John M. MacDonald
Vice President - Generation

Reference: NPDES Permit No. NH0001465, Merrimack Station,
Public Service Company of New Hampshire, issued June 25, 1992
and modified October 2, 1992.

Dear Mr. Stewart:

**Merrimack Station
Environmental Monitoring Program Annual Report**

This correspondence is being provided to transmit Merrimack Station's dissolved oxygen, pH, and water temperature data in accordance with annual requirements of Merrimack Generating Station's NPDES permit.

Public Service Company of New Hampshire (PSNH), in accordance with section 6(a) and 7 of the referenced permit, submits the environmental monitoring program annual report for its, Merrimack Station. The report covers the period June 1, 2010 through May 31, 2011. It presents the data collected and explains outages that occurred and summaries of remedial actions taken to keep the systems in service.

If you have any questions, please contact Mr. Paul Basiliere, PSNH Generation Operations Services at (603) 634-2684.

Very Truly Yours,

PUBLIC SERVICE COMPANY OF NEW HAMPSHIRE

John M. MacDonald, Vice President, Generation

- VI. MONTHLY SUMMARY REPORTS

I. EXECUTIVE SUMMARY

PSNH operates four (4) environmental monitoring stations. Two of the monitoring stations record seasonal river temperature only. These are N-10 and S-4, located north and south of the plant respectively. A monitoring station at the Unit #2 intake (N-5) records dissolved oxygen and pH of the incoming river water. Finally, a monitoring station at the out fall of the discharge canal (S-0) records dissolved oxygen, pH, and temperature.

The attached PSNH Merrimack Station Drawing No. D-10139 displays the continuous biological monitoring program station locations.

This report covers twelve (12) months of continuous monitoring of the above parameters at the four (4) monitoring stations. The report period is June 2010 through May 2011.

During the year, there were no major outages of ten days or longer.

Several data outages also occurred during the year, and were of lesser duration. A recurring cause of the data outages is electrical storm activity. Despite extensive protection, lightning strikes and subsequent voltage surges frequently burn out probe and circuit board components along with associated hardware. Table 2 will provide a complete listing of major equipment malfunctions with more detailed explanations.

Backup monitoring systems were used to collect substitute data whenever the installed equipment was out of service. Whenever possible, the minimum and maximum data points for temperature and pH were recovered for that day. The substitute data is provided by either backup equipment maintained by station personnel or by operators recording grab samples during routine rounds. When the stations are in service, the grab sample data is used to confirm the primary data readings. More specifics are provided in Section IV. Part D

Compliance with NPDES permit limits were maintained throughout the year. Table 1 will provide a summary of parameter average data on a monthly basis. The pH probe readings at Station S-0 were occasionally less than 6.5 SU due to naturally occurring conditions. Table 3 displays data for Station N-5 which verifies the pH of ambient waters.

EXECUTIVE SUMMARY continued

On occasions, slight pH differentials beyond normal were recorded between monitoring stations. This was generally caused by probe fouling as explained in Table 3.

It is important to note that the record established by 34 years of ecological studies and environmental monitoring at Merrimack Station demonstrates that the cooling water discharge has not adversely impacted the community of aquatic life in the river. pH levels reflect ambient conditions and, along with temperature readings, closely track historical trends. Unaffected passageways below the thermal plume have been documented and shown to be sufficient for fish migration. A Technical Advisory Committee (TAC) consisting of regulatory agency personnel was formed during the year 1992 to review the Merrimack Station biological and hydrological programs. PSNH submitted a research report which summarized and analyzed the thermal effects of the cooling water discharge on the aquatic community. Field studies were conducted in 1994 and 1995 to further assess the affects on the anadromous fish migration season and on the indigenous fish populations. Reports were submitted to the TAC:

1. Merrimack Station Thermal Discharge Modeling Study.
Normandeau Associates, Inc. October 1996.
2. Merrimack Station (Bow) Fisheries Study.
Normandeau Associates, Inc. January 1997.

In more recent years, several additional studies have been submitted to investigate the effects of the cooling water intake and discharge in more detail, including:

1. Proposal for Information Collection to Address Compliance with the Clean Water Act §316(b) Phase II Regulations at Merrimack Station, Bow, New Hampshire. Normandeau Associates, Inc. April 2005.
2. Merrimack Station Thermal Discharge Effects on Downstream Salmon Smolt Migration. Normandeau Associates, Inc. December 2006.

8. Biological Performance of Intake Screen Alternatives to Reduce Annual Impingement Mortality and Entrainment at Merrimack Station. Normandeau Associates, Inc. September 2009.
9. Supplemental Alternative Technology Evaluation, PSNH Merrimack Station Units #1 and #2, Bow, New Hampshire. Enercon Services, Inc. October 2009.
10. Supplemental Follow-up Report on the Biocharacteristics of Yellow Perch and White Sucker Populations in Hooksett Pool of the Merrimack River PSNH Merrimack Station. Normandeau Associates April 2010
11. Response to the United States Environmental Protection Agency Information Request for NPDES Permit Re-Issuance PSNH Merrimack Station Units 1&2 Bow, New Hampshire. Enercon Services, Inc. July 2010

EXECUTIVE SUMMARY continued

The biological data from Merrimack Station's monitoring programs continue to indicate that no adverse environmental impact to the aquatic ecosystems of the Merrimack River in the vicinity of the station has occurred, as measured by any representative important species or critical aquatic organism population as a result of the Stations existing CWIS operation.

II.GENERAL BACKGROUND

Normandeau Associates, Inc. conducted extensive ecological studies of Merrimack Station's impact on the river from 1972 through 1978. Continuous temperature monitoring has been a normal part of station operations for approximately 33 years. In June of 1979, EPA issued a revised NPDES permit which expanded the monitoring to include dissolved oxygen and pH parameters. A summary of the program's development follows:

<u>DATE</u>	<u>ACTIVITY</u>
6/80	The new D.O. and pH equipment is put into service. Environmental Engineers, Inc. (EEI), an affiliate of the Weston Group, is hired to coordinate the entire program.
9/81	The first annual report of the expanded program for 1980-1981 is submitted.
6/84	PSNH staff personnel assume responsibilities for the field portion of the program.
12/84	PSNH staff replaces EEI as the entire program coordinator.
8/86	The field maintenance and data collection portions of the program are delegated to Merrimack Station personnel.
6/87	Biological Monitoring Program system inexperience required the station responsibilities be remanded to PSNH staff. Station duties are reduced to daily basic equipment checks.

Equipment improvements have been regularly implemented to accelerate and upgrade the program. In October 1986, a new Beckman Dissolved Oxygen System was installed at Station S-0 to improve reliability and in June of 1987 an automated personal computer editing program was created to expedite data processing. In April of 1989, a new Beckman Dissolved Oxygen System was installed at Station N-5 to improve reliability. In March and April 1991, a new YSI temperature monitoring system was installed at stations N-10, S-0 and S-4 to improve reliability. In June of 1995 a new Great Lakes Instrument pH System was installed at N-5 and S-0 to improve reliability. In July 1998, new Campbell Scientific Data loggers were installed at all data collection stations to improve reliability. In conjunction with the new data loggers, a new Windows 95 based personal computer data editing program was created to expedite data processing. In April 2000 a new Rosemount Analytical Dissolved Oxygen system was installed at N-5 and S-0 to improve reliability.

A Windows 2000 software upgrade was required for the Campbell Scientific data loggers to make the data compatible with a Windows 2000 upgrade to the edit/ report program. In December 2000 the SO instrument control cable that connects the probes with the analyzers and data loggers suffered a slow and intermittent internal lead failure to the dissolved oxygen probe. It was not repairable. On short notice a new cable was ordered and obtained but only a shorter run was available. Consequently the SO enclosure was moved closer to the probes to accommodate the new cable and improve reliability. In June 2002 enhanced lightning protection devices were installed at all locations to improve reliability. In May 2003 new Scan Data radio systems were installed to try to improve response time for station acquisition of data. In November 2005 the S0 and N5 pH analyzers were replaced with an updated Great Lakes Model 53 pH analyzer. In November 2006 and March 2007 the pH systems at S0 and N5 were replaced with new Rosemount Analytical Solu Comp II pH analyzers and Models 3300HT and 399VP pH probes due to the lack of factory support for the Great Lakes Instruments pH system. In March 2008 a new Rosemount Analytical Model 5081 pH analyzer and a new Model 399-62 low ionic strength and low temperature pH probe was installed at N5 to improve reliability.

In July 2008, new Rosemount Model 1056 dual input (DO and pH) analyzers were installed at N5 and S0 to replace the Model 1054B analyzers due to lack of factory support. In December 2008 a new Rosemount Analytical Model 5081 pH Analyzer and a new Model 399-62 low ionic strength and low temperature pH probe was installed at S0 to improve reliability.

It is evident that the Monitoring Program is dynamic and has been modified frequently during its history. Many of the changes were associated with setbacks that hindered the reporting process. In particular, PSNH's assumption of the data processing function proved to be a tremendously time consuming task. An entirely new in-house computer system was required to collate the significant data base. These improvements have made it possible to submit the annual reports in a more timely manner.

III. SYSTEM DESCRIPTION

A. General

The system consists of four monitoring stations located as shown in Figure 1. The parameters measured at each station are as follows:

FIGURE. 1
PARAMETERS

<u>STATION</u>	<u>TEMP.</u>	<u>D.O.</u>	<u>pH</u>
N-10	X	N/A	N/A
N-5	N/A	X	X
S-0	X	X	X
S-4	X	N/A	N/A

Station N-5 pH and S-0 pH and temperature are kept operational all year. Stations N-10 and S-4 temperature probes are operational on a seasonal basis.

B. Installed Equipment

Stations N-10 & S-4

The temperature monitoring equipment at N-10 & S-4 consists of the following basic components:

- Logan Instruments shielded 250 foot cable (installed in river)
- Logan Instruments Platinum RTD sensor
- Wilkerson Instruments Control Module
- Scan- Data radio
- Scan- Data radio transmitter (R T)
- Campbell Scientific CR 10X data logger

With the exception of the temperature probes, all of the above equipment is installed within an equipment enclosure. The temperature probes, located near midstream, are deployed approximately 6" inches below the water surface of the river on buoys which are anchored to the bottom of the river.

The radio transmitter provides a signal to a Scan- Data base station which interfaces with an INVENSYS (Foxboro) IADCS Computer in the control room at the power station. The CR 10X data logger is used for data storage.

Station N-5

The installed equipment at Station N-5 consists of the following basic components:

- Instrumental panel enclosure with the following equipment:
 - * Rosemount Model 1056 D.O. analyzer (Dual Input)
 - * Rosemount Analytical Model 5081 pH analyzer
 - * Campbell Scientific CR 10X data logger

- Field Probes
 - * Rosemount Model 499A D.O. probe
 - * Rosemount Analytical Model 399-62 VP pH probe

The instrument panel enclosure is mounted in the screen house and the field probes are mounted in the north bay inlet adjacent to the traveling screens in Unit #2 intake structure. The probes are free floating and submerged approximately 6-inches below the water surface in the north bay inlet. During Unit #2 annual outages or extended unit outages the probes are relocated to the front railing of the intake structure to monitor ambient pH and D. O. river conditions and intercept river flow.

The CR 10X data logger is used for data storage.

Station S-0

The installed equipment at Station S-0 consists of the following basic components:

- S-0 instrument panel enclosure
 - * Scan- Data radio
 - * Scan- Data radio transmitter (R T)
 - * Rosemount Model 1056 D.O. analyzer (Dual Input)
 - * Rosemount Analytical Model 5081 pH analyzer
 - * Campbell Scientific CR 10X data logger
 - * Wilkerson Instruments Control Module
- Field probes
 - * Rosemount Model 499A D.O. probe
 - * Rosemount Analytical Model 3300 HT pH probe (summer operation)
 - * Rosemount Analytical Model 399-62 VP pH probe (winter operation)
 - * Logan Instruments Platinum RTD temperature probe

With the exception of the field probes, all of the above equipment is housed within a heated and ventilated enclosure. The field probes are mounted on the railing of a floating bridge located near the end of the cooling water discharge canal. The probes are positioned in the middle of the canal, 6-inches below the water surface. The CR 10X data logger is used for data storage.

IV. MAINTENANCE PROGRAM

A. General

The system maintenance program consists of weekly and monthly preventive maintenance. The weekly program consists primarily of cleaning and inspecting all onshore equipment and instruments. Every month, or more frequently if required, the instruments are calibrated and a boat is used to inspect, clean, and if required replace the RTD probe river installations.

B. Weekly Maintenance Program

During the weekly site visit, the following procedures are completed:

- Station N-5:
 1. Inspect D.O. probe. Clean probe. Check to insure the probe is approximately 6" below the water surface.
 2. Inspect pH probe. Clean electrodes. Check to insure the probe is approximately 6" below the water surface. Check % slope output on the pH probe.
 3. Check battery voltage reading of the CR 10X data logger. If battery voltage is below 12.0V, replace gel battery power supply according to manufacturer's manual.
 4. Check data logger outputs for D.O. and pH against instrument readings. If data logger output and instrument readings do not agree, refer to troubleshooting sections of manufacturer's manual.

Station S-0:

1. Follow procedure 1-4 as listed above for Station N-5.
2. Clean temperature probe and check to insure the probe is approximately 6" below the surface of the water.
3. Using a precision thermometer, check and record the temperature of the water at the probe location. Check and compare with D.O. and pH probe temperature outputs.
4. Check the temperature output from the data logger. If the temperatures do not agree, perform an electronic calibration or refer to the troubleshooting sections of the manufacturer's manual.

- Stations N-10 & S-4:

Check the temperature outputs from the data loggers. If temperatures are out of range, perform an electronic calibration or refer to troubleshooting procedures in the manufacturer's manual.

- All Stations:

1. Check all data for accuracy and consistencies.
2. Replace components or instruments as needed.

C. Monthly Maintenance Program

During the monthly site visit, the following procedures are completed:

- Stations N-10 & S-4:

1. Using the boat, go out to the buoy at each station, clean buoy and probe of debris and check to insure the probe is approximately 6" below the surface of the water.
2. Using a precision thermometer, check and record the temperature of the water where the probe is located.

3. Check the temperature output from the data logger. If the temperatures do not agree, refer to troubleshooting sections of the manufacturer's manual.

- Stations N-5 & S-0

1. Check calibration of the D.O. and pH probes according to the manufacturer's manual and the project SOP manual.

- All Stations

1. Check all data for accuracy and consistency.
2. Replace components or instruments as needed.

D. Discussion

A number of equipment repair and replacement problems occurred with the monitoring program during the reporting period which resulted in a corresponding number of data outages. Table 2 lists the major equipment malfunctions and the associated remedial actions. Additionally, the system suffered numerous short-lived data outages due to A. C. power interruptions, and unknown causes. In most cases, these minor outages went undetected and the system repaired itself without further service.

Auxiliary sources of data were enlisted to maintain monitoring program continuity during most extended data outages. Installed backup temperature monitoring equipment on the unit condensers is utilized to recover ambient river water temperatures when N-10 station is out of service. A Dissolved Oxygen Titration Kit and a bench calibrated portable pH meter are utilized by maintenance personnel on a weekly basis to supplement the data base. This grab sample data has been incorporated into the continuous monitoring data and is reflected in the monthly summaries.

PSNH makes a concerted effort to maintain equipment availability. The general nature of operating field equipment, however, makes this a difficult task.

Occasionally analytical equipment vendors have discontinued manufacturing replacement parts and or factory service for in-service units. Repairs for these units is sometimes more troublesome.

When justified, PSNH has replaced entire instruments to maintain the program integrity. As mentioned elsewhere, much attention has also been given to upgrade and improve the computer data processing function which helps audit equipment performance. In general, data retrieval from the program has been good.

pH units - Standard Units

NA - Station not in service during winter months

TABLE 2. SUMMARY OF MAJOR EQUIPMENT MALFUNCTIONS

<u>DATE</u>	<u>STATION</u>	<u>PARAMETERS</u>	<u>CAUSE/REMEDIAL ACTIONS</u>
6/6-6/8	S0	pH	A lightning strike caused pH isolation loop protection damage and pH analyzer failure. Replaced with backup units and calibrated.
6/28-6/29	S0	pH	New isolation devices installed on the pH loop to replace older devices previously damaged due to lightning strike.
7/5-7/6	S0	All	Unknown persons pulled the wire leads out from the Nema 4 box bus connection on the canal bridge. Police notified. Replaced leads to bus connections and calibrated.
7/19-7/20	N10	Temp.	AC Power outage due to line fault. No instrument damage. Powered up and placed in service.
7/19-7/22	S0	pH	5081 pH analyzer and loop protection fuses dropping out of service periodically due to AC surges which damage lightning protection fuses. Replaced fuses and restored power and ventilation as needed.
7/24-7/26	N5	pH	pH data analyzer program is corrupted and producing off scale data. Unknown cause. Reprogrammed, calibrated and placed in service.
8/11-8/13	N5	DO	Off scale data produced by failed internal RTD inside of the DO probe. New probe installed and calibrated.
8/19-8/20	N5	DO	Failed internal RTD in second DO probe. Replaced and calibrated. Unknown cause.
9/21	N5	All	AC power outage of short duration. Unknown cause. Instruments reset when AC restored.
10/2-10/4	N10	Temp.	High river flows dislodge the river anchor and the strain breaks the lead cable. Replaced on 10/4 with new RTD and calibrated.
10/10 & 10/19	N5	All	Short duration AC power outages due to breaker maintenance in the Unit #2 screen house. Reset and calibrated.

TABLE 2. SUMMARY OF MAJOR EQUIPMENT MALFUNCTIONS

10/27-10/29	N5	pH	pH probe RTD temperature read out is negative 2.4 degrees. Reprogrammed analyzer parameters and calibrated probe.
11/10-11/15	S0	pH	Protection loop fuse failure on 11/10. Holiday weekend prevented discovery until 11/15. Employed backup data and replaced fuse on 11/15. Upper fuse failed. Placed in service.
11/24-11/26	S0	pH	Protection loop fuse failure a second time. Lower fuse failure. Both upper and lower fuses have now been replaced. In service.
11/28	N5	All	AC Power outage required to relocate probes to the railing on the river due to an upcoming lengthy Unit #2 outage. In service.
2/22	S0	pH	Protection loop fuse failure due to an electrical surge. Replaced and placed in service.

PRB12/11 MKbiomon.doc

TABLE 3. SUMMARY OF pH DATA

Throughout the year, pH values fell below the specified lower limit of 6.5 SU. These occurrences were caused by the natural reduction of the pH due to the ambient conditions of the Merrimack River. A monthly summary of the pH data is provided below. This data is not identical to the data reported on the monthly DMR because it is a quick visual scan of all monthly pH data recorded, at S-0 and N-5.

<u>MONTH</u>	<u>N-5 RANGE</u>	<u>S-0 RANGE</u>
JUNE	6.72 -7.30	6.71 -7.33
JULY	6.53 -7.69	6.67 -7.70
AUGUST	6.71 -7.57	6.87 -7.54
SEPTEMBER	6.79 -7.47	6.90 -7.48
OCTOBER	6.52 -7.29	6.53 -7.32
NOVEMBER	6.55 -7.19	6.52 -7.21
DECEMBER	6.35 -6.82	6.37 -7.07
JANUARY	6.51 -6.80	6.73 -7.15
FEBRUARY	6.53 -6.97	6.72 -7.03
MARCH	6.34 -6.87	6.41 -6.97
APRIL	6.59 -6.90	6.62 -7.22
MAY	6.57 -6.83	6.57 -7.28

prb/ 2011 MKbiomon.doc.

On average, the differential between stations N-5 and S-0 is typically 0.3 SU or less. Occasionally the differential drifts slightly higher, usually due to probe fouling. The fouling process is aggravated during the year by various events such as river temperature increases, and spring run-off.

To date, the quality of data collected has not been significantly affected by probe fouling. PSNH has improved the equipment inspection and data processing schedule to lessen the impact of fouling and detect discrepancies.

V. Annual Summary

pH

Permit compliance was maintained. Station-to-station data was generally consistent with past seasonal fluctuations. On occasion recorded data was not completely consistent over short duration. This is attributed to minor disruptions such as probe fouling, floating debris, lightning damage and A. C. power outages. PSNH successfully limits these upsets by performing weekly maintenance inspections. Values below 6.5 SU were recorded during the year due to naturally occurring ambient conditions (see Table 3).

Temperature

Power spray modules were operated in accordance with the permit conditions. Station-to-station data was generally consistent with past seasonal fluctuations.

Stations S-0, S-4, and N-10 were in service at the beginning of the monitoring period. Station N-10 records are supplemented with data from unit condenser operation log when it is out of service. Station N-10 was removed from service on December 6, 2010 when the ambient river temperature fell below 40° F. Station S-4 was removed from service on December 6, 2010.

Station S-4 was installed on April 8, 2011 and Station N-10 was installed on April 8, 2011. The ambient river temperature was 42.4 ° F.

Unit condenser RTD temperature data was used to supplement data collection during N-10 station outages.

Dissolved Oxygen

Compliance with Class B water quality standards was maintained and concentrations were generally consistent with past seasonal fluctuations. Unfortunately, outages due to weather and other ambient environmental conditions occur.

Station N-5 probe was removed from service on December 21, 2010 after ambient river temperature fell below 40°F. Station S-O probe was removed from service on December 21, 2010.

The probe was installed at S-O on April 18, 2011, and the probe was installed at N-5 on April 18, 2011. The average ambient river temperature on April 18, 2011 was 35.85 °F.

On April 22, 2011 Unit #2 curtailed operations at 0515 due to a forced transmission line bus maintenance outage to replace damaged electrical insulators. Due to this outage the cooling water circulators were removed from service. The DO probe was left standing in stagnant water and recorded data that was off scale and out of range for ambient river conditions. The off scale data was reported to the State of New Hampshire, Water Division, Permits and Compliance Section after consultation with the agency. The data has been included on the May 2011 data sheet. Unit #2 returned to service on May 13, 2011 at 1145.

PSNH is stocking a large spare equipment inventory onsite for all of the biological monitoring parameters to prevent multiple outages.

CHILL EVENTS

In the 1991-1992 report, PSNH began reporting chill events in the cooling canal due to the curtailment of unit operation. The chill events were defined as events in which the temperature in the canal dropped at least 10 degrees centigrade in a 24-hour period to a temperature of less than 10 degrees centigrade.

There was one chill event (formally cold thermal excursions) due to the operation of the plant during the monitoring period.

CHILL EVENTS continued

On January 24, 2011 plant operation was curtailed at 0750 with Unit #1 due to the no load steam flow sensing line freezing due to the ambient cold temperatures. The line was repaired and the unit was returned to service at 0955. The same day Unit #2 was operating at reduced load due to the lower coal feeder being plugged and eventually unit operation was curtailed due to a gas recirculation duct floor tube leak at 1353. The unit was returned to service on January 29, 2011 at 1209.

TABLE OF CONTENTS

Merrimack Station biological monitoring data is organized in the following chronological sequence, June 2010 through May 2011. Twelve months of data are arranged by parameter:

<u>Station</u>	<u>Parameter</u>
S-0	Dissolved Oxygen
S-0	pH
S-0	Temperature
N-5	Dissolved Oxygen
N-5	pH
N10	Temperature
S-4	Temperature
