4. Pressure Rating: Factory test at minimum 500 psig.
5. Maximum Operating Temperature: 250 deg F.

2.2 VALVES AND SPECIALTIES

A. Diaphragm Packless Valves:
1. Body and Bonnet: Forged brass or cast bronze; globe design with straight-through or angle pattern.
2. Diaphragm: Phosphor bronze and stainless steel with stainless-steel spring.
3. Operator: Rising stem and hand wheel.
4. Seat: Nylon.
5. End Connections: Socket, union, or flanged.
6. Working Pressure Rating: 500 psig.
7. Maximum Operating Temperature: 275 deg F.

B. Packed-Angle Valves:
1. Body and Bonnet: Forged brass or cast bronze.
2. Packing: Molded stem, back seating, and replaceable under pressure.
3. Operator: Rising stem.
4. Seat: Nonrotating, self-aligning polytetrafluoroethylene.
5. Seal Cap: Forged-brass or valox hex cap.
6. End Connections: Socket, union, threaded, or flanged.

7. Working Pressure Rating: 500 psig.
8. Maximum Operating Temperature: 275 deg F.

C. Check Valves:
1. Body: Forged brass, or cast bronze; globe pattern.
2. Bonnet: Bolted ductile iron, forged brass, or cast bronze; or brass hex plug.
3. Piston: Removable polytetrafluoroethylene seat.
4. Closing Spring: Stainless steel.
5. Manual Opening Stem: Seal cap, plated-steel stem, and graphite seal.
6. End Connections: Socket, union, threaded, or flanged.
7. Maximum Opening Pressure: 0.50 psig.
8. Working Pressure Rating: 500 psig.
9. Maximum Operating Temperature: 275 deg F.

D. Service Valves:
1. Body: Forged brass with brass cap including key end to remove core.
2. Core: Removable ball-type check valve with stainless-steel spring.
3. Seat: Polytetrafluoroethylene.
4. End Connections: Copper spring.
5. Working Pressure Rating: 500 psig.

E. Solenoid Valves: Comply with ARI 760 and UL 429; listed and labeled by an NRTL.
1. Body and Bonnet: Plated steel.
2. Solenoid Tube, Plunger, Closing Spring, and Seat Orifice: Stainless steel.
3. Seat: Polytetrafluoroethylene.
4. End Connections: Threaded.
5. Electrical: Molded, watertight coil in NEMA 250 enclosure of type required by location with 1/2-inch conduit adapter, and 208-V ac coil.
6. Working Pressure Rating: 400 psig.
7. Maximum Operating Temperature: 240 deg F.
8. Manual operator.

F. Safety Relief Valves: Comply with ASME Boiler and Pressure Vessel Code; listed and labeled by an NRTL.
1. Body and Bonnet: Ductile iron and steel, with neoprene O-ring seal.
2. Piston, Closing Spring, and Seat Insert: Stainless steel.
3. Seat Disc: Polytetrafluoroethylene.
4. End Connections: Threaded.
5. Working Pressure Rating: 400 psig.
6. Maximum Operating Temperature: 240 deg F.

G. Thermostatic Expansion Valves: Comply with ARI 750.
1. Body, Bonnet, and Seal Cap: Forged brass or steel.
2. Diaphragm, Piston, Closing Spring, and Seat Insert: Stainless steel.
3. Packing and Gaskets: Non-asbestos.
4. Capillary and Bulb: Copper tubing filled with refrigerant charge.
5. Suction Temperature: 40 deg F.
6. Superheat: Nonadjustable.
7. Reverse-flow option (for heat-pump applications).
8. End Connections: Socket, flare, or threaded union.
9. Working Pressure Rating: 700 psig.

H. Straight-Type Strainers:
1. Body: Welded steel with corrosion-resistant coating.

2. Screen: 100-mesh stainless steel.
3. End Connections: Socket or flare.
4. Working Pressure Rating: 500 psig.
5. Maximum Operating Temperature: 275 deg F.

I. Angle-Type Strainers:
1. Body: Forged brass or cast bronze.
2. Drain Plug: Brass hex plug.
3. Screen: 100-mesh monel.
4. End Connections: Socket or flare.
5. Working Pressure Rating: 500 psig.
6. Maximum Operating Temperature: 275 deg F.

J. Moisture/Liquid Indicators:
1. Body: Forged brass.
2. Window: Replaceable, clear, fused glass window with indicating element protected by filter screen.
3. Indicator: Color coded to show moisture content in ppm.
4. Minimum Moisture Indicator Sensitivity: Indicate moisture above 60 ppm.
5. End Connections: Socket or flare.
6. Working Pressure Rating: 500 psig.
7. Maximum Operating Temperature: 240 deg F.

K. Replaceable-Core Filter Dryers: Comply with ARI 730.
1. Body and Cover: Painted-steel shell with ductile-iron cover, stainless-steel screws, and neoprene gaskets.
2. Filter Media: 10 micron, pleated with integral end rings; stainless-steel support.
3. Desiccant Media: Activated alumina or charcoal.
4. Designed for reverse flow (for heat-pump applications).
5. End Connections: Socket.
6. Access Ports: NPS 1/4 connections at entering and leaving sides for pressure differential measurement.
7. Maximum Pressure Loss: 2 psig.
8. Rated Flow: 5 tons.
9. Working Pressure Rating: 500 psig.
10. Maximum Operating Temperature: 240 deg F.

L. Permanent Filter Dryers: Comply with ARI 730.
1. Body and Cover: Painted-steel shell.
2. Filter Media: 10 micron, pleated with integral end rings; stainless-steel support.
3. Desiccant Media: Activated alumina or charcoal.
4. Designed for reverse flow (for heat-pump applications).
5. End Connections: Socket.
6. Access Ports: NPS 1/4 connections at entering and leaving sides for pressure differential measurement.
7. Maximum Pressure Loss: 2 psig.
8. Rated Flow: 5 tons.
9. Working Pressure Rating: 500 psig.
10. Maximum Operating Temperature: 240 deg F.

M. Liquid Accumulators: Comply with ARI 495.
1. Body: Welded steel with corrosion-resistant coating.
2. End Connections: Socket or threaded.
3. Working Pressure Rating: 500 psig.

4. Maximum Operating Temperature: 275 deg F.

2.3 REFRIGERANTS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
1. Atofina Chemicals, Inc.
2. DuPont Company; Fluorochemicals Div.
3. Honeywell, Inc.; Genetron Refrigerants.
4. INEOS Fluor Americas LLC.

B. ASHRAE 34, R-22: Monochlorodifluoromethane.

PART 3 - EXECUTION

3.1 PIPING APPLICATIONS FOR REFRIGERANT R-134a

A. Hot-Gas, Liquid Lines, and Suction Lines:
1. NPS 1-1/2 and Smaller: Copper, Type L, drawn-temper tubing and wrought-copper fittings with brazed joints.
2. NPS 2 to NPS 3: Copper, Type K, annealed- or drawn-temper tubing and wrought-copper fittings with brazed joints.

B. Safety-Relief-Valve Discharge Piping: Copper, Type K, drawn-temper tubing and wrought-copper fittings with soldered joints.

C. Safety-Relief-Valve Discharge Piping:
1. NPS 1-1/2 and Smaller: Copper, Type L, drawn-temper tubing and wrought-copper fittings with brazed joints.
2. NPS 2 to NPS 3: Copper, Type K, annealed- or drawn-temper tubing and wrought-copper fittings with brazed joints.

3.2 VALVE AND SPECIALTY APPLICATIONS

A. Install packed-angle valves in suction and discharge lines of compressor.

B. Install service valves for gage taps at inlet and outlet of strainers if they are not an integral part of valves and strainers.

C. Install a check valve at the compressor discharge and a liquid accumulator at the compressor suction connection.

D. Except as otherwise indicated, install packed-angle valves on inlet and outlet side of filter dryers.

E. Install a full-sized, three-valve bypass around filter dryers.

F. Install solenoid valves upstream from each expansion valve. Install solenoid valves in horizontal lines with coil at top.

G. Install thermostatic expansion valves as close as possible to distributors on evaporators.

1. Install valve so diaphragm case is warmer than bulb.
2. Secure bulb to clean, straight, horizontal section of suction line using two bulb straps. Do not mount bulb in a trap or at bottom of the line.
3. If external equalizer lines are required, make connection where it will reflect suction-line pressure at bulb location.

H. Install safety relief valves where required by ASME Boiler and Pressure Vessel Code. Pipe safety-relief-valve discharge line to outside according to ASHRAE 15.

I. Install moisture/liquid indicators in liquid line at the inlet of the thermostatic expansion valve or at the inlet of the evaporator coil capillary tube.

J. Install strainers upstream from and adjacent to the following unless they are furnished as an integral assembly for device being protected:
1. Solenoid valves.
2. Thermostatic expansion valves.
3. Compressor.

K. Install filter dryers in liquid line between compressor and thermostatic expansion valve, and in the suction line at the compressor.

L. Install flexible connectors at compressors.

3.3 PIPING INSTALLATION

A. Drawing plans, schematics, and diagrams indicate general location and arrangement of piping systems; indicated locations and arrangements were used to size pipe and calculate friction loss, expansion, pump sizing, and other design considerations. Install piping as indicated unless deviations to layout are approved on Shop Drawings.

B. Install refrigerant piping according to ASHRAE 15.

C. Install piping in concealed locations unless otherwise indicated and except in equipment rooms and service areas.

D. Install piping indicated to be exposed and piping in equipment rooms and service areas at right angles or parallel to building walls. Diagonal runs are prohibited unless specifically indicated otherwise.

E. Install piping above accessible ceilings to allow sufficient space for ceiling panel removal.

F. Install piping adjacent to machines to allow service and maintenance.

G. Install piping free of sags and bends.

H. Install fittings for changes in direction and branch connections.

I. Select system components with pressure rating equal to or greater than system operating pressure.

J. Install piping as short and direct as possible, with a minimum number of joints, elbows, and fittings.

K. Arrange piping to allow inspection and service of refrigeration equipment. Install valves and specialties in accessible locations to allow for service and inspection. Install access doors or panels as specified in

Division 8 Section "Access Doors and Frames" if valves or equipment requiring maintenance is concealed behind finished surfaces.

L. Install refrigerant piping in protective conduit where installed belowground.

M. Install refrigerant piping in rigid or flexible conduit in locations where exposed to mechanical injury.

N. Slope refrigerant piping as follows:
1. Install horizontal suction lines with a uniform slope downward to compressor.
2. Install traps and double risers to entrain oil in vertical runs.
3. Liquid lines may be installed level.

O. When brazing, remove solenoid-valve coils and sight glasses; also remove valve stems, seats, and packing, and accessible internal parts of refrigerant specialties. Do not apply heat near expansion-valve bulb.

P. Before installation of steel refrigerant piping, clean pipe and fittings using the following procedures:
1. Shot blast the interior of piping.
2. Remove coarse particles of dirt and dust by drawing a clean, lintless cloth through tubing by means of a wire or electrician's tape.
3. Draw a clean, lintless cloth saturated with trichloroethylene through the tube or pipe. Continue this procedure until cloth is not discolored by dirt.
4. Draw a clean, lintless cloth, saturated with compressor oil, squeezed dry, through the tube or pipe to remove remaining lint. Inspect tube or pipe visually for remaining dirt and lint.
5. Finally, draw a clean, dry, lintless cloth through the tube or pipe.
6. Safety-relief-valve discharge piping is not required to be cleaned but is required to be open to allow unrestricted flow.

Q. Install pipe sleeves at penetrations in exterior walls and floor assemblies.

R. Seal penetrations through fire and smoke barriers according to Division 7 Section "Through-Penetration Firestop Systems."

S. Install piping with adequate clearance between pipe and adjacent walls and hangers or between pipes for insulation installation.

T. Install sleeves through floors, walls, or ceilings, sized to permit installation of full-thickness insulation.

U. Seal pipe penetrations through exterior walls according to Division 7 Section "Joint Sealants" for materials and methods.

V. Identify refrigerant piping and valves according to Division 23 Section "Mechanical Identification."

3.4 PIPE JOINT CONSTRUCTION

A. Ream ends of pipes and tubes and remove burrs. Bevel plain ends of steel pipe.

B. Remove scale, slag, dirt, and debris from inside and outside of pipe and fittings before assembly.

C. Fill pipe and fittings with an inert gas (nitrogen or carbon dioxide), during brazing, to prevent scale formation.

D. Brazed Joints: Construct joints according to AWS's "Brazing Handbook," Chapter "Pipe and Tube."
   1. Use Type BcuP, copper-phosphorus alloy for joining copper socket fittings with copper pipe.
   2. Use Type BAg, cadmium-free silver alloy for joining copper with bronze or steel.

E. Threaded Joints: Thread steel pipe with tapered pipe threads according to ASME B1.20.1. Cut threads full and clean using sharp dies. Ream threaded pipe ends to remove burrs and restore full ID. Join pipe fittings and valves as follows:
   1. Apply appropriate tape or thread compound to external pipe threads unless dry-seal threading is specified.
   2. Damaged Threads: Do not use pipe or pipe fittings with threads that are corroded or damaged. Do not use pipe sections that have cracked or open welds.

3.5 HANGERS AND SUPPORTS

A. Hanger, support, and anchor products are specified in Division 23 Section "Hangers and Supports."

B. Install the following pipe attachments:
   1. Adjustable steel clevis hangers for individual horizontal runs less than 20 feet long.
   2. Roller hangers and spring hangers for individual horizontal runs 20 feet or longer.
   3. Pipe Roller: MSS SP-58, Type 44 for multiple horizontal piping 20 feet or longer, supported on a trapeze.
   4. Copper-clad hangers and supports for hangers and supports in direct contact with copper pipe.

C. Install hangers for copper tubing with the following maximum spacing and minimum rod sizes:
   1. NPS 1/2: Maximum span, 60 inches; minimum rod size, 1/4 inch.
   2. NPS 5/8: Maximum span, 60 inches; minimum rod size, 1/4 inch.
   3. NPS 1: Maximum span, 72 inches; minimum rod size, 1/4 inch.
   4. NPS 1-1/4: Maximum span, 96 inches; minimum rod size, 3/8 inch.
   5. NPS 1-1/2: Maximum span, 96 inches; minimum rod size, 3/8 inch.
   6. NPS 2: Maximum span, 96 inches; minimum rod size, 3/8 inch.

D. Support multifloor vertical runs at least at each floor.

3.6 FIELD QUALITY CONTROL

A. Perform tests and inspections and prepare test reports.

B. Tests and Inspections:
   1. Comply with ASME B31.5, Chapter VI.
   2. Test refrigerant piping, specialties, and receivers. Isolate compressor, condenser, evaporator, and safety devices from test pressure if they are not rated above the test pressure.
   3. Test high- and low-pressure side piping of each system separately at not less than the pressures indicated in Part 1 "Performance Requirements" Article.
      a. Fill system with nitrogen to the required test pressure.
      b. System shall maintain test pressure at the manifold gage throughout duration of test.
      c. Test joints and fittings with electronic leak detector or by brushing a small amount of soap and glycerin solution over joints.
      d. Remake leaking joints using new materials, and retest until satisfactory results are achieved.

3.7 SYSTEM CHARGING

A. Charge system using the following procedures:
   1. Install core in filter dryers after leak test but before evacuation.
   2. Evacuate entire refrigerant system with a vacuum pump to 500 micrometers. If vacuum holds for 12 hours, system is ready for charging.
   3. Break vacuum with refrigerant gas, allowing pressure to build up to 2 psig.
   4. Charge system with a new filter-dryer core in charging line.

3.8 ADJUSTING

A. Adjust thermostatic expansion valve to obtain proper evaporator superheat.

B. Adjust high- and low-pressure switch settings to avoid short cycling in response to fluctuating suction pressure.

C. Adjust set-point temperature of air-conditioning controllers to the system design temperature.

D. Perform the following adjustments before operating the refrigeration system, according to manufacturer's written instructions:
   1. Verify that compressor oil level is correct.
   2. Open compressor suction and discharge valves.
   3. Open refrigerant valves except bypass valves that are used for other purposes.
   4. Check open compressor-motor alignment and verify lubrication for motors and bearings.

E. Replace core of replaceable filter dryer after system has been adjusted and after design flow rates and pressures are established.

END OF SECTION 232300

N:\N0912.00\DOC\SPEC\2012_03-16_BID\232300 - REFRIGERANT PIPING.DOC

SECTION 233113 - METAL DUCTS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:
   1. Single-wall rectangular ducts and fittings.
   2. Double-wall rectangular ducts and fittings.
   3. Single-wall round and flat-oval ducts and fittings.
   4. Double-wall round and flat-oval ducts and fittings.
   5. Sheet metal materials.
   6. Duct liner.
   7. Sealants and gaskets.
   8. Hangers and supports.

B. Related Sections:
   1. Division 23 Section "Testing, Adjusting, and Balancing for HVAC" for testing, adjusting, and balancing requirements for metal ducts.
   2. Division 23 Section "Air Duct Accessories" for dampers, sound-control devices, duct-mounting access doors and panels, turning vanes, and flexible ducts.

1.3 PERFORMANCE REQUIREMENTS

A. Airstream Surfaces: Surfaces in contact with the airstream shall comply with requirements in ASHRAE 62.1-2004.

1.4 SUBMITTALS

A. Product Data: For each type of the following products:
   1. Liners and adhesives.
   2. Sealants and gaskets.

B. LEED Submittals:
   1. Product Data for Prerequisite EQ 1: Documentation indicating that duct systems comply with ASHRAE 62.1-2004, Section 5 - "Systems and Equipment."
   2. Product Data for Prerequisite EA 2: Documentation indicating that duct systems comply with ASHRAE/IESNA 90.1-2004, Section 6.4.4 - "HVAC System Construction and Insulation."
   3. Leakage Test Report for Prerequisite EA 2: Documentation of work performed for compliance with ASHRAE/IESNA 90.1-2004, Section 6.4.4.2.2 - "Duct Leakage Tests."
   4. Duct-Cleaning Test Report for Prerequisite EQ 1: Documentation of work performed for compliance with ASHRAE 62.1-2004, Section 7.2.4 - "Ventilation System Start-Up."

5. Product Data for Credit EQ 4.1: For adhesives and sealants, including printed statement of VOC content.

C. Shop Drawings:
1. Fabrication, assembly, and installation, including plans, elevations, sections, components, and attachments to other work.
2. Factory- and shop-fabricated ducts and fittings.
3. Duct layout (scale = 1/4" – 1'-0") indicating sizes, configuration, liner material, and static-pressure classes.
4. Elevation of top of ducts.
5. Dimensions of main duct runs from building grid lines.
6. Fittings.
7. Reinforcement and spacing.
8. Seam and joint construction.
9. Penetrations through fire-rated and other partitions.
10. Equipment installation based on equipment being used on Project.
11. Locations for duct accessories, including dampers, turning vanes, and access doors and panels.
12. Hangers and supports, including methods for duct and building attachment and vibration isolation.

D. Coordination Drawings: Plans, drawn to scale(scale = 1/4" – 1'-0"), on which the following items are shown and coordinated with each other, using input from installers of the items involved. Refer to Section 23 0000 – "Basic HVAC Requirements" for other coordination drawing requirements:
1. Duct installation in congested spaces, indicating coordination with general construction, building components, and other building services. Indicate proposed changes to duct layout.
2. Suspended ceiling components.
3. Structural members to which duct will be attached.
4. Size and location of initial access modules for acoustical tile.
5. Penetrations of smoke barriers and fire-rated construction.
6. Items penetrating finished ceiling including the following:
   a. Lighting fixtures.
   b. Air outlets and inlets.
   c. Speakers.
   d. Sprinklers.
   e. Access panels.
   f. Perimeter moldings.

E. Welding certificates.

F. Field quality-control reports.

1.5 QUALITY ASSURANCE

A. Welding Qualifications: Qualify procedures and personnel according to AWS D1.1/D1.1M, "Structural Welding Code - Steel," for hangers and supports. AWS D1.2/D1.2M, "Structural Welding Code - Aluminum," for aluminum supports. AWS D9.1M/D9.1, "Sheet Metal Welding Code," for duct joint and seam welding.

B. Welding Qualifications: Qualify procedures and personnel according to the following:
1. AWS D1.1/D1.1M, "Structural Welding Code - Steel," for hangers and supports.
2. AWS D1.2/D1.2M, "Structural Welding Code - Aluminum," for aluminum supports.
3. AWS D9.1M/D9.1, "Sheet Metal Welding Code," for duct joint and seam welding.

C. ASHRAE Compliance: Applicable requirements in ASHRAE 62.1-2004, Section 5 - "Systems and Equipment" and Section 7 - "Construction and System Start-Up."

D. ASHRAE/IESNA Compliance: Applicable requirements in ASHRAE/IESNA 90.1-2004, Section 6.4.4 - "HVAC System Construction and Insulation."

PART 2 - PRODUCTS

2.1 SINGLE-WALL RECTANGULAR DUCTS AND FITTINGS

A. General Fabrication Requirements: Comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible" based on indicated static-pressure class unless otherwise indicated.

B. Transverse Joints: Select joint types and fabricate according to SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Figure 1-4, "Transverse (Girth) Joints," for static-pressure class, applicable sealing requirements, materials involved, duct-support intervals, and other provisions in SMACNA's "HVAC Duct Construction Standards - Metal and Flexible."

C. Longitudinal Seams: Select seam types and fabricate according to SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Figure 1-5, "Longitudinal Seams - Rectangular Ducts," for static-pressure class, applicable sealing requirements, materials involved, duct-support intervals, and other provisions in SMACNA's "HVAC Duct Construction Standards - Metal and Flexible."

D. Elbows, Transitions, Offsets, Branch Connections, and Other Duct Construction: Select types and fabricate according to SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Chapter 2, "Fittings and Other Construction," for static-pressure class, applicable sealing requirements, materials involved, duct-support intervals, and other provisions in SMACNA's "HVAC Duct Construction Standards - Metal and Flexible."

2.2 DOUBLE-WALL RECTANGULAR DUCTS AND FITTINGS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
1. McGill AirFlow LLC.
2. Lindab, Inc.
3. Sheet Metal Connectors, Inc.

B. Rectangular Ducts: Fabricate ducts with indicated dimensions for the inner duct.

C. Outer Duct: Comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible" based on indicated static-pressure class unless otherwise indicated.

D. Transverse Joints: Select joint types and fabricate according to SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Figure 1-4, "Transverse (Girth) Joints," for static-pressure class, applicable sealing requirements, materials involved, duct-support intervals, and other provisions in SMACNA's "HVAC Duct Construction Standards - Metal and Flexible."

E. Longitudinal Seams: Select seam types and fabricate according to SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Figure 1-5, "Longitudinal Seams - Rectangular Ducts," for static-pressure class, applicable sealing requirements, materials involved, duct-support intervals, and other provisions in SMACNA's "HVAC Duct Construction Standards - Metal and Flexible."

F. Interstitial Insulation: Two-inch thick for supply and one-inch thick for return fibrous-glass liner complying with ASTM C 1071, NFPA 90A, or NFPA 90B; and with NAIMA AH124, "Fibrous Glass Duct Liner Standard."
   1. Maximum Thermal Conductivity: 0.23 Btu x in./h x sq. ft. x deg F Insert conductivity at 75 deg F mean temperature.
   2. Install spacers that position the inner duct at uniform distance from outer duct without compressing insulation.
   3. Coat insulation with antimicrobial coating in ducts with perforated inner liners.

G. Inner Duct: Minimum 0.028-inch solid or perforated sheet steel as indicated on drawings or on schedule below.

H. Factory Fabricated Transverse Joints (Flanges): Select joint types and fabricate according to SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Figure 1-4, "Traverse (Girth) Joints," for static-pressure class, applicable sealing requirements, materials involved, duct-support intervals, and other provisions in SMACNA's "HVAC Duct Construction Standards - Metal and Flexible."

I. Longitudinal Seams: Select seam types and fabricate according to SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Figure 1-5, "Longitudinal Seams - Rectangular Ducts," for static-pressure class, applicable sealing requirements, materials involved, duct-support intervals, and other provisions in SMACNA's "HVAC Duct Construction Standards - Metal and Flexible."

2.3 SINGLE-WALL ROUND AND FLAT-OVAL DUCTS AND FITTINGS

A. General Fabrication Requirements: Comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Chapter 3, "Round, Oval, and Flexible Duct," based on indicated static-pressure class unless otherwise indicated.
   1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
      a. Lindab Inc.
      b. McGill AirFlow LLC.
      c. SEMCO Incorporated.
      d. Sheet Metal Connectors, Inc.
      e. Spiral Manufacturing Co., Inc.

B. Flat-Oval Ducts: Indicated dimensions are the duct width (major dimension) and diameter of the round sides connecting the flat portions of the duct (minor dimension).

C. Factory Fabricated Transverse Joints (Flanges): Select joint types and fabricate according to SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Figure 3-2, "Transverse Joints - Round Duct," for static-pressure class, applicable sealing requirements, materials involved, duct-support intervals, and other provisions in SMACNA's "HVAC Duct Construction Standards - Metal and Flexible."
   1. Transverse Joints in Ducts Larger Than 16 Inches in Diameter: Flanged.

D. Longitudinal Seams: Select seam types and fabricate according to SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Figure 3-1, "Seams - Round Duct and Fittings," for static-pressure class, applicable sealing requirements, materials involved, duct-support intervals, and other provisions in SMACNA's "HVAC Duct Construction Standards - Metal and Flexible."
   1. Fabricate round ducts larger than 90 inches in diameter with butt-welded longitudinal seams.
   2. Fabricate flat-oval ducts larger than 72 inches in width (major dimension) with butt-welded longitudinal seams.

E. Tees and Laterals: Select types and fabricate according to SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Figure 3-4, "90 Degree Tees and Laterals," and Figure 3-5, "Conical Tees," for static-pressure class, applicable sealing requirements, materials involved, duct-support intervals, and other provisions in SMACNA's "HVAC Duct Construction Standards - Metal and Flexible."

2.4 DOUBLE-WALL ROUND AND FLAT-OVAL DUCTS AND FITTINGS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
1. Lindab Inc.
2. McGill AirFlow LLC.
3. SEMCO Incorporated.
4. Sheet Metal Connectors, Inc.

B. Flat-Oval Ducts: Indicated dimensions are the duct width (major dimension) and diameter of the round sides connecting the flat portions of the duct (minor dimension) of the inner duct.

C. Outer Duct: Comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Chapter 3, "Round, Oval, and Flexible Duct," based on static-pressure class unless otherwise indicated.
1. Factory Fabricated Transverse Joints (Flanges): Select joint types and fabricate according to SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Figure 3-2, "Transverse Joints - Round Duct," for static-pressure class, applicable sealing requirements, materials involved, duct-support intervals, and other provisions in SMACNA's "HVAC Duct Construction Standards - Metal and Flexible."
   a. Transverse Joints in Ducts Larger Than 16 Inches in Diameter: Flanged.
2. Longitudinal Seams: Select seam types and fabricate according to SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Figure 3-1, "Seams - Round Duct and Fittings," for static-pressure class, applicable sealing requirements, materials involved, duct-support intervals, and other provisions in SMACNA's "HVAC Duct Construction Standards - Metal and Flexible."
   a. Fabricate round ducts larger than 90 inches in diameter with butt-welded longitudinal seams.
   b. Fabricate flat-oval ducts larger than 72 inches in width (major dimension) with butt-welded longitudinal seams.
3. Tees and Laterals: Select types and fabricate according to SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Figure 3-4, "90 Degree Tees and Laterals," and Figure 3-5, "Conical Tees," for static-pressure class, applicable sealing requirements, materials involved, duct-support intervals, and other provisions in SMACNA's "HVAC Duct Construction Standards - Metal and Flexible."

D. Inner Duct: Minimum 0.028-inch solid or perforated sheet steel as indicated on drawings or in schedule below.

E. Interstitial Insulation: Two-inch thick fibrous-glass liner complying with ASTM C 1071, NFPA 90A, or NFPA 90B; and with NAIMA AH124, "Fibrous Glass Duct Liner Standard."
1. Maximum Thermal Conductivity: 0.23 Btu x in./h x sq. ft. x deg F at 75 deg F mean temperature.
2. Install spacers that position the inner duct at uniform distance from outer duct without compressing insulation.
3. Cover insulation with polyester film complying with UL 181, Class 1 in ducts with perforated inner liners.

2.5 SHEET METAL MATERIALS

A. General Material Requirements: Comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible" for acceptable materials, material thicknesses, and duct construction methods unless otherwise indicated. Sheet metal materials shall be free of pitting, seam marks, roller marks, stains, discolorations, and other imperfections.

B. Galvanized Sheet Steel: Comply with ASTM A 653/A 653M.
   1. Galvanized Coating Designation: G90.
   2. Finishes for Surfaces Exposed to View: Mill phosphatized.

C. Carbon-Steel Sheets: Comply with ASTM A 1008/A 1008M, with oiled, matte finish for exposed ducts.

D. Stainless-Steel Sheets: Comply with ASTM A 480/A 480M, Type 304 or 316, as indicated in the "Duct Schedule" Article; cold rolled, annealed, sheet. Exposed surface finish shall be No. 2B, No. 2D, No. 3, or No. 4 as indicated in the "Duct Schedule" Article.

E. Aluminum Sheets: Comply with ASTM B 209 Alloy 3003, H14 temper; with mill finish for concealed ducts, and standard, one-side bright finish for duct surfaces exposed to view.

F. Reinforcement Shapes and Plates: ASTM A 36/A 36M, steel plates, shapes, and bars; black and galvanized.
   1. Where black- and galvanized-steel shapes and plates are used to reinforce aluminum ducts, isolate the different metals with butyl rubber, neoprene, or EPDM gasket materials.

G. Tie Rods: Galvanized steel, 1/4-inch minimum diameter for lengths 36 inches or less; 3/8-inch minimum diameter for lengths longer than 36 inches.

2.6 DUCT LINER

A. Flexible Elastomeric Duct Liner: Preformed, cellular, closed-cell, sheet materials complying with ASTM C 534, Type II, Grade 1; and with NFPA 90A or NFPA 90B.
   1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
      a. Aeroflex USA Inc.
      b. Armacell LLC.
      c. Rubatex International, LLC
      d. Solacoustic
   2. Surface-Burning Characteristics: Maximum flame-spread index of 25 and maximum smoke-developed index of 50 when tested according to UL 723; certified by an NRTL.
   3. Liner Adhesive: As recommended by insulation manufacturer and complying with NFPA 90A or NFPA 90B.
      a. For indoor applications, use adhesive that has a VOC content of 50 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).
   4. Factory coated with EPA approved microbial coating.

B. Insulation Pins and Washers:
   1. Cupped-Head, Capacitor-Discharge-Weld Pins: Copper- or zinc-coated steel pin, fully annealed for capacitor-discharge welding, 0.135-inch- diameter shank, length to suit depth of insulation indicated with integral 1-1/2-inch galvanized carbon-steel washer.
   2. Insulation-Retaining Washers: Self-locking washers formed from 0.016-inch- thick aluminum or stainless steel; with beveled edge sized as required to hold insulation securely in place but not less than 1-1/2 inches in diameter.

C. Shop Application of Duct Liner: Comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Figure 2-19, "Flexible Duct Liner Installation."
   1. Adhere a single layer of indicated thickness of duct liner with at least 90 percent adhesive coverage at liner contact surface area. Attaining indicated thickness with multiple layers of duct liner is prohibited.
   2. Apply adhesive to transverse edges of liner facing upstream that do not receive metal nosing.
   3. Butt transverse joints without gaps, and coat joint with adhesive.
   4. Fold and compress liner in corners of rectangular ducts or cut and fit to ensure butted-edge overlapping.
   5. Do not apply liner in rectangular ducts with longitudinal joints, except at corners of ducts, unless duct size and dimensions of standard liner make longitudinal joints necessary.
   6. Apply adhesive coating on longitudinal seams in ducts with air velocity of 2500 fpm.
   7. Secure liner with mechanical fasteners 4 inches from corners and at intervals not exceeding 12 inches transversely; at 3 inches from transverse joints and at intervals not exceeding 18 inches longitudinally.
   8. Secure transversely oriented liner edges facing the airstream with metal nosings that have either channel or "Z" profiles or are integrally formed from duct wall. Fabricate edge facings at the following locations:
      a. Fan discharges.
      b. Intervals of lined duct preceding unlined duct.
      c. Upstream edges of transverse joints in ducts where air velocities are higher than 2500 fpm or where indicated.
   9. Terminate inner ducts with buildouts attached to fire-damper sleeves, dampers, turning vane assemblies, or other devices. Fabricated buildouts (metal hat sections) or other buildout means are optional; when used, secure buildouts to duct walls with bolts, screws, rivets, or welds.

2.7 SEALANT AND GASKETS

A. General Sealant and Gasket Requirements: Surface-burning characteristics for sealants and gaskets shall be a maximum flame-spread index of 25 and a maximum smoke-developed index of 50 when tested according to UL 723; certified by an NRTL.

B. Two-Part Tape Sealing System:
   1. Tape: Woven cotton fiber impregnated with mineral gypsum and modified acrylic/silicone activator to react exothermically with tape to form hard, durable, airtight seal.
   2. Tape Width: 4 inches.
   3. Sealant: Modified styrene acrylic.
   4. Water resistant.
   5. Mold and mildew resistant.
   6. Maximum Static-Pressure Class: 10-inch wg, positive and negative.
   7. Service: Indoor and outdoor.
   8. Service Temperature: Minus 40 to plus 200 deg F.
   9. Substrate: Compatible with galvanized sheet steel (both PVC coated and bare), stainless steel, or aluminum.
   10. For indoor applications, use sealant that has a VOC content of 250 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).

C. Water-Based Joint and Seam Sealant:
   1. Application Method: Brush on.
   2. Solids Content: Minimum 65 percent.
   3. Shore A Hardness: Minimum 20.
   4. Water resistant.
   5. Mold and mildew resistant.

6. VOC: Maximum 75 g/L (less water).
7. Maximum Static-Pressure Class: 10-inch wg, positive and negative.
8. Service: Indoor or outdoor.
9. Substrate: Compatible with galvanized sheet steel (both PVC coated and bare), stainless steel, or aluminum sheets.

D. Flanged Joint Sealant: Comply with ASTM C 920.
1. General: Single-component, acid-curing, silicone, elastomeric.
2. Type: S.
3. Grade: NS.
4. Class: 25.
5. Use: O.
6. For indoor applications, use sealant that has a VOC content of 250 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).

E. Flange Gaskets: Butyl rubber, neoprene, or EPDM polymer with polyisobutylene plasticizer.

F. Round Duct Joint O-Ring Seals:
1. Seal shall provide maximum leakage class of 3 cfm/100 sq. ft. at 1-inch wg and shall be rated for 10-inch wg static-pressure class, positive or negative.
2. EPDM O-ring to seal in concave bead in coupling or fitting spigot.
3. Double-lipped, EPDM O-ring seal, mechanically fastened to factory-fabricated couplings and fitting spigots.

2.8 HANGERS AND SUPPORTS

A. Hanger Rods for Noncorrosive Environments: Cadmium-plated steel rods and nuts.

B. Hanger Rods for Corrosive Environments: Electrogalvanized, all-thread rods or galvanized rods with threads painted with zinc-chromate primer after installation.

C. Strap and Rod Sizes: Comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Table 4-1, "Rectangular Duct Hangers Minimum Size," and Table 4-2, "Minimum Hanger Sizes for Round Duct."

D. Steel Cables for Galvanized-Steel Ducts: Galvanized steel complying with ASTM A 603.

E. Steel Cables for Stainless-Steel Ducts: Stainless steel complying with ASTM A 492.

F. Steel Cable End Connections: Cadmium-plated steel assemblies with brackets, swivel, and bolts designed for duct hanger service; with an automatic-locking and clamping device.

G. Duct Attachments: Sheet metal screws, blind rivets, or self-tapping metal screws; compatible with duct materials.

H. Trapeze and Riser Supports:
1. Supports for Galvanized-Steel Ducts: Galvanized-steel shapes and plates.
2. Supports for Stainless-Steel Ducts: Stainless-steel shapes and plates.
3. Supports for Aluminum Ducts: Aluminum or galvanized steel coated with zinc chromate.

PART 3 - EXECUTION

3.1 DUCT INSTALLATION

A. Drawing plans, schematics, and diagrams indicate general location and arrangement of duct system. Indicated duct locations, configurations, and arrangements were used to size ducts and calculate friction loss for air-handling equipment sizing and for other design considerations. Install duct systems as indicated unless deviations to layout are approved on Shop Drawings and Coordination Drawings.

B. Install ducts according to SMACNA's "HVAC Duct Construction Standards - Metal and Flexible" unless otherwise indicated.

C. Install round and flat-oval ducts in maximum practical lengths.

D. Install ducts with fewest possible joints.

E. Install factory- or shop-fabricated fittings for changes in direction, size, and shape and for branch connections.

F. Unless otherwise indicated, install ducts vertically and horizontally, and parallel and perpendicular to building lines.

G. Install ducts close to walls, overhead construction, columns, and other structural and permanent enclosure elements of building.

H. Install ducts with a clearance of 1 inch, plus allowance for insulation thickness.

I. Route ducts to avoid passing through transformer vaults and electrical equipment rooms and enclosures.

J. Where ducts pass through non-fire-rated interior partitions and exterior walls and are exposed to view, cover the opening between the partition and duct or duct insulation with sheet metal flanges of same metal thickness as the duct. Overlap openings on four sides by at least 1-1/2 inches.

K. Where ducts pass through fire-rated interior partitions and exterior walls, install fire dampers. Comply with requirements in Division 23 Section "Air Duct Accessories" for fire and smoke dampers.

L. Protect duct interiors from moisture, construction debris and dust, and other foreign materials. Comply with SMACNA's "Duct Cleanliness for New Construction Guidelines."

3.2 INSTALLATION OF EXPOSED DUCTWORK

A. Protect ducts exposed in finished spaces from being dented, scratched, or damaged.

B. Trim duct sealants flush with metal. Create a smooth and uniform exposed bead. Do not use two-part tape sealing system.

C. Grind welds to provide smooth surface free of burrs, sharp edges, and weld splatter. When welding stainless steel with a No. 3 or 4 finish, grind the welds flush, polish the exposed welds, and treat the welds to remove discoloration caused by welding.

D. Maintain consistency, symmetry, and uniformity in the arrangement and fabrication of fittings, hangers and supports, duct accessories, and air outlets.

E. Repair or replace damaged sections and finished work that does not comply with these requirements.

3.3 DUCT SEALING

A. Seal ducts for duct static-pressure, seal classes, and leakage classes specified in "Duct Schedule" Article according to SMACNA's "HVAC Duct Construction Standards - Metal and Flexible."

B. Seal ducts to the following seal classes according to SMACNA's "HVAC Duct Construction Standards - Metal and Flexible":
   1. Comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible."
   2. Unconditioned Space, Supply-Air Ducts in Pressure Classes 2-Inch wg and Lower: Seal Class A.
   3. Unconditioned Space, Supply-Air Ducts in Pressure Classes Higher Than 2-Inch wg: Seal Class A.
   4. Unconditioned Space, Exhaust Ducts: Seal Class B.
   5. Unconditioned Space, Return-Air Ducts: Seal Class B.
   6. Conditioned Space, Supply-Air Ducts in Pressure Classes 2-Inch wg and Lower: Seal Class A.
   7. Conditioned Space, Supply-Air Ducts in Pressure Classes Higher Than 2-Inch wg: Seal Class A.
   8. Conditioned Space, Exhaust Ducts: Seal Class A.
   9. Conditioned Space, Return-Air Ducts: Seal Class B.

3.4 HANGER AND SUPPORT INSTALLATION

A. Comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Chapter 4, "Hangers and Supports."

B. Building Attachments: Concrete inserts, powder-actuated fasteners, or structural-steel fasteners appropriate for construction materials to which hangers are being attached.
   1. Where practical, install concrete inserts before placing concrete.
   2. Install powder-actuated concrete fasteners after concrete is placed and completely cured.
   3. Use powder-actuated concrete fasteners for standard-weight aggregate concretes or for slabs more than 4 inches thick.
   4. Do not use powder-actuated concrete fasteners for lightweight-aggregate concretes or for slabs less than 4 inches thick.

C. Hanger Spacing: Comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Table 4-1, "Rectangular Duct Hangers Minimum Size," and Table 4-2, "Minimum Hanger Sizes for Round Duct," for maximum hanger spacing; install hangers and supports within 24 inches of each elbow and within 48 inches of each branch intersection.

D. Hangers Exposed to View: Threaded rod and angle or channel supports.

E. Support vertical ducts with steel angles or channel secured to the sides of the duct with welds, bolts, sheet metal screws, or blind rivets; support at each floor and at a maximum intervals of 16 feet.

F. Install upper attachments to structures. Select and size upper attachments with pull-out, tension, and shear capacities appropriate for supported loads and building materials where used.

3.5 CONNECTIONS

A. Make connections to equipment with flexible connectors complying with Division 23 Section "Air Duct Accessories."

B. Comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible" for branch, outlet and inlet, and terminal unit connections.

3.6 PAINTING

A. Paint interior of metal ducts that are visible through registers and grilles and that do not have duct liner. Apply one coat of flat, black, latex paint over a compatible galvanized-steel primer. Paint materials and application requirements are specified in Division 09 painting Sections.

3.7 FIELD QUALITY CONTROL

A. Perform tests and inspections.

B. Leakage Tests:
   1. Comply with SMACNA's "HVAC Air Duct Leakage Test Manual." Submit a test report for each test.
   2. Test the following systems:
      a. Ducts with a Pressure Class Higher Than 3-Inch wg: Test representative duct sections totaling no less than 25 percent of total installed duct area for each designated pressure class.
      b. Supply Ducts with a Pressure Class of 4-Inch wg or Higher: Test representative duct sections totaling no less than 100 percent of total installed duct area for each designated pressure class.
      c. Return Ducts with a Pressure Class of 2-Inch wg or Higher: Test representative duct sections totaling no less than 50 percent of total installed duct area for each designated pressure class.
      d. Exhaust Ducts with a Pressure Class of 2-Inch wg or Higher: Test representative duct sections totaling no less than 100 percent of total installed duct area for each designated pressure class.
      e. Outdoor Air Ducts with a Pressure Class of 2-Inch wg or Higher: Test representative duct sections totaling no less than 100 percent of total installed duct area for each designated pressure class.
   3. Disassemble, reassemble, and seal segments of systems to accommodate leakage testing and for compliance with test requirements.
   4. Test for leaks before applying external insulation.
   5. Conduct tests at static pressures equal to maximum design pressure of system or section being tested. If static-pressure classes are not indicated, test system at maximum system design pressure. Do not pressurize systems above maximum design operating pressure.
   6. Give seven days' advance notice for testing.

C. Duct System Cleanliness Tests:
   1. Visually inspect duct system to ensure that no visible contaminants are present.
   2. Test sections of metal duct system, chosen randomly by Owner, for cleanliness according to "Vacuum Test" in NADCA ACR, "Assessment, Cleaning and Restoration of HVAC Systems."
      a. Acceptable Cleanliness Level: Net weight of debris collected on the filter media shall not exceed 0.75 mg/100 sq. cm.

D. Duct system will be considered defective if it does not pass tests and inspections.

E. Prepare test and inspection reports.

3.8 DUCT CLEANING

A. Clean new duct system(s) before testing, adjusting, and balancing.

B. Use service openings for entry and inspection.
   1. Create new openings and install access panels appropriate for duct static-pressure class if required for cleaning access. Provide insulated panels for insulated or lined duct. Patch insulation and liner as recommended by duct liner manufacturer. Comply with Division 23 Section "Air Duct Accessories" for access panels and doors.
   2. Disconnect and reconnect flexible ducts as needed for cleaning and inspection.
   3. Remove and reinstall ceiling to gain access during the cleaning process.

C. Particulate Collection and Odor Control:
   1. When venting vacuuming system inside the building, use HEPA filtration with 99.97 percent collection efficiency for 0.3-micron-size (or larger) particles.
   2. When venting vacuuming system to outdoors, use filter to collect debris removed from HVAC system, and locate exhaust downwind and away from air intakes and other points of entry into building.

D. Clean the following components by removing surface contaminants and deposits:
   1. Air outlets and inlets (registers, grilles, and diffusers).
   2. Supply, return, and exhaust fans including fan housings, plenums (except ceiling supply and return plenums), scrolls, blades or vanes, shafts, baffles, dampers, and drive assemblies.
   3. Air-handling unit internal surfaces and components including mixing box, coil section, air wash systems, spray eliminators, condensate drain pans, humidifiers and dehumidifiers, filters and filter sections, and condensate collectors and drains.
   4. Coils and related components.
   5. Return-air ducts, dampers, actuators, and turning vanes except in ceiling plenums and mechanical equipment rooms.
   6. Supply-air ducts, dampers, actuators, and turning vanes.
   7. Dedicated exhaust and ventilation components and makeup air systems.

E. Mechanical Cleaning Methodology:
   1. Clean metal duct systems using mechanical cleaning methods that extract contaminants from within duct systems and remove contaminants from building.
   2. Use vacuum-collection devices that are operated continuously during cleaning. Connect vacuum device to downstream end of duct sections so areas being cleaned are under negative pressure.
   3. Use mechanical agitation to dislodge debris adhered to interior duct surfaces without damaging integrity of metal ducts, duct liner, or duct accessories.
   4. Clean fibrous-glass duct liner with HEPA vacuuming equipment; do not permit duct liner to get wet. Replace fibrous-glass duct liner that is damaged, deteriorated, or delaminated or that has friable material, mold, or fungus growth.
   5. Clean coils and coil drain pans according to NADCA 1992. Keep drain pan operational. Rinse coils with clean water to remove latent residues and cleaning materials; comb and straighten fins.
   6. Provide drainage and cleanup for wash-down procedures.
   7. Antimicrobial Agents and Coatings: Apply EPA-registered antimicrobial agents if fungus is present. Apply antimicrobial agents according to manufacturer's written instructions after removal of surface deposits and debris.

3.9 START UP

A. Air Balance: Comply with requirements in Division 23 Section "Testing, Adjusting, and Balancing for HVAC."

3.10 DUCT SCHEDULE

A. Fabricate ducts with galvanized sheet steel except as otherwise indicated and as follows:
   1. Laboratory exhaust ducts.

B. Supply Ducts:
   1. Ducts downstream of variable air volume terminal units:
      a. Pressure Class: Positive 2-inch wg.
      b. Minimum SMACNA Seal Class: A.
      c. SMACNA Leakage Class for Rectangular: 12 (non laboratory ducts) and 3 (laboratory ducts).
      d. SMACNA Leakage Class for Round and Flat Oval: 12 (non laboratory ducts) and 3 (laboratory ducts).
   2. Ducts upstream of Variable-Air Volume terminals Connected to Air-Handling Unit:
      a. Two inch double-wall from air handling unit to air terminal units including run-outs with perforated inner liner for first 50 feet from unit. Run-outs to air terminal units shall be one-inch double wall.
      b. Pressure Class: Positive 6-inch wg.
      c. Minimum SMACNA Seal Class: A.
      d. SMACNA Leakage Class for Rectangular: 3.
      e. SMACNA Leakage Class for Round and Flat Oval: 3.

C. Return Ducts:
   1. Ducts Connected to Air-Handling Units:
      a. One-inch double-wall with perforated inner liner for first 50 feet from unit.
      b. Pressure Class: Negative 3-inch wg.
      c. Minimum SMACNA Seal Class: B.
      d. SMACNA Leakage Class for Rectangular: 12.
      e. SMACNA Leakage Class for Round and Flat Oval: 6.

D. Exhaust Ducts:
   1. Ducts Connected to Fans Exhausting (ASHRAE 62.1, Class 1 and 2 Air):
      a. Pressure Class: Negative, 3-inch wg.
      b. Minimum SMACNA Seal Class: B if negative pressure, and A if positive pressure.
      c. SMACNA Leakage Class for Rectangular: 12.
      d. SMACNA Leakage Class for Round and Flat Oval: 6.
   2. Ducts Connected to Air-Handling Units:
      a. Pressure Class: Positive or negative 4-inch wg.
      b. Minimum SMACNA Seal Class: A if negative pressure, and A if positive pressure.
      c. SMACNA Leakage Class for Rectangular: 6.
      d. SMACNA Leakage Class for Round and Flat Oval: 6.
   3. Ducts Connected to Fans Exhausting Laboratory and Process (ASHRAE 62.1, Class 3 and 4) Air:
      a. Type 316, stainless-steel sheet.
         1) Exposed to View: No. 3 finish.
         2) Concealed: No. 2B finish.
      b. Pressure Class: Positive or negative 4-inch wg.
      c. Minimum SMACNA Seal Class: A.
      d. SMACNA Leakage Class: 3.

4. Ducts Connected to Equipment Not Listed Above:
    a. Pressure Class: Positive or negative 2-inch wg.
    b. Minimum SMACNA Seal Class: B if negative pressure, and A if positive pressure.
    c. SMACNA Leakage Class for Rectangular: 12.
    d. SMACNA Leakage Class for Round and Flat Oval: 6.

E. Outdoor-Air (Not Filtered, Heated, or Cooled) Ducts:
1. Ducts Connected to Air-Handling Units:
    a. Pressure Class: Positive or negative 2-inch wg.
    b. Minimum SMACNA Seal Class: A.
    c. SMACNA Leakage Class for Rectangular: 12.
2. Ducts Connected to Equipment Not Listed Above:
    a. Pressure Class: Positive or negative 2-inch wg.
    b. Minimum SMACNA Seal Class: B.
    c. SMACNA Leakage Class for Rectangular: 12.

F. Intermediate Reinforcement:
1. Galvanized-Steel Ducts: Galvanized steel.
2. Stainless-Steel Ducts:
    a. Exposed to Airstream: Match duct material.
    b. Not Exposed to Airstream: Match duct material.
3. Aluminum Ducts: Aluminum.

G. Liner:
1. Supply Air Ducts: Flexible elastomeric, 1 inch thick.
2. Return Air Ducts: Fibrous glass, Type I or Flexible elastomeric, 1 inch thick.
3. Exhaust Air Ducts: Flexible elastomeric, 1 inch thick.
4. Transfer Ducts: Fibrous glass, Type I or Flexible elastomeric, 1 inch thick.

H. Double-Wall Duct Interstitial Insulation:
1. Supply Air Ducts: 1 or 2 inch thick as specified.

I. Elbow Configuration:
1. Rectangular Duct: Comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Figure 2-2, "Rectangular Elbows."
    a. Velocity 1000 fpm or Lower:
        1) Radius Type RE 1 with minimum 0.5 radius-to-diameter ratio.
        2) Mitered Type RE 4 without vanes.
    b. Velocity 1000 to 1500 fpm:
        1) Radius Type RE 1 with minimum 1.0 radius-to-diameter ratio.
        2) Radius Type RE 3 with minimum 0.5 radius-to-diameter ratio and two vanes.
        3) Mitered Type RE 2 with vanes complying with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Figure 2-3, "Vanes and Vane Runners," and Figure 2-4, "Vane Support in Elbows."
    c. Velocity 1500 fpm or Higher:
        1) Radius Type RE 1 with minimum 1.5 radius-to-diameter ratio.
        2) Radius Type RE 3 with minimum 1.0 radius-to-diameter ratio and two vanes.
        3) Mitered Type RE 2 with vanes complying with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Figure 2-3, "Vanes and Vane Runners," and Figure 2-4, "Vane Support in Elbows."
2. Rectangular Duct: Comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Figure 2-2, "Rectangular Elbows."
    a. Radius Type RE 1 with minimum 1.5 radius-to-diameter ratio.
    b. Radius Type RE 3 with minimum 1.0 radius-to-diameter ratio and two vanes.

c. Mitered Type RE 2 with vanes complying with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Figure 2-3, "Vanes and Vane Runners," and Figure 2-4, "Vane Support in Elbows."

3. Round Duct: Comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Figure 3-3, "Round Duct Elbows."
   a. Minimum Radius-to-Diameter Ratio and Elbow Segments: Comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Table 3-1, "Mitered Elbows." Elbows with less than 90-degree change of direction have proportionately fewer segments.
      1) Radius-to Diameter Ratio: 1.5.
   b. Round Elbows, 12 Inches and Smaller in Diameter: Stamped or pleated.
   c. Round Elbows, 14 Inches and Larger in Diameter: Standing seam.

J. Branch Configuration:
1. Rectangular Duct: Comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Figure 2-6, "Branch Connections."
   a. Rectangular Main to Rectangular Branch: 45-degree entry.
   b. Rectangular Main to Round Branch: Spin in.
2. Round and Flat Oval: Comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Figure 3-4, "90 Degree Tees and Laterals," and Figure 3-5, "Conical Tees." Saddle taps are permitted in existing duct.
   a. Velocity 1000 fpm or Lower: 90-degree tap.
   b. Velocity 1000 to 1500 fpm: Conical tap.
   c. Velocity 1500 fpm or Higher: 45-degree lateral.

END OF SECTION 233113

SECTION 233300 - AIR DUCT ACCESSORIES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:
   1. Manual volume dampers.
   2. Control dampers.
   3. Fire dampers.
   4. Smoke dampers.
   5. Combination fire and smoke dampers.
   6. Corridor dampers.
   7. Flange connectors.
   8. Duct silencers.
   9. Turning vanes.
   10. Remote damper operators.
   11. Duct-mounted access doors.
   12. Flexible connectors.
   13. Flexible ducts.
   14. Duct accessory hardware.

B. Related Requirements:
   1. Section 233723 "HVAC Gravity Ventilators" for roof-mounted ventilator caps.
   2. Section 283111 "Digital, Addressable Fire-Alarm System" for duct-mounted fire and smoke detectors.

1.3 ACTION SUBMITTALS

A. Product Data: For each type of product.
   1. For duct silencers, include pressure drop and dynamic insertion loss data. Include breakout noise calculations for high transmission loss casings.

B. LEED Submittals:
   1. Product Data for Prerequisite IEQ 1: Documentation indicating that units comply with ASHRAE 62.1, Section 5 - "Systems and Equipment."
   2. Product Data for Prerequisite EA 2: Documentation indicating that duct insulation R-values comply with tables in ASHRAE/IESNA 90.1, Section 6 - "Heating, Ventilating, and Air Conditioning."

C. Shop Drawings: For duct accessories. Include plans, elevations, sections, details and attachments to other work.

1. Detail duct accessories fabrication and installation in ducts and other construction. Include dimensions, weights, loads, and required clearances; and method of field assembly into duct systems and other construction. Include the following:
   a. Special fittings.
   b. Manual volume damper installations.
   c. Control-damper installations.
   d. Fire-damper, smoke-damper, combination fire- and smoke-damper, ceiling, and corridor damper installations, including sleeves; and duct-mounted access doors and remote damper operators.
   e. Duct security bars.
   f. Wiring Diagrams: For power, signal, and control wiring.

1.4 INFORMATIONAL SUBMITTALS

A. Coordination Drawings: Reflected ceiling plans, drawn to scale, on which ceiling-mounted access panels and access doors required for access to duct accessories are shown and coordinated with each other, using input from Installers of the items involved.

B. Source quality-control reports.

1.5 CLOSEOUT SUBMITTALS

A. Operation and Maintenance Data: For air duct accessories to include in operation and maintenance manuals.

1.6 MAINTENANCE MATERIAL SUBMITTALS

A. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.
   1. Fusible Links: Furnish quantity equal to 10 percent of amount installed.

PART 2 - PRODUCTS

2.1 ASSEMBLY DESCRIPTION

A. Comply with NFPA 90A, "Installation of Air Conditioning and Ventilating Systems," and with NFPA 90B, "Installation of Warm Air Heating and Air Conditioning Systems."

B. Comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible" for acceptable materials, material thicknesses, and duct construction methods unless otherwise indicated. Sheet metal materials shall be free of pitting, seam marks, roller marks, stains, discolorations, and other imperfections.

2.2 MATERIALS

A. Galvanized Sheet Steel: Comply with ASTM A 653/A 653M.
   1. Galvanized Coating Designation: G90.

2. Exposed-Surface Finish: Mill phosphatized.

B. Stainless-Steel Sheets: Comply with ASTM A 480/A 480M, Type 304, and having a No. 2 finish for concealed ducts and finish for exposed ducts.

C. Aluminum Sheets: Comply with ASTM B 209, Alloy 3003, Temper H14; with mill finish for concealed ducts and standard, 1-side bright finish for exposed ducts.

D. Extruded Aluminum: Comply with ASTM B 221, Alloy 6063, Temper T6.

E. Reinforcement Shapes and Plates: Galvanized-steel reinforcement where installed on galvanized sheet metal ducts; compatible materials for aluminum and stainless-steel ducts.

F. Tie Rods: Galvanized steel, 1/4-inch minimum diameter for lengths 36 inches or less; 3/8-inch minimum diameter for lengths longer than 36 inches.

2.3 BACKDRAFT AND PRESSURE RELIEF DAMPERS

A. Basis-of-Design Product: Subject to compliance with requirements, provide product indicated on Drawings or comparable product by one of the following:
1. Air Balance Inc.; a division of Mestek, Inc.
2. American Warming and Ventilating; a division of Mestek, Inc.
3. Greenheck Fan Corporation.
4. Nailor Industries Inc.
5. Ruskin Company.

B. Description: Gravity balanced.

C. Maximum Air Velocity: 2000 fpm.

D. Maximum System Pressure: 3-inch wg.

E. Frame: Hat-shaped, 0.094-inch- thick, galvanized sheet steel, with welded corners or mechanically attached and mounting flange.

F. Blades: Multiple single-piece blades, off-center pivoted, maximum 6-inch width, 0.050-inch- thick aluminum sheet with sealed edges.

G. Blade Action: Parallel.

H. Blade Seals: Neoprene, mechanically locked.

I. Blade Axles:
1. Material: Stainless steel.
2. Diameter: 0.20 inch.

J. Tie Bars and Brackets: Galvanized steel.

K. Return Spring: Adjustable tension.

L. Bearings: Synthetic pivot bushings.

M. Accessories:
1. Adjustment device to permit setting for varying differential static pressure.
2. Counterweights and spring-assist kits for vertical airflow installations.
3. Electric actuators.
4. Chain pulls.
5. Screen Mounting: Front mounted in sleeve.
   a. Sleeve Thickness: 20 gage minimum.
   b. Sleeve Length: 6 inches minimum.
6. Screen Mounting: Rear mounted.
7. Screen Material: Aluminum.
8. Screen Type: Bird.
9. 90-degree stops.

2.4 MANUAL VOLUME DAMPERS

A. Standard, Steel, Manual Volume Dampers:
1. Basis-of-Design Product: Subject to compliance with requirements, provide product indicated on Drawings or comparable product by one of the following:
   a. Air Balance Inc.; a division of Mestek, Inc.
   b. American Warming and Ventilating; a division of Mestek, Inc.
   c. Flexmaster U.S.A., Inc.
   d. McGill AirFlow LLC.
   e. Nailor Industries Inc.
   f. Ruskin Company.
2. Standard leakage rating, with linkage outside airstream.
3. Suitable for horizontal or vertical applications.
4. Frames:
   a. Frame: Hat-shaped, 0.094-inch- thick, galvanized sheet steel.
   b. Mitered and welded corners.
   c. Flanges for attaching to walls and flangeless frames for installing in ducts.
5. Blades:
   a. Multiple or single blade.
   b. Parallel- or opposed-blade design.
   c. Stiffen damper blades for stability.
   d. Galvanized-steel, 0.064 inch thick.
6. Blade Axles: Stainless steel.
7. Bearings:
   a. Molded synthetic Stainless-steel sleeve.
   b. Dampers in ducts with pressure classes of 3-inch wg or less shall have axles full length of damper blades and bearings at both ends of operating shaft.
8. Tie Bars and Brackets: Galvanized steel.

B. Low-Leakage, Steel, Manual Volume Dampers:
1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   a. Air Balance Inc.; a division of Mestek, Inc.
   b. American Warming and Ventilating; a division of Mestek, Inc.
   c. McGill AirFlow LLC.
   d. Nailor Industries Inc.
   e. Pottorff.
   f. Ruskin Company.
   g. Vent Products Company, Inc.
2. Comply with AMCA 500-D testing for damper rating.

3. Low-leakage rating, with linkage outside airstream, and bearing AMCA's Certified Ratings Seal for both air performance and air leakage.
4. Suitable for horizontal or vertical applications.
5. Frames:
   a. Hat shaped.
   b. 0.094-inch- thick, galvanized sheet steel.
   c. Mitered and welded corners.
   d. Flanges for attaching to walls and flangeless frames for installing in ducts.
6. Blades:
   a. Multiple or single blade.
   b. Parallel- or opposed-blade design.
   c. Stiffen damper blades for stability.
   d. Galvanized, roll-formed steel, 0.064 inch thick.
7. Blade Axles: Stainless steel.
8. Bearings:
   a. Molded synthetic.
   b. Dampers in ducts with pressure classes of 3-inch wg or less shall have axles full length of damper blades and bearings at both ends of operating shaft.
9. Blade Seals: Neoprene.
10. Jamb Seals: Cambered stainless steel.
11. Tie Bars and Brackets: Galvanized steel.
12. Accessories:
    a. Include locking device to hold single-blade dampers in a fixed position without vibration.

2.5 CONTROL DAMPERS

A. Basis-of-Design Product: Subject to compliance with requirements, provide product indicated on Drawings or comparable product by one of the following:
1. American Warming and Ventilating; a division of Mestek, Inc.
2. Arrow United Industries; a division of Mestek, Inc.
3. Cesco Products; a division of Mestek, Inc.
4. Greenheck Fan Corporation.
5. McGill AirFlow LLC.
6. Metal Form Manufacturing, Inc.
7. Nailor Industries Inc.
8. NCA Manufacturing, Inc.
9. Pottorff.
10. Ruskin Company.
11. Vent Products Company, Inc.
12. Young Regulator Company.

B. Low-leakage rating, with linkage outside airstream, and bearing AMCA's Certified Ratings Seal for both air performance and air leakage.

C. Frames:
1. Hat shaped.
2. 0.094-inch- thick, galvanized sheet steel.
3. Mitered and welded corners.

D. Blades:
1. Multiple blade with maximum blade width of 6 inches.
2. Opposed-blade design.
3. Aluminum.

4. 0.0747-inch- thick dual skin.
5. Blade Edging: PVC.
6. Blade Edging: Inflatable seal blade edging, or replaceable rubber seals.

E. Blade Axles: 1/2-inch- diameter; stainless steel; blade-linkage hardware of zinc-plated steel and brass; ends sealed against blade bearings.
1. Operating Temperature Range: From minus 40 to plus 200 deg F.

F. Bearings:
1. Oil-impregnated stainless-steel sleeve.
2. Dampers in ducts with pressure classes of 3-inch wg or less shall have axles full length of damper blades and bearings at both ends of operating shaft.
3. Thrust bearings at each end of every blade.

2.6 FIRE DAMPERS

A. Basis-of-Design Product: Subject to compliance with requirements, product by one of the following:
1. Air Balance Inc.; a division of Mestek, Inc.
2. Arrow United Industries; a division of Mestek, Inc.
3. Nailor Industries Inc.
4. Pottorff.
5. Prefco; Perfect Air Control, Inc.
6. Ruskin Company.
7. Vent Products Company, Inc.

B. Type: Dynamic; rated and labeled according to UL 555 by an NRTL.

C. Closing rating in ducts up to 6-inch wg static pressure class and minimum 2500-fpm velocity.

D. Fire Rating: 1-1/2 hours.

E. Frame: Curtain type with blades outside airstream except when located behind grille where blades may be inside airstream; fabricated with roll-formed, 0.034-inch- thick galvanized steel; with mitered and interlocking corners.

F. Mounting Sleeve: Factory-installed, galvanized sheet steel.
1. Minimum Thickness: 0.138 inch thick, as indicated, and of length to suit application.
2. Exception: Omit sleeve where damper-frame width permits direct attachment of perimeter mounting angles on each side of wall or floor; thickness of damper frame must comply with sleeve requirements.

G. Mounting Orientation: Vertical or horizontal as indicated.

H. Blades: Roll-formed, interlocking, 0.034-inch- thick, galvanized sheet steel. In place of interlocking blades, use full-length, 0.034-inch- thick, galvanized-steel blade connectors.

I. Horizontal Dampers: Include blade lock and stainless-steel closure spring.

J. Heat-Responsive Device: Replaceable, 165 deg F rated, fusible links.

2.7 SMOKE DAMPERS

A. Basis-of-Design Product: Subject to compliance with requirements, product by one of the following:
   1. Air Balance Inc.; a division of Mestek, Inc.
   2. Cesco Products; a division of Mestek, Inc.
   3. Greenheck Fan Corporation.
   4. Nailor Industries Inc.
   5. Pottorff.
   6. Ruskin Company.

B. General Requirements: Label according to UL 555S by an NRTL.

C. Smoke Detector: Integral, factory wired for single-point connection.

D. Frame: Hat-shaped, 0.094-inch- thick, galvanized sheet steel, with welded corners and mounting flange.

E. Blades: Roll-formed, horizontal, overlapping, 0.063-inch- thick, galvanized sheet steel.

F. Leakage: Class II.

G. Rated pressure and velocity to exceed design airflow conditions.

H. Mounting Sleeve: Factory-installed, 0.05-inch- thick, galvanized sheet steel; length to suit wall or floor application with factory-furnished silicone calking.

I. Damper Motors: 24 volt, two-position action.

J. Comply with NEMA designation, temperature rating, service factor, enclosure type, and efficiency requirements for motors specified in Division 23 Section "Common Motor Requirements for HVAC Equipment."
   1. Motor Sizes: Minimum size as indicated. If not indicated, large enough so driven load will not require motor to operate in service factor range above 1.0.
   2. Controllers, Electrical Devices, and Wiring: Comply with requirements for electrical devices and connections specified in Division 23 Section "Instrumentation and Control for HVAC."
   3. Permanent-Split-Capacitor or Shaded-Pole Motors: With oil-immersed and sealed gear trains.
   4. Spring-Return Motors: Equip with an integral spiral-spring mechanism where indicated. Enclose entire spring mechanism in a removable housing designed for service or adjustments. Size for running torque rating of 150 in. x lbf and breakaway torque rating of 150 in. x lbf.
   5. Outdoor Motors and Motors in Outdoor-Air Intakes: Equip with O-ring gaskets designed to make motors weatherproof. Equip motors with internal heaters to permit normal operation at minus 40 deg F.
   6. Nonspring-Return Motors: For dampers larger than 25 sq. ft., size motor for running torque rating of 150 in. x lbf and breakaway torque rating of 300 in. x lbf.
   7. Electrical Connection: 24 Volt, single phase, 60 Hz.

K. Accessories:
   1. Auxiliary switches for signaling and position indication.
   2. Test and reset switches, damper or remote mounted.

2.8 COMBINATION FIRE AND SMOKE DAMPERS

A. Basis-of-Design Product: Subject to compliance with requirements, product by one of the following:

1. Air Balance Inc.; a division of Mestek, Inc.
2. Cesco Products; a division of Mestek, Inc.
3. Greenheck Fan Corporation.
4. Nailor Industries Inc.
5. Pottorff.
6. Ruskin Company.

B. Type: Dynamic; rated and labeled according to UL 555 and UL 555S by an NRTL.

C. Closing rating in ducts up to 6-inch wg static pressure class and minimum 2500-fpm velocity.

D. Fire Rating: 1-1/2 hours.

E. Frame: Hat-shaped, 0.094-inch- thick, galvanized sheet steel, with welded corners and mounting flange.

F. Heat-Responsive Device: Replaceable, 165 deg F rated, fusible links.

G. Smoke Detector: Integral, factory wired for single-point connection.

H. Blades: Roll-formed, horizontal, overlapping, 0.034-inch- thick, galvanized sheet steel.

I. Leakage: Class II.

J. Rated pressure and velocity to exceed design airflow conditions.

K. Mounting Sleeve: Factory-installed, 0.05-inch- thick, galvanized sheet steel; length to suit wall or floor application with factory-furnished silicone calking.

L. Damper Motors: 24 volt, two-position action.

M. Comply with NEMA designation, temperature rating, service factor, enclosure type, and efficiency requirements for motors specified in Section 230513 "Common Motor Requirements for HVAC Equipment."
1. Motor Sizes: Minimum size as indicated. If not indicated, large enough so driven load will not require motor to operate in service factor range above 1.0.
2. Controllers, Electrical Devices, and Wiring: Comply with requirements for electrical devices and connections specified in Division 23 Section "Instrumentation and Control for HVAC." Section ".
3. Permanent-Split-Capacitor or Shaded-Pole Motors: With oil-immersed and sealed gear trains.
4. Spring-Return Motors: Equip with an integral spiral-spring mechanism where indicated. Enclose entire spring mechanism in a removable housing designed for service or adjustments. Size for running torque rating of 150 in. x lbf and breakaway torque rating of 150 in. x lbf.
5. Outdoor Motors and Motors in Outdoor-Air Intakes: Equip with O-ring gaskets designed to make motors weatherproof. Equip motors with internal heaters to permit normal operation at minus 40 deg F.
6. Nonspring-Return Motors: For dampers larger than 25 sq. ft., size motor for running torque rating of 150 in. x lbf and breakaway torque rating of 300 in. x lbf.
7. Electrical Connection: 24 V, single phase, 60 Hz.

N. Accessories:
1. Auxiliary switches for signaling and position indication.
2. Test and reset switches, damper or remote mounted.

2.9 FLANGE CONNECTORS

A. Basis-of-Design Product: Subject to compliance with requirements, product by one of the following:
   1. Ductmate Industries, Inc.
   2. Nexus PDQ; Division of Shilco Holdings Inc.
   3. Ward Industries, Inc.; a division of Hart & Cooley, Inc.

B. Description: Roll-formed, factory-fabricated, slide-on transverse flange connectors, gaskets, and components.

C. Material: Galvanized steel.

D. Gage and Shape: Match connecting ductwork.

2.10 DUCT SILENCERS

A. Basis-of-Design Product: Subject to compliance with requirements, product by one of the following:
   1. Rink.
   2. Industrial Noise Control, Inc.
   3. McGill AirFlow LLC.
   4. Ruskin Company.
   5. Vibro-Acoustics.
   6. Nailor

B. General Requirements:
   1. Factory fabricated.
   2. Fire-Performance Characteristics: Adhesives, sealants, packing materials, and accessory materials shall have flame-spread index not exceeding 25 and smoke-developed index not exceeding 50 when tested according to ASTM E 84.
   3. Airstream Surfaces: Surfaces in contact with the airstream shall comply with requirements in ASHRAE 62.1.

C. Shape:
   1. Rectangular straight with splitters or baffles.
   2. Rectangular elbow with splitters or baffles.
   3. Rectangular transitional with splitters or baffles.

D. Rectangular Silencer Outer Casing: ASTM A 653/A 653M, G90, galvanized sheet steel, 0.040 inch thick.

E. Inner Casing and Baffles: ASTM A 653/A 653M, G90 galvanized sheet metal, 0.034 inch thick, and with 1/8-inch- diameter perforations.

F. Special Construction:
   1. High transmission loss to achieve STC 45.

G. Connection Sizes: Match connecting ductwork unless otherwise indicated.

H. Principal Sound-Absorbing Mechanism:
   1. Controlled impedance membranes and broadly tuned resonators without absorptive media.
   2. Film-lined type with fill material.

a. Fill Material: Inert and vermin-proof fibrous material, packed under not less than 15 percent compression.
b. Erosion Barrier: Polymer bag enclosing fill, and heat sealed before assembly.

3. Lining: Tedlar.

I. Fabricate silencers to form rigid units that will not pulsate, vibrate, rattle, or otherwise react to system pressure variations. Do not use mechanical fasteners for unit assemblies.
1. Joints: Continuously welded or flanged connections.
2. Suspended Units: Factory-installed suspension hooks or lugs attached to frame in quantities and spaced to prevent deflection or distortion.
3. Reinforcement: Cross or trapeze angles for rigid suspension.

J. Accessories:
1. Factory-installed end caps to prevent contamination during shipping.
2. Removable splitters.
3. Airflow measuring devices.

K. Source Quality Control: Test according to ASTM E 477.
1. Record acoustic ratings, including dynamic insertion loss and generated-noise power levels with an airflow of at least 2000-fpm face velocity.
2. Leak Test: Test units for airtightness at 200 percent of associated fan static pressure or 6-inch wg static pressure, whichever is greater.

L. Capacities and Characteristics:
1. Configuration: Straight and 90-degree elbow as shown on plans.

2.11 TURNING VANES

A. Basis-of-Design Product: Subject to compliance with requirements, product by one of the following:
1. Ductmate Industries, Inc.
2. Duro Dyne Inc.
3. Elgen Manufacturing.
4. METALAIRE, Inc.
5. SEMCO Incorporated.
6. Ward Industries, Inc.; a division of Hart & Cooley, Inc.

B. Manufactured Turning Vanes for Metal Ducts: Curved blades of galvanized sheet steel; support with bars perpendicular to blades set; set into vane runners suitable for duct mounting.
1. Acoustic Turning Vanes: Fabricate airfoil-shaped aluminum extrusions with perforated faces and fibrous-glass fill.

C. General Requirements: Comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible"; Figures 4-3, "Vanes and Vane Runners," and 4-4, "Vane Support in Elbows."

D. Vane Construction: Single or Double wall.

E. Vane Construction: Single wall for ducts up to 24 inches wide and double wall for larger dimensions.

2.12 REMOTE DAMPER OPERATORS

A. Basis-of-Design Product: Subject to compliance with requirements, provide product by one of the following:
   1. Pottorff.
   2. Ventfabrics, Inc.
   3. Young Regulator Company.

B. Description: Cable system designed for remote manual damper adjustment.

C. Tubing: Copper.

D. Cable: Stainless steel.

E. Wall-Box Mounting: Recessed.

F. Wall-Box Cover-Plate Material: Steel.

2.13 DUCT-MOUNTED ACCESS DOORS

A. Basis-of-Design Product: Subject to compliance with requirements, provide product by one of the following:
   1. American Warming and Ventilating; a division of Mestek, Inc.
   2. Ductmate Industries, Inc.
   3. Elgen Manufacturing.
   4. Flexmaster U.S.A., Inc.
   5. Greenheck Fan Corporation.
   6. McGill AirFlow LLC.
   7. Nailor Industries Inc.
   8. Pottorff.
   9. Ventfabrics, Inc.

B. Duct-Mounted Access Doors: Fabricate access panels according to SMACNA's "HVAC Duct Construction Standards - Metal and Flexible"; Figures 7-2, "Duct Access Doors and Panels," and 7-3, "Access Doors - Round Duct."
   1. Door:
      a. Double wall, rectangular.
      b. Galvanized sheet metal with insulation fill and thickness as indicated for duct pressure class.
      c. Vision panel.
      d. Hinges and Latches: 1-by-1-inchbutt or piano hinge and cam latches.
      e. Fabricate doors airtight and suitable for duct pressure class.
   2. Frame: Galvanized sheet steel, with bend-over tabs and foam gaskets.
   3. Number of Hinges and Locks:
      a. Access Doors Less Than 12 Inches Square: No hinges and two sash locks.
      b. Access Doors up to 18 Inches Square: Continuous and two sash locks.
      c. Access Doors up to 24 by 48 Inches: Continuous and two compression latches with outside.
      d. Access Doors Larger Than 24 by 48 Inches: Continuous and two compression latches with outside and inside handles.

C. Pressure Relief Access Door:
   1. Door and Frame Material: Galvanized sheet steel.

2. Door: Double wall with insulation fill with metal thickness applicable for duct pressure class.
3. Operation: Open outward for positive-pressure ducts and inward for negative-pressure ducts.
4. Factory set at 3.0- to 8.0-inch wg.
5. Doors close when pressures are within set-point range.
6. Hinge: Continuous piano.
7. Latches: Cam.
8. Seal: Neoprene or foam rubber.
9. Insulation Fill: 1-inch- thick, fibrous-glass or polystyrene-foam board.

2.14 DUCT ACCESS PANEL ASSEMBLIES

A. Basis-of-Design Product: Subject to compliance with requirements, provide product by one of the following:
1. Ductmate Industries, Inc.
2. Flame Gard, Inc.
3. 3M.

B. Labeled according to UL 1978 by an NRTL.

C. Panel and Frame: Minimum thickness 0.0528-inch carbon steel.

D. Fasteners: Carbon steel. Panel fasteners shall not penetrate duct wall.

E. Gasket: Comply with NFPA 96; grease-tight, high-temperature ceramic fiber, rated for minimum 2000 deg F.

F. Minimum Pressure Rating: 10-inch wg, positive or negative.

2.15 FLEXIBLE CONNECTORS

A. Basis-of-Design Product: Subject to compliance with requirements, provide product by one of the following:
1. Ductmate Industries, Inc.
2. Duro Dyne Inc.
3. Elgen Manufacturing.
4. Ventfabrics, Inc.

B. Materials: Flame-retardant or noncombustible fabrics.

C. Coatings and Adhesives: Comply with UL 181, Class 1.

D. Metal-Edged Connectors: Factory fabricated with a fabric strip 3-1/2 inches wide attached to two strips of 2-3/4-inch wide, 0.028-inch thick, galvanized sheet steel or 0.032-inch thick aluminum sheets. Provide metal compatible with connected ducts.

E. Indoor System, Flexible Connector Fabric: Glass fabric double coated with neoprene.
1. Minimum Weight: 26 oz./sq. yd..
2. Tensile Strength: 480 lbf/inch in the warp and 360 lbf/inch in the filling.
3. Service Temperature: Minus 40 to plus 200 deg F.

F. Outdoor System, Flexible Connector Fabric: Glass fabric double coated with weatherproof, synthetic rubber resistant to UV rays and ozone.
   1. Minimum Weight: 24 oz./sq. yd..
   2. Tensile Strength: 530 lbf/inch in the warp and 440 lbf/inch in the filling.
   3. Service Temperature: Minus 50 to plus 250 deg F.

G. Thrust Limits: Combination coil spring and elastomeric insert with spring and insert in compression, and with a load stop. Include rod and angle-iron brackets for attaching to fan discharge and duct.

2.16 FLEXIBLE DUCTS

A. Basis-of-Design Product: Subject to compliance with requirements, provide product by one of the following:
   1. Flexmaster U.S.A., Inc.
   2. McGill AirFlow LLC.
   3. Ward Industries, Inc.; a division of Hart & Cooley, Inc.

B. Noninsulated, Flexible Duct: UL 181, Class 1, aluminum laminate and polyester film with latex adhesive supported by helically wound, spring-steel wire.
   1. Pressure Rating: 10-inch wg positive and 1.0-inch wg negative.
   2. Maximum Air Velocity: 4000 fpm.
   3. Temperature Range: Minus 20 to plus 210 deg F.

C. Insulated, Flexible Duct: UL 181, Class 1, black polymer film supported by helically wound, spring-steel wire; fibrous-glass insulation; aluminized vapor-barrier film.
   1. Pressure Rating: 4-inch wg positive and 0.5-inch wg negative.
   2. Maximum Air Velocity: 4000 fpm.
   3. Temperature Range: Minus 20 to plus 175 deg F.
   4. Insulation R-Value: Comply with ASHRAE/IESNA 90.1.

D. Flexible Duct Connectors:
   1. Clamps: Stainless-steel band with cadmium-plated hex screw to tighten band with a worm-gear action and adhesive in sizes 3 through 18 inches, to suit duct size.

2.17 DUCT ACCESSORY HARDWARE

A. Instrument Test Holes: Cast iron or cast aluminum to suit duct material, including screw cap and gasket. Size to allow insertion of pitot tube and other testing instruments and of length to suit duct-insulation thickness.

B. Adhesives: High strength, quick setting, neoprene based, waterproof, and resistant to gasoline and grease.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Install duct accessories according to applicable details in SMACNA's "HVAC Duct Construction Standards - Metal and Flexible" for metal ducts and in NAIMA AH116, "Fibrous Glass Duct Construction Standards," for fibrous-glass ducts.

B. Install duct accessories of materials suited to duct materials; use galvanized-steel accessories in galvanized-steel and fibrous-glass ducts, stainless-steel accessories in stainless-steel ducts, and aluminum accessories in aluminum ducts.

C. Install backdraft dampers at inlet of exhaust fans or exhaust ducts as close as possible to exhaust fan unless otherwise indicated.

D. Install volume dampers at points on supply, return, and exhaust systems where branches extend from larger ducts. Where dampers are installed in ducts having duct liner, install dampers with hat channels of same depth as liner, and terminate liner with nosing at hat channel.
   1. Install steel volume dampers in steel ducts.
   2. Install aluminum volume dampers in aluminum ducts.

E. Set dampers to fully open position before testing, adjusting, and balancing.

F. Install test holes at fan inlets and outlets and elsewhere as indicated.

G. Install fire and smoke dampers according to UL listing.

H. Connect ducts to duct silencers rigidly.

I. Install duct access doors on sides of ducts to allow for inspecting, adjusting, and maintaining accessories and equipment at the following locations:
   1. On both sides of duct coils.
   2. Upstream and downstream from duct filters.
   3. At outdoor-air intakes and mixed-air plenums.
   4. At drain pans and seals.
   5. Downstream from manual volume dampers, control dampers, backdraft dampers, and equipment.
   6. Adjacent to and close enough to fire or smoke dampers, to reset or reinstall fusible links. Access doors for access to fire or smoke dampers having fusible links shall be pressure relief access doors and shall be outward operation for access doors installed upstream from dampers and inward operation for access doors installed downstream from dampers.
   7. At each change in direction and at maximum 50-foot spacing.
   8. Upstream from turning vanes.
   9. Upstream or downstream from duct silencers.
   10. Control devices requiring inspection.
   11. Elsewhere as indicated.

J. Install access doors with swing against duct static pressure.

K. Access Door Sizes:

   1. One-Hand or Inspection Access: 8 by 5 inches.
   2. Two-Hand Access: 12 by 6 inches.

3. Head and Hand Access: 18 by 10 inches.
4. Head and Shoulders Access: 21 by 14 inches.
5. Body Access: 25 by 14 inches.
6. Body plus Ladder Access: 25 by 17 inches.

L. Label access doors according to Division 23 Section "Identification for HVAC Piping and Equipment" to indicate the purpose of access door.

M. Install flexible connectors to connect ducts to equipment.

N. For fans developing static pressures of 5-inch wg and more, cover flexible connectors with loaded vinyl sheet held in place with metal straps.

O. Connect terminal units to supply ducts with maximum 36-inch lengths of flexible duct. Do not use flexible ducts to change directions.

P. Connect diffusers or light troffer boots to ducts with maximum 60-inch lengths of flexible duct clamped or strapped in place.

Q. Connect flexible ducts to metal ducts with clamps.

R. Install duct test holes where required for testing and balancing purposes.

S. Install thrust limits at centerline of thrust, symmetrical on both sides of equipment. Attach thrust limits at centerline of thrust and adjust to a maximum of 1/4-inch movement during start and stop of fans.

3.2 FIELD QUALITY CONTROL

A. Tests and Inspections:
1. Operate dampers to verify full range of movement.
2. Inspect locations of access doors and verify that purpose of access door can be performed.
3. Operate fire, smoke, and combination fire and smoke dampers to verify full range of movement and verify that proper heat-response device is installed.
4. Inspect turning vanes for proper and secure installation.
5. Operate remote damper operators to verify full range of movement of operator and damper.

END OF SECTION 233300

N:\N0912.00\DOC\SPEC\2012_03-16_BID\233300 FL - AIR DUCT ACCESSORIES.DOC

SECTION 233413 - AXIAL HVAC FANS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. This Section includes the following:
   1. Mixed-flow fans.

1.3 PERFORMANCE REQUIREMENTS

A. Project Altitude: Base fan performance ratings on [**actual Project site elevations above**] sea level.

B. Operating Limits: Classify according to AMCA 99.

1.4 SUBMITTALS

A. Product Data: Include rated capacities, furnished specialties, and accessories for each type of product indicated and include the following:
   1. Certified fan performance curves with system operating conditions indicated.
   2. Certified fan sound-power ratings.
   3. Motor ratings and electrical characteristics, plus motor and electrical accessories.
   4. Material thickness and finishes, including color charts.
   5. Dampers, including housings, linkages, and operators.
   6. Fan speed controllers.

B. Shop Drawings: Detail equipment assemblies and indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.
   1. Wiring Diagrams: Power, signal, and control wiring.
   2. Design Calculations: Calculate requirements for selecting vibration isolators and seismic restraints and for designing vibration isolation bases.
   3. Vibration Isolation Base Details: Detail fabrication, including anchorages and attachments to structure and to supported equipment. Include auxiliary motor slides and rails, and base weights.

C. Coordination Drawings: Show fan room layout and relationships between components and adjacent structural and mechanical elements. Show support locations, type of support, and weight on each support. Indicate and certify field measurements.

D. Field quality-control test reports.

E. Operation and Maintenance Data: For axial fans to include in emergency, operation, and maintenance manuals.

1.5 QUALITY ASSURANCE

A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.

B. AMCA Compliance: Products shall comply with performance requirements and shall be licensed to use the AMCA-Certified Ratings Seal.

C. NEMA Compliance: Motors and electrical accessories shall comply with NEMA standards.

1.6 DELIVERY, STORAGE, AND HANDLING

A. Deliver fans as factory-assembled units, to the extent allowable by shipping limitations, with protective crating and covering.

B. Disassemble and reassemble units, as required for moving to final locations, according to manufacturer's written instructions.

C. Lift and support units with manufacturer's designated lifting or supporting points.

1.7 COORDINATION

A. Coordinate size and location of structural-steel support members.

B. Coordinate size and location of concrete bases. Cast anchor-bolt inserts into bases. Concrete, reinforcement, and formwork requirements are specified in Division 03.

C. Coordinate installation of roof curbs, equipment supports, and roof penetrations. These items are specified in Division 07 Section "Roof Accessories."

1.8 EXTRA MATERIALS

A. Furnish extra materials described below that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.
   1. Belts: One set for each belt-driven unit.

PART 2 - PRODUCTS

2.1 MIXED-FLOW FANS

A. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

B. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   1. Loren Cook Company.
   2. Greenheck.
   3. New Philadelphia Fan Co.

C. Description: In-line, direct-driven centrifugal fans consisting of housing, wheel, outlet guide vanes, fan shaft, bearings, motor and disconnect switch, drive assembly, mounting brackets, and accessories.

D. General:
1. Base fan performance at standard conditions (density 0.075 Lb/ft^3).
2. Fans selected shall be capable of accommodating static pressure and flow variations of +/-15% of scheduled values.
3. Each fan shall be direct drive in AMCA arrangement 4 according to drawings.
4. Fans are to be equipped with lifting lugs.
5. After fabrication all carbon steel components shall be cleaned and chemically treated by a phosphatizing process to insure proper removal of grease, oil, scale, etc. Fan shall then be coated with a minimum of 2-4 mils of Permatector (Polyester Urethane), electrostatically applied and baked. Finish color shall be industrial gray. Coating must exceed 1,000-hour salt spray under ASTM B117 test method.

E. Fan Housing and Outlet.
1. Fan housing to be aerodynamically designed with high-efficiency inlet, engineered to reduce incoming air turbulence.
2. Tubular fan housing shall be completely welded and coated with a minimum of 2-4 mils of Permatector (Polyester Urethane), electrostatically applied and baked. Finish color shall be gray. No uncoated metal fan parts will be allowed.
3. Housing shall be constructed of welded structural steel members to prevent vibration and rigidly support the shaft and bearings.
4. All mixed flow housings shall include welded steel vanes to straighten airflow prior to exiting the fan discharge.
5. Units shall incorporate a universal mounting system that allows the fan to be mounted in either vertical or horizontal configurations and field rotation of the motor position in 90 degree increments. Units shall allow for field rotation of motor positions. Units shall accommodate base mount or ceiling hung mounting without structural modifications to the fan.
6. An access door shall be supplied for impeller inspection and service.

F. Fan Impeller.
1. Fan impeller shall be mixed flow design. The impeller shall be electronically balanced both statically and dynamically to balance grade G6.3 per ANSI S2.19.
2. Fan impeller shall be manufactured with continuously welded steel airfoils and coated with a minimum of 2-4 mils of Permatector (Polyester Urethane), electrostatically applied and baked. Finish color shall be industrial gray
3. The wheel and fan inlet shall be carefully matched and shall have precise running tolerances for maximum performance and operating efficiency.

G. Fan Motors and Drive.
1. Motors shall meet or exceed EPACT (Energy Policy ACT) efficiencies. Motors to be NEMA T-frame, 870, 1170 or 1770 in 60 Hz (720, 950, 720 in 50 Hz), Open Drip Proof (ODP) or Totally Enclosed Fan Cooled (TEFC) with a 1.15 service factor.

H. Accessories:
1. Companion Flanges: For inlet and outlet duct connections..

2.2 SOURCE QUALITY CONTROL

A. Sound-Power Level Ratings: Comply with AMCA 301, "Methods for Calculating Fan Sound Ratings from Laboratory Test Data." Factory test fans according to AMCA 300, "Reverberant Room Method for Sound Testing of Fans." Label fans with the AMCA-Certified Ratings Seal.

B. Fan Performance Ratings: Establish flow rate, pressure, power, air density, speed of rotation, and efficiency by factory tests and ratings according to AMCA 210, "Laboratory Methods of Testing Fans for Rating."

PART 3 - EXECUTION

3.1 INSTALLATION

A. Install axial fans level and plumb.

B. Support floor-mounting units using spring isolators and inertia base having a static deflection of 2 inch. Vibration- control devices are specified in Division 23 Section "Vibration Controls for HVAC Piping and Equipment."
   1. Secure vibration and seismic controls to concrete bases using anchor bolts cast in concrete base.

C. Install floor-mounting units on concrete bases. Concrete, reinforcement, and formwork requirements are specified in Division 03 Section "Cast-in-Place Concrete."

D. Install floor-mounting units on concrete bases designed to withstand, without damage to equipment, the seismic force required by authorities having jurisdiction. Concrete, reinforcement, and formwork requirements are specified in Division 03 Section "Cast-in-Place Concrete."

E. Support suspended units from structure using threaded steel rods and spring hangers having a static deflection of 1 inch. Vibration-control devices are specified in Division 23 Section "Vibration Controls for HVAC Piping and Equipment."

F. Install units with clearances for service and maintenance.

G. Label fans according to requirements specified in Division 23 Section "Identification for HVAC Piping and Equipment."

3.2 CONNECTIONS

A. Duct installation and connection requirements are specified in other Division 23 Sections. Drawings indicate general arrangement of ducts and duct accessories. Make final duct connections with flexible connectors. Flexible connectors are specified in Division 23 Section "Air Duct Accessories."

B. Ground equipment according to Division 26 Section "Grounding and Bonding for Electrical Systems."

C. Connect wiring according to Division 26 Section "Low-Voltage Electrical Power Conductors and Cables."

3.3 FIELD QUALITY CONTROL

A. Perform the following field tests and inspections and prepare test reports:
   1. Verify that shipping, blocking, and bracing are removed.
   2. Verify that unit is secure on mountings and supporting devices and that connections to ducts and electrical components are complete. Verify that proper thermal-overload protection is installed in motors, starters, and disconnect switches.

3. Verify that cleaning and adjusting are complete.
4. Disconnect fan drive from motor, verify proper motor rotation direction, and verify fan wheel free rotation and smooth bearing operation. Reconnect fan drive system, align and adjust belts, and install belt guards.
5. Adjust belt tension.
6. Adjust damper linkages for proper damper operation.
7. Verify lubrication for bearings and other moving parts.
8. Verify that manual and automatic volume control and fire and smoke dampers in connected ductwork systems are in fully open position.
9. Disable automatic temperature-control operators, energize motor and confirm proper motor rotation and unit operation, adjust fan to indicated rpm, and measure and record motor voltage and amperage.
10. Shut unit down and reconnect automatic temperature-control operators.
11. Remove and replace malfunctioning units and retest as specified above.

B. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.

3.4 ADJUSTING

A. Adjust damper linkages for proper damper operation.

B. Adjust belt tension.

C. Lubricate bearings.

END OF SECTION 233413

N:\N0912.00\DOC\SPEC\2012_03-16_BID\233413 - AXIAL HVAC FANS.DOC

SECTION 233416- CENTRIFUGAL HVAC FANS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes: For each product.
   1. Airfoil centrifugal fans.

1.3 ACTION SUBMITTALS

A. Product Data:
   1. Include rated capacities, furnished specialties, and accessories for each fan.
   2. Certified fan performance curves with system operating conditions indicated.
   3. Certified fan sound-power ratings.
   4. Motor ratings and electrical characteristics, plus motor and electrical accessories.
   5. Material thickness and finishes, including color charts.
   6. Dampers, including housings, linkages, and operators.

B. Shop Drawings:
   1. Include plans, elevations, sections, and attachment details.
   2. Include details of equipment assemblies. Indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.
   3. Include diagrams for power, signal, and control wiring.
   4. Design Calculations: Calculate requirements for selecting vibration isolators and seismic restraints and for designing vibration isolation bases.
   5. Vibration Isolation Base Details: Detail fabrication, including anchorages and attachments to structure and to supported equipment. Include auxiliary motor slides and rails, and base weights.

1.4 INFORMATIONAL SUBMITTALS

A. Coordination Drawings: Show fan room layout and relationships between components and adjacent structural and mechanical elements. Show support locations, type of support, and weight on each support. Indicate and certify field measurements.

B. Field quality-control reports.

1.5 CLOSEOUT SUBMITTALS

A. Operation and Maintenance Data: For centrifugal fans to include in emergency, operation, and maintenance manuals.

1.6 MAINTENANCE MATERIAL SUBMITTALS

A. Belts: One set(s) for each belt-driven unit.

PART 2 - PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

A. AMCA Compliance:
1. Comply with AMCA performance requirements and bear the AMCA-Certified Ratings Seal.
2. Operating Limits: Classify according to AMCA 99.

B. Unusual Service Conditions:
1. Ambient Temperature: 70°F.
2. Altitude: 2000 feet above sea level.

C. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

D. Capacities and Characteristics: See plans.

2.2 AIRFOIL CENTRIFUGAL FANS

A. Basis-of-Design Product: Subject to compliance with requirements, provide product indicated on Drawings or comparable product by one of the following:
1. Acme Engineering & Mfg. Corp.
2. Chicago Blower Corporation.
3. Greenheck.
4. Penn Ventilation.
5. Loren Cook Company.
6. New York Blower Company (The).
7. Twin City Blower.

B. Description:
1. Factory-fabricated, -assembled, -tested, and -finished, belt-driven centrifugal fans consisting of housing, wheel, fan shaft, bearings, motor, drive assembly, and support structure.
2. Deliver fans as factory-assembled units, to the extent allowable by shipping limitations.
3. Factory-installed and -wired disconnect switch.

C. Housings:
1. Formed panels to make curved-scroll housings with shaped cutoff.
2. Panel Bracing: Steel angle- or channel-iron member supports for mounting and supporting fan scroll, wheel, motor, and accessories.
3. Horizontally split, bolted-flange housing.
4. Spun inlet cone with flange.
5. Outlet flange.

D. Airfoil Wheels:
1. Single-width-single-inlet construction with curved inlet flange.
2. Heavy backplate.

3. Hollow die-formed, airfoil-shaped blades continuously welded at tip flange and backplate.
4. Cast-iron or cast-steel hub riveted to backplate and fastened to shaft with set screws.

E. Shafts:
1. Statically and dynamically balanced and selected for continuous operation at maximum rated fan speed and motor horsepower, with adjustable alignment and belt tensioning.
2. Turned, ground, and polished hot-rolled steel with keyway. Ship with protective coating of lubricating oil.
3. Designed to operate at no more than 70 percent of first critical speed at top of fan's speed range.

F. Prelubricated and Sealed Shaft Bearings:
1. Self-aligning, pillow-block-type bearings.
2. Ball-Bearing Rating Life: ABMA 9, Ll0 at 120,000 hours.
3. Roller-Bearing Rating Life: ABMA 11, Ll0 at 120,000 hours.

G. Belt Drives:
1. Factory mounted, with adjustable alignment and belt tensioning.
2. Service Factor Based on Fan Motor Size: 1.5.
3. Fan Pulleys: Cast iron or cast steel with split, tapered bushing; dynamically balanced at factory.
4. Motor Pulleys: Adjustable pitch for use with motors through 5 hp; fixed pitch for use with larger motors. Select pulley so pitch adjustment is at the middle of adjustment range at fan design conditions.
5. Belts: Oil resistant, nonsparking, and nonstatic; matched sets for multiple belt drives.
6. Belt Guards: Fabricate to comply with OSHA and SMACNA requirements of diamond-mesh wire screen welded to steel angle frame or equivalent, prime coated. Secure to fan or fan supports without short circuiting vibration isolation. Include provisions for adjustment of belt tension, lubrication, and use of tachometer with guard in place.
7. Motor Mount: Adjustable for belt tensioning.

H. Accessories:
1. Access for Inspection, Cleaning, and Maintenance: Comply with requirements in ASHRAE 62.1.
2. Scroll Drain Connection: NPS 1 steel pipe coupling welded to low point of fan scroll.
3. Companion Flanges: Rolled flanges for duct connections of same material as housing.
4. Variable Inlet Vanes: With blades supported at both ends with two permanently lubricated bearings of same material as housing. Variable mechanism terminating in single control lever with control shaft for double-width fans.
5. Discharge Dampers: Assembly with parallel blades constructed of two plates formed around and to shaft, channel frame, and sealed ball bearings; with blades linked outside of airstream to single control lever of same material as housing.
6. Inlet Screens: Grid screen of same material as housing.
7. Shaft Cooler: Metal disk between bearings and fan wheel, designed to dissipate heat from shaft.
8. Spark-Resistant Construction: AMCA 99.
9. Shaft Seals: Airtight seals installed around shaft on drive side of single-width fans.
10. Weather Cover: Enameled-steel sheet with ventilation slots, bolted to housing.

2.3 MOTORS

A. Comply with NEMA designation, temperature rating, service factor, and efficiency requirements for motors specified in Section 230513 "Common Motor Requirements for HVAC Equipment."

B. Premium efficiency, class F insulation, designed for inverter duty.

2.4 SOURCE QUALITY CONTROL

A. Sound-Power Level Ratings: Comply with AMCA 301, "Methods for Calculating Fan Sound Ratings from Laboratory Test Data." Factory test fans according to AMCA 300, "Reverberant Room Method for Sound Testing of Fans." Label fans with the AMCA-Certified Ratings Seal.

B. Fan Performance Ratings: Establish flow rate, pressure, power, air density, speed of rotation, and efficiency by factory tests and ratings according to AMCA 210/ASHRAE 51, "Laboratory Methods of Testing Fans for Certified Aerodynamic Performance Rating."

PART 3 - EXECUTION

3.1 INSTALLATION

A. Install centrifugal fans level and plumb.

B. Disassemble and reassemble units, as required for moving to the final location, according to manufacturer's written instructions.

C. Lift and support units with manufacturer's designated lifting or supporting points.

D. Equipment Mounting: Install centrifugal fans on cast-in-place concrete equipment base(s) using elastomeric pads and restrained spring isolators. Comply with requirements for equipment bases specified in Section 033000 "Cast-in-Place Concrete." Comply with requirements for vibration isolation devices specified in Section 230548 "Vibration and Seismic Controls for HVAC Piping and Equipment."
   1. Minimum Deflection: 1 inch.
   2. Coordinate sizes and locations of concrete bases with actual equipment provided. Cast anchor-bolt inserts into bases.
   3. Install dowel rods to connect concrete base to concrete floor. Unless otherwise indicated, install dowel rods on 18-inch centers around the full perimeter of concrete base.
   4. For supported equipment, install epoxy-coated anchor bolts that extend through concrete base, and anchor into structural concrete floor.
   5. Place and secure anchorage devices. Use setting drawings, templates, diagrams, instructions, and directions furnished with items to be embedded.
   6. Install anchor bolts to elevations required for proper attachment to supported equipment.
   7. Install on 4-inch- high concrete base.

E. Install units with clearances for service and maintenance.

F. Label fans according to requirements specified in Section 230553 "Identification for HVAC Piping and Equipment."

3.2 CONNECTIONS

A. Drawings indicate general arrangement of ducts and duct accessories. Make final duct connections with flexible connectors. Flexible connectors are specified in Section 233300 "Air Duct Accessories."

B. Install ducts adjacent to fans to allow service and maintenance.

C. Install piping from scroll drain connection, with trap with seal equal to 1.5 times specified static pressure, to nearest floor drain with pipe sizes matching the drain connection.

3.3 FIELD QUALITY CONTROL

A. Testing Agency: Engage a qualified testing agency to perform tests and inspections.

B. Manufacturer's Field Service: Engage a factory-authorized service representative to test and inspect components, assemblies, and equipment installations, including connections.

C. Perform the following tests and inspections:
1. Verify that shipping, blocking, and bracing are removed.
2. Verify that unit is secure on mountings and supporting devices and that connections to ducts and electrical components are complete. Verify that proper thermal-overload protection is installed in motors, starters, and disconnect switches.
3. Verify that cleaning and adjusting are complete.
4. Disconnect fan drive from motor, verify proper motor rotation direction, and verify fan wheel free rotation and smooth bearing operation. Reconnect fan drive system, align and adjust belts, and install belt guards.
5. Adjust belt tension.
6. Adjust damper linkages for proper damper operation.
7. Verify lubrication for bearings and other moving parts.
8. Verify that manual and automatic volume control and fire and smoke dampers in connected ductwork systems are in fully open position.
9. See Section 230593 "Testing, Adjusting, and Balancing For HVAC" for testing, adjusting, and balancing procedures.
10. Remove and replace malfunctioning units and retest as specified above.

D. Test and adjust controls and safeties. Controls and equipment will be considered defective if they do not pass tests and inspections.

E. Prepare test and inspection reports.

3.4 DEMONSTRATION

A. Train Owner's maintenance personnel to adjust, operate, and maintain centrifugal fans.

END OF SECTION 233416

N:\N0912.00\DOC\SPEC\2012_03-16_BID\233416 FL - CENTRIFUGAL HVAC FANS.DOC

SECTION 233423 – HVAC POWER VENTILATORS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

1.2 SUMMARY

A. This Section includes the following:
   1. Centrifugal roof ventilators.
   2. Mixed flow in-line centrifugal fans.
   3. Propeller fans.

1.3 PERFORMANCE REQUIREMENTS

A. Project Altitude: Base fan-performance ratings on sea level.

B. Operating Limits: Classify according to AMCA 99.

1.4 SUBMITTALS

A. Product Data: Include rated capacities, furnished specialties, and accessories for each type of product indicated and include the following:
   1. Certified fan performance curves with system operating conditions indicated.
   2. Certified fan sound-power ratings.
   3. Motor ratings and electrical characteristics, plus motor and electrical accessories.
   4. Material thickness and finishes, including color charts.
   5. Dampers, including housings, linkages, and operators.
   6. Roof curbs.
   7. Fan speed controllers.

B. Shop Drawings: Detail equipment assemblies and indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.
   1. Wiring Diagrams: Power, signal, and control wiring.

C. Field quality-control test reports.

D. Operation and Maintenance Data: For power ventilators to include in emergency, operation, and maintenance manuals.

1.5 QUALITY ASSURANCE

A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.

B. AMCA Compliance: Products shall comply with performance requirements and shall be licensed to use the AMCA-Certified Ratings Seal.

C. NEMA Compliance: Motors and electrical accessories shall comply with NEMA standards.

D. UL Standard: Power ventilators shall comply with UL 705.

1.6 DELIVERY, STORAGE, AND HANDLING

A. Deliver fans as factory-assembled unit, to the extent allowable by shipping limitations, with protective crating and covering.

B. Disassemble and reassemble units, as required for moving to final location, according to manufacturer's written instructions.

C. Lift and support units with manufacturer's designated lifting or supporting points.

1.7 COORDINATION

A. Coordinate size and location of structural-steel support members.

B. Coordinate installation of roof curbs, equipment supports, and roof penetrations. These items are specified in Division 7 Section "Roof Accessories."

PART 2 - PRODUCTS

2.1 CENTRIFUGAL ROOF VENTILATORS

A. Basis of Design Product: Subject to compliance with requirements, provide Greenheck, or a comparable product by one of the following:
   1. Loren Cook Company.
   2. New York Blower Company (The).
   3. Penn Ventilation.

B. Description: Direct- driven centrifugal fans consisting of housing, wheel, fan shaft, bearings, motor and disconnect switch, drive assembly, curb base, and accessories.

C. Housing: Removable, spun-aluminum, dome top and outlet baffle; square, one-piece, aluminum base with venturi inlet cone.
   1. Upblast Units: Provide spun-aluminum discharge baffle to direct discharge air upward, with rain and snow drains.
   2. Hinged Subbase: Galvanized-steel hinged arrangement permitting service and maintenance.

D. Fan Wheels: Aluminum hub and wheel with backward-inclined blades.

E. Direct-Driven Drive Assembly: Resiliently mounted to housing, with the following features:
1. Fan Shaft: Turned, ground, and polished steel; keyed to wheel hub.
2. Shaft Bearings: Permanently lubricated, permanently sealed, self-aligning ball bearings.

F. Accessories:
1. Disconnect Switch: Nonfusible type, with thermal-overload protection mounted outside fan housing, factory wired through an internal aluminum conduit.
2. Bird Screens: Removable, 1/2-inch mesh, aluminum wire.
3. Gravity Dampers: Counter balanced, parallel-blade, backdraft dampers mounted in curb base, factory set to close when fan stops.
4. Variable speed controller: Solid state control to reduce speed from 100 to less than 50 percent.

G. Roof Curbs: Galvanized steel; mitered and welded corners; 1-1/2-inch- thick, rigid, fiberglass insulation adhered to inside walls; and 1-1/2-inch wood nailer. Size as required to suit roof opening and fan base.
1. Configuration: Built-in cant and mounting flange.
2. Overall Height: 12 inches.
3. Sound Curb: Curb with sound-absorbing insulation matrix.
4. Pitch Mounting: Manufacture curb for roof slope.
5. Metal Liner: Galvanized steel.

H. Capacities and Characteristics: As scheduled on DWG. M702.

2.2 MIXED FLOW IN-LINE CENTRIFUGAL FANS

A. Basis of Design Product: Subject to compliance with requirements, provide products by one of the following:
1. Loren Cook Company.
2. New York Blower Company (The).
3. Penn Ventilation.

B. Description: In-line, direct-driven centrifugal fans consisting of housing, wheel, outlet guide vanes, fan shaft, bearings, motor and disconnect switch, drive assembly, mounting brackets, and accessories.

C. General:
1. Base fan performance at standard conditions (density 0.075 Lb/ft^3).
2. Fans selected shall be capable of accommodating static pressure and flow variations of +/-15% of scheduled values.
3. Each fan shall be direct drive in AMCA arrangement 4 according to drawings.
4. Fans are to be equipped with lifting lugs.
5. After fabrication all carbon steel components shall be cleaned and chemically treated by a phosphatizing process to insure proper removal of grease, oil, scale, etc. Fan shall then be coated with a minimum of 2-4 mils of Permatector (Polyester Urethane), electrostatically applied and baked. Finish color shall be industrial gray. Coating must exceed 1,000-hour salt spray under ASTM B117 test method.

D. Fan Housing and Outlet.
1. Fan housing to be aerodynamically designed with high-efficiency inlet, engineered to reduce incoming air turbulence.
2. Tubular fan housing shall be completely welded and coated with a minimum of 2-4 mils of Permatector (Polyester Urethane), electrostatically applied and baked. Finish color shall be gray. No uncoated metal fan parts will be allowed.

3. Housing shall be constructed of welded structural steel members to prevent vibration and rigidly support the shaft and bearings.
4. All mixed flow housings shall include welded steel vanes to straighten airflow prior to exiting the fan discharge.
5. Units shall incorporate a universal mounting system that allows the fan to be mounted in either vertical or horizontal configurations and field rotation of the motor position in 90 degree increments. Units size 30 and larger shall allow for field rotation of motor positions. Units shall accommodate base mount or ceiling hung mounting without structural modifications to the fan.
6. An access door shall be supplied for impeller inspection and service.

E. Fan Impeller.
1. Fan impeller shall be mixed flow design. The impeller shall be electronically balanced both statically and dynamically to balance grade G6.3 per ANSI S2.19.
2. Fan impeller shall be manufactured with continuously welded steel airfoils and coated with a minimum of 2-4 mils of Permatector (Polyester Urethane), electrostatically applied and baked. Finish color shall be industrial gray
3. The wheel and fan inlet shall be carefully matched and shall have precise running tolerances for maximum performance and operating efficiency.

F. Fan Motors and Drive.
1. Motors shall meet or exceed EPACT (Energy Policy ACT) efficiencies. Motors to be NEMA T-frame, 870, 1170 or 1770 in 60 Hz (720, 950, 720 in 50 Hz), Open Drip Proof (ODP) or Totally Enclosed Fan Cooled (TEFC) with a 1.15 service factor.

G. Accessories:
1. Companion Flanges: For inlet and outlet duct connections.

2.3 PROPELLER FANS

A. Basis of Design Product: Subject to compliance with requirements, provide Greenheck or camparable product by one of the following:
1. Loren Cook Company.
2. New York Blower Company (The).
3. Penn Ventilation.

B. Description: Direct-driven propeller fans consisting of fan blades, hub, housing, orifice ring, motor, drive assembly, and accessories.

C. Housing: Galvanized-steel sheet with flanged edges and integral orifice ring with baked-enamel finish coat applied after assembly.

D. Fan Wheel: Replaceable, cast-aluminum, airfoil blades fastened to cast-aluminum hub; factory set pitch angle of blades.

E. Direct-Driven Drive Assembly: Resiliently mounted to housing, statically and dynamically balanced and selected for continuous operation at maximum rated fan speed and motor horsepower, with final alignment made after installation.
1. Service Factor Based on Fan Motor Size: 1.4.
2. Fan Shaft: Turned, ground, and polished steel; keyed to wheel hub.
3. Shaft Bearings: Permanently lubricated, permanently sealed, self-aligning ball bearings.
a. Ball-Bearing Rating Life: ABMA 9, L_{10} of 100,000 hours.

F. Accessories:

1. Gravity Shutters: Aluminum blades in aluminum frame; interlocked blades with nylon bearings.
2. Motor-Side Back Guard: Galvanized steel, complying with OSHA specifications, removable for maintenance.
3. Wall housing flush with exterior and with OSHA guard.
4. Disconnect Switch: Nonfusible type, with thermal-overload protection mounted inside fan housing, factory wired through an internal aluminum conduit.
5. Variable speed controller: Solid state control to reduce speed from 100 to less than 50 percent.
6. Aluminum 45°degree weather hood with bird screen.

2.4 MOTORS

A. Comply with requirements in Division 15 Section "Motors."

B. Enclosure Type: Totally enclosed, fan cooled.

2.5 SOURCE QUALITY CONTROL

A. Sound-Power Level Ratings: Comply with AMCA 301, "Methods for Calculating Fan Sound Ratings from Laboratory Test Data." Factory test fans according to AMCA 300, "Reverberant Room Method for Sound Testing of Fans." Label fans with the AMCA-Certified Ratings Seal.

B. Fan Performance Ratings: Establish flow rate, pressure, power, air density, speed of rotation, and efficiency by factory tests and ratings according to AMCA 210, "Laboratory Methods of Testing Fans for Rating."

PART 3 - EXECUTION

3.1 INSTALLATION

A. Install power ventilators level and plumb.

B. Suspend or support units using isolators. Vibration- control devices are specified in Division 15 Section "Mechanical Vibration Control."

C. Secure roof-mounting fans to roof curbs with cadmium-plated hardware. Refer to Division 7 Section "Roof Accessories" for installation of roof curbs.

D. Install units with clearances for service and maintenance.

E. Label units according to requirements specified in Division 15 Section "Mechanical Identification."

3.2 CONNECTIONS

A. Duct installation and connection requirements are specified in other Division 15 Sections. Drawings indicate general arrangement of ducts and duct accessories. Make final duct connections with flexible connectors. Flexible connectors are specified in Division 15 Section "Duct Accessories."

B. Install ducts adjacent to power ventilators to allow service and maintenance.

C. Ground equipment according to Division 16 Section "Grounding and Bonding."

D. Connect wiring according to Division 16 Section "Conductors and Cables."

3.3 FIELD QUALITY CONTROL

A. Perform the following field tests and inspections and prepare test reports:
   1. Verify that shipping, blocking, and bracing are removed.
   2. Verify that unit is secure on mountings and supporting devices and that connections to ducts and electrical components are complete. Verify that proper thermal-overload protection is installed in motors, starters, and disconnect switches.
   3. Verify that cleaning and adjusting are complete.
   4. Disconnect fan drive from motor, verify proper motor rotation direction, and verify fan wheel free rotation and smooth bearing operation. Reconnect fan drive system.
   5. Adjust damper linkages for proper damper operation.
   6. Verify lubrication for bearings and other moving parts.
   7. Verify that manual and automatic volume control smoke dampers in connected ductwork systems are in fully open position.
   8. Disable automatic temperature-control operators, energize motor and adjust fan to indicated rpm, and measure and record motor voltage and amperage.
   9. Shut unit down and reconnect automatic temperature-control operators.
   10. Remove and replace malfunctioning units and retest as specified above.

B. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.

3.4 ADJUSTING

A. Adjust damper linkages for proper damper operation.

B. Refer to Division 15 Section "Testing, Adjusting, and Balancing" for testing, adjusting, and balancing procedures.

C. Replace fan as required to achieve design airflow.

D. Lubricate bearings.

END OF SECTION 233423

N:\N0912.00\DOC\SPEC\2012_03-16_BID\233423 - HVAC POWER VENTILATORS.DOC

SECTION 233600 - AIR TERMINAL UNITS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

1.2 SUMMARY

A. This Section includes the following:
   1. Shutoff single-duct air terminal units.

1.3 SUBMITTALS

A. Product Data: For each type of product indicated, include rated capacities, furnished specialties, sound-power ratings, and accessories.

B. Shop Drawings: Detail equipment assemblies and indicate dimensions, required clearances, method of field assembly, components, and location and size of each field connection.
   1. Include a schedule showing unique model designation, room location, model number, size, and accessories furnished.
   2. Wiring Diagrams: Power, signal, and control wiring.

C. Operation and Maintenance Data: For air terminal units to include in emergency, operation, and maintenance manuals. In addition to items specified in Division 1 include the following:
   1. Instructions for resetting minimum and maximum air volumes.
   2. Instructions for adjusting software set points.

1.4 QUALITY ASSURANCE

A. Product Options: Drawings indicate size, profiles, and dimensional requirements of air terminal units and are based on the specific system indicated. Refer to Division 1.

B. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.

C. NFPA Compliance: Install air terminal units according to NFPA 90A, "Standard for the Installation of Air Conditioning and Ventilating Systems."

PART 2 - PRODUCTS

2.1 SHUTOFF SINGLE-DUCT AIR TERMINAL UNITS

A. Basis of Design Product: Subject to compliance with requirements, provide Titus or a comparable product by one of the following:
   1. Nailor Industries of Texas Inc.
   2. Trane Co. (The); Worldwide Applied Systems Group.

B. Configuration: Volume-supply or exhaust damper assembly inside unit casing with control components located inside a protective metal shroud. Supply VAV terminals shall be specifically designed for supply applications, and exhaust air terminals for exhaust applications.

C. Casing:
   1. Casing Material:
      a. 0.034-inch steel, for all VAV supply and exhaust terminals except exhaust terminals serving Anatomy and Physiology laboratory #202.
      b. Exhaust terminals serving laboratory #202 shall have 316-stainless steel casing.
   2. Casing Lining: 1-inch- thick, coated, fibrous-glass duct liner complying with ASTM C 1071; secured with adhesive. Cover liner with nonporous foil.
   3. Air Inlet: Round stub connection or S-slip and drive connections for duct attachment.
   4. Air Outlet: S-slip and drive connections.
   5. Access: Removable panels for access to dampers and other parts requiring service, adjustment, or maintenance; with airtight gasket.

D. Regulator Assembly: Extruded-aluminum or galvanized-steel components; key damper blades onto shaft with nylon-fitted pivot points located inside unit casing.
   1. Automatic Flow-Control Assembly: Combined spring rates shall be matched for each volume-regulator size with machined dashpot for stable operation.
   2. Factory-calibrated and field-adjustable assembly with shaft extension for connection to externally mounted control actuator.

E. Volume Damper: Galvanized steel with peripheral gasket and self-lubricating bearings.
   1. Maximum Damper Leakage: ARI 880 rated, 2 percent of nominal airflow at 6-inch wg inlet static pressure.
   2. Damper Position: Refer to control sequences.

F. Hot-Water Heating Coil: Copper tube, mechanically expanded into aluminum-plate fins; leak tested underwater to 200 psig; and factory installed.

G. Electronic Controls: Bidirectional damper operator and microprocessor-based thermostat with integral airflow transducer and room sensor shall be compatible with temperature controls specified in other Division 15 Sections and shall have the following features:
   1. Damper Actuator: 24 V, powered closed, spring return open.
   2. Velocity Controller: Factory calibrated and field adjustable to minimum and maximum air volumes; shall maintain constant airflow dictated by thermostat within 5 percent of set point while compensating for inlet static-pressure variations up to 4-inch wg; and shall have a multipoint velocity sensor at air inlet.
   3. Thermostat: Wall-mounting electronic type with the following features:
      a. Proportional, plus integral control of room temperature.
      b. Time-proportional reheat-coil control.
      c. Temperature set-point display in Fahrenheit and Celsius.

H. DDC Controls: Single-package unitary controller and actuator specified in Division 15 Section "HVAC Instrumentation and Controls."

I. Control Sequence:
   1. As indicated on drawings.

2.2 SOURCE QUALITY CONTROL

A. Identification: Label each air terminal unit with plan number, nominal airflow, maximum and minimum factory-set airflows, coil type, and ARI certification seal.

B. Verification of Performance: Rate air terminal units according to ARI 880.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Install air terminal units level and plumb. Maintain sufficient clearance for normal service and maintenance.

3.2 CONNECTIONS

A. Piping installation requirements are specified in other Division 15 Sections. Drawings indicate general arrangement of piping, fittings, and specialties.

B. Install piping adjacent to air terminal units to allow service and maintenance.

C. Hot-Water Piping: In addition to requirements in Division 15 Section "Hydronic Piping," connect heating coils to supply with shutoff valve, strainer and union; and to return with balancing valve, control valve and union.

D. Connect ducts to air terminal units according to Division 15 Section "Metal Ducts."

E. Connect wiring according to Division 16 Section "Conductors and Cables."

F. Tighten electrical connectors and terminals according to manufacturer's published torque-tightening values. If manufacturer's torque values are not indicated, use those specified in UL 486A and UL 486B.

3.3 FIELD QUALITY CONTROL

A. Perform the following field tests and inspections and prepare test reports:
   1. After installing air terminal units and after electrical circuitry has been energized, test for compliance with requirements.
   2. Leak Test: After installation, fill water coils and test for leaks. Repair leaks and retest until no leaks exist.
   3. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.

B. Remove and replace malfunctioning units and retest as specified above.

3.4 STARTUP SERVICE

A. Engage a factory-authorized service representative to perform startup service.
   1. Complete installation and startup checks according to manufacturer's written instructions and do the following:
      a. Verify that inlet duct connections are as recommended by air terminal unit manufacturer to achieve proper performance.
      b. Verify that controls and control enclosure are accessible.
      c. Verify that control connections are complete.
      d. Verify that nameplate and identification tag are visible.
      e. Verify that controls respond to inputs as specified.

3.5 DEMONSTRATION

A. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain air terminal units. Refer to Division 1.

END OF SECTION 233600

N:\N0912.00\DOC\SPEC\2012_03-16_BID\233600 - AIR TERMINAL UNITS.DOC

SECTION 233601 - AIR VALVES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

1.2 SYSTEM DESCRIPTION

A. A laboratory airflow control system shall be furnished and installed to control the airflow into and out of laboratory rooms. The exhaust flow rate of a laboratory fume hood shall be precisely controlled to maintain a constant average face velocity into the fume hood at either a standard in-use or standby level based on an operator being present in front of the fume hood. The laboratory control system shall vary the amount of makeup/supply air into the room to operate the laboratories at the lowest possible airflow rates necessary to maintain temperature control, achieve minimum ventilation rates, and maintain laboratory pressurization in relation to adjacent spaces (positive or negative). The laboratory airflow control system shall be capable of operating as a stand-alone system, or as a system integrated with the Building Management System (BMS).

1.3 SUBMITTALS

A. Product Data: For each type of product indicated, include rated capacities, furnished specialties, sound-power ratings, and accessories.

B. Shop Drawings: Detail equipment assemblies and indicate dimensions, required clearances, method of field assembly, components, and location and size of each field connection.
   1. Include a schedule showing unique model designation, room location, model number, size, and accessories furnished.
   2. Wiring Diagrams: Power, signal, and control wiring.

C. Operation and Maintenance Data: For air valves to include in emergency, operation, and maintenance manuals. In addition to items specified in Division 1 include the following:
   1. Instructions for resetting minimum and maximum air volumes.
   2. Instructions for adjusting software set points.

1.4 PREVENTIVE MAINTENANCE

A. The laboratory airflow control system supplier shall provide, at no additional cost to the owner during and after the warranty period, five years of required preventive maintenance on all airflow sensors (e.g., pitot tube, flow cross, orifice ring, air bar, hot wire, vortex shedder, side wall sensors, etc.), and flow transducers provided under this section. Airflow sensors shall be removed, inspected, and cleaned annually during the five year period to prevent inaccuracies due to long term buildup from corrosion, lab tissues, wet or sticky particles, or other materials that foul the sensor. If impractical to remove the airflow sensors, the laboratory airflow control system supplier shall include in the proposal the cost of supplying and installing duct access

doors, one for each sensor. The transducer shall be checked and recalibrated annually to insure long-term accuracy. Note that auto-zero recalibration of transducers is not acceptable as a substitute for annual recalibration.

1.5 QUALITY ASSURANCE

A. Product Options: Drawings indicate size, profiles, and dimensional requirements of air valves and are based on the specific system indicated. Refer to Division 1 Section "Product Requirements."

B. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.

C. NFPA Compliance: Install air valves according to NFPA 90A, "Standard for the Installation of Air Conditioning and Ventilating Systems."

1.6 COORDINATION

A. Coordinate layout and installation of air valves and suspension system with other construction that penetrates ceilings or is supported by them, including light fixtures, HVAC equipment, fire-suppression system, and partition assemblies.

1.7 WARRANTY

A. Warranty shall commence upon the date of substantial completion and extend for a period of thirty-six months whereupon any defects in materials or laboratory airflow control system performance shall be repaired by the supplier at no cost to the owner.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. In other Part 2 articles where titles below introduce lists, the following requirements apply to product selection:
   1. Available Manufacturers: Subject to compliance with requirements:
      a. The plans and specifications for the laboratory airflow control system are based on systems and equipment manufactured by Phoenix Controls Corporation.
      b. In strict accordance with this specification, alternative laboratory airflow control systems and equipment shall only be considered for approval provided that the equipment be equal in every respect to the operational characteristics, capacities, and intent of control sequences specified herein. Approval to bid does not relieve the laboratory airflow control system supplier from complying with the minimum requirements or intent of this specification.
      c. The engineer and owner shall be the sole judges of quality and equivalence of equipment, materials, methods, and life cycle cost.
      d. Any alternate laboratory airflow control system supplier shall submit a detailed technical proposal for the owner’s evaluation. The proposal shall describe the manner of compliance with this minimum performance specification, with

particular emphasis on the following areas: diversity and energy analysis; proposed equipment; experience and performance verification. This proposal shall be separate from any other proposals.

e. Proposed Equipment
   1) The laboratory airflow control system supplier shall provide a detailed proposal describing all elements of the laboratory control system. A schematic laboratory layout shall be provided, showing relations of these elements and a description of how they interact.
   2) Technical specification data sheets shall be provided for all proposed system components and devices.
   3) All proposed airflow control devices shall include discharge, exhaust, and radiated sound power level performance obtained from testing in accordance with ARI Standard 880.

f. Experience
   1) The laboratory airflow control system supplier shall provide a list of at least three similar laboratory airflow control systems installed in the state or province as part of this proposal.
   2) The laboratory airflow control system supplier shall provide the names, addresses, and the telephone numbers of the consulting engineer and the owner's representative for each of these installations. It is understood that these individuals may be contacted regarding timely delivery, the quality of installation, the operation and performance of the equipment and the service requirements for each installation. Unsatisfactory performance or inability to provide references shall be grounds for rejection.

g. Performance Verification
   1) The laboratory airflow control system supplier shall demonstrate a typical laboratory space that includes multiple fume hoods, a general exhaust, and a supply airflow control device for the purpose of verifying the laboratory airflow control system's ability to meet the performance requirements indicated in this specification. All travel and lodging costs to witness the performance verification shall be the responsibility of the laboratory airflow control system supplier.

2.2 AIRFLOW CONTROL SYSTEM DESCRIPTION

A. Each individual laboratory shall have a dedicated laboratory airflow control system. Each dedicated laboratory airflow control system shall support a minimum of twenty (20) network controlled airflow devices.

B. The laboratory airflow control system shall employ individual average face velocity controllers that directly measure the area of the fume hood sash opening and proportionally control the hood's exhaust airflow to maintain a constant face velocity over a minimum range of 20% to 100% of sash travel. The corresponding minimum hood exhaust flow turndown ratio shall be 5 to 1.

C. The hood exhaust airflow control device shall respond to the fume hood sash opening by achieving 90% of its commanded value within one second of the sash reaching 90% of its final position (with no more than 5% overshoot/ undershoot) of required airflow. Rate of sash movement shall be between 1.0 to 1.5 feet per second.

D. The hood exhaust airflow control device shall be automatically switched between in-use and standby levels based on operator presence immediately in front of the hood. A presence and

motion sensor shall activate the switching. The airflow control device shall achieve the required in-use commanded value in less than one second from moment of detection with no more than a 5% overshoot or undershoot.

E. The laboratory airflow control system shall maintain specific airflow (±5% of signal within one second of a change in duct static pressure) regardless of the magnitude of the pressure change airflow change or quantity of airflow control devices on the manifold (within 0.6" to 3.0" wc),

F. The laboratory airflow control system shall use volumetric offset control to maintain room pressurization. The system shall maintain proper room pressurization polarity (negative or positive) regardless of any change in room/system conditions such as the raising and lowering of any or all fume hood sashes or rapid changes in duct static pressure. Systems using differential pressure measurement or velocity measurement to control room pressurization are unacceptable.

G. The laboratory airflow control system shall maintain specific airflow (±5% of signal) with a minimum 16 to 1 turndown to insure accurate pressurization at low airflow and guarantee the maximum system diversity and energy efficiency.

2.3 2AIRFLOW CONTROL SOUND SPECIFICATIONS

A. Unless otherwise specified, the airflow control device shall not exceed the sound power levels in Table 1, Table 2 and Table 3.

B. If the airflow control device cannot meet the sound power level specification, a properly sized silencer or sound attenuator must be used. All silencers must be of a packless design (constructed of at least 18 gauge 316L stainless steel when used with fume hood exhaust) with a maximum pressure drop at the device's maximum rated flow rate not to exceed 0.20 inches of water.

C. All proposed airflow control devices shall include discharge, exhaust and radiated sound power level performance.

2.4 USAGE BASED CONTROL EQUIPMENT

A. For variable air volume (VAV) systems, a sash sensor shall be provided to measure the height of each vertically moving fume hood sash. A sash sensor shall also be provided for horizontal overlapping sashes. Control systems employing sidewall-mounted velocity sensors shall be unacceptable.

B. A presence and motion sensor shall be provided to determine an operator's presence in front of a hood by detecting the presence and/or motion of an operator, and to command the laboratory airflow control system from an in-use operating face velocity (e.g., 100 fpm) to a standby face velocity (e.g., 60 fpm) and vice versa.
   1. The sensor shall define a detection zone that extends approximately 20" (50 cm) from the front of the fume hood. If the sensor does not detect presence and/or motion in its detection zone within five seconds, it shall command the system to the user-adjustable standby face velocity. When the sensor detects the presence and/or motion of an operator within the detection zone, it shall command the system to the in-use face velocity within 1.0 second.
   2. The sensor shall have a control circuit that adapts to its specific surroundings and automatically adjusts for inanimate objects placed within its detection zone. It shall map the area into memory and, after a period of five minutes, nullify the image of the inanimate object and return to a standby mode. Operators shall enter and leave the zone with the unit automatically adjusting between in-use and standby modes. If the inanimate object is moved or taken out of the zone, the unit shall automatically re-map the area.
   3. Wide area motion detectors (on the hood or room level) shall be unacceptable.

C. The airflow at the fume hood shall vary in a linear manner between two adjustable minimum and maximum flow set points to maintain a constant face velocity throughout this range. A minimum volume flow shall be set to assure flow through the fume hood even with the sash totally closed.

D. A fume hood monitor shall be provided to receive the sash sensor output and presence and/or motion signal. This same monitor shall generate an exhaust airflow control signal for the appropriate airflow control device in order to provide a constant average face velocity. Audible and separate visual alarms shall be provided for both flow alarm and emergency exhaust conditions.

2.5 AIRFLOW CONTROL DEVICE - GENERAL

A. The airflow control device shall be a venturi valve.

B. The airflow control device shall be pressure independent over its specified differential static pressure operating range. An integral pressure independent assembly shall respond and maintain specific airflow within one second of a change in duct static pressure irrespective of the magnitude of pressure and/or flow change or quantity of airflow controllers on a manifolded system.

C. The airflow control device shall maintain accuracy within ±5% of signal over an airflow turndown range of no less than 16 to 1.

D. No minimum entrance or exit duct diameters shall be required to ensure accuracy and/or pressure independence.

E. The airflow control device shall be constructed of one of the following three types:
   1. Class A - The airflow control device for non-corrosive airstreams such as supply and general exhaust shall be constructed of 16-gauge aluminum. The device's shaft and shaft support brackets shall be made of 316 stainless steel. The pivot arm and internal mounting link shall be made of aluminum. The pressure independent springs shall be a spring-grade stainless steel. All shaft bearing surfaces shall be made of a Teflon, or polyester, or PPS (polyphenylene sulfide) composite.
   2. Sound attenuating devices used in conjunction with general exhaust or supply airflow control devices shall be constructed using 24 gauge galvanized steel or other suitable material used in standard duct construction. No sound absorptive materials of any kind shall be used.
   3. Class B - The airflow control device for corrosive airstreams such as fume hoods and bio-safety cabinets shall have a baked-on corrosion resistant phenolic coating. The device's shaft shall be made of 316 stainless steel with a Teflon coating. The shaft support brackets shall be made of 316 stainless steel. The pivot arm and internal mounting link shall be made of 316 or 303 stainless steel. The pressure independent springs shall be a spring-grade stainless steel. The internal nuts, bolts and rivets shall be stainless steel. All shaft bearing surfaces shall be made of a Teflon or PPS (polyphenylene sulfide) composite.
   4. Class C - The airflow control device for highly corrosive airstreams shall be constructed as defined in Paragraph D.2 and, in addition, shall have no exposed aluminum or stainless steel components. Shaft support brackets, pivot arm, internal mounting link, and pressure independent springs shall have a baked on corrosion resistant phenolic coating in addition to the materials defined in paragraph D.2. The internal nuts, bolts, and rivets shall be titanium or phenolic coated stainless steel. Only devices clearly defined as “High Corrosion Resistant” on project drawings will require this construction.

F. For two-position or VAV operation, low-voltage, fast acting, electric actuator shall be factory mounted to the valve. Loss of control power shall cause normally open valves to fail to maximum position, and normally closed valves to fail to minimum position. Electric actuators that fail in last position are not

acceptable when used in fume hood and make-up air control applications. Constant volume valves do not require actuators.

G. The controller for the airflow control devices shall be microprocessor based and operate using a peer-to-peer control architecture. The room-level airflow control devices shall function as a stand-alone network.

H. The room-level control network shall utilize a LonTalk communications protocol.

I. There shall be no reliance on external or building-level control devices to perform room-level control functions. Each laboratory control system shall have the capability of performing; Fume hood control, Pressurization control, Temperature control, Humidity control, and implement Occupancy and Emergency mode control schemes.

J. The laboratory airflow control systems shall have the option of digital integration with the BMS.

K. Certification
   1. Each airflow control device shall be factory calibrated to the job specific airflows as detailed on the plans and specifications using NIST traceable air stations and instrumentation having a combined accuracy of at least ±1% of signal over the entire range of measurement. Electronic airflow control devices shall be further calibrated and their accuracy verified to ±5% of signal at a minimum of forty-eight different airflows across the full operating range of the device.
   2. All airflow control devices shall be individually marked with device specific, factory calibration data. At a minimum, it should include: tag number, serial number, model number, eight point characterization information (for electronic devices), and quality control inspection numbers. All information shall be stored by the manufacturer for use with as-built documentation.

L. Airflow control devices that are not venturi valves, and airflow measuring devices (e.g., pitot tube, flow cross, air bar, orifice ring, vortex shedder, etc.) shall only be acceptable provided they meet all the performance and construction characteristics as stated throughout this specification and:
   1. The airflow control device employs transducers manufactured by Rosemount, Bailey, Bristol, or Foxboro. Accuracy shall be no less than ±0.15% of span (to equal ±5% of signal with a 15 to 1 turndown) over the appropriate full scale range including the combined effects of nonlinearity, hysteresis, repeatability, drift over a one year period, and temperature effect. 316L stainless steel materials shall be provided for all exhaust applications. The use of 304 stainless steel materials shall be provided for all make-up air applications.
   2. Airflow sensors shall be of a multi-point averaging type, 304 stainless steel for all supply and general exhaust applications, 316L stainless steel for all fume hood, canopy, snorkel, and bio-safety cabinet applications. Single point sensors are not acceptable.
   3. Suppliers of airflow control devices or airflow measuring devices requiring minimum duct diameters shall provide revised duct layouts showing the required straight duct runs upstream and downstream of these devices. Coordination drawings reflecting these changes shall be submitted by the supplier of the laboratory airflow control system. In addition, suppliers shall include static pressure loss calculations as part of their submittals. All costs to modify the ductwork, increase fan sizes and horsepower, and all associated electrical changes shall be borne by the laboratory airflow control supplier.

2.6 EXHAUST AND SUPPLY AIRFLOW DEVICE CONTROLLER

A. The airflow control device shall be a microprocessor-based design and, shall use closed loop control to linearly regulate airflow based on a digital control signal. The device shall generate a digital feedback signal that represents its airflow.

B. The airflow control device shall store its control algorithms in non-volatile, re-writable memory. The device shall be able to stand-alone or to be networked with other room level digital airflow control devices using an industry standard protocol.

C. Room-level control functions shall be embedded in and carried out by the airflow device controller using a distributed control architecture. Critical control functions shall be implemented locally, no room-level controller shall be required.

D. The airflow control device shall use industry standard 24 Vac power.

E. The airflow control device shall have provisions to connect a notebook PC commissioning tool and every node on the network shall be accessible from any point in the system.

F. The airflow control device shall have built-integral Input/Output connections address fume hood control, temperature control, humidity control occupancy control, emergency control and non-network sensors switches and control devices. At a minimum the airflow controller shall have:
   1. Three (3) Universal Inputs, capable of accepting 0 to 10Vdc, 4 to 20mA, 0 to 65k ohms, or Type 2 or Type 3 10k ohm @ 25 degree C thermistor temperature sensors.
   2. One (1) Digital Input capable of accepting a dry contact or logic level signal input.
   3. Two (2) Analog Outputs capable of developing either a 0 to 10Vdc, or 4 to 20mA linear control signal.
   4. One (1) Form C (SPDT) relay output capable of driving up to 1A @ 24Vac/Vdc.

G. The airflow control device shall meet FCC Part 15 Subpart J Class A, and be UL916 listed.

2.7 TWO-POSITION EXHAUST AIRFLOW CONTROL DEVICE

A. The airflow control device shall maintain a factory calibrated fixed maximum and minimum flow setpoint based on a switched 0 to 10 volt signal. Two-position devices requiring feedback shall generate a 0 to 10 volt feedback signal that is linearly proportional to its airflow. All Two-Position devices shall either be networks, or hard-wired into the room-level network so as to be considered under pressurization control.

2.8 LABORATORY OFFICE AIRFLOW CONTROL DEVICE

A. The airflow control device shall maintain a temperature set point by controlling the airflow and the reheat valve (if required) in response to a room temperature sensor. An additional output shall be provided for supplementary cooling or heating of the office space. If the office airflow supply device is not required for make-up airflow control for fume hoods, then the 1-second speed of response, and fail-safe conditions required of the laboratory airflow control system shall not apply.

2.9 CONSTANT VOLUME AIRFLOW CONTROL DEVICE

A. The airflow control device shall maintain a constant airflow setpoint. It shall be factory calibrated and set for the desired airflow. It shall also be capable of field adjustment for future changes in desired airflow.

B. Laboratory airflow control systems suppliers not employing constant volume venturi airflow control valves shall provide pneumatic tubing or electrical wiring as required for their devices.

2.10 CLOSED LOOP VARIABLE FREQUENCY DRIVE

A. The drive shall be a high-performance pulse width modulated design, which generates a sine-coded, adjustable voltage/frequency, three phase output for complete speed control of any conventional squirrel cage induction motor.

B. The device shall not induce any voltage line notching distortion back to the utility line. The device shall maintain a displacement power factor of not less than 0.95 throughout its speed range. Synchronism between drive frequency and motor speed shall be maintained under all conditions.

C. The drive shall automatically restart a coasting motor after a power outage of any duration without tripping or shutting down. The drive shall apply rated power to accelerate the motor to the commanded speed within 0.5 second of the reapplication of drive power or the removal of a motor fault condition.

D. The drive shall accelerate the motor rapidly, limited only by the motor's rated torque and load.

E. An alarm circuit indicating low face velocity shall be included to electronically sense a loss of airflow via a drop in actual (not calculated) motor power or a difference between the actual and commanded motor speed. The alarm shall be enunciated through audible and visual means at the fume hood monitor.

2.11 CONTROL FUNCTIONS

A. The airflow control devices shall utilize a peer-to-peer, distributed control architecture to perform room-level control functions. Master/Slave control schemes shall not be acceptable. Control functions shall at a minimum include, pressurization, temperature, humidity control and respond to occupancy and emergency control commands.

B. Pressurization Control
1. The laboratory control system shall control supply and auxiliary exhaust airflow devices in order to maintain a volumetric offset (either positive or negative). Offset shall be maintained regardless of any change in flow or static pressure. This offset shall be field adjustable and represents the volume of air, which will enter (or exit) the room from the corridor or adjacent spaces.
2. The pressurization control algorithm shall sum the flow values of all Supply and Exhaust airflow devices and command appropriate controlled devices to new set points to maintain the desired offset. The offset shall be adjustable.
3. The pressurization control algorithm shall consider both networked devices, as well as:
   a. Up to three (3) non-networked devices providing a linear analog flow signal.
   b. Any number of Constant Volume devices where the total of supply devices and the total of exhaust devices may be factored into the pressurization control algorithm.
4. Volumetric offset shall be the only acceptable means of controlling room pressurization. Systems that rely on differential pressure as a means of control shall provide documentation to demonstrate that space pressurization can be maintained if fume hood sashes are changed at the same time a door to the space is opened.
5. The pressurization control algorithm shall support the ability to regulate the distribution of total supply flow across multiple supply airflow control devices in order to optimize air distribution in the space.

C. Temperature Control
1. The laboratory control system shall regulate the space temperature through a combination of volumetric thermal override and control of reheat coils and/or auxiliary temperature control devices. The laboratory control system shall support up to four separate temperature zones for each pressurization zone. Each zone shall have provisions for monitoring up to five (5) temperature inputs and calculating a straight-line average to be used for control purposes. Separate

cooling and heating set points shall be writable from the BMS, with the option of a local offset adjustment.

2. Temperature control shall be implemented through the use of independent primary cooling and heating control functions, as well as an auxiliary temperature control function, which may be used for either supplemental cooling or heating. Cooling shall be provided as a function of thermal override of conditioned air with both supply and exhaust airflow devices responding simultaneously so as to maintain the desired offset. Heating shall be provided through modulating control of a properly sized reheat coil.
3. The laboratory control system shall also provide the built-in capability for being configured for Hot Deck/Cold Deck temperature control.
4. The auxiliary temperature control function shall offer the option of either heating or cooling mode and to operate as either a stand-alone temperature control loop, or staged to supplement the corresponding primary temperature control loop.

D. Humidity Control
1. The Laboratory control system shall have an embedded humidity control function, which allows the monitoring and control of the relative humidity level in the pressurized zone. Using peer-to-peer control, the airflow devices shall have the ability to monitor the relative humidity level of the space and, based on a BMS writable set point, develop a control signal to drive one or the other humidification or dehumidification control circuits.
2. The humidity control loop(s) shall share a common set point, with a configurable deadband adjustment to prevent the humidification and dehumidification control functions to operate at the same time.

E. Occupancy Control
1. The laboratory control system shall have the ability to change the minimum ventilation and/or temperature control set points, based on the occupied state, in order to reduce energy consumption when the space is not occupied. The occupancy state may be set by either the BMS, as a scheduled event, or through the use of a local occupancy sensor or switch. The laboratory control system shall support a local occupancy override button that allows a user to override the occupancy mode and set the space to occupied, for a predetermined interval. The override interval shall be configurable for 1 to 1,440 minutes. The local occupancy sensor/switch, or bypass button shall be given priority over a BMS command.

F. Emergency Mode Control
1. The laboratory control system shall provide a means of overriding temperature and pressurization control in response to a command indicating an emergency condition exists and airflow control devices are to be driven to a specific flow set point. The system shall support up to four (4) emergency control modes. The emergency control modes may be initiated either by a local contact input, or BMS command.
2. Once an Emergency mode is invoked, pressurization and temperature control are overridden for the period that the mode is active. Emergency modes shall have a priority scheme allowing a more critical mode to override a previously set condition.

G. Local Alarm Control
1. The laboratory control system shall provide the means of summing selective alarm activity at the room-level network and generating a local alarm signal. The local alarm signal may be directed to any available output, as well as to the BMS. The alarm mask may be configured differently for each room-level system.

H. Diversity Alarm
1. The laboratory control system shall have the ability of monitoring the airflow values for the pressurized space, and generating an alarm signal in the event the Total Supply flow exceeds a predetermined threshold. The Diversity Alarm is intended to allow the user to take diversity in the

design and generate an alarm condition in the event the diversity threshold is compromised. This function must be available in either an integrated or stand-alone system.

I. Fume Hood Control

1. Airflow devices intended to control the face velocity of a fume hood, shall have the ability to interface directly with the Fume Hood Monitoring device. The airflow control device shall:
    a. Accept command inputs to regulate the flow accordingly and make this command value available to the BMS.
    b. Accept a Sash Position signal and make this value available to the BMS.
    c. Accept a Usage Based Control signal to indicate user presence and make this signal available to the BMS.
    d. Provide a flow feedback signal to the Fume Hood Monitor, which may be used for calculating face velocity, or to confirm the airflow device has achieved the proper flow rate and make this value available to the BMS.
    e. Provide alarm signals to the Fume Hood Monitor in the event the airflow device is unable to achieve the proper flow rate, or there is a loss of static pressure indicating improper fan operation, or that there is a loss of power to the airflow control device, in order to provide a local alarm indication.
2. The fume hood airflow control device shall respond to changes in sash position and user presence within 1 second, in order to provide a constant 100 feet per minute face velocity when the fume hood is in use.

J. The laboratory control system shall be segregated into individual sub nets to isolate network communications to insure room-level control functions and BMS communications may be carried out reliably. Each laboratory space, or pressurization zone shall be it's own sub net. Commercially available routers shall be used to provide this isolation.

K. The laboratory airflow control system shall support at least 20-networked devices in each pressurized zone.

L. All points shall be available through the interface to the building management system (BMS) for trending, archiving, graphics, alarm notification, and status reports. Laboratory airflow control system performance (speed, stability, and accuracy) shall be unaffected by the quantity of points being monitored, processed, or controlled.

M. Refer to the BMS specification for the required input/output summary for the necessary points to be monitored and/or controlled. 3.10.

2.12 INTERFACE TO BUILDING MANAGEMENT SYSTEMS

A. The laboratory airflow control system network shall have the capability of digitally interfacing with the BMS. The required software interface drivers shall be developed and housed in a Gateway, a dedicated interface device furnished by the laboratory airflow control system supplier.

B. Any, or all room-level points shall be available to the BMS for monitoring or trending. The Gateway shall maintain a cache of all points to be monitored by the BMS. The room-level airflow control devices shall update this cache continually.

C. The building-level network shall be a high-speed LonTalk (1.25 mbps) communications protocol. The building-level network shall support up to one hundred (100) sub nets, or pressurization zones, or six thousand (6,000) data points.

D. A commercially available interface card shall be provided with the Accel-Way in order to connect to the building-level network.

E. A commercially available network interface card shall be provided with the Accel-Way to interface with the BMS.

2.13 SOURCE QUALITY CONTROL

A. Identification: Label each air valve with plan number, nominal airflow, maximum and minimum factory-set airflows, coil type, and ARI certification seal.

PART 3 - EXECUTION

3.1 INSTALLATION

A. The automatic temperature controls (ATC) contractor shall install the sash sensors, interface boxes, presence and motion sensor, and fume hood monitor on the fume hood under initial supervision of the laboratory airflow control system supplier. Reel-type sash sensors and their stainless steel cables shall be hidden from view. Bar-type sash sensors shall be affixed to the individual sash panels. Sash interface boxes with interface cards shall be mounted in an accessible location.

B. The ATC contractor shall install all Routers and Repeaters in an accessible location in or around the designated laboratory room.

C. The ATC shall install an appropriately sized and fused 24 Vac transformer suitable for NEC Class II wiring.

D. The ATC contractor shall install 20 psi clean, dry pneumatic supply air to all airflow control devices, where required.

E. All cable shall be furnished and installed by the ATC contractor. The ATC contractor shall terminate and connect all cables as required. The ATC shall utilize cables specifically recommended by the laboratory airflow controls supplier.

F. The mechanical contractor shall install all airflow control devices in the ductwork and shall connect all airflow control valve linkages.

G. The mechanical contractor shall provide and install all reheat coils and transitions.

H. The mechanical contractor shall provide and install insulation as required.

I. Each pressurization zone shall have either a dedicated, single-phase primary circuit or a secondary circuit disconnect.

J. Install air valves level and plumb. Maintain sufficient clearance for normal service and maintenance

3.2 CONNECTIONS

A. Piping installation requirements are specified in other Division 23 Sections. Drawings indicate general arrangement of piping, fittings, and specialties.

B. Install piping adjacent to air valves to allow service and maintenance.

C. Hot-Water Piping: In addition to requirements in Division 23 Section "Hydronic Piping," connect heating coils to supply with shutoff valve, strainer, control valve, and union or flange; and to return with balancing valve and union or flange.

D. Connect ducts to air valves according to Division 23 Section "Metal Ducts."

E. Connect wiring according to Division 16 Section "Conductors and Cables."

F. Tighten electrical connectors and terminals according to manufacturer's published torque-tightening values. If manufacturer's torque values are not indicated, use those specified in UL 486A and UL 486B.

3.3 FIELD QUALITY CONTROL

A. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect, test, and adjust field-assembled components and equipment installation, including connections, and to assist in field testing. Report results in writing.

B. Perform the following field tests and inspections and prepare test reports:
1. After installing air valves and after electrical circuitry has been energized, test for compliance with requirements.
2. Leak Test: After installation, fill water coils and test for leaks. Repair leaks and retest until no leaks exist.
3. Operational Test: After electrical circuitry has been energized, start units to confirm proper motor rotation and unit operation.
4. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.

C. Remove and replace malfunctioning units and retest as specified above.

3.4 STARTUP SERVICE

A. System start-up shall be provided by a factory-authorized representative of the laboratory airflow control system manufacturer. Start-up shall include calibrating the fume hood monitor and any combination sash sensing equipment as required. Start-up shall also provide electronic verification of airflow (fume hood exhaust, supply, make-up, general exhaust, or return), system programming and integration to BMS (when applicable).

B. The balancing contractor shall be responsible for final verification and reporting of all airflows.

3.5 DEMONSTRATION

A. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain air valves. Refer to Division 1.

B. The laboratory airflow control system supplier shall furnish a minimum of eight hours of owner training by factory trained and certified personnel. The training will provide an overview of the job specific airflow control components, verification of initial fume hood monitor calibration, general procedures for verifying airflows of air valves, and general troubleshooting procedures.

C. Operation and Maintenance manuals, including as-built wiring diagrams and component lists shall be provided for each training attendee.

END OF SECTION 233601

N:\N0912.00\DOC\SPEC\2012_03-16_BID\233601 - AIR VALVES.DOC

SECTION 233713 - DIFFUSERS, REGISTERS, AND GRILLES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:
   1. Square ceiling diffusers.
   2. Perforated diffusers.
   3. Louver face diffusers.
   4. Linear slot diffusers.
   5. Adjustable bar registers and grilles.
   6. Fixed face registers and grilles.
   7. High capacity, low induction diffusers.

B. Related Sections:
   1. Division 08 Section "Louvers and Vents" for fixed and adjustable louvers and wall vents, whether or not they are connected to ducts.
   2. Division 23 Section "Air Duct Accessories" for fire and smoke dampers and volume-control dampers not integral to diffusers, registers, and grilles.

1.3 SUBMITTALS

A. Product Data: For each type of product indicated, include the following:
   1. Data Sheet: Indicate materials of construction, finish, and mounting details; and performance data including throw and drop, static-pressure drop, and noise ratings.
   2. Diffuser, Register, and Grille Schedule: Indicate drawing designation, room location, quantity, model number, size, and accessories furnished.

B. Samples for Initial Selection: For diffusers, registers, and grilles with factory-applied color finishes.

C. Samples for Verification: For diffusers, registers, and grilles, in manufacturer's standard sizes to verify color selected.

D. Coordination Drawings: Reflected ceiling plans, drawn to scale, on which the following items are shown and coordinated with each other, using input from Installers of the items involved:
   1. Ceiling suspension assembly members.
   2. Method of attaching hangers to building structure.
   3. Size and location of initial access modules for acoustical tile.
   4. Ceiling-mounted items including lighting fixtures, diffusers, grilles, speakers, sprinklers, access panels, and special moldings.
   5. Duct access panels.

E. Source quality-control reports.

PART 2 - PRODUCTS

2.1 CEILING DIFFUSERS

A. Square Ceiling Diffusers:
1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, the following:
   a. Anemostat Products; a Mestek company.
   b. Carnes.
   c. Krueger.
   d. Nailor Industries Inc.
   e. Titus.
   f. Tuttle & Bailey.
2. Devices shall be specifically designed for variable-air-volume flows.
3. Material: Steel.
4. Finish: Baked enamel, color selected by Architect.
5. Face Size: 24 by 24 inches or 12 by 12 inches.
6. Face Style: Three-cone.
7. Mounting: Surface or T-bar.
8. Pattern: Adjustable.
9. Dampers: Butterfly.
10. Accessories:
    a. Equalizing grid.
    b. Sectorizing baffles.

B. Perforated Diffuser:
1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, the following:
   a. Anemostat Products; a Mestek company.
   b. Carnes.
   c. Krueger.
   d. Nailor Industries Inc.
   e. Titus.
   f. Tuttle & Bailey.
2. Devices shall be specifically designed for variable-air-volume flows.
3. Material: Steel backpan and pattern controllers, with steel face.
4. Finish: Baked enamel, color selected by Architect.
5. Face Size: 12 by 12 inches or 24 by 24 inches.
6. Duct Inlet: Round.
7. Face Style: Flush.
8. Mounting: Surface or T-bar.
9. Pattern Controller: Fixed with curved blades at inlet.
10. Dampers: Radial opposed blade.
11. Accessories:
    a. Equalizing grid.

C. Louver Face Diffuser:
1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, the following:
   a. Anemostat Products; a Mestek company.

b. Carnes.
c. Nailor Industries Inc.
d. Titus.
e. Tuttle & Bailey.

2. Devices shall be specifically designed for variable-air-volume flows.
3. Material: Steel.
4. Finish: Baked enamel, color selected by Architect.
5. Face Size: As scheduled.
6. Mounting: Surface or T-bar.
7. Pattern: Four-way core style.
8. Dampers: Radial opposed blade.
9. Accessories:
   a. Adjustable pattern vanes.
   b. Sectorizing baffles.

2.2 CEILING LINEAR SLOT OUTLETS

A. Linear Slot Diffuser:
1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, the following:
   a. Anemostat Products; a Mestek company.
   b. Carnes.
   c. Krueger.
   d. Nailor Industries Inc.
   e. Titus.
   f. Tuttle & Bailey.
2. Devices shall be specifically designed for variable-air-volume flows.
3. Material - Shell: Steel, insulated.
4. Material - Pattern Controller and Tees: Aluminum.
5. Finish - Face and Shell: Baked enamel, black.
6. Finish - Pattern Controller: Baked enamel, black.
7. Finish - Tees: Baked enamel, color selected by Architect.
8. Slot Width: As shown on schedule.
9. Number of Slots: As shown on schedule.
10. Length: As shown on schedule.
11. Accessories: T-bar clips on both sides.

2.3 REGISTERS AND GRILLES

A. Adjustable Bar Register:
1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, the following:
   a. Anemostat Products; a Mestek company.
   b. Carnes.
   c. Krueger.
   d. Nailor Industries Inc.
   e. Titus.
   f. Tuttle & Bailey.
2. Material: Steel.
3. Finish: Baked enamel, color selected by Architect.
4. Face Blade Arrangement: Horizontal spaced as shown on schedule.
5. Core Construction: Integral.

6. Rear-Blade Arrangement: Vertical spaced, as shown on schedule.
7. Frame: 1 inch wide.
8. Mounting: Countersunk screw.
9. Damper Type: Adjustable opposed blade.
10. Accessories:

B. Adjustable Bar Grille:
1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, the following:
   a. Anemostat Products; a Mestek company.
   b. Carnes.
   c. Krueger.
   d. Nailor Industries Inc.
   e. Titus.
   f. Tuttle & Bailey.
2. Material: Steel.
3. Finish: Baked enamel, color selected by Architect.
4. Face Blade Arrangement: Horizontal spaced, as shown on schedule.
5. Core Construction: Integral.
6. Rear-Blade Arrangement: As shown on schedule.
7. Frame: 1 inch wide.
8. Mounting Frame: Flanged..
9. Mounting: Countersunk screw.

C. Fixed Face Grille:
1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, the following:
   a. Anemostat Products; a Mestek company.
   b. Carnes.
   c. Krueger.
   d. Nailor Industries Inc.
   e. Titus.
   f. Tuttle & Bailey.
2. Material: Steel.
3. Finish: Baked enamel, color selected by Architect.
4. Face Arrangement: As shown on schedule.
5. Core Construction: Integral.
6. Frame: 1 inch wide.
7. Mounting: Countersunk screw.
8. Damper Type: Adjustable opposed blade.

D. High-Capacity, Low Induction Supply Diffusers
1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, the following:
   a. Anemostat Products; a Mestek company.
   b. Nailor Industries Inc.
2. Ceiling flushed, perforated, radial pattern diffuser.
3. Steel distribution plenum with internal spreading means and round inlet collar.
4. Finish the diffuser in white enamel.
5. Lay-in frame.
6. Sizes and capacity as shown on schedule.

2.4 SOURCE QUALITY CONTROL

A. Verification of Performance: Rate diffusers, registers, and grilles according to ASHRAE 70, "Method of Testing for Rating the Performance of Air Outlets and Inlets."

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine areas where diffusers, registers, and grilles are to be installed for compliance with requirements for installation tolerances and other conditions affecting performance of equipment.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. Install diffusers, registers, and grilles level and plumb.

B. Ceiling-Mounted Outlets and Inlets: Drawings indicate general arrangement of ducts, fittings, and accessories. Air outlet and inlet locations have been indicated to achieve design requirements for air volume, noise criteria, airflow pattern, throw, and pressure drop. Make final locations where indicated, as much as practical. For units installed in lay-in ceiling panels, locate units in the center of panel. Where architectural features or other items conflict with installation, notify Architect for a determination of final location.

C. Install diffusers, registers, and grilles with airtight connections to ducts and to allow service and maintenance of dampers, air extractors, and fire dampers.

3.3 ADJUSTING

A. After installation, adjust diffusers, registers, and grilles to air patterns indicated, or as directed, before starting air balancing.

END OF SECTION 233713

N:\N0912.00\DOC\SPEC\2012_03-16_BID\233713_DIFFUSERS,REGISTERS AND GRILLES.DOC

SECTION 235216 - CONDENSING BOILERS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. This Section includes packaged, factory-fabricated and -assembled, gas-fired, fire-tube and water-jacketed condensing boilers, trim, and accessories for generating hot water.
   1. Secure Maryland Department of Environment (MDE) air quality permit-to-construct for all fuel burning equipment where required (Comar 26.11.02)

1.3 ACTION SUBMITTALS

A. Product Data: Include performance data, operating characteristics, furnished specialties, and accessories.

B. Shop Drawings: For boilers, boiler trim, and accessories. Include plans, elevations, sections, details, and attachments to other work.
   1. Wiring Diagrams: Power, signal, and control wiring.

C. Source quality-control test reports.

D. Field quality-control test reports.

E. Warranty: Special warranty specified in this Section.

1.4 CLOSEOUT SUBMITTALS

A. Operation and Maintenance Data: For boilers to include in emergency, operation, and maintenance manuals.

1.5 QUALITY ASSURANCE

A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.

B. ASME Compliance: Fabricate and label boilers to comply with ASME Boiler and Pressure Vessel Code.

C. ASHRAE/IESNA 90.1 Compliance: Boilers shall have minimum efficiency according to "Gas and Oil Fired Boilers - Minimum Efficiency Requirements."

D. DOE Compliance: Minimum efficiency shall comply with 10 CFR 430, Subpart B, Appendix N, "Uniform Test Method for Measuring the Energy Consumption of Furnaces and Boilers."

E. UL Compliance: Test boilers for compliance with UL 795, "Commercial-Industrial Gas Heating Equipment." Boilers shall be listed and labeled by a testing agency acceptable to authorities having jurisdiction.

1.6 COORDINATION

A. Coordinate size and location of concrete bases. Cast anchor-bolt inserts into bases. Concrete, reinforcement, and formwork requirements are specified with concrete.

1.7 WARRANTY

A. Special Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace components of boilers that fail in materials or workmanship within specified warranty period.
   1. Warranty Period for Fire-Tube Condensing Boilers:
      a. Leakage and Materials: 10 years from date of Substantial Completion.
      b. Heat Exchanger Damaged by Thermal Stress and Corrosion: Non-prorated for five years from date of Substantial Completion.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   1. AERCO International.
   2. Viessmann Manufacturing Co. (US) Inc.

2.2 FIRE-TUBE CONDENSING BOILERS

A. Description: Factory-fabricated, -assembled, and -tested, fire-tube condensing boiler with heat exchanger sealed pressure tight, built on a steel base; including insulated jacket; flue-gas vent; combustion-air intake connections; water supply, return, and condensate drain connections; and controls. Water heating service only.

B. Heat Exchanger: Nonferrous, stainless steel combustion chamber.

C. Pressure Vessel: SA53 carbon steel with 0.25-inch thick wall and 0.25-inch thick upper heads and tube connections or high alloy stainless steel and titanium.

D. Burner: Natural gas, forced draft capable of 15:1 turn down ratio or full modulating without loss of efficiency and low NOx.

E. Blower: Centrifugal fan to operate during each burner firing sequence and to pre-purge and post-purge the combustion chamber.
   1. Motors: Comply with requirements specified in Section 230513 "Common Motor Requirements for HVAC Equipment."

a. Motor Sizes: Minimum size as indicated. If not indicated, large enough so driven load will not require motor to operate in service factor range above 1.0.

F. Gas Train: Combination gas valve with manual shutoff and pressure regulator.

G. Ignition: Spark ignition with 100 percent main-valve shutoff with electronic flame supervision.

H. Exhaust and condensate collector: Stainless steel construction.

I. Casing:
1. Jacket: Sheet metal with interlocking closures.
2. Control Compartment Enclosures: NEMA 250, Type 1A.
3. Finish: Baked-enamel or powder-coated protective finish.
4. Insulation: Minimum 4-inch thick, mineral-fiber insulation surrounding the heat exchanger.
5. Combustion-Air Connections: Inlet and vent duct collars.
6. Mounting base to secure boiler.

2.3 WATER-JACKETED CONDENSING BOILERS

A. Description: Factory-fabricated, -assembled, and -tested, water-jacketed condensing boiler with heat exchanger sealed pressure tight, built on a steel base; including insulated jacket; flue-gas vent; water supply, return, and condensate drain connections; and controls. Water heating service only.

B. Heat Exchanger: Stainless-steel primary and secondary combustion chamber.

C. Pressure Vessel: Carbon steel with welded heads and tube connections where not in contact with combustion or flue gases.

D. Burner: Natural gas, forced draft; swing-open front and burner observation port.

E. Blower: Centrifugal fan, forced draft. Include prepurge and postpurge of the combustion chamber.
1. Motors: Comply with requirements specified in Section 230513 "Common Motor Requirements for HVAC Equipment."
a. Motor Sizes: Minimum size as indicated. If not indicated, large enough so driven load will not require motor to operate in service factor range above 1.0.

F. Gas Train: Combination gas valve with manual shutoff and pressure regulator. Include 100 percent safety shutoff with electronic flame supervision.

G. Ignition: Electric-spark ignition with 100 percent main-valve shutoff with electronic flame supervision.

H. Casing:
1. Jacket: Sheet metal, with snap-in or interlocking closures.
2. Control Compartment Enclosures: NEMA 250, Type 1A.
3. Finish: Powder-coated protective finish.
4. Insulation: Minimum 4-inch thick, mineral-fiber insulation surrounding the heat exchanger.
5. Combustion-Air Connections: Inlet and vent duct collars.
6. Mounting base to secure boiler.

2.4 TRIM

A. Include devices sized to comply with ANSI B31.9, "Building Services Piping."

B. Aquastat Controllers: Operating**,** firing rate, and high limit.

C. Safety Relief Valve: ASME rated.

D. Pressure and Temperature Gage: Minimum 3-1/2-inch diameter, combination water-pressure and -temperature gage. Gages shall have operating-pressure and -temperature ranges so normal operating range is about 50 percent of full range.

E. Boiler Air Vent: Automatic.

F. Drain Valve: Minimum NPS ¾ hose-end gate valve.

2.5 CONTROLS

A. Refer to Section 230900 "Instrumentation and Control for HVAC."

B. Boiler operating controls shall include the following devices and features:
1. Control transformer.
2. Set-Point Adjust: Set points shall be adjustable.
3. Operating Pressure Control: Factory wired and mounted to cycle burner.
4. Sequence of Operation: Micro-processor based operating on BACNet, MODBus or LONTalk protocol, factory-fabricated and field-installed panel to control burner firing rate to reset supply-water temperature inversely with outside-air temperature or as determined by building automation system (BMS).
    a. Master Boiler Control Panel: Factory programmed firing sequence for multiple boilers to ensure maximum system efficiency throughout the load range and to provide equal runtime for boilers.

C. Building Automation System Interface: Factory installed hardware and software to enable building automation system to monitor, control, and display boiler status and alarms thru RS-485 port.
1. Hardwired Points:
    a. Monitoring: On/off status, common trouble alarm and low water level alarm.
    b. Control: On/off operation, hot water supply temperature set-point adjustment.
2. A communication interface with building automation system shall enable building automation system operator to remotely control and monitor the boiler from an operator workstation. Control features available, and monitoring points displayed, locally at boiler control panel shall be available through building automation system.

2.4 ELECTRICAL POWER

A. Controllers, Electrical Devices, and Wiring: Electrical devices and connections are specified in electrical Sections.

B. Single-Point Field Power Connection: Factory-installed and -wired switches, motor controllers, transformers, and other electrical devices necessary shall provide a single-point field power connection to boiler.
1. House in NEMA 250, Type **1** enclosure.

2. Wiring shall be numbered and color-coded to match wiring diagram.
3. Field power interface shall be to single point connection, nonfused disconnect switch.
4. Provide branch power circuit to each motor and to controls with a disconnect switch or circuit breaker.
5. Provide each motor with overcurrent protection.

2.5 VENTING KITS

A. Kit: Complete system, ASTM A 959, Type 29-4C stainless steel, pipe, vent terminal, thimble, indoor plate, vent adapter, condensate trap and dilution tank, and sealant.

B. Combustion-Air Intake: Complete system, stainless steel, pipe, vent terminal with screen, inlet air coupling, and sealant.

2.6 SOURCE QUALITY CONTROL

A. Burner and Hydrostatic Test: Factory adjust burner to eliminate excess oxygen, carbon dioxide, oxides of nitrogen emissions, and carbon monoxide in flue gas and to achieve combustion efficiency; perform hydrostatic test.

B. Test and inspect factory-assembled boilers, before shipping, according to ASME Boiler and Pressure Vessel Code.

C. Allow Owner access to source quality-control testing of boilers. Notify Architect 14 days in advance of testing.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Before boiler installation, examine roughing-in for concrete equipment bases, anchor-bolt sizes and locations, and piping and electrical connections to verify actual locations, sizes, and other conditions affecting boiler performance, maintenance, and operations.
1. Final boiler locations indicated on Drawings are approximate. Determine exact locations before roughing-in for piping and electrical connections.

B. Examine mechanical spaces for suitable conditions where boilers will be installed.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 BOILER INSTALLATION

A. Equipment Mounting: Install boilers on cast-in-place concrete equipment base(s). Comply with requirements for equipment bases specified in Division 03.
1. Coordinate sizes and locations of concrete bases with actual equipment provided.
2. Construct concrete bases 6 inches high and extend base not less than 4 inches in all directions beyond the maximum dimensions of boiler.
3. Minimum Compressive Strength: 4500 psi at 28 days.

4. Install dowel rods to connect concrete base to concrete floor. Unless otherwise indicated, install dowel rods on 18-inch centers around the full perimeter of concrete base.
5. For supported equipment, install epoxy-coated anchor bolts that extend through concrete base, and anchor into structural concrete floor.
6. Place and secure anchorage devices. Use setting drawings, templates, diagrams, instructions, and directions furnished with items to be embedded.
7. Install anchor bolts to elevations required for proper attachment to supported equipment.

B. Install gas-fired boilers according to NFPA 54.

C. Assemble and install boiler trim.

D. Install electrical devices furnished with boiler but not specified to be factory mounted.

E. Install control wiring to field-mounted electrical devices.

3.3 CONNECTIONS

A. Piping installation requirements are specified in other Sections. Drawings indicate general arrangement of piping, fittings, and specialties.

B. Install piping adjacent to boiler to allow service and maintenance.

C. Install acid neutralizing canister from condensate drain of each boiler and run piping from equipment drain connection to nearest floor drain. Piping shall be at least full size of connection. Provide an isolation valve if required.

D. Connect gas piping to boiler gas-train inlet with union. Piping shall be at least full size of gas train connection. Provide a reducer if required.

E. Connect hot-water piping to supply- and return-boiler connections with shutoff valve and flanged connection.

F. Install piping from safety relief valves to nearest floor drain.

G. Boiler Venting:
1. Install flue venting kit and combustion-air intake.
2. Connect full size to boiler connections. Comply with requirements in Section 235100 "Breechings, Chimneys, and Stacks."

H. Ground equipment according to Section 260526 "Grounding and Bonding for Electrical Systems."

I. Connect wiring according to Section 260519 "Low-Voltage Electrical Power Conductors and Cables."

3.4 FIELD QUALITY CONTROL

A. Perform tests and inspections and prepare test reports.
1. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect components, assemblies, and equipment installations, including connections, and to assist in testing.

B. Tests and Inspections:
   1. Perform installation and startup checks according to manufacturer's written instructions.
   2. Leak Test: Hydrostatic test. Repair leaks and retest until no leaks exist.
   3. Operational Test: Start units to confirm proper motor rotation and unit operation. Adjust air-fuel ratio and combustion.
   4. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.
      a. Check and adjust initial operating set points and high- and low-limit safety set points of fuel supply, water level and water temperature.
      b. Set field-adjustable switches and circuit-breaker trip ranges as indicated.

C. Remove and replace malfunctioning units and retest as specified above.

D. Occupancy Adjustments: When requested within 12 months of date of Substantial Completion provide on-site assistance in adjusting system to suit actual occupied conditions. Provide up to two visits to Project during other than normal occupancy hours for this purpose.

E. Performance Tests:
   1. Engage a factory-authorized service representative to inspect component assemblies and equipment installations, including connections, and to conduct performance testing.
   2. Boilers shall comply with performance requirements indicated, as determined by field performance tests. Adjust, modify, or replace equipment to comply.
   3. Perform field performance tests to determine capacity and efficiency of boilers.
      a. Test for full capacity.
      b. Test for boiler efficiency at 20, 40, 60, 80, 100, 80, 60, 40, and 20 percent of full capacity. Determine efficiency at each test point.
   4. Repeat tests until results comply with requirements indicated.
   5. Provide analysis equipment required to determine performance.
   6. Provide temporary equipment and system modifications necessary to dissipate the heat produced during tests if building systems are not adequate.
   7. Notify Architect in advance of test dates.
   8. Document test results in a report and submit to Architect.

3.5 DEMONSTRATION

A. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain boilers. Training session shall be video taped by Contractor. Refer to Division 01 for other requirements for "Demonstration and Training."

END OF SECTION 235216

N:\N0912.00\DOC\SPEC\2012_03-16_BID\235216 FL - CONDENSING BOILERS.DOC

SECTION 235700 - HEAT EXCHANGERS FOR HVAC

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section includes plate heat exchangers.

1.3 ACTION SUBMITTALS

A. Product Data: For each type of product.
   1. Include rated capacities, operating characteristics, and furnished specialties and accessories.

B. Shop Drawings: Signed and sealed by a qualified professional engineer. Detail equipment assemblies and indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.

1.4 INFORMATIONAL SUBMITTALS

A. Coordination Drawings: Equipment room, drawn to scale, on which the following items are shown and coordinated with each other, using input from installers of the items involved:
   1. Structural members to which heat exchangers will be attached.

B. Source quality-control reports.

C. Field quality-control reports.

D. Sample Warranty: For manufacturer's warranty.

1.5 CLOSEOUT SUBMITTALS

A. Operation and Maintenance Data: For heat exchangers to include in emergency, operation, and maintenance manuals.

1.6 WARRANTY

A. Special Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace components of domestic-water heat exchangers that fail in materials or workmanship within specified warranty period.
   1. Failures include, but are not limited to, the following:

a. Structural failures including heat exchanger, and supports.
b. Faulty operation of controls.
c. Deterioration of metals, metal finishes, and other materials beyond normal use.

2. Warranty Periods: From date of Substantial Completion.
   a. Plate, Heat Exchangers:
      1) Plate-and-Frame Type: One year(s).

PART 2 - PRODUCTS

2.1 GASKETED-PLATE HEAT EXCHANGERS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
1. Alfa Laval Inc.
2. ITT Corporation; Bell & Gossett.
3. Mueller, Paul, Company.
4. Tranter, Inc.

B. Configuration: Freestanding assembly consisting of frame support, top and bottom carrying and guide bars, fixed and movable end plates, tie rods, individually removable plates, and one-piece gaskets.

C. Construction: Fabricate and label heat exchangers to comply with ASME Boiler and Pressure Vessel Code, Section VIII, "Pressure Vessels," Division 1.

D. Frame:
1. Capacity to accommodate 20 percent additional plates.
2. Painted carbon steel with provisions for anchoring to support.

E. Top and Bottom Carrying and Guide Bars: Painted carbon steel, aluminum, or stainless steel.
1. Fabricate attachment of heat-exchanger carrying and guide bars with reinforcement strong enough to resist heat-exchanger movement during seismic event when heat-exchanger carrying and guide bars are anchored to building structure.

F. End-Plate Material: Painted carbon steel.

G. Tie Rods and Nuts: Steel or stainless steel.

H. Plate Material: 0.031 inch thick before stamping; Type 316L stainless steel.

I. Gasket Materials: Glue free, Nitrile or EPDM rubber.

J. Piping Connections: Factory fabricated of materials compatible with heat-exchanger shell. Attach tappings to shell before testing and labeling.
1. NPS 2 and Smaller: Threaded ends according to ASME B1.20.1.
2. NPS 2-1/2 and Larger: Flanged ends according to ASME B16.5 for steel and stainless-steel flanges and according to ASME B16.24 for copper and copper-alloy flanges.

K. Enclose plates in solid aluminum removable shroud.

L. Capacities and Characteristics: As scheduled on plans

2.2 ACCESSORIES

A. Hangers and Supports:
   1. Custom, steel supports for mounting on floor.
   2. Field-fabricated steel supports to ensure both horizontal and vertical support of heat exchanger. Comply with requirements in Section 230529 "Hangers and Supports for HVAC Piping and Equipment."

B. Shroud: Aluminum sheet.

2.3 SOURCE QUALITY CONTROL

A. Factory Tests: Test and inspect heat exchangers according to ASME Boiler and Pressure Vessel Code, Section VIII, "Pressure Vessels," Division 1. Affix ASME label.

B. Hydrostatically test heat exchangers to minimum of one and one-half times pressure rating before shipment.

C. Heat exchangers will be considered defective if they do not pass tests and inspections.

D. Prepare test and inspection reports.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine areas for compliance with requirements for installation tolerances and for structural rigidity, strength, anchors, and other conditions affecting performance of heat exchangers.

B. Examine roughing-in for heat-exchanger piping to verify actual locations of piping connections before equipment installation.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 GASKETED-PLATE HEAT-EXCHANGER INSTALLATION

A. Install gasketed-plate heat exchanger on custom-designed wall supports anchored to structure as indicated on Drawings.

B. Install metal shroud over installed gasketed-plate heat exchanger according to manufacturer's written instructions.

3.3 CONNECTIONS

A. Comply with requirements for piping specified in other Section 232113 "Hydronic Piping." Drawings indicate general arrangement of piping, fittings, and specialties.

B. Comply with requirements for steam and condensate piping specified in Section 232213 "Steam and Condensate Heating Piping."

C. Maintain manufacturer's recommended clearances for, service, and maintenance.

D. Install piping adjacent to heat exchangers to allow space for service and maintenance of heat exchangers. Arrange piping for easy removal of heat exchangers.

E. Install shutoff valves at heat-exchanger inlet and outlet connections.

F. Install relief valves on heat-exchanger heated-fluid connection and install pipe relief valves, full size of valve connection, to floor drain.

G. Install hose end valve to drain shell.

H. Install thermometer on heat-exchanger and inlet and outlet piping. Comply with requirements for thermometers specified in Section 230519 "Meters and Gages for HVAC Piping."

I. Install pressure gages on heat-exchanger piping. Comply with requirements for pressure gages specified in Section 230519 "Meters and Gages for HVAC Piping."

3.4 FIELD QUALITY CONTROL

A. Perform the following tests and inspections:
   1. Leak Test: After installation, charge system and test for leaks. Repair leaks and retest until no leaks exist.
   2. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.

B. Heat exchanger will be considered defective if it does not pass tests and inspections.

C. Prepare test and inspection reports.

3.5 CLEANING

A. After completing system installation, including outlet fitting and devices, inspect exposed finish. Remove burrs, dirt, and construction debris and repair damaged finishes.

3.6 DEMONSTRATION

A. Train Owner's maintenance personnel to adjust, operate, and maintain heat exchangers.

END OF SECTION 235700

N:\N0912.00\DOC\SPEC\2012_03-16_BID\235700 FL - HEAT EXCHANGERS FOR HVAC.DOC

SECTION 236416 – AMMONIA SCREW CHILLERS

PART 1 - GENERAL

1.1 PROJECT LOCATION

A. The project location is Montgomery College – Germantown-Maryland Bioscience Center. The following specifications and drawings define the scope of work.

1.2 SCOPE OF WORK

A. Equipment Manufacturer shall furnish all labor, material, equipment and services including all piping and accessories as shown on the drawings and called for in these specifications or as required for delivery of a complete and functioning chiller skid package.

B. The scope of work is to deliver to the site one rotary screw compressor chiller skid package. The skid package shall be designed to operate with R-717 as the refrigerant. The package shall provide a minimum of 250.0 tons of cooling in the chiller mode.
   1. Loading and transportation of the skid package to the site. The Controller will rig the skid package into the Equipment Room.
   2. Frick RWBII screw compressor package with demand oil pump, premium efficiency motor suitable for variable frequency drive, and a plate and frame water cooled oil cooler.
   3. Variable frequency drive with by-pass contactor and main circuit breaker disconnect. The variable frequency drive shall be mounted on the chiller package.
   4. Laser welded plate and frame water-cooled condenser with pilot high pressure receiver and associated piping and valves as shown on the drawings.
   5. Laser welded plate and frame propylene glycol chiller with surge drum, oil pot, and associated piping and valves as shown on the drawings.
   6. Supply and install all isolation valves, relief valves, control valves, and auxiliaries required for a safe and automatically controlled skid package.
   7. Supply and install all piping as shown on the drawings and listed below:
      a. Refrigerant and oil piping.
      b. Relief piping.
   8. Supply and install full charges of R-717 refrigerant and compressor oil as recommended by the compressor manufacturer.
   9. All control wiring for the following items; propylene glycol supply temperature capacity control probe, propylene glycol return temperature probe, refrigerant high pressure liquid temperature probe, refrigerant solenoid valves, and high level cutout float switch and pilot receiver electronic level control.
   10. All power and control wiring between the variable frequency drive and the compressor package.
   11. All equipment, piping, and controls shall be mounted and supported on a structural steel base. The skid package may need to be shipped partially disassembled as required to pass through an opening in the equipment room.
   12. Shop painting and touch-up painting of all equipment and piping.
   13. Supply and install all pipe and vessel insulation with protective coverings in accordance with manufacturers recommendations.
   14. Supply and install all pipe, vessel, and heat exchanger supports as required.
   15. Provide start-up and demonstration services.

16. Provide a minimum of 16 hours of training for at least six college technicians in the operation and maintenance of the package. The training shall be split equally between classroom training and field training. The classroom will be provided by Montgomery College.
17. Provide shop drawing submittals, instruction manuals, and final record documents.
18. Supply and install condenser water flow switch, compressor oil cooling water flow switch, and glycol flow switch. Control wiring to interlock these switches to the screw compressor shall also be installed.

C. Items furnished in other sections of Division 23:
1. Condenser water piping, valves, pumps, and cooling towers.
2. Compressor oil cooler water pipe, valves, or pumps.
3. Chiller glycol pipe, valves, and pumps.
4. Relief piping from the skid package to atmosphere.
5. Power wiring to the variable frequency drive.
6. Water treatment systems.
7. Floor drains, hub drains and associated under floor piping.
8. Control or communications wiring between the skid package and building automation system.
9. Control wiring for the R-717 leak detection system, cooling tower fans, condenser water pumps, glycol pumps, and compressor oil cooler water pumps.
10. Motor starters, contactors and disconnects for cooling tower fans, condenser water pumps, glycol pumps, and the compressor oil cooler water pump.
11. Compressor room ventilation and safety equipment.

1.3 CODES AND STANDARDS

A. The entire refrigeration system, including work and materials, shall be in strict accordance with applicable codes, regulations, and/or authorities having jurisdiction.

1.4 SUBMITTALS

A. Submittals shall be provided in a timely manner. If such material or equipment differs in any way from that described herein, the Owner reserves the right to refuse substitutions.

B. Six (6) copies of shop drawings covering all major equipment and materials shall include the following; compressor package, compressor motor, compressor variable frequency drive package, plate and frame water cooled condenser, pilot receiver, plate and frame propylene glycol chiller, surge drum, isolation valves, control valves, insulation materials, and float switches. All shop drawings shall contain manufacturer's name, model number, electrical data, and capacity data. All shop drawings for major equipment shall be submitted prior to fabrication.

C. Six (6) copies of installation drawings shall also be prepared by the Contractor and submitted to the Architect for approval. Installation drawings shall include; dimensional drawings of the skid package, a piping and instrumentation diagram of the skid package, and a control wiring diagram of the skid package.

D. Each shop drawing shall be certified as being checked and approved by the Architect before being submitted to the Contractor.

E. Two (2) copies of instruction manuals shall be submitted to the Architect. This manual shall include installation instructions, manufacturer's literature for maintenance and operating instructions of the major equipment, lubrication instructions, recommended spare parts and replacement parts lists, performance tables or curves for all compressors, condensers, chillers, pumps, etc.

F. Two (2) copies of "Final Record Documents" shall be submitted to the Architect showing any changes made during construction.

PART 2 - MATERIALS

2.1 WATER COOLED ROTARY SCREW COMPRESSOR PACKAGE

A. Frick Model **RWBII** refrigeration screw compressor unit designed to provide scheduled capacity when absorbing with R717 at 100.0% capacity. This rating is based upon 21.0°F SST and 100.0°F SDT with 10.0°F of non-useful suction superheat and 0.0°F sub-cooling in the condenser and provide 250TR when absorbing with R717 at 100.0% capacity. This rating is based upon 35.0°F SST and 100.0°F SDT with 10.0°F of non-useful suction superheat and 0.0°F sub-cooling in the condenser. Each screw compressor unit will be completely factory wired, piped, pressure tested, and includes the following items factory mounted (unless indicated otherwise):

1. Rotary screw compressor with automatic continuous variable capacity control and “Volumizer” volume ratio control.
2. Oversized 5.0in suction shutoff valve with check valve and suction strainer (ships loose).
3. Standard 3.0in discharge shutoff valve with check valve and cold start valve.
4. Standard oil separator with sump, oil heaters, dual relief valve assembly, and access cover for replacement of internal coalescing element(s).
5. The oil separator is designed and constructed in accordance with ASME Section VIII, Div 1 for maximum design working pressure of 300psi.
6. High capacity SuperFilter II oil filters 5 micron filters with isolation valves.
7. One (1) extra set of SuperFilter II oil filters ship loose.
8. Quantum LX microprocessor in NEMA 4 enclosure.
9. Compressor is coupled to the motor with a flexible coupling.
10. Wiring harness consisting of AC and analog wiring.
11. Oil cooling
12. Frick #3 oil
13. Water-cooled oil cooler to be plate and frame design.
14. Three-way oil temperature control valve
15. Motor: RAM Inverter Rated, 5:1
16. ODP, 40C ambient, NEMA design B, Class F insulation, 1.15 SF, low noise, 95% efficiency, 460 volt / 60 Hz operation.
17. Options Included:
    a. RAM Enhancer II Air-cooled drive (shipped loose) to be mounted on skid. NEMA 1 Enclosure, IEEE519.
    b. Filters in separate NEMA 1
    c. Oversized suction valve to reduce pressure drop.
    d. 1.0in isolation valve for pump out connection downstream of the oil separator coalescers
    e. Frick #3 oil (ships loose)
18. Temperature capacity control allows the compressor to operate on temperature or pressure control, selectable via the microprocessor control keypad
19. Input to setback pressure/temperature control via a digital input to switch between different capacity control modes.
20. Second analog input/output board.
21. Entering process temperature monitoring provides hardware and software to monitor the entering process temperature.
22. Set points available to select alarm and shutdown parameters.

B. One Frick RWBII screw compressor package shall be installed on the skid complete with the following major components; positive displacement twin rotor screw compressor direct driven at 3550 nominal RPM, premium efficiency motor, variable frequency drive, variable volume ratio control, Quantum LX control panel with remote communications and control capability, OSHA approved drive coupling and guard, demand oil pump, 5" suction and 3" discharge stop valves, and 3" discharge check valves, suction scale trap/strainer, oil separator with heaters and initial oil charge, plate and frame water cooled oil cooler, three-way oil temperature control valve, temperature capacity control based on ethylene glycol supply temperature, oil filter assembly with one extra set of oil filter cartridges, and pressure relief valves. The above components, except the variable frequency drive, shall be factory wired, piped, tested, painted, and assembled on a structural steel base. All factory piping shall be performed in accordance with the latest ANSI B31.5 code for pressure piping.

C. R-717 capacity shall be 250 tons of refrigeration when operating at a +35°F saturated suction temperature and a +100°F saturated condensing temperature. The above ratings are based on 0°F of condenser subcooling and a non-useful suction gas superheat of 10°F.

D. The screw compressor casting shall be designed and tested per the requirements of ASHRAE 15 safety code for a maximum discharge pressure of 350 PSIG.

E. The rotors shall be precision machined to meet the tolerances of the latest SRM asymmetric profile.

F. The rotor antifriction bearings shall have a rated bearing life in excess of 100,000 hours at design operating conditions and shall be arranged for continuous lubrication.

G. The mechanical shaft seal shall be a single face type with a spring loaded carbon stationary surface riding against a cast iron rotating seat. The seal shall be capable of sealing up to 350 PSIG. Shaft seals shall be vented to low pressure to extend the life of the seal.

H. Variable volume ratio control shall be furnished with a range 2.2 Vi to 5.0 Vi.

I. Automatic capacity control shall be furnished to provide full modulating capacity control from 100% to approximately 10% of full load. This control shall be achieved by time proportional signals sent from the compressor microprocessor control panel. Temperature capacity control based on the ethylene glycol supply temperature shall be furnished. The standard suction pressure capacity control feature will not be operable for this application. However, a low suction pressure safety override shall be provided to stop loading or force unload the compressor.

J. The lubrication system shall be furnished with a demand oil pump with close coupled motor, suction strainer, bypass check valve, and isolation valves. The pump shall cycle off automatically when not required. A differential pressure cutout shall be provided. A three-way bellows operated oil temperature control valve shall be furnished to prevent low oil temperature.

K. The compressor package shall be furnished with a three-stage horizontal oil separator with integral sump and 1" valved pumpout connection. Two sight glasses shall be located in the reservoir section and one in the coalescing section. The separator shall be designed and constructed in accordance with ASME Section VIII, Division 1 with a maximum design working pressure of 300 PSIG and shall be furnished with a dual relief valve assembly. Two 500 watt heaters shall maintain oil temperature at +67°F during compressor shutdown. The heaters shall be replaceable without shutting down the compressor.

L. The compressor separator shall be furnished with coalescent separator elements capable of final oil / gas separation of particles down to less than 1 micron. An access manway shall be furnished to allow replacement of the internal coalescing elements.

M. Lubrication and injection oil for the compressor shall pass through a multi-cartridge, 15 micron, oil filter assembly complete with isolation and drain valves.

N. The compressor package shall be furnished with a plate and frame water cooled oil cooler. The cooler is designed and constructed in accordance with ASME Section VIII, Division 1 with a MAWP of 300 PSIG on the oil side and 150 psig on the water side. Oil temperature is maintained between 110°F and 130°F for ammonia and halocarbons with a thermally controlled valve. The oil cooler is mounted on the unit with the oil piping connected. Water connections and controls are field installed.

O. A Frick "Quantum LX" control system shall be factory installed on the compressor package. The microprocessor control system shall be completely piped and wired with all necessary safety and operating devices. The NEMA 4 control panel shall house the microprocessor and electrical terminals for field wiring. All transducers shall be wired and piped into a common manifold. A customized communications interface package shall be provided for connection to an existing building automation system and / or a standard modem. The following features shall be provided as a minimum to monitor and control the complete chiller package through the building automation system:

1. The microprocessor shall be capable of transmitting the following analog information to the building automation system or remote computer via an RS-422 communications cable:
    a. Suction pressure.
    b. Discharge pressure.
    c. Oil pressure.
    d. Oil filter pressure.
    e. Oil separator temperature.
    f. Inlet oil temperature.
    g. Discharge temperature.
    h. Suction temperature.
    i. Propylene glycol supply temperature.
    j. Propylene glycol return temperature.
    k. Saturated condensing temperature.
    l. Slide valve position.
    m. Motor current (%).
2. The microprocessor shall be capable of transmitting the following status information to the building automation system or a remote computer:
    a. Ready to start (contact closure output).
    b. Safety alarm condition (contact closure output).
    c. Cycling shutdown condition (contact closure output).
3. The microprocessor shall be capable of accepting the following setpoints from the building automation system or a remote computer:
    a. Propylene glycol supply temperature setpoint for ice building mode. Must be able to switch between set point for ice building mode (+32.0°F to +22.0°F) and set point for system cooling mode (+56.0 to +40°F).
    b. Motor current limit set point. The building automation system must be able to limit motor current between 0% and 100% during pulldown or under normal operating conditions.
4. The microprocessor shall be capable of accepting the following commands from the building automation system or a remote computer:
    a. Set compressor to remote control operation.
    b. Set compressor to local control operation.
5. The communications package shall include documentation describing how to send and retrieve the above information.

P. The following indications or readouts shall be displayed; suction pressure and temperature, ethylene glycol supply and return temperatures, discharge pressure and temperature, saturated condensing temperature via a temperature probe in the condenser high pressure liquid drain line, oil pressure and temperature, filter

pressure drop, slide valve position and mode, volume ratio position and mode, oil pump on / off, % full load motor amps, compressor operating hours, number of compressor starts, and compressor operating mode. The continuous status display shall also indicate that an alarm condition exists or other messages as required.

Q. The microprocessor shall display all fixed and adjustable setpoints and safeties as follows; suction pressure override, glycol supply temperature capacity control, low suction pressure alarm and cutout, motor recycle delay time, current transformer factor, motor current limit (%), motor controller fault, high discharge pressure alarm and cutout, oil heater temperature control, oil cooling temperature control, high oil filter pressure drop alarm, high discharge temperature alarm and cutout, high oil temperature alarm and cutout, high oil pressure alarm and cutout, low oil temperature alarm and cutout, low oil pressure alarm and cutout, glycol "no flow" cutout, condenser water "no flow" cutout, oil cooler water "no flow" cutout, and high motor current cutout.

R. The microprocessor shall display and store the cause, day, date and time of occurrence of an alarm or cutout condition. In the event of a cutout condition, the operating conditions at the time of the cutout shall be stored and available to the operator on a separate freeze display screen. A pre-alarm annunciation on all vital functions shall give warning of a potential shutdown condition.

S. The microprocessor shall reset a time proportioning capacity control at varying time intervals corresponding to deviations from compressor setpoints to provide stable operation under widely changing load conditions. The microprocessor shall also monitor operating conditions and adjust the compressor to operate at the most efficient volume ratio at both full and part load conditions. The microprocessor shall be programmable to automatically change the glycol temperature (automatic setback) setpoint based on a preset time schedule entered into the microprocessor by the operator. An access code protection system shall be furnished to allow only authorized personnel to vary the adjustable setpoints. However, setpoint display shall be available without the access code. The microprocessor panel shall also include a clearly marked emergency stop button.

T. The compressor manufacturer shall furnish start-up service and supervision for the compressor package. This shall include all labor, materials, tools, meals, lodging and transportation for a factory start-up representative to be on the job for a minimum of three working days.

U. The compressor package shall be furnished with a factory mounted open drip proof motor suitable for inverter duty. The motor shall be NEMA premium efficiency, 460 volt / 3Ø / 60 hertz input, with a 1.15 service factor.
   1. The motor shall meet or exceed NEMA Premium Efficiency standards.
   2. An oversized motor junction box shall be furnished to accommodate power feed connection.
   3. Compressor motor shall be RAM, Toshiba, Westinghouse, or approved equal.

V. The compressor package shall be furnished with a variable frequency drive complete with a solid state by-pass contactor.
   1. Requirements:
      a. The drive shall accept 460 volt / 3Ø / 60 hertz input.
      b. The controls shall be housed in a NEMA 1 indoor enclosure.
      c. A control circuit transformer individually fused shall provide 120 volt / 1Ø / 60 hertz power to the compressor microprocessor panel and oil heaters.
      d. A 460 volt / 3Ø / 60 hertz across-the-line motor starter shall be provided for the compressor oil pump.
      e. A compressor motor current transformer shall signal the microprocessor control panel if the motor exceeds its preset load limits.
      f. A 500% maximum current limiter and current override adjustable voltage ramp shall be furnished.
      g. The drive shall include; undervoltage protection, overvoltage protection, phase loss protection, phase reversal protection, and all appropriate interlocks and internal wiring. Terminals shall be marked to correspond to the compressor manufacturer's diagrams.

2. The drive shall be mounted on the chiller package.
3. The compressor starter shall be Underwriters Laboratories recognized or CSA certified. The starter package shall be RAM or approved equal.

2.2 PLATE AND FRAME WATER COOLED CONDENSER

A. Laser welded plate and frame water cooled condenser shall be installed on the skid package. The condenser shall be designed and constructed in accordance with ASME Section VIII, Division 1 with a MAWP of 300 PSIG on the refrigerant side and 150 PSIG MAWP on the water side. The unit shall be constructed with corrugated pattern 316 stainless steel plates laser welded together to form cassettes. The cassettes shall be gasketed and compressed into a carbon steel frame with end covers, carrying bar, and tightening bolts. The condenser shall be mounted on the skid package such that plate removal for cleaning will be possible. Maximum water velocity of 12 fps, 0.0005 water side fouling factor, and 15 PSI maximum water pressure drop.

2.3 PLATE AND FRAME PROPYLENE GLYCOL CHILLER

A. One laser welded plate and frame ethylene glycol chiller shall be installed on theskid package. The chiller shall be designed and constructed in accordance with ASME Section VIII, Division 1 with a MAWP of 300 PSIG on the refrigerant side and 150 PSIG MAWP on the propylene glycol side. The unit shall be constructed with corrugated pattern 316 stainless steel plates laser welded together to form cassettes. The cassettes shall be gasketed and compressed into a carbon steel frame with end covers, carrying bar, and tightening bolts. The chiller shall be furnished with a factory supplied insulation and drip tray package. The chiller shall be mounted on the skid package such that plate removal for cleaning will be possible. Flooded R-717 evaporating at 21°F at 4 fps minimum glycol velocity, 12 fps maximum glycol velocity, 0.0005 glycol side fouling factor, and 5 PSI maximum glycol pressure drop.

B. Minimum R-717 performance for chiller mode shall be 249.3 tons of cooling 375 GPM of 30% propylene glycol by volume, +_56°F glycol inlet, +40°F glycol outlet, flooded R-717 evaporating at +35°F.

2.4 PRESSURE VESSELS

A. One glycol chiller surge drum, one oil pot, and one pilot receiver shall be installed on the skid package. All vessels shall be designed and constructed in accordance with Section VIII, Division 1 of the latest ASME code for pressure vessels. Vessels shall be of all steel construction with ASME data plates mounted above the vessel insulation.

B. The vessels shall be furnished with all necessary connections, internal baffles, internal piping, lifting lugs, supports, etc. as required for proper operation. All internal baffling and piping shall be adequately supported to withstand shipment, installation, and continuous streams of gas and liquid.

C. The vessels shall be thoroughly cleaned of welding slag, scale and other foreign matter and shall be thoroughly dried after testing. After testing, all connections shall be capped for shipment.

D. The vessels shall be shop painted, outside only, with two coats of red oxide primer.

E. The glycol chiller surge drum shall have a MAWP of 300 PSIG, the oil pot shall have a MAWP of 400 PSIG, and the pilot receiver shall have a MAWP of 300 PSIG.

F. Pressure vessels shall be Frick, RVS, FES or approved equal.

2.5 REFRIGERANT CONTROLS

A. General:
   1. Refrigerant controls and accessories shall be supplied and installed as shown on the drawings and as specified below. Companion flanges shall be the same size as the adjacent pipe size unless noted otherwise.

B. Solenoid valves:
   1. Solenoid valves shall be of the pilot operated, spring closing, normally closed type with a 120/1/60 VAC watertight coil and pilot light, teflon seats, steel or ductile iron body, stainless steel piston, manual jacking stem. A close coupled 60-mesh strainer complete with socket weld companion flanges when called for on the drawings shall precede solenoid valves.
   2. Solenoid valves and strainers shall be Hansen Technologies, Refrigerating Specialties or approved equal.

C. Float switches:
   1. Float switches shall be suitable for refrigerant service and shall be magnetically actuated, mechanically operated, hermetically seated, with a 120/1/60 VAC SPDT switch and 3/4" FPT / 1" butt weld connections.
   2. Float switches shall be Hansen Technologies (type HLL), Refrigerating Specialties (type LL) or approved equal.

D. Relief valves:
   1. All pressure vessels and heat exchangers shall be equipped with ASME certified relief valves sized and rated in accordance with the latest ASHRAE 15 and ANSI B9.1 code requirements. Dual relief valves shall be required on vessels having an internal volume of 10 cubic feet or more.
   2. Relief valves shall be Hansen Technologies, Refrigerating Specialties, Shank or approved equal.

E. Liquid level bulls eyes:
   1. Liquid level bulls eyes shall be installed as shown on the drawings. Bulls eyes shall be equipped with reflex lenses.
   2. Bulls eyes shall be installed at approximately 12" on center on all float columns. Bulls eyes shall be equipped with saddle milled housings and frost shields where required.
   3. Liquid level bulls eyes shall be HA Phillips, Hansen Technologies or approved equal.

F. Pilot Receiver Level Control:
   1. Danfoss liquid level control system to consist of motorized valve type ICM with ICAD actuator, in-line strainer, AKS41/41U transmitter and probe, solenoid valve, EKC347 liquid level controller, and isolation hand valves all mounted and wired for level control of pilot receiver for high side float control sequence.

G. Hand expansion valves:
   1. Hand expansion valves shall be installed as shown on the drawings. Valves shall have socket weld or butt weld connections.
   2. Valves shall be of the back-seating type for packing replacement and shall have slotted throttling plugs, tight closing teflon seats, stainless steel stems, and bar handles.
   3. Hand expansion valves shall be Hansen Technologies, Refrigerating Specialties or approved equal.

2.6 PIPING SYSTEMS

A. Refrigerant and oil piping:
   1. General:

a. All components in direct contact with ammonia SHALL NOT contain copper, brass, mercury or alloys of these materials.
b. All materials used in the system shall be suitable for R-717 service, and shall comply with the latest ANSI/ASME B31.5 Code for Pressure Piping and meet system pressure-temperature requirements.

2. Piping:
   a. Lines 1-1/2" and smaller shall be schedule 80, A-106B seamless black steel pipe.
   b. Lines 2" and larger shall be schedule 40, A-53B electric resistance welded black steel pipe.
3. Joints:
   a. Joints in lines 1-1/2" and smaller shall be 3000# forged steel socket weld couplings. Joints in lines 2" and larger shall be butt welded. Where screwed joints on gauges, etc. are necessary, joints shall be made using Expando joint compound. Screwed joints shall be avoided wherever possible.
4. Fittings:
   a. Fittings for 1-1/2" and smaller pipe shall be 3000# forged steel socket welded. Fittings for 2" and larger pipe shall be butt welded.
5. Refrigerant shutoff valves:
   a. All valves shall be of the globe or angle type as shown on the drawings. Valves 2-1/2" and smaller shall have socket weld connections. Valves 3" and larger shall have butt weld connections. All valves shall be Hansen Technologies, Refrigerating Specialties or approved equal.
   b. All isolating valves shall be full line size of piping and furnished with hand wheels. Angle valves shall be used wherever possible.

PART 3 - EXECUTION

3.1 PIPING

A. Piping of the plate and frame heat exchangers must be routed to facilitate easy cleaning and removal of the plates.

B. Welded joints shall be made only by certified welders thoroughly experienced in welding on pressure piping systems. All welded joints shall be made in such a manner that the inside of the pipe is relatively free from welding slag, scale and drippings.

C. Long radius elbows shall be used to minimize pressure drops.

D. All piping shall be fabricated, installed, supported and tested in accordance with the latest edition of the American National Standard Code for Pressure Piping ANSI B31.5.

3.2 PAINTING

A. After the skid package is set in place by the Owner and ready for operation, the Contractor shall touch-up all equipment and piping that has become marred during shipping or installation.

B. The Contractor shall also paint all un-insulated pressure vessels, un-insulated black steel pipe, and steel supports supplied by the Contractor.

3.3 EVACUATION AND VACUUM DEHYDRATION

A. After pressure testing the skid package for leaks, the skid package shall be evacuated to remove air and moisture. The package shall be evacuated down to a minimum of 10,000 microns. Break the vacuum with refrigerant vapor and raise to 20 PSIG as a holding charge until ready to charge the system.

END OF SECTION 236416

N:\N0912.00\DOC\SPEC\2012_03-16_BID\236416 - AMMONIA SCREW CHILLERS.DOC

SECTION 236420- CENTRIFUGAL WATER CHILLERS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:
   1. Packaged, water-cooled, electric-motor-driven centrifugal chillers.
   2. Packaged, portable refrigerant recovery units.

B. Related Section:
   1. Section 283500 "Refrigerant Detection and Alarm" for refrigerant monitors, alarms, supplemental breathing apparatus, and ventilation equipment interlocks.

1.3 DEFINITIONS

A. BAS: Building automation system.

B. COP: Coefficient of performance. The ratio of the rate of heat removal to the rate of energy input using consistent units for any given set of rating conditions.

C. EER: Energy-efficiency ratio. The ratio of the cooling capacity given in terms of Btu/h to the total power input given in terms of watts at any given set of rating conditions.

D. IPLV: Integrated part-load value. A single-number part-load efficiency figure of merit calculated per the method defined by ARI 550/590 and referenced to ARI standard rating conditions.

E. kW/Ton: The ratio of total power input of the chiller in kilowatts to the net refrigerating capacity in tons at any given set of rating conditions.

F. NPLV: Nonstandard part-load value. A single-number part-load efficiency figure of merit calculated per the method defined by ARI 550/590 and intended for operating conditions other than the ARI standard rating conditions.

1.4 PERFORMANCE REQUIREMENTS

A. Condenser-Fluid Temperature Performance:
   1. Startup Condenser-Fluid Temperature: Chiller shall be capable of starting with an entering condenser-fluid temperature of 55 deg F and providing stable operation until the system temperature is elevated to the minimum operating entering condenser-fluid temperature.

2. Minimum Operating Condenser-Fluid Temperature: Chiller shall be capable of continuous operation over the entire capacity range indicated with an entering condenser-fluid temperature of 60 deg F.
3. Make factory modifications to standard chiller design if necessary to comply with performance indicated.

B. Site Altitude: Chiller shall be suitable for altitude at which installed without affecting performance indicated. Make adjustments to affected chiller components to account for site altitude.

C. Performance Tolerance: Comply with the following in lieu of ARI 550/590:
1. Allowable Capacity Tolerance: Zero percent.
2. Allowable IPLV/NPLV Performance Tolerance: Zero percent.

1.5 ACTION SUBMITTALS

A. Product Data: For each type of product indicated. Include refrigerant, rated capacities, operating characteristics, furnished specialties, and accessories.
1. Performance at ARI standard conditions and at conditions indicated.
2. Performance at ARI standard unloading conditions.
3. Minimum evaporator flow rate.
4. Refrigerant capacity of chiller.
5. Oil capacity of chiller.
6. Fluid capacity of evaporator and condenser.
7. Characteristics of safety relief valves.
8. Minimum entering condenser-fluid temperature.
9. Performance at varying capacities with constant design condenser-fluid temperature. Repeat performance at varying capacities for different condenser-fluid temperatures from design to minimum in 5 deg F increments.

B. LEED Submittals:
1. Product Data for Credit EA 4: Documentation indicating that equipment and refrigerants comply.

C. Shop Drawings: Include plans, elevations, sections, details, and attachments to other work.
1. Detail equipment assemblies and indicate dimensions, weights, load distribution, required clearances, method of field assembly, components, and location and size of each field connection.
2. Wiring Diagrams: For power, signal, and control wiring.

1.6 INFORMATIONAL SUBMITTALS

A. Coordination Drawings: Floor plans, drawn to scale, on which the following items are shown and coordinated with each other, using input from installers of the items involved:
1. Structural supports.
2. Piping roughing-in requirements.
3. Wiring roughing-in requirements, including spaces reserved for electrical equipment.
4. Access requirements, including working clearances for mechanical controls and electrical equipment, and tube pull and service clearances.

B. Certificates: For certification required in "Quality Assurance" Article.

C. Source quality-control reports.

D. Startup service reports.

E. Warranty: Sample of special warranty.

1.7 CLOSEOUT SUBMITTALS

A. Operation and Maintenance Data: For each chiller to include in emergency, operation, and maintenance manuals.

1.8 QUALITY ASSURANCE

A. ARI Certification: Certify chiller according to ARI 550 certification program.

B. ARI Rating: Rate chiller performance according to requirements in ARI 550/590.

C. ASHRAE Compliance:
1. ASHRAE 15 for safety code for mechanical refrigeration.
2. ASHRAE 147 for refrigerant leaks, recovery, and handling and storage requirements.

D. ASHRAE/IESNA Compliance: Applicable requirements in ASHRAE/IESNA 90.1.

E. ASME Compliance: Fabricate and label chillers to comply with ASME Boiler and Pressure Vessel Code: Section VIII, Division 1. For chillers charged with R-134a refrigerant, include an ASME U-stamp and nameplate certifying compliance.

F. Comply with NFPA 70.

G. Comply with requirements of UL and UL Canada, and include label by a qualified testing agency showing compliance.

1.9 DELIVERY, STORAGE, AND HANDLING

A. Ship chillers from the factory fully charged with refrigerant.

B. Ship each chiller with a full charge of refrigerant. Charge each chiller with nitrogen if refrigerant is shipped in containers separate from chiller.

1.10 COORDINATION

A. Coordinate sizes and locations of concrete bases with actual equipment provided. Cast anchor-bolt inserts into bases.

B. Coordinate sizes, locations, and anchoring attachments of structural-steel support structures.

1.11 WARRANTY

A. Special Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace components of chillers that fail in materials or workmanship within specified warranty period.

1. Extended warranties include, but are not limited to, the following:
    a. Complete chiller including refrigerant and oil charge.
    b. Complete compressor and drive assembly including refrigerant and oil charge.
    c. Refrigerant charge.
    d. Parts and labor.
    e. Loss of refrigerant charge for any reason.
2. Warranty Period: Five years from date of Substantial Completion.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
    1. McQuay International.

2.2 MANUFACTURED UNIT

A. Description: Factory-assembled and -tested chiller complete with compressor, compressor motor, compressor motor controller, evaporator, condenser, controls, interconnecting unit piping and wiring, and indicated accessories.
    1. Disassemble chiller into major assemblies as required by the installation after factory testing and before packaging for shipment.
    2. For chillers with dual compressors, provide each compressor with a dedicated motor and motor controller, and provide for continued operation when either compressor-drive assembly fails or is being serviced.

B. Fabricate chiller mounting base with reinforcement strong enough to resist chiller movement during a seismic event when chiller is anchored to field support structure.

2.3 COMPRESSOR-DRIVE ASSEMBLY

A. Description: Single-stage or multistage, magnetic bearing variable-displacement, centrifugal-type compressor driven by an electric motor.
    1. Provide oil-free compressor technology using a permanent magnet synchronous motor, magnetic bearings, integral variable frequency controller, and digital electronic controls.

B. Compressor:
    1. Casing: Cast iron, precision ground.
    2. Impeller: High-strength cast aluminum or cast-aluminum alloy on carbon- or alloy-steel shaft.
    3. Bearing: Frictionless magnetic bearings.

C. Drive: Direct, hermetic design using an electric motor as the driver.
    1. Seals: Seal drive assembly to prevent refrigerant leakage.

D. Compressor Motor:
    1. Continuous-duty, squirrel-cage, induction-type, two-pole motor with energy efficiency required to suit chiller energy efficiency indicated.
    2. Factory mounted, aligned, and balanced as part of compressor assembly before shipping.

3. Motor shall be of sufficient capacity to drive compressor throughout entire operating range without overload and with sufficient capacity to start and accelerate compressor without damage.
4. Provide motor with thermistor or RTD in each of three-phase motor windings to monitor temperature and report information to chiller control panel.
5. Provide motor with thermistor or RTD to monitor bearing temperature and report information to chiller control panel.

E. Vibration Balance: Balance chiller compressor and drive assembly to provide a precision balance that is free of noticeable vibration over the entire operating range.
1. Overspeed Test: 25 percent above design operating speed.

F. Service: Easily accessible for inspection and service.
1. Compressor's internal components shall be accessible without having to remove compressor-drive assembly from chiller.
2. Provide lifting lugs or eyebolts attached to casing.

G. Economizers: For multistage chillers, provide interstage economizers.

H. Capacity Control: Modulating, variable-inlet, guide-vane assembly combined with variable frequency drive, to achieve performance indicated.
1. Maintain stable operation that is free of surge, cavitation, and vibration throughout range of operation. Configure to achieve most energy-efficient operation possible.
2. Operating Range: From 100 to 15 percent of design capacity.
3. Condenser-Fluid Unloading Requirements over Operating Range: Drop-in entering condenser-fluid temperature per ARI allowed condenser relief for each 10 percent in capacity reduction.
4. Chillers with variable frequency controllers shall modulate compressor speed with variable-inlet, guide-vane control to achieve optimum energy efficiency.

2.4 REFRIGERATION

A. Refrigerant:
1. Type: R-134a; ASHRAE 34, Class A1.
2. Compatibility: Chiller parts exposed to refrigerants shall be fully compatible with refrigerants, and pressure components shall be rated for refrigerant pressures.

B. Refrigerant Flow Control: Manufacturer's standard refrigerant flow-control device satisfying performance requirements indicated.

C. Pressure Relief Device:
1. Comply with requirements in ASHRAE 15 and in applicable portions of ASME Boiler and Pressure Vessel Code: Section VIII, Division 1.
2. For Chillers Using R-134a: ASME-rated, spring-loaded, pressure relief valve; single- or multiple-reseating type. Pressure relief valve(s) shall be provided for each heat exchanger. Condenser shall have dual valves with one being redundant and configured to allow either valve to be replaced without loss of refrigerant.

D. Refrigeration Transfer: Provide service valves and other factory-installed accessories required to facilitate transfer of refrigerant from chiller to a remote refrigerant storage and recycling system. Comply with requirements in ASHRAE 15 and ASHRAE 147.

E. Refrigerant Isolation for Chillers Using R-134a: Factory install positive shutoff, manual isolation valves in the compressor discharge line to the condenser and the refrigerant liquid line leaving the condenser to allow for isolation and storage of full refrigerant charge in the chiller condenser shell. In addition,

provide isolation valve on suction side of compressor from evaporator to allow for isolation and storage of full refrigerant charge in the chiller evaporator shell.

2.5 EVAPORATOR

A. Description: Shell-and-tube design with water in tubes and refrigerant surrounding tubes within shell. Shell is separate from condenser.

B. Shell Material: Carbon-steel rolled plates with continuously welded seams or seamless pipe.

C. Designed to prevent liquid refrigerant carryover from entering compressor.

D. Provide evaporator with sight glass or other form of positive visual verification of liquid-refrigerant level.

E. Tubes:
1. Individually replaceable from either end and without damage to tube sheets and other tubes.
2. Mechanically expanded into end sheets and physically attached to intermediate tube sheets.
3. Material: Copper-nickel alloy.
4. Nominal OD: 3/4 or 1 inch.
5. Minimum Wall Thickness: 0.025 inch.
6. External Finish: Manufacturer's standard.
7. Internal Finish: Enhanced or smooth.

F. End Tube Sheets: Continuously welded to each end of shell; drilled and reamed to accommodate tubes with positive seal between fluid in tubes and refrigerant in shell.

G. Intermediate Tube Sheets: Installed in shell and spaced along length of tube at intervals required to eliminate vibration and to avoid contact of tubes resulting in abrasion and wear.

H. Water Box:
1. Cast-iron or carbon-steel construction; arranged to provide visual inspection and cleaning of tubes from either end without disturbing refrigerant in shell.
2. Marine type for water box with piping connections. Standard type for water box without piping connections.
3. Provide marine water-box with lifting lugs or eyebolts.
4. Nozzle Pipe Connections: Welded, ASME B16.5, raised-face flange.
5. Thermistor or RTD temperature sensor factory installed in each nozzle.
6. Fit each water box with 1-inch drain connection at low point and vent connection at high point, each with threaded plug.

2.6 CONDENSER

A. Description: Shell-and-tube design with water in tubes and refrigerant surrounding tubes within shell. Shell is separate from evaporator.

B. Shell Material: Carbon-steel rolled plates with continuously welded seams or seamless pipe.

C. Designed to prevent direct impingement of high-velocity hot gas from compressor discharge on tubes.

D. Provide condenser with sight glass or other form of positive visual verification of refrigerant charge and condition.

E. Tubes:
   1. Individually replaceable from either end and without damage to tube sheets and other tubes.
   2. Mechanically expanded into end sheets and physically attached to intermediate tube sheets.
   3. Material: Copper-nickel alloy.
   4. Nominal OD: 3/4 or 1 inch.
   5. Minimum Wall Thickness: 0.025 inch.
   6. External Finish: Manufacturer's standard.
   7. Internal Finish: Enhanced or smooth.

F. End Tube Sheets: Continuously welded to each end of shell; drilled and reamed to accommodate tubes with positive seal between fluid in tubes and refrigerant in shell.

G. Intermediate Tube Sheets: Installed in shell and spaced along length of tube at intervals required to eliminate vibration and to avoid contact of tubes resulting in abrasion and wear.

H. Water Box:
   1. Cast-iron or carbon-steel construction; arranged to provide visual inspection and cleaning of tubes from either end without disturbing refrigerant in shell.
   2. Marine type for water box with piping connections. Standard type for water box without piping connections.
   3. Provide marine water-box with lifting lugs or eyebolts.
   4. Nozzle Pipe Connections: Welded, ASME B16.5, raised-face flange.
   5. Thermistor or RTD temperature sensor factory installed in each nozzle.
   6. Fit each water box with 1-inch drain connection at low point and vent connection at high point, each with threaded plug.

I. Additional Corrosion Protection:
   1. Electrolytic corrosion-inhibitor anode.
   2. Coat wetted surfaces with a corrosion-resistant finish.
   3. Using same material as tubes, clad surfaces of end tube sheets in contact with fluid. Coat other wetted surfaces, including water boxes, with a corrosion-resistant finish.

2.7 INSULATION

A. Closed-cell, flexible elastomeric thermal insulation complying with ASTM C 534, Type I for tubular materials and Type II for sheet materials.
   1. Thickness: 2 inches.

B. Adhesive: As recommended by insulation manufacturer.

C. Factory-applied insulation over all cold surfaces of chiller capable of forming condensation. Components shall include, but not be limited to, evaporator shell and end tube sheets, evaporator water boxes including nozzles, refrigerant suction pipe from evaporator to compressor, cold surfaces of compressor, refrigerant-cooled motor, and auxiliary piping.
   1. Apply adhesive to 100 percent of insulation contact surface.
   2. Before insulating steel surfaces, prepare surfaces for paint, and prime and paint as indicated for other painted components. Do not insulate unpainted steel surfaces.
   3. Seal seams and joints to provide a vapor barrier.
   4. After adhesive has fully cured, paint exposed surfaces of insulation to match other painted parts.

2.8 ELECTRICAL

A. Factory installed and wired, and functionally tested at factory before shipment.

B. Single-point, field-power connection to non fused disconnect switch. Minimum withstand rating shall be as required by electrical power distribution system, but not less than 65,000 A.
   1. Branch power circuit to each motor, electric heater, dedicated electrical load, and controls non fused with disconnect switch or circuit breaker.
      a. NEMA KS 1, heavy-duty, fusible switch with rejection-type fuse clips rated for fuses. Select and size fuses to provide Type 2 protection according to IEC 60947-4-1.
      b. NEMA AB 1, motor-circuit protector (circuit breaker) with field-adjustable, short-circuit-trip set point.
   2. NEMA ICS 2-rated motor controller for auxiliary motors, hand-off-auto switch, and overcurrent protection for each motor. Provide variable frequency controller for each variable-speed motor furnished.
   3. Control-circuit transformer with primary and secondary side fuses.

C. Terminal blocks with numbered and color-coded wiring to match wiring diagram. Spare wiring terminal block for connection to external controls or equipment.

D. Factory-installed wiring outside of enclosures shall be in metal raceway except make terminal connections with not more than a 24-inch length of liquidtight conduit.

E. Factory install and wire capacitor bank for the purpose of power factor correction to 0.95 at all operating conditions.
   1. If capacitors are mounted in a dedicated enclosure, use same NEMA enclosure type as motor controller. Provide enclosure with service entrance knockouts and bushings for conduit.
   2. Capacitors shall be non-PCB dielectric fluid, metallized electrode design, low loss with low-temperature rise. The kVAr ratings shall be indicated and shall not exceed the maximum limitations set by NFPA 70. Provide individual cells as required.
   3. Provide each cell with current-limiting replaceable fuses and carbon-film discharge resistors to reduce residual voltage to less than 50 V within one minute after de-energizing.
   4. Provide a ground terminal and a terminal block or individual connectors for phase connection.

2.9 VARIABLE FREQUENCY CONTROLLER

A. Motor controller shall be factory mounted and wired on the chiller to provide a single-point, field-power termination to the chiller and its auxiliaries.

B. Description: NEMA ICS 2; listed and labeled as a complete unit and arranged to provide variable speed by adjusting output voltage and frequency.

C. Enclosure: Unit mounted, NEMA 250, Type 1, with hinged full-front access door with lock and key.

D. Integral Disconnecting Means: Door-interlocked, NEMA AB 1, instantaneous-trip circuit breaker with lockable handle. Minimum withstand rating shall be as required by electrical power distribution system, but not less than 65,000 A.

E. Technology: Pulse width modulated (PWM) output with insulated gate bipolar transistors (IGBT); suitable for variable torque loads.

F. Controller shall consist of a rectifier converter section, a digital/analog driver regulator section, and an inverter output section.
   1. Rectifier section shall be a full-wave diode bridge that changes fixed-voltage, fixed-frequency, ac line power to a fixed dc voltage. Silicon controller rectifiers, current source inverters, and paralleling of devices are unacceptable. Rectifier shall be insensitive to phase rotation of the ac line.
   2. Regulator shall provide full digital control of frequency and voltage.
   3. Inverter section shall change fixed dc voltage to variable-frequency, variable ac voltage, for application to a squirrel-cage motor. Inverter shall produce a sine-coded, pulse width modulated (PWM) output wave form and shall conduct no radio-frequency interference back to the input power supply.

G. Output Rating: Three phase; with voltage proportional to frequency throughout voltage range.

H. Operating Requirements:
   1. Input AC Voltage Tolerance: 460-V ac, plus 10 percent or 506 V maximum.
   2. Input frequency tolerance of 60 Hz, plus or minus 2 Hz.
   3. Capable of driving full load, without derating, under the following conditions:
      a. Ambient Temperature: 0 to 50 deg C.
      b. Relative Humidity: Up to 95 percent (noncondensing).
      c. Altitude: 3300 feet.
   4. Minimum Efficiency: 96 percent at 60 Hz, full load.
   5. Minimum Displacement Primary-Side Power Factor: 95 percent without harmonic filter, 98 percent with harmonic filter.
   6. Overload Capability: 1.05 times the full-load current for 7 seconds.
   7. Starting Torque: As required by compressor-drive assembly.
   8. Speed Regulation: Plus or minus 1 percent.
   9. Isolated control interface to allow controller to follow control signal over a 10:1 speed range.
   10. To avoid equipment resonant vibrations, provide critical speed lockout circuitry to allow bands of operating frequency at which controller shall not operate continuously.
   11. Capable of being restarted into a motor coasting in either the forward or reverse direction without tripping.

I. Internal Adjustability Capabilities:
   1. Minimum Output Frequency: 6 Hz.
   2. Maximum Output Frequency: 60 Hz.
   3. Acceleration: 2 seconds to a minimum of 60 seconds.
   4. Deceleration: 2 seconds to a minimum of 60 seconds.
   5. Current Limit: 30 percent to a minimum of 100 percent of maximum rating.

J. Self-Protection and Reliability Features: Subjecting the controller to any of the following conditions shall not result in component failure or the need for replacement:
   1. Overtemperature.
   2. Short circuit at controller output.
   3. Ground fault at controller output. Variable frequency controller shall be able to start a grounded motor.
   4. Open circuit at controller output.
   5. Input undervoltage.
   6. Input overvoltage.
   7. Loss of input phase.
   8. Reverse phase.
   9. AC line switching transients.
   10. Instantaneous overload, line to line or line to ground.
   11. Sustained overload exceeding 100 percent of controller rated current.

12. Starting a rotating motor.

K. Motor Protection: Controller shall protect motor against overvoltage and undervoltage, phase loss, reverse phase, overcurrent, overtemperature, and ground fault.

L. Automatic Reset and Restart: Capable of three restarts after controller fault or on return of power after an interruption and before shutting down for manual reset or fault correction. Controller shall be capable of automatic restart on phase-loss and overvoltage and undervoltage trips.

M. Visual Indication: On face of controller enclosure or chiller control enclosure; indicating the following conditions:
1. Power on.
2. Run.
3. Overvoltage.
4. Line fault.
5. Overcurrent.
6. External fault.
7. Motor speed (percent).
8. Fault or alarm status (code).
9. DC-link voltage.
10. Motor output voltage.
11. Input kilovolt amperes.
12. Total power factor.
13. Input kilowatts.
14. Input kilowatt-hours.
15. Three-phase input voltage.
16. Three-phase output voltage.
17. Three-phase input current.
18. Three-phase output current.
19. Three-phase input voltage total harmonic distortion.
20. Three-phase input current total harmonic distortion.
21. Output frequency (Hertz).
22. Elapsed operating time (hours).
23. Diagnostic and service parameters.

N. Operator Interface: At controller or chiller control panel; with start-stop and auto-manual selector with manual-speed-control potentiometer.

O. Control Signal Interface:
1. Electric Input Signal Interface: A minimum of two analog inputs (0 to 10 V or 0/4-20 mA) and six programmable digital inputs.

P. Active Harmonic Distortion Filter: Factory mounted and wired to limit total voltage and current distortion to 5 percent.

Q. Cooling: Refrigerant cooled.

R. Accessories: Devices shall be factory installed in controller enclosure unless otherwise indicated.
1. Control Relays: Auxiliary and adjustable time-delay relays.

S. Chiller Capacity Control Interface: Equip chiller with adaptive control logic to automatically adjust the compressor motor speed and the compressor pre-rotation inlet vane position independently to achieve maximum part-load efficiency in response to sensor inputs that are integral to the chiller controls.

2.10 CONTROLS

A. Control: Standalone and microprocessor based, with all memory stored in nonvolatile memory so that reprogramming is not required on loss of electrical power.

B. Enclosure: Unit mounted, NEMA 250, Type 1, hinged or lockable; factory wired with a single-point, field-power connection and a separate control circuit.

C. Operator Interface: Multiple-character digital or graphic display with dynamic update of information and with keypad or touch-sensitive display located on front of control enclosure. In either imperial or metric units selectable through the interface, display the following information:
   1. Date and time.
   2. Operating or alarm status.
   3. Fault history with not less than last 10 faults displayed.
   4. Set points of controllable parameters.
   5. Trend data.
   6. Operating hours.
   7. Number of chiller starts.
   8. Outdoor-air temperature or space temperature if required for chilled-water reset.
   9. Entering- and leaving-fluid temperatures of evaporator and condenser.
   10. Difference in fluid temperatures of evaporator and condenser.
   11. Fluid flow of evaporator and condenser.
   12. Fluid pressure drop of evaporator and condenser.
   13. Refrigerant pressures in evaporator and condenser.
   14. Refrigerant saturation temperature in evaporator and condenser shell.
   15. Compressor refrigerant suction and discharge temperature.
   16. Compressor bearing temperature.
   17. Motor bearing temperature.
   18. Motor winding temperature.
   19. Phase current.
   20. Percent of motor rated load amperage.
   21. Phase voltage.
   22. Demand power (kilowatts).
   23. Energy use (kilowatt-hours).
   24. Power factor.
   25. For chillers equipped with variable frequency controllers and harmonic filters, include the following:
      a. Output voltage and frequency.
      b. Voltage total harmonic distortion for each phase.
      c. Supply current total demand distortion for each phase.
      d. Inlet vane position.
      e. Controller internal ambient temperature.
      f. Heatsink temperature.
   26. Purge suction temperature if purge system is provided.
   27. Purge elapsed time if purge system is provided.

D. Control Functions:
   1. Manual or automatic startup and shutdown time schedule.
   2. Entering and leaving chilled-water temperatures, control set points, and motor load limits. Evaporator fluid temperature shall be reset based on building automation system (BMS) temperature.
   3. Current limit and demand limit.
   4. Condenser-fluid temperature.
   5. External chiller emergency stop.

6. Thermal storage.

E. Manually Reset Safety Controls: The following conditions shall shut down chiller and require manual reset:
1. Low evaporator pressure or temperature; high condenser pressure.
2. Low evaporator fluid temperature.
3. Low oil differential pressure.
4. High compressor-discharge temperature.
5. Loss of condenser-fluid flow.
6. Loss of evaporator fluid flow.
7. Motor overcurrent.
8. Motor overvoltage.
9. Motor undervoltage.
10. Motor phase reversal.
11. Motor phase failure.
12. Sensor- or detection-circuit fault.
13. Processor communication loss.
14. Motor controller fault.
15. Extended compressor surge.

F. Trending: Capability to trend analog data of up to five parameters simultaneously over an adjustable period and frequency of polling.

G. Security Access: Provide electronic security access to controls through identification and password with at least three levels of access: view only; view and operate; and view, operate, and service.

H. Control Authority: At least four conditions: Off, local manual control at chiller, local automatic control at chiller, and automatic control through a remote source.

I. Communication Port: RS-232 port, USB 2.0 port, or equivalent connection capable of connecting a printer and a notebook computer.

J. BAS Interface: Factory-installed hardware and software to enable the BAS to monitor, control, and display chiller status and alarms.
1. Hardwired Points:
a. Monitoring: On-off status, common trouble alarm, electrical power demand (kilowatts), electrical power consumption (kilowatt-hours) and power factor.
b. Control: On-off operation, chilled-water, discharge temperature set-point adjustment and electrical power demand limit.
2. ASHRAE 135 (BACnet) communication interface with the BAS shall enable the BAS operator to remotely control and monitor the chiller from an operator workstation. Control features and monitoring points displayed locally at chiller control panel shall be available through the BAS.

2.11 FINISH

A. Paint chiller, using manufacturer's standard procedures, except comply with the following minimum requirements:
1. Provide at least one coat of primer with a total dry film thickness of at least 2 mils.
2. Provide at least two coats of alkyd-modified, vinyl enamel finish with a total dry film thickness of at least 4 mils.
3. Paint surfaces that are to be insulated before applying the insulation.
4. Paint installed insulation to match adjacent uninsulated surfaces.
5. Color of finish coat to be manufacturer's standard.

B. Provide Owner with quart container of paint used in application of topcoat to use in touchup applications after Project Closeout.

2.12 ACCESSORIES

A. Flow Switches:
1. Chiller manufacturer shall furnish a factory furnished and mounted thermal dispersion sensor for each evaporator and condenser and verify field-mounting location before installation.

2.13 PACKAGED REFRIGERANT RECOVERY UNITS

A. Packaged portable unit consisting of compressor, air-cooled condenser, recovery system, tank pressure gages, filter-dryer, and valving that allows for switching between liquid and vapor recovery mode. Refrigerant recovery unit shall be factory mounted on an ASME-constructed and -stamped refrigerant storage vessel that is sized to hold the full refrigerant charge of the largest chiller furnished.

2.14 CAPACITIES AND CHARACTERISTICS

A. Capacity: See plans for chiller schedule.

B. Noise Rating: 85 sound power level when measured according to ARI 575. Provide factory-installed sound treatment if necessary to achieve the performance indicated.

2.15 SOURCE QUALITY CONTROL

A. Perform functional run tests of chillers before shipping.

B. Factory performance test chillers, before shipping, according to ARI 550/590.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine chillers before installation. Reject chillers that are damaged.

B. Examine roughing-in for equipment support, anchor-bolt sizes and locations, piping, and electrical connections to verify actual locations, sizes, and other conditions affecting chiller performance, maintenance, and operations before equipment installation.
1. Final chiller locations indicated on Drawings are approximate. Determine exact locations before roughing-in for piping and electrical connections.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 CHILLER INSTALLATION

A. Install chillers on support structure indicated.

B. Equipment Mounting: Install chiller on concrete bases using spring isolators and elastomeric pads. Comply with requirements for concrete bases specified in Section 033000 "Cast-in-Place Concrete." Comply with requirements for vibration isolation devices specified in Section 230548 "Vibration Controls for HVAC Piping and Equipment."
   1. Minimum Deflection: 1/2 inch.
   2. Install dowel rods to connect concrete base to concrete floor. Unless otherwise indicated, install dowel rods on 18-inch centers around the full perimeter of concrete base.
   3. For supported equipment, install epoxy-coated anchor bolts that extend through concrete base and anchor into structural concrete floor.
   4. Place and secure anchorage devices. Use setting drawings, templates, diagrams, instructions, and directions furnished with items to be embedded.
   5. Install anchor bolts to elevations required for proper attachment to supported equipment.

C. Maintain manufacturer's recommended clearances for service and maintenance.

D. Charge chiller with refrigerant if not factory installed.

E. Install separate devices furnished by manufacturer and not factory installed.

3.3 CONNECTIONS

A. Comply with requirements for piping specified in Section 232113 "Hydronic Piping" and Section 232300 "Refrigerant Piping." Drawings indicate general arrangement of piping, fittings, and specialties.

B. Install piping adjacent to chiller to allow service and maintenance.

C. Evaporator Fluid Connections: Connect to evaporator inlet with shutoff valve, strainer, flexible connector, thermometer, and plugged tee with pressure gage. Connect to evaporator outlet with shutoff valve, balancing valve, flexible connector, flow switch, thermometer, plugged tee with shutoff valve and pressure gage, flow meter, and drain connection with valve. Make connections to chiller with a flange.

D. Condenser-Fluid Connections: Connect to condenser inlet with shutoff valve, strainer, flexible connector, thermometer, and plugged tee with pressure gage. Connect to condenser outlet with shutoff valve, balancing valve, flexible connector, flow switch, thermometer, plugged tee with shutoff valve and pressure gage, flow meter, and drain connection with valve. Make connections to chiller with a flange.

E. Refrigerant Pressure Relief Device Connections: For chillers installed indoors, extend separate vent piping for each chiller to the outdoors without valves or restrictions. Comply with ASHRAE 15. Connect to chiller pressure relief device with flexible connector and dirt leg with drain valve.

F. Connect each chiller drain connection with a union and drain pipe, and extend pipe, full size of connection, to floor drain. Provide a shutoff valve at each connection.

3.4 STARTUP SERVICE

A. Engage a factory-authorized service representative to perform startup service.
   1. Complete installation and startup checks according to manufacturer's written instructions.

2. Verify that refrigerant charge is sufficient and chiller has been leak tested.
3. Verify that pumps are installed and functional.
4. Verify that thermometers and gages are installed.
5. Operate chiller for run-in period.
6. Check bearing lubrication and oil levels.
7. Verify that refrigerant pressure relief device is vented outside.
8. Verify proper motor rotation.
9. Verify static deflection of vibration isolators, including deflection during chiller startup and shutdown.
10. Verify and record performance of fluid flow and low-temperature interlocks for evaporator and condenser.
11. Verify and record performance of chiller protection devices.
12. Test and adjust controls and safeties. Replace damaged or malfunctioning controls and equipment.

B. Inspect field-assembled components, equipment installation, and piping and electrical connections for proper assembly, installation, and connection.

C. Prepare test and inspection startup reports.

3.5 DEMONSTRATION

A. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain chillers. Video record the training sessions.

END OF SECTION 236420

N:\N0912.00\DOC\SPEC\2012_03-16_BID\236420 FL - CENTRIFUGAL WATER CHILLERS.DOC

SECTION 236500 - COOLING TOWERS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:
   1. Open-circuit, induced-draft, crossflow cooling towers.

1.3 DEFINITIONS

A. BMS: Building management system.

B. FRP: Fiber-reinforced polyester.

1.4 PERFORMANCE REQUIREMENTS

A. Structural Performance: Cooling tower support structure shall withstand the effects of gravity loads and the following loads and stresses within limits and under conditions indicated.
   1. Seismic Loads: Zone 4, Importance factor 1.0.
   2. Wind Loads: 30psf.

1.5 SUBMITTALS

A. Product Data: For each type of product indicated. Include rated capacities, pressure drop, fan performance data, rating curves with selected points indicated, furnished specialties, and accessories.
   1. Maximum flow rate.
   2. Minimum flow rate.
   3. Drift loss as percent of design flow rate.
   4. Performance curves for the following:
      a. Varying entering-water temperatures from design to minimum.
      b. Varying ambient wet-bulb temperatures from design to minimum.
      c. Varying fan operation (off, minimum, and design speed).
   5. Motor amperage, efficiency, and power factor at 100, 75, 50, and 25 percent of nameplate horsepower.
   6. Electrical power requirements for each cooling tower component requiring power.

B. Shop Drawings: Complete set of manufacturer's prints of cooling tower assemblies, control panels, sections and elevations, and unit isolation. Include the following:
   1. Assembled unit dimensions.
   2. Weight and load distribution.

3. Required clearances for maintenance and operation.
4. Sizes and locations of piping and wiring connections.
5. Wiring Diagrams: For power, signal, and control wiring.

C. Coordination Drawings: Floor plans, drawn to scale, on which the following items are shown and coordinated with each other, using input from Installers of the items involved:
1. Structural supports.
2. Piping roughing-in requirements.
3. Wiring roughing-in requirements, including spaces reserved for electrical equipment.
4. Access requirements, including working clearances for mechanical controls and electrical equipment, and tube pull and service clearances.

D. Certificates: For certification required in "Quality Assurance" Article.

E. Field quality-control reports.

F. Startup service reports.

G. Operation and Maintenance Data: For each cooling tower to include in emergency, operation, and maintenance manuals.

H. Warranty: Sample of special warranty.

1.6 QUALITY ASSURANCE

A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

B. ASHRAE/IESNA 90.1-2004 Compliance: Applicable requirements in ASHRAE/IESNA 90.1-2004, Section 6 - "Heating, Ventilating, and Air-Conditioning."

C. CTI Certification: Cooling tower thermal performance according to CTI STD 201, "Certification Standard for Commercial Water-Cooling Towers Thermal Performance."

1.7 COORDINATION

A. Coordinate sizes and locations of concrete bases with actual equipment provided.

B. Coordinate sizes, locations, and anchoring attachments of structural-steel support structures.

C. Coordinate sizes and locations of roof curbs, equipment supports, and roof penetrations with actual equipment provided.

1.8 WARRANTY

A. Special Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace the following components of cooling towers that fail in materials or workmanship within specified warranty period:
1. Fan assembly including fan, drive, and motor.
2. Leak-free cold water basin.

3. Warranty Period: Five years from date of shipment.

PART 2 - PRODUCTS

2.1 OPEN-CIRCUIT, INDUCED-DRAFT, CROSSFLOW COOLING TOWERS

A. Products: Subject to compliance with requirements, provide one of the following:
   1. Baltimore Aircoil Company
   2. Marley Cooling Technologies
   3. Evapco

B. Fabricate cooling tower mounting base with reinforcement strong enough to resist cooling tower movement during a seismic event when cooling tower is anchored to field support structure.

C. Cooling tower designed to resist wind load of 30 lbf/sq. ft.

D. Casing and Frame:
   1. Casing Material: 304 stainless steel.
   2. Fasteners: Match construction.
   3. Joints and Seams: Sealed watertight.
   4. Welded Connections: Continuous and watertight.

E. Collection Basin:
   1. Material: Welded 304 or 316 Stainless steel
   2. Removable stainless-steel strainer with openings smaller than nozzle orifices.
   3. Overflow and drain connections.
   4. Makeup water connection.
   5. Outlet Connection: ASME B16.5, Class 150 flange.
   6. Equalizer connection for field-installed equalizer piping.
   7. Basin Sweeper Distribution Piping and Nozzles:
      a. Pipe Material: PVC.
      b. Nozzle Material: Plastic.
      c. Configure piping and nozzles to minimize sediment from collecting in the collection basin.

F. Electric/Electronic, Collection Basin Water-Level Controller with Solenoid Valve:
   1. Enclosures: NEMA 250, Type 4.
   2. Sensor: Solid-state controls with multiple electrode probes and relays factory wired to a terminal strip to provide control of water makeup valve.
   3. Electrode Probes: Stainless steel.
   4. Water Stilling Chamber: PVC pipe.
   5. Solenoid Valve: Slow closing, controlled and powered through level controller in response to water-level set point.
   6. Electrical Connection Requirements: 120 V, single phase, 60 Hz.

G. Electric Basin Heater:
   1. Copper Electric Immersion Heaters: Installed in a threaded coupling on the side of the collection basin.
   2. Provide low water cutout and thermostat installed in cooling tower basin.

H. Gravity Water Distribution Basin: Nonpressurized design with head of water level in basin adequate to overcome spray nozzle losses and designed to evenly distribute water over fill throughout the flow range indicated.
   1. Material: Galvanized steel, ASTM A 653/A 653M, G235 coating.
   2. Location: Over each bank of fill with easily replaceable plastic spray nozzles mounted in bottom of basin.
   3. Inlet Connection: ASME B16.5, Class 150 flange.
   4. Joints and Seams: Sealed watertight.
   5. Removable Panels: Same material as basin to completely cover top of basin. Secure panels to basin with removable corrosion-resistant hardware.
   6. Single-Inlet, Field Pipe Connection: PVC pipe arranged to provide balancing of flow within cooling tower cell without the need for additional balancing valves. Pipe each cooling tower cell internally to a single, field connection suitable for mating to ASME B16.5, Class 150 flange and located on the side unless otherwise indicated.

I. Fill:
   1. Materials: PVC, with maximum flame-spread index of 5 according to ASTM E 84.
   2. Fill Material Operating Temperature: Suitable for entering-water temperatures up through 120 deg F.

J. Drift Eliminator:
   1. Material: PVC; with maximum flame-spread index of 25 according to ASTM E 84.
   2. UV Treatment: Inhibitors to protect against damage caused by UV radiation.
   3. Configuration: Multipass, designed and tested to reduce water carryover to achieve performance indicated.
   4. Location: Integral to fill.

K. Air-Intake Louvers:
   1. Material: FRP.
   2. UV Treatment: Inhibitors to protect against damage caused by UV radiation.
   3. Louver Blades: Arranged to uniformly direct air into cooling tower, to minimize air resistance, and to prevent water from splashing out of tower during all modes of operation including operation with fans off.
   4. Location: Separate from fill.

L. Removable Air-Intake Screens: Aluminum steel wire mesh.

M. Axial Fan – Low Noise: Balanced at the factory after assembly.
   1. Blade Material: Aluminum.
   2. Hub Material: Aluminum.
   3. Blade Pitch: Field adjustable.
   4. Protective Enclosure: Removable, galvanized-steel, wire-mesh screens complying with OSHA regulations.
   5. Fan Shaft Bearings: Self-aligning ball or roller bearings with moisture-proof seals and premium, moisture-resistant grease suitable for temperatures between minus 20 and plus 300 deg F. Bearings designed for an L-10 life of 40,000 hours.
   6. Bearings Grease Fittings: Extended lubrication lines to an easily accessible location.

N. Belt Drive:
   1. Service Factor: 1.5 based on motor nameplate horsepower.
   2. Sheaves: Fan and motor shafts shall have taper-lock sheaves fabricated from corrosion-resistant materials.
   3. Belt: One-piece, multigrooved, solid-back belt.
   4. Belt Material: Oil resistant, nonstatic conducting, and constructed of neoprene polyester cord.

5. Belt-Drive Guard: Comply with OSHA regulations.
6. Inverter duty for Variable Speed Drive application.

O. Fan Motor:
1. General Requirements for Fan Motors: Comply with NEMA designation and temperature-rating requirements specified in Division 23 Section "Common Motor Requirements for HVAC Equipment" and not indicated below.
2. Motor Enclosure: Totally enclosed air over (TEAO
3. Energy Efficiency: Comply with ASHRAE/IESNA 90.1, NEMA Premium Efficient.
4. Service Factor: 1.0
5. Insulation: Class F
6. Variable-Speed Motors: Inverter-duty rated per NEMA MG-1, Section IV, "Performance Standard Applying to All Machines," Part 31, "Definite-Purpose, Inverter-Fed, Polyphase Motors."
7. Motor Location: Mounted inside cooling tower.

8. Motor Base: Adjustable, or other suitable provision for adjusting belt tension.

P. Vibration Switch: For each fan drive.
1. Enclosure: NEMA 250, Type 4.
2. Vibration Detection: Sensor with a field-adjustable, acceleration-sensitivity set point in a range of 0.2 to 2.0 g and frequency range of 0 to 3600 RPM. Cooling tower manufacturer shall recommend switch set point for proper operation and protection.
3. Provide switch with manual-reset button for field connection to a BMS and hardwired connection to fan motor electrical circuit.
4. Switch shall, on sensing excessive vibration, signal an alarm through the BMS and shut down the fan.

Q. Controls: Comply with requirements in Division 23 Section "Instrumentation and Control for HVAC."

R. Control Package: Factory installed and wired, and functionally tested at factory before shipment.
1. NEMA 250, Type 3R enclosure with removable internally mount backplate.
2. Control-circuit transformer with primary and secondary side fuses.
3. Terminal blocks with numbered and color-coded wiring to match wiring diagram. Spare wiring terminal block for connection to external controls or equipment.
4. Microprocessor-based controller for automatic control of fan based on cooling tower leaving-water temperature with control features to improve operating efficiency based on outdoor ambient wet-bulb temperature by using adaptive logic.
5. Collection basin level controller complying with requirements in Electric/Electronic, Collection Basin Water-Level Controller with Solenoid Valve Paragraph.
6. Electric basin heaters with temperature control and low-water-level safety switch for each cell, complying with requirements in "Electric Basin Heater" Paragraph.
7. Vibration switch for each cell, complying with requirements in "Vibration Switch" Paragraph.
8. Single-point, field-power connection to a circuit breaker for each cooling tower cell.
   a. Branch power circuit to each motor and electric basin heater and to controls with a disconnect switch or circuit breaker.
   b. NEMA-rated motor controller, hand-off-auto switch, and overcurrent protection for each motor. Provide variable frequency controller with manual bypass and line reactors for each variable-speed motor indicated. VFD shall be mounted in panel.
9. Field-installed wiring outside of enclosures shall be in metal raceway, except make connections to each motor and electric basin heater with liquidtight conduit.
10. Visual indication of status and alarm with momentary test push button for each motor.
11. Visual indication of elapsed run time, graduated in hours for each motor.
12. Cooling tower shall have hardware to enable BMS to remotely monitor and display the following:

a. Operational status of each motor.
b. Position of dampers.
c. Fan vibration alarm.
d. Oil-level alarm.
e. Collection basin high- and low-water-level alarms.

S. Personnel Access Components:
1. Doors: Large enough for personnel to access cooling tower internal components from both cooling tower end walls. Doors shall be operable from both sides of the door.
2. External Ladders with Safety Cages: Aluminum fixed ladders with ladder extensions to access external platforms and top of cooling tower from adjacent grade without the need for portable ladders. Comply with 29 CFR 1910.27.
3. Handrail: Galvanized steel complete with kneerail and toeboard, around top of cooling tower. Comply with 29 CFR 1910.23.
4. Internal Platforms: Galvanized-steel bar grating.
a. Spanning the collection basin from one end of cooling tower to the other and positioned to form a path between the access doors. Platform shall be elevated so that all parts are above the high water level of the collection basin.
5. Provide motor davits for each cell.

T. Capacities and Characteristics: As scheduled on plans.
1. Number of Cells: 2
2. Air-Inlet Arrangement: Two sides.
3. Maximum Drift Loss: 0.005 percent of design water flow.
4. Basin Heater:
a. Basin Water Temperature: 40 deg F
b. Outdoor Ambient Temperature: 0 deg F

2.2 SOURCE QUALITY CONTROL

A. Verification of Performance: Certify cooling tower performance according to CTI STD 201, "Certification Standard for Commercial Water-Cooling Towers Thermal Performance."

PART 3 - EXECUTION

3.1 EXAMINATION

A. Before cooling tower installation, examine roughing-in for tower support, anchor-bolt sizes and locations, piping, and electrical connections to verify actual locations, sizes, and other conditions affecting tower performance, maintenance, and operation.
1. Cooling tower locations indicated on Drawings are approximate. Determine exact locations before roughing-in for piping and electrical connections.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. Install cooling towers on support structure indicated.

B. Equipment Mounting: Install cooling tower using restrained spring isolators. Comply with requirements for vibration isolation devices specified in Division 23 Section "Vibration Controls for HVAC Piping and Equipment."
   1. Minimum Deflection: 1 inch.
   2. Provide galvanized-steel plate to equally distribute weight over elastomeric pad.

C. Install anchor bolts to elevations required for proper attachment to supported equipment.

D. Maintain manufacturer's recommended clearances for service and maintenance.

E. Loose Components: Install electrical components, devices, and accessories that are not factory mounted.

3.3 CONNECTIONS

A. Piping installation requirements are specified in other Division 23 Sections. Drawings indicate general arrangement of piping, fittings, and specialties.

B. Install piping adjacent to cooling towers to allow service and maintenance.

C. Install flexible pipe connectors at pipe connections of cooling towers mounted on vibration isolators.

D. Provide drain piping with valve at cooling tower drain connections and at low points in piping.

E. Connect cooling tower overflows and drains, and piping drains to sanitary sewage system.

F. Domestic Water Piping: Comply with applicable requirements in Division 22 Section "Domestic Water Piping." Connect to water-level control with shutoff valve and union, flange, or mechanical coupling at each connection.

G. Supply and Return Piping: Comply with applicable requirements in Division 23 Section "Hydronic Piping." Connect to entering cooling tower connections with shutoff valve, balancing valve, thermometer, plugged tee with pressure gage, and drain connection with valve. Connect to leaving cooling tower connection with shutoff valve. Make connections to cooling tower with a flange coupling.

H. Equalizer Piping: Piping requirements to match supply and return piping. Connect an equalizer pipe, full size of cooling tower connection, between tower cells. Connect to cooling tower with shutoff valve.

3.4 FIELD QUALITY CONTROL

A. Manufacturer's Field Service: Engage a factory-authorized service representative to perform field tests and inspections.

B. Perform tests and inspections.
   1. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect components, assemblies, and equipment installations, including connections.

C. Cooling towers will be considered defective if they do not pass tests and inspections.

D. Prepare test and inspection reports.

3.5 STARTUP SERVICE

A. Engage a factory-authorized service representative to perform startup service.

B. Inspect field-assembled components, equipment installation, and piping and electrical connections for proper assemblies, installations, and connections.

C. Obtain performance data from manufacturer.
   1. Complete installation and startup checks according to manufacturer's written instructions and perform the following:
      a. Clean entire unit including basins.
      b. Verify that accessories are properly installed.
      c. Verify clearances for airflow and for cooling tower servicing.
      d. Check for vibration isolation and structural support.
      e. Lubricate bearings.
      f. Verify fan rotation for correct direction and for vibration or binding and correct problems.
      g. Adjust belts to proper alignment and tension.
      h. Operate variable-speed fans through entire operating range and check for harmonic vibration imbalance. Set motor controller to skip speeds resulting in abnormal vibration.
      i. Check vibration switch setting. Verify operation.
      j. Verify water level in tower basin. Fill to proper startup level. Check makeup water-level control and valve.
      k. Verify operation of basin heater and control.
      l. Verify that cooling tower air discharge is not recirculating air into tower or HVAC air intakes. Recommend corrective action.
      m. Replace defective and malfunctioning units.

D. Start cooling tower and associated water pumps. Follow manufacturer's written starting procedures.

E. Prepare a written startup report that records the results of tests and inspections.

3.6 ADJUSTING

A. Set and balance water flow to each tower inlet.

B. Adjust water-level control for proper operating level.

3.7 DEMONSTRATION

A. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain cooling towers.

END OF SECTION 236500

N:\N0912.00\DOC\SPEC\2012_03-16_BID\236500 - COOLING TOWERS.DOC

SECTION 236510 – ICE STORAGE TANKS

PART 1 - GENERAL:

1.1 SECTION INCLUDES

A. Ice storage tanks

1.2 SUBMITTALS

A. Submit shop drawings under provisions of Division 01.

B. Submit shop drawings indicating components, assembly, dimensions, required clearances, and location and size of field connections. Indicate equipment, piping, connections, and valves required for complete system.
   1. Submit complete shop drawing of manifold piping.

C. Submit product data under provisions of Section Division 1.

D. Submit product data indicating total latent and sensible capacities, weight, maximum operating temperature, factory test pressure, maximum operating pressure, specialties and accessories.

E. Submit manufacturer's installation instructions under provisions of Section Division 1.

1.3 OPERATION AND MAINTENANCE DATA

A. Submit operation data under provisions of Section Division 1.

B. Include start-up instructions, maintenance data and parts lists and accessories.

C. Submit maintenance data under provisions of Division 1.

1.4 DELIVERY, STORAGE, AND HANDLING

A. Delivery products to site provisions of Division 1.

B. Store and protect products under provisions of Division 1.

C. Comply with manufacturer's installation instructions for rigging, unloading, and transporting units.

D. Protect units from physical damage. Leave factory shipping covers in place until installation.

1.5 WARRANTY

A. Provide factory warranty under provisions of Division 1 and as required as part of the section.

B. Warranty: Include coverage for heat exchanger, container and accessories.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Baltimore Air Coil Thermal Storage Unit

B. Warranty: Ten year warranty on tanks.

2.2 ICE THERMAL STORAGE UNITS

A. The ICE CHILLER® Thermal Storage Unit(s) shall be Baltimore Air coil Company Model TSU. Each unit shall have a latent ton-hour storage capacity as shown on the schedule. Rated system performance shall be provided in the format recommended by the Air-Conditioning & Refrigeration Institute (ARI) Guideline T. The thermal storage units shall be modular in design. Unit design shall allow units of different sizes to be installed in order to optimize unit selection and minimize space requirements. Tanks sizes can be mixed due to internal piping arrangements that create a balanced flow due to uniform pressure drop through the coil circuits.

B. The tank shall be constructed of heavy-gauge galvanized steel panels and include double brake flanges for structural strength. The tank walls shall be supplied with a minimum of 4-1/2" of insulation that provides a total insulating value of R-18. The tank design shall utilize multiple liners. The primary liner, which forms the interior of the unit, shall be of single piece construction and be suitable for low temperature applications. The secondary liner/vapor barrier shall be separated from the primary liner by 1-1/2" of extruded polystyrene insulation. The tank bottom shall be insulated with 2" of expanded polystyrene insulation and 1" of extruded polystyrene insulation.

C. The ICE CHILLER® Thermal Storage Unit shall be provided with watertight, sectional covers constructed of hot-dip galvanized steel. The covers shall be insulated with a minimum of 2" of expanded polystyrene insulation.

D. Contained within the tank shall be a steel heat exchanger that is constructed of 1.05" O.D., all prime surface serpentine steel tubing encased in a steel framework. The coil, which is hot-dip galvanized after fabrication, shall be pneumatically tested at 190 psig and rated for 150 psig operating pressure. The coil circuits are configured to provide maximum storage capacity. The coil connections on the unit are galvanized steel and are grooved for mechanical coupling.

E. Each ICE CHILLER® Thermal Storage Unit shall be provided with a sight tube. The sight tube, which shall be fabricated from clear plastic pipe, shall display the tank water level and corresponding ice inventory.

F. Operating controls, consisting of two float switches, shall be mounted on the outside of the tank. The high level float switch terminates the build cycle when the tank water level reaches the 100% ice build level. The high level switch shall also prevent re-initiation of the build cycle until approximately 15% of the ice has been discharged. The second float switch is a low water cutout. The cutout requires that the water level in the ICE CHILLER® Thermal Storage Unit be at or above the 0% ice build level before the ice build cycle can begin. Operating control quantities vary based on project requirements. An optional differential pressure transmitter shall be available to supply an electrical output signal proportional to the amount of ice in inventory.

G. The heat transfer fluid shall be an industrially inhibited, 30% by weight, propylene glycol solution specifically designed for HVAC applications. The 30% (by weight) solution is designed to provide freeze/burst and corrosion protection as well as efficient heat transfer in water based, closed loop systems.

Corrosion inhibitors shall be provided to keep pipes free of corrosion without fouling. DOWTHERM® SR-1 and UCARTHERM® are acceptable fluids.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Install in accordance with manufacturers instruction.

B. Place modular tank units on concrete pad as indicated on the drawings. Care must be exercised so as not to drop and/or damage tanks. Tanks that are dropped or damaged to the extent that the warranty is voided shall be replaced at no cost to the owner.

C. Provide main header piping as indicated on the drawings.

D. Install inventory meter, air pumps, make-up water and other accessories indicated on the drawings.

E. Air pressure test tanks and headers to 90 PSI in accordance with manufacturer's instruction. Correct leaks and re-test until pressure test is successful.

F. After successful pressure test, insulate piping as required under section 230700.

G. Charge system with solution of seven parts water and three parts propylene glycol (30 percent mixture). Thoroughly mix solution in a separate container before charging into system. Remove all air from the system.

H. Use propylene glycol manufactured by DOW Chemical (SR-1), Union Carbide (UCATHERM) or approved equal. Add the manufacturer recommended amount anti-foaming agents.

I. After the system is fully charged, circulate for 24 hours. Test the solutions glycol concentration by using a refractometer or equivalent methods. Draw off a sufficient amount of the solution and add propylene glycol or water as required to achieve a 30 percent propylene glycol solution.

J. Adjust and verify that inventory meters perform manufacturer's instructions.

3.2 DEMONSTRATION

A. Demonstrate system operation and maintenance to owner's representative under provisions of Section 230593 and Division 1.

END OF SECTION 236510

N:\N0912.00\DOC\SPEC\2012_03-16_BID\236510- ICE STORAGE TANKS.DOC

SECTION 236513 - GLYCOL HEAT TRANSFER FLUID

PART 1 - GENERAL

1.1 SUMMARY

A. This section includes the providing of a premixed glycol solution comprised of 3 parts water to 2 parts inhibited propylene glycol (30 percent mixture) for the glycol chilled water system.

1.2 SUBMITTALS

A. Refer to Section 23 0000.

B. Submit product data: proposed glycol mixture, manufacturers' certificate of analysis, jobsite fluid concentration test, and requirements for installation.

1.3 QUALITY ASSURANCE

A. All components such as pumps and valves: suitable for use with the acceptable heat transfer fluid.

B. Comply with all applicable codes in the transportation, use and disposal of the heat transfer fluid.

C. Provide the system with a (eight-inch by ten-inch) metal nameplate containing the following information:
   1. Date of original heat transfer fluid charge.
   2. Description of heat transfer fluid.
   3. Manufacturers name, address and telephone number.
   4. Percent of glycol.
   5. Estimated freeze point at concentration.
   6. Minimum concentration to provide burst protection.
   7. Total system volume.
   8. Reference to material safety data sheet.
   9. Instructions for sampling fluid.

1.4 DELIVERY

A. Deliver the glycol in 55-gallon drums or, if the system is larger, by tanker truck.

1.5 WARRANTY

A. Refer to Section 23 0000.

PART 2 - PRODUCTS

2.1 PROPYLENE GLYCOL-BASED PRODUCT

A. Provide a heat transfer fluid that is an inhibited propylene glycol-based heat transfer fluid specifically formulated for use in HVAC systems. Provide the fluid with corrosion inhibitors and buffers necessary for long fluid and system life. Provide the fluid with a fluorescent dye to aid in

leak detection. Provide an inhibitor level equivalent to the level found in a minimum 30% concentration of inhibited glycol.

B. Provide for 30 percent solution of heat transfer fluid and deionized water, premixed by the chemical manufacturer before delivery, having a freeze point of +10 degrees F. Water quality:

C. Sulfate and Chloride <25 ppm

D. Sodium <50 ppm

E. Magnesium and Chloride <1 ppm

F. Require the manufacturer to provide, at no charge, an annual solution laboratory analysis that accurately reports propylene glycol concentration, freeze point temperature, inhibitor level, alkalinity, particulates, and recommended additions to glycol, inhibitor and buffers to ensure a twenty year minimum life.

G. Field or distributor mixed fluid, automotive antifreeze, uninhibited glycol, or field or distributor inhibited glycol is not acceptable.

H. Manufacturers: Subject to compliance with requirements, provide factory pre-mixed propylene glycol:

I. Dow Chemical Co. "Dowfrost”

J. Interstate Chemical Co. NFP

K. PVS – Nolwood Chemical “PVC Chill PGHD”

L. Union Carbide Corp. "Foodfreeze”

PART 3 - EXECUTION

3.1 INSTALLATION

A. Hydrostatically test and clean the system prior to system fill of heat transfer fluid. Remove dirt, weld slag, filings, oil, etc., and flush from system prior to final fill. Isolate all heat transfer equipment while the field piping is being flushed. Completely drain the system.

B. Refill the system with fresh water and add 4% by volume of system cleaner PVC CLP or equivalent. Circulate the system at ambient temperature 48 hours.

C. Check with local sewer discharge requirements, if acceptable; drain the system to the sewer. Do not under any circumstance drain to waterway or open drainage ditch. If discharge requirements do not allow for sewer discharge, call approved licensed water disposal contractor.
   1. Approved Disposal Contractors
      a. Dynecol
      b. Northpointe Transfer LLC

D. Compare the final flush with the initial fill and identify how much water is trapped in the system. Calculate the proper premixed concentration and volume required for final operating specified concentration for the system.

E. Furnish 2 empty new drums on the jobsite before fill to accommodate any overage.

F. In cases of bulk fill by tank truck, provide for the glycol manufacturer to send a qualified technician to the job site to meet the contractor site supervisor and agree on a plan and required equipment that will maximize the time efficiency and safety of the filling process.

G. On the date of the system fill by bulk tank truck, provide for a qualified technician to be supplied by the glycol manufacturer to be on site to work with the contractor to maximize time efficiency and safety of the filling process. Provide for this person to also have with them spill containment media.

H. Pump the premixed heat transfer fluid into a 50-mm (2-inch) fill connection on the suction side of the pump. Position a 2-inch ball valve between the filling connection and the system as a method of preventing backfill into the delivery vehicle, should the filling process need to be interrupted during the fill. Before starting the filling pump, open high point vents. Man these vent locations at all times during the filling process so that the heat transfer fluid solution is not spilled.

I. When the heat transfer mixture reaches the vent, manually close the vent and stop the fill pump. Take care not to over pressurize the system.

J. Turn the system pump on for a few minutes at low speed or valve to approximately half design flow. This will remove most of the air from the system high points. With the system pump turned off, open the vents and start the fill pump again. Repeat this procedure a few times, and when most of the air is eliminated, open the valves and run the system pump at full flow.

K. Use the system air separator to remove the final amounts of air. Once all the air is removed, run the fill pump again until the system expansion tank is at the proper level and the system is at the proper working pressure.

L. Keep circulating the heat transfer fluid through the system at the design pressure. Monitor the system pressure and make sure the pressure does not drop. If the pressure drops, there is a leak in the system.

M. Take a fluid sample, with the manufacturer supplied kit, after the system has been recirculating for 24 hours. Require the manufacturer to provide a thermal fluid water analysis report.

END OF SECTION 236513

N:\N0912.00\DOC\SPEC\2012_03-16_BID\236513 - GLYCOL HEAT TRANSFER FLUID.DOC

SECTION 236515 – CHEMICAL FREE HVAC WATER TREATMENT

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division Specification Sections, apply to this section

1.2 BASIC MECHANICAL REQUIREMENTS

A. Basic Materials and Methods

B. Basic Piping Materials and Methods

C. Examine all drawings and data and coordinate the work of this Section with all related and adjoining work and trades

1.3 SUMMARY

A. This section includes water treatment systems for the following:
   1. Condenser Water - Open Cooling Water Loop Systems
   2. Closed Loop Systems

1.4 PERFORMANCE REQUIREMENTS

A. Maintain water quality for the Condenser water and closed systems that controls corrosion and build-up of scale and biological growth for a maximum efficiency of installed equipment without posing a hazard to operating personnel or the environment. Maintain the following operational water quality parameters:
   1. Total Planktonic Bacteria Count (TBC) of less than 10,000 CFU/ml as determined by Heterotrophic Plate Count (HPC) under method SMEWW 9215B (1998) at 35degC for 48 hours using plate count agar (tryptone glucose yeast agar) per Section 9215A.6;
   2. Uniform mild steel corrosion of not more than 5 mils per year (mpy) as determined by minimum of 90 day corrosion coupon exposure;
   3. Uniform copper corrosion of not more than 0.35 mpy as determined by minimum of 90 day corrosion coupon exposure;
   4. No scale formation on immersed surfaces including Tower Basins, Tower Fill, Tower Sumps, Piping, Heat Exchanger Tubes;
   5. Water shall be odorless and clear in appearance with no turbidity;
   6. No surface slime layer formation on immersed surfaces as judged by touch;

B. Base performance requirements on quality of raw water available from the Project site, HVAC system equipment material characteristics and functional performance characteristics, operating personnel capabilities, and requirements and guidelines of authorities having jurisdiction.

C. Use of chemical systems to achieve the condenser water quality parameters listed in PART 1.5 A will not be allowed. Use of mechanical systems for condenser water treatment requiring the aid or periodic use of chemicals such as biocides, scale inhibitors, and corrosion inhibitors will not be allowed. Methods of chemical introduction from solid components, such as copper or silver anode depletion, will not be allowed.

1.5 SUBMITTALS

A. Product Data: Include rated capacities; water pressure drops; shipping, operating and installed weights; and furnished products listed:
   1. Basis Of Design: Dolphin ™ Pulsed Power Chemical Free Water Treatment System by Clearwater Systems Corporation, Essex, CT
   2. Alternate Manufacturers: VRTX, Envirotower

B. Shop Drawings: Detailed equipment assemblies indicating dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection

C. Raw Water Analysis: Submit a copy of the project site water analysis to document the water quality available at the project site. Raw water test analysis to include at a minimum the analysis of the following compositions of the water:
   1. Calcium Hardness (as ppm CaCO3)
   2. Total Hardness (as ppm CaCO3)
   3. Total Alkalinity or m-Alkalinity (as ppm CaCO3)
   4. pH
   5. Silica (as SiO2)
   6. Specific Conductivity (μS/cm)
   7. Chloride (as Cl-)

D. Installation, Maintenance and Operation data for each piece of equipment, suitable for inclusion into a standard 3-ring binder.

1.6 QUALITY ASSURANCE

A. Manufacturer: Design, fabricate, and furnish an electronic pulsed power system manufactured to accurate dimensions, tolerances, and operating characteristics as specified in PART 2 – PRODUCTS of this specification section.

B. Supply equipment conforming to nationally recognized North American testing laboratory standards and bearing an “Approval Label” on all assemblies.

1.7 QUALIFICATIONS:

A. Manufacturer:
   1. Able to document a minimum of 5 years experience designing, manufacturing and supplying products for commercial, and industrial water treatment and water chemistry control.
   2. Maintain engineering and field service capabilities to ensure proper operation of the product within the service period specified in subsequent sections.
   3. All laboratory and technical service offices must be within 100 miles of jobsite to insure accurate HPC testing.

1.8 DELIVERY, STORAGE, AND HANDLING

A. Comply with manufacturers’ instructions. Store in original packaging.

B. Store in a dry location, protected from the elements, and from mud, dirt, and soiling

C. Protect components from damage during storage and handling.

D. Handle with care to prevent damage during movement and installation.

1.9 WARRANTY:

A. Comply with warranty provisions as specified in Section – Mechanical General Provisions

B. Provide special warranty for products specified in PART 2 – PRODUCTS of this specification Section

C. Standard Warranty - Manufacturer's standard form warranty of not less than one year from date of start-up covering replacement or repair of materials found to be defective in workmanship or quality.

PART 2 - PRODUCTS

2.1 GENERAL:

A. The contractor shall furnish and install an electronic pulsed power water treatment system as shown and detailed on the contract documents. The units shall be installed in accordance with this specification Section, and perform at the conditions as listed.

B. The unit must be a full flow device to maintain the biological counts required.

C. Approved manufacturers:
   1. Basis of Design: Clearwater Systems Corporation, Essex, CT
   2. Alternate manufacturers: VRTX, Envirotower

2.2 ELECTRONIC PULSE POWER CONDENSER WATER TREATMENT SYSTEM

A. Provide a complete pulse power water treatment system equal to the Dolphin System™ 3000 on:
   1. Condenser Water for Open Tower Systems (one 16" unit)

B. Condenser Water Treatment System Description
   1. The system shall consist of alternating current pulse power Transformer Panel and Coil-Pipe Assembly. Each Coil-Pipe assembly shall be equipped with a dedicated individual Transformer Panel.

C. Transformer Panel shall have/be:
   1. Wall mounted NEMA 3R metal enclosure, 304 brushed stainless steel case
   2. Terminal block for hard wiring to electrical power service.
   3. Fused primary on and secondary on 230v/1ph, 460v/1ph powered units (8" to 16" Dolphins)
   4. Dry form C contact (for building management system).
   5. Remote Start-Stop capability, switch field installed
   6. Female locking receptacle for connecting the Transformer Panel to the Coil-Pipe Assembly. Connection coded based on unit size to prevent mismatching of components
   7. LED Status indicating lights
   8. Powered Fan ventilation with inlet screen filter
   9. Pulsed power transformer and circuitry, which uses alternating current of 60 cycles per second to create a harmonic "ringing" signal of increasingly higher frequency until the decreasingly lower amplitude of this echo signal is damped down to zero. This effect imparts high frequency electric fields into the flowing water that includes frequencies in the kilohertz and megahertz range. Dolphin System 3000-G delivers a total of 240 pulses per second.
      a. Primary service:
         1) 8" thru 16": 208-230 VAC or 460 VAC, 60 cycle, 1 ph, primary service.
         2) 11 to 45 VAC secondary (depending on size).
         3) 150 to 2400 VA primary (depending on size).

D. Coil-Pipe Assembly:
   1. Pipe Material

a. 1" thru 16" - PVC Sch. 80 with flanged pipe ends

2. Field Connections:
   a. Furnish PVC Van Stone style (Slip-on) flanges for field mounting of Coil-Pipe Assembly
3. The coils shall be contained within a larger diameter PVC covering cylinder around the pipe and closed with PVC end caps with ventilation ports.
4. The high temperature coil bobbin assemblies are secured to pipe by circular clamps.
5. Locking power cable (Umbilical Cable) is supplied for connection between the Coil-Pipe Assembly and the Transformer Panel. Standard Umbilical cables are 10 ft. (Size 1" to 6") or 16 ft. (size 8" to 16").
   a. Furnish 25 ft. Umbilical Cable
6. Built in thermal protection shall automatically turn the coil assembly off if the operating temperature exceeds 200° F (PVC units 1" thru 6") or 190o F (PVC units 8" thru 16").
   a. The thermal protection for PVC units protects the internal circuitry from internally generated heat.
      1) The maximum applied fluid temperature of PVC units shall not exceed 140°F.

E. Pulsed power system (PPS) operational parameters:
1. Conductivity range of 300 to 5,000 µS/cm.
2. pH range of 6.8 to 9.0 or per cooling tower manufacturer's recommendation.
3. Local environmental regulations may dictate the highest pH permitted for blowdown. PPS can raise or lower pH by the balancing of fresh make-up water.
4. Total bacteria count (TBC) of less than 10,000 CFU/ml. The bacteria count is expected to range below 4,000 CFU/ml under most normal blowdown schedules.

F. System functions:
1. To keep system free from mineral scale on the fill material, pipes, heat exchangers, pipes, valves and other components in the system by changing calcium carbonate nucleation from surface nucleation to colloidal nucleation, thereby lowering activation energy of colloidal nucleation.
2. Control the population of microorganisms such as bacteria, algae and protozoa to 10,000 CFU/ml or below, by incorporation into colloidal precipitates (encapsulation) or through the pulsed power fields (electroporation) within the coil pipe assembly, regardless of what species are present and how they may have mutated.
3. Blowdown shall contain no added water treatment chemicals required to achieve performance listed. Neither oxidizing agents nor metals shall be added to the tower water.

G. Building Management System Interface
1. The interface to the building management system will be through a FORM "C" dry relay contact located on the circuit board in the transformer panel.
2. The interface will verify the following Dolphin operating status conditions
   a. Primary Power Status - e.g. Loss of utility power, tripped circuit breaker, blown fuse or unit unplugged.
   b. Secondary Power Status - e.g. Severed or removed coil assembly cable connection, defective transformer.
   c. Coil-Pipe Assembly Operation Status - e.g. Coil-Pipe Assembly overheated.
   d. Circuit Board Operation Status – e.g. Board overheated, electronic failure
   e. In the event of one of the above anomalies, the supervisory contact will change relay status.
      1) Supervisory Contact power rating
         a. 0.6 A at 125 VAC
         b. 0.6 A at 110 VDC
         c. 2.0 A at 30 VDC

H. Remote Start-Stop Switch

1. A remote switch shall turn off the coil-pipe Assembly, while maintaining power to the Transformer Panel. Switch shall be wired into predetermined contacts in the Transformer Panel.
    a. Status shall be indicated by a flashing green LED
    b. Utilize a field supplied 24v rated normally closed switch.

I. Initial System operation:
1. No water system containing a Dolphin System™ shall be put into operation without the Dolphin being energized and the blowdown system and mechanical filtration systems fully operational. Failure to comply may result in damage to connected heat exchange equipment from scaling and corrosion, or fouling from biological growth.
    a. New Tower Systems - The system shall initially be operated under blowdown settings or protocol specified by manufacturer. New galvanized towers must be conditioned to prevent white rust formation to the tower manufacturer's requirements. Operating the tower for a period of about 6 weeks with a pH below 8.3 accomplishes this conditioning. Alternately, chemical may be used to passivate galvanized towers prior to equipment start-up.

J. Conductivity Controller
1. Packaged Conductivity Meter/Controller: Provide a conductivity meter/controller with following functions:
    a. Provide NEMA 4x enclosure with lockable swinging door.
    b. Provide 115volt, single phase power plug cord.
    c. LCD display door setpoint and actual conductivity readout, solid state circuitry.
    d. High and low alarm with relay.
    e. 4 – 20 mA recorder output.
    f. Flow switch.
    g. LED indicators for power, control, alarm, no flow, and feed.

K. Blowdown Valve:
1. Provide Blowdown motorized ball valve equal to Belimo B2AF120, 115volt, single phase. Furnish cord with plug to connect to "Bleed" receptacle of the DC4000 conductivity controller. Furnish with watertight cover to maintain NEMA 3R if installed outdoors.
    a. Install same size valved bypass around blowdown valve for servicing and emergency manual blowdown operation.
    b. Do not install strainer(s) in blowdown line.
    c. Install throttling ball valve downstream of the blowdown valve to make adjustments in blowdown volume rate if required.

L. Corrosion Test Coupon Assembly:
1. Constructed of PVC, complete with piping, valves, and mild steel and copper coupons. Locate copper coupon downstream from mild steel coupon in the test coupon assembly. Include isolation and ball valves and a visual water flow balancing device. Entire assembly shall be mounted on a polyethylene panel suitable for wall mounting.
    a. Two-station rack equal to ACR-20BE.

2.3 CLOSED LOOP SYSTEM TREATMENT

A. General
1. Contractor will furnish and install all equipment, chemicals and service necessary to provide a complete Water Treatment Program. A single water treatment company shall provide all products and services for undivided responsibility throughout the warranty period. The water treatment company shall have a regional accredited laboratory, research and development facilities, plus technical service representatives located within the trading area of the job site.

B. Chemical Feeding Equipment (Hot / Chilled water) Closed Loop
   1. For each closed system the contractor shall provide and install the following apparatus (including isolation and drain valves):
      a. One shot feeder, minimum five gallon capacity with quarter turn cap and 3-½" opening. The feeder shall be rated for 200 psi service.

C. Water Treatment Chemicals
   1. Furnish one year's supply of the recommended formulas for control of scale and corrosion in the closed recirculating system. Formulations shall not contain any ingredients which may be harmful to system materials of construction. Provide MSD sheets on all chemical products. No system shall be operated without the benefit of chemical protection. Once the recommended chemical residual is achieved, any additional chemicals required to re-treat the system due to water loss or to accomplish other work shall be provided by the Mechanical Contractor. Products shall be Nitrite based.

D. Test Equipment
   1. Furnish basic water test equipment, including carrying case and spare reagents for maintaining control of the program standards in the closed loop system. Test kit will include reagents and apparatus for the determination of corrosion inhibitor level in the closed loop system.

E. Water Treatment Service Program
   1. The water treatment company shall provide all consulting services for a period of one year from start-up of the Closed Loop system which will include:
      a. Installation and system start-up procedure recommendations.
      b. Initial water analysis and recommendations.
      c. Training and operating personnel on proper feeding and control techniques.
      d. Monthly field service and consultation meetings.
      e. Any necessary log sheets and record forms.
      f. Any required laboratory and technical assistance.
   2. All services will be provided by a qualified, full-time representative of the water treatment supplier.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Verify field conditions and suitability for installation according to manufacturer's published installation data.

3.2 INSTALLATION

A. Install equipment level and plumb. Locate panels with indicator lights at eye level.

B. Install equipment per manufacturer's recommendations.
   1. Locate system components according to manufacturer's recommendation.
      a. Locate coil-pipe assembly in piping no closer than 3 ft from sources of turbulence such as the pump outlet. Consult manufacturer should field conditions fail to meet such clearances.
      b. Transformer panel and coil-pipe assembly should be located at least 3 ft. from additional units and 3 ft. from any large motor, pump, or high voltage equipment or source which may influence the system high frequency electric fields.
   2. Coil-pipe assembly should be supported by pipe hangers located no closer than 2" to the outer cover. Do not support or secure the coil-pipe assembly by means of the outer cover. Do not install bands, hangers, wires, hooks around the outer cover.

3. Coil-Pipe Assembly should not be energized for extended periods of time without having the pipe full of water. If the flow in the pipe will drain when the pumps are off, then the unit must be de-energized under these no flow conditions.
4. Loosely loop excess length of the coil-pipe assembly umbilical cord. Do not coil tightly.
5. Both the transformer panel and coil-pipe assembly should be installed at least 3 ft. from any motor, pump or high voltage equipment which might influence the system high frequency electromagnetic field.

C. Cleaning of piping systems containing the Chemical free system.
1. Immediately after hydrostatic testing of piping is completed, systems shall be cleaned, drained, and flushed with clean water. Any chemical additives used in this process shall be thoroughly flushed from the piping system.
2. If the system is not immediately put into operation after cleaning and flushing, the system shall be drained of any stagnant water left over from testing or flushing. Immediately prior to putting the system™ into operation, the system shall be re-filled with clean water.
3. Consult manufacturer representative for additional details.

3.3 CONNECTIONS

A. Piping installation requirements are specified in other Division 15 Sections. Drawings indicate general arrangement of piping, fittings, and specialties.

B. Install piping adjacent to equipment to allow service and maintenance.

C. Size and install the control loop piping to conductivity and optional sensors and/or corrosion coupon racks in the size PVC to match fittings provided. Install field provided full port ball valves for isolation of sensors and racks for routine maintenance. Control loop sensors shall not be installed directly in the piping mains.

D. Control loop shall be piped from the pressure side of the recirculating pump to the suction side of the pump, so that the control loop senses the highest temperature of the fluid system. In the case of Fluid Coolers or Evaporative Condensers, the control loop shall be taken from the pump discharge and the water shall be returned to the sump.

E. Blowdown line should not be attached to the control loop. Install the blowdown line on the pressure side of the recirculating pump, preferably from the bottom of the pipe to relieve the system of accumulated solids, dirt, and debris.

F. Confirm applicable electrical requirements in Division 16 Sections for connecting electrical equipment. Power and control and interlock wiring materials and labor provided by Division 16
1. Provide proper electrical ground top the equipment.
2. Tighten electrical connectors and terminals according to manufacturer's published torque-tightening values. If manufacturer's torque values are not indicated, use those specified in UL 486A and UL 486B.

3.4 FIELD QUALITY CONTROL

A. No water system shall be put into operation without the unit being energized and the blowdown system and mechanical filtration systems fully operational. Failure to comply may result in damage to connected heat exchange equipment from scaling and corrosion, or fouling from biological growth.

B. Engage a factory-authorized service representative to perform startup service.
1. Inspect field-assembled components and equipment installation, including piping and electrical connections. Report results in writing.

2. Inspect piping and equipment to determine that systems and equipment have been cleaned, flushed, and filled with water, and are fully operational.
3. Place HVAC water-treatment system into operation and calibrate controls during the preliminary phase of HVAC systems' startup procedures.

C. Initial Start-up Service – At no additional cost to the owner, a manufacturer representative shall set up the blow-down system according to the submitted operational parameters as indicated by the site water analysis as specified in PART 1.6 D – Submittal Data of this Section. An Initial Start-up Service report shall be provided to the operator and to Clearwater Systems.

3.5 ADJUSTING

A. Start-up and First Year Monitoring Service:
1. Initial Start-up Service:
a. At no additional cost to the owner, approximately every 30 days for 90 days from Initial Start-up Service, a manufacturer representative shall monitor the performance of the system.
b. A written Service Report shall be provided to the owner/operator and to manufacturer systems. The monitoring by the manufacturer representative will include the following:
1) Inspection of the system for functionality
2) Inspection of the blowdown system for functionality
3) Calibration and cleaning of conductivity probes or other instrumentation related to blow down
4) Visual inspection of overall system condition as accessible. Service visits may be timed to coincide with the opening of certain system components such as a closed vessel or chiller.
5) At each service visit, a field analysis of the following water chemistry parameters will be performed using field test kits.
a. pH
b. Specific Conductivity (µS/cm)
c. HPC by dipslide. Culture per package insert instructions.
c. Within 30 days and 90 Days after Start-up, but after tower conditioning is completed, a water sample shall be taken and the following parameters shall be evaluated by utilizing an independent and certified commercial laboratory:
1) Total Bacteria Count, planktonic (by HPC)
2) pH
3) Specific Conductivity (µS/cm)
4) Chloride (as Cl-)
5) Total Hardness (as ppm CaCO3)
6) Total Alkalinity or m-Alkalinity (as ppm CaCO3)
7) Calcium Hardness (as ppm CaCO3)
8) Depending upon raw water analysis, other tower water chemistry my be desired
a. Magnesium Hardness (as ppm CaCO3)
b. Silica (as SiO2)
c. Sulfate (as SO4)
d. Phosphate (as PO4)
2. First Year Service and Reporting:
a. For the first 9 months after the Initial 90 Day Monitoring, at no additional costs to the owner, perform monthly service and monitoring visits.
1) A written Service Report shall be provided to the owner/operator and to manufacturer. The monitoring by the manufacturer representative will include the following:
a. Inspection of the Dolphin System™ for functionality
b. Inspection of the blowdown system for functionality

c. Calibration and cleaning of conductivity probes or other instrumentation related to blow down

d. Visual inspection of overall system condition as accessible. Service visits may be timed to coincide with the opening of certain system components such as a closed vessel or chiller.

e. At each service visit, a field analysis of the following water chemistry parameters will be performed using field test kits.

(1) pH

(2) Specific Conductivity (µS/cm)

(3) HPC by dip slide. Culture per package insert.

b. For the first 9 months after the Initial 90 Day Monitoring, at no additional costs to the owner, perform two (2) water analyses of the water chemistry parameters in Part- 3.5 Section A.1.c to ensure that the system is maintaining water quality within performance requirements specified in this Section.

1) Perform analyses at least 60 days apart. Submit written reports of water analysis using field test kits to the operator and to manufacturer. Monitor and report as described in Part- 3.5 A.1.b. above.

c. Make adjustments to the conductivity controller and blow-down system as required to maintain water quality after each visit.

3. Provide adjustments to the blow-down and conductivity settings as required during and after the initial 6 week conditioning of new galvanized towers.

3.6 DEMONSTRATION

A. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain HVAC water-treatment systems and equipment.

B. Train Owner's maintenance personnel on procedures and schedules for starting and stopping, troubleshooting, servicing, and maintaining equipment and schedules.

1. Review data in maintenance manuals, especially data on recommended parts inventory and supply sources and on availability of parts and service. Refer to Division 1 Section "Closeout Procedures."

2. Schedule at least four (4) hours of training with Owner, through Architect, with at least seven days' advance notice.

END OF SECTION 236515

N:\N0912.00\DOC\SPEC\2012_03-16_BID\236515 - CHEMICAL FREE HVAC WATER TREATMENTS.DOC

SECTION 237250 – VARIABLE FREQUENCY DRIVES

PART 1 - GENERAL

1.1 DESCRIPTION

A. This specification is to cover a complete Variable Frequency motor Drive (VFD) consisting of a pulse width modulated (PWM) inverter designed for use with a standard NEMA Design B induction motor.

B. The drive manufacturer shall supply the drive and all necessary options as herein specified. The manufacturer shall have been engaged in the production of this type of equipment for a minimum of twenty years. VFD's that are manufactured by a third party and "brand labeled" shall not be acceptable. All VFDs installed on this project shall be from the same manufacturer.

C. VFD's specified in this section apply to VFD's for air handling units, exhaust and return fans, cooling towers and pumps. Chiller manufacturers shall provide VFD's designed for the specific chiller duty, performance and efficiency.

1.2 QUALITY ASSURANCE

A. Referenced Standards:
   1. Institute of Electrical and Electronic Engineers (IEEE)
      a. Standard 519-1992, IEEE Guide for Harmonic Content and Control.
   2. Underwriters laboratories
      a. UL508C
   3. National Electrical Manufacturer's Association (NEMA)
      a. ICS 7.0, AC Adjustable Speed Drives
   4. IEC 16800 Parts 1 and 2
   5. National Electric Code (NEC)
      a. NEC 430.120, Adjustable-Speed Drive Systems
   6. International Building Code (IBC)

B. Qualifications:
   1. VFDs and options shall be UL listed as a complete assembly. VFD's that require the customer to supply external fuses for the VFD to be UL listed are not acceptable. VFDs with red label UL stickers, requiring additional branch circuit protection are not acceptable. The base VFD shall be UL listed for 100 KAIC without the need for input fuses.
   2. CE Mark – The VFD shall conform to the European Union ElectroMagnetic Compatibility directive, a requirement for CE marking. The VFD shall meet product standard EN 61800-3 for the First Environment restricted level.
   3. Acceptable Manufacturer:
      a. ABB ACH550 Series.
   4. The VFD manufacturer shall have available a comprehensive, HVAC Drive Computer Based Training (CBT) product. The CBT product shall include detailed, interactive sections covering VFD unpacking, proper mechanical and electrical installation, and programming. The CBT product shall allow the user to provide just-in-time training to new personnel or refresher training for maintenance and repair personnel on the user's

site. The CBT product shall be repeatable, precise and shall include record keeping capability. The CBT product shall record answers to simulations and tests by student ID number. The CBT product must be professionally produced and have interactive sections, student tests, and include video clips of proper wiring and installation.

1.3 SUBMITTALS

A. Submittals shall include the following information:
   1. Outline dimensions, conduit entry locations and weight.
   2. Customer connection and power wiring diagrams.
   3. Complete technical product description include a complete list of options provided. Any portions of this specification not meet must be clearly indicated or the supplier and contractor shall be liable to provide all additional components required to meet this specification.
   4. Compliance to IEEE 519 – harmonic analysis for particular jobsite including total harmonic voltage distortion and total harmonic current distortion (TDD).
      a. The VFD manufacturer shall provide calculations; specific to this installation, showing total harmonic voltage distortion is less than 5%. Input filters shall be sized and provided as required by the VFD manufacturer to ensure compliance with IEEE standard 519. All VFD's shall include a minimum of 5% impedance reactors, no exceptions.

PART 2 - PRODUCTS

2.1 VARIABLE FREQUENCY DRIVES

A. Manufacturers: Provide products subject to compliance with specification, by one of the following:
   1. ABB-ACH 550.

B. The VFD package as specified herein shall be enclosed in a UL Listed Type enclosure, exceeding NEMA enclosure design criteria (enclosures with only NEMA ratings are not acceptable), completely assembled and tested by the manufacturer in an ISO9001 facility. The VFD tolerated voltage window shall allow the VFD to operate from a line of +30% nominal, and -35% nominal voltage as a minimum.
   1. Environmental operating conditions: VFDs shall be capable of continuous operation at 0 to 50^0 C (32 to 122^0 F) ambient temperature as per VFD manufacturers documented/submittal data or VFD must be oversized to meet these temperature requirements. Not acceptable are VFD's that can only operate at 40° C intermittently (average during a 24 hour period) and therefore must be oversized. Altitude 0 to 3300 feet above sea level, less than 95% humidity, non-condensing. All circuit boards shall have conformal coating.
   2. Enclosure shall be rated UL Type 1 and shall be UL listed as a plenum rated VFD. VFD's without these ratings are not acceptable. NEMA only type 1 enclosures are not acceptable (must be UL Type 1).

C. All VFDs shall have the following standard features:
   1. All VFDs shall have the same customer interface, including digital display, and keypad, regardless of horsepower rating. The keypad shall be removable, capable of remote

mounting and allow for uploading and downloading of parameter settings as an aid for start-up of multiple VFDs.

2. The keypad shall include Hand-Off-Auto selections and manual speed control. The drive shall incorporate "bumpless transfer" of speed reference when switching between "Hand" and "Auto" modes. There shall be fault reset and "Help" buttons on the keypad. The Help button shall include "on-line" assistance for programming and troubleshooting.
3. There shall be a built-in time clock in the VFD keypad. The clock shall have a battery back up with 10 years minimum life span. The clock shall be used to date and time stamp faults and record operating parameters at the time of fault. If the battery fails, the VFD shall automatically revert to hours of operation since initial power up. Capacitor back-up is not acceptable. The clock shall also be programmable to control start/stop functions, constant speeds, PID parameter sets and output Form-C relays. The VFD shall have a digital input that allows an override to the time clock (when in the off mode) for a programmable time frame. There shall be four (4) separate, independent timer functions that have both weekday and weekend settings.
4. The VFD's shall utilize pre-programmed application macro's specifically designed to facilitate start-up. The Application Macros shall provide one command to reprogram all parameters and customer interfaces for a particular application to reduce programming time. The VFD shall have two user macros to allow the end-user to create and save custom settings.
5. The VFD shall have cooling fans that are designed for easy replacement. The fans shall be designed for replacement without requiring removing the VFD from the wall or removal of circuit boards. The VFD cooling fans shall operate only when required. To extend the fan and bearing operating life, the VFD shall cycle the cooling fans on and off as required.
6. The VFD shall be capable of starting into a coasting load (forward or reverse) up to full speed and accelerate or decelerate to set point without tripping or component damage (flying start).
7. The VFD shall have the ability to automatically restart after an over-current, over-voltage, under-voltage, or loss of input signal protective trip. The number of restart attempts, trial time, and time between attempts shall be programmable.
8. The overload rating of the drive shall be 110% of its normal duty current rating for 1 minute every 10 minutes, 130% overload for 2 seconds. The minimum FLA rating shall meet or exceed the values in the NEC/UL table 430.250 for 4-pole motors.
9. The VFD shall have internal 5% impedance reactors to reduce the harmonics to the power line and to add protection from AC line transients. The 5% impedance may be from dual (positive and negative DC bus) reactors, or 5% AC line reactors. VFD's with only one DC reactor shall add an AC line reactor.
10. The input current rating of the VFD shall be no more than 3% greater than the output current rating. VFD's with higher input current ratings require the upstream wiring, protection devices, and source transformers to be oversized per NEC 430.120. Input and output current ratings must be shown on the VFD nameplate.
11. The VFD shall include a coordinated AC transient surge protection system consisting of 4-120 joule rated MOV's (phase to phase and phase to ground), a capacitor clamp, and 5% impedance reactors.
12. The VFD shall provide a programmable loss-of-load (broken belt / broken coupling) Form-C relay output. The drive shall be programmable to signal the loss-of-load condition via a keypad warning, Form-C relay output, and / or over the serial communications bus. The loss-of-load condition sensing algorithm shall include a programmable time delay that will allow for motor acceleration from zero speed without signaling a false loss-of-load condition.
13. The VFD shall have user programmable underload and overload curve functions to allow user defined indications of broken belt or mechanical failure / jam condition causing motor overload

14. The VFD shall include multiple "two zone" PID algorithms that allow the VFD to maintain PID control from two separate feedback signals (4-20mA, 0-10V, and / or serial communications). The two zone control PID algorithm will control motor speed based on a minimum, maximum, or average of the two feedback signals. All of the VFD PID controllers shall include the ability for "two zone" control.
15. If the input reference (4-20mA or 2-10V) is lost, the VFD shall give the user the option of either (1) stopping and displaying a fault, (2) running at a programmable preset speed, (3) hold the VFD speed based on the last good reference received, or (4) cause a warning to be issued, as selected by the user. The drive shall be programmable to signal this condition via a keypad warning, Form-C relay output and / or over the serial communication bus.
16. The VFD shall have programmable "Sleep" and "Wake up" functions to allow the drive to be started and stopped from the level of a process feedback signal.

D. All VFDs to have the following adjustments:
1. Three (3) programmable critical frequency lockout ranges to prevent the VFD from operating the load continuously at an unstable speed. The lockout range must be fully adjustable, from 0 to full speed.
2. Two (2) PID Set point controllers shall be standard in the drive, allowing pressure or flow signals to be connected to the VFD, using the microprocessor in the VFD for the closed-loop control. The VFD shall have 250 ma of 24 VDC auxiliary power and be capable of loop powering a transmitter supplied by others. The PID set point shall be adjustable from the VFD keypad, analog inputs, or over the communications bus. There shall be two independent parameter sets for the PID controller and the capability to switch between the parameter sets via a digital input, serial communications or from the keypad. The independent parameter sets are typically used for night setback, switching between summer and winter set points, etc.
3. There shall be an independent, second PID loop that can utilize the second analog input and modulate one of the analog outputs to maintain the set point of an independent process (ie. valves, dampers, etc.). All set points, process variables, etc. to be accessible from the serial communication network.
4. Two (2) programmable analog inputs shall accept current or voltage signals.
5. Two (2) programmable analog outputs (0-20ma or 4-20 ma). The outputs may be programmed to output proportional to Frequency, Motor Speed, Output Voltage, Output Current, Motor Torque, Motor Power (kW), DC Bus voltage, Active Reference, Active Feedback, and other data.
6. Six (6) programmable digital inputs for maximum flexibility in interfacing with external devices. All digital inputs shall be programmable to initiate upon an application or removal of 24VDC or 24VAC.
7. Three (3) programmable, digital Form-C relay outputs. The relay outputs shall include programmable on and off delay times and adjustable hysteresis. The relays shall be rated for maximum switching current 8 amps at 24 VDC and 0.4 A at 250 VAC; Maximum voltage 300 VDC and 250 VAC; continuous current rating of 2 amps RMS. Outputs shall be true Form-C type contacts; open collector outputs are not acceptable.
8. Run permissive circuit - There shall be a run permissive circuit for damper or valve control. Regardless of the source of a run command (keypad, input contact closure, time-clock control, or serial communications), the VFD shall provide a dry contact closure that will signal the damper to open (VFD motor does not operate). When the damper is fully open, a normally open dry contact (end-switch) shall close. The closed end-switch is wired to a VFD digital input and allows VFD motor operation. Two separate safety interlock inputs shall be provided. When either safety is opened, the motor shall be commanded to coast to stop and the damper shall be commanded to close. The keypad shall display "start enable 1 (or 2) missing". The safety input status shall also be transmitted over the serial communications bus.

9. The VFD control shall include a programmable time delay for VFD start and a keypad indication that this time delay is active. A Form C relay output provides a contact closure to signal the VAV boxes open. This will allow VAV boxes to be driven open before the motor operates. The time delay shall be field programmable from 0 – 120 seconds. Start delay shall be active regardless of the start command source (keypad command, input contact closure, time-clock control, or serial communications), and when switching from drive to bypass.
10. Seven (7) programmable preset speeds.
11. Two independently adjustable accel and decel ramps with 1 – 1800 seconds adjustable time ramps.
12. The VFD shall include a motor flux optimization circuit that will automatically reduce applied motor voltage to the motor to optimize energy consumption and reduce audible motor noise. The VFD shall have selectable software for optimization of motor noise, energy consumption, and motor speed control.
13. The VFD shall include a carrier frequency control circuit that reduces the carrier frequency based on actual VFD temperature that allows higher carrier frequency settings without derating the VFD.
14. The VFD shall include password protection against parameter changes.

E. The Keypad shall include a backlit LCD display. The display shall be in complete English words for programming and fault diagnostics (alpha-numeric codes are not acceptable). All VFD faults shall be displayed in English words. The keypad shall include a minimum of 14 assistants including:
1. Start-up assistant
2. Parameter assistants
   a. PID assistant
   b. Reference assistant
   c. I/O assistant
   d. Serial communications assistant
   e. Option module assistant
   f. Panel display assistant
   g. Low noise set-up assistant
3. Maintenance assistant
4. Troubleshooting assistant
5. Drive optimizer assistants

F. All applicable operating values shall be capable of being displayed in engineering (user) units. A minimum of three operating values from the list below shall be capable of being displayed at all times. The display shall be in complete English words (alpha-numeric codes are not acceptable):
1. Output Frequency
2. Motor Speed (RPM, %, or Engineering units)
3. Motor Current
4. Motor Torque
5. Motor Power (kW)
6. DC Bus Voltage
7. Output Voltage

G. The VFD shall include a fireman's override input. Upon receipt of a contact closure from the fire / smoke control station, the VFD shall operate in one of two modes: 1) Operate at a programmed predetermined fixed speed ranging from -500Hz (reverse) to 500Hz (forward). 2) Operate in a specific fireman's override PID algorithm that automatically adjusts motor speed based on override set point and feedback. The mode shall override all other inputs (analog/digital, serial communication, and all keypad commands), except customer defined

safety run interlocks, and force the motor to run in one of the two modes above. "Override Mode" shall be displayed on the keypad. Upon removal of the override signal, the VFD shall resume normal operation, without the need to cycle the normal digital input run command.

H. Serial Communications

1. The VFD shall have an EIA-485 port as standard. The standard protocols shall be Modbus, Johnson Controls N2, Siemens Building Technologies FLN, and BACnet. Optional protocols for BACnet IP, and DeviceNet shall be available. Each individual drive shall have the protocol in the base VFD. The use of third party gateways and multiplexers is not acceptable. All protocols shall be "certified" by the governing authority (i.e. BTL Listing for BACnet). Use of non-certified protocols is not allowed.
2. The BACnet connection shall be an EIA-485, MS/TP interface operating at 9.6, 19.2, 38.4, or 76.8 Kbps. The connection shall be tested by the BACnet Testing Labs (BTL) and be BTL Listed. The BACnet interface shall conform to the BACnet standard device type of an Applications Specific Controller (B-ASC). The interface shall support all BIBBs defined by the BACnet standard profile for a B-ASC including, but not limited to:
   a. Data Sharing – Read Property – B.
   b. Data Sharing – Write Property – B.
   c. Device Management – Dynamic Device Binding (Who-Is; I-Am).
   d. Device Management – Dynamic Object Binding (Who-Has; I-Have).
   e. Device Management – Communication Control – B.
3. If additional hardware is required to obtain the BACnet interface, the VFD manufacturer shall supply one BACnet gateway per drive. Multiple VFDs sharing one gateway shall not be acceptable.
4. Serial communication capabilities shall include, but not be limited to; run-stop control, speed set adjustment, proportional/integral/derivative PID control adjustments, current limit, accel/decel time adjustments, and lock and unlock the keypad. The drive shall have the capability of allowing the DDC to monitor feedback such as process variable feedback, output speed / frequency, current (in amps), % torque, power (kW), kilowatt hours (resettable), operating hours (resettable), and drive temperature. The DDC shall also be capable of monitoring the VFD relay output status, digital input status, and all analog input and analog output values. All diagnostic warning and fault information shall be transmitted over the serial communications bus. Remote VFD fault reset shall be possible.
5. Serial communication in bypass shall include, but not be limited to; bypass run-stop control, the ability to force the unit to bypass, and the ability to lock and unlock the keypad. The bypass shall have the capability of allowing the DDC to monitor feedback such as, current (in amps), kilowatt hours (resettable), operating hours (resettable), and bypass logic board temperature. The DDC shall also be capable of monitoring the bypass relay output status, and all digital input status. All bypass diagnostic warning and fault information shall be transmitted over the serial communications bus. Remote bypass fault reset shall be possible.
6. The VFD / bypass shall allow the DDC to control the drive and bypass digital and analog outputs via the serial interface. This control shall be independent of any VFD function. The analog outputs may be used for modulating chilled water valves or cooling tower bypass valves. The drive and bypass' digital (Form-C relay) outputs may be used to actuate a damper, open a valve or control any other device that requires a maintained contact for operation. In addition, all of the drive and bypass' digital inputs shall be capable of being monitored by the DDC system. This allows for remote monitoring of which (of up to 4) safeties are open.
7. The VFD shall include an independent PID loop for customer use. The independent PID loop may be used for cooling tower bypass value control, chilled water value / hot water valve control, etc. Both the VFD PID control loop and the independent PID control loop shall continue functioning even if the serial communications connection is lost. As

default, the VFD shall keep the last good set point command and last good DO & AO commands in memory in the event the serial communications connection is lost and continue controlling the process.

I. EMI / RFI filters. All VFD's shall include EMI/RFI filters. The onboard filters shall allow the VFD assembly to be CE Marked and the VFD shall meet product standard EN 61800-3 for the First Environment restricted level with up to 100 feet of motor cable. No Exceptions. Certified test reports shall be provided with the submittals confirming compliance to EN 61800-3, First Environment.

J. All VFD's through 75HP at 480 V shall be protected from input and output power mis-wiring. The VFD shall sense this condition and display an alarm on the keypad. The VFD shall not sustain damage from this power mis-wiring condition.

K. OPTIONAL FEATURES – Optional features to be furnished and mounted by the drive manufacturer. All optional features shall be UL Listed by the drive manufacturer as a complete assembly and carry a UL508 label.
   1. Door interlocked, padlockable circuit breaker that will disconnect all input power from the drive and all internally mounted options. Circuit breaker option shall be available with or without systems requiring bypass.
   2. Fieldbus adapters - Optional protocols such as LonWorks, DeviceNet, Ethernet IP (ControlNet over Ethernet & ModBus TCP), BACnet IP, and Profibus shall be available with the addition of an option card.

L. BYPASS CONTROLLER
   1. A complete factory wired and tested bypass system consisting of a door interlocked, padlockable circuit breaker, output contactor, bypass contactor, and fast acting VFD input fuses are required. UL Listed motor overload protection shall be provided in both drive and bypass modes.
      a. By-pass controller are not required chilled, condenser, glycol and heating water pumps in the main mechanical room. Door interlocked line input and output disconnects shall be provided for these pumps for servicing of VFD.
   2. The bypass enclosure door and VFD enclosure must be mechanically interlocked such that the disconnecting device must be in the "Off" position before either enclosure may be accessed.
   3. The VFD and bypass package shall have a UL listed short circuit current rating (SCCR) of 100,000 amps and this rating shall be indicated on the UL data label.
   4. Drive Isolation Fuses - To ensure maximum possible bypass operation, fast acting fuses, exclusive to the VFD, shall be provided to allow the VFD to disconnect from the line prior to clearing upstream branch circuit protection. This maintains bypass operation capability in the event of a VFD failure. Bypass designs which have no such fuses, or that incorporate fuses common to both the VFD and the bypass, will not be accepted.
   5. The system (VFD and Bypass) tolerated voltage window shall allow the system to operate from a line of +30%, -35% nominal voltage range. The system shall incorporate circuitry that will allow the drive or bypass contactor to remain "sealed in" over this voltage tolerance at a minimum.
   6. The bypass shall maintain positive contactor control through the voltage tolerance window of nominal voltage +30%, -35%. This feature is designed to avoid contactor coil failure during brown out / low line conditions and allow for input single phase operation when in the VFD mode. Designs that will not allow input single phase operation in the VFD mode are not acceptable.
   7. Motor protection from single phase power conditions - the bypass system must be able to detect a single phase input power condition while running in bypass, disengage the motor

in a controlled fashion, and give a single phase input power indication. Bypass systems not incorporating single phase protection in bypass mode are not acceptable.

8. The bypass system shall NOT depend on the VFD for bypass operation. The bypass system shall be designed for stand alone operation and shall be completely functional in both Hand and Automatic modes even if the VFD has been removed from the system for repair / replacement. Serial communications shall remain functional even with the VFD removed.
9. Serial communications – the bypass shall be capable of being monitored and / or controlled via serial communications. On-board communications protocols shall include ModBus; Johnson Controls N2; Siemens Building Technologies FLN (P1); and BACnet.
10. Serial communication capabilities shall include, but not be limited to; bypass run-stop control; the ability to force the unit to bypass; and the ability to lock and unlock the keypad. The bypass shall have the capability of allowing the DDC to monitor feedback such as, current (in amps), kilowatt hours (resettable), operating hours (resettable), and bypass logic board temperature. The DDC shall also be capable of monitoring the bypass relay output status, and all digital input status. All bypass diagnostic warning and fault information shall be transmitted over the serial communications bus. Remote bypass fault reset shall be possible. The following additional status indications and settings shall be transmitted over the serial communications bus and / or via a Form-C relay output – keypad "Hand" or "Auto" selected, bypass selected, and broken belt indication. The DDC system shall also be able to monitor if the motor is running in the VFD mode or bypass mode over serial communications. A minimum of 50 field serial communications points shall be capable of being monitored in the bypass mode.
11. The bypass serial communications shall allow control of the bypass' digital outputs via the serial interface. This control shall be independent of any bypass function or operating state. The bypass' digital (relay) outputs may be used to actuate a damper, open a valve or control any other device that requires a maintained contact for operation. In addition, all of the bypass' digital inputs shall be capable of being monitored by the DDC system.
12. There shall be an adjustable motor current sensing circuit for the bypass and VFD modes to provide proof of flow (broken belt) indication. The condition shall be indicated on the keypad display, transmitted over the building automation protocol and / or via a Form-C relay output contact closure. The broken belt indication shall be programmable to be a system (drive and bypass) indication. The broken belt condition sensing algorithm shall be programmable to cause only a warning or a fault and / or system shutdown.
13. The digital inputs for the system shall accept 24VAC or 24VDC. The bypass shall incorporate an internally sourced power supply and not require an external control power source. The bypass power board shall supply 250 ma of 24 VDC for use by others to power external devices.
14. There shall be a run permissive circuit for damper or valve control. Regardless of the source of a run command (keypad command, time-clock control, digital input, or serial communications) the bypass shall provide a dry contact closure that will signal the damper to open (motor does not operate). When the damper is fully open, a normally open dry contact (end-switch) shall close. The closed end-switch is wired to a bypass system input and allows motor operation. Up to four separate safety interlock inputs shall be provided. When any safety is opened, the motor shall be commanded to coast to stop, and the damper shall be commanded to close. This feature will also operate in Fireman's override / smoke control mode.
15. The bypass control shall monitor the status of the VFD and bypass contactors and indicate when there is a welded contactor contact or open contactor coil. This failed contactor condition shall be indicated on the bypass LCD display, programmed to fire a Form-C relay output, and / or over the serial communications protocol.
16. The bypass control shall include a programmable time delay for bypass start and keypad indication that this time delay is in process. A Form C relay output provides a contact closure to signal the VAV boxes open. This will allow VAV boxes to be driven open

before the motor operates at full speed in the bypass mode. The time delay shall be field programmable from 0 – 120 seconds.

17. There shall be a keypad adjustment to select manual or automatic transfer bypass. The user shall be able to select via keypad programming which drive faults will result in an automatic transfer to the bypass mode and which faults require a manual transfer to bypass. The user may select whether the system shall automatically transfer from drive to bypass mode on the following drive fault conditions:
    a. Over current
    b. Over voltage
    c. Under voltage
    d. Loss of analog input
18. The following operators shall be provided:
    a. Bypass Hand-Off-Auto
    b. Drive mode selector
    c. Bypass mode selector
    d. Bypass fault reset
19. The bypass shall include a two line, 20 character LCD display. The display shall allow the user to access and view:
    a. Energy savings – in US dollars
    b. Bypass motor amps
    c. Bypass input voltage– average and individual phase voltage
    d. Bypass power (kW)
    e. Bypass faults and fault logs
    f. Bypass warnings
    g. Bypass operating time (resettable)
    h. Bypass energy (kilowatt hours – resettable)
    i. I/O status
    j. Parameter settings / programming
    k. Printed circuit board temperature
20. The following indicating lights (LED type) or keypad display indications shall be provided. A test mode or push to test feature shall be provided.
    a. Power-on (Ready)
    b. Run enable
    c. Drive mode selected
    d. Bypass mode selected
    e. Drive running
    f. Bypass running
    g. Drive fault
    h. Bypass fault
    i. Bypass H-O-A mode
    j. Automatic transfer to bypass selected
    k. Safety open
    l. Damper opening
    m. Damper end-switch made
21. The Bypass controller shall have six programmable digital inputs, and five programmable Form-C relay outputs. This I/O allows for a total System (VFD and Bypass) I/O count of 24 points as standard. The bypass I/O shall be available to the BAS / DDC system even with the VFD removed.
22. The on-board Form-C relay outputs in the bypass shall programmable for any of the following indications.
    a. System started
    b. System running
    c. Bypass override enabled
    d. Drive fault

e. Bypass fault
f. Bypass H-O-A position
g. Motor proof-of-flow (broken belt)
h. Overload
i. Bypass selected
j. Bypass run
k. System started (damper opening)
l. Bypass alarm
m. Over temperature

23. The bypass shall provide a separate terminal strip for connection of freeze, fire, smoke contacts, and external start command. All external safety interlocks shall remain fully functional whether the system is in VFD or Bypass mode. The remote start/stop contact shall operate in VFD and bypass modes. The terminal strip shall allow for independent connection of up to four (4) unique safety inputs.
24. The bypass shall include a supervisory control mode. In this bypass mode, the bypass shall monitor the value of the VFD's analog input (feedback). This feedback value is used to control the bypass contactor on and off state. The supervisory mode shall allow the user to maintain hysteresis control over applications such as cooling towers and booster pumps even with the VFD out of service.
25. The user shall be able to select the text to be displayed on the keypad when an external safety opens. Example text display indications include "FireStat", "FreezStat", "Over pressure" and "Low suction". The user shall also be able to determine which of the four (4) safety contacts is open over the serial communications connection.
26. Smoke Control Override Mode (Override 1) – The bypass shall include a dedicated digital input that will transfer the motor from VFD mode to Bypass mode upon receipt of a dry contact closure from the Fire / Smoke Control System. The Smoke Control Override Mode action is not programmable and will always function as described in the bypass User's Manual documentation. In this mode, the system will ignore low priority safeties and acknowledge high priority safeties as required by UL 864/UUKL. All keypad control, serial communications control, and normal customer start / stop control inputs will be disregarded. This Smoke Control Mode shall be designed to meet the intent of UL864/UUKL.
27. Fireman's Override Mode (Override 2) – the bypass shall include a second, programmable override input which will allow the user to configure the unit to acknowledge some digital inputs, all digital inputs, ignore digital inputs or any combination of the above. This programmability allows the user to program the bypass unit to react in whatever manner the local Authority Having Jurisdiction (AHJ) requires. The Override 2 action may be programmed for "Run-to-Destruction". The user may also force the unit into Override 2 via the serial communications link.
28. Class 10, 20, or 30 (programmable) electronic motor overload protection shall be included.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Installation shall be the responsibility of the mechanical contractor. The contractor shall install the drive in accordance with the recommendations of the VFD manufacturer as outlined in the VFD installation manual.

B. Power wiring shall be completed by the electrical contractor, to NEC code 430.122 wiring requirements based on the VFD input current. Caution: VFDs supplied without internal reactors

have substantially higher input current ratings, which may require larger input power wiring and branch circuit protection. The contractor shall complete all wiring in accordance with the recommendations of the VFD manufacturer as outlined in the installation manual.

3.2 START-UP

A. Certified factory start-up shall be provided for each drive by a factory authorized service center. A certified start-up form shall be filled out for each drive with a copy provided to the owner, and a copy kept on file at the manufacturer.

3.3 PRODUCT SUPPORT

A. Factory trained application engineering and service personnel that are thoroughly familiar with the VFD products offered shall be locally available at both the specifying and installation locations. A toll free 24/365 technical support line shall be available.

B. A computer based training CD or 8-hour professionally generated video (VCR format) shall be provided to the owner at the time of project closeout. The training shall include installation, programming and operation of the VFD, bypass and serial communication.

3.4 WARRANTY

A. The VFD Product Warranty shall be 24 months from the date of certified start-up, not to exceed 30 months from the date of shipment. The warranty shall include all parts, labor, travel time and expenses. A toll free 24/365 technical support line shall be available.

END OF SECTION 237250

SECTION 237313 - INDOOR CENTRAL-STATION AIR-HANDLING UNITS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Provide factory-fabricated custom air handling units with capacity as indicated on the schedule. Units shall have overall dimensions as indicated and fit in the space available with adequate clearance for service as determined by the Engineer. All units shall come completely assembled. Multiple sectioned units shall be shipped as a single factory assembled piece (except where shipping limitations prevent) de-mounted into modular sections in the field by the contractor. Units shall be furnished with sufficient gasket and bolts for reassembly in the field by the contractor.
   1. Factory representative shall instruct contractor in the proper re-assembly of unit and shall field inspect assembled units. Factory representative shall furnish certification that units have been inspected and that assembled units meet the manufacturers quality standards.

B. Section Includes:
   1. Factory custom, variable-air-volume, single-zone air-handling units with multiple direct drive supply fan wall panel, enthalpy wheels, variable frequency drives and air flow measuring stations as indicated on plans.

1.3 PERFORMANCE REQUIREMENTS

A. Structural Performance: Casing panels shall be self-supporting and capable of withstanding 133 percent of internal static pressures indicated, without panel joints exceeding a deflection of L/200 where "L" is the unsupported span length within completed casings.

1.4 SUBMITTALS

A. Product Data: For each air-handling unit indicated.
   1. Unit dimensions and weight.
   2. Cabinet material, metal thickness, finishes, insulation, and accessories.
   3. Fans:
      a. Certified fan-performance curves with system operating conditions indicated.
      b. Certified fan-sound power ratings.
      c. Fan construction and accessories.
      d. Motor ratings, electrical characteristics, and motor accessories.
   4. Certified coil-performance ratings with system operating conditions indicated.
   5. Dampers, including housings, linkages, and operators.
   6. Filters with performance characteristics.
   7. Variable frequency drives.

8. Wiring diagrams.
9. Factory furnished air flow measuring stations.

B. Coordination Drawings: Floor plans and other details, drawn to scale, on which the following items are shown and coordinated with each other, using input from installers of the items involved:
1. Mechanical-room layout and relationships between components and adjacent structural and mechanical elements.
2. Support location, type, and weight.
3. Field measurements.

C. Source quality-control reports.

D. Field quality-control reports.

E. Operation and Maintenance Data: For air-handling units to include in emergency, operation, and maintenance manuals.

1.5 QUALITY ASSURANCE

A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

B. NFPA Compliance: Comply with NFPA 90A for design, fabrication, and installation of air-handling units and components.

C. ARI Certification: Air-handling units and their components shall be factory tested according to ARI 430, "Central-Station Air-Handling Units," and shall be listed and labeled by ARI.

D. Comply with NFPA 70.

1.6 COORDINATION

A. Coordinate sizes and locations of concrete bases with actual equipment provided.

B. Coordinate sizes and locations of structural-steel support members, if any, with actual equipment provided.

1.7 EXTRA MATERIALS

A. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.
1. Filters: Two set(s) for each air-handling unit for each pre-filter, gas phase and final filters.
2. Gaskets: One set(s) for each access door.
3. Fan Belts: Two set(s) for each belt driven air-handling unit fan.
4. Fan/Motor Assembly: One spare fan/motor for each air handling unit.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, the following:
   1. Ingenia
   2. Governair
   3. Energy Labs

2.2 UNIT CASINGS

A. Unit Base / Frame / Floor:
   1. Provide a full perimeter welded base frame manufactured with structural steel tubing and C-Channel cross support members on close centers. Unit frame shall be from 14-gauge carbon tubular steel, mig welded to form a unitized assembly for support of all internal components. Base and unit frame shall be painted with a lacquer resisting gray phenolic corrosion inhibitive primer. Base rails shall be fitted with lifting lugs at the corner of the unit or section (if de-mounted). The base shall include a 3-inch thick insulated “double bottom” floor with minimum 20 gauge G-90 galvanized outer and 16 gauge G-90 galvanized inner walk in surface. All floor seams shall be gasketed, caulked and sealed for an airtight / thermal break floor. Base frame shall be attached to the unit at the factory.

B. Exterior Panels:
   1. The exterior panel shall be fabricated from formed 16 gauge G-90 galvanized steel with exterior coating as specified below. Flat panel design is not acceptable. The air handling unit casing shall be of the “no-through-metal” design. The casing structure shall incorporate insulating thermal breaks as required so that, when fully assembled, there exist no path of continuous unbroken metal to metal conduction from inner to outer surfaces. Provide necessary support to limit casing deflection to 1/200 of the narrowest panel dimension. If panels cannot meet this deflection, add additional internal reinforcing. Panels shall be gasketed and secured to the tubular steel frame with 1/4" hex head, zinc plated fasteners and neoprene washers. Outer panels must be removable without affecting the structural integrity of the unit. All panel seams shall be caulked and sealed for an airtight unit. Leakage rates shall be less than 1% at design static pressure or 8” whichever is greater. The exterior panel finish shall be non paint: Bright spangled galvanized. The color shall be sterling gray.

C. Double Wall Construction:
   1. Each unit shall have double wall construction with 16 gauge solid galvanized steel liner in the entire unit. The entire double wall panel shall be removable from the outside of the unit without affecting the structural integrity of the unit.

D. Insulation:
   1. Entire unit section shall be insulated with full 2-inch thick non-compressed fiberglass insulation. The insulation shall have an effective thermal conductivity (C) of 0.24 (BTU in./sq.ft./Fº) and a noise reduction coefficient (NRC) of 0.70 / per inch thick (based on a type "A" mounting). The coefficients shall meet or exceed a 3.0 P.C.F. density material rating. Insulation shall meet the erosion requirements of UL 181 facing the air stream and fire hazard classification of 25/50 (per ASTM-84 and UL 723 and CAN/ULC S102-M88). All insulation edges shall be encapsulated within the panel.

E. Inspection and Access Panels:
   1. Panel Fabrication: Formed and reinforced, double-wall and insulated panels of same materials and thicknesses as casing.
   2. Inspection and Access Panels:
      a. Fasteners: Two or more camlock type for panel lift-out operation. Arrangement shall allow panels to be opened against air-pressure differential.
      b. Gasket: Bulb-type, neoprene, applied around entire perimeters of panel frames.
      c. Size: Large enough to allow inspection and maintenance of air-handling unit's internal components.
   3. Access Doors:
      a. Door Fabrication: Formed and reinforced double-wall and insulated panels of same materials and thicknesses as casing.
      b. The doorframe shall be extruded aluminum with a built in thermal break barrier and full perimeter gasket. The door hinge assembly shall be die cast zinc with stainless steel pivot mechanism, completely adjustable. There shall be a minimum of two heavy duty Ventlok 360 handles per door. Provide ETL, UL 1995, and CAL-OSHA approved tool operated safety latch on all fan section access doors.
      c. Gasket: Neoprene, bulb-type, applied around entire perimeters of panel frames.
      d. Fabricate windows in doors of double-glazed, wire-reinforced safety glass with an air space between panes and sealed with interior and exterior rubber seals.
   4. Locations and Applications:
      a. Fan Section: Doors.
      b. Access Section: Doors.
      c. Coil Section: Inspection and access panel.
      d. Damper Section: Doors.
      e. Filter Section: Doors large enough to allow periodic removal and installation of filters.
      f. Mixing Section: Doors.
      g. Enthalpy Wheel Section: Doors.
      h. Discharge Plenum: Doors.
   5. Service Light: 100 watt fluorescent, vapor proof fixture wired to a single timer switch box located outside of supply fan section access door.
      a. Locations: Each section accessed with door.

F. Condensate Drain Pans:
   1. IAQ style drain pans fabricated with two percent slope in at least two planes to collect condensate from cooling coils (including coil piping connections, coil headers, and return bends) and from heating coils and to direct water toward drain connection. The drain pan shall be fabricated from 16 gauge 304 stainless steel. All pans are to be triple pitched for complete drainage with no standing water in the unit. They shall be insulated minimum 3-inch "Double Bottom" construction with welded corners. Provide stainless steel, 1-1/4” MPT drain connection extended to the exterior of the unit base rail. Units in excess of 159 inches shall have drain connections on both sides. All drain connections shall be piped and trapped separately for proper drainage. .
      a. Depth: A minimum of 2 inches deep.
   2. Units with stacked coils shall have an intermediate drain pan to collect condensate from top coil.

2.3 FAN, DRIVE, AND MOTOR SECTION

A. Fan and Drive Assemblies: Statically and dynamically balanced and designed for continuous operation at maximum-rated fan speed and motor horsepower.
   1. Shafts: Designed for continuous operation at maximum-rated fan speed and motor horsepower, and with field-adjustable alignment.

a. Turned, ground, and polished hot-rolled steel with keyway. Ship with a protective coating of lubricating oil.
b. Designed to operate at no more than 70 percent of first critical speed at top of fan's speed range.

B. Fan Wall Panel: The fan wall shall consist of multiple, direct driven, arrangement 4 plenum fans constructed per AMCA requirements for the duty specified, (Class I, or II). All fans shall be selected to deliver the specified airflow quantity at the specified operating Total Static Pressure and specified fan/motor speed. The fan wall array shall be selected to operate at a system Total Static Pressure that does not exceed 90% of the specified fan's peak static pressure producing capability at the specified fan/motor speed. The array shall be provided with acoustical Coplanar silencers that reduce the bare fan discharge sound power levels throughout the eight octave bands.
1. All motors shall be standard pedestal mounted type TEFC T-frame motors selected at the specified operating voltage, RPM, and efficiency as specified or as scheduled elsewhere. All motors shall include shaft grounding. Each fan/motor cartridge shall be dynamically balanced to meet AMCA standard 204-96, category BV-5, to meet or exceed Grade 2.5 residual unbalance at design RPM. This balance equates to a vibration velocity less than or equal to 0.080 in. per second. Vibration amplitudes are in inches per second – peak. All values are filter-in at the fan speed. All other balance by others in field.
2. The fan array shall consist of multiple fans and motors, spaced in the air way tunnel cross section to provide a uniform air flow and velocity profile across the entire air way tunnel cross section and components contained therein. Each fan motor shall be individually wired to a control panel containing a minimum of two VFDs, as specified elsewhere, for the total connected HP for all fan motors contained in the fan wall array. Wire sizing shall be determined, and installed, in accordance with applicable NEC standards.
3. The manufacturer shall provide a complete spare fan/motor assembly for emergency replacement, one for each type of assembly provided on the project.
4. Each supply fan shall be provided with an automatic back draft designed for "zero systems effect".
5. Fan inlet cones shall be furnished with Ebtron extended face inlet cone air flow measuring stations wired to a single air flow measuring panel.

C. Plenum Fan Housings: Steel frame and panel; fabricated without fan scroll and volute housing.

D. Internal Vibration Isolation: Fans shall be factory mounted with manufacturer's standard vibration isolation mounting devices having a minimum static deflection of 2 inches.

E. Motor: Comply with NEMA designation, temperature rating, service factor, enclosure type, and efficiency requirements for motors specified in Division 23 Section "Common Motor Requirements for HVAC Equipment."
1. NEMA Premium (TM) efficient motors as defined in NEMA MG 1.
2. Motor Sizes: Minimum size as indicated. If not indicated, large enough so driven load will not require motor to operate in service factor range above 1.0.
3. Controllers, Electrical Devices, and Wiring: Comply with requirements for electrical devices and connections specified in Division 26 Sections.

2.4 COIL SECTION

A. General Requirements for Coil Section:
1. Comply with ARI 410.
2. Fabricate coil section to allow removal and replacement of coil for maintenance and to allow in-place access for service and maintenance of coil(s).
3. Coils shall not act as structural component of unit.

4. Stainless steel drain pan under heating coil with capped drain to the outside.

2.5 FILTER SECTION

A. Filters modules shall have filter racks, at one access door for filter removal, and filter block-offs to prevent air bypass around filters. The modules shall be supplied with 2-inch flat, anol cartridge, filters.

B. Filters: Comply with NFPA 90A.

C. Pleated Media Pre-filters: The filters shall be 2-inch thick, nonwoven fabric, treated with adhesive and continuously laminated to a supported steel-wire grid. Filters shall be capable of operating up to 625-fpm face velocity without loss of filter efficiency and holding capacity. The filters shall have a rated average dust-spot efficiency of 35-percent (MERV 7 rating) when tested in accordance with the ASHRAE Standard 52.2 atmospheric-dust-spot method.

D. Cartridge Final Filters: The filters shall be constructed with a continuous sheet of fine-fiber media made into closely spaced pleats with safe-edge aluminum separators. The filters shall be capable of operating up to 625-fpm face velocity for 12-inch-deep filters without loss of filter efficiency and holding capacity. The filters shall be sealed into a metal frame assembled in a rigid manner. The gasket material shall be installed on the metal header of the filter to prevent filter bypass where the metal headers meet on the side-access racks. The manufacturer shall supply a side-access filter rack capable of holding cartridge filters and prefilters. Cartridge filters shall have a 90-95-percent dust-spot efficiency (MERV 14 rating) based in ASHRAE Standard 52.2.

E. Filter Gage:
1. 3-1/2-inch- diameter, diaphragm-actuated dial in metal case.
2. Vent valves.
3. Black figures on white background.
4. Front recalibration adjustment.
5. 2 percent of full-scale accuracy.
6. Range: 0- to 2.0-inch wg.
7. Accessories: Static-pressure tips with integral compression fittings, 1/4-inch aluminum tubing, and 2- or 3-way vent valves.

2.6 DAMPERS

A. General Requirements for Dampers: Leakage rate, according to AMCA 500, "Laboratory Methods for Testing Dampers for Rating," shall not exceed 2 percent of air quantity at 2000-fpm face velocity through damper and 4-inch wg pressure differential.

B. Damper Operators: Comply with requirements in Division 23 Section "Instrumentation and Control for HVAC."

C. Electronic Damper Operators:
1. Direct-coupled type designed for minimum 60,000 full-stroke cycles at rated torque.
2. Electronic damper position indicator shall have visual scale indicating percent of travel and 2- to 10-V dc, feedback signal.
3. Operator Motors:

a. Comply with NEMA designation, temperature rating, service factor, enclosure type, and efficiency requirements for motors specified in Division 23 Section "Common Motor Requirements for HVAC."
b. Size to operate with sufficient reserve power to provide smooth modulating action or two-position action.
c. Permanent Split-Capacitor or Shaded-Pole Type: Gear trains completely oil immersed and sealed. Equip spring-return motors with integral spiral-spring mechanism in housings designed for easy removal for service or adjustment of limit switches, auxiliary switches, or feedback potentiometer.

4. Nonspring-Return Motors for Dampers Larger Than 25 Sq. Ft.: Size for running torque of 150 in. x lbf and breakaway torque of 300 in. x lbf.
5. Spring-Return Motors for Dampers Larger Than 25 Sq. Ft.: Size for running and breakaway torque of 150 in. x lbf.
6. Size dampers for running torque calculated as follows:
   a. Parallel-Blade Damper with Edge Seals: 7 inch-lb/sq. ft. of damper.
   b. Opposed-Blade Damper with Edge Seals: 5 inch-lb/sq. ft. of damper.
   c. Parallel-Blade Damper without Edge Seals: 4 inch-lb/sq. ft of damper.
   d. Opposed-Blade Damper without Edge Seals: 3 inch-lb/sq. ft. of damper.
   e. Dampers with 2- to 3-Inch wg of Pressure Drop or Face Velocities of 1000 to 2500 fpm: Increase running torque by 1.5.
   f. Dampers with 3- to 4-Inch wg of Pressure Drop or Face Velocities of 2500 to 3000 fpm: Increase running torque by 2.0.
7. Coupling: V-bolt and V-shaped, toothed cradle.
8. Overload Protection: Electronic overload or digital rotation-sensing circuitry.
9. Fail-Safe Operation: Mechanical, spring-return mechanism with external, manual gear release on nonspring-return actuators.
10. Power Requirements (Two-Position Spring Return): 24-V ac.
11. Power Requirements (Modulating): Maximum 10 VA at 24-V ac or 8 W at 24-V dc.
12. Proportional Signal: 2- to 10-V dc or 4 to 20 mA, and 2- to 10-V dc position feedback signal.
13. Temperature Rating: Minus 22 to plus 122 deg F.
14. Run Time: 90 seconds.

D. Outdoor- and Return-Air Dampers: Low-leakage, double-skin, airfoil-blade, extruded-aluminum dampers with compressible jamb seals and extruded-vinyl blade edge seals in parallel-blade arrangement with cadmium-plated steel operating rods rotating in sintered bronze or nylon bearings mounted in a single extruded-aluminum frame, and with operating rods connected with a common linkage. Leakage rate shall not exceed 5 cfm/sq. ft. at 1-inch wg and 9 cfm/sq. ft. at 4-inch wg.

E. Airflow Monitoring Station: The air monitoring station shall combine the functions of control damper and flow measurement station in one assembly. Air straightener shall be 3000 series aluminum alloy honeycomb contained in 5" long 16 gage galvanized sleeve attached to monitoring blade frame.. Fixed anodized aluminum monitoring blades are mounted in 10" 16 gage galvanized frame. Control dampers feature airfoil shaped 6063T5 heavy gage extruded aluminum blades rotating on 1/2" plated steel hex axles, mounted in a 4"x 1" 6063T5, .081" thickness extruded aluminum channel with mounting flanges on both sides of frame. Jamb seals are flexible metal compression type. Neoprene blade seals along control damper blade edges. Bearings shall be molded synthetic. Linkage is galvanized steel, concealed in frame. The acceptable range of operation is 200- fpm to 2000- fpm face velocity. The air monitoring station shall be tested to AMCA Standard 611-95 and qualified to bear the AMCA Ratings Air flow measuring station and damper shall be Ebtron-Tamco (Gold)

F. Mixing Section: Multiple-blade, air-mixer assembly located immediately downstream of mixing section.

G. Combination Filter and Mixing Section:

1. Cabinet support members shall hold 2-inch- thick, pleated, flat, permanent or throwaway filters.
2. Multiple-blade, air-mixer assembly shall mix air to prevent stratification, located immediately downstream of mixing box.

H. Variable Frequency Drives: Provide a minimum of two factory mounted and wired variable frequency drives (VFD) for each unit. Refer to Section 237250 – Variable Frequency Drives. Each drive shall be wired to control 100% of the multiple fan arrangement. Second VFD shall be wired as full stand-by with manual switchover. Each drive shall be furnished with disconnects in line input side and for each motor on the output side to allow service of a fan motor while other fans are energized.
1. Current sensors shall be factory installed at each VFD output to fan motors. Current sensors shall be wired to a junction box mounted near the VFD's for field connection by the BAS Contractor.

2.7 ENTHALPY HEAT WHEELS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
1. Advanced Thermal Technologies.
2. Airxchange Inc.
3. American Energy Exchange, Inc.
4. SEMCO Incorporated.

B. Casing:
1. Integral purge section limiting carryover of exhaust air to between 0.05 percent at 1.6-inch wg and 0.20 percent at 4-inch wg differential pressure.
2. Casing seals on periphery of rotor and on duct divider and purge section.
3. Support vertical rotors on grease-lubricated ball bearings having permanently lubricated bearings. Support horizontal rotors on tapered roller bearing.

C. Rotor: Aluminum segmented wheel strengthened with radial spokes, with nontoxic, noncorrosive, silica-gel desiccant coating.
1. Maximum Solid Size for Media to Pass: 500 micrometer.

D. Rotor: Polymer or aluminum segmented wheel strengthened with radial spokes impregnated with nonmigrating, water-selective, molecular-sieve desiccant coating.
1. Maximum Solid Size for Media to Pass: 800 micrometer.

E. Drive: Fractional horsepower motor, with speed changed by variable frequency controller and self-adjusting multilink belt around outside of rotor.
1. Comply with NEMA designation, temperature rating, service factor, enclosure type, and efficiency requirements for motors specified in Section 230513 "Common Motor Requirements for HVAC Equipment."
2. Motor Sizes: Minimum size as indicated. If not indicated, large enough so driven load will not require motor to operate in service factor range above 1.0.

F. Controls:
1. Starting relay, factory mounted and wired, and manual motor starter for field wiring.
2. Variable frequency controller, factory mounted and wired, permitting input of field connected 4-20 mA or 1-10-V control signal.
3. Variable frequency controller, factory mounted and wired, with exhaust-air sensor to vary rotor speed and maintain exhaust temperature above freezing.
4. Variable frequency controller, factory mounted and wired, with exhaust- and outdoor-air sensors, automatic changeover thermostat and set-point adjuster, to vary rotor speed and maintain exhaust

temperature above freezing and air differential temperature above set point. Rotor speed shall increase to maximum when exhaust-air temperature is less than outdoor-air temperature.

5. Pilot-Light Indicator: Display rotor rotation and speed.
6. Speed Settings: Adjustable settings for maximum and minimum rotor speed limits.
7. BACNet or LONTalk communication capable to allow start/stop control thru the AHU DDC controls and monitoring of status and temperature.

2.8 CAPACITIES AND CHARACTERISTICS

A. As scheduled on plans.

2.9 SOURCE QUALITY CONTROL

A. Fan Sound-Power Level Ratings: Comply with AMCA 301, "Methods for Calculating Fan Sound Ratings from Laboratory Test Data." Test fans according to AMCA 300, "Reverberant Room Method for Sound Testing of Fans." Fans shall bear AMCA-certified sound ratings seal.

B. Fan Performance Rating: Factory test fan performance for airflow, pressure, power, air density, rotation speed, and efficiency. Rate performance according to AMCA 210, "Laboratory Methods of Testing Fans for Aerodynamic Performance Rating."

C. Water Coils: Factory tested to 300 psig according to ARI 410 and ASHRAE 33.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine areas and conditions, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of the Work.

B. Examine casing insulation materials and filter media before air-handling unit installation. Reject insulation materials and filter media that are wet, moisture damaged, or mold damaged.

C. Examine roughing-in for hydronic, and condensate drainage piping systems and electrical services to verify actual locations of connections before installation.

D. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

1. Install galvanized-steel plate to equally distribute weight over pad.
2. Place and secure anchorage devices. Use setting drawings, templates, diagrams, instructions, and directions furnished with items to be embedded.
3. Install anchor bolts to elevations required for proper attachment to supported equipment.

B. Arrange installation of units to provide access space around air-handling units for service and maintenance.

C. Do not operate fan system until filters (temporary or permanent) are in place. Replace temporary filters used during construction and testing, with new, clean filters.

D. Install filter-gage, static-pressure taps upstream and downstream of filters. Mount filter gages on outside of filter housing or filter plenum in accessible position. Provide filter gages on filter banks, installed with separate static-pressure taps upstream and downstream of filters.

3.3 CONNECTIONS

A. Comply with requirements for piping specified in other Division 23 Sections. Drawings indicate general arrangement of piping, fittings, and specialties.

B. Install piping adjacent to air-handling unit to allow service and maintenance.

C. Connect piping to air-handling units mounted on vibration isolators with flexible connectors.

D. Connect condensate drain pans using NPS 1-1/4, ASTM B 88, Type M copper tubing. Extend to nearest equipment or floor drain. Construct deep trap at connection to drain pan and install cleanouts at changes in direction.

E. Hot- and Chilled-Water Piping: Comply with applicable requirements in Division 23 Section "Hydronic Piping." Install shutoff valve and union or flange at each coil supply connection. Install balancing valve and union or flange at each coil return connection.

F. Connect duct to air-handling units with flexible connections. Comply with requirements in Division 23 Section "Air Duct Accessories."

3.4 FIELD QUALITY CONTROL

A. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect, test, and adjust components, assemblies, and equipment installations, including connections.

B. Tests and Inspections:
1. Leak Test: After installation, fill water and steam coils with water, and test coils and connections for leaks.
2. Fan Operational Test: After electrical circuitry has been energized, start units to confirm proper motor rotation and unit operation.
3. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.
4. Test operation of enthalpy wheel.

C. Air-handling unit or components will be considered defective if unit or components do not pass tests and inspections.

D. Prepare test and inspection reports.

3.5 STARTUP SERVICE

A. Perform startup service.

1. Complete installation and startup checks according to manufacturer's written instructions.
2. Verify that shipping, blocking, and bracing are removed.
3. Verify that unit is secure on mountings and supporting devices and that connections to piping, ducts, and electrical systems are complete. Verify that proper thermal-overload protection is installed in motors, controllers, and switches.
4. Verify proper motor rotation direction, free fan wheel rotation, and smooth bearing operations. Reconnect fan drive system, align belts, and install belt guards.
5. Verify that bearings and other moving parts are lubricated with factory-recommended lubricants.
6. Verify that outdoor- and return-air mixing dampers open and close, and maintain minimum outdoor-air setting.
7. Comb coil fins for parallel orientation.
8. Verify that proper thermal-overload protection is installed for electric coils.
9. Install new, clean filters.
10. Verify that manual and automatic volume control and fire and smoke dampers in connected duct systems are in fully open position.

B. Starting procedures for air-handling units include the following:
1. Energize motor; verify proper operation of motor, drive system, and fan wheel. Adjust fan to indicated rpm. Replace fan and motor pulleys as required to achieve design conditions.
2. Measure and record motor electrical values for voltage and amperage.
3. Manually operate dampers from fully closed to fully open position and record fan performance.
4. Test air flow measuring stations.

3.6 ADJUSTING

A. Adjust damper linkages for proper damper operation.

B. Comply with requirements in Division 23 Section "Testing, Adjusting, and Balancing for HVAC" for air-handling system testing, adjusting, and balancing.

3.7 CLEANING

A. After completing system installation and testing, adjusting, and balancing air-handling unit and air-distribution systems and after completing startup service, clean air-handling units internally to remove foreign material and construction dirt and dust. Clean fan wheels, cabinets, dampers, coils, and filter housings, and install new, clean filters.

END OF SECTION 237313

N:\N0912.00\DOC\SPEC\2012_03-16_BID\237313 - INDOOR CENTRAL STATION AIR HANDLING UNITS.DOC

SECTION 238126 – VARIABLE FLOW REFRIGERANT AIR-CONDITIONERS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. This Section includes split-system air-conditioning units consisting of variable capacity, heat recovery air conditioning system with variable refrigerant volume (heat and cool model) split system. The system shall consist of multiple evaporators, branch selector boxes, factory approved joints and header connection methods, a two or three pipe refrigeration distribution system using PID control and variable flow refrigerant condenser unit.

B. The condenser shall be a direct expansion (DX), air-cooled heat recovery, multi-zone air-conditioning system with variable speed inverter driven compressors using R-410A refrigerant. The condensing unit may connect an indoor evaporator capacity up to 200% of the condensing unit capacity.

C. All zones shall be capable of operating separately with individual temperature control. A dedicated hot gas pipe shall be required to ensure optimum heating operation performance.

D. The indoor units shall be connected to the condensing unit utilizing manufacturers specified piping joints and headers to ensure correct refrigerant flow and balancing. T style joints are not acceptable.

E. Operation of the system shall permit either individual cooling or heating of each indoor unit simultaneously. Each indoor unit or group of indoor units shall be able to provide set temperature independently via a local remote controller, an Intelligent Controller, an Intelligent Manager or a BMS interface with ASHRAE Standard 135 BACNet Open Protocol.

1.3 SUBMITTALS

A. Product Data: Include rated capacities, furnished specialties, and accessories for each type of product indicated. Include performance data in terms of capacities, sound power characteristics, motor requirements, and electrical characteristics.

B. Shop Drawings: Diagram of refrigerant piping, power, signal, and control wiring.

C. Field quality-control test reports.

D. Operation and Maintenance Data: For split-system air-conditioning units to include in emergency, operation, and maintenance manuals.

E. Warranty: Special warranty specified in this Section.

1.4 QUALITY ASSURANCE

A. Product Options: Drawings indicate size, profiles, and dimensional requirements of split-system units and are based on the specific system indicated. Refer to Division 01 Section "Product Requirements."

B. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.

C. The units shall be tested by a Nationally Recognized Testing Laboratory (NRTL), in accordance with ANSI/UL 1995 – Heating and Cooling Equipment and bear the Listed Mark.

D. The system shall be installed by a factory trained contractor. Installing contractor shall submit training certification proof with shop drawings. The mechanical contractor shall have complete knowledge of the HVAC system operating and installation requirements.

E. Field piping shall be installed by a licensed refrigeration technician and shall comply with relevant local and nation regulations.

1.5 COORDINATION

A. Coordinate size, location, and connection details with roof curbs, equipment supports, and roof penetrations specified in Division 07 Section "Roof Accessories."

1.6 WARRANTY

A. Special Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace components of split-system air-conditioning units that fail in materials or workmanship within specified warranty period.
   1. Warranty Period: Five years (parts and labor) for compressors from date of Substantial Completion.

1.7 EXTRA MATERIALS

A. Furnish extra materials described below that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.
   1. Filters: One set of filters for each unit.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Acceptable Manufacturer:
   1. Mitsubishi Electronics America, Inc.; HVAC Division.

2.2 INDOOR, CONCEALED OR EXPOSED EVAPORATOR-FAN COMPONENTS

A. Cabinet: Enameled steel with removable panels on front and ends in color selected by Architect, and discharge drain pans with drain connection.

1. Drain Pan and Drain Connection: Comply with ASHRAE 62.1-2004.

B. Refrigerant Coil: Copper tube, with mechanically bonded aluminum fins, complying with ARI 210/240, and with thermal-expansion valve.

C. Fan: Variable or multispeed, Direct drive, centrifugal fan.

D. Fan Motors: Comply with requirements in Division 15 Section "Common Motor Requirements for HVAC Equipment."
1. Special Motor Features: Multitapped, multispeed with internal thermal protection and permanent lubrication.

E. Filters: Disposable, with ASHRAE 52.2 MERV rating of 6 or higher.

2.3 AIR-COOLED, INVERTER CONTROLLED COMPRESSOR-CONDENSER COMPONENTS

A. Casing: Steel, finished with baked enamel in color selected by Architect, with removable panels for access to controls, weep holes for water drainage, and mounting holes in base. Provide brass service valves, fittings, and gage ports on exterior of casing.

B. Compressor: Hermetically sealed with crankcase heater and mounted on vibration isolation. Compressor motor shall have thermal- and current-sensitive overload devices, start capacitor, relay, and contactor.
1. Compressor Type: Scroll.
2. Inverter controlled compressor motor with manual-reset high-pressure switch and automatic-reset low-pressure switch.
3. Refrigerant: R-407C or R-410A, variable flow control.
4. Reversing valves and controls for heat pump duty units.
5. Electronic expansion valves, solenoid valves, 4-way valve, distribution headers, capillaries, filters, shut off valves, oil separators, service ports and refrigerant regulator.
6. The system shall automatically restart operation after a power failure and shall not cause any settings to be lost to eliminate reprogramming.
7. The unit shall incorporate an auto-charging feature.
8. The following safety devices shall be included on the condensing unit; high pressure sensor and switch, low pressure sensor, control circuit fuses, crankcase heaters, fusible plug, overload relay, inverter overload protector, thermal protectors for compressor and fan motors, over current protection for the inverter and anti-recycling timers.
9. Oil recovery cycle shall be automatic occurring 2 hours after start of operation and then every 8 hours of operation.
10. Each system shall maintain continuous heating during oil return operation. Reverse cycle (cooling mode) oil return during heating operation shall not be permitted due to the potential reduction in space temperature.
11. The condensing unit shall be completely weatherproof and corrosion resistant. The unit shall be constructed from rust-proofed mild steel panels coated with a baked enamel finish.
12. Condensing unit fan shall consist of one or more propeller type, direct-drive 350 or 750 W fan motors that have multiple speed operation via a DC (digitally commutating) inverter.
13. Scroll compressors shall be variable speed, inverter controlled capable of changing the speed to follow the variations in total cooling and heating load as determined by the suction gas pressure as measured in the condensing unit.
14. Samplings of evaporator and condenser temperatures shall be made so that the high/low pressures detected are read every 20 seconds and calculated. With each reading, the compressor capacity (INV frequency or STD ON/OFF) shall be controlled to eliminate deviation from target value.
15. The inverter driven compressor in each condensing unit shall be of highly efficient reluctance DC (digitally commutating), hermetically sealed scroll with a maximum speed of 7,980 rpm.

C. Refrigerant Coil: Copper tube, with mechanically bonded aluminum fins, complying with ARI 210/240, and with liquid sub-cooler.

D. Fan: Aluminum-propeller type, directly connected to motor.

E. Motor: Permanently lubricated, with integral thermal-overload protection.

F. Low Ambient Kit: Permits operation cooling operation down to -4 deg F and heating operation down to -0 deg F.

G. Mounting Base: Polyethylene.

H. Snow guard.

I. Master Controller with BACNet Open Protocol.

2.4 ACCESSORIES

A. Control equipment and sequence of operation are specified in Division 15 Sections "Instrumentation and Control for HVAC" and "Sequence of Operations for HVAC Controls."

B. Thermostat: Low voltage with sub-base to control compressor and evaporator fan.

C. Thermostat: Wall mounted, hard wired to control compressor and evaporator fan, with the following features:
1. Compressor time delay.
2. 24-hour time control of system stop and start.
3. 24-hour/7-day programmable.
4. Liquid-crystal display indicating temperature, set-point temperature, time setting, operating mode, and fan speed.
5. Fan-speed selection, including auto setting.

D. Automatic-reset timer to prevent rapid cycling of compressor.

E. Refrigerant Piping: System shall be capable of refrigerant piping up to 540 actual feet or 620 equivalent feet from the condensing unit to the furthest indoor unit, a total combined liquid line length of 3,280 feet of piping between the condensing and indoor units with 295 feet maximum vertical difference, without any oil traps.

F. Manufacturers specified piping joints and headers shall be used to ensure proper refrigerant balance and flow for optimum system capacity and performance. T style joints shall not be acceptable as this will negatively impact proper refrigerant balance and flow for optimum system capacity and performance.

G. Retain subparagraph below if applying for LEED certification. LEED-NC Prerequisite EA 2 requires minimum pipe insulation thickness equal to requirements in ASHRAE/IESNA 90.1-2004, "Minimum Pipe Insulation Thickness." Requirements for minimum insulation thickness vary by pipe size and temperature.
1. Minimum Insulation Thickness: 1 inch thick.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Install units level and plumb.

B. Install evaporator-fan components using manufacturer's standard mounting devices securely fastened to building structure.

C. Install compressor-condenser components on neoprene pads with a minimum static deflection of ¼ inch. Refer to Division 15 Section "Vibration Controls for HVAC Piping and Equipment."

D. Install and connect pre-charged refrigerant tubing to component's quick-connect fittings. Install tubing to allow access to unit.

3.2 CONNECTIONS

A. Piping installation requirements are specified in other Division 15 Sections. Drawings indicate general arrangement of piping, fittings, and specialties.

B. Install piping adjacent to unit to allow service and maintenance.

C. Ground equipment according to Division 16 Section "Grounding and Bonding for Electrical Systems."

D. Electrical Connections: Comply with requirements in Division 16 Sections for power wiring, switches, and motor controls.

3.2 REFRIGERANT PIPING

A. Do not use flux when brazing the refrigerant piping. Use the phosphor copper brazing filler metal (B-Cu93P-710/795: ISO 3677) which does not require flux. (Flux has an extremely negative effect on refrigerant piping systems. For instance, if the chlorine based flux is used, it will cause pipe corrosion or, in particular, if the flux contains fluorine, it will damage the refrigerant oil.)

B. Pipes shall be clean inside and outside and shall not accumulate harmful sulfur, oxidants, dirt, moisture, or other contamination. (Foreign materials inside pipes including oils for fabrication must be 0.14 gr/10 ft or less.)

C. Use the following items for the refrigerant piping:
   1. Material: Jointless phosphor-deoxidized copper pipe
   2. Size: Refer to manufacturers' literature to determine the correct size.
   3. Thickness: Select a thickness for the refrigerant piping that complies with national and local laws.

D. For piping work, follow the maximum tolerated length, difference in height, and length after a branch per the manufacturer's recommendation.

E. Provide outdoor unit multi connection piping kit and refrigerant branching kit for connection of piping between outdoor units and piping branches.

F. Use only items specifically selected for the outdoor unit multi connection piping kit and refrigerant branching kit selection per manufacturer's recommendations.

G. Protect the piping to prevent moisture, dirt, dust, etc. from entering the piping by pinching the pipe if left for a month and taped if less than a month.

H. Exercise special caution to prevent dirt or dust when passing piping through holes in walls and when passing pipes edges to the exterior.

I. Perform nitrogen permutation or nitrogen blow when brazing. Brazing without performing nitrogen permutation or nitrogen blow into the piping will create large quantities of oxidized film on the inside of the pipes, adversely affecting valves and compressors in the refrigeration system and preventing normal operation.

J. The pressure regulator for the nitrogen released when brazing shall be set to approximately 2.9 psi (Enough to feel a slight breeze on your cheek).
   1. Do not use anti-oxidants when brazing the pipe joints. Residue can clog pipes and break equipment.

K. Removing pinch piping after removing gas when connecting refrigerant piping to an outdoor unit, remove the pinch piping per manufacturer's recommendation. Any gas remaining inside may blow off the pinch piping when you dissolve the brazing, causing damage.

L. Consult manufacturer when connecting refrigerant piping to outdoor units.

3.3 FIELD QUALITY CONTROL

A. Perform the following field tests and inspections and prepare test reports:
   1. Leak Test: After installation, charge system and test for leaks. Repair leaks and retest until no leaks exist.
   2. Operational Test: After electrical circuitry has been energized, start units to confirm proper motor rotation and unit operation.
   3. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.

B. Remove and replace malfunctioning units and retest as specified above.

3.4 STARTUP SERVICE

A. Engage a factory-authorized service representative to perform startup service.
   1. Complete installation and startup checks according to manufacturer's written instructions.

3.5 DEMONSTRATION

A. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain units. Refer to Division 01 Section "Demonstration and Training."

END OF SECTION 238126

N:\N0912.00\DOC\SPEC\2012_03-16_BID\238126 - VARIABLE FLOW REFRIGERANT AIR-CONDITIONERS_FL.DOC

SECTION 238216 - AIR COILS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

1.2 SUMMARY

A. This Section includes the following types of air coils that are not an integral part of air-handling units:
   1. Hot-water.

B. Related Sections include the following:

1.3 SUBMITTALS

A. Product Data: For each type of product indicated. Include construction details, material descriptions, dimensions of individual components and profiles, and finishes for each air coil. Include rated capacity and pressure drop for each air coil.

B. Operation and Maintenance Data: For air coils to include in operation and maintenance manuals.

1.4 QUALITY ASSURANCE

A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.

PART 2 - PRODUCTS

2.1 WATER COILS

A. Basis-of-Design Product: Subject to compliance with requirements, provide Trane or a comparable product by one of the following:
   1. Carrier Corporation.
   2. Dunham-Bush, Inc.
   3. USA Coil & Air.

B. Performance Ratings: Tested and rated according to ARI 410 and ASHRAE 33.

C. Minimum Working-Pressure/Temperature Ratings: 200 psig, 325 deg F.

D. Source Quality Control: Factory tested to 300 psig.

E. Tubes: ASTM B 743 copper, minimum 0.020 inch thick.

F. Fins: Aluminum, minimum 0.010 inch thick.

G. Headers: Cast iron with cleaning plugs, and drain and air vent tappings or seamless copper tube with brazed joints, prime coated.

H. Frames: Galvanized-steel channel frame, minimum 16-gauge thick for flanged mounting.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine ducts, plenums, and casings to receive air coils for compliance with requirements for installation tolerances and other conditions affecting coil performance.

B. Examine roughing-in for piping systems to verify actual locations of piping connections before coil installation.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. Install coils level and plumb.

B. Install coils in metal ducts and casings constructed according to SMACNA's "HVAC Duct Construction Standards, Metal and Flexible."

C. Straighten bent fins on air coils.

D. Clean coils using materials and methods recommended in writing by manufacturers, and clean inside of casings and enclosures to remove dust and debris.

3.3 CONNECTIONS

A. Piping installation requirements are specified in other Division 15 Sections. Drawings indicate general arrangement of piping, fittings, and specialties.

B. Install piping adjacent to coils to allow service and maintenance.

C. Connect water piping with unions and shutoff valves to allow coils to be disconnected without draining piping. Control valves are specified in Division 15 Section "HVAC Instrumentation and Controls," and other piping specialties are specified in Division 15 Section "Hydronic Piping."

END OF SECTION 238216

N:\N0912.00\DOC\SPEC\2012_03-16_BID\238216 - AIR COILS.DOC

SECTION 238233 - CONVECTORS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and other Division 1 Specification Sections, apply to this Section.

1.2 SUMMARY

A. This Section includes the following:
   1. Hydronic baseboard radiators.

1.3 SUBMITTALS

A. Product Data: Include rated capacities, operating characteristics, furnished specialties, and accessories for each type of product indicated.

B. Shop Drawings: Detail equipment assemblies and indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.
   1. Plans, elevations, sections, and details.
   2. Details of custom-fabricated enclosures indicating dimensions.
   3. Location and size of each field connection.
   4. Location and arrangement of piping valves and specialties.
   5. Location and arrangement of integral controls.
   6. Enclosure joints and other accessories.
   7. Method of attaching convection units to building structure.

C. Color Samples for Initial Selection: For units with factory-applied color finishes.

D. Color Samples for Verification: For each type of exposed finish required.

E. Field quality-control test reports.

F. Operation and Maintenance Data: For convection heating units to include in emergency, operation, and maintenance manuals.

G. Warranty: All radiators are covered by a 5-Year Limited Warranty.

PART 2 - PRODUCTS

2.1 HOT-WATER BASEBOARD RADIATORS

A. Basis-of-Design Product: Subject to compliance with requirements, provide Runtal North America, Inc.

B. General:
   1. Provide steel double panel radiators of the lengths and in locations as indicated, and of capacities, style and having accessories as scheduled.

C. Construction: The double heating panel radiation shall be of one-piece all-welded steel construction, consisting of a pair of flattened water tube panels welded to headers at each end. Welded to the inside of each panel shall be steel corrugated fins to increase the convective output of the radiator. The fins shall start at no less than 3" from the end of the radiator. The radiators shall include an integral heavy gauge (0.09" minimum) all-welded perforated top grille, which will cover the top of all of the finned areas.
The headers shall include all necessary inlet, outlet and vent connections as required. Internal baffling shall be provided where required for proper water flow. The radiant heating panels shall be available in lengths from 2'-0" to 29'-6" in two inch even increments without the need for splicing.

D. Pressure Ratings: Pressure ratings for the radiation shall be as follows.
1. Working Pressure 56 psig.
2. Test Pressure 74 psig.
3. Number of Tubes High: Two.
4. Number of Tubes Deep: Two.
5. Fin Spacing: No less than 32 fins per foot.
6. Panel radiation expansion shall not exceed 1/64" per foot of radiation at 215ºF. The installer shall provide adequate expansion compensation for each radiator.

E. Mounting:
1. Vestibules: The panel radiation shall be mounted to typical stud wall construction without additional blocking or strapping. Appropriate wall mounting brackets shall be provided with the radiation.
2. Second Floor Entry Lobby: Factory curved radiators installed along window mullions with radius matching wall curvature. The radiators are to be provided with floor mounted pedestals.

F. Finish: The panel radiation shall be cleaned and phosphatized in preparation for the powder coat finish. The radiation shall be then finish painted with a gloss powder coat finish, for a total paint thickness of 2-3 mils (0.002" - 0.003"). The color shall be selected form the standard colors by Architect.

G. Accessories:
1. Steel piping covers finished to match radiator finish.
2. Flex connectors shall be used where appropriate to provide expansion compensation for the radiators.
3. Full trim covers to conceal side piping on both sides of radiator.
4. Integral temperature sensor.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine areas to receive convection heating units for compliance with requirements for installation tolerances and other conditions affecting performance.

B. Examine roughing-in for hydronic-piping connections to verify actual locations before convection heating unit installation.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 BASEBOARD RADIATOR INSTALLATION

A. Install units level and plumb.

B. Terminate enclosures with manufacturer's end caps except where enclosures are indicated to extend to adjoining walls.

C. Install piping within pedestals for freestanding units.

D. Install expansion compensation hoses.

E. Install piping covers.

3.3 CONNECTIONS

A. Piping installation requirements are specified in Division 15 Section "Hydronic Piping." Drawings indicate general arrangement of piping, fittings, and specialties.

B. Connect hot-water units and components to piping according to Division 15 Section "Hydronic Piping."
   1. Install shutoff valves on inlet and outlet, Y-strainer on inlet and balancing valve and control valve on outlet.

C. Install control valves as required by Division 15 Section "HVAC Instrumentation and Control."

D. Install piping adjacent to convection heating units to allow service and maintenance.

3.4 FIELD QUALITY CONTROL

A. Perform the following field tests and inspections and prepare test reports:
   1. Leak Test: After installation, charge system and test for leaks. Repair leaks and retest until no leaks exist.

B. Remove and replace convection heating units that do not pass tests and inspections and retest as specified above.

END OF SECTION 238233

N:\N0912.00\DOC\SPEC\2012_03-16_BID\238233 - CONVECTORS .DOC

SECTION 238239 - UNIT HEATERS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:
   1. Cabinet unit heaters with centrifugal fans and hot-water coils.
   2. Propeller unit heaters with hot-water coils.

1.3 DEFINITIONS

A. BICS: Building Internetworked Control System.

B. CWP: Cold working pressure.

C. PTFE: Polytetrafluoroethylene plastic.

D. TFE: Tetrafluoroethylene plastic.

1.4 SUBMITTALS

A. Product Data: Include rated capacities, operating characteristics, furnished specialties, and accessories for each product indicated.

B. Shop Drawings: Detail equipment assemblies and indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.
   1. Plans, elevations, sections, and details.
   2. Location and size of each field connection.
   3. Equipment schedules to include rated capacities, operating characteristics, furnished specialties, and accessories.
   4. Location and arrangement of piping valves and specialties.
   5. Location and arrangement of integral controls.
   6. Wiring Diagrams: Power, signal, and control wiring.

C. Field quality-control test reports.

D. Operation and Maintenance Data: For cabinet unit heaters to include in emergency, operation, and maintenance manuals.

1.5 QUALITY ASSURANCE

A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.

1.6 EXTRA MATERIALS

A. Furnish extra materials described below that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.
   1. Cabinet Unit Heater Filters: Furnish two spare filters for each filter installed.

PART 2 - PRODUCTS

2.1 CABINET UNIT HEATERS

A. Basis-of-Design Product: Subject to compliance with requirements, provide McQuay International or a comparable product by one of the following:
   1. Airtherm; a Mestek Company.
   2. Dunham-Bush, Inc.
   3. International Environmental Corporation.
   4. Trane.
   5. USA Coil & Air.

B. Description: A factory-assembled and -tested unit complying with ARI 440.

C. Coil Section Insulation: ASTM C 1071; surfaces exposed to airstream shall be aluminum-foil facing to prevent erosion of glass fibers.
   1. Thickness: 1 inch.
   2. Thermal Conductivity (k-Value): 0.26 Btu x in./h x sq. ft. at 75 deg F mean temperature.
   3. Fire-Hazard Classification: Maximum flame-spread index of 25 and smoke-developed index of 50 when tested according to ASTM E 84.
   4. Adhesive: Comply with ASTM C 916 and with NFPA 90A or NFPA 90B.

D. Cabinet: Steel with baked-enamel finish with manufacturer's standard paint, in color selected by Architect.
   1. Vertical Unit, Exposed Front Panels: Minimum 0.0528-inch- thick, galvanized, sheet steel, removable panels with channel-formed edges secured with tamperproof cam fasteners.
   2. Control Access Door: Key operated.
   3. Base: Minimum 0.0528-inch- thick steel, finished to match cabinet, 6 inches high with leveling bolts.
   4. Extended Piping Compartment: 8-inch- wide piping end pocket.

E. Filters: Minimum arrestance according to ASHRAE 52.1 and a minimum efficiency reporting value (MERV) according to ASHRAE 52.2.
   1. Glass Fiber Treated with Adhesive: 80 percent arrestance and 5 MERV.
   2. Pleated: 90 percent arrestance and 7 MERV.

F. Hot-Water Coil: Copper tube, with mechanically bonded aluminum fins spaced no closer than 0.1 inch and rated for a minimum working pressure of 200 psig and a maximum entering-water temperature of 220 deg F. Include manual air vent and drain.

G. Fan and Motor Board: Removable.
   1. Fan: Forward curved, double width, centrifugal; directly connected to motor. Thermoplastic or painted-steel wheels, and aluminum, painted-steel, or galvanized-steel fan scrolls.
   2. Motor: Permanently lubricated, multispeed; resiliently mounted on motor board. Comply with requirements in Division 15 Section "Motors."
   3. Wiring Terminations: Connect motor to chassis wiring with plug connection.

H. Factory, Hot-Water Piping Package: ASTM B 88, Type L copper tube with wrought-copper fittings and brazed joints. Label piping to indicate service, inlet and outlet.
   1. Two-way, modulating control valve.
   2. Hose Kits: Minimum 400-psig working pressure, and operating temperatures from 33 to 211 deg F. Tag hose kits to equipment designations.
      a. Length: 24 inches.
      b. Minimum Diameter: Equal to cabinet unit heater connection size.
   3. Two-Piece, Ball Valves: Bronze body with full-port, chrome-plated bronze ball; PTFE seats; and 600-psig minimum CWP rating and blowout-proof stem.
   4. Calibrated-Orifice Balancing Valves: Bronze body, ball or globe type, 125-psig working pressure, 250 deg F maximum operating temperature; with calibrated orifice or venture, connection for portable differential pressure meter with integral seals, threaded ends, and equipped with a memory stop to retain set position.
   5. Y-Pattern, Hot-Water Strainers: Bronze body; 125-psig minimum working pressure; with threaded connections, bolted cover, perforated stainless-steel basket, and bottom drain connection. Include minimum NPS 1/2 threaded pipe and full-port ball valve in strainer drain connection.
   6. Wrought-Copper Unions: ASME B16.22.

I. Control devices and operational sequences are specified in Division 15 Sections "HVAC Instrumentation and Controls" and "Sequence of Operation."

J. Basic Unit Controls:
   1. Control voltage transformer.
   2. Wall-mounting thermostat with the following features.
      a. Heat-off switch.
      b. Fan on-auto switch.
      c. Manual fan speed switch.
      d. Adjustable deadband.
      e. Concealed set point.
      f. Exposed indication.
      g. Deg F indication.
   3. Unoccupied period override push button.

K. Electrical Connection: Factory wire motors and controls for a single field connection.

L. Capacities and Characteristics: As scheduled on plans.

2.2 PROPELLER UNIT HEATERS

A. Basis-of-Design Product: Subject to compliance with requirements, provide McQuay International products or comparable product by one of the following:
   1. Airtherm; a Mestek Company.

2. Trane.

B. Description: An assembly including casing, coil, fan, and motor in horizontal discharge configuration with adjustable discharge louvers.

C. Cabinet: Removable panels for maintenance access to controls.

D. Cabinet Finish: Manufacturer's standard baked enamel applied to factory-assembled and -tested propeller unit heater before shipping.

E. Discharge Louver: Adjustable fin diffuser for horizontal units.

F. General Coil Requirements: Test and rate hot-water propeller unit heater coils according to ASHRAE 33.

G. Hot-Water Coil: Copper tube, minimum 0.025-inch wall thickness, with mechanically bonded aluminum fins spaced no closer than 0.1 inch and rated for a minimum working pressure of 200 psig and a maximum entering-water temperature of 325 deg F, with manual air vent. Test for leaks to 350 psig underwater.

H. Fan: Propeller type with aluminum wheel directly mounted on motor shaft in the fan venturi.

I. Fan Motors: Comply with requirements in Division 15 Section "Motors."
1. Motor Type: Permanently lubricated, multispeed.

J. Control Devices:
1. Wall-mounting fan-speed switch.
2. Wall-mounting thermostat.

K. Capacities and Characteristics
1. As scheduled on plans.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine areas to receive unit heaters for compliance with requirements for installation tolerances and other conditions affecting performance.

B. Examine roughing-in for piping and electrical connections to verify actual locations before unit heater installation.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. Install cabinet unit heaters to comply with NFPA 90A.

B. Install propeller unit heaters level and plumb.

C. Suspend propeller unit heaters from structure. Hanger rods and attachments to structure are specified in Division 15 Section "Hangers and Supports." Vibration hangers are specified in Division 15 Section "Mechanical Vibration Control."

D. Install wall-mounting thermostats and switch controls in electrical outlet boxes at heights to match lighting controls. Verify location of thermostats and other exposed control sensors with Drawings and room details before installation.

E. New filters in cabinet unit heater within two weeks of Substantial Completion.

3.3 CONNECTIONS

A. Piping installation requirements are specified in other Division 15 Sections. Drawings indicate general arrangement of piping, fittings, and specialties.

B. Install piping adjacent to machine to allow service and maintenance.

C. Connect piping to cabinet unit heater's factory, hot-water piping package. Install the piping package if shipped loose.

D. Comply with safety requirements in UL 1995.

E. Unless otherwise indicated, install union and ball valve on supply-water connection and union and calibrated balancing valve on return-water connection of unit heater. Hydronic specialties are specified in Division 15 Section "Hydronic Piping."

F. Ground equipment according to Division 16 Section "Grounding and Bonding."

G. Connect wiring according to Division 16 Section "Conductors and Cables."

3.4 FIELD QUALITY CONTROL

A. Perform the following field tests and inspections and prepare test reports:
   1. Operational Test: After electrical circuitry has been energized, start units to confirm proper motor rotation and unit operation.
   2. Test and adjust controls and safety devices. Replace damaged and malfunctioning controls and equipment.

B. Remove and replace malfunctioning units and retest as specified above.

END OF SECTION 238239

N:\N0912.00\DOC\SPEC\2012_03-16_BID\238239 - UNIT HEATERS.DOC

SECTION 260100 - BASIC ELECTRICAL REQUIREMENTS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and General Provision of Contract, including Division 0 and Division 1 specifications, apply to this section. Where Paragraphs of this Section conflict with similar paragraphs of Divisions 0 and 1, most restrictive requirements shall govern work.

1.2 SUMMARY

A. This entire section forms an integral part of each, Electrical, section included in the 260000 series of the specifications.

B. Perform work and provide material and equipment as shown on Drawings and/or as specified and/or indicated in this Section of the Specifications. Completely coordinate work of this Section with work of other trades and provide a complete and fully functional installation.

C. Drawings and Specifications form complimentary requirements; provide work specified and not shown, and work shown and not specified as though explicitly required by both. Although work is not specifically shown or specified, provide supplementary or miscellaneous items, appurtenances, devices and materials obviously necessary for a sound, secure and complete installation.

D. Give notices, file plans, obtain permits and licenses, pay fees and back charges, and obtain necessary approvals from authorities that have jurisdiction as required to perform work in accordance with all legal requirements and with Specifications, Drawings, Addenda, Revisions, and Change Orders, all of which are part of Contract Documents.

E. Examine Drawings and other Sections of Specifications for requirements that affect work of this Section.

F. Attention is directed to the following specialized requirements of this Section:
   1. Paragraph GUARANTEE AND 24-HOUR SERVICE. The requirement to provide a 24 hour phone number for service during the guarantee period is incorporated; also, an extended warrantee to cover the full one year contractor's guarantee period starting on the date of beneficial occupancy, even if equipment has been previously used for temporary heat or other purpose.
   2. Paragraph SUBMITTALS. A special cover sheet for each shop drawing, to be filled out by the contractor, is required. A description of "Acceptable Manufacturers" is included. No other manufacturers will be considered for this project. The turn-around time Vanderweil Engineers requires to process shop drawings is described.

1.3 DEFINITIONS

A. As used in these Sections, "provide" means "furnish and install." "Furnish" means "to purchase and deliver to the project site complete with every necessary appurtenance and support," and "Install" means "to unload at the delivery point at the site and perform every operation necessary to establish secure mounting and correct operation at the proper location in the project. "Architect" means the "Prime Design Consultant," and if Vanderweil Engineers is not the prime design consultant, the Architect may authorize Vanderweil Engineers to act on the Architect's

behalf in matters concerning the 26000 series of specifications. "RFI" means "Contractor's Request for Information."

1.4 CONTRACT DOCUMENTS

A. Listing of Drawings does not limit responsibility of determining full extent of work required by these Contract Documents. Refer to Architectural, HVAC, Plumbing, Fire Protection, Electrical, and Structural, and all other Drawings and other Sections that indicate types of construction in which work shall be installed and work of other trades with which work of this Section must be coordinated.

B. Except where modified by a specific notation to the contrary, it shall be understood that the indication and/or description of any item, in the drawings or specifications or both, carries with it the instruction to furnish and install the item, regardless of whether or not this instruction is explicitly stated as part of the indication or description.

C. Items referred to in singular number in Contract Documents shall be provided in quantities necessary to complete work.

D. Drawings are diagrammatic. They are not intended to be absolutely precise; they are not intended to specify or to show every offset, pullbox, junction box fitting, and component. The purpose of the drawings is to indicate a systems concept, the main components of the systems, and the approximate geometrical relationships. Based on the systems concept, the main components, and the approximate geometrical relationships, the contractor shall provide all other components and materials necessary to make the systems fully complete and operational.

E. Information and components shown on riser diagrams, but not shown on plans, and vice versa, shall apply or be provided as if expressly required on both.

F. Data that may be furnished electronically by the Architect (on computer, diskette, CD, or otherwise) is diagrammatic. Such electronically furnished information is subject to the same limitation of precision as heretofore described. If furnished, such data is for convenience and generalized reference, and shall not substitute for Architect's sealed or stamped construction documents.

G. Exact location of receptacles, light fixtures, exit signs, fire alarm devices, etc., shall be coordinated with the architectural drawings and shall not be scaled from locations indicated on the electrical drawings.

1.5 CAD FILES

A. CAD files for Electrical drawings will be furnished by the Engineer at Contractor's request. A processing fee will be charged, per division 01 specifications. Contractor shall sign a disclaimer regarding use of the drawings so transmitted.

1.6 DISCREPANCIES IN DOCUMENTS

A. Where Drawings or Specifications conflict or are unclear, advise Architect in writing before Award of Contract. Otherwise, Architect's interpretation of Contract Documents shall be final, and no additional compensation shall be permitted due to discrepancies or unclarities thus resolved.

B. Where Drawings or Specifications do not coincide with manufacturers' recommendations, or with applicable codes and standards, alert Architect in writing before installation. Otherwise, make changes in installed work as Architect requires within Contract Price.

C. If the required material, installation, or work can be interpreted differently from drawing to drawing, or between drawings and specs, this contractor shall provide that material, installation, or work which is of the higher standard.

D. It is the requirement of these contract documents to have the contractor provide systems and components that are fully complete and operational and fully suitable for the intended use. There may be situations in the documents where insufficient information exists to precisely describe a certain component or subsystem, or the routing of a component or its coordination with other building elements. In cases such as this, where the contractor has failed to notify the Architect of the situation in accordance with Paragraph (A) above, the contractor shall provide the specific component or subsystem with all parts necessary for the intended use, fully complete and operational, and installed in workmanlike manner either concealed or exposed per the design intent.

E. In cases covered by paragraph above, where the contractor believes he needs engineering guidance, he shall submit a sketch identifying his proposed solution and the Architect shall review, note if necessary, and approve the sketch.

F. Where discrepancies exist between the mechanical, plumbing, fire protection, and electrical drawings in regards to what trade owns equipment such as disconnects, starters, etc., the discrepancy shall be brought to the Architect’s attention in accordance with paragraph (A) above. If the scope is not resolved prior to the Award of Contract, the Electrical Contractor shall provide such items.

1.7 MODIFICATIONS IN LAYOUT

A. Electrical Drawings are diagrammatic. They indicate general arrangements of electrical systems and other work. They do not show all offsets required for coordination nor do they show the exact routings and locations needed to coordinate with structure and other trades and to meet Architectural requirements.

B. In order to obtain the intended desired aesthetics in spaces used by building occupants, in all such spaces, prior to installation of visible material and equipment (including access panels), review Architectural Drawings for desired locations and where not definitely indicated, request information from Architect.

C. Check Contract Drawings, as well as Shop Drawings, of all subcontractors to verify and coordinate spaces in which work of this section will be installed.

D. Maintain maximum headroom at all locations. All raceways, pull boxes, junction boxes, and associated components to be as tight to underside of structure as possible.

E. Make reasonable modifications in layout and components needed to prevent conflict with work of other trades and to coordinate according to paragraphs above. Systems shall be run in a rectilinear fashion.

F. Where conflicts or potential conflicts exist and engineering guidance is desired, submit sketch of proposed resolution to Architect for review and approval.

1.8 REQUEST FOR INFORMATION (RFI'S)

A. If the RFI is a request to resolve a conflict or an unclarity, or a request for additional detail, Contractor's RFI shall include a sketch or equivalent description of Contractor's proposed solution, in accordance with paragraphs above in “Discrepancies in Documents” and “Modifications in Layout” above.

1.9 RELATED WORK IN OTHER SECTIONS

A. The following work is not included in the 260000 Series Sections and shall be performed under other Sections.
   1. Concrete work, including concrete housekeeping pads and other pads and blocks for vibrating and rotating equipment.
   2. Cutting and patching of masonry, concrete, tile and other parts of structure, with the exception of drilling for hangers and providing holes and openings in metal decks.
   3. Flashing of wall and roof penetrations.
   4. Installation of access panels in floors, walls, furred spaces or above ceilings.
   5. Painting, except as specified herein.
   6. Structural supports necessary to distribute loading from equipment to roof or floor except as specified herein.
   7. Temporary light, power, water, heat, gas and sanitary facilities for use during construction and testing.

1.10 SITE VISIT

A. Before submitting bid, visit and carefully examine site to identify existing conditions and difficulties that will affect work of this Section. No extra payment will be allowed for additional work caused by unfamiliarity with site conditions that are visible or readily construed by an experienced observer.

1.11 CODES, STANDARDS, AUTHORITIES AND PERMITS

A. Perform work strictly as required by rules, regulations, standards, codes, ordinances, and laws of local, state, and Federal governments, and other authorities that have legal jurisdiction over the site.

B. Prior to commencement of work, notify State and applicable authorities as required and submit all of the applicable notifications for construction, operation and/or demolition.

C. Materials and equipment shall be manufactured, installed and tested as specified in latest editions of applicable publications, standards, rulings and determinations of:
   1. Local and state building, electrical, fire and health department codes.
   2. National Fire Protection Association (NFPA).
   3. American Insurance Association (AIA) (formerly National Board of Fire Underwriters).
   4. Occupational Safety and Health Act (OSHA).
   5. Underwriters Laboratories (UL)
   6. Factory Mutual Association (FM)
   7. Owner’s Insurance Underwriter.

D. Material and equipment shall be listed by Underwriters' Laboratories (UL), and approved by ANSI and ASTM for intended service.

E. When requirements cited in this Specification conflict with each other or with Contract Documents, most restrictive shall govern work. Architect may relax this requirement when such

relaxation does not violate ruling of authorities that have jurisdiction. Approval for such relaxation shall be obtained in writing.

F. Most recent editions of applicable specifications and publications of the following organizations form part of these Contract Documents.
   1. American National Standards Institute (ANSI).
   2. National Electric Manufacturers Association (NEMA).
   3. American Society for Testing and Materials (ASTM).
   4. Institute of Electrical and Electronics Engineers (IEEE).
   5. Insulated Cable Engineers Association (ICEA).
   6. Certified Ballast Manufacturers (CMB).
   7. Illuminating Engineering Society (IES).
   8. National Electric Safety Code (NESC)

G. Specific reference is made to the following National Fire Protection Association (NFPA) codes which contain an exceptionally high quantity of electrical and fire protection requirements:
   1. NFPA No. 70 - National Electric Code- 2008 Edition
   2. NFPA No. 72 – National Fire Alarm Code
   3. NPFA No. 101 – Life Safety Code

1.12 GUARANTEE AND 24 HOUR SERVICE

A. Guarantee the Work of this Section in writing for one year following the date of beneficial occupancy. If the equipment is used for lighting, temporary electric service, etc. prior to initial beneficial occupancy by the Owner, the bid price shall include an extended period of warranty covering the one year of occupancy, starting from the initial date of beneficial occupancy by the Owner. The guarantee shall repair or replace defective materials, equipment, workmanship and installation that develop within this period, promptly and to Architect's satisfaction and correct damage caused in making necessary repairs and replacements under guarantee within Contract Price.

B. In addition to guarantee requirements of Divisions 0, 1 and of paragraph above, obtain written equipment and material warranties offered in manufacturer's published data without exclusion or limitation, in Owner’s name.

C. Replace material and equipment that require excessive service during guarantee period as defined and as directed by Architect.

D. Provide 24 hour service beginning on the date of Substantial Completion and lasting until the termination of the guarantee period. Service shall be at no cost to the project. Service can be provided by this contractor or a separate service organization. Choice of service organization shall be subject to Architect and Owner approval. Submit name and a phone number that will be answered on a 24 hour basis each day of the week, for the duration of the service.

E. Submit copies of equipment and material warranties to Architect before final payment.

F. At end of guarantee period, transfer manufacturers' equipment and material warranties still in force to designated operations personnel.

G. This Paragraph shall not be interpreted to limit Owner's rights under applicable codes and laws and under this Contract.

H. Part 2 Paragraphs of the Specification sections may specify warranty requirements that exceed those of this Paragraph.

I. Use of systems provided under this Section for temporary services and facilities shall not constitute Final Acceptance of work nor beneficial use by Owner, and shall not institute guarantee period.

J. Provide manufacturer's engineering and technical staff at site to analyze and rectify problems that develop during guarantee period immediately. If problems cannot be rectified immediately to Owner's satisfaction, advise Architect in writing, describe efforts to rectify situation, and provide analysis of cause of problem. Architect will suggest course of action.

1.13 RECORD DRAWINGS

A. As work progresses and for duration of Contract, maintain complete and separate set of prints of Contract Drawings at job site at all times. Record work completed and all changes from original Contract Drawings clearly and accurately including work installed as a modification or addition to the original design. Include actual location of existing utilities if they differ from design documents. Record location of all pull and junction boxes except standard 4" boxes as they are installed.

B. All panelboard feeder routing locations shall be shown on the record drawings.

C. Drawings shall show record condition of details, sections, riser diagrams, and corrections to schedules.

D. At completion of work, prepare a complete set of record drawings in electronic format. Deliver the following to the Engineer for approval.
1. CD delivered in AutoCAD 2009, or approved format drawings.
2. It is the Contractor's responsibility to configure the drawing layers consistent with Vanderweil Engineers format for this project. Drawing will otherwise be rejected.
3. One hard copy set of contract specifications (original Vanderweil Engineers specs) with all appropriate changes, marked in red stamped as "Record".
4. One set of blackline drawings stamped "record" and signed by the appropriate subcontractor. A hard copy of Record Drawings must indicate changes and deviations from design by the use of revision clouds.

E. The design tracings will be made available for the contractor's copying, at his expense, into vellum reproducibles to serve as backgrounds for the drawings. The quantity of design tracings which are made available shall in no way be interpreted as setting a limit to the number of drawings necessary to show the required information. Contractor's professional draftsperson shall incorporate changes and submit three sets of prints for comments as to comply with this section.

F. The Installing Contractor shall certify Record Drawings for accuracy. This is the sole responsibility of the contractor.

G. Submit the record set for approval by the Authority Having Jurisdiction in a form acceptable to the Authority, when required by the jurisdiction. Such drawing format size changes, and supplemental information required for the submittal are the requirement of the contractor.

1.14 BULLETINS, MANUALS, AND OPERATING INSTRUCTIONS

A. Obtain at time of purchase of equipment, three copies of operation, lubrication and maintenance manuals for all items. Assemble literature in coordinated manuals with additional information describing combined operation of field assembled units, including as-built wiring diagrams.

Manual shall contain names and addresses of manufacturers and local representatives who stock or furnish repair parts for items or equipment. Divide manuals into two sections or books as follows:

1. Directions for and sequence of operation of each item of the Electrical systems; i.e., panelboards, transformers, fire alarm, etc. Sequence shall list operations for systems and other devices used to start, stop and control system. Detail procedure to be followed in case of malfunctions. Include detailed approved riser or one-line diagrams of systems provided. Include schedules identifying equipment served.
2. Detailed maintenance and trouble shooting manuals containing data furnished by manufacturer for complete maintenance.

B. Furnish three copies of manuals to Architect for approval and distribution to Owner. Deliver manuals no less than 30 days prior to acceptance of equipment to permit Owner's personnel to become familiar with equipment and operation prior to acceptance.

C. Operating instructions: Upon completion of installation or when Owner accepts portions of building and equipment for operational use, instruct Owner's operating personnel in any or all parts of all systems. Instructions shall be performed by factory-trained personnel. Owner shall determine which systems require additional instructions. Duration of instructions shall take equipment through complete cycle of operation (at least five working days). Make adjustments under operating conditions.

1.15 PROTECTION OF WORK

A. Each contractor shall be responsible for his work and equipment until finally inspected, tested, and accepted. Carefully store materials and equipment which are not immediately installed after delivery to site. Close open ends of work with temporary covers or plug during construction to prevent entry of obstructing material.

B. Provide all materials, equipment and labor to provide adequate protection of all electrical equipment during the course of construction. This includes protection from moisture and foreign material.

C. Each separate contractor shall protect the work and material of other trades that might be damaged by his work or workmen and make good all damage thus caused.

1.16 SUBMITTALS

A. This Paragraph supplements section 01300- Submittals.

B. Definitions:

1. Shop Drawings are information prepared by the Contractor to illustrate portions of the work in more detail than shown in the Contract Documents.
2. Coordination Drawings are detailed, large-scale layout Shop Drawings showing HVAC, Electrical, Plumbing and Fire Protection work superimposed in order to identify conflicts and ensure inter-coordination of Mechanical, Plumbing, Fire Protection, Electrical, Architectural, Structural and other work.

C. Submittal Cover Sheet

1. Shop drawing submittal for each product shall include a copy of the following cover sheet completely filled out. Incomplete or incorrect cover sheet submittal shall constitute reason for rejection.
2. Shop drawings shall be submitted according to specification section with a separate cover sheet completed for each product, rather than one cover sheet for multiple products,

whether or not supplied by one manufacturer or vendor.

SHOP DRAWING COVER SHEET

SHOP DRAWING COVER SHEET			
PROJECT:	CONTRACTOR:		
DIVISION NO.:	SECTION NO.:		
DESCRIPTION:			
CONTRACT DRAWING REFERENCE NO:			
EQUIPMENT TAG:			
SUBMISSION (CIRCLE ONE): FIRST, SECOND, THIRD, FOURTH			
DATE:			
INFORMATION AND CHECKLIST			
1.	Contractor's Log #ID		
2.	Name, address, and phone number of supplier.		
3.	Are all specified or scheduled items included and exactly match scheduled/specified items?	Yes No	
4.	Is this item a substitution?	Yes No	
5.	Are deviations clearly identified?	Yes No	
6.	Does equipment fit space shown on construction documents, coordination drawings, and actual field conditions?	Yes No	
7.	Has support, erection, weights, and installation been coordinated with all trades?	Yes No	
8.	Does the proposed installation void warranties and/or violate UL or code requirements?	Yes No	
9.	Does this material/equipment add expense to any other trade or project costs?	Yes No	
10.	Does equipment require interface with other trades? List divisions and specifics requiring coordination?	Yes No	
11.	Is control interface coordinated?	Yes No	
12	List electrical characteristics (V/Ph/A)		

D. Submittal Procedures and Format

1. Review submittal packages for compliance with Contract Documents before submitting. Review by the Contractor is intended to ensure that the shop drawings contain adequate information to verify each specification requirement as well as the performance and dimensional requirements shown on the drawings BEFORE submission. If a shop drawing is returned with a "rejected" or "review and resubmit" it indicates that the shop drawing was not adequately reviewed by the Contractor. Subsequent submittals shall include written response to previous comments.
2. Submit transparency and two blue- or black-line reproductions of each Shop Drawing larger than 8½ x 11. Submit four sets of each smaller shop drawing. After review, transparency original of each large Shop Drawing and three sets of each small shop drawing will be returned with reviewer's marks.
3. Provide additional copies of reviewed shop drawings as required for full distribution.
4. Shop Drawings showing layouts of systems shall contain sufficient plans, elevations, sections, details and schematics to describe work clearly. They shall be ¼" = 1'-0" scale unless specified otherwise.
5. Shop drawings showing manufacturer's product data shall contain detailed dimensional drawings, weights, construction details, installation, operation and maintenance manuals, accurate and complete description of materials of construction, manufacturer's published performance characteristics and capacity ratings (performance data, alone, is not acceptable), electrical requirements and wiring diagrams. Drawings shall clearly indicate location (terminal block or wire number), voltage and function for all field terminations, and other information necessary to demonstrate compliance with all requirements of Contract Documents. Include all applicable manufacturer warranties and details involving other trades.
6. Faxes shall not constitute a shop drawing and will not be reviewed as such. Proper submittals shall be made in a timely fashion.
7. General catalog cuts without identifying the proposed product will not be reviewed. Options not included shall be crossed out so as not to imply they are included. Clearly indicate the specific piece of equipment being provided.

E. Acceptable Manufacturers: The electrical design for each product is based on the single manufacturer listed in the schedule or shown on the drawings. In Part 2 of the specifications certain Alternate Manufacturers are listed as being acceptable. These are acceptable only if, as a minimum, they:

1. Meet all performance criteria listed in the schedules and outlined in the specification. For example, to be acceptable, a light fixture must have the same or better photometrics as the light fixture listed in the schedules.
2. Have identical operating characteristics to those called for in the specification. For example, a two stroke diesel generator will not be acceptable if a four stroke model is specified.
3. Fit within the available space it was designed for, including space for maintenance and component removal, with no modification to either the space or the product. Clearances to walls, ceilings and other equipment will be at least equal to those shown on the design drawings. The fact that a manufacturer's name appears as acceptable shall not be taken to mean that the manufacturer's products will fit within the available space - this determination is solely the responsibility of the contractor.
4. For rooftop mounted equipment and for equipment mounted in areas where structural matters are a consideration, the products must have a weight no greater than the product listed in the schedules or specifications.
5. Products must adhere to all architectural considerations including, but not limited to: being of the same color as the product scheduled or specified, fitting within architectural

enclosures and details, and for lighting fixtures - being the same size and of the same physical appearance as scheduled or specified products.

6. All equipment of one type such as distribution equipment (panelboards, transformers, etc.) shall be a product of one manufacturer unless noted otherwise and approved by the Engineer.

F. Required Use of Acceptable Manufacturers on this Project:

1. Substitution of products other than those of the Acceptable Manufacturers specified herein shall not be made. Only the specified items or the comparable product by one of the specified Alternate Manufacturers shall be submitted. Products by other manufacturers shall not be used on this project.

G. Deviations

1. Concerning deviations, proposed deviations from Contract Documents shall be requested individually in writing whether deviations result from field conditions, standard shop practice, or other cause. Submit letter with transmittal of Shop Drawings which flags the deviation to the attention of the Architect.
2. Without letters flagging the deviation to the Architect, it is possible that the Architect may not notice such deviation or may not realize its ramifications. Therefore, if such letters are not submitted to the Architect, the contractor shall hold the Architect and his consultants harmless for any and all adverse consequences resulting from the deviations being implemented. This shall apply regardless of whether the shop drawings containing the deviation, has been reviewed and approved and will be strictly enforced.
3. Approval of proposed deviations, if any, will be made at discretion of Architect.

H. Submittal Notations: Submittals will be returned from the Architect marked as illustrated below:

"REVIEWED"

"Reviewed and found generally acceptable. Minor deviations may be noted. No further submittal required if notations are complied with."

"REVIEWED, DEVIATIONS NOTED; REVISE AND RESUBMIT"

"Submittal contains deviations which must be corrected and confirmed by a new submittal."

"REJECTED"

Submittal is incorrect to such an extent that material is unacceptable, or is incomplete to such an extent that a complete review cannot be made. Resubmit in accordance with requirements of the Contract Documents."

"NO ACTION"

Submittal not reviewed.

I. Responsibility

1. Intent of Submittal review is to check for capacity, rating, and certain construction features. Contractor shall ensure that work meets requirements of Contract Documents regarding information that pertains to fabrication processes or means, methods, techniques, sequences and procedures of construction; and for coordination of work of this and other Sections. Work shall comply with submittals marked "REVIEWED" to extent that they agree with Contract Documents. Submittal review shall not diminish responsibility under this Contract for dimensional coordination, quantities, installation, wiring, supports and access for service, nor shop drawing errors or deviations from requirements of Contract Documents. The noting of some errors while overlooking

others will not excuse the contractor from proceeding in error. Contract Documents requirements are not limited, waived nor superseded in any way by review.

2. INFORM SUBCONTRACTORS, MANUFACTURERS, SUPPLIERS, ETC. OF SCOPE AND LIMITED NATURE OF REVIEW PROCESS AND ENFORCE COMPLIANCE WITH CONTRACT DOCUMENTS.

J. Schedule: Incorporate shop drawing review period into construction schedule so that Work is not delayed. Contractor shall assume full responsibility for delays caused by not incorporating the following shop drawing review time requirements into his project schedule. Working days listed reference the time in the Engineer's office. It does not include transmittal time. Allow at least 10 working days, exclusive of transmittal time, for review each time shop drawing is submitted or resubmitted with the exception that 20 working days, exclusive of transmittal time, are required for the following:

1. Coordination Drawings.
2. If more than five shop drawings are received in one calendar week.

K. List of Proposed Equipment and Materials

1. Within four weeks after Award of Contract and before ordering materials or equipment, submit complete list of proposed materials and equipment and indicate manufacturer's names and addresses. No consideration will be given to partial lists submitted out of sequence.

1.17 COORDINATION DRAWINGS

A. A single set of coordination drawings shall be mutually prepared by all mechanical and electrical trades.

B. The initiation of these drawings begins with the Mechanical Contractor.

C. The Mechanical Contractor will prepare a complete set of background drawings, showing structure and other information as needed for coordination. He shall show sheet metal layout thereon. These will be the Coordination Drawings.

D. Each trade shall add its work to these background drawings with appropriate elevations and grid dimensions. Specialty trade information is required for mechanical rooms, electrical rooms, and for spaces in and above ceilings where congestion of work may occur such as corridors, and even entire floors. Drawings shall indicate horizontal and vertical dimensions, to avoid interference with structural framing, ceilings, partitions, and other services.

E. Refer to Specification Section 260500 Section “Common Work Results for Electrical,” for coordination of equipment location.

F. Each trade shall sign and date coordination drawing. Return drawings to the Mechanical Contractor, who shall route them sequentially to all trades.

G. Where conflicts occur with placement of materials of various trades, the Mechanical Contractor will be responsible to coordinate the available space to accommodate all trades. Any resulting adjustments shall be initialed and dated by the specialty trade. The Mechanical Contractor shall then final date and sign each drawing. If conflicts cannot be resolved, the decision of the General Contractor/Construction Manager shall be final.

H. A Subcontractor who fails to promptly review and incorporate his work on the drawings shall assume full responsibility of any installation conflicts affecting his work and of any schedule ramifications.

I. Mechanical Contractor shall make composite copies of all coordination drawings. Fabrication shall not start until such transparencies of completed coordination drawings are received by the Architect/Engineer and have been reviewed.

J. Review of coordination drawings shall not diminish responsibility under this Contract for final coordination of installation and maintenance clearances of all systems and equipment with Architectural, Structural, Mechanical, Electrical and other work.

K. After Review:
1. After review of coordination drawings, the method used to resolve interference not previously identified shall be as in "MODIFICATIONS IN LAYOUT" above.
2. All changes to reviewed coordination drawings shall be in writing by the Architect/ Engineer prior to start of work in affected area.

L. Distribution of Coordination Drawings:
1. The Mechanical Contractor shall distribute the documents.

M. All firewalls and smoke partitions and other required barriers, must be highlighted on the coordination drawings for appropriate coordination.

N. The main paths of egress and for equipment removal, from electrical rooms must be clearly shown on the coordination drawings.

O. Coordination Drawings shall include, but are not limited to:
1. Electrical distribution, systems and equipment.
2. Lighting fixtures.
3. Electrical Equipment Room layouts.
4. Access panels.
5. Major electrical conduit runs, panelboards, feeder conduit and racks of branch conduit.
6. Cable trays for telecommunication cabling.

PART 2 - PRODUCTS

A. Refer to specific sections for product specifications.

PART 3 - EXECUTION

3.1 LIFE SAFETY SYSTEMS CERTIFICATION OF COMPLETION

A. Definitions
1. Life Safety Systems - Mechanical and electrical systems including:
   a. Fire Suppression Systems
   b. Fire Notification (Alarm) and Detection Systems
   c. Egress Signage and Lighting Systems
   d. Emergency Power Systems
2. Complete - For a system to be complete the following shall be true:
   a. No further work is required to satisfy the requirements specified in the drawings, specifications and applicable codes and standards.
   b. Systems are fully operational with power to components, status indicators in "normal" condition and otherwise ready "as-is" to perform required functions.

c. Required product data and shop drawing submittals have been submitted and returned with a "Reviewed" status. See appropriate Division 16 Sections for submittal requirements.

d. Test certificates have been submitted and returned with a "Reviewed" status. See appropriate Division 16 Sections for submittal requirements.

e. Project visit report observations and "punch list" items have been addressed and/or corrected to the satisfaction of the Architect/Engineer.

f. "O&M" documentation and "as-built" plans have been submitted and returned with a "Reviewed" status.

B. Notification of Completion

1. Schedule the work such that life safety systems are complete in advance of other systems such that the Architect/Engineer may conduct a final project visit once notified of completion and any final issues may be addressed without affecting issuance of a Certificate of Occupancy by the Authorities Having Jurisdiction.

3.2 SPECIAL RESPONSIBILITIES

A. Cooperate and coordinate with work of other Sections in executing work of this Section.

1. Perform work such that progress of entire project including work of other Sections shall not be interfered with or delayed.
2. Provide information as requested on items furnished under this Section which shall be installed under other Sections.
3. Obtain detailed installation information from manufacturers of equipment provided under this Section.
4. Obtain final roughing dimensions or other information as needed for complete installation of items furnished under other Sections or by Owner.
5. Keep fully informed as to shape, size and position of openings required for material or equipment to be provided under this and other Sections. Give full information so that openings required by work of this Section may be coordinated with other work and other openings and may be provided for in advance. In case of failure to provide sufficient information in proper time, provide cutting and patching or have same done, at own expense and to full satisfaction of Architect.
6. Provide information as requested as to sizes, number and locations of concrete housekeeping pads necessary for floor-mounted vibrating and rotating equipment provided under this Section.
7. Notify Architect of location and extent of existing piping, conduit, ductwork and equipment that interferes with new construction. In coordination with and with approval of Architect, relocate piping, ductwork and equipment to permit new work to be provided as required by Contract Documents. Remove non-functioning and abandoned raceway, wiring, and equipment as directed by Architect. Dispose of or store items as requested by Architect.

B. Installation Only Items

1. Where this contractor is required to install items which it does not purchase, it shall coordinate their delivery and be responsible for their unloading from delivery vehicles and for their safe handling and field storage up to the time of installation. This trade shall be responsible for:
   a. Any necessary field assembly and internal connections, as well as mounting in place of the items, including the purchase and installation of all dunnage supporting members and fastenings necessary to adapt them to architectural and structural conditions.

b. Their connection to building systems including the purchase and installation of all terminating fittings necessary to adapt and connect them to the building systems.

2. This contractor shall carefully examine such items upon delivery. Claims that any of these items have been received in such condition that their installation will require procedures beyond the reasonable scope of work of this contractor will be considered only if presented in writing within one week of their date of delivery. Unless such claims have been submitted this contractor shall be fully responsible for the complete reconditioning or replacement of the damaged items.

C. Maintenance of equipment and systems: Maintain equipment and systems until Final Acceptance. Ensure adequate protection of equipment and material during delivery, storage, installation and shutdown and during delays pending final test of systems and equipment because of seasonal conditions.

D. Use of premises: Use of premises shall be restricted as directed by Architect and as required below.

1. Remove and dispose of dirt and debris, and keep premises clean. During progress of work, remove equipment and unused material. Put building and premises in neat and clean condition, and do cleaning and washing required to provide acceptable appearance and operation of equipment, to satisfaction of Architect.
2. Store materials in a manner that will maintain an orderly clean appearance. If stored on-site in open or unprotected areas, all equipment and material shall be kept off the ground by means of pallets or racks, and covered with tarpaulins.
3. Do not interfere with function of existing systems and services. Extreme care shall be observed to prevent debris from entering raceways and equipment. Confer with Architect as to disruption of services or other utilities due to testing or connection of new work to existing. Interruption of services shall be performed at time of day or night deemed by Owner to provide minimal interference with normal operation. Obtain Owner's approval of the method proposed for minimizing service interruption.

E. Surveys and Measurements:

1. Base measurements, both horizontal and vertical, on reference points established by Contractor and be responsible for correct laying out of work.
2. In event of discrepancy between actual measurements and those indicated, notify Architect in writing and do not proceed with work until written instructions have been issued by Architect.

F. Fireproofing:

1. Clips, hangers, clamps, supports and other attachments to surfaces to be fireproofed shall be installed, insofar as possible, prior to start of spray fiber work.
2. Raceways and other items which would interfere with proper application of fireproofing shall be installed after completion of spray fiber work.
3. Patching and repairing of fireproofing due to cutting or damage to fireproofing during course of work specified under this Section shall be performed by installer of fireproofing and paid for by trade responsible for damage and shall not constitute grounds for an extra to Owner.

G. Temporary Utilities:

1. Refer to Division 1 regarding requirements.

H. Miscellaneous

1. Unload materials and equipment delivered to site. Pay costs for rigging, hoisting, lowering and moving electrical equipment on and around site, in building or on roof.

3.3 PROJECT CLOSE-OUT PROCEDURE

A. General

1. The requirements of this section are in addition to and supplement the requirements outlined in Section 01700- Project Closeout.
2. It shall be each contractor's responsibility to personally hand-deliver all of the required project close-out checklist items and to obtain Owner's authorized representative(s) signed receipt on all items requiring Owner sign-off.

B. Project Close-Out Checklist

1. Review requirements of each section of the specifications and submit for approval to Architect the sign-off forms which shall become the project close-out checklist. These, at a minimum, shall include the following information shown in attached Project Closeout Checklist Example. The Architect and/or Owner may incorporate additional specific items to the following checklist which shall become part of the project requirements.
2. Close-Out Checklist Example.

PROJECT CLOSE-OUT

PROJECT CLOSE-OUT			
PROJECT:			
DIVISION NO.:			
CONTRACTOR:			
ITEM[1]	DATES		OWNER'S SIGN-OFF
	COMPLETED	RECEIVED BY OWNER	
Permits			
State Inspection			
Manufacturer's Warranties			
Contractor's Warranties			
State Fire Rating Data			
Copy of Final Shop Drawings			
List and Possession of Spare Parts			
Equipment Tests Required by Specs			
O & M Manuals			
Record Documents			
Coordination Drawings			
Commissioning Reports/Letters/Forms			
On Site Training Complete

[1] Provide separate line item for each specified item (do not group items).

SECTION 260500 - COMMON WORK RESULTS FOR ELECTRICAL

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:
   1. Electrical equipment coordination and installation.
   2. Sleeves for raceways and cables.
   3. Sleeve seals.
   4. Grout.
   5. Common electrical installation requirements.

1.3 DEFINITIONS

A. EPDM: Ethylene-propylene-diene terpolymer rubber.

B. NBR: Acrylonitrile-butadiene rubber.

1.4 COORDINATION

A. Coordinate arrangement, mounting, and support of electrical equipment:
   1. To allow maximum possible headroom unless specific mounting heights that reduce headroom are indicated.
   2. To provide for ease of disconnecting the equipment with minimum interference to other installations.
   3. To allow right of way for piping and conduit installed at required slope.
   4. So connecting raceways, cables, wireways, cable trays, and busways will be clear of obstructions and of the working and access space of other equipment.

B. Coordinate installation of required supporting devices and set sleeves in cast-in-place concrete, masonry walls, and other structural components as they are constructed.

C. Coordinate location of access panels and doors for electrical items that are behind finished surfaces or otherwise concealed. Access doors and panels are specified in Division 08 Section "Access Doors and Frames."

D. Coordinate sleeve selection and application with selection and application of firestopping specified in Division 07 Section "Penetration Firestopping."."

PART 2 - PRODUCTS

2.1 SLEEVES FOR RACEWAYS AND CABLES

A. Steel Pipe Sleeves: ASTM A 53/A 53M, Type E, Grade B, Schedule 40, galvanized steel, plain ends.

B. Cast-Iron Pipe Sleeves: Cast or fabricated "wall pipe," equivalent to ductile-iron pressure pipe, with plain ends and integral waterstop, unless otherwise indicated.

C. Sleeves for Rectangular Openings: Galvanized sheet steel.
   1. Minimum Metal Thickness:
      a. For sleeve cross-section rectangle perimeter less than 50 inches and no side more than 16 inches, thickness shall be 0.052 inch.
      b. For sleeve cross-section rectangle perimeter equal to, or more than, 50 inches and 1 or more sides equal to, or more than, 16 inches, thickness shall be 0.138 inch.

2.2 GROUT

A. Nonmetallic, Shrinkage-Resistant Grout: ASTM C 1107, factory-packaged, nonmetallic aggregate grout, noncorrosive, nonstaining, mixed with water to consistency suitable for application and a 30-minute working time.

PART 3 - EXECUTION

3.1 COMMON REQUIREMENTS FOR ELECTRICAL INSTALLATION

A. Comply with NECA 1.

B. Measure indicated mounting heights to bottom of unit for suspended items and to center of unit for wall-mounting items.

C. Headroom Maintenance: If mounting heights or other location criteria are not indicated, arrange and install components and equipment to provide maximum possible headroom consistent with these requirements.

D. Equipment: Install to facilitate service, maintenance, and repair or replacement of components of both electrical equipment and other nearby installations. Connect in such a way as to facilitate future disconnecting with minimum interference with other items in the vicinity.

E. Right of Way: Give to piping systems installed at a required slope.

3.2 SLEEVE INSTALLATION FOR ELECTRICAL PENETRATIONS

A. Electrical penetrations occur when raceways, cables, wireways, cable trays, or busways penetrate concrete slabs, concrete or masonry walls, or fire-rated floor and wall assemblies.

B. Concrete Slabs and Walls: Install sleeves for penetrations unless core-drilled holes or formed openings are used. Install sleeves during erection of slabs and walls.

C. Use pipe sleeves unless penetration arrangement requires rectangular sleeved opening.

D. Fire-Rated Assemblies: Install sleeves for penetrations of fire-rated floor and wall assemblies unless openings compatible with firestop system used are fabricated during construction of floor or wall.

E. Cut sleeves to length for mounting flush with both surfaces of walls.

F. Extend sleeves installed in floors 2 inches above finished floor level.

G. Size pipe sleeves to provide 1/4-inch annular clear space between sleeve and raceway or cable, unless indicated otherwise.

H. Seal space outside of sleeves with grout for penetrations of concrete and masonry
   1. Promptly pack grout solidly between sleeve and wall so no voids remain. Tool exposed surfaces smooth; protect grout while curing.

I. Interior Penetrations of Non-Fire-Rated Walls and Floors: Seal annular space between sleeve and raceway or cable, using joint sealant appropriate for size, depth, and location of joint. Comply with requirements in Division 07 Section "Joint Sealants.".

J. Fire-Rated-Assembly Penetrations: Maintain indicated fire rating of walls, partitions, ceilings, and floors at raceway and cable penetrations. Install sleeves and seal raceway and cable penetration sleeves with firestop materials. Comply with requirements in Division 07 Section "Penetration Firestopping."

K. Roof-Penetration Sleeves: Seal penetration of individual raceways and cables with flexible boot-type flashing units applied in coordination with roofing work.

L. Aboveground, Exterior-Wall Penetrations: Seal penetrations using steel pipe sleeves and mechanical sleeve seals. Select sleeve size to allow for 1-inch annular clear space between pipe and sleeve for installing mechanical sleeve seals.

3.3 FIRESTOPPING

A. Apply firestopping to penetrations of fire-rated floor and wall assemblies for electrical installations to restore original fire-resistance rating of assembly. Firestopping materials and installation requirements are specified in Division 07 Section "Penetration Firestopping."

END OF SECTION 260500

N:\N0912.00\DOC\SPEC\2012_03-16_BID\260500_COMMON WORK RESULTS.DOC

SECTION 260500.01 – COMMON WORK RESULTS FOR ELECTRICAL, SECURITY SUPPLEMENT

PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

A. Provide a conduit and supportive electrical powering systems to support Electronic Security Systems as listed in paragraph 1.1. Coordinated with Section 280500 work. See submittal requirements for submittal requirements.

B. Refer to 280500 Part 1

1.2 RELATED DOCUMENTS

A. Refer to 280500 Part 1

1.3 RELATED DIVISION PROVISIONS

A. Refer to 280500 Part 1

1.4 REFERENCES

A. Refer to 280500 Part 1

1.5 SUMMARY

A. Section includes requirement of Division 26 contractor to support electronic security systems work. This section provides requirements for planning, supplementary submittal requirements, product specifications and installation of conduit and electrical power systems supporting electronic security.

1.6 DEFINITIONS

A. Refer to 280500 Part 1

1.7 SUBMITTALS

A. General: Submittals shall adhere to submittal requirements outlined in Division 280500, Section 1.6. All submittals for Section 280500 including this supplement shall be submitted as one submittal as outlined in Section 280500, Paragraph 1.6.

B. Group 1 Technical Data Package: The data package shall include the following:

1. Shop Drawings: Provide conduit systems plan for routing and sizing of all security conduits and enclosure assemblies.

2. Construction Mock-up: In areas with exposed EMT/Conduit Raceways, Contractor shall conceal raceway as much as practical and unobtrusively. Installation means and methods should be approved by the Owner.

3. Power Circuits & Calculation: Contractor shall provide power circuit schedule for each security component requiring high voltage power. The schedule shall include the following information:

a. Panel Location
b. Panel Nomenclature
c. Circuit Number
d. Type of Circuit (emergency power, UPS, etc.)
e. Circuit power consumption

C. Product Data: For each type of product indicated in Part 2 of this section.

1.8 COORDINATION

A. Refer to 280500 Part 1

1.9 QUALITY ASSURANCE

A. Refer to 280500 Part 1

1.10 MAINTENANCE & SERVICE

A. Refer to 280500 Part 1

1.11 SYSTEM DESCRIPTION

A. The system shall be coordinate with 280500.

1.12 PERFORMANCE REQUIREMENTS

A. Refer to 280500 Part 1

1.13 DELIVERY HANDLING & STORAGE

A. Refer to 280500 Part 1

1.14 PROJECT CONDITIONS

A. Refer to 280500 Part 1

1.15 EQUIPMENT AND MATERIALS

A. Refer to 280500 Part 1

1.16 ELECTRICAL POWER

A. Refer to 280500 Part 1

1.17 ENVIRONMENTAL CONDITIONS

A. Refer to 280500 Part 1

1.18 LIGHTNING, POWER SURGES, & GROUNDING

A. Refer to 280500 Part 1

1.19 COMPONENT ENCLOSURES

A. Refer to 280500 Part 1

1.20 ELECTRONIC COMPONENTS

A. Refer to 280500 Part 1

1.21 SUBSTITUTE MATERIALS & EQUIPMENT

A. Refer to 280500 Part 1

1.22 LIKE ITEMS

A. Refer to 280500 Part 1

1.23 WARRANTY

A. Refer to 280500 Part 1

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. All materials, equipment, and devices shall, as a minimum, meet the requirements of UL where UL standards are established for those items, and the requirements of NFPA 70. All items shall be new unless specified or indicated otherwise.

2.2 CONDUIT AND FITTINGS

A. Types:

1. Rigid:

a. Rigid Steel Conduit (Zinc-Coated) shall meet ANSI C80.1.
b. Rigid Aluminum Conduit shall meet ANSI C80.5.
c. Rigid Nonmetallic PVC Type Conduit EPC-40 in accordance with NEMA TC2, or UL approved fiberglass reinforced epoxy (FRE).
d. Conduit coupling and connectors shall be of a compression type. Set screw couplings and connectors shall not be permitted.

2. EMT:

a. Electric Metallic Tubing (EMT) shall meet ANSI C80.3.
b. Conduit coupling and connectors shall be of a compression type. Set screw couplings and connectors shall not be permitted.

3. Flexible Metal Conduit:

a. Liquid-Tight Flexible Metal Conduit (Steel) shall meet UL 360.

4. Sheet Metal Cable Tray

a. Sheet Metal Cable Tray shall meet National Electrical Manufacturer's Association (NEMA) VE1-2002.

2.3 SPECIAL FIRE PANEL CONNECTIONS

A. All conduits between the security panel assembly and fire control panels are to be recessed in the wall. These conduits shall be marked with blue and red tape to indicate their association with fire and security systems.

2.4 SECURITY JUNCTION BOX:

A. The Contractor shall provide 6” x 8” metal junction box with cover and tamper proof Torx Center post security screws. Boxes containing security electronic circuitry shall be tampered.

2.5 ENCLOSURES:

A. The Contractor shall provide metallic enclosures as needed for equipment not housed in racks or supplied with a housing. The enclosures shall be as specified or shown.

1. Interior: Enclosures to house equipment in an interior environment shall meet the requirements of NEMA 250-Type 12.

2. Exterior: Enclosures to house equipment in an outdoor environment shall meet the requirements of NEMA 250-Type 4. Enclosures exposed to direct sunlight shall be finished with white polyester powder coating and be equipped with a sun shield finished to match the enclosure. Sun shield shall be mounted to protect the top of the enclosure from direct sun and shall extend at least 25.4 mm (1 in) beyond the edges of the enclosure on all sides.

3. Corrosion-Resistant: Enclosures to house equipment in a corrosive environment shall meet the requirements of NEMA 250-Type 4X.

4. Hazardous Environment: All system electronics to be used in a hazardous environment shall be housed in a metallic enclosure which meets the requirements of paragraph "Hazardous Environment."

5. Tamper Provisions: Enclosures, cabinets, housings (other than environmental camera housings), and boxes of every description having hinged doors or removable covers, which contain any part of the data transmission media, circuits, termination or power supplies, shall be provided with cover operated, corrosion-resistant tamper switches, arranged to initiate an alarm signal when the door or cover is moved. Tamper switches shall be mechanically mounted to maximize the defeat time when enclosure covers are opened or removed. Tamper switches shall be inaccessible until the switch is activated; have mounting hardware concealed so the location of the switch cannot be observed from the exterior of the enclosure; be connected to circuits which are under electrical supervision at all times, irrespective of the protection mode; and be wired so they break the circuit when the door or cover is disturbed. Tamper switches on the doors which must be opened to make routine maintenance adjustments to the system and to service the power supplies shall be push/pull-set, automatic reset type.

6. Enclosure Covers: Covers of pull and junction boxes provided to facilitate installation of the system need not be provided with tamper switches if they contain no splices or connections and held in place with tamper proof Torx Center post security screws. Provide stenciled labels for each box.

7. Construction of Enclosures:

   a. Consoles, power supply enclosures, detector control and terminal cabinets, control units, wiring gutters, and other component housings, collectively referred to as enclosures, shall be so formed and assembled as to be sturdy and rigid.

   b. Thickness of metal in-cast and sheet metal enclosures of all types shall not be less than those in Tables I and II, UL 611. Sheet steel used in fabrication of enclosures shall be not less than 14 gauge. Consoles shall be 16-gauge. Doors and covers shall be flanged. Enclosures shall not have pre-punched knockouts. Where doors are mounted on hinges with exposed pins, the hinges shall be of the tight pin type or the ends of hinge pins shall be tack welded to prevent removal. Doors having a latch edge length of less than 609.6 mm (24 in) shall be provided with a single construction core. Where the latch edge of a hinged door is more than 609.6 mm (24 in) or more in length, the door shall be provided with a three-point latching device with construction core; or alternatively with two, one located near each end.

   c. Any ventilator openings in enclosures and cabinets shall conform to the requirements of UL 611. Unless otherwise indicated, sheet metal enclosures shall be designed for wall mounting with tip holes slotted. Mounting holes shall be in positions that remain accessible when all major operating components are in place and the door is open, but shall be in accessible when the door is closed.

   d. Covers of pull and junction boxes provided to facilitate initial installation of the system shall be held in place by tamper proof Torx Center post security screws. Stenciled or painted labels shall be affixed to such boxes indicating they contain no connections. These labels shall not indicate the box is part of the Electronic Security System (ESS).

B. Wire Troughs

   1. Wire troughs shall be utilized for all enclosure assemblies wire management practices.

   2. Security Screws: Secure trough covers with tamper proof Torx Center post security screws.

   3. Trough Mounting: Wire Toughs shall be mounted securely to fire resistant plywood meeting UL Standard for fire retardant backboards.

PART 3 - EXECUTION

3.1 GENERAL

A. Power (Division 26):

1. Primary Dedicated Electrical Power (20 Amp, 120 VAC) circuits shall be provided by this Contractor at locations shown on drawings. Primary Dedicated Electrical Power (20 Amp, 120 VAC) circuits shall be derived from sources supported emergency power. The Contractor shall provide all the connections between powered junction boxes and security equipment.

2. Division 26 Contractor shall provide cable trays required by the security systems. Security conduits shall be labeled with blue marking band or blue paint every 30 ft Security junction box covers shall be painted with paint manufactured by Benjamin Moore #791, or Duron 5085A (Americana).

B. HVAC (Division 25)

1. Division 25 Contractor shall provide a Liebert Cooling System or equivalent, for the Security Monitoring Control and Equipment rooms.

C. Conduit: The following security provisions apply to system conduit requirements:

1. Conduit shall be provided in accordance with The National Electrical Code (NEC), and the requirements of other Division 26 Sections.

2. All wiring shall be installed in conduit and in cable trays or raceways when specifically permitted in Contract Documents. Conduit fill shall not exceed 40 percent of interior cross sectional area where three or more cables are contained within a single conduit.

3. Cable must be separated from any open conductors of Power, or Class 1 circuits, and shall not be placed in any conduit, junction box or raceway containing these conductors, as per the NEC.

4. All circuits shall be provided with transient suppression devices and the system shall be designed to permit simultaneous operation of all circuits without interference or loss of signals.

5. Conduit shall not enter the security control panel, or any other remotely mounted control panel equipment or back boxes, except where conduit entry is specified by the manufacturer.

6. Conduit shall be 3/4" minimum, except 1/2" flexible conduit is permitted when connecting to a single device.

D. Terminal Boxes, Junction Boxes and Cabinets:

1. All boxes and cabinets shall be UL listed for their use and purpose. Screws extending outside any cabinets shall be cut off and filed smooth to prevent any injury.

2. The security 120 VAC power supplies shall be connected to a separate dedicated branch circuit, maximum 20 amperes. This circuit shall be labeled at the main power distribution panel as Security. Security 120 VAC primary power wiring shall be 12 AWG. The control panel cabinet shall be grounded securely to a suitable ground.

3. Enclosure Penetrations: All enclosure penetrations shall be from the bottom unless the system design requires penetrations from other directions. Penetrations of interior enclosures involving transitions of conduit from interior to exterior, and all penetrations on exterior enclosures shall be sealed with rubber silicone sealant to preclude the entry of water. The conduit riser shall terminate in a hot-dipped galvanized metal cable terminator. The terminator shall be filled with an approved sealant as recommended by the cable manufacturer, and in such a manner that the cable is not damaged.

4. Cold Galvanizing: All field welds and brazing on factory galvanized boxes, enclosures, and conduits shall be coated with a cold galvanized paint containing at least 95 percent zinc by weight.

5. Wire Troughs: Wire troughs shall be utilized for all enclosure assemblies wire management practices. Security Screws: Secure trough covers with tamper proof Torx Center post security screws. Trough Mounting: Wire Toughs shall be mounted securely to fire resistant plywood meeting UL Standard for fire retardant backboards.

6. Backboards: Plywood, fire-retardant treated, 19 x 1220 x 2440 mm (0.75 x 48 x 96 in) minimum with actual dimensions to match panel assembly sizing. Comply with requirements for plywood backing panels in Division 06 Section "Rough Carpentry".

PART 4 - SYSTEM PROGRAMMING

4.1 NOT APPLICABLE

PART 5 - TESTING AND ACCEPTANCE

5.1 FIELD TESTS:

A. Contractor shall perform field test of all electrical circuits to ensure they conform to project requirements. A ground test shall be performed on all grounding systems to ensure continuity in the entire grounding system.

B. Unit Control Room

1. Contractor shall confirm the source, operation, and labeling of all power circuits.

5.2 REFER TO 280500 PART 5

END OF SECTION 260500 - SUPPLEMENT

SECTION 260519 - LOW-VOLTAGE ELECTRICAL POWER CONDUCTORS AND CABLES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. This Section includes the following:
   1. Building wires and cables rated 600 V and less.
   2. Connectors, splices, and terminations rated 600 V and less.

1.3 DEFINITIONS

A. EPDM: Ethylene-propylene-diene terpolymer rubber.

B. NBR: Acrylonitrile-butadiene rubber.

1.4 ACTION SUBMITTALS

A. Product Data: For each type of product indicated.

1.5 INFORMATIONAL SUBMITTALS

A. Field quality-control test reports.

1.6 QUALITY ASSURANCE

A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100.

B. Comply with NFPA 70.

PART 2 - PRODUCTS

2.1 CONDUCTORS AND CABLES

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

1. American Insulated Wire Corp.; a Leviton Company.
2. General Cable Corporation.
3. Senator Wire & Cable Company.
4. Southwire Company.

B. Copper Conductors: Comply with NEMA WC 70.

C. Conductor Insulation: Comply with NEMA WC 70 for Types THW, THHN-THWN.

D. Multiconductor Cable: Comply with NEMA WC 70 for metal-clad cable, Type MC with ground wire. Lengths of multiconductor cable shall be limited to six feet for recessed lighting circuits and ten feet for receptacle circuits. Multiconductor cable shall not be utilized for homeruns back to panelboards.

2.2 CONNECTORS AND SPLICES

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
1. AFC Cable Systems, Inc.
2. Hubbell Power Systems, Inc.
3. O-Z/Gedney; EGS Electrical Group LLC.
4. 3M; Electrical Products Division.
5. Tyco Electronics Corp.

B. Description: Factory-fabricated connectors and splices of size, ampacity rating, material, type, and class for application and service indicated.

PART 3 - EXECUTION

3.1 CONDUCTOR MATERIAL APPLICATIONS

A. Feeders: Copper. Solid for No. 10 AWG and smaller; stranded for No. 8 AWG and larger.

B. Branch Circuits: Copper. Solid for No. 10 AWG and smaller; stranded for No. 8 AWG and larger.

3.2 CONDUCTOR INSULATION AND MULTICONDUCTOR CABLE APPLICATIONS AND WIRING METHODS

A. Service Entrance: Type THHN-THWN, single conductors in raceway.

B. Exposed Feeders: Type THHN-THWN, single conductors in raceway.

C. Feeders Concealed in Ceilings, Walls, Partitions, and Crawlspaces: Type THHN-THWN, single conductors in raceway.

D. Feeders Concealed in Concrete, below Slabs-on-Grade, and Underground: Type THHN-THWN, single conductors in raceway.

E. Exposed Branch Circuits, Including in Crawlspaces: Type THHN-THWN, single conductors in raceway.

F. Branch Circuits Concealed in Ceilings, Walls, and Partitions: Type THHN-THWN, single conductors in raceway or Metal-clad cable, Type MC. Multiconductor cable shall not be utilized for homeruns back to panelboard.

G. Branch Circuits Concealed in Concrete, below Slabs-on-Grade, and Underground: Type THHN-THWN, single conductors in raceway.

H. Cord Drops and Portable Appliance Connections: Type SO, hard service cord with stainless-steel, wire-mesh, strain relief device at terminations to suit application.

I. Class 1 Control Circuits: Type THHN-THWN, in raceway.

3.3 INSTALLATION OF CONDUCTORS AND CABLES

A. Conceal cables in finished walls, ceilings, and floors, unless otherwise indicated.

B. Use manufacturer-approved pulling compound or lubricant where necessary; compound used must not deteriorate conductor or insulation. Do not exceed manufacturer's recommended maximum pulling tensions and sidewall pressure values.

C. Use pulling means, including fish tape, cable, rope, and basket-weave wire/cable grips, that will not damage cables or raceway.

D. Install exposed cables parallel and perpendicular to surfaces of exposed structural members, and follow surface contours where possible.

E. Support cables according to Division 26 Section "Hangers and Supports for Electrical Systems."

F. Identify and color-code conductors and cables according to Division 26 Section "Identification for Electrical Systems."

3.4 CONNECTIONS

A. Tighten electrical connectors and terminals according to manufacturer's published torque-tightening values. If manufacturer's torque values are not indicated, use those specified in UL 486A and UL 486B.

B. Make splices and taps that are compatible with conductor material and that possess equivalent or better mechanical strength and insulation ratings than unspliced conductors.
   1. Use oxide inhibitor in each splice and tap conductor for aluminum conductors.

C. Wiring at Outlets: Install conductor at each outlet, with at least 6 inches of slack.

3.5 SLEEVE AND SLEEVE-SEAL INSTALLATION FOR ELECTRICAL PENETRATIONS

A. Install sleeves and sleeve seals at penetrations of exterior floor and wall assemblies. Comply with requirements in Division 26 Section "Common Work Results for Electrical."

3.6 FIRESTOPPING

A. Apply firestopping to electrical penetrations of fire-rated floor and wall assemblies to restore original fire-resistance rating of assembly according to Division 07 Section "Penetration Firestopping."

3.7 FIELD QUALITY CONTROL

A. Perform tests and inspections and prepare test reports.

B. Tests and Inspections:
   1. After installing conductors and cables and before electrical circuitry has been energized, test service entrance and feeder conductors for compliance with requirements.

   2. Perform each visual and mechanical inspection and electrical test stated in NETA Acceptance Testing Specification. Certify compliance with test parameters.
   3. Infrared Scanning: After Substantial Completion, but not more than 60 days after Final Acceptance, perform an infrared scan of each splice in cables and conductors No. 3 AWG and larger. Remove box and equipment covers so splices are accessible to portable scanner.
      a. Instrument: Use an infrared scanning device designed to measure temperature or to detect significant deviations from normal values. Provide calibration record for device.
